Why then she lives.

Shakspeare.

To dye; to tinge.

The Inn is most amiss—

And hath but merely *stained*-painted walls.

Davies.

To disgrace; to spot with guilt or infamy.

Of honour void, of innocence, of faith, of purity,
Our wonted ornaments now soil'd and *stain'd*.

Milton.

STAIN, *s.* Blot; spot; discoloration.—We no where meet with a more pleasing show than what appears in the heavens at the rising and setting of the sun, which is wholly made up of those different *stains* of light that shew themselves in clouds of a different situation. Addison.—Taint of guilt or infamy.—Ulysses bids his friends to cast lots; for if he had made the choice himself, they whom he had rejected might have judged it a *stain* upon them for want of merit. Broome.—Cause of reproach; shame.—Hereby I will lead her that is the praise, and yet the *stain* of all womankind. Sidney.

STAINBROUGH, a township of England, West Riding of Yorkshire; 5 miles from Barnsley.

STAINBURN, a hamlet of England, in Cumberland; 1 mile east of Workington.

STAINBURN, a township of England, West Riding of Yorkshire; 4½ miles north-east of Otley.

STAINBY, a parish of England, in Lincolnshire; 2½ miles west-south-west of Colsterworth.

STAIN'DROP,

STAINDROP, a village and parish of England, in the county of Durham; 5 miles from Barnard Castle. It was formerly a market town. In the neighbourhood is the elegant mansion of the Earl of Darlington, called Raby castle. It is an irregular building, but is entirely embattled and surrounded by a fosse. It was built by John de Neville, about the year 1378.

STAINER, *s.* One who stains; one who blots; one who dyes; a dyer.

STAINES, a market town of England, in the county of Middlesex, situated on the northern banks of the Thames, over which there is a strong timber bridge, connecting the counties of Surrey and Middlesex. The Thames is here about 80 feet broad. Of late years the town has been greatly improved. Most of the houses extend along the sides of the great western road; but the parish church, with a few buildings, are situated nearly half a mile north-west of the chief mass of building. The church consists of a chancel, nave, and north aisle, separated by circular columns and pointed arches. The door of the chancel is of early Norman architecture. A square embattled tower at the west end was built by Inigo Jones in 1631, as appears by an inscription on the south side. Besides the church, here are meeting-houses for the Quakers, Anabaptists, and Methodists. A Lancasterian school has been recently established, and is supported by voluntary contributions. The bridge, in its present state, was completed in 1807. This bridge appears to have been one of the most ancient in the country. So far back as the year 1262, three oaks out of Windsor forest were granted for its repairs by Henry III.; and numerous grants of pontage or temporary tolls for the same purpose, were made from time to time in the subsequent reigns, which were confirmed by acts of parliament in 1509 and 1597. In 1791 an act was passed for building a new bridge, and allowing certain tolls to defray the expence. Under this act, a stone bridge of three arches was begun in August 1792, and opened in March 1797; but one of the piers giving way, the building was taken down, and an iron bridge substituted. This, however, also failed, and the builders were obliged to support it on wooden piles and frame-work. Staines is a lordship of the crown, and is governed by two constables and four headboroughs. In old records Staines was written *Stana*, a Saxon word for a stone; and Camden supposes that the name was derived from a stone that was fixed on the bank of the river here, to denote the extent of the jurisdiction of the city of London over the Thames westward. A stone, bearing the date of 1280, on the margin of the water, near the church, is still preserved here. In 1811, Staines parish contained 355 houses, and 2042 inhabitants. Market on Friday, and two annual fairs; 16 miles from Hyde Park corner.

STAINESBY, a small village of England, North Riding of Yorkshire, on the banks of the Tees, near Yarm.

STAINFIELD, a hamlet of England, in Lincolnshire; 3½ miles north-north-west of Bourne.

STAINFIELD, a parish of England, in Lincolnshire; 3 miles south-by-west of Wragby.

STAINFORTH, a township of England, West Riding of Yorkshire, on the banks of the Don. The Stainforth and Keadby canal commences here, and passing Thorne, enters Lincolnshire at Crowle Bridge. Population 508; 3½ miles west-north-west of Thorne.

STAINFORTH, a township of England, West Riding of Yorkshire; 2 miles north of Settle.

STAININGTON, a hamlet of England, West Riding of Yorkshire; 4 miles west-by-north of Sheffield.

STAINLAND, a township of England, West Riding of Yorkshire; 4½ miles south-by-west of Halifax. Population 2077

STAINLESS, *adj.* Free from blots or spots. *Not in use.*

The phenix wings are not so rare,
For faultless length and *stainless* hue.

Sidney.

VOL. XXIII. No. 1587.

Free from sin or reproach.

I cannot love him;

Yet I suppose him virtuous, know him noble,
Of great estate, of fresh and *stainless* youth. *Shakspeare.*

STAINLEY, NORTH, a township of England, West Riding of Yorkshire; 4½ miles north of Rippon.

STAINLEY, SOUTH, a township of England, West Riding of Yorkshire; 5 miles north-west of Knaresborough.

STAINMORE, or **STANEMORE**, a township of England in Westmoreland; 4 miles east-south-east of Brough. Population 502.

STAINS, a town of France; 6 miles north of Paris. Population 1100.

STAINSBY, a township of England, in Derbyshire; 6 miles south-east of Chesterfield.

STAINTON, a hamlet of England, in Cumberland; 1½ mile north-west of Carlisle.

STAINTON, a township of England, in Cumberland; 3 miles south-west of Penrith.

STAINTON, a township of England, in Durham; 1½ mile east-by-north of Barnard Castle.

STAINTON, a hamlet of England, in Durham; 8 miles west-by-north of Stockton-upon-Tees.

STAINTON, a parish of England, in Lincolnshire; 5 miles west of Wragby.

STAINTON, a township of England, in Westmoreland; 4½ miles south-by-east of Kendal.

STAINTON, a parish of England, West Riding of Yorkshire; 7 miles south-by-west of Doncaster.

STAINTON, a township of England, North Riding of Yorkshire; 5½ miles south-west of Richmond.

STAINTON, a township of England, North Riding of Yorkshire; 4½ miles north-north-west of Stokesley.

STAINTON DALE, a township of England, North Riding of Yorkshire; 7 miles from Scarborough.

STAINTON-IN-THE-VALE, a parish of England, in Lincolnshire; 6 miles north-east of Market Raisin.

STAINTON MARKET, a parish of England, in Lincolnshire; 7 miles east-by-north of Wragby

STAINVILLE, a small town in the north-east of France, in the department of the Meuse, on the Saux; 22 miles north-west of Vaucouleurs.

STAIR, *s.* [*stægen*, Sax., *stege*, Suetl., from *steigan*, M. Goth., *stiga*, Su. Goth., to ascend, to mount. *Serenius.* We have thus, in our northern dialect, *stee* or *stey*, a ladder, from the old verb *sty*, to ascend.] Steps by which we ascend from the lower part of a building to the upper. *Stair* was anciently used for the whole order of steps; but *stair* now, if it be used at all, signifies, as in Milton, only one flight of steps.

How many cowards, whose hearts are all as false

As *stairs* of sand, wear yet upon their chins

The beards of Hercules and frowning Mars. *Shakspeare.*

STAIR, a parish of Scotland, in Ayrshire, five miles long, by two broad, lying on the banks of the river Ayr. Population 614.

STAIRCASE, *s.* The part of a fabric that contains the stairs.—To make a complete *staircase* is a curious piece of architecture. *Wotton.*

STAKE, *s.* [*stæce*, *stæce*, Sax.; *stake*, Swed.; from the Su. Goth., *sticka*, to pierce. *Serenius.* And in like manner Mr. H. Tooke refers *stæc* to the verb *stæcan*, to stick, to pierce.] A post or strong stick fixed in the ground.

He wanted pikes to set before his archers;

Instead whereof sharp *stakes*, pluckt out of hedges,

They pitched in the ground. *Shakspeare.*

In France the grapes that make the wine grow upon low vines bound to small *stakes*, and the raised vines in arbors make but verjuice. *Bacon.*—A piece of long rough wood.

While he whirl'd in fiery circles round

The brand, a sharpen'd *stake* strong Dryas found

And in the shoulder's joint inflicts the wound. *Dryden.*

Any thing placed as a palisade or fence.
That halloo I should know: what are you, speak?
Come not too near, you fall on iron stakes else. *Milton.*

The post to which a beast is tied to be baited.
Have you not set mine honour at the stake,
And baited it with all the unmuzzled thoughts
That tyrannous heart can think? *Shakspeare.*

Any thing pledged or wagered. I know not well whence it has this meaning: I suppose it is so named from being at stake, that is, in a state of hazard, like an animal baited, and in hazard from which it cannot be withdrawn. *Dr. Johnson.*—It is more probably from the Teutonic *stecken*, to fix; whence to set out or settle.

The increasing sound is borne to either shore,
And for their stakes the throwing nations fear. *Dryden.*

The state of being hazarded, pledged or wagered.—Every moment Cato's life's at stake. *Addison.*—The stake is a small anvil, which stands upon a small iron foot on the work-bench, to remove as occasion offers; or else it hath a strong iron spike at the bottom let into some place of the work bench, not to be removed. Its office is to set small cold work straight upon, or to cut or punch upon with the cold chisel or cold punch. *Moxon.*

To STAKE, *v. a.* To fasten, support or defend with posts set upright.—Stake and bind up your weakest plants and flowers against the winds, before they in a moment prostrate a whole year's labour. *Evclyn.*—To wager; to hazard; to put to hazard.—Persons after their prisons have been flung open, have chosen rather to languish in their dungeons than stake their miserable lives on the success of a revolution. *Addison.*

STALACTITES, *s.* [from *σταλαξω*, Gr.] *Stalactites* is only spar in the shape of an icicle, accidentally formed in the perpendicular fissures of the stone. *Woodward.*

STALACTICAL, *adj.* Resembling an icicle.—A cave was lined with those *stalactical* stones on the top and sides. *Derham.*

STALAGMITES, *s.* Spar formed into the shape of drops. *Woodward.*

STALBRIDGE, a market town of England, in the county of Dorset, situated near the banks of the river Stour. The whole parish lies on a rocky bottom, whence the vicinity is supplied in great abundance with building stones. The manufacture of stockings is also carried on here to a considerable extent. Here is a large ancient church and a charity school. In the centre of the town is a neat stone cross, which, including the base, is 30 feet high. At the top is a square block, with four niches. Those on the east and west fronts have the crucifixion, with the Virgin and St. John. On this block stood a cross, and from the top of the freestone of the pyramid, to the hole in which this cross was fixed, the height is 10 feet. At the bottom of this block are several coats of arms. The pyramid itself is 12 feet high, and all the angles are fluted. On one side of it is a defaced figure of our Saviour, with a lamb at his feet. The four sides of the base are adorned with bas-reliefs, one of which seems to represent the resurrection of Christ, who holds a cross in his hand. The whole stands on three octagon flights of steps, each diminishing in the ascent. The manor of Stalbridge belonged at one time to the celebrated philosopher Robert Boyle, who resided and studied here in the early part of his life. In 1811, the parish of Stalbridge contained 141 houses, and 890 inhabitants. Market on Monday, and two annual fairs; 9 miles east of Sherbourne, and 112 west-south-west of London.

STALE, *adj.* [*stel*, Teut.] Old; long kept; altered by time. *Stale* is not used of persons otherwise than in contempt; when it is applied to beer, it commonly means worse for age.—Nappy ale, good and *stale*. *Old Ballad of the King and Miller of Mansfield.*—Used till it is of no use or esteem; worn out of regard or notice.—The duke regarded not the muttering multitude, knowing that rumours grow *stale* and vanish with time. *Hayward.*

STALE, *s.* [from *stælan*, Sax., to steal.] Something exhibited or offered as an allurement to draw others to any place or purpose; a decoy.

Had he none else to make a *stale* but me?
I was the chief that rais'd him to the crown,
And I'll be chief to bring him down again. *Shakspeare.*

In Shakspeare, it seems to signify a prostitute.
I stand dishonour'd, that have gone about
To link my dear friend to a common *stale*. *Shakspeare.*

[*stalle*, Teut., *urina*.] Urine; old urine.—The smell of *stale*, as I observed before, is admirable against the vapours! *Swift.*—Old beer; beer somewhat acidulated. — [*stete*, Dutch, a *stick*.] A handle.

But, seeing th' arrowes *stale* without, and that the head did
goe
No further then it might be seene, he call'd his spirits again. *Chapman.*

At the game of chess applied to the king, when he is forced into a situation from which he cannot move without going into check: by which the game is ended.—They stand at stay, like a *stale* chess, where it is no mate, but the game cannot stir. *Bacon.*

To STALE, *v. a.* To wear out; to make old. *Not now in use.*

Age cannot wither her, nor custom *stale*
Her infinite variety. *Shakspeare.*

To STALE; *v. n.* [*stallen*, Teut., *stallare*, Ital.] To make water.

Having ty'd his beast t' a pale,
And taken time for hoth to *stale*. *Hudibras.*

STALELY, *adv.* Of old; long time.

All your promis'd mountains
And seas I am so *stalely* acquainted with. *B. Jonson.*

STALENESS, *s.* Oldness; state of being long kept; state of being corrupted by time.—Provided our landlord's principles were sound, we did not take any notice of the *staleness* of his provisions. *Addison.*

STALHAM, a parish of England, in Norfolk; 7 miles south-east of North Walsham. Population 471.

STALISFIELD, a parish of England, in Kent; 2 miles north-north-east of Charing.

To STALK, *v. n.* [*stælcen*, Sax. *pedetentum ire*. Originally, our word meant to *step slowly*. "To the bedde he stalketh styll." *Gower, Conf. Am.*—"Ful thefely gan he stalke." *Chaucer, Leg. of Good Women.*] To walk with high and superb steps. It is used commonly in a sense of dislike.

Vexatious thought still found my flying mind,
Nor bound by limits, nor to place confin'd;
Haunted by nights, and terrify'd my days;
Stalk'd through my gardens, and pursu'd my ways,
Nor shut from artful bow'r, nor lost in winding maze. *Prior.*

It is often used with some insinuation of contempt or abhorrence.

Bertran
Stalks close behind her, like a witch's fiend
Pressing to be employed. *Dryden.*

To walk behind a stalking horse or cover.—The king asked how far it was to a certain town: they said six miles. Half an hour after he asked again: one said six miles and a half. The king alighted out of his coach, and crept under the shoulder of his led horse: and when some asked his majesty what he meant, I must *stalk*, said he; for yonder town is shy, and flies me. *Bacon.*

STALK, *s.* High, proud, wide, and stately step.
Great Milton next, with high and haughty *stalks*,
Unfetter'd in majestic numbers walks. *Addison.*

STALK, *s.* [Mr. H. Tooke considers this word as the participle

participle of the Saxon *ƿrigan*, to ascend; and says, "that perhaps it should be written *stawk*, (as we pronounce it), or *stak*, (the *a*, as formerly, broad;) and indeed the *l* may have been introduced to give the broad sound to our modern *a*. This, however, is only my conjecture; being unable otherwise to account for the introduction of *l* into this word. *Div. of Purl*. ii. 283. This conjecture and etymology must give place to the derivation offered by Serenius, namely, the Swedish *stelk*, or *stielke*, the same as our *stalk*; (and he also mentions "A Sax. *stalc*,") and this he deduces from the ancient word *stall*, basis, foundation, which is from *staa*, to stand.] The stem on which flowers or fruits grow.

Small store will serve, where store,
All seasons, ripe for use hangs on the *stalk*. *Milton*.

The stem of a quill.—Viewed with a glass, they appear made up of little bladders like those in the plume or *stalk* of a quill. *Grew*.

STALK, LOCH, a lake of Scotland, in Sutherlandshire; 2 miles long, and half a mile broad, giving rise to the river Laxford.

STALKED, *adj.* Having a stalk: as the long-stalked pear. See PEAR.

STALKER, *s.* One who stalks.—Let's ha' good cheer to-morrow night at supper, *stalk stalker*, and then we'll talk; good capon, and plover, do you hear, sirrah? *B. Jonson*.—A kind of fishing net. *Stat.* 13 Rich. II. ch. 20.

STALKINGHORSE, *s.* A horse either real or fictitious, by which a fowler shelters himself from the sight of the game; a mask; a pretence.—Hypocrisy is the devil's *stalkinghorse*, under an affectation of simplicity and religion. *L'Estrange*.

STALKY, *adj.* Hard like a stalk.—It grows upon a round stalk, and at the top bears a great *stalky* head. *Mortimer*.

STALL, *s.* [*ſtæl*, *ſteal*, Saxon; *stal*, Dutch; *stalla*, Italian.] A crib in which an ox is fed, or a horse is kept in the stable.

Duncan's horses,
Beauteous and swift, the minions of the race,
Turn'd wild in nature, broke their *stalls*, flung out,
Contending 'gainst obedience. *Shakespeare*.

A bench or form where any thing is set to sale.
Stalls, bulks, windows,
Are smothered up, leads fill'd, and ridges hors'd
With variable complexions; all agreeing
In earnestness to see him. *Shakespeare*.

[*Stall*, Swedish; *stal*, Armoric.] A small house or shed in which certain trades are practised.

All these together in one heap were thrown,
Like carcases of beasts in butcher's *stall*;
And in another corner wide were strown
The antique ruins of the Roman's fall. *Spenser*.

The seat of a dignified clergyman in the choir.—The pope creates a canon beyond the number limited, and commands the chapter to assign unto such canon a *stall* in the choir and place in the chapter. *Ayliffe*.

To STALL, *v. a.* To keep in a stall or stable.—For my part, he keeps me rustically at home; or, to speak more properly, sties me here at home unkept: for call you that keeping, for a gentlemān of my birth, that differs not from the *stalling* of an ox? *Shakespeare*.—[For *install*.] To invest.

Long may'st thou live to wail thy children's loss;
And see another as I see thee now,
Deck'd in thy rights, as thou art *stall'd* in mine. *Shakespeare*.

To STALL, *v. n.* To inhabit; to dwell.—We could not *stall* together in the world. *Shakespeare*.—To kennel.

STALLAGE, *s.* Rent paid for a stall.—[In old books.] Laystall; dung; compost.

STALLATION, *s.* [From the second sense of *To stall*].

Installation. *Obsolete*.—Then prepared he has fast for his translation from the see of Lincoln to the see of Yorke, as he did before to his *stallation*. *Cavendish*.

STA'LLFED, *adj.* Fed not with grass, but dry feed.
Every one must every day sustaine
The load of one beast, the most fat and best
Of all the *stallfed*, to the wooer's feast. *Chapman*.

STALLINGBOROUGH, a parish of England, in Lincolnshire; 6 miles north-west of Great Grimsby.

STA'LLION, *s.* [*ysdalwyn*, an old Welsh word: the one is derived from the other; but which from which I certainly cannot tell. *Wotton*.—*Stalon*, old Fr.; *stallone*, Ital.; *stalhengst*, Dutch.—Junius thinks it derived from *ſtælan*, to leap. *Dr. Johnson*.—Serenius derives it from *stall*, *stallr*, Su. Goth. Our ancient word is *stalaunt*: "To be turned out for a *stalaunt*." *Transl. of Bp. Gardiner's De Ver. Obed.* 1553.] A horse kept for mares.

If fleet Dragon's progeny at last
Prove jaded, and in frequent matches cast,
No favour for the *stallion* we retain,
And no respect for the degenerate train. *Dryden*.

STALLUPONEN, a small town of East Prussia, in the government of Gumbinnen. Population 2300; 40 miles south-east of Tilsit, and 80 east of Königsberg. Lat. 54. 37. 7. N. long. 22. 34. 12. E.

STALMYEE, a township of England, in Lancashire; 5 miles north-north-east of Poulton. Population 438.

STALOWICZI, a small town of Russian Lithuania, in the government of Minsk; 10 miles from Pinsk. In 1789 the Poles under Oginski were defeated here with great loss, by the Russians under Suwarrow.

STA'LWORTH, *adj.* [*ſtæl-pýrð* Sax. of uncertain origin. *Dr. Johnson* notices this word under *stallworn*, believing the latter to be a mistake for *stalworth*. *Warburton*, in a note on *Shakespeare* had printed a line from *Fairfax*, (which *Dr. Johnson* inadvertently assigned to *Shakespeare*), upon which *Mr. Edwards* in referring to that author, found the real word to be *stalworth*. There is, perhaps, no such word as *stallworn*. *Todd*.] Stout; strong; brave. Used by *Wicliffe*. *Now wholly obsolete*.—His *stalworth* steed the champion stout bestrode. *Fairfax*.

STAMATA, or STAMATI, a small village between Athens and Marathon, at the distance of 15 miles from the former.

STAMBACH, a small town of Bavarian Franconia, in the principality of Bayreuth; 18 miles north-north-east of Bamberg.

STAMBOURNE, a parish of England, in Essex; 5 miles north-west of Castle Hedingham. Population 1356.

STAMBRIDGE, GREAT and LITTLE, two adjoining parishes of England, in Essex; 2 miles north-east of Rochford.

STAMEN, *s.* [Lat.] Threads; foundation.—You are to know, that all, who enter human life, have a certain date or *stamen* given to their being. *Tatler*

STAMFORD, or STANFORD, an ancient and considerable market and borough town of England, in the county of Lincoln. It is situated on the banks of the river Welland, at the south-western angle of the county, on the borders of Rutlandshire and Northamptonshire. One of its parishes, *St. Martin's* or *Stamford Baron*, is in Northamptonshire, but the greater part of the town is built on the slope of a hill on the Lincoln side of the river. The town is large but irregularly built; most of the houses are of freestone, covered with slate. When approached from the south, it presents an interesting and picturesque appearance, several of the old buildings being grouped together with the towers and steeples of the churches. *Stamford* appears anciently to have been divided into 14 wards or parishes, but in 1461 some of the churches and houses were consumed by fire; and in 1547 the northern part of the town was divided, by act of parliament, into five parishes; *St. Martin's* constituting a sixth, The former are *St. Michael's*, *St. Mary's*, *St. George's*, *All Saints*, and *St. John the Baptist*. *St. Michael's* church stands near the centre of the town, and is supposed to have been

been the most ancient, part of it having existed antecedent to the year 1230. It consists of a nave and choir, with north and south aisles, and chancels extending beyond the aisles. The windows of this building were decorated with figures and heraldic ornaments, of which there are now no remains. St. Mary's church appears to have been built about the latter end of the 13th century, on the site, perhaps, of one much earlier. The upper part of the chancel contains a monument, without armorial ensigns, device, or inscription, but merely a statue in armour, lying besides a female figure: it was erected, according to Leland, to the memory of Sir David Philips and his wife, the former of whom distinguished himself in the battle of Bosworth field. St. George's church is a plain building, consisting of a chancel, a nave, north and south aisles, with a rectangular embattled tower at the west end. It was rebuilt in 1450 by William Bruges, the first garter king of arms, who bequeathed to it many valuable presents. The remains of David Cecil, high sheriff of Northamptonshire in 1542, grandfather of lord Burleigh, are here entombed. All Saints church is a large and well proportioned building consisting of a nave, two aisles, and chancels. At the west end of the north aisle rises the steeple, a lofty and handsome structure, embattled with octagonal turrets at the corners, and surmounted by a spire of a similar form, crocketed at the angles, from the base to the summit. This church was built at the expense of Mr John Brown, a merchant of the staple at Calais, who, with his wife, are buried at the upper end of the north aisle. St. John's church which was rebuilt about the year 1452, consists of a nave and two aisles, with a chancel at the east end of the first, and separated from it by elegant screen-work. The roof is adorned with figures carved in wood and stone, and the windows contain some admirable specimens of stained glass. St. Martin's church is a large and handsome building, consisting of a nave, two chancels and aisles, and a square pinnacled tower. At the upper end of one of the chancels are deposited the remains of Richard Cecil and his wife, the immediate progenitors of lord Burleigh. Here is also a splendid monument of William Cecil, baron of Burleigh, and several others deserving of attention. Stamford formerly contained several monastic establishments, and is related by tradition to have been at one time a seat of a university. In 1333, according to Camden, many of the masters and students at Oxford retired to Stamford, on account of a violent dispute which arose between the northern and southern scholars. Several of these, however, returned to Oxford, and soon afterwards a prohibition was issued by Edward III. for any person to study or perform scholastic exercises elsewhere than in the universities, on pain of certain forfeitures. In the reign of Henry III. the Carmelites had a monastery here, and gave public lectures on divinity and the liberal arts. Other religious houses also were converted into schools, and Stamford became famed for literary instruction. The other public schools which were supposed to constitute part of the above mentioned university, were Brazenose college, a school from which that of Oxford is supposed to have taken its name, and which was taken down in 1668, and a charity school erected in its place; Sempringham-hall, Black-hall, Peterborough-hall, and Vaudey-hall. The schools at present supported in Stamford are Radcliffe's free school, Wells's, or the Petty school, the Blue-coat school, and a school for girls on Dr. Bell's system. The charitable foundations in the town are numerous. The chief of these is one founded by William Brown, in the reign of Richard III. and the revenues of which have greatly increased. Another was erected by Mr Thomas Truesdale in 1730. Besides these, there are certain other charities, with various institutions of a similar kind. Of the other public buildings, the town-hall stands near St. Mary's church and was erected in 1776, the old hall being at that time taken down. It consists of two handsome fronts, and contains 20 apartments, a guard room, a house of correction, and a gaol. In St. Mary's-street is a small theatre, which was built in 1768: and in the south-west corner of St. George's-square is a spacious assembly-room which was erected in 1725.

A new row of commodious 'butchers' shambles has been recently erected. The river Welland is navigable to Stamford for boats and barges, and by this navigation some trade is carried on, chiefly in coals, malt, and freestone. The town is governed by a mayor, 12 aldermen, and 24 burgesses. It returns two members to parliament. The right of election is vested in the housekeepers paying scot and lot, and who receive no alms. The number of voters is about 500, and the mayor is the returning officer. The custom of borough English still prevails here; and the practice of bull baiting has been long in vogue, and is still repeated annually on the 13th November. Stamford is of great antiquity. It was a place of note in the time of the Danes and the Saxons. It is mentioned in Domesday Survey as containing 141 mansions, and 15 laymen or civil magistrates. It had an ancient castle, which was probably built by the Danes. After passing in subsequent ages through the hands of various possessors, it was granted by queen Elizabeth to lord Burleigh. Scarcely any vestiges of it are now visible. In the time of William the Conqueror, Stamford was governed by the laymen or aldermen. The privilege of sending members to parliament was conferred on it by Edward IV., who also incorporated the civic officers of the town by charter. Charles II. gave it a new charter, which was confirmed by James II. Market on Monday and Friday; 46 miles south-east of Lincoln, and 90 north of London. Lat. 52. 40. N. long. 0. 29. W.

STAMFORD, a small village of England, in Bedfordshire, near Southill.

STAMFORD, a hamlet of England, in Northumberland; 4½ miles north-east of Alnwick.

STAMFORD, a township of the United States, in Bennington county, Vermont. Population 378.

STAMFORD, a post township of the United States, in Fairfield county, Connecticut, on Long Island Sound; 31 miles north-east of New York. This township contains a considerable village, situated on Mill River, a small stream which flows through the town, into the sound.

STAMFORD, a post township of the United States, in Delaware county, New York; 15 miles east-north-east of Delhi. Population 1658.

STAMFORD-BRIDGE, EAST, a hamlet of England, East Riding of Yorkshire; 7½ miles east-north-east of York.

STAMFORD-BRIDGE, WEST, a hamlet adjoining the foregoing, remarkable in history for a bloody battle, in which Harold defeated the Danes, ten days before the invasion of William the Conqueror, from which event the place was anciently called Battle-bridge.

STAMFORDHAM, a parish of England, in Northumberland; 12½ miles north-west of Newcastle-upon-Tyne. Population 1813.

STAMFORD HILL, a small but improving village of England, in Middlesex, between Newington and Tottenham.

STAMIN, *s.* [*estamine*, Fr.] A slight sort of stuff; kind of woollen cloth.—Wearing of here or of *stamin*. *Chaucer*.

STAMINA, *s.* [Lat.] The first principles of any thing.—A prerogative, that had moulded into its original *stamina* irresistible principles of decay and dissolution. *Burke*.—The solids of a human body.—[In botany.] Those little fine threads or capillaments which grow up within the flowers of plants, encompassing round the style, and on which the apices grow at their extremities.

To STAMINATE, *v. a.* To endue with stamina.—The persons who, Moses tells us, lived to so great an age, were the special favourites of God, and formed and *staminated* by the immediate hand of God with peculiar principles of vitality. *Biblioth.*

STAMINEOUS, *adj.* [*stamineous*, Lat.] Consisting of threads.—*Stamineous* flowers are so imperfect as to want those coloured leaves which are called petals, and consist only of the stylus and the stamina; and such plants as do bear these *stamineous* flowers Ray makes to constitute a large genus of plants.

STAMMEL, *s.* [*estamel*, old French]. A species of red colour.

Redhood, the first that doth appear
In *stammel*: scarlet is too dear.

B. Jonson.

A kind of woollen cloth: perhaps a corruption of *stamin*.—His table with *stammel* or some other carpet neatly covered. *Comment.*

STAMMEL, *adj.* Of a reddish colour.

I'll not quarrel with this gentleman
For wearing *stammel* breeches.

Beaum. and Fl.

STAMMEL, a small town of the Prussian province of Cleves and Berg; 6 miles from Cologne. Population 900.

To STAMMER, *v. n.* [*stamer*], Sax. a stammerer; *stameren* Teut. to stammer; from the M. Goth. *stamms*, stammering. *Serenius.*] To speak with unnatural hesitation; to utter words with difficulty.

She *stammers*; oh what grace in lisping lies!
If she says nothing, to be surc she's wise.

Dryden.

To STAMMER, *v. a.* To pronounce or declare imperfectly.

They are famed to be a pair of absolute men:—
By my troth, I think fame but *stammers* them.

Beaum and Fl.

STAMMERER, *s.* One who speaks with hesitation.—A *stammerer* cannot with moderation hope for the gift of tongues, or a peasant become learned as Origen. *Bp. Taylor.*

STAMMERING, an hesitation or interruption of speech, which seems generally to arise from fear, eagerness, or some violent passion, that prevents a child's articulating rightly, by the confusion which it occasions in the vibrations that descend into the muscular system; so that, finding himself wrong, he attempts again and again, till he hits upon the true sound. It does not therefore begin, in general, till children are of an age to distinguish right from wrong in respect of pronunciation, and to articulate with tolerable propriety. A nervous disorder of the muscles of speech may have a like effect. When the trick of stammering has once begun to take place in a few words, it will extend itself to more and more from very slight resemblances, and particularly to all the first words of sentences, because then the organs pass in an instant from inactivity to action, whereas the subsequent parts of words and sentences may follow the foregoing from association; just as in repeating *memoriter*, one is most apt to hesitate at the first word in each sentence. A defect of memory from passion, natural weakness, &c., so that the proper word does not occur readily, also occasions stammering, and, like all other modes of speaking, it is caught, in some cases, by imitation.

Sometimes stammering takes place only in the utterance of such words as begin with certain letters, which are generally some of the labial or guttural consonants, as *b, p, m, c, g,* &c. Some persons, on the contrary, stammer in the utterance of all words indiscriminately, with whatever letter they begin, whether they be vowel or consonant, at certain times only; as *e. g.* when the speaker is placed in any situation that occasions hurry or embarrassment. Agreeably to the observations already made, we find that persons of great nervous irritability, and lively consciousness, are most liable to stammering. This sort of impediment is a bad habit, founded upon this constitutional susceptibility: and in attempting to remove stammering, while every attention should be paid such means as physical and medical science will point out for the strengthening of the corporeal system, it is of the utmost importance to induce the persons affected with it to reason on the subject. Let them practise the formation of the component parts of words (that is, simple vocal sounds and the powers of the consonants), singly, and in combination, alternately, till a facility and habit of subjecting the muscles concerned in speech to the will be acquired or regained. They should be accustomed to consider that which is true in fact, that the organs of speech are moved by muscles which, from the laws of animal economy, are the instruments

VOL. XXIII. No. 1588.

of the will; though we are conscious of an act of the will only at the commencement of such actions.

The following directions, with variations according to circumstances, will be found to be attended with advantage, if duly and perseveringly complied with:—

In order to raise a voice, or that material of which speech is formed, let the vowels be practised in a natural key, but with firmness and strength, for ten minutes or a quarter of an hour, at least, every morning. Then let the powers of the consonants be formed, in their order, singly, and variously combined with the vowels.

After a little rest, if imagination supply a subject, by all means let an imaginary conversation take place for twenty minutes, half an hour, or even an hour, in a firm and natural tone of voice, using every effort of fancy, to suppose it directed to persons indiscriminately; that is, sometimes to servants, sometimes to equals in age and rank, and sometimes to elders, or those considered as superior in consequence and rank in society, from whatever cause. But if imagination do not furnish a topic, then let the time be spent in reading, in a tone as nearly approaching to the ease of familiar conversation as possible, taking care to manage the fancy as above. This will furnish the lesson:—and after an interval of a few hours, the same sort of conversation or reading should be repeated, two or three times more in the course of a day. And on mixing with real auditors, every exertion should be made to associate the ideas of their imaginary, with their actual presence.

These directions, it will be perceived, are founded upon the principle of the association of ideas; than which a more powerful principle, in the formation of human habits, cannot be conceived.

An ingenious writer, whose observations we are now citing, is of opinion, that it may be laid down as an incontrovertible position, that persons possessing an ordinary mental capacity, with an adequate share of industry and strength, may *certainly* overcome the habit of stammering, by means such as here pointed out. See "Instruction of the Deaf and Dumb," &c. by Joseph Watson, LL.D. 2 vols. 8vo. 1809.

STAMMERINGLY, *adv.* In a stammering manner.

STAMMERSDORF, a large village of Austria; 9 miles north of Vienna.

STAMMHEIM, a small town of the Swiss canton of Argovia, divided into Upper and Lower, and containing 3000 inhabitants.

To STAMP, *v. a.* [*stampen*, Dutch; *stamper*, Dan.] To strike by pressing the foot hastily downwards.

If Arcite thus deplore,

His sufferings, Palemon suffers more:

He frets, he fumes, he stares, he *stamps* the ground;

The hollow tow'r with clamours rings around. *Dryden.*

To pound; to beat as in a mortar.—Some apothecaries, upon *stamping* of colicoquintida, have been put into a great scouring by the vapour only. *Bacon.*—[*estamper*, Fr.; *stampare*, Ital.; *estampar*, Spanish.] To impress with some mark or figure.

Here swells the shelf with Ogilby the great;

There, *stamp'd* with arms, Newcastle shines complete. *Popc.*

To fix a mark by impressing it.

Of mere ambition, you have made

Your holy hat be *stamp'd* on the king's coin. *Shakspeare.*

To make by impressing a mark.—If two pennyweight of silver, marked with a certain impression, shall here in England be equivalent to three pennyweight marked with another impression, they will not fail to *stamp* pieces of that fashion, and quickly carry away your silver. *Locke.*—To mint; to form; to coin.

We are bastards all;

And that most venerable man, which I

Did call my father, was I know not where

When I was *stamp'd*.

Shakspeare.

To STAMP, *v. n.* To strike the foot suddenly downwards.

What a fool art thou,
A ramping fool, to brag, to *stamp*, and swear,
Upon my party! Thou cold-blooded slave,
Hast thou not spoke like thunder on my side? *Shakspeare.*

STAMP, *s.* [*estampe*, Fr.; *stampa*, Ital.] Any instrument by which a distinct and lasting impression is made.

'Tis gold so pure,
It cannot bear the *stamp* without alloy. *Dryden.*

A mark set on any thing; impression.
That sacred name gives ornament and grace,
And, like his *stamp*, makes basest metals pass;
'Twere folly now a stately pile to raise,
To build a playhouse, while you throw down plays. *Dryden.*

A thing marked or stamped.
The mere despair of surgery he cures;
Hanging a golden *stamp* about their necks,
Put on with holy prayers. *Shakspeare.*

A picture cut in wood or metal; a picture made by impression; a cut; a plate.—At Venice they put out very curious *stamps* of the several edifices, which are most famous for their beauty and magnificence. *Addison.*—A mark set upon things that pay customs to the government.

Indeed the paper *stamp*
Did very much his genius cramp:
And since he could not spend his fire,
He now intended to retire. *Swift.*

A character of reputation, good or bad, fixed upon any thing.—Authority; currency; value derived from any suffrage or attestation.—Of the same *stamp* is that which is obtruded upon us, that an adamant suspends the attraction of the loadstone. *Brown.*—Make; cast; form.

If speaking truth
In this fine age were not thought flatt'ry,
Such attribution should this Douglas have.
As not a soldier of this season's *stamp*
Should go so general current through the world. *Shakspeare.*

STAMPA, a small town of Austrian Italy, in the district of Sondrio, near the Lake of Como.

STAMPALIA, or ISTAMPOLIA, anciently *Astypalaca*, a small island of the Grecian archipelago, situated about 60 miles west-north-west of Rhodes, in Lat. 36. 40. long. 26. 16. E. It is of an irregular form; 14 miles long and about 4½ broad. Its coasts afford several good bays and anchorage grounds, and the soil of the island is fertile; but water being scarce, and piratical incursions to be dreaded, the population is very thin: it consists of Greeks, in a very backward state of civilisation.

STAMPALIA, a small island of the Grecian archipelago, in the neighbourhood of Candia, with a harbour.

STAMPER, *s.* An instrument of pounding.—From the stamping-mill it passeth through the crazing-mill; but of late times they mostly use wet *stampers*. *Carew.*

STAMPFEN, STOMPFA, or STUPAWA, a small town of the west of Hungary; 10 miles north-by-west of Presburg. It is inhabited by Slowacs and Jews, the former mostly weavers, the latter petty merchants.

STAMPING GROUNDS, a post village of the United States, in Scott county, Kentucky.

STAN, amongst our forefathers, was the termination of the superlative degree: so *Athelstan*, most noble; *Betstan*, the best; *Leofstan*, the dearest; *Wistan*, the wisest; *Dunstan*, the highest. *Gibson's Camden.*

STANALL, a township of England, in Lancashire; 4 miles north-by-east of Poulton.

STANBRIDGE, a township of England, in Bedfordshire; 3 miles east-by-south from Leighton-Buzzard.

STANBRIDGE, a township of Lower Canada, in the county of Bedford.

STANCEL, a small hamlet of England, West Riding of Yorkshire; 6 miles from Doncaster.

To STANCH, *v. a.* [*estancher*, Fr.; *stagnare*, Ital.]

To stop blood; to hinder from running.—Iron or stone, laid to the neck, doth *stanch* the bleeding of the nose. *Bacon.*

To STANCH, *v. n.* To stop.—A woman touched the hem of his garment, and immediately her issue *stanch'd*. *St. Luke.*

STANCH, *adj.* Sound; such as will not run out.—What we endeavoured in vain may be performed by some virtuoso, that shall have *stancher* vessels and more sunny days. *Boyle.*—Firm; sound of principle; trusty: hearty; determined.—The standing absurdity, without the belief of which no man is reckoned a *stanch* churchman, is that there is a calf's-head club. *Addison.*

In politics, I hear, you're *stanch*,
Directly bent against the French. *Prior.*

In this sense is used a *stanch* hound. A dog that follows the scent without error or remissness.—Strong; not to be broken.

If I knew
What hoop would hold us *staunch* from edge to edge
O' th' world, I would pursue it. *Shakspeare.*

STA'NCHER, *s.* One that stops blood. *Sherwood.*

STA'NCHION, *s.* [*estanchon*, Fr.] A prop; a support.

STA'NCHLESS, *adj.* Not to be stopped.

There grows,
In my most ill-compos'd affection, such
A *stanchless* avarice, that, were I king,
I should cut off the nobles for their lands. *Shakspeare.*

STANCO, a small island in the Grecian archipelago, the ancient *Cos*, celebrated as the birth-place of Hippocrates and Apelles; it is about 70 miles in circumference, and 12 miles distant from the continent. The country is for the most part level, though on the eastern side there are some hills of small elevation. It contains large plantations of lemon trees, and abounds also with cypress and turpentine, and a number of medicinal plants. It produces that species of stone known by the name of whetstone, and the Latin name of which was derived from this island. There is one considerable town, situated in a bay, with a harbour, defended by a castle. Lat. 36. 46. N. long. 26. 56. E.

STANCO, a bay on the western coast of Asia Minor, deriving its name from the island which is situated at its mouth.

To STAND, *v. n.* preterite *I stood, I have stood.* [*standan*, Goth.; *stanban*, Sax.; *staen*, Dutch; *stare*, Ital.; *estar*, Span.; *stare*, Lat.] To be upon the feet; not to sit, kneel, or lie down.—The absolution to be pronounced by the priest alone *standing*, the people still kneeling. *Common Prayer.*—To be not demolished or overthrown.

What will they then? what but unbuild
A living temple, built by faith to *stand*? *Milton.*

To be placed as an edifice.—This poet's tomb *stood* on the other side of Naples, which looks towards Vesuvio. *Addison.*—To remain erect; not to fall.

To *stand* or fall,
Free in thine own arbitrement it lies. *Milton.*

Chariot and charioteer lay overturn'd,
And fiery foaming steeds: what *stood*, recoil'd
O'r weary'd, through the faint satanic host
Defensive scarce, or with pale fear surpris'd
Fled ignominious. *Milton.*

To become erect.
Mute, and amaz'd, my hair with horror *stood*;
Fear shrunk my senses, and congeal'd my blood. *Dryden.*

To stop; to halt; not to go forward.
The leaders, having charge from you to *stand*,
Will not go off until they hear you speak. *Shakspeare.*

Mortal, who this forbidden path
In arms presum'st to tread, I charge thee *stand*,
And tell thy name. *Dryden.*

To be at a stationary point without progress or regression.
Immense

Immense the pow'r, immense were the demand ;
Say, at what part of nature will they *stand* ? *Pope.*

To be in a state of firmness, not vacillation.—Common-
wealths by virtue ever *stood*. *Davies.*

My mind on its own centre *stands* unmov'd,
And stable as the fabric of the world,
Propt on itself. *Dryden.*

To be in any posture of resistance or defence.
Seeing how lothly opposite I *stood*
To his unnat'ral purpose, in fell motion
With his prepared sword he charges home
My unprovided body. *Shakspeare.*

From enemies heav'n keep your majesty :
And when they *stand* against you, may they fall.
Shakspeare.

To be in a state of hostility ; to keep the ground.—If he
would presently yield, Barbarossa promised to let him go
free ; but if he should *stand* upon his defence, he threatened
to make him repent his foolish hardness. *Knolles.*—Not to
yield ; not to fly ; not to give way.—Who before him *stood*
so to it ? for the Lord brought his enemies unto him.
Ecclus.—To stay ; not to fly.—At the soldiery word *stand*,
the flyers halted a little. *Clarendon.*—To be placed with
regard to rank or order.—Theology would truly enlarge the
mind, were it studied with that freedom and that sacred
charity which it teaches : let this therefore *stand* always
chief. *Watts.*—To remain in the present state.

That sots and knaves should be so vain
To wish their vile resemblance may remain ;
And *stand* recorded, at their own request,
To future days a libel or a jest. *Dryden.*

[*Estar*, Spanish.] To be in any particular state ; to be :
emphatically expressed.

Accomplish what your signs foreshow :
I *stand* resign'd, and am prepared to go. *Dryden.*

Not to become void ; to remain in force.
A thing within my bosom tells me,
That no conditions of our peace can *stand*. *Shakspeare.*

To consist ; to have its being or essence.—That could not
make that did the service perfect, as pertaining to the con-
science, which *stood* only in meats and drinks. *Heb.*—To
be with respect to terms of a contract.—The hirelings *stand*
at a certain wages. *Carew.*—To have a place.

If it *stand*
Within the eye of honour, be assured
My purse, my person, my extremest means,
Lie all unlock'd to your occasions. *Shakspeare.*

My very enemy's dog,
Though he had bit me, should have *stood* that night
Against my fire. *Shakspeare.*

To be in any state at the time present.
Opprest nature sleeps :
This rest might yet have balm'd thy broken senses,
Which *stand* in hard cure. *Shakspeare.*

So it *stands* ; and this I fear at last,
Hume's knavery will be the duchess' wreck. *Shakspeare.*

To be in a permanent state.
The broil doubtful long *stood*,
As two spent swimmers that do cling together,
And choke their art. *Shakspeare.*

To be with regard to condition or fortune.
I *stand* in need of one whose glories may
Redeem my crimes, ally me to his fame. *Dryden.*

To have any particular respect.
Here stood he in the dark, his sharp sword out,
Mumbling of wicked charms, conj'ring the moon
To *stand's* auspicious mistress. *Shakspeare.*

An utter unsuitableness disobedience has to the relation

which man necessarily *stands* in towards his Maker. *South.*
—To be without action.—A philosopher disputed with
Adrian the emperor, and did it but weakly : one of his
friends, that *stood* by, said, Methinks you were not like
yourself last day in argument with the emperor ; I could
have answered better myself. Why, said the philosopher,
would you have me contend with him that commands thirty
legions ? *Bacon.*—To depend ; to rest ; to be supported.—
He that will know, must by the connexion of the proofs see
the truth and the ground it *stands* on. *Locke.*—To be with
regard to state of mind.—*Stand* in awe and sin not ; com-
mune with your own heart upon your bed, and be still.
Psal.—To succeed ; to be acquitted ; to be safe.—Readers,
by whose judgment I would *stand* or fall, would not be
such as are acquainted only with the French and Italian
critics. *Addison.*—To be with respect to any particular.

Cæsar entreats,
Not to consider in what case thou *stand'st*
Further than he is Cæsar. *Shakspeare.*

To Heaven I do appeal,
I have lov'd my king and common-weal ;
As for my wife, I know not how it *stands*. *Shakspeare.*

To be resolutely of a party.—The cause must be presumed
as good on our parts as on theirs, till it be decided who have
stood for the truth, and who for error. *Hooker.*

Shall we sound him ?
I think he will *stand* very strong with us. *Shakspeare.*

It remains,
To gratify his noble service, that
Hath thus *stood* for his country. *Shakspeare.*

To be in the place ; to represent.—Chilon said, that
kings, friends and favourites were like casting counters ; that
sometimes *stood* for one, sometimes for ten. *Bacon.*—To
remain ; to be fixed.

How soon hath thy prediction, seer blest !
Measur'd this transient world, the race of time,
Till time *stand* fix'd. *Milton.*

To hold a course at sea ; to have direction towards any
local point.—The wand did not really *stand* to the metals,
when placed under it, or the metalline veins. *Boyle.*—To
offer as a candidate.—He *stood* to be elected one of the pro-
ctors for the university. *Walton.*—To place himself ; to be
placed.

The fool hath planted in his memory
An army of good words ; and I do know
A many fools that *stand* in better place,
Garnish'd like him, that for a tricky word
Defy the matter. *Shakspeare.*

Stand by me when he is going. *Swift.*—To stagnate ;
not to flow.

Where Ufens glides along the lowly lands,
Or the black water of Pomptina *stands*. *Dryden.*

To be with respect to chance.
Yourself, renowned prince, then *stood* as fair,
As any comer I have look'd on,
For my affection. *Shakspeare.*

To remain satisfied.—Though Page be a secure fool, and
stand so firmly on his wife's frailty, yet I cannot put off my
opinion so easily. *Shakspeare.*—To be without motion.
—I'll tell you who time ambles withal, who time gallops
withal.—Whom *stands* it still withal ?—With lawyers in
the vacation ; for they sleep between term and term, and
then they perceive not how time moves. *Shakspeare.*—To
make delay.—They will suspect they shall make but small
progress, if, in the books they read, they must *stand* to ex-
amine and unravel every argument. *Locke.*—To insist ; to
dwell with many words, or much pertinacity.—To *stand*
upon every point, and be curious in particulars, belongeth to
the first author of the story. *2 Maccab.*—To be exposed.—
Have I lived to *stand* in the taunt of one that makes fritters
of English ? *Shakspeare.*—To persist ; to persevere.

Hath

Hath the prince a full commission,
To hear, and absolutely to determine
Of what conditions we shall stand upon. *Shakspeare.*

To persist in a claim ; to adhere ; to abide.
Despair would stand to the sword,
To try what friends would do, or fate afford. *Daniel.*

To be consistent.—His faithful people, whatsoever they rightly ask, the same shall they receive, so far as may stand with the glory of God, and their own everlasting good ; unto either of which it is no virtuous man's purpose to seek any thing prejudicial. *Hooker.*—To be put aside with disregard.—We make all our addresses to the promises, hug and caress them, and in the interim let the commands stand by neglected. *Dec. of Chr. Piety.*

To STAND by. To support ; to defend ; not to desert.—If he meet with a repulse, we must throw off the fox's skin, and put on the lion's : come, gentlemen, you'll stand by me. *Dryden.*

To STAND by. To be present without being an actor.
Margaret's curse is fall'n upon our heads,
For standing by when Richard kill'd her son. *Shakspeare.*

To STAND by. To repose on ; to rest in.—The world is inclined to stand by the Arundelian marble. *Pope.*

To STAND for. To propose one's self a candidate.—How many stand for consulships ?—Three : but 'tis thought of every one Coriolanus will carry it. *Shakspeare.*

To STAND for. To maintain ; to profess to support.—Those which stood for the presbytery thought their cause had more sympathy with the discipline of Scotland, than the hierarchy of England. *Bacon.*

To STAND off. To keep at a distance.—Stand off, and let me take my fill of death. *Dryden.*

To STAND off. Not to comply.

Stand no more off,
But give thyself unto my sick desires. *Shakspeare.*

To STAND off. To forbear friendship or intimacy.

Our bloods pour'd altogether
Would quite confound distinction ; yet stand off
In differences so mighty. *Shakspeare.*

To STAND off. To have relief ; to appear protuberant or prominent.—Picture is best when it standeth off, as if it were carved ; and sculpture is best when it appeareth so tender as if it were painted ; when there is such a softness in the limbs, as if not a chisel had hewed them out of stoue, but a pencil had drawn and stroaked them in oil. *Wotton.*

To STAND out. To hold resolution ; to oppose.

King John hath reconcil'd
Himself to Rome ; his spirit is come in,
That so stood out against the holy church. *Shakspeare.*

To STAND out. Not to comply ; to secede.
Thou shalt see me at Tullus' face :
What, art thou stiff ? stand'st out ? *Shakspeare.*

To STAND out. To be prominent or protuberant.—Their eyes stand out with fatness. *Ps.*

To STAND to. To ply ; to persevere.

Palinurus, cry'd aloud,
What gusts of weather from that gath'ring cloud
My thoughts presage ; ere that the tempest roars,
Stand to your tackles, mates, and stretch your oars. *Dryden.*

To STAND to. To remain fixed in a purpose.

He that will pass his land,
As I have mine, may set his hand
And heart unto this deed, when he hath read ;
And make the purchase spread
To both our goods if he to it will stand. *Herbert.*

To STAND to. To abide by a contract or assertion.—As I have no reason to stand to the award of my enemies ; so neither dare I trust the partiality of my friends. *Dryden.*

To STAND under. To undergo ; to sustain.
If you unite in your complaints,
And force them with a constancy, the Cardinal
Cannot stand under them. *Shakspeare.*

To STAND up. To erect one's self ; to rise from sitting.
To STAND up. To arise in order to gain notice.—When the accusers stood up, they brought none accusation of such things as I supposed. *Acts.*

To STAND up. To make a party.—When we stood up about the corn, he himself stuck not to call us the many-headed monster. *Shakspeare.*

To STAND upon. To concern ; to interest. An impersonal sense.—Does it not stand me now upon ? *Shakspeare.*

To STAND upon. To value ; to take pride.—Men stand very much upon the reputation of their understandings, and of all things hate to be accounted fools ; the best way to avoid this imputation is to be religious. *Tillotson.*

To STAND upon. To insist.—A rascally, yea — forsooth, knave, to bear a gentleman in hand, and then stand upon security. *Shakspeare.*

To STAND, v. a. To endure ; to resist without flying or yielding.

None durst stand him ;
Here, there, and every where, enrag'd he flew. *Shakspeare.*
Love stood the siege, and wou'd not yield his breast. *Dryden.*

Oh ! had bounteous Heaven
Bestow'd Hippolitus on Phædra's arms,
So had I stood the shock of angry fate. *Smith.*

That not for fame, but virtue's better end,
He stood the furious foe, the timid friend,
The damning critic. *Pope.*

To await ; to abide ; to suffer.
Bid him disband the legions,
Submit his actions to the public censure,
And stand the judgment of a Roman senate. *Addison.*

To keep ; to maintain, with ground.
Turning at the length, he stood his ground,
And miss'd his friend. *Dryden.*

STAND, s. A station ; a place where one waits standing.
I have found you out a stand most fit,
Where you may have such 'vantage on the duke,
He shall not pass you. *Shakspeare.*

Rank ; post ; station. *Not used.*
Father, since your fortune did attain
So high a stand ; I mean not to descend. *Daniel.*

A stop ; a halt.
A race of youthful and unhandled colts
Fetching mad bounds, bellowing and neighing ;
If any air of music touch their ears,
You shall perceive them make a mutual stand ;
Their savage eyes turn'd to a modest gaze. *Shakspeare.*

Stop ; interruption.—Should this circulation cease, the formation of bodies would be at an end, and nature at a perfect stand. *Woodward.*—The act of opposing.

We are come off
Like Romans ; neither foolish in our stands,
Nor cowardly in retire. *Shakspeare.*

Highest mark ; stationary point ; point from which the next motion is regressive.—In the beginning of summer the days are at a stand, with little variation of length or shortness ; because the diurnal variation of the sun partakes more of a right line than of a spiral. *Dryden.*—A point beyond which one cannot proceed.

Every part of what we would,
Must make a stand at what your highness will. *Shakspeare.*

Difficulty ; perplexity ; embarrassment ; hesitation.—A fool may so far imitate the mien of a wise man as at first to put

put a body to a *stand* what to make of him. *L'Estrange*.
—A frame or table on which vessels are placed.

Such squires are only fit for country towns,
To stink of ale, and dust a *stand* with cloens;
Who to be chosen for the land's protectors,
Tope and get drunk before the wise electors. *Dryden*.

STANDAARBUIDEN, or ZANDERBIETEN, a village and lordship of North Brabant, in the marquise of Bergen-op-Zoom.

STANDARD, *s.* [стандард, Sax., from станбан; *standart*, old Fr.; *estandard*, mod.] An ensign in war, particularly the ensign of the horse.

To their common *standard* they repair;
The nimble horsemen scour the fields of air. *Dryden*.

That which is of undoubted authority; that which is the test of other things of the same kind.

First follow nature, and your judgment frame,
By her just *standard*, which is still the same. *Pope*.

That which has been tried by the proper test.—The English tongue, if refined to a certain *standard*, perhaps might be fixed for ever. *Swift*.—A settled rate.—That precise weight and fineness, by law appropriated to the pieces of each denomination, is called the *standard*. *Locke*.—The device of king Henry VII. was profound in making farms of a *standard*, that is, maintained with such a proportion of lands as may breed a subject to live in plenty. *Bacon*.—A standing stem or tree.—A *standard* of a damask rose with the root on, was set upright in an earthen pan, full of fair water, half a foot under the water, the *standard* being more than two foot above it. *Bacon*.

STANDARD, *adj.* Established; lasting in fame; chiefly applied to books as a *standard* work.

STANDARD-BEARER, *s.* One who bears a standard or ensign.—These are the *standard-bearers* in our contending armies, the dwarfs and squires who carry the impresses of the giants or knights. *Spectator*.

STANDARD-HILL, the *Durolerum* of the Romans, a hill of England, in Kent, south of Newington, by Sittingbourne, on which it is said Julius Cæsar encamped.—Also, a hill in Sussex, near Battel, now called Beacon-hill, where William the Conqueror raised his standard, the day before his battle with the English.

STAND-CROP, *s.* [*vermicularis*, Lat.] An herb.

STANDEL, *s.* A tree of long standing.—The Drunians were nettled to see the princely *standel* of their royal oak return with a branch of willows. *Howell*.

STANDER, *s.* One who stands; a tree that has stood long.—The young spring was pitifully nipt and over-trodden by very beasts; and also the fairest *standers* of all were rooted up and cast into the fire. *Ascham*.

STANDER *by*. One present; a mere spectator.

I would not be a *stander by* to hear
My sovereign mistress clouded so, without
My present vengeance taken. *Shakspeare*.

STANDER *up*. One who makes himself of a party.—The plausible, affected titles of public spirits, *standers up* for their country, and for the liberties, properties, and the rights of the subject. *South*.

STANDERGRASS, *s.* [*satyrion*, Lat.] An herb. *Ainsworth*.

STANDERWICK, a parish of England, in Somersetshire; 3½ miles east-north-east of Frome.

STANDFORD BISHOPS, a township of England, in Herefordshire; 3½ miles south-east of Bromyard.

STANDFORD REGIS, a hamlet in the above township; 3 miles south-south-east of Bromyard.

STANDFORD, a hamlet of England, in Kent; 3½ miles north-west of Hythe.

STANDFORD, a parish of England, in Oxfordshire; 3 miles from Deddington.

STANDFORD DINGLEY, a parish of England, in Berkshire; 8½ miles east-north-east of Speenhamland.

Vol. XXIII. No. 1588.

STANDGROUND, a village of England, in Huntingdonshire; 1 mile south-east of Peterborough. Population 442.

STANDIA, or DIA, a small island of the Grecian archipelago, a little to the north of Candia, opposite to the town of Candia. It is rocky and almost uninhabited, but has a harbour, where large ships, bound to Candia, generally discharge part of their cargoes; 10 miles north of Candia. Lat. 25. 36. N. long. 25. 9. E.

STANDIA, a small town of European Turkey, in Macedonia, on a small bay of the gulf of Salenichi; 15 miles north of Larissa.

STANDIA, a village on the western coast of Anatolia, in Asiatic Turkey. Lat. 36. 54. N. long. 27. 18. E.

STANDING, *part. adj.* Settled; established; not temporary.

Great *standing* miracle, that Heaven assign'd!
'Tis only thinking gives this turn of mind. *Pope*.

Lasting; not transitory.—The landlord had swelled his body to a prodigious size, and worked up his complexion to a *standing* crimson. *Addison*.—Stagnant; not running.—From *standing* lake to tripping ebb. *Milton*.—Fixed; not movable.

There's his chamber,
His *standing* bed and truckle bed. *Shakspeare*.

Continuing erect; not fallen; not cut down.—He let them go into the *standing* corn of the Philistines. *Judges*.

STANDING, *s.* Continuance; long possession of an office, character, or place.—Nothing had been more easy than to command a patron of a long *standing*. *Dryden*.—Station; place to stand in.—His coming in state, I will provide you a good *standing* to see his entry. *Bacon*.—Power to stand.—I sink in deep mire, where there is no *standing*. *Ps.*—Rank; condition.

STANDISH, *s.* A case for pen and ink.—I have newly made at least an essay of my invention in the structure of a little poor *standish*. *Wotton*.—A Grub-street patriot does not write to secure, but get something: should the government be overturned, he has nothing to lose but an old *standish*. *Addison*.

STANDISH, a parish of England, in Gloucestershire, where there is a medicinal spring, in great repute for the cure of many diseases; 4½ miles north-west of Stroud. Population 474.

STANDISH, a parish of England, in Lancashire; 3 miles north-west of Wigan. Population 6258.

STANDISH, a post township of the United States, in Cumberland county, Maine, on the Saco; 120 miles north-north-east of Boston. Population 1378.

STANDLAKE, a parish of England, in Oxfordshire; 5 miles south-south-east of Witney. Population 577.

STANDLINCH, a parish of England, in Wiltshire; 4½ miles south-east of Salisbury.

STANDON, STANTON, or STANELOW, a market town and parish of England, in the county of Hertford. It is a place of some antiquity, and is mentioned by Ingulphus as having been granted to Croyland abbey in the early part of the 9th century, and as the place where abbot Brithmere, about the year 1030, built a spacious house for the accommodation of himself and his retinue, during his journeys to London. In the parish, also, was a preceptory of knights hospitallers, the remains of which are now connected with a farm-house, called Friars. Standon church contains many monuments and sepulchral memorials. In the eastern part of the chancel are the tombs of Sir Ralph Sadler and his family. Market on Friday, and one annual fair; 1 mile south-east of Pockridge, and 26 north-north-east of London.

STANDON, a parish of England, in Staffordshire; 3½ miles north-north-west of Eccleshall.

STANE, *s.* [стан, Sax.] Our northern word for *stone*.

STANEMORE, a dreary district of England, in Westmoreland, between Brough and Kirkby-Steven, and partly in the parish of Bows, Yorkshire. Here is a fragment of Rerecross, placed as a boundary between England and Scotland, when Cumberland belonged to the latter kingdom.

STANFIELD, a parish of England, in Norfolk; 6 miles north-west of East Dereham.

STANFOLD, a township of Lower Canada, in the county of Buckingham, situated on the south-east side of the river Becancour, that bounds its front.

STANFORD, a parish of England, in Norfolk; 6 miles south-west of Watton.

STANFORD, a village and parish of England, in the county of Worcester. The church here is an elegant Gothic building of stone, recently erected. About one mile distant are the remains of an old hermitage, called Stonehouse, some of the rooms of which are hewn out of the solid rock; 11 miles from Worcester. Population 122.

STANFORD-ON-AVON, a parish of England, in Northamptonshire; 11½ miles north-by-east of Daventry.

STANFORD-ON-SOAR, a parish of England, in Nottinghamshire, situated on the river Soar, opposite to Loughborough, and 13 miles south-by-west of Nottingham.

STANFORD-IN-THE-VALE, a parish of England, in Berkshire; 4 miles east-south-east of Great Farringdon. Population 677.

STANFORD-LE-HOPE, a parish of England, in Essex, between Orset and the Thames, below Gravesend Reach. Here was formerly a ford, over the rivulet called by seamen, the Hope, which is now passed by a bridge.

STANFORD RIVERS, a parish of England, in Essex; 2 miles south-west of Chipping Ongar. Population 704.

STANFORD, a post township of the United States, and capital of Lincoln county, Kentucky, situated on a fertile and handsome plain. It contains a court-house, jail, a ropewalk, and about 100 houses; 40 miles south-south-west of Lexington, and 10 south-south-east of Danville.

STANFORD, a post township of the United States, in Dutchess county, New York; 18 miles north-east of Poughkeepsie. Population 2235.

STANG, *s.* [ʃtæŋz, Sax.; *ystang*, Welsh.] A perch; a measure of land.—These fields were intermingled with woods of half a *stang*, and the tallest tree appeared to be seven feet high. *Swift*.—A long bar; a wooden pole; the shaft of a cart: used in several parts of the north of England.

To ride the STANG. The preceding sense, and the present expression connected with it, Dr. Johnson has overpassed. It is still remembered in parts of the north of England; and may be traced to a very ancient origin. See Mr. Callender's account of the Goth. *nid stang*, the spear or pole of infamy, in his *Two Anc. Scott. Poems*, 1782, p. 153. *To ride the stang*, is to be mounted on a strong pole, borne on men's shoulders, and carried about from place to place; the rider representing usually a henpecked husband, and sometimes the husband who had beaten his wife. *To ride skimmington*, is, in some parts of England, of much the same import. See SKIMMINGTON, and Dr. Jamieson's *Scott. Dict.* in V. STANG.—A custom [is] still prevalent among the country people of Scotland; who oblige any man, who is so unmanly as to beat his wife, to ride astride on a long pole, borne by two men, through the village, as a mark of the highest infamy. This they call *riding the stang*; and the person, who has been thus treated, seldom recovers his honour in the opinion of his neighbours. When they cannot lay hold of the culprit himself, they put some young fellow on the *stang* or pole, who proclaims that it is not on his own account that he is thus treated, but on that of another person, whom he names. *Callender, Two Anc. Scott. Poems*.—The *riding of the stang* on a woman that hath beat her husband, is, as I have described, by one's riding upon a long piece of wood, carried by two others on their shoulders, where, like a herald, he proclaims the woman's name, &c. *Notes to Allan Ramsay's Poems, cited by Brand*.—There used formerly, and I believe it is still now and then retained, to be a kind of ignominious procession in the north of England, called *riding the stang*, when, as the glossary to Douglas's *Virgil* informs us, one is made to ride on a pole for his neighbour's wife's fault. *Brand, Pop. Antig.*

To STANG, v. n. [*stanga*, Icel.] To shooth with pain. *North. Grose*.

STANG-ALPE, a lofty mountain of the Austrian states, in Styria, to the south-west of Murau, between the circle of Judenburg and Carinthia. Elevation above the sea, 7550 feet.

STANGEBRO, a small town in the south of Sweden, in the province of Smaland, near Oalmar.

STANGERODE, a village of Germany, in Upper Hesse, near Grunberg, where the allies were defeated by the French in 1761.

STANGHOW, a township of England, North Riding of Yorkshire; 4 miles east-by-north of Guisebrough.

STANHOE, a parish of England, in Norfolk; 4 miles south-west of Burnham Westgate. Population 374.

STANHOPE (Philip Dormer), Earl of Chesterfield, a nobleman celebrated as a great wit, statesman, and a man of letters, was the eldest son of Philip, third earl of Chesterfield, by lady Elizabeth Saville, daughter of George, marquis of Halifax. He was born in London, in September, 1694.

He had the misfortune to lose his mother while he was very young, and being neglected by his father, he was educated under the care of his grandmother, lady Halifax, who proved herself quite adequate to the task. His elementary instructions were received at home from able masters, who had the advantage of finding in their pupil admirable qualities, and an ardent desire of excelling in whatever he undertook. In his 18th year he was entered of Trinity-hall, Cambridge, where he applied himself with great assiduity to the studies pursued in that seat of learning. He was particularly attentive to eloquence, which he was aware was a principal requisite in a free senate; and with a view of becoming a good and forcible speaker, he marked down all the finest speeches of the ancients that came in his way, in the course of his reading, and formed his own style and manner by translating them; a practice which cannot be too warmly recommended to young men likely to come into public life. On quitting the university, this young nobleman made the usual tour of Europe; and it was at the Hague that he first began the cultivation of that enlarged acquaintance with mankind, which has been denominated seeing and knowing the world; but with this knowledge he acquired certain pernicious propensities, which adhered to him through life: among others was that of gaming. A visit of some length to Paris further contributed to fashion his manners, and to render him at length that model of true politeness, which he exhibited in after-life to his admiring countrymen. This was about the time of the demise of queen Anne, and he did himself high honour by the assertion of those principles of freedom which effected the succession of the house of Hanover, and which, during the whole of his political life, he steadily maintained. On his return to England in 1715, he was presented to the new sovereign, and appointed one of the gentlemen of the bed-chamber to the prince of Wales. He was elected member of parliament for one of the Cornish boroughs, in the first parliament of George I., and commenced a speaker in the debate respecting the impeachment of the persons concerned in the peace of Utrecht. Upon this occasion he manifested a juvenile violence, which produced an intimation from the opposite side, that advantage would be taken of his being under the lawful age for sitting in parliament. Upon this hint he immediately quitted the house, and set off for Paris. On his return, he was sometimes the defender and sometimes the opponent of ministerial measures; but his talents, at this time, do not appear to have made much impression on the house or the country. In reward, however, for his support of a motion for the augmentation of the army, he was, in 1723, made captain of the yeomen of the guards; and it was a proof of his disinterestedness, that when advised by his predecessor, lord Townsend, to make the post more profitable than he had done, by the sale of subordinate places, he replied, "I rather wish, in this instance, to follow your lordship's example than your advice." He was dismissed from this office in 1725; and in the following year, on the death of his father, with whom he had never been on terms of cordiality, he entered the House of Lords; and

joined the opposition. To this assembly his talents were better adapted than to the House of Commons. His eloquence, the fruit of much study, was less characterized by force and compass than by elegance and perspicuity, and especially by good taste, and a vein of delicate irony, which, while it sometimes inflicted severe strokes, never passed the limits of decency and propriety. "It was that of a man, who, in the union of wit and good sense with politeness, had not a competitor." These qualities were matured by the advantage of a familiar acquaintance with almost all the eminent wits and writers of his time; many of whom had been the ornaments of the preceding age of literature, while others were destined to become those of a later period. He knew how to appreciate genius and talents, and was the friend of Pope, and received him in almost all his select parties at Twickenham, where he met the first nobility in association with the most distinguished votaries of the muses.

Soon after the accession of George II. lord Chesterfield was nominated ambassador at the Hague. Scarcely was any man ever better adapted than his lordship to fill a diplomatic situation, as well on account of his natural acuteness, and of his conciliating manners, as his familiarity with the modes and usages of general society. He was, however, at this time but little acquainted with public business; but possessing the laudable ambition of rendering himself fully master of whatever he undertook, he spared no pains to acquire the knowledge for the post in which he was placed, and which at that time was a very important one; the Hague being, in fact, the centre of the principal political negotiations carrying on throughout Europe. In the year 1730 he was appointed high steward of the household, and he was, at the same time, decorated with the order of the garter. He now returned to Holland, and was instrumental in forming an important treaty between the courts of London and Vienna, and the States-general. In 1732 he obtained his recall; and on his return, he supported the plans of the prime minister, though there does not appear to have been any cordiality between them; and when Sir Robert Walpole introduced his famous excise measure, the earl spoke against him with all his force, and thereby gave so much offence that he was deprived of his offices, and he again joined the party in opposition. He married, in 1733, the countess of Walsingham, niece or probably daughter to the duchess of Kendal, who had been mistress to George I. She was a lady of great merit and accomplishments, and by her prudence contributed very much to retrieve the deranged affairs of her lord. The noble earl did not neglect to pay his court to the prince of Wales, who attached himself to the opposers of his father's government. Of his oratorical exertions, none was more generally admired than his speech against the bill for granting to the lord chamberlain the power of licensing dramatic performances. In 1741, his health being much impaired, he was advised to make the tour of the continent. In his way to the Spa, he saw, at Brussels, Voltaire, with whom he had contracted a friendship in England. At Spa his reputation, and the urbanity of his manners, drew upon him much flattering notice from persons of distinction; and a short stay at Paris introduced him to the most distinguished of both sexes for rank and talents in that capital, where he was equally gratified and admired.

His stay in the south of France was shortened by the state of political affairs at home. The attempts of France to ruin the house of Austria were threatening destruction to what was denominated the balance of power in Europe; and the miscarriages of the English ministers in their political measures spread discontent through the nation. This at length produced the fall of that statesman (Walpole), who had so long ruled the public councils; and a new administration was formed, in which lord Chesterfield had no place. This omission was probably owing, in great part, to the personal dislike of the king, who could not forget the severe things he had said with respect to the royal partiality to the interests of Hanover, and the sacrifices made of the interests of Great Britain to those of the electorate. He

took an active and most decided part in opposition to the measures of the ministry, and was said to be particularly happy in his speech against the gin-licence bill, and against that for continuing attainders upon the posterity of persons convicted of high treason. This last bill was introduced in consequence of the prospect of a new rebellion, promoted by France, and which soon after took place. This event produced a change in the ministry, and lord Chesterfield was sent out as ambassador to the United Provinces; a station which he had before occupied with much reputation. He effected the purpose for which he was sent, viz., that of engaging the Dutch to concur in earnest in the war against France; and returned in 1745, at the time of the breaking out of the rebellion in Scotland. He was immediately nominated to the high station of lord lieutenant of Ireland; an office of great importance at this period, when there was cause of apprehension from the prevalence of the Roman Catholic religion in that island. He set off for his government in the end of August, and by vigour on the one hand, and conciliation on the other, by strict integrity, and a frank undisguised system of policy, he kept every thing quiet in that kingdom, while the sister island was over-run with terror and commotion. Instead of abridging the catholics of their religious liberty, he favoured and augmented it; wisely judging, that the more openly they shewed themselves in attendance at their own places of worship, the less their secret machinations were to be regarded. He, however, kept a vigilant eye upon all their proceedings, but discouraged idle suspicions and malicious informations. A zealous Protestant once came, very officiously, as the noble lord thought, to inform him that one of his coachmen went privately to mass. "Does he?" said the lord lieutenant: "I will take care that he never drives me thither." He returned to England in April, 1746, when the rebellion was terminated by the victory gained at the battle of Culloden.

He now accepted the office of secretary of state, with the duke of Newcastle as his colleague. Never approving, in his own mind, of the war in which the nation was engaged, and constantly wishing for peace upon reasonable terms, he was nevertheless carried away, by a superior influence in the cabinet, to concur in the measures of the court, till their ill success induced him to draw up a strong memorial, which being disregarded, he resigned his place in February, 1748, and never afterwards joined in any administration. From this period till his death he lived as a private nobleman, attached to the arts and to letters, and was looked up to throughout Europe as inferior to none of his high rank for brilliancy of wit, and the polish of cultivated society. Being seized with a deafness in 1752, that incapacitated him, in a measure, for the pleasures of society, he led a retired life, amusing himself with his books and his pen. He engaged rather largely as a volunteer in a periodical work, entitled "The World," in which his contributions have a distinguished degree of excellence. His lordship maintained a character for wit and talents that had few equals. He rendered himself illustrious, as we have seen, by his eloquence in parliament, on many important occasions, of which there is a characteristic instance of his own relating. He was an active promoter of the bill for altering the style; on which occasion, as he himself relates in one of his letters to his son, he made so eloquent a speech in the house, that every one was pleased, and said he had made the whole very clear to them; "which," says he, "God knows, I never attempted. I could just as soon have talked Celtic or Slavonian to them as astronomy, and they would have understood me just as well." The high character which lord Chesterfield had supported through life received no small injury, soon after his death, from a full display of it by his own hand. He left no issue by his lady, but had a natural son, named Philip Stanhope, whose education was, for many years, a close object of his attention; and who was afterwards envoy extraordinary at the court of Dresden, but who died before his father. After the death of the earl of Chesterfield, Mr. Stanhope's widow published a course of letters, written by the

the father to the son, filled with instructions suitable to the different gradations of the young man's life to whom they were particularly addressed. These letters have been highly applauded, and as loudly condemned. They contain many admirable observations on mankind, and rules of conduct; but the author lays a greater stress on exterior accomplishments and address than on intellectual qualifications and sincerity, and allows a much greater latitude to fashionable pleasure than sound morality will admit. Indeed no apology can be made for a father's attempts to fashion his son to politeness, by recommending connections with married women, which, however lightly regarded in the licentious courts and capitals at which he himself had been a visitor and resident, must ever be considered as a most serious violation of private friendship, and of the most sacred bond of social life. These obnoxious parts would, in all probability, have been suppressed, had the author revised and published his own letters. On the other hand, there are, in the course of the volumes and the other works of lord Chesterfield, many examples of his useful and efficacious endeavours to serve the cause of morality. Whether the son followed the father's advice in respect to adultery we know not: but as to politeness of manners, it is well known that the reiterated admonitions produced quite the opposite effect. His lordship died in March, 1773, in the 79th year of his age. He had for some time been extremely infirm, and having outlived most of his friends and contemporaries, he was in fact reduced to a state in which he rather patiently endured life than enjoyed it. "It is unnecessary," says his biographer, "to add any thing to the view already given of his moral character: if it was very far from faultless, it certainly exhibited many excellencies, which enabled him to perform important services to his friends and country. In his literary capacity, he possessed wit, good sense, and a fine taste, in an uncommon degree. His style is of the purest English." Of his works, which, besides those already referred to, contain papers in some of the political journals of the day, speeches, state papers, and letters, French and English, a Collection, in 2 vols. 4to., with memoirs of his life, by Dr. Maty, was published in the year 1777.

STANHOPE, a parish, and formerly a market town of England, on the banks of the Weare, Durham. It has a spacious park, in which the Scotch army encamped, when they were opposed by Edward III.; 21½ miles west-by-north of Durham, and 264½ north-north-west of London. Population 6376.

STANHOPE, a post township of the United States, in Morris county, New Jersey.

STANHOPE POINT, a point of land on the west coast of the Duke of York's Island, in Clarence's Strait, off the west coast of North America. Lat. 56. 2. N. long. 237. 38. E.

STANFORTH POINT, a cape on the coast of New Hanover, situated at the entrance of Gardner's Canal. Lat. 53. 34. N. long. 231. 17. E.

STANIHURST (Richard), a divine and historian, was born at Dublin about the year 1545, of which city his father was recorder. He was educated at the University college, Oxford, after which he came to London, and studied the law in Furnival's Inn, and then at Lincoln's Inn. Returning to Ireland, he practised some time at the bar; but having abandoned the Protestant for the Roman Catholic religion he thought it necessary to remove to the continent, for the purpose of obtaining a freer exercise of the duties which he owed to his Maker. After this he entered into orders, and became chaplain at Brussels to Albert, archduke of Austria. He died in 1618, having obtained a very high reputation for learning. His writings are enumerated as follow: "Harmonia, seu Catena dialectica in Porphyrium;" "Descriptio Hibernicæ," inserted in Holingshed's Chronicle; "De Rebus in Hibernia gestis. Lib. IV." In this work we are told he took Giraldus Cambrensis for his guide, and he is said to have adopted freely the erroneous statements of that writer, though in some places he has corrected him from other writers. He published likewise "A

Life of St. Patrick," and several Catholic works. Mr. Stanihurst tried his powers as a poet, by a version of the four first books of Virgil's *Æneid* in English hexameters. It is remarkable only for the uncouthness of its diction.

STANIMAK, a small river of European Turkey, in Romania, which falls into the Maritza, or ancient *Hebrus*.

STANINGFIELD, a parish of England, in Suffolk; 5 miles south-by-east of Bury St. Edmund's.

STANINGHALL, a village of England, in Lancashire, between Skipton and the ocean.

STANINGHALL, a village of England, in Norfolk, between Wursted and Norwich.

STANION, or **STANIERN**, a parish of England, in Northamptonshire; 4½ miles south-east of Rockingham.

STANISLAUS I. (Leizinski), king of Poland, born at Leopold in 1677, was son of a distinguished Polish noble, who, after occupying several important posts, was raised to that of grand treasurer of the crown. His son, the subject of this article, displayed, at a very early period, talents and dispositions which announced a character equally amiable and estimable. "His countenance," says his biographer, "expressed courage joined with sweetness, together with that air of openness and sincerity which is more persuasive than eloquence itself. He was brave, and enured to hardship and fatigue. He slept on a straw mattress, required scarcely any personal services from his domestics, was temperate, economical, adored by his vassals, and beloved by his friends." When Charles XII. of Sweden entered Poland, for the purpose of dethroning Augustus, Stanislaus, then palatine of Pomerania, was deputed to that prince from the confederation of Warsaw. In the conference with the monarch, he appeared to him in so favourable a light, that the Swede immediately took the resolution of raising him to the crown of Poland which was effected at an election held July 12, 1704, when Stanislaus was in his twenty-seventh year. The unexpected entrance of Augustus into Warsaw, when the king of Sweden was at a distance with his army, obliged Stanislaus to make a precipitate retreat: but by another change he was brought back, and crowned at Warsaw with his wife, in October 1705, and by a treaty in the following year, Augustus was compelled solemnly to abdicate the crown of Poland in favour of his rival. Stanislaus remained possessor of the kingdom till the fatal defeat of his patron Charles, at Pultowa, in July 1709. Being now unable to maintain himself in Poland, he withdrew with the Swedes into Pomerania, and thence crossed into Sweden, where he passed some time in retirement, while negotiations were carrying on to restore the peace of the north. As his abdication of the Polish crown seemed a necessary preliminary, he readily signified his own concurrence, and wrote to Charles at Bender to obtain his consent. Not being able, by letter, to persuade him, he resolved to try the effect of a personal conference; and accordingly assumed a feigned name, and, accompanied by two officers, proceeded for the frontiers of Turkey. On his arrival in Moldavia he was arrested, and brought before the Hospodar, who discovered his true person, and sent him to Bender, where he was detained as a prisoner, but was extremely well treated. He was suffered to depart in 1714, when he went to Deux Ponts, where he was joined by his family. A Saxon officer made an attempt to assassinate him but the design was discovered before it could be put into execution, and he pardoned and dismissed the conspirators. In 1719 he received intelligence of the death of Charles XII., and feeling himself now deprived of his protector, he applied to the court of France, which gave him a retreat in Alsace. Here he lived in a state of great obscurity, until his daughter the princess Mary, was unexpectedly chosen as queen to Lewis XV. This was in the year 1725, when Stanislaus removed to the castle of Chambord. On the death of Augustus in 1733, an attempt was made by the French monarch to replace Stanislaus on the Polish throne, and he repaired to Dantzic, in order to support the party which actually proclaimed him; but his competitor, the son of Augustus, and elector of Saxony, favoured by Austria and Russia, was more successful, and Stanislaus was obliged to quit

quit Dantzic in disguise, and through many dangers escaped to Konigsberg. He supported this reverse of fortune with philosophical resignation, and at the peace of 1736 he formally abdicated all claim and pretensions to the kingdom on condition of retaining the title, and being put in possession for life of the duchies of Lorraine and Bar. Thenceforth he lived as the sovereign of a small country, which he rendered happy by the exercise of virtues, that caused him to be named by the general voice of his subjects, "Stanislaus the Beneficent." Instead of imposing new and oppressive taxes, he relieved his people from the pressure of many which they had heretofore borne; yet he was able, by a prudent economy, to found many useful and charitable establishments, and to patronize the arts and sciences. He was himself attached to literature, and wrote various treatises on moral, philosophical, and political topics, which were published under the title of "*Œuvres du Philosophe Bienfaisant*," 4 vols. 8vo. These volumes were published in 1765, and the royal author of them died in the following year, universally lamented.

STANISLAUS-AUGUSTUS (Poniatowski). See **POLAND**.

STANISLAWCZY, a small town of Austrian Poland, in the circle of Zloczow, on the river Styr.

STANISLAWOW, a circle of Austrian Galicia, situated in the south-east of the province, adjacent to Hungary and the circles of Stryi and Tarnopol. It has a territorial extent of 1955 square miles, with 179,000 inhabitants. It consists for the most part of extensive and fertile plains, except on the frontiers of Hungary, where part of it is occupied by some lofty mountains of the Carpathian chain. It is watered by a number of rivers, the chief of which are the Dniester, the Pruth, and the Bistricza.

STANISLAWOW, a town of Austrian Poland, and the capital of the preceding circle. It is surrounded by a wall, and is well fortified; has a Catholic and an Arminian church, a gymnasium, a central school, and 6200 inhabitants. It has also a government depot of tobacco and snuff, and a considerable trade; 80 miles south-by-east of Lemberg, and 172 north-west of Jassy. Lat. 48. 56. N. long. 24. 43. E.

STANITZ, **STEINITZ**, or **ZDANICE**, a small town of the Austrian states, in Moravia; 21 miles east-south-east of Brunn. Population 1500.

STANK, *adj.* [*stanco*, Ital. *Dr. Johnson*.—Probably, as *Serenius* also notices, from the Icel. and Su. Goth. *stanka*, to pant for breath; and *to stank* is, in some parts of the north of England, to sigh.] Weak; worn out.

Diggon, I am so stiff and so *stank*,
That uneth I may stand any more,
And how the western wind bloweth sore,
Beating the withered leaf from the tree.

Spenser.

STANK, *s.* [*ƿanc*, Sax.; *ystanc*, Welsh.] A dam, or bank, to stop water. *Bailey*.—It has this meaning in the south and east of England. *Ray*.—In old English, it meant a pond or dam of water. *Mr. G. Chalmers*.—Thei lighted and ahiden beside a water *stank*. *R. of Brunne*.

STANK. The preterite of *stink*.—The fish in the river died, and the river *stank*. *Exod.*

STANKAU, a small town of the west of Bohemia, on the Radbusa; 9 miles north-north-east of Pilsen. Population 1000.

STANKY, an old town of Russian Poland, in the government of Kiev, on an eminence near the Dnieper.

STANLEY (Thomas), born at Cumberlow Green, in Hertfordshire, was the son of Sir Thomas Stanley, knight. He received his early education at home, under Edward Fairfax, the translator of Tasso's Jerusalem, and was admitted a gentleman-commoner of Pembroke-hall, Cambridge, in 1639. Having taken his degree of M. A., at that university, he went abroad, but returning during the civil war, he took up his residence in the Middle Temple. He there pursued his studies with much eagerness, and in 1651 published a volume of original poems, and a number of

translations in verse, from the ancient and modern languages. Turning his attention to graver topics, in 1655 he published the first volume of the work by which he is chiefly known, "The History of Philosophy; containing the Lives, Opinions, Actions, and Discourses of the Philosophers of every Sect." This was followed by three other volumes; they were afterwards republished in one volume folio; and in 1743, a quarto edition was given to the public. After the favourable reception which this work met with, the author published an edition of *Æschylus*, which was published in London in 1663, the text of which was copied into De Pauw's edition of 1745. He died in London, April 12, 1678, leaving behind him farther monuments of his industry and erudition, in manuscript, consisting of "Commentaries on *Æschylus*," in 8 vols. fol.: "Adversaria; or Remarks on Passages in various ancient Authors;" "Predictions on the Characters of Theophrastus;" and a Latin treatise on the first-fruits and tenths of the spoils mentioned in the Epistle to the Hebrews. He had been married to a Northamptonshire lady, co-heiress to a good estate, and he left a son, who published, at an early age, a translation of *Ælian's* "Various Histories."

STANLEY, a village of Scotland, in Perthshire, where there is an extensive spinning mill. Population upwards of 500.

STANLEY, a township of England, West Riding of Yorkshire, near Wakefield. In the neighbourhood, there is a salubrious cold spring, esteemed efficacious in many scorbutic complaints; over which a bathing-room has been erected, with a dwelling-house for the use of its visitors. Population 3769.

STANLEY, a hamlet of England, in Wiltshire; 2 miles east-by-south of Chippenham.

STANLEY, a township of England, in Derbyshire; 6 miles north-east of Derby.

STANLEY, a township of England; in Staffordshire; 5 miles south-west of Leek.

STANLEY, PONTLARGE, a parish of England, in Gloucestershire; 2 miles north-west of Winchcombe.

STANLEY, LEONARD'S and KING'S. See **LEONARD'S and KING'S STANLEY**.

STANLEY-TOWN, a small town of Pennsylvania, situated in the Alleghany mountains, on the road to Pittsburg. It consists of about 50 houses.

STANMER, a parish of England, in Sussex; 5 miles west of Lewes.

STANMORE, GREAT, a village and parish of England, in the county of Middlesex. It comprises 1400 acres of land, the greater part of which is occupied as meadow and pasture, but about 50 acres still remain in common. The village is of considerable extent, and consists chiefly of houses erected on the sides of the great road from London to St. Alban's. Within the parish are some handsome mansions and villas, the chief of which is Stanmore house, the elegant seat of the Countess of Aylesford. The house is seated in an extensive park, distinguished for its fine woods and varied surface. The present church of Stanmore was completed in 1632, at the sole expence of Sir John Wolstenholme: it is built of brick, and among other monuments in it, is one by Nicolas Stone, commemorating the builder of the church. From the number of Roman antiquities found within this parish, it is conjectured by Camden, Stukely and Reynolds, that the station called **SULLONIACÆ**, was at Brockley-hill. During the Anglo-Roman dynasty, this part of Middlesex, and a great part of Hertfordshire, were covered with woods. Fitzstevens, who wrote about 1170, says, that "an immense forest extends itself to the north of London, and is full of lairs and coverts of beasts and game." Population 840; 10 miles north-west of London.

STANMORE, LITTLE, a parish of England, adjoining to the above. Here is Canons, the ancient and celebrated seat of the Brydges family. This estate was rendered noted by the duke of Chandos, paymaster of the forces to Queen Anne, who having acquired great wealth, resolved to build two magnificent houses, to surpass any of the ducal resi-

dences in England. One was begun in Cavendish-square, London, but never finished; the other at Canons, was erected by the first architects in the kingdom. Italian artists were employed to finish the inside work, and the whole was executed in a style of the utmost elegance and splendour; the expence was estimated at not less than 250,000*l*. This mansion was taken down, and the materials sold by auction, in 1747. A small but neat villa was afterwards built in its place. Population 547.

STANNARDSVILLE, a post township of the United States, in Orange county, Virginia; 95 miles north-west of Richmond.

STANNARY, *s.* [from *stannum*, Lat.; *stean*, tin, Cornish; *steuer*, a tinner, pl. *stennerion*. *Pryce, Corn. Gramm.*] A tin mine.—If by public law the mint were ordained to be only supplied by our *stannaries*, how currently would they pass for more precious than silver mines! *Bp. Hall*.

STANNARY, *adj.* Relating to the tin-works.—A steward keepeth his court once every three weeks: they are termed *stannary* courts of the Latin *stannum*, and hold plea of action of debt or trespass about white or black tin. *Carew*.

STANNERN, a small town of the Austrian States, in Moravia; 6 miles south-by-east of Iglau. Population 1100.

STANNEY, GREAT and LITTLE, two hamlets of England, in Cheshire; 5½ miles north of Chester.

STANNINGTON, a parish of England, in Northumberland; 5 miles south-by-east of Morpeth. The church contains some elegant paintings on glass, presented by Sir M. W. Ridley. Population 1270.

STANNYEL, *s.* The common *stone-hawk*. See *Mr. Steevens's Note on Shakspeare*.—Dr. Jamieson and Mr. Mason consider the name as the Sax. *þrangilla*, which means the pelican. This may be doubted. It is called also *stanchil* in the north.—With what wing the *stannyel* checks at it! *Shakspeare*.

STANOVOI, a fortress of Asiatic Russia, forming part of the military line of the Issim. It is a square, flanked with four bastions, and contains a church and magazines, with a suburb of 70 houses; 8 miles south-west of Issim.

STANOVOY, a chain of mountains in Asiatic Russia, forming part of the great northern chain which crosses the breadth of that continent. It receives this name after turning to the north, near the source of the Aldane, whence it runs parallel to the Eastern sea or gulf of Okhotsk, leaving only a narrow plain intervening. It is of considerable height, and opposes serious difficulty to travellers proceeding to this extremity of the Russian empire. It is supposed to continue uninterrupted, though with some diminution of magnitude, to Cape Tchoutchi, at the north-east extremity of Asia; and the Alcutian and Fox isles may probably be considered in some degree as a continuation of it. An important and lofty branch passes into Kamtschatka and the Kurile islands. This chain is supposed to consist of chiefly granite and porphyry, though there are whole mountains composed of green jasper.

STANSFIELD, a parish of England, in Suffolk; 4½ miles north-by-east of Clare. Population 380.

STANSTEAD, a parish of England, in Suffolk; 5 miles north-east of Wrotham.

STANSTEAD, ABBOTTS, a parish of England, in Hertfordshire, situated in a vale, by the river Lea; 2½ miles north-east of Hoddesdon. In this parish stands the Rye-house, remarkable for the Rye-house plot in reign of Charles I. Population 832.

STANSTEAD, MONTFICHET, a parish of England, in Essex, which derives its name from an ancient castle built here on an artificial mount, about a quarter of a mile from the church, some relics of which were not long since visible. Population 870; 18 miles north-west of Chelmsford.

STANSTEAD, a township of Lower Canada, on the eastern side of Lake Memphramagog, in the county of Richelieu. Population 2500.

STANTHORNE, a small village of England, in Cheshire, near Middlewich.

STANTON, a hamlet of England, in Derbyshire; 3½ miles south-south-east of Bakewell. Population 656.

STANTON, a parish of England, in Derbyshire, situated near the Erwash and Derby canal; 8½ miles east-by-north of Derby. Population 356.

STANTON, a township of England, in the parish of Stepenhall, Derbyshire. Here is a very ancient chapel, the inside of which is still entire, and the ceiling, which was painted, carved and gilded, is in tolerable preservation. In the tower there are three rooms accessible by winding stone stairs; one of these was occupied by Pope, when he passed two summers here in retirement, while employed in his translation of Homer, and where he was frequently visited by Gay. Population 946; 12½ miles south-west of Derby, and 2 south-east of Burton-upon-Trent.

STANTON, a hamlet of England, in Dorsetshire; 5 miles west-by-south of Bridport.

STANTON, a parish of England, in Gloucestershire; 4½ miles north-east of Winchcombe.

STANTON, a parish of England, in Derbyshire; 6½ miles south-by-east of Derby.

STANTON, a township of England, in Northumberland; 5½ miles north-west of Morpeth.

STANTON, a township of England, in Staffordshire; 4 miles west of Ashborn.

STANTON, a parish of England, in Worcester, near Ridmerly, on the borders of Gloucestershire.

STANTON, or STANNON, a parish of England, in Gloucester; 3½ miles east-by-north of Monmouth.

STANTON, a hamlet of England, in Lancashire, south-east of Dalton.

STANTON, a small town of England, in Lincolnshire, with a market on Monday; 6 miles east-north-east of Lincoln, and 146 north of London.

STANTON, ALL SAINTS and ST. JOHN'S, two united parishes of England, in Suffolk; 3 miles north-east of Ixworth. Population 816.

STANTON-ON-ARROW, a parish of England, in Herefordshire; 5½ miles east-north-east of Kington. Population 370.

STANTON-UNDER-BARDON, a township of England, in Leicestershire; 9 miles north-west of Leicester.

STANTON, ST. BERNARD'S, a parish of England, in Wiltshire; 5½ miles east-by-north of Devizes.

STANTON BARRY, a parish of England, in Buckinghamshire; 3 miles west-by-south of Newport Pagnell.

STANTON-DREW, a parish of England, in Somersetshire, situated on the river Chew, which runs into the Avon near Pensford. At a short distance from the church is a monument resembling Stonehenge, supposed to have been a Druidical temple. It consists of a circle of stones 5 or 6 feet high, the diameter of which is 90 paces. Population 682; 2 miles west-south-west of Pensford.

STANTON FEN, a parish of England, in Huntingdonshire; 2 miles south-by-east of St. Ives. Population 742.

STANTON FITZWARREN, a parish of England, in Wiltshire; 2 miles south-west of Highworth.

STANTON ST. QUINTIN, a parish of England, in Wiltshire; 4 miles north-by-west of Chippenham.

STANTON ST. GABRIEL, a parish of England, in Dorsetshire, situated on the coast; 5 miles west-by-south of Bridport.

STANTON HARCOURT, a village and parish of England, in the county of Oxford, situated on the banks of the Thames. In the fields adjacent there is a large barrow, near which are some stones called the Devil's Coits: these are 8 feet high, and 7 broad near the bottom, and are supposed to have been formed by cementing together small stones, of which there are vast numbers in these fields. Population 553; 4 miles from Witney, and 6 west of Oxford.

STANTON LACY, a parish of England, in Salop; 3½ miles north-north-west of Ludlow. Population 1026.

STANTON

STANTON LONG, another parish in the above county; 13½ miles north-north-east of Ludlow.

STANTON LONG, a parish of England, in Cambridge-shire; 6½ miles north-west of Cambridge.

STANTON PRIOR, a parish of England, in Somerset-shire; 5 miles west-south-west of Bath.

STANTON ST. JOHN'S, a parish of England, in Oxfordshire; 4½ miles north-east of Oxford. Population 397.

STANTON-UPON-NINEHEATH, a parish of England, in Salop; 5 miles south-east of Wem. Population 571.

STANTON STONEY, a parish of England, in Leicestershire; 4 miles east by-north of Hinckley. Population 446.

STANTON, UPPER and LOWER, two hamlets of England, in the parish of Llanvihangel Crucorney, Monmouthshire, near Abergavenny.

STANTON-ON-THE-WOLDS, a hamlet of England, in Nottinghamshire, north of Plumtree.

STANTON-UPON-WYE, a parish of England, in Herefordshire; 8½ miles west-north-west of Hereford. Population 512.

STANTON, a township of the United States, in Clermont county, Ohio, immediately below Red Oak creek.

STANTON HILL, a post village of the United States, in Charlotte county, Virginia.

STANTONSBURG, a post village of the United States, in Newcomb county, North Carolina.

STANTZ, a small but well built town in the interior of Switzerland. It has 2100 inhabitants, a neat church, a council-house, and a pleasant fruitful territory. It is the chief place of the canton of Unterwalden, and has a statue of Walkenried, one of the founders of Swiss independence. In 1799, an obstinate action was fought here between the Swiss and the French, and the town was taken by the latter; 8 miles south-east of Lucerne, and 42 east of Bern.

STANWAY, a parish of England, in Essex; 4 miles west-by-south of Colchester. Population 431.

STANWAY, a parish of England, in Gloucestershire; 3½ miles north-east of Winchcombe.

STANWELL, a parish of England, in Middlesex; 2½ miles north-east of Staines. Population 1032.

STANWICK, a parish of England, in Northamptonshire; 2½ miles north-north-east of Higham Ferrars.

STANWICK, a small village of England, North Riding of Yorkshire; 8 miles north-by-east of Richmond.

STANWIX, or STANWICH, a village and parish of England, in Cumberland, adjoining to Carlisle, on the opposite side of the Eden. Here are vestiges of a Roman station. Population of the village, 400; of the parish, 1128.

STANZA, *s.* [*stanza*, Ital.; *stancc*, Fr.] A number of lines regularly adjusted to each other; so much of a poem as contains every variation of measure, or relation of rhyme. *Stanza* is originally a room of a house, and came to signify a subdivision of a poem; a staff.

So bold as yet no verse of mine has been,
To wear that gem on any line,

Nor till the happy nuptial house be seen,
Shall any stanza with it shine.

Cowley.

Horace confines himself strictly to one sort of verse or stanza in every ode. *Dryden*.—In quatrains, the last line of the stanza is to be considered in the composition of the first. *Dryden*

Before his sacred name flies every fault,
And each exalted stanza teems with thought.

Pope.

STANZIONE (Cavaliere Massimo), was born at Naples in 1585, and was a disciple of G. B. Caracciolo; he also received instructions in fresco painting from Belisario Cosenzio, one of the most eminent artists of his time, and indeed seems to have been exceedingly studious of the works of all the great painters of his day. He visited Rome, and in studying the works of Annibal Carracci, became intimate with Guido Rheni, into whose style he fell with so much success, that he obtained the name of *Il Guido Rheni di Napoli*.

It was in his native city that he principally exerted his ability in original productions, and was ranked amongst its ablest artists. Spagnoletto became jealous of him, and is said by Lanzi to have been guilty of a gross piece of perfidy to destroy the picture he had painted in competition with his Descent from the Cross, for the Certosa. The subject of his picture was Christ with the Maries, which having somewhat changed in tone, and become darker, Spagnoletto persuaded the monks to permit him to clean it; when he used some noxious preparation, which nearly destroyed the work. Upon application to Stanzone to remedy the mischief, he refused, declaring it should remain as it was, that the author of so disgraceful a procedure might reap the just fruits of his perfidy.

Among the considerable works executed by Stanzone at Naples, are the cielings of the churches of S. Paolo and del Gesu Novo, and a large picture at the Certosa, representing St. Bruno, presenting the regulations of his order to his monks. The small cabinet pictures by him are numerous, and much esteemed. He died at the age of 71, in the year 1656.

STANZ-STADT, a populous village in the Swiss canton of Unterwalden, on the lake of Lucerne, near the town of Stanz, inhabited chiefly by boatmen employed in the navigation of the lake.

STAPELIA [so named by Linnæus, in memory of Bodeus Stapel, a physician of Amsterdam, commentator on Theophrastus], in Botany, a genus of the class pentandria, order monogynia, natural order of contortæ apocineæ (*Juss.*)—Generic Character. Calyx: perianth one-leaved, five-cleft, acute, small, permanent. Corolla one-petalled, large, flat, thick, five-cleft beyond the middle: segments wide, flat, acuminate. Nectary, five leaflets, spreading, linear, grooved, emarginate, with a dagger point, opposite to the segments of the corolla. Leaflets five others, fastened alternately with three a little higher to the tube of the filaments, and running along it, vertical, bifid: interior segment erect, with the summit bent outwards; outer segment straight, compressed. Stamina: filaments five, united into a short tube. Each anther fastened internally to the base of each vertical leaflet of the nectary, and wider than it, incumbent on the stigma, short, two-lobed, two-celled, produced below on both sides into an earlet, contiguous to the margin to each of the neighbouring anthers as far as the tip, and ascending at the tip. Pollen united into ten corpuscles, crescent-shaped, flattish, ascending obliquely into the cells of the anther, each on a very short pedicel (with a transverse base, incumbent on the upper margin of the earlet,) fastened by pairs to five small twin coloured tubercles, placed on the apex of the earlets, and adhering to the angles of the stigma. Pistil: germs two, ovate, flat inwards. Styles none. Stigma common to both germs, large, placed on the tube of the stamens, acutely five-cornered, flat above, obliquely truncate-excavated at the sides for the reception of anthers. Pericarp: follicles two, long, awl-shaped, one-celled, one-valved. Seeds numerous, imbricate, compressed, crowned with a down. Receptacle free.—*Essential Character*. Contorted. Nectary a double little star covering the genitals.

In the distribution of this genus we have followed Willdenow, and have given his specific characters.

I.—Corolla five-cleft; segments hairy at the edge.

1. *Stapelia ciliata*, or ciliate stapelia.—Stem four-cornered, branched, decumbent, rooting, flowering at top; peduncle shorter than the corolla, which is papillose at bottom.—Native of southern Africa, below Boekland Berg.

2. *Stapelia revoluta*, or revolute-flowered stapelia.—Stem four-cornered, branched at the base, erect, flowering at top; peduncles shorter than the corolla; which is smooth, with the segments ovate, hairy at the edge, and revolute.—Native of southern Africa, in dry fields under shrubs: flowering in September and October.

3. *Stapelia hirsuta*, or hairy stapelia.—Branches ascending, four-cornered, flowering at the base; peduncle round, length of the corolla, which is villose at bottom, with the segments

segments ovate, sharpish, and villose at the edge.—Native of the Cape of Good Hope.

4. *Stapelia sororia*.—Branches divaricating, four-cornered, flowering at the base; peduncles round, longer than the corolla, which is very villose at bottom, and wrinkled transversely with the segments, oblong, acute, villose at the edge.—Native of the Cape of Good Hope.

5. *Stapelia grandiflora*, or great-flowered stapelia.—Branches erect, four-cornered, club-shaped, flowering at the base; peduncles thickened at the base, shorter than the corolla, which is villose with the segments, lanceolate-acuminate, ciliate at the edge.—Native of southern Africa, in hot places, as at Sondags river.

6. *Stapelia ambigua*.—Branches erect, four-cornered, club-shaped, flowering at the base; peduncles many-flowered; corollas hispid, with the segments ovate-lanceolate, acute, villose at the edge.—Native of southern Africa, in dry deserts.

7. *Stapelia pulvinata*, or cushioned stapelia.—Stem four-cornered, decumbent; branches ascending, flower-bearing; bottom of the corolla raised and villose; segments roundish, wrinkled, acuminate, villose at the edge.—Native of southern Africa; among shrubs.

8. *Stapelia asterias*, or starry stapelia.—Branches erect, four-cornered, attenuated, flowering at the base; peduncles length of the corolla; the segments of which are ovate-acuminate, wrinkled, revolute and villose at the edge.—Native of the deserts of southern Africa.

9. *Stapelia gemmiflora*, or bud-flowering stapelia.—Branches erect, four-cornered, flowering at bottom; peduncles length of the corolla, which is rugged, with the segments ovate, acute, ciliate at the edge, five-nerved above.—Native of southern Africa, in dry places, among shrubs, beyond Platte Kloof.

10. *Stapelia divaricata*, or straddling stapelia.—Branches four-cornered, attenuated, divaricate-spreading, flowering in the middle; peduncles longer than the corolla, which is smooth, with the segments lanceolate, acuminate, rolled back, and ciliate at the edge.—Native of southern Africa.

11. *Stapelia rufa*.—Branches four-cornered, erect, flowering at the base; peduncles shorter than the corolla, which is wrinkled and starred at the bottom, with segments lanceolate, acuminate, ciliate at the edge.—Native of southern Africa, in hot places beyond Platte Kloof.

12. *Stapelia acuminata*.—Branches four-cornered, ascending, flowering in the middle; peduncles shorter than the corolla, which is wrinkled; and the segments are ovate, cusp-acuminate, ciliate at the edge.—Native of southern Africa, in Namaqualand.

13. *Stapelia reclinata*.—Branches spreading, four-cornered, flowering above the base, peduncles longer than the corolla; which has a raised bottom, with lanceolate segments, ciliate at the edge.—Native of southern Africa.

14. *Stapelia elegans*.—Branches diffused, oblong, roundish, four-cornered, flowering in the middle; peduncles longer than the corolla, which is hispid, with a pentagon bottom and lanceolate segments, ciliate at the edge.—Native of southern Africa.

15. *Stapelia cæspitosa*, or tufted stapelia.—Branches pro-cumbent, four-cornered, flowering above the base; peduncles length of the corolla; the segments of which are lanceolate, acute, revolute and ciliate at the edge.—Native of southern Africa under shrubs.

16. *Stapelia arida*, or dry stapelia.—Branches four-cornered, erect, flowering at top; peduncles longer than the corolla, which has a circular bottom, and oblong acute segments, ciliate at the top of the margin.—Native of southern Africa, in Kanna Land.

17. *Stapelia parviflora*, or small-flowered stapelia.—Branches four-cornered, spreading, flowering in the middle on the outside of the teeth; peduncles longer than the corolla; the segments of which are lanceolate, bluntish, and ciliate at the edge.—Native of southern Africa, Namaqua Land.

18. *Stapelia subulata*, or awl-shaped stapelia.—Branches

four-cornered, attenuated, nodding, flowering below the top; corollas nodding; segments oblong, acuminate-cusped with the hairs pointing one-way.—Native of Arabia Felix.

19. *Stapelia concinna*, or neat stapelia.—Stem four-cornered, erect, branched at top; branches spreading, simple, flowering at the base; peduncles length of the corolla; corollas hispid, with the segments ovate, acute, ciliate.—Native of southern Africa.

20. *Stapelia glandulifera*, or glandular stapelia.—Branches spreading, four-cornered, flowering at the base; peduncles longer than the corolla, which is covered with hairs glandular at the tip; with the segments ovate, acute.—Native of southern Africa, in the deserts about Nord Olifant's River.

II.—Corollas five-cleft; segments smooth at the edge.

21. *Stapelia pedunculata*, or long-peduncled stapelia.—Branches four-cornered, two or three-toothed at the tip, flowering in the middle; peduncles twice as long as the branches; segments of the corolla lanceolate, acuminate; at the base surrounded at the edge by pedicelled glands.—Native of southern Africa, in Camies Berg.

22. *Stapelia aperta*, or open-flowered stapelia.—Branches four-cornered, three or two-toothed at the tip, flowering at the base; peduncles twice as long as the branches; corollas wrinkled; segments ovate, obtuse, smooth at the edge.—Native of southern Africa, in Namaqua Land, near Kok Fontein.

23. *Stapelia Gordoni*, or Gordon's stapelia.—Branches flowering at the top; tubercles round, spiny; peduncles shorter than the corolla, which is five-toothed, flat, and wheel-shaped.—Native of the Cape of Good Hope, in Groot Namaqua Land, toward Orange River.

24. *Stapelia pilifera*, or hairy-tubercled stapelia.—Branches flowering at the top; tubercles round, bristled; flowers sessile; segments ovate, cusp-acuminate, smooth at the edge.—Native of southern Africa, on very dry hills, under shrubs; as below Roggeveldt Bergen.

25. *Stapelia caudata*, or tailed stapelia.—Stem rough-haired, leafy; peduncles shorter than the corolla, drooping; segments of the corolla linear, acute.—Native of southern Africa.

26. *Stapelia articulata*, or jointed stapelia.—Branches flowering at the top; tubercles round, mucronate; flowers subsessile; corollas papillose; segments lanceolate.—Native of southern Africa, at Roggeveldt.

27. *Stapelia mammillaris*, or prickly stapelia.—Branches flowering in the middle, erect; tubercles hexagonal, spiny; peduncles shorter than the corolla, which is smooth, with the segments lanceolate.

28. *Stapelia pruinosa*, or frosted stapelia.—Branches erect, four-cornered, flowering in the middle; peduncles shorter than the flower; corollas pubescent; segments ovate, acute.—Native of southern Africa, in Namaqua Land, among shrubs.

29. *Stapelia ramosa*, or branched stapelia.—Branches almost upright, four-cornered, flowering in the middle, on the outside of the teeth; peduncles shorter than the flower; corollas flat; segments lanceolate, rolled back at the edge.—Native of southern Africa, beyond Platte Kloof, near the hot baths.

30. *Stapelia pulla*, or black-flowered stapelia.—Branches erect, sub-hexagonal, flowering in the middle, on the outside of the teeth; peduncles shorter than the flower; segments of the corolla erect, lanceolate-acuminate, rolled back at the edge.—Native of southern Africa, in hot sandy places in the desert.

31. *Stapelia adscenspens*.—Stem four-cornered, ascending, flowering at the top; peduncles shorter than the corolla, which is smooth, with the segments linear, reflexed at the edge, and acute. Stems several, a foot or two high, at the base resting on the ground and striking root; above erect, with blunt notched angles. Branches erect, like the stems. Leaves alternate, sessile, on the angles of the branches, lanceolate, very minute. Flowers axillary, about the extremities of the branches, generally single, erect, small, variegated with

with dark purple and yellow. Calyx five-cleft to the bottom: divisions lanceolate. Corolla: tube scarcely any: border flat. Fillicles erect, as thick as a goose quill, four or five inches long.—This plant is not very common in the East Indies, of which it is a native.

32. *Stapelia quadrangula*.—Stem four-cornered; branches divaricating, flowering at the top; teeth truncate; flowers sessile.—Native of Arabia Felix.

33. *Stapelia incarnata*, or flesh-coloured stapelia.—Branches four-cornered, stiff, flowering at the top on the outside of the teeth; peduncles shorter than the corolla; the segments of which are lanceolate and acute.—Native of southern Africa, in dry sandy fields.

34. *Stapelia punctata*, or dotted stapelia.—Branches decumbent, oblong, somewhat four-cornered, flowering in the middle; peduncles twice as long as the corolla, which is bell-shaped, with the segments spreading, lanceolate, acute.—Native of southern Africa, in Namaqua Lands.

35. *Stapelia geminata*.—Branches decumbent, round, flowering at the top; peduncles geminate, length of the corolla; the segments of which are lanceolate, rolled back at the edge.—Native of southern Africa, in hot places, under shrubs.

36. *Stapelia decora*.—Branches oblong, decumbent, round, obscurely four-cornered, flowering at the base; peduncles longer than the flower; bottom of the corolla five-cornered; segments ovate-lanceolate, rolled back at the edge.—Native of southern Africa.

37. *Stapelia pulchella*.—Branches four-cornered, decumbent, flowering above the base; peduncles many-flowered; bottom of the corolla circular; segments ovate, acute.—Native of southern Africa.

38. *Stapelia vetula*.—Branches four-cornered, erect, flowering at the base; peduncles shorter than the corolla, which is smooth; with the segments ovate, acuminate, three-nerved above.—Native of southern Africa, on mountains.

39. *Stapelia verrucosa*.—Branches ascending, four-cornered, flowering at the base; peduncles longer than the corolla, which is warted; with the segments ovate and acute, and the bottom five-cornered and rugged.—Native of southern Africa, in dry places: flowering in September and October.

40. *Stapelia irrorata*.—Branches from erect spreading, four-cornered, flowering at the base; peduncles longer than the corolla, which is wrinkled, with ovate acuminate segments.—Native of southern Africa, in dry places: flowering in September and October.

41. *Stapelia mixta*.—Branches four-cornered, ascending, flowering at the base; peduncles length of the corolla, which is wrinkled, with a circular raised papillose bottom, and ovate acuminate segments.—Native of southern Africa.

42. *Stapelia variegata*, or variegated stapelia.—Branches four-cornered, ascending, flowering at the base; peduncles longer than the corolla, which is wrinkled, with a circular concave wrinkled bottom, and ovate acute segments.—Native of southern Africa, on rocks, into the crevices of which it strikes the fibres of its roots.

III.—Corolla ten-toothed.

43. *Stapelia campanulata*, or bell-shaped stapelia.—Branches erect, four-cornered, flowering at the base; peduncles three-flowered; segments of the corolla larger, lanceolate, with a bell-shaped bottom.—Native of southern Africa.

44. *Stapelia barbata*.—Branches mostly four-cornered, erect, flowering at the base; peduncles shorter than the corolla, which is bell-shaped, with the segments larger, lanceolate, acuminate, rugged, clubbed and bearded.—Native of southern Africa.

45. *Stapelia venusta*.—Stem four or five-cornered, erect, branched at top; branches flowering at the base; peduncles longer than the corolla, bent down; corolla smooth; segments larger, ovate-acuminate, bottom concave, surrounded by an elevated ring.—Native of southern Africa, in Karro.

46. *Stapelia guttata*.—Branches somewhat spreading and

four-cornered, flowering at the base; peduncles length of the corolla; the segments of which are larger, ovate, acute, the bottom concave, rugged, surrounded by an elevated ring.—Native of southern Africa.

47. *Stapelia humilis*.—Branches four-cornered, spreading, flowering at the base; peduncles solitary, shorter than the corolla; the segments of which are larger, lanceolate, acute.—Native of southern Africa.

48. *Stapelia reticulata*, or netted stapelia.—Branches five-cornered, spreading, flowering at the base; peduncle in pairs, shorter than the corolla; the segments of which are larger, ovate, acute, the bottom bearded, surrounded by an elevated ring.—Native of southern Africa, in hollows of rocks, towards Olifant's River: flowering in spring and autumn.

IV.—Uncertain; the flowers being not yet known.

49. *Stapelia clavata*, or club-shaped stapelia.—Stem simple, thick, club-shaped, nettedly and obscurely warted, fruiting at the top.—Native of southern Africa, in sandy fields beyond Kopper-berg.

Propagation and Culture.—They are propagated here very easily during the summer months, by taking off any of the side branches, which, when planted, put out roots very freely.

STAPELEY, a village of England, in Cheshire, near Nantwich.

STAPENHILL, a parish of England, in Derbyshire; 1 mile from Burton, from which it is divided by the river Trent. Population 447.

STAPHISAGRIA. See DELPHINIUM.

STAPHORST, a large village of the Netherlands, in the province of Overysse, with 2600 inhabitants; 10 miles north-north-east of Zwoll.

STAPHYLE, a word used by the old Greek writers, sometimes to express a grape, and sometimes an elongation of the uvula.

STAPHYLEA [abbreviated by Linnæus from *Staphylodendrum*. From *σταφύλη*, Gr., a raceme or bunch; that being the inflorescence of this shrub], in Botany, a genus of the class pentandria, order trygynia, natural order of trihilata rhamnii (*Juss.*)—Generic Character. Calyx: perianth five-parted, concave, roundish, coloured, almost as big as the corolla. Corolla: petals five, oblong, erect, like the calyx. Nectary from the receptacle of the fructification, in the bottom of the flower, concave, pitcher-shaped. Stamina: filaments five, oblong, erect, length of the calyx. Anthers simple. Pistil: germ thickish, three-parted. Styles three, simple, much longer than the stamens. Stigmas obtuse, contiguous. Pericarp: capsules three, inflated, flaccid, united longitudinally by a suture, opening inwards by the acuminate apices. Seeds two, bony, globular, with an oblique point and an orbicular excavation by the side of the apex. The ternary number of the pistil and pericarp, in *Staphylea pinnata* becomes binary.—*Essential Character*. Calyx five-parted. Petals five. Capsule inflated, connate. Seeds two, globular, with a wart.

1. *Staphylea occidentalis*.—Leaves doubly-pinnate; capsules three-cornered; seeds solitary; stem arboreous. Flowers white, odorous.—Native of Jamaica: flowering there in spring and autumn.

2. *Staphylea pinnata*, or five-leaved bladder-nut.—Leaves pinnate; styles and capsules two. This has several shrubby stalks arising from the same root, and growing ten or twelve feet high, covered with a smooth bark, and dividing into several branches, which are soft and pithy. The flowers come out upon long slender pendulous peduncles from the axils of the stalks near their extremity, in oblong bunches. The petals are white, and expand in form of a rose.—Native of the south of Europe.

3. *Staphylea trifolia*, or three-leaved bladder-nut.—Leaves ternate; styles and capsules three. This has a more substantial stem than the preceding; the bark of the old branches and stalks is smooth, and of a gray colour; that of the

young ones is of a light green, and very smooth.—Native of North America; and now as common in the nursery-gardens as the other sort.

Propagation and Culture.—Second and third sorts are usually propagated by suckers from the root, which the second sends out in plenty; these should be taken from the old plants in autumn, and their roots trimmed, then planted in a nursery, in rows at three feet distance, and one foot asunder in the rows; in this nursery the plants should stand one or two more years according to their strength, and then be transplanted to the places where they are to remain. They may also be obtained by seeds and cuttings.

STAPHYLEPARTES, the name of a chirurgical instrument, in use among the ancients for elevating the uvula. It is mentioned by Paulus Ægineta.

STAPHYLINUS, in Anatomy, the muscle of the uvula, commonly called azygus.

STAPHYLINUS, in Entomology, a genus of insects of the order Coleoptera. The Generic Character is as follows:—Antennæ moniliform; four feelers; shell half as long as the body; wings folded up under the shells; tail not armed with a forceps, furnished with two exsertile vesicles. The insects of this genus are extremely rapacious, devouring not only the insects of other genera, but frequently each other. Many of them, when attempted to be caught, turn up the tail. The jaws are strong and exerted, with which they bite and pinch very hard: most of them are found in damp moist places, among substances, and a few upon flowers. There are about 180 species, separated into three sections, according as their feelers are filiform, hatchet-shaped, or clavate.

I.—All the Feelers filiform.

1. *Staphylinus aureus*.—Head, thorax, and shells, covered with ferruginous down; the abdomen is black, with cinereous bands.—It is found in Siam.

2. *Staphylinus hirtus*.—Hairy, black; thorax and hind-part of the abdomen yellow.—Found in sandy situations, in this country, and other parts of Europe.

3. *Staphylinus murinus*.—Pubescent, cinereous clouded; abdomen and legs deep black. The shells are blue, and polished beneath. The larva is six-footed, naked, and of a pale hue. The head and three first segments of the abdomen chestnut-brown; tail with two jointed bristles, and a cylindrical tubercle beneath.—It is found in this country, among decayed carcases and dung.

4. *Staphylinus olens*.—Black, opaque, immaculate; head broader than the thorax.—This is an English insect, but found likewise in many parts of the European continent.

5. *Staphylinus maxillosus*.—Pubescent black, with cinereous bands. The jaws of this insect are as long as the head; the antennæ are still longer; the shell covers one third of the abdomen; the legs end in small tufts of hair.

6. *Staphylinus erythropterus*.—Black; shells, base of the antennæ, and legs, are red; the head and thorax are unpolished, black; shells with two triangular spots; each side is composed of a few gilded hairs.

7. *Staphylinus politus*.—Black; thorax and shells polished; thorax with a line of impressed dots. This insect, when first caught, scatters a very fragrant odour.

8. *Staphylinus brunripes*.—Black; legs, base and tip of the antennæ, ferruginous; the antennæ are black, the first and two last joints are ferruginous; the eyes are white.

9. *Staphylinus marginatus*.—Black; sides of the thorax and legs are yellow. It is something less than the *staphylinus politus*, and of a glossy black.

10. *Staphylinus alpinus*.—Black; base of the antennæ, shells, and legs, livid. The body of this species is more depressed than is the case with regard to others; the antennæ are black, and pale at the base; the abdomen is black.—It inhabits the highest mountains of Lapland, on the birch.

11. *Staphylinus bifustulatus*.—Black; shells with a ferruginous dot behind.

12. *Staphylinus bi-guttatus*.—Black; shells with a whitish

dot; the eyes are prominent.—It inhabits the shores of the Baltic.

13. *Staphylinus fuscipes*.—Black; thorax roundish; shells and legs piceous; the body is small and thick; the edges a little blackish.

14. *Staphylinus atricapillus*.—Thorax rufous; shells brown, with a white dot and hinder margin.

15. *Staphylinus sanguineus*.—Gibbous, black; shells sanguineous; antennæ thicker towards the top. The antennæ are as long as the body; the head is rough; the shells are striate at the base; legs yellowish; thighs brown; body sometimes chestnut-brown.—This is found chiefly in France.

16. *Staphylinus caraboides*.—Yellow, immaculate.

17. *Staphylinus rugosus*.—Black; thorax and shells ruged. It is larger than the next. The head is flat; the thorax depressed, with longitudinal wrinkles.

18. *Staphylinus piceus*.—Black; thorax depressed, with three raised lines; the shells are piceous.

19. *Staphylinus flavus*.—Black; edges of the thorax and shells yellow; the latter with a brown fillet and outer margin; antennæ and legs yellow.

20. *Staphylinus litoreus*.—Black; shells grey on the fore-part; legs rufous.—It inhabits the sea-shores.

II.—Hind-feelers hatchet-shaped. Oxyporus.

21. *Staphylinus Rufus*.—Rufous; head and hind-part of the shells and abdomen are black.—It is found chiefly on fungi, in this and other European countries.

22. *Staphylinus lunulatus*.—Yellow; shells black, pale at the base and tip. Head is black; the tip of the abdomen is marked with a white ring.—It inhabits Europe, on fungi.

23. *Staphylinus merdarius*.—Black; thorax and shells rufous.—It is found in this and other European countries.

24. *Staphylinus chrysomelinus*.—Black; thorax rufous; shells testaceous, the margin at the base is black.

25. *Staphylinus rufipes*.—Glossy black; legs rufous.—It is found in the northern parts of Europe.

26. *Staphylinus hypnorum*.—Glossy-black; margin of the thorax, shells, and legs, testaceous; the body is black, glabrous, and polished.

27. *Staphylinus marginellus*.—Glossy-black; margins of the thorax and shells ferruginous. This is a very small insect.

III.—Fore-feelers clavate. Pæderus.

28. *Staphylinus riparius*.—Rufous; shells blue; the head and end of the abdomen are blackish. This is figured in Donovan's English Insects.

29. *Staphylinus elongatus*.—Hind-part of the shells and legs fulvous.

30. *Staphylinus fulgescens*.—Glossy-black; shells and ends of the legs testaceous; head slightly punctured. The head is marked with numerous small impressed dots.

STAPHYLOMA, is the name given, in Surgery, to that disease of the eye, in which the cornea loses its natural transparency, rises above its proper level, and even projects between the eye-lids, in the form of a whitish pearl-coloured tumour, which is attended with total loss of sight.

STAPHYLOSIS, a protuberance or protrusion of the choroid coat of the eye. See SURGERY

STAPLE. *s.* [*stapel*, Belg. et Sueth. emporium, ab antiquiori et Goth. *stapul*, columna, ædcs columnis compacta. *Serenius*. See also *Lye and Du Cange in Vocc. stapel* and *PATRONUS*. "*Patronus*, Gloss. Sax. Ælfr. ubi de partibus domûs, ꝛapal, quæ *basim* sonat, ut observat *Somnerus*."] A settled mart; an established emporium.

A *staple* of romance and lies,
False tears, and real perjuries.

Prior.

The customs of Alexandria were very great, it having been the *staple* of the Indian trade. *Arbutnot*.—Tyre Alexander the Great sacked; and, establishing the *staple* at Alexandria, made the greatest revolution in trade that ever

was known. *Arbutnot*.—The original material of a manufacture.

At Leister, for her wool whose *staple* doth excel,
And seems to overmatch the golden Phrygian fell. *Dryden*.

STAPLE, *adj.* Settled; established in commerce.

Some English wool, vex'd in a Belgian loom,
And into cloth of spongy softness made:

Did into France or colder Denmark roam,
To ruin with worse ware our *staple* trade. *Dryden*.

According to the laws of commerce.—What needy writer would not solicit to work under such masters, who will take off their ware at their own rates, and trouble not themselves to examine whether it be *staple* or no? *Swift*.

STAPLE, *s.* [*capul*, *Sax.*, a *prop.*] A loop of iron; a bar bent and driven in at both ends.

The silver ring she pull'd, the door she clos'd;
The bolt, obedient to the silken cord,
To the strong *staple's* inmost depth restor'd,
Secur'd the valves. *Pope*.

STAPLE, *MERCHANTS OF THE*, a denomination given to the first and most ancient commercial society in England, from their exporting the staple wares of the kingdom, which were wool, skins, lead, and tin, in their rough state for manufacture. This society is said to have had its rise in the year 1248; and it appears to have had the legal form of a corporation before the 12th year of Edward II. A. D. 1319; as there are records in the pipe-office of the Exchequer, which mention, that it was actually a corporation, with the title of the mayor and constables of the staple of England, who then had their staple at Antwerp, for conducting the sale of English staple wares, and the importation of such foreign goods as were wanted at home. However, in 1328, by 2 Edw. III. cap. 9. it was enacted, that the staples, on both sides of the sea, should cease, and that all merchant-strangers, &c., might go and come with their merchandize into England, after the tenor of the Great Charter. In 1336 the staple of wool was again fixed in Brabant; in 1341, at Bruges; and in 1348, at Calais; whither, and to no other place, all merchandize exported from England, Wales, and Ireland, either by denizens or aliens, were to be shipped from England and there landed. The customs from this staple are said to have then amounted to upwards of 60,000*l.* sterling yearly. In 1353, Edward III. removed the staple of wool from Bruges to Westminster, Canterbury, Chichester, Exeter, Winchester, Bristol, Lincoln, York, Norwich, Newcastle, and Hull, for England; and to Dublin, Cork, Waterford, and Drogheda, for Ireland. And it was enacted by 27 Edward III., and the act called the *statute of the staple*, that all staple wares for exportation should be first brought to some of these places only, where the custom should be paid, and exported by merchant-strangers only, under an oath not to hold any staple thereof beyond sea; which privilege was extended by 31 Edward III. to denizens also. Calais, however, still remained a staple.

In these staple-towns, courts of *law-merchant* were established, by the said statute, or determining all mercantile affairs, and for punishing and americing offenders. From the year 1375, the staple of Westminster seems to have been removed to the place called Staple-Inn, in Holborn; when Calais, which had been for many years a principal staple-port for dispersing, in more early times, the English wool, lead, and tin, and, in later times, the English woollen manufactures, under the conduct of the Merchant-Adventurers, into the inland countries of the Netherlands, France, and Germany, was lost to this country. In 1588, the staple for wool, &c. was established at Bruges; and queen Elizabeth, in the third year of her reign, granted a new charter of confirmation to the corporation of the mayor and constables of the staple of England, of all such privileges as they did, might, or ought to have enjoyed before the loss of Calais. However, king James I., in 1604, granted a new charter to the Merchant-Adventurers, and in 1617, confirmed

all their former powers and privileges for trading to the Netherlands and to Germany, with the woollen manufactures of England, exclusively of all who were not free of their company; in consequence of which, the merchants of the staple, who had before been declining, by the manufacture and exportation of our woollen cloth, were brought to ruin. And when at length it was judged expedient to enact a total prohibition of the exportation of our wool, it is no wonder that the staplers' company should become extinct. At this day they exist only in name; though they maintain the form of a corporation by annually electing the officers of their company, according to the direction of their ancient charters. This nominal corporation is kept up by those who deal in wool (still called woolstaplers), and who, in their corporate capacity, possess a small sum in the public funds, the interest of which serves to defray the expence of their meetings and elections. But they never had a hall, or office of their own, within the city of London, like other trading companies, although the Inn of Chancery in Holborn, so denominated from their warehouses, which were formerly situated there; as was also an office and warehouse of theirs, which, since the erection of the bridge at Westminster, has lost its place, as well as name of wool-staple, at the upper part of Cannon Row.

STAPLE, a township of England, in Kent; 3 miles south-west of Sandwich.

STAPLE, *FITZPAINE*, a parish of England, in Somersetshire; 5 miles south-east of Taunton.

STAPLEFORD, a parish of England, in Hertfordshire; 3½ miles north-by-west of Hertford.

STAPLEFORD, a parish of England, in Leicestershire; 4½ miles east-by-south of Melton Mowbray.

STAPLEFORD, a parish of England, in Lincolnshire; 12 miles south-west of Lincoln.

STAPLEFORD, a parish of England, in Nottinghamshire, near the canal and the river Erwash; 5½ miles west-south-west of Nottingham. Population 954.

STAPLEFORD, a parish of England, in Wiltshire; 4 miles north-north-west of Wilton.

STAPLEFORD, a parish of England, in Cambridgeshire; 3 miles south-east of Cambridge.

STAPLEFORD ABBOTS, a parish of England, in Essex, near the river Rothing or Rodon, over which it had a ford; 5 miles south-east of Epping. Population 351.

STAPLELORD TAWNEY, another parish in the above county; 1 mile distant from the foregoing, on the opposite side of the Rothing.

STAPLEFORD BRUINE'S, a township of England, in Cheshire; 7 miles east-by-south of Chester.

STAPLEFORD FOULK'S, a township in the above county; 6 miles east of Chester.

STAPLEGATE, a village of England, in Kent, contiguous to the northern extremity of the city of Canterbury.

STAPLEGROVE, a parish of England, in Somersetshire; 2 miles north-west of Taunton.

STAPLEHURST, a village and parish of England, in Kent, noted for the salubrity of its situation, and fruitfulness of the soil. Population 1341; 5 miles north-by-east of Cranbrook.

STAPLER, *s.* A dealer: as, a *wool-stapler*.—I do not mean only the *staplers* of Hamburg and Rotterdam. *Howell*.

STAPLETON, a parish of England, in Cumberland; 9½ miles east-north-east of Longtown.

STAPLETON, a parish of England, in Gloucestershire; 2½ miles north-east of Bristol. Here is a spring called the Boiling Well, the waters of which spring out perpendicularly like a boiling cauldron, and the stream is so copious as to drive a mill, a quarter of a mile distant from its source. Population 1921.

STAPLETON, a village of England, in Herefordshire, near Ludlow.

STAPLETON, a hamlet of England, in Leicestershire; 3 miles north-by-east of Hinckley.

STAPLETON,

STAPLETON, a hamlet of England, North Riding of Yorkshire; 11 miles north-east of Richmond, and 2 south-west of Darlington.

STAPLETON, a hamlet of England, West Riding of Yorkshire; 4 miles south-east of Pontefract.

STAR, *s.* [It may be curious to notice the concurrence of various languages in regard to *star*. Persian, *starra*. See *Sir T. Herbert's Trav.* Teut. *sterre*; Sax. *ŕœoppa*; Bretonne, *stêr*; Gr. *ἀστὴρ*; Germ. *stern*; Su. Goth. *stierna*; M. Goth. *stairno*. The word has been supposed by Wachter and others to have been formed from the verb, signifying to rule, to govern, to direct; as *sterren*, Teut., *steuren*, Germ., *stiuran*, Goth.] One of the luminous bodies that appear in the nocturnal sky.—When an astronomer uses the word *star* in its strict sense, it is applied only to the fixt stars; but in a large sense, it includes the planets. *Watts*.

Then let the pebbles on the hungry beech

Fillip the stars;—

Murdering impossibility, to make

What cannot be, slight work.

Shakspeare.

The pole-star.—Well, if you be not turn'd Turk, there is no more sailing by the *star*. *Shakspeare*.—Configuration of the planets supposed to influence fortune.

From forth the fatal loins of these two foes

A pair of *star* crost lovers take their life.

Shakspeare.

A mark of reference; an asterisk.—Remarks worthy of riper observation, note with a marginal *star*. *Watts*.

STAR, a village of Scotland, in Fifeshire, containing about 200 inhabitants.

STAR OF BETHLEHEM, *s.* [*ornithogalum*, Lat.] A flower. *Miller*.

STAR ISLAND, one of the isles of Shoals, belonging to Maine, in the United States.

STARACRIM. See *LEVKOPOL*

STARAJA RUSSA, a town in the west of European Russia, in the government of Novgorod, on the river Polista, not far from the lake Ilmen. It contains 5300 inhabitants, and has a considerable trade in hemp and flax; but the most important establishment is a salt work belonging to the government, which produces yearly about 60,000 tons of salt; 34 miles south of Novgorod, and 137 south-by-east of Petersburg.

STARAPPLE, *s.* A globular or olive-shaped soft fleshy fruit, inclosing a stone of the same shape. This plant grows in the warmest parts of America, where the fruit is eaten by way of dessert. It grows to the height of thirty or forty feet. *Muller*

STARASOL, a small town of Austrian Poland; 10 miles west-by-south of Sambor, with 3500 inhabitants, and some salt works.

STARBOARD, *s.* [*ŕœopborb*, Sax.] The right hand side of the ship, as larboard is the left. *Harris*.—On shipboard the mariners will not leave their *starboard* and larboard, because some one accounts it gibrish. *Bramhall*.

STARBOTTOM, a township of England, West Riding of Yorkshire; 13 miles north-east of Settle.

STARCH, *s.* [from *stark*, Germ., *rigidus, durus, solidus*; which Stiler and Wachter deduce from *starren*, *rigere, indurare*; hence the sense of *stiff* to the word: “à *stark*, *durus, rigidus, derivatur stærken, facere ut rigeat, à quo rursus fit stærke et stærke-mæl, gluten farinaceum, quo lintea solidantur.*” *Wachter*.] A kind of viscous matter made of flower or potatoes, with which linen is stiffened, and was formerly coloured.

Has he

Dislik'd your yellow *starch*, or said your doublet
Was not exactly Frenchified.

Fletcher.

A stiff, formal manner.—This professor is to infuse into their manners that beautiful political *starch*, which may qualify them for levees, conferences, visits. *Addison*.

STARCH is extracted from wheaten flour, by washing it in water. All farinaceous seeds, and the roots of most vege-

tables, afford this substance in a greater or less degree; but it is most easily obtained from the flour of wheat, by moistening any quantity thereof with a little water, and kneading it with the hand into a tough paste: this being washed with water, by letting fall upon it a very slender stream, the water will be rendered turbid as it runs off, in consequence of the fecula or starch which it extracts from the flour, and which will subside when the water is allowed to stand at rest. The residuum of the flower, which remains after the water has extracted all the fecula, and runs off colourless, will be found to be gluten.

Sir H. Davy conceives, that this matter or coagulated mucilage, which forms the greatest part of all grains and seeds which are used in the way of food, is generally combined with gluten, oil or albuminous matter. In corn, with gluten; in pulse, such as peas and beans, with albuminous matter; and in rape seed, lint-seed, hemp-seed, and the kernels of most nuts, with oils. He found that one hundred parts of good full-grained wheat sown in the autumn, afforded seventy parts of starch and nineteen parts of gluten: that one hundred parts of wheat sown in the spring yielded seventy parts of starch and twenty-four of gluten: that the same number of parts of Barbary wheat gave seventy-four of starch and twenty-eight of gluten: and that an equal number of parts of Sicilian wheat afforded seventy-five of starch and twenty-one of gluten. He has also tried different specimens of North American wheat, all of which have contained rather more gluten than those of British growth. In general, it is said, the wheat of warm climates abounds more in gluten and insoluble parts; and is of greater specific gravity, harder, and more difficult to grind, than that of others: and that the wheat of the south of Europe, in consequence of containing a larger proportion of gluten, is peculiarly fitted for making macaroni, and preparations of flour in which a glutinous quality is considered as an excellence.

In some trials made on barley, he obtained, from one hundred parts of a full, fair, Norfolk sort, seventy-nine of starch, six of gluten, and eight of husk; the remaining seven parts consisting of sweet or saccharine matter. The sugar in barley is suggested as probably the chief cause why it is more proper for malting than any of the other sorts of grain. It is stated that Einhoff, in his minute trials on barley-meal, found in three thousand eight hundred and forty parts, three hundred and sixty of volatile matter, forty-four of albumen, two hundred of saccharine matter, one hundred and seventy of mucilage, nine of phosphate of lime, with some albumen, one hundred and thirty-five of gluten, two hundred and sixty of husk, with some gluten and starch, two thousand five hundred and eighty of starch not quite free from gluten, and seventy-eight parts of loss in the whole. And that rye afforded to the same experimenter, in the same number of parts, two thousand five hundred and twenty of meal, nine hundred and thirty of husk, and three hundred and ninety of moisture; the same quantity of meal, on being analysed, gave two thousand three hundred and forty-five of starch, one hundred and twenty-six of albumen, four hundred and twenty-six of mucilage, one hundred and twenty-six of saccharine matter, and three hundred and sixty-four of gluten not dried. The remainder husk and loss.

STARCH, *adj.* [*ŕtarp*, Sax.] Stiff; precise; rigid.—If this will not do, 'tis but misrepresenting sobriety as a *starch* and formal, and virtue as a laborious and slavish thing. *Killingbeck*.

To **STARCH**, *v. a.* To stiffen with starch.

Her goodly countenance I've seen

Set off with kerchief *starch'd* and pinners clean.

Gay.

STARCHAMBER, *s.* [*camera stellata*, Lat.] A kind of criminal court of equity. *Now abolished*.—I'll make a *starchamber* matter of it: if he were twenty Sir John Falstaffs, he shall not abuse Robert Shallow, Esq. *Shakspeare*.

STARCHED, *part. adj.* Stiffened with starch.—Who?

this

this in the *starched* beard? *B. Jonson*.—Stiff; precise; formal.—As supercilious—as a *starch't* gallant is of any thing that may disorder his dress. *Hammond*.

STARCHEDNESS, *s.* Stiffness; formality.—Chancing to smile at the Moor's deportment, as not answering the *starchedness* of his own nation. *L. Addison*.

STARCHER, *s.* One whose trade is to starch.—The tailors, *starchers*, semsters. *Marston*.

STARCHLY, *adv.* Stiffly; precisely.—In answer to all this, I might with good pretence enough talk *starchly*, and affect ignorance of what you would be at. *Swift*.

STARCHNESS, *s.* Stiffness; preciseness.

STARCROSS, a village of England, in Devonshire; $\frac{1}{2}$ mile west of Exmouth.

TO STARE, *v. n.* [*ſtarpian*, Sax.; *stara*, Icel. et Sueth. fortiter adspectare. *Serenius*.] To look with fixed eyes; to look with wonder, impudence, confidence, stupidity, or horror.

And while he *stares* around with stupid eyes,
His brows with berries and his temples dies.

Dryden.

What dost thou make a shipboard?
Art thou of Bethlem's noble college free?
Stark *staring* mad, that thou should'st tempt the sea?

Dryden.

Struggling, and wildly *staring* on the skies
With scarce recover'd sight.

Dryden.

To stand out prominent.—Take off all the *staring* straws and jags in the hive, and make them smooth. *Mortimer*.—To stand up. [*starren*, Germ., *rigere*.] *Obsolete*.—His hair *stareth*, or standeth on end. *Barret*.

TO STARE, *v. a.* To affect or influence by stares.

Why dost thou not

Try but the virtue of that Gorgon face,
To *stare* me into statue?

Dryden.

TO STARE in the face. To be undeniably evident to. Both the following and the preceding examples are among those under the neuter verb, in Dr. Johnson's dictionary; but improperly.—Is it possible for people, without scruple to offend against the law, which they carry about them in indelible characters, and that *stares* them *in the face* whilst they are breaking it? *Locke*.

STARE, *s.* Fixed look.

I'the name of something holy, sir, why stand you
In this strange *stare*?

Shakspeare.

[*ſtarp*, Sax.; *sterre*, Teut.; *sturnus*, Lat.] The starling, a bird.—He, that hath nothing but language only, may be no more praised than a popinjay, a pye, or a *stare*, when they speake fealily. *Sir T. Elyot*.

STARER, *s.* One who looks with fixed eyes.

One self-approving hour whole years outweighs
Of stupid *starers*, and of loud huzzas.

Pope.

STARETON, a hamlet of England, in the parish of Stoneleigh, Warwickshire.

STARFISH, *s.* A fish branching out into several points. See *ASTERIA*.—This has a ray of one species of English *starfish*. *Woodward*.

STARGARD, an inland town of Pomerania, situated in a pleasant and fertile district on the river Ihna, which falls, at the distance of 20 miles, into the Oder. It is surrounded with a wall, has three small suburbs, and about 8600 inhabitants. It contains, on a small scale, manufactures of woollens, soap, and tobacco; also breweries and distilleries. It exports the corn of the neighbouring country by the Ihna, which is navigable without interruption to the Oder, and thence to the Baltic. Here are several schools for education on the usual plan; also one for teaching mechanical arts, on a more scientific plan than is generally done by masters to their workmen. Stargard suffered severely from war in the 16th and 17th centuries. In 1758 it was taken by the Russians; 21 miles east-by-south of Stettin.

STARGARD, a lordship of Germany, in the grand
Vol. XXIII. No. 1539.

duchy of Mecklenburg-Strelitz, which forms a very considerable part of that principality. Its superficial extent is 6350 square miles; its population about 60,000. The chief town is Stargard or Old Stargard, a small place with 900 inhabitants; 5 miles south-south-east of New Brandenburg.

STARGARD, or **STAROGRAD**, a small town of West Prussia, on the Fers; 27 miles south of Dantzic, and 41 north of Culm. Population 2800.

STARGAZER, *s.* An astronomer, or astrologer. In contempt.—A *stargazer*, in the height of his celestial observations, stumbled into a ditch. *L'Estrange*.—A fish so called. *Chambers*.

STARHAWK, *s.* [*astur*, Lat.] A sort of hawk. *Ainsworth*.

STARITZA, a small town of the interior of European Russia, in the government of Tver, on the Wolga. It has 3400 inhabitants, who carry on some traffic with St. Petersburg, in corn and hemp; 55 miles south-west of Tver.

STARK, *adj.* [*ſtarp*, Sax.; *stark*, Germ.; *sterk*, Teut. and *sterkr*, Icel., are all used for strong, robust. The use of *stark* for *stiff* is shewn under the etymology of the substantive *starch*.] Stiff; strong; unbending; unyielding.

Many a nobleman lies *stark* and stiff
Under the hoofs of vaunting enemies.

Shakspeare.

Deep; full; still.

Consider the *stark* security

The commonwealth is in now; the whole senate
Sleepy, and dreaming no such violent blow.

B. Jonson.

Mere; simple; plain; gross.

To turn *stark* fools, and subjects fit
For sport of boys, and rabble wit.

Hudibras.

STARK, *adv.* It is used to intend or augment the signification of a word: as *stark* mad, mad in the highest degree. It is now little used but in low language.

He is *stark* mad, who ever says

That he hath been in love an hour.

Donne.

STARK, a county of the United States, in the east part of Ohio, which has Harrison and Tuscarawa counties on the south, Columbiana and Wayne counties on the east, and Portage on the north. The first settlement of this county commenced in 1806, since which time the emigration has equalled, if not surpassed, any thing ever witnessed in any part of the state. In 1815 the population was estimated at 9450.

STARKEA, in Botany, received that name from the pen of professor Willdenow, in honour of the Rev. Mr. Starke, a clergyman at Gros Tschirna, in Silesia, who has paid great attention to the cryptogamic plants of that country, and is the author of an essay on *Byssus Jolittus*, in the first volume of Sims and Konig's Annals of Botany. It is chiefly composed of the Linnæan *AMELLUS*; which see.

STARKENBACH, or **GILEMNICE**, a small town in the north-east of Bohemia; 15 miles north-by-east of Gitschin, and 59 north-east of Prague. Population 1200.

STARKENBURG, one of the three large provinces of which the grand duchy of Hesse-Darmstadt is composed. It lies between the Rhine and the Maine, the one forming the west, the other the north boundary. Its extent is about 1060 square miles; its population nearly 200,000. It forms the southern part of the grand duchy, contains the Bergstrass, one of the most picturesque parts of Germany, and in the south-east a portion of the wild forest track called the Odenwald. The mineral kingdom presents here no great variety. The vegetables consist of wheat, barley, oats, and flax; also of the fruits of the kind usual in this latitude, among which, in favourable situations, are vines. Offenbach is the only manufacturing place in the province. The chief town is Darmstadt, the capital of the whole principality; but the province takes its name from a castle situated on an eminence in the Bergstrass, near the town of Heppenheim. For religion, manners, &c., see *HESSÉ-DARMSTADT*.

STAR'KLY, *adv.* Stiffly; strongly.

As fast lock'd up in sleep as guiltless labour,
When it lies *starkly* in the traveller's bones. *Shakespeare.*

STAR'KS, a post township of the United States, in Somerset county, Maine; 200 miles north-north-east of Boston. Population 828.

STAR'KSBOROUGH, a post township of the United States, in Addison county, Vermont; 28 miles west of Montpelier. Population 726.

STAR'LESS, *adj.* Having no light of stars.

A boundless continent,
Dark, waste, and wild, under the frown of night,
Starless expos'd. *Milton.*

Cato might give them furlo's for another world;
But we, like sentries, are obliged to stand
In *starless* nights, and wait th' appointed hour. *Dryden.*

STAR-LIGHT, *s.* Lustre of the stars.

Now they never meet in grove or green,
By fountain clear or spangled *starlight* sheen. *Shakespeare.*

Nor walk by moon,
Or glittering *star-light* without thee is sweet. *Milton.*

They danced by *starlight* and the friendly moon. *Dryden.*

STAR-LIGHT, *adj.* Lighted by the stars:

Owls, that mark the setting sun, declare
A *star-light* evening and a morning fair. *Dryden.*

STAR-LIKE, *adj.* Stellated; having various points resembling a star in lustre.—Nightshade tree with a wooden stem, green-leaved, and has *star-like* flowers. *Mortimer.*—Bright; illustrious.—The having turned many to righteousness shall confer a *star-like* and immortal brightness. *Boyle.*

These reasons mov'd her *star-like* husband's heart;
But still he held his purpose to depart. *Dryden.*

STAR'LING, *s.* [ræplɪz, Sax.; *sturnus*, Lat.] A bird; a stare; which is sometimes taught to talk as the magpie. See STARE.

I will have a *starling* taught to speak
Nothing but Mortimer, and give it him,
To keep his anger still in motion. *Shakespeare.*

A defence to the piers of bridges: probably from some old root similar to that of stare.

STARODUB, a town of European Russia, in the government of Czernigov. It has 4000 inhabitants, and a trade in hemp, potash, and cattle. It has also two well frequented annual fairs; 53 miles north-north-west of Novgorod-Sieverskoe, and 110 north-north-east of Czernigov.

STAROI BUCKOW, a town in the west of European Russia, in the government of Mohilev, on the Dnieper; 17 miles south-by-west of Mohilev.

STAROI OSKOL. See OSKOL STAROI.

STAROSOL, a small town of Austrian Poland; 50 miles south-west of Lemberg.

STAROVELSK, a small town of the south of European Russia, in the government of Slobodsk-Ukraine, on the river Aidar.

STARPA'VED, *adj.* Studded with stars.—In progress through the road of heaven *starpav'd*. *Milton.*

STARPROOF, *adj.* Impervious to starlight. *Unused.*

Under the shady roof
Of branching elm *starproof*. *Milton.*

STARHEAD, *s.* Doctrine of the stars; astronomy.

Ægyptian wisards old,
Which in *starhead* were wont have best insight. *Spenser.*

STAR'RED, *adj.* Influenced by the stars with respect to fortune.

My third comfort,
Starr'd most unluckily, is from my breast
Hal'd out to murder. *Shakespeare.*

Decorated with stars.

That *starr'd* Ethiop queen, that strove
To set her beauty's praise above
The sea-nymphs. *Milton.*

STAR'RING, *adj.* [*stellans*, Lat., from *star*. Dr. Johnson.—“I doubt if there be any such word in the language as *starring*. The true word, in the passage from Crashaw given by Dr. Johnson, is *staring*; and I wonder that the sense did not convince him that *starring* could be only the mistake of the copyist. I shall leave Dr. Johnson's definition of *starring* to be fitted with an example by others, if such a word there be. And here I will give the forcible lines of Crashaw, which are a translation from the Italian of Marino:

“His eyes, the sullen dens of death and night,
“Startle the dull air with a dismal red;
“Such his fell glances as the fatal light
“Of *staring* comets, that look kingdoms dead.”

See Crashaw's Poems, edit, 1670. *Todd.*] Shining with light; blazing with sparkling light.

STAR'RY, *adj.* Decorated with stars; abounding with stars.

Daphne wond'ring mounts on high,
Above the clouds, above the *starry* sky! *Pope.*

Consisting of stars; stellar.

Heaven and earth's compacted frame,
And flowing waters, and the *starry* flame,
And both the radiant lights, one common soul
Inspires and feeds, and animates the whole. *Dryden.*

Resembling stars.—Teas had dimm'd the lustre of her *starry* eyes. *Shakespeare.*

STARSHOOT, *s.* An emission from a star.—I have seen a good quantity of that jelly, by the vulgar called a *starshoot*, as if it remained upon the extinction of a falling star. *Boyle.*

STARSTON, a parish of England, in Norfolk; 1½ mile north-north-west of Harleston. Population 418.

STARSTONE, *s.* A kind of stone, having joints resembling the form of a star.—Hereabout are found *starstones*; but I was not then advised of it. *Ray*

To START, *v. n.* [Sax. rǣþpan, to move. Scott, and Mr. H. Tooke. Our word was, anciently, *stert*.] To feel a sudden and involuntary twitch or motion of the animal frame, on apprehension of danger.—*Starting* is an apprehension of the thing feared, and in that kind it is a motion of shrinking; and likewise an inquisition, in the beginning, what the matter should be, and in that kind it is a motion of erection; and therefore, when a man would listen suddenly to any thing, he *starteth*; for the *starting* is an erection of the spirits to attend. *Bacon.*

A shape appear'd
Bending to look on me: I *started* back;
It *start'd* back. *Milton.*

To rise suddenly; commonly with *up*.—They *starting* *up* beheld the heavy sight. *Dryden.*

Might Dryden bless once more our eyes,
New Blackmores and new Milbourns must arise;
Nay, should great Homer lift his awful head,
Zoilus again would *start up* from the dead. *Pope.*

To move with sudden quickness.
She at the summons roll'd her eyes around,
And snatch'd the *starting* serpents from the ground. *Pope.*

To shrink; to winch.
With trial fire touch me his finger end;
If he be chaste, the flame will back descend,
And turn him to no pain; but if he *start*,
It is the flesh of a corrupted heart. *Shakespeare.*

To deviate.
Th' old drudging sun from his long-beaten way,
Shall at thy voice *start* and misguide the day;
The jocund orbs shall break their measur'd pace,
And stubborn poles change their allotted place. *Cowley.*

To

To set from the barrier at a race.

When from the goal they *start*,
The youthful charioteers with heaving heart
Rush to the race.

Dryden.

To set out on any pursuit.

Fair course of passion, where two lovers *start*,
And run together, heart still yoked with heart.

Waller.

To *START*, *v. a.* To alarm; to disturb suddenly; to startle.

Direness, familiar to my slaught'rous thoughts,
Cannot once *start* me. *Shakspeare.*

To make to start or fly hastily from a hiding place; to rouse by a sudden disturbance.

The blood more stirs

To rouse a lion than to *start* a hare. *Shakspeare.*

To bring into motion; to produce to view or notice; to produce unexpectedly.

Conjure with 'em!

Brutus will *start* a spirit as soon as Cæsar. *Shakspeare.*

To discover; to bring within pursuit.—The sensual men agree in pursuit of every pleasure they can *start*. *Temple.*
—To put suddenly out of place.—One, by a fall in wrestling, *started* the end of the clavicle from the sternum. *Wiseman.*

START, *s.* A motion of terror; a sudden twitch or contraction of the frame from fear or alarm.

These flaws and *starts* would well become
A woman's story at a winter's fire,
Authorized by her grandam. *Shakspeare.*

A sudden rousing to action; excitement.

How much had I to do to calm his rage!
Now fear I this will give it *start* again. *Shakspeare.*

Sally; vehement eruption; sudden effusion.

Thou art like enough, through vassal fear,
Base inclination, and the *start* of spleen,
To fight against me under Percy's pay. *Shakspeare.*

Sudden fit; intermitted action.

Methought her eyes had crost her tongue;
For she did speak in *starts* distractedly. *Shakspeare.*

A quick spring or motion; a shoot; a push.—Both cause the string to give a quicker *start*. *Bacon.*—First emission from the barrier; act of setting out.

You stand like greyhounds in the slips,
Straining upon the *start*. *Shakspeare.*

To get the *START*. To begin before another; to obtain advantage over another.—*Get the start* of the majestic world. *Shakspeare.*—She might have forsaken him, if he had not *got the start* of her. *Dryden.*

START, *s.* [ʒteopt, Sax.] A tail; hence the name of the bird *redstart*. It signifies also the long handle of any thing. It is a common northern word.

START POINT, a cape of the English Channel, on the south-east coast of the county of Devon; 9 miles south of Dartmouth. Lat. 50. 11. N. long. 3. 38. W.

STARTER, *s.* One that shrinks from his purpose.

Stand to it boldly, and take quarter,
To let thee see I am no *starter*. *Hudibras.*

One who suddenly moves a question or objection.—A dog that rouses the game.—If Sheridan was not the staunchest hound in the pack, he was at least the best *starter*. *Delany.*

STARTFORTH, or *STRATFORD*, a parish of England, North Riding of Yorkshire; 4 miles north-west of Greta Bridge.

STARTING, *s.* The act of starting.

Nor fright thy nurse

With midnight *startings*. *Donne.*

STARTING-HOLE, *s.* Evasion; loophole.—What trick,

what *starting-hole*, canst thou find out, to hide thee from this open shame. *Shakspeare.*

STARTINGLY, *adv.* By sudden fits; with frequent intermission.—Why do you speak so *startingly* and rash? *Shakspeare.*

STARTINGPOST, *s.* Barrier from which the race begins.

To *STARTLE*, *v. n.* To shrink; to move on feeling a sudden impression of alarm or terror.

The *startling* steed was seized with sudden fright,
And bounding o'er the pommel cast the knight. *Dryden.*

Why shrinks the soul

Back on herself, and *startles* at destruction? *Addison.*

To *STARTLE*, *v. a.* To fright; to shock; to impress with sudden terror, surprise, or alarm.

Such whispering wak'd her, but with *startled* eye
On Adam. *Milton.*

To deter; to make to deviate.—They would find occasions enough, upon the account of his known affections to the king's service, from which it was not possible to remove or *startle* him. *Clarendon.*

STARTLE, *s.* Sudden alarm; shock; sudden impression of terror.—After having recovered from my first *startle*, I was very well pleased at the accident. *Spectator.*

STARTUP, *s.* A kind of high shoe; a galage.

Draw close into the covert, lest the wet,
Which falls like lazy mists upon the ground,
Soak through your *startups*. *Fletcher.*

One that comes suddenly into notice.—That young *start-up* hath all the glory of my overthrow. *Shakspeare.*

STARTUP, *adj.* Suddenly come into notice. *A bad word.*—A new *start-up* sect. *Warburton.*

To *STARVE*, *v. n.* [ʒteappian, Sax. *sterven*, Dutch, to die.] To perish; to be destroyed. *Obsolete.*

To her came message of the murderment,
Wherein her guiltless friends should hopeless starve. *Fairfax.*

To perish with hunger. It has *with* or *for* before the cause; *of* less properly. Were the pains of honest industry, and of *starving* with hunger and cold, set before us, no body would doubt which to chuse. *Locke.*—An animal that *starves* of hunger, dies feverish and delirious. *Arbuthnot.*—To be killed with cold. It has *with* or *for* before the cause.

Have I seen the naked *starve* for cold,
While avarice my charity controll'd? *Sandys.*

To suffer extreme poverty.

Sometimes virtue *starves* while vice is fed:
What then? Is the reward of virtue bread? *Pope.*

To be destroyed with cold. Had the seeds of the pepper-plant been borne from Java to these northern countries, they must have *starved* for want of sun. *Woodward.*

To *STARVE*, *v. a.* To kill with hunger.

I cannot blame his cousin king,
That wish'd him on the barren mountains *starv'd*. *Shakspeare.*

To subdue by famine.

Thy desires

Are wolfish, bloody, *starv'd*, and ravenous. *Shakspeare.*

To kill with cold.

From beds of raging fire to *starve* in ice
Their soft ethereal warmth, and there to pine
Immovable, infix'd, and frozen round. *Milton.*

To deprive of force or vigour.—The powers of their minds are *starved* by disuse, and have lost that reach and strength which nature fitted them to receive. *Locke.*

STARVEGUT BAY, a bay on the south west coast of Jamaica, south of Starvegut Point.

STARVEGUT

STARVEGUT POINT, a cape on the south-west coast of Jamaica. Lat. 17. 58. N. long. 77. 45. W.

STARVELING, *s.* An animal thin and weak for want of nourishment.—If I hang, I'll make a fat pair of gallows; for old Sir John hangs with me, and he's no *starveling*. *Shakspeare.*

STARVELING, *adj.* Hungry; lean; pining.

Poor *starveling* bard, how small thy gains!

How unproportion'd to thy pains!

Swift.

STARWORT, *s.* [*aster*, Lat.] A plant; elecampane. STARYSZOW, a small town in the south of Poland; 60 miles south of Warsaw, and 9 south-west of Radom.

STASSFURT, a small town of Prussian Saxony, in the duchy of Magdeburgh. Population 1600. It has an extensive salt work; 20 miles south of Magdeburgh.

STASZOW, a small town in the south of Poland, on the river Esama; 28 miles west of Sandomir, and 25 north-east of Cracow. Population 1600.

STATARY, *adj.* [from *status*, Lat.] Fixed; settled. The set and *statary* times of paring of nails, and cutting of hair, is but the continuation of ancient superstition. *Brown.*

STATE, *s.* [*status*, Lat.] Condition; circumstances of nature or fortune.

I do not, brother,

Infer as if I thought my sister's *state*

Secure.

Milton.

Modification of any thing.—Keep the *state* of the question in your eye. *Boyle.*—Stationary point; crisis; height; point from which the next movement is regression.—Tumours have their several degrees and times; as beginning, augment, *state*, and declination. *Wiseman.*—[*Estat*, Fr.] Estate; signiory; possession.

Strong was their plot,

Their *states* far off, and they of wary wit.

Daniel.

Mode of government.—No *state* can be named wherein any part of the body of those imperial laws hath the just force of a law, otherwise than as custom hath particularly induced it. *Selden.*—The community; the public; the commonwealth.

If any thing more than your sport
Did move your greatness, and this noble *state*
To call on him, he hopes it is no other
But for your health sake.

Shakspeare.

Hence *single state* in Shakspeare for individuality.

My thought, whose murder is but fantastical,
Shakes so my *single state* of man, that function
Is smother'd in surmise.

Shakspeare.

Civil power; not ecclesiastical.—The same criminal may be absolved by the church, and condemned by the *state*; absolved or pardoned by the *state*, yet censured by the church. *Leslie.*—A republic; a government not monarchial.

Well monarchies may own religion's name,
But *states* are atheists in their very fame.

Dryden.

Rank; condition; quality.

Fair dame, I am not to you known,
Though in your *state* of honour I am perfect.

Shakspeare.

Solemn pomp; appearance of greatness. [*Stact*, Su. Goth., *pompa*; *stact*, Icel., *jactantia*, *staeta*, *superbis gressibus incedere*. *Serenius.*]

There kings receiv'd the marks of sov'reign pow'r:
In *state* the monarchs march'd, the lictors bore
The awful axes and the rods before.

Dryden.

Dignity; grandeur.

He was staid, and in his gait
Preserv'd a grave majestic *state*.

Butler.

A seat of dignity.—This chair shall be my *state*, this dagger my sceptre, and this cushion my crown. *Shakspeare.*
—A canopy; a covering of dignity.

His high throne—under *state*
Of richest texture spread, at th' upper end
Was plac'd.

Milton.

A person of high rank. *Obsolete.* See STATES.—The archbishop of Grenada saying to the archbishop of Toledo, that he much marvelled, he, being so great a *state*, would visit hospitals. *Wits, Fitts and Fancies.*—The principal persons in the government.

The bold design
Pleas'd highly those infernal *states*.

Milton.

Joined with another word it signifies public.
Council! What's that? a pack of bearded slaves,
The scavengers that sweep *state* nuisances,
And are themselves the greatest.

Dryden.

To STATE, *v. a.* [*constater*, Fr.] To settle; to regulate.—He is capable of corruption, who receives more than what is the *stated* and unquestioned fee of his office. *Addison.*—To *state* it fairly, imitation is the most advantageous way for a translator to shew himself, but the greatest wrong which can be done to the memory of the dead. *Dryden.*

STATEDLY, *adv.* Regularly; not occasionally.—Why should not the body assume *statedly* the air of a thing, to which it is so often obliged to suit itself? *Philosoph. Lett. on Physiognom.*

STATELINESS, *s.* Grandeur; majestic appearance; august manner; dignity.—For *stateliness* and majesty what is comparable to a horse? *Morc.*—Appearance of pride; affected dignity.

She hated *stateliness*: but wisely knew
What just regard was to her title due.

Betterton.

STATELY, *adj.* [*statelig*, Su. Goth. *Serenius.*]—August; grand; lofty; elevated; majestic; magnificent.

A *statelier* pyramid to her I'll rear,
That Rhodope's or Memphis' ever was.

Shakspeare.

Elevated in mien or sentiment.—He maintains majesty in the midst of plainness, and is *stately* without ambition, which is the vice of Lucan. *Dryden.*

STATELY, *adv.* Majestically.—Ye that *stately* tread,
or lowly creep. *Milton.*

STATEMENT, *s.* The arrangement of a series of facts or circumstances. *Malone.*—The facts or circumstances so arranged; the thing stated. *Suppl. to Ash and Malone.*

STATEMONGER, *s.* One who is versed in the arts of government: perhaps in contempt for an over-busy politician.—I would therefore see the most subtle *statemonger* in the world chalk out a way for his majestic to mediate. *Ld. Keeper Williams.*

STATEN ISLAND, an island on the United States, which belongs to New York, and forms Richmond county. It is about 18 miles in length, and, where widest, 8 in breadth. On the south side is a considerable track of level, good land, but the island in general is rough, and the hills high. Population 5347.

STATEN LAND. See NEW ZEALAND.

STATE OF THE CHURCH, or ECCLESIASTICAL STATE. See POPE.

STATER, an ancient silver coin, weighing four Attic drachms, and worth about three shillings or three shillings and a penny sterling.

STATEROOM, *s.* A magnificent room in a palace or great house.

STATES, *s. pl.* Nobility. *Dr. Johnson.*—The other sceptre-bearing *states* arose. *Chapman.*

Kings, queens and *states*,
Maids, matrons.

Shakspeare.

STATESBURG, a post township and capital of the United States, in Claremont district, South Carolina, east of the Waterec.

STATES-GENERAL, the name of an assembly, consisting,

sisting, under the former government, of the deputies of the Seven United Provinces.

In this assembly, the deputies of each province, of what number soever they were, had only one voice and were esteemed as but one person, the votes being given by provinces. Each province presided at the assembly in its turn, according to the order settled among them: Guelderland presided first, then Holland, &c.

This assembly was the representative of the sovereignty of the Union, which resided properly in the general assembly of the states themselves of all the several provinces; but as that assembly ordinarily consisted of seven or eight hundred persons, it was resolved, after the departure of the earl of Leicester, in order to avoid expence, and the confusion of so numerous a body, that the provincial estates should for the future be ordinarily represented by their deputies, under the name of the States-general; who were always to reside at the Hague, and who alone were called States-general.

STATES-GENERAL OF FRANCE, assemblies which were first called A. D. 1302, and were held occasionally from that period to the year 1614, when they were discontinued, till they were summoned again at an interesting period, viz. in the year 1789. These States-general, however, were very different from the ancient assemblies of the French nation under the kings of the first and second race. The old States-general had only the privilege of advising and remonstrating; the legislative authority resided in the king alone.

STATESMAN, *s.* A politician; one versed in the arts of government.

It looks grave enough
To seem a statesman.

B. Jonson.

One employed in public affairs.—Is it a weakness which attends high and low; the *statesman* who holds the helm, as well as the peasant who holds the plough. *South.*—One who occupies his own estate; a small landholder. Used formerly in several parts of England, especially in the northern.

STATESVILLE, a post township and capital of the United States, in Iredell county, North Carolina, 24 miles west-south-west of Salisbury. It contains a court-house, jail, an academy, a church, and about 50 houses.

STATSWOMAN, *s.* A woman who meddles with public affairs; in contempt.—Several objects may innocently be ridiculed, as the passions of our *stateswomen*. *Addison.*

STAFFOLD, a parish of England, in Staffordshire; 2½ miles north-east of Tamworth.

STATHENI, a people of India, in the number of those who were subjugated by Alexander.

STATHEUSIS [formed of *σθεωω*, *I heat*], a word used by the old writers to express the torrefaction or roasting of some medicines before a slow fire, as is done frequently at present with rhubarb, &c.

STATIC, or STATICAL, *adj.* Relating to the science of weighing, chiefly the body.—If one by a *statical* engine could regulate his insensible perspiration, he might, often, by restoring of that, foresee, prevent, or shorten a fit of the gout. *Arbutnot.*

STATICE [of Pliny, *Στατική* from *στήμι*, *statuo*; perhaps from its uprightness], in Botany, a genus of the class pentandria, order pentagynia, natural order of aggregatae plumbagines (*Juss.*)—Generic Character. Calyx: perianth common, of a different structure in the species. Perianth proper, one-leafed, funnel-form: tube narrowed: border entire, plaited, scariose. Corolla funnel-form. Petals five, united at the base, narrowed below, above wider, obtuse, spreading. Stamina: filaments five, awl-shaped, shorter than the corolla, inserted into the corolla by their claws. Anthers incumbent. Pistil: germ very minute. Styles five, filiform, distant. Stigmas acute. Pericarp: capsule oblong, somewhat cylindrical, membranaceous, five-cusped, one-celled, valveless.—Proper calyx contracted at the neck, expanded in the border, cherishing the capsule when the corolla withers. Seed single, oblong, hanging from a long cord.—*Essential Character.* Calyx

one-petalled, entire, plaited, scariose. Petals five. Seed one, superior.

1. *Statice armeria.* Thrift, or sea gilliflower.—Scape simple, headed; leaves linear, flat, obtuse. Common thrift has a perennial woody root, bearing many thick tufts of lax, linear, channelled, smooth, entire leaves.—Native of Europe and North America. This has two or three varieties.

2. *Statice juniperifolia*, or juniper-leaved thrift.—Scape simple headed; leaves linear, three-sided, rigid, pungent. Tufted, smooth.—Native of Spain and Portugal.

3. *Statice alliacea.*—Scape simple headed; leaves linear-lanceolate, acute.—Native of Spain on the mountains of Enguera, and at the foot of the mountain Montduber and Grospeña.

4. *Statice cephalotes*, or large simple-stalked thrift.—Scape simple headed; leaves oblong, flat, acuminate, attenuated at the base.—It is a native of Algarbia, in Portugal: also of Spain, about Cadiz, &c. Desfontaines found it in sands near La Calle, in Barbary.

5. *Statice graminifolia*, or grass-leaved thrift.—Scape panicled; branches three-sided; leaves linear, channelled.

6. *Statice limonium.* Sea thrift, or sea lavender.—Scape panicled, round; leaves oblong, obtuse, smooth, nerveless; with a sharp point under the tip, waved at the edge. Sea lavender, as it is commonly called, though it has scarcely any resemblance to lavender, and none of its aromatic quality, has a strong, perennial, woody root. This plant varies much as to luxuriance, being sometimes found with leaves scarcely an inch long, and not more than six or eight flowers in a panicle, and at other times much larger, with the flowers far more abundant. The bright blue colour distinguishes it at a distance, and that colour is tolerably permanent. Though less magnificent than some of the foreign species, it is a beautiful plant. The leaves are obovate-lanceolate, and quite entire. The scape is alternately branched, with the branchlets corymbed. Capsule covered by the calyx and corolla, oblong, roundish, membranaceous, five-cusped at the top. Seed smooth, somewhat of a rust colour.—There are two varieties of this common in England, and one found in France.

7. *Statice Gmelini.*—Scape panicled, angular; leaves oblong-ovate, emarginate, flat, cartilage-edged, mucronate beneath.—Native of Siberia, in salt places from the Jaick to Angara.

8. *Statice scoparia.*—Scape panicled, round; leaves oblong-ovate, coriaceous, mucronate, dotted beneath.—Native of Siberia.

9. *Statice latifolia*, or broad-leaved sea lavender.—Scape panicled, very much branched, rugged; leaves pubescent, with hairs in stellated bundles.—Found in Russian Tartary.

10. *Statice oleæfolia*, or olive-leaved sea lavender.—Scape panicled; branches angular-winged; leaves lanceolate, mucronate-cusped, cartilaginous at the edge. Root perennial, woody.—It grows naturally in Narbonne and Provence, Italy and Spain.

11. *Statice incana*, or hoary sea lavender.—Scape panicled; leaves lanceolate, three-nerved, somewhat waved, mucronate at the tip; branches of the panicle three-sided.—Native of Egypt and Siberia.

12. *Statice auriculæfolia*, or auricula leaved sea lavender.—Scape simple, round; spikes lateral and terminating, directed one way; leaves spatulate, acute.—Native of the coast of Barbary.

13. *Statice cordata*, or heart-leaved sea lavender.—Scape panicled; leaves spatulate, retuse.—It grows naturally near the sea, about Marseilles, Leghorn, the maritime rocks of Piedmont, Spain, &c., and in Barbary.

14. *Statice scabra*, or rough-branched sea lavender.—Leaves radical, obovate, oblong, obtuse; branches rugged.—Native of the Cape of Good Hope.

15. *Statice tetragona*, or square-stalked sea lavender.—Scape panicled, four-cornered; leaves obovate.—Native of the Cape of Good Hope.

16. *Statice reticulata*, or matted sea lavender.—Scape panicled, prostrate, flexuose; lower branches barren; leaves

wedge-

wedge shaped, awnless.—Native of the South of France and Malta. Wheeler observed it in Greece.

17. *Statice echioides*, or rough-leaved sea lavender.—Scape panicled, round, jointed; leaves rugged.—Native of the South of Europe, and in Barbary, near Mascar, in the clefts of rocks.

18. *Statice speciosa*, or plaitain-leaved sea lavender.—Scape branched, round; branches ancipital, winged; flowers imbricate; leaves obovate-cusped, mucronate, cartilaginous at the edge.—Native of Russia.

19. *Statice Tatarica*, or Tartarian sea lavender.—Scape branched, divaricating; branches three-sided; flowers distant; leaves lanceolate-obovate, mucronate.—Native of Russia.

20. *Statice echinus*.—Scape panicled; leaves subulate, mucronate.—Native of Greece, and the deserts of Media.—The remaining species of this section are *Statice flexuosa*, *purpurata*, *longifolia*, *minuta*, *pectinata*, *suffruticosa*, *monopetala*, *axillaris*, *cylindrifolia*, *linifolia*, *aurea*, *ferulacea-pruinosa*, *sinuata*, *lobata*, *spicata*, *mucronata*, *globularia*, and *spathulata*.

Propagation and Culture.—Thrift may be propagated by parting the roots in autumn, that the plants may take good root before frost comes on, and that they may flower stronger if they were planted in the spring. The common sea lavender, and most of the other sorts are abiding plants, and will thrive in the open air.

STATICS, *s.* [*στατική*, Gr.; *statique*, Fr.] The science which considers the weight of bodies.—This is a catholic rule of *statics*, that if any body be bulk for bulk heavier than a fluid, it will sink the bottom; and if lighter it will float upon it, having part extant, and part immersed, as that so much of the fluid as is equal in bulk to the immersed part be equal in gravity to the whole. *Bentley*.

Those who define mechanics the science of motion, make statics a subordinate part of it; viz. that part which considers the motion of bodies arising from gravity.

Others make them two distinct doctrines, restraining mechanics to the doctrine of motion and weight, in reference to the structure and power of machines; and statics to the doctrine of motion, considered merely as arising from the weight of bodies, without any immediate respect to machines. On which footing, statics should be the doctrine or theory of motion; and mechanics, the application of it to machines.

STATION, *s.* [*statio*, Lat.] The act of standing.

In *station* like the herald, Mercury,
New-lighted on a heaven-kissing hill. *Shakspeare*.

A state of rest.—All progression is performed by drawing on or impelling forward some part which was before in *station* or at quiet, where there are no joints. *Brown*.—A place where any one is placed.—The planets in their *station* listening stood. *Milton*.—Post assigned; office.—Michael in either hand leads them out of Paradise, the fiery serpent waving behind them, and the cherubims taking their *stations* to guard the place. *Milton*.—Situation; position.

The fig and date, why love they to remain
In middle *station* and an even plain;
While in the lower marsh the gourd is found,
And while the hill with olive-shade is crown'd? *Prior*.

Employment; office.—Whether those who are leaders of a party arrive at that *station* more by a sort of instinct, or influence of the stars, than by the possession of any great abilities, may be a point of much dispute. *Swift*.—Character; state.—Far the greater part have kept their *station*. *Milton*.—Rank; condition of life.—I can be contented with an humbler *station* in the temple of virtue, than to be set on the pinnacle. *Dryden*.

To **STATION**, *v. a.* To place in a certain post, rank, or place.—He gained the brow of the hill, where the English phalanx was *stationed*. *Lyttleton*.

STATIONARII, were men, thus called in the middle ages, who trafficked in books, made large fortunes by lending them out to be read, at exorbitant prices, not in volumes, but in detached parts, according to the estimation in which the author was held.

STATIONARY, *adj.* [*stationnaire*, Fr. *Cotgrave* Fixed; not progressive.—Mine own businesses are rather *stationary* than retrograde. *Wotton*.

STATIONER, *s.* A bookseller. [“The term *stationers* was appropriated to *booksellers* in the year 1662.—The company of *stationers* existed long before the invention of printing. A *stationer*, therefore, was a dealer who kept a *shop* or *stall*, as distinguished from an itinerant vender, whether of books or broomsticks.” *Pegge*.] Some modern tragedies are beautiful on the stage, and yet Tryphon the *stationer*, complains they are seldom asked for in his shop. *Dryden*.—A seller of paper, pens, ink, &c.

STATIONERY, *s.* The wares of a stationer—paper, pens, ink.

STATISM, *s.* Policy; the arts of government.—Hence it is, that the enemies of God take occasion to blaspheme, and call our religion *statism*. *South*.

STATIST, *s.* A statesman; a politician; one skilled in government.

I do believe,
Statist though I am none, nor like to be,
That this shall prove a war. *Shakspeare*.

STATISTIC, or **STATISTICAL**, *adj.* Political. [This word, as well as the substantive, is of very recent date in our language. *Todd*.]

STATISTICS, *s.* This word implies commonly that part of political science that regards the population, buildings, agricultural and manufactured productions, revenue, &c. Neither the derivation of the word, the meanings of its collaterals (of *statist* especially), nor the wants of our language, which has no word comprehending the whole of political science, warrant this restriction.

STATIUS (Publius Papinus), an eminent Roman poet, was born at Naples, in which city his father was settled as a teacher of oratory, and was in great reputation both for his lectures and poetry, in which he gained several prizes. Statius was born probably about the year A. D. 61. He early displayed a lively disposition and good talents, and soon became a votary of the muses with so much success, that during his father's life he obtained the crown in the poetical contests of his native place. He was thrice a victor in the poetical games celebrated at Alba. The poems which he addressed to several of the principal persons in Rome, are proofs of the friendships which he contracted with men of rank in that city; and a piece, which he recited in the quinquennial games instituted by Nero, and renewed by Domitian, procured for him a golden crown from that emperor, and the honour of admission to his table. He was vanquished at a contest in the Roman games, on which occasion he recited a part of his principal work, the *Thebaid*. According to Juvenal, he was heard with delight by a crowd of auditors in other public recitations of this poem: the satirist at the same time intimating, that notwithstanding this applause, the author might have starved, had he not sold his “*Agave*,” apparently a new composition, to a celebrated actor, a favourite of Domitian. He possessed a small estate and country house near the site of the ancient Alba, and lived in a decent state of mediocrity. Having no children of his own, he adopted a son, whose death he tenderly laments in one of his miscellaneous poems. The time of his own death is not known, but it is thought to have been about the year 96, when he was only 35 years of age. He is not even mentioned by any contemporary poet, except Juvenal. Martial, who celebrates many other poets, takes not the least notice of him. The existing works of Statius consist of the “*Sylvæ*,” or miscellaneous pieces, in five books; the “*Thebaid*,” an epic poem, in twelve books; and two books of an unfinished poem, entitled “*Achilles*.” “They all, says his biographer, display a considerable share of genius and real talent, but are vitiated by the false taste which then began to infest Latin poetry, and gave a turn to turgid and unnatural thoughts and expressions. Several pieces in the ‘*Sylvæ*’ are, however, pleasing and elegant. His principal work, the ‘*Thebaid*,’ holds no mean rank among epic poems, and once it

was a great favourite among the remains of antiquity. For this preference it was indebted to its swelling sentiments, verging to bombast, and to the savage and sanguinary character of its incidents, which suited the times of chivalrous turbulence. But with these faults it exhibits strokes of the real sublime, and considerable force and novelty in natural description, especially in the similies." The best editions are those of Caspar Barthius, 4to. 1664; of Veenhuysen, Lug. Bat. 8vo. 1671; and the Delphin, 2 vols. 4to. 1685. Markland's edition of the "Sylvæ" is highly esteemed.

STATUARY, s. [*statuaire*, Fr.; from *statua*, Lat.] The art of carving images or representations of life.—Painting and the *statuary*-art, cousin Germans to poetry. *Hake-will*.—The northern nations, that overwhelmed it by their numbers, were too barbarous to preserve the remains of learning more carefully than they did those of architecture and *statuary*. *Temple*.—One that practises or professes the art of making statues.

As the *statuary*,

That, by the large size of Alcides' foot,
Guess'd at his whole proportion.

Beaum. and Fl.

On other occasions the *statuaries* took their subjects from the poets. *Addison*.—How shall any man, who hath a genius for history, undertake such a work with spirit and cheerfulness, when he considers that he will be read with pleasure but a very few years? This is like employing an excellent *statuary* to work upon mouldering stone. *Swift*.

STATUE, s. [*statue*, Fr.; *statua*, Lat.] The Latin form was anciently followed by our writers; and continued to be in use, till late in the seventeenth century. "Let there be a fountain, or some fair work of *statuas*, in the midst of this court." *Bacon*.] An image; a solid representation of any living being.—Architects propounded unto Alexander to cut the mountain Athos into the form of a *statue*, which in his right hand should hold a town capable of containing ten thousand men, and in his left a vessel to receive all the water that flowed from the mountain. *Wilkins*.

To STATUE, v. a. To place as a statue; to form as a statue. *Unused*.

Thou shalt be worshipp'd, kiss'd, lov'd and ador'd;
And were there senses in his idolatry,
My substance should be *statued* in thy stead. *Shakspeare*.

To STATUMINATE, v. a. [*statumino*, Lat.] To support; to underprop. *Not in use*.—I will *statuminate* and underprop thee. *B. Jonson*.

STATURE, s. [*stature*, Fr.; *statura*, Lat.] The height of any animal.—What *stature* we attain at seven years we sometimes double, most times come short of at one-and-twenty. *Bacon*.

STATURED, adj. Arrived at full stature.

How doth the giant honour seeme
Well *statur'd* in my fond esteeme! *Hall*.

STATUTABLE, adj. According to statute.—I met with one who was three inches above five feet, the *statutable* measure of that club. *Addison*.

STATUTABLY, adv. In a manner agreeable to law.—Holder was *statutably* established in this place by Dr. Fell. *Warton*.

STATUTE, s. [*statutum*, Lat.] A law; an edict of the legislature.—Not only the common law, but also the *statutes* and acts of parliament, were specially intended for its benefit. *Spenser*.

STATUTORY, adj. Enacted by statute.—In the formulary and *statutory* part of law a plodding blockhead may excel; but in the ingenious and rational part of it, a plodding blockhead can never excel. *Johnson*.

STAVANGER, s. An old town in the south of Norway, on the coast. It was formerly a bishop's see, but, on the town being burnt down in 1686, the bishopric was removed to Christiansand. The cathedral, however, remains, and is the finest in Norway. The town contains 2500 inhabi-

tants, and has a small harbour and good fisheries; 85 miles north-west of Christiansand. Lat. 58. 58. 20. N. long. 5. 56. 45. E.

STAUBBACH, s. a celebrated cataract in the Swiss canton of Bern, near the village of Lauterbrunn. The quantity of water is small, but the descent is almost unexampled, the water falling from a height of 1400 feet.

To STAVE, v. a. [from *staff*.] To break in pieces: used originally of barrels made of small parts or staves.—If an irreverent expression, or a thought too wanton, are crept into my verses, let them be *stav'd* or forfeited like contrabanded goods. *Dryden*.—To push away as with a staff: with *off*.—How can they escape the contagion of the writings, whom the virulence of the calumnies have not *staved off* from reading. *B. Jonson*.—To pour out by breaking the cask.—The feared disorders that might ensue thereof have been an occasion that divers times all the wine in the city hath been *staved*. *Sandys*.—To furnish with rundles or staves.—This was the shameful end of Aloysius Gritus, Solyman's deputy in Hungary; who climbing too fast up the evil-*staved* ladder of ambition, suddenly fell, and never rose more. *Knolles*.

To STAVE, v. n. To fight with staves.

Equal shame and envy stirr'd
I' the enemy, that one should be heard
So many warriours, and so stout,
As he had done, and *stav'd* it out. *Hudibras*.

To STAVE and Tail, v. n. To part dogs, by interposing a staff, and by pulling the tale. The conquering foe they soon assail'd,
First Trulla *stav'd*, and Cerdon *tail'd*,
Until their mastiffs loos'd their hold. *Hudibras*.

STAVE, s. A metrical portion; a staff. It is a common term for the verse of one of the psalms appointed to be sung.

STAVELE, s. a small town of the Netherlands, in the province of West Flanders, with 1000 inhabitants; 10 miles west-north-west of Ypres.

STAVELY, s. a parish of England, West Riding of Yorkshire; 3 miles south-west of Boroughbridge.

STAVELY, s. a parish of England, in Derbyshire; 4½ miles north-east of Chesterfield. Population 1793.

STAVELEY, s. a hamlet of England, in Lancashire; 9 miles north-east of Ulverston.

STAVELEY, NETHER, s. a hamlet of England, in Westmoreland; 5 miles north-west-by-north of Kendal.

STAVELEY OVER, s. a hamlet in the above county, half a mile distant from the foregoing.

STAVELOT, s. See **STABLO**.

STAVENISSE, s. a village of the Netherlands, in the province of Zealand, with 700 inhabitants; 13 miles west-north-west of Bergen-op-Zoom.

STAVEREN, s. a small town of the Netherlands, in the province of Friesland, on the Zuyderzee, opposite to Enkhuisen. It is a very ancient place, having been once the residence of the kings of Friesland, and at a later period one of the Hanse towns. Its harbour was large and commodious but repeated inundations of the sea have choaked it up, reducing its trade to insignificance, and its population to 1100; 14 miles north-north-east of Endhuysen. Lat. 52. 54. N. long. 5. 13. E.

STAVERN, s. a small town of the south of Norway, with a fortress and harbour, which serves as a port to the town of Laurwig, and as a station for galleys and small ships of war.

STAVERTON, s. a parish of England, in Devonshire; 3 miles north-by-west of Totnes. Population 1001.

STAVERTON, s. a parish of England, in Gloucestershire; 4½ miles north-east of Gloucester.

STAVERTON, s. a parish of England, in Northamptonshire; 2 miles west-south-west of Daventry. Population 448

STAVES, s. The plural of *staff*.

All in strange manner arm'd,
Some rustick knives, some *staves* in fire warm'd. *Spenser*.

STAVESACRE, s.

STA'VESACRE, *s.* Larkspur. A plant. See DELPHINIUM.

STAUFEN, a small town in the south-west of Germruy, in Baden, and the Brisgan; 24 miles north of Bale, and 9 south-south-west of Freyburg. It has 1500 inhabitants, and in the neighbourhood a lead and silver mine.

STAUFENBERG, a small town of the west of Germany, in Hesse-Darmstadt, on the Lahn: 5 miles north-north-east of Giessen, and 10 east-north-east of Wetzlar.

STAUGHTON, GREAT, a parish of England, in Bedfordshire; 10½ miles north-north-east of Bedford.

STAUGHTON, LITTLE, a parish of England, in Huntingdonshire; 3 miles south-east of Kimbolton. Population 960.

STAVIGRAD, a small town of the Austrian states, in Military Croatia, on the coast of the Adriatic; 55 miles south-south-east of Fiume.

STAVLOS. See STAGIRA.

STAUNCH. See STANCH.

STAUNTON, a hamlet of England, in Northamptonshire; 10 miles south-west of Daventry.

STAUNTON, a post town of the United States, and capital of Augusta county, Virginia. It is delightfully situated in a healthy part of the country, regularly laid out, and contains 2 court-houses, a jail, an academy, 3 churches, and had in 1818, about 1500 inhabitants. About 12 miles north-west of the town there is a sulphur spring, which was discovered in 1815, and is now much visited; 40 miles west-north-west of Charlottesville, and 120 west-north-west of Richmond.

STAUNTON, a post township of the United States, in Miami county, Ohio, on the Miami; 1 mile east of Troy.

STAUNTON, a principal branch of the Roanoke, Virginia, in the United States. It rises on the west side of the Blue Ridge, and there has the name of Roanoke; but after its passage through the Blue Ridge, it takes the name of Staunton, which it retains to its junction with the Dan, on the west border of Mecklenburg county. After the junction, it resumes the name of Roanoke. It might be made navigable at a small expence, 100 miles above the junction.

STAUNTON HARROLD, a township of England, in Leicestershire; 3½ miles north-north-east of Ashby-de-la-Zouch

STAUNTON WYVIL, a parish of England, in Leicestershire; 5 miles north-by-east of Market Harborough.

STAUNTON IN THE VALE, a parish of England, in Nottinghamshire; 6½ miles south of Newark.

STAUNTON WHITE, a parish of England, in Somersetshire; 4 miles from Chard.

STAVRES HOVED, a cape of Denmark, on the east coast of the island of Fyen. Lat. 55. 29. N. long. 10. 46. E.

STAURO KORAKI (signifying the Raven Cross), a mountain of Greece, in Attica, near the plain of Marathon.

STAUROPHORI [Σταυροφοροι, Gr., compounded of σταυρος, *a cross*, and φερω, *I carry*], in Church History, certain ecclesiastics, whose business it was to carry the cross in processions.

STAUROPHYLAX [Σταυροφυλαξ, Gr., derived from σταυρος, *a cross*, and φυλασσω, *I keep*], a dignified officer in the church of Constantinople, to whose care the keeping of the cross, founded by St. Helena, was committed.

STAVROPOL, a small town of the south-east of European Russia, on a branch of the Wolga, in the government of Simbirsk. It contains 2400 inhabitants, has a fort, and is agreeably situated in the midst of eminences covered with wood. The environs are inhabited by Calmucks, who, to the number of about 14,000, have been converted to Christianity, and have here their own court of justice and a school.

STAWELL, a parish of England, in Somersetshire; 4 miles east-by-north of Bridgewater.

STAWICZYN, a small town of the west of Poland; 11 miles north of Kalisch. Population 1000.

STAWISZKEN, a small town in the north of Poland;

92 miles north-north-east of Warsaw, and 15 north of Lomza. Population 1250.

STAWLEY, a parish of England, in Somersetshire; 5 miles west-by-north of Wellington.

STAXIGOE, a small village of Scotland, in Caithness. It has a harbour near the town of Wick.

STAXIS, a word used by the ancient physicians to express a distillation of the blood in drops from the nose.

STAXTON, a hamlet of England, East Riding of Yorkshire; 6½ miles south-south-west of Scarborough.

To STAY, *v. n.* [*staa*, Su. Goth.; *staen*, Dutch.] To continue in a place; to forbear departure.—*Stay*, I command you, *stay* and hear me first. *Dryden*.—Nor must he *stay* at home, because he must be *stay* again by one-and-twenty. *Locke*.—To continue in a state.

The flames augment and *stay*
At their full height, then languish to decay. *Dryden*.

To wait; to attend; to forbear to act.

I'll tell thee my whole device
When I am in my coach, which *stays* for us. *Shakspeare*.

Would ye tarry for them till they were grown? would ye *stay* for them from having husbands? *Ruth*.—To stop; to stand still.

When she list, pour out her larger spright,
She would command the hasty sun to *stay*,
Or backward turn his course. *Spenser*.

To dwell; to be long.

Nor will I *stay*
On Amphig, or what deaths he dealt that day. *Dryden*.

To rest confidently: with *upon*.—They call themselves of the holy city, and *stay* themselves *upon* God. *Isa*.—To wait; to give ceremonious or submissive attendance: with *upon*.—Worthy Macbeth, we *stay upon* your leisure. *Shakspeare*.

To STAY, *v. a.* To stop; to withhold; to repress.—The Syrens sang to allure them into danger; but Orpheus sang so well that he *staid* them. *Raleigh*.—He took nothing but a bit of bread to *stay* his stomach. *Locke*.

To *stay* these sudden gusts of passion,
That hurry you from reason, rest assur'd
The secret of your love-lies with me only. *Rowe*.

To delay; to obstruct; to hinder from progression.

The joyous time will not be *stay'd*
Unless she do him by the forelock take. *Spenser*.

I was willing to *stay* my reader on an argument that appears to me new. *Locke*.—To keep from departure.—The people—*stayed* him that he should not depart from them. *St. Luke*.

If as a prisoner I were here, you might
Have then insisted on a conqueror's right,
And *stay'd* me here. *Dryden*.

To wait for; to stay for.—[*Estayer*, Fr.] To prop; to support; to hold up.—On this determination, we might *stay* ourselves without further proceeding herein. *Hooker*.—Aaron and Hurr *stayed* up his hands, the one on the one side and the other on the other. *Exod*.

STAY, *s.* [*estaye*, Fr.] Continuance in a place; forbearance of departure.

Determine,

Or for her *stay* or going; the affair cries haste. *Shakspeare*.

Should judges make a longer *stay* in a place than usually they do, a day in a county would be a very good addition. *Bacon*.

So long a *stay* will make
The jealous king suspect we have been plotting. *Denham*.

Stand; cessation of progression.—Bones, after full growth, continue at a *stay*; teeth stand at a *stay*, except their wearing. *Bacon*.—Affairs of state seem'd rather to stand at a *stay*, than to advance or decline. *Hayward*.—A stop; an obstruction; a hindrance from progress.

His fell heart thought long that little way,
Griev'd with each step, tormented with each *stay*. *Fairfax*.

Restraint; prudence; caution; discreet steadiness; sobriety of judgment.

For her son

In her own hand the crown she kept in store,
Till riper years he raught, and stronger *stay*. *Spenser*.

Many just and temperate provisos, well showed and foretokened the wisdom, *stay* and moderation of the king. *Bacon*.—A fixed state.

Who have before, or shall write after thee,
Their works though toughly laboured will be
Like infancy or age to man's firm *stay*,
Or early and late twilights to mid-day. *Donne*.

A prop; a support.—Obedience of creatures unto the law of nature is the *stay* of the whole world. *Hooker*.

What surety of the world, what hope, what *stay*,
When this was once a king, and now is clay. *Shakespeare*.

Tackling that fixes and supports the masts.
With *stays* and cordage last he rigg'd a ship,
And, roll'd on levers, launch'd her in the deep. *Pope*.

Steadiness of conduct.

STAYED, *part. adj.* Fixed; settled; serious; not volatile.—Whatsoever is above these proceedeth of shortness of memory or of want of a *stayed* and equal attention. *Bacon*.
STAYEDLY, *adv.* Composedly; gravely; prudently; soberly; calmly; judiciously.

STAYEDNESS, *s.* Solidity; weight.—When substantialness combineth with delightfulness, and currentness with *stayedness*, how can the language sound other than most full of sweetness? *Camden*.—Composure; prudence; gravity; judiciousness.—Jesting—is a thing much unbecoming the *stayedness* of a christian. *Whately*.

STAYER, *s.* One who stops, holds or supports.

May Jove, the guardian of the capitol,
He, the great *stayer* of our troops in rout,
Fulfil your hopes, and animate the cohorts. *A. Philips*.

STAYLACE, *s.* A lace with which women fasten their boddices.—A *staylace* from England should become a topic for censure at visits. *Swift*.

STAYLESS, *adj.* Without stop or delay.

They fled the field

With *stainless* steppes, each one his life to shield.

Mir. for. Mag.

STAYLEY BRIDGE, a parish of England, in Cheshire, situated on the river Teame, over which there is an excellent stone bridge; 8 miles north-east of Stockport. Population 1104.

STAYMAKER, *s.* One that follows the trade of making stays. *Mason*.—Our ladies choose to be shaped by the *staymaker*. *Spence*.

STAYS, *s. pl.* Without singular: bodice; a kind of stiff waistcoat made of whalebone, worn by women.—No stubborn *stays* her yielding shape embrace. *Gay*.—Ropes in a ship to keep the mast from falling aft.—All masts, topmasts and flagstaves, have *stays*, except the spritsail topmast: the mainmast, foremast, with the masts belonging to them, have also back *stays*, which help to keep the mast from pitching forward or overboard. *Harris*.—[*stade*, Sax.] Station; fixed anchorage.—They were come upon the *stays*, when one of the sailors descried a galle. *Sidney*.

Our ships lay anchor'd close: nor needed we
Feare harme on any *staics*. *Chapman*.

Any support; any thing that keeps another extended.—Weavers, stretch our *stays* upon the west. *Dryden*.

To STAW, *v. n.* [*staa*, Su. Goth., to stand.] To be fixed or set; to stand still. Applied, in some parts of the north, to a cart when fixed in a rut; and to the stomach, when it is crammed.

VOL. XXIII. No. 1589.

STEAD, *sted*, being in the name of a place that is distant from any river, comes from the Saxon *steb*, *steb*, a place; but if it be not upon the river or harbour, it is to be derived from *stade*, a shore or station for ships. *Gibson*.

STEAD, *s.* [*stads*, Goth.; *steb*, Sax.; *sted*, Dan. and Germ.; *stede*, Dutch.] Place. Obsolete in writing; but retained in our northern dialect; as it lies in such a *stead*.

Fly therefore, fly this fearful *stead* anon,
Lest thy foolhardize work thy sad confusion. *Spenser*.

They nigh approached to the *stead*
Where as those mermaids dwelt. *Spenser*

Room; place which another had or might have. It is scarcely used but with the preposition *in*.—If we had taken them clean away, or else removed them, so as to place *in* their *stead* others, we had done worse. *Hooker*.—Use; help. To stand *in stead*; to be of great use; to help; to advantage.—A compleat man hath some parts, whereof the want could not deprive him of his essence; yet to have them standeth him *in singular stead*, in respect of special uses. *Hooker*.—The frame of a bed.

The genial bed,
Sallow the feet, the borders and the *sted*. *Dryden*.

To STEAD, *v. a.* To help; to advantage; to support; to assist. A word somewhat obsolete.—We are neither in skill, nor ability of power greatly to *stead* you. *Sidney*.

It nothing *steads* us

To chide him from our eyes. *Shakespeare*.

To fill the place of another. *Obsolete*.—We shall advise this wronged maid to *stead* up our appointment, and go in your place. *Shakespeare*.

STEADFAST, *adj.* [*stebfast*, Sax.] Fast in place; firm; fixed.

How reverend is the face of this tall pile,
Whose massy pillars rear their aged heads
To bear aloft its arch'd and pond'rous roof,
By its own weight made *steadfast* and immoveable,
Looking tranquillity; it strikes an awe
And terror on my aking sight. *Congreve*.

Constant; resolute.

I hope her stubborn heart to bend,
And that it then more *steadfast* will endure. *Spenser*.

Be faithful to thy neighbour in his poverty; abide *steadfast* unto him in the time of his trouble. *Ecclus*.—Him resist *steadfast* in the faith. 1 *Pet*.—Not turned aside by fear.

What form of death could him affright,
Who unconcern'd, with *steadfast* sight,
Cou'd view the surges mounting steep,
And monsters rolling in the deep? *Dryden*.

STEADFASTLY, *adv.* Firmly; constantly.—God's omniscience *steadfastly* grasps the greatest and most slippery uncertainties. *South*.

STEADFASTNESS, *s.* Immutability; fixedness.

So hard these heavenly beauties be enfir'd,
As things divine, least passions do impress,
The more of *steadfast* minds to be admir'd,
The more they *stayed* be on *steadfastness*. *Spenser*.

Firmness; constancy; resolution

STEADILY, *adv.* Without tottering; without shaking.—Sin has a tendency to bring men under evils, unless hindered by some accident, which no man can *steadily* build upon. *South*.—Without variation or irregularity.

So *steadily* does fickle fortune steer
Th' obedient orb that it should never err. *Blackmore*.

STEADINESS, *s.* [*stebignýrre*, Sax.] State of being not tottering nor easily shaken.—Firmness; constancy.—John got the better of his choleric temper, and wrought himself up to a great *steadiness* of mind, to pursue his interest through all impediments. *Arbutnot*.—Consistent unvaried conduct.—*Steadiness* is a point of prudence as well as

of courage. *L'Estrange*.—A friend is useful to form an undertaking, and secure *steadiness* of conduct. *Collier*.

STEADY, *adj.* [ʃteɪdi, Sax.] Firm; fixed; tottering.—Their feet *steady*, their hands diligent, their eyes watchful, and their hearts resolute. *Sidney*.—Regular; constant; undeviating; unremitted.—He—sails between worlds and worlds with *steady* wing. *Milton*.

Steer the bounding bark with *steady* toil,
When the storm thickens and the billows boil. *Pope*.

Not wavering; not fickle; not changeable with regard to resolution or attention.

Now clear I understand,
What oft my *steadiest* thoughts have search'd in vain.
Milton.

A clear sight keeps the understanding *steady*. *Locke*.

To STEADY, *v. a.* To make steady.—The bird not only clings with its claws, but partly supports itself by strongly inclining its tail against the wall, making that a fulcrum; and, thus *steadied*, it works and plasters the materials into the face of the brick or stone. *White*.

STEAK, *s.* [ʃteɪk, Sax.; which Mr. H. Tooke considers as the participle of *stican*, to stick; a *steak* being “a piece or portion of flesh so small, as that it may be taken up and carried, *stuck* upon a fork, or any slender *sticking* instrument.” *Div. of Purl*, ii. 221.]—A slice of flesh broiled or fried; a collop.—The surgeon protested he had cured him very well, and offered to eat the first *steak* of him.

Fair ladies who contrive
To feast on ale and *steaks*. *Swift*.

To STEAL, *v. a.* preterite, *I stole*, part. pass. *stolen*. [*stilan*, Goth. *stela*, Icel. *stelan*, Sax.]—To take by theft; to take clandestinely; to take without right; *To steal* generally implies secrecy; to *rob*, either secrecy or violence. *Dr. Johnson*. The primitive is *still*, (Teut. *stille*), tacitly, hiddenly. *Callander*.

Thou rann'st a tilt in honour of my love,
And *stol'st* away the ladies' hearts of France. *Shakspeare*.

A schoolboy finding a bird's nest, shews it his companion, and he *steals* it. *Shakspeare*.—To withdraw or convey without notice.

Let us shift away, there's warrant in that theft
Which *steals* itself when there's no mercy left. *Shakspeare*.

To gain or effect by private and gradual means.

Young Lorenzo
Stole her soul with many vows of faith,
And ne'er a true one. *Shakspeare*.

To STEAL, *v. n.* To withdraw privily; to pass silently.—Fixt of mind to avoid further entreaty, and to fly all company, one night she *stole* away. *Sidney*.

I cannot think it,
That he would *steal* away so guilty like,
Seeing you coming. *Shakspeare*.

A bride
Should vanish from her clothes into her bed,
As souls from bodies *steal* and are not spy'd. *Donne*.
Now his fierce eyes with sparkling fury glow,
Now sighs *steal* out, and tears begin to flow. *Pope*.

To practice theft; to play the thief; to take any thing thievishly; to have the habit of thieving.—*Stealing* is the taking from another what is his, without his knowledge or allowance. *Locke*.

STEALER, *s.* One who steals; a thief.—The transgression is in the *stealer*. *Shakspeare*.

STEALINGLY, *adv.* Slyly; by invisible motion; by secret practice.—They were diverse motions, they did so *stealingly* slip one into another, as the latter part was ever in hand before the eye could discern the former was ended. *Sidney*.

STEALTH, *s.* The act of stealing; theft.—The owner proveth the *stealth* to have been committed upon him

by such an outlaw, and to have been found in the possession of the prisoner. *Spenser on Ireland*.

The *stealth* of mutual entertainment
With character too gross is written on Juliet. *Shakspeare*.

The thing stoleu.
On his back a heavy load he bare
Of nightly *stealths*, and pillage several. *Spenser*.

Secret act; clandestine practice.—*By stealth* means secretly; clandestinely; with desire of concealment; but, like *steal*, is often used in a good sense.—The wisdom of the same spirit borrowed from melody that pleasure, which, mingled with heavenly mysteries, causeth the smoothness and softness of that which toucheth the ear, to convey as it were by *stealth* the treasure of good things into man's mind. *Hooker*.

The monarch blinded with desire of wealth,
With steel invades his brother's life by *stealth*
Before the sacred altar. *Dryden*.

STEALTHY, *adj.* Done clandestinely; performed by stealth.

Now wither'd murder with his *stealthy* pace,
Moves like a ghost. *Shakspeare*.

To STEAM, *v. n.* [ʃteɪm, Sax.] To smoke or vapour with moist heat.

Let the crude humours dance
In heated brass, *steaming* with fire intense. *Philips*.

To send up vapours.—Ye mists that rise from *steaming* lake. *Milton*.

See, see, my brother's ghost hangs hovering there,
O'er his warm blood, that *steams* into the air. *Dryden*.

To pass in vapours.
Scarcely had Phœbus in the gloomy east
Got harnessed his fiery-footed team,
Ne rear'd above the earth his flaming crest
When the last deadly smoke aloft did *steam*. *Spenser*.

To STEAM, *v. a.* To exhale; to evaporate.
How ill did he beseeame
In slouthful sleepe his molten heart to *steme*. *Spenser*.

STEAM is the name commonly given in our language to the visible moist vapour which arises from all bodies which contain juices easily expelled from them by heats not sufficient for their combustion. Thus we say, the steam of boiling water, of malt, of a tan bed, &c. It is distinguished from smoke by its not having been produced by combustion, by not containing any soot, and by its being condensable by cold into water, oil, inflammable spirits, or liquids composed of these.

We see it rise in great abundance from bodies when they are heated, forming a white cloud, which diffuses itself and disappears at no very great distance from the body from which it was produced. In this case the surrounding air is found loaded with the water or other juices which seem to have produced it, and the steam seems to be completely soluble in air, as salt is in water, composing, while thus united, a transparent elastic fluid.

But in order to its appearance in the form of an opaque white cloud, the mixture with or dissemination in cold air is necessary. If a tea-kettle boils violently, so that the steam is formed at the spout in great abundance, it may be observed, that the visible cloud is not formed at the very mouth of the spout, but at a small distance before it, and that the vapour is perfectly transparent at its first emission. This is rendered still more evident by fitting to the spout of the tea-kettle a glass pipe of any length, and of as large a diameter as we please. The steam is produced as copiously as without this pipe, but the vapour is transparent through the whole length of the pipe. Nay, if this pipe communicate with a glass vessel terminating in another pipe, and if the vessel be kept sufficiently hot, the steam will be as abundantly produced at the mouth of this second pipe as before,

J. Pass sc.

1 & 2 Robisons instruments. 3, 4, 5 Ure's instruments. 6, 7, 8, 9, Sir Geo. Cayley's Engine.

before, and the vessel will be quite transparent. The visibility therefore of the matter which constitutes the steam is an accidental or extraneous circumstance, and requires admixture with cold air.

The opaque and cloudy appearance of steam, is explained by saying that the vapour is condensed by coming into contact with the cooler air. But there is something in the form of this cloud which is very inexplicable. The particles of it are sometimes very distinguishable by the eye; but they have not the smart star-like brilliancy of very small drops of water, but give the fainter reflection of a very thin film or vesicle like a soap bubble. If we attend also to their motion, we see them descending very slowly in comparison with the descent of a solid drop; and this vesicular constitution is established beyond a doubt by looking at a candle through a cloud of steam. It is seen surrounded by a faint halo with prismatical colours, precisely such as we can demonstrate by optical laws to belong to a collection of vesicles, but totally different from the halo which would be produced by a collection of solid drops. It is very difficult to conceive how these vesicles can be formed of watery particles, each of which was surrounded with many particles of fire, now communicated to the air, and how each of these vesicles shall include within it a ball of air; but we cannot refuse the fact. We know, that if, while linseed oil is boiling or nearly boiling, the surface be obliquely struck with the ladle, it will be dashed into a prodigious number of exceedingly small vesicles, which will float about in the air for a long while. Mr. Saussure was the first who distinctly observed this vesicular form of mists and clouds; and he makes considerable use of it in explaining several phenomena of the atmosphere.

STEAM ENGINE, s. An engine so called, because its first movement takes place in consequence of the generation and condensation of steam.

The steam engine is the first of a series of machines which, no doubt, will hereafter become numerous; differing from all those which preceded it in the circumstance that it is at once a *chemical* and a *mechanical* instrument. The minute changes in the fabric of matter that are produced by the agency of fire, form the prime movers of an engine which, in other respects, differs not from the machines moved by wind, water, or animal strength.

In the article **MECHANICS**, we have already so far anticipated the subject under consideration, that the reader is informed that by means of heat applied to a boiler, water is evaporated into a cylinder furnished with a valve; that the steam thus sent into the cylinder drives the air through the valves, and then that the steam is suddenly condensed by cold, so that instead of filling the whole cylinder, it scarcely occupied $\frac{1}{1000}$ of its previous space: that, consequently, a vacuum is formed which operates so as to pull down forcibly a piston inserted into the cylinder, and that thus the prime movement of the engine is effected. This principle, belongs to all engines, except the high-pressure—so that, in fact, the former are properly pneumatic machines, and it is only to the last that the term steam engine ought properly to be applied. But whatever kind of engine is used, the elasticity of the steam on the one hand, and its condensation on the other, are the only agents employed. The first points to be known, then, are the laws of this elasticity and of this condensation.

It is a well-known law of heat, that all bodies, when they pass from a solid to a fluid state, or from fluidity to the aeriform or gaseous state, imbibe, during such change, a considerable quantity of heat, which is not rendered apparent by the thermometer, or perceptible to our sense. As, for example:—a sheet of ice, and any fluid of the same temperatures being placed in an exalted temperature, the fluid will become warmer immediately, but the ice will not; and the ice will require many times more heat to melt and exalt it to the heat of the fluid. The reverse, also, holds good. Water returning to the state of ice, indicates the loss of many times more caloric than the said water does if it be made to return

to the *temperature* of ice, without being allowed to freeze (a restriction which we may easily command). So, also, water heated to 212° of Fahrenheit, requires 800 degrees of heat to convert its whole mass into steam;—yet this steam only makes the thermometer rise to 212°. And thus again, the steam, when condensed, gives out many times more caloric than the difference of its apparent temperatures in the states of vapour and water.

A vast number of experiments have been made with the view of discovering the precise quantity of the heat thus latent in steam. They disagree considerably, but perhaps we shall not err much in stating, that under the ordinary pressure of the atmosphere, steam, exhibiting 212 degrees of heat, actually contains about 1200°. Steam, therefore, when mixed with 6 times its weight of water at 32°, will raise the temperature of the latter to 212 degrees.

The preceding principle is of considerable use in its application to practical purposes. Wherever large quantities of boiling water are wanted, as in dyeing-houses, breweries, and the like, it is of great advantage to employ steam for heating the water: It is also used extensively in manufactories, for heating rooms; which it does very effectually, and without any of the unpleasant effects resulting from common stoves.

Now temperature being the cause of the evaporation of fluids, and atmospherical pressure the force that opposes that change, it follows that the phenomenon itself varies either with the temperature or the pressure: and elasticity being a property counteracting this pressure, and regulated solely by it, this depends on both temperature and pressure. Thus it happens, that when we diminish atmospherical pressure by an air-pump, the water contained in the vacuum boils and evaporates at a lower temperature than 212°; and thus it happens, also, that under an increased pressure, water may be forced to imbibe more than 212 degrees of heat ere it boils.

With regard to the law that governs the elasticity of steam, as many experiments have been made to discover it as have been performed with the view of finding out the law of heat. The former experiments have not had better success than the latter; for, though an approximation has been sufficiently near for most practical purposes, yet the results arrived at by the first experimentalists offer discrepancies that are not accounted for. Perhaps the fairest mode that we can adopt, is to lay before our readers some brief descriptions of the manner in which different scientific experimentalists have proceeded in their investigations, and the conclusions they have respectively arrived at. Omitting the earlier experimenters, such as Mr. Kairne, Lord Charles Cavendish, and others, we shall commence with the description Professor Robison has left us of his own mode of endeavouring to ascertain the relation between elasticity and temperature. He used an instrument of the kind engraved in Pl. I. fig. 1.

ABCD (fig. 1.) is the section of a small digester made of copper. Its lid, which is fastened to the body with screws, is pierced with three holes, each of which had a small pipe soldered into it. The first hole was furnished with a brass safety-valve V, nicely fitted to it by grinding. The area of this valve was exactly $\frac{1}{4}$ th of an inch. There rested on the stalk at top of this valve, the arm of a steelyard carrying a sliding weight. This arm had a scale of equal parts, so adjusted to the weight that the number on the scale corresponded to the inches of mercury, whose pressure on the under surface of the valve is equal to that of the steelyard on its top; so that when the weight was at the division 10, the pressure of the steelyard on the valve was just equal to that of a column of mercury 10 inches high, and $\frac{1}{4}$ th of an inch base. The middle hole contained a thermometer T, firmly fixed into it, so that no vapour could escape by its sides. The ball of this thermometer was but a little way below the lid. The third hole received occasionally the end of a glass pipe SGF, whose descending leg was about 36 inches long. When this syphon was not used, the hole was accurately shut with a plug.

The vessel was half filled with distilled water which had been purged of air by boiling. The lid was then fixed on, having the third hole S, plugged up. A lamp being placed under the vessel, the water boiled, and the steam issued copiously by the safety-valve. The thermometer stood at 213, and a barometer in the room at 29.9 inches. The weight was then put on the fifth division. The thermometer immediately began to rise; and when it was 220, the steam issued by the sides of the valve. The weight was removed to the 10th division; but before the thermometer could be distinctly observed, the steam was issuing at the valve. The lamp was removed farther from the bottom of the vessel, that the progress of heating might be more moderate; and when the steam ceased to issue from the valve, the thermometer was at 227. The weight was now shifted to 15; and by gradually approaching the lamp, the steam again issued, and the thermometer was at 132 $\frac{1}{2}$. This mode of trial was continued all the way to the 75th division of the scale. The experiments were then repeated in the contrary order; that is, the weight being suspended at the 75th division, and the steam issuing strongly at the valve, the lamp was withdrawn, and the moment the steam ceased to come out, the thermometer was observed. The same was done at the 70th, 65th, division, &c. These experiments were several times repeated both ways; and the means of all the results for each division are expressed in the following table, where column 1st expresses the elasticity of the steam, being the sum of 29.9, and the division of the steelyard; column 2d expresses the temperature of the steam corresponding to this elasticity.

I.	II.

90	270 $\frac{1}{2}$
95	274 $\frac{1}{2}$
100	278
105	281

A very different process was necessary for ascertaining the elasticity of the steam in lower temperatures, and consequently under smaller pressures than that of the atmosphere. The glass syphon S G F, was now fixed into its hole in the lid of the digester. The water was made to boil smartly for some time, and the steam issued copiously both at the valve and at the syphon. The lower end of the syphon was now immersed into a broad saucer of mercury, and the lamp instantly removed, and every thing was allowed to grow cold. By this the steam was gradually condensed, and the mercury rose in the syphon, without sensibly sinking in the saucer. The valve and all the joints were smeared with a thick clammy cement, composed of oil, tallow, and rosin, which effectually prevented all ingress of air. The weather was clear and frosty, and the barometer standing at 29.84, and the thermometer in the vessel at 42°. The mercury in the syphon stood at 29.7, or somewhat higher, thus showing a very complete condensation. The whole vessel was surrounded with pounded ice, of the temperature 32°. This made no sensible change in the height of the mercury. A mark was now made at the surface of the mercury. One observer was stationed at the thermometer, with instructions to call out as the thermometer reached the divisions 42, 47, 52, 57, and so on by every five degrees till it should attain the boiling heat. Another observer noted the corresponding descents of the mercury by a scale of inches, which had its beginning placed at 29.84 from the surface of the mercury in the saucer.

The pounded ice was now removed, and the lamp placed at a considerable distance below the vessel, so as to warm its contents very slowly. These observations being very easily made, were several times repeated, and their mean results are set down in the following table: Only observe, that it was found difficult to note down the descents for every fifth degree, because they succeeded each other so fast. Every 10th was judged sufficient for establishing the law of variation. The first column of the table contains the temperature, and the second the descent (in inches) of the mercury from the mark 29.84:—

32°	3
40	0.1
50	0.2
60	0.35
70	0.55
80	0.82
90	1.18
100	1.61
110	2.25
120	3.00
130	3.95
140	5.15
150	6.72
160	8.65
170	11.05
180	14.05
190	17.85
200	22.62
210	28.65

Four or five numbers at the top of the column of elasticities are not so accurate as the others, because the mercury passed pretty quickly through these points. But the progress was extremely regular through the remaining points; so that the elasticities corresponding to temperatures above 70° may be considered as very accurately ascertained.

Not being altogether satisfied with the method employed for measuring the elasticity in temperatures above that of boiling water, a better form of experiment was adopted. A glass tube was procured of the form represented in fig. 2, having a little cistern L, from the top and bottom of which proceeded the syphons K and M N. The cistern contained mercury, and the tube M N was of a slender bore, and was about six feet two inches long. The end K was firmly fixed in the third hole of the lid, and the long leg of the syphon was furnished with a scale of inches, and firmly fastened to an upright post.

The lamp was now applied at such a distance from the vessel as to warm it slowly, and make the water boil, the steam escaping for some time through the safety-valve. A heavy weight was then suspended on the steelyard; such as it was known that the vessel would support, and at the same time, such as would not allow the steam to force the mercury out of the long tube. The thermometer began immediately to rise, as also the mercury in the tube M N; their corresponding stations are marked in the following table:—

Temperature.	Elasticity.
212°	0.0
220	5.9
230	14.6
240	25.0
250	36.9
260	50.4
270	64.2
280	106.0

This form of the experiment is much more susceptible of accuracy than the other, and the measures of elasticity are more to be depended on. In repeating the experiment, they were found much more constant; whereas, in the former method, differences occurred of two inches and upwards.

We may now connect the two sets of experiments into one table, by adding to the numbers in this last table the constant

constant height 29.9, which was the height of the mercury in the barometer during the last set of observations.

280	105.9

In the memoirs of the Royal Academy of Berlin for 1782, there is an account of some experiments made by Mr. Achard on the elastic force of steam, from the temperature 32° to 212°. They agree extremely well with those mentioned here, rarely differing more than two or three-tenths of an inch. He also examined the elasticity of the vapour produced from alcohol, and found, that when the elasticity was equal to that of the vapour of water, the temperature was about 35° lower. Thus, when the elasticity of both was measured by 28.1 inches of mercury, the temperature of the watery vapour was 209°, and that of the spirituous vapour was 173°. When the elasticity was 18.5, the temperature of the water was 189.5, and that of the alcohol 154.6. When the elasticity was 11.05, the water was 168°, and the alcohol 134°.4. Observing the difference between the temperatures of equally elastic vapours of water and alcohol not to be constant, but gradually to diminish, in Mr. Achard's experiments, along with the elasticity, it became interesting to discover whether and at what temperature this difference would vanish altogether. Experiments were accordingly made by Robison, similar to those made with water. They were not made with the same scrupulous care, nor repeated as they deserved, but they furnished rather an unexpected result. The following table will give the reader a distinct notion of them:—

Temperature.	Elasticity.
32°	0.0
40	0.1
60	0.8
80	0.8
100	3.9
120	6.9
140	12.2
160	21.3
180	34.
200	52.4
220	78.5
240	115.

We say that the result was unexpected; for as the natural boiling point seemed by former experiments to be in all fluids about 120° or more below their boiling point in the ordinary pressure of the atmosphere, it was reasonable to expect that the temperature at which they ceased to emit

sensibly elastic steam would have some relation to their temperatures when emitting steam of any determinate elasticity. Now as the vapour of alcohol of elasticity 30 has its temperature about 36° lower than the temperature of water equally elastic, it was to be expected that the temperature at which it ceased to be sensibly affected would be several degrees lower than 32°. It is evident, however, that this is not the case. But this is a point that deserves more attention, because it is closely connected with the chemical relation between the element (if such there be) of fire and the bodies into whose composition it seems to enter as a constituent part. What is the temperature 32°, to make it peculiarly connected with elasticity? It is a temperature assumed by us for our own conveniency, on account of the familiarity of water in our experiments. Ether, we know, boils in a temperature far below this, as appears from Dr. Cullen's experiments narrated in the *Essays Physical and Literary of Edinburgh*. On the faith of former experiments, we may be pretty certain that it will boil in vacuo at the temperature — 14°, because in the air it boils at + 106°. Therefore we may be certain, that the steam or vapour of ether, when of the temperature of 32°, will be very sensibly elastic. Indeed, Mr. Lavoisier says, that if it be exposed in an exhausted receiver in winter, its vapour will support mercury at the height of 10 inches. A series of experiments on this vapour similar to the above would be very instructive. We even wish that those on alcohol were more carefully repeated. If we draw a curve line, of which the abscissa is the line of temperatures, and the ordinates are the corresponding heights of the mercury in these experiments on water and alcohol, we shall observe, that although they both sensibly coincide at 32°, and have the abscissa for their common tangent, a very small error of observation may be the cause of this, and the curve which expresses the elasticity of spirituous vapour may really intersect the other, and go backwards considerably beyond 32°.

This range of experiments gave rise to some curious and important reflections in Robison's mind. He says, we now see that no particular temperature is necessary for water assuming the form of permanently elastic vapour; and that it is highly probable that it assumes this form even at the temperature 32°; only its elasticity is too small to afford us any sensible measure. It is supposed that even ice evaporates, since in an experiment to this purpose by Mr. Wilson in the *Philosophical Transactions*, a piece of polished metal, covered with hoar-frost, became perfectly clear by exposing it to a dry frosty wind.

Even mercury evaporates, or is converted into elastic vapour, when all external pressure is removed. The dim film which may frequently be observed in the upper part of a barometer which stands near a stream of air, is found to be small globules of mercury sticking to the inside of the tube. But their elasticity is too small to occasion a sensible depression of the column, even when considerably warmed by a candle.

With regard to the *cause* why increased pressure increases temperature and elasticity, Robison is of opinion that "Solution is performed by forces which act in the way of attraction; or, to express it more safely, solutions are accompanied by the mutual approaches of the particles of the menstruum and solved: all such tendencies are observed to increase by a diminution of distance. Hence it must follow, that air of double density will dissolve more than twice as much as water. Therefore when we suddenly rarely saturated air (even though its heat should not diminish) some water must be let go. What may be its quantity we know not; but it may be more than what would now become elastic by this diminution of surrounding pressure."

Another inference which may be drawn from these experiments is, that Nature seems to affect a certain law in the dilatation of aeriform fluids by heat. They seem to be dilatable nearly in proportion of their present dilatation. For if we suppose that the vapours resemble air, in having their elasticity in any given temperature proportional to their density

density, we must suppose that if steam of the elasticity 60, that is, supporting 90 inches of mercury, were subjected to a pressure of 30 inches, it would expand into twice its present bulk. The augmentation of elasticity therefore is the measure of the bulk into which it would expand in order to acquire its former elasticity. Taking the increase of elasticity therefore as a measure of the bulk into which it would expand under one constant pressure, we see that equal increments of temperature produce nearly equal multiplications of bulk. Thus if a certain diminution of temperature diminishes its bulk $\frac{1}{4}$ th, another equal diminution of temperature will diminish this new bulk $\frac{1}{4}$ th very nearly. Thus, in our experiments, the temperatures 110°, 140°, 170°, 200°, 230°, are in arithmetical progression, having equal differences, and we see that the corresponding elasticities 2.25, 5.15, 11.05, 22.62, 44.7, are very nearly in the continued proportion of 1 to 2. The elasticity corresponding to the temperature 260 deviates considerably from this law, which would give 88 or 89 instead of 80; and the deviation increases in the higher temperatures. But still we see that there is a considerable approximation to this law; and it will frequently assist us to recollect, that whatever be the present temperature, an increase of 30 degrees doubles the elasticity and the bulk of watery vapour.

That 4° will increase the elasticity from	1 to	$1\frac{1}{15}$
8	-	1 to $1\frac{1}{8}$
10	-	1 to $1\frac{1}{4}$
12 $\frac{1}{2}$	-	1 to $1\frac{1}{2}$
18	-	1 to $1\frac{1}{3}$
22	-	1 to $1\frac{2}{5}$
24	-	1 to $1\frac{3}{4}$
26	-	1 to $1\frac{4}{5}$

This is sufficiently exact for most practical purposes. Thus an engineer finds that the injection cools the cylinder of a steam engine to 192°. It therefore leaves a steam whose elasticity is three-fifths of its full elasticity, = 18 inches $\frac{3}{5}$. But it is better at all times to have recourse to a table framed from actual experiment. Observe, too, that in the lower temperatures, i. e. below 110°, this increment of temperature does more than double the elasticity.

This law obtains more remarkably in the incoercible vapours; such as vital air, atmospheric air, fixed air, &c., all of which have also their elasticity proportional to their bulk inversely: and perhaps the deviation from the law in steams is connected with their chemical difference of constitution. If the bulk were always augmented in the same proportion by equal augmentations of temperature, the elasticities would be accurately represented by the ordinates of a logarithmic curve, of which the temperatures are the corresponding abscissæ; and we might contrive such a scale for our thermometer, that the temperatures would be the common logarithms of the elasticities, or of the bulks having equal elasticity; or, with our present scale, we may find such a multiplier m for the number x of degrees of our thermometer (above that temperature where the elasticity is equal to unity), that this multiple shall be the common logarithm of the elasticity y ; so that $m \cdot x = \log. y$.

But our experiments are not sufficiently accurate for determining the temperature where the elasticity is measured by 1 inch; because in these temperatures the elasticities vary by exceedingly small quantities. But if we take 11.04 for the unit of elasticity, and number our temperature from 170°, and make $m = 0.010035$, we shall find the product $m \cdot x$ to be very nearly the logarithm of the elasticity. The deviations, however, from this law, are too great to make this equation of any use. But it is very practicable to frame an equation which shall correspond with the experiments to any degree of accuracy; and it has been done in French by Mr. Prony. It is as follows: Let x be the degrees of Reaumur's thermometer; let y be the expansion of 10,000 parts of air; let e be = 10, $m = 2.7979$, $n = 0.01768$; then $y = e^{m+nx} - 627.5$. Now e being = 10, it is plain that e^{m+nx} is the number, of which

$m+nx$ is the common logarithm. This formula is very exact as far as the temperature 60°, but beyond this it needs a correction; because air, like the vapour of water, does not expand in the exact proportion of its bulk.

We observe this law considerably approximated to in the augmentation of the bulk or elasticity of elastic vapours; that is, it is a fact that a given increment of temperature makes very nearly the same proportional augmentation of bulk and elasticity. This gives us some notion of the manner in which the supposed expanding cause produces the effect. When vapour of the bulk 4 is expanded into a bulk 5 by an addition of 10 degrees of sensible heat, a certain quantity of fire goes into it, and is accumulated round each particle, in such a manner that the temperature of each, which formerly was m , is now $m+10$. Let it now receive another equal augmentation of temperature. This is now $m+20$, and the bulk is $\frac{5 \times 5}{4}$ or $6\frac{1}{4}$, and the arithmetical increase of bulk is $1\frac{1}{4}$. The absolute quantity of fire which has entered it is greater than the former, both on account of the greater augmentation of space and the greater temperature. Consequently if this vapour be compressed into the bulk 5, there must be heat or fire in it which is not necessary for the temperature $m+20$, far less for the temperature $m+10$. It must therefore emerge, and be disposed to enter a thermometer which has already the temperature $m+20$: that is, the vapour must grow hotter by compression; not by squeezing out the heat, like water out of a sponge, but because the law of attraction for heat is deranged.

In the experiments of Robison, a main source of error had been, that he had neglected to keep the digester and the vacant part of the tube of the barometer of the same temperature as the digester. Mr. Dalton ingeniously obviated this inconvenience by a very simple contrivance. He procured a perfectly dry barometer tube of the usual size, and having introduced some mercury, which had been previously freed from air by boiling, marked the place where it became stationary. Then, dividing the space occupied by the mercurial column into inches and tenths, he poured out the mercury, and introduced some water to moisten the inside of the tube. On reversing the operation, that is, pouring out the water, and reintroducing the mercury, the water which adhered to the sides of the tube rose to the top of the mercurial column, where it formed a stratum from one-eighth to one-tenth of an inch in depth. The air was carefully excluded. Having thus satisfied himself as to the probable accuracy of the results to be obtained, he took an open cylindrical glass tube, two inches diameter and 14 inches long, in each end of which he fixed a cork. The corks were perforated in the middle, to admit the upper or vacant part of the barometer tube. The upper cork was fixed two or three inches below the top of the tube, and a small portion of it was cut away to allow water to be poured into the space between it and the lower cork. By this means, the upper or vacant part of the barometer tube was exposed to the several degrees of temperature from 32° to 155° inclusively; and the effect of heat, in the production of vapour within, was observed by the depression of the mercurial column. In experimenting on the higher temperatures, Mr. Dalton used a nearly similar apparatus, made of tin, with a syphon barometer, and thus obtained the remaining results up to 212 degrees.

The results of these experiments, from 32° to 212° inclusively, agree very closely with the results of experiments made by Dr. Ure.

Watt made experiments at a very early date, prior indeed to Robison's. Watt conducted his experiments with a tin pan, 5 inches diameter, and 4 inches deep, having an inverted barometer tube, 3 feet long, firmly fixed into a conical socket at the bottom, through which it passes. At one extremity of this tube was a bulb, an inch and a half in diameter, the capacity of which was nearly equal to the capacity of the tube. The bulb was filled with water, and the stem with mercury, and the lower end of the latter was immersed in a cistern

cistern of mercury. These were so perfectly freed from air, that the column of mercury in the tube was 34 inches high; when it was violently shaken, the mercurial column suddenly descended, and settled at 28.75 inches. Upon being inclined, a speck of air still remained; but when it was compressed by a pillar of mercury 27 inches high, this speck was not larger than a pin's head. When the tube was perpendicular, the mercury stood at 28.75 inches; and the column of water above it was about $6\frac{1}{2}$ inches, which is equal to half an inch of mercury. As the whole was 29.25 inches when the stationary barometer stood at 29.4, the difference, or pillar supported by the elasticity of the steam, was equal to 0.15 inch. The water in the pan was heated slowly by a lamp, and was stirred continually with a feather to distribute the heat equally throughout. By these means experiments were made from 55° to 196°·5 of temperature.

To determine the higher degrees of elasticity, Mr. Watt introduced a tube, 55 inches long, through a hole in the lid of a digester, and within the digester it terminated in a cistern of mercury. A thermometer was applied, as in the experiments of Professor Robison, and the digester was half filled with water, and heated by a lamp. This caused the air in the upper part of the digester to expand, and although a considerable quantity was allowed to escape, and the water heated to ebullition, still some remained, for the mercury stood at 213 $\frac{1}{2}$ °. Dissatisfied, however, with these experiments, Mr. Watt, in 1796, requested Mr. Southern to repeat them. The results clearly proved the accuracy of Mr. Watt.

Dr. Ure has thus detailed his experiments: "fig. 3 represents the construction employed for temperatures under and a little above the boiling point. Figs. 4 and 5 are used for higher temperatures; and the last is the most convenient. One simple principle pervades the whole train of experiments, which is, that the progressive increase of elastic force developed by heat from the liquid, incumbent on the mercury at $l' l''$, is measured by the length of column which must be added over L , the primitive level below, in order to restore the quicksilver to its primitive level above, at l . These two stations, or points of departure, are nicely defined by a ring of fine platina wire twisted firmly around the tube.

"At the commencement of the experiment, after the liquid, well freed from air, has been let up, the quicksilver is made a tangent to the edge of the upper ring, by cautiously pouring mercury in a slender stream into the open leg of the syphon D . The level ring below is then carefully adjusted.

"From the mode of conducting these experiments, there remained always a quantity of liquid in contact with the vapour, a circumstance essential to accuracy in this research.

"Suppose the temperature of the water or the oil in A to be 32° F., as denoted by a delicate thermometer, or by the liquefaction of ice; communicate heat to the cylinder A by means of two Argand flames playing gently on its shoulder at each side. When the thermometer indicates 42°, modify the flames, or remove them, so as to maintain a uniform temperature for a few minutes. A film, or line of light, will now be perceived between the mercury and the ring at l , as is seen under the vernier of a mountain barometer when it is raised a few feet off the ground. Were the tube at l and L of equal area, or were the relation of the areas experimentally determined, then the rise of the quicksilver above L would be one half, or a known submultiple of the total depression, equivalent to the additional elasticity of the vapour at 42° above that at 32°. Since the depressions, however, for 30 or 40 degrees in this part of the scale are exceedingly small, one half of the quantity can scarcely be ascertained with suitable precision, even after taking the above precautions; and besides the other sources of error, or, at least, embarrassment, from the inequalities of the tube, and from the lengthening space occupied by the vapour, as the temperature ascends, render this method of reduction very ineligible.

"By the other plan we avoid all these evils. For whatever additional elasticity we communicate to the vapour above l , it will be faithfully represented and measured by the

mercurial column which we must add over L , in order to overcome it, and restore the quicksilver under l to its zero or initial level, when the platina ring becomes once more a tangent to the mercury.

"At E a piece of cork is fixed, between the parallel legs of the syphon, to sustain it, and to serve as a point by which the whole is steadily suspended.

"For temperatures above the boiling point, the part of the syphon under E is evidently superfluous, merely containing in its two legs a useless weight of equipoise mercury. Accordingly, for high heats, the apparatus figs. 4 or 5 is employed, and the same method of procedure is adopted. The aperture at O , fig. 5, admits the bulb of the thermometer, which rests as usual on l'' . The recurved part of the tube is filled with mercury, and then a little liquid is passed through it to the sealed end. Heat is now applied by an Argand flame to the bottom of C , which is filled with oil or water; and the temperature is kept steadily at 212° for some minutes. Then a few drops of quicksilver may require to be added to D'' till L'' and l''' be in the same horizontal plane. The further conduct of the experiment differs in no respect from what has been already described. The liquid in C is progressively heated, and at each stage mercury is progressively added over L'' to restore the initial level, or volume at l''' , by equipoising the progressive elasticity. The column above L'' being measured, represents the succession of elastic forces. When this column is wished to extend very high, the vertical tube requires to be placed for support in the groove of a long wooden prism.

"The height of the column in some of the experiments being nearly 12 feet, it became necessary to employ a ladder to reach its top. It was found to be convenient in this case, after observing that the column of vapour had attained its primitive magnitude, to note down the temperature with the altitude of the column; then immediately to pour in a measured quantity of mercury nearly equal to three vertical inches, and to wait till the slow progress of the heating again brought the vapour in equilibrio with this new pressure, which at first had pushed the mercury within the platina ring at l'' . When the lower surface of the mercury was again a tangent to this ring, the temperature and altitude were both instantly observed. This mode of conducting the process will account for the experimental temperatures being very often odd and fractional numbers. They are therefore presented to the public as they were recorded on the instant.

"After bestowing the utmost pains in repeating the experiments during a period of nearly two months, it was found that the only way of removing the little discrepancies which crept in between contiguous measures, was to adopt the astronomical plan of multiplying observations and deducing truth from the mean. It is essential to heat with extreme slowness and circumspection the vessels $A B C$. One repetition of the experiment occupies, on an average, seven hours."

A surprising accordance is perceived in the numbers between 32° and 212, given by Dr. Ure and by Mr. Dalton, though the experiments were performed with different apparatus. This accordance is of course strong proof of the correctness of the results obtained.

The experiments of Mr. Philip Taylor were made with a strong boiler, furnished with the required thermometer and barometer. During the ascent of the mercurial column of the thermometer, and the corresponding descent of the barometer, the indications of temperature and elasticity were accurately noted; and when the steam had attained 320°, it was allowed gradually to subside, and the states of temperature and elasticity again ascertained. Thus a mean result was obtained, which is essential to great accuracy; for between the alternate ascents and descents of the mercurial columns there is some variation.

To save the trouble of continual reference to tables, as well as to obviate the necessity of numerous experiments, it has been attempted to construct formulæ by which the properties of unknown temperatures may be deduced from such as are known. In the first instance,
Dalton,

Dalton, in his experiments on temperatures between 32° and 212° perceived something like geometrical progression, with a ratio, however, gradually diminishing: Thus

	Inch.	Ratios.
the force at 32° =	·200	
122 =	3·500	17·50
212 =	30·000	8·57

and if divided, according to observation

the force at 32° =	·200	
77 =	·910	4·550
122 =	3·500	3·846
167 =	11·250	3·214
212 =	30·000	2·666

and if again divided:

the force at 32° =	·200	
54½ =	·435	2·17
77 =	·910	2·09
99½ =	1·820	2·00
122 =	3·550	1·92
144½ =	6·450	1·84
167 =	11·250	1·75
189½ =	18·800	1·67
212 =	30·000	1·59

and by another division we obtain the ratio for every addition of 11 degrees and a quarter to the temperature:

the force at 32° =	·200	1·485
43¼ =	·297	1·465
54½ =	·435	1·44
65¾ =	·630	1·43
77 =	·910	1·41
88¼ =	1·290	1·40
99½ =	1·820	
110¾ =	2·540	1·38
122 =	3·500	1·36
133½ =	4·760	1·35
144½ =	6·450	1·33
155¾ =	8·550	1·32
167 =	11·250	1·30
178¼ =	14·600	1·29
189½ =	18·800	1·27
200¾ =	24·000	1·25
212 =	30·000	

By this mode of estimation, Mr. Dalton concluded that, without the aid of experiment, he might, with tolerable accuracy, extend the table several degrees below 32° and beyond 212°. Thus, assuming the ratio for each interval of 11¼° above 212° to be 1·235, 1·222, 1·205, 1·190, 1·175, 1·160, 1·145, 1·130, &c. he has extended the table through many similar intervals, and determined the intermediate degrees, by interpolation. But these results differ very materially from those obtained by experiment.

M. Biot, in his "Traité de Physique," has deduced a general formula from Mr. Dalton's experiments, for calculating the force of steam at any given temperature. Respecting this formula, we may, in the first place, observe, that M. Biot represents the decrease of the logarithms of the elastic forces by a series of terms of the form $a n + b n^2 + c n^3$; $a b c$ being constant coefficients.

Thus $\log. F_n = \log. 30 + a n - b n^2 + c n^3$

To determine the coefficients $a b c$, he makes use of the elastic forces observed at the temperatures on the centigrade scale of 100°, 75°, 50°, and 25°; whence result these conditions:

	Inches.
$n = 0$	$F = 30·00$
$n = 25$	$F_{25} = 11·25$
$n = 50$	$F_{50} = 3·50$
$n = 75$	$F_{75} = ·91$

Substituting these conditions in the above general formula, and bearing in mind that the logarithm of a fraction is equal to the logarithm of the numerator, minus the logarithm of the

denominator, we shall have the three following equations of conditions:—

$$\begin{aligned} -0·4259687 &= 25a + 625b + 15625c \\ -0·9330519 &= 50a + 2500b + 125000c \\ -1·5180799 &= 75a + 5625b + 421875c \end{aligned}$$

Doubling the first, and subtracting it from the second, a disappears; trebling it, and subtracting it from third, a also disappears. Then dividing each of the two resulting equations by the coefficient of b , we have

$$\begin{aligned} -0·00006489160 &= b + 75c \\ -0·00006404635 &= b + 100c \end{aligned}$$

Subtracting one of these from the other, b will disappear; and dividing it by the coefficient of c , we shall have c . Next, by substituting the value of c in one of these equations, we get b . Lastly, putting b and c in one of the two first equations, we have a . Thus we shall find

$$\begin{aligned} a &= -0·01537419550 \\ b &= -0·00006742735 \\ c &= +0·00000003381 \end{aligned}$$

Whence the whole formula $\log. F_n = \log. 30 + a n + b n^2 + c n^3$ is completely determined, and may serve for calculating F_n , relative to any proposed value of n .

If we make, for example, $n = 100°$, we shall have the elastic at 100° below the boiling point, or at the temperature of melting ice. We thus obtain

$$\log. F_n = 1·4771213 - 2·1768831 = -0·7007618$$

Or employing negative indices in order to make use of the ordinary logarithmic tables.

$$\log. F_n = 1·2992382 \text{ whence } F_n = 0·19917 \text{ inches,}$$

Observation gives 0·200.

The error is obviously insensible; and we may adopt, says M. Biot, our formula as representing the experiments of Mr. Dalton. To introduce the Fahrenheit degrees into the formula, calling them f , and counting from 212°, we have $\frac{5}{9}f = n$; and substituting the value of n in the preceding formula, we obtain

$$\begin{aligned} a &= -0·90854121972 \\ b &= -0·00002081091 \\ c &= +0·00000000580 \end{aligned}$$

Whence $\log. F_f = 1·4771213 + a f + b f^2 + c f^3$, f being the number of degrees of Fahrenheit, reckoning them from 212°, positive below and negative above this point of estimation.

By the above formula, thus elaborately investigated by M. Biot, Dr. Ure has computed the elastic forces of steam at the three successive temperatures of 232°, 262° and 312°, or 20°, 50° and 100°, above the boiling point of Fahrenheit's scale. First, we have $f = -20$ and $a f + b f^2 + c f^3 = 20 + 400b - 8000c$; f is negative, being above the point of departure 212°, and consequently, the products $a f$ and $c f^3$ are positive, while $b f^2$ becomes negative.

$$\begin{aligned} 20a &= 0·170824 \\ 400b &= -0·008324 \\ 8000c &= +0·000046 \end{aligned}$$

$$\begin{aligned} &0·162546 + \log. 30 \text{ or} \\ &1·477121 \end{aligned}$$

$$\log. \text{ of } 43·62 = 1·639667$$

By M. Biot's formula therefore at 232° F 43·620
Mr. P. Taylor's experiment 43·00
At the temperature 262° Fahr.

$$\begin{aligned} f &= 50 \\ 50a &= 0·4270609 \\ 2500b &= -0·0520272 \\ 125000c &= +0·0007250 \end{aligned}$$

$$0·3757587$$

$$\log. 30 = 1·4771213$$

$$\log. \text{ of } F_{262^\circ} = 1·8528800 \text{ } F_{262^\circ} = 71·265$$

$$\text{Mr. P. Taylor's experiment } 72·50$$

At

At the temperature 312° Fahr.

$$\begin{aligned} f &= 100 \\ 100a &= 0.854121972 \\ 10.000b &= -0.208109100 \\ 1.000.000c &= +0.005800000 \\ &0.651812872 \\ &1.477121300 \end{aligned}$$

$$\begin{aligned} \text{Log. of } F &= 2.128934172 \quad F_f = F \ 100 = 134.57 \\ \text{Mr. Dalton's calculation} &\dots\dots\dots 125.85 \\ \text{Mr. P. Taylor's experiment} &\dots\dots\dots 159.45 \end{aligned}$$

The disagreement between M. Biot's formula and experiment, though trivial in the lower temperatures, increases rapidly in the higher.

Dr. Ure has a formula admirably adapted to express the force of steam between 32° and 212°

"The elastic force at 212°, = 30 inches, being divided by 1.23, will give the force for 10° below; this quotient, divided by 1.24, will give that for 10° lower; and so on progressively. To obtain the forces above 212°, we have merely to multiply 30° by the ratio 1.23 for the force at 222°; this product by 1.22 for that at 232°, and thus for each successive interval of 10° above the boiling point. Thus $30 \times 1.23 = F_{222}$; $30 \times 1.23 \times 1.22 = F_{230}$ using F to denote the force at any temperature n, according to the notation of Laplace.

"By departing from the point 210° F, we shall obtain results equally accurate and more convenient for comparison with the experiments of Dr. Ure; and it is observed, that this latter rule may be better adapted to give the elastic force corresponding to any given temperature moderately distant from 212°.

"Let r = the mean ratio between 210° and the given temperature; n = the number of terms (each of 10°) distant from 210°; F, the elastic force of steam in inches of mercury.

"Then log. of F = log. 28.9 + n, log. r; the positive sign being used above, the negative below 210°. Or by common arithmetic, multiply or divide 28.9 according as the temperature is above or below 210°, by the mean ratio, involved to a power denoted by the number of terms. The product or quotient is the tension required.

"Example I.—The temperature is 140°. What is the corresponding elasticity of the vapour from water heated to that point?

"140° is 7 terms of 10° each under 210°; 1.26 is the mean ratio = $\frac{1.23+1.29}{2}$; and consequently r = 1.26; n = 7.

$$\begin{aligned} \text{Log. } 28.9 &= 1.46090 \\ \text{Log. } 1.26 \times 7 &= 0.10037 \times 7 = -0.70259 \\ &0.75831 \text{ which is} \\ &\text{the logarithm of } 5.732 \text{ inches} \\ \text{Experiment gives } &5.77, \text{ leaving a difference of } .04, \\ &\text{which is inconsiderable.} \end{aligned}$$

"Example II.—What is the tension of steam at the temperature of 290°?

$$\begin{aligned} r &= \frac{1.23+1.16}{2} = 1.195 \quad n = 8 \\ \text{Log. } 28.9 &= 1.46090 \\ 8 \text{ log. } r &= 8 \times 0.07737 = +0.61896 \\ &2.07986 \text{ which is} \\ &\text{the logarithm of } 120.02 \text{ inches} \\ \text{Experiment gives } &120.15 \end{aligned}$$

"Example III.—Temperature 250°. Force of steam in contact with water?

$$\begin{aligned} r &= \frac{1.23+1.20}{2} = 1.215 \quad n = 4 \\ \text{Log. } 28.9 &= 1.46090 \\ 4 \text{ log. } r &= 4 \times 0.08458 = +0.33832 \\ &1.79922 \text{ which is} \\ &\text{the logarithm of } 62.98 \text{ inches.} \\ \text{Experiment gives } &61.90. \end{aligned}$$

The history of the steam engine has already been given under the article MECHANICS; but we shall, in this place, introduce some particulars of a more detailed nature than those we have yet entered into, to shew that of the steam engine on its present principle, Captain Savary was, undoubtedly, the first inventor.

The great elastic force of steam has been long known in the instrument called the *aeolipile* (see that article; and its property of condensation was also experienced in the use of the same instrument: the manner commonly practised for filling the ball with water being to plunge it into cold water, when heated and filled with steam; by which means the steam is condensed, and forms a vacuum sufficient to draw the water into the ball, although the orifice is so small that water could not be introduced by any other means. At the same time, the true principles of its action were so little understood, that the steam which issued from it, when placed on the fire, was supposed to be air produced by the decomposition of the water; and nearly all the old philosophers, who have described this instrument, proposed to employ it for blowing furnaces. The first idea of employing this force of steam to produce motion was by Brancas, a philosopher of Rome, who contrived a great number of different kinds of mills to be worked by the steam coming from a large *aeolipile*, and blowing against the floats or vanes of a wheel. We are obliged to this author for a number of other ingenious inventions, which he dedicated to M. Canci, governor of Loretto, in 1623, and published his work (*Le Machine*) at Rome the year following. The force, however, which he could have thus obtained from steam would have been found altogether inconsiderable, if he had ever put it in practice.

The earliest description which we have of a machine for raising water by fire, employed in raising steam from boiling water, is from the Marquis of Worcester, who, in the reign of king Charles II., and in the year 1663, published a small pamphlet, entitled "A Century of the Names and Scantlings of the Marquis of Worcester's Inventions," written in 1653.

This little work, it appears, was addressed to the king and parliament, and published with a view to obtain an encouragement from the public for the prosecution of 100 projects, which it details. No. 68. of this Century, contains as follows:—"68. An admirable and most forcible way to drive up water by fire; not by drawing or sucking it upwards, for that must be, as the philosopher calleth it, *intra sphaeram activitatis*, which is but at such a distance. But this way hath no bounder, if the vessel be strong enough: for I have taken a piece of a whole cannon, whereof the end was burst, and filled it three-quarters full of water, stopping and screwing up the broken end, as also the touch-hole; and making a constant fire under it, within twenty-four hours it burst, and made a great crack; so that having a way to make my vessels, so that they are strengthened by the force within them, and the one to fill after the other, I have seen the water run like a constant fountain stream forty feet high: one vessel of water, rarefied by fire, driveth up forty of cold water. And a man that tends the work is but to turn two cocks, that one vessel of water being consumed, another begins to force and re-fill with cold water, and so successively; the fire being tended and kept constant, which the self-same person may likewise abundantly perform in the interim between the necessity of turning the said cocks."

This passage certainly contains a description of an engine for raising water by the repellent power of steam; and from his

his expression, of one vessel of water, converted into steam, forcing up forty vessels of cold water to the height of forty feet, it is very probable that he had actually tried the experiment by a working model.

The marquis concluded his *Century of Inventions* by a promise to leave to posterity a book, wherein under each head the means of putting his several inventions in execution were to be described, with the assistance of plates; but as this work never appeared, we can only judge of his abilities by this specimen. He appears to have been a person of much knowledge and ingenuity; but his obscure and enigmatical account of these inventions, seems not so much intended to instruct the public as to raise wonder; and his encomiums on their utility and importance are, to a great degree, extravagant, resembling more the puff of an advertising tradesman, than the patriotic communications of a gentleman. The Marquis of Worcester was indeed a projector, and very importunate and mysterious withal in his applications for public encouragement.

It does not appear that he met with any public encouragement to his propositions; and though, at first sight, it seems surprising that an invention, by which the steam of boiling water is stated to be capable of producing a power equal to that of gunpowder, should be neglected for almost forty years; yet if we consider that the greater part of this *Century of Inventions* consists of things highly in the style of legerdemain, and some of them absolutely impossible, and contrary to all established rules of science, we need not so much wonder at the neglect which the whole experienced. For example, the 99th number of the *Century* is as follows:—"How to make one pound weight to raise an hundred as high as one pound falleth, and yet the hundred pounds descending doth what nothing less than one hundred pounds can effect."

It must be also further considered, that these projects were published at a time when true science was beginning to take place of empiricism.

The *Century of Inventions* appeared about three years after the establishment of the Royal Society, during the time of Mr. Boyle, Dr. Hooke, Dr. Wallis, Sir Christopher Wren, Sir Isaac Newton, and others equally skilled in calculations, as in the inventive parts of mechanics.

Under all these circumstances, it is not astonishing that the marquis's propositions in general should meet with a cool reception, or that this celebrated invention should be condemned to obscurity, amongst the other wonders with which it was accompanied.

The next attempt upon record, is that of Captain Thomas Savery, a commissioner of the sick and wounded, who, in the year 1698, obtained a patent for a new invention for raising water, and occasioning motion to all sorts of mill-work, by the impellent force of fire. This patent bears date the 25th July, in the tenth year of the reign of William III., that is 1698. The patent states, that the invention will be of great use for draining of mines, serving towns with water, and for working all sorts of mills.

In June 1669, he shewed a working model of his engine to the Royal Society, and in their *Transactions* for that year, viz. No. 253, vol. xxi. there is the following register:—

"Mr. Savery, June 14th, 1699, entertained the Royal Society with shewing a small model of his engine for raising water by the help of fire, which he set to work before them: the experiment succeeded according to expectation, and to their satisfaction." For the form and description of this engine, see the article *MECHANICS*.

Captain Savery, in the "*Miner's Friend*," in addition to the description of his engine, enumerates the following uses to which it may be applied, and which he describes rather fully, as follows; viz., 1st, to raise water for turning all sorts of mills; 2dly, supplying palaces, noblemen's and gentlemen's houses with water, and giving the means of extinguishing fires therein, by the water so raised; 3dly, the supplying cities and towns with water; 4thly, draining fens and marshes; 5thly, for ships; 6thly, for draining mines of water; and 7thly, for preventing damps in the said mines.

Dr. Harris, in his account of the fire engine, speaks of Captain Savery as one that he was acquainted with, and as a person of great merit and ingenuity. He first mentions another machine of Savery's, for rowing a ship in a calm by paddle-wheels placed at the vessel's side, of which the captain published an account in 1698; and it is worthy of remark, that the same kind of wheels, when actuated by improved steam engines, is the only method, amongst an infinite number of others, which at present has been found to answer for rowing vessels. Dr. Harris, in proceeding to the fire engine, says, "The other engine is for raising water by the force of fire, in which he has shewn as great ingenuity, depth of thought, and true mechanic skill, as ever discovered itself in any design of this nature." Notwithstanding this, Dr. Desaguliers has endeavoured to take away all the merit of the invention of the fire engine from Captain Savery, as if he had merely copied it from the Marquis of Worcester.

The account given by Dr. Desaguliers has been so frequently copied by different writers, that it is generally considered as correct; and we therefore think it a piece of justice to the memory of Captain Savery, to set his pretensions in a clearer light than has been generally done. The doctor says, "Captain Savery having read the Marquis of Worcester's book, was the first who put in practice the raising water by fire, which he proposed for the draining of mines. His engine is described in Harris's *Lexicon* (see the word *ENGINE*), which, being compared with the Marquis of Worcester's description, will easily appear to have been taken from him, though Captain Savery denied it; and the better to conceal the matter, bought up all the Marquis of Worcester's books that he could purchase in Paternoster-Row, and elsewhere, and burned them in the presence of the gentleman, his friend, who told me this. He said that he found out the power of steam by chance, and invented the following story to make people believe it; viz., that, having drank a flask of Florence at a tavern, and thrown the empty flask upon the fire, he called for a bason of water to wash his hands, and perceiving that the little wine left in the flask had filled up the flask with steam, he took the flask by the neck, and plunged the neck of it under the surface of the water in the bason, and the water of the bason was immediately driven up into the flask by the pressure of the air. Now he never made such an experiment then nor designedly afterwards, which I thus prove:—

"I made the experiment purposely with about half a glass of wine in a flask, which I laid upon the fire till it boiled into steam; then putting on a thick glove to prevent the neck of the flask from burning me, I plunged the mouth of the flask under the water that filled a bason, but the pressure of the atmosphere was so strong, that it beat the flask out of my hand with violence, and threw it up to the ceiling. As this must also have happened to Captain Savery, if ever he had made the experiment, he would not have failed to have told such a remarkable incident, which would have embellished his story."

This conclusion of the doctor's is altogether unphilosophical, and does not at all invalidate Captain Savery's account. We know that the Marquis of Worcester gave no hint concerning the contractibility or sudden condensation of steam, upon which all the merit of the modern engine depends. The Marquis of Worcester's engine was actuated wholly by the *elastic power of steam*, which he either found out, or proved by the bursting of a cannon, in part filled with water; but he gave not the least hint that steam so expanded is *capable of being again so far contracted in an instant*, as to leave the space it occupied in a vessel in a great measure a vacuum. This grand discovery was reserved to Captain Savery, and his account of its accidental origin is not at all improbable. The captain tells us, in the "*Miner's Friend*," that he did not bring his design to bear, until after a great number of fatiguing inquiries: and he actually erected several machines before he obtained his patent in July 1698. Many objections were made against the grant of that patent being passed; but in the hearing of these objections, the discovery of the Marquis of Worcester's prior claim was not mentioned:

mentioned: and, indeed, it is certain that the account given in the Century of Inventions could not instruct a person who was not sufficiently acquainted with the properties of steam to be able to invent the machine himself.

Desaguliers seems to have been too hasty in concluding that the captain had never made such an experiment as that of the wine-flask, because, in the single instances in which he tried it himself, he found the effect of the condensation took place in a much higher degree than reported by the captain. It is not difficult to conceive that a very small difference in the heat of the steam which filled the flask, and other circumstances, might create the whole of the difference in the result. And, on the whole, there is no reason to hesitate in believing that the captain actually took his hint of the condensation of steam from such an accident, and being of a very mechanical genius, he would naturally turn his thoughts towards the consideration of such a power; and the most obvious application of it would be to a machine on a construction similar to that described by the marquis. Or, if he really had been acquainted with, and considered the marquis's engine, he would easily see that the new principle of condensation might, with great advantage, be combined with the former, and thereby produce an effect more powerful than either of them could do alone. The only thing in the doctor's account which cannot now be disapproved is, that Captain Savery destroyed the Marquis of Worcester's books. Even if this is true, it may be accounted for; the captain must, first or last, have become acquainted with what had been before made public by the Marquis of Worcester; and after having in his books spoken of his invention, and his new power or cause of motion, and finding the marquis's inventions to be but little known, he might be tempted, in order to secure the whole credit and expected advantage to himself, to buy up the marquis's books and burn them. But the grounds for this assertion are very slight, and will never prevent the conclusion, that the great principle of obtaining force from the pressure of the atmosphere, by the condensation of the steam of boiling water, was a discovery for which we are indebted to Captain Savery, who had also the merit of first reducing it to practice in a most complete manner, in combination with the prior discovery of the marquis.

M. Amontons' Fire-Wheel.—The French writers who have treated of the steam-engine, seldom fail to mention Papin and M. Amontons as the first inventors of the method of raising water by steam, and speak of Savery as a person who put their ideas in execution, and brought them to perfection: we think it right on this account to state what was done by M. Amontons and Papin, although the attempts of the latter to employ the force of steam are not entitled to any notice, either from their originality, or from their real merit. It is probable, that the news of the patent granted to Savery in 1698, for raising water, and occasioning motion to mill-work by the impelling force of fire, excited the attention of the French academicians, before the means by which it was to be accomplished were made public, so as to be known abroad, and that they were thus induced to attempt the same thing; for in June 1699, which is the same month that Captain Savery shewed his machine at work before the Royal Society, M. Amontons delivered a memoir to the Royal Academy of Sciences at Paris, entitled "A commodious Way of substituting the Action of Fire instead of Men and Horses to move Machines."

This may be regarded as the first attempt to produce a circular motion by the means of fire, otherwise than by the aeolipile, or the fly of a smoke-jack: but as the motion of M. Amontons' wheel was to be produced by the alternate dilatation and contraction of air, and not of the steam of boiling water, it is nothing in common with Savery's machine, except that the first cause of motion is that of fire.

M. Amontons' fire-wheel, as he called it, consists of a number of close buckets, or chambers, placed in the circumference of a hollow wheel, and communicating with each other by valves opening in one direction; and a sufficient quantity of water is put into these buckets to fill about

one half of the number: another circle of similar buckets, but of larger dimensions, are placed on the outside of the circle of the former buckets; these large buckets contain air, and each one has a pipe conducted from it to one of the water-buckets which are nearer to the centre: a part of the circumference of the wheel, which is about the level of the centre, is exposed to the fire of a furnace, so that each air-bucket that passes will be heated; and also the lower part of the wheel is immersed in a cistern of cold water, so as to cool the same bucket again. The action of the machine may easily be understood. The air contained in the large bucket which is opposite the fire becomes heated and expanded, and by the pipe of communication it enters into that water-bucket which is at the low side of the wheel, and pressing upon the surface of the water therein, causes it to mount up through the other chambers, in the direction in which the valves open from one chamber to the next; the water, being thus accumulated in the chambers at one side of the wheel, will give it a preponderating power to turn round upon its axis. This motion brings another air-bucket opposite to the fire, and the air therein expands in its turn, and again elevates the water in the interior chambers as much as it had descended by the motion of the wheel; a continual succession is thus kept up, and the air-buckets which have passed the fire descend into the cold water, and the air is thereby cooled and reduced to its former bulk. By the communication with the water-buckets, the pressure of the expanded air is removed from within them, and puts them in a situation to repeat their action.

This machine is ingenious, and if a better application of fire, by rarefying water into steam, had not been discovered, it is possible that the invention of M. Amontons might have been further prosecuted. From his computations it would appear, that the machine he proposed would act with a considerable power; but as he exhibited no working model, or actual trial, it was never proved that the machine, if put into practice, would be capable of producing any thing near the effect promised by his calculations. Leupold, in his "Theatrum Hydraulicarum," 1724, proposed an improved form of this fire-wheel; and steam-engines have since been made with mercury, or fluid metal, contained within a hollow wheel, which is to be always kept on one side with the mercury by the force of the steam: they have not been found to equal other modes of applying the force of steam. Such of our readers as are curious to know more of the construction of M. Amontons' machine, can consult the original memoir; and they will also find a full account of it, with a figure, in Martin and Chambers' Abridgment of the Philosophical History and memoirs of the Royal Academy of Sciences at Paris, vol. i.

Papin's Pretensions to the Invention of the Steam Engine.—M. Papin, to whom the French attribute the invention of the steam engine, was a doctor of physic, and professor of mathematics at Marburg, in Germany, and in 1680 he was elected a fellow of the Royal Society of London. In the following year, and whilst in London, he invented and published a method of dissolving bones, and other animal solids, in water, by confining them in close vessels, which he called *digesters*, and which he made sufficiently strong to retain the steam and prevent all evaporation, so as to acquire a great degree of heat. About the same time Dr. Hooke, the most inquisitive experimental philosopher of that inquisitive age, observed that water could not be made to acquire above a certain temperature in the open air, and that as soon as it begins to boil, its temperature remains fixed, and an increase of heat only produces a more violent ebullition, and a more rapid waste. Papin's experiments with his digester rendered the elastic power of steam very familiar to him, and when he left England, and settled as professor of mathematics at Marburg, he made many attempts to employ this force in mechanics, and even for raising water.

By his own account, it appears that he had made some experiments with this view in 1698, by order of Charles, Landgrave of Hesse, but without effecting any thing. This is all the reason the French have to consider him as the first inventor

inventor of the steam engine. Nine years after Savery's patent he published an account of his invention, in a tract, entitled "Ars nova ad aquam ignis adminiculo efficacissime elevandum."—"A New Method of raising Water by the Force of Fire," printed at Cassel, 1707. This machine, which is described in Belidor's "Architecture Hydraulique," vol. ii., does not essentially differ from that of the Marquis of Worcester, but is far less perfect than Savery's: it works wholly by the repellent power of steam: the only advantage is, that the receiver being made cylindrical, the steam is separated from the cold water by a floating piston, and that the water is made to flow in some degree constantly, by being thrown into a large air-vessel. In this publication, Papin admits that he had seen a draft of Savery's engine, but says, that in the year 1698 he made a great number of experiments, by order of his serene highness Charles, Landgrave of Hesse, in order to raise water by the force of fire, which he communicated to several persons, and particularly to M. Leibnitz, who answered, that the same thought had occurred to himself. He also acknowledged that Captain Savery was about that time working upon the same subject in England, and that Savery had first published the fruit of his researches; that from 1698 the affair had lain dormant till the year 1705, when he received a letter from M. Leibnitz, then in London, which contained a draft of Captain Savery's engine, and desired Papin's opinion upon it. On shewing this draft to the landgrave, he ordered Papin to resume the work, and perfect the inventions which he had begun; and which Papin then published, not with a view to make it supposed that Captain Savery had taken the thoughts from him, but to shew the world its obligation to the landgrave, in having first formed a design so useful, and in having brought it to its present degree of perfection; and he labours much to shew that his engine is preferable to that of Captain Savery. Although we must allow Dr. Papin to compliment his patron and himself upon the success they met with, after encountering many unforeseen difficulties and experiments, which succeeded, as he tells us, quite contrary to their expectations, yet it cannot be allowed that Papin's experiments in 1698 were the first, because the Marquis of Worcester's publication was earlier by no less than thirty-five years: nor were they probable to have been so early as Savery's beginning, since we cannot suppose that he would be at the expence of a patent, without some previous experiments to confirm his speculation, or that he could bring his engine to the degree of perfection in which he exhibited it to the Royal Society on the 14th of June, 1699, in less than a year, at a period when workmen were not ready or skillful in the execution of such machines as they now are in this country.

The various improvements on Savery's engine made by *Blakey* and others, will be found under the article *Mechanics*, where the reader is also referred to the inventions of *Newcomen*, *Fitzgerald*, *A. Woolf*, *James Watt*, and *Hornblower*. Numerous have been the attempts since that period to improve the construction of the steam engine, but until the year 1823, no very great change was introduced. In this year appeared Mr. Perkins's steam engine.

This invention, as described in the *Edinburgh Philosophical Journal* for July 1823, appears to consist in substituting for the boiler a strong vessel of gun metal, which he very properly calls a *generator*, intending to subject the water to a heat of between 400° and 500°, and allowing it to escape only through a valve loaded with a weight equivalent to 35 atmospheres, while it is furnished with a safety valve loaded to 37, and with a gauge indicating, by means of a portion of compressed air, the actual pressure of the steam produced by it; and even the water that returns to the generator is subjected to a pressure of five or six atmospheres, which keeps it at a temperature of more than 300°. The generator contains eight gallons of water, or 2352 cylindrical inches, while the piston is two inches in diameter, and the cylinder 18 inches long, containing 72 cylindrical inches, or $\frac{1}{33}$ as much as the generator: affording a stroke of 12

inches, with a pressure initially of about 430 pounds on each square inch, that is, about 1300 pounds in the whole, or probably somewhat less, since the valve of the generator cannot be supposed to remain open long enough for the pressure on each side of it to become equal. The danger of explosion, which has hitherto prevented the general employment of engines with very high pressures, is here avoided by the great strength and the moderate dimensions of the apparatus; and besides the safety valves, a thin ball of copper, or a safety bulb, is provided, which will only sustain the pressure of 1000 pounds on the square inch, while every other part of the vessels is calculated to sustain 4000.

Mr. Perkins's mode of applying heat to the water appears in reality to be extremely advantageous, not so much from any evidence that has been produced respecting the performance of the engine, as from the fact asserted by the writer in the *Journal*, that "as much low pressure steam, of four pounds on the square inch, may be generated by one bushel of coals," employed upon three tubes of gun metal, communicating, by means of a loaded valve, with the boiler of a common engine, as by nine bushels applied in the ordinary manner. It has been conjectured that the heat is more easily communicated by the generator to the water, on account of the more intimate contact which subsists between them, and the absence of any nascent bubbles of steam in the neighbourhood of the common surface: but it appears to be more probable, that by far the most material part of the advantage depends upon the more perfect combustion of the coal at a high temperature near the external surface of the thick boiler: for it has been sufficiently proved by Sir. Humphry Davy and others, that an intense combustion evolves a much greater quantity of heat from the same materials than a more languid oxygenization.

The quantity of water, thrown out at each stroke, appears, from the table of densities inserted in this article, to be $\frac{1}{10}$ of the quantity that you will fill the cylinder, that is $\frac{1}{3530}$ of the content of the generator, and its conversion into steam at any temperature would not require, at the utmost, more than 940° of heat, that is, a quarter of a degree for the whole of the water in the vessel, and possibly not above one-fifth of a degree.

Numerous projectors have endeavoured to alter or improve the construction of the present steam engine; but though considerable improvements have taken place in minor details, and in accurately determining the relative proportions of the different parts, no important and general improvement on the engines previously described has been effected. We speak here strictly of the steam engine; for, of late, a new era has been constituted in science by the introduction of other gaseous fluids than steam, as prime movers.—Such engines ought, however, more properly to be called *vacuum engines*; a term, indeed, which would also include the majority of steam engines. As, however, the subject is mentioned, we shall not wait till our alphabetical arrangement brings us to that term, but shall introduce here what we have to say concerning these new instruments of motion.

The experiments of Mr. Faraday and Sir H. Davy, in which the condensation of gases into liquids was effected, led to the formation of the first gas engine. That able engineer, Mr. Brunel, was the inventor of it. The gas he used, was the carbonic acid; and the following is the structure of his engine:—

It consists of five distinct cylindrical vessels (see fig. 1, Pl. II.) The two exterior vessels, *a* and *b*, contain the carbonic acid reduced to the liquid form, and are called the *receivers*; from these it passes into the two adjoining vessels, *c* and *d*, termed *expansion vessels*; these last, having tubes of communication with the working cylinder, *e*, the piston therein (shown by dots) is operated upon by the alternate expansion and condensation of the gas, giving motion to the rod, *f*, and consequently to whatever machinery may be attached thereto.

As the working cylinder, *e*, is of the usual construction,

1 & 2 Brunel's Engine. 3 Chevreton's Engine.

Engraved for the Encyclopædia Londinensis 1827.

no further description of that part of the apparatus is necessary; and as the two vessels on one side of the cylinder are precisely similar to those on the other, a description of the receiver, *a*, and the expansion vessel, *c*, will apply to their counterparts, *b* and *d*; the two former (*a* and *c*) are therefore given in a separate figure in section, that their construction may be seen, and their operation better understood. The same letters of reference designate the like parts in both figures.

The communication of the condensing pump (before-mentioned) with the receiver, *a*, is through the orifice, *g*, which can be stopped at pleasure by the plug or stop-cock, *h*. When the receiver has been charged with the liquid and closed, a pipe, *i*, is applied to and connected to the expansion vessel, *c*, at *k*. *l* is a lining of wood (mahogany), or other non-conductor of heat, to prevent the absorption which would otherwise be occasioned, by the thick substance of the metal. The expansion vessel is connected through a pipe, *m*, to the working cylinder, *e*; these vessels contain oil, or any other suitable fluid, as a medium between the gas and the piston.

The receiver is a strong gun-metal vessel, of considerable thickness, in the interior of which are placed several thin copper tubes at *ooo*; the joints of these tubes through the top and bottom of the receiver are made perfectly tight by packing. The use of these tubes is to apply, alternately, heat and cold to the liquid contained in the receiver, without altering very sensibly the temperature of the cylinder. The operation of heating and cooling through the thin tubes, *ooo*, may be effected with warm water, steam, or any other heating medium; and cold water or any other cooling medium. For this purpose the tubes, *ooo*, are united by a chamber and cock, *pp*, by the opening of which, with the pipes, *oo*, hot and cold water may be alternately let in and forced through, by means of pumps, the cocks being worked in a similar manner to those in steam engines.

Now if hot water, say at 120°, is let in through the tubes of the receiver, *a*, and cold water at the same time through the receiver, *b*, the liquid in the first receiver will operate with a force of about 90 atmospheres, while the liquid in the receiver, *b*, will only exert a force of 40 or 50 atmospheres. The difference between these two pressures will, therefore, be the acting power; which, through the medium of the oil, will operate upon the piston in the working cylinder. It is easy to comprehend that, by letting hot water through the receiver, *b*, and cold water through the opposite one, *a*, a re-action will take place, which will produce in the working cylinder, *e*, an alternate movement of the piston, applicable by the rod, *f*, to various mechanical purposes as may be required.

It is to be observed, that the use of the gasometer and of the forcing-pumps is simply for obtaining the gas, and for charging the receivers with the liquid. When the receiver is once charged, and has been closed with the stop-cock, *h*, the gasometer and forcing-pumps are to be disconnected from the receiver by unscrewing the pipe, *i*, at the joint. The same pipe may, however, be used as the means of connecting the receiver with the expansion vessel; the adoption of two distinct pipes for these purposes is intentionally avoided, as it would become necessary in consequence to have two orifices, as well as two stop-cocks. It is obvious, that no difficulty exists in connecting the forcing pump with both receivers, as the small pipes used for that purpose may be made to reach either.

The most essential parts of this interesting invention are—the internal application of the tubes for conveying the heating and cooling medium; the cylindrical form, and the manner they are applied, rendering them capable of resisting the intense external pressure of the liquid, yet admitting of their being made so thin as to allow of the rapid and complete transmission of heat and cold through them; and the arrangements by which the receivers acting in opposition to each other produce, without any aid of intermediate valves, an alternating action, attended with scarcely any perceptible

diminution of power from friction, and bring into action a force so great, that it may almost be deemed irresistible.

A machine on the same principle was invented by Mr. Cheverton, and about the same time as Brunel's. It is not, however, so simple nor of so elegant an appearance, but has so much merit, that we shall introduce Mr. Cheverton's words:—He says, "I was, a few years ago, led by these views to turn my attention to the gases, having been forcibly struck with the prodigious pressure under which they are capable of being generated. Gunpowder, the fulminating powders generally, but especially that remarkable fluid, azotane, are examples in point. For mechanical purposes, a gradual production of gas is of course to be adopted. The evolution of carbonic acid gas, by the action of sulphuric acid on the carbonates, was an obvious case. On making the necessary calculations, this, with many other means, were found to be too expensive, because the scheme embraced this principle—an expenditure of the gas. It was, therefore, with no little pleasure that I read the paper laid before the Royal Society, containing an account of the experiments made by Sir Humphry Davy and Mr. Faraday, in which the condensation of the several gases into liquids was affected at a temperature, and under a pressure within practical limits, proving thereby that some of those gases to which my attention had been directed on the principle of their expenditure, could be reproduced in the fluid form, and used again in the same way as alcohol and ether. It immediately occurred to me, as a *sine qua non* condition of an engine working with such materials, that there be no moving joint to which the gas can have access; in short, that there must not be a possibility of its escape, and that the simplest and most obvious means of satisfying this condition, was to make the same vessel alternately a boiler and a condenser. Further consideration confirmed me in the idea of the practicability of this plan, since the difference of temperature required to produce a great difference in the elastic force of the gas is but a few degrees when the minimum elasticity is already considerable. The project of an engine, as represented in the figure prefixed, was therefore substantially completed; it remained only to adopt a mode of alternately heating and cooling the liquid employed. Several plans suggested themselves, but I prefer, for its simplicity, its certainty, and the ease with which it can be regulated, the method which will be immediately explained.

"Description of the Engine, fig. 3. Pl. II.—The figure presents a vertical section; with this remark, that as all the vessels have a circular form, an horizontal section becomes unnecessary. It is proper to observe, that the disposition of the parts as represented, has been adopted solely for the purpose of bringing the whole into one view. The engine consists of a duplication of parts, viz:—

"A A, two refrigerators, containing cold water. B B, calorators, containing hot oil. C C, alternators lined with wood, and filled alternately with the hot and cold medium. D D, generators, consisting of a cylindrical assemblage of capillary copper tubes, about half filled, at the minimum pressure, with the carbonic acid, or other liquid employed—they communicate with the upper end of E E, strong copper gasometers, lined with wood, nearly full of oil, at the minimum elasticity of the gas, but which, at its maximum, expels nearly the whole of it into the H, cylinder, in which works I, the piston. L L, solid wooden plungers. M M, capillary glass tubes, for observing the movements of the oil, and fixed in a particular manner—they are not absolutely necessary. N N, pipes for a constant supply of cold water. O O, pipes through which gas is in the first introduced, and oil occasionally injected, in order to supply the waste at the piston rod—they are closed in a particular manner. O P, boards floating on the oil. S S, circular cisterns containing oil, each having a circular row of lamps; (----), level of the water and of the oil; (.....), level of the separation between the water and the oil.

"Action of the Engine.—One of the gasometers being nearly full of oil, and the generator attached to it, with the

liquid contained therein, being reduced to the lower temperature, the elasticity of the gas is then at its minimum; but which will at all times be very considerable, especially if the carbonic acid, or the nitrous oxide, are the liquids employed; a flood of hot oil suddenly descends upon and surrounds the generator; instantly an evolution of gas takes place, and continues till its elasticity, pressing on the oil in the gasometer, causes the latter to rush into the cylinder, and carry with it the piston that works therein, to the further extremity. The duplication of the apparatus produces the return stroke, and thus an alternate movement is kept up. But to effect the re-action, the elasticity of the gas, which now occupies nearly the whole of the gasometer, must be reduced. For this purpose, the generator is flooded with cold water, which rises from below, bearing up the hot oil on its surface to the place from which it descended. The temperature of the generator and its liquid falls, the gas condenses rapidly on its extensive surface; its density as rapidly diminishes, it returns to its first elasticity, and the oil regains its former level in the gasometer. Again the water sinks, and the hot oil descends, and thus the same vessel becomes alternately a boiler and a condenser; in one case generating a gas, in the other a liquid.

“To force up the hot oil from the alternator into the calorator, in which it is heated, a plunger is immersed in the column of cold water contained in the refrigerator; this raises its level, and consequently the level of the column of water and oil with which it is in equilibrium. There is not the friction, concussion, or elaborate workmanship, which would attend a piston employed for this purpose. The specific gravity of the oil being less than that of water, there will of course be a difference and a varying difference in the altitude of the two columns when in equilibrium, according to well-known hydrostatic principles, but this is of no consequence. The plunger must be so proportioned, and immersed so deep, as to displace a body of water equal in volume to that of the oil elevated, besides what is required for the raising of its own level. Now it is obvious that here is an opportunity to regulate the power of the engine, for the less the plunger is raised the less is the descent of the hot oil, and consequently less of the liquid is exposed to its influence; a governor, therefore, would be very properly applied to the movements of the plungers. If a greater power is required than when the governor is at the extreme limit of its influence, that is, when the generator is entirely surrounded with hot oil, it may be produced by bringing the lamps nearer to the calorator, or by lighting a greater number of them. If, however, the same velocity of action is not required to be maintained, the engine, possessing in itself a source of self-regulation, will increase in energy for the occasion; because the slowness of the strokes, allowing a longer time for the heating of the liquid, its temperature will be raised to more than the ordinary degree, for this must be always less than that of the hot oil. The extent to which this enlargement of the power may be carried, and the facility with which it may be effected, is of great importance with respect to navigation, and will be duly appreciated by those conversant with the subject. It should be observed, that the action of the plungers must be a little in advance of that of the piston, in order to give time for the heating and cooling of the metal of the generator. There is this peculiarity in the engine, that it has neither valves, cocks, nor pumps, nor any moving joint, except that of the piston and its rod; hence its simplicity, and consequently the cheapness with which it may be constructed. The room which an eighty-horse power engine would occupy, would not probably be more than a cubical space of seven feet dimensions, so far as its cylinder and appendages are concerned. It would be quite practicable to attach a gauge to the engine, by which the pressure of the gas may be ascertained; and means are devised by which the height of the liquid in the generator may be known. The introduction of the carbonic acid, or other liquid employed, should be in the form of gas. For this purpose, the generator must be brought to a lower

temperature than the gasometer, which will occasion the greater part to condense therein; that which may form in the gasometer will distill over, after the apparatus for producing the gas is removed. It is also for this reason, that there is no fear that an accumulation of the liquid will take place in that vessel during the working of the engine. To prevent condensation, however, in any hurtful degree, its interior is lined with wood, and a board floats on the surface of the oil. Another plan would be, to maintain the gasometer at the higher temperature to which the liquid is raised; but this is by no means advisable if it can be avoided. The board is also of important use, in preventing the absorption of gas by the oil, during the greater pressure; which being evolved at the time of the collapse, would prove injurious, by diminishing the difference between the elastic forces. Oil is selected as the heating medium, because it is lighter than water, and has its boiling point so much higher. It is probable, however, that 212 degrees is a temperature sufficiently superior to that which the liquid will require to be raised, and such as will produce its almost instantaneous heating; if so, hot and cold water may be employed. From the relative position of the two mediums, little communication of heat can take place. The alternator is internally lined with wood, partly to prevent a loss of heat, but principally to preserve, as much as possible, the coldness of the water. In a locomotive engine, the water could only be occasionally changed; in the intervals, a cooling process may be at work, and the plungers would perform the office of a pump.”

The next of modern engines we feel it requisite to describe is, Mr. Eve's patent engine. We shall borrow in part his own description. He informs us, that he lays claim to improvements in the five following particulars:—

I. The application of revolving cones to rotary engines, for the purpose of compensating any loss by friction.

II. A steam generator so constructed of tubes, that the heat of the furnace shall cause the water to circulate constantly through these tubes, so that they shall be less liable to burn out or become oxidated.

III. An arrangement of one or more revolving cock or cocks, for the purpose of supplying the generator with water, in lieu of the ordinary forcing-pump.

IV. A new safety apparatus, by which the elasticity of steam in boilers is ascertained by weight applied directly instead of indirectly, as with the ordinary steel-yard valve.

V. An arrangement of cog-wheels, with a compound engine in such a manner, that the steam after having acted as high pressure, may be used with low pressure, with greater effect than in any engine now in use.

The manner in which each of these improvements is effected, we shall now proceed to explain; taking the specification of the patentee for our guide.

I. *The revolving Cones.*—Fig. 2. Pl. III. presents an end section; and fig. 3, a longitudinal section of this part of an engine, constructed according to Mr. Eve's simplest manner.—*a a* are the cylinder and cone, revolving in contact in opposite directions, the cone having one groove, and being one-third of the diameter of the cylinder, which latter has three wings or pistons, *c c c*, the ends of which, as they revolve, touch the outer case, *e*, and do not admit any steam to pass. The steam is admitted through the pipe *f*, and acting on the wing *c*, causes the cylinder to revolve until the said wing passes the pipe, *g*, where the stratum of steam lodged between each two wings is allowed to escape; the wing which has thus passed, falls into the groove *d*, of the cone, the bottom of which groove touches in passing, thus allowing no steam to escape between. The said wing, *c*, then passes again by the steam-pipe, *f*, and is acted upon as before described, and so in rotation. The cylinder, *a*, which is firmly fixed to its axis, *b*, rests on one side, on the outer case, *e*, through which the axis projects; but as there is some friction produced by the revolution of the said cylinder at its two ends, touching the outer case, Mr. Eve has placed a false end, *h h*, under the opposite end of the cylinder, which false end slides on the axis, *b*, freely, and

Eve's Patent steam-engine.

J. Ross sc

has a thread out at the end, by means of which, and the adjusting nut, *z*, the cylinder, if worn at the two ends can be easily tightened and adjusted. The adjusting nut is confined by the collar, *κ*, which collar is screwed to the outer case. The conical shape of the small runner, which can likewise be removed upwards or downwards in the outer case, serves to keep the two convex surfaces of the cylinder and cone in contact; so that no steam can escape between them. Mr. Eve conceives that from the conical shape of the runner, the longer the engine will be in use the better it will work, and the more steam-tight it will become.

By referring to fig. 4, which presents a longitudinal view of the conical runner, it will be seen that the groove, *d*, is cut into a separate piece of metal, which slides by an adjusting screw up and down in the empty space, *x*, so that when the engine is adjusted, the groove or the piece of metal into which the said groove is cut, can be moved up and down, so as to fit the wings of the cylinder by means of the adjusting screw, *o*. Two cog-wheels running into each other, are attached on the outside of the engine to the axis of the cylinder and cone, and are placed there for the purpose of producing a corresponding revolution of the said cylinder and cone, causing the groove of the cone to present itself regularly to the wings of the cylinder. *o* is a pinion, fixed to the other end of the axis, by means of which any machinery can be put into motion.

Mr. Eve has given a descriptions of two other modes of construction, founded on the same principle as the preceding; by means of which the power gained may be doubled, by the application of a double quantity of steam, but without any material augmentation in the size of the engine.

II. *The Steam Generator.*—Fig. 5 is a side view of the generator. *A*, the lower conduit pipe; *B* the steam receiver; *C C* are two pipes in which the water descends from the steam receiver to the lower or conduit pipe; *d* is the dome connected with the steam receiver, from which dome the steam enters into the steam-pipe, *F*, and into pipe *E*, which latter leads to the safety apparatus: *g g g g g g g g g g* are ten pipes which communicate with the lower conduit pipe, and the upper pipe or steam receiver. *p* is the grate and fire place, over the middle of which the smaller combination of pipes are placed: *o o* is the ash-pit; *Q* is an end which screws into the lower conduit pipe, by means of which the same may be cleaned out when necessary; the number of sections, number of pipes composing each section, and the manner in which the pipes are bent, is arbitrary. The generator or boiler is fed with water through the orifice *o*. The heat of the furnace will cause the water to circulate constantly through the tubes, thereby preventing the steam from driving the water out of them, and by which means they are in a great degree, prevented from burning out or oxidating. The tubes are from $\frac{1}{8}$ to $\frac{1}{4}$ inch thick, and 1 and 2 inches diameter; they may be of copper, iron, or any other metal which is sufficiently strong to bear the pressure. The pressure will be comparatively small, on account of the small size of the pipes, although steam of the highest pressure be used. Mr. Eve's horizontal pipes are $1\frac{1}{4}$ inch thick, and $9\frac{1}{2}$ inches diameter; the vertical pipes $\frac{3}{4}$ inch thick, and $4\frac{1}{2}$ inches diameter. To the orifice of each of the section pipes, where they enter into the horizontal tubes, there are valves attached, so that in case of a rupture in one of the sections to which they belong, the unbalanced pressure of steam will force the water so rapidly into the particular section that is ruptured, as to cause the valves to close, thereby preventing any waste of steam, and detaching the ruptured section from the rest of the generator, whereby the engine need not be stopped, but will only lose so much of its power as the proportion of one section to the remaining sound ones would be. The two large vertical, as well as the two large horizontal tubes, are imbedded in brick-work, and the sections only are exposed to the heat of the fire; it is, therefore, inferred, that no steam will be found or generated in the former, while the action of the fire will cause the steam and water to ascend rapidly through the small pipes into the steam receiver, while the water in the steam receiver, being heavier than the water

combined with steam in the smaller pipes, will descend through the vertical tubes into the lower conduit pipe, thereby causing a continual circulation through all the tubes, great and small. The steam will of course accumulate at the top, and through the dome find its way to the steam-pipe and safety apparatus. In case the circulation should be too rapid; and to prevent the possibility of the water being forced into the steam-pipe before it descends again into the vertical pipes, Mr. Eve has placed a piece of sheet iron, perforated with small holes, similar to a strainer, in the middle of the steam receiver, all across from end to end.

III. *The revolving cocks*, by which the generator is supplied with water, are explained by fig. 6. *n*, is a vessel filled with water, of any convenient shape; one side of which vessel is near the furnace, so as to keep the water warm. A tube at *O* connects this vessel with the generator, and this tube has two revolving cocks, *K* and *L*, with a chamber, *m*, between them. The cocks are made to revolve equally by cog wheels gearing into each other; so that, if cock *K* is open towards the water reservoir, cock *L* will be closed towards the tube leading to the generator. The chamber between the cocks, will, therefore, be filled with water through the cock, *L*. By that time cock *K*, closes, and *L* opens towards the generator; the water in the chamber will then descend through *O*, into the generator, by its own gravity, and its place be occupied, in the chamber, by steam from the generator. Cock *K*, opens again towards the chamber, and *L* is closed towards the generator; the steam in the chamber will be condensed by the water now entering, or escape into the water reservoir, *n*. This revolution will go on continually. If water be presented by cock *L*, to the generator, and the said generator should be sufficiently full, the water being up to the dotted lines, in such a case the water will not be received, but remains in the chamber until part or the whole is wanted, the cocks constantly revolving. By this arrangement, the water can be kept constantly at the desired height.

IV. *The Safety Apparatus.*—Figs. 7, 8, 9, 10, elucidate Mr. Eve's improvements in the safety apparatus, as applicable to his tubular circulatory steam generator, or to any other boiler where high or low pressure steam is generated. Fig. 5, shows a longitudinal section of the compound tube: *a*, is the piston rod, screwed into the piston, *b*, which piston fits into the cylindrical tube, *c*, screwed or otherwise fixed at its base into the pipe that connects it with the steam receiver or boiler. *O* is a hole perforated through *b*, to allow the steam to ascend into the hollow space, *n*, above the piston, so that the pressure is equal on both sides with the exception of the piston rod, the diameter of which alone, is unbalanced. The piece, *h*, screwed into the upper part of the tube *c*, prevents the steam from ascending higher; another piece, *g g*, having a hollow space on the top, is screwed into *h*. Both these pieces have a hole bored in their centre, lengthways, of a diameter equal to the piston rod, *a*, and to allow it to work up and down. The hollow space, *i i*, in the middle of the two pieces, *g* and *h*, is filled with packing so as to prevent any escape of steam along the piston. The hollow space, *p*, at the top, is filled with oil; *K K* is a bason, with water up to the dotted line, to keep the upper part cool, the weights, with which the safety apparatus are intended to be loaded, are placed on the collar, *m*. The hollow tube, *e*, has longitudinal openings, as will be perceived by fig. 7, which presents an outside front view of the apparatus, and through these openings the steam escapes whenever the piston, *b*, rises. These holes may be of an indefinite length and breadth; a jacket, *F*, represented by fig. 6, which fits over the tube, *c*, and has likewise the same number of longitudinal holes cut through it, slides over the said tube, and by adjusting this jacket at *X*, the channel for the escape steam can be made narrower, accordingly as it may be desirable to have the piston rod raised more or less. The hollow vessel, *L L*, or a vessel of any other form, slides or is otherwise fixed over the lower part of the apparatus, so as to intercept the steam from incommoding the upper part of it where the rod is loaded. The pipe, *g*, leads from this hollow vessel, *L*,

to the steam condenser, or serves for the escape of steam. Fig. 8, represents an outside view of the piston: *a*, is the rod already described; *c c*, are packing rings, two on the upper side and two on the lower side. These rings press against the tube, *c*, in order to keep it steam-tight, so that no steam can escape through the longitudinal openings; *d d*, are two pieces of metal, screwed on at the top and base of the piston, to confine the packing rings.

V. *The high and low pressure combination.*—A, fig. 1, is the furnace containing the steam generator or boiler: B, is the dome on the top of the steam receiver, with the steam pipe, C, and safety apparatus, M. D, is a cock upon pipe C, through which steam is admitted to the high-pressure engine, E. After having acted upon it, the said steam passes into the low pressure engine, F, constructed on Mr. Eve's principle on a larger scale, so as to allow the steam to expand, and then act upon it as low pressure: E and F, have pinion wheels of an equal pitch, gearing into a spur wheel, G; these wheels determine the power given to each engine by regulating their motion with reference to the power required from each. The steam finds its escape at Z, into the condenser, H; the condensed steam or water runs through pipe, I, by its own gravity, towards the two revolving cocks, K, whence it is conveyed back to the feeding pipe in the steam generator. V, is an engine, constructed upon the plan explained under head I., having two induction and two ejection pipes, which engine serves as a pump in this particular situation. Pipe, W, sucks the water from the well or river, and carries it into the refrigerator: X receives the water in the refrigerator, and carries it downwards; P is the bellows, fanning the fire by means of a band round the axle, Q, connected with two pulleys, R and S, or by any other contrivance; O is the valve and lever of the bellows, connected, by rod N, with the safety apparatus; T and U, are pulleys, connected by a band to give rotary motion to pump V; but many other contrivances may be used; L is a cock, which is only opened before the engine is set to work, in order that the air may be driven out of the pipes and condenser by the steam; the cock may then be shut, and the engine set to work; Y is a pipe leading from the safety apparatus to the condenser. If an engine, therefore, be so contrived, and the boiler once filled with water, the same water will answer for working the engine, as long as all the pipes through which the steam and water circulate, are tight; or, at any rate, the loss of water will be very inconsiderable.

The advantages supposed to attend these engines are thus summed up by the patentee:—

“It is presumed, in the first place, that from a steam generator so small as the above-described, containing little water and steam, with the provision made in its construction against any danger, even were a rupture to take place, no danger could possibly happen to persons near the engine.

“It is also obvious, that the quantity of fuel consumed, will bear a proportion to the boiler or steam generator, and that, comparatively, very little can be consumed in so small a furnace as my steam generator requires.

“There are no reciprocating parts, levers, fly-wheels, or valves, but simply two revolving parts; and, if I may so speak, the whole power of the steam is appropriated by the direct or first intention. The relative weight and bulk of this engine will require a few more words for elucidation. A more concentrated power in steam engines is attainable in two ways:—the first is by using steam of great elasticity; thus, on Mr. Perkins's plan, a cylinder, two inches in diameter, would be sufficient for a ten-horse power. The second method of diminishing the dimensions of steam engines is, to increase their mobility; that is, to give greater velocity to the part or parts on which the steam acts. This, in all engines having reciprocating motions, is limited; for motion, alternately in opposite directions, requires a certain time, otherwise the whole power of the engine may be consumed by simply overcoming the inertia. Now it is certain, abstractedly considered, that as we increase the velocity of the piston, we may decrease the size of the engine; if follows, therefore, from the above premises, that if we could

conveniently make use of steam of 150 pounds to the inch, instead of mere atmospheric pressure, and have 150 strokes to the same engine instead of 15, we should require 100 times the power; or, what is the object at issue, have the same power with an engine and generator in that proportion smaller.

“The first object, as regards high pressure, it will not be too much to concede, as it has been long ago practically attained by Evans, and others. And, as to the velocity which this engine is calculated to admit of from its construction, though not unlimited, it is certainly very great, much more than ten times that of reciprocating engines, and much greater even than that of rotary engines, that have reciprocating parts. Thus, if these premises be correct, it cannot be too much to say that this engine ought to have the same power as the engines in common use, though of smaller dimensions; and that the weight will be reduced, not in proportion to the reduction of its superficial, but its cubic dimensions.

“The simplicity of the engine (the next desideratum), I conceive, cannot be well increased, as the engine itself consists of but two revolving parts. And lastly, as a result, the expense of erecting an engine of a given power, on the construction of the above, ought to bear a proportion to the diminution of its bulk and weight, and greater simplicity.

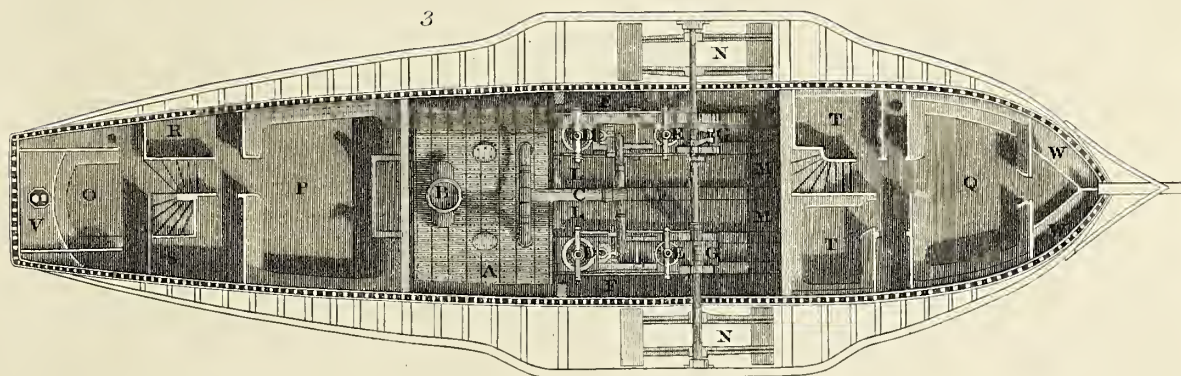

“The difficulty of availing ourselves of the advantage of using steam twice, that is, first as high pressure, and then in a condensing engine to any extent, is sufficiently apparent from the following considerations. It appears from Mr. Woolf's experiments, that steam, heated to balance six pounds to the inch, will expand into six times the volume under atmospheric pressure; at 20 pounds to 20 times; at 40 pounds to 40 times, and so on. Working with comparatively so low a pressure as 40 pounds to the inch, it would be found extremely inconvenient to use two engines whose capacities were as one to forty; and if not impossible, would appear ridiculous, if steam of 200 pounds elasticity, which is quite common in the United States, be used, as the second engine would have to be 200 times the capacity of the first, which, in this extreme case, would, at least, have a disproportionate appearance. All reciprocating engines, or those having reciprocating parts, will have to contend with this inconvenience; or, rather, can only avail themselves of a partial advantage from using high and low steam, as they have to work stroke for stroke. With my rotary steam engine the full benefit of this principle may be appropriated, as the engine that acts by high pressure may be made to revolve as much faster than the first as to allow of the full expansion of the steam before it is acted on, for the velocity may be carried to any extent required, without inconvenience.”

The application of the steam engine to navigation, and the earlier efforts that were made towards its improvement, are mentioned in the article MECHANICS. As, however, the subject is not very fully entered into in that place, we shall give it some further notice here. In the first place, as to the inventor of the steam, there are some disputes.

The method of propelling vessels by the action of wheels or paddles, instead of oars, is described in a very curious and learned treatise, *De Re Militari*, by Valturius, of Rimini, and first printed by John of Verona, in 1472.

From this book it is clear that, three or four centuries ago, boats, propelled by the action of paddle-wheels, were used on some of the large rivers in Italy, and, most probably, in other parts of the continent, for the transporting of troops. Valturius even speaks of pontoons, composed of three parts, like drums, which could be conjoined at any time, and again separated, to facilitate their carriage over land. The method of changing a reciprocating into a rotatory motion, by the help of a crank, though not applied to the steam engine till 50 or 60 years after its invention, had been understood and practised at the very dawn of the mechanical arts.

The atmospherical steam engine, which had been invented by Newcomen and improved by Beighton, began to be pretty generally adopted in the coal-works, about the year 1720; and

Elevation, plan, & section of a steam-boat.

Engraved for the Encyclopaedia Londinensis 1827.

and it does not seem to have required any great stretch of imagination to direct such an efficient power to other purposes besides the raising of water.

The first attempt, however, on record to apply steam to navigation, was made by a person of the name of Jonathan Hulls, who, on the 21st of December 1736, obtained a Patent, to endure for 14 years, for what may, without any impropriety, be called a *Steam-Boat*. The Letters Patent, and a description of this boat, illustrated with a plate, are contained in a very rare Tract, published by Hulls in 1737, under the following title: "A Description and Draught of a new invented Machine for carrying Vessels or Ships out of or into any Harbour, Port, or River, against Wind and Tide, or in a Calm."

Thus, Jonathan Hulls appears to have been the first person who suggested the propulsion of vessels by paddle-wheels moved by steam. His mode of converting the rectilinear into a rotatory motion was ingenious, though not so simple as the crank. It is most probable, however, that he possessed not the means, and did not receive at the time sufficient encouragement to carry his scheme into execution.

A long interval elapsed before a similar project was attempted. About the year 1772, the celebrated Mr. Watt had completely remodelled the steam engine; and before 1779 it was, by various improvements, reduced to a commodious form, and adapted to almost every purpose where great power was required. The idea of employing it to propel vessels then naturally suggested itself. One of the first to whom it occurred, was the Marquis De Jouffroy, who, in 1781, constructed a steam-boat on the Saone, at Lyons; it was 140 feet long, and he made several experiments with it.

In the year 1785, two keen competitors for the invention of steam navigation, appeared in America; namely, James Rumsey, of Virginia, and John Fitch, of Philadelphia.

But Mr. Symington was the first person who had the merit of successfully applying the power of the steam engine to the propulsion of vessels. Thomas Lord Dundas, of Kerse, wished him to construct a steam-boat for dragging vessels on the Forth and Clyde Canal, in place of horses. Agreeably to his Lordship's request, a series of experiments, which cost nearly 3000*l.*, were set on foot in the year 1801, and ended in 1802, upon a larger scale, and more improved plan, having a steam cylinder 22 inches diameter, and four feet stroke; and in March 1802, Lord Dundas, Archibald Speirs, Esq., of Elderslee, and several gentlemen of their acquaintance being on board, the steam-boat took in drag two loaded vessels, *Active* and *Euphemia*, of Grangemouth, Gow and Esplaine, masters, each upwards of 70 tons burthen, and with great ease carried them through the long reach of the Forth and Clyde Canal, to Port-Dundas, a distance of 19½ miles, in six hours, although the whole time it blew a very strong breeze right a-head; so much so, that no other vessels could move to windward, in the canal, that day, but those the steamer had in tow; which put beyond the possibility of doubt the utility of the scheme in canals or rivers, and ultimately on open seas; though in this state of forwardness it was opposed by some narrow-minded proprietors of the navigation, under a very mistaken idea, that the undulation of the water occasioned by the motion of the wheel, would wash and injure its banks: in consequence the boat was, with great reluctance, laid up in a creek of the canal, near Bainsford Drawbridge. In the year 1811, Henry Bell constructed the first steam-boat, *Comet*, to ply on the river Clyde, which was soon followed there by many more.

Considering the importance to America of navigating her mighty rivers, it is not surprising that the application of the power of steam to the propulsion of boats should, by persevering efforts, have been first carried into successful practice in that continent. This was achieved by the activity and zeal of Mr. Fulton, who appears evidently, however, to have derived all his primary knowledge of the subject from Mr. Symington's.

The first American steam-boat which completely succeeded, was launched at New York on the 3d of October

1807 (five years before the construction of the *Comet*, at Port-Glasgow), and soon after plied between that city and Albany, a distance of 160 miles.

In Britain, steam vessels were brought into general use in 1812, upon the Clyde. They were built at Port-Glasgow, Greenock, and Dumbarton, where the art of ship-building had for many years been conducted by carpenters eminent in their profession.

Having thus endeavoured to give a sketch of the origin of steam navigation, we shall now proceed to describe the form and parts of a steam-boat (suppose of 100 tons), and to some other details, calculated to furnish a more particular view of the present state of steam navigation in Britain and other countries.

Fig. 1. Pl. IV., is an elevation; fig. 2, a longitudinal section; fig. 3, a ground plan; fig. 4, a transverse section. The same letters refer alike to the respective parts of each figure: A, the two boilers, with their two manhole doors, one to each; B, the chimney; C, the steam pipes; DD, the cylinders of the two engines; EE, the two air pumps; F, the side lever; one on each side of each engine; GG, the crank of the paddle-wheel shaft; H, the rod that works the steam valves or hand gear, moved backward and forward by an eccentric wheel on the shaft; I, the nozzles; K, pillars of the framing; LL, the area where the firemen stands to put coals into the furnace; MM, place where the coals are stowed away; NN, the paddle-wheels and covers; O, ladies' parlour; P, principal cabin; Q, second cabin; having each a raised lantern or sky light, besides the lateral windows of P and Q; R, steward's room; S, breakfasting room; TT, refreshment rooms for the second cabin passengers; U, small boat ready to be let down on an emergency; V, rudder; WW, seamen's beds; XX, space for lumber or spare fuel. The fireman stands in the space LL; an iron trap-ladder leads down to it from the deck, flush with which are two horizontal gratings for the admission of fresh air to himself and the fire; his coals are built up behind him, and he brings down only a few lumps at a time, which he breaks into small pieces as required. The chimney B, is a series of sheet-iron cylinders rivetted at the joints, and slipt the one over the other. Each boiler has a flue within, making various convolutions under the surface of the water; through which the smoke and flame pass, until they enter the chimney.

These wheels being ponderous, acquire sufficient momentum to turn the crank, and supersede the necessity of a fly. The air-pump, feed-pump, and occasional cold water-pump, are wrought by rods from FF, the side horizontal levers. To prevent the waste steam of the boilers from annoying the passengers, a pipe conveys it into the chimney. Besides this, a waste steam valve is within reach of the engine-man, who loads and unloads it as he finds necessary: It is a curious fact, that a great flow of steam into the chimney prevents black smoke from issuing from it, which otherwise would. The paddle-wheels are firmly wedged on their shaft, and whatever pressure they exert against the water causes an equal re-action on the vessel, which is thus impelled either forwards or backwards according to the direction of circumvolution.

The principal cabin is painted, and otherwise tastefully fitted up, and furnished with a stove, the chimney of which rises up through the deck. The second cabin occupies the fore-end of the vessel, and is also completely furnished, though less elegantly. Small steam-boats, from 30 tons upwards, are generally laid out much in the same way, only varying according to the nature of their employment. When intended for sea voyages, a great part of the internal space is allotted for sleeping births.

It is remarkable that, after the first successful trial, very little improvement has been made in the construction of steam vessels. Experience has only fixed the suitable proportions of the several parts. Much, however, still remains to be done. The great objects wanted are to increase the power of the engine; to avoid the waste of force in the play of the paddles; and to render their action more equable.

The form and disposition of the paddles might certainly be improved. They seldom strike the water in the right direction, but splash it about, and leave it to impede the progress of the vessel. An irregular unpleasant motion is hence produced, and much force thereby lost. With a strong side-wind likewise, the larboard paddles are deeply immersed in the water, while the opposite ones are nearly suspended in the air, and scarcely act at all; the necessary consequence is, that, in such circumstances, the steam vessel describes a winding path, and becomes unmanageable by the helm. Proposals of various kinds have been made to obviate this defect; but though apparently ingenious, our practical engineers have not adopted them.

Of the application of steam to the propulsion of land-carriages, we have given an example in the article *MECHANICS*. The machine there described works by means of cogged wheels on a railway. On such a road it is easy to construct steam carriages that will travel with the most perfect safety, laden with almost any weight, and capable of the utmost velocity than can be required. The great expense of railways, however, has caused the use of these engines to be much circumscribed, and accordingly it has become a desideratum to construct a machine that could travel on the common roads. This is obviously very difficult, on account of the numerous irregularities presented to the feet of the engine; irregularities clearly of such a nature, that they cannot be calculated. Many ingenious attempts have been made; but that which appears to us to be the best, is Sir George Cayley's: he calls it his "Patent Universal Railway;" at fig. 6, Pl. I. it is seen. It is not furnished with its steam engine, but this is obviously easily added. This vehicle is formed by two endless chains, consisting of portions of a railway so jointed that they form an inflexible right line when resting on the ground, but each capable of coiling round a fore and hind wheel on one side of the wagon, and thus of revolving with them (see prefixed drawings.) Each joint carries with it a supporting piece or foot, which, in the engraving here given, is a small broad wheel, the line of its axle being parallel with the rail-chain. These, of course, give any required degree of lateral motion, but this movement is checked in the case of a road inclined towards one side, by a wheel placed on a hinged axle in such a manner as to operate laterally in the same way that a dray-pole does longitudinally when a carriage backs upon it: this wheel is not shown in the plate. Sledge-shaped feet are, on some occasions, substituted for these wheel-feet, particularly when broader supporting surfaces are necessary. Each link consists of a double frame of iron, with a space between them, so constructed as never to approach the two adjoining links within a couple of inches in any part but where the angular motion of the joint is stopped by a projecting piece of solid ash wood, resting on a flat face of iron (see A, fig. 7), where one link and its appendages are shown on an enlarged scale, and its connexion with the adjoining links by dotted lines.

A, fig. 8, shows a portion of the interior structure of a link, with the bed for the oak piece.

Fig. 9 is transverse section of the rail on a smaller scale, showing the mode of mounting the small wheels, each link being cast or forged in two pieces united longitudinally, by transverse bolts, B B, fig. 7.

C, in fig. 6, is a wheel not touching the rail-chain, but close to its surface, to support the chain when exposed to violent strains. This rail-chain obviously adds considerable weight to a vehicle, and it can only be determined by experiments on a large scale, whether this evil is more than counterbalanced by the very advantageous mechanical properties it possesses.

It is obvious from the construction, that if this vehicle were pushed forward over a precipice, it would keep putting down its feet in an horizontal line in the air, till the line of direction from the centre of gravity passed over the edge, then the whole would balance over and fall together; but if another precipice at the same horizontal level were within

reach of the leading foot before the vehicle did balance over, this foot would sustain the carriage in its path as correctly as if the way had been unbroken. Hence, as the hollow irregularities in bad roads will seldom, if ever, exceed half the length of the vehicle, these will not in the slightest degree affect the smooth course of the machine.

With respect to hard points that rise above the ordinary level of the road, three out of four will be avoided in the space between the feet; and as the number of points on which the chain rests must keep it about the average or middle height between the lowest and highest parts of the road, each elevated point that is hit by a foot will not cause more than half the immediate rise of wheel on the chain, that the usual depression on either side will give to an ordinary wheel on the road.

In addition to these advantages, the elevation is converted into an inclined plane of the length of one link, upon which the fore-wheel ascends, and into a similar but reversed inclined plane down which the hind-wheel descends, thus restoring the power required for the rise.

The perfect practicability of using steam for all purposes of conveyance, has been no where so completely shown as on the Darlington and Stockton railroad. The engine used here, will travel over the 25 miles seven times a-day, making 175 miles a day's work, with 90 tons, consuming seven tons of small coals each day, or 42 tons per week; which, at an average cost of 7s., will be 14*l.* 14s. One man and a boy in constant attendance, supposing the 24 hours equal to three days, will be three men and thirteen boys each day, at 16s. 6*d.*, will add 5*l.* 3s. 6*d.*, making the total weekly expense 19*l.* 17s. 6*d.* The engine will cost 600*l.*, 80 waggons 900*l.*, giving 1500*l.* for the entire expense.

Now, 90 tons will load six boats; each of these boats will be a day in performing 20 miles; therefore 52 boats, with 52 horses, 52 men, and 52 boys, will be required to execute the transfer of 90 tons 175 miles in one day; each horse will cost weekly a guinea, each man a guinea, and each boy 12s., forming a total weekly charge of 140*l.* 8s. in lieu of 19*l.* 17s. 6*d.* The 52 boats and horses will be worth 10,000*l.*, and requiring a considerably greater amount to keep them in repair; throwing a balance of full 7000*l.* per annum in favour of every locomotive engine that may be used. How many may eventually be at work it would be difficult to conjecture; but as 40 would be required to work the London, Birmingham, and Liverpool, and the Manchester and Stockport lines, in all probability not less than 500 would be employed: and, as the saving on every five engines would be equal to the interest of one million, the 500 would put the people yearly in possession of a sum as great as the interest of one hundred millions sterling, independent of the advantage of speed, and of the great saving of tonnage, the rail-road lines being one-third shorter than the canals in use. Finally, 1000 persons may be conveyed one mile, or one person 1000 miles, by locomotive engines, at the rate of eight miles an hour, at a cost of something less than five pence.

Of all the purposes that steam has been applied to, one of the most astonishing, though certainly not the most useful, is the projection of balls. The steam gun of Mr. Perkins was exhibited to the Duke of Wellington and other officers, in the year 1825, with the following surprizing results. At first, the balls were discharged at short intervals, in imitation of artillery firing, against an iron target, at the distance of thirty-five yards. Such was the force with which they were driven, that they were completely shattered to atoms. In the next experiment the balls were discharged at a frame of wood, and they actually passed through eleven one-inch planks of the hardest deal, placed at a distance of an inch from each other. Afterwards they were propelled against an iron plate one-fourth of an inch thick: at the very first trial the ball passed through it. The pressure of steam employed to effect this wonderful force did not at first exceed 65 atmospheres, or 900*lbs.* to the square inch; and it was repeatedly stated by Mr. Perkins, that the pressure might be carried

carried even to 200 atmospheres with perfect safety. Mr. Perkins next proceeded to demonstrate the rapidity with which musket balls might be projected by the same agency. To effect this, he screwed on to the gun-barrel a tube filled with balls, which falling down by their own gravity into the barrel, were projected, one by one, with such extraordinary velocity, as to demonstrate that, by means of a succession of tubes, filled with balls, fixed in a wheel, nearly one thousand balls per minute might be discharged. In subsequent discharges or volleys, the barrel, to which is attached a moveable joint, was given a lateral direction, and the balls perforated a plank nearly twelve feet in length. Thus, if opposed to a regiment in line, the steam-gun might be made to act from one of its extremities to the other. A similar plank was afterwards placed in a perpendicular position, and, in like manner, there was a stream of shot-holes from the top to the bottom. It is thus proved that the steam-gun has not only the force of gunpowder, but also admits of any direction being given to it. The advantage, in point of economy, is thus estimated:—Suppose 250 balls are discharged in a minute by the single-barrel steam-gun, or 15,000 per hour, this, for 16 hours, would require 15,000 ounces of gunpowder per hour, or 15,000 pounds weight for the 16 hours. The expense of gunpowder being 70s. per cwt., or 35*l.* per thousand, the total is 525*l.* Mr. Perkins says, that he can throw that number of balls in succession for the price of five bushels of coals per hour, or between 3*l.* or 4*l.* only for 16 hours.

The particulars of the structure of Mr. Perkins' gun, have not transpired; but it is of course sufficiently easy to be arrived at by any intelligent mechanic. War, is however, sufficiently dreadful in its present state, and, it is therefore hoped, that to the purpose of carnage, steam, hitherto sacred to the arts of peace, will never be applied.

STEAN, *s.* Applied by Spenser to the urn of Aquarius. [*Ἰσθῆνα, Sax. a pot.*] A vessel of stone. *Stean* is a jar, and still so called in the west of England.

Upon a huge great earth-pot *stean* he stood,
From whose wide mouth there flowed forth the Roman flood.
Spenser.

STEANBRIDGE, the name of three small hamlets of England, in Gloucestershire, in the parishes of Painswick, Bisley, and Stroud.

STEATITE, a mineral particularly distinguished for its unctuous feel, resembling that of soap. See MINEROLOGY.

STEATOCELE [from the Gr. *στέαρ, fat, κηλη, a tumour.*] A swelling of the scrotum, containing fat.

STEATOMA, *s.* [*στέατωμα.*] A species of wen.—If the matter in a wen resembles milk curds, the tumour is called atheroma; if like honey, meliceris; and if composed of fat, *scatoma*. *Sharp.*

STEBBING, a parish of England, in Essex; 3 miles north-east of Great Dunmow. Population 1072.

STEBBINGFORD, a small hamlet of England, in Essex, 3 miles from Dunmow, where there is a fair 10th July.

STECHELDEN. See STEPHANSFELDEN.

STECHWORTH, a parish of England, in Cambridgeshire; 2 miles from Newmarket. Population 336.

STECKBORN, a small town of the Swiss canton of Thurgovia, on the lake of Zell; 7 miles west of Constance.

STEDHAM, a parish of England, in Sussex; 2 miles west-north-west of Midhurst.

STEE, or STEY, *s.* A ladder. Common in the north of England.

STEED, *s.* [*ἵπτεbe.*] A horse for state or war.
My noble steed I give him,
With all his trim belonging. *Shakspeare.*
Impresses quaint, caparisons and steeds. *Milton.*
Who, like our active African, instructs
The fiery steed, and trains him to his hand? *Addison.*

STEEL, *s.* [*ἱσῆλ, ἱσῆλε, Sax. stael, Dutch, stal, Icel. a stel, Su. Goth. rigidus; sic Icel. stacla, indurare. Serenius.*] A kind of iron, refined and purified by the fire with other in-

gredients, which renders it white, and its grain closer and finer than common iron. Steel, of all other metals, is that susceptible of the greatest degree of hardness, when well tempered; whence its great use in the making of tools and instruments of all kinds.

At her back a bow and quiver gay,
Stuff'd with *steel-headed* darts wherewith she quell'd
The savage beasts in her victorious play. *Spenser.*

With mighty bars of long-enduring brass
The *steel-bound* doors and iron gates he ties. *Fairfax.*

It is often used metonymically for weapons or armour.
Brave Macbeth with his brandish'd *steel*,
Which smok'd with bloody execution,
Carv'd out his passage till he had fac'd the slave.
Shakspeare.

Polish'd *steel* from far severely shines. *Dryden.*—Chalybeate medicines.—After relaxing, *steel* strengthens the solids, and is likewise an antiacid. *Arbuthnot.*—It is used proverbially for hardness; as hearts of *steel*.

STEEL, *adj.* Made of steel.
A lance then took he, with a keene *stele* head,
To be his keepe off, both 'gainst men and dogges. *Chapman.*

To STEEL, *v. a.* To point or edge with steel.
Add proof unto mine armour with thy prayers,
And with thy blessings *steel* my lance's paint. *Shakspeare.*

To make hard or firm. It is used, if it be applied to the mind, very often in a bad sense.—Lies well *steel'd* with weighty arguments. *Shakspeare.*

So service shall with *steed* fingers toil,
And labour shall refresh itself with hope. *Shakspeare.*

O God of battles! *steel* my soldiers' hearts,
Possess them not with fear. *Shakspeare.*

Let the *steel'd* Turk be deaf to matron's cries,
See virgins ravish'd with relentless eyes. *Tickell.*

So perish'd all those breasts the furies *steel'd*,
And curs'd with hearts unknowing how to yield. *Pope.*

STEEL is a most valuable metal, consisting of iron combined with carbon. It is chiefly used for edge-tools, and other cutting instruments, and from its fine polish is used in ornaments of various kinds.

In chemistry it is called a carburet of iron. Its hardness is greater than that of iron; and its most valuable property is, that it can be made harder than any other metal, by suddenly cooling it when heated to redness: also, if it is heated to a lower temperature than redness, and suddenly cooled, it becomes the most elastic of all the metals. It is of a darker colour when polished, and retains its polish longer, not being so liable to oxydate.

The specific gravity of steel is greater than that of iron, thus, the spec. grav. of cast-iron is .72070; malleable iron, .77880; steel in its soft state, .78404; hardened steel, .78180.

Steel is manufactured by two processes, one in which the steel is made from pig-iron at once in the finery: this is practised in Germany, and is called natural steel. Cemented steel is formed by stratifying bars of iron with powdered charcoal in a close vessel, and by keeping the mass at a brisk red heat for a longer or shorter time, depending upon the size of the bars. This process is called *conversion*. The test of the conversion being complete is its blistered appearance, from which it has been called *blistered* steel. It is from blistered steel that all the different kinds of steel are manufactured. These are principally of two varieties, viz. *cast-steel* and *shear-steel*.

Cast-steel is blistered steel fused and cast into ingots, which are afterwards drawn into rods by the hammer, or by rolling. By this change the steel becomes much harder and of course entirely free from those seams and other defects which exist in the blistered steel: this is what renders cast-steel so much better for polished goods: for when blistered

blistered steel is attempted to be polished, the surface is seen to abound with numerous spots, arising from mechanical defects in the bars previous to conversion.

Cast-steel works much harder under the hammer, and will not bear much more than a red heat, without breaking in pieces under it. This, however, is more especially confined to that commonly made; since cast-steel may be made which will bear a white and even a welding heat; but it requires a much greater heat for its fusion, and would in consequence be sold at a higher price.

The refuse of blistered or common steel is generally melted into cast-steel; but this is not of the best quality. The best cast-steel is made by melting the bars of blistered steel, which, for this purpose, are a little more converted than for ordinary purposes, in order to give the steel a little more carbon than if it were used in the state of blistered steel. The bars are broken into small pieces, for the purpose of stowing the greatest quantity in the crucible.

STEEL POINT; a cape on the east coast of Labrador. Lat. 58. 40. N. long. 62: W.

STEELE (Sir Richard), a political and miscellaneous writer of considerable note, was born at Dublin, either in 1671 or 1676. His father, who was of English extraction, had been for some time private secretary to the first duke of Ormond, through whose influence the son was sent, at an early age, to England, and placed at the Charter-House for education. In 1691 he was entered of Merton college, Oxford. Of his academical life little or nothing is known, except that he composed a comedy during his residence, which, by the advice of a fellow-collegian, he suppressed. He left the university without a degree, and feeling a strong inclination for the army, he entered himself as a private in the horse-guards, but his friends soon after procured for him an ensign's commission. Feeling that he might not be able effectually to resist the temptations incident to his age and situation, he drew up a little treatise for his own admonition, and which is well known even now, entitled "The Christian Hero:" this was printed in the year 1701, at which time the author was secretary to Lord Cutts, and had, by his means, obtained a company in a regiment of fusiliers. The seriousness of the work exposed him to some ridicule among his companions, and the more so, as it failed in producing the corresponding good effect in regulating his own morals; he therefore, "to enliven his character," as he says of himself, brought out a comedy, entitled "The Funeral, or Grief à-la-mode." This piece proved successful: it had the merit of uniting entertainment with the more direct purpose of moral improvement, than was usual among dramatists at that time. Either on this or on other accounts he attracted the notice of king William, who meant to have bestowed upon him some mark of the royal favour, but he did not live to effect his intention. He obtained the very humble office of gazette-writer under queen Anne; but he now pursued his career as a writer, and in 1704, brought out his comedy of "The Tender Husband," which was acted with great success. This was followed by "The Lying Lover," which was not well received.

In 1709, Steele began a series of periodical papers, which, more than any of his other exertions, has contributed to establish his fame. The "Tatler," with which it began, was formed upon a plan which included the political information of a common newspaper. Its main object was, however, to improve the morals and manners, by holding up to ridicule fashionable follies and vices of every kind, and inculcating just and liberal sentiments on common topics, with a general regard to the proper decorum of social life. The author was fully qualified for this task by a knowledge of the world, acquired in free converse with it, by natural humour and vivacity, and by a generous and benevolent way of thinking. He had likewise the felicity of being able to engage coadjutors of considerable talents, among whom were Addison and Swift. The "Tatler" was extensively circulated, and as, in its politics, it sided with the minister, Steele obtained the reward of a place among the commissioners of the stamp-duties, which he retained after the dismissal of

the ministers who had granted it. In 1711, this paper was succeeded by the more celebrated "Spectator," in which the plan was matured, the politics of the day were rejected, and the assistance of Addison and other eminent writers was more constant, though Steele continued his own most active services. This work was brought to a close, and the "Guardian" commenced in 1713, and was terminated in the same year. He afterwards engaged in other periodical works, but being subservient to mere political purposes, they have all been long since forgotten.

On taking a decided political character against the government, he resigned his post in the stamp-office, and likewise his pension, which he had hitherto received, as having belonged to the household of the late prince, George of Denmark. He was now returned member of parliament for the borough of Stockbridge. He had not taken his seat long before he was expelled as the author of certain publications to which his name was prefixed, and which the House voted to be seditious and scandalous libels. The most noted of these, entitled "The Crisis," was not written by Steele, but by a friend and political coadjutor. The charge exhibited on this occasion, that the libels, as they were called, contained many expressions highly reflecting upon her majesty, &c., maliciously insinuating that the Protestant succession in the house of Hanover is in danger under her majesty's administration. Steele met with very able as well as zealous defenders in Addison, the Walpoles, Lords Finch, Lunley, and Hinchinbroke; but the party in power was determined on the sacrifice, and the charge against him was affirmed by a majority of nearly two to one. After his expulsion, he engaged in some literary undertakings; but on the accession of George I. he was taken into favour, and was presented with a small appointment under government.

Having procured a licence to be chief manager of the royal company of comedians, he had interest enough to get this licence exchanged for a patent for life as governor of that company. In the first parliament of the new reign, he re-entered the House as a member for Boroughbridge, in Yorkshire; and in April 1715, he received the honour of knighthood, on presenting an address: and about the same time, the more substantial reward of 500*l.* was given him by Sir Robert Walpole, for special service. Thus encouraged, his fertile pen produced a variety of political tracts in favour of that cause which seemed at all times to be near his heart, as well in its depressed as in its triumphant state. Having been appointed, in 1717, one of the commissioners for enquiring into the estates forfeited by the late rebellion in Scotland, he went to that country, and was treated in it with great respect, notwithstanding the unwelcomeness of the errand on which he was sent. It was on this occasion that he conceived the project of forming an union between the Scotch and English churches, and had several conferences with the Presbyterian ministers respecting the restoration of episcopacy; but his zeal, it is said, was not directed by judgment. He obtained, and with much justice, the character of a projector, which was both the effect and cause of that perpetual embarrassment under which he laboured, and which was principally owing to a radical want of economy, and a strange inclination to expences. He was twice married, and with each wife he had a good fortune; yet he seems to have been always necessitous. In 1718, he had a project for conveying fish to market alive, for which he obtained a patent, which, instead of mending his circumstances, only involved him still deeper in difficulties. His biographers observe, that "it were to be wished that his distresses had occasioned no other sacrifices than that of money; but there is reason to suppose that they sometimes interfered with the dictates of conscience." Whiston says, that once having met with Steele, after a vote in parliament contrary to his former declarations, with which he slightly upbraided him, the knight replied, "Mr. Whiston, you can walk on foot, but I cannot." Steele's spirit was not, however, formed for implicit submission, and for his opposition to the peerage-bill in 1719, he was deprived of his theatrical patent. He appealed to the public, and was restored in the following

following year. He pleaded the cause of the nation by a pamphlet against the South Sea scheme. In 1722, he brought forward his comedy of "The Conscious Lovers," which was received with great applause. He dedicated it to the king, and was remunerated with 500*l.*; but his embarrassments pressed upon him; and in addition to his other misfortunes, he engaged in an unsuccessful law-suit. Broken in fortune and constitution, he retired to an estate in Wales, where he died in 1729.

He appears to have been much beloved for the benevolence and warmth of his heart: in understanding, he has been characterized as a man of parts rather than of genius: his productions are lively, but they display neither great force nor accuracy. His style and his train of thinking are equally lax and incorrect. He was a lover of virtue, and frequently painted it in pleasing and attractive colours. His reputation as a writer seems to have been much indebted to the partnerships which he formed; and his name is scarcely entitled to a place among those which throw peculiar lustre upon the period of English literature. *Biog. Brit.*

STEELER, in Ship-Building, a name given to the foremost or aftermost plank, in a strake which drops short of the stem and stern-post, and of which the end or butt nearest the rabbet is wrought very narrow, and well forward or aft. Its use is to take out the snying-edge occasioned by a full bow, or sudden circular buttock.

STEELY, *adj.* Made of steel.

Thy brother's blood the thirsty earth hath drunk,
Broach'd with the *steely* point of Clifford's lance.

Shakspeare.

Hard; firm: unmoved; unfeeling.—That she would unarm her noble heart of that *steely* resistance against the sweet blows of love. *Sidnev.*

STEE'LYARD, *s.* A kind of balance, in which the weight is moved along an iron rod, and grows heavier as it is removed farther from the fulcrum.—The muscle at the shoulder, by which the arm is raised, is fixed nearly in the same manner as the load is fixed upon a *steelyard*, within a few decimals, we will say, of an inch from the centre upon which the *steelyard* turns. *Paley.*

STEE'LYARD-SWING. In the philosophical Transactions (No. 462. sect. 5.) we have an account of the *steelyard*-swing, proposed as a mechanical method for assisting children labouring under deformities.

STEEN, or STEAN, *s.* A vessel of clay or stone. *Un-used.*

STEEN (Jan), one of the brightest ornaments of the Flemish school of painting, was born at Leyden, in 1636. His father was a brewer in that city, who, perceiving an inclination in his son for painting, placed him as a pupil with N. Knuffer, an historical painter at Utrecht.

That he might not be entirely dependent upon his talents as an artist, his father established him in a brewhouse at Delft; but this kindness, which might have secured him comfort, only afforded him the means of sensual indulgence, to which he was prone, and which, in a short time, led to the ruin of the concern; and his father finding him irclaimably bent on dissipation, at length abandoned him. He afterwards became a keeper of a tavern; but this was a more ruinous occupation than the former, and soon brought on the calamities his conduct merited; as he was said to be a more active consumer of his own stores than any of his customers.

Amidst the interruptions of indulgence and of business, he continued constantly to practise the art he had acquired; presenting generally the scenes and subjects in which he passed his time and were most congenial to him. The festivity, frolic, and fun of low life, in the alehouse or other places of public resort, he treated with the clearest expression and character; and executed them with a pure tone of colour, and a freedom of touch peculiarly his own. Sometimes, however, he soared somewhat higher, and entering the domestic circles of his friends, perpetuated with the greatest felicity the diversities of character and amusements

Vol. XXIII. No. 1591.

which presented themselves to his observant and intuitive eye. In no man's pictures is an observer more amused with variety than in Jan Steen's; or more entertained by wit and humour, unless it be in those of our own Hogarth. His drawing and composition are in general very good, and his colour admirable, particularly in parts; but oftentimes his management of chiaro-scuro is deficient, and his pictures want air. While he lived, his works were not in much estimation; perhaps his vulgar and disorderly habits prevented them from being known: but since his death, and particularly since Sir Joshua Reynolds evinced an estimation of them, they have risen in value, and are now sold, when of fine quality, at very great prices, and sought with avidity. He died in 1689, at the age of 53.

STEEN PLAAT, a town on the west coast of the island of Gilolo. Lat. 1. 20. N. long. 127. 21. E.

STEENBERGEN, a fortified town of the Netherlands, in North Brabant, with a population of 4200. It was formerly a more considerable place, and was a sea-port; but the tide does not now come within two miles of it; 7 miles north of Bergen-op-Zoom, 19 west of Breda, and 25 north-north-west of Antwerp.

STEENBERGEN, a mountain of Southern Africa, in the territory of the Cape of Good Hope.

STEENDEREN, a small inland town of the Netherlands, province of Gelderland, with 2000 inhabitants; 6 miles south of Zutphen.

STEENKERKE, a small inland town of the Netherlands, in the province of Hainault. It has only 700 inhabitants, but is remarkable for an obstinate battle fought here on 24th July, 1692, between the allies and the French, in which the latter were victorious; 4 miles north-west of Braine-le-Compte, and 13 north of Mons.

STEE'NKIRK, *s.* Formerly a cant term for a neckcloth.—As for ruffles and *steenkirks*, they were never added in the very splendor and luxury of the empire! *King.*

STEENWORDE, a small town in French Flanders, with 3200 inhabitants. It has some manufactures of linen, woollens, and leather; 22 miles north-west of Lille.

STEENWYCK (Henry), was born at Steenwyck in 1550. He was a scholar of John de Vries, a painter of perspective and architectural scenes. Steenwyck surpassed his master in the same subjects, viz., interiors of churches and Gothic buildings, which he painted with great neatness and clearness. His colouring is rich and brilliant, but he injured his effects by painting the lights too much in lines, unblended and too sharp, which destroys the appearance of solidity.

He died in 1603, and left a son, Henry Steenwyck, born in 1589 at Antwerp, who excelled him in the same line and manner. He usually painted on a larger scale than his father. Vandyck, with whom he lived in intimacy, recommended him to Charles I., who invited him to England, where he resided several years, and died in London. The pictures of both these painters were embellished with figures by friendly artists, as old Franck, Teniers, Breughel, Van Thulden, &c.

STEENWYK, a small town of the Netherlands, in the province of Overysse, on the river Aa, with 1800 inhabitants; 20 miles north of Zwoll.

STEENWYKER-WOLD, a village of the Netherlands, in the province of Overysse, a little to the north of Steenwyk, with 800 inhabitants.

STEEP, *adj.* [*steap*, Sax.; *steypa*, Su. Goth., to fall or run down with violence; *stupa*, Swed., to fall. *Serenius.*] Rising or descending with great inclination; precipitous.—The mountains shall be thrown down, and the *steep* places shall fall. *Ezek.*

STEEP, *s.* Precipice; ascent or descent approaching to perpendicularity.

As that Theban monster that propos'd
Her riddle, and him, who solv'd it not, devour'd;
That once found out and solv'd, for grief and spight
Cast herself headlong from the Ismenian *steep*.

Milton.

Leaning

Leaning o'er the rails, he musing stood,
And view'd below the black canal of mud,
Where common sewers a lulling murmur keep,
Whose torrents rush from Holborn's fatal steep. *Gay.*

To STEEP, v. a. [stippen, Dutch.] To soak; to macerate; to imbue; to dip.

When his brother saw the red blood trail
Adown so fast, and all his armour steep,
For very fellness loud he gan to weep. *Spenser.*

Wheat steeped in brine twelve hours prevents the smut-tiness. *Mortimer.*

STEEP, a township of England, in Southamptonshire; 1 mile north of Petersfield. Population 436.

STEEP POINT, a cape on the south coast of the island of Java. Lat. 7. 32. S. long. 107. 3. E.

STEEP ROCKS, a ridge of rocks in the United States, forming the west bank of Hudson's river, beginning about 11 miles north of New York, and continuing, with some interruptions, 11 or 13 miles.

STEEPHOLMES, a small rocky islet of England, in the Bristol channel, under Quantock hills, which divides the counties of Somerset, Gloucester, and Bristol. It is a vast rock, about 1½ mile in circumference, in many parts overhanging the water, and inaccessible except by two very steep and dangerous passages. A few rabbits find subsistence upon it; and in summer it is the resort of vast numbers of sea-fowl.

STEEPINESS, *s.* State or quality of being steep.—The cragginess and steepness of places up and down is a great advantage to the dwellers, and makes them inaccessible. *Howell.*

STEEPING, GREAT and LITTLE, two adjoining parishes of England, in Lincolnshire; 3½ miles south-east of Spilsby.

STEEPLE, *s.* [ʔepel, ʔypel, Saxon.] A turret of a church generally furnished with bells; a spire.

They, far from steeples and their sacred sound,
In fields their sullen conventicles found. *Dryden.*

STEEPLE, a parish of England, in Dorsetshire; 4 miles west-by-south of Corfe Castle.

STEEPLE, a parish of England, in Essex, situated on a creek of the Blackwater; 5 miles west-south-west of Bradwell.

STEEPLE BARTON, a parish of England, in Oxfordshire; 5 miles from Deddington.

STEEPLE, CLAYDON, a parish of England, in Buckinghamshire, 3½ miles from Winslow.

STEEPLE MAGNA, a parish of England, in Lincolnshire, half a mile distant from the foregoing.

STEEPLE-MORDON, a parish of England, in Cambridge-shire; 3½ miles from Royston. Population 483.

STEEPLED, *adj.* Towered; adorned as with towers.—A steepled turbant on her head she wore. *Fairfax.*

STEEPLEHOUSE, *s.* A term given by the separatists to the churches of the established religion.—About caps and hoods, vestures and gestures, steeplehouses and churches, what fierce conflicts! *Bp. Taylor.*

STEEPLETON PRESTON, a parish of England, in Dorsetshire; 4 miles north-north-west of Blandford Forum.

STEEPLY, *adv.* With precipitous declivity.

STEEPNESS, *s.* Precipitous declivity.—Lord Lovel swam over the Trent on horseback, but could not recover the farther side, by reason of the steepness of the bank, and so was drowned. *Bacon.*

STEEPLY, *adj.* Having a precipitous declivity. *A poetical word.*

No more, my goats, shall I behold you climb
The steepy cliffs, or crop the flow'ry thyme. *Dryden.*

STEER, *s.* [stiurs, Goth.; ʔtype, ʔceop, Sax.; stier, Germ. Watcher and Serenius gave the more ancient words, tiur, Su. Goth.; tyr, Icel.; tarus, Welsh, from the Celt. taro, taru, to but, to strike; whence probably the Latin taurus.] A young bullock.

Nor has the steer,
At whose strong chest the deadly tiger hangs,
E'er plow'd for him. *Thomson.*

To STEER, v. a. [stiuran, Goth.; styra, stiorna, Icel. ʔceopan, ʔcypan, Sax.; stieren, Dutch.] To direct; to guide in a passage: originally used of a ship, but applied to other things.

A comely palmer, clad in black attire,
Of ripest years, and hairs all hoary gray,
That with a staff his feeble steps did steer,
Lest his long way his aged limbs should tire. *Spenser.*

To STEER, v. n. To direct a course at sea.—In a creature, whose thoughts are more than the sands, and wider than the ocean, fancy and passion must needs run him into strange courses, if reason, which is his only star and compass, be not that he steers by. *Locke.*—To conduct himself.

STEER, *s.* The instrument at the stern of the vessel by which its course is regulated.—A naked ship without *stere*. *Gower.*

STEE'RAGE, *s.* The act or practice of steering.—Having got his vessel launched and set afloat, he committed the *steerage* of it to such as he thought capable of conducting it. *Spectator.*—Direction; regulation of a course.

He that bath the *steerage* of my course,
Direct my suit. *Shakspeare.*

That by which any course is guided.

His costly frame
Inscrib'd to Phcebus, here he hung on high,
The *steerage* of his wings, and cut the sky. *Dryden.*

Regulation or management of any thing.
You raise the honour of the peerage,
Proud to attend you at the *steerage*. *Swift.*

The stern or hinder part of the ship.

STEE'RER, *s.* A steersman; a pilot. *Unused.*

STEE'RLESS, *adj.* Having no steer or rudder.

In a ship *stereless* (God wot)
They han her set, and bidden her learne sayle. *Chaucer.*

STEE'RSMATE, or STEE'RSMAN, *s.* [ʔceopet-mon, Sax.] A pilot; one who steers a ship.

The *steersman* seeks a readier course to run,
The souldier stirs, the gunner hies to gun. *Mir. for Mag.*

What pilot so expert but needs must wreck,
Embark'd with such a *steersmate* at the helm. *Milton.*

STEETON, a hamlet of England, in the parish of Bolton, Yorkshire; 7 miles from York.

STEETON, a parish of England, West Riding of Yorkshire; 3 miles north-west of Keighley. Population 545.

STEEVENS (George), the most successful of all the editors and commentators of Shakspeare, born at Poplar in the year 1735 or 1736, was the son of an East India captain, afterwards a director of the company. The subject of this article received the elements of his education at Kingston-upon-Thames, and he had Gibbon, the celebrated historian, for his school-fellow. From hence he went to Eton, and in a few years was admitted a fellow commoner of King's college, Cambridge, and having acquired a large portion of classical literature, with a general taste for learned pursuits, he devoted his time and fortune to the study and collection of books.

On the first establishment of the Essex militia he accepted a commission, but he spent the concluding years of his life in almost total seclusion from the world, seldom mingling with society, but was found either in the shops of book-sellers, in the Shakspeare gallery, or in the morning conversations of Sir Joseph Banks.

Although not an original writer, he deserves a place among the chief literary characters of the age, considering the works which he illustrated, and the learning, sagacity, taste, and general knowledge which he constantly exhibited in his writings. With a great versatility of talents, he was eminent both by his pen and pencil; but his chief excellence lay

lay in his critical knowledge of an author's text; and the best specimen which he gave of his great talent is his edition of the works of Shakspeare. He had studied the age of Shakspeare, and employed a very large portion of his life in becoming acquainted with the writings, manners, and laws of that period, as well as the provincial peculiarities; whether of language or customs, which prevailed in different parts of the kingdom, but more particularly in those in which Shakspeare passed the early years of his life. He was continually increasing this store of knowledge by the acquisition of the obsolete publications of a former age, to obtain which he spared no expence. In preparing his last edition for the press, he gave a very singular example of diligence and perseverance. To this work he exclusively devoted a period of full eighteen months, during which he left his house at Hampstead every morning at one o'clock, and coming to London, without any regard to the weather, or the season of the year, he found a proof-sheet of Shakspeare ready for his perusal and correction. Thus, while the printers slept he was awake, by which means he completed in about the time already mentioned his splendid edition of the works of Shakspeare, in 15 vols. octavo.

Mr. Steevens died in the year 1800, at the age of about 65 years. See MALONE.

STEFANO, called IL FIORENTINO, is the only one of Giotto's scholars who aimed at something beyond the mere imitation of his master, whom, according to Vasari, he surpassed. He was born at Florence in 1301, and was the grandson of Giotto, by a daughter called Caterina. He was the first who attempted foreshortening; and if he failed of complete success, he certainly corrected perspective, and gave more varied turns, more character, and greater vivacity to heads. His most accredited works in the church of Asa Coeli at Rome, Sta. Spirito at Florence, and elsewhere, are no more. No authentic work of his remains, unless we except a Madonna in the Campo Santo at Pisa, undoubtedly in a greater style than the works of his master, but retouched. He died in the year 1350, aged 49. *Fuseli*.

STEFANO (Tomaso), according to Baldinucci, was the son and disciple of the foregoing artist, and born at Florence in 1324. He acquired the name of Il Giotto, from the great resemblance of his works to those of Giotto. A Pietà, which still remains of him at S. Remigio at Florence, and some frescoes at Assisi, bear indisputable marks of that style. He died at Florence, at the age of 32.

STEFANO, ST., a small town of the island of Sicily, on the northern coast of the Val di Demona, between the town of Cefalu and Caronia. It has a population of 3000, is pleasantly situated, and regularly built, but subject to the *mal aria* in the autumn months.

STEFANO, ST., a small island of Italy, in the bay of Naples, covered with wood, but neither cultivated nor inhabited.

STEFANO DI BELBO, ST., a small town of the continental Sardinian states, in the dutchy of Montferrat, province of Acqui, with 3200 inhabitants. It stands on the river Belbo; 14 miles east-south-east of Alba.

STEFANO DEL BOSCO, ST., a small town of the south part of the kingdom of Naples, in Calabria Ultra, with 2400 inhabitants.

STEFFELSDORF, GREAT. See RIMA-SZOMBATH.

STEFFENSKLINT, a promontory of Denmark, on the east coast of the island of Zealand.

STEFT, or MARKT-STEFT, a small town of Bavarian Franconia; 12 miles east-south-east of Wurzburg. It has a trade in corn, fruit, and the transit of goods, for the promotion of which a magazine has been erected, and a canal dug for the security of boats in winter, against the breaking up of the ice in the Maine.

STEG, *s.* [*stegge*, Icel.] A gander: *common in the north.*

STEGANO'GRAPHIST, *s.* [*στεγανος* and *γραφω*, Gr.] One who practises the art of secret writing. *Bailey*.

STEGANO'GRAPHY, *s.* [*στεγανος* and *γραφω*, Gr.] The art of secret writing by characters or cyphers, intelligi-

ble only to the persons who correspond one with another. *Bailey*.—Such occult notes, *steganography*, polygraphy, or magnetical telling of their minds. *Burton*.

STEGE, a small sea-port town of Denmark, in the island of Moen, with 900 inhabitants; 48 miles south-south-west of Copenhagen.

STEGEBORG, a small town in the south of Sweden, in the province of East Gothland, with a well-frequented harbour; 9 miles north of Calmar, and 20 east of Nordkioping.

STEGNOSIS [*Στεγνσις*, Gr.], an obstruction of any natural discharge, especially that by the pores.

STEGNOTIC, *adj.* [*στεγνωτικός*, Gr.] Binding; rendering costive. *Bailey*.

STEGNOTICS, [*Στεγνωτικά*, Gr. formed from *στεγα*, *constipō*, I close,] in Medicine, remedies proper to close and stop the orifices of the vessels, or emuncatories, when relaxed, stretched, lacerated, &c.

STEIGE, a village of France, in Alsace, with 900 inhabitants.

STEIGERBERG, a small town of the north of Germany, in Hanover, on the Weser; 31 miles west-north-west of Hanover. Population 800.

STEIGERWALD, a mountainous and woody track of the Bavarian states, lying along the south of the Maine, to the east of the principality of Wurzburg.

STEIGNTEN, a parish of Wales, in Pembrokeshire, near Haverford West. Population 1961.

STEIN, a small town in the north-east of Switzerland, in the canton of Schaffhausen, on the Rhine, where it issues from the lake of Zell. Population 1800. Here are some vestiges of Roman antiquities; 13 miles west of the town of Constance.

STEIN, a small town of Lower Austria, on the Danube, joined to another on the opposite side of the river by a wooden bridge. It is 37 miles west-north-west of Vienna, and half a mile from Krems. It has only 1000 inhabitants.

STEIN, a small town of the west of Germany, in Baden; 9 miles east of Carlsruhe. Population 1200.

STEIN, a village of Austrian Illyria, in Carinthia, on the Drave; 14 miles north of Laybach.

STEIN AM ANGER, or SZOMRATHELY, a small town of the south-west of Hungary, on the river Guntz; 68 miles south-south-east of Vienna, and 65 south-south-west of Presburg. It is pleasantly situated in the midst of a plain, but is poorly and irregularly built. It is a bishop's see; and the cathedral, the episcopal palace, the seminary, and the meeting place of the diets of the county of Eisenburg, form a square, which, by its neatness, exhibits a striking contrast to the rest of the town. The inhabitants, only 2200 in number, are chiefly Catholics. The town contains a number of Roman antiquities, having been the ancient *Sabaria*, which held the second rank among the Roman colonies in Illyria. Lat. 47. 13. 30. N. long. 16. 38. E.

STEIN AM KIRCHEN, a market town of Austria; 53 miles west of Vienna.

STEIN AM RITTEN, a large village and parish of the Austrian States, in Tyrol, with 3600 inhabitants; 18 miles north of Brixen.

STEIN AM STEIN, a populous village of the Swiss canton of Appenzel; 4 miles east-south-east of St. Gall.

STEIN-SCHONAU, a small town of the north-west of Bohemia, circle of Leutmeritz, with 1600 inhabitants, and manufactures of beautiful glass.

STEIN SEIFEN, a small town of Prussian Silesia, in the government of Reichenbach. Population 1000.

STEINABRUCKL, a small town of Lower Austria, with cotton manufactures.

STEINACH, the name of two small rivers of the west of Germany. The one is in the duchy of Coburg, and falls into the Saale; the other in the kingdom of Wirtemberg, passes by Puding, and joins the Neckar.

STEINACH, a village of Germany, in the duchy of Saxe-Meinungen. Population 1100; 25 miles north-west of Coburg.

STEINACH, or MARKT-STEINACH, a small town of Bavarian

Bavarian Franconia; 5 miles east-north-east of Schweinfurt, and 30 north-east of Würzburg. Population 1200.

STEINACH, or STADT-STEINACH, a small town of Bavarian Franconia; 35 miles north-east of Bamberg, and 17 north-north-west of Bayreuth. Population 1100.

STEINAU, a small town of Prussian Silesia, near the Oder. It is fortified, and has often been besieged in the wars of Germany. Population 2000; 23 miles south-east of Gros Glogau, and 34 north-west of Breslau.

STEINAU AN DER STRASS, a small town of the west of Germany, in Hesse-Cassel, county of Hanau. Population 1100; 16 miles south-west of Fulda, and 25 east-north-east of Hanau.

STEINBACH, a small town of the west of Germany, in Hesse-Cassel, lordship of Smalcalden, with 2100 inhabitants, employed chiefly in manufacturing hardware; 5 miles east of Smalcalden.

STEINBACH, a small town of the west of Germany, in the principality of Saxe-Meinungen, bailiwick of Altenstein. Population 1600.

STEINBACH, a small town of the west of Germany; 9 miles south-west of the town of Baden. Population 1700.

STEINBACH, a small but neat town of the west of Germany, in Wirtemberg, on the Kocher.

STEINBACH, a large village of Upper Austria, on the river Steyer; 6 miles south of the town of Steyer.

STEINBACH, a village of Prussian Westphalia, in the duchy of Berg, near Muhlheim. In the neighbourhood are mines of iron, lead, and copper.

STEINBERG, a hill of Silesia, in the county of Glatz, with a fort which defends a pass into Bohemia.

STEINBUHEL, a large village of Austrian Illyria, in Carinthia; 1 mile south of Ratmannsdorf, with extensive iron-works.

STEINE, OLD, MIDDLE, and LOWER, three large villages of Prussian Silesia, in the county of Glatz, near Munschelburg.

STEINFELD, GREAT and LITTLE, two villages of France, in Alsace. They contain together about 1100 inhabitants.

STEINFELD, UPPER, a small town of the west of Germany, in Wirtemberg, near Marbach, with 1200 inhabitants.

STEINFURT, or BURG-STEINFURT, a small town of Prussian Westphalia, on the river Aa, and the chief place of a lordship belonging to the counts of Bentheim, but surrounded by the principality of Munster. Population 1300; 17 miles north-west of Munster, and 13 south-east of Bentheim.

STEINFURT, a small town of Prussian Westphalia; 11 miles south-south-east of Munster. Population 850.

STEINHAGEN, a small town of Prussian Westphalia, in the government of Minden, with 1500 inhabitants, employed chiefly in linen weaving; 5 miles west of Bielefeld, and 25 north-west of Paderborn.

STEINHEIM, a small town of Prussian Westphalia, in the government of Minden, on the Emmer; 13 miles north-north-east of Paderborn. Population 1700.

STEINHEIM, a small town of the west of Germany, in Hesse-Darmstadt, on the Maine; 11 miles east of Frankfort. Population 900.

STEINHEIM ON THE MUR, a small town of the west of Germany, in Wirtemberg; 14 miles north-by-east of Stutgard. Population 1300.

STEINHUDE, a small lake in the interior of Germany, in the county of Schauenburg-Lippe. It is about five miles in length, three in breadth, and on an average sixteen feet in depth. It contains an island, with a small fort called Wilhelmstein.

STEINHUDE, a small town on the above lake; 16 miles west-north-west of Hanover, with 900 inhabitants.

STEINHUN, or STONE-HEN, in Ornithology, a name given by the Germans to a bird of the LAGOPUS kind.

STEKAN, in Commerce, a liquid measure in Holland. Rhine and Mosel wine, and also spirits distilled from corn,

are sold by the aam, which contains 4 ankers, 8 stekans 21 viertels, 64 stoops, 128 mingels, 256 pints, or 1024 musies; which holds 8966 Dutch, 7705 French, or 9351 English cubic inches, or about 40½ English wine gallons.

STEINKIRCHEN, a village of Hanover, in the duchy of Bremen; 10 miles south-east of Stade.

STEINWEILER, a small town of the Bavarian circle of the Rhine, district of Landau. Population 1200.

STEINWIESEN, a large village of Bavaria, in the circle of the Maine, or principality of Bamberg.

STEKENE, a small town of the Netherlands, in East Flanders, situated on the canal leading from Ghent to Hulst; 17 miles north-east of Ghent. Population 3700.

STEKENITZ, or STEKENISSE. See STOCKENITZ.

STELE, *s.* [στῆλη, Sax.; stèle, Dutch.] A stalk; a handle.

STELE [Στήλη, Gr.], in Antiquity, a kind of punishment, being a pillar whereon a criminal was exposed, and on which was engraven an account of his crime.

STEELECHEIA, a word used by some authors to express the vena portæ.

STEELECHITES, in the Materia Medica, a name given by Dioscorides, and some other of the Greek writers, to a peculiarly fine kind of storax.

STEELECHIS, a strigil, or an instrument used in the baths to rub off the sweat from the skin.

STELIS, [στῆλις, an ancient Greek name for a sort of Misseltoe, parasitical, like this genus, upon trees], in Botany, a genus formed of some species of EPIDENDRON; which see.

STELLA (Jacques), an eminent French painter, was born at Lyons in 1596. In his twentieth year he travelled to Italy, intending to proceed to Rome to finish his studies; but was stayed in his progress at Florence, by Cosmo de Medici, to assist in the decorations preparing for the marriage of his son Ferdinand. The grand duke retained him in his service, and gave him a pension, with apartments; and he remained there seven years. At the end of that time he continued his intended journey, and at Rome he studied with unremitting attention the works of Raphael, in company with Nicolo Poussin, with whom he lived in intimacy and friendship.

Cardinal Richelieu recommended him to Louis XIV., and procured him a pension of a thousand livres, together with the employment of state painter.

Stella had considerable genius, but wanted a pure taste. His invention was ready, and his execution agreeable; the attitudes of his figures, however, exhibit the effect of study and the lamp; and nature is less frequently the guide of their expressions than art. His colouring is completely artificial; and yet with these defects, there is an agreeable air in his pictures; the parts are well balanced, and life and activity reign in them. He was most successful in his smaller productions. He died at Paris in 1647, aged 51.

STELLA, the name of a bandage in old Surgery, resembling a star, by the numerous crossings which it makes. It was employed after arteriotomy in the temple.

STELLA, a township of England, in Durham; 5½ miles west-by-north of Gateshead.

STELLA, a small river of Austrian Italy, in Friuli, which falls into the gulf of Venice, between the mouth of the Tagliamento and the town of Maranno.

STELLAR, *adj.* Astral; relating to the stars.

In part shed down
Their stellar virtue, on all kinds that grow
On earth; made hereby apter to receive
Perfection from the sun's more potent ray. *Milton.*

Salt dissolved, upon fixation, returns to its affected cubes, and regular figures of minerals, as the hexagonal of chrysal, and stellar figure of the stone asteria. *Glanville.*

STELLARIA [from the star-like form of the flowers], in Botany, a genus of the class decandria, order trigynia, natural order of caryophyllei, caryophyllæ (*Juss.*)—Generic Character. Calyx: perianth five-leaved; leaflets ovate-lanceolate,

lanceolate, concave, acute, spreading, permanent. Corolla : petals five, two-parted, flat, oblong, shrivelling. Stamina : filaments ten, filiform, shorter than the corolla : alternately longer and shorter. Anthers roundish. Pistil : germ roundish. Styles three, capillary, spreading. Stigmas obtuse. Pericarp : Capsule ovate, covered, one-celled, six-valved. Seeds very many, roundish, compressed. *Stellaria radians* has the petals five parted.—*Essential Character*. Calyx five-leaved, spreading. Petals five, two-parted. Capsule superior, one-celled, many-seeded, six-toothed at top.

1. *Stellaria nemorum*, or wood stitchwort.—Root perennial, small, creeping. Stems several, weak and lax, three feet high, branched, hollow, round, leafy, with hairs scattered here and there on it, chiefly in the upper part. Leaves opposite, pale, green, entire, a little hairy. The numerous star-like flowers are visible at a distance, and of a delicate structure when closely examined. They are white and upright, in a terminating, dichotomous, many flowered, divaricating, pubescent panicle, having a pair of small leaves at each of the forkings.—Native of Europe, in woods. In Britain, it is confined to moist woods and borders of clear shaded springs, in the northern counties of England, and the low-lands of Scotland : flowering in May.

2. *Stellaria dichotoma*, or dichotomous stitchwort. —Leaves ovate, sessile ; stem dichotomous ; flowers solitary ; fruiting peduncles reflexed. Root annual.—Native of the mountains of Siberia.

3. *Stellaria radians*, or ray-flowered stitchwort.—Leaves lanceolate serrulate ; petals five parted.—Native of Siberia in bogs.

4. *Stellaria bulbosa*, or bulbous stitchwort.—Leaves ovate-lanceolate, veinless beneath ; stem somewhat branched ; peduncle one-flowered ; root filiform, creeping, bulbiferous.—Native of the mountains of Carinthia, in moist shady places.

5. *Stellaria Holostea*, or greater stitchwort.—Leaves lanceolate, serrulate ; petals bifid ; calyx nerveless. Root perennial, creeping, weak, slender, jointed, sending down fibres to a considerable distance. Stems several, a foot high, decumbent at the base, then upright, supporting themselves among bushes or grass, otherwise the least breath of wind would lay them prostrate ; leafy, brittle, but with a strong woody structure in their inner part, as is the case with most of this tribe. Leaves in pairs at each joint, sessile, long, acuminate, a little revolute and serrulate at the edge. Flowers on very long, erect, rugged peduncles, from the axils of the upper pair of leaves, forming a sort of dichotomous panicle, white.—Native of Europe. Very frequent in woods, among bushes, and about dry hedge bottoms in England : flowering in May and June. Its large brilliant white starry blossoms render it conspicuous in the spring.

6. *Stellaria graminea*, or lesser stitchwort.—Leaves linear-lanceolate, quite entire ; panicle terminating, divaricating ; calyx three-nerved, equal, or nearly so, to the petal. Root perennial, creeping. The whole habit much like that of the preceding, but smaller, and of a grass-green, not glaucous colour.—Native of Europe. The white starry blossoms of this delicate plant prettily bespangle furze-bushes, heath, and low broom, on a gravelly or sandy soil.

7. *Stellaria glauca*, or glaucous marsh stitchwort.—Leaves linear, lanceolate, quite entire, glaucous ; peduncles erect ; calyx three-nerved, shorter than the petals.—Native of Germany and England : flowering in June and July.

8. *Stellaria crassifolia*, or thick-leaved stitchwort.—Leaves oblong-lanceolate, thickish, glaucous ; peduncles one-flowered, solitary, axillary ; petals bigger than the calyx ; stem upright. Annual.—Native of Germany, in moist meadows.

9. *Stellaria uliginosa*, or bog stitchwort.—Leaves elliptic, lanceolate, quite entire, callous at the tip ; flowers sub-panicled, lateral ; petals shorter than the calyx. Root annual, small and fibrous.—Native of Europe, on the sides of springs, rivulets, ditches and wet springy meadows. In England not uncommon. It flowers in June and July.

10. *Stellaria undulata*, or wave-leaved stitchwort.—Leaves

oblong, waved ; stem angular ; flowers axillary.—Native of Japan, by way sides : flowering there in April.

11. *Stellaria cerastoides*, or Alpine stitchwort.—Leaves elliptic-oblong, obtuse ; stem subbiflorous ; calyxes one-nerved, pubescent. Root perennial, creeping. Flowers erect, white.—Native of the mountains of Lapland, Norway, Switzerland, France, Piedmont and Scotland.

12. *Stellaria multicaulis*, or many-stalked stitchwort.—Leaves lanceolate, smooth ; branches upright, quite simple ; peduncles subsolitary, terminating ; petals bigger than the calyx.—Native of the mountains of Carinthia.

13. *Stellaria humifusa*, or procumbent stitchwort.—Leaves ovate, mostly on one side, sessile ; stems procumbent, four-cornered ; peduncles solitary, abbreviated. This is an annual plant, with the petals a little larger than the calyx.—Native of Sweden and Norway.

14. *Stellaria biflora*, or two-flowered stitchwort.—Leaves awl-shaped ; branches two-parted ; petals emarginate ; calyxes striated. This is a small plant, with the appearance of a sagina.—Native of the mountains of Lapland. Perennial.

15. *Stellaria Groenlandica*, or Groenland stitchwort.—Stems decumbent, subbiflorous ; leaves linear, subciliate at the base ; petals emarginate ; fruits globular. Flowers large in proportion to the plant.—Native of Groenland.

16. *Stellaria arenaria*, or sandwort stitchwort.—Leaves spatulate ; stem erect, bifid ; branches alternate ; petals emarginate. Root annual, fibrous.—Native of Spain.

17. *Stellaria scapigera*, or scape-bearing stitchwort.—Stemless ; leaves linear-lanceolate, three-nerved ; peduncles radical, one-flowered. Perennial. — Native country unknown.

Propagation and Culture.—See ARENARIA.

STELLARY, *adj.* Astral ; starry. *Unused*. *Cocke-ram*.

STELLATE, *adj.* Pointed in the manner of a painted star.—One making a regulus of antimony, without iron, found his regulus adorned with a more conspicuous star than I have seen in several *stellate* regulus's of antimony and mars. *Boyle*.

STELLATE PLANTS, such as have their leaves growing on the stalks, at certain distances, in the form of a star with rays ; or such flowers as are star-like, or full of eyes resembling stars.

STELLATION, *s.* Emission of light as from a star.

STELLED, *adj.* Starry.—And quenched the *stelled* fires. *Shakspeare*.

STELLENBOSCH and DRAKENSTEIN. These two form an extensive district of the settlement of the Cape of Good Hope. They include the whole extent from Cape Agulhas, the southernmost point of Africa, to the river Koussie, the northern boundary of the colony. This district is 380 miles long, about 150 broad, and may contain an area of 55,000 square miles. The greater part consists of mountains, sandy hills, and Karroo plains, but the remainder is the finest land in the colony. It is in the possession of about 1200 families, forming a population of 7256 Christians. The slaves amount to 10,703, the Hottentots to about 5000, forming in all 22,959. About 39,146 English acres are under cultivation.

STELLENBOSCH, a village delightfully situated 26 miles to the east of Cape Town, at the foot of a range of lofty mountains, near the Cape of Good Hope. It contains 70 habitations, arranged in several streets and open squares, and planted with trees.

STELLERA [so named by Gmelin, in memory of Georg. Wilh. Steller, adjunct of the Academy at Petersburg], in Botany, a genus of the class octandria, order monogynia, natural order of vepreculæ thymelææ (*Juss.*)—Generic Character. Calyx none. Corolla one-petalled, funnel-form, permanent : tube filiform, long : border four or five cleft, with the lobes ovate. Stamina : filaments eight or ten, very short. Anthers oblong, alternately in the middle of the tube, and within the throat. Pistil : germ subovate.

Style very short, permanent. Stigma headed. Pericarp none. Seed one, shining, beaked: a nut. *Stellera passerina* has eight, and *Chamæjasme* ten stamens.—*Essential Character.* Calyx none. Corolla four-cleft. Stamina very short. Nut one, beaked.

1. *Stellera passerina*, or flax-leaved *stellera*.—This is an annual plant, resembling *thesium alpinum*. The stem and branches are terminated by long loose interrupted leafy spikes. Leaves linear. The flowers are sessile, three, four or five together, in the axils of two or rather three leaves, of which the two side ones are shorter, and may be considered as bractes. Corollas small, greenish, with yellow tips.—Native of Germany, Switzerland, France and Italy. It flowers in July and August.

2. *Stellera chamæjasme*, or Siberian *stellera*.—Leaves lanceolate; flowers terminating, racemed, naked, five-cleft. Perennial.—Native of Siberia.

STELLI'FEROUS, *adj.* Having stars.

To STELLIFY, *v. a.* [*stella* and *facio*, Latin.] To make a star; to turn into a star. This is a frequent word in our old poetry.—Whether Jove will me *stellify*. *Chaucer.*—By him who strives to *stellify* her name. *Drayton.*

STELLING, a hamlet of England, in Kent; 6 miles south-by-west of Canterbury.

STELLIO, in Zoology, the name by which authors call the swift or spotted lizard. See LACERTA.

STELLION, *s.* [*stellio*, Lat.] A newt. *Unused.*

STELLIONATE, *s.* [*stellionat*, Fr.; *stellionatus*, Lat.] A kind of crime which is committed [in law] by a deceitful selling of a thing otherwise than it really is: as, if a man should sell that for his own estate which is actually another man's.—It discerneth of crimes of *stellionate*, and the inchoations towards crimes capital, not actually committed. *Bacon.*

STELOCHITES, a name given to osteocolla.

STELO'GRAPHY, *s.* [*στυλογραφία*, from *στυλη*, Gr., a pillar, and *γραφω*, to write; *stélographic*, Fr.] The art of writing upon a pillar.—This pillar (of Jacob) thus engraved gave probably the origin to the invention of *stelo-graphy*. *Stackhouse.*

STEM, *s.* [*stemma*, Lat.; *stemu*, Sax.; *stamm*, Germ., which Wachter derives from *stan*, to stand.] The stalk; the twig.

Two lovely berries molded on one *stem*,
So with two seeming bodies, but one heart. *Shakspeare.*

The louting Spring with lavish rain
Beats down the slender *stem* and bearded grain. *Dryden.*

[*Stænma*, Swed.; *stamm*, Germ.] Family; race; generation. Pedigrees are drawn in the form of a branching tree.

I will say her worth to celebrate,
And so attend ye toward her glittering state;
Where ye may all, that are of noble *stem*,
Approach. *Milton.*

Progeny; branch of a family.

This is a *stem*
Of that victorious stock, and let us fear
His native mightiness. *Shakspeare.*

The prow or fore part of a ship.
Orante's barque, ev'n in the hero's view,
From *stem* to stern, by waves was overborn. *Dryden.*

STEM, in Botany, that part of a plant arising out of the root, and which sustains the leaves, flowers, and fruits.

To STEM, *v. a.* [*stænma*, Su. Goth.] To oppose a current; to pass cross or forward notwithstanding the stream. Above the deep they raise their scaly crests,
And *stem* the flood with their erected breasts. *Denham.*

STEMMATA, in Entomology, are three smooth hemispheric dots, placed generally on the top of the head, as in most of the hymenoptera, and other classes. The name was first introduced by Linnæus. See ENTOMOLOGY.

STEMODIA, in Botany, a genus of the class didynamia order angiosperma, natural order of personatæ scrophulariæ (*Juss.*)—*Generic Character.* Calyx: perianth one-leafed, five-parted, erect, equal, permanent. Corolla one-petalled, irregular: tube length of the calyx: border subbilabiate, almost upright; upper lip ovate, entire; lower three-parted, with the parts rounded and equal. Stamina: filaments four almost equal, length of the tube, all bifid. Anthers eight, each placed on an arm of the filaments. Pistil: germ bluntish. Style simple, length of the stamens. Stigma bluntish. Pericarp: capsule oblong, ovate, two-celled, two-valved: partition contrary. Seeds numerous, globular. Receptacle subcylindrical.—*Essential Character.* Calyx five-parted. Corolla two-lipped. Stamina four, each filament bifid, two-anthered. Capsule two-celled.

1. *Stemodia maritima*.—Root long, round, with lateral horizontal fibres. Stem from one to three feet high, erect, four-cornered, hirsute, sometimes in hedges near the sea-coast in a manner scandent. Leaves small, sessile, ovate-lanceolate, obtuse, serrate, thickish, hirsute: with smaller leaves in the axils of the larger. Flowers few, axillary, among the terminating leaves, small, white or blue.—Native of Jamaica, and very common by the sea-side, in all the southern parts of the island: it has a pleasant aromatic smell, with a bitterish taste.

2. *Stemodia durantifolia*.—Leaves ternate and connate; flowers subtern, subsessile.—Native of Jamaica.

3. *Stemodia viscosa*.—Leaves opposite, embracing; flowers peduncled, solitary. This is a small herbaceous plant, with a pleasant aromatic smell.—Native of Coromandel: found on dry fields, after the crop has been cut. The Telingas call it *Boda-sarum*.

4. *Stemodia ruderalis*.—Leaves ovate, serrate, petioled.—Native of the East Indies.

STEMONA, was so denominated by Loureiro, from the Gr. *σῆμα*, a *stamen*, because of the remarkable form and connection of those organs in its flower; which latter circumstance led him to refer the genus to the class monadelphia. His genus, however, proves to be no other than Mr. Dryander's *ROXBURGHIA*; see that article.

STEMPHYLA, a word used by the ancients to express the husks of grapes, or the remains of the pressings of wine. The same word is also used by some to express the remaining mass of the olives, after the oil is pressed out.

STEMPHYLITES, a name given by the ancients to a sort of wine pressed hard from the husks.

STEMPLES, in Mining, cross bars of wood in the shafts, which are sunk to mines.

STENANTHERA, [from *στενος*, narrow, or contracted, and *ανθηρα*, an *anther*] in Botany, a genus of the class petandria order monogynia, natural order of epacrideæ (*Brown.*)—*Generic Character.* Calyx: perianth inferior, permanent, double; the inner of five broad, ovate, equal, convolute leaves; outer of numerous ovate, concave, imbricated, bluntish, pointless scales, not so long as the former. Corolla: of one petal, tubular, deciduous; tube twice the length of the calyx, limb in five short, spreading, lanceolate, bluntish segments, bearded underneath at the extremity. Nectary a cup-shaped undivided gland surrounding the base of the germen. Stamina: filaments five, inserted into the tube, and enclosed within it, thick and fleshy, broader than the anthers, which are linear, in the mouth of the tube. Pistil: germen superior, roundish of five cells; style capillary, the length of the tube; stigma simple, obtuse. Pericarp: drupa nearly dry, globose. Seed: nut of three or more cells, with a thick shell.—*Essential Character.* Outer calyx of many imbricated leaves. Corolla tubular; its tube swelling, twice as long as the calyx, naked within; limb much shorter, spreading, bearded half way. Filaments included in the tube, fleshy, broader than their anthers. Drupa almost dry, of from three to five cells.

Stenanthera pinifolia, or pine-leaved *stenanthera*.—The stem is woody, erect, spreading, branched, scarred; the younger branches hairy, clothed with innumerable, crowded, awl-shaped,

awl-shaped, pungent, revolute, roughish, sessile leaves, about an inch long. Flowers axillary, erect, sessile, about the base of each branch, very beautiful, with a rich scarlet tube an inch long, and a yellowish-green limb, making a singular but most agreeable contrast. Drupa the size of a small pea, invested with the brown chaffy calyx.—Native of the neighbourhood of Port Jackson, New South Wales.

STENAY, a small town in the north-east of France, on the Meuse, with a population of 2300. It has some iron works, and is a fortified place, but was taken by the Austrians in 1792; 21 miles north-north-west of Verdun.

STENBOCK (Magnus), a distinguished Swedish general, son of Gustavus Otto Stenboch, a general under Charles X. and XI., was born at Stockholm in 1664. He was educated at Upsal, and in 1683 he set out on his travels, and having entered into the Dutch army, he served several campaigns with the allied forces in the Netherlands, and on the Rhine, under the princes of Waldec and Baden. He distinguished himself so much by his bravery and good conduct, that he was, in 1697, appointed to be colonel of a German regiment, then in the garrison at Wismar, where he employed his leisure time in composing a work on the art of war, entitled "The Swedish Military School," which, however, he did not find leisure or inclination to publish. He accompanied Charles XII. in almost all his expeditions, and contributed by his skill and exertions to the victory obtained at Narva. In the Polish campaign, till 1706, he sometimes accompanied the king and the main army, and sometimes was intrusted with the command of detached bodies employed chiefly in levying contributions; a service for which he was exceedingly well qualified: he was also employed in constructing bridges over such rivers as the Swedish army had to pass, on its incursions into Poland, and on its return from that country. In the year 1706 he attended the king to Saxony, where he was appointed governor of Scania. When he arrived there, he found every thing in the utmost confusion; the most shameful abuses had been committed; and in order to put an end to them, and deter others from similar practices, he put the laws into most severe execution; but a war breaking out put a stop to his plans of reform. When intelligence of the Swedes being defeated at Pultava reached Frederic IV. of Denmark, he made preparations for the invasion of Scania. Stenbock was appointed to oppose him; he put himself at the head of 8000 old troops and 12,000 new levies, and went in pursuit of the Danes, who were committing incredible ravages in the country. There was no time to clothe the newly raised troops in military array; of whom the greater part was dressed in frocks, and had pistols tied to their girdles with cords. They attacked the enemy; and what was wanting in order and discipline, was amply compensated in zeal; and these raw troops completely defeated the regular army of the king of Denmark. The Danes quitted Sweden with great precipitation, having first killed their horses, and destroyed by fire their baggage and magazines. They left behind them about 4000 wounded soldiers, of whom the greater part died, as well by the infection from the dead horses, as by the want of food, of which they had been deprived by their own countrymen. After Scania had been freed from the ravages of the enemy, Stenbock's first care was to strengthen the fortifications of Christianstad, being a place of great importance, for the defence of that part of Sweden. The activity which he displayed on this occasion, induced Charles, the year following, to entrust him with the direction of another enterprize, to the successful and speedy execution of which great importance was attached. This was to repair, as speedily as possible, with several regiments to join the troops in that province and to proceed afterwards, under the command of Stanislaus, to meet his Swedish majesty, on his proposed return from Turkey. In this measure he was thwarted by the senate, and he experienced many difficulties which he did not anticipate; of these, one was the want of money. He, however, went to Stockholm, and exerted himself so successfully, that he collected, in the course of a month, more than 300,000 rix-

dollars, and fitted out some vessels for his intended expedition. In the course of his voyage he fell in with the Danish fleet, by which he was attacked, and more than thirty of the Swedish ships were lost. In consequence of this unfortunate event, Stenbock drew up a paper in vindication of his own conduct. After this he took Rostock; and having received a considerable reinforcement of troops, gained a memorable victory, in 1712, over the Danish and Saxon forces: he then proceeded to the army in Holstein, and having burnt Altona, was, in the month of May, 1713, hemmed in at Tonningen, by the combined Danish, Saxon, and Russian army, in such a manner, that he was obliged to sign a capitulation. Being now a prisoner, he was conveyed by order of his Danish majesty to Copenhagen, and so closely confined, that he was separated from all his attendants, except two domestics, who obtained leave to wait upon him, and was in other respects subject to great restraint and severity. At length, exhausted by misery, chagrin, and disease, he drew up, in the beginning of the year 1716, an account of his sufferings, to serve, to use his own words, as a consolation to his distressed relatives, and, at the same time, to preserve his name and reputation to posterity. This work was printed in 1773, in Lonbom's "Anecdotes of celebrated and distinguished Swedes." He died in 1717, and was interred with military honours, in the garrison church of Copenhagen. After the conclusion of peace, his body was conveyed to Sweden, and deposited in the cathedral of Upsal. Stenbock was a man of talents, and always held in high estimation by Charles XII. In his political sentiments he adopted the system of his father-in-law, the celebrated Oxenstierna. He spoke his sentiments with freedom, and gave such advice as he thought most conducive to the good of his country. In speaking of the Polish war, in one of his letters, dated June 20th, 1702, he says, "according to every appearance, unless providence interfere in a very remarkable way, war will be declared against the republic. How we shall get out of it God only knows. For my part, I would run no risk, but in a war really undertaken on just principles." He had no share in the deposition of Augustus, for whom he had a sincere esteem. He incurred considerable blame for the severity which he exercised at Altona, and the ministers and generals of Poland and Denmark wrote to him complaining of his cruelty on that occasion; but Stenbock, who considered this measure, however harsh, as a just retaliation for the conduct of the Saxons and Danes at Stade, which they had bombarded and burnt to ashes, replied, "that he proceeded to such an extremity, in order to teach the enemies of his sovereign, in future, not to wage war like barbarians, and to cause the law of nations to be respected."

STENCH, *s.* [from *stencan*, Sax.] A stink; a bad smell.

Death, Death; oh amiable and lovely death!
Thou odoriferous *stench*, sound rottenness,
Arise forth from thy couch of lasting night. *Shakspeare.*

Dryden has used it for a good smell.

Black bulls and bearded goats on altars lie,
And clouds of savoury *stench* involve the sky. *Dryden.*

To STENCH, *v. a.* To make to stink. *Not proper.*—The foulness of the ponds only *stenceth* the water. *Mortimer.*—[For *staunch*, corruptly.] To stop; to hinder to flow.—They had better skill to let blood than *stench* it. *King Charles.*

STEN'CHY, *adj.* Having a bad smell.

Far nobler prospects these
Than gardens black with smoke in dusty towns,
Where *stenchy* vapours often blot the sun. *Dyer.*

STENCILING, a method of distemping walls in various patterns like paper.

STENCZICZ, a small town in the south of Poland, in the palatinate of Sendomir; 20 miles east of Radom.

STENDAL, or STENDEL, a town of the Prussian states, formerly the capital of the Old Mark of Brandenburg, but
now

now included in the government of Magdeburg. It is situated in a plain on the river Ucht, and is of considerable size, but is not proportionally populous, the inhabitants not amounting altogether to 5000. Here is a colony of French Calvinists, who carry on several manufactures, particularly woollen and leather, established by their ancestors. The town is old, and suffered greatly from fire in 1575, 1680, and 1687. Winkelmann, the well known writer on the antiquities of Rome, was a native of this place; 31 miles north-north-west of Brandenburg, and 62 west of Berlin.

STONE, a decayed parish of England, in Northamptonshire; 2½ miles north-west of Brackley.

STENICO, a large village of the Austrian states, in Tyrol, circle of Roveredo, on the river Sarca.

STENNESS, a parish in the island of Pomona, in Orkney.

STENNESS, Loch, a small lake of Orkney, in the foregoing parish, noted for a remarkable causeway over it, forming a communication between two Druidical temples.

STENNESS, a small island of Shetland, on the north coast of the Mainland. It covers a small bay in Northmaven parish, where there is a good fishing station, with drying-houses and other conveniences.

STENNIGOT, a parish of England, in Lincolnshire; 5½ miles west-south-west of Louth.

STENO (Nicholas), a distinguished physician, and subsequently bishop of Titiopolis, and vicar-apostolic of the northern countries, was born at Copenhagen in 1638. His father was a Lutheran and goldsmith to Christian IV. king of Denmark. Having had the advantage of studying medicine and anatomy under the celebrated Bartholin, whose friendship he obtained by his ingenuity and industry, he was well prepared to profit by his travels through various parts of Holland, Germany, France, and Italy, in visiting the best schools, in which he passed several years. He was at Amsterdam in 1660, and resided during the three succeeding years at Leyden, where he pursued his studies with the utmost diligence. He arrived at Paris in 1664, and at the end of two years more went to Vienna, traversed part of Hungary, and entered Italy by the Tyrol. He visited the principal cities of this fine country, and passed some time especially at Rome and Florence, in the latter of which cities his reputation reached the court of Ferdinand II., grand duke of Tuscany, who appointed him his physician about the year 1667, with a liberal salary. He was afterwards honoured with the esteem and confidence of Cosmo III., who selected him a preceptor to his son. His attachment to the Protestant religion had been shaken by the eloquence of Bossuet while he was at Paris, and in 1669 he abjured that faith, and adopted the Roman Catholic persuasion. Frederick III., king of Denmark, invited him, near the close of his reign, to return to Copenhagen; but he refused the invitation, because he could not obtain permission to exercise the religion which he had adopted; but Christian V. repeating the invitation without any such restraint, about the year 1672, Steno returned to his native city, and was appointed professor of anatomy. He found his change of sentiments and circumstances, however, productive of less agreeable results than he had anticipated, and he again quitted Denmark, and resumed the education of the young prince of the house of Cosmo, at Florence. Some time after his return, he entertained a wish to enter the ecclesiastical state, and he embraced that profession in 1677. He was speedily nominated, by pope Innocent XI., to the bishopric in Isauria, which we have already mentioned; and was afterwards appointed vicar-apostolical to all the states of the north, in which capacity he became a zealous preacher in Hanover, Munster, Hamburg, and various parts of Germany, and died in the course of his missionary labours, at Schwerin, in the duchy of Mecklenburgh, in 1686, in the 49th year of his age.

The works of Steno which are extant, relate principally to medical subjects. He was a zealous cultivator of anatomy, and the author of some discoveries relative to the minute circulation of the eye, the nose, and organs of voice, and to

the lymphatic vessels; as the papers which he communicated to the Academy of Copenhagen, and his other works, will testify. The titles of the latter are "Observationes de Oris, Oculorum, et Narium Vasis," 1662; this was enlarged and reprinted in 1664, with the new title "De Musculis et Glandulis Observationum Specimen." "Elementorum Myologie Specimen, seu Musculi Descriptio Geometrica," 1667. "De solido intra solidum naturaliter contento Dissertationis Prodomus," 1669. "Dissertatio de Cerebri Anatome," 1671; which had been published in French at Paris in 1669. "Epistolæ duæ Adversariæ," 1680. In this year he again published his first work, with some alterations, under a new title, "Observationes Anatomicae, quibus varia Oris, Oculorum, et Narium Vasa describuntur, novique Salivæ, Lachrymarum, et Muci fontes deteguntur, &c." Steno was the uncle of Winslow, who subsequently carried anatomical science to the highest pitch.

STENOCARPUS [from στενος, narrow, and καρπος, Gr. fruit], a genus of Brown's, the EMBOTHRUM of Linnæus; which see.

STENOCHILUS [from στενος, slender, and χελος, Gr. a lip.] a genus of Brown's, somewhat obscure.

STENOGRAPHY, s. [στενος and γραφω, Gr.; stenographic, Fr.] The art of writing in short hand.—Some will preamble a tale impertinently, and cannot be delivered of a jest, till they have travelled an hour in trivials, as if they had taken the whole tale by *stenography*, and now were putting it out at large. *Feltham*.

Mr. Byrom's method of short-hand, as improved by Mr. Molineux, being now generally esteemed the best and most practical system extant, we refer such of our readers as may wish to attain any proficiency in short-hand, to "An Introduction to Byrom's Universal English Short-Hand," by Mr. Molineux, of Macclesfield, explaining the *theory* of the art in a very clear and perspicuous manner; and to a supplementary work, entitled "The Short-Hand Instructor, or Stenographical Copy-Book," which exhibits the *practice*, adorned with its peculiar characteristics of ease and beauty. These two elegant little works form together a complete system of stenography, and have the merit of familiarizing Mr. Byrom's excellent method for the general use of schools, and for the particular guidance of those who, without the assistance of a living instructor, may be desirous of this attainment.

STENOSA, an island of the Grecian archipelago. It is about 10 miles in circumference, and its only inhabitants are a few goat herds and their flocks. Lat. 37. 5. N. long. 25. 55. E.

STENSON, a township of England, in Derbyshire; 4½ miles south-south-west of Derby.

STENSZEWO, a small town of Prussian Poland; 12 miles south-west of Posen. Population 800.

To STENT, v. a. To restrain; to stint. To *stent* is the Scottish word for cease or stop. Spenser uses it merely for the sake of his rhyme. See the verb active STINT.

Therewith Sir Guyon left his first emprise,
And turning to that woman, fast her hent
By the hoare lockes that hong before her eyes,
And to the ground her threw: yet nould she *stent*
Her bitter rayling and foule revilement. *Spenser*.

STENTON, a parish of Scotland, in Haddingtonshire; about 3½ miles long and 3 broad. Population 685.

STENTORIAN, adj. [from *Stentor*. The French have an old word like our *stentorian*, viz., *stentoré*; as, "voix stentorée, a huge voice, such a one as the Grecian Stentor had." *Cotgrave*.] Loud; uncommonly loud.—They echo forth in *stentorian* clamours. *Sir T. Herbert*.

STENTOROPHONICK, adj. [from *Stentor*, the Homeric herald, whose voice was as loud as that of fifty men, and φωνη, a voice.] Loudly speaking or sounding.

I heard a formidable noise,
Loud as the *stentorophonick* voice,
That roar'd far off!

Hudibras.

T^o

To STEP, *v. n.* [ʔæppan, Sax.; *stappen*, Dutch.] To move by a single change of the place of the foot.—One of our nation hath proceeded so far, that he was able, by the help of wings, in a running pace, to *step* constantly ten yards at a time. *Wilkins*.—To advance by a sudden progression.

Ventidius lately
Bury'd his father, by whose death he's *stepp'd*
Into a great estate. *Shakspeare.*

To move mentally.—When a person is hearing a sermon, he may give his thoughts leave to *step* back so far as to recollect the several heads. *Watts*.—To go; to walk.

I am in blood
Stept in so far, that should I wade no more,
Returning were as tedious as go o'er. *Shakspeare.*

To come as it were by chance.—The old poets *step* in to the assistance of the medalist. *Addison*.—To take a short walk.

My brothers, when they saw me wearied out,
Stepp'd, as they said, to the next thicket side
To bring me berries. *Milton.*

To walk gravely, slowly, or resolutely.—Pyrrhus, the most ancient of all the bashaws, *stept* forth, and, appealing unto his mercies, earnestly requested him to spare his life. *Knolles*.

STEP, *s.* [ʔæp, Sax.; *stap*, Dutch.] Progression by one removal of the foot.

Thou sound and firm-set earth,
Hear not my *steps*, which way they walk. *Shakspeare.*

One remove in climbing; hold for the foot; a stair.—While Solyman lay at Buda, seven bloody heads of bishops, slain in battle, were set in order upon a wooden *step*. *Knolles*.—Quantity of space passed or measured by one removal of the foot.—The gradus, a Roman measure, may be translated a *step*, or the half of a passus or pace. *Arbutnot*.—A small length; a small space.—There is but a *step* between me and death. *1 Sam*.—Walk; passage; (in the plural).

O may thy pow'r, propitious still to me,
Conduct my *steps* to find the fatal tree
In this deep forest. *Dryden.*

Gradation; degree.—The same sin for substance hath sundry *steps* and degrees, in respect whereof one man becometh a more heinous offender than another. *Perkins*.—Progression; act of advancing.—To derive two or three general principles of motion from phænomena, and afterwards to tell us how the properties and actions of all corporeal things follow from those manifest principles, would be a very great *step* in philosophy, though the causes of those principles were not yet discovered. *Newton*.—Footstep; print of the foot.

From hence Astrea took her flight, and here
The prints of her departing *steps* appear. *Dryden.*

Gait; manner of walking.
Sudden from the golden throne
With a submissive *step* I hasted down;
The glowing garland from my hair I took,
Love in my heart, obedience in my look. *Prior.*

Action; instance of conduct.—The reputation of a man depends upon the first *steps* he makes in the world. *Pope*.

STEP, in composition, signifies one who is related only by marriage. [ʔceop, Sax., from ʔcepan, to *deprive* or *make an orphan*; ʔceop-ʔæber, ʔceop-mober, &c. *Step-father*, *step-son*, and *step-daughter*, are terms almost obsolete in our language: but this is to be regretted, since they are far more concise and elegant, than the barbarous compound father-in-law, son in-law, &c.]

Vol. XXIII. No. 1592.

You shall not find me, daughter,
After the slander of most *step-mothers*,
Ill-ey'd unto you. *Shakspeare.*

A father cruel, and a *step-dame* false. *Shakspeare*.—This queene endured some troubles in the reign of her *step-sonne* King Henry the Fifth. *Weeve*.

STEPAN, a small town in the west of European Russia, in Volhynia, with 3700 inhabitants; 46 miles north of Rovno.

STEPENITZ, a river of Prussia, in the government of Potsdam. It flows by Perleberg, and joins the Elbe at Wittenberg.

STEPENITZ, a river of the north of Germany, in the grand duchy of Mecklenburg, which joins the Trave, near its entrance into the Baltic.

STEPHANESTE, a small town of European Turkey, in Moldavia, at the conflux of the Pruth and the Baszeu; 40 miles north of Jassy, and 116 north-west of Bender.

STEPHANIA [so named by Loureiro, from στεφανη, Gr., any thing encircling the summit of something else], in Botany, a genus of the class dioecia, order monandria, natural order of sarmantaceæ asparagi (*Juss.*)—Generic Character. Male—Calyx: perianth of six rather acute, spreading leaves, the three alternate ones smaller. Corolla: petals three, small, obtuse. Stamina: filament one, as long as the calyx, thick and abrupt at the summit; anther circular, crowning the filament. Female—on a separate plant. Calyx as in the male. Corolla none. Pistil: germen superior, ovate; style none; stigma erect, elongated. Pericarp: berry minute, ovate. Seed solitary.—*Essential Character*. Male—Calyx of six leaves. Petals three, much smaller than the calyx. Anther annular. Female—Calyx of six leaves. Petals none. Stigma simple. Berry superior, with one seed.

1. *Stephania rotunda*, or round-rooted stephania.—Leaves peltate, roundish. Umbels compound.—Native of the woods of Cochin-china.

2. *Stephania longa*, or long-rooted stephania.—Leaves peltate, oblong. Heads of flowers lateral, sessile.—Found about the reed fences of Cochin-china.

STEPHANITÆ [στεφανίται, Gr.], in Antiquity, an epithet given to games and exercises, where the prize was only a garland.

STEPHANIVM, in Botany, a name given by Schreber to *Palicourea*.

STEPHANO, one of the highest hills of the small island of Ithaca, in Greece.

STEPHANOPHORUS [στέφανοφορος, Gr.], in Antiquity, the chief priest of Pallas, who presided over the rest. It was usual for every god to have a chief priest; that of Pallas was the Stephanophorus, just mentioned; and that of Hercules was called Dadouchus.

STEPHANSFELDEN, more commonly called STECKFELD, a small town of France, in Alsace; 16 miles from Strasburg.

STEPHANUS (Byzantius), a grammarian who flourished as it is conjectured, about the close of the fifth century, was professor in the imperial college of Constantinople, and composed a dictionary, containing nouns-adjective, derived from the names of places; and designating the inhabitants of those places. Of this work there exists only an abridgment, made by Hermolaus, and dedicated to the emperor Justinian. This work is known by the title Περὶ πόλεων, De Urbibus; but that of the original was Σδνικα: hence it has been inferred, that the author's intention was to write a geographical work. Much of the value of the original is unquestionably lost in the abridgment; yet learned men have derived considerable light from it; and it has been an object of critical illustration to Casaubon, Scaliger, and Salmasius. It was printed in Greek at Venice, in 1502, under the superintendance of Aldus Manutius.

STEPHENS, a parish of England, in the county of Cornwall; 1 mile west-south-west of Saltash. Trematon castle,

castle, which is in this parish, is situated on an eminence above the river Lynher. It was held under Robert, earl of Moreton and Cornwall, in the reign of William Rufus, by Rejerald de Vallerot. There are still some considerable remains of the original structure. Population 1121.

STEPHENS, CAPE, a cape on the north-west coast of America. Lat. 63. 33. N. long. 197. 41. E.

STEPHEN'S ISLAND, an island on the north-west coast of North America, about 30 miles in length, so called by Vancouver. It is about 10 miles to the north of Pitt's archipelago. On the north-west side of the island, a range of innumerable rocky islets and rocks extends for about a league and a half, and occupies a space of about two miles in width. Lat. 54. 11. N. long. 229. 30. E.

STEPHEN'S ISLAND, a small island in the north-west part of Cook's straits, in New Zealand. Lat. 40. 36. N. long. 185. 6. W.

STEPHEN'S ISLANDS, two small islands in the Eastern seas, discovered by Captain Carteret in 1767. They had a green pleasant appearance, and were well covered with trees; but whether they were inhabited he did not know. They run about north-west-by-west, and south-east-by-east: one is about three miles long, and the other about six. The passage between them appeared to be about two miles broad. They are surrounded with extensive reefs. Lat. 0. 22. S. long. 138. 39. E.

STEPHEN'S ISLAND, in Torres strait, north of Darnley's island, lying about long. 143. E. lat. 9. S. The cocoa nut grows abundantly here, and a tree which produces fruit resembling almonds. The natives dwell in huts, wherein are images of their gods; also several human skulls.

STEPHEN'S PASSAGE, the strait which divides Admiralty island from the west coast of North America. Its general direction is nearly north, in which direction it extends along the eastern shore of Admiralty island, when at Point Salisbury, on the continental shore, it divides into two branches. One of these, running in a north-west direction, along the north-east shore of Admiralty island, is separated into two channels by Douglas's island, and communicating with Chatham's strait and Cross sound, leads by this passage to the ocean. The channel between Douglas's island and the mainland, was found by Captain Vancouver's exploring party, to be interrupted with ice, even in the month of August. The other takes a north-east direction from Point Salisbury about 13 miles, and was encumbered with a great quantity of floating ice, the weather also being extremely cold. The shores at its termination spread out to east and west, and form a basin about a league broad, and two across. From the shores of this basin, Vancouver's party saw a compact body of ice extending some distance all around; and the adjacent region is composed of a lofty range of frozen mountains, whose sides, almost perpendicular, are formed entirely of rock, excepting close to the water side, where a few scattered dwarf pine trees found sufficient soil to vegetate in. Above these the mountains were wrapt in undissolving frost and snow. From the rugged gullies in their sides were projected immense bodies of ice, that reached perpendicularly to the surface of the water in the basin, and exhibited as dreary and inhospitable an aspect as the imagination can suggest. Lat. 57. 29. N. long. of the south entrance, 226. 35. E.

STEPHENS, POINT, a cape on the east coast of New Holland. Lat. 33. 41. S. long. 207. 50. W.

STEPHENS, ST., a parish of England, in Cornwall, adjoining to Launceston. Population 896.

STEPHENS, ST., a parish of England, in Cornwall; $4\frac{1}{2}$ miles west-north-west of St. Austell.

STEPHENS, ST., a parish of the United States, in South Carolina, Charleton district.

STEPHENS, FORT ST., a newly established town of the United States, in Washington county, Alabama territory. It is situated on the west bank of the Tombigbee, at the head of the sloop navigation, and is in a state of rapid improve-

ment. It contains about 250 houses, a printing office, an academy, and 15 stores or shops. It is built on very uneven ground, but in a healthy situation. It is the seat of government for the Alabama territory. Population in 1817, 800. 100 miles above Mobile by land, 120 or 130 by the river; 103 miles from Washington. Lat. 31. 33. N.

STEPHENTOWN, a post township of the United States, in Rensselaer county, New York; 22 miles south-east of Albany. Population 2567.

STEPNEY, a large and populous village and parish of England, in the county of Middlesex, being one of the out parishes of the city of London, and which may be regarded as a suburb to the metropolis, being connected with it by ranges of buildings. It was formerly of such vast extent, that in subsequent times the following parishes have been produced out of it, viz., St. Mary Stratford, at Bow; St. Mary, Whitechapel; St. Ann's, Limehouse; St. John's at Wapping; St. Paul's, Shadwell; St. George, Ratcliffe Highway; Christ Church, Spitalfields; St. Matthew's, Bethnal Green, and Poplar; all which have been separated from it, and yet it still remains one of the largest parishes within the bills of mortality. It contains the hamlets of Mile End, Old and New Towns, and Ratcliffe. In the year 1794, it contained, according to Mr. Lysons, about 1530 acres of land (exclusive of the site of buildings), of which about 80 were then arable, about 50 occupied by market gardeners, and the remainder meadow, pasture, and marshy land. But since that year, the increase of buildings has reduced nearly to nothing the ground appropriated to these purposes. The church of Stepney, dedicated to St. Dunstan and All Saints, is a large building, consisting of a chancel, nave, and two aisles, separated by columns and pointed arches. At the west end is a square tower. Here are tombs of several illustrious characters, especially of Sir Henry Colet, lord mayor in 1486 and 1495, the father of Dr. John Colet, who founded St. Paul's school; Sir John Berry, a distinguished officer in the reign of Charles II.; Sir Thomas Spert, comptroller of the navy to Henry VIII. and founder of the Trinity-house. The font stands on a circular pillar, surrounded by four others of a smaller size. On the south side of the church are sculptures of the crucifixion, &c. In the wall of one of the porches is a stone, on which some verses are inscribed, dated 1663, and stating it to have been brought from Carthage. The churchyard contains, with many other celebrated names, those of Dr. Richard Mead and his father. Besides the church, this parish contains several Methodist meeting-houses. Adjoining to Poplar is Stepney Marsh, peculiarly celebrated for the richness of its pasture. The hamlet of Ratcliffe lies in the western division of the parish. It is about two miles and a half in circumference. The charity school here was begun in 1710; and the school-house in White horse-street was built by subscription in 1719, and has since received great additional benefactions. In this hamlet are the church, the Friends' meeting, the Mercers' alms-houses, a cemetery belonging to the Protestant dissenters, with dwellings for seven poor persons, and a school instituted by them in 1783. Mile End occupies the greater part of the northern division of the parish. In this hamlet is Brewer's meeting-house and a Methodist chapel. On the north side of the road are two Judaic cemeteries. Several other charitable institutions belonging to public bodies, are situated on this road. The origin of the name of Stepney is uncertain, but it is supposed to be derived from the Saxon for a timber wharf, or from *Stiben*, a corruption of Stephen. In 1299 Edward I. held a parliament here, in the house of Henry Walleis, lord mayor of London, and gave his confirmation to the great charter. Lands in the manors of Stepney, Poplar, and Bromley, descend by the custom of gavelkind.

STEPPE, a name given in Russia to its plains and flats, which are very extensive, and are interspersed among its mountainous tracts.

STEPPING, *s.* The act of going forward by steps.

Though

Though short be fall of old Corvino's age,
His *steppings* with the other footsteps fit.

More.

STEPPINGLEY, a parish of England, in Bedfordshire; 3 miles south-west of Amptill.

STEPPINGSTONE, *s.* Stone laid to catch the foot, and save it from wet or dirt.

Like *Stepping-stones* to save a stride,
In streets where kennels are too wide.

Swift.

STER. Used in composition, as *webster*, *malster*, *spinner*, &c. Somner derives this from the Sax. *steope*, direction, the power of a master. See Lye in *V. steope*.

STERBA, or CSORBA, a small town of the north-west of Hungary, in the county of Liptau, with 1400 inhabitants, chiefly Protestants.

STERBECKIA [so named in memory of Francis Van Sterbeek, author of *Theatrum Fungorum*], in Botany, a genus of the class polyandria, order monogynia, natural order of guttiferae (*Juss.*)—Generic Character. Calyx: perianth three or five-leaved: leaflets roundish, concave, acute. Corolla: petals three or five, roundish, crenate, clawed, longer than the calyx. Stamina: filaments very many, capillary, inserted into the receptacle. Anthers roundish. Pistil: germ ovate, superior. Style long, curved in at the top. Stigma headed, concave. Pericarp: capsule, cylindrical, long, corticose, one-celled, not opening. Seeds many, large, angular, incumbent on each other, nestling in the pulp.—*Essential Character.* Calyx three or five-leaved. Corolla three or five-petalled. Capsule corticose, not opening, legume-shaped, many-seeded. Seeds imbricate.

Sterbeckia lateriflora.—This is a scandent shrub. Leaves subopposite, petioled, elliptic, acuminate, quite entire, veined, smooth. Peduncles many flowered, very short, lateral. Flowers white, small.—Native of Guiana, in woods.

STERCORACEOUS, *adj.* [*stercorosus*, Lat.] Belonging to dung; partaking of the nature of dung.—Green juicy vegetables, in a heap together, acquire a heat equal to that of a human body; then a putrid *stercoraceous* taste and odour, in taste resembling putrid flesh, and in smell human fæces. *Arbutnot.*

STERCORARIANS, a name which the Roman church anciently gave to such as held that the host was liable to digestion, and all its consequences, like other food.

STERCORATION, *s.* [from *stercora*, Lat.] The act of dunging; the act of manuring with dung.—The first help is *stercoration*: the sheep's dung is one of the best, and the next dung of kine, and that of horses. *Bacon.*

STERCULIA [from *Stercus*. So named on account of its fetid smell], in Botany, a genus of the class dodecandria, order monogynia, natural order of tricocceæ, malvacæ (*Juss.*)—Generic Character. Calyx: perianth one-leaved, very large, coriaceous, flat, deciduous, five-parted: parts lanceolate, acute. Corolla none: but a nectary placed on a cylindrical column, bell-shaped, small, five-toothed: teeth subtrifid. Stamina: filaments ten or about fifteen, very short, two or three on each tooth of the nectary. Anthers ovate. Pistil: germ globular, five-grooved, in the bottom of the nectary. Style filiform, curved in. Stigma club-shaped, bifid or five-lobed. Pericarp: capsules five, ovate, reniform, from spreading reflexed, one-celled, opening by the interior angle. Seeds many, oval, fastened to the suture.—*Essential Character.* Calyx five-parted. Corolla none. Nectary bell-shaped, five-toothed, staminiferous, fastened to the column of the germ. Germ pedicelled. Capsules five, one-celled, opening by the inner side, many-seeded.

1. *Sterculia lanceolata*, or lance-leaved *sterculia*.—This is a tree of moderate size, with smooth, veined, lanceolate leaves; the fruit appears to consist of five rather larger ovate capsules disposed in a stellated direction on the footstalk; they are of a red colour and contain three or four large black round seeds in each.—Native of China.

2. *Sterculia balanghas*.—This is a tall tree, with a stem of two feet in diameter, thick branches, covered with a thick

ash-coloured bark, and furnished with alternate, smooth, veined, lanceolate leaves; in general about nine inches long and three broad: the flowers are produced in sparse fascicles at the tips of the shoots: the capsules are rather large, smooth, ovate, and stand by fives in a stellated direction; each capsule containing six, seven or eight moderately large round seeds.—Native of Malabar, Amboina, &c.

3. *Sterculia crinita*.—A tree of sixty feet high, branching in a spreading manner at the top: leaves alternately scattered, and on long footstalks: they are smooth above, downy beneath, where they are also of a reddish cast; the flowers are borne on panicles the footstalks of which have each a stipule at the base.—Native of Guiana, in the woods of Sinemare, and near the river Galibien,

4. *Sterculia cordifolia*, or heart-leaved *sterculia*.—Leaves cordate, obsolete, three-lobed; capsules acuminate, tomentose. Stem arborescent.—Native of Senegal.

5. *Sterculia colorata*, or coral *sterculia*.—Leaves five-lobed; lobes acuminate; calyxes cylindric-club-shaped; capsules oblong, smooth, coloured. Trunk erect, growing to a very great size. Bark ash-coloured, and a little scabrous. Branches numerous, spreading irregularly; bark as on the trunk, but smoother. Panicles terminating, small, numerous, red like coral, covered with many red stellated hairs. Flowers numerous, about an inch long. This tree casts its leaves during the cold season. It flowers in April, and then appears as if entirely covered with fine ramifications of red coral. Soon after the leaves make their appearance.—Native of the mountainous parts of the Rajahmundry Circar. Called by the Telingas *Caraka*.

6. *Sterculia urens*.—Leaves five-lobed; lobes acuminate; calyxes bell-shaped; capsules ovate, hispid. Trunk erect, very straight, with the top large and shady.—It is a very large tree, chiefly a native of the mountainous countries of the coast of Coromandel.

7. *Sterculia platanifolia*, or maple-leaved *sterculia*.—Leaves palmate, five-lobed; calyxes wheel-shaped, reflexed. This is a very lofty tree.—Native of Japan and China.

8. *Sterculia fetida*, or fetid *sterculia*.—Leaves digitate. This is a tree above the middle size, with spreading unarmed branches.—Native of the East Indies, Cochin-china, &c.

Propagation and Culture.—Propagated by seed; and treated in the same way as *Sida*.

STERDYN, a small town in the east of Poland, near the town of Siedlee.

STEREOBATA, or STEREOBATES [from *στερεοβατης*, Gr., *solid prop*], in Architecture, the basis or foundation, whereon a column, wall, or other piece of building is raised.

This answers pretty well to the continued fœcle or basement of the moderns.

STEREOCAULON [from *στερεος*, *hard and solid*, and *καυλος*, Gr., *a stem*], in Botany, a name applied to a genus of the Lichens, invented by Screber in his *Gen. Pl.* 768. See LICHEN.

STEREOGRAPHIC, *adj.* Delineated on a plane; done according to the rules of stereography.—The angles made by the circles of the sphere are equal to the angles made by their representatives in the *stereographic* projection. *Reid.*

STEREOGRAPHY, *s.* [*στερεος*, *solid*, and *γραφειν*, I write; Gr.; *stereographie*, Fr.] The art of drawing the forms of solids upon a plane.

STEREOMETRY, *s.* [*στερεος* and *μετρον*, Gr.; *stereometrie*, Fr.] The art of measuring all sorts of solid bodies.

STEREOTOMY, *s.* [*στερεος* and *τομω*, Gr.; *stereotomie*, Fr.] The art of cutting solids; as walls, arches, &c.

STEREOTYPE, [from *στερεος*, Gr., *solid*, and *τυπος*, *type*; *stereotype*, Fr.] A multiform solid type; a type-metal plate to print from at the letter-press; the art of making type-metal plates, or other solid multiform types. See PRINTING.

STEREOTYPE, or STEREOTYPIC, *adj.* Pertaining to stereotype.

To STEREOTYPE, *v. a.* [*stereotyper*, Fr.] To make type-metal plates to print from at the letter-press, or any other multiform solid types. To print a book with these plates.

STEREOTYPYPER, *s.* One who stereotypes.

STEREOXYLON [from *στερεος*, *hard and solid*, and *ξύλον*, Gr., *wood*, a name given by Ruiz and Pavon in their Flora Peruviana, to the genus by Linnæus ESCALLONIA; see that article.

STERILE, *adj.* [*sterile*, Fr.; *sterilis*, Lat., from *στερος*, Gr., which has the same meaning, and which is usually derived from *στερεω*, *to deprive*.] Barren; unfruitful; not productive; wanting fecundity.

Our elders say,
The barren, touched in this holy chase,
Shake off their *sterile* curse.

Shakspeare.

STERILITY, *s.* [*sterilité*, Fr.; *sterilitas*, from *sterilis*, Lat.] Barrenness; want of fecundity; unfruitfulness.—Spain is thin sown of people, by reason of the *sterility* of the soil, and because their natives are exhausted by so many employments in such vast territories. Bacon.

To STERILIZE, *v. a.* To make barren; to deprive of fecundity; or the power of production.—Go! *sterilize* the fertile with thy rage. Savage.

STERLING, *adj.* [of this word many derivations have been offered; the most probable of which is that offered by Camden, who derives it from the *Easterlings*, who were employed as coiners.] An epithet by which genuine English money is discriminated.—Several of them would rather chuse to count out a sum in sesterces than in pounds *sterling*. Addison.—Genuine; having past the test.—There is not one single witty phrase in this collection, which hath not received the stamp and approbation of one hundred years; he may therefore be secure to find them all genuine, *sterling*, and authentic. Swift.

STERLING, *s.* [*sterlingum*, low Lat. from the adjective.] English coin; money.

Accept this offering to thy bounty due,
And Roman wealth in English *sterling* view. Arbuthnot.

Standard rate.—*Sterling* was the known and approved standard in England, in all probability from the beginning of King Henry the Second's reign. Leake.

STERLING, a township of the United States, in Franklin county, Vermont; 30 miles north-north-west of Montpelier. Population 121.

STERLING, a post township of the United States, in Worcester county, Massachusetts, which contains a considerable village. Population 1472; 12 miles north of Worcester, and 44 west of Boston.

STERLING, a post township of the United States, in Windham county, Connecticut. Population 1101; 18 miles north-east of Norwich. Lat. 41. 42. N. long. 71. 53. W.

STERLINGVILLE, a post township of the United States, in Granville county, North Carolina.

STERLITAMAK, a small town in the interior of Russia, in the government of Orenbourg, at the confluence of the rivers Stela and Belaja. It is the depôt of the salt made from the lake of Iletzk; 75 miles south-by-east of Ufa.

STERN, *adj.* [rœynn, Sax.] Severe of countenance; truculent of aspect.—Why look you still so *stern* and tragical? Shakspeare.—Severe of manners; harsh; unrelenting; cruel.

Women are soft, mild, pitiful, and flexible:
Thou *stern*, obdurate, flinty, rough, remorseless.

Shakspeare.

Hard; afflicitive.

Mischief stood,
And with his *stern* steele, drew in streams the blood.

Chapman.

STERN, *s.* [rœann, or rœope, Sax.] The hind part of the ship where the rudder is placed.—They turn their heads to sea, their *sterns* to land. Dryden.—Post of management; direction.

The King from Eltam I intend to send,
And sit at chiefest *stern* of public weal.

Shakspeare.

The hinder part of any thing.

She all at once her beastly body raised,
With doubled forces high above the ground;
Tho' wrapping up her wreathed *stern* around,
Lept fierce upon his shield.

Spenser.

STERNA, the TERN, in Ornithology, a genus of birds of the order Anseres, of which the Generic Character is: bill subulate, straightish, pointed, a little compressed, without teeth; nostrils linear; tongue pointed; wings very long; tail mostly forked. Twenty-five species of this genus are enumerated by Gmelin: they are mostly inhabitants of the ocean, and feed on fishes. Many of them are found on the shores of large lakes and rivers. Four of the species are common to our own country. They breed among small tufts of rushes, and lay three or four eggs of a dull olive colour, spotted with black. The birds belonging to this genus are at all times clamorous and gregarious, but more particularly in the spring of the year, during the time of nesting. At this period they assemble in large flocks, and their activity seems greatly increased, for they repeat with eagerness their sharp piercing notes so incessantly, that persons cannot approach the place where they breed without being almost stunned with their noise. With us the terns are migratory, leaving our shores regularly on the approach of winter.

1. *Sterna Caspia*.—The Caspian tern has its body above of a plumbeous-ash colour; beneath and neck white; the bill is scarlet; the frontlet and legs are black. It is found, as its specific name denotes, on the Caspian sea, and is nearly two feet in length.—It frequents the sea-shores and banks; feeds on small fish and sea-insects, hovering over the water, and suddenly darting into it for its prey.

There are three varieties: 1. Crown black, spotted with white; tail-feathers with brown bars.—It inhabits Bombay, and is twenty-one inches long: its bill is red; and legs black. 2. Crown black; hind-head sub-crested; outer tail-feathers white from the middle to the tip; the bill is yellowish; and the legs black.—It inhabits China, and the Sandwich islands. 3. The bill in this is white; frontlet varied black and white; ears black; back and wings cinereous; quill and tail-feathers tipped with black.

2. *Sterna Cayanensis*, or Cayenne tern.—Cinereous; the feathers edged with reddish; beneath they are white; the hind-head is black.—It inhabits Cayenne, and is sixteen inches long.

3. *Sterna Surinamensis*, or Surinam tern.—Bill, head, neck, and breast, black; back, wings, and tail, cinereous; belly whitish; legs red.—It inhabits Surinam, and is about fifteen inches long.

4. *Sterna fuliginosa*, or sooty tern.—Black; beneath, cheeks, front, and shafts of the quill and tail-feathers, white. The bill and legs are white; the eggs yellowish, with brown and violet spots; outer tail-feathers white, except at the tip.—It inhabits the Atlantic and Antarctic seas, and is sixteen inches long.

5. *Sterna Africana*, or African tern.—White; bill and legs black; crown, wings, and tip of the tail, spotted. The crown is spotted with black, the wings with brown, and the tail with white; quill-feathers blueish-ash.—It is an African bird, and is about the size of the *Sterna fuliginosa*.

6. *Sterna stolidus*, or noddy.—Body black; front whitish; eye-brows black; bill and legs black; the hind-head is cinereous.—It is fifteen inches long; found chiefly within the tropics; is clamorous; seldom goes far from shore, and always rests at night.—It builds on rocks; and its eggs are excellent food.

7. *Sterna*

7. *Sterna Philippina*, or Philippine tern.—Claret-grey; cap white; band through the eyes, wings, tail, bill, and legs, black.—It is found on the shores of the Philippine islands; and is about twice as large as the common swallow.

8. *Sterna simplex*, or simple tern.—Above plumbeous; beneath, crown, greater and middle wing-coverts, white; band behind the ears and quill-feathers black. A variety has the bill and legs black. The bill and legs are red; some of the wing-coverts edged with brown.—It inhabits Cayenne; and is fifteen inches long.

9. *Sterna nilotica*, or Egyptian tern.—Cinereous; beneath white; head and neck with blackish spots; orbits black, dotted with white. The bill is black; and the legs of a flesh colour.—It inhabits Egypt; and is above the size of a common dove.

10. *Sterna cantiaca*, or Sandwich tern.—White; back and wings hoary; cap black; front with white spots; quill-feathers blackish, with a white shaft. The bill is black, but yellowish at the tip; the legs are black; wings longer than the tail; the egg is of an olive-brown, with purplish and crowded spots: it is full eighteen inches long, and is found on the Kentish coast, generally appearing about Romney in the middle of April, and leaving the country in September. It is rather common at Sandwich, where it was first noticed by Mr. Boys. There are two varieties of this species: 1. Tail hardly forked; body variegated; ears with a black spot. 2. Above black, varied with paler colours; beneath white; tail forked; bill and legs black.—This last is found in Finland.

11. *Sterna hirundo*; common, or greater tern.—The two outer tail-feathers are half black and half white. There is a variety that has black legs; outer tail-feathers entirely white. The greater tern is about thirteen inches from the tip of the bill to that of the toes; its breadth, when the wings are spread, is about two feet. It is of a slender but elegant form, which is increased by the beautiful plumage with which it is adorned. The back is covered with a grey mantle; the breast is of pure white, elegantly contrasted with a large black spot upon the crown of the head, resembling a hat; the bill and legs are red. Early in the spring this species arrives on our own coasts, and sometimes is seen a considerable way from the shore, in the interior parts of the country, hovering about the lakes and rivers. They are observed by sailors during the whole passage from Britain to Madeira. They are the most active fishers of all the aquatic tribes; instantaneously darting upon the prey which they observe from a great height in the air. After having dived and caught the booty, they as suddenly rise again to their former elevation.

The action of the stomach which this tribe exhibits is amazingly powerful; the fish being so completely digested in an hour, that the bird is ready to swallow a new meal. Those parts of the food that are nearest the bottom of the stomach are dissolved, and make way for the rest, which soon undergoes the same process.

Immediately after the arrival of this species of the tern, the pairing season commences; during which each female chooses a warm bed of sand, where she deposits three eggs, of a size far superior to what might be expected from a bird of her dimensions. The eggs of the tern are of different colours, some grey, others brown, and some of a greenish hue. The manner in which their eggs are hatched is as singular as their external appearance, for it is accomplished chiefly by the heat of the sun. If the weather be dry and warm, the female seldom hatches by day, but resumes her maternal functions regularly about the time that the influence of the sun begins to decrease.

The young are not all protruded at the same time, but in the order in which the eggs were laid; and at the interval of a day between each of the three birds. The young terns are no sooner protruded from the shell, than they leave the nest, and follow the parent bird, who supplies them with small morsels of the fish upon which they themselves feed. During the whole period of incubation, the

parent birds display great solicitude for the safety of their eggs and their young. Should a person at this period approach their nest, both parents dart down from the air, and flutter about him, uttering all the while the most piercing screams, expressive at once of their fear, anxiety, and rage. These paternal cares soon cease; the young soon become capable of pecking their own food when provided for them. For a few days they are fed by the mother's bill; afterward, what food the parents provide, they bestow without even alighting upon the ground. Fond of indulging in their aerial excursions, they drop down the food upon their young, that are waiting below to receive it.

Terns are provided with very large wings, and from this very circumstance the young are not soon able to fly, their wings not being strong enough to accommodate them for flight. In this circumstance they resemble the swallow, which remains longer in the nest than any bird of its size, and leaves it more completely feathered. During this period of nonage, the parent terns continue to shower down plentiful supplies of food to their young, who at a very early period begin to dispute for their prey, displaying that insatiable gluttony which characterizes their race. The colour of the first plumage is a whitish-grey; the true colour is not obtained till after the first moulting.

12. *Sterna minuta*, or lesser tern.—Body white; back hoary; front and eye-brows white.—It is found in divers parts of Europe and America; and is of small size.

13. *Sterna striata*, or striated tern.—White; hind-head and nape black; body above and wings with transverse black streaks. The bill is black; the legs are of a lead colour.—It inhabits Zealand.

14. *Sterna vittata*, or wreathed tern.—Cinereous; crown black; surrounded with white; the rump, vent, and tail, are white; the bill is red, and legs tawny. A variety has a cinereous tail, with white spots.—It is found in Nativity island.

15. *Sterna spadicea*, or brown tern.—Reddish-brown; vent white; bill and claws black; tail and quill-feathers dusky; the secondaries tipped with white.—It inhabits Cayenne, and is fifteen inches long.

16. *Sterna fuscata*, or dusky tern.—Body blackish, without spots; bill brown, and legs red.—It is found in the island of Hispaniola.

17. *Sterna fessipes*.—Black; back cinereous; belly white; legs reddish.—It inhabits in different parts of Europe and America; and is about ten inches long.

STERNAGE, *s.* The steerage or stern. *Not used.*

STERNBERG, a town of the Austrian States, in Moravia; 13 miles north-north-east of Olmutz. It is well built, with large houses, wide streets, and a spacious square. It contains 8000 inhabitants, employed chiefly in manufacturing woollen, linen, and canvas. It is a thriving place, and its population has for some time back progressively increased. Lat. 49. 40. N. long. 17. 13. E.

STERNBERG, a small town of Germany, in the grand duchy of Mecklenburg-Schwerin, principality of Wenden, near a small lake. It contains 1300 inhabitants, and is, alternately with Malchin, the place of assembling for the diets of the grand duchy; 18 miles south-east of Wismar.

STERNBERG, a small town of the Prussian province of Brandenburg; 23 miles south-east of Custrin, and 20 east of Frankfurt. Population 800.

STERNDAL, EARL, a township of England in Derbyshire; 5½ miles south-east of Buxton.

STERNE (Laurence), the son of Roger Sterne, a lieutenant in the army, and grandson of Sterne, archbishop of York, was born at Clonmell, in Ireland, in November 1713, put to school at Halifax in 1722, and entered at Jesus College, Cambridge, in 1732, with a view to the church. After he had taken orders, he was presented to the living of Sutton, in Yorkshire, through the interest of his uncle, Dr. Sterne, prebendary of York. In 1741 he was married, and by the same uncle's interest obtained a prebend in York cathedral.

thedral. By means of his wife, he became possessed of the living of Stillingfleet, where, and also at Sutton, the place of his residence, he performed duty for nearly twenty years. During this time, as he informs us, he amused himself with books, painting, fiddling, and shooting. About this time, the only production of his pen was a little piece entitled "The History of a Watch-Coat," printed, but not published, about 1738, describing with humour some squabbles among the dignitaries of York, after the manner of Swift. In 1759 appeared two volumes of his "Life and Opinions of Tristram Shandy," a kind of peculiar novel, which was much read, and generally admired. Some commended and some censured it. However, it secured profit to himself, as it was bought by the booksellers, and as it was the means of procuring for him the presentation of the curacy of Coxwold. Several volumes appeared in succession, and the last, or 9th, in 1766. This is an eccentric performance, formed upon the idea of a kind of self-taught philosopher, in the person of an elderly country gentleman, full of odd and singular notions, which he displays chiefly in the plan he forms for the education of an only son, commencing from, or rather before, his birth. The work is original in its composition and style; and abounds with a variety of characters, observations, and exquisite touches of the pathetic, intermixed with a sufficient quantity of the indelicate and indecorous. It was new in its plan and execution, and though it has been often imitated, nothing strictly resembling it has yet appeared. In 1768, our author published another work, entitled "Sentimental Journey," in 2 vols. 12mo., which exceeded the former publication in popularity. With regard to purity and decorum, it is chargeable with the same, though perhaps not with equal blemishes with the former. In 1760, availing himself of his fame, he published two volumes of "Sermons of Mr. Yorick," and two more in 1766. Sterne had long contended with a tendency to pulmonary consumption, which at length became a confirmed disease, and terminated his life in March 1768. He left a widow and a daughter. The latter married a French gentleman, and published, in 1775, a collection of her father's letters, in 3 vols. 12mo., to which were prefixed "Memoirs of his Life and Family." In the same year, an anonymous editor published "Letters from Yorick and Eliza," which were regarded as an authentic correspondence of Sterne with Mrs. Draper, an East Indian lady.

STERNFIELD, a parish of England, in Suffolk, near Saxmundham.

STERNLY, *adv.* [stɛrnlice, Sax.] In a stern manner; severely; truculently.

Sternly he pronounc'd
The rigid interdiction. *Milton.*

STERNNESS, *s.* Severity of look.

Of stature large, and eke of courage bold,
That sons of men amaz'd their *sternness* to behold.
Spenser.

Severity or harshness of manners,

I have *sternness* in my soul enough
To hear of soldiers' work. *Dryden.*

STERNOMANTIS [στερνομαντις, Gr.], a designation given to the Delphian priestess, more usually called Pythia.

STERNOMANTIS is also used for any one that had a prophesying demon with him.

STERNON, or, more usually STERNUM, *s.* [στερνον, Gr.] The breast-bone.—A soldier was shot in the breast through the *sternon*. *Wiseman.*

STERNOPTYX, in Ichthyology, a genus of fishes, of the order Apodes, of which the Generic Character is as follows:—Head obtuse, teeth very minute; no gill-membrane; the body is compressed, without apparent scales; breast carinate, folded; belly pellucid. A single species only is mentioned by Gmelin, viz. —

Sternoptyx diaphana.—This is found in the American

seas: it is small, compressed, truncate before, narrowed and silvery behind. The eyes are large, and of an amber colour; the mouth is perpendicular; the tongue thick and rough; the upper lip is short, lower perpendicular, with four semi-circular depressed cavities from the ridge, and three others under the aperture of the gills; the aperture is oblique, with soft covers; the folds of the breast form a pellucid ridge; the back is of a greenish-brown colour, gibbous behind the fin, with a double ridge diverging towards the nostrils; it has no lateral line; the dorsal fin with an oblique, strong, spinous, immoveable ray, joined to which is a membrane very finely-toothed at the edge: pectoral fins of a fine amber colour; tail bifid.

STERNUTATION, *s.* [sternutatio, Lat.] The act of sneezing.

STERNUTATIVE, *adj.* [sternutatif, Fr., from *sternuto*, Lat.] Having the quality of provoking to sneeze.

STERNUTATORY, *s.* [sternutatoire, Fr., from *sternuto*, Lat.] Medicine that provokes to sneeze.

STERQUILINOUS, *adj.* [sterquilinum, Lat.; a dung-hill.] Mean; dirty; paltry. *Not in use.*

To STERVE, *v. n.* [stærppian, Sax.; *sterfen*, Germ.] To perish. Spenser often uses it, for the sake of his rhyme, instead of *starve*. It is also used by Chaucer. *Obsolete.*

Seven moneths he so her kept in bitter smart,
Because his sinful lust she would not serve,
Untill such time as noble Britomart
Released her, that else was like to *sterve*:
Through cruel knife that her deare heart did kerve. *Spenser.*

STERZINGEN, a small town of the Austrian states, in the Tyrol, at the foot of Mount Brenner. It contains 800 inhabitants, has a manufacture of sword blades, and in the neighbourhood a silver mine; 10 miles north-west of Brixen.

STESICHORUS, a Greek lyric poet, was born at Himera, in Sicily, and flourished about the year B.C. 612, being a person of some consequence in his native city; and he is said to have died in the year B.C. 556. His works were numerous, and much esteemed by the ancients. They were composed in the Doric dialect, but they have all perished, except a few fragments, amounting to 50 or 60 lines, printed in the collection of Fulvius Ursinus, Ant. 1568. To him we owe the first introduction into the ode of the triple division of strophe, antistrophe, and epode, which were called in a Greek proverb "the three things of Stesichorus," from which he is said to have derived his name, as signifying "placer of the chorus."

STETTEN, a large village of Germany, in Bavaria, not far from Augsburg, on a small lake also called Stetten, with 1100 inhabitants.

STETTEN AM KALTENMARK, a large village of the west of Germany, in Wirtemberg, in a rocky district called the Hart. Population 1000.

STETTEN IM REMSTHAL, a small town of the west of Germany, in Wirtemberg, near Stutgard, with 1600 inhabitants.

STETTEN UNTERM HEUCHELBERG, another small town of Wirtemberg; 11 miles west-by-south of Heilbronn. Population 1000.

STETTIN, a large town of the Prussian states, the capital of Pomerania, is situated on the Oder, about 60 miles from the Baltic. It stands on an eminence on the left bank of the Oder, which is divided here into four streams. Opposite to it, and connected by a long bridge over the main stream, is the part of the town called Lastadic. Stettin, including its three suburbs, contains 21,000 inhabitants, part of whom are descendants of French Protestant refugees. It has five gates, and several small squares. Of the public buildings the principal are the castle, the government house, the arsenal, the barracks, the hospitals, the exchange, the theatre, the public library. The government offices are in the castle. The majority of the inhabitants are Lutherans; and there is here an academical gymnasium, with several professors, and two assistants, who hold classes of divinity, law, medicine,

as well as of philosophy, mathematics, the classical, and some modern languages. The town school has been united with this institution since 1805; but there are in the place several other seminaries; among others, a navigation school. The manufactures are very diversified, comprising woollens, lincens, cotton, leather, soap, and tobacco; but above all, ships' anchors, of which, as of ships and boats built here, there is a large export. Stettin is the great outlet for the manufactures of Silesia, and the import of colonial goods and foreign fabrics required by that province, as well as by Berlin and other towns in Brandenburg. The vessels, in general small, that visit this town annually, are about 1000, of which nearly one-fourth are the property of merchants of the place. The drawbacks on its trade are the difficulty of navigating the Oder, vessels drawing more than seven feet water being obliged to stop at Swinemunde, a small town at the mouth of the branch of the Oder called the Swine. Of the exports, the leading articles are linen, corn, and timber; of the imports, coffee, sugar, cotton, dye-woods, and wine.

Stettin is a place of strength, but fell on 29th October, 1806, without resistance, into the hands of the French. It was garrisoned by them after their disastrous retreat from Russia in 1812, but obliged to capitulate in October, 1813, when the Dutch troops belonging to the garrison hoisted the Orange cockade. The adjoining country, called formerly the duchy of Stettin, was ceded to Sweden by the peace of Westphalia, but seized by the Prussians in the misfortunes of the latter years of Charles XII.; 80 miles north-north-east of Berlin. Lat. 53. 25. 36. N. long. 14. 45. E.

STETTIN, a government or large division of the Prussian states, comprising the middle part of Pomerania, beginning at the river Peene, and extending eastwards to a few miles beyond the Bega. Its area is computed at 6625 square miles, and its population at about 300,000. It is divided into the following 13 circles, viz., Randow, Anclam, Demmin, Usedom, Wollin, Greifenhagen, Pyritz, Saatzig, Naugard-Daber, Flemming, Greifenberg, Osten-Blucher, and Bork. See the proper names enumerated in this.

STETTIN, New, a small town of Pomerania, in the government of Coslin, with 1800 inhabitants, and a gymnasium; 41 miles south-by-east of Coslin, and 14 south-by-west of Baldenburg.

STEUART (Sir James), was born in 1712, and after a regular course of education at Edinburgh, devoted himself to the study of the law. In conformity to the fashion of the times he undertook a foreign tour, and having spent five years abroad, returned to his native country, an accomplished gentleman, in 1740. About three years after his return he married Lady Frances, the daughter of the Earl of Wemyss, and retired to his seat at Coltness. Having formed an acquaintance with the Pretender at Rome, he renewed his connection with him at Edinburgh, in the year 1745; but the hopes of the exiled prince being frustrated, Sir James removed to France, and remained at Sedan until the year 1754. In the following year he removed to Flanders, and began to communicate to the public the fruits of his literary labours. In 1757, during his residence at Frankfurt-under-the-Maine, he published "A Vindication of Newton's Chronology;" and having settled in the same year at Tubingen, in Germany, he there published his "Treatise on German Coins," in the German language. This was followed, in 1761, by "A Dissertation on the Doctrine and Principles of Money, as applied to the German Coin." Under assurances of protection in his native country, he settled at Coltness in 1763; and in this retirement he probably finished his work entitled "Inquiry into the Principles of Political Economy," on which he had bestowed the labour of eighteen years. In 1769 he again presented to the public, under the name of Robert Frame, "Considerations on the Interests of the County of Lanark." His full pardon passed the great seal in 1771; and in the following year he printed the "Principles of Money applied to the present State of the Coin of Bengal." He also wrote "A Plan for introducing an Uniformity of Weights and Mea-

asures," published after his death; and engaging in metaphysical speculations, he published "Observations on Beattie's Essay on Truth;" "Critical Remarks on the Atheistical Falsehoods in Mirabaud's System of Nature," 1779; and soon after, "A Dissertation concerning the Motive of Obedience to the Law of God." He died in November, 1780, at the age of 67. His collected works were printed at London in 1805, in six vols. 8vo.

STEUUBEN, a post township of the United States, in Washington county, Maine, on the Naraguagus; 311 miles north-east of Boston. Population 552.

STEUUBEN, a county of the United States, in New York, bounded north by Ontario county, east by Seneca lake and Tioga county, south by Pennsylvania, and west by Allegany county. Population 7246. Chief town, Bath.

STEUUBEN, a township of the United States, in Oneida county, New York. Baron Steuben died in this town in 1796, and here his remains lie buried, without any monument.

STEUUBENVILLE, a post town of the United States, and capital of Jefferson county, Ohio, situated on the Ohio. It is a very flourishing town, regularly laid out, and contained, in 1817, 453 houses, 3 churches, an academy, 2 banks, a market-house, a woollen manufactory, the machinery of which is put in motion by a steam-engine; a steam paper-mill; a flour-mill, and cotton manufactory, driven by steam power; a printing-office, from which is issued a weekly newspaper; an iron foundry, 27 mercantile stores, and 16 public inns. The progress of this place has been uncommonly rapid. In 1805, there were scarcely any houses where this town now stands, 69 miles by the river, below Pittsburg, 38 by land; 109 above Marietta, 25 north-east of St. Clairsville, and 150 east-by-north of Columbus. Population in 1810, 800; and in 1817, 2032. Lat. 40. 25. N. long. 8. 40. W.

STEVEN, *s.* [stɛpən, Sax.] A cry, or loud clamour. *Obsolete.*

Ne sooner was out, but swifter than thought,
Fast by the hide, the wolf Lowder caught;
And had not Roffy renne to the steven,
Lowder had been slain thilke same even.

Spenser.

STEVENAGE, a village, of England, formerly a market town, in the county of Hertford, pleasantly situated on the great north road, on a dry sandy hill. It consists of one large street, and several smaller ones, and contains a free school, and a small church. The name of the town was anciently written Stigerhaught. The manor was given by Edward the Confessor, to Westminster abbey, to which it was annexed, till Henry VIII. converted the abbey to a bishop's see, after its dissolution by Edward VI. Stevenage, with Ashwell and other manors in the county, became by grant the property of the see of London, to which they have since belonged. From James I. it received the grant of a weekly market and three annual fairs; but the neighbouring towns of Baldock and Hitchin have tended greatly to its decay. Nearly a mile southward are six large barrows, some of which have been opened, but nothing of consequence discovered. They appear to be composed of gravel and fine clay, and have been thought, from the titles of Dane and Mundane, which occur in this part of the county, to be of Danish origin; 12½ miles north of Hertford, and 31½ north-west of London.

STEVENSBURG, a post town of the United States, in Culpeper county, Virginia.

STEVENSTON, a considerable village in the district of Cunninghame, in Ayrshire. It contains 1777 inhabitants, among whom weavers and colliers are the most numerous classes. It is the seat of a small parish, of which the population amounts to 3607, a considerable part of the town of Saltcoats being situated within it. It is a very ancient place, being mentioned in charters as far back as in 1240. It is situated nearly a mile east from Saltcoats, and 5 west-by-north of Irvine.

STEVENSVILLE, a post village of the United States, in King and Queen county, Virginia.

STEVENSWAERT,

STEVENSWAERT, or **FORT ST. ETIENNE**, a village and fortress of the Netherlands, in the province of Limburg, on the Maese, with only 900 inhabitants; 19 miles north-east of Maestrcht.

STEVENTON, a parish of England, in Southamptonshire; 5 miles east of Whitechurch.

STEVENTON, or **STEVIINGTON**, a parish of England, in Bedfordshire; $5\frac{1}{2}$ miles north-west of Bedford. Population 436.

STEVENTON, a parish of England, in Berkshire; 5 miles south-south-west of Abingdon. Population 584.

STEVIA [so named by Cavanilles, in memory of Peter James Steve, or Esteve, an eminent physician of Valencia], in Botany, a genus of the class syngenesia, order polygamia-æqualis, natural order of compositæ discoideæ, corymbiferae (*Juss.*)—Generic Character. Common calyx simple, oblong, of several, nearly equal, leaves, in a simple row. Corolla: compound, uniform, discoid. Florets all uniform, perfect, fertile, funnel-shaped, with a five-cleft spreading limb, not numerous. Stamina: filaments in each floret five, capillary; anthers united into a cylindrical tube. Pistil: germen oblong; style thread-shaped; stigmas two, long and slender. Pericarp none, except the permanent upright calyx. Seeds solitary to each floret, oblong; down chaffy, or partly bristly. Receptacle small, naked.—*Essential Character.* Receptacle naked; down chaffy; calyx cylindrical, of a simple row of leaves. This genus is distinguished from eupatorium and ageratum, by its simple row of calyx-leaves. From the former, moreover, the chaffy seed-down keeps it clearly distinct.

1. *Stevia linearis*, or linear stevia.—Stems shrubby. Leaves simple, linear, entire. Seed-down of five lanceolate scales.—Native of New Spain.

2. *Stevia eupatorio*, or three-ribbed stevia.—Stem herbaceous. Leaves lanceolate, nearly entire, three-ribbed; flowers crowded; seed-down of short scales, with intermediate bristles.—Native of Mexico.

3. *Stevia salicifolia*, or willow-leaved stevia.—Leaves lanceolate, serrated; tapering and entire at each end. Seed-down of two awl-shaped bristles.—Native of Mexico.

4. *Stevia serrata*, or serrated stevia.—Leaves linear-lanceolate, most serrated towards the point. Seed-down of three short scales, with intermediate bristles.—Native of Mexico.

5. *Stevia pedata*, or compound-leaved stevia.—Leaves pedate, entire. Seed-down of several short equal scales.—Native of Mexico.

STEVIN (Simon), was born at Bruges after the middle of the 16th century, but the year of his birth is not ascertained. He was held in great estimation by Maurice, Prince of Orange, whose own taste led him to respect the mathematical and mechanical acquirements of Stevin, and he was employed in Holland as an inspector of the dykes. He seems to have been the first person who discovered the true proportion between the power and the weight on an inclined plane, which he accurately determined in all the different cases. In hydrostatics he was also no less an adept than in mechanics; and to him we owe the discovery of the famous paradox, that a fluid contained in a tube decreasing upwards, acts with the same pressure on the base as if the tube were every where uniform. He was also the inventor of a sailing-boat, which was moved entirely by the impulse of the wind, and with such velocity, that it conveyed passengers from Scheveling to Putten, though a distance of about forty miles, in the space of two hours.

It is also asserted by Swertius and Valerius Andreas, that Stevin could raise any weight with a small power, by a simple machine, called by the latter, "pantacrator." Stevin died at Leyden, according to Weidler, in 1633. His works are, "A Book of Arithmetic, in French," printed by Plantin, at Antwerp, in 1585, 8vo., and reprinted with his Algebra, in Flemish, in 1605; "Problematum Geometricorum, Lib. V." 4to.; and various other treatises in Flemish, translated into Latin by Snellius, under the title of "Hypomnemata Mathematica," Lugd. Bat 1608, 4 tom. fol., of which there is a French edition, with curious notes and additions by Albert

Girard, 1634, 6 vols. folio. The first contains arithmetic and algebra, with tables of interest; the second, cosmography, that is, the doctrine of triangles, geography, and astronomy; the third, practical geometry; the fourth, statics; the fifth, optics; and the sixth, castrametation, fortification by sluices, and general fortification. One of his treatises relates to the finding of harbours, and is entitled in the French edition, "Du Trouve-Port, ou la Manière de trouver les Havres," which was translated by Grotius into Latin verse, 1599, 4to. Montucla says, that none of Stevin's works contain any new things, except his Mechanics; but Dr. Hutton informs us, that his improvements in algebra were many and ingenious. *Hutton's Dict. and Mathematical Tracts.*

STEVIINGTON END, or **BARTLOW END**, a hamlet of England, in Essex; 5 miles north-east of Saffron Waldon.

STEUSSLINGEN, a large village of the west of Germany, in Wirtemberg, not far from Ehingen. Population 1100.

To STEW, v. a. [*estuver*, Fr.; *stoven*, Dutch.] To seethe any thing in a slow moist heat, with little water.—I bruised my skin with playing at sword and dagger with a master of fence, three veney's for a dish of *stew'd* prunes. *Shakspeare.*

To STEW, v. n. To be seethed in a slow moist heat.

STEW, s. [*estuve*, Fr.; *stufa*, Ital.; *estufa*, Span.; *stufwa*, Su. Goth.] A bagnio; a hot-house.—The Lydians were inhibited by Cyrus to use any armour, and give themselves to baths and *stews*. *Abbot.*—A brothel; a house of prostitution. This signification is by some imputed to this, that there were licensed brothels near the *stews* or fish-ponds in Southwark; but probably *stew*, like bagnio, took a bad signification from bad use.

I have seen corruption boil and bubble,
Till it o'er-run the *stew*.

Shakspeare.

With them there are no *stews*, no dissolute house, no curtesans. *Bacon.*—Making his own house a *stews*, a bordel, and a school of lewdness, to instil the rudiments of vice into the unwary flexible years of his poor children. *South.*—A prostitute. *Unused.*—It was so plotted betwixt the lady her husband, and Bristol, that instead of that beauty he had a notorious *stew* sent him. *Sir A. Weldon.*—[*stowen*, Dutch, *to store*.] A store-pond; a small pond where fish are kept for the table.

Full many a fat partrich had he in mewe,
And many a breme, and many a lucre in *stew*. *Chaucer.*

Meat stewed: as, a *stew* of veal, beef, or the like.—Confusion: as when the air is full of dust, smoke, or steam; which is a northern expression, as Grose observes.

STEWWARD, s. [*steward*, Sax.; Dr. Johnson. — From *stivardur*, Cimbr. of *stia*, *work*, and *vardur*, *warden*, *overlooker*.—One who manages the affairs of another.

There sat yclad in red,
Down to the ground, a comely personage,
That in his right hand a white rod managed;
He *steward* was, high diet, ripe of age,
And in demeanour sober, and in council sage. *Spenser.*

An officer of state.
The Duke of Suffolk is the first, and claims
To be high *steward*. *Shakspeare.*

To STEWARD, v. a. To manage as a steward. *Unused.*—Did he thus requite his mother's care in *stewarding* the state? *Fuller.*

STEWARDSHIP, s. The office of a steward.

The Earl of Worcester
Hath broke his staff, resign'd his *stewardship*. *Shakspeare.*

STEWART (Matthew, D.D.), professor of mathematics in the University of Edinburgh, was born in the year 1717. As soon as he left school in 1734, being intended for the church, he was placed at the University of Glasgow, where his application and proficiency engaged the peculiar notice and friendship of the two eminent professors, Dr. Hutcheson and Dr. Simson

Dr. Simson. In 1741, Dr. Simson recommended him to the celebrated Maclaurin, whose lectures he attended, and by which he signally profited. At this time he kept up a regular correspondence with Professor Simson, communicating to him the progress of his studies, and his geometrical discoveries, which were even at this time various and important, and receiving in return interesting information with regard to the *Loci Plani* and *Porisms* of Euclid. Both the professor and his student prosecuted their investigations of these abstruse subjects in different directions, but with similar success. The result of Mr. Stewart's enquiries was the discovery of those curious propositions, which he published in 1746, under the title of "General Theorems," and which gave him high rank, at an early age, among eminent geometers. The death of Maclaurin, in 1746, afforded an opportunity for his being advanced to the mathematical chair in the University of Edinburgh, so that he became the successor of that eminent mathematician and philosopher in September, 1747. His new office produced some change in the direction of his mathematical studies; and led him to make an application of geometry to those problems, for the solutions of which the algebraic calculus had been employed. The first specimen of his success in this way was the resolutions of Kepler's problem, founded on a general property of curves, which, perhaps, had never been before observed. This was published in the second volume of the "Essays of the Philosophical Society of Edinburgh," for 1756. The first volume of the same collection contains some other propositions, relating to the subject of porisms, and which are demonstrated with all the elegance and simplicity peculiar to the ancient analysis. Attached to the geometry of the ancients, Mr. Stewart had formed a plan of introducing its strict and simple mode of demonstration into the higher parts of the mixed mathematics; and in the prosecution of this plan he composed his "Tracts Physical and Mathematical," which were published in 1761. Mr. Stewart, in the first of these tracts, lays down the doctrine of centripetal forces in a series of propositions demonstrated, the quadrature of curves being admitted, with the utmost rigour, and requiring no previous knowledge of mathematics, except the elements of plane geometry and of conic sections. In the three following tracts the author proposed, in the same method, to determine the effect of those forces which disturb the motions of a secondary planet; and from these it was his design to deduce, not only the theory of the moon, but the sun's distance from the earth. But his declining health did not allow him to pursue the arduous investigation of these subjects. In the year 1763, when the result of the observations of the transit of Venus had been unsatisfactory to astronomers, Dr. Stewart determined to apply the principles he had laid down to this subject; and accordingly in this year he published his "Essay on the Sun's Distance," where, from actual computation, the parallax of the sun was found to be no more than 6."9, and consequently his distance nearly 29,875 semi-diameters of the earth, or about 118,541,428 English miles, a distance so much exceeding all former estimates as to excite surprise, and to produce a severe examination of the principles on which the calculation was founded. This "Essay" was the last work which Dr. Stewart published; but he declined engaging in any controversy on the subject. Some months before he published his "Essay," he presented to the public another work adapted to promote the study of the ancient geometry, and entitled "Propositiones Geometricæ more Veterum demonstratæ." Soon after the year 1763, the health of Dr. Stewart began to decline, and he therefore retired into the country. During the leisure of his advanced life, he took up the subject of the analogy between the circle and hyperbola; and he left among his papers some curious approximations to the areas of both. At length, the state of his health would not allow him to prosecute study even as an amusement; and he closed his honourable life in the month of January, 1785, at the age of 68 years. He left a son, the present distinguished Dugald Stewart.

Vol. XXIII. No. 1592.

STEWART, a county of the United States, on the north side of West Tennessee. Population 4262, including 778 slaves.

STEWART'S ISLANDS, a cluster of small islands in the South Pacific ocean, discovered by Captain Hunter in the year 1791. They are five in number, low, and of no great extent. Lat. 8. 26. S. long. 163. 18. E.

STEWART, PORT, a harbour on the west coast of North America, so called by Vancouver. It is about half a league in length, and three quarters of a mile in breadth, and is from 6 to 9 fathoms deep. Its south point of entrance is in Lat. 55. 38. N. long. 228. 24. E.

STEWARTTOWN, a pleasant and thriving town of Scotland, situated on the Annock water, in the district of Cunninghame, in Ayrshire. It is the seat of an extensive parish. The chief manufactures are bonnet-making, for which it has long been famed, and other branches of weaving; 4 miles north-by-west of Kilmarnock, and 8 north-east of Irvine.

STEWARTSTOWN, a neat little village of Ireland, in the county of Tyrone; 5 miles north-north-east of Dungannon, and 77 north-east of Dublin.

STEWARTSTOWN, a post township of the United States in Coos county, New Hampshire, on the Connecticut; 40 miles north of Lancaster. Population 186.

STEWISH, *adj.* Suiting the brothel or stew.—Rhymed in rules of *stewish* ribaldry. *Bp. Hall.*

STEWKLEY, a parish of England in Buckinghamshire; 6 miles east-by-south of Winslow. Population 802.

STEWIPAN, *s.* A pan used for stewing.

STEWTON, a parish of England, in Lincolnshire; 4 miles east of Louth.

STEWY POINT, a cape on the coast of Labrador. Lat. 58. N. long. 61. 40. W

STEYER, a town of Upper Austria, and the chief place of the circle of the Traun, is situated at the confluence of the rivers Steyer and Enns, which separate the town from its two suburbs. It is a neat place, of considerable size, being about 3 miles in circumference, and containing above 10,000 inhabitants. Well built houses, pleasant gardens, and a number of country seats in the environs, impress a stranger with the idea of comfort on the part of the inhabitants. The town has some manufacturing establishments of cottons and woollens; but they are insignificant when compared with those of iron, which are said to give employment to above 12,000 men in the town and neighbourhood, and afford business to a number of mercantile houses. The largest establishment is a manufactory of fire arms, for account of government. Among the other articles are knives and forks, kitchen utensils of all kinds, sword blades, reaping hooks, and scythes. Steyer was originally a castle, built about the end of the 10th century, to check the inroads of the Magyars. On the expulsion of that formidable horde from the Austrian states, houses were built round the castle, so as at last to form a town, which was for some time the capital of a duchy, and gave name to the province of Styria. Steyer has suffered repeatedly from fires; 92 miles west-by-south of Vienna, and 16 south-south-east of Lintz. Lat. 48. 4. 45. N. long. 14. 20. 5. E.

STEYER, a river of Upper Austria, which rises among the mountains of Styria, traverses the circle of the Traun, passes the town of Steyer, where it is joined by the Enns, and after a farther course of 15 miles, falls into the Danube;

STEYERBERG, a small town of the north of Germany, in Hanover, near a hill of the same name; 9 miles south-west of Nienberg.

STEYERECK, a small town of Upper Austria, near the Danube; 4 miles below Lintz.

STEYL, a small town of Prussian Westphalia, in the duchy of Berg, near the Roer; 2 miles south-east of Essen, and 19 north-east of Dusseldorf. Population 1200.

STEYNING, a market town and borough of England, in the county of Sussex. It is situated in a healthy air, at the foot of a lofty hill, near the river Adur, and consists of

four transverse streets, which are but poorly built. The church, of which the nave only remains, is a building of great antiquity, and contains some very curious specimens of early Norman architecture. A free grammar school was founded here about the middle of the 16th century. Steyning is a borough by prescription, and sends two members to parliament, elected by the householders and inhabitants within the borough not receiving alms. The number of voters is about 80, and the returning officer is the constable, who is besides the chief magistrate of the place, and is appointed at the court leet of the lord of the manor. The members of this place were formerly elected in conjunction with Bramber, and intermitted till 31st Henry VI.; but at present each town is entitled to return two representatives, although one part of Bramber is in the centre of Steyning. At a very remote period, a Benedictine priory for monks existed here, founded by Edward the Confessor. Steyning derives its name from Steyne-street, an ancient road which passed through this part of the county. Market on Wednesday; a monthly one for cattle, and three annual fairs. The Michaelmas fair is very considerable for Welsh and other cattle, sheep, hogs, horses, wheat, seed, &c. The others are pretty large; 15 miles west of Lewes, and 51 south-by-west of London.

STEZYCA, a small town of Poland, on the Vistula; 11 miles south-south-east of Warsaw.

STHENIA, [from *σθενος*, *strength*], a word of great import in the Brunonian theory of medicine, implying an inflammatory diathesis, and standing in opposition to *asthenia*, or debility. See **PATHOLOGY**.

STHENIA [*Σθενια*], a festival of Argos, supposed to be kept in honour of Minerva, surnamed *Σθενιας*, [from *σθενος*], *strength*.

STHENIUS, denoting powerful or strong, one of the epithets of Jupiter; as *Sthenius*, or robust, was one of the epithets of Minerva.

STIA, a small town of Tuscany, in the province of Florence.

STIBADIUM, among the Romans, a low kind of table-couch, or bed of a circular form, which succeeded to the *triclina*, and was of different sizes, according to the number of guests they were designed for. They were called *hexaclina*, *octaclina*, or *enneaclina*, according as they held six, eight, or nine guests, and so of any other number.

STIBBARD, a parish in Norfolk; 5 miles east-by-south of Fakenham.

STIBIAL, *adj.* [from *stibium*, Lat.] Antimonial. *Un-used*.

STIBIARIAN, *s.* [from *stibium*.] A violent man; from the violent operation of antimony. *Obsolete*.—This *stibiarian* presseth audaciously upon the royal throne, and after some sacrifice, tendereth bitter pill of sacrilege and cruelty; but when the same was rejected because it was violent, then he presents his antimonial potion. *White*.

STIBINGTON, a parish in Huntingdonshire; 8 miles north-west of Stilton.

STIBIUM, *s.* [Latin.] Antimony.

Ceruse nor *stibium* can prevail,
No art repair where age makes fail.

Collop.

STICCADOS, *s.* [*sticadis*, Lat.] An herb. *Ainsworth*.

STICH, *s.* [*στιχος*, Gr.] In some ancient Greek New Testaments, at the close of the Epistles, there were some numeral letters added, signifying how many *stichs* were in the Epistle. What these *stichs* were, the learned Suicerus informs us. A *stich* in poetry was a verse, whatsoever kinds or parts it may consist of: a verse is a measured line, whether it be iambick, heroic, or any other length. In rural affairs, a *stich* is an order or rank of trees; and a *verse* a furrow, or as much as the plowman turns up in one line. In military matters it is an order of ten men.

STICHOMANTIA, *στιχομαντεια*, in Antiquity, a sort of divination by verses, (commonly those of the Sibylline oracles), which being wrote on little pieces of paper, and

thrown into a vessel, the first drawn out was supposed to contain the will of the gods.

STICHO'METRY, *s.* [*στιχος* and *μετρον*, Gr.; *stichometric*, Fr.] A catalogue of books of Scripture, to which is added the number of verses which each book contains. *Chambers*.

STICK, *s.* [*sticca*, Sax., from *stican*; as *sticka*, Swed. a stake, from the verb *sticka*, to pierce, to stick.] A piece of wood small and long.

Some strike from clashing flints their fiery seed,
Some gather *sticks* the kindled flames to feed. *Dryden*.

Many instruments long and slender are called *sticks*; a thrust; a stab.

To **STICK**, *v. a.* preterite *stuck*; participle pass. *stuck*. [*stican*, *stician*, Saxon.] To fasten on so as that it may adhere.

Two troops in fair array one moment show'd;
The next, a field with fallen bodies strow'd:
The points of spears are *stuck* within the shield,
The steeds without their riders scour the field,
The knights unhors'd.

Dryden.

To **STICK**, *v. n.* To adhere; to unite itself by its tenacity or penetrating power.—The green caterpillar breedeth in the inward parts of roses not blown, where the dew *sticketh*. *Bacon*.—To be inseparable; to be united with any thing.—Generally in an ill sense.—In their quarrels they proceed to calling names, till they light upon one that is sure to *stick*. *Swift*.—To rest upon the memory painfully.—The going away of that which had staid so long, doth yet *stick* with me. *Bacon*.—To stop; to lose motion.

I shudder at the name!

My blood runs backward, and my faltering tongue
Sticks at the sound.

Smith.

To resist emission.

Wherefore could I not pronounce amen?
I had most need of blessing, and amen
Stuck in my throat.

Shakespeare.

To be constant to; to adhere with firmness: sometimes with *to*, and sometimes with *by*.—The knave will *stick by* thee, I can assure thee that: he will not out, he is true bred. *Shakespeare*.—Some *stick to* you, and some to t'other side. *Dryden*.—To be troublesome by adhering; with *by* or *to*.—I am satisfied to trifle away my time, rather than let it *stick by* me. *Pope*.—To remain; not to be lost.—Proverbial sentences are formed into a verse, whereby they *stick* upon the memory. *Watts*.—To dwell upon; not to forsake.—If the matter be knotty, the mind must stop and buckle to it, and *stick* upon it with labour and thought, and not leave it till it has mastered the difficulty. *Locke*.—To cause difficulties or scruple.—This is the difficulty that *sticks* with the most reasonable of those who, from conscience, refuse to join with the Revolution. *Swift*.—To scruple; to hesitate.—Every one without hesitation supposes eternity, and *sticks* not to ascribe infinity to duration. *Locke*.—To be stopped; to be unable to proceed.

He threw: the trembling weapon pass'd
Through nine bull-hides, each under other plac'd
On his broad shield, and *stuck* within the fast.

Dryden.

To be embarrassed; to be puzzled.—They will *stick* long at part of a demonstration, for want of perceiving the connection of two ideas, that, to one more exercised, is as visible as any thing. *Locke*.

To **STICK out**. To be prominent with deformity.—His flesh is consumed away that it cannot be seen, and his bones that were not seen *stick out*. *Job*.

To **STICK out**. To refuse compliance.

To **STICK**, *v. a.* [*stican*, Sax.; *sticken*, Teut.] To stab; to pierce with a pointed instrument.—The Heruli, when their old kindred fell sick, *stuck* them with a dagger. *Greuv*.—To fix upon a pointed body; as, he *stuck* the fruit upon his knife; to fasten by transfixion.

Her

Her death!

I'll stand betwixt: it first shall pierce my heart:
We will be *stuck* together on his dart.

Dryden.

To set with something pointed.

A lofty pile they rear;
The fabrick's front with cypress twigs they strew,
And *stick* the sides with boughs of baleful yew.

Dryden.

STICKFORD, a parish in Lincolnshire; 5 miles south-west of Spilsby.

STICKINESS, *s.* Adhesive quality; viscosity; glutinousness; tenacity.

STICKLAND, **WINTERBORNE**, a parish in Dorsetshire; 5 miles west-south-west of Blandford Forum.

To **STICKLE**, *v. n.* [from the practice of prize-fighters, formerly who placed seconds with staves or sticks to interpose occasionally.] To take part with one side or other.

Fortune, as she's wont, turn'd fickle,
And for the foe began to *stickle*.

Hudibras.

To contest; to altercate; to contend rather with obstinacy than vehemence.

Heralds *stickle*, who got who,
So many hundred years ago.

Hudibras.

To trim; to play fast and loose; to act a part between opposites.—When he sees half of the Christians killed, and the rest in a fair way of being routed, he *stickles* betwixt the remainder of God's host and the race of fiends. *Dryden.*

To **STICKLE**, *v. a.* To arbitrate. See Cotgrave in **V. ARBITRER**. "To *stickle*, to compound, to award, to adjudge by award."

Here Weever, as a flood affecting godly peace,
His place of speech resigns; and to the Muse refers
The hearing of the cause, to *stickle* all these stirs. *Drayton.*

STICKLEBAG, *s.* [Properly *stickleback* from *stick*, to prick; *pungitius*, Lat.] The smallest of fresh-water fish.—A little fish called a *sticklebag*, without scales, hath his body fenced with several prickles. *Walton.* See **GASTROSTEUS ACULEATUS**.

STICKLER, *s.* A sidesman to fencers; a second to a duellist; one who stands to judge a combat; an arbitrator.—Basilus, the judge, appointed *sticklers* and trumpets, whom the others should obey. *Sidney.*—An obstinate contender about any thing.—All place themselves in the list of the national church, though they are great *sticklers* for liberty of conscience. *Swift.*—A small officer who cut wood for the priory of Ederose within the king's parks of Clarendon. Rot. Parl. 1 Hen. 6. *Cowel.*

STICKNEY, a parish of England, in Lincolnshire; 7 miles south-west of Spilsby.

STICKNEY, a small island on the south coast of New Holland, in Spencer's gulf.

STICKY, *adj.* Viscous; adhesive; glutinous.—Herbs which last longest are those of strong smell, and with a *sticky* stalk. *Bacon.*

STICTA, in Botany, from *στικτος*, *dotted*, alluding to the minute impressions on the under side of the frond; a name given by Schreber to one of the sections into which he proposes to divide the Linnæan genus of **LICHEN**; which see.

STIDD, a village of England, in Derbyshire, on the river Dove, south-west of Derby.

STIDDICOT, a hamlet in the parish of Titherington, Gloucestershire.

STIDDY, *s.* [*stedia*, Icel.] An anvil; also a smith's shop. *North.* See **STITHY**.

STIECHOWITZ, a small town in the interior of Bohemia, on the river Moldau; 15 miles south of Prague, and remarkable chiefly for its powder mills.

STIEGE, a small town of Germany, in the duchy of Brunswick, with 900 inhabitants; 9 miles south of Blankenburg, on the Hartz.

STIEL, a village in the east of France, in Alsace, with 900 inhabitants.

STIENZ, a village in the north-west of the Netherlands in the province of Friesland, with 1200 inhabitants; 5 miles north-north-west of Leeuwarden.

STIERNHIELM (George), a learned Swede, was born in Dalecarlia, in the year 1598. Enjoying the friendship of Buræus, tutor to Gustavus Adolphus, he made great progress in literature and the sciences. Queen Christina treated him with respect, and nominated him antiquary of the kingdom; entrusted him also with the care of the public records, and conferring on him the title of "Custos Regni." In 1658 he was appointed by Charles X. provincial judge of Drontheim, in Norway; but when Drontheim was restored to Denmark, he became in 1661, a member of the council of war; and when the college of antiquities was established at Upsal, in 1666, he was appointed director. He died at Stockholm in 1672, at the age of 74. Stiernhielm was a man of great learning, and excelled in an extensive knowledge of languages. All languages, in his opinion, were derived from the Scythian, which he maintained to be older than the Hebrew itself. Among his numerous works were, "Magog Aramæo Gothicus, sive origines Vocabularum in Linguis pænia omnibus, ex Lingua Svetica veteri;" "Leges Vestrogothicae antiquæ, cum Præfatione et Indice Vocabulorum obscuriorum," Stock. 1663, fol.; "Ulphilas, seu Versio quatuor Evangeliorum Gothica, Literis Latinis quam Gothicis ediderat F. Junius, cum Versionibus parallelis, Sveogothica, Islandica, et vulgata Latina," &c. 1671; *ibid.* 4to.; "Epistola ad Olavum Verelium de Origine Vocabulorum Gothi et Svedi," prefixed to Hervaro Saga; Anticluverius, sive de Originibus Sveo-Gothicis," Holm. 1685, 8vo. "Archimedes Reformatus." He introduced hexameter or heroic verse, and Stiernhielm's "Hercules," is and will continue to be considered a masterpiece. *Gen. Biog.*

STIFF, *adj.* [ἄστυ, Sax.; *stiff*, Dan.; *styf*, Swed.; *stifur*, Icel; *stijf*, Dutch.] Rigid: inflexible; resisting flexure; not flaccid; not limber; not easily flexible; not pliant.

They, rising on *stiff* pinions, tower
The mid aerial sky.

Milton.

The glittering robe
Hung floating loose, or *stiff* with mazy gold. *Thomson.*

Not soft; not giving way; not fluid; not easily yielding to the touch.—Mingling with that oily liquor, they were wholly incorporate, and so grew more *stiff* and firm, making but one substance. *Burnet.*—Strong; not easily resisted.

On a *stiff* gale

The Theban swan extends his wings. *Denham.*

Hardy; stubborn; not easily subdued.

How *stiff* is my vile sense,
That I stand up, and have ingenious feeling
Of my huge sorrows! Better I were distract! *Shakspeare.*

Obstinate; pertinacious.—We neither allow unmeet nor purpose the *stiff* defence of any unnecessary custom heretofore received. *Hooker.*—Harsh; not written with ease; constrained.—*Stiff*, formal style. *Gondibert.*—Formal; rigorous in certain ceremonies; not disengaged in behaviour; starched; affected.—The French are open, familiar, and talkative; the Italians *stiff*, ceremonious, and reserved, *Addison.*—In Shakspeare it seems to mean strongly maintained, or asserted with good evidence.—This is *stiff* news. *Shakspeare.*

To **STIFFEN**, *v. a.* [ἄστυ, Sax.] To make stiff; to make inflexible; to make unpliant.

When the blast of war blows in our ears,
Stiffen the sinews, summon up the blood,
Disguise fair nature with hard-favour'd rage. *Shakspeare.*

To make torpid.

Her *stiffening* grief,
Who saw her children slaughter'd all at once,
Was dull to mine. *Dryden and Lee.*

To **STIFFEN**, *v. n.* To grow stiff; to grow rigid: to become unpliant.

Aghast,

Aghast, astonish'd, and struck dumb with fear,
I stood; like bristles rose my *stiff'ning* hair.

Dryden.

To grow hard; to be hardened.

The tender soil, then *stiffening* by degrees,
Shut from the bounded earth the bounding seas.

Dryden.

To grow less susceptible of impression; to grow obstinate.

Some souls, we see,
Grow hard and *stiffen* with adversity.

Dryden.

STIFFHE'ARTED, *adj.* Obstinate; stubborn; contumacious.—They are impudent children and *stiffhearted*.
Ezek.

STIFFKEY, a parish in Norfolk, situated upon the coast;
3 miles-east of Wells.

STIFFLY, *adv.* Rigidly; inflexibly; stubbornly.—
In matters divine, it is still maintained *stiffly*, that they have
stiffnecked force. *Hooker.*—Strongly.

Hold, hold, my heart;
And you, my sinews, grow not instant old,
But bear me *stiffly* up.

Shakspeare.

STIFFNECKED, *adj.* Stubborn; obstinate; contumacious.

This *stiff neck'd* pride, nor art nor force can bend,
Nor high-flown hopes to reason's lure descend.

Denham.

STIFFNESS, *s.* [τῑμνησε, Sax.] Rigidity; inflexibility; hardness; inaptitude to bend.—The willow bows and recovers, the oak is stubborn and inflexible; and the punishment of that *stiffness* is one branch of the allegory. *L'Estrange.*—Inaptitude to motion; torpidness.

The pillows of this frame grow weak,
My sinews slacken, and an icy *stiffness*
Benumbs my blood.

Denham.

Tension; not laxity.

To try new shrouds, one mounts into the wind,
And one below their ease or *stiffness* notes.

Dryden.

Obstinacy; stubbornness; contumaciousness.—Firmness or *stiffness* of the mind is not from adherence to truth, but submission to prejudice. *Locke.*—Unpleasing formality; constraint.—All this religion sat easily upon him, without any of that *stiffness* and constraint, any of those forbidding appearances which disparage the actions of the sincerely pious. *Atterbury.*—Rigorousness; harshness.

There fill yourself with those most joyous sights;
But speak no word to her of these sad plights,
Which her too constant *stiffness* doth constrain.

Spenser.

Manner of writing, not easy but harsh and constrained.—Rules and critical observations improve a good genius, where nature leadeth the way, provided he is not too scrupulous; for that will introduce a *stiffness* and affectation, which are utterly abhorrent from all good writing. *Felton.*

STIFFORD, a parish in Essex; 1½ miles north-north-west of Gray's Thurrock.

To **STIFLE**, *v. a.* [*estoufer*, Fr.] To oppress or kill by closeness of air; to suffocate.

Where have you been broiling?
Among the crowd i' the abbey, where a finger
Cou'd not be wedg'd in more; I am *stifled*
With the mere rankness of their joy.

Shakspeare.

That part of the air that we draw out, left the more room for the *stifling* steams of the coals to be received into it. *Boyle.*—*Stifled* with kisses, a sweet death he dies. *Dryden.*—To keep in; to hinder from emission.—Whilst bodies become coloured by reflecting or transmitting this or that sort of rays more copiously than the rest, they stop and *stifle* in themselves the rays which they do not reflect or transmit. *Newton.*—To extinguish by hindering communication; to extinguish by artful or gentle means.—Every reasonable man will pay a tax with cheerfulness for *stifling* a civil war in its birth. *Addison.*—To suppress; to conceal.

If't prove thy fortune, Polydore, to conquer,
Trust me, and let me know thy love's success,
That I may ever after *stiffe* mine.

Otway.

To suppress artfully or fraudulently.—These conclusions have been acknowledged by the disputers themselves, till with labour and study they had *stified* their first convictions. *Rogers.*

STIFLE, *s.* The first joint above a horse's thigh next the buttock. *Mason.*

STIFFLEMENT, *s.* Something that might be suppressed or concealed.

Uttering nought else but idle *stiflements*,
Tunes without sense, words inarticulate.

Brewer.

To **STIGH**. See To **STRY**.

STIGLIANO, a small town in the kingdom of Naples, in the province of Basilicata, with 3500 inhabitants; 16 miles south of Tricarico.

STIGMA, *s.* [*stigma*, Lat.] A brand; a mark with a hot iron.—A mark of infamy.—Happy is it for him, that the blackest *stigma*, that can be fastened upon him, is that his robes were whiter than his brethren's. *Bp. Hall.*

STIGMA, a minute red speck in the skin, without any elevation of the cuticle, of the same nature as *petechia*, from which they differ only in magnitude.

STIGMA, in Botany and Vegetable Philosophy, an essential part of the Pistillum. See **BOTANY**.

STIGMATIC, or **STIGMATICAL**, *adj.* Branded or marked with some token of infamy, or deformity.

He is deformed, crooked, old and sere,
Vicious, ungentle, foolish, blunt, unkind,
Stigmatical in making, worse in mind.

Shakspeare.

STIGMATIC, *s.* A notorious lewd fellow, who hath been burnt with a hot iron; or beareth other marks about him, as a token of his punishment. *Bullokar.*—One on whom nature has set a mark of deformity. *Steevens.*—Foul *stigmatic*, that's more than thou canst tell. *Shakspeare.*

Thou art neither like thy sire nor dam;
But like a foul misshapen *stigmatic*,
Mark'd by the destinies to be avoided.

Shakspeare.

STIGMATICALLY, *adv.* With a mark of infamy or deformity.

If you spy any man that hath a look,
Stigmatically drawn, like to a fury. *Wonder of a Kingdom.*

To **STIGMATIZE**, *v. a.* [*stigmatiser*, Fr.] To mark with a brand; to disgrace with a note of reproach.—They had more need have their cheeks *stigmatised* with a hot iron, some of our Jezebels, instead of painting! *Burton.*

STILAGO, in Botany, a genus of the class gynandria, order triandria.—Generic Character. Calyx: perianth one-leafed, hemispherical, almost entire, three-lobed. Corolla none. Stamina: filaments three, placed on the germ, spreading, longer than the calyx. Pistil: germ superior, roundish. Style cylindrical, permanent, shorter than the stamens. Stigma warted. Pericarp: drupe globular. Seed: nut globular. Male and female on separate trees.—*Essential Character.* Calyx one-leafed, pitcher-shaped. Corolla none. Female—Stigmas sessile. Drupe with a two-celled nut.

1. *Stilago Bunius.*—This is a tree, with the leaves alternate, petioled, simple, ovate-oblong, quite entire, smooth. Spikes alternate, naked, very long. Flowers small, scattered, sessile.—Native of the East Indies.

2. *Stilago diandra.*—Leaves alternate, on short petioles, nearly bifarious or two-faced, oval, entire, smooth, from two to four inches long, and from one to two broad. Stipules lanceolate. Spikes filiform, terminating, many-flowered. Bractes minute, one-flowered. Flowers very small, approximated.—In the male tree; perianth inferior, cup-form, obtusely four-toothed. Corolla none. Filaments two, four times longer than the calyx. Anthers thin, singly oval.—In the female; calyx inferior, closely embracing three-fourths of the germ, four or five-toothed. Corolla none.

Nectary.

Nectary, a yellow fleshy ring, surrounding the base of the germ. Germ obliquely ovate. Styles two, spreading; one of them always two-cleft. Stigmas simple. Drupe minute, succulent, one-celled. Nut one-celled, very small. It is a large tree.—Native of the mountainous parts of the Circars; and flowers in June.

The fruit, when ripe, is eaten by the natives. The wood serves for various uses.

STILAR, *adj.* Belonging to the stile of a dial.—At fifty-one and a half degrees, which is London's latitude, make a mark, and laying a ruler to the centre of the plane and to this mark, draw a line for the *stilar* line. *Moxon*.

STILBE [Στιλβη, *nitor*, *splendor*: from the shining appearance of the seeds], in Botany, a genus of the class polygamia, order dioecia.—Generic Character. Hermaphrodite.—Calyx exterior: perianth three-leaved (setting aside the four exterior ones): leaflets lanceolate, spreading and mucronate.—Interior: perianth one-leaved, five-toothed, cartilaginous. Corolla one-petalled, funnel-form: tube length of the calyx: border five-parted: parts linear. Stamina: filaments four, awl-shaped, placed on the throat. Anthers cordate, obtuse. Pistil: germ superior, ovate. Style filiform, length of the stamens. Stigma acute. Pericarp none: but the interior calyx inclosing, hardened, deciduous. Seed one. Male, on a distinct individual. Calyx exterior as in the hermaphrodite. Interior none. Corolla as in the hermaphrodite; but the tube membranaceous. Stamina as in the hermaphrodite. Pericarp and seed none. Hermaphrodite: calyx exterior, three-leaved. Interior five-toothed, cartilaginous. Corolla funnel-form, five-cleft. Stamina four. Seed one, clypted with the interior calyx. Male similar. Calyx, interior none. Fruit none. (The sex on a distinct plant.)

1. *Stilbe pinastra*.—Branches alternate, stiff, rugged with the remaining bases of the leaves. Leaves whorled in clusters, acute, smooth. Spikes oblong, terminating, sessile, imbricate; with bractes the length of the flowers.—Native of the Cape of Good Hope, by rivulets.

2. *Stilbe ericoides*.—Leaves in fours, lanceolate. Stature of an erica or heath. Spike terminating, sessile, growing out. Corollas even.—Native of the Cape of Good Hope.

3. *Stilbe cernua*.—Spikes drooping; leaves in fours. This is very like the first species, but the branchlets with the head hang down.—Native of the Cape of Good Hope.

STILE, *s.* [stigele, from stigan, Sax. *to climb*.] A set of steps to pass from one enclosure to another.—There comes my master and another gentleman from Frogmore over the *stile* this way. *Shakspeare*.

The little strutting pile,
You see just by the church-yard *stile*. *Swift*.

[*Stile*, Fr.] A pin to cast the shadow in a sun-dial. This should rather be *style*.—Erect the *stile* perpendicularly over the substilar line, so as to make an angle with the dial-plane equal to the elevation of the pole of your place. *Moxon*.

STILETTO, *s.* [Ital.; *stilet*, Fr.] A small dagger, of which the blade is not edged but round, with a sharp point.—When a senator should be torn in pieces, he hired one who entering into the senate-house, should assault him as an enemy to the state; and stabbing him with *stilettoes*, leave him to be torn by others. *Hakewill*.

STILICHO, or **STILICHON**. See **ROME**.
To STILL, *v. a.* [stillan, Sax.; *stillen*, Dutch; *stillen*, Germ., which has the substantive *stille*, *rest*; the Saxon, the adjective *stille*, *quiet*.] To silence; to make silent.

Is this the scourge of France?
Is this the Talbot so much fear'd abroad,
That with his name the mothers *still* their babes?
Shakspeare.

To quiet; to appease.—In all refrainings of anger, it is the best remedy to make a man's self believe, that the opportunity of revenge is not yet come; but that he foresees a time for it, and so to *still* himself in the mean time, and reserve it. *Bacon*.—To make motionless.—He having

a full sway over the water, had power to *still* and compose it, as well as to move and disturb it. *Woodward*.

STILL, *adj.* [stille, Sax.; *stil*, Dutch.] Silent; uttering no noise. It is well observed by Junius, that *st* is the sound commanding silence.

We do not act, that often jest and laugh:
'Tis old but true, *still* swine eat all the draugh. *Shakspeare*.

Your wife Octavia, with her modest eyes,
And *still* conclusion, shall acquire no honour,
Demuring upon me. *Shakspeare*.

Quiet; calm.

Atin when he spied
Thus in *still* waves of deep delight to wade,
Fiercely approaching to him, loudly cry'd. *Spenser*.

From hence my lines and I depart,
I to my soft *still* walks, they to my heart;
I to the nurse, they to the child of art. *Donne*.

Motionless.—Grecia sits *still*, but with no still pensiveness. *Sidney*.—That, in this state of ignorance, we short-sighted creatures might not mistake true felicity, we are endowed with a power to suspend any particular desire. This is standing *still*, where we are not sufficiently assured. *Locke*.—Continual; constant.

But that *still* use of grief makes wild grief tame,
My tongue should to thy ears not name my boys,
Till that my nails were anchor'd in thine eyes. *Shakspeare*.

Gentle; not loud. This, as well as the preceding sense, is overpassed in Dr. Johnson's and other dictionaries.—A *still* small voice. 1 *Kings*.—*Still* music. *Shakspeare*.

Me softer airs befit, and softer strings
Of lute or viol *still*, more apt for mournful things. *Milton*.

STILL, *s.* [stille, Germ.] Calm; silent.

Herne the hunter,
Sometime a keeper here in Windsor forest,
Doth all the winter time, at *still* of midnight,
Walk round about an oak with ragged horns. *Shakspeare*.

STILL, *adv.* [stille, Sax.] To this time; till now.—It hath been anciently reported, and is *still* received, that extreme applauses of great multitudes have so rarified the air, that birds flying over have fallen down. *Bacon*.—Nevertheless; notwithstanding.—The desire of fame betrays the ambitious man into indecencies that lessen his reputation; he is *still* afraid lest any of his actions should be thrown away in private. *Addison*.—In an encreasing degree.—The moral perfections of the Deity, the more attentively we consider, the more perfectly *still* shall we know them. *Atterbury*.—Always; ever; continually.—Unless God from heaven did by vision *still* shew them what to do, they might do nothing. *Hooker*.—After that.—In the primitive church, such as by fear being compelled to sacrifice to strange gods, after repented, and kept *still* the office of preaching the gospel. *Whitgift*.—In continuance.

I with my hand at midnight held your head:
And, like the watchful minutes to the hour,
Still and anon cheer'd up the heavy time,
Saying, what want you. *Shakspeare*.

STILL, *s.* A vessel for distillation; an alembic.
Nature's confectioner, the bee,
Whose suckets are moist alchemy;
The *still* of his refining mold,
Minting the garden into gold. *Cleveland*.

To STILL, *v. a.* To distil; to extract or operate upon by distillation.

Then starts she suddenly into a throng
Of short thick sobs, whose thundering volleys float,
And roll themselves over her lubrick throat
In panting murmurs, *still'd* out of her breast,
That ever bubbling spring. *Crashaw*.

To STILL, *v. n.* [stillo, Lat.] To drop; to fall in drops.
Out of use.

His sceptre 'gainst the ground he threw,
And tears *still'd* from him which mov'd all the crew.

Chapman.

STILL-LIFE, *s.* [A term in painting.] Things that have only vegetable life. *Mason.*—Even that, according to a term of art we commonly call *still-life*, must have its superiority and just preference in a tablature of its own species. *Id. Shaftesbury.*

STILLFRIED, a small town of Lower Austria, on the March. Near this town, Ottocar, king of Bohemia, was defeated and slain by the emperor Rodolph in 1278; 7 miles north-east of Weikersdorf.

STILLATITIOUS, *adj.* [*stillatitius*, Lat.] Falling in drops; drawn by a still.

STILLATORY, *s.* An alembic; a vessel in which distillation is performed.—In all *stillatories* the vapour is turned back upon itself, by the encounter of the sides of the *stillatory*. *Bacon.*—The room in which stills are placed; laboratory.—All offices that require heat, as kitchens, *stillatories*, stoves, should be meridional. *Wotton.*—These are nature's *stillatories*, in whose caverns the ascending vapours are congealed to that universal aquavitæ, that good fresh water. *More against Atheism.*

STILLBORN, *adj.* [*tille-bopene*, Sax.] Born lifeless; dead in the birth.

Grant that our hopes, yet likely of fair birth,
Should be *stillborn*; and that we now possess
The utmost man of expectation; we are
A body strong enough to equal with the king. *Shakspeare.*

STILLICIDE, *s.* [*stillicidium*, Lat.] A succession of drops.—The *stillicides* of water, if there be water enough to follow, will draw themselves into a small thread; because they will not discontinue. *Bacon.*

STILLICIDIOUS, *adj.* Falling in drops.—Crystal is found sometimes in rocks, and in some places not unlike the stitious or *stillicious* dependencies of ice. *Brown.*

STILLING, *s.* The act of stilling.—A stand for casks.

STILLINGFLEET (Edward), a learned prelate of the English church, was born in the year 1635; after preparatory education in the grammar-schools of Cranbourn and Ringwood, he was elected in 1648 to St. John's College, Cambridge, and was chosen fellow in 1653, and presented to the rectory of Sutton, in Bedfordshire, in 1657. In 1659, he published his "*Irenicum*, or the Divine Right of particular Forms of Church Government examined," hoping, by this publication, to remove the prejudices, and conciliate the attachment of those who were alienated from the church of England. In this treatise he maintains, that Christ did not determine the form of the government of his church by any positive laws; that the apostles adapted it to the various circumstances of time, place and persons; that episcopacy is lawful; that in the primitive church no invariable form of church government was adopted; and that the most eminent divines, at the Reformation, did not conceive any one particular form to be necessary. The *Irenicum* was highly commended for its learning and moderation; but the author himself, as Bishop Burnet says, desirous of avoiding the imputations of hostility to the church which it occasioned, retracted the book, and gave way to the humours of a high sort of people, beyond what became him, perhaps beyond his own sense of things. His next work was entitled, "*Origines Sacre*," or a rational Account of the Christian Faith, as to the Truth and Divine Authority of the Scriptures, and the Matters therein contained;" 4to. A work of his, published in 1685, was entitled "*Origines Britannicæ*, or the Antiquities of the British Churches," which gave an ample view of the origin and progress of Christian churches in Britain, since the first introduction of Christianity in the island to the conversion of the Saxons. He published a multitude of theological works, which betray great learning and talents.

STILLINGFLEET, a parish in the East Riding of Yorkshire, situated on the river Ouse; 8 miles south-by-west of York.

STILLINGIA [so named by Alexander Garden, in honour of Benjamin Stillingfleet], in Botany, a genus of the class monoecia, order monadelphia, natural order of tricocæ euphorbiæ (*Juss.*)—Generic Character. Male flowers digested in an amentaceous spike. Calyx: perianth many-flowered (seven-flowered), coriaceous, hemispherical, pitcher-shaped, quite entire; with two goblet-shaped glands. Corolla one petalled, fistular-funnel-form, widening gradually, much narrower than the calyx: mouth undivided, torn, ciliate. Stamina: filaments two, filiform, twice as long as the corolla, divaricating at the top, very slightly united at the base. Anthers twin reniform. Female flowers few, at the base of the same spike. Calyx: perianth one-flowered: the rest as in the males. Corolla superior. Pistil: germ roundish, between the calyx and corolla. Style filiform. Stigma three, distinct, recurved. Pericarp: capsule trilocous, subtrifurcate, subtrigonal, three-celled, surrounded at the base by the widened calyx. Seeds solitary, oblong, subtrigonal, with a transverse scar on the inner side.—*Essential Character.* Male: calyx hemispherical, many-flowered. Corolla tubular, crose. Female: calyx one-flowered, inferior. Corolla superior. Style trifid. Capsule tricocous.

Stillingia sylvatica.—This is a shrub, with many upright, round, milky stems, three feet high, terminated by a spike. Two branches commonly spring out at the base of the spike. Leaves alternate, petioled, remote, elliptic, serrulate, shining, spreading. Spike or ament terminating, sessile. Flowers small, yellow.—Native of Carolina, in pine woods.

STILLINGTON, a hamlet in Durham; 6½ miles north-west of Stockton-upon-Tees.

STILLINGTON, a parish in the East Riding of Yorkshire; 4½ miles east-south-east of Easingwold.

STILLNESS, *s.* [*tilleffe*, Sax.] Calm; quiet; silence; freedom from noise.

How sweet the moonlight sleeps upon this bank!
Here will we sit, and let the sounds of music
Creep in our ears; soft *stillness* and the night
Become the touches of sweet harmony. *Shakspeare.*

Habitual silence; taciturnity.
The gravity and *stillness* of your youth
The world hath noted. *Shakspeare.*

STILLSTAND, *s.* Absence of motion.
The tide swell'd up unto his height,
Then makes a *stillstand*, running neither way. *Shakspeare.*

STILL VALLEY, a post village of the United States, in Sussex county, New Jersey.

STILL WATER, a post township of the United States, in Saratoga county, New York, on the west side of the Hudson. Bemas's Heights are in this township; 3 miles north of the village. This place is famous for a battle fought on the 19th of September 1777, between the Americans and British. Population 2492; 22 miles north of Albany.

STILL WATER, a post township of the United States, in Sussex county, New Jersey.

STILL WATER, a river of the United States, in Ohio, which runs south-east into the Great Miami, above Dayton, and opposite the mouth of Mad river.

STILLY, *adv.* [*tillice*, Sax.] Silently; not loudly; gently.

From camp to camp, through the foul womb of night,
The hum of either army *stilly* sounds. *Shakspeare.*

Calmly; not tumultuously.
Thus mindless of what idle men will say,
He takes his own, and *stilly* goes his way. *More.*

STILO, a small town in the south of the kingdom of Naples, in Calabria Ultra, with a population of 1800. Here are the principal iron mines of Calabria. Some silver, lead and copper, are also found here; 22 miles south-east of Mileto.

STILO, a cape on the east coast of Calabria. Lat. 38° 27'. N. long. 16° 52'. E.

STILPO,

STILPO, a Grecian philosopher, who was a native of Megara, flourished in the third and fourth centuries, B. C., and is said to have died after the year 294 B. C. He is considered as belonging to the Megaric sect, and to have been a disciple of one of the successors of Euclid of Megara. When Ptolemy Soter captured Megara, he presented Stilpo with a large sum of money, and invited him to his court; but the philosopher returned the greater part of the present, and chose to retire during Ptolemy's stay at Megara to the island of Oegina. When Demetrius, son of Antigonos, took Megara, the soldiers were ordered to spare the house of Stilpo, and to return any thing that might have been precipitately taken from him. The philosopher being required to give an account of those effects which he had lost, replied "that he had lost nothing; for no one could take from him his learning and eloquence." To the conqueror he recommended himself by the pathetic manner in which he inculcated upon him the exercise of humanity. So great indeed was his fame, that when he visited Athens, the people ran out of their shops to see him; and even the most eminent philosophers of Athens took pleasure in attending upon his discourses. On moral topics, Stilpo is said to have taught, that the highest felicity consists in a mind free from the dominion of passion, a doctrine similar to that of the Stoics. He lived to a great age, and is said to have hastened his final departure by a draught of wine. *Diog. Laert. Brucker by Enfield*, vol. i.

To **STILT**, *v. a.* [*styllta*, Su. Goth. *to walk on stilts*.] To raise on stilts; to make higher by stilts.

This antic prelude of grotesque events,
Where dwarfs are often stilted.

Young.

STILTON, a village and parish of England, in the county of Huntingdon, situated on the high north road, and chiefly noted for its excellent cheese, which received the name of Stilton from having been first sold here, though it is now mostly manufactured in certain districts in Leicestershire. About one mile north of Stilton is Norman Cross, where very extensive barracks and a prison were erected during the late wars, the latter of which was appropriated to prisoners of war. The great Roman road to Ermine-street intersected this parish from north to south, between the two stations at Godmanchester called *Durotrivæ*, and at Castor called *Duroliponte*. In 1811, Stilton contained 107 houses and 663 inhabitants; 75 miles north of London.

STILTS, *s.* [*stylltor*, Swedish; *stelten*, Dutch; by some referred to the Sax. *ƿælcān*, *to stalk*; but they belong more justly to the Icel. *staula*, Su. Goth. *styllta*, *to take leisurely steps*. It has been said, that *stilts* were anciently used for the scaling of castles, walls, &c.] Supports on which boys raise themselves when they walk.—Some could not be content to walk upon the battlements, but they must put themselves upon *stilts*. *Howell*.

STIMULANT, *adj.* [*stimulans*, Lat.] Stimulating.—The solution of copper in the nitrous acid is the most acrid and *stimulant* of any with which we are acquainted. *Falconer*.

STIMULANT, *s.* A stimulating medicine.—*Stimulants* produce pain, heat, redness. *Chambers*.

To **STIMULATE**, *v. a.* [*stimulo*, Lat.] To prick.—To prick forward; to excite by some pungent motive.—To excite a quick sensation, with a derivation of blood towards the part.—Extreme cold *stimulates*, producing first a rigour, and then a glowing heat; those things which *stimulate* in the extreme degree excite pain. *Arbuthnot*.

STIMULATION, *s.* [*stimulatio*, Lat.] Excitement; pungency.—Some persons, from the secret *stimulations* of vanity or envy, despise a valuable book, and throw contempt upon it by wholesale. *Watts*.

STIMULATIVE, *adj.* Stimulating. *Suppl. to Ash*.
STIMULATIVE, *s.* A provocation; excitement; that which stimulates. *Malone*.

STIMULATOR, *s.* One who stimulates. *Scott*.
STINCHAR, a river of Scotland, in the county of Ayr,

and district of Carrick, which, after flowing to the south-west 22 miles, falls into the sea at Balantrae.

STINCHCOMBE, a parish of England, in Gloucestershire; 2 miles west-by-north of Dursley. Population 371.

To **STING**, *v. a.* pret. *stung*, or *stang*; part. pass. *stang*, or *stung*. [*ƿringan*, Sax.; *stungen*, sore pricked, Icelandic.] To pierce or wound with a point darted out, as that of wasps.

The snake, rolled in a flowery bank,
With shining checker'd slough, doth *sting* a child
That for the beauty thinks it excellent. *Shakspeare*.

That snakes and vipers *sting* and transmit their mischief by the tail, is not easily to be justified, the poison lying about the teeth, and communicated by the bite. *Brown*.—To pain acutely.

No more I wave
To prove the hero.—Slander *stings* the brave. *Pope*.

The *stinging* lash apply. *Pope*.

STING, *s.* [*ƿring*, Sax.] A sharp point with which some insects are armed, and which is occasionally venomous.

His rapier was a hornet's *sting*,
It was a very dangerous thing:
For if he chanc'd to hurt the king,
It would be long in healing. *Drayton*.

Any thing that gives pain.—The Jews receiving this book originally with such *sting* in it, shews that the authority was high. *Forbes*.—The point in the last verse.—It is not the jerk or *sting* of an epigram, nor the seeming contradiction of a poor antithesis. *Dryden*.—Remorse of conscience.—The *sting* of conscience. *Sherwood*.

STINGER, *s.* Whatever stings or vexes. *Cotgrave*, and *Sherwood*. Hence a sort of fly with a sting, vulgarly called a horse-stinger.

STINGILY, *adv.* Covetously.

STINGINESS, *s.* Avarice; covetousness; niggardliness.—Here our author, in pure good nature to make amends for his *stinginess* in the matter we last remarked, gives us three rules. *Johnson*.

STINGLESS, *adj.* Having no sting.

This merry jest you must excuse,
You are but a *stingless* nettle. *Old Ballad*.

STINGO, *s.* [from the sharpness of the taste.] Old beer. *A cant word*. It appears, however, to be old.—Returning with a large quart of mighty ale, that might compare with *stingo*, for it would cut a feather, they tossed the cannikin lovingly one to another. *Comment. on Chaucer*.—Shall I set a cup of old *stingo* at your elbow? *Addison*.

STINGY, *adj.* [A corruption of the old word *chinchy*. "The rich *chinchy* grede." *Chaucer*, Rom. R. 6002. And so *chinchy*: "*Chinche* and felon is richesse." *Ib.* 5998. In both places meaning stingy, niggardly: so *chinchy* is used for covetousness, stinginess. See the *Gloss. to Urry's Chaucer*. The old Fr. *chiche*, miserable, niggardly, covetous, is considered as its origin; and Chaucer once uses *chiche*.] Covetous; niggardly; avaricious.—He relates it only by parcels, and wont give us the whole, which forces me to bespeak his friends to engage him to lay aside that *stingy* humour, and gratify the public at once. *Arbuthnot*.

To **STINK**, *v. n.* pret. *stunk* or *stank*. [*ƿringan*, Sax.; *stincken*, Dutch.] To emit an offensive smell, commonly a smell of putrefaction.—Most of smells want names; sweet and *stinking* serve our turn for these ideas, which is little more than to call them pleasing and displeasing. *Locke*.

STINK, *s.* [*ƿring*, Sax.] Offensive smell.—Those *stinks* which the nostrils straight abhor are not most pernicious, but such airs as have some similitude with man's body, and so betray the spirits. *Bacon*.

They share a sin; and such proportions fall,
That, like a *stink*, 'tis nothing to them all, *Dryden*.
By

By what criterion do ye eat, d'ye think?

If this is priz'd for sweetness, that for *stink*. *Pope*.

STINKARD, s. A mean stinking paltry fellow.—You perpetual *stinkard*, go; talk to tapsters and ostlers, you slave. *B. Jonson*.

STINKER, s. Something intended to offend by the smell.—The air may be purified by burning of stinkpots or *stinkers* in contagious lanes. *Harvey*.

STINKING ISLANDS, a cluster of islands near the east coast of Newfoundland. Lat. 40. 28. N. long. 52. 50. W.

STINKINGLY, adv. With a stink.

Can'st thou believe thy living is a life,
So *stinkingly* depending?

Shakespeare.

STINKPOT, s. An artificial composition offensive to the smell.—The air may be purified by fires of pitch-barrels, especially in close places, and by burning of *stinkpots*. *Harvey*.

STINSFORD, a parish of England, in Dorsetshire; 1 mile from Dorchester.

STI PHILL, a petty town of European Turkey, in the north of the Morea, province of Sicyonia. It was ruined by the Albanians after the unsuccessful invasion of the Russians, and insurrection of the Greeks, in 1770. Its ancient name was *Philius*.

To STINT, v. a. [Tintan, Sax.; *stynta*, Swed.; *stunta*, Icel.] To bound; to limit; to confine; to restrain; to stop. Then hopeless, heartless, gan the cunning thief,
Persuade us die, to *stint* all further strife. *Spenser*.

She *stints* them in their meals, and is very scrupulous of what they eat and drink, and tells them how many fine shapes she has seen spoiled in her time for want of such care. *Law*.

To STINT, v. n. To cease; to stop; to desist: a northern expression.

The pretty wench, left crying, and said, Ay;—
And, pretty fool, it *stinted*, and said, Ay. *Shakespeare*.

STINT, s. Limit; bound; restraint.—The exteriors of mourning, a decent funeral, and black habits, are the usual *stints* of common husbands. *Dryden*.—A proportion; a quantity assigned.

Our *stint* of woe
Is common; every day, a sailor's wife,
The masters of some merchant, and the merchant
Have just our theme of woe. *Shakespeare*.

How much wine drink you in a day? my *stint* in company is a pint at noon. *Swift*.

STINT, s. A small bird common about the sea-shores in many parts of England. *Chambers*. See **TRINGA**:

STINTANCE, s. Restraint; stoppage.—Nay, I cannot weep you extempore: marry, some two or three days hence I shall weep without any *stintance*. *The London Prodigal*.

STINTER, s. Whatever or whoever stints, restrains, or cramps.—Let us see whether a set form or extemporary way of praying by the spirit be the greater hinderer and *stinter* of it. *South*.

STIPA, in Botany, a genus of the class triandria, order digynia, natural order of gramina, gramineæ or grasses.—Generic Character. Calyx: glume one-flowered, two-valved, lax, acuminate. Corolla two-valved: outer valve terminated at the tip by a very long twisted awn, jointed at the base and straight: inner valve length of the outer, awnless, linear. Nectary two-leaved: leaflets linear-lanceolate, membranaceous, gibbous at the base. Stamina: filaments three, capillary. Anthers linear. Pistil: germ oblong. Styles two, hirsute, united at the base. Stigmas pubescent. Pericarp none. Glume adnate. Seed one, oblong, covered.—*Essential Character*. Calyx two-valved, one-flowered. Corolla, outer valve with a terminating awn, jointed at the base.

1. *Stipa pennata*, or soft feather-grass.—Awns woolly. Root perennial, fibrous, tufted. Culms simple, a foot high, upright

slender, round, very smooth, without knots, clothed entirely with the sheaths of the leaves. The feathered awns are a beautiful and remarkable feature, at once distinguishing this from all our other grasses.—It has been found in several places in Germany, France, Italy, Spain, Barbary and Siberia.

Johnson, the editor of Gerarde's herbal, says it was nourished for the beauty in sundry of our English gardens; and that it was worn by sundry ladies and gentlewomen instead of a feather, which it exquisitely resembles.

2. *Stipa juncea*, or rush-leaved feather-grass.—Awns naked, straight; calyxes longer than the seed; leaves smooth within. Root perennial (or biennial).—Native of France, Switzerland, Silesia, Carniola and Barbary.

3. *Stipa capillata*, or capillary feather-grass.—Awns naked, curved; calyxes longer than the seed; leaves pubescent within. This resembles the preceding species very much.—Native of France, Germany, Switzerland and Italy. Perennial.

4. *Stipa aristella*, or short-awned feather-grass.—Awns naked, straight, scarcely twice as long as the calyx; germs woolly. Root perennial. Culms two feet high. Panicle subspiked, with two or three-flowered peduncles. Calyx length of the seed. Seed round, pubescent, with few villose hairs.—Native of the country about Montpellier.

5. *Stipa paleacea*, or chaffy feather-grass.—Awns half naked; panicle simple; leaves convoluted, awl-shaped, pubescent within. This has the appearance of the juncea.—Found about Tunis and in Egypt.

6. *Stipa tenacissima*, or tough feather-grass.—Awns hairy at the base; panicle spiked; leaves filiform. Habit of avena.—Native of Spain and Barbary, on sandy hills.

7. *Stipa Capensis*, or Cape feather-grass.—Awns hairy at the base; panicle spiked; leaves ensiform.—Native of the Cape of Good Hope.

8. *Stipa spicata*, or spiked feather-grass.—Awns hairy at the base; raceme spiked, directed to one side. Root perennial, creeping, producing many culms.—Native of the Cape of Good Hope.

9. *Stipa bicolor*, or two-coloured feather-grass.—Awns naked; seeds obovate, bearded at the base.—Native of Brasil, on Monte Video. Found by Thouin.

10. *Stipa avenacea*, or oat feather-grass.—Awns naked; calyxes equalling the seed. Culms slender.—Native of Virginia.

11. *Stipa membranacea*, or membranaceous feather-grass.—Pedicels dilated, membranaceous. The last flower but one sessile.—Native of Spain, where it was observed by Loeffling.

12. *Stipa barbata*, or bearded feather-grass.—Leaves rigid, striated on one side; panicle lax, elongated; awns very long, bearded from the base to the tip.—Native of Barbary, about Mascar and Tlemsen.

13. *Stipa parviflora*, or small-flowered feather-grass.—Leaves radical, stiffish, filiform; panicle diffused; awns naked, capillaceous. Roots perennial, fibrous, flexuose, long. Culms many, from the same head, slender, erect.—Native of dry hills, near Mascar, and in the kingdom of Tunis.

14. *Stipa tortilis*, or twisted-awned feather-grass.—Panicle spiked, rolled in at the base; inner calyx villose; awns twisted, villose at bottom. It is an annual grass.—Native of Barbary, in fields.

STIPE'ND, s. [*stipendium*, Lat.] Wages; settled pay.

All the earth,
Her kings and tetrachs are their tributaries;
People and nations pay them hourly *stipends*. *B. Jonson*.

To STIPE'ND, v. a. To pay by settled wages.—I, sir, am a physician; and am *stipended* in this island to be so to the governours of it. *Contin. of D. Quivote*.

STIPE'NDIARY, adj. [*stipendiarius*, Lat.] Receiving salaries; performing any service for a stated price.—His great *stipendiary* prelates came with troops of evil appointed horsemen not half full. *Knolles*.

STIPE'NDIARY,

STIPE'NDIARY, *s.* [*stipendiaire*, Fr., *stipendiarius*, Lat.] One who performs any service for a settled payment.—This whole country is called the kingdom of Tunis; the king wherof is a kind of *stipendiary* unto the Turk. *Abbot.*

If thou art become
A tyrant's vile *stipendiary*, with grief
That valour thus triumphant I behold,
Which after all its danger and brave toil,
Deserves no honour from the gods or men.

Glover.

To **STI'PPLE**, *v. n.* To engrave, not in stroke or line, but in dots. A term of art.

STI'PTICK. See **STYPTIC**.

To **STI'PULATE**, *v. n.* [*stipulor*, Lat.; *stipuler*, Fr.] This word is derived by some Latin etymologists from *stipe*, the ablative of *stips*, or *stipis*, a piece of money; or from *stipes*, a stake or landmark. But it comes from the Lat. *stipula*, a straw: "Dicta autem *stipulatio* à *stipulâ*; veteres enim quando sibi aliquid promittebant, *stipulam tenentes frangebant, quam iterum jungentes, sponsiones suas agnoscebant.*" Du Cange in V. **STI'PULATIO**. So an old English writer; "Their bargains (in the Isle of Man) are compleated, and confirmed, by the giving and taking of as mean a matter as a *straw*; as of old also, *per traditionem stipulæ*; from whence the phrase of *stipulation* came. Sadler, Rights of the Kingdom, 1649. Cole, iv. 69.] To contract; to bargain; to settle terms.—The Romans very much neglected their maritime affairs; for they *stipulated* with the Carthaginians to furnish them with ships for transport and war. *Arbutnot.*

STI'PULATION, *s.* [*stipulation*, Fr.] Bargain.—We promise obediently to keep all God's commandments; the hopes given by the gospel depend on our performance of that *stipulation*. *Rogers.*

STI'PULATOR, *s.* [*stipulateur*, Fr.] One who contracts or bargains. *Sherwood.*

To **STIR**, *v. a.* [*stiran*, Sax.; *stooren*, Teut. Formerly written *stere*; and by Spencer more than once, for the sake of his rhyme, *stire*. Butler, in his English Grammar, 1634, states our western dialect to be *stoor*.]—To move; to remove from its place.—My foot I had never yet in five days been able to *stir* but as it was lifted. *Temple.*—To agitate; to bring into debate.—Preserve the right of thy place, but *stir* not questions of jurisdiction, and rather assume thy right in silence than voice it with claims. *Bacon.*—To incite; to instigate; to animate.

With him is come the mother queen;
An Até *stirring* him to blood and strife. *Shakspeare.*

To raise; to excite.

The soldiers love her brother's memory;
And for her sake some mutiny will *stir*. *Dryden.*

To **STIR** *up*. To incite; to animate; to instigate by inflaming the passions.—This would seem a dangerous commission, and ready to *stir up* all the Irish in rebellion. *Spenser.*—To *stir* the factious rabble *up* to arms. *Rowe.*

To **STIR** *up*. To put in action; to excite; to quicken.—Hell is moved for thee to meet thee at thy coming; it *stirreth up* the dead for thee. *Isa.*—The use of the passions is to *stir up* the mind, and put it upon action, to awake the understanding and to enforce the will. *Addison.*

To **STIR**, *v. n.* To move one's self; to go out of the place; to change place.—No power he had to *stir*, nor will to rise. *Spenser.*—To be in motion; not to be still; to pass from inactivity to motion.—To become the object of notice.—If they happen to have any superior character, they fancy they have a right to talk freely upon every thing that *stirs* or appears. *Watts.*—To rise in the morning. This is a colloquial and familiar use.—If the gentlewoman that attends the general's wife be *stirring*, tell her, there's one Cassio entreats of her a little favour of speech. *Shakspeare.*

VOL. XXIII. No. 1593.

STIR, *s.* [*stur*, Runic, a battle; *ystwrf*, noise, Welsh.] Tumult; bustle.

What halloing and what *stir* is this to day?
These are my mates, that make their wills their law,
Have some unhappy passenger in chase. *Shakspeare.*

Commotion; public disturbance; tumultuous disorder; seditious uproar.

Raphael, thou heard'st what *stir* on earth,
Satan from hell 'scap'd through the darksome gulf,
Hath rais'd in paradise, and how disturb'd
This night the human pair. *Milton.*

Agitation of thoughts; conflicting passion.

He did keep

The deck, with glove or hat, or handkerchief,
Still waving, as the *stirs* and fits of's mind
Could best express how slow his soul sail'd on,
How swift his ship. *Shakspeare.*

STI'RABOUT, *s.* A Yorkshire dish, formed of oatmeal boiled in water to a certain consistency, and then eaten either with a bit of cold butter put into it and salt, or with milk. It is also a common breakfast among the lower orders in the north of Ireland. *Malone.*

STI'RCHLEY, a parish of England, in Salop, near Shrewsbury.

STI'RIOUS, *adj.* [from *stiria*, Lat.] Resembling icicles.—Chrystal is found sometimes in rocks, and in some places not much unlike the *stirious* or stillicidious dependencies of ice. *Brown.*

STIRK. See **STURK**.

STIRLING, a county of Scotland, formerly making part of what was called the shire or county of Lennox, bounded on the north by the shires of Perth and Clackmannan, from which it is separated by the Forth; on the east by the frith of Forth and Linlithgowshire; on the south and west by the shires of Lanark and Dumbarton; lying between 55. 55. and 56. 17. N. latitude, and between 3. 17. and 4. 40. W. longitude from Greenwich; being from 12 to 17 miles from north to south, and 35 from east to west; consisting of about 560 square miles, or 237,200 English acres. This shire occupies the central country between the friths already mentioned; and the face of it is diversified with mountains, hills, and plains, shaded with natural woods and plantations, the former covering about 13,000, and the latter 10,000 acres. An extensive plain, 40 miles in length, stretches from the water of Avon towards the north-west, terminated by the mountain of Benlomond, and intersected by the Forth, winding with placid dignity, and forming the beautiful links for which it is so remarkable. In this track, which includes the carses or valleys of Stirling and Falkirk, is the greatest quantity of fine land to be found in the kingdom, producing the most luxuriant crops. It is most elevated in proportion to its distance from either frith; so that in the parishes of Kilsyth, Campsie, and Fintry, the waters descend both towards the east and west. There are several considerable ridges of hills. Those of Lennox, Kirkintulloch, and Dumbartonshire, extend from the neighbourhood of Dumbarton north-east, through the centre of the shire, to the vicinity of Stirling. Northward of that ridge lies the fertile valley of the Forth. The central and southern districts are partly mountainous, and partly level and fertile. An extensive moor stretches from Sauchie in the parish of St. Ninian's, westward to the parish of Balfron, a distance of 16 miles, and from one to four in breadth. Another extends from Denny on the east about 30 miles, to the neighbourhood of Dumbarton on the west. In the north-west district, which includes Benlomond, there is a bleak and uncultivated track, 10 miles in length, and 3 in breadth. The southern district, consisting of peat mosses and uncultivated moors, occupies the space of 8 by 2½ miles, viz., from Muiravonside to Cumbernauld. The whole of these mountains and moors may consist of 100,000 acres nearly. In former times, the greater part of this county was covered

with wood, vestiges of which are still found in many parts. The principal rivers are the Forth; the Carron; the Bannockburn, which falls into the Forth; the Enrick, which loses itself in Loch Lomond; the Blane, which falls into the Enrick; the Kelvin, which, rising in the parish of Kilsyth, flows westward through extensive valleys, in a cut formed since the year 1792, and enters the Clyde. The navigable canal which connects the frith of Forth with the Clyde, is partly here. There is a great variety of soil in this county. In the western parishes, there is a considerable proportion of clay on hard till, that renders it cold and moist. The carse land on the banks of the Forth is a high coloured clay, with a mixture of sand. This soil is evidently alluvial, and the substances which are found in it, as well as the aspect of the higher grounds by which it is bounded, indicate that at some former period it was covered by the sea. Some beds of shells, from a few inches to four yards in thickness, form a part of the subsoil. There are patches of loam in different parts of the shire. Along the Enrick, Carron, and Blane, the soil in most places is light, inclining to gravel. The high moors are of a mossy soil; and in the low carse grounds, many peat mosses are formed. The hilly tracks are fit only for pasturage. Exclusive of the mosses, about two-thirds of the shire are enclosed, and considerably improved. There are few districts in Scotland that abound more in minerals of various kinds, than this county; and the abundance of coal in particular has given rise to many important branches of manufacture. The northern boundary of that great belt of coal which extends from Kintyre on the west, to Fifeshire on the east, in an oblique direction, appears to run in this county along the southern base of the Lennox hills. To the north of this range of mountains, coal has not yet been discovered, though repeated trials have been made; while to the south of this line, coal abounds everywhere. There is also in the county abundance of ironstone, freestone, and limestone; and more valuable minerals have been discovered, and in part wrought, as silver, copper, cobalt, and lead. In the hills between Dumbarton and Stirling, are piles of basaltic rocks. Stirlingshire is a noted scene of the most important historical events. In the early ages, it was a subject of bloody contention between the Scots and Picts. Here, too, the Romans found the greatest difficulty in subjugating the ancient inhabitants, who, from their impenetrable fastnesses, poured down upon them like torrents from their native mountains. To stop the inroads of the Caledonians, Agricola, the Roman general, built a chain of forts between the friths of Clyde and Forth, which were afterwards connected by the wall of Antoninus. Near Bannockburn was fought the eventful battle between Robert Bruce and Edward II., which finally defeated the schemes of the English monarch, for uniting the whole island by conquest under his sovereignty. Contiguous to this, is the Torwood, famous for being the hiding place of the renowned Wallace. Near Falkirk, two famous battles were fought, one wherein Wallace and the Scots were defeated, and the other where the adherents of the Stuart family obtained a victory in 1746. The castle of Stirling has frequently sustained the longest sieges recorded in the Scotch annals. Stirlingshire contains one royal burgh, viz., Stirling, the towns of Falkirk and St. Ninians, and several large villages, of which the principal are Denny, Larbert, Bannockburn, Kippen, Kilsyth, Buchlyvie, Airth, Campsie, and Killearn. Numerous seats and plantations are interspersed throughout, and enrich the appearance of the county. Stirlingshire is divided into 22 parochial districts, which, in 1811, contained 58,171, in 1821, 65,331 inhabitants.

STIRLING, or **SRIVELING** (*the place of contention or strife*, denoting the bloody scenes of warfare which have taken place in Stirling and the neighbourhood), is an ancient town, capital of the county to which it gives name. It is irregularly built, in the midst of a plain watered by the Forth, on the sloping ridge of a rock, the precipitous end of which, towards the west, is occupied by the castle. The street on the summit of the hill is broad and spacious, but

the other streets are narrow and irregular. At the south end of the town, on the way to St. Ninian's, are many elegant villas. The town is well supplied with excellent water, which is brought in pipes from the hills of Touch, somewhat more than three miles distant.

There are two churches, called from their situations, the East and West Kirks. The former is a very fine building, erected partly by Cardinal Beaton. The latter is a structure of much older date, and in a ruder style of what is called the Gothic. No date has ever been discovered on any part of its walls; but there is little room for doubt, but that it was the chapel of the monastery of Dominicans, which was founded near to the walls of Stirling, by Alexander II., in the year 1233. This church has been lately repaired, and is now, internally, one of the most elegant old churches in Scotland. There are three hospitals, the first endowed by Robert Spittal, tailor to James IV., and built in 1530, for the support of poor tradesmen. This same person also built the bridges of Doune and Bannockburn, and executed several other works of great utility. The second was founded by John Cowan, in 1639, for 12 decayed guild-brethren. This hospital is situated to the south of the church, and has a steeple and bell, and apartments for the guildry to meet in. The revenue amounts to £3000 per annum. The third was founded by John Allan, for the maintenance and education of the children of decayed tradesmen, the revenue of which amounts to £486 15s. 9d. In 1808, Alexander Cunningham, a merchant, left £5000 as a fund for educating the children of poor freemen mechanics, and to augment the pensions to their widows. The town-house is a large building, with convenient apartments for the town courts; and there has been lately erected a new jail, upon an approved plan, and a spacious and elegant hall for the circuit and sheriff courts. In the council-chamber is kept the *jugg*, appointed by law to be the standard for liquid measures in Scotland. The grammar school, the academy for accounts and mathematics, and the English school, are large and commodious, placed in airy and agreeable situations, and taught by masters who are a credit to their profession. At the termination of John's-street and the Baker's-wynd, where the meal market formerly stood, a new and elegant building, with a spire 120 feet high, is now finished, for a reading-room and a public library. The books are well selected and arranged, and consist of several thousand volumes. This structure is finely situated, and is a great ornament to the lower part of the town. In the Castle-wynd stands Argyll's lodgings, built in 1633, by Sir William Alexander, of Menstrie, secretary to Charles I. It afterwards came into the Argyll family; and here duke John resided in 1715. It is now the military hospital. At the end of the High-street stands Marr's wark, begun in 1572, during the regency of that nobleman, but never finished.

Stirling has a considerable inland trade, and some foreign, chiefly to the Baltic. Vessels of 60 and 70 tons burden come up to the quay; but the navigation from Alloa is circuitous, and no wind can be a fair one, either for going up or down, blow from what quarter it will. So early as the year 1600, Stirling manufactured a considerable quantity of shalloons for exportation, but this trade has fluctuated greatly since. Cotton and woollen are the principal manufactures at present, particularly carpets; but it cannot be considered as a manufacturing place. Besides a branch of the bank of Scotland, there is a banking company belonging to the town.

Stirling is a place of great antiquity. Buchanan mentions it frequently in his history, so early as the 9th century, but gives no description of it. The most ancient of the town's charters is granted by king Alexander I., and is dated at Kincardine, the 18th of August, in the 12th year of his reign (i. e. A. D. 1120); but there is reason to believe that Stirling was incorporated long before, as it is not a charter of erection, but only confers some additional privileges on the burghers and freemen. About the middle of the 12th century, it became a royal residence. David I. kept his court

court in it, probably that he might be near the abbacy of Cambuskenneth, which he founded. It is probable that the town grew to its present size very soon after it became the residence of royalty; and it appears to have undergone very little change either in size or in the number of its inhabitants, the last 600 years, till very lately. It holds a fifth rank among the Scottish royal burghs, and was one of the *curia quatuor burgorum*. The municipal government consists of a provost, four bailies, a dean of guild, treasurer, and 14 other councillors, making the whole 21; 14 of whom are merchants, and 7 representatives of the incorporated trades. It unites with Dunfermline, Inverkeithing, Queensferry, and Culross, in sending a member to parliament. The revenue arising from the salmon fishery, shore dues, meal and flesh market dues, customs, &c., amounts to about 2250*l.* per annum. Besides the ordinary jurisdiction in civil causes, the magistrates have also an extensive criminal jurisdiction, equal to the power of sheriffs, within their territories. The borough of Stirling, owing to some corrupt transactions in the council, was in 1775 disfranchised by sentence of the court of session; and its charter was not restored till 1781, when the borough received a new constitution from the crown. The castle is situated at the western extremity of the rock on which the town is built, and is of great antiquity; but previous to the 9th century, there are no accounts of it. When Kenneth II. overthrew the Pictish government, he ordered this castle to be razed. It was soon, however, rebuilt; for in the succeeding reign of Donald V. the kingdom was invaded by Osbriht and Ella, two Northumbrian princes, who, having possession of the territory south of the Forth, rebuilt the castle of Stirling, and placed in it a strong garrison, to preserve their new conquests, on the frontiers of which it was situated. In the 10th century it again came into the possession of the Scots; and, during the Danish invasion in 1009, it was the place of rendezvous for the Scottish army. In the 12th century, it was one of the most important fortresses in the kingdom, and was one of the four which were delivered up to the English, as part of the ransom of William the Lion, who, in 1174, had been taken captive near Alnwick, in Northumberland. During the tyrannical usurpation of Edward I. it was several times taken and retaken by the English and Scots; in the former of whose hands it was kept for ten years, until retaken by Robert Bruce after the battle of Bannockburn. It was for a short time in the possession of the English in 1333, and lastly taken by Monk in 1651. The rebels besieged it for a short time in 1746. Though it had been some time a regal residence before the accession of the Stuart family, it does not appear to have been fitted up with great magnificence, until it became the favourite residence of James I. It was the birth-place of James II.; and in it he perpetrated the murder of his kinsman, William earl of Douglas, whom he stabbed with his own hand. The room where the deed was committed still goes by the name of Douglas's room. About 20 years ago, the skeleton of a man was found in the cleft of the rock immediately under the window of this room; it was that of a tall man, and was supposed to be that of the earl. James III. was very fond of this palace, and built within it a magnificent hall for the meetings of parliament, which is now converted into barracks. Adjoining to the parliament-house is the chapel royal, erected by James VI. in 1594, for the baptism of his son prince Henry. In this chapel is shewn a coarse antique pulpit, which is said, but with little probability, to have been the pulpit of Knox, the celebrated Scotch reformer. The chapel has undergone a similar reverse of fortune with the parliament-house, and is now converted into a store-room and armoury. The royal chapel, however, in which James himself was baptized with so much pomp by the unfortunate Mary, was a building of much greater dignity than that which has been converted into a store-room. It is a stately building, in the form of a square, with a small court in the centre. Externally it is very richly and curiously ornamented with grotesque figures, standing upon pillars or pedestals. The palace is now converted into barrack wards for the

soldiers of the garrison, and affords a house to the governor, and rooms for the inferior officers. Here is also shewn the apartments occupied by Buchanan, while preceptor to James VI. A strong battery was erected about the year 1559, during the regency of Mary of Lorraine, called the French battery. In the reign of queen Anne, the castle was enlarged and repaired; and a flanking battery, named Queen Anne's battery, with barracks bomb proof, was erected on the south side. Since that period, no alteration or repairs of any consequence have been made. This castle has once been a place of great strength, before the use of artillery; but now it could scarcely hold out a few hours. About 36 guns are mounted on the ramparts. Stirling castle is commanded by a governor, deputy-governor, fort-major, and three subalterns. It is one of the Scottish forts which, by the articles of union, are always to be kept in repair. Parliaments were frequently held here. Upon the rock; and on the south side of the castle, is a flat piece of ground, inclosed, which was the place of the tournaments; and on one side is a place where the ladies used to sit, still named the Ladies' rock. As this fortress was frequently the scene of bloody contention, it is customary to point out to every stranger 12 fields of battle within view of its walls. The prospect from the Castle hill is most delightful, as well as extensive, being greatly beautified, especially towards the east, by the windings of the Forth, the ruins of the abbey of Cambuskenneth, the Abbey craig, a rock very similar to that on which Stirling is built, and the city of Edinburgh. The rock upon which the castle is built is basaltic, being composed of jointed pillars of a pentagonal or hexagonal form. Around the castle is a pleasant walk, carried from the town, in many places cut out of the solid rock. From this walk there are several beautiful views, and it gives an excellent opportunity of examining the basaltic pillars of which the rock is composed. The parish of Stirling is confined to the burgh, and a small territory round it, on the opposite side of the Forth, and in the county of Clackmannan; 35 miles north-west of Edinburgh, and 29 north-east of Glasgow. Lat. 56. 6. N. long. 3. 59. W.

STIRONE, a small river of Italy, in the duchy of Parma, which passes by Borgo San Domino, and falls into the Taro.

STIRP, *s.* [*stirps*, Lat.] Race; family; generation. *Not used.*—Sundry nations got footing in that land, of the which there yet remain divers great families and *stirps*. *Spenser.*—Democracies are less subject to sedition than when there are *stirps* of nobles. *Bacon.*—All nations of might and fame resorted hither; of whom we have some *stirps* and little tribes with us at this day. *Bacon.*

STIRRAGE, *s.* Motion; act of stirring.—They cannot sleep soundly, but the crowing of the cock, the noise of little birds,—every small *stirrage* waketh them. *Granger.*

STIRRER, *s.* One who is in motion; one who puts in motion.

But ever to no ends:

What, did this *stirrer* but die late?

How well at twenty had he fall'n or stood,

For three of his fourscore he did no good. *B. Jonson.*

A riser in the morning.—Come on; give me your hand, sir; an early *stirrer*. *Shakspeare.*—An inciter; an instigator.

STIRRER up. An inciter; an instigator.—A perpetual spring, not found elsewhere but in the Indies only, by reason of the sun's neighbourhood, the life and *stirrer up* of nature in a perpetual activity. *Raleigh.*

STIRRING, *s.* [*stirring*, Sax.] The act of moving.—The great judge of all knows every different degree of human improvement, from these weak *stirrings* and tendencies of the will, which have not yet formed themselves into regular purposes, to the last entire consummation of a good habit. *Addison.*

STIRRUP, *s.* [*stirrup*, *stirap*, from *stigan*, Sax.,

to climb, and pap, a cord.] An iron hoop suspended by a strap, in which the horseman sets his foot when he mounts or rides.

My friend, judge not me,
Thou see'st I judge not thee.
Between the *stirrup* and the ground,
Mercy I ask'd, mercy I found.

Camden.

STIRTON, a township of England, West Riding of Yorkshire; 1 mile from Skipton.

STISTED, a parish of England, in Essex; 3 miles east-north-east of Braintree. Population 574.

To STITCH, *v. a.* [*sticke*, Danish; *sticken*, Dutch.] To sew; to work with a needle on any thing.—To join; to unite, generally with some degree of clumsiness or inaccuracy.—Having *stitched* together these animadversions touching architecture and their ornaments. *Wotton.*

To STITCH *up*. To mend what was rent.—It is in your hand as well to *stitch* up his life again, as it was before to rent it. *Sidney.*—I with a needle and thread *stitch'd up* the artery and the wound. *Wiscman.*

To STITCH, *v. n.* To practice needlework.

STITCH, *s.* A pass of the needle and thread through any thing.—[from *stician*, Sax.] A sharp lancinating pain.—If you desire the spleen, and will laugh yourself into *stitches*, follow me; youder gull Malvolio is turned heathen, a very renegado. *Shakspeare.*—A link of yarn in knitting.—There fell twenty *stitches* in his stocking. *Mot-teux.*—In Chapman it seems to mean furrows or ridges.

Many men at plow he made, and drave earth here and there,
And turn'd up *stitches* orderly.

Chapman.

In the following line allusion is made to a knit stock.

A *stitch*-fall'n cheek, that hangs below the jaw,
Such wrinkles as a skilful hand would draw,
For an old grandam ape.

Dryden.

STITCHEL AND HUME, a united parish of Scotland, in the counties of Roxburgh and Berwick, of an irregular figure, five or six miles long, and between three and four broad. Population 930.

STITCHERY, *s.* Needlework. In contempt.—Come lay aside your *stitchery*; play the idle housewife with me this afternoon. *Shakspeare.*

STITCHWORT, *s.* Camomile. *Ainsworth.* See AN-THEMIS.

STITH, *adj.* [ἴτιθ, Saxon.] Strong; stiff: a *stithe* cheese, i. e. *strong* cheese. North. *Ray.*

STITH, *s.* [from the Sax. ἴτιθ, *strong*.] An anvil.

The smith

That forgeth sharpe swerdes on his *stith*.

Chaucer.

STITHIAN'S, ST., a parish of England, in Cornwall; 4 miles north west of Penryn. Population 1394.

STITHY, *s.* [*stedi*, Icelandic; ἴτιθ, *hard*, Sax.] A smith's shop; and sometimes merely an anvil, as in parts of the north of England.

My imaginations are as foul
As vulcan's *stithy*.

Shakspeare.

To STITHY, *v. a.* To form on the anvil.—The forge that *stithed* Mars his helm. *Shakspeare.*

STITTENHAM, a hamlet of England, North Riding of Yorkshire; 7½ miles west-south-west of New Malton.

To STIVE, *v. a.* [supposed of the same original with *stew*.]—To stuff up close.—You would admire, if you saw them *stive* it in their ships. *Sandys.*—To make hot or sultry.—His chamber was commonly *stived* with friends or suitors of one kind or other. *Wotton.*

STIVER, *s.* [Dutch.] A Dutch coin about the value of a halfpenny.

STIVICHALL, a parish of England, in Warwickshire, 1½ mile south-by-west of Coventry.

STIXWOULD, a parish of England, in Lincolnshire; 6½ miles west-south-west of Horncastle.

STOÆ [στοαι, Gr.], in Antiquity, the porticoes at Athens.

These were full of exedræ, [εἰσεδραῖ, Gr.], and side buildings, furnished with seats fit for study or discourse.

STOAKHAM, a hamlet of England, in the parish of East Drayton, near Tuxford.

STOAT, *s.* A small stinking animal, of the weasel kind.

Ne armed knight ydrad in war
With lion fierce will I compare:
Ne judge unjust with furred fox
Harming in secret guise the flocks:
Ne priest unworth of Goddes coat
To swine ydrunk, or filthy *stoat*.

Prior.

STOBÆUS (Joannes), a Greek writer, supposed to have flourished in the beginning of the fifth century, about A.D., 405, was the author of several works, none of which have come entire to modern times, except the fragments of a collection of extracts from ancient poets and philosophers. These have been published at various times, under the titles of "Eclogæ," "Sententiæ," and "Sermones." The "Sententiæ" were published by Gesner with a Latin version, Tigur. 1659, fol.; and Grotius gave an edition of "Dicta Poetarum apud Stobæum," Gr. and Lat., Paris, 1623, 4to. The latest edition of Stobæus is that entitled "Sermones," Lips. 1797. The writer seems to have been a mere compiler. Fabricius thinks that he was not a Christian, since his extracts are exclusively from heathen authors. *Fab. Bibl. Græc.*

STOBO, a parish of Scotland, in the county of Peebles; six miles long, and from three to four broad. Population 422.

STOCAH, *s.* [Irish; *stochk*, Erse.] An attendant; a wallet-boy. *Not in use.*—He holdeth himself a gentleman, and scorneth to work;—which he saith is the life of a peasant: but thenceforth becometh an horseboy, or a *stocah* to some kern, inuring himself to his sword, and the gentlemanly trade of stealing. *Spenser.*

STOCCA'DE, *s.* [*stockade*, Teut. (vulgo *stoccada*), a dagger. Kilian.] An enclosure or fence made with pointed stakes.

Extend a rail of elm securely arm'd,
With spiculated paling, in such sort
As round some citadel, the engineer
Directs his sharp *stoccad*.

Mason.

STOCCA'DO, *s.* [*estocade*, Fr., a thrust. See STOC-CADE. From the Teut. *stock*, a sword, a dagger; *stocco*, Ital.] A thrust with a rapier.—You stand on distance, your passes, *stoccados*, and I know not what. *Shakspeare.*

STOCHSTADT, a small town in the west of Germany, in the Bavarian states, on the Maine; 3 miles west of Aschaffenburg, and 15 south-east of Frankfort-on-the-Maine. Population 1100.

STOCK, *s.* [*stockr*, *stocks*, Su. Goth. *truncus*, *trabs*; *roc*, Saxon; *stock*, Dutch; *estoc*, Fr.] The trunk; the body of a plant.

That furious beast

His precious hour, sought of his enemies,
Strikes in the *stock*, ne thence can be releas'd.

Spenser.

The trunk into which a graft is inserted.

As fruits, ungrateful to the planter's care,
On savage *stocks* inserted, learn to bear;
The surest virtues thus from passions shoot,
Wild nature's vigour working at the root.

Pope.

A log; a post.—Men, serving either calamity or tyranny, did ascribe unto stones and *stocks* the incommunicable Name. *Wisd.*—A man proverbially stupid.

While we admire

This virtue and this moral discipline,
Let's be no *stocks*, nor no *stocks*.

Shakspeare.

The handle of any thing.—A support of a ship while it is building.

Fresh supplies of ships,

And such as fitted since the fight had been,
Or new from *stocks* were fall'n into the road.

Dryden.

[*Stock*,

[*Stock*, Teut. *stocco*, a rapier, Italian.] A thrust; a stoc-
cado.—To see thee here, to see thee there; to see thee pass
thy puncto, thy *stock*, thy reverse. *Shakspeare*.—Some-
thing made of linen; a cravat; a close neckcloth. Anciently
a cover for the leg, now *stocking*.—His lackey with a linen
stock on one leg, and a kersey boot-hose on the other.
Shakspeare.—A race; a lineage; a family.

Say what *stock* he springs of.—

—The noble house of Marcus.

Shakspeare.

Thou has seen one world begin, and end,
And man, as from a second *stock* proceed.

Milton.

The principal; capital store: fund already provided. The
word is rarely found in the plural.—We cast our eyes upon
all sorts of good that is to be done: The poor in extremity
must be holpen; orphans and aged must be provided for;
our poor friends that are behind hand; prisoners, and dis-
tressed householders, young tradesmen that want *stocks*,
must be thought on. *Dr. White*.

Some honour of your own acquire;

Add to that *stock*, which justly we bestow,

Of those blest shades to whom you all things owe. *Dryden*.

Yet was she not profuse; but fear'd to waste,
And wisely manag'd that the *stock* might last;
That all might be supply'd, and she not grieve,
When crouds appear'd, she had not to relieve;
Which to prevent, she still increas'd her store;
Laid up, and spar'd, that she might give the more. *Dryden*.

Quantity; store; body.—He proposes to himself no small
stock of fame in future ages, in being the first who has un-
dertaken this design. *Arbutnot*.—Cattle in general. North.
Pegge.—A fund established by the government, of which
the value rises and falls by artifice or chance. *Dr. Johnson*.
—The word, in this sense, is also old French: "*Stoques*,
a borrowing or taking up money upon interest; whence
faire stoques, so to borrow." *Colgrave*.

Statesman and patriot ply alike the *stocks*,
Peers and butler share alike the box.

Pope.

Prison for the legs: commonly also without singular. See
STOCKS.

To *STOCK*, *v. a.* To store; to fill sufficiently.

I, who before with shepherds in the groves,
Sung to my oaten pipe their rural loves,
Manur'd the glebe, and *stock'd* the fruitful plain. *Dryden*.

To lay up in store; as, he *stocks* what he cannot use.—
To put in the *stocks*. *Dr. Johnson*.—To stock means,
anciently, to confine. [*stucka*, in cippo vel robore tenere
aut custodire. Leges ant. Goth. *Screnius*. So *stecken*,
Teut. to confine in the stocks.] See also *STOCKS*.

Call not your *stocks* for me; I serve the king.
On whose employment I was sent to you:
You shall do small respect, shew too bold malice
Against the grace and person of my master,
Stocking his messenger. *Shakspeare*.

To extirpate. Sometimes with *up*.

The time shall quickly come, thy groves and pleasant springs,
Where to the mirthful merle the warbling mavis sings,
The painful labourer's hand shall *stock*, the roots to burn.
Drayton.

The wild boar not only spoils her branches, but *stocks up*
her roots. *Dec. of Chr. Piety*.

STOCK, a parish in Essex; 3 miles north-north-east of
Billericay. Population 532.

STOCK, or *STOKE*, a parish in Worcestershire; 7 miles
east-south-east of Droitwich.

STOOKACH, a small town of Germany, in Baden, on a
small river of the same name; 15 miles north-west of Con-
stance, and 19 north-east of Schaffhausen. The French under
Jourdan, were defeated here by the Austrians under
the archduke Charles, on 25th March, 1799.

VOL. XXIII. No. 1593.

STOCKAU, a small town of the Bavarian states, in the
principality of Neuburgh, on the small river Paar; 5 miles
east-south-east of Bayreuth.

STOCKBRIDGE, a market town of England, in the
county of Hants, situated on the road from Winchester to
Salisbury, and on the eastern side of the river Test. It con-
sists chiefly of a range of houses scattered along each side of
the highway. The inhabitants possess little trade, and de-
pend chiefly on the resort of travellers, the town being a con-
siderable thoroughfare. A new bridge was lately erected
here over the Test. About two miles to the westward, on
Houghton-down, is a good race course. Stockbridge is a
borough by prescription, and its government is vested in a
bailiff, who is the returning officer; a constable, and a serjeant
at mace. It sends two members to parliament, a privilege
first possessed in the beginning of the reign of Elizabeth.
The right of election is in the inhabitants paying church and
poor rates. The number of voters is about 57. Both mem-
bers and voters have been frequently cited before the House
of Commons for bribery and corruption. Market on Thurs-
day; 15 miles east of Salisbury, and 66 west-south-west of
London.

STOCKBRIDGE, a township of England, in Worcester-
shire; 2 miles from Perith.

STOCKBRIDGE, a small village of England, West
Riding of Yorkshire; 2½ miles north-by-west of Don-
caster.

STOCKBRIDGE, a post township of the United States,
in Windsor county, Vermont; 32 miles north-west of Wind-
sor. Population 700.

STOCKBRIDGE, a post township of the United States,
in Berkshire county, Massachusetts; 130 miles west of
Boston. Population 1372. It is an excellent agricultural
town, and has a handsome village, and contains a quarry of
marble.

STOCKBRIDGE, WEST, a post township of the United
States, in Berkshire county, Massachusetts; 135 miles west
of Boston. Population 1049. Here are very valuable
quarries of white and blue marble, and an iron mine. The
town is watered by William's river and its branches, which
furnish seats for mills and iron works.

STOCKBRIDGE HILL, in Hampshire, England, 620 feet
in height.

STOCKBROKER, s. One who deals in stock, or the
public funds.

STOCKBURY, a parish in Kent; 5 miles west-by-south
of Milton.

STOCKDOVE, s. Ringdove.

Stockdoves and turtles tell their am'rous pain,
And, from the lofty elms, of love complain. *Dryden*.

STOCKELSDORP, a village of Denmark, in Holstein;
2 miles from Lubeck. It has manufactures of stone-ware,
carpets, and cards.

STOCKEN, or *STOCKHEIM*, a small inland town of the
Netherlands, in the province of Limburg, on the Maese, with
1000 inhabitants; 12 miles north of Maastricht.

STOCKENITZ, or *STEKENISSE*, a small river in the south
of the Danish dominions, in the duchy of Lauenburg. It
has its source from a lake near the small town of Mollen, and
flows into the Elbe. A canal dug from this lake to the river
Trave, conveys boats from Boitzenberg to Lubeck.

STOCKERAU, a small town of Lower Austria, on the
Danube; 13 miles north-north-west of Vienna. It contains
including its parish, 3600 inhabitants. It has extensive corn
markets; also some cotton manufactures.

STOCKERSTONE, a parish of England, in Leicesters-
hire; 10 miles north-east of Market Harborough.

STOCKFISH, s. [*stockvisch*, Dutch.] Dried cod,
so called from its hardness.

He's to be made more tractable, I doubt not:—

Yes, if they taw him as they do whit-leather

Upon an iron, or beat him soft like *stock-fish*. *Beaum. and Fl.*

STOCKGALAND, a parish of England, in Dorsetshire; 6 miles from Chard.

STOCKG'LLYFLOWER, *s.* A plant. See **LEUCO-IUM**.

STOCKHAM, a township of England, in Cheshire; 3 miles north-east of Frodsham.

STOCKHEIM. See **STOCKEN**.

STOCKHEIM, a village of Bavaria, in the circle of the Lower Maine, near Melrichstadt, with 1200 inhabitants.

STOCKHOLM, a large city, the capital of Sweden, is situated at the junction of the lake Macler with an inlet of the Baltic. The form of the town is an irregular oblong, extending from north to south, while the waters cross it in two channels from east to west. The situation is extremely picturesque, as well from the mixture of land and water, as from the unevenness of the ground, which rises at one place into gentle eminences, and at another is covered with abrupt rocks of granite. Nothing can surpass the view from the buildings on the higher grounds; churches, spires, public edifices, are all in prospect, and intermingled with the vessels at anchor, or sailing along the capacious channels, while the view is terminated by mountains. The lake is finely diversified with islands, some bare and craggy, others adorned with trees, gardens, and villas. Stockholm is generally described as standing on seven islands, but it would be more correct to limit the number to three, *viz.*, one large island to the southward called Södermalm, a small one in the centre, another somewhat larger to the north-west, and a track on the mainland to the north, called Normalm. The smaller islands, or rather islets, contain only forts or buildings for naval purposes. The central island constituted the original city, and is still the most busy part of the town, its quays being bordered by a stately range of buildings, the residence, of the principal merchants. It contains the palace and other public buildings; but its houses being high, and its streets narrow, its appearance is somewhat gloomy, and a stranger experiences a pleasant change on crossing the great bridge to the northward, taking in his view the shipping to the right and left, and entering soon after on the long streets of the Normalm. Of these the principal is Queen-street, extending in a straight line more than a mile from the observatory to the side of the lake. In this part of the town are the prince's palace, the opera house, and, in the centre of a square, a bronze equestrian statue of Gustavus Adolphus. The streets are at right angles to each other, but several of them are narrow and indifferently paved; a remark applicable also to the Södermalm, or southern division of the city, which contains but few public buildings, but has, on an eminence called the Mount of Moses, a view displaying an assemblage of rocks, houses, plantations, ships, and water, in all the variety of romantic scenery.

The number of bridges, great and small, in this capital, is twelve. The houses of Stockholm are built in the central part of the town, either of stone or of brick, covered with plaster. Their foundations are on piles; their height seldom less than four or five stories; but in the suburbs they are of only one or two stories, and a number of them are of wood.

Public Edifices.—Of these, the principal is the royal palace, a large quadrangular structure, with a square or court in the middle. The situation is elevated, the style of the architecture grand but simple; so that it is accounted second to no palace in Europe, with the exception of that of Versailles. The lower part of the walls is of polished granite, and though the upper part be of brick, a covering of Stucco gives it the appearance of stone; the roof, like that of a number of public buildings in Sweden, is of copper. The interior is elegantly ornamented. In one of the halls are preserved certain relics of antiquity, brought from Italy by Gustavus III. (father of the king deposed in 1809), comprising a number of statues; among others the famous Eudymion, discovered in the Villa Adriana. At a short distance from the palace, on the quays, stands a fine bronze statue of Gustavus III. raised on a pedestal of polished porphyry. The palace, or house of assembling for the nobility

during the sitting of the diet, is an elegant edifice, ornamented on the outside with marble statues and columns, in the inside with paintings and sculptures. The arsenal, situated in a pleasant promenade called the king's garden, contains a number of trophies of the brilliant days of the Swedish monarchy, and other objects, interesting from their connection with the history of the country. The bank, built at the expense of the city, the mint, and the exchange, are all entitled to the notice of a stranger. After this come the hotel-de-ville, the royal stables, the great depôt or warehouse for iron, the hospitals and philanthropic institutions. The churches are substantial, and, in some cases, elegant buildings; but it would be difficult to point out any one of them particularly remarkable for size, architecture, or decorations. Their spires are in general lofty.

Literary Associations.—The literary societies of Stockholm are numerous and respectable. The academy of sciences was founded in 1739, by a small association which counted Linnæus among its members. At present it comprises 100 native and 60 foreign members. The Swedish academy, founded by Gustavus III. in 1786, is on a more limited scale, comprising only 18 members, and confining its labours to the improvement of the Swedish language, and to fixing, by the composition of a grammar and dictionary, on the plan of the academy of France, the standard of vernacular composition. Next comes the academy of fine arts, history and antiquities; a military academy, a patriotic and an agricultural society, an academy for painting and sculpture, and finally, an academy of music. Here is also a medical college, exercising a superintendance over the medical establishments of the kingdom at large. Of collections, the most interesting are the royal library (about 40,000 volumes), the cabinet of minerals, the zoological cabinet. This city contains an unusual number of private collections.

Trade.—Stockholm is the mercantile emporium of the central part of Sweden—the place to which its products are brought for export, and where the greater part of the imports from abroad are deposited. Few harbours have greater depth or capacity, for a thousand sail of shipping may lie here in safety, and the largest of them may come close to the quays. The only drawback on the navigation arises from the number of small islands and detached rocks at the mouth of the inlet from the Baltic, and the delay occasionally experienced in coming up a winding channel from the sea, a distance of more than twenty miles, and which in one part is contracted into a narrow strait bordered by high rocks. To lessen the hazard of loss from casualties on the adjoining coast, or in the arms of the sea, there is at Stockholm a singular institution called the "Company of Divers," who are bound to give their aid at shipwrecks, and are entitled in return to a proportion of the goods saved. The number of vessels that enter the harbour annually is averaged at one thousand. The chief exports are the ponderous and bulky commodities of the north, *viz.*, iron, steel, copper, pitch, tar, and timber; the imports, colonial produce, wine, fruit, salt, and, in a limited degree, British manufactures. The extent of inland trade becomes considerable even in this thinly peopled country, by the length of the lake, which extends sixty miles into the interior, with a much farther prolongation by the canals of Arboga and Stroemsholm. Iron and steel articles are the chief exports. The timber is not so large as that in the southern parts of the Baltic.

The manufactures of Stockholm, without being on a large scale, are diversified, comprising iron foundries, glass works, sugar refineries; also leather, cotton, hats, stockings, silk, watches, clocks, mathematical instruments, articles of gold and silver. Plates are likewise made in this city, the only place of extensive manufacture in the kingdom, and computed to carry on two-thirds of the foreign trade of Sweden. Of late years the trade of the capital, as of the kingdom at large, has been greatly cramped by restrictions imposed partly in England, to favour the import of timber from Canada, partly in Sweden, on the absurd calculation of promoting home industry, by prohibiting foreign manufactures.

tures. Nothing would conduce so much to the extension of trade as the abrogation of these prohibitions, and an equally ill judged discouragement on the export of timber in foreign vessels.

Stockholm appears to have been founded in the 13th century, and to have owed its gradual increase to the commercial advantages of its situation, the court having continued at Upsal until the 17th century. Since then, Stockholm has been, like London, at once the seat of government and the centre of commerce; like London also it possesses the advantage of water communication on a great scale, without being exposed to an attack by sea, or incurring alarms similar to those so severely experienced in the present age, by its southern rival Copenhagen. The population of the whole city and suburbs together, approaches to 80,000; 320 miles north-east of Copenhagen, 420 west of St. Petersburg, and 850 north-east of London. Lat. 59. 20. 31. N. long. of the observatory 18. 3. 30. E.

STOCKHOLM, an extensive province of Sweden, which comprises the eastern parts of Upland and Sudermania, or the districts of Roslagen and Sodertern, having an area of 2736 square miles, with 100,000 inhabitants. The city of Stockholm, with a small territory surrounding it, forms, however, a separate government, and has its own magistrates.

STOCKHOLM, a post township of the United States, in Lawrence county, New York; 30 miles east of Ogdensburg. Population 307.

STOCKHOLM, a post township of the United States, in Morris county, New Jersey.

STOCKHORN, a mountain of Switzerland, in the canton of Berne, among the Alps, 7200 feet in perpendicular height.

STO'CKING, *s.* [The original word seem to be *stock*, whence *stocks*, a prison for the legs. *Stock*, in the old language, made the plural *stocken*, which was used for a pair of *stocks* or covers for the legs. *Stocken* was in time taken for a singular, and pronounced *stocking*. The like corruption has happened to *chick*, *chicken*, *chickens*. *Johnson*.] The covering of the leg.—In his first approach before my lady he will come to her in yellow *stockings*, and 'tis a colour she abhors. *Shakspeare*.

To STO'CKING, *v. a.* To dress in stockings. *Stocking'd* with loads of fat town-dirt, he goes. *Dryden*.

STO'CKJOBBER, *s.* One who gets money by buying and selling shares in the funds.

The *stockjobber* thus from 'Change-alley goes down,
And tips you the freeman a wink;
Let me have but your vote to serve for the town,
And here is a guinea to drink.

Swift.

STO'CKJOBBERING, *s.* The act of buying and selling stock in the public funds for the turn of the scale, or on speculation.—A system, that ought to be plainest, and fairest imaginable, will become a dark, intricate, and wicked mystery of *stockjobbing*. *Bolingbroke*.

STO'CKISH, *adj.* Hard; blockish.

The poet

Did feign that Orpheus drew trees, stones and floods;
Since nought so *stockish*, hard, and full of rage,
But music for the time doth change his nature. *Shakspeare*.

STOCKLAND, a parish in Dorsetshire; 6 miles north-east of Honiton.

STOCKLAND, a hamlet in Somersetshire; 6½ miles north-west of Bridgewater.

STOCKLEWATH, a township in Cumberland; 8 miles south-by-west of Carlisle.

STOCKLEY, a hamlet in the county of Durham; 4½ miles south-west of Durham.

STOCKLEY, ENGLISH, a parish in Devonshire; 4½ miles north-by-east of Crediton.

STOCKLEY, POMERAY, another parish in the above county; 1 mile distant from the foregoing.

STOCKLINCH, MAGDALEN, a parish in Somersetshire; 2½ miles north-east of Ilminster.

STOCKLINCH, OTTERSEY, another parish in Somersetshire; 1 mile distant from the foregoing.

STO'CKLOCK, *s.* Lock fixed in wood.—There are locks for several purposes; as street-door-locks, called *stocklocks*; chamber-door-locks, called spring-locks, and cupboard-locks. *Moxon*.

STOCKPORT, a large market town and borough of England, in the county of Chester, situated on the river Mersey. It is, strictly speaking, partly in Cheshire, and partly also in Lancashire; the portion in the latter county being called Heaton Norris, and united to the Cheshire part by a bridge over the river. The ground on which the town is built is very irregular. The central part stands on the top of a hill, which has a very steep descent towards the Mersey on the north, but is of easy access on the other sides. The parish church and the market-place are situated on the summit of the hill, which affords a level of considerable extent. Towards the north the hill becomes perpendicular for a height equal to that of the houses, a row of which encircles the base. The appearance of these houses is very singular, and some of them have apartments hollowed out of the rock. An upper row of houses on the top of the rock completely encircles the market-place; and from this central part, the town branches off in different directions, extending, by the recent increase of buildings, into the country on all sides. The streets are very irregular, and some of them so steep that loaded carts can with difficulty be driven down them. The principal public buildings in the town are the places of religious worship. Of these, the parish church of St. Mary is the most ancient. The date of this building, and of the founder, are both unknown; but the style of some parts of the architecture appears to be of the 14th century. It is a spacious structure, consisting of a nave, chancel, and side aisles. But the stone of it is so worn away, that an additional row of masonry has been carried up to support the steeple. The town contains a Calvinist chapel, various meeting-houses for Presbyterians, Methodists, Quakers, and other dissenters; and also a Roman Catholic chapel. The chief public institutions in Stockport are, a free school, founded in 1437 by Sir Edmund Shaw; an alms-house, endowed in 1683 by Edward Warren, Esq.; a dispensary, built in 1797 on a very large scale; and several Sunday schools, instituted in 1714, one of which, conducted chiefly by Methodists, is on so extensive a plan, that 3000 children, are educated in it gratuitously. A large school was erected by subscription in 1805. The population of Stockport and of the neighbourhood is chiefly employed in the various branches of the cotton trade; and it is on the flourishing state of this manufacture, which has been carried on here to a great extent, that the importance of the town chiefly depends. This trade naturally arose from the silk manufacture, which was early established here on a plan procured from Italy. On the decline of this business, the machinery was applied to cotton spinning. In 1810, according to a statement of Messrs. Lysons, there were then in the town 25 spacious factories for cotton goods, one silk mill, and several establishments for the making of muslin. Since that time, the manufacturing establishments of the town have greatly increased, and many of the mills are driven by steam engines. Besides the cotton manufacture, the making of hats forms a considerable branch of employment in Stockport. The trade of the town in general has been greatly promoted by the canal which has been formed to Manchester, and which, by joining with the Duke of Bridgewater's canal at the latter place, communicates with, and forms a branch of, the extensive system of canal navigation in this part of the kingdom. The police of Stockport is managed by two resident magistrates, two constables, four churchwardens, and three overseers of the poor. The parish contains 14 townships, viz., Stockport, Bramhall, Bredbury, Binnington, Didsley, Duckinfield, Etmells, or Stockport Etmells, Hyde, Marple, Norbury, Offerton, Romiley, Torkinton, and Wernith. These are all populous, and appear chiefly to have been parts of baronies and manors; and in some of them there yet remain armorial

or architectural relics of their antiquity. Stockport was a barony under the ancient earls of Chester; but the time when that honour was conferred on it is still a matter of doubt, as it has been of much argument. In the time of Edward I. Robert de Stokeport, earl of Chester, made Stockport a free borough. In 1260, he also obtained a grant of a market and an annual fair. Soon after the Norman conquest, the manor of Stockport belonged to the De la Spencers. It is now the property of Lord Viscount Bulkeley. In the year 1173, the castle of Stockport was held by Geoffrey de Costentine against king Henry II. It afterwards belonged to the Stockports, and subsequently to the earls of Warren; but the whole has long since been demolished. During the civil wars in the reign of Charles I. Stockport was considered an important post, and was garrisoned by the parliamentary army. In May 1644, prince Rupert appeared before it with his army; the garrison, to the amount of 3000, drew out to oppose him, but were repulsed, and the town taken. In 1745, the bridge here was blown up, to prevent the retreat of the rebels after their advance to Derby. Market on Friday. Great quantities of corn, oatmeal, and cheese, are sold at it, for which, especially the latter, it is regarded the best market in the county. Here are four annual fairs, chiefly for cattle; 7 miles south-east of Manchester, and 176 north-north-west of London. Lat. 53. 25. N. long. 2. 12. W.

STOCKPORT, a township of the United States, in Wayne county, Pennsylvania, on the Delaware. There is a portage from this place to Harmony, on the Susquehannah.

STOCKS, *s.* [Commonly without singular.] Prison for the legs. *Dr. Johnson.*—*Stock* is our old word for a fetter; afterwards transferred to the wooden instrument of confinement for the legs. *Todd.*

Fetch forth the *stocks* :

As I have life and honour, there shall he sit 'till noon.

Shakspeare.

Wooden work upon which ships are built; public funds. **STOCKSTADT**, a small town of Germany, in the Bavarian States, on the Maine, with 1100 inhabitants; 4 miles west of Aschaffenburg.

STOCKSTILL, *adj.* Motionless as logs.—Our preachers stand *stockstill* in the pulpit, and will not so much as move a finger to set off the best sermon. *Addison.*

STOCKTON, or **STOCKTON-ON-TEES**, a market town and borough of England, in the county of Durham, situated on the north bank of the Tees, about ten miles from its mouth, where the river expands into a wide estuary, and joins the German Ocean. The town stands on a moderate ascent from the river. It is neat, clean, and airy, and on the whole perhaps the handsomest town in the north of England. The streets are well paved, flagged, and lighted; the houses are in general built with brick, and covered with tiles. The principal street extends for about half a mile in a direction nearly north and south, and is remarkable for its width, which, in the centre, at the market-place, is upwards of sixty yards, and continues nearly as broad throughout, a circumstance which renders the entrance from the north or south peculiarly striking. Several smaller streets branch off in different directions; and at the north-east side is a spacious square, which contains some good buildings. Near the middle of the principal street stands the town-hall, a large square building, with a lofty cupola and spire. Near this is a handsome column of the Doric order, where the market is held. Stockton was constituted a distinct parish in the year 1711, being prior to that time a chapelry to Norton, a pleasant village about two miles to the north. During the episcopacy of Bishop Poore, who died in 1234, a chapel of ease was erected here, which was taken down, and a new church opened in 1712. This is a handsome brick building, with the doors and windows cased with stone; its length, including the tower and chancel, is 150 feet. The tower is at the west end, and is 80 feet high. It contains a fine organ, and the whole interior view is neat and uniform. In the vestry

is a collection of books in divinity, which is increased every year by a small subscription; and circulated in the parish. Besides the church, the town contains also meeting-houses for Presbyterians, Quakers, Methodists and Roman Catholics. The custom-house is a plain but commodious building near the water side, and the theatre also is a neat building, but in a very inconvenient situation. The bridge over the Tees is an elegant structure of five elliptical arches; the centre arch is 72 feet wide, and 23 feet above the river. The foundation of this building was laid in 1764, and the whole was completed in 1771, at an expense of 8000*l.* In 1820, the debt upon the bridge was wholly discharged, and it was opened to passengers toll-free. The general appearance of the town and its approaches has been much improved lately. Waste pieces of ground have been inclosed, fenced in, and planted with shrubberies, forest trees, &c.; and an agreeable promenade has been formed from the town to the bridge. Stockton contains a charity school for 20 boys and 20 girls; to this a national school, consisting of between 300 and 400 children, has been annexed, and a large and commodious room, built by a legacy of 1000*l.* left for that purpose by a native of the place; a school of industry for girls, a grammar-school, two Sunday schools, a dispensary, and almshouses for 13 poor families belonging to the parish. These almshouses have been rebuilt upon a large and elegant Gothic plan, in consequence of a legacy of 3000*l.*, bequeathed for that purpose. The same building contains a committee-room, where the business for the poor is transacted, as well as the concerns of a bank for savings. Stockton is well situated for trade, on account of its vicinity to the sea and to the river. Below the town, the river flows in a very circuitous course, and as it approaches the German Ocean, expands into a large bay, upwards of three miles wide, within which many vessels that are not concerned in the trade of the river, seek shelter in tempestuous weather. In the year 1810, (in pursuance of an act of parliament obtained for that purpose), a navigable cut or canal was made across an isthmus or neck of land, about half a mile below the town, by which means this bend or winding in the river of difficult and dangerous navigation, extending upwards of two miles and a half in length, was shortened to less than one-twelfth part of that distance. This undertaking has proved of great advantage to the shipping-interest of the port, in facilitating the loading and delivery of goods, and has also amply paid the share-holders or proprietors. The commerce of the town began to revive soon after the restoration, and the principal officers of the customs were removed hither from Hartlepool in 1680, and lawful or free quays were set up under a commission from the exchequer in 1683. In 1795, the number of vessels belonging to the port were 47, carrying 5733 tons. At present the trade is of very considerable extent. Large imports are made from the Baltic, Hamburgh, Norway, and Holland, of hemp, flax, iron, timber, linen, yarn, sheetings, hides, bark, smalts, seeds, geneva, &c. The exports are chiefly of lead (in pigs), hams, butter, pork, cheese, leather, grain, flour, sail-cloth, huckabacks, plain linens, tammies, and various other articles, chiefly to the London and northern markets. The manufactures of Stockton consist of two manufactories of sail-cloth, and a considerable one of damask, diaper, and huckaback linens, two breweries, two rope-walks, a large dry dock, two ship-yards, where large vessels are built for the East and West India trades, and others for the coasting and river trades; also two iron foundries, chiefly for mill-work, and a manufactory of patent agricultural machines. Stockton consists of two parts, one called the Borough, where all the land is freehold, and the other the Town, where it is copy or leasehold, held under the vicar and vestrymen, and not within the Borough jurisdiction: for this reason there are two constaberies, with peculiar officers, though both form one parish. The civil government is vested in a mayor, aldermen, and recorder, besides inferior officers. The mayor is elected by a majority of the burgesses, though it is requisite that he should first have been an alderman. Stockton is a borough by prescription, its origin is uncertain, but

its antiquity may be inferred, from its giving name to one of the county wards. Stockton castle, on the south side of the town, was at one time inhabited by the Bishops of Durham, who were appointed to govern the whole province committed to their care. This fortress was on the northern bank of the river Tees, and commanded an extensive prospect of the Cleveland hills and the intervening country. In the time of Charles I., it was garrisoned in behalf of the king, but afterwards fell into the power of the parliamentarians, who ordered it to be destroyed, and not a stone of the former edifice now remains. The only vestiges are the moat, which defended the castle on three sides, and a barn, which appears to have stood within the area of the works. In the year 1327, the castle, and probably the town of Stockton, was nearly destroyed by the Scots. About the beginning of the last century, Stockton appears to have risen into celebrity, and its outward appearance to be considerably improved. The shock of an earthquake was felt here in 1780. Near the town, on the Tees, is a considerable salmon fishery; and at the mouth of the river is a fishery for cockles. Market on Wednesday and Saturday, and monthly cattle-fairs; 21 miles south-east of Durham, and 244 north of London. Lat. 54. 34 N. long. 1. 16. W.

STOCKTON, a parish in Salop; $4\frac{1}{2}$ miles north-by-east of Bridgenorth.

STOCKTON, a parish in Warwickshire; 2 miles north-east of Southam.

STOCKTON, a parish in Wiltshire; 6 miles north-east of Hindon.

STOCKTON, a parish in Worcestershire; 8 miles south-west of Bewdley.

STOCKTON, a parish in the North Riding of Yorkshire; 5 miles north-east of York.

STOCKTON, a parish in Norfolk; $3\frac{1}{2}$ miles north-west of Beccles.

STOCKWELL, a hamlet in Surrey; 2 miles from Westminster bridge, containing many neat villas, and a chapel of ease.

STOCKWITH, EAST, a hamlet in Lincolnshire; 3 miles north-north-west of Gainsborough, on the river Trent. Population 203.

STOCKWITH, WEST, a hamlet in Nottinghamshire, a mile distant from the foregoing, on the opposite side of the Trent. Population 569.

STOCKWOOD, a parish in Dorsetshire; 8 miles south-west of Sherborne.

STOCKY, *adj.* Stout: a provincial word.—They had no titles of honour among them, but such as denoted some bodily strength or perfection; as, such an one the tall, such an one the *stocky*, such an one the gruff. Addison.

STOCZEL, a small town in the interior of Poland, on the road from Warsaw to Lublin.

STODDART, a township of the United States, in Cheshire county, New Hampshire; 44 miles west-south-west of Concord. Population 1132.

STODDAY, a township in Lancashire; 2 miles south-south-west of Lancashire.

STODDERTSVILLE, a post village of the United States in Luzerne county, Pennsylvania.

STODDESSEN, a parish in Salop; 8 miles from Bridgenorth.

STODHART BAY, near the north-west point of the island of Jamaica, is to the east of Sandy bay, and between it and Lucea harbour.

STODMARSH, a parish in Kent; $4\frac{1}{2}$ miles east-north-east of Canterbury.

STODY, a parish in Norfolk; 3 miles south-west-by-south of Holt.

STOEBE. [*Στοιβή* of Dioscorides. Stoebe of Pliny], in Botany, a genus of the class syngenesia, order polygamia segregata, natural order of nucamentaceæ corymbiferae (Juss.)—Generic Character. Calyx: common roundish, imbricate: scales awl-shaped, covering the universal receptacle on every side. Perianth partial, one-flowered, five-

leaved, solitary within each scale of the common calyx, consisting of linear, acute, equal erect leaflets. Corolla proper, one petalled, funnel-form: border five-cleft, patulous. Stamina: filaments five, capillary, short. Anther cylindrical, five-toothed. Pistil: germ oblong. Style filiform, length of the stamens. Stigma acute, bifid. Pericarp none. Calyx unchanged. Seeds solitary, oblong. Down feathered, long. Receptacle proper, naked.—*Essential Character.* Calyx one-flowered. Corolla tubular, hermaphrodite. Receptacle naked. Down feathered.

1. Stoebe *Æthiopica*.—This, like all the rest, is a shrubby plant. The stem rises two or three feet high, sending out slender branches from the sides. Leaves short, linear, for the most part hooked, of a grayish colour, and placed irregularly round the branches. The flowers are produced in single heads at the end of the branches, and are of a pale yellow colour. The florets are single, and peep out between the scales of the calyx. It flowers in August, but seldom produces good seeds in England.

2. Stoebe *ericoides*.—Corollas two-flowered, difform. This is a distorted little shrub, like heath. Leaves clustered, linear, sharp. Flowers terminating, sessile.

3. Stoebe *prostrata*.—Leaves resupine, tomentose on one side; stems prostrate.

4. Stoebe *gnaphaloides*.—Leaves imbricate, pressed close. Stems shrubby, proliferous, rod-like, a foot and a half high; with filiform branches. Flowers sessile, in bundles.

5. Stoebe *gomphrenoides*.—Leaves lanceolate, imbricate, pressed close; head terminating, sessile. This resembles the preceding very much.

6. Stoebe *scabra*.—Leaves twisted, pressed close, linear, rugged, with tubercles on the outside, tomentose within; flowers in racemes.

7. Stoebe *reflexa*.—Procumbent; leaves linear; spikes ovate; branches ascending.

8. Stoebe *rhinocerotis*.—Leaves three sided, pressed close; branchlets tomentose, drooping; racemes proliferous.

9. Stoebe *disticha*.—Leaves in bundles, recurved; spikes bifarious.—All the species are natives of the Cape of Good Hope.

Propagation and Culture.—These shrubby plants may be propagated by cuttings or slips, planted in July, upon a bed of soft loam, and covered close down with a bell or hand-glass, shading them from the sun till they have taken root; then gradually inure them to the open air, and afterwards take them up, and plant them in pots, placing them in the shade till they have taken new root: then place them in a sheltered situation with other tender exotic plants, and in autumn remove them into the dry stove.

STOGUMBER, or STOKE GOMER, a parish in Somersetshire; 6 miles north-by-east of Wiveliscombe.

STOJANOW, a small town of Austrian Galicia, in the circle of Zolkiew.

STOIC, *s.* [*Στωικός*, Gr., from *στοα*, a porch.] A disciple of the heathen philosopher Zeno, who taught under a piazza or portico in the city of Athens; and maintained, that a wise man ought to be free from all passions, to be unmoved either by joy or grief, and to esteem all things governed by unavoidable necessity.

The *Stoic* last in philosophic pride,
By him called virtue; and his virtuous man. Milton.

The world, according to the Stoics, including the whole of nature, God, and matter, subsisted from eternity, and will for ever subsist; but the present regular frame of nature had a beginning, and will have an end. The parts tend towards a dissolution, but the whole remains immutably the same. The world is liable to destruction from the prevalence of moisture, or of dryness; the former producing an universal inundation, the latter an universal conflagration. These succeed each other in nature as regularly as winter and summer. When the universal inundation takes place, the whole surface of the earth is covered with water, and all animal life is destroyed; after which, nature is renewed, and subsists as before, till the element of fire, becoming prevalent

in its turn, dries up all the moisture, converts every substance into its own nature, and at last, by an universal conflagration, reduces the world to its pristine state. At this period, all material forms are lost in one chaotic mass: all animated nature is re-united to the Deity, and nature again exists in its original form, as one whole, consisting of God and matter. From this chaotic state, however, it again emerges, by the energy of the efficient principle, and gods and men, and all the forms of regulated nature, are renewed, to be dissolved and renewed in endless succession.

As a necessary consequence of the doctrine of the conflagration, and subsequent restoration of all things, the Stoics maintained, that the human race will return to life. Hence it appears in what sense we are to understand the Stoic doctrine of resurrection, upon which Seneca has written with so much elegance; and what meaning we are to annex to his words, when he says, "Death, of which we are so much afraid, and which we are so desirous to avoid, is only the interruption, not the destruction, of our existence; the day will come which will restore us to life." This tenet is not to be confounded with the Christian doctrine of the resurrection of the body; for, according to the Stoics, men return to life, not by the voluntary appointment of a wise and merciful God, but by the law of fate, and are not renewed for the enjoyment of a better and happier condition, but drawn back into their former state of imperfection and misery.

Concerning the duration of the soul of man, the Stoics entertained very different opinions. Cleanthes thought that all souls would remain till the final conflagration. Chrysippus was of opinion, that this would only be the lot of the wise and good; and Seneca seems to have entertained the same notion.

The soul, conceived by the Stoics to have been material, was represented by them as consisting of eight distinct parts, viz., the five senses, the productive faculty, the power of speech, and the ruling part, *το ηγεμονικον*, or reason.

STOICAL, or **STO'IC**, *adj.* [*stoique*, Fr.] Of or belonging to Stoics; cold; stiff; austere; affecting to hold all things indifferent.

O foolishness of men! that lend their ears
To those budge doctors of the *Stoick* fur,
And fetch their precepts from the Cynick tub,
Praising the lean and sallow abstinence!

Milton.

STOICALLY, *adv.* After the manner of the Stoics; austere; with pretended indifference to all things. *Minshcu.*—Be not *stoically* mistaken in the equality of sins. *Brown.*

STOICALNESS, *s.* The state of being stoical; the temper of a Stoic. *Scott.*

STOICISM, *s.* [*stoicisme*, Fr.] The opinions and maxims of the Stoics.—To pretend to virtue and holiness without reference to God and a life to come, is but to fall into a more dull and flat kind of *Stoicism*. *More.*—*Stoicism*, which was the pedantry of virtue, ascribes all good qualifications of what kind soever to the virtuous man. *Addison.*

STOKE, or **STOAK**. *Stoke*, in composition, comes from the Sax. *roc*, *locus*, place: hence the names of many of our towns, &c., as, Basingstoke. See *Lye* in *V. 6toc*.

STOKE. 1. A township in Cheshire; 5 miles north-by-east of Cheshire.—2. A hamlet in Derbyshire; 2 miles north-east of Stony Middleton.—3. A parish in Kent; 6 miles north-east of Rochester.—4. A township in Leicestershire; 2 miles from Hinkly.—5. A parish in Warwickshire; 1½ mile east of Coventry.—6. A parish in Norfolk with a ferry over the river Stoke, which is navigable to it from the Ouse; 6 miles north-east of Rochester.—7. A parish in Suffolk; 2 miles south-west-by-west of Clare.—8. Another parish in the above county. It has a church situated on a hill, the tower of which is 120 feet high, and the steeple serves as a landmark to ships passing the mouth of the Orwell, at the distance of 15 miles; 4 miles west-south-west of Ipswich and 59 north-east of London.—9. A parish of England, in

Surrey in the vicinity of Guildford.—10. A parish in Sussex; 2 miles from Arundel.—11. Another parish in the above county, on the opposite side of the Avon, commonly called North Stoke.—12. Another village in the same county; 3 miles from Chichester.

STOKE, **ABBOT'S** or **ABBAS**. 1. A parish in Dorsetshire; 2½ miles west-by-south of Beaminster.—2. **STOKE**, *Albany*, a parish in Northamptonshire; 4½ miles south-west-by-west of Rockingham.—3. **STOKE**, *Ash*, A parish in Suffolk; 3½ miles south-west of Eye.—4. **STOKE**, *Bardolph*, A township in Nottinghamshire; 5 miles east-north-east of Nottingham.—5. **STOKE**, *Bishop's*, A parish in South-amptonshire; 5½ miles west-north-west of Bishop's Waltham.—6. **STOKE**, *Bliss*, A parish in Herefordshire; 6½ miles north of Bromyard.—7. **STOKE**, *Bruern*, A hamlet in Northamptonshire; 3½ miles east-north-east of Towcester.—8. **STOKE**, *Canon's*, A parish in Devonshire; 4½ miles north-north-east of Exeter.—9. **STOKE**, *Charity*, A parish in Southamptonshire; 6 miles south-by-east of Whitchurch.—10. **STOKE**, *Clymeland*, A parish in Cornwall; 4 miles north of Callington.—11. **STOKE**, *Courcy*, A parish in Somersetshire; 7½ miles north-west-by-west of Bridgewater.—12. **STOKE**, *D'Abernon*, A parish in Surrey; 2 miles south-east-by-east of Cobham.—13. **STOKE**, *Damerell*, A parish in Devonshire, lying near Plymouth.—14. **STOKE**, *Doilly*, A parish in Northamptonshire; 1½ mile south-west of Oundle.—15. **STOKE**, *Dry*, A parish in Rutlandshire; 3½ miles south-west-by-south of Uppingham.—16. **STOKE**, *East*, A parish in Dorsetshire; 4 miles west-south-west of Wareham.—Also a parish in Nottinghamshire; 3½ miles south-west of Newark.—17. **STOKE**, *Edith*, A parish in Herefordshire; 7½ miles west-north-west of Ledbury.—18. **STOKE**, *Ferry*, a town and parish in Norfolk, standing on the river Wissey; 38 miles west-by-south of Norwich.—19. **STOKE**, *Fleming*, a parish in Devonshire, on the coast of the English channel; 2 miles south-south-west of Dartmouth. Population 620.—20. **STOKE**, *Gabriel*, a parish in Devonshire; 4 miles south-east-by-south of Totness. Population 572.—21. **STOKE**, *Gaylard*, a parish in Dorsetshire; 7½ miles east-south-east of Sherborne.—22. **STOKE**, *Gifford*, a parish in Gloucestershire; 5 miles north-north-east of Bristol.—23. **STOKE**, *Golding*, a hamlet in Leicestershire; 2½ miles north-west of Hinckley.—24. **STOKE**, *Goldington*, a parish in Buckinghamshire; 4 miles west-south-west of Olney.—25. **STOKE**, *St. Gregory*, a parish in Somersetshire; 5 miles west-by-north of Langport.—26. **STOKE-UNDER-HANDEN**, a parish in Somersetshire; 5½ miles west-by-north of Yeovil.—27. **STOKE**, *Hanmond*, a parish in Buckinghamshire; 3 miles south of Fenny Stratford.—28. **STOKE**, *Holycross*, or *Crucis*, a parish in Norfolk; 5 miles from Norwich.—29. **STOKE-IN-TEIGNHEAD**, a parish in Devonshire, on the shore of Babbicomb bay; 3 miles from Newton Abbas.—30. **STOKE**, *Lacy*, a parish in Herefordshire; 3 miles south-west of Bromyard.—31. **STOKE**, *Lane*, a parish in Somersetshire; 3½ miles north-east of Shepton Mallet.—32. **STOKE**, *Lyné*, a parish in Oxfordshire; 2½ miles north-by-west of Bicester.—33. **STOKE**, *Mandeville*, a parish in Buckinghamshire; 2½ miles north-west-by-west of Wendover.—34. **STOKE**, *St. Mary*, a parish in Somersetshire; 2½ miles south-east-by-east of Taunton.—Also a parish in Suffolk, in the vicinity of Ipswich.—35. **STOKE**, *St. Milborough*, a township in Salop; 7 miles north-east of Ludlow. Population 526.—36. **STOKE**, *Newington*. See **NEWINGTON STOKE**.—37. **STOKE**, *North*, a hamlet in Lincolnshire; 2½ miles north-west-by-north of Colsterworth.—Also a parish in Oxfordshire; 12 miles west-north-west of Henley-upon-Thames. Also a parish in Somersetshire; 4 miles north-west of Bath.—38. **STOKE**, *Orchard*, a hamlet in Gloucestershire; 3½ miles south-east of Tewkesbury.—39. **STOKE**, *Peró*, a parish in Somersetshire; 6 miles west-south-west of Minehead.—40. **STOKE**, *Poges*, a parish in Buckinghamshire; 2 miles north-north-east of Slough. The church yard of this parish was made the scene of Gray's beautiful elegy; and here the remains of the poet lie interred, without any memorial.

rial. A little to the north of it is Stoke-house, the great hall of which is adorned with many fine ancient busts of the Roman emperors, brought from Rome. From the hall there is an entrance into a fine park, with seven great avenues cut in the shape of a star, from each of which there is a delightful prospect.—41. **STOKE, Prior**, a township in Herefordshire; 3 miles south-east of Leominster.—Also a parish in Worcestershire; 1½ mile south of Broomsgrove.—42. **STOKE RIVERS**, a parish in Devonshire; 5½ miles east-by-north of Barnstaple.—43. **STOKE Rodney**, or *Stoke Giffard*, a parish in Somersetshire; 5 miles north-west-by-west of Wells.—44. **STOKE, Say**, a parish in Salop; 6½ miles north-west of Ludlow.—45. **STOKE, South**, or *Stoke Rochford*, a township in Lincolnshire; 2 miles north-west-by-north of Colsterworth.—46. **STOKE, South**, a parish in Somersetshire; 2½ miles south of Bath.—47. **STOKE TALMAGE**, a parish in Oxfordshire; 2 miles south-south-west of Tetsworth.—48. **STOKE-UPON-TERN**, a parish in Salop; 6 miles south-west-by-south of Drayton-in-Hales.—49. **STOKE-UPON-TRENT**, a parish in Staffordshire; 1½ mile east of Newcastle-under-Lyne. Population 22,475.—50. **STOKE, Trister**, a parish in Somersetshire; 2 miles east of Wincanton.—51. **STOKE, Wake**, a parish in Dorsetshire; 10 miles west of Blandford Forum.—52. **STOKE, West**, a parish in Sussex; 4 miles north-west of Chichester.

STOKE, a township of Lower Canada, in the county of Buckingham, on the east side of the St. Francis.

STOKE BOTTOM, a hamlet in the parish of Stoke Lane, Somersetshire.

STOKEFORD, a hamlet in Dorsetshire, near Binnegar.

STOKEHAM, a parish in Nottinghamshire; 5 miles north-east-by-north of Tuxford.

STOKENBURY, a hamlet in the parish of East Peckham, Kent.

STOKEN CHURCH, a parish in Oxfordshire; 6½ miles south-east-by-east of Tetsworth. Population 888.

STOKENHAM, a parish in Devonshire; 5 miles east-by-south of Kingsbridge. Population 1273.

STOKER, s. One who looks after the fire in a brew-house: a technical word.

As the plague of happy life,
I run away from party-strife:
A prince's cause, a church's claim,
I've known to raise a mighty flame,
And priest, as *stoker*, very free
To throw in peace and charity.

Green.

STOKES, a county of the United States, in the north-west part of North Carolina. Population 11,645, including 1746 slaves. The chief towns are Germantown and Salem.

STOKES, a township of the United States, in Montgomery county, North Carolina, near the Yadkin.

STOKES, a township of the United States, in Madison county, Ohio. Population 267.

STOKESBY, a parish in Norfolk; 2½ miles east-by-south of Acle.

STOKESIA [so named by Mons. L'Heritier, in honour of Jonathan Stokes, M.D., who very ably assisted Dr. Withering, in his botanical arrangement of British plants], in Botany, a genus of the class syngenesia, order polygamia æqualis.—Generic Character. Calyx, common leafy, subimbricate. Corolla, floscular, two-formed: corollets hermaphrodite, regular in the disk; in the outer circumference irregular, constituting a ray. Stamina: filaments five in each. Anthers cylindrical. Pistil: germ (in the regular florets) four-cornered: (in the irregular) three-cornered. Style filiform. Stigma two-parted, awl-shaped. Pericarp none. Seed down, filamentose, deciduous, equal to the corollet, four in the regular, three in the irregular florets. Receptacle naked.—*Essential Character.* Corollets in the ray funnel-form, longer, irregular. Down four-bristled. Receptacle naked.

Stokesia cyanea, or blue-flowered Stokesia.—This plant has a corolla resembling that of the common blue-bottle

(*Centaurea Cyanus*), with almost the calyx of *Carthamus* to which genus it was allied.—Native of South Carolina.

STOKESLEY, a market town and parish of England, in the North Riding of Yorkshire. It is situated on a branch of the river Leven, and consists chiefly of one broad street. Excepting the shambles and tolbooth, the buildings are mostly modern. A church is mentioned here in the Domesday Survey, but there is no evidence of the original foundation of St. Peter's. About 1363, a chantry was founded within this building by William de Stokesley, for the repose of the sons of John de Middleton and his wife. The ancient church is still remaining, but a modern one has been built at the eastern extremity of the town. The rectory house was rebuilt in 1792, and is an agreeable residence. Adjoining the churchyard on the north, stands the manor-house, a square building of stone, with gardens and a shrubbery in front. The petty sessions are held here for the western division of Langborough. The parish of Stokesley is of considerable extent, and incloses an area of about seven-square miles. Within it are comprised the townships of Stokesley, Bushby, and Easby, with the hamlet of Tamerton, and a part of Newby. The environs of the town are fertile, and the lands chiefly laid out in pasture. The lordship of Stokesley was granted at an early period to the family of Baliol, and was possessed by Guy de Baliol, who came into England with William the Conqueror. In 1811, Stokesley contained 388 houses, and 1439 inhabitants. Market on Saturday; 43 miles from York, and 242 north-west of London.

STOLBERG, a small county of Prussian Saxony, adjoining the counties of Schwartzburg and Mansfield. Its superficial extent is only 86 square miles; its population 10,500. The north-west side, which lies partly in the Harz, is hilly, and contains mines of silver and other metals; but the south-east, particularly the part called the Golden Meadow, is among the most fertile and beautiful districts of Germany.

STOLBERG, a small town of the Prussian province of the Lower Rhine, in the government of Aix-la-Chapelle, situated in a valley about 3 miles south-south-west of Eschweiler, with only 2000 inhabitants. It contains extensive manufactures, established originally by French Protestant refugees. The neighbourhood has good coal mines; and the brass, copper, and hardware, of different kinds, made in this place and its vicinity, give employment to 800 or 900 workmen. Here are also some woollen manufactures.

STOLBERG AM HARZ, a small town of Prussian Saxony, and the residence of the counts of Stolberg-Stolberg. In the neighbourhood are mines of copper and iron. Population 1900; 42 miles west of Halle, and 16 south-south-west of Quedlinburg. Lat. 51. 35. 0. N. long. 10. 56. 53. E.

STOLBOVA, a small town in the west of European Russia, government of Novgorod. A treaty was concluded here between Russia and Sweden in 1617.

STOLE, s. [*stola*, Lat.; *πτολ*, Sax.; *stole*, old French.] A long vest.

The solemn feast of Ceres now was near,
When long white linen *stoles* the matrons wear. *Dryden.*

STOLE. The preterite of *steal*.—A factor *stole* a gem away. *Pope.*

STOLE, or **STOLA**, [from the Gr. *στολη*, signifying a long robe, or *vestment*,] a sacerdotal ornament, worn by the Romish parish-priests over their surplice, as a mark of superiority in their respective churches.

STOLE, GROOM OF THE, the eldest lord of his majesty's bed-chamber, whose office and honour is to present and put on his majesty's first garment or shirt every morning; and to order the things in the chamber.

STO'LED, adj. Wearing a stole or long robe.

After them flew the prophets, brightly *stol'd*
In shining lawn.

G. Fletcher.

In vain with timbrell'd anthems dark

The sable-*stoled* sorcerers bear his worshipt ark.

Milton.

STOLEN.

STOLEN. Participle passive of *steal*.—*Stolen* waters are sweet, and bread eaten in secret is pleasant. *Prov.*

STOLID, *adj.* [*stolidus*, Lat.] Stupid; foolish. *Cockeram.*

STOLIDITY, *s.* [*stolidus*, Lat.; *stolidité*, Fr.] Stupidity; want of sense.—To the end his prince might never, by opening his eyes, come to the knowledge of his own *stolidity*. *Trans. of Boccalini*.—These are the fools in the text, indocile untractable fools, whose *stolidity* can baffle all arguments. *Bentley.*

STOLLBERG IM GEBIRGE (i. e. among the mountains), a small town of Saxony; 9 miles south-west of Chemnitz, and 49 south-west of Dresden. It has 1800 inhabitants, with manufactures, on a small scale, of woollens, linens, and stockings.

STOLLHOFEN, a village of Germany, in Baden, near the Rhine; 16 miles north-north-east of Strasburg. In 1703 lines were thrown up here, extending eastward to the Black Forest, and along the Rhine, towards Philipsburg: these the French attacked, but were defeated with heavy loss.

STOLPE, a walled town of Prussia, in Pomerania, on the river Stolpe. It contains 4500 inhabitants, with three Protestant churches, a convent, and a cadet school. It has some trade in linen and wood, and some petty manufactures of broad cloth, woollen stuffs, and amber, which is made into trinkets, and sent chiefly to the Levant. Its harbour is at the small town of Stolpemunde, at the mouth of the river; 110 miles north-east of Stargard, and 64 west of Dantzic. Lat. 54. 27. 59. N. long. 16. 55. 15. E.

STOLPE, a small town of Prussia, in Pomerania, on the Peene; 5 miles west of Anclam.

STOLPE, a small town of the Prussian province of Brandenburg, government of Potsdam; 45 miles north-east of Berlin.

STOLPEN, a small town of Germany, in Saxony; 13 miles east of Dresden. Population 1000. It has a citadel situated on a rock of magnificent basalt.

STOLWYK, a large village of the Netherlands, in Holland, with a population of 1100; 14 miles north-east of Rotterdam, and 4 south-east of Gouda.

STOLZ, a large village of Prussian Silesia, near Frankenstein, with 1000 inhabitants.

STOLZENAU, a small town of the north of Germany, in Hanover, on the Weser; 8 miles north of Nienburg. Population 1200.

STOLZENBERG, a town of West Prussia, adjoining to Dantzic. It was formerly a suburb of that city; but in 1772, this and the adjacent suburbs of Old Scotland, Schidlitz, and St. Albert, were united and formed into a separate town, with its own magistrates and municipal rights. The population of the whole is about 8000; they have a council-house, a Lutheran and a Franciscan convent, and a Catholic gymnasium. The principal manufactures are woollens, gloves, watches, buttons, and tanneries. See DANTZIC.

STOLZENBURG, or SZELINDEK, a large village of Transylvania, in the district called the province of the Saxons, situated in a deep valley to the north of Hermannstadt.

STO'MACH, *s.* [*estomach*, Fr.; *stomachus*, Lat.] The ventricle in which food is digested.

If you're sick at sea,
Or *stomach* qualm'd at land, a dram of this
Will drive away distemper. *Shakspeare.*

This filthy simile, this beastly line,
Quite turns my *stomach*. *Pope.*

Appetite; desire of food.

Tell me, what is't that takes from thee
Thy *stomach*, pleasure, and thy golden sleep? *Shakspeare.*

Inclination; liking.
He which hath no *stomach* to this fight,
Let him depart. *Shakspeare.*

[*Stomachus*, Lat.] Anger; violence of temper.

Is't near dinner time?—I would it were
That you might kill your *stomach* on your meat,
And not upon your maid. *Shakspeare.*

Sullenness; resentment; stubbornness.
That nobles should such *stomachs* bear!
I myself fight not once in forty year. *Shakspeare.*

Pride; haughtiness.
He was a man
Of an unbounded *stomach*, ever ranking
Himself with princes. *Shakspeare.*

To STO'MACH, *v. a.* [*stomachor*, Lat.] To resent;
to remember with anger and malignity.

Believe not all; or, if you must believe,
Stomach not all. *Shakspeare.*

To STO'MACH, *v. n.* To be angry.—Let a man,
though never so justly, oppose himself unto those that are
disordered in their ways, and what one amongst them commonly
doth not *stomach* at such contradiction, storm at reproof,
and hate such as would reform them? *Hooker.*

STO'MACHAL, *adj.* [*stomacal*, Fr.] Cordial; helping
the stomach. *Cotgrave and Sherwood.*

STO'MACHED, *adj.* Filled with passions of resentment.

High *stomach'd* are they both, and full of ire;
In rage deaf as the sea, hasty as fire. *Shakspeare.*

STO'MACHER, *s.* An ornamental covering worn by
women on the breast.

Golden quoifs and *stomachers*,
For my lads to give their dears. *Shakspeare.*

STO'MACHFUL, *adj.* [*stomachosus*, Lat.] Sullen;
stubborn; perverse.—Obstinate or *stomachful* crying should
not be permitted, because it is another way of encouraging
those passions which 'tis our business to subdue. *Locke.*

STO'MACHFULNESS, *s.* Stubbornness; sullenness;
obstinacy.—Pride, *stomachfulness*, headiness,—avail but
little. *Granger.*

STOMA'CHICAL, or STOMA'CHIC, *adj.* [*stomachique*,
Fr.] Relating to the stomach; pertaining to the stomach.
—By a cartarrh the *stomachical* ferment is vitiated. *Floyer.*

STOMA'CHIC, *s.* A medicine for the stomach.

STO'MACHING, *s.* Resentment.—This is no time for
private *stomaching*. *Shakspeare.*

STO'MACHLESS, *adj.* Being without appetite.—Thy
sleep broken, thy meals *stomachless*. *Bp. Hall.*

STO'MACHOUS, *adj.* [*stomachosus*, Lat.] Stout; angry;
sullen; obstinate. *Obsolete.*

That stranger knight in presence came,
And goodly salved them; but nought again
Him answered, as courtesy became;
But with stern looks, and *stomachous* disdain,
Gave signs of grudge and discontentment vain. *Spenser.*

STOMATIA, in Natural History, the name of a genus of
shell-fish, frequently confounded with the ear-shell.

The shell of the stomatia is formed of one piece, has no
perforations in any part of its surface, and is of a depressed
flat figure; and its mouth is the most patent of all the univalve
shells, the limpet only excepted. It has a short spiral
turn running into the mouth at the head.

There are several species of this genus.
STOMOXYS, in Entomology, a genus of insects of the
order Diptera. The Generic Character is: Sucker with a
single-valved sheath, enclosing bristles in their proper sheaths;
two feelers which are short and setaceous, with five articulations;
the antennæ are setaceous. There are sixteen species,
in two divisions.

I. Sheath convolute and geniculate at the base, with two
bristles.

1. *Stomoxys morio*.—Black; fore part of the thorax hairy,
ferruginous; wings black, with white spots.—This is found
in Brazil.

2. *Stomoxys grisea*.—The antennæ of this species are feathered

thered; hairy, grey, with testaceous thighs. The proboscis is black, a little testaceous at the base; the head is white, with a testaceous line on the front; the wings are whitish; the legs black, with rufous thighs.—It is found in Germany.

3. *Stomoxys siberita*.—Antennæ feathered; hairy, grey; sides of the abdomen pale diaphanous. Orbits snowy; legs black. with pale thighs.—It inhabits Germany.

4. *Stomoxys calcitrans*.—Antennæ slightly feathered; grey, with black legs. This very much resembles the common fly, and is the insect which buzzes about the legs of cattle, making them continually stamp with the feet, and which stings our legs in autumn.

5. *Stomoxys tessellata*.—Hairy, cinereous; abdomen grey, tessellate with brown.—It inhabits Kiel, and is larger than the *Stomoxys irritans*, next to be described.

6. *Stomoxys irritans*.—Cinereous, slightly hairy; abdomen spotted with black.—This is found in many parts of Europe, as well as in our own country, and is extremely troublesome on the backs of cattle.

7. *Stomoxys muscaria*.—Antennæ slightly feathered; hairy, black; abdomen paler, with deep black bands. The segments of the abdomen are black at the base; the wings are white.—This is found in Denmark.

8. *Stomoxys dorsalis*.—Black; abdomen snowy on the back, with three pair of black dots.—It inhabits France, and is small.

9. *Stomoxys longipes*.—Orbits white; thorax grey; abdomen grey-brown; legs ferruginous, black at the ends.

II. Sheath covering the mouth, with five bristles.

10. *Stomoxys rostrata*.—Thorax with obscure lines; proboscis, abdomen, and legs, testaceous. It resembles the common fly, and is very troublesome to cattle.

11. *Stomoxys lineata*.—Thorax black, with four white lines; abdomen black, with three lateral yellow spots, and tail. The proboscis is yellow, the tip emarginate and black.—It is found in Germany.

12. *Stomoxys musciformis*.—Thorax brown, with four whitish lines; abdomen black, with three pair of white lunules. The antennæ are black, with a broad compressed ferruginous club; the mouth is hairy; the head is brown; the tail is blueish; legs yellow, spotted with black.—This is also found in Germany.

STOMPWYK, a large village of Holland, near Gouda, with 1900 inhabitants.

STONAGE, a hamlet in the parish of Tickenham, Somersetshire.

STONAR, a parish in Kent, near Sandwich, in the neighbourhood of which are some valuable salt-works.

STOND, *s.* Post; station. *Obsolete.*

On the other side, the assieged castle's ward
Their steadfast *stonds* did mightily maintain. *Spenser.*

Stop; indisposition to proceed.—There be not *stonds* nor restiveness in a man's nature; but the wheels of his mind keep way with the wheels of his fortune. *Bacons.*

STONDON, MASSEY or MARCI, a parish in Essex; 2 miles south-east of Chipping Ongar.

STONDON, NETHER, a hamlet in Bedfordshire; 4½ miles north-by-east of Silsoe.

STONDON, UPPER, a parish in the above county; 4½ miles east of Silsoe.

STONE, *s.* [*stains*, Gothic; *ſtan*, Sax.; *steen*, Dutch.] Stones are bodies insipid, hard, not ductile or malleable, nor soluble in water. *Woodward.*—*Stones* are, the softer and the harder. Of the softer *stones* are, 1. The foliaceous or flaky, as talc. 2. The fibrose, as the asbestos. 3. The granulated, as the gypsum. Of the harder *stones* are, 1. The opaque stones, as limestone. 2. The semi-pellucid, as agate. 3. The pellucid, as crystal and the gems. *Hill.*

Relentless time, destroying power,
Whom *stone* and brass obey. *Parnel.*

Piece of stone cut for building.
Should I go to church, and see the holy edifice of *stone*,
And not bethink me strait of dang'rous rocks! *Shakspeare.*

Vol. XXIII. No. 1594.

Gem; precious stone.

I thought I saw
Wedges of gold, great anchors, heaps of pearl,
Inestimable *stones*, unvalu'd jewels. *Shakspeare*

Any thing made of stone.

Lend me a looking-glass;
If that her breath will mist or stain the *stone*,
Why then she lives. *Shakspeare.*

Calculous concretion in the kidneys or bladder; the disease arising from a calculus.—A specific remedy for preventing of the *stone* I take to be the constant use of alehoof-ale. *Temple.*—The case which in some fruits contains the seed, and is itself contained in the fruit.—To make fruits without core or *stone* is a curiosity. *Bacon.*—Testicle.—A weight containing fourteen pounds. A *stone* of meat is eight pounds.—Does Wood think that we will sell him a *stone* of wool for his counters? *Swift.*—A funeral monument.

Should some relenting eye
Glance on the *stone* where our cold reliques lie. *Pope.*

It is taken for a state of torpidness and insensibility.—I have not yet forgot myself to *stone*. *Pope.*

STONE is used by way of exaggeration.

What need you be so boist'rous rough?
I will no struggle, I will stand *stone* still. *Shakspeare.*

To leave no STONE unturned. To do every thing that can be done for the production or promotion of any effect.

He crimes invented, left unturn'd no *stone*
To make my guilt appear, and hide his own. *Dryden.*

STONE, *adj.* Made of stone.

Present her at the leet,
Because she bought *stone* jugs, and no sealed quarts. *Shakspeare.*

To STONE, *v. a.* [*ſtænan*, Sax.] To pelt or beat or kill with stones.—Crucifixion was a punishment unknown to the Jewish laws, among whom the *stoning* to death was the punishment for blasphemy. *Stephens.*—To harden.

Oh perjur'd woman! thou do'st *stone* my heart;
And mak'st me call what I intend to do,
A murder, which I thought a sacrifice. *Shakspeare.*

To remove stones.—As the stones were laid together in the wall for defence; so they were gathered off from the soil, to avoid offence. But to what purpose is the fruitfulness; fencing, *stoning*, if the ground yield a plentiful crop of briars, thistles, weeds? *Bp. Hall.*

STONE (Edmund), a famous Scotch mathematician, was the son of the Duke of Argyle's gardener, and probably born in the shire of Argyle, about the beginning of the last or end of the preceding century. He was eight years old when he began to read, but afterwards he made very rapid progress by his own almost unrivalled efforts. Before he attained the age of eighteen years, he had acquired a knowledge of the most sublime geometry and analysis without a master. When he was asked by the Duke of Argyle, how he had gained this knowledge, he replied, "I first learned to read; and the masons being at work on your house, I saw that the architect used a rule and compasses, and that he made calculations. Upon inquiry into the use of these things, I was informed there was a science named arithmetic; I purchased a book of arithmetic, and I learned it. I was told there was another science called geometry, and I learned that also. Finding that there were good books on these two sciences in Latin, I bought a dictionary, and learned Latin. I also understood there were good books of the same kind in French, and I learned French. This, my lord, is what I have done; and it seems to me, that we may learn every thing when we know the twenty-four letters of the alphabet." The Duke, pleased with this simple answer, drew Stone out of obscurity, and provided for him an employment which allowed of his favourite pursuits

pursuits. He soon discovered that Stone possessed the same genius for architecture, and all the sciences that depend upon calculations and proportions. The works of Stone, partly original and partly translations, are as follow: viz. "A New Mathematical Dictionary," first printed in 1726, 8vo.; "A Treatise on Fluxions," 1730, 8vo.; the direct method being translated from the Marquis de l'Hospital's "Analyse des Infiniments Petites," and the inverse method supplied by Stone himself; "The Elements of Euclid," 1731, 2 vols. 8vo., with an account of the life and writings of Euclid; besides some smaller works. Stone was a Fellow of the Royal Society; and communicated to it an account of two species of lines of the third order, not mentioned by Sir I. Newton or Mr. Stirling, which was printed in the 41st volume of the Phil. Trans. *Hutton's Math. Dict.*

STONE (Henry), known by the name of *Old Stone*, to distinguish him from his younger brother John, was the son of N. Stone, a statuary. He is principally known as the copyist of many portraits by Vandyck; and they are exceedingly close in their resemblance to the originals. He passed several years in Holland, France, and Italy; but died in London in 1653.

STONE, a market town in the county of Stafford. It is situated on the northern bank of the Trent, and has considerably increased in extent and population since the establishment of the canal navigation between the Trent and the Mersey, which has opened a regular and cheap communication with many of the great manufacturing and commercial towns of Lancashire, Staffordshire, Warwickshire, and more distant counties. It consists mostly of one long street, which is a pretty good one, and contains a newly formed market place. In the town is a free school or charity school. The church is a new erection, not unhandsome in its architecture, but disfigured by the small height of its tower. Stone is remarkable for the religious foundations which it anciently contained. Wulfere, king of Mercia, having murdered his two sons, and afterwards become a convert to Christianity, founded a monastery here in 670, in expiation of his crimes, which became a college of regular canons of the order of St. Augustine. His queen, Ermenudo, also established a nunnery here; but both these houses were injured, and the societies dispersed by the Danes. After the Norman conquest, the college and nunnery appear to have been again filled with monks and nuns, at least the establishment at Stone became a cell to the more eminent house at Kenelworth. About the year 1260, Robert de Stafford rendered the former independent of the latter. A considerable manufactory of shoes is carried on here; and a very useful and improving manufactory of Rangeley and Diggles, late Rangeley and Dixon's patent roller pump, employs a considerable number of hands. In 1811, the parish of Stone contained 463 houses, and 2314 inhabitants. In 1821, it contained 500 or 600 houses, and little less than 3000 inhabitants, but the parish is very extensive, and in some parts populous. Market on Tuesday, and three annual fairs; 7 miles north of Stafford, and 141 north-west of London. Lat. 52. 54. N. long. 2. 8. W.

STONE, a parish in Buckinghamshire; 3 miles west-south-west of Aylesbury. Population 592.

STONE, a hamlet in the parish of Berkeley, Gloucestershire.—Also a hamlet in the parish of Wimborne Minster, Dorsetshire.

STONE, a parish of England, in Kent; 2 miles east by-north of Dartford.—Another parish in the above county; 1 mile south-west of Feversham.—Another parish in the same county; 5½ miles south-east of Tenterden.

STONE, a parish of England, in Worcestershire; 2 miles south-east-by-east of Kidderminster.

STONE ARABIA, a village of the United States, in Palatine, New York, on the north side of the Mohawk; 52 miles west-north-west of Albany.

STONEASTON, a township of England, in Somersetshire, near the coal-pits between Mendip and Midsummer-Norton; 6½ miles north of Shepton-Mallet. Population 364.

STONE BAY, a small bay on the coast of Kent, between Ramsgate, and the north Foreland.

STONEBECK, NETHER, a township of England, West Riding of Yorkshire; about 14 miles west-by-south of Rippon. Population 451.

STONEBECK, UPPER, a township in the above county; 1 mile distant from the foregoing.

STONEBOW, *s.* A crossbow, which shoots stones.—Hailstones full of wrath shall be cast as out of a *stone-bow*. *Wisd.*—O for a *stone-bow* to hit him in the eye! *Shakespeare*.

STONEBREAK, *s.* An herb.

STONE-BRIDGE CREEK, a small stream of the United States, in Washington county, New York, so called from a natural stone bridge under which it runs. The stream has its rise in Essex county. It enters the township of Chester a little above the bridge, and immediately falls over a rocky precipice, into a large natural basin; whence turning easterly, it enters its subterranean passage in two branches. The northern branch enters its passage under an arch of massy granite forty feet high, and about eighty feet broad at the base, gradually diminishing in capacity as you descend. A person may follow the stream with ease, 156 feet from the entrance, where it becomes so contracted as to check any farther progress. At the distance of 247 feet from the entrance, the waters disembogue in one stream, having united in the subterranean passage; and here is a precipice of rock, 54 feet high, which terminates the bridge. The arch through which the water discharges, is about ten feet wide and five high. This stream enters Scroon river, about three-fourths of a mile below the outlet of Scroon lake, and the stone bridge is about 3 miles north-west from the mouth of the creek.

STONECHATTER, *s.* [*rubetra*, Lat.] A bird.

STONECRAISE, a hamlet of England, in Cumberland; 2 miles south-east-by-south of Wigton.

STONECRAY, *s.* A distemper in hawks.

STONE CREEK, a river of the United States, in Mississippi, which runs into the Mississippi. Lat. 32. 8. N. long. 91. 13. W.

STONECROP, *s.* [*tron cpop*, Sax.] A sort of herb.—*Stonecrop* tree is a beautiful tree, but not common. *Mortimer*.

STONECROUCH, a hamlet of England, in the parish of Goudhurst, Kent.

STONECUTTER, *s.* One whose trade is to hew stones.—My prosecutor provided me a monument at the *stone-cutter's*, and would have erected it in the parish church. *Swift*.

STONEDELPHI, a township of England, in the parish of Tamworth, Warwickshire.

STONEFERN, *s.* A plant.

STONE-FERRY, a township of England, East Riding of Yorkshire, so named from a ferry over the river Hull; 1½ mile north-by-east of Kingston-upon-Hull.

STONEFLY, *s.* An insect.

STONE FORT, a post village of the United States, in Franklin county, Tennessee.

STONEFRUIT, *s.* Fruit of which the seed is covered with a hard shell developed in the pulp.—We gathered ripe apricocks and ripe plums upon one tree, from which we expect some other sorts of *stonefruit*. *Boyle*.

STONEGRAVE, a village of England, North Riding of Yorkshire; 4½ miles south-east of Helmesley.

STONEHAM, EARLS, a parish of England, in Suffolk; 9 miles from Ipswich. Population 620.

STONEHAM, LITTLE, a parish in the same county, adjoining the foregoing.

STONEHAM, NORTH, a parish of England, in Southamptonshire, in the church of which is a beautiful monument to the memory of Lord Hawke. It is situated on the river Itchen; 4½ miles north-north-east of Southampton. Population 662.

STONEHAM, SOUTH, another parish in the above county also on the banks of the Itchen; about 1½ mile distant from the foregoing.

STONEHAM,

STONEHAM, a township of Lower Canada, on the north side of the St. Lawrence in the county of Quebec.

STONEHAVEN, or STONEHIVE, a sea-port town of Scotland, in Kincardineshire, situated on the coast where the Cowie and Carron unite their waters as they flow into the sea. It is composed of an old and new town, the former lying on the south bank of the Carron, adjacent to the harbour; the other on a peninsula formed by the Carron and Cowie. This last is laid out upon a regular plan, having broad streets, and a square in the centre. The old town consists of two considerable streets of houses, built on fens granted by the earls marischal, within whose estate it was situated. The harbour is a natural basin, sheltered on the south-east by a high rock which runs out into the sea, and on the north-east by a quay, very convenient for the unloading of goods; but it is neither very capacious nor safe, the entrance being obstructed by sunken rocks, although it is capable of considerable improvements. Notwithstanding its fine situation for carrying on manufactures, very little business was formerly transacted at Stonehaven. It derived its principal support from the sheriff-court of the county, which has its seat here. The place has on the whole a cheerful and elegant appearance, and abounds with genteel and wealthy people. Stonehaven is a burgh of barony, of which the jurisdiction is by the charter vested in magistrates chosen by the superior and feuars; 15 miles south-by-west of Aberdeen, and 22 north-by-east of Montrose.

STONEHAWK, *s.* A kind of hawk. *Ainsworth.*
See FALCO.

STONEHEARTED, or STONYHEARTED, *adj.* Hard-hearted; cruel; pitiless.—The *stony-hearted* villains know it well enough. *Shakspeare.*

STONEHENGE, the name of a very remarkable ancient monument in England, in the county of Wilts, situated in the middle of Salisbury Plain. It consists of a great collection of stones of immense size, which, from their being some erect, some inclined, and most of them quite down upon the ground, seem to have formed, at one time, an entire building. Their appearance at present is that of a perfect ruin, a confused heap of standing and fallen stones; but by comparing attentively their relative situations, the shape and dimensions of the original structure can still be traced; and the most probable opinion is, that it must have been some Druidical temple, but of so vast a size, and the stones themselves forming such enormous masses, that it is justly regarded as one of the wonders of antiquity. Many of the stones also have been squared and hewn by art. On the top of the outer circle a continued row of squared stones has been attached to the uprights by mortices and tenons, and various other circumstances contribute to give this monument a peculiar character, quite distinct from the temples of upright stones found in various parts of England, Wales, Scotland, Ireland, Denmark, &c. It presents, therefore, an object of great interest to the antiquary, and has accordingly been examined with due attention and assiduity. Many treatises have been written on the subject, and the origin and history of this extraordinary antique has excited more speculation and discussion than those of any other ruin of the kind in the kingdom. At a distance, this monument appears only a small trifling object, its bulk and character being lost in the vastness of the open space around it. Even on a nearer approach, it often fails to astonish or satisfy the stranger, filled perhaps with exaggerated prepossessions; and in fact it is more as a subject of historical and antiquarian interest, than as a spectacle that is calculated to make an impression on the observer. The whole building appears to have consisted of two circular and two elliptical rows of upright stones, with horizontal stones lying on the outer circle, in a continued order all around, and five imposts or horizontal stones on ten uprights of the third row. The whole is surrounded by a ditch and vallum of earth, connected with which are three other stones. The vallum does not exceed fifteen feet in height, and is interior to the ditch. The entrance through

this line of circumvallation is on the north east, and is marked by a bank and ditch called the Avenue, which leads directly from it, and separates into two branches at the distance of a few hundred yards. Approaching Stonehenge by this Avenue, the attention is first attracted by an immense rude stone called the Friar's Heel, which is now in a leaning position, and measures about 16 feet in height. Just within the vallum is another stone lying on the ground. It is 21 feet 2 inches in length, of which 3 feet 6 inches appear to have been formerly under ground when it stood upright. It is exactly 100 feet distant from the former, and as much from the outside of the uttermost circle of the monument. The circumference of this circle is about 300 feet. It was composed originally of 30 upright stones, of which 17 are still standing; but there are now no more than 6 imposts. Each impost has two mortices in it, to correspond with two tenons on the tops of the vertical stones. The imposts were connected together, so as to form a continued series of architraves. The uprights in this circle differ from each other in their forms and sizes, but their general height is from 13 to 15 feet, and their circumference nearly 18 feet. At the distance of 8 feet 3 inches from this outer circle is an interior row, which it appears consisted, in its original state, of 40 upright stones. These are much smaller, and more irregular in their shapes, than those of the outermost one, and also differ from them in species. The number standing is only 8, but there are remains of 12 others lying on the ground. Within these two outer circles are arranged the two elliptical rows of stones, the outermost of which constitutes the grandest portion of Stonehenge. This is not a perfect ellipsis, but rather two-thirds of that figure, being open at one end. It was formed of five distinct pairs of trilithons, or two large upright stones, with a third laid over them as an impost. The largest trilithon was placed in the centre, opposite to the entrance, and measured, when standing, exclusive of the impost, 21 feet 6 inches in height; that next it on each side was about 17 feet 2 inches, but the extremes were not more than 16 feet 3 inches. A progressive rise thus appears to take place in the height of the trilithons of this ellipsis from east to west, and a degree of regularity pervading its structure, above what appears in the other parts of the monument. The stones are also more regular in their shapes, and carefully formed, than those in the outer circle. The interior oval consisted of 19 uprights, without imposts. These stones are taller and better shaped than those in the corresponding circle, and incline to a pyramidal form. The Altar Stone, as it is usually called, occupies the interior of this oval, and may be regarded as the centre or keystone of the whole temple. It measures 15 feet in length, and is almost covered by the two fallen stones of the great trilithon. The other stones belonging to the monument are situated close to the vallum, and within it one on the south-east side, and the other on the north-west side. The total number of stones of which Stonehenge, in its complete state, was composed, appears to have been 109, of which the outer circle contained 30, the second or inner circle 40, the first ellipsis 15, and the second ellipsis 19. The remaining 5 are the altar stone, the three stones adjoining the agger, and the large stone in the Avenue. The stones in the outer circle and outer ellipsis, with the stone in the Avenue, and those adjoining the vallum, are all of a pure fine grained compact sandstone. The second circle and the small oval consist of a fine grained grinstein, interspersed with black hornblende, feldspar, quartz, &c. The slab or altar stone is different from all these, being of a very fine grained calcareous sandstone, which strikes fire with steel. The area of Stonehenge has, as may readily be supposed, excited the attention of the curious in a high degree, and has been examined with care by different antiquaries, but no discoveries of importance have been made within it. The surrounding plain, however, is covered with a profusion of barrows, unparalleled in any spot of similar extent in England, and probably in the world. Many of these were filled with burnt bones and entire skeletons, and with various relics of British art. Plans and descriptions of Stonehenge have been published by Inigo Jones, at the
desire

desire of James I.; also by Smith, Stukely, and Wood, the two latter of which, it is thought, are the most accurate. Various opinions also, and conjectures and hypotheses, have been formed as to the origin or object of this singular monument; but nothing very decisive seems to have been ascertained. The building seems very probably to have been intended for a Druidical temple; but neither its founders, the date of its erection, the process by which such enormous masses were raised into their respective situations, are known.

STONE HILL, in Herefordshire, England, 1417 feet above the level of the sea.

STONEHORSE, *s.* A horse not castrated.—Where there is most arable land, *stonehorses* or geldings are more necessary. *Mortimer.*

STONEHOUSE, a parish of Scotland, in Lanarkshire, 5 miles long, and on an average 2 broad.

STONEHOUSE, a market town of England, in the county of Devon. It is situated between the towns of Plymouth and Devonport, about one mile from either; and, from the rapid increase of buildings within these few years, has all the appearance of being very soon united to Plymouth itself, a street and road having been begun for the purpose, through a marsh which lies in the way. Here are excellent barracks for the royal marine corps, and one for 1000 regulars or militia. Here is also the royal naval hospital, for men who are sent from all ships coming into Plymouth harbour. The town contains two Episcopal chapels, and two chapels for dissenters. A public school has been erected for poor children, on Dr. Bell's system, and capable of educating 150 boys and girls. Stonehouse is subject to the magistrates of Devonport, on whom all civil decisions are dependent; but owing to its rapid increase, it is thought the town will soon acquire a jurisdiction of its own. In 1811, Stonehouse contained 5174 inhabitants; and at present the population is about 7000 or 8000. Market on Tuesday and Saturday, and two annual fairs; $1\frac{1}{2}$ mile south-west-by-west of Plymouth, and 217 west-by-south of London.

STONEHOUSE, a parish of England, in Gloucester, with two charity schools, and annual fairs in May and December.

STONEHOUSE, WEST, a township of England, in Cornwall, near the passage at Crimble Ferry; 1 mile west of Devonport.

STONE INDIANS, a tribe of Indians who inhabit the south of Fire Fort, or Assiniboin river, in North America. Their number was estimated by Mackenzie at 450, but this is much diminished.

STONELY, or **STONELEIGH**, a town and parish of England, in Warwickshire, on the north bank of the river Sow, near its confluence with the Avon. Market on Thursday; $4\frac{1}{2}$ miles south-by-west of Coventry, and 88 north-north-west of London.

STONE MOUNTAINS, mountains of America, in the west part of Virginia. Lat. 36. 40. N. long. 81. 40. W.

STONEPIT, *s.* A quarry; a pit where stones are dug.—There's one found in a *stonepit*. *Woodward.*

STONEPITCH, *s.* Hard inspissated pitch.—The Egyptian mummies are reported to be as hard as *stone-pitch*. *Bacon.*

STONEPLOVER, *s.* A bird. *Ainsworth.*

STONER, *s.* One who strikes, beats, or kills with stones.—It was the character of Jerusalem to be the killer of the prophets, and the *stoner* of them who were sent unto her. *Barrow.*

STONE RIVER, a river of North America, which runs into Lake Athapescow.

STONE'S RIVER, a river of the United States, in Tennessee, which runs north-west into the Cumberland; 6 miles above Nashville.

STONESBOROUGH, a post village of the United States, in Green county, Kentucky.

STONESBY, a parish of England, in Leicestershire; 6 miles north-east of Melton Mowbray.

STONESTCAST, or **STONESTHROW**, *s.* Distance to which a stone may be thrown.—A madder thing to see them ride though not half a *stonescast*. *Sir T. Herbert.*

STONESFIELD, a parish of England, in Oxfordshire; 4 miles west of Woodstock.

STONEMICKLE, *s.* A bird. This is perhaps the bird called *stonesmich*, a kind of Stone-chatter.

STONESQUARER, *s.* One who shapes stones into squares.—Hiram's builders did hew them, and the *stonesquarers*. *1 Kings.*

STONEWALL CREEK, a river of North America, which runs into the Missouri, just above the natural stone walls; 95 miles below the Great Falls.

STONWORK, *s.* Building of stone.—They make two walls with flat stones, and fill the space with earth, and so they continue the *stonework*. *Mortimer.*

STONEY, a small river of North America, which falls into the Ohio.

STONHAM, ASPALL, a parish of England, in Suffolk; $4\frac{1}{2}$ miles north-east-by-east of Needham.

STONINESS, *s.* The quality of having many stones.—Small gravel or *stoniness* is found therein. *Mortimer.*—Hardness of mind.—He hath some *stonygness* at the bottom. *Hammond.*

STONINGTON, a sea-port, borough, and post township of the United States, in New London county, Connecticut. Population of the borough, 804; of the township, 3043. The harbour sets up from the sound opposite Fisher's island. It borders on Rhode Island, and is a place of some trade. This town was bombarded by the British, without effect, on 8th August 1814.

STONINGTON, NORTH, a post township of the United States, in New London county, Connecticut; 9 miles north of Stonington.

STONO INLET, a river or channel of South Carolina, which separates the islands of James and John, and runs into the Atlantic. Lat. 38. 41. N. long. 80. 3. W.

STONY, *adj.* [*ῥανγ, ῥαεργ, Sax.*] Made of stone. With love's light wings did I o'erperch these walls; For *stony* limits cannot hold love out. *Shakspeare.*

Abounding with stones.

From the *stony* Mænalus
Bring your flocks, and live with us.

Milton.

Petrific.

Now let the *stony* dart of senseless cold
Pierce to my heart, and pass through every side. *Spenser.*

Hard; inflexible; unrelenting.

Thou art come to answer
A *stony* adversary, an inhuman wretch
Uncapable of pity.

Shakspeare.

STONY BROOK, a post village of the United States, in Broohaven county, New York.

STONY CREEK, a township of the United States, in Somerset county, Pennsylvania.

STONY HEAD, a point on the north shore of Van Diemen's Land. Long. 147. 10. E.

STONYHURST, a hamlet of England, in the parish of Whalley, Lancashire.

STONY ISLAND. 1. An island near the east coast of Labrador. Lat. 53. 4. N. long. 55. 30. W.—2. A small island in the Spanish Main. Lat. 14. 20. N. long. 82. 45. W.—3. An island in the east end of Lake Ontario, south-west of Sackett's harbour.

STONYKIRK, or **STEPHENKIRK**, a parish of Scotland, in Wigtonshire, lying in the west part of the bay of Luce.

STONY MIDDLETON, a township of England, in Derbyshire; 3 miles west-by-north of Bicester.

STONY POINT, a post village of the United States, in Albemarle county, Virginia.—2. A post village of the United States, in Abbeville district, South Carolina.—3. **STONY POINT**, a post on the right bank of the River Hud-

on, in the state of New York. In 1779 it was taken by the British, but recovered soon after by the Americans; and the whole garrison, consisting of 600 men, with their commanding officer, lieutenant-colonel Johnson, made prisoners of war. Opposite Verplank's Point.

STONY STRATFORD. See STRATFORD.

STOOD. The preterite of *To stand*. [*ƿoð*, Sax.]

Adam, at the news,
Heart-struck with chilling gripe of sorrow *stood*. *Milton*.

STOODELEY, a parish of England, in Devonshire; 5 miles from Tiverton.

STOOK, *s*. [*Serenius* adduces the West. Goth. *stukc*, signifying the same thing; and refers also to the Su. Goth. *stacka*, to collect grain or hay into a stack or mow.] A shock of corn containing twelve sheaves.

To STOOK, *v. a.* To set up the sheaves in stooks.

STOOL, *s*. [*stols*, Goth.; *ƿoel*, Sax.; *stoel*, Dutch; *stoll*, Germ.; from *stellen*, to place, to set.] A seat without a back, so distinguished from a chair.

Thou fearful fool,
Why takest not of the same fruit of gold?
Ne sittest down on that same silver stool,
To rest thy weary person in the shadow cold? *Spenser*.

Evacuation by purgative medicines.—The peristaltic motion, or repeated changes of contraction and dilatation, is not in the lower guts, else one would have a continual needing of going to stool. *Arbuthnot*.

STOOL of Repentance, or *catty stool*, in the kirks of Scotland, is somewhat analogous to the pillory. It is elevated above the congregation. In some places there may be a seat in it; but it is generally without, and the person stands therein who has been guilty of fornication, for three Sundays, in the forenoon; and after sermon is called upon by name and surname, the beadle or kirk-officer bringing the offender, if refractory, forwards to his post; and then the preacher proceeds to admonition. Here too are set to public view adulterers; only these are habited in a coarse canvas, analogous to a hairy or monastic vest, with a hood to it, which they call the sack or sackcloth, and that every Sunday throughout a year, or longer.

STOOLBALL, *s*. A play where balls are driven from stool to stool.

While Betty dances on the green,
And Susan is at stoolball seen. *Prior*.

To STOOM, *v. a.* To put bags of herbs, or other ingredients, into wine.

To STOOP, *v. n.* [*ƿrupian*, Sax.; *stuyppen*, Dutch.] To bend down; to bend forward.—Like unto the boughs of this tree he bended forward and *stooped* toward the earth. *Raleigh*.—To lean forward standing or walking.

He, *stooping*, open'd my left side, and took
From thence a rib. *Milton*.

To yield; to bend; to submit.

Mighty in her ships stood Carthage long,
And swept the riches of the world from far;
Yet *stoop'd* to Rome, less wealthy, but more strong. *Dryden*.

To descend from rank or dignity.—He that condescended so far, and *stooped* so low, to invite and to bring us to Heaven, will not refuse us a gracious reception there. *Boyle*.—To yield; to be inferior.

These are arts, my Prince,
In which your Zama does not *stoop* to Rome. *Addison*.

To sink from resolution or superiority, to condescend.—They, whose authority is required unto the satisfying of your demand, do think it both dangerous to admit such concurrence of divided minds, and unmeet that their laws, which, being once solemnly established, are to exact obedience of all men and to constrain thereunto, should so far *stoop* as to hold themselves in suspense from taking any effect upon

you, till some disputer can persuade you to be obedient. *Hooker*.—To come down on prey as a falcon. *Stooping* is when a hawke, being upon her wings at the height of her pitch, bendeth violently downe to strike the fowle, or any other prey. *Latham*.—When they *stoop*, they *stoop* with the like wing. *Shakspeare*.—To alight from the wing.

Satan ready now
To *stoop* with wearied wings and willing feet,
On the bare outside of this world. *Milton*.

To sink to a lower place.

Cowering low
With blandishment, each bird *stoop'd* on his wing. *Milton*.

To STOOP, *v. a.* To submit.

Sole cause that *stoops*
Their grandeur to man's eye. *Young*.

STOOP, *s*. Act of stooping; inclination downward. Descent from dignity or superiority.

Can any loyal subject see
With patience such a *stoop* from sovereignty?
An ocean pour'd upon a narrow brook? *Dryden*.

Fall of a bird upon his prey.
Now will I wander through the air,
Mount, make a *stoop* at every fair. *Waller*.

[*ƿtoppa*, Sax, *stoope*, Dutch.] A vessel of liquor.—Come, lieutenant, I have a *stoop* of wine; and here without are a brace of gallants, that would fain have a measure to the health of Othello. *Shakspeare*.—A post fastened in the earth: a northern word. [*stupa*, Lat.] Ray, and Grose. Written also *stoup* or *stowp*.

It might be known hard by an ancient *stoop*,
Where grew an oak in elder days. *Tancred and Gismunda*.

STO'OPER, *s*. One who stoops. *Sherwood*.

STO'OPINGLY, *adv*. With inclination downwards.—Nani was noted to tread softly, to walk *stoopingly*, and raise himself from benches with laborious gesture. *Wotton*.

STOOS, or Stosz, a mining town in the north of Hungary, in the county of Zyps, inhabited by descendants of Germans; 19 miles west of Caschau Lat 48. 42. N. long. 20. 49. 50. E.

To STOP, *v. a.* [*estouper*, Fr., *stopparc*, Ital., *stoppen*, Dutch.] To hinder from progressive motion.

From the oracle
They will bring all; whose spiritual counsel had
Shall *stop* or spur me. *Shakspeare*.

To hinder from successive operation.

Can any dresses find a way
To *stop* the approaches of decay,
And mend a ruin'd face? *Dorset*.

To hinder from any change of state, whether to better or worse. To hinder from action or practice.

Friend, 'tis the duke's pleasure,
Whose disposition, all the world well knows,
Will not be rubb'd nor *stopp'd*. *Shakspeare*.

To put an end to the notion or action of any thing; to intercept.

Almon falls, pierc'd with an arrow from the distant war:
Fix'd in his throat the flying weapon stood,
And *stopp'd* his breath, and drank his vital blood. *Dryden*.

To repress; to suspend.—Every bold sinner, when about to engage in the commission of any known sin, should arrest his confidence, and *stop* the execution of his purpose with this question: Do I believe that God has denounced death to such a practice, or do I not? *South*.—To suppress.—He, on occasion of *stopping* my play, did me a good office at court, by representing it as long ago designed. *Dryden*. To regulate musical strings with the fingers.—In instruments of strings, if you *stop* a string high, whereby it hath less scope to tremble, the sound is more treble, but yet more dead.

dead. *Bacon*.—To close any aperture.—Smite every fenced city, *stop* all wells of water, and marland with stones.—To obstruct; to encumber.—Mountains of ice that *stop* the imagin'd way. *Milton*.—To garnish with proper punctuation.

To *STOP*, *v. a.* To cease to forward.

Some strange commotion
Is in his brain: he bites his lip, and starts;
Stops on a sudden, looks upon the ground,
Then lays his finger on his temple; strait
Springs out into fast gait, then *stops* again. *Shakspeare*.
If the rude throng pour on with furious pace,
And hope to break thee from a friend's embrace,
Stop short, nor struggle through. *Gay*.

To cease from any course of action.—Encroachments are made by degrees from one step to another; and the best time to *stop* is at the beginning. *Lesley*.

STOP, *s.* Cessation of progressive motion.

Thought's the slave of time, and life time's fool;
And time, that takes survey of all the world,
Must have a *stop*. *Shakspeare*.

A lion, ranging for his prey, made a *stop* on a sudden at a hideous yelling noise, which startled him. *L'Estrange*.
—Hindrance of progress; obstruction: act of stopping.

My praise the Fabii claim,
And thou great hero, greatest of thy name,
Ordain'd in war to save the sinking state,
And, by delays, to put a *stop* to fate. *Dryden*.

Repression; hindrance of operation:—'Tis a great step towards the mastery of our desires to give this *stop* to them, and shut them up in silence. *Locke*.—Cessation of action.

Look you to the guard to-night:
Let's teach ourselves that honourable *stop*,
Not to outsport discretion. *Shakspeare*.

Interruption.

Thou art full of love and honesty,
And weight'st thy words before thou giv'st them breath;
Therefore these *stops* of thine fright me the more. *Shakspeare*.

Prohibition of sale.—If they should open a war, they foresee the consumption France must fall into by the *stop* of their wine and salts, wholly taken off by our two nations. *Temple*.—That which obstructs; obstacle; impediment.

The proud Duessa, full of wrathful spirit
And fierce disdain to be affronted so,
Inforc'd her purple beast with all her might,
That *stop* out of the way to overthrow. *Spenser*.

Instrument by which the sounds of wind music are regulated.—You would play upon me, you would seem to know my *stops*; you would pluck out the heart of my mystery. *Shakspeare*.

Blest are those,
Whose blood and judgement are so well commingled,
That they are not a pipe for fortune's finger,
To sound what *stop* she please. *Shakspeare*.

Regulation of musical chords by the fingers.—The further a string is strained, the less superstraining goeth to a note; for it requireth good winding of a string before it will make any note at all: and in the *stops* of lutes, the higher they go, the less distance is between the frets. *Bacon*.—The act of applying the *stops* in music.

The organ-sound a time survives the *stop*,
Before it doth the dying note give up. *Daniel*.

A point in writing, by which sentences are distinguished.
Even the iron-pointed pen,
That notes the tragic dooms of men,
Wet with tears still'd from the eyes
Of the flinty destinies,
Would have learn'd a softer style,
And have been asham'd to spoil

His life's sweet story by the haste
Of a cruel *stop* ill-plac'd.

Crashaw.

STOPCOCK, *s.* A pipe made to let out liquor, stopped by a turning cock.—No man could spit from him without it, but would drivel like some paralytic or fool; the tongue being as a *stopcock* to the air, till upon its removal the spittle is driven away. *Grew*.

STOPGAP, *s.* Something or some person substituted; a temporary expedient.

STOPHAM, a parish of England, in Sussex; 4 miles south-east-by-east of Petworth.

STOPPLESS, *adj.* Not to be stopped; irresistible.

Making a civil and staid senate rude,
And *stopless* as a running multitude. *Davenant*.

STOPNICA, a small town in the west of Poland; 50 miles north-west of Cracow, with 900 inhabitants.

STOPPAGE, *s.* The act of stopping; the state of being stopped.—The effects are a *stoppage* of circulation by too great a weight upon the heart, and suffocation. *Arbutnot*.—The *stoppage* of a cough, or spitting, increases phlegm in the stomach. *Floyer*.

STOPPER, *s.* One who closes any aperture.—The ancients of Gebal, and the wise men thereof, were in thee thy calkers, [in the margin, *stoppers* of chinks.] *Ezek*.—A stopple. See *STOPPLE*.

STOPPESLEY, a hamlet of England, in Bedfordshire; 2 miles north-north-east of Luton.

STOPPLE, or *STOPPER*, *s.* That by which any hole or the mouth of any vessel is filled up.—Bottles swunged, or carried in a wheel-barrow upon rough ground, fill not full, but leave some air; for if the liquor come close to the *stopple*, it cannot flower. *Bacon*.

STOR, a river of Denmark, in Holstein, which falls into the Elbe below Gluckstadt, after a course of 45 miles.

STORAX, *OFFICINAL*, is the resinous drug, obtained in perfection only from those trees that grow in Asiatic Turkey, and which issues in a fluid state from incisions made in the bark of the trunk, or branches, of the storax-tree. And our Pharmacopeias formerly directed the "pilulæ styrace," or Storax Pills; but this odoriferous drug has now no place in any of the official compounds; and is totally disregarded by modern practitioners. Woodville's Med. Bot.

STORAX, *LIQUID*, is a resinous juice, obtained from a large tree, with leaves like those of the maple, called by Linnæus *LIQUIDAMBAR STYRACIFLUA*, a native of Virginia and Mexico: it is at present wholly in disuse.

STORCHNEST, or *OSIECZNA*, a small town of Prussian Poland; 16 miles east north-east of Fraustadt, and 37 south-south-west of Posen.

STORCK (Anthony), a medical professor of considerable note at Vienna, succeeded the celebrated Van Swieten in the office of president and director of the faculty of medicine in the university of that metropolis, and was also honoured with the appointment of principal consulting physician to the empress Maria Theresa. He distinguished himself chiefly by a long and assiduous course of experiments relative to the operation of various narcotic vegetables, and to the best mode of preparing and administering them. The vegetables of which he has treated in various tracts, are the hemlock, henbane, stramonium, aconite, meadow-saffron, and pulsatilla nigricans: and although he was disposed to over-rate the efficacy of some of these substances, and has ascribed to them virtues which subsequent experience has not always confirmed, he had the merit of calling the attention of the medical world to a class of active remedies, which, under proper management, are productive of much benefit, and constitute a valuable addition to the *Materia Medica*. Between the years 1760 and 1771, his various tracts upon these subjects were printed at Vienna, and they have subsequently undergone several editions and translations in other countries. He was also author of a collection of cases which occurred under his observation in the hospital at Vienna, entitled "Annus Medicus, quo sistuntur Observationes circa Morbos

Morbos acutos et chronicos," 1759; of which he published an "Annus Secundus" in 1761. This work was afterwards continued by his successor, Dr. Colin. In 1775, he published a volume, entitled "Instituta Facultatis Medicæ Vin-dobonensis." *Eloy Dict. Hist. de la Méd.*

STORE, *s.* [*stór*, in old Swedish and Runick, is *much*, and is prefixed to other words to intend their signification; *stór*, Danish; *stoor*, Icelandic, is *great*. The Teutonic dialects nearer to English seem not to have retained this word.] Large number; large quantity; plenty.

None yet, but *store* hereafter from the earth
Up hither like aërial vapours flew,
Of all things transitory and vain, when sin
With vanity had fill'd the works of men.

A stock accumulated; a supply hoarded.

Divine Cecilia came,

Inventress of the vocal frame:

The sweet enthusiast from her sacred *store*
Enlarg'd the former narrow bounds,
And added length to solemn sounds.

Milton.

Dryden.

The state of being accumulated; hoard.—Is not this laid up in *store* with me, and sealed up among my treasures? *Deut.*—Storehouse; magazine.

Sulphurous and nitrous foam,
Concocted and adusted, they reduc'd
To blackest grain, and into *store* convey'd.

Milton.

STORE, *adj.* Hoarded; laid up; accumulated.—What floods of treasure have flowed into Europe by that action, so that the cause of Christendom is raised since twenty times told: of this treasure the gold was accumulate and *store* treasure; but the silver is still growing. *Bacon.*

To STORE, *v. a.* To furnish; to replenish.

Wise Plato said the world with men was *stor'd*,
That succour each to other might afford.

Denham.

To stock against a future time.

To *store* the vessel let the car be mine,
With water from the rocks and rosy wine,
And life-sustaining bread.

Pope.

To lay up; to hoard.—Let the main part of the corn be a common stock, laid in and *stored* up, and then delivered out in proportion. *Bacon.*

STOREA, among the Romans, a kind of basket made of ropes or rushes, for gathering flowers or garden-fruits.

STOREA was likewise a kind of defence, made of large cables fashioned into a sort of netting; which was so strong, that no weapon, though thrown out of an engine, could penetrate it.

STOREHOUSE, *s.* Magazine: treasury; place in which things are hoarded and reposit against a time of use.—Suffer us to famish, and their *storehouses* cramm'd with grain! *Shakspeare.*—A great mass reposit.

They greatly joyed merry tales to feign,
Of which a *storehouse* did with her remain.

Spenser.

STO'RER, *s.* One who lays up.

A wench of a *storer*, or

Your sutler's wife.

B. Jonson.

STORETON, GREAT and LITTLE, two hamlets of England, in Cheshire; lying between the rivers Dee and Mersey; 12 miles from Chester.

STORGE, *Στοργή*, a Greek term, frequently used by naturalists to signify that parental instinct, or natural affection, which animals bear toward their young.

STO'RIAL, *adj.* Historical. *Obsolete.*—Of *storial* thing that toucheth gentillesse. *Chaucer.*

STO'RIED, *adj.* Furnished with stories; adorned with historical pictures.

Some greedy minion or imperious wife,
The trophy'd arches, *storied* halls invade.

Pope.

STO'RIER, *s.* An historian; a relater of stories *Obsolete.*—The *storie*—made of thre moost famese and credible *storiens* in Greek lond. *Bp. Peacock.*

STORK, *s.* [*ἵτορε*, Sax.; *ciconia*, Lat.] A bird of passage famous for the regularity of its departure.—Its beak and legs are long and red; it feeds upon serpents, frogs, and insects: its plumage would be quite white, were not the extremity of its wings, and also some part of its head and thighs, black: it sits for thirty days, and lays but four eggs: they go away in the middle of August, and return in spring. *Calmet.*

Who bid the *stork*, Columbus like, explore
Heavens not his own, and worlds unknown before?

Who calls the council, states the certain day,

Who forms the phalanx, and who points the way. *Pope.*

STORKOW, a small town of the Prussian States, in the province of Brandenburg; 31 miles east-south-east of Berlin, and 15 west-north-west of Beeskow.

STO'RKSBILL, *s.* [*gcranium*, Lat.] An herb. *Ainsworth.*

STORM, *s.* [*ystorm*, Welsh; *ἵτορμ*, Saxon; *storm*, Dutch; *stormo*, Italian. Dr. Johnson.—The past participle of the Sax. *ἵτρυμian*, to agitate. Mr. H. Tooke.]—A tempest; a commotion of the elements.

We hear this fearful tempest sing,
Yet seek no shelter to avoid the *storm*.

Shakspeare.

Assault in a fortified place.

How by *storm* the walls were won,

Or how the victor sack'd and burnt the town.

Dryden.

Commotion; sedition; tumult; clamour; bustle.

Whilst I in Ireland nourish a mighty band;

I will stir up in England some black *storm*.

Shakspeare.

Affliction; calamity; distress.—A brave man struggling in the *storms* of fate. *Pope.*—Violence; vehemence; tumultuous force.—As oft as we are delivered from those either imminent or present calamities, against the *storm* and tempest whereof we all instantly craved favour from above, let it be a question what we should render unto God for his blessings, universally, sensibly, and extraordinarily bestowed. *Hooker.*

To STORM, *v. a.* [Sax. *ἵτρυμian*, both active and neuter.] To attack by open force.

There the brazen tower was *storm'd* of old,

When Jove descended in almighty gold.

Pope.

To STORM, *v. n.* To raise tempests.

So now he *storms* with many a sturdy stoure,

So now his blustering blast each coast doth scoure. *Spenser.*

To rage; to fume; to be loudly angry.

Hoarse, and all in rage,

As mock'd they *storm*.

Milton.

STORM, CAPE, in the straits of Northumberland, in North America, it is the northern limit of the mouth of Bay Verte, and forms the south-east corner of the province of New Brunswick.

STORMARN, the old name of a small district of Denmark, in the south of Holstein, comprising the track lying round Hamburg, between the rivers Stor, Elbe, Trave and Bille.

STO'RMBEAT, *adj.* Injured by storm.

O turn thy rudder hitherward awhile;

Here may thy *storm-beat* vessel safely ryde.

Spenser.

STO'RMINNESS, *s.* State or quality of being stormy.

STORMONT, a district of Scotland, in Perthshire, lying on the north-east bank of the Tay, and extending from Blairgowrie to Dunkeld. There is a small lake in this district, in which is an island, and a building said to have been a place for depositing the royal stores, whence is said to be derived the name Stormount.

STORMONT, a county of Upper Canada.

STORMORE, a hamlet of England, in the parish of West-ill, Leicestershire.

STO'RMY, *adj.* [Sax. *ἵτορμiz*.] Tempestuous.

Bellowing

Bellowing clouds burst with a *stormy* sound,
And with an armed winter strew the ground.

Addison.

Violent; passionate.

STORNODORF, a small town of the west of Germany, in Hesse-Darmstadt, province of Upper Hesse.

STORNOWAY, a parish of Scotland, in Ross-shire, in the island of Lewis, of great extent. It is of the figure of an irregular triangle, two of the sides of which are about ten miles, and the other about seven miles long.

STORNOWAY, a town in the above parish, situated at the head of Loch Stornoway, upon a point or ness jutting into it, which, from a small origin, has of late, by the exertions of Lord Seaforth, arrived at considerable size and extent. The harbour of Stornoway is excellent and well frequented, and the principal source of employment is the prosecution of the white and herring fisheries. There were 44 vessels belonging to it in 1808, the tonnage of which amounted to 1612 tons, navigated by 156 men; also 104 boats, navigated by 562 men, who are occasionally employed in the fishery, although the whole does not belong to the place. In five years, ending July 1808, there were exported from Stornoway 17,430 barrels of herrings; 719 tons of cod and ling; and oil, as is supposed, to the amount of 10,000*l*. It is a part of the custom-house, and has a post-office, and a regular packet.

STORO, a small town of the Austrian states, in the Tyrol, on the Sarca, to the south-west of Trent.

STORRINGTON, a town and parish of England, in Sussex, with a market on Wednesday, and two annual fairs, in May and November; 7 miles north-east of Arundel.

STORRITHS, a township of England, in the parish of of Skipton, West Riding of Yorkshire.

STORRS, a hamlet of England, in Westmoreland; 9 miles west-by-north of Kendal.

STORSIO, a large lake in the north of Sweden, province of Jamtland. It contains several islands, on two of which are villages; and it communicates with the gulf of Bothnia, through the medium of several other lakes and rivers. Lat. 63. 10. N. long. 14. 10. E.

STORTH, a hamlet of England, in Westmoreland; 8½ miles west of Kirkby Lonsdale.

STORTHWOOD, a village of England, East Riding of Yorkshire; 7 miles south-west-by-west of Pocklington.

STORY, *s.* [στῶρι, Saxon; *storie*, Dutch; *storia*, Italian; ἱστορία, Gr.]—History; account of things past.

Thee I have heard relating what was done

Ere my remembrance: now hear me relate

My *story*, which perhaps thou hast not heard.

Milton.

Small tale; petty narrative; account of a single incident.—In the road between Bern and Soleurre, a monument erected by the republic of Bern tells us the *story* of an Englishman not to be met with in any of our own writers. *Addison*.—An idle or trifling tale; a petty-fiction.

These flaws and starts would well become

A woman's *story* at a winter's fire,

Authoriz'd by her grandame.

Shakspeare.

STORY, *s.* [εἶπος, *place*. Skinner, and Dr. Johnson.—It is from *stage*; *stagery*, *stayery*, (the *a* broad) *stacry*, or *story*, i. e. a set of *stairs*. Mr. H. Tooke. See *STAGE*.] A floor; a flight of rooms.

Sonnets or elegies to Chlois,

Might raise a house about two *stories*;

A lyric ode would slate; a catch

Would tile; an epigram would thatch.

Swift.

To *STORY*, *v. a.* To tell in history; to relate.—How worthy he is, I will leave to appear hereafter, rather than *story* him in his own hearing. *Shakspeare*.—To range one under another.—Because all the parts of an undisturbed fluid are of equal gravity, or gradually placed or *storied*, according to the difference of it; any concretion that can be supposed to be naturally and mechanically made in such a fluid, must have a like structure of its several parts; that is, either be all over of a similar gravity, or have the more ponderous parts nearer to its basis. *Bentley*.

STORYTELLER, *s.* One who relates tales in conversation; an historian, in contempt.

In such a satire, all would seek a share,

And every fool will fancy he is there;

Old *storytellers* too must pine and die,

To see their antiquated wit laid by;

Like her who miss'd her name in a lampoon,

And griev'd to find herself decay'd so soon.

Dryden.

STORZHEIM, a small town in the east of France, department of the Lower Rhine. Population 1300.

STOT, *s.* [στος-ἵππος, Sax., "*stot*-horse, *caballus*." Prompt. Parv. πῶσσε, Sax. *equus vilis*.] A horse.

This reve sate upon a right good *stot*,

That was all pomelee gray, and hight Scot.

Chaucer.

A young bullock or steer. *stul*, Swed. *juvencus*, [Ihre.] This is common in the north of England.

STOTE, *s.* A kind of weasel. See *STOAT*.

STOTFIELD HEAD, a cape of Scotland, on the coast of Murray. Lat. 57. 42. N. long. 3. 10. W.

STOTFOLD, a parish of England, in Bedfordshire; 6 miles south-south-east of Biggleswade.

STOTINGWAY, a hamlet of England, in the parish of Upway, Dorsetshire.

STOVE, *s.* [*stoo*, Icelandic, a fire-place; πτοφα, Sax.; *estave*, French; *stove*, Dutch.]—A hot-house; a place artificially made warm.—Fishermen who make holes in the ice, to dip up such fish with their nets as resort thither for breathing, light on swallows congealed in clods of a slimy substance, and carrying them home to their *stoves*, the warmth recovereth them to life and flight. *Carew*.—A place in which fire is made, and by which heat is communicated.—If the season prove exceeding piercing, in your great house kindle some charcoals; and when they have done smoking, put them into a hole sunk a little into the floor, about the middle of it. This is the safest *stove*. *Evelyn*.

Stoves should, in propriety, be distinguished from fire-places, from the fire being inclosed within the stove, and giving out its heat through the substance of the materials of which the stove is composed, to the air in the apartment; and in many stoves there are ingenious contrivances, to make a great quantity of air pass in contact with the heated surface of the stove, and be thus heated before passing off into the apartment. Fire-places, on the contrary, have the fire as open and as much exposed as possible, consistently with the carrying off of the smoke, in order that it may throw out radiant heat into the apartment. See the articles *FIRE-PLACE*, and *GRATE* in this work.

The ancients are supposed to have used stoves, in which the fire was not seen; but on enquiring into the progress of the art of warming apartments economically, few traces remain of the manner in which the ancients warmed their habitations. It is imagined they lighted the fire in a large tube in the middle of a room, of which the roof was open, and that the other apartments were warmed by portable braziers. In Seneca's time, they began to construct tubes in the walls, to convey the heat into the upper apartments; the fire-places being still placed below. It appears, however, that this was the origin of flues for smoke and even of stoves; the situation and proportions of which have successively undergone an infinity of changes, according to the localities, the wants of the inhabitants, or the style of the decorations.

The ancients had the custom of heating apartments by fires placed under arches or vaults; but this was confined to palaces, and other edifices, where magnificence was augmented by prodigality; and the vestiges that have been discovered among ancient ruins, sufficiently point out this as their destination. In digging, some years ago, for foundations in the city of Antun, one of these ovens was discovered under a mosaic pavement, with chimnies at each extremity.

The northern Chinese have a method of warming their ground-floor, which resembles the ancient plan just mentioned. The floors are made of tiles a foot square, and two inches thick; their corners being supported by bricks set

on end, that are a foot long, and four inches square: the tiles, too, join into each other, by ridges and hollows along their sides. This forms a hollow under the whole floor, which on one side of the house has an opening into the air, where a fire is made; and it has a funnel rising from the other side to carry off the smoke. The fuel is a sulphurous pit-coal, the smell of which in the room is thus avoided, while the floor, and of course the room, are well warmed.

Francis Keslar, of Frankfort, whose work, entitled "Epargne-bois," &c. (the Wood-saver, &c.), appeared, in French, in 1619, is the oldest writer who deserves to be quoted, as having proposed any useful ideas on the subject of stoves. He formed eight chambers, one above another, through which the smoke was to pass before it entered the chimney. He also brought air directly from without into the ash-pan, to feed the fire; and there was another aperture to draw air from the apartment for the same purpose.

M. Dalesme, in 1686, suggested the first idea of a stove without smoke, which he called *furnus acapnos*. Here the smoke is forced to descend into the fire-place, where it is consumed.

This machine consisted of a tube of iron-plate, such as is used for the flue of a German stove. This tube was bent at right angles, and the part which was horizontal was about two feet in length, and joined to the rest of the tube, which ascended vertically. At the opposite end of the horizontal tube the furnace was made: it consisted of a cylindrical tube of plate-iron erected upon the horizontal tube near the end, and provided with a grating, upon which the fuel was placed; and the grate prevented the fuel falling down into the horizontal tube. To light this stove, some clear burning charcoal was put into the large short tube or furnace, and supported on the grate. As soon as the tubes grew warm, the air within them would ascend in the perpendicular tube or chimney, and go out at the top of it; fresh air must enter into the horizontal tube through the furnace. In this course it must descend through the burning fuel, and becoming heated by the burning coals, through which it has passed, would rise more forcibly in the longer tube, in proportion to its degree of heat, or rarefaction, and the length of that tube. Such a machine is a kind of inverted siphon; and as the greater weight of water in the longer leg of the common siphon, in descending, is accompanied by an ascent of the same fluid in the shorter; so in this inverted siphon, the greater quantity of levity of air in the longer leg, in rising, is accompanied by the descent of air in the shorter. The things to be burned being laid on the hot coals contained in the furnace, the smoke must descend through those coals, and be converted into flame, which, after destroying the offensive smell, comes out at the end of the longer tube, as mere heated transparent gas or vapour.

Whoever would repeat this experiment with success, must take care that the part of the short tube is quite full of burning coals, so that no part of the smoke may descend and pass by them, without going through them, and being converted into flame; and that the longer tube is so heated, that the current of ascending hot air will be established in it, before the things to be burnt are laid on the coals; otherwise there will be disappointment.

It does not appear that this idea was followed up either in England or France, but there is a German book, entitled "Vulcanus Famulans," by Joh. George Leutmann, printed at Wirtemberg in 1723, which describes, among a great variety of other stoves for warming of rooms one which seems to have been formed on the same principle. The construction is as nearly as possible the same as M. Dalesme's, except in the proportion of the parts; Leutmann's furnace being made in the form of a basin or vase, having the grate in the bottom of it.

Gauger, author of "La Méchanique du Feu," &c., printed at Paris in 1709, was the person to whom we are indebted for the first and most complete system of experiments on the circulation of heat, by means of air-holes affording warm air; as also the manner of making one fire warm several

rooms, and to send off the heat in elliptic curves. We there find a description of a chimney, with the back, the hearth, and the jambs, of hollow iron, to heat the air that is to enter the room. But it does not appear that this work produced much effect at the time.

The inhabitants of the northern parts of Europe have long been accustomed to the use of stoves in which the fire is shut up, and gives out its heat to a draught or current of air, which is made to pass through proper openings in the stove, and when sufficiently warmed, enters into the apartment. The smoke arising from the fuel is made to pass through a circuitous passage of flues, by which means the greatest part of the heat is absorbed. Stoves on this principle are known in England, but are very seldom used, except for warming of halls, staircases, and passages, in grand houses, as the English are not contented to feel the air warm, unless they see the fire. In Russia, Sweden, and other northern countries, they are indispensably necessary, as without them, it would be impossible to keep the rooms tolerably warm. A common fire-place has too large an opening, and if care be not taken to supply it continually with wood, &c., the heat it produces is hardly sensible, because this follows the current of the air, and is carried off by the smoke. These stoves, on the contrary, retain the heat a much longer time; and as their external parts, and also their flues, are very thin, they communicate their heat very readily, so that with a small quantity of wood, they warm an apartment much more than the fire of a common fire-place would do with six times the quantity.

It has been objected to the use of stoves that the heat produced from them is unwholesome, because they deprive the air of its moisture; and that the air, by being made too dry, loses its elasticity, in consequence of which, respiration becomes difficult and laborious. These objections would appear of great weight, if we had not the example of the Russians, the Swedes, the Danes, the Germans, and in short of all the inhabitants of the north of Europe, to shew that those who are habituated to such stoves, do not find them unwholesome. If others should be sensible of inconveniences from the dryness of the air in the apartment, it may be easily removed by the very simple expedient of placing upon the stove a vessel of glass or earthen-ware, which has a large surface, and is very shallow: this being filled with water, will insensibly evaporate, and restore to the air that moisture of which the heat of the stove has deprived it: the air will then recover its elasticity. If orange-trees are exposed to the heat of such a stove, and the fire is not properly regulated, the plants grow yellow and lose their leaves, especially if the air is not changed, which in winter is not very conveniently done; but if a vessel of water be placed upon the stove, the evaporation of the water will preserve the trees.

In a memoir published by M. Guyton, in the *Annales de Chimie*, the following principles are laid down, as very useful in making all kinds of stoves for warming apartments.

1. Heat is produced only in proportion to the volume of air consumed by the fuel.

2. The quantity of heat produced is greatest, (the quantity and quality of the fuel being the same), when the combustion is complete.

3. The combustion is the more complete, in proportion as the fuliginous part is longer retained in channels where it may undergo a second combustion.

4. The only useful heat is that sent out into, and retained in the space intended to be heated. The temperature of that space will be higher in proportion, as the current which must be renewed from without to support the combustion, is less enabled to take up in its passage the heat produced.

Hence the following inferences evidently arise:

1. The fire-place ought to be insulated from all bodies that are rapid conductors of heat. All the heat that goes out of the apartment is absolutely lost, unless intentionally directed into another apartment.

2. Heat being produced only by combustion, and combustion being sustained only by a current of air, the current should be brought in by channels, where the needful rapidity may be preserved without being too distant from the space to be warmed, so that the heat it there deposits, may be gradually accumulated in the whole of the insulated furnace, in order afterwards to flow out of it slowly, according to the laws of the equilibrium of that fluid.

3. The wood being so far consumed as to give no more smoke, it is advantageous to close the mouth of these channels, in order to retain there the heat that would otherwise be carried off through the upper flue, by the continuance of a current of fresh air, necessarily of a low temperature.

4. Lastly; it follows from these maxims, that all things being equal, a higher temperature will be obtained, and supported during a much longer time, by forming, in the internal parts of the stove, or under the hearth of a chimney, and in their vicinity, tubes in which the air that comes from without may be warmed before it enters the apartment, to serve the purpose of combustion, or replace that which has been consumed.

To **STOVE**, *v. a.* To keep warm in a house artificially heated.—For December, January, and the latter part of November, take such things as are green all winter; orange-trees, lemon-trees, and myrtles, if they be *stoved*; and sweet marjoram warm set. *Bacon.*

STOVEN, a village of England, in Suffolk; 5 miles north-east-by-east of Halesworth.

STOVER, *s.* [*estover*, Fr., from the Lat. *fovere*, to foster. Minsheu.] Fodder for cattle; coarse hay, or straw; and sometimes straw for thatch.

The turfy mountains, where live nibbling sheep
And flat meads thatch'd with *stover* them to keep. *Shakspeare.*

STOUGHTON, a hamlet of England, in Leicestershire; 4 miles east-south-east of Leicester.

STOUGHTON, a parish of England, in Sussex; 6 miles north-west of Chichester. Population 489.

STOUGHTON, GREAT, a parish of England, in Huntingdonshire; 3 miles south-east of Kimbolton.

STOUGHTON, LITTLE, a parish of England, in Bedfordshire, half a mile distant from the foregoing.

STOUGHTON, a post township of the United States, in Norfolk county, Massachusetts; 15 miles south of Boston.

STOULTON, a hamlet of England, in Worcestershire; 4½ miles north-west of Pershore.

To **STOUND**, *v. n.* [*stunde*, grieved, Icelandic, from *styn*, to grieve.] To be in pain or sorrow. Dr. Johnson states it to be out of use. "It *stounds*," i. e. it aches, it smart, is used in the north of England.

STOUND, part. For *stunned*.—So was he *stound* with stroke of her huge tail. *Spenser.*

STOUND, s. Sorrow; grief; mishap. *Out of use.* The Scots retain it.—Begin and end the bitter baleful *stound*. *Spenser.*—A shooting pain.

Keep your corpse from the carefull *stounds*
That in my carrion carcase abounds. *Spenser.*

A noise.

With that he roar'd aloud, as he were wound,
That all the palace quaked at the *stound*. *Spenser.*

Astonishment; amazement.

Thus we stood as in a *stound*,
And wet with tears, like dew, the ground. *Gay.*

[*stund*, Sax.] Hour; time; season; a small space of time. *This is still a provincial word.*

Till that *stound* could never wight him harme
By subtilty, nor slight, nor might, nor mighty charme. *Spenser.*

STOUR, s. [*stur*, Runick, a battle; *stœpan*, Sax. to *disturb*.] Assault; incursion; tumult. *Obsolete.*

And he that harrow'd hell with heavy *stour*,
The faulty souls from thence brought to his heavenly bow'r. *Spenser.*

STOUR, s. [*stur*, Saxon, from the Welsh *dwr*, water, "Sunt in nostrâ Britannia plurima flumina appellata *es dūr*, sive *Sturæ*, Anglorumsermone *stour*." *Barter.*] A river: whence the prefix *stour* to many of our places: *Stourton*, *Stourminster*, *Stourbridge*, *Sturrcy*, &c.

STOUR, EAST, a parish of England, in Dorsetshire; 4 miles west of Shaftesbury.

STOUR, WEST, another parish in the same county, separated from the foregoing by the river Stour, over which there is a bridge.

STOUR, a river of England, which rises in the county of Somerset, from three sources, the first near Wincanton, the second near Pen, and the third near More Park. The second and third of these streams unite, soon after their entering Dorsetshire, in Gillingham Forest, where the Stour becomes a considerable river, and directs its course nearly towards the south, where it is joined by the stream from Wincaunton, near Fifehead. About two miles and a half below this junction, it receives the waters of the Lyddon; and about half a mile farther, it is joined by the Dulish, flowing with a full stream to Sturminster Newton. Here it advances to the south-east, washing the town of Blandford, and receiving at Wimbourne Minster, the waters of the Allen. About four miles below its junction with the Allen it leaves Dorsetshire, and falls into the English channel at Christ Church, in Hampshire.—2. A river which rises in Shropshire, and running through Staffordshire and Worcestershire, falls into the Severn at Stourport, above Hartlebury castle. Its course is about 20 miles, and in that space it has on it upwards of 30 slitting mills, forges, corn mills, &c.—3. A river in Dorsetshire, which runs into the Avon near Canford Lawn.—4. A river which rises in Essex, and running through Hertfordshire, falls into the Lea at Hawsham.—5. A river which rises in Oxfordshire, and running through Warwickshire, falls into the Avon below Stratford.—6. *Stour*, or *Stoure*, *Greater* and *Lesser*, are two rivers of England, in the county of Kent. The Greater Stour rises from two principal branches, the first at Well-street, near Lenham, and the other among the hills between Liminge and Postling. These streams, with the addition of several rivulets, unite near Ashford, where turning to the north-east, they flow in one channel by Spring-grove to Wye. Thence proceeding through a beautiful country, this river passes several villages in its way to Canterbury, through which it flows in a divided stream, and again unites a little below the city, having formed three small islands in its progress. It then takes a north-easterly direction to the isle of Thanet. Here it anciently joined the Wantsume, a river at one time of considerable magnitude, but the channel of which became in time choaked up by the tides, and the name is now lost in that of the Stour. The Stour, after directing a branch north-westward from Sarre flows to the east, and being joined by the Lesser Stour, continues its course between the isle of Thanet and the mainland; and making an immense sweep southwards to Sandwich, it then returns towards the north, and falls into the Sandwich, and thence winding to the north, it falls into the British channel at Pepperness. That branch which proceeds northwards from Sarre, is called the Nethergong; and being joined by a stream from Cheslet, flows into the sea at Newhaven. The Lesser Stour rises near Liminge, and flows northwards in a north-easterly direction by Barham Downs, and passing various pleasant villages, in nearly a parallel line with the Greater Stour, falls into that river about a mile beyond Stourmouth. The Stour is famous for trout.—7. A river of England, which rises on the borders of Cambridgeshire; near Haverhill, and forms the entire boundary between the counties of Suffolk and Essex. It passes by Clare, Sudbury, and Nayland, and after being joined by the Bret and other smaller streams, receives the tide at Manningtree. Here, increasing considerably in breadth, it presents a beautiful object at high water, the effect of which, however, is considerably diminished by its muddy channel and contracted stream during ebb. It joins the Orwell from Ipswich, and their united streams form the noble harbour of Harwich, whence they

they discharge themselves into the German Ocean, between that town and Land-Guard Fort.

STOURBRIDGE, a market town of England, in the county of Worcester, situated on the river Stour, and deriving its name from the bridge here over that river. The town stands on a gentle declivity, and its general appearance is handsome, though the streets are irregularly laid out. The principal street is of considerable length, and contains some good houses. Being for a considerable period a hamlet belonging to Swinford, it had, until the time of Henry VIII., a chapel dependent on the church of that place; but having now become a large and populous town, it has been made parochial, and independent of the mother church; and a chapel was erected of brick in 1742, which is a neat good building. The town also contains several chapels for dissenters, viz., the Quakers, founded in 1680; the Presbyterians in 1698, but now occupied by the Independents; the present Presbyterians, erected in 1788, and reckoned an elegant building; and the Methodists in 1805. A theatre was erected here in 1790. A free-school was founded by Edward VI. The present one is handsomely endowed, and under the inspection of eight governors. Stourbridge is noted for its manufactures, which are various and considerable, in glass, iron, cloth, and bricks. The principal, however, is that of glass. Numerous iron-works, on a large scale, are interspersed through great part of the neighbourhood; and many of the more minute branches of the iron trade, as the making of nails, agricultural implements, &c. are successfully carried on here. The process of making leather from sheep-skins is practised here; and manufactures of broad and narrow cloth are of long standing. In the neighbourhood of the town there are mines which produce coal, iron-stone, and clay, the last of which, for its excellence and use in the manufacture of glass, is said to be unequalled in the world. This clay is found about 150 feet below the surface of the ground, under three strata of coal, in the space of about 200 acres, 48 of which contain it of superior quality to the rest: 4000 tons of it are raised annually. Clay of inferior quality is also found, suited to many important purposes. The trade and prosperity of Stourbridge has been greatly promoted by the various lines of inland navigation which have been formed in this part of the country, and with which it communicates. Market on Friday, and various annual fairs; 22 miles north of Worcester, and 124 north-west of London. Lat. 52. 26. N. long. 2. 8. W.

STOURBRIDGE, or **STURBRIDGE**, the name of a field near Cambridge, in England, on the banks of the Stour, noted for its fair, kept annually on the 18th September, continuing a fortnight under the jurisdiction of the University of Cambridge. The fair is well attended, and supplied with every article of manufacture and provision, as well as all kinds of cattle.

STOURHOLM, one of the smaller Shetland Isles, lying on the north side of the Mainland. Lat. 60. 54. N. long. 1. 35. W.

STOURMOUTH, a parish of England, in Kent; 8 miles east-north-east of Canterbury.

STOUR PAINE, a parish of England, in Dorsetshire; 3 miles north-west-by-north of Blandford Forum.

STOURPORT, a market-town of England, in the county of Worcester, situated on the banks of the river Stour, near its junction with the Severn. It is a place of very recent origin, and in fact owes its existence, as well as its increasing trade and prosperity, to the formation of the Trent and Severn, or the Staffordshire and Worcestershire canal, which entering the latter country at Wolverley, and following the course of the Stour for about nine miles, terminates in a basin at Stourport, where it joins the Severn. The basin was begun in 1768, and finished in 1771. Previous to this there was no appearance of a town here, and the soil presented nothing but a barren heath. It is now, however, a scene of the greatest activity and business, being the general depôt of communication between the central and western parts of the kingdom, and forming a kind of maritime town in the heart

of the country. The numerous barges and trows that come loaded both up and down the Severn, meet here the various carriers on the canals from the north and east, and a mutual exchange of their goods takes place. Additional basins have been formed for the accommodation of this trade, and these admit barges and trows from Worcester, Gloucester, and Bristol, which unlade into numerous warehouses built on the margins of the basins. Smaller vessels arrive from Colebrook, Shrewsbury, Welsh Pool, and their goods, with others from Kidderminster, Stourbridge, Wolverhampton, Dudley, and Birmingham, are forwarded to the Staffordshire potteries, to Liverpool, Manchester, Chester, and Derby, where they are distributed over all parts of the eastern coast. A very extensive trade is here carried on in coals from the Staffordshire and Worcestershire collieries. Stourport takes the lead of every other place in this part of the kingdom, as a market for hops, and apples in their season, &c.; and it is also of considerable importance as a corn-market. The town is handsome, and has an air even of elegance. The houses are neat and commodious, and mostly on a good scale. The streets are comfortable, full of shops, and thronged with people. Here is a handsome chapel of ease, but no other public building of consequence. The bridge here over the Severn is an object of curiosity, as well of utility, and of beauty. It consists of a single arch of iron 150 feet span, and about 50 above the surface of the water. It was erected in place of a stone-bridge, which was swept away by a great flood. In 1811, Stourport contained 464 houses, and 2352 inhabitants. At present the population is estimated at 3000. Market on Wednesday and Saturday; 11 miles north of Worcester, and 124 north-west of London. Lat. 52. 25. N. long. 2. 7. W.

STOUR PROVOST, or **STOWRE PATRELLIS**, a parish of England, in Dorsetshire; $4\frac{1}{2}$ miles west-by-south of Shaftsbury. Population 662.

STOURTON, or **STOUR HEAD**, a village of England, in Wiltshire, near the source of the river Stour. Here is Alfred's tower, a beautiful triangular building, 155 feet high, from the top of which there is one of the most striking and beautiful prospects in England. This tower is built on the spot where King Alfred erected his standard in the year 870, when he collected together his scattered friends, and defeated the Danes. Population 635; $2\frac{1}{2}$ miles west-north-west of Mere.

STOURTON CANDAL, a parish of England, in Dorsetshire; 3 miles from Stalbridge. Population 304.

STOURTON, a hamlet of England, in Warwickshire; 4 miles south-east of Shipston-upon-Stour.

STOUSE HEAD, a cape on the east coast of the island of South Ronaldshay. Lat. 58. 40. N. long. 2. 47. W.

STOUT, *adj.* [*stout*, Dutch; *stolz*, proud, German; *stautan*, Gothic, is to strike.] Strong; lusty; valiant.

When I was young,
I do remember how my father said,
A *stouter* champion never handled sword. *Shakspeare.*

Brave; bold; intrepid.—He lost the character of a bold, *stout*, and magnanimous man, which he had been long reputed to be. *Clarendon.*—Obstinate; pertinacious; resolute; proud.

The lords all stand,
To clear their cause most resolutely *stout.* *Daniel.*

There virtue and *stout* honour pass'd the guard,
Those only friends that could not be debarr'd. *Bathurst.*

Strong; firm.
The *stoutest* vessel to the storm gave way,
And suck'd through loosen'd planks the rushing sea. *Dryden.*

STOUT, *s.* A cant name for strong beer.
Should but his muse descending drop
A slice of bread and mutton-chop.
Or kindly, when his credit's out,
Surprise him with a pint of *stout*;
Exalted in his mighty mind,
He flies and leaves the stars behind. *Swift.*

STOUTING,

STOUTING, a parish of England, in Kent; 7 miles from Ashford.

STOUTLY, *adv.* Lustily; boldly; obstinately.

The general and his wife are talking of it,
And she speaks for you *stoutly*.

Shakspeare.

STOUTNESS, *s.* Strength; valour. Boldness; fortitude.—His bashfulness in youth was the very true sign of his virtue and *stoutness* after. *Ascham*.—Obstinacy; stubbornness.

Come all to ruin, let

Thy mother rather feel thy pride, than fear,
Thy dangerous *stoutness*: for I mock at death
With as stout heart as thou.

Shakspeare.

To STOW, *v. a.* [ἵστω, *Sax.*; *stoe*, old Frisick, a place; *stowen*, Dutch, to lay up.] To lay up; to reposit in order; to lay in the proper place.—Foul thief! where hast thou *stow'd* my daughter. *Shakspeare*.

STOW, or STOE. Whether singly or jointly, are the same with the Saxon ἵστω, a place.

STOW (John), an industrious antiquarian and historian, was the son of a merchant tailor in London, and born about the year 1525. About the year 1560 he formed the design of composing annals of the English history, and to this object he sacrificed his trade and domestic concerns; travelling on foot to several cathedrals and other public establishments, in order to examine records, charters, and ancient documents. He also purchased, as far as he was able, old books, manuscripts, parchments, &c., of which he made a large collection. But wanting patrons, and pressed by necessity, he was obliged to intermit his favourite pursuits, and to renew his application to business with a property that had been much lessened. Benefactions, however, from Dr. Parker, archbishop of Canterbury, enabled him to prosecute his studies; but being suspected of an attachment to popery, an information against him was laid before the council, in 1568, as a dangerous person, and as having possession of many pernicious books of superstition. His study was searched by order of Dr. Grindal, bishop of London, and many popish books were found in it; which discovery fixed upon his character the reproach of a suspected person; and two years after, an unnatural brother, who having defrauded him of his goods, was desirous of taking away his life, preferred against him above 140 articles before the ecclesiastical commission. But the infamous character of the witnesses who were engaged to prove the charges, caused him to be acquitted. His first work, undertaken at the request of the powerful favourite, Robert Dudley, earl of Leicester, had been already published: and as it had been dedicated to the said nobleman, his countenance was of service to him in his present circumstances. This was "A Summarie of English Chroniques," first printed in 1565, and several times reprinted. This book contained an account of the reign of every English king from the era of the fabulous Brute, down to his own time, with a list of all the principal magistrates of London from the Conquest. It was afterwards continued by Edmond Howes, who printed several editions, so that the work must have been popular. In 1575 he lost his best patron, archbishop Parker; but his mind was so ardently engaged in his antiquarian studies, that he prosecuted them with unintermitting diligence and zeal, amidst all the inconveniences and distresses of penury. In 1585 he presented a petition to the lord mayor and court of aldermen, stating that for 25 years he had been employed in compiling and publishing divers summaries, recording the memorable acts of famous citizens, and that he contemplated the publication of a larger summary, and soliciting encouragement and assistance: and four years after he presented another petition, requesting a pension, or some other benefaction; but it does not appear whether or not he succeeded in his solicitations.

To the improvement of the second edition of the Chroniques published by Hollingshed in 1587, Stow largely contributed; and he also supplied corrections and notes for two editions of Chaucer. His "Survey of London, &c." on

which he had been long employed, appeared in 1598, and a second edition was presented to the public before his death. It was several times reprinted, with successive improvements, and has been the basis of all the subsequent histories of the metropolis. For his large Chronicle or History of England he had been for 40 years collecting materials; but he only lived to print an abstract of it in 1600, entitled "Flores Historiarum, or Annals of England," 4to., dedicated to archbishop Whitgift. Edmond Howes published from his papers a folio volume, entitled "Stow's Chronicle;" but this does not seem to contain that "far larger work," mentioned by Stow, and which he left in his study fairly written out for the press. It is said to have come into the possession of Sir Symonds Dewes, but is not found among his MSS. in the British Museum. Stow having spent his patrimony, and acquired no certain income, sunk into wretched penury in his old age, and was under a necessity of applying for public charity: and James I., "by one of the meanest acts of his very mean reign," granted a licence, authorizing him, then in his 78th year, "to repair to churches, or other places, to receive the gratuities and charitable benevolence of well-disposed people." Of the amount of this bounty, we may from some conjecture from the collection in the parish of St. Mary Woolnoth, which reached the sum of 7*s.* 6*d.*! The city of London was not more liberal than the sovereign of the country; and it must reflect no small degree of reproach upon it, that it could not extend its liberality towards its own historian. Stow, oppressed by poverty and painful diseases, obtained a release in the year 1605, at the age of 80 years. His aspect is said to have been cheerful, and his behaviour mild and courteous.

"In his writings," says one of his biographers, "he displayed a sincere love of truth, and great diligence in investigating it, with the moral feelings of a worthy man. His brother antiquarians speak of him with respect; and if he ranks, in point of style and matter, with the inferior class of his historians, he may claim the praise of humble utility." *Gen. Biog.*

STOW, 1. A parish of Scotland, in the southern part of Mid-Lothian, and comprehending a small part of Selkirkshire; it extends 15 miles in length, and is on an average 5 miles in breadth.—2. A village in the above parish, situated on the east bank of Gala water.—3. A parish of England, in Cambridgeshire; 5 miles from Cambridge.—4. A parish in Huntingdonshire, 2½ miles north-by-east of Kimbolton.—5. A parish in Lincolnshire, supposed to be the ancient *Sidnacester*. The church, which is an ancient and very large fabric, was founded by one of the Bishops of Dorchester, and rebuilt by the first Bishop of Lincoln. In the park are to be traced the foundation of its abbey, which was afterwards the bishop's palace; 8 miles south-east of Gainsborough.—6. The remains of another parish in Lincolnshire, near Market Deeping, now united with Bardholm.—7. A hamlet in Oxfordshire; 4 miles north-east of Oxford.—8. A parish in Salop, near Bishop's Castle.—9. A post township of the United States, in Middlesex county, Massachusetts; 30 miles west of Boston.—10. A post township of the United States, in Portage county, Ohio.

STOW, BARDOLPH, a parish of England, in Norfolk; 2 miles north-north-east of Market Downham. Population 677.

STOW, BYDON, a parish of England, in Norfolk; 4 miles south-east-by-south of Watton.

STOW CREEK, a river of the United States, in New Jersey, which runs into the Delaware. Lat. 39. 38. N. long. 75. 26. W.

STOW, LANGTOFT, a parish of England, in Suffolk; 8 miles east-south-east of Bury St. Edmund's.

STOW, MARKET, a market town of England, in the county of Suffolk, situated on the river Orwell, almost in the centre of the county. It is a thriving town, and contains many good and even handsome houses, especially about the market-place. The church is a large and beautiful building, with a square tower, surmounted by a steeple 120 feet high, which is of wood, yet has a light and elegant appearance.

pearance. On an eminence about a mile from the town, stands the house of industry for the hundred of Stow. It is a very respectable building, and has rather indeed the appearance of a gentleman's seat than a receptacle for paupers. Its erection cost 1200*l.*; and it was opened in 1781. A manufacture of sacking, ropes, twine, and hempen, is carried on in Stow. This has succeeded to the manufacture of stuffs, and bombasines, which was formerly carried on. Being well situated for the barley trade, the market of the town is much frequented by the farmers, for a considerable distance round; and hence much business is done in the malting, in which trade there are from 15 to 20 houses. One great source of the prosperity of Stow Market is the navigable canal from this place to Ipswich, which was opened in 1793. It is 16 miles in length, and has 15 locks, each 60 feet long and 14 wide, three built with timber, and 12 with brick and stone. From the basin there is an agreeable walk about a mile in length, along the towing path, winding chiefly through hop plantations, of which there are 150 acres in this neighbourhood. Market on Thursday, and two annual fairs; 12½ miles north-north-west of Ipswich, and 75 north-north-east of London. Lat. 52. 11. N. long. 9. 59. E.

STOW, MARY'S, or STOW MARSH, a parish of England, in Essex; 5½ miles south-south-west of Maldon.

STOW-NINE-CHURCHES, a parish of England, in Northamptonshire; 5½ miles south-east of Daventry.

STOW, UPLAND, a parish of England, in Suffolk, adjacent to Market-Stow. Population 720.

STOW, WEST, a parish of England, in Suffolk; 5 miles north-north-west of Bury St. Edmund's.

STOW-ON-THE-WOLD, a market town of England, in the county of Gloucester, situated on the summit of a high hill, the base of which is about 3 miles in diameter. The situation is airy, and the air, though cold, is very healthy. The houses are mostly low, and built with stone: they have generally a very ancient appearance. The church is a strong and well-built edifice, apparently the work of different periods during the 14th and 15th centuries. It consists of a nave, aisles, and chancel, with an embattled tower on the south side, 81 feet in height, which, from its lofty situation, constitutes a principal object through a circumference of many miles. The arches are pointed, and supported by clustered pillars, some of which have zig-zag capitals. At the east end is a rich window of quatrefoils, and at the west end a window of ovals, with two trefoils in each. The principal charitable institutions in the town are an almshouse for nine poor persons, and a free-school. These are situated on the south side of the churchyard. The former was founded under the will of William Chestre, dated so early as the 16th Edward IV. Ailmere, Earl of Cornwall and Devon, the reputed founder of the original church here, is said also to have founded an hospital in the 10th century. The principal manufacture in Stow is that of shoes. The parish is governed by two bailiffs appointed annually. It is about 12 miles in circumference. The charter for the market was granted in the fourth of Edward III. to the abbey of Evesham, by which establishment some part of the manor was held in the time of Edward the Confessor; and within a century it had obtained possession of the remainder. Market on Thursday. The fairs, on 12th May and 24th October, have long been famous for hops, cheese, and sheep; 11 miles south-south-east of Camden, 25 north-east of Gloucester, and 77 west-by-north of London.

STOW'AGE, *s.* Room for laying up.—What were all the fasts and humiliations of the late reformers, but the forbearing of dinners? that is, the enlarging the *stowage*, and the redoubling the appetite for a large supper! *South.*—In every vessel is *stowage* for immense treasures, when the cargo is pure bullion, or merchandize of as great a value. *Addison.*—The state of being laid up.

'Tis plate of rare device, and jewels
Of rich and exquisite form, their value's great;
And I am something curious, being strange,
To have them in safe *stowage*.

Shakspeare.

The things stowed.

We ha' ne'er better luck,
When we ha' such *stowage* as these trinkets with us.

Beaum. and Fl.

Money paid for stowing of goods.

STOWBOROUGH, a parish of England, in Dorsetshire, situated on the river Frome, and forming a kind of suburb to Wareham.

STOWE, a parish of England, in the county of Buckingham, noted for containing the magnificent seat, gardens, and pleasure grounds of the Marquis of Buckingham, which forms the chief ornament of the county. This noble demesne is situated 2 miles north-west of Buckingham, and, when beheld at a distance, appears like a vast grove interspersed with columns, obelisks, and towers, which apparently emerge from a luxuriant mass of foliage. In approaching the house, the first architectural object that attracts attention is a Corinthian arch or gateway, 60 feet high by 60 wide, which forms the principal approach, and where a grand display is presented of the mansion, groves, temples, obelisks, lake, &c. At a short distance from the arch is one of the entrances to the gardens, which comprise about 400 acres of highly decorated grounds. These gardens obtained their celebrity from the alterations effected by Lord Cobham, under whose directions, with the aid of the best artists, the groves were planted, the lawns laid out, and many of the buildings of the place erected. On the south and west sides of the gardens, the principal objects are the hermitage; the temple of Venus, designed and executed by Kent, a square building, decorated with Ionic columns; the queen's statue; the Boycott pavilions, designed by Vanbrugh; the temple of Bacchus; and in the centre of a large lawn is the rotunda, raised on ten Ionic columns, and ornamented in the centre with a statue of Bacchus. On the east side of the gardens is the entrance to the Elysian Fields, where the figures of heroes, poets, and philosophers, seem to justify the name. This part is watered by a small rivulet, which flowing from the grotto, passes through a valley ornamented with a number of fine old trees, and which includes some of the most charming views and objects in the whole demesne. The rivulet then runs into the lake, which is a considerable sheet of water, dividing itself into two branches, and retiring through beautiful valleys. A Doric arch, decorated with the statues of Apollo and the Muses, leads into the Elysian Fields. Through the arch the Palladian bridge is seen, and a castellated lodge, built on the opposite hill. On the right is the temple of Friendship, and on the left are the temples of Ancient Virtue and of British Worthies. The temple of Ancient Virtue is a circular building of the Ionic order. The dome is supported by 16 columns. Within are four statues by Sheemaker, of Lycurgus, Socrates, Homer, and Epaminondas, with appropriate inscriptions by Lord Lyttleton. The temple of Worthies is a semicircular building, erected on the banks of the upper lake, after a design by Kent. It contains busts of Pope, Sir Thomas Gresham, Inigo Jones, Milton, Shakspeare, Locke, Newton, Bacon, Alfred, &c. The grotto is situated in a romantic dell, composed of broken stones, pebbles, flints, spars, and other materials. The temple of Concord and Virtue is a large handsome building, of an oblong shape, surrounded with 28 fluted Ionic columns, and is thought to be one of the most chaste and elegant ornamental structures in the kingdom. Lord Cobham's Pillar is 115 feet high, surmounted with a statue of his lordship. Captain Grenville's monument is a lofty column, erected by Lord Cobham, in honour of his nephew, Captain Thomas Grenville. The Queen's building is a beautiful temple, designed by Kent. On the opposite side of a deep valley, is the most picturesque and curious building in the gardens, termed the Gothic temple, a triangular building, with a pentagonal tower at each corner, one of which rises to the height of 70 feet, and terminates with battlements and pinnacles; the others are surmounted with domes. The inside is richly adorned with light columns and various pointed arches, and the windows are glazed with a fine collection of old painted glass, on which

a variety of sacred subjects and armorial bearings are represented. In a woody recess near the temple are some good statues by Rysbrach, of the seven Saxon deities, who gave names to the days of the week, on each of which is a Saxon inscription. The temple of Friendship is built in the Tuscan style of architecture. The Pebble Alcove and Congreve's monument were executed from designs by Kent. Such are the principal objects in these famous gardens, where, according to Walpole, the rich landscapes occasioned by the multiplicity of temples and obelisks, occasion both surprise and pleasure, sometimes recalling Albano's landscapes to our mind, and oftener to our fancy the idolatrous and luxurious vales of Daphne and Tempe. The house is situated on an eminence rising gradually from the lake to the south front, which forms the principal entrance. It covers a large extent of ground, measuring from east to west 916 feet, of which the central 454 include the principal apartments. These range on each side of the saloon, and communicate with each other by a series of doors placed in a direct line. The south or garden front is composed of a centre, two colonades, and two pavilion wings, the same height as the centre. The side has a rusticated casement, and is adorned with a great number of Corinthian and Ionic columns and pilasters. This front was wholly designed by Lords Cobham and Camelford. The saloon is perhaps one of the finest apartments of the kind in England, presenting a combination of objects, beautiful and sumptuous. The expenses of this apartment amounted to 12,000*l.* Its shape is oval, measuring 60 feet long, 43 broad, and 56½ high. The hall was designed and painted by Kent. The state drawing-room is 50 feet by 32, and 22 high. It contains a collection of well-executed pictures, most of which are by the best old masters. The state gallery, dressing-room, bed-chamber, and closet, are all formed on a suitable scale of extent, and elegance of embellishment. The pictures in them include portraits of all the celebrated characters in English history and literature. The library contains 10,000 volumes, many of which are very rare and valuable, with a great collection of unpublished manuscripts. The manor of Stowe appears to have been purchased into the Temple family in 1560, by Peter Temple, Esq., and the original mansion erected by that gentleman. Sir Peter Temple, a distant descendant, inclosed about 200 acres of ground for a park, which he stocked with deer. Sir Richard, the next heir, rebuilt the manor-house. On his death the estate devolved to his son, who was created Baron Cobham in 1714, and Viscount Cobham in 1718, with a collateral remainder of both titles to his second sister Hester, wife of Richard Grenville, Esq., of Watton, in this county. Lord Cobham died in 1749, and was succeeded by the above lady, who was then created Countess Cobham. The title of Marquis of Buckingham was obtained in the year 1784. When in the possession of Lord Cobham, Stowe was visited by the most distinguished poets and literati of the age; and Pope, Chesterfield, Hammond, Lyttleton, Pitt, and West, were among its frequent guests.

STOWELL, a hamlet of England, in Gloucestershire; 2 miles west-south-west of North Leach.

STOWELL, a parish of England, in Somersetshire; 5 miles south-south-west of Wincanton.

STOWEY.—1. A parish of England, in Somersetshire; 3 miles south-south-west of Pensford.—2. STOWEY (*Nether*), a town and parish of England, in Somersetshire, with a weekly market on Tuesday, and a fair on the 18th September. The church is a handsome building; and near it is a spring, which has the property of encrusting, with the appearance of stone, pieces of wood, &c., thrown into it. It had formerly a castle, of which no vestige now remains, except the ditch; 8 miles west-north-west of Bridgewater, and 149 west-by-south of London.—3. STOWEY (*Over*), another parish in the same county; about a mile distant from the foregoing.

STOWFORD, a parish of England, in Devonshire, between the rivers Lid and Thrushel; 10½ miles south-west-by-west of Oakhampton.

STOWGURSEY, a parish of England, in Somersetshire; 7 miles from Bridgewater. Population 1208.

STOWTON, a parish of England, in Devonshire; 3 miles from Exeter.

STOYESTOWN, a post township of the United States, in Somerset county, Pennsylvania.

STOZINGEN, LOWER and UPPER, a small town and village of the west of Germany, in Wirtemberg; 14 miles north-north-east of Ulm. The former has 1300, the latter only 400 inhabitants.

STRA, a small town of Austrian Italy, in the Venetian district of Padua.

STRABANE, a populous town of Ireland, in the county of Tyrone, pleasantly situated on the river Foyle. Before the union it sent two members to the Irish parliament; 40 miles north-west of Armagh, and 11 south-south-west of Londonderry. Lat. 54. 50. N. long. 7. 19. W.

STRABANE, a township of the United States, in Washington county, Pennsylvania.

STRABISM, *s.* [*strabisme*, Fr.; *strabismus*, Lat.] A squinting; act of looking askant.

STRABISMUS, [*Στραβισμος*, Gr.] Squinting.

STRABO, a celebrated geographer, was born at Amasia, a city of Pontus, but in what year we cannot ascertain. From his acquaintance with C. Gallus, prefect of Egypt, and from his having composed his geography in the fourth year of the emperor Tiberius, we may infer that he flourished in the century B. C.; and Blair assigns his death to the year 25 before the commencement of the Christian era. It appears, that he studied grammar and rhetoric at Nysa, and that he was instructed in the principles of the various sects of philosophers in several of the most celebrated schools of Asia. He owns himself a Stoic, and he followed their dogmas. Of the general course of his life, little is known; but he appears to have been a great traveller, and to have visited most of the countries which he describes. Besides his Geography, contained in seventeen books, which was written in his advanced age, and which is highly valued, he was the author of some historical works, which have been lost. His Geography, though from the time in which he lived it must be imperfect and erroneous in various particulars, is very useful for the illustration of the history and writings of the ancients; more especially as he intersperses many philosophical remarks, which indicate a cultivated mind, and many short narratives, which serve to extend our acquaintance with the history and antiquities of remote periods.

Several editions of a Latin version of Strabo appeared before the Greek text was printed. Of the Greek and Latin editions, the first that claims commendation for its erudition, was that of Is. Casaubon, fol., Genev. 1587, and Paris, 1620. That of Janson ab Almeloveen, cum notis variorum, Amst., 2 vols. fol., 1707, is much esteemed, though not very correct. An Oxford edition has also appeared, under the inspection of Mr. Falconer. *Fabr. Bibl. Græc. Gen. Biog.*

STRACHAN, formerly called STRATHAEN, a parish of Scotland, in Kincardineshire, lying on the north side of the Grampian ridge.

STRACHUR and STRALUCHAN, a united parish of Argyllshire, about 18 miles long, and from 3 to 6 broad, lying on the south side of Loch Fyne. Population 1129.

STRADA (Famiano), a celebrated Italian writer, born at Rome in 1572, who entered into the society of Jesus in 1592, and became professor of eloquence in the Roman college, where he resided till his death in 1659. His most famous work was a "History of the Wars in the Low Countries," in Latin, consisting of two decades: the first, comprising the events from the death of Charles V. to the year 1573, and published in 1632; and the second, as far as 1590, published in 1647. Strada's work was criticised with some severity, by Cardinal Bentivoglio; and it is allowed to have been more the production of a rhetorician than of an impartial and correct historian. The style, however, is animated, and the language pure, though defective in the good taste

taste of some other modern Latinists. It was attacked with virulence by Gaspar Scioppius, in his "Infamia Famiani Stradae," which injured his own reputation more than that of the historian.

The "Prolusiones Academicæ" of Strada, containing various dissertations on literary subjects, is an ingenious and elegant performance, particularly admired for its imitations of the most celebrated Latin poets. Addison pronounces this effusion to be "one of the most entertaining, as well as the most just pieces of criticism he had ever read;" and he has made it the subject of three papers in the *Guardian*. *Gen. Biog.*

STRADA, or STRADANUS, an eminent painter of a good family, was born at Bruges in the year 1536; and after studying in his own country, visited Italy for further improvement. At Florence, he was employed in some considerable works, and thence he went to Rome, where he painted at the palace of Belvidere in concert with Dan. da Volterra and Fr. Salviati. In compliance with the invitation of Don John, of Austria, he visited Naples, and accompanied his patron to Vienna, where his pencil was employed in commemorating that great officer's military exploits. He afterwards fixed his residence at Florence, where he became the head of the Florentine academy of painting; and he died in 1604. Besides history-pieces, he painted animals, huntings, and battles, in a noble style, with good drawing, and an agreeable tone of colouring. Although he may be considered as a competitor in a variety of respects with the celebrated artists of his time, he could never divest himself wholly of the Flemish taste which he had imbibed in his youth. Many of his pieces are engraved.

STRADBALLY, a small neat village of Ireland, in Queen's county, where a handsome church, a good market-house, and a charter school are erected. In the 12th century a monastery for conventual Franciscans was founded here by Lord O'More; 38½ miles south-west of Dublin.

STRADBROOKE, a parish of England, in Suffolk; 5½ miles east-by-south of Ely.

To STRADDLE, *v. n.* To stand or walk with the feet removed far from each other to the right and left; to part the legs wide.

Unskilful statuaries suppose

In forming a Colossus, if they make him

Straddle enough, strut, and look big, and gape,
Their work is goodly.

Chapman.

STRADELLA, a town of the continental Sardinian states, in the Milanese, pleasantly situated on a rising ground covered with vines and fruit trees, near the small river Aversa. It has some manufactures of woollens and silk, and a population of 3900; 10 miles south-south-east of Pavia.

STRADEN, a large village of the Austrian states, in Styria, circle of Gratz, with a well-frequented annual fair.

STRADFORD, or SLANEY, a town of Ireland in the county of Wicklow, pleasantly situated on the Slaney. It has a very thriving cotton manufactory, which employs a considerable population; 26 miles south of Dublin.

STRADISHALL, a parish of England, in Suffolk; 5 miles north-north-west of Clare.

STRADSET, a parish of England, in Norfolk; 4 miles east-north-east of Market Downham.

STRAFFORD, a village of England, in Dorsetshire; 3 miles from Dorchester.

STRAFFORD, a county of the United States, in the east part of New Hampshire, bounded north by Coos county, east by Maine, south-west by Rockingham county, and west by Grafton county. Population 41,394. Chief towns, Dover, Gilmanton, Rochester, and Durham.

STRAFFORD, a township of the United States, in Orange county, Vermont; 35 miles north of Windsor. Here is an extensive copperas manufactory.

STRAFFORD, a township of the United States, in Montgomery county, New York; 15 miles north-west of Johnstown.

To STRAGGLE, *v. n.* [Of this word no etymology is

known: it is probably a frequentative of *stray*, from *straviare*, Italian, of *extra viam*, Latin.] To wander without any certain direction; to rove; to ramble.

But stay, like one that thinks to bring his friend

A mile or two, and sees the journey's end:

I *straggle* on too far.

Suckling.

To wander dispersedly.—He likewise enriched poor *straggl*ing soldiers with great quantity. *Shakspearc.*—To exuberate; to shoot too far.

Were they content to prune the lavish vine,

Of *straggl*ing branches, and improve the wine.

Prior.

Trim off the small superfluous branches on each side of the hedge that *straggle* too far out. *Mortimer.*—To be dispersed; to be apart from any main body; to stand single.—Having passed the Syrens, they came between Scylla and Charybdis, and the *straggl*ing rocks, which seemed to cast out great store of flames and smoke. *Raleigh.*

STRAGGLE, *s.* A wanderer; a rover; one who forsakes his company; one who rambles without any settled direction.

Let's whip these *stragglers* o'er the seas again,

Lash hence these over-weening rags of France,

These famish'd beggars.

Shakspeare.

Any thing that pushes beyond the rest, or stands single.

Let thy hand supply the pruning knife,

And crop luxuriant *stragglers*, nor be loth

To strip the branches of their leafy growth.

Dryden.

STRAGGLETHORPE, a parish of England, in Lincolnshire; 12 miles west-north-west of Sleaford.

STRAID, a small village of Ireland, in the county of Antrim; 89½ miles north of Dublin.

STRAIGHT, *adj.* It is well observed by Ainsworth, that for *not* crooked we ought to write *straight*, and for narrow *strait*; but for *streight*, which is sometimes found, there is no good authority. *Dr. Johnson.*—It is from the Saxon *ƿƿrac*, *right*, *direct*; *strack*, Germ. the same; which, as Serenius and Dr. Jamieson have observed, are from the verbs signifying to stretch; as *straccka*, Su. Goth. *ƿƿeccan*, Sax. And a *straight* line, the latter adds, gives us the idea of that which is *stretched out* between two points.] Not crooked: right.

Beauty made barren the swell'd boast

Of him that best could speak; feature, laming

The shrine of Venus, or *straight*-pight Minerva.

Shakspeare.

Narrow; close. This should properly be *strait*; *estroit*, Fr. [See STRAIT.]—Queen Elizabeth used to say of her instructions to great officers, that they were like to garments, *strait* at the first putting on, but did by and by wear loose enough. *Bacon.*—Tense; tight. Of this sense it is doubtful whether it belongs to *strait*, *close*, *narrow*; or to *straight*, *not crooked*. Pull the cord *straight*, may mean, *draw it till it has no flexure*; tie it *straight* about you, may mean, *draw it into a narrower compass*. This ambiguity has perhaps confounded the orthography.

STRAIGHT, *adv.* [*strax*, Danish; *strack*, Dutch.] Immediately; directly. This sense is naturally derived from the adjective, as a *straight* line is the shortest line between two points.

If the devil come and roar for them,

I will not send them. I will after *straight*,

And tell him so.

Shakspeare.

STRAIGHT, a small river of North America, which falls into the Ohio between the Little Miami and the Scioto.

STRAIGHT CREEK, a river of America, which runs into the Ohio. Lat. 38. 38. N. long. 84. 2. W.

To STRAIGHTEN, *v. a.* To make not crooked; to make straight.—A crooked stick is not *straightened*, except it be as far bent on the clean contrary side. *Hooker.*—Of ourselves being so apt to err, the only way which we have to *straighten* our path is, by following the rule of his will,

whose

whose footsteps naturally are right. *Hooker*.—To make tense; to tighten.

STRAIGHTENER, *s.* A director; one who sets right.

STRAIGHTFORTH, *adv.* Directly; thenceforth.

She smote the ground, the which *straightforth* did yield
A fruitful olive tree. *Spenser*.

STRAIGHTLY, *adv.* In a right line; not crookedly.—Tightly; with tension.—The soul may deem herself too *straitly* girt up. *Mora*.

STRAIGHTNESS, *s.* Rectitude; the contrary to crookedness.—Some are for masts, as fir and pine, because of their length and *straightness*. *Bacon*.—Tension; tightness.

STRAIGHTWAY, *adv.* [It is very often written *straightways*, and therefore is perhaps more properly written *straightwise*.] Immediately; straight.

Like to a ship, that, having 'scap'd a tempest,
Is *straightway* claim'd and boarded with a pirate. *Shakspeare*.

To **STRAIN**, *v. a.* [*estreindre*, French.]—To squeeze through something.—Their aliment ought to be light, rice boiled in whey and *strained*. *Arbutnot*.—To purify by filtration.—Earth doth not *strain* water so finely as sand. *Bacon*.—To squeeze in an embrace.

Old Evander, with a close embrace,
Strain'd his departing friend; and tears o'erflow'd his face. *Dryden*.

To sprain; to weaken by too much violence.—The jury make no more scruple to pass against an Englishman and the queen, though it be to *strain* their oaths, than to drink milk unstrained. *Spenser*.

Prudes decay'd about may tack,
Strain their necks with looking back. *Swift*.

To put to its utmost strength.

Thus mine enemy fell,
And thus I set my foot on his neck;—even then
The princely blood flows in his cheek, he sweats,
Strains his young nerves, and puts himself in posture
That acts my words. *Shakspeare*.

To make strait or tense.

Thou, the more he varies forms, beware
To *strain* his fetters with a stricter care. *Dryden*.

To push beyond the proper extent.

See they suffer death,
But in their deaths remember they are men,
Strain not the laws to make their torture grievous. *Addison*.

To force; to constrain; to make uneasy or unnatural.

The lark sings so out of tune,
Straining harsh discords and displeasing sharps. *Shakspeare*.

To **STRAIN**, *v. n.* To make violent efforts.

To build his fortune I will *strain* a little,
For 'tis a bond in men. *Shakspeare*.

To be filtered by compression.—Cæsar thought that all sea-sands had natural springs of fresh water: but it is the sea-water; because the pit filled according to the measure of the tide, and the sea-water passing or *straining* through the sands, leaveth the saltness behind them. *Bacon*.

STRAIN, *s.* An injury by too much violence.—Credit is gained by custom, and seldom recovers a *strain*; but if broken, is never well set again. *Temple*.—[ʃtɹeɪn, Sax.] Race; generation; descent.

Thus far I can praise him; he is of a noble *strain*,
Of approv'd valour. *Shakspeare*.

Hereditary disposition.—Amongst these sweet knaves and all this courtesy! the *strain* of man's bred out into baboon and monkey. *Shakspeare*.—A style or manner of speaking.—In our liturgy are as great *strains* of true sublime eloquence, as are any where to be found in our language. *Swift*.—Song; note; sound.—Wilt thou love such a woman?

what, to make thee an instrument, and play false *strains* upon thee? *Shakspeare*.

Orpheus self may heave his head
From golden slumber on a bed
Of heap'd Elysian flowers, and hear
Such *strains* as would have won the ear
Of Pluto, to have quite set free
His half-regain'd Eurydice. *Milton*.

Rank; character.

But thou who lately of the common *strain*,
Wert one of us, if still thou do'st retain
The same ill habits, the same follies too,
Still thou art bound to vice, and still a slave. *Dryden*.

Turn; tendency; inborn disposition.—Because heretics have a *strain* of madness, he applied her with some corporal chastisements, which with respite of time might haply reduce her to good order. *Hayward*.—Manner of speech or action.—Such take too high a *strain* at the first, and are magnanimous more than tract of years can uphold, as was Scipio Africanus, of whom Livy saith, *ultima primis cedebant*. *Bacon*.

STRAINABLE, *adj.* Capable of being pushed beyond the proper extent.—A thing captious and *strainable*. *Bacon*.

STRAINER, *s.* An instrument of filtration.

These when condens'd, the airy region pours
On the dry earth, in rain or gentle showers,
Th' insinuating drops sink through the sand,
And pass the porous *strainers* of the land. *Blackmore*.

One who exerts his utmost strength.

Is he therefore to be deemed
Rude, or savage? or esteemed
But a sorry entertainer,
'Cause he is no common *strainer*
After painted nymphs for favours? *B. Jonson*.

STRAINING, *s.* The act of filtration; the substance strained.—The act of putting to the utmost stretch.—Our words flow from us in a smooth continued stream, without those *strainings* of the voice, motions of the body, and majesty of the hand, which are so much celebrated in the orators of Greece and Rome. *Atterbury*.

STRAINT, *s.* Violent tension. *Not in use*.

Sir Artegal —

Upon his iron collar griped fast,
That with the *strain* his wesand nigh he brast. *Spenser*.

STRAIT, *adj.* [*stretto*, Ital.] Narrow; close; not wide.

Witnesses, like watches, go
Just as they're set, too fast or slow;
And where in conscience they're *strait* lac'd,
'Tis ten to one that side is cast. *Hudibras*.

Close; intimate.—He, forgetting all former injuries, had received that naughty Plexirtus into a *straight* degree of favour, his goodness being as apt to be deceived, as the other's craft was to deceive. *Sidney*.—Strict; rigorous.

Proceed no *straiter* 'gainst our uncle Glo'ster,
Than from the evidence of good esteem.
He be approv'd in practice culpable. *Shakspeare*.

Difficult; distressful.—Narrow; avaricious.

I do not ask you much,
I beg cold comfort; and you are so *strait*,
And so ingrateful, you deny me that. *Shakspeare*.

It is used in opposition to crooked, but is then more properly written *straight*. [See **STRAIGHT**].—A bell or a cannon may be heard beyond a hill which intercepts the sight of the sounding body, and sounds are propagated as readily through crooked pipes as through *straight* ones. *Newton*.

STRAIT, *s.* A narrow pass, or frith.

Honour travels in a *streight* so narrow,
Where one but goes abreast.

Shakspeare.

Distress; difficulty. [*strete*, old Fr. *embaras*, difficulté. Lacombe.]

'Tis hard with me, whatever choice I make,
I must not merit you, or must forsake:
But in this *streight*, to honour I'll be true,
And leave my fortune to the gods and you.

Dryden.

To STRAIT, *v. a.* To put to difficulties.

If your lass

Interpretation should abuse, and call this
Your lack of love or bounty; you were *straited*
For a reply, at least, if you make care
Of happy holding her.

Shakspeare.

To STRAITEN, *v. a.* To make narrow.

If this be our condition, thus to dwell
In narrow circuit *straiten'd* by a foe,
Subtle or violent.

Milton.

To contract; to confine.—Feeling can give us a notion
of all ideas that enter at the eye, except colours; but it is
very much *streightened* and confined to the number, bulk,
and distance of its objects. *Addison.*

To make tight; to intend.

Stretch them at their length,
And pull their *streighten'd* cords with all your strength.

Dryden.

To deprive of necessary room.

The airy crowd
Swarm'd and were *straiten'd*.

Milton.

To distress; to perplex.—Men, by continually striving
and fighting to enlarge their bounds, and encroaching upon
one another, seem to be *straitened* for want of room.
Ray.

STRAIT'HANDED, *adj.* Parsimonious; sparing; nig-
gardly.

STRAITHANDEDNESS, *s.* Niggardliness.—They were
not more liberal than our Romish divorcers are niggardly:—
the Romish doctrine makes the *strait-handedness* so much
more injurious. *Bp. Hall.*

STRAITLACED, *adj.* Griped with stays.—Let nature
have scope to fashion the body as she thinks best; we have
few well-shaped that are *straitlaced*, or much tampered
with. *Locke.*—Stiff; constrained; without freedom.—
I was never so *strait-lac'd* to you, squire. *B. Jonson.*

STRAITLY, *adv.* Narrowly. Strictly; rigorously.—
Those laws he *straitly* requireth to be observed without
breach or blame. *Hooker.*—Closely; intimately.

STRAITNESS, *s.* Narrowness.—The *straitness* of my
conscience will not give me leave to swallow down such
camels. *King Charles.*—Strictness; rigour. If his own
life answer the *straitness* of his proceeding, it shall become
him well. *Shakspeare.*—Distress; difficulty; want; scar-
city.—The *straitness* of the conveniences of life amongst
them had never reached so far, as to the use of fire, till the
Spaniards brought it amongst them. *Locke.*

STRAITON, a parish of Scotland, in Ayrshire, about 15
miles in length from north-west to south-east, and 5 in
breadth. Population 1069.

STRAKE. The obsolete preterite of *strike*; struck.

Did'st thou not see a bleeding hind
Whose right haunch earst my stedfast arrow *strake*?

Spenser.

STRAKE, *s.* A long mark; a streak. See STREAK. A
narrow board; the strake of a cart is the iron with which
the cart wheels are bound. *Barret.*

STRAKONITZ, a small town of Bohemia, on the river
Wotawa, 60 miles south-by-west of Prague, and 18 north of
Prachatitz. Population 2000.

VOL. XXIII. No. 1595.

STRALEN, a small town of Prussian Westphalia, in the
government of Cleves; 6 miles south-west of Gueldres.

STRALSTEIN, ACTINOLITE. See MINERALOGY.

STRALSUND, a government of the Prussian states, in-
cluding the part of Pomerania which belonged to Sweden
until 1813, along with Rugen and other islands on the north
coast. It is almost entirely surrounded by water, the Baltic
bounding it on the north, and the Peene, the Trebel, and the
Reckenitz, three rivers partly navigable, on the other sides.
Its area is 1400 square miles; its population about 115,000;
and it is much more fertile than the rest of Pomerania. In-
stead of the lakes and light sandy soils of the governments of
Stettin and Coslin, there is here a heavy loam or black
mould, producing fine crops of corn, rye, and pulse, as well
as flax and tobacco. The pastures are not favourable for the
larger cattle; but the number of sheep, hogs, and above all,
of geese, is very considerable.

STRALSUND, a considerable town of Pomerania, long
subject to Sweden, now to Prussia. It is situated on the
strait which separates the island of Rugen from the mainland;
and being surrounded on one part by the sea, in others by
lakes and marshes, is accessible only by bridges, and was a
fortress of importance till 1807, since which it has been in
a manner dismantled. Its harbour is capacious and safe,
admitting ships of 15 feet of draught: those of greater bur-
den unload in the roads. The population exceeds 11,000,
but the aspect of the town is gloomy, the houses being low,
built of brick, and remarkable for being pointed at the top.
Of churches there are four Protestant and one Catholic. The
other public buildings are the government-house, the town-
house, the mint, the arsenal, and the governor's residence:
Of public institutions, the chief are the academy or gymna-
sium, the orphan-house, the poor-house, the lunatic hospital,
and the public library. The environs are flat and sandy,
and the water used by the inhabitants is raised by a hydrau-
lic machine. The manufactures are on a small scale, but
very diversified, comprising woollens, linen, tobacco, soap,
and glass: also breweries and distilleries. Stralsund was built
about the year 1209, became a member of the Hanseatic
league, and has long been a place of trade. Of corn, its
principal export, there is sometimes shipped between 30,000
and 40,000 quarters. The imports consist, as in the other
towns in the Baltic, chiefly of colonial produce and foreign
manufactures. Here, as at Stettin, the building of ships and
boats form a considerable branch of trade. The town has
suffered much at different times by sieges, but has always re-
covered, in consequence chiefly of its favourable situation for
trade; 90 miles north-north-west of Stettin. Lat. 54. 19.
N. long. 30. 32. E.

To STRA'MASH, *v. a.* [*stramazare*, Ital.] To beat;
to bang; to break irreparably; to destroy: a northern word,
according to Grose, who, however, notices no etymon.
Dr. Jamieson mentions the substantive *stramash* as a Scottish
word, and refers to the Fr. *estramacon*, a blow.

STRAMBERG, a small town of the Austrian states, in
Moravia; 35 miles east of Olmutz, and 5 south-south-west
of Freyberg. Population 1600.

STRAMBINO, a town of the Sardinian states, in the
Piedmontese province of Ivrea, on the Chiusella, with 3400
inhabitants.

STRAMINEOUS, *adj.* [*stramineus*, Lat.] Strawy;
consisting of straw.—Upon a sudden approach of the warned
electric, the *stramineous* bodies will, at first, a little
recede. *Dr. Robinson.*—Light; chaffy; like straw.—
Other discourse, dry, barren, *stramineous*, dull, and heavy.
Burton.

STRAMONIUM. See DATURA STRAMONIUM.

STRAMSHALL, or STRENSHALL, a township of England,
in Staffordshire, situated on a rivulet; 1½ mile north-north-
west of Uttoxeter.

STRAMULIPP, a district of modern Greece, comprising
the ancient Bœotia. See TURKEY.

STRAND, *s.* [strand, Saxon; *strande*, Dutch; *strënd*,
Icelandic.] The verge of the sea or of any water.

I saw sweet beauty in her face;
Such as the daughter of Agenor had,
That made great Jove to humble him to her hand,
When with his knees he kiss'd the Cretan *strand*.

Shakspeare.

Some wretch'd lines from this neglected hand,
May find my hero on the foreign *strand*,
Warm'd with new fires.

Prior.

A twist of a rope. (Derivation unknown.)

To STRAND, v. a. To drive or force upon the shallows.
Tarchon's alone was lost, and *stranded* stood,
Stuck on a bank, and beaten by the flood.

Dryden.

Some from the *stranded* vessel force their way,
Fearful of fate they meet it in the sea;
Some who escape the fury of the wave,
Sicken on earth, and sink into a grave.

Prior.

STRAND, NORTH, a strait of the North sea, between the island of Benbecula and North Uist.

STRAND, SOUTH, a strait of the sea, between the island of Benbecula and South Uist.

STRANG, adj. [ʃʁɑ̃ʒ, Sax.] Strong: our northern word.

STRANGE, adj. [*estrange*, Fr. *extranens*, Lat.] Foreign; of another country.—The natural subjects of the state should bear a sufficient proportion to the *strange* subjects that they govern. *Bacon*.—Not domestic.

As the man loves least at home to be,
That hath a slutish house, haunted with sprites;
So she, impatient her own faults to see,
Turns from herself, and in *strange* things delights.

Davies.

Wonderful; causing wonder.

Strange to relate, from young Iulus' head
A lambent flame arose, which gently spread
Around his brows, and on his temples fed.

Dryden.

Odd; irregular; not according to the common way.

Desire my man's abode, where I did leave him:
He's *strange* and peevish.

Shakspeare.

Unknown; new.—Here is the hand and seal of the duke: you know the character, I doubt not; and the signet is not *strange* to you. *Shakspeare*.—Remote.

She makes it *strange*, but she would be best pleas'd
To be so anger'd with another letter.

Shakspeare.

Uncommonly good or bad.—This made David to admire the law of God at that *strange* rate, and to advance the knowledge of it above all other knowledge. *Tillotson*.—Unacquainted.—They were now, like sand without lime, ill bound together, at a gaze, looking *strange* one upon another, not knowing who was faithful. *Bacon*.

STRANGE, interj. An expression of wonder.—*Strange!* that fatherly authority should be the only original of government, and yet all mankind not know it. *Locke*.

To STRANGE, v. n. To be estranged.

My wits chaungen,
And all lusts for me *straungen*.

Gower.

To wonder; to be astonished.—Were all the assertions of Aristotle such as theology pronounceth impieties, which we *strange* not at from one, of whom a father saith, *Nec Deum coluit, nec curavit*. *Glanville*.

To STRANGE, v. a. [*estranger*, old Fr.] To alienate; to *strange*.—*Stranging* them from their God. *Woodroephe*.

STRANGE (Sir Robert), an eminent English engraver, was born in one of the Orkney Islands, in 1721, and placed at a proper age with a painter in Edinburgh. When the Pretender landed in Scotland, he entered into the rebel army, and after the battle of Culloden, he concealed himself for some time in the Highlands. Returning to Edinburgh, he passed over to France, and settled at Rouen, where he acquired reputation by the productions of his pencil. At Paris, whither he next removed, he placed himself under the instruc-

tion of Le Bas, who excelled in engraving with what is called among artists the "dry needle." In 1751 he settled in London, and acquired the reputation of being the father of historical engraving in this country. He visited Italy in 1760, and by his admirable drawings of the capital pictures in that city, recommended himself to such a degree, that he was admitted a member of all the principal Italian academies. His early political errors having been forgotten, he was patronized at the English court, and in 1787 received the honour of knighthood. After a course of the most indefatigable labour in the practice of his art, he died in 1792. Besides a number of other works, he left fifty capital plates from pictures of the most celebrated masters of the Italian schools. Selecting, as he was accustomed to do, eighty copies of the best impressions of every plate which he engraved, he collected them into as many volumes, and prefixed to each two plates of himself, one an etching, the other a finished proof, from a drawing by I. Bapt. Greuse; together with an introduction on the progress of engraving, and critical remarks on the pictures from which the engravings were taken.

STRANGEA, a secondary ridge of mountains which branches off from the Hæmus chain on the south, and extends along the Black sea to the Thracian Bosphorus. An inferior branch called Mount Tekis, becomes detached from this, and stretches partly in a south-west direction to the point of the Chersonesus, partly in a circular form, round the gulf of Enos.

STRANGELY, adv. With some relation to foreigners.

As by *strange* fortune

It came to us, I do in justice charge thee
That thou commend it *strangely* to some place,
Where chance may nurse or end it.

Shakspeare.

Wonderfully; in a way to cause wonder, but commonly with a degree of dislike.

My former speeches have but hit your thoughts,
Which can interpret farther: only, I say,
Things have been *strangely* borne.

Shakspeare.

STRANGENESS, s. Foreignness; the state of belonging to another country.—If I will obey the Gospel, no distance of place, no *strangeness* of country, can make any man a stranger to me. *Sprat*.—Uncommunicativeness; distance of behaviour.—Ungird thy *strangeness*, and tell me what I shall vent to my lady. *Shakspeare*.—Remoteness from common manners or notions; uncouthness.

Men worthier than himself

Here tend the savage *strangeness* he puts on;

And undergo, in an observing kind,
His humorous predominance.

Shakspeare.

Mutual dislike.—In this peace there was an article that no Englishman should enter into Scotland, and no Scottishman into England, without letters commendatory: this might seem a means to continue a *strangeness* between the nations; but it was done to lock in the borderers. *Bacon*.—Wonderfulness; power of raising wonder.—This raised greater tumults and boilings in the hearts of men, than the *strangeness* and seeming unreasonablebleness of all the former articles. *South*.

STRANGER, s. [*estranger*, Fr.] A foreigner; one of another country.

I am a most poor woman, and a *stranger*,
Born out of your dominions; having here
No judge indifferent.

Shakspeare.

One unknown.

Thus the majestic mother of mankind,
To her own charms most amiably blind,
On the green margin innocently stood,
And gaz'd indulgent on the crystal flood;
Survey'd the *stranger* in the painted wave,
And smiling prais'd the beauties which she gave.

Young.

A guest; one not a domestic.

He

He will vouchsafe

This day to be our guest : bring forth and pour
Abundance, fit to honour and receive
Our heavenly *stranger*.

Milton.

One unacquainted.

My child is yet a *stranger* in the world :
She hath not seen the change of fourteen years.

Shakspeare.

One not admitted to any communication or fellowship.

I unspeak my detraction ; here abjure
The taints and blames upon myself,
For *strangers* to my nature.

Shakspeare.

To STRANGER *v. a.* To estrange ; to alienate.

Will you with those infirmities she owes,
Dower'd with our curse, and *stranger'd* with our oath,
Take her or leave her ?

Shakspeare.

STRANGER'S KEY, a small island among the Bahamas.
Lat. 26. 43. N. long. 78. 40. W.

STRANGFORD, an ancient town of Ireland, now decayed, in the county of Down, situated on a rapid inlet leading to Lough Strangford. Here a charter school was established in 1748, by the earl of Kildare, and liberally endowed ; 6 miles east of Downpatrick, and 80½ north-north-east of Dublin. Lat. 54. 21. N. long. 5. 28. W.

STRANGFORD, LOUGH, a large bay of Ireland, in the county of Down, extending from Killard Point in the Irish sea, to Newtown ; about 17 miles from south to north ; in some places five miles broad, in others three, and at its opening into the sea not one. It contains a great many small islands, and numerous creeks convenient for fishing harbours. It takes its name from the town of Strangford.

To STR'ANGLE, *v. a.* [*strangulo*, Lat.] To choke ; to suffocate ; to kill by intercepting the breath.

His face is black and full of blood ;
His eye-balls farther out, than when he liv'd ;
Staring full ghastly, like a *strangled* man.

Shakspeare.

To suppress ; to hinder from birth or appearance.

By th' clock, 'tis day ;
And yet dark night *strangles* the travelling lamp :
Is't night's predominance, or the day's shame ?

Shakspeare.

STR'ANGLER *s.* One who strangles.—The band that seems to tie their friendship together, will be the very *strangler* of their amity.

Shakspeare.

STR'ANGLES, *s.* Swellings in a horse's throat.

STR'ANGLING, *s.* Death by stopping the breath.—My soul chooseth *strangling* and death rather than life.

STRANGULA'TION, *s.* [*strangulation*, Fr. Cotgrave.] The act of strangling ; suffocation ; the state of being strangled.—The reduction of the jaws is difficult, and, if they be not timely reduced, there happen paralysis and *strangulation*.

Wiseman.

STR'ANGURY, *s.* [*σπαγγουρία*, Gr. ; *strangurie*, Fr.] A difficulty of urine attended with pain.—The liquor of the birch is most powerful for the dissolving of the stone in the bladder, bloody water, and *strangury*.

See SURGERY.

STRANING, a small town of Lower Austria, in the quarter below the Mannhartsberg, with 1600 inhabitants.

STRANORLANE, a neat little village of Ireland, in the county of Donegal, pleasantly situated on the river Fin ; 112 miles north-west of Dublin.

STRANRAER, or STRANRAWER, a royal burgh of Scotland, in Wigtonshire, seated at the head of the bay of Loch Ryan. It is the seat of a presbytery, and the chief town of the district called the Rinns. The principal street is of great length in proportion to the extent of the town. The greater part of the houses are old, and no regular plan has been observed. But whole streets of elegant houses have been lately built ; and a handsome town-house and prison erected about 45 years ago, adds greatly to the appearance of the town. It is a port of the custom-house. It has some trade to the

Baltic, to Ireland, and to England, chiefly in the exportation of grain. The cotton and linen manufactures are carried on to a considerable extent. There is also a considerable tan-work. The harbour of Stranraer is excellent, being sheltered on all sides, and lying at the head of Loch Ryan, which affords excellent anchorage. The tonnage of vessels belonging to it is 1200 tons. Stranraer is governed by a provost, two bailies, a dean of guild, and 15 councillors, and unites with Wigton, New Galloway, and Whithorn, in electing a member to parliament. Near the town is the old castle of Stranraer, formerly a seat of the earls of Stair ; and not far from it is the castle of Culhorn, the beautiful residence of that noble family. The burgh is chiefly the property of that nobleman, or dependent upon him. The great road from Carlisle, &c. to Port Patrick passes through the town. The parish is not large, and extends but to a small distance round the burgh ; 50 miles south of Ayr, 68¾ west of Dumfries, and 6¼ east of Port Patrick.

STRANSDORF, a small town of Lower Austria, on the river Bulka ; 32 miles north of Vienna. Population 900.

STRANTON, a parish of England, in Durham ; 10½ miles north-east-by-north of Stockton-upon-Tees.

STRAP, *s.* [στρόπος, Sax. *strop*, Teut. *stroppa*, Ital.] A narrow long slip of cloth or leather.—These clothes are good enough to drink in, and so be these boots too ; an they be not, let them hang themselves in their own *straps*.

Shakspeare.

To STRAP, *v. a.* To beat with a strap.

STRAPPA'DO, *s.* [old Fr. *strapade*, "sorte de punition militaire." Roq. Supposed to be from the Ital. *strappare*, to pull with force.] A kind of military torture formerly practised in drawing up an offender to the top of a beam, and letting him fall ; in consequence of which, dislocation of a limb usually happened.—Were I at the *strappado*, or all the racks in the world, I would not tell you on compulsion.

Shakspeare.

To STRAPPA'DO, *v. a.* To torture.—They had neither been haled into your gehenna at Lambeth, nor *strappadoed* with an oath ex officio by your bowmen of the arches.

Milton.

STRAPPING, *adj.* Vast ; large ; bulky. Used of large men or women in contempt.

STRASBURG, a large city of France, in Alsace, situated at the influx of the Brushe into the Ille, and only half a mile from the Rhine. Its form approaches to the semicircular ; and being built in a plain, it is divided into several parts by canals, over which there is a number of bridges. Its extent is considerable, its population about 50,000. The construction of the houses is after the German manner, Alsace having belonged to France only since the latter half of the 17th century, and the language and customs of the majority of the inhabitants being still German. The material chiefly employed for building is a red sort of stone found in the quarries along the Rhine. The houses are lofty, but often heavy and inelegant. Of the streets, the one called *La Grande rue*, and a few others, are wide and straight, but the far greater part are narrow. The *place d'armes* is a square, surrounded with good buildings, and planted with trees. It is frequented as a public walk ; but the more extensive promenades are the Contadin, adjacent to the city wall ; and at some distance, the Ruptborshant, a fine meadow, divided into a number of alleys bordered with trees. The fortifications are extensive : they are divided into old and new, the former only repaired by Vauban, the later entirely constructed under the direction of that celebrated engineer. The citadel lies towards the east. It is a regular pentagon, composed of five bastions, and as many half-moons, and with outworks extending almost to the Rhine.

Public Buildings.—Of these the principal is the cathedral or minster, justly classed among the most distinguished specimens of Gothic architecture that exist. Its tower, of 470 feet in height, and ascended by a stair of above 700 steps, is said to be the loftiest building in the world, with the exception of the highest of the pyramids of Egypt. It is a master-piece of architecture, being built of hewn stone, cut with

with such nicety as to give it at a distance some resemblance to lace, and combining the most elegant symmetry of parts with the most perfect solidity. It was from first to last upwards of a century and a half in building. The clock of the cathedral is no less a master-piece of mechanism; for, besides the hour of the day, it describes, when in repair, the motions of the heavenly bodies. Of the other churches, the only one worth notice is that of St. Thomas, containing the splendid monument erected by Louis XV. to Marshal Saxe. The town-hall, a large structure, has its façade ornamented with antique paintings. The episcopal mansion is a good modern building, and the theatre is, for a provincial one, handsome and spacious. Here are two hospitals, one for the military, the other for the lower class of the public generally, both extensive and well regulated. Here is also a foundling-hospital and an orphan-house; an artillery school, a cannon foundry, and an arsenal; to which are to be added, as worth the attention of travellers, a telegraph station, a monument to general Desaix, and the wooden bridge over the Rhine, of the extraordinary length of 3900 feet.

Strasburg is more favourably situated for trade than most inland towns; the fertile soil of Alsace furnishing the means of subsistence to manufacturers, and the Rhine connecting it with Switzerland on the one side, and the Netherlands on the other. Its articles for export consist of corn, flax, hemp, wine, spirituous liquors; also of linen, sailcloth, blankets, carpets, hardware, leather, cotton, and lace. Among other products of Alsace is tobacco, and snuff is consequently an object of manufacture and export at Strasburg.

In regard to education, it is common to give the seminaries of Strasburg the next rank after those of Paris; and though the difference is necessarily very wide, there is here a greater variety of institutions for education than in many towns of larger population. The medical school of Strasburg dates from 1538. After being long an academy, it was constituted a university in the 17th century, and though curtailed in its classes during the French revolution, was replaced on its former footing in 1803. In that year also was established a Protestant university, taught by ten professors, and comprising, as in the Scotch universities, a classical, philosophical, and theological course. The only other Protestant university (or, as they are here termed, academies) in France is Montauban. Strasburg contains not only a medical, but a law school; two public libraries of old date; and a botanic garden. For boys there is here a high school, on the plan of those of Rouen, Caen, and other large towns. The minor objects of a traveller's attention are a cabinet of medals and an anatomical class-room.

Strasburg is a place of great antiquity, having existed prior to the Christian era, and having been known to the Romans by the name of *Argentoratum*. It early received the doctrines of the reformation, and is said to have counted among its inhabitants a majority of Protestants until the latter part of the 17th century, when it was ceded to France. Till then it had held the rank of a free city of the empire, by which is to be understood a town electing its own magistrates, exempt from subjection to any neighbouring prince, and entitled to assert its independence at the Germanic diet. At present the proportion of Catholics considerably exceeds that of Protestants. The town is the see of a bishop, and being the capital of the department of the Lower Rhine, is, of course, the residence of a prefect.

Strasburg, or rather its vicinity, has been more than once the scene of military operations in the present age; in 1793, when the French revolutionists were hard pressed by the Austrians; in the early part of the summer 1796, when the former crossed the Rhine for the invasion of Germany; and, finally, in the autumn of that year, when the French being suddenly expelled from Franconia, Kehl, with its bridge leading to Strasburg, had very nearly fallen into the hands of their opponents. In the invasions of 1814 and 1815, Strasburg escaped attack, though the allies in both cases came very near it; 66 miles north of Bale, 75 east of Nancy, and 290 east of Paris. Lat. 48. 34. 56. N. long. 7. 44. 51. E.

STRASBURG, a small town of West Prussia, on the river Dribenz. Population 1800; 35 miles north-east of Thorn, and 39 east of Culm.—2. A small town of the Prussian states, in Brandenburg, on the borders of Mecklenburg, with 2700 inhabitants, part of them French Calvinists, the descendants of refugees; 12 miles north-west of Prenzlau, and 65 north of Berlin.—3. A small town of Austrian Illyria, in Carinthia, on the river Gurk, with a castle, where the bishop of Gurk commonly resides; 16 miles north of Klagenfurt.—4. A post township of the United States, in Franklin county, Pennsylvania, east of North Mountain; 145 miles west of Philadelphia.—5. A post township and village of the United States, in Lancaster county, Pennsylvania; 58 miles west of Philadelphia. Population 2710. It is a pleasant and considerable town. The village is built chiefly of brick and stone.—6. A post township of the United States, in Shenandoah county, Virginia; 12 miles north-east of Woodstock, containing about 40 houses.

STRACHETS, a small town in the west of Bohemia, with a park no less than 18 miles in circumference, belonging to the prince of Furstenberg; 20 miles west-by-north of Prague.

STRASOLDO, a small town of Austrian Italy, in the district of Udina, not far from that town.

STRASSWALCHEN, a small town of the Austrian states, in the duchy of Salzburg, on the Muhlbach, with 900 inhabitants; 10 miles north-east of Salzburg.

STRASZ, UPPER and LOWER, two large manufacturing villages of Switzerland, near Zurich.

STRASZ, a small town of Lower Austria, with 800 inhabitants; 2 miles north-east of Meissau.

STRATA *s.* [The plural of *stratum*, Lat.] Beds; layers. A philosophical term.—The terrestrial matter is disposed into *strata*, or layers, placed one upon another; in like manner as an earthy sediment, settling down from a fluid, will naturally be. *Woodward.*

STRATAGEM, *s.* [*stratageme*, Fr., *στρατηγημα*, Gr. from *στρατηγος*, to command an army. *Stratagem* has accordingly been the orthography of some.] An artifice in war; a trick by which an enemy is deceived.

John Talbot, I did send for thee,

To tutor thee in *stratagems* of war.

Shakspeare.

An artifice; a trick by which some advantage is obtained.

Those oft are *stratagems* which errors seem;

Nor is it Homer nods, but we who dream.

Pope.

STRATAGEMICAL, *adj.* Full of stratagems. *Cotgrave*, and *Sherwood*.—His wife to gain entirely his affections, sent him this *stratagemical* epistle. *Swift.*

STRATARITHMOMETRY [formed from the Gr. *στρατος*, army, *αριθμος*, number, and *μετρον*, measure.] In War, the art of drawing up an army, or any part of it, in any given geometrical figure; and of expressing the number of men contained in such a figure, as they stand in array, either near at hand, or at any distance assigned.

STRATEGUS, *στρατηγος*, in Antiquity, an officer among the Athenians, of which there were two chosen yearly, to command the troops of the state.

Constantine the Great, besides many other privileges granted to the city of Athens, honoured its chief magistrate with the title of *Μεγας Στρατηγος*.

STRATFIELD, MORTIMER, a parish of England, in Berkshire; 7 miles south-west-by-south of Reading. Population 672.

STRATFIELD, SAY, a parish of England, in Southamptonshire; 6½ miles north-east of Basingstoke. Population 708.

STRATFIELD, TURGES, another parish in the above county; 1 mile distant from the foregoing.

STRATFORD, or LONG STRATFORD, a village of England, in the county of Essex, and neighbourhood of London, the first that is met with after crossing Bow bridge, by which it is joined to Stratford-le-Bow. It is situated in the parish of Ham, and has of late years greatly increased in size and population, particularly on the forest side of the town, viz.,

Maryland

Maryland Point and the Gravel Pits, one facing the road to Woodford and Epping, and the other that to Ilford. The hither part is almost joined to Bow, notwithstanding the intervention of canals, rivers, and marshy grounds. The bridge over the river Lea is said to be the most ancient stone arch in England, having been built by Maud, wife of Henry I., as its old church was by Henry II.; 1 mile north of West Ham, and $3\frac{1}{2}$ north-east of London.

STRATFORD, a village and parish of England, in the county of Suffolk, situated near the river Stour, opposite Manningtree, and on the road from Colchester and London, to Ipswich. It is a great thoroughfare, and has also some manufacturing business. The church is a handsome building. About a quarter of a mile south-west of this place, on the bank of the Stour, is a camp, which some antiquarians assert to have been a Roman station; $58\frac{1}{2}$ miles north-east of London.

STRATFORD, a parish of England, in Suffolk; $2\frac{1}{2}$ miles south-west-by-west of Saxmundham.

STRATFORD, or STRATFORD-UPON-AVON, a large and respectable market town of England, in Warwickshire, is chiefly celebrated for being the birth-place of Shakspeare. It is seated on the western bank of the river Avon, over which is a bridge of 14 arches, and 376 yards in length. The town consists of 12 principal streets, and has on the whole a cheerful, though not a busy aspect. The public buildings are, the bridge over the Avon, the church, the chapel of the Holy Cross, and the town-hall. The church, a spacious and venerable structure, was formerly collegiate, but the college buildings are now destroyed. It stands on the margin of the river Avon, and is embosomed in lofty trees. The structure is of a cruciform description, with a square tower at the intersection of the transept, of early and curious architecture, and on which was raised in 1764 an octagonal spire of stone, in place of one of wood. The different parts of the church appear, from the style of architecture, to have been constructed of various periods during the 14th and 15th centuries. The interior is divided into a nave, two aisles, a transept or cross aisles, and a chancel. It contains numerous monuments and inscriptions, some of which are interesting. The most remarkable is the monument and bust of Shakspeare, which is attached to the north wall of the chancel, near which lie the remains of the poet. Two other flat stones near the grave of Shakspeare, denote the spots where were interred the bodies of his daughter Susanna, and her husband, John Hall, the physician. Several large monuments to the families of Combe, Clopton, &c., are preserved in this church. The chancel contains a monumental effigy of Mr. John Combe, a neighbour and acquaintance of Shakspeare, and who is said to have been satirised by the poet, in an epitaph written on him in his lifetime. The chapel of the Holy Cross is a handsome structure, and a considerable ornament to the town. It belonged to the guild of the Holy Cross, a fraternity partly civil and partly religious, which was established here so early as the year 1269, by Giffard, bishop of Worcester, under the name of the hospital of the Holy Cross in Stratford, and which had particular municipal privileges granted them. Many parts of the building were taken down, and rebuilt in the ornamental Gothic style, by Sir Hugh Clopton, in the reign of Henry VII.; but the chancel appears from the account of the fraternity, to have been rebuilt about the year 1443. In 1804 the chapel underwent some repairs, and it was then discovered that the interior face of the walls had been embellished with fresco paintings. Attached to the chapel are a hall for the brethren of the guild, an almshouse for 24 poor persons of both sexes, and a free grammar school for children, natives of the borough. The guild and fraternity were dissolved at the general suppression of religious houses, but the school and almshouses are still continued, and the guild-hall is used for the meeting of the corporation. The town-hall, first erected in 1633, was a lofty edifice, built on semicircular arches, and supported by round columns, with a cupola on the top. Above was a room used as a magazine for arms and ammunition, which being in the year 1642 much damaged by the explosion of a barrel of gun-

VOL. XXIII. No. 1595.

powder, was partly taken down in 1767, and the present building erected in the year following. Being dedicated in 1769, at Garrick's jubilee, to the memory of Shakspeare, it was then denominated Shakspeare-hall. It contains a room of 60 feet in length, decorated with two paintings by Wilson and Gainsborough, of the poet, and of Garrick, by whom they were presented. The outside of the hall is also ornamented with a statue of Shakspeare, likewise presented by Garrick. Stratford contains an old dilapidated house, in which it is said Shakspeare was born. It is situated in Henley-street, and remained the property of the Hart family, descended from Jone, the sister of Shakspeare, until 1806, when it was sold. It is now divided into two dwellings, and used as a butcher's shop and a public house. After he had attained comparative affluence, Shakspeare retired to a house called New Place, which is destroyed. It was originally erected by sir Hugh Clopton, in the time of Henry VII. In 1597, it was bought by Shakspeare, who gave it the name of New-Place, and resided in it till his death in 1616. In 1753, it was sold to the reverend Francis Gastrell, who seems to have had but little regard for the memory of its former possessor. In 1756 he cut down the famous mulberry tree planted by the hand of Shakspeare; and in 1759, razed the building to the ground.

Stratford has no staple manufacture, or business of any consequence, except a little trade in corn and malt. The great road from London to Holyhead, through Birmingham, passes through the town. Other turnpike roads branch off towards Warwick, Coventry, and Alcester, and to different parts of Northamptonshire, Oxfordshire, Worcestershire, and Gloucestershire. The Avon is navigable hence to the Severn; and a canal lately completed to join the Worcester and Birmingham canal, opens a communication with the northern parts of the kingdom. The town was formerly under the jurisdiction of a bailiff, 14 aldermen, and 14 burgesses; and was incorporated in the 7th year of Edward VI. A fresh charter of incorporation was granted in the 16th of Charles II. by which the municipal government is vested in a mayor, 12 aldermen, and 12 burgesses. The existence of Stratford may be referred to a period three centuries before the Norman conquest, when a monastery existed here, belonging to Ethelard, a viceroy of the Wiccians, and supposed to have been founded soon after the conversion of the Saxons to Christianity. This convent was annexed to the bishopric of Worcester, at the beginning of the 8th century, when the manor of Stratford had attained to some degree of consequence, and was rated in the Norman survey at the sum of £25. In the reign of Richard I. a charter was granted for a weekly market on Thursday, which is still continued. In the time of queen Elizabeth, the town was nearly destroyed by fires. In the civil war of Charles I. an important period in the history of the principal towns in Warwickshire, a party of the royalists was stationed at Stratford, but was driven from the town by the parliamentary army, who destroyed one arch of the bridge, to prevent their returning incursions; the royalists, however, again approached Stratford, and it afterwards became the residence of the queen Henrietta Maria, till she departed to meet Charles near Edge Hill. In 1769 was celebrated at Stratford, Garrick's jubilee in honour of Shakspeare, a performance which excited much attention at the time. Among the eminent natives of the town are John de Stratford, archbishop of Canterbury, lord Chancellor of England, and regent of the kingdom in the reign of Edward III.; Robert de Stratford, his brother, also lord Chancellor and bishop of Chichester; and Ralph de Stratford, nephew of the above prelates, and bishop of London in the same reign. In 1811, the town and parish of Stratford contained 563 houses, and 2842 inhabitants. Market on Thursday, and three annual fairs; 8 miles south-west of Warwick, and 94 north-west of London. Lat. 52. 12. N. long. 1. 41. W.

STRATFORD, a hamlet of England, in Bedfordshire; 2 miles north of Biggleswade.

STRATFORD, a post township of the United States, in Coos county, New Hampshire, east of the Connecticut. Population 339.

STRATFORD, a post township of the United States, in Fairfield county, Connecticut, on the west side of Stratford river, near its mouth. Population 2895. It is a pleasant town, and has an academy and some trade.

STRATFORD, the name applied to the river Housatonic, in the United States, after the junction of the Naugatic, at Derby.

STRATFORD, FENNY, a market town of England, in the county of Buckingham. It derives its name from the marshy nature of the adjacent lands, though the town itself stands on the rising of a hill. It consists of two streets, one on the main road in Watling-street, the other on the cross road leading to Aylesbury. The north side of the town is in the parish of Simpson, the west in that of Blecheley. Along the skirts of the town runs the little river Lofield, which is well supplied with fish, and over which there is a large stone bridge. The chapel which stands in the parish of Blecheley, was rebuilt and endowed at the expense of the antiquary Browne Willis, and his friends. The ceiling contains the arms of all the persons whose subscription amounted to 10*l.* or upwards. Mr. Willis, at his own request, was buried in this chapel, which he dedicated to St. Martin. The inhabitants of Stratford derive their chief support from the resort of travellers, and the manufacture of white thread lace. The south-east entrance to the town has been lately improved by a new road, and its trade increased by the proximity of the Grand Junction canal. The soil of the neighbouring lands is well adapted for grazing, and also for the culture of crops. The swan inn here has continued under that name since the year 1474. Market discontinued, but there are four annual fairs. Population 481; 12 miles east of Buckingham, and 44 north-west of London. Lat. 52. 0. N. long. 0. 43. W.

STRATFORD-LE-BOW. See Bow.

STRATFORD, OLD, a hamlet of England, in Warwickshire, adjacent to the town of Stratford-upon-Avon.

STRATFORD, OLD, a hamlet of England, in Northamptonshire, adjacent to Stoney Stratford.

STRATFORD, STONEY, a market town of England, in the county of Buckingham, situated on the river Ouse, which here divides the county from Northampton. The town is built on the Watling-street, which, entering the county near Brickhill, crosses it in a direct line. The houses are mostly of free-stone, and extend about a mile on each side of the road. The town is divided into two parishes, viz., St. Giles's and St. Mary Magdalen; and it is said there are scarcely 20 acres of land more than those on which the buildings are erected. Originally it appears to have only consisted of a few inns for the accommodation of travellers; but trade increasing, a stone bridge was built over the Ouse, and the road becoming more frequented, additional houses were successively erected. On the 19th of May 1742, it suffered greatly by fire. Nearly two-thirds of the east side were consumed, together with the body of the church of St. Mary Magdalen, but the tower yet remains. St. Giles's church, on the western side, was rebuilt, with the exception of the tower, in the years 1776 and 1777; it is a handsome structure. Near it is a neat market-place, though the principal business is carried on by means of samples displayed by the farmers in the public-houses. In the days of Camden, the centre of the town was adorned with a cross, erected on the spot where the body of Queen Eleanor had rested; but this was demolished in the civil wars. Besides the church, the town contains meeting-houses for dissenters, the inhabitants being divided into several religious denominations, chiefly Baptists. The Independants have a meeting-house at Potter's Pery, a village at a small distance. Two large Sunday schools have been opened, at which upwards of 300 children are taught the rudiments of education; and there are several charities belonging to the town, particularly one of 70*l.* per annum, for the apprenticing of children. The female inhabitants of the town are much employed in lace making; but the chief support and business of the town arises from the passage of travellers. There is no resident magistrate here; but two of the neighbouring magistrates

hold their meetings on the first Friday of every month. Market on Friday, a large one for butcher's meat and corn. In 1811, Stoney Stratford contained 314 houses, and 1488 inhabitants, viz., 520 on the east side parish, and 968 in the west; 6 miles north-west of Fenny Stratford, and 52 north-west of London. Lat. 52. 3. N. Long. 0. 48. W.

STRATFORD, TONEY, a parish of England, in Wiltshire; 4 miles south-west-by-south of Salisbury.

STRATFORD-UNDER-THE-CASTLE, a parish of England, in Wiltshire, in which is situated the noted borough of Old Sarum; 2 miles north-west-by-north of Salisbury.

STRATFORD WATER, or **WEST STRATFORD**, a parish of England in Buckinghamshire; 3 miles west-by-north of Buckingham.

STRATH, *s.* [*ystrad*, Welsh.] A vale; a bottom. *Phillips*.—Avimore is situated in a narrow valley or *strath*, called Strathspey, from its being intersected by the river Spey. *Garnett*.

STRATH, in Scotland, is generally understood to mean a valley broader than a dale or glen, and to receive its peculiar appellation from a river passing through it, as *Strath-bogie*, *Strathspey*, &c., or some particular characteristic, as *Strathmore*, *the Great Valley*, &c.

STRATH, or **STRATHSWORDLE**, a parish of Scotland, in Iverness-shire, in the Isle of Sky, about 19 miles long, and 5½ broad. Population 2107.

STRATHALLAN, a valley of Scotland, in Perthshire, through which runs the river Allan.

STRATHAVEN, a district of Scotland in Banffshire.

STRATHAVEN, a considerable town of Scotland, in the county of Lanark, situated on the Aven. Its chief branch of manufacture is the cotton, in which nearly 400 looms are employed. It was erected into burgh of barony in the year 1450, with the usual privileges, and had an extensive commony granted to the burgesses, all of which has long ago become private property. It has a weekly market, and five annual fairs, on the first Thursday of each of the months of January, March, June, August, and November; but having no public funds, it has no other magistracy than a baron-bailie, nominated by the Duke of Hamilton. Population in 1811, 1610; 7½ miles south of Hamilton, and 16 south-east of Glasgow.

STRATHBEG, LOCH, a small lake of Scotland, in Aberdeenshire, which covers 550 acres, and abounds with trout, eel, and flounders.

STRATHBLANE, a beautiful vale of Scotland, in the counties of Stirling and Dumbarton, formed by the Lennox hills on the south, and the Grampians on the north.

STRATHBLANE, a parish of Scotland, in the north-west corner Stirlingshire, 5 miles long, and 4 broad. Population 821.

STRATHBOGIE, a district of Scotland, in Aberdeenshire, formerly one of the great divisions of that shire called lordships or *thanages*, comprehending the whole original estate which King Robert Bruce gave to the noble family of Gordon. It extends over a surface of 150 square miles, divided into 10 parishes, including the arable and uncultivated land lying on each side of the river Bogie, which joins the Deveron at Huntly.

STRATHBRAN, a valley of Scotland in Perthshire.

STRATHDON, a parish of Scotland, in Aberdeenshire, at the western border of the county. It is 20 miles long, and from 7 to 8 broad. Population 1463.

STRATHERNE, a district in Scotland, in Perthshire, extending from Comrie to Abernethy; bounded by Perth proper on the north, Monteith on the west and south-west, Fife on the south, and the Tay on the east. The river Erne intersects this beautiful district, which consists, for the most part, of a rich and fertile soil, producing abundant crops. It is adorned with numerous villages and gentlemen's seats.

STRATHFILLIN, a vale of Scotland, in Perthshire, noted in former times for a sacred pool dedicated to St. Fillin.

STRATHGRYFE,

STRATHGRYFE, the ancient name of the county of Renfrew, in Scotland; so named from the Gryfe, the principal river.

STRATHMARTIN, a parish of Scotland, in Forfarshire, about 2 miles square. Population 627.

STRATHMIGLO, a parish of Scotland in Fifeshire, about $5\frac{1}{2}$ miles long, and $3\frac{1}{2}$ broad. Population 1697.

STRATHMIGLO, a town in the above parish. The inhabitants amount to 800, and are chiefly employed in the linen manufacture; 12 miles south-east of Perth, and 8 east of Kinross.

STRATHMORE, or the **GREAT STRATH**, in Scotland, a name applied to that valley which traverses the kingdom from Stonehaven in Kincardineshire on the east, to the district of Cowal in Argyllshire on the west. Its northern boundary is formed by the Grampian mountains; and its southern by the Sidlaws, the Ochils, and the Lennox hills. The whole vale is fertile and pleasant, interspersed with numerous towns and villages and elegant seats. Strathmore, however, is more generally applied, in a restricted sense, to that part of it which is bounded by the Sidlaws, extending from Methven in Perthshire, to Laurencekirk in Mearns.

STRATHMORE, a river of Scotland, in Sutherlandshire, which falls into an arm of the sea called Loch Hope.

STRATHNAVER, or **STRATHNAVERN**, a district of Scotland, in Sutherlandshire, and the north-east division of the county, anciently a county of itself, which gives second title of Baroness to the Countess of Sutherland.

STRATHPEFFER, a beautiful valley of Scotland, in Ross-shire, near the town of Dingwall. In this vale is a celebrated mineral spring, called the well of Strathpeffer, strongly impregnated with sulphurated hydrogen gas.

STRATHSPEY, a district of Scotland, in Inverness and Moray shires, through which the Spey flows, celebrated for its great forests of fir.

STRATHY, a river of Scotland, in Sutherlandshire, which has its rise from a small loch of the same name, where, after a course of 15 miles, it runs into the Northern sea, at a small creek called Strathy Bay.

STRATHY HEAD, a promontory of Scotland, in Sutherlandshire, forming the west boundary of Strathy Bay; 31 miles east of Cape Wrath. Lat. 58. 33. N. long. 3. 50. W.

STRATIFICATION, *s.* Arrangement of different matter; arrangement in beds or layers.—A mass in which there is no stratification. *Dr. Hutton.*

To **STRATIFY** *v. a.* [*stratifier*, Fr. from *stratum*, Lat.] To range in beds or layers. A chemical term.—Steel is made from the purest and softest iron, by keeping it red hot, stratified with coal-dust and wood-ashes, &c. *Hill.*

STRATIOTES. [*Στρατιωτης*, of Dioscorides. From *στρατος*, an army], in Botany, a genus of the class dioecia, order dodecandria, polyandria hexagynia (*Linn.*), natural order of palmæ, hydrocharides (*Juss.*)—Generic Character. Male—Calyx: spathe common two-leaved, three or five-flowered: leaflets boat-shaped, compressed, obtuse, converging, keeled, almost equal, permanent. Proper (of the lateral flowers) one-leaved, membranaceous, channelled at the back, opposite to the leaflets of the common spathe, and hidden by them. Corolla: petals three, obcordate, from erect spreading, twice as large as the perianth. Nectaries twenty, anther-shaped, linear-lanceolate, acute, in a ring, inserted into the receptacle. Stamina: filaments twelve, filiform, shorter than the nectaries, inserted into the receptacle. Anthers linear, erect. Female—Calyx: spathe two-leaved, one-flowered: leaflets boat-shaped, compressed, obtuse, converging, unequal, permanent. Perianth as in the male, superior. Corolla as in the male. Nectaries as in the male, a little larger. Pistil: Germ inferior, ovate-hexangular, compressed. Styles six, two-parted. Stigmas simple, recurved. Pericarp: berry ovate, narrowed to both ends, six-sided, six-celled: with a pellucid pulp. Seeds very many, oblong, cylindrical.—*Essential Character.* Spathe two-leaved. Perianth superior, trifold. Petals three. Berry six-celled.

1. *Stratiotes aloides*.—Leaves all radical, forming a star-like tuft, as in the aloes and sedums: their substance is rigid,

brittle, vascular, and pellucid; their teeth and points very sharp; the keel also sharp. Peduncles several, shorter than the leaves, upright, smooth; each bearing one upright white flower, arising from a two-leaved sheath.—Native of some parts of Europe, and of Siberia. In England, it occurs plentifully in the fen ditches of the isle of Ely, and in many other parts.

2. *Stratiotes acroides*.—Leaves ensiform, flat, very smooth, spathe bearded at the point. Root creeping, little branched, jointed as in acorus.—Native of the Ceylonese islands.

3. *Stratiotes alismoides*.—Leaves cordate. Spathe one-leaved, with five, membranaceous, longitudinal angles.—Native of the East Indies and Egypt.

Propagation and Culture.—Young plants must be procured in spring, when they first rise on the surface of the water, and placed in canals, ponds, or large tubs or cisterns, where they will strike down their roots, and increase without farther care.

STRATO, a philosopher of Lampsacus, who succeeded Theophrastus in the Peripatetic school, and took charge of it in the 3d year of the 123d Olympiad, B. C. 286, and presided in it 18 years, with a high degree of reputation for learning and eloquence; and from his attachment to natural philosophy, he obtained the appellation of "Physicus." Ptolemy Philadelphus chose him for his preceptor, and recompensed his services with a present of 80 talents. None of his works have reached our time. His constitution was feeble, and it is said that he lost the powers of perception before his death, which happened about the end of the 127th Olympiad. In his opinion concerning matter, Strato departed essentially from the system both of Plato and Aristotle, and he is said to have nearly approached that system of atheism, which excludes the Deity from the formation of the world. From Cicero (*De Nat. Deor. l. i. c. 13.*) we learn, that he conceived all divine power to be seated in nature, which possesses the causes of production, increase, and diminution, but is wholly destitute of sensation and figure; and the same author, in his *Tuscul. Quæst.* informs us, that he had nothing in common with the atomic principles of Democritus, but ascribes every thing to certain natural motions and librations. Brucker gives the following abstract of his opinions; that there is inherent in nature a principle of motion, or force, without intelligence, which is the only cause of the production and dissolution of bodies; that the world has neither been formed by the agency of a deity; distinct from matter, nor by an intelligent animating principle, but has arisen from a force innate to matter, originally excited by accident, and since continuing to act, according to the peculiar qualities of natural bodies. It does not appear, that he expressly either denied or asserted the existence of a divine nature; but in excluding all idea of deity from the formation of the world, it cannot be doubted, that he indirectly excluded from his system the doctrine of the existence of a supreme being. Strato also taught, that the seat of the soul is in the middle of the brain, and that it only acts by means of the senses. *Brucker by Enfield.*

STRATO'CRACY, *s.* [*στρατος*, Gr. an army, and *κρατος*, power.] A military government.—Ever since the invasion of Kouli Khan, Indostan, from being a well regulated government, became a scene of mere anarchy or *stratocracy*; every great man protecting himself in his tyranny by his soldiers. *Guthrie.*

STRATO'GRAPHY, *s.* [*stratographie*, Fr., *στρατος* and *γραφω*, Gr.] Description of whatever relates to an army.

STRATONISI, three small islands in the Grecian archipelago; 10 miles south of Speccia. Lat. 37. 16. N. long. 23. 25. E.

STRATOR, among the Romans, an officer who took care of the horses furnished by the provincials for the public service.

STRATOR is also used for an officer in the army, whose business it was to take care there was nothing in the roads to

to hinder or incommode the army in its march. For which purpose, he ordered banks and steep eminences to be levelled; laid bridges, cut down woods, and assisted the quartermaster to find out places proper for transporting the army over rivers.

STRATOR is also used for an equerry, who held the bridle of the prince's horse, and assisted him in mounting. This officer was by the Greeks called *anabolous*.

STRATOR likewise denotes a surveyor of the highways.

STRATTON, a market town and parish of England, in the county of Cornwall. It is situated in a low cold country, which stands much in need of draining. Here is a meeting-house for Wesleyan Methodists. The parish contains 2300 acres, and is famed for the well-known battle of Stratton, which was fought near the town, between the parliamentary army, under the Earl of Stamford, and the royal army under George Lord Lansdown, who was supported by Sir Beville Grenville and the Cornish army. The battle took place on the 6th of May 1643, on a hill called Stamford's Hill, from its having been the position of the parliamentary general, whose troops were defeated there with great slaughter. One of the Blanchminster family gave lands of considerable value, part of which are in the parish of Poundstock, to the church and poor of the parish. Market on Tuesday. In 1811, the parish contained 216 houses, and 1094 inhabitants; 46 miles west of Exeter, and 223 west-south-west of London.

STRATTON, a hamlet of England, in Bedfordshire; 1 mile east-south-east of Biggleswade.

STRATTON, a parish of England, in Dorsetshire, on the Roman road north of the river Frome; 3 miles north-west of Dorchester.

STRATTON, a parish of England, in Gloucestershire; 2 miles north-west of Cirencester.

STRATTON, a parish of England, in Wiltshire; 4 miles south-west-by-south of Highworth. Population 517.

STRATTON AUDLEY, a parish of England, in Oxfordshire; 3 miles north-east-by-north of Bicester.

STRATTON, EAST, a parish of England, in Southamptonshire; 5½ miles north-north-west of New Arlesford.

STRATTON-ON-FOSS, a parish of England, in Somersetshire; 5½ miles north-north-east of Shepton Mallet.

STRATTON, ST. MARY'S, a parish of England, in Norfolk; 10½ miles south-by-west of Norwich. Population 558.

STRATTON, ST. MICHAEL'S and ST. PETER'S, two united parishes in Norfolk, half a mile east of the foregoing.

STRATTON, STRAWLESS, another parish in Norfolk; 4 miles south of Aylesham.

STRATTON, a township of the United States, in Windham county, Vermont. Population 265.

STRATUM, *s.* [Lat.] A bed; a layer. A term of philosophy.

Drill'd through the sandy *stratum*, ev'ry way
The waters with the sandy *stratum* rise. *Thomson.*

STRAUBENZILL, a large village in the north-east of Switzerland, in the canton of St. Gall, near the Sittler. It has manufactures of linen and woollen.

STRAUBING, a considerable town of Bavaria, situated on the right bank of the Danube. It stands partly on a height, is divided into Upper and Lower, and is tolerably well built. It is surrounded with a wall, and the bridge over the river is defended, since 1809, by a *tete de pont*. It is the seat of a high court of justice, has several churches and charitable institutions, a flourishing academy, and, in a convent of Ursuline nuns, an establishment for female education. Straubing has 6200 inhabitants, with well frequented markets of corn and cattle, and a trade on the Danube, but no manufactures. The environs are very fertile, but the town has suffered much at different times from fire; 66 miles north-north-east of Munich, and 23 east-south-east of Ratisbon. Lat. 48. 52. 39. N. long. 11. 34. 48. E.

STRAUGHT, *pret. and part.* Stretched. Obsolete in England; but used (as *straucht*) in Scotland.—Striking me down on the place, where yet I lie *straught*. *Shelton.*

STRAVICHIO, a small town in the north-east of European Turkey, on the Black Sea, between two mouths of the Danube; 63 miles south-east of Ismail.

STRAUMNESS, a cape on the west coast of Iceland. Lat. 65. 39. 40. N. long. 24. 30. W.

STRAUPITZ, a large village of Prussian Silesia, near Hirschberg, with 1100 inhabitants.

STRAUSSBERG, a small town of the Prussian province of Brandenburg, government of Potsdam; 20 miles east of Berlin. Population 2700. Here is a large hospital.

STRAW, *s.* [ἵτρεος, Sax.; *stroo*, Dutch. *Dr. Johnson.*—The Saxon forms of this word are also ἵτρεα, ἵτρεο, ἵτρεα, ἵτρε; the last of which is our old English. "*Of stre many a load*," *Chaucer, Kn. Tale.* Our northern word is still *streea*.] The stalk on which the corn grows, and from which it is threshed.

I can countefeit the deep tragedian,
Trembling and start at wagging of a *straw*,
Intending deep suspicion. *Shakspeare.*

To STRAW. See To STREW.

STRA'WBERRY, *s.* [*fragaria*, Lat. ἵτρεα-βεϋε, Sax. Mr. H. Tooke considers *strawberry* as *straw'd-berry*, *stray-berry*, from *straw*, or *strew*. "He would have been pleased," says Todd, "to find, in a curious old book, his statement partly illustrated; the strawberry being there called 'from the manner in which it is set in beds, not cast in heaps, but, as it were *strawed* here and there at manifest distances.' *Dyct's Dry Dinner*, 1599."] A plant. *Miller.* See FRAGARIA.

Content with food, which nature freely bred,
On wildings and on *strawberries* they fed. *Dryden.*

STRAWBERRY PLAINS, a post village of the United States, in Knox county, Tennessee.

STRAWBERRY RIVER, a river of the United States, in the North-west Territory, which runs into Lake Superior, west of Goddard's River. Lat. 46. 40. N. long. 91. 44. W.

STRA'WBERRY TREE, *s.* [*arbutus*, Lat.] It is ever green, the leaves roundish and serrated on the edges; the fruit is of a fleshy substance, and very like a strawberry. *Miller.*

STRA'WBUILT, *adj.* Made up of straw.

They on the smoothed plank,
The suburb of their *strawbuilt* citadel,
New rubb'd with balm, expatiate. *Milton.*

STRA'WCOLOURED, *adj.* Of a light yellow.—I will discharge it in your *strawcolour'd* beard. *Shakspeare.*

STRA'WSTUFFED, *adj.* Stuffed with straw.

So rides he mounted on the market-day,
Upon a *straw-stuff'd* pannel all the way. *Bp. Hall.*

STRA'WWORM, *s.* [*phryganion*, Lat.] A worm bred in straw.

STRA'WY, *adj.* Made of straw; consisting of straw. There the *strawy* Greeks, ripe for his edge,
Fall down before him, like the mower's swath. *Shakspeare.*

Like straw; light.—Luther hath these words: the epistle — is contentious, swelling, dry, *strawy*. *Knott.*

To STRAY, *v. n.* [*stroe*, Danish, to scatter; *stravviare*, Ital., to wander. *Dr. Johnson.*—To *stray*, is the Sax. ἵτρεζαν, to scatter. The Goth, *strawan*, Sax. ἵτρεαϋαν, ἵτρεϋαν, ἵτρεζαν, proceed from *straw*, or, as our peasantry still pronounce it, *strah*; and *astray*, or *astrayed*, means *strawed*, scattered and dispersed, as the *straw* is about the fields. *Mr. H. Tooke, Div. of Purl. i. 469.*] To wander; to rove.

Lo, the glad gales o'er all her beauties *stray*,
Breathe on her lips, and in her bosom play. *Pope.*

To rove out of the way; to range beyond the proper limits.

She doth *stray* about
By holy crosses, where she kneeling prays
For happy wedlock hours. *Shakspeare.*

Wand'rest

Wand'rest thou within this lueid orb,
And *stray'd* from those fair fields of light above,
Amidst this new creation want'st a guide
To reconduct thy steps?

Dryden.

To err; to deviate from the right.—We have erred and *strayed*. *Common Prayer.*

To STRAY, *v. a.* To mislead. *Obsolete.*

Hath not else his eye

Stray'd his affection in unlawful love? *Shakspeare.*

STRAY, *s.* Any creature wandering beyond its limits; any thing lost by wandering.

She hath herself not only well defended,
But taken and impounded as a *stray*
The king of Scots.

Shakspeare.

STRAY, a small river of Franconia, which rises in the Henneberg, and flows into the Saale.

STRA'YER, *s.* One who strays; a wanderer. *Huloet.*—Hubberdin, an old divine of Oxford; a great *strailer* abroad in all quarters of the realm. *For.*

STRAY'ING, *s.* The act of roving; the act of going astray.—Do you see thousand little motes and atoms wandering up and down in a sun-beam? It is God that so peoples it; and he guides their innumerable and irregular *strayings*. *Bp. Hopkins.*

STRAZNITZ, a town of the Austrian states, in Moravia, which has a castle, a monastery, a deanery, a Piarist college, and 4100 inhabitants, of whom a small part are Jews; 14 miles south of Hradisch, and 36 south-east of Brunn.

STREAK, *s.* [ꝛꝛice, Saxon; *streke*, Dutch; *stricca*, Ital.] A line of colour different from that of the ground. Sometimes written *strake*.

The west yet glimmers with some *streaks* of day;
Now spurs the lated traveller apace,
To gain the timely inn.

Shakspeare.

To STREAK, *v. a.* To stripe; to variegate in hues; to dapple.

All the yearlings which were *streak'd* and pied,
Should fall as Jacob's hire.

Shakspeare.

To stretch. *Obsolete.*

She lurks in midst of all her den, and *streaks*
From out a ghastly whirlpool all her necks;
Where, glotting round her rock, to fish she falls. *Chapman.*

STRE'AKY, *adj.* Striped; variegated by hues.

When the hoary head is hid in snow,
The life is in the leaf, and still between
The fits of falling snows appears the *streaky* green. *Dryden.*

STREAM, *s.* [ꝛꝛeam, Saxon; *straum*, Icelandic; *stroom*, Dutch.] A running water; the course of running water; current.

As plays the sun upon the glassy *stream*,
Twinkling another counterfeited beam. *Shakspeare.*

Any thing issuing from a head, and moving forward with continuity of parts.—The *stream* of beneficence hath, by several rivulets which have since fallen into it, wonderfully enlarged its current. *Atterbury.*—Any thing forcible and continued.—It is looked upon as insolence for a man to adhere to his own opinion against the current *stream* of antiquity. *Locke.*—The very *stream* of his life, and the business he hath helmed, must give him a better proclamation. *Shakspeare.*

To STREAM, *v. n.* [*streyma*, Icelandic.] To flow; to run in a continuous current.

God bade the ground be dry,
All but between those banks where rivers now,
Stream, and perpetual draw their humid train. *Milton.*

To emit a current; to pour out water in a stream; to be overflowed.

Then grateful Greece with *streaming* eyes would raise
Historic marbles to record his praise. *Pope.*

VOL. XXIII. No. 1596.

To issue forth with continuance, not by fits.
Now to impartial love, that god most high,
Do my sighs *stream*.

Shakspeare.

To STREAM, *v. a.* To pour; to send forth.

She at length will *stream*

Some dew of grace into my wither'd heart,
After long sorrow and consuming smart. *Spenser.*

To mark with colours or embroidery in long tracks.—The herald's mantle is *streamed* with gold. *Bacon.*

STREAM, a hamlet of England, in the parish of St. Decuman's, Somersetshire.

STRE'AMER, *s.* An ensign; a flag; a pennon; any thing flowing loosely from a stock.

His brave fleet,

With silken *streamers* the young Phœbus fanning. *Shakspeare.*

STRE'AMLET, *s.* A small stream.

Unnumber'd glittering *streamlets* play'd,
And hurled every where their waters sheen. *Thomson.*

STRE'AMY, *adj.* Abounding in running water.

Arcadia,

However *streamy* now, adust and dry,
Deny'd the goddess water: where deep Melas,
And rocky Cratis flow, the chariot smook'd
Obscure with rising dust. *Prior.*

Flowing with a current.

Before him flaming his enormous shield,
Like the broad sun, illumin'd all the field;
His nodding helm emits a *streamy* ray. *Pope.*

STREATHAM, a village and parish of England, in the county of Surrey, and in the vicinity of London. It contains a newly built church, and a charity school; and in the neighbourhood there are numerous handsome villas and country seats. On the side of the small common between Streatham and Tooting is the Streatham Park, which belonged to the late Mr. Thrale, the friend of Dr. Johnson, and afterwards to his relict, Mrs. Piozzi. Dr. Johnson spent much of his time here. In the church, upon tablets of white marble, are Latin inscriptions from the pen of Johnson, to the memory of Mr. Thrale and Mrs. Salisbury, mother of Mrs. Piozzi. On Lime Common in this parish, was discovered in 1660, a mineral water of a mild cathartic quality, which is still held in considerable esteem, but there are no accommodations for persons coming to the spot, though the place is much resorted to; 7 miles south-by-west of St. Paul's, London.

STREATHAM, a parish of England, in the Isle of Ely, Cambridgeshire; 3½ miles south of Ely.

STREATLAM, a township of England, in Durham; 2½ miles north-east-by-east of Barnard Castle.

STREATLEY, a parish of England, in Bedfordshire; 5 miles north-north-west of Luton.

STREATLEY, a parish of England, in Berkshire; 5½ miles south-by-west of Wallingford. Population 596.

STREEFKERK, a village in the interior of Holland, near Goreum, with 900 inhabitants.

To STREEK, *v. a.* [ꝛꝛeccan, Saxon, *expandere*, to stretch.] To lay out a dead body. *North. Ray.*—Durand gives a pretty exact account of some of the ceremonies used at laying out the body, as they are at present practised in the north of England, where the laying out is called *strecking*. *Brand.*

STREET, *s.* [ꝛꝛæte, Saxon; *strasse*, German; *strada*, Spanish and Italian; *streede*, Danish; *straat*, Dutch; *stratum*, Latin. *Dr. Johnson.*—To these words Wachter and Serenius add the Welsh *ystriad*, Icel. *stracta*, Su. Goth. *straat*; and consider them derived from the verbs signifying to tread, as *tretten*, German; *traeda*, Su. Goth., having the *s* (which is common) prefixed.] A way, properly a paved way, between two rows of houses.—He led us through fair
7 U streets;

streets; and all the way we went there were gathered people on both sides, standing in a row. *Bacon*.

When night

Darkens the *streets*, then wander forth the sons
Of Belial, flown with insolence and wine;
Witness the *streets* of Sodom.

Milton.

Proverbially, a public place.—Our public ways would be so crowded, that we should want *street-room*. *Addison*.

STREET, a parish of England, in Somersetshire; 2 miles south-south-west of Glastonbury. Population 634.

STREET, a parish of England, in Sussex; 5 miles north-west of Lewes.

STREETHALL, a hamlet of England, in Essex; 4 miles west-north-west of Saffron Walden.

STREET-HAY, a township of England, in Staffordshire; 2 miles east of Lichfield.

STREET-HAYNE, a hamlet of England, in the parish of Colyton, Devonshire.

STREETWALKER, *s.* A common prostitute that offers herself to sale in the open street.

STREETWARD, or **STRE'TWARD**, *s.* An officer who formerly took care of the streets. See **COWEL**.

STREHLA, a small town of the interior of Germany, in Saxony, on the Elbe. It has 1400 inhabitants, with manufactures of pottery ware, and a corn trade carried on by the Elbe; 29 miles north-west of Dresden.

STREHLEN, a small town of Prussian Silesia, on the Ohle. It contains 3000 inhabitants, who manufacture woollens, stockings, and leather. It has also large wool markets; 17 miles west of Brieg, and 22 south of Breslau.

STREIGHT, *adj.* Narrow. See **STRAIGHT** and **STRAIT**: [*strictus*, Lat.] Restrained.

Whereas he meant his corrosives t' apply,

And with *streight* diet made his stubborn malady. *Spenser*.

STREIGHT, *adv.* Strictly.

My lord me sent, and *streight* behight
To seek occasion.

Spenser.

STREIN, or **STRINIUS**, an Austrian baron with the title Von Schwartzenuau, was born about the year 1538. The first object of his attention was jurisprudence; but afterwards, under the care of Francis Hotman, he prosecuted the study of Roman antiquities with such assiduity and success, that in the twentieth year of his age he composed a work "De Gentibus et Familiis Romanorum," which was published at Paris in 1599, fol. by Henry Stephens; and "Stemmata Gentium et Romanarum Familiarum," inserted in the 7th volume of "Grævii Thesaurus Rom. Ant." He also wrote "Commentarius de Rob. Bellarmini Scriptis atque Libris," and published, under his name, "A Defence of the Freedom of the States of Holland." He died at Vienna, according to De Thou, in 1601, but, as Baillet says, in 1600. He was a decided and steady friend to the Protestant communion.

STREITBERG, a petty town in the interior of Germany, in Bavarian Franconia, on the river Wiesent; 16 miles west-south-west of Bayreuth.

STRELITZ, a village of Scotland, in Perthshire, so named in honour of her Majesty, Queen Charlotte. It was built in 1763, as a place of residence for the discharged soldiers, at the conclusion of the German war. It consists of upwards of 80 dwelling-houses, built in a neat manner, forming a street 90 feet broad, watered by a small stream which runs through it. To every house is annexed a good garden, with about three acres of land, properly inclosed; and the whole village is finely sheltered by belts and stripes of planting; 8 miles north of Perth.

STRELITZ, a city in the north of Germany, the capital of the grand duchy of Mecklenburg-Strelitz, is situated in the lordship of Stargard, in the midst of lakes and marshes. It is divided into Old and New Strelitz, which form properly two towns, being a mile distant from each other. Old Strelitz was formerly the ducal residence, but the palace having been burned in 1713, the duke built a new one at a little

distance, at a place called Glienke, and in 1733 founded a town, called New Strelitz. The two came in time to be considered as one town, but each has its separate magistrates. Old Strelitz contains 3000 inhabitants. New Strelitz, a better built place, has 4000. The manufactures of the two consist of woollen, linen, and, in a small degree, of tobacco. Here are also the public offices of the duchy; 57 miles north-by-west of Berlin. Lat. 53. 25. N. long. 13. 8. E.

STRELITZ, a small town of Prussian Silesia; 35 miles east of Breslau, and 7 east of Namslau. Population 900.

STRELITZ, GREAT, another small town of Prussian Silesia, in the government of Oppeln. Population 1000.

STRELITZIA [so named by Sir Joseph Banks and Mr. Aiton, as a tribute of respect to the botanical zeal and knowledge of the queen of Great Britain, a princess of the house of Mecklenburg-Strelitz], in Botany, a genus of the class pentandria, order monogynia, natural order musæ, (*Juss.*)—Generic Character. Calyx: common sheath inferior, of one leaf, channelled, pointed, widely spreading, many-flowered; partial ones lanceolate, shorter than the flowers. Perianth none. Corolla: superior, irregular, of three-lanceolate, acute petals; the lowermost boat-shaped; two upper ones bluntly keeled. Nectary of three leaves; the two longest equal, rather shorter than the petals, broad at the base, then tapering, with a folded wavy border, embracing the stamens and style, half arrow-shaped towards the top, with a thick dorsal appendage; the third leaf much shorter, ovate, compressed, keeled. Stamina: filaments five, inserted into the receptacle, thread-shaped, three of them embraced by one leaf of the nectary, two by the others; anthers terminal, linear, erect, parallel, about as long as their filaments, concealed in the nectary. Pistil: germen below the corolla, oblong, bluntly triangular; style thread-shaped, the length of the stamens; stigmas three, awl-shaped, rising above the nectary, erect, glued together in an early state. Pericarp: capsule woody, oblong, slightly triangular, obtuse, of three cells and three valves, the partitions from the centre of each valve. Seeds: numerous, nearly globose, hairy, ranged in two rows along each partition.—*Essential Character.* Sheaths general and partial. Perianth none. Petals three. Nectary of three leaves, enfolding the stamens and pistil. Capsule inferior, of three cells, with many seeds.

1. *Strelitzia angusta*, or great white *Strelitzia*.—The root is perennial, with long and thick fibres. Leaves radical, about six feet long, resembling those of a *Musa*. Flowers white, bearing but a small proportion to the magnificent foliage.—Native of the Cape of Good Hope.

2. *Strelitzia reginæ*, or canna-leaved *Strelitzia*.—Leaves ovate, not one-third the length of their foot-stalks, which are nearly as long as the flower-stalk.

3. *Strelitzia farinosa*, or meally-stalked *Strelitzia*.—Stalk rather longer than the footstalks, which are half as long again as the oblong leaves, unequal at the base.—Native of the Cape.

STRELLEY, a parish of England, in Nottinghamshire; 4½ miles west-north-west of Nottingham.

STRELNA, a river in the north of European Russia, in the government of St. Petersburg, which falls into the gulf of Bothnia. On an eminence near its mouth stands a palace belonging to the emperor.

STRENÆ, in Antiquity, *new year's gifts*; presents made out of respect on new-year's day, as an happy augury for the ensuing year.

STRENGBACH, a small river of France, in Upper Alsace, which falls into the Ille at Gemar.

STRENGBERG, a small town of Lower Austria, on the road from Ens to Anstatten; 10 miles east-south-east of Ens.

STRENGNAS, a town of Sweden, in Sudermania, on the Malar lake. Though containing only 1100 inhabitants, it is of great antiquity, is a bishop's see, and has a large cathedral. Here is also a public school, founded in 1626; 32 miles west of Stockholm. Lat. 59. 20. N. long. 16. 55. E.

STRENGTH,

STRENGTH, *s.* [στρεγγος, Saxon.] Force; vigour; power of the body.

Thou must outlive
Thy youth, thy *strength*, thy beauty, which will change
To wither'd, weak, and grey. *Milton.*

Power of endurance; firmness; durability; toughness; hardness.—Not founded on the brittle *strength* of bones.
Milton.—Vigour of any kind; power of any kind.

This act
Shall crush the *strength* of Satan. *Milton.*

Power of resistance; sureness; fastness.
Our castle's *strength*
Will laugh a siege to scorn. *Shakspeare.*

Support; security; that which supports.
Bereave me not thy aid,
Thy counsel in this uttermost distress,
My only *strength* and stay. *Milton.*

Power of mind; force of any mental faculty.
We, like friendly colours, found our hearts unite,
And each from each contract new *strength* and light. *Pope.*

Spirit; animation.
Methinks I feel new *strength* within me rise,
Wings growing, and dominion given. *Milton.*

Adam and first matron Eve
Had ended now their orisons, and found
Strength added from above, new hope to spring
Out of despair. *Milton.*

Vigour of writing; nervous diction; force opposed to softness, in writing or painting.

Leave such to tune their own dull rhymes, and know,
What's roundly smooth, or languishingly slow,
And praise the easy vigour of a line,
Where Denham's *strength* and Waller's sweetness join. *Pope.*

Caracci's *strength*, Coreggio's softer line,
Paulo's free stroke, and Titian's warmth divine. *Pope.*

Potency of liquors. Fortification; fortress.—The rashness of talking should not only be retarded by the guard of our heart, but fenced in by certain *strengths* placed in the mouth. *B. Jonson.*

He thought
This inaccessible high *strength* to have seiz'd. *Milton.*
Betray'd in all his *strengths*, the wood beset;
All instruments, all arts of ruin met. *Denham.*

Support; maintenance of power.—What they boded would be a mischief to us, you are providing shall be one of our principal *strengths*. *Sprat.*—Legal force; validity; security. Confidence imparted.—The allies, after a successful summer, are too apt, upon the *strength* of it, to neglect their preparations for the ensuing campaign. *Addison.*—Arma-ment; force; power.—What is his *strength* by land? *Shakspeare.*—Persuasive prevalence; argumentative force.—This presupposed; it may then stand very well with *strength* and soundness of reason thus to answer. *Hooker.*

To **STRENGTH**, *v. a.* To strengthen. *Not used.*
Edward's happy-order'd reign, most fertile breeds
Plenty of mighty spirits, to *strength* his state. *Daniel.*

To **STRENGTHEN**, *v. a.* To make strong.—To confirm; to establish.

Thee, bold Longinus! all the Nine inspire,
And bless your critic with a poet's fire;
An ardent judge, who, zealous in his trust,
With warmth gives sentence, yet is always just;
Whose own example *strengthens* all his laws,
And is himself that great sublime he draws. *Pope.*

To animate; to fix in resolution.—Charge Joshua and encourage him and *strengthen* him. *Deut.*—To make to increase in power or security.

Let noble Warwick, Cobham, and the rest,
With powerful policy *strengthen* themselves. *Shakspeare.*

To **STRENGTHEN**, *v. n.* To grow strong.
Oh men for flatt'ry and deceit renown'd!
Thus when y' are young ye learn it all like him,
Till, as your years increase, that *strengthens* too,
T' undo poor maids. *Otway.*

STRENGTHENER, or **STRENGTHNER**, *s.* By contraction *strengthner*.—That which gives strength; that which makes strong.—Garlic is a great *strengthner* of the stomach upon decays of appetite or indigestion. *Temple.*—[In medicine.] *Strengthners* add to the bulk and firmness of the solids: cordials are such as drive on the vital actions; but these such as confirm the stamina. *Quincy.*

STRENGTHLESS, *adj.* Wanting strength; deprived of strength.

Yet are these feet, whose *strengthless* stay is numb,
Unable to support this lump of clay. *Shakspeare.*

As the wretch, whose fever-weaken'd joints,
Like *strengthless* hinges, buckle under life,
Impatient of his fit; breaks like a fire
Out of his keeper's arms. *Shakspeare.*

Wanting potency; weak. Used of liquors.—This liquor must be inflammable or not, and yet subtle and pungent, which may be called spirit; or else *strengthless* or insipid, which may be named phlegm. *Boyle.*

STRENSALL, a parish of England, East Riding of Yorkshire; 6 miles north-north-east of York.

STRENSHAM, a village and parish of England, in Worcestershire, near the influx of the Avon into the Severn. It is noted as the birth-place of Samuel Butler, the author of Hudibras; 4½ miles south-west-by-south of Pershore.

STRENUOUS, *adj.* [*strenuus*, Lat.] Brave; bold; active; valiant; dangerously laborious.

Nations grown corrupt
Love bondage more than liberty;
Bondage with ease than *strenuous* liberty. *Milton.*

Zealous; vehement.—He resolves to be *strenuous* for taking off the test, against the maxims of all wise Christian governments, which always had some established religion, leaving at best a toleration to others. *Swift.*

STRENUOUSLY, *adv.* Vigorously; actively.—Many can use both hands, yet will there divers remain that can *strenuously* make use of neither. *Brown.*—Zealously; vehemently; with ardour.—Writers dispute *strenuously* for the liberty of conscience, and inveigh largely against all ecclesiastics under the name of high church. *Swift.*

STRENUOUSNESS, *s.* The state of being strenuous; earnestness; laboriousness. *Scott.*

STREPENT, *adj.* [*strepens*, Lat.] Noisy; loud.

Peace to the *strepent* horn!
Let no harsh dissonance disturb the morn;
No sounds inelegant and rude
Her sacred solitude profane. *Shenstone.*

STREPEROUS, *adj.* [*strepo*, Lat.] Loud; noisy.—Porta conceives, because in a *streperous* eruption it riseth against fire, it doth therefore resist lightning. *Brown.*

STREPTACHNE [from στρεπτος, *twisted*, or *spiral*, and αχνη, *the pointed summit of the glume*, which insensibly becomes the awn, without any intermediate joint], a grass with the aspect of an Aristida or Stipa, differing from the latter genus in the want of an articulation between the awn and its glume. *Brown, Nov. Holl.*

STREPTIUM [from στρεπω, *to twist*, on account of the very singular spiral tube of the corolla]. See **TORTULA**.

STREPTOPUS [from στρεπτος, *twisted*, and πους, *a foot*; because of a peculiar twist about the middle of each flower-stalk], a genus of Michaux's allied to Convallaria and Uvularia; distinguished from the former by its polypetalous corolla, with nectariferous furrows; from the latter by having a berry, not a capsule, and the want of an appendage, or tunic, to the scar of each seed.

STRESS,

STRESS, *s.* [*r̄*teece, Saxon, violence; or from *distress*.]—Importance; important part.—The *stress* of the fable lies upon the hazard of having a numerous stock of children. *L'Estrange*.—Importance imputed; weight ascribed.—Consider how great a *stress* he laid upon this duty, while upon earth, and how earnestly he recommended it. *Atterbury*.—Violence; force, either acting or suffered.

By *stress* of weather driv'n,
At last they landed.

Though the faculties of the mind are improved by exercise, yet they must not be put to a *stress* beyond their strength. *Locke*.

To **STRESS**, *v. a.* To distress; to put to hardships or difficulties.

Stirred with pity of the *stressed* plight
Of this sad realm.

To **STRETCH**, *v. a.* [*r̄*teccan, Saxon; *strecken*, Dutch.] To extend; to spread out to a distance.

Eden *stretch'd* her line
From Auran, eastward to the royal towers
Of great Seleucia, built by Grecian kings.

To elongate, or strain to a greater space.

Regions to which
All thy dominion, Adam, is no more
Than what this garden is to all the earth,
And all the sea, from one entire globose
Stretch'd into longitude.

To expand; to display.

Leviathan on the deep,
Stretch'd like a promontory, sleeps.

To strain to the utmost.

This kiss, if it durst speak,
Would *stretch* thy spirits up into the air.

To make tense.—So the *stretch'd* cord the shackl'd dancer tries. *Smith*.—To carry by violence farther than is right; as strain; as, to *stretch* a text; to *stretch* credit.

To **STRETCH**, *v. n.* To be extended, locally, intellectually, or consequentially

A third? a fourth?
What! will the line *stretch* out to th' crack of doom?

To bear extension without rupture.—The inner membrane, that involved the liquors of the egg, because it would *stretch* and yield, remained unbroken. *Boyle*.—To sally beyond the truth.—What an allay do we find to the credit of the most probable event, that is reported by one who uses to *stretch*. *Gov. of the Tongue*.

STRETCH, *s.* Extension; reach; occupation of more space.

At all her *stretch* her little wings she spread
And with her feather'd arms embrac'd the dead:
Then flickering to his pallid lips, she strove
To print a kiss.

Force of body extended.

He thought to swim the stormy main,
By *stretch* of arms the distant shore to gain.

Effort; struggle: from the act of running.—Upon this alarm we made incredible *stretches* towards the south to gain the fastnesses of Preston. *Addison*.—Utmost extent of meaning.—Quotations, in their utmost *stretch*, can signify no more than that Luther lay under severe agonies of mind. *Atterbury*.—Utmost reach of power.

This is the utmost *stretch* that nature can
And all beyond is fulsome, false, and vain.

STRE'TCHER, *s.* Any thing used for extension.

His hopes enstill'd
His strength, the *stretcher* of Ulysses' string
And his steeles piercer.

A term in bricklaying.—Tooth in the stretching course two inches with the *stretcher* only. *Moxon*.—The timber against which the rower plants his feet.

This fiery speech inflames his fearful friends,
They tug at every oar, and every *stretcher* bends. *Dryden*.

STRETENSK, a village of Asiatic Russia, in the government of Irkoutsk; 492 miles east of Irkoutsk.

STRETFORD. 1. A parish of England, in Herefordshire; 4½ miles south-west-by-west of Leominster.—2. A township in Lancashire; 4 miles south-west-by-west of Manchester.

STRETTON. 1. A parish of England, in Derbyshire; 4½ miles north-by-west of Alfreton. Population 390.—2. A parish of England, in Rutlandshire; 9 miles north-east-by-east of Oakham.—3. A township in Staffordshire; 3 miles south-west-by-west of Penkridge.—4. A township in Cheshire; 10½ miles south-south-east of Chester.—5. A township in Cheshire; 7 miles north-north-west of Norwich.—6. A township in Staffordshire; 2 miles north-by-west of Burton-Upon-Trent.—7. **STRETTON**, *Baskerville*, a hamlet in Warwickshire; 3½ miles east-by-south of Nuneaton.—8. **STRETTON**, *Church*. See **CHURCH STRETTON**.—9. **STRETTON-ON-DUNSMOOR**, a parish in Warwickshire, situated on Dunsmoor-heath; 5½ miles west-north-west of Dunchurch.—10. **STRETTON-EN-LE-FIELDS**, a parish in Derbyshire; 5 miles south-west-by-south of Ashby-de-la-Zouch.—11. **STRETTON-ON-THE-FOSS**, a parish in Warwickshire; 3 miles west-south-west of Shipston-Upon-Stour.—12. **STRETTON-UNDER-FOSS**, a hamlet in Warwickshire; 5½ miles north west-by-north of Rugby.—13. **STRETTON**, *Grandsham*, a parish in Herefordshire; 6½ miles north-west of Ledbury.—14. **STRETTON**, *Magna* and *Parva*, two hamlets in Leicestershire; 6 miles east-south-east of Leicester.—15. **STRETTON**, *Sugwas*, a parish in Herefordshire; 3½ miles north-west-by-west of Hereford.

To **STREW**, *v. a.* [The orthography of this word is doubtful: it is sometimes written *strew*, and sometimes *strow*. Skinner proposes *strow*, and Junius writes *straw*. Their reasons will appear in the word from which it may be derived: *strawan*, Gothic; *stroyen* Dutch; *r̄*teapian, Saxon; *strewen*, German; *stroe*, Danish. Perhaps *strow* is best, being that which reconciles etymology with pronunciation. *Dr. Johnson*.—Todd adds the Sax. *r̄*teopian, and the Swedish *stroo*. *Straw*, as Junius writes it, and as it is often written in our translation of the Bible, is strictly conformable to the etymology, viz., to the Goth. *strawan*, which, as well as the Saxon verbs, Mr. H. Tooke derives from *straw*.] To spread by being scattered.

Is thine alone the seed that *strews* the plain?
The birds of Heav'n shall vindicate their grain.

To spread by scattering.

I thought thy bride-bed to have deck'd, sweet maid,
And not have *strew'd* thy grave.

To scatter loosely.

With furies and nocturnal orgies fir'd,
Whom ev'n the savage beasts had spar'd, they kill'd,
And *strew'd* his mangled limbs about the field.

STRE'WING, *s.* Any thing fit to be strewed. *Mason*.
The herbs, that have on them the cold dew o' the night,
Are *strewings* fitt'st for graves.

STRE'WMENT, *s.* Any thing scattered in decoration.

Her death was doubtful.—For charitable prayers,
Shards, flints, and pebbles should be thrown on her,
Yet here she is allow'd her virgin chants,
Her maiden *strewments*, and the bringing home
Of bell and burial.

STRI'E, *s.* [Lat.] In Natural History, the small channels in the shells of cockles and scallops.—The salt, leisurely permitted to shoot of itself in the liquor, exposed to the open air, did shoot into more fair crystalline *stræ*, than those that were gained

gained out of the remaining part of the same liquor by a more hasty evaporation. *Boyle*.

STR'ATE, or STR'ATED, adj. [*striæ*, Lat., *strié*, Fr.] Formed in *striæ*.—Crystal, when incorporated with the fibrous talcs, shews, if broke, a *striated* or fibrous texture, like those talcs. *Woodward*.

STR'ATURE, s. [*striæ*, Lat., *striure*, Fr.] Disposition of *striæ*.—Parts of tuberous hæmatitæ shew several varieties in the crusts, *striature*, and texture of the body. *Woodward*.

STRICH, s. [*στριχῆς*, Gr., *strix*, Lat.] A bird of bad omen.

The ill-fac'd owl, death's dreadful messenger,

The hoarse night-raven, trump of doleful dreere,

The leather-winged bat, day's enemy,

The rueful *strich*, still waiting on the bier. *Spenser*.

STRICHEN, a parish of Scotland, in Aberdeenshire, comprehending 8000 acres, sloping to the banks of the Ugie. Population, including that of the village, 1760.

STRICHEN, a village of the above parish, containing about 200 inhabitants, who are chiefly employed in the linen manufacture; 15 miles west-by-north of Peterhead.

STRICKATHROW, a parish of Scotland, in the county of Forfar; 7 miles long, and 2 broad. Population 580.

STR'ICKEN. The ancient participle of *strike*; but it has in the antiquated phrase *stricken*, (that is, advanced in years,) a meaning not borrowed from *strike*.—Abraham and Sarah were old, and well *stricken* in years. *Genesis*.

STRICKLAND, GREAT. 1. A township of England, in Westmoreland; 5½ miles south-east-by-south of Penrith. —2. **STRICKLAND, Little**, a township in the above county; 8½ miles north-north-west of Orton.—3. **STRICKLAND, Kettle**, also a township in Westmoreland; 3 miles north-west-by-west of Kendal.—4. **STRICKLAND, Roger**, another township in the same county; 4 miles north-by-west of Kendal.

STR'ICKLE, or STRICKLER, or STRICKLESS, or STRICHEL, s. That which strikes the corn to level it with the bushel. *Ainsworth*.—This level measure of grain is here provincially termed *stricke*, and *strickless*. *Shaw*.—*Strickle* is an instrument used to whet scythes with. *North*. *Grose*.

STRICT, adj. [*strictus*, Lat.] Exact; accurate; rigorously nice.

He checks the bold design;
And rules as *strict* his labour'd works confine,
As if the Stagyrite o'erlook'd each line. *Pope*.

Severe; rigorous; not mild; not indulgent.
Implore her, in my voice, that she make friends
To the *strict* deputy. *Shakspeare*.

Confined; not extensive.—As they took the compass of their commission *stricter* or larger, so their dealings were more or less moderate. *Hooker*.—Close; tight.

The god, with speedy pace,
Just thought to strain her in a *strict* embrace. *Dryden*.

Tense; not relaxed.—We feel our fibres grow *strict* or lax according to the state of the air. *Arbuthnot*.

STR'ICTLY, adv. Exactly; with rigorous accuracy.

Charge him *strictly*
Not to proceed, but wait my farther pleasure. *Dryden*.

Rigorously; severely; without remission or indulgence.—A weak prince again disposed the people to new attempts, which it was the clergy's duty to endeavour to prevent, if some of them had not proceeded upon a topic that, *strictly* followed, would enslave all mankind. *Swift*.—Closely; tightly; with tenseness.

STR'ICTNESS, s. Exactness; rigorous accuracy; nice regularity.—Such of them as cannot be concealed connive at, though in the *strictness* of your judgment you cannot pardon. *Dryden*.—Severity; rigour.—These commissioners proceeded with such *strictness* and severity as did much obscure the king's mercy. *Bacon*.—Closeness; tightness; not laxity.

STR'ICTURE, s. [from *strictura*, Lat. a spark.] A Vol. XXIII. No. 1596.

stroke; a touch.—The God of nature implanted in their vegetable natures certain passive *strictures*, or signatures of that wisdom which hath made and ordered all things with the highest reason. *Hale*.—Contraction; closure by contraction.—As long as there is thirst, with a free passage by urine, and *stricture* of the vessels, so long is water safely taken. *Arbuthnot*.—A slight touch upon a subject; not a set discourse.—Thus have I past through all your letter, and given myself the liberty of these *strictures*, by way of reflection on all and every passage. *Hammond*.

STRICTURE OF THE ŒSOPHAGUS, &c. See **PATHOLOGY**.

STRIDE, s. [ʒrjæbe, Sax.] A long step; a step taken with great violence; a wide divarication of the legs.

I'll speak between the change of man and boy,

With a reed voice, and turn two mincing steps

Into a manly *stride*. *Shakspeare*.

To **STRIDE, v. n.** pret. *strode* or *strid*; part. pass. *stridden*. To walk with long steps.

Mars in the middle of the shining shield

Is grav'd, and *strides* along the liquid field. *Dryden*.

To stand with the legs far from each other.

To **STRIDE, v. a.** To pass by a step.

See him *stride*

Valleys wide. *Arbuthnot*.

STRIDO, a small town in the south-west of Hungary. It is chiefly remarkable as being the ancient **STRIDONIA**, the birth-place of St. Jerome, a well known father of the Christian church; 116 miles south of Vienna, and 12 north-west of Csakathurn.

STRID'DOR, s. [Lat.] A quick loud noise; a clap.

Juturna from afar beheld her fly,

And knew the ill omen by her screaming cry,

And *stridor* of her wings. *Dryden*.

STRID'ULOUS, adj. [*stridulus*, Lat.] Making a small noise; hissing; creaking; chattering.—Not a *stridulous* jay, not a petulant sparrow. *Bp. Hall*.

STRIEGAU, a small town of Prussian Silesia. It contains 2700 inhabitants, and has several distilleries, but is more remarkable for the victory obtained here over the Austrians and Saxons by the Prussians, on the 4th June, 1745; 9 miles north-west of Schweidnitz, and 32 west-by-south of Breslau.

STRIEGIZ, a small river of Saxony, in the circle of the Erzgebirge, which falls into the Freyberg Mulda at Roswein.

STRIFE, s. [*estrif*, old French, contention; discord; from *estriver*. See **TO STRIVE**.] Contention; contest; discord; war; lawsuit.

These vows, thus granted, rais'd a *strife* above

Betwixt the god of war and queen of love;

She granting first, had right of time to plead;

But he had granted too; and would recede. *Dryden*.

Contest of emulation.

Thus gods contended, noble *strife*!

Who most should ease the wants of life. *Congreve*.

Opposition; contrariety; contrast.

Artificial *strife*
Lives in those touches, livelier than life. *Shakspeare*.

Natural contrariety; as, the *strife* of acid and alkali.

STRIFEFUL, adj. Contentious; discordant.—I know not what new creation may creep forth from the *strife*ful heap of things, into which, as into a second chaos, we are fallen. *Dr. Maine*.

STRIGES, in the Ancient Architecture, are what in the modern we call *flutings*.

STRIGIL, an instrument used among the ancients in their baths, and at some of their gymnastic exercises.

It served to absterge the sweat, or other sordes, from the body. Persons who intended to bathe, or to use any of

these exercises, when they entered the gymnasium, put off their clothes in the apodyterium; after which, such of them as intended to box, wrestle, or to use any of the more violent exercises, went into the alipterium, where they were anointed, and thence returning into the place where the dust was, they were sprinkled with this as they passed along, and then entered upon their several exercises; after this they returned to the alipterium, where they had the sweat and sordes wiped off from their bodies by the alipta with an iron strigil.

STRIGILIA [so named by Cavanilles, in allusion to the resemblance of the anthers to a *strigil*, or curry-comb], in Botany, a genus of the class decandria, order monogynia, natural order trihilatae, meliæ (*Juss.*)—Generic Character. Calyx: perianth inferior, of one leaf, bell-shaped, with five small teeth. Corolla, of one petal; tube cylindrical, the length of the calyx; limb in five deep, segments. Nectary a short cylindrical tube, of one leaf, hairy at the summit, bearing the anthers. Stamina: filaments scarcely any; anthers ten, erect, linear, besprinkled on the inner surface with starry hairs. Pistil: germen superior, ovate; style triangular, the length of the stamens; stigmas three, prominent, globose, combined. Seeds solitary.—*Essential Character.* Calyx five toothed. Corolla in five deep segments. Nectary tubular, shorter than the tube of the corolla, hairy, bearing the stamens. Anthers linear, erect. Fruit of six cells, with solitary seeds.

Strigilia racemosa.—The stem is shrubby, with round, downy, rusty, leafy branches. Leaves alternate, elliptical, entire, three or four inches long, single-ribbed, veiny, on shortish thick stalks; smooth above, clothed with reddish down beneath. Flowers in axillary simple clusters, shorter than the leaves.

STRIGMENT, *s.* [*strigmentum*, from *stringo*, Lat. to scrape.] Scraping; recement.—Many, besides the *strigments* and sudorous adhesions from men's hands, acknowledge that nothing proceedeth from gold in its usual decoction. *Brown.*

STRIGOVA. See **STRIDO.**

To STRIKE, *v. a.* pret. *struck* or *strook*; part. pass. *struck*, *strucken*, *stricken*, or *strook*. [*αἰτῦκαν*, Saxon; *streichen*, German; *adstrykia*, Icelandic; *striker*, Danish.] To act upon by a blow; to hit with a blow.

He at Philippi kept

His sword e'en like a dancer, while I *struck*
The lean and wrinkled Cassius.

Shakspeare.

To punish; to afflict.—To punish the just is not good, nor to *strike* princes for equity. *Prov.*—To dash; to throw by a quick motion.—The blood *strike* on the two side-posts. *Ex.*—To notify by sound.—The Windsor bell hath *struck* twelve. *Shakspeare.*—To stamp; to impress.—The memory in some men is very tenacious; but yet there seems to be a constant decay of all our ideas, even of those which are *struck* deepest, and in minds the most retentive. *Locke.*—To contract; to lower; to vail. It is only used in the phrases to *strike sail*, or to *strike a flag*.

How many nobles then would hold their places,
That must *strike sail* to spirits of vile sort!

Shakspeare.

Now, did I not so near my labour's end,
Strike sail, and hast'ning to the harbour tend,
My song to flow'ry gardens might extend.

Dryden.

To alarm; to put into emotion; to surprise.

Court virtues bear, lie gems, the highest rate,
Born where heaven's influence scarce can penetrate;
In life's low vale, the soil the virtues like,
They please as beauties, here as wonders *strike*.

Pope.

[*Fædus ferire.*] To make a bargain.

Sign but his peace, he vows he'll ne'er again
The sacred names of fops and beaus profane:
Strike up the bargain quickly; for I swear,
As times go now, he offers very fair.

Dryden.

To produce by a sudden action.

Take my caduceus!
With this the infernal ghosts I can command,
And *strike* a terror through the Stygian strand. *Dryden.*

To affect suddenly in any particular manner.

Strike her young bones.

Ye taking airs, with lameness.

Shakspeare.

He that is *stricken* blind cannot forget

The precious treasure of his eye-sight lost.

Shakspeare

To cause to sound by blows; with *up* only emphatical.

Strike up the drums and let the tongue of war,

Plead for our interest, and our being here.

Shakspeare.

To forge; to mint.

Though they the lines on golden anvils beat,

It looks as if they *struck* them at a heat.

Tate.

It is used in the participle, for *advanced in years*.

The king,

Is wise and virtuous, and his noble queen

Well *struck* in years; fair and not jealous.

Shakspeare.

To STRIKE off. To erase from a reckoning or account.

I have this while with leaden thoughts been prest;

But I shall in a more convenient time

Strike off this score of absence.

Shakspeare.

To STRIKE off. To separate by a blow, or any sudden action.—Germany had *stricken off* that which appeared corrupt in the doctrine of the church of Rome; but seemed, nevertheless, in discipline still to retain therewith great conformity. *Hooker.*—They followed so fast that they overtook him, and without further delay *struck off* his head. *Knolles.*

To STRIKE out. To produce by collision.

My thoughtless youth was wing'd in vain desires;

My manhood long misled by wand'ring fires,

Follow'd false lights; and when their glimpse was gone,

My pride *struck out* new sparkles of her own. *Dryden.*

To STRIKE out. To blot; to efface.—By expurgatory animadversions, we might *strike out* great numbers of hidden qualities, and having once a conceded list, with more safety attempt their reasons. *Brown.*

To STRIKE out. To bring to light.

To STRIKE out. To form at once by a quick effort.

Whether thy hand *strike* out some free design,

Where life awakes and dawns at ev'ry line,

Or blend in beauteous tints the colour'd mass,

And from the canvas call the mimic face.

To STRIKE, v. n. To make a blow.

I, in mine own woe charm'd,

Could not find death, where I did hear him groan;

Nor feel him where he *struck*.

Shakspeare.

To collide; to clash.—Holding a ring by a thread in a glass, tell him that holdeth it, it shall *strike* so many times against the side of the glass, and no more. *Bacon.*—To act, by repeated percussion.

Bid thy mistress when my drink is ready,

She *strike* upon the bell.

Shakspeare.

To sound by the stroke of a hammer.—Cæsar, 'tis *strucken* eight. *Shakspeare.*—To make an attack.

Is not the king's name forty thousand names?

Arm, arm, my name; a puny subject *strikes*

At thy great glory.

Shakspeare.

To act by external influx.—Consider the red and white colours in porphyre; hinder light but from *striking* on it and its colours vanish. *Locke.*—To sound with blows.

Whilst any trump did sound, or drum *struck* up,

His sword did ne'er leave striking in the field. *Shakspeare.*

To be dashed; to be stranded.—The admiral's galley, wherein the emperor was, *struck* upon a sand, and there stuck

stuck fast. *Knolles*.—To pass with a quick and strong effect.—Now and then a glittering beam of wit or passion *strikes* through the obscurity of the poem: any of these effect a present liking, but not a lasting admiration. *Dryden*.—To pay homage, as by lowering the sail.

We see the wind sit sore upon our sails;
And yet we *strike* not, but securely perish. *Shakespeare*.

To be put by some sudden act or motion into any state; to break forth.—It *struck* on a sudden into such reputation, that it scorns any longer to sculk, but owns itself publicly. *Gov. of the Tongue*.

To *STRIKE in with*. To conform; to suit itself to; to join with at once.—Those who, by the prerogative of their age, should frown youth into sobriety, imitate and *strike in with* them, and are really vicious that they may be thought young. *South*.

To *STRIKE out*. To spread or rove; to make a sudden excursion.—When a great man *strikes out* into a sudden irregularity, he needs not question the respect of a retinue. *Collier*.

STRIKE, s. A bushel; a dry measure of capacity; four pecks.

What dowry has she?—Some two hundred bottles,
And twenty *strike* of oats. *Beaumont and Fl.*

STR'KEBLOCK, s. Is a plane shorter than the jointer, having its sole made exactly flat and straight, and is used for the shooting of a short joint. *Moron*.

STR'KER, s. Person or thing that strikes.—Music, the most divine *striker* of the senses. *Sidney*.

STR'KING, part. adj. Affecting; surprising.—Though colour be the lowest of all the constituent parts of beauty, yet it is vulgarly the most *striking*. *Spence*.

STR'KINGLY, adv. So as to affect or surprise.—The force of many *strikingly* poetical passages has been weakened or unperceived, because their origin was unknown, unexplored, or misunderstood. *Warton*.

STR'KINGNESS, s. The power of affecting or surprising.

STRIMMING, a village of the Prussian province of the Lower Rhine, near Coblenz, with 900 inhabitants.

STRING, s. [ʃtrɪŋg, Sax.; *streng*, German and Danish; *stringhe*, Dutch; *stringo*, Lat.] A slender rope; a small cord; any slender and flexible band.—Any lower bullet hanging upon the other above it, must be conceived, as if the weight of it were in that point where its *string* touches the upper. *Wilkins*.—A riband.

Round Ormond's knee thou ty'st the mystic *string*,
That makes the knight companion to the king. *Prior*.

A thread on which any things are filed.—Their priests pray by their beads, having a *string* with a hundred of nutshells upon it; and the repeating of certain words with them they count meritorious. *Stillingfleet*.—Any set of things filed on a line.—I have caught two of these dark undermining vermin, and intend to make a *string* of them, in order to hang them up in one of my papers. *Addison*.—The chord of a musical instrument.

Thus when two brethren *strings* are set alike,
To move them both, but one of them we strike. *Cowley*.

A small fibre.—Duckweed putteth forth a little *string* in the water, from the bottom. *Bacon*.—A nerve; a tendon. The most piteous tale, which in recounting,
His grief grew puissant, and the *strings* of life
Began to crack. *Shakespeare*.

The nerve or line of the bow.
Th' impetuous arrow whizzes on the wing,
Sounds the tough horn, and twangs the quiv'ring *string*.
Pope.

Any concatenation or series; as, a *string* of propositions.
To have two **STRINGS to the bow**. To have two views or two expedients; to have double advantage, or double security.

No lover has that power
T' enforce a desperate amour,
As he that has *two strings to's bow*,
And burns for love and money too.

Hudibras.

To **STRING, v. a.** pret. *strung*, part. pass. *strung*, [from the noun.] To furnish with strings.

Has not wise nature *strung* the legs and feet
With firmest nerves, design'd to walk the street? *Gay*.

To put a stringed instrument in tune.
Here the muse so oft her harp has *strung*.
That not a mountain rears its head unsung. *Addison*.

To file on a string.—Men of great learning or genius are too full to be exact; and therefore chuse to throw down their pearls in heaps before the reader, rather than be at the pains of *stringing* them. *Spectator*.—To make tense—Toil *strung* the nerves, and purified the blood. *Dryden*.

STR'NGED, adj. Having strings; produced by strings.
Divinely warbled voice,
Answering the *stringed* noise,
As all their souls in blissful rapture took. *Milton*.

STR'NGENT, adj. [*stringens*, Lat.] Binding; contracting.

What down doth dive
Into the straiten'd cuspis, needs must strive
With *stringent* bitterness, vexation. *Morc*.

The serpents twisting round their *stringent* folds,
Inextricable tie! *Thomson*.

STR'NGER, s. One who makes strings for a bow. *Obsolete*.—*Stringers* ought more diligently to be looked upon—than either bowyer or fletcher. *Ascham*.

STR'NGHALT, s. A sudden twitching and snatching up of the hinder leg of a horse much higher than the other, or an involuntary or convulsive motion of the muscles that extend or bend the hough. *Farricr's Dict.*

STR'NGLESS, adj. Having no strings.
Nothing; all is said;

His tongue is now a *stringless* instrument,
Words, life, and all, old Lancaster hath spent. *Shakespeare*.

STRINGSTON, a parish of England, in Somersetshire; 10 miles north-west-by-west of Bridgewater.

STR'NGY, adj. Fibrous, consisting of small threads; filamentous.—A plain Indian fan, made of small *stringy* parts of roots spread out in a round flat form. *Grew*.

To **STRIP, v. a.** [ʃtrɪpən, Sax. *denudare*; *streifen*, Germ. *decorticare*; *strypr*, Icel. *nudum corpus*, *stripdr*, *denudatus*. *Serenius*.] To make naked; to deprive of covering: with *of* before the thing taken away.

Hadst thou not committed
Notorious murder on those thirty men
At Askalon, who never did thee harm,
Then like a robber *stripp'dst* them of their robes. *Milton*.

The bride was put in form to bed;
He follow'd *stript*. *Swift*.

To deprive; to divest.—One would imagine these to be the expressions of a man blessed with ease and affluence, not of one just *stript* of all those advantages, and plunged in the deepest miseries; and now sitting naked upon a dunghill. *Atterbury*.—To rob; to plunder; to pillage: as, a thief *stripped* the house.—That which lays a man open to an enemy, and that which *strips* him of a friend, equally attacks him in all those interests that are capable of being weakened by the one, and supported by the other. *South*.

—To peel; to decorticate.—If the leaves or dried stocks be *stripped* into small straws, they arise unto amber, wax, and other electricies, no other ways than those of wheat or rye. *Brown*.—To deprive of all.—When some fond easy fathers *strip* themselves before they lie down to their long sleep, and settle their whole estates upon their sons, has it not been seen that the father has been requited with beggary? *South*.—To take off covering: with *off* emphatical.—He *stript off* his clothes. 1 *Sam*.—To cast off. *Not in use*.

His

His unkindness,
That *stript* her from his benediction, turn'd her
To foreign casualties, gave her dear rights
To her dog-hearted daughters: these things sting him.
Shakspeare.

To separate from something adhesive or connected. *Not accurately used.*—Amongst men who examine not scrupulously their own ideas, and *strip* them not from the marks men use for them, but confound them with words, there must be endless dispute. *Locke.*—To draw the after-milkings of cows. *North. Grose.*

STRIP, *s.* A narrow shred.
A plumed fan may shade thy chalked face,
And lawny *strips* thy naked bosom grace. *Bp. Hall.*

To STRIPE, *v. a.* [*strepen*, Dutch.] To variegate with lines of different colours; to beat; to lash.

STRIPE, *s.* [*strepe*, Dutch.] A lineary variation of colour.—Gardeners may have three roots among an hundred that are rare, as purple and carnation of several *stripes*. *Bacon.*—A shred of a different colour.—One of the most valuable trimmings of their clothes was a long *stripe* sowed upon the garment, called *latus clavus*. *Arbutnot.*—A weal, or discolouration made by a lash or blow.—Cruelty marked him with inglorious *stripes*. *Thomson.*—A blow; a lash.—A body cannot be so torn with *stripes*, as a mind with remembrance of wicked actions. *Hayward.*

STRIPED, *part. adj.* Distinguished by lines of different colour.

STRIPPLING, *s.* [Of uncertain etymology. *Dr. Johnson.*—It is probable, by an easy metathesis, from the Sax. *pputan*, to shoot out. See *To OUTSTRIP.*] A youth; one in the state of adolescence.

'Thwart the lane,
He, with two *striplings*, lads, more like to run
The country base, than to commit such slaughter,
Made good the passage. *Shakspeare.*

STRIPPER, *s.* One that strips. *Sherwood.*
STRIPPINGS, *s.* After-milkings. *North.* See the last sense of *To STRIP*. *Grose.*

STRITCHEL, *s.* A strickle. *Sherwood.* See *STRICKLE*.
STRIVALI (the ancient *Strophades*), a small cluster of islands of the Ionian sea, on the west coast of the Morea. They are four in number. The largest, the abode, according to the Greek poets, of the harpies, abounds in olives and other fruit, but produces hardly enough of corn for its limited population. The smallest is little else than a rock, and the two others form a kind of harbour for small craft; 26 miles south of Zante. Lat. 37. 29. N. long. 21. 12. E.

To STRIVE, *v. n.* preterite *strove*, anciently *strived*; part. pass. *striven*. [*streven*, Dutch; *estriver*, Fr.] To struggle; to labour; to make an effort.

Was it for this that Rome's best blood he spilt,
With so much falsehood, so much guilt?
Was it for this that his ambition *strove*
To equal Cæsar first, and after Jove? *Cowley.*

To contest; to contend; to struggle in opposition to another: with *against* or *with* before the person opposed.

Do as adversaries do in law,
Strive mightily, but eat and drink as friends. *Shakspeare.*

To oppose by contrariety of qualities.
Now private pity *strove* with public hate,
Reason with rage, and eloquence with fate. *Denham.*

To vie; to be comparable to; to emulate; to contend in excellence.

Nor that sweet grove
Of Daphne by Orontes, and the inspir'd
Castalian spring, might with this paradise
Of Eden *strive*. *Milton.*

STRIVER, *s.* One who labours; one who contends. *Prompt. Parv.*—An imperfect *striver* may overcome sin in some instances; and yet in that do no great matter neither, if he lies down, and goes no further. *Glanville.*

STRIVING, *s.* Contest.—This is warrantable conflict for trial of our faith; so that these *strivings* are not a contending with superior power. *L'Estrange.*

STRIVINGLY, *adv.* With struggle; with contest. *Huloet.*

STRIX, the OWL, in Ornithology, a genus of birds of the order accipitres.—Generic Character: the bill is hooked, and covered at the base with bristles, instead of that membranous substance called the cere in other predatory birds. The nostrils of owls are oblong, and their tongues cloven at the end; the heads are, in every species, remarkably large, and in some, the large apertures of the ear, called the horns, are covered with a tuft of feathers; their claws are hooked and sharp; and the outer toe capable of turning backward like that of the parrot. There are forty-three species, besides many varieties; and they are ranged in two subdivisions; the eared, and the earless.

The eyes of these birds distinguish them from every other genus; they are large and protuberant, and possess such exquisite sensibility, that they are dazzled by the full light of day, and altogether overpowered by the rays of the sun. As among quadrupeds, those of the tiger and cat kind, by the structure of the eye, are capable of seeing in a faint light, so among the feathered race, this numerous tribe is fitted for plunder amid the darkness of night, when the other animals are overpowered by sleep. "In these birds," says Goldsmith, "the pupil of the eye is capable of opening very wide, or shutting very close; by contracting the pupil, the brighter light of the day, which would act too powerfully on the sensibility of the retina, is excluded; by dilating the pupil, the animal takes in the more faint rays of the night, and thereby is enabled to spy its prey, and catch it with greater facility in the dark." We are not, however to imagine that the eyes of these animals, which are so perfectly fitted for a feeble light, can see without it altogether, or are capable of penetrating into absolute darkness. On the contrary, in the dead of night it is probable that they see but little, and resemble the hares, wolves, and stags, who issue from the woods to feed or to chase in the night; only the eyes of these animals seem less dazzled by the full glare of the rays of the sun. It is in the evening twilight, or at the dawn of day, that the owls are best fitted for seeing; it is then they issue from their dark retreats to chase or surprise their prey. Their search is generally successful; for, at these hours of rest, the little animals are off their guard, and incapable of eluding their search.

Except during the nights of moon-shine, their time of chase is but very short; for they generally retire to their lurking places, before they are surprised by the profound gloom of midnight, or the dazzling beams of the sun. Moon-shine is their harvest; a season of pleasure and abundance; for then they protract their flight for several hours, and lay up an ample store of provision. If, from the scarcity of game, they continue their search longer than usual, and, following the dictates of appetite rather than of prudence, wait till broad day-light breaks in upon them, they are bewildered, dazzled, and confounded, and, however far from home, are obliged to remain in the same spot till the return of evening. If you force them away, they make short slow flights, as if afraid of dashing against some unseen object. If the other birds perceive, by his awkwardness or fear, the distress of the owl's situation, they fly with emulation to insult him. The thrush, the jay, the bunting, and the red-breast, attack him in a body, with cries, insults, and strokes of their wings. The unfortunate owl knows not how to defend himself, or where to fly; "astonished and purblind, he only replies to their mockeries by awkward and ridiculous gestures, by rolling his eyes, and turning his head with an air of stupidity." Among this tribe of tormentors, the smallest and most feeble of his enemies are commonly the foremost; and, by a mistake similar to what the owl himself has committed, they sometimes prolong their insults till the return of evening restores him the use of his sight. Then he becomes truly formidable, and inflicts on his tormentors dreadful revenge for their ill-timed audacity.

STRIX.

1 *S. virginiana*. 2 *S.ubo*. 3 *S. passerina*. *S. minor*.

All the different species of owls are not equally distinguished by sensibility in the organs of sight; and consequently not equally overpowered by the light of day. The great owl of North America takes considerable flights, and is sometimes seen chasing its prey successfully in broad day; while the common barn owl, far from being able to encounter the full rays of the sun, possesses such sensibility of vision, that it catches mice even in the middle of the night. This difference in the sight of the owls, regulates the time of their depredations; such as nearest resemble other birds, issue from their retreats immediately after the setting of the sun; the more quick-sighted, remain concealed till later in the evening, when they fall with destructive success on the smaller birds, in the midst of that season of repose. The owls in general conceal themselves in some dark retreat during the day; the cavern of a rock, the hollow of a tree, or the holes of a ruinous and unfrequented castle, are the solitary abodes preferred by these gloomy birds: there, they often render the solemnity of these dreary haunts tremendous by their cries. The harshness of their notes, the darkness and silence during which they are heard, joined to the gloomy habitations where these birds dwell, have always strongly affected the imaginations of men, and given rise to melancholy ideas. The prejudices and weakness of the uninformed part of mankind, alarmed by these frightful images, have always led them to regard the voice of the screech-owl as a presage of some sad calamity that awaited them. It is only, however, when the owls are stationary, that they utter these doleful notes; while in pursuit of their prey, they are all silent, as the smallest noise might alarm the animal which it is their endeavour to surprise.

I.—Eared.

1. *Strix bubo*; great owl, or rufous horned owl, variegated with black, brown, and ash-coloured spots and freckles.—The Specific Character given by Gmelin is, body tawny. There are three other varieties: 1. Body darker, with blackish wings. 2. Legs naked. 3. Blackish-yellow, variegated with white. This is the largest species of owl, and but little inferior in size to an eagle. Its general colour is rufous or ferruginous, varied with larger and smaller spots and markings of brown, black, and grey; together with innumerable freckles or minute specks of the same colours. It is found of a deeper or lighter hue, according to various circumstances of age, health, and climate: the larger wing and tail feathers are obscurely varied by dusky transverse bars; the bill is black, the eyes are very large, and of a bright reddish or golden orange-colour; the legs are short and strong, thickly clothed, down to the very claws, with fine, downy, and setaceous plumes; the claws are extremely large, strong, and black.

This species, including the varieties above enumerated, appears to be very generally diffused throughout the temperate and northern parts of the old continent, and is even supposed to occur both in North and South America. In this country it is rarely seen: in Germany it is rather common. It preys, in the manner of eagles and the larger falcons, on hares, rabbits, and almost all kinds of birds, and builds its nest among the crags of rocks, or among ruined edifices, and lays, as it is supposed, rarely more than two eggs, which are larger and rounder than those of a hen, and of a rufous colour, blotched with variegations not much unlike the bird itself.

2. *Strix Virginiana*, or Virginian owl.—Body above brown, varied with fine, zig-zag, tawny, and cinereous lines; beneath pale-ash, with longitudinal brown streaks; throat and sides of the breast orange, streaked with brown.—This is an inhabitant of America, and is less than the last. According to Mr. Edwards, it approaches in magnitude nearly to the greatest horn or eagle owl: the bigness of the head in this seems not at all inferior to that of a cat; the wing, when closed, measures, from the top to the ends of the quills, full fifteen inches; the bill is black, the upper mandible is hooked, and overhanging the nether, as in eagles and hawks,

having no angle in them, but plain on its edges; it is covered with a skin, in which are placed the nostrils, and that skin hidden with a bristly kind of grey feathers, that grow round the basis of the bill; the eyes are large, having circles round them, broad, of a bright shining gold-colour; the space round the eyes, which may be called the face, is of a light brown colour, confusedly mixed with orange, gradually becoming dusky where it borders on the eyes; over the eyes it has white strokes; the feathers that compose the horns begin just above the bill, where they are intermixed with a little white, but as they extend onwards beyond the head, they become of a red-brown, clouded with dusky, and tipped with black; the top of the head, neck, wings, and upper side of the tail, are barred across with bars of dusky-reddish; the feathers between the back and wings are orange-coloured, tipped with white; the fore-part of the neck and breast are bright brown, inclining to orange, which grows fainter on the sides; this brown part is spotted with pretty large dark spots; the middle of the breast, belly, thighs, and under-side of the tail, are white, or faint ash-colour, barred transversely with dusky lines pretty regularly: the inside of the wings is coloured and variegated in the same manner; the legs and toes, almost to the ends are covered with light ash-coloured feathers; the ends of the toes and claws are of a dark horn colour.

This species occasionally varies in the cast of its colours, which are sometimes darker, with fewer variegations in its plumage.—It is found in North America, as high as Hudson's Bay, frequenting woody districts, and uttering, it is said, a most hideous noise in the woods, not unlike the hallooing of a man.

3. *Strix Scandiaca*, or Scandinavian owl.—Body whitish, with black spots.—It inhabits the mountains of Lapland, and is the size of a turkey.

4. *Strix Zeylonensis*, or Ceylon owl.—Body above reddish-brown, beneath yellowish-white; circles on the face reddish-brown, streaked with black. The length of this species is nearly two feet, and its weight about two pounds and three quarters. The bill is horn-coloured; the irids yellow, the upper parts of the bill of a pale reddish-brown; the under parts yellowish-white; each feather appearing to be streaked and barred with a dusky-black; the ears of the horns are short and pointed; the prime quills and tail are barred with black, white, and pale-red.—It is, as its name denotes, an inhabitant of Ceylon, where it is called *Raia Allia*.

5. *Strix Sinensis*, or Chinese owl.—Body reddish-brown, with waved black lines, beneath streaked with reddish-black, and barred with white. The bill and legs are black; secondary quill-feathers with four blackish bars.—It inhabits China.

6. *Strix Coromanda*, or Coromandel owl.—Body above greyish-red, with reddish-white spots; beneath pale-red, with small semilunar black spots. The bill is black; the irids yellow; legs reddish; cheeks white; quill and tail feathers barred with reddish-white.—It is found in India.

7. *Strix otus*, or long-eared owl.—This, in its general appearance and colours, is very strikingly allied to the *Strix bubo*, but in size it is far inferior. It is about fourteen inches and a half in length. This bird is fond of woody and rocky solitudes, and is not observed to build any nest of its own, but contents itself with a deserted nest of a bustard or magpie, and usually lays five eggs.—In North America it is found to inhabit the woods at a distance from the sea-coast, and has been observed at Hudson's Bay, preying by night, with much clamour.

8. *Strix brachyotos*, or short-eared owl.—Horns short; body above brown; the feathers edged with yellow; beneath pale-yellow, longitudinally streaked with dusky.—This species is found in our country, in divers other parts of Europe, also in America and Siberia. The short-eared owl is a bird of passage, and has been observed to visit Lincolnshire in the beginning of October, and to retire early in the spring; so probably, as it performs its migrations like the

woodcock, its summer retreat is Norway. During the day, it lies hidden in long old grass; when disturbed, it seldom flies far, but will alight, and sit looking at any person who happens to be present, at which time the horns may be seen very distinctly. It has not been observed to perch on trees, like other owls; it will fly in search of prey in cloudy and hazy weather. Farmers are fond of seeing these birds in their fields, as they soon clear them of mice. It is frequently found on the hill of Hoy in the Orkneys, where it flies and preys by day, like a hawk. This bird in Hudson's Bay is called the mouse-hawk. Here it never flies, like other owls, in search of prey, but sits quietly on the stump of a tree, watching the appearance of mice. It breeds near the coast, making its nest with dry grass upon the ground, and migrates southwards in the autumn.

9. *Strix Brasiliana*, or Brasil owl.—Body above pale rusty-brown, spotted with white, beneath whitish, with rusty-brown spots. Bill, irids, short feet, and toes, yellowish.—It inhabits Brasil, and is about the size of a thrush.

10. *Strix Pulchella*, or Siberian owl.—Body grey, variegated with brown, rusty, and white.—It inhabits Siberia, and is nine inches long.

11. *Strix Scops*, or little horned-owl.—Ears of one feather each.—This inhabits Europe; is seven inches and a quarter long, and preys on field-mice. In the dead body the ears are scarcely conspicuous; the colour varies according to the age, grey, rufous, brown or blackish; the legs are spotted with brown; the toes and claws are brown. This is a species of uncommon elegance, and of a small size. The general disposition of its colours is similar to that of the eagle owl, but with a mixture of grey, which predominates on the breast and belly of the bird; it varies, however, considerably in the cast of its colours, according to the various circumstances of age and sex, and when young it is said to be wholly grey: the irids are also said to be of a pale yellow in the young, and deep yellow or even hazel in the old birds; the legs are covered to the toes with speckled grey and brown plumes. The scops is a native of the warmer parts of Europe, and is of a migratory nature. In France it is said to arrive and depart at the same time with the swallow. At particular times great flights arrive, and wage war against field-mice, in those years when these animals happen to be unusually numerous.

II.—Earless.

12. *Strix nyctea*, or snowy owl.—Body whitish, with a few brown lunate spots.—This is found in Europe, America, and Asia, and is two feet long; it flies abroad by day, and preys on herons, hares, mice, and sometimes carrion; makes a howling noise: in winter it is often snow-white. A variety has numerous spots; the bill and claws are black. According to Mr. Pennant, this species varies greatly in weight, being from three pounds to a pound and a half.—It inhabits the coldest parts of America, even as high as the remote mountains in the icy centre of Greenland, from which intense cold it migrates to the shores. It adds horror even to that country, by its hideous cries, resembling those of a person in deep distress. It is rare in the temperate parts of America, and strays seldom as low as Pennsylvania and Louisiana: it is very common in Hudson's Bay, Norway and Lapland. It has no dread of the utmost rigour of the season, but bears the cold of the northern regions the whole year. It flies by day, and is scarcely distinguished from the snow; it falls perpendicularly on its prey; feeds on white grouse, and probably on hares; hence its Swedish name *harfang*. In Hudson's Bay it is almost domesticated, harbouring in places near the tents of the Indians. It is scarce in Russia, but rather common on the Uralian mountains, and all over the north and east of Siberia, and in the Asiatic empire, even in the hot latitude of Astrakan. In Kamtschatka it is very numerous.

13. *Strix tengmalmi*, or Swedish owl.—Body grey, with small round spots.—It inhabits Sweden, and is the size of a black bird.

14. *Strix nebulosa*, or barred owl.—Head, neck, breast, back, and wing-coverts, brown, spotted with white; the belly and vent are of a dirty-white, streaked with brown; the tail is marked with brown and whitish bands, whitish at the tip.—It inhabits Hudson's Bay and New York; sometimes, but rarely, in England. It is two feet long, and feeds on mice, hare and cranes.

15. *Strix perspicillata*, or spectacle owl.—Head white, smooth, downy; body above, area of the eyes and chin, brownish; beneath reddish-white; the breast is barred with reddish-brown.—It inhabits Cayenne, and is twenty-one inches long.

16. *Strix cinerea*, or sooty owl.—Head, neck, and wing-coverts sooty, with dirty-white lines; breast and belly whitish, with large oblong dusky brown spots.—It inhabits Hudson's Bay; is two feet long; flies in pairs, and preys on mice or hares. The bill is whitish; irids yellow; the tail is marked with oblique brown and dirty-white streaks; a part of the skin from the chin to the vent bare of feathers.

17. *Strix wapacutha*, or spotted owl.—Back and tail-coverts white, spotted with dusky; breast and belly of a dirty-white, with reddish lines cross each other. This also is found in Hudson's Bay: it is two feet long; forms its nest of moss on the ground, and preys on mice and small birds: its flesh is considered as excellent food.

18. *Strix cucularia*, or Coquimbo owl.—Body above brown, beneath white; legs warty and hairy.—It is found in Chili; is the size of a pigeon; flies in pairs, sometimes by day; and preys on insects and reptiles; it lays four eggs, variegated with white and yellow, in long subterraneous burrows. The irids are yellow; the body above spotted with white.

19. *Strix aluco*, or aluco owl.—Head rusty; irids black; first quill-feathers serrate.—This is found in divers parts of Europe; is about fifteen inches long; lives during summer in woods, in winter near habitations: it feeds on mice.

20. *Strix sylvestris*, or Austrian owl.—Body variegated white and brown; the space round the eyes is white, the irids red.—It inhabits Austria; is the size of a fowl; the covering of the head is an elegant radiate wreath of white feathers.

21. *Strix alba*, or white owl.—Body above tawny, spotted with grey, beneath white; quill and tail feathers rufous, the latter tipped with white.—It inhabits Austria, as does the next.

22. *Strix noctua*, or rufous owl.—Body pale rufous, with longitudinal brown spots; the irids are brown.

23. *Strix rufa*, or ferruginous owl.—Body rusty, spotted with brown; the irids are blueish.—It inhabits the woods of Idria.

24. *Strix soloniensis*, or solonese owl.—Body above black-brown mixed with tawny, beneath white; tail white, with blackish lines crossing each other near the tip.—This inhabits France, and is fifteen inches long. Crown, and outward circle of feathers round the face, varied with reddish and white; toes horn-colour.

25. *Strix flammea*, or common owl.—Body above pale yellow, with white dots, beneath whitish, with black dots.—It inhabits Europe, America, and Northern Asia, and is about fourteen inches long.

26. *Strix barbata*, or mountain owl.—Space round the eyes and chin black. Bill and irids yellow; body cinereous; primary quill-feathers serrate on both edges.

27. *Strix stridula*, or tawny owl.—Body rusty, the third quill-feather is longest.—It inhabits Europe and Tartary, and is nineteen ounces in weight.

28. *Strix ulula*, or brown owl.—Body above brown, spotted with white; tail-feathers with linear white bands. A variety is much smaller, though some writers consider these two varieties as merely the male and female of the same.—This species inhabits Europe and Newfoundland, and is about fourteen inches long. With respect to the general manners of the brown owl, or, as it is called by Pennant, the wood owl, the naturalist observes, that by night these birds
and

are very clamorous. In the dusk they approach our dwellings, and will frequently enter pigeon-houses, and make great havoc in them. They destroy number of leverets, as appears by the legs frequently found in their holes; they also kill abundance of moles.

29. *Strix Arctica*, or Arctic owl.—Body rusty-brown, above spotted with black, beneath streaked with narrow brown lines; bill, orbits, and band under the wings, brown.—It inhabits Sweden, and is eighteen inches long.

30. *Strix funerea*, or Canada owl.—Body brown, with a few large white spots above, beneath white, with transverse narrow brown bars; the tail is long, with broad brown and narrow white bars. The head is black, with white points; five first inner quill-feathers not spotted on the outer edge; the irids are yellow.—This species is found in many parts of Europe and North America.

31. *Strix Hudsonia*, or hawk-owl.—Feathers above brown, with white edges, beneath white, with transverse black lines; the bill and irids are golden. This bird is, says Edwards, who was the first describer of it, rather larger than a sparrow-hawk, and has much the air and manner of a hawk, from the length of its wings and tail; but the form of the head and feet clearly show it to be near of kin to the owl kind. The birds of this species fly and prey at noon, which is contrary to the nature of most of the owl kind. The bill is like a hawk's, but without angles on the sides, of a bright reddish-yellow. Mr Edwards was told that the eyes are of the same colour. The spaces round the eyes are white, a little shaded with brown, and dashed with small, longish, dusky spots; the outsides of these spaces, towards the ears, are encompassed with black; without that again is a little white; the bill is covered almost with light-coloured bristly feathers, as in most of the owl kind; the top of the head is of a very dark brown, spotted finely with little regular round spots of white; round the neck, and down to the middle of the back, is dark brown, the feathers seeming to be tipped with white; the wings are of a brown colour, the quill and covert feathers being finely spotted on their outer webs with white; the three quills next the body are not spotted, but have whitish tips: the feathers between the back and wing are painted with broad transverse bars of brown and white; the inner coverts of the wing are white, with transverse lines of brown; the quills within are of a dark-ash-colour, with white spots on both webs; the prime quill is spotless within and without on its outer web, and hardly any of that reflecting back of the points of the outer web as is observed in owls; the rump and covert-feathers of the tail are dark-brown, transversely barred and mixed with a lighter brown; the tail on the upper side is dark brown, and ash-coloured beneath, composed of twelve feathers, the middlemost longer by two inches across than the very outermost; it is barred across by seven or eight transverse narrow bars of light brown; the breast, belly, thigh, and coverts under the tail, are white across, with narrow brown lines in a regular manner; the legs and feet are wholly covered with fine soft feathers of the colour of the belly, but the variegating lines are smaller; the claws are sharp, crooked and pointed, and of a dark brown colour. There was, says Edwards, another of this species brought with this, which was a little bigger, and differed something in colour, which he imagines was the female of this. These were natives of Hudson's Bay, where its native name is *Caparacock*. It preys on white partridges and other birds, and is so bold as to attend near the fowler with his gun, and will sometimes carry off a partridge after it is shot, before the sportsman can come up to it. Pennant, in his Arctic Zoology, says this species is common to North America, Denmark, and Sweden; it never hatches above two at a time, which for months after flight remain of a rusty-brown colour.

32. *Strix Uralensis*, or Ural owl.—Body whitish, with longitudinal brown spots in the middle of each feather. The bill is of a wax colour; the irids and eye-lids are black; orbits ash; the rump is white; the tail is long and wedged.—It inhabits the mountains of Ural, in Siberia, and is the size of a hen.

33. *Strix accipitrina*, or Caspian owl.—Body above yellowish beneath yellowish-white, both sides with longitudinal blackish streaks, belly dotted with black, irids citron. This inhabits near the Caspian sea; and is the size of the brown owl. Bill black; wings beneath and vent white; quill-feathers outside yellowish, within white tessellate with black; the tail is rounded, shorter than the wings, blackish barred with white, and whitish at the sides.

34. *Strix Javanica*.—Body cinereous, in a few places reddish, with black and white spots; beneath it is of a dirty white, mixed with reddish and black spots.

35. *Strix Nova Scelandia*, or New Zealand owl.—Irids yellow; body above brown, spotted with white; beneath it is twany. There is a variety of which the body is brown, the feathers edged with tawny; the tail is brown, with paler bars; orbits tawny.—It inhabits New Zealand: is eleven inches long; the bill is horny, with a black tip.

36. *Strix Cayennensis*, or Cayenne owl.—Body streaked with reddish, and transversely waved with brown: the irids are yellow.—It inhabits Cayenne, and is the size of the screech-owl. The bill is horny, claws black.

37. *Strix Dominicanensis*, or St. Domingo owl.—Body beneath rufous; breast a little spotted.—It inhabits St. Domingo; resembles the brown owl: bill larger, stronger, and more hooked.

38. *Strix tolchiquatli*, or New Spain owl.—Irids pale yellow; body above variegated with black, pale-yellow, white and tawny; beneath white. The bill, claws, and lower wing-coverts, black.—It inhabits New Spain.

39. *Strix chichictli*, or Mexican owl.—Body tawny, variegated with brown and black; the eyes are black, the eye-lids blue.—It inhabits New Spain, and is about the size of a hen.

40. *Strix Acadica*, or Acadian owl.—Body above bright bay, spotted with white; beneath dirty-white, mixed with rusty. The bill is brown, the irids yellow, crown, with pale spots; orbits cinereous; toes brown. It inhabits North America, and is seven inches long.

41. *Strix passerina*, or little owl.—Quill-feathers with five rows of white spots. There are two other varieties. 1. Larger; wings variegated with brown and yellow; the chin is white: the bird is twelve inches long.—This species is found in many parts of Europe, but is rare in England. It appears to vary not only in the cast of its plumage, but in the colour of its irids, which, in some specimens, are said to be of a darker colour than those in which the irids are yellow. The passerine owl frequents ruins, and is said to deposit its eggs in such situations more frequently than in trees.

STRIXTON, a parish of England, in Northamptonshire; 4 miles south-by-east of Wellingborough.

STROBILUS [*στροβίλος*, Gr.], in Botany and Vegetable Physiology, a name applied by the Greeks to the cone of a fir-tree, and adopted in the same sense by modern botanists, for every seed-vessel of the same structure and character. See BOTANY.

STROBULUS, among the Ancients, a kind of mitre, which rose to a height by many windings and turnings, and was used by the Barbarians; instead of which, the Romans wore the *apex*, which had a high but straight top.

STROEMIA [so denominated by the late Professor Vahl, in honour of the Rev. Hans Stroem, a clergyman at Eger, in Norway, author of some botanical and zoological treatises], in Botany, a genus of the class pentandria, order monogynia, natural order capparides (*Juss.*)—Generic Character. Calyx: perianth inferior, of four ovate, acute, deciduous leaves; the two outer ones concave; inner flat. Corolla: petals four, lanceolate, all turned to one side, wavy, with claws, the length of the calyx; sometimes wanting. Nectary of one-leaf, ligulate, lanceolate, ascending, inserted into the elongated receptacle towards its base; its tube slender, longer than the petals. Stamina: filaments five, sometimes but four, thread-shaped, unequal, inserted into the stalk of the germen, two in the middle, three below, longer than the nectary; anthers oblong, erect. Pistil: germen on a stalk

stalk exceeding the length of the stamens, ascending, oblong; style none; stigma sessile, obtuse. Pericarp: berry coriaceous, stalked, cylindrical, of one cell and two revolute valves. Seeds numerous, kidney-shaped, compressed, smooth, imbricated in three rows, imbedded in pulp.—*Essential Character.* Petals four, or none. Nectary ligulate. Calyx of four leaves, deciduous. Berry coated, stalked.

1. *Stroemia farinosa*, or mealy stroemia.—Leaves oblong, mealy. Flowers with petals, and five stamens.—Native of Arabia.

2. *Stroemia tetrandra*, or tetrandrous stroemia.—Leaves elliptic-oblong, obtuse, with a small point, naked. Flowers with petals, and four stamens.—Native of the East Indies.

3. *Stroemia glandulosa*, or glandular stroemia.—Hairy and viscid. Leaves roundish. Flowers without petals.—Native of Arabia, where it is called *tammim*.

4. *Stroemia rotundifolia*, or round leaved stroemia.—Leaves orbicular, smooth. Flowers without petals.—Frequent about Loheia, in Arabia, and known by the name of *kadhah*.

STRO'KAL, *s.* An instrument used by glass-makers. *Bailey.*

STROKE, or STROOK. Old preterite of *strike*, now commonly *struck*.—He hoodwinked with kindness, least of all, men knew who *stroke* him. *Sidney.*

STROKE, *s.* A blow; a knock; a sudden act of one body upon another.

The oars were silver,
Which to the tune of flutes kept *stroke*, and made
The water which they beat to follow faster,
As amorous of their *strokes*. *Shakspeare.*

A hostile blow.
As cannons overcharg'd with double cracks,
So they redoubled *strokes* upon the foe. *Shakspeare.*

A sudden disease or affliction.
Take this purse, thou whom the heav'n's plagues
Have humbled to all *strokes*. *Shakspeare.*

The sound of the clock.
What is't o'clock? —
Upon the *stroke* of four. *Shakspeare.*

The touch of a pencil.
Oh, lasting as those colours may they shine!
Free as thy *stroke*, yet faultless as thy line. *Pope.*

A touch; a masterly or eminent effort.—The boldest *strokes* of poetry, when managed artfully, most delight the reader. *Dryden.*—An effect suddenly or unexpectedly produced; power; efficacy.—These having equal authority for instruction of the young prince, and well agreeing, bare equal *stroke* in divers faculties. *Hayward.*—Perfectly opacous bodies can but reflect the incident beams, those that are diaphanous refract them too, and that refraction has such a *stroke* in the production of colours, generated by the trajection of light through drops of water, that exhibit a rainbow through divers other transparent bodies. *Boyle.*—He has a great *stroke* with the reader when he condemns any of my poems, to make the world have a better opinion of them. *Dryden.*

To STROKE, *v. a.* [ʃʁpacan, Sax.] To rub gently with the hand by way of kindness or endearment; to soothe.

Come, let us practise death,
Stroke the grim lion till he grow familiar. *Dryden.*

To rub gently in one direction. See STROKING.
STROKER, *s.* One who rubs gently with the hand; one who attempts to cure diseases by such application of the hand to the part affected. Ben Jonson figuratively uses the word for a flatterer.—An eye-witness of several wonderful cures by the famous Irish *stroker*, Mr. Greatrix. *Thoresby.*

STROKERTOWN, a neat town of Ireland, in the county of Roscommon; 71 miles west of Dublin.

STRO'KING, *s.* The act of rubbing gently with the hand.—The manner of his cure in those imperfections is somewhat strange: he useth no bindings, but oils and *stroking*s. *Wotton.*—The act of rubbing gently in one direction.

The big-uddered cows with patience stand,
Waiting the *stroking*s of the damsel's hand. *Gay.*

To STROLL, *v. n.* [ʃʁpæʒian, Sax.; to *stray*. See To STRAGGLE.] To wander; to ramble; to rove; to gad idly.—These mothers *stroll* to beg sustenance for their helpless infants. *Swift.*

STROLL, *s.* Ramble: a low expression; as, upon the *stroll*.

STRO'LLER, *s.* A vagrant; a wanderer; a vagabond
Two brother-hermits, saints by trade,
Disguis'd in tatter'd habits, went
To a small village down in Kent;
Where, in the *strollers'* canting strain,
They begg'd from door to door in vain. *Swift.*

STROMA, an island of Scotland, a mile long, and a mile and a half broad, in the middle of the Pentland frith, between Caithness and Orkney, and belonging to the former. It is extremely fruitful in corn, but destitute of fuel. The inhabitants, amounting to 30 families, consisting of 170 souls, are remarkable for industry, sobriety, and simplicity of life. The sea, particularly in the winter months, is inconceivably tempestuous around the island, more especially when it beats against the high western shore. At this time the spray rises so thick and so high, as to run down in rills to the opposite side, where a reservoir is made to retain the water, which, with the rain that falls occasionally, serves to turn the cornmill of the island. In the caverns of this island were formerly seen several human bodies in a state of great preservation, though they had been dead upwards of 60 or 80 years. On the west side of the island are the ruins of an old castle; and on another part is seen the ruins of an ancient chapel; 3 miles north-west of Duncansby head. Lat. 58. 35. N. long. 2. 53. W.

STROMATEUS, in Ichthyology, a genus of fishes of the order apodes. The Generic Character is as follows: head compressed; teeth both in the jaws and palate; body oval, broad, slippery; tail forked.

1. *Stromateus fiatola*.—Body beautifully barred.—It inhabits the Mediterranean, and has two stomachs.

2. *Stromateus paru*.—The back is of a gold-colour; the belly is silvery.—This is chiefly found in South America and Tranquebar: it feeds on lesser fish and vermes; the body is slender, covered with small thin deciduous scales; the flesh is white, tender, and reckoned very delicious food. Its other and minor characteristics are, that it has a middle-sized head, sloping, above brownish; the eyes are large and the pupil black; the iris is marked with a white ring and another yellow one; the mouth is small; the jaws equal; teeth small and sharp; lips strong and moveable; tongue smooth, broad; aperture of the gills very large, the cover of one piece, and surrounded with a membrane; the lateral line nearer the back, broad, silvery; vent nearer the mouth than the tail; the fins are long, scaly, rigid, white at the base, and edged with blue; the rays are soft and branched.

3. *Stromateus cumara*.—Back blue; belly white.—It is found in the fresh waters of Chili; it is about a span long, and not crossed with stripes.

4. *Stromateus cinereus*, or ash-coloured stromateus with a forked tail; the lower lobe longer than the upper.—The body of this species is of a more rhomboid form than that of the others, and the fins are somewhat more extended or pointed; the tail is more deeply forked, the lower lobe considerably exceeds the upper in length; the colour of the whole animal is cinereous, with a cast of yellow on the sides of the head and the base of the fins and tail; the pectoral fins are tinged with red.—It is a native of the Indian seas, and grows to about the length of a foot or more, and is about two inches in thickness: it is considered as excellent food, but the largest specimens are the finest flavoured. The bones are said to be of a soft or nearly cartilaginous nature: the residents in India use this fish both in its fresh and salted state, prepared in various ways. The trivial name with them is *pampel*.

5. *Stromateus argenteus*, or silvery stromateus.—The lobes of

of the tail of this species are equal.—It is of the same general form with the preceding, but with rather shorter fins and tail, the lobes of the latter being both of equal length; the mouth is situated considerably beneath the muzzle, which is thick and round; the colour of the whole animal is bright-silver, with a blueish or dusky tinge on the back and fins; the scales are small, thin, and easily deciduous.—It is a native of the same seas with the preceding, and is in equal estimation as an article of food.

6. *Stromateus niger*, or black stromateus.—This species is entirely black. It is, however, very nearly allied to the former in shape, but the mouth is placed in the usual manner, the upper part of the muzzle not rising above it, as in that species; the colour of the whole animal is blackish, with a silvery cast about the breast and sides of the head; the scales are small, and the lateral line, as in others of the genus, is curved in the direction of the back.—It is a native of the Indian seas, and not regarded in much estimation as an article of food, on account of a popular prejudice entertained against it from its colour, as well as from its feeding on onisci, which are occasionally found in its mouth.

Dr. Shaw observes, that there is a considerable degree of general resemblance between the habits of the genus stromateus and that of chætodon; but as the species of the stromateus are destitute of ventral fins, they cannot be placed in the same artificial order, and must rank among the apodes. “The same is the case with some other genera which are naturally allied to fishes placed in very different orders. This forms the greatest objection to the Linnæan arrangement of fishes: it would, however, be difficult to prove that a more natural distribution would lead to a readier investigation of the animals.”

STROMAY, one of the smaller Hebrides, in the sound of Harris.

STROMBERG, a small town of Prussian Westphalia, in the government of Munster; 24 miles west-by-north of Paderborn.

STROMBOLI, the most northerly of the Lipari islands, in the Mediterranean. It belongs to Naples. Though small (only 10 miles in circumference), it produces very good wine. The climate, mild and pleasant in winter, is hot in summer, from the reflection of the rays of the sun from the strand. The inhabitants derive their subsistence partly from fishing, partly from the cultivation of wine and fruits. Stromboli has from time immemorial been remarkable for its volcanic eruptions, and is perhaps the only volcano whose fires are in a state of constant activity. Its mountain has two summits, one of great height, but the crater is on its side. The eruptions last for a few moments at a time, but recurring at short intervals, the flames are seen by night, at a great distance, and being of considerable service to navigators, have procured this island the name of the great lighthouse of the Mediterranean. The matter thrown out consists of lava, ashes and stones; and each eruption is attended with an explosive noise; 16 miles north-north-east of Lipari, and 34 north of Melazzo, in Sicily. Lat. 38. 58. N. long. 15. 55. E.

STROMBUS, in Natural History, a genus of the class vermes and order testacea. The Generic Character is, animal a limax; shell univalve, spiral; aperture much dilated; the lip expanding, and produced into a groove, leaning to the left. These shells in their younger state want the lip, and have a thin turbinate appearance; many of them therefore, for this reason, have been mistaken by authors, and referred to a genus to which they do not belong. There are about forty-five species, divided into separate sections, according as the species have lips projecting, lobed, dilated, or tapering.

I.—Lip projecting into linear divisions or claws.

1. *Strombus fusus*.—Shell tapering, smooth, with a subulate beak and toothed lip. It is found in the Red Sea; resembles a murex, in having the beak rather straight; nevertheless it approaches nearer the genus strombus, in being smooth, and having the lip toothed; the shell is brown, and

transversely striate at the base; the pillar is white; the beak is black outwardly.

2. *Strombus pes pelecani*, or corvorant's foot.—Lip with four palmate angular claws; the mouth is smooth.—It is found in the American and European seas; is about two inches long; the shell is pointed; in colour it is whitish, cinereous, or reddish; within it is white, smooth, and polished; the whorls are tuberculate.

3. *Strombus chiragra*.—Lip with six curved claws, and recurved beak. The shell is large, brown varied with white, the back tuberculate; lip striate; it has six claws, including the beak, which are long; the two hind-ones are divergent and bent outwards.—It inhabits the Indian ocean, and is very rare and valuable.

4. *Strombus scorpius*.—Lip with four knotty claws, the hinder one is very long.—It inhabits the Indian ocean, and is four inches long.

5. *Strombus lambis*.—Lip with about seven straightish claws, and a smooth mouth. There are four varieties of it. The shell is large, brown varied with white; the mouth is reddish; claws not knotty.—It is found chiefly in Asia.

6. *Strombus millepeda*.—Lip with ten inflected claws, and substrate mouth; the back is compressed and gibbous.—It inhabits the southern coasts of Asia.

7. *Strombus clavus*.—The shell of this species is tapering, smooth, with a subulate beak and a simple lip.

II.—Lobed.

8. *Strombus lentiginosus*.—Lip thickened, and three-lobed on the fore-part; the beak is warty, crowned with tubercles; the beak is obtuse. It is about three or four inches long and is found in Asia and America.

9. *Strombus fasciatus*.—Lip entire; the back is crowned with three rows of protuberances, and is rosy between them.—It is found in divers parts of Africa.

10. *Strombus rapinus*.—Lip thin, rugged, repand above; back orange, transversely striate, and crowned with tubercles; the aperture is polished and white.

11. *Strombus gallus*.—Lip mucronate on the fore-part, and very long; the back is crowned with tubercles; the beak is straight. It is about six inches long. The shell is sometimes uniformly brown, yellow, or violet; sometimes it is varied with spots and rays; the back is surrounded with smooth ribs, which are sometimes simple, sometimes double; the first whorl is crowned with tubercles, which in the other whorls are more or less conspicuous.—It inhabits Asia and America.

12. *Strombus auris dianæ*.—Lip projecting to a sharp point; the back is muricate; the beak erect and acute. The shell is thick, and generally varied with colours.—It inhabits the southern coasts of Asia, and is three inches long.

13. *Strombus pugilis*.—Anterior lip prominent, rounded, smooth; the spire is spinous; beak three-lobed, obtuse.—It inhabits South America.

14. *Strombus alatus*.—Anterior lip rounded, prominent, smooth; spire unarmed; beak three-lobed and obtuse.

15. *Strombus marginatus*.—Lip a little prominent; the back margined, smooth; beak entire.

16. *Strombus luhuanus*.—Lip a little prominent; back smooth; whorls rounded and equal.—This species is found on the southern coasts of Asia, and is about two inches and a half long.

17. *Strombus gibberulus*.—Lip a little prominent; back smooth; whorls gibbous, unequal. The shell is white, with numerous bands, spots, and clouds; the lip is striate within, and with the pillar it is partly blue and partly red.—It is found on the southern shores of Asia.

18. *Strombus oniscus*.—Shell obovate, with knotty belts, and a subulate smooth projection.—This species is found in the South American ocean; and is about an inch long.

III.—Dilated.

19. *Strombus lucifer*.—Lip rounded and entire on the fore-part; the belly is doubly striate; spire crowned with tubercles; the upper ones minute. The shell is variegated, resembling

bling the next; but is thinner, and, armed with much less spines. It is thought to be a younger species of *strombus gigas*.

20. *Strombus gigas*.—Lip rounded, and very large; the shell is crowned; the belly and spire have conic expanded spines. The shell is of a beautiful glossy white; within it is of a rich rose-colour.—It is found in divers parts of South America; and is ten inches long and nine broad.

21. *Strombus latissimus*.—Lip rounded and very large; the belly is unarmed; the spire a little knotty. The shell is solid, fourteen inches long, varied with brown and white, sometimes radiate; the lip within is white; the mouth rosy.—It inhabits Asia.

22. *Strombus epidromis*.—Lip rounded, short; belly smooth; spire a little knotty.—It inhabits southern Asia; and is about three inches long.

23. *Strombus minimus*.—Lip retuse, gibbous; belly and spire knotty, with knotty plaits; aperture two-lipped, smooth.—Inhabits India; and is about an inch and a half long.

24. *Strombus canarium*.—Shell somewhat heart-shaped, with a rounded, retuse, smooth lip; pillars smooth.—It inhabits the southern coasts of Asia.

25. *Strombus vittatus*.—Lip rounded, short; belly smooth; spire elongated; the whorls are divided by an elevated suture. The shell is whitish, with brown bands.—It inhabits Asia; and is about four inches long.

26. *Strombus succinctus*.—Lip rounded, retuse; belly smooth, with four pale, linear, punctured belts.—It inhabits different parts of Asia.

27. *Strombus spinosus*.—Lip tapering, entire, slightly plaited, and crowned with fine spines; the spire is prickly.—It has been found hitherto only in a fossile state, and very much resembles the *Voluta vespertilio*, but is not emarginate at the base; and the pillar is not always plaited; the shell is whitish, with numerous parallel lines, above angular, and crowned with very sharp spines.

28. *Strombus fissurella*.—Lip continued into a longitudinal cleft ridge.—It inhabits India, and is found frequently in a fossile state in Campania.

29. *Strombus urceus*.—Lip tapering, short, striate; the belly and spire have knotty plaits; aperture two-slipped, unarmed. There are several varieties of this species.—It is chiefly found in the Indian ocean, is two inches and a half long; and varies much in colours and marks.

30. *Strombus tridentatus*.—The shell of this species is thin, white, with orange spots and clouds; the back is smooth and plaited; the beak is violet; the whorls are grooved; the lip is three-toothed.—It inhabits the Indian ocean.

31. *Strombus dentatus*.—Lip tapering, short, toothed; belly and spire plaited. This is very like the *strombus urceus*.

32. *Strombus costatus*.—Lip very thick, first whorl crowned with tubercles, the interstices of the tubercles plaited; the next transversely ribbed, the rest transversely striate.

33. *Strombus bryonia*.—Shell conic, with a mucronate eight-toothed lip and knotty spire. It is about seven inches long; extremely rare. Shell brown, varied with white and blueish clouds. Some authors suspect it is not of this division.

34. *Strombus affinis*.—Shell transversely striate, gibbous; spire unarmed; the first whorl crowned with tubercles.

35. *Strombus latus*.—The lip of this species is a little prominent, and twice emarginate beneath; the first whorl of the spire is smooth in the middle, and transversely striate on each side; the others are crowned with obtuse knots.

36. *Strombus lævis*.—Shell smooth, silvery, radiate with brown, with obsolete, transverse plaits; the spire is elongated, with inflated rounded whorls.

37. *Strombus vexillum*.—Shell solid and subcylindrical, with alternate, reddish, and ochraceous bands; lip denticulate within; pillar flat, glabrous, and emarginate at the base.—It is found in the Indian ocean, and is extremely rare.

38. *Strombus Norwegicus*.—Shell oblong, subulate, white with round wheals; aperture spreading, ovate; beak ascending a little.—This is obtained on the coasts of Norway.

IV.—Tapering, with a very long spire

39. *Strombus tuberculatus*.—Shell ovate, oblong, tuberculate; lip thickened. The shell is coarse; the whorls covered with rows of raised horny dots; lip gibbous; aperture ovate; the beak is very short and recurved.—It inhabits the Mediterranean.

40. *Strombus palustris*.—Shell smoothish; lip separated behind. The shell is thick, and yellow or brown, with from twelve to sixteen whorls; the first twice as large as the next; the rest longitudinally plaited, and with from three to five transverse striæ.—It inhabits the Savannas near the Indian ocean.

41. *Strombus ater*.—Shell smooth, lip separated before and behind. It is of a black-brown or bay, within white, very finely striate transversely; aperture ovate; spire subulate, with twelve flatish contiguous whorls.—It is found in the fens of Amboyna, and is more than two feet long.

42. *Strombus lineatus*.—Shell subulate, brown, with seven spiral impressed lines; the aperture is ovate.

43. *Strombus punctatus*.—Shell subulate, yellowish-white, band striate with red near the suture; the lesser whorls grooved.

44. *Strombus vibex*.—Shell subulate, cinereous, transversely striate; whorls nodulous, and marked with red streaks.—It inhabits Coromandel; and a variety is found in the Friendly Islands.

45. *Strombus auritus*.—Shell barred with brown; whorls muricate; aperture ovate.—It is found in different parts of Africa; is an inch and a half long.

46. *Strombus aculeatus*.—Shell brown, tuberculate; whorls minute; lip depressed, crenulate. A variety of this species is named the Hercules club.—This species inhabits the marshes of Africa, and is nearly two inches long.

47. *Strombus agnatus*.—Shell smooth; the lip very prominent, and emarginate behind.

48. *Strombus dealbatus*.—Shell with transversely, striate, black whorls; the outer ones smooth, and with the margin of the lip and pillar white.

49. *Strombus fuscus*.—The shell of this species is brown, with numerous tubercles on the whorls; the lip is separated before and behind, within it is striate with brown.

50. *Strombus marginatus*.—Shell brown; the lowest whorl is edged with white.

51. *Strombus lividus*.—Shell subangular, with spinous knots; the lip is separated on the fore part.

52. *Strombus striatus*.—Shell convex, striate, white, with a few fulvous streaks; the pillar is sinuated and inflected.

53. *Strombus sinister*.—Whorls turned contrary; the shell is thin, and longitudinally striate.—It has hitherto been found only in a fossile state in Switzerland.

STROMIO, or SPIRAZZA, a small river of the Morea, which falls into the gulf of Coron; 9 miles from Calamata.

STROMNESS, a town of Scotland, at the south-west end of the island of Pomona, on a bay of the same name, opposite to the north extremity of Hoy. It has a safe and commodious harbour. The entrance into it from the south is by a passage a quarter of a mile in breadth, which gradually expands as it advances inwards, to about a mile in breadth. It has a firm clay bottom, with a sufficient depth of water for vessels of 1000 tons burden, and is sheltered from all winds. On the west side is a sandbank, which is not dangerous; and two rocks on the east side point out the entrance. The bay is not above a mile long, and half a mile broad, but is one of the safest harbours in the northern parts of the kingdom. Very large vessels usually anchor in Cairston road, on the outside of the small islands; but there the tide is stronger, and the waves, especially with a south wind, very impetuous. It is regularly visited by the ships of the Hudson Bay Company, who have an agent constantly residing here. Numbers of young men enter into their service; it is said three-fourths of their servants are natives of Orkney. Many vessels bound for the Greenland and Davis' Straits whale fisheries also put in here, and frequently complete their crews from among the young Orcadian sailors. The town of Stromness, in the beginning

of the last century, was small, and much hampered in its commerce by the neighbouring royal burgh of Kirkwall; which, acting upon an act of parliament of William and Mary, that denies the benefit of trade to all other places except royal burghs, exacted from the town of Stromness a share of the cess or burdens to which Kirkwall was liable. The town of Stromness refused to pay the exaction, and was nearly ruined by the expenses of the process before the court of session and the house of lords; but in the year 1758, it was finally settled in favour of Stromness; and, since that time, its trade and commerce have greatly increased. There are vestiges of lead ore near the village; and hematitic iron ore is not uncommon. About a mile from Stromness is situated a very ancient circle of huge rude columns, called *The Standing Stones of Stennes*; which may be considered as constituting the Stonehenge of Orkney. Lat. 58. 51. N. long. 3. 9. W.

STROMMOE, the largest of the Faroe islands, in the North sea, belonging to Denmark. It is situated in the centre of the groupe, and is about 30 miles in length, and 6 in breadth. It is deeply indented by bays and creeks, some of which form good harbours, particularly that of Westman-shan, which is fit for the reception of vessels of any size. The coast presents a series of the most majestic, and in many places sublime scenery, the rocks rising in bold cliffs, almost perpendicular to the water, and forming in many places detached columns of great height. They are often hollowed so as to form immense caverns; and in some cases they are completely perforated, and afford a passage for boats. In the interior is the highest mountain of the Faroe islands, called Skieling Field, which rises to a perpendicular height of 3000 feet. The population of this and the neighbouring island of Nalsoe, is about 1600. They subsist, as in the other Faroe isles, by fishing, cultivating a little corn, and rearing cattle, but depend on Denmark for annual supplies. In 1812, the number of horned cattle was 600, of sheep 9000, and of fishing boats 150. The chief town is Thorhaven, a small place with 500 inhabitants.

STROMSTADT, a small town in the south-west of Sweden, in West Gothland, celebrated for its shell-fish, particularly lobsters. It lies in a hilly district, contains 1100 inhabitants, and has a good harbour; 43 miles north-north-west of Uddevalla. Lat. 58. 55. 30. N. long. 11. 12. E.

STROMZA, a small town of Greece in Macedon, situated on an eminence; 48 miles north of Salonica.

STROND, *s.* The beach; the bank of the water: *Obsolete.*

So looks the *strond*, whereon the imperious flood
Hath left a witness'd usurpation. *Shakspeare.*

STRONG, *adj.* [ʃtrɒŋ, ʃtrɒŋz, ʃtrɒŋz, Saxon; "Strangr, Icel.; strenuus, rapidus, intensus; streng, Sueth. asper; strong, rigidus: consent. linguis cognatis omnibus." *Serenius.*] Vigorous; forceful; of great ability of body.

The *strong-wing'd* Mercury should fetch thee up,
And set thee by Jove's side. *Shakspeare.*

Fortified; secure from attack.

Within Troy's *strong* immures

The ravish'd Helen with wanton Paris sleeps. *Shakspeare.*

Powerful; mighty.—The merchant-adventurers being a *strong* company, and well underset with rich men and good order, held out bravely. *Bacon.*—Supplied with forces. It has in this sense a very particular construction. We say, a thousand *strong*; as we say, twenty years old, or ten yards long.

When he was not six-and-twenty *strong*,
Sick in the world's regard, wretched and low,
My father gave him welcome to the shore. *Shakspeare.*

Violent; forcible; impetuous.

But her own kings she likens to his Thames,
Serene yet *strong*, majestic yet sedate,
Swift without violence, without terror great. *Prior.*

Hale; healthy.—Better is the poor, being sound and *strong* in constitution, than a rich man afflicted in his body. *Eclus.*—Forcibly acting on the imagination.—This is one of the *strongest* examples of a personation that ever was. *Bacon.*—Ardent; eager; positive; zealous.

Her mother, ever *strong* against that match,
And firm for doctor Caius, hath appointed,
That he shall shuffle her away. *Shakspeare.*

Full; having any quality in a great degree; affecting the sight forcibly.—By mixing such powders, we are not to expect a *strong* and full white, such as is that of paper; but some dusky obscure one, such as might arise from a mixture of light and darkness, or from white and black, that is, a grey or dun, or russet brown. *Newton.*—Potent; intoxicating.—Get *strong* beer to rub your horses' heels. *Swift.*—Having a deep tincture; affecting the taste forcibly.—Many of their propositions savour very *strong* of the old leaven of innovations. *King Charles.*—Affecting the smell powerfully.—Add with Cecropian thyme *strong*-scented centaury. *Dryden.*—Hard of digestion; not easily nutrimental.—*Strong* meat belongeth to them that are of full age. *Hebrews.*—Furnished with abilities for any thing.—I was *stronger* in prophecy than in criticism. *Dryden.*—Valid; confirmed.—In process of time, an ungodly custom grown *strong*, was kept as a law. *Wisdom.*—Violent; vehement.—In the days of his flesh he offered up prayers, with *strong* crying and tears. *Heb.*—The Scriptures make deep and *strong* impressions on the minds of men: and whosoever denies this, as he is in point of religion atheistical, so is he in understanding brutish. *J. Corbet.*—Cogent; conclusive.

Messengers

Of *strong* prevailment in unharden'd youth. *Shakspeare.*

Able; skilful; of great force of mind.

There is no English soul

More *stronger* to direct you than yourself,
If with the sap of reason you would quench,
Or but allay the fire of passion. *Shakspeare.*

Firm; compact; not soon broken.

Full on his ankle fell the ponderous stone,
Burst the *strong* nerves, and crash'd the solid bone. *Pope.*

Forcibly written; comprising much meaning in few words.

Like her sweet voice is thy harmonious song,
As high, as sweet, as easy, and as *strong*. *Smith.*

STRONG, formerly REEDSTOWN, a township of the United States, in Somerset county, Maine; 308 miles north-north-east of Boston. Population 424.

STRONG TIDE PASSAGE, a passage between Townshend island and the coast of New Holland, in which the tide runs at the rate of 4½ miles per hour.

STRONG SALINE, a river of the United States, in Louisiana, which enters the Arkansas.

STRONGBOW INDIANS, Indians of North America, about Lat. 62. N. long. 124. W.

STRONGFISTED, *adj.* Stronghanded.—John, who was pretty *strongfisted*, gave him such a squeeze as made his eyes water. *Arbuthnot.*

STRONGHAND, *s.* Force; violence.—When their captain dieth, if the seniory should descend to his child, and he an infant, another would thrust him out by *stronghand* being then unable to defend his right. *Spencer.*

STRONGILO, a small island, or rather rock, near the coast of Asia Minor; 6 miles south-west of Paros.

STRONGLY, *adv.* [ʃtrɒŋlɪce, Sax.] With strength; powerfully; forcibly.

The dazzling light

Had flash'd too *strongly* on his aking sight. *Addison.*

With strength; with firmness; in such a manner as to last; in such a manner as not easily to be forced.—Great Dunsinane he *strongly* fortifies. *Shakspeare.*—Vehemently; forcibly; eagerly.—All these accuse him *strongly*. *Shakspeare.*

STRONGOLI,

STRONGOLI, a small town in the south of the kingdom of Naples, in Calabria Ultra, with 1900 inhabitants. It is a place of great antiquity, for tradition declared it to have been built by Philoctetes, after his return from the Trojan war; 16 miles south-south-east of Cariati Vecchia, and 47 east of Cosenza. Lat. 39. 15. N. long. 17. 17. E.

STRONGSET, *adj.* Firmly compacted.—As to his person, he is described to be of middle stature; his body *strong-set* and fleshy. *Swift*.

STRONGWATER, *s.* Distilled spirits.—Metals receive in readily *strongwaters*; and *strongwaters* do readily pierce into metals and stones: and some will touch upon gold, that will not touch upon silver. *Bacon*.

STRONGYLE, a mountain in the northern side of the island of Candia.

STRONGYLUS, a genus of the class and order vermes intestina. The Generic Character is as follows: Body round, long, pellucid, glabrous; the fore-part is globular, truncate, with a circular aperture fringed at the margin; the hind-part of the female entire and pointed; in the male, it is dilated into loose, distant, pellucid membranes. There are only two species:—

1. *Strongylus equinus*.—Head opaque; the intestine is black. The male worm is of a pale yellow, with a fine yellowish membrane covering the intestines; the tail is three-leaved, with a small spine or two: the female with white filiform vesicles surrounding the intestines.—It is found in the stomach of the horse in great numbers.

2. *Strongylus ovinus*.—This, as its name imports, is found in the intestines of sheep.

STRONSAY, one of the Orkney islands, on the coast of Scotland. It is $7\frac{1}{2}$ miles long, by nearly as much in breadth, of a very irregular figure, deeply indented by the sea, and cut almost into three distinct islets. The coast is partly flat and partly rocky, having two remarkable promontories, Burrow-head on the south-east, and Rothiesholm or Rousom-head on the south-west. There are three sandy bays, which do not afford safe anchorage, on account of the low sunk rocks with which they are interspersed. These rocks, however, are the chief source of emolument to the inhabitants, from the immense quantity of sea-ware which they afford for the making of kelp: the island, on an average, produces 300 tons per annum. There are two safe harbours, viz., Ling bay on the west side of the island, sheltered by the holm of Ling, and Papa sound, lying between Stronsay and Papa Stronsay. The surface of the island is rugged, a ridge of low hills running its whole length from north to south. The soil is a dry friable blackish earth lying on a clay bottom, mixed with small stones, which in many places have been turned up by the plough, and render the soil very gravelly. Traces of lead-ore were discovered many years ago on the west coast of the island; but the whole island consists of secondary rocks, unfavourable to the expectation of any workable vein. There is a chalybeate spring called the well of Kildinguie, which was in so high repute while the Orkneys were subject to Denmark, that persons of the first rank in that kingdom used to come over to drink its waters. There are the remains of four chapels on the island. It was in Stronsay, in the summer of 1722, that kelp was first manufactured in Orkney; and in the autumn of that year, Mr. James Fea, a landholder in this island, sailed for Newcastle with the first cargo of that article, which now brings into Orkney several thousand pounds sterling a-year.

STRONSAY AND EDAY, a parish in Orkney, comprehending the islands of Stronsay, Eday, Papa Stronsay, Fairay, and nine holms or pasture isles. Population of the parish in 1801, 1642; in 1811, 1444.

STRONTIAN, or **STRONTIANITE** [*Strontiane carbonatée* of Haüy], a mineral composed of a peculiar earth combined with carbonic acid. See **MINERALOGY**.

STRONTIAN, a place of Scotland, in Argyleshire, in the parish of Ardnamurchan, noted for its lead mines. There is a small village erected for the accommodation of the miners. The mines of this place are famous for having given to the

world a new species of earth, which is distinguished by the name of *strontian*. The characters of this mineral are these: its colour is whitish or light green, its lustre common, its transparency intermediate between semi-transparent and opaque, its fracture striated, presenting oblong distinct concretions, somewhat uneven and bent; its hardness moderate, being easily scratched, but not scraped; it is very brittle, and its specific gravity is from 3.4 to 3.644. Independent of tinging flame of a blood red colour, it is found to disagree with barytes in its order of chemical attraction, holding an intermediate rank betwixt barytes and lime. An hundred parts of strontites are composed of 60.21 of pure earth, 30.29 of carbonic acid gas, and 8.59 of water. It was first discovered in 1720, and analyzed by Dr. Kirwan and Dr. T. C. Hope, of Edinburgh; 30 miles south-west of Fort William.

STROOK. The proterite of *strike*, used in poetry for *strok*. *Dr. Johnson*.—And also in prose.—The Lord *strook* the child that Uriah's wife bare unto David. 2 *Samuel*.

STROOM ROCK, a rocky islet in the strait of Sunda. Lat. 5. 51. S. long 105. 50. E.

STROP, *s.* [τρωπ, Sax.; *strop*, Teut.; *strupus*, Lat.] A piece of rope spliced into a circular wreath, and used to surround the body of a block, or for other purposes on board a ship. A leather on which a razor is sharpened.

STROPHADÆ. See **STRIVALI**.

STROPHANTHUS [compounded of στρεφω, Gr. from στρεφω, to twist, and ανθος, a flower, alluding to the twisted segments of its corolla], in Botany, a genus of the class pentandria, order monogynia, natural order contortæ, apocinæ (*Juss.*)—Generic Character. Perianth inferior, of one-leaf, in five deep, ovate-oblong, acute segments. Corolla of one-petal, funnel-shaped; crowned in the throat with ten undivided scales; limb in five segments, each terminating in a very long, taper, more or less contorted, point. Nectary of five scales below the germen. Stamina: filaments five, awl-shaped, short, inserted into the middle of the tube; anthers erect, converging, arrow-shaped, pointed or awned. Pistil: germen of two lobes; style simple, thread-shaped, dilated upwards; stigma nearly cylindrical.—*Essential Character*. Corolla funnel-shaped, with ten undivided scales in the tube; segments of the limb with very long tails. Nectary of five scales below the germen.

1. *Strophanthus sarmentosus*.—Smooth, trailing. Flowers aggregate, terminal and lateral, accompanying the leaves. Corolla nearly bell-shaped. Anthers with elongated capillary points.—Gathered at Sierra Leone.

2. *Strophanthus laurifolius*.—Smooth. Leaves opposite or ternate. Flowers aggregate, terminal, coming after the leaves. Anthers with elongated capillary points.—Found at Sierra Leone.

3. *Strophanthus dichotomus*, the **ECHITES CAUDATA**, of Linnæus; which see.

4. *Strophanthus hispidus*.—Very bristly. Tube of the corolla cylindrical, half as long as the calyx. Anthers acute, without points.—Gathered by Mr. Smeathman at Sierra Leone.

STROPHE, *s.* [*strophe*, Fr.; στροφή, Gr.] A stanza.—The measure of verse used in the chorus is of all sorts, without regard had to *strophe*, antistrophe, or epode, which were a kind of stanzas framed only for the music. *Milton*.

STROPHIARIUS, among the Romans, a person who prepared and made the strophia. See **STROPHIUM**.

STROPHIUM, among the Romans, a short swarth or band, by which the young women kept down the swelling of their breasts.

STROPHIUM was likewise a bandage for the head, made of two or three garlands of flowers tied together.

STROPHULUS, in Medicine. See **PATHOLOGY**.

STROPPE, or **STROBECK**, a village of the Prussian states, in the principality of Halberstadt, with 600 inhabitants.

STROPPEF, a small town of Prussian Silesia; 20 miles north-north-west of Breslau.

STROPIANA,

STROPPIANA, a small town of the Sardinian states, in the Piedmontese province of Vercelli, with 1900 inhabitants.

STROPPUS, among the Romans, the thong with which the oars were tied to the scalmus.

STROUD, a market town of England, in the county of Gloucester, situated on the ridge of a declivity, near the confluence of the river Frome and the Slade-water. The latter, also called the Stroud-water, has a very clear stream, and is particularly celebrated for its properties in the dyeing of broad cloth, scarlet, and other grain colours. On this account an extensive clothing trade has been established here, of which the town Stroud may be regarded as the centre; all the surrounding valleys exhibiting a continued range of houses or villages, inhabited by persons engaged in this manufacture. The clothiers occupy the banks of the river for nearly 20 miles together: they have erected many fulling mills on it, and some of them are supposed to make 3000 cloths a-year. The Stroud-water canal has been of great advantage to this trade. It accompanies the course of the river to the Severn, into which it falls about five miles below Gloucester. This canal is extended, in another direction, so as to join the Thames at Lechlade. The scenery of this district is very beautiful, though the steepness and irregularity of the ground render the roads fatiguing to the traveller. At the time of the Domesday Survey, the manor of Stroud appears to have been comprehended in the adjoining parish of Bisley. The church, dedicated to St. Lawrence, has been erected and repaired at different periods. It consists of a nave, chancel, and side aisles, with a tower and spire at the west end. Here are also commodious chapels for the Independents and Wesleyan Methodists. An endowed free school, and several charity schools, supported by subscription, have been established in the town. Stroud was the birth-place of John Canton, an ingenious philosopher and mathematician of the last century. In 1811, the town and parish contained 1184 houses, and 5321 inhabitants. Market on Friday, and two annual fairs; 11 miles south-east of Gloucester, and 103 west-by-north of London. Lat. 51. 44. N. long. 2. 12. W.

STROUD, a village and parish of England, in the county of Kent, situated on the river Medway, which separates it from Rochester, and over which it has a stone bridge of 11 arches. The church is a handsome building, consisting of a nave and two aisles, 100 feet in length. In the south aisle is a stone chapel, the pavement of which contains several specimens of Mosaic work. The remains of an ancient mansion-house of the knights templars is still discernible in a farm-house on the banks of the river, now called the Temple house; 28½ miles east of London.

STROUD'S BAY, a bay on the north-west coast of Barbadoes; 4 miles north of Speightstown.

STROUDEND, a hamlet of England, in the parish of Painswick, Gloucestershire.

STROUDSBURG, a post village of the United States, in Northampton county, Pennsylvania.

STROVE. The preterite of *strive*.—Having quite lost the way of nobleness, he *strove* to climb to the height of terrible-ness. *Sidney*.

SROVISI, or **VERDOGNA**, a small town of Greece, in the south-east of the Morea, in the province of Zaconia.

To STROUT, *v. n.* [*strotzen*, German.] To swell with an appearance of greatness; to walk with affected dignity; to strut. This is commonly written *strut*, which seems more proper. To protuberate; to swell out.

The daintie clover grows, of grass the only silke,
That makes each udder *strout* abundantly with milke.

Drayton.

To STROUT, *v. a.* To swell out; to puff out; to enlarge by affectation.—I will make a brief list of the particulars in an historical truth in nowise *strouted*, nor made greater by language. *Bacon*.

To STROW, *v. a.* [See **To STREW**.] To spread by being scattered.

VOL. XXIII. No. 1597.

Angel forms lay entranc'd,
Thick as autumnal leaves that *strow* the brooks
In Vallombrosa. *Milton*.

To spread by scattering; to besprinkle.

Come, shepherds come, and *strow* with leaves the plain;
Such funeral rites your Daphnis did ordain. *Dryden*.

To spread.—There have been three years' dearth of corn,
and every place *strow'd* with beggars. *Swift*.—To scatter;
to throw at random.—But little need to *strow* my store.
Spenser.

The tree in storms

The glad earth about her *strows*,
With treasure from her yielding boughs. *Waller*.

STROW, a petty village in Bohemia, not far from the town of Sanz, remarkable for nothing but the partial sinking of the mountain on which it stands, on 21st March, 1820. The removal was gradual, and no lives were lost; but the walls of every house in the village gave way during, this singular convulsion.

STROWAN, a parish of Scotland, in Perthshire, united to Blair-Athol.—Also a parish of Perthshire, united to Monivaird.

STROWAY, a small river of England, in Monmouthshire, which falls into the Ebwith, at Kirton.

To STROWL, *v. n.* To range; to wander. [See **To STROLL**.] 'Tis she who nightly *strowls* with saunt'ring pace. *Gay*.

STROXTON, a parish of England, in Lincolnshire; 4 miles south-south-west of Grantham.

To STROY, *v. a.* [For *destroy*.] Dig garden, *stroy* mallow, now may you at ease. *Tusser*.

STROZZI (Tito Vespasiano), a Latin poet of the 15th century, belonging to the famous Florentine family of that name. He was one of four sons, whose father caused them to be well instructed in public literature. Tito studied in poetry and eloquence under Guarino, at Verona. He married in 1470, and was made a cavalier by duke Borso. He sustained some considerable offices at Ferrara, and was employed as the ambassador of duke Hercules at the papal and other courts. His death is said to have occurred in 1505. He wrote many Latin poems, amorous, serious, and satirical; and having planned a long poem in praise of duke Borso, he wrote ten books, but did not live to finish it. Aldus printed a collection of his productions, but many more were left in MS. As an author he displayed a degree of facility and elegance, which was not common so soon after the revival of literature.

STRUBBY, a parish of England, in Lincolnshire; 3 miles north-by-west of Alford.

STRUCK. The old preterite and participle passive of *strike*.

This message bear: the Trojans and their chief

Bring holy peace, and beg the king's relief;

Struck with so great a name, and all on fire,

The youth replies; whatever you require. *Dryden*.

STRU'CKEN. The old participle passive of *strike*.

Down fell the duke, his joints dissolv'd asunder,

Blind with the light, and *strucken* dead with wonder.

Fairfax.

STRU'CTURE, *s.* [*structure*, Fr., *structura*, from *structus*, Latin.] Act of building; practice of building.

His son builds on, and never is content,

Till the last farthing is in *structure* spent. *Dryden*.

Manner of building; form; make.—Several have gone about to inform them, but for want of insight into the *structure* and constitution of the terraqueous globe, have not given satisfaction. *Woodward*.—Edifice; building.—High on a rock of ice the *structure* lay. *Pope*.

STRUDE, or **STRODE**, *s.* A stock of breeding mares.

Bailey.

STRUENSEE (John Frederic), was the son of a clergyman of Halle, in Saxony, and born at Halle in 1737. At

an early age he manifested very promising talents, and devoted himself to the study of medicine; and having taken his degree of doctor in 1757, he removed to Altona; and there obtained extensive medical practice. Besides the acquaintance he formed with two persons, viz., count Von Ranzau Aschberg, and count Brandt, connected with his subsequent fate, he acquired also, in the course of his practice, the friendship of the widow of the chief marshal of the court of Denmark; and thus was honoured with an appointment, in 1768, to be one of the physicians of the king, whom he accompanied in his tour to Germany, France, and England. Soon after the marriage of Christian VII. with Matilda, the English princess, an open rupture succeeded a coldness that was observed to subsist between this prince and the queen. The queen-dowager availed herself of this circumstance, with a view of recovering her lost influence. The misunderstanding between the two queens was increased on the birth of the crown-prince; nor did the king's tour contribute to lessen his indifference towards his consort. On his return, the discount was manifested more openly and decisively; and divided the nation into two parties. The most numerous party was supported by the minister and the principal officers of state; and at the head of it was count Holk, the king's favourite. The queen-dowager had her partizans at Friedensburg; and some young persons, who had neither influence nor property, took part with Matilda, and entertained hopes that, on account of her youth, beauty, and engaging manners, a reconciliation might be effected between her and the king. The young queen, however, well knowing that these friends had no experience in court-intrigues, formed her own plan; and determined to make every possible effort for depriving count Holk of the royal favour, and thus of regaining the confidence of the king. Holk, for his own security, endeavoured to widen the breach between the royal pair; and conceiving that Struensee hated the queen as much as he himself did, he persuaded his royal master to take Struensee with him, whenever he visited the queen. But, contrary to Holk's expectations, the king became attached to Struensee; and the queen, remarking this change, became gradually familiarized to his company; and her aversion to him was succeeded by an admiration of his talents, his wit, and his extensive knowledge. The crown-prince being at this time inoculated for the small-pox, under the superintendance of Struensee, the queen informed him, that, in recompence of his services, he should be intrusted with the prince's education. Struensee having succeeded in the operation, was made a counsellor of conference, with a salary of 1500 dollars, and appointed reader to the king and queen. This new favourite succeeded in his endeavours for producing a complete reconciliation between the king and his royal consort; which was followed by an indifference, on the part of the former, towards Holk. Bernstorff, the minister, became jealous of Struensee, and attempted, though unsuccessfully, to undermine the confidence reposed in him by the king and queen. Soon after, the court made a tour to Schleswic; and the heads of the different parties composed the royal suite. The queen behaved to both parties in the same courteous manner. Brandt succeeded Holk in the king's favour and confidence; but Bernstorff, though mortified by the loss of his influence over the king, declined making a voluntary resignation. His fate, however, was soon determined, and intimation was given him that his services were no longer necessary. The remaining members of government were dismissed, and the administration was formed by the friends of the queen and of Struensee. During these events, the queen-dowager remained at Friedensburg, watching their progress, and condoling with the discarded ministers. The queen at length obtained a complete triumph. The king behaved to her with the affectionate tenderness which her amiable qualities deserved; and Struensee possessed her confidence, and employed all possible means to retain it. The king, naturally of a weak mind, was secluded from society by Struensee; and Brandt was commissioned to keep him

constantly occupied with amusements. The king was gratified by this mode of life; the influence of Struensee was augmented; and he at length accomplished his main object, which was that of preventing his majesty from personally transacting any business with his ministers. In process of time, or towards the close of the year 1770, Struensee, in order to retain his power more securely, prevailed on the queen to commit to his management the whole business of the cabinet. In consequence of this measure, the whole form of the government was new-modelled; and public business was transacted in the king's name, by those immediately around him. But Struensee's paramount power was of no long duration. His boldness, approaching to the highest degree of insolence, degenerated into timidity, when any of his measures were opposed; and though he conducted foreign affairs according to the principles of sound policy, his internal administration, perverted by avarice or ambition, did not answer the purpose intended. The various measures which he projected for the improvement of the government and country, and which our limits will not allow us to detail, excited dissatisfaction amongst persons of every rank. Struensee, however, was indefatigable in the complicated duties of his office, and sedulously attentive to the education of the crown-prince. Two of his brothers were advanced to stations of importance; one in the new college of finance, and the other in the department of war. Brandt, Berger the physician, and other confidential persons, remained constantly near the king's person, nor were any others, suspected to be adverse to the existing order of things, permitted to have any intercourse with him; so that his indifference to public business gradually increased, and his capacity for conducting it diminished. In July 1771, the queen was delivered of a princess; and as she knew the surmises, originating at Friedensburg, that were circulated on this occasion, she was not unapprehensive that they might serve as pretences to wrest from her the power which she had acquired. She was unfortunately dependent on Struensee, who, by the abuse of his power, had become an object of detestation. Not content with being inrolled in the list of the Swedish nobility, and being created Count, he invented a new title, or that of private counsellor of the cabinet, and with this he acquired a degree of power which had never been enjoyed before by any minister of Denmark. In fact, it was this ambitious minister's aim to annihilate the royal authority; and in the circumstances then existing, and under the protection of the queen, if he had conducted himself with more prudence, he would have defeated the machinations of those who were meditating his ruin. His friends, probably foreseeing his fall, became cool and indifferent; and the people in general, while they despised his power, execrated his name. A spirit of discontent pervaded all ranks; the sailors and the soldiers complained of his conduct; and the populace joined the malcontents in their opposition and murmurs. The dissatisfaction and tumult that prevailed increased Struensee's timidity: his measures were indecisive, and his situation became every day more dangerous. The British minister, actuated by a respect for the young queen, endeavoured to hasten his removal from power, and he himself wished for a release. Accordingly, he offered him a sum of money to enable him to quit the country. The queen, apprehending that her enemies would get the king into their hands, and obtain possession of all the royal power, opposed this measure. A crisis, however, was approaching; and Struensee could no longer resist or controul the counsels and operations of those who were hastening his downfall. Notwithstanding the measures which he adopted for insuring his own personal safety, and which were interpreted by the people into a kind of avowal of his political misconduct, every thing conspired, not only to accelerate his own ruin, but to favour the plan which had been formed against the young queen. On the morning of the 17th of January, 1772, the inhabitants of Copenhagen heard, not without astonishment and terror, that this princess, count Struensee, his brother, count Brandt, and all their friends and adherents, had been arrested

arrested in the night. At 3 o'clock in the morning, succeeding a ball that had been given at court the preceding evening, and after the queen had closed about 1 o'clock with prince Frederick, colonel Koller, an inveterate enemy of Struensee's, whose regiment was on guard at the palace, informed his officers, after having admitted them into the palace, that he had the king's orders to take the queen into custody. The officers, without requiring to see the orders, which would have defeated the whole plan, implicitly obeyed. Ranzau hurried into the king's bed-chamber, and drawing the curtains so as to awaken him, told him, before he had time for reflection, that his life was in danger. "What must we do?" said the alarmed king: "Shall we fly? Stand by me: give me your advice."—"Sign this," replied Ranzau, "it will save my sovereign and the whole royal family." The king took hold of his pen, but let it drop as soon as he cast his eye on the name of his consort. At length he suffered himself to be persuaded; and Ranzau, supported by colonel Eichstadt, whose dragoons, surrounded the palace, and some other officers, carried out the fatal order; and, in a manner the most violent and brutal, seized the person of the unfortunate Matilda, and conveyed her in a carriage to the castle of Cronenberg. Struensee's arrest was followed by the appointment of a commission for his trial; the proceedings against him were carried on with great zeal and severity; and on the 25th of April was passed the following sentence:—"That after his right hand had been cut off, he should be beheaded; that his body should then be quartered, and in that state publicly exposed; and that his head and hand should be affixed to a pole." This sentence was, on the 28th, carried into execution.

To STRUGGLE, *v. n.* [Of uncertain etymology. *Dr. Johnson*.—It is probably from *strucken*, or *struyckelen*, Teut. to stumble; we have the old English word *strokeliuge*, and *strogelyn*, collectatio. *Prompt. Parv.*] To labour; to act with effort. To strive; to contend; to contest.

I repent, like some despairing wretch,
That boldly plunges in the frightful deep,
Then pants, and *struggles* with the whirling waves;
And catches every slender reed to save him. *Smith.*

To labour in difficulties; to be in agonies or distress.
Strong virtue, like strong nature, *struggles* still,
Exerts itself, and then throws off the ill. *Dryden.*

STRU'GGLE, *s.* Labour; effort. Contest; contention.—When, in the division of parties, men only strove for the first place in the prince's favour, an honest man might look upon the *struggle* with indifference. *Addison*.—It began and ended without any of those unnatural *struggles* for the chair, which have disturbed the peace of this great city. *Atterbury*.—Agony; tumultuous distress.

STRU'GLER, *s.* One who contends; a striver.—The Jews were hard-hearted and malicious *strugglers* against the truth. *Martin*.

STRU'GLING, *s.* The act of striving or contending.—No man is guilty of an act of intemperance but he might have forborne it, not without some trouble from the *strugglings* of the contrary habit; but still the thing was possible. *South*.

STRUMA, *s.* [Latin.] A glandular swelling; the king's evil.—A gentlewoman had a *struma* about the instep, very hard and deep about the tendons. *Wiseman*.

STRUMÆ [formed, as some will have it, *a struendo*; because they grow insensibly, *structum assurgunt*], in Medicine and Surgery, tumours arising most usually on the neck and throat; called also *serofula*, and popularly the *evil*, or *king's evil*. See *PATHOLOGY*.

The Greeks call them *χοιγαδες*, sores.
STRUMARIA, in Botany, a genus of the class hexandria, order monogynia, natural order spathaceæ, narcissi (*Juss.*)—Generic Character. Calyx: sheath of two, unequal, oval, pointed leaves or valves. Corolla: petals six, superior, spreading, the three outer ones generally carinated

at the back. Stamina: filaments six, inserted into the receptacle, shorter than the corolla, equal, awl-shaped; anther oval, or roundish. Pistil: germen inferior, triangular, three-furrowed; style longer than the stamens, inflated from the base to its centre, awl-shaped upwards; stigma trifid. Pericarp: capsule oval or roundish, slightly triangular, with three furrows, three cells, and three valves. Seeds numerous, round.—*Essential Character*. Petals six, spreading. Style thickened below the middle. Stigma three-cleft. Capsule inferior, roundish, of three cells.

1. *Strumaria linguæfolia*, or tongue-leaved *strumaria*.—Leaves linear-sword-shaped, flat, obtusely rounded at the tip. Stalk round; compressed upwards. Stamens the length of the corolla.—Native of the Cape of Good Hope.

2. *Strumaria truncata*, or truncated *strumaria*.—Leaves linear-sword-shaped, flat, obtusely rounded at the tip. Stalk compressed. Stamens longer than the corolla.—It flowers in April and May.

3. *Strumaria rubella*, or pale-red *strumaria*.—Leaves linear, waved in an oblique manner. Petals flat.—It flowers in May and June.

4. *Strumaria undulata*, or waved *strumaria*.—Leaves linear, waved in an oblique manner. Petals undulated. Root perennial. Stalk a foot high, erect. Flowers in a loose umbel. Petals narrow, undulated, pink at the tip.

5. *Strumaria angustifolia*, or narrow-leaved *strumaria*.—Leaves linear, flat. Germen with three glands.—It flowers in April and May.

6. *Strumaria filifolia*, or fine-leaved *strumaria*.—Leaves thread-shaped. Petals acute.—It flowers in November.

7. *Strumaria spiralis*, or spiral-stalked *strumaria*. See *HEMANTHUS SPIRALIS*.

STRU'MOUS, *adj.* Having swellings in the glands; tainted with the king's evil.—How to treat them when *strumous*, scirrhus, or cancerous. *Wiseman*.

STRU'MPET, *s.* [of doubtful original. "*Stropo*, vieux mot, *palliardise*: *stuprum*, Lat." *Trevoux*. *Dr. Johnson*.—The old French word is *strupe*, which denotes whoredom. See *Roquefort*, *Gloss*. And hence *strupet* might be formed, and by an easy corruption *strumpet*. The word is old in our language: it occurs in addition to the name of a woman, or by way of description, in a return made by a jury in the sixth year of King Henry the fifth. See *Cowel*. Mr. Tooke refers, as the *Etym. Dict.* of 1691 had before, to a Dutch word, applying in the way of contempt for the name. Wachter notices *strune* as having been used, in the dialect of Lower Saxony, for a prostitute. See his *Germ. Dict.* in *V. STRUNZE*.] A whore; a prostitute.

Ne'er could the *strumpet*,
With all her double vigour, art, and nature,
Once stir my temper; but this virtuous maid
Subdues me quite. *Shakespeare.*

STRU'MPET, *adj.* Like a *strumpet*; false; inconstant.
How like a younker, or a prodigal,
The scarfed bark puts from her native bay,
Hugg'd and embraced by the *strumpet* wind!
How like a prodigal doth she return,
Lean, rent, and beggar'd by the *strumpet* wind!
Shakespeare.

To STRU'MPET, *v. a.* To make a whore; to debauch.
If we two be one, and thou play false,
I do digest the poison of thy flesh,
Being *strumpeted* by the contagion. *Shakespeare.*

STRUMPFIA [so named by Jacquin, in memory of Christoph. Car. Strumpff, Professor of Chemistry and Botany, at Hall, in Madgeburgh], in Botany, a genus of the class syngenesia, order monogamia, natural order of compositæ nucamentacææ.—Generic Character. Calyx: perianth one-leaved, five-toothed, superior, very small, permanent. Corolla: petals five, oblong, obtuse, spreading. Stamina: filaments none. Anthers five, united into an ovate body. Pistil: germ inferior, roundish. Style awl-shaped, erect, commonly

commonly longer than the stamens. Stigma simple, obtuse. Pericarp: berry crowned with the calyx, roundish, one-celled. Seed one, roundish.—*Essential Character.* Calyx five-toothed, superior. Corolla five-petalled. Berry one-seeded.

Strumpfia maritima.—This is an upright shrub, three feet high. Branches round, somewhat ash-coloured, appearing to be composed of short joints from the fallen leaves, because the leaves together with the stipules take their rise from a common sheath, which surrounds the branch, and is permanent. The leaves are in threes, and very much resemble those of rosemary. Stipules small, acute and blackish, alternate with the leaves. Common peduncles axillary, and only half the length of the leaves, sustaining about five small flowers, with white petals, and on short peduncles. Berries soft and white, the size of a pea. The whole plant has an unpleasant smell.—Native of Curaçao, on the rocks by the coast.

Propagation and Culture.—It must be preserved in the bark stove, and will not bear transplanting; several plants that were raised from seeds, thrived very well while they continued in the pot where they were sown, but decayed when they were transplanted.

STRUMPSHAW, a parish of England, in Norfolk; 4 miles south-west-by-west of Acle.

STRUMUS, a name given by some of the old Roman authors to the cucubalus, or berry-bearing chick-weed. It had this name from its being found of service in strumous and scrofulous swellings, when externally applied. The name cucubalus seems to have been derived from the word *halicaccubum*, or the winter-cherry, for the ancients esteemed both these plants species of nightshade; and some of them have plainly described the cucubalus under the name of *solanum hortense*.

STRUNG. The preterite and participle passive of *string*.—The *string* bow points out the Cynthian queen. *Gay*.

STRUNKOWITZ, a small town in the south of Bohemia; 6 miles north of Prachatitz, and 70 south-by-west of Prague.

STRUPPI, among the Romans, garlands or wreaths of vervain, with which the statues of the gods were crowned.

STRUSOW, or STRUSZOW, a small town of Austrian Poland, in the circle of Tarnopol, on the river Sereth.

To STRUT, *v. n.* [*strätzen*, Germ.] To walk with affected dignity; to swell with stateliness.

Adore our errors, laugh at us while we strut
To our confusion. *Shakspeare.*

Does he not hold up his head and strut in his gait. *Shakspeare.*—To swell; to protuberate.

The pow'r appeas'd, with winds suffic'd the sail,
The belying canvass strutted with the gale. *Dryden.*

As thy strutting bags with money rise,
The love of gain is of an equal size. *Dryden.*

STRUT, *s.* An affectation of stateliness in the walk.—Certain gentlemen, by smirking countenances and an ungainly strut in their walk, have got preferment. *Swift.*

STRUTHIA, in Botany, a name originally given by Van Royen to the *Gnidia* of Linnæus; and which being derived from *στρουθός*, Gr., a sparrow, appears to have had in view the near affinity of that genus to passerina. See GNIDIA and PASSERINA.

STRUTHIO, in Ornithology, a genus of birds of the order Gallinæ. Bill subconic; nostrils oval; wings short, unfit for flight, feet formed for running. There are four species. Though the power of flying may be considered as the distinguishing characteristic of the feathered tribes in general, yet there are some families to which nature has denied that endowment, while she seems to have granted it to a few quadrupeds, and even partially to some fishes. It is thus that she displays the extent of her power, by the variety of her productions, and disdains to be confined within the narrow limits prescribed to her by the systems of philosophers. In descending from the class of quadrupeds to contemplate

that of birds, we find the connecting links, which unite these orders into one chain, very short, and almost imperceptible; for while the flying squirrel, the bat, and some other quadrupeds, are invested with the power of flight, and with other properties of birds, the ostrich, dodo, and cassowary, are by their great bulk confined to the ground, and they indicate by their habits, a near affinity to the four-footed animals. Hence, as we descend from those swift and slender birds, which are destined to move in the higher regions of the air, we find them growing, by almost imperceptible degrees, heavier and less agile, till at length, being wholly destitute of the qualities necessary for flight, they are incapable of rising from the surface of the earth.

1. *Struthio camelus*, or black ostrich.—Feet two-toed. This is the largest of all birds, and from this prerogative, in a great measure, is incapable of flight. Its weight is sometimes from eighty to one hundred pounds: from the top of the head to the ground, it is from seven to nine feet; and its length from the beak to the top of the tail eight feet. When walking, it seems as tall as a man on horseback. The plumage of the ostrich, however, as well as its weight, is an insuperable bar against its rising in the air. The vanes of wing-feathers are separate and detached, like hairs, and incapable of making any impression on the atmosphere. Those of the tail, and indeed of the whole body, are of the same structure. They are all as soft as down, and utterly unfit not only for flying, but for defending the body of the animal from external injury. The feathers of other birds have their webs broader on the one side than the other, but those of the ostrich have the shaft exactly in the middle. The head, the upper part of the neck, sides, and thighs, are covered with a clear kind of hair, which on the head somewhat resembles the bristles of a hog. The thighs of this bird, in which its great strength seems to lie, are large and muscular: and its hard and scaly legs, which are supported by two thick toes, have a considerable similarity to those of the goat. These toes are of unequal size; the inner, which is both longer and thicker, being seven inches in length, including the claw; the other, which is without a claw, is four inches. It is the only bird that possesses eye-lids, and these are fringed.

Though the ostrich be a bird known from the earliest ages, little comparatively is related of its history. In the scriptures, we have many comparisons drawn from its manners; as an article of food it was forbidden the Jews. It is mentioned by Aristotle as remarkable for its fecundity. In the parched deserts of Africa, where it resides, and where it runs with precipitation on the approach of an invader, it can rarely become an object of close examination. The race of these birds, though extremely ancient, still remains pure and almost solitary. Like the elephant, among the quadrupeds, the ostrich constitutes a genus offering few or no varieties, and is perfectly distinguished by characters equally striking and permanent. It is peculiar to Africa, to the neighbouring islands, and to those parts of Asia that lie in the vicinity of the African continent. It is seldom found beyond the distance of thirty-five degrees from the equator; and as it is incapable of flight, it must, like the quadrupeds of these latitudes, have always been confined to the ancient continent. It prefers for its residence those mountains and parched deserts that are never refreshed with rain, a circumstance which tends to corroborate the report of the Arabs, that these birds never drink. Vast flocks of them are seen in these barren and solitary regions. At a distance they are said to appear like an army of cavalry, and often alarm the caravans that are travelling through them.

Among some nations, the eggs, the blood, and the flesh, have been eagerly sought as articles of food. Whole people have obtained the appellation of *Struthophagi*, from their partiality for this food. The Romans considered the flesh of the ostrich as a delicacy; and the imperial glutton, Heliogabalus, is said to have had 600 of them slaughtered in one day, in order that he might have the brains served up as a dish to pamper his appetite. At present, the inhabitants

STRUTHIO.

1. *S. Novae Hollandiae.* 2. *S. Camelus.* 3. *S. Casuarinus.*

Engraved for the *Encyclopaedia Londinensis* 1827.

inhabitants of Numidia tame and breed them, to live upon their flesh, and sell their feathers. Their eggs are said to contain as much food as thirty of those of a common hen. The beauty of the plumage of this bird, particularly of the long feathers that compose the wings and the tail, is the chief reason why man has been so active in pursuing him into the deserts, at so much expense and labour. The Arabs, who made a trade of killing these birds, formerly converted their skins into a kind of buckler. The ancients used their plumes as ornaments for their helmets. The ladies in the East make them still an ornament in their dress, and they are not unfrequently used in this country for the same purpose. In Turkey, the Janizary, who has signalized himself by some military achievement, is allowed to assume them as a decoration to his turban; and the sultan, in the seraglio, when meditating conquests and feats of a more gentle nature, puts them on, as the most irresistible ornament of his person.

The spoils of the ostrich being thus valuable as articles of commerce, the hunting of that bird is one of the most serious employments of the Arabs, who train their fleetest horses for the purpose. Although the ostrich be far swifter than the best courser, yet by hunters on horseback he is commonly taken; and it is said of all the varieties of the chase, this is the most difficult and laborious. The Arab, when mounted, still keeps the ostrich in view, but without pushing him so close as to make his escape to the mountains, but at the same time so as to prevent him from taking food. This is the more readily done, as the bird takes its course in a wavering and circuitous direction, which is greatly shortened by the hunters, who come up behind, and relieving each other by turns, thus keep him still running. After two or three days of fatigue and famine, he becomes exhausted, and the hunters fall upon him by striking him on the head with cudgels, that his blood may not tarnish the lustre of his white feathers. When all possibility of escape is cut off, the ostrich hides its head, conscious that this is its most vulnerable point.

Ostriches, though inhabitants of the desert, and possessed of prodigious strength, are, especially if taken young, neither so fierce nor difficult to tame as might be expected. The inhabitants of Dara and Lybia render them domestic, like herds of cattle, with scarcely any other means than constantly accustoming them to the sight and society of man; to receive from him their food, and to be treated with gentleness. Besides the use of their feathers, ostriches, in their domestic state, are said to be mounted and rode upon in the same manner as horses. It is asserted by Adanson, that at the factory of Podore, he had himself two ostriches, that ran faster than a race-horse with a negro each on their backs. Though these birds may be so tamed that they will suffer themselves to be driven in flocks to and from their stalls, and even to be mounted like horses, yet their stupidity is such, that they can never be taught to obey the hand of the rider, to comprehend the meaning of his commands, or submit to his will. From this intractable disposition, there is reason to apprehend that man will ever be able to avail himself of the strength and swiftness of the ostrich, as he has availed himself of those qualities of the horse. The voracity of this bird far exceeds that of any animal whatever; for it will devour every thing it meets with, stones, wood, brass, iron, or leather, as readily as it will grain and fruit, which, in its native wilds, are probably its principal food.

The season at which the ostrich lays her eggs varies very much with the temperature of the climate. Those north of the equator begin to lay their eggs in the beginning of July, while such as inhabit the south of Africa defer it till the end of December. Climate and situation have also a great influence on their manner of incubation. In the torrid zone, the ostrich is contented with depositing her eggs in a mass of sand, seemingly scraped together with her feet. There they are sufficiently heated to the warmth of the sun, and need the incubation of the female only for a little time during the night. But although the ostrich be but little engaged in hatching her eggs, she displays, by continually watching for the preservation of her progeny, all the solicitude of a tender

mother. In proportion to the coldness of the climate, the ostrich hatches with more assiduity; and it is only in the warm regions, where there is no danger of her eggs being chilled, that she leaves them by day, a circumstance from which she very early incurred the reproach of being destitute of parental affection. So far, however, is this from being true, that she continually watches for their preservation, so long as they remain in a helpless state, which is always a longer or shorter period, according to the climate. Neither the size of the eggs of these birds, nor the time necessary for hatching them, nor the number of the young, are exactly ascertained.

2. *Struthio casuarius*, or cassowary.—Feet three-toed; helmet and dew-laps naked.—This bird inhabits the torrid zone, and especially the island of Java, whence it was brought into Europe in the year 1597. Its habitation begins in those temperate climes which are contiguous to the precincts of the ostrich; and as it occupies a region more favourable to the multiplication of the human race, its numbers are continually decreasing, in proportion to the increase of the number of its destroyers. Cassowaries are of various sizes; they have been seen as large as six feet high. The Dutch compare the bulk of this bird to that of a sheep. From the shortness of the legs and neck, they are not so tall as the ostrich, but the body has a more heavy and clumsy appearance. The most remarkable trait in the appearance of these birds is a sort of helmet on the head, which reaches from the base of the bill to the crown. The middle or upper eye-lid is furnished with a row of black hairs, which gives the animal a wild aspect, which the large aperture of the beak renders still more fierce and menacing. The head and upper part of the neck are almost naked, being only here and there interspersed with blackish hairs, that partially cover a blue wrinkled skin. The feathers that cover the body of the cassowary, as well as those of the wing are all of one kind, and of the same blackish colour. They are generally double, having two shafts, that grow from one short trunk, which is fixed in the skin. The small fibres of which the vanes are composed, have so little adhesion to each other, that the bird, when viewed at a distance, seems clothed with hair instead of feathers. The wings of the cassowary are still shorter than those of the ostrich, and consequently still more unfit for flying. They are furnished each with four hard pointed feathers, resembling darts, of which the longest, which is about eleven inches, is a quarter of an inch thick at the root. Its feet are also armed with large black claws, which give the animal an appearance of being formed for hostility. But though supplied with weapons that might render it formidable to the rest of the animal world, the cassowary leads a peaceable and inoffensive life. It never attacks others, and nothing short of necessity will make it defend itself. The movements of the cassowary, when travelling, are awkward and heavy, nevertheless it will, in running, outstrip the fleetest horse. It is distinguished by the same voracity which characterises the ostrich, swallowing every thing that is offered to it unless it be too large for the circumference of its throat; and it possesses the faculty of rejecting its food, when disagreeable, with the same dispatch with which it took it in. The female lays a number of ash-coloured eggs, about thirteen inches in circumference one way, and six the other; they are of a greenish colour, with dark green spots.

3. *Struthio Novæ Hollandiæ*, or New Holland cassowary.—Feet three toed; crown flat; shanks serrate behind. The bill is black; head, neck, and body, covered with bristly feathers, varied with brown and grey; throat rather naked, blueish; feathers of the body a little incurved at the tip; wings scarcely visible; legs brown.—This, as its specific name imports, is found chiefly in New Holland, and is seven feet two inches long.

4. *Struthio rhea*, or American ostrich.—Feet three-toed, and a round callus behind. This bird is so nearly allied to the ostrich, already described, that it has been considered as his representative in the new continent, to which it peculiarly belongs.—It inhabits Guiana, Brasil, Chili, and those

immense forests that extend northwards from the mouth of the River Plata, and it has been found as far south as the Magellanic Straits. Formerly, these birds were more widely spread over South America; but, in proportion as population increased, these timid animals fled from their habitations, or became the victims to superior power. It is by far the largest bird in the new world. The adults are full six feet high, and the thighs of some of them have been known to equal that of a muscular man. It has a long neck, small head, and flat beak, that distinguish the black ostrich; but in other respects it has a greater resemblance to the cassowary. The shape of the body is oval; and when fully covered with feathers, approaches to rotundity. Its wings are so short as to be useless for flight, but, like those of the ostrich, probably afford assistance in running. The back and rump are covered with long feathers, which extend and form what, in this animal, is called the tail. The whole upper part of the body is covered with grey plumage, and the under with white. The toes are three, all before; behind there is a callous kind of heel, which supports the bird, and is supposed to assist it in running. It possesses the same velocity which characterises the former species, and its running is attended with a singular motion of its wings. It raises one for some time above the body, and then drops it to erect the other, and hold it, for a while, in the same strange position. Such is their velocity, that the savages are obliged to lay snares in order to catch them: for they may, in vain, chase them with the swiftest dogs.

The rhea shews the same indiscriminate voraciousness with the ostrich: and it is probable, that her eggs are hatched partly by the heat of the sun, and partly by incubation. The young, when first excluded from the shell, are so familiar, that they will follow the first person they happen to meet with; but upon growing older, they acquire experience, and become more shy and suspicious. The flesh of the young rhea is reckoned good eating, but it might probably be much improved, and the race rendered more abundant, by domestication, as has been the case with the turkey and hen, which originally came from the torrid zone. The rhea defends itself with its feet, and calls its young by a kind of hiss.

STRUTHIOLA [Dimin. from *Στρούδιον*, a sparrow], in Botany, a genus of the class tetrandria order monogynia, natural order of vepruculeæ, thymelææ, (*Juss.*)—Generic Character. Calyx none, unless the corolla be taken for it. Corolla one-petalled, shrivelling. Tube filiform, elongated. Border four-parted, flat, shorter than the tube; segments ovate. Nectary eight glands, ovate, placed round the throat, surrounded with their proper pencil. Stamina: filaments four, very short, concealed within the tube. Anthers linear. Pistil: germ ovate. Style filiform, length of the tube. Stigma capitate. Pericarp coriaceous, ovate, one-celled. Seed one, sharpish. Allied to *Passerina*.—*Essential Character*. Corolla none. Calyx tubular, with eight glands at the mouth. Berry juiceless, one-seeded.

1. *Struthiola virgata*.—Leaves lanceolate, striated; the upper ones ciliate; branches pubescent. This is a shrub with long rod-like branches, and four-cornered branchlets. Flowers sessile, solitary, long, coriaceous, red, silky-tomentose without. It varies with yellow flowers, in whitish membranaceous calyxes, and yellowish anthers dark yellow at the tips. Also with longer and shorter leaves.

2. *Struthiola nana*.—Leaves linear, obtuse, hairy; flowers terminating, in bundles, tomentose.

3. *Struthiola juniperina*.—Leaves linear, acute, spreading; corollas and calyxes naked.

4. *Struthiola erecta*.—Leaves linear, smooth; branches smooth, four-cornered.

5. *Struthiola ovata*.—Leaves ovate, smooth; branches smooth, wrinkled.—This and all the preceding are natives of that inexhaustible magazine of shrubby plants, the southern promontory of Africa. They may be increased by cuttings.

STRUTT (Joseph), an artist and antiquary, the son of a miller at Springfield, in Essex was born there in 1794,

and in 1764 apprenticed to the ingenious but unfortunate engraver, W. Wynn Ryland. In 1770, he became a student at the Royal Academy, where he obtained the gold and silver medals. Connecting antiquities with the practice of engraving, he published, in 1773, a work entitled "The Regal and Ecclesiastical Antiquities of England," containing representations of all the English monarchs from Edward the Confessor to Henry VIII. and of many distinguished personages in their reigns, in their appropriate costumes, taken from illuminated MSS., and accompanied with remarkable passages of history. To this succeeded "A complete View of the Manners, Customs, Arms, Habits, &c. of the English, from the Arrival of the Saxons to the Reign of Henry VIII., with a short Account of the Britons during the Government of the Romans," in 3 vols. 1774, 1775, 1776, with 157 plates. In 1777 and 1778, he published a "Chronicle of England," designed to extend to six volumes, but discontinued for want of encouragement. His "Biographical Dictionary of Engravers" next appeared in 2 vols., 1785, 1786, with 20 plates. His other works are "A complete View of the Dresses and Habits of the people of England from the establishment of the Saxons in England to the present time," in 2 vols. 1796, 1799, with 143 plates. "The Sports and Pastimes of the People of England," 1801, with 40 plates. The decline of his health constrained Mr. Strutt to leave the metropolis in 1790, and to reside at a farm near Hertford, where he engraved a number of plates for an edition of the "Pilgrim's Progress." His disposition being benevolent and religious, he founded a Sunday school at the neighbouring village of Tewin, and devoted much time to reforming the morals of the inhabitants. He afterwards returned to London, where he died in 1802, with an estimable character for moral worth, and for indefatigable industry in elucidating the antiquities of his country. His style of engraving, in which he followed his master, Ryland, was that of dots in imitation of chalk, producing an effect of much softness and harmony. *Nichols's Liter. Anec.*

STRUTTTER, *s.* One who swells with stateliness; one who is blown up with self-conceit; a bragger.—We have seen what a mere nothing it is, that this *strutter* has pronounced with such sonorous rhetoric. *Annot.*

STRUTTINGLY, *adv.* With a strut; vauntingly. *Cotgrave and Sherwood.*

STRUVE, **POINT**, a cape of Ireland, on the coast of the county of Donegal, a little to the south of Inishowen Head.

STRUYS BAY, a bay at the southern extremity of Africa, to the east of Cape Agulhas. It extends nearly 100 miles to Cape Infant, and affords good anchorage, but no shelter, except from north-westerly winds, and is exposed to a continued swell and strong current.

STRY, a circle of Austrian Poland, lying in the east of the province, between Hungary and the circle of Lemberg. It is one of the largest in Galicia, having a superficial extent of 3100 square miles, with 174,000 inhabitants. Its appearance differs completely in the south and north, the former consisting almost entirely of mountains, the latter of extensive plains. A single large river (the Dniester), traverses it, first from west to east, and afterwards from north to south; and it is intersected in various directions, particularly in the east and south, by smaller streams.

STRY, or **STRYI**, a small town of Austrian Galicia, the capital of the above circle, stands on a small river of the same name, which divides here into a number of branches forming small islands. It is surrounded with a wall and ditch, has a castle, a Catholic and a united Greek church, with a circular school, and 5500 inhabitants; 35 miles west-north-west of Halicz, and 42 south of Lemberg.

STRYCHNINE, *s.* [from the Gr. *Στρούχνος*, the name Dioscorides gave the *datura stramonium*, but which we now apply to a different plant], an extract of a virulently poisonous nature, which is made from the nux vomica, the bean of Ignatius, or the poison of Java. It is of an alkaline nature, and so intensely bitter that it affects the palate when diluted with 10,000 times its weight of water. A
sixteenth

sixteenth part of a grain has been found to paralyse a dog in four or five minutes, and kill him in half an hour. It does not seem, according to Majendie's experiments, to have a direct influence on the brain, but to confine its action to the spinal marrow; the lower extremities being invariably paralyzed.

STRYCHNOS [Strychnon of Pliny. *Στρυχνος*, Gr. of Dioscorides], in Botany, a genus of the class pentandria, order monogynia, natural order of luridæ, apocineæ (*Juss.*)—Generic Character. Calyx: perianth five-parted, very small, deciduous. Corolla one-petalled: tube cylindric; border spreading, five-cleft, acute. Stamina: filaments five, length of the corolla. Anthers simple. Pistil: germ roundish. Style simple, longer than the stamens. Stigma thickish. Pericarp: berry brittle, globular smooth, very large, one-celled, full of pulp. Seeds orbicular, depressed, villose, radiant, with villose hairs towards the periphery.—*Essential Character.* Corolla five-parted. Berry one-celled, with a woody rind.

1. *Strychnos nux vomica*, or poison-nut.—This is a middling sized tree, with the trunk short and crooked, but pretty thick, and the branches irregular: both are covered with a smooth ash coloured bark. Leaves opposite, on short petioles, round oval, shining, smooth on both sides, entire, three-five-nerved, differing in size, from one and a half to four inches long, and from an inch to three inches broad. Stipules none. Flowers small, greenish white, collected in small terminating umbels. Berry the size of a pretty large apple, covered with a smooth somewhat hard shell, of a rich beautiful orange-colour when ripe, filled with a soft jelly-like pulp. Seeds from two to five, immersed in the pulp.—Native of the East Indies. The wood is hard and durable, and is used for many purposes by the natives.

2. *Strychnos colubrina*.—Leaves ovate, acute; tendrils simple. The Indian botanists contend that this is not a different species from the preceding.—Native of the East Indies.

3. *Strychnos potatorum*.—Leaves opposite, ovate, acute, quintuple-nerved, veined; cymes axillary. This is a tree with opposite branches.

STRYEN, a large and well built village of the Netherlands, in south Holland, with nearly 2000 inhabitants; 6 miles south-south-west of Dort, and 12 south-south-east of Rotterdam.

STRYKOW, a small town in the west of Poland; 59 miles west-south-west of Warsaw, and 21 east-south-east of Lenezicz. Population 1500, the half of whom are Jews.

STRYMON, or **CARASSU**, a river of European Turkey, in Romania, the ancient *Thrace*, which takes its rise in the hill of Scomius, and after a course of more than 50 miles, discharges itself into the gulf of Contessa. It flows through a fruitful valley.

STRYMONA, a small town of European Turkey, in Romania, on the river Strymon.

STRYNOE, a small island of Denmark, about two miles from the west coast of Langeland. Lat. 54. 54. N. long. 10. 38. E.

STRYP, a small town of the Netherlands, in North Brabant, a little to the north of Eindhoven, with 900 inhabitants.

STRYPE (John), a voluminous writer, of German extraction, was born in the parish of Stepney, near London, in the year 1643, educated at St. Paul's school, and in 1661 entered at Jesus college, Cambridge, from whence he removed to Catharine-hall. In 1669 he became Master of Arts, and taking orders, was nominated to the perpetual curacy of Theydon-Boys, in Essex, and being afterwards appointed minister of Low Layton, in the same county, he retained this office during the whole of his life. Having access to the numerous MSS. of Sir Mich. Hicckes, secretary to lord Burleigh, he availed himself of them in his subsequent writings on historical antiquities, to which, probably in consequence of this circumstance, he became zealously

attached. His first publication in this department of literature was entitled "Ecclesiastical Memorials, relating chiefly to Religion, and the Reformation of it under Henry VIII., Edward VI., and Queen Mary I.," in 3 vols. folio, with an appendix to each volume, consisting of original papers, records, &c. The last of these volumes, which were printed in succession, appeared in 1721. The publication of his "Annals of the Reformation of the Church of England," in 4 vols. fol., began in 1701, and were completed in 1731. the last volume being merely a collection of original papers. His much augmented edition of "Stow's Survey of London;" in 2 vols. fol. was published in 1720. The historical part of this work was brought down to his own time, and he added maps of all the wards, and illustrative plates, besides various other improvements. In the department of biography, he published separately, in folio volumes, the lives of archbishops Cranmer, Parker, Grindal, and Whitgift, and in three octavo volumes, the lives of Sir John Cheke, Sir Thomas Smith, and bishop Aylmer. In these works he manifested an industry and correctness, which claimed the respect of prelates and learned persons of his own time, and procured for him several small benefices in the church, though he was never advanced to any very high rank. He was for many years lecturer of Hackney, where he spent the latter part of a life, prolonged, notwithstanding his unintermitted course of study, to the uncommon age of 94. His death happened in December, 1757. Of his works Dr. Birch observes, that "his industry and fidelity will always give a value to his numerous writings, however destitute of the graces, and even uniformity, of style, and the art of connecting facts." *Biog. Brit.*

STRZELISKE-NOWA, a small town of Austrian Poland; 37 miles south-east of Lemberg.

STRZELNO, a small town of Prussian Poland, between the Lake Goplo and the river Netz, with 1100 inhabitants; 30 miles south-south-west of Thorn, and 12 south of Inowraclaw.

STUART (James), commonly called *Athenian Stuart*, rose from an obscure origin, by his talents and industry, to distinguished eminence. His father was a native of Scotland, and a mariner of humble station, and his mother a native of Wales. Their son was born in London in 1713; and his parents, though poor, yet respectable in character, gave him the best education which their limited means would allow. Being one of four children, left destitute at their father's death, he was employed, at an early age, in drawing and painting, and contributed to the support of his mother and family, by his ingenuity in designing and painting fans, for a shop in the Strand. By his own persevering but unaided efforts, he gained an accurate knowledge of anatomy, geometry, and the other branches of mathematics. He also studied the Latin and Greek languages; and made himself acquainted with most of the sciences. Urged by a strong desire to seek knowledge and improvement in foreign countries, he first settled a brother and sister in a situation, which would afford them a comfortable subsistence, and then, with a very scanty stock of money, set out on a pedestrian tour to Rome. In passing through Holland and France, he occasionally stopped in order to recruit his exhausted purse by the exercise of his talents. Having arrived at Rome, he formed an intimate acquaintance with Mr. Nicholas Revett, a skilful architect. These two friends studied together for several years, and in 1748 concerted a plan for visiting Athens; and having obtained requisite encouragement, they quitted Rome in 1750, and first visited Venice; and hence they took their course to Pola, in Istria; and when they had examined the interesting remains of antiquity in this place, they returned to Venice. In the beginning of the year 1751 they sailed for Zante, and thence to Corinth, and in the month of March reached Athens. Here they employed themselves, till the latter part of the year 1753, in making drawings and taking measures of the architectural remains to which they had access. At Athens Mr. Stuart

Stuart became acquainted with Sir Jacob Bouverie and Mr. Dawkins; and the latter, in particular, took pleasure in affording him and his companion patronage and encouragement. From Athens the two artists went to Salonica, where they copied the remains of a fine Corinthian colouade. Having visited several islands in the Ægean sea, on their way to Smyrna, they returned to England in the beginning of the year 1755. In the year 1762, the first volume of the result of their labours was published under the title of "The Antiquities of Athens measured and delineated, by James Stuart, F.R.S. and S.A., and Nicholas Revett, Painters and Architects," fol. This work was received with great applause by the lovers of art and antiquity; and though it had been anticipated by the publication of M. Le Roy, which surpassed it in picturesque beauty, yet its superior truth and depth of research gave it a more solid and permanent value. Mr. Stuart, after his return, obtained distinguished patronage in his profession as architect. Lord Anson, who was at the head of the Admiralty, conferred upon him the office of surveyor of Greenwich Hospital, which he occupied till his death. He was twice married: the second time, at the age of 67 years, to a very young lady, by whom he had four children. The death of one of these, who resembled himself both in mind and body, and who manifested an extraordinary talent for drawing at the age of three years, was followed by the rapid decline of the father's health, who died in 1788, in the 76th year of his age. Two additional volumes of the "Antiquities of Athens," were published after his decease; the second, in 1790, by Mr. Newton; and the third, in 1794, by Mr. Ravelly. *Gen. Biog.*

STUART (Gilbert), LL.D., the son of a professor in the University of Edinburgh, where he was born either in 1742, or 1745; the date of his birth being uncertain. He was originally intended for the profession of the law; but having acquired reputation, and the degree of LL.D., by an "Historical Dissertation concerning the Antiquity of the British Constitution," he cast his lot among those who are, professedly, writers. With these views he came to London, and for some time contributed to the Monthly Review; but disappointed in his expectations, he returned to Edinburgh in 1774, and commenced a magazine and review bearing the name of that city. Soon after he gained an increase of reputation by publishing "A View of Society in Europe, in its Progress from Rudeness to Refinement," of which an enlarged edition in 4to., appeared in 1778. His "Observations concerning the Public Law and Constitution in Scotland," were published in 1779. In this work he introduced a somewhat invidious reflection on Dr. Robertson, characterising him as being "no-where profound;" and indeed he seems to have been jealous of this distinguished historian's literary fame. Disappointed as candidate for the professorship of public law in the University of Edinburgh, his feelings were farther irritated; and from that time his leading object appears to have been to set himself in opposition to Robertson, and to depreciate his merits. In 1780 he published "The History of the Establishment of the Reformation of Religion in Scotland," which has been regarded as a spirited and tolerably impartial view of the important events which it details. This was followed, in 1782, by "The History of Scotland, from the Establishment of the Reformation till the Death of Queen Mary," 2 vols. 4to.

As the rival of Robertson, he enlists himself in this work among the warmest partisans of Queen Mary. How far he succeeded in his attempt for vindicating this unfortunate queen, it is not our province to determine; but his work was less popular than its opponent; and one of his biographers says, that though "he was not deficient either in acuteness or in diligence, he appears to have been wanting in the moral qualities essential to a writer of history." From this time, and after his removal to London, where he was employed in some periodical publications, his conduct subjected him to censure and reproach, and terminated in an incurable disease, under which, after his return to his native country, he sunk

in 1786. "He possessed," says the writer of his life already cited, "strong, if not brilliant talents: but his principles were lax, and his temper such as procured him many more enemies than friends." *Gen. Biog.*

STUARTIA. [This genus was named by Linnæus in honour of the late Lord Bute], in Botany, a genus of the class monadelphia, order polyandria, natural order of columniferæ. tiliaceæ (*Juss.*)—Generic Character. Calyx: perianth one-leafed, half-five-cleft, spreading; segments ovate, concave, permanent. Corolla: petals five, obovate, spreading, equal, large. Stamina: filaments numerous, filiform, united into a cylinder below, shorter than the corolla, connecting the petals at the base. Anthers roundish, incumbent. Pistil: germ roundish, hirsute. Style simple, filiform, length of the stamens. Stigma five-cleft. Pericarp: pome juiceless, five-lobed, five-celled, soluble into five closed parts. Seeds solitary, ovate, compressed.—*Essential Character.* Calyx simple. Style simple, with a five-cleft stigma. Pome juiceless, five-lobed, one-seeded, opening five ways.

1. *Stuartia malacodendron*.—Flowers lateral, subnate; calyxes ovate, obtuse; styles conjoined. This shrub grows naturally in Virginia, where it rises with strong ligneous stalks, to the height of ten or twelve feet, sending out branches on every side covered with a brown bark, and garnished with oval spear-shaped leaves, about two inches and a half broad: they are sawed on the edges, are pretty much veined, and stand alternately.

2. *Stuartia pentagyna*.—Flowers solitary, axillary; calyxes calyculate and lanceolate; styles distinct. This is an elegant shrub, rising to the height of about nine or ten feet: the root is woody and branching: the stem erect, branched, and covered with a chinky ash-coloured bark. The flowers are axillary, solitary, scarcely peduncled, of a snow-white colour, tinged on the outside with a reddish and greenish cast: they are very sweet scented, and consist of seven or eight unequal petals.—Native of Virginia: appears to have been formerly confounded by Linnæus with the preceding species.

Propagation and Culture.—Sow the seeds, which frequently fail when brought to England, either from not being properly impregnated, or duly ripened. When the plants come up, they are very difficult to maintain while young; for if they are exposed to too much sun, they will soon be destroyed, nor do they thrive when exposed to the open air. The seeds therefore should be sown under glasses, and the surface of the ground between the plants should be covered with moss to keep it moist, and the glasses should be constantly shaded when the sun is bright. With this management the plants will grow, but not make any great progress.

STUART'S ISLAND, an island near the north-western shore of America, about six or seven leagues in circuit. It is in general low, though some parts rise to a tolerable height. Lat. 63. 35. N. long. 162. 30. W.

STUART'S ISLAND, an island near the west coast of North America, at the entrance of Bute's canal, in the gulf of Georgia. Lat. 50. 24. N. long. 236. 9. E.

STUARTSBURG, a post village of the United States, in Westmoreland county, Pennsylvania.

STUB, *s.* [ʃteb, ʃtɔb, Saxon; *stubbe*, Sueth, from *stýbba*, (or *stubby*) to lop, to cut off. *Serenius.* *Stobbe* is the Teut. and also our word in some parts of the north.] A thick short stock left when the rest is cut off.

We here
Live on tough roots and *stubs*, to thirst inur'd,—
Men to much misery and hardship born. *Milton.*

A log; a block.—You shall have more ado to drive our dullest and laziest youth, our stocks and *stubs*, from the infinite desire of such a happy nurture, than we have now to haul our choicest wits to that asinine feast of sow-thistles and brambles. *Milton.*

To STUB, *v. a.* To force up; to extirpate.

The

The other tree was griev'd,
Grew scrubby, dry'd a-top, was stunted;
So the next parson *stubb'd* and burnt it.

Swift.

STUBBED, *adj.* Truncated; short and thick.

A pain he in his head-piece feels,
Against a *stubb'd* tree he reels,
And up went poor Hobgoblin's heels.

Drayton.

Hardy; not delicate; not nice.—The hardness of *stubb'd* vulgar constitutions renders them insensible of a thousand things, that fret and gall those delicate people, who, as if their skin was peeled off, feel to the quick every thing that touches them. *Bp. Berkeley.*

STUBBEDNESS, *s.* The state of being short, thick, and truncated.

STUBBEKIOBING, a small sea-port of Denmark, in the island of Laaland. It carries on some trade with Copenhagen, Norway, and Lubeck; 10 miles north-east of Nyekiobing.

STUBBENKAMMAR, a promontory of the island of Rugen, in the peninsula of Jasmund.

STUBBLE, *s.* [*estouble*, French; *stoppel*, Dutch; *stipula*, Latin. Serenius here recommends the derivation assigned to *stub*; which see. Chaucer's word is *stoble*.] The stalks of corn left in the field by the reaper.

This suggested

At some time, when his soaring insolence
Shall reach the people, will be the fire
To kindle their dry *stubble*, and their blaze
Shall darken him for ever.

Shakespeare.

STUBBLEGOOSE, *s.* A goose fed on the stubbles.—I'll make you a *stubble-goose*. *Beaum. and Fl.*

STUBBORN, *adj.* [This word, of which no obvious etymology appears, is derived by Minshew from *stoutborn*, referred by Junius to *στειβαρος*, and deduced better by Lye, from *stub*; perhaps from *stub-born*.] Obstinate; inflexible; contumacious.

The queen is obstinate,
Stubborn to justice, apt t' accuse it, and
Disdainful to be tried by't.

Shakespeare.

Persisting; persevering; steady.—All this is to be had only from the epistles themselves, with *stubborn* attention, and more than common application. *Locke*.—Stiff; not pliable; inflexible; not easily admitting impression.

Love softens me, and blows up fires which pass
Through my tough heart, and melt the *stubborn* mass.

Dryden.

Hardy; firm.

Patience under torturing pain,
Where *stubborn* stoicks would complain.

Swift.

Harsh; rough; rugged.—We will not oppose any thing that is hard and *stubborn*, but by a soft answer deaden their force. *Burnet*.—In all its uses it commonly implies something of a bad quality, though *Locke* has used it in a sense of praise.

STUBBORNLY, *adv.* Obstinate; contumaciously; inflexibly.

Stubbornly he did repugn the truth,
About a certain question in the law.

Shakespeare.

He wilfully neglects his book, and *stubbornly* refuses any thing he can do. *Locke*.

So close they cling, so *stubbornly* retire,
Their love's more violent than the chymist's fire.

Garth.

STUBBORNNESS, *s.* Obstinacy; vicious stoutness; contumacy; inflexibility. *Dryden* has used it in commendation.

Happy is your grace,
That can translate the *stubbornness* of fortune
Into so quiet and so sweet a style.

Shakespeare.

VOL. XXIII. No. 1597.

STUBBS (George), an eminent painter of animals, was born at Liverpool, in 1724. He particularly excelled in the knowledge of the anatomy of animals, for which he took great pains in dissection, as well as design. It is unfortunate, that the exercise of his talents was confined to animal painting, and particularly of race-horses, as he was capable of much higher productions: witness his picture of Phaton with the horses of the sun, and those of the horse and lion. His knowledge of the nature and actions of various animals, inspire his pictures with peculiar interest. Sometimes his colouring was very good, though never excellent; and he was defective in the execution of back-grounds. His long life was most laboriously and usefully employed. In 1766 he published his *Anatomy of the Horse*, the most perfect work upon the subject; which he drew, and etched himself, from a natural figure which he dissected for the purpose. He died in 1806, at the age of 82. He was an associate of the Royal Academy.

STUBBS, a township of England, West Riding of Yorkshire; 7 miles north-west of Doncaster.

STUBBY, *adj.* Short and thick; short and strong.—The base is surrounded with a garland of black and *stubby* bristles. *Grew*.

STUBBY-LANE, a township of England, in Staffordshire; 4 miles south-east of Uttoxeter.

STUBHAMPTON, a hamlet of England, in Dorsetshire, near the source of the river Tarent, a little north of Tarent-Gunvil.

STUBHILL, a hamlet of England, in the parish of Arthuret, Cumberland.

STUBLACH, a township of England, in Cheshire; 3 miles north of Middlewich.

STUBLEY, a hamlet of England, in the parish of Dronfield, Derbyshire.

STUBNA and STUBNYA, two villages in the north-west of Hungary; 8 miles north of Cremnitz. They have in the vicinity warm mineral springs; also iron and copper mines.

STUBNAIL, *s.* A nail broken off; a short thick nail.

STUBTON, a parish of England, in Lincolnshire; 10 miles north-by-west of Grantham.

STUCCO, *s.* [Italian; *stuc*, Fr.] A kind of fine plaster for walls.

Palladian walls, Venetian doors,
Grottesco roofs, and *stucco* floors.

Pope.

To STUCCO, *v. a.* To plaster walls with stucco.—Palaces, as adorned with tapestry, are here contrasted with lowly sheds and smoky rafters. A modern poet would have written *stuccoed* halls. *Warton*.

STUCK. The preterite and participle passive of *stick*.

Stuck o'er with titles, and hung round with strings,
That thou may'st be by kings, or whores of kings.

Pope.

STUCK, *s.* A thrust.—I had a pass with rapier, scabbard and all, and he gives me the *stuck* in which such a mortal motion, that it is inevitable. *Shakespeare*.

STUCKLE, *s.* A number of sheaves laid together in the field to dry. *Ainsworth*.

STUD, *s.* [ʃtʊd, Saxon.] A post; a stake. A prop.

Seest not thilke same hawthorne *studd*,
How bragly it begins to budde,
And utter his tender head?

Spenser.

A nail with a large head driven for ornament; any ornamental knob or protuberance.

Crystal and myrrhine cups emboss'd with gems,
And *studs* of pearl.

Milton.

[ʃtʊd, Sax.; *stod*, Icel., is a stallion.] A collection of breeding horses and mares.—In the *studs* of Ireland, where care is taken, we see horses bred of excellent shape, vigour and size. *Temple*.

To *STUD*, *v. a.* To adorn with studs or shining knobs. Thy horses shall be trapp'd,
Their harness *studded* all with gold and pearl. *Shakspeare.*

STUDENT, *s.* [*studens*, Lat.] A man given to books; a scholar; a bookish man.—Keep a gamester from dice, and a good *student* from his book. *Shakspeare.*

STUDHAM, a parish of England, in Bedfordshire; 3 miles west-south-west of Market Street.

STUDHAM, a hamlet of England, in the parish of Kirkhampton, Cumberland.

STUDIED, *adj.* Learned; versed in any study; qualified by study.

He died
As one that had been *studied* in his death,
To throw away the dearest thing he ow'd,
As 'twere a careless trifle. *Shakspeare.*

Having any particular inclination. *Out of use.*—A prince should not be so loosely *studied* as to remember so weak a composition. *Shakspeare.*

STUDIER, *s.* One who studied.—Lipsius was a great *studier* of the stoical philosophy; upon his death-bed his friend told him, that he needed not use arguments to persuade him to patience, the philosophy which he had studied would furnish him; he answers him, Lord Jesus, give me christian patience. *Tillotson.*—There is a law of nature, as intelligible to a rational creature and *studier* of that law, as the positive laws of commonwealths. *Locke.*

STUDIOUS, *adj.* [*studieux*, Fr.; *studiosus*, Lat.] Given to books and contemplation; given to learning.—A proper remedy for wandering thoughts, he that shall propose would do great service to the *studious* and contemplative part of mankind. *Locke.*—Diligent; busy.—*Studious* to find new friends, and new allies. *Tickell.*—Attentive to; careful: with *of.*—Divines must become *studious of* pious and venerable antiquity. *White.*

The people made
Stout for the war, and *studious* of their trade. *Dryden.*

Contemplative; suitable to meditation.

Let my due feet never fail
To walk the *studious* cloisters pale. *Milton.*

STUDIOUSLY, *adv.* Contemplatively; with close application to literature; diligently; carefully; attentively.

On a short pruning hook his head reclines,
And *studiously* surveys his generous vines. *Dryden.*

STUDIOUSNESS, *s.* Addiction to study.—Men are sometimes addicted to *studiousness* and learning, sometimes to ease and ignorance. *Hakewill.*

STUDLAND, a hamlet of England, in Hertfordshire, adjoining Kinsworth.

STUDLAND, a parish of England, in the county of Dorset, at the extremity of the isle of Purbeck. The church is an ancient building. In the neighbourhood are some curious barrows, the most remarkable of which is the Agglestone or Stone Barrow, which covers about an acre of ground. It is 90 feet high, and 50 feet in diameter at the top. Population 306; 6 miles east-by-north of Corfe Castle, and 118 south-west of London.

STUDLAND BAY, a bay in England, on the Dorsetshire coast, seven leagues north-west-by-west from the Isle of Wight. It extends about a league north-by-east, and affords good anchorage ground for vessels not drawing more than 14 feet water. Although an open road, ships ride here as safely as in a harbour, and may get out easily when the wind blows right in; there being about nine hours outset, and only three inset. The ground is all clear, and good for cables.

STUDLEY, a hamlet of England, partly in Buckinghamshire, and partly in Oxfordshire; 7 miles north-by-east of Oxford.

STUDLEY, a parish of England, in Warwickshire, on

the river Arrow; 4 miles north by west of Alcester. Population 1083.

STUDLEY, a parish of England, in Devonshire; 3 miles south-west of Bampton.

STUDLEY, a hamlet of England, West Riding of Yorkshire; 2 miles west-south-west of Rippon.

STUDY, *s.* [*studium*, Lat.; *estude*, Fr.] Application of mind to books and learning.—*Study* gives strength to the mind; conversation, grace. *Temple.*—Perplexity; deep cogitation.

Th' idea of her life shall sweetly creep
Into his *study* of imagination. *Shakspeare.*

The king of Castile, a little confused, and in a *study*, said that can I not do with my honour. *Bacon.*—Attention; meditation; contrivance.

What can happen
To me above this wretchedness? All your *studies*
Make me a curse like this. *Shakspeare.*

Any particular kind of learning.—*Studies* serve for delight in privateness and retiring, for ornament in discourse, and for ability in the judgment and disposition of business. *Bacon.*—Subject of attention.—The holy Scriptures, especially the New Testament, are her daily *study*. *Law.*—Apartment appropriated to literary employment.—Get me a taper in my *study*, Lucius. *Shakspeare.*—The sketched ideas of a painter, not wrought into a whole. *Gilpin.*—Notwithstanding all his faults, such is his [Tempesta's] merit, that, as *studies* at least, his prints deserve a much higher rank in the cabinets of connoisseurs, than they generally find; you can scarce pick out one of them, which does not furnish materials for an excellent composition. *Gilpin.*

To *STUDY*, *v. n.* [*studeo*, Lat.; *estudier*, Fr.] To think with very close application; to muse.—I found a moral first, and then *studied* for a fable. *Swift.*—To endeavour diligently.—*Study* to be quiet, and do your own business. *1 Thess.*

To *STUDY*, *v. a.* To apply the mind to.

Nothing lovelier can be found
In woman, than to *study* household good. *Milton.*

To consider attentively.—He hath *studied* her well, and translated her out of honesty into English. *Shakspeare.*—To learn by application.—You could, for a need *study* a speech of some dozen lines, which I would set down. *Shakspeare.*

STUDZIANA, a small town in the interior of Poland, near the river Pilica; 52 miles south-south-west of Warsaw.

STUFF, *s.* [*stoff*, Dutch; *estoffe*, Fr.] Any matter or body.

Of brick, and of that *stuff*, they cast to build
A city and tower. *Milton.*

Materials out of which any thing is made.

Cæsar hath wept;
Ambition should be made of sterner *stuff*. *Shakspeare.*

Furniture; goods.—Fair away to get out *stuff* aboard.
Shakspeare.—That which fills any thing.

With some sweet oblivious antidote
Cleanse the stuff'd bosom of that perilous *stuff*
Which weighs upon the heart. *Shakspeare.*

Essence; elemental part.

Though in the trade of war I have slain men,
Yet do I hold it very *stuff* o' th' conscience
To do no contriv'd murder. *Shakspeare.*

Any mixture or medicine.

I did compound for her
A certain *stuff*, which being ta'en, would seize
The present power of life. *Shakspeare.*

Cloth or texture of any kind; textures of wool thinner and slighter than cloth.—Let us turn the wools of the land into cloaths and *stuffs* of our own growth, and the hemp and flax growing

growing here into linen cloth and cordage. *Bacon*.—
Matter or thing. In contempt.

O proper *stuff*!
This is the very painting of your fear. *Shakspeare*.
To-morrow will be time enough
To hear such mortifying *stuff*. *Swift*.

It is now seldom used in any sense but in contempt or dislike.

To *stuff*, *v. a.* To fill very full with any thing.
Though plenteous, all too little seems
To *stuff* this maw, this vast unhide-bound corps. *Milton*.
To fill to uneasiness.

With some oblivious antidote
Cleanse the *stuff*'d bosom of that perilous *stuff*
Which weighs upon the heart. *Shakspeare*.

To thrust into any thing.—Put roses into a glass with a narrow mouth, *stuffing* them close together, but without bruising, and they retain smell and colour fresh a year. *Bacon*.—To fill by being put into any thing.

Grief fills the room up of my absent child,
Lies in his bed, walks up and down with me,
Stuffs out his vacant garments with his form. *Shakspeare*.

To swell out by putting something in.—I will be the man that shall make you great.—I cannot perceive how, unless you give me your doublet, and *stuff* me out with straw. *Shakspeare*.—To fill with something improper or superfluous.

For thee I dim these eyes, and *stuff* this head
With all such reading as was never read. *Pope*.

To obstruct the organs of scent or respiration.—These gloves the count sent me; they are an excellent perfume.—I am *stuffed*, cousin, I cannot smell. *Shakspeare*.—To fill meat with something of high relish.—She went for parly to *meat* a rabbit. *Shakspeare*.—To form by *stuffing*.—An eastern king put a judge to death for an iniquitous sentence, and ordered his hide to be *stuffed* into a cushion, and placed upon the tribunal. *Swift*.

To *stuff*, *v. n.* To feed gluttonously.
Wedg'd in a spacious elbow-chair,
And on her plate a treble share,
As if she ne'er could have enough,
Taught harmless man to cram and *stuff*. *Swift*.

STUFFING, *s.* That by which any thing is filled.—Rome was a farrago out of the neighbouring nations; and Greece, though one monarchy under Alexander, yet the people that were the *stuffing* and materials thereof, existed before. *Hale*.—Relishing ingredients put into meat—Arrach leaves are very good in pottage and *stuffings*. *Mortimer*.

STUHLINGEN, a small town of the west of Germany, in Baden; 9 miles west-by-north of Schaffhausen. Population 1000. It is the chief place of a lordship belonging to the prince of Furstenberg.

STUHL-WEISSENBURG, a county in the west of Hungary, lying between the counties of Veszprim and Pest, from which last it is separated by the Danube. Its territorial extent is 1600 square miles; its population 120,000, descended partly from Slavonians, partly from Magyars and German settlers. Except in the north, where it has a few hills, it is in general level, and in many places has lakes and marshes. Besides the Danube, flowing along its eastern boundary, it is watered by the Sarvitz, which having a slow motion, is formed into a canal for a considerable part of its course. The principal products are wheat, wine, and tobacco.

STUHL-WEISSENBURG, or SZEPES-FEJARVAR, a considerable town of the south-west of Hungary, the capital of a palatinate, and a bishop's see. This town was built by king Stephen in the 11th century, and was during five centuries the place where the kings of Hungary were crowned and buried. It was called on that account *Alba Regalis*,

and the ruins of its ancient establishment show that it must have been a place of note. Three large moles or causeways proceeded from it; and between these were churches, houses, and gardens, the whole forming extensive suburbs. The removal of the court, and still more the misfortunes occasioned by repeated sieges in wars with the Turks, have greatly altered it; and though it still contains several respectable buildings, it is, on the whole, a mean place. It was formerly traversed by several canals, but these having been neglected during the agitated state of the country, are choaked up, and the waters have formed marshes, which render the town to a certain degree unhealthy. At present it has about 13,000 inhabitants, with a gymnasium or high school, and barracks for soldiers; but its fortifications were demolished in 1702. As to religion, the inhabitants are either Catholics, or of the Greek church. Here are some woollen manufactures, such as coarse cloth and flannel; but gardening and tillage form in this, as in other parts of Hungary, a main occupation even of those who live in the town. The environs are very fertile, and produce wine. In the neighbourhood is a saltpetre work, and at a greater distance one of spirits distilled partly from grain; partly from potatoes and plums; Stuhl-Weissenburgh is 36 miles south-west of Buda, and 116 east-south-east of Vienna. Lat. 47. 11. 34. N. long. 18. 24. 45. E.

STUKE, or STUCK, *s.* [*stuc*, Fr., *stucco*, Italian.] A composition of lime and marble, powdered very fine, commonly called plaster of Paris, with which figures and other ornaments resembling sculpture are made. *Unused*.

STUKELEY (William), a physician of eminence, and a distinguished antiquary, descended from an ancient family in Lincolnshire, was born at Holbeach, in that county, in the year 1687. He received his early education at the free-school of his native town, and was entered of Bennet College, Cambridge, in 1793; and while an under-graduate, evinced a strong propensity to drawing, and to the study of antiquities. Being intended for the medical profession, however, his principal attention was directed to botany, and the other collateral studies, which he could pursue at the university, until he took the degree of M. B. in 1709. He then went to London, where he studied anatomy, and acquired a knowledge of the practice of medicine under Dr. Mead, at St. Thomas's Hospital. He first settled as a physician at Boston, in his native county; but in 1717, he removed to London. On the recommendation of Dr. Mead, he was elected a fellow of the Royal Society; and he was one of the revivers of the Society of Antiquaries in 1718, to which he acted as secretary for several years. He took the degree of M. D. at Cambridge in 1719, and in the following year was admitted a fellow of the College of Physicians in London. At this time he published his first antiquarian essay, containing a description of "Arthur's Oon," and "Graham's Dyke," in Scotland, with plates. In the year 1722, being appointed by the College of Physicians to read the Gulstonian lectures, he chose the structure and history of *the spleen* for his subject; and in the following year he published the substance of his lectures, in one volume, folio, with plates, under the title of "The Spleen, its Description, Uses, and Diseases;" to which he also subjoined, "Some anatomical Observations, made in the Dissection of an Elephant." In this work, however, he had not the credit of much originality; for Haller affirms, that the plates were copied, without acknowledgment, from Vesalius, and contained several errors. Conceiving that there were some remains of the Eleusinian mysteries among the secrets of freemasonry, he became a member of that fraternity, and was constituted master of a lodge. To this society he presented an account of a Roman amphitheatre at Dorchester. His propensity to the investigation of antiquities, indeed, continued to influence his pursuits; and being greatly afflicted with the gout, which generally attacked him during the winter months, he was accustomed to take various journeys in the spring for the recovery of his health, which afforded him many opportunities of gratifying his curiosity. He generally therefore directed his excursions to those places, where

where the indications of the progress of Cæsar's expedition in this island may be traced; and the collections which he made during these travels, were published in 1724, in folio, with numerous plates, under the title of "Itinerarium Curiosum;" and a second volume, containing his description of the Brill, or Cæsar's camp at Pancras, in 1725.

In the following year, 1726, Dr. Stukeley quitted London, and settled at Grantham, where he speedily acquired an extensive reputation, and was consulted by the nobility and principal families in that neighbouring country. In 1728 he married a lady of good family and fortune. The fatigues of the profession, however, and the repeated attacks of gout, which still harassed him, became at length too great for his strength, and he determined to enter the church. He was ordained at Croydon, in 1720, by archbishop Wake; and in the same year was presented, by Lord Chancellor King, to the living of All-Saints in Stamford. About the time of his entering on his parochial cure, in 1730, Dr. Rogers of that place had just invented his *oleum aritheticum*, which Dr. Stukeley was induced to try, and having experienced great relief from its use, both in his own person and in others, he was induced to publish an account of its effects, in a letter to Sir Hans Sloane, in 1733; and in the year following, he printed "A Treatise on the Cause and Cure of Gout, from a new Rationale." Besides some tracts of minor importance relative to antiquities, he published, in 1736, the first number of his "Palæographia Sacra; or Discourses on the Monuments of Antiquity that relate to Sacred History." In this work, which he intended to continue, he maintains that the heathen mythology is derived from sacred history, and that the Bacchus of the poets, for example, is the Jehovah of scripture, the conductor of the Israelites through the wilderness. During his residence at Stamford, he arranged his collection of Greek and Roman coins according to the order of the scripture history; and from this time his publications were very numerous.

In 1737 he lost his wife, and afterwards married the only daughter of the learned antiquary, Dr. Gale, dean of York, and sister of his intimate friends Roger and Samuel Gale, from which period he often spent his winters in London. In 1740, he published an account of Stonehenge, which he regarded as a druidical monument. This was followed by his account of the remains of Abury, in the same county; and into these works he incorporated a great part of a "History of the ancient Celts, particularly the first Inhabitants of Great Britain," which he had announced as a separate work. In his "History of Carausius," in two volumes 4to. published in 1757 and 1759, he has displayed much erudition and ingenuity in settling the principal events of that emperor's government in Britain. He published, besides, many interesting and valuable tracts, especially three numbers of "Palæographia Britannica;" some papers respecting earthquakes, &c.: but the last labours of his life were dedicated to the completion of an elaborate work on ancient British coins, particularly those of Cunobelin, in which he felicitated himself on having discovered many new and curious anecdotes relative to the reigns of the British kings.

Dr. Stukeley was one of the founders of the Egyptian Society in the year 1741, in which he became acquainted with the benevolent duke of Montague, who prevailed upon him, in 1747, to vacate his preferments in the country, and accept the rectory of St. George's, Queen-square. He therefore moved his residence again to London, and had a retreat at Kentish Town. In February, 1765, he was seized with a stroke of the palsy, which terminated his valuable life in the March following, in the 78th year of his age. He was interred in the church-yard of East Ham, in Essex, in a spot which he had chosen when on a visit to the vicar a short time previous to his death. All his works evince a profound knowledge of ancient history, tinged indeed with that propensity common to his fraternity, of magnifying the importance of his subjects by the assumptions of a lively fancy, and some credulity.

STUKELY, GREAT, a parish of England, in Huntingdonshire; 2½ miles north-north-west of Huntingdon.

STUKELY, LITTLE, another parish in the above county; one mile distant from the foregoing.

STUKELY, a township of Lower Canada, in the county of Richlieu. Population 250.

STULM, *s.* A shaft to draw water out of a mine.

STULTILOQUENCE, *s.* Foolish talk.

STULTILOQUY, *s.* [*stultiloquium*, Lat.] Foolish babbling or discourse.—What they call facetiousness and pleasant wit, is indeed to wise persons a meer *stultiloquy*, or talking like a fool. *Bp. Taylor.*

To STULTIFY, *v. a.* [*stultus* and *facio*, Lat.] To prove foolish or void of understanding.—In England no man is allowed to *stultify* himself. *Johnson.*

STUM, *s.* Wine yet unfermented: must.—An unctious clammy vapour, that arises from the *stum* of grapes, when they lie mashed in the vat, puts out a light when dipped into it. *Addison.*—New wine used to raise fermentation in dead and vapid wines.

Let our wines without mixture or *stum* be all fine,
Or call up the master, and break his dull noddle. *B. Jonson.*

Wine revived by a new fermentation.

Drink ev'ry letter on't in *stum*,
And make it brisk champaigne become. *Hudibras.*

To STUM, *v. a.* To renew wine by mixing fresh wine and raising a new fermentation.—Vapid wines are put upon the lees of noble wines to give them spirit, and we *stum* our wines to renew their spirits. *Floyer.*

STUM, a small town of West Prussia; 33 miles south-east of Dantzic. It contains 900 inhabitants.

To STUMBLE, *v. n.* [This word Junius derives from *stump*, and says the original meaning is to *strike*, or *trip against a stump*. Todd supposes it may come from *tumble*.] To trip in walking.

As we pac'd along
Upon the giddy footing of the hatches,
Methought that Glo'ster *stumbled*; and, in falling,
Struck me, that sought to stay him, overboard. *Shakspeare.*

To slip; to err; to slide into crimes or blunders.

This my day of grace
They who neglect and scorn, shall never taste;
But hard be harden'd, blind be blinded more,
That they may *stumble* on and deeper fall. *Milton.*

To strike against by chance; to fight on by chance: with *upon*.

What man art thou, that, thus bescreen'd in night,
So *stumblest* on my counsel. *Shakspeare.*

To STUMBLE, *v. a.* To obstruct in progress; to make to trip or stop.—It holds out false and dazzling fires to *stumble* men. *Milton.*—To make to boggle; to offend.

This *stumbles* me: art sure for me, wench,
This preparation is? *Beaum. and Fl.*

STUMBLE, *s.* A trip in walking; a blunder; a failure.—One *stumble* is enough to deface the character of an honourable life. *L'Estrange.*

STUMBLER, *s.* One that stumbles.

Be sweet to all: is thy complexion sour?
Then keep such company; make them thy ally:
Get a sharp wife, a servant that will low'r;
A *stumbler* stumbles least in rugged way. *Herbert.*

STUMBLINGBLOCK, or STUMBLINGSTONE, *s.* Cause of stumbling; cause of error; cause of offence.—Shakspeare is a *stumblingblock* to these rigid critics. *Spectator.*

STUMBLINGLY, *adv.* With failure; with blunder.—I know not whether to marvel more, either that he [Chaucer] in that misty time could see so clearly, or that we in this clear age go so *stumblingly* after him. *Sidney.*

STUMP, *s.* [*stumpe*, Danish; *stompe*, Dutch; *stompen*, Dan. *to lop*.] The part of any solid body remaining after the rest is taken away.—Your colt's tooth is not cast yet.—Not while I have a *stump*. *Shakspeare.*—Worn to the *stumps*

stumps in the service of the maids, 'tis thrown out of doors, or condemned to kindle a fire. *Swift.*

To STUMP, *v. a.* [*stompen*, Dan.] To lop.—Around the *stumped* top soft moss did grow. *More.*

To STUMP, *v. n.* To walk about heavily, or clumsily, like a clown: a *low colloquial term.*

Cymon, a clown, who never dreamt of love,
By chance was *stumping* to the neighbouring grove.

Song of Cym.

STUMPSTOWN, a township of the United States, in Dauphin county, Pennsylvania, on a branch of the Little Swatara; 24 miles east-north-east of Harrisburg.

STUMPY, *adj.* Full of stumps; hard; stiff; strong. *A bad word.*—They burn the stubble, which, being so *stumpy*, they seldom plow in. *Mortimer.*—[*stumpig*, Swedish.] Short; stubby; sometimes applied to a short but stout person: a *low expression.*

STUMPY INLET, a channel between two small islands on the coast of North Carolina. Lat. 34. 24. N. long. 77. 43. W.

To STUN, *v. a.* [*stunian*, *zerstun*, Saxon, *noise.*] To confound or dizzy with noise.

An universal hubbub wild
Of *stunning* sounds, and voices all confus'd,
Assaults his ear.

Milton.

Still shall I hear, and never quit the score,
Stun'd with hoarse Codrus' Theseid o'er and o'er.

Dryden.

To make senseless or dizzy with a blow.
One hung a pole-ax at his saddle bow,
And one a heavy mace to *stun* the foe.

Dryden.

STUNG. The preterite and participle passive of *sting*.
To both these sisters have I sworn my love:
Each jealous of the other, as the *stung*
Are of the adder.

Shakspeare.

STUNK. The preterite of *stink*.

To STUNT, *v. a.* To hinder from growth.
There he stopt short, nor since has writ a title,
But has the wit to make the most of little;
Like *stunted* hide-bound trees, that just have got
Sufficient sap at once to bear and rot.

Pope.

STUNTLEY, a hamlet of England, in the isle of Ely, Cambridgeshire; 1½ mile east-south-east of Ely.

STUPE, *s.* [*stupa*, Lat.] Cloth or flax dipped in warm medicaments, and applied to a hurt or sore.—A fomentation was by some pretender to surgery applied with coarse woollen *stupes*, one of which was bound upon his leg. *Wiseman.*

To STUPE, *v. a.* To foment; to dress with *stupes*.—The *escar* divide, and *stupe* the part affected with wine. *Wiseman.*

STUPE, *s.* A term in derision for a stupid or foolish person. The Scotch also use it.—Brother, he does not look like a music-master.—He does not look! was ever such a poor *stupe*! well, and what does he look like then? *Bickerstaff.*

STUPEFACTION, *s.* [*stupefaction*, Fr.; *stupefactus*, Lat.] Insensibility; dullness; stupidity; sluggishness of mind; heavy folly.

She sent to every child
Firm impudence, or *stupefaction* mild;
And straight succeeded, leaving shame no room,
Cibberian forehead, or Cimberian gloom.

Pope.

STUPEFACTIVE, *adj.* [from *stupefactus*, Lat., *stupefactif*, Fr.] Causing insensibility; dulling; obstructing the senses; narcotic: opiate.—Opium hath a *stupefactive* part, and a heating part; the one moving sleep, the other a heat. *Bacon.*

STUPEFACTIVE, *s.* An opiate.—It is a gentle fomentation, and hath a very little mixture of some *stupefactive*. *Bacon.*

STUPE'NDOUS, or STUPENDIOUS, *adj.* [*stupendus*, Lat. This word was at first *stupend.*] Wonderful; amazing;
Vol. XXIII. No. 1598.

astonishing.—All those *stupendous* acts deservedly are the subject of a history, excellently written in Latin by a learned prelate. *Clarendon.*

Great joy was at their meeting, and at sight
Of that *stupendous* bridge his joy increas'd.

Milton.

STUPE'NDOUSLY, *adv.* In a wonderful manner.

Without a friend
Stupendously she fell.

Sandys.

STUPE'NDOUSNESS, *s.* Wonderfulness.—Those very works, which, from their *stupendousness*, should have taught them the greatness of the former, were the occasion of their paying that homage to the thing made, which could be due to the worker only. *Ellis.*

STU'PID, *adj.* [*stupidus*, Fr., *stupidus*, Lat.] Dull; wanting sensibility; wanting apprehension; heavy; sluggish of understanding.

O that men should be so *stupid* grown
As to forsake the living God.

Milton.

Performed without skill or genius.
Wit, as the chief of virtue's friends,
Disdains to serve ignoble ends;
Observe what loads of *stupid* rhimes
Oppress us in corrupted times.

Swift.

STU'PIDITY, *s.* [*stupidité*, Fr.; *stupiditas*, Lat.] Dulness; heaviness of mind; sluggishness of understanding.

Shadwell alone, of all my sons, is he
Who stands confirm'd in full *stupidity*.

Dryden.

STU'PIDLY, *adv.* With suspension or inactivity of understanding.

That space the evil one abstracted stood
From his own evil, and for the time remain'd
Stupidly good.

Milton.

Dully; without apprehension.—On the shield there was engraven maps of countries, which Ajax could not comprehend, but looked on as *stupidly* as his fellow-beast the lion. *Dryden.*

STU'PIDNESS, *s.* Dulness; stupidity.—He so applies himself to his pillow, as a man that meant not to be drowned in sleep, but refreshed; not limiting his rest by the insatiable lust of a sluggish and drowsy *stupidness*. *Bp. Hall.*

STU'PIFIER, *s.* That which causes stupidity.—Whether the natural phlegm of this island needs any additional *stupifier*. *Bp. Berkeley.*

To STU'PIFY, *v. a.* [*stupefacio*, Lat. This word should therefore be spelled *stupefy*; but the authorities are against it.] To make stupid; to deprive of sensibility; to dull.

Those

Will *stupify* and dull the sense a while.

Shakspeare.

STU'POR, *s.* [Lat.; *stupeur*, Fr.] Suspension or diminution of sensibility.—A pungent pain in the region of the kidneys, a *stupor*, or dull pain in the thigh, and colic, are symptoms of an inflammation of the kidneys. *Arbutnot.*—Astonishment.—To the *stupour* and amaze of the whole world. *Parth.*

To STU'PRATE, *v. a.* [*stupro*, Lat.] To ravish; to violate.

STU'PRATION, *s.* [*stupratio*, from *stupro*, Lat.] Rape; violation.—*Stupration* must not be drawn into practice. *Brown.*

STURA, a considerable river of the north-west of Italy, in Piedmont, which takes its rise in Mount Argentera, on the borders of France, and after a course of 80 miles, discharges itself into the Tanaro near Cherasco. It gave name to a department of the French empire.

STURA, another river of the Sardinian states, in the duchy of Monterrat, which falls into the Po at the small town of Ponte di Stura.

STURA, a third river of the Sardinian states, which rises in the mountains on the borders of Savoy, and falls into the Po a little above Turin.

STURBRIDGE, a post township of the United States, in Worcester county, Massachusetts. It is watered by the

Quinebaug, and the turnpike from Worcester to Hertford passes through the town. Population 1927; 58 miles south-west of Boston.

STURDILY, *adv.* Stoutly; hardily.—Obstinately; resolutely.

Then withdraw
From Cambridge, thy old nurse: and, as the rest,
Here toughly chew and *sturdily* digest
Th' immense vast volumes of our common law. *Donne.*

STURDINESS, *s.* Stoutness; hardness.—Sacrifice not his innocency to the attaining some little skill of bustling for himself, by his conversation with vicious boys, when the chief use of that *sturdiness*, and standing upon his own legs, is only for the preservation of his virtue. *Locke.*—Brutal strength.

STURDY, *adj.* [*estourdi*, Fr. *Johnson.*—From the Icel. *stýrd*, rigidus. *Serenius.* Or from *stuer*, Teut. *torvus*, trux, horridus, ferox; dicitur *stuer* q. d. *stier*, i. e. taurus. *Kilian.* “By the accustomed addition of *z*, or *y*, to *stour*, or *τρυμ* (tumult), we have *sturdy*, and the Fr. *estourdi.*” *H. Tooke.*] Hardy; stout; obstinate.—It is always used of men with some disagreeable idea of coarseness or rudeness.

Aw'd by that house accusom'd to command,
The *sturdy* kerns in due subjection stand,
Nor bear the reins in any foreign hand. *Dryden.*

The ill-appareled knight now had gotten the reputation
of some *sturdy* lout, he had so well defended himself.
Sidney.

Sturdiest oaks
Bow'd their stiff necks, loaden with stormy blasts,
Or torn up sheer. *Milton.*

STURGEON, *s.* [*sturgeon*, old Fr.; *sturio*, *tursio*, Lat.] A sea-fish. See **ACCIPENSER STURIO**.—It is part of the scutellated bone of a *sturgeon*, being flat, of a porous or cellular constitution on one side, the cells being worn down and smooth on the other. *Woodward.*

STURGEON LAKE, a lake of North America, which is connected with Pine Island lake, by the river Saskatchewan, and which also communicates with the lake Winnipic by means of Sturgeon Weir river. It forms an irregular horse-shoe, one side of which runs to the north-west, and bears the name of Pine Island lake; and the other, known by the name of Sturgeon lake, runs to the east of north, and is the largest. Its length is about 27 miles, and its greatest breadth about 6 miles.

STURGEON WEIR RIVER, a river of North America, which discharges itself into Sturgeon lake. It is almost one continual rapid; and its course, including its windings, may be about 30 miles.

STURK, *s.* [τρυπε, Sax.] A young ox or heifer. *Obsolete.*

STURLESON (Snorro), a celebrated Icelandic writer, styled the Herodotus of the north, was born in the district of Dale, in the year 1178. At three years of age he was put to school under the learned John Loptson, a distinguished character at that period, with whom he remained till the time of his death, in 1197. Though of noble descent he was poor, till by marriage he so much increased his property, as to become the richest man in the island, excepting the son of his deceased preceptor. He was remarkably fond of parade; and when he went to the courts of justice, was usually attended with several hundred armed men. He possessed six large farms, and several on a smaller scale. After the death of his father-in-law, in 1202, he removed to Borg, the inheritance of his wife; but in 1209 he went to reside at the farm of Reikholt, in the improvements of which he spared neither time nor expense. He surrounded his mansion and church with a very high rampart, to serve as a security in time of danger; and by means of a subterraneous channel, constructed of stone, conveyed water from the neighbouring warm springs of Skribla, to a bath, still denominated after the founder, Snorrolaug, which was paved with hewn stone, and bor-

dered by seats of the same material. This building has survived the depredations of 600 years. In 1213, Snorro was chosen supreme judge over the whole island. About the same period he acquired great reputation abroad by his poetical talents. He composed a poem in honour of the powerful northern earl, Haco Galin, which he sent to him the same year from Iceland, and in return for the civility he received many valuable presents. In 1218 he proceeded to Norway, where he was in great favour with the king, Haco, and several of the nobility. Under the government of this sovereign, he was appointed to various offices, and went several times to Iceland, in order to promote his patron's views in regard to that island. It having been determined to send troops thither from Norway, either for the purpose of conquering the country, or for obtaining satisfaction on account of some acts of violence committed by the inhabitants against Norwegian merchants, Snorro prevented this expedition, by his remonstrances to one of the king's friends; but he engaged, on the other hand, with the assistance of his brother, to bring the island under the king's authority without bloodshed, and promised to send his son to Norway, as a pledge of what he had undertaken. When Snorro set out on this mission, he received, besides other presents, a ship completely equipped. Having returned to Iceland in 1220, nothing farther was done: either Snorro found it impossible to carry his designs into execution, in consequence of disturbances which agitated the island, and in which he himself had a share, or he endeavoured, through a view to private advantage, to deceive both the king and his own countrymen. He was at enmity with his relations, among whom were his brother, his nephew, and his three sons-in-law, who had all repudiated their wives. Finding himself too weak to contend with his numerous enemies, he quitted Iceland in 1237, and went again to Norway, where he arrived at the moment when duke Skule was preparing to deprive his son-in-law, king Haco, of the crown, and to place himself on the throne in his stead. Snorro espoused the party of the duke, but returned to Iceland in 1239. Gissur Thorraldsen, a relation of king Haco, by whom he had been raised to the rank of earl, was one of Snorro's sons-in-law, but had now become his bitter enemy. In 1240, king Haco sent him a message, after he had got rid of duke Skule, either to bring Snorro a prisoner to Norway, or to put him to death. At first, Gissur intended to execute his murderous designs at the place where justice, as it was called, was usually administered; but finding this inconvenient, he fell upon him at his residence, where he was assassinated, in the 63d year of his age. Snorro was unquestionably a great and learned man; his “*Heimskringla*, or *Chronicle of the Norwegian Kings*,” has been printed at various times, and under different forms. A Danish translation of it by Clausen, with Worm's preface, was published at Copenhagen in 1633 and 1657. It was printed at Stockholm in Icelandic, Swedish, and Latin, in 1697, 2 vols. fol. But the most elegant edition is said to be that of Schoning, published in Icelandic, Danish, and Latin, which was printed at Copenhagen in 1777 and 1783. This was printed at the expence of the crown-prince: the Latin translation and notes were by Schoning; but the Danish is that of Clausen, revised by J. Olafsen. By this important work, which throws so much light on the earliest history of Norway, Snorro rendered much service to posterity. But his merit does not rest on this alone, since he is commonly considered as the author of the prose Edda, edited by Resenius in 1665, which is founded on those old poems said to have been collected by Sæmund, and on that account called “*Edda Sæmundi*.” The Edda of Snorro is a poetic manual, or the Scandinavian art of poetry, consisting of three parts. In the first, which may be compared to Ovid's *Metamorphoses*, or Hesiod's *Theogony*, are related all those fables contained in the works of Skalda. The second part is a treatise on poetical phraseology or synonymy, which shews in what manner the Skalda gave names to different things: and the third, called *Skalda*, treats of alphabetical characters, their division, and the relation

relation they bear to musical tones; of poetical licences, metre, &c. The last part has never been published. Notwithstanding the general merit of Snorro, he is described as a cunning and deceitful man; unsteady in his friendship, fond of money, as well as ambitious, and of a violent and quarrelsome disposition. *Gen. Biog.*

STURM (James), was born of a family of eminence at Strasburgh, in 1489, and elected at the age of twenty-five into the senate of his native place. He was an active promoter of the Reformation, and deputed to the imperial diet, assembled on that occasion. When the deputies of the reformed were excluded, in 1529, from the diet at Spire, Sturm boldly entered his protest against the measure, and on behalf of his constituents and the other confederates, declared, that if good citizens were thus divested of their privileges, contrary to the customs of the empire, it could not be expected that they should contribute to the public expenses. This protestation on his part gave rise to the appellation of "Protestants." Amongst other offices of important trust, which were committed to him, he was one of the ambassadors sent in 1536 from the states of Germany to Henry VIII. of England. By his influence a college was established at Strasburgh in 1538, and at his death he left to its support a considerable legacy. Sleidan, in his "History of the Reformation," availed himself of much valuable information communicated by Sturm, of whom it is recorded, that being scandalized by the violent disputes among the Reformers concerning the Lord's Supper, he abstained for many years from receiving it. After having several times served his state as mayor, and having been ninety-one times delegated from it on public business, he died in high esteem, at the age of sixty-four. *Gen. Biog.*

STURM (John), was born at Sleida, near Cologne, in 1507, and studied at Liege and Louvain, in which last city he set up a press, and joined Rescius, the Greek professor, in printing several Greek books. In 1529 he transferred his printing-press to Paris, where he delivered lectures on the classics and on logic. He married there; but being suspected of an attachment to the new opinions, he removed to Strasburgh, where he was appointed first rector of the newly appointed college, which flourished greatly under his care, as he was well versed in the learned languages, wrote Latin, with purity, and had a good method of teaching. By his influence the college was raised, in 1566, by the emperor Maximilian II., to the rank of an university. The benefactions of Sturm to refugees from France and other parts, on account of their religion, injured his own circumstances; and his life was disquieted by the persecutions of the Lutheran ministers. His own sentiments were those of Zuinglius, though he conformed to the mitigated Lutheranism which he found at Strasburgh. However, in process of time, as the ministers became rigid on the subject of consubstantiation, he withdrew from the religious services, and at length, when he was obliged to declare his opinion, he was deprived of his office at the age of 67 years. Before his death he became blind, and terminated his life in 1689, in his 82d year. Sturm was the editor of many works, which gave him reputation in the learned world. From the Greek he translated Aristotle's books on Rhetoric, and the works of Hermogenes concerning oratory; and he composed some original treatises on the method of teaching those arts. Several of his letters are contained in the Latin correspondence of Roger Ascham, printed at Oxford. *Bayle. Moreri.*

STURM, or STURMIUS, (John-Christopher,) born at Hippelstein in 1635, was a professor of philosophy and mathematics at Altdorf, where he died in 1703. In 1670 he published a German translation of the works of Archimedes, and afterwards many books of his own composition. The titles and dates of several of them are as follow: "Collegium experimentale curiosum," 4to. Nuremberg, 1676; "Physica electiva et hypothetica," 2 vols. 4to. Nuremberg, 1675, reprinted at Altdorf, 1730; "Scientia Cosmica," fol. Altdorf, 1670; "Architecturæ Militaris Tyrocinia,"

fol. 1682; "Epistola de Veritate propositionum Borelli de Motu Animalium," 4to. Nuremberg, 1684; "Physicæ Conciatrix Conamina," 8vo. Altdorf, 1684; "Mathesis enucleata," 8vo. Nuremberg, 1695; "Mathesis Juvenilis," Nuremberg, 2 vols. 8vo. 1699; "Physicæ modernæ Compendium," 8vo. Nuremberg, 1704; "Tyrocinia Mathematica," fol. Leipsic, 1707; "Prælectiones Academicæ," 4to. 1722; "Prælectiones Academicæ," Strasburg, 12mo.

STURMERE, a parish of England, in Essex; 9½ miles north-west of Castle Hedingham.

STURMHAUBE, a mountain of Bohemia, in the Riesengebirge chain, about 4500 feet in height.

STURMINSTER MARSHAL, a parish, formerly a market town, of England, situated on the river Stour; 8½ miles south-west of Shaftsbury. Population 588.

STURMINSTER NEWTON CASTLE, or more generally STURMINSTER NEWTON, a market town of England, in the county of Dorset, situated on the river Stour. It consists of two townships that stretch along each side of the river, and communicate with each other by means of a causeway, and a bridge consisting of six arches. The buildings are rather low, and mostly covered with thatch. In the market-place, however, are some good houses covered with tiles. The market-house is a lofty oblong building, the upper part of which is used as a warehouse, and the under part serves for butchers' shambles. The church is a very lofty spacious piece of architecture. Baxter conjectures this place to be the *Anicetis* of Ravennas. It was undoubtedly known in the early ages of the Saxons; for the castle boasts of very remote antiquity. Its ruins are in the form of a Roman D, and stands on a high hill, surrounded by a high vallum and deep ditch on the south-west, and part on the east. Near the centre is a small artificial mount or keep. The manor was held by the abbey of Glastonbury, by a grant from king Edgar, having formerly been bequeathed by Alfred the Great to his son Ethelwald. Market on Thursday, and two annual fairs. In 1811 Sturminster contained 1461 inhabitants; 20 miles north-north-east of Dorchester, and 111 west-south of London.

STURNUS, the STARE, or STARLING, in Ornithology, a genus of birds of the order passeræ, of which the Generic Character is as follows: Bill subulate, angular, depressed, bluntish; the upper mandible is entire, somewhat open at the edges; the nostrils are surrounded with a prominent rim; tongue notched and pointed. There are seventeen species.

1. *Sturnus vulgaris*, or common starling.—Bill yellowish; body black, with white dots.—This is very common in our own country, and is found in other parts of Europe, Asia, and America. It is about nine inches long, and builds its nest in the hollows of trees, eaves of houses, towers, or rocky cliffs; it lays from four to five eggs, which are of a palish-green colour. In the winter season, starlings assemble in vast flocks in marshy places; feed on worms and insects; are very docile, and may easily be taught to speak. The flesh is bitter, and scarcely eatable. The other characteristics of this species are, that their quill-feathers and tail are of a dusky hue; the former are edged with yellow on the outer side, the latter with a dirty-green; lesser coverts edged with yellow, and slightly glossed with green; the legs are of a reddish-brown. Male is shining, with purple, green, and gold.

During the winter months, starlings crowd together in such close and well-arranged battalions, that no bird of prey dare to penetrate their ranks. This manner of flight, which is extremely useful in defending them against rapacious birds, renders them a more easy prey to the wiles of the bird-catcher, who dispatches among them a number of birds of their own kind, each having a glued thread tied to its leg, by which some of them are entangled and brought to the ground. Their love of society not only prompts them to associate with birds of their own species, but with others in no way allied to their tribe. In the spring and summer they are frequently seen with crows and choughs, and even with pigeons. It is, however, principally towards night that the starlings unite

unite in large companies, as if to put themselves in sufficient force to brave its dangers. Then they assemble in a flock, and after various evolutions, rush with much impetuosity into the midst of the thicket, where they spend the evening in chattering, till darkness puts an end to their conversation. In the morning, at day-break, the noisy conference is resumed, till they depart or separate in search of food. Starlings seldom take the trouble of building nests for themselves, but generally take possession of the deserted abodes of some other birds.

Their docility, and the beauty of their plumage, have rendered starlings great favourites. They are frequently taught to speak, and sing song-tunes. Their vocal powers are, however, acquired by education, and in the domestic state, they support a musical character much better than in the wild.

There is in the productions of Nature a continual tendency to variety, which is clearly exemplified in most of the tribes of birds, and which the distinct, and almost insulated characters of the starling, have not been able to defeat. Hence naturalists have enumerated five varieties of the common starling, of which the first (independently of that already described) has a white body; the second is white; the crown, neck, wings, and tail, are black; the third is white, but above the eyes and near the bill are two black spots; and the fourth is cinereous, with black bill and legs.

2. *Sturnus Capensis*, or Cape starling.—Blackish beneath; the sides of the head are white.—It inhabits the Cape of Good Hope, and is the size of the last. The black and the white, which are the only colours of this bird, are distributed very like those of our pies. The bill is thicker and longer than that of the European starling, and its distinguishing marks are two large white spots of a round form on each side of the head. In the middle of these are placed the two ears.

3. *Sturnus Ludovicianus*, or Louisiana starling.—The specific characters of these are, that they are spotted with grey and brown, beneath they are yellow: the head and eye-brows are marked with a white line; the chin is black. A variety is varied with brown, reddish, and blackish, beneath yellow; breast with a curved black band; the three lateral tail-feathers are white. The starlings of Louisiana are observed in great flocks in the interior regions of North America. By their manner of flight, as well as their shape, they indicate a near approach to our European kinds.

4. *Sturnus contra*, or Indian starling.—Brown; eye-spot, bar on the wings, and belly, white. The body of this species is blackish; the ring on the upper part of the neck white; the upper wing-coverts are marked with white spots: the legs are of a pale yellow.—It inhabits India, and is thought to be a variety of the *Sturnus Capensis*.

5. *Sturnus cinclus*, or water-ouzel; crane.—Black with a white breast. It is about seven or eight inches long; frequents waters, and feeds on aquatic insects and small fish; it is a very solitary bird, and breeds in the holes of banks; makes a curious nest of hay and fibres of roots, lined with dead leaves, and having an entrance of green moss. The chin is white; the tail black; belly ferruginous; in the young bird it is white; the legs are of a pale blue before, and black behind.—This species is common to our own country, other parts of Europe, and northern Persia.

6. *Sturnus Milibaris*, or Magellanic starling.—Grey; breast and chin red. Behind and under the eyes is a white spot; the lores are red; on each side the neck is a black blotch; the vent and sub-forked tail are black.—It inhabits the Falkland Islands, and is eleven and a half inches long.

7. *Sturnus Moritanus*.—Cinereous; lower part of the head and chin varied with cinereous and white; belly spotted with reddish, hoary; the bill is tipped with black.—This species inhabits the Alpine parts of Persia; it is the size of a common lark, builds in hollow rocks, and feeds on insects.

8. *Sturnus loyca*.—Spotted with brown and white, chin and breast scarlet.—It inhabits Chili, and is larger than *Sturnus vulgaris*; it builds in holes on the ground, and lays three

cinereous eggs, varied with brown: it sings well, and is easily tamed.

9. *Sturnus Mexicanus*, or Mexican starling.—Blue varied with black. The bill and eyes are black; irids pale-yellow; the head is small.—It inhabits South America, and is about the size of the *Sturnus vulgaris*.

10. *Sturnus obscurus*, or brown-headed starling.—Black, but the head is brown, whence its trivial name.—It inhabits New Spain.

11. *Sturnus Zeylanicus*, or Ceylonese starling.—Line over the eyes and one on the sides of the head black; body grey, varied with ochrey and white spots and crescents; quill-feathers green; tail marked with green and black lines. The bill is black, the head yellowish; the legs are of a blueish-grey.—It inhabits Ceylon, and imitates the notes of other birds.

12. *Sturnus fuscus*, or brown starling.—Olive; eye-band blueish; bill and legs reddish. The belly is yellowish; the tail long.—This is found chiefly in China.

13. *Sturnus viridis*, or green starling.—Green, beneath blueish; a tuft of black and white feathers on the front and chin. Above the front, and behind the eyes, a white spot, and two on the shoulders: quill-feathers and shafts of the tail-feathers white, legs blue-ash.—This inhabits China.

14. *Sturnus sericeus*, or silk starling.—Pale-grey; wings and tail black; the former with a transverse white bar; head ochre-yellow. Bill and legs orange or red; the plumage is silky.—It inhabits China, and is the size of the *Sturnus vulgaris*.

15. *Sturnus carunculatus*.—Bill and legs black; at each angle of the mouth a pendant orange wattle. The female is of a rusty-brown, with very small wattles. The male is black; the back and wing-coverts ferruginous.—It inhabits New Zealand, and is ten inches long.

16. *Sturnus collaris*, or collared starling.—Blackish-brown, spotted with brown; the flanks are rufous, the chin is white spotted with brown. The upper mandible is brown, lower yellowish, tipped with brown; breast brown-ash; the belly is rufous; quill-feathers blackish, the edge at the tip and inner side reddish; tail brown; legs of a horn-colour.—This species is found chiefly in Switzerland and Italy; size of a field-fare; it is a solitary bird; wags its tail, feeds on seeds, sings with a very weak voice, and builds on the ground, or in the clefts of rocks.

17. *Sturnus Dauricus*.—Body above violet-black; beneath ashy-white; the head and neck blueish-ash; crown with a violet-black streak; but in the female it is brown. The bill is black, and more convex than in others of its tribe; the tongue is blackish; the irids brown; down eyelids and lores white. The head of the female is cinereous; the back is of a grey-brown; the wing-coverts of the male are black; silky-green; the secondaries tipped with white; the quill-feathers are black; the two inner ones tipped with white; the primary ones are tipped with green; the tail is sub-forked, greenish-black; the covert violet; legs blueish-black.—This species is found chiefly among the ozier plantations of Dauria; it is above six inches long, and feeds on vegetables and insects.

STURRY, a parish of England, in Kent, on the river Stour, over which there is here an elegant stone bridge. Population 709; $2\frac{1}{2}$ miles north-east of Canterbury.

STURSTON. 1. A township of England, in Derbyshire; 1 mile east of Ashborne.—2. A parish in Norfolk; 5 miles south-west-by-west of Watton.—3. A parish in Suffolk; 3 miles north-by-west of Wye.—4. A hamlet in the parish of Bagden, Huntingdonshire.

STURTON. 1. A parish in Lincolnshire; $5\frac{1}{2}$ miles north-west-by-north of Horncastle.—2. A township in Lincolnshire; $8\frac{1}{2}$ miles south-east of Gainsborough.—3. Another township in the above county; 3 miles south-west of Glandford Bridge.—4. A hamlet in Staffordshire, situated on the river Stour; 3 miles from Stourbridge.—5. A hamlet in the West Riding of Yorkshire; $1\frac{1}{2}$ mile north-west of Skipton.—6. STURTON, or *Stretton*, a parish in Nottinghamshire; 6 miles east-north-east of East Retford. Population

STURNUS AND TANAGRA.

1. *S. militaris*. 2. *S. carunculatus*. 3. *T. tatar.* 4. *T. albirostris*. 5. *T. jayappa.*

lation 526.—7. STURTON, *Grange*, a township in the parish of Aberford, West Riding of Yorkshire.—Also a township in the parish of Warkworth, Northumberland.

To STUT, or To STU'TTER, *v. n.* [*stottern*, Germ., *the same.*] To speak with hesitation; to stammer.

She spake somewhat thicke,
Her felowe did stammer and *stut*,
But she was a foule slut.

Skelton.

STU'TTER, or STU'TTERER, *s.* One that speaks with hesitation; a stammerer.—Many *stutters* are very choleric, choleric inducing a dryness in the tongue. *Bacon.*—*Stutterers* use to stammer more when the wind is in that hole. *Howell.*

STUTTERTON, a parish in Lincolnshire; 9 miles from Spalding. Population 860.

STUTTESBURY, or STOTESBURY, a parish of England, in Northamptonshire; 5 miles north-by-west of Brackley.

STUTTGARD, a city in the south-west of Germany, the capital of the kingdom of Wirtemberg. It stands on the small river Nisselbach, in a valley, and is only 2 miles from the Neckar, over which there is an elegant bridge. It may be considered as divided into three parts, the town proper, two suburbs adjacent to each other, with the separate suburb called Esslingen. The town proper is badly built, the streets being narrow, the houses frequently of wood. The suburbs being less antique, are somewhat better, particularly that of Esslingen, in which are the royal palace, the gymnasium, the barracks, and several public buildings. The palace is a noble structure, situated near an extensive park. Its interior contains a good collection of paintings and statues, while its windows command a delightful view of the environs. Around the palace are several public establishments, a spacious opera-house, a small theatre, a museum, a garden, and an academy for painting, sculpture, and architecture. The royal library is said to contain 100,000 volumes, new and old, among which is an unique collection of bibles, comprising editions of every age and every country. The gymnasium has an observatory, and a good collection of mathematical instruments. The town has also a public library; and though it can boast of no handsome streets, except King's-street, which adjoins the palace, it has several pleasant walks, particularly that which leads to the royal villa of Monrepos. Its public buildings are an old palace, now converted into government offices, a mint, a town-house, a great church, and the royal stables. Though surrounded by a wall and ditch, Stuttgart is a place of no strength; and though repeatedly entered by the armies on both sides, between the years 1796 and 1815, it escaped altogether those calamities which pressed so severely on it in the wars of the 16th and 17th centuries. Here, as in other towns of Wirtemberg, manufactures are carried on on a small scale; they consist of leather, hats, cotton, silk, plated goods, and snuff. The expenditure of the court and nobility forms the chief support of the inhabitants. Provisions are abundant and reasonable, the surrounding country being equally fertile and beautiful, consisting chiefly of eminences covered with vineyards, and of valleys laid out in corn culture; 37 miles east-south-east of Carlsruhe, and 116 west-north-west of Munich. Lat. 48. 46. 15. N. long. 9. 11. 0. E.

STU'TTINGLY, or STU'TTERINGLY, *adv.* With stammering or hesitating speech.

STUTTON, a township of England, West Riding of Yorkshire, near Tadcaster.

STUTTON, a parish of England, in Suffolk; 6 miles south-by-west of Ipswich.

STY, *s.* [*stige*, Sax.; *stia*, Icel.] A cabin to keep hogs in.

Tell Richmond,
That in the *sty* of this most bloody boar,
My son George Stanley is frank'd up in hold. *Shakspeare.*

Any place of bestial debauchery.

[They] all their friends and native home forget,
To roll with pleasure in a sensual *sty*.

Milton.

VOL. XXIII. No. 1598.

[*stige*nd, Sax.; probably from *stigan*, to grow up. See *Etym. Dict.* 1691.] A humour in the eyelid: sometimes written *stian*.

To STY, *v. a.* [*stigean*, Sax.] To shut up in a sty.

Here you *sty* me
In this hard rock, while you do keep from me
The rest of the island. *Shakspeare.*

To STY, *v. n.* [*stigan*, Sax.; *steigan*, Goth., to climb.] To soar; to ascend; to climb.

To climbe aloft, and others to excell;
That was ambition, rash desire to *sty*. *Spenser.*

From this lower tract he dar'd to *stie*
Up to the clowdes. *Spenser.*

STY'CA, *s.* [*stica*, *stýca*, Sax.; from *stíce*, a small part.] A copper Saxon coin of the lowest value.—They had copper *stycas* also smaller than the penny, having the king's name on one side, and coiner's on the other, eight of which made a penny. *Leake.*

STYDD, or STEDE, a township of England, in Derbyshire; 4½ miles south-by-west of Ashborne.

STYFORD, a hamlet of England, in Northumberland; 7 miles east-by-south of Hexham.

STY'GIAN, *adj.* [*stygius*, Lat.] Hellish; infernal; pertaining to Styx, one of the poetical rivers of hell.

At that so sudden blaze the *Stygian* throng
Bent their aspect. *Milton.*

STYLE, *s.* [*stylus*, Lat.] Manner of writing with regard to language.

Happy
That can translate the stubbornness of fortune
Into so quiet, and so sweet a *style*. *Shakspeare.*

Manner of speaking appropriate to particular characters.—No *style* is held for base, where love well named is. *Sidney.*

There was never yet philosopher,
That could endure the toothach patiently,
However they have writ the *style* of gods,
And make a pish at chance and sufferance. *Shakspeare.*

Mode of painting.—The great *stile* stands alone, and does not require, perhaps does not as well admit, any addition from inferior beauties. The ornamental *stile* also possesses its own peculiar merit: however, though the union of the two may make a sort of composite *stile*, yet that *stile* is likely to be more imperfect than either of those which go to its composition. *Reynolds.*—It is likewise applied to music.—Title; appellation.—Ford's a knave, and I will aggravate his *stile*; thou shalt know him for knave and cuckold. *Shakspeare.*

O virgin! or what other name you bear
Above that *style*; O more than mortal fair!
Let not an humble suppliant sue in vain. *Dryden.*

Course of writing. *Unusual.*
While his thoughts the ling'ring day beguile,
To gentle Arcite let us turn our *style*. *Dryden.*

STYLE of Court, is properly the practice observed by any court in its way of proceeding. *Ayliffe.*—A pointed iron used anciently in writing on tables of wax.—When writing began to be common on tables of wood, covered over with coloured wax, men made use of a sort of bodkin, made of iron, or brass, or bone; which in Latin is called *stylus*:—As to the form of the *style*, it was made sharp like a pointed needle at one end, to write withal; and the other end blunt and broad, to scratch out what was written, and not approved of, to be amended; so that "vertere stylum," i. e. to turn the *style*, signifies, in Latin, to blot out. *Massey.*—Any thing with a sharp point, as a graver; the pin of a dial.—Placing two *stiles* or needles of the same steel, touched with the same loadstone, when the one is removed but half a span, the other would stand like Hercules's pillars. *Brown.*—The stalk which rises from amid the leaves of a flower.

flower.—*Style* is the middle prominent part of the flower of a plant, which adheres to the fruit or seed: 'tis usually slender and long, whence it has its name. *Quincey*.

To *STYLE*, *v. a.* To call; to term; to name.—The Chancellor of the Exchequer they had no mind should be *style* a knight. *Clarendon*.

STYLE, in Chronology, denotes a particular manner of accounting time, with regard to the retrenchment of ten days from the calendar, in the reformation made of it under Pope Gregory XIII. See *CALENDAR*.

STYLE is either *old* or *new*.

STYLE, Old, is the Julian manner of computing, which obtains in some Protestant states, who refused to admit of the reformation.

STYLE, New, is the Gregorian manner, followed by the Catholics, and others, in consequence of that reformation.

The Julian, or old style, agrees with the Julian year, which contains 365^d 6^h.

The Gregorian, or new style, agrees with the true solar year, which contains only 365^d 5^h 48^m 45^s.

STYLEMAN POINT, the north-west point of Port Snerdisham, on the west coast of North America. Lat. 57. 53. N. long. 226. 22. E.

STYLEPHORUS, in Ichthyology, a genus of fishes of the order Apodes. The Generic Character is as follows: The eyes are pedunculated, standing on a short, thick cylinder; the snout is lengthened, directed upwards, retractile towards the head by means of a membrane; the mouth is without teeth; it has three pair of gills beneath the throat; the pectoral fins are small; dorsal as long as the back; the caudal short, with spinous rays; the body is very long, and compressed.

This very singular genus, which consists of a single species, was first described in the year 1788, from a specimen at that time introduced into the Leverian museum, and figured in the first volume of the Linnæan Transactions.

Stylephorus chordatus, or silvery stylephorus.—The head of this extraordinary animal bears a distant resemblance to that of the genus *SYNGNATHUS*; which see. The rostrum or narrow part, which is terminated by the mouth, is connected to the back of the head by a flexible leathery duplicature, which permits it to be either extended in such a manner that the mouth points directly upwards, or to fall back, so as to be received into a sort of case formed by the upper part of the head. The eyes are placed at the top of the head: these are of a form very nearly approaching to those of the genus *Cancer*, except that the columns or parts on which each eye is placed are much broader or thicker than in that genus; they are also placed close together, and the outward surface of the eye, when magnified, does not show the least appearance of a reticulated structure. The colour of the eyes, as well as of the columns on which they stand, is a clear chestnut-brown, with a sort of coppery gloss. Below the head, on each side, is a considerable compressed semicircular space, the fore-part of which is bounded by the covering of the gills, which covering seems to consist of a single membrane, of a moderately strong nature. Beneath, on each side, are three small pair of branchiæ. The body is extremely long, and compressed very much, and gradually diminishes as it approaches to the tail, which terminates in a string or process of an enormous length, and finishes in a very fine point. This string, or caudal process, is strengthened throughout its whole length, or at least as far as the eye can trace it, by a sort of double fibre or internal part. The pectoral fins are very small, and situated almost immediately behind the cavity, on each side the thorax. The dorsal fin, which is thin and soft, runs from the head to within about an inch and a half of the tail, when it seems suddenly to terminate; perhaps, in the living animal, it may proceed quite to the tail. From this point commences a smaller fin, which constitutes part of the caudal one. The caudal fin is furnished with five remarkable spines, the roots or originations of which may be traced to some depth in the thin part of the tail. The general colour of this fish is a

rich silver, except on the flexible part belonging to the rostrum, which is of a deep brown: the fins and caudal process are also brown, but not so deep as the part just mentioned. There is no appearance of scales on this fish. It was from the singular figure and situation of the eyes, that it was named the *Stylephorus*; the name *chordatus* was taken from the extraordinary thread-like process of the tail. It is a native of the West Indian seas, and was taken between Cuba and Martinico, near a small cluster of little islands about nine leagues from shore, where it was observed swimming near the surface. The whole length of this uncommon fish, from the head to the extremity of the caudal process, is about thirty-two inches, of which the process itself measures twenty-two.

STYLIDÆ, in Botany, a natural order, established by Mr. R. Brown, Prodr. Nov. Holl. and named from its principal genus. See *STYLIDIUM*.

STYLIDIUM [so called by Sir J. E. Smith], in Botany, a genus of the class gynandria, order diandria, natural order campanulaceæ (*Juss.*)—Generic Character. Calyx: perianth superior, of one leaf, in two deeply separated lips, one divided, the other three-cleft, permanent. Corolla, of one petal; tube cylindrical, various in length, often crowned with glands; limb in five unequal, ovate-oblong, spreading segments, one of them a kind of lip, much smaller than the rest, and usually deflexed, mostly accompanied with a small appendage, on each side, at the base. Stamina: column linear, longer than the limb, approximated to the lip, curved and recurved, irritable underneath, flying over to the other side of the flower when touched, its summit then becoming deflexed; anthers sessile at the top, of two vertical lobes, subsequently greatly divaricated, bursting longitudinally. Pistil: germen inferior, roundish-ovate; style none, except the column; stigma between the anthers, and at first covered by them, afterwards rather prominent, obtuse, undivided. Pericarp: capsule ovate-oblong, or linear, of two cells and two valves, with a parallel incomplete partition. Seeds: numerous, small.—*Essential Character*. Calyx two-lipped, superior. Corolla tubular, five-cleft. Stigma undivided, between the anthers. Capsule incompletely two-celled.

This is chiefly a New Holland genus, and highly remarkable for the irritability of the column in every species, as far as has been observed. That part, when touched underneath, at its outer curvature, flies over, by a sudden spring, to the opposite side of the flower, thus scattering the pollen, with force, upon the stigma. No flower can be more truly gynandrous, than *Stylidium*.

1. *Stylidium pilosum*, or hairy-stalked stylidium.—Stalk somewhat branched, clothed with glandular hairs. Leaves flat, lanceolate-swordshaped.—Native of the south part of New Holland.

2. *Stylidium armeria*, or thrift-leaved stylidium.—Leaves linear-sword-shaped, entire. Stalk smooth. Cluster simple, downy. Lip without an appendage.—Found by Labillardiere at Cape Van Diemen.

3. *Stylidium graminifolium*, or grass-leaved stylidium.—Leaves linear, finely toothed. Flowers nearly spiked. Whole flower-stalk hairy. Lip with appendages at the base.—Native of the neighbourhood of Port Jackson, New Holland.

4. *Stylidium lineare*, or linear stylidium.—Leaves thread-shaped, compressed, minutely toothed. Cluster simple. Partial flower-stalks nearly as long as the germen. Common stalk smooth, slender. Lip with appendages at the base.—Found near Port Jackson.

5. *Stylidium luteum*, or yellow stylidium.—Stalk smooth, without a joint. Bractees whorled below; scattered and distant above.—Leaves radical, linear. Calyx-lips rather gibbous at the base. Mouth of the corolla crowned; its lip without appendages.—Gathered by Mr. Brown, on the south coast of New Holland.

6. *Stylidium scandens*, or climbing stylidium.—Stem climbing. Leaves linear, tipped with a spiral tendril. Mouth of the corolla crowned; lip with appendages. Column

lumn downy in the upper part.—Found on the south-west coast of New Holland.

7. *Stylidium tenuifolium*, or slender-leaved stylidium.—Leaves linear, almost setaceous, sessile, slightly hairy. Mouth of the corolla naked; lip with appendages.—Found at Port Jackson.

8. *Stylidium calcaratum*, or spurred stylidium.—Stem with few flowers. Leaves oval. Mouth of the corolla naked; segments somewhat toothed; lip without appendages.—Discovered on the south coast of New Holland.

9. *Stylidium alsinoides*, or chickweed stylidium.—Stem erect. Leaves ovate; the floral ones opposite. Flowers axillary, sessile, solitary, without bracteas.—Gathered in the tropical part of New Holland.

STYLIFORM, in Anatomy, a process of the temporal bone. See **ANATOMY**.

STYLITES, [*στυλιτης*, Gr. *Sancti Columnares*, or *Pillar Saints*,] in Ecclesiastical History, an appellation given to a kind of solitaries, who stood motionless upon the tops of pillars, raised for this exercise of their patience, and remained there for several years, amidst the admiration and applause of the stupid populace.

STYLOBATION, or **STYLOBATA**, in Architecture, the same with the pedestal of a column.

STYLOCORYNA [so named by Cavanilles, from *στυλος*, a style, and *κερυνη*, a club, because of the club-shaped figure of that organ], in Botany, a genus of the class pentandria, order monogynia, natural order rubiaceæ (*Juss.*)—Generic Character. Calyx: perianth superior, of one leaf, tubular, with five teeth, permanent. Corolla, of one petal, funnel-shaped; tube thrice as long as the calyx; limb in five segments. Stamina: filaments five. Pistil: germen inferior, globose; style club-shaped, as long as the stamens; stigma simple, acute. Pericarp: berry spherical, pulpy, of two cells; seeds numerous.—*Essential Character*. Corolla funnel-shaped. Berry of two cells. Stigma simple.

Stylocoryna racemosa, or clustered stylocoryna.—This is a small tree, whose trunk is twelve feet, or more, in height, with a grey bark, and an ample tuft of branches. Leaves opposite, stalked, elliptic-lanceolate, pointed entire. Footstalks about half an inch in length, combined and clasping the stem at their base. Calyx smooth. Corolla yellowish-white, hairy in the throat. Berry smooth, the size of a small pea.

STYLOID, from the Latin *stylus*, an instrument employed by the ancients in writing on their tablets, a name applied to some bony processes, and parts connected with them. The styloid process of the temporal bone is the most remarkable of these: there is also such a process belonging to the radius and ulna. The styloid ligament is the slender thread passing from the styloid process of the temporal bone to the os hyoides.

STYLO-GLOSSUS, a muscle of the tongue. See **DEGLUTITION**.

STYLOSANTHES [a name composed of *στυλος*, a column, and *ανθος*, a flower, and applied by Professor Swartz to the present genus, because the style, inclosed in the tube of the calyx, elevates the corolla above the bracteas], in Botany, a genus of the class diadelphia, order decandria, natural order of papilionaceæ leguminosæ (*Juss.*)—Generic Character. Calyx: perianth inferior, of one leaf; tube very long, bearing the corolla and stamens: limb small, in five deep unequal segments; the two hinder ones converging; two lateral ones obtuse; the foremost lanceolate, pointed, longer than the rest. Corolla, papilionaceous. Stamina: filaments ten, all combined in the lower part, separate above; anthers oblong. Pistil: germen oblong; style vertical, very long, running through the tube into the corolla, inclosed in the keel with the stamens; stigma lobed, downy. Pericarp: legume rather compressed. Seeds oblong.—*Essential Character*. Calyx tubular, very long, bearing the papilionaceous corolla. Germen below the corolla. Legume of one or two joints, hooked at the point.

1. *Stylosanthes procumbens*, or procumbent stylosanthes.—The **HEDYSARUM HAMATUM** of Linnæus; which see.

2. *Stylosanthes viscosa*, or clammy stylosanthes. A variety of **HEDYSARUM HAMATUM**; which see.

3. *Stylosanthes mucronata*, or pointed downy stylosanthes.—Leaflets elliptic-oblong, fringed; rather hairy beneath. Spikes many-flowered. Bracteas fringed. Stem finely downy.—Native of dry situations in Ceylon and Tranquebar.

4. *Stylosanthes elatior*, or taller stylosanthes.—The **TRIFOLIUM BIFLORUM** of Linnæus; which see.

5. *Stylosanthes Guianensis*, or Guiana stylosanthes.—Leaves lanceolate, pointed. Spikes capitate, many-flowered, villous. Stem erect, branched, hairy all round.—Found by Aublet, in Guiana: flowering in June.

STYLUS, the style of flowers, is the part serving to elevate the stigma above the Germen. See the article **BOTANY**.

STYMMATA [*στυμφω*, Gr., *I thicken*], a word used by some of the ancients, to express the stiff ointments.

STYMPHALIA [*στυμφαλια*, Gr.], in Antiquity, a festival at Stymphalus in Arcadia, in honour of Diana, called from that place *Stymphalia*.

STYMPHALIDES AVES, birds of an extraordinary size, which, in their flight, are said to have obscured the sun, and fed on human flesh.

STYNSFORD, a parish of England, in Dorsetshire; 1 mile east-north-east of Dorchester.

STYPANDRA, in Botany. [A New Holland genus of Mr. Brown's, named from *στυπη*, low, or any similar substance, and *ανηρ*, a man, because the filaments are densely bearded or tufted on their upper part.] It is of the class hexandria, order monogynia, natural order coronariæ, asphodeli (*Juss.*)

Mr. Brown thinks this genus may possibly hereafter be divided; its first section being most akin to *dianella*, the second to *anthericum*.

STYPHELIA [so named by Dr. Solander, from *στυφελος*, hard and rigid, alluding to the habit of all the species], in Botany, a genus of the class pentandria, order monogynia, natural order epacridæ (*Brown.*)—Generic Character.—Calyx: perianth inferior, of five, equal, erect, lanceolate leaves, with four, or more, smaller, imbricated scales at the base, permanent. Corolla of one petal, tubular, elongated; tube nearly cylindrical, with five tufts of hairs near the base withinside; limb in five deep, revolute, equal segments, bearded on the upper side. Nectary of five glands at the base of the germen. Stamina: filaments five, thread-shaped, equal, inserted into the tube, and projecting beyond its orifice; anthers incumbent, oblong, of one cell, bursting lengthwise. Pistil: germen superior, roundish, furrowed, style thread-shaped, longer than the stamens; stigma obtuse, notched. Pericarp: drupa but slightly succulent, oval or globular. Seed: nut hard and solid, of five cells, with a pendulous kernel in each.—*Essential Character*. Outer calyx of four, or more, imbricated scales. Corolla tubular, elongated, with five internal tufts of hairs near the bottom; limb revolute, bearded. Filaments prominent. Drupa rather dry, of five cells.

Mr. Brown; in consideration of the vast extent of the original genus *stypheia* in New Holland, has separated therefrom several genera. The only real *Stypheia*'s that remain to be described are therefore

1. *Stypheia longifolia*, or long-leaved stypheia.—Leaves lanceolate, elongated, taper-pointed, smooth-edged; rather concave on the upper side. Branches downy.—A native of the country near Port Jackson.

2. *Stypheia læta*, or gay stypheia.—Leaves elliptic-oblong, imbricated, glaucous, rough-edged, nearly flat, shorter than the flowers. Branches downy. Stem erect.—Gathered near Port Jackson.

3. *Stypheia adscendens*, or diffuse stypheia.—Leaves lanceolate, flat; glaucous and manifestly striated beneath; rough, with a tooth-like fringe at the margin. Stem diffuse, with ascending branches.—Gathered in Van Dieman's island.

4. *Stypheia latifolia*, or broad-leaved stypheia.—Leaves broad-ovate,

broad-ovate, acute, imbricated, rough-edged; rather concave above. Flowers almost erect.—Found near Port Jackson.

5. *Styphelia viridiflora*, or green-flowered styphelia.—Leaves obovate-oblong, flat, obtuse, with a spinous point; smooth and even above; minutely roughish at the margin; spreading widely as well as the solitary flowers.—Found near Port Jackson.

6. *Styphelia triflora*, or three-flowered styphelia.—Leaves elliptic-lanceolate, flat, smooth in every part, rather glaucous. Branches smooth. Flowers approximated, from one to three on each stalk.—Native of the country near Port Jackson.

7. *Styphelia tubiflora*, or crimson styphelia.—Leaves linear-obovate, slightly revolute; convex and roughish above. Flowers drooping.—Communicated in a dry state, with coloured drawings, from the neighbourhood of Port Jackson.

STYPTIC, or STYPTICAL, *adj.* [*στυπτικός*, Gr.; *styptique*, Fr. This is erroneously written *stiptic*.] The same as astringent; but generally it expresses the most efficacious sort of astringents, or those which are applied to stop hæmorrhages.—Fruits of trees and shrubs contain plegm, oil, and an essential salt, by which they are sharp, sweet, sour, or *styptick*. *Arbutinot*.

STYPTICITY, *s.* [*stypticité*, old Fr.] The power of staunching blood.—Catharticks of mercurials precipitate the viscidities by their *stypticity*, and mix with all animal acids. *Floyer*.

STYPTICK, *s.* An astringent medicine; a medicine applied to stop hæmorrhages.—In an effusion of blood, having dossils ready dipt in the royal *stiptick*, we applied them. *Wiseman*.

STYRAP, or STYRRUP, a township of England, in Nottinghamshire; $3\frac{1}{2}$ miles west-south-west of Bawtry.

STYRAX [*Στυραξ* of Theophrastus and Dioscorides.] in Botany, a genus of the class *decandria*, order *monogynia*, natural order of *bicornes*, *guaicanae* (*Juss.*)—Generic Character. Calyx: perianth one-leaved, cylindric, erect, short, five-toothed. Corolla: one-petalled, funnel-form; tube short, cylindric, length of the calyx; border five-parted, large, spreading; segments lanceolate, obtuse. Stamina: filaments ten, erect, in a ring, scarcely united at the base, awl-shaped, inserted into the corolla; anthers oblong, straight. Pistil: germ superior, three-celled, many-seeded; style simple, length of the stamens; stigma truncate. Pericarp: drupe roundish, one-celled. Seeds: nuts one or two, roundish, acuminate, convex on one side, flat on the other; number of stamens varies, but the natural number is ten.—*Essential Character*. Calyx inferior. Corolla funnel-form. Drupe two-seeded.

1. *Styrax officinale*, or officinal storax.—The officinal Storax-tree rises twelve or fourteen feet high: the trunk is covered with a smooth grayish bark, and sends out many slender branches on every side. Leaves about two inches long, and an inch and half broad, of a bright green on their upper side, but hoary on their under; they are entire, and placed alternately on short footstalks. The flowers come out from the side of the branches, upon peduncles sustaining five or six flowers in a bunch; they are white, and appear in June.—Native of Italy and the Levant.

Although the Storax-tree is indigenous to many of the southern parts of Europe, yet the resinous drug which it produces is only to be obtained in perfection from Asiatic Turkey.

2. *Styrax grandifolium*, or large-leaved storax.—Leaves obovate, villous beneath; lower peduncles, axillary, solitary, one-flowered.—Native of South Carolina.

3. *Styrax benzoin*, benzoin storax, or Benjamin-tree.—Leaves oblong, acuminate, tomentose beneath; racemes compound length of the leaves.—The Benzoin, or as it is corruptly called, the Benjamin-tree, is of quick growth, and rises to a considerable height: it sends off many strong round branches, which are covered with a tomentose or whitish downy bark.

This tree is deemed in Sumatra, which is its native country,

to be of sufficient age in six years, or when the trunk is about seven or eight inches in diameter, to afford the Benzoin: the bark is then cut through longitudinally, or somewhat obliquely, at the origin of the principal lower branches, from which the drug exudes in a liquid state, and by exposure to the sun and air soon concretes, when it is scraped off from the bark with a knife or chissel. The quantity which one tree affords never exceeds three pounds; nor are the trees found to sustain the effects of these annual incisions longer than ten or twelve years. The Benzoin which issues first from the wounded bark is the purest, being soft, extremely fragrant, and very white; that which is less esteemed, is of a brownish colour, very hard, and mixed with various impurities.—In Arabia, Persia, and other parts of the East the coarser sort is consumed in fumigating and perfuming the temples, and in destroying insects.

4. *Styrax lavigatum*, or smooth storax.—Leaves oblong, smooth on both sides; peduncles axillary, one-flowered, solitary, or two together.—Native of South Carolina.

Propagation and Culture.—It may be propagated by sowing the seeds in pots filled with fresh light earth, and plunged into a moderate hot-bed. This should be done as soon as possible when the seeds are procured, for if they are sown the latter end of summer, and the pots kept in a moderate hot-bed of tanner's bark all the winter, the plants will come up the succeeding spring; whereas those sown in the spring, often remain in the ground a whole year before the plants come up.

STYRIA, a large province of the Austrian empire, situated between Austria proper and Illyria, and extending from 45. 54. to 47. 50. N. lat. Its form would be nearly square, did it comprize Carinthia, a province situated to the south-west. Its extent, equal to about one-fourth of Scotland, is computed at 8500 square miles; its population, which, without being dense, is less thinly scattered than that of the northern part of Britain, is about 840,000. Its divisions are into Upper Styria towards the north, and Lower Styria towards the south. The former is subdivided into the circles of Judenburg and Bruck; the latter into those of Gratz, Marburg, and Cillej. Upper Styria is very mountainous, consisting in a great measure of a continuation of a branch of the Alps, which, after extending eastward through Switzerland, Tyrol, and Saltzburg, enter Styria at its western boundary, and continue their eastward direction throughout its whole extent. This range rises in various parts to the height of 7000, 8000, and 9000 feet, presenting several points covered with perpetual snow. A number of lateral ramifications extend into Lower Styria, but become gradually lower as they remove from the main chain, till they present nothing but small elevations, on the sides of which the vine is cultivated with success. The plains, however, even here, are not extensive, if we except that of Pettau, lying along the banks of the Drave.

Styria abounds in physical phenomena. Natural excavations, sometimes of great extent, are found in the elevated districts; and some naturalists have imagined that one or two mountains presented volcanic appearances. The rivers are numerous, but seldom navigable: the principal are the Enns, the Muhr, the Drave, and the Save. The climate of Styria, presents great discrepancies, arising chiefly from the greater or less elevation of the soil. In Upper Styria the air is elastic and pure, but cold. Winter commonly begins in November, and the snow lies on the hills till May. In Lower Styria the climate is much more temperate; the mountains shelter it from the north winds, but leave it open to the west. But though the air is in general of great purity, endemic fevers prevail in particular situations, and the constitutional imbecility or idiocy, called Cretinism, is very common in the mountains. The quantity of rain is less than might be expected, not exceeding 15 inches in the year. The soil of Styria is, with the exception of the higher mountains, in general fertile, and produces wheat, barley, oats, rye, and in the warmer situations, maize. The potatoe, though introduced so lately as the middle of the 18th century, is now become general. Agriculture is extremely backward, though irrigation

tion is practised extensively; a course necessary in a country of great summer heat, and facilitated by the command of water from the high grounds.

Styria has long been remarkable for the care bestowed on its cattle. They are in general of middle size, but well shaped. They are driven in summer to the highest parts of the mountains, where after passing the warm season, they return to the plains in autumn. Stall feeding is practised here, as in Bavaria and the rest of the south of Germany. In sheep, at least in the improvement of wool, the Styrians have not yet succeeded, and their horses are fitter for draught than for the saddle. Poultry is abundant, and is sent in quantities to Vienna.

Minerals.—Styria produces abundance of minerals. Coal is found in many places, and mines of it are wrought in several; but it is at present less used in mines and forges than it is likely to be when the forests shall be diminished. Almost all the metals are found in Styria, but in very different quantities; gold, silver, and copper, hardly defray the expense of mining; lead is less scarce; but the great produce is of iron. The mountain of Erzberg, situated in the north of Styria, was well known to the Romans. Instead of veins and strata, it presents a solid mass of ore, which has been wrought without intermission for eleven centuries; and although nearly 13,000 tons of pure iron have been obtained annually from it for a number of years, it hardly appears diminished, and the restriction in the quantity made, arises chiefly from the limited supply of fuel. At the small town of Turroch is a mine producing the celebrated Prescian steel used by the Romans for making sword blades. The other mines, though less rich, are not inconsiderable; and the total annual produce of iron in Styria is from 16,000 to 20,000 tons. Salt is still more abundant, particularly at Ausse, on the borders of Austria proper, from which almost any quantity might be produced, were the demand greater, and were the supply of fuel increased. Cobalt, arsenic, and molybdena, occur in Styria; but zinc, antimony, and bismuth, are rare.

Manufactures and Trade.—Of the manufactures of Styria, the principal are derived from the mines. The country contains in all 200 forges, and about 30 manufacturing establishments, in which it is computed that 300,000 sickles, and a still larger quantity of scythes, are made annually. Next to these come the copper forges, and the various preparations of sulphate of iron, alum, saltpetre, earthenware, gunpowder, and sulphur. These, however, almost complete the list of Styrian manufactures. The flax raised in this country is either made into coarse linen, or exported unwrought. The women are much employed in the fields, and little in spinning. The exports from Styria consist of metals, corn, wine, flax, clover seed, cattle; the imports, less bulky, but not less varied, comprise woollens, linens, silks, tobacco, oil, and groceries of all kinds.

The Styrians have the hospitality, the frankness, the simple habits of an agricultural people, but they are as yet very imperfectly educated, though parish schools have been established in the principal villages. As to religion, the great majority are Roman Catholics; the Protestants enjoy a full, the Jews but a limited toleration. In regard to government, like almost all nations of northern origin, the Styrians have a parliament under the name of States, composed of four orders—the higher clergy, the nobility, the deputies from the landholders, and the deputies from the towns.

History.—Our first accounts of this province are from Pliny and Strabo, who considered its inhabitants as descended from the Boii and Taurisci. They are described as completely uncivilized, and as harassing the adjoining provinces by their incursions, till the reign of Tiberius, (A.D. 8.) when Styria was subdued, and included in the extensive province of Noricum. During the period of its remaining in the hands of the Romans, considerable improvements took place, towns being built at the more important stations, tillage diffused throughout the country, and in the 4th century Christianity introduced. But this pleasing prospect was overcast by the irruption of the northern hordes; and Styria

was almost as unfortunate in repeated invasions as the adjoining provinces of Illyria and Pannonia. In the reign of Charlemagne, a tribe of barbarians submitting to his arms, fixed themselves on the banks of the Drave, the Save, and the Muhr; and from these are descended the Wends, now found in these districts. History records an invasion of southern Germany by the Magyars, the conquerors of Hungary and their expulsion from the limits of empire by Otho I. in 933. The reconquered territory was divided into a number of principalities, one of which called the county of Steyr, rose by gradual and successive augmentations to its present extent; its rulers obtaining the title of Margraves, and afterwards of Dukes. In 1172 it was annexed to Austria, and has since been governed either by the sovereign of that country, or by a member of his family.

STYRUM, a village and castle in the Prussian states, near the Rhine, on the Roer; 4 miles east-north-east of Duisburg. It gives title to a family which has borne a conspicuous part in the history of the Netherlands, and whose representative was active in the counter-revolution of Holland in 1814.

To STY' THY, *v. a.* See To STITHY.

STYX, in Mythology, a river of Hell, or Aëthra, over which was the passage called the hateful passage, from the previous region or suburbs of the realms of death into Erebus.

The Styx is properly a fountain in Arcadia, which flows from a rock, and then forms a stream, that continues for a long time buried under ground; its water was mortal, and this circumstance, according to Pausanias, gave occasion to the poets to make it a river or lake in hell.

SUABIA, the former name of one of the ten circles or great divisions of Germany. This country, situated in the south-west of the empire, was bounded on the west by France, on the south by Switzerland, the Rhine forming the limit between it and both. The population of Suabia has long exceeded 2,500,000; and its soil, with the exception of the rugged and mountainous track called the Black Forest, is in general fertile, yielding wheat, barley, oats, hemp, flax, and, in warm situations, vines. The pasturages also are extensive and good. Of the mountainous parts, the wealth consists in mines and timber, which is floated down the Neckar and Rhine to Holland.

Suabia is supposed to have derived its name from the Suevi, a German tribe who settled here about the time of Julius Cæsar. It was erected into a dukedom by the Franks in the fifth century, and continued to be thus governed until the thirteenth, when the reigning family became extinct. After the extinction of the ducal title, Suabia did not constitute, like Saxony or Bavaria, a single state, but was divided among a number of petty princes. Austria possessed here a territory, or rather several separate districts, containing in all a population of 170,000; but these have been renounced or exchanged. The Bavarian dominions at present extend over a part of the east of Suabia, but the chief part of the circle forms the kingdom of Wirtemberg and the grand duchy of Baden. A smaller portion is subject to the princes of Hohenzollern. See under their respective heads these territories, which now form the only independent governments in Suabia.

SUACHA, a settlement of New Granada, in South America; 9 miles south of Santa Fé, containing 100 houses.

To SUADE, *v. a.* [*suader*, old Fr.; *suadeo*, Lat.] To persuade. *Not in use.*—Flee then ill-swading Pleasure's baits untrue. *Grimoald.*

To SUAGE, *v. a.* To assuage. See To SWAGE.—*Suage* the tempestes. *Bp. Fisher.*

SUAITA, a settlement of New Granada, in South America, in the province of Velez.

SUAKIN, a sea-port town of Nubia, on the western coast of the Red Sea. The Turks obtained possession of it at the same time that they occupied the opposite coast of Arabia. They still retain it, but their power is circumscribed within the limits of the island on which the town is situated, and they dare not even set foot on the mainland. In the 15th century Suakin was a place of great wealth and importance,

the emporium of the Red sea, and one of the richest cities of the east. De Castro at that time considered it superior to every other city he had seen, except Lisbon. Since that time it has suffered an extreme decline, and is now almost in ruins. Instead of numerous ships unloading their cargoes on every side of the island into the houses of the merchants, only a few wretched Arabian vessels called dows, are seen at anchor by the side of some miserable houses. The port, however, still retains all its excellence, and is capable of containing two hundred large vessels, which can anchor close to the island in seven fathoms water. There might also be room for a prodigious number of smaller vessels. The approach, however, is rendered extremely dangerous by the rocks and shoals which lie off it in every direction; and the mouth is so narrow, as to render it impracticable to enter with any but the most favourable wind. It appears singular, that this narrow passage between coral rocks should have remained open for so long a period, amid the action of a sea continually breaking upon it, after having passed over sand-banks, and notwithstanding the clouds of sand which at one season were borne towards it from the desert. Two minarets give the town a handsome appearance at a distance; and the buildings being white washed, and on an elevated site, look much better than they really are. Suakin is supposed to be the Soter Limen of Diodorus, the Theon Soter of Ptolemy, though the difficulty of the entrance scarcely corresponds to these terms, which signify "the safe harbour." Its importance in the middle ages was derived from its being the maritime capital of the Turks in the Red Sea, where that empire maintained then a powerful navy. Since their power on the Arabian coasts has sunk into insignificance, Suakin has lost all political importance. It is supported only by being still the channel by which communication is maintained between Arabia and the interior of Africa. Pilgrims, slave dealers, or persons combining both these characters, quit the Nile at Shendi, and proceed through Taka and other districts of Nubia, to this port, where they embark for Jidda. They bring chiefly slaves, with a little ivory and gold, and take Indian goods in return. The natives have fine figures, and a good expression of countenance. They are of a dark copper colour, their hair is somewhat woolly, drawn out into points, and dressed with fat, occasionally powdered with red; a piece of wood is stuck through it nearly horizontally, which they frequently use to disturb any animalcules that bite too hard. They also employ it to separate the hair into ringlets, and turn it round the finger. They are on the whole a well looking race of people, and their skins are perfectly free from any eruption. There appears a striking resemblance between them and the South Sea islanders, as drawn in Captain Cook's voyages. They have a species of wood, with which they constantly clean their teeth, which are beautifully white and regular. Their head is uncovered, being only protected by the mass of greased woolly hair, and they wear a piece of white cloth wrapped round the middle, and thrown over the shoulder. The country round, and the coast to a considerable extent, are occupied by a hardy race of Bedouin Arabs, called Suakini. The water here is abundant and good, being preserved both in wells and tanks. Fish is cheap and plentiful; the mullets are particularly fine. Sheep may be had for a dollar each, but fowls are scarce and dear. There is no grain except that coarse species called dhourra or jowarry. Lat. 19. 48. N. long. 37. 33. E.

SUAN, a town of Hindostan, province of Bahar, and district of Rotas. Lat. 25. 15. N. long. 86. 25. E.

SVANEHOLM, a large village in the south of Sweden, province of Malmohus, with 1100 inhabitants.

SUAN-YANG, a town of Corea; 35 miles west of Tsin-tchuen,

SUAPURE, a river of Guiana, which collecting the waters of many other rivers, enters the Orinoco, opposite the rapid stream of the Marumarota.

SUAREZ (Francis), a Spanish theologian, was born at Granada in the year 1548. He was at an early age distinguished by an extraordinary memory, though his other

faculties arrived very gradually at maturity. Having been admitted into the society of Jesuits, he became a professor in the society's schools at Alcalá, Salamanca, and Rome, and at length was appointed first professor of theology at Coimbra. He died at Lisbon in 1617. His indefatigable industry may be inferred from the twenty-three folio volumes of his works, which have been printed at Lyons, at Mentz, and in the year 1748, at Venice. The principal subject of these voluminous publications, is theology. Suarez is accounted the principal author of the system denominated "Congruism," fundamentally that of Molina; by which he attempts to explain, from a simultaneous concurrence of the divine and human being, how grace infallibly produces its effect, without destroying man's free will. Suarez, being a well-known master of controversy, was desired by pope Paul V. to undertake the defence of the Catholic faith in England, where many of that communion took the oath of allegiance required by James I. His book was entitled, "A Defence of the Catholic Faith against the Errors of the English Sect." In discussing the legality of the oath demanded, the principles which he maintained were those of the civil as well as the ecclesiastical supremacy of the papal see. These gave such offence to James, that he ordered the book to be burnt in front of St. Paul's church, and prohibited it to be read in his dominions. The parliament of Paris also caused the book to be burnt, as containing seditious tenets.

SUA'SIBLE, *adj.* [from *suadeo*, Lat.] Easy to be persuaded.

SUA'SION, *s.* [*suasion*, old Fr., *suasio*, Lat.] Persuasion; enticement.—But it [temptation] is devilish, when it is either by *suasion* unto that which is evil; — or with a design to entrap or draw any into danger. *Bp. Hopkins.*—Mere petition, or precarious *suasion*. *South.*

SUA'SIVE, *adj.* [from *suadco*, Lat.] Having power to persuade.—It had the passions in perfect subjection; and though its command over them was but *suasive* and political, yet it had the force of absolute and despotic. *South.*

SUA'SORY, *adj.* [*suasorius*, Lat., *suasoire*, Fr.] Having tendency to persuade.—There is a *suasory* or enticing temptation, that inclines the will and affections to close with what is represented to them. *Bp. Hopkins.*

SUA'VITY, *s.* [*suavitè*, Fr., *suavitas*, Lat.] Sweetness to the senses.—She desired them for rarity, pulchritude, and *suavity*. *Brown.*

Mild-smiling Cupid's there,
With lively looks, and amorous *suavity*. *Morc.*

Sweetness to the mind.—That goes no farther than to some *suavities* and pleasant fancies within ourselves. *Glanville.*

SUATA, a settlement of New Granada, in the province of Tunja, which contains 1000 houses; 70 miles north of Tunja.

SUAZA, a river of New Granada, in the province of Neiva, which runs west, and enters the Magdalena, opposite the city of La Plata.

SUAZO, one of the large villages, or rather towns, which adjoin the city of Cadiz, in Spain. It stands on the east-side of the river St. Peter, at the extremity of the bridge of Suazo, which joins the isle of Leon to the mainland.

SUB, in composition, signifies a subordinate degree.

SUBA'CID, *adj.* [*sub* and *acidus*, Lat.] Sour in a small degree.—The juice of the stem is like the chyle in the animal body, not sufficiently concocted by circulation, and is commonly *subacid* in all plants. *Arbutnot.*

SUBA'CRID, *adj.* Sharp and pungent in a small degree.—The green choler of a cow tasted sweet, bitter, *subacid*, or a little pungent, and turned syrup of violets green. *Floyer.*

To SUBA'CT *v. a.* [*subactus*, Lat.] To reduce; to subdue.—Tangible bodies have no pleasure in the consort of air, but endeavour to *subact* it into a more dense body. *Bacon.*

SUBA'CTION, *s.* [*subactus*, Lat.] The act of reducing

ducing to any state, as of mixing two bodies completely, or beating any thing to a small powder.—There are of concoction two periods: the one assimilation, or absolute conversion and *subaction*; the other maturation; whereof the former is most conspicuous in living creatures, in which there is an absolute conversion and assimilation of the nourishment into the body. *Bacon*.

SUB'ALTERN, *adj.* [*subalterne*, Fr.] Inferior; subordinate; what in different respects is both superior and inferior. It is used in the army of all officers below a captain.—One, while a *subaltern* officer, was every day complaining against the pride of colonels towards their officers; yet, after he received his commission for a regiment, he confessed the spirit of colonelship was coming fast upon him, and it daily increased to his death. *Swift*.

SUB'ALTERN, *s.* A subaltern officer.

Love's *subalterns*, a duteous band,
Like watchmen round their chief appear;

Each had his lantern in his hand,
And Venus, mask'd, brought up the rear.

Prior.

SUBALTE'RNATE, *adj.* [*subalternus*, Lat.] Succeding by turns. *Dict.*—Subordinate. *Mason*.—Together with all their *subalternate* and several kinds. *Evelyn*.

SUBALTERNA'TION, *s.* Act of succeeding by course. *Bullock*.—State of inferiority; state of being in subjection to another.—Woman was created for man's sake to be his helper, in regard to the having and bringing up of children, whereunto it was not possible they could concur, unless there were *subalternation* between them, which *subalternation* is naturally grounded upon inequality, because things equal in every respect are never willingly directed one by another. *Hooker*.

SUBA'QUEOUS, *adj.* [*sub* and *aqua*, Lat.] Lying under water.—All plants, except the *subaqueous*, grow in a mixed earth, moistened with rain and dew, and exposed to the atmosphere. *Kirwan*.

SUBARKAN, a village of Diarbekir, in Asiatic Turkey, on the Euphrates; 75 miles east-south-east of Kerkesieh.

SUBARRA'TION, *s.* [low Lat. *subarrare*, "arrhabone uxorem sibi desponsare." *Du Cange*.] The ancient custom of betrothing.—In the old manual for the use of Salisbury, before the minister proceeds to the marriage, he is directed to ask for the woman's dowry, viz., the tokens of spousage: and by these tokens of spousage are to be understood rings, or money, or some other things to be given to the woman by the man; which said giving is called *subarration*, (i. e. wedding or covenanting), especially when it is done by the giving of a ring. *Wheatly*.

SUBASTRI'NGENT, *adj.* Astringent in a small degree.

SUBBE'ADLE, *s.* An under beadle.—They ought not to execute those precepts by simple messengers, or *subbeadles*, but in their own persons. *Ayliffe*.

SUBBULGHUR, a town and fortress of Hindostan, province of Agra, district of Gohd, but subject to the Mahrattas. It is surrounded by a good stone wall, with a number of bastions, but has very few cannon mounted. The country in the vicinity is well cultivated. Lat. 26. 22. N. long. 75. 25. N.

SUBBULGHUR, a town of Hindostan, province of Delhi, situated on the eastern side of the Ganges, and now included in the district of Moradabad. It formerly possessed a stone fort, which is now in a ruinous state; but the town is improving since it came under the British authority. Lat. 29. 48. N. long. 78. 10. E.

SUBCELE'STIAL, *adj.* Placed beneath the heavens.—The most refined glories of *subcelestial* excellencies are but more faint resemblances of these. *Glanville*.

SUBCHA'NTER, *s.* [*succentor*, Lat.] The deputy of the precentor in a cathedral.

That Holy, Holy, Holy, which they cry,

That are *sub-chanters* of heaven's harmony.

Davies.

SUBCLA'VIAN, *adj.* [Lat.] Applied to any thing

under the armpit or shoulder, whether artery, nerve, vein, or muscle. *Quincy*.—The liver, though seated on the right side, yet, by the *subclavian* division, doth equi-distantly communicate its activity unto either arm. *Brown*.

SUBCOMMITTEE, *s.* A subordinate committee.—Their sequestrators and *subcommittees* [were] men for the most part of insatiable hands. *Milton*.

SUBCONSTELLA'TION, *s.* A subordinate or secondary constellation.—As to the picture of the seven stars, if thereby be meant the Pleiades, or *subconstellations* upon the back of Taurus, with what congruity they are described in a clear night an ordinary eye may discover. *Brown*.

SUBCONTRACTED, *part. adj.* Contracted after a former contract.

Your claim,

I bar it in the interest of my wife;

'Tis she is *subcontracted* to this lord,

And I her husband contradict your banns.

Shakspear.

SUBCONTRARY, *adj.* Contrary in an inferior degree.—If two particular propositions differ in quality, they are *subcontraries*: as, some vine is a tree; some vine is not a tree. These may be both true together, but they can never be both false. *Watts*.

SUBCUTA'NEOUS, *adj.* Lying under the skin.

SUBDE'ACON, *s.* [*subdiaconus*, Lat.] In the Romish church they have a *subdeacon*, who is the deacon's servant. *Ayliffe*.

SUBDE'ACONRY, or SUBDE'ACONSHIP, *s.* The Romish order and office of a subdeacon.—Ye come to be promoted here to the holy order of *subdeconrie*. *Martin*.

SUBDE'AN, *s.* [*subdecanus*, Lat.] The vicegerent of a dean.—Whenever the dean and chapter confirm any act, that such confirmation may be valid, the dean must join in person, and not in the person of a deputy or *subdean* only. *Ayliffe*.

SUBDE'ANERY, *s.* The rank and office of subdean.—The *subdeanery* of York, founded anno 1229, has the impropriation of Preston in Holderness. *Bacon*.

SUBDE'UPLE, *adj.* [*sub* and *decuplus*, Lat.] Containing one part of ten.

SUBDERISO'RIOUS, *adj.* [*sub* and *derisor*, Lat.] Scoffing or ridiculing with tenderness and delicacy. *Not used*.—This *subderisorous* mirth is far from giving any offence to us: it is rather a pleasant condiment of our conversation. *More*.

SUBDITI'TIOUS, *adj.* [*subditiuus*, Lat.] Put secretly in the place of something else.

To SUBDIVE'RSIFY, *v. a.* To diversify again what is already diversified.—The same wool one man felts into a hat, another weaves it into cloth, another into arras; and these variously *subdiversified* according to the fancy of the artificer. *Hale*.

To SUBDIVI'DE, *v. a.* [*subdiviser*, Fr.] To divide a part into yet more parts.—When Brutus and Cassius were overthrown, soon after Antonius and Octavianus brake and *subdivided*. *Bacon*.

SUBDIVI'SION, *s.* [*subdivision*, Fr.] The act of subdividing.—When any of the parts of any idea are farther divided, in order to a clear explication of the whole, this is called a *subdivision*; as when a year is divided into months, each month into days, and each day into hours, which may be farther subdivided into minutes and seconds. *Watts*.—The parts distinguished by a second division.—How can we see such a multitude of souls cast under so many *subdivisions* of misery, without reflecting on the absurdity of a government that sacrifices the happiness of so many reasonable beings to the glory of one? *Addison*.

SUBDO'LOUS, *adj.* [*subdolos*, Lat.] Cunning; subtle; sly.—*Subdulous* and dishonest actions. *Bp. Reynolds*.

SUBDU'ABLE, *adj.* That may be subdued. *Sherwood*.—He hath indeed confessed in a certain place, that he had a natural touch of enthusiasm in his complexion; but such as (he thanks God) was ever governable enough; and which

which he had found at length perfectly *subduable*. *Dr. Ward.*

SUBDU'AL, *s.* The act of subduing.—Good is not only produced by the *subdual* of the passions, but by the turbulent exercise of them. *Warburton.*

To **SUBDU'CE**, or to **SUBDU'CT**, *v. a.* [*subduco, subductus*, Lat.] To withdraw; to take away.

Or nature fail'd me, and left some part
Not proof enough such object to sustain;
Or from my side *subducting*, took perhaps
More than enough.

Milton.

To subtract by arithmetical operation.—Take the other operation of arithmetic, subduction: if out of that supposed infinite multitude of antecedent generations we should *subduce* ten, the residue must be less by ten than it was before, and yet still the quotient must be infinite. *Hale.*

SUBDU'CTION, *s.* The act of taking away. O God, thine arm is strong and mighty; all thy creatures rest themselves upon that, and are comfortably sustained. O that we were not more capable of distrust, than thine omnipotent hand is of weariness and *subduction*! *Bp. Hall.*—Arithmetical subtraction.—Suppose we take the other operation of arithmetick, *subduction*; if out of that infinite multitude of antecedent generations we should subduce ten, the residue must be less by ten than it was before that *subduction*, and yet still the quotient be infinite. *Hale.*

To **SUBDU'E**, *v. a.* [from *subdo*, or *subjugo*, Lat.] To crush; to oppress; to sink; to overpower.

Nothing could have *subdu'd* nature
To such a lowness, but his unkind daughters. *Shakspeare.*

Them that rose up against thee, hast thou *subdu'd* under me. *2 Sam.*

If aught were worthy to *subduc*
The soul of man.

Milton.

To conquer; to reduce under a new dominion.—Be fruitful, and replenish the earth, and *subdue* it. *Gen.*—Augustus Cæsar *subdu'd* Egypt to the Roman empire. *Peacham.*—To tame; to subact; to break.

Nor is't unwholesome to *subdue* the land
By often exercise; and where before
You broke the earth, again to plow.

May.

SUBDU'EMENT, *s.* Conquest. *Not uscd.*

I have seen thee,
As hot as Perseus, spur thy Phrygian steed,
Bravely despising forfeits and *subduements*. *Shakspeare.*

SUBDU'ER, *s.* Conqueror; tamer.
Great God of might, that reigneth in the mind,
And all the body to thy hest dost frame;
Victor of gods, *subducer* of mankind,
That dost the lions and fell tygers tame,
Who can express the glory of thy might?

Spenser.

SUBDU'PLE, or **SUBDU'PLICATE**, *adj.* [*subduplex*, Fr., *sub* and *duplex*, Lat.] Containing one part of two.—The motion generated by the forces in the whole passage of the body or thing through that space, shall be in a *subduplicate* proportion of the forces. *Newton.*

SUBER, in Botany, the ancient Latin name of the Cork Tree, of obscure and doubtful derivation. See **QUERCUS**.

SUBERTHWAITE, or **SOWBERTHWAITE**, a township of England, in Lancashire; 6½ miles north-north-west of Ulveston.

SUBFU'SK, *adj.* [*subfuscus*, Lat.] Of a dark brown colour.—The Portuguese's complexion was a little upon the *subfusk*. *Tatler.*

SUBJA'CENT, *adj.* [*subjacent*, old French; *subjacens*, Lat.] Lying under.—The superficial parts of mountains are washed away by rains, and borne down upon the *subjacent* plains. *Woodward.*

SUBIACO, a small town of the Ecclesiastical State, the capital of a district in the Campagna di Roma. It is situated

on an eminence near the river Teverone, and its early buildings are supposed to have been erected out of the ruins of a villa of Nero; 12 miles north-west of Alatri, and 28 east of Rome.

SUBIBA, CAPE, a cape in the south-east of Spain, on the coast of Murcia. Lat. 37. 30. N. long. 1. 20. W.

To **SUBJE'CT**, *v. a.* [*subjectus*, Latin.] To put under.

The medal bears each form and name:
In one short view, *subjected* to our eye,
Gods, emperors, heroes, sages, beauties lie.

Popc.

To reduce to submission; to make subordinate; to make submissive.

Think not, young warriors, your diminish'd name
Shall lose of lustre, by *subjecting* rage
To the cool dictates of experienc'd age.

Dryden.

To enslave; to make obnoxious.

I see thee, in that fatal hour,
Subjected to the victor's cruel power,
Led hence a slave.

Dryden.

To expose; to make liable.—If the vessels yield, it *subjects* the person to all the inconveniencies of an erroneous circulation. *Arbutnot.*—To submit; to make accountable.—God is not bound to *subject* his ways of operation to the scrutiny of our thoughts, and confine himself to do nothing but what we must comprehend. *Locke.*—To make subservient.—[He] *subjected* to man's service angel-wings. *Milton.*

SUBJECT, *adj.* [*subject*, old Fr., *subjectus*, Lat.] Placed or situated under.

Th' eastern tower,
Whose height commands, as *subject*, all the vale
To see the fight.

Shakspeare.

Living under the dominion of another. Exposed; liable; obnoxious.—Most *subject* is the fittest soil to weeds; *Shakspeare.*—Being that on which any action operates, whether intellectual or material.—I enter into the *subject* matter of my discourse. *Dryden.*

SUBJECT, *s.* [from the old Fr. *subject*, *subgect*, *subgit*. In the 23 Edw. III., and throughout the Rolls of Parliament, we may observe Fr. *subgits*.] One who lives under the dominion of another: opposed to *governor*.

Never *subject* long'd to be a king,
As I do long and wish to be a *subject*. *Shakspeare.*

That on which any operation, either mental or material, is performed.—This *subject* for heroic song pleas'd me. *Milton.*—That in which any thing inheres or exists.—Anger is certainly a kind of baseness, as it appears well in the weakness of those *subjects* in whom it reigns, children, women, old folks, sick folks. *Bacon.*—In Grammar. The nominative case to a verb is called the *subject* of the verb.

SUBJE'CTION, *s.* The act of subduing.—After the conquest of the kingdom and *subjection* of the rebels, enquiry was made who there were that fighting against the king had saved themselves by flight. *Hale.*—[*subjection*, old Fr.] The state of being under government.—Both in *subjection* now to sensual appetite. *Milton.*

SUBJE'CTIVE, *adj.* Relating not to the object, but the subject.—Certainty, according to the schools, is distinguished into objective and *subjective*: objective is when the proposition is certainly true in itself; and *subjective*, when we are certain of the truth of it. *Watts.*

SUBJE'CTIVELY, *adv.* In relation to the subject.—The name of God, taken *subjectively*, is to be understood of Christ. *Pearson.*

SUBINDICA'TION, *s.* [*subindico*, low Lat.] Signification; the act of making known by signs. *Unused.*—The types of Christ served to the *subindication* and shadowing of heavenly things. *Barrow.*

SUBINFEDUATION, in Law, was where the inferior lords, in imitation of their superiors, began to carve out and grant to other minuter estates than their own, to be held of themselves,

themselves, and were so proceeding downwards *in infinitum*, till the superior lords observed, that by this method of subinfeudation they lost all their feodal profits of wardships, marriages, and estreats, which fell into the hands of these mesne or middle lords, who were the immediate superiors of the terre-tenant, or him who occupied the land. This occasioned the statute of *quia emptores*. *Bl. Com.* vol. ii.

SUBINGRESSION, *s.* [*ingressus*, Lat.] Secret entrance. *Unused*.—The pressure of the ambient air is strengthened upon the accession of the air sucked out; which forceth the neighbouring air to a violent *subingression* of its parts. *Boyle*.

To **SUBJOIN**, *v. a.* [*subjungo*, Lat.] To add at the end; to add afterwards.—He makes an excuse from ignorance, the only thing that could take away the fault; namely, that he knew not that he was the high-priest, and *subjoins* a reason. *South*.

SUBITANEOUS, *adj.* [*subitaneus*, Lat.] Sudden; hasty. *Unused*.

SUBITANY, *adj.* [*subitaneus*, Lat.] Hasty; subitaneous. *Unused*.

To **SUBJUGATE**, *v. a.* [*subjuguer*, Fr., *subjugo*, Lat.] To conquer; to subdue; to bring under dominion by force. O fav'rite virgin, that hast warm'd the breast,
Whose sov'reign dictates *subjugate* the east! *Prior*.

SUBJUGATION, *s.* [*subjugation*, Fr. *Cotgrave*.] The act of subduing.—This was the condition of the learned part of the world, after their *subjugation* by the Turks. *Hale*.

SUBJUNCTION, *s.* [from *subjungo*, Lat.] The state of being subjoined; the act of subjoining.—The verb undergoes in Greek a different formation; and in dependence upon, or *subjunction* to some other verb. *Clarke*.

SUBJUNCTIVE, *adj.* [*subjunctivus*, Latin; *subjonctif*, French.] Subjoined to something else. In Grammar. The verb undergoes a different formation, to signify the same intentions as the indicative, yet not absolutely but relatively to some other verb, which is called the *subjunctive* mood. *Clarke*.

SUBLAPSARIAN, or **SUBLAPSARY**, *adj.* [*sub* and *lapsus*, Lat.] According to **SUBLAPSARIANS**.

SUBLAPSARIAN, *s.* One who maintains the following doctrine. The *sublapsarians* say, that Adam having sinned freely, and his sin being imputed to all his posterity, God did consider mankind, thus lost, with an eye of pity; and having designed to rescue a great number out of this lost state, he decreed to send his Son to die for them, to accept of his death on their account, and to give them such assistances as should be effectual both to convert them to him, and to make them persevere to the end; but for the rest, he framed no positive act about them, only he left them in that lapsed state, without intending that they should have the benefit of Christ's death, or of efficacious and persevering assistances. *Burnet*.

SUBLATION, *s.* [*sublatio*, Lat.] The act of taking away.—He could not be forsaken by a *sublation* of union. *Bp. Hall*.

SUBLEVATION, *s.* [*sublevo*, Lat.] The act of raising on high.

SUB-LIEUTENANT, an officer in the royal regiment of artillery and fusileers, in which are no ensigns, who is the same as second lieutenant. See **LIEUTENANT**.

SUBLIMABLE, *adj.* Possible to be sublimed.

SUBLIMABLENESS, *s.* Quality of admitting sublimation.—He obtained another concrete as to taste and smell, and easy *sublimableness*, as common sal ammoniack. *Boyle*.

To **SUBLIMATE**, *v. a.* To raise by the force of chemical fire. To exalt; to heighten; to elevate.

And as his actions rose, so raise they still their vein
In words, whose weight best suit a *sublimated* strain. *Drayton*.

SUBLIMATE, *s.* Any thing raised by fire in the retort.—Enquire the manner of subliming, and what metals

endure subliming, and what body the *sublimate* makes. *Dacon*.—Quicksilver raised in the retort.

SUBLIMATE, *adj.* Raised by fire in the vessel.—The particles of mercury uniting with the acid particles of spirit of salt compose mercury *sublimate*, and with the particles of sulphur, cinnaber. *Newton*.

SUBLIMATION, *s.* [*sublimation*, Fr.] A chemical operation which raises bodies in the vessel by the force of fire.—Exaltation; elevation; act of heightening or improving.

She turns
Bodies to spirits, by *sublimation* strange. *Davies*.

SUBLIME, *adj.* [*sublimis*, Latin.] High in place; exalted aloft.

They summ'd their pens, and soaring th' air *sublime*
With clang despis'd the ground. *Milton*.

High in excellence; exalted by nature.

Can it be, that souls *sublime*
Return to visit our terrestrial clime;
And that the generous mind, releas'd by death,
Can covet lazy limb? *Dryden*.

High in style or sentiment; lofty; grand.—Easy in stile thy work, in sense *sublime*. *Prior*.—Elevated by joy.

Their hearts were jocund and *sublime*,
Drunk with idolatry, drunk with wine. *Milton*.

Lofty of mien; elevated in manner.
His fair large front and eye *sublime* declar'd
Absolute rule. *Milton*.

SUBLIME, *s.* The grand or lofty style.
Longinus strengthens all his laws,
And is himself the great *sublime* he draws. *Pope*.

To **SUBLIME**, *v. a.* [*sublimer*, Fr. from the adjective.] To raise by a chemical fire.

Study our manuscripts, those myriads
Of letters, which have past 'twixt thee and me,
Thence write our annals, and in them lessons be
To all, whom love's *subliming* fire invades. *Donne*.

To raise on high.
Although thy trunk be neither large nor strong,
Nor can thy head, not help'd, itself *sublime*,
Yet, like a serpent, a tall tree can climb. *Denham*.

To exalt; to heighten; to improve.
Flowers, and then fruit,
Man's nourishment, by gradual scale *sublim'd*
To vital spirits aspire. *Milton*.

The fancies of most are moved by the inward springs of the corporeal machine, which even in the most *sublimed* intellectuals is dangerously influential. *Glanville*.—Art being strengthened by the knowledge of things, may pass into nature by slow degrees, and so be *sublimed* into a pure genius, which is capable of distinguishing betwixt the beauties of nature and that which is low in her. *Dryden*.

Meanly they seek the blessing to confine,
And force that sun but on a part to shine;
Which not alone the southern wit *sublimes*,
But ripens spirits in cold northern climes. *Pope*.

To **SUBLIME**, *v. n.* To rise in the chemical vessel by the force of fire.

SUBLIMELY, *adv.* Loftily; grandly.
In English lays, and all *sublimely* great,
Thy Homer charms with all his ancient heat. *Parnel*.

SUBLIMENESS, *s.* [*sublimitas*, Lat.] The same as sublimity; *but unused*.

SUBLIMIFICATION, *s.* [*sublimis* and *facio*, Latin.] The act of making sublime. *Unused*.

SUBLIMITY, *s.* [*sublimité*, Fr., *sublimitas*, Latin.] Height of place; local elevation. *Little used*.—Height of nature; excellence.—In respect of God's incomprehensible *sublimity* and purity, this is also true, that God is neither a mind

mind nor a spirit like other spirits, nor a light such as can be discerned. *Raleigh*.—Loftiness of style or sentiment.—Milton's distinguishing excellence lies in the *sublimity* of his thoughts. *Addison*.

SUBLINGUAL, *adj.* [*sublingual*, French; *sub* and *lingua*, Lat.] Placed under the tongue, as the sublingual glands.

SUBLITZ, a village of Prussian Saxony; 2 miles west of Torgau, near which was fought, on 3d November 1760, an obstinate and sanguinary battle between the Prussians and Austrians, commonly called the battle of Torgau. It ended to the advantage of the Prussians. See **TORGAU**.

SUBLUNAR, or **SUBLUNARY**, *adj.* [*sublunaire*, Fr., *sub* and *luna*, Lat.] Situated beneath the moon; earthly; terrestrial; of this world.

Night measur'd, with her shadowy cone,
Half way up hill this vast *sublunar* vault. *Milton*.

SUBLUNARY, *s.* Any worldly thing.—Whatever temporal felicity we apprehend, we cull out the pleasures, and overprize them:—And that these *sublunaries* have their greatest freshness placed only in hope, it is a conviction undeniable, [as] that, upon enjoyment, all our joys do vanish. *Feltham*.

SUBLUXATION, *s.* A partial luxation; a sprain.

SUBMARINE, *adj.* Lying under the sea.—Not only the herbaceous and woody *submarine* plants, but also the lithophyta, affect this manner of growing, as I observed in corals. *Ray*.

To **SUBMERGE**, *v. a.* [*submerger*, Fr., *submergo*, Lat.] To drown; to put under water.

So half my Egypt were *submerg'd* and made
A cistern for scald snakes. *Shakspeare*.

To **SUBMERGE**, *v. n.* To be under water; to lie under water; spoken of swallows.—Some say, swallows *submerge* in ponds. *Gent. Mag.*

To **SUBMERSE**, *v. a.* [*submersus*, Lat.] To put under water. *Unused. Scott*.

SUBMERSION, *s.* [*submersion*, Fr., from *submersus*, Latin.] The act of drowning; state of being drowned.—State of lying under water.—The *submersion* of swallows appears by no means ascertained. *Transl. of Buffon*.

To **SUBMINISTER**, or To **SUBMINISTRATE**, *v. a.* [*subministro*, Lat.] To supply; to afford. *A word not much in use*.—Nothing *subministrates* apter matter to be converted into pestilent seminaries, than steams of nasty folks. *Harvey*.

To **SUBMINISTER**, *v. n.* To subserv; to be useful to.—Passions, as fire and water, are good servants, but bad masters, and *subminister* to the best and worst purposes. *L'Estrange*.

SUBMINISTRANT, *adj.* [*subministrans*, Lat.] Subservient: serving in subordination.—For that which is most principal, and final, to be left undone for the attending of that which is subservient, and *subministrant*, seemeth to be against proportion of reason. *Bacon*.

SUBMINISTRATION, *s.* Act of supplying.—Which [league] the electors have broken—by *subministration* of commodities to his army. *Wotton*.

SUBMISS, *adj.* [from *submissus*, Lat.] Humble; submissive; obsequious.

Nearer his presence, Adam, though not aw'd,
Yet with *submiss* approach, and reverence meek,
As to a superior nature, bowed low. *Milton*.

SUBMISSION, *s.* [*soumission*, Fr., from *submissus*, Lat.] Delivery of one to the power of another.

Submission, Dauphin! 'tis a mere French word,
We English warriors wot not what it means. *Shakspeare*.

Acknowledgment of inferiority or dependance; humble or suppliant behaviour.

In all *submission* and humility,
York doth present himself unto your highness. *Shakspeare*.

Acknowledgment of a fault: confession of error.—Be not

as extreme in *submission* as in offence. *Shakspeare*.—Obsequiousness; resignation; obedience.

SUBMISSIVE, *adj.* [*submissus*, Lat.] Humble; testifying submission or inferiority.

Her at his feet *submissive* in distress
He thus with peaceful words uprais'd. *Milton*.

SUBMISSIVELY, *adv.* Humbly; with confession of inferiority.

The goddess,
Soft in her tone, *submissively* replies. *Dryden*.

SUBMISSIVENESS, *s.* Humility; confession of fault, or inferiority.

SUBMISSLY, *adv.* Humbly; with submission.—Humility consists, not in wearing mean clothes, and going softly and *submissly*, but in mean opinion of thyself. *Bp. Taylor*.

SUBMISSNESS, *s.* Humility; lowliness of mind; resignation; obedience.—Whensoever she namcd God, though it were in common discourse, she would, for the most part, add the title of Maker; saying, God my Maker: and compose both her eyes and countenance to a *submissness* and reverence. *Rawley*.

To **SUBMIT**, *v. a.* [*soumettre*, Fr., *submitto*, Lat.] To let down; to sink.

Sometimes the hill *submits* itself a while
In small descents, which do its height beguile,
And sometimes mounts, but so as billows play,
Whose rise not hinders, but makes short our way. *Dryden*.

To subject; to resign without resistance to authority.—Return to thy mistress, and *submit* thyself under her hands. *Gen. xvi*.—To leave to discretion; to refer to judgment.—Whether the condition of the clergy be able to bear a heavy burden, is *submitted* to the house. *Swift*.

To **SUBMIT**, *v. n.* To be subject; to acquiesce in the authority of another; to yield.

To thy husband's will
Thine shall *submit*: he over thee shall rule. *Milton*.

SUBMITTER, *s.* One who submits.
SUBMULTIPLE, *s.* A *submultiple* number or quantity is that which is contained in another number, a certain number of times exactly: thus 3 is *submultiple* of 21.

SUBNASCENT, *adj.* [*subnascent*, Lat.] Growing beneath something else. *Mason*.—There is nothing more prejudicial to *subnascent* young trees, than, when newly trimmed and pruned, to have their wound poisoned with continual dripping. *Evelyn*.

SUBOBSCURELY, *adv.* Somewhat darkly.—The booke of Nature, where, though *subobscurely* and in shadows, thou, [God] hast expressed thine own image. *Donne*.

SUBOCTAVE, or **SUBOCTUPLE**, *adj.* [*sub* and *octavus*, Lat., and *octuple*.] Containing one part of eight.

SUBORDINACY, or **SUBORDINANCY**, *s.* The state of being subject.—Pursuing the imagination through all its extravagancies, is no improper method of correcting and bringing it to act in *subordinacy* to reason. *Spectator*.—Series of subordination.—The *subordinacy* of the government changing hands so often, makes an unsteadiness in the pursuit of the public interests. *Temple*.

SUBORDINATE, *adj.* [*sub* and *ordinatus*, Lat.] Inferior in order, in nature, in dignity or power.—It was *subordinate*, not enslaved to the understanding: not as a servant to a master, but as a queen to her king, who acknowledges a subjection, yet retains a majesty. *South*.—Descending in a regular series.—The two armies were assigned to the leading of two generals, rather courtiers than martial men, yet assisted with *subordinate* commanders of great experience. *Bacon*.

SUBORDINATE, *s.* An inferior person.
His next *subordinate*
Awakening, thus to him in secret spake. *Milton*.

To **SUBORDINATE**, *v. a.* [*sub* and *ordino*, Lat.] To range under another; to make subordinate. *Not in use*.

I that

I hate and highly scorn that kestrel brood
Of bastard scholars, that *subordinate*
The precious choice induements of the mind
To wealth or worldly good.

More.

SUBORDINATELY, *adv.* In a series regularly descending.

SUBORDINATION, *s.* [*subordination*, Fr.] The state of being inferior to another.

Nor can a council national decide,
But with *subordination* to her guide.

Dryden.

A series regularly descending.—The natural creatures having a local *subordination*, the rational having a political, and sometimes a sacred. *Holiday*.—Place of rank.—If we would suppose a ministry, where every single person was of distinguished piety, and all great officers of state and law diligent in chusing persons, who in their several *subordinations* would be obliged to follow the examples of their superiors, the empire of irreligion would be soon destroyed.

Swift.

To SUBORN, *v. a.* [*suborner*, Fr., *suborno*, Lat.] To procure privately; to procure by secret collusion.

Fond wretch! thou know'st not what thou speak'st,
Or else thou art *suborn'd* against his honour
In hateful practice.

Shakespeare.

To procure by indirect means.

Behold

Those who by lingering sickness lose their breath,
And those who by despair *suborn* their death.

Dryden.

SUBORNATION, *s.* [*subornation*, Fr.] The crime of procuring any to do a bad action.

You set the crown

Upon the head of this forgetful man,
And for his sake wear the detested blot
Of murder's *subornation*.

Shakespeare.

SUBORNER, *s.* [*suborneur*, Fr.] One that procures a bad action to be done.—You are to enquire of wilful and corrupt perjury; — as well of the actors, as of the procurers and *suborners* of it. *Bacon*.

SUBPŒNA, *s.* [*sub* and *pœna*, Lat.] A writ commanding attendance in a court under a penalty.

Your meetings, call'd the ball; to which appear,
As to the court of pleasure, all your gallants
And ladies, thither bound by a *subpœna*
Of Venus' and small Cupid's high displeasure.

Shirley.

To SUBPŒNA, *v. a.* To serve with a subpœna.—I was lately *subpœnaed* by a card to a general assembly. *Ld. Chesterfield*.

SUBPRIOR, *s.* The vicegerent of a prior.—The bishop ordered that the prior for the time being should pay £100 a year for seven years ensuing; and the *subprior* and convent 100 marks, in like manner, for this service. *Lowth*.

SUBQUADRUPLE, *adj.* Containing one part of four.

SUBQUINTUPLE, *adj.* Containing one part of five.

SUBRECTOR, *s.* The rector's vicegerent.—He was chosen *subrector* of the college. *Walton*.

SUBREPTION, *s.* [*subreption*, Fr., *subreptus*, Lat.] The act of obtaining a favour by surprise or unfair representation. *Dict*.—Lest there should be any *subreption* in this sacred business, it is ordered, that these ordinations should be no other than solemn both in respect of time and place.

Bp. Hall.

SUBREPTIOUS, *adj.* [*surreptice*, Fr., *surreptitius*, Lat.] Falsely crept in; fraudulently foisted; fraudulently obtained.

SUBREPTIOUSLY, *adv.* By falsehood; by stealth.

SUBREPTIVE, *adj.* [*subreptif*, Fr.] Subreptitious. *Not in use.*
To SUBROGATE, *v. a.* [*subrogo*, Lat.] To put in the place of another. A sumptuary law against excess of apparel was repealed; and a new one, a little more decent, *subrogated*. *Ld. Herbert*.

SUBROY, a town of Hindostan, province of Cutch, situated on the road from Luckput Bunder to Mandavie. It is defended by a citadel, and is a populous and flourishing place. Lat. not ascertained.

SUB-SALTS, in Chemistry, salts with less acid than is sufficient to neutralize their bases.

To SUBSCRIBE, *v. a.* [*souscrire*, Fr., *scribo*, Lat.] To give consent to, by underwriting the name.—The reader sees the names of those persons by whom this letter is *subscribed*. *Addison*.—To attest by writing the name.—Their particular testimony ought to be better credited, than some other *subscribed* with an hundred hands. *Whitgift*.—To submit. *Not used.*

The king gone to night! *subscrib'd* his pow'r!
Confin'd to exhibition! all is gone.

Shakespeare.

To SUBSCRIBE, *v. n.* To give consent.

Advise thee what is to be done,
And we will all *subscribe* to thy advice.

Shakespeare.

To promise a stipulated sum for the promotion of any undertaking.

SUBSCRIBER, *s.* [from *scriptio*, Lat.] One who subscribes, or contributes.—Let a pamphlet come out upon a demand in a proper juncture, every one of the party who can spare a shilling shall be a *subscriber*. *Swift*.

SUBSCRIPT, *s.* [*scriptum*, Lat.] Any thing underwritten.—Be they postscripts or *subscripts*, your translators neither made them, nor recommended them, for *Scripture*. *Bentley*.

SUBSCRIPTION, [from *scriptio*, Lat.] Any thing underwritten.—The man asked, Are ye Christians? We answered we were; fearing the less because of the cross we had seen in the *subscription*. *Bacon*.—Consent or attestation given by underwriting the name.—The act or state of contributing to any undertaking.

The work he ply'd;

Stocks and *subscriptions* pour on ev'ry side.

Pope.

Submission; obedience. *Not in use.*

I tax not you, you elements, with unkindness;
I never gave you kingdom, call'd you children,
You owe me no *subscription*.

Shakespeare.

SUBSECTION, *s.* [*sub* and *sectio*, Lat.] A subdivision of a larger section into a lesser; a section of a section.

SUBSECUTIVE, *adj.* [*subsecutif*, Fr. from *subsequor*, Lat.] Following in train.

SUBSEPTUPLE, *adj.* [*sub* and *septuplus*, Lat.] Containing one of seven parts.

SUBSEQUENCE, or SUBSEQUENCY, *s.* [from *subsequor*, Lat.] The state of following; not precedence.—By this faculty we can take notice of the order of precedence and *subsequence* in which they are past. *Grew*.

SUBSEQUENT, *adj.* [*subsequent*, Fr., *subsequens*, Lat. This word is pronounced long in the second syllable by Shakspeare.] Following in train; not preceding.

In such indexes, although small pricks
To their *subsequent* volumes, there is seen
The baby figure of the giant mass

Of things to come at large.

Shakespeare.

Why does each consenting sign
With prudent harmony combine

In turns to move, and *subsequent* appear

To gird the globe and regulate the year?

Prior.

SUBSEQUENTLY, *adv.* Not so as to go before; so as to follow in train.

To SUBSERVE, *v. a.* [*subservio*, Lat.] To serve in subordination; to serve instrumentally.—The memory hath no special part of the brain devoted to its own service, but uses all those parts which *subserve* our sensations, as well as our thinking powers. *Walsk*.

SUBSERVIENCE, or SUBSERVIENCY, *s.* Instrumental fitness, use, or operation.—There is an immediate and agile *subservience* of the spirits to the empire of the soul. *Hale*.

SUBSERVIENT, *adj.* [*subserviens*, Lat.] Subordinate; instrumentally

instrumentally useful. Sense is *subservient* unto fancy, fancy unto intellect. *Grew*.

SUBSEXTUPLE, *adj.* [*sub* and *sextuplus*, Lat.] Containing one part of six.

To SUBSIDE, *v. n.* [*subsido*, Lat.] To sink; to tend downwards. It is commonly used of one part of a compound, sinking in the whole.

He shook the sacred honours of his head:

With terror trembled heaven's *subsiding* hill,

And from his shaken curls ambrosial dews distill. *Dryden*.

SUBSIDENCE, or SUBSIDENCY, *s.* The act of sinking; tendency downward.—This gradual *subsidiency* of the abyss would take up a considerable time. *Burnet*.

SUBSIDARILY, *adv.* In an assisting way. *Sherwood*.

SUBSIDIARY, *adj.* [*subsidiare*, Fr., *subsidiarius*, Lat.] Assistant; brought in aid.—Bitter substances burn the blood, and are a sort of *subsidiary* gall. *Arbutnot*.

SUBSIDIARY, *s.* An assistant.—Which deceitful consideration drew on Pelagius himself, that was first only for nature, at last to take in, one after another, five *subsidiaries* more. *Hammond*.

To SUBSIDIZE, *v. a.* To furnish with a subsidy.

SUBSIDY, *s.* [*subsidi*, Fr., *subsidium*, Lat.] Aid, commonly such as is given in money.—They advised the king to send speedy aids, and with much alacrity granted a rate of *subsidy*. *Bacon*.

To SUBSIGN, *v. a.* [*subsigno*, Lat., *sousigner*, Fr.] To sign under.—Neither have they seen any deed before the conquest, but *subsigned* with crosses and single names without surnames. *Camden*.

SUBSIGNATION, *s.* [*subsignatio*, Lat.] Attestation given by underwriting the name.—The epistle with *subsignation* of the scribe and notary. *Sheldon*.

To SUBSIST *v. n.* [*subsister*, Fr., *subsisto*, Lat.] To be; to have existence. To continue; to retain the present state or condition.—The very foundation was removed, and it was a moral impossibility that the republic could *subsist* any longer. *Swift*.—To have means of living; to be maintained.—He shone so powerfully upon me, that like the heat of a Russian summer, he ripened the fruits of poetry in a cold climate; and gave me wherewithal to *subsist* in the long winter which succeeded. *Dryden*.—To inhere; to have existence by means of something else.—Though the general natures of these qualities are sufficiently distant from one another, yet when they come to *subsist* in particulars, and to be clothed with several accidents, then the discernment is not so easy. *South*.

To SUBSIST, *v. a.* To feed; to maintain.—We decry millions of species *subsisted* on a green leaf, which your glasses represent only in crowds and swarms. *Addison*.

SUBSISTENCE, or SUBSISTENCY, *s.* [*subsistence*, Fr.] Real being.—Not only the things had *subsistence*, but the very images were of some creatures existing. *Stillingfleet*.—Competence; means of supporting life.—His viceroy could only propose to himself a comfortable *subsistence* out of the plunder of his province. *Addison*.—Inherence in something else.

SUBSISTENT, *adj.* [*subsistens*, Lat.] Having real being.—Such as deny spirits *subsistent* without bodies, will with difficulty affirm the separate existence of their own. *Brown*.—Inherent.—These qualities are not *subsistent* in those bodies, but are operations of fancy begotten in something else. *Bentley*.

SUBSTANCE, *s.* [*substantia*, Fr., *substantia*, Lat.] Being; something existing; something of which we can say that it is.

The strength of gods,
And this empyreal *substance* cannot fail.

Milton.

That which supports accidents.—Every being is considered as *subsisting* in and by itself, and then it is called a *substance*; or it *subsists* in and by another, and then it is called a mode or manner of being. *Watts*.—The essential

part.—It will serve our turn to comprehend the *substance*, without confining ourselves to scrupulous exactness in] form. *Digby*.—Something real, not imaginary; something solid, not empty.

He the future evil shall no less

In apprehension than in *substance* feel.

Milton.

Body; corporeal nature.—Between the parts of opaque and coloured bodies are many spaces, either empty or replenished with mediums of other densities; as water between the tinging corpuscles wherewith any liquor is impregnated, air between the aqueous globules that constitute clouds or mists, and for the most part spaces void of both air and water; but yet perhaps not wholly void of all *substance* between the parts of hard bodies. *Newton*.—Wealth; means of life.—He hath eaten me out of house and home, and hath put all my *substance* into that fat belly of his, but I will have some of it out again. *Shakspeare*.

SUBSTANTIAL, *adj.* [*substantielle*, Fr.] Real; actually existing.—If this atheist would have his chance to be a real and *substantial* agent, he his more stupid than the vulgar. *Bentley*.—True; solid; real; not merely seeming.

O blessed! blessed night! I am afraid,

Being in night, all this is but a dream;

Too flattering sweet to be *substantial*.

Shakspeare.

Corporeal; material.—The sun appears flat like a plate of silver, the moon as big as the sun, and the rainbow a large *substantial* arch in the sky, all which are gross falsehoods. *Watts*.—Responsible; moderately wealthy; possessed of substance.—The merchants and *substantial* citizens cannot make up more than a hundred thousand families. *Addison*.

SUBSTANTIALS, *s.* Essential parts. *Unused*.—Although a custom introduced against the *substantial*s of an appeal be not valid.

SUBSTANTIALITY, *s.* The state of real existence.—Corporeity; materiality.—Body cannot act on any thing but by motion; motion cannot be received but by quantity and matter: the soul is a stranger to such gross *substantiality*, and owns nothing of these. *Glanville*.

SUBSTANTIALLY, *adv.* In manner of a substance; with reality of existence.—In him his father shone—*substantially* express'd. *Milton*.—Strongly; solidly.—Having so *substantially* provided for the North, they promised themselves they should end the war that summer. *Clarendon*.—Truly; solidly; really; with fixed purpose.—The laws of this religion would make men, if they would truly observe them, *substantially* religious towards God, chaste and temperate. *Tillotson*.—With competent wealth.

SUBSTANTIALNESS, *s.* The state of being substantial.—Firmness; strength; power of holding or lasting.—When *substantialness* combineth with delightfulness, fulness, with fineness, how can the language which consisteth of these sound other than most full of sweetness? *Camden*.

To SUBSTANTIATE, *v. a.* To make to exist.—The accidental of any act is said to be whatever advenes to the act itself already *substantiated*. *Ayliffe*.

SUBSTANTIVE, *s.* [*substantif*, Fr., *substantivum*, Lat.] A noun; the name of every mental conception that is perfect in itself.—Claudian perpetually closes his sense at the end of a verse, commonly called golden, or two *substantives* and two adjectives with a verb betwixt them to keep the peace. *Dryden*.

SUBSTANTIVE, *adj.* [*substantivus*, Lat.] Solid; depending only on itself. *Not in use*.—He considered how sufficient and *substantive* this land was to maintain itself, without any aid of the foreigner. *Bacon*.—Betokening existence.—One is obliged to join many particulars in one proposition, because the repetition of the *substantive* verb would be tedious. *Arbutnot*.

SUBSTANTIVELY, *adv.* As a substantive.

To SUBSTITUTE, *v. a.* [*substituer*, Fr., *substitutus*, from *sub* and *statuo*, Lat.] To put in the place of another.—In the original designs of speaking, a man can *substitute* none for them that can equally conduce to his honour. *Gov. of the Tongue*.

SUBSTITUTE,

SUBSTITUTE, *s.* [*substitut*, Fr.] One placed by another to act with delegated power.

Were you sworn to the duke, or to the deputy?

— To him and his *substitutes*. *Shakspcare.*

It is used likewise for things; as, one medicine is a *substitute* for another.

SUBSTITUTION, *s.* [*substitution*, Fr.] The act of placing any person or thing in the room of another; the state of being placed in the room of another.

He did believe

He was the duke, from *substitution*,

And executing th' outward face of royalty,

With all prerogative. *Shakspcare.*

To SUBSTRACT, *v. a.* [*subtrah*, Lat., *soustraire*, French.] To take away part from the whole. See To SUBTRACT.—To take one number from another.

SUBSTRACTION, *s.* [*soustraction*, Fr.] The act of taking away part from the whole.—I cannot call this piece Tully's nor my own, being much altered not only by the change of the style, but by addition and *subtraction*. *Denham.*

SUBSTRATUM, *s.* [Latin.] A layer of earth, or any other substance lying under another.—A half-finished phantom of a *substratum*. *Baxter.*

SUBSTRUCTION, *s.* [*substructio*, from *sub* and *struo*, Lat.] Underbuilding.—Vaults and *substructions* that serve as foundations to the ponderous mass of buildings which compose the palace. *Swinburne.*

SUBSTRUCTURE, *s.* [*sub* and *structura*, Lat.] A foundation.—A *substructure* of their chronology, geography, and history. *Harris.*

SUBSTYLAR, *adj.* [*sub* and *stylus*, Lat.] *Substylar* line is, in dialing, a right line, whereon the gnomon or style of a dial is erected at right angles with the plane.—Erect the style perpendicularly over the *substylar* line, so as to make an angle with the dial-plane equal to the elevation of the pole of your place. *Moron.*

SUBSULTIVE, or SUBSULTORY, *adj.* [*subsultus*, Lat.] Bounding; moving by starts.—I am levelling this rule against that *subsultory* way of delivery that rises like a storm in one part of the period, and presently sinks into a dead calm that will scarce reach the ear. *Abp. Hort.*

SUBSULTORILY, *adv.* In a bounding manner; by fits; by starts.—The spirits spread even, and move not *subsultorily*; for that will make the parts close and pliant. *Bacon.*

To SUBSUME, *v. n.* [*sub* and *sumo*, Lat.] To assume a position by consequence.—St. Paul cannot name that word, "sinners," but must straight *subsume* in a parenthesis, "of whom I am the chief." *Hammond.*

SUBTANGENT, *s.* In any curve, is the line which determines the intersection of the tangent in the axis prolonged.

To SUBTEND, *v. a.* [*sub* and *tendo*, Lat.] To be extended under.—In rectangles and triangles the square, which is made of the side that *subtendeth* the right angle, is equal to the squares which are made of the sides containing the right angle. *Brown.*

SUBTENISE, *s.* [*sub* and *tensus*, Lat.] The chord of an arch.

SUBTER. [Latin.] In composition, signifies *under*.

SUBTERFLUENT, or SUBTERFLUOUS, *adj.* [*subterfluo*, Latin.] Running under.

SUBTERFUGE, *s.* [*subterfuge*, Fr., *subter* and *fugio*, Lat.] A shift; an evasion; a trick.—Affect not little shifts and *subterfuges* to avoid the force of an argument. *Watts.*

SUBTERMOOKY, a river of Bengal, which forms one of the innumerable streams of the Delta of the Ganges.

SUBTERRANE, *s.* [*soubterrain*, Fr., *sub* and *terra*, Lat.] A subterraneous structure; a room under ground.—Josephus mentions vast *subterraneas* in some of the hills in the part of Canaan called Galilee, and in Trachonites. *Bryant.*

Vol. XXIII. No. 1599

SUBTERRANEAL, SUBTERRANEAN, SUBTERRANEOUS, or SUBTERRANY, *adj.* [*sub* and *terra*, Lat., *soubterrain*, Fr. *Subterranean* or *subterraneous* is the word now used.] Lying under the earth; placed below the surface.

Tell by what paths, what *subterranean* ways,

Back to the fountain's head the sea conveys

The reflux rivers. *Blackmore,*

SUBTERRANY, *s.* What lies under the earth or below the surface.—In *subterranyas*, as the fathers of their tribes, are brimstone and mercury. *Bacon.*

SUBTERRANITY, *s.* [*sub* and *terra*, Lat.] A place under ground. *Not in use.*—We commonly consider *subterranyities* not in contemplations sufficiently respective unto the creation. *Brown.*

SUBTILE, *adj.* [*subtile*, Fr., *subtilis*, Lat., from *sub* and *tela*. This word is often written *subtle*; it has been proposed to restrict the latter orthoepy to the metaphorical, and *subtile* to the material senses of the word.—Thin; not dense; not gross.

From his eyes the fleeting fair

Retir'd, like *subtle* smoke dissolv'd in air.

Dryden.

Nice; fine; delicate; not coarse.

But of the clock which in our breasts we bear,

The *subtile* motions we forget the while.

Davies.

Piercing; acute.

Pass we the slow disease and *subtile* pain,

Which our weak frame is destin'd to sustain;

The cruel stone, the cold catarrh.

Prior.

Cunning; artful; sly; subdulous.

Think you this York

Was not incensed by his *subtile* mother,

To taunt and scorn you?

Shakspcare.

O *subtile* love, a thousand wiles thou hast

By humble suit, by service, or by hire,

To win a maiden's hold.

Fairfax.

Deceitful.

Like a bowl upon a *subtile* ground,

I've tumbled past the throw.

Shakspcare.

Refined; acute beyond necessity.—Things remote from use, obscure and *subtile*. *Milton.*

SUBTILELY, *adv.* In a *subtile* manner; thinly; not densely.—The opakest bodies, if *subtilely* divided, as metals dissolved in acid menstruums, become perfectly transparent. *Newton.*—Artfully; cunningly.—By granting this, add the reputation of loving the truth sincerely to that of having been able to oppose it *subtilely*. *Boyle.*

SUBTILENESS, *s.* Fineness; rareness. *Cunning*; artfulness.

To SUBTILIATE, *v. a.* To make thin.—A very dry and warm or *subtilating* air opens the surface of the earth.

Harvey.

SUBTILIA'TION, *s.* [*subtiliation*, Fr.] The act of making thin.

SUBTILIZA'TION, *s.* Subtilization is making any thing so volatile as to rise readily in steam or vapour.—Fluids have their resistances proportional to their densities, so that no *subtilization*, division of parts, or refining can alter these resistances. *Cheyne.*—Refinement; superfluous acuteness.

To SUBTILIZE, *v. a.* [*subtilizer*, Fr.] To make thin; to make less gross or coarse.—Chyle, being mixed with the choler and pancreatic juices, is further *subtilized*, and rendered so fluid and penetrant, that the thinner and finer part easily finds way in at the straight orifices of the lacteous veins. *Ray.*—To refine; to spin into useless niceties.—The most obvious verity is *subtilized* into niceties, and spun into a thread indiscernable by common optics. *Glanville.*

To SUBTILIZE, *v. n.* To talk with too much refinement.—Qualities and moods some modern philosophers have *subtilized* on. *Digby.*

SU'BTILITY, *s.* [*subtilité*, Fr.] Thinness; fineness; exility of parts.

How shall we this union well express?

Nought ties the soul, her *subtily* is such.

Davies.

Nicety; exility.—Whatever is invisible, in respect of the fineness of the body, or *subtily* of the motion, is little enquired. *Bacon*.—Refinement; too much acuteness.—You prefer the reputation of candour before that of *subtily*. *Boyle*.—Cunning; artifice; slyness.

Sleights proceeding

As from his wit and native *subtlety*.

Milton.

SU'BTLE, *adj.* Sly; artful; cunning.—The serpent, *subtlest* beast of all the field. *Milton.*

SU'BTLY, *adv.* Slyly; artfully; cunningly.

Thou see'st how *subtly* to detain thee I devise;
Inviting thee to hear while I relate.

Milton.

Nicely; delicately.

In the nice bee, what sense so *subtly* true,

From poisonous herbs extracts the healing dew!

Pope.

To SUBTRACT, *v. a.* [*subtractus*, Lat.] To withdraw part from the rest.—Reducing many things unto charge, which, by confusion, became concealed and *subtracted* from the crown. *Davies.*

SUBTRACTIO, *s.* Subtraction: *which see*. In law.—*Subtraction* happens, when any person who owes any suit, duty, custom, or service to another, withdraws or neglects to perform it. *Blackstone.*

SUBTRACTER, or **SU'BTRAHEND**, *s.* [*subtrahere*, Lat.] The number to be taken out of a larger number.

SUBTRIPLE, *adj.* [*subtriple*, Fr.; *sub* and *tripulus*, Lat.] Containing a third or one part of three.—The power will be in a *subtriple* proportion to the weight. *Wilkins.*

SUBTUTOR, *s.* A subordinate tutor.—He [bishop Earl] had been his *subtutor*. *Burnet.*

SUBVENTANEOUS, *adj.* [*subventaneus*, Lat.] Adle; windy.—*Subventaneous* eggs. *Medic. Ess.*

SUBVENTION, *s.* [*subvention*, old Fr.] The act of coming under; the act of supporting; aid. *Cotgrave*.—The manner in which our Saviour is said to have been carried up, was, by the *subvention* of a cloud. *Stackhouse.*

To SUBVERSE, *v. a.* [*subversus*, Lat.] To subvert; to overthrow.

Returning back, these goodly rowmes, which erst

She saw so rich and royally array'd,

Now vanish't utterly and cleane *subverst*

She found, and all their glory quite decay'd.

Spenser.

SUBVERSION, *s.* [*subversion*, Fr.; *subversus*, Lat.] Overthrow; ruin; destruction.—These seek *subversion* of thy harmless life. *Shakspeare.*

SUBVERSIVE, *adj.* Having tendency to overturn: with *of*.—Lying is a vice *subversive* of the very ends and design of conversation. *Rogers.*

To SUBVERT, *v. a.* [*subvertir*, Fr.; *subverto*, Lat.] To overthrow; to overturn; to destroy; to turn upside down.

God, by things deem'd weak,

Subverts the worldly strong and worldly wise.

Milton.

To corrupt; to confound.—Strive not about words to no purpose, but to the *subverting* of the hearers. *2 Tim.*

SUBVERTER, *s.* Overthrower; destroyer.

O traitor; worse than Simon was to Troy;

O vile *subverter* of the Gallic reign,

More false than Gano was to Charlemagne.

Dryden.

SUBULARIA [so named from its awl-shaped leaves], in Botany, a genus of the class tetradynamia, order siliculosa, natural order of siliquosæ or cruciformes, cruciferae (*Juss.*)—Generic Character. Calyx: perianth four-leaved; leaflets ovate, concave, spreading a little, deciduous. Corolla, four-petalled, cruciform. Petals obovate, entire, a little bigger than the calyx. Stamina: filaments six, shorter than the

corolla: two of which are opposite and still shorter, anthers simple. Pistil: germ ovate; style shorter than the silicle; stigma obtuse. Pericarp: silicle ovate, subcompressed, entire, with a very short style, two-celled: partition contrary to the valves: valves ovate, concave; seeds some, very minute, roundish.—*Essential Character*. Silicle entire, ovate: valves ovate, concave, contrary to the partition. Style shorter than the silicle.

1. *Subularia aquatica*, or awl-wort.—The root is annual, and consists of many long simple white fibres. Leaves all radical, smooth, awl-shaped with a recurved point. Stalk seldom more than two inches high, simple, smooth, bearing a simple spike of small white flowers, always immersed in the water, and so closed that the impregnation is accomplished in safety under the protection of the calyx and petals. Seeds ovate, compressed, about three on each side.—Native of many parts of Europe.

SUBUNDATION, *s.* [*sub* and *unda*, Lat.] Flood; deluge. *Not in use*.—Banks defensive against *subundation*, called sea-banks. *Huloet.*

SUBUNREEKA, a river of Hindostan, which divides the provinces of Orissa and Bengal; and, till the year 1803, formed the boundary between the British and the Nagpore Mahrattas. It rises in the province of Bahar, and is about 250 miles long. It is fordable, except in the rainy season, and falls into the bay of Bengal, at Pipy pagoda. It was the first river of Bengal into which Europeans were allowed to enter; but the channel is much choaked up since that period.

SUBURB, *s.* [*suburbium*, Lat.] Building without the walls of a city.—There's a trim rabble let in: are all these your faithful friends o' th' *suburbs*? *Shakspeare*.—The confines; the outpart.

The *suburbs* of my jacket are so gone,

I have not left one skirt to sit upon.

Cleveland.

SUBURBAN, **SUBURBIAL**, or **SUBURBIAN**, *adj.* [*suburbanus*, Lat.] Inhabiting the suburb.

Athens the eye of Greece, mother of arts

And eloquence, native to famous wits

City or *suburban*, studious walks and shades.

Milton.

SUBURBED, *adj.* Bordering upon a suburb; having a suburb on its outpart.—The first place, which here offereth itself to sight is Bottreaux Castle, seated on a bad harbour of the north sea, and *suburbed* with a poor market town. *Cartew.*

SUBURBICARIAN, *adj.* [*suburbicarius*, Lat.] Applied to those provinces of Italy, which composed the ancient diocese of Rome.—The pope having stretched his authority beyond the *suburbicarian* precincts. *Barrow.*

SUBWORKER. *s.* Underworker; subordinate helper.—He that governs well leads the blind; but he that teaches gives him eyes: and it is glorious to be a *subworker* to grace, in freeing it from some of the inconveniences of original sin. *South.*

SUBZOW, a small town in the interior of European Russia, in the government of Tver, on the Wolga, with 1100 inhabitants.

SUCAIFE, a village of Hedsjas, in Arabia; 25 miles south-east of Yambo.

SUCCA, a small sea-port of Tripoli, in the gulph of Sidra; 45 miles south-east of Mesurada.

SUCCADANA, a town of the island of Borneo, on the west coast. It is situated on the principal or southern outlet of a large river, which is navigable 150 miles for prows. It is celebrated for very large diamonds, as also for the best camphire. It is also a considerable mart for opium, the sale of which is monopolized by the rajah and his family. Gold dust, tin, and pepper, are also to be procured. Lat. 1. 30. S.

SUCCEDANEOUS, *adj.* [*succedaneus*, Lat.] Supplying the place of something else.—Nor is Ætius perhaps too strictly to be observed, when he prescribeth the stones of the otter as *succedaneous* unto castoreum. *Brown.*

SUCCEDA'NEUM, *s.* That which is put to serve for something

something else.—They did not need a *succedaneum* to that inward conscious persuasion. *Warburton*.

To SUCCE'ED, *v. n.* [*succeder*, Fr.; *succedo*, Lat.] To follow in order.—Those of all ages to *succeed*—will curse my head. *Milton*.—To come into the place of one who has quitted or died.

Enjoy till I return
Short pleasures; for long woes are to *succeed*. *Milton*.

To obtain one's wish; to terminate an undertaking in the desired effect.—'Tis almost impossible for poets to *succeed* without ambition: imagination must be raised by a desire of fame to a desire of pleasing. *Dryden*.—To terminate according to wish; to have a good effect.—This was impossible for Virgil to imitate, because of the severity of the Roman language: Spenser endeavoured it in Shepherd's Kalendar; but neither will it *succeed* in English. *Dryden*.—To go under cover. *Unused*.

Please that silvan scene to take,
Where whistling winds uncertain shadows make;
Or will you to the cooler cave *succeed*,
Whose mouth the curling vines have overspread. *Dryden*.

To SUCCEED, *v. a.* To follow; to be subsequent or consequent to.—In that place no creature was hurtful unto man, and those destructive effects they now discover *succeeded* the curse, and came in with thorns and briars. *Brown*.—To prosper; to make successful. *Succeed* my wish, and second my design,
The fairest Deiopea shall be thine,
And make thee father of a happy line. *Dryden*.

SUCCE'EDER, *s.* One who follows; one who comes into the place of another.—Nature has so far imprinted it in us, that should the envy of predecessors deny the secret to *succeeders*, they yet would find it out. *Suckling*.

SUCCE'SS, *s.* The termination of any affair happy or unhappy. *Success* without any epithet is commonly taken for good success.
Perplex'd and troubled at his bad *success*
The tempter stood. *Milton*.

Succession. *Obsolete*.
All the sons of these five brethren reigned
By due *success*, and all their nephews late,
Even thrice eleven descents, the crown retained. *Spenser*.

SUCCESS, a township of the United States, in Coos county, New Hampshire, east of the Androscoggen; 23 miles east of Lancaster.

SUCCESS BAY, or GOOD SUCCESS BAY, a bay on the south-east coast of Terra del Fuego, in the straits of Le Maire. On the mountains inland of this bay, Mr. Banks and Dr. Solander found many new Alpine plants, unknown in Europe; but the cold was so intense, that the latter had well nigh fallen a sacrifice to its severity in the midst of summer. Dr. Solander, who had more than once crossed the mountains which divide Sweden from Norway, well knew that extreme cold, especially when joined with fatigue, produces a torpor and sleepiness that are almost irresistible; he therefore conjured the company to keep moving, whatever pain it might cost them, and whatever relief they might be promised by an inclination to rest. Whoever sits down, says he, will sleep; and whosoever sleeps will wake no more. Dr. Solander himself was the first who found the inclination, against which he had warned others, irresistible; and insisted upon being suffered to lie down. Mr. Banks intreated and remonstrated in vain; down he lay upon the ground, though it was covered with snow, and it was with great difficulty that his friend kept him from sleeping. Richmond also, one of the black servants, began to linger, having suffered from the cold in the same manner as the doctor. Mr. Banks therefore, sent five of the company, among whom was Mr. Buchan, forward to get a fire ready at the first convenient place they could find, and himself and four others remained with the doctor and Richmond, whom, partly by persuasion and intreaty, and partly by force, they brought on, till they

both declared they could go no farther. Mr. Banks had recourse to intreaty and expostulation, but they produced no effect. When Richmond was told that if he did not go now he would in a short time be frozen to death, he answered, that he desired nothing but to lie down and die. The doctor did not so explicitly renounce his life; he said he was willing to go on, but that he must first take some sleep, though he had before told the company that to sleep was to perish. Mr. Banks and the rest found it impossible to carry them, and there being no remedy, they were suffered to sit down, being partly supported by the bushes, and in a few minutes they fell into a profound sleep. Soon after, some of the people who had been sent forward returned with the welcome news that a fire was kindled about a quarter of a mile farther on the way. Mr. Banks then endeavoured to wake Dr. Solander, and happily succeeded; but though he had not slept five minutes, he had almost lost the use of his limbs, and the muscles were so shrunk that his shoes fell from his feet; he consented to go forward, with such assistance as could be given him, but no attempts to relieve poor Richmond were successful. Richmond, and a seaman sent to his relief, died. Lat. 54. 50. S. long. 65. 27. W.

SUCCESS CAPE, or CAPE GOOD SUCCESS, a cape on the south coast of Terra del Fuego, which forms the south-west entrance of the straits of Le Maire. Lat. 54. 58. S. long. 66. 14. W.

SUCCE'SSFUL, *adj.* Prosperous; happy; fortunate.
He observ'd the illustrious throng,
Their names, their fates, their conduct and their care
In peaceful senates and *successful* war. *Dryden*.

The early hunter
Blesses Diana's hand, who leads him safe
O'er hanging cliffs; who spreads his net *successful*,
And guides the arrow through the panther's heart. *Prior*.

SUCCE'SSFULLY, *adv.* Prosperously; luckily; fortunately.—He is too young, yet he looks *successfully*. *Shakspeare*.

SUCCE'SSFULNESS, *s.* Happy conclusion; desired event; series of good fortune.—An opinion of the *successfulness* of the work is as necessary to found a purpose of undertaking it, as the authority of commands, or the persuasiveness of promises. *Hammond*.

SUCCE'SSION, *s.* [*successio*, Lat.] Consecution; series of one thing or person following another.—Reflection on appearances of several ideas, one after another, in our minds, furnishes us with the idea of *succession*. *Locke*.—A series of things or persons following one another.—These decays in Spain have been occasioned by so long a war with Holland; but most by two *successions* of inactive princes. *Bacon*.—A lineage; an order of descendants.

Cassibelan
And his *succession*, granted Rome a tribute. *Shakspeare*.

The power or right of coming to the inheritance of ancestors.

What people is so void of common sense,
To vote *succession* from a native prince? *Dryden*.

SUCCE'SSIVE, *adj.* [*successif*, Fr.] Following in order; continuing a course or consecution uninterrupted.

God hath set
Labour and rest, as day and night to men
Successive. *Milton*.

Inherited by succession. *Not in use*.
Countrymen,
Plead my *successive* title with your swords. *Titus*.

SUCCE'SSIVELY, *adv.* [*successivement*, Fr.] In uninterrupted order; one after another.

Three sons he left,
All which *successively* by turns did reign. *Spenser*.

SUCCE'SSIVENESS, *s.* The state of being successive.—All the notion we have of duration is partly by the *successiveness*, of its own operations, and partly by those external measures that it finds in motion. *Hale*.

SUCCE'SSLESS,

SUCCE/SSLESS, *adj.* Unlucky; unfortunate; failing of the event desired.

Successless all her soft caresses prove,
To banish from his breast his country's love. *Popc.*

SUCCE/SSLESSNESS, *s.* Not prosperous conclusion; unsuccessfulness. Boyle has somewhere used this word.

SU'CCESSOR, *s.* One that follows in the place or character of another.

The surly savage offspring disappear,
And curse the bright *successor* of the year;
Yet crafty kind with daylight can dispense. *Dryden.*

SUCCI/NCT, *adj.* Tucked or girded up; having the clothes drawn up to disengage the legs.—His habit fit for speed *succinct*. *Miltou.*—Short; concise; brief.—A strict and *succinct* stile is that where you can take nothing away without loss, and that loss manifest. *B. Jonson.*

SUCCI/NCTLY, *adv.* Briefly; concisely; without superfluity of diction.

I'll recant, when France can shew me wit
As strong as ours, and as *succinctly* writ. *Roscommon.*

SUCCI/NCTNESS, *s.* Brevity; conciseness.—We have designed this in such a method, as that—the *succinctness* and brevity thereof may not make it the more obscure. *Hartlib.*

SUCCONDEE, a sea-port on the Gold coast of Africa, in the country of Ahanta, where some trade is carried on. The Dutch have here a respectable fort; and the English, till of late, had a settlement, which however, they have now withdrawn.

SUCCOOT, a town of Nubia, on the Nile, near the frontier of Dongola, and a little above the great cataract; 160 miles north of Dongola.

SU'CCORY, *s.* A plant. *Cichorium.*

A garden-sallad
Of endive, radishes, and *succory*. *Dryden.*

To SU'CCOUR, *v. a.* To help; to assist in difficulty or distress; to relieve.

As that famous queen
Of Amazons, whom Pyrrhus did destroy,
Did shew herself in great triumphant joy,
To *succour* the weak state of sad afflicted Troy. *Spenser.*

SU'CCOUR, *s.* Aid; assistance; relief of any kind; help in distress.

My father,
Flying for *succour* to his servant Banister,
Being distress'd, was by that wretch betray'd. *Shakspeare.*

The person or things that bring help.

Our watchful general hath discern'd from far
The mighty *succour* which made glad the foe. *Dryden.*

SU'CCOURER, *s.* Helper; assistant; reliever.—She hath been a *succourer* of many. *Romans.*

SU'CCOURLESS, *adj.* Wanting relief; void of friends or help.—Leave them slaves, and *succourless*. *Beaum. and Fl.*

SU'CCUBA, or SU'CCUBUS, *s.* A pretended kind of demon.

His ancient grandame,
Though seeming in shape a woman natural,
Was a fiend of the kind that *succubæ* some call. *Mir.*

SU'CCULENCE, or SU'CCULENCY, *s.* Juiciness.

SU'CCULENT, *adj.* [*succulentus*, Lat.] Juicy; moist.—These plants have a strong, dense, and *succulent* moisture, which is not apt to exhale. *Bacon.*

To SUCCU'MB, *v. n.* [*succumbo*, Lat., *succomber*, Fr.] To yield; to sink under any difficulty. *Not in use.* *Johnson.*

To their wills we must *succumb*,
Quocunque trahunt, 'tis our doom. *Hudibras.*

Wisdom *succumbing* under the bauble of folly. *Warburton.*

SUCCUMI, a town of Niphon, in Japan; 25 miles south-west of Fumai.

SUCCUSSATION, *s.* [*succussatio*, low Lat.] A trot.—They move two legs of one side together, which is totulation or ambling, or lift one foot before and the cross foot behind, which is *succussation* or trotting. *Brown.*

SUCCUSSION, *s.* [*succussio*, Lat.] The act of shaking or trembling.—When any of that risible species were brought to the doctor, and when he considered the spasms of the diaphragm, and all the muscles of respiration, with the tremulous *succussion* of the whole human body, he gave such patients over. *Arbuthnot.*

SUCH, *adj.* [*swaleik*, Goth. i. e. *swa*, so, and *leik*, like; *sulck*, *solck*, Teut. i. e. so-lick; *yplic*, Saxon. *Wicliffe* uses *swilke* for *such*.] Of that kind; of the like kind. With *as* before the thing to which it relates, when the thing follows: as, *such* a power as a king's; *such* a gift as a kingdom.—'Tis *such* another fitchew! marry, a perfum'd one. *Shakspeare.*—Can we find *such* a one as this, in whom the spirit of God is? *Gen.*—The works of the flesh are manifest, *such* are drunkenness, revellings and *such* like. *Gal.*

Such are the cold Riphean race, and *such*
The savage Scythian. *Dryden.*

The same that: with *as*.—This was the state of the kingdom of Tunis at *such* time as Barbarossa, with Solymans great fleet, landed in Africk. *Knolles.*—Comprehended under the term premised, like what has been said.

That thou art happy, owe to God;
That thou continu'st *such*, owe to thyself. *Milton.*

A manner of expressing a particular person or thing.

I saw him yesterday
With *such* and *such*. *Shakspeare.*

Those artists who propose only the imitation of *such* or *such* a particular person, without election of those ideas before mentioned have been reproached for that omission. *Dryden.*

SUCHITEPEQUE, a district of Guatimala, to the south of the province of Soconusco. It is throughout of a very hot temperature, and subject to continual rains, with tempests of thunder and lightning.

SUCHITEPEQUE, SAN ANTONIO DE, the capital of the above province, situated on a river of the same name, running into the Pacific Ocean. It contains 1480 Indians, occupied in the cultivation of cochineal and indigo; 72 miles north-west of Guatimala. Lat. 14. 47. N. long. 92. 14. W.

SUCHONA, a large river of the north of European Russia, which issues from Lake Kubenskoi, in the government of Vologda, flows southward till it reaches Usting, then turns north, receives the Jug, and afterwards takes the name of Dwina.

SUCHOVOLKA, a small town in the west of European Russia, in the province of Bialystok. Population 1000.

SUCHTELN, a small town of Prussian Westphalia, in the duchy of Juliers. It contains 3600 inhabitants, whose chief employment as manufacturers, is the weaving of velvet; 15 miles west-by-north of Dusseldorf, and 17 east-north-east of Ruremond.

To SUCK, *v. a.* [*ycan*, Saxon; *sugo*, *suctum*, Latin; *succer*, French.] To draw by making a rarefaction of the air.—To draw in with the mouth.—The cup of astonishment thou shalt drink, and *suck* it out. *Ezek.*

We'll hand in hand to the dark mansions go,
Where, *sucking* in each other's latest breath,
We may transfuse our souls. *Dryden.*

To draw with the milk.

Thy valiantness was mine, thou *suck'dst* it from me;
But own thy pride thyself. *Shakspeare.*

To empty by sucking.—A fox lay with whole swarms of flies *sucking* and galling of him. *L'Estrange.*

Bees on tops of lilies feed,
And creep within their bells to *suck* the balmy seed.

Dryden.

To draw or drain.—I can *suck* melancholy out of a song,
as a weazel *sucks* eggs. *Shakspeare.*

To *SUCK*, *v. n.* To draw by removing the air.—Continual repairs, the least defects in *sucking* pumps are constantly requiring. *Mortimer.*—To draw the breast.—Such as are nourished with milk find the paps, and *suck* at them; whereas none of those that are not designed for that nourishment ever offer to *suck*. *Ray.*—To draw; imbibe.—The crown had *sucked* too hard, and now, being full, was like to draw less. *Bacon.*

SUCK, *s.* The act of sucking.—I hoped, from the descent of the quicksilver in the tube, upon the first *suck*, that I should be able to give a nearer guess at the proportion of force betwixt the pressure of the air and the gravity of quicksilver. *Boyle.*—Milk given by females.—They draw with their *suck* the disposition of nurses. *Spenser.*—[*Succus*, Lat.] Juice. *Not in use.*—Take the *sucke* or juice of a radish root, and anoint your hands with it. *Ward.*

SUCK, a river of Ireland, which runs into the Shannon; about 6 miles south-east from Balinasloe, separating the counties of Galway and Roscommon during a course of 30 miles.

SUCK CREEK, a river of the United States, in Tennessee, which runs into the Tennessee, at the Whirl.

SUCKASUNNY, a pleasant village of the United States, in Morris county, New Jersey, containing a Presbyterian meeting-house.

SUCKER, *s.* [*suceur*, French.] Any thing that draws.—The embolus of a pump.—Oil must be poured into the cylinder, that the *sucker* may slip up and down in it more smoothly. *Boyle.*—A round piece of leather, laid wet on a stone, and drawn up in the middle, there being no air within, is pressed by the circumambient atmosphere down to the stone.—One of the round leathers wherewith boys play, called *suckers*, not above an inch and half diameter, being well soaked in water, will stick and pluck a stone of twelve pounds up from the ground. *Grew.*—A pipe through which any thing is sucked.

Mariners aye ply the pump,
So they, but cheerful, unfatigu'd, still move
The draining *sucker*.

Philips.

A young twig shooting from the stock. This word was perhaps originally *surcle*. [*surculus*, Latin.] The cutting away of *suckers* at the root and body doth make trees grow high. *Bacon.*

SU'CKET, *s.* A sweetmeat, to be dissolved in the mouth.—Here are *suckets* and sweet dishes. *Beaumont and Fl.*

SU'CKINGBOTTLE, *s.* A bottle which to children supplies the want of a pap.—He that will say, children join these general abstract speculations with their *suckingbottles*, has more zeal for his opinion, but less sincerity. *Locke.*

To *SU'CKLE*, *v. a.* To nurse at the breast.

The breast of Hecuba,
When she did *suckle* Hector, look'd not lovelier.

Shakspeare.

She nurses me up and *suckles* me. *L'Estrange.*—Two thriving calves she *suckles* twice a-day. *Dryden.*—The Roman soldiers bare on their helmets the first history of Romulus, who was begot by the god of war, and *sucked* by a wolf. *Addison.*

SU'CKLE, *s.* A teat; a dug.—The body of this fish [the manatee or cowfish] is three yards long, and one broad, thick-skinn'd, without scales, narrow towards the tail which is nervous, slow in swimming, wanting fins; in place whereof, she is aided with two paps, which are not only *suckles*, but serve for stilts to creep ashore upon. *Sir T. Herbert.*

SUCKLEY, a parish of England, in Worcestershire; 10 miles west-south-west of Worcester. Population 555.

Vol. XXIII. No. 1599.

SU'CKLING, *s.* A young creature yet fed by the teat.

I provide a *suckling*,
That ne'er had nourishment but from the teat. *Dryden.*

Young animals participate of the nature of their tender aliment, as *sucklings* of milk. *Arbutnot.*

SUCKLING (Sir John), an English poet, was born at Witham, Essex, in 1613, and is said to have possessed such natural talents, that he spoke Latin at the age of five years, and wrote it at nine. He chiefly devoted himself to music and poetry. Having finished his studies at home, he travelled abroad for farther improvement, and made a campaign under Gustavus Adolphus, in which he is said to have been present at five sieges, three battles, and some skirmishes. Upon his return to England, he appeared the accomplished gentleman and courtier, and excited admiration by his sprightliness and gallantry. Associating with wits and poets, he composed some dramatic pieces for the amusement of the court: and such was his prodigality, that when he brought his tragedy of "Aglaura," on the stage, he expended four or five hundred pounds. Whilst he drew attention in the gay period of that reign by his poetical effusions and courtly manners, he affected to be indifferent to literary fame. When the troubles of this reign began, he evinced his loyalty by raising a troop of horse at the expense of 12,000*l.*, and placing himself at their head. On this occasion he incurred a disgrace which was trumpeted in ballads and squibs by his brother poets, and which is supposed to have hastened his death in 1641, when he had arrived only at the 28th year of his age. *Suckling* has no claim to distinction among the British poets; though, if he had bestowed greater care and correctness on some of his songs and ballads, they might have served as models of that class of compositions. His "Wedding Ballad" has always been popular; and the fancy and wit that sparkle in some of his amatory pieces attract notice. His plays, which are four in number, have long disappeared from the stage. His collected works, in prose and verse, have passed through several editions: the last appeared in 1774, 2 vols. 12mo. Life of *Suckling*, prefixed to his Works.

SUCKLING, CAPE, a cape on the west coast of North America. Lat. 60. N. long. 216. 19. E.

SUCTASGUR, a town and fortress of Hindostan, province of Allahabad. The fortifications were formerly of considerable extent, and defended the passes into the western hills. They were erected nearly 500 years ago; but are now quite neglected. This place is the capital of a small district of the same name, which is now included in the collectorship of Benares. It is situated 14 miles south of the fortress of Chunar.

SU'CTION, *s.* [*suction*, Fr.] The act of sucking.—Sounds exterior and interior may be made by *suction*, as by emission of the breath. *Bacon.*—Though the valve were not above an inch and a half in diameter, yet the weight kept up by *suction*, or supported by the air, and what was cast out of it weighed ten pounds. *Boyle.*—Cornelius regulated the *suction* of his child. *Arbutnot.*

SUCUBITI, a river of South America, in the province of Darien, which enters the Chucunaqui.

SUCURIU, a river of Brazil, in the province of Cuiaba, which enters the Pardo, a tributary of the Parana. There is another river of this name, mentioned by Mr. Mawe, which falls directly into the Parana, with a mouth fifty fathoms wide.

SUCURY, a small river of Brazil, in the province of Cuiaba, which falls into the Tiete, a tributary of the Parana.

SUCUT, a town of Hindostan, province of Lahore, intersected by the Beyah river, belonging to the Seiks. Lat. 32. 41. N. long. 75. 45. E.

SUCZAVA, an ancient town of Austrian Galicia, in the Bukowine, at the confluence of the rivers Suczava and Sereth. It is situated beyond the southern boundary of Poland, is surrounded with a wall and ditch, and contains

about 4000 inhabitants, but is only a shadow of what it once was, having been the residence of the Princess of Moldavia, the ruins of whose palace, with those of seventeen large churches, bear testimony to its former population. The ravages of the Tartars and other invaders, the removal of the court, and the opening of new channels for trade, have reduced the town to a state of insignificance, from which the Austrian government has laboured in vain to raise it. At present it contains hardly any establishment worth notice, except a manufactory of Russian leather by some Armenian settlers, and a school for training teachers for the adjacent country; 70 miles west of Jassay, and 97 south-south-east of Lemberg.

SUD, RIVIERE DE, a beautifully winding stream of Lower Canada, which has its source in the high grounds about 20 miles to the southward of the St. Lawrence. Another principal branch descends from heights much farther, into the interior. It forms a large basin before it falls into the St. Lawrence. Its course being much impeded by shoals, it is not navigable except for canoes. The level of its bed is 20 feet above the St. Lawrence, which occasions a fall that produces a beautiful effect.

SUDA, a small town situated on a bay of the island of Candia, in the Levant. It has a good harbour, and is defended by a castle.

SUDAK, a small town in the south of European Russia, in the Crimea, situated on a hill, with a good but small harbour. The environs produce wine, nearly of the same colour and quality with that of Champagne. This town formerly belonged to Genoa, and in the flourishing days of that state was considerable, but is now dwindled into insignificance; 22 miles south-west of Theodosia.

SU'DARY, *s.* [*sudarium*, Lat.] A napkin or handkerchief. *Prompt. Parv.*—Lo, thi besaunt that I hadde put up in a *sudarye*. *Wicliffe*.

SUDASHYGUR, a fortress of Hindostan, on the western shore of the province of Canara. It is situated on a high point of land, and being remarkably white, is very conspicuous at sea. It commands the entrance of the Aliga river, and may be considered as the citadel of the town of Carwar.

SUDATION, *s.* [*sudo*, Latin.] Sweat.

SU'DATORY, *s.* [*sudo*, Lat.] Hot-house; sweating-bath—Shiraz is—defended by nature, enriched by trade, and by art made lovely; the vineyards, gardens, cypresses, *sudatories* and temples ravishing the eye and smell, so as in every part she appears delightful and beautiful. *Sir T. Herbert*.

SUDBOROUGH, a parish of England, in Northamptonshire; 3½ miles north-west-by-north of Threapston.

SUDBOURN, a parish of England, in Suffolk; 1½ mile north-by-east of Orford. Population 436.

SUDBROOK, a parish of England, in Lincolnshire; 4½ miles north-east of Lincoln.

SUDBURY, a market town and borough of England, in the county of Suffolk, situated on the north eastern side of the river Stour, which is here navigable for barges, and over which there is a well-built wooden-bridge. It was originally termed Southburgh, to distinguish it from Norwich, then Northburgh, and was anciently a place of much greater importance than at present. It was one of the first places at which King Edward III. settled the Flemings, whom he invited to England to instruct his subjects in the woollen manufacture. This business accordingly flourished here for some centuries, and afforded employment to many of the inhabitants of the town, in the weaving of says, crape, and ships' flags; but the trade has long since declined here, and fixed its seat in other districts of the kingdom, though the town has still a manufacture of says, and also an extensive and increasing silk manufactory, established some years ago by the London merchants, on account of the dearth of labour in Spitalfields. Sudbury comprehends three parishes, and has the same number of churches, which are large and handsome structures, *viz.*, St. Gregory's, St. Peter's, and All Saints.

The houses in the town are tolerably good buildings, but the streets are dirty, especially in bad weather. Sudbury is an ancient corporation, and is governed by a mayor and seven aldermen. It has sent members to parliament ever since the reign of Edward IV. The right of election is in the whole body of freemen, the number of whom is about 725; the mayor of the town is the returning officer. In this town was born Simon de Sudbury, Archbishop of Canterbury, in 1375, who was beheaded by the populace in the rebellion of Wat Tyler. He erected a part of St. Gregory's church, where he is interred, and also founded and endowed a college on the site of his father's house, Lelaud observes, that this prelate, in conjunction with John de Chertsey, founded here a priory of the order of St. Augustine, part of which building, converted into a dwelling-house, is yet standing. Amica, Countess of Clare, in the reign of King John, also founded in this town an hospital, dedicated to Christ and the Virgin. Sudbury was the birth-place of Thomas Gainsborough, one of the most eminent English painters of the 18th century. Population in 1831, 3371. Houses 876. Market on Saturday, and two annual fairs; 14 miles south-south-east of St. Edmondsbury, and 56 north-east of London. Lat. 52. 3. N. long. 1. 14. E.

SUDBURY, a parish of England, in Derbyshire, on the river Dove; 14 miles west-by-south of Derby. Population 525.

SUDBURY, a hamlet of England, in the parish of Tiddensham, Gloucester.

SUDBURY, a post township of the United States, in Rutland county, Vermont. Population 754.

SUDBURY, a township of the United States, in Middlesex county, Massachusetts; 22 miles west of Boston. Population 1287.

SUDBURY, EAST, a post township of the United States, in Middlesex county, Massachusetts; 18 miles west of Boston. Population 824.

SU'DDEN, *adj.* [*soudain*, French; *roben*, Saxon.] Happening without previous notice; coming without the common preparatives; coming unexpectedly.

We have not yet set down this day of triumph;
To-morrow, in my judgment, is too *sudden*. *Shakspeare*.

Hasty; violent; rash; passionate; precipitate. *Not now in use*.

I grant him
Sudden, malicious, smacking of ev'ry sin. *Shakspeare*

SU'DDEN, *s.* Any unexpected occurrence; surprise. *Not in use*.—Parents should mark the witty excuses of their children at *suddains* and surprisals, rather than pamper them. *Wotton*.

On or of a SUDDEN, or upon a SUDDEN. Sooner than was expected; without the natural or commonly accustomed preparatives.

Following the flyers at the very heels,
With them he enters, who *upon the sudden*
Clapt to their gates. *Shakspeare*.

SU'DDENLY, *adv.* In an unexpected manner; without preparation; hastily.

You shall find three of your Argosies
Are richly come to harbour *suddenly*. *Shakspeare*.

Without premeditation.
If thou can'st accuse,
Do it without invention *suddenly*. *Shakspeare*.

SU'DDENNESS, *s.* State of being sudden; unexpected presence; manner of coming or happening unexpectedly.
All in the open hall amazed stood,
At *suddenness* of that unwary sight,
And wonder'd at his breathless hasty mood. *Spenser*.

SUDDY, a parish of Scotland, in Ross-shire, united to Kilmuir Wester.

SUDELY, a hamlet of England, in Gloucestershire; 1 mile south-south-east of Winchcombe.

SUDENBERG,

SUDENBURG, a small town of Prussian Saxony, on the south side of the city of Magdeburg, of which it is properly a suburb, though governed in all respects as a separate town. In the reign of Jerome Buonaparte, a great part of it was demolished, to facilitate the defence of Magdeburg; but since the cession of the latter to Prussia (in 1814) it has been rebuilt.

SUDERMANIA, or **SODERMANLAND**, a province of Middle Sweden, situated to the west of Stockholm. Its greatest length from east to west is about 100 miles; its breadth from north to south 55; its territorial extent is 3470 square miles; its population about 156,000. The face of the greatest part of the province is hilly, and finely variegated with lakes. The climate, though cold, is not intemperate; the air is pure and healthy. The inhabitants raise corn in sufficiency for their consumption, and a small quantity for export. The pasturage is good, the forests extensive. In the mountains, which are almost all of primitive formation, are found mines of lead, copper, iron; and from Tunaberg, a large quantity of cobalt ore is sent to England, for the use of the potteries. The Baltic and the Lake Malar, promote greatly the conveyance of commodities.

SUDEROE, one of the Faroe islands, belonging to Denmark. Its area is 42 square miles, and its population 700.

SUDERSHAUSEN, a neat village of Germany, in the south of Hanover, province of Gottingen.

SUDETES, a large mountain chain of Germany, which separates the states of Austria from those of Saxony and Prussia, and is distinguished by the names of the Erzgebirge and the Riesengebirge, viz., the Mining and the Giant's Mountains. Besides this great chain, it sends off on both sides a number of branches into Bohemia, Moravia, Lusatia, and Silesia. These are known by a variety of names, such as the mountains of Glatz, the forest of Bohemia, the Isargebirge, the Wohlische Kamme, the Eulengebirge, &c. The great mountains are primitive, and abound in metallic ores; those of the middle rank consist chiefly of clay, slate, limestone and trap, and in some places of pit coal. The side branches and lowest mountains contain floetz trap and freestone, wack and basalt. For a more particular description of different parts of the Sudetes, see **SAXONY**, **BOHEMIA**, **ERZGEBIRGE**, **RIESENGBIRGE**, and other names mentioned above.

SUDGROVE, a hamlet of England, within a mile of the city of Gloucester.

SUDIS, the *ESOX MURÆNA*; which see.

SUDISLAVI, a small town of the interior of European Russia, in the government of Kostroma; 26 miles east-by-north of Kostroma.

SUDOGDA, a small town of the interior of European Russia, in the government of Vladimir, on the Sudogd; 32 miles south-east of Vladimir.

SUDORIFIC, *adj.* [*sudorifique*, Fr., *sudor* and *facio*, Lat.] Provoking or causing sweat.—Exhaling the most liquid parts of the blood by *sudorific* or watery evaporations, brings it into a morbid state. *Arbuthnot*.

SUDORIFIC, *s.* A medicine promoting sweat.—As to *sudorifics*, consider that the liquid which goes off by sweat is often the most subtle part of the blood. *Arbuthnot*.

SUDOROUS, *adj.* [*sudor*, Lat.] Consisting of sweat. *Not used*.—Beside the strigments and *sudorous* adhesions from men's hands, nothing proceedeth from gold in the usual decoction thereof. *Brown*.

SUDS, *s.* [From *soeben*, to *seeth*; whence *soeben*, Saxon.]—A lixivium of soap and water.

To be in the SUDS. A familiar phrase for being in any difficulty.—Will ye forsake me now and leave me *i' the suds*? *Beaum. and Fl.*

SUDSHA, a town of the interior of European Russia, in the government of Kursk, containing 5700 inhabitants. In the middle of the town is a marsh, which renders it unhealthy, and part of the streets almost impassable; an instance, among many others, of the miserable want of attention in this country to the comfort and even the safety of the people. The environs are, however, fertile, and contain a

number of orchards. The town has a salt manufacture, and a petty traffic with the adjacent country; 47 miles south-west of Kursk.

To SUE, v. a. [*suiver*, French.] To prosecute by law.—If any *sue* thee at the law, and take away thy coat, let him have thy cloak also.—To gain by legal procedure.

I am denied to *sue* my livery here,
And yet my letters patent give me leave. *Shakspeare*.

To follow; to ensue.—Léchery that *sueth* always glut-tony.—[In falconry.] To clean the beak, as a hawk.

To SUE, v. n. To beg; to entreat; to petition.

Full little knowest thou that hast not try'd,
What hell it is in *suing* long to bide. *Spenser*.

If me thou deign to serve and *sue*,
At thy command lo all these mountains be. *Spenser*.

To SUE, v. a. To obtain by intreaty; with *out*. The expression is borrowed from the *law*.—Nor was our blessed Saviour only our propitiation to die for us, but he is still our advocate, continually interceding with his Father in the behalf of all true penitents, and *suing* out a pardon for them in the court of heaven. *Calamy*.

SUE, a river of Africa, in Benguela, one of the branches of the larger river called Bembarogue.

SVEABORG, a sea-port and fortress situated on the gulf of Finland; 4½ miles south of Helsingfors. The harbour of this place is capable of containing 70 men of war, and easily defended by batteries which sweep the channel forming the only entrance for large ships. It is formed by several small islands, of which the principal, called Wargoe, contains the arsenal, docks, basins, and magazines for fitting out or repairing men of war. The inhabitants of the place do not exceed 3500, but the garrison is generally more numerous, and the fortifications are likely, when completed, to stand a comparison with Gibraltar. They were begun in 1788, and continued by the Swedish government, with more or less activity, from that date to 1808, when the place falling into the hands of the Russians, they have been farther continued on the plan of making this the principal naval station in Finland. The walls are chiefly of granite, covered with earth from 6 to 10 feet in thickness, and in some places 40 feet in height. In 1790, Gustavus III. of Sweden defeated the Russians in a naval engagement near this place.

SUECA, a town in the south-east of Spain, in the province of Valencia, not far from the mouth of the Xucar, which is joined here by a small stream flowing from the lake of Albufera. It stands on the great road along the coast, contains 4800 inhabitants, and belonged formerly to the grand master of the knights of Montesa; 21 miles south of Valencia. Lat. 39. 16. N. long. 1. 10. W.

SUEIRA DA CASTA, a small river of Western Africa, which falls into the Atlantic, in Lat. 5. 5. N.

SVELMOE, a small island of Denmark, near the south coast of the island of Funen. Lat. 55. 8. N. long. 10 20. E.

SUEMEZ, ISLAND OF, an island in the Pacific ocean, at the entrance of Puerto de Baylio Bucareli; about 25 miles in circumference. Lat. 55. 16. N. long. 236. 50. E.

SVENDBORG, a small town of Denmark, on the south-east coast of the island of Funen. It is fortified, and has a safe and spacious harbour. Population 2000; 25 miles east-south-east of Odensee.

SUEN-HOA, a city of China, of the first rank, in the province of Pe-che-lee, situated among mountains in the immediate vicinity of the great wall. It is considerably distinguished by the number of its inhabitants, the beauty of its streets, and its triumphal arches. The mountains afford fine crystal, marble, and porphyry. Its district includes a considerable number of forts, destined to defend the great northern barrier of the empire; 77 miles north-west of Peking.

SVENINGOROD, a small town in the interior of European Russia; 38 miles west of Moscow, situated on a hill near the river Moskva. Population 1000.

SVENIGORODKA, a small town in the south-west of European

European Russia, the chief place of a circle; 93 miles south of Kiev.

SVENZIANY, a small town of Russian Lithuania, the chief town of a circle; 33 miles north-north-east of Wilna.

SUESCA, formerly a large and rich city of New Granada, in the province of Ubates, but now reduced to a small village, containing about 100 inhabitants, and as many Indians: 29 miles north-north-east of Santa Fe.

SU'ET, *s.* [*suet*, an old French word according to Skinner.] A hard fat, particularly that about the kidneys.—The steatoma being *suet*, yields not to escaroticks. *Wiseman.*

SUETI, a river of New Granada, in the province of Choco, which runs west, and enters the mouth of the river Atrato.

SUETI, a river of South America, in the province of Darien, which enters the Chucmaqui.

SU'ETY, *adj.* Consisting of suet; resembling suet.—If the matter forming a wen resembles fat or a *suet* substance, it is called steatoma. *Sharp.*

SUEVRE, a town near the central part of France, in the department of the Loire and Cher, with 1300 inhabitants; 9 miles north-east of Blois.

SUETONIUS TRANQUILLUS (Caius), was the son of Suetonius Lenis, tribune of a legion in the time of Otho, and born about the beginning of the reign of Vespasian, and died after A. D. 117. He is designated by Pliny the younger, as one of the "Scholastici." He was probably a teacher of grammar and rhetoric, composed fictitious pleadings, and perhaps sometimes pleaded real causes. With Pliny he was intimate, and was indebted to him for several favours. By his interest he obtained the dignity of military tribune, and also the "jus trium liberorum," granted to him by the emperor Trajan, though he was childless. He was afterwards secretary to the emperor Adrian, though he lost this office by his indiscreet familiarity with the empress Sabina; an incident which occurred about the year 121, but how long, or in what condition he afterwards lived, no records inform us.

Suidas calls him a "grammarian," and ascribes to him several works: but all are lost, except his Lives of the Cæsars, his Lives of eminent grammarians, and a small part of those of eminent rhetoricians. His work of the Lives of the first twelve emperors, down to Domitian inclusively, is one of the most interesting remains of ancient history; for without being distinguished by style or sentiment, it abounds with anecdotes relating to the manners, characters, and incidents of those times, which no where else occur. Some of the facts which he relates have been doubted; but his general character and mode of writing narratives, acquit him of any intentional misrepresentation; though he indicates a propensity to pay undue attention to vulgar tales and surmises.

SUEUR (Eustachius Le), was born at Paris in 1617, the son of an obscure sculptor; who, upon discovering his son's inclination for painting, placed him as a pupil with Simon Vouet.

He appears to have drawn his taste from prints after the compositions of Raphael, as he never was out of his native country; and there were not many pictures of the Roman school at that time in France. It may be fairly said, that a portion of the spirit of Raphael had taken up its abode with him. The same kind of subjects interested him, and above all he was actuated by the same devotedness to the subject, of whatever nature it were. With him, as with Raphael, it led to the composition, and controlled his imagination in the execution of it: as is fully exemplified in his series of pictures on the life of St. Bruno.

The brilliancy of Le Sueur's talents soon caused their employment; and at the age of 23 (in 1640), he was clected a member of the Royal Academy at Paris, and painted upon his admission a picture of St. Paul casting out a Devil. In 1649, he was engaged upon the great work in which his fame principally reposes, viz., the Life of St. Bruno, which he painted in 22 pictures, for the convent of the Chartreux in Paris: they were afterwards purchased by the king of

France, and now form part of the gallery at the Luxembourg. This celebrated series of compositions has suffered exceedingly by the hand of time; and still more, have so severely endured the unhallowed touch of picture-cleaners and restorers, that we cannot now form a perfect judgment of their original beauty. The compositions remain, but most of the faces of the figures have been re-touched, so that expression is weakened or destroyed: the original colouring, which happily of necessity simple, has been disturbed; and it would be harsh to attach to Le Sueur the defects of their present condition in this respect. There is, however, sufficient evidence in them of this ingenious artist's superior feeling and acquirements. He was only three years employed upon them; and when his youth is considered, they must be regarded as emanating from a mind of no common mould. His largest work is the Condemnation of St. Gervaise and St. Protais, now in the gallery of the Louvre; it was painted soon after the series above-mentioned; but is an attempt to combine somewhat of the taste of his master with his own, as if he were controlled by his employers. It is more confused in forms, and stronger and more varied in colour, than his pictures usually are; and is not the better for it. His picture of the Burning of the Magic Books at Ephesus, has infinitely more character and pathos; but is eminently defective in colour: in which quality the pictures of the Muses, painted by him, and in the Gallery also, are by far his most perfect productions. He died at the early age of 38, in 1655.

SUEZ, a city of Egypt, on the borders of Arabia, and remarkable by its situation at the head of the Red Sea. Although there must always have been a place of trade in this vicinity, the actual city of Suez appears to have been of modern origin. According to D'Anville, it occupies the site of the ancient *Arsinoe*; but in the opinion of Volney, that place was situated farther north, towards the bottom of the gulf. The celebrated Arabian city called Kolzum, which among that people gave its name to the Red Sea, was also placed farther to the north. Its ruins may still be traced; but the sea has so far retired, that ships could no longer enter its harbour. This circumstance enforced the removal to Suez, which appears to have taken place about the beginning of the 16th century. It soon became a flourishing mart, being at once the emporium of the trade with India, and the rendezvous of the numberless pilgrims, who from every part of the Turkish empire, repaired to the holy shrine of Mecca. The assemblage of these, though the stationary population was never large, produced often an immense crowd. When Niebuhr was there, Suez appeared to him as populous as Cairo. Since that time it has greatly declined, in consequence of the diminution both of the general trade of the Red Sea, and of the concourse to Mecca. It sustained, also, irreparable injury from the wanton devastations committed by the French. Great part of the trade of Suez being carried on by the Bey, or Mameluke chiefs, each of whom had a factor stationed at that place, the French, in revenge for the spirited resistance made by that race, demolished a great part of Suez; and the disturbed state of the country ever since has afforded little opportunity for repairing these injuries.

Suez, though a maritime place, is so situated, that vessels cannot approach nearer than two miles and a half from the town. From this point the water is divided into three channels, which unite into one before reaching the town, and through which the Arab boats, called dows, and other small vessels, can pass. The surrounding country is a complete desert, composed of a mere bed of rock, slightly covered with sand. Trees, gardens, and meadows, are entirely unknown, and scarcely a plant is to be seen. All provisions and necessaries of life must be brought from Cairo. There is also an entire deficiency of water, unless of the most offensive and noxious description. It is clear indeed to the eye, but most disgusting to the smell and taste; so that in strangers it even occasions vomiting. By long keeping it loses some of its bad qualities; but it is then sold at a very high price. This bad water also is brought from the distance of about two leagues, at the opposite side of an arm of the gulf. The town

town contains about 500 stone houses, of which more than half were destroyed by the French, and still continue in ruins. The numerous pilgrims reside entirely in tents, confusedly scattered about the town. Suez has no walls; but the houses are built so close together, that it can be entered from the land side only at one point. This is defended by three cannon; and eight are placed on the side towards sea; but these defences are of no use, unless against the wandering Arabs, and could not withstand the attack of 50 regular troops for half an hour. Upon the whole, Mr. Turner conceives Suez to be indisputably the most miserable place in the Levant, and that only the settled passion for money which characterises the Levantines, could induce any man to make it his residence. Its trade lies under many disadvantages, particularly from the difficult navigation of this upper part of the Red Sea, where vessels can only pass through a narrow channel, amid rocks often sunk beneath the surface. Danger also arises from the north winds, which blow with great violence for nine months in the year. Cosseir, which is less liable to these disadvantages, is now, notwithstanding the inconvenience of a longer and more difficult land journey often preferred for the trade to Egypt. Suez, however, still carries on much of the communication of Arabia and India with Cairo, and almost the whole of that with Syria and Palestine. Frequent caravans come from Gaza, Jaffa, and Jerusalem, bringing soap, oil, tobacco, and other goods. The staple import consists of coffee, an article of universal consumption throughout the east. Vessels bring also tea, pickled ginger, and a great quantity of tamarinds. There are eight considerable mercantile houses in Suez, of which six are Greek, and two are French. The charges of conveyance by the caravan are moderate. The pacha is said to pay very little attention to the accommodation of pilgrims, and involves them in long delays, which, causing the exhaustion of their funds, reduces many to perish with hunger. Lat. 30. 1. N. long. 32. 28. E.

SUFANGI UL BAHRI, a narrow island in the Red Sea, near the coast of Egypt: about 7 miles long. Lat. 27. N. long. 33. 56. E.

SUFFELNHEIM, a large village of France, in Alsace, containing 1600 inhabitants.

To SUFFER, *v. a.* [*suffer*, old French; to which Lacombe assigns the date of the eleventh century; *souffrir*, modern; *suffero*, Latin.]—To bear; to undergo; to feel with sense of pain.—A woman *suffered* many things of physicians, and spent all she had. *St. Mark.*

Obedience impos'd,

On penalty of death, and *suffering* death. *Milton.*

To endure; to support; not to sink under.

Our spirit and strength entire

Strongly to *suffer* and support our pains. *Milton.*

To allow; to permit; not to hinder.

He wonder'd that your lordship

Would *suffer* him to spend his youth at home. *Shakspeare.*

To pass through; to be affected by; to be acted upon.—The air now must *suffer* change. *Milton.*

To SUFFER, *v. n.* To undergo pain or inconvenience.—My breast I arm, to overcome by *suffering*. *Milton.*—Prudence and good-breeding are in all stations necessary; and most young men *suffer* in the want of them. *Locke.*—To undergo punishment.—The father was first condemned to *suffer* upon a day appointed, and the son afterwards the day following. *Clarendon.*

He thus

Was forc'd to *suffer* for himself and us!
Heir to his father's sorrows and his crown. *Dryden.*

To be injured.—Public business *suffers* by private infirmities, and kingdoms fall into weaknesses by the diseases or decays of those that manage them. *Temple.*

SUFFERABLE, *adj.* [*suffrable*, old Fr.] Tolerable; such as may be endured.

Thy rages be

Now no more *sufferable*. *Chapman.*

VOL. XXIII. No. 1599.

SUFFERABLENESS, *s.* Tolerableness. *Scott.*

SUFFERABLY, *adv.* Tolerably; so as to be endured.

An infant Titan held she in her arms;

Yet *sufferably* bright, the eye might bear

The ungrown glories of his beamy hair. *Addison.*

SUFFERANCE, *s.* [*souffrance*, French.] Pain; inconvenience; misery.

He must not only die,

But thy unkindness shall the death draw out

To ling'ring *sufferance*. *Shakspeare.*

Patience; moderation.

He thought t' have slain her in his fierce despight;

But, hasty heat tempering with *sufferance* wise,

He had his hand. *Spenser.*

Some villains of my court

Are in consent and *sufferance* in this. *Shakspeare.*

Both gloried to have 'scap'd the Stygian flood,

As gods, and by their own recover'd strength;

Not by the *suff'rance* of supernal power. *Milton.*

SUFFERER, *s.* One who endures or undergoes pain or inconvenience.

This evil on the Philistines is fall'n,

The *sufferers* then will scarce molest us here,

From other hands we need not much to fear. *Milton.*

One who allows; one who permits.

SUFFERING, *s.* Pain suffered.—Rejoice in my *sufferings* for you.

SUFFERINGLY, *adv.* With pain.

To SUFFICE, *v. n.* [*suffire*, French; *sufficio*, Latin.]

To be enough; to be sufficient; to be equal to the end or purpose.

To recount almighty works

What words or tongue of seraph can *suffice*,

Or heart of man *suffice* to comprehend? *Milton.*

To SUFFICE *v. a.* To afford; to supply.

The pow'r appeas'd, with winds *suffic'd* the sail;

The bellying canvas strutted with the gale. *Dryden.*

To satisfy; to be equal to want or demand.—Parched corn she did eat, and was *sufficed*, and left. *Ruth.*—Let it *suffice* thee that thou know'st us happy. *Milton.*

SUFFICIENCY, *s.* [*suffisance*, Fr.] State of being adequate to the end proposed.—His *sufficiency* is such, that he bestows and possesses, his plenty being unexhausted. *Boyle.*—Qualification for any purpose.—I am not so confident of my own *sufficiency*, as not willingly to admit the counsel of others.—Competence; enough.—An elegant *sufficiency*, content. *Thomson.*—Supply equal to want.—It is used by Temple for that conceit which makes a man think himself equal to things above him; and is commonly compounded with *self*.—*Sufficiency* is a compound of vanity and ignorance. *Temple.*

SUFFICIENT, *adj.* [*suffisant*, Fr., *sufficiens*, Latin.] Equal to any end or purpose; enough; competent; not deficient.—*Sufficient* unto the day is the evil thereof. *St. Matt.*

Heaven yet retains

Number *sufficient* to possess her realms. *Milton.*

Qualified for any thing by fortune or otherwise.—In saying he is a good man, understand me, that he is *sufficient*. *Shakspeare.*

SUFFICIENTLY, *adv.* To a sufficient degree; enough.—If religion did possess sincerely and *sufficiently* the hearts of all men, there would need be no other restraint from evil. *Hooker.*

Seem I to thee *sufficiently* possess'd
Of happiness?

Milton.

All to whom they are proposed, are by his grace *sufficiently* moved to attend and assent to them; *sufficiently*, but not irresistibly; for if all were irresistibly moved, all would embrace them; and if none were *sufficiently* moved, none would

would embrace them. *Rogers*.—In a few days, or hours, if I am to leave this carcase to be buried in the earth, and to find myself either for ever happy in the favour of God, or eternally separated from all light and peace; can any words sufficiently express the littleness of every thing else? *Law*.

SUFFIELD, a parish of England, in Norfolk; 3½ miles west-by-north of north Walsham.

SUFFIELD, a hamlet of England, North Riding of Yorkshire; 4½ miles west-north-west of Scarborough.

SUFFIELD, a post township of the United States, in Hartford county, Connecticut. It is a pleasant and considerable town, and contains four houses of public worship, two for Congregationalists, and two for Baptists. Here is a mineral spring considerably resorted to. Population 2680; 11 miles south of Springfield. Lat. 41. 59. N. long. 72. 40. W.

SUFFISANCE, *s.* [Fr.] Excess; plenty. *Obsolete*.

There him rests in riotous *suffisance*

Of all gladfulness and kingly joyance.

Spenser.

To SUFFLA'MINATE, *v. a.* [*sufflamino*, Lat.] To stop; to stay; to impede.—God could any where *sufflaminate* and subvert the beginnings of wicked designs. *Barrow*.

To SUFFLA'TE, *v. a.* [*sufflo*, Lat.] To blow up. *Not used*.

SUFFLATION, *s.* [*sufflatio*, Lat.] The act of blowing up. *Unused*.

To SUFFOCATE, *v. a.* [*suffoquer*, Fr., *suffoco*, Lat.] To choke by exclusion or interception of air.

Let galls gape for dog, let man go free,

And let not hemp his windpipe *suffocate*.

Shakespeare.

A swelling discontent is apt to *suffocate* and strangle without passage. *Collier*.

SUFFOCATE, *part. adj.* Choaked.

This chaos, when degree is *suffocate*,

Follows the choking;

Shakespeare,

SUFFOCATION, *s.* [*suffocation*, Fr.] The act of choking; the state of being choaked.—Diseases of stoppings and *suffocations* are dangerous. *Bacon*.

SUFFOCATIVE, *adj.* Having the power to choak.—From rain, after great frosts in the winter, glandulous tumours and *suffocative* catarrhs proceed. *Arbutnot*.

SUFFOLK, a maritime county of England, bounded on the north by the county of Norfolk, on the west by Cambridge, on the south by Essex, and on the east by the German ocean. The river Stour divides it from Essex, the Little Ouse and Waveney from Norfolk, and the Great Ouse and one of its branches from Cambridge. It lies within 0. 19. and 1. 45. east long., and 51. 56. and 52. 36. north lat. Its figure somewhat resembles a crescent, with the concavity towards the north, and the two horns projecting, the one along the coast towards Yarmouth, and the other along the Ouse on the west; but an oblong of almost unindented form may be measured on its surface from east to west, 47 miles long, and 30 broad. Its area has been variously stated. Mr. Young, in his agricultural survey, estimates it at 1269 square miles, or upwards of 800,000 acres. According to Arrowsmith's map, it contains about 1450 square miles; and some measurements make it as high as 1520 or 1560. It contains from 150 to 160 inhabitants to each mile. It has two grand divisions, viz., the liberty of Bury St. Edmund's, and what is termed the body of the county, for each of which there is a separate grand jury. It is subdivided into 21 hundreds and 75 parishes, which contain 7 boroughs, viz., Aldborough, Dunwich, Eye, Ipswich, Orford, Sudbury, and Bury St. Bury's, and 21 other market towns, viz., Beccles, Bildeston, Brandon, Botesdale, Bungay, Clare, Debenham, Framlingham, Hadleigh, Haverhill, Ixworth, Lavenham, Lowestoff, Mendlesham, Mildenhall, Needham, Neyland, Saxmundham, Southwold, Stow Market, and Woodbridge. It sends 16 members to parliament, two for the county, and two for each of the boroughs.

Suffolk is, in general, a level county, without any considerable eminences. The highest land in the county is in

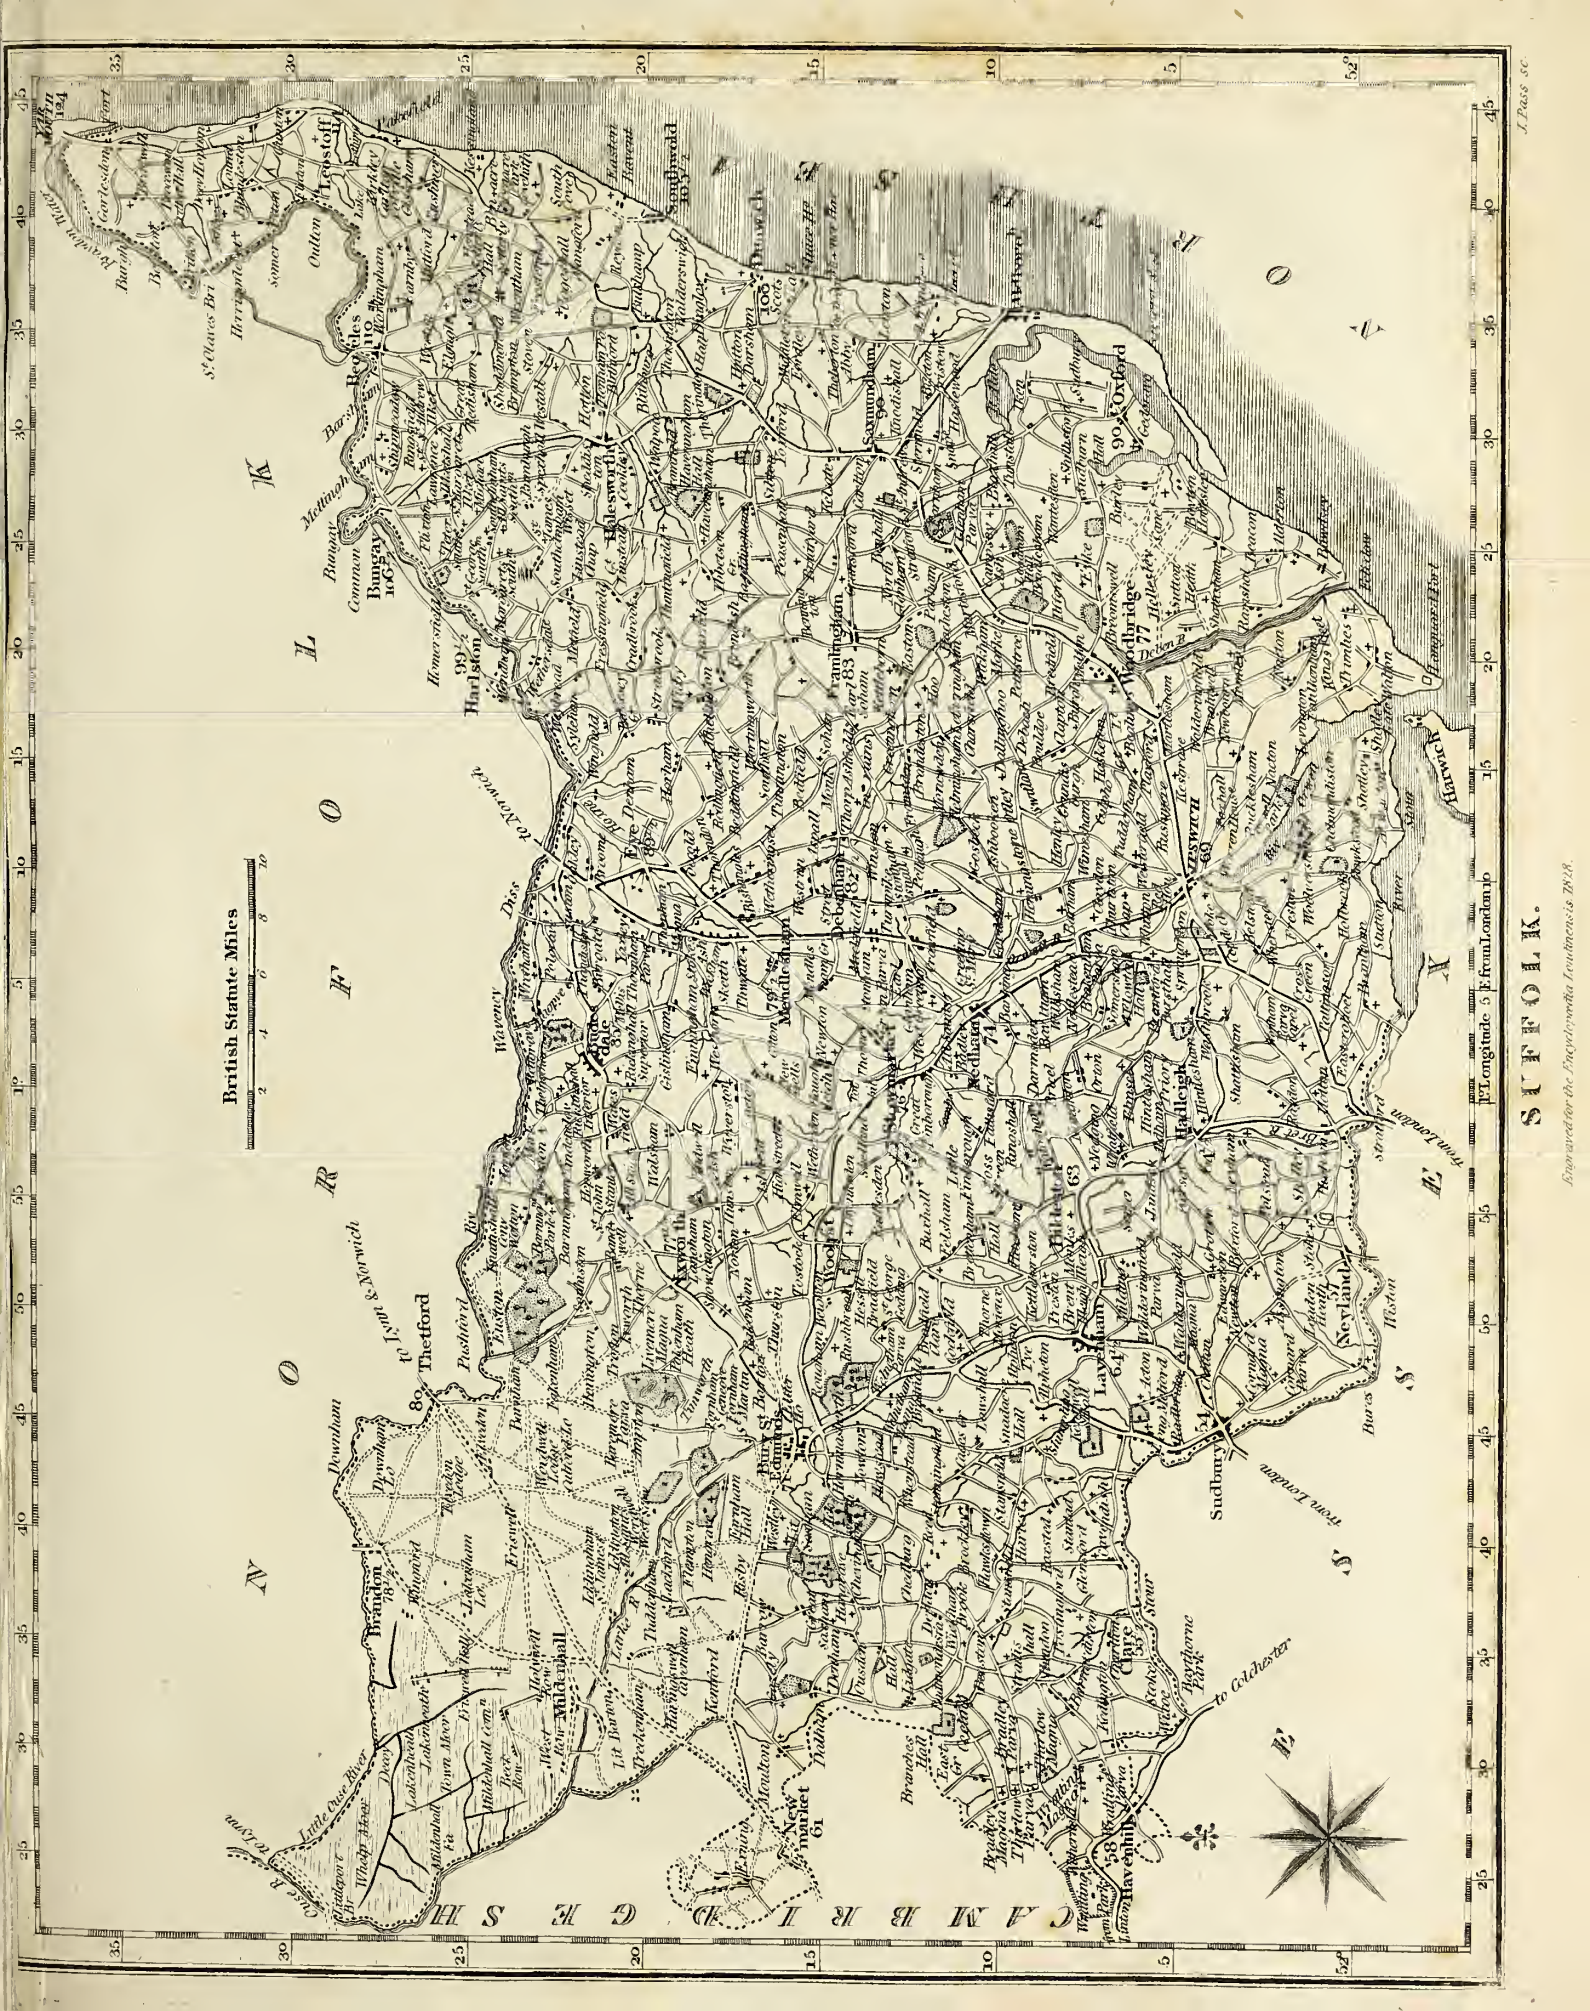

the west, where the great chalk ridge of this part of England extends from Haverhill, by Bury, to Thetford, in Norfolk. The rivers of the county, besides the Stour, the Waveney, and the Ouse, on the borders, are none of them of any great magnitude, except the Orwell, which rises above Stow Market, and, under the name of Gipping, descends by Needham to Ipswich, where it becomes navigable, widens into a kind of estuary, and then joins the Stour at Harwich. The other rivers are the Deben, the Ald, and the Blyth, along the coast, and the Lark on the west. The climate of Suffolk is reckoned the driest in the kingdom. In winter the frosts are severe, and the north-east winds in the spring sharp and prevalent.

The soil of this county is various, but very distinctly marked. 1st. A strong loam or a clay marl bottom predominates through the centre and greatest part of the county, extending from Haverhill to Beccles on the one hand, and from near Ipswich to beyond Ixworth on the other. 2d. On the east of this, and between it and the coast, extends northwards of the river Orwell, a district of sandy soil, and southwards a much smaller one of rich loam. 3d. To the west again occurs another considerable district of sand, which extends to the north-west corner of the county, where a fourth track of fen land is included between the Great and Little Ouse. The strong loam in the middle of the county is of a clayey nature, and highly productive in all the objects of husbandry, but varies in different places, more particularly along the banks of the rivers and streams, where it becomes a rich friable loam of superior quality. The sandy district along the coast varies from pure sand to loamy sand and sandy loam. It rests on a substratum of sand chalk or a shell marl, termed here *crag*, which is found in great masses in various parts of the county, particularly near Woodbridge, and is much used as a manure. This is one of the best cultivated districts in England, and abounds with wealthy farmers. Besides its arable land, it contains heaths, which afford extensive sheep walks, and marshes which feed numbers of cattle. The sea shore is composed of long cliffs, which are continually falling down by the action of the waves, which have almost washed away several towns, once considerable. The rich loam district extends with a small breadth across the Orwell, along the coast to the Deben; and here is a friable putrid vegetable mould, inclining to clay, and of extraordinary fertility. The rest of the district is more sandy. The sandy district on the west is of a much poorer quality than along the coast. The country is less cultivated, and abounds largely in warrens and sheep-walks. The soil of the fens is composed, from one to six feet under the surface, of common peat bog. Part of the land is under water, but a good deal has been drained. Suffolk is almost solely a farming county; and agriculture is practised to a great extent, with great skill, and after the most approved systems. The largest estate in the county is supposed not to exceed 9000*l.* a-year; and of the smaller estates, which are very numerous, many are occupied by the proprietors themselves, by whom they are farmed to great advantage. The size of farms is in general large. The farm houses, though much improved of late years, are still too often built of lath and plaster. Many of the cottages have undergone improvement. Mr. Young has made the following estimate of the extent of the different kinds of land, and of the rental of the county:—

Acres.	£.
30,000 fens, at 4 <i>s.</i>	6,000
46,667 rich loam, at 18 <i>s.</i>	42,000
156,667 sand, at 12 <i>s.</i>	93,999
113,333 sand, at 6 <i>s.</i>	33,999
453,333 strong loam, at 16 <i>s.</i>	362,666
800,000	£538,664

This estimate was made in 1796, since which period the value of the several kinds of land has improved, at an average, from 20 to 30 per cent.

The raising of crops is the principal object of the Suffolk husbandry, although the management of the dairy is also much attended to, as well as the rearing of sheep. The crops

British Statute Miles

Longitude 5 E from London

SUFFOLK.

Prepared for the Encyclopaedia Britannica in 1888.

A. Pass sc

crops commonly cultivated are wheat, barley, oats, rye, beans, pease, buck-wheat, cole-seed, turnips, clover, trefoil, white clover, and sainfoin. Buck-wheat forms a very valuable crop on sandy soils, and is more common on these, even on the poorest, than in many other parts of England. Cole-seed is one of the principal productions of the fen district, and, as food for sheep, is said to exceed turnips, both as to fattening and milk. The culture of turnips prevails in this county, almost as much as in Norfolk. Various other crops are raised in particular spots. A district called the Sandlands, lying between Woodbridge, Saxmundham, and Orford, is famous for its carrots, which have been raised here in great quantities for upwards of two centuries. Formerly they used to supply the London market, but they are now principally used as food for draught horses, for which purpose they are peculiarly adapted. Hops are raised in small quantity at Stow Market and neighbourhood, and cabbages for cows generally in the heavier land. Hemp is raised in a district about 10 miles in breadth, extending from Eye to Beccles, and is superior to that of Prussia. It is woven on the spot, into cloth of various degrees of fineness. Lucerne and chicory are also raised in the county. The cultivation of potatoes is little attended to. The management of the arable land, and the courses of crops, vary considerably in different districts. In strong soils, where manure is plenty, the best rotation is, first fallow, second wheat, third beans, fourth barley, fifth clover, and sixth wheat. On the rich loam and sand, the most usual course is, first turnip, second barley, third clover, and fourth wheat. On the said districts, turnips are every where the preparative, both for corn and grass. In the fenny district, cole-seed is usually sown after paring and burning; and after two successive oat crops, the land is laid down in grass for six years. Several new agricultural implements have been introduced into this county, and the use of threshing machines is extending. Suffolk is by no means remarkable for its grass lands, either in point of fertility or management; and this branch of husbandry is, on the whole, rather neglected here. Irrigation is very little practised. The district which was more peculiarly the seat of the dairies, lies near Framlingham, and extends about 20 miles by 12; but the late high price of corn induced the ploughing up of a great quantity of pasture. The butter made here is chiefly used in this and the adjoining county of Essex, and is annually about 10,000 firkins. Much cheese is also made; but being only supplementary to the butter, it is of an inferior quality. The Suffolk cows have long been celebrated for their abundance of milk, which, in proportion to the quantity of food, and size of the animal, exceeds that of any other kind in the kingdom. They are all of the hornless or polled breed, are of a small size, few rising, when fatted, to 50 stone, at 14 pounds each. The best milkers are in general red brindled, or of a yellowish cream colour. They yield of milk from four to six gallons a-day. The practice of feeding them on cabbages, formerly universal, is now on the decline. In some parts of the county black cattle are bought from north country drovers, to eat up the turnips. Some of these are Irish, others Welch, but most of them Scotch, of different breeds. After being fattened, they are sent to the metropolis. The sheep, of which large flocks are kept in the county, were, till of late years, almost entirely of the Norfolk breed. The South Down, however, which were introduced by Mr. Young, are now very prevalent, and, from their superior qualities, have superseded the former. Mr. Young calculates the number of sheep kept in the whole county at 240,000. Suffolk is no less noted for its breed of horses, than for its cows. These are found in the highest perfection in the maritime districts, extending to Woodbridge, Debenham, Eye, and Lowestoff. Of hogs, the short white breed in the cow district has great merit. Poultry is kept here in abundance, especially turkeys, for which the county is nearly as much celebrated as Norfolk. Great quantities of pigeons are reared in the open fields, in that part of the county bordering on Cambridgeshire. Suffolk contains many rabbit warrens, especially in the western sand district. One near

Brandon is reckoned to return above 40,000 rabbits in a year. Of late years, however, considerable tracts occupied by them, have been converted into arable and pasture land. The waste lands in this county Mr. Young estimates at 100,000 acres, comprehending sheep-walk, commons, warrens, &c.; most of which are capable of improvement. Though this is one of the earliest inclosed counties, it still contains very large tracts of open field land. It contains few woods or plantations of consequence. The commerce and manufactures of Suffolk have been long on the decline, and are now inconsiderable. Corn and malt are the principal exports, and the imports are chiefly for the supply of the county with the articles of ordinary consumption. Lowestoff is noted for its herring fishery. The spinning and carding of wool was formerly carried on to a great extent all over this county; but this has been in a great measure transferred to Yorkshire. At Sudbury there is a manufactory of serges, and also a small silk manufactory. This town was one of the first seats of the Flemings. Some calimancoes are still made at Lavenham. At the time of the Roman invasion, Suffolk belonged to the Tiene, and afterwards formed part of the province of Flavia Cæsariensis. At the conquest it was divided by the conqueror among his principal officers.

SUFFOLK, a county of the United States, in Massachusetts, comprising only two towns, Boston and Chelsea. Population 34,381.

SUFFOLK, a county of the United States, in New York, on the east part of Long Island, bounded north by Long Island sound, east and south by the Atlantic, and west by King's county. It comprises about two-thirds of the island. This county is much indented by its numerous creeks and bays, from many of which other small ones extend in arms, which have local names, and these form coves, points, heads, and necks, which are almost innumerable. The land on the north side, or next the sound, is considerably broken and hilly, though the soil is better than in the interior, where there is more woody plains; on the south side more loamy and level. Deer still abound in the extensive forests of pine in the interior; and Long Island is justly celebrated for the great variety of its wild fowl and game for sportsmen. Population 21,113. The chief towns are River-head, Sag-harbour, Satauket, and Huntington.

SUFFOLK, a post township of the United States, and capital of Nansemond county, Virginia, on the river Nansemond. It contains a court-house and a jail. The river is navigable to this place for vessels of 250 tons; 85 miles south-east of Richmond. Population 350.

SUFFOSSION, *s.* [*suffossio*, Lat.] The act of digging under.—Those conspiracies against maligned sovereignty, those *suffossions* of walls, those powder-trains. *Bp. Hall.*

SUFFRAGAN, *s.* [*suffragant*, Fr., *suffraganeus*, Lat.] A bishop considered as subject to his metropolitan.—The four archbishops of Mexico, Lima, S. Foy, and Dominico, have under them twenty-five *suffragan*-bishops, all liberally endowed and provided for. *Heylin.*—*Suffragan*-bishops shall have more than one riding apparitor. *Ayliffe.*—An assistant bishop: this is the more proper sense of the word. By an act, 26 Hen. VIII. *suffragans* were to be denominated from some principal place in the diocese of the prelate, whom they were to assist.—For a bishop to have a coadjutor, or, as the statute calls him, a *suffragan* to assist him, was no new thing, but of ancient use in England before Henry the Eighth.—Such *suffragan*, or coadjutor, was to have no revenue or jurisdiction in his diocese, whose *suffragan* he was; save what the bishop should by commission under his seal allow him. *Bp. Barlow.*

SUFFRAGANT, *adj.* [*suffragans*, Lat.] Assisting; concurring

concurring with.—Heavenly doctrine ought to be chief ruler and principal head every where, and not *suffragant* and subsidiary. *Florio*.

SUFFRAGANT, *s.* An assistant; a favourer; one who concurs with.—Hoping to find them more friends and *suffragants* to the virtues and modesty of sober women, than enemies to their beauty. *Bp. Taylor*.

To SUFFRAGATE, *v. n.* [*suffragor*, Lat.] To vote with; to agree in voice with.—No tradition could universally prevail, unless there were some common congruity of somewhat inherent in nature, which suits and *suffragates* with it, and closeth with it. *Hale*.

SUFFRAGATOR, *s.* [*suffragator*, Lat.] A favourer; one that helps with his vote.—The Synod in the Low Countries is held at Dort; the most of their *suffragators* are already assembled. *Bp. of Chester to Abp. Usher*.

SUFFRAGE, *s.* [*suffrage*, Fr., *suffragium*, Lat.] Vote; voice given in a controverted point.—The fairest of our island dare not commit their cause to the *suffrage* of those who most partially adore them. *Addison*.—United voice of persons in public prayer.—The *suffrages* next after the Creed shall stand thus. *Comm. Pr.*—Aid; assistance: a Latinism.—They make little account of indulgences, especially of those which are to be applied to the souls in purgatory by way of *suffrage*. *Dorrington*.

SUFFRAGINOUS, *adj.* [*suffrago*, Lat.] Belonging to the knee-joint of beasts.—In elephants, the bought of the forelegs is not directly backward, but laterally, and somewhat inward; but the hough or *suffraginous* flexure behind, rather outward. *Brown*.

SUFFRUTICOUS, *adj.* Being of a structure partly woody and partly herbaceous: as thyme.

SUFFUMIGATION, *s.* [*suffumigation*, Fr., *suffumigo*, Lat.] Operation of fumes raised by fire.—If the matter be so gross as it yields not to remedies, it may be attempted by *suffumigation*. *Wiseman*.

SUFFUMIGE, *s.* [*suffumigo*, Lat.] A medical fume. *Not used*.—For external means, drying *suffumiges* or smokes are prescribed with good success; they are usually composed out of frankincense, myrrh, and pitch. *Harvey*.

To SUFFUSE, *v. a.* [*suffusus*, Lat.] To spread over with something expansible, as with a vapour or a tincture.

Suspicious, and fantastical surmise,
And jealousy *suffus'd* with jaundice in her eyes. *Dryden*.

SUFFUSION, *s.* [*suffusion*, Fr.] The act of over-spreading with any thing. That which is suffused or spread. A drop serene hath quench'd their orbs,
Or dim *suffusion* veil'd. *Milton*.

The disk of Phœbus, when he climbs on high,
Appears at first but as a bloodshot eye;
And when his chariot downward draws to bed,
His ball is with the same *suffusion* red. *Dryden*.

SUG, *s.* [from *sugo*, Lat. to suck.] A small kind of worm.—Many have sticking on them *sugs*, or trout-lice, which is a kind of worm like a clove or pin, with a big head, and sticks close to him, and sucks his moisture. *Walton*.

SUGACHI, a river of Quito, in the province of Mainas, which runs south-south-east, and enters the Pastaza.

SUGAR, *s.* [*succe*, Fr. It has been traced to the Arabic *succar*, which is formed from the Pers. *schachar*.] The native salt of the *sugar*-cane, obtained by the expression and evaporation of its juice. *Quincy*.—All the blood of Zelman's body stirred in her, as wine will do when *sugar* is hastily put into it. *Sidney*.—Any thing proverbially sweet.

Your fair discourse has been as *sugar*,
Making the hard way sweet and delectable. *Shakspeare*.

A chymical dry crystallization.—*Sugar* of lead, though made of that insipid metal, and sour salt of vinegar, has in it a sweetness surpassing that of common *sugar*. *Boyle*.

To SUGAR, *v. a.* To impregnate or season with *sugar*.

Short thick sobs
In panting murmurs, still'd out of her breast,
That ever-bubbling spring, the *sugar'd* nest
Of her delicious soul, that there does lie,
Bathing in streams of liquid melody. *Crashaw*.

To sweeten.

His glosing sire his errand gaily said,
And *sugar'd* speeches whisper'd in mine ear. *Fairfax*.

SUGAR CREEK, a river of the United States, in Pennsylvania, which runs east into the east branch of the Susquehanna, about 6 miles above Tawandee Creek.

SUGAR CREEK, a township of the United States, in Armstrong county, Pennsylvania. Population 1113.

SUGAR CREEK, a township of the United States, in Venango county, Pennsylvania. Population 461.

SUGAR CREEK, a township of the United States, in Greene county, Ohio. Population 1826.

SUGAR CREEK, a river of the United States, in Ohio, which joins the Little Miami above Waynesville.

SUGAR HILL, a ragged eminence which overlooks and commands the old fortifications of Ticonderoga, in the United States, where the waters of Lake George flow into Lake Champlain, opposite Mount Independence.

SUGAR ISLAND, an island in the strait of St. Mary, which connects lakes Superior and Huron. It is long and narrow, bending towards the north in the form of a crescent, and causing an enlargement of waters between it and the continental coast.

SUGAR LOAF, a cape of Benguela, on the western coast of Africa. Lat 12. 5. S.

SUGAR LOAF, a township of the United States, in Luzerne county, Pennsylvania. Population 282.

SUGAR LOAF, a mountain of the island of Cuba; 55 miles north-east of St. Jago.

SUGAR LOAF BAY, a bay on the north-east coast of the island of Juan Fernandez.

SUGAR LOAF HILL, an eminence which serves as a landmark, on the north coast of Lake Erie.

SUGAR LOAF POINT, a projection on the east coast of New Holland, in Lat. 32. 29. S.

SUGAR RIVER, a river of the United States, in the territory of Michigan, which runs into Saganaum bay.

SUGAR RIVER, a river of the United States, in New Hampshire, which runs from the Sunapee lake into the Connecticut, in Clermont.

SUGAR RIVER, a river of Veragua, which runs into the Bay of Honduras.

SUGARCA'NDY, *s.* Sugar candied, or crystallized.—One poor pennyworth of *sugar-candy*. *Shakspeare*.

SU'GARY, *adj.* Sweet; tasting of sugar.

With the *sugary* sweet thereof allure
Chaste ladies' ears to phantasies impure. *Spenser*.

Fond of sugar or sweet things.—*Sugary* palates. *Hist. R. S.*

SUGAT, a town of Asia Minor, in the pachalic of Bursa, supposed to occupy the position of the ancient Tottarium. The houses, like most of those in the Turkish towns, are built of wood and mud, in general two stories high, with projecting verandahs, and roofed with a common red tile, which almost always admits the rain. It is remarkable for the tomb of Ali Osman, held in high respect by the natives.

SUGER, Abbot of St. Denis, and prime minister of France under Louis the Young, was born in the year 1082. He was employed by Louis le Gros, who conferred on him the abbey of St. Denis, and employed him in a variety of concerns. When Louis the Young, successor to Louis le Gros, set out on a crusade to the Holy Land in 1147, he nominated Suger regent of the kingdom. In this high station he acted with wisdom and integrity, and adopted measures for supplying the king with money, without burdening his subjects. His works were a "Life of Louis le Gros," "Memoirs of his Administration at the Abbey of St. Denis," &c. "Epistles,"

"Epistles," &c., which Du Chesne has published in the collection of French historians. *Moreri*.

SUGE/SCENT, *adj.* [from *sugeo*, Lat.] Relating to sucking.—The *sugescent* parts of animals are fitted for their use, and the knowledge of that use put into them. *Paley*.

To SUGGEST, *v. a.* [*suggero*, *suggestum*, Latin; *suggerer*, Fr.] To hint; to intimate; to insinuate good or ill; to tell privately.

Are you not ashamed?

What spirit *suggests* this imagination? *Shakspeare*.

Some ideas make themselves way, and are *suggested* to the mind by all the ways of sensation and reflexion. *Locke*.—To seduce; to draw to ill by insinuation. *Out of use*.

When devils will their blackest sins put on, They do *suggest* at first with heavenly shows. *Shakspeare*.

To inform secretly. *Out of use*.—We must *suggest* the people. *Shakspeare*.

SUGGESTER, *s.* One that remindeth another.

Some suborn'd *suggester* of these treasons. Believ'd in him by you. *Beaum.*

SUGGESTION, *s.* Private hint; intimation; insinuation; secret notification.

He was a man

Of an unbounded stomach, ever ranking Himself with princes: one that by *suggestion* Tied all the kingdom. *Shakspeare*.

Native and untaught *suggestions* of inquisitive children. *Locke*.—Secret incitement.

Arthur, they say, is kill'd to-night On your *suggestion*. *Shakspeare*.

SUGGESTUS, among the Romans, a place in the Campus Martius raised higher than the rest, where every magistrate, according to his rank, was allowed to harangue the people; but private persons could not, unless they first obtained leave from some magistrate to do it.

To SUGGIL, *v. a.* [*suggillo*, Lat.] To defame: the Latin word has the same figurative meaning.—They will not shrink to offer their blood for the defence of Christ's verity if it be openly impugned, or secretly *suggilled*. *Abp. Parke*.

To SUGGILATE, *v. a.* [*suggillo*, Lat.] To beat black and blue; to make livid by a bruise.—The head of the os humeri was bruised, and remained *suggilated* long after. *Wiseman*.

SUGGILLATION, *s.* [*suggilation*, Fr. Cotgrave.] A black and blue mark; a blow; a bruise.

SUGGOWLY, a town of Hindostan, province of Bahar, district of Bettiah. It is situated on the south side of the Boora Gunduck river, and carries on a considerable trade in timber, floated down from the northern hills. Lat. 26. 43. N. long 85. 5. E.

SUGGRUNDARIUM, among the Romans, a place where infants, not exceeding forty days old, were buried; it being unlawful to burn them.

SUGGSVILLE, a post village of the United States, in Clark county, Alabama; 12 miles from Clairborne.

SUGILLATIO, in Surgery, an ECCHYMOISIS; which see.

SUGTIVA, a term used by some authors to express medicines which suck up and absorb the serosities in dropsical persons.

SUGLEY, a township of England, in the parish of Newburn, Northumberland.

SUGUACHI, a large and abundant river of South America, which runs through unknown territories to the south-east, and enters the Pastaza, in Lat. 3. 35. S.

SUGULMESSA, or SIGILMESSA, which, according to Mr. Jackson, ought more properly to be called Segin Messa, a district of Africa, to the south-west of Morocco, situated beyond the Atlas. It forms part of that immense plain which, through the greater part of the breadth of Africa, intervenes between Barbary and the desert of the

VOL. XXIII. No. 1600.

Sahara. Aridity is the prevailing character of the soil, though it still retains moisture sufficient for the production of dates. At an early period Sugulmessa was a city of great importance, being the rendezvous of the caravans from Morocco to Soudan; but since these have been in the habit of passing by Akka and Jaffa, Sugulmessa has lost its former importance, and the district is now included in the kingdom of Tafilet.

SUHLA, a town of Prussian Saxony, and the chief place of the circle of the Henneberg, is situated in the hilly track called the Forest of Thuringia. It contains 4 churches, 4 hospitals, and 6000 inhabitants, who are employed in two manufactures of a very different description, viz., fire-arms and cotton goods, particularly dimity. From the 15th to the 17th century, this was the principal place in Germany for making fire-arms. At present this manufacture, though shared with a number of other towns, is still sufficient to consume the metals prepared at six forges in the neighbourhood. The cotton manufactures were introduced in the latter part of the 18th century, and occupy between 500 and 600 looms; 8 miles north-by-west of Schleussingen, and 28 south-south-west of Erfurt.

SUIATOI NOS, or the HOLY CAPE, a cape of Asiatic Russia, in the province of Irkoutsk, between the rivers Yana Indigirka. It is situated on the coast of the Frozen Ocean, but points to the west. Lat. 68. 30. N. long. 39. 30. E.

SVIATOI NOSS, the name of two capes on the north coast of European Russia, in the Frozen Ocean. The one in Lat. 67. 30. N. long 49. 44. E. on the eastern side of the gulf called Tscheskaia Guba; the other at the north-east extremity of Lapland. Lat. 68. 56. N. long. 41. 25. E.

SVJATOI PAUL, a small fortress of Russia, in the Crimea, opposite to the promontory of Ortasch, in the island of Taman.

SUI/CIDE, *s.* [*suicidium*, Lat.] Self-murder; the horrid crime of destroying one's self.—Child of despair, and *suicide* my name. *Savage*.—A self-murderer.

If fate forbears us, fancy strikes the blow, We make misfortune, *suicides* in woe. *Young*.

SUIEN-PIN, a town of China, of the third rank, in Tchekiang.

SVIJASK, a small town of the east of European Russia, in the government of Kasan, on the river Sviaja. Its situation is picturesque. It has a manufactory of potash, and some traffic in corn, and contains 3100 inhabitants; 20 miles west-by-south of Kasan.

SUIKEON, a town of China, of the third rank, in Chan-si.

SU/LLAGE, *s.* [*souillage*, Fr.] Drain of filth. *Obsolec.*—When they have chosen the plot, and laid out the limits of the work, some Italians dig wells and cisterns, and other conveyances for the *suillage* of the house. *Wotton*.

SU/ING, *s.* [This word seems to come from *suer*, to sweat, Fr. It is perhaps peculiar to Bacon.] The act of soaking through any thing.—Note the percolation or *suing* of the verjuice through the wood; for verjuice of itself would never have passed through the wood. *Bacon*.

SVINOE, one of the Faroe islands, in the Atlantic, belonging to Denmark. Lat. 61. 56. N. long. 6. 0. W.

SUIPPE, a small town of France, in Champagne, department of the Marne, containing 2200 inhabitants. It has manufactures of leather and woollens, and is 15 miles west of St. Menehould, and 12 north of Chalons sur Marne.

SUIPPE, a small river of France, in Champagne, which runs into the Aisne; 6 miles north-east of Roncy.

SVIR, a river of European Russia, which unites the lakes Ladoga and Onega. It is navigable for small boats.

SUIRE, a river of Ireland, which rises in the county of Tipperary, and runs into the sea in Waterford harbour.

SUIT, *s.* [*suite*, Fr.] A set; a number of things correspondent one to the other.

We, ere the day, two *suites* of armour sought, Which borne before him, on his steed he brought. *Dryden*.
Clothes made one part to answer another.

Him all repute

For his advice in handsoming a *suit*;
To judge of lace, pink, panes, print, cut, and plait,
Of all the court to have the best conceit. *Donne.*

[From *To sue.*] A petition; an address of entreaty.

She gallops o'er a courtier's nose;
And then dreams he of smelling out a *suit*. *Shakspeare.*

Many shall make *suit* unto thee. *Job.*—Courtship.

He that hath the steerage of my course,
Direct my *suit*. *Shakspeare.*

In Spenser it seems to signify pursuit; prosecution.—A keeper, whiche I knewe, [was] requyred to folow a *sute* with hys hounde after one that hadde stolen a decree. *Abp. Cranmer.*

High amongst all knights hast hung thy shield,
Thenceforth the *suit* of earthly conquest shoone,
And wash thy hands from guilt of bloody field. *Spenser.*

[In Law.] *Suit* is sometimes put, for the instance of a cause, and sometimes for the cause itself deduced in judgment. *Ayliffe.*—All that had any suits in law came unto them. *Susanna.*—John Bull was flattered by the lawyers that his *suit* would not last above a year, and that before that time he would be in quiet possession of his business. *Arbutnot.*—[In Law also, from the old Fr. *suit*, “l'obligation de suivre les plaids de son seigneur. Les Anglois se servent encore de ce mot depuis Guillaume le Batard. 960.” *Lacombe.*] *Suit* of court; suit-service; attendance of tenants at the court of their lord.

Then found he many missing of his crew,
Which wont doe *suit* and service to his might. *Spenser.*

SUIT Covenant, s. [In Law.] Is where the ancestor of one man covenanted with the ancestor of another to sue at his court. *Bailey.*

SUIT Court, s. [In Law.] The court in which tenants owe attendance to their lord. *Bailey.* See the last sense of *SUIT*.

SUIT Service, s. [In Law.] Attendance which tenants owe to the court of their lord. *Bailey.* See the last sense of *SUIT*.

To *SUIT, v. a.* To fit; to adapt to something else—*Suit* the action to the word, the word to the action, with this special observance, that you o'erstep not the modesty of nature. *Shakspeare.*—To be fitted to; to become.

Compute the gains of his ungovern'd zeal,
Ill *suits* his cloth the praise of railing well. *Dryden.*

To dress; to clothe.

Be better *suit*ed;

These weeds are memories of those worsor hours.

Shakspeare.

To *SUIT, v. n.* To agree; to accord. *Dryden* uses it both with *to* and *with*.

The one intense, the other still remiss,
Cannot well *suit with* either; but soon prove
Tedious alike *Milton.*

The place itself was *suiting* to his care,
Uncouth and savage as the cruel fair. *Dryden.*

SUITABLE, adj. Fitting; according with; agreeable to; with *to.*—fo solemn acts of royalty and justice, their *suitable* ornaments are a beauty; are they only in religion a stain? *Hooker.*

SUITABLENESS, s. Fitness; agreeableness.—With ordinary minds, it is the *suitableness*, not the evidence of a truth that makes it to be yielded to; and it is seldom that any thing practically convinces a man that does not please him first. *South.*

SUITABLY, adv. Agreeably; according to.—Whosoever speaks upon an occasion may take any text suitable thereto; and ought to speak *suitably* to that text. *South.*

SUITE, s. [Fr.] Order, series; regular order.—Every five-and-thirty years the same kind and *suite* of weather come about again; as great frost, great wet, great droughts, warm winters, summers with little heat; and they call it the prime.

Bacon.—Retinue; company.—Plexirtus's ill-led life, and worse-gotten honour, should have tumbled together to destruction, had there not come in Tydeus and Telenor, with fifty in their *suite* to his defence. *Sydney.*

SUITER, or SUI'TOR, s. One that sues; a petitioner, a supplicant.

She hath been a suitor to me for her brother,
Cut off by course of justice. *Shakspeare.*

My piteous soul began the wretchedness
Of suitors at court to mourn. *Donne.*

A wooer; one who courts a mistress.

By many *suitors* sought, she mocks their pains,
And still her vow'd virginity maintains. *Dryden.*

SUITRESS, s. A female supplicant.

'Twere pity

That could refuse a boon to such a *suitress*;
Y' have got a noble friend to be your advocate. *Rowe.*

SUK EL HARF, a town of Yemen, in Arabia; 28 miles south-south-east of Saade.

SUKANA, or SUKNA, a village of the Syrian desert, near which is a warm sulphurous spring; 140 miles south-south-east of Aleppo.

SUKERRABA, a town of Yemen, in Arabia; 4 miles south-south-east of Otuma.

SUKI, a town of Anatolia, in Asiatic Turkey, governed by an Aga; 12 miles north-north-east of Milets.

SUKOTYRO, in Zoology, a genus of the class and order Mammalia Bruta. Horn on each side near the eyes. There is only one species:—

Sukotyro Indicus.—This species has an upright mane, which is short, narrow, reaching from the top of the head to the rump. This animal is described by Dr. Shaw. “This,” according to Niewhoff, its only describer, and who has figured it in his Travels to the East Indies, “is a quadruped of a very singular shape. Its size is that of a large ox; the snout like that of a hog; the ears long and rough, and the tail thick and bushy; the eyes are placed upright in the head, quite differently from those of other quadrupeds. On each side the head, next to the eyes, stand the horns, or rather the teeth, not quite so thick as those of an elephant. This animal feeds on herbage, and is seldom taken. It is a native of Java, and is called by the Chinese Sukotyro.” Niewhoff was a Dutch traveller, who visited the East Indies about the year 1563, and continued his peregrinations for several years.

SUKSUNSK, a large village of the east of European Russia, in the government of Perm, circle of Krasnu-fimsk, on the borders of Asia. It has 1800 inhabitants, and near it are large iron-works.

SULAU, or ZULAU, a small town of Prussian Silesia; 27 miles north of Breslau, and 7 west-south-west of Militsch. Population 1200.

SULBY, a hamlet of England, in Northamptonshire; 6 miles south-west of Market Harborough.

SULCATED, adj. [sulcus, Lat.] Furrowed.—All are much chopped and *suleated* by having lain exposed on the top of the clay to the weather, and to the erosion of the vitriolic matter mixed amongst the clay. *Woodward.*

SULETI. See *SURTI.*

SULGRAVE, a parish of England, in Northamptonshire. Near it is Barrow hill, on which is a tumulus, from whence may be seen nine counties, namely, Northampton, Warwick, Worcester, Oxford, Gloucester, Berks, Bucks, Bedford and Hertfordshires, and in very clear weather part of Hampshire and Wiltshire. Population 437; 6 miles north-by-west of Brackley.

SULHAM, a parish of England, in Berkshire; 5 miles west-north-west of Reading.

SULHAMPSTEAD, ABBOTS, and SULHAMPSTEAD, BANNISTER, two united parishes of England, in Berkshire; 5 miles south-west-by-west of Reading.

SULLI, SOULLI, or SULLI, a district of European Turkey, in Albania, formerly called Cassiopœa. It lies to the north of Porto Phanari, nearly 40 miles from Joannina, and about

SUKOTYRO. SUS.

3

4

1. Suk. Indicus. 2. Sus. Aethiopicus 3. Sus Babyrussa. 4. Sus Scrofa.

20 from Santa Maura. It consists of a large valley, inclosed by almost inaccessible mountains. This territory, about 26 miles long from north to south, and 8 in breadth, has been long inhabited by a memorable race of Greeks, who maintain themselves in the form of an independent republic. It contained formerly 18 villages, of which 5 were situated in the southern and less difficult part of the valley towards Louro, and 13 in the Upper part, more rugged and inaccessible. The principal villages were Mega Souli, the capital, Navarikos, and Kiapha. On the east, at the foot of the mountain, is a fine plain, of about 6 square leagues, which is very fertile. In it the Suliotes settled for the purpose of cultivating the land, but in times of danger retired with their property to the mountains. On the south Suli is bounded by the Chimæra mountains. Their wars, particularly between 1786 and 1803, were remarkable for the courage and pertinacity which they displayed. In vain did Ali Pacha attack them in 1792, with a powerful army. He was repulsed, as well in that year as subsequently; and it was not until 1803 that he definitively succeeded. On the loss of their independence, a part of the Suliotes left their country, and took service in Russia and France. But in the last war, (for the particulars of which see TURKEY); they have been nearly exterminated. The population of this tribe in 1821, was about 10,000.

SULIA, a large and abundant river of New Granada, in the province of Pamplona. It rises in the vicinity of this province, runs constantly north, and collecting the waters of many other rivers, unites itself with the Catacumbo, and again separating itself, after a little space, it forms three mouths, whereby to enter the lake Maracaibo. Its mouth is in Lat. 8. 35. N.

SULIA, a settlement of New Granada, in the province of Pamplona, situated at a small distance from the city of Pamplona.

SULIAGO, or SURIAGO, a chain of small islands in the Pacific Ocean, extending about 90 miles in length, and 12 in breadth. Lat. 9. 24. to 10. 32. N. long. 125. 27. to 128. 30. E.

SULIAGO, an island in the Pacific Ocean, about 20 miles in circumference, and 20 miles distance from the north-east coast of Mindanao. It gives name to a cluster. Lat. 9. 27. N. long. 126. 27. E.

SULIAGO, or SURIAGO, a town of the north coast of the island of Mindanao, in a bay between two projecting capes. Lat. 9. 45. N. long. 125. 31. E.

SULINGEN, a small town of the north-west of Germany, in Hanover; 28 miles south of Bremen. Population 1000.

SULISKER, a small insulated rock in the northern district of the Hebrides, about a quarter of a mile in circuit, lying 4 leagues east of the island of Rona, and 13 leagues north-west of the Butt of Lewis. It is noted for its great abundance and variety of sea fowl. Lat. 58. 44. N. long. 5. 53. W.

To SULK, *v. n.* [jolcen, Sax. deses, desidiosus, *sulky*. Lye, edit. Manning.] To be sluggishly discontented; to be silently sullen; to be morose or obstinate.

SULKHOLME, or SOUCAM, a township of England, in Nottinghamshire; 4 miles north-by east of Mansfield.

SULKILY, *adv.* In the sulks; morosely.—He stands *sulkily* before me. *Iron Chest*.

SULKINESS, *s.* [Sax. jolceneþe, *desidia*. Lye, edit. Manning.] State of silent sullenness; moroseness; gloominess.—I am come to my resting-place, and find it very necessary, after living for a month in a house with three women that laughed from morning till night, and would allow nothing to the *sulkiness* of my disposition. *Gray*.

SULKY, *adj.* [jolcen, Sax.] Sluggishly discontented; silently sullen; morose.—During the time he was in the house, he seemed *sulky*, or rather stupid. He never asked any questions; and, if spoken to, either replied shortly, or turned away without giving any answer. *Haslam*.

SULL, *s.* [rulh, Sax. idein; *suola*, Icel. lignum crassum et nodosum. *Serenius*.] A plough. *Ainsworth*.

SULLEN, *adj.* [from the Icel. *sollin*, tumidus, livescens, or the Lat. *solus*, solitary; whence our old word *solein*,

used in that sense, and afterwards, by an easy application from place to person, transferred to a gloomy disposition, to persons morosely shunning the company of others.] Solitary.

It maketh me drawe out of the waie,
In *soleyn* place by myselfe.

Gower.

Gloomily angry; sluggishly discontented.

He loveth none heviness,
But mirth and play and all gladnesse;
He hateth eke alle trechours,
And *soleine* folke and enviours.

Chaucer.

Wilmot continued still *sullen* and perverse, and every day grew more insolent. *Clarendon*.—Mischievous; malignant.

The *sullen* fiend her sounding wings display'd,
Unwilling left the night, and sought the nether shade.

Dryden.

Intractable; obstinate.—Things are as *sullen* as we are, and will be what they are, whatever we think of them. *Tillotson*.—Gloomy; dark; cloudy; dismal.

Night with her *sullen* wings to double shade
The desert; fowls in their clay nests were couch'd,
And now wild beasts came forth the woods to roam. *Milton*.

Heavy; dull; sorrowful.

Be thou the trumpet of our wrath,
And *sullen* presage of your own decay.

Shakspeare.

To SULLEN, *v. a.* To make sullen.—In the body of the world, when members are *sullen'd*, and snarl one at another, down falls the frame of all. *Feltham*.

SULLENLY, *adv.* Gloomily; malignantly; intractably.—To say they are framed without the assistance of some principle that has wisdom in it, and come to pass from chance, is *sullenly* to assert a thing because we will assert it. *More*.

SULLENNESS, *s.* Gloominess; moroseness; sluggish anger; malignity; intractability.—Speech being as rare as precious, her silence without *sullenness*, her modesty without affectation, and her shamefacedness without ignorance. *Sidney*.

SULLENS, *s. pl.* Morose temper; gloominess of mind. *A burlesque word*.—Let them die that age and *sullens* have. *Shakspeare*.—My pretty mistress Livia—is fallen sick o'the sudden.—How, o'the *sullens*? *Beaum. and Fl.*

SULLIAGE, *s.* [*souillage*, Fr.] Pollution; filth; stain of dirt; foulness. *Not in use*.—Calumniate stoutly; for though we wipe away with never so much care the dirt thrown at us, there will be left some *sulliage* behind. *Dec. of Chr. Piety*.

SULLINGTON, a parish of England, in Sussex; 5½ miles west-north-west of Steyning.

SULLIVAN, a post township of the United States, in Hancock county, Maine, at the head of Frenchman's bay; 280 miles north-east of Boston. Population 711.

SULLIVAN, a township of the United States, in Cheshire county, New Hampshire. Population 516.

SULLIVAN, a post township of the United States, in Madison county, New York, on the south side of Oneida lake. Gypsum and iron-ore are found here. Population 1974.

SULLIVAN, a county of the United States, in New York, bounded north-west by Delaware county, north-east by Ulster county, south by Orange county, and south-west by the Delaware, which separates it from Pennsylvania. It contains a pretty large proportion of mountainous country, with fertile plains, however, intervening. Thompson is the chief town. Population 6108.

SULLIVAN COVE, a harbour about 9 miles from the mouth of Derwent river, in Van Diemen's river, where a settlement was established in 1804.

SULLIVAN ISLAND, an island of the United States, at the mouth of Ashley and Cooper rivers; 6 miles below Charleston, South Carolina. This island is much resorted to by the people of Charleston during the summer months.

SULLIVAN

SULLIVAN MOUNTAINS, mountains of the United States, in New Hampshire, extending from Cockburne to the White mountains; about 2000 feet high.

SULLIVAN, POINT, a cape on the west coast of an island in Chatham's strait, on the west coast of North America. Lat. 56. 38. N. long. 225. 51½. E.

To SULLY, *v. a.* [*souiller*, Fr.] To soil; to tarnish; to dirt; to spot.

He's dead, whose love had *sully'd* all your reign,
And made you empress of the world in vain. *Dryden.*

Lab'ring years shall weep their destin'd race,
Charg'd with ill omens, *sully'd* with disgrace. *Prior.*

SULLY, *s.* Soil; tarnish; spot.—A noble and triumphant merit breaks through little spots and *sullies* in his reputation. *Addison.*

SULLY (Maximilian de Bethune), Duke of, marshal of France, and prime minister under Henry IV., was born at Rosni in 1559, and educated by his father, who had sprung from an illustrious family of the ancient counts of Flanders, in the reformed religion, to which he steadily adhered, even in some trying circumstances, through life. At the age of eleven he was presented to the Queen of Navarre, and her son Henry, whom he followed to Paris, where he pursued his studies. Here he lay concealed for three days, during the horrible massacre of St. Bartholomew's, in 1572, and thus, by favour of the principal of the college of Burgundy, he escaped the fate to which all the Hugonots were destined. At this time Sully entered into the service of the King of Navarre; taking lessons in history and mathematics from the young king's preceptor, and habituating himself to military exercises. After the death of Charles IX., Henry of Navarre quitted the court, and placed himself at the head of the Hugonot party; and on this occasion Sully entered into the infantry as a volunteer. In his youth he manifested more valour than military skill; but he possessed another very important and useful quality, which was economy, and which enabled him to maintain at his own expense a company of cavaliers; and it was by the exhibition of this quality that he gained the friendship and confidence of Henry. In 1580, the king conferred upon him the office of counsellor of Navarre, and that of his own chamberlain. During the time which he spent in the service of the Duke of Anjou, brother to Henry III., and into which he entered for the purpose of regaining some property that belonged to his family, he attended that prince in his visit to the English court; but when he found that the bigotry of the duke led him to treat his Protestant followers with coldness and indifference, he abandoned his service, and returned to that of the King of Navarre. Henry wishing at this time for a confidential person, whom he could employ at the court of France to watch and penetrate the designs of the League, sent Rosni thither for this purpose in 1583. During his residence there he married, at the beginning of 1584, Anne de Courtenay, descended from an illustrious family of that name. In the following year he was summoned by Henry to assist in the approaching war with the League; and having joined him without hesitation, he presented him with a sum of money which he had amassed, and was honourably employed in various sieges and battles. In 1586 he concluded a treaty with the deputies of Switzerland, by which they stipulated to furnish 20,000 men for the royal cause. In the battles of Coutras and Ivry he acquitted himself so well, that his fidelity and bravery were signally distinguished by the approbation and applause of Henry. Having lost his wife, he married again in 1592, and for some time lived in retirement. But being neglected by Henry, who was now lawful King of France, his zeal in his service was somewhat abated; however, when his presence and assistance became necessary, his affection for his master induced him to forget any apparent or real slight with which he had been treated, and to aid him again with his counsel. Henry, being a Protestant, found it difficult to maintain, without very hazardous struggles, his tenure of the throne; and began seriously to think of reconciling himself to the Catholic faith. But one

of his chief objections was an apprehension that he should thus offend his former faithful friends, and reduce himself to the necessity of fighting against them. Rosni, more consonantly perhaps to principles of policy than to those of truth and integrity, persuaded him to adopt the measure, to which his interest more than the conviction of his judgment led him to incline. His arguments prevailed; and Sully himself was employed to negotiate with the Catholic chiefs on the ground of Henry's abjuration of Protestantism. Sully, however, never sacrificed his own principles or profession; but he acted in this instance with a persuasion, that religion was a matter of little importance to Henry himself, and that the question, whether he was to be denominated Calvinist or Catholic, was of trivial consideration compared to that, whether there were to be peace or war in France. Such temporizing measures, however, did not immediately produce the effect which might have been expected. The League, supported by Spain, continued to oppose Henry's tranquil possession of his crown; and for this purpose the talents of Sully, both in the cabinet and the field, were found to be very important and useful. Accordingly they were called forth into vigorous exertion; and in the progress of his promotions, he was made secretary of state in 1594, member of the council of finance in 1596, and superintendant of the finances in 1598; and, moreover, he was employed in many interesting negociations, one of which was for that of the king's second marriage to Mary de Medicis. Another of Sully's diplomatic missions was that which produced a confidential interview, in 1601, with Queen Elizabeth at Dover. The accession of James I. to the throne of England, in 1603, afforded occasion to another mission of Sully to this island, where, by his reputation and dexterity of management, he succeeded in renewing the treaties subsisting between the courts France and Great Britain. As a finance minister, Sully contrived to improve the royal revenues, and to lighten the burdens of the people. The spirit of his administration was that of order, regularity, and economy, joined with that sobriety of manners which he derived from the reformed religion.

The picture of Sully's own life is thus exhibited by one of his biographers, and it is curious and interesting. "He rose every day at four in the morning, and employed his two first hours in reading and dispatching the memorials which lay upon his desk. At seven he went to the council; and he passed the rest of the morning with the king, who gave him orders relative to the different offices which he held. He dined at noon, and afterwards gave a regular audience, to which persons of all ranks were admitted. When this was concluded, he usually resumed his labours till supper-time, when he caused his doors to be shut, and laying aside all business, indulged himself in society with a few friends. He commonly went to rest at ten; but if any thing extraordinary had deranged the operation of the day, he borrowed some hours of the night. His table was simple and frugal; and when he was reproached with its plainness, he would reply with Socrates, "that if his guests were wise, they would be satisfied; if not, he did not wish their company." Sully was firmly attached to his religion, nor was any temptation that could be presented sufficient to pervert his mind, and seduce him from it. The Pope even addressed him with a letter of eulogy on his administration, and closed it by expressing a wish, that he would enter into the right faith. In his reply he said, that "on his part he would not cease to pray God for his holiness' conversion." The faithful services of this excellent minister were further rewarded by the posts of governor of Poitou, and grand-master of the ports and havens in France; and also, in 1606, by the dignity of a duke and peer, on which occasion he chose to take his title from his estate of Sully-sur-Loire. He continued at the head of affairs till the assassination of Henry, in 1610. He was then dismissed from court, with a gratuity of 100,000 crowns, and afterwards lived chiefly in retirement. He died in 1641, at the age of 82 years. A statue was erected to this great man by Louis XVI., and his eulogy was made a prize-subject by the French Academy. The "Mémoires de Sully,"

Sully," entitled by the author, "Oeconomies Royales," were written without order or connexion, and in a very simple style. They have been several times printed; and the Abbé de l'Écluse gave an edition of them in 1745, which were arranged in better order, and the language was rendered more correct. They have always been held in high estimation, on account of their historical and political information, and the interesting anecdotes of the person and court of Henry IV., which they afford. *Gen. Biog.*

SULLY, a parish of Wales, in Glamorganshire; 5 miles from Cardiff.

SULLY, a small town near the central part of France, in the department of the Loiret, on the Loire, with 2100 inhabitants; 21 miles south-east of Orleans.

SULMETINGEN, UPPER, a small town of the west of Germany, in Wirtemberg, and the chief place of a domain belonging to the prince of Tour and Taxis. Population 1000. Near it is the large village of Lower Sulmetingen.

SULMIERSZYCE, a small town of Prussian Poland; 25 miles west-south-west of Kalisch, and 62 south-south-east of Posen. Population 1400.

SULMONA, a town of Italy, in the north of the kingdom of Naples, in the Abruzzo Citra. It is a place of antiquity, having been the birth-place of Ovid. In 1709 it was greatly injured by an earthquake. At present it contains 4000 inhabitants, and is the see of a bishop; 21 miles south of Civita di Chieti, and 72 north of Naples. Lat. 42. 3. N. long. 13. 59. E.

SULPHATE, *s.* A salt formed by the combination of sulphuric acid with any base.

SULPHITE, *s.* A salt formed by the combination of sulphurous acid with any base.

SULPHUR, *s.* [Lat.] Brimstone.

In his womb was hid metallic ore,
The work of sulphur.

Milton.

SULPHUR CREEK, a branch of Green river, in the United States, Kentucky.

SULPHUR ISLAND, an island in the North Pacific Ocean, discovered by Captain Gore, in the year 1779; about five miles long, in a north-north-east and south-south-west direction. The south point is a high barren hill, flattish at top, and when seen from the west-south-west, presents an evident volcanic crater, conjectured to be filled with sulphur, both from its appearance to the eye, and the strong sulphureous smell. Lat. 24. 48. N. long. 141. 12. E.

SULPHUR MOUNTAIN, a noted mountain in the island of Guadaloupe, famous for exhalations of sulphur, and eruptions of ashes. On the east side are two mouths of an enormous sulphur pit. One of these mouths is 100 feet in diameter; the depth is unknown.

SULPHURATE, *adj.* [*sulphuratus*, Lat.] Of or belonging to sulphur; of the colour of sulphur.—He interprets their breastplates of fire, and of jacinth and brimstone, of the colour of their horsemen's coats, as if they were made of thread of either colour "de feu," violet colour, or a pale sulphurate colour. *More.*

SULPHURATION, *s.* [*sulphuratio*, Lat.] Act of dressing or anointing with sulphur.

SULPHUROUS, or SULPHUROUS, *adj.* [*sulphureus*, Lat.] Made of brimstone; having the qualities of brimstone; containing sulphur; impregnated with sulphur.

My hour is almost come,
When I to sulphurous and tormenting flames
Must render up myself.

Shakspeare.

No sulphurous glooms
Swell'd in the sky, and sent the lightning forth.

Thomson.

SULPHUROUSLY, *adv.* In a sulphureous manner.

SULPHUROUSNESS, *s.* The state of being sulphurous.

SULPHURET, *s.* Any substance of which sulphur forms a component part.

SULPHURWORT, *s.* The same with HOGSFENNEL. See PEUCEDANUM.

SULPHURY, *adj.* Partaking of sulphur.

VOL. XXIII. No. 1600.

That Bathonian spring,

Which from the sulphury mines her medicinal force doth bring.

Drayton.

SULPICE, ST., a village in the east of France, in the department of the Cote d'Or. A fire in the summer of 1818 destroyed no less than 80 houses here.

SULPICE DE LEZAT, ST., a small town in the south of France, department of the Upper Garonne, near the river Agout, with 1000 inhabitants; 18 miles south of Toulouse.

SULPICE DE LA POINTE, ST., a small town in the south of France, department of the Tarn, with 1100 inhabitants; 25 miles south-west of Alby.

SULPICE DES CHAMPS, ST., a small town near the central part of France, in the department of La Creuse, with 1100 inhabitants; 9 miles north-west of Aubusson.

SULPICE LES FEUILLES, ST., a small town in the south-west of France, department of the Upper Vienne, with 1250 inhabitants; 13 miles east-north-east of Le Dorat.

SULPICE, ST., a seigniory of Lower Canada, on the north side of the St. Lawrence, in the county of Leicester.

SULPICIA, a Roman lady, wife of Calenus, lived in the reign of Domitian, and distinguished herself by her poetical talents. At the close of some editions of Juvenal, we have the fragment of a satire written by her, in easy and elegant language, against Domitian, when he expelled the philosophers from Rome; it is also to be found in the "Poetæ Latini Minores," Leyd. 1731, and in Mattaire's "Corpus Poetarum Latinum." Her poem on conjugal love, addressed to her husband, and pronounced by Martial in one of his epigrams to be equally chaste and nervous, is still more celebrated. *Gen. Biog.*

SULPICIOUS-SEVERUS, an ecclesiastical historian and presbyter of the fifth century, who is placed by Cave about the year 401, and who is supposed to have died about the year 420. He was a native of Aquitain in Gaul, educated for the bar, and became eminent for his eloquence. He acquired wealth and married. After the death of his wife, he took orders, and devoted himself to a religious life, first under the discipline of Phebadius, bishop of Agen, and afterwards under that of St. Martin, bishop of Tours. Paulinus, bishop of Nola, with whom he was intimate, makes honourable mention of him in his letters. He resided for some time at Toulouse, and afterwards at Eause, in Gallia Narbonnensis. Gennadius says, that in his old age he embraced Pelagianism; but being convinced of his error, manifested his repentance by perpetual silence afterwards; that is, as some suppose, by writing no more books. He was the author of many works, the principal of which is his "Sacred History," in two books, written in a neat and elegant Latin style, bearing a comparison with that of the best classical writers, and containing a summary account of the affairs of the Jews, and of the church, from the beginning of the world to the consulship of Stilicho and Aurelian, A.D. 400. His most entertaining work is one of his dialogues, which relates the mode of life of the eastern monks, and affords an instructive delineation of the state of monachism at that period. Some epistles to his sisters and other persons are also preserved. His works have been several times republished. The best editions are those of Le Clerc, Lips. 1709, 8vo., and of Hieron, a Prato, Veron. 4to., 2 vols., 1741, 1754. *Dupin. Lardner.*

SULTAN, *s.* [a Tartarian word, probably appropriated only to Mohammedan princes; from the Heb. *shelton*, signifying sovereign power or command.] A Turkish emperor.

By this scimitar,

That won three fields of sultan Solyman.

Shakspeare.

SULTANA, or SULTANESS, *s.* The queen of an Eastern emperor.—Turn the *sultana's* chambermaid. *Cleaveland.*—Lay the towering *sultaness* aside. *Irene.*

SULTANABAD, an old city of Persia, called now TUR-SHEEZ, which see.

SULTANGUNGE, a town of Hindostan, province of Oude, district of Lucknow. Lat. 26. 59. N. long. 80. 15. E.

SULTANHISSAR, a village of Anatolia, in Asiatic Turkey.

key, situated near the remains of the ancient Greek city of Tralles. On the top of a neighbouring hill appear the traces of some very grand buildings, particularly a temple and a theatre, with fifty rows of seats. There are also remains of a very magnificent portico, with two rows of pillars; 23 miles east of Scalanova.

SULTANIA, an ancient city of Persia, in the northern part of the province of Irak. It was anciently large and magnificent, and under one of the Tartar dynasties, formed the capital of the empire. A series of political vicissitudes, however, have entirely destroyed this early prosperity. It is now an entire mass of ruins, being only inhabited by about twenty poor families, who occupy wretched hovels in the vicinity of the tomb of Sultan Hodabunda, the founder. This is a large and beautiful structure, built of brick, and covered with a cupola, 90 feet in height, that would do honour to the most scientific architect in Europe. Lat. 36. 32. N. long. 48. 26. E.

SULTANPORE, a town of Hindostan, province of Lahore, belonging to the Seiks. It is the capital of the Doabeh Jallinder district. Lat. 31. 18. N. long. 74. 45. E.

SULTANPORE, a town of Hindostan, province of Oude. It is pleasantly situated on the eastern bank of the Goompty river, and is the station of a British detachment. It was at this place that the first British brigade employed by the Nabob Shuja Addowlah, was cantoned in the years 1773 and 1774. Lat. 26. 18. N. long. 82. 3. E.—There are several other places of this name in Hindostan, founded by different sultans or monarchs, but none other of consequence.

SULTANRY, *s.* An Eastern empire.—I affirm the same of the *sultanry* of the Mamalukes, where slaves, bought for money, and of unknown descent, reigned over families of freemen. *Bacon.*

SULTRINESS, *s.* The state of being sultry; close and cloudy heat.

SULTRY, *adj.* [*ſwɛltən*, Sax. signifies *to die*. Chaucer uses *swelte* to signify the effect of a great oppression of spirits. Hence our word *sultry*, i. e. *sweltry*, to express a suffocating heat. Hence, also, the verb *sulter* or *soulter*, was used for *swelter*, i. e. to overpower with heat. "Horse and asses tired, and *soulter'd* with the heat of the day." *Gayton, Notes on Don Quix.*] Hot without ventilation; hot and close; hot and cloudy.—It is very *sultry* and hot. *Shakspeare.*

The *sultry* breath

Of tainted air had cloy'd the jaws of death. *Sandys.*

SULZ, a small town in the north of Germany, in the grand duchy of Mecklenburg Schwerin, on the Reckenitz. Population 1400; 20 miles east of Rostock, and 21 south-west of Stralsund.

SULZ, a small town in the west of Germany, in Wirtemberg, on the Neckar. It is remarkable for its productive salt springs. Population 2100; 14 miles south-east of Freudenberg, and 14 north of Rothweil.

SULZ, or **UPPER SULZ**, a small town of Lower Austria, on the small river Sulz. Population 1500; 20 miles north-east of Vienna.

SULZ, or **SULZ BELOW THE FOREST**, a large village in the east of France, department of the Lower Rhine. Here are salt and mineral springs. Population 1300.

SULZ, a small river of Franconia, which rises near Neumark, and falls into the Altmuhl.

SULZ, **UPPER**, a small town of the east of France, in Alsace, department of the Upper Rhine. It has 4,000 inhabitants, and some manufactures, but is known in history for little except having been a commandery of the order of St. John; 14 miles south-south-west of Colmar.

SULZA, or **STADT SULZA**, a small town of the interior of Germany, in the grand duchy of Saxe-Weimar, on the Ilm, near its confluence with the Saale. Population 1100; 14 miles north-east of Weimar, and 8 west-by-south of Naumburg.

SULZA, **NEW**, another small town of Germany, in the duchy of Saxe-Gotha, near Stadt-Sulza, in Saxe-Weimar, remarkable for its salt-works.

SULBACH, a small town of Germany, in Bavaria. It contains 2200 inhabitants, who are partly Catholics, partly Lutherans; and the town, small as it is, is divided into Upper and Lower; 6 miles west-by-north of Amberg, and 36 north-by-west of Ratisbon.

SULZBACH, a small town of the west of Germany, in Wirtemberg, county of Lowenstein-Wertheim, on the Muhr, with 1100 inhabitants.

SULZBERG, a small town of Bavaria; 64 miles west-south-west of Munich, and 5 south of Kempten. Population 1700.

SULZBURG, a small town in the west of Germany, in Baden, situated in a well wooded valley. It has mineral springs, and mines of lead and cobalt, but only 1000 inhabitants.

SULZER (John-George), was born in 1720, at Winterthur, in the canton of Zurich, and being the youngest of twenty-five children, and having lost both his parents in the same day in the year 1734, his patrimony was scarcely sufficient for defraying the expense of his education. In 1736, however, he was sent to the gymnasium of Zurich, where he was principally indebted for instruction to John Gesner, and also to Bodmer and Breitinger, who formed and directed his taste. At this time his attention was divided between the study of the Hebrew language, Wolf's philosophy, and the system of Linnæus. In 1739 he was licensed to preach by the synod of Zurich. His first publication was entitled "Moral Considerations on the Works of Nature;" and his account of a tour which he made in 1742 into the neighbouring part of the Alps was printed in 1745. He now visited Berlin, and there gained the friendship of Euler and Maupertius; but during his previous residence at Magdeburg, he edited a translation of "Scheuchzer's Itinera Alpina," and wrote his "Treatise on the Education and Instruction of Youth." In the year 1760, he had the misfortune to lose his wife. In order to dissipate his grief, he employed his time in completing his "Theory of the Fine Arts." In 1768 he published, for the use of schools, "Exercises to excite Attention and Reflection," and "Observations on the reciprocal Influence of Reason on Language, and of Language on Reason." In the next year he committed to the press his excellent "Dictionary of the Fine Arts:" the first part of this work appeared in 1771. In the same year, Sulzer made an attempt in dramatic writing, but his talents did not appear suited to this kind of composition. He expired, as if falling asleep, in the month of February 1779. *Gen. Biog.*

SULZERTOWN, a village of the United States, in the territory of the Mississippi, situated on the Mississippi, about 10 miles above Natchez.

SULZFELD, a small town of Bavarian Franconia, with 800 inhabitants; 9 miles south-east of Wurzburg.

SUM, *s.* [*summa*, Lat.; *somme*, Fr.] The whole of any thing; many particulars aggregated to a total.

Weighing the *sum* of things with wise forecast,
Solicitous of public good.

Philips.

Quantity of money.

I did send to you
For certain *sums* of gold, which you deny'd me.

Shakspeare.

[*Somme*, Fr.] Compendium; abridgement; the whole abstracted.—This, in effect, is the *sum* and substance of that which they bring by way of opposition against those orders, which we have common with the church of Rome. *Hooker.*—The amount; the result of reasoning or computation.—I appeal to the readers, whether the *sum* of what I have said be not this. *Tillotson.*—Height; completion.

Thus I have told thee all my state, and brought
My story to the *sum* of earthly bliss,
Which I enjoy.

Milton.

To SUM, *v. a.* [*sommer*, Fr.] To compute; to collect particulars into a total; to cast up. It has *up* emphatical.

You cast the event of war,
And *summ'd* th' account of chance.

Shakspeare.

The

The high priest may *sum* the silver brought in. 2 *Kings*.—To comprise; to comprehend; to collect into a narrow compass.

So lovely fair!

That what seem'd fair in all the world, seem'd now
Mean, or in her *summ'd up*, in her contain'd. *Milton*.

[In Falconry.] To have feathers full grown.—With prosperous wing full *summ'd*. *Milton*.

SUMA, a small river of Guiana, which rises in the country of the Carab Indians, and enters the Caroni.

SUMACH-TREE, *s.* [*sumach*, Fr.] A plant. The flowers are used in dyeing.

SUMAGE, SUMAGIUM, or SUMMAGIUM, in our Old Writers, toll for carriage on horseback. "Pro uno equo portante summagium per dimidium ann. obolum. *Chart. de Forest. c. 14.*

SUMANYSTOWN, a post village of the United States, in Montgomery county, Pennsylvania; 33 miles north-north-west of Philadelphia.

SUMAPAMPA, a settlement of South America, in the province of Tucuman, on the shore of the Rio Doce.

SUMAPAZ, a large and abundant river of New Granada, which rises in the interior mountains, and running north, unites itself with the Pasca, and their united stream enters the Magdalena.

SUMARA, in Music, a sort of flute with two pipes, one of which, the shorter, is used for playing airs, and the longer, in a continued bass; just like the long pipe in the Bulgarian bagpipe.

SUMARA, a mountain of Yemen, in Arabia; 6 miles south-west of Jerim.

SUMAREIN, SOMEREIN, or SOMORJA, a large market town in the west of Hungary; 12 miles south-east of Presburg, in the isle of Schutt. It has a monastery of Paulinists, the only one in Hungary, and extensive manufactures of stone-ware. The village called Waste-Sumarein, is in the palatinate of Wicselburg.

SUMASINTLA, a river of Mexico, which rises in the mountains of Chiapa; 20 miles south of Sacatulan, and which falls into the gulf of Mexico, near the isthmus of Yucatan.

SUMATRA, a large island in the Eastern seas, the most western of that immense collection of islands which are so thickly scattered over the ocean from the coasts of New Holland and New Guinea to the coast of China on the east, and westward to the Malayan peninsula. It is divided obliquely by the equator into almost equal parts, and its general direction is north-west and south-east. The one extremity is in Lat. 5. 56. north, and the other 5. 56. south. In respect to relative position, its northern point stretches into the bay of Bengal; its south-west coast is exposed to the great Indian ocean; towards the south it is separated by the straits of Sunda from the island of Java; on the east, by the commencement of the Eastern and China seas, from Borneo and other islands; and on the north-east by the straits of Malacca, from the Malayan peninsula. Its length may be estimated at 1050 miles, by 165 miles the average breadth. Among the eastern people generally and the better informed of the natives, this island is known by the names of Pulo Purichu and Indalas; the origin of the term Sumatra is uncertain. By Marco Polo it is called Java Minor.

A chain of mountains runs through the whole extent of this island, and the ranges are in many parts double and treble. The height of these mountains has never been accurately ascertained. Mount Ophir, situated immediately under the equinoctial line, is supposed to be the highest visible from the sea, its summit being elevated 13,842 feet above that level. These mountains, though of great height, do not reach the limit of perpetual snow under the equator; and there is no positive account of snow having ever been seen among them. Among these ridges of mountains are extensive plains of great elevation, and of a temperate climate; and from this advantage they are esteemed the most eligible portion of the country, are consequently the best inhabited, and

the most cleared from woods, which elsewhere in general throughout Sumatra, cover both hills and valleys with an eternal shade. Here too are found many large and beautiful lakes, that extend, at intervals, through the heart of the country, and facilitate the communication between its different parts.

The mountains which run through the whole extent of the island of Sumatra, are much nearer the western than the opposite coast, being, on the former, seldom so much as 20 miles from the sea, while, on the eastern side, the extent of the level country cannot be less than 150 miles. In consequence of this position of the mountains, all the greatest rivers are found on the eastern side of the island. These are Siak, Indragiri, Jambi, and Palembang. These rivers roll a large body of water into the ocean, and having a large space for the formation of their respective streams, they generally flow with an even and steady course. They labour, however, under this inconvenience, that scarcely any, except the largest, run out to sea in a direct course. The continual action of the surf, more powerful than the ordinary course of the stream, throws up at their mouths a bank of sand, which, in many instances, has the effect of diverting their course to a direction parallel with the shore, between the cliffs and the beach, until the accumulated waters at length force their way wherever there is found the weakest resistance. In the southerly monsoon, when the surfs are usually highest, and the streams, from the dryness of the weather, least rapid, this parallel course is of the greatest extent. As the rivers swell with the rain, they gradually remove obstructions, and recover their natural channel. The rivers on the western coast having a shorter course, are not so large; though the Kataun, Indrapura, Tabuyong, and Sinkel, are considerable streams. They derive also a material advantage from the shelter given to them by the peninsula of Malacca and Borneo, Banca, and the other islands of the archipelago, which, breaking the force of the sea, prevent the surf from forming those bars that choke the entrance of the south-western rivers, and render them impracticable to boats of any considerable draught of water.

The climate of Sumatra varies, of course, with the height of the ground. Even on the plains, however, the heat is not so intense as might be expected in a country situated immediately under the line; the thermometer, even at the most sultry heat, which is about two in the afternoon, generally fluctuating between 82 and 85 degrees in the shade. At Fort Marlborough, Mr. Marsden mentions that he never observed it, in any case, rise higher than 86 degrees in the shade, although at Natal, in Lat. 0. 34. north, it is not unfrequently at 87 and 88 degrees; at sun-rise it is usually as low as 70. The sensation of cold, however, is much greater than this would seem to indicate, as it occasions shivering and a chattering of the teeth; doubtless from the greater relaxation of the body and openness of the pores in that climate; since the same temperature in England would be esteemed a considerable degree of warmth. These observations on the state of the air apply only to the districts near the sea-coast, where, from their comparatively low situation, and the greater compression of the atmosphere, the sun's rays operate more powerfully. Inland, as the country ascends, the degree of heat decreases rapidly, insomuch, that beyond the first range of hills, the inhabitants find it expedient to light fires in the morning, and continue them till the day is advanced, for the purpose of warming themselves; a practice unknown in the other parts of the island; and in the journal of Lieutenant Dare's expedition it appears, that during one night's halt on the summit of a mountain, in the rainy season, he lost several of his party from the severity of the weather, whilst the thermometer was not lower than 40 degrees. Frost, snow, or hail, are unknown to the inhabitants in any quarter. The hill people in the country of Lampong speak of a peculiar kind of rain which falls there, which some have supposed to be sleet; but the fact is not sufficiently established. The atmosphere is in general more cloudy than in Europe. The fog, called Kabut by the natives, which is observed to rise every morning among the distant hills, is denser

dense to a surprising degree; the extremities of it, even when near at hand, being perfectly defined; and it seldom is observed to disperse till about three hours after sunrise. On the west coast of Sumatra, southward of the equinoctial, the south-east monsoon, or dry season, begins about May, and slackens in September: the north-west monsoon begins about November, and the hard rains cease about March. The monsoons for the most part commence and leave off gradually there; the months of April and May, October and November, generally affording weather and winds variable and uncertain. It thus appears that this island is for one half the year deluged with constant rains.

In this island, as well as all other countries between the tropics, of any considerable extent, the wind uniformly blows from the sea to the land for a certain number of hours in the four and twenty, and then changes and blows for about as many from the land to the sea; excepting only when the monsoon rages with remarkable violence, and even at such time the wind rarely fails to incline a few points, in compliance with the efforts of the subordinate cause, which has not power, under these circumstances, to produce an entire change. On the west coast of Sumatra, the sea-breeze usually sets in after an hour or two of calm, about ten in the forenoon, and continues till near six in the evening. About seven the land breeze comes off, and prevails through the night till towards eight in the morning, when it gradually dies away. The land wind in Sumatra is cold, chilly, and damp; an exposure to it is, consequently, dangerous to health, and sleeping in it is almost certain death. Thunder and lightning are very frequent, especially during the north-west monsoon, when the explosions are extremely violent, the forked lightning shoots in all directions, and the whole sky seems on fire, whilst the ground is agitated in a degree little inferior to the motion of a slight earthquake.

The soil of the western side of Sumatra may be spoken of generally as a stiff, reddish clay, covered with a stratum or layer of black mould, of no considerable depth. From this there springs a strong and perpetual verdure of rank grass, brush-wood, or timber trees, according as the country has remained a longer or shorter time uncultivated; and the population being in most places extremely thin, a great proportion of the island, and especially to the southward, is in consequence an impervious forest. Along the western coast of the island, the low country, or space of land which extends from the sea shore to the foot of the mountains, is intersected and rendered uneven to a surprising degree by swamps.

The earth in Sumatra is rich in minerals, and other fossil productions; and the island has, in all ages been famous for gold, which still continues to be procured in considerable quantities, and might be greatly increased if the gatherers had a competent knowledge of mineralogy. There are also mines of copper, iron, and tin. Sulphur is collected in large quantities among the numerous volcanoes. The natives extract saltpetre from the impregnated earth, which is chiefly found in extensive caves that have been long frequented by birds and bats, from whose dung the soil is formed, and acquires its nitrous properties. Coal, mostly washed down by the floods, is procured in many parts, particularly at Kutaun, Ayer, Rami, and Bencoolen; but it is light, and not considered of a good quality. Mineral and hot springs, in taste resembling those of Harrowgate, are found in many districts. Earth oil, used chiefly as a preservative against the destructive ravages of the white ant, is collected at Ipu and elsewhere. There is scarcely any species of hard rock to be met with in the low parts of the island, near the sea-shore, in the cliffs along which various petrifications and sea shells are discovered. Copper is found on the hills of Mucky, near the sea, between Analaboo and Soosoo, to the north of the English settlement at Tappanooly. The space affording the ore is considerable, extending above a degree in length, and farther east into the country than has been yet ascertained. A considerable quantity of rich copper ore is found on the surface of the hills, to which the natives at present limit their researches. On analyzation it is found to contain a considerable

portion of gold. Here are also found various species of earths, which might serve for colours to the painter, and might be converted to other valuable purposes. The most common are the yellow, red, and white ochres.

The most important article of cultivation in Sumatra, as indeed generally throughout the east, is rice, of which there are many different species, distinct in shape, size, and colour of grain, modes of growth, and delicacy of flavour. All those different sorts, however, may be ranged under the two comprehensive classes of upland rice, from its growing on high and dry grounds, and lowland or marshy rice, from its growing in the low and marshy grounds. For the cultivation of upland rice, the site of woods is universally preferred, and the more ancient the woods the better, on account of the superior richness of the soil; the continual fall and rotting of the leaves forming there a bed of vegetable mould, which the open plains do not afford, being exhausted by the powerful operation of the sun's rays, and the constant production of a rank grass. The husbandman makes choice of a spot for the plantation of upland rice, on the approach of the dry season in April or May, and he proceeds to clear it of wood, which is a very laborious task. The plantations of low ground rice are for the most part overflowed in the rainy season between the months of October and March, to the depth of six inches or a foot. The produce varies according to circumstances. In very favourable circumstances it rises as high as 140 for one; but the common produce is only 30 for one. Mr. Marsden is of opinion that the soil of Sumatra is far from being fertile, being for the most part a stiff red clay, burned nearly to the state of a brick, under the influence of a tropical sun. There are many parts of the island, however, which he states are entirely unknown to us; and the luxuriant woods with which the country is every where covered, do not certainly indicate a barren soil. The upland rice will not keep above six months, and the lowland rice not above twelve. The cocoa-nut tree may be esteemed the most important object of cultivation. Its value consists principally in its kernel, which is in universal consumption, being an essential ingredient in most dishes. The oil of the nut is also employed for anointing the hair, and for burning in lamps. There are also large plantations of the betel-nut tree and the bamboo. The latter is used in the fortification of villages, as it grows so thick that it forms an impenetrable mass. There is also the sago tree, and a great variety of palms. The sugar cane is very generally cultivated, but not in large quantities, and more frequently for the purpose of chewing the juicy reed, than for the manufacture of sugar, which is usually imported from Java. Maize, chilly pepper, turmeric, ginger, coriander and cumin seed, are raised in the gardens of the natives. There are various other shrubs and plants, some of which are converted by the inhabitants to various useful purposes. Hemp is extensively cultivated, not for the purpose of making rope, to which they never apply it, but to make an intoxicating preparation called bang, which they smoke in pipes along with tobacco. In other parts of India a drink is prepared by bruising the blossoms, young leaves, and tender parts of the stalk. Small plantations of tobacco, which the natives call *tambaku*, are met with in every part of the country. There are other creeping plants which are manufactured into twine, sowing thread, &c.

No region of the earth can boast of greater variety and abundance of indigenous fruits than Sumatra; though the natives never appear to bestow the smallest labour in improving them. They are planted for the most part in a careless irregular manner, about their villages. We cannot, within the limits to which we are confined, give a full description of all the various fruits and shrubs of this luxuriant island. The following, however, are the most remarkable:—The mangustin, which holds the pre-eminence among all the Indian fruits, is produced in great abundance. Its characteristic quality is extreme delicacy of flavour, without being rich or luscious. It is a drupe of a brownish red colour, and the size of a common apple, consisting of a thick rind, somewhat hard on the outside, but soft and succulent within

within, encompassing kernels which are covered with a juicy and perfectly white pulp, which is the part eaten, or, more properly, sucked, for it dissolves in the mouth. Its qualities are as innocent as they are grateful, and the fruit may be eaten in any moderate quantity without danger of surfeit, or other injurious effects. The returns of its season appear to be irregular, and the periods short. The pine-apple, though not indigenous, grows here in great plenty with ordinary culture. Oranges of many sorts are in the highest perfection. The shaddock of the West Indies is here very fine, and distinguished into the white and red sorts. Limes and lemons are in abundance, as is also the bread-fruit; the jack-fruit; the mango, a rich high flavoured fruit of the plumb kind; the papaw, a large, substantial, and wholesome fruit, in appearance not unlike a smooth sort of melon, but not very highly flavoured; the pomegranate, the tamarind, nuts and almonds of different sorts, besides various other fruits, of which the names are not known in Europe. Grape vines are cultivated with success by Europeans for their tables, but not by the people of the country. There is found in the woods a species of wild grape, besides various other wild fruits, some of which possess a fine flavour, but others are little superior to common berries, though they might be improved by culture.

Of shrubs and flowers, there is an innumerable variety and a perpetual succession throughout the year. They diffuse a delightful fragrance all around, and many of them are medicinal, while from others dyes are extracted. The castor-oil plant grows wild in abundance, especially near the sea shore; and the elastic gum vine, or caoutchouc, is also found. From the indigo plant the dye is extracted, and generally used in a liquid state. Brazil wood is common in the Malay countries, as is also ubar, a red wood resembling log-wood in its properties. The upas, or poison tree, is found in the woods.

Sumatra, from the shelter afforded by its vast woods, abounds in wild animals, some of them most ferocious and destructive. The tyger grows in this island to a prodigious size and strength. Marsden mentions that he saw the head of one which had been killed, and which measured across the forehead 18 inches. Such is their strength, that with a stroke of their fore-paw, they will break the leg of a horse or buffalo, and the largest prey is without the least difficulty dragged by them into the woods. The number of inhabitants who are killed by these animals exceeds belief, whole villages being sometimes depopulated by them. Yet such is the superstitious prejudice of the natives, that it is with difficulty they are prevailed upon, by rewards from the East India Company, to use any methods for their extirpation. The traps, however, which they make for this purpose are ingeniously contrived. Sometimes they are in the nature of strong cages, with falling doors, into which the beast is enticed by a goat or dog inclosed as a bait; sometimes they manage that a large timber shall fall in a grove, across his back; he is noosed about the loins with strong rattans, or he is led to ascend a plank, nearly balanced, which, turning when he is past the centre, lets him fall upon sharp stakes prepared below. Instances have occurred of a tiger being caught by one of the former modes, which had many marks in his body of the partial success of this last expedient. The escapes, at times, made from them by the natives are surprising. In addition to the other methods of destroying them, besides shooting them, the natives sometimes place water in their way, impregnated with arsenic, by drinking of which the animal perishes. They subsist chiefly, it is supposed, on the monkeys and other animals with which the woods abound. Elephants are common. They traverse the country in large troops, and prove highly destructive to the plantations of the inhabitants. The hippopotamus haunts most of the rivers. The rhinoceros, both the single and double horned species, is a native of the woods; also the bear, which is small and black, and climbs the cocoa-nut trees in order to devour the tender part or cabbage. There are many species of the deer kind, and the varieties of the monkey tribes are innumerable; here are also sloths, squir-

rels, teleggos or stinkards, civet cats, tiger cats, porcupines, hedgehogs, pangolins, bats of all kinds, alligators, guanos, cameleons, flying lizards, tortoises, and, turtle. The house lizards are in length from four inches down to one, and are the largest reptiles that can walk in an inverted position; one of these, large enough to devour a cochroach, runs along the ceiling of a room, and in that situation seizes its prey. The tail of these reptiles, when broken off, renews itself.

Among the domestic animals is the buffalo, which supplies milk, butter, and beef. It is not to be found in a wild state, being too much exposed to the attacks of the tyger. The cow, called Sapi and Jawi, is obviously a stranger to the country, and does not appear to be yet naturalized. The breed of horses is small, well made, and hardy, and are brought down by the country people nearly in a wild state. In the Batta country they are eaten, which is a custom also in Celebes. The sheep are a small breed, probably imported from Bengal; the other animals are the goat and hog, both domestic and wild; the otter, the cat, the rat, and the dog. Of the latter, those brought from Europe degenerate, in the course of time, to curs, with erect ears.

With animals of the frog kind the swamps everywhere teem; and their noise upon the approach of rain is tremendous. They furnish prey to the snakes, which are found here of all sizes and in great variety of species; the larger proportion harmless, but of some, and those generally small and dark coloured, the bite is mortal. The boa constrictor is found in marshy places, and sometimes grows to the length of 30 feet, and of proportionate bulk and strength. Among the poisonous serpents is the viper.

On the coast is found great variety of shell-fish. The cray-fish is as large as the lobster, but wants its biting claws. The small fresh water cray-fish, the prawns and shrimps are in great perfection. The crab is not equally fine, but exhibits many extraordinary varieties. There is also the *kima*, or gigantic cockle. The oysters are by no means so good as those of Europe. The smaller kind are generally found adhering to the roots of the mangrove, in the wash of the tide. Among the fish are the dugong, a large sea animal of the mammalia order, with two strong pectoral fins serving for the purposes of feet; the grampus whale; violiers, so called from the peculiarity of its dorsal fin resembling a sail; sharks, skates, the muræna, gymnotus, rock cod, pomfret, mullet, the flying fish, and many others.

Birds are in great variety, and consist chiefly of the Sumatran pheasant, a bird of uncommon magnificence and beauty; of peacocks, eagles, vultures, kites, and crows, jackdaws, king's fishers, the rhinoceros bird, chiefly remarkable for what is termed the horn, which, in the most common species, extends half way down the upper mandible of its large beak, and then turns up; the stork, the common fowl domestic and wild, the snipe, coot, plover, pigeons, quails, starlings, swallows, minas, parrots and paroquets, geese, ducks, teal, &c. The bird of paradise is not found here, and the cassowary is brought from Java. The loory is brought from the islands still further east.

The whole island swarms with insects, amongst which are cockroaches, crickets, bees, flies of all sorts, mosquitoes, scorpions, centipedes, and water and land leeches. The fire fly is larger than the common fly, and emits light as if by respiration, which is so great, that words on paper may be distinguished by holding one in the hand. Ants exist in immense numbers and varieties, which differ in taste from each other when put into the mouth. Some are hot and acrid, some bitter, and some sour. The large red ant bites severely, and usually leaves its head, as the bee its sting, in the wound. The Chinese dainty, named indiscriminately biche de mer, swallow, tripan or sea slug, (holothurion) is collected from the rocks, and dried in the sun for the China market.

Of the productions which are regarded as articles of commerce, the most abundant is pepper, of which large quantities used formerly to be exported by the East India Company. But this trade is now reduced to one solitary cargo

of the annual value of about £15,000. The pepper vine is a hardy plant, growing readily from cuttings or layers rising in several small knotted stems, and twining round any neighbouring support. If suffered to run along the ground, its fibres become roots, in which case, like the ivy, it would never exhibit any marks of fructification. It begins to bear in its third, and attains its prime in its seventh year, after which it declines. The white pepper is made by bleaching the grains of the common sort, by which it is deprived of its exterior pellicle. This article takes little damage by submersion in sea water.

The jealousy of the Batavian government in rigorously confining the cultivation of spices to its own islands, is well known; and for a long time, all attempts to procure those valuable plants were in vain. After the conquest of the Dutch islands, however, by the British in 1796, the nutmeg and clove plants were brought over, and placed under careful management. Among the valuable productions of the island as articles of commerce, a conspicuous place belongs to the camphor. This peculiar substance is a drug for which Sumatra and Borneo have been celebrated from the earliest times, and with the virtues of which the Arabian physicians appear to have been acquainted. The tree is a native of the northern parts of the island only, not being found to the southward of the line, nor yet beyond the third degree of north latitude. It grows, without cultivation, in the woods lying near to the sea coast, and is equal in height and bulk to the largest timber trees, being frequently found upwards of fifteen feet in circumference. The camphor is found in the concrete state in which we see it, in natural fissures or crevices of the wood, but does not exhibit any exterior appearance by which its existence can be previously ascertained; and the persons whose employment it is to collect it, usually cut down a number of trees, almost at random, before they find one that contains a sufficient quantity to repay their labour. It is said, that not a tenth part of the number felled is productive either of camphor or of camphor-oil, although the latter is less rare; and that parties of men are sometimes engaged for two or three months together in the forests, with very precarious success. The oil is procured from the same tree, frequently gushing out copiously when the tree is cut.

Benzoin or benjamin is, like the camphor, found almost exclusively in the batta country, to the northward of the equator, but not to the Acheenese dominions immediately beyond that district. It is also met with, though rarely, to the south of the line. When the trees have attained the age of about seven years, and are six or eight inches in diameter, incisions are made in the bark, from whence the balsam or gum exudes. The finest of the gum is that which comes from these incisions during the first three years, and is white, inclining to yellow, soft, and fragrant. The finest sort is sent to Europe; and the inferior sorts are sent to Arabia, Persia, and some parts of India, when it is burned, to perfume with its smoke their temples and private houses, expel troublesome insects, and obviate the pernicious effects of unwholesome air or noxious exhalations. The greater part of what is brought to England, is re-exported to countries where the Roman Catholic and Mahometan religions prevail, to be there burnt as incense in the churches and temples. The remainder is chiefly employed in medicine. Cassia is produced in the inland parts of the country, and is exported in considerable quantities. Rattans also furnish annually many large cargoes; and walking canes are found near the rivers which open to the straits of Malacca. The annual and the shrub cotton are cultivated by the natives, but only in sufficient quantities to supply their own wants. The silk cotton is a most beautiful raw material, but owing to the shortness and brittleness of the staple, is unfit for the reel and the loom, and is only applied to the unworthy purposes of stuffing pillows and mattresses. The coffee tree is universally planted, but the berry is not of a good quality, probably owing to the want of skill in the management. Among other articles of commerce is the dammar, a species of turpentine or resin procured from a species of pine, which

is exported in large quantities to Bengal and elsewhere, and which exudes from the tree so copiously, that there is no need of incisions to obtain it. A drug named dragon's blood is procured from a large species of rattan, which grows abundantly in the countries of Palembang and Jambi, where it is manufactured and exported, first to Batavia, and afterwards to China, where it is highly esteemed. Gambir juice is extracted from the leaves of a plant of that name, and is eaten by the natives, being supposed to have the property of cleaning and sweetening the mouth. The agila wood or lignum aloes is highly prized in all parts for the fragrant scent it emits when burning. The forests contain an inexhaustible store and endless variety of timber trees, many sorts of which are capable of being applied to ship-building; but the teak does not appear to be indigenous to the island, although it flourishes to the northward and southward, in Pegu and Java. The other remarkable trees are the poon, so named from a Malay word, which signifies wood in general, and is preferred for masts and spars; the camphor wood, used for carpenters' purposes; the iron wood, so named on account of its hardness; the marbau, used as beams for ships and houses; the pinaga, valuable as crooked timber for frames and knees; the ebony; the kayn gadis, a wood possessing the flavour and qualities of sassafras; the rangi, supposed to be the manchineel tree of the West Indies, has a resemblance to mahogany. Of the various sorts of trees producing dammar, some are also valuable as timber; and here also is found the spreading banyan tree of Hindostan.

Gold is found chiefly in the interior of the island, none being observed to the southward of Limun, a branch of Jambi river, nor to the northward of Nalabu, from which port Acheen is principally supplied. Menancabow has always been esteemed the richest seat of it; and this consideration probably induced the Dutch to establish their head factory at Padang, in the immediate neighbourhood of that kingdom. Colonies of Malays from thence have settled themselves in almost all the districts where gold is procured, and appear to be the only persons who dig for it in mines, or collect it in streams; the proper inhabitants or villagers confining their attention to the raising of provisions, with which they supply those who search for the metal. The metal is sometimes found imbedded in the rock, when it is called rock-gold. It consists of pieces of quartz, more or less intermixed with veins of gold, generally of fine quality, running through it in all directions, and forming beautiful masses, which being admired for their beauty, are sometimes sold by weight as if they were all solid metal. The mines yielding this sort of gold are commonly situated at the foot of the mountain, and the shafts are driven horizontally to the extent of from 8 to 20 fathoms. Gold is also found in the state of smooth, solid lumps, in shape like gravel, and of various sizes, one of which, seen by Mr. Marsden, weighed 9 ounces 15 grains. Gold-dust is collected either in the channels of brooks running over ground rich in the metal, in standing pools of water occasioned by heavy rains, or in a number of holes dug in a situation to which a small rapid stream can be directed. Their instruments for working the mines are not, as may be supposed, the most perfect. They have for digging an iron crow three feet long; and for beating the lumps of rock to a powder, a heavy iron hammer is used. The pulverized mass is thence carried to the nearest place where there is a supply of water, by which the gold is separated from the quartz. In the horizontal mines, the shaft is supported by timbers, and the water is drawn off by means of a drain. In the perpendicular mines it is drawn out by means of buckets. The mines of gold are very numerous, amounting to no fewer than 1200 in the dominions of Menancabow. Probably only one half of all the gold procured reaches the hands of Europeans; yet it is asserted, on good authority, that from 10,000 to 12,000 ounces have been annually received at Padang alone, at Nalaboo 2000, at Natal 800, and at Mocomoco 600. The merchants carry the gold from the interior to the sea coast, where they barter it for iron and iron working tools, opium, and the fine piece goods

goods of Madras and Bengal. When bought at the settlements, it used formerly to be purchased at the rate of 3*l.* 5*s.* per ounce, but afterwards rose to 3*l.* 18*s.* which would yield no profit on exportation to Europe. In many parts of the country it is employed instead of coin, every man carrying a small pair of scales about with him. At Acheen small thin gold coins were formerly struck, but the coinage has been abandoned in modern times. Silver is not produced in Sumatra. Tin, which is found in the neighbouring island of Banca, is a very considerable article of trade; and a rich mine of copper is worked by the Acheenese, the ore of which yields half its original weight in pure metal. Iron ore is dug at a place named Turawang, in the eastern part of Menacabow, and there smelted, but not in large quantities, the consumption of the natives being amply supplied with English and Swedish bar-iron, which they are in the practice of purchasing by measure instead of weight. Sulphur is abundantly procured from the numerous volcanoes, and especially from that very great one which is situated about a day's journey inland from Priaman. Yellow arsenic is also an article of traffic. In the country of Kattaun, near the head of Urei river, there are extensive caves, from the soil of which saltpetre is extracted. M. Whalfeldt, who was employed as a surveyor, visited them in March 1773. Into one he advanced 743 feet, when his lights were extinguished by the damp vapour. Into a second he penetrated 600 feet, when, after getting through a confined passage, about three feet wide and five in height, an opening in the rock led to a spacious place 40 feet high. The edible birds-nest, so much celebrated as a peculiar luxury of the table, especially amongst the Chinese, is found in similar caves in different parts of the island, but chiefly near the sea-coast, and in the greatest abundance at its southern extremity. The birds resemble the common swallow, or rather perhaps the martin. The nests are distinguished into white and black, of which the first sort are by far the most scarce and valuable, and generally sell for nearly their weight in silver. The biche de mer is also an article of trade to Batavia and China, where it is employed in enriching soups and stews. Bees wax is a commodity of great importance in all the eastern islands, from whence it is exported, in large oblong cakes, to China, Bengal, and other parts of the continent. No pains are taken with the bees, which are left to settle where they list, generally on the boughs of trees, and are never collected in hives. Their honey is much inferior to that of Europe, as might be expected from the nature of the vegetation. Gum-lac, called by the natives *ampalu* or *ambalu*, although found upon trees, and adhering strongly to the branches, is known to be the work of insects, as wax is of the bee. It is procured in small quantities from the country inland of Bencoolen; but at Padang is a considerable article of trade. Foreign markets, however, are supplied from the countries of Siam and Cambodia. It is chiefly valued in Sumatra for the animal part, found in the nidus of the insect, which is soluble in water, and yields a very fine purple dye, used for colouring their silks and other webs of domestic manufacture. Like the cochineal, it would probably, with the addition of a solution of tin, become a good scarlet. The forests abounding with elephants, ivory is consequently found in abundance, and is carried both to the China and Europe markets. The animals themselves were formerly the objects of a considerable traffic from Acheen to the coast of Coromandel, or *Kling* country, and vessels were built expressly for their transport; but it has declined, or perhaps ceased altogether, from the change which the system of warfare has undergone, since the European tactics have been imitated by the princes of India. The large roes of a species of fish said to be like the shad, but more probably of the mullet kind, taken in great quantities at the mouth of Siak river, are salted and exported from thence to all the Malayan countries, where they are eaten with boiled rice, and esteemed a delicacy. The most general articles of import trade are the following:—From the coast of Coromandel various cotton goods, as long-cloth, blue and white, chintz and coloured handkerchiefs, of which those manufactured at Pulicat are the most

prized; and salt: from Bengal, muslins, striped and plain, and several other kinds of cotton goods, as cossaes, baftaes, hummums, &c., taffetas and some other silks; and opium in considerable quantities: from the Malabar coast, various cotton goods, mostly of a coarse raw fabric: from Ceina, coarse porcelain *kwalis* or iron pans, in sets of various sizes; tobacco shred very fine; gold thread, fans, and a number of small articles: from Celebes (known here by the names of its chief provinces, Nangkasar, Bugis, and Mandar), Java, Balli, Ceram, and other eastern islands, the rough striped cotton cloth called *kain sarong*, or vulgarly *bugis clouting*, being the universal body dress of the natives; kris-es and other weapons; silken krisbelts, hats, small pieces of ordnance, commonly of brass, called *rantaka*; spices, and also salt of a large grain, and sometimes rice chiefly from Balli; from Europe, silver, iron, steel, lead, cutlery, various sorts of hardware, brass, wire, and broad cloths, especially scarlet.

Generally speaking, the inhabitants have made no great progress in the arts of industry; though there are some particular manufactures in which they excel. In the accounts of ancient writers, great foundries of cannon are mentioned in the district of Acheen; and it is certain that fire arms, as well as knives, are at this day manufactured in the country of Menacabow. In general, however, they do not excel in manufactures of iron. They make nails, though they are not much used in building, wooden pins being generally substituted; also various kinds of tools, such as adzes of different sorts, axes, hoes, &c. In carpenters' work they are equally rude, being ignorant of the use of the saw, excepting where it has been introduced by the British. Trees are felled by chopping at the stems; and in procuring boards, they are confined to those, the direction of whose grain, or other qualities, admit of their being easily split asunder. In this respect the species called maranti and marakuli have the preference. The tree being stripped of its branches and its bark, is cut to the length required, and by the help of wedges split into boards. For cements they chiefly use the curd of the buffalo milk. It is to be observed that butter, which is used by the Europeans only, is made, not as with us, by churning, but by letting the milk stand till the butter forms of itself on the top. It is then taken off with a spoon, stirred about with the same in a flat vessel, and well washed in two or three waters. The thick sour milk left at the bottom, when the butter or cream is removed, is the curd here meant. This must be well squeezed, formed into cakes, and left to dry, when it will grow nearly as hard as flint. For use, you must scrape some of it off, mix it with quicklime, and moisten it with milk. There is no stronger cement in the world, and it is found to hold, particularly in a hot and damp climate, much better than glue; proving also effectual in mending china-ware. Ink is made by mixing lamp-black with the white of egg. To procure the former they suspend over a burning lamp an earthen pot, the bottom of which is moistened, in order to make the soot adhere to it. Painting and drawing they are quite strangers to. In carving, both in wood and ivory, they are curious and fanciful, but their designs are always grotesque and out of nature. The handles of the kris-es are the most common subjects of their ingenuity in this art, which usually exhibit the head and beak of a bird, with the folded arms of a human creature, not unlike the representation of one of the Egyptian deities. In cane and basket work they are particularly neat and expert; as well as in mats, of which some kinds are much prized for their extreme fineness and ornamental borders. Silk and cotton cloths, of varied colours, manufactured by themselves, are worn by the natives in all parts of the country, especially by the women. Some of their work is very fine, and the patterns prettily fancied. Their loom or apparatus for weaving is extremely defective, and renders their progress tedious. The women are expert at embroidery, the gold and silver thread for which is procured from China, as well as their needles. Different kinds of earthenware are manufactured in the island; and they extract the cocoa-nut oil, which is in general use. Gunpowder

is also manufactured in various parts of the island, but less in the southern provinces than among the people of Menancabow, the Battas, and the Acheenese, whose frequent wars demand large supplies. The powder is very imperfectly granulated, being often hastily prepared in small quantities for immediate use. Salt is mostly supplied by cargoes imported, but they also manufacture it themselves by a very tedious process. But of all their manufactures, their work in fine gold and silver filagree has been most admired, and it deserves the greater admiration, considering the coarse tools with which it is made, and which, in the hands of a European, would not be thought fit for the most ordinary purposes, being rudely and inartificially formed by the goldsmith from any old iron he can procure. From a piece of old iron hoop the wire drawing instrument is made; a hammer head stuck in a block serves for an anvil; and a pair of compasses is seen composed of two old nails tied together at one end. The gold is fused in a piece of a rice pot. In general they use no bellows, but blow the fire with their mouths through a joint of bamboo. If the quantity of gold to be melted be considerable, three or four persons sit around their furnace, which is an old iron pot, and blow altogether. By a series of nice operations, the gold is formed into leaves, which are afterwards put together, and being united with a solder of gold filings and borax, moistened with water, and spread over them with a feather, the whole is put into the fire for a short time, until it becomes united. The Chinese also make filagree, mostly of silver, which is very elegant; but it wants the extraordinary delicacy of the Malayan work. The inhabitants of Sumatra are particularly expert in the manufacture of fishing nets, and in making springs for catching birds. They have many of them a remarkably fine aim; but the mode of letting off the matchlocks, which are the pieces most habitual to them, precludes the possibility of shooting flying.

The art of medicine among the Sumatrans consists in the application of simples, which are the juices of certain trees and herbs. These are administered internally, or externally by means of a poultice put on the breast or part affected. In fevers they give a decoction of herbs, or bathe the patient for two or three mornings in warm water. If this does not prove effectual, they pour on him, during the paroxysm, a quantity of cold water, which brings on copious perspiration. Pains and swellings in the limbs are likewise cured by perspiration. There are two sorts of leprosy to which the inhabitants are subject. In the milder species, the skin is covered with a white scurf or scales, which renders them loathsome to the sight. In the more fatal sort, few instances of recovery are known; the skin comes off in flakes, and the flesh is corrupted. The small pox sometimes visits the island, and makes terrible ravages. In cases of insanity, they imagine the patient seized by an evil spirit, which is exorcised in the following manner. He is shut up in a hut, which is set on fire about his ears, and he is allowed to make his escape through the flames in the best manner he can. Their notions of astronomy and geography are extremely imperfect. They are fond of music, and have several instruments, most of which are derived from the Chinese.

The Malayan language is everywhere spoken along the coasts of Sumatra. It prevails also in the inland country of Menancabow and its immediate dependencies, and is understood in almost every part of the island. Their writing is in the Arabic character, and many Arabic words are incorporated with the Malayan. Besides the Malayan, there is a variety of languages spoken in Sumatra, which, however, have not only a manifest affinity among themselves, but also to that general language which is found to prevail in, and to be indigenous to, all the islands of the Eastern sea, from Madagascar to the remotest of Captain Cook's discoveries, comprehending a wider extent than the Roman, or any other tongue, has yet boasted. The other principal languages of Sumatra are the Batta, the Rejang, and the Lampong; the difference between them being chiefly marked by their being expressed in distinct written characters. They

write on the inner bark of a tree, and on bamboos, and form their lines from the left hand towards the right.

Among the modern political divisions of the island, the principal are the empire of Menancabow and the Malays; in the next place, the Acheenese; then the Battas, the Rejangs; and next to them the people of Lampong. The chain of islands which extends in a line nearly parallel to the western coast, at the distance of little more than a degree, are inhabited by a race or races of people, apparently from the same original stock as those of the interior of Sumatra. Their genuineness of character has been preserved to a remarkable degree, whilst the islands on the eastern side are uniformly peopled with Malays. Until about 100 years ago, the southern coast of Sumatra, as far as the Urei river, was dependent on the king of Bantam in Java, whose lieutenant came yearly to Bencoolen or Sillebar, to collect pepper, and fill up the vacancies. Almost all the forms of government throughout Sumatra are a mixture of the feudal and patriarchal; but the system of government among the people near the sea coast is much influenced by the power of the Europeans, who exercise, in fact, the functions of sovereignty, and with great advantage to their subjects. The districts over which the East India Company's influence extends are preserved in a state of uninterrupted peace; and were it not for this coercion, every village would be in a state of perpetual hostility with its neighbour. The form of government among the Kejangs applies generally to the Orangulu, or inhabitants of the interior. Among the hills and woods, property in land depends upon occupancy, unless where fruit trees have been planted; and as there is seldom any determined boundary between neighbouring villages, such marks are rarely disturbed. The laws of the Sumatrans are properly a set of long established customs, handed down to them from their ancestors, the authority for which is founded in usage and general consent. The law which renders all the members of a family reciprocally bound for each others' debts, forms a strong connection among them. When a man dies, his effects descend to his children in equal shares. The Sumatran code admits of a pecuniary compensation for murder, on which account their laws take no cognizance of the distinction between a wilful murder and what we term manslaughter. Corporeal punishment of any kind is rare. All gaming is rigorously prohibited by the laws, though these laws are often broken; and theft is punished by the restoration of double the value of the goods stolen, and a fine, in addition, of 28 dollars. Assaults, violences, and even murders, are all compensated by fines, increasing in proportion to the enormity of the offence. The place of the greatest solemnity for administering an oath, is the burying ground of their ancestors; and they have certain reliques, or swearing apparatus, which they produce, on important occasions. These generally consist of an old broken creese, a broken gun barrel, some copper bullets, or any thing else to which chance or caprice has annexed the idea of extraordinary virtue. These they generally dip in water, which the person who swears drinks off, after pronouncing a form of words. At Manna the relique most venerated is a gun barrel, which, when produced to be sworn on, is carried to the spot wrapt up in silk, and under an umbrella. The Sumatran, impressed with the idea of invisible powers, but not of his own immortality, regards with awe the supposed instruments of their agency, and swears on creeses, bullets, and gun barrels, weapons of personal destruction. The right of slavery is established in Sumatra, as it is throughout the east, and has been all over the world: yet but few instances occur of the country people actually having slaves; though they are common enough in the Malayan or sea-port towns. Their domestics and labourers are either dependent relations, or insolvent debtors. The simple manners of the people require that their servants should live, in a great measure, on a footing of equality with the rest of the family, which is inconsistent with the authority necessary to be maintained over slaves. At Bencoolen, the East India Company have a body of negro slaves, who are said to be humanely treated, to be well clothed and well fed, and not to

be overworked. These hold the natives of the island in great contempt, have an antipathy to them, and enjoy any occasion of doing them mischief: the Sumatrans, on the other hand, consider the negroes merely as devils half humanized.

The inhabitants of Sumatra are rather below the middle size; their limbs are, for the most part, slight, but well shaped, and particularly small at the wrists and ancles. The women follow the preposterous custom of flattening the noses and compressing the skulls of children newly born, and also pull out the ears of the infants to make them stand at an angle with the head. The males destroy their beards, and keep their chins remarkably smooth. Their complexion is properly yellow, wanting the red tinge that constitutes a tawny or copper colour. The females of the upper classes not exposed to the rays of the sun, approach to a degree of fairness. Persons of superior rank encourage the growth of their hand nails to an extraordinary length; the hands of the natives generally, and even those of the half breed, are always cold. The inland natives are superior in size and strength to the Malays on the coast, and possess also fairer complexions. Among the hills, the inhabitants are subject to monstrous wens or goitres on the throat. Both sexes have the extraordinary custom of filing and disfiguring their teeth, which are naturally very white and beautiful, from the simplicity of their food. Many, particularly the women of the Lampong country, have their teeth rubbed down even with their gums; others have them formed into points, while some file off no more than the outer extremities, and then blacken them with the empyreumatic oil of the cocoa-nut shell. The great men set their teeth in gold, by casing with a plate of that metal the under row; which ornament, contrasted with the black dye, has by candle light a very splendid effect. It is sometimes indented to the shape of their teeth, but more usually is quite plain, and it is not removed either to sleep or eat. The original clothing of the Sumatrans is the same with that found by navigators among the South Sea islands, and in Europe generally, called Otahaitan cloth. It is still used among the Rejangs as their working dress, but the country people now, in a great measure, conform to the costume of the Malays.

The dusuns, or villages of the Sumatrans, for the inhabitants are so few that they are not entitled to the name of towns, are always situated on the banks of a river or lake, for the convenience of bathing, and of transporting goods. Their buildings are of wood and bamboos, covered with palm leaves. The frames of the houses rest on stout wooden pillars, about six or eight feet in height, and are ascended to by a piece of stout bamboo cut into notches. Detached buildings in the country are raised 10 or 12 feet from the ground, as security against tigers. The furniture is extremely simple, and neither knives nor forks are required, as in eating they take up the rice and other victuals between the thumb and fingers, and throw it into the mouth by the action of the thumb.

The manners of the Sumatran women are in general pure and unexceptionable. They are brought up in the strictest reserve and chastity. Polygamy is permitted among them; but it is rarely practised, except among the great, the lower classes being debarred by their poverty from all indulgence of their irregular inclinations. Their contracts of marriage are intricate in the extreme; and it is chiefly owing to this circumstance that legal disputes are so common among them. A wife is obtained by various modes of purchase; and when the full sum is paid, the female becomes to all intents and purposes the slave of the husband, who may at any time sell her, making only the first offer to her relations. The debts due for these sales constitute, in fact, the chief part of their riches; and a person is reckoned in good circumstances who has several due to him for his daughters, sisters, aunts, and great aunts. Prostitution is unknown in the interior, being confined to the more polite bazars on the sea coast, where there is usually a concourse of sailors and other strangers. Adultery is punishable by fine, but the crime is rare, and law suits on the subject still less frequent. The husband, it is probable, either conceals his shame, or revenges it with

his own hand. In the Lampong country, which is in the western extreme of the island, the manners are more licentious than those of any other native Sumatrans. An extraordinary liberty of intercourse is allowed between the young people of different sexes, and the loss of female chastity is not a very uncommon consequence. The offence is there, however, more lightly thought of, and instead of punishing the parties, as in Passumah and elsewhere, they prudently endeavour to conclude a legal match between them. The country is best inhabited in the central and mountainous parts, where the people live independent, and in some measure secure from the inroads of their eastern neighbours, the Javans, who, from about Palembang and the straits, frequently attempt to molest them. It is probably within but a very few centuries that the south-west coast of this country has been the habitation of any considerable number of people; and it has been still less visited by strangers, owing to the unsheltered nature of the sea thereabouts, and want of soundings, in general, which renders the navigation dangerous for country vessels; and to the rivers being small and rapid, with shallow bars, and almost ever a high surf. If you ask the people of these parts from whence they originally came, they answer, from the hills, and point out an inland place near the great lake, from whence, they say, their forefathers emigrated; and further than this, it is impossible to trace. They, of all the Sumatrans, have the strongest resemblance to the Chinese, particularly in the roundness of face, and constructure of the eyes. They are also the fairest people of the island, and the women are the tallest, and esteemed the most handsome.

All ranks are most passionately addicted to gaming. Besides the common method of gambling with dice, they have a practice of playing with small shells, which are taken up by handfuls, and being counted out by a given number at a time (generally that of the party engaged), the success is determined by the fractional number remaining, the amount of which is previously guessed at by each of the party. They have also various games on chequered boards or other delineations; and persons of superior rank are in general versed in the game of chess. They are even to a greater degree addicted to cock-fighting; and when they are in affluent circumstances, their propensity to it is so great, that it resembles rather a serious occupation than a sport. A countryman coming down, on any occasion, to the bazar, or settlement at the mouth of the river, if he boast the least degree of spirit, must not be unprovided with this token of it. They often game high at their meetings; particularly when a superstitious faith in the invincibility of their bird has been strengthened by past success. An hundred Spanish dollars is no very uncommon risk; and instances have occurred of a father staking his children or wife, and a son his mother or sisters, on the issue of a battle, when a run of ill luck has stripped him of property, and rendered him desperate. Quarrels, attended with dreadful consequences, have often arisen on these occasions. The Malay breed of cocks is much esteemed by connoisseurs who have had an opportunity of trying them. Great pains is taken in rearing and feeding them. The artificial spur used in Sumatra resembles in shape the blade of a scimitar, and proves a more destructive weapon than the European spur. It has no socket, but is tied to the leg, and in the position of it the nicety of the match is regulated. As in horse-racing, weight is proportioned to inches, so in cocking, a bird of superior weight and size is brought to an equality with his adversary, by fixing the steel spur so many scales of the leg above the natural spur, and thus obliging him to fight with a degree of disadvantage. It rarely happens that both cocks survive the combat. In the northern parts of the island, where gold-dust is the common medium of gambling, as well as of trade, so much is accidentally dropt in weighing and delivering, that at some cock-pits, where the resort of people is great, the sweepings are said, probably with exaggeration, to be worth upwards of a thousand dollars per annum to the owner of the ground, beside his profit of five-pence for each battle. In some places they match quails, in the manner of

cocks. These fight with great inveteracy, and endeavour to seize each other by the tongue. The Acheenese bring also into combat the dial bird, which resembles a small magpie, but has an agreeable, though imperfect note. These sometimes engage one another on the wing, and drop to the ground in the struggle. The Malays have other diversions of a more innocent nature. Matches of fencing, or a species of tournament, are exhibited on particular days; as at the breaking up of their annual fast, or month of *ramadan*, called there the *puasa*. The Sumatrans, and more particularly the Malays, are much attached, in common with the eastern nations, to the practice of smoking opium.

The native Sumatran of the interior differs in some respects from the Malay of the coast, being mild, peaceable, and forbearing, unless when roused by violent provocation. He is temperate and sober, his diet being mostly vegetable, and his only beverage water. Their hospitality is very great, with very simple manners; and they are, in general, except among the chiefs, devoid of the Malay cunning and chicane. On the other hand, they are litigious, indolent, addicted to gaming, dishonest in their dealings with strangers, which they consider as no moral defect, regardless of truth, mean, servile, and though cleanly in their persons, filthy in their apparel, which they never wash. They are careless and improvident of the future, and make no advances in improving their condition. The Macassars and Buggesses who come annually from Celebes in their prows to trade at Sumatra, are looked up to by the Sumatrans and Malays as their superiors in manners. They also derive part of the respect paid to them from the richness of their cargoes, and the spirit with which they spend the produce in gaming, cock-fighting, and smoking opium.

Scarcely any traces now remain of the ancient religion of the Rejangs (the Sumatran race with which we are best acquainted), if they ever had any. There prevails, in general, a gross ignorance on this subject; and though Mahometanism be generally professed, many of its converts give themselves not the least trouble about its injunctions, or even know what it requires. There is no public or private form of worship of any kind, neither prayers, processions, meetings, offerings, images, nor priests. They neither (says Marsden) worshipped God, devil, nor idol. They are not, however, without superstitious beliefs of many kinds, and have certainly a confused notion, though perhaps derived from their intercourse with other people, of some species of superior beings, who have the power of rendering themselves visible or invisible at pleasure. No attempts have been ever made at any time to convert the inhabitants of this island to Christianity.

SUMAÜN, a town of Hindostan, province of Agra, and district of Etawah, belonging to the British. Lat. 27. 6. N. long. 79. 5. E.

SUMAURA, an island formed by a large arm of the river Amazons.

SUMBAWA, a large island in the Eastern seas, extending about 200 miles in the parallel of 9 degrees south lat. and separated from the island of Lombock by the straits of Allas. It is about 40 miles in average breadth.

This island is divided into the different districts of Beema, Dompoo, Tambora, Sangur, Pekat, and Sumbawa, all governed by their respective chiefs, who were formerly all either allies of the Dutch East India Company, or under their protection, with the exception of the one last mentioned. Near the north-east end of the island, on a fine bay, which stretches seven or eight leagues south, is situated the town of Beema, remarkable for its excellent harbour, the sides of which are bold and high, and the approach safe; but the passage through is sometimes attended with inconvenience, from the strong current that generally prevails, and the great depth of water; as a hundred fathom line, though close in shore, will hardly reach the bottom. When, therefore, ships cannot pass through, they are obliged, for the want of anchorage, to return to sea, and there wait for a more favourable wind. The batteries erected on each side of the entrance, and opposite to one another, are no longer capable

of defence, and are, in fact, gone to ruin. The channel, in some places, is only 150 or 200 yards across; but there is no danger whatever in the passage; and a ship of the line may sail along either side within thirty yards of the rocky mountains. These give a grand and picturesque appearance to the channel, which terminates in a safe and commodious basin, presenting one of the finest harbours in the world, both for capaciousness and security; extending a considerable way inland, and encompassed by lofty mountains. On the east side of this bay stands the town of Beema. The landing here is very unfavourable, owing to a mud-bank, which extends three quarters of a mile from the town. The sultan of Beema is named Abdul Ahmed; and the population is computed to be 80,000. The island furnishes sappan wood, rice, horses, saltpetre, sulphur, wax, birds'-nests, tobacco, &c., though there is but little trade carried on now at this place. The island, however, has means of great improvement, and would be highly productive, if the inhabitants could be roused to exertion, and their labour turned to industry and agriculture. The number of horses annually exported under the appellation of Beema horses, is very considerable. The finest of these are procured from the small island of Gonong Api, situated at the north-east end of Beema harbour, about three or four miles from Sumbawa point, and forming the west side of the north entrance of Sapy straits. It is a large volcanic mountain, which terminates in two high peaks, and the soil is of great fertility. Another volcanic mountain on the north coast of Sumbawa, is said to be responsive to that of Gonong Api; an explosion of the latter being immediately answered by an eruption from the former; for which reason the inhabitants of Gonong Api are looked upon with a superstitious veneration by those of Sumbawa. The great depth of water here makes it dangerous for vessels, except prows, to approach the shore sufficiently near to find anchorage. Ships may be plentifully supplied with refreshments, as buffaloes, calves, sheep, fruit, and vegetables, both at Beema and the town of Sumbawa. This last place is situated on a large bay, open to the north and north-west, and a good harbour stretches inland, between the reefs at the west side of the entrance. Sumbawa is about 100 miles to the westward of Beema, and is governed by a chief denominated a rajah, whose name is Mahomed, but subject to the authority of the sultan. Tambora is the place mostly resorted to by the dealers in horses. Gold-dust is found in Sumbawa, particularly in the district of Dompoo, which also supplies teak-timber, and is the best cultivated district in the island. Pearls are fished for in the large bay to the westward of Beema bay, as also at Pekat.

SUMBHOONAUT, a town of Northern Hindostan, province of Nepaul. It owes its prosperity to a very celebrated temple, containing the sacred fire, reported to have been preserved there from time immemorial. It is a very ancient place, and said to have been built at a period when Nepaul was subject to the lama of Thibet. It is situated on the terrace of a lofty hill, and is distinguished at a great distance by the spires or turrets, which are covered with gilt copper. This temple is annually visited by innumerable pilgrims from Bootan and Thibet, and is a source of considerable revenue to the Nepaul government. Lat. 27. 33. N. long. 85. 38. E.

SUMBHULPORE, a district of Hindostan, province of Gundwanah, situated between the 21st and 22d degrees of northern latitude. It is a mountainous and woody country, and the climate very unfavourable to foreigners. The soil in the valleys is a rich loam, which produces sugar, cotton, and all kinds of grain; and in the mountains both gold and diamonds are found. But it is an acknowledged fact, that an equal extent of arable land would be more beneficial to the state. The diamonds are for the most part found in the rivers Hebe and Mahanuddy. As soon as the floods have subsided, the people employed in this business explore the beds of these rivers, for lumps of red earth which have been washed down from the mountains by the rains, and in which diamonds are frequently discovered. The gold is found in
the

the smaller streams, and is discovered by washing the sand. The tracks in which both are found are farmed out annually by the rajah. The inhabitants of this territory are all Hindoos, but are not possessed of those amiable qualities for which, in some other places, they are celebrated.

The district of Sumbhulpore constituted part of the ancient kingdom of Gurrah. It was overrun by the Mogul armies of Aurungzebe, and the rajah compelled to pay tribute; but on the decline of the Mogul empire, it again became independent, and continued so till about the middle of the last century, when it was once more laid waste by the Nagpore Mahrattas, and again reduced to the humiliating condition of a tributary state. During the war between the British and the Mahrattas in 1803, the former took possession of several of the pergunnahs or parishes which adjoined their territories, and still retain them, to the great comfort and satisfaction of the inhabitants.

SUMBHULPORE, the capital of the above mentioned district, and residence of the rajah Jonjar Singh. It is situated on the eastern bank of the Mahanuddy river. Lat. 21. 33. N. long. 83. 47. E.

SUMBUL, a town of Hindostan, province of Delhi, district of Bareilly, and capital of a small district of the same name. During the period the Rohillas were masters of that country, Sumbul was the residence of one of their chiefs, and a flourishing town. It is situated on the western side of the Yarvufadur river. Lat. 28. 38. N. long. 78. 32. E.

SUMBURGH HEAD, the southern promontory of the mainland of Shetland.

SUMEH, a village of Anatolia, in Asiatic Turkey; 24 miles north of Magnesia.

SUMELIBENI, a village of Egypt, on the left bank of the Nile; 27 miles south of Cairo.

SUMENE, a small town in the south of France, in the department of the Gard. It has 2900 inhabitants, who manufacture silks and cottons; 4 miles east of Le Vigan, and 18 south-west of Alais.

SUMIDOURO, a river of Brazil, in the province of Matto Grosso. Its source is a short distance from that of the Syptotuba, a large western branch of the Paraguay, with which there is a communication. It falls into the Arinos, a western branch of the Tapayos.

SUMLESS, *adj.* Not to be computed.

Above, beneath, around the palace shines,
The *sunless* treasure of exhausted mines.

Pope.

SUMMAH, a village of Algiers, in the province of Constantina; 12 miles south-south-east of Constantina.

SUMMARILY, *adv.* Briefly; the shortest way.—The decalogue of Moses declareth *summarily* those things which we ought to do; the prayer of our Lord, whatsoever we should request or desire. *Hooker.*

SUMMARO, one of the Aland islands, in the Baltic, situated to the south-east of the principal one. Lat. 59. 58. N. long. 20. 5. E.

SUMMARY, *adj.* [*sommaire*, Fr.] Short; brief; compendious.

The judge
Directed them to mind their brief,
Nor spend their time to shew their reading,
She'd have a *summary* proceeding.

Swift.

SUMMARY, *s.* Compendium; abstract; abridgement. We are enforc'd from our most quiet sphere
By the rough torrent of occasion;
And have the *summary* of all our griefs,
When time shall serve, to shew in articles.

Shakspeare.

SUMMER, *s.* One who casts up an account; a reckoner. *Unused.*

SUMMER, *s.* [*jumei*, Saxon; *somer*, Dutch.] The season in which the sun arrives at the hither solstice.

Sometimes hath the brightest day a cloud;
And, after *summer*, evermore succeeds
The barren winter with his nipping cold.

Shakspeare.

[*Trabs summaria.*] The principal beam of a floor.—Oak, and the like true hearty timber, may be better trusted in cross and transverse works for *summers*, or girders, or binding beams. *Wotton.*

To SUMMER, *v. n.* To pass the summer.—The fowls shall *summer* upon them, and all the beasts shall winter upon them. *Isaiah.*

To SUMMER, *v. a.* To keep warm.—Maids well *summer'd*, and warm kept, are like flies at Bartholomew-tide, blind, though they have their eyes. *Shakspeare.*

SUMMERBY, a village of England, in Lincolnshire, near Glandford Bridge.

SUMMERCOTES, a township of England, in Derbyshire; 2 miles south-east-by-south of Alfreton.

SUMMERFIELD, a post village of the United States, in Guilford county, North Carolina.

SUMMERFORD, RADNOR, a village of England, in Cheshire, near Congleton.

SUMMERHOUSE, *s.* An apartment in a garden used in the summer.

With here a fountain, never to be play'd,

And there a *summerhouse*, that knows no shade. *Pope.*

SUMMERHOUSE, a hamlet of England, in Durham; 6½ miles north-west-by-west of Darlington.

SUMMERSAULT, or SUMMERSET, *s.* [See SOMERSET.] A high leap, in which the heels are thrown over the head.

Some do the *summersault*,

And o'er the bar like tumblers vault.

Hudibras.

SUMMERSET. See SOMERSET.

SUMMIST, *s.* One who forms an abridgement. *Unused.*

SUMMISWALD, a village in the west of Switzerland; 12 miles west of Berne.

SUMMIT, *s.* [*summitas*, Lat.] The top; the utmost height.

Ætna's heat, that makes the *summit* glow,

Enriches all the vales below.

Swift.

SUMMITY, *s.* [*summitas*, Lat.] The height or top of any thing.—This quarrel began about a small spot of ground upon one of the two tops of the hill Parnassus:—therefore they offered—that the ancients would please to remove themselves and their effects down to the lower *summit*. *Swift.*

To SUMMON, *v. a.* [*summono*, Lat.] To call with authority; to admonish to appear; to cite.

Catesby, sound lord Hastings,

And *summon* him to-morrow to the Tower. *Shakspeare.*

To excite; to call up; to raise: with *up* emphatical.

When the blast of war blows in our ears,

Stiffen the sinews, *summon up* the blood.

Shakspeare.

SUMMONER, *s.* [See SOMNER. Chaucer writes it *sompnour*, and others *sumner*. See Phillips's Dict.] One who cites; one who summons.

Close pent-up guilts

Rive your concealing continents, and ask

These dreadful *summoners* grace.

Shakspeare.

SUMMONS, *s.* [from the law-writ called a *summonas*. See Pegge's Anecd. of the Engl. Lang., 2d edit. p. 173.] A call of authority; admonition to appear; citation.

The sons of light

Hasted, resorting to the *summons* high,

And took their seats.

Milton.

SUMNAUT, a sea-port town of Hindostan, province of Gujerat, and district of Puttun, on which account it is called Puttun Sumnaut, to distinguish it from the Temple of Somnauth, in the island of Diu. It is a place of considerable consequence, is defended by a stone citadel, and possesses a temple held in high estimation by the Hindoos. It has lately been conquered by the Rajpoot chief of Sorut. Lat. 20. 57. N. long. 70. 23. E.

SUMNER, a post township of the United States, in Oxford

ford

ford county, Maine; 170 miles north-north-east of Boston. Population 611.

SUMNER, a county of the United States, in the north side of West Tennessee. Population 13,792, including 3734 slaves. The chief town is Gallatin.

SUMNUM, a small town of Persia, in the western part of the province of Korassan. It is the capital of a rich district, containing fifty villages, and bounded on the north by Mount Elbourz, and on the south by the Great Salt desert.

SUMOOKGUR, an ancient fortress of Bengal, situated on the eastern bank of the Hoogly river, about 27 miles north of Calcutta, but now in ruins. There is no tradition by whom it was built.

SUMOROKOF (Alexander), the founder of the Russian theatre, was the son of Peter Sumorokof, a Russian nobleman, and born at Moscow in the year 1727. And under the patronage of count Ivan Shuvelof, he was introduced to the empress Elizabeth. At the age of 29 he composed his first tragedy, intitled "Koref." This was exhibited at the court-theatre, and the applause it gained induced the writer to proceed in the same career, till he had produced nine tragedies, several comedies, and some operas. In his tragedies, Racine was his model; and though he fell short of the perfection of his exemplar, he was in many instances a successful imitator of his excellencies. His comedies possessed humour, but were deficient in purity. Sumorokof, also wrote love songs, idyllia, fables, satires, anacreontics, elegies, versions of the Psalms, and Pindaric odes. He died at Moscow in October, 1777, in the 51st year of his age.

SUMPTER, *s.* [*somnier*, Fr.; *somaro*, Ital.] A horse that carries the clothes or furniture.

Return with her!

Persuade me rather to be a slave and *sumpter*
To this detested groom.

Shakspeare.

SUMPTER, a district of South Carolina, east of the Santee. Population 19,054, including 11,538 slaves.

SUMPTION, *s.* [*sumptus*, Lat.] The act of taking. *Not in use.*—The *sumption* of the mysteries does all in a capable subject. *Bp. Taylor.*

SUMPTUARY, *adj.* [*sumptuarius*, Lat.] Relating to expence; regulating the cost of life.—To remove that material cause of sedition, which is want and poverty in the estate, serveth the opening and well-balancing of trade, the banishing of idleness, the repressing of waste and excess of *sumptuary* laws. *Bacon.*

SUMPTUOSITY, *s.* Expensiveness; costliness. *Not used.*—He added *sumptuosity*, invented jewels of gold and stone, and some engines for the war. *Raleigh.*

SUMPTUOUS, *adj.* [*sumptuosus*, from *sumpsus*, Lat.] Costly; expensive; splendid.—We see how most Christians stood then affected, how joyful they were to behold the *sumptuous* stateliness of houses built unto God's glory. *Hooker.*

SUMPTUOUSLY, *adv.* Expensively; with great cost. This monument five hundred years hath stood,
Which I have *sumptuously* re-edified.

Shakspeare.

Splendidly.—A good employment will make you live tolerably in London, or *sumptuously* here. *Swift.*

SUMPTUOUSNESS, *s.* Expensiveness; costliness.—I will not fall out with those that can reconcile *sumptuousness* and charity. *Boyle.*

SUMRAH, a village of Syria, in the pachalic of Tripoli, the ancient *Simusa*; 18 miles north-east of Tripoli.

SUMSKOE-OSTROG, a small town of the north-west of European Russia, in the government of Olonetz, at the mouth of the river Sura; 70 miles south-by-east of Kemi. Population 1100.

SUMTERSVILLE, a post village of the United States in Claremont county, South Carolina.

SUMY, a large town in the interior of European Russia, in the government of Charkov, on the river Psol. It is surrounded with a wall and ditch, and farther defended by an old citadel. Like other Russian towns, it is built chiefly of wood, and wretchedly paved; but it contains several chari-

table institutions, and public depôts and warehouses, is the chief place of a circle, and has 11,000 inhabitants. Agriculture, in one shape or another, whether gardening, tillage, or pasturage, forms the chief employment of the inhabitants of this town and neighbourhood, for the only manufacture is the distilling of spirits. The traffic of the place is considerable, but transactions on a large scale are, in a great measure, confined to four annual fairs, where a number both of Greek and Russian merchants attend for the disposal of foreign commodities; 90 miles north-west of Charkov. Lat. 50. 54. N. long. 35. 6. E.

SUN, *s.* [*Junna*, Junne, Sax.] The luminary that makes the day.

Doth beauty keep which never *sun* can burn,
Nor storms do turn?

Sidney.

A sunny place; a place eminently warmed by the sun.—Yonder bank hath choice of *sun* and shade. *Milton.*—Any thing eminently splendid.—I will never consent to put out the *sun* of sovereignty to posterity, and all succeeding kings. *King Charles.*—*Under the SUN.* In the world. *A proverbial expression.*—There is no new thing *under the sun.* *Eccl.*

To SUN, *v. a.* To isolate; to expose to the sun; to warm in the sun.

The cry to shady delve him brought at last,
Where Mammon earst did *sun* his treasury.

Spenser.

SUNAPER, a lake of the United States, in New Hampshire, in the township of Fisherfield, Wendell, and New London. It is 11 miles long, and 1½ broad. Little Sunapee; 2 miles long, lies north-east of it, in New London.

SUNAPEE, a mountain of the United States, in New Hampshire, south of Sunapee lake.

SUNART, LOCH, a navigable inlet of the sea, between the counties of Argyle and Inverness, in Scotland, about 20 miles long, and from 1½ to 2 miles broad. It is also the name given to the district bordering on the loch.

SUN-BEAM, *s.* [*Junnebeam*, Sax.] The old poets have usually placed the accent on the last syllable.] Ray of the sun.

The Roman eagle, wing'd

From the spungy south to this part of the west,
Vanish'd in the *sun-beams*.

Shakspeare.

SUN-BEAT, *part. adj.* Shone on fiercely by the sun.

Its length runs level with the Atlantic main,
And wearies fruitful Nilus to convey
His *sun-beat* waters by so long a way.

Dryden.

SUNBINGEN TARN, or LAKE, a small lake of England, in Westmoreland, which abounds with eels, and in which are bred vast quantities of red trout, like char. The adjoining moors abound with grouse and moor game.

SUN-BRIGHT, *adj.* Resembling the sun in brightness.

Gathering up himself out of the mire,
With his uneven wings did fiercely fall
Upon his *sun-bright* shield.

Spenser.

SUN-BURNING, *s.* The effect of the sun upon the face.—If thou cant love a fellow of this temper, Kate, whose face is not worth *sun-burning*, let thine eye be thy cook. *Shakspeare*

SUN BURNT, *part. adj.* Tanned; discoloured by the sun.

Where such radiant lights have shone,
No wonder if her cheeks be grown
Sun-burnt with lustre of her own.

Cleveland.

Scorched by the sun.

How many nations of the *sun-burnt* soil
Does Niger bless; how many drink the Nile? *Blackmore.*

SUNBURY, a parish of England, in Middlesex, situated on the banks of the Thames; 18 miles west-south-west of St. Paul's, London. Population 1655.

SUNBURY, a borough and post township of the United States, and capital of Northumberland county, Pennsylvania,

on the Susquehanna, 1 mile below the junction of the east and west branches. It is regularly laid out, and contains a court-house, a jail, and a Presbyterian and Lutheran church. Population 790; 122 miles north-west-by-west of Philadelphia.

SUNBURY, a seaport and post township of the United States, in Liberty county, Georgia, at the head of St. Catharine's sound; 42 miles south-south-west of Savannah. The harbour is safe and commodious, and the situation of the town is pleasant and healthy. It contains an academy, and is the resort of planters from the adjacent country during the sickly season.

SUNCHILI, a mountain of the viceroyalty of Buenos Ayres, in the district of Laricaxas, celebrated as having been the situation of a gold mine, which was discovered in 1709, and was worked with immense profit till 1756, when it was inundated by a spring which suddenly burst into it.

SUN-CLAD, *part. adj.* Clothed in radiance; bright.

To him, that dares

Arm his profane tongue with contemptuous words
Against the *sun-clad* power of Chastity,
Fain would I something say.

Milton.

SUNCOOK, a river of the United States, in New Hampshire, which runs south-west into the Merrimack; 7 miles below Concord.

SUNDA, **STRAITS OF**, the arm of the sea which separates the large islands of Sumatra and Java. It is known to Europeans by this name; by the Malays it is termed Sunda Kalapa. The length of this channel taken from the flat point to Varkens or Hog point, is about 70 miles, and on the opposite coast, from Java head to Bantam point, about 90. In the mouth of the straits lies Prince's island, by the situation of which two passages are formed; one between Prince's island and Java, which is made use of, for the most part, by ships which have to pass the straits during the south-east monsoon, in order that, sailing close in with the Java shore, they may soon get within anchoring depth, and escape all danger of being driven to sea with the currents, which at that time of the year set strongly out of the straits to the westward. The other passage, which is called by seamen the Great Channel, sometimes also serves as an entrance to the straits during the south-east monsoon, but it is with the greatest difficulty, and after continual struggling with the south-easterly winds and the current, that this can be effected. In the narrowest part of the straits, and opposite to Hog's point, on Sumatra, lies an island, that, on account of its situation, has been called Thwart the Way, or Middle isle. A strong current runs through the passage on both sides of this island during the whole year, setting with the prevailing easterly or westerly winds, either to the north-east or south-west. The chief islands in the straits of Sunda are Prince's isle, Krakatau, Thwart the Way, and Pulo Baby. The others are very small and insignificant, mostly level, founded on beds of coral, and covered with trees. A few have steep naked sides, and at a little distance resemble old castles, mouldering into ruins, but, on a nearer view, appear to be of volcanic origin. The Dutch East India Company claim an absolute sovereignty over the straits of Sunda, but it never has been, in any respect, enforced. These pretensions originate from the circumstance of their superiority over the land on each side; Bantam on the Java shore, and Lampong on that of Sumatra.

SUN'DAY, *s.* [ˈsʌnˌdaɪ, Sax.; *the day of the sun.*] The day anciently dedicated to the sun; the first day of the week; the sabbath.—If thou wilt needs thrust thy neck into a yoke, wear the print of it, and sigh away *Sundays*. *Shakespeare.*

SUNDAY ISLAND, a small island on the east coast of New Holland, discovered by Captain Bligh in 1789. Lat. 11. 58. S.

SUNDBURG, a fortress in the south-west of Sweden, in the province of Bahus, on the Swynesund, a bay to the north of Gottenburg.

VOL. XXIII. No. 1601.

SUNDEELA, a town of Hindoostan, province of Oude, and district of Lucknow. Lat. 27. 5. N. long. 80. 30. E.

SUNDEEP, an island of Bengal, situated at the mouth of the eastern or great branch of the river Ganges. It is about 20 miles in length by 10 in breadth. The soil is fertile, and affords excellent pasture for cattle, and might easily be rendered of much more value than it is at present; but the same reasons which have hitherto induced the British not to cultivate Sagur, apply equally to this island, and it is chiefly used as the station of one of the government factories in the manufacture of sea salt, being an appendage of the Chittagong agency. Ships may safely approach it on all sides but the north, where the passage between it and Boming is reckoned dangerous. The town is situated on the north bank of a river or creek called Sittal, and stands about a mile from the western shore. The entrance to the river is safe, and at the distance of a mile inland has four fathoms water even at ebb tide. It possesses also good anchorage where ships might remain in safety during the adverse monsoon; but the climate is unfavourable to Europeans. Towards the end of the sixteenth century, a number of Portuguese were settled on the coasts of Arracan and Chittagong. Many of these had entered into the service of the native princes, and from their knowledge of maritime affairs, and desperate bravery, had risen to considerable commands, and had obtained extensive grants of land both on the continent and adjacent islands. Turbulent or treacherous conduct of these adventurers having, in the year 1607, given offence to the rajah of Arracan, he determined to extirpate them from his dominions. Many were in consequence put to death, but a number of them escaped in their vessels, to the islands at the mouth of the Ganges, where for some time they lived by piracy, and having elected a person named Sebastian Gonzales to be their chief, took possession of the island of Sundeep. His countryman, and some converts to Christianity joined his standard, and in a few years he had collected an army of 3000 men, and 80 small vessels of war, with which force he took possession of all the neighbouring islands. After a turbulent career of nine years, he was defeated by the rajah of Arracan, who took possession of the island, and retained it till the year 1666, when it was conquered by a Mogul army sent from Dacca by the nabob Shaista Khan, and, with the rest of the province, came into possession of the British. The town is situated in Lat. 22. 25. N. long. 91. 36. E.

To **SUN'DER**, *v. a.* [ˈsʌndə, Sax.] To part; to separate; to divide.—It is *sundered* from the main land by a sandy plain. *Carew.*

SUN'DER, *s.* [ˈsʌndə, Sax.] Two; two parts.—He breaketh the bow, and cutteth the spear in *sunder*. *Psalms.*

SUNDERBERG, or **SONDERBORG**, a small town of Denmark, in the island of Alsen. It has a castle and an hospital, and contains a population of 2700. Its harbour is accounted one of the best in Denmark, and has belonging to it about 60 vessels, great and small. In the castle at this place Christian II., king of Denmark, was confined as a prisoner for 13 years; 16 miles east-north-east of Flensborg. Lat. 54. 56. N. long. 9. 49. E.

SUNDERBUNDS, or **CHUNDERBUND**, an extensive and woody district of Bengal, situated in the Delta of the Ganges and intersected by innumerable rivers or creeks, all of which are salt, and through the whole track nothing but brackish water is to be found. It is therefore, generally speaking, uninhabited, except by deer and tigers: even the birds seem to have abandoned this inhospitable territory, as not one is to be seen till you approach one of the few scattered villages which are mostly situated at the junction of two of the most frequented rivers, and are supplied with fresh water by the passing boats. The navigation through the Sunderbunds is, however, extremely romantic, and well worth seeing once. There are pilots who are well acquainted with all its intricacies, and who conduct the boats through with great safety. Instances have occurred of tigers jumping into, or swimming to boats, and carrying off some of the crew, but they are

very rare. This route is seldom taken as a matter of choice; but boats coming down the country to Calcutta in the hot season, are obliged to come through the Sunderbunds. The boats also from Chittagong and Arracan come through them in all seasons of the year; and during the dry weather salt-makers and wood cutters reside here, and follow their respective occupations, though at the great risk of their lives. It is observable, that none of the trees are of a great size, nor afford valuable timber. They are, however, extremely useful to Calcutta and other European towns on the Bhaggarutty river, by yielding them an inexhaustible supply of firewood. Some attempts have been made to bring parts of the Sunderbunds into cultivation, but with little success, as the want of fresh water must always prove a great obstacle. In a political point of view the Sunderbunds are esteemed of much utility, as forming a strong barrier towards the south, there being only three of the rivers accessible by ships.

SUNDERBURGER-SUND. See **ALSINGSUND.**

SUNDERLAND, a large and populous market-town and sea-port of England, in the county of Durham. It is situated near the mouth of the Wear, on the south bank of the river. It is joined to the town of Monk Wearmouth, on the opposite side, by a famous iron bridge; so that the whole, including Bishop Wearmouth, forms one connected town, which extends about a mile and a half in length, and about one mile (the river Wear included) in breadth. The High-street is spacious, and tolerably handsome, especially the central part, which rises with a considerable ascent. Some of the other streets which branch off from this are narrow and dirty; but of late years many improvements have been made, in widening, repairing, and lighting the streets; and the general appearance of the town has, in consequence, been greatly improved. Of its public buildings, the church is a spacious and handsome edifice. The east end has a very light and elegant appearance, the altar being placed in a circular recess, surmounted by a dome. This building proving too small for the increasing population of the town, a spacious and elegant chapel of ease was erected in 1769; and the town contains, besides, a large and handsome chapel for the Methodists, and meeting-houses for the Presbyterians, Independents, Baptists, Quakers, and Unitarians. Several benevolent institutions exist in different parts of the town, particularly a dispensary established in 1794; a humane society, begun about the year 1790; a charity for decayed seamen and seamen's widows; a school for girls, founded about the year 1778; and a blue-coat school for boys. For the latter, a new school-house has been erected by subscription. The expense of education is chiefly defrayed by the money collected from communicants at the times of administering the sacrament. Here is also a charity school for boys, on the Lancasterian plan, and another at Bishop Wearmouth, on Bell's system. The exchange at Sunderland is a handsome building; and here is also an excellent public library, a large assembly-room, and a neat theatre. During the last war, very extensive and commodious barracks were erected on the moor on the east of the town. At a short distance to the south was formerly a chalybeate spring, said to be scarcely less powerful than that of Harrogate; but by the encroachment of the sea on the Town-moor, where it was situated, this has been entirely washed away. The harbour of Sunderland is formed by two piers, situated on the south and north sides of the river. That on the south side is of long standing, and has undergone several repairs, having been much damaged by the high flood in November 1771. The other has been constructed since the year 1788, and forms a capital improvement in the harbour. Before this period, the navigation of the river was much impeded for want of a sufficient depth of water to admit ships of large burden with their cargoes, so that they were obliged to take in part of their lading in the open road. This inconvenience is now, in a great measure, removed. The northern pier, by narrowing the river, gives the ebbing tide greater force to clear away the bar of sand which is apt to form at the entrance of the harbour. The tide now flows 16 feet, and admits vessels of 300 or 400 tons

burden. Near the extremity of the northern pier an elegant light-house has been erected, which was finished in 1802. The iron bridge of Sunderland is justly regarded as the greatest curiosity in this part of the country, and is deserving of attention, both as a magnificent work of art, and as being among the first of the kind ever erected. It consists of an arch of iron frame-work, thrown over the river, 237 feet span, and rising 100 feet above the level of the water; so that ships even of 400 tons can sail under it, by only striking their top-gallant masts. The trade of Sunderland has been long on the increase, and during the last half century in particular, has advanced with great rapidity. Its imports are chiefly flour, wines, spirituous liquors, timber, tar, deals, flax, iron, &c. Coal is the staple article of export, and the coal trade furnishes employment for nearly 600 vessels, besides nearly 500 keels, which convey the coals from the coal-wharfs to the ships. The whole quantity of coals exported from Sunderland in the year 1820, was 421,061½ Newcastle chaldrons. The number of persons dependent on this trade is very great, and cannot be estimated at less than 20,000 or 30,000. Most of the coals go to the metropolis, and to different places along the eastern coast. Considerable quantities are also sent to the Baltic, and in time of peace to France and Holland. The other articles of export are lime, glass bottles, grindstones, and coppers. The lime is sent chiefly to the coasts of Yorkshire and Scotland. In the year 1814, no fewer than 8000 vessels cleared out from this port. The manufactures of Sunderland are chiefly those of flint and bottle glass, earthenware, coppers, coal, tar, patent ropes, &c. Ship-building is carried on to a great extent, and a greater number of vessels have been launched here of late years, than at any other part in the kingdom. Sunderland is a borough by prescription. In the year 1634, the burgesses and inhabitants were incorporated, by the title of mayor, 12 aldermen, and commonalty; but through the destruction and confusion incident to the civil wars which immediately followed, the charter was suffered to expire, no mayor or aldermen having ever been chosen to replace the first nominees. It sends no member to parliament. Population in 1811, 25,180; in this return seafaring men, and persons serving in the army, or old militia, were not included. The real population at present, including these, will not be short of 35,000. Market on Friday; 13 miles north-east of Durham, and 268 north of London. Lat. 54. 55. N., long. 0. 40. E.

SUNDERLAND, a village of England, in Cumberland, near Cockermouth.

SUNDERLAND, a township of the United States, in Franklin county, Massachusetts, east of the Connecticut; 90 miles west of Boston. Population 551.

SUNDERLAND BRIDGE, a hamlet of England, county of Durham; 3½ miles south-south-west of Durham.

SUNDERLAND FORT, a fort of the island of Barbadoes; 1 mile north of Speights Town.

SUNDERLAND, NORTH, a township of England, in Northumberland; 6½ miles east-south-east of Belford. Population 528.

SUNDERLAND WICK, a hamlet of England, East Riding of Yorkshire; 2½ miles south-south-west of Great Driffield.

SUNDEW, *s.* An herb. *Ainsworth.*

SUNDHAUSEN, a village of the east of France, in the department of the Lower Rhine, with 1000 inhabitants.

SUNDI, or **SOONDI**, a district of Congo, in Africa, on the upper part of the bank of the Zaire. It is rocky and barren.

SUNDIAL, *s.* A marked plate on which the shadow points the hour.—The body, though it really moves, yet not changing perceivable distance, seems to stand still; as is evident in the shadows of *sun-dials*. *Locke.*

SUNDON, a parish of England, in Bedfordshire; 5 miles north-west-by-north of Luton.

SUN-DRIED, *part. adj.* Dried by the heat of the sun.—The building is of *sun-dried* brick. *Sir T. Herbert.*

SUNDRISH, or **SUNDRIDGE**, a parish of England, in Kent;

Kent; $3\frac{1}{2}$ miles west-by-north of Seven Oaks. Population 854.

SUNDRY, *adj.* [jʊndəp, Sax.; *sundr*, Goth., from *to sunder*. See also *ASUNDER*.] Several; more than one.—Not of one nation was it peopled, but of *sundry* people of different manners. *Spenser*.

How can a mirror *sundry* faces show,
If from all shapes and forms it be not clear? *Davies*.

SUNDSWALL, a small town of Middle Sweden, in the province of Medelpedia, on the gulf of Bothnia, surrounded by high hills. It is the only town in the province, consists of one broad street, but has a population of only 1500. The harbour is large and convenient. The chief trade is in timber and tar; also in linen; 20 miles south of Hernosand, and 185 north of Stockholm. Lat. 62. 22. 30. N. long. 17. 16. 30. E.

SUNDWICH, or **SUNDWIG**, a village of Prussian Westphalia, in the county of Mark, with manufactures of iron and brass-wire; 2 miles from Iserlohn.

SUNERAMPORE, a town of Bengal, district of Dacca. It is advantageously situated on the eastern branch of the Megna river, and carries on a considerable trade. Lat. 24. 5. N., long. 91. E.—There are several other places of this name in Hindostan, but none of consequence.

SUNERGONG. See **SOONERGONG**.

SUNFISH. See **TETRODON MOLA**.

SUNFISH CREEK, a river of the United States, in Ohio, which runs into the Ohio; 22 miles below Wheeling.

SUNFLEET POINT, a cape on the south coast of New Holland, in Spalding Cove, Port Lincoln.

SUN-FLOWER, *s.* A plant. See **HELIANTHEMUM**.

SUNG. The preterite and participle of *sing*.

A large rock then heaving from the plain,
He whirl'd it round, it *sung* across the main. *Pope*.

SUNGEI TENANG, a county in the interior of Sumatra, situated between the 2d and 3d degrees of south latitude. The access to this territory is extremely difficult, on account of the different ranges of high mountains, covered with forest trees and thick jungle, that intervene. It is bounded on the north-west by Korinchi and Serampe; on the west and south-west by the Anak Sungei, or Mocomoco and Ypu district; on the south by Laboon, and on the east by Bantang Asei and Pakalangjambu.

The general produce of the country is maize, padi, potatoes, sweet potatoes, tobacco, and sugar-cane; and the valleys on the whole are well cultivated. The principal part of the clothing is procured from the eastern part of the island. It is a practice with many individuals among these people (as with mountaineers in some parts of Europe) to leave their country, in order to seek employment where they can find it, and at the end of three or four years revisit their native soil, bringing with them the produce of their labours. If they happen to be successful, they become itinerant merchants, and travel to almost all parts of the island, particularly where fairs are held, or else purchase a matchlock-gun, and become soldiers of fortune, hiring themselves to whoever will pay them, but always ready to come forward in defence of their country and families. They are a thick, stout, dark race of people, something resembling the Acheenese; and in general they are addicted to smoking opium. The men are very fantastical in their dress. They commonly carry charms about their persons, to preserve them from accidents; one of which was shewn to Mr. Marsden, printed (at Batavia or Samarang in Java) in Dutch, Portuguese, and French. It purported that the writer was acquainted with the occult sciences, and that whoever possessed one of the papers impressed with his mark (which was the figure of a hand, with the thumb and fingers extended) was invulnerable and free from all kinds of harm. It desired the people to be very cautious of taking any such, printed in London (where, certainly, none were ever printed), as the English would endeavour to counterfeit them, and to impose on the purchasers, being all cheats. The houses are all built on posts. Every

village has a town-hall about 120 feet long, and broad in proportion, the wood-work of which is neatly carved. The dwelling-houses contain five, six, or seven families each, and the country is populous.

SUNIUM, the cape or promontory forming the southern extremity of Attica. Its bay is insignificant, and the chief curiosity is a ruined temple of Minerva, once adorned with exquisite sculpture, of which 15 columns are still standing. Its present name is Cape Colonna.

SUNK. The preterite and participle passive of *sink*.—We have large cavés: the deepest are *sunk* six hundred fathom, and some digged and made under great hills. *Bacon*.

SUN-LESS, *adj.* Wanting sun; wanting warmth.

He thrice happy on the *sun-less* side,
Beneath the whole collected shade reclines. *Thomson*.

SUNLIKE, *adj.* Resembling the sun.

She came, as if Aurora faire
Out of the East had newly made repaire,
Making a *sun-like* light with golden shine
Of her bright beauty in the gazers' eine. *Mir. for Mag.*

SUN-LIGHT, *s.* The light of the sun.

Where highest woods, impenetrable
To star or *sun-light*, spread their umbrage broad. *Milton*.

SUNNINGHILL, a very pleasant village and parish of England, in Berkshire, situated in the most delightful part of Windsor forest. Here are many handsome villas, and some mineral wells in the neighbourhood, which are much frequented in summer, and are reckoned efficacious in paralytic cases. Population 913; 6 miles south-south-west of New Windsor.

SUNNINGWELL, a parish of England, situated on the opposite banks of the Thames, in Berkshire and Oxfordshire, the two parts being connected by a wooden bridge; 2 miles north of Abingdon.

SUNNY, *adj.* Resembling the sun; bright.
She saw Duessa *sunny*-bright,
Adorn'd with gold and jewels shining clear. *Spenser*.

Exposed to the sun; bright with the sun.—Him walking
on a *sunny* hill he found. *Milton*.

The filmy gossamer now flits no more,
Nor halcyons bask on the short *sunny* shore. *Dryden*.

Coloured by the sun.

Her *sunny* locks
Hang on her temples like a golden fleece. *Shakspeare*.

SUN-PROOF, *adj.* Impervious to sun-light.—This shade,
sun-proof, is yet no proof for thee. *Peele*.

SUN-RISE, or **SUN-RISING**, *s.* Morning; the appearance of the sun.

Send out a pursuivant
To Stanley's regiment; bid him bring his power
Before *sun-rising*. *Shakspeare*.

We now believe the Copernican system; yet, upon ordinary occasions, we shall still use the popular terms of *sun-rise* and *sun-set*. *Bentley*.—East.—In those days the giants of Libanus mastered all nations, from the *sun-rising* to the *sun-set*. *Raleigh*.

SUN-SET, *s.* Close of the day; evening.
At *sun-set* to their ship they make return,
And snore secure on deck till rosy morn. *Dryden*.

West.

SUNSHINE, *s.* [jʊn-ʃaɪn, Sax. Milton accents it on the last syllable; and so *sun-shiny* was formerly accented on the second.] Action of the sun; place where the heat and lustre of the sun are powerful.

That man that sits within a monarch's heart,
And ripens in the *sun-shine* of his favour,
Would he abuse the countenance of the king,
Alack, what mischiefs might be set abroad,
In shadow of such greatness? *Shakspeare*.

SUN-SHINE, or **SUN-SHINY**, *adj.* [It was anciently accented

accented on the second syllable.] Bright with the sun.—The cases prevent the bees getting abroad upon every *sun-shine* day. *Mortimer*.—Bright like the sun.

The frightful-headed-beast, amaz'd
At flashing beams of that *sun-shiny* shield,
Became stark blind, and all his senses daz'd,
That down he tumbled.

Spenser.

SUNTA BEDNORE, a town of the south of India, province of Mysore. It is defended by a mud wall and a bound hedge; but was burnt by the Mahrattas in 1792. Lat. 14. 8. N. long. 76. 5. E.

SUOVĒTAURILIA, or SOLITAURILIA, a solemn sacrifice among the ancient Romans; in which they offered three victims of three different kinds, viz., a bull, a ram, and a boar.

Livy, describing it, calls it *suovetaurilia*; as composed of *sus*, *ovis*, and *taurus*; the names of the three victims sacrificed.

To SUP, *v. a.* [*supan*, Sax.; *soepen*, Dutch.] To drink by mouthfuls; to drink by little at a time; to sip.

There I'll find a purer air
To feed my life with; there I'll *sup*
Balm and nectar in my cup.

Crashaw.

To SUP, *v. n.* [*souper*, Fr.] To eat the evening meal. There's none observes, much less repines,
How often this man *sups* or dines.

Carew.

To SUP, *v. a.* To treat with supper.—He's almost *supp'd*: why have you left the chamber? *Shakspeare*.

SUP, *s.* A small draught; a mouthful of liquor.

Tom Thumb had got a little *sup*,
And Tomalin scarce kist the cup.

Drayton.

SU'PER, in composition, notes either more than another, or more than enough, or on the top.

SU'PERABLE, *adj.* [*superabilis*, Lat.; *superable*, Fr.] Conquerable; such as may be overcome.—Antipathies are, generally, *superable* by a single effort. *Johnson*.

SU'PERABLY, *adv.* So as may be overcome.

SU'PERABLENESS, *s.* Quality of being conquerable.

To SUPERABO'UND, *v. n.* To be exuberant; to be stored with more than enough.—She *superabounds* with corn, which is quickly convertible to coin. *Howell*.

SUPERABUNDANCE, *s.* More than enough: great quantity.—The precipitation of the vegetative terrestrial matter at the deluge amongst the sand, was to retrench the luxury and *superabundance* of the productions of the earth. *Woodward*.

SUPERABUNDANT, *adj.* Being more than enough.—So much *superabundant* zeal could have no other design than to damp that spirit raised against Wood. *Swift*.

SUPERABUNDANTLY, *adv.* More than sufficiently.—Nothing but the uncreated Infinite can adequately fill and *superabundantly* satisfy the desire. *Cheyne*.

To SUPERA'DD, *v. a.* [*superaddo*, Lat.] To add over and above; to join any thing extrinsic.—The peacock laid it extremely to heart that he had not the nightingale's voice *superadded* to the beauty of plumes. *L'Estrange*.

SUPERADDITION, *s.* The act of adding to something else.—The fabric of the eye, its safe and useful situation, and the *superaddition* of muscles, are a certain pledge of the existence of God. *More*.—That which is added.

SUPERADVE'NIENT, *adj.* [*superadveniens*, Lat.] *Unuscd.*—Coming to the increase or assistance of something. Coming unexpectedly.

To SUPERA'NNUATE, *v. a.* [*super* and *annus*, Lat.] To impair or disqualify by age or length of life.—If such depravities but yet alive, deformity need not despair, nor will the eldest hopes be ever *superannuated*. *Brown*.

To SUPERA'NNUATE, *v. n.* To last beyond the year. *Not in use*.—The dying of the roots of plants that are annual, is by the over-expend of the sap into stalk and

leaves, which being prevented, they will *superannuate*. *Bacon*.

SUPERANNUATION, *s.* The state of being disqualified by years.

SUPERB, *adj.* [*superbe*, Fr.; *superbus*, Lat.] Grand; pompous; lofty; august; stately; magnificent.—The most *superb* edifice, that ever was conceived or constructed, would not equal the smallest insect, blest with sight, feeling and locomotivity. *Bryant*.

SUPERBLY, *adv.* In a superb manner.—Wood's manuscript was very *superbly* bound and embossed. *Warton*.

SUPERCARGO, *s.* An officer in a ship whose business is to manage the trade.

I only wear it in a land of Hectors,
Thieves, *supercargoes*, sharpeners, and directors. *Pope*.

SUPERCELESTIAL, *adj.* Placed above the firmament.—I dare not think that any *supercelestial* heaven, or whatsoever else, not himself, was increate and eternal. *Raleigh*.

SUPERCHERY, *s.* [An old word of French original.] Deceit; cheating.

SUPERCILIOUS, *adj.* [*supercilium*, Latin.] Haughty; dogmatical; dictatorial; arbitrary; despotic; overbearing.—Several *supercilious* critics will treat an author with the greatest contempt, if he fancies the old Romans wore a girdle. *Addison*.

SUPERCILIOUSLY, *adv.* Haughtily; dogmatically; contemptuously.

SUPERCILIOUSNESS, *s.* Haughtiness; contemptuousness.

SUPERCONCEPTION, *s.* A conception admitted after another conception. *Unused*.—Those *superconceptions*, where one child was like the father, the other like the adulterer, seem idle. *Brown*.

SUPERCONSEQUENCE, *s.* Remote consequence. *Unused*.—Not attaining the deuterostopy, and second intention of the words, they omit their *superconsequences* and coherences. *Brown*.

SUPERCRE'SCENCE, *s.* [*super* and *cresco*, Lat.] That which grows upon another growing thing.—Wherever it groweth it maintains a regular figure, like other *supercrecences*, and like such as, living upon the stock of others, are termed parasitical plants. *Brown*.

SUPERE'MINENCE, or SUPERE'MINENCY, *s.* [*super* and *emineo*, Lat.] Uncommon degree of eminence; eminence above others though eminent.—The archbishop of Canterbury, as he is primate over all England and metropolitan, has a *supereminency*, and even some power over the archbishop of York. *Ayliffe*.

SUPERE'MINENT, *adj.* Eminent in a high degree.

SUPERE'MINENTLY, *adv.* In the most eminent manner.

SUPERE'ROGANT, *adj.* The same as supererogatory.

To SUPERE'ROGATE, *v. n.* [*supcr* and *erogatio*, Lat.] To do more than duty requires.

So by an abbey's skeleton of late,

I heard an echo *supererogate*

Through imperfection, and the voice restore,

As if she had the hiccup o'er and o'er. *Cleveland*.

SUPEREROGATION, *s.* Performance of more than duty requires.—There is no such thing as works of *supererogation*; no man can do more than needs, and is his duty to do, by way of preparation for another world. *Tillotson*.

SUPEREROGATIVE, *adj.* Supererogatory.—I can brook better a fellow that hath bought his new-found nobility with nobles, than another of an high birth and low-stooping spirit, who can justly brag of nothing of his own, but lives upon the *supererogative* deeds of his ancestors. *Stafford*.

SUPEREROGATORY, *adj.* Performed beyond the strict demands of duty.—*Supererogatory* services, and too great benefits from subjects to kings, are of dangerous consequence. *Howell*.

SUPERESSENTIAL, *adj.* Above the constitution or existence

existence of a thing.—It being impossible for any nature to comprehend what is *superessential*, or infinitely above it. *Ellis*.

To SUPEREXALT, *v. a.* To exalt above the ordinary rate.—God having *superexalted* our Lord,—is therefore said to have seated him at his right hand. *Barrow*.

SUPEREXALTATION, *s.* Elevation above the common rate.

SUPEREXCELLENT, *adj.* Excellent beyond common degrees of excellence.—We discern not the abuse: suffer him to persuade us that we are as gods, something so *superexcellent*, that all must reverence and adore. *Dec. of Chr. Piety*.

SUPEREXCRESCENCE, *s.* Something superfluously growing.—As the eschar separated between the scarifications, I rubbed the *superexcrescence* of flesh with the vitriol stone. *Wiseman*.

To SUPERFETATE, *v. n.* [*super* and *fatus*, Lat.] To conceive after conception.—The female brings forth twice in one month, and so is said to *superfetate*, which, saith Aristotle, is because her eggs are hatched in her one after another. *Grew*.

SUPERFETATION, *s.* [*superfetus*, Fr.] One conception following another, so that both were supposed to be in the womb together.—*Superfetus* must be by abundance of sap in the bough that putteth it forth. *Bacon*.

To SUPERFETE, *v. n.* To superfetate.

So is my fancy quicken'd by the glance
Of his benign aspect and countenance:
It makes me pregnant, and to *superfete*.

Howell.

To SUPERFETE, *v. a.* To conceive upon a conception.—The Spaniard doth use to pause so in his pronunciation, that his tongue seldom foreruns his wit; and his brain may very well raise and *superfete* a second thought before the first be offered. *Howell*.

SUPERFICE, *s.* [*superficus*, Fr., *superficies*, Latin.] Outside; surface.

Then if it rise not to the former height
Of *superfice*, conclude that soil is light.

Dryden.

SUPERFICIAL, *adj.* [*superficial*, Fr., from *superficies*, Lat.] Lying on the surface; not reaching below the surface.—That, upon the *superficial* ground, heat and moisture cause putrefaction, in England is found not true. *Bacon*.—Shallow; contrived to cover something.

This *superficial* tale

Is but a preface to her worthy praise.

Shakspeare.

Shallow; not profound; smattering, not learned.—Their knowledge is so very *superficial*, and so ill-grounded, that it is impossible for them to describe in what consists the beauty of those works. *Dryden*.

SUPERFICIALITY, *s.* The quality of being superficial.—By these salts the colours of bodies receive degrees of lustre or obscurity, *superficiality* or profundity. *Brown*.

SUPERFICIALLY, *adv.* On the surface; not below the surface. Without penetration; without close heed.—Perspective hath been with some diligence inquired; but the nature of sounds in general hath been *superficially* observed. *Bacon*.—Without going deep; without searching to the bottom of things.

You have said well;

But on the cause and question now in hand,
Have glaz'd but *superficially*.

Shakspeare.

SUPERFICIALNESS, *s.* Shallowness; position on the surface. Slight knowledge: false appearance; show without substance.

SUPERFICIES, *s.* Outside; surface; superface.—A convex mirror makes objects in the middle to come out from the *superficies*: the painter must, in respect of the light and shadows of his figures, give them more relieve. *Dryden*.

SUPERFINE, *adj.* Eminently fine.—If you observe your cyder, by interposing it between a candle and your

eye, to be very transparent, it may be called *superfine*. *Mortimer*.

SUPERFLUENCE, *s.* [*super* and *fluo*, Lat.] More than is necessary.—The *superfluence* of grace is ordinarily proportioned to the discharge of former trusts, making use of the foregoing sufficient grace. *Hammond*.

SUPERFLUITANCE, *s.* [*super* and *fluito*, Lat.] The act of floating above.—Spermaceti, which is a *superfluitance* on the sea, is not the sperm of a whale. *Brown*.

SUPERFLUITANT, *adj.* [*superfluitans*, Lat.] Floating above.

SUPERFLUITY, *s.* [*superfluité*, French.] More than enough; plenty beyond use or necessity.—A quiet mediocrity is still to be preferred before a troubled *superfluity*. *Suckling*.

SUPERFLUOUS, *adj.* [*super* and *fluo*, Lat.] Exuberant; more than enough; unnecessary; offensive by being more than sufficient.

If ye know,

Why ask ye, and *superfluous* begin

Your message, like to end as much in vain?

Milton.

SUPERFLUOUSNESS, *s.* The state of being superfluous.

SUPERFLUX, *s.* [*super* and *fluxus*, Lat.] That which is more than is wanted.

Take physic, pomp;

Expose thyself to feel what wretches feel,

That thou may'st shake the *superflux* to them.

Shakspeare.

SUPERFOLIATION, *s.* Excess of foliation.—This, in the pathology of plants, may be the disease of *superfoliation*, mentioned by Theophrastus; whereby the fructifying juice is starved by the excess of leaves. *Sir T. Brown*.

SUPERGA, a mountain of the north of Italy, in the Sardinian states, in Piedmont, about five miles from Turin, remarkable for its picturesque scenery, and for the elegance of a church which crowns its summit. This edifice, built by Victor Amadeus, is of a circular form, supported by pillars of beautiful marble, and surmounted by a dome. The altars are decorated with bas-reliefs, and the pavement is of variegated marble. It is the burial place of the royal family, is seen from the surrounding country to a considerable distance, and commands, in return, a most delightful view.

SUPERHUMAN, *adj.* Above the nature or power of man.

SUPERIMPREGNATION, *s.* Superconception; superfetation.

SUPERINCUMBENT, *adj.* Lying on the top of something else.—It is sometimes so extremely violent, that it forces the *superincumbent* strata. *Woodward*.

To SUPERINDUCE, *v. a.* [*super* and *induco*, Lat.] To bring in as an addition to something else.—Father is a notion *superinduced* to the substance of man, and refers only to an act of that thing called man, whereby he contributed to the generation of one of his own kind, let man be what it will. *Locke*.—To bring on a thing not originally belonging to that on which it is brought.—Relation is not contained in the real existence of things, but something extraneous and *superinduced*. *Locke*.

SUPERINDUCTION, *s.* The act of superinducing.—A good inclination is but the first rude draught of virtue; the *superinduction* of ill habits quickly deface it. *South*.

SUPERINJECTION, *s.* An injection succeeding another.

To SUPERINSPECT, *v. a.* To overlook; to oversee.—He *superinspects* the whole affair of victualling at that port. *Maydman*.

SUPERINSTITUTION, *s.* [In Law.] One institution upon another; as if A be instituted and admitted to a benefice upon a title, and B be instituted and admitted by the presentation of another. *Bailey*.

To SUPERINTEND, *v. a.* To oversee; to overlook; to take care of others with authority.—This argues design, and a *superintending* wisdom, power, and providence in this special business of food. *Derham*.

8 Q SUPERINTENDENCE,

SUPERINTE'NDENCE, or **SUPERINTE'NDENCY**, *s.* Superior care; the act of overseeing with authority.—The Divine Providence, which hath a visible respect to the being of every man, is yet more observable in its *superintendency* over societies. *Grew.*

SUPERINTE'NDENT, *s.* [*superintendant*, Fr.] One who overlooks others authoritatively.—Our new *superintendents* and ministers. *Martin.*

SUPERINTE'NDENT, *adj.* Overlooking others with authority.—Next to Brama, one Deuendre is the *superintendent* deity, who hath many more under him. *Stillingfleet.*

SUPE'RIOR, *adj.* [*superieur*, Fr.; *superior*, Lat.] Higher; greater in dignity or excellence; preferable or preferred to another.—*Superior* beings above us, who enjoy perfect happiness, are more steadily determined in their choice of good than we, and yet they are not less happy or less free than we are. *Locke.*—Upper; highly locally.—By the refraction of the second prism, the breadth of the image was not increased, but its *superior* part which in the first prism suffered the greater refraction, and appeared violet and blue, did again in the second prism suffer a greater refraction than its inferior part, which appeared red and yellow. *Newton.*—Free from emotion or concern; unconquered; unaffected.—There is not in earth a spectacle more worthy than a great man *superior* to his sufferings. *Addison.*

SUPE'RIOR, *s.* One more excellent or dignified than another.—Those under the great officers of state have more frequent opportunities for the exercise of benevolence than their *superiors*. *Addison.*

SUPERIOR, LAKE, a lake of North America, and the largest body of fresh water which has yet been discovered. It is the most western of the great American lakes, and may be considered the head reservoir from which the St. Lawrence derives its ample stream. This immense lake, unequalled in magnitude by any collection of fresh water upon the globe, is almost of a triangular form; its greatest length is 351, its breadth 161, and its circumference little less than 1152 miles; and is remarkable for the unrivalled transparency of its waters, as for its extraordinary depth. Its northern coast, indented with many extensive bays, is high and rocky; but on the southern shore the land is generally low and level. A sea almost of itself, it is subject to many vicissitudes of that element; for here the storm rages, and the billows break with a violence scarcely surpassed by the tempests of the ocean. In the distant range of mountains that form the land's height beyond its northern and western shores, several considerable rivers, and numerous small ones, have their rise, which being increased in their course by many small lakes, finally discharge themselves into Lake Superior. To the southward also there is another lofty range, dividing the waters that find their way to the gulf of Mexico through the channel of the Mississippi, from those that take a northern course into the great lake; so that its vastness is increased by the tributary streams of more than 30 rivers. On its north and north-east sides there are several islands, of which one called Isle Royale is the largest, being 100 miles long and 40 broad. Out of the south-east angle of Lake Superior a very rapid current, interrupted and broken by many small islands, or rather huge masses of rock, flows through a channel of 27 miles in length, at the end of which it flows into Lake Huron. The falls of St. Mary are nearly midway between the two lakes. This denomination, though generally given, but little accords with the usual appellation of Falls, as applied to the descent of large bodies of water precipitated from great heights, that so frequently occur on the rivers of America; for, in this place, it is only the impetuous stream of the enormous discharge from Lake Superior, forcing its way through a confined channel, and breaking with proportionate violence through the impediments that nature has thrown in its way; yet this scene of tumultuous and unceasing agitation of the waters, combined with the noise and dazzling whiteness of the surge, is not deficient either in grandeur or magnificence. The lake abounds with

fish, particularly trout and sturgeon, which may be caught at almost any season in the greatest abundance. The trout in general weigh about 12lbs.; but some are caught that exceed 50. Besides these, a species of white fish is taken in great quantities here, that resemble a shad in their shape, but they are rather thicker, and less bony: they weigh about 4lbs. each, and are of a delicious taste. There are likewise many sorts of smaller fish in great plenty here, and which may be taken with ease. Among these are a sort resembling a herring, that are generally made use of as a bait for the trout. Very small crabs, not larger than half a crown piece, are found both in this and Lake Michigan. Lat. 46. 4. to 48. 45. N. long. 84. 46. to 91. 55. W.

SUPERIO'RITY, *s.* Pre-eminence; the quality of being greater or higher than another in any respect.—The person who advises, does in that particular exercise a *superiority* over us, thinking us defective in our conduct or understanding. *Addison.*

SUPERJURARE. Anciently, when a criminal endeavoured to excuse himself by his own oath, or by that of one or more witnesses, and yet the crime was so notorious, that he was convicted by the oaths of many more witnesses; this was called *superjurare*.

SUPERLA'TION, *s.* [*superlatio*, Lat.] Exaltation of any thing beyond truth or propriety.—There are words that as much raise a style as others can depress it; *superlative* and overmuchness amplifies: it may be above faith, but not above a mean. *B. Jonson.*

SUPE'RLATIVE, *adj.* [*superlatif*, Fr.; *superlativus*, Lat.] Implying or expressing the highest degree.—Some have a violent and turgid manner of talking and thinking: they are always in extremes, and pronounce concerning every thing in the *superlative*. *Watts.*—Rising to the highest degree.—Ingratitude and compassion never cohabit in the same breast; and shews the *superlative* malignity of this vice, and the baseness of the mind in which it dwells. *South.*

SUPE'RLATIVELY, *adv.* In a manner of speech expressing the highest degree.—I shall not speak *superlatively* of them; but that I may truly say, they are second to none in the Christian world. *Bacon.*—In the highest degree.—Tiberius was bad enough in his youth; but *superlatively* and monstrously so in his old age. *South.*

SUPE'RLATIVENESS, *s.* The state of being in the highest degree.

SUPERLU'NAR, or **SUPERLU'NARY**, *adj.* Not sublunary; placed above the moon; not of this world.

The mind, in metaphysics, at a loss,

May wander in a wilderness of moss;

The head that turns at *superlunar* things,

Pois'd with a tail, may steer on Wilkins' wings. *Pope.*

SUPERNA'CULUM, *s.* ["*vox hybrida*, ex Lat. *præpositione super* (upon) et Germ. *nagel* (a nail) composita; qui mos nova vocabula fingendi Anglis potissimum usitatus est, vocemque *supernaculi* apud eosdem produxit." De *Supernaculo* Anglorum, 4to., Lips. 1746, p. 8. Cited by Brand, Pop. Antiq. ii. 239.] Good liquor, of which there is not even a drop left sufficient to wet one's nail. *Grose.*—To drink *supernaculum* was an ancient custom not only in England, but also in several other parts of Europe, of emptying the cup or glass, and then pouring the drop or two that remained at the bottom upon the person's nail that drank it, to shew that he was no fincher. *Brand.*

I saw some sparks as they were drinking,

With mighty mirth, and little thinking;

Their jests were *supernaculum*,

I snatch'd their rubies from each thumb;

And in this crystal have 'em here. *King.*

SUPE'RNAL, *adj.* [*supernus*, Lat.] Having an higher position; locally above us.—By heaven and earth was meant the solid matter and substance, as well of all the heavens and orbs *supernal*, as of the globe of the earth, and waters which covered it. *Raleigh.*—Relating to things above; placed above; celestial; heavenly.

That

That *supernal* Judge that stirs good thoughts
In any breast of strong authority,
To look into the blots and stains of right. *Shakspeare.*

SUPERNA'TANT, *adj.* [*supernatans*, Lat.] Swimming above.—Whilst the substance continued fluid, I could shake it with the *supernatant* menstruum, without making between them any true union. *Boyle.*

SUPERNATA'TION, *s.* [from *supernato*, Lat.] The act of swimming on the top of any thing.—Bodies are differenced by *supernatation*, as floating on water; for chrystal will sink in water, as carrying in its own bulk a greater ponderosity than the space of any water it doth occupy; and will therefore only swim in molten metal and quicksilver. *Brown.*

SUPERNA'TURAL, *adj.* Being above the powers of nature.

What mists of providence are these,
Through which we cannot see?
So saints by *supernatural* power set free
Are left at last in martyrdom to die. *Dryden.*

SUPERNA'TURALLY, *adv.* In a manner above the course or power of nature.

SUPERNUMERARY, *adj.* [*supernumeraire*, Fr.; *super* and *numerus*, Lat.] Being above a stated, a necessary, an usual, or a round number.—Antiochus began to augment his fleet; but the Roman senate ordered his *supernumerary* vessels to be burnt. *Arbutnot.*

SUPERPLANT, *s.* A plant growing upon another plant.—No *superplant* is formed from a plant but misletoe. *Bacon.*

SUPERPLUSAGE, *s.* [*super* and *plus*, Lat.] Something more than enough.—After this there yet remained a *superplusage* for the assistance of the neighbour parishes. *Fell.*

To **SUPERPONDERATE**, *v. a.* [*super* and *pondero*, Lat.] To weigh over and above. *Dict.*

To **SUPERPRAISE**, *v. a.* To praise beyond measure.
To vow, and swear, and *superpraise* my parts,
When I am sure you hate me with your hearts. *Shakspeare.*

SUPERPROPORTION, *s.* [*super* and *proportio*, Lat.] Overplus of proportion.—No defect of velocity, which requires as great a *superproportion* in the cause, can be overcome in an instant. *Digby.*

SUPERPURGATION, *s.* [*superpurgation*, Fr.; *super* and *purgation*.] More purgation than enough.—There happening a *superpurgation*, he declined the repeating of that purge. *Wiseman.*

SUPERREFLEXION, *s.* Reflexion of an image reflected.—Place one glass before and another behind, you shall see the glass behind with the image within the glass before, and again the glass before in that, and divers such *superreflexions*, till the species speciei at last die. *Bacon.*

SUPERSA'LIENCY, *s.* [*super* and *salio*, Latin.] This were better written *supersaliency*.] The act of leaping upon any thing.—Their coition is, by *supersaliency*, like that of horses. *Brown.*

To **SUPERSCRIBE**, *v. a.* [*super* and *scribo*, Lat.] To inscribe upon the top or outside.—Fabretti and others believe, that by the two fortunes were only meant in general the goddess who sent prosperity or afflictions, and produce in their behalf an ancient monument, *superscribed*. *Addison.*

SUPERSCRIPTION, *s.* [*super* and *scriptio*, Lat.] The act of superscribing. That which is written on the top or outside.—Read me the *superscription* of these letters; I know not which is which. *Shakspeare.*

It is enough her stone
May honour'd be with *superscription*
Of the sole lady, who had pow'r to move
The great Northumberland. *Waller.*

SUPERSE'ULAR, *adj.* Above the world.—Let us, saith he, celebrate this feast, not in a panegyric but divine, not in a worldly but *superse'cular* manner. *Bp. Hall.*

To **SUPERSE'DE**, *v. a.* [*super* and *sedeo*, Latin.] To make void or inefficacious by superior power; to set aside.—In this genuine acceptation of chance, nothing is supposed that can *supersede* the known laws of natural motion. *Bentley.*

SUPERSE'DEAS, *s.* [In Law.] Is a writ which lieth in divers and sundry cases; in all which it signifies a command or request to stay or forbear the doing of that which in appearance of law were to be done, were it not for the cause whereupon the writ is granted: for example, a man regularly is to have surety of peace against him of whom he will swear that he is afraid; and the justice required hereunto cannot deny him: yet if the party be formerly bound to the peace, in Chancery or elsewhere, this writ lieth to stay the justice from doing that, which otherwise he might not deny. *Cowel.*—The far distance of this county from the court hath afforded it a *supersedeas* from takers and purveyours. *Carew.*

SUPERSE'VICEABLE, *adj.* Over officious; more than is necessary or required.—A glass-gazing, *superserviceable*, finical rogue. *Shakspeare.*

SUPER-STATUTO, 1 Ed. III. c. 12, 13., is a writ that lay against the king's tenants holding in chief, who aliened the king's land without his licence.

SUPER-STATUTO de articulis Cleri, cap. 6., a writ lying against the sheriff, or other officer, that distrains in the king's highway, or in the lands anciently belonging to the church.

SUPER-STATUTO facto pour Seneschal et Marshal de Roy, &c., a writ that lies against the steward or marshal for holding plea in his court, or for trespass or contracts not made, and arising within the king's household.

SUPER-STATUTO versus Servantes et Laboratores, a writ which lies against him who keeps any servants, departed out of the service of another contrary to law.

SUPERSTITION, *s.* [*superstition*, Fr., *superstitio*, Lat.] Unnecessary fear or scruples in religion; observance of unnecessary and uncommanded rites or practices; religion without morality.

A rev'rent fear, such *superstition* reigns
Among the rude, ev'n then possess'd the swains. *Dryden.*

Rite or practice proceeding from scrupulous or timorous religion. In this sense it is plural.

Their truth
With *superstitions* and traditions taint. *Milton.*

False religion; reverence of beings not proper objects of reverence; false worship.—They had certain questions against him of their own *superstition*. *Acts.*—Over-nicety; exactness too scrupulous.

SUPERSTITIONIST, *s.* One who is addicted to superstition.—Every vain-glorious *superstitionist*, that would make a show in the flesh. *More.*

SUPERSTYTIOUS, *adj.* [*superstitieux*, Fr., *superstitiosus*, Latin.] Addicted to superstition; full of idle fancies or scruples with regard to religion.

A venerable wood,
Where rites divine were paid, whose holy hair
Was kept and cut with *superstitious* care. *Dryden.*

Over accurate; scrupulous beyond need.
Have I with all my full affections
Still met the king? lov'd him next heav'n? obey'd him?
Been out of fondness *superstitious* to him?
And am I thus rewarded? *Shakspeare.*

SUPERSTYTIOUSLY, *adv.* In a superstitious manner; with erroneous religion.—There reigned in this island a king, whose memory of all others we most adore; not *superstitiously*, but as a divine instrument. *Bacon.*—With too much care.—Neither of these methods should be too scrupulously and *superstitiously* pursued. *Watts.*

SUPERSTYTIOUSNESS, *s.* The state of being superstitious.—Remembrance also hys prynce's pleasure, which hath wylled all *superstyeuousnesse* to be taken away from the ceremonies. *Bale.*

To SUPERSTRAIN, *v. a.* To strain beyond the just stretch.—In the straining of a string, the further it is strained, the less *superstraining* goeth to a note. *Bacon.*

To SUPERSTRUCT, *v. a.* [*superstruo, superstructus, Lat.*] To build upon any thing.—This is the only proper basis on which to *superstruct* first innocence, and then virtue. *Dec. of Chr. Piety.*

SUPERSTRUCTURE, *s.* An edifice raised on any thing.—I want not to improve the honour of the living by impairing that of the dead; and my own profession hath taught me not to erect new *superstructures* upon an old ruin. *Denham.*

SUPERSTRUCTIVE, *adj.* Built upon something else.—He that is so sure of his particular election, as to resolve he can never fall, must necessarily resolve, that what were drunkenness in another, is not so in him, and nothing but the removing his fundamental error can rescue him from the *superstructive*, be it never so gross. *Hammond.*

SUPERSTRUCTURE, *s.* That which is raised or built upon something else.—You have added to your natural endowments the *superstructures* of study. *Dryden.*

SUPERSUBSTANTIAL, *adj.* More than substantial.

SUPERSUBTLE, *adj.* Over subtle.—If sanctimony and a frail vow betwixt an erring barbarian and *supersubtle* Venetian be not too hard for my wits. *Shakspeare.*

SUPERVACANEOUS, *adj.* [*supervacaneus, Lat.*] Superfluous; needless; unnecessary; serving to no purpose. *Unused.*

SUPERVACANEOUSLY, *adv.* Needlessly. *Unused.*

SUPERVACANEOUSNESS, *s.* Needlessness. *Unused.*

To SUPERVENE, *v. n.* [*supervenio, Lat.*] To come as an extraneous addition.—His good-will, when placed on any, was so fixed and rooted, that even *supervening* vice, to which he had the greatest detestation imaginable, could not easily remove it. *Fell.*—Such a mutual gravitation can never *supervene* to matter, unless impressed by a divine power. *Bentley.*

SUPERVENIENT, *adj.* [*superveniens, Lat.*] Added; additional.—If it were unjust to murder John, the *supervenient* oath did not extenuate the fact, or oblige the juror unto it. *Brown.*

SUPERVENTION, *s.* The act of supervening.—An espousal contract may be broken off by the *supervention* of a legal kindred, unexpected. *Hall.*

To SUPERVISE, *v. a.* [*super and visus, Latin.*] To overlook: to oversee; to intend.—M. Bayle speaks of the vexation of the *supervising* of the press, in terms so feeling that they move compassion. *Congreve.*

SUPERVISE, *s.* Inspection. *Not in use.*

That on the *supervise*, no leisure bated,
No, not to stay the grinding of the axe,
My head should be struck off.

Shakspeare.

SUPERVISION, *s.* Act of supervising.—I have a confused remembrance of having seen an old donation, for the sustenance of a perpetual lamp to burn before the high-altar in the royal chapel at Islip, under the trust and *supervision* of the abbots of Westminster. *Warton.*

SUPERVISOR, *s.* An overseer; an inspector; a superintendent.—A *supervisor* may signify an overseer of the poor, an inspector of the customs, a surveyor of high-ways, a *supervisor* of the excise. *Watts.*

How satisfy'd, my lord!

Would you be *supervisor*, grossly gape on? *Shakspeare.*

To SUPERVIVE, *v. n.* To overlive; to outlive.—Upon what principle can the soul be imagined to be naturally mortal, or what revolutions in nature will it not be able to resist and *supervive*? *Clarke.*

SUPINAMA, a river of Guiana, which falls into the Essequibo. Many estates and settlements are already on its banks; and it is also the residence of several timber cutters and brick-makers, the soil for which is particularly good.

SUPINATION, *s.* [*supination, Fr., from supino, Latin.*] The act of lying, or state of being laid with the face upward.—In anatomy, the position of the hand, in which the

palm is turned upwards.—They [the muscles] can perform—flexion, extension, pronation, *supination*, the tonic motion, circumgyration; and all these with so great expedition and agility, that they are much sooner done than said, yea, as soon done as thought on. *Smith.*

SUPINE, *adj.* [*supinus, Latin.*] Lying with the face upward: opposed to *prone*. *Brown.*

At him he lanc'd his spear, and pierc'd his breast;
On the hard earth the Lycian knock'd his head,
And lay *supine*; and forth the spirit fled. *Dryden.*

Leaning backwards with exposure to the sun.

If the vine,

On rising ground be plac'd or hills *supine*,
Extend thy loose battalions. *Dryden.*

Negligent; careless; indolent; drowsy; thoughtless; inattentive.

Supine amidst our flowing store
We slept securely. *Dryden.*

Supine in Sylvia's snowy arms he lies,
And all the busy cares of life defies. *Tatler.*

SUPINE, *s.* [*supin, French; supinum, Latin.*] In Latin Grammar, a term signifying a noun formed from a verb.

SUPINELY, *adv.* With the face upward.—Drowsily; thoughtlessly; indolently.

Who on the beds of sin *supinely* lie,
They in the summer of their age shall die. *Sandys.*

SUPINENESS, *s.* Posture with the face upward.—Drowsiness; carelessness; indolence.—When this door is open to let Dissenters in, considering their industry and our *supineness* they may in a very few years grow to a majority in the house of commons. *Swift.*

SUPINITY, *s.* Posture of lying with the face upwards.—Carelessness; indolence; thoughtlessness.—The fourth cause of error is a *supinity* or neglect of enquiry, even in matters wherein we doubt, rather believing than going to see. *Brown.*

SUPONGA, a small river of Guiana, which runs south, somewhat inclining to the west, and enters the Caroni.

SUPPAGE, *s.* What may be supped; pottage. *Unused.*

SUPPALPATION, *s.* [from *suppalpor, Lat. to wheedle.*] Act of enticing by soft words.—Thou art a courtier, and hast laid a plot to rise; if obsequious servility to the great; if those gifts in the bosom, which our blunt ancestors would have termed bribes; if plausible *suppalpations*, if restless importunities will hoist thee; thou wilt mount! *Seasonable Sermon.* (1644.)

SUPPARASITATION, *s.* [from *supparasitor, Lat. to flatter.*] The act of flattering or paying servile court to. *Unused.*

SUPPEDA'NEOUS, *adj.* [*sub and pes, Lat.*] Placed under the feet.—He had slender legs, but increased by riding after meals; that is, the humour descended upon their pedulosity, they having no support or *suppedaneous* stability. *Brown.*

To SUPPE'DITATE, *v. a.* [*suppedito, Latin.*] To supply.—Whosoever is able to *suppeditate* all things to the sufficing of all must have an infinite power. *Pearson.*

SUPPER, *s.* [*supper, Fr.* See SUP.] The last meal of the day; the evening repast.—To-night we hold a solemn *supper*. *Shakspeare.*—The hour of *supper* comes unearn'd. *Milton.*

SUPPERLESS, *adj.* Wanting supper; fasting at night. She ey'd the bard, where *supperless* he sat.
And pin'd, unconscious of his rising fate. *Popc.*

To SUPPLANT, *v. a.* [*supplanter, Fr., sub and planta, Latin.*] To trip up the heels.

The thronging populace with hasty strides

Obstruct the easy way: the rocking town

Supplants their footsteps; to and fro they reel. *Philips.*

To displace by stratagem; to turn out.—It is Philoclea his heart is set upon: it is my daughter I have borne to *supplant* me. *Sidney.*

To displace; to overpower; to force away.

If it be fond, call it a woman's fear;
Which fear, if better reasons can *supplant*,
I will subscribe, and say, I wrong'd the duke. *Shakspeare.*

SUPPLANTER, *s.* One that supplants; one that displaces.—A treacherous *supplanter* and underminer of the peace of all families and societies. *South.*

SUPPLANTING, *s.* The act of displacing or turning out.—That sad disunion and jealousy, those divisions and *supplantings* that were among the king's own friends. *Hoadley.*

SUPPLE, *adj.* [*souple*, Fr.] Pliant; flexible.
Will ye submit your necks, and choose to bend
The *supple* knee? *Milton.*

And sometimes went, and sometimes ran,
With *supple* joints, as lively vigour led. *Milton.*

Yielding; soft; not obstinate.—If punishment reaches not the mind, and makes not the will *supple*, it hardens the offender. *Locke.*—Flattering; fawning; bending.—There is something so *supple* and insinuating in this absurd unnatural doctrine, as makes it extremely agreeable to a prince's ear. *Addison.*—That which makes *supple*.

Each part deprived of *supple* government,
Shall stiff, and stark, and cold appear, like death. *Shakspeare.*

To **SUPPLE**, *v. a.* To make pliant; to make soft; to make flexible.—Poultices allaying pain, drew down the humours, and *suppled* the parts, thereby making the passages wider. *Temple.*—To make compliant.

Knaves having by their own importunate suit,
Convinc'd or *suppled* them, they cannot chuse,
But they must blab. *Shakspeare.*

To **SUPPLE**, *v. n.* To grow soft; to grow pliant.
The stones

Did first the rigour of their kind expel,
And *suppled* into softness as they fell. *Dryden.*

SUPPLELY, *adv.* Softly; mildly; pliantly. *Unused.*
SUPPLEMENT, *s.* [*supplement*, Fr., *supplementum*, Latin.]—Addition to any thing by which its defects are supplied.—His blood will atone for our imperfection, his righteousness he imputed in *supplement* to what is lacking in ours. *Rogers.*

Instructive satire, true to virtue's cause!
Thou shining *supplement* of public laws! *Young.*
Store; supply. *Not in use.*

We had not spent
Our ruddie wine a ship-board; *supplement*
Of large sort, each man to his vessel drew. *Chapman.*

SUPPLEMENTAL, or **SUPPLEMENTARY**, *adj.* Additional; such as may supply the place of what is lost or wanting.—*Supplemental* acts of state were made to supply defects of laws; and so tonnage and poundage were collected. *Clarendon.*

SUPPLENESS, *s.* [*souplesse*, Fr.] Pliantness; flexibility; readiness to take any form.—The fruit is of a pleasant taste, caused by the *suppleness* and gentleness of the juice, being that which maketh the boughs also so flexible. *Bacon.*—Readiness of compliance: facility.—Study gives strength to the mind, conversation grace; the first apt to give stiffness, the other *suppleness*. *Temple.*

SUPPLETORY, *adj.* [from *suppleo*, Latin.] Brought in to fill up deficiencies.—I have partly from Prynne, partly from my own conjecture, supplied the mutilated places as well as I could; but have included all such *suppletory* words in crotchets. *Wharton.*

SUPPLETORY *s.* [*suppletorium*, Lat.] That which is to fill up deficiencies.—They invent *suppletories* to excuse an evil man. *Bp. Taylor.*

SUPPLIAL, *s.* The act of supplying.—Society is preserved by mutual wants, the *supplial* of which causeth mutual happiness. *Warburton.*

VOL. XXIII. No. 1602.

SUPPLIANCE, *s.* Continuance.

A violet in the youth of primy nature,
Forward, not permanent, sweet, not lasting,
The perfume and *suppliance* of a minute. *Shakspeare.*

SUPPLIANT, *adj.* [*suppliant*, Fr.] Entreating; beseeching; precatory; submissive.—To bow and sue for grace with *suppliant* knee. *Milton.*

SUPPLIANT, *s.* An humble petitioner; one who begs submissively.

Hourly suitors come:
The east with incense and the west with gold,
Will stand like *suppliants* to receive their doom. *Dryden.*

SUPPLIANTLY, *adv.* In a submissive manner.
SUPPLICANT, *s.* [*supplicans*, Lat.] One that entreats or implores with great submission; an humble petitioner.

SUPPLICANT, *adj.* [*supplicans*, Lat.] Entreating; submissively petitioning.—[They] offered to this council their letters *suppliant*, confessing that they had sinned. *Bp. Bull.*

To **SUPPLICATE**, *v. n.* [*supplier*, Fr., *supplico*, Lat.] To implore; to entreat; to petition submissively and humbly.—Many things a man cannot with any comeliness say or do, a man cannot brook to *supplicate* or beg. *Bacon.*

SUPPLICATION, *s.* [*supplication*, Fr.] Petition humbly delivered; entreaty.

My mother bows,
As if Olympus to a mole-hill should
In *supplication* nod. *Shakspeare.*

Petitionary worship; the adoration of a suppliant or petitioner.

Bend thine ear
To *supplication*; hear his sighs though mute. *Milton.*

SUPPLICATORY, *adj.* Petitionary.—If we except the Creeds, no part of the service was accompanied by music, which was not either of the *supplicatory* or thanksgiving species. *Mason.*

SUPPLIER, *s.* One who supplies; one who makes up for an omission.

To **SUPPLY**, *v. a.* [*suppleo*, Lat., *suppleo*, Fr.] To fill up as any deficiencies happen.—Out of the fry of these rakehell horseboys are their kern *supplied* and maintained. *Spenser.*—To give something wanted; to yield; to afford.—They were princes that had wives, sons, and nephews; and yet all these could not *supply* the comfort of friendship. *Bacon.*—To relieve with something wanted.

Although I neither lend nor borrow,
Yet, to *supply* the ripe wants of my friend,
I'll break a custom. *Shakspeare.*

To serve instead of.
Burning ships the banish'd sun *supply*,
And no light shines but that by which men die. *Waller.*

To give or bring, whether good or bad.
Nearer care *supplies*
Sighs to my breast, and sorrow to my eyes. *Prior.*

To fill any room made vacant.
The sun was set; and Vesper, to *supply*
His absent beams, had lighted up the sky. *Dryden.*

To accommodate; to furnish.
While trees the mountain-tops with shades *supply*,
Your honour, name, and praise shall never die. *Dryden.*

SUPPLY, *s.* Relief of want; cure of deficiencies.
Art from that fund each just *supply* provides,
Works without show, and without pomp presides. *Pope.*

SUPPLY'S PASSAGE, a channel of the South Pacific ocean, between Sirius island and Queen Charlotte's island; so named by Lieutenant Ball, who commanded the Supply store-ship in 1790.

SUPPLY'MENT, *s.* Prevention of deficiency. *Not in use.*

I will never fail
Beginning, nor *supplyment*. *Shakspeare.*

To SUPPO'RT, *v. a.* [*supporter*, Fr., *supportare*, Ital.] To sustain; to prop; to bear up.—Stooping to *support* each flower of tender stalk. *Milton.*

The palace built by Picus, vast and proud,
Supported by a hundred pillars stood. *Dryden.*

To endure any thing painful without being overcome.—Strongly to suffer and *support* our pains. *Milton.*—To endure; to bear.—None can *support* a diet of flesh and water without acids, as salt, vinegar, and bread, without falling into a putrid fever. *Arbuthnot.*—To sustain; to keep from fainting.

With inward consolations recompens'd,
And oft *supported*. *Milton.*

SUPPO'RT, *s.* [*support*, Fr.] Act or power of sustaining.—Though the idea we have of a horse or stone be but the collection of those several sensible qualities which we find united in them, yet, because we cannot conceive how they should subsist alone, we suppose them existing in and supported by some common subject, which *support* we denote by the name substance, though it be certain we have no clear idea of that *support*. *Locke.*—Prop; sustaining power. Necessaries of life.—Maintenance; supply.—Let us next consider the ward, or person within age, for whose assistance and *support* these guardians are constituted by law. *Blackstone.*

SUPPO'RTABLE, *adj.* [*supportable*, Fr.] Tolerable; to be endured. It may be observed that *Shakspeare* accents the first syllable.

As great to me, as late; and, *supportable*
To make the dear loss, have I means much weaker
Than you may call to comfort you. *Shakspeare.*

SUPPO'RTABLENESS, *s.* The state of being tolerable.—It hath an influence on the *supportableness* of the burthen. *Hammond.*

SUPPO'RTANCE, or SUPPORTA'TION, *s.* Maintenance; support. *Obsolete.*—Give some *supportance* to the bending twigs. *Shakspeare.*—The benefited subject should render some small portion of his gain, for the *supportation* of the king's expence. *Bacon.*

SUPPO'RTER, *s.* One that supports.—Because a relation cannot be founded in nothing, and the thing here related as a *supporter*, or a support, is not represented to the mind by any distinct idea. *Locke.*—Prop; that by which any thing is borne up from falling.—There is no loss of room at the bottom, as there is in a building set upon *supporters*. *Mortimer.*—Sustainer; comforter. The saints have a companion and *supporter* in all their miseries. *South.*—Maintainer; defender.—The beginning of the earl of Essex I must attribute in great part to my lord of Leicester; but yet as an introducer or *supporter*, not as a teacher. *Wotton.*—*Supporters*. [In Heraldry.] Figures of beasts, birds, and sometimes of human beings, which support the arms.—More might be added of helms, crests, mantles, and *supporters*. *Camden.*

SUPPO'RTFUL, *adj.* Abounding with support. *Not used.*

Upon the Eolian god's *supportfull* wings,
With chearefull shouts, they parted from the shore.
Mir. for Mag.

SUPPO'RTMENT, *s.* Support. *Obsolete.* *Milton.*

SUPPO'SABLE, *adj.* That may be supposed.

SUPPO'SAL, *s.* Position without proof; imagination; belief.—Little can be looked for towards the advancement of natural theory, but from those that are likely to mend our prospect: the defect of events, and sensible appearances, suffer us to proceed no further towards science, than to imperfect guesses and timorous *supposals*. *Glanville.*

To SUPPO'SE, *v. a.* [*supposer*, Fr., *suppono*, Lat.]—

To lay down without proof; to advance by way of argument or illustration without maintaining the truth of the position.—Where we meet with all the indications and evidences of such a thing as the thing is capable of, *supposing* it to be true, it must needs be very irrational to make any doubt of it. *Wilkins.*—To admit without proof.—This is to be entertained as a firm principle, that when we have as great assurance that a thing is, as we could possibly, *supposing* it were, we ought not to make any doubt of its existence. *Tillotson.*—To imagine; to believe without examination.

I *suppose*
We should compel them to a quick result. *Milton*

To require as previous.—This *supposeth* something, without evident ground. *Hale.*—To make reasonably supposed.—One falsehood always *supposes* another, and renders all you can say suspected. *Female Quixote.*—To put one thing by fraud in the place of another.

SUPPO'SE, *s.* Supposition; position without proof; unevicted conceit.

Is Egypt's safety, and the king's, and your's,
Fit to be trusted on a bare *suppose*
That he is honest? *Dryden.*

SUPPO'SER, *s.* One that supposes.
Thou hast by marriage made thy daughter mine,
While counterfeit *supposers* bear'd thine eyne. *Shakspeare.*

SUPPOSITION, *s.* [*supposition*, Fr.] Position laid down; hypothesis; imagination yet unproved.

Sing, syren, for thyself, and I will dote;
Spread o'er the silver waves thy golden hairs,
And as a bed I'll take thee, and there lye;
And in that glorious *supposition* think
He gains by death, that hath such means to die. *Shakspeare.*

SUPPOSITIONAL, *adj.* Hypothetical. *Unused.*

SUPPOSITIOUS, *adj.* [from *suppositus*, *suppositivus*, Latin.] Not genuine; put by a trick into the place or character belonging to another.—It is their opinion that no man ever killed his father; but that, if it should ever happen, the reputed son must have been illegitimate, *supposititious*, or begotten in adultery. *Addison.*—Supposed; imaginary; not real.—Some alterations in the globe tend rather to the benefit of the earth, and its productions, than their destruction, as all these *supposititious* ones manifestly would do. *Woodward.*

SUPPOSITIOUSLY, *adv.* By supposition.—*Suppositiously* he derives it from the Lunæ Montes 15 degrees south. *Sir T. Herbert.*

SUPPOSITIOUSNESS, *s.* State of being counterfeit.

SUPPO'SITIVE, *adj.* Supposed; including a supposition.

SUPPO'SITIVE, *s.* What implies supposition: as *if*.—The *suppositives* denote connection, but assert not actual existence; the positive imply both the one and the other. *Harris.*

SUPPO'SITIVELY, *adv.* Upon supposition.—The unreformed sinner may have some hope *suppositively*, if he do change and repent: the honest penitent may hope positively. *Hammond.*

SUPPO'SITORY, *s.* [from *suppositorium*], in Medicine, a species of clyster.—Various medicated substances which cannot be retained long enough in the bowels in a liquid form to produce their effects, are rolled up into a long cylinder and introduced into the anus, where they gradually dissolve. Soap generally enters into the composition of suppositories. They are but rarely used in the present day.

To SUPPRESS, *v. a.* [*supprimo*, *suppressus*, Lat., *supprimer*, Fr.] To crush; to overpower; to overwhelm; to subdue; to reduce from any state of activity or commotion.—Every rebellion, when it is *suppressed*, doth make the subject weaker, and the prince stronger. *Davies.*—To conceal; not to tell; not to reveal.—Still she *suppresses* the name, and this keeps him in a pleasing suspense; and,

and, in the very close of her speech, she indirectly mentions it. *Broome*.—To keep in; not to let out.

Well did'st thou, Richard, to *suppress* thy voice;
For had the passions of thy heart burst out,
I fear we should have seen decypher'd there
More rancorous spight, more furious raging broils.

Shakspeare.

SUPPRESSEDION, *s.* [*suppression*, Fr., *suppressio*, Lat.] The act of suppressing.—Not publication.—You may depend upon a *suppression* of these verses. *Pope*.

SUPPRESSIVE, *adj.* Suppressing; overpowering; concealing; keeping in.—Johnson gives us expressive and oppressive, but neither impressive nor *suppressive*, though proceeding as obviously from their respective sources. *Seaward*.

SUPPRESSOR, *s.* One that suppresses, crushes, or conceals. *Sherwood*.

To **SUPPURATE**, *v. a.* [from *pus puris*, Lat., *suppurator*, Fr.] To generate *pus* or matter. *Unused*.—This disease is generally fatal: if it *suppurates* the *pus*, it is evacuated into the lower belly, where it produceth putrefaction. *Arbuthnot*.

To **SUPPURATE**, *v. n.* To grow to *pus*.

SUPPURATION, *s.* [*suppuration*, Fr.] The ripening or change of the matter of a tumour into *pus*.—This great attrition must produce a great propensity to the putrescent alkaline condition of the fluids, and consequently to *suppurations*. *Arbuthnot*.—The matter *suppurated*. *Unused*.—The great physician of souls sometimes cannot cure without cutting us: *sin* has festered inwardly, and he must lance the imposthume, to let out death with the *suppuration*. *South*.

SUPPURATIVE, *adj.* [*suppuratif*, Fr.] Digestive; generating matter. *Cotgrave*.

SUPPURATIVE, *s.* A *suppurating* medicine.—If the inflammation be gone too far towards a *suppuration*, then it must be promoted with *suppuratives*, and opened by incision. *Wiseman*.

SUPPUTATION, *s.* [*supputo*, Lat.] Reckoning; account; calculation; computation.—From these differing properties of day and year arise difficulties in carrying on and reconciling the *supputation* of time in long measures. *Holder*.

To **SUPPUTE**, *v. a.* [from *supputo*, Lat.] To reckon; to calculate.

SUPPRA. [Latin.] In composition, signifies *above*, or *before*.

SUPRALAPSARIAN, or **SUPRALAPSARY**, *adj.* [*supra*, and *lapsus*, Latin.] Antecedent to the fall of man.

SUPRALAPSARIAN, *s.* One who maintains the *supralapsarian* doctrine.—*Supralapsarians*, with whom the object of the decree is *homo conditus*, man created, not yet fallen; and the *sublapsarians*, with whom it is man fallen, or the corrupt mass. *Hammond*.

SUPRAMUNDANE, *adj.* Above the world.—He that was in the form of God, clothed with all the majesty and glory of the *supramundane* life, yet emptied himself of all this unspeakable felicity, and took upon him the form of a servant. *Hallywell*.

SUPRAVULGAR, *adj.* Above the vulgar.—None of these motives can prevail with a man to furnish himself with *supravulgar* and noble qualities. *Collier*.

SUPREMACY, *s.* Highest place; highest authority; state of being *supreme*.—No appeal may be made unto any one of higher power, in as much as the order of discipline admitteth no standing inequality of courts, no spiritual judge to have any ordinary superior on earth, but as many *supremacies* as there are parishes and several congregations. *Hooker*.

As we under heav'n are *supreme* head,
So, under him, that great *supremacy*,
Where we do reign, we will alone uphold. *Shakspeare*.

SUPREME, *adj.* [*supremus*, Lat.] Highest in dignity; highest in authority. It may be observed, that *superiour* is

used often of local elevation, but *supreme* only of intellectual or political.

The god of soldiers,
With the consent of *supreme* Jove, inform
Thy thoughts with nobleness.

Shakspeare.

Highest; most excellent.
No single virtue we could most commend;
Whether the wife, the mother, or the friend;
For she was all in that *supreme* degree,
That as no one prevail'd, so all was she.

Dryden.

SUPREMEPLY, *adv.* In the highest degree.
The starving chemist in his golden views
Supremely blest, the poet in his muse.

Pope.

SUR. [*sur*, Fr.] In composition, means *upon* or *over* and *above*.

SUR, a small river in the north of Switzerland, in the canton of Lucerne, which issues from the Lake of Sur, and falls into the Rhine below Arau.

SUR, or **SOUR**. See **TYRE**.
SURA, a village of Diarbekir, in Asiatic Turkey, on the Euphrates.

SURA, a village of Irak Arabi, on the Euphrates; 160 miles south of Bagdad.

SURACA, a small town of the island of Samos; 4 miles south-west of Cara.

SURADDITION, *s.* Something added to the name.

He serv'd with glory and admir'd success

So gain'd the *suraddition*, Leonatus.

Shakspeare.

SURADSJE, a village of Yemen, in Arabia; 16 miles east-south-east of Doran.

SURAJEGHUR, a town of Hindostan, province of Bahar, district of Monghier. It is situated on the south bank of the river Ganges, and formerly possessed a stone fort. Lat. 25. 14. N. long. 86. 15. E.

SURAJEPORE, a town of Hindostan, province of Allahabad. It is pleasantly situated on the western bank of the river Ganges, and is adorned with many Hindoo temples, and steps leading down to the river for the convenience of bathing. Lat. 26. 10. N. long. 80. 37. E.—*Suraje* being the name of the sun, which is one of the innumerable Hindoo deities, there are many towns so dedicated to, or called after him, in India.

SURAL, *adj.* [from *sura*, Lat.] Being in the calf of the leg.—He was wounded in the inside of the calf of his leg, into the *sural* artery. *Wiseman*.

SURAMACA, a river of Dutch Guiana, which runs into the Atlantic, near the settlement of Cupename.

SURAMI, a village and fortress of Georgia, in the province of Cartuel; 24 miles west-south-west of Gori.

SURAN, a village of Korassan, in Persia; 45 miles north of Meru.

SURANCE, *s.* Warrant; security; assurance.

Give some *surance* that thou art revenge;

Stab them, tear them on thy chariot wheels. *Shakspeare.*

SURANY, **NAGY**, a small town in the north-west of Hungary, on the river Neutra; 20 miles north of Comorn.

SURASH, a market town of the west of European Russia, in the government of Vitepsk, on the Dwina, with only 700 inhabitants; 24 miles east-north-east of Vitepsk.

SURAT, a large and populous city of Hindostan, province of Gujerat. It is situated on the south bank of the river Taptee, about 20 miles from its embouchure. It is a fortified town, contains about 70,000 inhabitants, of all nations and religions, and carries on a very extensive trade, notwithstanding all large vessels are obliged to remain at the mouth of the river called Swallow roads, where they are rather exposed to storms, but the anchorage is good. *Surat* was formerly called the Imperial port, and was the place whence the Mahometan pilgrims were conveyed to Mecca, often at the expense of government. It was here that the English East India Company obtained permission from the Mogul emperor Jehangire, to establish their first factory in Hindostan.

Hindustan. The firman, or order, is dated in 1612. The Dutch and French acquired the same privileges a short time after. At this period its articles of commerce were of the richest kind, viz.; diamonds, pearls, gold, musk, ambergris, spices, indigo, saltpetre, silk, and fine cotton manufactures, both plain and coloured. But since the rise of Bombay, the value of its traffic has much declined, and now consists chiefly of raw cotton, a few of its own manufactures, and articles imported from Gujerat. The greater number of vessels which now enter the port are Arabs. Although Surat is inhabited by persons of all nations, the Parrses, or fire worshippers, are the most considerable in affluence. They have been settled here since the 7th century, when driven from their native country, Persia, by the followers of Mahomet. They intermarry only with each other, and retain all their ancient customs and prejudices, the most remarkable of which are their repugnance to extinguish fire, and exposing their dead to be eaten by birds. They are, however, dextrous mechanics, good servants, and skilful merchants.

The next extraordinary people of this city are a set of Hindoos, who never willingly deprive any thing of life, and erect hospitals for the preservation of maimed or diseased animals, though this practice has of late fallen into disuse. Surat is situated on a fertile plain, protected on one side by the river, and on the three others by a brick rampart and ditch. It also possesses a strong citadel, situated on the bank of the river, and surrounded by an esplanade. Under the native governments the citadel was always commanded by an officer, independent of the governor of the town, and who, under the Mogul system, was also superintendant of the royal marine. The governor of the citadel and its garrison were maintained by an assignment on the revenue of the district. The governor of the town received not only the customs of the ports, but the duties levied in the city, and the rents of the district surrounding it. Of the ancient history of Surat under the Hindoo dynasties, we have no authentic records, although it was probably at that period a place of considerable consequence. But it is stated in Feriskta's History of Gujerat, that in the year 1538 Sultan Mahmoud being much alarmed at the incursions of the Portuguese, sent orders to his general, Khodovund Khan, a Turk commanding in the southern districts, to build a strong fortress at this place; and from the description given of it, it is doubtless the present citadel. It was taken by the Mogul emperor Akbar, in the year 1572, after a vigorous siege of 47 days, who found therein a number of Turkish cannon, which were called Soleymany, from their having belonged to the Ottoman emperor, and had been sent on board his fleet to India for the purpose of expelling the Portuguese. Akbar appointed a governor to the district including the city, but the defence of the citadel was entrusted to a Kelada independent of the governor, which system was continued by his successors. To the latter was subsequently added the appointment of admiral or comptroller of the Mogul marine, which consisted of several men of war, and a number of small vessels. In the year 1664 the city was surprised and plundered by the Mahratta chief Sevajee. The exterior wall at that time was only of mud, and the gates were not strong. He had therefore little difficulty in entering the town, but was compelled to retreat by the fire from the citadel. The booty he obtained for his own share amounted to a million sterling. Five years subsequent to this event he again repeated his visit; and although a new and better wall had been commenced, yet as it was not finished, the inhabitants were compelled to pay a heavy contribution: the English and Dutch factories were, however, exempted, as they had been in 1664. In the year 1671 Sevajee again appeared before Surat, and compelled the inhabitants to ransom their property, from which circumstance he jocosely named that city his private treasury; and his successors, not willing to relinquish their claim, laid it again under contribution in the years 1702 and 1707. On the decline of the Mogul authority, when the governor of every province assumed independence, those of Surat also wished to take advantage of the general confusion; but quarrelling with each other, one of the parties called in a

body of Mahrattas to his assistance, and assigned to them a third part of the customs of the port, while the English and Dutch factories espousing opposite sides, assisted them with ammunition and cannon. After various contests, Moyeen Addeen, the governor of the city, finding himself unequal to the reduction of the citadel, offered to cede the place to the British, provided they would assist him to expel his rival. This proposal was accepted by the Bombay government, and a civil servant named Spencer was sent, in the year 1759, with a considerable force, to effect this object. On their arrival at Surat they were admitted into the town, and in a few days compelled the garrison to capitulate.

The British took possession of the fortress, but in the name of the emperor of Delhi, from whom they shortly after obtained, in the name of the East India Company, the commissions of governor of Surat, and admiral of the Mogul fleet, with an assignment on the duties and customs, of 25,000*l.* per annum, for the support of the marine and citadel. But as the Mahrattas still required the fulfilment of their agreement, and were too powerful to be refused either by the English or the nabob, this circumstance established three discordant authorities in the place, which could not fail of causing much confusion and oppression of the inhabitants.

In 1763, the nabob Moyeen Addeen died, and was succeeded by his son Cuttub Addeen, who died, in 1792, and was succeeded by his son Nazim Addeen, who died in 1800, and was succeeded by his son Nasir Addeen, who shortly after this event entered into a treaty with the British, to resign all his authority for the payment of an annual sum of 12,500*l.*, and a proportion of the extra revenue that may hereafter be collected. The successes of the British against the Mahrattas in 1803 also compelled them to relinquish all claims on Surat, which is now governed by a civil servant, who is styled the *chief* and senior judge of the court of circuit and appeal, having under him a magistrate for regulating the police of the city and adjoining district. Under this judicious management the country in the vicinity of Surat, which was formerly overrun by banditti, is fast recovering its prosperity; and although the city, owing to the rivalry of Bombay, can never again attain its former splendour, it is still a rich and populous place, and of much political consequence. Lat. 21. 13. N. long. 73. 3. E.

SURATA, a river of South America, in New Granada, and province of Santa Martha, which runs into the river Lobrija.

SURBASE, *s.* A kind of skirt, border, or moulding, above the base.—There is a double flight of steps, a rustic *subase*. *Pennant.*

Round the hall, the oak's high *subase* rears

The field-day triumphs of two hundred years. *Langhorne.*

SURBASED, *adj.* Having a *subase* or moulding.—The tomb—has a wide *sur-based* arch with scalloped ornaments. *Gray.*

To SURBATE, *v. a.* [*solbatir*, Fr.] To bruise and batter the feet with travel.—Their mareh they continued all that night, the horsemen often alighting, that the foot might ride, and others taking many of them behind them; however, they could not but be extremely weary and *subated*. *Clarendon.*

SURBATING, is a term used to signify when the sole of a horn is worn out, bruised, or spoiled by any accident, as by bad shoeing, especially when the shoes lie flat on the feet.

SURBEAT, or SURBE'T. The participle passive of *subate*, which Spenser and Hall have used for *subate*.

A bear and tiger being met

In cruel fight on Lybick ocean wide,

Espy a traveller with feet *subet*,

Whom they in equal-prey hope to divide. *Spenser.*

SURBURG, a large village in the north-east of France, in Lower Alsace, on the river Saur, with 1500 inhabitants.

To SURCEA'SE, *v. n.* To be at an end; to stop; to cease; to be no longer in use or being.

Small favours will my prayers increase:
Granting my suit, you give me all;
And then my prayers must needs *surcease*;
For I have made your godhead fall.

Donne.

To leave off; to practise no longer; to refrain finally.
Nor did the British squadrons now *surcease*
To gall their foes o'erwhelm'd.

Philips.

To *SURCEASE*, *v. a.* To stop; to put to an end.

All pain hath end, and every war hath peace;
But mine no price, nor prayer, may *surcease*.

Spenser.

SURCEASE, *s.* Cessation; stop.—It might very well agree with your principles, if your discipline were fully planted, even to send out your writs of *surcease* into all courts of England for the most things handled in them.

Hooker.

To *SURCHARGE*, *v. a.* [*surcharger*, Fr.] To overload; to overburthen.

More remov'd,
Lest heaven *surcharg'd* with potent multitude,
Might hap to move no broils.

Milton.

SURCHARGE, *s.* [*surcharge*, Fr.] Burthen added to burthen; overburthen; more than can be well borne.—The air, after receiving a charge, doth not receive a *surcharge*, or greater charge, with like appetite as it doth the first.

Bacon.

SURCHARGER, *s.* One that overburthens.
SURCINGLE, *s.* A girth with which the burthen is bound upon a horse. The girdle of a cassock.—Justly he chose the *surcingle* and gown.

Marvel.

SURCINGLED, *adj.* Girt.
Is't not a shame to see each homely groom
Sit peached in an idle chariot room,
That were not meete some pannel to bestride,
Sursingled to a galled hackney's hide?

Bp. Hall.

SURCLE, *s.* A shoot; a twig; a sucker. *Not in general use.*—It is an arboreous excrescence, or superplant, which the tree cannot assimilate, and therefore sprouteth not forth in boughs and *sureles* of the same shape unto the tree.

Brown.

SURCO, the name of two inconsiderable settlements in Peru, in the provinces of Cercado and Guarochiri.
SURCOAT, *s.* [*surcot*, old Fr.] A short coat worn over the rest of the dress.

That day in equal arms they fought for fame;
Their swords, their shields, their *surcoats* were the same.

Dryden.

SURCREW, *s.* Augmentation; additional collection. *Not in use.*—It [a fever] had once left me, as I thought; but it was only to fetch more company, returning with a *surcrew* of those splenetick vapours that are called hypochondriacal.

Wotton.

SUR CUI in vita, in Law, a writ that lies for the heir of a woman, whose husband aliened her land in fee, and she neglected to bring the writ *cui in vita* for the recovery thereof, her heir may bring this writ against the tenant after her decease.

To *SURCULATE*, *v. a.* [*surcalo*, Lat.] To prune; to cut off young shoots.

SURCULATION, *s.* The act of pruning.—When insinuation and grafting, in the text, is applied unto the olive tree, it hath an emphatical sense, very agreeable unto that tree, which is best propagated this way; not at all by *surculation*.

Sir T. Brown.

SURCULUS, a word used to express that part of the branching of the ribs of a leaf which is of the middle kind, between the great middle rib and the smallest reticular ramifications.

SURD, *adj.* [*sourd*, Fr.] Deaf; wanting the sense of hearing.—He who hath had the patience of Diogenes, to make orations unto statues, may more sensibly apprehend how all words fall to the ground, spent upon such a *surd* and earless generation of men, stupid unto all instruction, and rather requiring an exorcist than an orator for their con-

version. *Brown.*—Unheard; not perceived by the ear. Not expressed by any term.

SURDNUMBER, *s.* That which is incommensurate with unity. See *ABSURD*.

SURDITY, *s.* Deafness.

SURDY, a small uninhabited island in the Persian gulf, situated to the south of Kishme. Lat. 25. 54. N.

SURE, *adj.* [*seure*, Fr.] Certain; unfailing; infallible.

Who knows,

Let this be good, whether our angry foe
Can give it, or will ever? How he can
Is doubtful, that he never will is *sure*.

Milton.

Certainly doomed.—Our coin beyond sea is valued according to the silver in it: sending it in bullion is the safest way, and the weightiest is *sure* to go. *Locke.*—Confident; undoubting; certainly knowing.

Friar Laurence met them both;

Him he knew well, and guess'd that it was she;

But, being mask'd, he was not *sure* of it.

Shakspeare.

Safe; firm; certain; past doubt or danger. To *make sure* is to secure, so as that nothing shall put it out of one's possession or power.

I bred you up to arms, rais'd you to power,

All to make *sure* the vengeance of this day,

Which even this day has ruin'd.

Dryden.

Firm; stable; steady; not liable to failure.

Thou the garland wear'st successively;

Yet though thou stand'st more *sure* than I could do,

Thou art not firm enough.

Shakspeare.

To *be SURE*. Certainly. This is a vicious expression: more properly *be sure*.—Objects of sense would then determine the views of all such, *to be sure*, who conversed perpetually with them. *Atterbury.*

SURE, *adv.* [*surement*, Fr.] Certainly; without doubt; doubtless. It is generally without emphasis; and, notwithstanding its original meaning, expresses rather doubt than assertion.

Something, *sure*, of state

Hath puddled his clear sp'rit.

Shakspeare.

SUREFOOTED, *adj.* Treading firmly; not stumbling.

True earnest sorrows, rooted miseries,

Anguish in grain, vexations ripe and blown,

Surefooted griefs, solid calamities.

Herbert.

SURELY, *adv.* Certainly; undoubtedly; without doubt. It is often used rather to intend and strengthen the meaning of the sentence, than with any distinct and explicable meaning.—In the day that thou eatest thereof thou shalt *surely* die. *Genesis.*—Firmly; without hazard.—He that walketh uprightly, walketh *surely*. *Proverbs.*

SURENESS, *s.* Certainty.

The subtle ague, that for *sureness* sake

Takes its own time th' assault to make.

Cowley.

SURETISHIP, *s.* The office of a surety or bondsman; the act of being bound for another.

Idly, like prisoners, which whole months will swear

That only *suretiship* hath brought them there.

Donne.

SURETY, *s.* [*sureté*, Fr.] Certainty; indubitableness.

—Know of a *surety* that thy seed shall be a stranger. *Gen. xv.*—Security; safety.—There the princesses determining to bathe, thought it was so privileged a place as no body durst presume to come thither; yet, for the more *surety*, they looked round about. *Sidney.*—Foundation of stability; support.

We our state

Hold, as you your's, while our obedience holds:

On other *surety* none.

Milton.

Evidence; ratification; confirmation.

She call'd the saints to *surety*,

That she would never put it from her finger,

Unless she gave it to yourself.

Shakspeare.

Security

Security against loss or damage; security for payment.

There remains unpaid

A hundred thousand more, in *surety* of the which
One part of Acquittain is bound to us. *Shakspeare.*

Hostage; bondsman; one that gives security for another;
one that is bound for another.

That you may well perceive I have not wrong'd you,
One of the greatest in the Christian world
Shall be my *surety*. *Shakspeare.*

SURF, *s.* [probably from the French *surf*, "the rising of billow upon billow, or the interchanged swelling of several waves. *Cotgrave.*] The swell or dashing of the sea that beats against rocks or the shore.—Swell is more particularly applied to the fluctuating motion of the sea, which remains after the expiration of a storm; and also to that which breaks on the shore, or on rocks and shallows, called *surf*. *Falconer.*—Foam.

SURFACE, *s.* [*surface*, old Fr. Milton places the accent on the last syllable.] Superficies; outside; superface.

Which of us who beholds the bright *surface*
Of this ethereous mold, whereon we stand. *Milton.*

To **SURFEIT**, *v. a.* [French, *to do more than enough; to overdo.*] To feed with meat or drink to satiety and sickness; to cram overmuch.

The *surfeited* grooms
Do mock their charge with snores. *Shakspeare.*

To **SURFEIT**, *v. n.* To be fed to satiety and sickness.—They are as sick that *surfeit* with too much, as they that starve with nothing. *Shakspeare.*

SURFEIT, *s.* Sickness or satiety caused by overfulness.—When we are sick in fortune, often the *surfeits* of our own behaviour, we make guilty of our disasters the sun, the moon and stars. *Shakspeare.*

SURFEITER. One who riots; a glutton.

I did not think
This am'rous *surfeiter* would have donn'd his helm
For such a petty war. *Shakspeare.*

SURFEITING, *s.* The act of feeding with meat or drink to satiety and sickness.

Kill not her quickening power with *surfeitings*;

Mar not her sense with sensuality. *Davies.*

SURFEITWATER, *s.* Water that cures surfeits.—A little cold distilled poppywater, which is the true *surfeit-water*, with ease and abstinence, often ends distempers in the beginning. *Loeke.*

SURFLEFT, a village and parish of England, in Lincolnshire, situated at the mouth of the river Coln. It has a handsome church built of stone, and two free schools; and here is one of the largest heronries in the kingdom. Population 658; 4 miles north of Spalding.

SURGE, *s.* [from *surgo*, Lat.] A swelling sea; wave rolling above the general surface of the water; billow; wave.

The wind-shak'd *surge*, with high and monstrous main
Seems to cast water on the burning bear,
And quench the guards of the ever-fired pole:
I never did like molestation view
On the enchafed flood. *Shakspeare.*

To **SURGE**, *v. n.* [from *surgo*, Lat.] To swell; to rise high.

The serpent mov'd, not with indented wave,
Prone on the ground, as since; but on his rear
Circular base of rising folds, that tower'd
Fold above fold, a *surging* maze! *Milton.*

SURGELESS, *adj.* Without surges; calm.

In *surgeless* seas of quiet rest when I
Seven yeares had sail'd, a pirrie did arise,
The blasts whereof abridg'd my libertie. *Mir. for Mag.*

SURGEON, *s.* [Corrupted by conversation from *chirurgion*. *Dr. Johnson.*—*Surgeon* is a very old English word; and is no doubt adopted from the ancient French, *surgien*. *Todd.*] One who practises surgery.—The wound was past the cure of a better *surgeon* than myself, so as I could but receive some few of her dying words. *Sidney.*

SURGERES, a small town in the west of France, in the department of the Lower Charente. Population 1500. Its chief traffic is in the horses of the neighbouring country; 12 miles north-east of Rochefort, and 21 north of Saintes.

S U R G E R Y.

SURGERY, *s.* [Corrupted from *Chirurgery*, which is derived from the Greek *χειρ*, a hand, and *εργον*, labour.] In its strictest and primary sense, the art of operating manually on the human body for the cure of diseases; in its second acceptation, it embraced the science of curing the body of such maladies, internal or not, as arise in consequence of accident or injury. At present surgery implies the art of manual operation, the science of pathology, inasmuch as it is connected with the well-doing of patients under surgical operations, and also several complaints quite unconnected with manual operation, but which custom and convenience have thrown into the hands of the surgeon.

The division of the healing art into medicine and surgery being marked by a line so far from precise, and being, in fact, quite arbitrary, it has been deemed by many unnatural and inexpedient. Virtually, the two branches are united in the practice of surgeons of the present day; and there are some of them who have lent astonishing assistance to the science of medicine. Viewed generally, however, it must be confessed that if they exhibit no deficiency in practical success, yet that in the discrimination of symptoms and rules for prognosis in internal diseases they have displayed none of that remarkable and accurate observation which has so much distinguished English physicians from the time of Sydenham to the present day. At the same time we must give the highest meed of praise to the surgeons who broke through that absurd custom which rendered them the mere mechanical servants

of the physician,* and to those who brought the science of pathology to the test of anatomical and physiological investigation.

In our own time, we have seen a surgeon introduce into the practice of medicine as memorable a change as any which has been made since the time of Hippocrates. Nor have the researches of physicians been lost on the practice of surgery; operations have been instituted which entirely owed their success to sound views of the resources of the animal oconomy: and the nature and extent of these resources had been, in the first instances, discovered by those who practised medicine only. In both branches the metaphysical acumen of the physician has cleared away obscurities in physiological or pathological phenomena, and has been of great service in making minute distinctions or useful generalizations. While the professors of the surgical art, by their facility at dissection, have done immense service towards morbid anatomy, and the experiments their chirological tact has enabled them to perform on various animals, have materially advanced physiology, which is universally allowed to be the foundation of pathology.

It is to be hoped, therefore (whatever petty attempts may be made to disturb their harmony), that the physician and

* Johnson defined a surgeon,—“One who cures by manual operation; one whose duty is to act in external maladies by the direction of the physician.”

surgeon will continue to go hand in hand in their career of improvement. The former brings from the colleges those powers of analysis and of strict logical demonstration which the study of the learned languages and the mathematics is calculated to develop. While the latter, ever tied down to contemplate the gross and visual objects under his knife, reduces the discursive flights of theory to accurate and practical experiment. It is true, that if the physician had generally made dissection a part of his education, we should have seen fewer of those brain-spun systems which anatomy has so often overthrown; but at the same time, if surgeons had been more generally classically educated, the disgrace of being proverbial for a barbarous and inelegant style of writing had been spared us, and we might have escaped the ridicule which some recent theories of life have tended to cast on our logical accuracy.

We shall not, however, enter further into any question as to the respective merits of surgeons or physicians, or rather of their courses of education; our own feelings being, perhaps, too much interested to allow us to be impartial. We shall content ourselves with observing that the public, who are the best judges of their own interest, have pretty generally decided that it is individuals, and not classes, who are to derive honour and profit from the profession, and they appear very justly and naturally to think that the division of their medical attendants into two or three rival classes, by keeping up a spirit of emulation, is conducive to the general welfare of the community, and the advancement of pathological knowledge.

The diseases, then, which are assigned to the surgeon, are, 1st. Every disease which may or can require a manual operation: as, fracture, dislocation, distortion, tumour, hernia. 2d. The medical diseases of such parts as are usually the subjects of surgical operations: e. g. diseases of the urethra and other urinary organs; syphilis, diseases of the eye and the ear.

Since, in the treatment of all these maladies, the general principles of inflammation and of other morbid actions are requisite to be known, and as the practice founded on these principles is incalculably more useful than any manual dexterity which may be called into play in an operation, it becomes necessary to enter somewhat fully into those diseases which are

UNIVERSAL OR GENERAL.

Notwithstanding the multitudinous divisions of the nosologists, all diseases may be resolved into two classes:—diseases of vessels and diseases of nerves. This division, which is to a demonstration real, because there are no other active or vital parts, except vessels and nerves in the body, is practically extremely convenient; since every person is aware that the chief difficulty in practice is to distinguish those diseases which are simply nervous, and which may continue for a long time without danger, and are often cured by stimulation or mild and feeble measures, from those actions of the vascular system which destroy the functions or structure of an organ, and which are for the most part curable only by agents promptly and vigorously put in force.

The two divisions run into each other; the actions of the secreting organs, especially, are so intimately connected with functions of nerves, that it is scarcely possible to suppose any organ can have one of these elementary parts in a morbid state, without the other participating in it. The class of diseases, however, which are usually meant by the term vascular, are such as affect the red blood-vessels; for though these also are subservient to the action of the nervous system, the connection is not so intimate. No division of disease will be expected by the physiologist, to be marked with a precise line. The human body is a machine, every part whereof depends so closely on another, that an insulated action, and consequently an insulated disease, cannot take place.

The function of a nerve in pathology is confined, 1st. To giving notice of the receipt of injury or other morbid cause to the mind; in other words, suffering pain: this, however, is not invariable. 2dly. To causing an increased flow of

blood to the inflamed part. 3dly. To exciting such remote actions of the system as may assist collaterally to the restoration of the part affected. Thus the action of the heart becomes increased, the secretions of the digestive apparatus locked up, and other analogous changes take place in proportion to the severity of the primary disease.

The reason why an injury should excite pain is very evident. The utility of removing the injured part out of the sphere of the injuring cause, and of keeping it at rest, being apparent to any one. But why a blow should excite local inflammation, and also general fever, with a morbid change in the constitution of the whole mass of blood and in the action of all the animal organs, is so difficult of explanation, that what we shall proceed to offer can be looked upon as nothing more than conjecture.

We shall do well to reflect that whatever injury may take place in the body, whether a contusion destroys the properties of a part, or an incision separates it, two things are necessary to be done. The dead part is to be removed, and the loss to be repaired by means of a new and similar structure. Both these changes take place through the medium of the blood. Into this fluid the old structure is to be absorbed; and from it the new one formed. Since these processes, though of the same nature, are greater in degree than the powers of the parts are wont to perform, it is necessary that these powers be increased. In the first place, we should naturally expect that the quantity of blood should become greater. With this expectation the facts accord. There is obviously in inflamed limbs a greater quantity of blood than ordinary. But this blood requires to be changed, to be converted into the structure which is to be built up. Now, there can be little doubt that the assimilating power of blood-vessels is under the control of the nervous system; and hence we see that extraordinary changes being required, extraordinary nervous energies ought to be developed. Accordingly, increased heat and acute sensibility are manifested.

Other and more general phenomena, however, take place, especially after serious injuries. A fever called sympathetic comes on. This fever consists in an increased action of the heart and lungs, exalted temperature of the skin, and diminution and alteration of all the secretions. The two first of these phenomena being exactly of the same nature as what occurs in the limb itself, we may naturally refer them to the same purposes; namely, the increment in the quantity of blood sent through the limb, and of nervous power, in order to convert the blood into new structure. The diminution of the discerning functions might be explained from a well known law of the nervous system; namely, that if one portion of this system acts with unusual vigour, every other portion betrays unwonted languor. But it is probable that we should go deeper; that there is a second end answered by this tardiness of the secretions,—the alteration in the state of the blood. That this fluid is changed, is evident, since, in all inflammations it is what is called *buffed*,—that is, inclined to separate coagulable lymph more rapidly, and in greater quantities than ordinary from the rest of its component parts.

We have already so far anticipated what we had to say on the action of vessels in inflammation, as to state that the quantity of blood is increased in a limb when it is inflamed; this being a point easily solved by experiment, and allowed on all hands. Authors, however, are divided as to the question whether the blood moves slower or faster than ordinary in inflamed vessels. Doctors Hastings, Wilson Philip, and others, conclude, from microscopical observations, that the current of the blood is retarded in velocity, but that the calibre of the vessels is enlarged. But the inaccuracy of this opinion is proved by a process of reasoning far less liable to inaccuracy than observations made with the microscope. There is no fact more obvious than that the arteries going to an inflamed part, are larger than ordinary. But supposing there were in the part which they are passing any impediment to the flow of blood, would they enlarge? On the contrary; no law is more clearly established than that arteries contract whenever a resistance is offered to the exit of their blood. A ligature around an artery causes this phenomenon to take place at once. Pressure causes the same thing, though

though more tardily. On the other hand, where hæmorrhage, or any unusual discharge is taking place, there occurs an inordinate afflux of blood. Again, if there be a lentor of the blood in inflammation, how happens it that the veins, returning from an inflamed part, are also enlarged in calibre, and apparently increased in number? Such are the facts, as any one may satisfy himself by experiment on an animal, and they prove that no impediment to the flow of blood exists. There may be an *error loci*, as Boerhaave called it: the passage of blood may be impeded through the smaller capillary vessels, and the larger ones may hence be preternaturally distended. Such a supposition, however, by no means accords with the appearances on dissection, for the sanguineous vessels are found as much increased in number as in bulk.

Inflammations are divided into various kinds, according to the appearances they present. On the surface of the body we distinguish phlegmon and erysipelas. The former is described in the four words of Celsus, tumor, calor, rubor, dolor. The tumour is a regular swelling which gradually subsides by a regular circumference into the surrounding parts, and loses as it diminishes the other characters. It is to be remarked, that the heat, though greater to the feelings of the patient, occasions no great rise in the thermometer; that the pain is of a dull kind, and indeed there is seldom little more felt than the throbbing of the arteries of the part. Phlegmon belongs to the skin, cellular tissue, and muscles; the constitutional fever it excites, is of that kind usually denominated inflammatory; a pulse full and frequent; a disturbance of the nervous system, varying from a little restlessness or disinclination for sleep to actual delirium; a sustained increase of the heat of the skin; all the secretions partially stopped and altered, whence result dry furred tongue, constipation, high coloured urine, and want of perspiration.

Erysipelas is a form of inflammation confined to the skin and cellular tissue. It is just the reverse of phlegmon, in regard to its outward appearance; for instead of a regular swelling highest in the middle, and imperceptibly sinking into the surrounding parts, it has an abrupt edge, ending, as it were, all at once; is quite irregular; instead of being hard, is boggy; subsides on pressure, but returns; spreads very rapidly laterally, and very slowly downwards. It betrays little tendency to secrete pus, and none for the deposition of coagulating lymph; and it varies from a slight red blush, acquiring in a few days a yellowish hue and ending in desquamation, to a deep red, hot, painful swelling, quickly covered with vesications, and ultimately terminating in gangrene.

The sympathetic fever varies of course extremely with the various appearances of the inflammation; generally speaking, however, it may be characterised as of the low nervous kind. It is very trifling in common cases, but when erysipelas attacks the face, the constitutional irritation is very high, coma and delirium supersede, and the patient is frequently carried off.

It is difficult to learn the cause of the peculiar appearance of this form of inflammation. Some have supposed that it arises from the particular structure it affects, but this is assuredly not the case, since phlegmon also affects the skin. It may perhaps arise from the peculiar matter exuded; but this is a mere conjecture. Nor is the reason why sometimes erysipelas, and sometimes phlegmon follow the same injury at all apparent. This only has been established by repeated observations, that there is nearly always antecedent to the inflammation something amiss in the constitution of the patient. Either he was drunk when he was exposed to the causes of erysipelas, or he was an habitual drunkard, or otherwise had an impaired constitution.

The appearances of phlegmon and erysipelas are often modified by their being mixed together. Of the union of the two inflammations the most remarkable examples are the *carbuncle* and the *boil*. These tumours, which vary only in degree (the former being small and occurring in healthy persons, and the other being large and commonly the sign of a broken-down constitution), are remarkable for swelling higher than phlegmon and terminating in more irregular

edges; they are also attended with the hot burning sensation of erysipelas; but their most distinctive characters are the formation of a gangrenous core at the bases, accompanied by the formation of pus in irregular holes, and extreme hardness.

The fever which accompanies the boil is scarcely perceptible, when the patient has a good constitution. But in carbuncle there is always much constitutional disturbance—a fever of the typhus kind, accompanied often by great depression and restlessness.

Inflammation of the internal organs presents different symptoms as it affects the mucous membranes, the serous membranes, or the parenchyma of the viscera. The mucous membranes undergo an inflammation so far erysipelatous, that it spreads laterally; but here the resemblance, both as to appearance and constitutional symptoms, ends. Inflammations of the parenchyma, indicate most of the characters of phlegmon; there is a sensation of heat and distention in the part affected; dissection shews it to have been gorged with blood. Making some allowance for the particular parts of the nervous system implicated, the fever in these affections is of the kind which belongs to the phlegmonous; namely, the inflammatory.

The serous membranes, as well as the cartilages and the bones, scarcely undergo any active inflammation without sudden and complete disorganization. The pleura is capable of intenser inflammation than the peritoneum, without being destroyed; nor is there much depression of strength,—a phenomenon very remarkable when the latter is affected.

By an arrangement differing from the one we have chosen, inflammations have been divided according to their terminations, as into adhesive, suppurative, and the like; but since the circulating vessels are only capable of one kind of action, such divisions are not strictly true. These phenomena are rather to be considered as consequential or secondary, and should not therefore be confounded with inflammation which is simply an affection of the red blood-vessel, and is therefore identical in every structure. Proceeding in this view of the case, we shall consider the terminations of inflammation.

The first and rarest, called *resolution*, occurs only after slight accidents, and consists in the restoration of the properties of the injured part by a little exaltation in the circulatory and nervous powers.

In the second, a separation of the blood takes place at the extremity of the inflamed vessels; that portion called coagulable lymph is deposited. This deposition is one of the most general and useful of all morbid processes. If a part is merely contused, this substance is poured into its interstices, where it serves to supply the place of such parts as having lost their vitality, are removed by absorption. If a cut has been made, it furnishes a cement which by its tenacity mechanically unites the divided parts; and this union is shortly after rendered permanent by means of vessels that shoot through the lymph in every direction. It forms a bed for the formation of new bone, or cartilage, when these structures are broken, and it affords room for adhesions in various parts of the viscera, frequently effecting a very remarkable preservation of life, but as often producing very dangerous effects.

The effusion of coagulable lymph, though ordinarily, is not invariably in direct proportion to the vehemence of the attendant inflammation; and there are many facts which warrant the inference that it depends very much on the state of the blood. It is generally most copious as the inflammation subsides, affects the serous membranes more than any other part, and rarely attacks the mucous membranes. On the former structures, it is found uniting them together in various directions, and vascular; the latter coagulable lymph does not unite, but is found lining them as with additional membranes, sometimes in patches, sometimes assuming very accurately their form. The effusion of serum accompanies that of lymph; it often occurs likewise alone, but then seems peculiar to the unbroken surface of the Dermis, when the cuticle is taken off, as in a blister, and to the serous membranes. The inflammation which precedes it is of a milder character

character than that which precedes the deposition of solid lymph. The third way inflammation terminates is in suppuration. In this process the absorption of the affected structure is so rapid, that a considerable cavity is formed. This cavity, if the skin is entire, we denominate an *abscess*; if broken, an *ulcer*. The filling up of this cavity is effected by the secretion of a fluid called *pus*. It is poured forth from the sides of the cavity which are always indurated. Its composition bears a very near affinity to blood; its colour, however, being a yellow white. In this pus there are soon observed red spots which the microscope shows to be blood-vessels; these growing up in bundles present a granulated appearance, and gradually fill up the cavity with flesh of the same kind as had been removed.

Now this process is liable to many irregularities; the abscess frequently burrows into important parts and forms dangerous sinuses. The secretion of pus is often incomplete, being mixed with too much blood, or presenting a watery composition which is called *sanies*. In this case the ulcer assumes every variety of appearance, and requires the interference of art to bring about the formation of natural pus. The granulations are often deficient, and do not fill up the vacancy, or they are so redundant as to ascend beyond its edge, and form a protrusion, having a fungoid or sprouting appearance.

The last mode in which inflammations terminate, is by gangrene. This formidable affection supervenes after any species of inflammation, and there is no structure exempt from it. It consists in a perfect dissolution of the structure it attacks, which is converted into a dark-brown fetid mass, and loses all but a mechanical connection with the living parts. In the bones, where it is called *necrosis*, its appearance is much varied. If a blow is so severe that it utterly annuls the vital action of the vessels and nerves, and destroys the natural cohesion of the intimate particles of flesh for each other, gangrene ensues. If inflammation be carried on so violently at first that it cannot be supported by the powers of the part, the same thing occurs. If the disease be so extensive or general, that the constitution cannot effect the absorption of the old structure without danger, gangrene is here met with.

Though the word gangrene, or mortification, appears at first to imply a very formidable disease, it is to be observed, that it is only when, from the extent of the injury or the feebleness of the constitution, the mortified parts are not easily separated from the living, that any danger ensues. From sores having but very small dimensions, and producing no constitutional disturbance, little black layers are often detached, which are called *sloughs*: these are no other than portions of mortified flesh. From the depressions left by the small-pox during its decay, similar, but very minute pieces of the same substance, are detached. It is only when a violent accident or an extensive inflammation causes a very large surface to become gangrenous, or when the patient is old, or has a feeble constitution, that this disease is terrible and perhaps fatal. In such cases the dead parts, instead of being detached from, advance upon and convert into their own offensive substance, the living structure.

Having thus given an outline of those diseases of the red-blood vessels, which may be said to be primary in regard to their simplicity and universal, since they can attack all structures, it would now be requisite, if we followed in this article any thing like a philosophical arrangement, to proceed to the disease of the secreting or white vessels. As, however, these diseases are of a chronic character, and are very rare, their investigation cannot be reckoned essential to the understanding of active diseases. We shall, therefore, defer their consideration until we have entered into the treatment of inflammation and its consequences.

Phlegmonous or pure inflammation, whether it be idiopathic, or the result of injury, is treated locally by means of refrigerating lotions. How these act is unknown, but it is certain, that by reducing within certain limits the heat of inflamed parts, they subside quicker than by any other

mode of treatment. It is, however, curious enough, that if the inflammation last a long time, this plan becomes hurtful, and warm applications salutary. The time at which a change is to be made from one to the other, is chiefly regulated by the feelings of the patient.

The local treatment of erysipelas is a point concerning which surgeons are by no means united. Some advising cold applications, others warm; some scarifying the erysipelatous parts, others applying blisters to them, and others again powdering them with flour. Perhaps none of these means do any good, and the disease is only to be subdued by constitutional remedies.

The deposition of coagulable lymph is of course not to be interfered with by any topical applications. It is, however, to be remembered, that the healthy disposition of this substance, is chiefly dependant on the degree of phlegmon preceding it.

The formation of pus is facilitated, the attendant inflammation rendered milder, and the pain less, by the application of warm fomentations and poultices. The *modus operandi* of these matters is quite unknown, but the fact of their beneficial tendency is known to every body; and to make a smooth poultice has been laid down by a surgeon of the highest eminence, as a most important surgical attainment. When pus is formed, if the abscess does not break, some surgeons are in the habit of opening it with the lancet. As, however, it generally partially unites and fills again, the practice has been much blamed, and indeed we may lay it down as a rule, that it is only when an abscess spreads into important parts, or when its coverings are so thick as to preclude the hope of a natural opening (as when it is under fascia, and among tendons) that it should be opened. The ulcer which results from the opened abscess, requires no other treatment than to be kept moist, and secluded from the air. If its granulations are superabundant, it is usual to causticate them, and if deficient, to excite inflammation by various stimuli. When, however, an ulcer has continued long, it is often very troublesome, requiring a multitude of various stimuli, and of very opposite characters. In those cases where the inveteracy of the disease baffles all these attempts, the edge of the ulcer should be swept off with a knife, and the cut surfaces drawn together by adhesive plaster, and united at once. The chief danger of this procedure is, that the constitution is liable to suffer from the sudden stoppage of the accustomed discharge.

As to the treatment of boils and carbuncles, the former may safely be trusted to nature; occasional poulticing, and, when very severe, a little opening medicine, being all that is necessary. The carbuncle, though we may be unwilling to trust it to nature, is, nevertheless, a disease in which our interference probably does little good; it is held, however, as established practice, to lay open carbuncles very freely, in order to give passage to the core or nucleus which forms at their bases. This being done, if the patient's constitution is good, several sloughs come out, and the wound heals; if not, these are thrown off very tardily, an ichorous discharge follows, the ulcer spreads deeply and widely, and the patient, exhausted by irritation, dies. Perhaps the only chance of curing bad carbuncles, in bad constitutions, would be to endeavour to extirpate altogether the diseased structure and unite the wound by the first intention. The plan, however, is merely a suggestion, and has never been tried.

The treatment of gangrene is typically by poultices, either simply of linseed meal, or of this matter mixed with charcoal, or juice of carrots, or yeast. The powers of the part, however, when they are sufficient to throw off the dead parts, require no stimulant application, and when they are not, do not seem very amenable to external remedies. Indeed, our plan should be to prevent such a degree of inflammation as may threaten gangrene, for in nine cases out of ten this is a mere consequence of previous excitement. No danger is to be apprehended from it, if we find a line of separation extending between the dead and living parts. When this does not take place, and the gangrene spreads, it becomes necessary

to remove the gangrenous part; care being at the same time taken to remove so much of the apparently healthy part that no return of the gangrenous action may be indicated.

With respect to the constitutional treatment of local diseases, this is of far more consequence than any topical remedies; a fact, which, though so apparently obvious, was not clearly observed by any one before the beginning of the present century. Mr. Abernethy, in his work on the "Constitutional Origin of Local Diseases," has put this matter in so clear a light, and laid down a line of practice so successful, that it has received, for some time, the assent of all surgeons and may safely be said to have produced a greater revolution in surgical practice than has ever been effected by any individual.

Advancing upon the very evident principles that the reparation of all injured parts must be made from the blood which is eliminated by the digestive organs, and must be influenced by the irritated or quiescent state of the digestive organs, this author proceeded to shew that in all local diseases it is of the prime importance to procure healthy secretions from the bowels and other viscera of the abdomen, and by appropriate diet, and other minor adjuvants, to tranquilize the inordinate actions of the nervous system. A foolish notion has gone abroad that this plan consisted in *purging*, and the name of Dr. Hamilton has been very unjustly associated with that of Mr. Abernethy, as if they had each discovered the same principle. The plan, however, of the former was to purge, because he found it lower the pulse and alleviate some chronic diseases. The practice of the second arose out of a philosophical consideration of the functions of animal bodies, whereby he saw the dependence of one part on another, and the reciprocating action that resulted from the healthy performance of separate functions. So that he did not fail to perceive that the due action of the skin, the lungs, the stomach, and the liver, were as essential to health as the action of the bowels; and if in his practice he seemed to pay more especial attention to the alimentary canal, it was only because this is the prime recipient of all medicine, and the part through which other functions are influenced in the greatest degree.

The particular remedies to be used, we need not here detail, after the very full consideration of the influence of the digestive system, on the general health, that we indulged in under the article *PATHOLOGY*. It is enough to observe that, whether inflammation be going on, or any of its consequences, the due action of the alimentary canal is essential to their salutary progress.

The effects of injuries on all parts of the nervous system are extremely irregular, but as their consequences are often very formidable, they should be diligently noted. Commonly, we find so general a prostration of strength, such debility in the nerves governing the actions of the respiratory muscles of the heart and the stomach, that no other plan remains than to support the patient by stimuli, even though we may anticipate a re-action that will require great blood-lettings. At times no re-action comes on, or, at least, not for a considerable time; this is especially the case in extensive burns or scalds, when it is often necessary to support the patient by warm cordials for eight or ten days. The re-action that follows is occasionally succeeded a second time by prostration of strength; but now the stimulating plan must be had recourse to with less confidence, and endeavours made to rouse into action the secretory system.

With regard to the fever which attends inflammation, it does not appear that we have any reason to interfere with this. If, indeed, the theory be true which we have broached with regard to the cause of sympathetic fever, it is obvious that this is a salutary process.

It happens to be sure that this action often runs alarmingly high, that at other times the patient is sunk into extreme debility; but in either case, our attention should solely be directed to the original inflammation; if this be found excessive, it must be reduced; if deficient, excited, and thus

bleeding on the one hand, or stimuli on the other, may be indicated; but these not to cure the fever, but its cause.

Nevertheless, the fever should be carefully noted, because it is an indication of the original inflammation, and of the strength of the constitution. Thus the fever technically called Hectic, which comes on when large quantities of pus are formed, or when this matter has been produced for a long time, points out a debility of the vital powers, which requires continued, but gentle stimulation; or, on the other hand, points out the necessity of immediately removing the offending part. So, the delirium and the hiccup attending gangrene, point out the dangerous degree of this action.

It has been generally held that the formation of a line of separation in gangrene, and of healthy pus in abscess, are both much influenced by the administration of bark. Under due regulations, and used merely as an adjuvant to remedies that excite regular action of the secretions, this drug is valuable; but its administration as a specific, and the practice of increasing the dose, when it was found inert, to an extreme extent, have now fallen in disuse.

The treatment of inflammation attacking the mucous membranes is best developed in the works of Badham and Hastings, and of Broussais and others of the French school. We observe in these, however, considerable discrepancies; the former laying great stress on bleeding and counter-irritation; the latter considering that mild measures alone are necessary, and that phlogoses of these membranes are cured rather by time and abstinence, than by any determined practice.

The inflammation of the serous membranes is for the most part characterized by such remarkable lowness of pulse, and general depression and weakness of the vital powers, as might deter a practitioner, not acting on the result of experience, from using the lancet. There is no class of diseases, however, which demand larger and more sudden bleedings than this, nor any that require a more violent degree of counter-irritation by purging and blistering. When muscles, or the synovial membranes are inflamed, we have these inexplicable forms of diseased inflammation, called Gout and Rheumatism. Of their treatment little can be said. As they are aggravated by disorders in the general health, and ameliorated as this is improved, attention to this point is of course indicated. Some specific remedies, especially the Colchicum, are also occasionally useful; but upon the whole, the general treatment of inflammation does not apply to them. The inflammation of the joints which occurs from injury, observes the same laws, and requires the same treatment as the early stages of phlegmon; namely, depletion generally, and cold lotions topically; but the depletion may be carried further. The synovial membranes frequently, when the inflammation is subdued, continue to secrete inordinate quantities of their natural fluid, by which means great pain and irritation are produced. Frictions and blistering form the sole local means of treating this disorder.

The phenomena of inflammation attacking arteries, were not till lately much investigated. Contrary to what might be expected, this is a very rare disease. The causes are hidden in obscurity: its characters are remarkable redness of the skin and turgescence of the face, with other symptoms of vehement general action. This is followed by a typhus fever of the gravest description. Great danger results from the circumstance that the inflamed artery betrays no tendency to unite, by the adhesive inflammation, and that consequently the disease spreads rapidly towards the heart. On dissection, the usual appearances are rough granulations on the surface of the artery, separation and erosion of the coats and suppuration. It has been conjectured, that though acute arteritis be very rare, a chronic kind often exists, which gives rise to the several diseases of the inner surface of the heart.

The inflammation of veins is generally brought on by bleeding. It exists in various degrees; sometimes being so slight, that no further consequences ensue from it than a slight thickening of the vein and adhesion of its sides. At other

other times the vein bursts on the surface, and exhibits abscesses of various conditions. But instances are not wanting, and these are truly dangerous, in which the inflammation has communicated itself along the parietes of the veins to the brain or heart, giving rise to a severe typhoid fever, and commonly terminating in death. The treatment is to subdue the disease in its earlier stage, by leeching and poultices, and to endeavour to procure adhesion of the sides of the vessel by the application of a compress above the wound. Some Frenchmen having found inflammation of the veins very frequent concomitants of typhus fever, and that the latter invariably followed the former, have concluded that the two were always related to each other as cause and effect. The anatomical characters of phlebitis vary according to the violence and the duration of the phlogosis. "In the early stage, we find the internal membrane of the vessel of a brownish-red colour, with or without traces of vascular injection. At a more advanced period, this membrane becomes thickened, and easily lacerated. In this condition, it is readily separated from the subjacent tunic, and is often covered with purulent matter, or ulcerated in its structure to a greater or less extent. It is still more common to find the pus, which is the product of the inflammation, mixed with a certain quantity of the blood contained in the vein—hence the purulent, sanguinolent, or fetid matter which we see in the vessels of many of our sick—hence the manifest decomposition of the blood, with the presence of gas, which we occasionally observe. In some cases, the purulent matter secreted by the inflamed vein, determines a sort of coagulation of the venous blood, and produces those long fibrinous clots, which obstruct the canals of the vessels. Sometimes, though rarely, the concretible and organisable matter secreted by the vein agglutinates the opposite parietes, and the vessel is ultimately converted into a solid cord. This, however, is a rare circumstance, because the matter, as it is secreted, is hurried along into the general circulation. When the inflammation has, at length, invaded all the coats of the vein, the vessel becomes thickened in its parietes, and readily lacerable."

Inflammation of the absorbents follows nearly the same course as phlebitis, except that it is usually attended with glandular swellings. These vessels are seen running along the limbs, hard, red, and inflamed. Erysipelas generally appears on the skin, coagulable lymph is effused around them in the cellular tissue, wherein, as well as in the glands, abscesses are formed. Inflammation of veins and absorbents are, however, rarely if ever seen, except in consequence of the inoculation of poisons, and of these, that of putrid bodies is, perhaps, the most frequent. Many have been the unfortunate victims who have been carried off by this complaint, whilst prosecuting anatomical studies; and though of course from many feelings this complaint has called forth much attention from pathologists, our practice is very unsuccessful. The profession is divided as to whether this complaint ought to be treated like other inflammations, by venesection, mercury, purgatives, &c., or by stimulation and a high diet. With regard to the success that has followed these two modes of practice, it amounts to nearly nothing. Where life has been prolonged by any means for some time, the powers of the constitution seem to have overcome the virulence of the poison, and the patient has slowly recovered: but it is very doubtful whether any thing ought to be attributed to the treatment.

It must be confessed, however, that though the depleting system has been adopted in all degrees, and with the most obstinate pertinacity, there is no evidence that a plan of stimulation, regulated solely by effects and pushed to the utmost sufferable degree, has ever been fairly put on trial. Viewing the matter on theoretical grounds, (and it is to theory we must resort when experience shews no certain way), we should be inclined to think that the stimulating plan is the only one likely to be attended with success, and that the measures adopted by those who preferred antiphlogistic measures, were calculated on all accounts to be productive of injury. In the first place, we suppose it will be

allowed on all hands, that a specific poison is absorbed into the blood either through the veins or absorbents. What is the process nature adopts in ordinary cases to prevent the ingress of morbid matter into the system? Why first, the part affected inflames, coagulating lymph is thrown out, a cyst is formed by it round the inflamed part, into this cyst pus is secreted, and the poison is probably thrown off; at all events no ill consequences result, and though the sore long remains open, and is very troublesome, no dangers are threatened. It appears here that the indurated cyst which is formed round the wound, or the adhesion that closes the inflamed vein afford a powerful opposition to the transmission of poison into the system. Yet we do every thing to prevent this consolidation. We bleed, which is the very treatment we adopt when we wish to prevent adhesive inflammation from taking place. We give mercury in large doses; a medicine of the utmost efficacy in checking the deposition of lymph, and which has moreover the reputation of promoting absorption. It would be more consonant with reason, and not at all opposed by experience, to tie a ligature round the poisoned limb, so as to retard the flow of blood, and thus favour deposition, and to give the sulphate of quinine, or other medicine of a stimulating nature, in such doses as might keep up a strong action of the heart and arteries.

Having thus given a general account of the varieties of active inflammation, we shall proceed to some account of those sudden injuries or accidents which call this action into play. These may naturally be divided in wounds, contusions, burns, scalds, dislocations, and fractures.

Wounds are of three kinds—cuts, stabs, and rents; words with the meaning of which every one is so familiar, that they require no definition. They are dangerous nearly in the order set down; the first being the least so. The effect of an incision through the flesh is to cause hæmorrhage from all the blood-vessels divided; if any of them are of large size, (say the size of the third string of a fiddle,) and it is not compressed, the patient commonly bleeds to death. Arteries of smaller dimensions, however, having bled a little, have an inflammation set up in their vasa vasorum, which causes them to swell, and obliterates them. Though the blood is by this means stopped, the orifices pour forth a lymph which, coagulating, forms a cement to unite the divided surfaces. This deposition of coagulation has of course the greater effect the nearer the respective sides of the wounds are approached to each other, and thus it happens that if the wound be very deep, the lower not being brought into opposition by an unskilful surgeon, the exterior part unites while suppuration takes place below. The accurate union of all the wound is therefore our first duty. This is for the most part easily effected by adhesive plaster laid over the wound in strips, so as to bring the edges of the wound in contact, while the bottom of the wound may be closed by means of compresses laid on the sides of the limb and fixed by bandages. There is considerable tact required in this as well as in the removal and re-application of dressings. The following rules are extracted from a very useful book, "Cooper's Surgery:"—

"The strips of adhesive plaster should be removed by taking hold of their ends, and drawing them always in a direction towards the wound. Were the plasters pulled off in the contrary direction, the edges of the wound would be separated, and perhaps torn asunder again, and the process of reunion at all events disturbed. The plaster should not be pulled up, as by this proceeding the edges of the wound would be torn from the subjacent parts.

"In large wounds, especially, only one strip, or at most two, should be off the injury at a time; and the part from which the plaster has been removed, having been carefully wiped with a sponge and dried, is then to be supported with a fresh strip, before any more strips are taken off.

"The edges of the wound, particularly if it be large and deep, should always be held together by an assistant at the time of changing the dressings.

"The frequency of dressing must be regulated by the quantity

quantity and quality of the discharge; by the situation of the injury; by the climate and season of the year; by the effects which the renewal of the dressings seems to produce; and by the feelings, and sometimes the wishes, of the patient."

There are some wounds of very moveable parts that no plaisters or bandages will keep in apposition. These are to be united by sewing their edges together. There is a furious opposition amongst the English surgeons to the use of these sutures, because they cause constitutional irritation. This is true, but the matter has been much exaggerated.

If a great artery has been divided by a wound, our first object is to stop the bleeding. This is effected by sticking a tenaculum through the bleeding vessel, and tying that with a ligature. An operation, in ordinary states, easy enough, with a little practice; its only difficulty is to tie the artery, and nothing else; no nerve, vein, or flesh. There has been much disputation amongst surgeons, as to whether a small ligature tied very tightly round a vessel so as to cut through its internal or softer coats, or a broad ligature less strictly drawn, are most conducive to the safe obliteration of large arteries. Experience seems to decide in favour of the former.

Arteries not of the largest size may have their bleeding stopped by pressure, that is, by means of compresses formed of lint, laid over the vessel and bound tightly down. Pressure is also often used as a temporary method of suspending hæmorrhage, until a ligature can be applied, as when we amputate or perform any other operation in which larger arteries are involved: in this case the pressure is made by means of the tourniquet, a well known instrument, constructed so as to apply its pressure exactly over the vessel required to be stopped.

Wounds are dangerous, however, from other causes besides hæmorrhage; as for instance, when they involve nerves, or any of the viscera; but their varieties, in this respect, will be best considered when we come to speak of particular regions of the body. Stabs are more dangerous than cuts, because they bruise the parts so as to destroy their vitality; the process of adhesion is, therefore, not sufficient, and consequently suppuration is always required. The same may be said of lacerated wounds, which are indeed perfectly similar to stabs, except that they are often more extensive. Punctured and lacerated wounds are, however, dangerous, independently of their tending to suppuration. They excite a peculiar and dangerous irritation of the nerves: no wounds are so liable as these to destroy life by the nervous depression they cause; none are so frequently attended with tetanus. The only local method of treating these wounds is by fomentations and poultices, which sooth the pain, and are said to promote suppuration.

In the constitutional treatment of these wounds when extensive, as well as of all great accidents, we observe three stages. In the first, when the violent impression made on the nerves has paralyzed or enervated their powers, it is proper to stimulate the patient gently by slight doses of brandy, ammonia, and the like. When re-action takes place, we are called upon topically and generally to reduce inflammation and to regulate and sometimes lower the vehement actions of the nervous system. Thirdly, when the inflammatory action subsides, and suppuration or mortification commences, we are called upon to support the strength by regulating diligently the diet and secretions, and by the occasional exhibition of tonics.

Besides these simple varieties, wounds are rendered much worse if any foreign bodies remain within them. Hence, partly, though not so much as to their laceration, are we to attribute the dangerous nature of gun-shot wounds.

Foreign bodies should be extracted from wounds whenever this can be effected without doing more mischief than their remaining is likely to create. Hence it is often requisite to leave bullets in the body. Gun-shot wounds illustrate the general effects of contusions and lacerations in the most remarkable degree, since they are the severest of these accidents. They vary, however, very much in character. Mr. Hennen observes, that "If a musket or pistol ball has

struck a fleshy part, without injuring any material blood-vessel, we see a hole about the size of (or smaller) than the bullet itself, with a discoloured lip, forced inwards; and if the ball has passed through the parts, an everted edge, and a more ragged or larger orifice at the point of its exit. The hæmorrhage is generally very slight, and the pain often inconsiderable, insomuch that in many instances the wounded are not even conscious of having received any injury. If, however, the ball has touched a large vessel or nerve, the hæmorrhage will be profuse, or the pain of the wound severe, and the power of the part lost. Some men will have a limb carried off, or shattered to pieces by a cannon ball, without exhibiting the slightest symptoms of mental or corporeal agitation; while a deadly paleness, instant vomiting, profuse perspiration, and universal tremor, will seize another on the receipt of a slight flesh wound."

Balls which are somewhat spent, and which strike the body in an oblique direction, are most curiously bent from their original direction. Some very extraordinary instances of the reflection of balls, from one part of the body to another, are recorded by Mr. Hennen. The ball (he observes) is in many instances found very close to its point of entrance, having nearly completed the circuit of the body. In one case, which occurred to a friend of his in the Mediterranean, the ball which struck about the pomum Adami was found lying in the very orifice of its entrance, having gone completely round the neck. This winding course of balls is represented as particularly frequent when they strike the ribs or abdominal muscles; for, says Mr. Hennen, they are turned from the direct line by a very slight resistance indeed, although they will sometimes run along a continued surface like that of a bone, a muscle, or a fascia, to a very extraordinary distance. If there is nothing to check its course, and its momentum be very great, it is surprising what a variety of parts may be injured by a musket ball. Mr. Hennen affirms, that he has seen cases where it has traversed almost the whole extent of the body and extremities. In one instance, which occurred in a soldier with his arm extended, in the act of climbing up a scaling ladder, a ball, which entered about the centre of the humerus, passed along it over the posterior part of the thorax, coursed along the abdominal muscles, passed deeply through the glutæi, and presented itself on the fore-part of the middle of the opposite thigh. In another case, a ball which had struck the breast, lodged in the scrotum.

To determine when limbs are so injured by gun-shot wounds or other contusions, that they cannot recover, is one of the most difficult and important points in surgery. No certain rules on the subject can be laid down, and much, therefore, must be left to individual judgment. We may state, however, as a general rule, that when the bones are fractured into many splinters, and when large arteries or nerves are torn through, amputation should be decided on; while on the other hand, most extensive contusions and lacerations of the soft parts may be trusted to general surgical treatment. With respect to the time an amputation should be performed, it seems pretty generally decided by the best army surgeons, that this should be as soon after the accident as possible, and before inflammation is set up. An exception, however, is to be made in favour of those cases where the nervous depression is very great, for in such the combined influence of the accident and the operation is too much for the nervous system to bear, and the patient sinks suddenly. It is therefore only when the spirits are not entirely sunk, and when the pulse indicates some power in the system, that we should proceed to these immediate amputations. A soldier betraying extreme debility lying nearly in a state of syncope, with hardly any pulse or warmth, should be relieved by slight cordials, and when he becomes reanimated and begins to feel some stiffness and aching in the limb, this is the most favourable time for the amputation to be performed.

Burns and scalds vary in their appearances. When slight they cause merely a little redness of the skin, attended with great heat. When more severe they produce blisters; a violent

violent symptomatic fever takes place if they are large, and the adjacent dermis commonly suppurates. In severer cases, or even sometimes in the preceding, mortification on the skin takes place, and then occur shivering, convulsions and delirium. Though they should be treated on general anti-phlogistic principles, their peculiarities cause some deviations from any uniform plan. When the skin is unbroken, cold applications may be applied. These, however, should not be at first of the coldest possible nature, and indeed we have some reason to suppose, that if we acted in this respect on the same principle as when we apply warmth to frozen parts, namely, by beginning with very slight changes of temperature, and gradually increasing them, our success in the cure of burns would be greater. In severe burns, it is useless to attempt to prevent suppuration, and violent depletory measures are to be avoided, partly on the same account and partly because they weaken the constitution, and disable it of the powers necessary to support the secretion of pus. Emollient poultices are, therefore, the only applications that are required. A liniment composed of oil and lime water, is in general use: all that can with justice be said in its favour, is that it does no harm. The constitution requires a great deal of management in severe burns. The support of the system during the formation of pus or the separation of sloughs, must be sedulously attended to. Medicines are of little use; but wine and occasionally brandy require to be administered, in small quantities and in conjunction with nutritious matters, very frequently.

Fractures of the bones are known by various signs as they occur in different parts; sometimes the limb is found flexible; sometimes it is shortened, lengthened, or otherwise distorted; but the most general sign is, that by taking hold of and irritating it, a grating or crepitus is produced by the friction of the irregular broken surfaces. When bones are broken, coagulable lymph is thrown out between them, which gradually hardens and becomes callous. Into this, vessels shoot, which deposit osseous matter, and by this means union is effected. This deposition takes place only, however, when the bones are in contact, and occurs as quickly if the two bones lie side by side as when their broken surfaces are in opposition. The process of union is completed in various periods of time, being most rapid in the smallest bones; usually from four to six weeks are required to consolidate a broken bone.

The treatment of simple fractures consists, 1st. In extending, by pulleys, or by manual strength, the distorted limb, and then placing the broken ends in the position they naturally occupied: as the muscles, however, seldom offer so great a resistance in fractures, as in dislocations, violent extension is not generally necessary. 2d. In retaining the bone in its natural situation: this is effected by placing the limb in such a position, as shall relax the majority of the muscles tending to displace the bones, and by antagonizing the action of others by means of unyielding splints, fastened tightly round the limb, or in other situations by bandages. Then, the moderation of inflammation, and the subduction of irritation, which sometimes causes violent twitchings of the muscles, are all we have to attend to.

Sometimes the deposition of callus does not occur, and the bones consequently remained unconnected. In these cases it is usual to rub the ends of the broken surfaces together; if this fails, to pass a seton through the fracture, or open the fracture and saw off the broken ends. These measures are, however, hardly ever called for, and the latter is very dangerous.

A fracture, which is accompanied with a fissure or laceration in the integuments, is very dangerous; because these cases are nearly always effected by a violent contusing force, and because the suppuration or mortification which may be set up, debilitates very much the restorative powers of the constitution. The treatment, however, of compound fractures differs not from that of simple fractures, unless the injury has been so severe as to preclude the hope of preserving the limb. In these cases amputation should be

performed. In this, as we stated when treating of gun-shot wounds, much must be left to the individual judgment, and no certain rule can be laid down. A large wound, much laceration and contusion of the soft parts, but above all considerable splintering of the bone, should induce us to amputate.

Dislocations are accidents whereby the articulating surfaces of bones are thrown out of their places.

The general symptoms of dislocations are alteration in the length of the dislocated limb; alteration also in its position, which is owing to the altered axis of the muscular movements, not as some have thought to the remaining and unbroken portion of the ligaments, for the ligaments may be (according to the violence of the accident), either stretched only, or partially, or completely torn; yet the position of the limb is in all these cases much the same. The loss of motion which (with a few marked exceptions) attends dislocations, is to be attributed to the "permanent contraction of the muscles." When the limb is shortened the muscles are relaxed; but when lengthened they are so much stretched as to be sometimes torn. Considerable tumefaction from effusion of ruptured vessels sometimes obscures the prominences of the bones. Severe and obtuse pain is felt from the pressures of the dislocated heads of bones on the muscles, or paralysis of the whole limb may come on when a large nerve is thus compressed. The head of a dislocated bone may be sometimes felt in its new situation, and on rolling the shaft of the bone we feel rotation of the head also. *Crepitus* (from the inspissation of the synovia) comes on frequently, but not at first, and is thus distinguished from the crepitus arising from broken bones—though it is audible, we have no jarring sensation communicated to our hand. *Suppuration* seldom follows dislocations, when reduction has been made, when it happens it is generally eventually fatal. Unreduced bones form by pressure new beds, and some motion (to a greater extent in the upper than the lower limbs) is recovered. On dissection, laceration of the ligaments of the tendons of muscles going over the joint, and sometimes of the muscles themselves, is met with. These lacerations cause for some time weakness of the joint, or disposition to be dislocated. In old dislocations we see that when a bone's head is imbedded in muscle, its pressure on the cellular membrane causes inflammation and thickening of that structure, and thus a substance sufficiently dense to furnish some support is formed, which new capsular ligament surrounds the whole articular surface of the bone, but does not adhere to it. When the surface of another bone forms the resting place of the dislocated head, the pressure incurred produces absorption on the one hand of the periosteum, on the other of the articular surface. "A smooth hollow surface is formed; the ball becomes altered in shape to adapt itself to the new surface; and whilst absorption proceeds upon the part on which the head of the bone rests, an ossific deposit takes place around it from the periosteum which is there irritated, but not absorbed. This bony matter is deposited between the periosteum and the original bone, by which a deep cup is formed to receive the head of the bone." The socket smoothed on its internal surface to allow motion, it sometimes so completely surrounds the ball of the bone that the part cannot be separated without fracture. The muscles gradually accommodate themselves to the displacement of the bones.

Dislocations are sometimes produced by relaxation of the ligaments without force, as in case of scrofulous patients, and sometimes in dancers, and other persons who practice unnatural postures, or in old and paralytic persons. It may arise also from accumulation of synovia in a joint. Dislocations are sometimes complicated with fractures, as when (which is very common) the fibula is fractured in the ankle-joint, or the acetabulum in dislocation of the hip or the head of the os humeri in displacements of the shoulder joint, or the coronoid process in those of the ulna, which last produces a species of luxation which does not admit of the preservation of the natural site of the bone. In dislocation

tion and fracture, the dislocation is to be reduced at once; for if it is not done at first, it cannot afterwards without displacing the fracture. It is proper to secure the fracture, however, first with splints. The same rule is good when one bone is broken and another dislocated.

Compound dislocations are accompanied by great injury of the muscles, often by rupture of blood-vessels, by the escape of synovia from the joint and the passage of blood into it. When a joint is opened, inflammation succeeding, suppuration in a few hours comes on, and granulations spring from the secreting membrane, which being of the mucous kind is more disposed to the suppurative than to the adhesive inflammation. At the extremity of the bone the cartilage after some time becomes absorbed, in consequence of an ulceration often beginning on its synovial surface, but more commonly arising from the end of the bone itself. The cartilage being destroyed, granulations spring from the denuded bones, and fill up the joint: generally, becoming ossified, they cause ankylosis; sometimes remaining soft a degree of motion is in time regained. During this process constitutional irritation rises to a great height; hence in weak patients we must sometimes amputate the limb to preserve life. The joints most subject to dislocation are such as have much motion, hence the frequency of luxations of the humerus. *Partial dislocations* occur commonly to the knee. This joint is rarely dislocated in any other way. It happens also to the shoulder joint, as when the os humeri rests on the edge of the glenoid cavity; the ancle joint even has been found subject to it. Then the end of the tibia rests on part of the astragalus, but a larger portion is seated on the os naviculare. *Partial dislocations* also affect the elbow both in respect to the radius and the ulna.

Dislocations are caused by violence when the bone is in an oblique direction; it is necessary, however, that the muscles be unprepared, for otherwise tremendous force would be required to overcome their contraction. Of this we have examples in the cases of Damien and Ravillac, when repeated efforts of strong horses were insufficient to dislocate any of the limbs while the muscles were engaged in resisting them. Dislocations are uncommon in old persons, because their bones are more liable to break from injuries, and in children the same effect takes place, because the epiphyses are not firmly united.

The *reduction* of dislocations is little impeded by the form of the joint. The projecting lip, indeed, of the acetabulum requires the head of the former to be lifted over it in dislocation; and in displacement of the radius, the head of this bone being larger than its cervix, reduction is difficult; but still the form of the bone is to be slightly considered.

The weak and inelastic structure of the capsular ligaments, and the extensive lacerations they suffer from injuries, shews that they cannot impede reduction. The chief impediment to reduction exists in the muscles. These, independent of their common contraction, which always require rest after a short exertion, have another kind of contraction which is permanent, and which is in an inverse proportion to the resistance that is made to it. Thus if the biceps be cut, the triceps keeps the arm always extended. Thus when a bone is dislocated, the muscles draw it from the joint as far as possible, and there fix it. In old cases, adhesions to the surrounding parts also impede reduction.

The means of reduction are constitutional and mechanical: the constitutional are, bleeding from a large orifice, warm bath at 101 or 110, till faintness comes on, and nauseating doses of antimony to keep up the effect, produce relaxation of the muscles, and thus reduction of the limb. The mechanical means are to relax the stronger muscles, apply gradual tension to the dislocated bone by means of pulleys or manual assistance, and to be careful to fix the opposite bone. Natural form and unimpeded motion, mark reduction. The shoulder is apt to slip out of its cavity after reduction, if not secured by bandages; especially if the force of pulleys has been required. Rest is all that is requisite for the union of the broken ligaments, and

the strength of the muscles and ligaments may be greatly promoted by pouring cold water upon the limb, and by the subsequent employment of friction.

Severe injury of the muscles and nerves attends attempts at reduction in old dislocations. Hence, though they have been reduced at later period, it may be given as a general rule not to attempt reduction of the hip after eight weeks, nor of the shoulder after three months' dislocation, except in aged or extremely relaxed persons.—*Sir A. Cooper on Dislocations.*

Having thus passed in a sketching and imperfect manner through the varieties of acute inflammation, and of the accidents and other causes that produce it, we may now enter into some account of chronic inflammation, and of those tardy and inexplicable changes in the actions of blood or secreting vessels by which the original structures of the body are destroyed, and morbid structures or degenerations substituted in their place.

It is very difficult to define the characters of chronic inflammation. On the surface of the body, where it is however rarely observed, except as accompanying ulceration or desquamation, it exhibits the redness, and, in a slight degree, the tumour of active inflammation. But the pain and throbbing is absent as well as the increased heat.

The fever which attends chronic inflammation is that so well known by the term *hectic*. It is characterized by irregularity, rather than excess or diminution in the actions of the body. The heat is not permanently increased, but flushes come on in the evening or after meals, tinging the cheeks with a deep and circumscribed redness; the pulse is not hard but very frequent, fluttering and small; there is heartburn and flatulence, alternating with good appetite; diarrhoea comes on irregularly, and night sweats. The nervous system is usually in a state of unnatural excitement; there is want of sleep and considerable restlessness, though these alternate also; for sometimes we observe great alacrity, mildness, and quietude. The treatment of hectic fever has been laid down, but this is absurd. Its only cure is to remove its cause; where this is impossible, the amelioration of that cause is to be had in view, but we have no power to remove a necessary symptom.

The commonest way in which we meet with chronic inflammation, is producing fistulous abscesses or chronic ulcers. Fistulous abscesses require simply free openings, which convert them into ulcers or open sores. Chronic ulcers are of various kinds. In some, the secretion of pus is nearly stopped, and frequent accessions of pain and heat come on attended with an ichorous discharge, with inversion or eversion of the edges, and much constitutional disorder: these are called irritable ulcers. In others, the secretion of pus is changed in quite an opposite way; it is mixed with coagulable lymph, is very tenacious, and shews no granulations. The edges are smooth and hard: this they call an indolent ulcer. To the first kind, soothing applications are of course applicable; and when they get better, and we are desirous of bringing their sides closer together for the purpose of uniting the skin, care must be taken not to bandage them too tightly at first. The second kind of ulcer requires, in various constitutions, various stimuli; generally weak caustics; and when one does not succeed, another may be tried. The red precipitate ointment, under proper constitutional treatment, is as effectual as any thing. Ulcers are, in old people, rendered very troublesome and even dangerous, by varicose veins running into them. We need not say that the treatment of these sort of ulcers is to cure varicose veins.

Of chronic inflammation in internal parts, we know very little. It has been the fashion to attribute tubercle, ascites, ossifications, and other depositions in the arteries and on the inner surface of the heart, tumors of all kinds, and even cancers, to chronic inflammation: and while it has seemed to some to account for these tremendous changes, others have made it subservient to the explanation of the slight irritations that are of hourly occurrence in the digestive tube. We shall not adopt as proved, any theories that rest on so little visible

visible foundation; but shall content ourselves with giving a descriptive catalogue of the various changes that the different animal structures undergo, without endeavouring to fix precisely the nature of the morbid action that gives rise to them. At the same time, we must not be accused of deeming this a matter of slight consideration. Every one must have noticed a connection between inflammation and morbid depositions. No point in the whole range of pathology are we more desirous to ascertain, than whether this inflammation produce these depositions, or whether these depositions, by the irritation their growth excites, cause the inflammation. But if inflammation were the sole cause of all the above-mentioned degenerations, that and these would be synonymous, or, at least, inseparable. It is true this would be of little consequence in a practical point of view, if experience shewed that the treatment proper for chronic inflammation prevented the formation of tubercle, cancer, &c. &c. Unfortunately such is not the case.

Arteries are subject to few changes from chronic action. Besides depositions of bone and cartilage on their inner surfaces, they exhibit scarcely any disease, except aneurisms. These are enlargements or dilatations of certain parts of arteries; according to some, they arise from a rupture of the inner or muscular coat, and from a consequent dilatation of the outer coat; but others affirm, that though this is often the case, yet that aneurisms may arise from a simple dilatation of all the arterial coats. The latter opinion, though supported by good authorities, has one physiological fact strongly against it; namely, that when we inject an artery, however forcibly dilated, it preserves its round form whilst the muscular coat remains entire; but that no sooner is that broken, than the outer coat bulges out into an irregular tumour, like an aneurismal sac.

The first change that takes place in an artery, is the dilatation of its coats;—the second, the rupture of the muscular coat;—the third, the deposition of the layers of coagula in the tumour. The action of the heart continuing to act on the tumour, gradually enlarges it, until at length it bursts, or the patient dies. On the other hand, if the coagula are freely deposited, they may gradually close up the orifice of the artery altogether, and thus the patient's life may be saved. An instance is on record, where even the aorta was thus closed.

An aneurism is known from other tumours by its pulsating synchronously with the heart, and by its subsiding when pressed upon. But these diagnostic signs must not be considered infallible; an extensive abscess will, if it lies over an artery, have a pulsation; and if it has extensive sinuses, may subside when pressed. It is a symptom more to be depended on that we find the tumour subside, if we intercept its blood by pressing on the artery that supplies it. This, of course, would cause any tumour to leave off beating; but an aneurism would, if not filled with too solid a coagulum, subside under this pressure which, of course, could not happen to any other tumour.

There are several artificial divisions of aneurisms. They are called *diffused*, if long, and *circumscribed* if short; *false* if the blood gets through all the coats of the artery into the surrounding cellular tissue; and false aneurisms are again divided into false circumscribed, and false diffused, and the like. But there are only three sorts of aneurism that require notice. The common aneurism, the aneurismal varix, or varicose aneurism, and the anastomosing aneurism. The first we have described; the second is brought about when in bleeding we cut through the vein into the artery, the consequence of this is, that the blood of the latter vessel is driven into the former, which begins to pulsate synchronously with the heart and to dilate. The third is totally different from any of the preceding forms of disease, as it proceeds from a morbid growth, or dilatation of the arterial ramifications, by which a very vascular interstitial substance is produced, which has a singular propensity to increase to a great and dangerous extent, and which, when cut or broken, bleeds with incredible obstinacy.

The cure of aneurisms is constitutional and local. The constitutional treatment is by large and frequent bleedings and low diet, to slacken the action of the heart and facilitate, as it is supposed, the deposition of coagula in the tumour. The success of this plan, in a few instances, is affirmed by some surgeons, but it is difficult to reconcile this with the fact, that bleeding in general tends to prevent the deposition of coagulating lymph. In fact, it seems we bleed commonly to prevent morbid adhesions, while, in aneurisms, we bleed to cause them. The fact is, however, that the constitutional treatment, though a few patients have got well under its influence, probably did neither good nor harm, but allowed nature to effect a spontaneous cure.

Aneurisms have been cured by long continued pressure, especially varicose aneurisms; but in general when a large aneurism is formed, the only way to cure it is to tie the artery that supplies it with blood. Every artery of the body has been tied up to the abdominal aorta, but of course the nearer the heart the greater the danger. Desault formerly, and Mr. Wardrop recently, have endeavoured to shew, that when aneurisms are formed near the heart, and it is dangerous to tie the arteries that supply them, a cure may be effected by tying the artery beyond the tumour. In this case, the artery so tied becomes obliterated up to the aneurism, the aneurism itself becomes obliterated, and a small part of the vessel that supplied it. Success has crowned these endeavours to a certain extent; but not so much as to establish that the new operation is as effectual as the old.

The method of tying arteries for aneurisms, as well as to prevent hæmorrhages, is now pretty nearly settled amongst surgeons. To make as small an opening as possible, to use as fine a ligature as will effectually compress the vessel, to remove as little of the surrounding tissue as possible, and to exclude from the ligature every thing but the vessel, are the principles that should be held in view. The accomplishment of these ends, in different parts of the body, is, however, attended with extreme difficulties, and can only be effected by perfect anatomical knowledge, and great practical tact.

The anastomosing aneurism, and the *nævus maternus*, which bears a faint resemblance to it, may both be relieved by tying the artery which supplies them.

The only disease the veins are subject to, is *varix*. This is an enlargement of their calibres; it occurs, for the most part, in old persons, and is of little consequence unless the varicose vein opens into an ulcer, or grows so large that it threatens to burst. The treatment for slight cases, is to support the limb by proper bandaging. When this fails, and the ulcer is troublesome, we should cut through the vein; this is dangerous if we make a wound, on account of the air getting into the vein, or inflammation being set up and communicated to the heart; but a plan first suggested by Mr. Brodie, is not, we believe, liable to these ill consequences. It consists in passing a curved bistoury, in an oblique direction, through the skin, dividing the vein, and leaving the skin immediately over it uncut.

We come now to the consideration of tumours; concerning which we have nothing novel to offer, either in arrangement or description. We shall, therefore, make free with some considerable extracts from Mr. Abernethy's excellent work on the subject. He is of opinion "there can be little doubt, but that tumours form every where in the same manner. The coagulable part of the blood being either accidentally effused, or deposited in consequence of disease, becomes afterwards an organized and living part, by the growth of the adjacent vessels and nerves into it. When the deposited substance has its attachment by a single thread, all its vascular supply must proceed through that part; but in other cases the vessels shoot into it irregularly at various parts of its surface. Thus an unorganized concrete becomes a living tumour, which has at first no perceptible peculiarity as to its nature; though it derives a supply of nourishment from the surrounding parts, it seems to live and grow by its

own independent powers; and the future structure which it may acquire, seems to depend on the operation of its own vessels.

"The structure of a tumour is sometimes like that of the parts near which it grows. Those which are pendulous into joints, are of a cartilaginous or osseous fabric; fatty tumours frequently form in the midst of adipose substance, but in many cases the nature of the tumour depends on its own actions and organization; and, like the embryo, it merely receives nourishment from the surrounding parts."

The medical treatment of tumours appears to Mr. Abernethy to be identical with that of chronic inflammation, namely, to subtract the heat and blood topically from the part by leeching, and evaporating lotions, to excite, when inflammation subsides, counter-irritation, and to regulate the general health.

Encysted tumours are so called, because they are contained in a cyst. They are formed of matters extremely various in appearance and consistence: sometimes soft, sometimes fluid, and in other instances ossified, or horny.

When the contents of an encysted swelling are fluid, like honey, the tumour is named *meliceris*; when of a pappy quality, *atheroma*; when fatty, *steatoma*. These swellings have a soft or hard feel, according to the nature of their contents, but the consistence of the contained matter cannot always be ascertained by the touch, especially when the cyst is exceedingly thick.

Sometimes the cyst is very thin, sometimes of considerable thickness, but in general, though not always, its thickness is proportioned to its age. It is often quite firm, like parchment or cartilage, and it commonly contains only one cavity; however, this is frequently intersected by several partitions. Ordinarily, they are not at all painful. At first, they are constantly moveable, and probably would continue so, if all external pressure were kept from influencing them, but, in time, they generally become more fixed, in consequence of being adherent to the skin and subjacent parts. The only way to cure these tumours is to cut them out. The art of doing this with adroitness, consists in dissecting the parts surrounding the tumour, without wounding the cyst. It is also a great point to remove every particle of the cyst; for, when any portion remains behind, the wound will not frequently heal, in consequence of fungous granulations, arising from the diseased part.

"A ganglion is a small hard tumour, unattended with pain, and composed of a cyst, which is of a firm tendinous texture, connected with a subjacent tendon, and filled with a fluid resembling the white of an egg. It is usually more or less moveable beneath the skin; its growth is slow, and it is seldom much larger than a hazel-nut. Its figure is commonly round, smooth, and even; it seldom inflames, and still more rarely does it suppurate; but, when the latter event happens, an ill-conditioned ulcer is generally produced.

Ganglions occur most frequently on the hands and fingers, and either over a tendon, or ligamentous expansion, with which the sac is connected underneath. But, there are instances of these tumours making their appearance in many other situations, and they sometimes attain a considerable magnitude. A ganglion has been known to cover the whole back part of the neck. These tumours appear sometimes to be the consequence of a bruise, or violent sprain. Occasionally they move along with the tendon, to which they are attached; while, in other instances, they seem fixed."

If pressure fails to remove a ganglion, its superincumbent skin must be drawn aside, and the ganglion punctured. The skin then being let free, forms a valve, through which the fluid escapes; but no air can be admitted which would excite troublesome inflammation. Some have, by a blow, broken the ganglion without puncturing the skin; and the fluid thus let out into the cellular tissue, has been absorbed.

Sarcomatous tumours are such as are fleshy, and are of various kinds. Mr. Abernethy, to whom we are indebted for a very excellent classification of these productions, divides them into the following kinds:—

1. Common vascular, or organized sarcoma, are such tumours as are organized throughout, but without any distinguishable peculiarity of structure. "This structure is met with not only in distinct tumours, but likewise in the testis, mamma, and absorbent glands.

"When it has attained a considerable size, the superficial veins appear remarkably large; on which account, together with their curiously meandering course beneath the skin, they cannot fail to attract attention.

"These tumours are generally dull in their sensation; enduring even a rough examination by the hand, and electrifying, without becoming painful. They generally grow till the skin is so distended that it ulcerates, and exposes the new-formed substance; which, being as it were obliged to inflame, and not being able to sustain disease, sloughs and falls out; sometimes portions seem to be detached, and come away without sloughing. In this manner is the disease occasionally got rid of; but such is the constitutional irritation attending this process, and the disgusting fœtor and frightful appearance of the part, that the surgeon generally recommends, and the patient submits to its removal at this juncture."

2. Adipose sarcoma. This is generally formed in the midst of cellular and adipose substance. The capsule which surrounds it is very thin, adheres but slightly to the tumour; and the principal connection appears to be by vessels, which pass through it to enter the substance of the tumour. "These vessels are so small and the connection so slight, that no dissection is required to separate it; for when the tumour is to be removed, the hand of the operator can be easily introduced between it and its investment, and it is thus readily turned out of its capsule. In some instances, however, when inflammation has been induced, the capsules even of these tumours are thickened, and adhere so as not to be separable without difficulty from their surface."

3. Pancreatic sarcoma, so called, because it resembles the pancreas in its internal structure. It consists of irregular-shaped masses, connected together by a fibrous texture. This species of sarcoma is sometimes formed distinctly in the cellular substance, but, most commonly, occurs in the female breast, perhaps originating in the lymphatic glands. In general, the disease is chronic, and does not involve the absorbent glands in the vicinity. But, in a few instances, this species of sarcoma, when situated in the breast, deviates from its ordinary indolent nature, and occasions severe and lancinating pain, an inflammatory state of the integuments, and an adhesion of them to the tumour. The axillary glands also enlarge.

Pancreatic sarcoma is sometimes so irritable a disease, that Mr. Abernethy thinks it may frequently be considered as bad as a cancer. When the glands in the axilla become affected, one generally swells at first, and is extremely tender and painful; afterwards the pain abates, and it remains indurated; another then becomes affected, and runs through the same course.

4. Cystic sarcoma. This name is applied because the disease contains cysts, or cells. Cystic sarcoma sometimes occurs as a distinct tumour, but is commonly met with in the testis and ovary. The cysts, both in the former and latter part, are capable of being rendered red by anatomical injection. The cavities generally contain a serous fluid, but sometimes a caseous substance. Mr. Abernethy believes this last sort of case, when the testicle is concerned, is peculiarly intractable.

5. Mastoid, or mammary sarcoma, so named from its resemblance to the mammary gland in structure. Mr. Abernethy has not frequently seen this kind of tumour, and his attention was called to the nature of the disease, by a case, in which a swelling, partaking of the above structure, and about as large as an orange, was removed from the front of the thigh. The wound seemed at first disposed to heal, but it afterwards degenerated into a malignant ulcer, which occasioned death in the course of two months.

As this kind of tumour is gradually lost in the surrounding parts,

parts, which probably retain a disposition to assume a similar morbid alteration, Mr. Abernethy very judiciously recommends a more extensive removal of them, than was practised in the above example.

Mr. Abernethy thinks this kind of sarcoma more malignant than the preceding species; but not so much so as the following.

6. Tuberculated sarcoma consists of an aggregation of small, roundish tumours, of various sizes and colours, connected together by a kind of cellular substance. The size of the tubercles is from that of a pea to that of a horse bean, or sometimes larger; their colour is of a brownish red, and some are of a yellowish tint.

Mr. Abernethy has chiefly seen this disease in the lymphatic glands of the neck. The tumours ulcerated, became painful incurable sores, and destroyed the patients. Tuberculated sarcoma is so terrible a disorder, that it may be deemed a fatal one; fortunately it is uncommon.

7. Medullary sarcoma. This is commonly seen affecting the testis, and has been termed the soft cancer of that part. The tumour resembles the structure and appearance of the medullary substance of the brain.

In consequence of the diseased state of the testis, the inguinal glands on each side become affected with the same morbid change, and acquire a very enormous size. The skin covering the disease in the groin gives way, and the most prominent of the enlarged glands inflame, and are gradually detached in the form of sloughs. Hemorrhage succeeds the separation of each slough, and can only be suppressed by means of continued pressure. After all the dead portions have been thrown off, the skin heals, and continues cicatrized till the distention of another gland renews the foregoing process, and the patient is at length exhausted.

Dissections after death evince, that the glands in the pelvis and abdomen are affected with the same disease. Indeed, the facility with which medullary sarcoma is propagated along the absorbent vessels, is one of its most striking peculiarities.

The medullary sarcoma is often considered to be exactly the same sort of disease as the fungus hæmatodes; but they appear different in the medullary sarcoma, after the parts have sloughed out, the place heals, until another similar swelling bursts the skin; but, in fungus hæmatodes, the fungus always grows larger and larger, without being materially retarded by sloughing and no healing process ever occurs.

Fungus hæmatodes, or the bleeding fungus, commences by a small fluctuating, colourless tumour, painful when occupying the mamma, not painful in other situations,—advances to a considerable size, breaks and protrudes from its opening small fungi, which grow rapidly and bleed considerably. It changes into a liver-like structure the muscles, makes carious the bones, and spreads rapidly along the glands. Its base, from where the fungi grew, is of a soft nature, somewhat like brain. This disease attacks young persons, and is always fatal; unless completely extirpated with the knife. This even commonly fails, because the disease has often spread along the glands into remote parts before any operation is decided on. No structure, but the brain, seems free from fungus hæmatodes.

We shall throw together the remarks we have to make on scirrhus, on cancer, and on carcinomatous tumours. A cancer is an open ulcer which discharges a copious and peculiarly fetid matter; its surface is very uneven; its edges irregular, and both its edges and its base extremely indurated. It is accompanied by violent lancinating pains, frequently bleeds, forms every now and then fungoid granulations, and has a tendency to involve in its structure "nearly every part with which it comes in contact. It always begins in a small spot, and extends from thence in all directions like rays from a centre." A cancer is incurable by art, and there are but one or two instances on record in which it has been removed by the powers of nature. In these a deep-seated mortification occurred which threw off the whole sore. Extreme emaciation and great disturbance of the or-

ganic functions are the constitutional attendants of this malady. Cancer may succeed to various kinds of indurations and tumours; but its most common predecessor is the tumour called *scirrhus*. This is not merely a scirrhus or indurated swelling, but an induration attended with peculiar characters. These are accurately described by Mr. Samuel Cooper in his "First Lines:"—

"The puckering of the skin, the dull leaden colour of the integuments, the knotted and uneven feel of the disease, the occasional darting pains in the part, its fixed attachment to the skin above, and muscles beneath, form so striking an assemblage of symptoms, that, when they are all present, there cannot be the smallest doubt that the tumour is a scirrhus."

"But, it is not to be denied, that the diagnosis is frequently more obscure. In some cases scirrhus is moveable, and not fixed to the subjacent parts; and the disease may be indolent, without much pain, or without discolouration of the skin. In the female breast the part first affected may be very small, and feel like a loose pea under the skin; in other instances it may be more extensive and deeply situated." Neither is the swelling always irregular and craggy; Howard describes it as being generally roundish and renitent. "He describes the skin, at an advanced period, as being smooth and shining, and having a reddish hue, inclining to purple. He tells us, also, that an external strongly marked cancer, when much distended, and tending to ulceration, but not actually ulcerated, may be compared with a hard, prominent carbuncle, before it sloughs; for they have each a similar hardness, with a shining prominence; and if the cancer be adherent to a broad base, there is posteriorly a similar firmness and immobility."

"The progress of a scirrhus, before ulceration takes place, is generally slow; but when this last process commences, the ravages of the disease mostly spread with great rapidity."

"A scirrhus induration is not prone to acquire the magnitude, which almost all other tumours are apt to attain, when their growth is not interrupted."

"Other tumours, especially when they have not been inflamed, are commonly much more moveable than scirrhi."

"If we except the fungus hæmatodes, other tumours do not involve every kind of structure, skin, muscle, cellular substance, &c.; and the integuments seldom become affected before the distention, produced by the size of such swellings, becomes very considerable. In scirrhus cases, the skin soon becomes contaminated, discoloured, and puckered."

"Some few tumours may be harder and heavier than a few scirrhi; but the reverse is commonly the case."

"In a scirrhus of the breast, the part affected is generally hard, heavy, and connected with the mammary gland; and, when moved, the whole gland moves along with it."

"In parts which have become scirrhi, the structure usually consists of a very firm light brown substance, intersected by membranous or ligamentous septa, which run in various directions. The membranous septa are more numerous, and of greater thickness in some cases than others. There is occasionally mixed with this structure a cartilaginous substance, and even bony matter, has been met with."

No cure having been discovered either for scirrhus or cancer, the only method of treating these diseases is to cut them out. In recommending such operations we must be guarded by the same reasons as regulate our practice with regard to other tumours; namely, by the consideration whether the patient is constitutionally affected, and whether we can perfectly remove all the diseased portions. When these cannot be effected, our object should be to palliate the disease. Scirrhus may be kept under for some time by cooling applications and attention to health; and some have attributed good effect to the iodine ointment, but we think with insufficient reasons.

Under the words carcinomatous tumour, cancer has been included. We shall here make use of it to express those anomalous diseases which bear a resemblance to cancer, and which, though often as fatal, arise from common causes, such as long continued chronic inflammation. The appearances of these diseases, as well as the symptoms that precede them, are,

however, extremely various. Sometimes a common tumour having formed, has burst and discharged for some time good matter, but afterwards the sides of the ulcer having become indurated, it has gradually acquired the appearance and the incurable nature of cancer.

"Diseases also, which strikingly resemble carcinoma in appearance, form in the following manner. An enlarged lymphatic gland shall gradually become soft, and contain a fluid. In this state it ulcerates or is opened; but instead of subsiding, it inflames; the surrounding parts become indurated; the integuments acquire a dusky hue; the opening and cavity enlarge, and assume the appearance of a cyst, from the sides of which fungus arises, and turns over the averted edges of the opening. I have also seen, after the bursting of an encysted tumour the surrounding parts indurate, and throw out a fungus, forming a disease appearing like cancer, and which could not be cured."—*Abernethy on Tumours.*

Our cursory view of general diseases being now run through, it remains to enter into particular details. The arrangement we have adopted is a mere arbitrary division of the body into regions. But this is practically the best arrangement that can be adopted, because we have before us at once all the possible diseases of any one part, so that their discrepancies or similarities are at once apparent. This method applies very well to medicine, and, indeed, has long ago formed the basis of some very fair systems of nosology. But with this we have not here to do. We shall confine ourselves to surgical diseases, and consider them in this order—The surgical diseases of the abdomen, of the pelvis and urinary organs, of the chest, of the throat and face, of the head, of the back, of the upper extremity, and of the lower extremity: we shall not, however, confine ourselves very strictly to the anatomical division of these parts.

OF THE ABDOMEN.

Wounds of the abdomen differ as they are confined to the muscles, fascia, and integuments, or as they involve the peritoneum. The former are only troublesome because they weaken the parietes of the abdomen, which are thus rendered liable to hernia; an accident incidental also to severe contusions. The abscesses that form from these superficial wounds require free openings, because they are apt to burrow between the fascia and peritoneum, but otherwise are not particularly dangerous. Wounds that pass through the peritoneum, are, however, very different. Active inflammation is set up, and the whole of the serous membrane may be shortly involved in disorganization. But if a wound be merely a puncture, it is often difficult to say whether the peritoneum has been punctured or not; generally, such a wound produces great sickness, syncope, and fear, but these often attend fixed wounds. As, however, a puncture can scarcely be supposed to wound the peritoneum without also wounding some of the viscera, in these cases we shall have particular symptoms; as, for instance, bloody urine, when the kidneys and urinary bladder are injured; vomiting of blood, when the stomach is pierced; discharge of blood with the fæces, when the large intestines are wounded. Symptoms, like these, must of course throw considerable light on the nature of the accident.

With regard to our not being always able to pronounce whether a wound penetrates the cavity of the belly or not, the want of precise information on this point is of little practical importance; for, if the case be not complicated with any urgent symptoms, the treatment should obviously resemble that of a simple wound, and if inflammation of the peritoneum evinced itself, it would then be met by depleting measures.

"When, in the case of a penetrating wound of the abdomen, a portion of intestine, or omentum protrudes, the sooner it is returned, the more effectually will the irritation, arising from the exposure and constriction of the part, be prevented. The mesentery is always to be returned before the intestine; and the intestine before the omentum; but the last protruded portion of each of these parts ought to be the first reduced.

"The two index fingers are the most convenient for reducing the parts; and it is a rule to keep the portion first returned from protruding again by one finger, until it has been followed by another portion, introduced by the other finger. The second piece is to be supported in the same way, by the finger used to return it, and so on, till all the displaced parts have been put into their natural situation."

"As soon as the reduction seems complete, the surgeon is to assure himself of it, by introducing his finger into the cavity of the abdomen, in order to feel that the parts are all freely reduced. When it is absolutely necessary to enlarge the wound, in order to get back the bowels, the dilatation should be made in a direction parallel to the muscular fibres.

"The reduction of the viscera having been effected, the patient is to be laid upon his back, with the thighs bent upon the pelvis, and he must strictly avoid making any exertion, lest he bring on another protrusion. The wound is then to be closed with adhesive plaster, and the uniting bandage; but if the division be extensive, and these means ineffectual, it may be proper to have recourse to a suture."

If the bowel should be found injured as well as protruded, other measures are to be used. If the wound of the viscera be very small, a suture, or a ligature may be applied to it. If it is large, and transverse, or involves much of the circumference of the bowel, it is best to retain it, dress the wound lightly, use very active antiphlogistic measures, and leave the case to nature. The wound will, for some time probably, serve as an artificial anus; adhesions will take place between the bowel and peritoneum, which adhesions gradually becoming a canal, the natural passage is re-established. It has been proposed, however, to sew the divided portions together. See Mr. Travers' Inquiry into the Process of Nature, in repairing Injuries of the Intestines.

Extravasations of various balls from guns, are of occasional occurrence in the cavity of the abdomen, but they cannot be removed with any certainty, or without doing much injury, and are therefore better suffered to remain.

Of Hernia, or Rupture.—By this term is meant a tumour, which occurs from some of the viscera passing out through fissures or openings in the abdominal muscles, and pressing out the elastic skin and cellular tissue, and forming a swelling. It is well known that in these muscles, there are some particular parts very incompletely closed; it is there that hernia usually makes its appearance. Hernia has been applied, however, to any protrusion, as of the brain, &c.: here we speak of hernia covered by peritoneum.

Our anatomists and earlier surgeons having been men who, for the most part, despised the harmonious and expressive language called English, set themselves to designate the varieties of hernia by the following harsh compounds of Greek and Latin. When the intestine only was contained in the hernia, they called the case an *enterocele*; when the omentum only, an *epiplocele*; when both, an *entero-epiplocele*; when the stomach came down, it was *gastrocele*; the liver *hepatocelc*; the protrusion of the bladder was *cystocelc*. Then a hernia in the groin was *bubonocelc*, and when this descended into the scrotum, *oschocelc*. A hernia that came through at the navel, was called *exomphalos*.

The nature of hernia being stated, it follows that any violent or irregular action of the abdominal muscles, such as raising weights, or the like, must tend to produce it. And that heat, illness, or any cause tending to relax extraordinarily the muscular fibres, must favour its production. At the same time, it must be confessed that it is not always traceable to these causes, and that it often appears without any obvious reason. The general rule is, however, established.

We shall now proceed to speak of various kinds of hernia. The Inguinal Hernia is known—"1. By a tumour arising from a protrusion of some part of the bowel through that canal or opening which is commonly called the abdominal ring, and which in the male subject gives passage to the spermatic cord; and in the female, to the round ligament of the uterus. The swelling is not preceded by any symptoms of inflammation; and though, according to the opinion of the most accurate

accurate observers, its commencement is generally slow and gradual, it afterwards frequently undergoes a sudden enlargement, and is for the first time particularly noticed by the patient himself, after he has been making some violent effort.

"2. By the diminution, or even total disappearance of the swelling, when the patient lies upon his back; by its recurrence, when he stands up again; and by the impulse which is felt in the swelling, whenever the patient coughs."

The inguinal hernia passes out of the internal abdominal ring, or, in other words, beneath the united tendon of the internal oblique and transversalis muscles. It afterwards lies in the inguinal canal, and ultimately passes out at the external abdominal ring. It will be recollected that the external ring is considerably nearer the pubis than the internal ring; but in a hernia of any duration the rings become so far dilated, that they are nearly opposite to one another. When a hernia is strangulated, it is in a few instances constricted at the external abdominal ring. These are generally old cases. The commonest situation is at the internal ring which is found about an inch deeper than the outer ring. But when the hernia is very small, and the parts consequently not much displaced, the stricture is found as deeply situated as two inches. Occasionally a membranous band forms across the neck of the sac, which produces the stricture, and this is generally very remote. The coverings of inguinal hernia are the peritonæum which forms the sac, the cremaster muscle which is expanded and thickened, the fascia superficialis and the common integuments. The epigastric artery is behind and to the inner side of the hernia.

There is a sort of hernia which Sir A. Cooper calls direct, and Hesselbach internal. Instead of coming through the internal abdominal ring, it passes, as Scarpa very clearly explains, through a fissure in the muscle which is nearer the pubis than that ring. Consequently it passes nearly straight outwards to the external ring, and of course leaves the epigastric artery on its outer side. Now Sir A. Cooper states that this direct sort of hernia has one more covering than the oblique hernia, namely, a fascia protruded before it that is derived from the fascia transversalis, and transversalis muscle.

Hernia of the Tunica Vaginalis.—"This case differs from all other ruptures in the circumstance of the protruded bowels being in immediate contact with the testicle, the tunica vaginalis serving as the hernial sac. Or, (to use the words of Richter), the displaced bowel and the testicle, simply covered by its albuginea, lie together in one and the same sac."

The origin of this species of hernia is as follows: until the approach of birth, the testes of the fetus are lodged within the cavity of the abdomen, and situated immediately below the kidneys, on the fore-part of the psoas muscles, by the side of the rectum, which bowel is larger in proportion to the capacity of the pelvis than in the full-grown subject, and lies before the lumbar vertebrae as well as the os sacrum. The anterior and lateral surfaces of the testis are covered by reflected peritonæum, while posteriorly it adheres to the psoas muscle by means of cellular substance. A little while before birth, generally in the eighth month, but sometimes subsequently to this event, the testes descend through the abdominal ring, and then pass through a kind of membranous canal, which the peritonæum forms from that aperture into the scrotum. Thus, as they were already furnished with one peritoneal investment up in the loins, a second is acquired by their entering this canal, or rather elongation of the peritonæum. The first covering, which is smooth, and every where closely adherent to the surface of the testis, constitutes the tunica albuginea; while the other, which is denser, and in front loose and unconnected, becomes the tunica vaginalis. Now it is into this production of peritonæum (originally formed, and placed ready for the reception of the testes on their descent from the loins), that the bowels are sometimes accidentally propelled, before the passage leading into it from the belly is duly closed. The congenital inguinal hernia, therefore, differs from the generality

of ruptures in having no hernial sac, formed and produced by the peritonæum being thrust forth from the belly by the displaced bowels themselves. There is, however, one uncommon species of hernia which, in the tunica vaginalis, is included also in a common hernial sac, so that the protruded bowels neither lie in contact with the preceding membrane, nor with the albuginea. It seems to be formed, after the communication of the cavity of the peritonæum with that of the tunica vaginalis has been obliterated, but previously to the closure of the passage lower down.

"The most important symptom, by which a congenital inguinal hernia may be distinguished from a common scrotal rupture, is the situation of the testis, which, in the latter disease, can always be plainly felt towards the lower and back part of the tumor. But, in a congenital hernia, if the protrusion be at all considerable, the testis cannot be felt while the bowels are down. In a congenital hernia, the viscera usually pass from the groin down into the scrotum in a very short space of time, and, as it were, precipitately; but, in a common inguinal hernia, the protrusion is generally slower and more gradual. However, we may consider the quickness with which the bowels have descended from the groin into the scrotum, as a characteristic mark of a congenital hernia.

The femoral or crural hernia is that to which women are most liable. It seldom occurs in male subjects, who, on the other hand, are very subject to bubonocoeles, from which females are almost entirely exempt. It consists of a protrusion of some of the abdominal viscera under the pubic extremity of Poupart's ligament. It rarely acquires a large size, and is generally of a globular shape, while an inguinal hernia is more or less oblong. Anatomical examinations prove, that the aperture through which the parts escape is exceedingly small, and hence, we must not be surprised at the remarkable rapidity with which the symptoms usually advance.

In this hernia we find that the viscera are protruded through the crural ring, which lies under the crural arch, between its thin edge and the external iliac veins. A protrusion of the viscera, under any other part of the tendon, is prevented by the attachment of the iliac fascia. The hernia, having passed through the crural ring, rises above its edge, and therefore, as Mr. Hey has observed, if a surgeon attempts to reduce it when strangulated, by pushing it upwards, he effectually frustrates his intention. The viscera descend from the abdomen at first nearly in a perpendicular direction, and come into the hollow in front of the pectineus. They then come forwards to the surface, so as to lie in general in front of the crural arch. The neck of the sac, or that portion of it lying under Poupart's ligament, is generally about half an inch in length, and it is obvious that the strangulation must have a very deep situation, since it occurs exactly where the neck of the sac communicates with the abdomen. The tumour is situated in front of the pectineus, and of the fascia lata. There is one variety of femoral hernia, and in which the parts descend into the sheath of the crural vessels. In this case the tumour is situated under the fascia lata, is more obscure to the feel, and has not a defined edge.

The femoral hernia is usually of a rounder form, and less bulk when strangulated, than the scrotal hernia. Mr. Hey has repeatedly seen it resembling an enlarged inguinal gland. It is apt also to extend in a horizontal rather than a vertical direction.

The femoral hernia is liable to be mistaken for a bubonocoele. The cases may always be discriminated by recollecting, that if the swelling of a crural hernia be drawn downwards, the crural arch may be traced passing over the neck of the sac, while in bubonocoele it extends under that part. The spine of the os pubis, which is behind and below the neck of the sac in an inguinal hernia, is on the same horizontal level, and rather within it in the crural rupture. A varix of the femoral vein may be distinguished from a crural hernia by the disappearance of the swelling on the patient's lying down, and its recurrence again as soon as the

vein is pressed upon above Poupart's ligament. A psoas abscess may be known by the fluctuation of the matter, the preceding pain in the loins and shivering, and the absence of intestinal complaints.

The term umbilical hernia has been applied, not only to protrusions of the bowels through the opening of the navel, but to all other tumours of a similar nature, which present themselves any where in the vicinity of that aperture; the majority of them take place in the linea alba, either above or below the precise situation of the umbilicus.

The congenital exomphalos sometimes affects the fœtus in utero, and of course exists at the time of birth; the viscera protruding out of the umbilical ring itself, and passing into the cellular substance, which connects the vessels of the cord together. It may commence in any of the stages of gestation; for it is observed in the embryo, and in the fœtus which has not yet acquired its full size, as well as in that which is completely grown.

According to all appearances, the principal cause of the congenital exomphalos is a slow and imperfect development of the abdominal muscles. As the umbilical ring in the fœtus is the weakest point of all the parietes of the abdomen, the viscera must be very liable to protrude at this opening, and gradually make their way into the cellular substance, which connects the vessels of the cord together.

Children born with umbilical herniæ generally live but a short time, because they are simultaneously afflicted with other malformations.

The true umbilical hernia, which is formed subsequently to birth, presents itself in children after the separation of the funis, and is generally attended with the following particularities:—The swelling is either of a round, cylindrical, or conical shape, with a circular base. No vestige of the cicatrix of the navel can be discerned upon it, except that near the apex, or upon one side of the tumour, a small portion of the skin seems paler and thinner than the rest. Underneath the common integuments another covering is found, consisting of a cellular substance, and of that delicate fascia which is spread over the surface of the abdominal muscles. When this second investment is opened, the true hernial sac is seen, which is thin, semitransparent, and in every respect similar to the rest of the peritoneum, as in other herniæ. It usually contains a noose of intestine, and never, or but very rarely, omentum; a circumstance which Scarpa accounts for by the natural shortness of this membrane in young children.

The occurrence of exomphalos in children always implies an imperfect closure of the umbilical ring. The quickness with which the navel is closed after birth, and especially the retraction of the cicatrix by the umbilical ligaments, as the growth of the body proceeds, greatly promote the efficacy of bandages, and, in young children, facilitate the radical cure of this species of hernia. A disposition to such protrusions is very common during the first three or four months after birth, but moderate compression suffices for the removal of the swelling, and for keeping the parts reduced.

The exomphalos of the adult subject is a hernia in the linea alba. Scarpa lays down, with great accuracy, the distinguishing characters both of the true umbilical hernia, and of other cases which occur in the linea alba near the navel. The first disease, says he, whether met with in the infant or the adult, has a circular neck, or pedicle, at the circumference of which the tendinous margin of the umbilical ring can be felt with the end of the finger. Whatever may be the size of the tumour, its body always retains nearly a spherical shape; nor can any wrinkle of the skin, nor any thing at all resembling the cicatrix of the navel, be observed either upon the convexity or upon the sides of the swelling; the skin being merely a little paler and thinner at some points than others: on the contrary, in a hernia of the linea alba, the neck of the swelling is of an oval shape, like the fissure through which the protrusion has taken place. The tumour itself is also constantly of an oval form. When the finger is pressed deeply round its neck, the edges of the aperture in the linea alba are perceptible; and if the hernia be very near the navel, the umbilical cicatrix may be seen on one of the

sides of the swelling, a sure indication that the viscera, do not protrude through the umbilicus itself.

Herniæ of the linea alba, when left to themselves, are much slower in their progress than true cases of exomphalos. On account of their small size they are frequently unobserved, especially in corpulent subjects, or when situated at the side of the ensiform cartilage. However, they bring on complaints of the stomach; habitual colics, particularly after meals; and the patient may be troubled for a long while with such disorders before their true cause is detected. On the other hand, a true umbilical hernia may be known from the earliest period of its formation, both by the changes which it produces in the cicatrix of the navel, and by the rapidity of its increase.

These two species of hernia require similar modes of treatment; but the cases which happen in the linea alba are more difficult of cure than the exomphalos.

The treatment of reducible hernia is sufficiently simple: it consists merely in returning the bowel into the belly, and placing a truss on so adjusted that its pad presses fairly on the opening. The same sort of truss serves for crural and inguinal hernia, and except in particular cases, the common one answers perfectly well. Trusses for umbilical hernia have merely a large concave pad to lie over the umbilicus, secured by a broad belt that passes round the waist.

With respect to irreducible hernia, if the incapacity for reduction be of recent standing and no untoward symptoms are present, we may frequently get it back, by desiring the patient to take some brisk purges, live low, and use the recumbent posture for a few days. But ordinarily there are adhesions formed before the surgeon is applied to, and all that can be done is to support the hernia and prevent its further protrusion, by using a suspensory bandage.

Hernia is a complaint only formidable to life when it becomes strangulated: that is to say, when the viscus protruded through the abdominal opening swells and cannot be returned, so that inflammation spreads into the contents of the abdomen, while at the same time the passage of the fœces is stopped, and the strictured bowel becomes inflamed to a degree that threatens speedy gangrene. The symptoms of strangulated hernia are thus described by Sir A. Cooper.—"The patient first complains of pain about the region of the diaphragm. He will describe the sensation to be as if he felt a cord bound tightly round the upper part of the stomach. The next symptom is constant eructation, owing to the great quantity of air rising from the intestines to the stomach. The patient is next troubled with vomiting, accompanied with costiveness. He has a great disposition to have motions, but cannot succeed in his attempts to expel the fœces. There is some pain in the swelling, and a good deal at the part where the stricture is situated. These symptoms attend the first dawn of strangulation. The abdomen afterwards becomes considerably distended with air, not at first from inflammation, but in consequence of the accumulation of flatus in the intestines. This is evident, because the patient does not at first complain of pain on pressure of the abdomen. The vomiting becomes more frequent, and feculent matter is rejected from the stomach. A clyster will sometimes bring away a portion of feculent matter; but the quantity will be extremely small. During the time that the abdomen is in this tense state, but unaccompanied with pain, and while there is frequent vomiting of the fœces, the pulse is hard, frequent, but very distinct; but in the next stage of symptoms, when the abdomen is not only tense but painful to the touch, you will find the pulse extremely small and frequent; so small that it can scarcely be felt; so frequent that it can hardly be counted. The vomiting and eructations continue, and the patient is pale, and covered with a cold perspiration. The tumour becomes very tense, hard, and in general a little inflamed on the surface of the skin. The next change in the symptoms of strangulated hernia is, that in addition to the vomiting, which is not less frequent, hiccough supervenes. Hiccough was formerly considered to be a sign of the presence of gangrene, but it is now known not to be so. Patients have had hiccough for many

many hours, and have recovered after the operation for strangulated hernia. After the appearance of hiccough, you may prevent gangrene by bleeding, and using other means for reducing the patient. The hiccough will sometimes remain for several days after the operation, and in this case bleeding will relieve the patient more than any thing else. When gangrene has actually taken place, the patient will tell you that he has got rid of all his pain, and that he feels a great deal better; but if you put your hand on his abdomen, you will find it still tense and tender; his pulse will be intermitting, small, and irregular, and the swelling will feel tense and somewhat emphysematous. In this state it sometimes happens that the hernia, by a little pressure, may be returned into the abdomen, in consequence of the great relaxation of the surrounding parts from the effects of gangrene. Death, however, is close at hand."

Clearly as these symptoms are detailed, and accurately as they correspond with what is in the majority of cases observed, the student must not expect to find them invariable. There are some cases, especially in very old persons, in whom the marked tenderness of the abdomen as well as its tenseness and inflation are not very obvious. A frequent hard pulse, nausea, anxiety and constipation, are, in a few rare instances, the only symptoms, and the cases are more numerous in which the symptoms, though severer, are yet by no means equal to those so well noted by Sir Astley as usual in this complaint. Exomphalos especially, the most dangerous to life, has the mildest symptoms.

When a man applies to a surgeon with strangulated hernia, the course pursued should be as follows:—In the first place, he should endeavour, by means of the hand, very gently and carefully, to return the intestine. If this does not succeed, he should neither practice nor allow any more handling, but immediately use constitutional remedies. His attention ought to be directed to making the patient faint as fast as possible. For this purpose a very large bleeding should be made, and the patient immediately placed in a warm bath. The endeavour to return the bowel may now be made. If faintness be perfectly induced, and yet this attempt does not succeed, it is of no use to do any thing more, and the sooner the operation is performed the better. But if faintness has not been induced, other means are sometimes had recourse to, such as the tobacco enema. There is a difference of opinion among surgeons as to the use of this remedy, but there seems no reasonable objection to its use, except one which applies to every thing else, *viz.*, that too much time may be lost in its application.

The measures above mentioned being found unsuccessful, an operation for the relief of the intestine is at once to be decided on. With respect to the time that may be suffered to elapse, between the occurrence of the strangulation and the performance of the operation, this is various. It is generally allowed, that most patients die because the operation is performed too late. With respect to young patients, those who have small or recent hernia, there is no occasion to wait an instant. Inflammation, is in these cases, going on rapidly; the constitutional means have been tried, (and these, if not successful when suddenly put in force, cannot be successful when more tardily used); the disease has never the slightest tendency to a spontaneous cure: then, why delay the operation and keep the patient in suspense at all? In old patients, in those who have large and ancient hernia, we may wait for some time without danger; but even here we can expect no advantage from waiting, that is, if we are perfectly convinced strangulation exists. But old persons, with large hernia, are subject to an obstruction in the intestines, which the French call *engouement*, and which arises from a quantity of foetid matter distending preternaturally the intestine, so that it cannot return into the belly. These cases are generally to be cured by the application of pounded ice to the swelling, and the exhibition of brisk purgatives and emetics.

The operation for hernia varies, of course, with the nature of the complaint: we shall first describe the operation for common inguinal hernia. The external incision should

begin an inch above the outer angle of the ring, and extend over the middle of the tumour to its lower part. Either by this first incision, or in the subsequent dissection down to the sac, the external pudic branch of the femoral artery may be divided, and ought to be tied when the hemorrhage from it is profuse. After thus dividing the skin, the cellular substance lying upon the outside of the hernial sac is to be raised with a pair of dissecting forceps and cautiously cut, layer by layer. In order to lessen the risk of cutting suddenly through the sac and wounding the bowels, the surgeon should not only elevate the layers of cellular substance with the forceps, but take care to divide them with the edge of the knife inclined rather horizontally. The opening into the sac can be accomplished with most security at the lower part of the tumour, because fluid is sometimes contained in the sac, and, in that case, always gravitates to the bottom of the swelling. An opening having been made, it is to be enlarged in both directions with the probe-pointed bistoury, guided by the finger or director until the whole cavity is laid open. The presence of fluid is not a constant circumstance, and, therefore, cannot be depended upon as a criterion, which will always serve for shewing when the first aperture is made in the hernial sac. The circular arrangement of the arteries of the intestine, and its very smooth surface distinguish it from the hernial sac, which is rather rough and cellular on its surface, and is in general closely connected with the surrounding parts. Since the spermatic vessels are apt sometimes to deviate from their ordinary situation, in respect to the hernia, and lie more or less in front of the sac, every operator ought to endeavour to ascertain such variations, if possible, before hand, in order that he may avoid parts which should never be injured. When the hernial sac has been in this manner opened, and its contents fairly brought into view, the next object is to liberate them from the state of stricture in which they are. "The finger should be carried as far into the neck of the sac as it can be without violence, and between the protruded parts and the upper margin of the stricture. The bistoury, with its back resting on the finger, is pushed forwards towards the abdomen, followed and supported by the finger which protects the viscera. The length of the incision should not exceed what is sufficient to allow the viscera to be replaced with ease." *Lawrence*.—The direction of this should be, in every case, *i. e.* whether the hernia be direct or oblique, *directly upwards*.

The last thing which the surgeon has to achieve in the operation, is to reduce the viscera into the cavity of the abdomen, a circumstance, which may be directly done, when the protruded parts are sound and free from adhesions. When the bowel is mortified, which is known by its being tessellated with green spots, it is useless to return it; it must be cut off, and an artificial anus formed, as in cases of mortification of the intestines from ordinary wounds. Adhesions, when recent and slight, may be divided with the finger, when old by a cautious use of the knife. The omentum, when redundant or mortified, may be removed, and any bleeding arteries in its substance secured by ligatures.

In the operation for femoral hernia, "the first incision exposes the superficial fascia, which is given off by the external oblique muscle, and which covers the anterior part of the hernial sac; but if the patient is thin, and the hernia has not been long formed, this fascia escapes observation, as it is then slight and delicate, and adheres closely to the inner side of the skin. When this fascia is divided, the tumour is so far exposed, that the circumscribed form of the hernia may be distinctly seen. It is still, however, enveloped by a membrane, which is the fascia, that the hernial sac pushes before it, as it passes through the inner side of the crural sheath. This membrane, the fascia propria, is to be next divided longitudinally from the neck to the fundus of the sac; and if the subject is fat, an adipose membrane lies between it and the sac, from which it may be distinguished by seeing the cellular membrane passing from its inner side to the surface of the sac.

“The hernial sac, being exposed, is to be next opened; and, to divide it with safety, it is best to pinch up a small part of it between the finger and the thumb; to move the thumb upon the finger, by which the intestine is distinctly felt, and may be separated from the inner side of the sac; and then to cut into the sac, by placing the blade of the knife horizontally. Into this opening a director should be passed, and the sac opened from its fundus to the crural sheath.” See *A. Cooper on Crural and Umbilical Hernia*. The incision of Gimbernat's ligament should now be made, and the operation completed.

The treatment of a congenital inguinal hernia is to be conducted on the same general principles as apply to other ruptures. After the viscera are reduced, the communication between the abdomen and scrotum may, by the regular and uninterrupted use of a well-made truss, be obliterated. If the patient be young, this cure may be completed in the course of a few weeks. But if a piece of intestine, or omentum, gets low down in the sac, while the testis is in the abdomen, the application of a truss would be highly improper; except, however, when a hernia takes place in a patient whose testis has not descended, and whose age makes it doubtful whether it ever will descend.

In the operation, the surgeon should remember, that the testis will often be found between the intestine and omentum; that, after their reduction, it will be left quite bare in the exposed cavity of the sac; and that, as it is a part very sensible and prone to inflammation, it should never be unnecessarily handled and disturbed.

The sac of a congenital rupture is frequently very thin; sometimes firmly adherent to the skin, at others to the testis, often subject to that kind of strangulation which is caused by the neck of the hernial sac, and liable to various contractions in the course of the sac which require dilatation.

Besides the preceding ruptures, there are several others of various kinds; which, though unfrequent, are deserving of notice. These are,—

1. Ventral herniæ.—The term *ventral* is extended to all such ruptures as happen at any other parts of the abdomen besides the abdominal ring, under the crural arch, and at the navel.

In certain instances, these eventrations are the consequence of repeated pregnancies. In this way, the fore-part of the abdomen has been observed to be so completely weakened (the effect of reiterated distention), as to form a bag, which descended over the thighs, and contained not only the omentum and mass of intestines, but even the gravid uterus itself. See what we have said under *exomphalos*.

Eventrations can hardly become strangulated, though bad and fatal symptoms may be occasioned by an accumulation of intestinal matter, and by obstruction in some part of the protruded viscera.

2. Hernia of the bladder, or cystocele.—A hernia of this kind differs materially from ordinary cases, since there is no hernial sac, and the disease rather consists of an elongation, than a displacement of the bladder. The impossibility of a complete displacement must, indeed, be immediately obvious, on reflecting how firmly this organ is fixed to the perineum and os pubis.

When, in a person subject to retentions of urine, the bladder is much dilated, rising above the pubes, it acquires a situation behind the abdominal ring, without any interposition of the peritoneum. In this state, the least effort may bring on an elongation of the distended bladder through that opening. Thus, a kind of appendage to this organ is formed, which may reach more or less downwards. In most instances it descends no lower than the groin; occasionally it passes into the scrotum. When a considerable portion of the urinary bladder is protruded, its fundus and posterior surface are dragged towards the ring, and even pass through this aperture, together with the peritoneum, which covers them.

The portion of this membrane, which is thus drawn out by the protruded part of the bladder, and follows it, composes a pouch, into which the omentum and bowels escape, so that

a cystocele is very commonly complicated with an ordinary inguinal hernia.

A hernia of the bladder is characterized by a soft, oblong, fluctuating tumour, situated in the bend of the groin; it makes its first appearance near the abdominal ring, and gradually increases in size by descending more and more towards the scrotum. The swelling is made to disappear by compression; it becomes larger when the patient holds his water; but diminishes and entirely subsides when he makes such evacuation. The last circumstance unequivocally distinguishes the disease from the encysted hydrocele of the spermatic cord, while the feel of fluctuation exhibits its difference from an enterocele. It is also to be remembered that cystocele seldom afflicts persons unless they have been often troubled with retentions of urine. The patient in general makes water more frequently than natural.

Besides this sort of hernia of the bladder, there are cases on record, where portions of this viscus have been protruded under the crural arch, and in the perineum and vagina.

Were a surgeon called to a cystocele in a very recent state, he should endeavour to reduce the protruded part, and keep it up with a truss. In almost all cases, however, the case is irreducible, in consequence of the prolapsed part being firmly adherent in its unnatural position.

3. Perineal hernia.—The records of surgery furnish us with examples of herniæ, which have occurred at the lower aperture of the pelvis. In men, the viscera are protruded between the bladder and rectum; in women, between the rectum and vagina. As the part, where the peritoneum is reflected from the rectum to the vagina, or bladder, is at a considerable distance from the peritoneum, it is not difficult to comprehend, that a protrusion may exist, without forming any external swelling. When this is the case, the hernia can only be distinguished in men by examining within the rectum; in women, the disease may be detected both in this way, and by feeling within the vagina.

4. Hernia of the vagina.—The situation in which the protrusion begins is the same as in the perineal rupture; but in the latter case, the vagina resists, and does not give way. In the rupture now under consideration, the swelling projects into the vagina, and is covered by the membrane of that canal. Women who have borne children, are more subject to this disease than other females. The tumour is mostly formed by the small intestines. When the protrusion is occasioned by the bladder, the swelling is situated on the anterior and upper surface of the vagina. This species of hernia is generally brought on by a violent exertion. Its contents may be readily pushed up by the hand, but they descend again if the patient coughs or strains. All active and laborious pursuits are productive of a painful sense of bearing down. The disease is frequently accompanied with disorders of the alimentary canal. Very often the bladder is affected, in consequence of the vicinity of the tumour. When this receptacle itself forms the protrusion, pressure on the swelling will cause a discharge of urine from the meatus urinarius.

In this disease, the first indication is to reduce the parts by the pressure of the hand, care being taken to effect a complete reduction, and not allow any portion of the protruded viscera to continue in the long track, through which they may have descended. Therefore they must be pressed up as far as the os uteri. They are to be prevented from descending again by the use of a pessary, which must be shaped either like a globe, or hollow cylinder.

The vaginal hernia might be attended with much danger and inconvenience, were it to be down at the time of parturition. Hence, during the labour pains, it behoves the practitioner to maintain the viscera reduced by pressure, until the child's head has passed down into the pelvis. Should the head have descended, while the rupture is down, delivery should be expedited as much as possible.

There is an operation which surgeons are occasionally called on to perform, called *Paracentesis Abdominis*. This operation consists in plunging a trocar into the cavity of the peritoneum,

peritoneum, for the purpose of discharging the fluid collected there in dropsical cases. Modern practitioners usually prefer making the puncture in the linea alba.

When the operation is to be performed in the linea alba, the instrument should be introduced about two or three inches below the navel.

As soon as the trocar meets with no further resistance, it is not to be pushed more deeply without any object, and with a possibility of injuring the viscera. The stilet is now to be withdrawn, and the fluid allowed to escape through the cannula. Since, in consequence of the sudden removal of the pressure of the fluid from the viscera and diaphragm, patients are very apt to swoon. The abdomen is to be compressed with a bandage or belt.

An operation for aneurism of the aorta, was performed some years ago by Sir A. Cooper; but the patient died, and the apparent hopelessness of this sort of case is such, that no surgeon has followed his example. The following account of the operation is extracted from that gentleman's *Surgical Essays*:—

“The patient's shoulders were slightly elevated by pillows, in order to relax as much as possible, the abdominal muscles; for I expected that a protrusion of the intestines would produce embarrassment in the operation, and was greatly gratified to find that this was prevented by their empty state, in consequence of the involuntary evacuation of the fæces; and here let me remark that I should, in a similar operation, consider it absolutely necessary, previously to empty the bowels by active aperient medicines.

“I then made an incision three inches long into the linea alba, giving it a slight curve to avoid the umbilicus: one inch and a half was above, and the remainder below the navel, and the inclination of the incision was to the left side of the umbilicus in this form (5). Having divided the linea alba, I made a small aperture into the peritoneum, and introduced my finger into the abdomen; and then with a probe-pointed bistoury, enlarged the opening into the peritoneum to nearly the same extent as that of the external wound. Neither the omentum nor intestines protruded; and during the progress of the operation, only one small convolution projected beyond the wound.

“Having made a sufficient opening to admit my finger into the abdomen, I then passed it between the intestines to the spine, and felt the aorta greatly enlarged, and beating with excessive force. By means of my finger nail, I scratched through the peritoneum on the left side of the aorta, and then gently moving my finger from side to side, gradually passed it between the aorta and spine, and again penetrated the peritoneum on the right side of the aorta.

“I had now my finger under the artery, and by its side, I conveyed the blunt aneurismal needle armed with a single ligature behind it; and my apprentice, Mr. Key, drew the ligature from the eye of the needle to the external wound; after which the needle was immediately withdrawn.

“The next circumstance, which required considerable care, was the exclusion of the intestine from the ligature, the ends of which were brought together at the wound, and the finger was carried down between them, so as to remove every portion of the intestine from between the threads: the ligature was then tied, and its ends were left hanging from the wound. The omentum was drawn behind the opening as far as the ligature would admit, so as to facilitate adhesion; and the edges of the wound were brought together by means of a quilled suture and adhesive plaister.”

OF THE PELVIS.

The surgical diseases of the pelvis, besides inflammations (which are of course common to the contents of this cavity as well as all other parts,) are such as affect the urethra, bladder and prostate gland, diseases of the rectum, and in females diseases of the vagina and uterus. Of the last, we have spoken fully under *PARTURITION*; of the second, under *PATHOLOGY*. We have therefore only to give some account of the first. We shall speak of diseases of the mucous

membranes in the first instance, and of the external parts and general structures afterwards.

The ureters, the bladder, and the urethra, are all liable to be affected with catarrhal affections from general causes, the same as other mucous membranes.

The catarrh of the bladder is more frequent among men than among women; and old people are more subject to it, than those at any other period of life.

This disease is marked by pains of the bladder, and at the point of the urethra, both before, and whilst making water. The injection of the urethra is more or less difficult, according to the action of the bladder, and of the freedom of the passage of the urethra. The hypogastric region is tense, and the urine presents a variety of colours; it is sometimes whitish, or reddish, or of a deep yellow colour; it is muddy, and it exhales an odour of ammonia, which becomes more sensible a short time after it has cooled. It also forms, in most common cases, a mucus, which mixes and comes away with the urine in the form of glairy filaments, and which is afterwards deposited at the bottom of the vessel, in the form of the tenacious glairy substance, resembling somewhat the white of an egg.

The chronic inflammation of the mucous membrane of the bladder, may be accompanied with an ulceration of the kidneys or bladder; the mucus discharged then becomes of a greenish yellow colour, sometimes mixed with streaks of blood. It is deposited slowly, is mixed easily among the urine, and in water; it has little viscosity, or fœtor, and does not coagulate by ebullition. The other symptoms which accompany this excretion, as fever, pain, wasting of the flesh, sufficiently distinguish this double affection of the bladder. The chronic catarrh is subject to return with intolerant pain in the region of the pubis and perinæum, accompanied with restlessness and anxiety. These intermissions are irregular, and may remain some weeks.

The matter which exists in the mucous membrane of the bladder, and that of other membranes of the same name, is sufficient to point out the means which are to be employed in its treatment. The warm bath, and mucilaginous drinks, are particularly indicated at the beginning of the acute catarrh; but the tendency which it has to become chronic ought to make us cautious in not prosecuting debilitating remedies too far. Opium should be employed with great circumspection, notwithstanding the intensity of the pain; and as this is often the result of the distension of the bladder, from the accumulation of urine, it is sometimes necessary to have recourse to the introduction of the catheter.

This mucous membrane is liable to a very acute form of catarrh, induced by specific causes, and called gonorrhœa. The first symptom of this complaint is usually an itching at the orifice of the urethra, sometimes extending over the whole glans penis. A little fulness of the lips of the urethra is next observable. Very soon after the discharge has appeared, the itching changes into pain, especially at the time of voiding the urine. The penis, and particularly the glans are affected with swelling. The latter part has a transparent appearance around the mouth of the urethra, the skin seeming distended, smooth, and red, like a ripe cherry. Sometimes the glans, as well as the beginning of the urethra, are more or less excoriated. This canal becomes narrower, as is proved by the stream of urine being smaller than common. Small swellings are often observable along the lower surface of the penis, in the course of the urethra: these were suspected by Mr. Hunter to be the enlarged glans. In some instances, also, Cowper's glans in the perineum inflame and suppurate.

The natural discharge from the urethra is first changed from a transparent viscid secretion, to a watery, whitish pellucid fluid; and this, becoming gradually thicker, assumes the appearance of pus. The matter often changes its colour and consistence; sometimes it is almost white; sometimes, quite yellow; and, in other instances, greenish.

In ordinary cases, the affection of the urethra does not extend very far along this canal from its orifice.

Besides

Besides the symptoms already mentioned, a very acute, scalding pain is experienced in making water, which frequently can only be discharged by drops, or in an extremely small broken stream. The patient is also incessantly troubled with a sensation as if he wanted to make water, and is obliged to be repeatedly emptying the bladder of what little collects in it.

In the neighbouring parts, a variety of other affections are occasionally produced: pain, soreness, and uneasiness, may be experienced all over the pelvis; and the scrotum, testicles, perineum, anus, and hips, may become disagreeably sensible. The testicles often require to be suspended in a bag-truss, and are so irritable, that the least exertion makes them swell. The inguinal glands may inflame and enlarge also, producing the kind of swelling termed a *sympathetic bubo*. In many instances the bladder is unusually irritable, and cannot bear the least distension, so that the patient is, almost every five minutes, obliged to make water with violent pain, not only in the bladder itself, but likewise in the glans penis; and such pain frequently continues after the urine is discharged.

The consequences of the inflammation are various. Sometimes the discharge stops, and the testicle swells; sometimes the prepuce inflames and is thickened to an amazing extent. If this happens while it is below the glans, the penis is strangulated; a disease named paraphymosis. When inflammation comes on while the skin is before the glans, and it cannot be retracted, the disease is named a phymosis.

The treatment of gonorrhœa is resolved into two very simple principles—to subdue the inflammation at first, and stimulate the vessels when the disease becomes chronic. The inflammation of the prepuce and the testicles requires very active depletory treatment.

Of the great variety of diseases of these organs, strictures in the urethra are perhaps the most frequent, and most serious. They prevent the free evacuation of the bladder; greatly disturb, if not entirely destroy the function of generation; and often give origin to constitutional symptoms which sometimes increase to an alarming degree, and even prove fatal.

The whole extent of the urinary canal is lined by a delicate membrane, which is constantly covered with a viscid fluid, secreted by numerous glands, whose ducts open on its internal surface by orifices which are called lacunæ.

It is highly vascular, and is endowed with so much nervous sensibility, that irritating bodies applied to it often affect, or even derange the whole system.

It has a considerable degree of contractility, is evidently elastic, and perhaps may possess a muscular power, although no muscular coat has yet been demonstrated; but to whatever cause this contractility be owing, it is well known it does not contract upon irritation.

The contraction which forms a stricture in the urethra may take place round the whole circumference of the canal; it may arise chiefly at a particular point of the circumference; or, it may extend along a considerable extent of its surface, and thus produce obstructions of different forms.

The stricture once begun, continues no longer than the cause which first produced it continues to operate. But if the parts are kept long in this state of contraction they generally are attended with a degree of inflammation; the membrane of the urethra acquires a morbid degree of thickness; the surrounding parts are altered in structure; and this change of form and appearance remains after the cause which originally produced them has ceased to operate.

That spasmodic strictures do exist appears from the impressions made on bougies which have been passed through them, and from the examination of the parts after death; for although complete obstructions to the bougie were found when alive, yet not the smallest remains can be observed on dissection.

When there has been a permanent stricture, the natural structure of the urethra is changed, and the morbid alterations it has undergone may be seen on dissection. There is

commonly a contraction at one particular part of the canal; and the appearance of it has been compared to that which would have been given had a packthread been tied round it, or in slight cases it is mere narrowing.

The mode of curing strictures by means of constitutional remedies and dilating the passage with a catheter having been fully laid down under *PATHOLOGY*, we are not required to say more here on the subject, but may at once recur to the graver consequences of this disease—to fistulæ in perinæo, and diseased prostate.

When the urethra is very much obstructed, nature often endeavours to procure relief by ulceration on the inside of that part of the urethra which is within the stricture. Hence, the urine insinuates itself into the loose cellular membrane of the scrotum and penis. The extravasation of this fluid becomes the cause of suppuration, wherever it is diffused, and even of mortification, first of all the cellular substance, and then of several portions of the skin. If the patient survives, all these sloughs are detached, leaving a free communication between the urethra and external surface. Every opening thus produced, is termed a *fistula in perinæo*.

Sometimes the urine finds its way into the corpus spongiosum urethræ, becomes diffused through the whole of this texture, and injected into the glans penis, occasioning mortification of the parts in which it is lodged.

When the effused urine forms only a circumscribed tumour, an incision may be made into the swelling, and an elastic gum catheter introduced and worn. When the effusion is extensive, and strictures are the cause, a complete cure cannot be accomplished without removing them. But, in general, this indication cannot be fulfilled in time to prevent all the mischief arising from the extravasation of urine. An attempt indeed should be made to pass a bougie; for, sometimes, the stricture is, more or less, removed by the ulceration. When this is the case, Mr. Hunter advises the almost constant use of bougies, in order to procure a passage onward into the bladder. However, if it were possible, in this state of things, to introduce a bougie through the whole course of the urethra, there can be little doubt, that the most advantageous plan would be that of making the patient keep an elastic gum catheter continually in the passage. This instrument would at once conduct the urine outward, hinder any more from being effused, and act, like a bougie, on the remains of the stricture. In cases of this nature, the larger the catheter is which can be introduced the better, as it will not only act more quickly on the remains of the stricture, but will be more likely to hinder a further extravasation of urine.

In the cases under consideration, we are advised by Mr. Hunter to endeavour to unload the bladder, and prevent the further effusion of urine into the cellular substance, by making an opening into the urethra, somewhere beyond the stricture; but the nearer to it, the better.

Introduce a director, or staff, into the urethra, as far as the stricture. Cut down on the extremity of the instrument, and extend the incision a little farther towards the anus, so as to open the urethra beyond the stricture.

When the stricture is opposite the scrotum, Mr. Hunter recommends making an opening into the urethra in the perineum; but, here, we cannot have the end of the staff to guide us, and we must trust to our anatomical knowledge. The rest of the operation resembles that for the cure of a false passage. A flexible gum catheter should then be introduced, and the wound healed.

Great attention should still be paid to the inflammation, produced by the diffusion of the urine. Free incisions ought to be made, in order to give vent to this fluid as well as the purulent matter. When there are sloughs, of course the surgeon ought to prefer dividing them to cutting the living parts; yet this consideration must not lead him to omit making the requisite openings in the most depending situations.

When the total obstruction of the urethra and the extravasation are ascertained to depend upon the lodgment of calculi

calculi at the stricture, the plain indication is of course to make an incision down to the extraneous substances, and extract them.

In old cases of fistulæ in perinæo, where the dangers arising from the diffusion of urine, are past, the surgeon is to endeavour to make the natural passage as free as possible by the use of bougies and catheters: for the fistulous openings in the perineum often heal up spontaneously, as soon as the urine finds a ready passage forwards through the urethra.

The prostate gland is liable to enlargement, which interferes with the passage of urine, and renders it very difficult to get any instrument into the bladder. Counter-irritation, leeching the perineum, and a long continued course of constitutional remedies, will frequently cause great diminution in the enlargements.

An account of the formation of stone in the bladder is contained under the article *PATHOLOGY*, and the futility of any means of dissolution pointed out. It remains only, in the present plan, to speak of the surgical operations for its removal.—There are several operations of this kind, but only two that deserve our particular consideration, namely, the removal of small stones through the urethra, and that which is called the lateral operation. The lateral operation is performed either with a knife or with gorgets of various constructions altogether: the former instrument and of a straight director appears to us by far the simplest and easiest mode of operation. We shall therefore merely subjoin an account of it by Mr. Key, who has lately brought it into notice.

“With a view to obviate the evils attending the employment of the gorget and curved staff, and, at the same time, to adhere closely to the operation of Cheselden, I use a straight director, which I find to answer all the purposes of a common staff, to be entirely free from its objections, and to combine advantages which a curved instrument cannot possess.

“I was first led to try an instrument of this form, on the dead subject, by the following accidental occurrence. Being called upon to examine a child who had died with stone in the bladder, I was desirous of performing the operation, before making any examination of the body; and having neither staff, gorget, nor knife with me, I was obliged to operate with a common director, a scalpel, and dressing forceps; and I was forcibly struck with the facility with which the director conducted the knife into the bladder.

“The introduction of this instrument is not attended with difficulty; it enters the bladder of the adult, or infant, with as much facility as one of the accustomed form. When held in the position for the first incision of the operation, it might strike a surgeon, in the habit of using a common staff, that the point of the director was not in the bladder, an objection that, if correct, would justly condemn it as a dangerous instrument. To satisfy my own doubt on the subject, when first I used it, I cut open the bladder, while an assistant held the director, and in every subject on which I tried it, I found the extremity projecting some way into the base of the bladder. At first I had the extremity made straight, but thinking that in depressing the handle it might be caught by a projecting fold in the bladder, which would considerably embarrass the operator, I had the point slightly curved upwards, and as the knife is never introduced so far into the bladder, as to reach the curve, it will cause no difficulty in its introduction. The groove is made somewhat deeper than in the common staff; to prevent any risk of the knife slipping out. The extremity is not grooved, but rounded like a common sound, to prevent abrasion of the prostate or mucous lining of the bladder. The handle is somewhat larger, to afford a better purchase to the hand of the operator.

“The advantage of a straight over a curved line, as a conductor to a cutting instrument, is too obvious to require any comment, but its chief superiority consists in allowing the surgeon to turn the groove in any direction he may wish. Before carrying the knife into the prostate, the groove, which has been held downwards for the first incision, may be turned in any oblique line towards the patient's

left side, that the operator may think preferable for the division of the prostate. Nor does it preclude the use of the gorget. This instrument may be propelled along the straight groove, with more safety than in the curved staff. To those who have been used to the gorget, it may be difficult to lay it aside; and its employment is certainly less objectionable with the straight director than with the common staff. When the gorget is employed, the corresponding motion of the left hand is not required to carry it into the bladder; the director should be held perfectly quiet, while the gorget is propelled along its groove. The danger of passing it out of the groove of the director is diminished, if not entirely removed, from which circumstance alone the surgeon gains much additional confidence, and, consequently, the patient much benefit.

“The knife resembles, in form, a common scalpel, but is longer in the blade, and is slightly convex in the back near the point, to enable it to run with more facility in the groove of the director. The scalpel blade has this advantage over the common beaked lithotome, that the external incision can be made with the same instrument, as the section of the prostate gland, thus rendering a change of instrument unnecessary. There is less danger also of any membrane getting between the groove and the knife, as the point of the cutting edge, being buried in the groove, will divide whatever lies before it, which is not done by a beaked instrument. The opening made in the prostate, and also in the perineal muscles, can, in some measure, be regulated by the angle which the knife makes with the director, as it enters the bladder. In the majority of cases, it will merely be necessary to pass the knife along the director, and having cut the prostate, to withdraw it without carrying it out of the groove; varying the angle according to the age of the patient, the width of the pelvis, and the size of the stone. As the direction in which the prostate should be divided (in order to adhere to Cheselden's operation), is obliquely downwards and outwards, the increasing the angle at which the knife enters the bladder, will incur no risk of wounding the pudic artery. When the stone is unusually large, it will be necessary to dilate the prostate, in withdrawing the knife.

“This want of power to regulate the size of the incision, is an objection to which the gorget is acknowledged to be open. Whether the stone be large or small, the same opening, and that a small one, must serve in either case; and, if the stone be large, the operator cannot avoid employing violence in its extraction.

“As not more dexterity is required to introduce this knife upon the director, than every surgeon, however unused to lithotomy, possesses, it is almost needless to caution against the employment of undue force in the section of the prostate. The knife may be conducted with deliberate care into the bladder; the resistance afforded by the prostate will be readily felt, and the hand of the operator should be checked as soon as he feels the prostate has given way. It will be evident, that the most important part of the operation is thus divested of that blind force, which renders it hazardous in the hands of the most dexterous, as well as of the most unskilful lithotomist.

“The mode of conducting the operation is as follows:—

“An assistant holding the director, with the handle somewhat inclined towards the operator, the external incision of the usual extent is made with the knife, until the groove is opened, and the point of the knife rests fairly in the director, which can be readily ascertained by the sensation communicated; the point being kept steadily against the groove, the operator with his left hand takes the handle of the director, and lowers it till he feels a check, keeping his right hand fixed; then with an easy simultaneous movement of both hands, the groove of the director and the edge of the knife are to be turned obliquely towards the patient's left side; the knife having the proper bearing, is now ready for the section of the prostate; at this time the operator should look to the exact line the director takes, in order to carry the knife safely and slowly along the groove; which

may now be done without any risk of the knife slipping out. The knife may then be either withdrawn along the director, or the parts further dilated, according to the circumstances adverted to. Having delivered his knife to the assistant, the operator takes the staff in his right hand, and passing the forefinger of his left along the director through the opening in the prostate, withdraws the director, and exchanging it for the forceps, passes the latter upon his finger into the cavity of the bladder.

"In extracting the calculus, should the aperture in the prostate prove too small, and a great degree of violence be required to make it pass through the opening, it is advisable always to dilate with the knife, rather than expose the patient to the inevitable danger consequent upon laceration."

The testicle is very liable to inflammation and in this state the disease is very absurdly styled *hernia humoralis*. According to Hunter, the first symptom of this complaint is a soft, pulpy, fulness of the body of the testicle, which is exceedingly tender when handled. This fulness increases to a hard swelling, accompanied with considerable pain. The hardest part is commonly the epididymis, and principally the lower portion of it, as may be distinctly felt. The spermatic cord is often affected, and particularly the vas deferens, which is thickened, and, when touched, very tender and painful. The spermatic veins sometimes become varicose; cholicky pains may be experienced in the bowels; and sickness is a common symptom, and even vomiting. In some cases, a great accumulation of air takes place within the alimentary canal, producing much oppression and inconvenience. The bowels in other instances are obstinately constipated, and if this symptom be conjoined with incessant vomiting, a large tumour of the scrotum, and a great swelling and thickening of the spermatic cord, the case may partly resemble a hernia, from which, however, a surgeon well acquainted with all the characters of the latter disease, will have no difficulty in distinguishing it. A severe pain in the loins is usually attendant on the complaint. In addition to the preceding complaints, the patient in severe cases has a great deal of symptomatic fever, pain shooting down the thighs, and considerable heat and difficulty in making water. The description of the manner in which this disease commences, as delivered by some other writers, does not however correspond altogether to the foregoing account. Thus, Richter asserts, that the patient first complains of pain in the groin; then the spermatic cord becomes swollen, particularly the vas deferens; and shortly afterwards the epididymis; but, says he, the testis itself always swells the last, and frequently not till some days have elapsed. The scrotum, in consequence of the distention which it suffers, becomes smooth, loses its corrugated appearance, and is redder than in the healthy state. The disease rarely affects both testes at once; though, as Mr. Hunter observes, it sometimes happens, that the swelling changes from one of these organs to the other with surprising rapidity. In slight cases, the vas deferens and epididymis may be affected alone; but in all usual examples, the body of the testes is equally implicated. Any man, says Mr. Hunter, who is accustomed to know the difference between a swelling of the whole testis, and that of the epididymis only, will immediately be sensible, that in *hernia humoralis*, the whole testis is commonly swelled. This organ assumes the same shape that it does from other causes, where we know from being obliged to remove it, that the whole has swelled, and the pain is in every part of it. Mr. Hunter has seen *hernia humoralis* suppurate at the anterior part of the swelling; he has known several instances, in which the complaint produced adhesions between the tunica albuginea and tunica vaginalis, as was discovered after death, or in the operation for a partial hydrocele. Such changes, says he, could not have taken place, if the body itself of the testes had not been inflamed.

The patient should be kept perfectly quiet, and in a horizontal posture in bed. If he be young and robust, the swelling of the part considerable, and the pain in the loins very violent, phlebotomy may be practised; the quantity

of blood taken away, and the repetition of the operation being determined, by the patient's ability to bear the evacuation, and by the state of the local disease. With regard to local applications, fomentations and poultices prove more beneficial than cold astringent lotions. But, an object, of the highest importance, is to keep the testicle constantly supported, by means of a bag truss, or suspensory bandage.

Mr. Hunter states, that emetics have been known to remove the swelling almost instantaneously. Without giving full credit to the literal meaning of this observation, it is very certain, that the great degree of swelling, in cases of *hernia humoralis*, often occurs and subsides more rapidly, than in any other inflammatory affection whatever.

When the pain in the part and loins is unusually severe, opiates become necessary.

After the inflammation is completely subdued, the hardness of the epididymis commonly remains. Sometimes, this may be lessened by frictions with camphorated mercurial ointment, or the use of discutient plaisters; but, in general, more or less of such induration continues during life.

The testicle is liable to a particular sort of cancer, called the chimney-sweepers' cancer; it was first described by the celebrated Mr. Pott. It is said to be endemial in this country.

This disease almost always makes its first appearance in the inferior part of the scrotum, where, as Mr. Pott observes, it produces a superficial, painful, ragged, ill-looking sore, with hard and rising edges. With the exception of one case, which was shewn to him by Sir J. Earle, and which occurred in a child under eight years of age, that eminent surgeon never saw the complaint occur under the age of puberty. In no great length of time, it makes its way completely through the scrotum, and attacks the testicle, which it enlarges, hardens, and renders thoroughly distempered. Next, it extends up the spermatic cord, contaminating the inguinal glands, and parts within the abdominal ring, and then very soon becoming painfully destructive. The only treatment is extirpation.

The veins of the testis are liable to varix, generally, in consequence of some enlargement of the gland; and the spermatic veins especially are liable to this disease, which has received the denomination of *circoscele*. This dilatation of the veins being combined, in some instances, with a similar affection of the lower portion of the vas deferens, the convoluted canal of the epididymis, and even of the tubuli seminiferi testis, compose an unnatural mis-shapen mass perceptible in the scrotum.

Circoscele frequently occasions great uneasiness, and sometimes a wasting of the testicle. It is commonly limited to that part of the spermatic cord, which is below the abdominal ring; and the vessels are generally larger, the nearer they are to the testicle. It is attended with a sense of weight in the scrotum; an unequal knotty swelling; and, if the disease affects the whole corpus pampiniforme, with a sensation that seems to arise from a bundle of ropes, or earthworms. The disease generally begins at the lower part of the spermatic cord, by the side of the testis. Excepting the uneasy sensation of weight in the scrotum, and a little tenderness when pressed, the recent *circoscele* is productive of only trivial, or even no inconvenience. But in an advanced stage of the disease, very severe pains gradually come on, sometimes extending upward to the back and loins, and downward to the thigh. The case does not invariably make the kind of progress above described: it is often confined to the spermatic cord, or epididymis; and it has been known to continue in this state for many years, without increasing, notwithstanding the patient's employments were of a nature very likely to aggravate the disease. Standing long at a time, walking, horse-exercise, great exertions of the lungs, and every thing requiring forcible expirations, always augment the turgidity of the veins, and the painful sensations experienced by the patient. The weight of the testis, when this organ is not wasted, appears also to have a similar effect.

This disease is more frequently than any other, mistaken for an omental rupture. A bag-truss and astringent lotions are the only agents necessary for treating this disorder.

disorder. The direction which Sir A. Cooper gives for avoiding mistakes, is simple and good; the patient is to be placed in a horizontal posture, and the swelling emptied by pressure; the surgeon is then to put his fingers firmly upon the abdominal ring: if the case be a hernia, the tumour cannot re-appear, as long as the pressure is continued at the ring; but, if the disease be a cirsocele, the swelling will appear again with increased size, on account of the return of blood into the abdomen being prevented by such pressure.

A cirsocele may be really combined with a hernia; a case which is extremely perplexing, because the former complaint renders the patient incapable of wearing a truss.

The testicle is liable to various chronic enlargements, which are all included in the general term *sarcocele*. The common sarcocele has the same structure as the ordinary vascular sarcoma. The testis becomes larger than natural; and this increased size, which, in some cases, is inconsiderable, in others, attains a degree, in which the part affected is as large as two fists. While the tumour is of moderate dimensions, the shape of the testis is partly retained; the swelling being oval and flattened at the sides, with its larger end turned upward and forward, and its smaller directed downward and backward. Its weight is very considerable, in comparison to its size; and it is its nature to remain a long while indolent, giving but little pain, except it be left unsupported, when from the dragging of the spermatic cord, more or less annoyance is produced. The scrotum is of its natural colour, without any augmentation of its temperature, or any signs of fluctuation. At first the spermatic cord is unaffected, and of course the swelling does not extend quite up to the abdominal ring; but, after a time, the disease generally extends higher up, and the cord itself becomes enlarged. However fleshy and indolent a common sarcocele may be in its incipient stages, and even for years, the possibility of its assuming a more painful and malignant nature should never be forgotten, because it is a fact, that ought always to be allowed to weigh in considering the propriety of persevering in attempts to save the part. The species of sarcocele which is liable to change into scirrhus and cancer, generally begins in the body of the testicle, and very seldom in the epididymis and spermatic cord, which parts, however, are often subsequently affected.

The testicle is sometimes converted into a scrofulous mass. It is enlarged in size; and when cut into, a whitish or yellowish coagulated matter is discovered, mixed with pus.

Fungus hæmatodes, or *soft cancer*, sometimes attacks the testicle, and particularly demands the earnest attention of the surgeon, not only on account of its fatal character; but also because it is a distemper very insidious in its attack, and peculiarly liable to be mistaken for a common hydrocele. It is described by Dr. Baillie as sometimes much enlarged, and converted into a uniform pulpy matter, in which its natural structure is entirely lost. This sort of change has been sometimes mistaken for scirrhus, but it is very different from what is called scirrhus in other parts of the body, and what is found in the testicle itself.

According to the excellent description given by Mr. Wardrop, the fungus hæmatodes of the testicle is mostly seen in persons under the age of thirty. In some cases, it begins in the body of the organ, while, in others, its origin is attended with a tumour in the epididymis. The progress of the disease is very slow, and, as the swelling of the gland increases, the tumour retains an oval, or globular form, and it becomes difficult, if not impossible, to distinguish the body of the testicle and epididymis from one another. The pain of the disease is generally so trifling as to excite little alarm, and there is no inequality, nor hardness in the gland, nor any change in the structure of the scrotum. When the testicle has increased considerably in bulk, it becomes remarkable for its softness and elasticity, and produces a sensation, as if it contained fluid. Hence, the disease has often been mistaken for hydrocele, and punctured.

Mr. Wardrop says, that the want of transparency in the tumour is one appearance in the fungus hæmatodes of the

testicle, which might be expected to lead to an accurate diagnosis between it and hydrocele; but, as there are many collections of water in the vaginal coat of a dark colour, and sometimes even of blood, and as the vaginal coat is often very much thickened, this cannot be always regarded as a diagnostic symptom: The fungus hæmatodes of the testicle, when of considerable bulk, though resembling many of the more frequent varieties of hydrocele in shape, yet, on inquiry, will not be found to have had a similar progress. In hydrocele, the water begins to collect at the bottom of the scrotum, and the testicle may generally be distinguished at the posterior part, until the tumour has acquired a very large size; whereas, in fungus hæmatodes, the disease commences in the body of the testicle, or in the epididymis, and the whole gland gradually enlarges. The tumour, too, in hydrocele, is accurately circumscribed towards the ring, whereas, in the fungus hæmatodes, there is a gradual swelling, or fulness, extending up from the testicle along the spermatic cord. This fulness is described as being very different also from the unyielding hardness of a scirrhus affection of the part. In judging of the nature of the disease, the comparative weight of the swelling, to that of an hydrocele of equal bulk, is likewise to be considered.

A fungus hæmatodes of the testicle, when large, sometimes becomes hard at some points, and soft at others, where the swelling seems as if it were about to break. It is not common for the scrotum to give way, and a fungus to protrude; but, if the patient live long enough, the disease may follow such a course.

The testicle often becomes scirrhus; it is found converted into a hard mass, of a brownish colour, and generally intersected by membranes, and sometimes there are cells in the tumour, filled with a sanious fluid. This is the truly scirrhus testicle, which is attended with a great hardness, severe pains darting along the spermatic cord to the loins, and an unequal, knotty feel. The health commonly becomes impaired. To use Mr. Pott's words, sometimes the fury of the disease brooks no restraint; but, making its way through all the membranes which envelope the testicle, it either produces a large, foul, stinking, phagedenic ulcer with hard edges, or it thrusts forth a painful gleetings fungus, subject to frequent hæmorrhage. These latter states of the disease are denominated the *cancer of the testis*.

Sooner or later, the scirrhus induration extends from the epididymis upward along the spermatic cord, even within the abdominal ring. In the latter case, the lymphatic glands, in the loins usually become diseased; and this extension of mischief, together with the impossibility of removing the whole of the diseased cord, too frequently deprives the patient of every chance of getting well.

"It is now well known," says S. Cooper, in his First Lines, "that various sarcomatous enlargements of the testicle, at first quite indolent, and exempt from pain, and every alarming complication, such as swelling and induration of the cord, tumours of the inguinal glands, and swellings within the abdominal parietes, are capable of assuming, in a very sudden manner, a malignant and cancerous tendency; and that sometimes the scirrhus induration of the cord makes rapid progress upward. When these changes have taken place, attended with severe hectic symptoms, extreme emaciation, a pallid wan face, and a tendency to anasarca, no measures which the healing art can suggest, will now avail to save either the diseased part, or the patient's life. Hence, that surgeon acts with prudence, who recommends an early extirpation of every testis that is incurably diseased, and entirely deprived of its original organization." This, of course, should never be done, until the general treatment of chronic inflammation has failed.

There is a particular affection of the testicle, in which a fungus grows from the glandular substance of this body, and, in some cases, from the surface of the tunica albuginea. This excrescence is usually preceded by an enlargement of the testicle, in consequence of gonorrhœa, a bruise, or some species of external violence. A small abscess takes place and bursts, and, from the ulcerated opening, the fungus gradually

ally protrudes. In some instances, the disease appears to have been accompanied with great irritability of the urethra, or strictures.

If, when the inflammatory affection of the testicle has subsided, the substance of this body should not be much indurated or enlarged, it is a very rational practice, to endeavour to extirpate the fungus, and diseased portion of the testis, without removing the whole of this body, and the object may sometimes be fulfilled by destroying the fungus with the *lapis infernalis*.

The sarcocele is very liable to be confounded with hydrocele when the tunica vaginalis is much thickened. Hence some surgeons have advised that an opening should be made into the scrotum previous to commencing extirpation.

Another disease, liable to be confounded with sarcocele, is a great and sometimes an enormous thickening of the scrotum itself. This case is more frequently met with in warm, than cold, or temperate countries; but it has been seen both in this country and in France. Though the scrotum may attain a magnitude which is truly surprising, the testes, concealed in the mass of new-formed matter, remain perfectly sound; and the principal grievances depend upon the manner in which the patient's fitness for every active employ, and even his capability of walking, riding, and taking exercise, are destroyed by an enormous swelling, which sometimes weighs nearly a hundred pounds. The only mode of relief consists in cutting the diseased scrotum away, in doing which, the operator is to avoid injuring the spermatic cord and testicles.

The preceding diseases frequently render necessary the operation of castration, which should be thus performed.

The parts being previously shaved, the patient is to be laid upon a firm table covered with a blanket or mattress. His legs should hang over the table, and be supported by assistants. An incision is to be made through the integuments with a common scalpel, extending from a little above the external abdominal ring to the bottom of the scrotum. The cellular membrane around the spermatic cord is to be dissected back, and the cord laid fairly bare; and this part of the operation is much more easily accomplished when the incision through the skin is very free. The cord is to be divided as high as the disease renders necessary and handed to an assistant who is to compress it. The whole of the testicle and its vaginal coat may then be readily dissected away, taking care not to cut into the vaginal cavity of the opposite side of the scrotum. After the testicle is removed, the cord should be loosened, and the spermatic artery and veins included in separate ligatures. Much care should also be taken to secure any arteries of the integuments of the scrotum which are seen bleeding.

The wound is to be dressed, so as to be healed if possible by adhesion; and this may generally be accomplished, except at the upper part where the ligatures come through. With this view the wound and scrotum are to be carefully washed, and two or three stitches, as may be thought most expedient, are to be put through the edges of the wound; for in a part like the scrotum, where the skin is loose and puckered, it is hardly possible to apply adhesive straps with sufficient accuracy, so as to serve the purpose. Small pieces of adhesive plaister, however, should be neatly placed between each of the stitches along the whole extent of the wound and a pledget of simple ointment and compress afterwards to be laid over; the whole being secured with a T bandage. After the operation, the patient is to be put to bed, being directed to lie on his back with a pillow between the thighs, so as to support the scrotum. Opium should be given to allay pain, and if any inflammatory symptoms supervene, bleeding at the arm had recourse to. Hemorrhage from imperceptible vessels of the scrotum may generally be stopped by cold lotions.

The scrotum is often exceedingly enlarged by collections of fluid. Of these, *hydrocele*, or watery swelling, is the most frequent.

“Of this disease there are three principal kinds; one, in which the fluid is lodged in the cellular texture of the scro-

tum; another, in which it is contained in the tunica vaginalis testis; and a third, in which the fluid collects in the spermatic cord.”

The first sort, sometimes named *hydrocele œdematodes*, is strictly only an anasarctous tumour of the scrotum, and generally a symptom of a dropsical affection of the whole constitution. And the most frequent causes of this species of hydrocele do not differ from those which are concerned in the production of ascites and œdema in general. The pressure also of certain tumours upon the large veins and lymphatics within the abdomen; the accidental rupture of a hydrocele of the tunica vaginalis, or the water of this last disease not having a ready outlet through the puncture in the skin, in consequence of the aperture having changed its situation with respect to the opening in the tunica vaginalis, after the lancet is withdrawn; violent contusions of the scrotum; the pressure of a very tight ill-made truss; are all circumstances which may give rise to an œdematous hydrocele, has generally the appearance of a smooth, oblong, or pyriform swelling of one side of the scrotum. It is not attended with any discolouration of the skin, and, if carefully watched from the beginning, it is observed at first only at the lower part of the scrotum, whence it gradually spreads upward, until it reaches the higher part of the spermatic cord, on the outside of the ring. The ordinary shape of the tumour somewhat resembles a swan's-egg pear, with its broader part downwards. In an early stage, it presents a softish feel, attended with fluctuation; but, on the fingers being removed, it immediately rises to its former level. It cannot be diminished either by pressure, or by making the patient lie down upon his back; it cannot be pushed into the cavity of the abdomen by any artifice of the surgeon; nor can any impulse be distinguished in it, when the patient coughs; circumstances particularly marking its difference from hernia. When the disease is more advanced, and has attained a larger size, the tumour becomes oblong, and its weight and firmness increase, though they are still much less than in cases of common sarcocele. At the same time, the fluctuation grows less distinct. If the fluid in the tunica vaginalis be clear, this membrane and the cremaster not much thickened, and a candle be placed behind the tumour, the scrotum will be found to have a semitransparent appearance. Whenever the quantity of fluid is at all considerable, the testicle cannot be plainly felt, being distinguishable only at the upper and back part of the tumour, by a certain hard feel. The spermatic cord, however, is still obvious to the touch. Even when the swelling has acquired its greatest size, and the scrotum is considerably distended, the corrugations are seldom so completely obliterated as they are in the œdematous hydrocele. The penis appears small, and, as it were, buried in the tumour. In cases of long standing, the integuments of the scrotum are sometimes much thickened; the veins are large; and, upon handling the swelling, a sense of elasticity, rather than of fluctuation, is communicated. When the hydrocele is of very great size, the spermatic cord itself may be concealed by it nearly or quite up to the ring. In children, the water commonly extends higher up the cord, than in adults.

The quantity of fluid varies in different cases; a hydrocele of ordinary size contains about six, eight, or ten ounces; but instances are recorded, in which four, and even six pints of water have been drawn off.

Scarpa, who has carefully examined hydroceles in the dead subject, assures us, that, whenever the tumour is large, the spermatic vessels are found so displaced and separated, that the artery and vas deferens usually lie on one side of the swelling, and the veins on the other; and that sometimes all these different vessels extend from the sides towards the front of the tumour, chiefly at its lower part.

“In a hydrocele, as well as a rupture, the cremaster (says Mr. Hunter) “becomes stronger than usual, and its fibres can be traced spreading on the tunica vaginalis, and seem at last to be lost upon it near to the lower end of the body of the testicles.”

Fungus hæmatodes testis is more liable to be confounded with

with hydrocele than any other disease; for the swelling of the testicle is so elastic, and the feel which it communicates so like that of a fluid, that many surgeons of great judgment and experience have been deceived, and actually introduced a trocar into the substance of the tumour.

The cure of hydrocele is very simple. We should first ascertain that there is no disease of the testicle, then we may plunge a trocar and canula into the scrotum and evacuate the water. This having been done, it will be found that the tumour is soon refilled, and that the operation is again required. Our object now is to change the action of the secretions, or to promote adhesion of the tunics of the testicle, and thus the obliteration of the cavity which is between them and which contains the water. After puncturing it, therefore, we now inject red wine, weak solution of sulphate of zinc, or even common water, desire the patient to go to bed for a short time, and await the coming on of inflammation. This should be watched and regulated, because, though rarely, instances have been known occasionally to occur, of very formidable inflammation, followed by sloughing, &c., coming on. A small portion of the tunica vaginalis may be drawn through the opening made by the cannula and snipped off, and this little operation frequently brings on the requisite degree of inflammatory action. In injecting and puncturing hydrocele, the greatest care should be taken that neither the fluid to be removed nor that injected get into the cellular tissue of the scrotum, and also when any thing is injected that it be perfectly evacuated again.

When the fluid collected in the scrotum is blood, the disease is called hæmatocele. It may be doubted whether there is any true secretion of blood in this situation. We may generally trace the disease to some blow or injury, or to some enlargement of the vessels which has caused the rupture of a blood vessel and consequent extravasation.

When the case is clearly distinguished from a hernia, attempts must be made to promote the absorption of the extravasated blood, by applying to the tumour the lotion composed of spirit of wine, vinegar, and the muriate of ammonia, or even camphorated liniments. The patient, if young, or not too much reduced, should also be bled, and, as purgatives are of essential use in promoting the absorption of effused blood, their exhibition should never be omitted. A bag-truss is to be worn, and the patient kept in bed. When, under this treatment, the swelling, instead of diminishing, increases in size, the bag-truss may be tightened, and compresses laid upon the scrotum, wet with cold water.

If the case should obstinately resist all these means, a thing which seldom happens, an incision must be made into the tumour, and if any bleeding point be discovered, it should either be tied, or stopped with a dossil of lint.

The penis is sometimes amputated. Almost the only case that requires this operation, is cancer; but if this exists to such an extent, as to involve the pubis or inguinal gland, the use of the knife is of course unjustifiable. Common warty excrescences have been mistaken for cancer of the penis. These, however, have a spreading, mushroom-like top, and slender base; and if the intermediate parts can be seen, they retain their natural appearance. A cancer begins with an irregular warty excrescence, having a broad base in the substance of the prepuce, or on the frænum. In a more advanced and ulcerated stage, the sore is of a dark red colour, covered with a sanious discharge; its bottom is solid, and deep excavations, and irregular cauliflower excrescences, present themselves. The neighbouring skin, of a purple colour, indurated, swelled, and tuberculated, stands out from the sore, while its irregular edge is turned inwards. The discharge has a peculiar smell, being highly offensive, and when the urethra is ulcerated, the urine gushes out from preternatural openings.

Cancer upon the glands, also, usually begins in the form of a wart, or small, not very troublesome, induration, which gradually changes into a most painful ulcerated excrescence.

The operation (not a very easy one, on account of the profuse hæmorrhage that attends it, and the tendency to

retract themselves out of sight, that the corpora cavernosa have), is to be thus performed:—

Having drawn the integuments as much forwards as possible, and fixed them there with a circular tape, make an incision behind the tape, but only just deep enough to see the blood issue from the divided arteriæ dorsales, which should be immediately taken up with a tenaculum, and tied. Then cut straight down through the middle of the corpora cavernosa, until the blood gushes from two arteriæ profundæ, which are to be secured in the same manner. Lastly, the third sweep of the knife should cut the corpus spongiosum and its arteries, without, however, dividing the urethra completely through; then the arteries of the spongy substance are tied, and the part is afterwards entirely severed.

When, from long continued irritation, a very narrow stricture has been formed, any sudden accession of inflammation will completely close the passage, so that no catheter or other instrument can be passed. In these cases, if the usual means of reducing vascular action and relaxing spasm have been used without effect, it is necessary to puncture the bladder.

There are two situations, in either of which the surgeon may make an opening into the bladder, viz., above the os pubis, and through the rectum.

In the first, a perpendicular incision is made, about an inch and a half or two inches in length, through the integuments and fat, covering the lower part of the linea alba. The bottom of the incision should just meet the upper part of the above bone. A cut of the same length is next to be made between the pyramidal muscles, and, this being done, the surgeon can feel with his finger the prominent, distended bladder. A trocar, the curvature of which forms a segment of a small circle, is now to be introduced into the exposed part of this viscus.

Many operators make no preliminary division of the integuments and fat, but introduce the trocar at once into the bladder.

In the puncture through the rectum, the patient is to be put in the same posture as for lithotomy. An assistant is to make pressure on the abdomen, just above the os pubis, in order to make the prominence of the bladder more distinct to the surgeon's finger in the rectum. A curved trocar, with its point drawn within the canula, is to be introduced with the right hand, and conveyed, upon the index-finger of the left, along the swelling, formed by the distended bladder. The instrument should be kept exactly in the central line of the front portion of the rectum, and, when conveyed sufficiently beyond the prostate gland, the point of the trocar is to be pushed into the bladder, through the anterior part of the intestine.

This operation is so easy of accomplishment, and so very safe, that it certainly merits a general preference. The coats of the rectum and bladder, at this part, are in immediate contact, and the instrument has to penetrate no thickness of substance. The operation is not more painful than venesection, and the distended bladder is so distinctly perceptible to the finger, that no mistake can well be made. The only chance of doing mischief arises from the situation of the vesiculæ seminales; but, all risk is removed, when the trocar and the finger are introduced sufficiently into the rectum, and the puncture is made exactly in the central part of the swelling. The curved trocar, about five inches long, is the most proper.

The diseases of the rectum, with the exception of fistula, have already been noticed by us under PATHOLOGY.—Fistula in ano generally makes its attack, in the form of phlegmonous inflammation, attended by sympathetic fever. A part of the buttock near the anus is considerably swollen, and has a large circumscribed hardness. The middle of this hardness soon becomes very red, and matter forms in its centre. As Mr. Pott remarks, the pain is sometimes great, the fever high, the tumour large, and exquisitely tender; but, however high the symptoms may have risen before suppuration, yet, when that end is fairly and fully accomplished,

the patient generally becomes easy, and free from fever. The matter, though plentiful, is good.

On other occasions, the fistula in ano begins as an erysipelatous inflammation, without any of the circumscribed hardness which characterizes the preceding tumour. The affection, on the contrary, spreads more extensively; the disease is more superficial; the quantity of matter small, and the cellular membrane sloughy to a considerable extent.

Sometimes, the complaint begins somewhat like a carbuncle. The skin is of a dusky red, or purple kind of colour, and, although harder than in the natural state, yet it is not nearly so tense as in phlegmonous, or erysipelatous inflammation.

At first, the pulse is full and hard; but, if no relief be obtained, it soon becomes unequal, low, and faltering; and the strength and spirits are greatly dejected. The matter formed under the skin is small in quantity, and bad in quality, and the cellular membrane is in a sloughy state. This species of the disease affects persons, whose habit is bad.

Sometimes the fistula in ano first appears as an induration of the skin near the anus; but without pain or alteration of colour; which hardness gradually softens or suppurates.

The matter may either point in the buttock, at a distance from the anus; or near this latter part; or in the perineum. The matter may escape from one opening, or from several. Sometimes, there is not only an external aperture, but another internal one communicating with the cavity of the intestine. In other instances, there is only one external, or internal opening.

The matter may be formed at a considerable distance from the rectum, which is not even laid bare by it; in other cases it is laid bare, but not perforated; sometimes it is both denuded and pierced.

These inflammations can scarcely be prevented from suppurating. Hence, the indications are, to moderate the symptoms, to promote the formation of matter, and, when this has collected, to let it out, and treat the sore in such a manner, as shall be most likely to produce a speedy cure.

A soft poultice is the best application for promoting supuration. When the inflammation is phlegmonous, the thinner the skin is suffered to become, before the abscess is opened, the better. If the patient be of a full, sanguine habit, venesection, and mild purgatives, are proper.

When the attack is of an erysipelatous kind, and there is a sloughy state of the cellular membrane; the sooner it is opened the better.

When the fistula in ano commences with that kind of inflammation which a carbuncle exhibits, no evacuations are necessary. The part should be opened early by a very free incision.

In opening all abscesses about the anus, the incision should be so large as to divide the whole of the skin covering the matter. Thus the abscess will be discharged at once; future lodgment of matter will be prevented; and convenient room will be made for the application of proper dressings.

All fistulæ in ano do not necessarily interest the rectum; sometimes the matter is so distant from the intestine, that the surgeon has no more to do with this part, than if it did not exist, and the abscess is to be treated upon general principles.

The operation consists in dividing the rectum, from the top of the hollow, in which the matter is lodged, as far as the anus. Thus the sinus is converted into an open wound. A narrow, curved, probe-pointed knife, is the proper instrument, and if it can be guided by the director, introduced through the track of the fistula, quite as far as the intestine, so much the better. The surgeon's fore-finger in the rectum will here feel the point of the knife. Then the director, if used, is to be withdrawn, and the operation is to be completed, by bringing the knife out, with its point applied to the finger, which was in the intestine. In this manner, all that is between the edge of the knife and the anus, must obviously be divided.

Immediately after the operation, a soft dossil of fine lint should be introduced, from the rectum, between the lips of the incision. This first dressing should remain, till loosened by suppuration. All the future dressings should be light.

OF THE CHEST.

The outer surface of the chest is the frequent seat of cancer: in this place, therefore, we may properly describe the operation for the extirpation of that disease.

The operation is usually performed as the patient is in a sitting posture, well supported by pillows and assistants.

The pectoral muscle is to be made tense by keeping the arm back, by means of a stick, placed transversely behind the back, in front of the arms, above the bend of the elbow.

If none of the integuments are to be removed, a straight incision is to be made through them; the tumour is to be regularly dissected all round from the circumjacent parts; and lastly, its base is to be detached from its connections, from above downward, until the whole is separated.

If the outer incision has been made transversely, the lower half of the swelling should be separated from its surrounding connections, before the dissection of the upper portion is begun, by which means, the surgeon will not be incommoded by the blood, from the vessels above, falling into the lower part of the wound, before the detachment of the adjacent portion of the tumour is effected. As soon as the lower half of the swelling is separated from its connections, the surgeon is to undertake the dissection of the upper half.

Such are the modes of removing all simple tumours, which are not of a malignant nature, nor of immense size.

When the tumour is of a malignant nature, and adherent to the skin and pectoral muscle beneath, the operator is to remove, at least, an inch or two of the fat on every side of the disease. The portion of the skin, intended to be taken away, must be included in two semicircular incisions; which meet thus () at their extremities; and when the base of the tumour is to be detached, the surface of the pectoral muscle, wherever it is adherent to the tumour, is also to be removed. The advantage of making the incision in the preceding manner obviously consists in enabling the surgeon to bring the edges of the wound together after the operation, so as to form a straight line, and be capable of uniting by the first intention.

The mere magnitude of a tumour frequently renders it highly judicious to take away a portion of the skin in the above method: if none were removed, the dissection of the tumour would be exceedingly tedious; and, after the operation, the loose undistended skin would lie in folds, and form, as it were, a large pouch for the lodgment of the matter.

In the extirpation of a diseased breast, the direction of the external incision must partly be determined by the shape of the tumour; but according to Dessault, there are advantages in cutting as much as possible transversely, when circumstances will allow. It is alleged, that, as the integuments are more yielding upwards or downwards, than they are in a cross direction, especially near the sternum, the transverse wound may be more expeditiously united; and that, as the great pectoral muscle only acts perpendicularly, with respect to the edges of the incision, it cannot tend to separate them. Dessault thought these advantages of higher importance, than that of the easy escape of the matter at the depending angle of the wound; the reason generally assigned for preferring a perpendicular cut.

As in the abdomen, so in the chest, an important practical distinction arises as to whether wounds penetrate or do not penetrate the cavity; for wounds of the thorax are dangerous when they pass through its parietes, but very important when they are only partially divided.

It is frequently difficult to pronounce, however, whether a wound extends into the cavity of the thorax or not. Many punctured wounds are very long and narrow, so as not easily to admit a probe to their termination.

Sometimes, however, the passage of air into and out of the chest, through the wound, leaves no doubt that the in-

jury extends beyond the pleura costalis. But this symptom can only be expected when the wound is straight and freely pervious.

“To discover whether the wound has injured the lungs, or not (says Mr. Hennen), is a point which has given to the older surgeons great room for the employment of their ingenuity in devising possible cases, and has occasioned no small waste of time and wax-tapers in ascertaining the exit of air through the passage. A practical surgeon will require but little investigation: bloody expectoration *immediately* on receiving the wound, and the terrible symptoms of dyspnoea, sense of stricture and suffocation, insupportable anxiety and faintness, which succeed, soon enough discover the fact.” The immediate danger is either from debility from hemorrhage, or suffocation from the blood flowing into the air cells and cavity of the thorax. Emphysema may also cause more or less suffering and danger. The symptoms here enumerated, whether single or in combination, may be deemed the primary effects of wounds of the lungs. Violent inflammatory affections of these organs and of the pleura occur; or long and tedious suppurations and exfoliations of bones, which, though not so rapidly fatal, are often as certainly so as the others. Diseases also may follow, which, although we cannot strictly call them pulmonary consumption, agree with it in many points, particularly in cough, emaciation, debility, and hectic.

The commonest effect of penetrating wounds of the thorax is the disease called emphysema. This is a swelling, arising from a diffusion of air in the cells of the cellular substance. It may occur in wounds which just enter the cavity of the chest; in others that extend more deeply, so as to wound the lungs; and also in cases in which these organs are wounded by the spiculæ of a broken rib, or clavicle, while there is no outward wound whatever. We find, that emphysema is a more common consequence of fractured ribs, and narrow stabs, than of large penetrating wounds; because, in the latter cases, the air readily passes outward, through the opening.

When the chest becomes expanded, in the act of inspiration, some of the air, which enters through the trachea into the wounded lung, instead of distending this organ, now passes through the breach in it, so as to get into the space between the pleura pulmonalis and pleura costalis.

When the thorax is next diminished in the act of expiration, the effused air is compressed against the wounded lung; but none of it can enter this viscus again; accordingly, fresh air accumulates in the space between the pleuræ at every inspiration, while none can escape during expiration. This case may produce suffocation from the pressure of the collected air on the diaphragm, mediastinum, and opposite lung.

However, as emphysema commonly follows narrow stabs, or fractures of the ribs, attended with injury of the lungs, the pleura costalis and intercostal muscles are at the same time wounded or lacerated, so that part of the air also usually gets through the above wounded membrane and muscles, into the cellular substance on the outside of the chest, and thence is sometimes diffused, through the same substance, over the whole body, so as sometimes to inflate it in an extraordinary degree.

So unlimited is the diffusion of air in some cases, that the cellular substance beneath the conjunctiva of the eye has been known to be prodigiously inflated.

From what has been stated, it is evident, that, in cases of emphysema, the danger does not depend so much on the extent of the external swelling, as on the degree of compression produced on the mediastinum, diaphragm, and the lung of the opposite side, combined with inflammation and extravasation of fluid in the chest.

In all cases of penetrating wounds of the chest, and especially in injuries of the lungs, the free use of the lancet is the only thing which can be depended upon in the early part of the treatment. By it, internal hæmorrhage is restrained; and by it, the dangers of the subsequent inflammation of

the thoracic viscera are to be averted. The records of surgery furnish abundant proof of the necessity of such practice.

In every penetrating wound of the chest, therefore, and more particularly when the lungs are injured, the first bleeding should be copious. If the patient should faint, we ought not to administer cordials, but allow him to revive gradually. We should avail ourselves of this opportunity to extract, without pain, all foreign bodies within reach, whether cloth, ball, iron, wood, or splinters of bone. Should there be reason for believing that any of these extraneous substances are lodged, and that by an enlargement of the wound, they might be extracted, the practice ought to be immediately adopted. The next object is to dress the wound itself. If it is a gunshot, a light mild dressing will be sufficient; but if incised, the lips of it should be closed at once. The patient is now to be left to repose, and he will often lie for some hours in a state of comparative ease, till the vessels again pour forth their contents, induce fresh spitting of bloody froth, and a repetition of all the symptoms of approaching suffocation. In this circumstance, the lancet must be used again without hesitation; for, as Mr. Hennen justly remarks, though in the after-treatment of a wound of the nature here described, considerable benefit may be derived from medicine, until the danger of immediate death from hemorrhage is over, “we must not think of employing any thing, except depletion by the lancet; it, and it only, can save the life of the wounded man.”

If air does not diffuse itself before the third or fourth day from the accident, there is not much chance of its doing so afterwards, because the extravasation of coagulating lymph around the wound soon shuts up the cavities of the cellular membrane.

It is sometimes requisite to open the chest either to evacuate air or water: an operation called paracentesis thoracis. The most eligible place, is between the sixth and seventh true ribs, just at that point, where the indigitations of the serratus major anticus terminate. By placing the patient on his abdomen, this opening may be rendered very depending.

An incision, about two inches long, must be made through the integuments. These are first to be drawn to one side, if it be intended to close the wound immediately afterwards. The intercostal muscles are next to be cautiously divided, and a small puncture carefully made in the pleura costalis, as soon as it is exposed. The intercostal muscles must be divided closely to the upper edge of the lower rib, in order to avoid any chance of wounding the intercostal artery, which runs in a groove along the lower edge of the upper rib.

Water is sometimes found in the *pericardium* when there is none in any other cavity of the thorax, but it is generally accompanied with hydrothorax. The symptoms of this disease are nearly similar to those of hydrothorax; and we find that Dessault and other very eminent surgeons have not been able to distinguish them. Dr. Baillie says, “that the feeling of oppression is more accurately confined to the situation of the heart; and the heart is more disturbed in its functions in dropsy of the pericardium than in hydrothorax.” It is also said, that a firm undulatory motion can be felt at every stroke of the heart.

If the existence of this complaint is ascertained, and if the quantity of water is suspected to be great, it may be perhaps advisable to discharge it, as practised by Dessault and others, by making an opening between the sixth and seventh ribs of the left side, opposite to the apex of the heart.

The ribs are not often broken; the upper escape on account of their guarded situation beneath the clavicle and shoulder; the lower because their great mobility makes them elude the effect of external violence. These injuries are rarely attended with any material displacement; the intercostal muscles tending to hinder a permanent separation of the fragments. The injury is most commonly situated near the greatest

greatest convexity of the bone. The surgeon should place his hand on the part where the patient complains of a pricking pain, or where the blow has been received; and then the latter should be desired to cough, in which action, the ribs must necessarily undergo a sudden motion, and a crepitus thereby be likely to be rendered perceptible. However, all the best practical surgeons are in the habit of adopting the same treatment when there is reason to suspect a rib to be fractured, as when the injury is actually known to exist.

When the point of a fractured rib is beaten inward, a train of alarming symptoms may ensue, as for instance, extravasation of blood, emphysema, and inflammation of the pleura and lungs.

Except when urgent symptoms arise, the treatment of fractured ribs is a business of great simplicity. The principal indication is to render the injured bone or bones as motionless as possible, during the cure. For this purpose, a jacket of strong linen should be made, and tightly laced.

OF THE THROAT AND FACE.

"There are several anatomical points," observes Mr. Cooper, "which should be remembered by the surgeon in all cases of wounds about the throat. First, that the arch of the aorta lies in the upper part of the chest, in front of the trachea, and that where the carotid arteries come out of the chest to run up the neck, they are scarcely at the sides of the trachea, but rather in front of it. As they get higher, however, they incline more to the side of that tube; and on their arrival near the angle of the jaw, where they begin to give off their branches to the head and neck, they even lie rather behind the side of the larynx. Hence, we see the reason why a wound at the lower part of the neck is very often fatal, while one higher up is generally less dangerous. The suicide rarely strikes at the lower part of the neck, and it is from the accidental circumstance of his cutting very high up, near the chin, that the carotids escape."

Secondly, as Mr. John Bell has explained, it should be remembered, that the carotid artery, the great jugular vein, and eighth pair of nerves, lie very closely connected with each other, being all inclosed in one mass of cellular substance, which forms a kind of common sheath for them. "Now," says this author, "since the eighth pair is one of the greatest nerves of the viscera, and since, from experiments on animals, we know that a wound of it is more fatal than a wound of the brain itself, this frequently puts an end at once to all questions about the way of managing wounds of the carotid artery, or of the great vein." But that the internal jugular vein, or the carotid artery itself, may sometimes be partially injured, without the par vagum being also hurt, or the patient instantly perishing, has now been fully proved.

Mr. John Bell asserted, that it is impossible to cut through the trachea, without wounding the carotid artery, the jugular vein, and the eighth pair of nerves. It is true such an accident cannot be frequent. "The fact is (says he), that neither the œsophagus nor the trachea is touched in the least degree, but the wound is much above them, for a suicide always strikes immediately under the chin. This wound, as far as I have observed, commonly falls in the line which divides the neck from the chin, that is, the place where the os hyoides lies, and he commonly cuts the os hyoides away from its connection with the thyroid cartilage, or pomum Adami. In that case, the thyroid cartilage, forming the uppermost part of the larynx is not touched; the rima glottidis lies below the wound quite safe. It only separates the larynx from the root of the tongue; it is properly a wound in the root of the tongue; it is rather a wound of the mouth than of the throat; and when the food comes out along with spittle and froth, it is by rolling over the root of the tongue."

In these high wounds of the throat, it is the superior thyroid artery, which is most frequently cut. This vessel, after quitting the external carotid at the angle of the jaw,

passes along the side of the upper part of the trachea, inclining forwards the thyroid gland in its descent, and therefore much exposed to the edge of the razor. The bleeding from this artery is profuse, and if not speedily stopped, is as fatal as hemorrhage from the carotid itself. In some of these cases, the bleeding also proceeds from the lingual artery, or its branches.

Wounds of the trachea are either simple or complicated. In both descriptions of cases, the usual symptoms are, an emission of air from the wound, loss of the voice, and sometimes emphysema. Such injuries of the windpipe, as are not complicated either with hemorrhage, emphysema, or loss of substance, may generally be easily cured by means analogous to those which are employed for the cure of wounds in general. The reunion is still more easily accomplished, when the trachea is divided longitudinally, than when it is cut transversely. If the wound be of a certain size, and attended with hemorrhage, the first indication is to tie the bleeding vessels, and, in particular, to obviate the inconvenience and danger which would result from the entrance of the effused blood into the windpipe; an occurrence which has sometimes proved fatal.

The greater sensibility of the larynx, its complicated structure, and the number and size of its blood vessels, render wounds of it much more dangerous than those of the trachea. They produce a great deal more irritation, and are generally attended with a convulsive cough. In general, however, simple wounds of the thyroid cartilage heal very favourably.

Transverse wounds, extending through only the anterior half of the upper part of the trachea, generally do well. Such injuries mostly leave nerves and vessels of consequence untouched. Loss of the voice; the entrance and exit of air through the wound, and sometimes an emphysematous swelling of the integuments, are the speedy consequences of the injury. Wounds of this description, made by gunshot violence, are more dangerous; but even these not unfrequently terminate well. In most instances, transverse wounds of the trachea, which have not divided it completely through, can be cured by the strict observance of a proper position. By bringing the patient's chin downward and forward to the sternum, and maintaining the head in this posture by the support of pillows, the edges of the wound in the trachea may be placed, and kept in contact, until they have grown together.

The manner in which sutures aggravate the cough, and inflame the wound, often necessitates the surgeon to withdraw them, when they have been employed. Besides the irritation, which, as extraneous bodies, they create in the trachea, they are in general unnecessary. Nothing prevents a wound of the trachea from uniting more than the disturbance of a convulsive cough; and the irritation of sutures always increases this hurtful symptom in a great degree. In fact, unless the greatest part of the trachea be divided, there never can be such a space between the edges of the wound that they cannot be brought into contact with the assistance of a judicious posture of the head.

When the troublesome cough seems to be owing to an inflammatory state of the wound, the complaint may be mitigated by bleeding and soothing remedies.

Many surgical writers recommend the patient to refrain from making forcible expirations, and drawing his head suddenly backward, for a certain time after the wound is healed. By such causes, it is asserted, the recent coalescence of the wound may be easily destroyed.

When a wound has detached the upper portion of the trachea from the lower one, and it is not immediately fatal by the injury of other important parts, the bleeding vessels are first to be tied, and the two ends are then to be brought into contact. In this sort of case, the employment of a suture is warrantable. A flat broadish ligature should be employed; the needle should not be introduced through the lining of the trachea; and one stitch will be quite enough, when the chin is kept properly approximated to the breast.

In cases in which the whole diameter of the trachea is cut through, the French surgeons have proposed the introduction of a flexible catheter, from one of the nostrils, into the larynx and trachea, in order to insure a passage for respiration, which, they say, without this means, is liable to be intercepted when the outer wound is closed, in consequence of the two portions of the windpipe being separated and not corresponding. This, however, is not the practice to which we should give a preference; first because the introduction of a flexible catheter is a thing which is not always easy of accomplishment; secondly, because its use in this way is constantly productive of considerable irritation; and, thirdly, because the employment of a suture appears a better way for preserving a passage for the air, by keeping the ends of the trachea together.

A flexible catheter should be introduced through one of the nostrils into the œsophagus, for the purpose of giving food and medicines to the patient, without disturbing the wounded parts.

A total division of the œsophagus may be considered as fatal. The inevitable injury of other important parts, at the same time, would render such a case at once mortal. The celebrated Prussian surgeon Schmucker, has treated small wounds of the pharynx and upper part of the œsophagus with success. Wounds dividing half, or even two-thirds of the tube, are also stated to have been cured.

The tying of the carotid artery when divided in wounds of the neck, is of course the same process as tying any other artery in any other wound. When this vessel is to be tied for the cure of aneurism, the following operation is performed:—

Begin the incision at the lower edge of the thyroid cartilage; continue it upwards and outwards through the integuments and platysma myoides for two inches and a half, immediately on the inner side of the sterno mastoid muscle, so as to form an angle with the thyroid cartilage: dissect very carefully by the edge of the muscle, drawing it a little outwards, and the artery is found where it emerges from beneath that muscle and the omo-hyoideus. Be careful not to wound the internal jugular vein, which is situated on the outer side of the artery, and rather anteriorly; the nervus vagus is behind, and to its outer side, and the descendens noni runs down the front of the artery: the whole is surrounded by condensed cellular membrane, forming a kind of sheath.

The windpipe is cut into in various parts, to prevent suffocation. When surgeons make an opening into the trachea, the operation is called tracheotomy; when into the larynx, laryngotomy. These operations are only performed, when we have in view to make a passage for the air, or to extract foreign bodies from the œsophagus. Laryngotomy is thus performed:—

The skin being made tense, and the larynx fixed, the skin and cellular substance are to be divided to the extent of an inch, from the lower part of the thyroid to the cricoid cartilage, between the sterno-thyroidei and hyoidei muscles. The surgeon is then to place on the membrane his finger, with which he is to guide the point of the knife. The puncture should be made rather towards the cricoid cartilage, in order to avoid an arterial branch, which usually runs along the lower edge of the thyroid cartilage. Should any vessel happen to bleed, it must be tied. Lastly, the silver tube is to be introduced, and being covered with a bit of gauze, is to be fixed in its place with ribands. Care must be taken to withdraw and clean the canula as often as it may become obstructed with mucus, during the necessity for continuing its employment.

The following is the common method of performing tracheotomy:—

When a free incision into the trachea is requisite, the surgeon may make an incision in the integuments, which should begin just below the inferior lobes of the thyroid gland, and be carried straight downwards about two inches. The sterno-thyroidei muscles are then to be pushed a little

towards the side of the neck, and a longitudinal wound, of the necessary size, is next to be made in the front of the trachea. The knife must not be carried either to the right or left hand, in order to avoid all risk of injuring the large blood-vessels; and the incision ought never to extend too near the first bone of the sternum, lest the subclavian vein should unfortunately be cut.

The treatment of bodies in the œsophagus.—If possible they should be extracted, and if this cannot be done and they are not such as are likely to be pushed through the vessels of the pharynx and produce worse consequences, they may be propelled down the œsophagus with a probang.

The operation of extracting the thyroid gland, is one that rarely requires to be performed: Desault's method is reckoned the best; it was conducted in the following manner:—An incision was made along the middle of the swelling, beginning about an inch above, and ending at the same distance below it. This extent was given to the wound for the purpose of having plenty of room for the continuance of the dissection. The inner edge of the incision being drawn to the left by an assistant, the tumour was next separated from the sterno-cleido-mastoideus by the operator cutting the cellular substance that connected these parts. In doing this, two small arteries were divided, and immediately tied. The next object was to detach the inner part of the swelling from the trachea. While this was performed, the assistant drew the tumour outwards with a hook. In this part of the operation, several branches of the thyroid arteries were tied as soon as cut.

The assistant with the hook, then pulled the gland inwards and forwards, while Desault finished the dissection outwards and above and below. This part of the operation was the most difficult, and it was necessary every instant to wipe away with a sponge the little blood that was effused, in order that the parts might be distinctly seen. The operator only ventured to divide a very little at a time, and every part was carefully examined with the fingers before it was cut. With these precautions, Desault succeeded in exposing the superior and inferior thyroideal arteries, without wounding them, and a ligature was immediately put under them by means of a curved blunt needle. The vessels were then divided, and the detachment of the swelling from the trachea completed. The patient was discharged from the Hôtel-Dieu, quite well, on the 34th day after the operation.

The tumour which was removed was nearly five inches in circumference. The wound made in the operation was almost three inches in depth, being bounded externally by the sterno-cleido-mastoideus, internally by the trachea and œsophagus, and behind by the common carotid, and par vagum, which were visible.

That the extirpation of the thyroid gland is a delicate and difficult operation, must be evident to every body at all acquainted with anatomy. Above, are the superior thyroideal arteries; below, the inferior ones; at the sides, the common carotids, and internal jugular veins; in front, an extensive plexus of veins; and the trachea, œsophagus, recurrent nerves, and par vagum, all close to the tumour.

Wounds of the face, though they involve important parts, and are extremely frightful to behold, are not generally attended with danger, and heal up in a surprising manner.

There is nothing peculiar in their treatment, unless in cuts of the cheek, when the parotid duct sometimes becomes divided, and the disease called salivary fistula is formed. In this complaint the saliva, instead of taking its natural course into the mouth, flows out on the cheek. The treatment of the salivary fistula is as follows:—an opening should be made into the mouth with a trocar as close to the open orifice of the duct as possible, and this being withdrawn, a seton introduced.

Desault's method of applying the seton is the most eligible. When the trocar had been introduced, he used to withdraw the stilette, and pass through the canula a thread into the mouth. The tube was then taken out, and

the seton was drawn, by means of the thread, from within the mouth outwards into the track of the wound; but care was taken not to draw it through the external opening, out of which the single thread alone passed, and was then fastened to the cheek with a bit of sticking plaster. The outer aperture was now dressed with lint, covered with compresses wet with the saturnine lotion. Thus the external opening had an opportunity of healing, with the exception of a mere point which soon closed; the seton, after being worn long enough, was taken out, and the little aperture touched with the *argentum nitratum*.

Hare-lip.—This well known deformity is curable by a surgical operation which requires, however, a great deal of attention and address. In the operation, the object is to make the wound as smooth and even a cut as possible, in order that it may more certainly unite by adhesion, and of such a shape that the *cicatrix* may form one narrow line.

The best plan is, either to place any flat instrument, like a spatula, the handle of a wooden spoon, or a bit of paste-board, underneath the lip, and then cut away the edge of the fissure with a sharp bistoury, or to hold the lip with a pair of forceps, in such a manner, that as much of the edge of the fissure as is to be removed is situated on one side of the blades of the instrument, so that it can be cut off with one sweep of the knife. This is to be done on each side of the cleft, and the two incisions are to meet at an angle above, thus A, in order that the whole track of the wound may be brought together, and united by the first intention.

The lips being exceedingly moveable, and it being essential in this case to heal the wound by adhesion, a particular process is always pursued to keep the lips of the wound in contact. Two silver pins, made with steel points, are introduced through the edges of the wound, and a piece of thread is then repeatedly twisted round the ends of the pins, from one side of the division to the other, first transversely, then obliquely, from the right or left end of one pin above, to the end of the lower on the opposite side, &c. Thus the thread being made to cross as many points of the wound as possible, greatly contributes to maintain its edges in even apposition. It is obvious, that a great deal of exactness is requisite in introducing the pins, in order that the edges of the incision may afterwards be precisely applied to each other in the proper manner. The pins ought never to extend more deeply than about two-thirds through the substance of the lip. It would be a great improvement always to have them constructed a little curved. This is what is named the *twisted suture*. The pins are usually removed in three or four days; the support of sticking plaster being afterwards quite sufficient.

We come to speak of diseases about the mouth. The tongue is liable to ulcers of a painful, obstinate, and malignant-looking nature, sometimes produced by the sharp or rough edge of a tooth. Some very obstinate ulcers are connected with disorder of the digestive organs; but ulcers that are *malignant* and *cancerous*, not unfrequently form on the tongue. Sometimes the malady, in its most incipient state, appears as a sore. Sometimes a circumscribed moveable or immovable scirrhus swelling is first observable, which gradually becomes painful, and ulcerates. In other instances, there is in the beginning only an induration in the substance of the tongue, without the smallest appearance of any swelling. The ulcers under consideration are always surrounded by hardness. They may make their first appearance either at the edges or at the apex of the tongue. In certain cases, the whole, or a large portion of this organ is covered with numerous small scirrhus tubercles, which gradually fall into a state of ulceration. All the medicines tried in other cases of cancer, especially arsenic, conium, &c., may here be tried, but on the whole, the timely employment of the knife merits the most confidence.

The tongue is in children occasionally too much confined by its *frænum*: it may be divided to a very small extent with a pair of blunt-pointed scissors.

The most frequent wounds of the tongue are those which are transverse. They are hardly ever produced by outward means; but usually by the teeth, when the lower jaw is forcibly and spasmodically brought against the upper one, while the tongue is out of the mouth, as sometimes happens in epilepsy, and falls upon the chin. In this way, transverse wounds of considerable extent frequently happen, almost separating, in some instances, the apex from the body of the tongue. In such cases, the injury may easily be converted into a sort of cleft, which may remain for ever afterwards, and more or less impede the functions of the organ. This disagreeable consequence is more likely to happen when no care is taken to keep the opposite sides of the wound in proper contact, and hinder them from becoming distant from each other. Hence, wounds of the tongue should be immediately closed with a suture.

An hæmorrhage from the ranal vessels sometimes follows accidental wounds, and surgical operations on the tongue. When it is an artery that bleeds, the accident may prove dangerous, and even fatal. Moving the tongue and jaw about, and continually sucking, promote the hæmorrhage, and render the adoption of the measures necessary for its suppression extremely difficult. As in these cases a ligature, compression, and styptics, hardly admit of being applied, the bleeding cannot be stopped without much trouble.

The plan is that of directing an assistant to keep a compress on the bleeding vessels, as long as necessary, with his finger, while with his thumb he takes care to make counter-pressure under the jaw.

If a surgeon were to find this unavailing, he must cut down to and tie the trunk of the lingual artery, just where it passes over the cornu of the os hyoides.

Sometimes, when this organ is inflamed, it swells so prodigiously, that it protrudes between the teeth, entirely fills up the cavity of the mouth, and obstructs speech, deglutition, and even respiration. In such a case, the most prompt assistance is demanded. Ordinary evacuations of blood, and other antiphlogistic measures, here seldom bring relief with sufficient celerity. According to surgical authors, the most certain plan consists in making two longitudinal cuts along the edges of the dorsum of the tongue, from one to two inches in length. A copious bleeding generally follows, which soon brings about a diminution of the swelling. No troublesome consequences are to be apprehended from such incisions, which heal with ease, and scarcely leave any scar behind.

The ranula is a tumour arising from a distension of the salivary ducts underneath the tongue, and from an accumulation of the saliva in the dilated part. The cause of the disorder is an obstruction of the excretory duct either of the sublingual, or of the inferior maxillary gland.

The swelling is usually situated on one side of the *frænum linguæ*, and particularly when it is large, sometimes extends under the apex of the tongue. The tumour consists of a sac, which is composed of the dilated portion of the duct, and is either filled with clear fluid, a purulent matter, or an earthy substance. Unless the tumour has been of long standing, its contents bear a perfect resemblance, in colour and consistence, to the white of an egg. When the disease is less recent, the matter is thicker, and it may become like plaster, or even acquire a calcareous hardness. Its size varies considerably in different cases, from that of a pea to that of a hen's egg. In some instances, it becomes exceedingly large, elevating the tongue so much, that deglutition and respiration are greatly obstructed. Some swellings of this kind have been known to contain a pint of matter.

Ranulæ are frequently quite free from pain; but, in some instances they are very painful, especially when the tongue is moved; and in others, they are more or less in an inflamed state.

From what has been stated, it might be inferred, that the cysts of these swellings ought to be dissected out, in the same manner as those of ordinary encysted tumours. Owing to the particularity of the situation of ranulæ, this is not exactly
the

the case. If the surgeon were to endeavour to take out the whole sac, he could hardly avoid wounding the ranal artery, the hæmorrhage from which might prove excessively troublesome, and even fatal.

Practitioners, therefore, are content with laying open the tumour from one end to the other; squeezing out its contents; and removing every particle of calcareous matter that can be felt within the wound.

Cutting away a portion of the sac is sometimes necessary; for when a mere incision is too small, or closes prematurely, the disease generally recurs. After making a free opening into the swelling with a knife, the surgeon can easily cut off a part of the edges of the incision, either with the same instrument and a pair of forceps, or with a pair of scissors.

The tonsils are exceedingly liable to inflame, and sometimes the swelling thus produced is so great as to obstruct deglutition and respiration in a very dangerous degree. Prompt succour is now most urgently required, and relief may commonly be obtained by scarifying the enlarged tonsils, and promoting the bleeding with warm gargles.

The tonsils sometimes become enlarged, without being inflamed. Discutient and astringent applications here prove ineffectual. The tumour admits of being removed, but it is unnecessary and improper to take away the whole tonsil, as a dangerous and even fatal hæmorrhage might be the consequence. Only so much of the swelling should be removed as is sufficient to afford relief. The remaining portion in general heals without difficulty.

Cancerous diseases of the lip are met with in various forms; sometimes having the appearance of an ulcerated, wart-like excrescence, which occasionally becomes as large as an apple; sometimes the form of a very destructive ulcer, which consumes the surrounding substance of the lip; and, in other examples, the disease resembles a hard lump, which at length ulcerates. The disease in its infancy is often no more than a pimple, which gradually becomes malignant.

Cancers of the lip are said to be more frequent in men than women, and generally to occur in the lower spheres of life. The under lip is commonly the seat of the disease; the upper one being but seldom affected.

Every obstinate hardness and ill-conditioned ulcer on the lips, is not to be regarded as cancerous; many may be cured by keeping the constitution under the influence of either mercury, cicuta, opium, or the arsenical preparation.

Whenever there is reason to believe that the disease is of an unyielding, cancerous nature, the sooner it is extirpated the better.

The operation should be done as for the hare-lip, making the wound of such a shape as will allow its edges to be evenly united by adhesion, and taking care to extirpate every portion of the morbid part. When the affection is extensive, the surgeon, however, is frequently necessitated to remove the whole of the lip, a most unpleasant occurrence, as the patient's saliva can then only be prevented from continually running over his chin by some artificial mechanical contrivance. The deformity is very great; and swallowing, and the pronunciation of words, can only be imperfectly performed.

When the membrane lining the antrum inflames and ulcerates, a darting pain is felt in the side of the face, extending from the teeth to the orbit, and unattended with any external swelling. The pain and tenderness do not affect the integuments, which may be handled without inconvenience to the patient. This state of the disorder is not attended with much fever, and is usually regarded as a tooth-ach.

In some instances, matter flows into the nose; and, its being discharged from one of the nostrils, excites a suspicion of the nature of the case. But many patients do not distinguish the pus from the usual mucous evacuation; and frequently, in consequence of the communication between the nose and antrum being closed, there is no purulent discharge whatever.

The disease, when further advanced, becomes more obvious. The whole antrum now expands, and its parieties are rendered thinner by absorption. The expansion of the bone towards the nose may produce a complete obstruction of the nostril, or its swelling above may raise the floor of the orbit, and push the eye out of its situation. But the greatest degree of expansion commonly takes place towards the surface of the body; for, all collections of matter have a natural tendency to burst externally.

At length, the abscess makes its way through the bony parieties of the antrum, and continues to be discharged through ulcerated openings. In some instances, the matter finds a passage into the mouth, through one of the sockets for the teeth.

The indications in the cure are chiefly two, viz., to procure a vent for the matter confined in the antrum as speedily as possible, which is done by drawing a tooth; and to check the suppuration, and promote the separation of any exfoliations which are taking place.

The ossa nasi are occasionally broken: as there are no muscles that tend to displace these bones, they merely require to be reduced.

The lower jaw may be fractured either in its body, or rami, on one side or both; at the neck of one of the condyles, or near the symphysis. According to Delpech, the fracture is never situated exactly at the symphysis itself; but this remark is incorrect, at least with respect to children, in whom the bone sometimes splits in that very situation.

When the fracture has happened towards the chin, whether the bone be broken on one side, or both, the fragment comprehending the symphysis is drawn downwards. If the fracture be oblique, this sort of displacement is much more considerable, especially when the solution of continuity runs downwards and backwards, as it frequently does; for, in this case, the direction of the muscles, which depress the jaw, and are chiefly inserted into the portion of bone most liable to be drawn out of its right place, is parallel to that of the fracture, and consequently they have a greater effect in producing the displacement.

A fracture of the lower jaw may be detected by introducing a finger into the mouth, and pressing on the front teeth of the side on which the fracture is supposed to be, while, at the same time, the fingers of the other hand are applied to the basis of the bone, near the angle. On making alternate pressure in each of the above situations, the bone may be felt to move, and a crepitus distinguished. This painful mode of examination, however, is not invariably requisite; for, when the fracture is displaced, the nature of the accident is obvious enough without any such proceeding. In this case, the body of the bone is drawn downwards from the rami; the mouth is more or less open, and so distorted that the commissure of the lips is much lower on the injured side than the other; while the front teeth are below the level of the molares; the regularity of the arch formed by the teeth and alveolar process being more or less destroyed.

The generality of fractures of the jaw are easily reduced; but the reduction cannot be maintained without difficulty.

When the fracture is not displaced, the surgeon need only adapt some pasteboard, wet and softened with vinegar, to the outside of the jaw, both along its side, and under its basis. Over this wet pasteboard, a bandage with four tails is to be applied, the centre being placed on the patient's chin, the two posterior tails pinned to the front part of his night-cap, and the two anterior attached to a part of the same cap, more backward. When the pasteboard becomes dry, it forms a convenient apparatus for supporting the fracture. The soap plaister frequently applied to the skin is rather to be considered as a thing done for the amusement of the patient and bystanders than as a measure of any real utility.

When the symphysis appears to be drawn below the level of the base of the jaw behind the fracture, the coronoid process

process is to be gradually pushed backward with the index finger of one hand, while the index and middle fingers of the other hand are to be applied to the front teeth, and the thumb to the basis of the anterior part of the jaw. At the same moment that the coronoid process is pushed backwards, the front portion of the bone is to be raised and inclined forwards. When one end of the fracture is situated over the other, the two parts of the bone are to be pushed in opposite directions, and if this be skilfully done, the slightest pressure on the extremities of the fracture will suffice for placing them in contact.

That the fracture is well reduced, may always be readily known by adverting to the evenness of the dental line, and that of the base of the jaw.

The surfaces of the fracture having been placed in even contact, the jaw is to be covered with pasteboard, and the four-tailed bandage applied. It will also be necessary to counteract the action of muscles, between the lower jaw and os hyoides, by supporting the front portion of the bone with compresses placed under the bandage.

According to Delpsch, nothing is more essential for keeping the fragments in their right place, than applying betwixt the teeth of the upper and lower jaws a piece of cork, cut into a suitable shape, and with depressions for receiving the projections formed by the teeth. Without this apparatus, he says, the four-tailed bandage, the pasteboard, and even the plan of fastening the adjoining teeth together with wire, or catgut, will not have due effect. A similar piece of cork is also to be placed between the teeth on the opposite side, an interspace being left between the two portions sufficient to receive a small spoon, with which the patient is to be fed.

The lower jaw is subject to only one species of dislocation, namely, that in which the condyles advance forwards over the eminentiæ articulares, and slip under the zygoma. Sometimes the luxation is confined to one side; but, in all common instances, both condyles are displaced.

A very little consideration would inform a surgeon, duly acquainted with anatomy, that the condyles of the lower jaw could not be displaced backwards, under the prominence formed by the lower part of the meatus auditorius, unless the bone were raised considerably above its point of contact with the upper jaw. Nor could one condyle be displaced outwards, without the other being at the same time carried inwards, below the projection of the spinous process of the sphenoid bone. This is a movement, therefore, which may be regarded as impossible, because it could not take place without a fracture of the spinous process, and any blow, or cause at all calculated to produce this accident, would be much more likely to fracture the ramus, or body of the lower jaw-bone itself.

With respect to the causes of a dislocation of the jaw, every thing that has a tendency to separate the upper and lower maxillæ further from each other, than is natural, may occasion the accident. Thus, yawning, vomiting, laughing, and blows on the chin, may be considered as the most frequent causes of the displacement.

When the lower jaw is dislocated by the action of the muscles, as in gaping, vomiting, laughing, &c., the muscles, which are inserted into the os hyoides first depress the bone, and, in proportion as this movement increases, the pterygoideus externus acts, and draws the condyle and inter-articular cartilage forwards upon the eminentia articularis. The displacement now more readily follows, because in the above-mentioned circumstances, the pterygoideus externus contracts in a powerful spasmodic manner.

When the lower jaw is dislocated, the bone is depressed and fixed in this position; the dental arches are separated by a space of about an inch and an half. The upper and lower teeth no longer correspond: the lower incisores are placed too much forwards; and it is at the same time manifest, that if the mouth were completely shut, these teeth would project beyond those above them. The grinders undergo an analogous displacement, each of the lower ones

advancing some distance more forwards, than its fellow in the upper jaw. The space between the molares of the two jaws is not very great, and, in many cases, the thumb can scarcely be got between those situated furthest back.

Except when the accident has been caused by outward violence, and the soft parts are much injured, there are only two indications in the treatment of a dislocated jaw; viz., to reduce the bone, and to keep it reduced.

In order to accomplish the first of these purposes, the patient is to be placed upon a low seat, and his head is to be supported against the breast of an assistant, who is to apply both his hands close round the forehead. The surgeon being in front of the patient, is to put his thumbs, covered with a handkerchief, or a thick pair of gloves, as far as he can betwixt the back grinders on both sides of the mouth. The fore-fingers are then to be applied to the crowns of the last surger grinders, while the body of the bone is grasped on each side with the rest of the fingers, which are to extend obliquely under its base. While the head is steadily held in the above way, the surgeon now presses directly downwards with his thumbs, by which means the condyles are separated a little way from the anterior part of the transverse process of the temporal bone. This movement is to be performed in an uniform manner, without either raising or depressing the chin. The condyles are then to be inclined backwards and a little downwards, by pressure applied to the back molares and the coronoid process, and at the same time, the chin is to be inclined with the fingers upwards and forwards.

As soon as the condyles slip into the glenoid cavities, the muscles generally act, and suddenly shut the mouth, so that, if the surgeon were not quickly to move his thumbs towards the cheeks from between the grinding teeth, they might be injured. Hence the prudence also of protecting them with a napkin, handkerchief, or, what is better, a thick pair of gloves. It must be acknowledged, however, that the danger here spoken of has been rather exaggerated by writers on surgery, as upon the reduction taking place, the muscles do not shut the mouth with the force generally represented.

OF THE HEAD.

The surgical injuries of the head are such as affect the scalp—such as produce concussion—such as produce compression of the brain.

Injuries of the scalp are not exempt from danger, as the integuments of the head have free connection with the parts within the skull by means of vessels. Contusions of the head sometimes occasion abscesses beneath the aponeurosis of the occipito-frontalis muscle. The matter ought to be evacuated as soon as its existence is ascertained; and, if possible, the opening should be made in a depending situation.

No wounds are more liable to be followed by erysipelas than those of the head; a circumstance explained by Pétit, Desault, and Bichat, by the supposition, that injuries of the head are particularly apt to disorder the hepatic functions, and thus produce a state of the constitution favourable to the occurrence of the erysipelas. It is on the same principle, that these celebrated men, with their countryman M. Larrey, attempt to account for the frequency of the abscesses found in the livers of persons who have died after injuries of the head; a thing which Richerand refers to the liver itself generally having suffered a concussion or mechanical injury at the same time as the brain. But, whatever may be the cause of these events, the facts remain incontestible, that the head is particularly liable to erysipelas from wounds, and that disorder of the liver, and even abscesses in this organ are common consequences of injuries of the head. When erysipelas comes on, the pain in the head grows worse; uneasiness and oppression about the liver are experienced; the skin becomes exceedingly hot, and the pulse hard, small, contracted, and frequent. The appearance of the wound at the same time becomes less favourable. If the injury be recent, its lips are puffed up and dry, without any secretion. Should it be already in a state of suppuration, the matter is yellowish

yellowish and foetid. The tension of the scalp is considerable, and, if the attempts at resolution fail, abscesses are formed, and the matter is commonly discharged by openings, which take place behind the ears, in the upper eyelid, or other situations.

When the symptoms are still more intense, delirium and coma ensue.

Fractures of the Cranium.—When the breach of continuity in the bone is very fine, it is termed a *fissure*; when wide and open, it is named a *fracture*. When the fracture happens in a situation at some distance from the spot on which the external violence has immediately operated, it is denominated a *counter-fissure*. The skull, at the fractured part, either continues on a level with the rest of the cranium, or it is depressed. The inner table alone is sometimes broken, while the external one remains entire.

Fractures of the cranium are in themselves by no means dangerous; that is to say, the simple breach of continuity in the bone, were it unaccompanied with other mischief, would rarely give rise to any serious complaints. In fact, fractures of the skull have often been known to get well without any bad symptoms whatever. The alarming symptoms which sometimes originate when the skull is broken, are occasioned by the bone being beaten inward, so as to press upon or even wound the brain; or by the sharp irregular edges of the fracture irritating the dura mater, and making it inflame and suppurate; or else by mischief done to the parts within the cranium by the same force which broke the bone itself.

A fracture of the cranium, without depression, is not only itself unproductive of any dangerous effects, it is also unattended with any particular symptoms.

Even fractures, with considerable depression of the bone, are sometimes unattended with urgent symptoms; and, in this circumstance, the application of the trephine is unnecessary. We shall see, from what follows, that there can only be one genuine reason for trephining, viz., to remove such pressure from the surface of the brain, as gives rise to bad symptoms.

But whenever these symptoms accompany a depressed fracture, the sooner the bone is elevated the better. Sometimes the inner-table is depressed, so as to wound the dura mater and brain, and cause perilous symptoms, while the outer-table is merely broken, and not thrown out of its natural level.

External violence, applied to the head, very frequently occasions a rupture of the spinous, or some other artery of the dura mater; and a large quantity of blood becomes effused on the surface of this membrane beneath the cranium. In many instances, the blood is extravasated between the dura and pia mater, or in the very substance or cavities of the brain. Extravasations between the dura mater and any part of the base of the skull are mostly fatal.

The symptoms of pressure on the brain, whether that pressure be caused by a depressed portion of bone, by blood, purulent matter, or a foreign body, like a bullet, lodged between the dura mater and skull, are all of one kind.

In cases of extravasation of blood, the patient is usually stunned by a blow, from which state he sometimes soon recovers; while, in other instances, he remains stupid and senseless. When he regains his senses soon after the first effects of the violence have subsided, and afterwards gradually relapses into a drowsy condition, and then into a state which we are about to describe, considerable light is thrown upon the case by there having been an interval of sense. That the following symptoms cannot arise from the concussion is proved by the patient having recovered his senses, which he at first lost by being stunned; that the symptoms cannot be imputed to a depression of any part of the skull, is clear, because the patient would have continued senseless from the first; that the same symptoms cannot be attributed to matter beneath the skull is certain, because the time would not have been sufficient for the formation of matter, and there have been no symptoms of inflammation of the dura mater. Here any reflecting man must know, that hæmorrhage beneath the skull must exist, and that in propor-

tion as it increased after the accident, it alone has induced the bad symptoms under which the patient labours.

Unfortunately, much obscurity is frequently occasioned by the effects of extravasation taking place, before those of concussion have subsided, in which case not the least interval of sense returns, and we know not whether to ascribe the general insensibility to the former or the latter cause. But the worst cases of all are those in which concussion and extravasation are co-existent.

When the quantity of blood is at first small, drowsiness and head-ach may be the only symptoms. When, however, the pressure on the brain is augmented by the increased extravasation, the patient is gradually deprived of all sensibility, as in apoplexy. The eyes are half open; the pupil dilated; the iris does not move, even when a candle is brought near the eye; there is no sickness, which would betray sensibility in the stomach and œsophagus; the pulse beats regularly and slowly; the fæces and urine pass involuntarily; and respiration is carried on with difficulty, and with a stertorous noise.

These symptoms indicate with tolerable certainty the existence both of extravasation and dangerous pressure on the brain; but it is to be lamented, that the surgeon has few or no means of judging with precision where the effused blood is situated, nor of course where he should perforate the cranium with the trephine. He neither knows whether the blood lies immediately under the skull, upon the outer surface of the dura mater; between the dura mater and tunica arachnoides; in the convolutions; in the ventricles; or deeply in the substance of the brain. Supposing it to lie upon the dura mater, he knows not the exact point of its situation.

The common rule in these cases is to apply the trephine to the place where any traces of external violence appear, the extravasation being often situated under that part of the skull which received the blow. Should an appearance of contusion be manifest on the scalp, after the head has been shaved and carefully examined; should the scalp be wounded; or lastly, should there be a visible fracture of the cranium; the perforation is to be made in the situation of such injuries. The practitioner, however, has often the mortification to find, that in following this plan, the extravasation being elsewhere situated, is not brought into view.

Paralysis is a symptom of pressure on the brain, and when it seems to affect one side of the body more than the other, and one pupil seems more dilated than its fellow, we have great reason to suspect, that the extravasation is on that side, on which there is least paralysis, and least dilatation of the pupil. In the Hôtel Dieu, however, the extravasation has frequently been found on both sides of the head, or generally diffused, even though the paralytic affection was local.

Mr. Abernethy has observed, that, when blood lies on the dura mater, the bone above it does not bleed when scraped. This is a most valuable remark.

When a considerable collection of matter forms on the surface of the dura mater, it finally produces the same sort of symptoms as have been just described.

The first effect of concussion consists essentially in a sort of contusion, or general irritation of the brain, occasioned by the shock, which every part of this organ has received.

Whatever may be the nature of concussion, certain it is, that it may happen in very different degrees. Of course, many varieties exist between that slight stunning, the sudden effect of an inconsiderable blow, and that complete disorganization, which, at the instant of the injury, annihilates at once all power of motion and every spark of life!

When the concussion has not been great, a transient stunning, a slight pain in the head, a little acceleration of the pulse, a vertigo and sickness sometimes immediately follow such accident; but none of these complaints last long, especially if evacuation has been used. In certain instances, however, the dura mater inflames after slight blows on the head, and this at a period when sometimes there is not the least apprehension of danger. If the violence has been great, the symptoms are as follow:—the patient is at first stunned and

in a state of total insensibility; his extremities are frequently cold, his pulse weak, slow, and intermitting; his respiration hardly perceptible; his power of motion abolished; in short, he is in a state which is the immediate result of the violent commotion which the brain has suffered. This is what Mr. Abernethy has so judiciously called the first stage of concussion. In proportion as the stupefaction, arising directly from the injury, goes off (supposing the violence not to exceed a certain degree, for then no signs of returning sensation follow), sickness, increased frequency of the pulse and respiration, more or less motion, and other symptoms take place, which are followed by marks of inflammation of the brain. The tendency to phrenitis gradually increases as the first effects of concussion subside. If the patient's eyelids are now opened, he will shut them again in a peevish manner; the pupil is contracted, and though the patient is regardless of slight impressions, he is not by any means insensible. As the case advances, the patient gets no sleep at all; has a wild look, an eye much like that of a person who has long watched through apprehension and anxiety; talks much and very inconsistently; has a hard labouring pulse; if not retained, he will get out of bed, and act with a kind of frantic absurdity; and, in general, he appears much hurt by a strong light. As the signs of delirium increase, the pulse becomes small, frequent, and even rapid. The inflammation under the skull may now produce suppuration, or a copious effusion of serum, and to the foregoing afflictions may be added those depending on the pressure of the secreted fluid. Stertorous respiration is said more particularly to indicate compression, than concussion.

Death is the unavoidable consequence of violent concussion; such is then the extent of the disorder, that every means are incapable of re-establishing the functions of the brain. But when the injury, which this organ has received is less considerable, its functions may be gradually restored in a more or less perfect state. Frequently the patient is for ever afterwards affected by the accident. Imbecility, loss of memory, and a marked change in the character, are sometimes the permanent consequences. In certain instances, the patient's memory remains weakened, and he can only recollect things which have very recently attracted his attention. Desault used to cite a curious case, in which the patient could at first only remember circumstances with which the mind had been lately impressed; but afterwards, he could recollect nothing, except what had happened in his childhood.

The treatment of concussion consists in taking away very copious quantities of blood repeatedly from the temporal artery and arm, giving antimonials, administering saline purges, and aperient clysters, and ordering a low diet. In the first stage of concussion, when all the animal functions are, as it were, at the lowest ebb, such measures, however, are not necessary. While the system is in this state, cordials and stimulants may be allowable, but when the second stage arrives, which is invariably attended with a tendency to inflammation of the brain, or its membranes, the antiphlogistic treatment holds forth the best chance of preservation. Counter-irritation should also be excited on the outside of the head by a large blister, which may afterwards be kept open with the savine cerate. It is wonderful, what immense quantities of blood it is necessary to take away in these cases, in order to keep down the symptoms of phrenitis.

Mr. Abernethy divides concussion into two stages. In the first, the system is senseless, and almost lifeless. Here, bleeding and evacuations are not essential, while stimulants and cordials can do no harm, and may perhaps do good, by promoting the return of sensation, the action of the heart and arteries, the function of respiration, &c. But, in the second stage, when the first effects of concussion have subsided, and the disposition to phrenitis is about to commence, reason and experience are decidedly in favour of copious and repeated bleeding, evacuations, low regimen, and blistering the head.

Operation of trephining.—This operation consists in re-

moving a portion of the skull, and is usually done for the sake of elevating a part of the bone producing dangerous pressure on the brain, or in order to give vent to collections of matter, or blood, which have the same effect; or to be able to extract a ball, or other foreign body lodged under the skull.

Every part of the cranium cannot be trephined with equal safety. The moderns consider, however, that the mere presence of a suture ought not to deter the surgeon from making the perforation in any place which seems advantageous; that the fears, respecting wounds of the longitudinal sinus, have been vastly exaggerated, and that if the situation of a depressed fracture or extravasation, demanded the removal of a piece of the skull directly over this vessel, the operation would be justifiable.

The longitudinal sinus has often been wounded by spiculae of the cranium, in cases of fractures; and it has been purposely punctured with a lancet, in order to bleed the patient; yet, the hæmorrhage was never known to be troublesome, after placing a little bit of lint over the opening. At the same time, it is as well to avoid it if possible. The frontal sinuses, then just over the middle meningeal artery, the lateral sinuses, and just over the spine of the os frontis, are the only situations in which the trephine should not be used.

When the bone is already sufficiently exposed by a wound, the operation may commence at once; but otherwise, it is first requisite to make room for the application of the trephine, by making an incision of a crucial form. Of course none of the scalp should ever be removed.

When the scalp has been divided, and loose splinters of the cranium are found lying underneath, they ought to be taken away with the forceps or finger. The depressed pieces of the skull are sometimes completely detached from the rest of the cranium, and may be taken away in the same manner.

In order to fix the centre-pin of the trephine, surgeons make a small hole in the external table of the skull with an instrument named a perforator. The crown of the trephine is to be alternately turned in one direction, and then in the other by the pronation and supination of the surgeon's hand. As soon as the teeth of the instrument have made a circular groove, sufficiently deep for fixing the trephine, the centre-pin is to be removed, lest it should injure the dura mater, before the internal table of the cranium is perforated.

When the sawing is far advanced, the surgeon must proceed with greater caution, and frequently examine with the point of a quill, whether any part of the circle is nearly, or completely sawn through.

In a few cases, the surgeon clearly perceives the entrance of the saw into the diploe, by the sensation which the instrument communicates to his fingers. However, he is not warranted in sawing too boldly, until a criterion of this sort takes place; for, in many skulls, the diploe is very thin, and in old persons obliterated.

When the operation is finished, the scalp is to be laid down in its natural position.

The trephine should never be used when the depressed portion can be raised by Mr. Hey's saws.

There is a very troublesome disease that follows, when any part of the cranium is removed either by disorganization or the trephine. It protrudes through an ulcerated opening of the dura mater, and very soon attains the magnitude of a pigeon's or hen's egg, the pia mater covering it seeming inflamed. As it enlarges, frequent hæmorrhages occur, and its surface is commonly darkened with coagulated blood. In a few cases, it is not attended with loss of the mental faculties, though in most instances we find that coma, insensibility, and other marks of pressure on the brain, accompany the disease.

According to Mr. Abernethy, this singular malady seems to proceed from an injury done to a part of the brain at some distance from its surface, which injury produces a diseased state of the vessels, similar to what occurs in apoplexy. The morbid state increasing, one or more vessels give

give way, and an effusion of blood into the substance of the brain follows. This occurrence, if the skull were entire, would probably occasion apoplexy; but when there is a deficiency of bone, that allows the brain to expand, this viscus and its membranes protrude through the aperture. The dura mater soon ulcerates, and the tumour rapidly increases, in proportion as the internal hæmorrhage goes on. At last, the pia mater, and stratum of the brain, covering the effused blood, give way, and the blood oozes out and coagulates. In the cases recorded by Mr. Stanley, however, the protrusion consisted both of the cortical and medullary substance of the brain, and the effused blood is described as merely lying upon the surface, and not extending thence to any other place.

The best practice is to repress the increase of the swelling by pressure, which, in cases where the tumour is already large, must be preceded by a removal of the protruding mass with a scalpel, and to combine with such treatment copious evacuations of blood. The pressure may be exerted to a very great extent.

Fungous tumours sometimes grow from the external surface of the dura mater, and, after destroying the superincumbent portion of the cranium, make their appearance in the form of an external swelling under the scalp.

The severe pains in the head, which precede the appearance of the disease externally, become still more violent as soon as the fungus protrudes through the opening in the bone, and is irritated by the sharp inequalities of the edge of the aperture. The swelling has a manifest pulsation corresponding to that of the arteries, and when compressed, it either returns entirely within the cranium, or is considerably lessened. The pain then subsides, the tumour being no longer irritated by the irregular circumference of the opening in the skull. But should the size of the fungus be large, no relief can be thus obtained; for, when an endeavour is made to reduce the tumour, all the alarming symptoms of pressure on the brain are immediately excited.

Fungous tumours of the dura mater constitute an exceedingly dangerous disease, and mostly prove fatal.

Before a fungus of this description has made its way through the cranium, and projected under the scalp, so that its nature and existence can be ascertained, the practitioner has no opportunity of attacking the disease with any effectual means. The ordinary treatment of the severe pain occurring in certain parts of the head, after blows or falls on the cranium, and before the fungus protrudes, has consisted of bleeding and evacuations. But when the disease has manifested itself in the form of an outward swelling, the nature of which is recognised by previous circumstances, as well as by the pain which attends it, and subsides on its reduction and its pulsatory motion; the surgeon should have the head shaved, make a crucial incision in the scalp covering the fungus, dissect up the angles, and fairly bring into view the whole of the tumour, and the margin of the opening through which it protrudes. But as it is impossible to get at the entire root of the fungus, while it is closely embraced by the cranium, it becomes necessary to saw away the surrounding bone. This object has generally been accomplished very inconveniently with the trepan or trephine, which, while it cuts away more of the cranium than is requisite, cannot effect the removal of every part of the bony circumference, and the surgeon has to break away the pieces betwixt the perforations with a gouge and mallet after the manner of the French surgeons. The best instruments for cutting away the surrounding part of the cranium, are the saws described by Mr. Hey. With these, the division of the bone may be made in any direction desirable.

The root of the fungus being thus exposed, the next business is to cut the swelling away, which is most effectually done by carefully dissecting out the part of the dura mater with which it is connected.

The preceding operation is not practicable, when the fungus protrudes at the orbit, or very near the ear. The

upper part of the head is evidently the most favourable situation for such a measure.

Diseases of the Eye may be divided into such as are deep-seated, and those affecting superficial parts. We shall speak, then, first of the eyelids.

Ectropium is an affection in which the inner lining of the palpebra is turned outward, and the lower portion of the eyeball is uncovered. The consequence is, that the exposure of the eye and sensible lining of the eyelid induces in these parts a species of chronic inflammation, not only attended with a constant flux of tears and pain, but also with a preternatural redness and thickening of the lining of the affected eyelid. At length, the exposed membrane is converted into an indurated, callous substance, which lies just under the globe of the eye. The disease obstructs the flow of tears towards the inner angle, and through the puncta lachrymalia, and the complaint is always attended with a weeping of the eye.

One of the most common causes of this malady is a contraction of the integuments of the eyelid, or neighbouring part of the face, after the cicatrization of burns, ulcers, and wounds.

Slight cases, arising in this manner, may sometimes be cured, by keeping the eyelid gradually raised more and more every day, with small strips of sticking plaister, which are to be applied to the outside of the affected eyelid, and to the lower part of the forehead. This method, however, is seldom permanently efficacious.

In most instances, it is necessary to remove a considerable portion of the thickened exposed lining of the eyelid, with the aid of a convex bistoury, and a pair of dissecting forceps; and afterwards, in proportion as the wound heals, the eyelid, being properly supported by a compress and bandage, returns to its natural position. In the operation, care must be taken not to cut the puncta lachrymalia. The eyelid is drawn inward again by the same principle which caused its eversion, viz., the contraction of the cicatrix.

The eyelashes are subject to the diseases called *trichiasis*, in which they are turned inward toward the eyeball. Trichiasis is of two descriptions; in the first, there is no defect of the eyelid, and the whole grievance depends entirely on the wrong direction in which the eyelashes grow; in the other, the defect lies altogether in the eyelid itself, the margin of which is preternaturally turned towards the eye, so that the cilia rub against the front of this organ, and cause considerable inconvenience. The latter case, which is by far the most common, is termed *entropium*.

It is observed by Mr. Saunders, that the superior palpebra, when inverted in the slightest degree, is the cause of a most vexatious irritation of the eye; but when a large portion is inverted, the case becomes truly distressing, from the violent ophthalmia which is produced. The friction of the cilia against the eye is incessant, and from the continual suffering, the patient's health and strength decline. The cornea is ulcerated, and becomes opaque, and the sight is ultimately destroyed. Nor is this the end of the patient's misery; except, as occasionally happens, the cornea becomes thickened and indurated in an extraordinary degree, assuming a white appearance, like that of a macerated ligament. If this be the case, the patient finds ease in the insensibility of this new formed substance.

The appearance of the disease in its inveterate form, is truly disagreeable. The discharge, the copious flow of tears, the excoriation of the cheek, the opacity of the cornea, the villous, granular, or fungous conjunctiva, compose altogether a disgusting sight. The patient carries his head obliquely, and attempts, in the most awkward manner, to direct the pupil towards the objects which he wants to see. Indeed, when it is the upper eyelid which is inverted, the patient, in order to evade turning up the eye, distorts the head so as to seem as if he had a wry neck.

The cure of the first description of trichiasis consists in plucking out the inverted hairs, and preventing their growing again in the same direction. When many project inward,

ward, it is as well to be content with eradicating a few every day, lest the operation should create too much pain and inflammation. The prevention of the hairs from growing again in the same position is frequently very difficult; and, except in young subjects, in whom a frequent repetition of this method of extracting the hairs sometimes leads to a radical cure, Beer states, that the practice is to be considered only as a means of palliation.

After plucking out the hairs, the most successful plans are to smear the whole inner half of the margin of the eyelid, by means of a fine hair pencil, with the *aq. ammon. pur.*; or a solution of the *argentum nitratum*; or else to remove a piece of the skin, containing the roots of the inverted cilia, as proposed by Mr. Saunders.

The second kind of case, called entropium, is the most frequent. In the upper eyelid, the defect is often owing to a relaxed state of the levator muscle; and then it may sometimes be cured by supporting the eyelid for a certain time, with the aid of sticking plaister; but if this plan fails, a cure may always be accomplished by cutting away, with the aid of a pair of forceps and scissors, a fold of the integuments near the edge of the tarsus. Care should be taken to do this just in the middle of the inverted part. The wound is then to be closed, as well as circumstances will allow, with sticking plaister, compresses, and a bandage. In proportion as the contraction of the cicatrix follows, the eyelid will be restored to its right position.

Ptosis is a disease which consists in an inability of properly raising the upper eyelid. Of this, three varieties are noticed: the first depends on a preternatural elongation of the skin of the upper eye-lid; the second, on a weakness or total paralysis of the levator muscle; and the third, on a spasmodic contraction of the orbicularis palpebrarum.

"The first example is the most frequent, and is cured by the removal of the redundant integuments of the eyelid.

"The second species is principally met with in old persons, in whom the cure is often impracticable. This sort of ptosis sometimes seems to be symptomatic of other affections, chlorosis, irritation in the stomach and bowels, worms, &c., while in other examples it is entirely a local defect.

"The chief means of cure are, the external use of the tincture of cantharides and cold water; the shower bath; the internal exhibition of bark; the use of camphorated liniments; electricity. This ptosis is frequently periodical.

"The third species of ptosis arises from a spasmodic affection of the orbicularis muscle, and is the most uncommon. The affection is never continual, but makes its attacks at certain or uncertain periods, and its duration varies in different cases.

"The spasmodic ptosis usually depends on some sympathetic irritation in the system. The removal of this particular irritation, whatever it may be; the internal exhibition of antispasmodics; applying a blister to the temple, and bathing the eye with warm milk containing saffron, or with a decoction of poppy-heads or *cicuta*; form the usual method of the treatment."

Lagophthalmus, or hare-eye, is a complaint, in which the eyelids cannot be shut, nor the eye covered. The inconveniences resulting from the disease are of various kinds. The eyes weep constantly, because the interruption of the alternate closure and opening of the eyelids hinders the tears from passing into the nose: the patient becomes blind in a very light situation, in consequence of his not being able to diminish the rays of light which fall on the eye; and, on the same account, the sight becomes gradually very much weakened; the patient cannot sleep in a chamber into which any light enters; and the extraneous substances in the atmosphere settling on the eyeball, cannot be washed away by the action of the eyelids, so that they occasion irritation, pain, and redness.

The cause of this complaint sometimes depends on a swelling or protrusion of the eyeball out of the orbit. But the defect commonly lies in the upper eyelid. Sometimes,

though very seldom, it originates from a paralytic affection of the orbicularis muscle. This case requires the same kind of treatment as the second species of ptosis.

Lagophthalmus most frequently arises from a contraction of the skin of the upper eyelid, in consequence of wounds, abscesses, burns, &c. This case is to be treated on the same principles as the ectropium.

Until the complaint is permanently cured, the eye should be protected by a shade from exposure to a strong light.

Tumours of the eyelids are of various kinds. The hordeolum stye is always situated at the edge of the eyelids. It is a very small circumscribed tumour, about the size of a barleycorn. An inflamed stye is commonly extremely red and painful; and is very similar, in every respect, to a small boil, or an inflamed encysted tumour.

The cure of the inflamed stye demands the external employment of emollient applications; for, the tumour always suppurates, and the more this is promoted, the sooner is the patient freed from inconvenience. Even when the stye has already suppurated, emollients are the best applications, until the hardness has subsided. When the suppuration has terminated, a weak solution of the acetate of lead may be used to disperse the remaining redness and swelling.

The *indurated* stye, as it is called, occasions a good deal of inconvenience, by frequently inflaming and becoming painful, hindering the motion of the eyelids, and preventing the free enjoyment of sight. The best mode of curing this disease is to touch the little induration with the *argentum nitratum* until it is destroyed.

Encysted tumours of the eyelids are most frequently situated immediately under the skin, but sometimes they lie so deeply, that they can be taken out more easily from the inside than the outside of the part. They seldom become very large, and are more commonly observed on the upper, than the lower eyelid. When they have attained a certain size, they hinder the elevation of the eyelid, and occasion ptosis, they should be cut out.

Of conjunctivitis.—The irradiation of red vessels over the white eye-ball, terminating in a short time in a perfect continuous blush, marks conjunctivitis. There is in this complaint, at first, a copious flow of tears, but a great dryness, or want of secretion is manifested. A sense of grittiness in the eye-ball, and a great deal of pain, much aggravated by light, also attend. Much constitutional disorder is also present. The inflammation is subdued by a full general bleeding, followed by local bleedings, and warm fomentations to the part affected, and by purgation and low living.

In general, inflammation of the conjunctiva is a very manageable complaint. It passes into chronic inflammation, after the acute stage has continued for a certain time, and it not unfrequently subsides of itself. A spontaneous cure, however, is by no means to be trusted to, because simple inflammation of this membrane may lead to inflammation of the deeper seated tunics of the globe of the eye. The consequences of inflammation of this membrane are very similar to those of inflammation in other parts of the body. It sometimes terminates in effusion, the serum or blood under the conjunctiva rising in a roll above the transparent cornea, and forming the appearance called chemosis. It sometimes produces the adhesive process, and when it terminates in this manner, the adhesive matter is deposited under the conjunctiva, which covers the transparent cornea, and is recognized by a hazy appearance at the part. This is technically called nebula; when considerable in quantity, and very opaque, it is called albugo, or leucoma. The inflammation sometimes proceeds to the suppurative process. Ulceration is also sometimes produced; this usually occurs in the cornea, in consequence, probably of its denudation or exposure. Lastly, sloughing and mortification of the cornea, is not an uncommon effect of a high degree of inflammation. In chronic inflammation the redness is less intense, the pain less acute, the intolerance of light less, the chemosis and swelling diminished, the effusion of tears less considerable, the

the constitutional irritation a great degree have subsided, and, in short, all the acute symptoms much mitigated. There still however remains a considerable degree of irritability in the eye, on exposure to light, some artificial defence to exclude the light will be necessary, and the person will still be incapable of applying the organ to the ordinary purposes of vision.

The treatment of the chronic conjunctivitis may be considered in conjunction with that of the terminations of acute inflammation, the object in the former is to excite new action, and constrict the dilated blood vessels; for this purpose a variety of lotions are in use. A few drops of tincture of opium, put into the corner of the eye with a camel-hair pencil, or syringing the eye with solutions of lead, seem to answer as well as any thing. No local treatment is however likely to be successful, if the general health remains unimproved. And in strumous subjects especially we find chronic inflammation, and its consequences, excessively troublesome. The consequences of conjunctivitis, are treated of course according to their various natures in various ways. Nebula may generally be removed by mild stimuli, not however, that these must be used while any inflammation of consequence is going on. Pustules sometimes occur on the conjunctiva. These are generally seated at the junction of the transparent with the opaque cornea; but they may sometimes occur in the cornea itself, or the conjunctiva covering it, or the ball. The appearances that they present at first are red or yellowish spots arising from a deposit of lymph in those parts, and are slightly elevated. These ulcers are difficult to manage, as they often occur in scrofulous habits of body, and broken up constitutions, and are apt to become chronic, and consequently difficult of cure. As for the treatment this affection requires, it will be hardly necessary to say, that if considerable inflammation exists, depletion must be employed.—The inflammation, however, is of the atonic kind.—First apply leeches, not in too large numbers, so as to carry depletion to too great an extent—it will be proper to evacuate the bowels, not by drastic purges, but mild aperients, and to attend to the secretions. Blisters will be useful if the sight be affected. Mild astringent collyria used; the best is the vinum opii.

Fungus sometimes grows on the conjunctiva. It becomes loose and red; the vessels turgid with blood, and there is a fold of this membrane on the inside of the lids, which produces considerable irregularity on its surface—a morbid secretion is kept up on the part—and not unfrequently eversion of the lids is the result. To prevent this, and remedy the complaint, the loose portion of the conjunctiva should be removed with a pair of curved scissors.

The same treatment may also be used, when we find little granulations growing on the membrane, or when we have a pterygium (which is a little triangular thickening between the cornea and the inner canthus), or an encanthus, (which is a granulated thickening of the caruncula lachrymalis).

Next to the conjunctiva, the iris is that texture of the eye which is most frequently affected with inflammation, and the changes which this process occasions, can no where else be so distinctly seen and examined.

Scarcely any disease to which the eye is subject, has a more immediate or rapid tendency to destroy vision, than inflammation of the iris. In the *idiopathic iritis*, as (Professor Schmidt observes,) besides the common symptoms of ophthalmia, certain changes happen at the very commencement, indicating the seat of inflammation. The pupil appears contracted, the motions of the iris are less free, and the pupil loses its natural bright black colour. The brilliancy of the colour of the iris fades, and it becomes thickened and puckered, with its inner margin turned towards the crystalline lens. The change of colour happens first in the lesser circle of the iris, which becomes of a darker hue; and afterwards in the greater circle, which turns green, if it had been greyish or blue; and reddish, if it had been brown or black. The redness accompanying these changes is by no means con-

siderable, and is at first confined to the sclerotic coat, in which a number of very minute rose-red vessels are seen running in straight lines towards the cornea. In the words of Mr. Saunders, the vascularity of the sclerotica is very great, whilst that of the conjunctiva remains much as usual; the plexus of vessels lying within the latter tunic. The insculcations of these vessels are numerous, and form a species of zone at the junction of the sclerotica and cornea. Here the vessels disappear, not being continued over the transparent cornea, as in a case of simple ophthalmia, but penetrating the sclerotica, in order to pass to the inflamed iris. The irritation caused by the light is distressing, and the patient is much incommoded by any pressure on the globe of the eye, or by the rapid or sudden motions of this organ. Considerable uneasiness is felt over the eyebrow, and acute lancinating pains shoot through the orbit towards the brain. The pupil loses its circular form, becomes somewhat irregular, and presents a greyish appearance. Examined by means of a magnifying glass, this appearance is seen to be produced by a substance very like a cobweb occupying the pupil, and which can soon afterwards be distinguished, even without the aid of the glass, to be a delicate flake of coagulable lymph. Into this, says Professor Schmidt, the processus or dentations of the irregular pupillary margin of the iris seem to shoot, and it is afterwards found that adhesions are apt to be established at these points. Owing to these adhesions, the patient, whose vision has been all along indistinct, now complains of being able to see only one side or part of an object. Occasionally, when the cornea has been attacked, it becomes cloudy, thickened, and adherent to the iris, before any visible effusion of lymph takes place; or, when the inflammation is violent, and extends to the other tunics, the eye is totally destroyed by suppuration; but the disease rarely advances to this extreme, and generally terminates in the adhesive stage. Lymph is then deposited on the anterior surface of the iris, and between the iris and the capsule of the crystalline lens, and often in so large a quantity, as to extend through the pupil, and drop pendulously to the bottom of the anterior chamber. If this process is not interrupted, the pupil is entirely obliterated, or the iris adheres to the capsule of the lens, leaving only a very minute aperture, which is most commonly occupied by an opaque portion of the capsule, or of organized lymph, and the patient is totally blind.

From the preceding description, it is evident that the principal danger in iritis depends upon the effusion of lymph, its quick organization, the rapid formation of adhesions between the iris and other parts, and the closure and obstruction of the pupil. Of late years great improvement has unquestionably been made in the treatment of this disease, an improvement derived from a knowledge of the fact, that mercury is one of the most effectual means of stopping the effusion, and promoting the absorption, of lymph in the adhesive inflammation.

In the idiopathic iritis, before lymph is effused, copious bleeding either from the temporal artery or veins of the arm, and cathartics, followed by nauseating doses of tartarized antimony, with a view of enfeebling the pulse, are the means from which most benefit may be expected. When general bleeding has been carried as far as the state of the pulse will allow, leeches are to be applied to the vicinity of the eye, and their application repeated at short intervals. When the inflammation stops in this stage, the cure may be completed by covering the eye with linen, wet with a collyrium of the acetate of lead, and keeping the patient for some time in a dark room. Professor Schmidt, however, describes cold local applications as quite useless in iritis, and he says, the only topical treatment which is admissible, is the fomentation of the eye with water, made as warm as the patient can bear, which will sometimes mitigate the violence of the pain. In the first stage of the process, he observes, that blisters to the temple, or behind the ears, have little or no effect, though a large one on the nape of the neck sometimes seems to be of service.

When the disease, however, advances to the stage in which the effusion of lymph begins, every possible means must be adopted for resisting this process, and bringing about the absorption of the substance already deposited in the posterior chamber, in the pupil, or upon the iris. Of all remedies for this purpose, none merits so much encomium as mercury, which must be freely exhibited, in order to affect the constitution as soon as possible. The ointment, or the pil. hydrarg. with opium, may be employed, and often it is right both to exhibit the medicine internally, and have recourse to frictions. In this second stage of iritis, Professor Beer gives calomel united with opium, applies to the eye a solution containing oxymuriate of mercury, mucilage, and a considerable quantity of vinum opii; and when this collyrium loses its effect, he introduces daily between the eyelids a small quantity of a salve, composed of two drachms of fresh butter, six grains of red precipitate, and eight grains of extract of opium. He observes also, that frictions once a day, over the eyebrow with mercurial ointment, containing opium, will very much assist in producing an absorption of the effused lymph. The tendency of the iris to expand, and the pupil to contract, the late Mr. Saunders used to oppose by the use of the extract of belladonna, with which he sometimes smeared the eyelids and eyebrows.

Closure of the pupil sometimes occurs in consequence of violent inflammation of the internal membranes of the eye, especially the iris. In particular instances, the malady follows the extraction and depression of the cataract, but without any inflammatory affection of the interior of the eye appearing to have any share in its origin. After an indeterminate time from the operation, the pupil is perceived to diminish in diameter daily, without any evident cause, and ordinarily closes so much, that it can hardly admit a pin's head. The iris is motionless, assumes a radiated rugous appearance, and, when no opacity exists behind it, a little black speck is seen in its centre. In this state if the retina be sound, the patient may sometimes regain a considerable power of vision, by having an artificial pupil formed.

Cheselden was the first who performed an operation, with a view of diminishing the blindness produced by this malady; he introduced a couching needle, having a sharp edge only on one side, through the sclerotica, about a line and a half from the margin of the cornea. After perforating the iris, towards the external angle, and then pushing the point of the needle transversely through the anterior chamber, as far as the edge of the iris next the nose, he turned the edge of the instrument backward, and withdrew it, so as to make a transverse division of the iris.

Janin practised this method in two instances, but without success, as the edges of the opening after a time united. Here, Baron Wenzel practised the excision of a portion of the iris. He introduced the point of the cornea knife into the anterior chamber, exactly in the same manner as in the extraction of the cataract, but when it had arrived nearly as far as the centre of the iris, it was plunged into this membrane, and then, by a slight motion of the hand backward, it was brought out again, about the distance of three quarters of a line from the part in which it entered. Next, the incision being continued as in cases of cataract, the section of the iris was completed before that of the cornea, and presented a small flap, which was cut off with a pair of scissors.

Beer opens the cornea, draws out the iris by means of a fine hook, and removes a small portion of this membrane.

Hypopium is an accumulation of a glutinous yellowish fluid, like pus, in the anterior chamber of the aqueous humour, and frequently also in the posterior one, in consequence of violent ophthalmia.

The symptoms exciting apprehension of an hypopium, are the very same which occur in the highest stage of violent acute ophthalmia, viz., prodigious tumefaction of the eyelids, redness and swelling of the conjunctiva, as in chemosis; burning heat and pain in the eye; pains in the eyebrow and nape of the neck; fever; restlessness; aversion to light, and a contracted state of the pupil.

During the first stage of violent ophthalmia, while the

hypopium is increasing, the same treatment as is recommended for severe acute inflammation of the eye is the most proper. In the second stage of the ophthalmia, when the hypopium has become stationary, the surgeon must endeavour to quicken the action of the absorbents in the eye. Camphorated emollient poultices may be applied; the vapours of the spir. ammon. comp. may be directed against the eye, through a tube two or three times a day; a blister may be put on the nape of the neck, and when the irritability of the organ has diminished, the vitriolic collyrium may be used. This may be afterwards strengthened by the addition of a few drops of camphorated spirit. Under such treatment, hypopium most commonly disappears, in proportion as the chronic ophthalmia is relieved.

When the secreting extremities of the arteries, and the minute mouths of the absorbent vessels of the eye do not act in their naturally reciprocal manner, the organ may become distended with a morbid redundancy of an aqueous secretion. This disease constitutes what is termed dropsy of the eye, and is at first attended with great weakness, and afterwards with total loss of sight.

In the last stage of the disease, when the dropsical eye projects from the orbit, so as not to admit of being covered by the eyelids, with the inconveniences already enumerated, others associate themselves, arising from the dryness of the eye; the contact of extraneous bodies; the friction of the eyelashes; the very viscid secretion from the eyelids; the ulceration of the lower eyelid, and even of the eye itself. Hence, the advanced stage of dropsy of the eye induces violent ophthalmias, followed by ulceration and a total destruction of the organ.

In the incipient period of the disease, it is usual to prescribe mercurials, or cicuta, and make a seton in the nape of the neck. Scarpa describes astringent applications as hurtful, and recommends the eye to be bathed with a decoction of mallows.

When the disease has attained such a pitch, that the eye protrudes from the orbit, there is no means of opposing the grievous dangers now impending, except making an incision, in order to evacuate the superabundant fluid in the eye. But simply puncturing the eye is no more adequate to produce a permanent cure of the dropsical affection, than puncturing the tunica vaginalis is sufficient to effect a radical cure of the hydrocele. Besides discharging the redundant humours contained in the organ, inflammation and suppuration must be excited. For this purpose, a portion of the centre of the cornea, about as broad as a pea, is to be cut out, and so much of the humours is then to be pressed out as will permit the eyelids to be brought over the eye. Nothing but a pledget of dry lint, kept on by a bandage, is to be applied before the inflammation has taken place, which is usually about the third or fifth day. Then antiphlogistic means may be adopted, and emollients employed.

After operating for the relief of the present affliction, a fungus occasionally grows out of the internal part of the eye. Such an excrescence was, in one instance, destroyed by the external employment of belladonna. But, in case this or other means fail in preventing the reproduction of the fungus, it is the duty of the surgeon to recommend the entire extirpation of the diseased organ.

"Carcinoma of the eye is said to make its appearance in three forms. Sometimes the eyeball becomes irregular and knobby, and swells to the size of an apple; the sight is gradually lost; the blood-vessels in the white of the eye enlarge; and the whole external and internal structure of the organ becomes so altered, that the part resembles a piece of flesh, and no vestiges of its original organization remain. Sometimes a portion of the cornea is still visible, within which a small aperture is also discernible, through which can be distinguished the remains of the vitreous humour, and of the choroid coat. In some instances, the eyeball is ulcerated, and emits a foetid discharge; while, in others, there is not the smallest appearance of ulceration, and the eyeball resembles a piece of firm flesh. The patient usually experiences from the first considerable burning, and at last, violent

violent darting pains in the organ extending over one side of the head. This is the most frequent description of cancer of the eye.

Sometimes excrescences form upon the anterior surface of the eye, especially upon the transparent cornea, and frequently admit of being radically cured by the knife, caustic, or ligature. But, occasionally, they repeatedly grow again after the employment of these means, becoming broader, more malignant, and even cancerous, and at length, changing into a spongy fungus, which is very painful, covers the whole anterior surface of the eye, and renders extirpation indispensable. This is the second species of cancer of the eye.

On several occasions, ulcers form on the front of the eyeball, which, though generally curable by proper means, sometimes are exceedingly inveterate, entirely destroying the eyesight, and becoming so malignant as to obtain the appellation of cancer. This is the third form of the disease."

According to Scarpa, we have no pathognomonic symptoms, excepting one, indicative of the exact period when the sarcoma of the eye changes from a benign fungus to carcinoma. The exquisite sensibility, darting pains, rapidity of growth, colour, and ichorous discharge, are by no means a sufficient criterion, and, says Scarpa, the only symptom, if not entirely pathognomonic, at all events less uncertain than any other, is the almost cartilaginous hardness of the malignant ulcerated fungus, which induration is not met with in the benign fungus, and never fails to precede the formation of cancer.

Cancer and fungus hæmatodes of the eye, however, are the two diseases, for which the extirpation of the eye is commonly required.

In the performance of the operation, there are two important circumstances to which attention ought to be paid. The first is, to remove every particle of the disease, and leave none of the affected parts behind. The second is, to avoid piercing or injuring the orbit, behind which the dura mater is immediately situated.

In order to be able to separate the eyelids far enough from each other, for the easy removal of an eye that is much enlarged, it is sometimes recommended, in the first instance, to make an incision through them at their external commissure. The patient should lie down on a table of convenient height, with his face exposed to a good light.

The best instrument for the operation is a common scalpel. When the diseased part is very large, a knife, somewhat curved, has been occasionally used for dividing the parts deeply situated in the orbit. Scarpa uses a knife for the division of the conjunctiva and superficial connections, and completes the rest of the incisions with a pair of curved scissors. The patient being placed in a horizontal posture, and the upper eye-lid raised by an assistant, and the lower one depressed by the surgeon himself, the conjunctiva, connecting the eye with the two eye-lids, is first to be divided.

As when the eye-ball is enlarged, it mostly falls towards the cheek, so that an incision between the diseased part and the lower eye-lid cannot easily be made, Richter recommends first, separating the globe from the upper eye-lid, then dividing the superior and lateral attachments of the eye; and, lastly, its connections with the lower eye-lid. This mode of operating is said to be the more easy, because the globe of the eye can always be more readily inclined downwards, so as to make room above, than pushed upwards for the purpose of making room below.

Scarpa, after dividing the external commissure of the eyelids, if the tumour be very large, perforates the conjunctiva at the external angle, and from thence, keeping the knife close to the upper plane of the orbit, as far as the caruncula lachrymalis inclusively, cuts through the elevator muscle of the upper eye-lid, the tendon of the greater oblique muscle, and the superciliary nerve. The diseased eye-ball being then raised, and the lower eye-lid depressed, the incision is next continued along the inferior segment of the orbit, from the external towards the internal angle; by doing which, the knife will penetrate between the orbit and lesser oblique

muscle, and not pass between the eye-ball and this muscle, as would happen in cutting in the opposite direction. The eye freed from these attachments, and from that formed by the nasal branch of the ophthalmic nerve, will fall on the external side of the orbit, and give the surgeon room on the internal side as far as the bottom of the orbit, where he is to divide, with one stroke of the scissors, the origin of the muscles of the eye and the optic nerve. He is then gently to bring his finger round to the external side of the orbit, and push its contents a little towards himself, while, with a second stroke of the scissors, he divides all the parts which enter the orbit through the sphæno-orbital fissure.

Until the optic nerve has been divided, the operator must avoid drawing the eye-ball too forcibly forwards.

As soon as the eye has been completely detached, all the inside of the orbit should be very carefully examined, and whatever indurated parts are found should now be diligently removed. In particular, the surgeon should introduce his finger along the inner side of the orbit, where he will feel the greater oblique muscle, which he must dissect away by means of a tenaculum and the scissors.

All writers agree concerning the propriety of cutting away one or both the eye-lids, whenever they are affected with cancerous disease; but in all other instances they should be spared.

The first appearances of a fungus hæmatodes of the eye, according to Mr. Wardrop, are in the posterior chamber. The pupil becomes dilated, of a dark amber, or greenish hue, instead of its natural deep black colour, and iris immovable. Mr. Ware states, however, that the first symptom is a white shining substance in the posterior part of the eye, visible through the pupil in some particular positions of the head; but not in all; an appearance compared to that of burnished iron. As the disease advances, this deviation from the natural appearance of the pupil is discovered to be produced by a solid substance, which is formed at the bottom of the eye, and gradually approaches the cornea. At length the excrescence occupies the whole interior of the eye behind the iris, and appears through the pupil to be of an amber or brown colour.

When the disease advances still further, the form of the eyeball begins to alter, acquiring an irregular knobby appearance; and at the same time, the sclerotic coat loses its natural pearly white colour, and becomes of a dark blue, or livid colour. The tumour, by its continued growth, finally occupies the whole anterior chamber; and in some cases a quantity of purulent matter collects between the diseased mass and the cornea.

At last, the cornea ulcerates, and a fungous tumour shoots out, or else the excrescence makes its way through the sclerotic coat, and is then covered with the conjunctiva.

The protruded fungus is generally rapid in its growth, often attains a large size, is of a dark red, or purple colour, has an irregular surface, and is frequently covered with coagulated blood. It bleeds profusely from the slightest causes, and when it is large, its most prominent parts are apt to slough.

In some cases, the optic nerve becomes thicker, firmer, and harder, than common, assumes a brownish ash-colour, and loses its natural tubular appearance. Sometimes, it is converted into a tumour, of the figure and size of an olive, the disorganized substance of which exactly resembles that of the fungus, which fills the orbit, and projects beyond the eyelids. In other instances, the nerve, besides being altered in its structure, is split into one or more pieces, the morbid growth filling up the intervening spaces, and surrounding the different portions of the nerve. The divided parts of the nerve are entirely deprived of their proper structure and colour.

Among many other particulars, Mr. Wardrop mentions, that when the optic nerve is diseased, the alteration in its structure generally extends as far up as its junction with the opposite nerve. In many cases, it extends further, the thalamus being converted into an irregular, soft pulpy mass, more or less blended with blood. Sometimes, the dura matter and

and pericranium exhibit dark red-coloured spots; and, on other occasions, the tunica arachnoides and pia mater are studded with numerous white spots, which, on being cut into, are found to be small bags, or abscesses containing a white viscid fluid, like cream.

It appears, that children are far more subject, than adults, to fungus hæmatodes of the eye; for out of 24 cases, with which Mr. Wardrop has been acquainted, 20 have been in children under 12 years of age. Bichat informs us, that more than a third of the patients, on whom Desault operated for carcinoma of the eye, were under the same early age; and this circumstance is not surprising, when we reflect, that this eminent surgeon did not discriminate fungus hæmatodes from cancer. The truth is, the latter distemper mostly afflicts persons advanced in years; while the former prevails most frequently in children; a circumstance strongly proving the dissimilarity of the two affections.

According to the observations of Mr. Wardrop, when the fungus hæmatodes takes place in children, they generally lose the sight of the affected eye, before the disease is at all noticed by the parents. In many cases, however, the appearance of the diseased substance at the bottom of the eye is preceded by a blow and inflammation of the organ. But when no external violence is concerned, the first perceptible symptom is merely a little fulness of the vessels of the white of the eye. Sometimes the iris is full of vessels, its colour changes and the pupil is considerably dilated and motionless. The child seldom complains of much pain; but sometimes appears languid and feverish.

In adults, the disease generally begins without any apparent cause; though, sometimes, it seems to arise in consequence of a blow. As in children, it commences with a slight redness of the conjunctiva, and an impairment of vision. These symptoms increase slowly, and at length are followed by headaches, which often become exceedingly agonizing, especially during the night, and continue with violence, until the eye bursts, and the humours are discharged.

In most cases, only one eye has been affected with the disease. In some examples, however, the distemper extends to both.

As surgeons are utterly unacquainted with any internal or external medicine which have the power of checking or curing the fungus hæmatodes of the eye; and as it is the nature of the disease to extend its ravages till the patient is destroyed, the only chance of preservation depends upon the early extirpation of the affected eye, care being also taken to remove every part in the orbit having any appearance of participating in the distemper. Hitherto, however, the disease has mostly recurred after the operation, and ultimately proved fatal. Indeed when we consider that the disorder generally spreads along the optic nerve, we must be prepared for this unfortunate truth.

A blindness which occurs when all the parts of the eye appear healthy, is called Amaurosis, or Gutta Serena. It arises from inaction of the optic nerve. If this inaction arise from any permanent change in the structure of the nerve, or of the part of the brain, to which it goes, the case is hopeless, but a mere debility of the nerve may be cured.

The blindness, produced by the gutta serena, is generally preceded by an appearance of numerous insects, or substances like pieces of cobwebs, interposing themselves between the objects and the eye. The origin of a cataract, on the other hand, is usually attended with a simple cloudiness in vision.

As Beer has observed, the various cases of gutta serena all admit of being comprised in two classes; one attended with a diminution in the irritability of the whole eye, and where the patient constantly seeks a strong and brilliant light; the other characterized by great tenderness and irritability of the organ, and an aversion to every light which is bright or vivid.

When amaurosis has prevailed several years in persons of advanced age, whose eyesight has been weak from their youth; when it has come on slowly; at first, with a morbid increase of sensibility in the immediate organ of sight,

then with a gradual diminution of sensation in this organ, to the state of utter blindness; when the pupil is motionless, and has lost its circular shape, without being very much dilated; when this aperture is dilated in such a degree, that the iris seems as if it were wanting, and its margin is irregular and fringed; and when the bottom of the eye, independently of any capacity of the crystalline, presents an unusual paleness, like that of horn, or else a greenish hue; the malady may generally be considered incurable. Those cases may also be deemed irremediable which are attended with universal headache, and a constant sense of tension in the eyeball; which are preceded by a violent, protracted excitement of the whole nervous system, and by general debility, and languor of the whole constitution. There is no remedy for such cases as are preceded or accompanied by epileptic fits, or frequent hemicrania; nor for such as are the consequence of severe, obstinate, internal ophthalmies. We may also set down those cases as incurable, which, besides being of long standing, have originated from violent concussions of the head, or blows on the eyeball. The same may be said of amaurosis, when it arises from a violent contusion, or laceration of the supra-orbital nerve: when it proceeds from the entrance of foreign bodies into the eyeball; when it is attended with exostoses on the forehead, sides of the nose, or os maxillare; and when conjoined with a manifest change in the figure and dimensions of the whole eyeball.

Recent and sudden cases, in which the pupil is not excessively dilated, and in which the disk of this aperture retains its regularity, while behind it the bottom of the eye is of a deep black colour; cases which are not accompanied by any acute and continual pain in the head and eyebrow, nor by any sense of constriction in the eyeball; cases which originate from violent emotions of the mind; excessive fulness of the stomach; irritating matter in the viscera; plethora; suppression of some habitual evacuation; great loss of blood; nervous debility, not of an inveterate nature and in young subjects; are all, generally speaking, curable.

All surgeons agree, that this disease, in its curable and incomplete state, commonly depends on a morbid irritation in the digestive organs, sometimes complicated with general nervous debility, in which the eyes participate.

Hence, the chief indications in the majority of recent, incomplete cases, is to empty the stomach and bowels; then to strengthen the tone of the digestive organs, together with that of the whole nervous system; while at the same time efforts are made to invigorate the action of the nerves of the eye in particular.

For the latter purpose, Scarpa directs the vapour of the aqua ammoniæ puræ to be applied to the organ, till a copious secretion of tears and redness are brought on; then the practitioner is to desist a little; but he must renew the application in this manner three or four times at once, and persevere till the amaurosis is cured.

The action of the ammoniacal vapours may be aided by other external stimulants, applied to such parts of the body as have a great deal of sympathy with the eyes. Blisters to the nape of the neck; frictions, with liniments on the eyebrow; sternutatories; and electricity; are the chief auxiliary means.

In the amaurosis, arising from the suppression of the menses, the first evident indication is to re-establish the evacuation of blood from the uterus.

When the crystalline lens, or its capsule, is affected with opacity, the species of blindness, thence resulting, is denominated a *cataract*. The opacity originates, for the most part gradually, and augments in the same manner. Sometimes, however, it makes its appearance suddenly, and in a very high degree. The first effect of an incipient opacity is a mist before the eyes, surrounding every object, and afterwards gradually increasing so much in density, as to render things quite invisible. The opacity, behind the pupil, increases in proportion as the cloudiness in vision augments. As the lens is thick at its centre, and thin at its edge, the incipient opacity, when viewed externally, always seems the greatest

greatest in the middle of the pupil; while the circumference of the lens appears like a black ring, surrounding the white nucleus of the crystalline. Some rays of light are capable of penetrating the thin margin of the lens in its most opaque state: and hence, patients with cataracts are almost always able to distinguish light from darkness, and in the early stage of the complaint, discern objects best when these are a little on one side of the axis of vision, and not immediately opposite the eye. Hence, such patients also see better in a moderate, than a brilliant light, which makes the iris contract over the thin circumference of the lens.

When the opaque lens is either more indurated than in the natural state, or retains a moderate degree of consistence, the case is termed a *firm* or *hard cataract*.

When the substance of the lens seems to be converted into a whitish, or other kind of fluid, lodged in the capsule, the case is denominated a *milky*, or *fluid cataract*.

When the opaque lens is of a middling consistence the case is termed a *soft*, or *caseous cataract*.

There is another variety of the disease, necessary to be noticed, the *secondary membranous cataract*, which is an opacity of the anterior or posterior layer of the crystalline capsule, taking place after the lens itself has been removed from this little membranous sac by a former operation.

Cataracts are usually cured, either by removing the opaque lens from the axis of vision by means of a needle, or by extracting the lens from the eye, through a semicircular incision made at the lower part of the cornea. The first operation is termed *couching*, or depression of the cataract; the second is named *extraction*. To these two methods may be added the mode of operating devised by Mr. Saunders, and which chiefly consists in lacerating the central part of the front layer of the capsule, without moving the lens at all out of its situation.

Couching is thus performed:—The operator may employ, with equal advantage, a common slender spear-shaped needle. If the curved couching needle be made use of, it is to be held with the convexity of its curvature forward, its point backward, and its handle parallel to the patient's temple. The surgeon, having directed the patient to turn the eye towards the nose, is to introduce the instrument boldly through the sclerotic coat, at the distance of not less than two lines from the margin of the cornea, in order to avoid the ciliary processes.

The exact place, to which the point of the needle should next be guided, is between the cataract and ciliary processes, in front of the opaque lens and its capsule; but, as the attempt to hit this delicate invisible mark borders upon impossibility, and may endanger the iris, it seems safer to direct the extremity of the instrument immediately over the opaque lens. Thus room is made for the safe conveyance of the instrument between the cataract and ciliary processes, in front of the diseased crystalline and its capsule. Care must be taken, in this latter step of the operation, to keep the marked side of the handle forward, so as to have the point of the instrument turned away from the iris. The needle will now be visible in the pupil, and its point is to be pushed in a transverse direction as far as the inner edge of the lens. Then the operator is to incline the handle of the instrument towards himself, by which means its point will be directed through the capsule into the substance of the opaque lens, and on inclining the needle downward and backward, the former will be lacerated, and conveyed, with the latter, deeply into the vitreous humour.

It is deemed of great importance to lacerate the front layer of the capsule in the operation; because this plan renders the subsequent absorption of the opaque lens more certain and quick.

When the case is a *fluid* or *milky* one, the contents of the capsule flow out as soon as the little membranous sac is pierced with the needle, and they sometimes completely conceal the iris, the pupil, and the instrument from the operator's view. The object now is to lacerate the capsule as much as possible.

VOL. XXIII. No. 1605.

When the cataract is *soft*, the particles of which it is composed will frequently elude all efforts made with the needle to depress them. This, however, is quite unnecessary. The operator may either be content with a free laceration, and disturbance of them, or he may imitate Scarpa in pushing the fragments of the capsule, and the particles of caseous matter, into the anterior chamber, where absorption is observed to be carried on with more vigour, than behind the pupil.

When the case is a *secondary membranous* cataract, the surgeon is to turn the point of the needle cautiously towards the pupil, and pierce the opaque capsule. This is to be broken, as far as it is practicable, at every point of its circumference, and the fragments may either be left in their situation, or pushed forward through the pupil into the anterior chamber.

When the capsule is adherent to the iris, it may often be separated by skilful and delicate movements of the needle.

If the operator should prefer the straight needle, he must be careful to depress the cataract a little in the first instance, before making any attempt to place the instrument in front of the cataract, in order to be able to depress it downward and backward, in the most convenient manner.

In the extraction of the cataract, by dividing the cornea, the knife should be so constructed as to increase gradually in thickness from the point to the handle; by which means, as Mr. Ware has observed, the aqueous humour will be prevented from escaping before the section is begun downwards; for when the aqueous humour escapes prematurely, the accident causes the iris to fall forward beneath the edge of the knife, and be wounded.

The patient is to sit in a low chair, and not in too strong a light, as this makes the pupil contract too much. The sound eye is to be covered with a compress. An assistant is gently to raise the upper eyelid with his fore and middle fingers, and he is to press the tarsus against the upper edge of the orbit. The operator should be seated a little higher than the patient, resting his right foot on a stool, in order that his knee may be raised high enough to support the elbow. The knife is to be held like a writing pen, and the little finger of the hand is to rest steadily on the outside of the cheek.

When the eye is still, and so turned towards the outer angle that the inner and inferior part of the cornea can be distinctly seen, the operator is to plunge the knife into the upper and outer part of this tunic, at the distance of a quarter of a line from the sclerotic, and a little above the transverse diameter of the cornea.

The blade of the knife is now to be pressed slowly downwards, till it has cut its way out, and divided a little more than half of the circle of the cornea.

The incision of the cornea being accomplished, the next object is to divide the anterior layer of the capsule of the crystalline lens, in order to allow the opaque lens itself to escape. Wenzel used to puncture the capsule with the point of the knife, at the same time that he was dividing the cornea.

In general, the exit of the opaque lens very readily follows the division of its capsule, as soon as gentle pressure is made on the eye. If any fragments of opaque matter remain behind, they are usually taken away by an instrument resembling a minute spoon, termed a *curette*.

A very small pair of forceps is commonly employed for extracting the capsule itself, when deprived of its natural transparency.

OF THE BACK.

The bones of the spine are liable to fractures from blows, and to dislocations from falls. Superficial fractures of the vertebræ may be felt with the finger. Fractures of the more deeply situated parts of the vertebræ can hardly be detected with certainty; for the parts themselves cannot be examined and the various symptoms which usually occur, are not calculated to dispel all doubt, inasmuch as they may originate from a simple concussion of the spinal marrow. A blow,

9 E which

which has not been violent enough to break the vertebræ, may be sufficiently powerful to cause either a very dangerous commotion of the delicate production which they contain, or an effusion of blood within the theca, or the substance of the medullary matter itself. Some surgeons have cut through the skin and muscles, and raised a portion of the ring of the vertebræ, by means of Hey's saw, but the practice has been attended with no success; all that our art can do, is to keep down inflammation, by general treatment, and trust the rest to nature.

Dislocations of the vertebræ, when complete, are always fatal, and when higher than the origin of the phrenic nerve, immediately so. The danger is always proportionate to the height at which the column is dislocated. Persons with dislocation low down, live sometimes for a considerable period.

The spine is frequently diseased either in its osseous, ligamentous, or muscular structure, so that it does not properly support the superincumbent weight of the cranium; and consequently bending in various directions, deforms the whole trunk of the body, or, by its pressure on the spinal marrow, causes palsy of the limbs.

Children who grow fast, and otherwise are of a feeble constitution, especially if they live in great towns, and do not take much exercise, are liable to slight distortions of the spine: it is observed, that one of their shoulders is higher than the other. If they are removed into the country, induced to take exercise, bathed occasionally, and when they are fatigued, instead of being allowed to sit down, directed to take rest by lying on their backs, a cure may be soon effected. These measures should not be neglected, because, though many children outgrow these slight deformities, so great is the misery the disease inflicts, if it becomes established, that such an event should never be trusted to chance.

Curvature of the spine has often a deeper and more irremediable source. A caries of the bones, or ulceration of the intervertebral cartilages too often produce it.

The first symptom which engages the attention, in these cases, is palsy of the limbs—a palsy, however, in which the limbs are not flabby and relaxed, but permanently contracted or extended.—This symptom cannot, of course, exist until the disease of the skin has continued some time, and permanent disorganization is established. Unfortunately, the preceding or preliminary symptoms are very obscure. Mr. Brodie says, there is pain, and some tenderness over the affected vertebra, uneasiness at the pit of the stomach, and in the abdomen generally, with disturbance in the functions of that cavity, weakness, aching, and occasional cramp in the muscles of the leg.—These, however, are of course, symptoms that must rather follow some degree of irritation of the spinal marrow, than precede it. Pott states that lassitude, a sense of coldness in the thighs, and dull pain in the loins precede, with adults, the attack; and that in children, the coming of the disease may be foretold by the coming on of an incapacity of using the limbs steadily or with precision. The little patient being apt to totter, or to cross the legs involuntarily, when walking.

There does not appear to be any difference in the symptoms, whether the curvature be produced by caries of the bone, or supuration of the cartilages,—the former sort of disorganization is said, however, to advance more rapidly than the latter, but not to produce such extensive mischief. The disease, except when it arises from accident, which, however, is its rarest source, is mostly traceable to a disordered state of the general health, and especially to scrofula.

As to the treatment of curvatures of this kind, they are resolvable into three principles:—To improve the constitutional disorder which has given rise to the disease—to prevent the weight of the head from pressing down, and thereby still further distorting the spine—to promote ankylosis of the diseased vertebræ. The first indication would, of course, be best promoted by air and exercise. Unfortunately, active exercise, cannot be taken, or even attempted, on account of the state of the spine. A removal into good air is, however, one great step towards improving the general health, and passive exercise may be pushed to any extent. The second end may be

effected by placing the patient on his back, or on an inclined plane, and regulating its inclination by the severity of the disease. It is clear, that by means of machinery, a plane of this kind may be moved in any required direction, and with as much velocity as may be desirable. To the two great purposes of securing rest to the diseased parts, and improvement to the general health, there are still to be added the use of some agents which seem to expedite the cure. Thus issues, or moxa, applied to the back, on the sides of the spines of the vertebræ are very useful. Formerly these were entirely depended on; at present their use is confined to keeping down, by their counter-irritation, the inflammatory action of the bone or cartilage until the general treatment has had time to take effect.

Spina bifida is a swelling situated on the spines of infants, commonly on the lumbar vertebræ, occasionally on the dorsal, or cervical ones, and sometimes, though less frequently, on the os sacrum: it is filled with a limpid fluid, and arises from an imperfection of the bones, and a protrusion of the membranous lining of the spinal canal.

In spina bifida, the swelling is soft, and gradually diminishes, or even quite disappears on pressure; but, the tumour returns immediately the pressure is removed. The fluctuation of a fluid is distinctly perceptible to the touch. The integuments retain their natural colour and appearance. However, the children seem to experience pain, when the tumour is compressed, or when they are placed on their backs. The size of the swelling is very various.

The generality of children affected with spina bifida, are deficient in strength and vigour, and are subject to frequent diarrhœa. Some cannot retain their urine and fœces. A weakness and emaciation are often particularly observable in the lower extremities, which, indeed, are sometimes almost paralytic. Though most cases agree with this account, some children are, in every respect, except the tumour, perfectly healthy, and well formed.

The swelling consists of a sac, filled with an aqueous fluid, and composed of the integuments, and of the membranous sheath, which lines the canal for the spinal marrow. The lining of the spinal canal protrudes through a fissure in the vertebræ. This fissure is owing to an imperfect formation of these bones, and is commonly found at their posterior part, where the spinous processes would otherwise be. The preternatural opening is sometimes confined to one bone, and then the swelling often has a small base. In many instances, several vertebræ have not their ossification completed behind, so that the canal for the spinal marrow resembles an open furrow. Even the whole spine, from one end to the other, has been found thus imperfect.

The sac is commonly filled with a clear, transparent fluid; but, occasionally, it is turbid, yellowish, and bloody. The portion of the spinal marrow, surrounded by the fluid, is generally softened, and almost like mucus, or thin matter.

Children afflicted with this disease, seldom live longer than a year after birth; but are observed to live longest when the swelling is remote from the head. The instances of persons attaining a middle age with this disorder, are rare, and they have mostly had their lower extremities in a paralytic, useless state.

Experience has fully proved, that puncturing the tumour with a lancet, and thus discharging the fluid, either at once, or gradually, cannot be done without putting the patient in the greatest danger, the consequences being for the most part fatal in a very short space of time. Some years ago, Mr. Abernethy suggested the method of letting out the fluid, of closing and healing the puncture immediately afterwards, and repeating the same proceedings, as often as necessary.

Sir Astley Cooper tried the effect of thus puncturing spina bifida, but he did it with a fine pointed needle, instead of a lancet, and promoted a closure of the opening in the spine, by applying a compress and bandage. In one case he thus accomplished a perfect cure.

The region of the loins is liable to the formation of a very large abscess, called the psoas abscess, from its situation over that muscle. In the beginning, this disease is not, in general,

general, attended with any symptoms of acute pain and inflammation, nor with any febrile disturbance of the constitution. There is only a dull uneasiness in the region of the loins. The matter is formed slowly, and imperceptibly, and occasions, at first, no manifest swelling, nor fluctuation, and no material symptom whatever, excepting the uneasiness in the loins, and a slight weakness of the thigh and leg on the affected side.

The outward swelling, at length occurring, may take place in various situations. For the most part, the matter descends by its own gravity, in the course of the psoas muscle, passes forward under Poupart's ligament, and occasions an external, fluctuating tumour, quite free from pain and inflammation. The exemption from the latter circumstance is a clear indication, that the matter is not originally formed at the place where it first makes its appearance. The enlargement of the swelling, when the patient draws in his breath; its diminution in an horizontal posture, and on pressure being made; and lastly, the fluctuation perceptible to the surgeon's fingers, when the patient coughs, are circumstances which, combined with the other preceding complaints, clearly evince the nature of the case.

The swelling in the groin seldom becomes exceedingly large, because the matter in general soon insinuates itself beneath the femoral fascia. In some instances, it descends as far as the knee, and forms there a prominent swelling. Sometimes it makes its way downward, into the pelvis, and occasions a swelling in the neighbourhood of the anus. Sometimes it tends towards the loins and sacrum, giving rise to a swelling exactly in the place where abscesses often make their appearance in the disease of the hip joint. In a few instances, the matter causes a swelling in the vicinity of the vertebræ; and, less frequently still, it makes its way through the abdominal muscles, and occasions a tumour at some part of the abdomen.

The disease, even before it bursts, or is opened, is frequently attended with loss of appetite, weakness, nocturnal sweats, and other hectic complaints.

Lumbar abscesses are sometimes attended with a carious state of the vertebræ.

Experience shows, that, when a psoas abscess is opened in the common manner, death in general follows sooner than when the swelling is allowed to burst of itself. The formation of a large opening, but particularly the aperture being afterwards left unclosed, causes an inflammatory affection of the whole cyst of the abscess, and the most violent description of constitutional disturbance. The discharge is profuse, thin, and fetid. The patient's pulse becomes small, rapid, and irregular; copious perspirations, unremitting diarrhoea, and even delirium, ensue, and death very commonly closes the scene.

Mr. Abernethy's method, which is that universally followed, is to open the tumour with a broad abscess lancet, observing to introduce the instrument somewhat obliquely. Such an opening is generally sufficient for the discharge of the coagula, which are commonly blended with the contents of lumbar abscesses.

The abscess being completely emptied, the lips of the orifice are to be brought together by means of lint and sticking plaster, in the same way as after phlebotomy, and a compress and bandage are to be applied. The wound generally heals without trouble.

The matter of course collects again, and, regularly as it is secreted, descends to the lower part of the cyst, on which account the upper part of the cavity will remain a good while undistended, and have an opportunity of contracting. When the integuments are again sufficiently elevated to allow a puncture to be made, without hazard of wounding the subjacent parts, the abscess is to be emptied again, and the wound healed, in the manner above described. Thus the operation is to be repeated as often as may be necessary.

By this method, the cyst of the abscess, particularly its upper part, gradually unites.

OF THE LOWER EXTREMITY.

Of the Thigh.—The thigh may be dislocated upwards on the dorsum of the ilium; downwards on the foramen ovale, backwards and upwards or into the ischiatic notch, and forwards and upwards or upon the pubis. Dislocations downwards and backwards are improbable, though some have (through mistake perhaps) described them. Upwards—The bone is here shortened from $1\frac{1}{2}$ to $2\frac{1}{2}$ inches, as we see by comparing the malleoli of each limb. The toe is turned inwards, resting against the tarsus of the opposite foot; the thigh cannot be drawn outwards, but may be brought over the other limb a little way, unless there is much tumefaction; we may feel the round head of the femur on the dorsum ilii, and when we roll the thigh bone inwards, we feel this head rolling also. The trochanter is not quite so distinct as in a natural state, but is placed nearer the anterior superior spine of the ilium; the natural curve of the hip is nearly lost, and the knee advances a little over its fellow. This accident is distinguished from fracture of the neck of the femur, by these marks. In fracture of the cervix femoris, the knee and foot are generally turned outwards; the trochanter drawn upwards and backwards on the dorsum ilii; the limb can, though with pain, be bent freely on the trunk, but above all, the limb can be pulled down to its original length, with a slight force, in which reduced state crepitus is felt on rotation, but when this force is removed, the deformity returns, and now crepitus on rotation is of course not perceived; the limb is shortened from one to two inches. Whether the cervix be fractured within or without the ligament, the position is the same. Fractures within the ligament rarely occur, but in the aged, and are effected by slight accidents. Fractures external to the capsule, occur at any period of life, and are easily detected, "if the limb be rotated, and the trochanter compressed with the hand." Dislocation of the hip may arise from disease, not violence; but here the history of the case is the safe guide. "The gradual progress of the symptoms, the pain in the knee, the apparent elongation at first, and real shortening afterwards; the capacity for motion, yet the pain given under the extremes of rotation, as well as of flexion and extension, are marks of difference which would strike the most careless observer." In this dislocation the pyriformis, glutei, triceps, pectineus, semitendinous semimembranosus, iliacus and one head of the biceps are shortened. The obturator externus is also shortened, but the obturator internus gemelli and quadratus are stretched. This accident happens when the patient falls, or receives a blow when the knee and foot are turned inwards. To reduce this dislocation (constitutional means, mentioned under the general head of dislocations, having been used) the patient is to lie on a table, between two strong posts, or on a floor with two rings fixed in it, about ten feet asunder; then a strong girth is to be passed between his pùendum and thigh, and fixed to one staple. A wet linen roller is put light round, just above the knee, and upon this a leather strap is buckled, "having two straps with rings at right angles with the circular part. The knee is to be slightly bent, but not to a right angle, and brought across the other thigh a little above the knee." The patient being thus adjusted, the pullies are slightly stretched, till pain is felt, then suffered to remain, then tightened, and so on. The surgeon, when he feels the bone approach the acetabulum, gently rotates the bone, which then slips into the socket, but seldom with a snap, when pullies are used. It is sometimes necessary to lift the bone, by placing the arm or a napkin under it close to the joint, and raising the head over the edge of the acetabulum. The dislocation downwards into the thyroid hole, is marked by lengthening of the limb to the extent of two inches; the head of the femur is felt at the inner and upper part of the thigh in very thin persons; the trochanter major is not prominent; the body bent forwards by the iliacus and psoas; the knee advanced if the body be erect; the leg adducted to a great extent and incapable of being brought inwards, without great difficulty; and the feet, though widely separated, neither inverted nor turned out. The head
bone

of the bone is a little below, and anterior to the axis of the acetabulum, and there is a hollow below Poupart's ligament.

The dislocation happens when the thighs are widely separated from each other. The ligamentum teres is torn; together with the lower part of the capsule.

The reduction is effected by fixing the pelvis, by means of a circular belt passed round it, and fixed to some point on the sound side; another round the thigh, to which pullies must be applied, so as to make extension outwards and slightly upwards when he is on his back, or directly upwards when he is on his side. The circular belt must be passed within the femoral one. The large one reduces the bone, by bringing the dislocated leg across the sound one, taking care not to raise it much anteriorly, lest the head of the bone slip back into the ischiatic notch, fig. 2. In recent cases, if the patient be laid on a bed and drawn down till the bed-post be in contact with the ramus of the ishium, the drawing the legs across may then reduce the bone.

In the dislocation backwards, the head of the thigh bone is placed on the pyiformis, between the edge of the bone which forms the upper part of the ischiatic notch, and the sacro-sciatic ligaments behind the acetabulum, and a little above the level of the middle of that cavity. The distortion and reduction are both difficult. The limb is generally half but sometimes one inch shortened. The trochanter behind its usual place, but still nearly at right angles with the ilium, and slightly inclining to the acetabulum. In very thin persons, if the bone is rolled far forwards, we may feel the head in the ischiatic notch. The toe is turned inwards till it rests against the ball of the opposite great toe, which is much less inverted than we find in the dislocation upwards. In the standing posture the toe touches the ground; not so the heel; the knee is not so much advanced as in the dislocation upwards, and is slightly bent. The limb is fixed.

This accident happens when the trunk being bent on the thigh, or, vice versa, force is applied against the knee, the reduction is effected by fixing the pelvis and drawing down the thigh, as in dislocation on the dorsum ilii; but further, a napkin must be placed round the thigh. Traction being then made in such a direction that the dislocated femur crosses its fellow about its middle, the surgeon, by means of the napkin or a towel long enough to pass over the neck, lifts the head of the bone over the acetabulum while he presses the spine of the ilium; the patient being on his side.

Dislocation on the pubis happens from falling backwards, while the foot is prevented from sliding forwards, as when a man slips into a hole and falls back. The limb is shortened an inch, turned outwards, cannot be rotated inwards, but slight flexion forwards and outwards remains; the grand criterion, however, is to feel the head of the bone, or the fore part of the pubis above the level of Poupart's ligament and outside of the femoral artery and vein. The situation of the bone is as follows:—The crural nerve passes over the fore part of the neck, upon the psoas muscle, so that the head rests between the crural sheath, and anterior inferior spine of the ilium; bony deposits growing from the pubis surround the cervix of the bone. The feeling of the head on the pubis distinguishes this accident from fracture of the neck of the femur. It is thus reduced:—In the dislocation upwards, put one girth round the innominatum, one round the lower part of the thigh; but fix the first in a line before the axis of the body, and the other considerably behind it: when it is drawn some way down, raise the head over the pubis and edge of the acetabulum, by means of a napkin passed round the thigh. The patient, being in this, as in the last accident, laid on his side. Of these dislocations the proportions may be thus stated:—12 in 20 on the dorsum ilii, 5 in the ischiatic notch, 2 in the foramen ovale, and 1 on the pubis.

Fractures of os innominatum must be carefully distinguished from femoral dislocations, because pulling down the thigh does in the former accident create much mischief. When the acetabulum is broken, the head of the thigh is

drawn up and the toes inverted; the trochanter being forwards. If the os innominatum be disjoined from the sacrum, and the pubis and ischeum broken, the limb is shortened but not altered in its axis.

Fractures of the upper part of the femur, which are much more common accidents than dissolution, are of three kinds: 1. When the fracture happens through the neck of the bone entirely within the capsule. 2. When at the junction of the neck, and trochanter when it is external to the capsule, and 3. When the fracture is through the trochanter beyond this junction.—In the first, the leg is shortened from one to two inches; for the connection being destroyed between the head and trochanter, the latter is drawn up as far as the ligament will allow, and thus rests on the acetabulum or dorsum ilii above it; the retraction of the limb to its original position may be made by slight pulling; and this repeatedly, till the muscles acquire a fixed contraction, which happens in some hours. The limb is turned outward with rare exceptions, (Mr. Langstoff had a case where it was inverted), a circumstance which happens from the power of the strong rotators; not, as some have thought, from the mere weight of the limb, as may be inferred from the difficulty of rolling the limb inwards. Pain is felt on rotation inwards, opposite the insertion of the psoas and iliacus, or, sometimes below that point.

Though extension of the limb may be made, flexion is difficult and highly painful, at least in the duration forwards and inward; outwards it is not so bad. In this accident the trochanter being drawn upwards on the ilium with the broken cervix nearer the spine of the ilium, the trochanter projects less on the injured side. Indeed it is much concealed till the wasting of the muscles allows it to be felt. In the patient he put in the erect position the shortening of the limb, smallness of the trochanter, eversion of the limb are rendered more apparent, and if directed to stand on his injured thigh the first attempt is attended with much pain, and there will be more or less projection of the trochanter. Crepitus is only felt when the limb is pulled down either by force or its own weight.

The horizontal portion of their cervix femoris, and the feebleness of their constitution, render women more liable to this accident than men. Weakness of the bones in the aged render them also liable to this fracture; hence it rarely occurs under fifty.

“For from the different state of the bone, the same violence which would produce dislocation in the adult, occasions fracture in old age.” Very slight injuries cause this accident. A person slipping from an elevated pavement, slips down on the carriage-way only a few inches in descent, and the muscles being off their guard, fracture takes place.

A frequent cause is a slight fall upon the trochanter. The bone thus broken never has been known to unite by bony union, but the possibility may be allowed, for there may be fracture through the head, which does not separate the fractured ends, or the bone may be broken without its periosteum, and the reflected ligament torn, or it may be broken obliquely; partly within and partly without the capsular ligament. The first cause why union does not regularly happen, is want of apposition in the fractured surface—this being prevented by those powerful muscles which pass from the pelvis to the thigh. The next reason is the want of pressure between the two broken surfaces, even when the length of the bone is preserved; for if the capsule be unbroken, it will be distended by synovia, and this distension will prevent the due apposition of the broken pieces. And when this fluid becomes absorbed, the inflammatory process has ceased, and ligamentous matter has been secreted. But the third and chief reason of want of union, seems to be, that the ossific action cannot take place from the inner fractured portion, because it receives blood only from the vessels of the ligamentum teres. Naturally the head and neck are supplied with blood by the periosteum of the cervix and reflected membrane which covers it, and so when these are torn, we find no ossific, but merely a ligamentous deposit

at the extremity of the fracture. On dissection, we find the ligamentum teres holding the head in the cavity, and upon this small white spots covered with the articular cartilage. The cervix broken transversely or obliquely; the cancellated structure of the inner portion hollowed or rendered smooth by the pressure of the extended pieces of the cervix. "The cancella are rendered firm and smooth by friction, as we see in other bones which rub upon each other when their articular surfaces are absorbed, giving the surface the appearance of ivory. Loose portions of bone covered with ligamentous matter are formed on the joint. When, however, these excite no inflammation, the external portion of the head of the bone is much absorbed, its surface is yellow, and bearing the character of ivory. Some ossific deposition often takes place round the trochanter cervix and even shaft of the bone. The capsular ligament is thickened, and the synovial membrane covering it, as well as the portion which covers the external cervix, is also very much thickened. Serous synovia is secreted in abundance, and flakes of ligamentous matter are seen proceeding from the synovial surface and uniting it with the edge of the head of the bone. The membrane separating from the cervix sometimes forms a bond of connection between this part and the inner fractured portion, and bands of ligamentous matter passing from one end of the fracture to the other, an union by ligament ensues. The head becomes lighter and more spongy than ordinary when macerated, except its smooth ivory surface."

The same want of union takes place in fractures of the condyles of the humeri and the coronoid process of the ulna within the capsule. In experiments on rabbits and dogs, it was found that union did not take place when the fracture was made within the capsule, but if it was across the cervix, in part within and part without the capsule, union took place (but then apposition was of course maintained, which could not be done in the other cases). This accident is distinguished from dislocation on the dorsum ilii or in the ischiatic notch, by the eversion of the limb, and from the dislocation forwards on the pubes, by the absence of the head under Poupart's ligament—from all these by the mobility of the limb. It is distinguished from fractures external to the capsule by its occurring at a very advanced age, by the limb being considerably shortened, by the absence of crepitus if the limb be not drawn down and rotated, by the slight causes which induce it, and by the absence of much constitutional irritation. To produce union these plans have been used.—First, a double inclined plane has been placed under the limb, by which means it has effectually stretched to the proper length, and a broad bandage thrown round the pelvis to keep the fractured portions in apposition. Secondly, a broad board has been fixed to the foot of the bed, and the sound leg rested against it to prevent the descent of the body. A cord was then put through a hole in the board with one end tied to a weight, and the other by bandage to the diseased foot, and thus gradual extension was maintained. Thirdly, both limbs have been extended and tied together with a roller, or an iron plate may be appended to the sole of the shoe on the sound foot, and by means of a screw through it, a bandage round the knit limb may be tightened *ad libitum*. Boyer's splint, which has been used for the same purpose, is hurtful, on account of the pressure of its band on the inner and upper part of the thigh. Mr. Amesbury's apparatus is doubtless the best that has been contrived, but, hitherto, it has not been applied to any case with success.—Union takes place when the head only is broken, so that the cervix remains in the acetabulum, or when the periosteum is unbroken, and in neither of these cases is the bone much drawn up. The limb should be kept extended for ten days or a fortnight, and then the patient may rise and sit in a high chair. A patient with the aid of crutches or a stick, may recover so far as to walk with a little sinking on the affected side. The accident is sometimes fatal on exhausted frames. Lameness is sure to follow, but the degree is various.

Vol. XXIII. No. 1605.

Fracture of the cervix external to the capsule.—This fracture, like the former, has the leg shortened and everted—has pain at the hip and on the inner and upper part of the thigh, and the joint loses its soundness; but it is thus distinguished. 1st. It happens in the young and in the old till under 60. 2dly. It requires much severer force to effect it, as violent blows, falls from a great height, or the passage of heavy weights over the pelvis. 3dly. It is attended by crepitus when we rotate the limb, even when we do not draw it down. 4thly. There is much severer pain, especially on motion, the thigh and leg are swelled, and there is an high degree of irritative fever—recovery is tardy. The limb is not shortened so much as in the accident before noticed, rarely more than an inch; but this, of course, is subject to variation, according to the obliquity of the fracture and the degree of laceration in the muscular parts. On dissection, the fracture has various situations, but most commonly it is at the *root* of the neck of the femur.

Fracture through the trochanter, without injury of the cervix, occurs at any period of life.—Symptoms. The leg is very little or not at all shortened; the broken part of the bone sometimes is drawn forwards towards the ilium, sometimes it falls towards the outer ischium. The portions are, however, widely separated; the patient cannot sit; the foot is extremely everted; crepitus is with difficulty discovered by rotation. It unites firmly and quickly.

Fractures below the trochanter.—The iliacus internus and psoas magnus, as well as the pectinalis and top of the triceps, draw up the fractured portion of the bone in this accident to near a right angle with the body. If pressure be made on this fractured portion, it only adds to the pain of the sufferer, without at all depressing the bone. To prevent horrid distortion, the knee should be elevated very much over the double inclined plane, and the patient placed, well supported by pillows in the sitting position. Then the common splints may be used, or, what is better, a strong leather belt should be buckled round the limb.

Fractures of the patella are almost always transverse; seldom oblique; and still more rarely longitudinal, or perpendicular. The bone, however, is sometimes broken into three or four pieces.

There is no difficulty in ascertaining the existence of a transverse fracture of the patella. When the patient is standing up at the period when the force of the muscles breaks the bone, the subsequent fall is a consequence of the accident. In this case, as well as in the example in which the bone is broken by the fall itself, the patient cannot get up without succour; and if, when he is put upon his legs, he endeavour to walk a few paces forwards, he falls down again. But, if he be assisted with an arm, and keep his limb straight, he may hobble along a good way, drawing the member after him, and meet with no other fall, especially, if the ground be not too irregular. The transverse division of the bone, and the interspace between the two fragments, can be plainly distinguished under the integuments. Instead of the prominence of the patella in front of the knee, a flatness or even a depression may be remarked. When the leg is extended and the thigh bent, the two pieces of bone are brought near together again, and a very little pressure will then suffice for putting them in contact with each other. When this has been done, if they be moved laterally in opposite directions, they will rub against each other, and a crepitus be felt.

Fractures of the patella are very rarely united by bone, the connecting medium being in almost all cases a fibrous ligamentous substance. The possibility of a bony union, however, is admitted.

For the cure of fractures of the patella, Boyer employed a very simple, but effectual apparatus. It consists of a hollow wooden splint, long enough to reach from the middle of the thigh to below the calf, sufficiently deep to embrace two-thirds of the thickness of the limb; broader above, than below; and lined with wool, or other soft materials. On the outside of the edges of this splint, little round-headed pegs,

or nails, are arranged, the use of which is for fixing the straps, which serve for holding the fragments of the bone in a state of approximation. These straps are two in number, rather more than an inch wide, and about seven inches long. Their middle portions are quilted with wool, covered with chamois, and made of softer leather than their extremities, which are of calf-leather, and furnished with holes placed at the distance of about a quarter of an inch from each other. The limb is to be placed in the concavity of the splint, the ham occupying its middle; and the empty spaces, left between the limb and the apparatus, are to be nicely filled up with soft tow. Then, while an assistant presses the pieces of bone together, the straps are to be applied in such a way, that the one which lies above the upper fragment of bone, is to be fastened to two of the pegs lower down; and that which crosses immediately under the lower fragment is to be fastened to two pegs situated higher up. By this contrivance, the straps, the ends of which cross each other, leave between them a transverse space, in which is comprehended the broken patella. Any resolvent lotion may now be applied to the injured part; and, lastly, the limb is secured in the splint by means of a roller, or four or five pieces of broad tape, doubled, and tied over one side of the wood.

Boyer generally enjoins his patients not to begin to bend their knees earlier than two months after the accident.

Dislocations of the patella happen either upwards, when the ligament that attaches this bone to the tibia, is ruptured, or to the side; the second kind of dislocations are far more frequent than the first, and the displacement is oftener to the outer than to the inner side of the limbs. External force is a common cause of all these accidents; but the bone is often displaced outwards, by the action of the muscles in bandy-legged people.

In the dislocation outwards, which is the most common, the leg is extended, and cannot be bent without seriously increasing the pain, which the patient already suffers; the inner margin of the articular pulley, off which the patella has slipped, can be plainly felt under the skin; over the outer part of the same pulley, the patella itself forms a remarkable swelling, and the outer edge of this bone is quite perceptible. Were the luxation complete, the extended position of the leg, the depression in the natural situation of the bone, the facility of distinguishing the articular pulley, and the tumour caused by the luxated bone itself upon the side of the outer condyle, would leave no chance of mistaking the nature of the accident.

A dislocation inwards may happen, when an external force propels the outer edge of the patella in this direction: but, the case is hardly ever complete. The patella forms a considerable prominence upon the internal condyle; its front surface is inclined outwards, and its posterior one inwards; while its outer edge is turned backwards, and its inner one forwards. In the depression observable in the situation, from which the patella is removed, the outer condyle may be plainly felt with the finger. The leg is extended, and an attempt to bend the knee produces a great increase of pain. To reduce these dislocations, the surgeon having fully relaxed the exterior of the leg, by raising the heel until it forms a right angle with the pelvis, presses down that edge of the patella which is most remote from the joint, whether the luxation be outwards, or inwards. This pressure raises the inner edge of the bone over the condyle of the femur, and the patella is immediately drawn into its natural situation by the muscles.

Of fractures of the leg.—The cases in which both bones of the leg are broken together, are more frequent than those, in which only one of them is fractured. When the two bones are broken, the solutions of continuity are sometimes parallel; sometimes at different heights. The direction of the fracture of each bone is also subject to variety, in some cases being transverse, which is most common in children; in other instances, being oblique; and, what is remarkable, the obliquity of fractures of the tibia has something determinate about it, usually extending from below upwards, and from

within outwards, so that the end of the upper fragment is generally manifest below the integuments at the front and internal part of the leg. Lastly, either of the bones may be broken in several places, and the soft parts more or less contused, or lacerated, either by the ends of the broken bone, or the same force which occasioned the fracture itself.

Cases in which the two bones are broken, are frequently the consequence of falls upon the feet, and then the fracture is mostly oblique, and that of the tibia happens a little below its middle portion. However, when the tibia gives way at this point, it often happens, that the fibula breaks towards one of its extremities. As the tibia alone sustains the weight of the body, it is evident, that when both bones are broken by a force, which acts perpendicularly, the tibia gives way first, its fragments are displaced, and the force continuing to operate, then bends the fibula, the fracture of which is subsequent to that of the other bone. Both bones of the leg may also be fractured by violence applied directly to the seat of the injury, as when the wheel of a carriage passes over the limb, while this is extended on the ground, or a heavy body falls upon the member.

In fractures of the leg, the displacement of the fragments depends upon the direction of the division of the bones, and the nature of the cause of the injury. When the fracture is transverse, the displacement can only take place in the diameter of the fragments, particularly when the injury is situated high up, where the surfaces of the broken part of the tibia, which are applied together, are large. In fractures of both bones of the leg, however, it is remarked, that the ends of the bone seldom remain long in their natural situation; even when their surfaces are broad, and the solution of continuity is transverse, because every movement of the limb has a tendency to produce displacement. When the fracture is oblique, and has been produced by a fall on the foot, the ends of the fracture must inevitably pass beyond each other. In the majority of instances, the end of the upper piece of bone presents under the integuments of the shin a sharpish point directed downwards and inwards; while the extremity of the lower portion is drawn backwards and outwards by the muscles of the calf. However, notwithstanding the obliquity of the surfaces of the fracture, and the tendency to displacement necessarily resulting from it, experience proves, that these cases are never followed, as broken thighs are, by any subsequent increased shortening of the member, excepting where the tibia has been driven out through the skin.

The lower portions of the broken bones are also liable to a rotatory displacement; an inconvenience facilitated by the foot being naturally turned outwards, and the greater portion of its mass and weight being external to the axis of the limb.

Fractures of both bones of the leg are readily ascertained; for the slightest deformity is obvious along the sharp ridge termed the spine of the tibia, as well as upon its anterior flat surface, usually called the shin. The gentlest movement of the member will also produce a very plain crepitus.

Dislocations of the tibia happen either forwards, backwards or to one side. In the first case, according to Sir A. Cooper, while the tibia projects forwards, the thigh-bone is depressed and thrown somewhat laterally as well as backwards; the pulsation of the popliteal artery is stopped by the pressure of the condyles of the femur, and the tibia and patella are both turned forwards.—The dislocation backwards (a rare accident) is marked by depression of the patella, projection of the condyles of the femur and flexion of the leg *forwards*, according to Sir A. Cooper; *backwards* according to Heister.—Lateral dislocations, though commoner than the preceding, are nevertheless rare, and they are always incomplete; for in the dislocation inwards, the inner condyle of the femur is merely thrown into the external articular cartilage, so as to leave the the head of the tibia projected half way towards its fellow; and in the dislocation, outwards, the outer condyle is thrown on the inner cartilage: in both these cases, according to Sir A. Cooper, the femur is somewhat twisted on the tibia, so that

that its outer condyle in dislocations inwards and its inner condyle in dislocation outwards are turned backwards as well as sideways. These accidents are all to be reduced by a very obvious process—namely, extension and pressure in that direction that will replace the bones. There are partial or subluxations in this situation which are troublesome to recognize or reduce. The limb can be bent or straightened by the surgeon without creating much pain, but the patient has not himself a perfect command of it. It should be bent and extended, and then sometimes turned inwards, sometimes outwards, and, by a little management of this kind, may often, but not always, be reduced. The fibula is rarely dislocated from the top of the tibia by violence, but sometimes from relaxation. It is in either case easily replaced, but requires a long continued support to retain it in its situation.

Accidents about the ankle joint.—The lower end of the tibia may be displaced backwards, forwards, or to either side. The dislocation of this bone inwards, is the commonest. Here the inner malleolus violently stretches, and often bursts the skin; the ligaments connecting it with the astragalus are torn, and the fibula necessarily broken, a fracture which takes place about two or three inches from its lower articulation. The foot is everted and turned upwards. The reduction is effected by bending the leg on the thigh, which relaxes the muscles producing distortion; by extension in a slight degree; and by lateral pressure. The retention of the bone in its situation, is effected by splints and by a foot-board, to which the foot should be laced.—In dislocation outwards, the inner malleolus is necessarily broken from the tibia, either directly or by a fracture which involves the centre of the bone and passes into the midst of its articulation with the astragalus. Even the astragalus may be broken; and unless the fibula itself be broken, the external lateral ligament must be torn. Here again reduction must be effected by relaxing the muscles of the calf, by bending the leg on the thigh, and gently extending the leg. Then if we press the tibia inwards, the bone may be restored to its place, and a splint with a foot-board attached, will secure it in its proper station. The foot-board should be raised at the part next the toes, in order to prevent the leg-bones slipping from their articulation.—The complete dislocations of the tibia forwards, cannot occur until the outer and inner malleoli are broken; then the tibia is thrown forwards in the navicular and internal cruciform bones, and the heel, abandoned to the action of the gastrocnemii, is accordingly drawn behind the bones of the leg, and the toes necessarily turned downwards. The reduction is here very difficult, and the retention of the displaced bones, in situ still more so. Extension and the bending the toes upwards, are the obvious means to be employed for reduction, and our apparatus must be so arranged as to keep the heel supported forwards, the leg retained in its due place backwards, and their apposition secured by properly raising the metatarsus.—There is also a partial dislocation of the tibia forwards, that has been occasionally met with. In this the tibia rests in part of the navicular bone, whilst its other half remains attached to the astragalus; the fibula is of course broken, the leg altogether seems a little shortened, and the toes are turned downwards, and are stiff. This accident, easily rectified in its early stages, produces so perfect a change in the state of the joint and the muscles, that, when long established, no efforts for its relief can be effectual. The appearance of a dislocation of the tibia backwards and its treatment, are obvious, but it is the rarest of these rare accidents—so much so, that Sir A. Cooper has never seen a case of the kind.—The astragalus is sometimes dislocated; and so difficult is this bone of replacement, that surgeons have been usually content either to advise its entire removal, or to allow it to remain unreduced. It has, however, been reduced thus:—In a dislocation inwards, the knee was fixed; the foot straightened to a line with the leg, the toes forcibly bent outwards, and the astragalus pressed inwards: an entirely opposite case was similarly successful, simply by bending the toes in the opposite direction. Other dislocations of the tarsus produce no very serious

deformities, and those of the phalanges are easy of reduction.

The arteries of the lower extremity require to be tied for aneurism or injury, in various situations. The tying of the internal iliac is thus described by Mr. Steevens, the first who performed it:—

“An incision about five inches in length, was made on the left side, in the lower and lateral part of the abdomen, parallel with the epigastric artery; and nearly half an inch on the outer side of it. The skin, the superficial fascia, and the three thin abdominal muscles were successively divided; the peritoneum was separated from its loose connection with the iliacus internus and psoas magnus, it was then turned almost directly inwards, in a direction from the anterior superior spinous process of the ilium, to the division of the common iliac artery. In the cavity which I had now made I felt for the internal iliac, insinuated the point of my forefinger behind it, and then pressed the artery between my finger and thumb. I then passed a ligature behind the vessel, and tied it about half an inch from its origin. I found no difficulty in avoiding the ureter: when I turned the peritoneum inwards, the ureter followed it. Had it remained over the artery, I could easily have turned it aside with my finger. The woman did not complain of much pain, and I am certain she did not lose one ounce of blood.”

The external iliac.—The hairs being previously shaved from the part, begin the incision about an inch within, and rather below the anterior and superior spinous process of the ilium; continue it, in a semilunar form, in the direction of Poupart's ligament, for a little more than three inches, so as to make it terminate just above the external abdominal ring: this exposes the tendon of the external oblique muscle, which being divided to the same extent, and turned aside, lays bare the internal oblique, where it arises with the transversalis from the outer half of Poupart's ligament. With your finger, or the handle of the scalpel, turn up the borders of these muscles, and the spermatic cord becomes exposed; pass your finger behind it, push the peritoneum upwards, and you feel the artery with the vein on its inner side; they are closely connected by cellular membrane, and must be carefully separated with the handle of the scalpel, or a blunt probe. After having cut through the tendon of the external oblique, be careful to use the knife as little as possible, lest you wound the epigastric artery, which is generally situated near the inner extremity of your incision, crossing behind the spermatic cord.

The femoral artery in the groin.—The patient being placed on his back, separate the thigh to be operated on from the other, and let the leg hang over the edge of the table; this renders the artery more superficial, by putting the integuments and sartorius muscle on the stretch. Begin the incision half inch below the middle of Poupart's ligament; continue it downwards for three inches, inclining it slightly to the inner side of the thigh, taking care to avoid the saphena vein, which is rather superficially seated, and nearly over the artery. Having cut through the integuments, fat, aponeurosis, and fascia lata, you come to the sheath of the vessels. This being cautiously opened, as in the last operation, exposes the artery, which has the vein on its inner side, but separated from it by a process of the sheath: the anterior crural nerve not included in the sheath, is a little to its outer side.

The femoral artery in the thigh.—Put the sartorius in action by placing the leg in the tailor's position; then make an incision, three inches in length, rather above the middle of the thigh, in the oblique direction of the muscle, and on its inner edge: continue it through the integuments and fat, till the border of the muscle is exposed. Observe the direction of the fibres to ascertain that you have not come upon the vastus; then elevate the sartorius, drawing it a little outwards, which brings the femoral sheath into view; open this with care by a small incision, and then dilate it by cutting from within outwards; this exposes the artery, which has the vein rather behind and to its outer side.

The posterior tibial.—A little below the middle of the leg, begin

begin an incision on the inner edge of the gastrocnemius; continue it obliquely for three inches in the direction of that muscle, so as to separate it from those beneath; elevate it with the upper part of the tendo Achillis, and on the first division of the muscle beneath, you find the artery with the nerve rather behind and to its outer side, and an accompanying vein on each side.

Peroneal.—Let the incision be three inches long, parallel with the fibula, but behind its outer edge; a few muscular fibres will require to be divided; the artery may then be felt by passing the finger across the bone to its posterior and inner border, where it is situated; as it is small and deeply seated, there will be some difficulty in passing the ligature.

The anterior tibial.—Begin an incision rather below the middle of the tibia on its outer edge; continue it upwards and outwards, for three inches, in the direction of the interspace of the tibialis anticus, and extensor longus digitorum muscles; cut through the fascia to the same extent, then separate the muscles, between which, on the interosseus ligament, you find the artery, having before it a branch of the peroneal nerve, and an accompanying vein on each side. These arteries, like the smaller of the upper extremity, require, when wounded, to be secured by two ligatures.

OF THE UPPER EXTREMITY.

The arteries of the upper extremity require to be tied for aneurisms, in operations, or for great wounds. To tie the arteria innominata, make an incision from the middle of the upper edge of the first bone of the sternum obliquely upwards, along the inner margin of the sterno-cleido-mastoideus muscle, about three inches; the muscular fibres of the sterno-hyoid and sterno-thyroideus being now divided, the finger may be passed under the sternum to where the artery may be felt lying on the fore-part and right side of the trachea.—There is great difficulty in passing the ligature round the vessel.

The subclavian above the clavicle.—Mr. Hodgson has given the following rules for performing this operation:—

“The patient being seated in a chair, or placed upon a table, in a horizontal position, with the shoulder of the diseased side drawn downwards as much as possible, the operator divides the skin immediately above the clavicle, from the external margin of the clavicular portion of the mastoid muscle, to the margin of the clavicular insertion of the trapezius. The edges of this incision being separated, the platysma myoides will be exposed, and its fibres are to be cut through, so as to avoid wounding the external jugular vein, which will be found immediately under them, near to the middle of the incision. When this vein is discovered, it is to be detached from the surrounding parts, and drawn towards the shoulder with a blunt hook. The operator then divides with his knife, or separates with his finger, the cellular membrane in the middle of the wound, until he arrives at the acromial margin of the anterior scalenus muscle. He passes his finger down the margin of this muscle, until he reaches the part where it arises from the first rib, and in the angle formed by the origin of the muscle from the rib he will feel the artery. The ligature is now to be passed underneath the artery, either with a common aneurism-needle, or that recommended by Desault.”

The subclavian below the clavicle.—Put the pectoral muscle on the stretch by raising the arm and extending it backwards; then observe the depression formed by the junction of its clavicular with its sternal portion, the direction of which must be the course of the incision. Begin it half an inch from the sternal extremity of the clavicle, and continue it through the integuments for three inches in the above direction; separate the two portions of muscle from each other exactly in the course of its fibres, then bring the arm to the side, which, by allowing of a wider separation, exposes more readily the parts beneath; at exactly one third of the length of the clavicle from its sternal extremity, you find

the vein which is situated directly anterior to the artery, often concealed by fat and cellular membrane. To avoid wounding the vein, the greatest care is requisite.

The axillary artery.—The part being shaved, or the hairs cut closely off with a pair of scissors, place the patient on his side, and let the arm be raised up by an assistant; then feel in the axilla for the head of the bone, which is thus lowered by the position of the arm; over it make an incision, in the direction of the limb, three inches long, the middle part of which should be exactly over the head of the bone; this will expose a part of the axillary plexus, behind the largest nerve of which, the median, the artery will be found: the vein passes rather below the artery at this part.

The brachial.—Make an incision through the integuments two inches long on the inner edge of the biceps muscle: this first exposes the median nerve, which has the artery on its inner side between its two accompanying veins; the internal cutaneous nerve is situated on the inner side of the artery, diverging from it, as it descends in the arm.

The radial near the elbow joint.—In the axis of the angle formed by the two condyles of the os humeri, and the extensors and flexors of the hand, an incision is to be made through the integuments, commenced a little below the joint, and continued downwards for three inches. This exposes the fascia of the forearm, which is to be divided to the same extent; when the artery will be laid bare.

The radial.—Feel for the styloid process of the radius, at which point begin your incision; continue it through the integuments for two inches, in the direction of a line which, if continued, would pass between the condyles of the os humeri; the artery will be found superficially situated, having the tendon of the supinator radii longus muscle on its outer side.

The ulnar.—Feel for the pisiform bone, half an inch above which, and on the outer side of the flexor carpi ulnaris muscle, make a straight incision of two inches in extent through the integuments; cut through the fascia, an assistant drawing the internal edge of the wound to the inner side; dissect carefully by the side of the tendon, and you find the artery situated on the outer side of the nerve.

Of fractures and dislocations of the upper extremity. —The exposed situation, and natural slenderness of the clavicle, render it very liable to be broken, either at its middle, its sternal, or its scapular extremity. Its middle part, however, where its curvature is greatest, most frequently suffers.

Fractures of the clavicle, besides being oblique, or transverse, may be divided into two different kinds, according as they happen to be situated at some point between the coracoid process of the scapula and the sternal extremity of the clavicle; or more towards the scapular end of the bone.

The first case is most frequently the consequence of a fall upon the outer part of the shoulder, or upon the palm of the hand; for, anatomy teaches us, that the clavicle receives the impulse of every force, which is applied to the whole upper extremity. The second kind of fracture is generally produced by a blow directly on the part, and is attended with but a very trivial displacement of the fragments. On the contrary, in the former case, the displacement is very conspicuous; being caused by the weight of the arm, and the action of the pectoralis major and latissimus dorsi. Hence, the shoulder is depressed nearer to the trunk: the arm falls downwards and inwards; the inner end of the fracture is made to project partly by the action of the sterno-cleido-mastoideus, but chiefly by the external portion of the bone descending below it, the latter being displaced in the direction downwards, inwards, and forwards. In general, the fragments are still in contact, but, in such a manner, that the extremity of the outer piece touches only the lower side of the sternal portion.

The symptoms of a fracture of the clavicle are, pain at the injured part; all motion of the arm difficult, but not very painful; impossibility of raising the hand to the head; the arm hangs close to the side, and is rotated inwards; the shoulder

shoulder is lowered, and drawn towards the median line of the body; the head is inclined towards the injured shoulder; the patient supports the weight of his arm with the hand of the sound side; the internal fragment projects upwards and backwards; the external is situated below it, directed downwards and forwards; the natural position of the shoulder may be restored by taking hold of the upper part of the humerus, and carrying it upwards, backwards, and outwards, which manœuvre also puts the ends of the fracture in due contact, and sometimes produces a crepitus; lastly, the displacement returns immediately the arm is left unsupported.

Fractures of the middle or inner part of the clavicle are rarely united, without some degree of deformity being left; but those which happen towards the acromion are both more easily and more perfectly cured.

For this purpose, let a large pad be placed in the arm and well secured in its situation; let a bandage so broad, as effectually to enclose the elbow, be placed round the lower part of the humerus of the affected side, and over the opposite shoulder. When it is properly tightened, it will raise the shoulder, and, at the same time, it will employ the pad as a lever so as to pull the clavicle outwards. A few turns of the roller round the breast, may be used to steady the whole.

Fractures of the clavicle are much more common than dislocations. A dislocation can more readily happen at the sternal, than the scapular, extremity of the clavicle, on account of the greater degree of motion, which takes place in the former situation, and the weaker structure of the ligaments. When a dislocation happens at the sternum, the clavicle is usually thrown forward; sometimes, however, backward; in which event, the symptoms may be severe and even dangerous, on account of the pressure produced by the bone on the parts in the neck.

The dislocation of the sternal end of the clavicle forwards may arise from the sudden application of considerable force with a view of drawing back the shoulder, in which state the ligaments, and perhaps even a part of the lower tendon of the sterno-cleido-mastoideus muscle, are ruptured, and the inner head of the clavicle propelled forwards.

The luxation of the inner end of the clavicle forwards may also arise from a fall, in which the shoulder is forcibly driven backward.

The luxation of the inner end of the clavicle forwards is reduced in the following way:—the surgeon is to apply one hand to the inner and upper part of the arm, and the other to the external lower side of it above the elbow. The latter part is now to be inclined towards the trunk, while the upper end of the humerus is propelled outwards, by which means this bone is made to answer the purpose of a lever, the action of which immediately operates upon the clavicle. By these combined efforts of both hands, the shoulder is to be carried backwards and upwards, and the elbow forwards, so that the extension may be made in the oblique direction of the clavicle; that is to say, outwards, backwards, and a little upwards. The wedge-like cushion, used for fractures of this bone, is to be put under the axilla, as a point d'appui, which will tend to do permanently what the surgeon does with both his hands. However, if this extension should fail to bring the inner end of the clavicle into the articular cavity on the sternum, the reduction must be promoted by pressing the displaced part backwards. As soon as this is in its place again, the shoulder is to be inclined forwards, and the elbow backwards, in order to lessen the risk of the head of the bone slipping forwards again. Lastly, the arm is to be confined in the eligible posture over the cushion by means of a roller applied round the member and the trunk, and the elbow and forearm are to be well supported in a sling.

The dislocation of the scapular end of the clavicle is always upwards; for, the root of the coracoid process will not allow the bone to descend below the acromion. The accident is generally the consequence of a fall upon the shoulder, the scapula being then suddenly and violently depressed, and fixed, as it were, against the ground, while the powerful action of the trapezius muscle pulls the clavicle upwards. The displacement, however, cannot happen, unless the liga-

ments tying the bones together be torn, and even some of those ligamentous bands, which connect the clavicle to the coracoid process.

The reduction of a luxation of the outer end of the clavicle upwards is easily accomplished: for this purpose, the trapezius is to be relaxed, and the shoulder is to be inclined outwards, and raised, by making the humerus act in the desirable direction. At the same time, pressure is to be made upon the outer end of the clavicle, in order to adapt it to the inner and upper part of the acromion.

But, easy as the reduction is, the maintenance of it is extremely difficult. The apparatus advised for the fractured clavicle is the best when used with a slight modification, which consists in alternately carrying the roller that goes under the elbow, both to the shoulder of the injured, and that of the uninjured side.

The body of the scapula is rarely fractured; and when this occurs, it is easily discovered by the crepitus and deformity it causes, and requires nothing but keeping the bone quiet to effect its union.

The acromion is the part which is most exposed, and most frequently broken; but the coracoid process, neck and glenoid cavity, may be similarly injured.

When the acromion is broken, the solution of continuity mostly happens across its base. The external fragment is drawn downwards by the weight of the arm, through the medium of the deltoid muscle. The displacement, however, is not very considerable, amounting merely to a simple inclination of the point of the bone downwards; a change, which may be rectified either by raising the arm from the trunk, or elevating it in a parallel line to its axis. These circumstances, together with the crepitus, suffice for denoting the nature of the accident.

Fractures of the acromion may generally be cured, without any deformity, either by keeping the humerus close to the side, raised in a line parallel to its axis, or by placing and maintaining it at nearly a right angle to the trunk. In the first case, it is necessary to interpose between the arm and the side a cushion, which is thicker below than above, because a very close approximation of the elbow to the body has a tendency to bring on a displacement of the outer fragment of the bone, by rendering the deltoid muscle tense. The head of the humerus should also be kept well up against the acromion, an object, which may be fulfilled by means of a good sling, and a bandage extending from the elbow on the injured side over the opposite shoulder. The difficulty, however, of maintaining the arm constantly in the right position, unless the patient be confined in bed, is generally acknowledged.

In fractures of the coracoid process, the arm should be put in such a position as will relax the coraco-brachialis muscle, a tense state of which must produce displacement of the detached point of that process. The humerus should therefore be inclined towards the sternum, and confined in this situation by means of a sling and a roller. When the neck of the scapula is broken, the glenoid cavity, and os brachii, fall downwards, and a crepitus is usually felt on raising the limb, which descends again immediately it is left unsupported. The evident indications are, to keep the elbow and whole arm properly elevated in a sling, and to forbid all exercise of the limb. The shoulder may be dislocated in various directions.

The most common dislocation of the head of the humerus is that, in which it is thrown downwards into the axilla. This is what might be expected from a review of the structure of the joint, the capsular ligament being in this direction very loose and thin, and unsupported by any muscle. A displacement downwards would even be a more frequent accident than it is, were it not that the elevation of the arm, by which the head of the bone is inclined downwards, is not the most common movement of the limb; and that a sufficiently oblique position of the bone on the glenoid cavity for a dislocation to happen, is usually prevented by the scapula following and adapting itself to all the movements of the humerus.

In the dislocation downwards, the arm is lengthened, the elbow separated from the side, and the forearm is extended in consequence of the tension of the triceps muscle; the arm cannot be put near the body, nor the forearm bent without pain; the acromion projects more than natural; a vacancy is distinguishable under this process; the fulness of the shoulder is lost, the deltoid muscle not being now duly supported by the head of the bone; the arm cannot be raised to a level with the acromion; and, lastly, the swelling caused by the head of the bone may be plainly felt in the axilla.

The dislocation into the axilla is usually the consequence of external violence, combined with a powerful sudden contraction of the pectoralis major, latissimus dorsi, and teres major muscles. The accident frequently happens from falls, in which the elbow strikes against the ground, while separated from the side of the trunk. When a person falls sideways, he naturally puts out his arm in order to hinder his head from striking the ground. In this situation, the weight of the body is upon the shoulder-joint; and, as, at the same instant, the pectoralis major, latissimus dorsi, and teres major, act strongly and pull the arm forcibly towards the chest, they make the head of the humerus slip out of its cavity, because the elbow rests upon the ground as a fixed point, while the upper end of the bone is the moveable one.

On many occasions, however, the head of the humerus is dislocated downwards, not exactly in the foregoing manner, in which the elbow is fixed against the ground, or some other surface with which it comes into contact in the fall: thus, an ostler, in putting on a bridle, often has his arm dislocated by the horse suddenly throwing up its head, and striking the under part of the elbow, while raised from the side of the body. In this last instance, the lower end of the humerus is violently thrown up, and its head propelled down into the axilla, the movement being like that of a lever.

In the dislocation downwards, the tendon of the subscapularis is ruptured. The tendons of the supra and infra-spinatus muscles may likewise be torn from the bone, and with them a shell of the head of the humerus may be detached. Writers do not agree in their accounts of what becomes of the long head of the biceps.

The dislocation next in frequency to that downwards, is the case, in which the head of the humerus breaks through the internal portion of the capsular ligament, and passes immediately under the great pectoral muscle, constituting the *luxation inwards*. Thus, when the arm is raised so as to form nearly a right angle with the trunk, and the elbow is inclined backwards, a fall on the side may drive the head of the humerus through the inner part of the capsular ligament. In this kind of accident, the resistance of the ground operates very obliquely upon the elbow, and, consequently, a great part of the violence is lost.

In the dislocation inwards, the length of the limb is not much altered, and, if changed at all, it is somewhat diminished. The forearm is not fixed in the half-bent position, because the muscles are less stretched, than in the luxation downwards. The direction of the arm is downwards and backwards. The flatness of the shoulder, and the depression formed by the glenoid cavity, are not very obvious, excepting towards the back of the joint. The head of the humerus seems to be as much under the coracoid process, as in the axilla, and that it is situated more towards the median line, than the neck of the scapula, is quite manifest. The movement, in which the elbow is carried forwards, is attended with the greatest difficulty, and that, in which the limb is inclined in the opposite direction, the least painful.

Many surgical authors believe, that the head of the humerus cannot be dislocated backwards. But, a few cases, in which the head of the humerus was dislocated backwards, under the spine of the scapula, may now be found in the records of the profession. Thus, M. Fizeau has detailed one rare instance, which was also witnessed by Professor Boyer.

In the case here alluded to, the bone, after its reduction, was observed to have a remarkable tendency to slip out of its place again: and, in one case dissected by Delpech, the head of the bone lay under the infraspinatus muscle, in immediate contact with the scapula.

Paralysis of the arm is sometimes the consequence of a dislocation downwards, or inwards, and is supposed to proceed from injury done to the axillary-plexus of nerves by the head of the humerus. This paralytic affection may remain for ever incurable, may get well spontaneously, or yield to stimulating liniments, blisters, issues, or the moxa. A still more frequent ill effect of luxations of the shoulder is paralysis of the deltoid muscle; an infirmity ascribed by some writers to laceration of the circumflex nerve.

To reduce these dislocations, the trunk is usually fixed by means of a sheet, or table cloth, put round the chest, and the ends of which are either held by one or more assistants, or fastened to a post, or any other immovable point. The scapula may be kept back by a napkin folded longitudinally, placed over the shoulder and tied to the sheet.

Whether the extension be made at the wrist, or at the lower end of the humerus, the soft parts should be protected from the effects of the pressure with flannel, or a few turns of a wet calico roller, over which the longitudinally folded table-cloth or sheet, or the quilted leather of the multiplied pulley employed for making the extension, may be placed.

When the dislocation is downwards, the extension should be made directly outwards, and the arm afterwards inclined downwards, and a little forwards, until it touches the side. The surgeon must be careful to guide the movement, by which the assistants change the direction of the extension; and, in proportion as the wrist is inclined downwards, he is to press with his abdomen on the external side of the elbow, while, with both his hands applied to the inner and upper part of the humerus, he inclines the head of the bone upwards and a little backwards. The success of these manœuvres will depend in a great measure upon the extension and counter-extension being well proportioned to each other, and regulated so as to promote the movements, which it is the duty of the surgeon to communicate to the limb during the operation.

When the dislocation is inwards, Boyer recommends the extension to be made horizontally outwards and a little backwards; and the limb is afterwards to be inclined forwards and downwards, until it is brought obliquely over the front of the chest. But, previously to the arrival of the member in the last position, the operator is to press with one of his hands upon the back of the elbow, and with the other, upon the front and upper part of the humerus, in order to push the head of the bone outwards, and direct it into the glenoid cavity of the scapula.

Were the case originally a dislocation downwards, or inwards, but the head of the bone now in a state of consecutive, or secondary displacement inwards, or upwards, the aim of the surgeon should be first to bring the head of the humerus down into the axilla, and then to guide it over the lower part of the brim of the glenoid cavity, where the capsular ligament was torn at the moment of the accident.

Whether the extending force to be applied to the wrist, or just above the elbow, the position and inclination of the humerus during the operation should be the same. In short, while the extension and counter-extension are kept up by the assistants, the limb, or the humerus itself, is to be employed by the surgeon as a lever for moving the head of the bone gradually towards the glenoid cavity. In Boyer's account, we see, that this principle is acted upon, the elbow and wrist being inclined in particular directions, while the surgeon forms with his hands a kind of fulcrum, or active resistance at the upper part of the humerus. When the extension has been performed in a certain degree, many surgeons make a still more efficient fulcrum by directing one of the assistants to draw up the upper portion of the humerus with a towel placed under the member just on the outside of the axilla. Others execute the same purpose by letting the ends of the towel, or table-cloth, be fastened over the back part of their necks,

necks, which they drew back at the period, when it is desired to keep well up the superior portion of the humerus.

When a dislocation is accompanied with a fracture of the humerus, the reduction is generally impracticable, especially when the solution of continuity in the bone happens to be very near the shoulder joint.

Fractures of the os humeri, are distinguished into three kinds; first, those which happen above the insertion of the deltoid muscle; second, those which occur below that point; and, thirdly such as take place towards the lower end of the bone.

In the first example, the pectoralis major, latissimus dorsi, and teres major, draw the upper fragment inwards; while the deltoid pulls the lower one outwards.

In the second instance, the displacement happens in the inverse of the former manner.

In the third, if the fracture be not situated in the broadest portion of the humerus, but where the bone is covered by the triceps and brachialis, without their being attached to it, the ends of the fracture may be displaced in any direction by external force. On the contrary, if the injury be very near the elbow joint, the displacement can only happen backwards or forwards, on account of the considerable transverse extent of the bone at this point, and the resistance of the muscles of the forearm, which almost all arise from the external and internal condyles, and of course are connected with both the fragments. The lower one is mostly found drawn forwards and rotated outwards.

A fracture of the head of the bone can only be distinguished by a very careful examination; but, when any other part of the os brachii is broken, the case is in general plainly indicated by the grating of the surfaces of the fracture against each other, the inability to use the arm, and the manifest change in its figure. The ends of the broken part may be in contact with each other; or they may be drawn asunder, and the limb be more or less shortened. When the lower end of the fracture is retracted, the biceps muscle, brachialis internus, and coraco-brachialis, are to be relaxed, and moderate extension made; but, in consequence of the extension of the forearm, it is sometimes drawn forwards and rotated outwards. When the external, or internal, condyle is fractured, the muscles, arising from the part, should be relaxed; a piece of soap-plaster, a figure-of-eight bandage, and a splint, to the side of the arm, on which the injury is situated, should be applied and the fore arm placed in a sling. The external condyle cannot be broken, without the fracture communicating with the joint, and, in every instance in which there is reason to suspect this event, it is necessary, after all risk of inflammation is past, to move the joint occasionally, in order to prevent the formation of adhesions within the capsular ligament, and an irremediable stiffness of the articulation.

In ordinary fractures of the arm it is usual to apply two pieces of soap-plaster, which together surround the limb, at the situation where the accident has happened. Extension, if necessary, being now made by an assistant, who at once draws the lower portion of the bone downward, and bends the elbow, the surgeon is to apply a roller round the limb. The external splint is to extend from the acromion to the outer condyle, and being lined with a soft pad, the wood cannot hurt the limb by pressure. The internal splint is to reach from the margin of the axilla to a little below the inner condyle, and is to be well guarded with a pad, filled with tow, or any other soft materials.

When the humerus is fractured near or above its tuberosities, the only useful measures are to keep the arm well supported, and perfectly quiet in a sling, to confine the member close to the side, and make the patient avoid moving about.

When the fracture is oblique, and situated precisely at the part of the bone where the pectoralis major, latissimus dorsi, and teres major are inserted, such failure is observed to be most disposed to happen, and the circumstance is accounted for by the fragments being drawn away from each other for-

wards and backwards by the action of the foregoing muscles, combined perhaps with that of the deltoid.

The dislocation of the elbow forwards cannot take place unless the olecranon be broken. The kind of dislocation most frequently occurring at the elbow, is that in which the upper heads of the radius and ulna are displaced backward. This accident is facilitated by the small size of the coronoid process, which slips behind the os humeri into the lower portion of the cavity, naturally destined for the reception of the olecranon in the extended state of the forearm. However, in some instances, the coronoid process is fractured; a complication, which is said not to admit of the ulna being preserved in its natural situation. The lower end of the humerus is situated upon the anterior surface of the radius and ulna, between the coronoid process and the insertion of the tendon of the biceps muscle; and the lateral ligaments are torn. The fibres of the anconeus and brachialis also probably suffer the same fate. The olecranon and part of the biceps project backward to an unusual distance, causing an appearance, as if the arm were broken above its lower third. The biceps, pronator teres, supinator brevis, and triceps, are all in a state of tension; and, in consequence of the forearm being thus drawn in opposite directions by the antagonist muscles, it remains in a half-bent position. There are particular instances of this kind of dislocation, where the displacement is much more extensive, and the injury of the soft parts far more considerable, than what is above described. Thus, the lower end of the humerus may be thrown further from the elbow, along the anterior surface of the radius and ulna, which displacement cannot happen without the laceration of several of the preceding muscles. In cases of this description, the humerus has sometimes been driven through the integuments, and even the brachial artery has been ruptured, which last injury one would expect to be more frequent than experience proves it to be, considering the relative situation of the vessel to the elbow-joint.

The next most frequent dislocation at the elbow consists in the ulna being pushed into the place of the radius upon the lower end of the humerus. In this case, the olecranon is brought nearer to the external condyle, the distance between the olecranon and internal condyle being of course much greater than natural; and, as these projecting points of bone can hardly ever be obscured by any degree of swelling of the soft parts, they are, in accidental injuries of the elbow-joint, important sources of information to every surgeon.

In the lateral luxation of the head of the ulna outwards, the radius is invariably pushed off the lesser articular surface of the humerus; this surface and the outer side of the articular pulley being now in contact with the sigmoid cavity of the ulna. The internal portion of the trochlea of the humerus is no longer applied to the ulna, and forms a prominence at the inner side of the elbow, while the olecranon and coronoid process, being propelled outwards, do not correspond to the cavities in the humerus naturally intended for their reception; and hence, they seriously limit the flexion and extension of the forearm. As the point of the olecranon constantly touches the back of the humerus, the forearm remains slightly bent; and the brachialis, biceps, and triceps, are in a state of tension, drawn outwards. A similar derangement of the pronator teres, and of nearly all the muscles situated on the palmar side of the forearm, will also explain the fixed pronation of the hand, and the bent state of the fingers.

The lateral dislocation of the heads of the ulna and radius inwards, is more uncommon and generally incomplete. Lateral dislocations of the upper heads of the radius and ulna are always attended with rupture of the lateral ligaments, and generally also with a laceration of the annular ligament of the radius, which is so intimately connected with the external lateral ligament, so as to be as it were a part or production of it. That it is frequently torn, is proved by the fact, that after a lateral dislocation of the elbow has been reduced, it is not at all uncommon for the surgeon to perceive

ceive a distinct luxation of the radius yet claiming his assistance. And, as Delpsch observes, the radius and ulna can only preserve their due relation to each other in dislocations of the elbow, when the external lateral ligament happens to break above its connection with the annular ligament of the radius.

When extension is made, recent dislocations of the elbow are easily reduced. For this purpose, an assistant is to take hold of the arm above the joint and fix the humerus, while another assistant makes the requisite extension at the wrist in the axis of the displaced forearm. At the same time the surgeon is to promote the reduction by pressing the heads of the ulna and radius in the desirable direction.

The arm should afterwards be kept in a sling; and if there be much swelling of the soft parts, venesection, leeches, cold washes, low diet, and purging, will be proper. In these cases, there is not much tendency to displacement again.

The radius and ulna may be broken at their middle, or extreme portions; and the injury most frequently happens to the radius. The latter circumstance is accounted for by the different relations of these two bones to the hand, and by the naturally curved form of the radius. They are both most liable to be broken at their narrowest parts, and hence, when fractured together, the injury seldom happens at a parallel point of the two bones. In some instances, however, the radius is broken at its lower end, and the ulna at its upper one. When the radius breaks, it is mostly from a fall on the hand, but, when the ulna alone suffers, or both bones are fractured together, it is generally in consequence of violence applied directly to the forearm.

In fractures of the forearm, the fragments are generally displaced, both with regard to the diameter and direction of the injured bone. The ends of the fracture are mostly inclined towards the centre of the limb. It is to be observed, however, that the upper portion of a broken ulna is not susceptible of this kind of displacement, on account of the manner in which it is articulated with the humerus. When both bones are broken, the member is sometimes bent forwards, or backwards.

Fractures of the radius are easily detected; for, on endeavouring to rotate the bone, or, in other words, to place the hand alternately in a prone and supine posture, a crepitus is immediately perceptible. When the two bones are broken, the nature of the accident is indicated both by the crepitus and the distortion of the forearm. Fractures of the ulna, especially when high up, are not always immediately obvious. However, if the surgeon make pressure on each side of the suspected point, with his thumbs alternately, he will generally distinguish a grating sensation.

As the fragments do not pass over each other, scarcely any extension is necessary for their reduction; but, the surgeon must incline them away from the interosseous space by pressure gently exercised on the dorsal and palmar sides of the limb.

During the treatment, the elbow is to be bent, and the hand put in the mid-state, between pronation and supination; that is to say, the palm of the hand is to face the patient's breast. Only two splints are necessary; one is to be placed along the inside, the other along the outside of the forearm; and soft pads must be interposed between the skin and the splints.

The olecranon may be broken by falls, or blows upon the elbow, or by the violent action of the triceps muscle; the injury may take place at various distances from the extremity of this process; the solution of continuity may be single; or the part may be broken into several pieces. In consequence of the action of the triceps and the effect of bending the elbow, the detached fragment of a broken olecranon would always be drawn up a considerable distance from the rest of the bone, were it not for the aponeurosis, which is extended from the tendon of the triceps over the posterior surface of the olecranon; for, it mostly happens, that this tendinous expansion is not ruptured, or, at all events, not completely; and what remains entire has the

effect of limiting the separation of the fragment or fragments from the main part of the bone.

The member having been slightly bent, a pad filled with tow, and thicker in its centre than at its ends, in order to fill up the hollow in front of the elbow, is to be laid along the forepart of the arm and forearm, and then a splint is to be put over it, and fixed (but not too tightly) with a common roller. When the inflammation of the soft parts is very considerable, I think the immediate use of the bandage and splint should be deferred for a few days, until the swelling has been diminished by leeches, venesection, cold applications, and other antiphlogistic remedies. Were the fascia derived from the tendon of the triceps, entirely lacerated, and the fragment of bone drawn very far up the arm, it might be necessary to have recourse to a compress and bandage for hindering such retraction; but, in this case, the movements of the elbow after the cure would probably be somewhat weak and imperfect.

Fractures of the metacarpal bones, and fingers.—The metacarpal bone of the little finger is said to be most frequently broken. In the treatment of fractures of the metacarpal bones, the only object is to keep the adjacent joints perfectly motionless.

Fractures of the carpus are, for the most part, produced by such extreme violence, as perfectly jams the limb and causes immediate amputation to be necessary. In milder cases, to extract splinters of bone, to keep the parts perfectly immovable and reduce inflammation, is all that can be done. Dislocations of the carpus are, of course from the slowness of the coverings of the bones at this part, easily detected; and, in most instances, at first may be easily reduced by the obvious means of extension and pushing the displaced bones into their place. The same may be said of other dislocations of the hand, with the exception of luxation of the thumb, which is very difficult of reduction.

The phalanges of the thumb are most liable to be dislocated backwards. In this case, the base of the phalanx glides backward behind the head of the first metacarpal bone, lacerating the capsular ligament, stretching the tendons of the extensor muscles, and changing the direction of the lateral ligaments, without breaking them.

The nature of the case may be known by the head of the first phalanx of the thumb projecting back, so as to form nearly a right angle with the metacarpal bone; by the tumour produced in front of the joint by the head of the latter bone; by the bent position of the second phalanx caused by the tense state of the tendon of the flexor longus pollicis; and by the impossibility of either bending or extending the first phalanx.

Extension should be made, not however so as to bring the bones in a straight line, but so as to bring forward the phalanx in its distorted condition. The articular surface may now be pressed into contact, the bones straightened, and then the reduction effected. If this plan does not succeed, a couching-needle may be introduced under the shin, so as to divide one of the lateral ligaments.

SURGICAL, *adj.* Pertaining to the art and skill of a surgeon; *chirurgical*.

SURGOOJA. See **SIRGOOJA**.

SURGUT. See **SOURGOUT**.

SURGY, *adj.* Rising in billows.

Do public or domestic cares constrain
This toilsome voyage o'er the *surgy* main?

Pope.

SURHUYS-TERVEEN, a petty town of the Netherlands, in the province of Friesland, with 1100 inhabitants.

SURIANA [so named by Plumier, in honour of Joseph Donat Surian, physician at Marseilles, who accompanied him in his travels], in Botany, a genus of the class decandria, order pentagynia, natural order of succulentæ rosaceæ. (*Juss.*)—Generic Character. Calyx: perianth five-leaved; leaflets lanceolate, acuminate, permanent. Corolla: petals five, obovate, length of the calyx, spreading. Stamina: filaments ten, filiform, shorter than the corolla; anthers simple.

Pistil :

Pistil: germs five, roundish. Styles solitary, filiform, erect, length of the stamens, inserted into the middle and inner side of the germ. Stigmas obtuse. Pericarp none. Seeds five, roundish.—*Essential Character.* Calyx: five-leaved; petals five. Styles inserted into the inner side of the germs. Seeds five, naked.

Suriana maritima.—Stem shrubby, a fathom high, unarmed. Branches erect, subdivided, round, cicatrised with the fallen leaves, glaucous, pubescent. Leaves clustered, in bundles towards the ends of the branchlets, erect, wedged, nerveless, veinless, villous-pubescent, pale green: on very short petioles. Peduncles terminating and axillary, shorter than the leaves, from three to five-flowered. Flowers small, yellow. Number of stamens always five.—Native of the sea-coast of South America and the islands in the West Indies.

Propagation and Culture.—Sow the seeds on a hot-bed early in the spring; when the plants come up, weed them and refresh them frequently with water. In the winter these plants must be kept very warm, especially whilst they are young. They must also be frequently refreshed with water, but it must not be given them in large quantities in cold weather. These plants make slow progress the first year, but afterwards will grow pretty freely.

SURIMENA, a populous settlement of New Granada, in the province of Los Llanos de Neiba, on the shore of the river Meta.

SURINAM, a flourishing colony of Guiana, in South America, settled and improved by the Dutch. It is bounded on the north by the Atlantic, on the east by the river Marawina, on the south by a country of Indians, and on the west by the river Corentin; about 150 miles from east to west, and 60 from north to south. The principal rivers that belong to this settlement are the river Surinam, from which the colony takes its name, the Corentin, the Copename, the Seramica, and the Marawina. Of those rivers the first only is navigable; the rest, not excepting the Marawina, being, though very long and broad, so shallow, and so extremely crowded with rocks and small islands, that they are of little consequence to Europeans, nor are their banks inhabited, except by some of the Indians or natives of the country. The other branch into which this large river is divided, is named Commewina, and keeps due east for about 16 miles, with a depth of about three or four fathoms at high-water mark; but as the tide makes a difference of 15 feet, it is not considered as navigable for any ships of burden, though its breadth may be computed at about two miles. The banks of this river, though later cultivated than those of the river Surinam, are in a more flourishing condition; and as it runs parallel with the sea-coast, they enjoy the benefit of the sea breezes, and are reckoned more healthy. Coffee is mostly planted on the estates which lie on the side of this river; and as its preparation requires many buildings, the plantations have a fine appearance. At the distance of 16 miles, the river Commewina is again divided into two branches, one of which bears the same name to the south-east, for a length of above 50 miles, and that of Cottica to the east-south-east, for more than 40 miles, when this last takes a meandering course to the south-south-west for the distance of 24 or 30 miles. Into all these rivers, the courses of which are not straight, but serpentine, are discharged a number of very large creeks or rivulets, the banks of which are inhabited by Europeans, and cultivated with sugar, cocoa, cotton, and indigo plantations, which form the most delightful prospects that can be imagined to those who travel by water, the universal mode of journeying in this country, as the soil is in general ill adapted for the construction of roads; and in some places the woods, &c., are absolutely impenetrable, a small path of communication between Paramaribo and the river Seramica, being the only passable road in the settlement. The rivers whose banks are uncultivated, such as the Corentin, Copename, Seramica, and Marawina, afford but little matter for description. It is therefore only necessary to remark, that they are generally from two to four miles in breadth, exceedingly shallow, and crowded with

quick-sands, small islands, and rocks, which form a number of beautiful cascades. In the river Marawina is frequently found a curious stone or pebble, which is known by the name of the Marawina diamond, and which, being polished, bears a very near resemblance to that most valuable gem, and is consequently often set in rings, &c. In all the above rivers, without exception, the water rises and falls for more than 60 miles from the mouth, occasioned by the stoppage of the freshes by the tide, yet fresh water may generally be met with about 24 or 30 miles from the mouths of these rivers, for watering the ships. The climate of Surinam, which was formerly extremely fatal to Europeans, has within the last 20 years been considerably improved. The great population of the colony, and the better clearing of the ground, has been the principal cause of this happy change. Formerly extensive swamps exhaled thick clouds of vapour, and being shaded by immense forests, the breezes had little or no power of dispersing them, so that in the time of the heavy rains, they became stationary the greatest part of the year. But now a more serene atmosphere prevails. The year is divided into two dry and two wet seasons. When the sun is advancing from the tropic of Cancer, within 12 or 10 degrees, light showers refresh the land; this begins about the middle of April, and increases till about the middle of June, when the rain falls in torrents, and greatly surprise those who have lately come from the north of Europe; but in the southern part, as Portugal and Italy, the showers are sometimes as heavy, though sooner over. At the beginning of July these heavy rains begin to decrease, and in August the long dry season begins, and continues till November. When the sun is approaching to the line from the tropic of Capricorn, the second wet season begins; but as at that time the sun is more distant from this part of the globe, the showers do not then last so long. Captain Stedman found no difference in the two rainy seasons; but as he was most of his time in the forest in the interior parts of the colony, where it always rains more than in the vicinity of Paramaribo, he had no opportunity of observing the distinction. December and January constitute the short rainy season. February and March the short dry season. The highest degree of heat during the dry season is stated to be 91 degrees; but in general the thermometer ranges between 84 and 75. This equal degree of heat is owing to the sea-breezes, which regularly set in at 10 o'clock, and continue till 5 in the afternoon, cooling the atmosphere, and refreshing all nature with an equable and constantly flowing stream of delightful air. Of the animal and vegetable productions, an account will be found under the general article GUIANA. The uncultivated parts are covered with immense forests, rocks, and mountains; some of the latter enriched with a great variety of mineral substances; and the whole country is intersected by very deep marshes or swamps, and by extensive heaths or savannas. The stream along the coast flows continually towards the north-west, and the whole shore is rendered almost inaccessible, from its being covered with dangerous banks, quicksands, bogs, and rocks, with prodigious bushes, and a large quantity of brush-wood, which are so closely interwoven as to be impenetrable. That part of Terra Firma which is called Guiana, or *The Wild Coast*, and in which lies the colony of Surinam, is said by some to have been first discovered by the justly celebrated Christopher Columbus, in the year 1498, when he was sent home in chains; though others contend, that it was not discovered till the year 1504, by Vasco Unes, a Spaniard: In 1579, it was visited by Sir Walter Raleigh, under queen Elizabeth, who also sailed up the river Orinoco above 600 miles, in search of the supposed El Dorado, and in hopes of discovering the gold mines, of which he had the most lively expectations, from samples of a marcasite, which the Spaniards call *madre de oro*. In the year 1634, a Captain Marshal, and about 60 English, were discovered in Surinam, employed in planting tobacco, according to the relation of David Pitease de Vries, a Dutchman, who conversed with them upon the spot. In 1640, Surinam was inhabited by the French, who were obliged to leave it soon

after, on account of frequent invasions which they justly suffered from the Carribean Indians, for having, like their neighbours the Spaniards, treated them with the most barbarous cruelties. In the 1650, this colony being vacant, Francis Lord Willoughby of Parham, by king Charles II.'s permission, sent thither one vessel, equipped by himself, to take possession of it, in the name of his royal master: a little after which he dispatched three vessels more, one of them carrying 20 guns. All these were well received by the Indians or inhabitants of the country, with whom they entered into friendly treaties, and a kind of negotiation. In the year 1662, the colony of Surinam was granted by charter of Charles II. to Francis Lord Willoughby, and at that lord's desire, to be divided with Laurence Hyde, second son of Edward Earl of Clarendon, for them and their descendants for ever. In the year 1665, Surinam was successfully cultivated, mostly by planting tobacco. They had also raised above forty fine sugar-plantations, and erected a strong fortress of hewn stone for their defence. It is proper, however, to remark, that some suppose these improvements were effected by the Portuguese, though at what period is uncertain; while the French strenuously dispute the point, and insist that they were the work of Monsieur Ponsert de Breigny, when France had possession of that country. However this may be, the fortress is situated about 16 or 18 miles from the mouth of the river Surinam; and these industrious settlers found themselves perfectly happy, in a small town which they had built under the walls. Their felicity was not of long duration; for in the wars between Charles II. and the United Provinces, the Dutch having been driven, in 1661, from the Brazils by the Portuguese, took the colony of Surinam from the English in 1667, under the command of a Captain Abraham Criuvon, who was dispatched for that purpose with three ships of war and 300 marines. The English commander, William Biam, lost the settlement of Surinam by surprise, when above 600 of the best men in the colony were at work on the sugar-plantations. This neglect appears from the trifling loss of the Dutch, who in storming the citadel had but one man killed. They immediately planted the Prince of Orange's flag on the ramparts, and gave to this fortress the name of Zelandia, and that of Middleburgh to the town of Paramaribo, after making the inhabitants, amongst other contributions, pay 100,000 pounds weight of sugar, and sending a number of them to the island of Tobago. This event took place in February; and in July following, the peace was concluded at Breda; but most unluckily for the new possessors of Surinam, it was concluded unknown to the English commodore, Sir John Harman, who in October, that same year, having first taken Cayenne from the French, entered the river with a strong fleet of seven ships of war, two bomb-ketches, &c., and retook the colony from the Dutch, killing on this occasion above fifty of their men, and destroying nine pieces of cannon in Fort Zelandia. The new inhabitants were now in their turn laid under contribution, and the Dutch garrison were transported to the island of Barbadoes. At the discovery in Surinam, that the peace had been concluded between the contending powers, before Commodore Harman retook the colony from the Dutch, considerable tumult and disorder took place among the inhabitants, who knew not whom they ought to acknowledge as their lawful sovereign. At length, by an order of king Charles, the settlement was ceded to the Dutch in 1669, when 1200 of the old inhabitants, English and negroes together, left it and went to settle on the island of Jamaica. At the close of the succeeding war, it was agreed by the treaty of Westminster, that Surinam should be the property of the Dutch for ever, in exchange for the province of New York, which accordingly took place in the year 1674. In 1799, Surinam was taken by the British. It was given up at the peace of Amiens in 1802, but was again taken in the subsequent war, and is now retained by Britain. Paramaribo is the chief town. Lat. 4. 45. to 6. N. long. 53. 40. to 56. 25. W.

SURINAM, a river in the above province or district, which rises in the mountains of the interior, and after a

winding course of about 150 miles from south to north, falls into the Atlantic Ocean, in Long. 55. 40. W. lat. 6. 25. N. It is at its entrance nearly the breadth of 4 English miles, and in depth from 16 to 18 feet at low water mark, the tide rising and falling above 12 feet. This breadth and depth is continued from its mouth upwards to the distance of 8 or 10 miles, when it divides itself into two branches, winding to the south-south-east, for the length of upwards of 120 miles. All this extent is navigable for small craft, but beyond this distance the river proceeds directly south, sometimes in its course surrounding small islands, and sometimes forming small cataracts. The source of this beautiful river has never yet been discovered by Europeans. All large vessels, after entering the Surinam, ought to keep rather near the east shore, the opposite side being very full of shoals, as far as the town of Paramaribo, which is about 18 miles from its mouth.

SURINGLA, a sea-port of Nippon, in Japan, capital of a province of the same name; 170 miles east of Meaco.

SURIRISSA, a river of Quito, in the province of Jaen, which runs from south-west to north-east, and enters the Tamora, in Lat. 4. 3. S.

SURKUK, a village of Anatolia, in Asiatic Turkey; 8 miles north of Kastamouni.

SURLILY, *adv.* In a surly manner. *Sherwood.*—They were both hastily passionate; he was sometimes *surly* ill-natured, while she was apt to conceive what he never intended. *The Student.*

SURLINESS, *s.* Gloomy moroseness; sour anger.

Thus pale they meet; their eyes with fury burn;
None greets; for none the greeting will return;
But in dumb *surliness*, each arm'd with care
His foe profest, as brother of the war.

Dryden.

SURLING, *s.* A sour morose fellow. *Not used.*—As for these sour *surlings*, they are to be commended to sieur Gaulard. *Camden.*

SURLINGHAM, a village of England, in Norfolk, including the parishes of St. Mary and St. Saviour. Here is a ferry over the river Yare; 5½ miles east-south-east of Norwich.

SURLY, *adj.* [from *jup*, *sour*, Sax.] Gloomily morose; rough; uncivil; sour; silently angry.

'Tis like you'll prove a jolly *surly* groom,
That take it on you at the first so roundly.

Shakspeare.

SURMISAL, *s.* Imperfect notion; surmise.—From this needless *surmisal* I shall hope to dissuade the intelligent and equal auditor. *Milton.*

To SURMISE, *v. a.* [*surmise*, Fr.] To suspect; to image imperfectly; to imagine without certain knowledge.

It waited nearer yet, and then she knew
That what before she but *surmis'd*, was true.

Dryden.

SURMISE, *s.* [*surmise*, Fr.] Imperfect notion; suspicion; imagination not supported by knowledge.

My compassionate heart
Will not permit my eyes once to behold
The thing, whereat it trembles by *surmise*.

Shakspeare.

SURMISER, *s.* One who surmises.—I should first desire these *surmisers* to point out the time when, and the persons who began this design. *Lively Oracles.*

To SURMOUNT, *v. a.* [*surmonter*, Fr.] To rise above.—The mountains of Olympus, Atho, and Atlas, overreach and *surmount* all winds and clouds. *Ralegh.*—To conquer; to overcome.—He hardly escaped to the Persian court; from whence, if the love of his country had not *surmounted* its base ingratitude to him, he had many invitations to return at the head of the Persian fleet; but he rather chose a voluntary death. *Swift.*—To surpass; to exceed.

What *surmounts* the reach
Of human sense, I shall delineate so,
By lik'ning spiritual to corporeal forms,
As may express them best.

Milton.

SURMOUNTABLE,

SURMO'UNTABLE, *adj.* [*surmontable*, old Fr.] Conquerable; superable.

SURMO'UNTER, *s.* One that rises above another.

SURMO'UNTING, *s.* The act of getting uppermost.

SURMULLET, *s.* [*mugil*, Lat.] A sort of fish. *Ainsworth*.

SURNAME, *s.* [*surnom*, Fr. "It is a great dispute whether we should write *surname* or *sirname*; on the one hand, there are a thousand instances in court-rolls, and other ancient muniments, where the description of the person, *le Smyth, le Tayleur*, &c., is written over the Christian name of the person, this only being inserted in the line; and the French always write *surnom*. And certainly *surname* must be the truth, in regard of the patriarch or first person that bore the name. However, there is no impropriety, at this time of day, to say *sirname*, since these additions are so apparently taken from our *sires* or fathers. Thus the matter seems to be left to people's option." *Pegge, Anonym.*] The name of the family; the name which one has over and above the Christian name.—The epithets of great men, *monsieur Boileau* is of opinion, were in the nature of *surnames*, and repeated as such. *Pope*.—An appellation added to the original name.

Witness may

My *surname* Coriolanus: the painful service,
The extreme dangers, and the drops of blood
Shed for my thankless country, are requited
But with that *surname*.

Shakspeare.

To **SURNAME**, *v. a.* [*surnomer*, Fr.] To name by an appellation added to the original name.

How he, *surnam'd* of Africa, dismiss'd
In his prime youth the fair Iberian maid.

Milton.

SUROU', a fortified town of Hindostan, province of Agra, belonging to an independent chief. Lat. 26. 51. N. long. 77. 8. E.

To **SURPASS**, *v. a.* [*surpasser*, Fr.] To excel; to exceed; to go beyond in excellence.

The climate's delicate,

Fertile the isle, the temple much *surpassing*
The common praise it bears.

Shakspeare.

SURPASSABLE, *adj.* That may be excelled. *Dict.*

SURPASSING, *participial adj.* Excellent in an high degree.

O thou! that with *surpassing* glory crown'd,
Look'st from thy sole dominion like the god
Of this new world.

Milton.

SURPASSINGLY, *adv.* In a very excellent manner.

SURPLICE, *s.* [*superpellicium*; Lat.] The white garb which the clergy wear in their acts of ministration.—It will wear the *surplice* of humility over the black gown of a big heart. *Shakspeare*.—The *cinctus gabinus* is a long garment, not unlike a *surplice*, which would have trailed on the ground, had it hung loose, and was therefore gathered about the middle with a girdle. *Addison*.

SURPLICE-FEES, *s.* Fees paid to the clergy for occasional duties.

With tithes replete his barns he sees,
And chuckles o'er his *surplice-fees*;
Studies to find out latent dues.
And regulates the state of pews.

Warton.

SURPLICED, *adj.* Wearing a surplice.

Lo! as the *surplic'd* train draw near
To this last mansion of mankind.

The slow sad bell, the sable bier,
In holy musings wrap the mind.

Mallet.

SURPLUS or **SURPLUSAGE**, *s.* [*sur*, and Lat. *plus*,] A supernumerary part; overplus; what remains when use is satisfied.

That you have vouchsaf'd my poor house to visit,
tis a *surplus* of your grace.

Shakspeare.

SURPRI'SAL or **SURPRI'SE**, *s.* [*surprise*, Fr.] The act of taking unawares; the state of being taken unawares.

This let him know,

Lest, wilfully transgressing, he pretend
Surprisal, unadmonish'd, unforewarn'd.

Milton.

A dish, I suppose, which has nothing in it.
Few care for carving trifles in disguise,
Or that fantastic dish some call *surprise*.

King.

Sudden confusion or perplexity.

To **SURPRI'SE**, *v. a.* [*surpris*, Fr.] To take unawares; to fall upon unexpectedly.

The castle of Macduff I will *surprise*,
Seize upon Fife, give to the edge o' th' sword
His wife, his babes.

Shakspeare.

Bid her beware,

Lest, by some fair appearing good *surpris'd*.
She dictate false, and misinform the will.

Milton.

To astonish by something wonderful.—People were not so much frightened as *surpris'd* at the bigness of the camel. *L'Estrange*.—To confuse or perplex by something sudden.—Up he starts, discovered and *surpris'd*. *Milton*.

SURPRISING, *participial adj.* Wonderful; raising sudden wonder or concern.—The greatest actions of a celebrated person, however *surprising* and extraordinary, are no more than what are expected from him. *Addison*.

SURPRI'SINGLY, *adv.* To a degree that raises wonder; in a manner that raises wonder.—If out of these ten thousand, we should take the men that are employed in public business, the number of those who remain will be *surprisingly* little. *Addison*.

SURQUEDRY, *s.* [*sur* and *cuider*, old Fr. *to think*.] Overweening; pride; insolence. *Obsolete*.

They overcommen, were deprived

Of their proud beauty, and the one moiety

Transform'd to fish for their bold *surquedry*.

Spenser.

SURREBUTTER, *s.* [In Law.] A second rebutter; answer to a rebutter. A term in the courts.

SURRECTORIUM, the name of a surgical instrument, mentioned by Ambrose Paré, and intended to keep the arm in an erect situation when required.

SURREJOINDER, *s.* [*surrejoindre*, Fr. In Law.] A second defence of the plaintiff's action, opposite to the rejoinder of the defendant, which the civilians call *triplicatio*. *Bailey*.

To **SURRENDER**, *v. a.* [*surrender*, old Fr.] To yield up; to deliver up.—Recal those grants, and we are ready to *surrender* ours, resume all or none. *Davenant*.—To deliver up an enemy; sometimes with *up* emphatical.

Ripe age bade him *surrender* late,

His life and long good fortune unto final fate.

Fairfax

To **SURRENDER**, *v. n.* To yield; to give one's self up.—This mighty Archimedes too *surrenders* now. *Glanville*.

SURRENDER, or **SURRE'NDRY**, *s.* The act of yielding.

Our general mother, with eyes

Of conjugal attraction unprov'd,

And meek *surrender*, half-embracing lean'd

On our first father.

Milton.

The act of resigning or giving up to another.—If our father carry authority with such disposition as he bears, this last *surrender* of his will but offend us. *Shakspeare*.

SURREPTION, *s.* [*surreptus*, Lat.] Act of obtaining or procuring surreptitiously.—The *surreption* of secretly misgotten dispensations. *Bp. Hall*.—Sudden and unperceived invasion or intrusion.—Sins compatible with a regenerate estate, are sins of a sudden *surreption*. *Hammond*.

SURREPTITIOUS, *adj.* [*surreptitius*, Lat.] Done by stealth: gotten or produced fraudulently.—A correct copy of the Dunciad the many *surreptitious* ones have rendered necessary. *Letter to Publ. of Pope's Dunciad*.

SURREPTITIOUSLY,

SURREPTITIOUSLY, *adv.* By stealth; fraudulently. —Thou hast got it more *surreptitiously* than he did, and with less effect, *Gov. of the Tongue*.

SURREY, one of the inland counties of England, is situated in the southern part of the kingdom, and is bounded by Sussex on the south, by Kent on the east, by Berkshire and Hampshire on the west, and on the north is separated from Middlesex and a small part of Buckinghamshire by the river Thames. Surrey ranks below most of the other counties of England in extent; its greatest width from north to south being about 26 miles, and its utmost length from east to west about 38. The best modern authorities compute its contents at 811 square miles, or 519,000 acres.

The surface of almost the whole of this county consists of a gentle diversity of hill and dale, the hills in some parts rising to a considerable height, and presenting very bold and commanding views. It will be found, on a general survey, that Surrey presents as great a variety of scenery as any county in the kingdom. In some parts naked heaths impart a wildness to the prospect, which is strikingly contrasted with the numberless beauties scattered over the surface of the county by the hand of art; while the hills, aspiring to the bold character and picturesque scenery of mountains, gradually decline into richly wooded dales, and plains covered with luxuriant harvests. Its extensive downs also afford pasture to numerous herds of the finest sheep. The north-west corner of the county is diversified by several rising grounds: from these there are the most commanding prospects. Across the middle of the county, the downs rising with a gentle slope from the north, and broken in their eastern division into deep and waving valleys, form a striking object, and give variety to the appearance of the county. Towards the northern border of the downs there are several hills, which afford an extensive view. To the south of the downs, the surface of the county above rises into hills, that overhang the Weald. As we approach the western extremity of the county, these hills cover a greater breadth; and near Wonsley, Godalming, and Pepperharrow, covered with a rich foliage, and waving, with a graceful line, into intermediate valleys, watered by the different branches of the Wey, they present the most picturesque prospect that Surrey can afford. On Leith Hill, to the south-west of Dorking, Tilbuster Hill near Godstone, and Gratewood Hill near Godalming, the views are very extensive; but perhaps there is no part of the county in which the appearance of the richly wooded vale of the Weald is more strikingly pleasing than on the road from Albury to Ewhurst. After toiling up the deep and barren sands to the south of Albury, that present no object on which the eye can repose, even for a moment, we suddenly come to the southern edge of the hill, whence the whole extent of the Weald, clothed with wood, appears to the south, with an occasional peep of the sea, through the breaks of the Sussex Downs, which form the back-ground: on the south-west appears the rich and finely varied country about Godalming, backed by the wild heaths that stretch across from Farnham to Haslemere. Sometimes on a clear night, the light of the moon is to be seen glancing on the waves of the English channel, forming a singular and romantic feature in the prospect.

General Aspect, Soil, and Climate.—The soil of this county is greatly varied, the different species lying intermixed in small patches. These, however, may be reduced to the general heads of clay, loam, sand and chalk. The most extensive and uniform track of soil is that which occupies the whole southern border of the county, and forms what is denominated the Weald of Surrey; a district about 30 miles in length, and from 3 to 5 in breadth. This consists of a pale, cold, retentive clay, upon a sub-soil of the same nature: its surface is flat, covered with wood, and its elevation is said to be less than any other vale district in the whole island. Proceeding northwards, the soil is chiefly loam, stretching across the whole county. Near Godalming it runs to a great depth, and rests on a base of sand-stone, veined with iron-ore. Contiguous to this commences the most remarkable

district of the chalky downs, which lie nearly in the middle of the county, entering from Kent, into Surrey, by Croydon and Limpsfield, where their width is about seven miles. They, however, gradually decrease towards the west, till their termination near the border of Hampshire, where there is merely a narrow ridge, but little broader than the turnpike road. Along the elevated summit of the downs, particularly about Walton and Hedley, and between the Mole and the Wey, is a large extent of heath, which for a considerable depth separates the chalk of the northern from that of the southern compartment of the downs. From the eastern extremity of the downs, running northward, is a variety of soils, consisting chiefly of strong clay and sandy loam, with patches of gravel, which continue almost to Dulwich, from which place to the extremity of the county, near Rotherhithe, is a strong mixed clay.

Climate.—In a county where the soils and elevations are so various, the climate also must of course vary considerably. It is the general opinion, that less rain falls in most parts of Surrey, than in the metropolis, or in the vale of London; so that the climate may, upon the whole, be regarded as dry, as far as respects the quantity of rain merely; but the southern border must necessarily be moist and damp, from the nature of the soil, the flatness of the surface, and the immense number of trees which cover it and obstruct ventilation. From the like causes, the low parts near the Thames must be considered as rather damp. On the other hand, the atmosphere of the chalk hills, which run across the whole county from east to west, is dry, rather keen, and bracing. On the wide and exposed heaths about Bagshot, Aldershot, and Hind-head, a similar climate prevails; so that the whole west side may, with a very small exception, be said to have a dry, and rather cold atmosphere. The spring is in general early, and here vegetation is not so often checked by frosty mornings, and cold, raw, easterly winds, as in some of the more southern counties. The summers are commonly dry and warm, and the harvest early, generally commencing in the first ten days of August; and from the steadiness of the weather at that important time, there is seldom any corn out in the fields after the first week of September. The wind blows most steadily from the west and south-west, seldom keeping long in any point between the north-west and north-east. In the spring, and frequently towards the end of autumn, the easterly winds prevail; and the weather is then cold and raw, with a drizzling moisture; but the greatest quantity of rain falls when the wind blows from the south-south-west, or south. The climate is deemed very healthy in most parts of the county, between the southern district called the Weald, and the Thames, particularly near the northern foot of the chalk hills. The dryness of the soil and atmosphere, and the entire freedom from the smoke of the metropolis by the prevalence of the westerly winds, have deservedly conferred the character of salubrity on this division of the county. Even in the Weald, where the surface is low, and the soil moist, diseases are by no means frequent, neither is the ordinary duration of human life abridged.

Mineralogy.—Iron-ore is found in considerable quantities in the south-west part of the county, about Haslemere, Dunsfold, and Cranley; and in the south-east quarter, about Lingfield and Horne; but in consequence of the high price of fuel, the iron-works of Surrey have been totally neglected. Fuller's earth is discovered both to the north and south of the downs, but the former is of inferior quality to the latter. This mineral has been dug for a great length of time in Surrey, as the oldest pit now wrought is said to have lasted for 50 or 60 years. Extensive quarries of stone, of a peculiar quality, are worked near Godstone and its vicinity. When first taken from the quarry, it is incapable of bearing a damp atmosphere; but after being kept covered for a few months, it becomes sufficiently firm to resist the heat of a common fire, and is thence called fire-stone. In consequence of this property, it is much in demand for fire-places in the metropolis and its neighbourhood. These stones are procured

SURREY.
 Engraved for the Encyclopædia Londinensis, 1827.

T. Lucas sc.

5° Longitude W from 45 Greenwich

procured of various sizes, from 10 inches thickness to 72 superficial feet. There are large quarries of lime-stone near Dorking, which afford lime equal in purity and strength to any in the kingdom, and which is particularly serviceable in the construction of works under water. Lime-stone is also dug and burnt in various other parts. Chalk is abundant, and is in general use as a manure. The sand is in great request for hour-glasses; and the brick earth produces those articles denominated fire-bricks, from their property of resisting heat. Camden and Evelyn notice jet-pits in Surrey, but no traces of them can be now discovered.

Rivers.—The principal rivers of this county are the Wey, the Mole, and the Wandle; whilst the Thames also washes its northern border. The former streams, after watering the county in different directions, finally discharge themselves into the Thames. A considerable branch of the Medway rises in the parishes of Godstone and Horne, and passing through the parish of Lingfield, quits Surrey, and enters Kent. The river Loddon skirts Surrey on its west side; its waters are used for the supply of the Basingstoke canal. In the western and south-eastern parts of the county are several ponds, some of which are preserved as stew-ponds, to keep fish to supply the London market. The mineral waters of Surrey were at one period in very high repute, but are now wholly neglected. This county is in general well furnished with springs; but for wells it is sometimes found necessary to perforate to the depth of 300 feet.

Surrey may be considered inferior in agricultural improvement to many other districts. The drill husbandry has not found many followers, except in the west part of the county, in some parts of which it is very general. The produce of wheat is from two to five, and sometimes six quarters an acre, and that of barley from four to seven and a half. The latter is used only for malting, for which purpose it is reckoned equal in quality to any in the kingdom. The climate of Surrey seems to be less favourable to oats than to wheat or barley. As the former is often grown on foul land, the produce is sometimes very low, not exceeding three quarters per acre; but when sown on clean ley, or after turnips, it frequently yields from six to eight quarters. Garden peas and beans are cultivated in the immediate neighbourhood of the metropolis and the sandy loams near the Thames, about Mortlake; while the field varieties of both are extensively grown in most other parts of the county, and especially on the chalk hills. Turnips are here raised in large crops. Hops are largely cultivated about Farnham, where they occupy about 900 acres. The crops which are only partially cultivated in Surrey are those of cabbages, potatoes, lucerne, and grass, of which latter it has a much smaller proportion than most other counties in England. Carrots, clover, sainfoin, and hops, are extensively cultivated; and a greater quantity of land is employed in raising physical herbs, than in any other shire in Britain. Those which are chiefly reared are peppermint, lavender, camomile, aniseed, liquorice, and poppy. Upwards of 350 acres of land in Surrey are thus given to medicinal purposes. The whole quantity of garden ground employed for the London market in this county, amounts to about 3500 acres. Surrey is not celebrated for any particular kind of cattle. The Holderness, or short-horned breed of cows, is preferred, of which there are kept about 600, for the supply of London with milk. Rearing of calves for the market of the metropolis was once a common employment in this county, but this system is now disused. The cattle chiefly bred in Surrey are sheep, oxen, and hogs; many geese are also kept on the commons, and in the Weald. Within the last 10 or 12 years, large tracks of the heath-lands have been inclosed and cultivated; before which period it was calculated that nearly one-sixth part of Surrey was in this unprofitable state. The whole amount of waste lands is still computed at about 73,000 acres.

It has been ascertained, that the first locks used in England were those erected on the river Wey, in Surrey. This county contains four canals, entitled the Basingstoke, Vol. XXIII. No. 1606.

which runs from that place to the Wey; the Wey and Arun Junction canal, which falls into the Wey about a mile above Guildford, thus opening a direct communication with the sea; the Surrey, which communicates with the Thames at Rotherhithe; and the Croydon, which commences there, and enters the Surrey canal at Deptford.

The situation of this county being contiguous to the capital of the Roman settlements in Britain, numerous antiquities are found within its limits. St. George's Fields, Southwark, where coins and pavements have been found at different periods, was the centre of several Roman ways. Remains of Roman encampments are to be seen on Holmbury hill, in the parish of Ockley, about two miles to the west of the Stanestreet; and on Bottle Hill, in the parish of Warlingham, near another military way, which also bore the denomination of Stanestreet, and passed through the eastern part of the county. But the most extensive work of this nature is that of St. George's Hill, near Walton-on-the-Thames. Here Cæsar seems to have encamped, previous to his crossing the Thames at Coway Stakes, so named from the contrivance of the Britons to obstruct his passage over that river. At Walton-on-the-Hill, also, great quantities of Roman bricks and other relics have been discovered within an inclosure of earth work; and on Blackheath are the remains of a Roman temple, surrounded with embankments. Various other military antiquities are to be found in Surrey.

Surrey is divided into thirteen hundreds, which together contain one county town, fourteen boroughs and market towns, and 140 parishes, all of them in the diocese of Winchester, with the exception of nine parishes, which are peculiar of the see of Canterbury. According to the population report of 1811, the number of houses in the whole county was 55,484, and that of the inhabitants 323,851. In 1821 the number of males amounted to 189,871; of females to 208,787. Surrey is represented in parliament by fourteen members; two for the county, and two for each of the boroughs of Southwark, Guildford, Ryegate, Haslemere, Blechingly, and Gatton.

To SURROGATE, v. a. [surrogo, Lat.] To put in the place of another.—By the report of a French writer, very ancient, king Pepine of France was *surrogated* into the place of Childericke by the whole nation of the Franks. *Proceed. against Garnet.*

SURROGATE, s. [surrogatus, Lat.] A deputy; a delegate; the deputy of an ecclesiastical judge.—The quality of *surrogates. Const. and Canons Eccl.*

SURROGATION, s. [surrogatio, Lat.] The act of putting in another's place. *Cockeram.*—This St. Peter gives as the reason why there should be a *surrogation* and new choice of an Apostle to succeed into the room of Judas the traitor, viz., That he might be a witness with them of the resurrection. *Killingbeck.*

SURROOL, a town of Bengal, district of Birbhoom. The East India Company have or had here a factory for white cottons. Lat. 25. 39. N. long. 87. 42. E.

To SURROUND, v. a. [surround, Fr.] To environ; to encompass; to enclose on all sides.

Yelling monsters that with ceaseless cry,
Surround me, as thou sawest.

Milton.

SURRY, a post township of the United States, in Hancock county, Maine; 257 miles north-east of Boston. Population 360.

SURRY, a township of the United States, in Cheshire county, New Hampshire; 62 miles west-south-west of Concord. Population 564.

SURRY, a county of the United States, in Virginia, bounded north by Prince George county and James river, north-east by Isle of Wight and Southampton counties, and south-west by Sussex county. Population 6855, including 3440 slaves.

SURRY, a county of the United States, in the north-west

part of North Carolina. Population 10,366, including 1469 slaves.

SURRY, a county in the island of Jamaica, which contains seven parishes, the two towns of Kingston and Port Royal, and eight villages.

SURSEE, a small town of the Swiss canton of Lucerne, on the river Sur, near the lake Sempach. It is well built, and contains 1000 inhabitants; 13 miles north-west of Lucerne, and 26 east of Soleure.

SURSEFF, a small town of Tunis, in Africa, the ancient *Sarsara*; 38 miles east of Kuirwan.

SURSK, a small town of the east of European Russia, in the government of Simbirsk, on the river Sura; 77 miles north-north-east of Penza.

SURSO'LID, *s.* [In Algebra] The fourth multiplication or power of any number whatever taken as the root. *Tre-vout.*

SURSO'LID PROBLEM, *s.* [In Mathematics.] That which cannot be resolved but by curves of a higher nature than a conic section. *Harris.*

SURSUTTY, a river of Hindostan. It rises in the mountains on the north-east boundary of the province of Delhi, and running to the south-west, is lost in the sands of Ajmeer. It is celebrated for being the scene of battle between Sultan Mohammed Ghory and the allied Hindoo chiefs, in the year 1191, when the latter obtained a signal victory over their invaders.—It is the name of several other rivers in Hindostan.

SURSUTTY, a town and fortress of Hindostan, province of Delhi. It is situated on the western bank of the above-mentioned river, and now belongs to an independent chief. It was first taken by the Mahometans in the year 1191. Lat. 29. 13. N. long. 75. 27. E.—There is also a strong fortress of this name in the province of Cashmere.

SURTOU'T, *s.* [Fr.] A large coat worn over all the rest.

The *surtout* if abroad you wear,
Repels the rigour of the air;
Would you be warmer, if at home
You had the fabric, and the loom?

Prior.

SURUBIA, a river of Guiana, which runs south, and enters the Amazons between the strait of Pauxis and the river Curapatuba.

TO SURVE'NE, *v. a.* [*survenir*, Fr.] To supervene; to come as an addition.—Hippocrates mentions a suppuration that *survenes* lethargies, which commonly terminates in a consumption. *Harvey.*

TO SURVEY, *v. a.* [*surveoir*, old French.] To overlook; to have under the view; to view as from a higher place.

Round he *surveys*, and well might where he stood,
So high above.

Milton.

To oversee as one in authority. To view as examining.

With alter'd looks

All pale and speechless he *survey'd* me round.

Dryden.

To measure and estimate land or buildings.

SURVEY, *s.* [The accent on this substantive is now, usually, on the first syllable; formerly, it was uniformly on the last.] View; prospect.

Her stars in all their vast *survey*

Useless besides!

Milton.

Superintendence. Mensuration; which see.

SURVE'YAL, *s.* The same as survey.—The truth of this doctrine will further appear by the declaration and *surveyal* of those respects, according to which Christ is represented the Saviour of men. *Barrow.*

SURVE'YOR, *s.* An overseer; one placed to superintend others.

Were't not madness then,
To make the fox *surveyor* of the fold?

Shakspeare.

A measurer of land.

Should we survey
The plot of situation, and the model;

Question *surveyors*, know our own estate,
How able such a work to undergo,
To weigh against his opposite.

Shakspeare.

SURVE'YORSHIP, *s.* The office of a surveyor.

TO SURVE'EW, *v. a.* [*surveoir*, old French.] To overlook; to have in view; to survey. *Not in use.*

That turret's frame most admirable was,
Like highest heaven compassed a round,
And lifted high above this earthly mass,
Which is *surview'd*, as hills do lower ground.

Spenser.

SURVE'EW, *s.* Survey. *Obsolete.*—After some *surview* of the state of the body, he is able to inform them. *Sanderson.*

TO SURVISE, *v. a.* To look over. *Not in use.*—The most vile and ridiculous escutcheon that ever this eye *survis'd*. *B. Jonson.*

SURVIVAL, or **SURVI'VANCE**, *s.* [*survivance*, Fr. Hume has somewhere used *survivancy*. *Survivance* is the old word; *survival*, modern.] Survivorship.—His son had the *survivance* of the stadtholdership. *Burnet.*

TO SURVIVE, *v. n.* [*supervivo*, Lat.; *survivre*, Fr.] To live after the death of another.

I'll assure her of
Her widowhood, be it that she *survives* me,
In all my lands and leases whatsoever.

Shakspeare.

To live after any thing.—Now that he is dead, his immortal fame *surviveth*, and flourisheth in the mouths of all people. *Spenser.*—To remain alive.

No longer now that golden age appears,
When patriarch-wits *surviv'd* a thousand years;
Now length of fame, our second life, is lost,
And bare threescore is all ev'n that can boast;
Our sons their father's failing language see,
And such as Chaucer is, shall Dryden be.

Pope.

TO SURVIVE, *v. a.* To outlive.—The rhapsodies, called the *Characteristicks*, would never have *survived* the first edition, if they had not discovered so strong a tincture of infidelity. *Watts.*

SURVIVER, or **SURVI'VOR**, *s.* One who outlives another.

Your father lost a father,
That father his; and the *survivor* bound
In filial obligation, for some term,
To do obsequious sorrow.

Shakspeare.

SURVIVERSHIP, or **SURVI'VORSHIP**, *s.* The state of outliving another.—Such offices granted in reversion were void, unless where the grant has been by *survivorship*. *Ayliffe.*

SURY LE COMTAT, a town in the east of France, department of the Loire, with 1800 inhabitants; 12 miles north-west of St. Etienne, and 6 south-east of Montbrison.

SUS, the Hog, in Zoology, a genus of the class and order mammalia belluæ, of which the Generic Character is as follows:—The four upper fore-teeth are convergent; the lower six are prominent; the two upper tusks are shorter, the two lower standing out; the snout prominent; truncate, and moveable; and the feet are mostly cloven. The individuals of this genus dig in the earth with the snout, which is furnished at the end with a strong, round cartilage; they feed indifferently upon almost every thing, even the most filthy; they wallow in the mire, and are in general extremely prolific.

1. *Sus scrofa*, or hog.—Back bristly on the fore part; the tail is hairy. There are two varieties:—1. Tail hairy; ears short, roundish; being the wild hog:—2. Tail hairy; ears long, acute; being the common hog; which is subdivided into those that have their hoofs undivided; and into those whose backs are nakedish, belly reaching almost to the ground.—This is the Chinese hog, as it is denominated.

The

The common hog is found, either in a wild or domestic state, in almost all the temperate parts of Europe and Asia; but it is not met with in the most northern parts of these continents. It is found in many parts of Africa. Dr. Shaw remarks, that it is not indigenous to the British isles; but Mr. Pennant asserts that the wild boar was formerly a native of this country, as appears from the laws of Hoeldda, who permitted his grand huntsman to chase that animal from the middle of November to the beginning of December. William the Conqueror punished with the loss of eyes those that were convicted of killing the stag, or the roe-buck; and it is asserted by Fitz-Stephens, that the vast forest which in his time grew on the north side of London, was the retreat of stags, wild boars, and bulls.

The wild boar inhabits woods, living on various kinds of vegetables, such as roots, mast, acorns, &c. It also occasionally devours animal food: it is in general considerably smaller than the domestic hog, and is of a dark brindly-grey colour, sometimes blackish; but when only a year or two old, it is of a pale red or dull yellowish-brown cast; and when quite young, it is marked with alternate dusky and pale stripes, disposed longitudinally on each side the body. Between the bristles, next the skin, is a finer or softer hair, of a woolly or curling nature. The snout is somewhat longer in proportion than that of the domestic animal; but the principal difference is in the superior length and size of the tusks, which are often several inches long, and capable of inflicting the most severe and fatal wounds.

Of the tame hog, white is the most general colour; but other colours are often intermixed in various proportions. In some respects, the hog seems to form an intermediate link between the whole and the cloven-footed animals; in others, he seems to occupy the same rank between the cloven-footed and digitated. Destitute of horns; furnished with teeth in both jaws; with only one stomach; incapable of ruminating; and producing at one birth a numerous progeny; the union of these faculties confers on the hog a remarkable peculiarity of character. He does not, like other animals, shed his fore-teeth, and put forth a second set, but retains his first set through life.

Hogs seem to enjoy none of the powers of sensation in eminent perfection. They are said to hear distant sounds; and the wild boar distinguishes the scent of the hunter and his dogs, long before they can approach him. But so imperfect is their feeling, that they have suffered mice to burrow in the fat of their backs without discovering any uneasiness, or appearing even to notice it.

The Chinese hog is distinguished from the common, by having the upper part of its body almost bare, its belly hanging nearly to the ground; its legs are very short, and its tail still more disproportionately short. The flesh of this variety is whiter and more delicate. The colour is commonly a dark grey. It abounds in China; and is diffused through New Guinea, and many islands in the South Sea. The New Hebrides, the Marquesas, the Friendly and the Society islands possess this animal, and cultivate it with great care, as it is almost the only domestic animal of which they can boast.

2. *Sus porcus*, or Guinea hog.—Back bristly on the hind parts; tail reaching to the ground. A variety has erect ears, a little pointed; the tail reaching nearly to the ground.—It inhabits Guinea; and the variety is found chiefly at Siam. It is less than the hog; the tail is naked; ears long and pointed; the body is red; hair longer on the head and buttocks.

3. *Sus tajassu*, peccary, or Mexican hog.—Back with a glandular orifice; it has no tail. The tusks of this species are scarcely conspicuous, when the mouth is shut; the ears are short, erect, pointed; the eyes are sunk in the head; the neck is short and thick; the bristles are nearly as large as those of the hedge-hog, longest on the neck and back; in colour it is hoary, black, annulate with white; from the shoulders to the breast is a collar of white. In size and figure this animal bears an imperfect resemblance to the hog

of China. From the gland on the back constantly distils a thin fetid liquor, which is the most remarkable peculiarity of this species.

The habits of the Mexican hog are not very different from those of Asia and Europe. It is found in great abundance in all the warm climates of South America. Their instincts, and arms of offence and defence, are the same as those of our own hog, but they seem to possess dispositions much more gregarious. They are usually found associating together in parties. Though only an individual be singled out, the whole body join together against an enemy. They grunt with a stronger and harsher voice than the hogs of Asia and Europe. Forests are their favourite haunts; they do not resort, like our own hogs or the wild boar, to marshes and mires. Fruits, seeds, and roots, are their chief food; but they will devour, with great eagerness, serpents, toads, and lizards; and they display great dexterity in tearing off the skins of those reptiles; but they do not wallow and become fat, like the common hog. They produce a number of young at each litter, and the mother treats them with the tenderness and solicitous care of a kind parent. Though existing in a wild state, they are susceptible of domestication, but nothing can overcome their natural stupidity. Beasts of prey, no less than man, are hostile to this species. The American leopard, or jaguar, one of their most formidable enemies, often attacks them, and commits upon the herd the most cruel slaughter. If killed in the night season, provided the gland on the back be taken off, and the liquor which it secretes carefully washed away at the instant of death, the flesh of the Mexican hog is reckoned agreeable food.

4. *Sus Africanus*, or Cape hog.—Two fore-teeth in the upper jaw. This hog is of a superior size, and peculiar to Africa. The head is long; the snout slender; tusks large, and hard as ivory; and that in the upper jaw thick, and truncated obliquely; the ears are narrow, erect, and pointed; the tail is slender, and terminating in a tuft reaching down to the highest point of the leg; both jaws furnished with twelve grinding teeth; the body is covered all over with long fine bristles. This species has sometimes been confounded with the Ethiopicus; but the form of the head, the structure of the mouth, and the manner in which the body is covered, establish a sufficient difference.—It is found in abundance between the Cape de Verde and the Cape of Good Hope.

5. *Sus Ethiopicus*, or Ethiopian hog.—This species has no fore-teeth; under the eyes is a soft wrinkled pouch. The manners and economy of this species are but very imperfectly known. They live chiefly under ground, where the texture of their snout enables them to make their way as readily as the mole.—It inhabits Madagascar, and the hot parts of Africa. They are, in fact, diffused from Sierra Leone to Congo.

The Ethiopian hog is nearly five feet long, and between 24 and 30 inches in height; the body is thick and broad; the snout is somewhat horny; the mouth is narrow, as well as destitute of fore-teeth, but it is furnished with hard gums to supply their functions: the tusks in the lower jaw are small, in the upper very large; the eyes are small, and situated high in the fore-head, the horizontal lobe or wattle under them intercepting from the sight of the animal all objects placed immediately below. The skin is of a dusky hue; the bristles thinly dispersed in separate parcels over the body, between the ears and on the shoulders longer than on any other parts.

6. *Sus Babyrussa*.—Two crooked tusks piercing through the upper part of the face.—It inhabits the islands of the Indian ocean; is gregarious; feeds on herbs and leaves; of quick scent; swims and dives well; grunts: it is the size of a stag, and the flesh is good.

SUSA, a province of the Sardinian states, in Piedmont, with a superficial extent of 700 square miles, and 65,000 inhabitants. It consists of a broad valley, situated at the foot of the Cottian Alps, and interspersed with steep rocks and pleasant

pleasant eminences. Its principal products are wine, chestnuts, fruit, silk in some districts, and a little corn. Grazing forms an important branch of its industry; and in several of the petty districts are manufactures of linen and leather. It contains likewise mines of iron and marble.

SUSA, a small town situated at the foot of the Alps, on the great road leading across Mount Cenis. The valley in which it stands is watered by the Dora-Piccola, and presents the most romantic appearance. The town itself is meanly built, and contains only 1700 inhabitants. It is, however, a place of great antiquity, and must have been formerly of importance in a military view, from its situation on the only road, or rather passage, then known from Gaul into Italy, to defend which it had extensive works, and a castle at a small distance, now called La Brunette. It has several relics; but the only monument at present existing in a state of preservation, is a beautiful triumphal arch in honour of Augustus, erected by a Roman prefect, called Cottius, from whom the contiguous portion of the Alps probably took the name of Cottian; 23 miles west-north-west of Turin.

SUSA, a town of Korassan, in Persia; 130 miles south-east of Nishapour.

SUSAO, a small town in the north of Portugal, in the west of the province of Beira, near the Douro; 17 miles west of Oporto. It has 2300 inhabitants.

SUSCEPTIBILITY, *s.* Quality of admitting; tendency to admit.—The *susceptibility* of those influences, and the effects thereof, is the general providential law whereby other physical beings are governed. *Hale.*

SUSCEPTIBLE, *adj.* [*susceptible*, Fr.] Capable of admitting; disposed to admit.—Children's minds are narrow, and usually *susceptible* but of one thought at once. *Locke.*

SUSCEPTIBLENESS, *s.* Susceptibility.

SUSCEPTION, *s.* [*susceptus*, Lat.] Act of taking.—I see the *susception* of our human nature lays thee open to this condition. *Bp. Hall.*

SUSCEPTIVE, *adj.* [*susceptus*, Lat.] This word is more analogical, though less used than *susceptible*. *Dr. Johnson.* Capable to admit.—Since our nature is so *susceptive* of errors on all sides, it is fit we should have notices given us how far other persons may become the causes of false judgments. *Watts.*

SUSCEPTIVITY, *s.* Capability of admitting.—Nor can we have any idea of matter, which does not imply a natural discernibility, and *susceptivity* of various shapes and modifications. *Wollaston.*

SUSCEPTOR, *s.* [*susceptor*, Lat.] One who undertakes; a godfather. *Coler.*—In our church, those who are not secular persons, are not forbid to be godfathers (as in the church of Rome), nor are any *susceptors* supposed to contract any affinity, as that such an undertaking should hinder marriage between the sponsors and the persons baptized, if otherwise it be lawful. *Puller.*

SUSCIPENCY, *s.* Reception; admission.

SUSCIPIENT, *s.* [*suscipiens*, Lat.] One who takes; one that admits or receives.—The sacraments and ceremonies of the Gospel operate not without the concurrent actions, and moral influences, of the *suscipient*. *Bp. Taylor.*

SUSCIPIENT, *adj.* [*suscipiens*, Lat.] Receiving, admitting.—Effecting miracles, superior or contrary to the law and course of nature, without any preparatory dispositions induced into the *suscipient* matter, in the same manner, by mere willing, saying, or commanding, doth persuade the same. *Barrow.*

To SUSCITATE, *v. a.* [*suscito*, Lat.] To rouse; to excite.—He shall *suscitate* or raise the courage of all men inclined to virtue. *Sir T. Elyot.*

SUSCITATION, *s.* [*suscitation*, Fr.] The act of rousing or exciting. *Bullokar.*—The temple is supposed to be here dissolved; and, being so, to be raised again: therefore the *suscitation* must answer to the dissolution. *Pearson.*

SUSDAL, a small town in the interior of European Rus-

sia, government of Vladimir. It contains 2200 inhabitants, is a bishop's see, and has a seminary for the education of priests. Eudoxia Federovna, the first wife of Peter the Great, was long confined in a convent here; 24 miles north-north-east of Vladimir.

SUSE, a province of Morocco, situated at its southern extremity, immediately bordering on the desert. It is the most extensive, and, unless in grain, the most fertile of any in the empire. There is not, perhaps, a finer climate in the world; its fruits are exquisite, particularly olives, the plantations of which are so extensive, that a man may travel uninterruptedly through them for several days. The sugarcane is said to grow spontaneously. Cotton, indigo, and gums, are abundant. Stick-liquorice abounds to such a degree, as to be called the root of Suse. Almonds and olive oil are produced more plentifully for exportation than in all the rest of the empire put together. The population consists of many wandering tribes of Arabs and Shelluchs. The principal town is Agadur, or Santa Cruz, situated at the mouth of the river of Suse; but the whole province has suffered materially, since its trade, by a capricious order of the emperor, was transferred to Mogodor.

SUSE, RIVER OF, rises in a branch of the Atlas, and traversing the above province, falls into the Atlantic to the south of Cape Geer. The breadth at the mouth is not in proportion to the length of its course, as a great part of it is drawn off for irrigation.

SUSEDON, a town of Hindostan, province of Delhi, situated near the ancient canal of Sultan Feroz, and now possessed by an independent chief. Lat. 29. 20. N. long. 76. 30. E.

To SUSPECT, *v. a.* [*suspicio*, *suspectum*, Lat.] To imagine with a degree of fear and jealousy what is not known.—Nothing makes a man *suspect* much, more than to know little; and therefore men should remedy suspicion by procuring to know more. *Bacon.*

Let us not then *suspect* our happy state,
As not secure.

Milton.

From her hand I could *suspect* no ill. *Milton.*—To imagine guilty without proof.—Though many poets may *suspect* themselves for the partiality of parents to their youngest children, I know myself too well to be ever satisfied with my own conceptions. *Dryden.*—To hold uncertain; to doubt.—I cannot forbear a story which is so well attested, that I have no manner of reason to *suspect* the truth. *Addison.*

To SUSPECT, *v. n.* To imagine guilt.—If I *suspect* without cause, let me be your jest. *Shakspeare.*

SUSPECT, *part. adj.* [*suspect*, Fr.] Doubtful.—Sordid interests or affectation of strange relations are not like to render your reports *suspect* or partial. *Glanville.*

SUSPECT, *s.* Suspicion; imagination without proof. *Obsolete.*

No fancy mine, no other wrong *suspect*,
Make me, O virtuous shame, thy laws neglect. *Sidney.*

SUSPECTABLE, *adj.* That may be suspected. *Col-grave.*

SUSPECTEDLY, *adv.* So as to be suspected; so as to excite suspicion.—[They] have either undiscernibly as some, or *suspectedly* as others, or declaredly as many, used such additaments to their faces, as they thought most advanced the beauty or comeliness of their looks. *Bp. Taylor.*

SUSPECTEDNESS, *s.* State of being suspected; state of being doubted.—Some of Hippocrates' aphorisms transplanted into our nations, by losing their lustre, contract a *suspectedness*. *Dr. Robinson.*

SUSPECTER, *s.* One who suspects.—A base *suspecter* of a virgin's honour. *Beaum. and Fl.*

SUSPECTFUL, *adj.* Apt to suspect; apt to mistrust. *Bailey.*

SUSPECTLESS, *adj.* Not suspecting; without suspicion.—Eighty of them being assembled, and *suspectless* of harm, were all knocked down. *Sir T. Herbert.*—Not suspected.

pected.—*Suspectless* have I travell'd all the town through.
Beaum. and Fl.

To SUSPEND, *v. a.* [*suspendre*, Fr.; *suspendo*, Lat.] To hang; to make to hang by any thing.

As 'twixt two equal armies, fate

Suspends uncertain victory;

Our souls, which to advance our state,

Were gone out, hung 'twixt her and me.

Donne.

To make to depend upon.—God hath in the Scripture *suspended* the promise of eternal life upon this condition, that without obedience and holiness of life no man shall ever see the Lord. *Tillotson*.—To interrupt; to make to stop for a time.

The harmony

Suspended hell, and took with ravishment

The thronging audience.

Milton.

To delay; to hinder from proceeding.—*Suspend* your indignation against my brother, till you can derive from him better testimony of his intent. *Shakspeare*.—To keep undetermined.—A man may *suspend* his choice from being determined for or against the thing proposed, till he has examined whether it be really of a nature to make him happy or no. *Locke*.—To debar for a time from the execution of an office or enjoyment of a revenue.

SUSPENDER, *s.* One who suspends or delays.—I may add the cautiousness of *suspenders* and not forward conclusions. *Mountagu*.

SUSPENSE, *s.* [*suspensus*, Lat.] Uncertainty; delay of certainty or determination; indetermination.

Ten days the prophet in *suspense* remain'd,

Would no man's fate pronounce; at last constrain'd

By Ithacus, he solemnly design'd

Me for the sacrifice.

Denham.

Act of withholding the judgment.—Whatever necessity determines to the pursuit of real bliss, the same necessity establishes *suspense*, deliberation, and scrutiny, whether its satisfaction misleads from our true happiness. *Locke*.—Stop in the midst of two opposites.

For thee the fates, severely kind, ordain

A cool *suspense* from pleasure or from pain.

Pope.

SUSPENSE, *adj.* [*suspensus*, Lat.] Held from proceeding.

The great light of day yet wants to run

Much of his race, though steep, *suspense* in heaven

Held by thy voice.

Milton.

Held in doubt; held in expectation.

This said, he sat; and expectation held

His looks *suspense*, awaiting who appear'd

To second or oppose.

Milton.

SUSPENSION, *s.* Act of making to hang on any thing.—True and formal crucifixion is often named by the general word *suspension*. *Pearson*.—Act of making to depend on any thing. Act of delaying.

Had we had time to pray,

With thousand vows and tears we should have sought,

That sad decree's *suspension* to have wrought.

Waller.

Act of withholding or balancing the judgment.—The mode of the will, which answers to dubitation, may be called *suspension*; and that which in the fantastick will is obstinacy, is constancy in the intellectual. *Grew*.—Interruption; temporary cessation.—Nor was any thing done for the better adjusting things in the time of that *suspension*, but every thing left in the same state of unconcernedness as before. *Clarendon*.—Temporary privation of an office: as, "the clerk incurred *suspension*."

SUSPENSIVE, *adj.* Doubtful. *An old and elegant word.*

VOL. XXIII. No. 1606.

Psyche, snatch'd from danger's desperate jaws

Into the arms of this illustrious lover,

The truth of her condition hardly knows,

But in *suspensive* thoughts awhile doth hover. *Beaumont.*

SUSPENSORY, *adj.* [*suspensus*, Lat.] Suspending; belonging to that by which a thing hangs.—There are several parts peculiar to brutes which are wanting in man, as the seventh, or *suspensory* muscle of the eye. *Ray*.—Doubtful.—This moves sober pens unto *suspensory* and timorous assertions. *Brown*.

SUSPICABLE, *adj.* That may be suspected; liable to suspicion.—I look upon these two last cures as done out of *susplicable* principles and upon extravagant objects. *More*.

SUSPICION, *s.* [*suspicion*, Fr.; *suspicio*, Latin.] The act of suspecting; imagination of something ill without proof.

Suspicion all our lives shall be stuck full of eyes;

For treason is but trusted like a fox,

Who ne'er so tame so cherish'd and lock'd up,

Will have a wild trick of his ancestors.

Shakspeare.

SUSPICIOUS, *adj.* [*suspiciosus*, Lat.] Inclined to suspect; inclined to imagine ill without proof.—Nature itself, after it has done an injury, will for ever be *suspicious*, and no man can love the person he suspects. *South*.—Indicating suspicion or fear.—A wise man will find us to be rogues by our faces: we have a *suspicious*, fearful, constrained countenance, often turning and slinking through narrow lanes. *Swift*.—Liable to suspicion; giving reason to imagine ill.

I spy a black *suspicious* threatening cloud,

That will encounter with our glorious sun.

Shakspeare.

SUSPICIOUSLY, *adv.* With suspicion. So as to raise suspicion.—His guard entering the place, found Plangus with his sword in his hand, but not naked, but standing *suspiciously* enough, to one already suspicious. *Sidney*.

SUSPICIOUSNESS, *s.* Tendency to suspicion.—To make my estate known seemed impossible, by reason of the *suspiciousness* of Miso, and my young mistress. *Sidney*.

SUSPIRAL, *s.* A spring of water passing underground towards a conduit or cistern; also, a breathing-hole or ventiduct. *Chambers*.

SUSPIRATION, *s.* [*suspiratio*, from *suspiro*, Lat.]

Sigh; act of fetching the breath deep.

Not customary suits of solemn black,

Nor windy *suspiration* of forc'd breath

That can denote me truly.

Shakspeare.

To SUSPIRE, *v. n.* [*suspiro*, Lat.] To sigh; to fetch the breath deep. To breathe.

By his gates of breath

There lies a downy feather which stirs not:

Did he *suspire*, that light and weightless down

Perforce must move.

Shakspeare.

SUSPIRED, *part. adj.* Wished for; desired earnestly: a *latinism*.—O glorious morning, wherein was born the expectation of nations; and wherein the long *suspired* Redeemer of the world did, as his prophets had cried, rent the heavens, and come down in the vesture of humanity! *Wotton*.

SUSQUEHANNAH, a county of the United States, on the north side of Pennsylvania, bounded north by New York, east by Wayne county, south by Luzerne county, and west by Ontario county. Chief town, Montrose.

SUSQUEHANNAH, a river of the United States, and the largest river of Pennsylvania, which is formed by two branches that come from the east and west. The east rises in Otsego lake, New York, and the west in Huntingdon county, Pennsylvania. They unite at Northumberland. The river then runs south-east into the head of the Chesapeake, in Maryland. It is $1\frac{1}{2}$ mile wide at its mouth, but is navigable only 5 miles. The Susquehannah was surveyed in 1817 by commissioners appointed by Pennsylvania, who

9 K

reported,

reported, that below Columbia no ascending navigation was practicable, but that, at the expense of about 20,000 dollars, every obstacle might be removed to the head of the two branches. It is contemplated to unite the waters of this river with those of the Schuylkill. By the Juniatta and its other tributary streams from the west, the Susquehanna also approaches near the waters of the Allegany, which forms one of the two branches of the Ohio; and there is no more than a short land carriage from the Tioga and its other confluent waters to the east, to reach Lake Seneca and the river Genesee, which fall into Lake Ontario.

SUSSEX, one of the southern counties of England, bounded on the west by Hampshire, on the north by Surrey, on the east and north-east by Kent, and on the south by the British channel. It is 76 miles in length, and nearly 20 in average breadth. Towards the boundary of Kent it is contracted to an obtuse point.

The aspect of Sussex is varied in a pleasing manner, by the inequalities of the downs, with the intervening valleys, through which the many little streams of the county pursue their respective courses to the sea. The wooded scenery which it presents, and the pasture land with which it is contrasted, give to the county in general a rural and a rich diversity of appearance. The tracks of land which come under the description of mere wastes in Sussex, are very considerable. They chiefly occupy the northern side of the county, where, in a district containing by computation 500,000 acres, these almost desert tracks form not less than 110,000. The climate upon the downs fronting the south-west is bleak, being exposed to violent winds, which are impregnated with saline particles, occasioned by the spray, driving against the beach. In the western part of the maritime district the climate is warm, and highly favourable to the purposes of vegetation; and in that division called the Weald, the circulation of air is impeded, and the climate is cold and damp.

In regard to minerals, Sussex is not inferior to most of the counties of England. In the easternmost parts of the Weald is found every sort of limestone. The Sussex marble, when cut into slabs for ornamental chimney-pieces, and highly polished, is equal to most kinds for beauty and quality. It is an excellent stone for square building, and for paving is not exceeded. It affords a very valuable manure, equal, and by some thought superior to chalk, and cheaper to those who live near the place where it is dug. It is found from 10 to 20 feet under ground, where it lies in strata, 9 or 10 inches thick. The Sussex lime-stone has been found superior to both that of Maidstone and Plymouth; and for cement it is thought to surpass any in the kingdom. Iron-stone abounds in this county; and to the ferruginous mixture with which its soil is in many places so highly impregnated, is to be ascribed, the sterility of so large a portion of its surface. Chalk is still more plentiful, a vast range of hills which occupy a considerable part of the county contiguous to the coast, being composed of that material. On the south side of these hills marl is dug in various places. Fuller's earth is found at Tillington, and consumed in the neighbouring mills; and red ochre at Graffham, Chidham, and other places on the coast, whence much of it is sent to the metropolis.

The rivers of Sussex are insignificant streams, when compared with those of some other provinces of the kingdom; but they are exclusively its own, as their origin and courses are confined within the limits of the county. All of them fall into the British channel.

Sussex is one of those counties which, from the remotest antiquity, has been celebrated for its timber, principally oak. Before the Norman conquest it was one continued forest; and the quantity of wood-land which it at present contains cannot be estimated at less than 170,000 or 180,000 acres. The reigning feature of the Weald is its timber, which over-spreads it in every direction; and so naturally is it adapted to the soil, that if a field were sown with furze only, the ground, in the course of a few years, would be covered with

young oaks, without any trouble or expense of planting. The quality of this timber may be collected from this circumstance, that the navy contractors stipulate for Sussex oak in preference to every other kind. The turnpike roads of this county are in general good, being composed of whinstone and Kentish rag; and where these have not been used, the roads are found to be inferior, as in some of the eastern parts where they are narrow and sandy. There are no canals in Sussex, but the river Arun has been made navigable from the sea to its junction with the New Cut, a distance upwards of 17 miles; and from thence a company of merchants have extended it to Newbridge. A similar process has also been taken with the Rother, a branch of the former river, which constitutes part of a grand plan for connecting London with Sussex, by means of the junction of the Arun with the Wey at Guildford. A plan has also been proposed for cutting another canal from Newbridge on the Rother to Horsham, and thence to the iron railway at Merstham, near Reigate in Surrey. The proportion between pasture and arable land varies in different parts of this county. In the Weald, one-third is pasture, one-third arable, and one-third wood and waste. On the south side of the downs, the arable exceeds the pasture in the proportion of thirty to one. The rotation of crops in Sussex entirely depends upon the district in which they are sown. Some instances have occurred on very rich land, where wheat has been repeated four or five years in succession, and the product amounted to four or five quarters per acre. The crops commonly raised in Sussex are wheat, oats, clover, turnip, pease, barley, and tares. The crops not commonly cultivated are beans, potatoes, buck-wheat, lettuces, hops, carrots, rhubarb, opium, sainfoin, lucerne, and chicory. The management of the meadow and pasture lands varies but little from the practices common in other counties; though here indeed there is but too much reason to complain of negligence with respect to the improvement of grazing land. Irrigation is but locally known; and it is only in the western parts of the county that any signs of it are to be observed. Very great improvements, however, have of late years been effected in the marshes situated along the coast, or in the neighbourhood of the rivers. In the western part of Sussex are some considerable orchards; and where the soil is adapted to the fruit, the plantations are thickly interspersed. The neighbourhood of Petworth yields the best cyder of any in the county. The manures used in Sussex, besides common dung, are chalk, lime, marl, sleet, soap-ashes, wood-ashes, peat-ashes, rags, sheep clippings, pilchards, paring-dust, and gypsum. The first three are applied in great abundance; the rest, from their nature, but partially.

Sussex is distinguished for its breed of cattle, which are universally allowed to be equal to any in the kingdom. It is also celebrated for its breed of sheep, which are fed on the south downs. They require but a very slight quantity of food for their subsistence, and the quality of their flesh is peculiarly sweet and tender. Their wool is little, if at all, inferior to that of the Hereford sheep, and their hardiness is demonstrated by their healthiness and freedom from losses, amid the storms to which they are exposed in winter and spring, on their bleak native hills. The total amount of all the sheep kept in the county is about 450,000. The largest estate in Sussex does not greatly exceed £7500 per annum, and most of the proprietors hold their land in their own occupation. The principal manufacture carried on in this county was the making of iron into bars; but this has decayed, on account of the great establishments in Scotland and Wales, where, by the use of pit coal, the article is supplied at a much cheaper rate.

The county of Sussex contains many Roman, and some British antiquities. The Ermine-street, one of the eight British roads, led from this coast to the south-east part of Scotland. Here also was the Stane-street of the Romans, which passed from east to west of the county, with a vicinal, or branching road, towards Porchester. There are also many remains of Roman encampments in this district; these are situated

situated in the vicinity of the downs, and overlook the Weald. Mr. Dallaway, in his "History of Western Sussex," recounts eleven of those relics of early encampment. Over the downs, and other parts of Sussex, are scattered various tumuli or barrows, which, when opened, have been found to contain either bones, urns, or entire skeletons. Sussex, and the adjoining counties of Hants and Surrey, were by the Romans denominated Belgæ, from the circumstance of their being inhabited by a people so called. These were afterwards joined by the Regni, who settled in the same district antecedent to the invasion of England by Julius Cæsar. After that event during the Roman dominion of Britain, there were four large stations or towns in Sussex, which included the minor tribes of the Bibroci and the Rhemi. Under the Britons, Sussex formed a part of the South-Seaxna-ricæ, as already mentioned in Surrey; and by a similar modulation has been reduced to its present sound. Like the other counties of England, Sussex was, at the Norman invasion, divided into lordships, and assigned to some of the followers of king William. At that period the title of Earl of Sussex was given to one of these, and the title continued till 1801, when it became extinct. It was then constituted a dukedom, and given to Augustus Frederick, the present Duke. The general division of Sussex is into rapes, a division peculiar to this county. These rapes, each of which is said to have had its particular castle, river, and forest, are Chichester, Arundel, and Bramber, forming the western; and Lewes, Pevensy, and Hastings, the eastern portion. The rapes are subdivided into sixty-five hundreds, and comprehend 313 parishes. Chichester is the chief town.

Sussex sends 28 members to parliament, two for the county, two for the city of Chichester, and two for each of the four Cinque Ports that are situated within the county. Population: males 116,605, females 116,314.

SUSSEX, a county of the United States, in New Jersey, bounded north-north-east by New York, south-east by Bergen, Morris, and Hunterdon counties, and west and north-west by the Delaware, which separates it from Pennsylvania. Population 25,749. Chief town, Newton.

SUSSEX, a county of the United States, in Delaware, bounded north by Kent county, east by Delaware bay and the Atlantic, south and west by Maryland. Population 27,750, including 2402 slaves. Chief towns, Georgetown and Lewistown.

SUSSEX, a county of the United States, in Virginia, bounded north-east by Surrey county, south-south-east by Southampton county, south-west by Greensville county, and north-west by Dinwiddie and Prince George counties. Population 11,362, including 6644 slaves.

SUSSMILCH (John Peter), a German Lutheran divine, was born about the beginning of the last century, and applied with diligence not only to the study of history, but to that of mathematics, so that he became an expert calculator in political arithmetic. He is principally known by a work, entitled "Die Gottliche, &c." i. e. "the order observed by God in the changes of the human race, demonstrated by the births, deaths, and propagation of man;" a fourth edition of which, improved and corrected by J. C. Bauman, was published at Berlin in the year 1775, in 3 vols. 8vo. In this work, the author first treats of the multiplications of men in general, and shews that the number of births is almost always greater than that of the deaths: he then enumerates the obstacles to the increase of mankind; examines how many persons live on the earth, and how many it could contain; treats on the different causes of fecundity; the propagation of the two sexes, and the proportion of one to the other; of the proportion of those who die at different ages; of diseases and their proportion, &c.

To SUSTAIN, *v. a.* [*sustineo*, Lat.] To bear; to prop; to hold up.

Vain is the force of man,
To crush the pillars that the pile sustain. *Dryden.*

To support; to keep from sinking under evil.—If he have

no comfortable expectations of another life to sustain him under the evils in this world, he is of all creatures the most miserable. *Tillotson.*—To maintain; to keep.—My labour will sustain me. *Milton.*—To help; to relieve; to assist.—They charged on pain of perpetual displeasure, neither to entreat for him, or any way sustain him. *Shakspeare.*—To bear; to endure.

Can Ceyx then sustain to leave his wife,
And unconcerned forsake the sweets of life? *Dryden.*

To bear without yielding.
Sacharissa's beauty's wine,
Which to madness doth incline;
Such a liquor as no brain
That is mortal can sustain. *Waller.*

To suffer; to bear as inflicted.
If you omit
The offer of this time, I cannot promise,
But that you shall sustain more new disgraces,
With these you bear already. *Shakspeare.*

SUSTAIN, *s.* What sustains or supports. *Not used.*

I lay and slept, I wak'd again,
For my sustain
Was the Lord. *Milton.*

SUSTAINABLE, *adj.* [*soustenable*, Fr.] That may be sustained.

SUSTAINER, *s.* One that props; one that supports.—The first founder, *sustainer*, and continuer thereof, [the church.] *More.*—One that suffers; a sufferer.

Thyself hast a sustainer been
Of much affliction in my cause. *Chapman.*

SUSTEAD, a parish of England, in Norfolk; 4½ miles south west of Cromer.

SUSTENANCE, *s.* [*soustenance*, Fr.] Support; maintenance.—Is then the honour of your daughter of greater moment to her, than to my daughter her's, whose sustenance it was? *Addison.*—Necessaries of life; victuals.—The experiment cost him his life for want of sustenance. *L'Estrange.*

SUSTENTACLE, *s.* [*sustentaculum*, Lat.] Support. *Not in use.*—God's the sustentacle of all natures. *More.*

SUSTENTATION, *s.* [from *sustento*, Latin.] Support; preservation from falling.—These steams once raised above the earth, have their ascent and sustentation aloft promoted by the air. *Boyle.*—Use of victuals.—A very abstemious animal by reason of its frigidity, and latiancy in the winter, will long subsist without a visible sustentation. *Brown.*—Maintenance; support of life.—When there be great shoals of people, which go on to populate, without foreseeing means of life and sustentation; it is of necessity that once in an age they discharge a portion of their people upon other nations. *Bacon.*

SUSTEREN, or SUSTERN, a small town of the Netherlands, in the province of Limburg, with 1400 inhabitants; 10 miles south-south-west of Ruremonde.

SUSTINENTE, a small town of Austrian Italy, on the Po; 12 miles south-east of Mantua.

SUSURRATION, *s.* [from *susurro*, Lat.] Whisper; soft murmur.

SUSZEN-KIRDHEN, a village of the west of Germany, in Baden, near Freyberg, where a partial action was fought in 1796, between the French and Austrians, in favour of the latter.

SUTALURY, a town of Bengal, district of Backergunge. It is advantageously situated, and carries on a considerable trade in grain, &c. Lat. 22. 38. N. long. 90. 10. E.

SUTCHANA, a town of Hindostan, province of Gujerat, belonging to the jam or chief of Noonagur. It is situated on the eastern side of the gulf of Cutch, and carries on an extensive fishery. Some pearl oysters are also found in its vicinity. Lat. not ascertained.

SUTCOMBE,

SUTCOMBE, a parish of England in Devonshire; $5\frac{1}{2}$ miles north-by-east of Holsworthy.

SUTE, *s.* Sort. I believe only misprinted.—Touching matters belonging to the church of Christ, this we conceive that they are not of one *sute*. *Hooker*.

SUTERA, or SUTERRA, a town of Sicily, in the Val di Mazzara, with 4000 inhabitants; it is 16 miles north-north-east of Girgenti, and nearly 20 miles from any part of the coast; so that its trade is limited, and it is seldom visited by travellers.

SUTHBURY HILL, a hill of England, in Wiltshire, between Everley Warren and Luggershall. It is the highest in the county, and has the traces of a vast fortification, supposed to have been Danish.

SUTHERLAND CREEK, a river of Upper Canada, which runs into the lake of St. Francis.

SUTHERLAND POINT, the south point of entrance into Botany Bay, so called for Forby Sutherland, one of Captain Cook's seamen, who was buried there in the year 1770.

SUTHERLANDSHIRE, one of the most northerly counties in Scotland, extending the whole breadth of the island, from the German to the Atlantic oceans. It is situated between Lat. 57. 53. and 58. 33. N. and between long. 3. 40. and 5. 13. W. from London. It was erected into a separate sheriffdom in the year 1633, having previous thereto, together with the other northern counties, been included within that of Inverness. It is bounded on the west for a distance of $40\frac{1}{2}$ miles, by the Mynch, an arm of the Atlantic ocean, which separates it from the islands of Harris and Lewis; on the north, for a distance of 50 miles, by the Northern ocean; on the east, for a distance of $37\frac{1}{2}$ miles, by the county of Caithness; on the south-east, for a distance of $32\frac{1}{2}$ miles, by the Moray frith; and on the south and south-west, for a distance of $52\frac{1}{2}$ miles, by the Dornoch frith, the Oickel, and some lesser streams, which separate it from the county of Ross. The name of Sutherland signifies the south part of Caithness; that province having originally included both counties. The name of Caithness signifies the Ness or promontory of the province of Catuibh, the Gaelic name for this district, which is the appellation by which Sutherland is still known in the dialect of the inhabitants; while Caithness is called Gallaibh, or the country of the Gauls or strangers. This county was inhabited by the three clans of Sutherland, Mackay, and Macleod. The clan of Sutherland is called Chattach, and their chief Moir-fhear Chattabibh, the lord or the great man of Sutherland. When that dignity is vested in the female, her designation is Ban Mhoir-fhear Chattaibh, the great lady of Sutherland, the patronymic by which Lady Stafford, as countess of Sutherland, is universally styled in the Highlands. This clan occupied the shores of the Moray frith and the glens terminating on that coast, with a considerable part of Caithness; and included, besides those of the name of Sutherland, the inferior sept of the Gunns, Bannermans, Murrays, Matheisons, with many of the name of Gordon and Mackay. The northern and north-western coasts, and the adjoining straths, together with a part of Caithness, belonged to the Mackays, of whom lord Reay is the chief. Strathnaver, formerly the seat of his family, was acquired by the Earl of Sutherland in the 17th century. The south-west portion of the county, or Assynt, was the country of the Macleods, from whom it was conquered by the clan Kenzie, and came by purchase into the family of Sutherland towards the middle of the last century.

The county of Sutherland, though it never has been surveyed, is computed to contain 1,840,000 acres, deducting 32,000 for salt water lochs. The north-western districts, extending from the Kyles Ku of Assynt to the water of Borgia, is the property of lord Reay, and comprises about 400,000 acres. The greater proportion of the remainder comprises the estate of Sutherland, which is washed on one side by the Northern ocean, and on the other by the Moray and Dornoch friths, and is computed to contain more than

800,000 acres. The residue of the county is divided among ten other proprietors.

The face of the country is extremely mountainous and rocky towards its western extremity. At first view nothing appears but vast groups of mountains, towering in succession above one another, and covered with heath. The valleys diverge from the central mountains in every direction. Some of them are from 30 to 40 miles in length, and extremely narrow, forming separate districts, divided from one another by ridges of inaccessible mountains, and watered by rapid streams, which sometimes form mosses and lakes of various dimensions. Owing to the high northern latitude of the county of Sutherland, and its almost insular position, the air is moist and sharp, and the exposure to the sea-breeze renders it adverse to the rapid growth of timber, especially near the coast. In sheltered bays and glens, where the soil is deep; trees reach a respectable size, such as at Dunrobin Castle, Tongue House, and Skibo. The wych-elm, the sycamore, and the ash, thrive best. Of the latter sort, there are two trees at Dunrobin, which measure twelve feet in circumference at the height of eight feet from the ground. The climate is variable; but though the winters are tedious and boisterous, it is seldom that the snow lies long upon the coast, and even in the interior it prevails less than in the central Highlands of Inverness and Perthshire. The springs are cold and ungenial, and are frequently prolonged late into the year, so that the summers are consequently short. But as the sun at this season has great power during the day, owing to the length of time it is above the horizon, and the heat being much increased by the intense reflection from the hills, a most rapid vegetation takes place, and the harvest, upon the coast side, is got in earlier than in a large proportion of Scotland. Indeed, the wheat upon the coast side, has been housed, more than once, before that of a considerable district of England. The evenings, however, are never warm, and among the mountains are always very cold, piercing, and chilly, frequently accompanied with mildews and early frosts, which, sweeping down the glens and the courses of the burns, destroy every sort of crop and cultivated vegetable. The commencement of October is generally fine clear weather, but the remainder of the year is boisterous and unsteady.

This county may be considered as divided into three districts, namely, the eastern, near the German ocean; the western, on the coast of the Atlantic; and the middle, or central district. The eastern district consists of a strip of level land, which runs along the coast side, and is from a quarter to a mile in breadth. The climate here is more favourable than that in Morayshire, for bringing corn to maturity, and is said not to differ materially from East Lothian, except that it has a somewhat later spring, and an earlier winter. It is sheltered from the northern blast by a ridge of mountains, from the Ord of Caithness to the vicinity of the Little Ferry, or Strath-fleet, whose bold and heathy front affords shelter, and reflects the rays of the meridian sun upon the cultivated ground between them and the Moray frith. These mountains are from 300 to 800 feet above the level of the sea. The middle district resembles the other parts of the North Highlands: it consists of the four straths or valleys of the rivers of Helmsdale, Brora, Fleet and Oickel, with their tributary streams issuing from the adjoining mountains. The soil between the mountains is a sharp loam. Black cattle and sheep are the staple commodities on which the farmers and tacksmen depend for the payment of their rent.

The shores bordering the Atlantic are bold; and the whole district is wild, rocky, and mountainous. The Assynt mountains, viz., Ben-mor Assynt, Glass-bhein, Bencanap, Ben-choinag, or the Sugar loaf mountains, Ben-erie, Craig-Rou; also the Ben-mor, and Stack-ben of Edderachylis, are huge barren mountains of immense height, without scarcely a stalk of heath to be seen on their barren surface; even their bases, and the track of country that borders the Atlantic,

Atlantic, are so rugged and rocky, that hardly any vegetation can be discovered; yet the glens, ravines, and hollows, betwixt these mountains, are extremely favourable to pasturage, and under the improved system of management adopted by the Marquess of Stafford and other great proprietors, have been converted into extensive sheep farms. It is well known that the western coasts of Britain are more subject to heavy rains, brought by the westerly winds from the Atlantic Ocean, than the eastern; and on the coast of Sutherlandshire, whenever the wind blows from the west or north-west, heavy rains constantly ensue; and it is supposed that there is no part of Scotland more subject to rain than the western district of the county of Sutherland. On the coasts of the numerous bays, there are many rugged and partially arable fields; but the climate, from the constant rains and mists, does not second the favourable properties of the soil. From this prevalence of rain, the west and north-west sides of the county are damp, and the interior, though in a less degree, is the same, in consequence of its high mountains, lakes, and swampy mosses; but on the south-east side, which is generally termed the coast side, they complain, that in the summer months in general they experience too little rain. Each shore is fringed with a narrow border of arable soil, and on the south-east coast it extends from a few hundred yards to about one mile in breadth. The valleys are occupied by numerous lakes and rivers, the chief of which are Loch Shin, which stretches 20 miles from north-west to south-east, and is about 1 mile broad, and abounds with salmon and trout; Loch Assynt, 6 miles long and 1½ broad; Loch Naver, Loch Hope, Loch Lyal, Loch More, Loch Brora, and Baden Loch, all abounding with trout. The rivers and streams, as may be supposed in such a mountainous country, are numerous. The most considerable of the rivers is the Oikel, or frith of Dornoch, which is navigable 12 miles for vessels of 50 tons; the water of Fleet, or Strathfleet; the water of Brora; the water of Helmsdale. On the northern and western coasts is the water of Hallidale, the water of Strathy, the river Naver, the waters of Kenloch, Hope, and Eribol. The north-west and west coasts are indented by numerous bays of great extent, and have many promontories extending into the ocean. These are Cape Wrath, Far-out-head, Whiten-head, and Strathy-head. Some small islands are scattered along the coast, few of which are inhabited. Rock crystals and pebbles are found in many parts; and beautiful garnets are found on the coast, in the parish of Tongue; and specimens of native gold have been found in the parish of Kildonan. Sutherland has been an earldom in the Sutherland family since the year 1057. It sends one member to parliament; and Dornoch, the county town, is classed with the burghs of Tain and Dingwall in Ross-shire, Wick in Caithness, and Kirkwall in Orkney. There are three great deer forests; and other kinds of game are found in great plenty, as common and alpine hares, moorfowl, black cocks, ptarmigans, wild pigeons, and partridges.

The valued rent of the county is divided among the several heritors as follows:—

Earldom of Sutherland, lordship of Strathnaver, and barony of Assynt, including Wadsetters, }	16,951	2	2
Lord Reay	3,720	8	5
Skibo	1,975	11	6
Bighoun	900	0	0
Poyntzfield	466	13	4
Balnagowan	431	18	0
Lord Ashburton	400	0	0
Cadboll	354	0	0
Embo	346	8	0
Opisdale	253	6	8
Creech	200	0	0
Achany	194	2	8
	<hr/>		
	£26,193	10	9

The real rent has been estimated at about 40,000*l.* per annum.

In consequence of the peculiar situation of the property in this county, the right of voting for the commissioner of the shire differs from the rest of Scotland, being vested in all persons having 200*l.* Scots of valued rent, whether holding of the crown or a subject superior.

In no part in Scotland have greater changes and improvements taken place within the last 20 years, than in the county of Sutherland, which, from a variety of causes, both moral and physical, long laboured under peculiar disadvantages, in comparison with other parts of the country. It was here that the feudal system appeared to make its last stand; and, while in other parts the last traces of that rude and ancient state of property and manners were fast disappearing, they still prevailed in Sutherlandshire in all their vigour; nor was it easy to see how a breach could be made in the system, while this county continued to be in a manner debarred, both by physical obstructions, and by the want of all practicable communications, from all intercourse with the more civilized parts of the country. By the enterprize and exertion, however, of the landed proprietors, these obstructions to a free and extended intercourse were at length done away; and this advantage, while it tended in every view to improve the trade and agriculture of the county, paved the way also for a total change in the tenure by which property was held, and for the gradual abolition, in consequence, of that state of manners to which the feudal system gave rise. In order to give a clear view of these changes, and their effects, it will be proper to describe the state of the county antecedent to the year 1800, taking for our guide Mr. Loch's judicious account of the improvements made in this rude and remote part of the island.

One of the most important obstacles to the improvement of Sutherlandshire was its secluded situation, being cut off from all intercourse with the rest of the kingdom. On referring to the map of Scotland, it will be observed, that the island narrows towards its northern extremity, and that the four northern counties of Ross, Cromarty, Sutherland, and Caithness, are detached from the more southern counties of Scotland by the Moray frith, which almost crosses the county. This district, it will be observed also, is still more cut off from the southern counties, and intersected in itself by four inlets of the sea, stretching into the country, to the very base of the mountains, which constitute by far the larger portion of this part of the island. These inlets, or friths, are the Beaully frith, which, extending from Fort George to Beaully, separates Ross-shire from the county of Inverness; the frith of Cromarty, which intersects the counties of Ross and Cromarty; the frith of Dornoch, which divides the counties of Ross and Sutherland; and Loch Fleet, which intersects this latter county. From a mere inspection of the map, however, no adequate idea can be formed of the practical obstacles which these friths opposed to the communications between different parts of the country. Ferries were indeed necessarily established at these different inlets of the sea; but they were totally unprovided with every thing necessary for the accommodation of passengers. There was only one of them, that nearest to Inverness, provided with piers. There were no inns; nothing to shelter the traveller from the inclemency of this variable and boisterous climate, while the natives were slowly and unskilfully putting his horse and carriage into the wretched boats; not to mention the risk of crossing these narrow friths, hemmed in between mountains, and exposed to violent gusts, which, suddenly bursting forth from the hollow glens, leave little time to prepare for the storm; while the various eddies and currents also added to the delay, if not to the dangers of the passage. Equally rude and unfit for travelling were the roads which connected these ferries. Beyond the Dornoch frith, indeed, no road existed; so that the county of Sutherland was not only cut off from all means of communication with the rest of the kingdom, but its interior means of communication were even more deficient. On the coast side road, the track for a carriage to follow was traced out by two narrow ruts along the ground;

and in a county so much intersected by water, there was only one bridge, that at Brora, the span of which does not exceed 24 feet. Consisting as this county does, almost entirely of one uninterrupted succession of wild mountain or deep morass, the intercourse between one district and another was confined exclusively, or nearly so, to the exertions of those who could travel on foot; and even this mode of communication, except to the natives, who were brought up to such toil and exertion, was almost impracticable. Besides the fatigue of such an exertion, it was accompanied by considerable difficulty and danger to a person accustomed to such exercise, to which he was exposed in passing precipices or struggling through swamps. Being, moreover, like all mountainous countries, intersected by deep and rapid rivers, and numberless lesser streams, which, although at one moment nearly dry and easily fordable, are apt, in the course of a few hours, to be so swollen, as to remain for days impassable; the adventurous traveller was exposed to the chance of being cut off from all shelter, or subjected to the sad accommodation of a Highland hut. So long as this rude state of things continued, all improvement was impossible; and as the communication of Sutherland with the south lay through the counties of Ross and Inverness, it was evident, that until the proprietors of these counties opened the communication, all that could be done in Sutherlandshire would be of little avail.

Such was the state of this district until the year 1803, when parliament having agreed to advance half the expense of constructing certain roads and bridges in the Highlands of Scotland, the proprietors of Ross-shire and Inverness embraced the offer, and in consequence, a line of road has been constructed according to the best principles of the art, from the town of Inverness by Beaully and Dingwall, to the boundaries of the county of Sutherland; two excellent stone bridges, consisting of five arches each, having been built across the Beaully and Conon rivers. This line of communication, with the above exception, was opened for the public accommodation in the years 1816 and 1817.

The county of Sutherland was still more forward in availing itself of the liberality of parliament. The two principal obstacles to a free communication, arose from the friths of Dornoch and Loch Fleet, over which it was a difficult undertaking to construct bridges; though, without this, the communication by means of ferries must have been tedious and imperfect. After a careful survey of the frith of Dornoch, it was determined to construct an iron bridge across it, at a place called Bonar, where the breadth of the frith is considerably diminished, though above this point it again expands. The work was accordingly begun in June, 1811, and finished in November, 1812, at an expense of £13,971. It consists of an extensive embankment on the Ross-shire side, with two stone arches, of 50 and 60 feet span respectively, and one iron arch of 150 feet span, which was cast in Denbighshire, and being there first erected, it afterwards was taken to pieces, and sent to the Highlands of Scotland. From this point different roads have been constructed, one to the seat of Lord Reay, situated upon the Northern Ocean, a distance of about 50 miles, which was commenced in 1810, and completed in 1820; and another towards the county of Caithness, which is separated from Sutherland by a lofty range of mountains, intersected by deep and almost impassable ravines, terminating in a vast precipice, jutting into the sea, well known by the name of the Ord of Caithness. The new road is conducted across these ravines, and over the mountain, with such skill, that the traveller is unconscious of the height to which he has ascended, until the diminished sight of the objects below him point out to him the reality. The length of this road is about 41 miles. It was undertaken in different portions, and begun in the several years of 1807, 1809, 1811, and 1813, and finished respectively, in the years 1811, 1813, and 1814. In the line of this road occurs the arm of the sea called Loch Fleet, or the Little Ferry. Across this inlet of the sea it was necessary to have the means of an easy and uninterrupted communication; and for this pur-
