PREFACE.

THE first idea of this Work arose from the occasional use of Mr. Damon's 'Catalogue of the Shells of Great Britain and Ireland,' named after the 'History of British Mollusca,' etc. Here was, on one side, a very useful list of names, without figures or references to guide an inquirer to the species ; and on the other, a very large and splendid Work, placed by its heavy price beyond the reach of Naturalists in general. There was nothing between the two ; nothing within reach that would assist collectors of British Shells to name their acquisitions from ocean, beach, river, pond, or hedgerow. A public want seemed here to be discovered. It was thought that a list like the above, with a coloured drawing of every species, if produced at an available price, would supply that want. At first no more than this was thought of, but afterwards, as the preparations advanced, various suggestions were made tending to some extension of the plan. The results are here presented.

About 700 Figures in the Plates represent all the recognized species. They amount to 600, being 60 more than are admitted in the latest monograph. The greater part of these are either new or newly introduced as British. The rest are raised from varieties to species.

As the nomenclature used by Messrs. Forbes and Hanley in their great Work will be most generally adopted in this country, it is followed here with very few alterations ; and the synonyms given (in italics) are selected from those which are most familiar and likely to be met with.

Some information is added respecting habits and localities, range of depth of marine species, and comparative abundance. The letters C., Cc., Mc., R., Rr., and Mr., signifying 'common,' 'extremely common,'

'moderately common,' 'rare,' etc., must be taken with great caution, especially the latter, as subject to continual change.

A list is given of British Fossil Shells identical with now living species.

A familiar description of British Mollusca and some peculiarities in their families and genera will, it is hoped, form a useful and suitable introduction to the names and figures. The Author's best thanks are due to his friends, Madame De Burgh, who has collected many beautiful shells; R. M'Andrew, Esq., F.L.S., whose dredging experiences are so extensive; J. G. Jeffreys, Esq., F.R.S., etc., whose researches have resulted in so many additions to our Fauna; Mr. Brice Wright, the Naturalist, of Great Russell Street, and others, who have in the most liberal manner supplied him with specimens from which his drawings are taken. The loan of delicate and minute shells to authors and artists has so often proved disastrous, that nothing but a generous friendship, and a zealous love of Natural History, could have induced proprietors so freely to incur the risk.

INTRODUCTION
TO
SHELL-BEARING BRITISH MOLLUSCA.

A COMMON garden Snail, observed crawling and feeding, is easily seen to possess a distinct head, upon which are four feelers or horns, with eyes at the end, and underneath which is a mouth; a broad disc, extending the whole length of the body, is the organ of locomotion; a spiral or coiled shell surmounts the whole.

If, on the other hand, an Oyster be opened, no distinct head, or place for eyes or mouth, can be seen, but only a seeming mass of pulp, with a round gristle in the centre (the muscle of attachment), the former enclosed in a soft skin with a double fringe round the edge (mantle), placed within a shell composed of two pieces.

All Mollusca are more or less completely represented by these two. The Snail and its class are named *Gasteropoda* (abdomen-creeping), and their shells *Univalves*; the Oyster and its class, *Acephala* (headless), and their shells *Bivalves*. We begin with the latter class at—

PLATE I.

Pholadidae, or “Borers,” 1–13, have the power of piercing and inhabiting holes in submarine wood, rocks, and stones. The hinder part of the body is lengthened out in the form of a double tube, with openings for the ingress and egress of fluids. *Teredo*, 1–6, has short valves, two pallets fixed at the sides of the siphons, and lines its hole with a shelly tube. *Pholas* and *Pholadidea*, 8–13, have long valves and some-

times accessory plates. The shell of *Xylophaga*, 7, is like that of *Teredo*, but the animal has neither pallets nor tube.

Gastrochæna, 14, has a gaping shell, and encloses itself in a bottle-shaped covering of cemented stones and sand. *Saxicava*, 15, 16, *Venerupis*, 18, and *Petricola*, 17, burrow in sand, or live in holes of rocks.

Myadæ, or "Gapers," *Mya*, 19, 20, and *Panopaea*, 21, 21*, burrow downwards in sand and mud, their siphons protected by a coriaceous covering. Their shells are not closed all round, and those of *Mya* have a spoon-shaped process in the hinge of one valve.

Corbulidae, 22–28, have short siphons with fringed edges, and the foot protrudes through a hole in the otherwise closed mantle.

PLATE II.

Poromya, 1, 1*, and the beautiful pearly *Pandora*, 2, 3, might be included in the family of *Corbulidae*. *Iyonsia*, 4, and *Thracia*, 5–10, represent the *Anatinidæ*. 11–18 are *Solenidæ*, or "Razor-shells." Solens burrow in deep holes in the sand, where they remain in a perpendicular position at a great depth below the surface, where yet their presence may be traced by the opening left. Their large muscular foot enables them to take great leaps when out of the holes.

PLATE III.

Psammobia, 1–4, and *Tellina*, 5–16, include some of our most beautiful shells. The animals have a large, fleshy, curved foot, and the mantle open and fringed. Their shells are provided with an external ligament, and teeth on the hinge. *Donax*, or "Wedge," 19, 20, has long, separated, fringed siphons. Besides the small external ligament, properly so called, the *Mactridæ* have a triangular pit in the hinge of their shell, containing an elastic substance or spring, designed to resist the action of the adductor muscles. *Mactra*, 21–26, ends the Plate.

PLATE IV.

Lutraria, 1–3, is another genus of *Mactridæ*. The *Veneridæ*, 4–16 and 23, or "Venus" tribe, differ from it in not having the spring-holding pit. *Artemis*, 10, 11, is known by a large angular bend in the pallial impression; and *Cytherea*, 23, is distinguished from Venus

by one tooth on the hinge standing out a little way from the central ones. *Astarte*, 17–22, belongs to the *Cyprinidae*.

PLATE V.

Fig. 1–3 also represent genera of *Cyprinidae*. They have no bend in the pallial impression. *Cardium*, or “Cockle,” 4–13, presents a peculiarity in the foot, which is large and bent, and enables the animal to leap in a very lively manner. The family of *Lucinidae* occupy the remaining figures. *Lucina* has a curious tongue-shaped doubling of the pallial impression.

PLATE VI.

The *Kelliadæ*, 1–15, are marine, while the *Cycladidæ*, completing the Plate, are fresh-water bivalves, and may be found in many ponds and rivers.

PLATE VII.

Of the *Unionidæ*, or “Fresh-water Mussels,” *Unio*, 1–3, has teeth on the hinge, and *Anodon*, 4, has not: it is a thin shell. The foot of these molluscs is very large, and is used in cutting the animal’s way through the mud in which it burrows. Of the marine, or true Mussels, *Modiola*, 6–9, and *Crenella*, 12–17, have a portion of the shell reaching beyond the point or apex, which in *Mytilus* is terminal, 18–21. *Dreissina*, 5, is shaped like *Mytilus*, but lives in fresh-water docks. The *Mytilidæ* attach themselves by means of horny threads spun from the foot, and called a “byssus.”

PLATE VIII.

Shells of *Arcadæ*, 1–14, have the hinge characterized by a series of teeth on each side of the apex. *Nucula*, *Arca*, and *Pectunculus* are easily distinguished. *Limopsis*, 14, has a spring pit between the two rows. Our figure of *Pinna*, 16, is from a young specimen: it grows to great size, and spins a very silky byssus. The shell of *Anomia*, 18, is fixed to rocks, etc., by means of a bony button passing through a hole or sinus in the lower valve. *Lima*, 22–24, has a light, thin shell, and its mantle is adorned with beautiful fringes. It swims rapidly through the water by the opening and shutting of its valves, and also has the

habit, in seasons of rest, of protecting itself by a network or vest of marine fragments strung together by its byssal threads.

PLATE IX.

Contains the shells of our Pectens, or Scallops, 1-16. The animals swim like *Lima*, as above, and also spin a byssus.

The class *Brachiopoda*, 17-24, so named because what seem to be organs of locomotion consist of a pair of coiled, ciliated arms, ends the list of Headless Molluscs and their bivalve shells.

PLATE X.

Class *Pteropoda*, 1-4, contains minute Mollusca, with glassy shells variously formed, and wing-like expansions for swimming.

Chiton, 5-17, or "Coat of Mail," which may often be seen incrusting rocks, commences the *Gasteropoda*; although seemingly fixed, they are capable of locomotion, using the whole of the oval disc, which may be seen on turning them over, for the purpose. The same may be said of the "Limpet" tribe, *Patella*, 1-22.

PLATE XI.

This Plate commences with other forms of the Limpet tribe, *Fissurella*, 1, 2, with a hole at the top; *Puncturella*, 3, with a fissure near the top; and *Emarginula*, 4-6, with a slit at the margin. *Haliotis*, 7, or pearly "Ear-shell," leads to the *Trochidae*, or "Tops," 8-27.

PLATE XII.

Ianthina, 1-4, is genus of oceanic molluscs, which are provided with a beautiful floating apparatus, on which the female carries her egg-bags.

Neritina, 5, and the *Paludinidæ*, 8-11, live in fresh-water. The animal of *Paludina* is sprinkled all over with bright, golden specks. The *Littorinæ*, or "Winkles," 12-24, are marine, and frequent the shore among seaweeds. *Lacuna*, 25-32, belongs to the same family.

PLATES XIII., XIV.,

Are small genera, various in their characters and habits, but reasonably included in the last family, *Littorinidæ*.

PLATE XV.

The animals of *Turritella*, 1-3, and *Cæcum*, 6, 7, are not unlike, although the shells are so different; eyes at the base of the tentacles, a short foot, and horny operculum. The somewhat similar animal of *Aporrhais*, 4, 5, is brilliantly coloured with gold and red. *Cerithium*, 8-10, differs from *Cerithiopsis*, 11-15, more in regard to the animal than the shell; the latter animal has a retractile proboscis, and its operculum is not spiral.

PLATE XVI.

Chemnitzia, 1-11, and *Truncatella*, 12, together with *Stylifer*, *Eulima*, and *Odostomia*, form the family of *Pyramidellidæ*. Notwithstanding the difference in the shells, the animals are very similar, having a retractile proboscis, and eyes immersed at the base of their tentacles.

The animal of *Natica*, 13-19, has a lobe on the upper part of the foot, reflected over the shell in front, and another lobe behind. The shells of *Laminaria*, 23, 24, are completely enveloped in similar lobes.

PLATE XVII.

The shells of *Odostomia* are known by a fold in the inner lip of the aperture.

PLATE XVIII.

Two *Tritons*, 1, 2, are admitted for the first time as British, on what we consider fair evidence, although only two or three specimens have been taken off Guernsey. One of *T. nodiferus* was incrusted by a truly British *Lepralia*. *Murex*, 3, is now familiar as an aquarian, as well as *Purpura*, 5. A milky secretion found in the head turns purple when exposed, and gives the celebrated purple dye. *Buccinum*, 7-13, includes the common "Whelk," 8. *Fusus Berniciensis*, 14, is among the rarest and most beautiful of our British shells.

PLATE XIX.

Nassa reticulata, 3, is a favourite inhabitant of the tank; it burrows in search of food among the pebbles, elevating its siphon above the

surface. *Mangelia*, 4-26, has a similar long siphon. The shell of *Erato*, 27, is wrapped in the lobes of the animal's mantle, as is also that of *Cyprea*, 28, the latter presenting a beautiful object.

PLATE XX.

After *Tornatella*, 1, and *Ovula*, 2, 3, come *Bullidæ*, 4-27, including several genera differing remarkably in the shape and disposition of the lobes of their mantles, which in some instances, as in *Philine*, 20-25, cover the shell. The stomach of *Scapander*, 26, 27, is a remarkable kind of mill, composed of two bones, between which the food is ground. The shells of *Aplysia*, 28, and *Pleurotranchus*, 29, 30; are quite internal. *Spirula*, 31, belonging to the Cephalopodous or Cuttle-fish tribe, is only introduced doubtfully, as there is no proof of the species living in our seas.

PLATES XXI., XXII., XXIII., XXIV.

These are occupied by shells of *Gasteropoda pulmonifera*, so named because they breathe air by a pulmonary cavity, instead of water by gills. The *Limnæadæ*, or fresh-water Snails, contained in Plate I., live in water, but breathe by exposing the pulmonary cavity to air at the surface. *Succinea*, Plate XXII., 1-3, lives by the sides of streams, sometimes immersed. *Conovulus*, 4-7, affects brackish marshes. Our common Slugs yield, on dissection, thin shells, which are concealed beneath the mantle, *Limax*, 9-12. The shells of *Testacellus*, 13, 14, are fixed near the end of the foot, outside. The glassy shells of *Vitrina*, 15, 16, do not enclose the whole Slug-like animal. The other genera of Land Snails have shells large enough to receive the animal when retracted and withdrawn for repose.

BRITISH FOSSIL SHELLS.

THE following living species are also found in a fossil state in drift and strata of the British Isles. They are all enumerated in Mr. Searles Wood's monograph of the CRAG Mollusca.

The numbers refer to the species as figured in our Plates, Mr. Wood's nomenclature being inserted in italics when differing from ours.

### SUCCINEA. Amphibious.

Fig.

1. S. PUTRIS, Linn. (*Helix*)—*H.*, *S.*, and *Limnaea Succinea* and *amphibia*.—On plants by the side of rivers, ditches, etc., C. Rather oval in form.
2. S. GRACILIS, Alder.—*S. putris*, var. *gracilis*, *S. amphibia*, var. *Pfeifferi*.—By sides of streams and in damp meadows, C. Elongated, with spire produced.
3. S. OBLONGA, Drap.—*Helix elongata*, *Amphibulina o.* and *e.*—Swansea, Glasgow, etc. Sometimes at a distance from water, R. Spire with more distinct whorls.

### CONOVULUS. Partly marine, amphibious.

4. C. BIDENTATUS, Mont. (*Voluta*).—*C.*, *N.*, *Actæon*, and *Auricula alba* (var.) and *erosa*.—Salt-water marshes, and on rocks near high-water mark all round our coasts, C. No tooth on outer lip.
5. C. MYSOTIS, Drap.—*C. denticulatus*, var., etc.—Brackish marshes, Thames, etc., C. Outer lip with one tooth.
6. C. DENTICULATUS, Mont. (*Voluta*).—*C.*, *V.*, *Auricula*, and *Actæon ringens, reflexa* (var. f. 7), *Mysotis*, and *personata*.—Numerous places, near the sea, C. Outer lip with many teeth.
7. C. REFLEXUS.—*Auricula reflexa*, *C. denticulatu*, var. *Jeffreys*.

### CARYCHIUM.

8. C. MINIMUM, Müller.—*Turbo Carychium*, *Auricula minima*.—Moist places, wet Mosses, etc. Generally distr., C.

### LIMAX. Land Slug, with shell under shield.

9. L. CINEREUS, Müller.—*L. maximus, maculatus*, *Limacella parma*. Brit. gen., C.; Eu. Shell oval, large, thin.
10. L. AGRESTIS, Müller.—*L. concava* and *obliquus*.—Brit. gen., C. *Foss cr.* Shell small, oblique.
11. L. BRUNNEUS, Drap.—*L. concava*.—Under stones, etc. Shell minute, square.
12. L. FLAVUS, Linn.—*Limacella unguiculata* and *variegata*.—The large Cellar Slug. Shell thick, rather square.

### TESTACELLA. Slug with shell or tail.

13. T. MAUGEI, Féussac.—Clifton, Taunton, Plymouth, Swansea, etc., Mr. Large, and more square than 14.

VITRINA. Shell not including the whole Slug.

Fig.

14. T. HALIOTOIDEA, Drap.—*T. europea*, *T. scutulum*.—Near London. Channel Isl., etc., Mc.
15. V. PELLUCIDA, Müller, (*Helix.*)—*H. diaphana*, *Helicolina*, *Limacina major*, etc.—Various parts of the country, under stones, etc., Mc. Eu. Very transparent.
16. V. DRAPARNALDI, Jeffreys.—*V. oblonga*, *H. brevipes*?—Less globular than 15, R.

ZONITES. Transparent, thin-edged Snails.

- 17, 18. Z. CELLARIUS, Müller, (*Helix.*)—*H.* and *Z. lucida* and *nitens*.—Brit. gen., C.
- 19, 20. Z. NITIDUS, Müller, (*Helix.*)—*H.* and *Z. nitens*, *lucida*, *tennis*, *Succinea*, etc.—Less depressed than 17, 18, with larger umbilicus.
21. Z. CRYSTALLINUS, Müller, (*Helix.*)—*H.*, *Z. Discus*, and “*Polita*” c., *eburnea*, *vitrea*.—In damp spots, among stones and Moss. Minute, white, transparent.
22. Z. NITIDULUS, Drap.—Generally distributed, Mc. Mouth oblique. Umbilicus small.
- 23, 24. Z. ALLARIUS, Miller, (*Helix.*)—*H.* and *Z. glabra*, *alliacea*, *nitens*, *tenera*, *lurida*, etc.—Distr. gen., C. Smaller and more convex than 17, 18.
25. Z. EXCAVATUS, Bean, (*Helix.*)—*H.* and *G. nitida*, *lucida*, etc.—Durham, Northumberland, Galway, etc., Mc. Umbilicus very large.
- 26, 27. Z. RADIATULUS, Alder, (*Helix.*)—Distr. gen., C. Striated, minute.
- 28, 29. Z. PURUS, Alder, (*Helix.*)—*H.* and *Z. polita*, and *Helicella nitidosa*, *electrina*, etc.—Most common North Engl. Whorls less close and more oblique than 21.
