## P R E F A C E

---

VOLUME II of the "History of the World," which is now given to the public, is the fifth in the order of publication. With Volumes I and III it presents now, for the first time since the inception of this work, a continuous narrative in conformity with our original design. Like the preceding and the succeeding volume, too, we hope it will bear eloquent testimony to the conscientious care with which that design has been executed. Our "History," conceived as it is upon ethnogeographical principles, has laid itself open to the reproach that it violates thereby the first law of historical writing — the preservation of the chronological sequence of events. In reply to this charge we may justly and repeatedly declare that in no other work bearing a like name does the course of the narrative, from the dimmest ages of antiquity to the present day, flow on as illuminatingly and as uninterruptedly as within the main divisions of the "History of the World." (On this point we would expressly refer the reader to the Editor's Announcement in the Supplement to the "Allgemeine Zeitung" for October 26, 1899, already mentioned in the preface to Volume IV.) Our method, indeed, has made it possible to write history from the broad standpoint of evolution. The divisions of the subject which we have made are neither accidental nor arbitrary. They are based solely upon the great historic fact that the human race, originally homogeneous, has, in the course of time, become subject to marked differentiations, and that these differences find expression in various ethnic groups, between whom the line of demarcation is sharp. Thus Volume I was devoted to a treatment of the American branch of the human race, a branch which in the course of centuries has developed into a mighty stem. In the same manner Volume III dealt with the history of a second great unity, embracing the peoples of Western Asia and Africa. The present volume fills the gap between the two by taking up the intervening element between America and the western Orient, namely, the sphere of East Asian and Oceanic civilization in all its subdivisions.

There are three great routes along which nature points the way across the Pacific (Volume I), from America to the eastern shores of Asia. In the north the path runs from Alaska across Behring Strait to Siberia; in the middle latitudes steamers plough from San Francisco to Yokohama in the Britain of the Pacific; in the south the way lies across the far-stretching island-bridge of Polynesia to Australia and Indonesia. The far north, however, has very little to show in the way of historic life, and the authentic history of Australasia, in comparison with that of the world, is quite recent. We have, therefore, had no hesitation in choosing the middle route and in beginning the present volume with the history of Japan, followed by that of its neighbours, China and Korea. These are naturally succeeded by Central Asia and Siberia, whence we have deemed it best to pass on to the fifth continental division with its numerous dependencies (Australasia), whose history falls almost entirely within the last two centuries. The second half of the volume, divided into three parts, deals with the sphere of Indian civilization as a whole. Nearer and Further India, the Malay Archipelago, and the Indian Ocean, throughout their past history, have constituted a firmly articulated entity which ought not to be dismembered. The concluding monograph, which deals with the countries bordering on the Indian Ocean, brings us, it will be found, so frequently in contact with the races of Western Asia and Africa as to make the section an introduction almost to Volume III. With this volume, then, we conclude our account of the non-European world, an account which we deem in no way disproportionate to the merits of the subject. In the preface to Volume III we spoke of the importance of the history of the Orient, and of the remarkable degree to which, up to the present day, it has been depreciated and misunderstood. There are so few names, indeed, to be cited in support of our contention that we feel compelled to make reference to what has been said on the subject by Gustav Strakosch-Grossman in the introduction to his excellent work, *Einfall der Mongolen in Mitteleuropa in den Jahren 1241 und 1242* (February, 1893). He speaks unqualified truth when he says: "The scope of our knowledge is sure to be broadened by a more thorough study of the historical literature of the East, which contains so much valuable material for the history of mediæval Europe. A systematic examination of the Oriental writers would supply the historical student with a wealth of new data, revealing many hitherto unsuspected contributions to the history of the relations between the peoples of Europe and of the East."

This very aim is the one that above all others has been pursued in the present work. In his general introduction to Volume I of the "History of the World," the Editor made the promise that the work then begun should not consist of a mere collection of unrelated monographs dealing with different nations, but that there

should be, too, "bridges that connect one structure or division with another." Naturally, this difficult task was made possible only by the readiness of the various writers who, in the great majority of cases, had worked up their subjects independently, to submit to changes in their contributions, which, in many instances, amounted to much more than editing simply for stylistic and formal purposes. It has been the Editor's task to reconcile or, at least, to soften contradiction; but, more than that, it has been his to bind together the various parts of this work into a harmonious whole. Not without justice does this "History" bear the Editor's name. The latter finds in the fact something more than an empty and little merited honour. Rather he deduces therefrom the duty, which he gladly assumes, of seeing to it that this "History of the World," far from remaining a mere collection of some fifty or sixty essays, shall be fashioned into a real history of the human race. By this method the authors of the various parts of a composite work are made veritable "contributors"; but by this method, too, the Editor assumes his share of the responsibility. We believe the time has come for making this fact public. In the present volume, for instance, the Editor has had a relatively important part in the revision of the section on India.

All this, however, would have been impossible of accomplishment were it not for the valuable assistance the Editor, as on previous occasions, has been fortunate enough to obtain, in the form of information supplied by eminent specialists, as well as in unselfish support on the part of his younger colleagues in the historical field. In addition, the success of the entire work is due in no little measure to the kindness of those public authorities and persons in private life who have furnished us with valuable originals for our illustrations. Our special thanks are due to the authorities of the Museum of Ethnology at Berlin, the Imperial and Royal Library, and the Imperial and Royal Museum of Natural History at Vienna, as well as to His Highness Prince Roland Bonaparte, of Paris. The greater number of originals for the plates accompanying the section on the history of China were placed at our disposal by Professor C. Arendt, whose early death occurred January 30, 1902; for those on the history of Oceania we are indebted to Professor Dr. Felix von Luschan, of Berlin.

In view of the frequent and general complaints of Indian and Arabic scholars, concerning the total or almost total lack of care exhibited by works of a popular nature in the transliteration of Oriental proper names, we have endeavoured to comply with at least some of the principal demands formulated. In so doing, we have partly followed the usage of the learned Jesuit, Alexander Baumgartner, in his monumental *Geschichte der Weltliteratur*, a work similar in plan to our own, and partly have availed ourselves of the guidance afforded by Ferdinand Justi in his

*Iramsches Namenbuch.* Thus we have attempted to preserve the distinction among the three hard sibilants in Sanskrit, the palatal ś, the lingual sh, and the dental s, as well as the differences between corresponding forms in the other consonants (ñ = guttural, ñ̄ = palatal, ŋ = lingual, n = dental; ṭ and ṭh, ḍ and ḍh = lingual, t and th, d and dh = dental, etc.). Ā is pronounced like final n in French, especially before sibilants (saṁskṛita), and before h (siṁha). On the other hand, we have thought it vain to attempt adequately to represent the rare vowel ɾ (similar to the Bohemian vocalised ɾ). The hard palatals c and ch appear as such in the section on China, elsewhere we have represented them by the less equivocal combination tseh. The soft palatals j and jh are everywhere represented by the equally preferable combinations dj and djh. All such other departures from common usage, as may occasionally occur, call for no special explanation (*c.g.* the differentiation in Sanskrit of the long vowels ā, î, and û by the use of the circumflex, which the diphthongs e and o long by routine do not require).

“ We have given ourselves up to a study of the languages of the East, not merely for the reason that the genius of the nations of the East has exerted a powerful influence on the Western world in ages past, but because from such studies we hope to derive still greater gains for the future. We fondly expect that our special study, in conjunction with other rapidly developing disciplines, will be instrumental to a very important degree, in leading man to abandon his narrow, one-sided view of life, and to re-endow him with an understanding of the Beautiful in its universal aspect. And for those nations that cherish the Beautiful, practical achievement shall go hand in hand with spiritual conquests. It is our chronic neglect of the past that has made us blind to universals.” Thus Georg Jacob, at the close of his address on “ Eastern Elements of Civilization in the Occident.” manfully pleaded for a widening of man’s spiritual horizon. May his words prepare as a friendly and auspicious welcome for the present volume at its appearance before the learned world.

### JAPAN, CHINA, AND KOREA

BY MAX VON BRANDT

FORMERLY GERMAN RESIDENT MINISTER IN JAPAN AND AMBASSADOR TO CHINA

---

#### 1. JAPAN

##### A. THE COUNTRY AND ITS PEOPLE

(a) *Configuration.*—The Japanese islands Kyūshū (Saikaidō), Shikoku, Hondo (Honshū, Nippon), Yezo (Hokkaidō), and Saghalien (Karafuto, Krafto), the last of which is separated from Japan only politically (since 1875), confront the continent of Eastern Asia from the southern promontory of Korea on the southwest up to the mouth of the Amur on the northwest, and are divided from it by that great mediterranean sea known as the Sea of Japan, which is connected by a few narrow straits with the Pacific Ocean and its component seas. On the north, the island of Saghalien is divided from the mainland by that passage which has been known to Europeans for the last fifty years only as the Nevelski Strait, or Gulf of Tartary. On the south, the Sea of Japan and the eastern Chinese Sea are joined by the Straits of Korea, which lead between Korea and Hondo, and are further subdivided into three passages by the islands of Tsushima and Iki(-shima). On the east, the Tsugaru (or La Perouse) Strait, between Yezo and Saghalien, make communication possible between the Pacific Ocean and the Sea of Japan. But hitherto this great mediterranean sea has been rather an obstacle than a means of communication. In prehistoric times there may have been one or two immigrations from the Asiatic mainland into the chief islands of Japan by way of Saghalien and Yezo, but it is only in comparatively recent years that unimportant bodies of Giljaks have crossed the five-mile breadth of the straits and driven the Ainos out of the northern part of Saghalien. Evidence, also exists of an immigration from Korea to Hondo as early as the second century A. D., though this passage had undoubtedly been traversed at an earlier period.

The long-drawn islands of Japan, which extend from 24° 20' to 54° 20' latitude north, are of volcanic origin; the numerous mountain ranges of the interior, which generally run from southwest to northeast, or from south-southwest to north-northeast, contain many volcanoes, some of which are apparently extinct, while a considerable number are yet active. Everywhere throughout the country traces are constantly to be found of volcanic action yet in progress in the shape of sul-

plur vents and hot springs; it is indeed remarkable that these phenomena seem to have exercised no influence upon Japanese cosmogony or upon the mythology of the native Shintoism. An important part is played by the warm, dark-coloured stream known as the "black river" (Kuro Shiwo), which rises between Luzon and Formosa and washes with its main current the southeastern coasts of Kyūshū, Shikoku, and Hondo, and gives their soil the luxuriant verdure and fertility of tropical regions. The climate of the northwest coast of Hondo is not so warm, though even here the cultivation of the tea-plant, which usually ceases at latitude 36° north, has been continued nearly as far as latitude 39° north; however, the warm and cold streams which flow into the Sea of Japan from south and north produce many fogs and make it dangerous and inhospitable. Far greater influence has been exercised upon the development and the history of the country by the conformation of the coast line (see the map, "Japan and Korea"). On the southeastern side of the main islands, especially in Shikoku and Kyūshū, the coast line for the most part is precipitous and falls down sheer to the sea, while at the same time providing countless bays and harbours, great and small, as a sure refuge for fishermen and mariners; on the other hand, the northwest coast of Hondo is flat, covered with sand and shingle, and almost harbourless. For this reason the southeast coast was naturally populated more densely and at an earlier period.

(b) *The Population.* — Our information concerning the earliest inhabitants of Japan is alike scanty and unreliable. At different spots in Yezo and the Kurile islands excavations have been found from three to six feet deep, with a length or diameter of fifteen to twenty feet; these lie in groups, numbering as many as one thousand, and are attributed by the Ainos to a people called Koko-pok-guru ("people having excavations," "cave-dwellers") or Koshito ("dwarfs"), who are said to have inhabited the island before the Ainos and to have been exterminated by them. These holes were probably covered with a roofing of branches on which earth was laid. Excavations in their neighbourhood have brought to light potsherds and stone arrows, a fact which is the more remarkable, as the Ainos seem never to have learnt the art of making pottery, which they do not even now possess. On the other hand, a few centuries ago they also made use of stone arrowheads; these were then replaced by points of bamboo, which are both more easily made and better suited to hold the poison which they employ in hunting.

Nothing is known as to the origin of the Koko-pok-guru or of the Ainos (Ainu, Ebisu, Emishi; cf. below, p. 214); apparently both peoples immigrated from the north at an early period, and the Ainos at any rate advanced as far as the northern half of Hondo, and perhaps even farther south. Some authorities consider the Ainos as a Mongolian, others as a Polynesian people. Dr. E. Baelz places them among the Caucasian races, and believes them to have been related to the Mujiks, the peasants of Great Russia; their resemblance to these, at any rate in advanced years, is certainly remarkable. In this case we must consider the Ainos as members of a greater continental race, which migrated to Japan in prehistoric times and was gradually driven further northward by later arrivals, ultimately crossing into Yezo by the Tsugaru Strait. There are probably twenty thousand of them in Yezo, the southern part of Saghalien, and in the Kuriles. Where their race has maintained its purity, their civilization is scarcely higher than it was at the time when they first came in contact with the Japanese.

The origin of the Japanese is also wrapped in mystery. The attempt to solve the problem from the anthropological side, and to consider the modern Japanese as a mixed people consisting of Aino, Korean, Chinese, and Malayo-Chinese elements, may be said to have been successful, in so far as all these races have undoubtedly contributed to the formation of the nationality now inhabiting Japan; but no proof has been brought forward to show to which of these races the main body of those immigrants belonged, who probably made their way into Japan long before the seventh century B. C.

Ethnological comparisons promise better results. The practice of soothsaying by means of the shoulder-bones of a slaughtered animal, and that of sending horses and servants to accompany a dead prince, who were not killed and buried with him, but were partly buried in an upright posture round the grave mound to serve as a living fence, — these seem to have been Japanese customs from a very early antiquity. For purposes of soothsaying they used the shoulder-bones of the stag; the sheep, which is usually employed for this purpose in Northern Asia, is not found in Japan. Concerning their burial customs, the chronicles known as the *Nihongi* speak as follows: "The brother of the emperor Suinin [29 B. C. — 70 A. D.] died and was buried at Musa. All those who had been in his personal service were gathered together and were buried alive in an upright position around his barrow. They did not die for many days, but wept and bewailed day and night. At length they died and became putrid. Dogs and crows came together and ate them up." The emperor, who had also listened to the lamentations, ordered the abolition of this custom; and it is said that from the year 3 A. D. clay figures instead of human beings were buried in or about the barrows. Pieces of these figures are constantly found at the present day. However, this ordinance was frequently disregarded. Thus the Chinese annals of the Wei dynasty stated that, on the death of the empress regent Himeko (*Jingō Kogu*, according to the Japanese lists), in the year 247 A. D., a large mound was piled above her grave, and more than a thousand of her male and female servants followed her to death. It is indeed difficult to eradicate customs which have become part and parcel of the national life, as is the case when the unwilling sacrifice has become voluntary in the course of centuries and is considered an honourable duty. In the year 646 A. D. the mikado issued an order for the cessation of all these customs, — namely, suicide or the murder of others for the purpose of sharing the fate of the deceased, the killing of his horses, the burying of treasure for the benefit of the dead, the cutting short the hair, stabbing in the thigh, or loud wailing on the part of mourners; yet almost a thousand years later we find Ieyasu obliged to forbid the Samurai to kill or mutilate themselves upon their master's grave.

Both of these customs, divination by shoulder-bones and the slaughter of servants at their master's grave, are undoubtedly of North Asiatic or Tartar origin. In China they also existed. *Kungfutsé* mentions the second of these customs as belonging to antiquity, as also the substitution of wooden figures for human sacrifices; and the last known example occurs in the time of the present Manchu dynasty after Kanghis's ascent of the throne (1662). They are to be retraced to the influence of Tartar dynasties. Moreover, the obscene characters of the Shintoist mythology and the popular phallus-worship, which was practised without concealment in Japan so recently as 1860, are evidences in favour of a Tartar-Shamanist origin. Finally, it is important to observe that the earliest events of importance

in the Shinto mythology are laid not in Kyūshū, which would be evidence in favour of an immigration from the west or south, but in Izumo, Yamato, and Setsu, thus pointing to a migration from the north. According to Chinese annalists, Korea was conquered and civilized by a member of the Shan dynasty, Kītsze, on the fall of that dynasty, 1122 B. C.; therefore the migration from Korea to Japan must have taken place before that date, as the immigrants in question had certainly never come in contact with Chinese civilization. It is, however, quite possible that this migration may have started from one of the Manchurian States (for example, Fumu) lying to the north of Korea. According to Chinese sources of information the inhabitants of these districts seem to have had many ideas and customs corresponding to those of Old Japan. In that case old Engelbert Kämpfer was correct when he wrote in his "Amœnitates Exotica" in 1712: "*Latuerunt diu obscuro nomine e Datz seu Tartaria hospites in Japonia et per provincias disseminati incultam ichtyophagorum vitam vixerunt*" ("Strangers from Datz or Tartary have long lain concealed in Japan under a name of doubtful meaning, and, scattered about the provinces, lived the wild life of fish-eaters").

#### B. THE AGE OF THE GODS AND HEROES (TO THE APPARENT FOUNDATION OF THE EMPIRE IN 660 B. C.)

THE age of the Japanese gods and heroes falls into two divisions, seven generations of heavenly beings and five of earthly, embracing altogether many hundreds of thousands of millions of years. In the beginning was Chaos, a monotonous and stormy sea out of which, by degrees, the light, pure elements arose and formed the heaven, while the gross and heavy sank to create the earth. Between the two appeared the first god, the lord of the eternal kingdom. The duration of his reign is given as one hundred thousand millions of years; and the two self-created deities, who succeeded to his throne in turn, ruled each for a like period. Then followed three pairs of male and female deities, who created their successors by sinking into contemplation of one another; they ruled during six hundred thousand millions of years, and, like their predecessors, in virtue of the power of an element possessed by each, water, fire, wood, metal, and the earth. The last or seventh generation of the heavenly beings includes the male Isanagi no mikoto and the female Isanami no mikoto. These two were the first to be carnally conjoined, and created the eight lands, that is, the islands and provinces of Japan (eight is the sacred number constantly recurring in the Shinto religion), the sea, the rivers, the mountains, the first trees and the first plants, the goddesses of the sun and moon, the sea-god Yebis, and the god of the storms; then they returned again to the heavens. They conclude the seven generations of the heavenly beings.

The five generations of terrestrial spirits form what may be called the heroic period of Japanese history. The bad spirit, Sofan, the god of the winds and storms, whom Japanese expositors identify with winter, is overcome by the vivifying influence of the sun-goddess, Amaterasu, and the earth is made fruitful. Sofan submits and descends to the earth, where he frees the daughter of the first human couple from a dragon in the province of Izumo, and marries her. After begetting a son, he leaves her and retires to the desert in the southeast of Japan, which has been previously assigned to him by his parents as a dwelling-place. The grandson of the sun-goddess, Amatsu, is then said to have been made ruler of the earth; and

different children of the gods come down to the earth to drive away the evil spirits and to make all things ready for the arrival of the god, but instead of fulfilling their task, they settle upon the earth, and enter into alliance with the son of Sofan. Two new messengers from the gods, themselves also of divine nature (Kami), succeed in reducing their refractory forerunners to obedience. Some of the terrestrial Kamis submit, others are destroyed. Amatsu comes down to earth, and takes over the government of the province of Hyuga in Kyūshū. He is followed by his son and grandson, with whom the succession of the terrestrial spirits comes to an end. The historical age, according to the Japanese, then begins.

Ihauriko, the youngest son of the last terrestrial spirit and the daughter of the dragon-god Kiosiu, whom Japanese expositors would consider as a ruler of the Liukiu islands, succeeds his father in the government of Hyuga in virtue of his high capacities. In the year 667 B. C., at the age of forty-five, he advances with his three brothers to conquer the whole kingdom. He first subdues Tsukushi (the modern Chikuzen and Chikugo), then Kibi (that is, Bizen, Bichiu, and Biūgo) in Kyūshū, and also Aki in Hondo. After three years of preparation for a further campaign he sails along the coast with his fleet to Naniwa (Osaka), where he lands. However, at Kusagesaka in Yamato and at Kumano in Kii he is beaten, and is obliged to retire to his fleet. He loses the greater part of his ships in a storm; the remainder are saved only by the devotion of two of his brothers, who cast themselves into the sea to appease the anger of the gods. With fresh troops he returns to Yamato, and in the year 660 B. C. subdues the independent petty chiefs, partly by treachery, his supremacy being established by the surrender of the tokens of empire, the sword, mirror, and insignia (pearls?), which had hitherto been in different hands. He builds his residence, half palace and half temple (that is, house for ancestors) on the mountain Unchi in Yamato, and hands over the government of the kingdom to four ministers, one of whom becomes the ancestor of the famous family of the Fujiwara. The first tenno (heavenly king) of Japan is known by the name of Jimmu (spirit of war), which was given him after his death; so run the Japanese narratives.

If there be any substratum of reality to these traditions, it probably consists in the fact that the main settlement of the immigrants was situated in the provinces of Izumo, Yamato, and Setsu, which were united at a later period with Yamashiro and Kawachi, and formed the Gokinai (the five original provinces), which was the central point of the kingdom. From this centre the advance to the conquest of the western and southern districts was made. Probably Jimmu's expedition was undertaken to enforce the recognition of actual or putative rights which had existed at an earlier period; he is said to have married the daughter of the ruler of Izumo. The struggles appear to have been fought out between members of the same clan. Whether the Takeru, who are mentioned later as inhabiting Kyūshū, are to be identified with the Kumaoso (Kumaso), whether they were members of the immigrant hosts, whether and how far they were commingled with the Malay-Chinese or Korean nationalities, are problems insoluble at the moment. According to Japanese sources of information, the first Korean immigration is said to have taken place in 59 A. D.; however, embassies from Korea seem to have arrived in the country as early as 33 B. C. In the northeast the Ainos were the only enemies with whom the immigrants had to contend, although their opponents in that direction are mentioned under different names.

C. THE LEGENDARY PERIOD (UNTIL THE INTRODUCTION OF BUDDHISM,  
552 A. D.)

(a) *Foreign Relations.* — The great obstacle to the proper comprehension and relation of early Japanese history is the fact that native historical records are entirely wanting until the eighth century A. D. Until the sixth century A. D. the Japanese possessed no system of writing of any kind, and from that period until the invention of the Katakana script in the ninth century they used nothing but the Chinese characters. The oldest piece of historical writing extant, the Kojiki, the book of the old traditions, was completed in the years 711 and 712; two older works apparently belonging to the years 620 and 681 have been lost. The Kojiki contains the history of the creation of the gods and heroes and of the mikados up to the year 628 A. D.; it was printed for the first time between 1624 and 1642. The next work in point of age, the Nihongi (Chronicles of Japan), belongs to the year 720 A. D., and treats of the same subject-matter as the Kojiki, except that it carries on the annals of the emperors to 699. For this reason, apart from the fact that Chinese, Korean, Buddhist, and Confucian influences are very strongly marked, these books can only be used with the utmost caution. The lists of rulers given by them often fail to correspond with those contained in Chinese works upon the subject (for example, Matuanlin); moreover, they obviously bear the stamp of improbability. For instance, they relate that Jimmu reached the age of one hundred and twenty-seven years, and that among his first sixteen successors, the last of whom died 399 A. D., thirteen lived more than one hundred years; one of them, Suinin, the Solon of Japanese history, lived one hundred and forty-one years, and ruled for ninety-nine of them. Moreover, the long line of the mikados (the ruling mikado, Mutsuhito, is the one hundred and twenty-third) does not continue in direct succession according to our ideas, but, as even Japanese accounts admit, is broken by seven empresses and many adopted children.

Where contemporary Chinese and Korean accounts exist side by side, — and this is constantly the case in the histories of the individual dynasties and states of these countries, — the Japanese versions usually appear wholly unreliable. For instance, as regards the empress Jingō Kogu (201–269) and her reported successful conquest in 202 of Shiraki (Silla) in Korea, the account given by the writer of the Nihongi is adorned with the most impossible extravagances. Apart from all the evidence against any historical foundation to the narrative (such as the mention of names which can be proved not to have existed at that period, etc.), the Chinese and Korean annalists mention Japanese attacks against Silla only in the years 209, 233, and 249. The first was a wholly unimportant event, while in the two latter the Japanese were defeated with heavy losses in ships and troops. The annals of the Chinese Wei dynasty of the year 247 mention the death of the queen Himeko, (that is, Jingō Kogu), and relate that, after the outbreak of a civil war in which one hundred thousand persons were killed, a girl of thirteen years of age succeeded to the throne. This is a far more probable account than the story that Jingō Kogu reigned sixty-eight years after her consort's death.

Influenced by these and similar discrepancies between the Chinese and Korean historians on the one hand and the Japanese upon the other, W. G. Aston has declared his conviction that the Japanese narratives are unworthy of credence, not

only up to 400 and 500 A. D., but also during the sixth century of our era. He considers that the first demonstrably historical event in the Japanese chronology occurs in the year 461. Japanese history properly so called does not begin before 500 A. D., and the introduction of Chinese civilization into Japan took place one hundred and twenty years later than the date given by the Japanese to that event, — in 397 A. D., instead of 277 A. D. Modern Japanese criticism has also declared against the credibility of the *Nihongi*. In 1889 Tachibana Riohei collected a large number of instances showing the unreliable character of the work. According to the *Nihongi*, Yamato-dake, the national hero of the Japanese, died in the forty-third year of the emperor Keikō, that is, 114 A. D.; but his son Tsinai, according to the same authority, was born in the nineteenth year of the reign of Seimu (150), that is, thirty-six years after his father's death. Prince Oho usu no mikoto was the twin brother of Yamato-dake; the latter was aged sixteen when he took the field against the Kumasos in 98 A. D., so that the brothers must have been born in 83 A. D. But the *Nihongi* informs us that prince Oho seduced a nobleman's daughter in the year 75, that is, eight years before his birth. A large number of similar discrepancies have been collected by Tachibana.

Consequently, to reconstruct Japanese history from the foundation of the kingdom (660 A. D.) to the introduction of Buddhism, we are forced to restrict ourselves to such information as can be checked and corrected by accounts other than Japanese. These latter are, at best, nothing but a patchwork of incredible traditions arbitrarily put together, apparently with the object of providing some support for the claims which the ruling dynasty advanced at a later period. Hence there can be no possible doubt that the three original settlements of the immigrants, Yamato, Izumo, and Tsukushi (north Kyūshū), existed independently of one another long after the time of Jimmu tenno. In the annals of the Han dynasty (25–220 A. D.) mention is made of Japanese embassies which could only have been sent out by petty princes. The Chinese records compiled by Matuanlin in the thirteenth century show how low was the stage of Japanese development at the time when these accounts were written.

The annals of the later Han say that there is a mountainous island to the southeast of Korea, divided into more than a hundred districts. After the conquest of Korea by Wuti (140–86 B. C.) thirty-two of these tribes, who called their hereditary rulers kings, are said to have entered into communication by messenger with the authorities of the Han. The ruler of Great Wo (Wa, Japan) resided in Yamato. Their customs were similar to those of the province of Tschekiang, which lay opposite to Wo. The soil was suitable for the cultivation of corn, hemp, and mulberry-trees. The people understood the art of weaving. The country produced white pearls and green nephrite. In the mountains there was cinnabar. The climate was mild, and vegetables could be cultivated both in winter and summer. They had no oxen, horses, tigers, leopards, or magpies. Their soldiers carried spears and shields, bows and arrows of wood, the points in many cases being made of bone. The men tattooed their faces and bodies with designs. Difference of rank was denoted by the size and position of these designs. The clothes of the men were fastened crossways by knots, and consisted of one piece of material. The women bound up their hair in a knot, and their clothes resemble Chinese clothes of the thickness of one piece: these they drew over their heads. They used red and purple colours to besmear their bodies as the Chinese

used rice powder. They had forts and houses protected with palisading. The father and mother, the older and younger brothers of a family lived apart, but when they came together no difference was made between the sexes. They took up their food in their hands, but laid it upon plates of bamboo and wooden dishes. They all went barefoot. Reverence was paid by crouching low. They were very fond of strong drink. They were a long-lived race, and people a hundred years old were constantly met with. The women were more numerous than the men. All men of high rank had four or five wives, others two or three. The wives were faithful and not jealous. Theft was unknown and litigation extremely rare. The wives and children of criminals were confiscated, and for grave offences the criminal's family was destroyed. Mourning lasted only ten days; during that period the members of the family wept and lamented, while their friends came, sang, danced, and made music. They practised soothsaying by burning bones (over the fire), and thereby (pre)determining good or evil fortune. They appointed one man who was known as the "public mourner;" he was not allowed to comb his hair, to wash, to eat meat, or to approach any woman. If they, the survivors, were prosperous, they made him valuable presents; but if misfortune came upon them, they blamed the "mourner" for having broken his vows, and all joined in killing him, a custom the existence of which is confirmed by Japanese sources.

Further on we are told, "Between 147 and 190 Wo was in a state of great confusion, and civil wars continued for many years, during which period there was no ruler. Then a woman Pimihu (Himeko) appeared. She was old and unmarried, and had devoted herself to the arts of magic, so that she was able to deceive the people. The people agreed to recognize her as queen. She has one thousand male servants; but few see her face, except one man, who brings her meals and maintains communication with her. She lives in a palace of airy rooms, which is surrounded by a palisade and protected by a guard of soldiers."

From the third century A. D. we have constant references to embassies from Japan to China bringing presents (tribute) and seeking grants of titles and seals. Many of such mentions may have been inspired by Chinese vanity alone; none the less it is quite possible that the half-barbarian Japanese of that age may have been flattered by the conferment of such outward distinctions, although their descendants naturally deny the dependency of their country upon China. Traces of a certain degree of dependency are to be found until the period of the great Mongol invasion of 1370-1380.

From the last century B. C. more constant and closer connections subsisted between Japan and the States on the south of the Korean peninsula, Peh tsi (Pékeché, Hiak'sai, Kudara), Shinra (Shiragi, Silla Sinlo), Kara and Kaya (Mimana), Kokuli (Konia, Korai). It is not easy to distinguish the character or results of the various embassies, incursions, and larger expeditions undertaken by the State or by individuals; at any rate, many of the hostile descents of the Japanese upon the Korean seaboard of which we hear were made as often for piratical purposes as to support one or other of the political parties in Korea. The Japanese State was too loosely organised at that period to have provided the impulse to each one of these different movements. E. H. Parker, who has made a special study of the relations of China and Japan with Korea, says on this point: "The Chinese twice overran Korea, once in the third century B. C. and once in the seventh century A. D. In both cases their personal government was of short duration, and their vice-

royalty never extended over the northern half, and for some time not even beyond the mountain range which divides the northern half into eastern and western portions. The Japanese never set foot in that part of Korea which was actually under Chinese influence, except during a few months at the time of Hideyoshi at the end of the sixteenth century. They never really subdued any part of Korea. It is, however, possible that scattered remnants of the Japanese races may have existed in the extreme south of the peninsula during the first century A. D. There is no doubt that Japanese influence was strong in the southwestern parts until the second Chinese invasion; at a later time they were mere pirates, until Hideyoshi conceived the idea of attacking China by way of Korea. On the other hand, the Japanese from the earliest to the latest periods seem to have possessed a settlement in the extreme south of Korea, or at Fusan."

(b) *Internal Development.* — Japanese records mention many battles with the Kumaso in Kyūshū, who were either invaded and attacked in their own country, or themselves invaded and overran the western provinces of the chief island. The first battles against these eastern neighbours are those mentioned as having occurred under the emperor Keiko (71–130 A. D.). His son Yamato-dake, the warrior prince, carried the fame of the Japanese arms, though certainly only for a time, into the mountain district of Nikko, north of the modern capital of Tokio. In other respects the records are confined to accounts of the gradual and very slow internal development of the interior, which is naturally ascribed to the enterprise of individual emperors. Sūjin, the tenth emperor (97–30 B. C.), is said to have constructed the first aqueduct for the irrigation of the rice fields. His successor, Suinin (29 B. C.–70 A. D.), continued this work, and extended it by making canals; he is also said to have encouraged the national kami (god) worship. He seems also to have been the first to introduce a system of taxation, a reform of which the chief object was to provide funds for religious worship. Under the twelfth mikado, Seimu (131–190), the expedition against the Ainos of the east took place, and under the fifteenth, the empress Jingo Kogo (201–269), occurred the fabulous voyage to Korea. Her son Ojin, of whom she is said to have been pregnant at that time, and who for that reason has been worshipped at a later period as the god of war, Hachiman, succeeded her (270–310), and is reported to have paid special attention to trade and manufactures, teachers of which he brought over from Korea. His successors imitated his example, and thus we reach the epoch of the introduction of western civilization into Japan, although many of the statements upon this subject must be considerably post-dated.

During the whole of this period the immigrants seem to have been in no very close relations with the emperor. Tokuzo Fukuda connects these "Yamato" together even during their earliest period by the fusion of three subordinate tribes, — the Tenson (grandsons of the heaven), Tenjin (heavenly deities), and Chiji (earthly deities), standing in different degrees of relationship to the sun-goddess. But here he is probably describing the results of later developments; such distinctions do not usually become manifest until the necessity becomes apparent for sharper lines of demarcation between the upper and lower grades of society, and this can hardly have become imperative at the stage of development reached by the immigrants about 660 B. C. The development of the priesthood must also have been a very slow process, even according to the Japanese reports.

The more pronounced ancestor worship with which were connected the more definite distinctions of social rank may be ascribed to later Confucian influences.

This much is certain, that the race which held the upper hand in Central Japan—the power of the Yamato scarcely reached beyond this region—was composed of a large number of tribes (Uji), each of which had originated in a single family. Both in Japan and China we find the same course of development which has been followed in Greece, Rome, Germany, and among the North American Indians. Such tribal unions increase to a remarkable degree the stability and permanence of the body politic in which they pass the first stages of their constitutional development. In Japan each tribe with its chief formed a self-contained whole, the emperor's tribe under his personal leadership being the most numerous and powerful. The worship of their common ancestor was the bond of union within each individual Uji, and the worship of the sun-goddess formed the tie between the imperial and the other tribes. The creation of fresh Ujis, especially such as were formed of prisoners of war, slaves, and Tomobe, seems to have been a privilege of the emperor, who was allowed to incorporate such Ujis with his own to increase the strength of his household troops. It seems that originally within the Uji, while it was yet small, the products of hunting, fishing, and agriculture were held in common, and that ultimately there was community of all acquisitions; in this way some organisation parallel to that of European trade guilds in the Middle Ages may have been developed. The Uji could also enter into external relations without losing its corporate character, appearing in some respects as a legal personality. Certain offices belonged to the tribe and were hereditary in it: the man followed the woman into her tribe, to which also the children belonged. Here we have a remarkable coincidence with the customs of the Iroquois, which perhaps originated at the time when women were scarce and a girl was consequently a valuable possession to a tribe. The power which the head of the tribe had over the members was very considerable, and appears to have resembled the Roman *patria potestas*; on the other hand, the relations of individual Ujis to the imperial tribe seem to have been very loose. Tokuzo informs us that they consisted chiefly in the recognition of the emperor as high priest for the worship of the common ancestral goddess, as lord of war, as the representative of the common interests abroad, and as chief judge to decide disputes between the different Ujis. The emperor had no right over the land or property of the Ujis.

#### D. BUDDHISM IN JAPAN FROM ITS INTRODUCTION IN 552 A. D. TO THE PRESENT TIME

BUDDHISM has been to Japan what classical antiquity and Christianity were to the West: it brought with it a better religion and Chinese civilization. The different accounts of the time and manner of its introduction are widely discrepant. The most probable story is that in 552 a king of Kudara in Korea sent pictures of Buddhist sacred history to the emperor Kimmei (540–571), and that the new teaching fell upon fruitful soil. It does not, however, seem to have obtained a footing in the country entirely unopposed; in consequence of the outbreak of an epidemic, under the emperor Bindatsu (572–585) it was persecuted and forbidden. Prince Shōtoku, a son of the empress Suiko, seems to have materially influenced

the extension of Buddhism; in 587 he built a great temple, and encouraged foundations and organisations for works of mercy and charity. The new doctrine obtained an informal official recognition from the emperor Sinmu (715-731), who ordered the erection of a temple in every province of the empire.

Japanese Buddhism, like the Chinese and Korean forms, and perhaps under their influence, was soon broken up into a number of sects (six); at the same time the antagonism and hostility between Buddhism and Shintoism became strongly apparent. It is remarkable that the emperors generally accepted the new teaching, though it threatened from the outset to discredit their own divine origin. Thus on both sides the desire may well have arisen to incorporate the new belief with the old. In 794 the emperor Kwammu changed his place of residence from Nara to the modern Kioto; at the same time the Japanese Buddhists began their journey to China, in order to seek information and enlightenment at the sources of the doctrine, which for Japan at least was new. Dengio went to China, and on his return in 798 founded the Tendai sect, and the monastery Enriakuji on the Hieizan as its centre of meeting and departure.

A yet more important influence upon the development of religion and of scientific life and thought was exercised by Kukai (Kobodaishi, 774-835); he is also said to have visited China, and upon his return in 816 to have founded the Shingon sect. On the Koya mountain he founded the monastery of Kougaï, which became, with the support of the emperor Saga, the central point, in many respects, of Japanese Buddhism. Kobodaishi invented the Japanese alphabet, Iroha, consisting of forty-seven signs, and also the first Japanese writing, the Katakara: hitherto only the Chinese characters had been known, and these continued in use for the writing of works of a scientific character. But the greatest achievement of Kobodaishi was his effort, which attained a great measure of success, to make a fusion of Buddhism and Shintoism. The old divinities were received into the Japanese heaven and explained as incarnations of Buddha; while the demi-god heroes and warriors received general, or at any rate local, worship as "gongs." Thus he gave a Japanese colouring to Buddhism. To him it is undoubtedly due that the emperors gave their unconditional adherence to the foreign doctrine, which had now become national. During several centuries after his age most of the emperors resigned after a short rule, shaved their heads, and ended their lives as Buddhist monks. To him also is to be ascribed the introduction of cremation; in several cases even the emperors accepted this custom.

During the struggles between the rival families of the Taira and Minamoto the prestige and power of the Buddhist priesthood steadily increased. With Yoritomo's victory over his rival in 1186, and the removal of the capital of the shōgun<sup>1</sup> to Kamakura (near the modern Yokohama), begins the most brilliant age of Japanese Buddhism, as regards the number of its sects, their power, and their political influence. In 1191 Yeizai founded the Ruizai sect; and Shinran, in 1220, founded the Shin sect, the nationalist party of Japanese Buddhism. Shinran allowed the priests of his sect to eat meat and to marry; and in order to break down the barriers between priest and people, removed the temples to the towns from the moun-

---

<sup>1</sup> The shōguns were originally military commanders, four in number, and ruling the four military districts into which the empire was divided. But in 1192 the title was given to a supreme military chief or field-marshal; and from that date to 1868 there was an almost unbroken succession of shōguns, whose importance will be seen in the later course of the narrative.

tains and desert places where they had been previously erected. Contrary to the usage of other sects, the writings of the Shin sect are in Japanese characters. They are known by the names of Ikko (the first word of their most important work, the book of everlasting life) and Monto (servant of the gate, referring to the unity of their organisation). They are spoken of, and with much reason, as the Protestants of Japan. They refuse to consider as obligatory not only celibacy and abstinence from certain meats, as we have already observed, but also the practices of penance and ascetic living, pilgrimages, and the monastic life. They teach that men are justified by faith in Buddha. Among them the priesthood is hereditary. In 1227 the Yodo sect was founded by Daghin, and in 1261 Nichiren founded the sect which has been called after him, which may be considered as a counterpoise to the Shin sect, and perhaps owes its origin to a feeling that some such opposition was required. Like its founder, who escaped the death sentence pronounced upon him by Hōjō Tokemori, owing to the miraculous splintering of the sword upon his neck, this sect was invariably characterised by intolerance and fanaticism, and therefore played a leading part in the struggle against the Christians. One of its members was Kato Kiyomasa, that persecutor of the Christians who is a notorious figure in the Jesuit relations at the outset of the seventeenth century; and its motto was to be seen on the standards of many a general,—"Namu mio ho ren ge kio" ("Honour to the book of the law that bringeth redemption"), which was adopted in place of the old "Namu Amida Buddha" ("Honour to the Holy Buddha"). In 1288 the last of the great sects, li ("Seasons of the year"), was founded by Yippen.

During the wars which devastated the country between 1332 and 1602, the priests kept alive the study of science and literature; but they also took a very definite part in the political struggles of the time, and many an abbot, harnessed and armed, charged into the fray at the head of his monks and vassals. Hence it was only to be expected that Ota Nobunaga, the first important personality who made it his object to restore peace and order throughout the country and to secure obedience to the emperor's will (though this redounded also to his own advantage), should have turned upon the monasteries. In 1571 the worst of these spiritual strongholds, the monastery of the Shingon sect on the Hieiizan, was destroyed by his orders and all its inhabitants slain. Some years later the same fate befell the great temple of Hongwanji of the Shin sect in Osaka. The priests of this latter had harboured robbers and also political opponents of Nobunaga. After weeks of fighting, three fortresses were captured out of the five which composed the monastery. Upon the entrance of the mikado the survivors were permitted to depart (two thousand of the garrison are said to have fallen during the siege). The Buddhist priesthood, however, never recovered from these two blows; and even though it was found necessary at a later period to break down one or another of the strongholds of political Buddhism, Nobunaga had already performed the hardest part of this task.

The Yodo sect was the most important under the Tokugawa rule. It is noteworthy that the shōguns of this dynasty showed special favour to that sect, which certainly was less cultivated than any other. Its priests followed the chief rules of Indian Buddhism, and taught that the welfare of the soul depended rather upon prayers, and upon the strict performance of external ceremonies and pious precepts, than upon moral purity and perfection. The shogunate was therefore able to

entrust to this sect the religious guidance of the people without fear of any attempt to exercise an influence in opposition to its own plans. The priests of this sect also provided the services in the burial grounds of the shōguns at Shiba and Nikko (see the plate, "The Burial Grounds and Temple Precincts of Nikko," p. 40). The temple of Zozoji, situated in Shiba, which was burnt down in 1574, also belonged to them. The Buddhism which had become the State religion, at any rate of the shōgun bureaucracy (Bak'fu), declined greatly in the later years of the shogunate, as did all other branches of the public service. It failed completely in the final struggle of the shogunate against the mikado. After the shōgun himself had given up the contest, the adherents of the shogunate made an attempt to set up an opposition mikado in the person of Riunoji no mya, a prince of the empire and high priest of the Tendai sect, with a residence in the temple of Toyuisan in Ugeno. This proceeding had, however, nothing to do with Buddhism as such; it was little more than an historical recollection of the reasons which had induced the shōguns of the Tokugawa dynasty to find an instrument for use against the mikado in the chief of this sect, which the emperor Kwammu had joined upon its foundation by a prince of the blood royal.

After the fall of the Tokugawa dynasty, the victors began to display a violent doctrinaire animosity against Buddhism which resulted in persecution. This was the more natural as the literary activity of the Shintoists and authors who gave themselves out to be Shintoists materially contributed, from the eighteenth century onward, to bring about the downfall of the shogunate in 1868. The mikado issued a decree making a sharp distinction between the Buddhist and Shintoist forms of worship. Buddhist priests who had hitherto been allowed to perform Shintoist ceremonies were now prohibited from doing so, and all temples in which the two creeds had been united were assigned to the Shintoists. At the same time a special ministerial department (the Shingaikwan) for the support of Shintoist worship was created, the object of which was to spread Shintoist doctrines by means of missionaries educated for the purpose. In 1870 a new decree appeared forming these missionaries into a kind of political corporation, to which also prefects and other administrative officials might belong. In 1871 relations between Buddhism and the government were entirely broken off. The Buddhist sanctuary in the palace was closed, the Buddhist festival of the emperor abolished, and the statue of Buddha removed from the palace. At the same time the titles of honour given to the temples were annulled and their landed property was sequestered. In 1872 the government deprived the priests of their clerical titles and dignities and ordered them to resume their family names. At the same time the prohibitions against marriage and the eating of meat were removed, all temples without priests and congregations were sequestered, and the priests were forbidden to appeal to the charity of their believers. The importance of these rules can be easily understood if it be remembered that in 1872, in a population of rather more than thirty-three millions, there were 72,000 Buddhist priests and 9,621 nuns, to which must be added about 126,400 novices, students, and families belonging to the Shin sect, and that the number of temples in the possession of the seven chief sects amounted to more than 67,000.

These efforts of the government to suppress Buddhism and to revive Shintoism remained fruitless, as was bound to be the case, for Shinto doctrine contains none of those elements which are essential to successful religious propaganda. The

Shingaikwan was consequently dissolved, and the religious question submitted to the ordinary ministerial department of public worship, which now laid three injunctions upon the state missionaries: they were to preach the fear of the gods and the love of the fatherland; to explain the laws of nature and sound morals; to serve the emperor and to obey his orders. At the same time the government appointed for every Buddhist and Shintoist sect a chief of these official missionaries, and allowed the members of all Buddhist sects to preach when and where they would, provided that they taught nothing opposed to the three injunctions above mentioned. As these measures did not produce the desired result, the government abolished the official missionaries in 1884, and left the settlement of the missionary question to the heads of the different sects whom it was to appoint. Finally, in 1889 the new constitution recognised religious toleration as a cardinal point. Proposals for a law to settle the questions concerning the Buddhist, Shintoist, and Christian sects were rejected by the first chamber in 1899. The most obvious consequence of the government's interference in religious questions and of the persecution of the Buddhists may be said to consist in the fact that, with the exception of the Shin sect, which seems to have gained new strength in the struggle for existence, all the Buddhist sects have suffered financially to a greater or less extent, while their religion has emerged from the period of trial with advantage rather than loss.

#### E. THE CHANGE OF CONSTITUTIONAL FORM

(a) *The Supremacy of the Fujiwara.*—If the Japanese annals are to be believed, Jimmu, immediately after the foundation of the kingdom, handed over the government to four ministers, one of whom was an ancestor of the family of the Fujiwara. In this piece of information we may probably recognise nothing more than a desire, formulated by this powerful family some fifteen hundred years later, to justify their actual predominance by reference to an antiquity as remote as possible. In reality the true state of affairs for a long period must have been that the supreme chieftains (emperors; Sumera Mikoto) of the victorious tribe, who did not receive the Chinese title of "tenno" until a much later date, found themselves obliged to defend and to extend their tottering supremacy as best they could. As the emperors attempted to strengthen the forces under their control, so also did the chieftains of other Ujis. In the course of centuries conflicts can be shown to have been waged between the emperor and unruly Uji chiefs, which were generally decided by the interference of other chiefs in favour of one or other of the contending parties, and not always in favour of the rightful superior. Such struggles constantly broke out over questions concerning the succession to the throne, for it was not until the reign of Kwammu (782–806) that the right of primogeniture was asserted, and it was some time before it advanced from the theoretical to the practical stage.

These continual contests for power and supremacy involved the downfall of the old tribal system. The ultimate causes of the change are to be found in the increase of the population and consequently of the members of the individual Ujis, and also in the increased necessity for labour to provide sustenance for individuals, resulting in the abandonment of fishing and hunting for agriculture. The rise of the family and of the individual within the tribe gradually made itself felt as a

danger both to the upper and to the lower strata of society: to the upper, because the Uji system, in the event of a rapid increase in the members of the Uji, placed these numbers at the immediate disposal of a vassal anxious to create disturbance; to the lower, because the tribe was no longer able to provide for the welfare of its members. The Chinese constitution offered a solution of these difficulties, on which the emperor or his councillors gladly seized. In the great neighbour kingdom the monarch's person was unapproachable to the mass of the population. He ruled by means of his officials, of whom he saw none but the highest. Everything in the country, men as well as land, was his property, and was wholly subject to his will, which he exercised through his ministers in the capital and through his viceroys in the provinces. The constitution of the Japanese Empire now underwent a change in accordance with these principles. The mikado was nominally at the head of the government: in practice, though not as a matter of right, he was confined to the precincts of his palace, and as time went on became more and more a stranger to his subjects. Ultimately he became, what he remained until 1868, a mythical personality, for the possession of whom disputants would fight, because this alone could give to their measures the stamp of legality; but a personality who could only give expression to his will, when his servants provided the means to this end, with a view to their own advantage and aggrandisement. The executive power lay in the hands of the central administration, which had been remodelled after the Chinese pattern. This body was controlled by any one who had sufficient strength or cunning to make himself master of the situation. From the heads of tribes a court nobility, the *kuges*, was created, from which were selected the high officials of the central administration and the viceroys of the provinces and departments.

The tribes, as such, lost the political and economic importance which they had hitherto possessed, and their property was no longer held in common. Their place was taken by the family, the *ko*, in which the individual member had greater freedom of action. On the other hand, again after the Chinese model, freedom was limited and the solidarity of family life increased by the introduction of a new system of police, to which the history of mediæval England supplies a striking parallel. The *ko* were organised in groups of five, and each group became answerable in common for its members: this regulation seems to have been further strengthened by the creation of similar unions of ten families, or twenty, and so on. Only a few of the greatest tribes, such as the Fujiwara, the Taira, and the Minamoto, retained that influence which the Ujis had formerly exercised, and this in spite of the fact that the unity of the members on which the strength of the Uji had rested was now a thing of the past. We may, however, conclude that these families, and especially the Fujiwara, were the chief agents in the introduction of this change, which exercised so great an influence upon the whole of Japanese internal development, that the battles of the next eight hundred years were, almost without exception, fought out between and within such tribes. Such a change was naturally slow of completion. Initiated and supported by Chinese and Buddhist influences, a necessary condition of its accomplishment was the downfall of the existing system, the reduction of the emperor's position which that system strengthened, and above all things, energy and decision. As early as 603 the empress Suiko created twelve new grades of nobility; in 647 these were reorganised in thirty subdivisions by the emperor Kōtoku. In this institution we

may trace the origin of the *kuges*, the court nobility. In 603, also, eight ministers of the imperial palace were created, to deal with administration and education, ceremonies, finance, and the census, military affairs, the judicature, the exchequer, and the domestic economy of the palace. At this time the "counsellor of the gods of heaven and earth" (*jingi kuan*), who had previously been a supreme authority, was deprived of his dignity by the progress of Buddhist influence. In 786 the *daijo kuan* was created, a board of the chief officials of the realm, consisting of four ministers (the princes and the chief of the *kuges*); these were the *daijo daijin* (great minister of a great government), the *sadaijin* and the *ndaijin* (great ministers of the left and right), and the *nai daijin* (great private minister). The entire government was in the hands of these officials. Finally, in the year 889 the hereditary dignitary of the *kwambaku* or regent was created.

Other changes exerted a deeper influence upon the social organism. Under the emperor *Kōtoku* (645-654), a succession of regulations called the *Taikwa* (this being the name of the year-period in which they were issued) withdrew from the *Ujis* the offices which had hitherto been connected with them, and arranged that these offices should henceforward be held only by men of proved capacity; the members of the *Ujis* now became the vassals of the empire, and the land was divided into provinces (*kuni*) and districts (*kori*), the inhabitants of which were now responsible to the emperor for the payment of taxes in kind and the performance of labour services. In the year 689 was promulgated the "*Taiho*," that is, the existing body of legislation reduced to writing. The most important point of this code was the introduction of a system that had existed in China from immemorial antiquity, the division of the arable land, all of which henceforward belonged to the emperor, into temporary family holdings (on leases of six or twelve years); the size of these was proportioned to that of the families that held them, and rent was paid in the form of produce and of labour services. Forest, moorland, etc., remained common property. If the peasant brought fresh land under cultivation, he had the right of usufruct for a considerable period free of taxation, and this right he could even sell to others with the consent of the authorities. At a later period this system of land tenure became the basis for the formation of the feudal state; at that time the territorial lords claimed to stand in the position of the emperor toward the tenants, raised the taxation upon arable land from three to fifty per cent, appropriated the common land, and respected only those articles of the code which happened to correspond with their own convenience. Under this system the possessions of the temples and monasteries increased with unusual rapidity; in addition to the land which they gained by making clearings for cultivation, they acquired, notwithstanding repeated prohibitions, rich presents and legacies, which enabled the priests during the wars of the coming century to play a part by no means in consonance with their vows of poverty.

In the year 669 *Nakatomi no Kamatari* received from the emperor *Tensi*, who favoured his desires, the family name of "*Fujiwara*" (*wistaria* field, a name taken from his place of birth). His family was of divine origin: their ancestor was *Amano koyane no mikoto*. One of their forefathers had accompanied *Jimmu* on his campaign, and had received from him the daughter of a subjugated prince in marriage; another member had taken the family name of *Nakatomi* under the mikado *Kimmei* (540-571). Thus the *Fujiwara* were the oldest and most distinguished clan in the country after the mikado family. Of one hundred and fifty-five families com-

posing the court nobility (Kuges), the first ninety-five traced their descent from Kamatari, and it was from the first five of these, the Gosekke, that the mikado was obliged to choose his consort. From 888 to 1868 the office of regent and also that of daijo daijin was hereditary in this family. Its influence was further increased by constant intermarriage with the house of the mikados, the daughters of which were also almost invariably married into the same family. However, this position of almost complete supremacy which the family had succeeded in acquiring was destined to bring about the loss of its political power. In the hand of the Fujiwara the mikados were mere puppets, generally children, and often in their tenderest years. The provincial governors remained peacefully in Kioto, and sent substitutes to occupy their posts. If a shōgun was appointed to deal with a revolt of the Ainos or of some governor, he left others to do the work, and remained at court to lead the life of pleasure for which he found there all possible provision. Japanese literature centred round the court of the mikado, and in this period attained its zenith; but the period was also one of extreme luxury and unbridled immorality.

(b) *The Wars of the Taira and of the Minamoto (until 1185 A. D.).* — The real power consequently passed by degrees into the hands of those who did the work of the government. While the effeminacy of the court nobility increased, a stronger caste rose into prominence, the Bukes, who may be defined as a military nobility. The chief representatives of this caste were the two families of the Taira and the Minamoto. The former traced their descent from Takamochi, the great-grandson of the emperor Kwammu (782–806), while the latter family were descended from Tsunemoto, a grandson of the emperor Seiwa; both were originally members of the court nobility, five families of which retraced their origin to the Taira and seventeen to the Minamoto as late as the year 1868. The first serious danger with which the Fujiwara were confronted arose from a struggle for precedence against the kuge family of the Sugawara, who were no less ancient than themselves. The conflict was fought out amid the intrigues of court life, and ended with the overthrow of Michizané, the representative of the Sugawara family, who was defeated in the reign of Daigo (898–930) and sent into exile. More dangerous was the revolt of one Taira, who set himself up as emperor in Kwanto under the mikado Shujaku (931–946), and was supported by some members of the Fujiwara; the movement, however, was suppressed after a bloody conflict. The influence of the Fujiwara in Kioto remained unimpaired until the beginning of the twelfth century. The Taira were active in the south and west, the Minamoto in the north and east, where they won a great military reputation, and gathered bands of bold and predatory warriors around them. Both parties were fully occupied with wars against the Ainos in the north, and against the Koreans who had invaded Kyūshū in the south.

Meanwhile, both the Taira and the Minamoto began to acquire influence in the capital. A favourite of the emperor Toba, by name Taira no Tadamori, had a son by one of his master's concubines (or by a servant of the palace whom he married later) in 1118, whom he named Kiyomori. In the disputes concerning the succession which broke out upon the death of the emperor Konoye in the year 1155, the two chief claimants for the throne were Shutoku, a former mikado, who had abdicated in 1141, and now claimed the imperial title for his son, and Go Shi-

rakawa, one of the sons of the emperor Toba, who had abdicated in 1123. Almost all the Minamoto supported the first of these claimants, while the cause of the other was espoused by the Taira. The latter succeeded in obtaining the election of Go Shirakawa; Kiyomori, who had inherited all the dignities and offices of his father, offered to support him. In the battles between the two parties, Yoshitomo, a member of the Minamoto, also fought on the side of the Taira. The Minamoto were defeated; their leader, Yorinaga, committed suicide, while another leader, Tametomo, a renowned archer, was captured and banished. The victorious Kiyomori was rewarded with the position of daijō daijin. He now ruled as the Fujiwara had done before him. The Minamoto became the special objects of his hatred, and he persecuted them with such ferocity that in 1159 Minamoto no Yoshitomo, who had previously been on his side, declared against him. He, however, was quickly overpowered and murdered while in flight. This victory gave Kiyomori absolute predominance. His father-in-law, the mikado Go Shirakawa, who had abdicated in 1158 (see the plate, "The Abduction of Go Shirakawa in the Year 1159"), was sent into exile, and the war of extermination against the Minamoto continued. Yoritomo, the fourth son of Yoshitomo, escaped the fate of his brother owing to the pleading of the sons of Kiyomori, and was sent into exile. Three of his half-brothers, including the famous Yoshitsune, who was then an infant at the breast, were spared for a like reason. Their mother, the fair Tokiwa, a clever peasant woman by birth, who had been the concubine of Yoshitomo, saved them after they had been cut off from flight by offering herself to the victor as his concubine. Yoritomo, who had married the daughter of Hōjō Tokimasa, the man to whose custody he had been committed, raised the standard of revolt against the Taira. His first attempt ended in disaster; but he escaped to Kwanto, soon collected a force, and fortified himself in Kamakura, where the Taira did not venture to attack him. Shortly afterward (1181) Kiyomori died; his last words to his family were that the observance of the usual burial customs were to be omitted in his case, and that the only monument to be set up before his grave was the head of Minamoto no Yoritomo.

His son Munemori possessed neither the capacity nor the bloodthirsty energy of his father. He wasted valuable time in deliberation while his enemies in the north, who were joined by the remnant of the Minamoto, grew more powerful every day; their cause was also espoused by many of the Fujiwara, by the priests of Hieizan, and by the exiled Go Shirakawa. The first conflict took place in the mountains of Nakasendo, between an army of the Taira and Minamoto no Yoshinaka, whose father had also been a victim of Kiyomori. The Taira were utterly beaten in 1182, and Munemori fled from Kyoto with the young mikado Antoku. There the old Go Shirakawa greeted the conqueror upon his entry. Antoku was declared to be deposed, and Go Toba was elected emperor in his place. He appointed Yoshinaka to the post of shōgun, so that this personage now became leader of the opposition to the family of his cousin Yoritomo. Minamoto no Yoritomo sent his younger brothers Yoshitsune and Noriyori against him; they defeated him in 1184 at Lake Biwa, and Yoshinaka committed suicide. Yoshitsune availed himself of this advantage to resume the pursuit of Munemori. After a series of combats, all of which went against the Taira, a decisive naval battle was fought in 1185 at Dan-no-ura, near Shimonoseki. The Taira made a most valiant resistance, but were utterly defeated. The widow of Kiyomori drowned herself with the

## THE ABDUCTION OF GO SHIRAKAWA, FORMER EMPEROR OF JAPAN, BY FUJIWARA NO NOBUYORI IN THE YEAR 1159

The illustrations to the book "Heiji-monogatari," that is, "Narratives of the Year Heiji," have been partly lost. The picture here reproduced forms part of the illustration to the Sanjōden-Yakiuti section (the destruction by fire of the Sanjōden castle). On the ninth day of the twelfth month of the year Heiji (1159 A. D.), Fujiwara no Nobuyori, with five hundred cavalry under the field-marshal Minamoto no Yoshitomo, surprised about midnight the Sanjōden castle, where the former emperor Go Shirakawa was in residence. The emperor in terror took to flight; but Nobuyori, Yoshitomo, Mitsuyasu, Mitsumoto, and Suesane brought him back by force in his carriage to the imperial palace. Concerning the monk Keion, the painter of this picture, we have but very scanty information; however, he must have been born some twenty years after the "Heiji revolt."

(From Vol. XIV of the monthly periodical "Kokkura" (flora of the country), published in Tokio by Yamamoto, on behalf of the Kokkura-sha society; translated by Dr. Kitasato in Berlin.)

As Dr. Kitasato adds, the disturbances of the year Heiji were due to the following causes: The emperor Go Shirakawa, who had reigned from 1156, abdicated in 1158 in favour of his little son Nijo (1159-1165), but continued to govern as regent, and lived till 1192. At this period a political quarrel broke out between two court officials, Shinsei and Nobuyori, of the noble family of the Fujiwara. Nobuyori's jealousy was aroused by the preference which Go Shirakawa showed for Shinsei; he captured the ex-emperor in his castle of Sanjōden, brought him as a prisoner to the imperial palace, and murdered Shinsei, his opponent. This rising is known as the "Heiji revolt." The author of the "Heiji-monogatari" is supposed, though on no certain evidence, to be Hamura Tokinaga, who lived in the thirteenth century.

# THE ABDUCTION OF GO SHIRAKAWA, FORMER EMPEROR OF JAPAN, BY FUJIWARA NO NOBUYORI, IN THE YEAR 1159.

(From an illustration to the "Heiji-monogatari" painted by the monk Keion, about the year 1200.)

mikado Antoku, who was then five years old. Most of the Taira who did not fall in the battle committed suicide or were killed in the pursuit. A few found refuge in the remotest parts of Kyūshū, where it is said that their descendants may to this day be recognised. The utter ruin with which the Taira had once threatened the Minamoto was now dealt out to them by the enemy they had formerly conquered.

In certain respects the wars of the Taira and Minamoto are analogous to the wars of the Roses in England; the comparison can be extended to the colours worn by the Japanese parties, the standards of the Minamoto being white and those of the Taira red. The events of these wars form the subject of the most famous Japanese novels *Heike* (Chinese for Taira, peace), *Monogatari* and *Genge* (Chinese for Minamoto, source), *Konogatari*, which are to-day the delight of young and old in Japan.

#### F. THE MINAMOTO, THE HOJO, AND THE ASHIKAGA (1186-1573)

THE following four centuries of Japanese history are filled with indiscriminate fighting. Law and order are non-existent, treachery and murder are of daily occurrence, and our contempt for the faithlessness of the nobles to the mikado, the shōgun, and the regent is increased by the numerous instances of the fidelity displayed by the lower orders toward their masters. Each individual is concerned only with his own advantage and the easiest means of obtaining it. The one inspiring feature of the period is the stoical courage with which the conquered, who as conquerors were merciless, met their death,—they fell upon their own swords, after the manner of the ancient Romans.

At the outset of the rule of the Fujiwara in the eighth century the necessity became apparent, probably owing to the growing effeminacy of certain classes of the population, for the creation of a special military class (the Samurai). At an earlier period every man was a soldier, and marched out when he received his summons; now this militia was replaced by a class of professional soldiers. Instances occur at an early period of the existence of body-guards of which the military forces of the greater lords may have been composed; these, however, are purely exceptional cases. As in Anglo-Saxon England and in Europe at large during the ninth and tenth centuries of our era, the necessities of the time obliged the free peasants and often the petty nobles of Japan to place themselves under the protection of a more powerful lord, and to give up their freedom in return for the security which he could offer them. An additional piece of evidence for this fact is the argument invariably adduced by the Japanese themselves during the debates on the proposal to capitalise the incomes of the Samurai (1870-1880), that this order of nobility had originated from the peasant class in the eighth century and ought to revert to that condition. The peasant serfs, like those who voluntarily sought the protection of a lord, owed military service to this lord and not to the emperor; eventually, in view of the unbroken continuance of war, both parties, lord and peasant, found it to their advantage to draw a more definite line of demarcation between the productive and the military classes.

Similar circumstances no doubt gave rise to the great feuds. In the times when might preceded right, the regent, the field-marshal, or whoever was in power for the moment, either seized the property of a defeated enemy for himself or divided

it among his adherents. At a later period, when an increased number had been able to carve a kingdom for themselves out of the property which theoretically belonged to the emperor, when the country was divided among great and small lords, actual possession formed nine-tenths of the law, and often the whole of it; whether the possessor of land had been duly and formally invested with it was a matter of total indifference. What the sword had won the sword alone could keep. So when social conditions became more stereotyped at the beginning of the seventeenth century, the whole of the country was in possession of greater or smaller lords, who held their lands in theory from the mikado either directly, or mediately through the shōgun. The theory became practice when, upon the restoration of the mikado's power, the landed property and all the inhabitants of the kingdom were claimed as imperial possessions by the government.

For the period from the victory of the Minamoto over the Taira until the restoration of the mikado in 1868, a period of almost seven centuries, two facts are of primary importance for the internal development of Japan. First, that whereas Kioto had hitherto been the social and political centre of the country, this centre of gravity was now transferred to the northeast, first to Kamakura, a foundation of Yoritomo, and afterward to Yedo, founded by Iyeyasu. The second fact is of no less importance: during the greater portion of this period the actual power was not exercised by the bearers of the different titles of office, the mikado, shōgun, and regent, who were generally children, and sometimes babes in arms; the strings of government were pulled by relations and other personages behind the scenes. Extremely rare are the cases in which the bearer of the title plays anything but a passive part, and that, too, at a time when there was certainly no lack of vigorous and energetic men in Japan.

(a) *Yoritomo*. — The victory of Dan-no-ura was followed by the outbreak of serious dissensions within the Minamoto family, evoked by the jealousy of Yoritomo at the military success of his half-brother Yoshitsune; shortly afterward the latter was murdered by the order of Yoritomo. The personality of this most attractive of all the Minamoto has become the nucleus of a cycle of legends; some of these represent him as fleeing to the Ainos and spending long years among them, while others recognise in him the great Genghis Khan who made the Mongols the greatest nation in Asia. The most probable story says that he committed harakiri, after killing his wife and children, and that his head was brought to Kamakura, to be shown to his brother as evidence of the execution of his orders. Yoritomo himself was invested in 1192 with the title of Sei-i Tai Shōgun ("the great general subduing the barbarians"). He died in 1199. Upon his hereditary estates at Kwanto he instituted a properly organised system of government, the "Bak' fu" ("behind the curtain" which surrounds the tent of the field-marshal). This system corresponded in some respects with the military administration of the field-marshal; the incompetent provincial governors were replaced by capable subordinates of his own. Under him Kamakura became a large and beautiful town, of which only a pair of stately temples now remain, together with a large image of Buddha (the Daibuz) and the simple sepulchral monument of its founder.

(b) *The Shadow Shōguns and the Hojo Family*. — After the death of Yoritomo his father-in-law, Hojo Tokimasa, together with his widow, Masago, acted as the

guardians of Yori-iyē, who was then eighteen years of age; after a rule of four years he was deposed in 1203, sent into exile, and murdered a year later. He was succeeded by Sanetomo, a brother eleven years of age, who was murdered in 1219 by his nephew Kokio, the son of Yori-iyē. The main branch of the family of Yoritomo thus became extinct, and power remained in the hands of the Hojo family. They did not themselves assume the title of shōgun, but contented themselves with that of shikken (regents) of Kamakura, preferring to appoint children of the Fujiwara family, or of the imperial house, to the position of shōgun, and ruling under their names. Of the eight shōguns included in the period 1220–1338 six were between three and sixteen years of age at the time of their appointment; all were deposed, and two are known to have been murdered. In the family of the regents affairs were no better; eight rulers succeeded one another in the years 1205–1326, and three or four in the short space between 1326 and 1333. The family then became extinct.

The assumption of the power by the Hojos caused much dissatisfaction in Kioto. The three ex-mikados, Go Toba and his sons Tsuchi and Juntoku, together with the son of the latter, Chukyo tenno, who had been ruling from 1222, offered resistance but were overpowered; the three ex-mikados were sent into exile and there thrown into prison, while the reigning mikado was deposed. The first of the Hojo shikken or their councillors were men of high capacity. Yoshitoki (1205–1224) and Yasutoki (1225–1242) did their utmost to maintain peace throughout the country, but were forced to struggle against the parties in Kioto and the Buddhist priests, especially in Yamato, who stirred up the population against them. Tsunetoki ruled for only three years (1243–1246), and abdicated in favour of his younger brother Tokiyori (1246–1256). He also gave proof of much energy and made special efforts to improve the administration of justice. The greatest services to Japan were, however, those of Tokimune (1257–1284). After his conquest of China, Kublai Khan sent a letter by the Koreans to the mikado Go Uda (1275–1287), demanding the recognition of his supremacy and the payment of tribute from Japan. Tokimune scornfully rejected the demand. The Chinese ruler continued his diplomatic efforts, but with no greater success. The Mongols then got possession of the islands of Tsu Shima and Iki Shima, making Korea their base of operations, and attempted in 1275 to establish themselves in Kyūshū but were driven back. In the year 1279 Chinese ambassadors again arrived at Nagasaki with demands for the submission of the country, but were beheaded at the orders of the government at Kamakura. Finally, in 1281 a powerful Mongol fleet appeared off the coasts of Kyūshū. The Japanese annals are full of stories concerning individual deeds of valour. The truth appears to be that this fleet of between three and four thousand sail carrying a hundred thousand warriors, including ten thousand Koreans, was almost entirely destroyed by a typhoon, and the Japanese then made an end, without loss to themselves, of such of the crews as had been saved.

This success and the absolute power which they exercised in the kingdom tempted the Hojos to disregard the most ordinary dictates of prudence and common sense. Hitherto they had ruled with an iron hand, had deposed and appointed mikados and shōguns at their pleasure; but their measures had been actuated by desire for the national welfare; now, however, they and their officials began a course of appalling oppression of the lower classes, in order to provide them-

selves with the means for luxury and dissipation. Dissatisfaction and irritation increased, until at last in 1330 the mikado, Go Daigo, the fifth who had ruled since 1287 and himself a nominee of the Hojos, raised the standard of revolt. One of his sons, Moriyoshi, had previously attempted in 1327 to shake off the yoke which lay heavy upon the imperial house and the country, but his plan had been discovered and he was himself sent into a monastery. Upon this occasion his father was equally unfortunate; he was conquered, deposed, and sent into exile. Kusunoki Masahigé, who had revolted in Kawazi, was also defeated, but escaped capture.

The country now appeared to be bound more than ever firmly in its chains; but salvation was to come from the family of the Minamoto. Two grandsons of Minamoto Yori-ye, the great-grandfather of Yoritomo known to Japanese history as Hachiman taro, that is, eldest son of the war god), had founded two families in Nitta and Ashikaga, who now revolted against the Hojo. Nitta Yoshisada, who had formerly been in the service of the regents, allied himself with Moriyoshi (now Otonomiya) in 1333, collected his adherents and those of his family, and made a forced march upon Kamakura, before which he appeared on the fourteenth day of his revolt. Takatoki, who had himself resigned the regency in 1326, was then conducting the government for the last of the child regents. He was completely taken by surprise. The castle of Kamakura was captured after a short resistance. Takatoki and a large number of his adherents committed suicide, while the remainder were slain by the conquerors or peasants who joined in the revolt. At the same time Ashikaga Takauji, in alliance with Kusunoki, had broken the power of the Hojos in Kioto. There also all the adherents of the Hojo were slaughtered wherever they could be caught. Even at the present day in Japan the memory of the Hojos is regarded with hatred and abhorrence.

(e) *The Ashikaga.* — Upon the success of his friends the ex-mikado Go Daigo returned from exile and again ascended the throne in 1334. He appointed his son Moriyoshi as shōgun of Kamakura, and rewarded Ashikaga Takauji with Hitachi, Musashi, and Shimosa; Kusunoki Masahigé was rewarded with Setsu and Kawazi; while Nitta Yoshisada received Kozuke and Arima; many others receiving smaller possessions. Peace and unity were not, however, to endure for long. Go Daigo in Kioto and Moriyoshi in Kamakura led a life of debauchery that shocked even the carelessness of that age. A former Buddhist priest, under the pretext of seeking for the adherents of the Hojos, overran Kwanto, robbing and murdering at the head of a mob of scoundrels, until he was crucified by the orders of Takauji. Moriyoshi availed himself of the opportunity to make clamorous complaints to his father, until at last a younger brother of Takauji, Todoyoshi, revolted and proclaimed a new shōgun. At first the two brothers fought upon different sides, but ultimately they joined forces, marched together upon Kamakura, and expelled Moriyoshi. Takauji now declared himself shōgun. Go Daigo summoned his adherents, including Nitta Yoshisada, for war against the pretender. Nitta, however, after obtaining some initial success, was defeated at the pass of Hakone near Takenoshita. Takauji now marched upon Kioto, and Go Daigo fled, bearing the insignia of empire to the fortified temple of Miidera on the Hieizan, but was ultimately driven out from thence. Meanwhile, however, his adherents had collected and drove Takauji out of Kioto and Miidera, but were ultimately defeated with crush-

ing loss at Minatogowa, near Hiogo. Kusunoki Masahigé, the commander of the mikado's troops, also fell in the battle. Go Daigo fled to Miedera once more, and in 1337 Takauji appointed a younger son of Go Fushimi (1299-1301) as mikado under the name of Komiyo tenno. Ultimately the conflicting parties came to an agreement upon the terms that the position of mikado should be occupied for alternating periods of ten years by the descendants of Go Daigo and Go Fushimi. Go Daigo temporarily restored the insignia of empire, and Komiyo was crowned. Takauji became grand shōgun and consequently resided in Kioto, while his son Yosimiri remained in Kamakura as shōgun. Under the latter a shikken at Kioto dealt with the affairs of the western provinces, while a kwanrei (governor) ruled over the eastern provinces from Kamakura. However, the peace between the two parties was not destined to be permanent. In the same year (1337) Go Daigo declared himself the only legal mikado, and proclaimed his opponent illegitimate, collecting round him his adherents, the chief of which were Kusunoki Masayuki, the son of Masahigé, and Nitta Yoshisada.

Henceforward until the end of the century two mikados ruled in Japan in the south and the north, the former of whom was considered as the legal ruler, while the latter possessed the real power. Meanwhile the supporters of the southern mikado were destroyed one after the other, and in 1392 a convention was arranged providing the same conditions as the agreement of 1337. Go Kameyama tenno, the second of the southern emperors, who had been nominal ruler since 1366, resigned, and surrendered the insignia of the empire to his opponent in the north.

Takauji died in 1358, at the age of fifty-three. He was succeeded by his son Yoshimori, who abdicated in 1367; his grandson Yoshimitsu, who also abdicated in 1393, lived till 1409, and exerted a highly beneficial influence upon the government. Under him the empire enjoyed for a short space the peace of which it was greatly in need. Soon, however, dissension broke out again among the different families who had gained power and prestige in the wars of the last century. The Hosokawa, Takeda, Uyesugi, Tokuguwa, Ota, and Odawara in the north and centre of the country, the Mori in the west, the Satsuma, Hisen, and Bungo, in Kyūshū, were continually at war with one another and with other neighbours. The Ashikaga were powerless to restore peace and order until the last of them, Yoshiaki, was deposed in 1573 by Ota Nobunaga. The country was in a terrible condition; on every side were to be seen devastated fields and the ruins of formerly flourishing towns and villages. Kioto itself was a heap of ruins; all who could leave the capital had fled long since to take refuge in the camp of one of the great territorial lords. The prestige of the mikado had sunk so low that in 1500 the body of Go Tsuchi stood for forty days at the gates of the castle because the money for the funeral expenses was not forthcoming. The peasant class had been almost entirely exterminated; every peasant who had the strength had become a soldier or had joined one of the piratical hordes which raided the coasts of China, Korea, and Japan. The condition of the country may be compared with that of Germany during the Thirty Years' War, and even as the German princes of that time begged support from foreign countries, France, Spain, and Sweden, so the shōgun Yoshimochi at the beginning of the fifteenth century requested the emperor Yung lo of the Chinese Ming dynasty to grant him the title of "King of Japan," and obtained his request in return for the yearly payment of a thousand ounces of gold.

## G. CHRISTIANITY AND FOREIGN INFLUENCE IN JAPAN (1543 TO 1624)

(a) *History of the Relations between Japan and Christianity.* — It was at the close of the gloomy Ashikaga period that Europeans first came in contact with the Japanese. The actual date, which lies between 1530 and 1545, has not been established, and the names of the first Europeans to visit the country are equally doubtful. The date usually adopted is 1543. If Fernand Mendez Pinto observed any chronological sequence in the narrative of his adventures (though he is known as the "father of lies," his story is none the less deserving of serious historical examination), he at any rate can no longer claim the honour of being one of the first three foreigners to enter Japan. In any case, these early visitors, whatever their names may have been, belonged to that class of adventurers who then harassed the seas and coasts of Eastern Asia, working either on their own account or in the company of the Chinese freebooters. Shortly after the discovery of Japan, and the announcement of a good opening for trade existing in that country, a much stronger influx of foreigners must have taken place.

The trader was followed by the missionary. In 1549 Francis Xavier arrived at Kagoshima; there he met with a hostile reception, as the prince (or king, as he is termed in the chronicles) of Satsuma was enraged at the fact that the Portuguese ships had failed to appear off his coasts during the previous year; Xavier therefore proceeded to Nagato and Bungo, and from thence to Kioto, where he met with equally little success on account of the prevailing disturbances. In 1551 he left Japan with the intention of returning to India to enlist missionaries for service in Japan, but died during the voyage. However, the new field was not long without labourers. As early as 1564 seven churches and chapels existed in the suburbs of Kioto, and a number of smaller Christian communities were established in the southwest of Japan, especially upon the island of Kyūshū. In 1581 there were more than two hundred churches in Japan, and the number of the native Christians had risen to one hundred and fifty thousand. The conversion of the population continued peacefully until the death of the shōgun Nobunaga in the following year; he had openly favoured the Christians, possibly because he hoped to find in them a counter-influence to the Buddhist priesthood, which was hostile to himself. In the year 1583 the Christian princes of Bungo, Arima, and Ōmura in the island of Kyūshū, sent an embassy, consisting of four nobles, to declare their subjection to Rome. The ambassadors were received by Pope Sixtus V and King Philip II, and returned to Japan in 1591, bringing seventeen Jesuit missionaries with them.

However, in the year 1587 the first clouds began to gather above the heads of the foreign missionaries; a decree of banishment against them was issued, probably inspired by the desire of the prime minister Taikosama to secure the support of the Buddhists in his struggle for the supremacy of the country. The Jesuits, who in the Far East have always understood how to avert the dangers that threatened them and their work, by an outward show of submission closed their churches and ceased their public preaching; the process of conversion, however, continued without interruption or disturbance, and was attended with such success that during the three years succeeding this edict thirty thousand Japanese were baptized. Taikosama (Hideyoshi) seemed at first to be satisfied with this formal submission to his will; he may also have feared that the exercise of greater severity would result in

the loss of the advantage which accrued to him from the foreign trade, or would induce the Christian princes of Kyūshū to abandon his cause. But further measures were necessitated by the appearance of the Spanish mendicant friars, who came over in great numbers from the Philippines and defied his orders by preaching and wearing their priestly robes in public. The decree of banishment was revived; some churches, and the houses belonging to the missionaries, were destroyed, and finally, in 1596, six Franciscan monks, three Jesuits, and seventeen Japanese Christians were crucified at Nagasaki.

Even now, however, the prudent behaviour of the Jesuits seemed to have obviated any immediate danger. Upon the death of Taikosama, Iyeyasu, the most powerful of the leaders who were struggling for the supremacy seemed inclined to favour the missionaries; he even attempted to use the Spanish monks as a means of initiating commercial relations between the Philippines and his own domain of Kwanto (the district near Yedo). Soon, however, he found himself obliged to oppose the foreign missionaries and the native Christians. For this change of policy the latter had only themselves to blame. The Spanish mendicant friars continued to defy the orders of the government and to inspire their converts with a refractory spirit; and the insubordination displayed by the native Christians in many places occasioned serious forebodings in the government. During the period when the work of conversion was at its height, cruel persecutions of the Buddhists had been instituted in many of the districts governed by Christian princes, and in particular in Kyūshū. If these were not instigated by the missionaries, they were at any rate countenanced by them, as is plain from their narratives. For example, in Omura, after the conversion of the prince in 1562, troops were sent out to destroy all the temples and images in the district. In Amakusa, in 1577, the prince offered his subjects the choice between conversion or exile, and in many other places any one who hesitated to embrace the new religion was driven forth from house and home, no matter what his position. The victory of Taikosama and Iyeyasu over the south, where their chief opponents were settled, was followed by a fresh distribution of the principalities among new rulers. The heathen princes then began to persecute their Christian subjects, as their predecessors had persecuted the heathen. At this moment a refractory spirit of resistance was manifested by the peasant population, — a spirit unprecedented among the peasant class of Japan. A natural result was the issue of further edicts against missionaries and Christians, and, in short, against all foreigners. In the year 1606 Christianity was prohibited, and was declared in 1613 to be a danger to the constitution, perhaps in consequence of a conspiracy thought to have been discovered in 1611 in the gold mines of the island of Sado, where thousands of native Christians had been transported to undergo convict labour. It was resolved to destroy all the churches and expel all the missionaries, and the decision was carried into effect. In the year 1614 twenty-two Franciscan, Dominican, and Augustine monks, one hundred and seventeen Jesuits, and several hundred Japanese priests and catechists were forcibly placed on board three junks and sent out of the country, so that the six hundred thousand native Christians of Japan (two million, according to Japanese historians) were thus at one blow deprived of their spiritual pastors. Their position became even more serious after the battle of Sekigahara, when Iyeyasu defeated Hideyori, the son of Taikosama, as in that battle the Christian princes had been upon the losing side.

The main reason which drove the Japanese government to severer measures is to be found in the continual attempts of foreign priests to return into the country by stealth. Hidetada, the son of Iyeyasu, who had succeeded him in 1616 (or 1615), issued a decree in 1617 that all foreign priests found in Japan should be put to death, a penalty to which they had been previously subjected upon one occasion only (1596). In the year 1617 foreign trade was limited to Hirado and Nagasaki; in 1621 the Japanese were prohibited from leaving their country, and in 1624 all strangers, with the exception of the Dutch and Chinese, were sentenced to expulsion, though the latter edict was not fully carried out until fifteen years later. Meanwhile the persecution against the native Christians continued. Thousands were crucified, burnt, drowned, or otherwise martyred, though, as was to appear more than two hundreds years later, Christianity was never entirely exterminated by this means.

In December, 1637, a revolt broke out in Kyūshū, which, though but indirectly connected with the Christian movement, resulted in a renewal of the persecution with increased severity. The revolt began with a rising of the peasants of Arima, who had been driven to despair by the repeated imposition of fresh taxation and by other oppressive measures; they were soon joined by all the Christians who remained in the neighbourhood. According to the Dutch narratives written at the time, the rebels wore linen clothes, shaved their heads, and destroyed the heathen temples, and had chosen Sant Jago as their war-cry. After a vain attempt to storm the castle of the daimyō (prince) of Amakusa, they established themselves in the peninsula of Shimabara, and there offered a heroic defence, both against the forces of their overlords, the princes of Arima and Amakusa, and against the troops of the government, until they succumbed to superior numbers after a desperate struggle on April 16 and 17, 1638. Seventeen thousand heads are said to have been exposed as tokens of victory, and probably very few escaped of the thirty-five thousand men who are said to have taken part in the revolt. On April 25 the overseers of the Portuguese factories were imprisoned, as they were considered to blame for the revolt. On August 22 the Portuguese galleys were forbidden to approach Japan under pain of death, and on September 2 the last Portuguese were banished from the country, and took with them their overseers, who had remained in imprisonment up to that time. On May 11, 1741, the Dutch, the only Europeans remaining in Japan, were ordered to remove their settlement to Nagasaki, whither the Chinese were also sent. Thus for the moment the first period of contact between Japan and European Christianity came to an end; it had lasted for nearly a century.

(b) *Reasons for the Rapidity of the Establishment and the Fall of Christianity in Japan.*—The conditions of Japanese life during the second half of the sixteenth century and the first fifteen years of the seventeenth century are the best explanation of the rapidity with which the pioneers of religion and trade succeeded in gaining a footing in the country. The land was torn by dissension and war, which had utterly destroyed the economic prosperity of the middle and lower classes of the population. From the two native religions no consolation could be derived. Shintoism had become a mere mythology, and in any case had never taken hold upon the sympathies of the people; Buddhism had lost its vitality, and had replaced it by the doctrine that prayer and priests alone could provide

help and salvation from the dangers which threatened the soul in its wanderings after death. Moreover the priests were far too busily concerned with the political questions of the day to bestow attention and sympathy on the sufferings of the lower classes, and hence the Christian missionaries found numerous converts from the very outset; to the poor and miserable they promised immediately upon their death the joys of that paradise of which the Buddhists only held out a prospect after long trials and vicissitudes. By the splendour of its services, by its numerous and mystic ceremonies, in which the converted were themselves allowed to take a part, Christianity defeated its adversaries on their own ground.

A material reason for the first success was also the fact that the introduction of Christianity was entrusted to the Jesuits; the mendicant orders are largely to blame for the ultimate collapse of the work of conversion. Pope Gregory XIII, in a bull of January 28, 1585, gave the Jesuits the exclusive right of sending out missionaries to Japan. On December 12, 1600, Clement VIII extended this permission to include the mendicant orders, upon the condition that they should take ship in Portugal and go to Japan by way of Goa. On June 11, 1608, Pope Paul V extended this permission to mendicants who should go to Japan by way of the Philippines. In most cases the members of the mendicant orders had not waited for the pope to grant them the permission which they had requested; they went to Japan without, although by so doing they incurred the greater excommunication (*excommunicatio major ipso facto incurrenda*). This proceeding gave rise to unseemly quarrels among the missionaries themselves, and further contributed to undermine their prestige in the eyes of the unfriendly Japanese. Moreover, the procedure of the mendicant orders during their work of conversion in Japan differed greatly from that followed by the Jesuits. The latter did their best to accommodate themselves to the views, wishes, and orders of the Japanese authorities, whereas the Franciscans, Dominicans, and Augustines continually defied the authorities and declined to make any such sacrifice of the external or the non-essential as might have enabled them to attain their object.

At the same period political dissensions broke out between the Portuguese and the Spaniards, which were rather increased than lessened by the union of the two kingdoms (1580). Since the date of the first entry of the Portuguese into Japan the power of Portugal and the prestige of her emissaries had steadily declined; the revolt of the Spanish Netherlands, the wars between England and Holland, and the downfall of the Spanish power under Philip II and Philip III, enabled the Japanese authorities to attempt during the seventeenth century what they could not have dared in the sixteenth. Moreover, the behaviour of the foreign merchants and mariners was not calculated to arouse the respect or the good-will of the Japanese. The foreign trade certainly brought a great increase of wealth to the princes of the country, but this again was a continual source of jealousy and of friction between them, as each was anxious to secure the lion's share for himself, and to use it for the purpose of gaining some advantage over his neighbours. After a strong central government the shogunate of Iyeyasu had been set up; this again naturally attempted to secure control of the trade, and to exclude those who had previously been its rivals and were now its subjects. The different nationalities who traded with Japan, the Portuguese, Spaniards, Dutch, and English, damaged their reputation by continually accusing and slandering one another to the Japanese, and by lodging complaints with them concerning goods and ships of which they

had deprived one another. The continual quarrels between the foreigners in Japan, and the condescension with which they treated the natives, are sufficient explanation of the dislike which the proud Japanese conceived for them in the course of a few years.

An additional and a justifiable reason for dissatisfaction was the slave trade carried on by all the foreigners in Japan, and particularly by the Portuguese. Civil war, the expedition against Korea, and the growing poverty of the lower classes had brought so many slaves into the market, that, as Bishop Cerqueira relates, even the Malay and negro servants of the Portuguese traders were able to buy Japanese or Korean slaves upon their own account, with the object of afterwards selling them in Macao. Both the civil and ecclesiastical authorities in Macao (Bishop Cerqueira in 1598 and his predecessors) had made vain attempts to suppress this trade in human flesh, which was undoubtedly the strongest ground of complaint possessed by the Japanese; in 1621 the authorities of Japan forbade the export of hired or bought natives without special permission, and prohibited it at a later period under the severest penalties.

(c) *The Mode of Procedure against the Foreigners adopted by the Japanese.*—The unprecedented enthusiasm of the Japanese converts became a serious anxiety to the rulers of the country, and inclined them to suspect some political object behind the religious zeal of the missionaries; hence their determination to put an end to foreign trade by the destruction of Christianity was received with unanimous approval by the whole country. Moreover, the government had taken special care to lower the prestige of the foreigners in the eyes of the population, and to deprive them of their influence by a series of regulations extending over a number of years. In 1635 the Portuguese were forbidden to walk under an umbrella carried by a Japanese servant, or to give alms beyond a minimum sum. At the same time they were ordered to take off their shoes upon entering the council chamber; and in that year all of them, except the overseers, were forbidden to carry arms, and were obliged to dismiss their old servants and to take new ones. The Dutch were forbidden to employ Japanese servants for the future, except within their houses. In 1638 a Dutch ship-captain was beheaded. In 1639 all Japanese women living with Dutch or English were banished, and Japanese women were forbidden to contract marriages with the Dutch. In 1640 a steward was executed for adultery with a Japanese woman. Two white rabbits found on a ship called the "Gracht" did not appear upon the list of living animals which had to be provided, and the captain was consequently deprived of his office. The Dutch factories in Hirado were searched for ecclesiastical articles, and the Dutch were ordered to pull down all buildings which bore a date upon their walls. The imperial decree ran as follows: "His Imperial Majesty [that is, the shōgun] has reliable information that you are Christians, even as the Portuguese. You celebrate Sunday, you write the date Anno Domini on the roofs and gables of your houses, you have the Ten Commandments, the Lord's Prayer, the Creed, the Cup and the Breaking of Bread, the Bible, the Testament, Moses and the Prophets and the Apostles,—in short, everything. The main points of resemblance are there, and the differences between you seem to us insignificant. That you were Christians we have known long since, but we thought that yours was another Christ. Therefore his Majesty gives you to know through me," etc. In

1641 the decree was issued that the Dutch were no longer to inter their dead, but to bury them at sea four or five miles away from the coast. This decree was executed for the first time on August 29, "because a Christian corpse is not worthy of burial in the earth." In the next year the Dutch cemetery in Hirado was destroyed. The Dutch and the Chinese were indeed allowed to remain in Nagasaki; but this permission was given because they were the sole medium for the importation of certain necessary goods, and had also made themselves useful by providing timely information of the proposals that other powers might make against Japan. In other respects the members of both nations were treated little better than prisoners.

(d) *The Situation since the Reopening of Japan to Foreign Nations.* — When Japan was opened to foreign trade during the years 1854 to 1858, the Catholic missionaries, who once again had followed in the footsteps of the trader, found remnants of a former Christian community existing in Nagasaki in the village of Urakami, though it was thought that Christianity had long been exterminated as a result of cruel and continued persecution. The attention of the Japanese government was drawn to this case by the imprudent action of the missionaries. In the year 1867 seventy-eight of these native Christians were imprisoned, and the attempt was made to induce them to abjure their faith by threats. Owing to the efforts of foreign representatives, especially those of the French ambassador, M. Roehes, the prisoners were set at liberty upon the promise that the missionaries would abstain from any attempt at proselytising outside the settlement. Hardly, however, had the mikado begun the reconstituted government of 1868 than the persecution of these people and their coreligionists was resumed, and the prohibitions against this evil Christian sect were again enforced. More than four thousand native Christians were imprisoned, and, notwithstanding all the efforts of the foreign representatives, were sent in small bodies to hard labour upon the estates of different territorial princes. It was not until 1873 that it became possible to procure their liberation, and the removal of the prohibitions issued against Christianity. From that date missionaries have been allowed a free hand within those limits imposed upon all foreigners. The chief obstacle, however, to their efforts is the strongly developed national feeling of the Japanese; besides this, there is undoubtedly a widespread dislike of the foreign missionaries, who are often considered merely as the political agents of the country which sent them out. In particular, Japanese self-consciousness, even under the form of new Shintoism, has found a useful lever in the elevation by the missionaries of God, Jesus, the pope, the Church, and the Bible above the mikado. In any case, this "Japanese self-concentration," however modified by individual feelings and opinions, has hitherto proved the greatest obstacle to the spread of Christianity; the various successful attempts even of the Japanese Christians to break away from the influence of foreign missionaries, and from connection with them, are to be ascribed to this source. If there is any hope for the Christianising of Japan, the movement must first be founded upon a Japanese basis (cf. below, p. 57).

## II. THE PERIOD OF THE PARVENUS (1573-1600)

(a) *Nobunaga.* — The fall of the Ashikaga family was brought about by the action of its own adherent, Ota Nobunaga (p. 11). This youth was descended from

a grandson of Taira no Kiyomori, who had been secretly left in charge of the magistrate of the village of Tsuda by his mother when in flight before the soldiers of the Minamoto; shortly afterward the magistrate handed him over to a Shinto priest from Ota, living in Echizen, who adopted him as his son. The boy grew up, entered the profession of his foster father, and founded a family from which in 1533, nearly four hundred years later, Nobunaga was born. The immediate ancestors of the latter had taken an active share in the disturbances of the period: his father, Ota Nobuhide, who died in 1549, bequeathed to him possessions of considerable importance. The son entered the service of the Ashikaga, and succeeded in adding to his hereditary property, until he found himself in possession of six provinces and the capital of the country. Among his servants were included Kinoshita Hideyoshi and Tokugawa Iyeyasu (Minamoto), two men who were to play a great part in the future history of Japan. In 1574 Nobunaga quarrelled with the Ashikaga, marched against them, and defeated the shōgun Yoshiaki, whom he captured and deposed. This event ended the dynasty of the Ashikaga. As he was not himself descended from the Minamoto, he could not be shōgun, and therefore governed under the title of *naidaijin*. Of his struggles against the Buddhist monks and the preference which he showed to the Christians we have already spoken (p. 24). His rule lasted but a short period (1574–1582), too short to enable him to restore peace to his country. The battles against the powerful princes in the west of Hondo and in Kyūshū continued uninterruptedly, and while Hideyoshi was leading the greater portion of the troops of his master against Mori in the west, Nobunaga fell a victim to treachery. He had insulted Akeshi Mitsuhide, one of his generals; this leader, who had been despatched with the remainder of the troops upon another expedition, suddenly halted under the gates of Kioto, invited his soldiers to revolt, entered the town with them, and surrounded the temple of Honnoji in which Nobunaga had established himself. Surprised by the appearance of so many soldiers, Nobunaga opened a window in order to inform himself of the state of affairs; an arrow struck him in the arm, and seeing that his cause was lost he committed suicide after commanding the women of his company to flee and setting the temple on fire. The traitor assumed the title of shōgun, but twelve days later was defeated by Hideyoshi, who had hurried to the spot, and slain while in flight.

(b) *Hideyoshi*. — Hideyoshi was the son of a peasant, and was born in 1536 at Nakamura in Owari. At an early age he enlisted in the service of Nobunaga, under the name of Kinoshita Tokichiro. Here he quickly gave proof of bravery and military skill, and eventually became the most capable and trustworthy general of Nobunaga. At the time of the attack upon the latter he was opposing the troops of Mori in company with Nobunaga's son, Nobutaka; with him he quickly came to an agreement, and was thus enabled to turn his steps to Kioto with the success we have already described. Of the three sons of his former master, one was already dead, leaving behind him a son, who nominally continued his grandfather's rule from 1582 to 1586 under the name of Samboshi. The second son was now with Iyeyasu, who was pledged to prevent any outbreak on his part. The third son, Nobutaka, entered into alliance with a brother-in-law of his father, by name Shibata, who was in possession of Echizen, but was unable to make head against Hideyoshi. He was defeated, and his ally was also overpowered in Echizen by the pursuing enemy. The narrative of the death of Shibata is one of the most impres-

sive incidents among the many moving events of Japanese history. Besieged in his castle at Fukui with no hope of relief, Shibata resolved to die. He invited all his friends and adherents to a feast, at the conclusion of which he informed his wife, the sister of Nobunaga, of his determination, and gave her permission to leave the castle and save her life. The proud woman, however, declined to avail herself of the opportunity, and demanded to be allowed to share her husband's fate. Shibata and his comrades then slew their wives and children, who thanked them that they had thus been privileged to die with them, and then committed hara-kiri. All were buried in the ruins of the castle, which they had previously set on fire.

Hideyoshi succeeded in restoring peace and order to the country, though at the price of a severe struggle. Iyeyasu was ruling in Kwanto, with which he had been invested by Hideyoshi, and is said to have built himself a capital in Yedo on the advice of Hideyoshi. Possibly the political recollections and sympathies of the latter made it, in his opinion, far more desirable to have the powerful Minamoto, who had been subdued only at the cost of a long struggle, resident in Odawara, the headquarters of the shōguns subsequent to the destruction of Kamakura. Between Iyeyasu and Hideyoshi there existed a general understanding, which was, however, modified by their mutual suspicion. The former, for instance, declined to go to Kioto to have an audience of the mikado until Hideyoshi, who was staying in the town, had handed over his mother as a hostage. The most important prince in the west, Mori of Nagato (Choshū), had also made submission to Hideyoshi; and the most powerful prince in Kyūshū, Shimazu of Satsuma, who had made himself almost absolute master of the island after long struggles with Riuzogi of Hizen and Otomo of Bungo, was utterly defeated after a campaign of many vicissitudes, in which Hideyoshi himself was ultimately obliged to assume the command (1586 to 1587). Why Hideyoshi did not entirely destroy this most powerful and restless of his opponents is a doubtful point. He allowed the son of the conquered man, who was forced to abdicate and to accompany the victor to Kioto as a hostage, to remain in possession of his father's territory, alleging as a reason for this clemency that he did not wish to exterminate their ancient family. This, however, seems an extremely unlikely motive in the case of so practical a politician as Hideyoshi. It is more probable that he hoped by the exercise of kindness to gain the gratitude of the prince of Satsuma and of his father, and then to use them as a counterpoise to the other princes of the south and west.

As soon as peace was restored throughout the kingdom, Hideyoshi proceeded to attempt the great ambition of his life, which he is said to have entertained from early youth, — the conquest of Korea and China. In 1592 he had demanded of the king of Korea the tribute which had formerly been paid to Japan. At a later period he had required that Korea should form his first line of defence in his war against China, where the Ming dynasty was in power. Upon the rejection of these demands, he sent an army of nearly two hundred thousand men against Korea in the spring of 1592. His first successes were as rapid as they were sweeping. Eighteen days after his landing at Fusan, Seoul fell into the hands of the Japanese. The army speedily advanced to the Tai-dong-gang and overpowered the town of Phyang-yang, situated on the northern bank of that stream. At this point, however, his advance was checked partly by the difficulty of obtaining supplies, but chiefly owing to the fact that the Japanese fleet which was to cover his further

advance had been defeated by the Koreans. Shortly afterward the Chinese forces appeared, which the Koreans had begged might be sent to their help. The plans of the Chinese were also favoured by the jealousy existing among the Japanese generals, one of whom, the Christian Komishi Yukinaga, was at the head of a column formed entirely of Christians, while the other, Kato Kiyomassa, was a Buddhist and hostile to the Christians. Almost a year after the capture of Seoul, the Japanese were obliged to evacuate the town, which was not re-entered by a Japanese force for another three hundred years (1894).

Military operations and negotiations between Kioto and Peking occupied the period ending with the year 1596. Upon the failure of the negotiations, Hideyoshi sent additional reinforcements to China in the year 1597, while the Chinese also sent out another army which advanced far beyond Seoul. Fortune at first favoured the Japanese. In October they had again advanced nearly to the walls of Seoul; but a second victory of the united Chino-Korean fleet and a threatening advance of the Chinese again obliged them to retreat, in the course of which operation they utterly devastated the country through which they passed. The Chinese pursued their retreating enemy to Urusan, where the beaten Japanese army took refuge. The Chinese made vain attempts to capture the fortress until the 13th of February, 1598, when a Japanese division relieved their besieged compatriots. With that event the great war ended. A few unimportant skirmishes followed, but Hideyoshi, who died on the 8th September, 1598, recalled the expedition upon his deathbed. The only outward token of success was the Mimizuka (the hill of ears), a monument erected near Kioto, under which the noses and ears of 185,738 slaughtered Koreans and of 29,014 Chinese are said to have been buried.

Whether Hideyoshi was actuated solely by the motives by which he declared himself induced to attack Korea, or whether he was also attracted by the possibility of providing occupation for the disorderly elements in the country, and weakening the military power of the Christians, is a question which must remain undecided. During his reign numerous prohibitions were issued against Christian teachers and proselytes, but at the same time he continued the policy of Nobunaga against the Buddhist monks and destroyed their monastery of Kumano among others. He is certainly one of the best known figures in Japanese history. Even at the present day he is an object of general reverence to all classes of the population, and no doubt his Korean expedition largely contributed to increase his reputation. But his government was a period of prosperity for the country in other respects. Acting in the name of the emperor, he gave full support to law and justice, and in many branches of the administration he not only established order, but effected great improvements by new laws and regulations. We may presume that the attempt of his successor Iyeyasu to reduce the country definitely to peace and order would have proved fruitless without his preliminary labours. It is customary at the present day to utter reproaches against the dynasty of the Minamoto shōguns, but at the same time we must not forget that they gave the country more than two hundred and fifty years of peace after centuries of war and consequent disruption.

Hideyoshi appears in Japanese history under different names. We have already mentioned that (p. 30) under which he first entered the service of Nobunaga. While a general he was known by the name of Hashima, and afterward the mikado conferred upon him the name of Toyotomi. He is, however, best known as Taikosama, the title usually assumed by the kwambaku upon laying down their

office. He could not hold the title of shōgun, as he did not belong to the Minamoto family, who for nearly four hundred years had been the exclusive possessors of this dignity. However, at an advanced age he procured his adoption by one of the Kugés belonging to the Fujiwara family, and was thus able to take the position of kwambaku (prime minister). Like other great men, he was known by a number of nicknames, such, for instance, as Momen Tokichi, that is, cotton-wool Tokichi, as he was useful for every purpose, like cotton wool. After he had obtained the dignity of kwambaku he was known as Saru kwanja, the crowned ape, on account of his ugliness. Notwithstanding his high position and the great honour in which his name is held, his burial place in Kioto is unknown.

(c) *The Victory of the East (Iyeyasu.)*—According to the Japanese custom, Hideyoshi resigned the post of kwambaku in 1591 in favour of his son, but continued to exercise the actual power. Before his death he married his son, who was six years old (or his adopted nephew?), Hideyori, to a granddaughter of Iyeyasu, thinking thereby to secure the support of this most powerful of the imperial princes. He appointed five councillors of the kingdom as regents. However, the actual government was in the hands of the mother of the heir, a woman of extraordinary beauty and energy. The peace that had been established was not destined to endure for long. It is by no means certain who was the first to break it. The ambition of Iyeyasu, who, like other nobles, had been obliged to acknowledge the capacity of the father, but despised the son, may have been the occasion of an open rupture. The outbreak of the war, which was in any case inevitable, may also have been precipitated by the regent's fear of the actual or supposed plans of Iyeyasu. The fact that the most powerful princes of the west and the south, especially Mori and Shimazu (p. 30), were on the side of Hideyori, no doubt strongly contributed to induce Iyeyasu, the champion of the east, to take up arms.

After long preparations and petty conflicts in different places, in which Iyeyasu displayed both greater power and more patient forbearance, matters came to an open rupture in 1600. In a battle fought at Sekigahara on Lake Biwa, not far from Kioto, Iyeyasu utterly defeated the allies, partly with the help of treachery, and followed up his advantage with unexampled energy. Osaka and Fushimi, which had been strongly fortified by Taikosama and formed the key to Kioto, fell, one after another, together with the capital itself, into the hand of the conqueror. Many of the hostile leaders committed hara-kiri; others, who declined as Christians to commit suicide, were publicly executed; the remainder were forced to submit; while those who favoured Iyeyasu were bound more firmly to his cause by gifts of land and marriage alliances. Notwithstanding this great success, Iyeyasu left Hideyori in possession of his position and dignities, and merely limited his income by imposing upon him the duty of erecting castle buildings and other expensive undertakings. The newly discovered gold mines in Sado provided him with rich resources for the execution of his further plans. In 1603 Iyeyasu was appointed shōgun. However, he soon abdicated, and procured the appointment of his son Hidetada to this dignity in 1605, retaining the actual power in his own hands. Hidetada resided in Yedo, while Iyeyasu kept watch upon his opponents from Suruga. In 1614 a new conflict broke out, the result, no doubt, of the growing popularity of Hideyori. Iyeyasu and Hidetada made an attack upon Osaka, the

residence of Hideyori, apparently without success. After concluding the pacification they marched back toward Kwanto, but suddenly wheeling round, reappeared before Osaka, and took the town after a short struggle, being aided by treachery within the walls. During the storming of the fortress, Hideyori disappeared; Iyeyasu himself, who had been wounded during the operations, died in the next year (1615). The lords of the east had now definitely conquered the west, and the advantage thus gained they were enabled to retain until the restoration of the mikado government (1868; cf. p. 49).

#### (J) THE ORIGIN AND DEVELOPMENT OF FEUDALISM

(a) *Anterior to the Year 1615.* — Feudalism in Japan is usually considered to have originated in the year 1192, when Yoritomo abolished the imperial civil governors (Kokushu), who had been previously drawn from the Kugés (court nobility); and replaced them with military governors (shugo, protectors) belonging to the Buké class. However, the actual beginnings of this organisation must belong to that period toward the close of the ninth century, when the family holdings of the peasants (that is, under the system of vassal tenure under taxation created by the Taikwa reforms; cf. p. 16) were replaced by the great estates, exempted from taxation, of the Shoyo and Denyo owners. The former of these systems originated in grants of land to those by whom it had been brought under cultivation, the latter in the arbitrary appropriation of government lands by the governors and their subordinate officials. From the tenth to the twelfth century, as Fukuda observes, the Shoyos absorbed the larger proportion of all the landed property; the country became the freehold property of the occupants, who were independent of the provincial governors and exempt from taxation. These inhabitants were known as Ryoshu (territorial owners) or Honjo (owners of hereditary estates); they usually lived in Kioto, or upon their ancestral property, and handed over the administration of their estates to shoshi, or bailiffs. The territory subject to the governors (kokuga) passed through a similar stage of development. These officials and their subordinates, like the Kugés of Kioto, absorbed the peasant holdings, bought up the properties held by families in common, and possessed themselves of the common forests and meadows, which thus became private denyo possessions. The right of administering justice was usually concurrent with possession; the consequence was that not only the income of the emperors, that is, the government, but also their judicial powers, were greatly restricted, and what they lost the great landowners gained.

During the following centuries, which were occupied by continual civil war, this condition of affairs was naturally considerably extended. Toward the end of the sixteenth century the whole country was in the hands of great territorial lords, who, whatever their position, had risen from the military order, and to whom, instead of to the emperor, the peasants were responsible for the payment of taxation and the performance of labour services. Where individuals of importance gained and exercised high powers, the smaller owners within the boundaries of their property, or within their sphere of influence, were dependent upon them. Hence at the outset of the seventeenth century two lines of feudal relation had been formed: there was the theoretical relation of the great owners to the helpless emperor, and the practical dependence of the smaller owners upon their powerful

overlords. Of the latter character was the connection of the members of the Samurai (military and noble) classes with their masters, though here again a further subdivision existed, according as a dependant was invested with the possession of land, or only received pay, usually made in rice; he performed service according to his rank, either alone or with a following of his adherents, either in the cavalry or as a foot-soldier. Cavalry service in Japan, as in all feudal States, was considered the more respectable, and carried with it the further distinction of permission to ride on horseback in times of peace.

(b) *Under Iyeyasu and his Successors.* — Such was the general condition of affairs when Iyeyasu became powerful enough to establish the main features of his administration. In general he introduced but few reforms, and contented himself with accommodating the existing system to the necessities of his government, and with making numerous changes in the possessions held by the territorial lords; he transferred them from one province to another, according as he desired to reward or to punish them, a change which carried with it diminution or increase of revenue. Officials in immediate connection with the empire were alone excepted from this measure. Hideyoshi had already cleared the way for these changes by his distribution of the landowners into three classes: these were the Kokushu, the owners of a province at least; the Ryoshu (landed owners), in possession of land bringing in a yearly revenue of one hundred thousand koku or more of rice (a koku equals one and eight-tenths hectolitres); and the Yoshu (the owners of castles whose property brought in an annual income of less than one hundred thousand koku). Territorial owners were known as Daimyos (landed lords), a title which, however, properly belonged to the first two of these classes. The Kokushu became the military governors of Yoritomo; after the fall of the Hojo family (about 1333), the title formerly appropriated to the civil governors had been assumed by them, though their relation to the emperor had been in no way altered by the change; when for a short period the government returned to the hands of the emperor and the Kugés, the friendly treatment then meted out to this class was of an illusory nature, possessing no practical value.

Iyeyasu added two additional classes — the Hatamoto and the Gokenin — to the three already existing. The Hatamoto, who numbered apparently two thousand, possessed different positions and incomes, some being small landed owners, while others were paid yearly incomes in rice by the shōgun: of the former, seven were placed upon an equality with the Daimyos, in so far as they were obliged to reside alternately in Yedo and upon their property, whereas all the others were forced to remain permanently in Yedo. The Gokenin, about five thousand in number, received a small salary, and were employed to fill low official posts under the shōgun. Next in order to these came the common Samurai.

Very similar was the condition of the larger territorial owners, since they also had a number of vassals in direct dependence upon them. Generally speaking, the organisation of these private vassal-trains was as follows: In the first place, the Karos, who often bore the title of minister, were almost invariably in possession of land within the district of their lords, who could summon them with their contingents to war. In the case of certain territorial owners, Iyeyasu seems to have appointed Karos, and to have sent them into their territory, apparently with the object of thus keeping watch upon the lords and bringing pressure to

bear upon them in case of necessity. The Samurai were either in possession of land or received an income of rice, the former of the two positions being the higher esteemed. They usually dwelt under the prince's roof, or in close proximity to his castle. Many of these territorial owners, upon their transference to other districts, were unable to take with them a large proportion of their adherents, but they often found numerous Samurai upon the spot who had lost their former lord or had been unable to depart with him. From these people (Goshis) a kind of provincial militia was formed, the eldest son of a family inheriting the name, rank, and property of his father, while the other children remained upon the level of the common folk. The Goshi was allowed to sell his name, his position, or his land, with the permission of the overlord. If he sold only a portion of the latter, he retained his name and his rank; he lost both upon the sale of his whole property. The Goshis were allowed to possess horses, and were often people of influence and position; the common peasants were their servants. Upon the restoration of the mikado dignity they alone retained their landed property, since it was assumed that they had not received it from the Tokugawa, but had been in occupation from the remotest times (cf. above, p. 19). Intermediate between the Samurai and the common peasants were the Kukaku, a kind of inferior country nobility who received a yearly income of rice and wore two swords, were not allowed to ride, and lived on the borders of the capital or in the country.

The peasants paid their taxes to their overlord, the Karo, or the Samurai, to whom their land had been assigned, but he was not obliged to transmit such payments to the territorial owner. The peasants do not seem to have been absolutely in the condition of serfdom. In cases of gross idleness they could be removed from their property, which they could also sell under certain conditions; in time of war they served only as workmen or carriers. The unit of peasant society was the village, or mura, which usually consisted of fifty men (families), divided into ten groups of five members. Taxes were neither assessed upon nor paid by individuals; a fixed amount was debited against the village, and the inhabitants were collectively liable. Every peasant possessed his own house and arable land; but pastures and grazing lands were common property, while forest and moor land belonged in most cases to the overlord.

When Iyeyasu took up the government, eighteen Kokushu were in existence. In due course these were increased by the two princes of Kii and Owari, thirty-two Ryoshu, and two hundred and twelve Yoshu. He introduced, however, another distribution of the territorial owners. There were seventy-five Tozama appointed on an equality with the princes (apparently the earlier of the crown officials). All others were entitled Fudai (for a long period a term of courtesy, or with the meaning, old servants); they were invested with their possessions by the shōgun, and were allowed, or probably obliged, to take up positions under government. For this system of division Iyeyasu himself gave as a reason that the Gofudai were the class of owners who had supported him before the capture of the castle of Osaka in 1603, while the Tozama had only submitted to him at a later period.

Of still greater importance was the distribution of the territorial owners, the Hatamoto and the officials, into councils, in which they deliberated apart when summoned by the shōgun. The names of these deliberative bodies, derived either from the names of their meeting chambers, or from those of their component members, were as follows: (1) Oroka: nine princes of the Tokugawa family and the

prince of Kaga, the richest and most powerful of the Kokushu. (2) Ohiroma: twelve princes of the Tokugawa family and seventeen Kokushu. (3) Tamarinoma: the seven most distinguished Gofudai, six from the family of the Minamoto no Yoritomo, and one, Ikamon no Kani, from the Fujiwara family. (4) Ganaginoma: seventy-five Tosamma. (5) Tekanoma: sixty-seven Gofudai. (6) Ganoma: forty-three Gofudai. (7) Kikunoma: thirty-one Gofudai. (8) Fudionoma: the Hatamoto and officials of the rank of the Bunyo or governors. (9) Nokonoma: officials who had been invested by the mikado with the title of Hoi, the sixth in rank at the imperial court. (10) Kikionoma: subordinate officials. (11) Takiminoma: inferior officials above the rank of the Kumi gassira, vice-governors, and Narui, vice-inspectors. These chambers were summoned when any important questions arose. They arrived at their decisions in isolation by a majority of votes, and the question at issue was ultimately decided by the vote of the majority of the chambers. However, the government seems to have paid special attention to the views of the Tamarinoma, and to the chambers composed of the Hatamoto and the officials. Current business was transacted by committees composed of such members of individual chambers as were present in Yedo.

The relations of the mikado and the Kugés to the empire were so arranged that while they retained all their titles and prerogatives, they lost every vestige of influence and power. The income of the imperial court and of the Kugés was reduced as much as possible, and they were almost entirely excluded from connection with the outer world. One hundred and thirty-seven Kugés with five titles of the second class and twenty-seven of the third class had a yearly income of about 42,500 koku, whereas two hundred and sixty-three Bukés, including the shōgun, though possessing only one title of the second and four of the third class, had a yearly income of 30,000,000. The revenue of the imperial court was established in 1615 at 10,000 koku, and gradually increased to 120,000 by the year 1706. In 1632 the yearly incomes of all territorial lords amounted to 18,700,000 koku, while the income of the shōgun house, derived from its immediate property, amounted to 11,000,000. Iyeyasu issued several proclamations, particularly the so-called Eighteen and One Hundred laws, the first of which deals particularly with the relations of the shōgun to the imperial court, and the latter with the position of the shōgun to the territorial lords, the Samurai, and the people. These manifestoes explained that the larger incomes of the Buké class carried with them the obligation of greater services to the State, whereas the Kugés were allowed to expend their smaller revenues exclusively upon themselves. Beyond this the Bukés were obliged to provide cavalry in proportion to one-half of their revenue, at the rate of five men to every thousand koku, so that a lord with a total income of 200,000 koku provided five hundred cavalry in case of war.

To understand the Japanese constitution at this time is only possible when we take into account the theory on which Iyeyasu defended the virtual deposition of the emperor and of the Kugés, and the transference of the power to the shōgun and Bukés. "According to an old doctrine of the country of the gods (Japan), the gods are the genii of the heaven, as the emperors are of the earth. The genii of the heaven and of the earth can be compared with the sun and the moon. And for the same reason that the sun and the moon fulfil their course, so must the emperor keep his noble heart unharmed. For that reason, he lives in his palace as in heaven; indeed, corresponding to the nine heavens, the palace contains nine sets

of rooms with twelve gates and eighty chambers; moreover, his insignia are the ten virtues, and he is lord of ten thousand chariots (in China the emperor marched out to war with ten thousand chariots). Every day he is to pray to heaven that he be an example to the country in philanthropy, the love of his parents, intelligence, and economy; he shall also be assiduous in the practice of science and the art of writing. By such means the lofty virtue of the emperor is spread abroad, so that the faces of his subjects be not overspread with the colour of grief, and that peace and happiness rule everywhere within the four walls." (The Eighteen Laws, No. 1.) "As the office of overseer of the two court schools in Kioto (this official, with others, regulated etiquette at the imperial court) has been transferred to the shōgun, the three Shinno (imperial princes), the Shikke (families in which the highest dignities were hereditary), the Kugés, and the territorial lords, are collectively subordinate to him. By his orders he regulates all duties owed to the State, and in State questions he may act without the emperor's assent. If the country between the four seas is not at peace, then the shōgun shall bear the blame." (The Eighteen Laws, No. 2.) "In ancient times the emperor was wont to make pilgrimages to different temples, and this in order that he might become acquainted with the sorrows of his people upon the way. Now, however, the emperor has reformed the government, and entrusted it to the Bukés. If these be unaware of the miseries of the people, the shōgun shall bear the blame. Therefore the ruling emperor shall no longer leave his palace, except when he betakes himself to visit in his palace the emperor who has abdicated." (Eighteen Laws, No. 4.) "With Minamoto no Yoritomo, who governed as Hao (the helper of the emperor), the supremacy of Japan has passed to the hands of the Bukés. As the Kugés carried on the government carelessly, and were unable to maintain order in the country, all that could be done was for the emperor to order the Bukés to take over the ancient government. But with inadequate revenues it is impossible to govern a country, to feed the people, and to perform the public services. Thus the Kugés would commit a great wrong should they seek to detract from the Bukés. According to the old saying, 'All the country under heaven belongs to the emperor,' the emperor has been ordered by heaven to feed and to educate the people; for this reason he orders officials and warriors to care for the peace and prosperity of the country. It would have been possible to entrust the Kugés with the performance of this office; as, however, this arrangement is displeasing to the people, the emperor has given it to the Bukés. If the land be not at rest, differences of rank between high and low disappear, and uproar is the consequence, and therefore the Bukés shall conscientiously perform the duties of their office." (Eighteen Laws, No. 15.) "If the five harvests do not come to maturity, then is the government of the Tenchi (the son of heaven, the emperor) bad; but if many punishments must be inflicted throughout the realm, then ye are to know that the military powers of the shōgun are inadequate. In either case ye (my successors) shall make trial of yourselves to that end, and be not careless." (One Hundred Laws, No. 89.) Cf. Kempermann in the "Mitteilungen der deutschen Gesellschaft für Natur- und Völkerkunde Ostasiens."

Originally the position of the shōgun compared with that of the Kokushu was little more than one of *primus inter pares*; it was only by degrees that he gradually assumed the dominant position. Originally the Kokushu were exempt from the rule binding upon the landowners of spending a year in Yedo and a year

upon their properties alternately, their families being obliged to remain permanently in Yedo; but under the third shōgun the Kokushu were in this respect treated like the smaller princes. The only prerogative which they possessed was, that as theoretical vassals of the mikado they were crown officials, and received their investiture at his hands. However, they could only approach the mikado through the shōgun, who superintended the confirmation of titles upon the territorial lords by the emperor. Any direct communication between the imperial court and the territorial lords was strictly forbidden. Even when travelling from their districts to Yedo or back, they were not allowed to pass through the capital; if they desired to visit the capital or its suburbs, they were required to obtain a special permit from the shōgun, and even then they were not allowed to approach within a certain distance of the emperor's palace. For a marriage between a member of a Buké family and one of a Kugé family, the express permission of the shōgun was equally necessary. To become a medium for the transmission of gossip upon political affairs to the imperial court, was to commit a crime punishable with the utmost severity.

In other respects all possible measures were taken to keep the territorial lords in a state of dependence. Upon the redistribution of districts, friends and earlier foes were so intermingled, that the former could keep an eye upon the latter, and apart from this, the property of the shōgun was scattered throughout the country in such a manner as to enable him to visit other districts without trouble. Strong garrisons were kept up in Kioto and Fushimi, as also in several districts of the province of Suruga; all the passes leading to Kwanto were provided with guards, and the chief trading and commercial centres (such as Osaka, Sakai, Nagasaki, eighteen in number) were in the power of the shōgun. Officials of the shōgun now undertook those tours of inspection upon which the emissaries of the mikado had previously been sent every five or seven years, and in cases where the high position of the territorial lords, such as the Kokushu, made this kind of supervision impossible, friends and presumable enemies were entrusted with the task of keeping guard upon one another. Thus, for instance, the defence of the island of Kyūshū was entrusted to Satsuma and his opponent, Hizen, who relieved one another every year. Moreover, the whole country was covered with a net-work of officials and spies of the Bak'fu bureaucracy. Thus Iyeyasu and his successors made every possible effort to keep the territorial lords within bounds. The system eventually collapsed, not so much before foreign attacks, as because those classes whom its founder had specially designed to be its supporters, first undermined and then overthrew it. The shogunate fell because it was abandoned by those who should have had the greatest possible interest in ensuring its permanence.

#### K. THE TOKUGAWA (1603 TO 1868)

If the regulation of the position of the emperor, the Kugés, and the territorial lords had been difficult, a yet more arduous task confronted the founder of the dynasty when he came to grapple with the settlement of questions of family precedence and of the succession. Iyeyasu left five sons, the princes of Echizen, Kii, Owari, Mito, and the second son, Hidetada, whom he had appointed as his successor during his lifetime, and invested with the power. He arranged that the succession should follow the direct line of Hidetada's family, and that if no heir should be

forthcoming one should be chosen from the house of Kii or that of Owari. These houses, and that of Hidetada, were entitled "Go-san-ké," as being the three most important houses. At a later period the title was also extended to include the houses of Kii, Owari, and Mito, though it did not in this case imply the possession of claims to the succession. On the other hand, the prince of Mito obtained the right of demanding or proclaiming in certain cases the deposition of a shōgun who had not performed the duties of his office, while under other conditions the position of regent was reserved to the prince of Echizen. Thus the prince of Mito was also the only territorial lord who possessed the right of direct communication with the emperor. It is by no means clear that Echizen, the eldest son, and Mito, the youngest, were excluded from the succession; the first had been originally adopted by Hideyoshi, and had thus ceased to belong to his father's family according to Japanese ideas, while the latter had married the daughter of a former enemy. Iyeyasu himself is said to have characterised his son Mito as a very important, but extremely dangerous personality, and to have compared him to a sharp sword, which is only harmless so long as it remains in the sheath. Two hundred and fifty years later the foresight of the founder of this dynasty was to be confirmed; in any case, the house of Mito materially contributed to bring about the downfall of the shogunate.

The question of the succession, already sufficiently difficult, became still further complicated by the fact that in 1715 the family of Hidetada became extinct in the direct line. The prince of Kii, who had been appointed shōgun, hastened to invest his second, third, and fourth sons with the titles of princes of Taiasu, Shimizu, and Hitotsubashi: he then arranged that these three families, to whom he gave the common title "Go-san-kiō" (the three lords), should provide a successor in the event of his first son's descendants becoming extinct in the direct line. This regulation also proved ineffectual. A younger son of the house of Mito, who had been adopted by a prince of Hitotsubashi, was appointed shōgun; the last of a long line, his loss of the supremacy in no way redounded to his honour.

Iyeyasu died at his castle of Sumpu, in Suruga, on March 8, 1616, and, according to his wish, was buried a year later in Nikko. This is a mountainous district, richly wooded and adorned with every kind of natural beauty, about ninety miles north of Yedo, where Buddhist and Shintoist temples, erected by the holy Shōdo Shōnin, had existed from the close of the eighth century. A representative of the mikado and of the shōgun, together with a great number of the Kugés, the territorial lords, and their military comrades, were present at the burial of the deceased, upon whom the mikado conferred a special title of honour to mark the occasion. The dead man was created Sho-ichi-i, To-shō, Dai Gon-gen; that is, noble of the first class, of the first rank, great light of the east, great incarnation of Buddha. After the death of the former abbot and the abdication of his successor, Go Mizuno, the fifth son of the mikado was appointed high priest of Nikko, in the year 1654, under the title of Riunōji no Miya. He and his successors, who were afterwards princes of the imperial house, usually resided at Yedo, in the temple of Uyeno, and visited Nikko three times a year. The last of these royal priests, Kita Shirakawa no miya, who was educated in Germany, was abducted by the northern party during the civil war of 1868, and set up as an opposition mikado, but shortly afterward succumbed to the attacks of the victorious southerners. Of the successors of Iyeyasu, one only, his grandson, Iyemitsu (1623

THE BURIAL PLACE AND TEMPLE GROVES OF NIKKŌ IN JAPAN

(From a Japanese woodcut.)

to 1651; ob. 1652), was buried in Nikko. All the other shōguns were buried at Yedo, either within the precinct of the temple of Uyeno or within that of Shiba. The temple buildings of Nikko (see the plate, "The Cemetery and Temple Buildings of Nikko in Japan"), are certainly the greatest, the richest, and the most beautiful in Japan, and are distinguished by the artistic finish of the buildings and the decorations of their interior, as well as by the beauty of the surrounding landscape. The interest of the spot and of its buildings is further increased by the numerous dedicatory presents in and about it which have been brought from every part of the country, and, in some cases, even from Korea.

Hidetada, the first successor of Iyeyasu, followed in his father's footsteps, and maintained the institutions introduced by him. Iyemitsu, the grandson of the founder of the dynasty, was, undoubtedly, the most important of the fourteen shōguns who followed Iyeyasu. He laid a stronger hand upon the reins of government, obliged the great landowners to render a formal recognition of his undisputed supremacy, and made himself and his successors masters of Japan. The visit which he paid to the mikado in Kyoto, in 1623, was the last paid by any shōgun until the year 1863. It was under his rule, in 1641, that the Dutch and the Chinese were sent to Nagasaki, and all other foreigners were expelled from the country, while emigration was forbidden to the Japanese. The coinage and the weights and measures in use were reduced to a common standard, the delimitation of the frontiers was begun and completed, maps and plans of the districts and castles belonging to the territorial lords were made, the genealogical trees of these latter were drawn out, and all names obliterated which might have aroused disagreeable political recollections or have given rise to inconvenient claims. Moreover, the two State councils, the upper and the lower chambers were reorganized. Finally, Iyemitsu made his capital of Yedo, not only the most beautiful, but also the most cleanly and the best fortified town in the kingdom. The castle, with its triple line of walls and moats, was then considered as impregnable, and even to-day rouses the admiration of the visitor. Iyemitsu was also the first to employ the title of "taikun" (great lord), as the expression of his absolute power in his intercourse with other countries, such as Korea.

Of his successors we need only mention Yoshimune (1716-1745), the last of the direct descendants of Iyeyasu. He gave much attention to the improvement of agriculture and manufactures, and removed the prohibition upon the introduction of European books, though this still held good of such as dealt with the Christian religion. Of the remaining successors it need only be said that they confined their actions, generally speaking, to the lines already laid down. However, their power of independent action was completely destroyed by the bureaucracy, which took into its hands more and more of the administration. Government departments degenerated in consequence, and the fall of the shogunate was the ultimate result.

Tukuzo Fukuda, in his work upon the social and economic development of Japan, defines the government of the Tokugawa as a period in which the government was that of a policeman with unlimited powers. This statement, however, is true only of the second half of the government of the shōguns, and of that only in so far as the administration was careful to maintain existing institutions and to throw obstacles in the way of all innovations, which the bureaucracy in Japan, as everywhere, considered as so many threats against the existence of the State. The

heaviest oppression has never been more than a temporary obstacle to national development; and so in Japan under the shogunate, development, far from coming to a standstill, followed a roundabout course, and society advanced by devious paths from the old order to the new. The most obvious confirmation of this fact is the part played by the towns, or, more correctly, by the mercantile class of the community.

The vigorous rule of the first sbōguns, and especially of the third, had convinced the territorial lords that the dynasty of the Tokugawa was entirely capable of maintaining its supremacy, and that any attacks upon it would recoil upon the heads of their promoters. At the same time the measures of the shogunate, especially those respecting the hereditary rights of the great families, had inspired the conviction that the existence of the territorial nobility, so far from being endangered, was secured even more permanently than before. The great nobles were therefore able to concentrate their attention upon the peaceful development of their districts. The common Samurai were in a far more evil case (cf. above, p. 19), especially in the matter of their yearly salary of rice. Their business was war, and any other occupation was forbidden to them. As, however, their salaries were usually inadequate for their support, the consequence was that in the course of time a large proportion of the Samurai became deeply involved in debt. They were then obliged either to lay aside their swords, renounce their profession and enter some other, or while retaining their swords, to leave the service of their overlords and to join the class of the Ronins, the masterless Samurai, who were the terror not only of the peaceful citizens, but also of the government. As regards the peasants (cf. above, p. 36), the position of those settled upon the land of the shōgun was, upon the whole, preferable to the lot of those within the districts of the territorial lords. While the former were treated with kindness and consideration, the latter were without defence against the extortions of the officials of their prince. The average holding of a peasant was small; the least quantity of land amounted to about a hectare, and was but seldom increased, consequently their agriculture was rather of the character of market gardening.

Fukuda asserts that the towns had developed from and around the permanent castles of the territorial lords, for the reason that the formation of towns in Japan dates from the period of war after the twelfth century. The statement is correct only from one point of view. In a State which had already existed for a thousand years, men and houses must have collected in large numbers at the most important points upon the several lines of communication. Naturally the new territorial lords would choose such positions for the central points of their districts, and would settle and erect their fortified castles in them; not less naturally the inhabitants would gather more closely round the protecting castles, and possibly in the course of time two or three villages may thus have been united into one community. At any rate, the towns of early Japan never attained any power of self-government; they were not even considered as independent communities, and the period of their growth and prosperity begins, in almost every case, at the time following the rule of Iyeyasu. Centuries of civil war by no means favoured the increase of merchants and handicraftsmen, and of these the population of the towns was chiefly composed. The system of caste which prevailed in Japan must also have hindered commercial development. The warrior caste was the first; with it, if not theoretically, at any rate in practice, were conjoined the castes of scholars,

physicians, artists, priests, and others; then came the farmers, the handicraftsmen, and finally the merchants. Below these were the dishonourable castes (actors, jugglers, dancing women, etc.) and the unclean castes (knaekers, tanners, executioners, etc.).

After their rise the towns lay either on the demesne of the landed lords, upon whose whims and ideas their growth materially depended, or on the demesne of the shōguns, who had succeeded in getting possession of the most important trading centres, —Yedo, Osaka, Kanagawa, Nagasaki, Sakai, Hakodate, and Niigata. Hence the shogunate was obliged to confront the task of extending trade and procuring the recognition of the traders' importance. Even during the period of foreign influx the shōguns had made every effort to secure to themselves the largest possible share of the profits derived from commercial intercourse with other lands, and this object they entirely attained when they removed the Dutch and the Chinese to Nagasaki. At the same time exports and imports were so regulated in amount that the balance of trade might be, as much as possible, in favour of Japan. Foreign wares were sold at so high a price as to be within the reach only of the richest classes, while the exportation of anything that the country wanted, or seemed to want, was restricted or prohibited entirely. Thus in 1752 the exportation of gold, which had previously been subject to repeated restrictions, was entirely forbidden; in 1685 the exportation of silver, which had been employed to pay for the imports, was limited to two thousand pounds, an amount further reduced to five hundreds pounds in 1790; in 1685 exports of copper were limited to two thousand piculs (about one thousand kilogrammes); from 1715 onward, only two Dutch ships were allowed to touch at Japan, and from 1790 only one. Communication with the Chinese was limited in a similar manner.

On the other hand, every effort was made to provide facilities for internal trade, especially after the year 1694, when guilds (*kumiai*) were created in Osaka and Yedo, at first ten in each town, a number afterward increased to twenty during the years 1720 to 1730. These were free societies, occupied with mercantile and shipping business, and seemed to have been chiefly active in promoting the sale of the manufactures produced on the demesnes of the territorial lords. Consequently an unusually severe blow was dealt at their existence in the middle of the eighteenth century, when the lords demanded and obtained the permission to sell their products at the great commercial centres by means of their own merchants. Possibly it was this regulation which induced the government in 1813 to place the guilds upon another footing. They now became close corporations of merchants and manufacturers; their numbers and the numbers of their members were defined by law. They were not allowed to elect new members, but upon the death of an individual could admit only his blood relations, and they held the monopoly of the sale of that particular article with which they were concerned. In 1841 this arrangement was abolished, after many complaints had been made of the manner in which prices had been forced up; but it was reintroduced in 1851, apparently because the government thought they could not dispense with the general supervision exercised by the guilds.

In other respects, during the rule of the Tokugawa, conditions remained practically unaltered. Ancestor worship continued, as did the patriarchal system, and the responsibility of the patriarch for the actions of members of the family. The law of inheritance, which gave a disproportionately favoured position to the eldest son,

remained unaltered. The majority of posts in the service of the shōguns and of the territorial lords continued to be hereditary. Custom demanded that a son should succeed to the profession or the handicraft of his father. It was extraordinarily difficult to pass from one class to another. All these restrictions must have constituted so many obstacles to the free development of the individual and consequently to the progress of society.

#### L. THE FALL OF THE SHOGUNATE

(a) *The Last Tokugawa Shōguns.* — Soon after the shogunate had passed to the Tokugawa, a certain opposition began to arise within this family itself to the policy of usurpation by which the mikado had been deprived of his rights. This movement remained for a long period exclusively literary, and its chief representatives and supporters were to be found among the princes of the house of Mito. The early history of this house is a good example of the manner in which the fortunes of the landed nobility changed during the age preceding the definite pacification of the kingdom. The territory afterward included in this principality was governed from the tenth century by scions of the Taira family. It was overcome in 1427 by Yedo Michifusa, who was the first to assume the name of Mito. In the year 1590 the Yedo family were driven out by the Satake. Yoshinobu, a member of the latter house, who had joined the side of Hideyori, was transferred to Akita by Iyeyasu in 1602. The fifth son of Iyeyasu was appointed prince of Mito in his place: when he died, upon the journey to Mito, the tenth son took up the position. He was afterward transferred to Suruga in 1609, but became prince of Kii about ten years later, and was then succeeded by the eleventh son, Yorifusa, who was born in 1603 (cf. above, p. 39).

Yorifusa died in 1661, and was succeeded by his second son, Mitsukuni. He invited learned men to his court, among them apparently a number of Chinese who had fled to Japan before the Manchus, and with their help he published, among other works, the "Dainihonshi" (the history of greater Japan, from Jimmu Tenno as far as the year 1393, in two hundred and forty books): this is still considered as a work of capital importance for Japanese history. He also published the "Reigirites" (concerning the ceremonies at the imperial court, in five hundred and ten books). These works and a large collection of Chinese and Japanese books, to which the prince continued to make additions until his death (1700), largely contributed to direct the attention of scholars to early Japanese history; hence Mitsukuni is justly considered as the founder and promoter of the movement which is usually characterised as a revival of the pure Shinto teaching, and undoubtedly exerted a powerful influence in preparing the way for the restoration of the mikados. The men who were chiefly influential for their work in this direction were Kada (ob. 1736), Mabushi (ob. 1769), and Motoori (ob. 1801): the latter published the *Kojikiden*, that is, explanations of the *Kojiki*, a work which attracted the greatest attention not only among scholars, but also, and particularly, among the landed nobility. The "Dainihonshi" was continued by the princes of Mito, and printed in 1851 after a long period of circulation in manuscript. The successors of Mitsukuni, besides being patrons of literature, were also sound and economical administrators of the country, so that the princes of Mito acquired a reputation as excellent rulers in contrast to the shōguns. In 1829 Nariakira,

the brother of his predecessor, Narinaga, became prince; he was destined to play a leading part in the struggle against the shogunate.

The increasing poverty of the Samurai, the growing degeneracy of the shōgun government due to the rise of a bureaucracy, the rapid spread of foreign ideas and the concurrent diminution in the power of the shōguns, together with the more ardent desire of the territorial lords for partial or complete independence, — these influences found expression in the formation of parties at the imperial court as well as at the court of the shōgun. The situation became even more strained as the repeated appearance of foreign vessels off the Japanese coasts (the first of these visitors was the Russian squadron off Yezo in 1792) increased the fears of a hostile attack. When apprehensions of this nature drove the government of the shōgun in 1842 to request the landed nobility to take measures for coast defence, the only response was a general outcry occasioned by the shortness of money and the need for assistance.

(b) *The Opening of Japan to the Foreigner.* — Some years after the appointment of Nariakira, collisions had taken place in Mito between the political schools (sects) of the country, one of which stood for the mikado, another for the shōgun, while the third remained in a vacillating frame of mind. These disturbances resulted in an open revolt against the government of the shōgun, which was, however, suppressed with comparative ease. None the less, after so long a period of peace, such a movement was necessarily regarded as a sign of serious import. In every principality were to be found those divisions of opinion which existed in Mito. During this period of ferment in 1853 occurred the arrival of the Commodore Matthew Galbraith Perry, who, in the name of the United States of North America, demanded that Japan should be thrown open to his countrymen. During the progress of the discussions which his appearance had occasioned, both within the government and among the territorial lords, the shōgun Iyeyoshi died, having been apparently murdered. In him the government lost an energetic and far-seeing prince, and his successor, Ii-kamon no kami, the hereditary regent, who then conducted the government for Iyesada during his minority, was a man of greatly inferior capacity. As Ii-kamon, the most distinguished of the Gofudai Daimyos, was determined to maintain the old shogunate constitution and to avoid any step that might bring a foreign enemy into alliance with the old native opposition, he concluded the treaty of Kanagawa with Commodore Perry, by which the harbours of Simoda and Hakodate were thrown open to the United States (March 31, 1854).

This step provided the mikado and his adherents with a common war-cry, "Jo-i!" ("Drive out the strangers!"), which, as a matter of fact, was directed rather against the shogunate than against the foreign intruders. While negotiations were in progress with Mr. Townsend Harris, the resident minister of the United States, for the conclusion of an additional treaty, the young shōgun died in 1859. It seems that he, like his father before him, was murdered, and the crime was attributed to the instigation of the prince of Mito. On this occasion a motive for the murder can be found. By the laws of the kingdom, one of the three Gosankio princes would now have to be chosen as shōgun, and the prince of Hitutsbashi was a son of Nariakira. But Ii-kamon once again gave proof of superior strength, and succeeded in procuring the appointment of the prince of Kii, who was then twelve

years old. The prince of Mito was condemned to close confinement in his palace, and the princes who seemed to have supported him were obliged in some cases to abdicate, and were punished in others with imprisonment. The regent appeared to have broken down all resistance. However, in March, 1860, he was attacked by a band of the retainers of Mito and murdered. His successor, Ando Tsushima no kami, met a similar fate. A year later he was also attacked, and only escaped at the cost of a severe wound. Shortly afterward he resigned his office.

In the meanwhile, in the year 1858, conventions were concluded with the United States, England, France, Russia, and Portugal, and with Prussia in 1861, whereby Kanagawa, Nagasaki, and Hakodate were thrown open to foreign trade; the opening of further harbours was contemplated; diplomatic representatives were admitted to Yedo, and consuls to the treaty ports; while foreign subjects were placed under the jurisdiction of their consuls. These steps gave the mikado and the territorial nobility new reasons for dissatisfaction with the shōgun and an excuse for hostile action against the foreigners. The export trade developed rapidly, and the consequent rise in the price of every article caused great irritation among the Samurai and excited them to the murder of a number of foreigners. The flames were further fed by an attempt on the part of the Russians to get possession of the island of Tsushima in 1861, notwithstanding the fact that English intervention forced them to retire from the island. On the 5th of July, 1861, the English embassy in Yedo was attacked by a band of desperadoes. The English minister, Mr. Rutherford Aleock, was unable to secure the payment of the indemnity which he demanded, and at the same time the shōgun's government declared that the general feeling of the country would not permit the opening of the other harbours which had been proposed. Aleock returned to England, followed by a Japanese embassy. However, the Japanese government found itself unable to fulfil the conditions on which the English had thought it necessary to insist in granting the period of grace which the Japanese demanded for the performance of their existing treaty obligations. Meanwhile, the English embassy had been again molested, and two of the marines who had been told off to guard it were killed in an affray on the 26th of June, 1862; and on the 14th of September, 1862, a number of English were attacked on the Tokaido by the members of the following of Shimazu Saburo, the father of the prince of Satsuma. Some were wounded and one (Mr. Richardson) was killed.

While these events were taking place in and around Yedo, the enemies of the shōgun in Kioto had not remained idle; large bands of wandering Samurai had collected, apparently with the object of protecting the mikado and making a movement against the foreigners. The landed nobility of Satsuma, Choshu (Nagato, the family of Mori) and Tosa, who had there united, were entrusted by the mikado with the conduct of the movement against his enemies. The coalition of these three princes, which was to become of high importance during the following years, was named "Sat-cho-to" by the Japanese, from the initial syllables of the three names. The old Nariakira had died in September, 1861; however, the mikado was zealously supported in all his plans by the above-named princes together with the prince of Echizen. On the 1st of January, 1863, the newly erected embassy on the Gotenyama in Yedo was burned to the ground by Ronins, an outbreak caused by the fact that the mikado had forbidden the transference of the place to the English, while the latter refused to surrender their rights. Meanwhile, negotiations

were proceeding for the indemnities demanded by England for the murder of Richardson and the second attack upon the embassy. By arranging or permitting an emigration of the whole Japanese population from Yokohama in the month of May, the Japanese authorities had attempted to put pressure upon the English chargé d'affaires, Colonel Neale, and upon the other foreigners. It was not until this attempt together with others had failed that they resolved on the 24th of June to pay the indemnities demanded. On the following day, however, at the mikado's orders they demanded the closing of Yokohama, a demand which was renewed upon the 25th of October in spite of the protests of the foreign representatives. The Japanese government was not without excuse for this extraordinary step in so far as in the letter of the President, Millard Fillmore (1850-1853), which Commodore Perry had delivered, the opening of Japan was expressly described as an experiment, an explanation repeated by the parties to the wording of the contract of 1858.

On the 30th of September, 1863, the Choshu men in Kioto made an attempt, which was defeated without bloodshed by the troops of the shōgun, to seize the person of the mikado. They then evacuated the town and retired into the district of their master with the seven Kugés who had been implicated in the movement. Two of these Kugés, Iwakura and Sawa, became important after the restoration of the mikado's position, as prime minister and minister for foreign affairs. A few days before this event the batteries of the prince of Choshu opened fire in the Straits of Shimonoseki upon an American trading steamer which was there lying at anchor, and a fortnight later upon a French gunboat, the "Aviso Kienchang," and the Dutch corvette "Medusa," as they were passing through. This was an attempt of the prince to carry out the mikado's order for the expulsion of the foreigners. Some of the prince's ships and batteries were destroyed by the action of the French and the American fleets, but these powers were not able to reopen the straits to communication. The representatives of England, France, the United States, and the Netherlands met in Yokohama to discuss the situation on the 25th of July, 1863. Colonel Neale then led the English squadron to Kagoshima to demand satisfaction from the local territorial lord for the murder of Richardson at the hands of his people. The refusal of this dignitary was followed by the bombardment of Kagoshima on the 15th of August. Though this cannot be described as a military success, yet it served to convince the leading powers in Satsuma of the necessity of coming to an understanding with England. On the 11th of December, 1863, the ambassadors of the prince in Yokohama paid down the indemnity demanded. Attempts made by the French government to conclude a convention for the reopening of the Straits of Shimonoseki with a Japanese embassy which had come to them upon other business proved a failure, as also did the personal efforts of two young men of Choshu, Ito and Inouye, who were afterward destined to play a greater part in Japan (cf. the summary of the last ministry supplemental to p. 52). In the first days of September, 1864, a united squadron of the four powers ultimately destroyed the fortresses in the straits and forced the prince to submit to the foreign demands. The episode ended with the payment of an indemnity (£750,000) by the Japanese government to the four powers.

(c) *The Fall of the Shogunate.* — Notwithstanding the European intervention, these events had only been so many links in the war carried on by the western and

southern princes against the shōgun, and in the meantime events in Kioto had developed further. On the 20th of August the men of Choshu advanced again toward the town and made a second attempt to seize the person of the mikado. In the street fighting which followed the town was set on fire and largely destroyed. But the troops of the shōgun were joined by the men of Satsuma, whom the high-handed proceedings of Choshu had offended, and succeeded in driving off their opponents. Those of the assailants who had not been killed committed *hara-kiri*. The prince of Choshu was banished as a rebel, and the imperial princes were called out against him. Events had thus changed in favour of the shōgun; however, he wanted money, men, and resolution; above all there was disunion and disloyalty in his party, and even in his own family. Mito, Kii, Owari, and Echizen were inclined to treachery, and it was only from the northern princes that the shōgun could hope for energetic support. Thus the struggle tended to develop into a conflict of south and west against east and north. It was a repetition (cf. p. 33) of that earlier struggle for existence between the two parts of the kingdom in which the northern had hitherto been the conqueror.

The objection of the mikado to the presence of foreigners in the country, and to the concessions made to foreigners in the conventions, had hitherto been the chief obstacle with which the Europeans had to deal in their relations with Japan, hence the recognition of the conventions by the mikado appeared to be a political necessity. This success was attained by the common action of the representatives during November, 1866, though the general feeling of the country toward the foreigners remained without improvement. In September, 1866, shortly after the infliction of a decisive defeat upon the troops of the shōgun by those of Choshu, the shōgun Iyemochi died, and the death of the mikado Komei followed in January of the next year. Iyemochi was succeeded by Hitotsubashi, and Komei by the present mikado, Mutsuhito. These changes in the leading personalities did not, however, cause any alteration in the political situation; on the contrary, the feeling between the two parties was the more intensified. An agreement was brought about between Satsuma and Choshu, chiefly by the intervention of the elder Saigo, who was revered as a national hero. This step increased the pressure put upon the weak and vacillating Hitotsubashi. He declared himself in favour of the view, which had been for a time gaining ground among the more enlightened of Japanese politicians, that the government should be in future controlled by one head, and that head the mikado. Ultimately, on November 16, 1867, he resigned his office of shōgun, at any rate with reference to the conduct of domestic policy, while retaining the administration of foreign affairs, and demanded that the whole question of the constitution should be laid before a general assembly of the territorial lords. His opponents declined to consider the proposal, and on January 3, 1868, they seized the person of the mikado. The shōgun, who had hitherto been resident in Kioto, abandoned the capital, retired to Osaka, and at the end of January, 1869, made an advance upon Kioto. On the 30th of the month he was defeated at Fushimi, partly by treachery, and fled to an American warship lying in the roadstead of Osaka, and from thence to a Japanese vessel bound for Yedo. Proscribed as a rebel, he submitted without a blow to the troops of the mikado, which were advancing on Yedo. His life was spared, but the clan of the Tokugawa was deprived of almost all its revenue, and its territory was limited to the district about Sumpu.

Such of the Tokugawa and of the northern Daimyos as remained in Yedo were defeated on July 4 at the storming of Uyeno. The imperial prince there resident was, however, carried off to the north, and set up by the local princes as a kind of opposition mikado. On November 6 the resistance in this district was broken down by the capture of the castle of Wakamatsu, the residence of the prince of Aizu. The fleet of the shōgun had shown great vacillation, and had neither taken part in the war nor made submission to the mikado. On October 4, after taking on board some of the land forces, it left the Bay of Yedo for Yezo, under the leadership of the admiral Enomoto. The most important places in the south of the island were rapidly conquered and a republic proclaimed. A considerable interval elapsed before the mikado's forces advanced upon Yezo. However, after a series of battles Enomoto surrendered the fort of Kamida at Hakodate, the last stronghold of the defence, to the mikado's troops, on June 26, 1869. His life and those of his followers were spared.

Thus dishonourably, almost without resistance, fell the dynasty of the Tokugawa shōguns, which for nearly four hundred years had given peace and prosperity to the country. Its fall was due to its own weak and miserable condition, and also to the fact that it was deserted by those who should, for their own interest, have lent it their support. The dynasty and its adherents were lacking in the determination which distinguished their opponents, the princes of the south and west. As in all former struggles in Japan, victory ultimately remained with that party which had succeeded in securing the person of the mikado. None the less, it is one of the most remarkable facts in history that the moral influence of a ruling dynasty which had been powerless for seven hundred years, and the heads of which had been excluded from any practical intercourse with the outer world for two hundred and fifty years, should yet have counted for so much in the conflict. As a matter of fact, it was rather the southwest that had conquered the north, than the mikado who had defeated the shōgun.

### M. THE MODERN PERIOD

(a) *The Restoration of the Mikado Rule.*—The movement against the shogunate had begun with the cry, "Down with the foreigner!" This cry undoubtedly expressed the desires of the majority who took part in the movement. As fate would have it, the attacks upon the foreigners united them by the tie of mutual sympathy at the very outset of the movement. On February 4, a number of people from Bizen, marching through Kobe, opened fire upon the foreigners who were watching a play; on March 8, eleven sailors of a French warship were treacherously murdered in Sakai by men of Tosa; and on March 22, two of the soldiers belonging to the mikado's body-guard attacked an English minister as he was on his way to an audience with his retinue. These outbreaks led to two consequences: they forced the foreign representatives, whose views cannot have invariably coincided, to unite for purposes of common defence, and they obliged the counsellors of the mikado, whether before or behind the scenes, definitely to state their intentions. To the honour of the advisers it must be said that many of them did not hesitate to declare their anxiety for the maintenance of good relations with the foreigners and for the introduction of Western civilization, and that they were also ready to support their views at the expense of their personal safety. As in previous years the foreigners

had been exposed to the attacks of the discontented party, so the counsellors of the mikado now found themselves in a similar position; more than one suffered death or severe wounds for what the adherents of the Jo-i party considered as a sin against patriotism. The mikado's counsellors had indeed a heavy task before them. Their first step had been to revive the Taikwa constitution of the year 645 *v. d.* (cf. p. 16). Shortly afterward, at the beginning of April, 1868, the mikado took a solemn oath before his whole court that a deliberative assembly should be summoned; a few days afterward he reviewed the troops and the fleet in Osaka, and on January 5, 1869, he received the foreign representatives at Yedo.

That the barriers which had previously secluded the mikado had now been broken down was a great step in advance, but the situation both at home and abroad was strained and full of danger. In 1867, by orders of the shōgun government of Kioto, a persecution of the native Christians was begun in the district of Nagasaki, where remnants of the old Christian community had remained unnoticed. The persecution was resumed with increased severity when the mikado returned to the head of affairs, and long efforts on the part of the foreign representatives were necessary before the old prohibitions against Christianity were removed in 1878. A yet more difficult problem was the relation of the government to the reactionary party in the country. On the removal of Mutsuhito from Kioto to Yedo (which had now received the name of Tokio, the eastern capital), the imperial body-guard (Shimpei) declined to remain behind in the old capital. They accompanied the mikado to Tokio, where their presence soon gave rise to a movement hostile to foreign influence and progress. The government had the greatest trouble in removing them from Tokio, and the war minister who conducted their return was murdered by his own followers upon the road, under suspicion of being friendly to the foreigners. However, the government found that no support was to be obtained from the assembly of the deputies of the Samurai class, the first of which met in April, 1869, and the second in June, 1870. This assembly displayed great inexperience and unwavering opposition to any progressive movement.

None the less, the work of reform continued, and in a manner that must have been totally unexpected by the instigators and promoters of the movement against the shōguns. In March, 1869, the princes of Satsuma, Choshu, Tosa, and Hizen, the chiefs of the southwestern confederation, despatched a communication to the mikado, placing their districts and their subjects at his disposal. The offer was accepted, after the majority of the other Daimyos had joined the movement with some hesitation. The Daimyos were at first appointed imperial governors over their districts (Han), but in August, 1871, they were removed from office and recalled with their families to Yedo. The country was then divided into provinces (Kin), under the government of imperial prefects. Upon their appointment as governors, the territorial nobles had lost the larger part of their income, which had been appropriated for purposes of government; a definite commutation for their former incomes and those of the Samurai was now arranged. In the case of these latter (according to the census of 1872, they numbered 634,761 men, and a slightly larger number of women, out of a total population of rather more than 33,000,000), their pensions were capitalised at the rate of seven years' purchase if hereditary, and five years' purchase if for life. To some the capital amount was paid at once; others received bonds for the amount bearing interest at eight per

cent. Notwithstanding the fact that somewhat more advantageous conditions were secured by later necessities, most of the Samurai were financially ruined by this measure. With the abolition of the supremacy of the Daimyos over their districts, disappeared also the personal connection which had subsisted between themselves and their adherents; the Samurai were allowed to lay down their swords, and to enter any profession that they preferred. At the same time, those differences were abolished which had hitherto existed between different classes of the population (the dishonourable and the unclean castes included), and a new order of nobility was created, which was, however, purely honorary. The peasants' holdings became their personal property, and the old laws ordaining a certain rotation of crops were abolished in 1871. In 1872 the sale of landed property, and in 1875 the division of it, was permitted. Nominally, at any rate, the obligation to belong to a guild was removed in the case of the merchant and the craftsman. Trade and manufacture were thrown open to all. The responsibility of the head of the family for its behaviour and the mutual responsibility of its members were also abolished. Together with relief from these duties, the head of the family naturally lost many of his rights.

Such comprehensive alterations naturally could not be carried out without much friction and continual misunderstandings. The government of the shōgun was not really replaced by the mikado, who continued to be a generally revered symbol of supremacy, but by the government of the southwest princes, or rather of their advisers. The new government soon became a government of clans; at its head stood individuals who used the means and the power of their clan to carry out their plans. In addition to this, the government was shared by a number of Kugés, who, like the members of the warrior nobility, had been equalized with other classes. The two most powerful clans, Satsuma and Choshu, quarrelled, in 1871, over the distribution of posts under the new administration, the Satsuma considering that it had been unfairly treated in the division. The settlement of this quarrel led to the creation of an imperial army. Peasant revolts broke out in Bungo, Shinano, Echigo, and other places. In 1871 a conspiracy was discovered in Tokio, headed by certain Kugés; in 1884 a revolt of the Samurai broke out in Hizen, under the leadership of the former minister of justice, Eto Shimpei; and the year 1877 was occupied by the revolt in Satsuma, which was with difficulty suppressed. The leader of this latter movement was the former general and state counsellor, Saigo, the ideal of all the Samurai (p. 48).

(b) *Japan's Foreign Policy from 1874 to 1893.* — Questions of foreign policy also proved highly embarrassing to the government. The undertaking against Formosa, which was brought to an end in 1874 by an agreement with China, produced ill-feeling between the two States, which was increased in 1880, when Japan incorporated the Liukiu Islands, which had paid tribute to China from 1372, and also to Satsuma from 1609.

It was, however, the question of Korea which led to war between China and Japan. Shortly after the restoration of the mikado government the Japanese government demanded from the Korean the resumption of their payments of tribute, a demand which was rejected with scorn. Feeling in Japan ran high, and the expedition against Formosa was partly undertaken to distract the popular excitement. In September, 1875, when the sailors of a Japanese warship, which was occupied

in surveying the coast, were captured, the national pride again flared up, although the fort to which the assailants belonged was stormed on the following day, and almost the whole garrison slaughtered. A Japanese ambassador was sent to Peking to request definite information upon the position of the Chinese government with reference to Korea, and when the Chinese declined all responsibility for the affairs of that district a Japanese expedition was sent to Korea. Negotiations, however, preceded any outbreak of hostilities. On February 27, 1876, a convention was signed, in which Japan practically recognised the independence of Korea, and that country threw open three harbours to Japanese trade. The peaceful nature of these operations was one of the chief causes of the revolt of the Satsuma (p. 51). The peace lasted until the year 1882, when the United States, and shortly afterward England and Germany, followed the example of Japan, and concluded conventions with Korea. In July, 1882, a revolt broke out in Seoul, instigated by the father of the king, Tai wen kun, and directed against the king and the Japanese; the Japanese embassy was obliged to flee, but returned a few weeks afterward, and in the convention of Chemulpho Japan obtained the right to keep troops in Seoul for the protection of her ambassadors. Chinese troops set the king free and captured Tai wen kun after a short time; he was transported to China, but allowed to return to Korea a few years later. In 1884 fresh disturbances broke out in Seoul. On this occasion the moving influence was the radical party in connection with the Japanese, the object being to get possession of the person of the king, and to depose the queen, who was virtually head of the government. These events gave the Japanese government the opportunity of sending Ito to China as their ambassador. On April 18, 1885, Ito and Li Hung Chang concluded the convention of Tientsin, both sides pledging themselves to withdraw their troops from Korea, and in the event of either being obliged by circumstances to despatch troops to that country, undertaking to give the other party due notice. The peace continued for some years, although the commercial rivalry of the two powers maintained a state of tension in Korea. The persistence of the opposition in Japan, where a constitution and parliamentary representation had been introduced since 1890, in demanding a more determined foreign policy, placed the government more than once in an embarrassing situation. The tactless procedure of the radical deputy, Oishi, who was appointed ambassador to Seoul in 1893, would even then have brought about a breach but for the diplomacy of Li Hung Chang.

(c) *The War against China, 1894 to 1895.* — In the year 1894 a revolt of the Tonghaks, a fanatical religious sect, broke out in Korea. The government, being unable to deal with the movement, applied to the Chinese, who sent a small division of troops to their aid, and duly informed the Japanese government of their action. Japan immediately replied that she could not recognise the Chinese description of Korea as a tributary State, and would herself also send troops to Korea. The first Chinese troops landed at Assan, on the east coast of Korea, on June 8, and the first Japanese in Chemulpho on June 12, 1894. The revolt of the Tonghaks was quickly suppressed; but when the Chinese sent information of the fact, as well as of their intention to withdraw their troops, Japan replied that she had no intention of evacuating Korea until she had come to an understanding with China about the reforms to be introduced there.

THE JAPANESE CABINETS FROM DECEMBER 1886 TO THE BEGINNING OF 1902.

On the refusal of China to discuss the question, the English steamship "Kowshing" was sunk on July 25 by a Japanese war ship, though no previous declaration of war had taken place, as the Chinese troops which she had on board for Assan declined to surrender; and on July 28 the Chinese troops were attacked by the Japanese at Assan and defeated. The Japanese followed up their first advantage with great determination; a ministry was formed of their adherents in Seoul, which concluded an alliance with Japan, and invited the Japanese to expel the Chinese from the country. On December 15 the Japanese captured Piyeng yang, on the 17th the Chinese fleet was defeated at the mouth of the Yalu, and on October 25 the Japanese crossed this river and defeated the Chinese for the second time. While the army which had accomplished this success advanced into Manchuria, where the campaign was soon brought to a standstill by the approach of winter, a second Japanese army landed on the east coast of the peninsula of Liautung at the end of October, captured Talienswan on November 2, and stormed Port Arthur on the 21st. This succession of defeats obliged the Chinese government to open negotiations for peace; however, the two Japanese embassies sent out in November, 1894, and February, 1895, were recalled apparently for lack of full powers to treat. At the end of January, 1895, a Japanese division crossed into Weihaiwei in Pechili. On the 30th the land forts of this military harbour were captured, and on February 14 the harbour and the Chinese fleet within it were attacked by land and sea, and surrendered to the Japanese.

The Chinese government now determined to send Li Hung Chang to Japan to conduct the negotiations. After long hesitation the Japanese declared themselves ready to receive him. On March 18, 1895, Li landed in Shimoneseki, and was received by the prime minister, Ito, and the minister of foreign affairs, Munemitsu Mutsu (cf. the plate, "Japanese Cabinet from 1886 to 1902"), the real promoter of the war. The first demands of the Japanese, who demanded the surrender of the forts of Taku, Tientsin, and the railway from Shanhaikwan to Tientsin, before they would grant an armistice, seemed an insurmountable obstacle to any negotiations. However, when Li, on March 24, was wounded by a Japanese assassin, the mikado proposed an armistice upon the basis of the *status quo*. On April 17 peace was signed at Shimoneseki, China recognizing the independence of Korea, ceding Formosa, the Pescadores, and Liautung to Japan, and promising payment of an indemnity of 200,000,000 taels (more than £50,000,000). Meanwhile, the success and the demands of the Japanese had given rise to serious anxiety in Europe. The possession of Liautung made Japan practically mistress of China, and consequently destroyed the balance of power in East Asia. Russia, Germany, and France united in representations to Tokio (England having declined to join their action). Japan then agreed to give back Liautung on May 5, in return for an additional 30,000,000 taels by way of indemnity. The treaty of Shimoneseki was formally completed by both parties, and Formosa, the governor of which declared himself independent at the head of the Formosan republic, was occupied without difficulty by the Japanese.

In Korea events had developed more unfavourably for the conquerors. Even during the war revolts had broken out against the Japanese in different places, and with the conclusion of peace the feeling against the interference of the Japanese in the government became strongly marked in court circles and among the higher government officials. An attempt which was made, on October 8, 1895,

by certain Japanese in concert with the radical Koreans, and at the instigation of the Japanese embassy, to produce an alteration in the feeling of the country by the murder of the queen, proved a failure. On February 11, 1896, the king and the crown vassals fled from the royal palace, took refuge in the Russian embassy, and remained there until February 20, 1897. During this period agreements were concluded between Japan and Russia in May, 1896, at Seoul, and in July of the same year at St. Petersburg, by which each of the two powers was permitted to maintain troops to the strength of one thousand men in Korea for the protection of its interests, and each pledged itself in no way to interfere in the internal affairs of the country. Thus, as far as Korea was concerned, the war between China and Japan had enabled the powerful Russia to take the place of the helpless China, notwithstanding the fact that the main object of the war in the eyes of the Japanese military party had been to anticipate Russia in East Asia, and to check her advance in that direction.

(d) *Japan during Recent Years.*— Considerable alterations were made in the relations between Japan and foreign countries. The old conventions, concluded upon the principle that foreigners were extra-territorial, were replaced by others which brought the foreigners under the jurisdiction of the Japanese courts. Efforts to bring about an alteration of the agreement in this direction began immediately after the mikado's restoration. An embassy was sent out in 1871 for this purpose to the United States and to Europe, but returned without success. One of the ministers for foreign affairs, Okuma, lost a leg owing to the attack of an assassin during the progress of the negotiations. These led to no definite result, while popular feeling and attacks upon the government increased in Japan; finally England in 1894 consented to conclude a convention in accordance with the wishes of the Japanese. The other powers followed her example. Thus since 1899 a new principle became operative whereby foreigners were brought under Japanese jurisdiction, and Japan was allowed entire freedom in the imposition of custom duties, with the exception of those which had been already arranged by convention upon certain articles. The fears aroused by the introduction of these innovations have as yet remained unfulfilled. At the beginning of 1902 Japan made a further step toward equality with the western powers by concluding an offensive and defensive alliance with England on the 30th of January, thus being the first of the yellow races permitted to enter into a contract with a white power. Only the future can show whether this moral support is likely to be followed by the practical result of checking the eager advance of Russia into Manchuria and upon Korea.

Upon the occasion of the outbreak of the Boxer revolt in China in the year 1900, Japan was prevented by the jealousy of individual powers and by financial difficulties at home from playing that part which her geographical position and her Chinese interests assigned to her of right; but it must be admitted that on this occasion the military organisation of the country proved to be as sound as before, and that the energy of the Japanese leaders and their troops materially contributed to the timely relief of the besieged embassies in Peking. The attitude of Japan upon the occasion of the unsuccessful attempt at reform of Kang Yu Wei in the autumn of 1898 is not so easy to explain; at any rate, the presence of the prime minister, Marquis Ito (cf. supplement to p. 52), though not at that moment in

office, gives good ground for the theory that the attempt was supported by Japanese advice.

The historian who attempts to explain the rapid collapse of the feudal system in Japan upon considerations drawn from the condition of the country, must remember that if not all, yet the majority of official posts were hereditary both in the district of the shōgun and in that of the individual territorial lords, a fact which largely contributed to lower the official capacity of these potentates. The real power had for a long time been in the hands of the petty nobility, who stood behind the scene and pulled the strings which moved the official figures. These were the men who had brought about the revolution, who have turned it to their own advantage, and to-day conduct the business of the empire with no attempt at concealment. Although the revolution was set on foot by the nobility, yet its character was necessarily democratic, if not demagogic. After the victory over the shōguns, the privileges of the territorial lords, the court nobility, and also of the Samurai class came to a rapid end, and if the mikado was spared, such clemency was actuated mainly by the fact that his influence was indispensable to success. But even at that time loud cries were raised for the proclamation of a republic. Generally speaking the position of compromise adopted by the territorial lords has brought them rather gain than loss: in place of a pretence of power which they could only exercise within the walls of their castle and under the restraints of the most narrowing ceremonial, they have acquired a rich income, the title of nobility, and power to work or not as they please.

The great class of the Samurai came worst out of the revolution, in which they lost their incomes and their influence, such as it was, and also their occupation. Hence it is by no means surprising that this class manifested the greatest dissatisfaction with the course of the movement from which most of them had expected very different results; it was therefore necessary to find them occupation as being the most capable element in the population and the most inclined to revolutionary courses. This fact has materially influenced the foreign policy of the government, and was a leading motive in their decision upon the war with China and the expedition to Formosa. Even at the present day this class remains the most influential, and must be considered as leading the new social development both on the intellectual and on the material side. Partly by reason of their own energy, and partly owing to the support of the government, which itself consists of former members of the Samurai, the men of this class (now known as Shizoku) appear at the head of most economic enterprises and edit most of the leading journals in the country. The condition of the merchant handicraftsman and peasant has in general advanced very little, and is to-day rather characteristic of old than of new Japan.

We shall therefore be committing no injustice if we characterise this latest phase of development as one confined within the limits of a comparatively small circle, which has, however, been able to absorb many foreign elements and to impose them upon the country. Japan never had a native civilization of any importance whatever. What she borrowed from China brought upon the country the Taikwa reforms, that is, the government of a strongly centralised imperial power which gradually degenerated into military feudalism, remaining a monarchy only in name. What she has borrowed from the West brought about the fall of the feudal system and the nominal restoration of the imperial power, together with

government by clans, from which neither a free nor a party government has yet been successfully developed, while the final consequence was the parliamentary system of 1889. The results which will eventually follow all these influences cannot as yet be predicted. In spite of the obvious external changes in the country, many of its essential features are still those of old Japan. The new constitution has not succeeded in producing any far-reaching innovations either in family life or in commercial intercourse. The family and not the individual remains the unit, and as Fukuda truly observes, the individual even at the present time is only conceivable as a member of some family. The guilds and their official monopolies have been removed; but private companies for trade and manufacture exist to-day with the same objects and probably with the same rights, though these are not expressly stated. Few changes have taken place in the country population; as in early times, so now, it has no independence of its own, and though the system of units of five families has decayed, yet it has been replaced by other associations of a no less corporate nature and possessing an official status.

In one point only is there any material difference between the present and the past. In the lower classes, especially in the country population, the old beliefs and superstitions are maintained almost in their entirety, notwithstanding official attempts at their destruction; whereas in the so-called upper classes a complete indifference toward religion has taken the place of the earlier official worship which was a fusion of Buddhism, Shintoism, and Confucianism. Buddhism has fallen into disrepute partly owing to the action of the government; Shintoism, after fulfilling its political task of reviving the imperial idea, has relapsed as a religion into insignificance; and the indifferentism of the modern Japanese cannot be said accurately to represent the teaching of Confucian morality. Ancestor worship alone, which is closely connected with Confucianism, and, with the Shinto belief, still possesses some vitality; this may be said to form the foundation of Japanese ethics. Whether Christianity is destined to take the place of these decaying religions is doubtful; in any case, it will not be European nor American Christianity, but a faith founded upon a thoroughly Japanese basis with a strong leaning to rationalism.

## 2. CHINA

### A. THE NAME

THE earliest name by which the Chinese themselves have called their country is certainly "Tien Hia" (Under the Sky); "Sz' Hai" (Everything within the Four Seas) and "Chung<sup>1</sup> Kwoh" (the Kingdom of the Centre) are also early names. Heavenly kingdom is the translation of "Tien Chau;" that is, heavenly dynasty, or the country over which the dynasty appointed by Heaven rules. "Chung Hwa Kwoh" (the Flowery Land of the Centre) is usually a literary expression, and is to be referred to the fact that the Chinese consider themselves the most highly educated (Hwa) nation in the world. "Nui ti" (the Inner Land) is used chiefly to distinguish China from foreign barbarian countries. "Li Min" (the Black-haired Race) is an expression often used to designate the people; the name

<sup>1</sup> Pronounced Tshung. In all Chinese names the initial sound represented by Ch is to be pronounced as Tsh.

of "The Hundred Families" also occurs. The country is also designated by the name of "Chung Kwoh yin" (People of the Central Kingdom) and as "Han yin" or "Han tsze" (Men or Sons of Han). Under the Chin dynasty, 221 B. C., the custom appears to have come into force of calling the country and its inhabitants by the name of the reigning dynasty; however, the duration of this dynasty was too short and the hatred of its founders too great for this title to become permanent. On the other hand, as we have already observed, the names of other dynasties, such as the Han, the Tang, and the present Manchurian Ching dynasty, have become common expressions; "Tang yin" (Men of Tang) and "Ching yin" (Men of Ching) are constantly recurring expressions. The present dynasty calls the kingdom by its own title, "Ta Ching Kwoh" (the Great Pure Kingdom); a common expression is also "Ching Chau" (the Pure Dynasty). "Hwa Hsia" (the Glorious Hsia) is a name to be referred to the ancient Hsia dynasty (2205 to 1769 B. C.), but came into use only at a later period. The "Kitai" of the Russians and the "Kathay" of the Persians are names derived from the Kitan Tatars who ruled in North China from 937 to 1125 under the name of the Liau (Liao) dynasty. The Indian Buddhists call China "Chin tan" (the Morning Dawn). Manzi, or Manji, is the name of Southern China, and has also been extended to include the whole of China since the Sung dynasty were driven out of the north by the Mongols and took up their residence in Hang Chau in 1227 A. D. as the southern Sung dynasty. Manzi was the object of the expedition of Columbus (cf. Vol. I, p. 349). "Tung tu" (the Land of the East) is employed as a name for China only by Mohammedan authors.

The origin of the name "China" is still entirely doubtful. That it is to be referred to the Chin dynasty is extremely unlikely, in view of the evidence quoted by Ferdinand Freiherr von Richthofen. The same author denies the connection of the name with the Sinim of the Old Testament (Isaiah), the old Persian Matshin, the Great Tshin, which was certainly a name for China in the Middle Ages, and with Tshina, which occurs in the legal code of Manu and in the Mahābhārata. On the other hand, the various peoples of antiquity knew China as Yin, Chin, Tsin, Tshin, Tshina, and Tzinistan. Richthofen considers that the name from which all these appellations were derived was spread along the maritime trading routes, and derives it from "Yi nan" (South of the Sun), by which name the Chinese of antiquity designated Tongking and Cochin China, and perhaps also Cambodia. The fact that Marco Polo speaks of the sea at Zayton (Kwang chau fu, between Amoy and Fuchau) as the sea of Tschin, seems evidence in favour of this theory. The name employed by the Romans, "Seres," may possibly be derived from sze, sse, sser (the Chinese word for silk).

## B. THE COUNTRY AND ITS POPULATION

(a) *Configuration.*—The enormous empire of China, with the two adjoining countries Manchuria and Mongolia (Dzungaria, Ili, and East Turkestan), has an area of 9,881,100 square kilometres, of which 5,369,100 belongs to China proper, 942,000 to Manchuria, and 354,000 to Mongolia. The country is situated in the east of Asia between 50° and 19° lat. N., and 75° and 132.5° long., east of Greenwich. With the exception of the coast line belonging to the peninsula of Korea and Russian East Siberia, the eastern frontier of the empire is bounded by the three seas known as the China Sea, the Eastern Sea, and the Yellow Sea, all of

which are, strictly speaking, part of the Pacific. On the north and northwest China is bounded by Russia; on the southwest by Tibet, which is tributary to it; on the south by Tongking and Siam (see the map, "China").

The only mountain range which has exercised any material influence upon the historical development of the country is the Nan-ling (Southern Range), an offshoot of the Himalaya; this mountain chain passes through Yunnan, forms the northern boundary of Kwangtung and Kwangsi, traverses Chekiang, and after reaching the sea, is broken into the Chusan Islands and other groups, thus cutting off the south-east from the rest of China with a precipitous barrier broken by a few passes; to this fact is due the long independence and exclusiveness of this district. The surface of China as a whole slopes from the west to the east; the mountainous country lies between the meridian passing through Canton to the frontiers of Tibet, while east of this meridian and south of the Yangtze Kiang the hill country begins; to the northeast of this river lies the great plain, the most fruitful part of the country. The characteristic feature of Pechili, Shansi, Shensi, and Kansu is the yellow loam soil which was first described in 1864 by Raphael Pumpelly, and is supposed to be the deposit of fresh-water lakes. Richthofen is more probably correct in his view that the loam was precipitated under atmospherical action, with the exception of those places in the steppes where it appears as the deposit of salt lakes (lake loam). The loam is broken by precipitous gorges, which often reach a depth of many hundred feet and form a serious obstacle to communication. They are, however, a certain advantage to the population, inasmuch as numerous dwellings and often whole villages have been excavated in their walls. Where there is a sufficiency of rain the loam is extremely fertile; but the inhabitants have neither the means nor the knowledge for scientific irrigation.

In the geography of China rivers are of much greater importance than mountains, especially the three great streams which traverse the empire from west to east, the Hoangho, Yangtze Kiang, and the Chukiang. The Hoangho (Yellow River) has so often burst its banks and flooded the country as to have been called "the plague of China," and is said to have completely changed the lower part of its bed no less than nine times; it rises in the plain of Odontala south of the Kuenlun Mountains, and passes through North China for a distance of more than 4,800 kilometres. The district which it waters is about 1,211,700 square kilometres in extent. The course of the Hoangho was apparently followed by the first immigrants whose descendants we now know as Chinese, and in its valley the larger part of ancient and medieval Chinese history has been worked out. Since 1852 the Hoangho has emptied itself into the Gulf of Pechili, though formerly it flowed into the Yellow Sea south of the peninsula of Shantung. The nature of its bed makes it of no importance as a navigable waterway.

The Yangtze Kiang (so named only in its lower reaches from Nanking onward, toward Yangchau) is known in its upper course as *kin sha kiang* (River of the Golden Sands), its central portion being called merely *Kiang* or *Takiang* (River, or Great River), and from Wuchang onward it is usually known as *Chang-kiang* (the Long River). It rises in the Tangla Mountains, hardly 160 kilometres from the sources of the Hoangho and the Kuenlun range. Its bed, which is fully 5,100 kilometres in length, passes through the central Chinese provinces of Szechwan, Hupei, Ngan-hwei, and Kiangsu. It waters a district of more than 1,402,000 square kilometres. It is also the most important line of communication

in China; towns such as Nanking, Hankau, Wuchang, Ichang, and Chungking are situated upon this stream. As far as Hankau it is sufficiently deep to permit the passage of large steamers, and its importance will be increased in this respect by the construction of canals to pass the rapids between Ichang and Chungking.

The Chukiang (the Pearl River) rises in Yunnan, and is formed by the confluence of the East, North, and West rivers, of which tributaries the latter, the Sikiang, is the most important. The Chukiang passes through South China, and reaches the sea near Canton; it waters a district estimated at more than 332,000 square kilometres.

(b) *The Population.*—Nothing certain is known of the origin of the Chinese people. The theory that would refer their original ancestors to the time of the Tower of Babel cannot be established by evidence, which is equally lacking for the theories proposed by Terrien de la Couperie and Robert Kennaway Douglas, which would consider them as descended from the Accadians, relying among other evidence upon the similarity of the earliest Chinese writing to the cuneiform script. More probable is the view of Richthofen, that the original home of the first immigrants into China was in the valley of the Tarim, where they may have come into contact with Accadian and Indian civilization. Such an origin, if proved, does not, however, explain the great difference of the Chinese from all the other peoples of Asia (as, for instance, in the entire absence of a priestly or military professional class); still less does it explain the similarities (for example, the apparent existence of a certain amount of astronomical knowledge at so early a period as that of the Hsia dynasty). Equally difficult is it to discover evidence of their origin from ethnographical inquiry. According to E. Baelz the main part of East Asia (the greater part of China, Japan, Korea, Formosa, Mongolia, and Tibet) is inhabited by a population of about 500,000,000 of Mongolian race, to which must be added the peoples of Further India with the Malays. It is scarcely possible to draw a definite line of demarcation between these and the Mongolians. In North Asia, Manchuria, in the district of the Sungari River, in part of Korea and in a part of the west coast of Japan, the Manchu-Korean type is predominant. In China we also meet with the Miotse and the little known Lolo; in Southern China and Japan infusions of Polynesian blood can be traced, while a slight infusion of the woolly haired negro appears at rare intervals. The true Mongolian is predominant in Central and Southern China; further south the Malay type becomes more prominent, as does the Manchu-Korean in the north.

These facts are indisputable, but they do not help us to solve the riddle of the origin of the Chinese or of the races which existed in the East at the time of their migrations. Of such independent races which have either been exterminated or absorbed by the Chinese, there may have been a great number, though it is improbable that any one of these races was considerable in its numbers. Mention is made of the San Miao in the Shuking, the historical record of the time of Yao and Yu (2145–2046 and 2255–2206 B. C.); and in a speech made by King Wu of Chau (1134–1116 B. C.) against Chau Hsin of Shang before the battle of Mu, he refers to eight auxiliary peoples, the Yung, Shu, Chiang, Mao, Wei, Lu, Phang, and Pho. At a later period, between the eighth and seventh centuries B. C., mention is made of eight tribes of the Dsung (Yung) who were western barbarians in Shantung, Chili, Honan, Shansi, Shensi, and on the frontier of the kingdom. The Ti, who were northern barbarians, dwelt in Shansi and Chili, the I barbarians of Shantung

extended as far as the Han River, and the Man lived on the central and upper Yangtze, chiefly on the right bank. But the number of the tribes that had not then been subdued must have been much greater; even at the present day, more than two thousand six hundred years later, tribes of original inhabitants in complete or partial independence are constantly found in the southern and western provinces of the empire. That such tribes as the Li (Limin or Linnu, probably descendants of the Miaotsze to whom Kublai Khan [Shi Tsu] is said to have assigned a part of Formosa in 1292) should have held their ground in the interior of Formosa and Hainan is the less remarkable, in view of the fact that even at the present day whole tribes of original inhabitants have been able to maintain their independence in the provinces on the mainland, where the Chinese supremacy has endured for hundreds or thousands of years.

The Miaotsze are divided into sung (savage) and shuh (domesticated) according to the amount of Chinese civilization which they have acquired, and live to the number of fully eighty different tribes in Kwangtung, Kwangsi, Hunan, Yunnan, and Kweichau. They are supposed to be relations of the Siamese and Burmese, and possibly the Hakkas belong to the same race; these foreigners are said to have immigrated into the two Kwangs apparently at the time of the Mongol dynasty of Kiangsu or Shantung, in 1205-1368. It was not until 1730 that the Miaotsze in Yunnan and Kweichau were subjected to the Chinese supremacy, whereas in Kwangsi independent tribes still maintain their existence. The Yao or Yau yin, also said to be members of the Miaotsze, lived in Kwangsi until the twelfth century and then migrated to the peninsula of Liauchau, where they still continue a half-independent existence; in 1832 they began a revolt which was only suppressed with difficulty. The other great group of original inhabitants which has maintained itself within the country is that of the Lolo in Szechwan and Yunnan, who are thought to be related to the Kakyas, Shans, and Burmese; they are also divided into tribes which have made a nominal submission to the Chinese and tribes which decline to allow the Chinese a passage through their mountains, whence they make raids upon the surrounding districts.

The fact that historical documents and ethnology give us no definite starting-point for our investigations makes it necessary to turn to other sources of information upon the degree of civilization attained at the time of their migration by the ancestors of the mixed people who now inhabit the modern district of China. The most reliable evidence is to be found in the earliest style of Chinese writing; this is of a hieroglyphic nature, and contains a number of signs (said to be six hundred and eight, though really more) which are undoubtedly ideographic. The resemblance between the original form of the signs and the objects which they represented is clearly recognisable. The invention of this writing is said to belong to the legendary period; the hieroglyphic signs ceased, as early as the fourth century B. C., to be representations of definite objects, and had become purely conventional. The meaning of the earliest ideographs was usually modified by the addition of signs representing the west, a sheep, a cow, and a woman; the west and to return mean, to pass sentence as a judge; the west and the earth mean, victim of the ruler; the west and a woman mean, to wish or desire; the west and the sign implying valuable mean, to buy or to sell (objects of value from the west?); a sheep and the sign for great mean, good or excellent; a sheep and the sign for the pronoun I mean, self-respect or pride (the possession of sheep being a sign of distinction); a sheep and a man

mean, false (sheep stealer?); a sheep and a prince or a guide mean, a herd or crowd (the prince being the possessor of flocks); a sheep and the sign for words mean, to investigate carefully, to discuss a matter; a sheep and wings mean, to hover, to look back, dignified, serious (a winged ram?); a sheep and the sign for ill mean, to itch or to scratch; a cow and the sign for covering mean, security, imprisonment; two cows mean, friend; a cow and the sign of avarice mean, to appropriate (cattle-lifter?); a woman and the sign for truth mean, insinuating, persuasive, cunning in speech; one woman above another means, beautiful; a hand over a woman means, secure, firm, in peace; a roof over a woman means, quietness, peace, or to be at rest; two women together mean, to dispute or to quarrel; corn above a woman means, to be bowed under a heavy burden, to bear a weight, or to be in office, to send some one to do something; a woman with the sign for dirt means, a wife and to obey; a woman and the sign for to take mean, to marry; a man and a field mean, a husband.

If, with the help of the objects represented in the hieroglyphic writing, together with the collocations above mentioned, the attempt be made to draw a picture of the conditions which prevailed at the time when these signs were in use, we may conclude that a nation migrated into the country from the West, retaining many recollections of their old home, though these were somewhat clouded; or that they were a people who derived whatever civilization they had from the West, a people also who were in the stage of transition from nomadic to agricultural life and settled habitations. Riches, however, at that time consisted chiefly of flocks and herds, and the possession of these implied power and influence. The most common crimes were sheep-stealing and cattle-lifting, and the health or the straying of sheep was the subject upon which interest was chiefly concentrated. The woman, whom the man perhaps even then carried off by force for marriage, was regarded as an inferior and jealous creature, to be kept in stern subjection; her business was the household cares and the menial duties of the establishment. The man cultivated the field; he was free and respected; the woman's lot was toil and seclusion. A highly developed worship (of spirits or ancestors) seems to have existed; at any rate, the great number of sacrificial vessels, in many cases of the same form as those used at the present day, point to a comprehensive and extremely minute ceremonial.

### C. THE MYTHICAL PERIOD

ACCORDING to Chinese tradition, the world was developed from chaos, which was formed like an egg; from this came forth first the quickening power, the great breath, the life (Tai Chi), by the influence of which the germ of life within was awakened to life, when it divided into the male and female principle (Yin and Yang). The male principle, which was pure, bright, and light, rose up and formed the heaven; the unclean, dark, and heavy female principle sank downward and formed the earth. Both of these principles are henceforward continually operative in the work of destruction and renovation. After this division, there arises from the parts (or is created) Panku, who is often represented with hammer and chisel as forming the earth; at the same time there is a tradition of him that after his death his breath became the wind, his voice the thunder, his left eye the sun, and his right eye the moon, his blood the rivers, his hair the trees and plants, his flesh

the ground, his sweat the rain, and the parasites upon his body the men. Panku is the ancestor of the first race of rulers, the heavenly emperors, of which there were thirteen generations: these were followed by the earthly race of eleven generations, and the human race of nine generations. These in turn were succeeded by the age of the five dragons (brothers), composed of Shih ti, with fifty-nine generations, of Ho lo, with three generations, of Lientung, with six generations, of Su ming, with four generations, and of Sun fei, with twenty-two princes, who exerted a formative influence upon mankind by their examples.

The eighth age is that of Yin ti (thirteen rulers), the most prominent of whom are Yu chao (the one living in a nest) and Sui yen. Sui yen, as the Chinese Prometheus, produced fire by rubbing two sticks together, and is also said to have discovered a means of communication by tying knots in string; while Yu chao taught men to build dwelling-places at the time when they had begun to eat flesh instead of living upon a vegetarian diet, and had thus made enemies of the animals, which had hitherto been friendly to them.

The ninth age, that of Shan tung, includes five rulers, most of whom were conceived and born in some miraculous way. Fu h(s)i (said to have lived from 2852 to 2738 B. C.), who is represented with the body of a snake and the head of an ox, or of a man with two horny excrescences, taught men to fish, to tame the six domestic animals, and to use them for the support of life. The dragon-horse brought him on its back the writing of the Lo river, which is said to have led to the discovery of the eight diagrams (Pakwa). Fu hi is said to have shared with Tsangki, whom other authorities place six hundred years later, the honour of discovering the first alphabet; the introduction of family names and of musical instruments is also ascribed to him. His successor, Shen nung (Yen ti; said to have lived from 2737 to 2705), the divine husbandman with the human body and the ox's head, was the inventor of the ploughshare and discoverer of the five cereals, the use of which he taught the people; he also discovered the medicinal properties of plants and introduced markets and commerce by barter. He was succeeded by seven more generations. The distinguishing feature of this last age is the fact that the supreme power becomes hereditary in one family.

The duration of the mythical period, that is, until Huang ti (2404 B. C.), is estimated by some Chinese authors at 2,264,777 years, and by others at one million years longer.

#### D. THE LEGENDARY PERIOD

ACCORDING to some authorities, the legendary period continues until the age of Yu, that is, until the beginning of the Hsia dynasty, 2205 B. C.; according to others, until the beginning of the Chau dynasty, 1112 B. C. As Karl Arendt observes in his "Synchronistic Tables of Rulers for the History of the Chinese Dynasties," the dates given by the different historians and annals show great discrepancies. For instance, the Bamboo Books, which were discovered in 279 A. D. and consist of tablets of bamboo found in the grave of King Hsiang of We, who died in 319 B. C., containing the mythical and the legendary history as well as the annals of Chin of We, reduce the dates at the commencement by two hundred and thirteen years. It is not until 850 B. C. that chronological harmony begins.

The age of Suh yi includes the following rulers: Huang ti, 2704 to 2595 B. C., resident in Chili; Sha Hao, his son, 2594 to 2511 B. C., resident in Shangtung;

Chuan hsu, 2510 to 2433 B. C., nephew of the preceding, resident in Pechili; Ti Ku, his nephew, 2432 to 2363 B. C., resident in Honan; Ti Chi, 2362 to 2358 B. C., son of the preceding, deposed; Yao, 2357 to 2258 B. C., his brother, resident in Shansi; Shun, 2258 to 2206 B. C., step-son of Yao, resident in Shansi. Fu hi, Shennung, Huang ti, Yao, and Shun are often referred to as the "Five Emperors," a name which is also applied to the whole age, although it contains a larger number of rulers. The greater part of the history of this period is purely legendary. The development of the people proceeded very slowly. Upon the evidence of the Chinese themselves, civilization must have been at a very low level, as under Huang ti the employment for a boat of a tree trunk, which had been hollowed out and fitted with a mast, is mentioned as a new discovery. This king was also said to have been the first to distinguish the five colours (green or red, blue, black, yellow, and white), according to those of the birds and the flowers. An important event, which marks the beginning of a long-enduring agricultural system resting upon a political and social basis, is the division of the arable land into plots of nine fields, each consisting of one hundred mau (675.68 acres). These fields were divided into three rows, each row consisting of three fields, thus,  $\begin{matrix} \text{++} \\ \text{++} \\ \text{++} \end{matrix}$ , the eight outer fields belonging to the people, while the central plot was appropriated to the government, the necessities of which were represented by a special class of officials, who were also entrusted with the supervision of the fields belonging to the people. One such field was called a lin, three lin = one ping, three ping = one li, five li = one i, ten i = one du, ten du = one shy, ten shy = one chau. From the chau (the department or province) the later vassal principalities seem to have been developed.

To the rule of Shun belong the works of Yu, which formed the content of the first paragraph in the third section of the Shuking, entitled "The Tribute of Yu; Yu Yukung." Many authorities, following the examples of Chinese expositors, consider them as the narratives of a great flood and of the drainage works undertaken by Yu. Richthofen and others are probably more correct in considering this section as of especial, though not of exclusively geographical, importance. Yu, who secured by his energy the favour of the emperor Shun, received his two daughters in marriage, and when the emperor's son showed himself unworthy, was appointed his successor, and took up his residence in Shansi.

Yu was the first emperor of the Hsia dynasty, which includes seventeen legitimate rulers, and lasted from 2205 to 1766 B. C. The period from 2118 to 2079, during which the usurper Han Cho ruled, is the most eventful portion of this age. Tai Kang, the grandson of Yu, a dissolute prince, was deposed in 2160, after a reign of twenty-nine years; he was succeeded by his younger brother, Chung Kang. Ti Hsiang, the son of this ruler, was conquered in 2199 by Hau Cho, who murdered every member of the Yu family. The empress, however, succeeded in escaping, and while in flight she gave birth to a son, Shao Kang, who, after many adventures, killed the usurper in the year 2079. Ti Kuei, the last emperor of this dynasty, and his wife, Mei Hi, are depicted as dissolute tyrants, whose rule was ended in 1783 by Lu, prince of Shang, a descendant of Huang ti. However, it was not until 1766 that Lu ascended the throne as Cheng Tang, and became the first emperor of the Shang dynasty (also known as Yin since 1401), which lasted until 1122 B. C. Little is known of the twenty-eight princes of this dynasty, most of whom are merely mentioned by name in the annals. Cheng Tang (1766-

1754) who took up his residence in Honan, was a powerful and upright monarch. Under his successors the capital was constantly transferred to different places in Honan, and to Shantung, Pechili, and Shensi (near Singanfu).

The last emperor, Chan hsin (1154–1122), like the last of the Hsia, was a cruel tyrant, and his consort Tan ki was of a none the less degenerate character. He was overthrown by Wu wang of Chau. The hostility between the two families seems to have been of long standing, and had at any rate existed since 1327, when Tan fu, the "old duke" (Ku kung), had given his district the name of Chau. His grandson Wen wang (King Wen), or Hsi po (chief of the west), made an attempt, according to Chinese authors, though in vain, to convert the emperor to better methods; he died in 1135. His son Wu wang finally opposed Chau hsin, and conquered him in the battle of Mu in 1122, after which the emperor burnt himself alive in his palace, together with his wives and his treasures. Wu wang ascended the throne in 1122; with him begins the Chau dynasty (until 249 B.C.). The beginning of the historical period is usually placed in the year 875 B.C. On August 29 of this year an eclipse of the sun is mentioned as having taken place during the government of the emperor Yu wang, which enables the date to be accurately established. There is, however, no reason why the historical period should not begin with the outset of the Chau dynasty.

#### E. THE RELIGION, PHILOSOPHY, AND CIVILIZATION OF THE ANCIENT CHINESE

(a) *The Religion.*—The ancient Chinese religion, the origin of which is unknown, teaches of a supreme being, the heaven, Tien, incarnate as a supreme ruler, Shang ti. The religion is, however, very far from being a pure monotheism; on the contrary, it peoples the universe with heavenly, earthly, and human spirits which can exercise influence and receive worship. To the heavenly spirits belong the sun, the moon, the planets, and some of the constellations; to the earthly spirits, the mountains, seas, streams, rivers, springs, trees, etc. There is, moreover, a special guardian spirit of the empire, together with spirits of the soil. At an earlier period for every principality, and now for every town and locality, there are guardian spirits of agriculture, of the crops, of the herds, etc. To the class of human spirits belong the spirits of the deceased in their relations with the family, that is, the ancestors and the spirits of famous men. The religion never had, and does not now possess, a priesthood. The emperor is the high priest, and is obliged to perform in person certain religious duties, such as that of offering prayer in the temple of heaven, while there are others which he may leave temporarily or permanently to his official representatives. In his double capacity as emperor and father of his people he assumes responsibility to the heaven for the behaviour of his subjects, and national misfortunes are considered as due to remissness on his part.

(b) *The Philosophy.*—Together with the religion, popular participation in which depends solely upon the practice of ancestor worship, and the ceremonial thereby implied, two philosophical schools of thought have existed from an early period. On the one hand, the system of intuitive, metaphysical philosophy, from which Taoism has been developed; and an ethical political system, now known as Confucianism. However, neither Lao tsze nor Kung fu tsze (in Latin form Confucius) were the creators of the teaching ascribed to them, or named after

them. On the contrary, both have expressly declared themselves to be merely the preachers and the exponents of the teachings of earlier sages. As regards Confucianism, an additional proof of this truth may be found in the fact that his so-called classical works, commonly known as the "Five King" and "Four Shu," and also often as the "Thirteen King," belonged to a much earlier time than the life of Kung fu tsze.

The great classics can be enumerated as follows: 1. The Iking (book of changes), which was destined to expound the eight trigrams composed of whole and broken lines, and the sixty-four hexagrams, further developed from these, which were used for purposes of foretelling the future. These symbols, which belong to the mythical period (cf. p. 61), are certainly older than the thirteenth century B. C. Wen wang of Chau, the father, and Chau kung, the brother, of the first emperor of this dynasty, are said to have produced the explanations of these symbols preserved in the Iking. The remaining ten sections of the work are, probably in error, ascribed to Kung fu tsze. 2. The Shu king (the book of historical records), contains the remnants of a much larger collection of historical events and examples, extending from 2357 to 627 B. C. The composition of this work is also ascribed to Kung fu tsze; but the first mention of his authorship occurs in the second century B. C., three hundred and fifty years after his death. Moreover, Kung fu tsze during his life never played that part which was afterward assigned to him by Shi Huang ti (220-210; cf. below, p. 75), at a time when scholars desired a leader round whom they could form a party. After his death, a temple was erected to him on the order of the duke, in Lu, the principality of his birth, in which sacrifice was offered four times a year. But it was not until the year 1 A. D. that the emperor Ping Ti, of the older western Han dynasty, conferred upon him a supplementary title of honour, and offerings were made to him in all the imperial schools, for the first time, in the year 57 A. D. Until 609 A. D. he shared this honour with Chau kung, the duke of Chau, and the first temple was dedicated to him outside the province of Lu, in 628. However, no dynasty has done so much in his honour as the reigning Manchu dynasty. 3. The Shi king (the book of songs), contains three hundred and five songs, which may perhaps be called national odes and festival songs for different occasions, belonging to the period of 1765 to 585 B. C. The Shi king is also assigned to Kung fu tsze, no doubt erroneously. In any case, the Shi, and also the Shu, existed long before his time. 4. The Chau li, the State institutions (the State calendar) of the Chau dynasty, is said to belong to the twelfth century B. C. Like most of the other books, it was lost during the Chin dynasty, and not rediscovered until the year 40 A. D. 5. The Ili (book of ceremonies), in its present form consists of two texts which were rediscovered in the second century A. D. The Ili is mentioned by Meng tsze. But a book of this name certainly existed at the time of Kung fu tsze, if not before him. 6. The Liki (also a book of ceremonies), is a work apparently belonging to the second century A. D., containing earlier explanations of the questions treated of in the Ili. In this work is contained the so-called calendar of the Hsia dynasty, which, if it were genuine, would provide us with astronomical dates two thousand years before the Christian era. 7 to 9. The Chun chiu (chronicle of Kung fu tsze), properly autumn and spring, that is, the book of annals, contains the chronicles of the Chinese kingdom from 722 to 484 B. C., arranged according to the reigns of the princes of Lu. This

work, ascribed by Meng tsze to Kung fu tsze, is a dry and incomplete chronicle, a mere skeleton, which has been clothed with interest by the additions of the three expositors, Tso chiu ming, Kung yang, and Ku liang. 10. The Lun Yu, contains the conversations of Kung fu tsze, proverbial sayings of the sage collected by his pupils. 11. The works of Meng tsze, according to some authorities the work of the philosopher himself, who lived from 371 to 288 B. C., while others consider it as the composition of his pupils. It is, at any rate, a collection of the sayings of this master. 12. The Hsiao king (book of filial love), is said to have been composed by Tsze sze, the grandson of Kung fu tsze, from conversations held by Kung fu tsze with one of his pupils. It treats of questions concerning the fulfilment of the duties of filial affection, and also of the relations between master and servant. 13. The dictionary Urhuya of the year 500 B. C., also contains portions which are supposed to date from the thirteenth century. 14. The Tahio (great teaching), also ascribed to the grandson of Kung fu tsze, teaches the duty of practising virtues, educating the people, and continuing in perfection. 15. The Chung Yung (the unalterable mean), a work of the grandson of Kung fu tsze, teaches that whatever man has received from heaven is his nature, and that he who acts in harmony with it walks in the path of virtue, and that man can only learn this path by instruction. Every one, especially the prince, must exert influence by example, and to be able to use these influences he must strive for perfection. The way to this end lies, however, in the mean. 16. The Tshu shu (the Bamboo Books), the origin of which has already been mentioned (p. 62). These bamboo tablets, inscribed with more than one hundred thousand signs, contained, besides annals, a copy of the Iking and thirteen other works, in part of a highly imaginative character. A book that, though not authentic, is highly esteemed for the large mass of tradition it relates, is the Kung tsze kia yu (sayings of Kung fu tsze among his pupils), dating from the third century B. C.

Most of the works above mentioned, with the exception of the Iking, the works of Meng tsze, and the Urhya, were lost in the general destruction of books which took place under Shi Huang ti (cf. p. 75), and some of them were not rediscovered for a considerable period. In many cases they were recovered in an incomplete state, or in different and discrepant texts. The industry of collectors and expositors has restored as much as was possible. But Chinese critics consider many of the passages, officially recognised as genuine, to be doubtful or false. However, the classical works of the Chinese in their present state must be considered as representing a faithful picture of the ages in which they were composed, or, any rate, of those ages as they appeared to the later Chinese.

The other school of thought, Taoism, possesses no ancient works beyond the half-legendary Tao teh king, ascribed to Lao tsze, the book of the way and of virtue. Lao tsze (the old youth), whose true name is said to have been Li R, is said to have been born in 604 B. C., and to have disappeared in 517, after a meeting with Kung fu tsze, which can hardly be historical. In the Tao teh king are to be found many quotations, introduced with the words "a sage," "an old man," a fact which proves that the teaching of Lao tsze cannot have been new. What Lao tsze advocates as resulting from the wisdom of earlier periods is complete abstinence and introspection. The meaning of the word "Tao" has never been explained or understood. Like the Hellenistic "Logos," it is at once the efficient and the material cause. Lao tsze says of the Tao, "It was undetermined and

perfected, existing before the heaven and the earth. Peaceful was it and incomprehensible, alone and unchangeable, filling everything, the inexhaustible mother of all things. I know not its name, and therefore I call it Tao. I seek after its name, and I call it the Great. In greatness it flows on for ever, it retires and returns. Therefore is the Tao great." Another passage has led critics to suppose Hebrew influence. "We look for the Tao, but we see it not; it is colourless. We hearken for it, we do not hear it; it is voiceless. We seek to grasp it, and cannot comprehend it; it is formless. That which is colourless, soundless, and formless cannot be described, and therefore we call it One." The fact that colourless, soundless, and formless in the Chinese text are represented by Ji, hi, wei, has led Abel Rémusat, Victor von Strauss, and Joseph Edkins, in opposition to the views of almost all other Chinese scholars, to assert that Lao tsze was attempting to express the Hebrew Jehovah. It is more probable that Indian influence, though this fact is equally impossible to prove, gave the impulse to the development of this intuitional teaching. As regards his cosmogony, Lao tsze takes his stand upon the ancient Chinese teaching. "The Tao brought forth One, One brought forth Two, Two brought forth Three. Three brought forth everything. Everything leaves behind it the darkness out of which it came, and goes forward toward the light, while the breath of the void makes it perfect;" that is, from the original chaos, which contains the germs of life, but as being incorporeal is called the void, there are now developed the male and female principles, which create dead matter, represented by its three highest appearances as heaven, earth, and man, to which the breath gives life.

To summarise the further development of Taoism, its most flourishing period was that of contest against Confucianism and sharp criticism of Kung fu tsze. Kwang tsze, Lieh yu kan (in Latin, *Licinus*), and perhaps also Chang Chu, place rather too great an emphasis upon Epicurean and Cynic tendencies, but as thinkers stand high above Kung fu tsze and also above Meng tsze (Meng ko, Mencius, 371 to 289 B.C.), who is himself far in advance of his master. But as early as the period of Meng tsze, Taoism seems to have taken upon itself the alchemist and necromantic character, which has since been its dominant feature. It thus became a very superficial system of teaching, and the Tao priests turned their attention from the pursuit of philosophy to the exploitation of superstition. Where, in spite of these disadvantages, the doctrine was able to influence princes and statesmen, it has always proved an obstacle to healthy development.

Taoism, though originally on a higher intellectual plane than Confucianism, thus sunk far below it, while the dry worldly wisdom of Kung fu tsze and his school maintained its old position, and to the present day exercises undiminished influence upon the Chinese. Confucianism teaches the art of becoming a good father, official, minister, landed noble, and emperor, of fulfilling the duties connected with a man's position, and of seeing that subordinates, children, and people, as well as officials, perform their duty likewise. Beginning with the love of the child for his father, and concluding with the love of the emperor for his people, the philosophy of this school embraces the whole range of human relations, and has thereby gained a hold upon the life and conduct both of individuals and of the community which has remained unshaken to the present day (cf. p. 68, above).

(c) *The Civilization of the Ancient Chinese.*—Taoism and Confucianism are proofs of a high degree of intellectual development. The great exponents of these schools bear witness, and the fact is confirmed by the evidence of the Chinese classics, that this development began long before the days of Lao tsze and Kung fu tsze. It must have been founded on a widespread civilization and a relative high degree of culture. In the Chau li, I li, and Li ki we find proofs of the existence of a comprehensive and detailed system of administration. The rights and duties of every class of the population are prescribed to the smallest details. Every season has its appointed tasks. Full provision is made for the observance of all ceremonies connected with funerals, receptions, the dedication of temples, festivals, drinking feasts, archery, etc. The relations of parents to children and children to parents are detailed in full form and ceremony.

Great attention was paid to the equipment and evolutions of the troops, to which orders were transmitted by signal. Two-wheeled chariots, both open and closed, and harnessed with one, two, three, and four horses side by side, were in common use. In war, chariots were used drawn by two horses and carrying three people,—the charioteer, a spearman, and an archer. The emperor takes the field with ten thousand chariots. Cavalry does not seem to have been employed in the earliest period, though pictures of cavalry conflicts are found belonging to the second century A. D. The arms in use were the spear, the halberd, the sword, the club, and the axe, the bow and arrow and crossbow. The defensive armour apparently consisted of a small shield, and, in early times, of leather harness. This last was afterward replaced by chain and mail armour.

In the arts of peace the Chinese had also made great progress a thousand years at least before the Christian era. There are in existence at the present day vessels of bronze which date from the Hsia, Shan, and Chau dynasties. The book called "Po ku tu lu," the first edition of which belongs to the years 1119 to 1126, and the "Si tsing Kan kien," a work published by order of the emperor Kien lung in 1759, and describing his collection of antiquities, contain numerous illustrations of these vessels. They display excellent workmanship and rich ornamentation. Animals are often represented; numerous examples of palaces, great and small, are met with. A large number of beautiful works of art in nephrite are also in existence, especially sacrificial vessels and plates, with ornaments for the extremities of chariot poles. The art of silk weaving seems to have been highly developed, and the attention devoted to it at the courts of the emperor and the princes must have exercised a beneficial influence upon its progress. Little is known of the art of pottery as practised by the Chinese. Proofs exist of the production of pots and tiles of clay in the second and third centuries B. C., but there can be no doubt that earthenware had been made at a much earlier period. Porcelain ware, on the other hand, does not appear before the sixth or seventh century of the Christian era (cf. p. 113).

We have no certain knowledge concerning the invention of written characters. It appears from the Chau li, which probably belongs to the twelfth century B. C., that in the ninth year of that century the historians of the different principalities met together in the capital for the purpose of reducing pronunciation and written signs to a common standard. According to a lexicographer of the twelfth century A. D., the Tai tung, the first powerful prince of the Chau dynasty, reduced the prevailing confusion to order and uniformity. In the "Unalterable Mean," a work

OLD CHINESE STONE CARVING IN RELIEF: ORNAMENTATION IN BAS-RELIEF ON THE SIXTH STONE OF THE NEARER BURIAL  
VAULT OF THE FAMILY WU IN SHANTUNG, ABOUT 150 A. D. ONE-SEVENTH ACTUAL SIZE

(Drawn by Dr. Franz Eitold from the cast reproduced by Ed. Clavannes in his "Sculpture sur Pierre en Chine.")

## EXPLANATION OF THE OLD CHINESE SCULPTURE IN RELIEF

At the foot of the mountain range Wu che shan (T'se yun shan), in the department of Kia slung (Shantung), lies the extensive burial place of the Wu family, which flourished in the second century A. D. The tombs are of the highest importance for our knowledge of early Chinese sculpture.

Wu ting (Kao Tsung, 1324-1266): twentieth emperor of the Shang dynasty; reputed ancestor of the Wu family

Wu (names unknown)

The monuments erected by the four sons to their common father (whose name is not given), and the memorial to Wu Pan, who died prematurely, have aroused the attention even of the modern Chinese, on account of the bas-reliefs, which give an accurate description of life and manners under the later or Eastern Han dynasty. In 1786, casts were made of the sculptures in relief by Hoang J (Siao sung), which were added to by Li K'o cheng and Liu Chao yung in 1789 and again in 1820.

As regards the character of this relief work, Edward Chavannes observes: "The figures and objects are flat, but are raised about two millimetres above the surface of the background; one might say that they had been cut out with a pinking-iron and then fastened upon a level surface. Shadows and detail are indicated by grooves." Cf. also the section upon "La pierre sculptée" in Paléologue's "L'art chinois" (Paris, 1887).

The bas-reliefs reproduced overleaf are upon the sixth stone of the nearer burial vault, which is 2 metres in length and 0.8 metres in height. The illustration is divided into two parts of unequal size.

*Upper Division:* The last two carriages on the left are, as the inscriptions tell us, those of the scribe and of the military commander. At the left extremity are three nobles on horseback; one of the horses, boldly but rudely designed, is turning its head back. On the right (beyond the limit of our reproduction) a man is holding a shield and sword, and a second a cross-bow; a kneeling woman appears to be asking mercy.

*Lower Division:* A battle is in progress on level ground, on a bridge, and on a river with boats, at the same time. On the right (barely visible in our illustration) are to be seen, as the inscriptions tell us, the carriages of the chief of police, of the taxgatherer, and the scribe; on the left, those of the chief receiver of taxes and of the chief of the scribes.

(Mainly after Edouard Chavannes, "La Sculpture sur Pierre en Chine au Temps des Deux Dynasties Han." Paris, 1895.)

belonging to the fifth century B. C., mention is made of the fact that it was the emperor's prerogative to arrange use and custom, establish standard weights and measures, and determine the signs of the alphabet. From that time onward it is said that all the chariot wheels throughout the kingdom were of the same shape, and that all writing was executed with the same signs. Tablets of bamboo were used for writing even after the period of Kung fu tsze. The signs were first cut into these and then painted over with a composition of lacquer. The invention, or, at any rate, the general use, of the camel's-hair brush dates from the year 220 B. C. At a later period silk and other cheaper materials were employed. The use of paper made of the bark of trees, hemp, rags, and old nets, does not appear before 105 A. D.; and it can be proved that silk also was in use until the year 418 A. D.

Of special interest for our knowledge of early Chinese civilization are the remains, existing in different parts of Shantung, of the interior lining of tombs. The two main centres of these discoveries are upon the Wu tsze shan and on the Hiao tang shan. In other parts of Shantung these slabs appear separately or in twos and threes. They date from the second century A. D., probably between the years 147-169 and 125-137. However, references in the classics make it certain that the art of sculpture in low relief was widely spread throughout China during the second century B. C. The scenes represented upon the interior lining of the above-mentioned tombs, which are chiefly known to us through the researches of Edouard Chavannes, are most exclusively taken from the Chinese classics, but their great variety affords a characteristic picture of ancient China. They afford representations of chariots, riders, battles, hunting, fishing, imperial receptions, and of solemn processions with elephants, camels, and apes (see the plate, "Ancient Chinese Stone Relief").

Certain representations of palaces with rich decorations on the outer walls provide us with a complete explanation of a poem by Wang Wen kao, composed in the second half of the second century A. D., upon the "Palace of Supernatural Splendour." This was erected at Lu in Shantung by King Kung, the son of the emperor king (154-140 B. C.), in the second half of the second century B. C. Wang describes the palace as follows: "High above on the upper beams are barbarians in great number; they appear to observe the rules of courtly behaviour by kneeling down, and they are looking at one another; they have great heads and the fixed look of the vulture; they have enormous heads, with deeply sunk eyes, and they open their eyes wide; they seem like people who are in danger and are afraid; attacked by fear, they knit their eyebrows and are full of uneasiness. Divine beings are upon the summit on the roof tree; a woman of nephrite is looking down below at the window. Suddenly the gaze is troubled by an uproar and a crowd of figures, as if demons and spirits were there. All kinds and a whole company of beings are represented, those in heaven and those on the earth, the most different objects, the most remarkable miracles, the gods of the mountains, the spirits of the sea. Their pictures are there. With red and blue colours the thousand figures and their ten thousand transformations have been represented. Everything has its place and its own character; through the colouring each is like to its kind, and by art their being has been expressed. Above we are taken back to the great separation (of the two elements out of chaos) and to the beginning of the earliest antiquity. There are the five dragons with two wings; Jen hoang, with his nine heads, Fu hi, with his body covered with scales, Niu kwa, in form a

man above and a snake below. Chaos is huge and without form; its appearance is rough and unworked. And here appear, blazing with light, Hoang ti Tang and Yu; they have the chariot *hien* and the hat *nien*; their mantles and clothes are of different materials. Beneath we see the three dynasties (of Hsia, Yu, and Chua); here are the favoured wives of the emperor, the chiefs of the revolts, the true subjects and the pious sons, the famous men and the virtuous women, the wise and the stupid, the victor and the conquered; there are none that are not represented. The bad examples are there to inspire posterity with abhorrence for the bad, while for the instruction of posterity the good are there." The palaces represented upon the slabs of the tombs are ornamented with birds (peacocks, pheasants, bustards, owls, geese, and crows) and apes at play, also with a falcon swooping upon a hare. These animals are seen upon the roof tree and upon the broad, roof-like covering of pillars, standing apparently by themselves; other slabs contain representations of fabulous beings of a mythical period, and portraits of the early emperors and heroes which resemble those described by Wang.

#### F. THE ANCIENT HISTORY OF CHINA

(a) *The Chau Dynasty (1122 to 249 B. C.).*—The home of the ancestors of the Chau was originally situated in the neighbourhood of the modern Pinchau, in the central part of the Ching River, a tributary on the left bank of the Wei, which again runs into the Hoangho. Hard pressed by the Ti barbarians (p. 59), whom he was unable to appease either by presents or payment of tribute, Tanfu, the first duke of Chau (p. 62), settled in the year 1327 B. C. in the Chi Mountains (Chi shan), on the south, half way between the Ching and the Wei. His son Wen wang then removed the capital yet further south to the right bank of the Wei, on the Feng, near the modern Singanfu in Shensi. A supposition that the people and the dynasty of the Chau were of Tartar origin is highly probable, and the theory is further supported by the fact that the State religion in their period was largely subject to Shaman influences. Witches and sorcerers had an official position under the Chau; they accompanied the prince everywhere, and hardly any State or family business could be transacted without previous consultation with them. Human sacrifices (at funerals), which are mentioned in the Shiking, in the Liki, and in the works of Meng tsze, and are heard of under the early rulers of the present Manchu dynasty (middle of the seventeenth century), may also be referred to Tartar influences.

(a) *The History of the Chau until 600 B. C.*—The creation of a large number of feudal States by the first and second rulers of the dynasty is perhaps to be referred to the necessity which they felt for strengthening their own power by attaching relations and servants to their persons, and also to their desire to gain friends among such nobles as were then in existence. Fiefs were granted to fifteen brothers of the first ruler, to the descendants of the Five Emperors, and to other rulers and deserving statesmen, numbering fifty-five in all. In addition to these there existed, or were created, a large number (apparently eighteen hundred) of great and small immediate officials of the empire. The size of the fiefs was proportionate to the rank of the recipients, and seems to have varied between one hundred li for princes and counts, and fifty for the common nobility. Of the

greater fiefs, of which one hundred and twenty-five are known to us by name, Chi, Lu, and Tsao were situated in Shantung, Yen in Pechili near the modern Peking, Tsin, afterward divided into Chao Han and We, in Shansi; all of these were north of the Hoangho. To the south of this river in Honan were Chen, Cheng (at first in Shensi), Sung, Tsai, and Wei; Chin (Tsin) was in Shensi, to the west of the great curve made by the Hoangho; on the central Yangtze in Hukuang was Chu; finally, Wu was situated in the modern Kiangsu, and Yue in Chekiang. The creation of these feudal States led to the eventual downfall of the dynasty; the great territorial lords increased their power at the expense of the imperial authority, and made their strength felt at first in family disputes within their own principalities, and afterward in struggles between the different feudal States.

The first sign of a change in the relations between the emperor and the princes was a revolt in Lu and the ascent of Tsi to the throne, after murdering his brother (1039), to which act of aggression the emperor Chao wang offered no opposition. Mu wang (1001 to 946) plays a great part in the later Taoist literature. Apparently an expedition which he actually carried out against a tribe of the Jung gave rise to the story that he paid a visit to Si Wang mu, the mother of the western emperor who lived in the Kuenlun. This visit the Bamboo Books relate with many imaginary details. Li wang (878 to 827) was driven out of the kingdom in 842 by his people on account of his dissolute behaviour, and spent the rest of his life in exile, while the government was carried on by his ministers. His son Hsuan wang (827 to 782) undertook in person, or through his generals, a number of campaigns, directed principally against the frontier peoples who had revolted from China during his father's rule; these he again reduced to subjection.

With his son Yu wang (781 to 771) the "historical" period begins. To his reign belongs the story of the beautiful girl of Pao, Pao sse; she was sent as a present by the prince of the small vassal State of Pao, which the emperor proposed to subdue, and soon succeeded in completely entangling him in her toils. The Chinese historians relate that in order to get a smile from his lady, the king one day had the signal fires lighted which were to bring up the troops of the vassal States to his help. She certainly laughed to see these troops thus fooled; but a few years later an incursion of the Jung took place, and upon this occasion the princes disregarded the signal, and the emperor, with his lady love, was slain by the enemy. His son and successor, Ping wang (770 to 720), removed his residence to the eastern capital of Tung tu in Lo yang, which had been previously founded by Cheng wang, a son of Wu wang (1115). With him begins the period of the Tung Chau, that is, the eastern Chau. Chinese history then becomes rather the history of struggles between the different feudal States than that of the imperial house, which was itself in a state of great confusion.

(3) *Kung fu tsze*. — Kung fu tsze (Confucius, cf. p. 64) belonged to a collateral branch of the family of the Shang emperors. He was born in the principality of Lu, in the reign of Ling-wang (571–544) and in the year 550. By the influence of the Ki family, one of the three chief families of the principality, upon which he seems to have been to some extent dependent, Kung fu tsze received an official post at an early age, which, however, he resigned about 517 for the profession of teacher. He gathered about himself a number of younger scholars from the great families; attended by these followers, he travelled about the country and also visited the

capital. There, according to a later tradition, he is said to have met Lao tsze, who was older than himself, and held the post of overseer of the treasury. After his return to Lu, quarrels broke out between the three most powerful families in the principality, the Ki, Shih, and Mang. The duke was driven out in consequence, and Kung fu tsze followed him into the neighbouring principality of Tse. Being unable to obtain any appointment there, he returned to Lu; after fifteen years he was given a position in this province as chief official of the town of Chung tu. Afterward he became assistant to the chief inspector of public buildings, and finally minister of justice. In these three posts he is said to have performed excellent service, but he ultimately succumbed to the machinations of his adversaries, who had made a strong impression upon his duke by a present of sixty beautiful dancing and singing girls. It is more probable that the family of Ki, which had appointed him, also brought about his dismissal when they saw that Kung fu tsze was attempting to overthrow the power of the great vassals in the principality and to destroy their fortified towns. To the influence of this family the fact is also to be ascribed that Kung fu tsze, after wandering through the empire for many years without obtaining any appointment, was at length (483) allowed to return to Lu in old age and feebleness. There he died in 478 B. C. at the age of seventy-three, his temper soured by the disappointment of all his hopes. His last words were, "No wise ruler appears; no one in the whole kingdom desires my advice: it is time for me to die."

Kung fu tsze was a characteristic product of his age and his country; he was careful to confine his teaching to those relations between man and man arising out of the intercourse of daily life, and to this fact is due the permanence of that influence which he has exerted upon his compatriots. One of his later commentators says of him: "Confucius preferred to deal with the usual and the normal, not with the abnormal nor the extraordinary; he spoke of what can be attained by energy and persistence, and not of achievements due to superhuman strength; law and order, not anarchy and intrigue, were his subjects; he spoke of human affairs, and left the supernatural alone. He taught the meaning of the principles laid down in the writings of the ancients, and enjoined conformity with these, together with morality of life and fidelity to ethical principles." To the question of one of his pupils whether there was any one word which might be taken as a general rule for behaviour throughout a man's life, he replied, "Is not reciprocity such a word?" When another pupil disputed whether or no evil should be repaid with good, he answered, "Wherewith, then, shall good be repaid? Repay evil with justice, and good with good." Here he shows himself as representative of popular opinion (Lao tsze in the Tao teh king transgresses the golden rule), as he does when expressly confirming the principles of blood vengeance, which prevailed in China at that period and long afterward.

There is nothing exceptional in Kung fu tsze's adoption of the profession of a teacher, or in his wanderings from one princely court to another. Before and since his time, teachers have traversed China, generally with a strong following of pupils and adherents, amounting in many cases to several thousands; they may, perhaps, be compared with the Jewish prophets, with the Brahman and Buddhist sages and the Greek philosophers. Half rhetoricians, half politicians, they were anxious for appointments and occupation at the courts of the princes. They were never willingly received, on account of their haughty demeanour and their claims to superior

knowledge, and perhaps even less willingly in view of their desires for material advantage. To the princes and often to the population they were a burden, as they were the abhorrence of the professional statesman. Generally, even in cases where they had found recognition for the moment and practical employment, they were not long able to maintain their ground, and succumbed to the machinations of the native nobles and official families who were struggling for power in every small State. "After the death of Kung fu tsze," so runs the history of the earlier Han dynasty (210 B. C.—24 A. D.), "his teaching came to an end, and after the death of his seventy pupils [this number includes, no doubt, only the chief of these] his doctrines were distorted. There were a great number of different texts of the Shu king, of the Shi king, and of the I king; during the disorders and quarrels in the period of warfare between the States, truth and falsehood became yet more confused, and great disorder reigned throughout the doctrines of the different philosophers."

(7) *Meng tsze.* — Meng tsze (Mencius) first appears during this period of the decay of philosophy and the empire. He, too, was born in Lu, in 371, and was a descendant of one of the three great families who shared the power of that principality at the time of Kung fu tsze, though they had by this time lost their position and become impoverished; so far his career was similar to that of his prototype. At an early period he gathered a number of scholars around him in his native State, who, according to the custom of the time, contributed to his maintenance in proportion to their means; but in 331 he gave up this peaceful existence, and set out with his pupils to begin a career of political reform at the courts of the smaller principalities. He occupied an unimportant post in Tse until the year 323, apparently with no great success, and then travelled to Sung, Su, Tsao, Tang, and Leang, ultimately returning to Tse; eventually he travelled back to Lu in the year 309, discouraged and undecieved. Here he lived in retirement, and died forgotten and unnoticed in 289 B. C.

Meng tsze was undoubtedly a man of much greater energy and importance than Kung fu tsze; nevertheless, more than thirteen hundred years elapsed before he received official recognition (1088 A. D.) and was given a place, though only a fourth in rank, among the scholars in the temples of Kung fu tsze. At this time his works were included among the classics (p. 65). This official disregard is by no means in harmony with the respect with which he was regarded in literary circles from the second century A. D., and is, no doubt, to be ascribed to the fact that whereas Kung fu tsze supported the supremacy of the imperial house, and condemned any transgression of the narrow limits of ceremonial duty by one of the imperial princes as unjustifiable presumption, Meng tsze, on the other hand, had observed the weakness of the existing dynasty, which indeed collapsed forty years after his death, and propounded the opinion that the imperial throne belonged by right to the worthiest. Moreover, in his teaching the people were the first consideration. "The people," he says, "are the chief element in a country; after them come the deities of the arable land and the corn, while the ruler is the least important of all." In his explanation of the passage in the Shu king, "The heaven sees as my people see," Meng tsze observes that the heaven is not speaking for itself. If the leader who is in power rules well, this is a proof that his power has been given him by the heaven; should he rule badly, some one will arise to take his power

from him. It was for this reason that the founders of the Chau dynasty had overthrown the last unworthy monarchs of the Shang dynasty, and in this act had shown themselves the instruments employed by the heaven. Meng tze even asks King Suen, at whose court he then was, to follow this example and to overthrow the Chau dynasty, which had shown itself unworthy of the throne. Naturally such principles were not likely to predispose rulers of that or of later periods in favour of the man who publicly proclaimed them. However, the principles which he preached proved a material counterpoise to the absolutist tendencies of Chinese rulers. The vigour of intellectual life in China at his time is shown by his discussion of the question whether human nature is good or bad, by his opposition to the demands of the socialists of the period that every one, the prince included, should procure what was needful for his own maintenance, that is, should sow, reap, and prepare for harvest; by his refutation of the teaching of Mi Tih upon "universal love," that is, benevolence toward all, and also by his refutation of the principle enunciated by the Taoist Chan Chu, "Every man for himself," and by his philosophical dissertations on the doctrine of predestination, on filial affection, and many other subjects. Perhaps in China as in Germany the system of petty States which limited the political horizon of the people and of the princes proved favourable to the development of science.

(δ) *The Fall of the Chau.* — The power of the imperial house had been weakened both by the struggles between the princes of the empire and by family disputes and consequent quarrels about the succession, which often resulted in revolt and murder; it was no longer capable of interference in the continual struggles between the vassals of the empire. The results of these struggles, which began at the outset of the fifth century B. C. and ended in 221 B. C., can be seen in the following summary drawn up from the lists of Arendt: Sung conquers Tsao in 487, and is conquered by Chi in 286 (Chi is conquered by Chin, 221). Chu conquers Chen in 478, Tsai in 447, Chi in 445, Yue in 334, Lu in 249, and is conquered by Chin, 223. Yue conquers Wu in 473, and is conquered by Chu in 334 (Chu conquered by Chin, 223). Han divides Tsin with Chao and Wē in 376; conquers Cheng, 375, and is conquered by Chin, 230. Chao (later Tai) divides Tsin with Han and Wē in 376; is conquered by Chin in 228, as also is Tai in 222. Wē divides Tsin with Han and Chao in 376; is conquered by Chin in 225. Chi conquers Sung, 286, and is conquered by Chin in 221. Chin conquers Han in 230, Chao in 228, Wē in 225, Chu in 223, Tai and Yen in 222, Chi in 221, and annexes Wei in 209.

(b) *The Chin Dynasty (220–206 B. C.).* — The State which ultimately emerged victorious from this universal struggle and overthrew the imperial house of the Chau was that of the Chin. The new dynasty, like the old, was profoundly affected by Tartar influence. Fei tze, the ancestor of the clan, had been overseer of the stable of the emperor Hsiao (909–895) of the Chau dynasty, and had been invested by him with the district of Chin. His son ruled as count of Chin from 857–848; the first duke was Po (847–845), and the first king of Chin, Hui wen (337–311). In 256 B. C. Nan wang, the last ruler of Chau, abdicated in favour of Chao Hsiang of Chin; his second successor, Chuang Hsiang (249–247), deposed the regent of the eastern Chau, the last scion of the imperial family, in 249, and

thereby brought the dynasty to an end. His successor in Chin subdued (246-221) the States of Han, Chao, Wē, Chai, Tai, Yen, and Chi, which had hitherto been independent, and in 220 B. C. ascended the throne of the united kingdom under the title of Chin Shi Huang ti, the first (illustrious) emperor of the Chin dynasty.

Shi Huang ti, one of the greatest princes of China, enjoys a very bad reputation among the Chinese. This is due to two events for which he was responsible,—the “burning of the books” and the building of the great wall. Sze ma tsien (163-85 B. C.) in his “Historical Records” has given a dramatic description of the events which preceded the destruction of the classics ordered in the year 213 B. C. From this destruction only the books of medicine, of fortune-telling, and of agriculture, and the works of Meng tze, are said to have been spared. The truth probably is that the emperor desired to put an end to the criticisms of the literary classes, who were continually referring to the traditions of the past, and therefore ordered the destruction of the works containing these traditions. When this edict produced no satisfactory result, he determined upon the execution of the culpable literati. More than four hundred and sixty learned men who had retained the proscribed books instead of surrendering them for destruction, and had spoken evil of the emperor, were buried alive, and the edict was carried out with the utmost severity against all suspicious persons. The edict was issued at the instigation of the minister Li sze. It was to the effect that all chronicles, with the sole exception of those of the house of Chin, together with all copies of the Shi king, of the Shu king, and the books of the Hundred Schools, should be burned; any one who did not deliver up his books was to be branded and sent to hard labour on the great wall. We can easily understand that the *laudatores temporis acti* were troublesome, and perhaps appeared dangerous to the man who had been the first to put down the dangers of the vassal system with a strong hand, and to save the kingdom from the disruption into which it would have fallen without his family and himself; moreover, similar measures had been employed at an earlier period in China by conquerors and usurpers, or at any rate had been directed against the records of the principalities which they had subdued.

Since the last years of the fourth century B. C. ancestors of Shi Huang ti had built isolated fortifications against the Hu, as also had the princes of Chao and Yen against the same enemy and against the Jung, who now appear under the name of Hiung nu. Shi Huang ti probably did nothing more than unite these isolated fortresses into one. The great wall so constructed was an earthen rampart forming a protection against the incursions of mounted freebooters, with a length of twenty-five hundred kilometres, extending from Minchau on the east of Lunchaufu in Kansu as far as Pechili, and perhaps as far as the sea, where a wall of later date now ends at Shanhaikuan. He did not, however, begin the construction of this wall until he had driven back the Hiung nu with a great army; the erection of the great wall was consequently rather a triumphal monument than a work of defence. The retreat of the nomadic races on the north and west further westward, and the resulting invasions of West Asia and Eastern Europe, are more easily explicable as a consequence of a revival of strength in China and of her advance, than by the existence of the wall. It is impossible to say how much credence may be given to the reports of the fabulous numbers of men employed in the construction of the wall; according to Chinese authors, only convicts were employed upon the work. Popular ideas upon the subject are, however, well illustrated by the fact that in

the recollection of the people the time of the building of the great wall lives as the only period when the birth of a daughter was an occasion for joy, as daughters could not be sent to work upon the wall.

Shi Huang ti (220-210) also built a castle in Hsienyang, near Singanfu, the famous O fang kung. The chief hall in the upper floor is said to have been large enough to contain ten thousand persons, and standards fifty feet high could be set up in the under rooms. Round these rooms galleries ran; a high causeway led from the castle to the ridge of the mountain lying to the south, where a similar construction passed over the river Wei to the capital. One of the palace gates is said to have been made of loadstone; if a warrior in mail armour or any one with arms concealed about him attempted to pass the gate he was rooted to the spot by the loadstone. A similar legend referring to the action of the loadstone upon iron appears at a later time in the history of the popular hero Chu ko liang (181-234 A. D.), and is no doubt to be referred to Indian sources. If the legend about Shi Huang ti does not also belong to a later time, it may contain a reference to his regulations for the general disarmament of the people. Of the arms collected upon that occasion bells and twelve statues of the barbarians are said to have been constructed; most of the latter were apparently broken up in the year 192 A. D. and coined into cash, though some survived until the third century A. D.

For the maintenance of the Chin dynasty and the continuance of the work begun by its first emperor a supply of capable men was an indispensable necessity. Shi Huang ti died in the year 210. His funeral was celebrated with great solemnity, and a number of his wives and servants, and the labourers who had been employed upon the tomb, are said to have been buried with him. His elder son Fusu had been set aside in the arrangements for the succession, and the throne fell to the younger son, under the title of Erhshi Huang ti, or second emperor. However, at the same moment pretenders arose in all the vassal States which his father had subdued, and though at the outset the imperial armies fought successfully, they were afterward defeated. Finally (207 B. C.) the eunuch Chao Kao murdered the emperor, and set his nephew Tsze Ying upon the throne; he, however, after sixty-four days surrendered the power to Liu Pang of Pei, who had been an official, and afterward became the first emperor of the Han dynasty. Thus the Chin dynasty came to an inglorious end in the year 206.

(c) *The First or Western Han Dynasty (206 B. C.—8 A. D.).*—The period of the Han dynasty may be described as a time of literary reaction, and also, if the Tartar origin of the preceding dynasty, or at any rate their Tartar tendencies, be taken into account, as a period of national reaction against foreign rule and influence. The founder of the dynasty had to pass through a severe struggle before he succeeded in establishing peace and order throughout the kingdom. In all the thirty-six districts of the kingdom pretenders had arisen and assumed the title of kings; the least at which they aimed was independence of the central power. Liu Pang was originally a peasant of the modern Kiangsu, and owed his influence to a rich marriage. At the head of a body of rebels he had made himself duke of Pei; he formed an alliance with Hsiang Chi, the "tyrant or royal protector" of the Western Chu (Honan and North Ngan-hwei), and the nephew of Hsiang Liang († 206), who as early as 209 B. C. had revolted against the house of Chin; and the two allies were successful where Hsiang Liang had failed. The last of the Chin,

Tsze Ying, surrendered to Liu Pang the insignia of the empire; but the latter was unable to cope alone with Hsiang Chi, who had put to the sword, if report be true, the whole army of the Chin in 206 (two hundred thousand men), which had surrendered to him. Liu Pang, therefore, procured his appointment as king of Han by Hsiang Chi. Hsiang Chi, or "Pa wang," first murdered Tsze Ying and afterward I Ti (Prince Huai of Chu), whom he had set up as nominal ruler of the principality; Liu Pang then revolted against him, and conquered him after a long struggle. In 202 Pa wang committed suicide, and Liu Pang ascended the throne, under the name of Kao Tsu (or Kao Ti), as the first emperor of the Han dynasty.

(*a*) *From Kao Tsu to Ching Ti.*—Kao Tsu (202–195) is considered to have been a kind and upright prince. He was, however, continually forced to struggle against rebel nobles to whom, in opposition to the policy of the Chin, he had assigned districts of their own; and he died of wounds received in one of these campaigns. The injustice and cruelty committed in his reign is ascribed to the action of his consort, the empress Lu hau. Her son Hui Ti (194–188) succeeded his father Kao Tsu; but under his reign and that of his successor, his adopted son Shao Ti, as also under Prince Hung of Hengshan, whom the empress set up after dethroning Shao Ti, the power of the empress became unlimited; she is the only woman who appears in the Chinese lists of rulers as an empress (187–180). Her object seems to have been to secure the possession of the throne to her family; but after her death Prince Hung was deposed, and Chau Po, an old adherent of Kao Tsu, slaughtered all the members of the Lu family, and gave the throne to the son of a concubine of Kao Tsu, who had hitherto lived in retirement under the title of prince of Tsai. The new ruler assumed the name of Wen Ti upon his accession.

Wen Ti (179–157) appears to have done his best to increase the prosperity of the nation. He abolished the prohibition upon the books, which had become a dead letter since the time of Kao Tsu; he created a system of general liability to military service which obliged men between twenty-three and fifty-six years of age to serve upon the frontier, and he founded military colonies at the great wall. In place of the "Five Punishments" (branding, cutting off the nose, mutilation, castration, and death) which had been in use since the time of the Chau dynasty, he introduced the punishments of shaving the head and of flogging, and reserved the death penalty for the most serious offences; he also abolished the law which in the case of certain crimes punished the family of the guilty man. Under the successor of Wen Ti, his son Ching Ti (156–141), a great revolt of the chief vassals broke out, which was only suppressed with difficulty. With the most powerful of these nobles, Chao To, who had lived as prince of South Yueh in Kwangtung and Kwangsi after the fall of the Chin dynasty, disputes frequently occurred, which, however, were always peacefully adjusted. In the year 196 B. C. Chao To recognised the supremacy of the emperor Kao Tsu; a revolt under the empress Lu hau added the province of Hunan to his possessions. He died in the year 137 B. C., at the age of more than one hundred; his grandson, who succeeded him, was subdued by Wu Ti, the son and successor of Ching Ti.

(*β*) *Wu Ti.*—Wu Ti (140–87) is certainly the most important ruler of this dynasty, although he seems to have been entirely in the hands of the Taoists,

who had then sunk to the position of mere alchemists and diviners. On the other hand, he greatly furthered the development of Chinese literature by the support which he gave to authors by the organisation of public examinations, the foundation of an academy and a library, and a discussion and rearrangement of the ceremonial which forms an important part of the Chinese education. He also introduced the custom of year mottoes (*mien hua*), that is, the designation of longer or shorter periods of years by a name considered to be of good omen, such as "eternal peace." Events which occur in such a series of years are dated as having happened in the first, second, or following years of the "eternal peace." In early times these mottoes were constantly changed (Wu Ti employed eleven in the reign of fifty-three years). From the time of the Ming dynasty the emperors employed only one such motto throughout their reign, by which they were known, at any rate to foreigners; instances are Yung lo and Wan li (Ming), Kang Hsi, Kien Lung, Kwang Sii (Manchu).

Chinese chronology is usually reckoned by cycles of sixty years, each of which is designated by a name composed of two signs (words), one of which is taken from the ten signs of the Heavenly Branches and the other from the twelve signs of the Earthly Twigs. These are taken in order, so that the first ten Heavenly Branches coincide with the first ten Earthly Twigs; then the first of the former coincides with the eleventh of the latter, the second of the former with the twelfth of the latter, the third of the former with the first of the latter, and so on, until the ten Heavenly Branches have been repeated six times and the twelve Earthly Twigs five times, so that the full number of sixty conjunctions has been attained. This system was at first exclusively used for fortune-telling, and its invention is ascribed to Ta Nao, an official of Huang Ti, in the year 2697 B. C.; however, the first cycle does not begin until the year 2637 B. C. For chronological purposes (for the identification of any one year) the cyclic system is said to have been introduced for the first time under the Han dynasty, by the usurper Wan Mang (330-323 B. C.). However, there are many traces of its earlier use; the two earliest dates thus determined occur in the years 1753 and 1122 B. C. The employment of the twelve signs of the Animal cycle for chronological purposes, that is, for a cycle of twelve years, seems to be of Tartar origin, and to have been first employed under the Tang dynasty (618 or 628-907). It did not, however, come into general use until the Mongol dynasty (1206 or 1280-1367), though Chinese historians profess to detect traces of the use of this system under the Han dynasty. By this system mention is made of events as happening in the year of the rat, etc. The signs of the Chinese animal cycle are the rat, the ox, the tiger, the hare, the dragon, the snake, the horse, the cat, the ape, the cock, the dog, and the pig.

Wu Ti appears to have paid special attention to securing the permanence of his rule. He again broke down the power of the great vassals, and in the year 106 B. C. replaced the seventy-four districts into which the kingdom had gradually been divided, by thirteen provinces. These were (1) Sy li Chiao Wei, the north-western part of the modern Shansi; (2) Yu, the modern Honan; (3) and (4) Chi and Yen, parts of Shantung and Pechili; (5) Hsu, parts of Shantung and Kiangsu; (6) Tsing, the eastern part of Shantung; (7) Ching, composed of Hupeh and Hunan; (8) Yang, composed of Kiangsu, Kiangsi, and Ngan-hwei; (9) I, parts of Hupeh and Szechwan; (10) Liang, parts of Shensi and Kansu; (11) Ping, part of Kansu; (12) Yu, parts of Pechili and Liautung; (13) Chiao, composed of

Kwangtung, Kwangsi, and Tongking. It appears from the above statement that the most populous and therefore the most important part of the kingdom was then situated on either bank of the middle and lower Hoangho. Chinese accounts estimate the district ruled by the first Han dynasty at 145,136,405 Ching (1 Ching = 100 Mau); 8,270,536 Ching of this total are said to have been arable land. Here it is to be observed that the estimate of 1874 only gives 7,368,050 Ching, of arable land, and the last estimate preceding that date, 8,150,188 Ching, both of which totals are considerably less than that of the second century. The chief source of income for the government was at that time the property tax, which was levied to the extent of one-fifteenth of the produce of the land. At times this was reduced to one-thirtieth, and was even remitted entirely in years of famine, or in districts through which the emperor had passed on his journeys. The occupant was himself responsible for the declaration of his assessment, and false information was punished by death. Payment was made in kind, and also, under the later Han dynasty, in woollen cloth and silk. The thirteen provinces were subjected to an equal number of travelling inspectors, the predecessors of the later governors.

Wu Ti also strove to extend the power of his kingdom abroad. Campaigns undertaken against the Hiung nu in the years 123, 121, and 110 led to successful results, though not so the campaign of 99. Korea was subdued between the years 108 and 106, and a part of it was for a time incorporated with China. The emperor's efforts to extend China's influence westward appear to have led to the despatch of various embassies; of these the best known was that of General Chang kien, who was sent to the Yuetshi (Yueh Ti = Getae ?), who were continually at war with the Hiung nu. The latter captured the general and kept him prisoner for many years. When he was at last released he was again despatched to Ta yuan (Ferghana) with diplomatic proposals, and also to Si Yu (Turkestan) in the year 122. By his intervention, diplomatic and commercial communication was begun as early as 115 with thirty-six States situated in those districts. The States of An hsi and Ta tsin, which are more frequently mentioned from this period, are identified by Friedrich Hirth with Parthia and Syria (the capital, Antu = Antioch).

(7) *From Chao Ti to Ju tsze Ying.*—Wu Ti executed his legitimate consort, together with the heir to the throne, for their share in a supposed conspiracy against himself, and appointed the son of one of his concubines as his successor, the mother of whom he forced to commit suicide, in order that she might not become a second Lu hau. Little need be said of the later emperors of this dynasty: Chao Ti (86–74), Hsüan Ti (73–49), Yüan Ti (48–33), Cheng Ti (32–7), Ai Ti (6–1 B. C.), Ping Ti (1–5 A. D.), and Ju tsze Ying (6–8 A. D.). Home affairs were made up of family and harem quarrels, and disputes about the succession, which often led to revolts. On the other hand, Chinese influence abroad seems to have increased; at any rate, ambassadors of the Hiung nu appear more constantly and more regularly at the court. The mother of the emperor Cheng Ti belonged to the Mang family, the members of which gradually gained control of the administration until the year 8 A. D., when Wang Mang deposed the last representative of the western Han, who was only six years of age, and proclaimed himself emperor, under the title of "Hsin" (new dynasty).

(8) *The Influence of the Western Han upon Literature and Architecture.*—The efforts of the first Han dynasty to revive interest in Chinese literature (cf. p. 76) seem

to have been successful. As regards the classical works alone there were in existence 294 collections (fragments, sections *!*) of the I king, 412 of the Shu king, 416 volumes of the Shi king, 555 collections of the Li ki, 165 of the treatise upon music, 948 upon history, 229 of the Lun Yu, 836 of the orthodox sages, as well as other works within the imperial library. Such emperors as Wu Ti did a great deal to arouse and maintain interest in the literature of the country.

In other respects the age of the western Han must be considered as one of especial brilliancy. Apart from all the descriptions given by Chinese historians of the palaces and gardens of the emperors of this time, much yet remains to arouse our astonishment. A great advance in architecture had been made under the Chin dynasty (cf. p. 74), but this was far surpassed by the Han emperors, and by Wu Ti in particular. At the outset of the second century B. C. the emperor Kao Tsu built a town and palace in Changan, which is said to have been sixty-five li (about thirty-three kilometres) in extent, with twelve gates and sixteen bridges, and surrounded by a lofty wall of earth thirty-five feet high. The town existed until the year 582 A. D., and was then abandoned by the emperor Wen Ti of the Sui dynasty, who removed the capital to Singanfu. Parts of the wall are still in existence. In this town was situated the palace of the empress Chao yang, formerly a famous dancer, under the name of Chao Fei yen (Chao = the flying swallow). The emperor Cheng Ti had taken her into his harem in 18 B. C., and made her his consort in 16 B. C. The palace rooms are said to have been painted with cinnabar red, the ceilings were in red lacquer, the component parts of the walls were clamped together with gilded copper, and the stairs were of marble. The beams were carved with dragons and snakes, and the walls were decorated with pearls, precious stones, and the blue feathers of the kingfisher, as well as with golden hanging lamps. All the curtains were made of pearls, and the windows and folding doors of glass. A great palace built by Wu Ti is said to have contained a number of buildings more than five hundred feet high, connected by lofty galleries in such a manner that the emperor could pass from one to another over the town as well as across the moat. On the roofs of the palace, on the temples and the gates, stood great copper statues of men, partly gilded, with statues of the phoenix (used as weather-cocks?), and of other monsters. We also hear of bronze and stone figures of men, of unicorns and other animals, of astronomical instruments and large bells, and of a whale carved of stone, thirty feet long, in an artificial lake, which the emperor had made for the exercising of his soldiers and for the pleasure of the women of his harem.

(d) *The Period of the Usurper Wang Mang, and the Time of Anarchy (9-24 A. D.).* — Wang Mang, the nephew of the consort of the emperor Yuan Ti, had been appointed commander-in-chief in the year 6 B. C. Upon the death of the emperor Ai Ti, in the year 1 B. C., the widow, who was left as regent, handed over the government to Wang Mang, and in the following year he received the title of Dual Protector of the House of Han. In the year 3 A. D. he married his daughter to the emperor Ping Ti, who was still in his minority. He poisoned the emperor in the year 5 A. D., and induced his daughter, who was childless, to adopt the great-grandson of the emperor Hsian Ti (cf. p. 79), who was then two years old. In the year 8 A. D., he deposed this ruler, and proclaimed himself emperor. He then reintroduced the old redistribution of the Chau into plots of nine fields

(p. 63), and abolished slavery. The dissatisfaction aroused by these innovations was aggravated by the increased taxation which a great campaign against the Hiung nu made necessary. A revolt that broke out in 19 A. D. was suppressed. A second movement, however, led by two descendants of the house of Han, Liu Huan and Liu hsiu, was more successful. Wang Mang, after suffering several defeats, was murdered in the year 23 by his own troops.

(c) *The Later or Eastern Han Dynasty (25-220 A. D.).*—Dissensions and struggles broke out among the rebels and other pretenders. Li Huan, who had declared himself emperor on the death of Wang Mang (according to others, he ruled on behalf of the prince of Huai Yang, whom he had appointed emperor), abdicated two years later in favour of Liu hsiu. The latter was a descendant of the emperor Hang Ching Ti (156-141 B. C.), and ascended the throne in 25 A. D., as the first emperor of the later or eastern Han dynasty. The larger part of the reign of this "Shi Tsu" (or Kwang Wu Ti, 25-57) was occupied with warfare against the other pretenders to the throne. It was not until the year 37 that Lu fang, the last of his opponents within the kingdom, was conquered, while in the year 41 an invasion of the ruler of Cochin China was successfully repulsed. The second half of the reign of this emperor seems to have been so peaceful that he expressed his thankfulness by making solemn offerings on the Taishan, one of the five sacred mountains in Shantung. It was under his son Ming Ti (58-75), and in particular through the action of his younger brother, Ying, that Buddhism was enabled to make its entry into China (cf. below).

The emperors of this dynasty are of little account. Most of them, including Shang Ti (106), An Ti (107-125), Chung Ti (145), Chi Ti (146), Huan Ti (147-167), Ling Ti (168-189), and Shao Ti (189), ascended the throne as children under the regency of their mother, an arrangement which naturally favoured harem intrigues. In 189, when the eunuchs abducted the young emperor Shao Ti and his brother from the capital, the general, Yuan Shao, hastened to the rescue, and apparently exterminated the abductors. Internal dissensions and wars against the Hiung nu, the Man, and other tribes upon the frontier, provided an opportunity for ambitious soldiers to acquire power and influence upon the government. This was misused in their own interests, so that the second half of this dynastic period is almost entirely occupied with the intrigues of usurping ministers, and with revolts against them. In the earlier years of the dynasty much attention was paid to literature. In 175, the text of the Five Classics was definitely established, carved in stone, and set up at Loyang in Honan, the capital of the dynasty (the first Han dynasty had resided in Changan). The second Han dynasty comes to an end with Hsien Ti (189-220), but long before his abdication the rising of the "Yellow Turban" rebels, and the formation of the three kingdoms of Shu (South-west China), under Liu Pei, of Wē (Wei, North China), under Tsao Tsao, and Wu (Southeast China), under Sun Chuan, had made a practical end of the emperor's power (cf. p. 87).

#### G. BUDDHISM IN CHINA

(a) *The Historical Development of the Buddhist Doctrine in China.*—The introduction of Buddhism was an event of the highest importance for the moral

development of China, and is the most striking event of the rule of the Han dynasty, and indeed in the whole of China's history. An unauthenticated account states that Indian missionaries had entered China as early as 217 B. C., and in 122 B. C. a Chinese expedition is said to have advanced beyond Yarkand, and to have brought back a golden image of Buddha. Communication between China and India becomes very frequent from this date. Knowledge of the foreign doctrine entered the country, and in the year 61 A. D. the emperor Ming Ti sent messengers to India to bring back Buddhist books and priests. This step may have been urged upon him by the Taoists, who thought to find the Buddhist doctrine of retirement from the world in harmony with their own views, though legend relates that the emperor followed the monitions of a dream. At any rate the priests were brought, and one of them, Kashiapmadanga, translated a Sutra in Loyang. Toward the end of the second century A. D. another Indian in Changan translated the "Lotus of the good law."

The development of Buddhism seems to have advanced somewhat slowly at first. Not until the beginning of the fourth century do we hear that men of Chinese birth had begun to take upon themselves the vows of Buddhist monks. In 355 a prince of the house of Chau at the time of the eastern Tsin gave his subjects permission to take this step and in 381 the emperor Hsiao Wu Ti built a pagoda in his palace at Nanking. At the same period large monasteries were erected in North China, and nine-tenths of the common people are said at that time to have embraced the Buddhist teaching. The kingdom of Tsin (southern Shensi and Kansu) seems to have been the chief centre of Buddhism, and here, in 405, a new translation of the sacred Buddhist books was brought out. An army seems to have been sent to India, and to have brought back Indian teachers to Changan, who there undertook the work, aided by eight hundred other priests, and under the emperor's personal supervision. Communication between India and China was constant at that date. Numerous travellers went southward, returned with sages and books, and wrote the story of their travels. Thus Fa hien describes the flourishing condition of Buddhism in Tartary, among the Ugurian races to the west of the Caspian Sea, in Afghanistan, on the Indus in Central India, and in Ceylon. It was from this island that he returned by sea to Changan in the year 414, after an absence of fifteen years; and he then devoted himself, with the help of an Indian scholar, to publishing the books he had brought back.

In the year 420 the Tsin dynasty fell; it was replaced in the north by the Tartar Wē, in the south by the native dynasty of Sung. The princes of the two new dynasties at first displayed an aversion to Buddhism. In Wē the erection of temples and statues was strictly forbidden, and the priests were persecuted. In 426 a decree was issued for the destruction of books and statues, and many priests were executed in the course of the persecution. But after the death of the first emperor these orders were rescinded, and in 451 permission was given to erect a Buddhist temple in every town; forty or fifty of the inhabitants were allowed to become priests; and the emperor himself shaved the heads of some of those who devoted themselves to the priesthood. Similarly the persecutions of the Sung princes soon ceased, and their government gained a reputation for the special favour which it showed to Buddhism. Embassies arrived from Ceylon and from Kapilavastu (the birthplace of Shakyamuni), all of which referred to the uniformity of the religion,

and sang the praises of the Sung emperor of the kingdom of Yaehen (Kiang-ning, with parts of Honan).

The special favour shown to Buddhism, and the rapid rise of this doctrine, naturally gave the Confucianists many reasons for complaints against and attacks upon the new doctrine. Even under the Sung emperors the reports of the officials show that Buddhism had lost its former purity, and that piety had given way to carelessness. Ostentation and petty jealousies had taken the place of simplicity and purity of heart. New temples were continually erected with great splendour, while the old were allowed to fall into ruins. These facts called for official supervision, and it was urged that no one should be allowed to set up an image without the previous consent of the authorities. A conspiracy discovered in 458, in which a Buddhist priest had taken the leading part, provided an excuse for giving effect to these proposals. An imperial decree was issued, declaring that there were many among the priests who were criminals fleeing from justice, who had taken the vows only to secure their personal safety, and had used their sacred character as the cloak for further crimes. The authorities were, however, to examine closely the conduct of the monks, and to punish the guilty with death. A further decree ordained that monks who did not observe the vows of abstinence and poverty were to return to their families and their previous secular occupations; at the same time the nuns were forbidden to approach the palace or to speak with women of the harem.

The differences between Buddhism and Confucianism gave rise to public disputations. During one of these, which was held in 483 under the emperor Wu Ti of the Chi dynasty, a minister of state, Tse Liang, supported the Buddhists. The chief arguments of the Confucianists were devoted to combating the opinion that the present condition of mankind was to be considered as a recompense for good or evil deeds committed in a previous existence. "Men are like the leaves on the trees," it was said; "they grow together, are torn away by the same wind and scattered abroad; some fall upon gardens and carpets, even as men who are born in palaces, while others fall upon dunghills, like to men of low estate." Riches and poverty can thus be very well explained without reference to the doctrine of recompense. Moreover, the soul belongs to the body, like sharpness to the knife; the soul can therefore exist after the destruction of the body, as sharpness exists when the knife has been destroyed.

In 518 Sun yun was sent to India by the emperor Hsiao ming Ti of Pei We, and returned with seventy-five Buddhist works, after a prolonged stay in Kandahar and Udyana. In 526 the twenty-eighth Buddhist patriarch, Ta mo (Bodhidharma), came to China by sea; the downfall of Buddhism in the country of its origin had forced him and many of his countrymen to seek a new home (in China, chiefly in Loyang, three thousand Indians are said to have lived at the beginning of the sixth century). He first visited Kiang-ning (Nankin). However, his meeting with Wu Ti, the first emperor of the Liang dynasty (502-549), brought no satisfaction to either party. Ta mo, therefore, betook himself to Loyang, and declined all the later invitations of Wu Ti. The life of Bodhidharma was fully representative of that contemplation which shuns the external world, and that mystical retirement characteristic of Buddhism. In Loyang he is said to have sat with his face to the wall of his room for nine years without speaking a word, for which reason he was popularly known as "the saint looking at the wall." He died of old age, after surviving

five attempts which were made to poison him, and left the dignity of patriarch to a Chinese, the second of the Six Eastern Patriarchs.

The emperor Wu Ti became a monk at the close of his life. His son Chien wen Ti was favourably inclined to Taoism, and attempted to bring about a union between this school and Buddhism. Taoists who objected were executed. In 558 the emperor Wu Ti of the Chen dynasty also became a monk. Under the first emperor of the Sui dynasty, Wen Ti (581-604), full tolerance was given to Buddhism. Toward the end of his reign he forbade any destruction of the relics or statues of Buddhists or Taoists. The Tang emperors, who had been opposed to Buddhism at the beginning of their dynasty (618), soon became favourably disposed to it. This was especially the case with the second ruler of the dynasty, Tai Tsung (627-649), in whose reign the Syrian Christians came to China in 639. When Hsuen Tsang, who had gone to India in 629 without asking the emperor's leave, returned after an absence of sixteen years, the emperor gave him a kindly reception, and ordered him to translate in Changan the six hundred and thirty-seven books he had brought home. Three thousand seven hundred and sixteen monasteries are said to have been in existence in China at that date. In 714 a violent persecution of the Buddhists broke out. Ten thousand priests and nuns were obliged to return to their families. In spite of this, individual priests continued to occupy State offices, and Indians were entrusted with the arrangements of the calendar. Under the later emperors of the Tang dynasty, especially under Su Tsung (756-762), Tai Tsung (763-779), and Hsien Tsung (806-820), Buddhism made great strides; and when Han Yu (Han Wen kung), under the last of these kings, in 819, protested against the transportation of a Buddhist relic into the imperial palace, he was banished from the court and sent as governor to Chao-Chau in Kwang Tung, which was then a purely barbarian district.

In 845 a third and specially violent persecution broke out under the emperor Wu Tsung. Four thousand six hundred monasteries, together with forty thousand smaller buildings, were destroyed. The possessions of the temples were confiscated, and employed for the erection of government buildings. The bells and statues were melted down and coined into cash, and more than two hundred and sixty thousand priests and nuns were obliged to return to the ranks of the laity. However, Hsuan Tsung, the successor of Wu Tsung, permitted the erection of new monasteries, though a few years later he forbade the entry of new monks. The emperor Yi Tsung (860-873) was a zealous Buddhist, as were both his successors and the rulers of the later Tang dynasty (923-936). During the short period of the later Chu dynasty (951-960) numerous temples were destroyed, and only two thousand six hundred and ninety-four retained. Priests were also forbidden to practise self-martyrdom and mutilation. The first emperors of the northern Sung dynasty (960-997) were less favourably disposed to Buddhism. A reaction set in under their successors, though these often acted arbitrarily in the designation of the temples, monasteries, and priests, and of Buddha himself. Under this dynasty the communication with India increased, and Indian Buddhism began to exercise an important influence on Chinese belief.

Strong support was given to Buddhism by the Mongol (Yuan) dynasty (1280-1368). Kublai Khan, who held the throne of China from 1280 to 1294, under the name of Shi Tsu, was a zealous Buddhist. The temples devoted to the old national religion of the Chinese were now transformed into Buddhist shrines, while Taoism

was persecuted. In this matter Kublai was probably thinking of the welfare of his own Mongols rather than considering the wishes of the Chinese; even before he had united the Chinese empire under his sway, he had attempted to spread the Buddhist teaching among his people, whom he caused to be instructed by Kuoshi, national teachers. His successor followed his example. The enumeration made toward the end of the thirteenth century showed 42,318 Buddhist temples and 213,148 monks in China. Translations from the Tibetan language are frequently mentioned, and were used; as also, though only among the Mongols, were the immoral representations which had passed into Tibetan Buddhism from the Brahman Shiva worship. However, even at that time the Chinese Buddhists seem to have sought teaching and information in India. A Chinese priest, Tan wu, travelled to India by land, and returning as usual by sea, brought a number of books back to China. This example, which occurs in the first period of the Mongol rule, is the last of its kind.

It is remarkable that the national rising of the Chinese against the Mongols, which ended in the utter extermination of these rulers, produced no similar effects on the religious side; on the contrary, the first rulers of the national Ming dynasty show themselves specially well disposed toward the Buddhists. It was not until 1426 that measures were taken to limit the rising power of the monks. Those who wished to enter a monastery were then obliged to subject themselves to previous examination, and in 1450 the regulation was made that no monastery should possess more than sixty Mau of landed property. A similar law seems to have existed under the Mongols. Under Shi Tsung (1522-1566) the Confucianists attempted to introduce a persecution of the Buddhists, but were defeated by the action of the government; they only succeeded in procuring the destruction of the temple existing in the imperial palace.

The first ruler of the present Manchu dynasty, Shi Tsu (1644-1661) was friendly to Buddhism; however, his successor, Sheng Tsu, was converted to Confucianism, probably for political purposes. For the same reason, he and his successors showed special favour to the Llama-worship of their Tibetan and Mongol subjects, and the erection of Llama temples and monasteries at that seat of government in Pekin dates from this period.

(b) *The Influence of Buddhism on the Chinese Civilization.* — The attempt to estimate the influence exerted upon the Chinese by Buddhism and Buddhist priests will show that, apart from the personal and political influence which the adherents and preachers of the Indian teaching may have had upon individual emperors and statesmen, the effects of Buddhism are to be seen chiefly upon the philological and philosophical sides. At any rate, the meritorious attempt to substitute an alphabet for the monosyllabic language and writing of the Chinese is of the highest importance. In the third century a beginning was made with sixteen symbols, which were increased ultimately to thirty-six during the sixth century under the Liang dynasty. The discoverer of this latter series, the priest Shen kung, and his successors taught the Chinese to write the sounds of their language with the signs appropriate to it. It is difficult to overestimate the service thus rendered, even though, some centuries later, changes of language considerably reduced the practical value of the system. Buddhism also exercised an animating influence upon literary activity; at one period Buddhist works were

more numerous than Confucian. Thus, in the history of the Sui dynasty (589–618 A. D.) mention is made of the existence of nineteen hundred and fifty different Buddhist works.

An important influence was also exerted by Buddhist opinions and teaching upon the development of philosophy in China. This influence is especially apparent in the writings of Chu hi (1130–1200), the most important modern expositor of the old classical teaching, whose works still form the basis of what may be called official Confucianism (p. 95). During the last one hundred and fifty years the Chinese themselves have shown a tendency to criticise his teaching more severely, chiefly on account of the Buddhist influences apparent in it; none the less the official recognition of his teaching has remained. The doctrines held by the mass of the population are a confused mixture of native and foreign teaching, as expounded by Taoist and Chinese sages, from which the original Buddhism has almost vanished; the result is superstition in the truest sense of the word. Confucianism, Taoism, and Buddhism play the same part in the life of the people, including the upper classes; but the influence of Buddhism is chiefly obvious in the ceremonies customary upon the death of the individual. At the funeral both of the emperor and of the poorest of his subjects, Buddhist ceremonies and the reading of the sacred books are a very prominent feature.

## H. THE MEDIEVAL HISTORY OF CHINA

(a) *The "Three Kingdoms" (216 or 220 to 265).*—The period of the three contending kingdoms is one of the most difficult in the whole course of Chinese history for the historian, and is undoubtedly that which has made the strongest impression upon the national spirit,—an impression chiefly due to the famous historical romance, "San kuo chi," which treats of the "History of the Three Kingdoms," in one hundred and twenty sections. Kuan Yu, one of the heroes of the book and of the history of the period, the adopted brother and general of Liu Pei, died in 219 A. D., was canonised during the twelfth century, and under the name of Kuan Ti became the Chinese god of war in 1594. Chu ko liang (Kung Ming), another general of Liu Pei, is to-day the national hero, the ideal of every Chinese statesman, and the leading character in a dozen dramatic works.

The revolt of the "Yellow Turban" rebels (Hwang chin tséi), who overran the whole kingdom (p. 81), led indirectly to the fall of the later Han dynasty; this event was, however, also accelerated by the intrigues of those statesmen and generals who were anxious to form independent districts of their own from the fragments of the empire. One of the most successful of these upstarts was Tsao Tsao, the son of an officer of low rank, who made himself governor of the modern Shantung in 192, after distinguishing himself against the "Yellow Turbans" in 184. In the meanwhile he had entered into an alliance with Yuan Shao (cf. above, p. 81). With this ally he defeated the general Tung Cho, who had deposed the emperor Sha Ti in 189, and had placed a child of his own, Hsien Ti, upon the throne. Tung Cho murdered the emperor's widow and the deposed emperor, burnt down Loyang, with all its palaces and other buildings (which are said to have covered an area of eighty kilometres), and removed the capital to Changan; shortly afterward, in 192, he was murdered by one of his officers. Tsao Tsao availed himself of this opportunity; after overcoming Lu Pu, one of the adherents of Tung Cho, he seized

the government in 195 and appointed himself generalissimo of the kingdom, assuming the title of duke of Wē in 213.

His efforts had aroused some of his previous comrades to hostility against him. Liu Pei, a descendant of the prince Ching of Chung shan, a son of the emperor Ching Ti, who died in 141 B. C., whose ensign was a seller of straw shoes, had also distinguished himself in 185 while fighting against the "Yellow Turbans," at the head of a body of volunteers. At a later period he fought against Tung Cho, but rose against Tsao Tsao upon the latter's attempt to seize the chief power. On the downfall of the Han dynasty he declared himself emperor of the smaller (Shu) Han dynasty, though for the moment the principality of Shu was his only possession.

A third successful military leader was Sun Tseh, who had been made marquis of Wu by Tsao Tsao. After his death, in the year 200, his brother Sun Chuan succeeded him; he broke away from Tsao Tsao, and successfully repulsed his attacks and also those of his brother-in-law, Liu Pei. The former, however, defeated him in the battle of Ho Fei, and after a long-continued struggle he was obliged to recognise the supremacy of Tsao Tsao in 221; however, in 229 he regained an acknowledged independence, assumed the imperial title as Ta Ti, and founded the dynasty of Wu.

Thus between the years 220 and 230 three kingdoms arose: Wē, which included the whole of the northern half of modern China, with the capital of Yiē, the modern Changtêfu in Honan; Wu, the eastern part of Southern China, together with the mouth of the Yangtze River, the capital of which was Nanking (at that period Chien yiē); and Shu, the western half of Southern China, forming the modern province of Szechwan, with Iehau, the modern Cheng-tu, as its capital. The period of the three kingdoms is entirely occupied by their mutual conflicts. In 263 Shu and in 280 Wu were destroyed by Wē. In Wē itself the reigning family was dethroned in 265 by Sze ma Yen (Tsin Wu Ti), a grandson of the general Sze ma I († 251), who had played a great part in the early struggles between the three States. His son Sze ma Chao was appointed minister to Fei Ti, the third ruler of the Wē dynasty (240–253), and became prince of Tsin. Under this title his son founded a new dynasty in 265.

(b) *The Western and Eastern Tsin Dynasty (265–316 and 317–420).*—Under the emperors of the house of Tsin, of whom the western rulers resided in Loyang and the eastern in Nanking, smaller independent States arose everywhere throughout the empire, some of them being governed by foreign rulers of Tartar origin. This is therefore called "The Period of the Sixteen States." Karl Arendt mentions the following eighteen:—

1. Han, from 319 Chao, later Chien Chao (the earlier Chao), in Shansi, 304–329.
2. Cheng, from 338 Han, or Cheng Han, in Szechuen (304–347), with the capital Cheng tu.
3. Liang, or Chien Liang (the earlier Liang), in Kansu (317–376 and 386–387).
4. Hou Chao, 319–352 (350–352, named also Min and Wē by the pretender Jan, or Shi).
5. Yen, or Chien Yen (the earlier Yen), 345–370.
6. Chin, Ta Chin, or Chien Chin (351–394).
7. Tai (338–376), in the north, Shansi, under the house, T'o pa (To ba), the Hsien pi-Tartars (Tunguses), who established the northern Wē in 386.
8. Hou Yen (the later Yen), 384–407; cf. No. 18.
9. Hsi Yen (the western Yen) in Shensi (384–394).

10. Hou Chin (the later Chin) in Kansu (384-417), founded by Yao Chang in Pei ti (Ching yang lu).
11. Hsi Chin (the western Chin) in Kansu (385-400 and 409-431), founded by Chi fu Kuo yen in Lung yo (Min Chou).
12. Hou Liang (the later Liang) in Kansu (386-403); hence diverged:
13. Nan Liang (the southern Liang) in Kansu (397-404 and 408-414), founded 397 by the family Tu fo, the Hsien pi-Tartars; and
14. Pei Liang (the northern Liang) in Kansu (397-439), founded by Tuan Yiê, from 401 under the supremacy of Hsiung nu chü Chü Meng hsun.
15. Nan Yen (the southern Yen) in Honan (398-410), founded by Mu jung Te in Hua tai.
16. Hsi Liang (the western Liang), near Tun huang (400-421), in Central Asia, outside the northwestern corner of the Great Wall.
17. Hsia, or Ta Hsia (the great Hsia), in Kansu (407-431), set up by the Hsiung nu Ho lien Po po.
18. Pei Yen (the northern Yen), 407-436, formed from Hou Yen (No. 8) (foundation of Kao Yün).

The rapid rise and decay of these mushroom States is evidence of the weakness of the central power during the Tsin dynasty. As a matter of fact, their whole history, even that of the first rulers, is a record of internal dissension and struggles with new States, governed sometimes by emperors and sometimes by kings, and also at discord among themselves. In 304 Liu yuan founded the kingdom of Han and assumed the title of emperor in 308; he was succeeded by Liu tsung in 310, who took the Tsin emperor Huai Ti prisoner in 311 and carried him off to his capital, Ping yang, in Shansi. In 313 Liu Tsung murdered the emperor and placed Min Ti on the throne; the latter was also brought to Ping yang in 316 and murdered there. Yuan Ti, the first emperor of the eastern Tsin dynasty (317 to 322), removed the capital to Nanking. In 350 Mi Chiün, who had been emperor of Chien Yen since 349, conquered Chi cheng, the modern Peking, and made it his capital. In 371 the prince of Kuei chi deposed Ti Yi, who had represented the Tsin dynasty from 366, and made himself emperor under the title of Chienwen Ti. In 403 the rebel Huan Hsuan got possession of the throne; he was murdered, and the deposed emperor An Ti of the eastern Tsin dynasty (397-418) again came into power; he, however, was also murdered in 418 by Liu Yu, who placed Te Wen, a younger brother of An Ti, on the throne. In 420 Kung Ti (formerly Ten Wen) abdicated in favour of Liu Yu; he originally, like Liu Pei, had been a seller of straw shoes, had risen to be general by his military capacity, and had distinguished himself in the operations against Huan Hsuan, and had been appointed the first minister of An Ti; in 420 he ascended the throne as the first emperor of the Sung dynasty.

(c) *The Period of Separation between North and South, 420-581 (589).—*

(a) *The South.*—The last of the five independent States which were still in existence upon the accession of the founder of the Sung dynasty of the house of Liu, who now called himself Wu Ti, survived until 439. Pei Yen and Pei Liang, the last two of these States, were incorporated in 436 and 439 respectively with Pei Wē (North Wē), which had sprung from the ruins of the State of Tai; after the year 386 it had gradually extended its area in North China until it had grown nearly equal in size to the Wē, as that kingdom had been limited at the time of the "Three States." The Sung dynasty, which produced eight emperors during the short period from 420 to 479, was ruined by internal dissensions. Four of these

emperors were murdered, the last but one, Tsang wu wang, or Fei Ti, being murdered in 477 by the field-marshal Hsaio Tao Cheng; the latter then placed Shun Ti upon the throne, but in 479 forced him to abdicate, and executed him with his whole family.

Hsaio Tao Cheng became prince of Chi in 479, and, under the title of Kao Ti, founder of the Chi dynasty (479-502). The seven emperors of this dynasty seem to have been particularly bloodthirsty tyrants; four of them were murdered, the last, Ho Ti, by Hsaio Yen, who seized the power in 502, and founded the Liang dynasty (502-557). Nanking was the capital of this dynasty also. Wu Ti, formerly Hsaio Wen (502-549), was a powerful emperor, who showed great favour to Confucianism at the outset of his reign, and still more to Buddhism at a later period. He was successful in repulsing the attacks of Wē. But the last years of his reign were disturbed by internal dissensions, which concluded in the year 557 with the deposition of his fifth successor, Ching Ti (murdered in 558).

In 557 the victorious rebel Chen Pa hsien ascended the throne as the first emperor of the Chuen dynasty. The State of Hou Liang, which had existed in Honan and Hupei since 550, continued under the new dynasty; after 581 the first beginnings of the later Sui dynasty appeared in Shensi. The Chuen dynasty also collapsed, in consequence of family dissensions, quarrels about the succession, and the dissolute lives of its princes. In 587 Yang Chien occupied Hou Liang, and in 589 he overthrew the Chuen dynasty, taking the last emperor, Hou Chu, prisoner; he then ascended the throne under the name of Wen Ti or Kao Tsu, as the first emperor of the Sui dynasty, and united the whole kingdom under his sceptre.

(β) *The North.*—The Pei Wē dynasty (386-534) was of Tartar origin; as, however, the population subject to them grew more settled, the points of variance between themselves and the other Tartar races who were still living a nomadic life became more acute, and in consequence Ming yuan Ti (409-423) resolved to build a great wall of two thousand li in length as a defence against their incursions. At a later period relations with these kindred tribes seem to have improved, and extensive commercial intercourse developed upon the north and west, as far as the Obi and Lake Baikal. The favour of the emperors was given alternately to Taoism and Buddhism, so that the adherents of these two sects were at times taken under protection and at other times exposed to persecution. The energy of the State was largely occupied by quarrels with and struggles against the south, and family dissensions weakened the power of the imperial house, which ended its existence amid dreadful atrocities.

In 534 Kao Huan, the governor of one of the imperial provinces revolted. The emperor Hsaio wu Ti fled to Chang (Si ngan) in Shensi, which now became the capital of Hsi Wē, the western Wē (535-557). The first ruler of this branch was Wen Ti in 535, after Hsaio wu Ti had been poisoned at the end of 534 by the prime minister, Yü wen Tai. In Lo-yang, Kao Huan appointed Yuan Shan chien, under the title of Hsaio ching Ti, in 534 to be emperor of the eastern or Tung Wē (534-550). The capital of the new kingdom (Pei Wē now disappears from our notice) was Chang-te-fu in Honan. A few years later (550) a son of Kao Huan, by name Kao Yang, founded the northern Chi, or Pei Chi (550-557), upon the ruins of Tung Wē. In 557, in place of Hsi Wē arose the realm of the northern Chau, or Pei Chau (557-581), under the emperor Yu wen Chio, who was

murdered in the same year; the murderer, Yu wen Hu, set Ming Ti on the throne. In 576 the emperor An te wang of Pei Chi was taken prisoner by Wun Ti of Pei Chu, and in 577 Pei Chi is merged into Pei Chu. In 581 Pei Chu suffered the same fate at the hands of Wen Ti, whereupon the incorporation of Hou Liang (587; cf. *supra*) was followed by the union of the empire under the Sui dynasty in the year 589.

(d) *The Sui Dynasty (581 or 589 to 617 or 619).*—Wen Ti (581–604) ordered a survey of the empire to be made, and introduced a new principle of administration by making the several administrative departments independent of one another. He was a patron of literature and a supporter of commerce, and made a vain attempt to introduce the Indian system of caste into China. In 604 he was apparently murdered by his son Kwang, who succeeded him as (Sui) Yang Ti (605–617). The three capitals of the kingdom were Changan in Shensi, Loyang in Honan, and Chiangtu (Nanchow) in Kiangsi. However, as early as 613 “emperors” of new petty States existed in different parts of the empire. Li Yuan, duke of Tang, or more correctly his son Li Shi min, set up an opposition emperor in 617 against Yang Ti, who had plunged into the wildest excesses and had directed two unsuccessful campaigns against Korea: this pretender was Kung Ti I (Yō), who was succeeded by Kung Ti II (Tung), who was murdered in 619. Li Shi min then placed his father upon the throne, under the name of Kao Tsu, as the first emperor of the Tang dynasty.

(e) *The Tang Dynasty (618–907).*—The reign of Kao Tsu (618–626) was almost entirely occupied with struggles against more than twenty usurpers, who had been in existence under the Sui dynasty, or had set themselves up under the new government in different parts of the country and declared themselves independent kings (Wangs) or emperors. It was not until 628 that the last of these petty kings was conquered in the person of Shi tu, who had made himself lord of Liang in 617. The Tang dynasty was then recognised throughout the empire.

Kao Tsu, weary of government, abdicated in 626, and his son Li Shi min took up the power under the title of Tai Tsung (627–649). Under this highly important ruler universal peace prevailed. The free tribes still in existence on the south coast were incorporated with the Chinese Empire, and the western frontier was extended to the Caspian Sea. In the country which is now Chinese Turkestan four governorships were formed, and even beyond the boundary of Kashgar, the furthest of these, many tribes recognised the supremacy of China, which was manifested by the institution of sixteen commanders. Chinese influence extended to Sogdiana, Khorasan, and Nepal. In 643 the Greek emperor Theodosius sent an embassy to Changan. Kao Tsu and his son made great efforts to promote literature and education among the Chinese people; they erected schools and arranged public examinations; and Tai Tsung composed a legal code for his officials.

Toward the end of his reign the latter undertook an expedition against Korea, which was successfully concluded by his son. Kao Tsung (650–683) was a weak voluptuary: during his life, and after his death, his consort Wu Hau, the empress Wu (see Fig. 2 on the plate, “Heroes and Heroines of Chinese History”) became a highly important personage. Originally one of the inferior concubines of Tai

## HEROES AND HEROINES OF CHINESE HISTORY

*Top left* : 1. Tsch'iao-kuō-fu-jin, the heroic chieftainess of a volunteer band toward the end of the sixth century of our era.

*Bottom left* : 2. Wu Tsê-tien, famous empress (625-705).

*Bottom right* : 3. Yo Fei, national hero and great patriot (1103-1141).

*Top right* : 4. Hu Ta-hai, leader of the vanguard and faithful friend of the founder of the Ming dynasty (second half of the fourteenth century of our era).

HEROES AND HEROINES OF CHINESE HISTORY  
From original Chinese paintings on silk.

Tsung, she had retired into a Buddhist monastery after his death in 649. When Kao Tsung seemed to have been entirely subjected to the influence of one of his court ladies, his wife remembered her father-in-law's former favourite and brought her back to the court. Wu Chao (her original name) became a leading figure at court in 654. She soon succeeded in driving out the rival empress and in completing her destruction, and in 674 she gained for her nephew Wu Chengsze the appointment of Duke of Chau, while her husband (after 655) and she herself assumed the titles of Emperor and Empress of the Heaven. After the emperor's death (683) she at first set her two sons Chung Tsung and Jui Tsung on the throne, but undertook the government herself in the same year. From 684 to 705 she ruled with great cruelty and despotie power; but was so successful that even after her deposition by Chung Tsung, who had been recalled from exile, she was treated with high consideration until her death, which followed shortly afterward. She is best known under the name of Wu Tse tien.

Chung Tsung, who had entirely lost his intellectual powers during his long banishment, was a mere tool in the hands of his ambitious and voluptuous wife, the empress Wei Hou, who poisoned him in 710, and placed his son Chung Mao on the throne; he, however, was deposed after a short time and replaced by Yui Tsung (710-712), who had also been recalled from banishment. His son Lung chi then revolted, stormed the palace, slew the empress Wei, and was recognised by his father as emperor.

Under Hsuan Tsung (also known as Tang Ming Huang; 712-756) the greatest disorder prevailed at the court and throughout the empire. The emperor was entirely in the hands of his favourite, Yang Kwei Fei (Kwei Fei is the title next in dignity to that of empress), whose three sisters he had also taken into his harem; upon this woman and her relations he showered favours. Among his favourites of the other sex, An Luh shan, a Tartar, originally known as A la shan, took the first place; in the year 755 he was appointed to the command of a great army intended for service against the Turkish and Tartar tribes, whereupon he declared himself independent and turned upon the capital. The emperor fled; during his retreat his soldiers revolted and forced him to order Kao Li sze, his favourite eunuch and minister, to strangle Yang Kwei Fei, while the soldiers themselves publicly executed a brother and a sister of the favourite. This event has been commemorated in some of the most beautiful of the Chinese popular ballads. Indeed the period of the Tang dynasty and the reign of Hsuan Tsung was the most flourishing epoch of Chinese poetry. Under this monarch lived and died the most famous lyric poet of China, Li Tai peh. An Luh shan was murdered in the hour of his success by one of his sons. His descendants, who murdered one another as they found occasion, established themselves in the frontier provinces, until the death of the last of the family in 763 removed all opposition to the imperial supremacy.

Su Tsung (756-762) was a weak prince who was entirely in the hands of one of his favourites, Chang Liang ti, who had gained the position of empress through the influence of a eunuch, Li Fu kuo. The eunuch and the empress quarrelled, and upon the emperor's death Li availed himself of the opportunity of murdering the empress. He seems to have enjoyed no less influence at the outset of the reign of Tai Tsung (763-779), but was afterward executed with other eunuchs. A revolt of the frontier tribes at the instigation of Chinese malcontents was suppressed in 765, chiefly by the efforts of the general Kwo Tsze-i, whose military talents

had been of the highest service under the previous emperor. Te Tsung (780-805) attempted to introduce various innovations into the imperial government, but did not possess the strength or the perseverance to carry out his intentions; he was anxious to break down the power of the provincial governors (several of whom often existed concurrently in each of the ten Tao), who had in part made themselves the hereditary lords of the districts under their charge; but the emperor was obliged to flee, and only won his way back to the capital after long and severe struggles. Other attempts at reform were equally unsuccessful; the attempt of the minister Yang Yen to abolish the land tax, labour services, and payment of taxes in kind, and to substitute for these a tax in money to be paid every half year, ended with the reformer's execution in 781. During the last years of this emperor's reign the greatest disorder prevailed in every department of the administration, and offices were usually assigned to the highest bidder.

From this time onward the Tang dynasty steadily decayed; the rulers were either entirely subject to the influence of Taoist intriguers or to the eunuchs, who deposed and murdered several members of the dynasty. The attempts of the provincial governors to secure their independence led to a constant series of revolts, which were only suppressed with difficulty. In 880 Huang Chao seized the capital of Changan and declared himself emperor. It was not until 884 that he was overpowered, and then only with the help of Tartar frontier troops. Chu Chuan chung, one of the adherents of Huang Chao, had taken the emperor's side and received a command in the army; he now became a personage of high importance. The eunuchs, who had murdered many princes of the imperial house, attempted to abduct the emperor Chao Tsung. Chu brought him back to Changan, murdered him in 904, and placed his son Chaohsuan Ti upon the throne. Chu then removed every official and prince from whom opposition to his plans could possibly be feared, and deposed the emperor in 907. This event brought the Tang dynasty to an end, and Chu Chuan chung assumed the title of Tai Tsu and became the first ruler of the later (Hou) Liang dynasty.

(f) *The Five Dynasties (907-960).*— Previous to the fall of the Tang dynasty independent States had been formed in different parts of the empire. At a later period similar States were added to these, in which adherents of the Tang dynasty had succeeded in defending their independence against the usurpers of the Hou Liang dynasty and their successors. The Chinese usually designate this age as that of the "Later Five Dynasties," and also as the age of "The Ten States." Of these States (Chien) Shu was situated in Szechwan, Wu in Kiangsu, Min in Fokien, Wu Yüe in Chekiang, Nan Han in Kwangtung (Canton), Chu in Honan, Ching nan in Hupei. In addition to these the States of Chi in Shensi and Kansu, and Yen in Pechili (Peking), existed independently. Upon the north and west two Tartar tribes, the Khitan (Liao) and the Hsia, had extended their boundaries and become independent kingdoms, the former dating from 937 and the latter from 1031.

The first of the Five Dynasties was the later (Hou) Liang dynasty (907-923), which actually ruled only over Honan and Shantung. Mo Ti, the second emperor of this dynasty, was overpowered by a usurper of the principality of Tsin, Li Tsun hsu, of Turkish origin. In 923 he founded the later (Hou) Tang dynasty, under the title of Chuang Tsung. This came to an end after the inglorious rule of four emperors, the latter of whom, Fei Ti, was besieged by the Khitan, and burnt himself

alive in his palace at Loyang. The later (Hou) Tsin dynasty, set up by and tributary to the Khitan, was also destroyed by them. In 946 the Khitan captured the capital of Kaifong in Honan, and carried the emperor Chu Ti into captivity. After a short interregnum, Liu Kao ascended the throne under the name of Kao Tsu, the first emperor of the later (Hou) Han dynasty; he succeeded in driving the Khitan out of the empire. His son Yin Ti was defeated in 950 by the general Kuo Wei, who was proclaimed emperor by his soldiers with the title of Tai Tsu, and ascended the throne as the first emperor of the later (Hou) Chau dynasty in the year 951. His grandson, however, was dethroned in 960 by the general Chao Kuang yin, who had been appointed emperor by his army.

The area of these conflicts was almost exclusively confined to the valley of the Hoangho; in the southern and western parts of China a period of comparative peace prevailed.

(g) *The Northern Sung Dynasty (960-1127).* — Tai Tsu (960-976), the first ruler of the northern Sung dynasty, was dragged out of his tent in a condition of hopeless drunkenness by his soldiers and clothed with the imperial robes; none the less he proved himself an excellent ruler, and after long and bitter struggles restored peace and order throughout the empire. Ching nan, one of the ten States, gave in its submission in 963, as did Hou Shu in 965, Nan Han in 971, Nan Tang in 975, Wu Yue in 978, and Pei Han in 979; the whole empire was now united under Tai Tsung (976-997), with the exception of the districts ruled by the Khitan and the Hsia, under the government of Tai Tsung (976-997). The governments of Chen Tsung (998-1022) and Yen Tsung (1023-1063) were also periods of prosperity for the country, although the latter of these rulers was obliged to purchase a disgraceful peace from the Khitan. He operated with greater success against the Hsia, who were settled near Ning hsia in Kansu; they made, at any rate, a nominal submission to his supremacy. However, in the year 1038 the Hsia-wang Chao Yuan hao assumed the title of emperor. During an illness of Yen Tsung, as also during the first years of his successor's reign, Ying Tsung, the empress Tsao (Tsao Hau) played an important part as regent, though her powers were persistently limited by the famous statesman Han Ki.

During the period of Shen Tsung (1068-1085) took place the interesting attempts at reform introduced by the minister Wang An shih, who was himself a famous scholar and author; these reforms were founded upon the precedents and uses of the old Chau dynasty (1200 B. C.). The chief feature of the reform was the almost paternal interference of the government in the life of the agricultural population. The system of tithings was reintroduced throughout the population, together with the mutual responsibility of the members of the tithing, and a militia system was drawn up based upon the provincial system and the general liability to military service. In the spring of each year advances were made to the peasants from the exchequer; in the autumn, after the harvest, this amount had to be returned plus twenty per cent interest. Those liable to labour services were obliged to commute them for monetary payments. The objections raised to these reforms by some of the highest State officials (Han Ki, Sze Ma kwang, Su shih, and others) were founded upon the unreliability and the corruption of the officials, which would make it impossible to carry out the reforms in detail; as a matter of fact, it was

chiefly for this reason that they failed. The struggle between the two parties continued with varying success and under different rulers for nearly forty years, and resulted in a victory of the old conservative party. Wang An shih was canonised and his name inscribed in the temple of Kung fu tsze; in 1086, long after his death, he was deprived of all posthumous honours, and now lives in the memory of the Chinese people as the "shameful" minister.

The period was also characterised by other movements in a philosophical, literary, and antiquarian direction. But for the State at that period its military power was the most important point, and here this dynasty appeared entirely incompetent as compared with earlier and more glorious times. It ultimately succumbed to the attacks of the Tartar kingdoms then existing or in process of formation upon the frontiers. In 907, Apaochi, apparently the chief of a Tungu tribe, advanced beyond the Amur and the Liau rivers to the northeast frontier of China, where he founded the kingdom of Khitan and the Liau dynasty in 916 under the title of Tai Tsu (the dynasty lasted from 916 to 1125); this kingdom gradually extended from Amur to North Pechili and from the Gulf of Liautung to the Desert of Gobi (Shamo), and carried on many long wars against China, plundering and humiliating the empire and extorting payments of tribute, until an opponent, at first its equal and soon its superior, arose in the Kin Tartars (Nu chen, Nu chi), who are the ancestors of the Manchu dynasty now ruling in China. Threatened by the Liau, the emperor Hui Tsung (1101-1125) turned to Akuta, the prince of the Kin, for help against the Liau, with whom this prince was himself at war. Akuta, who had assumed the title of "Emperor of Kin," under the name of Tai Tsu (1115-1122), acceded to this request: his brother and successor, Tai Tsung, overthrew the kingdom of the Liau in 1125 and captured the capital and the last emperor, Tien tsu Huang ti. Te Tsung (Yiě lu Ta shi), a member of the imperial family, fled to the westward and founded in Central Asia the kingdom of the Kara Khitai, the Black Khitan, or the dynasty of the Hsi Liao (the western Liau), which was destroyed in 1201 by the khan of the Naiman Mongols. The Chinese gained no advantage by the destruction of the Liau, for the Kin proved a far more dangerous enemy. This nation forced China to make concessions of territory and payments of tribute. In 1125 they again passed the frontier, captured Loyang in 1127, and carried the emperor Chin Tsung (1126-1127) into captivity. Their kingdom, the capital of which was at first Yen (Peking), extended to Honan, where at first Kaifong and afterward the more southerly Shu-ning became the capital. Chang Pang chang, originally an official whom they had set up under the title of the emperor of Chu in the year 1127, abdicated in the same year, and Kao Tsung, the ninth son of Hui Tsung, ascended the throne, thus becoming the first emperor of the southern Sung dynasty.

(h) *The Southern Sung Dynasty (1127-1295).* — Repeated incursions by the Kin forced Kao Tsung (1127-1162) to remove the capital from Nanking to Lin an (Hangchau) in Chekiang. The struggles of the Chinese against the Kin were by no means invariably unsuccessful. The general Yoh Fei especially distinguished himself in this warfare, but his attempts to induce the emperor to make a decisive attack upon the enemies of the empire were rendered nugatory by the minister Tsin Kuei, who was apparently in the pay of the Kin. Eventually Yoh Fei and his son were thrown into prison, and executed in 1141. Yoh Fei was canonised in

1179, and his opponent is still regarded with abhorrence both by the Chinese people and the native historians.

The sole feature of interest in the history of the southern Sung dynasty, which consists of a series of struggles, first against the Kin and then against the Mongols, is the revival of philosophic study, which reached its highest point in the exegetical school of Chu hi (1130–1200; see p. 86). His exhortations upon the classical books, and those of his pupils Chau Tun-i, Cheng Teh shiu, and others, are still authoritative works for the explanation of the orthodox belief.

The wars against the Kin, to whom China was at times nominally allied and often actually tributary, exhausted the strength of the empire, until at the outset of the thirteenth century the Kin were confronted with the attacks of the Mongols. A convention concluded by the emperor Li Tsung (1225–1264) with Ogotai, the successor of Genghis Khan, in 1239, proved advantageous rather to the Mongols than to the Chinese, although the Chinese troops won a great victory over the Kin under the agreement. The Mongols got possession of Tsaichau (Shu-ning), where Ai Tsung and Mo Ti, the last emperors of the Kin dynasty, lost their lives. All attempts of the Chinese to check the advance of the Mongols by force of arms or by offers of submission proved vain. In 1276 the Mongol general Bayan (Bo yen) conquered Hang-chau, captured the emperor Kung Ti with almost all the members of the royal family, and carried them northward into captivity. The eldest son of Tu Tsung (1265–1274), by name Chao Shi, succeeded in escaping from the enemy, and was recognised for nine years as emperor in Fuchau, under the name of Tuan Tung. However, he was soon obliged to flee before the advancing Mongols to Kwangtung, where he died in 1278. His younger brother, Ti Ping, fled with the last of his adherents to the island of Yai shan, which was attacked by the Mongols in 1279. Upon the loss of the battle, the minister Lu Shiu plunged into the sea with the nine year old emperor on his back, both being drowned together. This example was followed by a number of the court attendants upon the young emperor to avoid capture at the hands of the Mongols. Thus the southern Sung dynasty came to an end with the subjugation of the Chinese people by the Mongols.

(i) *The Mongol Yuan Dynasty, 1206 (1260 or 1280) to 1368.* — Temudshin, better known as Genghis Khan, was the son of a chieftain of the Nirun Mongols, and was born in 1155. After a long struggle he made himself chief of this tribe, overcame his most important rival, Ong Khan, in 1203, and was elected chief of all the Mongol tribes. His possessions were situated in Karakorum, from whence he advanced to the conquest of the world, overcoming the Uigurians in 1209, the Kharismians in 1220, and defeating the Russians, who were in alliance with the Kumaris, on the Kalka in 1223. He died on the mountain Lu pan shan, in Kansu, while upon an expedition against the Tanguts in 1227, the year of the downfall of the western Hsia dynasty. His influence upon China was merely indirect, through his expulsion of the Kin dynasty. His imperial title, and his Chinese name Tai tszu, which he bore after 1206, are no doubt honourable additions of a later period. After his son To Lei (Tuli; 1227–1229) had ruled for a short period he was succeeded by his third son, Ogotai Khan (Wokuo tai; in Chinese, Tai Tsung), 1229–1241. Under his rule the Mongols destroyed the Kin dynasty, and became the immediate neighbours of China. Upon the west also the Mongol kingdom was

rapidly extended; their expeditions against North Russia as far as the district of Novgorod (1237-1238), against South Russia as far as Volhynia and Podolia (1240), against Poland, Silesia, and Moravia (1240-1241), against Hungary (1241-1242), spread terror of the Mongol arms far and wide throughout Eastern Europe, and also brought the existence of China to the knowledge of the West. The three great kingdoms founded in Asia, Persia, Turkestan, and that of the Golden Horde on the Volga, recognized, though perhaps only nominally, the supremacy of China, — a submission later renewed to Timur the conqueror of India. The rulers of the three kingdoms received yearly subsidies from China, whence also they acquired their appointment and their royal seals. Prisoners of war formed the body-guards of the Chinese emperor, a Russian guard, for example, being formed in 1330. Numerous embassies also brought tribute from the subject princes.

After the death of Ogotai, his wife, *Nai Ma chen*, the sixth queen, undertook the government during the minority of her eldest son, *Kuyuk Khan* (*Kuei yu*; in Chinese, *Ting Tsung*), who ascended the throne in 1246; however, he died in 1248. The empress *Wo wu li haimi shi* in *Karakorum* undertook the regency until the coming of age of *Mangu Khan*, the son of *Tu li* (*Meng Ko*; in Chinese, *Hsien Tsung*; 1251-1259); he spent most of his time in his summer capital of *Shang tu* (*Xanadu*) in Southeast Mongolia, where he died. His reign was almost entirely occupied with wars against the southern Sung dynasty, which was ultimately destroyed in 1279 under the rule of his younger brother, *Kublai Khan* (*Hu pi lie*; in Chinese, *Shi Tsu*; 1260-1294). The first war of *Kublai* was directed against the pretender within his own nation, *Arikbuga* (*Alipuko*), who revolted against him in *Karakorum*, but was defeated in 1261, and forced to flight and submission in 1264. In the same year *Peking* was declared the capital of the country, under the name of *Chung tu* (central residence), and in 1271 *Kublai* adopted the title of the *Yuan* dynasty for his family. The Mongols, who had already subdued Korea, made this country the base of operations for an attempt (which was defeated by the Japanese) to establish themselves in *Kyushu*. Negotiations were carried on by Japan with the idea of ultimate subjection, but led to no result, and a great fleet sent out by *Kublai* against Japan in 1281 was almost entirely destroyed by a fearful storm. In spite of this failure, *Kublai* maintained peace and order throughout the twelve provinces into which the empire was divided, and under his administration every possible consideration was given to Chinese customs. The great "Imperial Canal," which had already been begun under the dynasties of the *Sui*, *Sung*, and the *Kin*, was extended and completed, and the nation developed advantageously in other directions. *Marco Polo* visited the court of the Grand Khan between 1275 and 1292 with his two uncles, *Nicolo* and *Maffeo*, spent some time in different parts of the empire, and acquired much information upon its riches and treasures ("Marco Million"). His accounts led indirectly to the discovery of America (cf. Vol. I, p. 347), as *Columbus* set out "to sail westward to the east," that is, to discover *Manzi* or Southern China.

*Timur* (*Tie murh*; in Chinese, *Cheng Tsung*; 1295-1307), the successor of *Kublai*, reintroduced the veneration of *Kung fu tsze*, whose doctrines had been tolerated, but not respected, by his predecessors. His example was followed by the succeeding rulers, who evinced keen interest in the classical literature, though they did not thereby gain the affection of their subjects. Upon the whole, the Mongol rulers seem to have governed wisely; they invariably showed themselves anxious

to lessen the burdens upon the people, but the remembrance of the fear inspired by the Mongol invasions had not as yet been obliterated. Any convulsion of nature which ravaged the country was considered by the learned classes and the common people to be a heaven-sent punishment. In court life eunuchs were also influential. The emperor Shotepala (yng Tsung) was murdered in 1323 by his chamberlain, T'ie shi; but those family dissensions which had so largely contributed to the downfall of earlier dynasties were almost unknown. The first instance of such outbreaks occurred in 1328, after the death of the emperor Yesun Timur (Tai ting Ti). Wen Tsung, or Tup Timur, a son of Kaisun (Hai shan, Wu Tsung; 1308-1311), got possession of the throne, and drove out Asu chipa (Achakpa), a son of Yesun Timur, who had also assumed the imperial title within Shang tu. The elder brother, Ho shi la (Ming Tsung), was recognised in 1328 by Tup Timur as the legal heir, and ascended the throne in Mongolia, but died in 1329 on a visit to a younger brother, who is supposed to have poisoned him. Wen Tsung then ruled until 1332, and died in Shang tu.

I-liu-chi-pan, a son of Ho-shi-la, who was but seven years of age, was set upon the throne, and died in the same year; he was succeeded by his eldest brother, To-huan T'ie-murh (Shun Ti; 1333-1368), the last ruler of the Mongolian dynasty. The reign of Shun Ti was opened by a series of earthquakes, showers of blood, and other phenomena, which, together with the failure in the harvest and an outbreak of floods, threw the nation into a state of disquietude. Much dissatisfaction was also caused by the issue of a decree for the undertaking of works upon the banks of the Hoang Ho, in the course of which taxation was necessarily increased. In 1348 the first disturbances broke out. In 1351 an opposition emperor, Hsu Shou hui, was set up in Hupei, and another emperor, Chang Shi cheng, in Kiangsu in 1353. In 1360 Hsu Shou hui was deposed by Chen Yō liang, who styled himself emperor of Han, while Chang Shi cheng proclaimed himself king of Wu in 1363, and was deposed by Chu Yuan chang in 1367. In 1355 Han Lin erh proclaimed himself emperor of Sung in Ngan-hwei; and in 1363 Ming yu chen proclaimed himself emperor of Hsia in Szechwan.

The most important of all these pretenders was Chu Yuan chang; he had been born of poor parents, and after becoming a Buddhist priest had entered the service of Kwo Tze King, who had made himself prince of Chu yang in Ngan-hwei in the year 1353. After the death of his father-in-law, Chu conquered Nanking at the head of a division of the forces collected by the former, and made himself king of Wu in 1367; he then became the chief opponent of the Mongols. In 1368 he assumed the imperial title, with the dynastic name of Ming; in the same year his generals (see Fig. 4 of the plate, p. 90) conquered Peking, whence the last Mongol emperor, Shun Ti, fled, passing through the Nanking Pass into those same steppes whence his forefathers had once set out for the invasion of China.

#### (J) THE BEGINNINGS OF CHRISTIANITY IN CHINA (635-1368)

(a) *Nestorianism*. — An inscription on the monument discovered in 1625 at Singanfu, the authenticity of which was erroneously doubted in the seventeenth century, states that a Nestorian, the first Christian missionary, arrived in China in 635. Upon the monument he is known as "Olopen," which is perhaps merely a corruption of the Chinese expression for monk, and the religion, of which a some-

what vague summary is given, is called the noble law of Ta tsin (Syria; cf. p. 79). The books brought by Olopen were translated with the emperor's leave, and official sanction was given to the dissemination of his teaching. The Tang emperor, Tai Tsung, is said in 638 to have given his express permission to the preaching of the new doctrine, and to have allowed the building of a church, in which his picture was placed. Kao Tsung (650-683) also favoured the doctrine. At a later period, however, difficulties rose; but Hsuan Tsung (712-756) again showed favour to the doctrine, and a new missionary, Kiho, is said to have entered the country. Finally the monument records its own erection in 781, under Te Tsung (780-805). The inscription is in the Chinese language, and partly in poetical form; it contains quotations in the Syrian language (Estrangelo), from which it appears that a large number of Nestorian priests (one reference contains sixty-seven names) were then working in China. They are said to have been organised under several episcopal vicars, the first of whom is entitled the pope of Zinstan (Zinistan, or China; cf. Vol. IV, p. 214). According to later accounts, closer relations existed between the Nestorians and the mother church in Syria, until broken off by the advance of Mohammedanism. In 845 the Christian priests, who are said to have numbered three thousand, came under the edict of Wu Tsung, which ordered them, like those of Buddha, to return to their temporal occupations. Nevertheless the Nestorians maintained their footing in China and Central Asia (Presbyter, or Prester, John, a very fabulous personage, may perhaps be identified with Ong Khan, the rival of Genghis Khan; cf. p. 95). They possessed a large number of parishes and churches throughout the empire, and were not without influence at the court of the Mongol princes and emperor, making many converts among the women and among some of the higher officials. They fell with the Mongol dynasty, without leaving any trace of their existence.

(b) *The Roman Catholic Belief.* — At the time of the Mongol dynasty the first Roman Catholic priests arrived in China, appearing in the character of ambassadors with a diplomatic message from the pope and temporal princes. The success of the Mongols in Western Asia and Eastern Europe, together with the growing power of Mohammedanism in Syria and Egypt, had seriously occupied the attention of the popes who preached, and the princes who took part in, the several crusades, and it was thought that an alliance might be made with the Mongols against the Mohammedans, the common enemy of both parties. This view of the situation commended itself also to the followers of Genghis Khan. The attempts to bring about a political and military alliance of this nature led to no result, no doubt in consequence of the fact that both popes and Mongol princes, instead of applying their energies to the practical solution of the questions before them, discussed more extensive plans involving the extension of their power. However, the reports of the papal messengers, and the emissaries of the other princes who went to Mongolia and China by land, offer many points of high interest. Before the meeting of the Council of Lyons (1245), Pope Innocent IV sent to the East an embassy of Dominicans under Nicolas Anselm (Anselm of Lombardy). In August, 1247, they met the army of the general Bachu Noyan in Khwarezm, and he sent them back with two Tartar (Mongolian) envoys with a message to the pope (1248). The message was conceived in a discourteous style, and the pope was ordered to give in his submission; but the general treated the ambas-

sadors with the greatest kindness, in the hope of continuing further relations. Simultaneously with the first mission, Innocent also despatched two Franciscans, Lorenzo of Portugal, who was appointed papal legate in the East, and John of Plano Carpini, who started on the journey from Breslau, in company with Benedict of Poland. These latter were the first to reach Bachu, who sent them on to the encampment of Ogotai, where they arrived at the moment when Kuyuk ascended the throne in July, 1246. There they found Russian and Hungarian priests, and a goldsmith by name Kosmos. Kuyuk was himself the son of a Nestorian woman, and among the women of his harem and his high officials were many Christians, who were allowed to practise their religion.

In November the ambassadors were dismissed with a written answer from the Great Khan. They were diplomatic enough to decline the company of Tartar ambassadors, as they did not desire the latter to be witnesses of the dissensions existing among the Christian princes, and so to acquire courage for further invasions. The homeward journey through Russia, Poland, Bohemia, and Austria proved difficult, and they did not reach the pope until the end of the year 1247.

Meanwhile King Louis IX of France received in 1247 a demand from Bachu to offer his submission, to which no reply was sent. In 1248, when Louis was on his first crusade, ambassadors from Ilchikadai, the successor of the deceased Bachu, came to the king in Cyprus, offering him an alliance against the Mohammedans, and informing him that Ilchikadai and the Great Khan had themselves become Christians. Upon this information, Louis sent out an embassy from Nicosia in 1249, consisting of Dominicans, under Andrew of Lorjumeau, to the Great Khan, to present him with several relics and exhort him to continue in the Christian religion. The embassy went by way of Persia, in order to speak with Hehi, and on arrival at the camp of the Great Khan found Kuyuk dead (1248). The queen regent, Ogul Haimish (Wo wu li hai mi shi; 1248-1251), accepted the gifts as a token of tribute, and sent back the ambassadors with presents. They were unable to gain any more accurate information on the subject of the alleged conversion. They returned to the king at Acre in 1251.

In spite of his dissatisfaction at the false construction laid upon the object of this embassy, Louis sent out in May, 1253, new ambassadors, the Franciscan, William of Rubruquis, and Bartholomew of Cremona, using the supposed conversion as an excuse for their despatch. They travelled by way of Constantinople through the steppes between the Dnieper and Don, and reached the encampment of Khagatai in July, whence they were sent on to Sartak Khan, the son of Bachu, three days' march beyond the Volga. He, however, declined to give them leave on his own responsibility to remain and preach in the country, and sent them to Mangu. At his court in December, 1253, they found many Nestorian priests, who had been given precedence over the Mohammedan Imans and the Bonzes. Mangu was present at their divine services with his family, but probably this was a matter of indifference to him. He himself, however, was very superstitious, and never entered into any undertaking without previous divination by means of the shoulder-bones (cf. p. 2). They accompanied Mangu to Karakorum, where they found Guillaume Bouchier, a Parisian goldsmith. There, at the orders of Mangu, they had a discussion with the priests of other religions. Mangu finally dismissed Rubruquis (Bartholomew remained behind, as he declined to journey homeward through the desert), with a written answer to King Louis, in which he assumed

the titles of "Son of the heaven" and "Lord of lords," and contradicted the information that had been given by the ambassadors of Uchikadai and of Ogul Haimish, and directed the king to act upon the orders of Genghis Khan. After a march of two months Rubruquis met with Sartak, who betook himself to the camp of Mangu, and had been baptised as his "chaplain" reported. In September, 1254, Rubruquis reached the encampment of Bachu, whom he accompanied for a month; ultimately he returned through the Caucasus, Armenia, and Syria, and arrived at Tripoli in August, 1255, whence he sent his report to King Louis in Acre.

The popes also were by no means idle, though their objects were now rather religious than political. In 1278 Nicholas III sent five monks to the Great Khan, but nothing is known of the results of this embassy. The Franciscan monk, John of Montecorvino, who had started in 1289, arrived at the coast of South China in 1292 and made his way to Cambaluc (Peking), from whence he sent favourable reports in 1305 and 1306; in 1307 he was appointed archbishop of Cambaluc. In this year and in 1312 a number of suffragan bishops and other priests were sent out to him, though it seems that some failed to reach their destination. In Peking, Zaitun (Changchau or Chinchiu), and Yangchau there existed episcopal towns, churches (three in Peking), and parishes, and when John of Montecorvino died in 1328, the prospects of the Minorite mission appeared highly favourable, although Andrew of Perugia, bishop of Zaitun, published a complaint in 1326 that no converts were made of the Mohammedans and Jews, and that many of the baptised heathen strayed from the Christian faith. On the other hand, as he himself observed, the country enjoyed full religious toleration, and no opposition was offered to the preaching of the missionaries.

Odoric of Pordenone, who arrived at the coast of China between 1320 and 1330, remained for three years in the country and returned by way of Tibet, when he drew up an exhaustive report of the religious conditions prevailing in the Far East. The last communications upon the state of the country which were received from China came from John Marignolli, who resided in Peking as the papal legate from 1342 to 1346. Communications were then cut off. In 1370 Urban V attempted to improve the situation by sending out a papal legate, an archbishop, and some eighty clergy to Peking; but no news was ever received of any of them. The Catholic mission perished amid the disturbances which broke out upon the downfall of the Mongolian dynasty, as the Nestorians had perished before them. The hostility of the national Ming dynasty in China to all foreigners, the spread of Mohammedan influence in Central Asia, and the conversion of rulers and peoples to this faith are hardly of themselves a sufficient explanation of the calamities which befell the Christians; popular hatred of the foreign doctrine and the foreign teachers must have materially contributed to their extermination.

#### K. CHINA DURING THE PERIOD OF TRANSITION FROM MEDIEVAL TO MODERN TIMES; THE MING DYNASTY (1368-1644)

THE first years of Tai Tsu, the first ruler of the house of the Ming (Ta Ming, the great Ming, also generally known to foreigners as Hung wu, from the motto<sup>1</sup> of his race; 1368-1398), were devoted to completing the expulsion of the Mongols

<sup>1</sup> The mottoes (cf. p. 78) will be added henceforward in brackets.

and the subjugation of the pretenders within the empire. Ming Shen, the emperor of Hsia (or Shu), submitted himself in 1371; in the same year a son of the last Mongol ruler, who had hitherto maintained his ground in Szechwan and Yunnan, was finally conquered. Shun Ti himself (p. 97), who had taken refuge with the northern Mongols, was followed up by the Chinese and besieged in Yingchang, where he died. His son succeeded in escaping after the fall of the town (1370). The national rising of the Chinese helped to extend their influence abroad. Korea and Annam sent tribute, and the Japanese who had ravaged the coasts of China at intervals by way of revenge for the Mongol invasion were temporarily driven back by a so-called Chinese naval victory at the Liu kiu Islands. In 1381 a revolt in Yunnan was suppressed. The emperor, who resided in Nanking, paid much attention to the reorganisation of the country and of the administration; he divided the kingdom into thirteen provinces (Shansi east and west, Shantung, Honan, Hukwang, Szechwan, Yunnan, Kweichau, Kwangsi, Kwangtung, Fukien, Kiangsi, and Chekiang), which were redivided into Fu, Chau, and Hsien (prefectures, departments, and sub-departments), an arrangement which continues to the present day.

Tai Tsu was succeeded by his grandson Hui Ti (Chien wen), who, however, was immediately sent into a Buddhist monastery in 1403 by his uncle Tai Tsung (Yung lo; 1403-1424), who had hitherto resided in Peking as king of Yen. Tai Tsung introduced a double system of government with two sets of ministers, etc.; the one in Peking, where he himself resided, the other at Nanking. Disturbances which broke out as a protest against his usurpation were ruthlessly suppressed; at the same time he raised the prestige of China abroad. From the year 1406 to 1411 he carried on a war against Tongking, which ended with the subjugation of the country, though his supremacy was not permanently established. In 1419 he defeated the Japanese, who had made an incursion into Liautung. Expeditions (embassies?) were sent out under the eunuchs Cheng ho and Ma Hnan to Siam, Ceylon, Java, Sumatra, Bengal, and to the Red and Persian seas. In fact, Chinese influence seems not only to have been felt in many of these countries at that time, but to have been paramount. Ceylon recognised the political supremacy of China for more than fifty years, and ambassadors came to China from Aden in 1422, from Egypt in 1441, and from Samarkand in 1481. However, the great anxiety of the emperor was the continued incursions of the Mongols, whereby he was induced to transfer the capital to Peking and to strengthen the great wall by works undertaken between the capital and Kalgan, which were afterward increased by his successors. He himself carried on a number of campaigns against the Mongols, which, though invariably successful, produced no permanent effect, and upon one of these he died.

The successor of Tai Tsung was also obliged to struggle against these enemies. Ying Tsung (Cheng tung; 1436-1449) was defeated by the Mongols and carried into captivity, being ultimately released in 1457 at the price of a heavy ransom; he then resumed the government until 1464 under the motto, "Tien shun." Under his successor, Hsien Tsung (Chenghua; 1465-1487), the Mongol raids continued, and obliged the government to further extend the existing fortifications. Revolts also broke out in the interior, especially in the district of the Miao and Yao of Kwangsi and Kweichau (cf. p. 59, 60), which were not suppressed until 1467, after long struggles. During the reign of Hsiao Tsung (Hung chi; 1488-1505) the

Mongol invasions were renewed with varying success. Additional troubles under Shi Tsung (Chia ching; 1522-1566) were caused by the repeated and energetic attacks of the Japanese upon the Yangtze district (1550) and Fukien. In 1516 the Portuguese appeared at Canton; their first ambassadors entered Peking in 1520, and on returning to Canton paid with their lives for the misdeeds of their compatriots, whose piracy had brought them into collision with the authorities and the population.

During the government of Shen Tsung (Wan li; 1573-1620), one of the more energetic rulers of this dynasty, three events occurred of the greatest importance for China and the whole of East Asia. In 1581 the first Jesuit came by sea to China. In 1618 the Manchus, the descendants of the Kin dynasty, which had been destroyed by the Mongols in 1234, entered the modern district of Manchuria under Aisin Gioro, afterward known as Tai Tsu, and settled in Hsing ching. At a later date they removed to Mukden (Shingking), whence the Chinese were unable to expel them. From 1592 to 1598 the Japanese held sway over Korea (cf. p. 31), China sending military help to this her tributary State as she saw her own security threatened by the advance of the Japanese. This measure of support, together with the obstinate resistance of the Koreans, raised such obstacles in the path of the Japanese that, after a campaign of varied fortunes and fruitless diplomatic negotiations, the dying Hideyoshi recalled his army to Japan.

In spite of this indisputable success, the Ming dynasty began henceforward to decline. The influence of the eunuchs and the harem, which had always been dominant in Peking, rapidly increased under the weaker emperors. Troops and money were lacking, and the invasions of the Manchus grew more frequent and more successful. In 1623 they were in possession of the whole of Liautung, and in 1629 they advanced as far as Peking and Tientsin, and were only driven back after a severe struggle. In 1622 the government applied to Macao, and enlisted from that district a body of Portuguese and Chinese freebooters four hundred strong, and partly armed with guns, for service against the Manchu. These, however, were not employed, probably from fear that they would turn upon the government. The empire itself was in a general state of ferment. Revolts, partly due to years of famine, broke out in Shansi, Hupei, and Szechwan. While the general Wu San kuei was striving his utmost to protect the northern frontier against the advancing Manchus, who had been under the command of Tai Tsung from 1627 (1627-1643), Li Tsze cheng revolted and marched upon Peking, which fell in 1644 after a short siege. Huai Tsung (Chung cheng), who had ruled from 1628, and seems to have been an honourable but weak character, committed suicide after killing his wife and daughters. With him the Ming dynasty came to an end. Li Tsze cheng proclaimed himself emperor, but after a short time was forced to evacuate the ruined capital by the advance of the Manchus, who had been joined by Wu San kuei.

#### L. THE SECOND PERIOD OF CHRISTIANITY IN CHINA (FROM 1581)

(a) *The Period of Prosperity of the Jesuit Mission.*—In 1579 the provincial of India sent two Jesuits to China, Ruggiero and Matteo Ricci. This step was taken by the advice of Francis Xavier, who had himself intended to make his way to China on the conclusion of his work in Japan, but had died upon the journey

at the island of Sancian in 1552. His aims were supported by the Jesuit Alessandro Valignani, who had visited Macao. They succeeded in reaching Canton from Macao in 1581, and after infinite difficulty erected mission stations in Kwangtung, Kwangsi, and afterward also in Nanking. In 1601 Ricci arrived at Peking, where he won general respect. His view was that in the work of conversion the opinions of the Chinese should be spared as much as possible. But his successor, Nicholas Longobardi, whom he had himself appointed (he died in 1610), did not share these views, and laid the foundation of that opposition which was to prove terribly destructive to the Catholic missions a century later. The rapid progress of the missionaries soon excited the jealousy and hatred of the official and learned classes, and in 1616 an order was issued from Peking to imprison all missionaries. The edict was, however, executed only in that town and in Nanking. When the invasions of the Manchus began in 1618, the missionaries were recalled to support the government with advice and practical help, and especially to aid them by casting cannon. This was the most prosperous period of the missionaries. Until 1627 they counted thirteen thousand converts in the seven provinces of the empire, and more than forty thousand ten years later.

The position of the missionaries was in no way affected by the downfall of the Ming dynasty. Shi Tsu (Shun chi), the first emperor of the Manchu dynasty, appointed the head of the mission for the time being, Adam Schall of Cologne, to be president of the board of astronomy in 1645, and remained well disposed toward him until his death (1661). However, during the minority of his successor, Sheng Tsu (Kang hsi), the regents instituted measures of severe repression against missionaries. It was not until the emperor himself assumed the power in 1671 that the decree of banishment which had been issued against the missionaries was repealed. The revolt of Wu San kuei in Yunnan (1673) enabled Ferdinand Verbiest, the successor of Schall, to make himself useful by casting cannon. These and other services so increased the influence of the missionaries at the court, that in 1691, when the provincial authorities of Chekiang began to persecute the foreign priests and the native Christians, the emperor issued a special decree in the following year securing toleration for the Christian faith.

(b) *The Downfall of the Christian Missions in China.*—The downfall of the mission was brought about by French intrigue and by the disputes of the different Christian orders and missionaries. The pope's patronage in India, to which China was treated as belonging, had been transferred to the crown of Portugal. This monopoly, however, appeared to conflict with the growing interests of France in Further India and East Asia. The Père Alexandre de Rhodes of Avignon and the Duchesse d'Aiguillon, supported by the French government, succeeded in obtaining a decree from Pope Alexander VII appointing three French bishops to Siam, Tongking, and China. No foreign ship was to be found to take them to their destination, and this difficulty became the occasion of the foundation of the *Compagnie des Indes* (cf. Vol. VII, p. 104), which was afterward succeeded (after 1698) by the various *Compagnies de la Chine*. At the same period the institution of the *Missions étrangères* was founded in Paris, 1663, to provide a supply of clergy for the projected missions. At the wish of Colbert a number of the pupils there educated went out to China in 1685. There can be no doubt that trade and political influence were the main objects which the French missionaries then

proposed to themselves,—a fact which explains the later animosity of the native population.

It was, however, the religious dissensions of the missionaries themselves which became the occasion of the suppression of Christianity in China. Even among the Jesuits conflicting views were held as to the attitude which should be taken toward certain questions (cf. p. 103). However, the chief points of difference centred around the traditional worship of Kung fu tsze and of ancestors. Ricci and most of the Jesuits could see no idolatrous meanings in these customs which they consequently permitted, whereas the fanatical Dominicans, as afterward the Lazarists and the priests of the Missions étrangères, were entirely opposed to this view. The popes declined to pronounce a decided opinion. Innocent X (1644–1655) declared for the Dominicans, Alexander VII in 1656 for the Jesuits, and Innocent XI (1676–1689) pronounced the ceremonies permissible in so far as they were merely the expression of national veneration. Ultimately Bishop Maigrot of the Lazarists forbade the customs in 1693, and characterised the representations made by the Jesuits to the papal chair as false in many respects. The Jesuits declined to recognise this decision, and in 1699 applied to the emperor Kang hsi, who made a declaration in full harmony with their views. Meanwhile at Rome the Congregation of the Inquisition had declared against the Jesuits,—a decision confirmed by Clement XI in 1704. At the same time Tournon, the patriarch of Antioch, was sent to Peking to procure an adjustment of these differences. He did not dare to publish the papal decree; but Kang hsi, whom the Jesuits undoubtedly used as an instrument to accomplish their designs, was informed by them of what had happened, and acted the more energetically when Maigrot declared against him and declined to recognise the imperial authority in a matter which only the papal chair could decide. Kang hsi banished Maigrot and ordered Tournon to leave China. The latter, being still unwilling to publish the papal decree as such, made a summary of its contents and issued it as his own decision. Kang hsi replied by arresting him. He was carried to Macao, where the Portuguese were obliged to place him in confinement, and there he died in 1710.

Clement XI in 1718 issued a bull, "Ex illa die," which threatened with the greater excommunication any one who declined to obey the papal constitution of 1704, and sent a new legate to Peking, Mezzabarba, the patriarch of Alexandria. Kang hsi absolutely declined to enter into further negotiations, but stated that Mezzabarba, who had arrived in 1720, might leave the former missionaries in China, but must return to Rome with all the remainder, where the pope was welcome to issue any orders he pleased regarding them. He was himself the sole ruler of the Chinese, and he forbade them to follow the papal decrees. Mezzabarba then published the papal bull, with the additional clauses which allowed the practice of the prohibited customs, considered merely as ceremonies of national veneration, but this compromise produced no satisfaction either in Peking or at Rome. Mezzabarba was definitely ordered by the emperor to leave China and take with him the missionaries he had brought. Pope Benedict XIII declined responsibility for the actions of his legate, and confirmed the decision of Clement XI by the bull, "Ex quo singulari," the terms of which remain in force at the present day.

Thus in the struggle between the temporal and ecclesiastical power, the former had proved victorious and maintained its advantage throughout the following century. It is impossible to say whether the methods of the Jesuits would have

ultimately proved successful or have resulted in the conversion of China. At any rate, the action of their adversaries both in China and in Japan precipitated the outbreak of the struggle and accentuated its severity. Even under Yung cheng (1723-1735), the successor of Kang hsi, persecution became fiercer; and although Kien lung (1736-1795) showed much personal consideration for the Jesuits who remained in Peking after the dissolution of the Order (1773), none the less both during his reign and that of Kia king (1796-1820) the bloody persecutions against the native Christians and the missionaries who had secretly remained in the country continued without interruption.

(c) *The Revival of Christian Missions in China.* — The state of affairs above described continued until the years 1845 and 1846, when the emperor Tao kuang (1821-1850) was induced by the proposals of the imperial commissioner Kiying, who had approached him at the desire of the French ambassador de Lagréné, to permit the practice of the Christian religion among his subjects. He issued an order that any missionaries who might be found in the interior should be merely handed over to their authorities in the harbours open to commerce. The conventions of 1858 and 1860 gave permission to the missionaries to visit the interior of the country and to take up residence there. Moreover, the decree of 1860, which was falsified by a French interpreter, gave missionaries the right to acquire landed property in the country. From that date the Catholic missions in China have been able to develop undisturbed, apart from persecutions of a more or less local nature. Before the Boxer revolt (1900), there were about five hundred and thirty European missionaries and five hundred and thirty-five thousand native Christians in thirty-one apostolic vicariates.

The oldest Protestant mission in China was the Dutch, which began in 1624 upon Formosa with the foundation of the East Indian Netherland Company, and ended in 1662 with the expulsion of the company from the island. In 1684 the last surviving Dutch prisoners were released, and with them every trace of the activity of this mission disappeared from the island. Other Protestant missions, especially those from England, America, and Germany, did not begin their career until the acquisition of Hong Kong by England (1841) and the peace of Nanking (1842). Like the Catholic missions, they have suffered under the various animosities of the authorities, the learned classes, and the population. Previous to the year 1900 the Protestant missions in China numbered about forty thousand communicants and nearly one thousand three hundred missionaries, more than seven hundred of whom were women.

## M. THE MODERN HISTORY OF CHINA

(a) *The Manchu (Ta Ching) Dynasty (1644-1820).* — What conditions Wu San kuei may have made with the Manchus when he joined their party, it is impossible to say. On the Chinese side, it is often maintained that the Manchus secured the supremacy over China by the violation of a treaty. On the other hand, it is certain that upon their conquest of the country they received every support not only from Wu San kuei, but also from a number of other Chinese generals who were at first rewarded with vassal fiefs. After the capture of Peking, where Fu lin ascended the throne under the title of Shi Tsu (Shun chi, 1644-1661), armies com-

manded by Manchu princes and Chinese generals were sent into every part of the country to subdue the adherents of the Ming dynasty and the pretenders who arose in every quarter. Li Tse cheng was gradually driven back to Szechwan, where he committed suicide. Prince Fu, who had assumed the imperial title in Nanking, was conquered in 1647; Prince Tang, who had been proclaimed emperor in Fokien (as had Prince Lu in Chekiang and Prince Kuei in the west), was overcome with greater or less success. Eventually, however, the Manchus were everywhere victorious. In 1659 peace was established through the empire, with the exception of Yunnan and Kweichau, and the contingents still fighting in those quarters (the Pretender had fled to Burmah and was given up by that country) were overpowered in the course of the following year. A son of the freebooter known by the name of Koxinga alone continued to hold out in Formosa. His piratical grandfather, Cheng Chi lung, had long harassed the southern coasts of China, and had then joined the side of the Ming in the struggle against the Manchus. At first successful and afterward repeatedly defeated, he at length surrendered to the Manchus, while his son, Cheng Cheng kung, upon being expelled from Amoy, had turned upon Formosa and taken the island from the Dutch. Cheng Chi lung was executed at Peking in 1661; his son, who was named Koxinga by the Portuguese, died on the island in 1662. It was surrendered to the Manchus in 1683 by his son, Cheng Ko chuang.

Upon the occupation of the empire by the Manchus, their Chinese allies were richly rewarded; Wu San kwei became the hereditary prince of Yunnan and Szechwan, while Shang Ko hi and Keng Ki mau received similar positions in Kwangtung and Fokien. When Wu San kwei revolted in 1674, the princes of Kwangtung and Fokien supported the Manchus; but their eldest sons, Shang Chin sie and Keng Tsing chung, joined the rebel party. Wu San kwei died in 1678; a few months later the revolt in the West was suppressed, and peace was established throughout the empire in 1680. The emperor, Shi tsu, had died in 1661; he was succeeded by his second son, a boy of eight years old, under the title of Sheng Tsu (Kang hsi, 1662-1672), during whose reign most of the events above detailed took place. During the revolt of Wu San kwei, the interference of the Chinese became necessary in Mongolia, where disturbances had broken out in consequence of dissensions between Galdan (Go Erh dan), the chieftain of the Eleuthes, and Tsi wang, the chief of the Khalka. After two campaigns, in which Kang Shi was present in person, Galdan was defeated and committed suicide (1696). His former opponent, Tsi wang, made an incursion into Tibet, which was under Chinese protection, and was only defeated in 1721 after a struggle that lasted for several years. Kang shi also came into collision with the Russians, who were advancing in Siberia; his troops conquered the town of Albasin, which the Russians had founded, hostilities being ultimately concluded in 1689 by the peace of Neretchinsk. The welfare of the country largely occupied the attention of Kang hsi, and in him Chinese literature found a zealous patron. During his reign were published the great dictionary named after him, and the encyclopædia, "Chinting tshu chi cheng," in five thousand and twenty volumes, by imperial commission. He was also the author of the "Sacred Edict," which consists of sixteen rules of behaviour to be observed by the people, and to which his successors appended many explanations.

He was succeeded by Shi Tsung (Yung cheng, 1723-1735), his fourth son, under whom the persecution of the Christians was carried out with unusual

severity. More than three hundred churches were destroyed, and by the expulsion of all the missionaries, with the exception of those resident in Peking and Canton, more than three hundred thousand native Christians were deprived of their spiritual pastors. Conflicts with the Mongols were frequent also during this reign, and expeditions were made against the inhabitants of Turkestan, who were ultimately subdued in 1734. Attempts made to bring Miaotsze, who had established himself in Yunnan and Kweichau, under the Chinese administration were only partially successful. This emperor died suddenly, and was succeeded by his eldest son, Kao Tsung (Chien or Kien lung; 1736-1795), under whom the empire and the dynasty reached the highest point of their prosperity. Revolts in Human and Kungsi, and at a later period in Szechwan, were suppressed, after a struggle lasting nearly three years, in 1749. A long period was occupied by disturbances in Mongolia, which broke out in 1745, as a result of quarrels about the succession; a chief cause was the action of Amursana (Amu sa na), who had at first supported the Chinese, but raised the standard of revolt after the defeat of Davatsi (Tse wan da shi), because only a part of the territory of the conquered prince was assigned to him; he was conquered in 1735 and fled into Russian territory, where he died shortly afterward of smallpox. As the princes of Kokand, Kashgar, and Yarkand had supported Amursana, the Chinese armies advanced against them and possessed themselves of their territory at the end of 1759. In 1769 Burmah was conquered after several years' fighting, and made tributary, and the same fate befell Annam during the years 1787 to 1789. A revolt in Formosa was suppressed in 1787, as also was a similar movement at an earlier date by Miaotsze in Szechwan after several years' fighting, in which the natives of this district were almost exterminated. Finally (1787-1792), a Chinese army invaded Nepal and forced the Gurkas to declare themselves a tributary State of China in 1791; this expedition was brought about by the invasions of the Gurkas into Tibet, and their attempts to extort payments of tribute from that district.

These wars and the numerous journeys which the emperor undertook throughout his kingdom, though they increased his reputation, materially contributed to shatter the financial resources of the country. The difficulties and the rise in taxation resulting from his policy no doubt brought about the series of calamities which threatened the dynasty under the succeeding emperors. It cannot be denied that Kien lung, like his predecessors, showed much interest in the welfare of the people. The administration was reorganized, and the duties of the officials were lightened by the division of the empire into eighteen provinces instead of thirteen. On this redistribution, the province of Shensi was formed of East Shansi, West Shansi becoming Shansi and Kansu, while Hunan and Hupei were created out of Hukuang; Pechili was formed of the district of Peking (the capital itself forms the special administrative department of Shun tien fu), and Kiangsu with Ngan-Hwei were formed of the province of Nanking. This distribution remains in force at the present day. Kien lung abdicated at the end of 1795, that the length of his reign might not exceed that of his grandfather Kang hsi (sixty years), and died in 1799.

Under his successor, Yen Tsung (Chia ching or Kia king; 1796-1820), revolts, probably instigated by secret societies, broke out in different provinces of the empire, and were only suppressed with great expense and difficulty. On two occasions attempts were made upon the emperor's life by members of a sect of "White

Lilies," and the southern coasts of the kingdom were harassed and plundered by pirates. As is often the case with eastern empires, the presumption of the government increased as its power declined. Under Kien lung the English ambassador, George Viscount Macartney (afterward Governor at the Cape; cf. Vol. III, p. 436), was treated with the utmost courtesy in 1793, though he was unable to obtain any diplomatic success. Under Kia king a Russian count, Jurij A. Golovkin, was sent back to the frontier in 1806, as he declined to perform the *kotow* before a table covered with a yellow cloth; and William Pitt, Baron Amherst, was expelled from Peking in 1816 because he declined to appear before the emperor in his travelling dress immediately upon his arrival.

(b) *The Manchu Dynasty, from 1821 to the Present Day.* — (a) *From the Opium War to the Conventions of Peking.* — Before the reign of the emperor Hsuan Tsung (Tao kuang; 1821–1850) China had certainly come in contact with foreign nations, but if one leaves out of account the different embassies sent by the Portuguese, Spanish, Dutch, Russians, and English, her relations with the powers over-seas were neither friendly nor hostile. The foreigners who visited China were either restless and dangerous freebooters who felt the weight of that power which they themselves strove to exercise, or were merchants who were obliged to court the favour of the Chinese people and officials for commercial objects. The merchants resident in Canton, which for a long time had been the only harbour open to trade, transacted their business by means of other merchants, and not through the officials of the empire. The English also declined any other representation than that of the agents of the East India Company; and these facts, together with the extremely low esteem in which the Chinese merchant is held by the population, contributed to increase the overbearing behaviour of the Chinese. When the monopoly of Chinese trade held by the East India Company expired in 1834, and the English government took the place of the company, it became clear that the foreigners must sooner or later acquire some legal status. The attempt of the Chinese to put a stop to the opium trade became rather the excuse than the occasion of the first war carried on by England, which broke out in 1840 and ended in 1842 with the peace of Nanking after some display of military capacity on the part of the Chinese. From that time foreigners in China have enjoyed a legally recognised protection, instead of being merely tolerated. At the same time five harbours were thrown open to foreign trade, — Canton, Amoy, Fuchau, Ning-po, and Shanghai, — and the island of Hong Kong, which the English had taken in 1841, was formally ceded. Compacts with France and the United States followed in 1844; the arrangement with the French included facilities enabling the practice of the Christian religion (cf. p. 104).

The result of the first conflict with the European power had thus considerably damaged the prestige of the dynasty, and in other respects the government of Tao kuang was distinctly unfortunate. Revolts in Formosa and Hainan, supported by Miaotsze, who was only suppressed with difficulty, and by Jihangir in Turkestan (1825–1828), necessitated great efforts on the part of China, and largely contributed to increase the financial embarrassments of the government and to diminish the welfare of the population. These facts, together with tribal quarrels in Kwangsi, and nationalist exasperation at the weakness of the government's policy toward the foreigners, caused the revolt of the "Long-haired" rebels (called Chang mao

FOUR CHINESE OF INFLUENCE AT THE CLOSE OF THE NINETEENTH CENTURY

## EXPLANATION OF THE PORTRAITS OVERLEAF

*Top left:* Yi Sin, *Prince Kung*, born January 11, 1833, brother of the emperor Hienfeng (1850-1861), foreign minister in 1861. After his brother's death, regent for the minor T'ungchih (born September 5, 1855); tolerant, and a friend to reform, for which reason he was deprived of his dignities in 1884; was recalled in 1894 as president of the Tsung-li-Yamen.

(From a photograph by Signor Beato, lithographed by Day & Son, in Robert Swinhoe's "Narrative of the North China Campaign of 1860." London, 1861.)

*Bottom left:* *Chung Hou*, the first real Chinese ambassador in Europe. In France, 1870-1871; in 1879 concluded at Livadia the unfavourable compact concerning Kuldseha, which was eventually rectified by the marquis Tsêng (1881).

(From a photograph of the year 1868.)

*Top right:* Y-Yung, hereditary *Marquis K. T. Gear Khan Tsêng*, born 1839, in the province of Hunan, of one of the oldest families of China. Ambassador to the Russian court in 1879; in 1881 obtained the restoration of Ili from Russia; ambassador to London and Paris, 1882-1885, to London and St. Petersburg, 1885-1886; member of the Tsung-li-Yamen; died April 12, 1890, in Peking.

(From a photograph taken at the close of the 1870 decade.)

*Bottom right:* *Li Hung Chang*, born February 14, 1821, in the village of Hweilung in the Hsfei district of the province Anhui. In the academy of the Haulin, 1848; secretary in 1853 to Tseng kuo Fang, the governor-general of the two Kiangs, and father of the marquis Tseng; in 1861, provincial judge in Chekiang, then governor of Kiangsu, obtains the honour of hereditary nobility; in 1870, is governor-general of Pechili and commercial superintendent of the northern harbours; in 1872, viceroys of the empire; conducted the peace negotiations with Japan in 1895 (assaulted in Shinonoseki).

(From a hand-coloured photograph by See Tay in Shanghai.)

or Tai ping, from the motto of their later emperor), which took place under a successor of Tao kuang, Wen Tsung (Hsien feng or Hien fung; 1850-1861). The outbreak of the revolt took place in 1850 under the leadership of a certain Hung Tsiu tsuen, who had enjoyed the teaching of Mr. Roberts, an American missionary, in Canton for a short period, and had given himself out as the younger son of God and brother of Christ. Advancing from Kwangsi to the Yangtze, he quickly won a series of victories, conquered Nanking in March, 1853, and there proclaimed himself emperor. In the month of May of that year a detachment of the Taiping troops crossed the Yangtze and began their advance northward. After a number of battles they got possession of Tsinhai, on the Imperial Canal, where they were soon besieged by the imperial troops, together with a body of Mongol auxiliaries. In April, 1854, a relieving army of the Taiping approached, and reached the town, but after several small successes was driven back in the month of May beyond the Hoangho by the imperial troops. The failure of this attempt decided the fate of the revolt; the expeditions of the Taiping armies degenerated into marauding raids, and the end would have come at an earlier period had not the government been involved in further difficulties with the foreigners.

The attempts of China to avoid the practical issues of the conventions, especially that regarding a settlement of strangers in the town of Canton (see the plate, p. 113), brought about the second war of England against China, in 1857. France, who had entered a complaint upon the murder of a missionary, joined England. The capture of the Taku forts, and the occupation of Tientsin, brought about negotiations and the conclusion of conventions (June, 1858), by which other harbours were thrown open, and foreign representatives were also admitted to Peking. When, however, the ambassadors of England and France appeared before Taku, in June, 1859, with the object of proceeding to Peking for the formal completion of the convention, the Chinese refused to allow them a passage, and an attempt at force was repulsed with great loss. Thus broke out a third war, between China on the one side, and England and France on the other. On August 20, the Taku forts were taken, the Chinese were defeated on September 18, at Chang kia wan, and on the 21st at Pa li kiao, by Ch. G. M. A. A. Cousin Montaban ("count of Palikiao"), and Peking was besieged on October 13. On October 18, the imperial summer palace (Yuan ming yuan), was destroyed by the English as a punishment for the treacherous capture and cruel treatment of the English envoys, and new conventions were signed in Peking on October 24 and 25, which conceded permission for the foreign representatives to reside permanently in the capital. The troops of the allies evacuated Peking, but retained possession of Tientsin, the Taku forts, Shanghai, and Canton, until the accomplishment of the conventions.

(β) *The Disturbances of the Last Forty Years.* — On the approach of the allies, Hsien feng fled to Jeho, where he died on August 22, 1861. When his widow, and the mother of his only son, returned to Peking in September they allied themselves with two brothers of the deceased emperor, Prince Kung (at the end of April, 1898; see Fig. 1 of the plate, "Four Influential Chinese at the Close of the Nineteenth Century"), and Prince Chun, to support the council of regency which had been (or professed to have been) appointed by the late emperor. The women then made themselves regents. The mother of the young emperor, Mu Tsung (Tung Chi

1862 to 1875), is the empress dowager of the Western Empire,<sup>1</sup> Tsu hsi, of whom mention is often made at a later period. On taking over the government, the regents found the empire torn by revolts. The Taiping emperor was still resident in Nanking. Since 1860 the Nienfei, a tribe of mounted robbers, had devastated the north of the empire. In Yunnan, where a Mohammedan revolt had broken out in 1856, an independent kingdom existed, Talifu, under the sultan Sulaiman ibn-i Abdur-Rahman. In Chinese Turkestan and Ili, Yakub Khan was in power, while Kansu and Shensi were almost entirely in the hands of Mohammedan rebels. Nanking fell in 1864 (by Charles George Gordon), after the Taiping emperor had committed suicide, and a year later the last bands of the "long-haired" rebels were overpowered. In 1868 the Nienfei revolt came to an end; Talifu fell in 1872, the last fortresses of the rebels in that quarter in the following year, and in 1878, as a result of the death of Yakub Khan, on May 31, 1877, the revolt in Turkestan was suppressed. It had been ended in China proper as early as 1873. Ili (Kulja), which the Russians had occupied during the disturbances in these districts, and to which they had laid claim by the compact of 1879, concluded in Livadia with Chung Hou (see Fig. 3 of the plate), was restored under the convention of St. Petersburg, concluded by the marquis Tseng (see Fig. 2 of the plate), in 1881, in return for an indemnity and a more accurate delimitation of the frontier.

Foreign embarrassments, unfortunately, did not allow the Chinese government to concentrate their attention exclusively upon the internal affairs of the country. In 1880 Japan seized the Liukiu Islands, which were tributary to China. French action in Tongking and Annam led to hostilities between France and China during the years 1883 to 1885. These ended with the recognition of a French protectorate over these countries, which had hitherto been tributary to China, and in 1886, England occupied Burmah, which had been in a similar relation to China.

More serious were the dissensions between China and Japan. Korea, which was also tributary to China, had been obliged to conclude a convention with Japan in 1876, whereby certain harbours were opened to Japanese trade. In 1882 further compacts were concluded with Japan, to which China assented. But in June of that year a revolt, chiefly directed against the Japanese, broke out, and was suppressed by the Chinese. In 1884 the Radicals, in alliance with the Japanese, revolted in Seoul, and, in the end, the people turned once more upon the Japanese. China again quelled the outbreak, and was forced into a further series of negotiations with Japan. In 1885 both powers agreed to withdraw their troops from Korea, on the condition that if either party should be obliged to send troops into the country, the other should receive timely notice. By this agreement, the relations of the two countries were improved during the following years.

The year 1891 was marked by one of those movements which recur from time to time, directed against the native Christians and the foreign missionaries, — the scene of action upon this occasion being the valley of the Yangtze. Instigated, apparently, by the secret society of the Kolao Hui, the movement soon assumed much larger proportions. To the united action of the foreign ambassadors was due the ultimate suppression of the movement. But the opportunity of convincing the

<sup>1</sup> The mother of the emperor Mu Tsung was, under the name Yebonala, the concubine of Hsien feng. But on the accession of her son she received, by imperial grant, the title given above. The lawful, but childless, wife of Hsien feng was distinguished as the empress dowager of the Eastern Empire. — Ed.

Chinese government of the unity and the serious intentions of the foreign powers was not, unfortunately, turned to account, and the seed of later troubles connected with the question as to the standing of foreigners and missionaries was thereby sown. A revolt of the Tonghak sect in Korea led to Chinese interference in that country in 1894. Japan raised objections, and brought about the war which ended in 1898, with the peace of Shimonoseki (cf. above, pp. 52 to 53). The interference of Russia, Germany, and France saved the Liautung peninsula for China; but the claims which Russia and France made upon China for concessions, in the way of railways and mining concessions, began to exercise a disastrous influence upon the general feeling of the country. In 1897 two Catholic German missionaries were murdered in Shantung, and it became necessary for Germany to take more energetic measures to secure the safety of her subjects and their interests in China. In consequence she acquired the possession of Kiauchau in January, 1898, which was shortly followed by similar agreements with Russia concerning Port Arthur and Talienwan, with England concerning Weihaiwei, and with France concerning Kwang-chau-fu.

These calamities affected the general welfare of the kingdom. The failure of the crops for several years in Shantung, and general economic distress, which was further increased by the concessions granted to foreign companies, called forth the "Boxer revolt," which broke out in the spring of 1900. This movement, which started at Shantung, was at first directed against the native Christians, then against the missionaries, and, ultimately, against all the foreigners in Peking and Tientsin. The emperor Tung chi died on January 13, 1875, after three years only of independent government, and his cousin, who belonged to the same generation, Tsai tien (Kuang hsu), the son of Prince Chun, succeeded him (until 1882 under the regency of the empress dowager Tsu hsi). This choice did not correspond to Chinese precedent. Moreover, the new emperor remained childless, and, in 1898 acceded to the impossible projects of reform proposed by Kang Yu wei, which culminated in a conspiracy against the former queen regent. Hence, in September, 1898, Pu Ch'un, a grandson of the prince of Tun, and also a brother of Hien fung, was appointed his successor. His father, prince Tuan, seems to have played a strongly anti-foreign part in these events, and in this movement the government and the court were also involved when its first victim, the German ambassador, Freiherr Klemens von Ketteler, was killed in Peking on June 20, 1900. The ambassadors and other foreigners were besieged for two months in the embassies, and were relieved in the middle of August by European, American, and Japanese troops. The Court fled to Shensi, while the troops sent out to China under the general command of the German field-marshal, Count Alfred von Waldersee, undertook various expeditions in the interior of the province of Pechili, whence they expelled the Chinese troops, these operations lasting until April, 1901. Lengthy negotiations led to the punishment of some of the chief culprits, the concession of considerable indemnities, and the adoption of a number of measures to obviate the recurrence of similar events. After the signing of the last protocol, in June, 1901, most of the foreign troops were withdrawn from China. The Court returned to Peking in December. Here the foreign ambassadors were received by the emperor and the queen regent in January, 1902.

## IV. RETROSPECT

CHINA is the only kingdom on the habitable globe which has continued without interruption from a remote antiquity to modern times. Though later in date than Egypt and the kingdoms of Western Asia, yet its authentic history embraces a period of two thousand five hundred years, while the comparatively high stage of civilization evidenced at the beginning of this epoch implies another one thousand five hundred years of previous development. The ethical system of Confucius evolved from earlier traditions about the year 600 B. C. furnishes the guiding principles of Chinese morality and political philosophy even in their latter-day forms. The *patria potestas*, the influence of the family and of the clan, continue in China to-day as they have existed for more than two thousand five hundred years. Neither Taoism, which, though a far more elevated and poetical philosophy, was of contemporary origin with Confucianism, nor Buddhism, which was introduced into China some six hundred years later, have exercised any material influence upon Chinese morality; both degenerated into superstition and eventually disappeared, whereas Confucianism remains at the present day the foundation of the domestic and public life of every class of the population. The individual is not absolutely despised in China; this is proved by the idea, theoretically admitted and operative in practice, that personal knowledge alone can make success either certain or possible. The individual is, however, inconceivable in isolation from the family and the clan; precedent and custom existing for centuries hold him fast in chains which though a protection and a support from one point of view prove an obstacle to any liberty of development in any other directions.

Political influence has proved powerless against the old and deeply rooted customs of the country. Certain customs and usages undoubtedly exist which owed their origin to the power of foreign dynasties and to the influence of foreign teaching and example; examples are the doctrines of Shamanism, and the practice of human sacrifice at burials which continually recurs until the middle of the seventeenth century; none the less Chinese civilization proved itself capable of absorbing and incorporating foreign influences. The Tartar Mongolian and Manchurian dynasties which have ruled and continue to rule China in part or in entirety have all been subjected to the influence of Chinese civilization, and have in some cases done more to maintain that civilization than Chinese nationalism has been able to effect. The existence of these dynasties, the introduction of Buddhism into China, and the presence of numerous Mohammedans in the empire are so much evidence in contradiction of the wide-spread view that Chinese civilization is completely stereotyped; influences from Central Asia, India, in some degree from Japan, and since the seventeenth century from Europe have left their mark upon religion, philosophy, literature, and art, and more particularly upon artistic production. Comparatively speaking, the fundamental principles of the family and of the State may be called stereotyped in so far as education and administration, together with the customs of the old State religion and the ancestor worship connected with this and with Confucianism, remain unchanged.

The history of the Chinese Empire does not offer a wholly satisfactory picture, but differs in no material respect from the history of other Asiatic peoples in the past and in the present. Polygamy with its consequences, the harem and the

eunuch, is the rock on which every dynasty made shipwreck. A strong man seizes the power, overcomes his rivals and secures the kingdom or a part of it for himself; his successors follow in his footsteps and increase or, at any rate, maintain their possession; then degeneracy begins. Eunuchs become the counsellors and often the executive officials of the princes; lands, titles, and offices are heaped upon the relations of favourite wives; governors and generals become more or less independent, until one of them proclaims himself generalissimo and administrator of the empire, drives the reigning monarch from the throne, and becomes the founder of a new dynasty. Within the ruling families themselves murder is an ordinary occurrence; in the course of twenty-five centuries almost one-third of the rulers met with a violent death. Harem government appears to have exercised an even more degrading influence upon the men than upon the women; at any rate, notwithstanding the low position which custom and Chinese morality assigned to the wife within the family and in society as a whole, we meet with a large number of female members of the imperial families who take an important part in the government of the empire as regents during the minority of their sons (see the plate, p. 90). The charges of licentiousness which are brought against so many of them may be nothing more than the tittle-tattle of court society; but they may also prove that a predominance of masculine characteristics in a woman generally coincides with a loss of virtue.

The unsettled character and rapid fall of the different dynasties have produced but little effect upon the foreign relations of the empire, the size and the unity of which has diverted attention from internal dissensions. The misery produced by weak governments was lost upon the distant spectator in view of the overpowering impression which a powerful and foreign monarch could produce; remoteness and inaccessibility have invested this country, which was to East Asia what Greece and Rome were to Europe, with a mysterious splendour which has often led the investigator to misestimate its actual condition. Antiquity has no monopoly of such mistakes; the reports of the Catholic missionaries during the seventeenth and eighteenth centuries have contributed more than any other influence to produce an exaggerated impression of the importance of China. These opinions continued until the events of the years 1894-1895, after which exaggeration seems to have rather proceeded to the opposite extreme.

These remarks are applicable to a number of inventions which have been ascribed to the Chinese. Gunpowder, for instance, is said to have been a Chinese discovery, but the country did not become acquainted with its value for artillery purposes until instructed by foreigners during the fifteenth century; and yet, there can be no doubt that they were acquainted with it during the fifth or sixth century, perhaps also through foreign influence. The production of porcelain begins with the seventh century A. D., and it may be questioned whether the Chinese did not first learn from strangers the use of the compass for maritime purposes, although they are said to have been previously acquainted with its properties. On the other hand, printing from wooden blocks was known in China five hundred years (922) before its discovery in Europe (1440); moveable types, though but rarely employed, were undoubtedly in use in China from the outset of the eleventh century. The employment of coal is of much earlier date in China than in Europe; at the salt springs in Szechwan, with their simply arranged borings to a depth of seven hundred metres, natural gas was employed for heating purposes centuries ago. Sus-

pension bridges of bamboo chains and wires more than one hundred metres long are by no means rare; dikes hundreds of kilometres in length protect low-lying districts from the devastations of rivers and the inundations of the sea, and many of the temples, pagodas, and palaces (see the plate, "Chinese Residences at Canton") justly arouse the admiration of the foreigner. Bronze founding was well known in 1200 B. C.; Chinese silk was famous in Rome and Byzantium and the achievements of Chinese art in porcelain, celluloid, enamel, and lacquer ware, and in hundreds of other directions is well known. These industries continued until the period of the Taiping revolt; as the Thirty Years' War and its devastations inflicted wounds upon Germany which required a century to heal, so China suffers to-day from the damage inflicted by this revolt, which was not ended until 1865.

Hence it would be unwise to draw any conclusions as to the future of the country from its past. At the same time, it must not be forgotten that the completion of much desired internal reforms would raise China from a passive to an active and even to an aggressive State; in this case, the country would then exercise an influence difficult to estimate, in consequence of its vast territory and teeming population. Tso Tsung-tang, the conqueror of the rebels in Kansu and Turkestan; Chang Chi Tung, who largely contributed to confine the Boxer revolt to the north of the empire; Li Hung Chang (see Fig. 4 of plate, p. 109), who died on the 6th November, 1901, and since the year 1870, when the French missionaries were slaughtered in Tientsin, had exercised a strong influence upon the future of his fatherland; Yuan Shi-kai, the former governor of Shantung and now governor-general of Pechili,—these instances and many more prove that there is no lack in China of men capable of understanding and providing for the interests of the country.

### 3. KOREA

#### A. THE COUNTRY AND ITS POPULATION

KOREA, so called after the old Korai (Kaoli), has during the greater part of its history been the apple of discord and the theatre of war between contending neighbours. Jutting out of the continent of East Asia and extending over twelve degrees almost directly north and south, this slender peninsula, little more than two degrees wide in some places, is bounded on the northwest by the Yalu and on the north by the Tumen-ula. Its western shores are washed by the Yellow, and its eastern by the Japanese, seas, while in the south it is divided from Japan by a narrow strait half filled with islands (see the maps, pp. 2, 58). Known to Europeans through the Portuguese as Coria, the country was named Sila by the Arabs in the ninth century A. D. (Sinra, after one of the Korean kingdoms of that time); the Chinese name is Tung kwo, the Eastern kingdom; the native name is Chosen (Morning rest; hence the country is known as "The land of morning rest").

Korea is divided into two unequal parts by an offshoot of the mountain range of Manchuria, which may be said to form the northern frontier wall of Korea; this offshoot passes down the district from north to south, with many windings. Of these parts the eastern is mountainous, and the coast falls sheer into the sea, with few or no rivers, harbours, or islands, whereas the western side slopes down

So-called "Temple of Heaven," with double roof. Residence of the emperor on the occasion of his presence in Canton.

Reception room (summer house) of the summer residence of the Tartar general, built upon weather-worn granite rock.

## EXPLANATION OF THE BUILDINGS OVERLEAF

A characteristic feature of Chinese architecture is its lack of monumental size and solidity; this is apparent in the lightness of the wood and roofing material employed. As with the Polynesian natives, it is only in the huge substructures of terraces and flights of steps that square buildings of monumental size are found. This feature also appears in the smallness of the scale on which the various architectural forms are constructed; even in the temples and imperial palaces, space and size are only obtained by the multiplication and juxtaposition of small buildings within one enclosure. Freedom of artistic taste and choice has been entirely repressed in China by the narrow-minded and jejune precepts of the authoritative architectural treatises, which prescribe for every householder the proper number of pillars befitting his rank, give accurate measurements to determine the proportions of every part of the building, and allow the architect no opportunity to develop his own ideas, except perhaps in those parts of the structure which are out of sight of the passer-by.

Chinese architecture employs vaulting, except in the case of substructures, only for gate and bridge construction; and even here true groin-vaulting is often replaced by the use of overlapping projections. Cupolas are to the Chinese architect almost entirely unknown. Certain tendencies to true cupola form are to be found, though in scanty number, in the localities devoted to the worship of the heaven. The wooden framework of the roof of every building, which in the interior is sometimes left open and sometimes covered with sunken panels, supports the tiled roof, which projects beyond the walls and is somewhat concave; this framework, is supported by wooden uprights, the form of which is generally determined by the rules of architecture, but in many cases by the lattice-work, which is a development from wabbling. The wall between the uprights supports no weight but its own. It is, as Semper says, "when closely considered, merely a folding-screen executed in tile-work, a frame for hangings;" so far from bearing any weight or supporting the house, pails are invariably taken to represent it "as moveable, put in sideways, entirely independent of the weight of the roof." The pillars of the supporting framework, which are usually round, generally of wood, only in the imperial palaces of marble, can consequently be placed either before or behind or in the walls. In the first case, they form a verandah to the front of the building; in the second case, they are invisible from without; and in the third, they appear as half-pillars. Their pediments usually consist of a simple rounded block; the capitals are often, as in India, bracket-shaped supports, often in the form of the dragon, the emblem of the Chinese heaven and the Chinese imperial power, or of other fabulous animals. In other respects, to quote Semper once more, lattice-work forms the main basis of decoration in Chinese architecture. We have especially fine bamboo lattice-work upon the lower part of the walls within, strong trellis-work with daintily varied and sometimes exaggerated geometrical patterns in the outer walls of summer houses and other airy buildings, carpentry in wood alternating with branchery and paintings, especially in the balustrading which forms the transition from the massive substructure to the more lightly built upper floors.

The most impressive part of these buildings, which usually run horizontally, is, from the artistic point of view, the roof, with its concave formation far overhanging the walls. The roof is usually sloping, and anything in the nature of gables is exceptional; the tiles laid in regular lines give it a ribbed appearance, and on the ridge beam and extreme points of the roof are often snakes, dragons, or other animal figures of clay, with open-worked beams adorned with dragons' teeth. Roofs of this kind cover temples, huts, palaces, towers, and gates, and are even to be seen in bare outline and without beam-work upon simple enclosure walls. But the greatest peculiarity of Chinese architecture is the fact that this roof is often repeated two or three times above one building to increase the effect, so that a building may show several stories of roofs one above the other. The well-known Chinese towers which overlook town and country rise from nine to fifteen stories high, each story being terminated by the overlapping edge of a roof; the perpendicular lines of the stories are in some cases so far hidden by the projecting eaves that roofs with bells hanging upon their edges appear to have been piled upon one another with no intervening stories. The theory has often been advanced that the type of Chinese roof was an imitation of the Tartar tent; but Fergusson has disproved this hypothesis by showing that this tent is usually conical in form. The English investigator inclines to consider the typical roof as the outcome of Chinese taste combined with practical utility, this form of roof being especially adapted to repel the rainstorms and the sunbeams. Of high importance for the general impression of a Chinese building, whether belonging to noble or to peasant, is the rich and often staring coat of colour which covers the whole edifice with the exception of the massive stone substructure. The brick walls are covered with coloured plaster; the wooden portions of the building are brightly painted, and sometimes even lacquered. The use of yellow and green glazed tiles seems, however, to be a privilege reserved for the temple buildings and imperial dwellings.

(Chiefly after Karl Wernmann, "Geschichte der Kunst aller Zeiten und Völker.")

toward the Yellow Sea and contains the only rivers of any importance; its coast-line, which is much broken, offers many harbours and numerous islands at the sea level. As might be expected from the configuration of the country, the western portion is the more thickly populated, and consequently of the greater commercial and political importance; at the present day only three provinces are found to the east of the central mountain chain, whereas the western portion possesses five, together with the capital of Seoul. The climate is marked by great contrasts of heat and cold: during the spring the mountains are covered with flowering azaleas, and the summer is tropically hot, whereas the winter is extremely cold, and the tigers who come down to the plains from the snows in the higher parts of the country bear the thick fur of their Manchurian cousins.

The area of Korea is about 218,650 square kilometres, and the population is said by some to amount to seven or eight million, by others to exceed ten million inhabitants. These, according to Baelz (see pp. 2, 60), belong to the Manchurian-Korean type, the former element predominating. In reality the population of Korea has been formed by the blending of many northeast Asiatic races, among which the Ainos are well represented (see p. 214). Strangely enough, the characteristic type often bears a resemblance to the Semitic. But in the case of Korea, as in that of the neighbouring States of China and Japan, nothing certain is known either of its earliest inhabitants or of the origin of later immigrants, and still less concerning the time of these immigrations. According to the Chinese annals, in 1132 B. C. Ki Tsze, an adherent of the Shang dynasty which had been overthrown a short time previously (p. 64), entered the country with five thousand followers at Chosen, which at that time embraced chiefly the southern portion of the modern Manchuria. He is said to have subdued and to have civilized the natives. The Koreans also gave official sanction to this legend as the beginning of their relations with China. It is impossible to say what amount of truth may be contained in the legend; though perhaps Ki Tsze may have carried out the undertaking not in Chosen, but at Fuyu, lying to the north of that district, which at least appears to have possessed at an early period a civilization resembling that of ancient China. Equally impossible is it to assign any definite date for the introduction of Chinese and Confucian civilization. We only know that Confucianism and Buddhism travelled to Japan by way of Korea.

### B. THE EARLY HISTORY OF KOREA

UNTIL the outset of the second century B. C. the relations of Korea to China may be described as a series of struggles between North China, which was often designated at that period as the kingdom of Yen, and Northern Korea, which at one period extended westward beyond its frontiers. In Korea proper there lay to the north Chosen (Korai), and to the south two other districts, known as the Western Ma han and the Eastern Shin han, both inhabited by independent tribes, who appear in some cases to have intermarried freely with fugitives from China. When the first Han dynasty came to power in China (see p. 76) it enforced its rights to Yen by conquering the kingdom in 206 B. C. Fugitives from that district arrived at Chosen, where their leader, Wē men, overthrew the king and seized the kingdom in 194 B. C.; his capital of Wang hien lay to the east of Ta tung. The king, Ki jun, of Chosen fled to Ma han, where he was hospitably

received by the tribe of the "One Hundred Families" (Hiaksai), and became their chieftain at a later period. This tribe afterwards became the dominant power of Ma han, and the kingdom there formed received the name of Hiaksai (also Kudara and Pehtsi). After the fall of the Chin dynasty (206 B. C.), Chinese are also said to have fled to Shin han, and there to have founded the later kingdom of Sin ra (Sila Sinlo), under Yu kio, the grandson of Wē men. War broke out between Chosen and China in 108, which ended in 107 with the entire defeat of the Koreans, the capture of the capital, the death of the king, and the occupation of the kingdom by the Chinese. Their supremacy continued until the downfall of the Han dynasty (p. 79).

### C. THE MEDIEVAL HISTORY OF KOREA

IN the meanwhile Kokorai, a new kingdom, had arisen to the north of Chosen and south of Fuyu; it came into contact and soon into collision with the Chinese at the outset of the Christian era. These relations and those of the later kingdom of Puhai, which replaced that of Kokorai, have had but little influence upon the history of Korea. More important were the struggles between the three States which had been formed within the peninsula itself, Hiaksai, Sinra, and Korai. Hiaksai was the first of these States, and was strongly influenced by Confucianism and Buddhism, both doctrines being firmly established there toward the end of the fourth century A. D. Struggles with Kokorai, Korai, and Sinra occupy a large part of the history of this State, which was subjugated by China in 1660. Ten years later a Buddhist priest raised the standard of revolt against the Chinese, and with the help of the Japanese, set up Hoshō, a son of the former king, as prince of the country; but Hiaksai was conquered, and a large portion of the population emigrated to Korai and Japan. Korai, which had successfully repulsed different attacks, at last succumbed to the Chinese, so that of the three kingdoms only Sinra maintained some measure of independence.

During the period of the Tang dynasty (618–907; see p. 90), Sinra maintained close connection with China, and its capital Chung-ju was the true centre of Sino-Korean civilization and of Buddhism. It was there that the Korean Nido alphabet was discovered, which may perhaps have served as a model for the Japanese alphabet. Sinra gradually absorbed the whole of the eastern half of the kingdom. However, a war against Puhai, which was undertaken in 733 at the instigation of the Chinese, proved unsuccessful. In general, the kingdom maintained its position until 912, when a Buddhist priest, Kung wo, revolted against the weak reigning monarch. Kung wo was soon pushed aside by the General Wang ken; he declared himself ruler of the country and made Phyeng-yang and Kai-chau the headquarters of his government. In a short time he succeeded in subjugating the whole peninsula and founding a united kingdom under the name of Korai (he is said to have been a descendant of the princes of ancient Korai). He now set up his court in Sumto, situated more nearly in the centre of the country (the modern Kaiseng, about fifty kilometres from Seoul), and died in 945. After long internal struggles, his successor recognised the supremacy of China, which had been united under the northern Sung dynasty (p. 93).

The king of Korai laid claim to Liautung, alleging relationship to the princes of Kokorai and Puhai. In consequence, he came into collision with the Khitan

Tartars (Liao dynasty; see p. 93), who were then at the height of their power. The Koreans were rapidly defeated by the Khitans during the years 1012–1014, and could only maintain their ground against their powerful enemies by means of an alliance with the Nuchi Tartars (Kin). When the kingdom of the Kin was destroyed by the Mongols in 1230, Korea made submission to the conqueror; but the murder of a Mongol ambassador (1231) called forth an invasion of the Mongols in 1240. After a long resistance, the king surrendered and betook himself to the court of Mangu Khan in 1256 to acknowledge his supremacy in person.

Kublai Khan, the successor of Mangu, made Korea the base of operations for his projected attack upon Japan (see pp. 21, 96). There can be no doubt that the Mongols largely contributed to increase the animosity between Korea and Japan during the years 1266–1281, owing to the help given to the Koreans, the losses which they suffered at the hands of the Japanese in the course of operations, and the devastations upon the Korean coasts committed by Japanese pirates during the following centuries. Korea had been and remained the teacher of Japan in almost all the arts and sciences, and there is no doubt that a higher civilization existed in Korea itself. Korean bronze groups, existing in Japan and dating from the seventeenth century, are proofs of the fact. But at the present day these arts have disappeared in Korea and left scarce a trace behind.

#### D. KOREA DURING THE TRANSITION FROM MEDIEVAL TO MODERN TIMES

(a) *The Predominance of the Ming.* — After the fall of the Mongol dynasty in China (1368) the Ming issued a demand that Korea should resume the payments of tribute that had previously been enforced. This the king of Korea, the thirty-second ruler of the Wang dynasty, met with a direct refusal. But his army was unwilling to march against the Chinese; the king was deposed, and Ni Taijo, the leader of the rebels, founded in 1392 that dynasty of which a minor branch is in power at the present day. The new dynasty became entirely dependent upon China; the calendar and chronology, the administrative methods and the costume of the Chinese were adopted, and present-day Korea, more than two hundred and fifty years after the fall of the Ming dynasty, offers a faithful picture of China as it was under the government of those kings. Ni Taijo was an energetic ruler. He transferred the seat of government from Sunto to Han yang on the Han, now known as Seoul (that is, capital), and divided the kingdom into eight provinces. The list was as follows: Ham gyeng, Kang wen, Kjong sang, lay in the order given from north to south on the sea of Japan; the other provinces in order from south to north on the Pacific were Chel la, Chhung chheng, Kjong kwi, Kwang hai, and Phyeng an. Buddhism was almost entirely suppressed, and priests were absolutely forbidden to enter Seoul; a stern Confucianism practically became the state religion of the country. To this dynasty is also ascribed the abolition of the custom which had hitherto prevailed, and is probably of Tartar origin, of performing human sacrifice and burying slaves and others alive at the funerals of famous people. The first descendants of Nai Taijo were vigorous rulers who increased the centralisation of the government and advanced the prosperity of the people. As regards their foreign policy, they were dependent, according to Asiatic custom, on both of the two neighbouring powerful kingdoms of China and Japan, sending to both of these

periodical embassies, which theoretically, at least, were supposed to make payments of tribute. These embassies came to an end in 1460, in consequence of the internal wars in Japan during the second half of the fifteenth and the first half of the sixteenth century (p. 23), the downfall of the shōgunate under the Ashikaga, to whom these embassies were usually sent, and the uncertainty of communication between the two countries, owing to the activity of the Japanese pirates.

(b) *The Policy of Aggression of Hideyoshi.* — This behaviour on the part of the Korean government, together with Hideyoshi's visionary plans for the subjugation of China, led to the invasion of Korea by Japan (1592; cf. p. 31). The Japanese won a rapid series of victories, conquering Fusan on the 25th of May and capturing Seoul eighteen days later. The king and the court fled from the town to Pingan (Phyeng yang). In July the Japanese reached the Ta tung. At this river they fought a successful engagement, and were able to cross and capture Pingan. The king fled to An-ju; the advance of the Japanese was then checked, owing to the fact that their fleet on which they depended for their supplies was almost entirely destroyed by the Koreans at Fusan. The contingents of Chinese, for which the Koreans had appealed, now came upon the scene of action. Their advance guard stormed the suburbs of Pingan on the 27th of August, but was almost entirely destroyed by the Japanese on entering the town proper. The main body of the Chinese, together with the remnants of the Korean troops, reappeared before Pingan in February, 1593, and stormed the town on the tenth of the month. The Japanese general, the Christian Yukinaja Konishi, was abandoned by his colleagues, who had taken up positions further to the south, and was forced to fall back upon Seoul. Here he joined the other commander-in-chief, the Buddhist Kiyomasa Kato. A battle was fought outside the town in March; the Chinese were defeated and retired to Pingan, but the pursuit was feeble, since the Japanese had lost heavily in the conflict.

Both sides were now glad to resume the negotiations for peace which had been previously opened, and were chiefly conducted by the Chinese Chin I-kei. In spite of the opposition of the Koreans and of Kato, a treaty was concluded, by which Korea ceded the most southerly provinces to Japan and recognised her tributary relation to that country. The old commercial relations between China and Japan were to be resumed, Hideyoshi was to marry the daughter of the emperor of China and to be recognised as the emperor's equal. Until the completion of this convention, the Japanese were to withdraw to the coast of Fusan, where they were to garrison twelve strongholds. On the 23d of May, 1593, the Japanese evacuated Seoul and began their retreat, slowly followed by the allies; further collisions took place in the course of this operation which would have led to another outbreak of war had not Konishi's mediation been successful. The Chinese retired northward; part of the Japanese forces were transported to Japan, and negotiations were continued partly in that country and partly in Peking. In October, 1595, a Chinese embassy arrived in Japan, and was received on the twenty-fourth of the month in Fushimi by Hideyoshi. However, the message with which they were intrusted from the emperor Shang Tsung merely recognised him as "king of Japan," a title which had been previously granted to the shōguns of the Ashikaga family.

The war consequently broke out again. Chin I-kei, whose action during these proceedings is by no means clear, was captured by his compatriots and executed;

reinforcements were sent to Korea by both nations. In January, 1597, the Japanese defeated the Korean fleet and made a triumphant advance to the neighbourhood of Seoul. But the destruction of their fleet by the united Chinese and Korean forces again obliged them to retreat to the sea-coast. During their retirement they utterly devastated the country and destroyed Chung ju, the old capital of Simra. To this action is to be ascribed the hatred which has inspired the Koreans against the Japanese from that date (cf. above, p. 116). In the south the struggle centred round the fortress of Urusan, into which, after fierce fighting, a large body of the Japanese troops had been thrown. When the garrison had been reduced to the extremities of famine, a Japanese army defeated the Chinese and Koreans who had advanced to meet them, on the 9th of February, 1598, and relieved the town on the 13th. This final success of the Japanese brought the great war to an end. A number of unimportant conflicts by land and sea took place; but shortly before his death, on the 8th of September, 1598, Hideyoshi recalled his troops to Japan.

Korea emerged victorious from this struggle, but terribly weakened. Relations with Japan were broken off until 1623, when Iyemitsu, the second shōgun of the Tokugawa dynasty who had united the nation into a powerful whole, successfully demanded the resumption of the embassies and their tribute. The first ambassadors appeared at Yedo in 1624. However, the shōguns soon found the expenses of these embassies, which were void of any practical meaning, too heavy, and discontinued them. From that period communication between the two countries was confined to Fusan, where trade was possible under strict supervision, to Tsushima, of which the prince, apparently of Korean origin, had always been anxious to maintain commercial relations, and to Satsuma. To the latter place Korean prisoners had been brought during the expedition to Korea, and they were there employed as potters; the town in consequence being occasionally visited by Korean junks.

### E. THE MODERN PERIOD

KOREA maintained friendly relations with her Chinese neighbours. When the Manchus began to threaten the Ming dynasty in 1616, the latter, in order to prevent the incursions of their enemies, agreed with the Korean government to lay waste a district on the right bank of the Yalu about one hundred kilometres broad, and four hundred and eighty kilometres long. The villages were destroyed, the inhabitants expelled, and on the Chinese side this frontier district was strengthened by wooden palisades and a double, or, in some cases, a triple row of forts. When the invasions of the Manchus became more frequent the Chinese government applied to its vassal State for help, which was readily granted. In consequence, the Manchus invaded Korea in 1627, defeated the allied Chinese and Koreans and besieged Seoul, until the king, who had fled to the island of Kang hwa, gave in his submission. No sooner, however, had the enemy retreated than he declined to fulfil his promises. A new invasion of the Manchus followed, and in 1637 the king was forced to conclude a convention whereby he definitely broke off his connection with the Ming, gave hostages, recognised his position as tributary, permitted the opening of a market on the frontier of Liau tung, and promised to send out a yearly embassy to make payment of an appointed tribute. After the conquest of Peking, this tribute was diminished on different occasions until it became abso-

lutely unimportant from a monetary point of view, while the periods for its delivery were fixed at intervals of three years.

Christianity appears to have entered Korea at the end of the sixteenth century. The first foreign missionary is said to have attempted, but in vain, to enter the country in 1791. At that date the first persecution of the native Christians took place. In 1835, a French missionary, P. Maubant, of the Missions étrangères de Paris, succeeded in entering Korea, and was almost immediately followed by others. However, in the same year three missionaries and one hundred and thirty native Christians were executed. Other missionaries arrived at Korea in 1842, but the persecutions continued and nine French missionaries were martyred in March, 1866; only three, including Bishop Ridel, succeeded in escaping. The French Government availed itself of this opportunity, and as the authorities in Peking declined all responsibility for these outrages, an expedition was sent to Korea which destroyed several forts, in October, 1866, but was forced to withdraw after suffering several reverses from the Koreans without attaining any definite success. These operations on the part of the French were followed by an American expedition in 1871, which was ordered to land and make inquiry into the fate of a schooner, the "General Sherman," which had been lost off the coast with its crew. An attempt was also to be made to enter into friendly relations with the Koreans. The expedition was attacked by the Koreans, and after destroying a number of forts in the neighbourhood of the Han River returned home.

The Japanese were more fortunate. The mikado's government, shortly after the restoration (1868), made a demand for the resumption of the payments of tribute, which the Koreans rejected with scorn. In September, 1875, the sailors of a Japanese ship of war were attacked by the soldiers of a Korean fort, and the Japanese Government sent an expedition to Korea. On the 27th of February, 1876, a convention was signed for the opening of the harbour of Fusan during that year, and two other ports, Gensan and Ninsen (Chemulpho), in 1880. Resident consuls and diplomatic representatives were also to be admitted, and Japan was to recognise the independence of Korea. We have already treated of the events connected with this opening of Korea as they affected other powers (1882), the outbreaks of 1882 and 1884, the Chinese-Japanese convention of Tientsin in 1885, and the Chinese-Japanese war during the years 1894-1895 (see the history of Japan, p. 52, and of China, pp. 109, 110). We are therefore here concerned only with the internal affairs of Korea in so far as they contributed to or were the result of these events.

In the year 1864 the dynasty of Ni became extinct in the direct line. The king Chul chong died after a reign of thirty-one years, without issue. The eldest of the three wives who survived him seized the government and proclaimed the son of the prince Ni kung, who was thirteen years old, as the successor of Chul chong. Ni kung was able, however, to seize the power for himself, and he ruled with ruthless cruelty until 1873, under the title of Tai wen kun (Tai in kun, lord of the great court). The persecutions of Christianity and the execution of all foreigners were ascribed to the initiative of this regent, who was opposed to foreign influence and progress in any form. Upon the majority of the young king I hung (formerly Li Shi, 1873), conditions changed for the better; an improvement most probably due to the influence of the queen, whom he took in 1866 from the noble family of the Min. The further history of the domestic policy of Korea is

entirely occupied with the bitter struggles between the queen and the Tai wen kun, which ended with the murder of the former at the instigation of the Japanese ambassador, Miura, on the 8th of October, 1895.

The Tai wen kun died a few years later, a helpless and broken man. The part played by Japan and the Japanese in these domestic disturbances is by no means wholly to their credit. The progressive party in Korea naturally associated himself with Japan and looked to her for help. But the fact that in these different revolts and political murders Japan played so large a part, directly or indirectly, throws a somewhat discreditable light upon her methods of introducing her civilization into Korea. The country has been cursed throughout its history by the ambitions and the quarrels of the great noble families, the Min, Kim, Li, Ni, and others, and the resulting conflicts have materially contributed even in modern times to impoverish the country and provide opportunities for foreign interference.

After the murder of the queen, the king was for a considerable period in the hands of those who had instigated the deed. On the 11th of February, 1896, he fled to the Russian embassy with the crown prince, and did not return to his palace for a full year. Since the 12th of October, 1897, he has borne the title of emperor, probably with the object of emphasising his independent position, which is not necessarily implied by the title of king. Korea has now become the apple of discord between Russia and Japan, as it was formerly between Japan and China. The various treaties executed between the two powers (among others that of 1896), have by no means provided a solution of the Korean question. The "land of morning rest" has, on the contrary, undoubtedly called forth these preparations in Japan which have been pursued with feverish haste and have brought with them serious financial embarrassments. It remains to be seen whether the treaty concluded between England and Japan on the 30th of January, 1902 (p. 54), will produce the intended result of maintaining the *status quo* in Korea.

## II

## CENTRAL ASIA AND SIBERIA

BY DR. HEINRICH SCHURTZ

## 1. THE EARLIEST PERIOD AND THE HISTORICAL BEGINNINGS OF CENTRAL ASIA

IN comparatively recent times the vast highlands of Asia with their glittering ramparts of eternal snow, their pasture grounds, their bleak deserts, and verdant oases, were regarded with awe by the civilized nations of Europe. It seemed that science, in harmony with the religion and the myths of so many peoples, had succeeded in demonstrating by almost irrefragable proofs that Central Asia was the primitive home of mankind, the cradle whence even our own forefathers were sent out in the pride of youth to find eventually a new home in Europe, while other brothers of our race descended into India, that sun-steeped land of marvels. It was a splendid picture, that of a stream of nations rushing down from the snow-encircled highlands, where the race of the new lords of the world had dreamed away its youth in the pure mountain air; a picture in which the fancy of the poet seemed to combine with the clear and sober reality. Any doubts cast on this theory, which satisfied both reason and imagination, could hardly claim attention. But research, advancing from question to question and acquiring fresh knowledge, has undermined and shaken, and in the end has overthrown, the seemingly inviolable sanctuary of this belief. The truth is still to seek, but it has been shown that Central Asia possesses, so far as we know, less claim than many other regions of the earth to be considered the cradle of the human race. Least of all can the highlands of Tibet, with the barren and rough nature of which we are now more familiar, be considered the primitive home of mankind, the fountain-head from which stream after stream of wanderers has flowed over the earth. The belief in the importance of Central Asia for the earliest history of mankind was not altogether irrational. As long as the beginning of human tradition was regarded as identical with the beginning of the history of man, and the antiquity of the human race was limited to a few millenniums, the thought was suggested that the original home might be found in the heart of the Asiatic Continent. If, indeed, we substitute "home of the higher civilization" for the expression "home of mankind," Central Asia deserves, even at the present day, the most serious attention of scientific enquirers. Around this citadel of the world lay clustered in a wide semicircle the ancient countries of civilization. Babylonia, China, and India, and even the beginnings of Egyptian culture point to Asia. All who believe in a common fountain-head of these higher civilizations must look for it in Middle Asia, or must assume that the germs of higher forms of life were carried through that region in consequence of migrations or of trading expeditions. In later times the importance

of Central Asia for the history of mankind seems, indeed, much changed, but not less perceptible. It no longer produces the germs of civilization, but, like an ever-glowing volcano, sends out streams of warlike nomads, and shakes the earth far and wide, so that smiling lands become desolate and prosperous towns sink into the dust. From the earliest times to the present day mankind has been deeply influenced by the existence of Central Asia and its races.

#### A. THE COUNTRY AS THE THEATRE OF HISTORICAL EVENTS

CENTRAL ASIA is the most continental region of the world. In a geographical sense Middle or Central Asia comprises the self-contained interior of Asia; in a historical sense Siberia and the plains of Western Asia and Europe form an appendage of this vast expanse. Central Asia, in the more restricted sense, is the arid plateau, without any outlet, which is divided by immense chains of mountains stretching from east to west into distinct regions, Tibet, Eastern Turkestan, and Mongolia (see the inserted map of Central Asia). These mountain-chains partially alter the bleak and desert-like character of the country, for moisture collects on their slopes, and wherever the streams and rivulets which flow down from them irrigate the soil, agriculture and the growth of a permanent population are possible. If the rivers had an outlet to the sea, their effect would be still more beneficial, for they would extract from the salt-impregnated soil the excessive amount of soluble chemical substances and give it that inexhaustible fertility which is peculiar to the alluvial districts of China, whereas they now lose themselves in brackish swamps or disappear in the sand.

But this bleak and desolate region has not remained unaltered in the course of thousands of years. In the tertiary period, which perhaps saw man develop into the most distinctive form of living creature on the earth, a sea was rolling where now the barren wastes of the Gobi desert and the basin of the Tarim extend: new mountains were upraised and mighty masses subsided. When the sea disappeared and Central Asia acquired its present configuration, a long time must have elapsed before the land was changed into the sterile steppe which we know at the present day. The glacial period, which filled Siberia with immense glaciers, hardly assisted that transformation. The inhabitants of Central Asia therefore, at the close of the glacial period, which must provisionally form the starting-point of historical investigation in this field, were still living in a comparatively well-watered and favoured region, which later became by slow degrees mere steppe and desert. This is an important fact, if we wish to learn the significance of Central Asia for the beginnings of civilization. On the other hand, the elevated character of the country has not changed; and this produces even in the southern parts a temperate and almost cold climate, and has in this way exercised a lasting influence on the inhabitants.

Central Asia in the restricted sense is partly bounded, partly intersected, by numerous chains of mountains, which by their trend from east to west are of great importance for the character and history of the country and divide it into several distinct sections. On the south the immense wall of the Himalaya divides the cold plateau of Tibet so sharply from the sultry plains of India that the two countries, notwithstanding their close proximity, have exercised little influence on each other and have never entered into close political relations. Farther to the north the Kuen

Lun with its offshoots divides Tibet from the desolate plain of the Tarim, which in its turn is cut off on the north by the Tian shan. All three ranges meet toward the west in an immense group of mountains, the centre of which is formed by the Pamirs, so that on this side Central Asia is quite separated from the Turanian lowlands. But even the rest of the high plateau of Central Asia, the Gobi desert with the surrounding steppes, is bounded by a vast circle of mountain ranges of which the most important are the Altai on the west, and the Sayansk and Yablonoi mountains on the north. Beyond the Altai stretch the lowlands of Siberia, which are separated from the plains of Eastern Europe only by the Ural range. On the northeast, however, a chaos of mountains bars the way and fills up the greater part of Eastern Siberia. In this direction, therefore, the migratory spirit of Central-Asiatic tribes found least scope. The mountain ranges on the west were never any permanent check on the movements of the nomads, who found in the plains of Turkestan and Western Siberia room for expansion and growth of power. Toward the south the Himalaya blocked their advance; but on the east China, although partially protected by highlands, lay open to the attacks of the peoples of the steppes. Thus the trend due east and west, which characterises the lie of the mountain ranges, is clearly noticeable in the migratory movements of the nations. But it is not visible in the great wanderings of the tribes alone; even the small peaceful migrations of commerce, which are more momentous for the growth of civilization than the devastating floods of nomad hordes and deserve our undivided attention in a country which is the connecting link between Eastern and Western civilization, follow the universal east-westerly direction. At the foot of these long mountain-chains lie the oases, which, in the desert of the Tarim basin especially, alone render it possible for the traveller to cross the dismal wastes. Even if traffic was less difficult in earlier times, when the water supply was larger, it must certainly have adapted itself to the existing line of direction, and passed at the foot of the ranges. The configuration of the country determines the roads along which trade and civilization marched. The outlets for traffic were, on the one side, the lowlands to the east of the Caspian Sea, which were in close relations with Iran and the farther West, and with India itself; on the other, China, the oldest home of Oriental culture.

It is thus a most significant fact that the chain of the Kuen Lun, which runs right through the heart of Central Asia, stretches with its offshoots and parallel ranges, the Altyn Tagh and Nanshan, as far as the middle Hoangho, that is to say, into the most fertile districts of China. Along these lines of mountains, especially on the north side, extends a strip of fertile and more or less well-watered land, which enables the husbandman to make a home there and opens a road to the basin of the Tarim through the horrors of the desert. The importance of this district, the modern province of Kansu, for the civilization and history of the country is incalculable. It was here that the persevering and stolid Chinaman first waged war with the nomads, built a rampart of fortified towns and agricultural colonies across the pasture lands of the unruly Central Asiatics, and thus discovered the key to the political supremacy over the whole interior of Asia; but this road must have been taken in far earlier times by those who first brought the manners and customs of the West and the East into contact, even if the people which first introduced civilization into China did not follow that course in their migration.

Farther westward, through the valley of the Tarim, there are two practicable roads leading from Kansu, a southern one which runs along the northern foot of the Kuen Lun, and a northern one along the south foot of the Tian shan. The southern road, the course of which is marked by the oases of Kargalik, Cherchen, Kiria, Khotan, and Yarkand, is now disused; the northern road with the oases of Hami, Turfan, Karashar, Kuehar, and Aksu, thus gains in importance. The two routes meet in Kashgar and lead through the western range to Ferghana. From Hami, which is for China the key to Central Asia, there are other practicable outlets, farther to the north, leading to Turkestan and Southern Siberia, especially toward the Ili valley, and along the northern foot of the Tian shan to the lake of Balkash. Beyond the mountains therefore, in the plain of Turkestan, lie the commercial cities which owe the greater part of their prosperity to the trade with Central Asia and China, namely, Samarkand, Bokhara, Khokand, and Tashkent; the trade of the East with Europe, Western Asia, and India passes through them, but they are also the capitals of rich districts, well watered by the mountain rivers and streams, and strongholds of settled agriculturists in the midst of the restless nomads. But Central Asia is not exclusively an avenue for transit trade; it offers products of its own, which attract the merchant and increase the economic resources of the inhabitants. First and foremost come the minerals; the most important discoveries of jade and nephrite, both of which are still extraordinarily valued in China, are made in East Turkestan. The Altai is rich in metals, which at a very early period caused a special form of civilization to spring up in this region. Tibet and some districts of Siberia possess prolific gold washings; and, lastly, salt, which is usually common on the steppes, is brought in considerable quantities from Mongolia to China. Among the vegetable products rhubarb is important; it grows abundantly in Kansu, and from early times was brought to the West as a valued medicinal article. From an early date Siberia and the North of Central Asia have driven an important trade in furs with China and the West.

The products, however, which were most important for the inhabitants of Central Asia, even if not for export, were supplied by cattle-breeding. This is the primary cause of the great mobility of the peoples of the steppes, while it also assigns definite limits to their advance, for it is only where his cattle thrive that the nomad can live permanently, so long as he remains a nomad. Here again certain limitations are felt. The nomads of the centre, who breed horses, oxen, sheep, and camels, have been able to push farthest afield, since the steppes of Turkestan, West Siberia, East Europe, Iran, and Western Asia offer suitable pastures for their herds; on the other hand, the migratory herdsmen of Tibet depend for their existence on the yak, which only thrives in a restricted area, and have therefore been unable to undertake extensive campaigns of conquest, while the Reindeer nomads of Siberia dare not leave the region of the tundras. Similarly an advance to Tibet or to Northern Siberia was difficult or impossible for the nomad hordes of Central Asia; their movements, from economic reasons, had to be directed mainly eastward or westward; they followed, therefore, the same paths as trade. It was not until a late period that Buddhism by its pilgrimages produced in Central Asia an important movement from north to south.

If the history of the surrounding countries is unintelligible without a clear knowledge of Central Asia and its peoples, that of the region of the steppes in the interior of Asia is still more so without reference to the civilized countries which

border it, to China on the east, the area of Mediterranean civilization on the west, and India on the south.

India, which was repeatedly overrun by hordes of Central Asiatic nomads, for a long period exercised little influence generally on the steppe region, and almost none politically, since the barrier of the Himalaya was a deterrent from military enterprises, and, apart from this, the natural features of Tibet offered no attraction to a conqueror. The attempt made in 1337 by Djaunah Mohammed-shâh ibn Toghluq to push on victoriously from India to China was foiled by the Himalaya and was not subsequently imitated. But here, as in so many other cases, the spirit has been mightier than the sword. Northern India, that great seminary of religious and philosophic thought, gradually made its influence felt in Central Asia and by Buddhist propaganda revolutionised the lives and opinions of the nomads. It was, of course, a case of scattered seeds which were carried across the mountains and struck root independently, and we must not imagine any permanent union of Indian philosophy with the nomad culture of the steppes.

China stood in a quite different position toward Central Asia. The highlands of Western China offered, it is true, some protection against the inroads of the nomads, so long as the favourable strategic positions were held by an adequate force of well-disciplined soldiers, and this natural protection was designedly completed by the construction of the Great Wall; but it did not always prove sufficient. The policy, which the Chinese often adopted, of playing off the nomads one against the other and of settling various tribes as border-guards within the natural ramparts of the empire, sometimes led to the result that these guardians asserted their independence or made common cause with their kinsmen of Central Asia. The weapons with which China fought the peoples of the steppes were, at all times, not so much the warlike spirit of her sons or the inaccessibility of the country, as the highly advanced civilization, which rendered it possible for an extremely dense population to live on the fertile soil. The country might submit, partially or altogether, to the attacks of the inhabitants of the Central Asiatic steppes, of the Tibetans, and lastly to those of the mountain tribes of Eastern Siberia, but the bands of the conquerors soon disappeared among the overwhelming numbers of the conquered, and their barbarian strength could not withstand the example of a higher culture. To political superiority the nomads might attain; to intellectual, never.

The civilized countries of Western Asia were better protected than China against the tide of restless nomads. Between the Caspian Sea and the Himalaya rise the mountains of Chorasan and Afghanistan. Eastward of these the fertile districts of the Oxus and the Jaxartes, where agricultural colonies and fortified towns could grow up, formed a vanguard of civilization. But between the Caspian and the Black Sea the Caucasus rises like a bulwark built for the purpose, and cuts off Western Asia from the steppes of Southern Russia, that ancient arena of nomadic hordes. So long as the natural boundaries were maintained the fertile plains of Western Asia were safe from the raids and invasions of the nomads. But the people of Iran, which guarded civilization there, succumbed at length to the attack. The nomads found homes to their liking in the steppes, which abound in Iran, Syria, and Asia Minor, and consequently preserved their individuality far longer than in China, and were only partially absorbed by the peoples they had conquered.

We have thus an explanation of the great difference between East and West. China was never more than nominally subject to the nomads, and it finally crippled their power by a systematic colonisation of the steppes, while the ancient civilization of Western Asia sank beneath the repeated onslaught of the nomad horsemen, and the country became for a long time an appendage of Central Asia.

Europe, the eastern steppes of which merge into those of Southwest Siberia without any well-defined boundaries, was never able to ward off the attacks made from Central Asia. The Huns advanced to the Atlantic, the Avars and Hungarians invaded France, the Mongols reached Eastern Germany, and the Osman wave spent itself against the walls of Vienna. This continent still harbours in the Magyars, the Turks, and numerous Finnish and Mongolian tribes, the remnants of these inhabitants of the heart of Asia. But Western Europe, with its moist climate, its deficiency in wide tracts of pasture ground, and its national strength and civilization, suffered no permanent injury, but was able to accept the inheritance of West Asiatic culture.

### B. THE ECONOMIC CONDITIONS

THIS brief survey of the geographical conditions of Central Asia clearly shows the sharp economic distinction which separates the inhabitants of this district from those of the neighbouring countries, — the difference, namely, between nomads and agriculturists. Regarded as remote history, the relations between the two seem to be a continuous struggle, which shows itself at one time in a violent onslaught, at another in obstinate contests or cunning strategy, presenting a ceaseless spectacle of bloodshed and destruction. Viewed from a nearer distance, this gloomy picture loses much of its horrors, and we recognise that even in these parts war is not the rule, but that the wish for barter and the interests of commerce continually induced the representatives of the various forms of industry to enter into peaceful intercourse with each other and to forget their ancient feuds. The economic contrast is for the most part less abrupt than we are at first led to suppose from the great historical events in which this antagonism appears on so gigantic a scale.

Most nomads are more or less familiar with agriculture. We might assume that the custom of cultivating suitable pieces of land on the rivers or in otherwise well-watered localities was a result of predatory wars on civilized peoples. The captured slaves would as a rule be employed merely on agriculture, since the members of the horde were enough to tend the flocks, and industries could only flourish in the sparsely scattered towns of Central Asia. But probably in Asia agriculture is older than cattle-breeding on the steppes; in fact, it is likely that in some cases settled nations changed into nomads, although, of course, other nomad tribes may have passed directly from the hunting stage to that of cattle breeding. Thus the agriculture of many peoples of Central Asia can be traced back to old habits. Where agriculture exists the social order gains in permanency, and the inclination to predatory expeditions is checked, since in cases of distress, especially when disease diminished the stock of cattle, men preferred to support their existence by farming than by robbing their neighbours. We must not, however, regard the life of the purely nomadic peoples as an arbitrary wandering to and fro. Among the Kirghiz, for example, the summer pasturages are the common property of the tribe, and each family selects its place there as it thinks best; but the favourably situated localities, which are suitable for the winter encampments, form the well-defined

private property of the separate families, and the tribal districts are as a whole accurately marked out. The possession of cattle implies a right to pasturage on a corresponding scale, which cannot be disturbed. The man who increases his herds must also widen his lands. Thus in reality the nomads have as marked an appreciation of ownership of land and of the importance of boundaries as the agriculturists.

When the necessity of widening their pasturages was pressing, the nomads would be much more disposed to make attacks on their fellows than on the civilized peoples, who were agriculturists and town-dwellers. Nomadism is, indeed, far from being an economic phase which can simply be substituted for agriculture, nor can the pasture grounds of the herdsman be straight away appropriated for husbandry. The economic methods of the nomad are, on the contrary, devoted predominantly to the utilisation of tracts of land which could not support settled husbandmen. The restless nomad, ranging with his herds over the dry but grassy steppe, utilises vegetation which could not serve for human food, and compels these wildernesses, which nature has neglected, to yield him milk and meat. The agriculturist can only make full use of the arid steppe when he is able to irrigate it sufficiently for his crops. On the other hand, the land, which when once cultivated must support a comparatively dense population, is far too valuable to be devoted with any degree of prudence to the feeding of cattle. A Mongolian general, at the time when the Mongols conquered China, actually made the brilliant suggestion to his sovereign that all the Chinese should be exterminated and their country turned into pasture land. But the idea did not commend itself even to these barbarian sons of Central Asia. A similar plan may have been carried out elsewhere on a small scale, though hardly with any conscious intent. In Western Asia particularly the settled peasants were often exterminated by the conquering invaders, the artificial system of irrigation fell into decay, and the country of itself became once more a steppe on which the nomads could now disport themselves unhindered. What chiefly drove the herdsman to attack the agriculturist was the wish for his movables and for slaves, coupled with the innate love of fighting and the desire to rule,—motives most characteristic of the migratory herdsman. He seldom coveted the land of the agriculturist.

A prolonged study of the historical traditions, which delight in recording the wars, murders, and ravages of the nomads, and picture the absolute terror with which the invasions of these roving Asiatic tribes filled the hearts of the survivors, might well lead us to regard the perpetrators of such horrors in the darkest colours, and to consider them as a species of ravenous wild beasts rather than as beings deserving the name of men. But such a view would be premature. When peaceful intercourse prevails between the settled inhabitants and the nomads (and this is rather the rule than the exception), the nomads appear in a better light. The civilized man is the superior in the peaceful contest, which is ultimately seen in all intercourse for trade and barter. But the sympathies of the impartial spectator will rather be with the nomad, whose good qualities are absolutely fatal to him; and perhaps it is intelligible that war should sometimes seem to the nomad the only way out of his difficulties. Certain characteristics of the nomads are conspicuous in both cases.

The nature of the herdsman, who grows up on the monotonous steppe, and in consequence of his wanderings is forced to limit his possessions to a few movables,

has a simplicity which is not devoid of dignity (cf. the explanation of the plate, p. 158). The wide, clear horizon of his home is reflected in his temperament. The flowers of imagination and thought which blossom so magnificently in the burning plains of India or the luxuriant gardens of Iran, find no nourishment in the steppe. A sober clearness of thought is as characteristic of the inhabitant of Central Asia as of the Arab who grew up on similar soil (cf. Vol. III, p. 253). This simplicity of thought, which can degenerate into narrow-mindedness, gives all the greater scope to the will. A reckless strength of will is ultimately the weapon with which the nomad fights, and not infrequently subdues and governs, his intellectual superiors. Where this weapon cannot be used, the artless nature of the nomad yields to the cunning and cleverness of his civilized neighbours. The rugged honesty, which is a natural result of his simple, independent existence and has always distinguished the roaming herdsman (the Seythians are called by Homer "the most upright of men," —

*ἀγανῶν Ἰππημολγῶν  
γλακτοφάγων, Ἀβίων τε, δικαιοτάτων ἀνθρώπων*

IL. xiii. 5, 6)

makes the nomad the favourite victim of the crafty dealers in the towns, and the butt of their wit. Heinrich Moser has admirably described how the Kirghiz are duped and hoaxed in the bazaars of Turkestan by the settled Sarts, and admits that in integrity and moral purity the Kirghiz, notwithstanding his robber proclivities, is far superior to the inhabitants of the town. Many an orgy of hideous cruelty, celebrated by victorious nomads, is no longer incomprehensible when we recognise these conditions which are everywhere characteristic of the intercourse between the herdsman and the town-dweller.

These outbursts of savagery, which are in strange contrast to the ordinary harmless and even friendly behaviour of the nomads, are frequently due to a second cause. The life of the roving herdsman does not demand that continual and regular expenditure of energy which claims the physical powers of the agriculturist throughout practically the whole year, and yet, thanks to its simplicity and the constant open-air existence, it does not render him enervated or weak. The nomad can thus always draw on a large reserve of strength, which has perhaps long been concealed, and bursts out only when an object for action is presented. What he has once begun he carries out thoroughly, especially robbery and murder. Notwithstanding all this lust of destruction, traits of generosity and honesty appear from time to time. Even chivalry is not unknown to the nomads: the members of the Turkish race are renowned for it, and it is still kept up and honoured as a virtue among the modern Magyars, a settled nomad nation.

This clear simplicity of thought and strength of will explain how the nomad becomes so easily the master of more settled peoples, who, partly enervated by civilization, partly disposed to inaction by an excess of imagination or of commercial spirit, or, finally, from hard daily work, have lost the habit of looking at things from a broad point of view. The nomad knows how to produce order. He remorselessly hews his path through the rank undergrowth that springs up in such wild luxuriance on the soil of an old civilization, and lets light and air into the stifling heat. He creates no civilization of his own, but he is an indirect agent in its promotion, since he breaks down the barriers between the countries and creates world-empires, whose boundless horizon awakes once more the thought of the

unity of the human race, even when such thought seemed choked by a system of petty States and the self-complacency which that engenders. The result indeed shows that the garnered work of innumerable generations, as embodied in culture, is stronger than the unbridled energy of the nomad. Even the wildest peoples of the steppes bow their proud necks at last before the power of thought and the subtle coercion of a higher civilization.

### C. THE PREHISTORIC PERIOD

THE perspective of history, which in any case makes the recent event appear of gigantic size and dwarfs the more remote, must necessarily present peculiarly incorrect pictures when applied to a region which is still the most inaccessible to the student of origins. Immense intervals of time shrivel up into nothing, and events which have been determinative for the existence of the whole human race are, from want of all direct evidence, brought before our eyes only blurred and indistinct. The beginnings of the development of mankind must perforce be dismissed from consideration. If we suppose that the original home of mankind lay somewhere in the southeast of Asia, as the discovery of the *Pithecanthropus erectus* by E. Dubois in Java (1891-1892) rendered probable, then the rest of the globe may have been early populated from this source. But we cannot speak definitely on this point. It has been shown that man was a contemporary of the mammoth in Siberia. An attempt at a connected historical account must start provisionally with the end of the glacial period, since from that epoch onward no extensive changes of climate or of the earth's surface have taken place. The increasing desiccation of Central Asia is, for instance, important in itself, but cannot be compared with the stupendous phenomenon of the Ice Age.

Two main types, which recur in Europe, are represented among the peoples of Central Asia and Siberia in varying combinations. There is a dolichocephalic race, which was perhaps originally allied to the negro, but has acquired in the north a light complexion and partly also fair hair, and a brachycephalic race, also comparatively light-complexioned, whose purest representatives we may at present find among the Mongols and Northern Chinese. Besides these, a pigmy race may have been sparsely distributed, as prehistoric discoveries in Europe and early accounts from China and Japan attest; but this gradually disappeared among the others, and attained no importance for civilization. The relation of the long-headed tribes to the short-headed has become all the more important. At the present day the short head is predominant in Central Asia; but that is a result which has been preceded by many important stages of evolution. According to all appearances long-headed races filled the North of Europe and Asia at the close of the Ice Age, and they certainly predominated in both continents, with the exception of certain regions of Central Asia. The remnants of these dolichocephalic peoples in Asia are probably the Ainos in Yezo and Saghalien, the Yenissei-Ostiaks who have preserved their ancient tongue in the midst of tribes speaking a Mongolian and Finno-Ugrian language, and other fragments of nationalities in Siberia. In the South the long-heads are again predominant in the mixed population of Tibet. Many of these primitive dolichocephalic nations have developed in Northern Europe, and partly in Northern Asia, under the influence of the climate into fair-haired and blue-eyed men; among the Siberians and the

inhabitants of Central Asia large numbers of these can still be found. Probably long heads and also a dark skin are the peculiarities common to primitive man.

Granted that the fair-skinned races were developed under the influence of the climate, the short-headed race is perhaps a variety which is explicable by the relaxation of the struggle for existence which growing civilization induced. We may find parallels in the domestic animals, in which the same fundamental cause leads to all sorts of changes,—to gigantic or diminutive growth, to wool-like hair or different coloured hair, and so on. A very frequent example of these transformations is the shortening of the skull, which has been observed as “pug-head” in dogs, goats, horses, pigs, and even gold-fish. Mankind may have equally passed through a period when varieties of this kind were possible, until gradually the exclusive preference given to brain-work checked further transformations, and stereotyped the existing differences so far as they were not compensated to some degree later by intermixture. At the present day the body no longer adapts itself to new duties, but the brain devises new instruments and safeguards for it. Similarly the constructive forces of the body no longer play with their material, but the spirit finds an outlet for the superfluous energy in dances, games, and art-productions. This theory may be correct or not; in any case, a short-headed race developed in Asia in early times and in the course of history occupied the greater part of that continent as well as large districts of Europe. Innermost Asia may possibly have been the primitive home of this race. It cannot at present be definitely settled whether it grew up in Tibet, as Karl Eugen Ujfalvy assumes, or in Mongolia, as Augustus H. Keane asserts on better grounds, or, lastly, farther west in Turkestan and even Iran.

The beginnings of a higher civilization seem to start from this race. The first gleam of credible historical knowledge shows to us in the west and east of Asia, in Babylonia and China respectively, a brachycephalic people as the representatives of civilizations which are so closely related in their main features as to suggest, with almost overwhelming force, a former connection between these peoples or at least their manners and customs. That civilization was based on agriculture by means of the plough, and on stock-breeding, that is, on the same foundation as our modern farming. These are by no means obvious achievements which must necessarily have been made by every progressive people; the contrary is proved by the instance of the civilized nations of America, who were ignorant of the plough or beasts of draught, and adhered to the use of the mattock, although in other respects their husbandry stood on a high level. In Eastern as well as Western Asia wheat was originally the chief cereal. Even stock-breeding which at first was almost exclusively cattle-breeding, shows similar features in both regions. In ancient Babylonia, as in China even to-day, cattle were used exclusively for drawing burdens and for food, and no use was made of their milk. In this respect the two civilized peoples are sharply differentiated from the nomads, who later interrupted the connection between east and west, for the existence of the wandering herdsman depended mainly on the milk of his herds. Horse-breeding appears to have been already practised at the time when the two civilizations were still in contact or arose in a common original home. Here, again, a peculiarity appears. The horse is not ridden, but is used only for draught, and nothing is known of the value of mare's-milk, the favourite drink of the Scythians (*Ἰππημολγῶν*) and Mongols.

Another peculiarity common to both the ancient civilized peoples is their acquaintance with copper and bronze, so that we may regard the short-headed races as inventors of metal-working. This fact is important for Europe. There also short-headed tribes, following the range of the Alps, migrated in early times from the east, and spread the knowledge of casting bronze as far as Britain. Another similar stream of civilization reached Southern Siberia, where the rich copper mines and gold mines of the Altai favoured the growth of a peculiar bronze culture. The investigation of primitive history will in course of time cast more light on all these conditions, especially when excavations can be made on a large scale in Chinese soil. Comparative philology and the investigation of myths will aid in the task and will lead, perhaps, to many astonishing results. Let us refer, for the sake of an example, to the dragon-myth, which appears in the east and west, but in China apparently in an older form, which sees in the winged celestial snake a beneficent deity, while in the west the younger gods of light are usually imagined as conquering the dragon of cloud and storm.

Supposing that the original home of civilization did not lie in Central Asia, still the union of the two most ancient civilizations must somehow have been produced by this region. Thus the immense importance of Central Asia for the history of mankind is at once patent. For the rest, the expression "original home of civilization" is, perhaps, premature. It is probable that isolated productions of this ancient Asiatic civilization were at first made in different places, until they were exchanged and combined. But if there really was an original home, it could hardly have lain in East Asia; for the abodes of the primitive Chinese people in Northern Shensi, namely, in the immediate vicinity of the gate of Kansu, point, together with certain traditions, to an immigration from the west, of which Ferdinand von Richthofen assumes the oasis of Khotan to have been the starting-point. For the present we practically know nothing of the origin of the short-headed aborigines of Babylonia, the Sumerians (cf. Vol. III, p. 4).

This much therefore can be stated with tolerable certainty, that an ancient civilization depending on agriculture, stock-breeding, and the knowledge of bronze, whose representatives were peoples of a short-headed race, developed in Central Asia or its western frontiers. Under the influence of this civilization the population increased, so that emigration and colonisation were possible in various directions. In this way tribes of the northern as well as of the southern long-headed race may have been influenced and won over to this higher civilization. The Egyptian civilization is certainly only an ancient and independent offshoot of the Babylonian (cf. Vol. III). The influence of the ancient Central Asiatic culture seems to have made itself felt toward the south. We find, for example, that cattle-breeding without dairy-farming existed in pre-Aryan India. Where the effects of this civilization did not extend, we find the oldest economic state prevailing,—that of hunting, fishing, etc., or at any rate of the use of the mattock, which must be reckoned the first step toward agriculture. This first epoch ends roughly with the close of the fourth millennium B. C.

#### D. THE RISE OF NOMADISM

THE view that agriculture is older than nomadism contradicts the traditional idea which makes the stages of subsistence by natural products, of cattle-breeding,

and of agriculture, follow one after another as regular steps in development. But this notion, which has so long stood in the way of a sound comprehension of the most ancient questions of civilization, has long been doubtful, and has finally been dismissed by the splendid labours of Eduard Hahn. The oldest agricultural peoples, who broke up the ground with the plough, were also the first cattle-breeders. This does not imply that men tamed oxen and horses from the very first with the conscious intention of using them as beasts of draught. Comparative ethnology teaches us that even now primitive peoples, who tame all sorts of animals, first do so to make pets or companions of them, before they think of turning the animals to any profitable use. This does not exclude the possibility that religious conceptions may have first prompted them to domesticate animals (cf. Vol. III, for the worship of animals in Egypt). But we push matters too far if we see in the early adopted custom of gelding the bulls any special proof that cattle were bred at first for purposes of worship. The restive males would thus be only made more tractable and prepared for hard toil at the plough, while the whole chaos of licentious and barbarous cults, which was later connected with this rite, only arose much later.

So long as the breeding of cattle and subsequently of horses continued to be closely bound up with agriculture, and so long as the milk of the female animals was not used, there could be no idea of nomadism. It was the use of milk that first enabled whole nations to depend on the possession of flocks and herds for their existence, without checking too greatly the increase of their animals by excessive slaughtering. This food first made the arid tracts of steppe habitable and actual sources of prosperity and power. But the nature of their homes and pastures forces these peoples to make continual and systematic migrations, and thus stamps on the whole sphere of their material civilization a trait of mobility and uncertainty, while it marks their character with a mixture of unrest and aggressiveness which from time to time recurs prominently in history. This new economic form of nomadism cannot have arisen suddenly; it assumes the breeding of such animals as secrete a continuous and large quantity of milk. This is, again, a result of long custom; for the female animals of themselves give only as much milk as is necessary for the early nourishment of their young ones, after which time the supply dries up. The laborious and tedious breeding of milk-giving breeds of cows and soon afterward of mares was not accomplished by the short-headed civilized nations, among whom the Chinese to the present day despise milk, but apparently by long-headed tribes. We now see Aryan-speaking nomads in the north and Semitic-speaking nomads in the south appear on the scene as economic and political powers. The civilization of China still remained uninfluenced by them; for this very reason nomadism must have originated on the steppes of Western Asia and Eastern Europe, not in Central Asia. In Babylonia, the old empire of Sumerian civilization had been overthrown by Semitic nomads before the year 3000 B. C. After that date the conquerors and conquered gradually amalgamated and appeared next in history as Babylonians (cf. Vol. III). Other Semites as migratory herdsmen kept to that way of life, of which the oldest narratives in the Bible draw so pleasing a picture.

Still more momentous was the first appearance in history of the Aryan nomads. The old dispute as to the origin of the Aryans cannot be answered, because the whole problem has been put so wrongly. Two totally distinct questions have been jumbled together, namely, what was the origin of the blond or at least light-coloured

dolichocephalic peoples, the majority of whom now employ Aryan dialects, and what was the starting-point of the Aryan language? Of the first question we have already spoken. The fair-skinned dolichocephalic peoples are a race of men which has developed under the influence of the cool climate out of the long-headed tribes spread over the whole of Europe and the greater part of Asia since the deluge. The original Aryan language, on the other hand, may have begun, as some good linguists maintain, in the lowlands of Eastern Europe. It is easy to draw the inference that precisely this commencement of a nomadic way of life and the necessary migrations go far to explain the extraordinary dissemination of Aryan dialects. In this connection one further point is to be considered; since nomadism first developed from agriculture through all sorts of intermediate forms, it seldom appears at first in a pure form as a method of life exclusively based on cattle-breeding, but as always more or less connected with agriculture. It is clear from this that the ancient migratory peoples possessed, in addition to their mobility, great powers of adaptation, and were not restricted to the steppes and large tracts of pasture. Where cattle-breeding was insufficient, agriculture came into the foreground as later in Western Europe or in the highlands of Iran owing to increasing population. It is a significant fact that in the tribal legend of the nomad Scythian the plough and yoke are mentioned as the earliest property, and that the Scythian steppe more than two thousand years ago exported large quantities of grain through the agency of Greek trading-towns in the Crimea.

The great historical events with which the Aryan nomads appear on the scene are the conquest and the Aryanisation of Iran and India. The wave of nations may have rolled in the third millennium B. C. from Eastern Europe over the Turanian steppe to the south and have first flooded Eastern Iran, until an outlet was made through the valley of Cabul, through which a part of the Aryans flowed into India, then inhabited by dark and dolichocephalic tribes (cf. for the further development of the Aryan Iranians and Indians the second chapter in the fourth main section of this volume and Vol. III).

A large number of the nomads remained behind in the steppes of Eastern Europe and Western Siberia, where they were already known to the earliest Greek authorities as Scythians. Probably all the nomad tribes of the great lowlands of Asia and Europe were comprised under the name "Scythians" in the wider sense, and among them probably were represented peoples speaking a non-Aryan language. In the more restricted sense the word signifies the migratory herdsmen of the region, who spoke Iranian dialects, and thus showed their affinity to the Iranians and Indians, who had been pushed farther toward the south. The Sace, Massagete, Sarmatians, and Scolote in particular were demonstrably akin to the Iranians (cf. Vol. IV, p. 72). These tribes, although they practised agriculture to some extent, depended for their existence mainly on the possession of flocks and herds, mares and cows being especially important as givers of milk. The Scythians long showed no wish to penetrate into the mountainous civilized country of the Balkan peninsula, or to push on over the Caucasus into the region of the Assyrio-Babylonian civilization. Iran was protected by their own kinsmen, who gradually settled there. On the other hand, they certainly spread widely toward the east, perhaps beyond the Altai, where other tribes gradually imitated them in their way of life. Numerous blond nomads are found at a subsequent period in West Central Asia.

The discovery of the art of riding on horseback gave another characteristic to nomad life. The wild horse appears to have been domesticated by the short-headed civilized peoples at an early period, though doubtless later than the ox, and to have been employed for draught purposes. We use the term "early period," for the Chinese at all times used the horse to draw the war chariots, as did the Babylonians. But this was not at a very early period, for the Egyptians obtained horses through the nomad Hyksos, and did not possess them from the beginning (cf. Vol. III, 623). The horse was employed at first by the nomads to draw their wagons, until they acquired the art of riding, and by that means enormously increased their mobility. It cannot yet be decided with complete certainty whether the Aryans of India on their migrations were acquainted with riding. It is indisputable that the Scythians by Homeric times were a nation of horsemen.

The nomad tribes became acquainted with iron at a later period than the settled civilized nations. The Iranian Massagete in the modern Turkestan, when they fought their battles with the Persians in the time of Cyrus, were familiar with only copper and gold. Both these metals were obtained from the mines in the Altai, and probably also from the old mining district of the Caucasus.

The great Aryan migrations completely interrupted the connection between the old civilizations of the east and west, if such connection still existed. The Chinese nation has continued its independent development, although it has by no means remained quite stiff and impervious to external influences. Any stimulus that reached China later on the long and dangerous road through the nomad regions of Central Asia or by sea round Farther India, was far too weak to produce deep results. The Chinese nation had to concentrate all its energies on external policy, to keep off the nomads who thronged round its frontiers or to absorb them, and finally to separate them and pacify them by a well-devised system of throwing out agricultural colonies.

The men with whom the Chinese had to struggle were not migratory herdsmen of Aryan language, but members of the short-headed race or the Mongolian stock, as it is called after a victorious people which appeared late on the scene. The earliest history of China records nothing as yet of struggles with nomads, but only of the conquest of the forces of nature and at most of collisions with aborigines, who were at the early hunting stage. However incredible and indefinite in detail these earliest traditions may be, yet the absence of all accounts of nomad invasions, which subsequently were every-day occurrences and could hardly have been forgotten in an artificial construction of history, is a very significant feature.

If, on the other hand, we reflect on the early appearance of Aryan and Semitic migratory herdsmen in the west, the important fact results that nomadism, as an economic form, migrated from west to east and was only adopted by the short-headed tribes of Central Asia comparatively late. The knowledge of breeding cattle and horses, and also, as Otto Schrader has proved, the use of the waggon, existed among the Aryans earlier than among the Mongols and the tribes of the Ural-Altai. The tribes that adopted nomadism were naturally not civilized peoples like the Chinese or Babylonians. They formed part of the short-headed race, and, in sterile regions, had not shared the advancement of the more favoured peoples, but led a precarious existence on the steppes as hunters and gatherers of natural products. That the inhabitants of Central Asia must have passed directly from the hunter-stage to nomadism is a fact shown by the slight inclination to

agriculture which most of them show, and by the great importance of hunting, and of collecting berries and roots for food, to the pastoral tribes of Central Asia. Further in the north, where the breeding of cattle and horses is unremunerative, many peoples to the present day have remained at the hunter-stage, others have only later begun to tame the reindeer, and in this way made a peculiar sort of nomadism possible, even in Northern Siberia. It cannot yet be shown whether the nomads of Central Asia had a Bronze Age of a duration worth mentioning, or whether they passed immediately from the Stone Age to the Iron Age. The last alternative is more probable in the case of most tribes of Central Asia, of course, apart from the old Bronze-region in Southern Siberia and its adjoining districts.

## 2. CENTRAL ASIA AFTER THE RISE OF THE MONGOLIAN NOMADS

### A. GENERAL REMARKS

(a) *The Sources of our Information.*—The difficulties which hinder any survey of the history of other nations low down in the scale of civilization, are felt when dealing with the inhabitants of Central Asia. We cannot rely on the historical traditions of these peoples, but we must content ourselves mainly with the accounts furnished by their civilized neighbours. It is true that the arts of reading and writing gradually spread even in Central Asia; in fact, independent alphabets were invented among several races (see plate, p. 168). But this very circumstance prevented literary monuments from spreading beyond narrow confines and thus being preserved from oblivion. The remains of the historical literature of Central Asia are, therefore, lamentably scanty. For the earlier period, they are limited to a few inscribed tombstones and commemorative columns, such as the sepulchral slabs of Orkton, which are invaluable for the history of the Turks. With these exceptions, we depend almost exclusively on the accounts given by the neighbouring peoples on the east and west, the Chinese, and the inhabitants of Western Asia and Greece. The Chinese accounts, since China was permanently influenced by the affairs of Central Asia, are, owing to the dry and sober style of their compilers, by far the most trustworthy and important; for the earliest period of the history of the Mongolian nomads they are, indeed, our only materials. Unfortunately, the peculiarities of the Chinese language and writing make any comparative investigation very difficult; the ethnical and geographical names never appear in their true forms, but are adapted to the nature of the Chinese language and are, therefore, often marvellously disguised and distorted. The original form can sometimes be ascertained by the help of other accounts or by philological deductions; often, however, these aids are insufficient, and there is no choice but to accept the Chinese term.

The earliest Western account of the conditions of Central Asia was the "Arimaspeia" of Aristæus, which must have been written in the seventh century B. C., and was one of the chief authorities of Herodotus. This work, notwithstanding its poetical dress, seems to be based on an actual journey, which the author made along the old trade-route of Central Asia as far as the basin of the Tarim.

(b) *The Relation of China to Nomadism.*—Another reason why we have only Chinese accounts of the first movements of the nomads of Central Asia is found in

the fact that the disturbances, which arose after the growth and organisation of warlike migratory tribes speaking a Mongolian-Turkish language and gradually convulsed the greater part of Asia, must have made themselves painfully felt in China first. The rich and accessible land of China attracted the swarms of nomads like wasps to ripe fruit; if it repelled the invaders, they turned to other countries, and tribe after tribe continued to attack remote districts. But China was for the nomads more than a goal for wild raids, it was also a school, in which they first learnt the rudiments of political combination, and the advantage of united action. We may venture to assert that, without the example of the organised giant empire of China, the nations of Central Asia would have remained much longer, if not permanently, in a petty and disintegrated tribal system, prohibitory of all great actions, and that they would not have attained that measure of civilization which was requisite for the discharge of their part in the history of the world. From the earliest times we see Chinese busily occupied in organising the nomads; China was for the Mongols the model State, to which they owed the possibility of organising and administering their vast world-empire. The nomads, on their side, seem to have repaid these benefits, with base ingratitude, by raids and attacks on the peaceful Middle Kingdom. We cannot reconcile ourselves to the immeasurable havoc which they caused by the feeble consolation that China with her congested population would only be benefited by the occasional opening of a vein. But we may recall more fairly how often the Chinese people, unprogressive and dulled by monotonous work, was stimulated into fresh life by vigorous dynasties of nomadic races, and how respect for manly virtues, for courage, loyalty, and justice was revived in the days of degeneracy by the influence of the nomads.

These favourable aspects of the intercourse with her nomad neighbours were at first, it must be admitted, only gradually and indirectly perceived by China. There still remained the foremost duty of keeping the restless inhabitants of the steppes away from the agricultural districts, and of adopting every method to render them peaceful and harmless. The Chinese generals occasionally employed unworthy means, such as poisoned arrows or poisoning the wells in the deserts, in order to attain these objects, and treachery of every sort naturally abounded. But these petty resorts cannot be compared with the great defensive and offensive methods, by the help of which China was in the end victorious. No permanent results could be achieved merely by repelling the foe with huge levies of ill-disciplined masses, or by the erection of great ramparts. The essential point was to gain influence over the restless peoples of the steppes and to use it in various ways for the advantage of China. We therefore find the Chinese statesmen always anxious to place the power and the superior civilization of China before the eyes of the rude nomads, to introduce new needs among them, to humanise their customs, and, finally, link their dynasties to China by bonds of marriage. This policy succeeded so well that it gradually became the dearest ambition of a desert chieftain to possess a pompous Chinese title and a Chinese princess. It is true that these marriage alliances occasionally furnished the nomad princes with a welcome pretext for interfering in the dynastic feuds in China or aspiring themselves to the royal dignity. On the whole, however, the system was advantageous to the Middle Kingdom.

A second test of Chinese diplomacy was to pit the nomads against each other,

and to stir up fresh antagonists in the rear of an invader. This attempt was partially the reason why China entered into relations with remote tribes,—a policy which could not but promote indirectly the spread of Chinese civilization and commercial intercourse. Another more dangerous way of fighting the nomads with their own weapons was to settle small hordes in their own frontier provinces, and to intrust to them the protection of the country against their nomad kinsmen. Large numbers of the inhabitants of Central Asia were gradually civilized in this fashion and absorbed. But often these frontier guardians allied themselves with the invaders and became doubly dangerous from their knowledge of the country; or they strove for political power in the centre of the country. Several Chinese dynasties arose from such hordes, and the feudal decay which so long jeopardised the unity of China is largely due to this cause.

No permanent victory of Chinese civilization over nomadism was possible until a defensive policy had been exchanged for an aggressive. An armed attack would only be the prelude to the real and difficult work of civilization, for otherwise it would only have a brief and transitory effect. The gigantic armies of the Chinese simply disappeared in the desert, and the nomads, who were scattered before them, soon reappeared on the frontiers of the empire, thirsting for booty. The state of things was different when agriculturists appeared in the train of the army or, as privileged immigrants, founded populous colonies and strong towns in suitable positions and thus laid a solid foundation for the Chinese sovereignty.

This plan of sending out colonies was not prompted so much by the over-population of China, which in earlier times was less marked than now, as by the wish to gain political influence in the steppe. Penal settlements of criminals are known to have existed at an early period, and prove that attempts were made to carry out systematically the difficult task for which sufficient volunteers did not come forward. As might be expected, the earliest and most successful settlements were planted along the strip of oasis and the ancient trade-route on the northern slope of the Kuen Lun. They were certainly encouraged from the wish to secure trade and to enter into direct communication with the inhabitants of the oasis in the basin of the Tarim. But commercial considerations did not constitute the sole motives which led China, formerly so pacific, to advance to the Caspian Sea. Here again we notice the prominent wish to check the restlessness of the nomads by advancing the sphere of Chinese sovereignty to the farthest edge of the steppe regions. Similar considerations have forced Russia in recent times to advance from Siberia to Turkestan, and only to stop on the far side of the nomad region, on the frontiers of Persia and Afghanistan. In this way alone has any complete subjugation of the migratory hordes been possible.

(c) *The Mixture of Nationalities in Central Asia.*—In Central Asia itself the growth of nomadism with its warlike propensities and its mobility greatly favoured the mixture of nationalities. We find a proof of this in the language. While in earlier times the Aryan language spread in the west under the influence of nomad life, at a later period the Mongolian and Finnish-Ugrian group of languages prevailed in Central Asia and far in the direction of Siberia and Europe. The characteristics of the boundless plains, in which the nations combine and blend like clouds of dust, are reflected in the facts of history. In the gorges of the few mountains a people may possibly preserve its individuality. But any nations

that have developed without disturbance for a time will at last inevitably be dislodged, destroyed, and absorbed in another nationality, only to share with this in its turn a similar fate. Small tribes carry others along with them, increase like an avalanche, and finally give their name to an enormous nationality composed of most heterogeneous elements. Peoples before whom the world trembled burst like soap-bubbles, and disappear from the pages of history without leaving a trace behind. The result is that the population of Central Asia becomes more and more homogeneous from the point of view of language and ethnology, and that the national names designate less and less distinct groups of humanity. New differences are only created by the degree of civilization and by the mixture with other races on the edge of the steppe region of Central Asia. Such racial mixtures were naturally formed first where the Aryan nomads adjoined the Mongolian, and where subsequently Iranian agriculturists gained a footing on the pasture lands of Turkestan. The Aryan race lost much ground here from the point of view of language, but from that of anthropology it exercised great influence on the Mongolian peoples. The old dolichocephalic race is often mixed with the Mongolian in Siberia. On the other hand, the linguistic affinity of the Mongols with the Tibetans and with the inhabitants of Further India has nothing to do with these more recent occurrences, but may point to a very early connection, which cannot for the moment be more accurately determined. A significant trace of this connection is the name of heaven and the god of heaven (Chinese, *tiên*, Bureyatic, *tengri*, Altaic, *tengere*), which crops up as *tangaroa* on the islands of Polynesia, and was clearly brought there by the Malayan wave of nations from Southern Asia.

### B. THE HUNS

THE nation of Mongolian nomads, which first formed a constitutional unit, and harassed Eastern Asia for many centuries, bore, according to Chinese authorities, the name of the Hiung nu. The similarity of the name with that of the Huns, who later flooded Europe and heralded the great migration of nations (cf. Vols. V and VI), has long been noticed, and Joseph de Guignes (1721–1800), the first real student of the history of Central Asia (“*Histoire générale des Huns, des Turcs, des Mogols et des autres Tatares occidentaux*,” 1756–1758), had declared the Huns to be kinsmen or descendants of the Hiung nu. It was left, however, for Friedrich Hirth in recent times to corroborate this conjecture by convincing proofs. We may therefore designate the old Hiung nu (Hiün yün, Hiün yo) by the indisputably more correct name of Huns. They appear in the Indian epics as Hûna, in the Avesta as Hunavô, in Greek accounts as Funoi and Unoi. Linguistically the nation was most akin to the later Turks.

The kingdom of the Huns was formed in the modern Mongolia, about 1200 B. C., apparently under the influence of a Chinese exile of high rank, who created out of the scattered hordes the beginnings of constitutional unity on the model of his own country. In the preceding century some of these hordes had made inroads on China, but were unable to achieve great results. After the unification of the Huns, and especially after the beginning of the Chau Tschan dynasty in China (1122 B. C.), which marks the commencement of the Chinese feudal system, the danger became greater. The scantiness of our sources of information prevents us from deciding whether any connection existed between the wars against the

nomads and the growth of the feudal system of partitioning the land. The first ruler of the Chau dynasty, Wu wang, had still maintained friendly relations with the Huns, who certainly feared the power of the empire which had gained fresh strength under his government and tried to buy his good-will by presents. As the imperial power decayed, the attacks were renewed with increased force. Northern Shansi was laid waste in 910. Some decades later the Huns must have been driven out from the heart of Shansi, where they had established themselves, by an army under the personal command of the emperor. There was a recurrence of similar events. There was apparently pasture land enough in China at that time to attract the nomads to a long sojourn, just as afterwards small hordes of nomads frequently settled in the interior of China.

About 700 B. C. the Huns advanced to Shantung; in 650 B. C. they devastated Pechili, and there was a succession of attacks on the country, disintegrated by feudalism, and incapable of any combined resistance, until at last the ruler of the Chin Empire, under the name Shi Huang ti (246-210 B. C.), once more transformed (in 220 B. C.) China into a real united State, enormously increased his power by the conquest of Southern China, and proceeded to take prompt and decided steps against the nomads. A powerful army drove out the Huns from the country of Ordo within the northern bend of the Huangho, which was an important position as the rendezvous for nomad invaders. The new possessions were protected by military colonies, but China proper was defended against the attacks of predatory hordes by the gigantic rampart of the "Great Wall." Portions of the Great Wall already existed on the frontiers of some earlier feudal States. Shi Huang ti connected them so as to form a continuous line of defence, which stretched from the shore of the Yellow Sea to the port of Kansu, and, if it had been kept in repair and efficiently defended, it would certainly have checked the inroads of the Huns. During the first period it served its purpose to some extent. It was due to the Great Wall that the attacks of the Huns were now directed against another quarter, and remote regions of Asia indirectly felt the mighty shock. But the chaotic condition into which China relapsed immediately after the death of Shi Huang ti soon stultified the object of the stupendous erection.

It was then that the power of the Huns was acquiring new strength under vigorous leaders. The age of Shi Huang ti marks an era in Chinese historical composition, since this emperor by the great burning of the books (p. 75) had almost destroyed the ancient Chinese literature, so that only scanty and bald notices of the period preceding him have come down. It is only after his reign that we have more copious sources of information. Our first comparatively accurate account of the constitution of the Huns dates from the period subsequent to the death of Shi Huang ti. The eyes of the Chinese were then turned with anxious attention to the increasing power of their nomad neighbours. The new growth of the Hun Empire began under the rule of Mete (Maotun, Meghder ?) whose father, Tuman (Deuman), had already extended his power from Northern Mongolia to Kansu. Mete, who would have been excluded from the legitimate succession, murdered his father with the help of a devoted army, and was soon able to reanimate the old warlike spirit of his people. He found the territory of the Huns shut in by powerful neighbours on two sides. On the east the Tunghu or Wu hwan, Tungusian tribes, akin to the Koreans, had founded a powerful realm and felt themselves so superior to the Huns that they took advantage of the usurpation

to claim a high price for their neutrality. On the southwest on the Altyn in Tagh were settled the Yue tshi (Jue-tehi), a nomad people of Tibetan stock, who were the connecting link of the trade of China and the West, and were perhaps identical with the old Issedones. The Tunghu, deceived by the apparent compliance of Mete, were first attacked and dispersed (209 B. C.); they withdrew to the highlands of modern Manchuria. A part of the Sien-pē Tartars (Hsien pi, Tungusians), a people living further to the east, who also suffered from the attacks of the Huns, migrated to Korea and Japan.

On the east the sea fixed an impassable limit to further shiftings of the position of nations; but on the west, where the Huns now hurled themselves against the Yue tshi, the movement had room to spread more widely. The Yue tshi first retreated before the advance of their assailants only into more remote regions of their own country, to the basin of the Tarim (177 B. C.). After the death of Mete (170) they attempted to recover their old territory, but suffered a second crushing defeat from his successor, which produced a division of the nation (165 B. C.). The smaller part found homes south of the Nanshan range; but the bulk of the people, the "Great Yue tshi," did not turn southward, but followed the natural trend of the country westward. Driven out from the Tarim basin, they crossed the Tianshan mountains and sought refuge in the pasture lands on the confines of Europe and Asia, the old arena of the Scythian nomads. On the Issik-kul they came across a shepherd people of Iranian stock, the She, who were compelled to fly before the overwhelming invasion into Ferghana.

Meanwhile the Huns had succeeded in conquering a part of Northwest China and East Siberia. A policy was adopted with regard to the subjugation of nomad tribes which was not unknown to other conquering nations of Central Asia, and became the chief cause of the extraordinary intermixture of races among the Central Asiatics. The vanquished tribes were not dislodged or made tributary, but to some degree absorbed, since the women were distributed among the conquerors and the young men enrolled in the army. In their life and customs the Huns appear as a people who depended for their existence on cattle-breeding, hunting, and to some extent agriculture, but gave the fullest play to their warlike propensities. The place of honour was given to the young and efficient warriors, and old age was despised. No one was reckoned to have reached full manhood until he had slain at least one foe. The method of fighting which afterward decided the battles of the Western Huns and Mōngols — the charge of mounted archers, the feigned flight, and the storm of arrows which laid low the unsuspecting pursuer — was already developed among the ancient Huns, as well as the division of the army into two wings. This military system was maintained in times of peace also. The ruler, Shenyu, who to some degree commanded the centre, had two supreme officials, the Tuchi (Duchī), under him, one of whom was over the eastern, the other over the western, wing or division of the army and the country. The trend from west to east in the geographical configuration of Asia is again recognisable in this arrangement, which was also adopted by the later great nomad empires. The Tuchi and a number of other high officials could only be chosen from the kinsmen of the Shenyu, who with some few other families had the virtual government of the empire in their hands.

After the death of Mete (170) the power of the Huns increased at first. The Yue tshi were completely beaten, and the Usun, one of the fair-haired nomad

tribes of Central Asia, were driven from their homes in Kansu to the west, where, following on the steps of the Yue tshi, they caused these latter to fly before them from the Issik-kul farther southward. The sphere of the Mongolian language and race was thus considerably extended by the Huns. The growing power of the Hun empire was most dangerous to China, the frontiers of which were perpetually ravaged, and seemed still more threatened, since the Tibetan nomads, who were settled in the western mountains, now began to form alliances with the Huns, and to undertake their raids on a mutual understanding. It was no use merely to repel these attacks. If the Chinese wished to free themselves from their oppressors, they were compelled to advance along the old road from Kansu to the Tarim basin, take up strong positions there, separate the southern nomad countries from the northern, and at the same time obtain possession of the indispensable bases and halting-places of the Hun armies to the south of the desert of Gobi. In this way the Western trade also, which had previously depended for its prosperity on the caprice of the nomads, was certain to come under the influence of China. The energetic emperor Wu Ti (140-87) staked everything on the execution of this colossal plan, entered into alliances with the Yue tshi and Usun, by this means threatening the Huns in the rear, and finally forced them by successful engagements to retire to the north of Mongolia (120). The first step in the advance westward was thus taken, and a new era inaugurated in the foreign policy of China.

The Hun empire still maintained its position in the north for some time, and even considerably extended its power toward the west, but the old sovereignty was a thing of the past. The attacks of the neighbouring peoples and disputes for the crown began to disorganise the constitution, until finally, about 50 B. C., the empire broke up into a southern and a northern part, of which the first recognised the Chinese suzerainty, while the northern still maintained its independence. Transitory successes could no longer check the fall of the Hun power, for the Chinese could now play off the southern Huns successfully against the northern Huns, and instigate other nomad tribes against the northern empire, which was encircled by enemies. The northern Hun empire finally, in 84 A. D., succumbed to the attacks, in which even Siberian tribes, and especially the Sien-pé Tartars, formerly the victims of the Huns, but now grown strong enough for a new conflict, took part. Some of the Huns fled westward, where they were destined yet to attain great prosperity; the rest were scattered or were absorbed in the Sien pē, who now possessed the greater portion of Mongolia. The Southern Huns held out longer; at one time as subjects and allies of the Chinese, at another as their opponents, or as supporters of pretenders to the throne. But after 142 A. D. there was an end to the southern empire of the Huns, though not to the influence of the people on the destinies of China. The Huns, who had familiarised themselves with the Chinese civilization, gradually began to exert a political influence, and finally emperors of Hun origin for a time sat on the throne of the Celestial Empire, or on those of the fragments into which it broke up. But they no longer ruled as nomad princes; they had become genuine Chinese in act and thought.

#### C. WESTERN CENTRAL ASIA AND THE ADJOINING COUNTRIES

THE nomadic element in the west of Central Asia was of earlier origin than that in the east, and large migrations of nomad peoples had taken place far earlier

there than elsewhere. Some thousand years before the founding of the empire of the Huns migratory tribes of Aryans had occupied Iran and India. But there the movements met with a certain check. The Iranians did not succeed in penetrating westward into the lowlands of Babylonia (cf. Vol. III); on the contrary, they saw themselves restricted to their new home, and by the influence of the inhabitants who had settled before them, as well as of the ancient civilization of the country watered by Tigris and Euphrates, they were gradually brought over to a settled life, without immediately losing the warlike virtues of their old pastoral existence. The mixed Iranian people, which was formed from the Aryan immigrants and the aboriginal population, thus became a bulwark of Western Asia against any further inroads of nomads. The shock of invading hordes was checked by the resistance of a people clinging more closely to the soil. The Iranians were not pushed further toward Western Asia by vast bodies of men pressing after them, but the great movement of the nations came to a stop. When the Medes and the Persians obtained the sovereignty over the whole of Western Asia, they were already under the spell of Western civilization, and were unable to give any Iranian character to the newly conquered countries.

It thus follows that the Aryan nomads of Western Asia generally are hardly spoken of for more than a thousand years. The Assyrio-Babylonian records know nothing of them, and no news of them has reached the Chinese. There were no doubt numerous battles and movements of nations, but these last were not on the imposing scale of the migration to India and Iran. The arrival of brachycephalic nomad tribes in Central Asia proper must gradually have made its influence felt, with the effect that the Scythian hordes, which had been pushed far toward the east, were partly absorbed, partly driven back to the west; these shocks continued, wave upon wave. The last consequence of the mightiest onslaught was the invasion of Asia Minor by the Cimmerians about the year 700 B. C. These were a nomad people of Thracian stock, who pastured their flocks north of the Danube. After them pressed on the Scythians (*Scylothæ*), who again were expelled by the Sarmatians. The first cause of the movement may perhaps be considered to be the westward advance of the Huns, who had long since founded an empire, and clearly pressed on not only against China, but also toward the west. The Cimmerians threatened Assyria from Asia Minor and Armenia, and by so doing came into contact with the Medes, who were pressing on from the east (cf. Vol. III, p. 132; Vol. IV, p. 52).

The period of more certain history, which begins with the founding of the Medo-Persian Empire, shows us at once the settled Iranians at war with the nomads. An incorrect idea, which is explained by the failure of the Greek historians to understand the conditions of Persia, and Eastern Persia in particular, represents the Persians as the aggressors, who coveted the territory of the nomad herdsmen. In reality the half mythical expedition of Cyrus against the Massagetæ (530), and the well-authenticated march of Darius against the Scythians (515), were only attempts to attack the ever restless neighbours in their own country and by this means to secure the frontiers. The expedition of Darius in particular was probably based on the plan of attacking the nomad tribes by a sweeping flank movement, and of thus preventing their retreat and finally subjugating them. The Persian Empire was too short lived to complete so colossal an undertaking, which would have required the dogged patience of the Chinese. The attempt of

Darius, which effectively secured the lower line of the Danube for the Persians, was not repeated. The Scythians, on the other hand, realised the weak points in the Persian Empire, as is proved by their somewhat later plan (Vol. IV, p. 77) of attacking Persian territory by way of the Caucasian isthmus, for which they tried to obtain the aid of the Spartans, who were intended to make a simultaneous invasion of Asia Minor.

The system of colonisation, which alone promised permanent results, seems to have been prosecuted all the more vigorously from Eastern Iran, and the fact that the majority of the nomads were of Iranian stock, like the Persians, facilitated the movement. It is probable that in quite early times on the Oxus and Jaxartes, that is to say, in Bactria and Sogdiana, States possessing an Iranian civilization were developed, which were afterward politically united with Persia, although they can hardly have remained in permanent and complete dependence. By the expedition of Alexander the Great (327) they were more closely united with the new world empire of that monarch, and the foundation was laid for a Græco-Iranian civilized State, the Bactrian Empire, which was developed in the Seleucid period (250 B.C.) and showed a considerable vitality (cf. Vol. IV, p. 157). This empire, like the ancient Iranian Bactria, was a bulwark against the onset of the nomads. It showed itself a match for the migratory Iranian tribes, and it was only the impact of a non-Aryan shepherd people from Central Asia that for the first time shook once more the strong rampart which guarded Western Asia and India. This new tide of nations, which set in about 160 B.C., was certainly, even if indirectly, due to the Huns.

The nomad tribe of the Usun had abandoned its home on the borders of China and had retreated westward away from the sphere of the power of the Huns (cf. above). Since it followed the roads which led away along the Tianshan and finally crossed that range, it reached the Issik-Kul, where the Yue tshi, their predecessors on the same path, had won homes for themselves. These latter were now compelled to give way; but they did not again turn westward, where warlike Scythian tribes barred the way, but southward against the Bactrian Empire, the internal disruption of which would have been well known to them as neighbours. The result was that Northern Bactria, the country on the Oxus and Jaxartes, fell easily into their hands, while the rest of the Greek State south of the Hindu Kush maintained its position for the time. The Parthian kingdom, which successfully undertook the defence of the frontiers against the nomads, had grown up since 250 B.C. in Western and Central Iran (cf. Vol. III, p. 274). But if Iran was closed to the Yue tshi, they did not allow the road to India, which from all time had possessed a magic attraction for every conquering people, to be permanently blocked. The southern part of the Bactrian Empire stood for some hundred years more. Then, about 25 B.C., Kozulo Kadphises (Kieu Tsien Kio; cf. Vol. IV, p. 160), who had reunited the Yue tshi after their division into five clans, subdued the modern Afghanistan. This immediately opened the road to the Indian possessions of the Bactrian Empire. About the year 10 A.D. his successor, Huemo Kadphises, or Kadaphes, advanced into Northwestern India, and thus laid the foundation of the Indo-Scythian Empire. The Yue tshi now appear in history as Indo-Scythians. They have frequently been confused at a later date with the "White Huns," or Ephthalites, with whom they are absolutely unconnected. Undeniably the fact that Bactria as far as the borders of Central Asia was then united

with large portions of India under one rule, did much to make Indian influence, especially the Buddhism then flourishing in India, felt far away northward. India generally entered into closer and more direct relations with Central Asia. Fifty years after the founding of the Indo-Scythian Empire the Buddhist propaganda had already reached China. The empire of the Yue tshi showed a stubborn vitality, and only broke up in the year 579 A. D.

#### D. THE TARIM BASIN (EAST TURKESTAN)

(a) *The Tarim Basin and the Trade from West to East.*—While a large part of Central Asia first acquires importance for the history and culture of mankind, on the appearance of nomad peoples, and as the fountain-head of a disintegrating force, the Tarim basin, which is also called East Turkestan or High Tartary, claims the attention of the historian far earlier and in another sense. By far the greater part of the plain lying between the Tianshan, the Pamirs, and the Kuen Lun is emphatically a region of steppe and desert. But the mountain streams, the largest of which unite in the river Tarim and the Lob-nor, create a series of fertile oases, which support a considerable permanent population, and form a chain of trading posts along the foot of the mountains. In all probability the oases were more numerous in early times, and the intermediate barren stretches less desolate. The Tarim basin could thus form in ancient days the bridge between the civilization of Eastern and Western Asia, even if it was not an international highway, and saw at the same time a higher civilization develop in its fertile regions. The key to many problems of the prehistoric period lies under the burning sands of Eastern Turkestan.

The ancient trade communications through the Tarim basin are certainly to be regarded as a relic of the former connection with civilization, which was maintained notwithstanding the increasing poverty of the soil and the appearance of barbarous nomad tribes. Those who wish to see in the nomads, with their restless mobility, the first promoters of trade, forget that these tribes never showed a pronounced predilection for it, although from the example of others they frequently recognised the profits derivable from a transit trade, and familiarised themselves with it. The nomad as such is not inclined to amass the heavy goods which the town merchant stores in his vaults. His chief wealth lies in his flocks and herds, which again depend for their numbers on the possession of the requisite pasture land. Even in the Tarim basin the real traders were thus always to be found among the settled inhabitants of the oases, although the security and success of their commerce depended on the good-will of the nomads, and although sometimes closed trade routes were reopened by the great migrations and conquests of nomads, and districts which had long been estranged were once more united (cf. the empire of the Yue tshi).

The earliest recorded trade which passed through the Tarim basin and brought Eastern and Western Asia into some sort of communication was the silk trade. The breeding of silkworms, if Chinese tradition does not err, was practised by that people from very ancient times; the wife of the emperor Huang Ti was renowned as a keen promoter of this industry. The Chinese themselves seem to have attached no especial importance to the silk trade with the West, as is shown by the silence of the ancient accounts. The trade accordingly must have been chiefly

conducted by foreigners, who were eager to obtain in exchange the highly valued product of China, while it was long a matter of indifference to the Chinese, who were aware that they could very well dispense with the goods received in return. The imagination of the West was all the more excited by the mysterious Eastern land, which produced the costly silk, and attempts to gain further information were made from early times. Herodotus was able to refer to a book of travels, which did not indeed throw light on China itself, but only on the route of the silk trade and the condition of things in the valley of the Tarim; this was the "Arimaspeia" of Aristæus, which appeared in the seventh century A. D., soon after the Cimærian expedition (cf. *ante*, pp. 137 and 143). This narrative, notwithstanding its romantic dress, was probably based on actual explorations and travels, as Wilhelm Tomaschek has been at pains to show. The Issedones, whom Aristæus professes to have reached, were an actual people, and their homes probably lay in the Tarim basin. The western neighbours of the Issedones were the Massagætæ, that is, the Iranian nomads who pastured their herds in Western Turkestan. The name of the Issedones may be of Iranian origin, and have been given to the people, who styled themselves otherwise, by the merchants, who were mainly Iranians. We thus see why Chinese records do not mention the name. The Issedones were probably a branch of the Tibetan stock, which once spread further northward than now. They are possibly identical with, or at least allied to, the later Yue tshi, who were expelled by the Huns from their homes in the Tarim basin. But the population of that region can hardly have been homogeneous at the time of Aristæus. The Tibetan Issedones, who are occasionally called Scythians, were far more probably a nomad people, who exercised sovereignty over the country of the oases; but the remnants of the representatives of an earlier civilization may well have settled in these oases, precisely as in modern times the towns of Eastern Turkestan are inhabited by a very mixed population. Dolichocephalic Iranians, who came into the country as traders or immigrated as agriculturists, may well have mixed here in early times with the permanently settled brachycephalic inhabitants and with the tribes of the Tibetan nomads.

The Arimaspes, a warlike tribe of nomads, which seems to have made frequent inroads into the Tarim basin, are mentioned by Aristæus as northern neighbours of the Issedones. By this title he undoubtedly means the Huns, whom we have already seen as invaders of China. In the second century B. C. they also fundamentally altered the conditions of Eastern Turkestan by driving the Yue tshi westward. The settled population of the oases probably was little influenced by these movements. Aristæus gives noteworthy accounts of the battles of the Arimaspes with the "griffins," the guardians of the gold, who lived to the north of them. These "griffins" are certainly the nations on the Altai, the representatives of the old bronze culture of Southern Siberia, and the builders of those tombs in which great quantities of gold ornaments have recently been found. Thus the picture of the activity of the warlike nation of the ancient Huns, that leaven of the nomad peoples, is complete on every side. On the east the indefatigable sons of the desert continually advanced against the rich plains of China; on the south they directed their raids against the representatives of the transit trade of Central Asia, the Tibetan nomads, and the inhabitants of the oases in the Tarim basin; and on the north they harassed the industrious tribes of the Altai with their expeditions. The great Hun campaign, which finally convulsed Europe to its

foundations (Vol. V), was only a gigantic continuation of these earlier struggles for power and booty. While Aristæus has exhaustively described the Issedones and Arimaspes, he appears to confound the Chinese with the Hyperboreans, the peaceful people on the uttermost border of the world; at any rate, his account of the Hyperboreans as reported by Herodotus almost coincides with the later descriptions of the Seres (cf. p. 57).

The towns and trading settlements in the Tarim basin, which Aristæus mentions, can partially be identified with still existing modern localities. This is impossible in the case of many, as may be concluded from the great number of towns buried beneath the sand, which have been recently explored by Sven Hedin. Further aids toward identification are supplied by the accounts of the Macedonian merchant Maës, or Titianus, who enables us to fix the stations on the East Asiatic trade route in the first century A. D. This road led from Samarkand to Ferghana, whence the "Stone Tower" and the valley of the Kihil Su were reached, at the entrance of which an important trading town lay in the territory of Kasia. This was certainly the modern Kashgar, for which natural advantages of situation have secured uninterruptedly since ancient times a foremost position among the cities of the Tarim basin. The "Seythian Issedon" may be represented by the modern Kuchar, the most important mart of the Turkish tribes settled to the north in the Tianshan; Asmira may be the present Hami. The first Chinese trading-town in the district of Kansu which was reached by the caravans coming from the west, the modern Su chau, is, according to Tomaschek's belief, to be rediscovered in the ancient Drosache. The larger centres of trade, from a political point of view, enjoyed certainly some share of independence, although they did not venture on any very stringent measures against the nomads from fear of interruption to commerce. The different vicissitudes in the relations of the nomads to the dwellers in the country and the towns will have been repeated on a small scale in the Tarim basin; at one time brute force, at another the refinements of civilization, gained the day. The connection with India, the beginnings of which are obscure, was of great importance to this civilization. In this way Eastern Turkestan became the bridge on which Indian manners and customs, and above all Indian religion, passed both to China and the rest of Central Asia, in order, in course of time, to work great revolutions in the character and habits of the Central Asiatic peoples.

(b) *The Changes in Commercial Intercourse.*—The trade which moved on the long commercial highway of Central Asia, a road unparalleled for its length and difficulties, could not always be prosecuted with unvarying uniformity. External influences and internal commotions produced the inevitable result that the traffic became brisker at one time, and at another flagged or almost died away, and that the character of the trade altered. In fact, so far as we can survey the conditions generally, we see continual changes occurring. The routes along which the main bulk of trade passes are changed, the customs of commerce are altered, and finally even the wares, which east and west exchange, are not always the same, but new ones are added to the old.

It is quite in accordance with the nature of commercial intercourse that it always seeks out paths for itself along the line of least resistance. This resistance, the effect of which is shown in the risks and costs of transport, and therefore admits of being roughly calculated, appears in the form of natural obstacles or

human opposition. The two are reciprocally connected. A somewhat difficult and laborious route is preferred to the best road, if this involves risk and cost from repeated robberies, exorbitant tolls, and other vexatious imposts. In Central Asia, where on the one hand different routes were available for the trade between Eastern and Western Asia, and on the other hand the nomads were always ready to plunder the merchants directly by brigandage or indirectly by tolls, commerce clearly changed its roads more frequently than the extant accounts give us to understand. The supremacy of the Huns in the north doubtless largely contributed toward the result that the northern routes were deserted and the traffic restricted to the roads in the Tarim basin. The wars of the Arimaspes with the Issedones may well have partially had the object of securing to the former the monopoly of trade. After the expulsion of the Yue tshi, who possibly are to be identified with the Issedones, the Huns had the northern highway through the Tarim basin in their power, while in the south Tibetan nomads, the Khiang, commanded the roads. It appears from the account furnished in the year 122 B. C. by Chang kien to his emperor Wu Ti, after an inquiry into the roads leading to the west and the possibilities of trade, that traffic then went quite in the south through Szechwan and Tsaidam to the southern border of the Tarim basin, while in the north the Huns and in the centre the Khiang barred the roads. These unfavourable conditions largely contributed to the result that the Chinese abandoned their former policy of indifference toward the peoples of the steppe.

The opening up of new connections on quite different routes between China and the other civilized countries must have exercised a more important and unfavourable influence on the traffic of Central Asia. No success, it is true, attended the attempts to come into direct communication with India through Tibet, and thus obviate the necessity of bringing Indian goods by a *détour* through the Tarim basin, although the emperor Wu Ti made various efforts with this object, and a small transit trade from India to Tibet must have been in existence long before his time. Maritime trade flourished all the more at a later time, when the distance between the Chinese and Indian ports had been immensely lessened by the conquest of Southern China. It is significant that the real impetus to maritime commerce was not given until the second century A. D., when the Chinese had again lost the command of the highways of Central Asia.

There must also have been changes in the customs of trade. Over vast distances trade can be prosecuted in two ways: either one tribe hands on the goods to another by a system of frontier trade, until they finally reach their farthest destination after various exchanges, or the members of one or more peoples adopt the carrying trade as a profession and traverse the whole distance with their wares. It is of course conceivable that for part of the distance caravan trade was usual, and for the other transit trade. On the Central Asiatic routes both methods may have been popular, according to circumstances. The transit trade is, however, certainly older than the caravan system on a large scale. Whether it actually in places, as early western accounts report, took the simple form of "dumb trade," or whether customs had been ascribed to the half mythical Seres, which were observed elsewhere in intercourse with primitive nations, can no longer be ascertained. It is in accordance with the whole attitude of China to the outer world that the Chinese did not engage until late in the carrying trade, while on the contrary the merchants of Iranian stock were continually exerting themselves to obtain

the caravan trade over the whole distance. The opponents of the direct traffic between east and west were naturally the nomads, above all the Huns, who preferred to make the roads a desert rather than to lose the high profits obtainable from the transit trade. The laboriousness and insecurity of the traffic produced the result that large emporiums grew up in different places, which served also as markets for the surrounding tribes; such were Samarkand in Western and Kashgar in Eastern Turkestan.

The changes in traffic, which affect the goods themselves, are most marked. The products of Central Asia itself, jade, rhubarb, musk, and gold, were exported as objects of trade to China, as well as to the West and to India. But on the whole it was the demand of the Western nations for Chinese commodities that kept the traffic alive in earlier days. In this connection many changes took place in the exports of China, as well as in the goods which the West had to offer in exchange.

The most important and most prized product which China supplied was unquestionably silk. The ancient authorities of the West designate the Chinese by the name of Seres, the silk growers. It is difficult to fix the date when this trade in silk and silken materials began. Aristeas, strangely, seems not to mention it, but since Wilhelm Gesenius has pointed out that some passages of the Bible belonging to the sixth century B. C. (Ezekiel xvi, 10, 13 and Isaiah xlix, 12) refer to silken materials and the Chinese nation, no weight need be attached to that circumstance. The mere existence of a flourishing trade with China could hardly be explained unless some such potent attraction as silk had been present in the Far East. A large part of the silks seem to have gone to Phœnicia, where they were dyed brighter colours or were unravelled and rewoven into half-silk fabrics, in order once more to be put on the market. The export of silk from China must inevitably have received a considerable blow so soon as the attempt to rear silkworms in other countries succeeded, and such a contingency could not long be avoided. As a fact, the silk industry gradually spread along the line of the old trade route. The advance of the Chinese toward the west introduced in 140 B. C. the culture of mulberry-trees and silkworms into Turkestan, after which that country gradually became an important centre for the export of silk. The Persians, also, were acquainted with the new industry; indeed for a time Persia, which both produced silk and commanded the routes to China, had the silk trade almost entirely in her hands. It was only in the year 557 that the Byzantines succeeded in introducing the eggs of the silkworms and thus breaking down the Persian monopoly. This naturally caused a fresh and important diminution in the export of silk from China, and it was only much later, when European powers began to foster the maritime trade with China, and thus the cheaper freight by sea influenced the prices, that it became once more possible for Chinese silk to compete with that of the Nearer East.

A second group of products which were sent from China to the West were lacquers and varnishes. Certain kinds of lacquer from Eastern Asia even at the present day are highly esteemed, and the trade in them may well have been profitable in ancient times. Probably articles of lacquered wood, such as are now sent in endless numbers from Japan, were early exported.

The case is quite different with the two articles which subsequently became of the first importance to the trade of China, and to some degree took the place of the then less prized silk, namely, porcelain and tea. Porcelain, even if previously dis-

covered, was not produced in any considerable quantity by the Chinese before the seventh century A. D., although pottery was known to them from earliest times. Tea did not become an important article in China itself before the fourth century A. D., and it was long before it was appreciated in foreign countries, and became for the nomads of Central Asia in particular so indispensable, that the demand for it tended to make the unruliest tribes dependent on China.

While China at all periods was able to supply goods which were eagerly sought for by the Western nations, there was always the great question to be solved, what could be offered in exchange to China and to India, which were both amply supplied with all that they needed. India and China either did not require the goods which European and Western Asiatic traders supplied, or only required them in small quantities; the deficit had, therefore, to be made up by the precious metals, the only product prized by the civilized nations of the East. The result was that gold and silver flowed into India and Eastern Asia to an alarming extent, and thus the requisite medium of circulation was withdrawn from Western trade. The elder Pliny calculated the annual loss which the world-empire of Rome sustained from this cause at £1,000,000 sterling, more than half of which was consumed by India.

The West could not permanently pay for the imports from the East with the yield of her mines, but only with the products of a superior civilization and industrial activity. In this connection it is a significant fact, as well as a proof of the extreme antiquity of barter, that the ancient industries of Phœnicia and Syria prepared articles for export to Eastern Asia. Among the imports to China the first place was taken by cloth stuffs; but it was not the art of weaving, with which the Chinese also were very familiar, that made the stuffs highly valued, and prevented even the cost of the long transport appearing excessive, so much as the dyeing. An attempt, as might be expected, was early made to put on the Eastern market the Phœnician purple stuffs, which were renowned and prized throughout the West. In addition to the dyed stuffs, there was an article still more valued for centuries, which was produced to greatest perfection in Syrian manufactories, namely, glass. According to Chinese accounts glass was valued in the East as much as precious stones, and fetched a correspondingly high price, as long as the art of making glass was unknown. But just as the silk trade on the highway of Central Asia suffered a severe blow by the transference of the cultivation of silkworms to Persia and the Eastern Roman Empire, so the importation of glass to China dwindled away when, with the article itself, the secret of its production finally spread to the East. This happened in the fifth century A. D., about one hundred years before the silk industry was known in Byzantium.

The above-mentioned wares were not, of course, the only staple of Central Asiatic commerce. China sometimes supplied great quantities of iron ware, as well as skins, which reached China through the Siberian trade, or were given as tribute by nomad tribes, while the West imported spices, jewels, etc. Besides this, the stream of Indian trade blended with that of the West and East in the Tarim basin. But these goods could not prevent the trade from languishing so soon as the demand for the chief products diminished or entirely disappeared.

(c) *The Chinese as Conquerors in the Basin of the Tarim.* — China, as we have seen, originally had little need for commerce with the outer world. Foreigners

came to the Middle Kingdom in order to purchase the valued Chinese wares, but the Chinese themselves were quite satisfied to take in exchange all kinds of foreign products, with which they could easily dispense in case of need. The state of affairs could not permanently remain so favourable for China. The constant large exportations inevitably led to the growth of a sort of export industry; that is to say, silk, lacquer, etc., were produced in greater quantities than the home Chinese market required. If the export trade suddenly stopped, the consequences to China were serious. Besides this, China became gradually accustomed to certain foreign commodities, with which it could not dispense, especially to the spices, drugs, etc., of India and Arabia. Thus any dislocation of trade was severely felt. Such a result ensued when the Huns overthrew the Yue tshi and barred the valley of the Tarim, while uncivilized Tibetan hordes rendered the roads dangerous in the south. It was an intolerable situation that the Huns should be able to cut off trade communications entirely, or to cripple them by excessive tolls, and the Chinese were inevitably driven to reprisals so soon as an energetic ruler governed them.

Other considerations prompted an advance into the basin of the Tarim. It was recognised in China that the menacing growth of the power of the nomads could not be checked unless they took up a strong position in their rear, and divided the steppe region into two sections by a strongly fortified military road. Even in this case the old trade route through the Tarim basin suggested itself as the natural line of direction for the advance, while the trading towns naturally formed suitable bases of operations.

The emperor Wu Ti about 125 B. C. tried, therefore, to reopen the trade route of Central Asia, and at the same time to crush the enormously increased power of the Huns. An effort was made to gain for this object the alliance of the hereditary enemies of the Huns, the Yue tshi, who had just conquered Northern Bactria and Sogdiana, and thus were masters of the western extremity of the Tarim roads. Wu Ti sent to them his general, Chang kien; but being taken prisoner on the way by the Huns, he did not reach the Yue tshi until ten years later, and returned to China after an absence of thirteen years. He had been unable to accomplish his chief object of concluding an alliance with the Yue tshi and arranging a combined attack on the Huns, since the successes of the Yue tshi in Bactria had given a new, and for China an unfavourable, turn to the future policy of that people. In compensation he brought back to China a store of information about the western countries and India. The consequent attempts of Wu Ti to establish communications with India through Tibet were a failure. On the other hand, the war against the Huns was now vigorously prosecuted, and the old trade road was intentionally made the base of operations. The Yu-men Pass was occupied and secured by military colonies, while the power of the Huns was weakened by repeated blows and ousted from the Tarim basin. Trade revived, but with the difference that now even Chinese caravans and embassies went westward and there formed political connections, especially with the people of the An hsi (Ansi), by whom, according to Friedrich Hirth, we are to understand the Parthians. The most easterly point of the Parthian Empire appears then to have been Margiana (Merv, the Mu lu of Chinese accounts). The Chinese, therefore, certainly advanced so far.

Many petty States of the Tarim basin and possibly of the countries lying

farther to the west entered into closer political union with the east, and partially recognised the suzerainty of China. It was not, however, before the year 108 B. C. that the immediate possessions of China were extended to the Lob nor, that is to say, to the eastern boundary of the basin of the Tarim and secured by fortifications. Chinese troops later advanced to Kashgar (101 B. C.). But the dominion of China in the Tarim basin was never firmly established, although alliances were frequently concluded with the Usun against the Huns. The power of the latter was still too strong to allow the petty States of Eastern Turkestan and the Uigurians any permanent connection with China. The influence of the Huns on the valley of the Tarim and the Western trade rose or fell according to their successes or reverses in their struggle with China.

But the other nomad tribes of Central Asia also interfered in the affairs of those parts. The childless sovereign of the small kingdom of Yarkand (Shao Che) had destined a son of the king of the Usun to succeed him. The inhabitants of Yarkand, after the death of their monarch, with the consent of the Chinese emperor Hsuan Ti, summoned this prince from China, where he was being educated, and placed him on the throne, thus hoping to secure for themselves the protection of the Usun and of the Chinese (64 B. C.). But the brother of the late king, with the help of the Huns, deposed the new sovereign, who, rightly or not, was accused of cruel tyranny, and put him to death. A Chinese army then appeared, killed the usurper in his turn, and placed on the throne a new monarch, approved by China, who appears also to have asserted his power. The influence of China in the Tarim valley gradually diminished. At the beginning of the first century A. D. the power of Yarkand grew so strong that its king claimed the suzerainty of the entire basin of the Tarim, after his request to be recognised by China as governor of Eastern Turkestan had been refused (33 A. D.). The prayers of the other oppressed minor States and the commercial blockade maintained by the king of Yarkand ought to have forced Shi Tsu to take vigorous action. The war with Yarkand, however, was mainly left to the Huns, who harassed the new kingdom in the Tarim basin for decades with varying success.

The second great advance of the Chinese toward the west did not begin until 72 A. D. The wish to open up communications with the West was stimulated then by the introduction of the Buddhist teaching, which had entered China through the Tarim basin. A deputation which Ming Ti, the second emperor of the later or Eastern Han dynasty, had himself sent to the Yue tshi had returned in 65 A. D., and brought back detailed information about Buddhism. The emperor in consequence was induced to erect a statue of Buddha in his capital, and to show peculiar favour to the new doctrine, without, however, giving it preference over the doctrines of Kung fu tse. The chief cause, however, of the renewed advance westward was doubtless the circumstance that the South Huns had once more combined with the North Huns to block the traffic, and had completely disorganised the otherwise unsatisfactory conditions existing in the Tarim basin. Various Chinese armies marched against the Huns in the year 72, one of which, under the command of the general Pan Chan, followed the old trade route to the Tarim basin. The appearance of this renowned commander and diplomatist immediately secured the victory of Chinese influence among the petty States, which had all suffered under the insecurity of trade and the prevailing military policy of the Huns.

This time the Chinese were not content with the easily acquired spoil. They had heard, meanwhile, that a mighty empire of Ta ts'in, the Roman world-empire, lay in the west. The remarkable magnetic force exercised on each other by great States, which lies at the root of their conditions of existence and compels them gradually to absorb all petty intervening States and to form a well-defined frontier, began to assert its power here, although its complete triumph was prevented by the immensity of the distance to be traversed. The Chinese never obtained accurate knowledge of the Roman Empire. Friedrich Hirth has shown that they probably were partially acquainted with the eastern half only, and thought that Antiochia was the capital of the empire. The name Fu lin for the Roman Empire, which subsequently occurs, seems to be derived from Bethlehem, and thus merely to point to the Christian faith of the later Romans. The campaign of Pan Chau, which took him nearly to the confines of Roman influence, dates some decades after the conquest of the Tarim basin. Pan Chau crossed the range of mountains to the west, traversed the territory of the Yue tshi, and finally reached the Caspian Sea, whence he sent explorers further to the west in order to prepare for an attack on the Roman Empire (102). The unfavourable report, however, which he received and his advanced age forced him to return to China, where he died shortly after.

The political importance of his conquest was considerable, but could hardly be lasting. The numerous petty States, which at the sight of his army had sought the protection of China, had no choice but to go their own way, and to make terms with their other powerful neighbours, now that China ceased to lend them any effective assistance. The revenue from tribute, gifts, and tolls which China drew from the western countries was far from being sufficient to cover the great outgoings. And the traditional Chinese policy, which would hear nothing of any expansion of the old boundaries and attached little importance to the promotion of trade, now reasserted itself. There was, as early as 120 A. D., a feeling in favour of abandoning all possessions beyond the Yu-men Pass, and it was due to the advice of a son of Pan Chau that the military road, at least as far as the Tarim basin, was retained. The long series of disorders which soon afterward broke out in China completely checked any vigorous foreign policy, while the growing prosperity of maritime commerce diminished the importance of the overland trade. The petty States in the Tarim basin for many years subsequently led a quiet existence, more influenced by India than by China.

#### E. THE WESTERN HUNS

THE advance of the Chinese toward the west, in spite of the bold plan of Pan Chau to attack the Roman Empire, inflicted no injury upon civilization, but on the whole was beneficial to it. Far more momentous was the turn of events when the nomad hordes of Central Asia sought an outlet in Western Asia and Europe. Northern India had already fallen into the hands of the Yue tshi, and the hour was approaching when a great part of Europe also would tremble beneath the scourge of the yellow races of the steppes. The main body of the Huns, when their star had set in Mongolia, hurled themselves against the civilized nations of the west. The consequences which the onslaught of the Huns and, in close connection with it, the advance of other Asiatic nomads had for Europe do not come into the history of Central Asia (see Vol. V); but, aided by the researches of

Hirth, it is worth our while to glance at the development of Asiatic affairs up to the invasion of the Huns.

The western civilized world had long escaped any dangerous attacks from the nomad peoples of Asia and Europe, perhaps because the nomads of East Europe became gradually more settled and paid more attention to agriculture. The Alani, who are identical with the Aorsi of earlier accounts, seem to have been the most influential nation. Probably it is no question of a closely connected nationality, but rather of a collective name for the nomad tribes, who occupied the region from the Black Sea to the Sea of Aral, and were composed partly of the remains of Irano-Scythians, partly of Ural-Altaians. The proper bearers of the name were settled in the first century B. C. to the north of the Caucasus, where they fought against Pompey in the year 65 B. C., but then spread themselves further over the steppe, and appear to have ruled for a time at least over most of the nomad tribes of the region of Pontus and the Caspian. There were frequent but unimportant contests with the Romans. According to Chinese records a part of the country of the Alani (Ants'ai) belonged for a time to Sogdiana, a fact which argues armed complications on that frontier. Attacks through the Caucasian gate on Persian and Roman territory occurred several times, but there was no immense migration until the advance of the Western Huns.

The first march of Hun nomads toward the west took place about the middle of the first century B. C., when the empire of the Huns was thrown into the most violent confusion by internal seditions. Several rulers tried simultaneously to usurp the power, and waged bitter war on each other. When at last one of the pretenders, Huhanyé, appeared to be victorious, his own brother, the "Viceroy of the East," rose against him. This "Chichi," as he now called himself, expelled his brother from the capital, but then turned to the west, and, since he could not hold the whole empire, founded an independent power, which he gradually extended further westward. The circumstance that a prince in Sogdiana called in his help against the Usun enabled him to transfer the seat of his power to the region of the Sea of Aral. Part of the Alani in that district were perhaps already subject to the Huns. The wars with the Chinese in the Tarim basin ended with the death of Chichi (36 B. C.), and greatly weakened the power of the Huns.

Their power did not revive until, in the year 90 A. D., another Hun prince with a large part of his people marched westward and joined the earlier emigrants. This migration was due to the complete collapse of the empire of the Eastern Huns. Hirth rightly points out that in both the migrations of the Huns it was the most warlike and strongest part of the population which turned westward. The West Huns, therefore, were the picked men of their traditionally war-loving and adventurous race. Their people can hardly have remained unmixed during its migrations, but it probably incorporated the bravest men from the conquered tribes. In this way a new nationality might well be developed, whose thirst for war would prove fateful for even distant regions, so soon as an occasion should arise when this concentrated energy could find an outlet.

The Chinese, after the advantages gained in the west by the advance of Pan Chau had been mostly relinquished, had at the beginning of the second century A. D. to face new contests with the Huns and their Ugurian allies in the Tarim basin. After the middle of the century the West Huns disappear from the horizon of the Chinese, a fact which suggests that the warlike nomads, finally renouncing any

plans for the reconquest of their old homes in Mongolia, turned their attention in other directions. For two centuries more they seem to have been content with minor hostilities, until at last in 350 A. D. the avalanche began to roll. The Huns attacked the Alani first, killed their king and partly brought the people under their power, partly forced them in panic further to the west. The great steppe of Eastern Europe and Siberia was thus opened to the Huns and the direction of their further advance suggested. That the storm of conquest did not sweep down on Persia, the fertile plains of which certainly aroused the greed of the marauders, was due to the awe with which the still powerful Neo-Persian empire of the Sassanids inspired the nomads (Vol. III, p. 284).

The appearance of the Huns would not have had nearly so great an influence on Europe had it not been that the Roman Empire was already beginning to decay and that the Germanic races were in confusion and disorder. The convulsions which shook Europe, when the Huns under the leadership of Balamir in 375 invaded the Danubian countries, do not concern the history of Asia (cf. Vol. V). It is unlikely that all the Huns and Alani took part in the movement toward the west; on the contrary, the supremacy of the Huns was still maintained in the region of Pontus and the Caspian. For when, after the death of Attila (453), the European empire of the Huns broke up, the rest of the people withdrew once more to the east, and found a refuge there in the old homes of the Huns and Alani. The sovereignty of those regions devolved on Attila's favourite son Irnach (Hernae, Irnas). In the sixth century the empire gradually disintegrated into petty States, whose princes frequently interfered in the wars between Persia and Byzantium, or took up arms against each other. In 558 an army of Huns advanced to the gates of Constantinople. As the power of the Huns broke up, the separate elements of which this heterogeneous nation of warriors was composed recovered individual importance, until finally even the name of Huns disappeared from history.

The same fate befell another very mixed branch of the Hun nation, the "White Huns," or Hephtalites (Tin la; cf. p. 144), who had firmly planted themselves in the modern Khiva, and after 420 made vigorous attacks on Persia. The Sassanid king, Peroz, fell in battle against them (484). The year 531 saw the last fights with these Huns, some of whom were destined to reappear under a new name and mixed with other nations as K(a)harsmians.

#### F. CENTRAL ASIA AFTER THE FALL OF THE EMPIRE OF THE HUNS

(a) *The Sien Pē and the Yen Yen.*—After the disruption of the great Hun Empire in Central Asia and the retreat of most of the Huns to the west, the major part of Mongolia had fallen to the Sien pē, since the Chinese had neither the wish nor the power to hold the immense region of the steppes. The Tungusian nation of the Sien pē came originally from the modern Manchuria, and by its advance to the west, during which it probably absorbed the remnants of the Huns and other inhabitants of the steppes, it introduced a new ingredient into the hotchpotch of nations in the pasture lands of Mongolia. Like all nomad peoples, the Sien pē broke up into a number of petty States, which usually had their own political systems, but were occasionally united under an energetic ruler, and then constituted a formidable power, which soon made its influence felt in China and in the Tarim basin.

Some such rapid rise of the Sien pē occurred about 150 A. D., when Tun shih huai (Dardjegwe ?) placed himself at the head of one of their tribes and soon extended his power far over the adjacent peoples. This new nomad empire was hardly inferior in size to the earlier Hun empire, and comprised roughly the same countries, since then, as formerly, the line of least resistance lay due east and west. Even the division of their gigantic territory into a central kingdom with an eastern and a western province was once more adopted by the Sien pē. Since it was virtually the personality of the ruler which kept the empire together, the power of the Sien pē was considerably diminished by the death of their first prince (190), and would certainly have given way to the influence of China, had not this danger been averted by the overthrow of the Han dynasty in China (220) and by the disorders which subsequently ensued. The Sien pē were thus able to realise for a moment the great ambition of the ruling nomad tribes, namely, to bring under their control the Western trade. Like the Huns before them, they had, for this purpose, to come to terms with the Tibetan nomads in the south of the Tarim basin.

During the civil wars in China several hordes of the Sien pē found a welcome opportunity of migrating into that country, where they either served as mercenaries or founded independent States. The most powerful of these tribes were the To ba (Topa, Tufa). Between 333 and 376 the house of To ba ruled the State of Tai in Northern Shansi. In 386 Kuei, who belonged to that dynasty, founded there the Northern (Pei) Wē, which expanded farther and farther over Northern China, until it practically covered the same area as the Wē of the "three kingdoms" (p. 86). In 534 Pei Wē broke up into the Eastern (Tung) and the Western (Hsi) Wē, which were overthrown in 550 and 557 (p. 89). Wu ku, also a member of the house of To ba, governor of Hohsi after 394, declared himself king of Hsi ping in 397, and formed the State of Nan Liang, which was conquered in 414 by the prince of Hsi Chin. The To ba had soon become Chinese in life and thought, and they were forced to confront their kinsmen, the nomads of the steppes, entirely in the spirit of the traditional policy of China.

The condition of Mongolia had changed in the course of time. The empire of the Sien pē crumbled away after the strongest and most numerous hordes had migrated to China, and its place was taken by a new one under the rule of the Yen Yen (Gun gen, Shuan Shuan), a mixed people, which apparently had incorporated fragments of primitive Siberian peoples, but linguistically belonged to the Turco-Tartar race. In the early stages of their history the Yen Yen appear to have acquired so invidious a reputation for barbarity and vice, that they aroused disgust even among their nomad neighbours, who certainly were not fastidious in this respect. The emperors of the Wē dynasty long held this refractory people in check. The Yen Yen ultimately founded their power at the close of the fourth century by the subjugation of the industrious tribes of the Altai range; they proceeded further to the west and obtained possession of the Central Asiatic trade routes, and extended their influence over Mongolia as far as the frontiers of Korea. The ruler to whom they owed this rapid rise was Talun (Shelm, Zarun). From the name of his successor, Tataru (Dudar), is said to be derived the designation "Tartars," which in time has become usual for the peoples of the Turco-Mongolian stock.

The To ba in Northern China soon saw themselves involved in arduous wars with the new nomad empire, but in the end proved fully a match for it. After the

Yen Yen, in 425 and on many subsequent occasions, had received heavy reverses in their attacks on China, and had been pursued into their own territory, the Pei Wē, according to the time-honoured Chinese policy, extended their influence once more along the old trade route to the west, and thus sapped the very foundations of the opposition of the nomads. Alliances with the two other empires, into which China then was divided, those of the Sung and the Liang, brought little advantage to the Yen Yen; they were repeatedly defeated, and were unable to regain the command of the trade routes, although in the year 471 they reduced the kingdoms of Kashgar and Khotan to great straits. The Yen Yen were not completely overthrown by the Chinese. It was not until the middle of the sixth century that their kingdom, weakened by internal dissensions, fell before the onslaught of the Turks. A great part of the people followed the example of the Huns and fled to the west. The Avars, who soon afterward appeared as conquerors in East Europe, are probably identical with the Yen Yen. Like the remnants of the Yen Yen in Central Asia, the Avars finally disappeared altogether or were absorbed by the other nations.

(b) *The Uigurians.* — When we see these nomad empires attaining such gigantic size and then completely disappearing, we may easily forget that Central Asia was not exclusively a region where wandering hordes fed their flocks and herds, but that it offered homes and food to more or less settled peoples. It has already been shown how flourishing and comparatively civilized settlements developed in the Tarim basin, owing to the favourable position for the trade of East and West, and became the centres of small States. But there were trade routes even further north which led to the west, and at the foot of the mountains lay districts which were adapted for agriculture. Still further away towered the Altai, with its rich mines, the focus of a primitive civilization, which, in spite of countless raids by nomads, was still vigorous.

It is certain that numerous towns and permanently settled nations were to be found from the Tian shan to the Altai. Political power, however, lay mostly in the hands of the nomads, who stamped their character on the constitution of the country, and thus do not appear even in the earliest records as true disseminators of culture. The Uigurians (Jugures, Igures, Shni She) were long the most important nation of this region; they formed the nucleus of the nine Oghuz (hordes), to which the Tongra, Sukit, Adiz, Sap, etc., belonged. A distinction was made between a northern branch of the Uigurians which was settled on the Selenga and subsequently spread to the sources of the Yenissei, and a southern branch in the south and east of the Tian shan. While the northern Uigurians, called by the Chinese Kao che, or Thin le, did not attain any high degree of civilization, the southern Uigurians, whose country was touched or traversed by the most important trade routes from west to east, were not unaffected by the civilized nations (cf. below, p. 168). A remarkable mixture of civilizations, which had a momentous influence on the life of the other nomad peoples, was developed in the towns of the southern Uigurians.

#### G. THE TURKISH EMPIRES

THE supremacy of the Yen Yen in Mongolia was broken by the Turks (Tu kiu), a nation which significantly became powerful on the Altai. The Turks,

it is true, do not belong at all to the old representatives of civilization of Yenissean stock on the Altai; they were genuine nomads of Mongolian descent, probably one of those fragments of the great Hun people, which gradually increased again in numbers and importance. But the mineral wealth of the Altai doubtless furnished a source of power, which they knew how to use, whether they themselves mined and smelted, or entrusted this work to their subjects, the old settled inhabitants. The term "our smiths" which the Yen Yen applied to the Turks on the outbreak of the war was probably only a deliberate taunt, and not in accordance with facts. It must be observed, however, that among the nomads of Central Asia the trade of the smith was held in high esteem, quite otherwise than, for example, among the nomad tribes of North Africa, and that in Mongolian tradition even the legendary national hero Genghis Khan appears as a smith. At any rate, the superior armament of breastplates, helmets, swords, and lances, and the marvellous "singing arrows," rendered possible by the rich mines, contributed greatly toward securing for the originally not very numerous Turks the victory over their opponents.

(a) *The Beginnings.* — The national legend of the Turks traces the descent of the nation from a boy whom a she-wolf suckled. This tradition, which recalls the story of Romulus and Remus, refers, like it, to totemistic customs, for a golden wolf head was the badge of Turkish warriors. The scanty Chinese accounts represent the Turks as a branch of the Aschin (Asona), Huns who, after their expulsion from China by the Wē dynasty, placed themselves under the protection of the Yen Yen, and were allotted (in 439) settlements by these on the southern slopes of the Altai. Few traces of Chinese civilization seem to have been retained by them; on the other hand, they appear to have acquired some culture from the Uigurians, to which fact the adoption of the Uigurian script points (see the inserted plate, "The Eighth Page of the Kudatku Bilik"). The feuds of the northern Uigurians with the Yen Yen offered to the Turks a welcome opportunity of further advances. At the first contest of the two peoples (in 490) the Turks made no movement, but when in the year 536 an Uigurian army marched eastward, and in so doing touched Turkish territory, the ruling chief of the Turks, Tu myn, attacked and conquered them, and incorporated into his people the whole tribe of fifty thousand Yurtes. The ease with which this amalgamation was effected betokens the close affinity which existed between the peoples on the boundless steppes of Central Asia. Tu myn was now in a position to defy the Yen Yen, whose power had long been tottering, and he did so after the prince of the Yen Yen had contemptuously rejected him as a suitor for the hand of one of his daughters. In the year 552 the overthrow of the empire of the Yen Yen was complete, and the Turks now assumed the headship of the Central Asiatic nomads, whose conditions on the whole were little altered by this change of rulers.

Since the traditional policy of aggression against China was rendered hopeless by the now firmly consolidated power of that State, the Turks turned toward the west, along the road which the Huns had pointed out to all succeeding peoples; even Uigurian armies had penetrated to the Volga in 463. The first success of the Turks was the subjugation of Sogdiana, where the descendants of the Yue tshi still maintained their supremacy, and an advance had been made toward the Tarim basin. By the year 437 nine States existed in Sogdiana which were ruled by princes of the dynasty of the Can wu (Yue tshi). The most important of them was

TRANSLATION

[VII. The Season of Bright Spring, the Praise  
of the Great Bokra.

- 36 who enters service stands at the gate,  
who stands at the gate stands and serves.
- 37 For such service the world has bestirred itself,  
the enemy has bowed his back and risen up.
- 38 The voice and glance of the Chakan penetrated  
the world. || with longing eye . . . he himself . . .
- 39 The world obtained rest, order was created,  
his name was uplifted with the law.
- 40 whoever would see the form of magnanimity,  
let him come and behold the countenance of  
the Chakan. [suffering,
- 41 Whoever would have joy and happiness without  
Let him look on him, his acts are pure joy.
- 42 If thou wouldst see one of gentle nature  
and noble heart, come, look on him.
- 43 Wouldst thou be profited, reveal thy whole  
secret, approach and serve with cheerful heart.
- 44 Oh, noble deed, sprung from noble stock,  
may the world honour unceasingly . . .
- 45 God has granted the wish, and given complete  
happiness, || thanks must be rendered him and  
his name praised for ever.
- 46 A very ancient saying lies in this proverb :  
"The father's name and place remain for the  
son."
- 47 The father's place remained with his name  
may his name remain among others a thousand  
and a thousand years.
- 48 A hundred thousand hands have carried away  
all possessions and dignity, || seek this dignity,  
the "happy knowledge."
- 49 Your dignity comes and goes away again,  
this my dignity remains for ever. [itory,
- 50 All that the world gives is delusive and tran-  
sient but the written word endures, so long as the  
world moves. [book,
- 51 This name of the Chakan was written in the  
this name has become everlasting and gives rich  
store of happiness. [doings,
- 52 Oh God! let happiness be perfected in his  
in every action be thou a support and help.
- 53 Keep his friend, banish his enemy,  
Fill him with confidence, bless him with joy.
- 54 Let the rain fall, let the flowers spring up.  
The parched trees shall shake their branches.
- 55 Fate revolves ever as it wills, || Let him succeed,  
and the head of the enemy is hollowed out.
- 56 Until the grey earth becomes red as copper  
or until green grass grows in the fire

VIII. On the Seven Stars (Planets) and the  
 Twelve Signs of the Zodiac.

1 With the name of God I have begun my speech,  
 Oh God, my creator, who doth destroy and  
 forgive.  
 2 He created at will all the worlds, | he made the  
 sun and the moon to shine in the world.  
 3 Behold! he created the ever circling heaven,  
 all things move, moving together with it.  
 4 He created the blue sky and all the stars,  
 he made the black night as bright as the day.  
 5 of the stars in the heaven some . . .  
 Some are the sentinels of these . . .  
 6 Some show the path to men who have lost  
 their way, # some are illumined by the creator.  
 7 one is higher, the other is beneath,  
 one is brighter, the other is dark.

The Kudatku Bilik ("the Blessing of Knowledge") is a system of moral philosophy in rhymed verses, which expounds the relation of the individual to the transitory world and to the inexorable destinies of fate. It deals with the duties of a prince toward his people, with the characteristics of the different official classes, and with the virtues which belong to an honest career and the vices which corrode society. It is a code of morals according to the old Turkish ideas. The work was composed in eighteen months by a certain Nusuf in the reign of Bokra (or Boghra) Khan, by whom he was rewarded with the title of Privy Vizier. The full name of the author, therefore, runs, Nusuf Khass Hadjib. The first half was composed in the most eastern part of East Turkestan (Khami?), the second in Kashgar. The work has been preserved for us in a copy made at Herat in the year of the Hegira, 843 (= 1440 A. D.), which thirty-six years later came to Tokat in Asia Minor and reached Constantinople in 1492 A. D. Thence it came into the possession of Baron Jos. von Hammer-Purgstall, from whom it passed to the Imperial Library at Vienna.

The Kudatku Bilik, the oldest linguistic monument and literary product of the Turkish nations, furnishes the first trustworthy information, not merely of the particular dialect, but of the whole life and habits of the Uigurians, one of the oldest tribes of the Turkish nationalities, who led a nomad existence in Eastern Turkestan (Hami, Turfan, and Karashar), between the Manchus in the east and the Parsees in the west. The Kudatku Bilik, dating from the year 462-463 of the Hegira (1068-1069 A. D.), mentions an independent Kashgar kingdom, where the above-mentioned Bokra Khan reigned, and a prince in the east. The Uigurians therefore composed several small separate States. The upper classes of the tribe were the Black People (the nobles) and the officials or servants. The population was made up of merchants, farmers, and cattle-breeders; there were also Scid, physicians, magicians, and astrologers. Among the government officials are mentioned the vizier, the general, the secretary, the ambassador, and the keeper of the gate. The public and private life was of a completely patriarchal character. The emphasis laid on the importance of science and learning is especially noteworthy.

Uigurian is the first dialect of Turkish which was reduced to writing, and has, therefore, retained the oldest forms and roots of the language. The alphabet is the Syro-Sabaean. It was not until the descendants of Genghis Khan professed Islam, and the learning of the western Mohammedans conquered Central Asia, that the old Uigurian characters, in which Emir Timur as late as 1379 issued proclamations on the banks of the Dnieper, had to give way to the newly adopted Arabian, and were driven back into the valleys of the Tienshan.

(Mostly from Hermann Vambéry, "Uigurische Sprachmonumente und das Kudatku Bilik." Innsbruck, 1870.)

Samarkand. In Tashkent, Ferghana, and Kharismia other dynasties occupied the thrones. The conquest of Sogdiana, the petty States of which, however, had hardly disappeared, gave the Turkish conquerors an interest in the Western trade, especially in the export of silk from Sogdiana, which was then hindered by the Persians, probably because in Persia itself the breeding of silkworms was a prevalent industry, and also because silk was obtained from China by the sea route. The attempt to win the desired object from the Persians by diplomacy led to a long series of hostile complications. The Turks then determined to enter into direct communication with the Byzantines, who must have been equally interested in breaking the Persian trading monopoly (569). A Turkish embassy arrived at Constantinople, in consequence of which Zimareh (Zemarkh) went to the capital of the Turkish Great Khan in the Altai with a commission from Justin II, the Byzantine emperor. We possess his detailed account of the journey and of the battles of the Turks against the "White Huns" and the Persians, at some of which he was present. We learn from him also that the west of the Tarim basin then fell into the power of the Turks. Later, the Byzantines also, in spite of their cautious policy, were hard pressed by the Turks, since with the period of the Turkish power generally a fresh flood of Central Asiatic tribes poured over Western Asia and Europe. The Khazars, who advanced in 626 to East Europe, were a detached fragment of the Turkish nation. As might be expected, attacks were made on China so soon as any opportunity presented itself.

(b) *The Eastern and Western Turks.*—China now adopted her successful policy of sowing seeds of dissension among the nomads. The Turkish Empire, like the earlier empires, split up into an eastern and a western province, which were governed by a viceroy, while the centre, both in peace and war, was under the command of the supreme ruler. The Chinese, about the year 600, succeeded in weakening permanently the power of the Turks by dividing the empire into an eastern and a western part.

In the year 630 the Chinese armies won a brilliant victory over the eastern Turks, in which the khan, Kin Li, was captured; thus Chinese influence was again extended to Sogdiana. The eastern empire then broke up into a number of weak and petty States; but part of the Turks migrated to China, where settlements were assigned to them in order that they might serve as a frontier guard against other nomad tribes. The people, which had not forgotten its old fame, became in Chinese territory once more so strong that in 681, under Qutluq (Ko to lo, Ku tut luk), it was able to shake off the Chinese rule and spread its influence over Mongolia. The power of the Turks grew still stronger under Me chun (Me tsu), the brother and successor of Qutluq, who skilfully availed himself of the disputes for the Chinese throne. Once more the Turkish Empire became a mighty power. Even the western Turks seem temporarily to have been subjugated, and the Turkish supremacy was re-established in Sogdiana, where the petty States of the Yue tshi still existed.

After Me chun's death, Kultegin, the commander of the army, a nephew of the dead man, murdered the lawful heir, his cousin, and placed his own brother Me ki lien on the throne. We have accurate accounts of these events from the inscriptions on the grave-pillars of Orkhon. The east Turkish Empire still kept its position as a formidable power. But its decline recommenced, and the end was

produced by a coalition of the Uigurians and Chinese in the year 745. From that date the Turks almost disappear from the history of Central Asia. The fall of the Turkish power was hastened by the advance of the Arabs, who in the meantime had conquered Persia and penetrated to Sogdiana, where some of the princes sought help from the Turks and fought with chequered success against their new oppressors. In 712 the Arabs won a brilliant victory over the allied Sogdians and Turks, the latter probably led by Kulteġin. In the year 730, however, they met with a severe defeat at Samarkand from the same antagonists. The necessity under which they lay of defending themselves on different sides certainly helped to effect the rapid fall of the east Turkish Empire.

The western Turks, soon after their separation from the east empire, had been forced to acknowledge a sort of suzerainty of Persia. In 620, however, they felt themselves strong enough to extend their empire (which must have lain between the Altai and the Sea of Aral), and to invade Persia and Sogdiana. Turkish mercenaries or allies played a momentous part in the contests for the Persian throne at that time. All the conquered territory, indeed, was very loosely united, as is invariably the case with nomad empires, and when occasion offered it was the more easily broken up again, since the nomad is never so closely attached to his country as the agriculturist. Instances occur where entire nations crossed the steppes of Central Asia in their fullest extent, in order to escape the yoke of a hated conqueror and to seek protection perhaps on the Chinese frontier. The western Turks then had command of the northern trade routes of Central Asia so far as they passed through the Uigurian country. Since the Chinese thereupon favoured the southern roads through the Tarim basin, Turks and Uigurians combined and invaded the petty States of that district, attacked Hami, which was occupied by the Chinese, and thus compelled China to act on the defensive (639). These disorders lasted for a long time, but finally ended in favour of the Chinese. Soon afterward the advance of the Arabs through Persia was felt by the western Turks, while the Chinese armies pressed on threateningly from the east. The result was the almost complete fall of the power of the western Turks, and their inheritance passed for a short period to the Tibetans, who had become powerful in the interval. It was not until the year 700 that the empire revived, only to find itself soon entangled in bitter wars with the Arabs. It was almost more shattered by remarkable factions at the court and within the tribal federation, the true cause of which, whether ethnic, social, or political, cannot be discovered. There was a black and a yellow party, which often fought furiously together and put forward their own candidates whenever the succession to the throne was disputed. The complete overthrow of the empire was effected in 760 by the Qarluk (Ko lo lu), a tribe of the Turco-Mongolian race living to the west of the Altai range. The remnants appear in later history as Ghuzes (Oghuz). We have already seen in Vol. III how the Turkish tribes, which conformed to Islam, such as the Seljuks and later the Osmons, found a field for their warlike activity in West Asia.

(c) *The Kirghiz and the Khitan.*— In Central Asia the place of the Turks as the dominant people was taken by the nomad Uigurians, who were then called Hoi he (Goei he, Shui she). Their chief opponents were the Kirghiz (Hakas) in southwestern Siberia, who now for the first time came forward as a powerful people and tried to enter into direct relations with China. In alliance with the

Chinese they shattered the Uigurian supremacy in the year 830. The question at issue seems once more to have been the command of the trading communications with the west. The Kirghiz then appeared as the connecting agents, who conducted with armed escorts Arabian caravans to China through the hostile Uigurian territory. The Kirghiz never founded an empire of equal extent with that of the Huns or Turks. The Uigurian empire was always restricted to a limited area (cf. the explanation of the plate, p. 158).

Later, in the tenth and eleventh centuries, the nation of the Khitan (Chitan), which was mainly of Tungusian stock, extended its rule from Manchuria over a large part of the steppes of Central Asia, until the Mongols founded a new world-empire in that region.

## II. TIBET

TIBET for a long period was little affected by the enormous revolutions that convulsed Central Asia, and in any case it was only its frontier that felt them. These frontier tribes of Tibet were formerly further removed from the centre. On the south the Himalayas always formed a strong barrier, but to the north Tibetans were settled as far as the Tarim basin, and even a great part of Southeastern China was filled with Tibetan tribes, which were only gradually absorbed by the Chinese population. Tibet proper lay completely off the main track. The roads of trade and culture did not traverse the country; nor did the desolate plateau, scorched by intolerable summer heats and lashed by winter snowstorms, allure the neighbouring nomads to daring raids, which might at least have interrupted the stereotyped monotony of existence, and thus created movement and life. The achievements of civilization were slow in permeating to this region, and it was long before the seeds of progress sprang up from the barren ground.

Originally all Tibetan peoples must have lived that life of mere hunters which appears to be the lowest grade of human existence. Tibet, in spite of its desolation, was adapted for this mode of life. However poor it might be in edible wild plants, it teemed with beasts of the chase, which even now cover the country in immense herds. The old agricultural life, which originated with the brachycephalic race, was only followed in the advanced posts of the Tibetan people, which were settled in the Tarim basin on the trading route, and found in the oases suitable tracts of country at their disposal. The reason why they did not spread further toward Tibet is mainly due to the fact that the only districts at all adapted for agriculture lay far to the south, in the upper valleys of the Brahmaputra and the Indus. Any germs of culture that developed in these southern tracts were brought from India, and naturally not until the Aryan inhabitants of India had created a civilization of their own. This circumstance thus helps to explain the slow advance of civilization in Tibet as well as the enormous influence of India on what was once purely a Central Asiatic region.

What the inhabitants of Northern and Central Tibet derived from Central Asia was not the old agricultural life, but the newer social economy of the nomad tribes. It must remain a moot point whether Tibetans were in this matter mere recipients, or whether by the domestication of the yak they did not greatly add to the number of useful animals. The wild yak is spread so far to the north that a tribe of Turco-Mongolian or even Aryan race may have made the first attempts at breeding them. In any case the wagon was hardly known in Tibet as a means of transport, but

animals, and especially the yak, were exclusively used to carry burdens. The introduction of nomadic habits gave the Tibetans, especially those of the north, a greater mobility, allowed an increase of population, and gradually taught them the warlike marauding life peculiar to all nomads. It would seem that the bow also, which is not the national weapon in Tibet, was introduced from the north.

(a) *Prehistoric Age of Tibet.* — The Tibetan tribes may have waged little wars on each other, and also on the nomad peoples of Mongolian race living to the north, but no historically important struggles took place until the growing power of Tibet sought its booty among the settled nations. The roads to the south and west were completely barred, but, in compensation, the great commercial route on the north, with its trading stations and oases, was exposed to attack, and on the northeast the riches of China itself presented a goal for profitable raids. In Mongolia the mighty empire of the Huns had already been formed out of small tribes, which combined for such marauding expeditions. In Tibet, where the conditions were far less favourable, the political unification of the separate hordes began far later and was less successful. Occasionally, indeed, some frontier tribes had an opportunity of interfering in the internal affairs of China. A doubtful account states that Tibetan auxiliaries appeared in the Chinese service in 1123 B. C., but no large empire appears to have been formed until the advent of Buddhism, which with its proselytising power levelled the barriers between rival tribes, first stimulated national union.

The Tibetan history, the "Book of the Kings," which only appeared comparatively late under the influence of Chinese models, contains a legendary account of the prehistoric period, which naturally is untrustworthy in its details, but proves from what sources the Tibetans themselves derived their civilization. According to it there appeared, in the first century B. C., in the country to the south of the modern Lhasa, a marvellously endowed child, whom the wild natives soon regarded as their heaven-sent leader. This child, an invention clearly on the model of the infant Dalai-Lamas of a later age, was a direct descendant of Buddha. He founded a kingdom, the subjects of which were gradually raised by his successors to higher grades of culture, precisely in the way in which Chinese prehistory traces the progress of civilization. Under the seventh monarch, in the second century A. D., smelting, the use of the plough, and irrigation were discovered. In the fifth century the fields were enclosed, articles of clothing were made from leather, and walnut-trees were planted. Soon afterward the yak was crossed with the ox, and mules were bred, etc. Although the legend does not acknowledge any direct introduction of Indian civilization into Tibet, still the fact that the centre of culture lay in the vicinity of the Indian frontier, and that the genealogy of the royal house was traced from Buddha, points unmistakably to this source. The widening dissemination of Buddhist doctrine in India (cf. Section IV of this volume) had fired a missionary zeal there, which brought the new faith, and in its train a higher civilization, over the dreaded barrier of the Himalayan snows. From the West, also, where the Buddhist doctrine spread as far as the Tarim basin, Tibet felt this same influence, and when the new faith struck root even in China, Tibet as the connecting link between China and Central Asia on the one side, and India on the other, suddenly acquired a new importance; and finally, after the decay of Buddhism in the Indian mother-country, Tibet became the peculiar home and sanctuary of the northern worshippers of Buddha.

While in Southern Tibet a small civilized State gradually developed, which depended for its power and prosperity on agriculture, the northern nomads had also begun to organise themselves, and in so doing may have been influenced by the example of the neighbouring Chinese constitution, and of the nomad kingdoms in Central Asia. The northeastern tribes of Tibet, called by the Chinese Ti (Tufan), played, in the first century after the Christian era, on a small scale the rôle of the Central Asiatics, since they figured at one time as enemies, at another as allies, of the Chinese kingdoms and their claimants. Tibetan chieftains even appear as rulers of small Chinese States in the same way as Hun and Turkish princes usurped the thrones of isolated kingdoms. The Khiang, who lived to the southeast of the Tarim basin and menaced trade communications with the west, were another branch of the Tibetan race.

(b) *The Empire of Tibet.* — No real empire was established until, in the course of the sixth century B. C., the civilized State in the south brought the northern nomads also under its influence. A power was created which had a large share in the further political development of Central Asia. Almost impregnable in its own country, it held a menacing position on the southwest frontier of China and on the trade routes which crossed the Tarim basin. The shifting fortunes of the Turkish empires offered ample opportunities of interference.

The empire of Tibet first aroused the attention of the Chinese in the year 589. With what deliberate purpose the Tibetan rulers endeavoured to advance their civilization by Indian influence is shown by the embassy to India in 632, which resulted in a more accurate knowledge of the Buddhist religion and in the invention of a script formed after the Indian model. Even then Lhasa was the capital of the empire and the focus of religious life. The relations of the new empire with China were friendly at first; but very soon the pretext for war was given by an incident of a kind not unusual in the history of Central Asiatic kingdoms: the request of the Tibetan monarch for the hand of a Chinese princess was insultingly refused. Since, however, the king obtained his wish in the end, the campaign cannot have resulted so favourably for the Chinese as their historians would have us believe. But the Tibetan preferred to turn his arms for the future against the Tarim basin, where there was a state of anarchy which offered greater prospects of successful conquest; and by the year 680 the power of Tibet extended as far as the Tian shan. A combined attack of the Chinese and Turks in 692 had indeed the momentary effect of driving back the Tibetans; but they returned to the attack, and pressed on in 715 as far as Ferghana, after they had concluded an alliance with the Arabs. During the whole of the eighth century Tibet remained the foremost power in the south of Central Asia, and a formidable enemy of China, the capital of which was actually stormed and plundered by the Tibetans in the year 763. It was not until 820 that a permanent peace was concluded between Tibet and China, and a pillar with an inscription was erected in Lhasa to commemorate the event.

(c) *The Fall of the Tibetan Empire.* — In the course of the ninth century the power of Tibet rapidly diminished. The Uigurians seized the borderland on the north, and Hsia successfully took over the duty of guarding the frontier against the decaying empire of Tibet. This kingdom (more accurately Hsi Hsia, Western

Hsia; cf. p. 92) had been formed in 884, at the time of the Tang dynasty, on the upper course of the Hoangho. The royal house was descended from the Toba dynasty of Pei Wē, which had been destroyed in North China in 557; but Tangutes, that is to say, near kinsmen of the Tibetans, formed the picked warriors of the people. In 1032 the State made itself completely independent of the northern Sung dynasty which ruled in Southern China and subsequently maintained its position, since it allied itself at one time with the Sung, at another with the Khitan, and later with the Kin, who were supreme in Northern China. The independent position of the country was outwardly demonstrated (and this is a feature which frequently recurs in Central Asia) by the invention of a new script, which was mainly based on the ancient Chinese signs. We have only brief records of the wars of the Hsia kingdom. An invasion of the Tibetans in 1076 ended in a precipitate retreat, the result, it is said, of a superstitious panic which seized the army. In 1227 the Hsia kingdom was annihilated by the Mongols (cf. below, p. 173).

The fall of the political power of Tibet must be ultimately traced to the fact that Buddhism then permeated the country, crippled the secular power, and effected a thorough spiritual revolution in the minds of the people. Buddhism soon assumed a peculiar character in that isolated country. The priests of Tibet showed little appreciation of the more subtle theological and philosophical disputes and doctrines of their Indian or Chinese co-religionists. But all the more important was the influence of the originally Shamanistic national religion, which exalted the Buddhist clergy and monks into magicians and ascribed to them all the various arts of a degraded mysticism. This is the explanation of the commanding position which the Buddhist priesthood was able to acquire in Tibet, and of the chaos of superstitious ideas which gradually spread thence over Central Asia.

After the end of the ninth century Tibet led a quiet existence, which in no respect excited the attention of its neighbours. In the year 1015 alone an armed quarrel with China caused a short interruption of this tranquillity. Relations with China had again slightly improved the culture of the country. After the entry of the Chinese princess mentioned on page 163, the knowledge had been acquired of making wine from rice or barley, of erecting water mills, and weaving stuffs. Chinese artisans also had come into the country, and the sons of the best families were frequently sent to China to be educated. Tibetan civilization, which had been at first entirely subject to Indian influence, took more and more a Chinese stamp, until finally the storm of the Mongols swept over Tibet, and brought the country into a still closer political union with China.

#### I. THE STATE OF CIVILIZATION AND RELIGION IN CENTRAL ASIA DOWN TO THE TIME OF THE MONGOLS

THE example of Tibet shows how closely the progress of civilization is connected with religious propaganda, and how the wish to spread their own peculiar creed can be the chief cause why members of a more highly civilized people venture to be the apostles of culture in the most remote and most uninviting regions of the world. But this is not a unique phenomenon in Central Asia. However greatly the trade between East and West promoted the civilization of Central

Asia, it cannot be disputed that the most strenuous work in the cause of culture was done by those who, as preachers of the different world religions, penetrated into the heart of Asia, or marched toward the east on the great commercial roads. Religious zeal alone created that endurance and self-denial which all must possess who attempt to sow in backward nations the seeds of a higher culture and of nobler modes of life. It is an important fact that among the civilized countries which border upon Central Asia China alone produced no world religion, properly so called, and sent out no missionaries apart from Buddhists. In consequence of this, the Chinese never succeeded in firmly attaching the Central Asiatics to themselves until they finally found in their encouragement of the Buddhist teaching a substitute which did them inestimable service in taming the wild nomad hordes.

The original "religion" of the Central Asiatics was doubtless that simple mysticism which under various forms is to be found in all primitive peoples. The chief duties of the wizard priests, who are revered as possessors of mystic powers, consist in averting evil influences and in healing diseases. That belief in one supreme divinity, which is usually found in such cases, has only a subordinate significance and has little influence on the spiritual life. The characteristic form of lower mysticism among the Northern and Central Asiatics is Shamanism. The shaman, or sorcerer, works himself up to a frenzy by beating a drum or by other similar methods, and then enters into communication with the spirit world, about the nature of which very different ideas, partly influenced by the civilized religions, prevail among the various nations. Even where a higher form of religion has already penetrated, Shamanism usually remains for a long time as a popular national custom; in fact, it stamps a peculiar local character on these religions. In the eyes of the nomads of Central Asia, all priests were a kind of shamans, from whom cures, prophecies, and miracles might be expected. This led to perverted forms of the original religious doctrines, from which neither Buddhists nor Nestorians were exempt.

Every higher form of religion is based on written records and has its sacred books. It thus follows that writing, the first great step toward culture, spreads most quickly in the train of a religious propaganda. Art also follows in the steps of religion. Images of deities and saints, or temples erected in their honour, form part of the indispensable equipment of the missionaries, and announce the victory of the new doctrine (see the illustration, "The Gate of Kiu-yung Kuan," p. 168). It is thus conceivable that the position of Central Asia between important spheres of civilization and foci of religious doctrines must certainly have led to a marvellous mixture of influences, amongst which the original racial characteristics were still discernible. We must not forget in this connection that the oases of Central Asia were themselves the sites of an ancient civilization, but that this civilization after the irruption of warlike nomad peoples rested on so narrow a foundation that it could not have made any continuous progress without the stimulating example of other civilizations. The blending of religions and civilizations was accelerated by the fact that rival doctrines did not make their appearances successively, but that the majority of them began to strike root in Central Asia side by side during the centuries preceding and following the Christian era. Buddhism appeared the earliest on the scene, and also exercised the greatest influence on Central Asia. Zoroastrian sun-worship was not vigorously disseminated until 250 A. D., when under the Sassanids its priests were stimulated to under-

take the work of missionaries by the renaissance of Iranian life and thought (Vol. III, p. 283); but concurrently Christianity began to enlist supporters (Vol. IV, p. 212). Neither of these religions was completely victorious until finally Islam gained the supremacy in one part of that region, while Buddhism, disseminated from Tibet, held the field in the east. The earlier Buddhism of Eastern Turkestan, which was directly connected with India, entirely disappeared.

We are tolerably well informed from literary sources as to the religious conditions of Central Asia. Our knowledge has been widened by recent archaeological investigations in Central Asia, which have yielded a rich harvest of results, notably in the Tarim basin, and give us a vivid idea of the influence exercised by the various civilizations and doctrines. The British excavations in the western valley of the Tarim have brought to light, in addition to Indo-Buddhist, Chinese, and Persian antiquities and inscriptions, rude copper images, which probably served Shamanistic purposes, and may have come from the old civilized province of the Altai, where Shamanism still exists even at the present day.

(a) *Buddhism in Central Asia.* — The importance of Buddhism for the west of Central Asia was chiefly felt before the Mongol period. The activity of Buddhist missionaries outside the confines of India could not be vigorously exerted until the new religion had taken firm root in its native country. The period of the great Asoka (263–226 B. C.; cf. Section IV of this volume) marks both the victory of Buddhism in Northern India and the extension of the political and religious influences toward the northwest. Kashmir, the bridge to Central Asia, recognised the suzerainty of Asoka. Even if Buddhism was unable to gain a firm footing there, and was driven to wage frequent struggles with remnants of the old native snake-worship and a repressed Brahmanism, still access had been obtained to the civilized oases of the Tarim basin, where the new religion quickly found ready acceptance.

In external this Buddhism was, it must be admitted, no result of purely Indian culture. In the first place, the Iranians had encroached upon India and left traces of their nationality on the manners and customs of the people; but after the age of Alexander the Great an offshoot of Hellenistic civilization existed in Bactria, which exercised an effective influence on art and culture both in the Tarim basin and in Northwestern India. Where the missionary zeal of Buddhism appeared at this time, it was accompanied and permeated by the elements of Greek art. This Græco-Buddhist art and culture of Northwest India found a new home in the Tarim basin. Here, too, the difference between the more ancient western form of Buddhism and the more modern eastern form, which took its shape in Tibet, is clearly defined. Generally speaking, Indians of pure race preached the new faith, and their labours led naturally enough to a wide diffusion of the Indian language; since a knowledge of Sanscrit was necessary for the comprehension of the sacred books. A large non-religious immigration also probably took place.

The influence of India apparently first made itself felt in Khotan, where a son of Asoka is said to have founded a dynasty. Khotan, owing to its geographical position, has generally formed the connecting link between Central Asia and India, and shows in its civilization abundant traces of Indian influences. A large number of Buddhist shrines and monasteries were to be found in Khotan. The densely populated oasis, helped by its religious importance, repeatedly obtained great power,

although it could not permanently keep it, since, as the key to the trade route from India and the southern road from the West to the East, it appeared a valuable prize to all conquering tribes of Central Asia. From Khotan Buddhism spread farther over the Tarim basin and its northern boundary. The clearest proof of this is found in the numerous cave temples constructed on the Indian model, as well as in the products of Graeco-Buddhist art, which modern explorations have brought to light, especially in the western part of Eastern Turkestan. It was certainly the settled portions of the nation, which were steeped in the ancient civilization, that most eagerly adopted this higher form of religion. The nomads were less satisfied with it. The counsellor of a Turkish prince candidly stated his opinion that neither the building of towns nor of Buddhist temples was advantageous to the nomads, since it was opposed to their traditional mode of life and would break their spirit. This opinion was justified, for in reality it was Buddhism which, thanks to the crafty support of the Chinese, finally destroyed the savage bravery of the Central Asiatics.

(b) *Zoroastrianism in Central Asia.* — The second great religion, Zoroastrianism, had naturally its chief sphere of expansion in Western Turkestan, which repeatedly stood completely under Iranian influence. Following the line of the trade routes, which were chiefly frequented by Persian merchants, it forced its way farther to the East, without being able to win for itself there any considerable position as compared with Buddhism. Zoroastrianism spread also among the western nomads, especially the Scythians of Iranian stock, and left some remarkable traces behind. The ancient Slavonic mythology, with its contrast between deities of light and deities of darkness, seems to have been influenced by the Iranian sun-worship; so, too, were the ideas of the heathen Turkish tribes on the Altai, according to which the human race held the middle place between the powers of light and of darkness. Among several nations, such as the Uigurians, Buddhism and Zoroastrianism for a time counterbalanced each other. We cannot now decide whether their domestic dissensions, which were numerous and important especially among the Turks, had also a religious tinge.

(c) *Christianity in Central Asia.* — Even before the Iranian sun-worship acquired fresh powers of winning adherents at the beginning of the Sassanid period, the missionaries of Christianity had already traversed Iran and set foot in Central Asia. The revival of Zoroastrianism must partly be regarded as a reaction against the irresistible advance of Christianity, so unacceptable to the true Iranians. It was not indeed the great united Christian Church that broke down the Iranian barriers by her emissaries, but a branch separated from the parent stem, that of the Nestorians (cf. Vol. IV, p. 211). The latter planted the seeds of Western civilization far away toward the East, but in their isolation they soon became degenerate, since they were thrown upon their own resources and were unable to keep up any constant communications with the West.

The Nestorian Church, nevertheless, attained for a time to great prosperity. At the commencement of the Mongol period, when the Western Church began to concern herself about her estranged sister in the East, it did not appear hopeless to think of converting the Mongol rulers, and thus to assure the victory of Christianity over its rivals, of whom Islam had long been the most dangerous. There were

Christian communities and even small States with Christian princes in China after the seventh century. Here lay originally the half-legendary realm of Prester John, the discovery of which was one of the motives for the Portuguese explorations, until it was thought to have been rediscovered in Abyssinia. Besides the Nestorians, missionaries of the Manichæans (see Vol. III, p. 284) found their way to China about the year 1000.

(d) *Islam in Central Asia.*—The prospects of the older forms of religion in western Central Asia were completely, even if not immediately, destroyed by the advance of Islam. It was its appearance late on the scene, full of fresh ideals, that secured it the victory over the other faiths which were honeycombed by Shamanist influences and had degenerated in their isolation. In the decisive contest for the conversion of the Mongolian chieftains, which secured spiritual supremacy for the successful religion, Islam was finally victorious in the West. The struggle nevertheless lasted for centuries. At the beginning of the eighth century the Arabs had already become lords of western Central Asia, and had then advanced on their victorious career to the Tarim basin. Khotan, the chief seat of the Buddhists, had resisted attacks for twenty-five years. Among the inhabitants of Eastern Turkestan the traditions of these religious wars found a concrete expression in the legendary hero Ordan Padjah, whose marvellous deeds are supposed to have decided the victory of Islam. The new doctrine did not triumph until, in the tenth century, Satuk, the Turkish ruler of Kashgar (cf. the explanation of the plate, p. 158), adopted it, and conquered a large part of the Tarim basin and even of Western Turkestan. After his death in 1037 the power of the new empire rapidly diminished. Religious differences gradually acquired a certain ethnic importance, even for the nomad tribes of Central Asia. The Turco-Tartar branch now comprised mainly the Central Asiatics won over for Islam, the Mongolian branch contained the adherents of the Buddhist creed, while originally both branches were quite closely related, or, more correctly speaking, were of common origin and only partially altered by admixture of foreign blood. Among the Uigurians in particular Islam found at a comparatively early period numerous believers, by the side of whom, however, the representatives of other religions long maintained their position.

The mixture of religions, to which, in the West, Hellenic mythology may have slightly contributed, corresponded to the mixture of civilizations, which found its most permanent expression in the native script and styles of art. Modern excavations in Turkestan have furnished more exact information on the point, especially as to the existence of a style which has grown up out of Indian, Greek, and Persian influences.

If this mixed style betrays the effort made to rise from mere imitation of foreign forms to a certain individuality, this tendency appears still more clearly in the fact that Central Asia produced, in addition to foreign methods of writing, a large number of peculiar scripts, which were naturally suggested by already existing models, but nevertheless possess distinctive features of their own (cf. the explanatory note to the illustration, "The Gate of Kiu-yung Kuan"). The Chinese script seems least of all to have served as a model, since its defects, as contrasted with the syllabic and alphabetic scripts of the other civilized nations, were too

## EXPLANATION OF ACCOMPANYING ILLUSTRATION

The gate of Kiu-yung kwan (Chu yung kuan) stands on the road which leads from Peking in a northwesterly direction to Kalgan and the Great Wall, in the pass of Nan kau between Chang ping and Hwai-lai-hsien, and forms part of the outer wall. This gate is celebrated both for the richness of its decorations, as shown in the accompanying illustration, and for the two long inscriptions on the two perpendicular inside walls of the archway, which rivet the attention of linguists. These inscriptions date from the year 1345 A. D. They are composed in six languages, Sanscrit, Tibetan, Mongolian in the 'Phags pa character, Uigurian Turkish, Chinese, and a language as yet unknown, which is only preserved in this instance. Wylie, who was the first to attempt the deciphering of this interesting series of inscriptions (1870), thought that the mysterious dialect was the *yu chen* or *niu tshé* of the Kin dynasty (Su chi); G. Devéria, on the other hand, supported the view that it was the character of the Tangute tribe, which founded the kingdom of Hsi Hsia (Sia hja) on the upper Yellow River, between N. lat. 34° and 42°. The two inscriptions, in large letters, are abbreviated versions of two mystic prayers (*dhāraṇī*), on the east wall from the *Sarva-durgatī-paricodhana-usūṣā-dhāraṇī*, and on the west wall from the *Samanta-mukha-praveṣa-raṅgā-vimalosūśa-prabhā-sarva-tathāgata-hṛdaya-samā-virocana dhāraṇī*. The Chinese and Mongolian text (in the 'Phags pa lama character) has been translated by Edouard Chavannes, the Tibetan by Sylvain Lévy, the Uigurian by W. Radloff (1894), and Georg Hirth (1895) has carefully re-examined the Mongolian text and translated it into French ("Journal Asiatique").

Our illustration shows the gate, seen from the west, which was restored in 1445 by Lin P'ou hien, but has since fallen once more into decay. At the top we see Garūda above two Nāgas with the tails of snakes. On the lower side to the left, shaded by the tree, is a bas-relief, — an elephant, mounted by a fantastic form, on whom a small human figure is seated. The narrow strip of ornamentation to the left is a chain of vajras. On the inside of the vaulting, which is not shown in the picture, on the triangular ceiling, a Buddha is seated in each of the inscribed compartments. On the perpendicular walls there are the two great inscriptions between four Mahārājas (Dhrtaras-tra, playing on a mandolin and companions) as guardians of the gate.

(From a copy in the possession of the editor of the "Documents de l'époque mongole des XIII<sup>e</sup> et XIV<sup>e</sup> siècles," by Prince Roland Bonaparte. Paris, 1895. Privately printed.)

THE GATE OF KIU-YUNG KWAN

(Drawn by Franz Etzold after *Prin<sup>ce</sup> Roland Bonaparte*, "Documents de l'époque mongole des XIII<sup>e</sup> et XIV<sup>e</sup> siècles." Paris, 1895.)

vividly prominent. The influence of the Indian scripts was greater, especially in the Tarim basin. On the other hand, the Persian Pehlevi script had been adopted by the Uigurians, probably through the medium of the Yue tshi, and the Turkish tribes in their turn learnt it from them. After that, through the influence of the Nestorian missionaries, the use of the Syrian script was extended, and this soon served as a model for new native systems (see illustration, p. 158). The Mongols and the Manchus used varieties of the same script. The number of foreign and native scripts in Central Asia during the eighth and ninth centuries seems, as numerous discoveries prove, to have been unusually large. This circumstance leads us to infer a certain incoherency in the prevailing civilization. The characteristics of the Central Asiatic culture, which was local and at the same time most susceptible to foreign influences, are also clearly shown in this.

### 3. CENTRAL ASIA FROM THE MONGOL PERIOD TO MODERN TIMES

#### A. GENGHIS KHAN

THE efforts of civilization and religion to tame the barbarous people of Central Asia had been continued for many centuries. Temples of Buddha, Zoroastrian seats of culture, Christian churches, and Moslem mosques arose in the oases; industries flourished, trade brought foreign merchants into the country, and those who aimed at a refinement of manners and customs and a nobler standard of life were amply provided with brilliant models. Of the nomads a less favourable account must be given; and yet in many of them the higher forms of religion had struck root. Skilled writers were to be found among them, and the allurements of civilized life made considerable impression. The road which was destined to lead these tribes out of their ancient barbarism had been already often trodden; the forces of civilization seemed pressing on victoriously in every direction. The nomad spirit then once more rallied itself to strike a blow more formidable than any which had previously fallen. The effort was successful, and as the result of it a region once prosperous and progressive lay for generations at the mercy of races whose guiding instincts were the joy of battle and the lust of pillage. The world glowed with a blood-red light in the Mongol age. Twice, first under Genghis Khan and his immediate successors, and secondly under Timur, the hordes of horsemen burst over the civilized countries of Asia and Europe; twice they swept on like a storm-cloud, as if they wished to crush every country and convert it into pasture for their flocks. And so thoroughly was the work of ravage and murder done, that to the present day desolate tracts show the traces of their destructive fury. These were the last great eruptions of the Central Asiatic volcano. Civilization conquered, and the hordes of the wide steppes were no longer a danger at which it needed to tremble.

That which now struck at the civilized world was once more the full power of the nomads of Central Asia welded together for a time by a master spirit. The new people which suddenly appeared on the scene, and, although hardly known or noticed before, now advanced with gigantic armies, in reality dealt only the first blow, and represented the vanguard of hosts which grew larger and larger, like an avalanche. The vanguard gave its name to the hosts who followed and rekindled

in them the wild enthusiasm for war, which had died away, owing to the intercourse with civilization. But the personality of some individual is always of paramount value. The man who feels himself born to rule, and is not prematurely torn from his heroic path by a harsh fate, may belong to the smallest, most despised, horde, but he will always end as leader of a great people. The tribes of Central Asia, with their different names but their practically identical manners and customs, are easily moulded by the iron hand of a ruler into a gigantic national power. The empires of the steppes do not indeed enjoy a long life, for so soon as the pressure is relaxed, the enormous fabric breaks up again. Then once more in the different regions separate nations and empires are formed from the chaotic confusion of the tribes and men of Central Asia.

(a) *The Beginnings of the Mongols.* — The Mongols play so small a part in the earlier history of Central Asia that we may fairly doubt whether in their case we are dealing with a race whose roots stretch far back into the past. The original home of the Mongols lay, so far as can be ascertained, on the northern edge of the Central Asiatic steppe, in the region of Lake Baikal. Now it was this same northern edge which was the scene of the most important nomad States, and was the true home of the conquering pastoral peoples. It was there that the Huns held their own until the last, and the centre of the Turkish power lay there. The nomad population of that region was mainly due to the disruption of the older nationalities, and contained remnants of all earlier inhabitants. The Mongols in particular rose from the remains of the Turkish people, which again was a mixture of Hun and other stocks. It was no mere accident that this people rekindled the ancient nomad love of war and rapine. In their remote homes they had been the least softened by civilization or tamed by religious influence, and they had most loyally preserved their warlike traditions. The longing for plunder and sovereignty over countless nations had been transmitted to these rude nomads by a long line of vigorous ancestors. Even the legends of the origin of the Mongolian dynasty, whether it be traced from a sun-god or from a wolf, are only echoes of earlier traditions.

The Mongolian horde had begun to make a name for itself in Central Asia at the commencement of the twelfth century. The conditions of that period were favourable for its rise, as there was no great power in Central Asia at the time. The Kin, or Nu chi, who in 1125 had conquered and dislodged the Khitan (Chitan, Liao), were the most powerful in the eastern parts of the country; both peoples were of Tungusian stock, and a part of North China recognised their suzerainty. The Mongols seem to have been tributary to the Nu chi. In the west the power of the Hakas had greatly weakened; the Uigurians and some Tartar hordes, such as the partially Christianised Kerait (Vol. IV, p. 213), led an independent life. Yesukai (Yissugây), the father of Genghis Khan, first brought a number of nomad tribes under his rule, and thus aroused the distrust of the Nu chi, who in 1135, and again in 1147, made futile efforts to nip in the bud the growing world-power.

(b) *Genghis Khan (Temujin).* — Little is known of the other exploits of Yesukai. His empire seemed ready to collapse as quickly as it had arisen. On Yesukai's death (1175) his son Temujin (in Chinese, Tié mu chên) was only twenty, or according to some accounts, twelve, years old. This was a sufficient

reason why the subjugated hordes revolted from him, so that the new ruler, who was under his mother's guardianship, had scarcely more left him than the original parent tribe. But an iron will animated the youth. He rallied his adherents and fought with Ong khan (Wang), the rival ruler chosen by the other hordes, a battle which at once put an end to any further spreading of the revolt, while a year later he won a brilliant victory over the insurgents, who renewed their attack. He thoroughly vindicated his power as a monarch by the barbarous punishment of the rebel leaders. Some tribes now sought the friendship of the conqueror, others plotted against him or openly attacked him, but, in the midst of unceasing wars, the power of Temujin steadily increased. He defeated the Naiman, the Kerait, who were at first his allies, and other tribes, in a series of campaigns, until in the year 1206 he was able to hold on the banks of the Onon (a tributary of the Amur) a great review and council, at which he saw the greater part of the nomad fighting strength collected round him. Here, at the wish of his followers, he assumed the name of Genghis Khan ("perfect warrior;" in Chinese, Ch'êng chi sze). It now seemed time to adopt a bolder policy and to carry his victorious arms into the adjoining civilized countries.

A pretext for further wars was afforded by the machinations of the Naiman prince Kushlek (Gutshluk, K'u ch'u lu), who had dealt the deathblow to the empire of the Kara Khitai in 1201; he was compelled to fly for refuge to the Nu chi. The Kirghiz, and after them the Uigurians (1209), voluntarily submitted in the meantime. The war with the Nu chi, after some unimportant skirmishes, broke out in the year 1211, and in it the Khitan, who had been subjugated by the Nu chi, lent valuable aid to the Mongols. Genghis Khan's chief object was to gain possession of Northern China, the best part of the Nu chi Empire. Hsuan Tsung, the emperor of the Nu chi, finally fled to the south, and was thus entirely cut off from his northern resources (1214). Yen King, the capital which roughly corresponds to the present Peking, now fell into the hands of the Mongols; but the war only ended in 1234 with the overthrow of the Kin dynasty, seven years after the death of Genghis Khan (p. 95). It was fortunate for the Nu chi that they could place in the field against the Mongols the forces of half China and could fall back on the strongly fortified Chinese towns. The Mongols learnt gradually in the school of necessity the art of laying siege, in which later they were destined to perform great feats at the cost of the civilized peoples who were hard pressed by them. The employment of gunpowder in siege warfare was already familiar to the Chinese, who could teach many other lessons in this branch of warfare, where scientific knowledge was more important than impetuous valour.

During the wars between the Mongols and the Nu chi, the Khan Kushlek had journeyed to Turkestan, had formed an alliance there with Qutb (Alâ) ed-dîr Mohammed, the sultan of the Kharismians, and was on the point of building an empire in western Central Asia with his help. The interference of the Kharismians on behalf of Kushlek may partly be attributed to trade jealousy. Genghis Khan had certainly tried to bring the trade over the northern roads, but encountered the distinct opposition of the rulers of Turkestan, of whom the most powerful was the sultan of Kharismia (Chwarizm). Mohammed, who was master of Kashgar, and therefore of the southern roads, had ordered the envoys of Genghis Khan, who wished to conclude a sort of commercial treaty, to be put to death on the spot. The prince of Turkestan could not but have been aware of his power. It

seemed as if the Kharismians would be the successors of the enfeebled Seljuks in their dominion over Western Asia and in their protectorate over the khalifs of Bagdad (Vol. III, p. 363). As always happens in such cases, a considerable part of the Kharismian power rested on the wealth which they derived from the possession of the Central Asiatic and Indian trade roads.

But now this power, and all the covetous dreams which were connected with it, received an overwhelming shock by the onslaught of the Mongols. First of all, Kushlek, who had raised a considerable army, was completely defeated and slain during the rout (1218). The Mongolian forces then swept on against Kharismia, which at that time comprised a great portion of Turkestan and Persia, besides the modern Khiva. Bokhara, the garrison of which offered only a feeble resistance was plundered and burnt; Otrâra, on the middle Syr-Daria, the proper border fortress facing Central Asia, held out longer, but finally fell into the hands of Genghis Khan, as did Khojend, Uzgent, and other fortified towns (see map, p. 123). The main army turned toward Samarkand, which soon surrendered, but had to pay for the sins of its ruler by a terrible massacre. The resistance of the sultan Mohammed was now broken; he did not venture on a battle in the open field, but fled in Persia from town to town, continually pursued by the Mongolian troops, only to die at last in misery on an island of the Caspian Sea. The greater part of Persia submitted to the Mongols (1220). A counter-blow which Mohammed's son, Jelal ed-din Mankburni, dealt temporarily repulsed the troops of Genghis Khan. Nevertheless, the appearance of the Mongol sovereign in person forced the Kharismian to fly to India, upon which various revolted towns, Herat among them, were relentlessly massacred and burnt. The Mongols pressed on toward the Indus and laid waste Peshawar, Lahore, and Malikpur.

Thus the old path of conquest to India had been already trodden when Genghis Khan took the first steps on the beaten road which leads from the plains of Western Siberia to Europe. Pretexts for a campaign, which was first directed against the nomad tribes in the north of the Caucasus, were soon forthcoming. When, therefore, the Russians from Kieff appeared in the field as allies of these peoples, Mongolian and European troops for the first time faced each other in battle (1233). The Russians, who were victorious at the outset, were finally beaten, and the grand duke of Kieff himself was taken prisoner. The Mongols, however, to guard against whose attacks even Constantinople had been more strongly fortified, did not follow up their victory.

In the year 1224 Genghis Khan planned a campaign in person against India, but was induced by a portent, or more probably by the exhaustion of his war-worn army, to retire to Karakorum, the former capital of the Christian Kerait, which had now become the centre of the Mongolian Empire (see map, p. 174). In the previous year he had organised in the steppe of South Siberia with his whole army a gigantic battue, an enormously exaggerated example of the method of hunting familiar to the nomads of Central Asia, both as a sport and as a means of livelihood.

In the meantime the war in China had continued. Even the West Chinese Empire of the Hsia, with its partly Tibetan (Tanguse) population, had been drawn into the whirlpool of war, and had been wasted in the years 1209 and 1217. Now, after losing its northern province Ordos, it suffered a still more sweeping devastation at the hands of the Mongols (1223-1226), until in 1227 the last

prince of the dynasty was captured and the country completely conquered by the generals of Genghis Khan. The Kin, or Nu chi, in Northern China, on the other hand, still resisted (until 1234) the attacks of the Mongols, whose best general, Mogli, died in 1225.

Genghis Khan only survived his general two years. He died in 1227 in a town on the Upper Hoangho; whether from natural causes or poisoned by one of his wives is uncertain. With him passed away the most genuine representative of the wild, untameable nomads of Central Asia, who, in the old Hun fashion, had built up for himself a giant empire over dead bodies and ruined cities. A thirst for power and a savage joy in destruction were the guiding motives of his policy. The need of professing any nobler aims, even as a specious pretext for his campaigns, was absolutely unfelt by him. And yet he was not wanting in those traits of rough honesty and magnanimity which are redeeming points in the heroes of nomadism; indeed, a certain receptivity of civilization is apparent in him. The lesson which all the savage commanders of Central Asia learned in the end was destined to be revealed in him, and, above all, in his descendants. Civilization, down-trodden and bleeding from a thousand wounds, showed itself the stronger in the spiritual contest, and crushed the obstinate pride of the princes of the steppes, until at last they humbly did homage in chapels and temples to the ideals of the civilized world, and painfully accustomed their mail-clad hands to hold the pen.

(e) *The Administration of the Empire under Genghis Khan.*—It was the successors of Genghis Khan who submitted to these influences; but already by the side of the gloomy blood-stained figure of the first Mongol monarch a man had appeared whom the powerful nomad prince seemed to have chosen as a representative and advocate of civilization. This was Ili chu tsai (Yeliu Chutsai), a scion of the royal house of the Kin, a Tungusian, and therefore acquainted with Chinese culture (cf. pp. 94 and 169). The motive that induced Genghis Khan to bring this member of a hostile family to his court, and soon to entrust him with the complete internal administration, was certainly less the wish to promote the culture of his Mongol subjects than the effort to organise his empire, and especially his revenue, on the model of China. This succeeded so well that Ili chu tsai continued to hold his high position under the successors of Genghis Khan and until his death. But it reflects far more honour on him that he regarded himself at the same time as the advocate of an advanced civilization, that he boldly opposed the cruel commands of the monarch, protected the oppressed, and, wherever he could, preserved the monuments of art from destruction. He devoted his own property to these objects, or employed it in collecting archives and inscriptions. A number of these latter and a few musical instruments composed the whole wealth which he was found to possess, when calumniators suspected his official administration. In Genghis Khan and his minister we see the embodiment, side by side, of two great and antagonistic principles,—barbarous despotism and civilized self-restraint. These two men seem an epitome of the whole history of Central Asia.

It is difficult to ascertain the extent of the Mongol Empire on the death of Genghis Khan; it was still an incompleated structure (see map, p. 174). The steppes of Mongolia and Southwest Siberia were the immediate possessions of the new ruling nation, or were governed, as the country of the Uigurians was, by native rulers in complete subjection to the conqueror. Turkestan might rank as con-

quered, whereas in Persia the Mongol power was still insecurely established, and Northwest India had been raided rather than really subjugated. In China the empire of the Western Hsia was completely annexed; the Nu chi, on the contrary, still offered stubborn resistance in the provinces on the Lower Hoangho. The extent of the Mongol influence toward the south is the most uncertain. No large campaigns were undertaken in the Tarim basin or in Tibet; but probably a part at least of the States in the oases of Eastern Turkestan voluntarily submitted. Many of these petty States were probably subject to the suzerainty of the Uigurians, the Kerait, and other nations, and shared their fate; others, like Kashgar, had been already conquered in the wars against the Kharismians.

The constitution of the Mongol Empire was organised throughout on a military footing, and from this aspect was a mere renewal of the ancient Central Asiatic system which obtained among the Huns and Turks. All men capable of bearing arms in the different tribes were enrolled by tens, hundreds, or thousands. The army recruited its ranks from the young men of the subjugated districts, who were distributed among the existing troops, or, if the country had voluntarily surrendered, formed distinct regiments. Standards of yak-tails or horse-tails, of which the most important were the nine-tailed Mongol ensign and the banner of the Khan made of four black horse-tails, were equally in accordance with Central Asiatic custom. The nine-tailed flag denoted the nine great divisions or army corps into which the Mongolian levies were distributed. Genghis Khan regulated the internal affairs of his people by a series of laws, most of which were derived from traditions and earlier precedents and were still suitable to the nomad life. The attitude which he maintained toward religion is noteworthy. On the one side there is the evident wish to elevate the traditional Shamanistic creed by laying greater stress on the belief in the existence of a divine being; on the other side, it is recommended that consideration be shown to all other religions and to their priests. Public offices, however, were not to be entrusted to the priests. Generally speaking, the enactments of Genghis Khan are principally concerned with military matters; at the same time they regulate family life in a very simple fashion, define the close time for game, and make universal regulations of certain Mongol customs; such as, for instance, the slaughtering of animals by slitting up the body, and the prohibition of bathing, and so on. In his latter days Genghis Khan displayed some leaning toward Buddhism, but showed otherwise that indifferent toleration of the various religions which is everywhere characteristic of the Mongols. Religious zeal, the excuse for so many cruelties, never prompted the massacres perpetrated by Mongols.

#### B. THE MONGOL EMPIRE DOWN TO ITS PARTITION

THE great nobles of the Mongol Empire met in solemn deliberation in 1227 on the banks of the river Kerulen (Kyrylun) in the northern steppe. Genghis Khan by his will had nominated as his successor his third son Ogdai (Ogotai Khan; in Chinese, *Wo k'uo t'ai*, or *T'ai Tsung*), who soon afterward, at a great imperial diet at Karakorum, received the homage of his subjects. Since Ogdai still conceded considerable powers to *Hsi chu tsai*, his father's first minister, the latter was able to continue the internal development of the empire, to organise thoroughly the system of taxation, and to draw up lists of the men liable to military service, thus laying a firm foundation, which enabled the Mongol monarchs to extract the maximum

 Under the successors of Jinghis Khan, the Mongolian Empire separated into a number of States which are shown in colours on the Map and remained independent for indefinite periods  
 ——— Important trade routes

profit from the subjugated civilized countries without crushing them completely. The magnificently executed organisation of the Mongol Empire, which at a later time moved the admiration of Marco Polo, was mainly the work of this minister.

The conquering power of the united nomad peoples made bold advance under Ogdai. Persia, where the Kharismian Jelal ed-din had recovered a part of his inheritance (cf. p. 173), was once more subjugated, and the unfortunate prince was compelled to seek refuge in August, 1231, among the western mountains, where he was murdered by Kurdish robbers. Ogdai himself directed his attention against China, where the empire of the Kin (Nu Chi) was struggling for existence with failing strength. The provinces of Pechili, Shantung, Shansi, and Liantung were then already in the possession of the Mongols. The Kin held their own only to the south of the Hoangho in Shensi and Honan. Tuli (Tului, T'olei), the youngest brother of Ogdai, was commander-in-chief of the Mongols in most of the later battles. The siege of the capital, Kaifongfu, at which the beleaguered Chinese employed powder with great effect, was unsuccessfully attempted in the year 1232. But subsequently an alliance was negotiated between the Mongols and the Chinese Empire of the southern Sung, which quickly crushed the resistance of the Kin. In the year 1234 the last emperor of the Nu chi was defeated by a combined army of Mongols and Chinese. Shensi fell to the Mongols, Honan principally to the Sung, although misunderstandings already arose between the allies which were precursors of subsequent events. The conquest of North China was of paramount importance to the Mongols. Chinese civilization was the first with which they had any lasting intercourse, and thus the political institutions of China served in many respects as models for the wild people of the steppes, while the Uigurian civilization, which had originally been imitated, sank into the background. The ancient power of China in transforming and absorbing the peoples of the steppe gradually asserted itself more strongly. The farther the Mongols penetrated into the Middle Kingdom, the more Chinese they became, until at last the disruption of the gigantic world-empire into the districts of Central Asia on the one side and of China on the other was inevitable.

The forces which were set free by the overthrow of the Kin were destined to extend the Mongol Empire toward the west. The Mongol hordes under the command of Batu swept on after 1235 against Europe, where the protection of the frontiers lay in the hands of the Russian princes. Riazan was captured on December 21, 1237, and on February 14, 1238, Vladimir fell on the Kliasma. The Russian chiefs had to submit to the suzerainty of the Mongols, while Kiev was destroyed on December 6, 1240. Poland was now ravaged, Duke Boleslav V, the Modest (or the Chaste), was forced by Sandomir to take refuge in Hungary, and a mixed army of Poles and Germans under Henry II of Lower Silesia was annihilated at Liegnitz on April 9, 1241. But there, at the edge of the steppe region, the western march of Paidar (Peta) and his Mongols ended. They turned to Hungary, which Batu himself had already invaded (March, 1241). There was imminent danger that these Mongols would establish themselves firmly in the Hungarian steppe, and that Hungary would now, as on several previous occasions, become the nest of predatory swarms of nomads, who would perpetually harass Europe. The Magyars suffered the very fate which their forefathers had inflicted on so many prosperous countries. The Mongols seemed, in the summer and autumn of 1241, to have formed the intention of making room for themselves and of extermi-

nating the inhabitants. However, on the tidings of the death of the Great Khan Ogdai, which occurred at Karakorum on December 11, 1241, they resolved, in the spring of 1242, to withdraw through Kumania to Russia.

The expansive power of the Mongol Empire was even then immense (see the map, p. 174, "Central Asia in the Times of Genghis Khan and Timur"). While war was being waged in Europe, Ogdai's armies threatened Irak and Asia Minor. Like Turkish armies earlier and later, the Mongols used the road through Armenia, and repeatedly attempted to attack Bagdad. Simultaneously there began in China the attack on the kingdom of the southern Sung, whose princes, in blind infatuation, had helped to destroy the bulwark of their power, the empire of the Kin. The troops of the Sung held for a long time the lines of the middle Hoangho and of the Weiho by dint of hard fighting; at the same time the contest was raging in Szechwan on the upper Yangtse Kiang, during which, at the siege of Lu-cheng, a strong Mongolian army was almost totally destroyed. There also the death of Ogdai temporarily put an end to the operations.

The Great Khan had bequeathed the empire to one of his grandsons, a minor; but in 1241 the first wife of Ogdai, Nai ma chên (Jurakina), usurped the regency in his place. Ili chu tsai, the aged chancellor of the first two Great Khans, who wished to secure to the defrauded heir his rights, died suddenly. The empress now succeeded in carrying at a great *kurultai*, or imperial diet, the nomination of her son Kuyuk Khan (Gajuk; in Chinese, Kuci yu, or Ting Tsung) as sovereign (1246). Thus ended an interregnum which had greatly impaired the aggressive powers of the Mongols. It is this which partly explains why in many places, especially when confronting the western States of Europe, the policy of conquest, notwithstanding all sorts of threatening preparations, was abandoned. Besides this, envoys of the pope (p. 98) had appeared at the diet, in order to ask the Mongols to abstain from further expeditions against the Christians. It is true that they had irritated the self-conscious sovereigns of a world-empire. Nevertheless the mutual hostility of the Christians and the Mongols to the Mohammedans seemed to offer the basis for an understanding, especially in Syria, where Crusaders and Mongols were forced to stand by one another. Indeed, finally, there appeared some prospect of converting even the Mongol dynasty to Christianity, and of thus winning a mighty triumph for the Church.

Kuyuk turned his attention principally to the east and attacked Korea, which at the same time might form a bridge to Japan. He died, however, in the year 1248, and Mangu Khan (Mêngko, or Hsien Tsung), a son of Tuli and grandson of Genghis Khan, came to the throne, although only after long deliberations by the great nobles (1251). The gigantic extent of the Mongol Empire of that day is shown by the length of time required to summon and assemble the great councils of the realm. The decay of the unwieldy structure was only a question of time. Mangu himself took the first step toward it when he nominated his brother Kublai governor-general in China (Monan, or "the countries south of the desert"), and thus placed his destined successor under the immediate influence of Chinese civilization. The Mongol dynasty was fated to become Chinese at no very distant date.

For the time being, however, the frontiers of the Mongol Empire continued to expand under Mangu. Tibet, hitherto protected by its situation, was attacked and, as Marco Polo testifies, was completely devastated. A second advance, under the leadership of Hulagu against Irak and Syria, was momentous in results. The war

was first waged with the Assassins, whose eastern or Persian branch was almost exterminated (Rokn ed-din Chersshah, killed on November 19, 1256; see Vol. III, p. 368). The Mongol arms were then turned against Bagdad, which the feeble resistance of the ruling khalif failed to save. A frightful massacre almost exterminated the whole population of this religious capital of the Islam world. The hostility then evinced by the Mongols to the Mohammedan faith strengthened the hope that the Mongols would let themselves be won over to Christianity. Christians did, indeed, obtain a favoured position at the Great Khan's court; but Mangu regarded baptism and other rites merely as a sort of convenient magic formula. The behaviour of the unorthodox Nestorian and Armenian priests could not but confirm him in this belief. The Mongol princes must have had very hazy notions as to the inner meaning of the various religions, the ceremonies of which they occasionally observed.

After a great part of Syria and Asia Minor had been ravaged, the attention of the Mongol sovereign was once more directed to the dominions of the southern Sung, which were now vigorously attacked for some successive years. Kublai, who had satisfactorily averted the disfavour which threatened him, conquered the western borderlands of the Chinese Empire, Szechwan and Yunnan, and, by advancing his armies as far as Tongking and Cochin China, surrounded Southern China on all sides. Once more the death of the Great Khan temporarily brought the operations to a standstill. Mangu died in the year 1259, and all the Mongol leaders went off to the Tartar steppe to attend the imperial diet.

### C. THE FALL OF THE MONGOL WORLD-EMPIRE

(a) *The Beginning of the Fall.*—The fall of the gigantic empire could no longer be delayed. It was not merely due to the enormous size of the Mongol State, and the impossibility of preserving the unity of the realm in the face of such immense distances. Still more destructive was the influence of the different civilizations which everywhere forced their way, as it were, through the layer of sand spread over them by the storm-wind of the desert: a spiritual revolution was at work.

If Kublai was on the point of being transformed into a civilized Chinese, the western governors felt themselves surrounded by the civilizations of Western Asia and Europe, while the ancient and genuine Mongol spirit in its primitive barbarism was only to be found in the steppes of Central Asia. The force of the geographical position, which had first called to life the earlier States and civilizations, made itself again irresistibly felt; out of the provinces of the Mongol world-empire were formed once more national States under the rule of dynasties of Mongol origin. The way in which the fall would take place depended on the point to which the centre of gravity of the empire was shifted. If toward the east, then the west at once wrested itself free; if toward the civilized countries of the west, it was a natural consequence that China should attain independence under a Mongol ruler.

In 1260 the choice of the Mongols fell on Kublai Khan (Chinese, H'u pi liě, Shi Tsu, or Wen wu Huang ti); by this election the centre of gravity was shifted toward the east. Kublai still indeed was reckoned the supreme lord of all Mongols; but in truth he ruled only the eastern steppe-districts of Central Asia and

the parts of China hitherto conquered. Iran and the possessions in Syria and Asia Minor fell to his brother Hulagu; in Kipchak, the steppe country of West Siberia and the adjoining European regions, the descendants of Batu ruled, and other Mongol dynasties were being formed in Turkestan.

Chinese civilization now triumphed in the main eastern empire. What conquering energy still existed among the Mongol people was employed on the subjugation of the empire of the southern Sung and on futile attacks against Japan, after the disorders in Mongolia which followed on the change of sovereigns had been quieted. Serious operations against the Sung were not commenced until the year 1267, and twelve years elapsed before the final resistance of the Southern Chinese was ended. But while Kublai thus won the dominion over the whole of China, he was threatened by the danger of losing his possessions in Central Asia through rebellious Mongol princes. At Karakorum, in the years 1260 to 1264 appeared a rival emperor, Alipuko, or Arikbnga. A grandson of Ogdai, Kaidu by name, rebelled, and held out till his death in 1301. Baian, however, to whom the victory over the Sung is chiefly to be ascribed, brought Mongolia, with the old capital Karakorum, once more into the possession of his master. Kublai himself resided from the first in Peking (Khan Baligh, Cambaluc, p. 98), and thus announced that he was more Chinese than Mongol. The histories of China have recognised this fact, since, after 1280, they treat the Mongol reigning house of Kublai as a genuine Chinese dynasty. The further destinies of this dynasty accordingly belong to the history of Central Asia in a very restricted degree, especially after the death of Kublai (1294), whose name had testified to some sort of imaginary cohesion between the various fragments of the Mongol Empire still.

Any one who has tried to pass a fair judgment on the crumbling world-empire, and asks what its effect on the civilization of mankind was, will, as he turns over the records of that blood-stained period, be filled first with a feeling of abhorrence, and of despair of any progress or of any results of higher culture. Is it always the destiny of the nations which are laboriously struggling forward to succumb to the onslaught of rude barbarians, whose dull senses are intoxicated with battle and booty until they are maddened with an aimless and hideous lust for murder? Have flourishing towns, filled with the products of art and science, been raised by the energy of successive generations merely that rude hordes may stamp them into the blood-stained earth, as a wanton child breaks his toy from a senseless love of destruction? True it is that on no page of history does the old cruelty of nature and destiny, that cruelty which sacrifices a thousand lives in order to preserve a few favoured individuals, stare us so derisively in the face. If countless multitudes of sentient men bleed to death under the sabres of the nomads, it seems to look on with as great indifference as if a swarm of hovering flies was consumed by the flames of a desert fire.

But it has been already stated that counter influences to all that evil and mischief existed which were able to mitigate the terrible impression. The storm did not only wreak destruction, but it purified the atmosphere. It was the Mongols who first put an end to the sect of murderers, the Assassins, — a conspicuous but not an isolated example of this purifying power. Far higher value must be attached to the fact that once again, although for a brief period and under the supreme command of a barbarous people, all the civilized countries of the Old World enjoyed free intercourse with each other; all the roads were temporarily open, and repre-

representatives of every nation appeared at the court of Karakorum. Chinese artisans were settled there; Persian and Armenian merchants met the envoys of the pope and other Western powers; a goldsmith from Paris (p. 99) constructed for Mangu the chief ornament of his court, a silver tree; there were numerous Arabs in the service of the khan, and Buddhist priests laid the civilization of India at his feet. These representatives of different civilizations must have reacted on each other. For the isolated kingdom of China in particular the Mongol age marked the influx of new and stimulating ideas (see the plate, p. 168). Arabian writings were frequently translated into Chinese; Persian astronomers and mathematicians came into the country; daring European travellers also found many opportunities to communicate their knowledge. The keen zest for learning exhibited by the better part of the Mongols seemed to communicate itself to the Chinese, and for a period to overcome the stiff conservatism of the old self-centred civilized nation.

(b) *The Western Sections of the Divided Empire.*<sup>1</sup> — While the history of the Eastern Mongol Empire was gradually becoming a chapter of Chinese history, an Iranian State was developing in the west with a Mongol dynasty, which it is usual henceforth to designate as the dynasty of the Ilkhans. Hulagu, who in Mangu's time had consolidated the conquest in Persia and had added other parts of Western Asia to them, must be reckoned as an independent sovereign after the accession of Kublai, although a semblance of dependence was preserved. After the capture of Bagdad, Hulagu had conquered some of the petty Mohammedan princes, and thus put himself on good terms with the Christians in Armenia and Palestine. But when an Egyptian army inflicted a heavy defeat on his general, Ketboga, not far from Tiberias, the Mongol advance was checked in that direction also (1260). The attempts of Hulagu to reconquer Syria led to frightful massacres, but had not been crowned with any real success when Hulagu died, 1265.

His successor, Abaka (Abaga), was in consequence restricted to Persia and Irak, thus realising the idea of an Iranian empire under a Mongol dynasty (Vol. III, p. 371). The irony of fate willed that Abaka was forced immediately, according to

<sup>1</sup> Temujin (Genghis Khan, 1206-1227)

(Principally from Stanley Lane-Poole, "The Mohammedan Dynasties," Westminster, 1894.)

the old Iranian policy, to take measures for protecting his realm against his own countrymen, the Mongols of Kipchak, who threatened to invade the land through the Caucasian Gate from Derbend, and had already come to an understanding with the Egyptians, the arch foes of Abaka. Nothing shows more clearly how complete the fall of the Mongol Empire then was. War now began on the other frontier of Iran, toward Turkestan, which had long been threatened, since the Mongols of Jagatai invaded Khorasan, and were only driven out of Persia by Abaka's victory at Herat. A final attempt to recover Syria ended, however, in the defeat of Abaka at Emesa (1281). In that same year Abaka died, and with his successor the transformation of the dynasty seemed to be completed. The prince, originally a baptised Christian, and brother of the deceased, openly adopted the Mohammedan religion under the name of Ahmed, and thus snapped the last bond of union with his unruly Central Asiatic brethren. This step was, however, premature. The Christians of Armenia and Georgia, the mainstay of the empire, were roused to ominous excitement, and the Mongols could not make up their minds so quickly to abandon their hatred of Islam and its followers. Rebellions ensued, the leaders of which called in the help of the far-off Great Khan, Kublai. Ahmed was deposed, and his nephew Argun gained the sovereignty. Then followed a period of disturbances and renewed fighting in Syria, which was favourable to the Mongols, especially in the time of the Ilkhan Ghazan (1295-1304), but ended later in repeated disasters. Under Ghazan, who henceforward helped Islam to victory, the empire of the Ilkhans temporarily acquired new power; but a reconciliation with the Mohammedan world was not effected, and the zeal of the Christians for the Mongol dynasty soon cooled.

Under the successors of Ghazan the empire became disorganised, but the semblance at least of unity was kept up until the death of the Ilkhan Abu Said Bahadur (1335). The disruption then began which repeated on a small scale the fate of the Mongolian world-empire. The provinces became independent, and the Ilkhan retained a mere shadow of dignity without any real power. In 1336 round Bagdad, under sheikh Hasan Busurg (d. 1356), the emir of the Jelair, was formed the empire of the Ilkhani, which acquired fresh power, but finally was destroyed in the struggle with the Mozaffarids and Timur (1393-1405). In 1410 died the last of the Ilkhani but one, Ahmed ben Owais, as a prisoner of the Tureoman prince Kara Yusuf (Vol. III, p. 376).

The dynasties which had been formed in the steppe regions of West Siberia and Turkestan were better able to maintain their individuality than the Mongol princes of China and Iran; it was from these districts that the second great advance of the Mongols under Timur started. In Turkestan arose the empire of Jagatai (Zagatai, *Māwarā'l-nahr* = Transoxania), which took its name from one of the sons of Genghis Khan, and at the time of its greatest prosperity comprised all the countries on the Oxus and Jaxartes, as well as the greatest part of the Tarim basin. The prevailing religion in these regions was Islam; sectarians of that faith had there offered the Mongols in 1232 a more obstinate resistance than the native princes had previously done. At an early period one of the Mongol sovereigns had gone over to the teaching of Mahomet, although the bulk of the people had not followed his example. Since there were no external enemies left, the natural effect was that the Mongols soon fought among themselves. Disputes as to the succession, and rebellions were endless; the legitimate reigning dynasty

of the line of Genghis Khan sank into the background after 1358, and a government by a mayor of the palace took its place, which obviously could not remain uncontested in the hands of any one family. Some provinces became absolutely independent; for example, Kashgar, which was the most powerful State in those parts in 1369, when Timur first appeared on the scene. The Mongolian dynasty of the Shaibanids, though temporarily overthrown, did not disappear, but after the fall of Timur's dynasty (1494) soon raised itself again to the throne of Samarkand and Bokhara, which it held in the male line until 1599, and in the female until 1868.

The kingdom of Kipchak (the Golden Horde), which, roughly speaking, comprised the lowlands of Western Siberia and Eastern Europe, showed greater stability than the Jagatai. A more vigorous foreign policy was both possible and necessary there, and helped to bind the Mongols closely together. The command of Russia, that land of constant ferment, the wars with Poland and Byzantium, and the raids over the Caucasus into Western Asia, kept alive the old warlike ardour of the conquest-loving nation. The countries which later formed the kingdom of Kipchak were first partially subdued by Juji (Tuschi), the eldest son of Genghis Khan, and then were completely brought under the dominion of the Mongols by Batu (see preceding genealogical table). The expedition of Batu to Central Europe ended the period of great conquests in the west. The Mongols were unable to hold their position in Hungary and Poland, which were both attacked again in 1254, and Russia alone remained completely in their hands. Batu, who died in 1256, had been practically an independent ruler. He was succeeded, without opposition from the Great Khan, Kublai, by his younger brother Berkai (Bereke, Baraka, Burka), who was soon involved in contests with the Iranian sovereign of the Mongols, Abaka. The highest civilization in the kingdom of Kipchak was then found in the Crimea. The towns of the Crimea had flourished since ancient times, and had increased in prosperity under the Mongols; the country had maintained its intercourse with Byzantium and Southern Europe. The influence of this advanced culture was noticeable in the Mongolian princes. Many of them, in spite of their soldier-like roughness, appreciated scientific pursuits, tried to draw learned men to their court, and showed toward the representatives of the different religions that tolerance which is perhaps the most pleasing trait in the Mongol character. It must be admitted that the hopes which were so often entertained of winning the Mongolian princes completely over to one definite religion were long unrealised.

The history of the kingdom of Kipchak is full of constant wars against all neighbours on the west and the south, and of dynastic disputes and insurrections at home. Part of it belongs to the course of Russian history (Vol. V). The Mongol age does not imply for Russia a brief and bloody interlude, as it does for most other Western countries; on the contrary, the nomads of the steppes seem for a time to have associated so much with the native population that at the present day indelible traces of that affinity are left on the national Russian character. A still closer amalgamation was partly prevented by the circumstance that finally the dynasty of Kipchak in the time of Uzbeg (Usbek; 1312-1340) went over to Islam, and thus repelled the Christian Russians in the same way as the Persian Mongols offended the Armenians and Georgians. After 1360 the kingdom was filled with disturbances, and it was only the union of the White and the Blue

Hordes by Toktamish (1378) and the invasion of Timur (1391 and 1395) that temporarily restored order, but with the result that, after the death of Toktamish in 1406, the disorders increased and the power of the kingdom continually diminished. In the fifteenth century the Crimea, with the adjoining parts of Southern Russia, was all that remained of the once mighty realm of Kipchak. In the year 1502 the "Golden Horde" died out, and the kingdom completely broke up.

The Nogai, a branch of the Mongol Jujis, formed in 1466 a kingdom round Astrakhan, which fell before the attacks of the grand duke of Moscow. Farther to the north arose in 1438 the Khanate of Kasan, and in the Crimea a small Mongol State, founded in 1420 with the help of Turkey, to which it agreed to pay tribute, held its own until its incorporation with Russia in the year 1783.

#### D. TIMUR (TAMERLANE)

WITH the fall of the Mongol Empire in the time of Kublai the era of the great conquests was virtually closed, although raids and border wars still lasted for a long time. The subjugation of Southern China brought the eastern Mongols completely under the influence of Chinese civilization. The more westerly of the Mongol States did not show any further power of similar expansion. The most striking proof of this stagnation is the fact that no attempt was made to conquer India, although the gates to this country, so alluring to every great Asiatic conqueror, were in Mongol hands, and although the Mongols had already traversed the Punjab in the time of Genghis Khan. A fresh and powerful impulse, which united a part of the ancient Mongol power once more under one ruler, was needed in order to reach this last goal.

(a) *The Beginning of Timur's Career.* — It seems at first sight strange that the new tide of conquest flowed from Turkestan, from the kingdom of Jagatai (Zagatai), that is to say, from the Mongol State which was most rent by internal wars and showed the least energetic foreign policy. But these dissensions were actually a proof that the ancient Mongol love of fighting was all-powerful there, and that the forces and impulses of nomadism had remained there unimpaired. The nomad tribes of Turkestan, who were only superficially Mongolian, and who, long before the time of Genghis Khan, had repeatedly made victorious inroads into Iran and India, supplied the most splendid material to a leader who knew how to mould them into a loyal and devoted army. While Mongolia proper, which had spread its armies over half the globe, was now poor in men and no longer a theatre for great enterprises, Turkestan had every claim to become the foremost power of the nomad world. All that was required was a master will.

Civilization may have tried her arts on the forefathers of Timur, that true child of the desert, who was born, the son of a Mongol general, on April 8, 1336. They had lived for some hundred years or so as the feudal lords of the small district of Kash (Shaar, Shehrisebs), in the very heart of the civilized world of Turkestan, to the south of the prosperous town of Samarkand. But Timur's character shows barely a trace of these influences. In his relations to his native soil he is true to the nomad bent. The little country of Kash served him indeed as a starting-point for his first operations, but he soon shook himself free from it, and fought like a soldier of fortune whose true home is among the moving tents of his camp, — who

to-day has under him a mighty army recruited or impressed from every nation, and to-morrow with a few faithful followers is seeking a precarious refuge in the mountain gorges or the desert. The vivid contrasts, so usual among nomads, between harshness and magnanimity, between cruel contempt for the life of strangers and desperate grief for his kinsmen and his friends, are repeated in Timur. Like a true Mongol, he was indifferent in religious questions; but—and this one evil trait he learnt from the civilized peoples—he could play the Mohammedan fanatic when it served his purpose. He knew how to disguise his warlike expeditions, occasionally under a specious veil of piety.

In the year 1358 the realm of Jagatai was in the most desperate disorder. The khan, Buyan Kuli, had become a mere puppet in the hands of his mayors of the palace; but even the family which ruled in his place saw itself in this same year deprived of all influence by a general revolt of the vassal princes, and the kingdom broke up into its separate provinces. In the wars which these new principalities continually waged on one another, Qutb ed-din Amir Timur, as a nephew of the reigning prince of Kash, found opportunities of gaining distinction, and used them to the full. The first attempts to reconstitute the State under a different rule, started in Kashgar, the prince of which, Toghluq Timur (descended from Jagatai in the sixth degree), appears to have extended his influence as far as the Altai Mountains. In the years 1359 and 1360 the armies of Kashgar advanced victoriously to Western Turkestan; Timur found it politic to join them, and he contrived that after the fall of his uncle the principality of Kash should come to his share. But it must have soon been obvious that there was not much to gain in this way. He soon reappeared in the field, but this time as an ally of the emir Hosain, who, as a descendant of the family of the Mayors of the Palace, had held out in Kabul and now reasserted his claims to the supreme power. In the year 1360 the two allies experienced the most strange vicissitudes, being at one time victors, at another fugitives and even prisoners. But after years of fighting, fortune inclined to their side; a change of sovereign in Kashgar gave them breathing time, and in 1363 they were able to enthrone as khan at Samarkand a new puppet of the family of Jagatai, Kabul Sultan. It is not surprising that Timur now tried to put aside his overlord Hosain; but he met with an overwhelming defeat in 1366. He contrived, however, to obtain the forgiveness of Hosain in 1367 and to regain his influence. After better preparations, his attempt succeeded in 1369. Hosain was captured and executed, and a council of the realm nominated Timur to be supreme Great Khan (Cha Khan). The nominal sovereignty of the descendants of Genghis Khan was not terminated for some time. Suyurghatmish was succeeded in 1388–1397 by his son Mahmud as khan of Transoxania.

(b) *Timur's Campaigns.*—The new "Lord of the World" began with West Turkestan for his sole possession, and even of that territory parts remained to be conquered. Yusuf Beg of Kharismia, which then comprised Khiva and Bokhara, defied Timur continually, and was not completely defeated until 1379. Kamar ed-din of Kashgar, in spite of repeated campaigns (1375–1376), could never be completely vanquished. It was only when West Turkestan was entirely subjugated that the great wars and raids of Timur, fraught with such consequences for civilization, began with an attack on Persia, which then, like Jagatai at an earlier time, was broken up into several independent principalities. The separate States

could not resist the united power of Turkestan. Khorasan (with the last Serbedarid Ali Muaggad) and Herat (with the last Kurtid Ghagath ed-din Pir Ali), the ancient bulwarks of Iran against the nomads, were the first to succumb before the attack of Timur (1381). In the years 1386-1387 the Mongolian army fought with Armenia, the Turkomans, and the Ilkhani (Jelairs) of Bagdad. The year 1388 saw the terrible overthrow of the Iranian national States of the Mozaffarids, which had been formed in Farsistan (the ancient Persis), Kirman, and Kurdistan, and the complete destruction of Ispahan, the capital of Persia. The invasion of Turkestan by the ungrateful Khan Toktamish of Kipchak called Timur away from Persia in 1388-1391. He was then completely occupied with the subjugation of the Tarim basin. In 1392 he reappeared in Persia and laid the country waste, since most of the dethroned princes, even the Mozaffarids, had partially regained their dominions. The race of the Mozaffarids was this time exterminated. In 1393 Armenia and Kurdistan were occupied once more.

It was most unfortunate for the subjugated countries that Timur by his love of conquest was always allured from vanquished regions to other parts of his territories. The native princes then found opportunities to recover their dominions for a time; whereupon Timur would retaliate. Timur's imagination revelled in horrors; he aimed at striking terror far and wide. He delighted in raising towers of skulls or building gigantic monuments of corpses and living prisoners.

A momentous campaign in India called Timur away from Persia on this particular occasion. The influence of the Mongols seems to have been asserted here and there in Northern India on the east side of the Indus. Independent border-tribes impeded, as now, the communications between Afghanistan and the valley of the Indus. Beyond the Indus lay Mohammedan States. In 1398 part of the border-tribes were conquered after a laborious campaign under the personal command of Timur. Meanwhile a grandson of Timur, Pir Mohammed, captured Multan after a six months' siege, and the combined forces then advanced before Delhi. The city fell into the hands of Timur after a bloody battle. The conqueror then marched beyond the Ganges, and returned to Samarkand in 1399 laden with immense booty.

The attacks on the West were now at once renewed. In 1399 Timur was in Georgia, which he cruelly devastated; but his looks were already fixed on Asia Minor, where the Osmans had founded their empire, and on Syria, which was under Egyptian rule. The Osman war began in the year 1400 with the siege of the city of Sivas, which resisted so long that Timur after taking it desisted for the time from further operations in that quarter. He advanced, instead, against the feebly defended Syria, the northern part of which, including Damascus, fell into his hands. Bagdad also, where Ahmed ibn Owais had established himself, was captured. The storm then broke on the heads of the Osmans. In the middle of 1402, the Turkish army was defeated near Angora by the forces of Timur. Sultan Bajazet I himself was taken prisoner, and Asia Minor totally laid waste. Faraj of Egypt, who feared a similar fate, acknowledged the supremacy of Timur.

Thus the "lame" Timur (Timur-i-leng, Timur-lenk = Tamerlan) had again united the three chief western portions of the Mongol world-empire, Jagatai, Kipchak, and Persia, and widened their frontiers still more (see the map, "Central Asia in the Times of Genghis Khan and Timur," p. 174). When he once more convened a great council of the realm at Samarkand in the year 1404, he

THE MOSQUE OF GUR-AMIR IN SAMARKAND, WITH THE TOMB OF TIMUR

## EXPLANATION OF THE VIEWS ON THE FRONT OF THE PAGE

*Top:* The mosque of Gur-Amir at Samarkand, containing the tomb of Timur. The imposing building with its dome of tiles, which have preserved their splendid glaze, its lofty façades and broad gateways, dates from the period of the Mongolian conqueror, who made Samarkand his capital about 1400.

*Bottom:* The tomb of Timur and his relations, under the dome of the mosque of Gur Amir at Samarkand. The black stone with a crack in the middle is the tomb of the conqueror. It is a single block, hewn out of dark green jade, and of incalculable value. The slab has been broken across by some unknown hand. Superstitious Mohanmedans (who consider the splinters to be infallible remedies against all internal diseases) and Russian collectors have knocked off pieces of it. According to the St. Petersburg correspondent of the "Daily Chronicle," the tomb was plundered by robbers in October, 1901. They not only destroyed the priceless stone of Timur, but carried off all the valuables from the mosque, which, notwithstanding its interesting inscriptions, was left unguarded.

(Mostly from Franz v. Schwarz's "Turkestan." Freiburg im Breisgau, Herder, 1900.)

explained to his magnates that only one great undertaking was left him, the conquest of China. But this time a kindly fate spared the prosperous Chinese Empire. An army of two hundred thousand men was already in the field, when death cut short his plans on February 18. He died of fever at the age of sixty-nine years (see the inserted illustration, "The Gur-Emir Mosque in Samarkand, with the Tomb of Timur").<sup>1</sup> The spirit of boundless ambition and conquest was once more embodied in him; but it died with him, and the down-trodden seeds of culture were free to spring up again if life was still in them. The age of the great nomad empires definitely closed with Timur, but not before it had produced endless misery and had rent the ancient civilization of Western Asia to a few shreds.

Timur's empire had been only held together by the personality of the ruler, and it crumbled away even in his hands so soon as his attention was too closely riveted in any one direction. The term "empire" is almost too pretentious for this political structure which merits rather the name of military despotism. The national basis was almost entirely replaced by the purely military. The body that took the field was not a levy from defined districts, but the recruited or impressed followers of the individual leaders. Every campaign was an undertaking at the common cost, the supreme command being in the hands of Timur. The troops were not paid by Timur, but by the generals, who looked to recoup themselves with interest. If by so doing they amassed excessive wealth, Timur simply ordained that all sections of the army should be strengthened. Every leader then was forced to employ his fortune in enlisting more soldiers. Such an army could naturally only be kept on foot so long as it was fighting. It would soon have eaten itself away in peace time. Thus behind Timur's unbridled lust for war, which entirely corresponded to his character, there was a compelling force from which he could not, with safety to himself, withdraw. He possessed an army ready to hand only so long as he waged war and obtained booty, and, as long only as this army remained loyal to him, he was lord of a gigantic empire. He was confronted by the national rulers, whose existence was more firmly rooted in the soil, but who were seldom able to face the rushing torrent of his enormous hosts.

#### E. THE DESCENDANTS OF TIMUR

WITH the death of Timur these opposing forces were certain soon to regain the upper hand. No course was left to the descendants of the mighty conqueror but to submit to them or to give a national tinge to their own policy, a course for which the earlier Mongol dynasties furnished a precedent. For the moment, indeed, the army, the invincible weapon of Timur, was still available, and its leaders were ready to continue the previous system, although there was no longer a master mind to lead them. Above all it was intended that the expedition against China, which promised such ample booty, should be intrusted to a board of generals and the question as to Timur's successor left temporarily in abeyance. But

<sup>1</sup> The tombstone of Timur, 6 feet 6 inches long, 15 inches broad, and 12 inches high, is engraved with his genealogy. According to C. C. Dukmeyer, it is made of two differently veined stones so accurately fitted together that it has been supposed to be a shattered monolith (cf. the description of the illustration). At the head of the stones the flags of the conqueror and the horse tails are suspended from a high pole. His bones repose in the vault beneath, exactly under the nephrite, covered by heavy black marble.

the dispute about the inheritance, which at once broke out, brought these plans to an abrupt close.

The wars about the succession lasted four years. At first it seemed as if Timur's grandson, Khalil, would inherit the empire; but Shah Ruch (Roch), a son of the conqueror, born in 1378, asserted his claim in Persia. In 1409 the well-meaning and peaceful Khalil was deposed, and Timur's empire, which already seemed likely to break up into the two States of Turkestan and Persia, was again united under Shah Ruch. But it was no longer the old empire. The larger States, which had outwardly submitted to the scimitar of the lord of the world, Kipchak, Egypt, the Osman empire, the Turkoman States of Armenia, and the majority of the Indian possessions, were irretrievably lost now that Timur was dead. Only West Turkestan, the Iranian highlands, and a part of the Punjab were still retained by his successors. Shah Ruch was not the man to contemplate a continuance of the old policy of war and conquest. The only recourse left to him was to bring the national forces of his States into his service; in other words, to recognise the Iranian people with their culture and to help them. It was chiefly due to the prudence with which he pursued this object that he was able to maintain the remnant of the empire for many years until his death (April, 1447).

His arch-foes were the Turkomans (Vol. III, p. 371) in Armenia and Azerbaijan, wild hordes of Central Asiatic nomads, who had planted themselves there on the old military route of the Turkish and Mongol invaders and had formed a predatory State in the old Hun style. There were fragments of all the migratory tribes, who at one time were divided by internecine feuds, at another were united into a formidable military power by the prospect of booty.

The headship of the hordes rested at first with the Turkoman tribe of the "Black Sheep" (Kara Koinlo) under its chief Kara Yusuf, who brought Mesopotamia and Bagdad into his power, and gravely menaced Persia. The sudden death of Kara Yusuf (1420) freed Shah Ruch from his most formidable antagonist. Azerbaijan was now definitely taken from the Turkomans.

But any hope that the Iranised House of Timur would retain Persia and Turkestan at least was ended by the disorders ensuing on the death of Shah Ruch. A stormy period, in which parricide and fratricide were not infrequent, shook the empire for years, and while the descendants of Timur tried to exterminate each other, the swarms of Turkomans, at whose head the horde of the "White Sheep" (Ak Koinlo) now stood, poured afresh over the Persian frontier. Abul Kasim Barbar Bahadur, a grandson of Shah Ruch, held his own in Khorasan until 1457; then, while West Persia was already lost to the Turkomans, Sultan Abu Said, a grandnephew of Shah Ruch, usurped the power (1459). But in the year 1467 he found himself forced to fight with Uzun Hasan, the leader of the Ak Koinlo. The heir of Timur was defeated and killed (1468); the larger part of his Persian possessions fell to the Turkoman. Complete disorder then reigned in Turkestan, until in 1500 Mohammed Shaibani (of the family of Genghis Khan; cf. *ante*), and his Uzbeks, who represented the nomad spirit as modified by Iranian civilization, became masters of the country. The Uzbek dynasties of the Shaibanids, Janids, and Mangites possessed down to 1868 the various kingdoms, into which the country again broke up almost precisely as before the Mongol age.

A Timurid dynasty had held its own in Ferghana. Driven thence by the Uzbek leader Shaibek Khan, the ruling prince Zehir ed-din Babar, grandson of Abu Said

(born 1483), threw himself into the mountains of Afghanistan, where he commanded the gates to India. The old conquest-loving spirit of his ancestor awoke in Babar, whom the splendid triumphs of Timur in India may have stimulated to similar enterprises. He first secured his position in Kabul (1505), where he collected round him a small force of some two thousand men. He took the field five times, until eventually in 1526 he succeeded in defeating Ibrahim of Delhi (of the dynasty of the Bahlul Lodhi), and thus bringing into his power the most powerful of the five Mohammedan empires which then existed in India. When he died in the year 1530, the last and, intellectually the foremost, conqueror of Mongolian stock, he had founded a permanent empire, that of the "Great Mogul," which only fell before the attack of the English in 1857. (See on this subject Section IV of this volume.)

#### F. TIBET AND EASTERN BUDDHISM AFTER THE CLOSE OF THE THIRTEENTH CENTURY

THE world was still trembling before the warlike hosts of Central Asia, when those forces were gathering strength which eventually succeeded in taming and rendering harmless the wild spirits of the nomads. These forces were Chinese civilization, which will be discussed later (p. 194), and eastern Buddhism, whose influences can only be understood by a survey of the more recent history of Tibet, the theocratic State *par excellence* of Eastern Asia. The teaching of Buddha had long lost its power in the Indian mother country, when it acquired Eastern Central Asia, beginning with Tibet. Mongol Buddhism was not rooted in Indian civilization, but in the fantastically developed monastic and ecclesiastical system of the lonely Tibetan highlands, which had cut themselves completely off from the plains of India, when the Buddhist teaching died away in those parts.

For this reason the more recent eastern Buddhism of Central Asia is sharply differentiated from the earlier western form, which once was so important for the culture of a wide area. The older form had stood in close connection with the plains of the Indus and the Ganges valleys; yet the missionaries in the time of Asoka, when the Buddhism of India was at its zenith, had passed through Kashmir and scaled the southern mountain walls of Central Asia, and had carried their sacred books, their script, and their civilization directly to the Tarim basin, and thence northward to the Uigurians and eastward to China. The new teaching had hardly met with any response then among the Mongols and the other eastern nomads; in Tibet it first began slowly to gain a footing. But in the course of time the whole western mission field was once more lost. Christian and Zoroastrian emissaries had worked in opposition to the Buddhist priests, until the doctrine of Islam, grand in its simplicity, which has always exercised a marvellously enthralling influence over semi-civilized peoples, drove out all other forms of religion. Besides this, the Buddhism of Central Asia had lost any support in India, owing to the victory of the Brahminic teaching, and was entirely dependent on its own strength. The term "simplicity" is indeed only to be applied with reserve to Islam, which reached Central Asia through Persia. An Islamite mysticism developed under the influence of Iranian intellectual life, which was hardly inferior to the Buddhist in profundity and love of the marvellous, but was for that precise reason capable of ousting and replacing the former. In its ultimate meaning, the

victory of the Mohammedan teaching signifies the supremacy of West Asiatic culture over the Indian. And this victory was natural, for Western Asia marches with the steppes of Central Asia for some distance and is closely connected with them by old trade-routes, while the bonds of intercourse between India and the heart of Asia have never been strong.

The later eastern dissemination of the Buddhist faith over Central Asia would have been inconceivable but for the circumstance that even in China Buddhism reckoned numerous followers, and that the Chinese of set purpose favoured a doctrine so gentle and so much opposed to military brutality. But that Tibet of all others should become the holy land of Buddhism had been the object of the efforts of Genghis Khan, who indeed, as a true Mongol, tried to employ to his own purposes the "magic powers" of all religions, without adopting any one of them exclusively. It was after all a very natural result that Tibet took, so far as religion was concerned, the place of India in the eyes of Central Asia; men were accustomed to look for the home of Buddhism in the South, and, since India seceded, Tibet, which was always full of mystery, offered a welcome substitute.

At first, indeed, the growing reputation of Tibet for sanctity did not shield it from disastrous attacks: under the first Mongol princes it was mercilessly plundered and laid waste. But perhaps these lamentable events, by which the temporal kingdom of Tibet was overthrown, were the contributory cause that henceforth the spiritual power came forward and undertook the protection of the country with better prospect of success (cf. p. 163).

Kublai Khan took account of the altered conditions when he promoted the Lama (or priest) Pasépa, who was a member of a noble Tibetan family, to be the supreme head of all Lamas in his realm, and thus shifted the centre of gravity of the Buddhist hierarchy to Tibet. In reality by so doing he conferred on him the temporal power also over the country. On the complete disruption of the Mongol empire, Tibet, which was not claimed by the Chinese Mongol dynasty, remained as an independent ecclesiastical State, and could then for more than a century continue its unaided development under the successors of Pasépa. While in China the Buddhist papacy of the Tibetan chief-lama was no longer recognised or remained without influence, the activity of Tibetan missionaries was, on the contrary, successfully continued. Tibet could not fail to become the religious centre for these efforts.

The Buddhist doctrine of a new birth made men regard the chief-lamas as reincarnations of great saints, or, indeed, as Buddhas themselves. Ultimately a belief gained ground that the Great Lama remained always the same, and immediately after his death was reincarnated in a child, who without demur was regarded and revered as Great Lama; the first regeneration of this kind is said to have occurred in the year 1399. At the beginning of the fifteenth century there was still no idea of strict religious government. The reincarnated Great Lama had by no means met with universal recognition, and many years elapsed before he attained any great authority. Most of the monasteries, in which religious life and learning were centred, probably led a very independent existence. China, where the new reigning house of the Ming was threatened from the side of Mongolia by the Mongolian dynasty driven out in 1368, then turned her attention again to Tibet. The religious influence of Tibet on the nomads of Central Asia was not to be underestimated. Halima, one of the most esteemed Tibetan Lamas, was brought to the

Chinese imperial court, overwhelmed with pompous titles and intrusted with the spiritual supremacy in Tibet, on the condition that a small tribute was paid yearly. Tibet thus was more closely linked to China, and the conversion and civilization of the Central Asiatic nomads by emissaries from the holy land were encouraged in accordance with the Chinese policy.

The Buddhist Reformation, which took place about the middle of the fifteenth century, is a noteworthy counterpart of the Reformation of Luther, which began only a little later. In Tibet also the immediate cause of the movement was found in the depravity of the priesthood and the adulteration of the pure faith with popular superstitions of a Shamanistic origin, while the national questions, which played an important part in Europe, were hardly noticeable there. Tsong ko pa (Dsung khaba, 1419-1478) founded the new sect of the "Yellow Lamas," which the followers of the old sect opposed under the name of "Red Lamas." The yellow sect remained victorious in Tibet proper, while the red sect held its own in Ladak and elsewhere. Tsong ko pa was the real founder of the Tibetan hierarchy in the form which it has retained up to the present day. He nominated one of his pupils to be Dalai-Lama, a second to be Panchan-Lama; both would undergo a perpetual process of rebirth and hold permanently the spiritual headship. Tibet was partitioned between them, but the Dalai-Lama received the greater half, and gradually drove the Panchan-Lama into the background. It was long before the Chinese paid attention to the new order of things in Tibet, although under certain circumstances it might produce serious results. A Chinese embassy, accompanied by a small army, appeared at the court of the Dalai-Lama in the year 1522, in order to invite him to the imperial court. When the prince of the church declined and was concealed by his subjects, attempts were made to carry him off by force, but they resulted in complete failure. The Chinese emperor Wu Tsung died at this crisis, and his successor, Shi Tsung, who favoured Taoism, did not continue the plans against Tibet.

The third reincarnated Dalai-Lama, So nam, gave himself out for a "living Buddha," and as such won wide recognition. He travelled into Mongolia, where, being received with the deepest reverence, he came forward as a mediator between a Mongol prince and the Chinese. The victory then of the yellow sect was decisive in the north also; countless Mongol pilgrims went yearly to Lhasa, and Buddhist monasteries were founded in great numbers. In China the propitious influence of the Tibetan high priest was noticeable in the increasing peacefulness of the nomads of the steppe. Shi Tsu, the first emperor of the Manchu dynasty, which had ousted the house of the Ming after 1644, fully appreciated that fact, and acknowledged the presents of Tibetan envoys with a flattering invitation to the Dalai-Lama to come to Peking. The invitation was accepted this time; the Great Lama appeared in the year 1653 at the court of the Manchu dynasty, where he was the centre of universal respect, was invested with magnificent titles, and was finally escorted to his home by a guard under an imperial prince.

But this triumph of the "living Buddha" was soon followed by a humiliation. Since at the death of each Dalai-Lama the office passed to a child, who was considered to be his reincarnation, the government every time rested for many years in the hands of regents, who were naturally tempted to keep their power even when the Dalai-Lama came to manhood, or, what was still simpler, never to allow the boy to live beyond a certain age. The regency was held by temporal princes,

in whom we most simply see the successors of those old Tibetan rulers, who for a time had made Tibet a powerful State, but then had been more and more driven back by the hierarchy. As temporal protectors of the priesthood, and supported doubtless by large possessions of land, they had learned how to maintain a certain position.

Then finally, when the reins of power slipped from the hands of the decrepit fifth Dalai-Lama, the reigning Tipa (King) Sang Kiú saw that the moment had arrived to replace the spiritual supremacy, which might be nominally retained, by a temporal. When the Great Lama died in 1682, the Tipa concealed his death, and was then in fact lord of Tibet. The alteration was soon noticed by the surrounding countries. The Tipa placed a Calmuck prince, Kaldan, educated in Tibet as a Lama, at the head of this tribe, and the Calmucks (Eleutes, Dzungarians) helped him in return to repel an attack of the Nepalese, a powerful nation of mountaineers, who were dangerous neighbours of the holy land. The prince of the Eleutes now extended his power on a secret understanding with the Tipa, and ventured to attack China, where the fact had been realised with great dissatisfaction that the influence for peace exercised by Tibet on the nomads of the steppes was completely changed. A Chinese Lama, who had been sent to the Dalai-Lama, had not been allowed to see him. When then the Eleutian prince, after a defeat, declared to his lord that he had begun the war with China simply and solely at the wish of the Dalai-Lama, the terrified Tipa acknowledged, in answer to a peremptory letter of the emperor Sheng Tsu (Kang hsi), that the fifth incarnation of the Dalai-Lama was long since dead, and that the deceased had been reincarnated in a boy; the death had been hushed up and the sixth incarnation not publicly acknowledged, in order to avoid disturbances. The news of these events spread rapidly, and, although China took no further steps, considerably lessened the power of the Tipa. He began in the year 1705 a fresh war against a Tibetan chieftain, but was defeated and slain.

The victorious prince, La tsang, had already instated a new Dalai-Lama. But he was not recognised by China and was replaced by another, whom La tsang undertook to protect. Another Dalai-Lama, who appeared in Mongolia and claimed to be the real sixth incarnation, was also rejected by the Chinese government, and was only recognised as a saint of inferior rank. The bad example of the Tipa Sang-kiú had, however, produced its result: the Dzungarian prince Zagan Araptan, successor to Kaldan (p. 193), who had seen what power in politics and religion the protector of the Dalai-Lama could exert, invaded Tibet with an army, in order to seize the Buddhist pope (1717). Potala, near Lhasa, where the Dalai-Lama resided with the Khan La tsang, was stormed, the Khan killed, but the Great Lama was kept in a place of safety. China no longer hesitated to check by force this dangerous turn of events, which might lead to a new invasion of the Middle Kingdom by the nomads. A Chinese army and a Mongolian levy pushed into Tibet, but the united troops were outflanked and cut to pieces by the Dzungarians on the river Kola. The dejection which the Chinese and Mongols felt at this reverse led to the proposal that Tibet should be left to itself, and that a new Dalai-Lama should be appointed in another district. Emperor Kang hsi, however, insisted on renewing the campaign with increased forces. The attempt was successful this time; the Dzungarians evacuated the country in the year 1720, and Kang hsi was then able to effect the necessary closer union of Tibet with China. For the future two

Chinese residents, for whom the necessary respect was ensured by a considerable armed force, undertook the protection of the Dalai-Lama in place of the native temporal kings. The reverence felt for this living Buddha diminished, however, considerably in China, when the Dalai-Lama, who was staying in Peking on a visit, died like any ordinary man, of smallpox. The small feudal princes of Tibet at first still retained some power; but after repeated disturbances they were completely subordinated to the Dalai-Lama, that is to say, to the Chinese governors, in the year 1750. The internal administration of the country, with which China generally interfered very little, was now entirely organised on an ecclesiastical system, since every local governor was given a Lama as colleague, who jointly with him managed the affairs of the inhabitants.

Although the Dalai-Lama was again recognised as supreme, there could be no idea of any actually permanent rule of the "living Buddha," since a new Dalai-Lama was always raised to his high dignity in tender infancy and imperatively required an adviser. For all foreign affairs the Chinese regents undertook this post; for home affairs a sort of new temporal monarchy was founded, since the "Rajah" of Lhasa usually conducted the government until the Dalai-Lama attained his majority. A strange fatality afterward willed that the Dalai-Lama hardly ever attained the required age of twenty years, but usually died just before, and then was always reincarnated in a child. In this way the Chinese influence also lost ground. Tibet detached itself more and more completely on every side, and has remained down to the present day, when Russia is apparently eagerly courting its good-will, one of the most mysterious and isolated countries in the world. When in 1792 a new invasion of the Nepalese was repulsed with the aid of Chinese troops, the frontier toward India was almost entirely barred. A safeguard against the influences of civilization was also found in the Himalayan State of Bhutan, lying south of Lhasa, which is a miniature Tibet with a dual government, temporal and spiritual, and an equally intense aversion to any influences from the outside world.

Since Tibet supported the Buddhism, which was losing ground in India, and became the centre from which a successful propaganda was sent among the nomads of Central Asia, it discharged an important duty in the history of the world. The dissemination of the Buddhist teaching, with its gentle code of morality and its peaceful monastic life, may claim to have performed a paramount service in preserving China and the Western World from fresh inroads of nomads, or, at any rate, in enabling them to repel such attacks without difficulty.

#### G. MONGOLIA AND THE TARIM BASIN FROM 1300 TO THE PRESENT DAY

(a) *The Last Descendants of Genghis.* — When the flood-tide of Mongolian conquest ebbed, the home of the new world-conquerors sank rapidly from its dazzling height. The sparsely peopled country had given up its best resources, and needed a long time to regain its strength. It was always a point of honour with the eldest branch of the Mongolian dynasty, the Chinese, to preserve the cradle of their race, with its old capital, Karakorum. This endeavour also harmonised with the traditional Chinese policy, which always aimed at exerting some influence over the restless nations of the steppe, and must have been adopted by the Mongol sovereigns when they had transformed themselves more and more into

genuine Chinese. Kublai Khan had repeatedly suppressed rebellions in Mongolia and become master of the country; his successor, Timur (Cheng Tsung, p. 96), brought the whole country for a time under his influence. At the period of the Mongol supremacy in China the Buddhist propaganda, of which Tibet was the centre, seems to have shown great activity, being favoured by the Chinese emperors, who were mostly attracted by Buddhism. The circumstance that the Mongols, who had immigrated into China and were again driven out by the Ming, were streaming back to their old home, could not fail to help this change.

When the Mongolian dynasty was fighting for its existence against the Ming, the Mongols of Central Asia rendered feeble and ambiguous aid. After his complete defeat in 1368, Shun Ti (Tohuan, or Tughan Timur), the Mongolian emperor, fled to Shang tu in the north, and soon afterward died. His son and successor, Biliktu (1370-1378), removed his court once more to Karakorum. Since all the Mongol foreign territories had long since been lost, the sole remnant of the empire left him was the pasture country on the north of the Gobi, which had been the starting-point of the power of his house. There was still the possibility that a new storm might be slowly gathering there, whose bursting would bring disaster on more civilized countries. But the loss of China, which to a large extent was due to the lack of union between the generals and the princes, had not taught the Mongols wisdom. The smaller the remnants of their empire became, the more furiously they fought for each shred, until finally complete disintegration set in. The emperor of the Ming seized this opportunity to subjugate Eastern Mongolia. The kingdom of Altyn Khan, to the northwest of the Gobi, remained as the last relic of the Mongolian power.

(b) *The Empire of the Calmucks (1630-1757)*. — The more modern attempts to found a great power in Central Asia, and then in the true Hun fashion to attack the civilized nations, were no longer initiated by the Mongols, whose character had been altered by the tribal disintegration and the awakening zeal for the exercise of the Buddhist religion, but by the tribes to the south and southwest of the desert of Gobi, whose country was now partly known as Dzungaria. The contemplative doctrines of Buddhism had not gained ground here so quickly, since many of the nomads had been won over to Islam, which is less dangerous to the warlike spirit. From the chaos of peoples in Central Asia a new branch of the Mongolian race had detached itself to the south of the Gobi, the Eleutes, or Calmucks, who after 1630 had shaken off the Mongol yoke, and had already extended their influence as far as China.

Under its Khan Kaldan this people seized Kashgar, where religious controversies favoured the admission of this powerful Mohammedan priesthood, destroyed the Mongol Empire of the Altyn Khan (p. 191), and threatened China toward the end of the seventeenth century. At the same time Kaldan tried to employ the religious power of Tibet in his own interest, by declaring that the Dalai-Lama had raised him to his high position; the temporal prince of Tibet, Sangkiú, supported him secretly (p. 190). The Mongols suffered severely under the attacks of the Eleutes, and China's influence in Central Asia dwindled considerably, until eventually the Manchu emperor, Kang hsi, determined in the year 1696 on a great campaign against Kaldan. Kaldan was forced to retreat farther and farther. Since his scheme for the support of his claims by the Dalai-Lama seemed

not to work satisfactorily, he now went over to Islam, which had many followers in the west of his dominions; but his death, which occurred soon afterward, cut these plans short.

The military power of the nomad world, which had been again concentrated in Dzungaria as a focus, was not extinguished by this event. Zagan-Araïtan, the successor of Kaldan, subjugated most of the towns of the Tarim basin and extended his dominions in other directions. He then formed the plan of sending an army to Tibet, to assume by force the protection of the Dalai-Lama, and in this way to make full use of the influence of this religious puppet to his own purposes. The attempt met with unexpected success, but drove the Chinese to adopt more decided measures. The expulsion of the Eleutes from Tibet (1720) was the result. The Dzungarian empire remained nevertheless for some time a dangerous neighbour of the other Central Asiatic tribes and of the Chinese. Finally, however, China employed dynastic quarrels and internal wars as an excuse to destroy the last great nomad empire of Central Asia, and thus, as it seems, to terminate forever the age of the great wars between the nomad races of Central Asia and the civilized peoples. Eastern Turkestan, which had been in the hands of the Calmucks, now (1757) fell to the Chinese.

(c) *The Advance of Russia and the Restraining Influence of the Buddhist Teaching.*— It was not the first time that the Chinese had taken possession of the Tarim basin, commanded the trade roads of Central Asia, and divided the nomad tribes in the north from those in the south (p. 523); but this time the effect was different and more permanent. The perpetually turbulent nomad tribes could not be really subdued until they were shut in and surrounded on both sides,—until the strong fortresses of civilization bounded the illimitable horizon of the steppe. The first steps toward this condition had meanwhile been taken by the advance of Russia; the frontier toward Siberia had been already determined, and any movement of the Mongols toward the north and the northwest was made impossible. In the southwest Russia only gradually succeeded in acquiring Turkestan. Here, too, the Chinese position was so weak that the Tarim basin was temporarily lost. When, however, the khanates of Turkestan were occupied by the Russians, China also soon recovered what she had lost.

The expansion of the power of Russia, which in the long run presents dangers to China itself, has therefore admirably supported the Chinese policy, which has always been directed toward the subjugation of the nomad nations of Central Asia. But this very policy employed not only the old method of colonisation and of pitting one nomad prince against another, but also the newer method of encouraging Buddhism. The Manchurian dynasty in this respect has entirely followed the example of the Ming, and the result is simply astonishing. "Buddhist doctrines," says Nikolai von Prschevalskij, "are more deeply rooted in Mongolia than in almost any other part of the world. Buddhism, whose highest ideal is indolent contemplation, entirely suits the natural disposition of the Mongol, and has created a terrible asceticism, which deters the nomad from any progress, and tempts him to seek the goal of human existence in misty and abstract ideas as to the Deity and the life beyond the grave." The ordinary good-tempered indolence of the nomads is left, but in the place of outbursts of martial fury, which affected individuals as well as nations, a continual slow dissipation of energy in

religious observances, prayers, and pilgrimages has appeared. In this light the pilgrimages to Tibet or famous Mongolian sanctuaries are substitutes for the old predatory and warlike expeditions. All the less important for the spiritual life of the Central Asiatics is the Buddhist teaching, whose primitive form is so instinct with spirituality and thought. The Tibetan form of religion is itself quite debased, and has been merely outwardly introduced into Mongolia, where even the priests as a whole do not understand the Tibetan sacred writings and formulae, but use them in ignorance as an obscure system of magic. This branch of Buddhism only shows a certain independence in so far as centres of the faith are found in Mongolia, especially the town of Urga, whose *Kutuchta*, or high priest, ranks directly after the two highest Tibetan Lamas, and, like these, is always reincarnated. As a rule, almost every Buddhist monastery possesses a "Gegan," or reincarnated saint. But the priests have in their influence taken the place of the old tribal chieftains. They are treated with unbounded respect, and the wealth of the country is collected in their sanctuaries. In the border districts toward Islam stand fortified Buddhist monasteries, where the inhabitants seek refuge from marauding or insurrectionary Mohammedans.

While the Buddhist religion thus showed its marvellous ability to restrain the wild Central Asiatics, and while the region of nomadism was more and more encroached upon by Chinese colonies, another and ancient aid to the progress of civilization, the commerce and international communication on the highroads of the heart of Asia, leading from east to west, had gradually lost most of its significance. Even in the Mongol age wars broke out for the possession of these roads. The attack of Genghis Khan on the Kharismians (p. 171) was due partly to reasons of commercial policy. But the discovery of the sea route to the East Indies, which soon led to the appearance of European ships in Chinese harbours, could not fail to reduce the already much diminished overland trade to insignificant proportions. It was no longer a profitable undertaking to make the immense journey through insecure districts with valuable wares. The great caravan traffic was suspended, and in its place was left merely a transit trade from station to station, which had no bearing upon civilization. The overland trade, especially the export of tea, revived only in one previously neglected place, namely, in the north of Mongolia, where the frontiers of the two civilized empires, Russia and China, touch each other. This route contributed distinctly to the pacification of the Mongol tribes, who now obtained good pay for transporting tea through the steppes, and acquired an interest in the prosperity of the trade.

(d) *The Age of the Insurrections of the Dzungans (1825-1894)*. — The Chinese policy, notwithstanding all the improvement in the outlook, still met with many obstacles in Central Asia, the chief causes of which were the adherents to Islam in Dzungaria, the Tarim basin, and the western provinces of China. Where Islam had once gained a footing it could not be ousted by the more accommodating Buddhism. But the influence which the doctrines of Mohammed exercised on the warlike spirit, the industry and energy of its followers, had to be considered, and it required care and tact on the part of Chinese officials to avoid dangerous outbreaks of the masses whom the new faith had brought into a closer unity. In spite of all this, there were often sanguinary and temporarily successful insurrections of the Dzungans, in which the last embers of the old warlike spirit of Central Asia glowed

afresh. In the Tarim basin an Islamite revolt had already raged from 1825 to 1828 (p. 108). About the middle of the nineteenth century the descendants of the dynasty which had been driven out of the Western Tarim basin by the Chinese at the close of the Eleutian war in 1757 tried to win back their territory, after they had already made small expeditions over the Chinese frontier. The first campaign failed through the resistance of the towns of Kashgar and Yarkand. An Islamite revolt under the leadership of Raseh ed-din Khodja prepared the ground in 1862 for further operations. An auxiliary force from Khokand, under Mohammed Yakub Bey, took part in a new invasion, which was led by Buzurg (Busuruk) Khan, then a pretender. This time the Dungan soldiers of the Chinese mutinied and seized Yarkand and Khotan, while simultaneously bands of Kirghiz robbers swept by and besieged Kashgar (1864); when they had taken the town, Buzurg Khan deprived them of their booty. During the subsequent wars with the Chinese and the Dungan insurgents, who refused to submit to the Mohammedans from Khokand, Yakub Bey distinguished himself more and more as a general, until he entirely deprived the incapable Buzurg Khan of his command and sent him back to Ferghana. In the year 1868 the greater part of the Tarim basin was in the possession of the new ruler, who styled himself, after 1870, "Atalik Ghazi" (defender of the faith).

These successes would have been impossible had not at the same time a revolt of the Mohammedans in Western China and Dzungaria reduced the Chinese government to dire straits. It was fortunate for China, which was in addition weakened by the Taiping insurrection, that the insurgents attained no great results and did not combine in a general attack on the tottering celestial kingdom; still less did they think of making common cause with Yakub Bey, to whom they were on the contrary hostile, or even with the Taipings and the disaffected Buddhist Mongols. The great Dungan insurrection was thus after all only a chain of local risings, involving terrible bloodshed and widespread devastation. The Chinese took refuge in the towns, some of which gave way before the attacks of the surrounding Dungsans, while others held out and thus became important bases for the reconquest of the country; this was especially the case in Kansu, the highroad from China to the Tarim basin, where the insurrection broke out in 1862. In 1869 a Dungan army once more advanced and pillaged as far as Ordos; and again, in 1873, towns in Southern Mongolia were attacked and destroyed. The conduct of the war on both sides was pitiable.

After 1872 the Chinese began once more to take the offensive and to reconquer Kansu. When this object was attained, after some years of fighting, the fate of Yakub Bey was practically sealed. In the meantime he had been deprived of the support of his fellow tribesmen and co-religionists in Western Turkestan by the advance of the Russians. In the year 1878, after the sudden death of Yakub (May 31, 1877) had put an end to all organised resistance, the Tarim basin fell again into the hands of the Chinese, and together with the districts on the Tianshan was constituted a separate province in 1884. Here, too, China touches almost everywhere on the territory of the civilized nations, Russia and England, since the last ill-defined border country, the highlands of the Pamirs, has been distributed among the three powers (1895, Anglo-Russian agreement). The trade in the Tarim basin has improved since England has devoted her attention to the communications with India, and has stimulated a considerable caravan traffic. Russia, on the other side,

is anxious to revive the old routes to Western Turkestan. The fact that the population of the Tarim basin and that of many parts of Western China profess the Mohammedan faith is a permanent danger to the Chinese (1894, rebellion of the Dzungars), which can only be obviated in course of time by an extensive settlement of Chinese colonists.

## II. WESTERN TURKESTAN FROM THE FALL OF THE HOUSE OF TIMUR TO THE ADVANCE OF THE RUSSIANS

AFTER the Mongol onslaught the population had gradually divided into three groups. The first of these consisted of the settled agricultural section of the people, the inhabitants of the towns, oases, and riparian districts, the Sarts. These represent to us the relics of the oldest elements of culture, which had been Iranised in course of time, and, owing to large Persian immigrations, had acquired also a physical likeness to the Persians. This peculiarity was intensified by the importation of Persian slaves, and the otherwise inevitable admixture of brachycephalic nomads was counterbalanced. The Sarts had long abandoned their old faith, and that of Islam was universally adopted. The Sarts showed no capacity for political organisation. By the second group, the Uzbeks, on the contrary, we are to understand half-settled Turco-Tartars, in whom, notwithstanding an admixture of Iranian blood and a smattering of higher culture, the military temper of the nomad is predominant. This large section of the people, which sprung up during the nomad conquests, first ventured to lay claim to the supremacy, and finally usurped the power of the Mongol dynasties. The movement was really started in the Tarim basin, where even in the time of Timur the Kashgarians, who were never completely subjugated, had repeatedly tried to subjugate Western Turkestan (p. 182). A third group of inhabitants of Turkestan is composed of genuine nomads, whose chief pasture lands lie partly in the north and partly to the west of the Amu Daria, toward the Caspian Sea and Khorasan (see map, p. 122). In the north the people of the Kirghiz (Cossacks) had lived since early times, and had been only driven out for a short time and from a few regions by roving bands of other nomads; in the west the Turkomans, predatory hordes who controlled the communications between Persia and the States of Turkestan, had risen from the fragments of nomad tribes.

(a) *The Kirghiz from the Commencement of the Sixteenth to the Close of the Eighteenth Century.*—The rule of the House of Timur in Turkestan ended in 1494. This revolution originated in an attack of several Timurid princes on Mohammed Shaibek Khan (Shaibani), the leader of the Uzbeks, who seem then to have had their homes on the upper Jaxartes and in the borderlands of Eastern Turkestan. The attack led to a complete defeat of the Timurids, and in consequence they lost their possessions in Masenderan and Khorasan. It seemed as if the whole of Persia would be conquered by Shaibek; but at that very time the Iranian people had been roused to fresh vitality under the leadership of Ismail el-Safi, and Shaibek with his army fell before this new power (1510). Under his successors, the Shaibanids, Turkestan still remained for a time a united empire, but then broke up, as had been the case in the later period of the Timurids, and yet earlier under the princes of the Yue chi, into a

number of independent States, whose position and size were prescribed by geographical conditions. The purely nomad countries in this way became, for the most part, independent. The people of the Kirghiz, who inhabited the steppe to the north of the Aral Sea and Lake Balkash, had only partially submitted to the House of Timur and the Uzbeks. The decline of the empire of Kipchak gave these nomads an increasing degree of liberty, until in the sixteenth century two empires were formed in the southwestern Siberian steppes,—that of the Ulu Mongol and that of the Kirghiz proper, or Cossacks, under the Khan Arslan, who brought numerous other nomad tribes of Central Asia under his rule. The Kirghiz Empire prevented the Uzbeks from encroaching further to the north, but subsequently it broke up, that is to say, the nation of the Kirghiz divided itself into several hordes. In the eighteenth century we find the Southern Kirghiz, who were comparatively the most highly civilized and were partly settled, forming a State in the region of Tashkent. They subsequently commanded the middle course of the Syr Daria. The purely nomadic elements of the people formed the Great, the Middle, and the Small Horde. Among the Kirghiz there lingered a trace of the old warlike and predatory spirit of the Central Asiatics, which the surrounding nations must have often felt to their prejudice. At the beginning of the eighteenth century there was formed a league of the Dzungarians, the Bashkirs, the Calmucks of the Volga, and those Cossacks who were already settled in Siberia as Russian advance guards, which reduced the Kirghiz to such straits that in 1719 they vainly appealed to Russia to interfere. Turkestan, the capital of the Middle Horde, lying on the right bank of the Syr Daria, was taken by the Dzungarians. Part of the Kirghiz submitted, the others retreated toward the south. Soon, however, they advanced again and won back their country, though only to fall more and more under the influence of Russia.

The two towns of Turkestan and Tashkent were in the Middle Ages commonly regarded as forming a part of the province which went by the name of Maurenahar (*Ma wara'l-nahr*, p. 180), and included the civilized parts of the province of Western Turkestan. Their relations with the nomads were of a fluctuating character. If the power of the Kirghiz diminished, then they or their Uzbek princes were practically independent, but if it again increased, then they were more or less subject to nomad rule. For the time being they were attached to the Uzbek empires. The Dzungarians possessed Turkestan in 1723, but after 1741 the Kirghiz were again masters of the town. In the year 1780, Yunus Khoja of Tashkent inflicted so crushing a defeat on the Kirghiz of the Great Horde, and inspired such terror by the massacre of several thousand prisoners, that they acknowledged him as their supreme lord.

(b) *The Uzbek States of Khiva, Bokhara, and Khokand, after 1500.*—Maurenahar, owing to the nature of its soil, is divided into different regions, from which in the course of history corresponding States have been developed: the district on the lower course of the Amu Daria (Khiva), that on the middle course of the same stream with the valley of the Zarafshan (Bokhara), and the upper valley of the Syr Daria (Ferghana, Khokand). In addition to these the country on the upper Amu Daria (Balkh) often formed a separate State; but this latter region soon fell under the influence of Afghanistan, when a stronger empire was formed in the south. The middle and lower course of the Syr Daria were so much under the influence of

purely nomad tribes that no powerful States could have been formed there. Not infrequently the upper valley of the Zarafshan, with its capital Samarkand, detached itself from the region of Bokhara and constituted a separate State (Mau-remnahar in the more restricted sense).

Of these States Khiva (Kharismia) had been at first seized by the Persians after the defeat and death of Shaibek Khan. But since the Persians soon made themselves unpopular with the strictly Sunnite inhabitants of the country by favouring the Shiite propaganda, an insurrection broke out in 1515, headed by the Uzbek prince Ilbars; with the help of his brothers he gradually drove out the Persians from all the towns in the country and made successful attacks on Khorasan. Further developments in that direction were checked by the Turkoman tribes, who even then regarded the steppe on the borders of Persia and Khiva as their exclusive property. Since the brothers of Ilbars had firmly established themselves in different towns as feudal lords, there could be no idea of any close union after the death of the first monarch. It was not until the feuds between the various vassal princes had somewhat calmed down and the Turkomans were pacified, that the Uzbeks of Khiva with those of Bokhara could renew their attacks on the territory of Persia. The Sefewide Tamasp I of Persia finally had no other recourse than to ally himself by marriage with the royal family of Khiva, and to purchase with a large sum a treaty which ensured peace for his frontiers. Fresh disorders in China ended with the almost entire extermination of the descendants of Ilbars by Din Mohammed Sultan, who divided the country among the members of his family and was proclaimed Khan (1549). He took from the Khan of Bokhara the town of Merv, that ancient outpost of Persian culture, and made it his capital. After his death, however, in 1553, Merv soon lapsed to the Persians. The Khan of Bokhara, Abd Allah, repeatedly interfered in the ensuing disorders, until he succeeded in making himself master of the whole realm (1578). It was not until 1598 that one of the expelled princes was able to seize the greater part of the country.

Nor was this the last time that Khiva was harassed by civil wars. Princes of the reigning house were allotted towns which they governed almost independently, relying sometimes on the Uzbeks, sometimes on the Turkomans, the Naiman, the Kirghiz, or the Uigurians, the remnants of whom were living in Khivan territory. Toward the middle of the seventeenth century, when Abu'l Ghâzi I Behâdur (1605-1664) distinguished himself as prince (1644-1663) and as historian of the descendants of Genghis, the Calmucks (p. 192) extended their rule over the Kirghiz steppe as far as Khiva. The struggles with these new antagonists, and renewed wars with Bokhara, filled up the succeeding decades. Then a more peaceful period set in; the Khan, who resided in Urgenj or Khiva, was really only the most powerful of the numerous vassal princes, who lived in the various towns and sometimes fought out their petty feuds among themselves. The characteristic feature of the history of Turkestan in modern times is this pettiness. In the eighteenth century the Kirghiz of the Small Horde got the upper hand in Khiva, until in 1792 an Uzbek chieftain founded a new dynasty, which lasted until 1873 (cf. below, p. 223). Bokhara, the central province of Western Turkestan, also played no further important part in the world's history. At first the descendants of Shaibek Khan established themselves there; one of these, Obaid Allah (1533-1539), waged war with Persia, if we may apply such a

term to his marauding expeditions. The most important of the Shaibanids, Abd Allah II (1556–1598), attempted with better success to reach a higher stage of civilization. In the year 1599 a dynasty from Astrakhan (the Janids<sup>1</sup>) came to the throne, having migrated back again from the Khanate of Astrakhan to Transoxiana in 1554. The Khanates of Balkh and of Samarkand soon completely severed themselves from Bokhara; the political downfall of which became still more complete when Nadir Shah of Persia, in the year 1737, took vengeance for the constant raids on his frontiers by a victorious campaign. A new Uzbek dynasty, that of the Mangites,<sup>2</sup> which also boasted of Mongol descent, drove out the House of Astrakhan and occupied the throne of Bokhara until 1868 (cf. below, p. 222). Ferghana, or the Khanate of Khokand, was the country where the Timurids had held their own for the longest period. It then fell into the power of the Shaibanids and House of Astrakhan, but won in 1700 complete independence, which it preserved until 1876. Owing to the geographical position of Ferghana, the Persian power, which Khiva and Bokhara were always forced to respect, was unimportant in those parts, but in return the affairs of Eastern Turkestan and the Kirghiz steppe demanded continual attention; for example, the campaign of Yakoub Khan, who temporarily drove the Chinese out of the Tarim basin, was commenced from Ferghana (p. 195). In the year 1814 Khokand, which was then gaining strength, conquered the southern Kirghiz steppe with the towns of Tashkent and Turkestan, and thus exasperated the jealousy which Bokhara had always felt toward Khokand since the rise of the Mangite dynasty. Khokand was finally conquered in 1841 by Nasr Allah of Bokhara (1827–1860), and notwithstanding frequent rebellions it continued in this subjection until the appearance of the Russians in Central Asia — an event of which we shall have more to say hereafter.

On the whole the Uzbek period was for Turkestan an age of petty struggles, which shows little genuine progress in civilization. A nomadic spirit was predominant in the population, which showed itself in ceaseless raids upon Persia. The international traffic, which once had brought prosperity to Turkestan, was diverted into other channels, and the formerly wealthy cities showed but the shadow of their earlier magnificence.

4. SIBERIA AND ASIATIC RUSSIA

SIBERIA lies, like the body of some giant half-numbed with frost, between the Mongol steppe and the icy waters of the northern Arctic Ocean. This enormous territory, with its magnificent rivers, would offer a boundless store of wealth to the inhabitants, were it not that a terrible climate blocks the mouths of the rivers with ice, changes the soil of the vast plains into swamps and barren tundras, and even

in summer keeps the ground hard frozen beneath its surface. It is true that the country which we call Siberia falls into various divisions according to the climate. The northern tracts, which can hardly support a thin and widely scattered population, abut farther to the south on a region of forests, which are especially dense in the mountainous east, while in the level west the steppe begins which stretches without a break to Turkestan and Eastern Europe. Various economic zones are thus produced: a North Siberian, embracing the tundras, which is broader in the west than in the east, a West Siberian prairie zone, and an East Siberian forest zone. Besides these the east coast must be reckoned a separate economic region; while the northern sea is of little value to the inhabitants of the tundras, the east coast with the lower Amur and Kamchatka may be called a strip, where fishing is the staple means of existence.

#### A. THE HYPERBOREAN ZONE

THE various forms of social economy which exist in Siberia are not, of course, restricted to this region. The climatic zones, however much the differences of height in the countries and the influences of the temperatures of the sea complicate the simple conditions, taken as a whole encircle the earth in belts. Inside these belts we find everywhere peoples who are subject to almost the same natural conditions, and have adapted themselves in their way of life to these circumstances. Thus tribes which are of completely different origin show in this way an affinity of habits and customs which is often closer and more marked than that of blood; for example, the Arab nomad of the steppe resembles the Mongol, and the roving Bushmen of South Africa have more resemblance to the Australian black than to the Nigritian agriculturist. It is not, however, the climatic conditions only which affect the economic life of a people; the possibilities of intercourse form an additional factor. If, for instance, the nomadic methods of life, for which large portions of their country are adapted, had been known to the isolated Australians, the Europeans on their landing would have found a quite different people, capable, probably, of offering a stronger resistance. On the other hand, a good example may be despised: the Bushman has learnt nothing from his cattle-breeding neighbours. Peculiarities of character which have been acquired by a long process of heredity and natural selection, but are difficult to express and define accurately, play an important part in this. In spite of these limitations, the climatic-economic zones gain importance in proportion as the other sources of historical knowledge grow scanty. From this aspect we cannot treat the northern Siberians merely as a distinct group of the human race, but must investigate the economic zone to which they, in common with American and European stocks, belong, — that is to say, the northern polar zone, whose inhabitants have been called by the collective name of Hyperboreans (see the map, "North Polar Regions").

The main features of this universal Hyperborean civilization are determined by the direct and indirect influences of the climate; on the other hand, the separate branches into which it is divided are differentiated by the specific character of each several region, by its position as regards the rest of the world, and by the type of its inhabitants. The direct influence of climate appears very distinctly in modes of dress and domestic architecture, since among the Hyperboreans some special protection for the body is absolutely necessary, owing to the inclemency of the weather. The indirect influences of climate show themselves in the fact that

the number of edible plants is very small in the north. For food and for the paraphernalia of civilized existence the peoples of the north rely chiefly on the abundant fauna of those regions. The extensive and almost exclusive employment of animal and mineral in the place of vegetable products is the most striking characteristic of the Hyperborean culture.

This culture appears in its purest form among the Eskimos of America, since hardly any southern influence is perceptible among them. Utensils and weapons of bone, horn, and stone, fur clothing, houses and tents constructed from stone, blocks of snow, or skins, are the characteristic features; to which we may add, as peculiarities equally produced by the climate, snow-shoes, snow spectacles, and sledges drawn by dogs (cf. Vol. I, p. 131). The Eskimos show at the same time that the Arctic tribes, like all other primitive races of the globe, at first practised a purely acquisitive economy. They obtained the greater part of their subsistence by hunting or fowling, or, to a less extent, by fishing. Wild plants, in so far as they were suitable for food, were by no means despised. Indeed, among the southern Ostiaks roots and bulbs constituted a considerable part of their diet, but there is nowhere any idea of agriculture. Still less was there any notion of breeding domestic animals, with the solitary exception of the dog, which almost everywhere on the earth is the companion of man, even among the roving nations, and has acquired a peculiar importance among the Hyperboreans. In these regions the dog, as a beast of draught, improves the mobility of the inhabitants, and thus widens the area from which they satisfy their needs. In winter also, when provisions are scarce, he serves his master as food; usually only a few dogs are left alive in order to keep up the breed.

Like these tribes, the European inhabitants of the southern ice-belt lived, during the diluvial period, in the most simple Hyperborean fashion, as we learn from prehistoric finds. Like the Eskimos, they delighted in a rude form of art, which aimed at a realistic representation of animal and human forms (see Figs. 20-22 of the plate p. 120 in Vol. I), and may in essentials correspond directly to the character and inclinations of these purely hunter peoples. In order to explain this affinity, it is not necessary to dwell upon the former junction of Greenland with Western Europe, though this may have facilitated migrations among the Arctic nations (see the soundings marked in the accompanying map, "North Polar Regions"). But, strangely enough, the Asiatic and the modern European Hyperboreans do not possess this fondness for naturalistic art, but prefer a conventional ornamentation. This small trait illustrates the great difference which has grown up between the American and Asiatic polar nations. The former have remained hunters and gatherers of plants; the latter have mostly changed into Arctic nomads, and thus revolutionised their economic principles, their interests, and inclinations. This is the result of a development within historic times, the course of which can to some extent be still followed.

(a) *The Dolichocephalic Hunters and Reindeer-breeders.*—We saw (p. 130) that after the glacial period the north of Asia and Europe was inhabited by a dolichocephalic race which was adapted to a somewhat inclement climate, and was therefore able to colonise the regions now accessible owing to the shrinkage of the great crust of ice. Thus long-headed Arctic hunter nations were found throughout the entire breadth of Siberia, who by their Hyperborean culture were

little by little sharply differentiated from their kinsmen living more to the south. While these, then, were influenced by the higher development of agriculture and metal-working among the short-headed nations of Western and Eastern Asia, and while a northern offset of the copper and bronze culture, whose representatives were mainly dolichocephalic, was traceable on the Altai, the northern Siberians remained almost untouched by these agencies. Tillage was for them a physical impossibility, and the smelting of ore implies an immense supply of suitable fuel, which is almost entirely wanting in the tundras. Some new arts and contrivances may have found their way to the north. Potters and smiths had practised their crafts at an early period in the territory of the Ostiaks; but on the whole the Asiatic Hyperboreans remained a small and poverty-stricken nation of hunters, with whom neither friends nor foes had intercourse. The chase, an occasional fishing expedition, and the berries and cedar-nuts which they gathered, furnished the bulk of their food.

The rise of nomadic pastoral nations, first of Aryan and then of Mongol stock, could not alter these conditions much at first. The device of breeding cattle, horses, or sheep could not be directly introduced into the Arctic regions, even though the Yakuts showed later that cattle-breeding could be successfully attempted in quite northern latitudes. The example, therefore, which was afforded by the nomad tribes of Central Asia, could only produce an indirect effect. It is indisputable that cattle-breeding tribes had been driven to the northern tundras, where their cattle could no longer thrive, so that they were forced to look for some substitute. A long time seems to have passed before the discovery was made that the reindeer could be domesticated like cattle, and could supply milk, draw burdens, or be slaughtered for food. Many tribes have only adopted this new method of economy in modern times,—for example, the Oroks on Saghalien, according to J. A. Jacobsen's views. The Eskimos, although there was always a certain traffic across the Bering Straits, have not yet acquired a knowledge of reindeer-breeding. Even the Kamchatkans at the time of their discovery bred only dogs.

The reindeer has in many ways taken the place of the dog, and, by adding to the mobility of man even more than the latter, it has enlarged the possibilities of existence. It can be used not merely to draw the sledge, but for riding or as a beast of burden, and it finds its own food. It certainly yields far less milk than the cow; but it produces milk on a diet of moss and bents. Thanks to the reindeer, man extracts a living from the vegetation of the tundras. The extent to which the existence of most Asiatic Hyperboreans depends upon the reindeer, is shown by the remarks of Otto Finsch on the dangers of pestilence among the reindeer in Western Siberia. "If the supply of reindeer fail, the indigenous population must sink deeper and deeper into poverty, and be reduced to the status of fishermen living from hand to mouth. Without reindeer the tundra, and the skins, etc., which it supplies, will be inaccessible and useless; without reindeer the natives lose their greatest resource for barter, food, clothing, and shelter." The welfare of the people is not, however, everywhere so closely bound up with the possession of reindeer, since hunting or, after the disappearance of the beasts of the chase, fishing must supply the majority with food. In many places, also, the use of reindeer milk is not yet known or has only recently been learnt. These observations indicate that the breeding of reindeer, to which the Greeks and Romans make no allusion, is not yet of any antiquity. The small number of varieties among the

reindeer, and their general uniformity of colour, are facts which support the same conclusion. When, finally, observation shows that among the most westerly Hyperboreans of the Old World, that is to say the Lapps, the fullest use is made of the reindeer, while the most easterly tribes on the Bering Strait, for example, are not yet acquainted with it, we have some intimation of the source from which the practice of reindeer-breeding has been borrowed, and of the direction in which it has spread. Reindeer-breeding, after all, belongs exclusively to the Hyperboreans. No other nation seems to have served them directly as a model, and none of the civilized nations which have penetrated into the northern regions have imitated them to any appreciable extent.

(b) *Composite Nature of Hyperborean Civilization.*—The inquiry into the characteristics of the Hyperboreans assumes a quite different aspect when we examine the racial affinity of the different tribes. It will then appear that not even the Asiatic Hyperboreans are genuine descendants of that dolichocephalic primitive population which filled Northern Asia and Northern Europe at the close of the diluvial epoch, but that a strong contingent of short-headed peoples was mixed with most of them. This fact is established by an investigation of their languages. The "Yenisseian" languages, which originally were spoken by the dolichocephalic Hyperboreans, were for the most part supplanted by Mongolian or Finno-Ugrian languages, belonging certainly to short-headed peoples. A nation that even in its language has not undergone any change, is that of the Yenissei-Ostiaks, who have been erroneously confounded with the Finno-Ugrian race of Western or Obi-Ostiaks. It is likely that some stray tribes of fair-complexioned dolichocephalic Aryans mixed with the Hyperboreans, as the prevalence of a blond complexion among the Ostiaks seems to prove; it is, however, also possible that among the Hyperboreans themselves, a fair-complexioned variety may have been locally developed. In any case these blonds increase the racial confusion which reigns there. But, on the whole, it can be said that the Finno-Ugrian group, to which most Hyperboreans are usually now assigned, is the product of a mixture of dolichocephalic Hyperboreans on the one side, with brachycephalic Mongols, speaking one of the languages derived from the same stem as the Mongolian, on the other, but that the extent of the admixture may vary greatly in each separate tribe. Community of culture has naturally tended to obliterate the differences which were due to race. But this culture deserves a more minute investigation, since, notwithstanding its genuinely Hyperborean character, it has been compounded of two elements, one of which was peculiar to the old dolichocephalic people or Yenisseians, while the other may be ascribed to the Mongol immigrants. The remnants of the former, which suggest to us the most ancient ways of life and thought in the north, must be followed with especial attention.

One of the most obvious survivals is the Bear-worship, which was originally connected with the idea that the spirits of the deceased were incarnated in bears. As a further development, therefore, the bear appears as a sort of divinity, the lord of the forests, whom men must treat with the most marked consideration, even when they fight or slay him. This cult, still vigorous in the east among the Ainos and the Giliaks, lost hold on the west, though it did not entirely disappear. In Finnish tradition the ancient significance of the bear is still most prominent. The Ostiaks and Vogules celebrate the slaughter of a bear with feasting, and

swear by the paws and the skin of the beast. According to Wilhelm Radloff, the Yenissei-Ostiaks in particular, the purest remnant of the old population, observe these customs.

A second peculiarity of the ancient Hyperboreans is the great importance which they attach to mystic implements, the original meaning of which is hard to arrive at. We may especially notice sticks hung with rags or similar things. Georg Wilhelm Steller (1709-1746), relates of the Kamchatkans that they worship "fly-whisks," that is, sticks hung with grasses, as gods, under the name of Inoul; the grasses being intended to represent the curling hair of the deity. The Ainos make similar sacred emblems for themselves; they leave half-cut shavings fluttering at the end of a stick, so that a sort of whisk is produced. Similar things can be traced to Southern Japan; even the ancient Shinto religion (cf. p. 3) includes among its sacred implements sticks wrapped with strips of paper (Gohei). As usually happens, the traces of this primitive implement of magic grow less frequent as one goes westward, but an attentive search will show a fair number of instances. Among the Tartars of Minusinsk, who certainly possess a strong element of Hyperborean blood, staves hung with rags are much used in the Shamanist ritual, and the Tartars of the Bureya mountains worship festoons of leathern strips and scraps of cloth as divine objects. Even among the Magyars, the custom of constructing "rag-trees" can be shown to have existed even in modern times.

Genuinely Hyperborean is also the belief in a subterranean world precisely similar to the upper world; the severity of the climate does not encourage the thought that the future world lies in the cold clouds, but it guides men's looks to the warm and sheltering earth. This trail is harder to follow, since the belief in subterranean realms can be found elsewhere; only among the more southern nations do we find that the lower world assumes a gloomy character and is contrasted with the bright celestial abodes. Finally, the art of ornamentation shows a surprising affinity throughout the whole of Northern Siberia. Once more the most recognisable remains of this old art are to be found in the east, although the patterns used in ornament can be traced far in the west among Samoyeds and Ostiaks.

In all these matters a long period of development is implied, which is produced less from great wanderings and shiftings than from slow transpositions which can only be followed in their results. Aggressive wars on a large scale, resulting in ethnical displacements of a sudden and important nature, can hardly have occurred in the Hyperborean region in antiquity. The warlike nomads of the south, to whom the rich civilized countries lay open, ventured occasionally on marauding expeditions into the "land of darkness;" but the nature of the country prohibited wide conquests, for it could not feed large armies, and was only accessible to the native who had sledges and reindeer and dogs at his disposal.

(c) *The Northern Migration of the Yakuts.* — If, nevertheless, Mongol elements have gradually mixed with the Hyperboreans, it is only a question of detached fragments which have been forced into the inhospitable northern realms. A comparatively recent example of this is shown by the Yakuts, who are at present settled in the district of the Lena, as far as the Arctic Sea. The Yakuts are genuine Turks who still cherish the memory of their southern origin. It is con-  
jec-

tured that the Bureyats, who at the time of the first Mongol invasion in the thirteenth century pushed on from the Amur into the region round Lake Baikal, drove them to retreat to the north, when they thrust themselves between the Tungusian tribes (cf. below, p. 214). They adapted themselves admirably to their new country, without, however, abandoning their original industry of cattle-breeding. The kine of the tribe acclimatised themselves to their new home, and gave the energetic Yakuts a better means of subsistence than the Tungusians and Ostiaks possessed in the reindeer. The Yakuts, who retain a trace of nomad love of enterprise, are certainly superior to their neighbours in industry and vigour.

### B. THE WEST SIBERIANS

THE nomadic West Siberians on the one hand, and the East Siberian hunter peoples on the other, are groups distinct from the genuine Hyperboreans in their modes of life, although both are ethnically more or less akin to the old dolichocephalic races of the Arctic regions.

While the Hyperborean tribes as a whole lived undisturbed in their inhospitable regions, and for their own part can hardly have felt any inclination to seek new homes in more southern lands, the inhabitants of the West Siberian steppes (see the map, p. 208) had been drawn into many of the great movements of the nations of Central Asia, and their territory had often formed a part of nomadic world empires. The West Siberians, in the more restricted sense, from whom the northern Arctic peoples are to be distinguished, inhabit a steppe country which is turned to the best advantage by such a combination of cattle-breeding and hunting as forms the staple means of subsistence among the Huns and Mongols. It naturally follows that restlessness is innate in the West Siberians. In fact, the era of the Huns roused up a people there which exercised a lasting influence on the development of European civilization. — the people, that is, of the Magyars.

(a) *The Magyars, Alani, and Avars.* — The Magyars, differing from the Osmons, whose zone of expansion touched their own in their power of adaptation to European ways and thought, attached themselves more and more firmly to their new home, while the Turk was slowly driven back from the soil of Europe. That they succeeded in thus adapting themselves is partly the result of their ethnical affinities. At the dawn of history, we find Southwestern Siberia filled with Scythian peoples who were mainly of Iranian stock, and therefore belonged to the fair-complexioned and dolichocephalic group of European nations (cf. Vol. IV, p. 73). It was probably through these Scythians that the hunter nations living farther to the north, who were akin to the dolichocephalic Hyperboreans, became acquainted with nomadic ways of life; and this result was hardly effected without a mixture of races. At a later time the Mongol nomads drove out or absorbed the Scythians, and, by intermingling freely with the West Siberians, imparted to the latter a Mongol language and physique without, however, destroying the central nucleus of this people; the Volga-Finns remained distinctly dolichocephalic. In this way is explained the surprising phenomenon that the modern Magyars by their appearance bear little resemblance to the inhabitants of the steppes of Central Asia. Later admixtures with European peoples have naturally tended to produce the same result.

The Ural formed no impenetrable barrier for the Finno-U'grian peoples, or, to speak more correctly, the mixture of races, from which they sprung, took place in the steppes of Eastern Europe; the Ural-Altai stock spread as far as the Volga in the south, and Finland and Norway in the north. The similarly compounded nation of the Alani, in which Iranian and Mongol elements were more strongly represented than the Hyperborean, kept the Finnish tribes in Western Siberia and Eastern Europe for a long time aloof from contact with the world of civilization. It was only when swept forward by the great Hun onrush that it left an open road for the Siberian nomads, dwelling further to the north.

History tells us little about the earlier condition of the Finno-U'grian nomads, who then for the first time attracted the attention of the civilized world. It seems that a line passing through Tobolsk, Tomsk, and Krasnoiar'skoi represents the northern frontier of the true nomad peoples and the Hyperborean hunting-tribes; for the stupendous sepulchral mounds (Kurgans, Vol. IV, p. 76), so characteristic of West Siberia, are only found to the south of this line. The contents of these tombs make it at once clear that the culture of the nomads was closely connected with that of the Altaian region, which, from its use of bronze and copper, may be regarded as an offshoot of the ancient civilization of the south. The frontier towards the Hyperboreans may gradually have been shifted further northward. The introduction of reindeer-breeding possibly modified the differences between the nomads and the northern hunters. No accurate information is forthcoming as to the original homes of the Magyars; but the great number of Turkish words in their vocabulary shows that they lived comparatively far to the south of West Siberia and found opportunities of mixing there with Turkish tribes. They were there drawn into the great westward movement of Central Asiatic peoples, which lasted for centuries after the descent of the Huns upon Europe. They were preceded by a people with whom they had much in common, the Avars, a branch of the Yen Yen, who, after the destruction of their Central Asiatic empire, pushed toward the west, and in this movement carried Uigurian tribes with them. They invaded the modern Hungary about 565 and held their position there until their overthrow by Pepin, son of Charles the Great, in the year 796. In the meanwhile the Magyars, who had already reached the Volga in 550, had followed on their tracks until they appeared in the year 886 on the Danube and founded a new and more lasting empire in the former territory of the Avars. In contrast to their distant kinsmen the Bulgarians south of the Danube, who exchanged their language for a Slavonic dialect, they preserved their own peculiar tongue, and in doing so insured the permanence of their nationality.

(b) *Ugrians*.—After the disappearance of the Huns and Alani, and after the withdrawal of the Magyars, the nomad nation of the Kirghiz, or Cossacks, came more prominently into notice in Southwest Siberia. The tribes of the northwest, on the other hand, are included under the generic name of Ugrians, and their country is called Ugría. This, notwithstanding its remoteness, attracted some notice from an early time, since it became an important district for the fur trade, and also communicated with Europe through the passes of the Ural range. Ugría shared on the whole the political destinies of the districts lying immediately to the south; both the one and the other were usually attached to the great nomad empires of Central Asia, first to that of the Turks, then to that of the Uigurians.

The Kirghiz themselves, the chief nation in Southwest Siberia, formed at a later time a powerful empire of their own. The new wave of conquest, which surged outwards from Central Asia in the Mongol era, naturally poured over Western Siberia. On the dissolution of the mighty Mongol Empire the country formed part of Kipchak, which, in addition, included the steppes as far as the sea of Aral and the Caspian and the lowlands of Eastern Europe. An attempt of the Mongol general Nogai, the grandson of Teval (p. 179, note), to found in the north an independent State, finally failed (1291); but his followers, who from their leader's name are known as the Nogais, held their own in West Siberia and South Russia. After that, we hear little of Ugría as a part of the Mongol Empire, not even at the time of Timur, who temporarily annexed Kipchak to his ephemeral world empire. Timur on one occasion only (1391) penetrated by a laborious march through the steppes of Southwest Siberia, as far as the Irtysh and Tobol, but he then turned westward to the lower Volga.

But although Ugría had politically little importance, steps were taken at an early time to develop its industries. As early as the eleventh century merchants from Novgorod reached the country and opened up a trade in furs. These commercial relations became more frequent as time went on; Novgorod established fortified factories, and finally the natives were regarded as subjects of the powerful commercial city, and were required to pay a fixed tribute in skins. At that period the country appears to have also supplied valuable metals. In the year 1187 the tribes of Ugría, who were governed by different princes, revolted. In 1193 an expedition from Novgorod against Northwest Siberia proved disastrous, and before fresh operations could be undertaken, the period of the Mongol conquests dawned. Novgorod, however, contrived to come to terms with the new rulers and to resume her trading expeditions, so that even then the connection of West Russia with Ugría was not entirely interrupted.

(e) *The Empire of Siberia*, — On the fall of the empire of Kipchak the leaders of Nogaian hordes began to found small principalities in Ugría. When Timur died, On was the most powerful of these princes of Siberia, as the country was now called for the first time; but, besides his Tartar rivals, he had to reckon with the men of Novgorod who had once more acquired a footing in Ugría. On, having been dragged into the succession-wars of Kipchak, was defeated and slain, whereupon his son Taibga turned his attention toward the lower Tobol, drove the Novgorodians thence, and founded a small kingdom, the capital of which corresponded roughly to the modern Tiúmen (see map, p. 208). There were incessant struggles with the Ostiaks and Vogules, with the Kirghiz and with the Mongol rulers of Kasan. It was connected with these events that Ugría in 1465 became tributary to the Russians, who now appeared on the scene as a new great power. The destruction of Novgorod by Ivan the Terrible transferred to Russia all claims of that ancient commercial city to the supremacy. In the year 1499 the districts on the lower Obi were incorporated in Ivan's dominions. The Tartar prince of Tiúmen removed his royal residence to the country of the modern Tobolsk, where he built the fortified town of Isker or Sibir. The Siberian princes, who in 1557 wisely agreed upon an annual tribute to Russia, remained there undisturbed for some considerable time.

Besides the "Siberian" Empire other Tartar principalities must have existed in Western Siberia. These examples of organised constitutions were not left unnoticed

by the Ostiaks, the most southerly of the Hyperborean nations; probably attacks of the Tartars forced them into closer combination. Every small Ostiak horde was soon in possession of a *rosh*, or little town, where the chief developed his power on the model of the Tartar princes. Every fortified spot thus became the centre of a petty principality; several of these small States were, later, occasionally united into one large State. The strongholds lay on heights above the rivers and were fortified, on the Tartar model, with ramparts, ditches, and palisades. According to legend, there were some of the smallest size which were armoured with plates of copper. Numerous remains of these are to be found even to-day in Western Siberia: the southern fortresses, built by Tartars, are much superior to the northern, which are to be ascribed to the Ostiaks. The Ostiak principalities had only a very thin population; the largest of them, Tiaparovsh, in the modern province of Tobolsk, hardly put three hundred armed men into the field, which implies twelve hundred inhabitants at most, while the smaller could only reckon some hundred souls or less. In face of this political disunion the merchants of Novgorod might well have ruled as kings for a while. The principalities of the Tartars were somewhat more important; Siberia, the most powerful of them, might have boasted a population of thirty thousand or so.

In this empire of Siberia a revolution was consummated in the second half of the sixteenth century. The reigning prince Yedigâr (Yadgar) was overthrown and Siberia was conquered in 1563 by the Uzbek chief Kozum (Kuchum) who adopted an aggressive policy toward his neighbours and assumed the proud title of Emperor of Siberia. But at the same time with crafty calculation he began to enforce the creed of Islam amongst his mostly heathen subjects, for which end he applied to the prince Abd-Allah at Bokhara for the necessary missionaries. If this measure had not been adopted too precipitately, and had not the encroachment of a new power materially altered the state of affairs, the prestige of the Siberian Empire would have been extraordinarily enhanced. In a country so vast and so sparsely populated a closer union could not be looked for unless some spiritual bond, such as Islam offered, brought the separate national groups nearer together. At the same time Mohammedan fanaticism was a splendid weapon against the Christian Russia. Since, however, the Mohammedan propaganda met at first with vigorous opposition, especially among the Ostiaks, it conduced rather to the weakness of the empire, precisely at the moment when the great merchants of Eastern Russia, who had suffered heavily by the attacks of the Siberians, sent the Cossack chief Yarmak to Ugrïa. The accounts of this expedition (cf. below, p. 218) show that a number of petty Tartar principalities existed in Ugrïa, more or less dependent, according to circumstances, on the Siberian empire. The national strength, as well as the majority of the inhabitants, lay along the rivers and streams; and along the rivers also the Russians pressed forward, as they took possession of the limitless plains of Siberia. The southwestern steppe, the home of the Nogai and Kirghiz nomads, preserved its independence far longer than the Ugrïan north.

### C. THE EAST SIBERIANS

THE east of Siberia is principally mountainous, and the tundras here lie farther to the north than is the case in the west (see the map "Siberia"). The industries which this hill country may profitably support are very various. In parts it is so

# SIBERIA.

Natural scale 1:21000000.

Scale of Miles

RUSSIAN EMPIRE

Siberia is divided into the governments of Tobolsk & Tomsk & also the general governments of Irkutsk & Amur for the districts in the latter in to provinces as the map. The principal places of the governments & provinces are understood.

China & Empire

rich in forests and game that the chase, and as a consequence of that the fur trade, could in themselves support a really considerable population, while on the numerous rivers another branch of merely acquisitive industry, fishing, may be profitably pursued. In the more southern parts there are numerous hills and plains, suitable for agriculture, as well as stretches of pasture land, well adapted for cattle-breeding. The increase of the population is not, therefore, restricted by any hard and fast limitations. On the other hand the mountainous character of the country checks those vast migrations of peoples which are so conspicuous in Central Asia. Only the southern border of East Siberia was involved in them, or, to speak more correctly, it was a nursery for those nations which inundated Central Asia or China from that quarter. The country round Lake Baikal was the cradle of the Mongolian and Turkish tribes; but many, though in their influence less important, nations of conquerors poured forth out of Manchuria.

(a) *The Northern Migration of the Tungusians.* — From this southern border migrations were made toward the north also, which gradually changed the ethnic character of the regions adjoining the North Pole; but it was naturally a long series of slow movements which brought about this result. It is more than probable that in early times there was in East Siberia no break in the chain of Hyperborean tribes which stretched from Northern Europe along the shore of the Arctic Ocean to America and Greenland; this view is supported by the connection between the ancient civilizations of the Western Hyperboreans and the small nations on the shores of the Bering Sea (p. 214). This chain was, however, snapped by the northern migration of the Tungusian nation, which had been formed in the southeast highlands of East Siberia mainly of Mongoloids, but with a strong infusion of Hyperborean blood; we must regard the Nu chi (p. 212) and the Manchus (p. 213) as the people most nearly akin to it.

The Tungusians are remarkable as an instance of a primitive people whose language and national customs are not closely connected with their manner of life. The explanation is found in the natural configuration of the country, which offers several possible means of livelihood, and in its position, lying as it does close to the nomad territories of Central Asia, the agricultural districts of China, and the Arctic hunting-grounds. It follows that no nation perhaps has so easily changed its method of living and adapted itself to different conditions of existence as the Tungusian. When at first there was only a superficial knowledge of the Tungusians a distinction was made between the different groups according to their way of life; there were thus Tungusians of the steppe, or of the forest, and Tungusians employing the reindeer, the horse, or the dog. In this sense one could also speak of agricultural Tungusians in the south. There are accordingly genuine hunters, nomads of the steppe, Polar nomads, and settled agriculturists among this many-sided nation, the individual tribes of which have even in modern times, at great crises, placed their mode of life on a new economic basis; for example, Tungusians who have lost their herds of reindeer from pestilence have taken up dog-breeding, and agriculturists, who had pushed on to more northern regions, have learnt to become once more simply hunters and fishermen. In earlier times, as to some extent even now, the chase was the most important industry of the Tungusians, whose life clearly shows the traits of a nation of mountaineers and hunters. Observers have unanimously described the true Tungusians as brave and yet good-

natured, trustworthy and honourable, industrious and intelligent. It is owing to these qualities, coupled with their great capacity for adapting themselves to all economic conditions, that the Tungusians were able to expand farther to the north and practically drive out the Hyperboreans. We still find, as relics of the old Arctic nations, Samoyedes on the Taimir peninsula, Yukahires on the coast of the Arctic Ocean east of the mouth of the Lena, and Chukehis on the great northeastern peninsula which terminates in the East Cape.

The Tungusians did not remain undisturbed in their new possessions. Just as Manchuria, that cradle of nations, had sent them northward, so in the Mongol period the Yakuts, came to the Arctic regions from that other cradle on Lake Baikal, and made a broad road for themselves through the Tungusian territory down to the mouth of the Lena. The Hyperboreans seem, so we may conclude from the traditions of the Samoyedes, to have given way at an earlier time before the Tungusians with more or less of a good grace. The warlike Tungusians, on the other hand, only allowed their country to be taken from them after desperate battles, the most fierce of which is said to have been fought not far from the confluence of the Patoma and the Lena. The victorious Yakuts introduced cattle-breeding into the Arctic regions (cf. above, p. 204). In the northeast also, the Tungusians were again driven back, this time by the Chukehis, whose strength and mobility may have been greatly increased by the introduction of reindeer-breeding.

(b) *The Southeastern and Southern Branches of the Tungusians.* — Although their northern migration spread the Tungusians over enormous tracts, yet, since the polar regions can only support a small population, it was on the whole the least important of the ramifications of Tungusian tribes, which spread from Manchuria in every direction, with the exception perhaps of the purely western one. Far more important was the advance of the Tungusians to Korea and Japan, which, like the later wanderings toward the south, seems to have been effected under the indirect, but early felt, influence of Chinese civilization. The Tungusian tribe of the Suchin, settled in Manchuria, paid as early as 1100 B. C. a tribute of stone arrow-heads to China. The Chinese political system, on the one side, and the nomad empire of the Hiung nu, on the other, soon served as models to the Tungusian peoples, only that the latter, in accordance with their national character, showed a tendency to republican, or, at any rate, federal forms of government.

(a) *The Wu hwan and the Sien pē.* — The first instance of this kind was apparently the tribal league of the Wu hwan (p. 140) in Western Manchuria, which flourished shortly before 200 B. C., but then succumbed to the superior power of the Huns, and only preserved a remnant of independence by placing itself under the protection of China. In the east of Manchuria, on the other hand, the Sien pē (Hsien pi) organised themselves; some of them advanced to Korea and thence to Japan, where they exercised great influence on the ethnic characteristics of the population. This "advance" was more probably a retreat before the Huns, who in 209 B. C. had broken up the western Tungusians and were now pressing hard on the eastern section. It is open to question whether the migration was really led by Chinese, as the historians of the middle kingdom tell us; but there is no doubt that the Tungusians brought with them to Korea and Japan a civilization which was deeply tinged with that of China: the germs of the Japanese State (p. 8) point to a Chinese model.

The main body of the Sien pē remained behind in Manchuria, where it gradually acquired strength, while the Wu hwan in the year 77 B.C. were again defeated by the Huns and then completely humiliated by the Chinese. When the northern empire of the Huns broke up in 84 A. D. (p. 142), the Sien pē seized the greater part of Mongolia and, varied though their fortunes were, long remained the first power in eastern Central Asia. Their empire attained its greatest size about the middle of the second century, when Tunshih huai extended its frontiers beyond the Tianshan and the Altai (p. 156); according to Hun fashion it was divided into a central province with an eastern and a western wing. The wide diffusion of the Sien pē over the steppe country of Central Asia proves that they were predominantly nomadic in their way of life. The uncultured Tungusian inhabitants of the shores of the Pacific, mere tribes of fishermen, took no part in political organisation, while the southern and settled Tungusians in Liautung, which had even then a strong admixture of Chinese blood, had founded a State on the Chinese model, which was now required to recognise the suzerainty of the Sien pē.

The empire of the Sien pē lost ground at times after the death of Tunshih huai. But the nation still held the inheritance of the Hun power for centuries, monopolised the western trade, and attempted to gain influence over China. There soon arose in the middle kingdom, which was torn by civil wars, States with Tungusian dynasties, whose founders had forced their way into China as chiefs of separate tribes of the Sien pē, or as leaders of mercenaries. In Liautung the Yumen in the year 317 A. D. founded an empire, which embraced later a large part of North China and Korea; other powerful tribes were the Twan, the Mu sung, and especially the To ba. The greater part of China stood for centuries under the sceptre of Tungusian princes. These, however, quickly became Chinese in sympathies, and were absolutely no support to the empire of the Sien pē; indeed they knew how to protect their new homes against the attacks of their kinsmen better than the Chinese themselves. Notwithstanding a temporary rally in the fourth century, the power of the Sien pē sank; their western possessions fell to the Yen Yen and later to the Uigurians and the Turks, so that nothing was left them but Manchuria and the eastern border of the Central Asiatic steppe. They then constituted only a loosely compacted body of separate tribes, which was sometimes welded more firmly together by an energetic leader. Isolated groups had pushed southward as far as Kuku Nor, where a not unimportant State of the Sien pē arose in the fourth century. When great powers, such as the empire of the Turks (p. 159), were formed in Central Asia, the various Tungusian tribes fell under their sway; if China gained in strength, she extended her influence over them. The tribe of the Sien pē gradually entirely disappeared and others assumed the headship. In the seventh century the empire of Pu hai (Bo khai) was formed in Manchuria, which soon attained a great prosperity.

(β) *The Khi tan, Nu chi, and Manchus.* — The Tungusian peoples of Manchuria became once more important for the outside world at the beginning of the tenth century, when the tribe of the Khi tan (Kidani, Kathai; see map, p. 174, and cf. p. 57) extended its power. The Khi tan were a people deeply tinged with Chinese culture and also mixed with Chinese blood, such as might be expected to arise on the borders of Liautung; in their national character the rude vigour of the savage was harmoniously blended with the usages of a higher stage of civilization.

Under the leadership of Yü A pao chi, who deliberately encouraged this mixture of races by transporting Chinese prisoners to Manchuria, they hurled themselves in 907 against Ta tung fu in Shanshi, where the overthrow of the Tang dynasty had lately led to civil war. In the year 947 the power of the Khi tan, who in 924 had subjugated the empire of Pu hai and later also a great part of Mongolia, and whose leader (d. 926) styled himself after 916 Tai Tsu, "emperor," reached the zenith of its power, only to sink rapidly. Nevertheless their empire, which in 937 had assumed the official title (Ta) Liau = (great) Liau dynasty, held its own until 1125, when another Tungusian race, the Kin or Nu chi, won the supremacy in North China. These in turn succumbed before the Mongols in the year 1234 and even Manchuria became tributary to the new ruling people. When the Mongol dynasty was forced to retire from China (1368), the southern cultivated districts remained more or less dependent on China, while the northern tribes, so far as they were not harassed by the advance of the Yakuts, were of little importance in their disunited condition. The Chinese long succeeded in hindering the reconstruction of a Tungusian State, which, as experience taught them, would have soon encroached on the south by carefully fomenting all petty jealousies. Manchuria was then divided into four Aimaks, which were almost incessantly at war one with the other. It was not until the beginning of the seventeenth century that the combined strength of the country found a vent for itself in one irresistible outbreak. In the year 1608 an insurrection, produced by the extortions of the excise, ought to have warned the Chinese to act carefully, but, before that, a small spark had caused a fire, which, neglected for a time, continued to smoulder until it finally overwhelmed the whole of China.

A petty prince of the Manchu race had been defeated and killed by his opponents with the help of the Chinese. An avenger of his death arose in his son Nurehazi (Tai Tsu, Kao huang ti, or Aisin Gioro; p. 101), who took the field in the year 1583 with thirteen mail-clad horsemen and, after long years of fighting, united the Manchus under his rule (1616). The Chinese then for the first time began to notice the danger, but could not decide upon any thorough-going measures. Threats from the Chinese gave Nurehazi the welcome pretext for invading in 1623 the Chinese frontier-province of Liantung and thus initiating a series of battles, which sapped the strength of China and shattered the power of the Ming dynasty. In the year 1625 the Manchu sovereign removed his court from Hsing ching to Mukden. Nurehazi's successor, Tai Tsung Wen Huang ti (1627-1643), assumed the imperial title in 1636; yet, properly speaking, it was not by the Manchus that the Ming dynasty was overthrown, but by Chinese bands against whom the help of the Manchus was invoked as the last desperate resource (p. 102). When once the Manchus had seized Peking in 1644, they never left the country again; they became masters of South China also after forty years of fighting.

The new dynasty of the Manchus, with Peking for their capital, kept possession of their old home up to the Amur. In the meantime, the Russian power had begun to spread farther in the north, and the Chinese government was now forced to reckon with this factor. The destinies of the northeastern Siberians were now soon decided by the influence of the Russians (cf. p. 221).

#### D. THE NATIONS ON THE COAST AND ON THE ISLANDS OF THE NORTHWESTERN PACIFIC OCEAN

THE Hyperboreans, who, with their scattered and poverty-stricken settlements fringe the northern limit of the inhabited earth, are a true border nation, in communication with the rest of mankind on one side only. The races on the northeast boundary of Asia deserve this title less, because there a sea studded with islands and accessible to navigation washes the coasts, and the mainland of America approaches closely to the East Cape. Like all border-districts, this part of Asia shelters fragments of nations, scattered or repulsed remnants of earlier and lower civilizations, whose representatives have taken refuge from the great floods of the continental peoples in the peninsulas and islands or have offered a last and successful resistance on the narrow strips of coast.

Two circumstances favoured this resistance. Any one who studies the map on p. 208 will notice on the northeast the Stanovoi chain, which borders the greatest part of the coast and cuts it off from the hinterland; the narrow space between these mountains and the sea offered the conquering nations no room for expansion. Regions such as the peninsula of Kamchatka, which is only connected with the mainland by a narrow pass far to the north, or the islands of Saghalien and Yezo, were naturally still more secure from their attack. But even if the nomads of Central Asia, or even the hunter nations of Manchuria had attempted to hold the coast, they would have been forced to betake themselves to an unaccustomed industry, that of fishing. Some few Tungusian tribes, which reached the coast at an early date, have indeed conformed to the customs of the earlier inhabitants and have become typical fishermen with a surprisingly low civilization. Such a transition was hardly possible for the pastoral nations of the steppe, who, on the rare occasions when they entered the coast country, did so as conquerors, not as fugitives.

(a) *The Common Features of the History of Northern Asia.* — Defective culture and complete political disintegration characterise the nations of the North Asiatic coast and the adjacent islands. It will probably never be possible to write a connected "history" of these races; some general features may be noticed; for the rest, we can do no more than attempt to adduce some historical facts as to the various countries and races. The chief countries to be distinguished are the Chukchi peninsula in the north, Kamchatka, the islands of Saghalien and Yezo, the coasts of the sea of Okhotsk, and lastly the valley of the lower Amur, the only part where the coast seems more closely connected with the hinterland and where it is possible for a nation of fishermen to live farther in the interior. The peoples of North Asia here came most frequently in contact with more advanced civilizations. The broad outlines of the history of the northeast Asiatic races are somewhat as follows. In the period immediately succeeding the Ice Age a dolichocephalic population of Arctic hunters and fishermen spread over a part of the northeastern mainland and had already crossed the Bering Straits, as certain resemblances to the civilizations of Arctic and Northwest America seem to show. The advance of nations like the Mongols toward the north forced a part of the inhabitants to retreat to the peninsulas and islands, where they long remained

unmolested. Tungusian tribes, later, on their northern migrations, caused new displacements and partially broke through the chain of coast nations, while other Tungusians, by crossing over to Japan, helped to drive back the old north Asiatics even on the islands. The Chinese for their part several times extended their rule as far as the Amur, and influenced the tribes whom they found there by inter-marriage and introduction of civilization.

(b) *The Separate History of the Palæo-Asiatics.* — The Chukchis are the most northeasterly branch of the Palæo-Asiatic nations, as Leopold von Schrenck proposes to call the whole group. Not so very many years have elapsed since a part of the nation passed from the primitive condition of mere hunters to reindeer-breeding: according to Stephan Krascheninnikov ("Kamchatka," 1754), the use of reindeer milk was not yet known about the middle of the eighteenth century. Similarly the Koriaks, who lived farther to the south, were divided into settled fishermen and nomad reindeer owners. The nomads despised the fishermen, and, as a matter of fact gained in strength and warlike spirit by the change in their mode of life. In recent times the Tungusians have been actually driven back again by the Chukchis. The knowledge of reindeer-breeding did not cross the Bering Straits to America. But the presence of true Eskimos, the Namollo, or Yu-lte, on the Asiatic side of the Bering Sea shows that nevertheless international relations were established there.

The inhabitants of Kamchatka, the Kamchadales, or Itelmes are physically, if not linguistically, akin to the Chukchis. The multiplicity of languages among the Palæo-Asiatics, and the physical differences between them (for example, between the Chukchis and the Ainos), shows that this group of nations, formerly scattered over a wide region, is extremely heterogeneous.

The Kamchadales considered themselves the original inhabitants; they certainly must have reached their peninsula as fugitives at a comparatively early date. That their immigration dates back to a remote period is proved by the extraordinary way in which the nation has adapted itself to the nature of its new home. The Kamchadales were politically disunited; but, at the time when first, owing to the Russians, more accurate knowledge of them was forthcoming, the lesson of tribal consolidation had been learnt to some extent. The need of it was impressed on them not only by domestic wars but also by attacks from abroad. The Koriaks, probably the more mobile reindeer nomads, invaded Kamchatka from the north, and the seafaring inhabitants of the Kuriles plundered the southern districts and carried away numerous Kamchadales into slavery. Some sort of intercourse with the civilized countries of the South must have existed then; the Russians found Japanese writings and coins among the Kamchadales, and even captive Japanese sailors, who had been shipwrecked on the coast. The beginnings of a State under an able chief led to the rise of two federations on the peninsula, which were able to assert their independence, until later the encroachment of the Russians put an end to this slow process of internal evolution. The Ainos (Ainus, cf. Vol. I, p. 574) hold a peculiar position among the Palæo-Asiatics in physique, language, and culture. A type of the old northern race has been developed in them, which, in externals, particularly in the luxuriant growth of hair and beard, strikingly recalls the northern Europeans, while other characteristics, such as the colour of the skin, the salient cheek-bones, etc., resemble those of the Mongolian race. This

people also, as their isolated language proves, must have been long settled in their home, the northern islands of Japan and Saghalien. When a State began to be organised in the south of Japan by the combined action of Malays and Tungusians, a struggle at once broke out with the aborigines, the "field-spiders," by which we must understand a race of pigmies dwelling in caves, and the Ainos. The former, the "Koko pok guru," were exterminated, and the Ainos ousted or absorbed. An examination of place names shows that the Ainos once were settled in the South as far as Kyushu; in historical times, they were still to be found in large numbers in Northern Hondo (Honshiu). They are at present limited to Yezo, Saghalien, and some of the Kuriles. The withdrawal of the Ainos was not consummated without the Palæo-Asiatic civilization having left distinct traces on the customs, religion, and art of the Japanese. Many perplexing phenomena of Japanese civilization can only be explained by the discovery of their prototypes among the Ainos.

At the present day, the Ainos give the impression of a people who are decadent in every respect. Many of the arts of civilization, which they formerly possessed (the knowledge of making earthenware? cf. page 2), appear to have been lost, partly, no doubt, under the overpowering influence of Japanese culture. The fact also that the Ainos now exhibit a predominantly gentle and friendly nature, instead of their old strength and savagery, seems a sign of exhaustion in the struggle for existence rather than proof of advancing civilization. Their political retrogression is undeniable. So long as the nation was still at war with the Japanese, a certain degree of combination clearly existed. The Ainos on Yezo even now relate that in former times a mighty chief lived in Piratori, who exacted tribute from the whole island. Every village now has its petty chief, under whose government it leads an independent existence.

Many changes seem to have occurred on Saghalien. Even before the arrival of the Russians, the Giliaks, a race closely akin in its civilization to the Ainos, had migrated thence to the mouth of the Amur, possibly in consequence of wars with the Ainos, whose territory was more and more curtailed by the advance of the Japanese from the south. The short-headed race of the Giliaks, with its strong Tungusian admixture, was probably led by these events to return to its earlier home. Tungusian reindeer nomads, the Orokes (Oroko, Olta) crossed over later to Northern Saghalien, apparently with peaceful intentions. Like the Giliaks, in whom an infusion of Palæo-Asiatic blood was unmistakable, the peoples on the lower Amur and the neighbouring coast may be mixed races, but the Tungusian element is predominant in them. Under this head come the Lamuts on the shore of the sea of Okhotsk, the Goldes on the Amur, and many smaller tribes. The Tungusians themselves are a mixture of Mongolian tribes and the dolichocephalic permanently settled population.

Trifling as may be the historical results obtained by a survey of the regions of Northeast Asia, yet it is interesting to see how, before the destructive encroachment of a European power began, the slowly surging waves of civilization had spread to the remotest border-countries. In the interior we see how with the advance of the Yakuts the last wave, which finally brought to the north the cattle-breeding industry known since the earliest times in the more southern countries, filled the district watered by the Lena. An earlier wave, which brought

with it the reindeer nomadism, has reached in places the coasts of the Bering Sea, and begins gradually to advance to Northern Kamchatka and, through the migration of the Oroks, to the island of Saghalien. But outside, on the more remote peninsulas and islands, there still live the mere fishermen and hunters, who are acquainted with no domesticated animal but the dog, and eke out their existence, as their ancestors have done for thousands of years past, by a system of mere acquisition.

#### E. THE RUSSIANS IN SIBERIA AND CENTRAL ASIA

THE appearance of Russia in Siberia and on the frontiers of Central Asia marks a new and important chapter in the history of the Old World. The struggle of the unruly nomad nations with the civilized countries which surround the steppe districts of Asia had lasted more than two thousand years. Western Asia had succumbed under the repeated shocks, or had become a nomad country; India had frequently sunk defenceless before the attacks of the sons of the steppes; Eastern Europe had met with the same fate and lay, since the time of Genghis Khan, under the yoke of barbarism; only China, that ancient country, although continually overrun and apparently crushed, had with indomitable pertinacity won back yard by yard the soil from the powers of destruction, and pushed the limits of her influence up to the western extremity of Central Asia. Now a second civilized power from the west came on the scene, and if it used its weapons in order permanently to possess the lands up to the frontiers of the Chinese Empire, the evil spirit of destruction at any rate was fettered until it was, to all appearance, stilled beneath the grip of civilization. The Chinese had indeed already shown by their support of Buddhism and by their agricultural colonies how even the barbarism of Central Asia could be tamed.

That from Europe a crushing counter-blow would be eventually struck at the source of such unspeakable calamities, and would bring a part of Inner Asia into the power of the western civilized nations, was in itself to be anticipated, since the highest existing power of civilization and culture had been developed there. To this power, for which soon the earth itself seemed too small, the wild warlike spirit of the nomads of the steppe was doomed to yield so soon as the path which led to the desired goal was trodden. It is far more astonishing that this counter-blow was struck so late; the reasons for this, however, are to be found to some extent in geographical conditions.

If the European civilization wished to advance towards Central Asia, only the east of Europe could serve as a basis. Now the east of Europe is nothing more than an offshoot of the great plains of Northwest Asia, and is a piece of Asia that required to be conquered and colonised before any further action could be contemplated. The south of Russia had always been the favourite battle-ground of the nomads. It was there the swarms of Scythian horsemen had forced the Persian army of Darius to retreat; there the Alani had been overwhelmed by the storm of victorious Huns; there the hordes of Bulgarians, Khazars, Avars, and Hungarians had rested at various periods, and there, finally, Mongol hordes had ruled as lords for centuries. But farther to the north, where the forests prevented the nomads of the steppe from any long sojourn, lived Finnish and Hyperborean tribes of hunters, who resembled those of Siberia in poverty and defective civilization.

Against all these forces so adverse to civilization, Europe could never once place her most capable and advanced nations in the field. The Russians, who as the eastern vanguard of the Aryan race had to bear the brunt of the attack, were hardly less barbarous than the wildest Central Asiatics, but, as a nation of peaceful agriculturists, were no match for them in warlike ability. This is the only explanation why the Russians soon fell before the attack of the Mongols, and then for centuries bore the yoke of the nomads in shameful dependence, and indeed after the liberation still trembled before the Tartar Empires in the Crimea and on the Volga. The long servitude, to which the bloodthirsty tyranny of Ivan the Terrible was a sequel, naturally did not help to raise the character of the people; one would hardly have foretold a brilliant future for the Russian even in the seventeenth century. It was therefore one of the chief duties of the Western civilized world to introduce European civilization among the Russians themselves. Attempts were made to reach this goal by means of western European immigrants, who first worked upon the princes, and through them on the people, until Peter the Great openly broke with Asiatic barbarism, and applied all the resources of European civilization to the protection and extension of his realm (cf. Vol. V). It was only after that date that Russia was really qualified to undertake, and to bring to a victorious close, the war against the destructive forces of the nomad world.

(a) *The Cossacks down to the Year 1600.*— Even if the Russian had retained, from a period when he was more Asiatic than European, qualities which made him seem akin to the nations of the steppes, that was perhaps no hindrance to his new task. He who would track the nomad to his last lurking-place needs something of the nomad in him. A ruler of Asiatics would understand his subjects better if he felt a trace of the Asiatic spirit in his own character and impulses. In addition to this the Russian nation, sorely against the will of its rulers, had to some extent forged for itself an instrument which was admirably adapted for the conquest of the steppe and could soon be used with the greatest success against nomadism: namely, the Cossacks. In the insecure border lands between Russian territory and the Tartar steppe, a new nationality had been gradually formed. All who had made Russia too hot to hold them, criminals as well as the persecuted innocent, fugitive serfs, sectaries, fraudulent taxpayers, thieves, and vagabonds, sought an asylum in those lawless regions, where they organised themselves and daily fought for freedom and life with the Russians and Tartars. Every revolution in Russia brought fresh masses of discontented people to the Cossack settlements, and doubtless fugitives from the Tartar countries swelled their numbers. Thus semi-nomad nations of horsemen were formed, at first the Ukraine Cossacks, from Little Russia chiefly, on the Dnieper, and the Don Cossacks of Great Russia on the lower Don. It was by slow steps only that they were incorporated in the Russian Empire. The fact was then recognised that these border folk and robbers were men admirably adapted for use in the struggle with the inhabitants of the Asiatic steppes. A large number of Cossacks, organised on a military system, were gradually deported and planted under various names in Siberia, as far as the Amur, and in Turkestan.

The merchants of the republic of Novgorod had first discovered the way to Siberia, and had even founded a sort of sovereignty among the tribes of that region

(p. 206). Such a policy, which was not entirely checked even by the disorders of the Mongol age and was soon resumed by the Russian sovereigns after the overthrow of Novgorod (1477-1479; cf. Vol. VII, p. 45), was possible because in the north it was not necessary to traverse the homes of the nomad inhabitants of the steppes, but merely the hunting-grounds of small Finnish and Arctic tribes. The northern road of the fur trade was little affected by the revolutions in the south; indeed it was not even under the control of the Russians, whose power was centred round Moscow and did not extend far to the north. Even after the fall of Novgorod (1570) the merchants in the northeast of Russia led an almost independent existence, and it was only through them that the Russian princes exercised a certain dominion over some of the northwestern tracts of Siberia. Almost by chance these conditions led to a campaign against the still independent Siberian princes, which was destined to alter the situation completely.

In the second half of the sixteenth century, the Russian family of Stroganoff in the district of Perm had got the trade with Siberia in their hands, but saw their profits and their influence menaced from two sides. The Great Khan of Siberia was beginning to form schemes of conquest and had sent his Tartar armies on expeditions over the Ural right into the country of Perm, while from the southwest the Volga Cossacks, kinsmen of the Don hordes, were harassing and plundering the trading haunts of the great merchants. According to the time-honoured commercial policy of Russia, the Stroganoffs tried to pit the two invaders one against the other, and with this object applied to the Cossacks, whose raids in the north were only made because this people, disturbed in their old settlements by the Russians, were seeking new homes. It was not difficult to persuade an army of seven thousand Cossacks under the command of Yarmak Timofeyev (*itech*) to make an attack on Siberia in the pay of the Stroganoffs. Yarmak started in 1579, but lost the greater part of his army in the very first winter, which he had to spend on the west of the Ural. He pushed on with the survivors, and with his fast dwindling army eventually reached in 1581 the Tobol, on whose banks he more than once defeated the forces of the Siberian Khan Kozum. On October 23, 1582, Isker, the capital of the Khan, was taken; but after that there was no prospect of any further action by the weak handful of men, against whom the petty Tartar princes soon advanced from every side, since no help could be expected either from the Stroganoffs or from the Cossack bands which had remained behind.

In this dilemma Yarmak applied to the Russian Tsar Ivan IV, the Terrible, who already claimed the sovereignty over the countries on the Obi. The first tidings of the expedition against the Khanate of Siberia had not been favourably received at Moscow, since men were tired of wars against the Crim Tartars, and did not wish to bring Russia into conflict with the Siberian Tartar Empire, the power of which they clearly overestimated. The victory of the Cossacks was now welcomed with the greater enthusiasm. The support, which Yarmak received, was at first indeed insignificant; Isker was lost again, and when Yarmak fell in 1584, practically nothing was left in the hands of the Russians but the territory which had long been claimed by them, even if never really subject to their rule. But the way had been paved, the dread of the Tartars had been overcome, and the effectiveness of the Cossacks for such undertakings had been clearly shown. The welcome possibility of giving these unruly auxiliaries a new sphere for their energies was an incentive to further operations. Isker was reoccupied in the year 1588, while

Tobolsk (Bitsik-Tura) had already been founded as a centre of the Russian power. In 1598 Kozum Khan, who had held his own in the south, suffered a decisive defeat and fled to Central Asia, where he disappeared. His sons and grandsons<sup>1</sup> continued to make inroads with nomad hordes into Russian territory, but achieved no lasting successes.

(b) *Russian Aggression in the East and West (after 1600).*—The Asiatic possessions of Russia now had two fronts from which to repel attacks or to make an advance: a southern one, namely, toward the steppes of South Siberia and Turkestan, where warlike nomad nations lived as insecure and dangerous neighbours, and an eastern one toward the tundras and hill country of East Siberia, where only semi-civilized hunters and reindeer herds men offered a feeble resistance. An advance was naturally made first on the east frontier, and comparatively soon extended to the shores of the Pacific. The necessity of acquiring a secure frontier also forced the Russians inevitably onward to the south, notwithstanding the great sacrifices and efforts which were here required of them as time went on. The flanking position, which the command of the Caspian Sea offered them, was not used successfully until late in the wars between Khiva and the Turkomans, after a disastrous attempt of Peter the Great (1717). In the north, on the other hand, communications by sea through the Arctic Ocean were soon resumed. The English explorer, Hugh Chancellor, penetrated in 1554 to the White Sea, and a short while after founded the Muscovy Company of English merchants for trade with the far north of Russia. His venture was patronised both by Ivan the Terrible and by the English court; and though he perished in 1556, while attempting to repeat his first great voyage, the heirs of his enterprise did not lose heart, the Muscovy Company flourished, and English ships from Archangel appeared at the mouth of the Obi in 1614.

(a) *The Peaceful Acquisition of Eastern and Northern Siberia (until 1800).*—Eastern Siberia had been mainly occupied by Cossacks, who pushed on along the rivers, protected the new territory, as they acquired it, by fortified settlements, and thus in course of half a century reached remote Kamchatka. The Russian government was careful to cover this advance by the establishment of friendly relations with the Mongol Altyn Khan (p. 192). The trade with China had then been already started; the first tea reached Russia in 1638 through the agency of Altyn Khan. Meantime rapid advance was made in the north. In the year 1632 Yakutsk was founded on the Lena; in 1643 the first Cossacks forced their way to the upper Amur, and followed this stream down to the sea of Okhotsk. Kam-

chatka was discovered a few years later, but it was not occupied until after 1696. All these results were naturally not obtained without a struggle; the collection of the fur tribute, the *yassak*, often led to insurrections. But the paucity of the native population and the European armament of the Cossacks always turned the scale in favour of the new masters. The *ostroy* or fortress of Nijni Kolimsk, on the Arctic Ocean at the mouth of the Kolyma, which was founded in 1644 by the Cossack, Michael Staduchin, formed for a long time an important base for the opening up of Northeast Siberia. Anadyrsk, the inhabitants of which held their own for years in their wars with the Chukchis, was built soon afterward. When the Cossacks had firmly established themselves on the Amur, the country round Lake Baikal was annexed to the Russian dominions, and Irkutsk founded in the year 1652. But it usually happened that the authority of the home government was for a long time disregarded in the distant territories they acquired. The Cossack settlers habitually indulged in civil war, plundering and massacring each other without scruple; sometimes, also, they openly defied the home authorities, as was the case in Kamchatka during the years 1711-1713.

In the Amur districts resistance was met with from the Manchus, who at first retreated, but then, aided by the resources of the subject Chinese Empire, regained their old possessions (1656). Once again the Russians tried to extend their sovereignty from the strong town of Albasin (Yaktz), which they founded on the upper Amur as a base of operations, but after the place had been twice (1659 and 1685) taken and destroyed by the Chinese, they were compelled in the year 1689 to decide to evacuate the whole Amur district. Russia, nevertheless, did not cherish hostile feelings toward China, whither repeated embassies were sent. On the contrary, the most northerly of the trade routes to China, which now was completely in Russian hands, began to develop vigorously. The two nations gradually recognised that both imports and exports would pass best and most safely at the point where their territories directly touched each other with well-defined boundaries. The crests of those mountains, which border the Gobi desert and the Tarim basin on the north, seemed suitable as such boundaries. The first settlement of frontiers was arranged by the envoys of the two great powers in the years 1728 and 1729. The Chinese party in Manchuria had, however, been much strengthened in consequence of the wars with the Russians, and a systematic partition of the country had been carried out, so that for the future Chinese culture triumphed in the original home of the Manchus. Chinese military colonies guarded the Amur, which formed a fixed boundary for a long period. The seat of the Chinese military administration was at first at Aigun (founded in 1684), subsequently Mergen, and finally Tsitsikar. The disturbances on the frontier now almost entirely terminated.

The gradual establishment of peace and order in Siberia enabled the Russian government to undertake the scientific exploration of this enormous and still unknown territory. There were first and foremost geographical problems to be solved, especially the problem whether Asia was joined to America. The report of the Cossack Deschnef about his voyage through the channel, afterward called the Bering Straits (1648), still reposed unread in the archives of Irkutsk. Finally in the year 1733 a scientific expedition was sent, which, by its admirable constitution, gave to the entire civilized world for the first time definite information as to the nature of Siberia. It was almost entirely composed of non-Russians. The Danish captain,

Vitus Bering, who had already explored the seas round Kamchatka in the years 1725-1730, commanded the expedition. He was accompanied by Martin Spangenberg and Alexis Tschirikov, who had been his lieutenants on his previous voyages, and by members of the Russian Academy of Sciences, namely, the Tübingen botanist, Joh. Georg Gmelin,<sup>1</sup> the astronomer, Louis Delisle de la Croyère (died October 22, 1741), the historian, Gerhard Friedrich Müller,<sup>2</sup> and Johann Eberhard Fischer, of Esslingen.<sup>3</sup> The expedition was joined later by Georg Wilhelm Steller<sup>4</sup> and Stephen Kraseheninnikov, who devoted their energies to the exploration of Kamchatka. A number of minor expeditions were sent at the same time to investigate particular regions, especially the east coast. In the course of some few years large portions of Siberia were thoroughly explored, while Bering himself, amidst many dangers and adventures, cruised on the icy coasts of the sea that was called after him. He was able to prove the existence of the strait between Asia and America, but died on December 19, 1741, of scurvy. Müller and Gmelin returned home to St. Petersburg in 1743, the rest of the expedition not until 1749. Steller had died on his way back from Kamchatka in 1746. Since this splendidly organised undertaking, the scientific exploration of Siberia has been continuous, although enthusiasm for the work has sometimes flagged. Especially successful were the geological researches, which revived the mining industry on the Altai and confirmed the existence of auriferous strata. Much has been added to our knowledge of the coasts of Eastern Asia by the voyages of Russian circumnavigators, especially by those of Adam Johann Ritter von Krusenstern (1803-1806) and of Otto von Kotzebue (1815-1818 and 1823-1826). It should be noticed that these voyages were partly prompted by the wish of Russia to open relations with Japan.

(β) *The Struggle with the Nomads of Southwest Siberia.* — The state of things in the southwest, where a boundless horizon of steppe seemed to bid defiance to all the permanent and restraining influences of civilization, was very different from that in the regions of Northern and Eastern Siberia. - The southwest was the theatre of the real struggle between Russia and the nomads, whose eastern representatives had, at almost this same period, been finally subdued by China. While in the east the Cossacks showed themselves willing conquerors and settlers, the Russian government itself was forced to undertake the struggle in the southwestern steppe, to which direction settlers reluctantly turned. After the death of Peter the Great (1725), who had raised Russia to a great European power, the frontier ran from Kurgan to Omsk, and then along the Irtish as far as the spurs of the Altai. The system of cordons was introduced by Field-marshal Burkhard Christoph von Münnich, and such a cordon, corresponding roughly to that frontier, was drawn through West Siberia. For a long time this fortified line was hardly crossed, although the influence of the Russian power soon produced the result that a large part of the Kirghiz living further to the south professed their submission. Raids by these "subjects" into the sphere of the Russian colonies, and corresponding punitive expeditions, form for nearly a century the scanty history of the possessions in West Siberia.

<sup>1</sup> Author of "Flora Sibirica," St. Petersburg, 1748-1749, and "Reise durch Sibirien," Gottingen, 1751-1752.

<sup>2</sup> Editor of "Sammlung russischer Geschichte," St. Petersburg, 1758.

<sup>3</sup> Author of "Geschichte von Sibirien," St. Petersburg, 1768.

<sup>4</sup> Author of "Reise von Kamtschatka nach Amerika" (cf. p. 204), St. Petersburg, 1793.

It was only after the termination of the Napoleonic wars that attention was paid once more to Asiatic affairs. The first object clearly was to effect a permanent occupation of the Kirghiz territory by advancing the Russian cordon. For this purpose the services of the Cossacks were again employed with success. In this way Russia entered on a path of conquest which had for its ultimate goal the subjugation of the turbulent steppe-country and the acquisition of a firm foothold on its southern margin where permanent settlements existed. Step by step the troops pushed forward. Every fresh advance of the line made the nomads more desperate. When they saw their freedom of movement curtailed and their pasturages cut off, they broke out in revolt; and Russia's answer to revolt was invariably an extension of the fortress cordons. But for a long time it was impossible to carry out the plan systematically, since large tracts of the steppe were not suited for permanent settlements. The Russian lines of defence had therefore to rest on the rivers; in the year 1847 the southern frontier line ran from the lower Syr Daria to the river Chu and thence to the Ili. But it was impossible to halt at this stage. Hitherto the struggle had been with the Kirghiz and other nomad hordes, but now the sphere of the power of Turkestan was entered. If the Khanates had been consolidated States, with which a well-defined boundary could have been arranged, the advance would have been perhaps checked for a long time there, as was actually the case on the Chinese frontier, with the exception of the districts on the Amur. But these countries were only centres of power with an ill-defined sphere of influence, which expanded or contracted according to the energy of the ruler and the accidents of fortune.

The first collision was with Khiva, since on the west, between the Aral and the Caspian Seas, a frontier secure against the predatory nomads, who were willing to act as subjects of Khiva, could only be obtained by the occupation of the Khanate proper. In the year 1839 General Perovsky started from Orenburg, but, after losing a quarter of his army and ten thousand four hundred camels from snowstorms in the steppe, he was compelled to return without having set eyes on the troops of Allah-Kuli Khan. On the other side the first conflicts with Khokand occurred in the year 1850, when the men of Khokand, and the Kirghiz who were subject to them, tried to drive back the Russians from the lower Syr Daria, with the sole result that the number of Russian fortresses was increased. Fort Perovsk was built in 1853 as the most advanced post. After a long period of quiet caused by the Crimean War, the upper Chu valley was occupied from the Ili district in spite of Khokand. The town of Turkestan fell on June 23, 1864, and Chimkent on October 4.

In the meantime, however, a war had broken out between Bokhara and Khokand, and when the Russians under Michael Tschernajev took possession of Tashkent also (June 29, 1865), which the Bokharians already regarded as a certain prize, a war between Russia and Bokhara was the natural consequence. After an uneventful campaign, the Bokharian army was totally defeated by the Russians on May 20, 1866, near Irjar; and immediately afterwards General Romanovski marched against the Khanate of Khokand, now a dependency of Bokhara, and took the town of Khojent. The territory on the Syr Daria, which had been previously administered from Orenburg, was united in 1867 with the possessions on the Ili (Semirechensk) into a general government of Turkestan (until 1878). Mozaffar ed-din of Bokhara, who had been compelled to abandon Khokand, now made vain

efforts to conclude an alliance with it against the Russians. Khiva also refused to help him, when, urged by the fanaticism of his people, he once more made preparations to attack the new Russian territory from Samarkand. But before he had raised his sword, it was struck out of his hand; General Konstantin von Kaufmann unexpectedly advanced on Samarkand, defeated the superior forces of the Bokharians, and entered the old capital of Timur on May 14, 1868.

The humbled Khan of Bokhara was forced to abandon the Zarafshan valley with Samarkand, and so lost one of his best provinces. It was in the end an advantage for Bokhara that Russia in this way obtained a well-defined boundary in the civilized country. This is the only explanation why there was no complete subjugation, and why the reigning house was left in possession of some, even if very restricted, powers. Russia subsequently went so far as to support the Emir of Bokhara (died November 12, 1885) and his son Seyyid Abd ul-Ahad against insurrections of his subjects.

By their advance into Turkestan the Russians had entered on the region which since earliest times had commanded the central Asiatic trade and the roads through the Tarim basin. Although this trade had greatly fallen off, it still appeared to be an important source of wealth and political influence. Russia had early tried to establish communications with Yarkand. The revolt of the Dungans and the successes of Yakub Bey in the Tarim basin (p. 195) during the sixties had prevented any direct intercourse with China, which was bound to be the final object of Russian policy; the Russians were obliged to content themselves with occupying Kuljar, the terminus of the northern road (1871), and with requiring Yakub Bey to conclude a commercial treaty (1872). Even then the diplomatic rivalry with the English, who anxiously watched the advance of the Russian power in Central Asia, and the still independent States of Turkestan, was in full swing. While the Russians were busy in diverting the trade of the Tarim basin to their possessions, the English were renewing the old connection between India and that region. Everywhere, in Khokand, Bokhara, and Khiva, English gold was pitted against Russian bayonets. Gradually, also, China, which after prodigious efforts had suppressed the revolts of her subjects in the Tarim basin, appeared on the scene as a great power, with whom definite frontiers could be arranged. Kuljar was restored to the Chinese at their own wish (p. 110).

Meanwhile in the west the struggle with Khiva had begun afresh, since Seyyid Mohammed Rahim Khan was neither willing nor able to hinder the incursions of the Kirghiz and Turkomans into Russian territory. In spring, 1873, the Khanate was attacked simultaneously from the Caspian Sea and several other directions. The Khan was not deposed, but was forced on August 12 to abandon the right bank and the delta of the Amur Daria and become a vassal of Russia. Soon afterwards the days of the Khanate of Khokand were also numbered; a revolt, which caused the prince Khudayar to seek flight (1875), furnished the Russians with a welcome pretext for interference. Finally, on March 3, 1876, all that was left of the Khanate of Khokand was incorporated with the Russian Empire as the province of Ferghana. A condition of things which promised to be stable was thus established in the northern and eastern parts of Turkestan; in front of the Russian territory, the nomad inhabitants of which might be considered as subjugated, lay the Khanates of Khiva and Bokhara, both subject to Russian influence, as a secure belt of frontier, whose complete incorporation into the dominions of the Tsar could be of little importance.

The situation was different in the west, in the steppes between the Caspian Sea and the Amu Daria. Here marauding Turkoman tribes still roamed without let or hindrance; and their nominal suzerain, the Khan of Khiva, was, after his humiliation by Russia, less capable than ever of holding them in check. To subdue them was only possible if the southern frontier were pushed forward to the southern margin of the steppe and the Persian sphere of influence. But there was a twofold inducement for undertaking this laborious enterprise. It was not merely a question of abating the nuisance of Turkoman marauders; Russian statesmen considered the new move as a check to England. The military party avowed their belief that the surest way of settling the Eastern question in Europe was to frighten England by advancing to the gates of India. Both military men and civilians thought that, at the least, an advance was the only means of neutralising hypothetical English intrigues with the native princes of Central Asia. Accordingly, the Turkomans were attacked, at first by a series of small campaigns, but, these proving unsuccessful, larger schemes were framed, and attempts were made to reach the chain of oases which were the real centre of Turkoman power either from the mouth of the Atrek, or from Krasnovodsk at the foot of the mountains on the Persian frontier. The first undertaking of this kind failed in the year 1879. But a year later a new expedition started, under the command of General Michael Skobelev. This time a railway was built simultaneously with the advance of the troops, the first portion of the subsequent Transcaspian Railway, which has now reached Samarkand and opened a new road to international traffic. The fate of the Turkomans was soon sealed. On January 24, 1881, their strongest fortress, Geok-Tepe, was taken after a heroic defence, and soon afterward the subjugation of the northern, or Tekke, Turkomans was complete. In this same year a frontier treaty with Persia made the fact clear that Russia had as her neighbour on that side a State possessing a tolerable degree of culture. Toward the southeast, on the other hand, the advance of the Russians did not stop until it reached the borders of Afghanistan. There was no necessity for further wars against the nomads: the Turkomans of Merv tendered their submission under diplomatic and military pressure. In spite of this the Russians were soon active in the country to the south of Merv; and in 1885 their advanced posts came into collision with the Afghans on the river Kushk, and a battle was fought in which the Afghans were defeated. The blame for this collision has been thrown by some on England; it is alleged that the Afghans were instigated to prevent Russia from acquiring that firm position in the south of the steppe country which was a political necessity for her. Others have accused the Foreign Office at St. Petersburg of having deliberately forced on a breach with Afghanistan. The trouble would seem to be that the hand of the Russian government was forced by the zeal of frontier generals. The questions at issue were settled by a Boundary Commission in 1886-1887, which fixed the frontier between Afghanistan and Asiatic Russia. In 1895 the delimitation of English and Russian spheres of influence was advanced yet another step by the partition of the mountainous Pamir region, which separates Northeastern Afghanistan from the Tarim basin. Since 1886 the influence of Russia within her allotted sphere has been materially increased by the extension of the Transcaspian Railway, which has brought districts long desolate within the range of Russian commerce, and has completely assured the military supremacy of its possessors.

If we look back on what Russia has done in Turkestan, we shall see that there

is room for conjecture as to her ultimate policy. Her advance might be explained solely by the causes which have induced the peaceful Chinese Empire to occupy the Tarim basin on the verge of the Central Asiatic steppes, were it not that evidence exists to suggest some motive beyond the mere desire of obtaining security from the raids of nomad tribes. The first plan for a Russian invasion of India was framed as long ago as 1791; and similar plans have been considered at various dates since then, notably in 1800, 1855, and 1876. These plans have usually been formed with the idea of influencing the European situation to the advantage of Russia, by locking up English troops in India and inducing England to take a more conciliatory attitude. In all of them the occupation of Afghanistan has been an essential feature, and no pains have been spared to detach that country from its dependence on England. An attempt of this kind in 1878, immediately after the Treaty of Berlin, was so far successful that the Afghans declared war on England. But Russia took no steps to assist the Afghans when they had been drawn into the war; and since that time Russian influence in Afghanistan has suffered a check. To judge from recent events the foreign policy of Russia, at the present time, looks rather toward the Persian Gulf than toward India. The possession of the mouth of the Euphrates would give Russia one of those outlets for the trade of her empire which it has always been her prime anxiety to secure.

(γ) *The Endeavours to obtain a Secure Position on the Pacific (after 1800).*—The occurrences in East Asia have shown that the necessity of obtaining free access to the ocean can really alter the otherwise clearly marked-out policy of Russia. While in Central Asia the boundaries between Russia and China, with the exception of the Kulja country, have hardly been shifted to any appreciable degree, Russia is recklessly pushing on in the northeast toward China and Korea, and thus finds herself confronted by the hardest problems of her policy. The causes of this phenomenon are those which brought about the wars of the Russians with the Swedes, who commanded the shores of the Baltic, namely, the wish for a large naval base on the ocean.

When the Russian Cossacks firmly established their position on the sea of Okhotsk, they suddenly gave a new base to the Russian power, whose centre had been separated from East Siberia by an infinity of sparsely populated tracts. However immense the distance by sea might be to the harbours of the Baltic or the Black Sea, it was, on the whole, easier to surmount than the shorter one, diagonally across Siberia. But apart from this, the possibility of some communication with the civilized peoples and international trade marts of Central Asia meant a considerable advantage to the countries on the Pacific. The value of this position has increased largely since the introduction of steam navigation. On the other side, it was incontestable that Russia's position on the sea was extraordinarily unfavourable; the shores of the sea of Okhotsk with their thinly inhabited hinterland, their harbours icebound for many months, and their mountain chains which rise up directly behind the coast, were far from being adapted to promote a flourishing commerce. An improvement of the situation could only be attained by the acquisition of the Amur district; more favoured harbours were to be found there, and the valley of a mighty river opened up a comparatively rich hinterland, and offered easy communications with the interior. Little was to be feared from the Chinese, who only occupied the right bank of the upper Amur and had neither

garrisons nor colonies on the coast. A fresh advance then was made by the Russians in the nineteenth century towards the south, which they had already once partly possessed, but had evacuated owing to the threats of the Manchus. In the year 1849 the Russian flag was hoisted without opposition at the mouth of the Amur; in 1851 a bay near the Korean frontier was seized, where later Vladivostok was founded; in 1854 a fleet under Count Nikolai Muravier (*Amurskij*) was sent from the upper Amur, where the Russians still had possessions from an earlier date, down to its mouth, and Nikolaievsk, founded there in 1850, was more strongly fortified. The government in Peking, which did not dare to venture on war, raised futile protests. By the convention of Aigun (May 28, 1858), the whole left bank of the Amur was ceded to the Russians, and on November 14, 1860, the Ussuri district together with the whole coast as far as Korea was added to it.

Since by the founding of Vladivostok an almost ice-free harbour was obtained, the movements of Russia ceased for some time. But diplomatic intrigues continued to rattle the relations of Russia with other powers in this quarter, and notably with the ambitious State of Japan; the object at stake in these intrigues was the preponderance of influence in Korea. The Chinese government favoured the colonisation of Manchuria as far as possible; but the suppression of strong bodies of bandits, who had collected in the deserted border provinces, proved a troublesome task. The successes of Japan in the war of 1894-1895 with China were a serious check to Russian plans, and proved that the island kingdom of East Asia had taken its place among the great powers of the world. The Russians now found themselves inferior to the Japanese at sea, and they were alarmed by an attempt on the part of their new rivals to seize Southern Manchuria. A counter-blow was soon delivered. By a treaty concluded with China on March 27, 1898, Russia occupied Port Arthur and Talienswan on the Gulf of Pechili; and even before this treaty she had already exacted from China the permission to construct a railway through Manchuria (September 6, 1896), which was intended to join the great Trans-Siberian line, begun in the meantime.

Then the situation was suddenly altered by the outbreak of an antforeign movement in China, which was aimed with peculiar force against the Russians, and Russia was driven to occupy Manchuria (1900). The ultimate reason which forced the Russians to round off their East Siberian dominions by the absorption of Manchuria may easily be conjectured; they knew that the Amur country was not adapted for colonisation on a large scale, and gave the Russian power on the Pacific no firm support, while Manchuria would completely meet this requirement. Besides this the ice-free harbour of Port Arthur was of little value to Russia, so long as it was not in assured command of the hinterland and the overland communications with Siberia. At the same time, indeed, the plan seems to have been formed of shifting the Russian frontiers forward across the steppes up to China proper; in other words, of detaching Mongolia and East Turkestan from China. Russia has in recent times repeatedly formed alliances with the Dalai-Lama (p. 189). In this way the same policy was adopted in the east and in the heart of Central Asia which Russia followed in the west as far as the borders of Afghanistan and the gate of India; political and economic superiority over China is the natural consequence to which this policy should lead.

While advantageous frontiers had been thus won by a series of wars, the

economic situation of Siberia had passed through many phases. The first occupation had been effected by the Cossacks, who governed as lords among the Hyperboreans, exacted the tax known as the *yassak*, and, without exactly outdoing Spanish *conquistadores* in cruelty, were the cause of an extraordinary diminution in the population; frequent revolts of the natives (for example, in 1731 in Kamchatka) hastened this result. Even after affairs had been more satisfactorily organised, the shrinkage of the native population continued. S. Patkanoff, who made a searching investigation into the condition of the Irtish-Ostiaks, calls attention to the low birth-rate among the natives, which in itself must, so soon as the rate of mortality increases, cause the numbers of the inhabitants to become stationary or shrink. The diseases introduced by Europeans, especially smallpox and typhus, have produced terrible and permanent gaps in the population. Still more disastrous is the effect of alcohol, not only from the degeneracy and vice which it brings with it, but perhaps still more because the drunken mothers neglect their children and let them die. Finally there are the economic changes, such as the diminution of wild animals and consequent scarceness of food, and the intrusion of Russian peasants into the Ostiak communities; so soon as the Russians are in the majority, they make use of the existing common land for their own advantage, and appreciably reduce the earnings of the natives. The consequences are pauperism, non-payment of taxes, and serfdom for debtors, and all these causes unfavourably affect the increase of the population. Nevertheless decadence is not so rapid that we may not anticipate, under an amelioration of the conditions, a change for the better, since on the whole the Ostiaks have shown some capacity of adapting themselves to the requirements of an advanced civilization. The state of things existing among most of the tribes of North Siberia will be much the same.

The Russians, apart from the Cossacks, who poured into Siberia, were still less calculated to carry out a systematic colonisation and to settle in the zone suitable to agriculture. Partly to remedy this disadvantage, partly on other grounds, it became customary by the middle of the seventeenth century to send criminals to Siberia, as well as to force prisoners of war, especially Poles, to settle there. The unruly and Cossack-like features of the national life in Siberia were still more accentuated by this, and for a long time healthy development was checked. A second hindrance was the tendency of officials to regard the country as a mere source of profit to themselves, for the improvement of which no means were available. It was not until the end of the eighteenth century that the reformed methods of Western government were applied to neglected Siberia. The settlement of free peasants, which had been tried before, was now resumed on a more systematic basis, although it did not always meet with the anticipated success. The trade route from China to Russia ran through the zone of Siberian civilization, and a great part of the settlers found it more remunerative to devote themselves to trade or the carrying industry than to clear the forests and cultivate the soil, since the roving tradesman and carrier could better avoid the extortions of the officials. The short period of energetic reform inaugurated by Michael Speransky (1819-1821) did much to ameliorate these conditions. The mining industry, especially in the Altai, where it was only needful to revive the habits of the past and appeal to the traditions of an older civilization, did much to revive the prosperity of Siberia. How neglected and on the whole unexplored the greater part of Siberia nevertheless remained, may be gathered from the fact that even in

the agricultural zone of Siberia new settlements often remained for years unknown to the officials, until they were eventually discovered and included in the tax-paying community. The country has at last been more thoroughly opened up through the devoted energy of many, and mainly German, scientists. The intellectual life of Siberia made very slow progress, although the great number of educated exiles had its effect. The founding of the University of Tomsk in the year 1888 had a beneficial influence, and was followed on December 31, 1900, by the opening of the first Siberian polytechnic. The first school for secondary studies in East Siberia was opened in November, 1899, at Vladivostok.

The construction of the Trans-Siberian Railway, which connects the east with the west and also for the first time gives a proper support to the strong position of Russia on the Pacific, long secured by a systematic organisation of the Amur district, must be of vital importance for all periods of the development of Siberia. The commencement of the railway was ordered by an imperial Ukase of March 29, 1891. The line starts from Cheliabinsk on the southern Ural and traverses Western Siberia at about the fifty-fifth degree of latitude, touches Omsk, Tomsk, and Krasnoyarsk, then takes a bend to the southeast to Irkutsk, coasts the lake of Baikal, passes diagonally across Transbaikalia, then runs on the left bank of the Amur down stream as far as Khabarovka, and finally turns westward to Vladivostok. Pending the entire completion of the line the sections already in existence are connected by steamboat services on Lake Baikal and the Amur. This great undertaking has been supplemented by the Eastern Chinese Railway, which starts from the upper waters of the Amur, traverses Manchuria, and will in due course be extended to Port Arthur and Talienswan. The construction of the railroad has been begun simultaneously at various points, among others from Vladivostok on the Pacific, where the present emperor, Nicholas II, then the heir to the throne, turned the first sod on May 19, 1891. At the beginning of 1902, since the difficult section round the southern shore of Lake Baikal had been completed in 1901, the permanent way of the gigantic undertaking was roughly complete.

Toward the end of the nineteenth century the colonisation of Siberia with free Russian immigrants had made immense strides, a result indirectly due to the extraordinary increase of the population in the once so sparsely inhabited continent of European Russia. The commencement of the railway had a stimulating effect, since it was then possible to export agricultural produce on a larger scale, as the western section of the line traversed the fertile black-earth region. In 1800 the European population of Siberia amounted roughly to half a million. The slow rate of growth in the first half of the nineteenth century was somewhat quickened after 1861, the year of the abolition of serfdom, and then increased its pace rapidly. From 1860-1880 the number of free immigrants amounted to one hundred and ten thousand; between 1880-1892, four hundred and sixty-seven thousand new colonists settled there, and between 1892-1899 a million persons or more sought homes in Siberia. The first railroad (Perm-Ekaterinburg-Tiumen), which crossed the Ural in the year 1881, produced a great influx of colonists. A law has been in force since 1889, which guarantees to every man who immigrates, with permission of the government, fifteen *dessiatines* (about forty acres) of land as his own, three years' exemption from taxation, and nine years' exemption from military service. Even more advantageous terms are offered

to immigrants in the provinces on the Amur and the Pacific. Most settlements spring up naturally along the railway under the direction of the Siberian Railroad Committee, which at the same time builds churches and schools and promotes in every way the interests of the colonists. The use of the water-ways has, however, not been neglected; for example, the fleet of steamers on the Obi has increased in the years 1880-1898 from thirty-seven to one hundred and twenty vessels. Thus a movement is visible on every side, which in spite of all possible reverses cannot but exercise a profound influence on the future of Northern Asia and indirectly on that of Central Asia.

Siberia will certainly not be spared grave economic crises. It is already clear that the work of colonisation has been carried out prematurely and in unsuitable regions. While masses of pauper emigrants continually stream into Siberia from the famine-stricken districts of Russia, they are already met by another stream of starving and disillusioned wanderers who are returning to their old soil. Besides all this, agriculture in Siberia, whether practised near the Arctic frontier in the old forest area or in the steppe districts, is threatened more than elsewhere by the severity of the climate. Even the colonists of the Amur district had to contend with unexpected difficulties.

There is apparently a wish to abandon the very dubious method of populating the country by settlements of criminals or political suspects. In the year 1899 the Tsar Nicholas II invited a commission to give an opinion as to the advisability of discontinuing transportation to Siberia. This is the beginning of the end of a practice which has given an unfortunate aspect to the character of Siberian colonisation and of the newly created national life. The custom of sending political offenders out of Russia to Siberia has obtained from an early period; the first authentic case occurred in 1599. The country has been dotted with penal colonies of ordinary criminals since 1653; but by the side of these, a large number of capable and intelligent men, who had merely become inconvenient to the government, have been at all times removed to the Far East. The further destinies of the exiles concerned nobody; the majority probably died there. Others on the contrary furthered the cause of civilization by their efforts to obtain means of subsistence for themselves; exiles gave the first impetus to the mining industry on the Altai. It was not until 1754 that regulations were made as to the settlement and employment of the exiles by which two classes of banished were distinguished, namely, the criminals condemned to hard labour (*Katorga*), and the deported colonists (*Posselenie*). In the nineteenth century the Decabrist rebellion of 1825 (Vol. VIII), the Polish insurrections of 1830-1832 and 1863, and the Nihilist movement, brought again a large number of educated men to Siberia. It is difficult to estimate the influence of the exiles on the development of Siberia; in any case it would be wrong to describe it merely as unfavourable. The abolition, moreover, of the transportation laws, which were perhaps most disastrous for Russia itself, will inaugurate for Siberia also an era of economic moral and spiritual improvement.

## III

## AUSTRALIA AND OCEANIA

BY PROFESSOR DR. KARL WEULE

## 1. INTRODUCTORY REMARKS

THERE can be no doubt that the southeast part of Australia, together with the adjacent island of New Zealand, is destined some day to rule the whole Oceanic half of the world. — C. E. MEINICKE, 1836.

**C**ONTRARY to the customary French nomenclature, which includes under the collective name of Oceania the continent of Australia together with the whole immense world of islands in the Pacific Ocean, so far as it does not belong to Indonesia and the eastern border of Asia, the Germans do not accept this extended meaning of the word, but divide the vast region into two halves, by distinguishing between the Australian continent and an Oceania in a more restricted sense, comprising only the island groups of Polynesia, Micronesia, and Melanesia. This division is based equally on geographical grounds and on those of anthropology and ethnology; it expresses the contrast between the compact mass of the Australian continent and the world of islands spread over a vast space but containing a quite trifling superficial area. It also indicates the truth that the population of these islands, whatever diversities it may reveal to the eye of the anthropologist, is ethnologically homogeneous and entirely different from the population of the Australian continent.

It would hardly have been necessary for the writing of history, so far as there can be any idea of such when dealing with the native races of the South Sea, that this example should be followed. There is a difference, it is true, between the history of the insular and the continental peoples, in so far as the development of culture reached, on the whole, higher stages among the former than in Australia. Beside that, a small number at least of archipelagoes can look back on a certain independent political growth. In both these respects, the mainland, so far as the aborigines are concerned, is far behind; in fact, it shows absolutely no trace of any real development in a political sense. Notwithstanding all this, the difference is not so fundamental as to necessitate a partition of the whole region. This would be imperative, so soon as one or the other of the divisions definitely intruded into the turmoil of universal history, or when one was influenced by this in a conspicuously greater degree than the other. But neither alternative has happened. As a matter of fact the separate history of the whole vast region, from New Zealand in the south to Hawaii in the north, and from New Guinea and the Caroline Islands in the west to Easter Island in the east, is characterised by a remarkable isolation. Only on the extreme western margin of this region, in the Marianne, Caroline, and Pelew groups, in Western New Guinea and Northwestern Australia, do we find instances of brief and involuntary intercourse with the neighbouring

and more aggressive races of Asia and Indonesia. These exceptions apart, both Oceania and Australia have played a minor and self-centred part in history.

If under these circumstances we retain the usual two great divisions, we do so from the following reasons. First, for a reason not connected with our own subject: this division is preserved by the sciences of geography and ethnology, which are closely akin to history; and one branch of science ought never, without convincing reasons, to repudiate the classifications which are recognised in other branches. There is the less object in doing so since we have waited a long time before we have attained any clear or satisfactory classification. A second reason is found in the above-mentioned contrasts in degrees of cultures and political self-development between the two principal regions. Under this head it is especially the great core of the island world with Fiji, Samoa, and Tonga, and the pillars on the north and south in the shape of Hawaii and New Zealand, which claim peculiar attention owing to their individual historical development. The last and most weighty argument for the division of the whole region is connected with the changes which have been effected in the South Sea by encroachments from outside. At the present day the original population, — and it does not matter whether it had ever previously reached the stage of making history, or whether, as in Australia, it led an obscure existence as a primitive race of hunters, — has been covered by a new and foreign stratum of Europeans, Americans, Malays, and Eastern Asiatics, which is barely a few centuries old. These have assumed everywhere in the Pacific the task of colonisation and simultaneously the rôle of political and industrial leaders. But while none of the several groups of islands have been able, owing to their small size, to attain an importance which might raise them politically or economically far above their circle of neighbours, and each of them is rather regarded, at all times, by the interested powers as a no-man's land which may be made useful as a strategic base in the Pacific, the case is different with Australia. This great continent, under the rule of European immigrants, has shown a development which at the present day, only one century after the beginning of its colonisation, prevents it from being compared in any respect with the island world.

The main difference lies in the complete, though easily explicable, refusal of the Australian colonists to enlist the services of the aborigines. These have not allowed themselves to be ignored on any of the island groups. On the small islands of Micronesia and Polynesia, where the colonising energy of the whites was limited to the exportation of the few natural products suitable for international trade, the assistance of the native or the imported Oceanian was indispensable. On the main groups, the Fiji, Samoan, and Tonga Islands, the comparatively large population showed itself as uninterested in the industrial efforts of the white men as the aborigines of the Australian continent; but, politically, they derived the most important suggestions from their contact with strangers. Before the arrival of the explorer in Oceania no State extended beyond the limits of a single island; often there was no political organisation. But in the nineteenth century each separate group coalesced into a more or less united State; until the most recent times the government of these federated groups remained in native hands. New Zealand and finally Hawaii had prepared the way for this step even before the intrusion of the whites, and they carried it out with remarkable energy, until eventually in quite modern times the united efforts of the intruders succeeded in

levelling the laboriously reared political edifice and placing the aborigines completely in the background. Although these, in view of their past achievements and their former advanced civilization, will never sink into such insignificance as the Australians, yet their rôle in history is ended. The future development of the two island groups lies as completely in the hands of the whites as it has in Australia since their landing in Botany Bay in 1788. New Zealand, owing to the proximity of the Australian continent, experienced this change at an earlier time than the Hawaiian group. Relations between the two countries were soon opened when a new life and vigour began to stir in Australia, and the connection was gradually tightened. Only in quite recent days has New Zealand drawn slightly apart, since it has not joined the Australian Confederation which has at last become an accomplished fact. It remains to be seen if this isolated position will be maintained. From the standpoint of geographical position there is no necessity for union between New Zealand and its enormous neighbour; in fact the position is in favour of standing aloof. After all, there can be no doubt as to the future of New Zealand in any case; its situation facing the broad southern expanse of the Pacific is so advantageous that the greater part of the later history of the Pacific must be bound up with New Zealand. Melanesia (see the accompanying map) occupies a peculiar position toward the whole. If we apply the standard of superficial contents, then the small islands are simply to be ranked with the corresponding formations in Micronesia and Polynesia; they too are historically insignificant. This standard is no longer applicable to the groups of wider area, such as the Bismarek Archipelago, the Solomon Islands, the New Hebrides, and New Caledonia. Each of these, from its size and population, would be suited to play a part in history at least as important as that of Central Oceania. But what do we find? Apart from Fiji, which, from the standpoint of politics rather than of anthropology and ethnology, shows a Polynesian stamp, none of them has developed any political constitution which is superior to the village community. There are therefore no tangible historical events to be recorded of them. On the other hand the neighbouring Australian has, for the time being, shown a want of perseverance, since not one of these island groups has been taken in hand by the whites on a large scale as a focus of civilization. Until this attempt has been once made it is impossible to ascertain what historical character is peculiar to the Melanesians. That their prospects of playing a more noteworthy rôle would be especially good, even if they on their part contributed all the necessary preliminaries, can hardly be asserted, if we consider the existing conditions in the Pacific and the general political situation. It is due to this latter that the Pacific Ocean is at present the object of universal interest, and is constantly navigated by the fleets of all colonial powers. Owing to this the Oceanic island world is far from being the remote part of the globe's surface which it was some centuries, or even decades, since. The vigorous economic rivalry of all nations even in these regions must be considered; in a word, all circumstances point to the fact that the natives from the first will have to be content with playing a very subordinate part. The more active and enterprising Melanesian may under the circumstances save himself from such repression as has been the fate of the Australian, but on the other hand any combination into larger societies is impossible from the purely material drawback of the multiplicity of languages; to say nothing of the boundless distrust with which one tribe inspires another. These conditions hold good for the island groups, and

in increased force for New Guinea. This gigantic island, which exceeds in size the Japanese and the British island-empires together, is historically unique, not only in the Pacific but on the whole surface of the earth; Borneo alone shows some points of resemblance. Fitted, from its size and apparently from its natural wealth as well, to dominate the entire system of islands in Indonesia and Oceania, New Guinea has the initial disadvantage of lying in the immediate vicinity of the incomparably vaster Australia, and, what is more, of facing the barren part of that continent. While New Zealand, which lies, as one may say, opposite the façade of Australia, has been involved with it in a most happy development, New Guinea has of all the large islands in the world remained the longest totally neglected. The most recent encroachments of the modern colonial powers have called attention to it, but it has had the further misfortune of not being annexed to its natural neighbour Australia, but of being partitioned among no fewer than three powers with completely conflicting interests. Although the unnatural character of this arrangement has not yet caused serious inconveniences, owing to the caution with which the preliminary steps have been taken, a time will certainly arrive when the drawbacks of the system will be patent. The part that suffers from this is in the first place New Guinea itself, but, in the second, Australia. British New Guinea has indeed the advantage of forming the coast opposite to North Australia, a position which everywhere and always in the course of the history of mankind has proved to be profitable. But it turns its face away from the open sea, and thus stands far behind Kaiser Wilhelm's Land, the German part of New Guinea, from the point of view of political importance. This circumstance had, however, been realised by the Anglo-Australian colonies long before the inauguration of the new colonial age, since they have always rightly estimated the special value of their geographical situation. They like to call the South Sea "our ocean," and it is never forgotten how at the first dawn of that period the colony of Queensland enforced the "natural right of possession" for the whole area, from New Guinea in the west to Fiji in the south. That inheritance, on which doubts were then generally cast, has now been accepted by the great Australian Commonwealth.

The sources of our information for the history of Australia and Oceania differ in kind and value, according as we deal with the period anterior to or later than the arrival of the whites. About the modern era, which we may fairly define as the period from the permanent discovery of the islands to the present day, we possess on the whole ample information from the accounts of missionaries and travellers; but for the whole of the early period no records exist. We find merely tradition, which does not, however, extend over the whole region, but is limited to Polynesia; but there it comes into the foreground in a way that is unparalleled among primitive peoples. The whole of Polynesian chronology is based upon generations; separate groups and islands enumerate long series of them. Thus Rarotonga reckons thirty generations; New Zealand, since the Maori immigration, fifteen to twenty; the dynasty of Mangarewa, twenty-seven. Hawaii with the sixty-seven ancestors of Kamehameha I, and Nukahiva with eighty-eight generations far exceed these figures; but in these instances a series of deities and spirits as ancestors are plainly introduced into the royal succession.

Tradition, from the reasons above mentioned, shows itself to be an obscure, unimportant, and doubtful source of information, and on other grounds it is only of qualified interest to us. However interesting its study may be for an exhaustive

examination of some special district, yet it is entirely immaterial to the general course of the history of mankind whether on an island lost in the vastness of the Pacific Ocean a few chiefs more or less of this or that name lived and worked. The value of their ascertained total merely consists in the possibility which is then presented of calculating roughly the beginning of tribal life in the islands, and thus of obtaining some starting-point for the period of the first migrations. The answer to this question is the pivot of the first and general part of our investigations devoted to Oceania. The second, and in a narrower sense historical part, opens everywhere with the appearance of the Europeans. From that era onwards there are visible traces of reciprocal relations between the South Sea and the rest of the globe. Ethnology as a coadjutor in the science of history has, if possible, a more difficult task to perform in Oceania than in Africa (cf. Vol. III). In the first place, it alone can only give unexceptionable proof of the relations between the separate great ethnical groups of the region itself; there is no other method available here than that of comparative anthropology and ethnology. The second task is more important and incomparably more difficult, that of elucidating the origin and affinity of the Polynesians. The solution of this problem, notwithstanding the diligence of numerous explorers, is still wanting. We may not only hope but assume that it will in the end be discovered, and mainly by the help of ethnography.

## 2. AUSTRALIA AND TASMANIA AS PARTS OF THE INHABITED EARTH

### A. AUSTRALIA

(a) *The Position of Australia.* — The position of Australia, from the standpoint of the history of the world and of civilization, is best described as terminal or marginal. In this respect it has many features in common with Africa, and especially the southern half of Africa. Just as this continent runs out toward the west into the narrow but almost landless Atlantic, and toward the south into the desolate and inhospitable Antarctic Ocean, so the mighty waste of waters of the Southern Indian and Southern Pacific Oceans spreads round the western and southern halves of Australia. And precisely as the inhabitants of the western and southern sides have, of all the races in Africa, remained most aloof from the sea, so the corresponding parts of Australia have always been the least attractive to navigators. Even in the present days of enormous commerce, when the enterprising white man does not ignore the less alluring districts, the south and southwest of Australia are far behind the other parts of the country in every respect. Australia is only shut off from the open sea upon the east; we there find large clusters of islands, which, on the map at least, produce the impression of a dense mass. But, in reality the area of these eastern islands is nothing in comparison with the expanse of ocean and the continent; and leaving New Zealand out of the question, they cannot, with their diminutive superficial size, be considered as having influenced Australia in the past.

Australia is thus the most insular of all continents. It would appear completely free and detached from the other continental land masses, were it not for the dense Indonesian group which lies to the northwest, and forms a connecting link with the southeast coast of Asia. This group contains larger islands than its Oceanic

continuation; it is also more densely packed, so that it seems admirably adapted as a bridge for migrations. And it has undoubtedly served such purpose. In the case of certain plants and animals, the migration from Asia to Australia can be proved, and it is extremely probable that the ancestors of the Australian native tribes crossed the Indonesian bridge.

If we consider Australia under these circumstances a part of the Old World, we are certainly treating the question rightly; only, this conclusion is less frequently based by historians on the facts of geography, zoölogy, and botany, than upon the evidence of native culture and institutions, which are entirely borrowed from the civilization of the Old World. But the first argument is more interesting and historically more far-reaching, since it brings into our field of view not only Australia, but also all Oceania, which is, much more obviously than Australia, connected with the Asiatic continent. The path from Asia to both regions is almost precisely the same.

The marginal situation of Australia has produced on its aboriginal inhabitants all the effects which we find in every primitive nation in the same or a similar position. The whole development of their culture bears the stamp of isolation. The disadvantageous position of the continent is by no means balanced by variety of internal conformation. The coast line compares favourably in extent with those of South America and Africa when the greater superficial area of these two continents is taken into account. So with the number of its peninsulas, Australia fares better than those two continents, as a glance at the map, p. 232, will show. But what profit do the natives derive from these very slight advantages, if the islands and peninsulas are as sterile, inaccessible, and desolate as most of the coast districts and the greater part of the interior itself?

(b) *The Physical Characteristics of Australia.*—The physical characteristics of Australia show at the first glance a great poverty and monotony. The continent, according to its vertical configuration, is a vast plateau, rising in the east, and sinking in the west, which slopes away from north to south. This table-land is only fringed by mountain ranges on its edges. A chain of mountains runs along the east coast from the southern extremity, which follows the coast line at a varying though never great distance, until it ends in Cape York. From this great watershed the land gradually slopes away in a southwesterly direction to the Indian Ocean, seamed by a few detached ranges and mountains, which rise to a considerable height in isolated masses. The western coast range is not so high as the eastern; but, in contrast to the latter, it is prolonged into the interior as a table-land, which abounds in extensive salt marshes and stretches far into the centre of the country. On the south and north there is no such high ground bordering the coast and turning inwards. Some half century ago, this high ground played an important part in the current theories as to the interior, since its assumed existence necessarily required the interior to be an enormous basin, in which the rivers from all sides united their waters in a large inland sea. We know now that the north rises so gradually from the sea to the interior that the rivers, in consequence of their gentle and uniform fall, overflow their banks far and wide after every heavy down-pour of tropical rain. There is still less difference of height observable between the interior and the south coast. The lake district, which runs in a long line from Spencer Gulf to the north and northwest, lies almost on the level of the sea.

(c) *The Hydrography of Australia.*—The hydrography of Australia is intimately connected with the physical characteristics of the country. Not one of its mountains is high enough to form among perpetual snows a reservoir for the constant supply of the rivers; but the principal, and from its position the most important range, that of the east coast, is high enough to divert the atmospheric moisture from the remaining parts of the continent. The existing conditions are precisely similar to those in South Africa, which geographically and ethnographically has many points of affinity with Australia. Just as the curving ranges of the east coast of Africa collect on their wild and rugged flanks all the aqueous vapour of the southeast trade-wind blowing from the Indian Ocean, so the moisture contained by the Pacific southeast trade-wind does not go beyond the limits of the high grounds of East Australia; this is a blessing for the colonies of Victoria, New South Wales, and Queensland, where the economic and political centre of gravity of the whole continent must always lie, but a curse for the whole of the rest of the interior.

As a result of this restricted area of rainfall, there is no river system of importance, except that of the Murray and its tributary, the Darling, on the east of the continent. This testifies to the absence of any watershed in the interior, in so far as its sources comprise the whole western slopes of the East Australian coast range from New South Wales to Queensland. Measured by a European standard, the region included by the two rivers embraces a triangle, the angles of which would be formed by the towns of Turin, Königsberg, and Belgrade. We are concerned, therefore, with measurements such as Europe can only show in its eastern half at most. The real value both of these rivers and of most of the rest in Australia, whether rapid or stagnant, does not unfortunately accord with the figures. The Darling, indeed, is by far the longer but shallower arm, which only becomes navigable after great floods, and can then be ascended by steamers of small draught as far as the point where it cuts the thirtieth degree of southern latitude. Even the Murrumbidgee, the right tributary of the Murray, is only open to navigation some months in the year. The Murray alone is available at all times for the objects of commerce, but only since a great and lasting interest has been taken in the regulation of its channels.

In the north and northeast, owing to the heavier rainfall, there is less scarcity of water. We find there numerous watercourses of considerable breadth, of which quite a number are navigable for a short distance inland. But they do not open up the interior of the country itself. Only the still little known streams of the northern territory, the Roper, the Daly, and the Victoria, seem to form a notable exception, since they can be ascended by large vessels for a very considerable distance.

In contrast to this, the prospect throughout the west and south, and in the interior is very disheartening. We find, indeed, numerous and apparently large watercourses on the map, but not in reality. The name of a river in those parts is given to channels which either lie quite dry for the greater part of the year, or under the most favourable conditions consist of a chain of broad ponds, which are divided by banks and never connected after their formation. These beds only become real watercourses at the time of the summer rains; but then they swell to such a size that the overflow does no good to the land. The torrents then rush down many feet deep, only to disappear in the ever-thirsty ground after a short

course and a still shorter time, and thus once more to make room for the old order of things. Australia, like Africa, is the land of contrasts. The south coast does not even enjoy the doubtful advantage of such streams; it is, on the contrary, as far as the mouth of the Murray entirely devoid of any river worth mentioning. It is sufficiently obvious that such a lack of uniformity in the water supply of the continent must have the most far-reaching effects on all its phenomena of life. The abrupt change from complete drought to a deep flood which destroys all life is in itself sufficient to reduce wide tracts to wildernesses, and all the more so since the numerous lakes are subject to the same variations. Ethnographically, however, and therefore in a wider sense historically, more important than this change is the permanent characteristic of Australia, the marvellous drought, which prevails over the whole continent as far as the tropical regions of it, and is only made more apparent by the rarity and short duration of the rainfall. This drought is in the first place the cause of the barrenness of the country, and in the next place it obliges the natives to be continually migrating if they wish to find sufficient food. Finally, it is the cause why these unsettled migratory bands can never attain any size, if, indeed, the scanty supplies of the soil are to be enough to feed them. The consequence is that the Australians are split up into a number of small tribes or hordes, among whom no traces of national life can be discovered. Their gradual disappearance without leaving any mark on history is a necessary sequel. Nor does this main feature of the hydrography of Australia limit its effects to the natives only; it has, on the contrary, exercised a marked influence on the density of colonisation by the whites. In the parts of the country remote from the coast the colonist, precisely as in sub-tropical South Africa, required ample room, and it is no mere coincidence that the colonies of Australia were everywhere founded in the more fertile coast districts.

(d) *The Australian Climate.*—The characteristic feature of the Australian climate is its dryness. The country from its position between the tenth and fortieth degrees of southern latitude is for the most part, and unfortunately throughout its whole length, included in the region of the southern trade-winds. In addition to this, there is the second disadvantage which we have already mentioned, that the highest ranges of mountains are found on the weather side of the continent; the result of which is that the main portion of the country is sheltered from wind and rain. If, under these circumstances, the interior is not such a sandy waste as the Sahara, the centre of the North African trade-wind region, Central Australia owes this merely to the excessive heating of its soil and the openness of the north coast. The former produces, in summer especially, an extensive Central Australian zone of low pressure, which gives rise to a rain-bringing northwest monsoon, and draws it far into the continent, sometimes even to the south coast. Unfortunately this wind, in the extent of the regions over which it passes and in its effect on the climate, is far inferior to the southeast trade-wind, under the dominion of which many tracts are for months without any rain whatever. The west, which it reaches after all moisture has been deposited, suffers peculiarly from this drawback.

The conditions of the rainfall in Australia go by extremes. "It never rains but it pours" is the saying of the settlers, which aptly characterises the way in which the water pours down from the clouds; in Sydney, on one occasion, ten

inches of rain, a quarter, that is to say, of the annual rainfall, fell in two hours and a half. The vegetation of the country is nowhere sufficient to store up such volumes of water; they rush away, doing more or less havoc, are immediately sucked up by the ever-thirsty earth, and then make way for as parching a drought perhaps as had previously prevailed.

The temperatures also are no exception to this general description. The vicinity of the sea modifies the extremes on the coast regions; yet in Perth, for example, a maximum temperature of 113° Fahrenheit is contrasted with a minimum temperature of 24 Fahrenheit. The interior, however, is completely subject to a pronounced continental climate; there the thermometer during the day rises to 120° Fahrenheit, while at night the pools are covered by a thick coating of ice; for night represents winter in Australia. However easy it has been for the European immigrant to adapt himself to these climatic peculiarities, the aborigine has always been helpless in face of them. In addition to anxious care for his daily food, and above all for the life-giving water, he is met, in the sub-tropical regions at any rate, by a second and not less serious anxiety about a shelter from the weather. Certainly, for a creature so dependent on nature as the Australian, the combination of these three cares is sufficient to divert the thoughts of even the most intelligent among them from any higher intellectual occupation.

(e) *The Vegetation of Australia.*—The vegetation of his native soil only assists the Australian to a limited extent in his struggle for existence, yet he owes more to it than to the animal kingdom. The Australian flora is like that of all steppe regions, rich in varieties, of which it affords, for example, more than Europe; but in its general characteristics of dryness, stiffness, and want of sap it is quite on a keeping with the pervading nature of the country. These features belong to the Australian trees with their stiff, ever green yet dull and lustreless, foliage and their scanty shade; they are still more emphatically peculiar to the typical Australian growth of "scrub," that dense gray tangle of stubborn, sapless bushes, which is hard to destroy even by burning and presents more obstacles to the advance of the explorer than the most luxuriant vegetation of the tropics. The characteristic of stiffness and dryness is found in every blade of the notorious Australian spinifex or porcupine-grass plains with their dry, sharp-edged grasses. And lastly we find it most conspicuously in those districts seamed with sandhills, salt plains, and stony tracts, where the steppe becomes a desert, and where only the extraordinary abundance of certain grasses and thorns succeeds in keeping the soil from being absolutely bare.

These different forms of vegetation have totally different effects upon the population. From the point of view of moving from one place to another, the forest and the grass steppe are contrasted with the scrub and the spinifex steppe. The forest, or, as it would be more correctly called, the Australian heath, with its tree trunks standing far apart and its want of underwood, has never offered any obstacle to the wanderings of the natives or the whites. On the contrary, with the vigorous growth of grass which has been able to spring up unchecked everywhere between the smooth, branchless stems, it has formed a carpet over which the settler could march to the tempting pasture grounds of the hinterland. The economic centre of gravity of the continent lies, even at the present day, in these open forests and meadow-like districts, which are limited to the southeast and the northern

parts of the interior; indeed, cattle-breeding, the most extensive and important of Australian industries, entirely depends on them.

The two other forms of vegetation have nothing of this. It is a known fact that the impenetrability of the scrub is one of the chief causes why the exploration of Australia has proceeded so slowly. The boldest travellers have wandered for weeks and months round the enormous thickets without finding a path through the stubborn mass. So, too, the boundless spinifex plains, with their pleasing aspect, which recalls waving fields of ripe corn, form anything but a pleasant road. The stalks, from their dryness and stiffness, are unsuited for fodder, and the leaves are so sharp that they draw blood from the legs of the traveller. All traffic through these districts, therefore, has been abandoned. Economically also, neither kind of country concerns the European for the present. It is true that for some time very successful attempts have been made to increase the value of the dryer grass steppes by a system of wells, and without doubt in the future the feasibility of cultivating the steppes now overgrown with scrub and porcupine grass will be considered. But it appears problematical whether the labour expended will repay itself. The native has nothing to hope from either kind of country. They have both been always inaccessible to him and in the future will secure for him neither a shelter nor a livelihood. With food plants of all kinds the native has not been so stingily provided by the continent as the older accounts would seem to say. The bulbs so characteristic of steppe countries are indeed insignificant in Australia; but in their place the native, who is certainly not fastidious, has at his disposal numerous other roots, various wild kinds of corn, mushrooms, berries, and blossoms, so that there can be no question of any actual lack of food. But the niggard nature of the country does not make it easy for him to obtain these crops, any more than it will ever allow the white settler to bring agriculture into the first rank of industries in place of cattle-breeding.

(f) *The Animal Life of Australia.*—The Australian has been most inadequately endowed with a native fauna. As one might expect from the general physical features of the continent, it is limited; but it has become a matter of grave importance for the native that it has not provided him with a single domestic or useful animal. The few animals that might be thought of for such purposes, are all considered too wild. The dingo, the only mammal available for domestication, was in all probability, introduced in a domesticated state and has since become wild. In addition to this, hunting, owing to the fleetness of all animals of the chase, is a very difficult undertaking for the aborigine armed with inadequate weapons; none even of the numerous well-equipped European expeditions have ever been able to provide themselves with food by this means. The nocturnal habits of an unusually large number of animals greatly increase the difficulty of catching them. This difficulty, insuperable for the aborigines, the European has met in the best possible way by introducing European domestic animals. They have all succeeded admirably, have multiplied to an astounding degree, and now represent a most valuable part of the national property, in fact, together with the mineral output, cattle-breeding has contributed the largest share to the marvellously rapid development of the colonies.

(g) *Australia's Mineral Wealth.*—Even the mineral wealth of the country has entirely failed to affect the position of the native. He, like the Bushman of South

Africa, has never gone so far as to employ any metal in its crude state, but meets the European as a fully developed man of the Stone Age, or in some degree of a yet earlier stage. The whites have set about all the more vigorously to make use of the mineral treasures of Australia. The opening of the gold fields about the middle of the nineteenth century certainly marks the most crucial chapter in the history of the colonies. Even now, when the "gold fever" has long since given way to a normal temperature, the mining industry has all the greater importance for the development of Australia and its position in the great future which we may anticipate for the Pacific Ocean, because its wealth in other useful minerals, especially in coal and iron, is undisputed. The east, in all things the favoured region, in this respect also retains its natural superiority, since it possesses the most extensive coal-fields. The history of the continent will thus in the future point more decisively and distinctly toward the east and the north than hitherto.

### B. TASMANIA

THE natural features of Tasmania call for little remark. In the conformation of its surface, a direct continuation of the coast range of East Australia, it resembles in its flora and fauna also the southeast of the continent. On these and above all on geological grounds it cannot be separated from the mainland, in comparison with which, however, it is singularly favoured by climate. Tasmania has neither abrupt contrasts of heat and cold nor an uncertain supply of water; a comparatively large rainfall is distributed over the whole year, and the temperature has only the range of a genial and temperate maritime climate. There is an abundant and perpetual supply of water both running and stagnant, and Tasmanian vegetation is of a luxuriance such as on the mainland is found only in the more favoured parts of Victoria. Tasmania really deserves the name of "Australia Felix," which was formerly given to the southeastern portion of the mainland. It may appear at the first sight astonishing that from such a favourable foundation the aborigine has not mounted to any higher stage of culture than the Australian, but the explanation is not far to seek. In the first place, owing to the close affinity of the Tasmanian and the Australian, the intellectual abilities of the two races are on a par. Even in the domain of ethnical psychology, the law of inertia holds good; the better conditions of life enjoyed by the Tasmanian are balanced by the greater isolation and seclusion of his country. The forest and the sea, which runs far inland in numerous creeks, have furnished the native with a more ample diet; but an opposite coast, which might be the transmitter or source of new achievements in culture, was more completely wanting there than even in the case of Australia. The coasts of the mainland were out of the question as promoters of culture; and the Tasmanian only navigated the sea to the most modest extent; longer voyages would only have brought him to a wilderness of water.

### 3. THE POPULATION OF AUSTRALIA AND TASMANIA

WHAT, then, is the state of the inhabitants of these countries, whose external conditions have just been sketched as guides to the historical development, and of the makers of their history? What place do the primitive inhabitants take in the circle of mankind? Are they autochthonous in their land, or have they immi-

grated? Have they kinsmen, and, if so, where? And what, lastly, is the composition of the modern non-native population of the continent? We will endeavour to answer these questions.

#### A. THE ANTHROPOLOGICAL POSITION OF THE AUSTRALIANS

A SATISFACTORY consensus of opinion now prevails as to the anthropological position of the Australians. The similarity of their methods of life, the uniformity of their attainments in culture and of their habits, and to some degree the identity of the languages might lead to the erroneous view that they are a homogeneous race, which cannot be grouped with the Malayan or Papuan. Anthropological investigation has now proved that this homogeneousness does not exist, and that the native population of Australia represents, on the contrary, a mixture of at least two very distinct elements. This view finds corroboration in the differences of the colour of the skin and the formation of the hair, and also of the shape of the face. The colour of the skin varies from a true yellow to a velvety black with numerous intermediate degrees, among which the dark-brown tint is far the most common colouring. The hair, too, with a prevalent tendency to curl, ranges from the true straight-haired type to the complete woolly-haired type of the negro. The shape of the face and skull, finally, shows a multiplicity of differences, such as cannot be greater even in nations proved to be largely mixed with foreign blood. The flat negro nose on the one side, and the typical Semitic nose on the other, form the extremes here. It is thus clearly established that a dark, woolly-haired race and a light, straight-haired race shared in the ancestry of the Australian. But where, then, was their original home? Both races obviously could not be autochthonous at the same time; indeed, the nature of the continent seems to exclude the possibility that it was the cradle even of one race. Whence, therefore, did the two elements of admixture come, and which is the earlier on the new soil?

A key to this problem we find even at the present day on the north coast of Australia, in the still existing trade of the Malays with the northwest, and in the immediate vicinity of New Guinea with a Papuan population, which also has a predilection for crossing the group of islands of the Torres Straits to the south. For the migration of the Papuan-Melanesian, or, in more general terms, of the negroid element, no other path than that by New Guinea can be thought of. But two roads were open to the Malayan; the direct road from the Indian archipelago, which even at the present day maintains a connection with Australia, and the *détour* by Polynesia. We have no evidence that this second one was used; but we know now from the ethnography of New Guinea that its population had a distinct infusion of Malayan-Polynesian blood. But what in the case of New Guinea is demonstrable fact lies in the case of Australia within the range of probability, since the conditions of access to both countries from Polynesia are practically identical.

The question of priority sinks into the background compared with the solution of the main problem. An answer also is barely possible, since the migration from both sides to Australia must not be regarded as an isolated event, but as a continuous or frequently recurring movement. A certain coincidence of time is under the circumstances to be assumed.

From another standpoint also the question of priority gives way before that of

the predominance of the one or the other element. The point, briefly put, is to ascertain clearly the causes of the wonderful inability of the modern Australian to navigate the sea, — a peculiar defect, which has prevented him from settling not only on the more remote of the coasts which face Australia, but even on the neighbouring islands, with the exception of Tasmania, to which access was facilitated by the crowded group of islands in the Bass Strait. When we see how the negroes and all the dusky remnants of nations on the southern margin of Asia feel the same dread of the sea, and when we reflect that the nature of his present home has induced the Melanesian to become a navigator, although he is far removed from being a true seaman, we must at once entertain the conjecture that it is the negroid blood in his veins that fetters the Australian so firmly to the sod. Up to a certain point this conjecture is doubtless correct, for the law of heredity holds good in the domain of ethnical psychology. It is impossible, however, to make Papuan ancestry alone responsible for this peculiarity; it has not hindered the Melanesians from arriving, under favourable circumstances, at a fair degree of proficiency in navigation. If the Australian has failed to do the same, it is partly because his circumstances have made him unfamiliar with the sea.

The full force of this second cause is apparent when we consider the nature of the country, and the extent to which the economic basis of the Australian native's life is narrowed by the poverty and inhospitable character of his surroundings. He who must devote every moment in the day to the task of providing food and drink for his body, and is forced to roam unceasingly as he follows his fleeting quarry from place to place, has neither the time nor the inclination to retain or to develop an accomplishment like navigation, which requires constant practice, and which does not at first seem necessary in a new country. And even if the ancestral Malayan blood had transmitted to the young race any nautical skill, such as we admire to-day among the Polynesians and Western Malays, the Australian continent would have put an end to it, for it has always been the country of material anxiety, and as a consequence the country of continual decadence.

The loss of seamanship is in reality only a sign of this. The aloofness from the outer world which began with it was the first step toward that complete disappearance of Australia from history for the millenniums that have elapsed since its first colonisation. The cause of this is not to be found in the isolation of the continent, for other completely remote races have developed a history and a civilization. It was not to the absolute seclusion from the rest of the world and the unbroken quiet in which Australia reposed, as the corner pillar of the Old World between the Indian Ocean and the Pacific, that the entire absence of any historical development of its own was due, but to the total impossibility of creating a true national life on its niggard soil. The attempts to do so, which the Europeans found on their arrival, can at best be termed a caricature of political organisation.

#### B. THE ANTHROPOLOGICAL POSITION OF THE TASMANIANS

THE Tasmanian also has not progressed far in the field of political development. Since the nature of his country is richer in resources than Australia, economic considerations must be excluded from the list of possible causes. The same remark applies to the small proficiency in navigation, which we noticed also in Australia. The explanation can only be found in that close affinity of the Tasmanian to the

Melanesian ethnical group, upon which all observers have insisted. This is primarily shown in the physical characteristics; but, secondarily, it appears in the inability of the Papuan to rise higher than the stage of village communities. New Guinea offers the closest parallel.

### C. THE WHITES

THE whites do not belong to the continent, but have made it commercially subject to them, and have thus, in contrast to the aborigines, who have never succeeded in breaking the strong fetters of nature, become the true makers of its history. This history even now looks back barely on a century, a period of time that hardly counts in the life of a people. Yet it has already been full of vicissitudes, even if, in this respect, it has been greatly surpassed by the outwardly similar history of the United States of America. Australia has so far followed the comfortable road of a daughter State; the storms begin to gather when the first thought of independence is suggested.

In contrast to America, which for centuries has been a crucible for almost all the races and peoples of the globe, the immigrant population of Australia, Tasmania, and New Zealand is unusually homogeneous. It is composed almost exclusively of Britons, by the side of whom the members of other nationalities practically disappear. Even the hundred thousand Germans who have settled there hardly affect the result, especially since their absorption in the rest of the population is merely a question of time. The Chinese, since they never make their home in the country, may be disregarded as factors in the growth of national life.

The ethnical unity of the white population of Australia is of extreme importance for the British empire. England's dominant position on the Indian Ocean (see the section at the end of the volume) may appear most favourable; but in view of the efforts made by the colonial powers of Western Europe to strengthen their recently acquired possessions in those parts and to increase their influence generally, but above all in view of the danger that Russia may deliver a flank attack from the north on India, this position may grow less tenable from day to day. The same turn of fortune is in prospect for England (and all other European colonial powers) on the Pacific. There it is the cutting of the Central American Isthmus, which is to the advantage, both strategically and economically, of the United States, above all other powers, and threatens to give them in the South Seas a great superiority over all rivals. The interests of England are, from the position of affairs, most at stake. It is for this reason a great stroke of good fortune for her that the corner pillar, which both supports the dominions on the Indian Ocean, and is, on the other side, the chief agent of British interests in the Pacific Ocean, is not only an English possession, but, as it were, a part of England itself. In thought and action, customs and habits, mother and daughter exactly resemble each other. Even in the matter of dress the daughter country has not found it necessary to consider the change of climate; the tall hat is the only admissible head gear even in the streets of Sydney and Melbourne.

This feeling of complete sympathy must be most soothing to the mother country. It knows that the two countries are identical in customs and manners, and it tacitly assumes that the same community of feeling must reign in every other department of life. This feeling is so strong that even the latest and boldest of

all the political steps of the Australian colonies, their union into the Commonwealth of Australia, which was proclaimed on September 17, 1900, is regarded in England as taken entirely in the interests of Great Britain. This view of the situation is creditable, in a way, to England, since it proves her complete confidence in the colonies; but there is room to doubt whether it is justified by the facts. How would it be if this federation, notwithstanding all professions of loyalty, were the first step toward political independence? Joseph Chamberlain, who with all the defects of his character is undoubtedly the most far-seeing English statesman of the present day, has declared emphatically in a public speech that such a step or even the thought of it lay entirely outside the range of possibility. But when we see how in the national life of to-day economic interests outweigh all other impulses and have become completely the gauge of international relations, we can hardly share the view of the English minister, especially when we recall the defection of the United States, whose ethnographical relations toward the mother country were quite as favourable as those of Australia.

England might see a faint ray of hope, so far as she could ever imagine herself in need of it, in a phenomenon, which perhaps is even more interesting in the history of development than it is pregnant with results from the point of view of colonial politics, namely, in the political and intellectual transformation which has taken place among the white immigrants in Australia and New Zealand. The astonishing change which the white man of North America has undergone in his whole physical aspect is well known. It has now gone so far as to create a peculiar type, the Yankee, that tall, gaunt figure, which no longer suggests the original European immigrant, but seems completely Americanised. Even in the colour of his skin and the formation of his hair the Yankee has begun to differentiate himself from his European kinsmen and to approach the type of the aboriginal Indians. Similar changes, for which on so large a scale we cannot suggest any explanation, although generally the climate may be regarded as the main cause of the transformation, have been suffered by the Briton in Australia and New Zealand. A. K. Newman, in 1876, only some thirty years after the colonisation of New Zealand by Europeans, pointed out (as Heinrich Schurtz describes in his "Urgeschichte der Cultur") the growth of a peculiar New Zealand type, which shows itself in a narrowing of the lower jaw, a contraction of space for the teeth, and irregularities of the teeth themselves. There are also other modifications of type. "The fresh complexions of the Englishmen give way, among the young New Zealanders, to duller and more faded tints. It is a remarkable fact that very few children are born in New Zealand with dark eyes and hair. The parents may be as dark as they can be, with jet-black hair and black eyes, their progeny will always show less intense colour. On the Australian continent, by contrast, the blondes seem always in a minority with the brunettes. The effects also of a hotter climate on the people are noticeable in New Zealand, but more especially on the continent of Australia. In Australia, under the influence of a scorching sun, the children grow up quickly; but they also fade as quickly as hothouse flowers, and their intellectual and physical powers are nearly exhausted at an age when the Englishman still possesses his youthful energy. The young people of New Zealand and of the Australian colonies are physically and intellectually weaker than the inhabitants of the old country at the same age. They are less capable of working; toil and privations quickly tell on them. This colonial younger generation possesses little physical power of

endurance; every attack of sickness rapidly prostrates the people, and they recover slowly. Even the women soon lose their bloom. The Australian, like the Yankee type, tends toward a tall, slouching figure, with slender muscular development, a peculiarity which has produced the nickname of 'corn-stalk.' For the present this remarkable phenomenon possesses merely an anthropological interest; sufficient time has not elapsed for political results to follow from it. Should, however, the question of political independence come before the colonies, the possibility is not excluded that the steadily increasing total of the negative qualities just enumerated may decide it unfavourably for the Australian.

#### 4. THE ASCERTAINABLE FACTS IN THE HISTORY OF THE AUSTRALIANS AND TASMANIANS

##### A. CONJECTURES AS TO THE PRE-EUROPEAN PERIOD

ONE of the greatest achievements of the nineteenth century in the field of ethnology, the art of reconstructing from prehistoric finds the national history of long-past ages, lying beyond all tradition and written record, fails in Australia. This does not imply that discoveries of the kind might not be made; quite the reverse. The continent has its *mirnjongs*, or ash-heaps, measuring sometimes ten feet in height, and often several hundred yards in circumference, and containing pieces of bone and stone axes; these are very common in South Australia and Victoria, particularly on Lake Connewarren, and form an exact counterpart of the "kitchen middens" of Denmark and the *sambaquis* of South America (cf. Vol. I, p. 182). Great heaps of mussel-shells are also found in the vicinity of the sea-shore; there is even one really artistic erection dating from prehistoric times. This ancient monument, as we may fairly call it, is the stone labyrinth of Breewarina on the upper Darling, some sixty miles above Bourke. It consists of a stone weir a hundred yards or so long, which, built on a rocky foundation, stretches diagonally through the river. From this transverse dam a labyrinth of stone walls reaching some ninety yards up stream has been constructed, which is intended to facilitate the catching of the fish which swim up or down stream. The walls form for this purpose circular basins of from two to four feet in diameter; some are connected together by intricate passages, while others only possess one entrance. These walls, according to Emil Jung, are so firmly built of ponderous masses of rock, that the mighty floods, which sometimes poured down with a depth of twenty feet, were only able at best to dislodge the topmost layers of the stones.

The conclusions which we can draw from the existence of the *mirnjongs* and the shell mounds, but especially from the Breewarina Labyrinth, throw some little light on the ancient Australians. Each of the three constructions presupposes in the first place that the population, at least in the southeast, was considerably denser in early times than at the time of the landing of the Europeans; otherwise the piling up of the refuse mounds would imply periods of whose length we could form no conception. The building of the labyrinth also can only be explained by the employment of large masses of men, especially since the materials had to be brought from a considerable distance. But, besides this, it can only have been erected by an organised population; Australian hordes of the present day would be incapable of such combined efforts.

Another circumstance confirms our assumption of the retrogression of the Australians both in numbers and in culture. The boats, whether they consist of nothing better than a piece of bark tied together at both ends and kept apart in the middle by pieces of inserted wood, or appear in the shape of simple rafts, carry in the middle on a little pile of clay a fire, the modern object of which is merely the immediate cooking of the fish that are caught, but its invariable presence there suggests the thought that it is a survival from former regular sea voyages, when the custom was justified.

This proof by probability that the Australians have retrograded in numbers and in civilization is all that can be derived from the evidence of the country and the national life. This is no great achievement; but it shows how completely unfavourable natural conditions have overwhelmed the energy and capabilities of the natives. It is, for the time being, impossible to judge the length of the periods with which we have to reckon or to determine whether a deterioration of the climate has contributed to this decline; such a contingency is not impossible (cf. Vol. III, p. 398, as to the Sahara).

After all we can only follow the history of the Australians and Tasmanians from the moment of their intercourse with the white men. There is no question here of a true development, such as can be traced in all nations except a few border nations in the north and south of the globe. The expression "history" really connotes too much in this case; for all that European civilization and the white men brought to them tended to one and the same result ultimately; the slow but sure extinction of the whole race. The methods of extermination may differ, but the end is always the same.

In physical geography the expression "geographical homologies" is constantly employed. It is borrowed from comparative anatomy and signifies the recurrence of the same configuration, whether in the horizontal outlines or in the elevation of the surface, which we find in the countries of our globe. The best known of these homologies is the striking similarity in the contours of South America, Africa, and Australia, which, in the words of Oskar Peschel, display as great a uniformity of shape as if they had been constructed after a model. It is not our intention to examine this similarity closely; but we must consider for a few moments that exact correspondence of the southern extremities of those continents, which goes far beyond a mere linear resemblance.

The tapering away into a wedge-like point, facing the Antarctic, which is a feature peculiar to the three continents (if the island of Tasmania is reckoned as part of Australia), is, so far as its shape goes, an excrescence breaking through the general scheme on which their outlines are modelled; the meaning and cause of this precise contour have remained a mystery to men like Humboldt and Peschel. But there is no doubt as to the influence which these vast and lonely promontories, tapering away into the ocean, have exercised on physical geography and the distribution of culture.

From the first point of view, their position and shape determine the course of the entire circulation of the seas of the southern hemisphere. The character of the climatic conditions is influenced by them, and the greater or less degree to which the land masses of the southern hemisphere can be inhabited is decided in the last resort by them. On civilization the effect of this wedge-like shape is exclusively negative. It places the inhabitant of those promontories on the

remote southern edge of the habitable world, cuts him off to the north from the centres of civilization, and confines him to regions which are continually narrowing. Still more momentous are the consequences on the art of navigation. The vast ocean, limitless and islandless, surrounds each of the three extremities. How, then, should primitive people venture on the high seas, when even a highly developed navigation cannot flourish without some opposite coast which can be reached?

But the homology goes still further, for Africa and Australia in a large degree, and in a more restricted degree for South America. It shows itself this time in the destiny of the natives during intercourse with the whites. How these latter have treated the Bushman and the Hottentot in South Africa can be seen in another part of this history (Vol. III, p. 424); the result of a war of extermination for more than two centuries was similar; both peoples at the present time can hardly be called even the fragments of a nation. The aborigine of southern South America has hitherto fared better. Neither Patagonians nor Araucos have, it is true, emerged unscathed from intercourse with the white intruders; but they have been able to retain the characteristics of their race, and have remained free and independent. No careful observer will imagine that this is a consequence of creole courage; what has preserved the Indian hitherto from destruction is merely the political immaturity of his opponents and the insufficiency of their numbers to people the vast territory of South America.

#### B. THE HISTORY OF THE TASMANIANS

THE Australians and Tasmanians did not fare so well. The latter have been for a quarter of a century blotted out from the list of living peoples; the same fate impends upon the former, and is, from all appearance, inevitable. The Tasmanian tragedy is not only the most gloomy from its *dénouement*, but has a sad pre-eminence for the large number of sensational details. It opens on the 4th of May, 1804, when the natives, on approaching the new settlement of Hobart in a friendly spirit, were, through an unfortunate misunderstanding of their intentions, greeted by the English garrison with a volley of bullets; or we can, if we prefer, take the date June 13, 1803, when the first batch of English convicts landed on the spot where the present capital of the country, Hobart, stands. This year saw the birth of the Tasmanian woman, Trukanini, or Lalla Rookh, who was destined to survive all her tribesfolk. She died in London in 1876. The death struggle of the whole people had thus precisely lasted a lifetime.

The destruction of the Tasmanians was not accomplished without vigorous resistance on their part. By natural disposition peaceable, harmless, and contented, they had endured for many years the ill-treatment of the transported convicts and the colonists without transgressing the laws of self-defence. It was only after 1826 that, driven to frantic desperation, they amply revenged the treatment they had suffered, and murdered all their tormentors who fell into their hands. The 'twenty-two years that had intervened do not add fresh laurels to the history of English colonisation, nor redound to the honour of mankind generally. In the very first years of the settlement, the hostilities, which, according to the official admission, were always commenced by the whites, assumed such proportions, and the oppression of the natives was so harsh, that in 1810 a special law (Collins)

had to be passed which proposed to punish the murder of an aborigine as an actual crime. Like so many measures which have been passed in the course of European colonial history for the protection of the native populations, this also remained a dead letter, since it was impossible to obtain legal evidence in the case of blacks, who were despised and possessed no rights. The aborigines were shot down where they were met, just as before; their women were captured or enticed away, to live in concubinage with their captors.

It was not only by these persecutions that the growth of the English colony exercised an adverse influence on the fortunes of the natives. Until the landing of the whites, the sea, with its inexhaustible store of fish, molluses, and other living creatures, had supplied all their food; but in proportion as the colony increased, with the growth and prosperity of the towns, the advance of the colonists, and the multiplication and extension of their pasture grounds, the region where the natives could live was curtailed; above all, they were driven away from the coast. But this was a vital question for the Tasmanians, since the rough and wild interior was absolutely wanting in all the means of life. We now understand how these originally timid natives became veritable heroes from desperation, and strove to harm their persecutors when and how they could.

The "victory" of the English was not lightly won. The natives, driven by force into the interior, soon acquired so accurate a knowledge of this country, covered with dense forest and intersected by ravines, that it was difficult to get at them. As Charles Darwin tells us, they often escaped their pursuers by throwing themselves flat upon the black ground, or by standing rigidly still, when, even at a short distance, they were indistinguishable from a dead tree trunk. Faced by these tactics, the English finally resorted to other measures. By a proclamation they forbade the natives to cross a certain boundary. They then (in 1828) offered them also a reservation where the persecuted and pursued might collect and live in peace. Both measures proved futile. The first would never have been really understood by the people, even if they grasped the sense of the words. For the second, the time was already past: the natives were no longer susceptible to a fair treatment, nor were the Europeans disposed to maintain a pacific attitude. The old order of things revived. Head-money, and liberal sums of it, since the quarry was so splendid, was offered for the shooting or capture of the blacks, and aborigines were brought over from Australia in order to track out the enemy more surely. Finally, when all failed, Colonel Arthur, the governor, who suggested all these measures, tried to attain his object by a colossal "drive." A cordon was to be drawn across the whole island from coast to coast, and the "game" thus forced on to a narrow peninsula. Two natives, or, according to other accounts, only one, composed the "bag" of this attempt, which cost the mother country the sum of thirty thousand pounds sterling.

With the failure of these last attempts of Arthur, the tragedy of the Tasmanians enters on another phase. This was free from bloodshed, but was not less disastrous than the former, and is inseparably connected with the name of George Augustus Robinson. This extraordinary man, by trade a simple carpenter at Hobart, and unable to write English correctly, offered, when all warlike measures were ineffective against the natives, to induce them by peaceful overtures to emigrate. We know how thoroughly he accomplished his self-imposed task. Unarmed and single-handed, he attained by pacific negotiations a result which a

whole populous colony had failed to achieve in decades of bloody warfare, and thus clearly demonstrated how easily matters might have been arranged with the Tasmanians if only the good-will had been forthcoming. Through the mediation of Robinson, one tribe was assigned to Swan Island, three others to Gun Carriage Island. Later (1843) all the natives were united on Flinders Island. These "tribes" were by this time not very numerous: powder and shot, syphilis, and smallpox, had caused too great ravages in the past forty years. In 1804 the native population was put at eight thousand souls roughly; in 1815 some five thousand were still estimated to exist. Their number in 1830 reached some seven hundred, and in 1835 dwindled to two hundred and fifty, or one hundred and eleven heads. In 1845, when the survivors were taken across to Oyster Cove in the D'Entrecasteaux Channel, only forty-five, and in 1861 only eighteen, were left. The last male Tasmanian, King Billy, or William Lanne, died in 1869 at Hobart, aged thirty-four, and in 1876 the race of the Tasmanians became entirely extinct on the death of Trukaniui,—the fate that awaits all primitive races from intercourse with civilization.

It is idle at the present day to load the parties concerned with reproaches. No nation, vigorously engaged in colonisation, has yet been destined to keep the shield of humanity spotless and pure. It must also be admitted that in later years earnest attempts were made to atone for the wrongs done to the natives in the earlier period. That the wrong methods were chosen is another consideration, which does not do away with the crime, but may be pleaded as an extenuating circumstance.

### C. THE HISTORY OF THE AUSTRALIANS

THE knell of the Australians has not yet sounded. The restless race still roams the vast steppes, still hunts here and there the nimble kangaroo, and throws with strength and skill the spear and the boomerang. But how cooped in its once wide domain! The whole of the east, fairly rich in resources even for the rude savage, the northeast and southeast, have long been taken by the white man. Now, in most recent times, the latter is making vast strides from the west into the interior, and the north is being more and more encroached upon. The aborigine is faced by the alternatives of retiring into the desert-like interior, or of being forced to capitulate to civilization and become the servant of the European. Neither alternative is calculated to perpetuate either him or his peculiar nature.

The tragic history of the Australians is distinguished from that of the Tasmanians in two respects: it was of longer duration, and covered an incomparably larger space. In character the two struggles have been much alike, and the final issue would have already been the same for the Australian as for the Tasmanian had not better natural conditions been offered to the victims in the shape of a wider district into which to retire, and had not times and customs become less cruel. And this even in the Australian bush. The whole tide of misfortune that overwhelmed the race on the landing of the whites in Australia may be ultimately traced to the unbounded contempt which the Englishman has shown since 1788 for the "black fellow" and the "black gin." This contempt has prevented him from studying the people and their institutions, and has especially kept him from conceding to the native any vested rights in the soil. But any one who knows that the political organisation of ancient Australia found practically its only

expression in the claim of each single tribe to one definite territory (within the tribe itself the land was at times divided between the various families) will also understand that the rude encroachments of the first Europeans, whether convicts or free colonists, could not fail to provoke grave disputes. Among the natives themselves violation of territory ranked as the most flagrant breach of the peace.

Next to this contempt for all rights of the natives, the class of human beings who were first brought to those shores greatly influenced the form which subsequent conditions assumed. There may be a division of opinions about the value of transportation as a means of punishment or as a measure for colonisation; but there can be no doubt that it has been ruinous to native races, whose fine qualities might have been turned to good account. Tasmania, to give an example in our own field, has proved this; so, too, New Caledonia, and it is patent in Australia. That shiploads of convicts were disembarked without precautions, and were still more carelessly looked after, is admitted even by the official reports of the time; in 1803 complaints were made that the number of guards was insufficient. Under the circumstances it was very easy for the prisoners to escape into the bush, and they did not fail to use the opportunity. The consequences for the unfortunate blacks were soon apparent. The first gift to them consisted of smallpox, brandy, tobacco, and syphilis; and they soon learned to be immoral, foul-mouthed, beggars, and thieves. And while the natives were at first peaceable and friendly, the coarseness and brutality of the convicts soon led to their becoming more and more hostile, until they, on their part, began that guerilla warfare which has lingered on more than a century. There has, however, been no lack of good intentions on the Australian continent. The energies of the government have been more than once directed toward the object of gaining over the natives; the term of office of the first governor, Phillip, was full of such praiseworthy efforts; but there could be no idea of any success unless all the immigrants radically changed their behaviour toward the natives.

The settlers, again, whose immigration began in 1790, did their honest best to fill the cup to overflowing. They stole the wives of the blacks, shot down all of them who came within range, and openly boasted of poisoning them with arsenic, like rats and mice. A handful of poisoned meal which a settler offered to the unsuspecting wretch, or a piece of poisoned mutton hung temptingly in the bush, were methods considered worthy of commendation. The government, it is true, gave official guarantees of protection to the blacks; but these guarantees existed only on paper. Thus a proclamation guaranteed a reward of £100 sterling to any one who handed over to justice the black murderer of a white, while in the event of the murder of a black by a white only £25 were offered. But what white would have assisted to enforce this remarkable measure by giving evidence against a man of his own colour on account of a deed which no one considered a wrong, much less a crime? And the testimony of an aborigine had as little weight here as in Tasmania.

The following story illustrates the popular feeling and the estimation in which the native was, and still is, held. As Emil Jung tells us, a society was formed in Sydney in 1839 for the protection of the aborigines, and had, after much trouble, carried a law, which provided for the appointment of commissioners who should be responsible for the care of the natives. This measure, intended to check the settlers in their high-handed treatment of their black neighbours, was sufficient to

rouse a certain section of the population to great indignation. In order to show how little they cared about an edict which proposed to lessen their prescriptive rights over the despised and detested race, seven Englishmen rode out one Sunday to a native camp, which was inhabited by thirty men, women, and children. They drove them all into a hut, tied them together with a rope, and killed them, one after the other, in cold blood. When the murderers were brought to justice the whole colony rose up against their condemnation, and it needed the exercise of the full authority of the governor to protect the witnesses from open threats, and to bring the guilty parties to the gallows. The treatment of the native in the more remote parts of the country is even yet discreditable to humanity. Any one of them in South Australia who has no visible means of subsistence incurs the risk of being clapped into prison for six months, unless he prefers to hire himself out as a "contract labourer" to the farmers.

The effects of such treatment of the Australian race on the outposts of civilization can easily be imagined. The blacks have been for more than a hundred years systematically driven away from the rivers, and thus exposed to the danger of dying from thirst; so, too, their once boundless hunting-grounds have been systematically transformed into enclosed pasturages, and they have thus been robbed of their most prolific source of food. To crown all this, the settler treats them with universal contempt, and thus changes the native pride of the free savage into the servility of the beggar. A physical and moral degeneration of the race is the first consequence; a rapid diminution in numbers is the second. The food supply of the Australian has never been abundant; the niggard nature of his country has ensured that; but he had at least the power to exercise his own will freely and could adapt himself to circumstances unhindered, or restrained only by the unwritten code of tribal custom. He thus presented the picture of an infinitely poor yet morally and economically independent people. At the present day he roams about emaciated, starving, and ragged, painfully eking out his existence by beggary and theft, more like a ghost of the past than a member of the human family of the present. The scarcely veiled and not unnatural feeling of revenge alone suggests the Australian of former days.

The number of the Australian natives has never been accurately determined. The highest estimate is that of L. C. D. de Freycinet, who allows for more than 1,100,000 Australians at the beginning of the European immigration. This figure is certainly far too high and is universally rejected; other calculations range from 100,000 to 200,000 for the pre-European period. Beyond doubt the continent was sparsely peopled. So far as aborigines are concerned, it is incomparably more so now; 50,000 is certainly too high an estimate. The diminution of the native population has therefore proceeded at an alarmingly rapid rate. In Victoria in 1836 they were counted to be some 5000 souls; in 1881 they had sunk to 770. The shrinkage has not been so great in all districts, but it is universal; the birth rate among the natives is nowhere equal to the death rate.

The government of the mother country has, since it realised the miserable decay of the aborigines and its own responsibility in the matter, bestirred itself to devise remedies; it has again and again seriously exhorted the colonial governments of Australia to consider the interests of the blacks, and has founded native schools in Adelaide and other towns with considerable sums from the imperial exchequer. But it did not touch the root of the matter. The schools were certainly well and

diligently attended and showed good results; but what use could they be to the scholars, when they, like their whole tribe, only disappeared the sooner, the closer their intercourse was with the European. Such a state of things could only have been remedied by the most thorough control over the spread of colonisation, but, above all, by the abandonment of the cheap and comfortable principle, so ruinous for its victims, of the appropriation of the land without compensation. The former would have directly protected the life of the natives by preventing the perpetual man hunts: but a fair compensation for their claims would in the first place have restrained them from the racial war so fatal to them, and secondly, would have strengthened their economic position. England, which did not feel strong enough for both steps, bears therefore the responsibility for the unceasing deterioration of the Australian aborigines. If extenuating circumstances count, they can only be found in the mysterious fact that contact with the white man is in itself ruinous to every primitive people, and it is quite immaterial what treatment he vouchsafes to them.

## 5. THE COLONIAL HISTORY OF AUSTRALIA AND TASMANIA

THE efforts of the Europeans of Australasia in the field of economics and politics have been crowned with a success which is in striking contrast to the failure of their efforts to preserve and civilize the natives. On the one side they have completely or partially effaced from the list of living races one or two peoples, who although shattered had still some pleasure in existence; on the other side, from a corner of the world, which Europe during a whole century and a half, from its discovery by Abel Tasman in 1642 to the landing of Phillip in Botany Bay in 1788, had not deemed worthy of any notice, they have conjured forth a State which at the present day needs only a sufficient period of development, independence, and a more considerable population, in order to be reckoned as one of the important factors in the making of the history of mankind. All these deficiencies, however, are such as will repair themselves in course of time.

### A. THE OPENING OF THE COLONIAL HISTORY OF AUSTRALIA

(a) *The History of its Discovery.* — The history of the discovery of Australia is deeply interesting, both as regards the history of civilization and as regards that of international trade, because its effects have been parallel in many ways to those produced by the discovery of America, — both continents required to be twice discovered by the civilized world before it appreciated their value and permanently occupied them. This similarity is expressed even in the intervals of time between the old and new discoveries which are to some extent proportional to the size of the two land masses. In the case of America the period that elapsed between the discovery by the Northmen and the voyage of Columbus (cf. Vol. I., p. 349) was five hundred years; in the case of Australia little more than a century and a half elapsed between the voyage of Quiros in 1606 through the Torres Strait and the discovery of the east coast by James Cook in 1770. If we consider Abel Tasman's voyages in 1642 and 1644 as the first proper discovery, the interval is considerably diminished.

The abandonment of the first discovery was no accident in the case of the two continents; no necessity then existed for bringing the new worlds into the sphere of civilized activity. At the period of the first discovery of America, as in the centuries preceding, the centre of gravity of Europe inclined one way, — toward the east which had long supplied all its needs, both material and spiritual. It therefore neither understood nor valued the new discovery and let it sink into complete oblivion. At the second and final discovery of America the position of affairs was quite altered; in fact it may be said that the discovery itself was a consequence of the very alteration. Europe, after the year 1000, had gravitated strongly to the east, as the Crusades and the prosperity of the city states of the Mediterranean prove (cf. Vols. VI. and VII.); but since the appearance of the Osmons the centre of gravity had been considerably shifted, and men felt more and more urgently the necessity of freeing themselves at least from the necessity of trading through Egypt, Syria, and Poutus, and of securing the communication with the south and east coast of Asia by a direct route. There was no cause to abandon this goal, which was at first supposed to have been found in the discoveries of Columbus and his contemporaries, after a new world was recognised in the newly discovered continent. Such important economic considerations do not concern the first discovery and subsequent neglect of Australia. The whole story of its discovery comes rather under the head of the search for the *terra australis incognita*, the great unknown southern continent, which lasted two thousand years. The search originated with an assumption that the great continents of the northern hemisphere must be balanced by similar masses of land in the south. The hypothetical southern continent always excited an interest which was purely theoretic; and herein lies the explanation why in the sixteenth and seventeenth centuries, that age of practical tendencies, so little attention was paid to the problem. The explorers of the southern seas hoped to demonstrate the existence of this country; but the idea of making full use of it crossed no one's mind. Australia, after the first glimpses of her shores, was allowed to relapse into oblivion. Tasman's first voyage had proved that the ocean was landless for many degrees of southern latitude, that is to say, the presumed continent did not exist in that region. Although Dutch ships had touched or sighted points of the west and north coast of Australia several times since 1606, no one guessed that in his winding course Tasman had circumnavigated a continent. Scientific curiosity was satisfied with the negative conclusions established by his voyage.

An additional circumstance kept the practical European long aloof from Australia: the desolate appearance of the tracts of coast which were first touched. Although with the exception of the south and east coasts the greater part of the coastline of Australia is little calculated to rouse pleasant anticipations of the value of the country, yet it may be termed a marvellous misfortune for the continent that the majority of the numerous navigators who set foot on the shore before James Cook were fated to land on spots which were especially bleak, sterile, and inhospitable. This was the case of the Dutchman, Dirk Hartog, who landed on the shores of Shark Bay in 1616; and such were the experiences of the numerous other Dutchmen who in the first half of the seventeenth century set foot on the west, north, and south coasts, Abel Tasman among their number. The opinion of the Englishman, William Dampier, was, however, fraught with conse-

quences for the continent. This navigator, as successful in piracy as exploration, who in two voyages (1689–1699) at the end of the seventeenth century surveyed a considerable part of the west coast, penetrated to some distance into the interior in order to form an opinion as to its worth. His verdict was crushing enough; according to him the country was the poorest in the world, far inferior to the coast of Portuguese South Africa. No corn grew there, no roots, no pod fruits and vegetables from which food could be got. The miserable aborigines had neither clothing nor houses, and were the most miserable creatures in the world. Compared with these blacks the very Hottentots seemed gentlemen. The results of this report by Dampier, which was unfortunately only too much based on fact, show themselves in the entire cessation of voyages of discovery to Australia for more than two-thirds of a century, apart from some attempts at colonisation in the country, such as had already been made by the Dutch in 1628.

Even the final and lasting discovery of Australia by James Cook in 1770 did not immediately lead to the exploration of the continent. That far-sighted explorer certainly had such a goal before his eyes when he took possession of the whole east coast, from the thirty-eighth degree of southern latitude as far as Cape York, in the name of his king, for England; certainly the glowing accounts which his companion Banks, the botanist, brought back of the magnificent scenery and the splendid climate were calculated to attract the attention of governments to the possibility of colonising this new earthly paradise. But the political situation was not favourable to such plans. England stood on the eve of her tedious war with the united colonies of North America; she required to guard her position on the near Atlantic and could not possibly think of following out any plans in a remote corner of the southern seas. And yet the birth of the Australian colonies dates from the War of Independence in America.

(b) *The Founding and Early Days of New South Wales.* — England had, since 1600, transported a large number of her criminals to the Atlantic colonies (especially to Virginia; cf. Vol. I, p. 435) where their hard labour was welcome. The convicts were bought by the colonists at sums ranging from £8 upwards, and they became a source of considerable profit to the government at home. The War of Independence brought this arrangement to an abrupt end in 1779, and England, whose prisons were soon overcrowded, was compelled to look round for some other locality. Of the districts proposed in parliament in 1783, namely, Gibraltar, the Gambia territory, and the region of Botany Bay in New South Wales, only this latter, from reasons easy to explain, could be seriously considered: Gibraltar did not offer room enough, and transportation to Gambia would have simply meant “the execution of capital punishment by malaria,” as the phrase in the parliamentary report ran. The objections to Australia were only the enormous distance and the difficulties attending the transport of such numbers. In any case the decision of parliament, in spite of the royal assent, was not put into action soon enough to anticipate the plan of a certain Mr. Matra, subsequently English consul in Tangiers. He proposed to settle in New South Wales the numerous families who had been expelled from North America on account of their support of the mother country, and at the same time to improve appreciably the position of England in the trade of Europe by the increase in production which might be looked for. Matra, also, failed to carry his plan then. The secretary of state, Lord

Sydney, certainly favoured the scheme in 1784, but he finally recurred to the idea of transportation.

A frigate and a tender of the royal navy, six transports and three store ships with some 1,100 men, of whom about 350 were free, sailed from England on May 13, 1787; they landed on the shores of Botany Bay between the 18th and 20th of January, 1788, but finding that this site was destitute of the natural resources which they had been led to expect, the emigrants removed within a few days to the site of the modern town of Sydney. The expedition was under the command of Captain Arthur Phillip, the son of a German governess who had married an English seaman. Phillip conducted the difficult duty of transporting the convicts with that circumspection and humanity which distinguished him during the whole of his five years' term of office as governor, even in his attitude toward the natives. Circumspection and an invincible energy were the qualities which were required in the succeeding years from the governor of the newly formed community. Phillip and his settlers were spared none of the experiences which are inseparably connected with the founding of agricultural colonies.

In February, 1788, the governor removed a small number of convicts, under the superintendence of Lieutenant King and some soldiers, to Norfolk Island, which lies almost half way between New Zealand and New Caledonia. The duty of this minor colony was to manufacture the flax which Cook had found there in large quantities, in order to supply the main colony cheaply and conveniently with material for clothing. King set to work with zeal, planted corn and vegetables, and devoted himself to the manufacture of flax. But in spite of all efforts it was possible neither here nor on the mainland to feed the colony from its own products; the need for some help in the way of provisions was most urgently felt by both countries during the early years. The same need had been felt by some of the early colonists on different parts of the east coast of America, in Virginia and Carolina; and this was the cause of the failure of the great French scheme of colonisation in Cayenne in 1763. Virgin soil is not at once in a condition to feed large masses of inhabitants, especially when it is treated with as little technical knowledge as was shown by the settlers of Phillip and King, no one of whom understood anything of agriculture; beside that, the soil of Sydney is not fertile. Again, the criminals, who preponderated in numbers, felt little desire to work. According to Phillip, twenty free men did more than a thousand convicts. The leading thought of the whole of Phillip's term of office was to increase the number of free settlers and to bring over skilled agriculturists. But when Phillip voluntarily resigned his post in December, 1792, through shattered health, the number of free immigrants was still insignificant. The bulk of private holdings were in the hands of "emancipists," or time-expired convicts, who were hardly more industrious than the convicts themselves.

Under the prevailing circumstances the internal conditions of the colony were terribly disorganised during the first years. The want of provisions, which was felt soon after landing, became so acute in 1790 that for months only half rations or less could be distributed; the cattle that had been brought with the settlers escaped or died, and the first fields which were sown produced nothing. In addition to this, scurvy broke out from want of fresh meat. The soldiers were disobedient and mutinous, and drunkenness became a besetting vice. Robbery, murder, and arson were daily occurrences. In February, 1790, the distress became so acute that

the governor found himself compelled to send two hundred prisoners to the Norfolk Islands, although there was anything but a superabundance of food there. Meanwhile, fresh transports kept arriving from England with prisoners, masses of poor wretches crowded together, more than half of whom frequently died on the long voyage. The survivors were then often so weak, that, half dead, they had to be unloaded at Port Jackson in slings like bales of merchandise. On the other hand, provisions, seed corn, and cattle did not arrive.

Governor Phillip, in the midst of all this misery, which often forced him to live on half rations like the convicts, never lost heart for an instant. On the contrary, amid the mass of duties which devolved on him in the way of constructing houses, laying out gardens and fields, and continually battling with famine and mutiny, he found the time to interest himself in the exploration of the interior; he was also desirous of forming amicable relations with the natives. One thing alone was calculated to fill this patient, dogged man with distaste for his post, and that was the opposition, passive indeed, but all the more obstinate, which his own troops showed to all his measures. As a matter of fact, up to the end of 1790, the marines, and then the New South Wales Corps, a regiment specially organised for Australia, thwarted every one of his regulations. The soldiers disregarded the acts of parliament, in virtue of which Phillip exercised his office, and submitted to military laws only.

A successor to Governor Phillip was finally appointed at the end of 1795 in the person of Hunter, also a sailor, who had accompanied the expedition of 1787. The interval of nearly three years was filled by the government of two officers of the New South Wales Corps, Major Grose and Captain Paterson. The administration of both is conspicuous for the enormous growth of the abuses against which Phillip had vainly contended. Above all the general vice of drunkenness had assumed most dangerous dimensions, being chiefly encouraged by the increased trade in spirits, which the soldiers of the militia as well as their officers made their chief business, from want of military duties. The name "Rum Corps" that was soon given to these troops has perpetuated this strange conception of military service. For the colony itself it clearly involved great losses. The convicts, instead of being educated to be peaceable and industrious families of farmers, were being ruined by the vilest alcohol. As a result, the coarsest immorality, blood-curdling outrages, and inhuman cruelty were the order of the day.

Captain Hunter, the second governor, was unable to check these evils during the term of his office, which he held from September, 1795, to 1800. He certainly put an end to the tyranny of the military, and re-established the civil courts which had long been in abeyance. He also as far as possible suppressed the distilling of spirits in the colony, and checked the general immorality. But the evils were by this time too deeply rooted to be eradicated so quickly by a somewhat imprudent man like Hunter. Drunkenness therefore continued rife, just as the ordinary quarrels of the whites among themselves and with the natives. Even the enormous tracts of country, which Hunter's predecessors had distributed to civil servants and military officers, remained in their possession, as well as the excessive number of convicts, whom they ruled despotically like slaves. It would, however, be unjust if we judged Hunter's administration by this one side of it; on the contrary, it distinctly promoted the development of the colony in more than one department. The cultivation of large tracts, which was compulsorily enforced by

the owners, did much to relieve the scarcity of food — the chief misfortune of the colony up to the nineteenth century; but on the other hand, it placed the monopoly of all economic advantages in the hands of a few. These were indeed the two objects that Major Grose had contemplated when he made similar regulations in his time.

The two new achievements, by which Hunter's term of office was honourably distinguished are more partial, but not less important in results. Firstly, under him the knowledge of the geography of the continent was widened. This was due to the voyage of Mr. Bass, a naval surgeon, which proved clearly that Van Dieman's Land was an island, to the first exploration of the Blue Mountains, and to the discovery of coal seams near Point Solander. It was also found that the cattle, which had run away in the early days of the colonisation, had begun to multiply into large herds of half-wild animals; and in this way it was proved that the supposed impossibility of acclimatising cattle did not in fact exist.

The introduction of systematic sheep farming with a view to the wool, which is now one of the most important branches of industry on the continent, is inseparably connected with the name of John MacArthur. During the whole of the unedifying struggle between the governor and the military, this officer had been the most vigorous representative of the movement in favour of making and selling spirits. He was altogether a shrewd and practical man, to whom among other things the Australian wine trade owes its origin. In 1794 MacArthur procured sixty Bengal sheep from Calcutta, to which he shortly added some Irish sheep. By crossing he created a breed whose fleeces were a mixture of hair and wool. In 1797, in order to produce a finer wool, he obtained, through the agency of some friendly naval officers, a few sheep from Capetown. These were, as it happened, fine merinos, a God-send to the continent, for these few animals, and some ordinary Cape sheep, which were subsequently added, were the progenitors of immense flocks, and the foundation of the present wealth of Australia.

The results of MacArthur's breeding were prodigious. When in 1801, in consequence of a duel with a fellow officer, he was ordered to England, he took back specimens of the wool he had grown himself and put them before experts in London. Their verdict was most favourable. MacArthur's proposal that land and convicts should be assigned him in Australia with the definite object of providing the English woollen industry with Australian material on a wholesale scale, was favourably answered in October, 1804. Lord Camden, the new secretary of state, instructed the governor of New South Wales to concede to MacArthur five thousand acres in perpetuity for grazing purposes, to give him convicts as shepherds, and to afford him generally every possible assistance. The governor thereupon issued a proclamation, in which the concession of tracts for sheep farming or cattle breeding was publicly announced. MacArthur, however, received the land he selected in the best part of the colony, on Mount Taurus in the cow pasture district, where the half-wild herds of cattle had been found in 1795. There with his original flock, augmented by purchases in England and Australia, he established his breeding farm, which he called Camden Estate, in honour of the secretary of state. This became the centre of the new and rapidly flourishing wool-growing industry.

Since 1800 the governor had been Philip Gidley King, a man who seemed more qualified than any one else to rescue from the quicksands the misdirected

fortunes of the Australian colonisation. King is the same man whom we have already (p. 255) met with as vice-governor of Norfolk Island, where he had displayed excellent qualities in his ten years' struggle against the deficiencies of nature and the insubordination of his charges. The inheritance to which he succeeded was not hopeful. The New South Wales Corps was more powerful than ever in the country, and had just given a proof of its influence in London by effecting the recall of his predecessor. As might be expected, the brandy trade was in full swing; not less than twenty thousand gallons were stored in Sydney alone. Even of other wares the civil and military officers had a practical monopoly which was exceedingly remunerative to them, even if it did not bring in the twelve hundred per cent which the spirits paid. King's first step was to check this abuse. Impowered by the government in London to make the landing of spirits in Port Jackson dependent on his consent, he prohibited in the autumn of 1800 their importation and sale without a special permission. All that came by ship in defiance of this order was either sent back again (in one year, according to Zimmerman, no less than thirty-two thousand gallons of spirits and twenty-two thousand gallons of wine) or was bought by King and sold again at a cheap price. The cheapness only ensured that the usurious trading profits ceased.

It is easy to conceive the reception which the measures of King found among the members of the New South Wales Corps, especially when we consider what a strong backing they had in London. Owing to the perpetual European wars the import of Spanish wool to London had come to a standstill, so that the proposals of MacArthur to provide the industry with raw material from Australia were thankfully adopted. MacArthur himself obtained a splendid position at home through it, as did the entire New South Wales Corps, whose most influential member he was. Notwithstanding the exasperation of the corps, things did not go so far as open hostility to the governor. The corps certainly made the governor's life as unpleasant as possible through the infringement of his regulations in a thousand ways, while King retaliated by limiting the authority of the regiment to purely military affairs. But this did not prevent the governor from honourably and honestly helping MacArthur in his efforts in wool-growing. Nevertheless the perpetual friction was quite enough to induce King to resign his responsible post in July, 1805. He retired without expecting or receiving thanks from the home government, which had always listened to his opponents more attentively than to him. He might, however, take the consciousness with him that he had done good service to the colony.

The survey of the western part of the south and east coasts between Cape Stephens ( $33^{\circ}$  S.) and Cape Palmerston ( $22^{\circ}$  S.) which was carried out during King's term of office, as well as the exploration of the Gulf of Carpentaria by Matthew Flinders, were valuable additions to geography, and important for later colonisation. The formal annexation of the continent by means of extensive schemes of settlement was his work. This step was necessitated by the unceasing efforts of the French to gain a firm footing in Australia. King, indeed, impressed upon the French explorers the prescriptive rights of England, but at the same time he thought it expedient to make these rights patent to all by an immediate colonisation of different places. In 1803 Van Diemen's Land was occupied, while, simultaneously with the removal of the convicts, who constituted a common danger, two settlements were founded at Restdown (Risdon) on the left bank, and Hobart

Town on the right bank of the Derwent. At the same time the first (but unsuccessful) attempt at colonisation from London was made at Port Phillip, the great bay on which Melbourne now lies; and, lastly, the foundations were laid of Launceston, on the north coast of Van Diemen's Land, and of Newcastle, now the second harbour of New South Wales.

King might also be satisfied with the results of national industries at the end of his career. On the departure of Phillip, in 1792, about 1,700 acres were under permanent cultivation, and the number of domestic animals could hardly be reckoned in dozens. In 1796, a year after Hunter's arrival, the number of such animals had reached 5,000, and there were 5,400 acres under the plough. In August, 1798, according to Jenks,<sup>1</sup> the figures were 6,000 acres and 10,000 head of cattle; for August, 1799, 8,000 acres and 11,000 head. The white population had amounted to 4,000 souls when Hunter entered on office. On his retirement in 1800, their number was, according to Mossman, 6,000. Under King's five years of government, this inheritance had developed into the following dimensions: In 1806, according to Zimmerman, 165,882 acres had been given away in estates or reserved for the crown; of these 20,000 acres were cleared; 6,000 acres were planted with wheat, 4,000 with maize, 1,000 with barley, 185 with potatoes, 433 served as garden ground. Of the districts allotted, 15,620 acres were held by civil officials, 20,697 by officers; 18,666 acres were the property of 405 "emancipists." There were 112 free settlers; in addition there were 80 discharged sailors and soldiers, and 13 persons born in the colony. The number of stock was as follows: 566 horses, 4,790 cattle, 23,110 sheep, 2,283 goats, 7,019 pigs; altogether, 37,768 head. The white population amounted to 9,462 persons in 1806. Of these there were 5,172 men, 1,701 women, and 2,589 children.

The successor of King, nominated in 1805, was William Bligh, long well known in geographical circles by the wonderful voyage, in the course of which he traversed in an open boat large portions of the Pacific and Indian oceans. Being commissioned, as captain of the ship "Bounty," to transplant the breadfruit tree from Tahiti to the West Indies, he had caused such discontent among the crew by his terrible severity that in the middle of the voyage they placed him with eighteen companions in a boat, on which he eventually reached Batavia, while the rest of the crew either returned to Tahiti or founded on Pitcairn Island the small community which has been so often described since. Bligh's marvellous rescue had not deprived his character of any of its original roughness. As commander of a man-of-war, he had provoked a mutiny of the crew by his tyranny, and in New South Wales, also, where he arrived in the middle of August, 1806, he contrived to make himself unpopular from the first by his inhuman severity. He was not, indeed, deficient in an honourable intention of promoting the interests of the colony, which now showed such promise; but he lacked a proper comprehension of his duties. Caprice of every sort, brutal floggings even of free settlers, the razing of houses the position of which dissatisfied him, the compulsory removal of colonists in 1807 from Norfolk Island to Van Diemen's Land,—all these were measures which made the new governor hated. He also by such acts repelled the better class of people, so that he was surrounded with persons of ill repute in their place.

The episode which brought the ill-feeling to a head, is, as Mr. Jenks expresses

---

<sup>1</sup> "History of the Australasian Colonies," by E. Jenks (Cambridge, 1896), p. 36.

it in his "History of the Australasian Colonies," "the most picturesque incident in the early history of the colony." In accordance with his instructions, which required him to continue the measures directed by King against the excessive power of the New South Wales Corps, and above all to proceed against the still flourishing brandy trade, Bligh had issued an edict in February, 1807, which absolutely prohibited the making and sale of spirits, and forbade the erection of distilling apparatus on private property. Now, MacArthur had ordered some distilling apparatus from England, in connection with his attempts at vine culture. This was taken from him and sent back by the orders of the governor. The strained relations thus produced between the two men were aggravated by Bligh's accusation that MacArthur had received his five thousand acres of pasture land by supplying false information. MacArthur's self-justification by reference to the order of the Privy Council was finally answered by Bligh with a command to appear in court, because a convict had fled to one of the breeder's ships. When MacArthur did not obey the summons, he was arrested. Even if Bligh had law upon his side, as seems to have been the case, yet his sharp procedure was unwise in view of MacArthur's honourable position. The indignation of the New South Wales Corps at once vented itself in action. At the instigation of the officers, Major Johnston liberated the prisoner on January 26, 1808, occupied the government house, and, agreeably to the wish of MacArthur and other prominent colonists, declared the governor deposed, and sent him as a prisoner on board a ship lying in the harbour. All the executive officials who had supported the governor were dismissed or arrested, the colony was put under martial law, and for almost two years, until the arrival of the new governor on December 31, 1809, was administered by Johnston and the members of his corps. MacArthur himself, on a fresh hearing of the case, was unanimously acquitted.

The attitude of the British government toward the unpleasant incident was long in making itself known. The tidings of what had happened had reached England by the end of the year, but there every one was so occupied with the Napoleonic wars that another year elapsed before any steps against the rebels were decided upon. Lachlan Macquarie was entrusted with the mission. Johnston was brought back to England under strict arrest on a charge of mutiny. All the appointments and assignments of land which had been made after Bligh's arrest were declared null and void, and all the old officials were reinstated. Bligh, who was still living on his ship in Australia, was recognised as governor, but immediately recalled and replaced by Macquarie. MacArthur was finally expelled from the country. He thus had the hardest lot; keenly interested in its industrial welfare, he was compelled to remain for years far away from the country and his undertakings. It was not until 1817 that he was allowed to return to his Camden estate. Johnston fared better, since, thanks to the representations made by Macquarie to the proper quarters as to Bligh's character and method of governing, he was merely cashiered. Honours were finally showered upon Bligh himself in England. He became vice-admiral of the Blue and a fellow of the Royal Society. He died on December 7, 1817.

Macquarie had not come across from England alone. On the contrary, he brought a whole line regiment of soldiers with him. This meant nothing less than a complete change of system. The New South Wales Corps was incorporated into the English army and withdrawn from Australia forever; the governor henceforth

had at his disposal disciplined regulars instead of a corps which had been ruined by twenty years' sojourn in a penal colony. Macquarie had generally a much easier position than any of his predecessors. Twenty years of work had produced valuable results, notwithstanding all hindrances and cessations, and after King's careful tenure of office the colony had made great advances in prosperity. In 1810 there were already 11,590 white colonists; 7,615 acres were under the plough; the number of cattle reached 12,442, that of sheep 25,888; the taxes brought in nearly £8,000 annually.

Under these favourable conditions, the energy of Macquarie could be principally devoted to matters of a positive and executive nature, as was most in keeping with his disposition. In this respect he was the direct opposite of Bligh, whose abilities were merely directed toward the repression of abuses, while he displayed no sort of talent for organisation. Macquarie's first care was to establish well-regulated conditions in Sydney. He nearly rebuilt the town; the construction of new streets, the organisation of police, the erection of public buildings, especially schools and churches, the laying out of promenades, — all this is his work. In 1816 the first bank was set up, followed three years later by a savings bank. He made it his object to construct good roads in the vicinity of the town, as well as to regulate the courses of the rivers. He especially encouraged the cultivation of the soil in every direction, and not least so by extreme liberality in grants of land. This liberality, coupled with the extensive demands for public, that is to say, home assistance for his reforms, exposed him even then to much censure, both in England and Australia. Macquarie's efforts to extend the range of colonisation were not less meritorious than his attempts to raise the moral tone and develop the industries within the colony itself. His four predecessors had all been sailors, whose interest in geography was exhausted by voyages of discovery along the coast. The contour and shape of the Australian continent had, it is true, been definitely ascertained by them, but for a full quarter of a century, after the landing in Botany Bay, nothing more was known of the interior than the narrow strip of land between the coast and the Blue Mountains looming in the west, which had always been considered impassable. Macquarie urged the colonists to new efforts, and finally in 1813, Wentworth, Blaxland, and Lawson discovered a way through the mountains, and found beyond them immense plains of fertile country. Macquarie, in spite of the hundreds of miles of most difficult ground between Sydney and the new territory, at once set about constructing a road, which was ready to be opened in 1815. At the same time the town of Bathurst was founded as the centre of the newly opened up country, which soon became the seat of a brisk wheat-growing industry and the source of the rapid prosperity of the colony.

New South Wales owed this renewed prosperity largely to the favourable period at which its discovery and exploitation had taken place. With the close of the Napoleonic wars England's hands were untied; even private persons revived their interest in the oversea possessions. New South Wales now became the goal of a continuously swelling stream of emigration, which added to the existing settlers a large percentage of free colonists, who were either time-expired soldiers or discharged convicts. Macquarie himself was by no means friendly to the newcomers. From the very first he supported the view "Australia for the convict," and tried by every means to check the influx of free immigrants. In 1818 he actually carried a measure by which these latter were deprived of the free passage

which had been customary since the founding of the colony. The results turned out quite otherwise from what Macquarie expected. The small man indeed kept away, but not the man of means. The latter, however, could at once set to work on a large scale. He only required to buy sheep, the government supplied him with land and convicts as shepherds. Thus he became a large landed proprietor; but the convict was not the least helped by Macquarie's measures. In spite of all his popularity, the obvious favour which he showed to the emancipists provoked a feeling against him among the free settlers, which finally led to the recall of the well-intentioned governor. The unfavourable attitude of the government against him was intensified by the outcry of the great landed proprietors. These claimed wide tracts of land for their grazing farms; but the governor was pledged to support the small proprietors who had been convicts previously. This was sufficient incentive to the now powerful wool industry to advocate the recall of Macquarie, which took place in 1821.<sup>1</sup>

Macquarie had still more reason to be satisfied with his results than King. Even the statistics presented a quite different aspect. In 1821 the white population of the colony was estimated roughly at 39,000 souls; 32,267 acres were under cultivation; there were 103,000 head of cattle, 4,564 horses, and more than 250,000 sheep. The annual revenue of the community was £30,000 sterling. Besides this, internal affairs were splendidly organised, and there was confident hope that the stream of immigration would not dry up. In short, the departing governor might fairly feel that it was his own diligent activity for eleven years that had extricated Australia from her seemingly hopeless position in the swamp of corruption.

(e) *The Development of New South Wales to the Middle of the Nineteenth Century.* — Macquarie's entrance on office had brought with it a change of system in the administration, and a similar change signalised his departure. The former had substituted the civil administration for the military; the latter put the beginnings of a constitution in the place of the autocracy. All the governors of the colony had been hitherto practically despotic; they had marked out the methods of colonisation according to their own judgment, and embodied in themselves the legislative power; they were indeed the ultimate court of appeal. They were, it is true, responsible to the British secretary of state for war and the colonies; but London was far away, and the political situation in Europe guaranteed sufficiently that too much notice would not be taken of Australia. Bligh's motto, "My will is the law," is characteristic of this view. So long as the majority of the population consisted of convicts or was descended from them, unlimited authority might be concentrated in one hand; but as soon as the free population predominated, this situation was impossible. Even in 1812 the creation of a board of assessors, composed of officials and colonists, had been suggested, but Macquarie had considered that such an institution, which had proved its value in all other English colonies, was unsuitable for Australia.

After his departure, the limitation of the power of the governor was an accomplished fact. The acts of July 19, 1823, placed at his side an advisory board, to

<sup>1</sup> For a more favourable view of Macquarie's policy v. E. Jenks, *op. cit.*, p. 49, who holds that the real cause of his unpopularity was his determination to give the emancipists equal rights and an equal social status with the free immigrants. — EDITOR.

which every law had to be submitted for assent; its five to seven members exercised also a limited financial control. In the one case of a rebellion the governor had dictatorial power. If the majority of the board voted against a law, it had to be brought before the crown for decision. On the legal side, the reforms were also extensive. Hitherto the governor had been the highest court of appeal in all questions of law; now these were absolutely withdrawn from his decision in favour of a supreme court of judicature on the English model. The only right retained by the governor was the remission of sentences on criminals, subject to the approval of the English government. The first governor who ruled under these new forms was Sir Thomas Brisbane (1821-1825). His administration kept strictly within the limits imposed on the governor; but, in compensation, he devoted his chief attention to the further exploration and opening up of the country. The course of the Murray and Murrumbidgee was now traced; the country was traversed diagonally as far as the south coast in the vicinity of modern Melbourne, the shores of Queensland and North Australia were explored, and the continent secured from the renewed designs of the French by settlements on various outlying points. The first observatory on Australian soil was constructed at Brisbane.

The effects of Brisbane's attitude toward the colonisation of the newly opened up interior are economically more important than the fruits of this scientific activity. Even Macquarie had made settlement in the interior dependent on permission from himself; Brisbane was more liberal; he gave the perpetually increasing number of free immigrants the land for grazing purposes free, and conceded to the Australian Agricultural Company, founded in England in 1824 with a capital of one million pounds sterling, not less than a million acres of land near Port Stephens and in the Liverpool Plains. He encouraged production and trade in every way; in 1825 there were 45,514 acres under cultivation; more than 4,000 hundred-weight of wool were exported, and some thirty Australian ships were engaged in fishery and commerce. The incomings (over £70,000 sterling) had more than doubled since 1821.

Two other important and essentially different events fall into the term of Brisbane's office: the separation of the island of Van Diemen's Land from New South Wales, and the official declaration of the freedom of the press. The former was decreed in 1823, and took effect in 1825; the latter was announced in 1824, but did not come into force under the successor of Sir Thomas. Its actual application was postponed until the administration of Bourke (see later).

Brisbane's successor was Sir Ralph Darling, who guided the destinies of the colony from 1825 to 1831. He did not make himself during the six years of his administration the favourite of the people which his name would imply. He continued, it is true, his predecessor's policy of expansion with success, and added Westernport in the south and Shark Bay in the west to the list of English stations. It was once more essential to take steps against the expected encroachments of France; but his action in the colony itself was little calculated to win him friends. The convicts had in his eyes absolutely no claim on humane treatment, while he treated the free settlers with tyranny and brutality. Two soldiers, who had stolen a piece of cloth with the object of being transported to Van Diemen's Land, were ordered by him to be fettered together, in defiance of the verdict in the case given by the jury, an institution established in the interval. He

then had a heavy iron collar, studded on the inside with sharp points, put round the neck of each, and compelled them to work on the roads in the blazing sun. One of the poor wretches, who suffered from heart disease, died a few days after; the other went mad. This incident provoked furious attacks on the part of the opposition papers, which had been started since Brisbane's times; the answer was the abolition of the liberty of the press.<sup>1</sup>

At the same time Darling did good service in the development of the colony. Under this head come his action against the bushrangers, and his resourceful treatment of the land question, which became year by year more difficult. The home government then made many attempts in this direction; one set of "regulations" followed another, up to the middle of the century. Previous to 1824, estates had been practically given away; the only incumbrance consisted in a definite annual quit-rent, of which the amount, in any case insignificant, had undergone various alterations in the course of years; from two shillings for one hundred acres in the case of free settlers, and sixpence for thirty acres in case of discharged convicts, it had gradually risen to five per cent of the estimated annual value of the land. Governor Brisbane had distinctly made these conditions more stringent. In the first place, he altogether abolished the free concessions of land, and fixed the purchase money at five shillings an acre; but, besides this, he altered the obligation, which had been enforced since the colony was first founded, of keeping and supporting one convict to every hundred acres of land, by ordering that five convicts should take the place of the one. There was still in addition the quit-rent of two shillings for every one hundred acres. Even these conditions were insufficient in view of the enormous demand for land, so that Darling, in 1828, adopted the expedient of establishing a special land office. This was an undeniable advance towards settling the business of distributing the land among the applicants. But it no more solved the land question than did the order issued from London (1824) that the land should be publicly sold by the governor to the highest bidder. The lowest price was five shillings per acre, as in Brisbane's proclamation of 1824; the highest amount of land to be conceded to any one purchaser was 9,600 acres.

The object of this limitation was to suppress the speculation in land which was then rampant. The land was to be reserved for *bonâ fide* settlers; and, further, only so much was to be cultivated as the needs of the colony required. The object finally was to look to the future with its growing claims for land. The results did not correspond to the unwearied solicitude of the government. On Darling's departure, the area of the land sold or leased amounted to 3,422,000 acres, which obviously could not be kept entirely under cultivation by the 51,155 white colonists. In the short period from 1831 to 1835, this number increased by no less than 585,000 acres, which had been purchased by auction. The government had realised by this sale the sum of £202,600; but it could not fail to see that only the smaller part of these estates had been bought with the immediate object of cultivation; the vast majority were merely bought as a speculation. This applied to the 1,548,700 acres, which had been publicly sold in the years

---

<sup>1</sup> The author appears not to be aware that these and other charges, made by Darling's opponents, were investigated by a strong committee of the House of Commons, and that he was absolved from all blame, and subsequently knighted. — EDITOR.

1836 to 1840.<sup>1</sup> The area expressed by these figures was far too gigantic to be required by the real demand for land, notwithstanding the brisk immigration of those years. Nevertheless these figures testify to the enormous impetus which was then given to the prosperity of the colony, a prosperity which was indeed interrupted at the beginning of the "forties" by a disastrous industrial crisis. Its beginnings were foreshadowed in the figures for the years 1839 and 1840.<sup>1</sup>

(a) *The Land Question.*—Hardly less than the trouble caused by the speculative purchaser of land was that which arose from the common practice of "squatting." This is a word which originally came from North America; but the practice designated by the word proved more important for the development of Australia than for the history of the United States. This process of squatting was extremely simple; cattle breeders on their own responsibility, without any authorisation, and without payment of purchase money or quit-rent, took possession of tracts of country for grazing purposes, and thus withdrew them from any possibility of being legally divided among later candidates. It was in the first place essential for the squatter's trade of cattle breeding that the "run" which he appropriated should cover a large extent of country. Moreover, if endless quarrels and disputes were to be prevented among the owners of the herds, no other expedient was left for them except that of all pastoral societies under simple conditions, indeed of all primitive farming generally; that is to say, since the country offered no natural boundaries, and there was neither inclination nor time nor means to erect artificial boundaries, a clear demarcation was obtained by leaving broad tracts unused between the separate estates. There was in fact a reversion to the most primitive type of boundary; that which consists of a strip or border of land. It is a type still to be found in the case of African village communities, which are often surrounded by zones of wilderness or forest; it was prevalent in Europe of the Dark Ages, and some German villages had boundaries of this kind down to the time of the Hohenstaufen dynasty.

The most complicated difficulties were thus produced for the government. It had declared at home that the whole continent was its property, and all land belonged to the crown. In this way it possessed the incontestable right to dispose of the land at pleasure; but on the other hand the equally incontestable obligation was imposed on it of directing its distribution in such a way that all who shared in the most important duty of developing the colony—mother country, colonial government, and settlers alike—might have their rights secured. This was, however, no easy task, owing to the conflict of interests between large landed proprietors and small farmers, between cattle breeding and agriculture, which had rapidly been produced under the squatter system.

The most various attempts had been made to solve the problem. The governor, Sir Robert Bourke (1831–1838), had already attempted to check the excessive growth of squatting by a decree which deprived individuals of any legal title to land which they had appropriated. When that proved a dead letter, and more and more cattle breeders sought their fortunes in the interior so soon as food for their herds grew scarce in the coast districts, parliament in 1836 proceeded to hold an inquiry, the result of which was, on the whole, the retention of the Regulations of 1831.

---

<sup>1</sup> 1836: 389,500; 1837: 368,600; 1838: 315,300; 1839: 285,900; 1840: 189,400 acres.

A part of the members of the commission voted for high prices for land; others, on the contrary, considered the existing minimum price of five shillings per acre as excessive, since high prices of land were the first inducement to squatting. The governor of New South Wales was therefore empowered to reduce the minimum price mentioned still lower if required.

Even this means did not produce the intended result. On the contrary, the unauthorised appropriation of wide tracts of the interior assumed larger proportions; and bloody fights with the natives, quarrels among the squatters themselves, and a spread of intense discontent among the small farmers who were injured by the practice of land grabbing were the order of the day. For this reason a new proclamation of the governor in 1837, in view of the impossibility of exercising even a moderate control over squatting itself, made the right to squat dependent on the payment of a definite fee. Whoever paid it had the right to settle in the interior as a farmer wherever he liked. From the proceeds a new troop of police was formed and maintained, which was intended to secure peace and order.

As might be expected, even this arrangement did not remove all the deficiencies which are connected with a young farming industry. Cattle breeding indeed flourished and its profits were enormous. In 1839 there were reckoned to be a quarter million of cattle and more than a million sheep. The revenue of the colony was also materially increased by the grazing tax, then fixed at ten pounds annually, to which were added payments of one penny for every sheep, threepence for every ox, and sixpence for every horse; and the enterprising spirit of the sheep farmers alone had made the colony economically independent. Of the export trade, which had risen in 1840 to five millions sterling, by far the greater part was due to the wool industry. But two drawbacks of the system are incontestable: firstly, the uniformity of the tax brought great grievances with it; and, secondly, pastoral enterprise on a large scale, the form of industry which alone was encouraged by it, exercised a far-reaching, but not beneficial influence on the entire social development of the white population of the continent. The right to occupy land thus depended on the payment of the fee, but after that the choice of locality as well as the quantity of land were entirely in the discretion of the colonist. None of them suffered from excessive modesty; every one took as much as he could, or as the vicinity of the districts already occupied allowed. Under these circumstances, most of the estates were far larger than was required to graze the stock of the owner, even if full weight is given to the often pleaded excuse of the growth of the herds; and properties as large as a German principality were not uncommon. This mattered little, so long as free land was available and to spare. But when the supply grew limited these enormous estates were felt to be hindrances on colonisation, and the more oppressively so since now the gross disproportion between the holdings was obvious to all. A few instances show for what the proclamation of 1837 is responsible in this respect. Apart from the inconsiderately large assignment of land to the Australian Agricultural Company (one million acres), and the gifts to the officers and the officials of the New South Wales Corps, the concessions of land in the first decades of the century had been confined within very modest limits. Even the most wealthy man could not call more than a few hundred acres his own. How different was the position of the pastoral kings of the forties and fifties! When Governor Gipps, in 1845, made a searching inquiry into the property of some colonists, he ascertained that in one district eight persons

with eight licenses occupied 1,747,000 acres, while in the same part nine others with nine licenses had only (!) 311,000 acres. The four largest stock breeders of the colony owned 7,750,000 acres, that is to say, they were masters of a territory nearly twice the size of Yorkshire. The colossal size of such tracts of property could not but be harmful to the community. The pastoral industry requires on the one hand immense tracts; on the other, and especially under the favourable climatic conditions of Australia, it has no use for a large supply of labour; even the largest sheep farmers retain very few hands in permanent employment. The immediate result is a twofold loss to the entire population. The wool clip brings large sums of money into the country, which instead of circulating remain in the hands of a few, and thus encourages capitalism. Closely connected with this is the impossibility of raising the density of the population above a certain minimum rate. Where hardly a dozen hands are employed on hundreds of square miles, and where, further, the settlement of other independent colonists would diminish the profits of the cattle owner, it is impossible for the population to become dense. As a matter of fact, even at the present day, the rural population of the interior is trifling in comparison with that of the towns on the coast.

Still more serious, however, than all these defects in the Regulations of 1837, was the immunity of the greater part of the land to which claim was laid from the payment of the grazing tax, since it inevitably jarred upon the popular idea of justice. A man who was fortunate, or sufficiently unscrupulous, could acquire a kingdom for his ten pounds, while his neighbour could only call a few elods his own. As a matter of fact, the owner of the above-mentioned gigantic tracts had not paid a penny more than any other colonist who had obtained land after the promulgation of the regulations. Strangely enough, the effort to abandon this untenable position was not started by the population itself, which was short-sighted enough to believe that the salvation of the colony lay in the immediate and unrestricted exploitation of the pasture land. On the contrary, it was solely due to the services of the despotic but far-sighted governor, George Gipps, who had been at the head of affairs in Sydney since 1838. He ventured to attempt to check the extension of squatting, and issued a proclamation with retrospective force, by which every squatter was bound, for the purpose of maintaining his existing title to his property, to buy at least three hundred and twenty acres of land by auction; any improvement to the land would be taken into consideration. If he did not do this, he exposed himself to the risk of being ousted from his position by any other squatter who had conformed to the prescribed conditions.

This proclamation met with the worst possible reception from the people. This is comprehensible on the part of the menaced cattle breeders; but all other circles were intensely exasperated, partly at the contents of the proclamation, partly at the want of consideration with which Gipps had treated the legislative council of New South Wales, which had existed since 1842; he had neither laid his plan before it nor made any official announcement of his decision in the matter. Indignation ran so high that petitions were sent to the English parliament and even to the queen, in order to obtain a revocation of the edict, or at least a mitigation of its terms. But Gipps impressed upon the home government that the continuance of the practice which had hitherto obtained would soon deprive the crown of all available land; and by this argument and by proving that the greatest outcry was made by the largest landed proprietors he succeeded in upholding his enact-

ments; only in small points was any consideration shown to the squatters. On the whole, it cannot be denied that the proclamation of 1844 was bound to injure the colony as well as the cattle breeders, if we reflect on the bad economic condition of Australia. This was intimately connected with another question.

(β) *The Transportation Question.*—During the first four decades of the colonial development of Australia the question whether the introduction of English convicts was useful or harmful did not come forward. It was only at the time when the free settlers began to outnumber the others, and the influx of respectable English countrymen produced an adequate supply of free labour, that a movement made itself felt in favour of checking or diverting the still numerous arrivals of criminals from the old country. In favour of this agitation was the noticeable fact that the presence of so many persons of low morality in the country<sup>1</sup> had a most detrimental effect on the characters of both old and young. The number of crimes and misdemeanours committed by them reached an alarming figure. The colony received an annual subsidy of £200,000 to defray the cost of maintaining the convicts, and out of the subsidy there was a substantial balance available for public works. The system also meant cheap labour. But these were poor set-offs to the moral degradation for which the system was responsible,—so at least thought one party of the colonists.

At the same time there would have been no idea of any change in the existing conditions had not an equally strong movement in favour of the abolition of an institution which had proved such a failure arisen in England. It had been observed that there also transportation was to blame for the terrible increase of crimes. While the population of England, as Alfred Zimmerman states, had increased between 1805 and 1841 by 79 per cent, the number of crimes had risen by 482 per cent; and from 1834 to 1845 as many as 38,844 prisoners were transported. Transportation was not reckoned as a punishment in the circles which it concerned. It was owing to this movement that a commission appointed by the lower house recommended that the transportation of criminals to New South Wales and Van Diemen's Land should be at once discontinued, and expressed its opinion that it was desirable to facilitate the emigration of prisoners to other countries when they had served their sentences. These resolutions went too far for the Australians, although they had so often petitioned for the discontinuance of transportation. They feared to lose the cheap labour hitherto available, and begged, therefore, but without success, that the existing arrangement should be continued. The penal colony of Moreton Bay, established in 1826, was done away with in 1839; and on May 22, 1840, New South Wales was struck out from the list of countries to which prisoners could be transported. Only Van Diemen's Land and Norfolk Island retained temporarily their old character (cf. pp. 269 and 273).

This step, which was very important also from the philanthropic standpoint, entailed a series of hard years for New South Wales. In 1839 the amount of the land sold to colonists reached 285,900 acres; in 1840 it was only 189,400 acres; it dwindled in 1841 to 86,300, and in 1842 to 21,900 only. The cause for this remarkable shrinkage was, firstly, the want of labour, which became felt as soon

<sup>1</sup> Out of 60,794 inhabitants of New South Wales, there were in the year 1833 no fewer than 16,151 convicts, and in 1836, 27,831.

as the sending over of criminals was discontinued, and, next, the general industrial depression which rapidly spread over the whole country. This was produced by the fall in the prices of all provisions, which was intimately connected with the reduced requirements of the prison authorities; by the discontinuance of the maintenance subsidy hitherto contributed by England; and, lastly, by the circumstance that though prices sank, the wages of labourers did not fall in the same ratio. Then there was the fact that precious metals were not yet obtained in the country itself, and that, with the great falling off in the sales of land, the government coffers were soon at a low ebb. In order to replenish them, measures were taken to collect the numerous outstanding quit-rents, and this again caused new difficulties among the settlers. Nor were matters improved when a new law was promulgated in 1842 which fixed the minimum price for an acre at a pound sterling. The sales of land fell off still more. In 1843 4,800 acres, and in 1844 only 4,200, were sold. It was only when the crisis ended that these figures improved once more to 7,200 acres in 1845, and 7,000 acres in 1846.

The change for the better coincides with the fall of the ministry of Peel on June 26, 1846. The new colonial secretary, Earl Grey, at once returned to the old paths and allowed the concession of pasturage rights for fourteen years, with the right of pre-emption. At the same time the regulations as to the recovery of the quit-rent were considerably modified. The land legislation in the succeeding year went still farther in this direction, since on March 9, 1847, the governor of New South Wales received authority to let in the uncolonised districts tracts of 16,000 or 32,000 acres for eight or fourteen years. Each lessee received with his contract the right to acquire 640 acres at the fixed price of £640 sterling as a homestead, and to have the lease renewed after the expiration of the fourteen years for a further term of five years. The rent was based on the number of the head of stock; a run which was large enough for 4,000 sheep was to cost £10 sterling. The lease at the same time gave the lessee the right of pre-emption. The land question in New South Wales thus obtained its definite settlement for a decade and a half. The new regulations did not, indeed, meet with universal assent; on the contrary, in consequence of the renewed outbreak of wild speculation in land, and the loss suffered by the already permanently settled districts, violent demonstrations were made in these latter. The government, however, had neither inclination nor time to destroy the work so laboriously brought to a close and to begin again; so the cries for alteration died away unheard.

The cause of this policy of the mother country lay in the difficulty of finding room for her criminals now that transportation to New South Wales was abolished. Van Diemen's Land was soon overcrowded, but the plan of founding a new convict settlement in North Australia was shown to be impracticable. At the same time the thought of once more stocking with convicts the districts of East Australia, which had been so capable of receiving them for more than half a century, forced itself forward; and all the more so as the colony of Port Phillip (since 1851 "Victoria"), which had arisen meanwhile in the south, cried out loudly for cheap labour, and in New South Wales there were still many landowners who earnestly desired to see the restoration of the old condition of things, with its abundance of workers. Both encouraged the home government (1848) to resume the old policy. The act of 1840 was repealed, and the institution of new penal colonies was contemplated.

These plans were not carried out. In the first place, there was already too general and too deep-rooted a belief in the ruinous results of transportation to New South Wales; and, secondly, the opposition of the free labourers, who had now become numerous, to the threatened competition was so vigorous and persistent that the oldest of the Australian colonies, at any rate, remained spared for the future from the unwelcome gift. Only two shiploads of convicts were sent over in 1849. The one ship was allowed to land her freight at Sydney, when the convicts were at once secretly hired by private persons and sent up country; the other, which tried to land at Melbourne, had to return with all on board. The vigorous opposition of the people did not prove ineffective in the sequel. In 1851 New South Wales, which between 1788 and 1839 had received not less than 59,788 convicts, finally ceased to be considered as a sphere for transportation. The prospects for Victoria were hardly less favourable; and in 1853 Van Diemen's Land, which since 1803 had received the enormous number of 67,655 convicts from the mother country, and at that time sheltered 20,000 of the worst criminals, gained exemption for the future from any further influx. After 1853 only Western Australia was still employed as a transportation district; and since South Australia from the first had been constituted on a different principle, the institution did not last much longer. It was abolished there also in 1868, after some 10,000 convicts had been brought into the country between 1849 and 1868. Since that time Australia has been allowed to possess a population uniformly composed of free colonists.

#### B. THE GROWTH AND DEVELOPMENT OF THE DAUGHTER COLONIES DOWN TO THE MIDDLE OF THE NINETEENTH CENTURY

(a) *The Effect on Colonisation produced by the Wider Exploration of the Continent.*—The internal development of New South Wales, which was shown conspicuously during the forties and fifties by the treatment of the land question and the transportation question, was accompanied by a corresponding widening of the sphere of colonisation. But while the land question chiefly hinged on the distribution of the districts which lay roughly within the boundaries of modern New South Wales, this territorial expansion went far beyond such limits. In the first enthusiasm of early colonisation, attempts were made to cover the whole continent at once; but when the deficiency of their powers was recognised the settlers were content to occupy some few districts, which were very unequally distributed along the coast of the continent; for while they were numerous in the southeast and east, the distant west lay isolated, and the north was entirely uncolonised.

This peculiar distribution is very closely connected with the history of the rise of the different daughter colonies of New South Wales; this again was strongly influenced by the course of the geographical exploration of Australia. As a general rule exploration came first, and colonisation followed. This order of things was only reversed in the founding of Western Australia; there colonisation began in one part which had long been known; but the exploration of the hinterland was the concern of later decades.

The successful expedition of Wentworth, Blaxland, and Lawson, in the year 1812, across the Blue Mountains into the interior (p. 261), had fired the zeal for exploration. The years 1817 and 1818 saw the discovery by J. Oxley of the exten-

sive grazing grounds known as the Liverpool Plains. In 1824, two young colonists, Hamilton Hume and William Hovell, were the first to reach the vicinity of Geelong, near modern Melbourne, from Sydney, having traversed the whole southeast of the continent, past the sources of the Murrumbidgee and the Murray. At the same time Allan Cunningham, the botanist, continued the explorations of Oxley in the north as far as the Darling Downs (1827). Finally in the years 1828 and 1829, came the important journeys of Charles Sturt in the district watered by the Darling and Murray Rivers; these journeys not only threw new light on the river system of the country, but also guided the colonial expansion of Australia into other paths. In this respect particularly all these travels were rich in results. The first successful founding of Port Phillip is the direct consequence of the journey of Hume and Hovell. Various sheep farmers of the interior followed Allan Cunningham's tracks, and thus laid the real foundation of the later Queensland. The favourable report by Sturt on the district between the lower Murray and the Gulf of St. Vincent was entirely responsible for the colonisation of South Australia. The travels of later years did not, with one exception, produce any political results, when once the foundation of the new States had been laid. Geographically they are not, for the most part, inferior to the earlier essays in exploration, and certainly brought more definite information as to the industrial value or worthlessness of the soil than the first rapid journeys. This applies, particularly, to the expeditions which took as their object the accurate investigation of the river system of the Darling-Murray, the travels, that is to say, of Major Thomas Livingstone Mitchell, who succeeded in accomplishing his survey after six years of strenuous effort; it also applies to the discovery of the interior of Victoria ("Australia Felix") by the same traveller, and not less to the enterprises of the brave Edward John Eyre (born 1815, died January, 1902) on the soil of inland South Australia, in the low-lying lake region, and on the terribly barren south coast as far as King George's Sound (1839-1841).

Finally similar results were achieved by numerous exploring parties in the heart of Western Australia. The majority of these travellers could not bring back very pleasant reports. Apart from Victoria, all accounts of the industrial value of the country were discouraging or absolutely deterrent. The northeast alone formed a striking exception; there later travels accomplished results which, to some degree, are comparable to those of the first explorers. It was the journeys of Ludwig Leichhardt which can claim this marvellous effect, and Queensland and North Australia are the regions which owe their real discovery and opening up to a German. It is not too much to say that Leichhardt's splendid expedition from Darling Downs to Port Essington (1844-1846) increased the possible area of colonisation by about a million square miles, or one-third of the whole continent. The colonists only required to follow the steps of the explorer, in order to come into possession of an almost incalculable expanse of profitable land.

A peculiar feature of all Australian exploration before the middle of the nineteenth century was its restriction to the edge of the continent; the centre was not reached. The explanation is found in the novelty of the sphere of work. Until the broad strip of territory along the edge was thoroughly explored in most of its parts, there was no motive to attack the real heart of the country. Even when, in the second half of the nineteenth century, the centre was chosen as a goal, the want of any tangible attraction greatly checked the course of exploration.

(b) *The Colonial History of Tasmania (Van Diemen's Land)*. — Of the six colonies which compose the Commonwealth of Australia, only three, Tasmania, Victoria, and Queensland, are offshoots from New South Wales; South Australia and Western Australia (like New Zealand also) were, on the contrary, founded by direct colonisation from England. Considering the enormous difficulties with which New South Wales had permanently to contend, this circumstance is not surprising. In the case of Western Australia, the mere distance from the east coast of the continent was sufficient to restrain native enterprise. But South Australia was, in its origin, so hazardous an experiment, that the government in Sydney did well to play the part of an unconcerned spectator. In other respects even there, east of the Great Australian Bight, the question of distance was not devoid of importance. It is, at least, no accident that the three daughter colonies lie in one zone with their mother colony; that Van Diemen's Land, an island comparatively far away from Sydney, was colonised as the first offshoot, to the complete neglect of the neighbouring parts of the mainland; and that even the first steps toward founding Victoria were not taken from Sydney, but from Van Diemen's Land. Seldom has the natural advantage which attaches to the position of an island facing a wide stretch of opposite coast been so clearly shown as here.

The first step of the Australian mother colony towards the establishment of independent offshoots was the founding of the penal colony of Van Diemen's Land in the year 1803. The cause of this settlement was primarily the fear of French schemes of annexation, which more than once had given rise to the erection of military posts on the coast of Australia. In the next place, the English government did not think it advisable to concentrate too large a number of criminals in any one place; a small convict settlement on Norfolk Island had already been founded under the influence of this idea, but had not proved successful. Van Diemen's Land seemed, both in point of size and of remoteness from the continent, a more desirable place than Norfolk Island for the confinement of dangerous criminals. To carry out these intentions, Governor King sent Lieutenant Bowen with a detachment of soldiers and some convicts to Van Diemen's Land in June, 1803. A settlement called Restdown, a name later corrupted into Risdon, was founded on the left shore of the estuary of the Derwent.

About this same time the plan had been formed in England of colonising the shores of the recently discovered Port Phillip on the southeast corner of the mainland. The execution of the plan was intrusted to Colonel Collins, a man who had gone to Port Jackson as a judge in the first convict ship, had been advocate-general of New South Wales for a long time, and happened then to be in London. The expedition, consisting of two ships with four hundred convicts and the necessary warders, landed on the south side of Port Phillip, near the site of the modern Sorrento. Small excursions into the country soon showed it to be bare and inhospitable, and as Collins also, after prolonged search, found no water, he abandoned the district on January 27, 1804, in order to take his people over to Van Diemen's Land, a course which Governor King sanctioned at his request. He sailed directly for the estuary of the Derwent, broke up the colony of Bowen there, and founded a new joint settlement on the right bank of the river at the foot of Mount Wellington. He called the place, in honour of Lord Hobart, the colonial minister of the day, Hobart Town, a name abbreviated in 1881 to Hobart. The north of the island was also occupied. Simultaneously with Collins's expedition, and again, owing to

the fear of a French occupation, Colonel Paterson conducted another troop of convicts from Sydney to Van Diemen's Land, where, on the west shore of Port Dalrymple, Yorktown was immediately founded. Its first inhabitants could not make themselves at home there, and in 1806 they were taken further into the interior and settled in a locality called Launceston, after King's native town in Cornwall.

The occupation of this new field for colonisation from opposite sides had greatly hastened the exploration of the island, and, with it, the knowledge of its economic advantages; but the first steps had been taken without the orders of the home government and by no means to its satisfaction. The permanent shortage in provisions, which had shown itself in the early days of colonisation in New South Wales and Norfolk Island, soon was felt in the newly planted colony. The cause was primarily the strict embargo on the landing of any except convict ships; and next the complete economic dependence on New South Wales. Under ordinary conditions this would not have led to inconvenience; but when, as happened in the year 1806, owing to the great floods of the river Hawkesbury, supplies ran short in the mother colony, the position of all the settlers could not but be the more precarious, since about that time (1807) the number of the inhabitants of Van Diemen's Land was increased by the entire population of Norfolk Island—a settlement which had always proved somewhat of a failure. The conditions of life in Van Diemen's Land under these circumstances did not for the moment appear hopeful. For a long time the government was forced to leave it to every convict to find his own food, clothing, and shelter. Since the flesh of the kangaroo was known to be a suitable article of food, the convicts at once scattered over the whole interior. This was advantageous for the exploration of the country, but not calculated to produce law and order among the colonists, and still less to maintain good relations with the aborigines (cf. p. 247). The process of extermination was cruel and pitiless; but it had at any rate the merit of being brief and vigorous, for the whole white population went against the black fellows like one man. The convict killed them from sheer lust of blood, the settler chased them on the plea of self-defence, and the government tried to catch them from the wish to acquire territory. The effect of these combined efforts was thoroughly complete; the famous "black war" of 1830, with the costly "drive" of Governor Arthur (p. 248), came almost too late.

The mutual relations of the whites were not so simply settled. The aggressor here was the convict only, while the mass of the settlers and the government were the injured party. Unequal as it was, this struggle delayed the political and economic development by fully two decades. To many a convict, who had been given leave for a kangaroo hunt, but especially to the numerous prisoners who had escaped from the gaols, it did not occur to return from their roving in the interior to the yoke of servitude. They soon acquired a taste for the free life of the bush, formed themselves into bands, which lived by plundering the white settlers, and with this comfortable vocation, which was disastrous to the prosperity of the colony, laid the foundation for that wild bushranging which up to 1830 was such a curse to Van Diemen's Land, and spread later to the mainland (cf. p. 263). Both classes of fugitives had cause enough for this renunciation of human society. It had always been the custom throughout Australia to hand over the convicts to the settlers as labourers, a proceeding that, in the case of the rougher part of the settlers, did not always lead to humane treatment; merciless flogging for the slight-

est offence was the mildest penalty. Nevertheless those who were suffering under the yoke of a private individual might call themselves lucky in comparison with the other unfortunates, who were kept in the penal establishments erected by government, of which Macquarie Harbour, set up in 1821, and Port Arthur, which was added in 1832, were the most notorious in Van Diemen's Land. Many of the inmates preferred to put an end to their existence; others broke prison only to die in the trackless woods. The few who eventually succeeded in escaping had every motive for showing no consideration to the free settlers of every kind. Robbery, arson, and murder were the distinguishing features of colonial life in Van Diemen's Land. The energetic Governor Arthur at last succeeded, by a rapid campaign, in checking the evil for a time at least (1825-1826). Twenty years later, under Governor Wilmot, it revived with all the greater force.

Considering all the misery which the bushrangers brought upon the island, it was fortunate that the outrages by which they thoroughly intimidated the settlers were mostly confined to the interior; the south and north coasts remained, on the whole, free from such calamities, and were therefore able to develop steadily but slowly. Collins himself, who died at Hobart Town in 1810, did not live to see much of this progress. He had laid the foundations for it when he began to construct (in 1807) the marvellous road from Launceston to Hobart Town, but, under the prevailing conditions, it had not lain in his power to develop it farther. Lieutenant-Colonel Davey, his successor, only arrived at Hobart Town at the beginning of 1813. In the interval, Governor Macquarie (p. 260) had paid his first visit (November, 1811), which was an important event for Van Diemen's Land, since Macquarie with characteristic energy flooded the island with an infinity of new schemes, urged the construction of roads, public buildings, even whole towns, and, what was most essential, succeeded in awakening the public spirit of the better classes. Now, for the first time, a systematic organisation was noticeable, which soon showed itself in the proclamation of Hobart Town as the capital of the country in the year 1812. Davey's term of office, which lasted until 1817, hardly carried out the extensive plans of Macquarie. Jenks says of him: "Davey seems to have treated his office more or less as a joke. He was totally without ceremony and would drink and jest with any one." Bushranging alone was an eyesore to him, and the wish to suppress it finally led him to exercise his office. His first act was to place the whole island under martial law; but besides this he forbade any inhabitant to leave his house at night without permission. If, under this régime, there was any progress at all it was entirely due to private persons. In 1815 the colony was already in a position to export wheat, and in the following year salted meat, to Sydney. In 1816, the first newspaper was started in Hobart Town. When Davey left, the white population counted quite three thousand souls, and an equally large number of acres were under cultivation. But there was not yet any cattle breeding or sheep farming. These industries were introduced in the succeeding years. Davey's place was filled by William Sorell, an able man, whose chief concern was not to place free and respectable immigrants amongst a population composed of convicts; he next turned his attention to the economic development of the island as well as to the suppression of bushranging. He, like Davey, was unable to achieve great results in that field; on the other hand, he had attracted settlers in large masses, thanks to the favourable terms which he offered. Not only did the government grant free allotments of land, but it also supplied food for six

months, lent the entire stock of cattle required at the outset as well as the first seed corn, and, besides this, guaranteed a minimum price for the entire produce in grain and meat. When, in 1821, Governor Macquarie set foot for the second and last time on the soil of Van Diemen's Land after an interval of ten years, the white population amounted to 7,400 souls, who had 14,000 acres under cultivation and 180,000 sheep with 35,000 cattle on their pasturages. The introduction of systematic sheep farming coincided indeed with Sorell's governorship, but the credit belongs to the Colonel Paterson so frequently mentioned in these pages, who induced the experienced sheep breeder, MacArthur (p. 257), to send him over a shipload of his famous flock. An attempt, made in 1819, to put wool on the English market failed lamentably; in 1822, however, 794 bales were exported and gladly received by the market. At the present time the wool trade has long been recognised as the mainstay of the colony. It is easy to understand that under these circumstances the colonists regretted the departure of the governor, who was also personally popular. When he was recalled in 1823, the home government was actually petitioned to appoint him for a second term.

Sorell's successor, Arthur (1823-1836), did not do so well, in spite of a long administration and great services. His personal character was partly to blame for this; partly, also, his stiff official bearing toward the free settlers. Arthur's entrance on office was connected with important changes in the constitutional position of Van Diemen's Land. The rapid growth of the white population during the last few years had made the want of an independent government widely felt. Not only were all questions touching the common interests dependent upon Sydney, but even the matters of daily occurrence were decided there. Weeks were always lost in this way, and even though Macquarie tried to check this evil by conferring larger powers on the lieutenant-governor, the position was bound to become intolerable. This view was held in London; the same act of parliament, in 1823, which limited the powers of the governor of New South Wales, entirely severed Van Diemen's Land from the parent colony. It was declared an independent colony, received its own law courts, as well as a special executive assembly, and, in short, was put on the same footing as New South Wales. Colonel Arthur was appointed the first governor.

In spite of the flourishing condition of the island, there was no lack of scope for his work; on the contrary, his twelve years' tenure of office was the most eventful in the whole history of Van Diemen's Land. The settlement of the convict question which met him at the outset demanded all his energies. Soon after his arrival a band of more than one hundred criminals had escaped from Port Macquarie and pillaged the island. The strengthened military force proved sufficient to check their excesses; and one hundred and three of the culprits were executed by the orders of the governor. Clemency towards criminals was not a characteristic of Arthur, although he thought his island was only intended for them, an opinion which Macquarie in his day had held about Australia. Arthur regarded the free settlers as a necessary evil. The outcome of this biased attitude was an unremitting, if not exactly paternal, solicitude for the prisoners. When in 1832 Macquarie Harbour on the west coast had to be given up on account of the excessive density of the population, he established a new settlement at Port Arthur on the southeast, where the prison system was raised to a veritable science.

The second task of Arthur was the native question (cf. p. 248). Notwith-

standing all the unrest which the struggles with the convicts as well as with the aborigines produced in the island, they were not serious enough to check the growth of the colony in any sensible degree; there was a surprising increase during Arthur's term of office both in the population and the area of cultivated land. At his arrival the population had amounted to something over ten thousand souls; when he left in 1836, this total was quadrupled, and the area of cultivation had similarly increased. The number of sheep then reached nearly a million; and the exports, which in 1823 had amounted to approximately £25,000 sterling, had risen to over £500,000. In order to open up the industries of the island on a large scale, the Van Diemen's Land Company had been formed in England, which obtained a concession first of two hundred and fifty thousand acres, and then of one hundred thousand more. It exercised an influence on the development of the colony up to quite recent times. For educational purposes there were twenty-nine schools, while religious needs were provided for by eighteen churches. Peace was at last concluded between the government and the newspaper press, with which Arthur for years had waged as bitter a war as Sir Ralph Darling in Australia (see p. 263); after 1828 complete freedom of the press prevailed. On the whole Arthur and the colony could be satisfied with the results.

The subsequent fortunes of Van Diemen's Land up to the beginning of the second period in Australian development, which commenced in the same way and about the same time for all the colonies, can be given in a few lines. Arthur's successor was Sir John Franklin (1836-1843), who had already gained renown by his exploration of the North Polar regions. Fitted by his whole disposition for scientific pursuits, he was the less competent to face the numerous difficulties of his responsible position, since the decline of Australian industries began in his time. Yet he too did good service to the island. The organisation of the educational system was entirely his work. He was further the founder of the Tasmanian Society, now known as the Royal Society of Tasmania; he enabled William Jackson Hooker to complete his work on the flora of Tasmania, and finally initiated the study of the geology and natural history of the island by encouraging numerous travellers. His administration was the scientific era in Van Diemen's Land.

The brief administration of his successor, Sir Eardley Wilmot (1843-1846), was occupied with the struggle between the colonists and the English government about the abolition of transportation. Van Diemen's Land had always enjoyed the dubious advantage of being provided with large masses of criminals in proportion to its area. The detrimental effects of penal colonisation in its moral and economic bearings had therefore been most noticeable there, and in 1835 there commenced a systematic agitation of which the object was to prevent convicts from being landed on the island for the future. This agitation did not completely stop even in the succeeding years, and when at the beginning of the "forties" the prisoners of Moreton Bay were taken across to the island, it immediately flared up again brightly. Fuel was added to the flame when, under Wilmot's government, two thousand prisoners were brought over from Norfolk Island, which after 1825 had once more become a penal settlement, and when it was seen that new batches were constantly arriving from England. Up to 1844 the number of criminals sent to Van Diemen's Land amounted to forty thousand. The most worthless of these were the Norfolk Islanders, many of whom escaped to the bush, where they combined in marauding gangs of from one hundred to five hundred men, and

waged a guerilla warfare on every one. They burnt the houses, killed the inhabitants, drove away the cattle, and revived the worst features of the old bushranging. This was the climax. The agitation against the system of penal colonisation became general. A great league against it was founded, and in the government of Sir William Denison, who had succeeded Wilmot in 1846, after several years of effort, transportation to Van Diemen's Land was finally abolished in 1853. This reform was accompanied by a change in the name of the colony, which has since then been known as Tasmania.

(c) *Port Phillip (Victoria)*. — "The colony of Victoria might, with some justice, be spoken of as a granddaughter rather than a daughter of New South Wales" (*Jenks*). It was finally founded by settlers from Van Diemen's Land; it was purely Australian only in the period before it was definitely colonised. This begins with the attempt of Colonel Collins, with which we are already familiar (p. 272), to establish a penal settlement on the shores of Port Phillip in 1803. The plan failed, with the result that no one for more than twenty years troubled about a country which was considered "unproductive and unpromising." In 1825 the attempt was renewed in consequence of the favourable reports of Hume and Hovell, and also with the object of forestalling the French. The penal station of Dumaresq was founded on Westernport which was mistaken for Port Phillip; no water, however, could be found, and the settlement was discontinued in 1828. This concludes the preliminary stage in the history of the colony. The real founding of Port Phillip, as modern Victoria was called until 1851, was due to private enterprise. The few fishermen and sailors who in the first half of the nineteenth century led a half-savage existence on the eastern parts of the south coast of Australia, were joined in 1834 by a family named Henty, which settled in Portland Bay. The members of it had already taken part in the unlucky enterprise in Western Australia (cf. p. 280), had afterwards hoped to find free land in Van Diemen's Land, and now, since they were at the end of their resources, ventured on a bold plunge into the unknown. The special permission to settle for which they applied was at first refused by the authorities, but subsequently granted, in consideration of the still dreaded encroachment of the French.

Henty's success prompted further enterprise, which was once more directed toward Port Phillip, — the true nucleus of the modern colony of Victoria, — and has been for this reason regarded by many as the actual starting point of this State. The leader of this attempt was John Batman, a wealthy sheep farmer of Van Diemen's Land. He started in May, 1835, with several companions for the south coast of Australia, inspected the country, and "bought" on June 6, 1835, for a couple of dozen axes, knives and scissiors, some blankets, thirty mirrors, and two hundred handkerchiefs, with the stipulation of a yearly payment of about £200 sterling in goods, two vast territories comprising together six hundred thousand acres, an area more than the size of Cambridgeshire. The consequence was the founding of an association of various settlers of Van Diemen's Land, the Port Phillip Association, and the planting of the first settlement in Geelong. The contract of sale was sent to England; the government naturally termed it worthless. If the country was English, the natives had no right to alienate the land without the governor's sanction; if it was not English, the association had no claim on the protection of England. The association, realising in the end that it

had no case, was content with twenty thousand acres, worth then some £7,500. In 1836 it was dissolved.

In England there was at first little inclination to allow a new colony to be founded; the cost of administration promised to be formidable, and the recently planned settlement in the adjoining South Australia would be thus unnecessarily exposed to the danger of a keen competition. Circumstances were, however, stronger than the will of the government. Even on August 26, 1835, Governor Bourke of New South Wales had prohibited the occupation of land round Port Phillip without his permission; but only a year later, in September, 1836, he and the English government saw themselves compelled by an unexpectedly large influx of immigrants to open the country to colonisation. After this concession, development was rapid. The administration had in 1835 started with a single government official, a Captain Lonsdale. In the following year it was enlarged by a regular police force, with whom three land surveyors were associated. In 1837 Sir Robert Bourke himself laid the foundation of Melbourne and Williamstown, and in 1842 the former received a municipal government. In June, 1836, there were calculated to be one hundred and seventy-seven colonists with twenty-six thousand sheep; two years later both figures were tripled or quadrupled. At the same time the exports of the young colony amounted to £12,000 sterling, while the imports reached £115,000. As in New South Wales, the crown lands were sold by public auction, except for the period 1840-1842, when the plan of allotment at a fixed price was tried. Owing to the strong tide of immigration, by the end of 1841 no fewer than 205,748 acres had been transferred to fixed proprietors, and in return £394,300 had been paid to the land fund, from which source the expenses of government were defrayed. This large sum illustrates the superabundance of money in the country at the time. Owing to the scarcity of workmen, wages of ten shillings a day and upward were not considered high. An ox cost from £12 to £15, a horse £100 or more, a sheep up to £3. Champagne, so Alfred Zimmerman tells us, was drunk in such quantities that the streets could have been paved for miles with the bottles.

The inevitable reaction followed. The over-production of corn and cattle, which very soon appeared, led in every department to a collapse of prices, ending in a regular bankruptcy. Wages rapidly sank; the price of an ox was hardly as many shillings as it had fetched pounds in the past, and hundreds of businesses suspended payment. The crisis was violent but short; it was ended by the middle of the "forties." Since that time, apart from the gold fever which set in a little later and the declaration of the independence of the colony, no event of great importance has disturbed the development of Port Phillip. It made continuous but rapid progress. In 1840 Melbourne was declared a free port; in 1843 the trade of the colony amounted to £341,000; in 1848 it had reached £1,049,000. The proceeds of the sales of land increased in proportion. Of the £250,000 which composed the whole revenue of the colony in the year 1850, more than half came from that source alone. The outgoings were thirty per cent less than the incomings.

It is pleasant to record that good relations existed from the first between the colonists and natives. This is partly traceable to the sensible behaviour of the early settlers; it is partly due to the services of William Buckley, whose romantic adventures are well known. He had been a convict, and had escaped from Collins's expedition in 1804. He then lived thirty-two years among the natives, and now was the mediator between the two races. We hardly hear of any outrages, fights

with the blacks, or similar occurrences, in the history of Port Phillip. The settlers could extend their sheep runs farther and farther into the interior without molestation. In 1849 Port Phillip owned more than a million sheep; the export of wool amounted to nearly thirteen million pounds.

This splendid growth brought up as early as 1842 the question of the political severance of the colony from New South Wales. Nevertheless, a whole series of representations to the English government on the subject produced no effect. The colonists then, in July, 1848, resolved on a step as bold as it was original. Six representatives should have been elected to the legislative council which sat at Sydney. The candidates were requested to withdraw their applications, and the English secretary of state for the colonies, Earl Grey, was chosen as their solitary representative. The scheme was, of course, apparent. At the subsequent election in October, the government insisted on the nomination of proper deputies. But the object of the colonists was so far attained that the separation of the two colonies was now seriously considered in England. The board of trade took up the question, the ministry gave way, and in the Constitution Act of 1850 the settlement (numbering seventy-seven thousand souls) was raised to an independent colony under the name of Victoria. The news of this decision reached Melbourne in November, 1850; but it was not until July 1, 1851, that the new order of things came into force.

(d) *Queensland.* — The expedition, which had been made by Oxley (p. 270) along the east coast north of Sydney had prompted several attempts at colonisation. Settlements had been founded at Port Essington, on Melville Island, and at other points, but no results had been obtained. When, then, a little later the maintenance of the convicts in Van Diemen's Land began to cause difficulties, the expedient was adopted of founding a penal station on Moreton Bay. This lasted until 1840, and has, under the name of Brisbane, remained to the present day the seat of government of the later Queensland. But it must not be regarded as the true nucleus of the colony. In the first place, the presence of the penal station deterred all free settlers from going there; and next, the land in its neighbourhood was not offered for sale. Queensland thus, at least for its first beginnings, showed a unique development from the standpoint of political geography. It developed from the interior toward the coast.

Queensland's real origin is traceable to the squatters (p. 265) who followed the track of Allan Cunningham (p. 270) from New South Wales to the north. They continually drove their flocks on further from the Liverpool Plains to the New England district and the Darling Downs. These districts were even then the best pasture grounds in the world, but suffered much from want of access to the sea, since owing to the intervening chain of mountains the long *détour* by New South Wales had to be taken before the value of the products could be realised. Even the discovery of a difficult mountain path to Moreton Bay was of no use, since the authorities absolutely prohibited the squatters from any communications with the place. A change was first made in 1839 after the abolition of the penal station. Practicable roads were now constructed over the mountains, public sale of land was introduced in 1842, and the fresh stream of immigration was diverted into the newly opened districts. Yet there was not at once a marked development; good land was abundant, but the labour to cultivate it was not forthcoming. In nine years less than two thousand five hundred acres had been disposed of.

As was the case everywhere in Australia, there was first an outcry for convicts as a makeshift. Men were not afraid to receive a batch of convicts which was refused admission into New South Wales in 1849, and finally, since after this date no more convicts were sent out from England, they adopted the two-edged expedient of importing Chinamen. Queensland, thanks to the action of the mother country rather than through her own foresight, has been spared from the transportation question. The more difficult Chinese question has never been settled, and was revived in 1901, owing to the decreasing immigration of white labourers. On the whole, those first coolies were of no use to the squatters. Racial aversion made it difficult to employ them at the same time with white hands, and the difficulty became an impossibility during the Chinese war of 1841-1842 (p. 108). A rumour spread that the coolies had formed a plan of putting poison in the tea consumed by the whites; and no white hand would stay on the same station with a coolie.

Thus the labour question in Queensland remained for the moment unanswered. The discoveries of gold made in Victoria and New South Wales in 1851 were only calculated to increase the deficiency of labourers in the country hitherto considered devoid of gold. The wish of the colonists for convicts was so great that efforts were soon made to obtain political separation from New South Wales, merely in order to be able to reintroduce transportation. The first request was granted in 1859; the northeast corner of Australia was proclaimed an independent colony under the name of Queensland. The second request was refused. In the first place, the general feeling throughout the whole of the rest of Australia was not favourable to the system, and in the second place, Western Australia, a country more convenient and involving a cheaper voyage, was still available for transportation.

The aspect of Queensland, at the moment when it received independence, was essentially different from that of the other Australian colonies at the same stage in their career. The entire white population amounted in 1859 to only thirty thousand souls, who were equally distributed between the town and the country. There were some twenty towns, of which Brisbane then contained four thousand inhabitants, while others of them boasted only of some hundreds. The so-called town of Allora had only fifty-five inhabitants. These settlements were mere villages, not only from the small number of their inhabitants but in their essential nature; they did not show a trace of organised municipal government. The greater credit is thus due to the certainty and rapidity with which all the authorities adapted themselves to the new conditions suddenly burst upon them. Mr. Jenks is disposed to regard the example of Queensland as proving the high capacity of the Anglo-Saxon to adapt himself to any form of polity. And it is true that the Queenslanders entered upon self-government without any such preliminary training as all the other Australian colonies had enjoyed in their gradual process of political development.

(c) *Western Australia.*—Western Australia was founded directly from England. It is true that a number of convicts had been sent in 1826 from Sydney to the west coast of the continent in order to counteract any French schemes; but the establishment of the stations of Albany and Rockingham can hardly be termed a colonisation in the proper sense of the word. The first real settlement was in 1829. In the previous year a Captain Stirling had published a glowing account

of the district at the mouth of the Swan River, which induced the government to order Captain Fremantle to hoist the English flag there. But further measures of the government failed from want of means.

The moving spirit of the private enterprise which first started the colonisation was Thomas Peel. In combination with others he offered to send in the course of four years ten thousand free emigrants to the Swan River, on condition that, in return for the cost, which he estimated at £300,000, an area of four million acres should be assigned to him. When the government did not accept this offer, Peel considerably reduced the scale of his scheme, and this time was successful. Under the guidance of Captain Stirling, destined to be the governor of the new colony, to whom one hundred thousand acres of land had been promised, the first band of emigrants sailed from England in the spring of 1829, arrived in June on the Swan River, and founded at its mouth the town of Fremantle, and higher upstream the town of Perth. In the course of the next year and a half thirty-nine emigrant ships, with 1,125 colonists, attracted by eulogistic descriptions, followed the first party to Western Australia. Fortune did not smile on the attempt; there was land enough and to spare, but there was a lack of workingmen, of roads, and of markets.

Peel's plan had been to cultivate tobacco and cotton, sugar and flax, to breed horses for India, and by fattening oxen and swine, to provide the English fleet with salted meat. All this came to nothing; the colonists themselves had hardly enough to eat, and the larger their landed property, the greater their helplessness and distress. Many settlers, and among them the Henty family (p. 277), left the ungrateful soil of the colony; others lost all they possessed; Peel himself, who had settled with two hundred colonists, is said to have lost £50,000. The founders had, from the very beginning, never given a thought to the support of the newcomers, nor had any one troubled about dividing the land even roughly, to say nothing of a proper survey. It was nothing unusual for the settlers to lie for months after their arrival shelterless on the shore, exposed without protection to the scorching Australian sun, to sandstorms, and to violent downpours of rain. Thus much of the labour that had been expended on the soil was wasted, while the health of the people suffered. If they finally were in a position to occupy the tract assigned to them, difficulties of another sort began. From the very first hour the relations between the settlers and the aborigines were most hostile; and the aid of a troop of mounted police was required for the protection of the former. Under these circumstances there could be no idea of progress, in the sense in which it can be recorded of the majority of other Australian colonies in their early days. Everything went on very slowly, especially as immigration, after the first wave, absolutely came to a standstill. The few settlers left in the land certainly did their utmost; they most energetically set about breeding sheep and horses, laid the foundation of some other towns, and settled King George's Sound. Development in the first six years did not go beyond this; of 1,600,000 acres distributed to the colonists as such, in 1834, only 564 acres were under cultivation.

Some stimulus was given to development by the Western Australian Association, founded by Major Irwin in 1835, which was intended to encourage emigration to Western Australia and safeguard its interests in other countries. Among its members, besides English gentlemen, were included some residents of Calcutta, who

contemplated the establishment of a health resort as well as a trading settlement. The company benefited the colony in many ways; but in spite of all agitation it could not alter the slow course of the economic growth. In 1840 the population had only amounted to twenty-three hundred souls; two years before the colonists had received the privilege of sending four members to the legislative council (p. 268).

The year 1841 saw the formation of some large undertakings to exploit Western Australia. One was a limited company founded by the Western Australian Association, with the object of buying up cheaply the land once assigned to Captain Stirling, and then disposing of it in small lots. One pound sterling was to be paid down for each acre. This plan never came into execution. The other undertakings of the same Western Australian Association promised greater success. At the suggestion of the traveller, George Grey, subsequently distinguished as a civil servant (p. 285), a settlement which received the name of Australind was founded in the Leschenault district on the north coast of Geographe Bay, some hundred miles south of Perth. It was flourishing splendidly when the company broke up; the small town still exists.

The want of labourers, which became more urgent from year to year, drove the colony to follow the example of Queensland. In 1845 the council seriously contemplated inviting German settlers, under the impression that the harsh treatment of German immigrants in the United States would make it easy to divert the stream. At the same time the advisability of admitting pauper immigrants was considered. The most momentous resolution, however, was the introduction of transportation. According to a resolution of the council of 1846, a certain number of convicts, whose passage was to be provided at the cost of the mother country, were to be admitted annually, in order to be employed on roadmaking and other public works. The English government accepted the proposal only too willingly. While it did nothing at all to help the execution of the two other schemes, it lost no time in disembarking shipload after shipload of convicts on the welcome new transportation territory, as Western Australia was officially declared to be on May 1, 1849. After 1850 "ticket-of-leave" men were sent out, and allowed freedom of movement within the colony, subject to the obligation of periodically reporting themselves to the police.

In contrast to New South Wales and Van Diemen's Land, the colony of Western Australia was greatly assisted by the introduction of penal colonisation. By April, 1852, there were fifteen hundred transportees in the country, half of whom were ticket-of-leave men. This number implied a large staff of officials, and a stronger military force; it also necessitated the construction of large buildings, for which the sum of £86,000 was granted by England alone. Thus money and life were brought into the colony. The old colonists took heart again, a new stream of free settlers flowed in, more and more land was bought and cultivated, and the land fund grew in an encouraging fashion. Coal fields also were discovered, guano beds were exploited, and sandalwood exported; the Madras cavalry began to obtain their remounts from Western Australia, and a pearl fishery was started in Shark Bay. Under these circumstances it is not wonderful that the white population, which had only amounted to five thousand in 1850, was now trebled. The number of sheep and cattle, as well as the volume of trade, showed a corresponding increase.

There was, however, a dark side to this bright picture. In spite of the increase

in sales of land, the incomings did not cover the expenditure. In order to make good this deficit, an arrangement had been made by which the ticket-of-leave men should be able to buy their liberty at a price varying from £7 to £25, according to the length of their sentence. But, in spite of the extensive use which the transportees, who in Western Australia belonged exclusively to the male sex, made of this privilege, the measure was ineffectual; the colony was more than ever dependent on liberal subsidies from the mother country. This had an important effect on political development, since this financial dependence, in connection with the transportation which suited England, was the chief reason why Western Australia was absolutely ignored when a responsible government was granted to the other colonies. A third reason was the composition of the inhabitants and their stage of civilization in 1850. Even in 1859, forty-one per cent of the male population were actual or former convicts, and in most localities these convicts outnumbered the free colonists. The number of illiterate persons, excluding the actual convicts, reached  $37\frac{1}{2}$  per cent. It was absolutely impossible to place a community so constituted on an independent footing.

Western Australia was long in making up for its original inferiority to the sister colonies. It lost, however, its character of a penal colony quicker than was acceptable to the free and the emancipated colonists, who were spoilt by the cheap price of labour and the sums of money spent by the mother country on transportation. The continuous influx of escaped criminals soon caused bad blood in the adjoining colonies, as well as the circumstance that many convicts from Western Australia, on serving their sentence, turned their steps toward the east. In 1864, Victoria raised a violent protest against the continuance of penal colonisation in the far west of the continent, and demanded measures of repression. Finally, in 1868, the English government struck Western Australia out of the list of penal colonies, after it had received in all 9,718 transportees. The complete ruin of the colony, which the colonists who had been enriched by convict labour prophesied, did not occur. But it cannot be denied that the development of Western Australia was delayed by the suspension of transportation. It is only recently that it has been able to meet its outgoings from its own resources, and not until 1890 did it receive self-government and attain the same footing as the other colonies. But the discovery and working of large gold fields in the interior guarantee to it, however, a more successful course of development.

(f) *South Australia.*—The founding of South Australia, which, like Western Australia was colonised from England, was really due to the favourable accounts brought back by the explorer Sturt as to the country seen by him at the mouth of the Murray, and to the report of Captain Collet Barker, who was intrusted with the exploration of the Gulf of St. Vincent. In consequence of this the South Australian Land Company, which included, besides a number of members of parliament, Edward Gibbon Wakefield, was formed in London in 1831. Wakefield had learnt from personal experience the defects of English prison life; he saw the only remedy in a systematically conducted removal of the superfluous English population, which, in his opinion, plunged the masses into distress and misery and assisted crime, to new scenes, such, for example, as South Australia, just then coming into notice. According to his plan, large uncultivated tracts of land should be assigned to a colonisation company provided with sufficient means, on the

understanding that it founded settled communities. The company was to indemnify itself for all initial expenditure by the sale of land at fixed prices; the profits, above that, were to be applied to the cost of bringing over English workmen to the colony.<sup>1</sup> In every colony there were to be neither more nor less hands available than required.

The government at first took up almost the same attitude toward Wakefield's plans and the proposals of the South Australian Land Company as toward the founders of Port Phillip (p. 271). There was a reluctance to sap existing settlements by establishing new ones; and, further, it seemed impolitic to confer legislative rights on a private company. On the other hand, the influence of the Wakefield family was strong, and possibly this new system might prove more lasting than those previously adopted. The government therefore, in 1834, resolved to make an attempt on the lines of Wakefield's plan. The means for the undertaking were to be furnished by the company. The direction of land sales and emigration was placed in the hands of three commissioners in London; in the colony itself the government reserved the right to nominate a governor and some other officials, while the rest were to be nominated by the company. It was definitely promised that no convicts should be transported from the United Kingdom to the colony. The first three ships sailed from England in February, 1836. Two landed in July, on Kangaroo Island, where the passengers immediately began to establish themselves on Nepean Bay; the third ship, which did not arrive until August, sailed to the coast of the mainland and the banks of the river Torrens. The choice of this landing place by Colonel Light seemed to most of the newcomers as unsuitable as the choice by them of Nepean Bay appeared to him. In the next year, the votes of the colonists were finally given in favour of the spot chosen by Light; and the building of a town, which, at the wish of King William IV, was called Adelaide, after his consort, was at once commenced.

The development of the young colony shows a bright and a gloomy side. The existence of two sets of officials, and the numerous restrictions which were imposed on the officials of the company, soon led to such friction that the majority of both parties had to be recalled. These measures exercised little influence on the purely economic development. In 1837 alone more than 60,000 acres of land were sold, from which £43,151 accrued to the company. Up to the middle of 1839 a quarter of a million acres had been sold, bringing in £230,000. In 1840 there were 10,000 settlers, who owned 200,000 sheep and 15,000 head of cattle.

The rapid and brilliant rise of South Australia, like that of Victoria, was followed by a great financial crash. The frenzy for speculation in land had grown to a prodigious extent; and, although wages reached a giddy height (skilled workmen earned up to fifty shillings a day), the profits to be made by speculation proved a greater attraction and distracted many from industrial enterprise. In addition to this, the second governor of the colony, Colonel Gawler, allowed himself to be led into constructing large public buildings and parks, although the mother country had expressly refused to bind herself to any contributions. The colony had very soon to deal with a debt of £405,000. The South Australian Company was equally to blame with Colonel Gawler for this turn of affairs. The head of the

---

<sup>1</sup> This idea of an emigration fund raised by sales of land originated with Wakefield and was the essential feature of his system. It is discussed and warmly praised by Mill in the last chapter of his "Political Economy." — EDITOR.

company, Angus, had also speculated in a manner quite contrary to the objects which Wakefield had in view. He invested half the company's capital in land, engaged in whale fishery, trading, and banking, and induced the colonists, by guaranteeing them an excessively high interest on deposits, to intrust him with their cash. The commissioners also did not rightly understand their duties. The price which had been fixed for land before the founding of the colony was one pound an acre; huge tracts had been disposed of at that figure. But instead of raising the price they took the astonishing step of reducing it to twelve shillings.

Some improvement of the situation was finally effected by the appointment of George Grey to guide the colony. His name will always be conspicuous in the history of the English colonies, but it is also famous in the field of ethnography. On his return from his two journeys through Western Australia in 1837 to 1839 he had prepared a memorandum, showing the methods by which the British possessions in the South Seas and in South Africa should be administered. When South Australia declared itself bankrupt in 1841, the opportunity was offered him of putting his theory into practice. By his appointment to be governor in Adelaide the administration of the colonies practically was transferred to the English government.

Grey found a heavy task awaiting him. The treasury was empty; a host of officials had eaten up the revenues of the colony, and the burden of debt was crushing, notwithstanding that some of the bills drawn by Gawler upon the home government, which had been dishonoured on presentation, were ultimately paid by the English parliament. Grey's first step was to discontinue all building not imperatively urgent, to dismiss superfluous officials and to lower the salaries of the rest. An improvement was soon apparent. In 1841, out of 299,077 acres sold, only 2,503 had been under cultivation; at the end of 1842 there were more than 20,000 cultivated, and that with an increase in the population from 14,600 to 17,000 souls. Unfortunately for the colony the mother country was not willing to take over the rest of the old burden of debt. Grey was neither able nor willing simply to break with the existing financial methods; he issued bills drawn on the home government, but only a small part of them were paid. This caused ill-feeling in South Australia, where the financial crisis reached its height in 1843. Meanwhile the situation grew more tolerable, as rich veins of copper were discovered and worked. From that time, South Australia has developed regularly with a few trifling fluctuations, easily explicable from the youth of the undertaking. The population amounted in 1848 to 38,600 whites, against 3,700 natives; the trade, in 1839 only £427,000, reached in 1849 the sum of £888,000, of which £504,000 came from exports. Even the incomings grew on a corresponding scale; after 1845 they not only covered the outgoings, but furnished a considerable surplus.

The term of office of George Grey, so fraught with blessings for South Australia, ended in 1845. It was his fortune always to be placed in a position where a keen sight and a tight grip were necessary; for he was then removed to New Zealand. The history of his unimportant successors is featureless except for the efforts of the colonists to win political self-government. When the colony was founded, the English government had intended to give it a constitution so soon as the number of inhabitants reached fifty thousand. In 1842, when the system of commissioners was abolished, a council of eight members, four of whom were offi-

cial, and four colonists selected by the governor, was placed under the governor. In spite of the growing prosperity of South Australia, some years had yet to elapse before the home government would make any further concession, although the interests of the colonists were insufficiently represented by the new institution. It then happened that in 1849 the population, contrary to expectation, amounted to fifty-two thousand. The government kept faith, and, in 1850 South Australia became a recognised colony. On August 20, 1851, a council of twenty-four members met for the first time; of these, two-thirds were elected by the colonists, eight (but of these only four might be officials) were nominated by the governor.

### C. THE COLONIES IN THE SECOND HALF OF THE NINETEENTH CENTURY

(a) *The Bestowal of Self-government.* — The favourable and rapid development of the younger Australian colonies in the second half of the "forties" had fostered, among those English statesmen who were interested in the colonies, the idea that the same measure of self-government should be granted them that New South Wales had enjoyed since 1842. Van Diemen's Land and Port Phillip, which were in a position to meet their outgoings entirely from their own resources, had the foremost claim to the independent control of their revenues; but South Australia also was rapidly approaching this same consummation. Western Australia alone lagged behind. In 1847 these ideas took some tangible shape. Earl Grey, then secretary of state for war and the colonies, openly expressed to the governor of New South Wales his intention of granting to the young colonies the constitution of 1842; in fact he wished to take a further step, and to establish in all Australian colonies, by the side of the legislative council, an upper house, whose members should be drawn from the town communities. Since a vigorous protest against the last two heads of the plan was raised in Australia, he abandoned them, but put the matter before the committee of the privy council for trade and foreign plantations. As the result of their deliberations the committee recommended the introduction of a constitution, modelled on that of New South Wales, for Van Diemen's Land, South Australia, and Port Phillip, which latter was to be separated from New South Wales. The elaboration of details was to be entrusted to the various parliaments; but the committee expressed their expectation that the customs duties and excise would at first require to be administered by the British parliament. At the same time the committee advised the introduction of a uniform tariff for all the colonies. The bill which was drafted in accordance with the suggestions of the committee became law on August 5, 1850, under the title, "An Act for the better government of her Majesty's Australian Colonies." Van Diemen's Land, South Australia, and Victoria (hitherto Port Phillip) received the constitution recommended by the committee; Western Australia had the prospect of obtaining it so soon as it was able to defray the costs of its civil administration. Every proprietor of land of the value of £100, who was at least twenty-one years of age, had the franchise, as had every one who occupied a house or rented a farm of the annual value of £10. The customs and excise were settled on the understanding that the colonial governments decided their amount; but no differential duties were to be imposed. At the same time goods intended for the use of English troops were not dutiable, and existing commercial contracts were not to be prejudiced.

The first step toward the federation of the Australian colonies, which has just been completed (see p. 296), was taken by Earl Grey, when, after the introduction of the new constitution, he nominated the governor of New South Wales to be governor-general of the four colonies. New South Wales, Victoria, Tasmania, and South Australia. Grey had only wished to give visible expression to the idea of identity of interests; but, since he compelled the heads of the last three colonies to consult not only the colonial office, but also the governor-general, that is to say, the governor of New South Wales, he reduced the position of those three to that of a vice-governor. The independent spirit and the mutual jealousy of the colonies augured no permanence to such an arrangement. The Victorians showed their contempt for the dignity of the governor-general by voting their own governor a salary of £7,000, or £2,000 more than was received by his superior. In 1855 a governor was at the head of every colony, and although at Sydney the governor up to 1861 bore the additional title of governor-general, it did not carry with it any real power.

With the act of August 5, 1850, the chief step toward the alteration of the constitution of the Australian colonies was taken; but it did not signify any final settlement. It is true that the receipts from the customs were guaranteed to the colonies, but they were still collected by officials nominated from England. Again, the profits from the sale of the crown lands were not entirely at the disposal of the Australians, since half was applied by the mother country to the encouragement of emigration. Finally, the nomination of the higher officials rested completely with the home government. A general agitation against the retention of these powers was raised directly after the introduction of the new constitution. Absolute self-government, without any restrictions, was demanded, and the English government did not delay to concede this clamorous demand. The moving cause of this concession was by no means mere philanthropy, but in the first place the fear of entirely alienating the mass of the Australian population by a refusal of these proposals. From the very first this population had been undisciplined and deterred by nothing; and now, since in consequence of the discoveries of gold, the stream of morally undesirable immigrants had been enormously swollen, it had developed more unpleasant characteristics, of which the disputes in the camps with the authorities gave daily fresh proof. Another reason was that the Crimean War had complicated the European situation and left the mother country little time for the discussion of colonial affairs. The result was that in April, 1851, the entire management of the customs was put into the hands of the colonies; in the following year the application of the proceeds of the diggers' licenses was entrusted to them, and at the same time it was left to their discretion to bring before the English government their further wishes as to the completion of the constitution. At the end of 1854, the colonies submitted their propositions to the government. Those of South Australia and Tasmania received the royal assent at once, while those of Victoria and New South Wales were reserved to be confirmed by act of parliament, on the ground that they involved concessions which the crown by itself was powerless to make. The confirmation of parliament was granted, after some slight amendments had been made, in the year 1855.

The contents of the new constitutions may be briefly recapitulated as follows. The most essential innovation, which is common to all four colonies, is the transition from the single-chamber system to the dual-chamber system. By the side of the

former legislative council, which is henceforth the first chamber or upper house, comes in each case an assembly, or lower house. In New South Wales the former consisted of twenty-one members nominated by the crown for life, while the lower house, according to the scheme, numbered fifty-four representatives, who were chosen from the well-to-do classes of electors possessing a certain income. At the present day the number of members of the upper house is unlimited, while that of the lower house amounts to one hundred and twenty-five; these are elected for three years. The council of Victoria comprised, after the law of 1855, thirty (at the present day forty-eight) members; the assembly, seventy-five (now ninety-five); both houses are elective in this colony. The members hold office for six and three years. In South Australia the council nominated by the crown consisted of twelve; the assembly, elected by votes, comprised thirty-six members; but in 1856 voting was introduced for the upper house also, and the number of its members was fixed at eighteen. The number in the upper house later was raised to twenty-four (for twelve years), and in the lower house to fifty-four members (elected for three years), who were well paid. In 1902, however, from motives of economy, the number of representatives was lowered to eighteen and forty-two. In Tasmania, finally, the council has always numbered eighteen, and the assembly thirty-seven representatives, who are all elected.

In each colony there is a governor, nominated by the crown, but paid by the colony. The usual term of office is six years, and the salary varies from £3,500 in Tasmania, to £7,000 in New South Wales. The governor exercises the royal prerogative of mercy in his colony; convokes, prorogues, and dissolves the legislature; controls the patronage of the public services, and forms the colonial cabinet. His position with regard to the legislature and the cabinet is that of a constitutional sovereign. But his power is also limited by the instructions which he receives from the colonial office. His assent is necessary to all colonial legislation; but a bill which has received his assent, though it is then provisionally enforced as law, may be disallowed by the colonial office. It would not be possible to discuss within the limits of our space the question as to the real influence which the governor exercises in virtue of these legal powers. But one or two of the recent appointments to Australian governorships have been of a nature to suggest that the home government regards the governor in the light of an ornamental appendage; and that, if differences of opinion arise between an Australian colony and the mother country, the governor's part in arranging a settlement will be insignificant. The telegraph has given a wonderful impetus to centralisation.

The constitutional position of the colonies and their inhabitants toward the mother country, is peculiar. The parliaments, according to the form proposed by themselves, are called "Parliaments of the King," in whose name they pass their laws binding the Australian subjects of his Britannic Majesty. The colonists in fact enjoy to the fullest extent all the rights and privileges of a British citizen without paying one penny to England, which only expresses her suzerainty by the fact that English law holds good in Australia, so far as it has not been superseded by local legislation.

The highest executive officials are the ministers, whose number varies from six in Tasmania to nine in New South Wales. Since they are always chosen from the parliamentary majorities they change very quickly; between 1856 and 1876, in Victoria eighteen, in New South Wales seventeen, in South Australia twenty-

nine different ministers have been at the head of affairs. On the other hand there is this compensatory advantage, that members of the most varied professions obtain posts as ministers, and then often display great ability in the administration of affairs.

(b) *The Discoveries of Gold.* — The solution of the constitutional question would certainly not have been so quickly reached, had not all the conditions in Australia at the beginning of the "fifties" been suddenly and radically altered by the discovery of rich gold fields in various districts. Gold had been already found during the construction of the road over the Blue Mountains (1814; see page 261). The government had hushed up the discovery from fear that it would be unable to control the excitement which would assuredly be caused by its publication. Various rumours of gold mines had cropped up later, but they had not found much credence. It was only when the opening of the Californian gold mines in 1848 had attracted the attention of the world and had caused a regular migration of gold diggers to those parts, that serious attention was paid to the precious metal in Australia. An Australian blacksmith, Hargraves, who had spent some years in California, carefully examined the mountains near Bathurst, in February, 1851, and on the 12th of that month he found quantities of alluvial gold in Lewes Pond Creek. This discovery did not remain a secret as the former had. The whole continent rang with the news, and by May dense crowds of colonists were flocking to the place. A few weeks later gold was also found near Ballarat in Victoria; then in October also near Mount Alexander, north of Melbourne. A few months later the veins of gold at Bendigo to the south were also discovered. In Queensland, gold was not found until 1858, and in Western Australia not until 1886–1887.

The effect of these discoveries upon the world was indescribable. In the first place the whole population of Australia caught the gold fever. Every man who could work or move, whether labourer, seaman, or clerk, rushed to the gold washings. The old settlements were so emptied of their inhabitants that Melbourne for a long time had only one policeman available. South Australia produced the impression of a country inhabited merely by women and children. The situation was the same in Tasmania and even in New Zealand. Afterward, when the news of the discoveries reached America and the Old World, a new wave of immigrants flooded the country, and the whole overflow of the population streamed to the gold fields. Under these circumstances the population of Australia rapidly increased. In Victoria, where the influx was the greatest, the population had numbered 70,000 souls in July, 1851; nine months later that number was living on the gold fields alone, and in 1861 the whole population of the colony amounted to 541,800 souls. New South Wales then reckoned 358,200 inhabitants; South Australia 126,800; Tasmania 90,200; Queensland had 34,800, and Western Australia 15,600. This rise in the figures of the population was encouraging to the economic development of the colonies, but it put the government which was suddenly confronted with these occurrences in a very difficult position. The exodus of civil servants from their recently created posts was so universal that the administration threatened to come to a standstill. Salaries were doubled, but to no purpose; the attraction of the gold fields was too potent. The governor of Victoria found himself finally compelled to apply to England for a regiment of

soldiers, who could not run away without being liable to a court-martial. The government offices were at the same time filled by two hundred pensioned prison warders, brought over from England. The government was soon faced by another class of difficulties arising from its legal position toward the new branch of industry. According to the view of the legal advisers of the government all mines of precious metals, whether on crown land or private property, belonged to the crown. They advised the governors, therefore, to prohibit gold mining absolutely, in order not to disturb the peaceful development of the colonies. Under the prevailing conditions this counsel was as superfluous as it was foolish, since the means at the disposal of the authorities were absolutely insufficient to enforce it. Sir Charles Fitzroy, the governor of New South Wales, contented himself with issuing a proclamation, as soon as the first find of gold was publicly announced, which only permitted gold mining on crown land on payment of a fixed prospecting tax of thirty shillings a month; and on the discovery of rock gold claimed for the government ten per cent of the proceeds of working the quartz.

This order naturally met with little response from the gold diggers, however much in other respects it was calculated to aid the development of the colony by increasing the public resources. It is true that they agreed to it in New South Wales, where the political situation had not been so violently disturbed, but not so in Victoria, where the governor had also adopted the enactment of Sydney. For one thing, the government was not so firmly established there as in the mother colony; and Victoria had also received a very high percentage of the roughest and most lawless people as new members of the population. Not every one of them was so fortunate as to find gold; they could not pay the high fee, and began to agitate, first, against the amount of the impost, secondly, against the institution itself. The ill-feeling was soon universal, not only in the gold fields, but also in the old settlements and towns. The prevalent idea was that the application of the large sums derived from the licenses and imposts merely to the payment of the costs of the administration did not meet the interests of the population, and that the system should be changed. A reduction of the tax did not satisfy anybody; on the contrary, disturbances in the camps became more and more frequent. A murder had been committed in October, 1854, in Eureka camp near Ballarat. The feeble police force made some blunders in following up the case, and consequently disturbances broke out among the gold diggers, which were soon aimed at the hated prospecting license; and finally, when the governor had sent all the troops at his disposal into the riotous district, a regular battle was fought on December 3d between thirty gold diggers and a body of soldiers. Out of the one hundred and twenty rioters who were captured, the ringleaders were sent to Melbourne to be tried, but there was no court to be found which, in spite of the overwhelming evidence of guilt, would pronounce a verdict against them.

The tax question was only settled in 1855. A gold digger's license, costing one pound for the year, was substituted for the monthly prospecting tax, which was abolished. In order to cover the loss of revenue to the colonial exchequer, an export duty of half a crown on every ounce of gold was imposed. This wise measure laid the imposts primarily on the successful gold digger, a policy which secured a good reception for the law and satisfied all parties. Before the end of the year the governor of Victoria was able to report to London that quiet prevailed in every camp.

(c) *The Development of Australia to the Present Time.* — (a) *The Economic Growth.* — The discovery of the astonishing wealth in Australia in gold did not indeed cause complete self-government to be given to the colonies, but it immensely quickened the course of proceedings. The general situation was so changed with the commencement of working the mines that the fullest measure of independence was a vital question for the local governments. The act of 1855 testifies to the political discernment of the English government. The interval between 1850 and 1855 was a period of transition. The large administrative organism created in 1850 had to become acquainted with its work, a process which the phenomena attendant on the gold fever rendered far from easy. The population, the body of old settlers as much as the mass of recently arrived and arriving newcomers, was faced by new problems; the old centres of population were deserted, while towns sprang up like mushrooms on the gold fields. This shifted in the first place the economic centre of gravity of the colonies, and, after the franchise had been given to the alien gold diggers in 1855, the political centre of gravity was equally affected.

The old land question now once more became prominent. With all the wealth of Australia in gold (the average yearly output from 1851 to 1901 amounted to £9,000,000 sterling) it was inevitable that among hundreds of thousands of gold diggers thousands should be unsuccessful. Few matters caused the authorities of those days more anxiety than the task of making satisfactory provision for the crowds of the unemployed. Macquarie had formerly considered that increased facilities of communication were the necessary preliminary to all economic development, and the new colonial governments acted in the same spirit. In 1855 the railroad from Sydney to Paramatta was opened, and extensive roads and lines of telegraph were soon constructed. Jenks points with pride to the fact that England, between the years 1788 and 1821, gave the sum of £10,000,000 to advance economic interests of New South Wales and Tasmania. That is a large sum, well calculated to keep alive in the Australian of to-day the feeling of attachment to the mother country. But what is it in comparison with the £100,000,000, which Australia spent on similar purposes in the shorter period from 1855 to 1880! Those ten millions had come from the pockets of the English taxpayers; these hundred millions could not have been provided by the Australians. As a matter of fact, they were mostly obtained by government loans, which were raised in London. They have, on the one hand, formed the foundation for the enormous amount of the public debt in the Australian colonies (£187,000,000 in the year 1900, or £50 sterling per head of a population of 3,750,000 persons); on the other hand, the unfailing willingness of the English money market to place its ample resources at the service of the Australian colonies has largely contributed to strengthen the feeling of kinship. The extensive grant of electoral powers by the constitution of 1855 soon set the land question rolling. The suffrage especially benefited the small settlers, whose numbers, always larger than those of the great landowners or squatters, had been enormously swelled by the new influx. Adroitly availing themselves of this welcome increase of power, they proceeded to revive the old antagonism between the interests of the stock breeders and the agriculturists, in order to obtain a decision in their favour. The result in New South Wales in 1861 was a land law which regulated the division of crown lands according to a new point of

view; other colonies followed this example. The small settlers were benefited everywhere, while the privileges of the large estates were curtailed; the former, for example, received in New South Wales the right to select for themselves homesteads and farms of a definite small size on the still unsurveyed pasture grounds. The economic struggle, which was waged so vigorously by both parties half a century ago, under the effect of the new stimulus given by the discovery of gold, has continued to the present day, with less violence, perhaps, but with more obstinacy; and the large landed proprietors are still the object of attack. It is true, they offer a bold resistance, but the small farmer ("selector" or "cockatoo farmer") during the last few decades, has steadily secured new advantages, which are not always confined to a change in the letter of the law. Since 1890 the tendency to encourage the small man is so great that, for the purpose of acquiring land, advances are made to him at a low rate of interest which are refused to others.

The advance in the population of Australia in the last half century is of great interest. We have already called attention (p. 289) to the enormous growth directly produced by the discovery of gold in the southeastern colonies, when we gave the number of the inhabitants in 1861. The rate of increase in the following years is, as might be expected, not so rapid; but, apart from the last twenty years, it has attained a height which, in view of the great American competition, is quite astounding. In 1861 the mainland and Tasmania contained between them 1,167,695 white inhabitants; on January 1, 1900, the number had increased to 3,756,894; in barely four decades, therefore, it has been more than tripled. The chief share in this increase is due to the immigration, which has been particularly large from Great Britain. Between 1853 and 1890, 1,374,422 persons emigrated from the British Isles, half of whom were assisted by money grants from the respective colonies. This emigration has naturally diminished in consequence of the great industrial depression at the beginning of the "nineties." In fact, in Victoria and South Australia the tendency has been toward emigration, so that the increase of the population there is only due to the excess of births over deaths.

This excess of births is lessening from year to year; partly because of the bad times for trades and industries, which disastrously affect the number of marriages, but partly also from a cause involving more serious issues for the future of the continent, which makes the Australian statesmen regard this future with serious apprehension. This is the physical and mental degeneration of the white race on the soil of Australia (p. 243). Its causes are looked for in the pernicious effects of the climate and of the purely English diet, consisting of animal food, which is unsuitable to a hot country. However this may be, the original physique of the settler has altered for the worse; even the national morality has become less strict. Divorces are common occurrences, and the size of families is much reduced.

Immigration received a severe setback in 1890, when most of the colonies discontinued the practice of aiding any British subjects desirous of emigrating. This measure reflects the internal political condition of the colonies, in so far as it clearly shows the great influence of the labour party, which turned the scale almost everywhere. It had, as may well be imagined, a strong interest in keeping up high wages, and strained every nerve to check immigration. With this object it also considerably restricted or entirely stopped the immigration of coloured set-

tlers. The International Congress of Workmen held at Brisbane, in May, 1899, and attended by delegates from Queensland, New South Wales, Victoria, and South Australia, actually resolved on the exclusion of *all* foreigners from Australia.

The continent was once plunged into great danger by this unduly pronounced confidence of its labour party. Toward the end of the "eighties" the old antagonism between the small farmer and the large landed proprietor, between work and capital, became so acute that it only needed a trifling pretext to make the former light skirmishing blaze into a serious battle. The battle itself was only a trial of strength. The conditions of existence in Australia have always been better than in any other civilized country, both as regards the height of wages, the cheapness of food and land, and the length of the working hours. The workmen then wished for a greater share in the regulation of labour; when the employers opposed this claim with all their power, the struggle broke out in 1890. The pretext for the opening of the campaign was the refusal of a shipowner to reinstate a discharged workman. This led immediately to a strike on the part of the dock labourers; and other trades followed suit. The plan of the leaders of the agitation was to cripple all the industries of the entire continent by a general strike; an imposing idea, but it proved impracticable. Most of the workmen had been well organised previously, but the employers soon put themselves in an equally favourable position by combining into large bodies; in addition to this, the non-organised workmen were not under any compulsion to strike. After many isolated strikes capital was victorious along the whole line.

Partly as a result of the industrial fluctuations, partly in consequence of a movement which seems characteristic of agricultural and pastoral colonies, an acute financial crisis spread over the whole continent in the year 1893. Just as, half a century before, in New South Wales, South Australia, and Victoria, foolish speculation in estates and land had brought the young colonies to the verge of ruin (p. 264), so now a correspondingly exaggerated and abnormal industrial development and a wild speculation in land and shares brought the whole continent into a dangerous position. Even the most securely founded undertakings began to totter. At the present day, although only a short interval has elapsed, there are few traces visible of this crisis in the antipodes. Australia resembles the United States of America, in so far as it possesses an enormous wealth of natural resources in proportion to its population. An efficient remedy for industrial depression is supplied not only by the gold and the other valuable minerals, but also by the fertility of much of its soil and the admirable climate; the startling rapidity with which its exports of meat and fruit have doubled and redoubled is the best proof of this.

The main industries of Australia have always been stock breeding, mining, and agriculture; manufactures are in comparison unimportant. The growth of stock breeding is irregular, but encouraging on the whole. In spite of the greatly diminished number of cattle and sheep in New South Wales and Queensland, owing to the long-continued droughts of the last few years, Australia and Tasmania contain nearly 100,000,000 head of stock (cattle, sheep, horses, and pigs). The export of wool amounts to more than a million bales, and the export of preserved meat, butter, and cheese brings many million pounds annually into the country.

The improvement in agriculture is less marked. The greatest hindrances to this are the extreme dryness of climate, which has already been often mentioned, and then the periodical recurrence of extraordinary droughts. Of the 1,900,000,000

acres which Australia and Tasmania contain, about 112,000,000 at the present day have been sold and 700,000,000 rented, while approximately 1,100,000,000 acres are as yet unused, or will remain permanently useless. It is a striking proof of the proportionate size of the various industries that of these 812,000,000 acres of serviceable land barely 7,500,000 are available for agriculture; all the rest of that vast amount is at present only good for stock rearing. This immense disproportion has often caused anxiety to the Australians, and it is not without good reason that facilities have been given to the poorer classes to acquire land anywhere. In view of the recurring droughts and what is technically termed the *extensive* system of cultivation, successful efforts have been made to regulate the water supply by artesian wells, irrigation canals, and dams. The adoption of rational methods of field farming and rotation of crops is more and more felt to be as much a necessity for Australia as for North America. The same remark applies generally to the long-neglected science, forestry.

The most important industry next to stock breeding is mining, notwithstanding that it has now been carried on for fifty years, and that the system of working has been careless. It is true that, in the old gold-mining centres of Victoria, New South Wales, and Queensland, the easy process of gold washing has long been impossible; on the contrary, the auriferous ore must be brought up from a great depth. But these colonies are still productive, although since 1899 they have been nearly overtaken by Western Australia. The output of gold from the latter colony amounted in that year to £6,250,000 sterling, while that of the other three together was £8,250,000. The total yield of gold from Australia and Tasmania reached in round figures £15,000,000 sterling. The growth in the output of other minerals is less striking, but of an importance for the prosperity of the colonies which must not be underestimated. Copper, in consequence of the increased demand due to the spread of electrotechnics, has been mined on a steadily growing scale; and the same remark applies to silver and tin. The wealth of Australia in coal has proved an important factor in the development of the railway system, as also of the mines and manufactures, which latter are still in their infancy. The coal not only supplies the home demand, but is already exported to South and West Asia and to America. The iron industry alone in Australia has not yet shown a corresponding progress, notwithstanding the enormous extent of the deposits of iron ore, which might profitably be worked.

(β) *Educational Progress.*—In the second stage of their development the Australian colonies followed the policy of raising money on loans with such consistency and success that few countries have now a larger debt in proportion to their population. This has been of great benefit to the culture of the people. The large sums which flowed into the country from these loans placed the government in a position to do more than meet material requirements and to attend to the spiritual and intellectual welfare of their subjects.

The numerous religious sects receive no assistance from the government, but each provides for the needs of its own members. On the other hand, the organisation and improvement of primary education has long filled a large space in the programmes of the governments. Before 1880 there were two classes of schools. The "national schools" were immediately subject to State control; there were also voluntary schools (these were particularly numerous in New South Wales),

which were conducted by four denominations, the Church of England, the Presbyterians, the Wesleyans, and the Roman Catholics, but received support from the State. In 1880 the schools became undenominational and, in their elementary branches, compulsory. The school fees were at first only remitted to poor persons, but later they were abolished altogether (in Victoria this reform had been passed in 1872).

The organisation of higher education has moved more slowly; the present state of affairs is, however, satisfactory. There are a large number of grammar schools, collegiate schools, and colleges which, like the voluntary schools of the past, are in the hands of private individuals or religious societies. Of late years the State has founded similar institutions. There are at present three Australian universities, at Sydney, Melbourne, and Adelaide. In Tasmania one was founded at Hobart in 1892, but for the time being it is merely an examining body. The degrees granted by the universities are recognised as equal to those obtained in English universities, and are open to women. Lastly, the learned societies in the capitals, which in organisation and titles are closely modelled on corresponding English bodies, are connected with the universities, and promote the exploration of the country and scientific studies generally.

The press shows a less encouraging development. The number of its organs is considerable, — they amount to a thousand, if periodicals are included, — but on the whole they do not stand high. External questions are treated superficially, without any grasp of the economic and political situation; home affairs on the contrary are discussed in great detail.

(γ) *The Military Position.* — The Australian colonies have on the whole always maintained good relations with the mother country (cf. p. 243). Even in the antipodes there is a complete feeling of sympathy and union between the settler and his kinsfolk in England. Nevertheless there have been occasional disputes, quarrels, and misunderstandings. Victoria, for example, keenly resented the interference of England in the home affairs of the colony in 1869, consequent on an appeal of the Royal Colonial Institute to all the colonies to attend a conference for the purpose of putting the relations between the mother country and the colonies on a satisfactory footing. The language of Victoria was then very confident and menacing; yet it did not prevent the rich colony from continuing to enjoy the protection of the troops paid for by the mother country, although, as long before as 1862, the English parliament had advised that all colonies should, on receiving self-government, be left to defend their own hearths and homes. It was not until 1870 that England withdrew her troops, not only from Victoria, but from the whole of Australia, which now first realised how helplessly it lay exposed to an attack from outside, and how expensive it would be to provide its own system of defence.

The formation of a colonial army and navy, in the first place doubtless from financial reasons, was slow in coming. It began, and this is a point worth noticing, at the moment when the internal political development of the older colonies ended, and when the first attempt was made to expand beyond the borders of the continent. In addition to the French, who are still as feared as they were a century ago, the Germans by their efforts at colonisation have caused considerable anxiety to the Australians, and have awakened the feeling of the necessity for military

preparations. At the present day every colony has its own small standing army, and some thousands of militia and volunteers. This force has not yet had any opportunity of active service in its own country or in the Pacific. On the other hand New South Wales in 1885 sent six hundred men to help the mother country in the Sudan War (Vol. III, p. 561), and several thousand men of the Australian militia took part in the Boer War in 1900. These local levies, insignificant in number and deficient in military discipline, could not cope with a vigorous attack from a foreign enemy. Australia, in this respect finds herself in the same position as the United States of America, which latter, however, have the protection of a strong navy available. The great continent in the Pacific, poorer in money and men, has not yet obtained a fleet of effective fighting power. It is true that each of the separate colonies possesses one or two warships; but these, from want of any combination in numbers or tactics, produce the impression of a military plaything rather than of a fighting implement of serious value, and are insufficient to defend the vast extent of coast line. Conscious of this defect, though ultimately at the suggestion of England, Australia made an agreement in 1887 with the mother country, in virtue of which the latter formed for the colonies the "Australian Auxiliary Squadron." This fleet, which consists of five twin-screw cruisers and two gunboats, is supplied, manned, and commanded by England, but kept up by the colonies. They pay for it £126,000 annually, besides five per cent interest on the cost of the floating material. The agreement came into force in 1891, when the squadron appeared in the Pacific, Sydney being its headquarters. At the same time England maintains a special squadron in Australian waters, the cost of which, as Moritz Schanz remarks, constitutes the only expense which Australia imposes upon the British exchequer.

In order to strengthen the defence of the coast, but also to complete the line of British naval and military outposts round the world, a number of the Australian seaports have been fortified or made into naval harbours; thus, Brisbane, Sydney, Melbourne, Adelaide, Launceston, and Hobart.

(δ) *The Completion of the Internal Development and the first Oversea Expansion.*  
— The grant of full self-government to the Australian colonies in the middle of the nineteenth century, and the separation of Victoria as an independent colony from New South Wales, did not complete the organisation and the external enlargement of this colonial system. Since gold had been found in large quantities in the district of Moreton Bay in 1858, at the petition of the inhabitants this also was separated from New South Wales and, under the name of Queensland, was provided with the same self-government as the elder sister colonies. The legislative council contains forty-one members nominated by the crown, the assembly seventy-two members elected for three years. Seven ministers are associated with the governor, who is nominated by the crown.

The growth of Queensland has been as steady as that of most of the other colonies. The year 1866 brought drought and great mortality among the cattle, involving the ruin of many businesses and private individuals; the financial crisis also, at the beginning of the "nineties," struck the colony with great force. But in spite of these blows the population has grown comparatively rapidly and prosperity has increased. The number of inhabitants, which in 1861 hardly amounted to 35,000, had reached 147,000 in 1873; on January 1, 1900, it amounted to

512,604 souls. This growth, which is principally due to large immigration, has been much helped by the policy adopted since 1871 of subsidising the immigrants. The rich gold fields, of which some twenty-five are being worked at the present day, attracted large multitudes. The immense size of Queensland, stretching through eighteen degrees of latitude, and the consequent variety of industries (in the sparsely peopled north all the tropical products are grown, while in the densely inhabited south the crops of the temperate zone are cultivated) led some years ago to the idea of its division into two provinces with separate governments, but a common central administration. The twenty-first degree of southern latitude was suggested as the boundary line.

Western Australia was the last of the Australian colonies to receive self-government. The system of transportation was in force there until the year 1868. Its discontinuance did not alter the relations to the mother country. The year 1870 saw the introduction of a legislative council composed of members partly nominated, partly elected; but it was not until October 21, 1890, that the previous crown colony joined the ranks of the other colonies on equal terms. Its council contains twenty-four members, the assembly forty-four, all of whom are elected. The development of Western Australia has only quite lately been more rapid, since large gold fields of great extent were discovered in 1887. The population, numbering in 1881 barely thirty thousand souls, has increased, almost entirely through immigration, to nearly two hundred thousand. The internal development of the colonies was early accompanied by the effort to spread the power of Australia beyond the limits of the continent. This was noticeable as far back as 1869 in the opening of the Fiji question (*vide* p. 310); but no real oversea expansion took place before 1883. Notwithstanding the position of New Guinea in the immediate vicinity of Australia, neither the colonies nor England itself had ever showed any inclination to acquire territory there. It was only about the middle of the "seventies," when rumours of Germany's intentions on the immense island were rife, that the Australians remembered its proximity, and New South Wales suggested offhand the incorporation of that part of New Guinea which was not subject to Dutch suzerainty. England assented, on the stipulation that the Australians bore the cost of administration; that they refused. The question, however, was still discussed in Australia, and when the Germans really threatened to take steps, the premier of Queensland, on his own responsibility, declared that he had taken possession of the eastern portion of the island in March, 1883. England then shrunk from placing the destiny of so large a territory in the hands of the small population of Queensland, although the Australian Colonial Conference in December was in favour of the acquisition. Meanwhile Germany actually took possession of the north of the island, and England was obliged to content herself, on November 6, 1884, with the southeast alone. At the present day British New Guinea is an English crown colony, and Queensland, New South Wales, and Victoria contribute a fixed sum yearly toward the cost of administration; its administrator communicates with the English colonial office through the agency of the governor of Queensland.

Regarded from the Australian standpoint, this first step toward an international policy marks a failure. The colonies have always felt it to be so; to the present day the tone of their press is, on the whole, anti-German. They have not attempted any further practical realisation of their colonising dreams. British New Guinea

may be considered an appanage of Queensland; far distant Pitcairn, Lord Howe Island, and, since 1896, Norfolk Island stand in the same relation to New South Wales; that is the entire transmarine territory. All the more strongly during the last two decades have signs been shown of an effort to influence in favour of Australia that part of the British foreign policy which touches the very extended sphere of Australian interests; thus in the Samoa question (p. 324). England could not meet the wishes of Germany and the United States of America, simply because Australian interests would presumably be prejudiced by so doing. The cry for a "greater Australia" is already ringing in men's ears.

(ε) *The Steps toward Federation.* — The idea of a political union of all the Australian colonies is as old as the efforts for expansion. As far back as the beginning of the "fifties" a universal Australian parliament was proposed in order to settle the question of tariffs; the house of lords, however, rejected the bill. There was, besides, in Australia itself, both then and later, little feeling in favour of such federation. It was only in 1871, after the establishment of a *souverein* in Canada, that the idea of such a union found strong support in Australia. There was, however, a difficulty in the way. The most practical step toward tariff federation would be that individual colonies should come to agreements for reciprocal reduction of the duties on goods imported from one to the other. The colonial office has always upheld the principle that one part of the empire should not be allowed to differentiate between the rest in its tariff regulations. It was, therefore, intimated that no partial customs union would be sanctioned by the mother country; but that a scheme for a customs union of all the colonies would be favourably considered. This was an intelligible point of view; but it may be criticised as showing a want of faith in the future.

At length, in 1873, under the first ministry of W. E. Gladstone, the colonies obtained their point, that the prohibition against differentiated tariffs should be removed. From that date the several colonies were free to give each other specially favourable tariffs, or to isolate themselves. Uniformity of tariffs was obligatory when dealing with England or foreign States. This measure was hardly more than a step toward the desired goal. Greater unanimity among the individual colonies was necessary before that goal could be reached. It was not until 1884, after the encroachment of Germany upon the Australian sphere of interests, that a further step was taken. This time it was decided to form a "federal council," which should discuss the common interests of Australia, without interfering in the affairs of the several colonies. But although the majority of the colonies were represented, and the council actually held some sittings, no results ensued.

At the instance of Sir Henry Parkes, the prime minister of New South Wales, a conference met in 1890 and 1891, first in Melbourne, then in Sydney, at which the five Australian colonies, Tasmania, and New Zealand, were represented by their premiers. After long discussions, a "bill to constitute the Commonwealth of Australia" was finally drafted; and after the colonial representatives had met for several successive years, it was adopted, though not without considerable alterations, by six out of the seven colonies, received the royal assent on July 9, 1900, and came into force on January 1, 1901. The name of the new federation is the "Commonwealth of Australia." It comprises at present all the Australian colonies and Tasmania; New Zealand has not yet joined it. According to the constitution promulgated on

September 17, 1900, the legislative power rests with a government which consists of a governor-general, representing the crown, a senate, and a house of representatives. The senate consists of six members for each State; the house of representatives contains at present one member to every fifty thousand inhabitants, with a minimum of five members for each State, so that according to the last census New South Wales has twenty-six seats, Victoria twenty-three, Queensland nine, South Australia seven, Tasmania and Western Australia, five seats each. The senate is elected for six years, the house of representatives for three years; but the latter may be at any time dissolved by the governor-general. The legislative powers of the federal government extend to customs duties and excise, public expenditure, trade and quarantine, military and naval defence, beside the settlement of disputes between masters and workmen. There is one power which calls for special notice; it is that of settling the relations between the commonwealth and the islands of the Pacific. The Pacific question is the one question of foreign policy by which the Australian colonists feel that their interests are immediately touched. They are likely, therefore, to put a high value on this power, while at the same time the crown is amply protected against its abuse. For every law passed by the commonwealth requires the assent of the crown, and can be rejected, within a year of its acceptance by the Australian parliament, by the governor-general as representing the crown. The highest court of justice is the high court of Australia; appeals from this can be made to a court of appeal attached to the privy council, in which Canada, South Africa, and India, are each represented by one judge. The Earl of Hopetoun was appointed first governor-general, but he resigned his office in May, 1902.

Since the new federal government has come into force, Australia has entered on a completely new stage of its chequered development. The founding of the commonwealth is undoubtedly the most important step in the history of the continent. Even the subjects of his Britannic Majesty, who do not see any danger to the integrity of the empire in the federation of the colonies, cannot deny that the foreign policy of the commonwealth will henceforth strike out wider and distinctly more independent paths. The great importance of the Pacific Ocean for the history of mankind, especially in the future, is beyond question (cf. Vol. I, p. 598). Australia is faced by a historical future; if it even only half realises the part it has to play, it will take a more energetic part in the Pacific than it has taken during the last decades. The first indication of this new departure may be found in the proposal made by the premiers, that the federal government should undertake the administration of British New Guinea. For a long time certainly, the policy of Greater Australia will be a British policy; yet it is a question whether the change of geographical and economic conditions, such as will be effected by the completion of the Central American canal, will not be strong enough to shake the ancient loyalty, and to show to the policy of the new commonwealth paths which lie far from the old direction and away from the interests of the mother country.

## 6. OCEANIA AS PART OF THE INHABITED WORLD

### A. THE POSITION, SIZE, AND DISTRIBUTION OF THE ISLANDS

FROM a geographical point of view Oceania is a unique feature of the surface of the globe. In the first place it is of enormous size. From the Pelew Islands

in the west to Easter Island, or Sala y Gomez, in the east it stretches over 120 degrees of longitude, that is to say, over fully a third of the circumference of the earth, and from Hawaii in the north to New Zealand in the south it covers 80 degrees of latitude; it resembles, therefore, in this respect the giant continent of Asia, while with its entire area of 27,000,000 square miles it is nearly half as large again.

The distribution of the "world of islands" within this enormous space is most uneven. Speaking generally, the islands are less densely clustered and smaller in size as one goes from west to east. Melanesia indeed does not include many large islands, but it includes New Guinea, a country which is not only twice as large as all the other islands of Oceania put together (320,000 square miles to 177,000 square miles), but represents the largest insular formation on the globe. The Bismarek archipelago and the Solomon group contain islands which in size far exceed all the Micronesian and most of the Polynesian islands; New Caledonia alone is in area twice as large as all the Polynesian islands put together, if Hawaii is omitted (7,000 square miles to 4,000 square miles). New Zealand, finally, which in its formation cannot be separated from the island belt of Melanesia, has almost exactly ten times the area of the whole Polynesian realm of islands including Hawaii (106,000 square miles to 11,000 square miles). Melanesia, as a glance at the map will show, forms the inner of the two great belts of island groups, which curve in a thin line round the continent of Australia, while the outer belt contains all Micronesia and West Polynesia. But between the island clusters of Melanesia, in spite of their considerable area and their dense grouping on a narrow periphery, stretch broad expanses of sea. How thinly scattered, then, must be the islets of Micronesia and Polynesia with their insignificant area, over the vast waters of the ocean!

This isolation is the main feature in their distribution. Our maps of the Pacific are always on a very small scale and cannot bring out this peculiarity. The Caroline Islands, to give an instance, do not indeed appear on them as a dense cluster, but still show clearly how close their interconnection is. Including the Pelews they comprise forty-nine islands and atolls, whose total area is six hundred square miles; or, to give an English parallel, almost precisely the area of Monmouthshire. This is certainly not much in itself, and how infinitely small it appears when distributed over the expanse of sea which is framed by the archipelago. Stretching over thirty-two degrees of longitude and nine degrees of latitude it almost precisely covers the same area as the Mediterranean, namely one hundred thousand square miles. We are therefore dealing with magnitudes which practically allow of no comparison, and all the more so, since of those six hundred square miles five islands, which, it may be remarked, are the only ones of non-coraline formation, contain more than two-thirds. The small remainder is distributed over forty-four atolls, hardly rising above the level of the sea, which with their average size of one square mile literally disappear in that vast waste of waters. The case is the same with the majority of the Micronesian and Polynesian archipelagoes. Even if the distribution is not so thin as that of the Caroline Islands, still the insignificance of the land surface in comparison with the sea is shown by the fact that the Spaniards in the sixteenth century cruised for tens of years up and down the south seas without sighting more than a few islands, and those only which formed part of the densest clusters.

This distribution of its homes over so vast a region has been of the greatest importance for the population of Oceania. In the first place, it could only reach its ultimate home by navigation; and, besides that, it was impossible to form and maintain any relations with neighbours by any other means of communication. One result of this was that the natives in general had attained a high degree of skill in seamanship at the time of the arrival of the Europeans; another that they showed a marvellous disregard of distances and a mobility most unusual among primitive races. Not one among all the peoples of the earth can compare with the Oceanians in all these respects. The clumsy Melanesians, it is true, remain in the background; but where can we find ships to compare in grace and seaworthiness with those of Polynesia or Micronesia? or voyages so extended as those of the Pacific races? and what primitive people can point to colonisation so wide and so effective as the Polynesian? And it must be borne in mind that all these astounding performances were executed by races who knew nothing of iron until quite recent times, and were restricted to stone, wood, and shells.

#### B. THE CONFIGURATION OF THE ISLANDS

THE configuration of the islands in the South Sea has exercised as great an influence on the racial life as the geographical distribution and the size. According to the degree of their visibility from the open sea the realm of islands is divided into high (mainly volcanic) and low (or coral) islands. There is no sharp local differentiation of the two groups within the vast region. Some archipelagoes indeed, such as the Tuamotu, Gilbert, and Marshall islands, are purely coral constructions; others again, like all the remaining groups of East and West Polynesia, are high islands. But, generally speaking, the fact remains that coralline formations, whether fringing reefs or barrier reefs, are the constant feature of the high islands. This is also the case with the five high islands of the Carolines.

This peculiar arrangement, as well as the configuration of the islands, has in various points greatly influenced the Oceanians and their historical evolution. In the first place the labour of the coral insects always increases the size of the land. This is most clearly seen in the atolls; the reef-building capacity of those insects has produced the whole extent of those dwelling places for man. The activity of the corals, though less in itself, is more varied in its effect in the case of the high islands surrounded by reefs. First, the beach is widened and thus the entire economic position of the islanders is improved. The fertile delta of the Rewa on Vita Levu, as well as the strips of shore from half a mile to two miles broad which border the Tahiti islands, lie on old reefs. These themselves are, wherever they occur, the best fishing grounds; besides this, they always form excellent harbours and channels,—a most important point for seafarers like the Oceanians. The seamanship and bold navigation of this racial group has thus been markedly affected by the activity of diminutive molluscs.

The great poverty of the islands as a whole has been an important factor in their history. From a distance they appear like earthly Paradises, but on landing the traveller finds that even the most picturesque of them offers little to man. Barely one per cent of the surface of the coral islands is productive; in the

majority of the larger volcanic islands, the fertile soil does not amount to more than a quarter, or according to some authorities not more than an eighth, of the entire surface. There is also often an entire lack of fresh water. Under such circumstances the possibility of settlement is confined within narrow limits; if the population exceeds a definite figure, there is imminent risk of death from starvation or thirst. The South Sea Islanders are therefore, in the first place, prone to wander; in the second place they adopt the cruel custom of infanticide, in order to check the growth of the population.

A third result of the poverty of the islands, and one which is important for the geographical aspect of the settlements, is the limitation of the habitable region to the outer edge of the islands. This peculiarity is on the atolls a necessary consequence of their circular shape; but it is the rule also among the high islands, even the largest of them. Even in New Guinea itself, that immense island, with its enormous superficial development, the coast districts seem to be distinctly more densely inhabited than the interior. This is the most striking fact about the distribution of animal and vegetable life in Oceania. The land is poor, the sea, the only means of communication, is rich in every form of life.

### C. THE CLIMATE OF OCEANIA

THE poverty of this world of islands is partly connected with the nature of the soil and the enormous distances, which most organisms cannot cross, but partly also with the climate. If we leave out of consideration New Zealand, which extends into temperate latitudes, Oceania possesses a tropical climate tempered by the surrounding ocean. The temperatures are not excessive even for Europeans. But uniformity is their chief feature; the diurnal and annual range is limited to a few degrees Celsius.

The differences in the rainfall are more marked. Although generally ample, in places amounting to two hundred and fifty or three hundred inches in the year, it is almost completely wanting in parts of that vast region, which are so dry that extensive guano beds can be formed. The contrasts in the rainfall on the several groups and islands are the more striking, since they are confined to a smaller space. These are not of course noticeable on the flat coral islands, which scarcely project a couple of yards above the sea; but the elevation of the high islands into the moister strata of the atmosphere presupposes a strong differentiation between the weather side and the lee side. The side sheltered from the wind escapes the rain. These two sides do not face the same points of the compass throughout the whole Pacific Ocean. Its western part, as far as the Solomons, belongs to the region of the West Pacific monsoon; the east, however, is the definite region of the trade-winds. As a result, in the east on the islands of the southern hemisphere the east and south sides, but on those of the northern hemisphere the east and north sides, are covered with the most luxuriant tropical vegetation, while on the lee side the true barrenness of the soil shows itself. In the west of the ocean the position of affairs is almost reversed.

The effects of this climate on the development of the culture and history of the Oceanian are at once seen in the difference of temperament and character between the wild and energetic, yet politically capable, Maori on far distant New Zealand with its bracing Alpine air, and his not ungifted, but indolent and politically

sterile northern kinsmen, who have been unnerved by the unvarying uniformity of temperature. On the other hand the steadiness of the meteorological conditions has allowed the Oceanians to develop into the best seamen among primitive races.

Where, as in Oceania, one can be certain of the weather often for months in advance, it is easier, from inclination or necessity, to venture on an excursion into the unknown than in regions where the next hour may upset all calculations. The regularity of the winds and currents of the Pacific Ocean (see the map in Vol. I, p. 567) has played a great part in the theories that have been formed about the Polynesian migrations; in fact most of them are absolutely based upon them. Thanks to geographical exploration, we now know that this regularity is by no means so universal as used to be assumed, that on the contrary in these regions also, the wind veers with the variations of atmospheric pressure and the currents with the wind. Here also from time to time deviations from the usually prevailing direction, that is, from the eastern quadrants, are to be noticed. On the other hand, we are indebted to the spread of ethnographical investigation for the knowledge that the seamanship of the Polynesians not only extended to sailing with the wind, but that an occasional tacking against it was not outside the limit of their nautical skill. The ocean and its meteorology thus lose some of their value as sources furnishing an answer to the question of the origin of the Polynesians, in comparison with anthropological and ethnographical evidence; but it would be at any rate premature to disregard them altogether. Even if skilful use of the last-mentioned methods of inquiry is likely to solve the problem of origin, the other and almost equally important question of distribution over the whole ocean can only be answered by giving full weight to geographical considerations.

#### D. THE FLORA OF OCEANIA

THE main feature of the flora of Oceania is its dependence on the region of the southeast Asiatic monsoon. This feature is very marked in Melanesia; but further toward the east it gradually disappears, while the number of varieties generally diminishes. Strangely enough, it is this very scantiness that has proved of such importance for the history of the Oceanian. The Melanesian, surrounded by a luxuriant wealth of vegetation, dreams away his existence and leaves no history; his wants are supplied by the unfailing store of the ocean or the rich forest. We first find a historical life in the Fiji archipelago, where nature is less prodigal. The inhabitant of Polynesia and Micronesia has not been so spoiled. Scantly endowed with fertile soil and edible plants, he is confronted by the wide ocean, which he has nevertheless learnt to subdue. Although he did not possess a single tree which could furnish him with seaworthy timber, he became a craftsman, whose skill compensated for the deficiencies of nature. But by so doing he had in one direction freed himself from the constraint of nature, and nothing could hinder him from mastering her in another. Progress in technical skill has always been the first step toward every other form of progress, including the annihilation of distance.

Nevertheless, the Polynesians would not have been able to extend their wanderings so widely, had not nature, so niggard in everything else, given them further support in the shape of the cocoanut palm. Its seeds, together with those of a few other plants, can cross spaces as vast as the distances between the Pacific islands.

without losing their germinative power; thus these seeds have been the first condition of the diffusion of the Polynesians over the wide realm of islands. It is only recently that other food plants have become more important for the nourishment of the islanders than the cocoanuts.

What we have said does not apply to New Zealand. Just as the country climatically is distinct from the rest of the island world, so its flora bears an essentially different stamp. It is unusually varied, and the number of species can be counted by the thousand. Only two plants, however, have proved of value to the aborigines; the rarauhe (*Pteris esculenta*), a fern with an edible root, and the harakeke or New Zealand flax (*Phormium tenax*). The value attached to it by the first Europeans and their consequent efforts to obtain it led to the first friendly intercourse between the Maoris and the whites.

#### E. THE FAUNA OF OCEANIA

THE characteristic of the fauna of Oceania is its poverty in mammals and animals of service to man, in the east even more than in the west. Even the dingo (p. 239), which the wretched native of Australia could make his somewhat dubious companion, has not been vouchsafed by nature to the Oceanian. It is only in quite modern times that the kindness of foreigners has supplied the old deficiency by the introduction of European domestic animals. New Zealand was once rich in the species and number of its large fauna. Many varieties of the moa (*dinornis*), some of gigantic size (the largest species measured thirteen feet in height), roamed the vast plains. At the present day it is one of the long extinct classes, having fallen a victim to the insatiable craving of the Maori for flesh food. It is easy to understand that the small islands are poor in animal life, for with their scanty space they could not afford the larger creatures any means of existence. On the other hand, the poverty of the fauna of New Guinea is more surprising; notwithstanding the tropical luxuriance of its soil, its fauna is even more scanty than that of Australia. The pig alone has proved valuable to the population.

The result of this limited fauna, as reflected in an ethnographically important phenomenon, has been of much consequence in the historical development of the races of Polynesia and Micronesia. The races which live principally on islands of very small size are at the present day either entirely without bows and arrows as weapons or they retain them merely as a survival. Oskar Peschel traced this back to the want of opportunity for practice, which is more essential for the bow than for any other weapon. This opportunity could never have been very frequent, even if the supply of game had been ample at the time of the emigration of the hunters. The loss of any weapon which would kill at a distance must naturally have appreciably altered the tactics of the islanders. It is true that on some groups of islands fighting at close quarters, which all primitive peoples dread, was avoided by the adoption of the slingstone or the throwing club in place of the arrow; but, as a rule, the transition to hand-to-hand fighting with spear, axe, or club was inevitable. This always denotes an improvement in tactics, as is shown by the classic example of the Zulus of South Africa, who, merely from the method of attack in close order introduced by Tchaka (*vide* Vol. III, p. 437) and the use of the stabbing spear as the decisive weapon, won the foremost place in the southeast of the dark continent. In Polynesia the new method of fighting certainly con-

## SPECIMENS OF MELANESIAN CARVING

Fig. 1. Dancing mask from New Ireland; with enormous wing-like ears, carved in wood and brightly painted.

Fig. 2. Dancing mask from New Ireland; helmet-shaped, with large crest.

Fig. 3. Dancing mask from New Ireland; unusually realistic, representing a typical Melanesian with his face painted red and white.

Fig. 4. Carving from the Solomon Islands; head and arms of a male figure, inlaid with mother-of-pearl. The prow ornament of a boat.

Fig. 5. A large dancing mask from New Ireland, with wide spreading wings in the shape of fishes instead of ears. The hair, whitened with chalk according to the native custom, is represented by yellowish stalks of pith.

Fig. 6. Dancing mask from New Ireland, helmet-shaped. A small cock is seen between the teeth of the face of the mask, a second stands on the top of the head.

Fig. 7. Carved pole from New Ireland. On the top, a human figure, with large wing-shaped ears, which is holding a bird in its hands and pressing it to its breast; on its face are painted lizards, two black and one white; beneath, snakes, birds, and fishes.

Fig. 8. Carved pole from New Ireland; probably in memory of a woman who died in childbirth.

(Cf. F. v. Luschan, "Beiträge zur Völkerkunde der deutschen Schutzgebiete." Berlin, 1897.)

Fig. 9. Carving from New Ireland; showing a large eagle, which grips a snake. Probably a symbolic representation of heaven and earth, to be compared with the Indian Garûda with the Nâgas.

Fig. 10. Carved and painted plank from New Ireland; in the centre a human figure between two fishes. Cf. Fig. 2 of the coloured plate "Specimens of Micronesian Carving."

(The originals of all the objects represented on this plate are in the Royal Ethnological Museum at Berlin.)

SPECIMENS OF MELANESIAN CARVING.

(Partly from F. v. Luschan's "Beiträge zur Völkerkunde", partly drawn by L. Süsserlin from the originals in the Ethnological Museum at Berlin.)

tributed to that bloodiness of the battles (both among the natives themselves and against the whites), which distinguishes its history from that of all other primitive races. The political consequences, from want of any suitable antagonist, could naturally not be so important here as in South Africa. Nevertheless, the comparatively rigid organisation of the majority of the Polynesians is certainly to a large degree the result of their tactics.

## 7. THE POPULATION OF OCEANIA

### A. THE ANTHROPOLOGICAL POSITION OF THE OCEANIANS

ETHNOLOGY separates the population of Oceania into three large groups: the Melanesians, who inhabit the inner belt of coast from New Guinea to New Caledonia and Fiji; the Micronesians, on the Caroline, Marianne, Pelew, Marshall, and Gilbert islands, and the Polynesians, who inhabit the rest of the great world of islands, including New Zealand.

The question of the racial position, the connection, and the origin, of these three groups has occupied scientific inquiry since the early days of their discovery, and has created a truly enormous literature, although no thoroughly satisfactory solution has hitherto been found. So far as the Melanesians are concerned, the question is indeed to be regarded as settled, since no one at the present day feels any doubt of their connection with the great negroid group of nations (*vide* Fig. 3 of the accompanying plate, "Melanesian Carvings"). Even on the subject of the Micronesians there is a general consensus of opinion that they can no longer be contrasted with the Polynesians. They are seen to be a branch of the Polynesians, and that branch indeed which, on account of the close proximity of Melanesia, has received the largest percentage of negroid elements.

Thus it is only the Polynesian question which awaits its solution. Nothing supports the view that the Polynesians grew up in their present homes. Such a theory is impossible on purely geographical grounds. We are left, therefore, with immigration from outside. The claims of America on the one hand, of Indonesia on the other, to be the cradle of the Polynesian race, have each their supporters. Under the stress of more modern views on the penetration and wanderings of nations, the disputants have agreed in recognising a physical and linguistic connection with the one region (Indonesia), without, however, denying ethnical relations with the other region (America). The racial affinity of the Polynesians with the inhabitants of the Malay archipelago is firmly established on the strength of physical and linguistic resemblances. There is more difference of opinion as to the nature and amount of the foreign admixture. As matters stand, a negroid admixture can alone enter into the question. Even those who believe in the former racial purity of the Polynesians must allow such an admixture in the case of Micronesia. As the result of numerous modern observations, it appears probable, however, that a similar admixture exists as far as Samoa and still farther; even remote Easter Island does not appear quite free from it.

A multitude of facts supports also the ethnical connection of Polynesia with America. The faith and religious customs in both regions rest as a whole on the same basis of animism and ancestor worship. In both we find the same rude cosmogony, the same respect for the tribal symbol, and the same cycle of myths, to

say nothing of the numerous coincidences in the character of material culture possessed by them, and in the want of iron common to both. Ethnology, in face of these coincidences, is in a difficult position. Few ethnologists still venture to think of any direct migration from America. It is certain that the Polynesians were bold sailors, and often covered long stretches in their wanderings, voluntary or involuntary; but to sail over forty to sixty degrees of longitude without finding an opportunity to put in anywhere would surely have been beyond their powers, and still more those of their forefathers.

Under these circumstances the most satisfactory assumption is that of a large Mongoloid primitive race, whose branches have occupied the entire "East" of the inhabited world, East Asia, Oceania, and America. This theory extricates us at once from the difficulty of explaining those coincidences; but it does not directly solve the problem of the great differences in the civilizations belonging to the different branches of the Mongoloid family. It seems a bold guess to explain it by absorption of influences of the surrounding world, but this theory offers possibilities.

#### B. THE WANDERINGS OF THE OCEANIANS

THE first really historical activities of the Oceanians are their migrations. At the present day they are the most migratory people among the primitive races of the world, and voyages of more than a thousand nautical miles are nothing unusual. There are various incentives to such expeditions, such as the wish and the necessity of trading with neighbouring tribes, starvation, which is not infrequent on the poor islands, political disturbances, and a pronounced love of roaming. This last is the most prominent feature in the character of the Malayo-Polynesian, which has, more than anything else, scattered this ethnic group over a region of two hundred and ten degrees of longitude, from Madagascar to Easter Island, and eighty degrees of latitude. Compared with this, the other causes of migration shrink in general significance, although locally they are often of primary importance and have had great bearing on history.

The number of the journeys known to us is not great; the interval since the opening up of the island world of Oceania is too short, and the region is too remote. Yet the number is sufficient to bring more than one characteristic of the past history of these races clearly before our eyes.

In the first place, the frequent involuntary voyages, when the seafarers were driven far out of their course, teach us that the winds and currents have not set from east to west with that persistency which old and celebrated theories maintain, and that therefore no natural phenomena hindered the Polynesian from spreading from west to east; under these conditions the way from the west as far as distant Easter Island was not barred. Secondly, the frequency of these voyages allows us to understand the true character of the Pacific Ocean. It is no waste of waters, where islands and archipelagoes, like the oases in a desert, lie remote and solitary, but a sea full of life, where the constant traffic prevents any one group of islands from being absolutely cut off from the outer world.

The ocean has not presented this feature merely for the last few centuries: it has been characteristic of it, since the day when the first keel touched the shores of Hawaii, New Zealand, and Easter Island. We have the evidence of the aborigines themselves for this. Their rich store of legends hinges on these old wanderings,

and as it deals more particularly with the earliest voyages, it gives us a welcome insight into the original relations of the islanders with one another and with the outside world ; it is thought that the question of the original home of the Polynesians might be solved in this way. The part which the land of Hawaiki under its various names (Savaii, Hawaii, Hapai, Hevava, Awaiki and others) plays in the ancestral legends of most Polynesians is familiar even beyond the circle of ethnologists. It recurs among the Maoris of New Zealand, in Tahiti, Raiatea, Rarotonga, the Marquesas, Hawaii, and elsewhere. To see in it a definite and limited locality, from which the streams of emigration flowed at different times to the most varied directions of the ocean, appears impracticable in view of the fact that the geographical position of Hawaiki is not accurately fixed in all the traditions but varies considerably ; it even meets us as the land of ghosts, the western land where the souls sink together with the sun into the lower world.

Nevertheless, the investigation of the primitive period in Polynesian history is benefited in several instances by tracing out the Hawaiki myth, especially if this task be supplemented by a review of the anthropological, ethnographical, and geographical evidence. We may then assume with great probability that the island of Savaii, which belongs to the Samoa group, was the starting point of the migration of the Maoris to New Zealand. Under the name of Hawaii it also forms the starting point of the inhabitants of Raiatea and Tahiti. To this fact, again, point the legends of the Marquesas and Hawaii group, partly also of Rarotonga, which, on its side, as the "nearer Hawaiki" of tradition, served the Maoris as an intermediate station on the way to New Zealand, while it was a regular starting place for the inhabitants of the Austral and Gambier islands. A final starting point was the Tonga group ; the inhabitants of Nukahiva in the Marquesas sent for their ancestors from Vavau with breadfruit and sugar cane. Not only is the number of starting points surprisingly small in comparison with the size of the territory occupied by the Polynesians, but the original relations among the several groups appear simple to an astonishing degree. Examined in the light of ethnology and history this simplicity cannot be maintained. It is an ascertained fact as regards the Maoris that their immigration did not occur in the form of one single wave of nations, but that fresh batches came from the north ; and a very late subsequent immigration is specially recorded. The inhabitants of the Hawaii islands are connected with Tahiti by language, customs, and legendary travels ; on the other hand, the place names show the enduring recollection of Samoa. Rarotonga is the focus of the entire remotest south, while it was itself peopled with settlers almost simultaneously from Samoa and Tahiti. In the end, Tahiti seems to have sent emigrants to Rarotonga and Hawaii, also to the southern Marquesas, as the correspondences in language and customs prove.

It is difficult to determine the date of these migrations, since these movements are a constant feature. Obviously, no reliance can be placed in the genealogical lists of the several islands, which vary from twenty to eighty-eight generations (p. 233). History does not carry us very far ; ethnology alone tells us that the dispersion of the Polynesians over the Pacific Ocean cannot go back to any remote period, for they have not had the time to develop any marked racial peculiarities. It can only be a question of centuries for New Zealand and many other countries ; in the case of Tahiti and perhaps Hawaii, the first settlement may be assigned possibly to an earlier date. But in no case need we go back more than a millennium and a half.

The wanderings extended also to Melanesia, in the east of which, as a consequence of the distances, more settlements were planted than in the west. While Fiji in respect of social and political customs shows almost as many Polynesian traits as its two neighbours, Tonga and Samoa, and has experienced a considerable infusion of Polynesian blood, we certainly find in New Guinea marked traces of this blood, but an almost total absence of Polynesian customs and political institutions. It can hardly be shown at the present day, when the Western Pacific contains so mixed a population, in what proportion migration has been deliberate or involuntary, but doubtless, besides the frequent driftings to east and west, there were many cases of systematic colonisation. We thus get to know an aspect of the Polynesians which is not often represented among primitive peoples. In Africa the only examples are the Wanyamwesi of Central German East Africa (Vol. III, p. 442), who since the middle of the nineteenth century have colonised the whole equatorial east of the continent, and advanced their settlements far into the southern Congo basin, and the Kioto in the Western Congo State (Vol. III, p. 472) of whom Pogge, L. Wolf, and Wissmann tell us how they succeed in planting themselves among the inland tribes.

In America we can only mention in this category the Caribs (Vol. I, p. 186), who conquered and colonised large portions of the inner half of the continent and the whole group of islands in the waters of Central America. The colonising activity of the Polynesians need not surprise us. They showed themselves in the art of navigation a worthy branch of the Malayan racial group, and in politics and economy they are little inferior to the Western Malays. If the latter claim to extend their wanderings to Madagascar in the west and the Philippines in the northeast, the Polynesians may contemplate the possession of a territory which reaches from the Carolines and New Guinea in the west as far as Easter Island in the east.

## 8. THE HISTORY OF THE OCEANIANS

### A. CONJECTURES AS TO THE PRIMITIVE HISTORY OF THE OCEANIANS

OUR knowledge of the history of Oceania hardly goes beyond the discoveries of the island world; for the tradition of Polynesia, which goes considerably further back into the past, does not distinguish between fact and fiction. Nevertheless, even in Oceania it is possible to have a glimpse of the past. Here, as in Australia (p. 245), we find remains of old buildings and sites, whose nature presupposes certain definite political and social conditions then existent; but, besides this, we have adequate data in the information which the early explorers give as to the state of things which they discovered.

In the case of the Polynesians and Micronesians, as in that of the Australians, it admits of no doubt that their present stage in civilization does not denote the highest point of their development, but that in many departments of national life a distinct retrogression has taken place. In Melanesia, on the other hand, where the civilization does not even reach the present stage of the neighbouring peoples on the east, all evidence for a previous higher culture is wanting. Melanesia is, in this respect, like a hollow between an elevation in the west, the Malay civilization, and a second somewhat lower elevation in the east, the Polynesian civili-

zation. This by no means implies that the culture possessed by its inhabitants was in itself inferior or lacked originality. On the contrary, as a glance at the plate opposite page 304 tells us, the arts were highly developed in Melanesia; indeed much of the material culture, and some branches of intellectual culture, surpass anything at least shown by the Micronesians. It is only in political respects that the Melanesian is behindhand. The cause of this is to be found primarily in the character of the negroid race, and secondly in the absence of any stimulus from outside. Where these causes are absent, as in Fiji, even the Melanesian has shown himself capable of political development.

The decadence of the Polynesian and Micronesian civilization is shown in two ways: first, in buildings and works of a size, mass, and extent, which preclude all idea that they could have been erected by a population at the stage in which the first Europeans found them; and, secondly, in the political and social institutions, which bear every trace of decay. The South Sea is not poor in remains of the first class. On Pitcairn Island, which has long been deserted by all primitive inhabitants, even now the stone foundations of ancient temples are to be found; on Rapa old fortifications crown the hills, and on Huaheine a dolmen rises near a cyclopean causeway. Under the guano layers of the Christmas Islands roads skilfully constructed of coral-rag bear witness to an age of a greater spirit of enterprise, of a higher plane of technical skill, and of a more pronounced national life. Timian, one of the Marianne group, has its colossal stone pillars, crowned with capitals, to mark the dwelling places of the old and more vigorous Chamorro. But all this is nothing in comparison with the ruins of Nanmatal on Ponape, and the stone images on Rapanui in Easter Island.

The decadence in the political and social field is not generally so obvious as that in technical skill; but it is incontestable everywhere, and has been distinctly more disastrous to the national development of the islanders. This is shown by the loss of the old patriarchal society, in which the king was revered by the people as a god, where he was the natural owner of all the land, and where the view prevailed that all was from him and all was for him. When James Cook and his contemporaries appeared in the South Sea, in many places hardly any trace of such a society remained, while in others it was rapidly disappearing. The ancient dynasties had either been entirely put aside and the States dissolved, or if they still existed, only a faint gleam of their former glory was reflected on the ancient rulers. The old organisation of the people, with its strictly defined grades, had already been destroyed; and a struggle of the upper class for property and power had taken the place of the former feudalism. This effort had been everywhere crowned with success, and had mainly contributed to break up the rigid and yet universally acceptable system. Finally, even religion entirely lost its ancient character. The original gods were indeed retained; but their number, at first limited, had been in the course of time indefinitely multiplied, since the gods springing from the class of the high nobility were gradually put on a level with the older deities. Thus the national and popular religion was changed into a superstitious worship of the individual. As Karl Meinicke insists, it is one and the same thing which destroyed the State and the religion of the Polynesians—the degradation of the old civil and religious authorities or the promotion of the formerly lower degrees. But in any case the abandonment of the old idea of a State was complete. The tokens of retrogression in Oceania, when collected, speak

a clear language. They tell us, in the first place, that there must have been a period in the prehistoric period of the South Sea Islanders when an overgrowth of the population on the already settled islands made it necessary to send out colonies; further we learn that the period of colonisation must have also been the period of the highest development of culture. Colonisation was only possible under the government of a rigid political organisation, of which we can at most discover a reflection in the subsequent life of the South Sea races. We may not assume a growth of technical knowledge on the settled islands, such as was requisite for the erection of large buildings, so that even in the field of material culture we can only suppose the existence of an original and more universal standard of accomplishment. We thus find the phenomenon, interesting both from the historical and the geographical point of view, that the moment of the widest dispersion of a race denotes the beginning of its decadence. This phenomenon is not surprising if we take into account the nature of the homes of the race. It is easier for the population of small islands to attain a higher culture, and a more strict political organisation than to maintain themselves at the stage which they inherited or brought with them. The narrow limits of space make a comprehensive scheme easy and possible, but involve the danger of a conflict between opposite parties and thus the destruction of the existing system. None of the Polynesian islands escaped this fate, especially since the character of the people shows few traits of conservatism. Quarrels and disputes have been the chief and the favourite occupation of the Polynesians as long as we have known them. The decadence is the greatest where the island communities are the smallest, and where therefore destructive influences are most powerful; thus in the centre of the world of islands hardly a trace of the ancient culture has come down to us. When the Europeans appeared on the scene, marked traces of this culture (in one place a vigorous national life, in another stupendous monuments) were only extant on the outer belt, in Hawaii, New Zealand, and the remote Easter Island.

The fall of the Maoris is the best illustration of the rapidity with which the attainments of civilization can be lost. At all times addicted to violence and intolerant of united effort, they split up the larger States of their twin islands into numerous mutually hostile and aggressive communities, from which every notion of a national unity and its effect in maintaining a civilization has disappeared. At the same time the originally vigorous racial character lost more and more in moral restraint, and became more savage and cruel. The downfall of the ancient religion finally accompanied this change. The old gods lost their personality, and were transformed into a multitude of forest and sea demons, unparalleled for extravagance and grotesqueness of form. The representations 1 and 2, 4 and 5, 7 and 8 on the plate at page 332, give a good idea of them. Art and technical skill did not escape. As early as Cook's time, it was no longer possible to produce carvings of the older kind (*vide* Figs. 1, 4, and 5 in the same plate).

#### B. THE HISTORY OF THE MELANESIANS

(a) *General Remarks.* — Melanesia, apart from Fiji, has no history properly so-called. We are acquainted merely with the treatment which the inhabitants have received at the hands of foreigners. The chief cause of this phenomenon, which recalls the passivity of the Australians, is the slight political capacity of the

negroid race. A second cause is that isolation from the outside world which can be partly attributed to the dreaded fierceness of the Melanesians. The more enterprising Polynesians have never shown any great inclination to attempt colonisation on a large scale in Central and Western Melanesia, nor have the whites entered on the task of opening up these islands with the zeal which they have shown in the rest of Oceania since the days of Cook. Exploration and missionary activity are tardy and timid in these parts, and European colonisation is still later in coming. Notwithstanding this late beginning of serious encroachments from outside, the Melanesians came early into hostile contact with the whites. Out of the long roll of explorers, from J. Le Maire and W. Schouten (1616) on, past W. Dampier (1700) and J. Roggeveen (1722) to L. A. de Bougainville and de Surville (1768), there is hardly one who had not been guilty of the greatest cruelties to the natives. Even Cook, in 1774, ordered the natives of Erromango to be shot down with cannon for some trifling misconduct. But the nineteenth century has behaved still more outrageously to these islands. Their wealth in sandalwood soon attracted numerous traders, English and American in particular, but also Polynesians. All these persons, who merely sought their own advantage, behaved like savages. They plundered peaceable tribes, and forced them to work as slaves on other islands; they cut down the valuable trees, and thus caused disputes with their owners, which generally ended in the defeat of the latter.

Extortions and unprovoked bombardment of villages were matters of daily occurrence. The traders captured a chief, and only released him at a ransom of a shipload of sandalwood; and once when the inhabitants of Fate in the New Hebrides fled from the crew of an English ship and a body of Tongan allies into a cave with wives and children, their opponents lighted a fire at the entrance and suffocated all the fugitives.

The consequences of this treatment of the natives were soon seen. The warlike and able-bodied Melanesians returned blow for blow, and avenged the outrages committed by the whites upon their fellows when and where they could. Whoever was imprudent enough to land upon their coasts was murdered. It thus comes about that the history of the exploration of Melanesia down to the present day has been written in blood. Even missions (cf. below, p. 340) have met with greater initial difficulties here, and found a harder task than anywhere else in the South Sea.

The long duration of racial struggles has produced the result that the national characteristics of Melanesia are no longer in their primitive integrity. New Guinea, where little more than the fringe of the island has been explored, has, indeed, suffered little, and the inhabitants of the Bismarck archipelago and the Solomons have hitherto successfully repulsed any serious attack on their modes of life and thought or their material possessions. The state of things is less favourable in the more easterly archipelagoes, Santa Cruz, New Hebrides, New Caledonia, and Fiji. Here, undoubtedly, the stronger infusion of Polynesian blood has weakened the powers of resistance of the population; while these groups have also been longest exposed to the brunt of the attacks of the whites. The result, as is always the case where the barbarian comes into touch with civilization, has been a decline in the numbers, physique, and morals of the native population. This is most marked in New Caledonia, where the natives, under the influence of the French system of transportation, have sunk from a warlike and honour-loving nation,

endowed with high intellectual gifts, into a ragged mob. It is difficult to form an idea of the numerical shrinkage, since the older accounts are mere estimates. Nevertheless, the inhabitants of the New Hebrides and Santa Cruz have undoubtedly much diminished in numbers, a change which in Fiji can be proved by actual statistics.

(b) *Fiji*. — The great political capacity, judging by a Melanesian standard, of the Fiji (or Viti) Islanders, can be traced to the strong admixture of Polynesian elements and the position of the archipelago, which lies advanced toward the east. Their history begins with those feuds which have played a part in all the Polynesian Islands for centuries. In these wars, unimportant enough in themselves, the Europeans interfered about the beginning of the nineteenth century, without any political intentions at first. In 1804 twenty-seven convicts, escaped from Norfolk Island, took sides sometimes with one, sometimes with another chief; but the crew of the slaver "Eliza," which was wrecked on the cliffs of Nairi in 1808, had a still more decisive share in the course of events, since they possessed muskets. Their choice fell on the chief, Naulivau of Mbau, who thus was enabled to overthrow the head of the "State" of Verata in Eastern Viti Levu. His successors remained in possession of the supreme power until 1874. After a reign full of military successes, which won him the surname "Vuni Valu," or "root of war," Naulivau died in the year 1829. He was followed by his brother, Tanoa, one of the most ferocious cannibals whom Fiji ever knew.

Under his son, Seru, better known by the name of Kakobau or Thakombau (1852-1874), the kingdom founded by the first Vuni Valu reached its greatest prosperity and extent, comprising almost the entire archipelago. His accession occurred at a time when the Fiji archipelago had attracted, in more than one respect, the attention of the whites. The Wesleyan mission had obtained a footing here since 1835, in 1844 the Catholic mission also. Principally through the activity of the former the old feuds had stopped, at any rate in the coast districts of Viti Levu; English, American, and other white traders were able to settle there in complete security. In 1847 the United States of America, in order to express their appreciation of the newly discovered field, established a consular agency there. At the same time artful aspersions were cast on the Wesleyan mission in order to weaken English influence. In 1849, when the house of the consul, Williams, was burnt, the natives stole some of his property. Williams demanded from Thakombau compensation to the amount of "three thousand dollars, twelve and a half cents." An unprejudiced witness informs us this "exact" sum was not justified, and was not paid. In the next year, in consequence of other thefts, it had mounted to five thousand and one dollars and thirty-eight cents. Williams laid this demand before the commanders of two American warships, with a request for support, but it was rejected. In 1855, however, Captain Boutwell, who had been sent to Fiji for a renewed inquiry, ordered Thakombau to pay capital and interest forthwith. The sum to be paid was fixed in a second letter at thirty thousand dollars, and threats of force were held out. Finally, Boutwell sent for the chief on board his ship, demanded forty-five thousand dollars, and threatened to hang him. Thakombau then signed the agreement.

Complications, also, were threatened with France. Fourteen years after the unsuccessful attempt at settlement of 1844, French Catholic missionaries tried

## SPECIMENS OF MICRONESIAN CARVING

Fig. 1. Beam of a house, from the Pelew Islands ; representing an areca-palm, by which a man wished to climb up to heaven, but fell down (after Kubary).

Fig. 2. Beam, from the Pelew Islands ; representing a man between two fishes (Belone ; the name of the species is not certain). Cf. Fig. 10 of the coloured plate, "Specimens of Melanesian Carving" (after Kubary).

Fig. 3. Part of a beam, from the Pelew Islands ; according to Kubary, it represents the mythical bird *adalrock*, with the pieces of money vomited by him in Keklan.

Fig. 4. Beam from a gable end, from the Pelew Islands ; with representation of a cock with enormously long neck. Cf. Fig. 8 of this plate (after Kubary).

Fig. 5. Part of a beam, from Yap ; with representation of a shoal of whales (*Physeter macrocephalus*).

(From the original in the Ethnological Museum at Berlin.)

Figs. 6 and 9. Parts of the decorated beam of a house on Yap.

(From the original in the Ethnological Museum at Berlin.)

Fig. 7. Beam from the Pelew Islands ; showing a crocodile which was outwitted by an ape (after Kubary).

Fig. 8. Gable end of a house called Auloná on the Pelew Islands, used for the isolation of lying-in women and similar purposes. On both gable beams a man with an excessively long body (from Kubary).

Fig. 10. Carving from the gable of a house on Yap.

Fig. 11. Carved inner side of a plant from a house on Yap ; with representations of the sun (?), fishes, dogs, etc. The drawing must be looked at upright.

Figs. 12 and 13. Carving from the gables of houses on Yap. Fig. 12 represents a sitting female figure with outstretched arms and legs. Fig. 13, three dancers.

(The last three from the originals in the Ethnological Museum at Berlin.)

SPECIMENS OF MICRONESIAN CARVING.

(Partly from Kubary's "Beiträge zur Kenntnis des Karolinen-Archipels", partly drawn by L. Sutcliffe from the originals in the Ethnological Museum at Berlin)

once more to gain a footing on Viti Levu. Since Thakombau, who in 1854 had adopted Christianity, partly from conviction, but mostly on political grounds, felt the impossibility of any longer maintaining his position, especially since his relations with Tonga were very strained at that time, he determined to escape from his difficulties and cede his land to England. On October 12, 1853, he made a treaty with the English consul, Pritchard, to which all the chiefs of the island subsequently agreed, to the following effect: Thakombau, who wished to become a British subject but yet retain his title and suzerainty, promised two hundred thousand acres of land; in return, England was to take over the American debt. The English government, from the wish not to cause unpleasantness with America, refused the offer. Now, not only did the Americans immediately press their claims, but Tonga demanded a large sum of money for the assistance which it professed to have previously rendered. The monarch in his difficulty accepted the proposal of the Melbourne Polynesian Company in 1868, which promised to satisfy the claims of America in return for the grant of the land offered to the English government. The flourishing condition of the German trading firms, which had been active in the country since 1860, had drawn public attention to Fiji. On conclusion of the treaty, the company paid the Americans £9,000. In return, it at once received one hundred and ten thousand acres.

During these negotiations there had been incessant disputes among the natives themselves; at the same time there had been quarrels between them and the numerous white immigrants. In order to put an end to this state of things, Thakombau in 1871 formed a constitutional government, with a ministry composed of twelve chiefs, a legislative council, chosen by the whites, and a supreme court. So long as the interests of the government and the colonists coincided, this artifice, frequently tried in the South Sea, was harmless in results; but when the whites were required to pay taxes, they simply ignored the laws. The public debt soon grew to £80,000. Thakombau saw no alternative left him but to renew the offer of his land to Great Britain, but this time as a gift. England at first refused it again, and only changed her purpose from the fear that other powers (America, or Germany, which was interested just then in the enterprise of the Godefroys — *vide* p. 327) might close with the offer. On September 30, 1874, England accepted Thakombau's offer, which had actually in the interval been made to the German Empire and declined by it. Fiji became a British crown colony. England took over all the debts, and paid Thakombau a yearly allowance, until his death in 1883. The sales of land completed before the British annexation were not at once recognised, but gradually tested; in 1885, more than ten years later, the Germans concerned were compensated with a small solatium (£10,620). In the spring of 1902 Fiji concluded a separate federal treaty with New Zealand (Mr. Seddon); a counterpart to the Australian Commonwealth.

### C. THE HISTORY OF THE MICRONESIANS

THE small average size of the Micronesian Islands has not prevented the inhabitants from developing a peculiar and, in many respects, higher culture than their kinsfolk in the east and south (*vide* the illustration, "Micronesian Carvings"). The several localities have, indeed, proved too limited for any development of political importance. The only events to be recorded are the usual feuds between

the hostile village communities, although, judging by the ancient buildings and terraces on the Pelews, on Ponape and the Marianne Islands, the conditions for a politically organised activity must have been far more favourable in earlier times than at the present day. It is at present impossible to determine whether the decadence of the Pelews and the Carolines is due to other reasons than the antagonism of conflicting interests produced by the cramped space.

On the other hand, the process of disintegration on the Marianne Islands can accurately be traced. All accounts from the period anterior to the beginning of the Spanish conquest and conversion speak in the highest terms of the condition of the islands, their high stage of civilization, and large population. Guam was compared to one immense garden, and in 1668, at the beginning of the Jesuit mission, contained one hundred and eighty splendid villages. The total number of the Chamorro, as the aborigines were called by the Spaniards, is reckoned variously: a favourite estimate is 200,000, but even 600,000 has been given; the lowest calculation does not sink below 40,000. In addition to an advanced agriculture, which notwithstanding primitive tools could boast of cultivating rice, we find an excellently developed art of navigation, a knowledge of pottery, a regulated calendar, and so forth. The Spaniards destroyed all this in a few years. According to an accurate calculation, in 1710, forty-two years after the arrival of the Jesuit father Sanvitores, there were 3,539 Chamorro still left; in 1741 there were 1,816. Their rapid diminution was caused by the fierce fights between both parties, which broke out so soon as the freedom-loving inhabitants perceived that conversion in the ultimate resort aimed at subjecting them to the Spanish yoke; the wars did not stop before 1699. The census of 1741 brought home to the Spaniards the magnitude of the devastation wrought by them. In order to make up for the alarming mortality they introduced Tagals from the Philippines. The number of the inhabitants after that increased; in 1783 it amounted to 3,231 souls; in 1803 to 4,303; in 1815 to 5,406; and in 1850 to more than 9,000. But an epidemic of smallpox raged among the population in 1856. It had only risen again to 5,610 in 1864, and at the present day it reaches to about double that figure. The reckless extermination of the people is almost the least evil which the Spaniards perpetrated on the Chamorro; the annihilation of the nationality was still worse. At the present day no more traces are left of the old culture with its buildings, its navigation, its agriculture, and technical skill, than of the old strong and proud physique of the inhabitants. In place of a love of freedom the miserable half-caste people of to-day show a dull indifference, while lethargy has taken the place of industry, and an unthinking use of Christian customs is substituted for a naïve paganism. Next to the Tasmanians no people in the South Sea can have felt more deeply the curse of contact with the Europeans than the Chamorro.

#### D. THE HISTORY OF THE POLYNESIANS

AN account of the history of the Polynesians presents difficulties, in so far as every separate group has its own history. It is the exception to find any points of connection between neighbouring archipelagoes. This necessitates the separate treatment of the larger and more important groups at any rate, although certain broad characteristics recur regularly. Since this phenomenon is still more marked in the case of the smaller and less densely peopled archipelagoes, whose importance

is slight, we shall therefore abandon the task of any detailed description, and refer the reader for their most interesting features to the section on missionary work (p. 340).

(a) *East Polynesia*.—Within the region of Polynesia the Hervey, Tubuai, Society, Tuamotu and Marquesas Islands form a mass which stands out apart from the other clusters (*vide* map, p. 232). This purely external grouping has, it is true, no geological foundation, but justifies the inclusion of the archipelagoes under the general title of East Polynesia, although the relations of the groups among themselves belong mostly to prehistoric or very early times.

(a) *Tahiti*.—The history of East Polynesia, whether native or colonial, is mainly connected with the double island of Tahiti (Otaheiti). It is the only focus of an independent development, and also the natural starting point and centre of the French Colonial Empire in East Polynesia. When Samuel Wallis finally discovered the island on June 19, 1767, he found three States there, which were fighting savagely for the upper hand. The Spaniards took possession of the island on January 1, 1775, but they soon abandoned it again after the death of their captain, Domingo de Bonechea, on January 26. In 1789 the mutineers of the "Bounty" (p. 259) landed on Tahiti; some preferred to remain there, took the side of the king Otu or Pomare, as he preferred to call himself, and thus enabled him to extend his sovereignty over the other islands of the archipelago. The first English missionaries landed there on March 7, 1797, and were destined soon to play a large part in the political life of Tahiti. In 1802 Pomare carried away the sacred Oro (Orohho) figure from the Marae (Morai) at Atahuru, the possession of which was fiercely contested. But he was compelled to surrender the image in the end, and died suddenly on September 3, 1803, and his son Pomare II, born in 1780, was forced to fly. He took up his abode on Murea (Eimeo), the headquarters of the Christian mission. In July, 1807, he crossed with a number of Christians over to Tahiti, surprised his enemies, and massacred them so relentlessly that the whole island rose against him and the missionaries, and drove them all back to Huahine and Murea. But in the battle at Narii (November 12, 1815) King Pomare II, who had become a Christian on July 12, 1812, completely defeated his enemies; the other islands of the archipelago adopted Christianity in consequence. Pomare crushed the power of the nobles, and gave the islands at the end of 1818 a new and written constitution. He died on November 30, 1821. Pomare's infant son died on January 11, 1827. His sister Aimata, a girl of seventeen, then mounted the throne as Pomare IV (or Pomare Wahine I), while her aunt Ariipaia, as was customary, remained regent.

The reign of Aimata is marked by an overflowing tide of calamity, which soon burst on Tahiti, and ended in the loss of its independence. It began with the attempt of the Catholic Church, made in November, 1836, from the Gambier Islands, to gain a footing in the island. In consequence of a law introduced by the British preachers of the gospel, the French missionaries were forbidden to land; they therefore appealed to France for aid. On August 27, 1838, Captain Abel Dupetit-Thouars appeared off Papeete with the frigate "Venus," in order to demand satisfaction, consisting of an apology under the sign manual of the queen, and two thousand piastres in Spanish money; the queen was forced to comply.

In April, 1839, Captain C. P. Th. Laplace demanded that the Catholic Church should be granted as ample privileges as the Protestant, and that a building site for a church should be conceded. And in September, 1842, Dupetit-Thouars, who had returned, once more expressed extravagant "wishes" to the government, and, when they could not be granted, proclaimed a French protectorate in defiance of the protests of the queen and the English missionaries. When a Tahitian popular assembly, relying on the intervention of the English Captain Nicholas, declared for England and Pomare IV (1843), Dupetit-Thouars on November 6th deposed the queen, and threw into prison the English consul, Pritchard, in whose house she had taken refuge. The storm of indignation roused in England by this procedure forced France in 1844 to reinstate Queen Pomare IV; but the protectorate over the island was retained. It was only after a three years' war, waged with great fury on both sides, that the Tahitians submitted on February 6, 1847, and the queen returned from Eimeo to Papeete.

Pomare IV died after a reign of fifty years, on September 17, 1877. Her son, Pomare V, abandoned all his imaginary sovereign rights to France on June 19, 1880, in return for an annuity of £1000, and died in 1891.

The political development has not been favourable in any way to the preservation of the national existence. In Cook's time the inhabitants were estimated at 120,000, a figure far too high, but one which in any case denotes an unusual density of population; in 1892 the numbers hardly reached 10,000. The introduction of disease, immorality, and drunkenness has taught the Tahitians a bitter lesson about the "blessings" of civilization.

(β) *The Remaining Archipelagoes.* — The history of the island groups which cluster round Tahiti, the Society, Tuamotu (Paumotu), Marquesas, and Tubuai (or Austral) Islands, is not without some anthropological, political, and religious interest. The picture presented to the discoverers was everywhere the same; war and discord prevailed, limited usually to the separate islands and groups. The warlike inhabitants of the Tuamotu island, Anaa, undertook even at the beginning of the nineteenth century bold expeditions to other islands, plundered them and carried off the inhabitants as captives, until a stop was put to their proceedings by the influence of Tahiti.

The relations between the natives and the Europeans in these parts were everywhere due to the instrumentality of the missions. It would have been well if the matter had rested with the introduction of one confession only. But the Protestant missionaries were soon followed on every group by Catholics under the protection of France. The inevitable result was an effort on the Protestant side to keep the intruders off, and on the side of the French Catholics to gain a religious and political footing. In all this the native was the scapegoat. Any infectious diseases which the traders had not introduced were communicated by the crews of men-of-war. The French tricolour now floats over the whole large group of islands, and the Romish propaganda has succeeded, though not to the full extent desired, in breaking down the undisputed power of Protestantism. European civilization as such has finally diminished the number of inhabitants and has put a mere caricature in the place of a nationality which, despite many dark traits, was primitive and vigorous.

(γ) *Rapanui* (*Easter Island*).—Te Pito te Henua, as the natives, or Rapanui, as the other Polynesians call the most remote islet of the vast island world, is, with its area of forty-five square miles, one of the smallest high islands of the Pacific Ocean. Nevertheless it draws our attention on account of one of the weightiest problems of ethnology, and thus of the history of mankind. If any connection at all exists between Polynesians and Americans, we must regard Rapanui as the most easterly pier in the bridge.

There is nothing in the ethnography of Easter Island, as known to the Europeans, which supports such a theory. Salmon, the Tahitian who accompanied the German "Hyena" expedition of 1882 under Lieutenant-Captain Geiseler, and the American "Mohican" expedition of 1886, reported indeed a story of the natives of Rapanui, according to which they are supposed to have come in a large boat from one of the Galapagos islands with the trade-wind and to have landed at Anakena in the north of the island; but he did not disguise the fact that this tradition was contrary to the ideas of other natives, who maintained that there had been an immigration from the west. The architecture of Rapanui is supposed to show resemblances to buildings in Central and South America; but the simple huts of the Easter Islanders are not to be compared with those colossal erections (*vide* the plates, pp. 264 and 314 of Vol. I). Again, the construction of the famous stone images, some fifteen feet high, made of lava (*hanga*) extends to comparatively recent periods, when there can be no possible idea of America's influence; besides this, productions of similar size, although not of quite the same character, were nothing extraordinary among the other Oceanians, at least in earlier times.

For this reason the modern relations between Rapanui and America are all the more frequent. Intercourse with the whites generally has indeed only brought the islanders misery and destruction hitherto. The beginning of the "mission of civilization" is marked by the landing of the Dutchman Jacob Roggeween, on April 6, 1722, who ordered the natives to be fired upon without any reason whatever. He found the island then most prosperous and densely populated, an appearance which it has long since lost. The natives were possibly too friendly and yielding to the whites. In 1805 the ship "Nancy" from New London, which had been engaged in seal fishery at Mas a fuera (southwest of Juan Fernandez) came to Rapanui and carried away twelve men and ten women after a desperate fight. The men, when, three days after, they were released from their chains on the open sea, sprang overboard immediately, in order to reach their home by swimming; but the women were carried to Mas a fuera. The "Nancy" is said to have made several subsequent attempts at robbery. The American ship "Pindos" later carried away as many girls as there were men on board, and on the next morning as a pastime fired at the natives collected on the beach. The most calamitous period began in 1863. Peruvian slave dealers then established a depot on Rapanui in order to impress labourers for the guano works in Peru from the surrounding archipelagoes; for this purpose they carried away the majority of the inhabitants of Rapanui. Most of them were, however, brought back at the representations of the French government; but unfortunately smallpox was introduced by them and caused great ravages. In 1866 Catholic missionaries began their work, but they left the island after a few years, accompanied by some faithful followers, and went to Mangarewa. The last reduction in the number of the population was

effected by the deportation of four hundred Easter Islanders by a Tahitian firm to Tahiti and Eimeo, where they were employed as plantation labourers.

The population has not been able to bear such frequent and heavy drains on its vitality. Estimated by Cook at 700, by later travellers at 1,500 souls, and numbering before 1860 some 3,000, it has dwindled at the present day to 150, whose absorption in the mass of the immigrant Tahitians, Chilians, and others is only a question of time. Since 1888 Rapanui has been used by Chili as a penal colony.

(8) *Pitcairn*.—The history of Pitcairn, an isolated island lying far to the southwest of the Tuamotu, is, during the period which we can survey, detached from the framework of native history; its personages are almost entirely European immigrants. Pitcairn is one of the few islands which were uninhabited when the Europeans discovered them, although numerous remains in the form of stone images, relics of Marae, stone axes, and graves with skeletons attest that the island was once populated.

The modern history of the island begins with the mutiny of the crew of the "Bounty" against their captain, Bligh, 1779 (p. 259). While the latter steered with his eighteen companions in his open boat to Batavia, the twenty-four mutineers sailed first to Tahiti. A part of them remained behind there (p. 315), while eight men, under the leadership of the helmsman Christian, accompanied by six Tahitian men and twelve women, set sail in January, 1790, for the uninhabited island of Pitcairn. In order to prevent any escape from the island, Christian burnt the "Bounty," whose tall masts might have betrayed the refuge of the mutineers. The beginning of the community was at once marked by disputes and quarrels; the men were killed in fighting, and in 1801, John Adams (formerly Alex. Smith, d. March, 1829), aged thirty-six, was the only man on the island, with some women and twenty children.

Adams, realising by the previous course of affairs the danger which threatened the little society, struck out other paths. By his care in educating the young generation a tribal community was developed which, to adopt Meinicke's expression, united many of the good qualities of the Europeans with the virtues of the Polynesians, and by its sterling character and high morality; won the sympathies of England to no small extent, especially since these colonists regarded themselves as Englishmen and spoke English as familiarly as Tahitian. England has always watched over the welfare of this little society. The limited water supply of the island having threatened to prove insufficient for the growing numbers, the eighty-seven inhabitants then living were removed by the English government to Tahiti in 1831; but most of them soon returned to Pitcairn. When, in 1856, in consequence of hurricanes it became difficult to find food for the once more rapidly increasing population, 187 of the 194 settlers were removed to the then uninhabited Norfolk Island. The majority remained there, and increased and prospered. In 1871 the number had risen to 340 souls; in 1891 it reached 738; and, according to the last account, it now is 900 souls. Some, however, this time also, could not live in a strange island, and returned to Pitcairn, where their number in 1879 had again risen to 79 souls.<sup>1</sup> Contrary to the disquieting rumours which the Ger-

<sup>1</sup> 1790, 27; 1800, 29; 1825, 66; 1831, 87; 1837, 92; 1841, 114; 1856, 194; 1864, 43; 1873, 76; 1879, 93; 1881, 104; 1898, 142; 1901, 126.

man press circulated in 1896, to the effect that Pitcairn no longer supplied the requirements of human inhabitants, the population is thriving at the present day.

(b) *Hawaii*. — (a) *The Pagan Period*. — The history of Hawaii begins for us with its discovery by James Cook; all that took place on it previously bears the impress of myth. The legends mention sixty-seven ancestors of Kamehameha I, and place therefore the beginning of the settlement of Hawaii at a period which would approximately correspond to the sixth century of the Christian era. As a matter of fact human bones have been discovered under old strata of coral and lava streams; in any case with such a system of chronology a large margin of error must be allowed for. Far more important is the exceptional evidence for the solution of the question of the origin of the Hawaiians. A large mass of the traditions point to the Samoan Sawaii (p. 307), as the chief point of emigration, without necessarily excluding accretions from other groups of Polynesia. The recurrence of Samoan geographical names in Hawaii is an argument in favour of the legends. If we may judge by the frequent mention which they make of Tahiti and the Marquesas the main route seems to have led over these islands.

A. Fornander arrives at the conclusion that, some twenty generations after the first immigration, about the eleventh century, that is, a new wave of nations touched Hawaii, produced by a general movement in the island worlds of the South Sea, which, again, was due to the expulsion of Polynesian immigrants from the Fiji Islands. Into this period, therefore, fall, according to legend, the journeys of famous chiefs and priests to distant isles, rendered possible from the greater enterprise of the ancient races and the higher perfection of navigation at that time. The first and only attempt at oversea expansion gave way to a fresh period of isolation, which lasts at least into the sixteenth century, probably down to the date of Cook's landing. During this long period the Hawaiian people developed all its peculiar characteristics; then it was that those numerous States and societies were founded, which were mutually hostile. The waves of war surged high in the fourteenth century, when King Kalaunuiohua tried for the first time to unite all the islands under his sceptre. The first intercourse with Europeans dates, according to James J. Jarves and Remy, from the sixteenth century. In 1527 one of the three vessels of Don Alvarado de Saavedra is said to have been wrecked on the cliffs of South Kona, and in 1555, the Spanish navigator Juan Gaëtano is supposed to have discovered the Hawaiian Islands. This intercourse, even if it is based on fact (*vide* Figs. 3a and 3b on the plate facing p. 334), produced no results on the external and internal history of the country.

James Cook, on his landing (1778), found three States: Hawaii and Maui, both of which were governed by one ruler (Taraïopu, Terriobu), since the ruler of Hawaii had married the queen-widow of Maui; and thirdly, Oahu, to which Kauai and Nuhau belonged. Not only were Oahu and Hawaii at war with each other, but all these States were riddled with internal dissensions. The task of reducing this chaos to order was reserved for Kamehameha I (Tamea-Mea; 1789-1819), who not only won more foreign successes than any other Polynesian ruler, but in intellectual gifts towered above the average of his race. He had distinguished himself in war as a young man, and national bards prophesied of him that he would one day unite the people. A few years after Cook's murder (February 14, 1779) he began to put into practice his bold plans, on Hawaii at first, and after its sub-

jugation, on Maui (1781) and the other islands. Partly by his personal valour, partly with an army disciplined by the help of Europeans (to which after 1804 a fleet of twenty-one ships was joined), he attained his object in 1795. After storming the fort "Pali" on Oahu, to which island Kamehameha is said to have crossed with 16,000 men, he proclaimed himself sole monarch of the Hawaiian Isles. The two northwest islands, Kauai and Nuhau, then voluntarily submitted.

Like the Zulu king Tshaka and the Wanyamwesi leader Mirambo (Vol. III, pp. 437, 443), Kamehameha has been compared to great rulers of the Mediterranean sphere of civilization. Turnbull places him by the side of Philip of Macedon, and Jarves calls him the Napoleon of the South Sea; to others he has suggested Peter the Great. He must have been a powerful personality. Adalbert de Chamisso was proud of the fact that he had shaken hands not only with General Marquis de Lafayette and Sir Joseph Banks, but also with the great Hawaiian. Kamehameha I was, as Theodor Waitz says, not merely great in intellectual capacity, he was still greater by his moral strength and the power and purity of his will. If we take into account also his majestic bearing, which commanded respect, the vastness of his influence is at once accounted for.

The course of Kamehameha's reign, after he had united his kingdom, was peaceful. It was for the Hawaiians an era of revolution in every field, though least so in that of social life. Kamehameha made no changes in the relations of the several classes of the people to each other and to the monarch. The lower class remained, then as formerly, in its strictly dependent and subservient condition, and he had further weakened the power of the nobility, which even before his time had been slight. A new feature was the external reputation gained by political union, and the growth of the people into a power unprecedented in the Pacific. This, at an early period for Oceania, had quickly turned the attention of the European powers and of North America to the north of the Pacific Ocean, as is shown by the numerous British, Russian, American, and French expeditions. The changes in the domain of culture and economics involved more momentous consequences for the future of the Hawaiian people. Only the higher classes of the people were materially Europeanised; the masses had to continue for some time in the old paganism and the ancient Polynesian semi-culture. Nevertheless it could not be long before the whole nation was subject to this change. Kamehameha neither intended nor suspected that it should take the form of a complete disintegration of the old national life. This decline was mainly produced by the introduction of European immigrants, who made their way into all the influential posts, and produced a temporary economic prosperity by transmarine commercial enterprise and a policy of tariffs; but at the same time their intimate relations with the natives were destined to destroy the old religion, the stronghold of Hawaiian nationality.

(β) *The Christian Period to the Extinction of the line of Kamehameha.* — As long as Kamehameha held the reins of government with the strong hand, the crash was delayed. Kamehameha was all his life a firm supporter of paganism, for only through a strict observance of the traditional doctrines was it possible in those times of ferment to retain the respect of the people for the person and power of the godlike monarch. His death, which occurred on May 8, 1819, changed the situation. Liholiho (Rio-Rio), his son, who mounted the throne as Kamehameha II, immediately sank to be a puppet in the hands of his nobles, and

especially of his co-regent Kaahumanu (Kahumonna), the favourite wife of the late king, and his aged chief counsellor, Kaleimoku (Karemaku), the "Pitt of the South Sea." At their advice he abolished the ancient and revered custom of *Taboo*, and compelled women to share a large public banquet and to eat the pork which was forbidden them. The majority of the people gladly welcomed this step. The minority, who, under the lead of Kekuaokalani, a cousin of the king, remained true to paganism, were defeated in the sanguinary battle of Kuamoo; Kekuaokalani fell, together with his heroic wife, Manona. The destruction of the old temples and images, already initiated, was carried out with renewed zeal; nevertheless idolatry had many supporters in secret. The half-heartedness of the reforming policy was more unfortunate; the Hawaiians had been deprived of paganism, but nothing tangible was put in its place.

The visits of European and American squadrons during this period induced the monarch to seek an alliance with England, particularly since Russia and the United States had already shown signs of establishing themselves permanently in the archipelago. Kamehameha I, in order to increase his dignity at home by the support of the great world power, had made over his kingdom to England in February, 1794, but his offer did not meet with any cordial response. In 1823 Liholiho and his consort, Kamamalo, went to London, in order in this way to anticipate the wishes of others. They both died in 1824 in England, but were buried in their native country. Liholiho's successor, his brother Keaukeanoui (Kauikeoui, Kiu-kiuli), was only nine years old when he was placed on the throne under the name of Kamehameha III. The regency during his minority was held by Kaahumanu and the old and tried Kaleimoku. Both found work enough in the succeeding years. It is true that Protestant missionaries had laboured since 1820 with good results; but all their efforts were stultified by a faction of morally and physically corrupt white immigrants, whose numbers grew from year to year. Drunkenness and prostitution became so rampant that no improvement of the conditions could be hoped for except by means of legislation. Toward the end of the "twenties" the contest of the Christian missions for supremacy began on Hawaii. The Protestant mission was under the protection of the Americans: the Catholic only gained ground after numerous threats from the French warships under Dupetit-Thouars (p. 315). In the year 1837 the French extorted a declaration of universal religious liberty, which put an end to the violent persecutions often suffered by the Catholic Christians.

The wise Kaleimoku died in 1827, and the death of the energetic queen-regent, Kaahumanu, followed in 1832. Kamehameha III declared himself of full age in 1833, when he chose another woman, Kinau, for his co-regent, and nominated her son, Alexander Liholiho, heir to the throne.

The first newspapers printed in the Hawaiian language appeared in 1834. Churches and schools of every sort were erected in large numbers. At the same time the first sugar plantations were laid out, and silkworm-breeding introduced on the part of the English. Soon cotton-growing was added as a new branch of industry. In October, 1840, the kingdom received its first constitution. It was drawn up by the American, Richards, and presented, as Karl Emil Jung expresses himself, a strange mixture of ancient feudalism and Anglo-American forms. The ministry consisted entirely of foreigners. Richards became minister of public instruction; Wylie, a Scotch doctor, represented the Foreign Office. The finances

were administered after 1842 by Dr. Judd, under whom the public revenue increased from forty-one thousand dollars in the year 1842 to two hundred and eighty-four thousand dollars in 1852.

In spite of religious toleration the disputes between the Protestant and Catholic clergy continued until the year 1837. They were often exploited by the French consul in order to put strong pressure on the Hawaiian government in favour of the Catholic mission. At the same time the English consul took steps which seemed to point to an annexation of the islands by Great Britain. This induced the Hawaiian government to obtain a guarantee of the independence of the kingdom from the United States of America (December, 1842), France (at the beginning of 1842), and England (July 26, 1843). The action of Lord Paulet, commander of the frigate "Carys," in taking possession of the island (February 25, 1843), on his own responsibility, was not recognised by the British government.

The constitution of 1840 was changed in 1852, 1864, and on July 6, 1887; with every revision it resembled more and more the usual European constitutional forms, especially when in 1864 the old institution of the *Kuhina nui*, or queen regent was abolished. A privy council, consisting of the ministers and a number of members nominated by the king, stood next to the sovereign. The cabinet contained first five, and later four, members; the parliament was composed of a house of nobles and a house of representatives. The most important offices have always been filled with foreigners.

Kamehameha III died in December, 1854. His successor, Alexander Liholiho (Kamehameha IV, married to Queen Emma), then aged twenty, lost no time in placing himself on better terms with France, which, in defiance of the independence guaranteed in 1843, had overwhelmed the kingdom with difficulties and had repeatedly humiliated it. A final treaty between the two countries was effected in 1858. On the death of Kamehameha IV in 1864, his elder brother, who had something of Kamehameha I in him, succeeded to the crown. The first act of Kamehameha V was to alter the constitution of 1864. In the next year an immigration bureau was instituted as a check on the constant shrinkage in the population; five hundred Chinese were first brought into the country, to be followed by the first Japanese in 1868. Finally measures were taken to check the leprosy which had been introduced from China in 1853, and had spread alarmingly. Kamehameha V died suddenly in 1872, the last of his family.

(7) *The Last Period of Hawaii as an Independent State.* — For some months Lunalilo, a kinsman of the Kamehamehas, held the sceptre. After his death, which occurred on February 3, 1874, Colonel David Kalakaua, born on November 16, 1836, in Honolulu, was elected king. In spite of his somewhat frivolous nature he was a far-sighted monarch; he concluded in 1875 a commercial treaty with the United States of North America, which secured for his kingdom the most favourable tariffs and greatly promoted the prosperity of the islands. The cultivation of sugar and rice, the two principal exports, increased enormously, and indeed there was a general increase both in exports and in imports. But this revival of trade benefited only the whites. Want of labourers made it once more necessary to introduce foreigners. In 1877 the first Portuguese came into the country from the Azores (in 1884 there were some 10,000); at the same time increasing streams of Chinese and Japanese flooded the land (in 1890 there were counted 15,301 and 17,360).

The numerical proportion of these ethnically undesirable Mongols to the native population has, up to the beginning of the twentieth century, steadily increased. In moving forward to the conquest of the Pacific, the yellow races have found Hawaii the best point of attack. The growth of economic and political relations with America during the reign of Kalakaua (1874–1891) has been as rapid and continuous as the Mongol immigration. As long ago as the winter of 1873–1874, Pearl Harbour near Honolulu was offered by Lunalilo to the Americans by way of compensation for commercial concessions. When the treaty of 1875 required to be renewed in 1887, the United States of North America claimed this place as a permanent possession; further, Hawaii was not to venture to conclude treaties with any other foreign power without their consent, while they claimed the right to land troops in Hawaii at all times. The influence of the English residents prevented Kalakaua from conceding these humiliating conditions. The refusal of the American proposals signified, from an economic aspect, the beginning of a financial crisis, by which, in the opinion of Adolf Marcuse, the Hawaiian dynasty was ruined.

Kalakaua died on January 20, 1891, at San Francisco. The seventeen years of his reign had been outwardly rich in "progress." He had a small standing army at his disposition; Hawaii had obtained lines of railroads and steamships; palaces and lighthouses had been built, and Honolulu lighted by electricity. Waterworks and telegraph lines had been constructed, and large stretches of barren country had been made cultivable by irrigation works. The stage of European civilization commenced, it must be confessed, with an enormous load of debt, attributable to the frivolity and the extravagance of the popularly beloved king, who had been married since 1863 to Kapiolani, but had no issue.

He was succeeded by his sister, Lydia Kamakaeha Liliuokalani, a woman of fifty-two, who was proclaimed queen on January 29, 1891. Her short reign ended with the downfall of the Hawaiian monarchy and the annexation of the island by the United States. Under the dominion of the new American tariff laws, which secured considerable export bounties to native sugar producers, Hawaii could no longer compete in the world market; exports rapidly fell off, and the national prosperity flagged. The foreign section of the population, which was dependent chiefly on the American trade, found this a reasonable cause for supporting more boldly the idea of close connection with the United States. The results were dissensions in the government, an over-rapid change in the constitution, which was intended to weaken the influence of the foreigners, and a threatened *coup d'état* on the queen's part. The end was the deposition of the queen and the proclamation of Hawaii as a republic on January 17, 1893.

The efforts of the victorious Americanists of Honolulu toward a close connection with the United States were at first unsuccessful. The President, Benjamin Harrison, shortly before the expiration of his term of office which ended on March 4, 1893, advocated annexation in a message to the senate; but his successor, Grover Cleveland, was opposed to it. The kingdom thereupon was declared to be changed into the republic of Hawaii on July 4, 1894, and a constitution was framed, which provided a legislative assembly, a senate, and a house of representatives. The constitution, however, hardly lasted long enough to become an actuality; after McKinley's entrance on office in the spring of 1897 the incorporation with the Union was effected without any difficulty. The constitutional position of the

island group was settled on June 14, 1900. Hawaii now forms a territory of the United States; the popular element in its government consists of a senate with fifteen members and a house of representatives with thirty members. The first election of a representative to Congress took place on November 6, 1900. The governor, a secretary, and the three judges of the supreme court are nominated by the president of the United States, the other officials by the governor.

The planting of the stars and stripes in the middle of the Northern Pacific Ocean is not the first step which American imperialism has taken since 1898 (*vide* Vol. I, p. 574), but it is one of the most momentous. Tutuila in the Samoan group and Guam in the Marianne Islands are both like feelers which are stretched out far towards the southwest in the direction of Melanesia and Australia; the broad surfaces of the Philippines flank the important international trade route from Europe to the eastern margin of Asia. In the case of Hawaii a higher standard must be applied. When the Isthmus of Panama has been cut through, and the United States really becomes a power in the Pacific, then Hawaii, apart from its trade, will be indispensable as a strategic base commanding the northern half of the Pacific. It will be the only intermediate station on the long route from the Central American canal and from San Francisco to Eastern and Southern Asia. The annexation of Hawaii by America is a particularly hard blow for Japan, which had itself been forced to see a similar attempt fail; nor is it welcomed by England, Germany, Russia, and France.

Only remnants are now left of the native race, and only traces of the nationality of Hawaii. There has been an uninterrupted decline in the native population since the discovery of the islands. In 1778 there were estimated — though the calculation is certainly excessive — to be 400,000 souls; in 1832 the first actual census gave 130,313 natives. Four years later there were only 108,579; in 1850, 82,203; 1860, 71,019; 1872, 49,044; 1884, 40,014; 1896, 30,019. At the present day it is extremely difficult to fix the number of pure natives, on account of the numerous half-castes, whose numbers were put at 6,186 in 1890, and 8,485 in 1896; an increase of more than 33 per cent in six years. At the same time the full-blooded Hawaiians have diminished by 10 per cent. These make up barely a fifth of the whole population (in 1900, 154,000 souls); they are therefore less than the Chinese and Japanese taken separately, and will soon be equalled by the Portuguese. We cannot make the Europeans entirely responsible for the alarmingly rapid retrogression of the Hawaiians. Besides the diseases introduced by the former, the original laxity of morals, the drunkenness, various epidemics, and more than all, the traditional practice of infanticide, have been the chief causes. In place of the natives there will soon be only Chinese, Japanese, Europeans, and Americans in Hawaii.

(c) *Samoa*. — More labour has been devoted of recent times to the investigation of the history of Samoa than to that of all the other Polynesian island groups put together. The results obtained are hardly proportionate. The long list of proud genealogies with an infinity of names tells of the vigorous life of the petty States on the several islands and their divisions; tradition also records various invasions from Fiji and Tonga. But we do not obtain the smallest information about the date of the various events to which the legends refer. The investigations of George Turner, W. von Bülow, O. Stübel, Augustin Krämer, and others go to prove that

the general conditions of Samoa in the periods before its discovery by Europeans was hardly distinguished from that of other archipelagoes. Its political organisation and to some degree its stage of social institutions had alone been somewhat more fully developed. The vendettas and disputes between different influential families, which are also recorded, are of little importance to the world, although they have naturally been exaggerated to great events from the perspective of the Polynesians.

(a) *History of Samoa Proper.*—The traditions of Samoa do not run back very far; we need not assume more than five hundred years for its inhabitants as a historical nation; how far before that date their immigration must be placed, is impossible to calculate. The chief event of early history is the subjugation by the Tongans, and the Samoan war of liberation which was connected with that (according to Von Biilow, about 1600 A. D., according to Krämer about 1200 A. D.). That was their heroic age. *Malie tau, malie toa* ("Well fought, brave warriors") was, according to legend, the admiring shout of the Tongan king to two young chiefs, as he pushed off from shore on his return journey. This title, which then passed to the elder of the two brothers, Savea, has been hereditary in his family down to the present day.

Samoa is the land of titles. Above the common people stand the nobles, at the head of whom are the village chief *Alii*, and the district governor *Tui*, while the highest chief (king) bears the title of *Tupu*. Little inferior to him are the *Tulafale*, or orators, whose political position, generally, depends entirely on their personal abilities. Besides this, titles taken from certain districts or places, in commemoration of certain persons or events, are conferred as honourable distinctions, whose possession is a preliminary condition for the attainment of the political headship. The most famous of these titles is the above mentioned "*Malietao*," which the township of *Malie*, lying nine miles to the west of *Apia*, has the right to confer; a second and hardly less renowned is "*Mata'afa*," which is bestowed by the village of *Faleata*. On the other hand, the claim to the sovereignty rests on the lawfully conferred right to the four names, *Tuiatua* and *Tuiaana*, *Gatoaitete* and *Tamasoalii*, the last two of which are traced to the names of two princesses.

Shortly before *Jean François* Count *Lapérouse* landed on Samoa, in 1787, *Galumalemana*, a chief of the *Tupua* family, had, after fierce civil wars, usurped the sovereignty of the whole island. On his death, about 1790, violent struggles broke out between the brothers entitled to the inheritance, from which at first *Nofoaesea* (an ancestor of *Tamasese*) emerged victoriously. He could not, however, permanently maintain his position, but retired to his ancestral home, *Asau*, on *Savaii*, and once more revived the cannibalism which had almost been forgotten in Samoa. *Galumalemana's* posthumous son, *Panafana*, who even before his birth had been called by the dying father prophetically the uniter of the kingdom, finally inherited the throne. He was succeeded (after 1800) by *Mata'afa Filisoumu'u*, who was at once involved in serious wars with the *Malietaos*. The victory rested with the *Malietao Vainupo*, an ally of the ruler of *Manono*, who conquered the country of *Aaana* and seized the power on the same day of August in the year 1830 on which *John Williams* (Vol. VII, p. 362) set foot on *Savaii* as the first missionary. *Malietao* assumed in consequence the title "*Tupa*," which has since been customary in Samoa. He also was converted to Christianity, and received the name of *Tavita* (*David*); he died on May 11, 1841.

The two decades after his death were in Samoa once more a war of all against all. Out of the number of claimants to the throne, Malietoa Laupepa and his uncle Pe'a, or Talavou, finally held the power jointly for some years. But influenced by the foreigners in the country, the Samoans in 1868 resolved to put only one chief at the head of affairs, and to assemble the estates of the realm no longer in Manono, but in Mulinuu, near Apia. Manono, jealous of its ancient precedence, declared Pe'a king, and conquered Malietoa Laupepa and his followers. Finally, in 1873, through the intervention of the foreign consuls, who had been appointed in the interval, a treaty was concluded, by which the ruling power was put in the hands of the seven members of the Ta'imua, an upper house, by the side of which the meetings of the district governors, the Fai Pule, or lower house, still continued. But in 1875 disorders recommenced, and this time the impulse came from outside.

(β) *The Invasions from Outside.*—As far back as 1872 the enterprising New Zealanders had advocated a British annexation of Samoa, and had offered to equip a ship for that purpose. At the same time the United States had obtained, on February 17, 1872, the concession of the harbour Pango-Pango on Tutuila, the best of the group. The annexation of all Tutuila, proclaimed by a sea captain on his own responsibility, was not sanctioned in Washington. About the middle of 1873, the American "Colonel" Steinberger, a German Jew by descent, appeared as a commissioner in Samoa, in order to study the resources of the island group. This cunning and ambitious man soon raised himself to the most influential position, and induced the natives to ask for a protectorate of the United States. Steinberger himself conveyed the petition to Washington; he returned on April 1, 1875, to Samoa, but only with presents and a letter of introduction from the President, Ulysses S. Grant. Steinberger gave the country a simple constitution, appointed Malietoa Laupepa king (nominally), while he himself modestly assumed the title of "Prime Minister;" he settled the succession, arranged the system of jurisdiction, and established order and peace throughout the land. But in December, 1875, at the instance of the jealous missionaries and the English population, he was carried off by an English man-of-war, after a bloody battle, and taken to New Zealand. He died in New York toward the end of the century.

The intentions of the Union on Samoa were now more apparent; in 1887, the American consul hoisted his flag, and only the energetic remonstrances of Germany and England hindered the Americans from firmly establishing themselves. In June of that year the German government concluded a treaty with the Samoans, by which they were prevented from giving any foreign government special privileges to the prejudice of Germany. On January 17, 1878, the Americans, for their part, entered into a treaty, to secure friendly relations and promote trade, with Malietoa Laupepa; at the same time the harbour of Pango-Pango was definitely given over to them. On January 24, 1879, Germany was assigned the harbour of Saluafata, on Upolu, as a naval station; England also, by a treaty of August 28, 1879, secured for herself the use of all these waters, and the right to choose a coaling station. On September 2, by a treaty between Germany, England, the Union, and Malietoa, the district of Apia was declared neutral territory, and placed under a municipal council to be appointed by the three powers in turn. Finally, on December 23, on board the German ship "Bismarck," Malietoa Talavou (Pe'a) was elected, by numerous chiefs, to the dignity of king for life, with Laupepa as regent.

Since the middle of the "fifties" the Hamburg merchant house of Johann Cesar Godeffroy and Son had made the South Sea the chief sphere of its enterprises, and, a decade and a half later, had monopolised the trade with the central and eastern group of islands; it had also acquired large estates on the Carolines and the three large Samoan islands, Savaii, Upolu, and Tutuila. Misfortunes on the stock exchange placed the firm, toward the end of the "seventies," in so precarious a position that, in view of the Anglo-Australian movement to occupy all the unappropriated South Sea Islands, Prince Bismarck abandoned his colonial policy of inaction, and, at the beginning of 1880, introduced the "Samoan proposition," by which the empire was to interfere and undertake to guarantee the small tribute due from the Godeffroys. But the German Reichstag rejected the proposition on the third reading on April 29, 1880; "where difficult duties can only be discharged by the resources of a nation, there our German history shows merely a list of wasted opportunities" (Oskar Peschel).

(7) *Samoa and the Powers.*—King Malietoa Talavou died on November 8, 1880. His nephew, Malietoa Laupepa, was totally unable to check the renewed outbreak of civil war among the natives; in fact, at the beginning of 1886 one party chose, at the advice of Eugen Brandeis, the chief Tamasese as king. He found support from the Germans, because Laupepa, in November, 1885, had secretly offered the sovereignty to England. Continued injury to German interests, and insults and outrages inflicted by Laupepa's adherents on German civil servants, led, in August, 1887, to Laupepa being arrested by German marines, and taken first to the Cameroons and then to the Marshall Islands.

Tamasese's rule was also brief. On September 9, 1888, the adherents of Malietoa Laupepa proclaimed the renowned Mataafa king, and defeated Tamasese. When his people ventured on outrages against the Germans, the two German warships lying off Apia, at the request of the German consul, Knappe, landed their crews; but through treachery they fell into an ambush on December 18, and were almost annihilated. Stronger German detachments were required before the rebels were repulsed. In addition to this, a hurricane, on March 19, 1889, wrecked the two German gunboats, "Eber" and "Adler," in the harbour of Apia, and ninety-five brave sailors lost their lives. The English ship, H.M.S. "Calliope," escaped by steaming out, and the captain, Kane, displayed the greatest skill and seamanship. The Americans suffered nearly as heavily as the Germans.

A settlement of Samoan affairs was the result of the conference held in Berlin during the summer of 1889, to which Germany, England, and the United States sent representatives. In the final protocol of June 14 the island group was declared independent and neutral under the joint protection of the three powers. Tamasese and Mataafa were deposed, and Malietoa Laupepa, who had been brought back to Samoa in late autumn, was reinstated on the throne. Mataafa, however, was soon re-elected king by his party; but in 1893 was conquered on Manono and banished by the powers who signed the treaty. Tamasese the Younger took his place, and the civil war continued. Malietoa Laupepa then died on August 22, 1898. Only two candidates for the succession were seriously to be considered,—the banished but popular Mataafa, and Tanu Mafili, the son of Laupepa, aged sixteen, a *protégé* of the English mission, and thus of the English and American governments. Tamasese the Younger was kept by the English in reserve merely as a substitute for Tanu.

The subject of the drama, which was unfolded in the winter of 1898-1899 in the distant South Sea archipelago, was not so much the welfare of the few Samoans or the possession of the small islands as far weightier conflicting interests. No words need be wasted about the causes of the intense Anglo-Australian longing for the islands. The United States of North America, who had obtained Hawaii and the Philippines immediately before this, thus possessed magnificent strategic and commercial bases for the northern part of the Pacific, but not for the south. The interests of Germany, finally, were based on economics. In production and trade it considerably surpassed both parties: and it was a point of honour with the German government not to let the prize which had once been grasped escape in the end from their fingers.

The Samoans chose Mataafa by an overwhelming majority. At the same time the American Chief Justice Chambers, on December 21, declared that the young Tanu was elected with his approval, and that Mataafa could not come into the question, since he was excluded by the Berlin protocol, although a clause to that effect proposed by Prince Bismarek had not been adopted in the final version. The remonstrances of the German consul, Rose, and the German municipal councillor, Dr. Raffel, were disregarded. Mataafa then took the matter into his own hands and drove the supporters of Tanu out of Apia down to the sea and the ships of the allied powers. After repeated bombardments of the coast villages by the British and American war vessels in the second half of March, a joint committee of inquiry was instituted in the spring of 1899 at the suggestion of Germany, and this transferred in July the rights of the abolished monarchy temporarily to the consuls of the three powers. In the treaty of London of November 14 Germany and England came to an agreement, and in the Washington protocol of December 2 the United States also gave their assent.

Great Britain under this treaty entirely renounced all claim to the Samoan Islands. By the repeal of the Samoa act, Upolu and Savaii, with the adjacent small islands, became the absolute property of Germany, while Tutuila and the other Samoan Islands east of 171° W. longitude fell to the United States. Germany in return renounced her claims to the Tonga Islands and Savage Island in favour of England, and ceded to the same power the two Solomon Islands, Choiseul and Isabel. The German Reichstag approved the treaty on February 13, 1900. On March 1 the newly nominated German governor, Solf, took formal possession of the islands. On August 14, finally, the wisely conceded self-government of the natives came into force again. The royal dignity alone was abolished. Mataafa bore, instead of the former title of Tupu, that of a Alii Sili, or high chief.

(d) *Tonga*. — Of the islands in the central part of Oceania, the Tonga archipelago alone, besides Fiji and Samoa, has a noteworthy history. We know little of its course before the arrival of James Cook, with exception of the social conditions. At the head of the constitution stood the Tuitonga, monarch and god at once, with absolute power over persons and property. Almost equal to him in reputation and sanctity was the Tui Ardeu, according to Meinicke the descendant of a dethroned royal family, which had still retained a special position. The Tuitonga had to show peculiar honours to the Tui Ardeu on different occasions. The king and his family composed the first class ("Hau") of the nobility. The second (the "Eiki," or "Egi," who also bore the title Tui, or lord) furnished the highest

officials in the kingdom and the district governors, and was appointed by the king, although the dignity was hereditary. The first of the Eiki was in pre-European times the Tui Hatakalawa, the minister of the interior; in Mariner's time (1810) he came in precedence after the Tui Kanakabolo, or war minister. Since in the nineteenth century the Tuitonga was excluded from all share in the wars, the war minister easily attained to greater influence than the monarch himself; indeed, the Tui Kanakabolo has been taken by more than one traveller for the Tuitonga. Among the Eiki titles, those of the Ata, the highest commander in war, and of the Lavaka, the minister of public instruction, were also of importance. The last class of nobility (Matabule) furnished councillors and servants of the Eiki and the Tuitonga, district governors, public teachers, and representatives of the most honourable crafts, such as shipbuilding and the making of weapons. The three classes of nobility were the sole possessors of the soil, as well as of the power of Taboo. The common people had no share in either; it only possessed its personal freedom, and supported itself merely by the cultivation of the lands of the nobles, by handicrafts, or by fishing. Among handicrafts those requiring superior skill were reserved for the higher class of the commons, the Mua, while agriculture and the profession of cooking were assigned to the lower class, or Tua.

Cook in 1773 and 1777 found the glory of the old dynasty, Fatafehi (Fatafahi), already eclipsed by the power of the Tupu nobles, who had secured all the important offices of State. According to Meinicke, the Tuitonga might apparently only take their wives from the family of Tupu. Toward the end of the eighteenth century this concentration of power had increased to the extent of driving out the Tuitonga. This roused other Eiki families to imitate the example of the Tupu. The regents of Hapai and Vavau first revolted; those of Tongatabu followed. After long struggles the victory rested with Finau, the Eiki of Hapai, although he could no longer force the whole archipelago to obey his rule. At the beginning of the nineteenth century the Finau shifted the political centre of gravity to Vavau. In 1830 Tautaaahu, the lord of Hapai, and Tubo, the Eiki of Tongatabu, adopted Christianity. When the Finau died out in 1833, Vavau fell to the former. In this way Tautaaahu governed over the same kingdom as Finau I thirty years earlier. In 1845 Tubo, or, as he was called after his conversion, Josiah of Tongatabu, died also. Tautaaahu, as King George Tubou I, now united the whole archipelago into one kingdom. This State bore from the first the stamp of European influence. The Wesleyan mission had soon extended its activity to political and social matters. In 1839 George issued an edict for Hapai and Vavau, which established a court of justice of four members and a written code, and abolished the old customs, according to which each chief administered justice at his own discretion. The legislation of 1862 finally raised the existing serfs to the position of free farmers of the soil, from which they could not be ousted so long as they paid their rent. The taxes (six dollars yearly) were uniformly imposed on all male inhabitants over sixteen years of age.

After 1838 on Tonga also there were quarrels between the Catholic and Protestant missions. In December, 1841, threats of a French warship caused the ruler of Tongatabu to seek an English protectorate, which was granted him. The Catholic missionaries, however, obtained admission. Their success in the religious field was never important; but in the political field they had even in 1847 so great an influence over Tongatabu, that the chiefs of that part commenced an oppo-

sition to the rule of George I, which was only repressed in 1852 by the storming of the fortresses Houma and Bea, defended by French missionaries. Although the chiefs were reinstated in their former posts, and the missionaries received no injury to life or property, France felt herself aggrieved, and extorted in 1858 an official permission of the Catholic teaching, and put various Catholic chiefs in the place of Protestants.

King George, notwithstanding, found time to make expeditions to other countries. The Tongans had at all times, owing to their great nautical skill, undertaken campaigns against Samoa and Nuka Hiwa, and had caused panic especially in the neighbouring archipelagoes. The people of Fiji had thus a strong tinge of the Polynesian in them. A few years after Cook's second visit (1777), a Tongan condottiere played a great part in the Fijian disorders. In 1854 King George appeared with a large fleet, avowedly to support Thakombau in his difficulties (p. 313). This expedition gave the Tongans subsequently a pretext for claiming large compensation, which finally drove Thakombau into the arms of England.

George Tubou I completed the internal reforms of his island kingdom by the constitution of November 4, 1875. This was partly the creation of the king himself, partly that of his old and loyal councillor, the missionary Shirley Baker. Its contents kept closely to English forms; in its ultimate shape, as settled by the chambers and printed in the English language in 1877, it provided for a legislative assembly, which met every two years. Half of its members belonged to the hereditary nobility and were nominated by the king; the rest were elected by the people. The executive power lay in the hands of a ministry of four, who, together with the governors of the four provinces and the higher law officers, composed the cabinet. The administration of justice was put on an independent footing, and comprised a supreme court, jury courts, and police courts. Education was superintended by the missionaries, who had erected well-attended schools on all the islands. An industrial school and a seminary, which was called Tubou College in honour of the king, were founded. The prohibition against the sale of land to foreigners, which was inserted in the constitution at Baker's advice ("the Tongans are not to be driven into the sea"), was important for the economic future of the Tongans; even leases of land were only allowed after notice had been given to the government.

In view of the increased interest which the European powers in the "seventies" took in the South Sea Islands, Tonga with its favourable situation could not permanently be neglected. King George and his chancellor, Baker, were on terms of open friendship with Germany. On the outbreak of the Franco-German War they assured King William of their absolute neutrality. On November 1, 1876, this "good-feeling" took the form of a commercial treaty, establishing friendly relations with the German Empire, according to which the harbour of Taulanga on Vavau was ceded as a coaling station. The accompanying request of George Tubou for a protectorate was naturally declined by Germany. On November 29, 1879, Tonga concluded a similar treaty of amity with England. By an agreement of April 6, 1886, Germany and England decided that Tonga should remain neutral territory. On August 1, 1888, a treaty was made with the United States.

King George Tubou I, died on February 18, 1893, at his capital, Nukualofa, aged ninety-five years. He was succeeded by his great-grandson, George Tubou II, a timid youth of nineteen. Down to the time of his accession German trade and

influence had outstripped English. But when the prime minister Baker had fallen a victim to English intrigues, and the service of the North German Lloyd to Tonga and Samoa, under subsidy from the empire, had been discontinued, the English occupied the vacant position. When, in March, 1899, the German warship "Falke" appeared off Tongatabu, nominally with orders to occupy the harbour of Taulanga until Tongan debtors had paid the sum due of \$100,000 (according to Moritz Schanz merely with orders to induce the king to open the Tongan courts to the recovery of debts to foreigners), an English warship from the Australian station sailed in on April 10, paid George II \$125,000 on the sole condition that the king made no concessions whatever of landed rights to any foreign power; in return for this, England renewed her guarantee of independence for Tonga. Since that time the group of islands has only been valuable to Germany as the object of an exchange; in the treaty of November 8, 1899, she abandoned all claims in exchange for half Samoa (p. 321). Thus Tonga and the adjoining Niué (Savage Island) were placed, in spite of the protest of King George II, under a British protectorate on May 19, 1900.

With the Tongan kingdom, the last of the native States of Oceania disappeared. It is true that the constitution, formulated on a European model, was in many details unadapted to the Polynesian nature. But Tonga preserved many other points which recalled the old nationality. These relics of an indigenous development are fated soon to die away.

(e) *New Zealand.*—(a) *The Position and Physical Features of New Zealand.*—New Zealand, which from weighty considerations is better treated here than in connection with Australia, occupies a geographical position which reminds one strongly of that of the neighbouring continent. To the south and east of New Zealand, the ocean is quite free from any considerable islands; only toward the north and west are relations possible with the habitable world: on the one side with Australia and Tasmania, on the other with New Caledonia, Fiji, Tonga, and the Cook Islands. New Zealand is so situated as regards all these countries that the lines of communication with it are almost radii of a circle, a fact important geographically and historically. It was merely a consequence of the inferior seamanship of their inhabitants that the original immigration to New Zealand did not take place from Australia, New Caledonia, and Fiji.

New Zealand lies about twelve hundred and fifty miles from the countries just mentioned. This distance, in spite of their advanced nautical skill, was too far for the navigation of the Polynesians, and thus must have prevented any permanent and systematic expansion of the Maoris; their naval expeditions did not go beyond one or two voyages to the Hawaiki of legend (p. 307), and the occupation of the neighbouring Chatham Islands (Warekauri), which was effected in 1834 with the help of a European captain. The case was otherwise for the New Zealand of the Europeans. Two or three generations ago its proximity to Australia and Tasmania enabled a thorough and rapid scheme of colonisation to be carried out thence; at the present day when it feels itself strong in the number of its inhabitants and its resources, it lies far enough off to be able to entertain the idea of an independent national existence by the side of the Australian commonwealth. A feeling in favour of independence was discernible as early as 1860 or 1870, hardly a generation after the beginning of the colonisation proper. The interference

of New Zealand in Samoan affairs in the year 1872 (p. 326), was followed by the annexation of the Kermadec Isles to New Zealand, in 1887, and that of the Cook Islands and Manihiki in 1900; Fiji appears nearing the same destiny now (p. 312). The influential circles of New Zealand are universally of opinion that all the island groups of Polynesia belong to it as naturally as, according to the idea of the Australians, the Western Pacific Ocean falls within *their* magic circle. Each of the two countries feels itself a leading power in the southern hemisphere; hence the grandiose phrase, "the position to which this land is entitled in the concert of the powers" used in 1900 by Richard Seddon, the prime minister of New Zealand.

Although the population of New Zealand, according to the census of 1900, amounted to little more than that of Glasgow (eight hundred thousand souls), it would be unwise to ignore those pretensions. Apart from their advantageous position for the command of the Southern Pacific Ocean, the two islands possess a coastline so greatly indented that it surpasses Italy itself in the number of bays. Besides this, it now produces gold and coal in considerable quantities, while copper, silver, iron-ore, sulphur, platinum, and antimony are also to be found plentifully.

New Zealand, lying entirely within the temperate zone, possesses a further advantage in its climate, which, judging by the physical and intellectual qualities of the Maoris, must be credited with a considerable power of modifying racial types for the better, unless it be indeed the case, as is sometimes asserted, that it has a bad effect on the physique of Europeans (p. 241). Agriculture in New Zealand, as in Australia, is diminishing; although the climate is temperate, there are cold nights in summer, which makes the produce of the harvests very variable. Nevertheless there are more than seven hundred thousand acres of land under cultivation at present; according to rough calculations twenty-six million acres, (nearly forty thousand square miles), or two-fifths of the entire surface, are suitable for agriculture, though at present more than two-thirds of the country is covered with forests. The backbone of the industries of New Zealand, as of Tasmania, which in many respects enjoys the same climatic conditions, is the breeding of cattle and sheep. This industry is steadily growing, as cattle can remain out in the open and find sufficient food the whole year through. It is owing to this advantage that New Zealand has outstripped Australia, which lies several days' voyage nearer the Old World, in the export of frozen meat. Of the exports for the year 1899, amounting nearly to £12,000,000, not less than £8,000,000 came from animal products; minerals produced £1,600,000, agriculture only £900,000.

(β) *The History of the Maoris to the Year 1839.*—The original inhabitants of New Zealand, the Maoris, were only benefited by the advantages of their country to a certain degree; their physique indeed was improved there; but industrially they were not able to profit by the green fields or the splendid forests of Kauri pine. They only made use of the native fauna, so long as there were creatures to hunt and eat; even yet the heroic ballads of the Maoris tell of conflicts with the gigantic moa, the first species of the fauna, which had lived on for thousands of years unmolested, to fall a victim to the intrusion of man.

The first Maoris immigrated into the two islands, then uninhabited, fully five hundred years ago; in the course of time batches of fresh immigrants followed them, the last perhaps in the eighteenth century. The point from which the

## EXPLANATION OF THE POLYNESIAN ANTIQUITIES AND CARVINGS DEPICTED ON THE OTHER SIDE OF THE PAGE

Fig. 1. Maori coffin, under side. Some three generations older than Cook, dating therefore from the second half of the seventeenth century. With two richly tattooed human figures, male and female. The hole in the centre was used to place the coffin on a wooden pole rising higher than a man's head from the ground.

(From the original in the Ethnological Museum at Berlin.)

Fig. 2. Pou Pou, carved under-side of a wall-pillar in the great meeting-house of Ohinemutu. The richly tattooed figure is supposed to represent Tama-te-Kapua, the great ancestor of the Arawa, presumably walking on stilts.

(From the original at Ohinemutu in New Zealand.)

Figs. 3 a and b. Large sculpture in basaltic lava, found on the island of Oahu, in the Hawaiian group. The figure represents an old-time European with wig, pig-tail, and ruff, presumably one of the old, otherwise unknown Spanish navigators, who had "discovered" Hawaii long before Cook.

(From the original in the Ethnological Museum at Berlin.)

Fig. 4. Korupe. Lintel from an old house in New Zealand. From Cook's collection, but even then ancient, probably belonging to the seventeenth century, perhaps older. One of the most valuable and beautiful works of the old Maori art. The mythological meaning of the three richly tattooed figures is obscure.

(From the original in the Ethnological Museum at Berlin.)

Figs. 5 a and b. Carved chest from New Zealand, for keeping feather ornaments. To the right (5 a) one side of the chest, to the left (5 b) the lid let into the other. From Cook's collection: probably belonging to the seventeenth century.

(From the original in the Imperial Museum at Berlin.)

Fig. 6. Carving from New Zealand, representing two tattooed men, who are making fire by rubbing.

(From the original in the Ethnological Museum at Vienna.)

Fig. 7. The central portion of a large richly decorated transverse board from the front of a pataka or storehouse. The scene, carved almost in a heraldic style, has not yet been explained; it is supposed to refer to the legend of the creation. Demons with the heads of birds and lizards play an important part in the ancient art of New Zealand. The small triangular notches, conspicuous features in parts of this carving, are called tara-tara o kai. The pataka, to which this board belonged, was built in 1820 by the chieftain Haere Huka, and stood between Rotorua and Lake Rotoiti. It now stands in the museum at Auckland.

(After a copy by Hamilton.)

Fig. 8. A board from the inside of a large Maori meeting-house, with the representation of a Melusina-like demon, taniwha, or mara-kihaui, having a tube-like tongue, by which these demons were able to suck in and wreck ships. Similar objects are still to be found in Ruatahuna and in Te Kuiti (New Zealand).

(From the original in the Museum of Honolulu.)

POLYNESIAN ANTIQUITIES AND CARVINGS

migration started was Hawaiki, the theme of so many legends, the Savaii of the Samoan Islands; the intermediate station, and for some Maoris the actual starting point, was Rarotonga (cf. above, p. 306). According to the legend the chief Ngahue, with eight hundred vassals in twelve ships, whose names are still kept sacred, landed in Plenty Bay on the North Island; when the English began to colonise, the population was estimated at one hundred thousand to two hundred thousand souls. Such an increase in a comparatively short time could, so Robert von Lendenfeld thinks, only be the result of periods of undisturbed tranquillity. The beasts and birds, above all the numerous gigantic species of moa, reaching thirteen feet in height, did not enjoy this peace; they soon fell, to the last one, under the spears and clubs of the immigrants. The inhabitants, accustomed to a flesh diet and with ever increasing numbers, looked for a substitute and were driven in desperation to cannibalism. With this momentous step, the first crisis in the history of the Maoris, the prosperous time of peace was irrevocably past; the ensuing period was one of continuous murder and slaughter, tribe against tribe, man against man.

In the centuries immediately after the first immigration all evidence points to the existence of large States, which occasionally were subject to one common head. There seems also to have been a religious centre. This was the period of the national prosperity of the Maoris, when their workmanship also attained its highest perfection (see the accompanying plate, "Polynesian Antiquities and Carvings"). Europeans had only a passing knowledge of them in this advanced stage; Abel Tasman alone saw in 1642 large and splendid double canoes in use among them; such canoes the Maoris of the eighteenth century were no longer able to build. The decadence was universal. The ancient kingdoms broke up into small communities of bold incendiaries and robbers, who recognised no political centre, but were engaged in fierce feuds one against another. The belief in the old gods gave way to a superstitious belief in guardian spirits, charms, and countercharms. The national character, always inclined to pride and tyranny, ended by becoming more and more bloodthirsty, revengeful, and cruel.

The intercourse of the Maoris with the Europeans at the end of the eighteenth and the beginning of the nineteenth century only rendered the incessant civil wars more fierce by the introduction of firearms. In the year 1820 the chief Hongi (Shongi), accompanied by the missionary Kendall, visited England, and was presented to King George IV, who received him with marked attention and showered presents upon him. Having soon learnt the political condition of Europe, and dazzled by the still brilliant reputation of the victorious career of Napoleon I, he exchanged his presents in Sydney for weapons and ammunition, armed his tribe, and filled the North Island until 1828 with all the horrors of war. Thousands of Maoris were shot or made slaves, and hundreds eaten. Hongi, having neglected to wear in some battle in 1827 the cuirass which the king of England had given him, received a shot in the lungs, from the effects of which he died fifteen months afterward.

The diminution of the native population owing to such protracted wars was an advantage to the whites already settled in the country. Ever since the year 1800, there had been a large number of "pioneers of culture," runaway sailors, escaped convicts from New South Wales, and other adventurers. Their relations with the Maoris had at first been restricted to a barter of New Zealand flax and timber for

rum, iron, and other European products; later a trade in tattooed Maori heads sprang up, to which, even at the present day, European and American museums testify. In 1814 the Anglican mission under Samuel Marsden began its labours in the Bay of Islands, and soon obtained such an influence among the natives that it seemed in 1820 as if the North Island would develop into a Christian Maori State. The horrors launched on the island by Hongi only temporarily stopped this movement; after his death the work of conversion not only proceeded rapidly, but the idea of a Maori State under Anglican guidance was approaching its realisation. There was at that time in England little inclination to organise a state colonisation of New Zealand; Australia lay nearer and had a less dangerous population. But when in 1831 a French warship anchored in the Bay of Islands, the missionaries induced thirteen leading chiefs of that district to petition King William IV for protection for New Zealand. The government consented, and nominated in 1833 James Busby, a colonist from New South Wales, as resident, and entrusted him with a jurisdiction over the British settlers which was backed up by no force at all. Busby's first act was to grant a national flag to New Zealand, which was officially recognised by England toward the end of 1834. The missionaries thus obtained the object for which they had so perseveringly tried, a Maori State apparently self-governing, but in reality dependent on them. At Busby's instigation this State, represented by thirty-five chiefs of the north, was called after the autumn of 1835 the "United Tribes of New Zealand." At the same time the chiefs declared that they would annually hold an assembly, and there pass the necessary laws. Busby himself wished to conduct the government with the help of a council consisting of natives, for which, after a definite interval, representatives were to be elected. The preliminary costs of this new constitution should, he proposed, be defrayed by England, which was to be petitioned not only for a loan, but also for the further protection of the whole scheme.

Busby's plan, which was ridiculed by all who were acquainted with the conditions of New Zealand, had been suggested by another fantastic undertaking, that of Baron Thierry. This adventurer had commissioned Kendall, the missionary, to obtain large tracts of land for him in New Zealand, and Kendall had bought in 1822 forty thousand acres on the Hokianga from three chiefs for thirty-six hatchets. But Thierry, without entering on his property, roamed about in South America, in order to become the "sovereign" of some people, even if it were the smallest Indian tribe. Later he pursued the same aims on the South Sea Islands, and was finally chosen by the island of Nukahiwa in the Marquesas to its head. As "sovereign chief in New Zealand and king of Nukahiwa" he announced to the British resident in North New Zealand his speedy arrival from Tahiti (1835). The kings of Great Britain and France, he declared, as well as the president of the United States, had consented to the founding of an independent State on Hokianga Bay, and he was only waiting for the arrival of a suitably equipped warship sent from Panama to sail to the Bay of Islands.

Busby's counter-measure was the founding of the United Tribes of New Zealand. Strange to relate, this step was taken seriously in England (though not in Australia), and every protection guaranteed to the chiefs. There was a strictly correct exchange of notes between Thierry and Busby, until Thierry, at the close of 1837, accompanied by ninety-three European adventurers, appeared in person on the North Island. At first amicably received by some of the chiefs, he soon perceived

that the English settlers as well as the missionaries were working against him. When it appeared that his announcement that hundreds of his subjects would soon follow him was idle talk, Thierry became the laughing stock of whites and Maoris, was deserted by every one, and thenceforward eked out a scanty existence as a pauper.

(7) *The Treaty of Waitangi.* — Thierry's French name, the founding of the "Compagnie Nanto-Bordelaise," and the "Compagnie Française de la Nouvelle Zélande," for the colonisation of the east side of the South Island, finally the settlement of the French missionary, Pompallier (Pomparlier), in New Zealand, — all this gradually aroused a keen interest in the two islands among private circles in England. James Cook, who had explored the islands in 1769–1770, 1773–1774, and 1777, had always advocated an occupation of the country, and even Benjamin Franklin had proposed to found a company for the colonisation of New Zealand; both without results. In 1825, it is true that a "New Zealand Company" was formed, and some emigrants were sent to New Zealand.

The behaviour of the natives, however, so alarmed the newcomers that, with the exception of the four most stout-hearted, who remained in the country, all returned to Australia or England. The attempt, which had swallowed up ten thousand pounds, was a failure. In 1837 the idea of colonisation was again taken up by Edward Gibbon Wakefield, the founder of the colony of South Australia (p. 283), Lord Durham, the leader of the attempt of 1825, and other representatives of the British parliament; but since the "Association for the Colonisation of New Zealand" could not break down the opposition, fostered by the missionary societies, of the government and of the two houses of parliament, it was broken up. At the end of 1838 the "New Zealand Land Company," also founded by Wakefield and Lord Durham, took its place. This wished to acquire land from the Maoris, in order to resell it to English emigrants. The price was to be so adjusted that not only a surplus should be produced for the construction of roads, schools, and churches, but also an adequate profit for the shareholders. When the company, on June 1, 1839, publicly put up to auction one hundred and ten thousand acres of New Zealand land, so many bidders were forthcoming that very soon one hundred thousand pounds poured into their coffers.

In view of the fact that a vigorous colonisation of New Zealand was unavoidable, the colonial minister, the Marquis of Normanby, now tried to anticipate the New Zealand Land Company and to secure for the government the expected profits. Under the influence of the Wakefield agitators, the predecessor of Normanby in office, Lord Glenelg, had planned the appointment of a British consul to New Zealand and the annexation of districts already occupied by whites under the government of New South Wales. On June 15, 1839, Captain Hobson was nominated by Normanby consul for New Zealand, with a commission to induce the natives to recognise the sovereignty of the queen of England. He was to administer the island group as belonging to New South Wales, in the capacity of a deputy governor. In order to nip the plans of the company in the bud, Hobson was further instructed to bind the Maori chiefs to sell land exclusively to the crown, and to suppress the speculation in land which was raging in New Zealand (cf. p. 265), by requiring that all purchases of land effected by British subjects should be investigated by a special committee.

But the government came forward too late with their measures. An expedition of the New Zealand Land Company, under the guidance of a brother of Wakefield, had already landed in Queen Charlotte's Sound on August 16, 1839, had obtained an immense territory from the natives for a few articles of merchandise, in spite of all the efforts of the missionaries, and had lost no time in founding the town of Wellington on Port Nicholson. The capital of the "Britain of the South Sea" was thus created. One out of every eleven acres of the purchased land was to remain reserved for the natives as an inviolable possession.

Since also the "Compagnie Nanto-Bordelaise" was well on its way to secure a strong footing in New Zealand, Hobson, who had landed on the North Island on January 29, 1840, concluded, with the support of the missionaries, who saw in a crown colony the lesser evil, the treaty of Waitangi with a number of the more important chiefs, in which they absolutely and forever resigned the sovereignty of their land to the crown of England. The crown in return guaranteed to the Maoris the royal protection, all the privileges of British subjects; and all their rights to land and property, but reserved the right of pre-emption of every district which the natives should be willing to sell. The few dozens who first signed were soon joined by other chiefs, so that the number of signatures shortly before the middle of the year 1840 reached five hundred and twelve. In June, therefore, the British sovereignty could also be proclaimed over the South Island and Stewart Island "on the basis of the right of Cook's discovery." On September 19 Hobson hoisted the British flag in Auckland. Finally, on November 6, 1840, New Zealand was declared a crown colony. Hobson was nominated governor, and Auckland became temporarily the seat of government.

The treaty of Waitangi is in various respects an event of historical importance. For the first time a European nation laid down the fundamental principle that the natives even of an uncultivated country have full possessory rights over their own land. We may contrast with this the conduct adopted by the government and the settlers toward the neighbouring Australians and Tasmanians! Now, for the first time, as Theodor Waitz emphasises, "savages" were officially put on a level with colonists, that is to say, were treated as men.

The treaty is also important politically. England, by firmly establishing herself in front of the broad expanse of the Pacific Ocean, secured a commanding position in the entire Central and Southern Oceanic world. This was an exceptionally hard blow for France, since, after the total failure of her Australian and Tasmanian schemes of colonisation, there was no other considerable tract of territory to be found which could serve as a strong base within her widely distributed colonial empire in the South Pacific. The French ships, which arrived off New Zealand in July, 1840, were compelled to return without having effected their purpose.

Who will prove victorious in the fight for the supremacy in the Pacific Ocean? This is a difficult question. At the present day the Pacific is a stage trodden by many actors; in a possibly not distant future it will become the theatre of war for the United States, Russia, and England, which latter has in reality been most closely identified with the Pacific Ocean (cf. Vol. I, p. 599). In any case New Zealand will possess great value, owing to its geographical position. Strategically it forms a splendid flanking outpost for Australia which is otherwise exposed defenceless to every attack from north or east; and as far as industries go, it is at least as well endowed as her larger neighbour. Inferiority of size is compensated by more favourable climatic conditions.

(8) *The Fortunes of the Maoris from 1840 to the Present Day.* — The treaty of Waitangi soon involved momentous consequences for the colony itself. The English government, which had never recognised the New Zealand Land Company, reduced its claims (20,000,000 of the 46,000,000 acres of land "bought" by Europeans) first to 997,000, and after a more exact investigation (1843) to 282,000 acres. To the Englishmen who claimed the remaining 26,000,000 acres, only 100,000 were awarded; to the London mission only 66,000 instead of 216,000 acres. The rest in all cases, instead of being given back to the natives, was declared to be crown land and bought by the government. From that time the natives had quite a different notion of the value of their land, which they had hitherto unsuspectingly sold for muskets, rum, tobacco, blankets, and toys. They began more and more constantly to dispute the old bargains, first by complaints and protests, then by blows, and finally by war and murder. After the Maoris had murdered several Europeans in 1843 and repeatedly torn down the English flag, England was obliged to consider herself at war with the islanders. The successor of Hobson (d. 1842) was Robert Fitzroy, known as the commander of the "Beagle," which had carried Charles Darwin on his voyage round the world. Fitzroy was, however, incompetent for his post, and by all sorts of concessions (remission of entrance-tolls, and restitution of land sold by the Maoris to the immigrants) he prompted the natives to make renewed demands. His measures with this view rapidly emptied the colonial coffers. The New Zealand Land Company, in consequence of the perpetual disturbances, also fell into difficulties and temporarily suspended its operations. Besides this, the English forces, from want of artillery, did very little against the brave Maori warriors.

In November, 1845, George Grey, who had won his spurs as the first governor of South Australia (p. 285), arrived in New Zealand. Since the attempt to quiet the insurgents by peaceful methods was unsuccessful, the governor prohibited the importation of arms and ammunition, and rapidly defeated the chiefs Heki and Kawiri. He was able to conclude peace by the end of January, 1846. Isolated subsequent outbreaks were suppressed with equal promptness. Grey's next object was to prevent the recurrence of civil wars by a system of suitable reforms. Besides the above-mentioned reduction of the landed property of the missions, he put an officer into the post of native secretary, which had been hitherto administered by a missionary, and settled the land question in the interests of the natives. The new constitution, recommended by the British government, which gave the colony complete self-government, appeared premature to him, and was not therefore put into force; he contented himself with dividing the colony into two provinces. In order to revive immigration, which had almost ceased, steps were taken to advance to the New Zealand Land Company in 1846 and 1847 a sum of £236,000 free of interest, and the crown lands of the district of New Munster were assigned to it until July, 1850. The minimum price for an acre was fixed at £1 sterling. With its co-operation the Free Church of Scotland founded the colony of Otago on the South Island in 1847, and the Church of England Canterbury in 1849. These were the last acts of the company, whose directors were compelled to suspend the business finally in 1850 from want of funds; a fortunate turn for the development of the colony of New Zealand, which had only suffered from the juxtaposition of the company and government. For this reason the government remitted the payment by the company of the sum advanced, and

assigned to the shareholders in 1852 £268,000 sterling as compensation for their landed rights.

George Grey's term of office ended on December 31, 1853; after a short furlough at home he was transferred to Cape Colony (cf. Vol. III, p. 507). But, before leaving, he had obtained for the two islands that same privilege of self-government which had been granted by the mother country to the Australian colonies (p. 286); that is, a responsible government (1852). The constitution, which was largely due to Grey himself, provided for six provinces with separate administration under a separate council and an elected superintendent. The provinces composed a federal State with a parliament, which, consisting of an elected lower house of representatives and a nominated legislative council, met for the first time in 1854 at Auckland, the seat of the governor and of the central government. Simultaneously with the final settlement of the Australian constitutional question in general, the forms of responsible government were extended to New Zealand in all its parts. In the matter of the native question alone the home government reserved the right of interference until 1862. The colonial cabinet included a native minister, but his powers were slight; all matters relating to the natives and their lands were really settled by the governor and an imperial official known as the native secretary.

The departure of Sir George Grey was followed by a cycle of years of external tranquillity, and of visible prosperity for the colony. Nevertheless they contained the germ of fresh troubles. From fear lest the chambers, in which they were not represented, should weaken the power of the central government, which had been greeted with confidence, the natives of the North Island combined into the "Land League" (1856), which was intended to check completely the further sale of land to the government. In 1857 matters culminated in a national combination, which was intended to block the growth of the foreign element. The centre of the movement lay on the shores of Lake Taupo in North Island, a region in which the natives still kept their lands. South Island had by this time passed completely into European hands, and therefore did not come within the sphere of war. The lead in the struggle was taken by the chiefs of the Waikato valley, who proclaimed the old chief Potatau as their king. But Potatau was of a conciliating temper, and the leading spirit of the whole agitation was the young and vigorous Wocemu Kingi (William Thompson), of the tribe of the Ngatiawa, called the king-maker, who had the support of the younger chiefs. As long as the "King of Peace," Potatau I, lived, the Maoris kept quiet.

Under his successor, Potatau II, hostilities to the whites broke out (1860), which soon assumed such proportions that the British government sent out Sir George Grey to New Zealand for the second time. In spite of all the respect which the natives entertained for him, and of the constitution which he gave the Maoris, he was unable to procure more than a brief suspension of hostilities. The question now to be answered was which race should remain in the country. The great Maori war lasted fully ten years, if several interruptions owing to the exhaustion of both sides are included. The Maoris showed in it a courage and endurance, which places them in the first rank of all primitive peoples; on the other hand the English operations were hampered by continual friction between the colonial government, the governor, and the commanders of the military forces sent from home; and these dissensions were not the less disastrous because the

blame for them lay rather with the system of dual control itself than with the individuals who were fated to work it. One defeat of the English followed another; troops after troops were sent across from England and Australia as time went on. At length in 1866 William Thompson the chief of the Waikato confederacy made his submission; a last effort on the part of his more irreconcilable supporters was crushed in 1868 and 1869 by the colonial troops, the English regiments having left the island. Practically the war was at an end by 1867. In that year an agreement was made that the Maoris should have four seats in the lower house; in 1870 peace was completely restored. The war had cost the colony and the mother country a large sum of money, had imposed a heavy burden of debt, of which the effect was to be felt for the next fifteen years, and had sacrificed a considerable portion of the colonists.

The natives, their pride crushed and deprived of all hope of maintaining their nationality or even their race, withdrew into "Kingsland," a district some sixteen hundred square miles in size to the northwest of Lake Taupo, where they were left unmolested for a time. The last three decades indeed have not been entirely free from collisions with the whites; but on the whole the Maoris have resigned themselves to the situation. They have cultivated a considerable part of Kingsland on a sensible system, and they possess more than three million sheep, fifty thousand cattle, and one hundred thousand pigs. Almost all can speak and write English, and all have been baptised; they eagerly vote for parliament, where they are represented by four members in the lower house and two in the upper house. It is true that here too the old nationality is gone irrevocably; the forty thousand Maoris, for such is the figure to which the nation numbering one hundred and fifty thousand in its palmy days has shrunk, hardly resemble their ancestors in any one respect. They have not, for two generations, practised cannibalism, but, on the other hand, they have become addicted to drunkenness; and consumption, asthma, and scrofula have followed in the wake of this vice.

(e) *The Colonial Development of New Zealand.* — "New Zealand has been unfortunate in its development as a colony from first to last," wrote Ferdinand von Hochstetter in 1862. Almost a century had elapsed since James Cook had hoisted the flag of Great Britain on its shores, and there were not yet one hundred thousand European colonists in the country. The causes of this slow movement, as compared with the rapid development of New South Wales and Victoria, were not to be found in the nature of the country; the South Island, which was almost entirely spared from disturbances, developed during those first decades considerably faster than the North Island, where war was raging. The squatters (p. 265) and shepherds who immigrated from New South Wales and Tasmania, soon perceived that the South Island was very suitable for sheep farming, and a few years after the founding of the church colonies Otago and Canterbury (p. 337) almost the entire centre and east of the island were divided into pasture lands. In 1861 the island exported, roughly, eight million pounds of wool of the value of £500,000 sterling; in 1899 wool was by far the chief export of New Zealand (£4,330,000).

The South Island also gained much from the discovery of gold. The finds at Coromandel and Nelson on the North Island in 1852 remained solitary instances until in 1861 the discovery of the rich alluvial deposits at Otago produced a regular gold fever. After they were exhausted, the productive fields on the west

coast were worked. Otago exported in 1863 gold to the value of more than £2,000,000, the west coast in 1866 rather more. Toward the end of the "sixties" the production and export from the North Island increased. Owing to this the confidence of the mother country in the future of New Zealand was immensely strengthened; the London money market shows a long list of loans made during the last thirty years for the development of the resources of the country. New Zealand at the present day has the largest public debt of any country in the world. (On March 31, 1900, £47,870,000 sterling, equivalent to £61 13s. per head.)

The administration has undergone very few alterations in the course of the last half century. At the beginning of the "sixties" it was certain that the union of the provinces, which in course of time had increased by three, and were working independently side by side, was only a question of time. After Wellington, which lies in the centre (on Cook Strait), had been chosen for the federal capital, the privileges of the provinces were abolished in 1875. Since then New Zealand consists of eighty-one counties, which send their representatives to parliament at Wellington. On the question of foreign policy, and the decision for or against federation with the Australian Commonwealth, the reader can refer to pages 243, 298, and 328. The main questions of domestic politics are temporarily obscure. A "democratic experimental policy" is followed (Moritz Schanz), but efforts are made to solve the land question, if possible, in favour of the small people and to promote native industries by high import duties; on the whole, since the falling off in the output of gold, socialism is much to the fore.

## 9. MISSIONARY WORK IN THE SOUTH SEA

### A. MISSIONS IN AUSTRALIA

THE whites acquired influence over the destinies of the Australians and Oceanians, as over the majority of primitive peoples, in two ways; by taking possession of their territory politically and exploiting its industries, and by introducing Christianity into the national paganism. It is a characteristic feature in Oceania that the impression produced by the missions far surpassed the other in permanence and to some degree in results. This is not the case with the Australian continent, where missionary attempts have always remained occasional and, in comparison with the gigantic area, of trifling extent; they were timidly commenced and achieved no important results. Much indeed is told us of the achievements of native pupils in reading, writing, and arithmetic, but that says less for the general success of the mission than for the intellectual gifts of the race. The love of the Australian black fellow for an irregular, hand-to-mouth, hunter's life was ineradicable.

### B. MISSIONS IN OCEANIA

BETTER prospects were open to the missionary in Oceania (see the map of the religions and missions of the world in Vol. VII, p. 357). In the first place the confined area allowed a concentration of all available forces, and in the next place the national disunion of the Oceanians prepared the ground for the missionaries, as the conversions of Thakombau, Pomare, and Kamehameha II show; the prospect

of the political support of the white preachers of the gospel was too alluring, and many availed themselves of the easy method of an almost always superficial change of faith. The real results of conversion are nevertheless generally unimportant. The very promising commencement made in Tahiti (p. 315) suffered a severe setback after the interference of the missionaries in the disputes for the throne. In New Zealand the disorders under Hongi (p. 333) brought the work of conversion to a standstill for years, as was the case in Hawaii from the struggle of the Kamehameha dynasty for the political headship in the archipelago. It was only on Tonga that the conversion of the entire north was completed within ten years of missionary work (1830-1840). The kings Tafaahau and Tubou lent it valuable aid, and, besides that, the field was then left exclusively to the Protestant church. From the moment when the French bishop Pompallier set foot on the soil of Tongatabu (1841; cf. above, p. 335) we have presented to us that picture of denominational discord and intense jealousy among the disciples of the different schools of religion, which only too easily poisoned other phases of national life.

This hostility between the confessions is one of the greatest hindrances to missionary work in Oceania, and prevents any disinterested feeling of joy being felt when a whole group of peoples is won for Christianity. It is difficult to decide on whom the chief blame rests, since the accounts of individual efforts as well as of the combined result vary according to the denominations. But in the great majority of cases the Catholic missions, which came too late, were the disturbing element. Since they enjoyed the protection of France everywhere, they made up for their tardiness by unscrupulous action, of which the events on Tahiti, the Marquesas, and Tuamotu, in Hawaii, and above all in the Loyalty Isles supply us with examples. In the Loyalty Isles, the English missionary Murray had won over the greater part of three islands to Protestantism. In 1864 the group of islands was occupied by the French, at the instigation of Catholic missionaries, and Protestant were replaced by Catholic services. The French soldiers treated the natives so harshly that various powers lodged protests with the government of Napoleon III. But this interference only became disastrous in 1872, 1873, and 1880, when in regular religious wars between the members of the two churches even women and children were not spared.

On the other hand the Protestant mission must be made responsible to a large degree for having often combined the functions of missionary and trader. This practice, which had been adopted by John Williams, the apostle of the South Sea, has not been discontinued, in spite of frequent prohibitions by England. The co-operation of all whites, which is an essential condition for an effective mission of civilization, was thus destroyed; the professional trader had no motive for supporting the church whose labourers were obnoxious to him as competitors. There was also a second reason. While the Catholic missionary sharply defined the exterior boundaries of his community, and then devoted himself exclusively to it (hence the success of the Jesuits in building up large communities, the increase of Catholics on Hawaii, etc.), the Protestant missionary was distracted by reason of his business as a trader. Both confessions were equally open to the reproach of having interfered in the political affairs of the Oceanians, as long as any territory was still to be obtained. It is true that the missionaries working alone in the middle of turbulent tribes, were often forced to take one side or the other, if they did not wish to risk both their lives and the success of their missions; but just as

frequently we find no apparent cause. In New Zealand there had been an attempt to found a separate Maori kingdom under ecclesiastical rule, a counterpart to the Jesuit State in Paraguay (Vol. I, p. 400).

What did missions do for the Oceanians? In the controversy, which raged in the press for nearly the whole nineteenth century, as to the value of missions in the South Sea, many voices entirely condemned their line of action. Charles Darwin, on the other hand, has pointed out that, apart from other progress, missionary activity had the noteworthy result of creating a network of stations over the wide South Sea, before the value of that proceeding was realised by the Western powers, and by so doing indisputably civilized the habits of the native; we have only to compare the little-visited Solomon islanders with the formerly savage and now quite peaceful Fijians. The credit of this does not belong entirely to the missions. So long as they alone represented Europeanism, there was on the contrary much bloodshed in Oceania (wars of Hongi, dynastic conflicts on Tahiti, Hawaii, Tonga, and Samoa). It was only when the strong hands of the colonial governments, which were more concerned with the undisturbed possession of the country than the welfare of the inhabitants, guided the helm, that these improvements in culture were evident.

The mixture of good and evil in the achievements of the missionaries is visible in the domain of knowledge. It must not be forgotten with what zeal the more enlightened of them identified themselves from the first with the national feelings of the Oceanic peoples, and how much they collected which has been essential for our later comprehension of the subject. But it is none the less to be remembered that in the complete (although possibly inevitable) destruction of the national characteristics of Oceania, no persons took part more ignorantly than these very missionaries. They unscrupulously invaded every branch of the national life in order to adapt them to their own views. They even substituted, in many parts, the ugly calicoes of Europe for the time-honoured dress, at once tasteful and practical, of Oceania; they introduced fashions which were bound to jar on the native sense of beauty, and which, by their total disregard of hygienic laws, have promoted the increase of various chronic diseases.

Now, when the island world of Oceania is divided, missions with their thoroughly successful enterprises have played their historical part. The history of mankind now takes broader strides; its wide paths surround even the diminutive islands in the Pacific.

## 10. THE COLONIAL HISTORY OF THE SOUTH SEA

OCEANIA, at the present day, is in its full extent colonial territory; the few land surfaces on which as yet no white power flies its flags, are uninhabited or barren rocks and reefs. The New Hebrides alone are not yet disposed of. The value attached to Oceania, which is expressed in its political annexation, dates from recent times. Apart from the Marianne Isles, on which the beginnings of Spanish colonisation go back to the sixteenth century, no group of islands found favour in the eyes of European governments before the close of the eighteenth century. The reason was the deficiency of Oceania in precious metals, valuable spices, and rich stuffs. This deficiency made the region valueless to the leading colonisers of early times, Spain and Portugal; the others, however, Holland,

France, and England, had their hands full with the development of their Indian, African, and American colonial possessions.

The first steps toward the colonisation of Oceania in the nineteenth century were taken by the French. Since the conquest of Algeria was not enough to prop his tottering throne, Louis Philippe had, after the middle of the "thirties," issued the programme of a Polynesian colonial empire. The plan only succeeded in East Polynesia, where a really compact region could be brought under French suzerainty; elsewhere France had already opponents of her schemes to contend with, who were found not only in the ranks of the Protestant missionaries, but also in the cabinets of London, Washington, and St. Petersburg. She was thus able to annex only the southeast wing of West Melanesia, New Caledonia, and its vicinity.

England has had to take over a large part of her present Oceanic possessions, even New Zealand, under compulsion, not from choice. In earlier times the constantly recurring fear of French rivalry was the moving cause. As German trade relations with the South Sea developed, there was the additional anxiety of German encroachment, and in this connection the Australian colonies and New Zealand, now conscious of their place in history, had become the representatives of the British idea of colonisation. When the German Empire stepped on to the colonial world stage, the half-compulsory annexation of new territories to the British colonial empire ceased. Since then Albion tries to take anything that is left to be taken. At the present day it may regard Central Melanesia, Central Polynesia, and Southeast Micronesia as its spheres of interests. The "free" New Hebrides, French New Caledonia, and German Samoa make little difference to this.

Germany has become a colonial power in consequence of long-standing commercial relations. In this way it could partly occupy unclaimed countries; partly also, following the American example, it has entered upon the inheritance of the oldest Pacific power, the Spaniards. At the present time Germany rules a compact territory, important both by its extent and wealth, which comprises a large part of Melanesia, and almost all Micronesia, but, like the French possessions, suffers from its excessive remoteness from the mother country. Besides this, Germany has rivals, which are formidable both industrially and politically, in the new American colonies of Hawaii and the Philippines, and still more in Australia. Samoa, which lies in front, will prove more of a trouble than a blessing to the empire.

The power which has appeared last in order of time on the Pacific stage is the United States of America, whose right of entry has been bought by the expulsion of Spain. The firm footing of the Union on the Philippines, Hawaii, Guam (Mariannes), and Tutuila (Samoa), that is, on four places distributed over the whole range of islands, becomes important from the change in the political situation thus produced; America, which hitherto has turned its face merely toward the east, now looks to the Pacific. At the same time it is preparing to cut through the only obstacle to the development of its power on the west, the Central-American isthmus. The total effect of this American movement is that the possession of Oceania is valued more highly than before, and that the Pacific Ocean has become the focus of interest in the history of man (Vol. I, Chapter VI); recent events on the east coast of Asia furnish the best proof of this. Oceania has room only for colonisation by the great powers. Spain has been compelled to leave it, since it has been blotted out from the list of living world powers. Portugal, following the

decisive sentence of a pope, has never set foot on it. Holland, at the most easterly extremity of its colonial kingdom, just touches the Pacific with Dutch New Guinea; but it has not yet been active there. Chili possesses Easter Island merely for show. Japan, finally, has found on Hawaii the doors closed to her.

## 11. THE ANTARCTIC REGION

THE region round the South Pole is, in all probability, uninhabited. We do not even know whether a continuous land surface or islands support the enormous fields of polar ice. The history of such a region can only be expressed in the effects which its exploration has produced on the course of the development of human civilization. These begin at a quite early date with the idea of the unknown southern country (cf. p. 253). The search for it fills a large part of the sixteenth, the seventeenth, and quite two-thirds of the eighteenth, centuries. In the geographical exploration of that time, which was dominated by material aims, it was the only object of discovery with an ideal background, and for that very reason it was not without significance for the history of mankind. The investigation of the relative proportions of water and land on the surface of the globe is one of the few questions of physical geography on a large scale to which two millenniums have seriously devoted their attention. The feeling of uncertainty was first dissipated by the magnificent polar circumnavigation of James Cook (1772-1775). Since then people have been contented with the consciousness that the earth, even without the enormous counterpoise to the northern regions which the students of physiography demanded, pursues its path in safety. In this respect, the Antarctic regions, which are inferior to the north polar continent in significance for the history of mankind, are indisputably more interesting.

With the beginning of the age of scientific geographical exploration the importance of the two polar regions for the development of human culture has been somewhat altered. The revival of Arctic and Antarctic exploration in the year 1818 (J. Ross and W. E. Parry) has invested the two regions on the verge of the inhabited world with the character of a neutral sphere of exploration for all civilized nations. The laborious efforts of the nineteenth century to become acquainted with the dwelling places of man, even in the remotest corners, is one of the most attractive chapters in the history of the world. Undismayed by disastrous failures, civilization has for fully a century striven to reach this goal, and has been rewarded by great success. While, in spite of all the idealism which fills modern exploration, human selfishness is conspicuous, so soon as the further destinies of the discovered lands come into the question, the Arctic and Antarctic regions form an honourable exception; they are of little or no economic value, but the scientific gain to be derived from them is immense. For this reason the civilized nations of to-day consider both these regions, and particularly the south polar lands, as sacred ground, where any one is welcome who wishes to co-operate in the unveiling of those far remote dwelling places which lie hushed in icy night. From the moment when this veil is lifted, mankind will feel the poorer by the loss of that property now common to all.

## IV INDIA

By PROFESSOR DR. EMIL SCHMIDT

---

### 1. THE CHARACTERISTICS OF NEARER INDIA

#### A. THE COUNTRY

(a) *General Observations.*— Few countries in the world contain within well-defined boundaries a greater diversity of geographical, anthropological, and ethnographical conditions than those displayed by the Indian peninsula. India is indeed a world in miniature; those natural conditions which modify the progress of civilization are varied in the extreme, and the civilization of the inhabitants of this country is characterised by divergencies which are the inevitable result of conformation to so varied an environment. The points of contrast are intensified by their mutual proximity; broad alluvial plains are followed by the highest mountains in the world, burning tropical heat by the everlasting frost of the snow-clad peaks, the extremity of drought by the greatest rainfall in the world, tropical luxuriance by appalling desolation. Here we find savages living almost entirely on the products of the chase, and by agriculture of the most primitive character; again, we find Brahmans devoted to the contemplation of the deepest problems of human existence; here we find the black Dravidians, there the yellow-skinned Mongols, with the representatives of the white races in the flourishing capital towns. The history of India is a history of the struggles for predominance between these different peoples and races.

Nearer India owes its name to the river upon its northwest frontier, the "rushing" Sindhu of the Aryans, a name which was extended to include all the territory beyond the river by the old civilizations of Europe, when they first came in contact with this distant land. India is the midmost of the great peninsulas which project southward from the continent of Asia. The southern portion of the country lies within the tropic zone, while its northern regions advance into the temperate zone beyond latitude 35°. Its frontier position has separated it from immediate communication with the steppes and deserts upon the boundaries of Asia proper except upon the north, the northeast, and northwest; its coasts running southwest and southeast are bounded by broad seas impassable to peoples in the lower stages of civilization. Upon the extreme south the island of Ceylon lies so close to the mainland that the intervening straits are rather a means of communication than an obstacle to intercourse.

The area of India is nearly equivalent to that of Western Europe, if a line of division be drawn passing through the eastern frontiers of Norway, Denmark, Germany, and Austria (cf. Vol. VII, p. 1). In respect of population it considerably

surpasses the district thus defined (293,000,000 as compared with 240,000,000); while its population is more than double that of East Europe (125,000,000).

(b) *The Configuration of the Country.*—The configuration of the country in horizontal section is simple; its long coasts are broken by but few capes or gulfs, and these of little importance. The largest gulf is that of Cambay (Khambhat), which was of high importance at an early period as a commercial centre. Good harbours are comparatively few in number (Bombay and Goa). Upon the west coast landing is a difficult operation, as the western ghats descend abruptly to the sea, while on the east the coast, though flat, is lashed by formidable seas during the monsoon season. Lagoons have been formed only in the south of the peninsula on either side of its extremity. These facilitate communication along the coast even during the unfavourable monsoon season. On the northeast and northwest of the coast line the Indus, the Ganges, and the Brahmaputra, which bring down large quantities of sediment, have pushed out formidable deltas into the sea, communication through which is impeded by the constant changes in the course of the various mouths and the heavy deposits of silt; one arm of the Ganges alone (Hugli) has attained to political and commercial importance during the last one hundred and fifty years. The Indian frontier with respect to the rest of Asia is defined with no less simplicity than the coast line.

The configuration of the country, considered in vertical sections, is more complicated. Here we meet with three great districts characterised by sharply contrasting features, the great mountain range in the north of the peninsula, the lowlands in the north of India, and the table-land in the south.

The northern frontier of India, which divides the country from the table-lands of Central Asia, is formed by the highest mountain range in the world, the "home of snows," the Himalayas. Bounded upon the east and on the west by the openings made respectively by the Brahmaputra and the Indus, this range has a length of fifteen hundred miles, with a nearly uniform breadth of one hundred and thirty-seven miles; its area is almost equivalent to that of Germany. Its importance for India consists in the climatic protection it affords against the influence of the waterless districts of Asia, in the large rainfall which it collects, in the supply which it affords to the great fertilising streams of Northern India, and in the protection it gives to the country against the invasions of the restless inhabitants of the steppes. Not only does the range contain the highest peaks in the world, but it is as a whole almost impassable for large bodies of men. Never has there been an invasion of India from Tibet across the Himalaya by great armies or large bodies of people. The mad attempt of the sultan Mohammed ibn-Tughlak to attack China by land ended with the total destruction of the army of Hindustan in the snow-fields of the mountain (1337). The few passes which exist can be traversed only at rare intervals and by small bodies; the merchant and the missionary make their way across them; from a remote period, a certain number of Mongol immigrants have very gradually trickled into Northern India by this route (Bhutan, Sikkim, Nepal), by which also Buddhism made its way to the north.

Mountain systems join the Himalaya at either end, completely excluding India from the rest of Asia. On the northwest we have the mountains dividing India from Afghanistan and Baluchistan, which run from north to south, decreas-

ing in height as they advance southward, and broken by several important passes. These long, narrow valleys have been followed by all those foreign invaders (Aryans, Assyrians, Greeks, Scythians, Afghans, Mongols, Persians, etc.), who from earliest times have acted as modifying forces upon the historical development of the Indian populations.

On the eastern side the Himalaya range is joined by a number of high, steep mountain chains running north and south, divided by deep valleys, through which the rivers of the Irawadi, Salwén, Mekong, Yangtse-kiang, flow southward — a barrier of extraordinary strength preventing any communication eastward. The most westerly member of this mountain system sends one of its spurs southeast to the Bay of Bengal, the Patkai Mountains, 5,666 feet in height. Thus upon the east India is also shut off by a mountain wall surrounding the low-lying plains of the lower Brahmaputra in the shape of a horse-shoe. This wall is passable only upon the south, and by this route has undoubtedly entered that infusion of Hindu-Chinese blood which is plainly recognisable to the anthropologist in the mixed races of Assam, Lower Bengal, and Orissa.

The second great region of India is composed of two great river systems, those of the Indus and of the Ganges-Brahmaputra. The Indus turns at right angles to the mountain range, taking the shortest route to the sea, which it reaches in a rapid descent, a fact of no less importance for the nature and the inhabitants of its valley than the fact that the long channels of the Ganges and the Brahmaputra run parallel to the mountain range. While the Indus passes the spurs of the Himalaya, and is fed by tributaries from these sources, a sufficient supply of moisture is available for the cultivation of the ground; the earth then showers her gifts upon mankind with such lavish bounty that the district of the Five Rivers, even in the gray dawn of history, was the goal of the ambitions of the nomad tribes inhabiting the dry steppes of Afghanistan and Central Asia. On the other hand, in the valley of the lower Indus the arable land is restricted to a narrow belt on either bank of the stream, which here runs so rapidly that navigation is almost impossible, while it brings down such heavy deposits of silt that its delta is continually changing, and the arms of the delta and the sea, in their neighbourhood, are with difficulty accessible on account of the outlying banks of sediment. Eastwards from this arable country, upon the Indus, stretches the Great Desert, across which communication is almost impossible. It extends southwards to the sea, and northwards almost to the foot of the Himalayas, at which point alone a narrow strip of land makes communication between the two river systems possible. Hence it was at this spot that peoples advancing into India from the west came into collision with the inhabitants already settled in the valley of the Ganges: this district has repeatedly been the scene of those decisive battles which predetermined the history of India for long periods.

The eastern, which is the larger portion of the plains of North India, is far more favourably situated than the western. The Ganges and Brahmaputra run parallel to the mountains, though they are so far apart from the Himalayas, from the heights of the Deccan on the south, and from the frontier mountain range about Burmah, that on either side a wide declivity is available for copious irrigation by artificial means. The whole river valley is alluvial land; but a distinction must be made between the earlier and the later deposits; the line of demarcation between these begins at the Ganges delta. Up to that point the land falls away

so rapidly from the west that the soil is dry and fruitful; everywhere irrigation can be provided in sufficient measure to satisfy the most zealous cultivator of the soil, which also receives new deposits of rich manure from the silt-laden waters of the rivers. Navigable streams cross this district, which is more suitable than any other in India for the development of important towns (the Magadha kingdom, the Mohammedan kingdom, the centre of the English supremacy; see also the plate, p. 370). The characteristics of the eastern portion of the river valley are wholly different; in the delta of the Ganges, and in the whole of Assam the deposits of silt have been so recently made, and the ground in consequence lies so low, that drainage works are impossible: the country is almost everywhere in a swampy condition, and the malaria of the district is dangerous to human occupants. Navigation is difficult, as also is communication by land, for the ground is not sufficiently firm to permit the laying down of roads. Hence the civilization of this part of the Ganges-Brahmaputra valley was in a comparatively backward condition before the rise of the English power in India; Aryan and Mussulman influences made themselves felt comparatively late, and it is only during the last one hundred and fifty years that the greater intellectual power and energy of Europeans has brought prosperity to the delta of the Ganges.

In the southern part of India the table-land known as the "South Land," the Deccan of the Aryans of North India, rises in isolation. It forms a great elevated highland with steep walls, which fall sheer into the Arabian Sea on the west (the west ghats); on the eastern side the plateau is somewhat lower and lies at some distance from the Bay of Bengal, from which it gradually retires as it advances southward. In this district between the highlands and the sea rise individual isolated plateaus and numerous single peaks, by which the plains are diversified. The table-land attains its greatest height (with the mountains of Anamalai, 8,977 feet high, and of Nilgiri, 8,477 feet high) on the west coast and falls gradually away to the eastward. Hence most of the rivers of the Deccan run eastward (Son, Mahanadi, Godavari, Kistna, Kaveri, Tambraparni); two streams only, the Nerbada and the Tapti, have worn out deep gorges in their westward career. These, together with the mountain ranges of the Vindhya and Satpura running parallel to them, divide the highlands of the Deccan into a southern and northern half (Central India), which for a long time proved an obstacle to the advance of the Aryans, more by reason of its malarial swamps and its jungle vegetation than because of its mountainous nature. All the above-mentioned streams are unimportant as means of navigation and communication, on account of the variable water supply and the rapids and waterfalls, by which they are broken when they reach the precipitous edge of the highlands.

(c) *The Geographical Position.* — Friedrich Ratzel, the most brilliant of modern geographers, has laid great emphasis upon the importance of geographical position to national history; the position of India has exercised a decisive influence upon the whole course of development of the natural products of the country and its population.

The position of this central peninsula of Southern Asia, situated as it is with reference to the enormous dry, waterless districts of the desert and the steppes on the one hand, and on the other hand to the tropical sea with its moisture-laden atmosphere, determines the amount of the rainfall and its distribution, and there-

fore, also the fertility of different parts of the land, which again influences the population. In the spring and summer the great deserts and steppes of Central Asia are scorched by the sun which then attains its greatest altitude; the barometrical pressure is low and the currents of air with their burden of moisture from the tropic Indian seas travel in a northeasterly direction across India (a deviation due to the revolution of the earth). In the southern portion of the country these clouds then meet the steep wall of the western ghats and deliver a large proportion of their moisture, breaking in violent thunder storms upon the mountain wall to return again to the sea in rushing brooks and streams. The air currents, however, after crossing the watershed of the ghats become drier and provide but a scanty rainfall for the eastern district where the highlands slope away. Not until they reach the giant wall of the Himalaya do they drop all the moisture which they have retained, and for this reason the mountains of Assam can boast the heaviest rainfall upon the earth (the rainfall of Cherra Punji in the Hsia Mountains of Assam amounts to four hundred and forty-four inches during the summer and five hundred and twenty for the whole of the year). On the other hand, during the winter months a high barometrical maximum prevails over Central Asia, while South Africa and the Indian Ocean, which are then scorched by the sun, show an average low barometrical pressure. The currents take a backward movement and blow from the great dry continent as the northeast monsoon, bringing but little moisture, and that at uncertain intervals to India. Consequently the wide districts to the east of the ghats as far as the Himalaya Mountains suffer greatly from drought, and should the rains of the east monsoon fail, are confronted with terrible famines.

The fertility of the country depends upon the amount of natural or artificial irrigation which it receives. Vegetation, apart from human agency, flourishes most luxuriantly on the Malabar coast. Beyond the range of the western ghats different conditions prevail. A forest country is first met with, where the deciduous nature of the trees is a protection against the excessive drought of the dry season. Vegetation then conforms to the character of the steppes in general and agriculture is restricted to the immediate neighbourhood of springs or tanks, to the river banks, or to the river deltas. The steep wall of the western ghats ends upon the north with the river Tapti, so that at this point the moisture-laden currents penetrate more deeply into the country. The remoter heights of Central India produce a heavier rainfall; though the forests are more extensive in that district, the prevalence of malaria is an obstacle to human occupation. The great plains in the north of India receive a diminishing rainfall in proportion as they are removed from the delta of the Ganges on the west; compensation is, however, afforded by the works of artificial irrigation which distribute the streams falling from the Himalaya and in some degree those which rise on the north wall of the Deccan. The delta of the Ganges and the lower ground in the valley of the Brahmaputra suffer from an excess of rainfall and ground moisture.

The cultivation of the country, especially as regards the growth of cereals, is primarily conditioned by the existing facilities for irrigation. Where copious supplies of water are to be had, rice is the staple product of agriculture, as it is on the whole of the Malabar coast, on the deltas of the Deccan rivers, of the Indus and the Ganges, and in Assam. Under proper irrigation, land containing less moisture will produce a heavy yield of wheat as is the case in the Punjab, the British Northwest Province, Oudh, the Central Provinces, and certain favoured parts

of the presidency of Bombay. Where irrigation is difficult, several kinds of cereals (such as *Eleusine coracana*, etc.) and other subsidiary products flourish. Where the land is too dry for these plants, as is the case in large districts of the southern Deccan, stock breeding (of the sheep, buffalo, etc.) enables mankind to make a living at the expense of some hardship; the caste of the Kurumbas (shepherds), which is now scattered and decayed, played an important part at an early period.

### B. THE POPULATION

THE population of India is distributed according to the fertility of the soil. The mineral wealth of the country is comparatively small. Coal is by no means common and has only recently been worked upon any large scale; iron ore is widely distributed, but was only used by the natives to a very small extent, and the importance of this industry has been practically extinguished by the competition of the great European undertakings. The riches of India in precious metals and stones have been considerably exaggerated; the real wealth of the country does not lie within the soil, but grows upon it. Consequently the population is almost entirely of a peasant character; the last census to hand shows only 2,035 towns properly so-called among 717,549 settlements; of this number 1,401 had less than 1,000 inhabitants, 407 had between 10,000 and 20,000, and 227 had a population above 20,000. Only 26 towns have more than 100,000 inhabitants and only 4 more than 300,000 (Calcutta, Bombay, Madras, and Haidarabad). In England 53 per cent of the population live in 182 towns of more than 20,000 inhabitants, whereas in India this holds good only of 4.84 per cent (distributed in 227 towns of 20,000 inhabitants). The collective population of the country (287,133,481 inhabitants upon 1,560,080 square miles, excluding Burmah) gives an average of 184 inhabitants to the square mile. In individual districts of some size this average varies between 24 and 1,395; it is larger in British India than in the native States, a fact apparently due to European influence upon the country, and still more to the circumstance that England has occupied all those States where the soil is more than usually fertile.

A systematic ethnographical examination of the population of India is an extremely difficult task; no universal lines of division can be drawn including all the most important phenomena of divergent nationality. The differences, moreover, by no means run in parallel lines. The most important points to be noted are physical characteristics, language, religion, and social peculiarities, together with the characteristic signs of national feeling which these differences imply.

(a) *Physical Characteristics.* — The many changes in Indian history presuppose the impossibility of any physical uniformity throughout the population. Apart from the infusions of Portuguese and Dutch and English blood during the last four centuries, foreign representatives of the white or yellow races have frequently invaded the country through the northwest passes. However, as far as the Mongol princes are concerned, almost every trace of their existence has disappeared from the ethnological characteristics of the modern Indian. The Mediterranean (white) races have, however, exercised a permanent modifying influence and their descendants form one of the main racial elements of the country. From a remote epoch vigorous commercial relations were maintained on the west coast with the western

continents, which have left their traces upon the physical characteristics of the coast dwellers; the Semitic type of countenance common among the Mohammedans of the Malabar coast is derived from the Arabs. Fugitive Jews have repeatedly entered the country in bodies, such as the Jews of Cochin (now thirteen hundred in number) who, according to their traditions, left their country after the destruction of their great sanctuary by Titus (70 A. D.); another instance is the Jewish colony in Bombay which was expelled from its former settlements by Mohammedan fanaticism. Similarly, a large number of fire worshippers fled from Persia in the year 1717 before the zeal of the Mohammedans, and the coast of Bombay is now inhabited by ninety thousand Parsees who remain true to the religion of Zoroastrianism. In many cases their Semitic cast of features recalls the representations of the kings in ancient Nineveh, whereas others remind us of the modern representatives of the white races in the Armenian highlands (the Tadshik).

The east coast has been peopled rather by Indian migrations directed especially toward the opposite coast of Burmah (Klings, that is, descendants of the kingdom of Kalinga) than by immigration from abroad. However, a strong infusion of Mongolian blood has entered from the north and northeast. The southern slopes of the Himalaya to the east of Dardistan are peopled by a mixed race of Mongol Indians apparently formed by the slow infusion of Mongols from Tibet over the extremely difficult mountain passes. A similar population is to be found in Assam and in many of the tribes inhabiting East Bengal and Orissa, though here the Mongol element more probably entered the country by the easier route through Burmah than by crossing the extremely difficult mountain ranges which run in parallel lines to the east of Assam.

All these infusions of foreign blood, however, excluding the mixed Indo-Mongolian population, form a very small and almost unappreciable element in the racial composition of the country. The two main component elements are the representatives of a white race, which entered the country from the northwest at a comparatively early period (more than four or five thousand years ago), and a dark race, which may be considered as directly descended from the original population. This race is recognisable by the dark colouring of the hair, eyes, and skin, which is of universal distribution, and is often intensified into the deepest shades of dark brown; a further characteristic point, reminding us of the black negro races of Africa, is the moderate size of the skull and the short, broad nose; the race, however, is differentiated from the negro type by the shorter and more upright stature, and especially by the hair, which though black, is but moderately crisp, and while often found in curls or waves is never of a woolly nature. The representative types of this race usually attain a stature which is considerably less than the average height of the German. Races living under very unfavourable conditions, with an insufficiency of nourishment (such as many of the dwellers in the mountains and jungles, the slave castes, etc.), are so far below this average stature that they may be considered as dwarf tribes (cf. Vol. III), though it is impossible to make this characteristic a line of demarcation between them and the other dark races of India.

The white races in India are distinguished from the dark especially by their complexion, which in pure blooded types is no deeper than that of the Europeans about the Mediterranean. Their average stature is considerably higher, while their features are smaller, and their noses, with higher bridges, are more prominent than in the case of the black races.

An examination of the geographical distribution of the different Indian races will begin with what are, comparatively speaking, pure representatives of the fair races on the northwest, immediately adjoining the population of Afghanistan and Baluchistan, which has been more or less modified by infusions of Semitic blood. Such influence is less prominent in Kashmir, in the hill country, and the Five Rivers district as far as the upper course of the Ganges; on the other hand, further eastward in the centre, and especially in the lower course of the Ganges, a deeper complexion may be observed in many of the subordinate grades of caste and settlement. Further east again in Assam, the characteristics of the fair race disappear by degrees, and are but moderately pronounced among the higher castes; the chief element of the population is formed by the fusion of the black and yellow races. Of similar composition are the numerous small mountain tribes of the Himalaya as far as Dardistan. Southward the fusion of black and yellow comes to an end about the frontiers of Orissa; at this point the characteristics of the fair race are again strongly marked in the higher castes (Brahmans). In Central India is found a belt of almost purely dark complexioned population; further south again in the Deccan and the plains upon its frontier the black races are greatly preponderant, though in individual castes varying infusions of white blood may be observed. On the west coast, on the other hand, with the exception of small colonies of foreigners (Jews and Parsees), closely united bodies of white inhabitants are to be found concentrated among the dark population. Individual branches of the Brahman caste (the Konkanath, Nambutiri, and Haiga Brahmans) zealously preserve the purity of their caste and race; a warrior caste of the Nair and the caste of the Temple Maidens are distinguished from the surrounding population by their fairer complexions.

(b) *The Languages of India.* — Indian languages display the utmost variety. Philology has distinguished three typical forms of language, the isolating, the agglutinative, and the inflectional. These three types are represented in India, and, in general, coincide with the three racial types there represented; the mixed Mongolian and dark-skinned races (Hindu-Chinese), the unmixed dark races (the Dravidians) and the white race (the Aryans). If a straight line be drawn from Goa in a northwesterly direction to Rajmahal, at the beginning of the Ganges delta (see the map, p. 430), the agglutinative languages will lie chiefly to the southeast of this line, the district of the inflectional languages extending on the northwest into the Ganges delta and the valley of the Bramaputra, while the isolating languages are found at the edge of the southern slopes of the Himalayas and the mountains of Southern Assam. The boundary between the Aryan and Dravidian languages is not to be conceived as a sharp line of demarcation; the Dravidian languages are sporadically found within the district of the Aryan tongues. The early disruption of the Dravidian peoples has naturally brought about great differences of grammatical form, and many dialects have borrowed numbers of foreign words from neighbouring languages. These isolated Dravidian tribes invariably live hard lives upon a low plane of civilization; they include the Khonds, in the mountain districts of Orissa, Ganjam and Cuttack; the Gonds, a tribe which has been broken into several isolated linguistic units, between the Narbada and Godavari, the Oraon in Chota Nagpur, and finally the most northerly representative of this division, the Mal Paharia, established upon the lower

Ganges in the mountains of Rajmahal, whose language, though greatly differing from the other Dravidian tongues, must none the less be included within the Dravidian family. Whether the Brahui, who inhabit the district from the Lower Indus to Baluchistan, should be added to the Dravidian family, is an unsettled question. Assuming that they are members of this family, the strong differences between their language and that of related tribes may easily be explained as the effect of the different migrations which had passed over their country. Philologically their language resembles in such respects the Dravidian languages of South India. More accurate information will be forthcoming upon the conclusion of the "Linguistic Survey of India," undertaken by George A. Grierson.

The Kolarians (about three millions in number) in the Presidencies of Bengal, Madras, and the Central Provinces, are an ethnological puzzle; they have been broken into isolated communities, and their language, which was undoubtedly widely distributed at an early period, has been broken up and confined by the advance of the Aryan and Dravidian languages. Their language is to be distinguished from the Dravidian tongues (though physically they closely resemble the Dravidian type) by an entirely different vocabulary, and by an embryonic inflectional system. As yet, however, very little is known of them, and further research will no doubt modify the views now held upon their philological position and dialectical division. It has been said, but by no means proved, that they are philologically related to certain tribes of Further India.

(c) *The Distribution of the Indian Religions.* — The construction of a scheme to illustrate the distribution of the different religions is by no means facilitated by the fact that sharp distinction between them is often impossible. The simple conception of a divine being, inherited and obstinately retained from the earliest periods of tribal development, is in every case the primitive underlying idea, and is manifest even in the most advanced religious systems. While the Hindus assert their faith now in Vishnu, now in Śiva, at the same time none are found to deny the existence of demons, upon whom the religious fears and veneration of lower tribes are entirely concentrated, and these powers have also been recognised within the Hindu heaven. Consequently, statistics of the adherents of the various religions are extremely unreliable; their variations as compared with the known populations of different nationalities frequently show the lines of religious demarcation to be extremely vague and unstable. For the lowest of these faiths, the demon worship, the census of 1890, gives a percentage of 2.64 of the whole population in British India, and of 5.20 for the other parts of the country. Under these figures are comprised chiefly the wild races dwelling in inaccessible jungle districts, which have been as yet untouched by Brahman civilization, and also many of the so-called slave castes. Consequently, pure demon worship exists chiefly among the Dravidian and Kolarian races in the Central Provinces (14.8 per cent of the population), and in the neighbouring native States (22.7 per cent), though it is also found in Lower Bengal (13 per cent), in Assam (17.7 per cent), etc.

The greater proportion of the inhabitants of India ( $72\frac{1}{3}$  per cent) are worshippers of one or other of the great divinities of the Hindus. Where this average is not attained we find that Hinduism has had to struggle with Mohammedanism, and also with demon worship, or other special forms of religion; such cases are the Punjab (37.1 per cent Hindus, 55.7 per cent Mohammedans, 6.7 per cent

Sikhs), Kashmir (27.2 per cent Hindus, 70.5 per cent Mohammedans), Assam (54.7 per cent Hindus, 27 per cent Mohammedans, 17.7 per cent demon worshippers), the whole of Bengal (63.4 per cent Hindus, 32.8 per cent Mohammedans, 3.2 demon worshippers). In all the other provinces and States the average percentage of Hinduism is surpassed, and is highest in the south of India, especially in Mysore, Kurg, Haidarabad, in the Presidency of Madras and in Poonah and Baroda.

The Mohammedan worshippers have been estimated at 243,000,000, and of this total 57,000,000, that is, almost a quarter (23.5 per cent) belong to India. This belief is represented in every part of India; the tolerance displayed by the Mohammedans toward the caste system gives them the advantage of being able to maintain commercial relations with every branch of society in the country, though naturally to a larger extent in the older Mohammedan towns. Consequently, the northwest provinces and States (where Islam entered the country) are most thickly populated with Mohammedan worshippers; to the average already given for the Punjab and Kashmir we must add Sindh with 70 per cent of Mohammedans; these are followed by the chief provinces of the Mogul Empire, the mountainous frontier of the northwest provinces (30.6 per cent), East Bengal (with more than half of the inhabitants) and individual parts of the Presidency of Bombay (especially the old trading stations, etc.). In the south, the numbers of the Mohammedans diminish considerably. The faith is practically unknown to the tribes of the Central Provinces and a very small percentage is found in Mysore and Haidarabad. Mohammedanism would also be unrepresented in the remaining Presidency of Madras were not the prevailing Hinduism broken by individual groups of Mohammedans (the Mapilla or Moplah on the Malabar coast, the Labbe on the Coromandel coast; both groups have originated in the presence of Arab traders).

Buddhism, at one time so widespread in India, has now degenerated into Hindu-polytheism in the mountainous countries of the north (Himalaya and the Kashmir valleys), and on the northeast (the frontiers of Tibet and Burmah). Few adherents survive of the northern branch of this religion, and in Kashmir alone they scarcely amount to one per cent of the whole population. The Jain religion, which is related to Buddhism, is better represented in certain provinces, though nowhere has it retained a higher average than five per cent of the whole population. Rajputana, Ajmir, and Gujarat are the chief centres of this belief, which only numbers 1,400,000 adherents throughout India (one-half per cent of the whole population).

Of other religions we may mention that of the Sikhs, which is almost exclusively confined to the Punjab (1,900,000, two-thirds per cent of the whole population). They form the Hindu sect, which has been influenced by Mohammedanism, and their religion is now only distinguished from Hinduism by its ceremonial. Other religions which have entered India from abroad are very weakly represented; such are the Parsees (the west coast of India, with Bombay as their centre), with 90,000, that is, 0.03 per cent, the Jews (early colonists in Bombay and Cochin, together with scattered Jews of various origin throughout India), numbering 17,200 souls (0.006 per cent), and the Christians with 2,300,000 (0.8 per cent). Of these latter, 2,036,600, that is, 89 per cent, are converted natives, while 80,000, that is, 3.5 per cent, are half-breed Indians, and 168,000, that is, 7.4 per cent, are Europeans. More than half of this latter number are soldiers with their relatives.

(d) *The Caste System.*—The caste system has exercised so deep an influence, is so characteristic a phenomenon of Indian social life, and is, moreover, an institution of such infinite diversity in its details that its true nature can only be understood in connection with its historical development as a part of the national history (cf. p. 374 ff.).

## 2. THE HISTORY OF INDIA

THE history of India is a drama in three great acts. The first of these is occupied by the struggles of two races for predominance; the second, by the struggles of two religions; and the third, by the conflict for the economic exploitation of the country. In the first epoch, Aryans are opposed to Dravidians. The result of their struggle is a development of a mixed race of people whose political, social, and religious institutions are to be explained partly as the result of fusion, and partly as due to the predominant influence of one or the other element. The mixed people which was thus developed supported the Hindu religion and theory of existence. The Semitic, Turanian, and Mongol tribes who entered the country from the northwest brought the Mohammedan faith with them, and the life and death struggle of these two religions forms the second epoch. In the third act Europeans appear upon the scene, and the economic struggle for the wealth of the country ends with the total collapse both of Mohammedan and Hindu independence, victory remaining with the side that possessed superior intellectual power, clearer foresight, and greater strength. From the prehistoric period to the end of the first thousand years after Christ forms the period of native Aryan-Dravidian development (the period of ancient India). For about seven hundred years the struggle of Hinduism with the foreign religion continued, and forms the "mediæval" period, while the "modern" period contains only the last one hundred and fifty years, in which, however, the whole people has undergone far more fundamental changes than any that all previous centuries have brought to pass.

### A. ANCIENT INDIA

(a) *Prehistoric Age.*—We have first of all to consider the two races whose struggle composed the first epoch of Indian history, together with the mutual influence which they exercise upon each other.

(a) *The Original Inhabitants of the Country.*—The original inhabitants of India have left us neither written nor traditional records of their existence during the prehistoric period. Traces of human agency during this epoch have, however, been discovered in India. As in Europe, discoveries of stone implements, of lance and arrow heads, of knives, razors, hammers, etc., made of jasper, agate, and chalcodony (flint proper does not occur in India) show that an earlier age of human development preceded the time when metals were employed. Whether this period goes back to the Tertiary age, as many investigators suppose, is still a doubtful question.

Graves and funeral monuments are frequently met with; on the Malabar coast we find tombs dug in the earth. Mounds of earth or stone cairns are of frequent occurrence throughout India. Such a cairn in the country of Gond is supposed to

commemorate the death of a tribal princess in battle, and was increased by the practice which the passers-by observed of casting upon the heap one of the quartz crystals which are numerous in that district. Further discoveries have been made of stone burial-chambers, corridors for sculpture, megalithic stone tables with three or more supporting stones, menhirs (single stones set up on end), single or double circles of stones, stone avenues, etc.; in short, of all those arrangements in stone which occur in the countries about the Mediterranean Sea (see Vol. I, p. 163), together with pure Indian forms, such as the Kudikal (that is, umbrella stone) or the Topikal of Malabar (hat stone or stone table with one support only). The first-known memorials in the megalithic style are found in the far North (Khasia Mountains), in the Central Provinces (Haidarabad, etc.), and also in the South (Nilgiri, Anamala Mountains, the districts of Coimbatore, and Tinneveli, etc.). The most ancient tombs contain no examples of metal work; those, however, that are found in sepulchres of later date display high technical skill, and enable us to infer a considerable advance of civilization in general (such objects are iron arrow-heads, knives, lamps, tripods, stirrups, etc.). Fragments of burnt pottery ware, coloured red or black, and also complete vessels are among the objects most frequently discovered in these tombs. Clumsy figures in clay of men or buffaloes also occur. In many cases the corpse was cremated and the ashes were interred in cinerary urns; in other cases the skeletons have remained, though rarely in a complete state of preservation, and in most cases so disintegrated as to fall into dust upon exposure to the air. In many cases women or men were beheaded at the funeral of a dignitary and buried with him. Rarely has any definite tradition of the person buried in the grave been preserved. In Southern India these graves are known by the population as Pandicazhay, that is, Pāṇḍya graves, as they are ascribed to the period of the great Pāṇḍya kingdom (p. 387) which was popularly supposed to be of great antiquity. However, the earliest literature, Dravidian and Sanscrit alike, has not a word to say upon the subject of these graves.

On the other hand, the poems of the Aryans, who were making their victorious invasion of India at the dawn of history proper, provide us with much information upon the life of the original inhabitants, who are naturally described from a hostile point of view. They are contemptuously known as Dāsa (slaves), Daśyu (low class) Mleccha (people talking an unintelligible jargon). They are described as being of black complexion, their figures small and ugly, in spite of their heavy ornaments of gold and precious stones, their noses broad, and their eyes small. They were indeed a complete contrast to the Aryans, who must have been particularly impressed with these points of difference in the enemy, as their own stature was tall and proud, their complexion fair, their noses boldly formed. ("With beautiful noses" is the title which they give to the images modelled in their own likeness.) The enemy are said to have been driven back into the mountains, from whence they made reprisals, attacking the herds and the property of their oppressors as "robbers" without harm to themselves. Magical arts were attributed to them, including the power of drying up the streams and rivers which bring fertility and verdure to the plains. Mysterious, also, is the power of the gods to whom they prayed; hence these were soon considered as demons or "Yakshu," who disturbed the fire of the Aryan sacrifices ("Śimyu"), and for whom no sacred flame was ever kindled ("Kikāṭa").

This description of the original inhabitants in the old Aryan poems entirely corresponds with the appearance of the mountain and jungle tribes of the present

day and also with that of the lowest classes of the population in modern India, with the exception of the Brahman castes. Like their savage ancestors, the tribes of the present day carry on their existence under conditions of the greatest difficulty, and their general civilization is as low as their environment is rough. In many cases their sole agricultural implement is a stick with the point hardened in the fire, with which they grub up the scanty roots and bulbs of the jungle; at a somewhat higher stage of development, agriculture is carried on by burning down a portion of the forest every year and planting in the fructifying ashes the seeds of the native cereals or tuberous plants, a scanty harvest which ripens rapidly. The tribe then sets out upon its wanderings to choose a new piece of forest for its next harvest. A few goats or sheep and the small pariah dog alone accompany it; from the climbing plants or the bark of the trees nets are woven, the waters of the tanks or pools are poisoned with leaves or fruits and the tribe thereby obtains a meal of fish. The arrows of the savage wanderers lay low the forest game which falls into their traps and snares; wild honey provides them with the sweets of their meal. They roast their food at a fire which is kindled by the rotatory friction of two sticks; comparatively few of the forest tribes have learned the art of pottery. A roof of leaves or an overhanging rock is their shelter, an apron of grass or leaves or of tree-bark is their clothing, the scantiness of which serves to emphasise the weight of the ornaments with which they load every possible part of their bodies.

Though the poverty of the life of these tribes may arouse our sympathy, yet their character demands our hearty respect. All who have come into contact with them and have learned their habits, praise their independent spirit, their fearless bravery, their truth, honour, and fidelity. They are true to their plighted word, true to their wives and to their race. The arrow of an absent chief, given by his wife as a means of recommendation into the hands of an English ambassador, secured for this emissary security and hospitality among all the members of this wild tribe, even in the remotest districts.

Family life has often developed upon different lines than among modern civilized peoples; but however much the form of marriage may have changed, man and wife yet remain true to one another within the limits of that family life which custom has consecrated, and woe to him who would break faith or attempt to seduce another's wife. Both patriarchal and matriarchal organisations occur; that is to say, either the father or the mother may be considered as the family and tribe. In the latter case, relationships are reckoned through the female line. Under the patriarchal system monogamy prevails, and marriage continues until dissolved by the death of one or other of the parties. A man acquires his wife by purchase or capture, though the latter is only conventional in form. Only in rare cases does the man take a second or several wives. In many cases it certainly happens that upon the completion of a marriage the husband's brothers become *eo ipso* husbands of his wife (in Kurg among the Todas, Kurumbas, etc.). To be distinguished from this kind of polyandry, where the man always remains head of the family, is the primæval custom, still prevalent among certain castes on the Malabar coast, which allows the wife to choose her own husband, to dismiss him at pleasure, and take another without thereby incurring any stigma. Marriages which can be thus dissolved are entirely legitimate, as also are the children of them. The man, however, remains a stranger to the wife's family, and the children

reckon their descent from the mother. Consequently, in these cases descent is reckoned through the female line, whereas in the patriarchal system descent in the male line is the fundamental principle of those larger social organisms, the hordes, consisting of several families (Vedda, Uladen, Nayadi, etc.), which again may develop into a tribe at a later period. In the latter case, the head of a tribe is sometimes a hereditary chieftain, and at other times is chosen by the heads of families. He is the representative of the tribe and directs its general policy. The tribe forms an exceedingly close corporation in its dealings with the outer world; attacks made by strangers often lead to blood feuds, and peaceful intercourse and barter of goods is conducted, as among the Vedda in Ceylon, by the so-called silent trade.

The mountain and jungle tribes are obliged to carry on a hard struggle for existence. The climate alternates between seasons of burning heat and terrible rain storms, and a tribe driven into the jungle or on to the thirsty plains of the steppes obtains but scanty nourishment; often enough, even those tribes which enjoy more favourable conditions of life are hard pressed by the extremities of famine. In the jungle the tiger and the poisonous snake lie in wait for them; their scanty crops are destroyed by wild animals, elephants, pigs, and porcupines; leprosy, malaria, cholera, and other diseases make their way to the remotest settlements, and Death plies his scythe with ruthless power. Encompassed as he is by hostile powers, how could the savage conceive of the supreme beings which guide human destinies as being friendly to man? Evil demons pursue him from his birth to his grave, thirsting for his blood. Everywhere they lie in wait for him, in earth, in water, and in air; in the rocks, in the darkness of the forests, upon the dry steppes; at night they rush through the darkness to destroy whomsoever they may meet. They hunger for blood and can therefore be temporarily appeased by bloody sacrifices of fowls, goats, or even of men; their anger can also be averted by those magic arts which the Shaman priests employ against them in their frenzied dances (devil's dancers). Can we be surprised that such men were considered as demons, as Yakshu, as Rākshasa by the Aryans, whose bright and heavenly gods were their stay and counsel?

The most ancient Aryan poems do not, however, display to us these miserable savages as the only opponents of the invaders; we gain information upon other tribes in higher stages of civilization. Together with the unsettled and nomadic Kikāṇa (p. 357) settled tribes also existed, the Nishāda, who lived under a settled social organisation and were even envied and hated by the Aryans for their wealth. The gods, and especially Indra, the destroyer of cities Purandara, are constantly praised for overthrowing hundreds of cities of the Black Dasyu; these latter indeed are said to have possessed not only fortifications to protect them against the enemy, but also "winter retreats," autumn rain and cloud castles on their mountains, where they might take refuge from inundations in the plains or from dangerous miasmas. The tribes of the Nāga who worshipped snakes were to be destroyed on account of their wealth and valuable possessions. Their capital, in which their Prince Wāsuki rules, is said to abound in treasures and fair women; the prince possesses a talisman which can even bring the dead to life. "The treasure chambers in the rocky ground are full of cattle, horses, and good things; the warders, the Paṇi, are faithful watchmen." At the same time, these tribes are represented as cunning traders, ever ready to take advantage, and bringing to the Aryans for barter the products of nature's bounty or of their own skill in handi-

crafts. The trade indeed is welcome, but hateful are the traders, the "hateful misers," the men "without faith, without honour, without victims," and Indra is called upon to stamp down the greedy merchants with his feet. Upon the further advance of the Aryans we learn that there were important native kingdoms in the country and that the conquerors entered into friendly relations with these (Krishṇa the black tribal prince of the Yādawa). When the conquerors made their way into the central district between the Jumna and the Ganges they appointed the King of Nishadi, a vassal of the kingdom of Ayodhya, to guard the sacred district of the confluence of these two streams; at a later date Aryan Brahman missionaries (Agastya) came upon the flourishing Pāṇḍya kingdom in the south of the peninsula.

The old Aryan songs and myths provide no further information upon the civilization of the more advanced native tribes; however, the language of the dark races who belong to the Dravidian family (p. 353) enables us to draw many further conclusions as to the civilization to which they had attained. This language is certainly modified by Aryan elements (Sanskrit), but the non-Aryan portion of its vocabulary provides an accurate picture of the pre-Aryan civilization of those races. According to Bishop R. Caldwell, who lived among the black population and devoted more than a generation to the study of their language, the original vocabulary of the Dravidian races enables us to conclude that before they came in contact with the Aryans they possessed kings who lived in permanent dwellings and ruled over small districts. They had bards who sang songs at their feasts, and it also appears that they were in possession of an alphabet and that they were accustomed to write upon palm leaves with a stylus. A bundle of these leaves formed a book. There were no idols, no hereditary priesthood, and the primitive Dravidians appear to have been entirely unacquainted with the ideas of Heaven or Hell, of sin, or of the soul; however, they believed in the existence of gods, which they named *ko* (king), an absolutely non-Aryan word. Temples were erected in their honour, known as *ko-il* (house of god); no conclusions as to the nature of their divine service can be drawn from their language. The Dravidians of that period possessed laws, but no judges; doubtful cases were decided by precedent. Marriage was a permanent institution among them. The most important metals were known to them with the exception of tin, lead, and zinc, as also were the greater planets with the exception of Mercury and Saturn. They could count up to a hundred and in some cases to a thousand; higher numbers, such as the Aryan *lakh* (100,000) or *crore* (10,000,000), were unknown to them. Medicine was practised among them, though medical science or doctors were unknown. Hamlets and villages existed, but no large towns. Boats great and small, and even decked ships able to keep the sea were employed; these, however, did not cross the ocean, and consequently foreign countries, with the exception of Ceylon, were unknown to them, and their language appears not to recognise the difference between continent and island. Agriculture was a professional occupation, while war was their chief delight, their arms being bows and arrows, swords and shields. Manufactures were highly developed, especially the arts of spinning, weaving, and dyeing, and their pottery had been highly perfected, as is indeed plain from the examples found in the graves. Little was known of the higher arts and sciences; no word exists to signify Sculpture or Architecture, Astronomy or Astrology, Philosophy or Grammar. Indeed their vocabulary is singularly lacking in words

which imply intellectual pursuits; their only word for spirit is "diaphragm" or "the inside;" there certainly exists a Dravidian word for to think, but no special words for thought, judgment, consciousness, or will.<sup>1</sup> As against this last sentence, we must not, however, forget that the overpowering influence of the Brahmaus and their highly developed terminology for abstract mental operations may very well have superseded many native expressions. Comparative philology does not provide wholly conclusive results even in religious matters, and a comparison of those elements common to the early Vedda and to all Dravidian races, even to those at a high stage of civilization, plainly shows that the fundamental beliefs and religious conceptions of the jungle tribes were not confined to those we have mentioned, but were the common property of Dravidian religious thought and practice from the very outset.

There can be no doubt that the Aryans found the dark-skinned race in possession of the country upon their advance into India; the only question is whether this race belonged to the Kolarian or the Dravidian group. Weighty evidence can be adduced to show that the chief mass of the population belonged to the Dravidian group; especially significant is the fact that offshoots of the Dravidian languages have advanced further than the Kolarian group into the linguistic area of the Aryan languages. In the extreme northwest the Brahui appear, in spite of long isolation and strong influence exercised by different surrounding languages, to have preserved a number of Dravidian elements in their tongue; in East India the Dravidian races extend further north than the scattered Kolarian groups; for instance, the Paharia and Rajmahali are more northerly than the Santhals and Juangs, and in Central India the Hos, Mundas, Bhumij, and Gonds are more northerly than the Kurku. Upon the whole the linguistic characteristics of the Kolarians, though their language has not yet been thoroughly investigated, appear to extend rather eastward toward Farther India; in this direction they live in more coherent groups, whereas upon the west their settlements occur more sporadically and give the impression of colonies planted by a people who had entered the country from the east. Further evidence for the Dravidian connection of the pre-Aryan inhabitants of India would be gained if the theory of individual philologists could be proved, which would assume the immigration of the Dravidians from the northwest on the ground of their close linguistic affinities with the Ural-Altaic group. However, this sweeping assumption is as yet unsupported by sufficient evidence upon the philological side; the points of resemblance are in some cases wholly isolated and therefore, perhaps, fortuitous, though in other respects a general resemblance can be noted; moreover the physical characteristics of the race pronounce so decisively against their connection with the Mongolian peoples as to invalidate the probability of this hypothesis. Under these limitations, then, whatever view may be taken of the prehistoric period in India, the fact remains that the dark-complexioned inhabitants of the country, of whom the Dravidians were by far the strongest element, formed the original population of India.

(β) *The Iranian-Indian Aryans in their Original Abode.* — In the year 1833 Franz Bopp, observing the close connection of Sanscrit, the language of the

<sup>1</sup> A Comparative Grammar of the Dravidian or South Indian Family of Languages; second edition. London, 1875.

Brahmans (p. 415), with most of the ancient and modern languages of Europe, was able to establish the affinity of these languages beyond all dispute. He pointed out that Sanscrit was closely related not only to the old Persian (Zend) but also to almost all the other languages of Europe, the only exceptions being the Basque and certain isolated groups of Ural-Altai languages in the north and east of Europe. How was this similarity to be explained? Peoples thus connected by the tie of language might easily be conceived as connected by the tie of blood, that is, as descended from a common ancestral tribe; and Aug. Pott, Christian Lassen, Jakob and Wilhelm Grimm and others lent their support to the theory that this primitive people had lived in Asia, a supposition which became almost an article of faith. The ancestral tribe there settled was said to have been gradually broken up, the component parts migrating in different directions, for the most part westward, even as the solar system is conceived to have been formed by the separation of the planets and their satellites from the primal nebula. At a later period the influence of the Darwinian theory made the genealogical table illustrating these descents somewhat more complex; however, the idea that Asia has been the common cradle of these "Indo-Germanic" or "Aryan" families of peoples continued to maintain its ground. In more recent times philological and anthropological evidence has led investigators to place the common origin of all these peoples in one or another part of Europe and this theory is to-day supported by the large majority of philologists, ethnologists, and anthropologists.

We may, indeed, doubt the intrinsic probability of the fact that any single district of the enormous steppe country extending from Central Asia to the North Sea could have been the cradle of so large a family of peoples. Natural boundaries are unknown upon the steppes, and the peoples inhabiting them spread outward without let or hindrance. The nomads inhabiting those districts prefer to follow the natural changes of season, climate, and consequently of vegetation, wandering abroad at their will and pleasure. The language of the Yakuts in the northeast of Siberia is closely connected with that of the Ottomans in the extreme southwest of that great continent. It is waste of time to inquire at what point the first immigrants entered the steppe district. It is highly probable that as soon as a tribe had secured a footing there it did not confine its movements to a small district, but finding no barriers to oppose its passage, rapidly extended its settlements over a wide area in uniform development, though sporadic distribution. Not until then did isolation of position, difference of environment, and foreign influence begin to produce divergences in physical characteristics, language, and customs. Thus in different provinces similar peoples, occupying widely distributed settlements, developed into individual tribes more or less strongly differentiated. In 1872 Johannes Schmidt conceived the development of the Indo-Germanic languages in the following manner: "I should like to replace the genealogical tree by a diagram of waves expanding in concentric circles at a distance from a central point, the rings becoming weaker in proportion to the distance to which they spread from the central point." With some such theory the facts as known to us most nearly coincide, in so far as the peoples and the languages in close local connection show stronger mutual affinity than those at a remoter distance. The development of Indo-Germanic peoples conceived as occurring in concentric waves is shown in order of development by the rough diagram on p. 362.

The westerly development of the wave circles after radiation from the central

point does not concern us here, and we need only follow the history of the most eastern, or Indo-Iranian group. Our investigation into the date, locality, and the mode of life of this original circle depends upon information derived from comparative philology, and from the traditions and the earliest literature of the peoples which have proceeded from this centre. Such an investigation will show that the two peoples of the Iranians and Indians, between whom all outward connection has now disappeared, broke away from their common centre only a few thousand years before the outset of historical chronology. The comparatively late date of this separation is proved not only by the close similarity of the old Iranian language (Zend) to the language of the earliest Indian hymns, but also by the wide

ORDER OF DEVELOPMENT OF THE INDO-GERMANIC PEOPLES. (See p. 361)

similarities existing in manners and customs, especially those concerned with religion, language, mythology, and worship. Both peoples are called by the same proud name of Aryans (*Ārya*, *Airyū*), the noble, or the lofty; in both peoples the arrival of the youth at man's estate was marked by the custom of girding him with a string. Both religions contain the same names for the deities worshipped, — *Mitra*, *Indra*, *Śiva*, *Yama* (*Yima*), *Asura* (*Ahura-Mazdāh*). However, the deep gulf dividing the two peoples is apparent in the different manner in which these beliefs have developed: the gods worshipped by the Indian branch as the chief deities have sunk to low estate and lost their sanctity among the Iranians; the bright, shining, glorious, all-helping *Indra* of the old Indian faith and the great god (*Mahādeva*) *Śiva* became in the Persian pantheon evil-minded gods or hostile demons, as does *Asura* in India. The figures of the gods have remained unchanged and only the faces have been altered, while to the highest deities the same sacrificial drink, the *sama* (*haoma*) is still offered.

The traditions and the language of the two peoples point to a former common settlement in the north, and there is good reason for accepting the generally received theory which considers their early home as situated in the land watered by the *Oxus* and the *Jaxartes* (*Amu Daria* and *Sir Daria*). The civilization of this early settlement can be inferred in its general features from the vocabulary in

use by its descendants. As might be expected in a country of steppes, the chief food supply depended upon cattle breeding. The wealth of the population consisted in herds of cattle, sheep, and goats, and in the keeping of these flocks the dog was the faithful companion of man. The horse was also bred, but only for traction, not for riding purposes. War chariots drawn by horses played an important part in the struggles of the Aryans upon their immigration to India. The possession of wagons enables us to conclude that the Indo-Iranians were not exclusively a shepherd people. The fact that they were able to build houses of wood, and that their animals were driven into permanent courtyards, justifies the conclusion that they were to some extent a settled race. The cultivation of cereal plants, barley, wheat, and millet was common throughout the Indo-Germanic family in primitive times. Most probably when the Aryans entered the fertile district of the Five Rivers they had already acquired the knowledge and practice of regular irrigation from experience on the banks of the Oxus and Jaxartes. Cattle breeding provided their chief sustenance (milk and flesh, for fish was not eaten), as also their clothing (wool and skins). Of metals, copper and bronze were known, while iron is rarely mentioned. Horn was used more often than bronze for the arrow-heads, which the Aryans smeared with poison. Besides the bow and arrow, their offensive weapons included the club, the axe, the sword, and the spear. There must have been a considerable amount of peaceful intercourse. Straight roads existed traversed by wagons drawn by horses, while rafts and rowing boats passed over the rivers; commerce by barter was established, and hospitality readily granted to the stranger who came in peace. Generally speaking, the morality of the Indo-Iranians reached a high pitch of perfection. Family life was pure; the relations of the members of the race among themselves were regulated by established custom, which insisted upon truthfulness and good faith; in their dealings with foes the race were high-spirited, bold, and warlike. The father was the head of the family, but the wife also was highly respected and honoured. At the head of the tribe or community, the chief or ruler, the "king," was placed not only to conduct the temporal affairs of his tribe, but also to represent the tribe before the powers of heaven. There was no special priestly class, but the whole people was inspired with a profound religious feeling.

(b) *The First Stage of Aryan Immigration into the Punjab.*—We have no knowledge of those causes which induced the Indian Aryans to migrate from their original settlements. Increase of the population above the number that the land could permanently support, the hostile attacks of other steppe tribes, either of remote Indo-Germanic peoples from the west or nomadic Mongolian tribes from the east and north, those internal dissensions which ultimately led to the definite separation of the Iranian and Indian branches, possibly also the reports of the fabulous fertility of a great land on the south,—any or all of these causes may have led to a great national movement. For this, of course, no accurate date can be given; modern experts are inclined to place it about the middle of the third millennium B. C., or considerably earlier.

(a) *The Route of Migration.*—The route followed by the migrating people led southward. Here, indeed, they were confronted by a high mountain wall,—the Hindukush and the Pamirs; but these districts could easily be traversed by a

hardy mountain-bred shepherd people, who would be able to drive their flocks over these chains and to reach the plains beyond, the fertility of which must have seemed an attractive paradise to a people of the steppes, hard pressed by the stern necessities of existence. It is by no means improbable that the Indian Aryans may have entered the country both by the Pamirs and the Hindukush. At a point further eastward they could without difficulty have crossed by Chitral or Gilgit to the Indus and the lovely district of Kashmir, as well as to the upper Punjab. The western road over the Hindukush led them into the Cabul district of Northern Afghanistan. Here the earliest of their extant sacred hymns seem to have been composed; here also the last links between the Iranian and Indian branches of the Aryans may have been severed. From the frontiers of the Afghan highland the spectator could behold the fruitful plains of the Five River Land, and an advance to the plains through the natural passes of the mountain wall was easy. It was no doubt by this route that the main branch of this race reached its new home, though not, however, in one great column, but in detachments, tribe following tribe at long intervals. Powerful was the impression made upon those who crossed the mountain range reaching to the heavens, and long did the recollection of those snow-lad peaks remain among the people; they alone were considered worthy to support the throne of the gods on high.

Magnificent also were the results of the migration when the Aryans arrived in the Punjab, that district watered, with what was to them an inconceivable abundance, by streams swollen with rain and melting snow,—a guarantee of inexhaustible fertility. The poets sang the praises of these rivers with high enthusiasm, especially those of the Indus, the Saraswatî of the Vedas, which unites the waters of the five streams flowing eastward and bears them to the sea. The Vitastâ (Jihlam), Asiknî (Chenab), the Marudvridhâ rejoicing in the wind (Ravi), the Vipâś (Beyah), and the Śutudrî (Sutlej), these are the rivers that cross the district named from their number, Five River Land, the Pautshanada. The poet also sings of the land of the seven streams (Sapta Sindhavas), adding to the Five Rivers, from the memories of the long migration, the Cabul River from the west, and the Saraswati, the chief of the seven sisters.

Not without a struggle did this fair land fall into the hands of the immigrants; the dark-skinned inhabitants whom they found in possession (p. 352) did not tamely surrender. The Vedas of that period ring with the din of battle and the cry of victory; the great gods of the Aryan heaven are called upon to strike down the wicked Dasyu, and are praised with cheerful thanks for overthrowing hundreds of the cities of the despised and miserable slaves, the Dâsa. Serious friction occasionally occurred between different tribes of the same race when newcomers demanded their share of the conquered territory. The Aryan masses pressed successively further eastward. We can trace their advance from their resting place on the heights of the Afghan frontier to the Jumna (Yamunâ), the most western of the Ganges streams, across Five River Land. This river is often named in the later Vedas, but the Ganges not more than once or twice. Such an upheaval of the different tribes, and so great a rivalry for the possession of the fertile soil, must necessarily have led to collisions. Many tribes and their kings are mentioned by name, especially the federation of the "Five Peoples" in the north of Five River Land, the Yadu and Turvasa, the Druhyu and Anu, together with the Puri, who were situated farthest inland on the banks of the main stream, and headed

the confederacy, which originally included the two first-named tribes, and afterward the third and fourth. Beyond the boundaries of these five confederate peoples who inhabited Arya Varta, or Aryan land proper, the Tritsu, a branch of the powerful ambitious warrior tribe of the Bharata, advanced eastward, and bloody conflicts arose between them and the western peoples of the Punjab. The allied tribes were driven back, were confined henceforward to Five River Land, and gradually lost their common interests and the consciousness of their kinship with those of the Aryans who extended further eastward. Most of them disappear from our view; only the Puru (King Porus) held out for a long time on the Indus.

(*B*) *Progress in Civilization.*—In the general civilization of those Aryans who migrated into Five River Land, that progress may everywhere be observed which is connected with a higher development of agriculture and results in greater prosperity, greater security, and greater expansion in other directions. The Aryans now no longer lived a nomadic life on the boundary steppes, but were settled in permanent habitations upon arable territory, with well-defined boundaries. Cattle breeding continued to be vigorously pursued; the ox was the unit of value, not only for purposes of trade, but also for estimating the rank of individuals; the title of a tribal chief was even then "Possessor of Cows" (*gopati*), and battle is still called "desire for cows" (*gawishti*). Milk, either fresh or in the form of buttermilk, cream, butter, and curds, was still the staple article of food; the flesh of domestic animals was rarely eaten, and hunting was carried on chiefly as a sport, or for protection against wild beasts, while fish as an article of food was still despised. A flesh diet was replaced by the use of corn, chiefly of barley, to a less extent of wheat, while rice is not yet mentioned. The plough and sickle were more important implements than of yore. Corn was threshed, pounded in the hand-mill by the women, and made into bread or cakes or porridge. The house was now a permanent habitation and built on a new and stronger plan. A roof of vegetable fibres, tree bark, or straw kept out the rain: in the centre of the main room blazed the hearth, round which seats were arranged (probably of earth as at present); these were covered with animal skins and served as sleeping-places. Earthenware pots, brazen caldrons, and hand-mills for the corn were the most important kitchen utensils. Close to the house stood the fenced yard where the herds were penned, and in which the threshing-floor was laid out. The house was the special care of the woman; here she cooked food for the whole family, spun the wool for thread, and wove artistic fabrics; here she made beautifully adorned cloaks of the skins of the animals killed; here under her care grew up the daughters and small boys. The man's business lay outside in the field, on the pasture and the corn land, at hunting or in war. It was his part to ply the handicrafts which were now increasing in number and rising to a higher level of skill; the wagon builder made strong vehicles, the smith blew up his fire with a fan made of bird's feathers, and wrought not only bronze, but also the iron which the original inhabitants probably brought to him in its raw condition, after smelting it out of the ore (the native Indian form of pocket bellows does not seem to have been in use among the Aryans); the goldsmith produced bright decorations, artistic plates, bracelets, and rings to be worn in the ears, round the neck, and upon the wrists and ankles of the women.

The relations of man and wife were regulated by sound moral principles. To bring forth sons, worthy members of a tribe and an honour to the parents, was the highest ambition and the greatest pride of the father and mother. Respected, and on an equality with her husband, the woman was mistress of the house, though the man as being the stronger was the natural head, protector, and leader of the family. The man wooed the maiden on whom his choice had fallen through friends and relations; if his suit was approved of by the girl's parents, the marriage took place before the hearth of the house in which the maiden had lived hitherto under the protection of her parents. The bridegroom took the girl's hand and led her three times round the hearth; the newly married pair were then conveyed to their new home in a chariot drawn by white steers, the former ceremony was repeated and a meal in common concluded the festival. Polygamy was exceedingly rare, while polyandry was utterly unknown to the ancient Aryans. If a death took place in a house, the body was buried or burnt (interment in both forms is mentioned in the early Vedas); widows never followed their dead husbands into death, either voluntarily or as a matter of social custom.

The houses stood in groups, forming separate hamlets or villages. Some of these places were fortified against hostile attacks by walls of earth or stone (place names ending in *pur* meaning fortified); men and animals were often obliged to flee into fortified settlements, which were usually uninhabited, before the outbreak of floods or hostile incursions. A group of villages formed a larger community, while several of these latter became a district. The district belonging to one tribe formed a corporate whole, each of these groups having its own special chief, while at the head of the whole stood the king (Râjan, the "reigning"); his title was hereditary, or he might be elected, but in either case a new king must be recognized in the general assembly (*samiti*) of all men capable of bearing arms. In the *samiti* were discussed all those matters which affected the whole tribe, especially questions of war and peace. The inhabitants of the district or the village met together in special halls (*sabhâ*), which served not only for purposes of discussion and judgment, but also for conversation, and for social amusements, such as dice playing. As the race was thus organised for the purposes of peace, so also the army, composed of all men capable of bearing arms, was made up of divisions corresponding to the family, village, and district group, each under its own leader. Famous warriors fought in their own war chariots harnessed with two horses and driven by a charioteer, while the main body of the people fought on foot.

The king was the leader in war; he was also the representative of his people before the gods; in the name of the people he asked for help or offered praise and sacrifice. He was allowed in certain cases to be represented by a *Purohita*, who conducted the sacrifice, while any one who possessed high poetical gifts and a dignified appearance might permanently occupy this position. Other nobles, princes of districts, etc., might appoint *Purohitas*, whose influence was increased in proportion as formal prayer took the place of extempore petitions, and worship became stereotyped by the growth of special uses and a fixed ceremonial. Here we have in embryo the separate classes of king and priesthood, an opposition which was to exercise the most far-reaching influence upon the further development of the Aryan people (cf. p. 373).

(γ) *The Religion of the Indian Aryans in the Punjab.*—The Aryan people brought from their primal home one precious possession, a deep religious feeling, a thankful reverence for the high powers presiding over nature, who afforded them a secure and peaceful existence by assuring the continued welfare of the flocks and of the crops planted by man. The good and kindly gods were those who sent to man the fertilising rain and sunshine, bringing growth and produce, and to them, as to high and kindly friends, man offered his faithful prayers and pious vows. To them he prayed that his flocks might thrive, and that he might be victorious in battle, that he might be given sons and have long life; they, the bright, the all-knowing, and the pure, were the protectors of morality and the wardens of the house, of the district, and of the whole tribe. Certain gods belonging to primeval times appeared in the Pantheon of the Aryans who conquered Five River district; Âditya, the "Infinite," Mitra and Varuṇa, the Great Spirit Asura (the Ahuramazdah of the Iranians), Aryaman, etc., bright figures, which were still worshipped in common by the Iranians and the Indian Aryans. But among these latter they grow pale and lose their firm outlines, like the misty figures of dim remembrance; they become many-sided, secret, uncanny, diabolical (Asura); and other gods of more definite character come into prominence.

Three gods are of special importance, Indra, Sûrya and Agni. Together they form the early Indian Trinity (Trimûrti). In the hymns which have come down to us, Indra is most frequently mentioned; he was the atmospherical god, especially favourable to the Aryans, who gave the rain and the harvest, and governed the winter and the thunder storm. We can easily understand how the god of the atmosphere became the chief Aryan divinity; as the Aryans learnt upon Indian soil to observe the regular recurrence of atmospherical phenomena, especially that of the monsoon winds and the thunder storms upon which their prosperity depended, the deeper and stronger became their gratitude and reverence to this god. It is Indra who sends down the water of the heaven, who divides the clouds with the lightning flash before which blow the roaring winds, the Maruts, especially the fierce Rudra, the hurricane, which rushes immediately before the black thunder clouds. As Indra's flash divides the clouds, so also does it overthrow the citadels of the enemy and strike down the wretched Dasyu by thousands in the battle. Thus this god protects the Aryan race, which celebrates his worship in thankfulness with sacrifice (the Soma drink) and with hymns of praise. The second of the three chief gods is Sûrya, the bright sun god, giving light, warmth, and life, an object of high veneration. Ushas, the morning dawn, opens for him the doors through which he passes to traverse the heavens in his chariot with its seven red horses. After these two gods the third of importance is Agni, the fire born from sticks when rubbed together; this god lights and warms the hearth of the house, drives away all things evil and impure, and watches over the morality of the household. As the sacrificial flame upon the altars, he is the means of communication between mankind and the other gods; in his destructive character he devastates the settlements of the enemy and the hiding places of their demons in the depths of the forest.

The worship of these gods is characterised by a feeling of lofty independence. Not only does man receive gifts from them, but he also gives them what they need. They, indeed, prepare for themselves the draught of immortality, the Amrita; but

they hunger for sacrifices and cannot do without them. Especially do the gods love the honey-sweet draught of Soma;<sup>1</sup> they press forward eagerly to the sacrificial flame in which the draught is poured which gives even Indra himself the courage for great deeds and the energy of victorious and heroic power. Almost presumptuous appears to us the prayer in which Indra is invited to partake of the Soma offering: "Ready is the summer draught, O Indra, for thee; may it fill thee with strength! drink the excellent draught which cheers the soul and conveys immortality! hither, O Indra, to drink with joy of the juice which has been pressed for thee: intoxicate thyself, O hero, for the slaughter of thy foes! sit thou upon my seat! here, O good one, is juice expressed; drink thyself full, for to thee, dread lord, do we make offering." Though Indra is here invited in person, yet the personifications of early Indian mythology were much less definite than those of the Greeks. Imagination and expression vary between the terms of human existence and the abstract conceptions of the natural powers of fire, thunder, sunshine, etc. Consequently the god as such is somewhat vague and intangible in the mythology of the old Aryans of India; the characteristics of one deity are confused with those of another and the different attributes of any one god often reappear as separate personifications. The mythological spirit, with the legends which it creates, is confined within narrow limits, and the genealogy of the gods in no way resembles the family picture observable in the Greek Olympus (Vol. IV, p. 269).

A large number of the hymns to the gods have been preserved to us (1,017 in all); these form the earliest body of evidence upon Indian life, thought, and feeling. The earliest of these songs were undoubtedly sung by the Aryans upon their migrations, when they invoked the protection and help of the gods to enable them to reach their goal; new songs were composed on the banks of Five River land and during the further advance into the Ganges territory. At first the unpremeditated outpourings of a pious heart, they gradually became formal prayers; thus these hymns were preserved in families of bards and faithfully handed down from generation to generation until at a much later period they were reduced to writing. Such at any rate was the origin of the earliest collection (*samhitâ*) of the sacred books, the Rig-Veda (*ric* means song or poem; *veda* means sacred knowledge), and at a later period the more modern Vedas. The length of the period in the course of which these songs arose is shown by their many linguistic divergences, and also by the great difference in the phases of thought which they reveal. In many of the Vedas belonging to the earliest period we find a deep longing for truth, a struggle for the solution of the deepest mysteries of existence, in short, a speculative spirit of that nature which marks a later stage of Brahman development; other songs, however, are pure and simple prayers for victory, children, and long life, while others again contain promises of sacrifice and praise if the help of the gods should be granted. The general collection of all these hymns was made at a considerably later period, subsequently to the occupation of the Ganges territory, and not before the seventh century B.C.

(c) *The Expansion of the Aryans in the Ganges Territory.*—The most important events at the conclusion of the Vedic age took place on the frontier line between the Indus and the Ganges. Here certain special characteristics were

<sup>1</sup> In Hindi a certain plant (*Sarcostemma brevistigma*) is still called Som or Soma.

developed which were afterward to lead to important results; we speak of the opposition between the warrior and priestly classes. At the head of the allied tribes in the Punjab stands the proud King Visivâmitra, who combines the functions of king and priest in his own person and invokes the help of the gods for his people. Among his adversaries, however, the King Sudâs no longer commits the duties of prayer and sacrifice to his own priests, but to a special class, the white-clothed, long-haired priests of the Vasishṭha family, and their prayers are more effectual than those of the priest-king. This event is typical of the second stage of early Indian development, which ends in the complete victory of the priests over the warrior class and the establishment of a rigid hierarchy. The date of this social change coincides with that of the expansion and establishment of the Aryans in the Ganges' territory.

(a) *Historical Evidences — The Mahābhārata.* — The sacred books are of less value for the external history of this period than are the songs of the Rig-Veda for the preceding age; nevertheless many of them, such as the Brāhmaṇas, contain important evidence concerning individual tribes, their settlements and history. A large body of historical evidence is, however, contained in the second great epic poems of this period, the Mahābhārata and the Rāmāyaṇa (see p. 496, below); the riotous imagination of the composers has given a strong poetical colouring to the whole, and the lack of definite purpose which is apparent in their construction makes careful and minute criticism imperative.

The Mahābhārata in its present state is the longest poem of any people or age. It contains one hundred and ten thousand double lines (ślokas); and each one of its eighteen books is enough to fill a large volume. The historical basis of the great poem of the Bharata (p. 364) rests upon early tradition. The enthusiasm inspired by heroic deeds found its vent in poetical composition, and the praise of heroes was passed from mouth to mouth. Thus epic poems in embryo may be earlier than the first one thousand years B. C., but when that period of turmoil and confusion was followed by an age of more peaceful development, the memories of these exploits grew fainter in the minds of successive generations; the old songs and ballads were collected and worked into one great epos; many of the events and of the figures are the additions of later poets (such as the story of the Five Pându brothers), while the whole poem is marked by the brilliant overflow of a luxuriant imagination and by ruthless compression of the historical facts; the histories of nations become the victories or defeats of individual heroes; long years of struggle with warlike tribes are reduced to one lengthy battle. To this quasi-historical part of the Mahābhārata were added at a later time a series of lays more extensive than the original poem and written from the Brahman point of view. If the non-epic elements be removed from the poem the following story remains.

At the point where the two streams of the Jumna and the Ganges leave the mountains and flow through the plains, the powerful Bharata tribe of the Kuru had established themselves upon their eastern and western banks; even to-day, the district on the right bank of the Jumna is known as the Kuru-kshetra the sacred Kuru land. This royal tribe divided into two branches. Of the two sons of King Sântanu the elder, Dhritarâshṭra was born blind, and the royal power was therefore conferred upon his younger brother Pându. To the latter five sons were

born and to the former one hundred, and the struggles of these two groups of cousins (Kaurawas-Pāṇḍawas) formed the substratum of the epic. All these brothers were admirably instructed in knightly pursuits by the Brahman Droṇa "in the use of the bow and club, of the battle axe and the throwing spear, of the sword and dagger, in the chase of the horse and elephant, in conflicts from chariots or on foot, man to man or in combination." In the elder line (Kuru) Duryodhana, the eldest of the one hundred brothers, was especially distinguished for his skill in the use of the club; Bhīma, the second son of Pāṇḍu, was famous for his superhuman strength. The third son of Pāṇḍu, the beautiful long-haired Arjuna, excelled with all arms, but especially in the use of the bow and arrow. In one of the tournaments which concluded the education of the princes he outstripped all competitors; after a contest with many other princes, he won the hand of the beautiful Kṛishnā ("The Black") the daughter of Drupada, the king of Pañṭshāla. By his victory she also became the wife of the other four brothers, a polyandric marriage which is represented by the Brahman poet as the result of a misunderstanding with the mother of the Pāṇḍu brothers.

Duryodhana, who had meanwhile been crowned king, dreading the military power of his cousins and of the Pañṭshāla with whom they had allied themselves by marriage, divided his kingdom with the eldest of the Pāṇḍu brothers, Prince Yudhishṭhira. At the moment of his coronation Yudhishṭhira played a game of dice with the enemies of his house, the Kaurawas, in which he lost not only his crown, but also the freedom of himself and his brothers, and the wife whom they possessed in common. But by the decision of the blind old prince Dhritarāshṭra the forfeit was commuted for a banishment of thirteen years. The Pāṇḍu brothers with their wife spent this period in solitude, need, and misery in the forests, and then demanded their share of the kingdom. To this proposition the Kaurawas declined to agree, and both parties secured the support of numerous powerful allies. The Kaurawas were joined by Karṇa (a second Siegfried or Achilles), who distinguished himself in these battles by his splendid bravery and military prowess; the Pāṇḍawas enjoyed the advantage of the cunning advice of the Yādava prince, Kṛishṇa, who placed his services as charioteer at the disposal of Arjuna. A fearful battle ensued of eighteen days' duration, in which, after marvellous deeds of heroism, all the warriors were slain with the exception of the five Pāṇḍu brothers. From this time onward the whole of the kingdom was in their power, and Yudhishṭhira ruled for a long period after the manner of an ideal Brahman prince. Thereupon they retired from all earthly splendour and became ascetics with no temporal needs, wandering from one holy shrine to another, until at length they entered the heaven of the gods opposite the holy Mountain of Meru.

However large an element of the Mahābhārata may be purely poetical, none the less the poem enables us to localise with some accuracy a number of the tribes which were actively or passively involved in the struggle of the two royal houses, and the overthrow of the warrior class to which that struggle led. Of the warrior class the chief representatives are the Kuru, who are represented as settled on the upper course of the Jumna and Ganges, Hastināpura being their capital town (see the map, p. 430); they were also in occupation of the sacred Kuru land to the west of the Jumna as far as the point where the Saraswatī disappears in the sands of the desert. The poem places the Pāṇḍu and their capital of Indraprastha (the

ETCOP 100

modern Delhi on the Jumna) in the central Duab (the central district between the Jumna and the Ganges); in the lower Duab is settled a federation of five tribes, the Pañtshâla. Opposite these on the western bank of the Jumna dwell the Śūrasena, while to the east beyond the Ganges are the Kosala (capital town Gogra) who extended their power after the destruction of the Kuru and Pāṇḍu, their later capital of Ayodhyā becoming a focus of Brahman civilization. Below the confluence of the Jumna and Ganges, the sacred Prayāga, where at an earlier period Pratisthāna (Allahābād) had become a centre for pilgrimages, the northern bank of the main stream was occupied by the Bharata tribe of the Matsya, while to the southeast of these in the district of the modern Benares<sup>1</sup> lived the Kāsi; on the southern bank the native tribe of the Nishada formed a defence against the Aryan tribes in the north. East and north of the Ganges together with the Kosala were also settled the mountain tribes of the Kirāṭa who were in alliance with the Kuru, while further to the south were the Pundra Banga and Anga, the Mithilā, the Wideha (Tirhit), and Magadha.

The action of the great epic poem is laid within the district of these various tribes. Several centuries must have elapsed since the battle of King Sudās, during which the Aryans had formed States in the fruitful central district, the Madhyadesa, and had extended to that tributary of the Ganges now known as the Garuti. In the earlier period of Indian antiquity, the chief historical events take place in the country between the Ganges and its great western tributary the Jumna; whereas at a later period pure Brahman civilization is developed in the kingdoms formed further to the east, namely north of the Ganges in Wideha (capital town Mithilā, the modern Muzaffarpur) and upon the southern bank of the great river, in Magadha and Wihāra (the modern Belār; capital town Pāṭaliputra, the modern Patna). During this period at any rate the eastern frontier of these States was also the eastward limit of Aryan occupation. That national movement ceased at the point where the first arms of the great delta of the Ganges diverge from the southern bank of the river behind the mountains of Rajmahal; the almost impenetrable malarial swamp districts which then composed the whole delta remained for a long period in the undisputed possession of the wild jungle tribes and noxious and poisonous animals. However, the last offshoots of the stream of Aryan immigration turned southward to the fertile districts of Orissa from Magadha, at the period when Brahmanism had reached its culminating point. Here the north-eastern arms of the Mahanadi delta mark the extreme limit of the territory then in Aryan occupation, which consequently extended to the sea upon the east (see the map, p. 430).

At a yet earlier period the Aryans had reached the Western Sea (the Arabian Sea). Immediately after the occupation of Five River Land, the waves of the migration passed down the Indus valley and the Aryans became acquainted with the districts at the mouth of the river, to which also they gave its name (Sindhu). Their settlements in that district did not, however, become a point of departure for transmarine migration (cf. section 6 of this volume). The coast was ill-suited for the navigators of the period, and a far more favourable spot was found further to the southwest in the Gulf of Cambay (p. 346 above); settlements were made here at a period considerably subsequent to the arrival at the mouth of the Indus.

<sup>1</sup> See the plate, "Benares on the Ganges."

The Great Desert and the unhealthy swamps which intervene between this gulf and the Indus district prevented any advance in that direction; moreover an easier route was discovered by the tribes advancing from Five River Land to the Ganges district along the narrow frontier between both territories. Consequently new arrivals found the land already occupied by settlers who had taken this route, and bloody conflicts may have been of repeated occurrence. Driven on by tribes advancing in their rear, hemmed in before by earlier settlers, they found a favourable opening of escape in the strip of fertile territory which extended southward between the Desert and the northwestern slopes of the central Indian Highlands (the Aravalli Hills); this path could not fail to bring them to the Gulf of Cambay, which here runs far inland, and, on its western shores, the rich districts of Gujerat and those at the mouth of the Narbada (Narmadâ) and the Tapti lay spread before them. This was the most southerly point on the western side of India at which the Aryans made any permanent settlement.

Hence during this period Aryan India included the whole of the northwestern plains extending in a southwesterly direction as far as Gujerat, and eastward as far as the Ganges delta, its extreme southeasterly point being the delta of Orissa. The Highlands of Central India formed a sharp line of demarcation between the Aryan and Dravidian races. The district was, however, not entirely secluded from Aryan influence, which at the outset of that period had begun to put out feelers across the frontier line. The Aryans had already become acquainted with the sea, which was for them rather a means than a hindrance to communication; the fact is proved by the similes occurring in the old battle songs, wherein the hard-pressed warrior is compared to a sailor upon a ship staggering under a heavy storm upon the open sea. The Aryan colonisation of Ceylon took place before the power of the warrior class had been broken and the social organism stamped with the impress of Brahmanism (see p. 496).

On comparing this period with that during which the Aryans advanced into Five River Land, we find a fundamental change in the conditions of Aryan life as they are displayed in all these struggles and settlements. Nomadic life under the patriarchal system is replaced by feudal principalities surrounded with all the splendour of chivalry. Changes in other conditions of life had necessarily effected a fundamental transformation in the political and social condition of the people. A more settled life, and the advance of agriculture at the expense of cattle breeding led to a more comprehensive subdivision of labour; though when occasion demanded, the peasant left the ploughshare for the sword, yet it was no doubt at an early period that that warrior nobility arose which made war its business and profession. The leadership of the tribe as the latter flourished and increased became rather a professional post; in place of the tribal elder, who originally was merely *primus inter pares*, appears the king in possession of full royal powers and standing high above and apart from his people. The position of both king and noble must have advanced to more brilliant development in the greater area of the Ganges territory. In the Mahâbhârata the battles and the names connected with them are no doubt in large part the result of poetical invention; but the description of the civilization then existent cannot be wholly imaginary, and the royal courts with their knightly organisation, however romantic in appearance and akin to the institutions of mediæval Europe, may be considered as definite historical facts.

(β) *Political and Social Changes.*—No greater change can be imagined than that apparent in the later condition of those peoples whose history we have traced throughout this proud and warlike period. Gone is the energy of youth; gone, too, the sparkling joys of life and struggle; the green verdure of the Aryan spring has faded, the people has grown old. The nobility has yielded the pride of place to the priesthood, whose ordinances shackle all movement toward freedom and independence. The new power appears in the garb of deepest poverty, but its spiritual influence is all the more profound; the ambition of the priests was not to be kings, but to rule kings.

The origins of this great social change go back to a remote epoch. Even during that period when the Aryan power was confined to Five River Land, the seeds of opposition between the temporal and spiritual powers are found in existence; in the great battle in which King Sudās conquered the confederacy of the Punjab the opposition becomes prominent for the first time (cf. p. 369). At an earlier period it was the natural duty of the tribal chieftain to stand as mediator between his people and their gods. But it was not every powerful prince or general who possessed the gifts of the inspired poet and musician, and many kings therefore entrusted this sacred public duty to their Purohita (p. 367). His reputation was increased by his power of clothing lofty thoughts in inspiring form, and the position passed from father to son together with the more stirring hymns which were orally transmitted. Thus priestly families arose of high reputation whose efforts were naturally entirely directed to secure the permanence of their position; the most certain means to this end was the creation of a complicated ritual for prayer and sacrifice which could only be performed by a priesthood with a special training. The scene of sacrifice was prepared with great attention to minutiae, the altars were specially adorned on every opportunity, and the different sacrifices were offered with scrupulous respect to ceremonial detail; there were priests who recited only the prayers from the Rig-Veda (hotar), others who sang the hymns from the Sāmaveda (udgātār); a high priest stood at the head of the whole organisation.

Consequently the character of prayer, sacrifice, and indeed the whole body of theology underwent a fundamental transformation. Originally the victim had been the pure offering of a thankful heart, while prayer had been the fervent yet humble expression of those desires which man in his weakness laid before the almighty powers of heaven. Gradually, however, the idea of sacrifice had been modified by the theory that human offerings to the gods were not only welcome, but also necessary and indispensable to those powers. In the sacred writings of a later date passages repeatedly occur, stating that the gods are growing weak because the pious priests have been hindered by evil spirits from making the necessary sacrifices. Indeed it was only by means of the sacrifices that the gods, who had formerly been subject to death like men, had acquired immortality. "The gods lived in the fear of death, the strong Ender, and therefore they underwent severe penance and made many offerings until they became immortal." Hence was developed the further idea that by means of sacrifice man could gain a certain power over the gods themselves and thereby extort gifts and services from them; and ultimately the sacrifice was conceived to be a thing of immense magical power before which all the other gods must bow. The all-compelling power of the sacrifice was in the hands of the priests, the Brahmans, and became the firm foundation of their increasing predominance. An Indian proverb says: "The universe depends upon

the gods, the gods upon the Mantra (the formula of sacrifice), the Mantra upon the Brahmans, and therefore the Brahmans are our gods."

Tradition is silent upon the details of the process by which the dominant power passed from the hands of the nobility to the priesthood. It was to the interests of the priests to obliterate historical facts as rapidly and completely as possible from popular memory, and to inculcate the belief that the high position of the Brahmans had been theirs from the outset. The history of the period has been thus designedly obscured, and only at rare intervals is some feeble light thrown upon it. The epos of the fall of the great race of the Bharata shows us how the power of the nobility was worn away in bitter struggles; many priestly figures such as Droṇa and his son Aśwaththāman take up arms and join in the destruction of the nobility. A fact throwing special light upon the acerbity of the contest between the two struggling powers is the appearance in the poem of the mythical figure of Rāma who was considered an incarnation of Vishṇu at a later period, a Brahman by birth, and armed with the axe (*paraśurāma*). The balance of fortune did not, however, invariably incline in favour of the Brahmans, as is plain from the many maxims in their ritual and philosophical writings conceived in a very humble tone: "None is greater than the Kshatriya (the warrior), wherefore the Brahman also makes sacrifices together with the royal offerings to the Kshatriya." The issue of the struggle began to prove doubtful from the Brahman point of view, and therefore the myth claimed the personal interference of the powerful god Vishṇu, who usually became incarnate in times of greatest need, and therefore descends for this reason to the aid of his special favourites, the Brahmans. After an infinite series of bloody conflicts, he gains for them a brilliant victory; thrice seven times did *Paraśurāma* purify the earth of the Kshatriya.

(7) *The Brahman Caste System.* — Notwithstanding their military capacity and their personal strength, the nobles had been defeated, and the priests, armed with the mysterious magical power of the sacrifice, had gained a spiritual dominion over the people. This power the priesthood at once proceeded to secure permanently and irrevocably by arrogating to themselves the monopoly of all religious and philosophical thought, by the strict and detailed regulation of public and private life in its every particular, by forcing the mind, the feelings, and the will of every individual into fixed grooves prescribed by the priests. The legal books, the earliest of which belong to the course of literature of the old Vedic schools (the *Dharmasūtras* of Gautama, Apastamba, Baudhāyana, and others), explain the high ideal which the Brahmans proposed to themselves as the true realisation of national life; an ideal, however, which was hardly ever attained in its reality or at the most only within the narrow areas of individual petty States.

The position of the priests is defined with the greatest precision and detail in the *Dharmaśāstra* of Mānava, a work afterward ascribed to Manu. In order to make this work yet more authoritative, its composers assigned to the personality of its author an age almost amounting to immortality (30,000,000 of years) and divine origin, attempting to identify him with the first ancestor of the Aryans, the mythical Manu. In reality it was not until shortly before the middle of the first millennium B. C. that the Brahman code had developed so large a quantity of precepts defined with such exactitude; in its present form the work of Manu seems to be the result of later re-editing, and according to Arthur C. Burnell, dates

from the period between the first century B. C., and the fifth century A. D. Buddhist precepts are plainly apparent in it, and many prohibitions of the earlier and later periods are brought together in spite of their discrepancy (for instance, the slaughter of animals and the eating of flesh, side by side with the religious avoidance of animal food); Buddhist terms of expression are also found, such as the mention of female anchorites "an apostate sect," which are evidence in favour of a later date. The book consists of a collection of proverbial sayings which were intended to fix the customary law, as established by the Brahmans, for a district of Northern India of limited area. The work contains 2,685 double lines divided into twelve books; of these books, five are concerned with the rights and duties of the Brahmans, whereas only two books are devoted to the warrior caste, and only one to all the other castes put together.

Manu expressly proclaims the existence of four castes<sup>1</sup> only: "The Brahmans, Kshatriyas, and Vaiśyas form the classes in a second state of existence, the Śūdra, is in the first state of existence and forms the fourth class; a fifth class does not exist." In this division, the first point of note is the contrast between those in a first and those in a second state of existence, a contrast which coincides with the racial contrast between the Aryans and the original inhabitants; within the Aryan group a principle of tripartition is again apparent, which, in modern language, amounts to the separate existence of a learned, a military, and a productive class.

Manu here speaks of only four divisions of society; elsewhere he recognises the existence of other caste subdivisions: the castes of the physicians, astrologers, handicraftsmen, oil manufacturers, leather workers, musical performers, Tshandāla, etc., are subdivisions of the fourth class. Properly speaking, however, the origin of these castes is, according to Manu, different from that of the main groups; these latter are of primæval origin, created together with the world and (an important fact) by the purpose of the Creator. A famous hymn of the Rig-Veda, which is a later interpolation, describes the origin of the castes: "The sacrifice Purusha, those who were born at the very first (the first men), they offered it upon sacrificial grass; to it the gods made offering, the Sādhyas and the Rishis. When they divided Purusha, into how many pieces was he cleft? What did his mouth become, and what his arms, what his legs and his feet? His mouth became the Brahman, the Rājanya (Kshatriya) came forth from his arm, the Vaiśya from his thighs, the Śūdra from his feet. The world was born from his soul, the sun from his eyes, Indra and Agni from his mouth, Wāyu from his breath. From his navel came forth the air, from his head the heaven, from his feet the earth, from his ear the districts of the world. In this manner did the gods create the world." Symbolically, the Brahmans were formed from the same member of the body as the great gods of early India, Indra, and Agni, namely, from the mouth, which speaks "sanctity and truth;" the military Kshatriyas were formed from the arms, whence they received their "power and strength." The thigh bones were the means of mechanical progress, the lowly toil of life; from these, therefore, were the Vaiśya formed, who go behind the plough and gain material "riches and possessions" by their industry. From the feet, however, which ever tread in the dust of earth, is formed the lowly Śūdra, who, from the very beginning, is "destined to service and obedience." Thus, according to Manu, by means of the sacrificial

<sup>1</sup> The word "caste" is of Portuguese origin, *casta* meaning race in that language.

power of the gods and of the sacred primeval Brahmans, the Rishis were formed, the four great classes of human society.

The Brahmans have another theory to account for the subdivisions within the Śūdra class, which are explained as mixed castes proceeding from the alliance of members of different castes. It is important to notice that position within these mixed castes is dependent upon the higher or lower caste to which the man or the woman belonged at the time of procreation. Alliances of men of higher castes, and even of the Brahmans themselves with low-caste women, are legally permissible; however, the children of such a marriage do not take the father's caste, but sink to the lowest castes. Wholly different is the punishment of breaking caste incurred when a woman has children by a man of lower caste than herself; not only is she expelled from her own caste with ignominy and disgrace, but the higher the caste to which she belonged by birth, the lower is the social depth to which she and her children sink; indeed, the lowest of all castes, that of the Tshandāla, is considered by the Brahmans to have been formed by the alliance of Brahman women with Śūdra men. On the other hand, the children begotten by a Brahman of a Śūdra woman belong to the higher gradations of the Śūdra group, while the father in no way loses his own permanent position.

Such is the teaching of the Brahmans as laid down in the book of Manu upon the origin of mixed castes. The investigator, however, who leaves the Sanscrit writings, examines Indian society for himself, and judges the facts before him without prejudice, cannot resist the impression that this theory upon the origin of mixed castes is as impossible as that of the creation of the four main castes from the sacrifice. The only mixed caste in the proper sense of the words is that of the temple women, and their children; among these, daughters become temple women, sons temple musicians, or inferior temple servants, etc. But in all other cases where there is no very great difference of caste between the parents, the child takes the lower caste and a new mixed caste never arises. However, in the very rare cases in which a woman of extremely high caste has a child by a man of very low caste, abortion is invariably procured, or the mother commits suicide. The Brahman doctrine upon the origin of the lowest castes is an intentional perversion of the facts. One of the most skilful investigators of the caste system, W. R. Cornish, says, "The whole chapter (of Manu) upon mixed castes is so childishly conceived and displays so much class prejudice and intolerance, so appalling a punishment awaiting the Brahman woman who should err, while at the same time the Brahman is allowed so much freedom of communication with other castes without injury to his position, that the intentions of the author become forthwith obvious." These intentions were to maintain purity of blood in the higher castes and especially in that of the Brahmans, by appointing the heaviest of all punishments upon any woman who should prove unfaithful to her caste. It was not thus that the lower social groups of which we have spoken originated; they are earlier than the laws of Manu. The legislator, however, employed the fear inspired by the prospect of sinking to their degraded position as a powerful instrument whereby he might attain his object, the preservation of racial purity among the Brahmans.

The truth is that castes have arisen from different origins. Differences of race and racial prejudice form a first line of cleavage. Noteworthy in this connection is the old Aryan name for caste, *varṇa*, that is, colour. The white and the black,

the Aryan and the original inhabitant, the "best," the "first" (because the most successful and powerful) in contrast with the low and the common, the Dasyu, — these oppositions form the first sharp line of demarcation. At their first meeting the latter class were naturally not allowed the privilege of conforming to the institutions of Aryan society; extermination was the sole method of dealing with them. At a later period, however, as the conquerors became more prosperous and settled, it was found advantageous to employ prisoners or subject races as serfs for the purpose of menial duties. The original inhabitants of the country were thus adopted into the Aryan society, and in that social order the first deep line of cleavage was made. Other differences then developed within the Aryan population. It was only natural that the man who displayed a special bravery in battle should be more highly honoured and receive a larger share of booty, of territory, and of slaves to cultivate that territory. Thus, in course of time, a warrior nobility was formed, the Kshatriya, who rose to power as we have seen in the struggles of the Mahābhārata. We have already explained (p. 373) the manner in which a further social division was brought about by the formation of a hereditary priesthood (Brāhmaṇa). In proportion, however, as these two classes became exclusive hereditary castes, so did they rise above the great mass of the people, the farmers, the shepherds, and the handicraftsmen whose occupations were now considered as professions lacking in dignity. The Kshatriya proudly called themselves Rājāna, Rājwansi, the royal, or the Rajputes (rājaputra), the men of royal race, and thought themselves high above the wiś, the miserable plebs, the Vaiśya.

Thus the great castes appointed by Manu had been formed. Further differences arose within these. Only the Brahmans and Kshatriyas were able for any length of time to prevent the rise of subdivisions within their own groups. Their narrow and well-defined profession, and also among the Brahmans, at any rate, their jealously preserved racial purity protected them from disruption. But in the two remaining groups, the Vaiśya and the Śūdra, who had now entered the social organism of the Aryans, a different set of circumstances prevailed; the development of larger political bodies resulted in subdivision within these classes. As existence grew more secure and prosperity increased, the necessities of life increased proportionately. In the simple times of the primeval Aryan period, every tribe was able to satisfy such demands for skilled labour as might arise within it; in the more complex organisation of society within the Ganges States such simplicity was no longer possible. Undertakings demanding technical skill called forth by the claims of a higher civilization necessarily brought about the subdivision of labour and the creation of technical professions; manual labour in its several branches became hereditary among individual families of the lower castes, as other professions had become hereditary among the Brahmans and Kshatriyas. It is possible that similar caste divisions corresponding to the various professions may have existed among the original inhabitants of the country before they came into contact with the Aryans. The natives were by no means, in every case, uncivilized savages; some of their tribes were superior in technical skill to the Aryans themselves, and bartered the products of their higher knowledge with the Aryans through merchants (wānidja; in modern Indian, banya). The existence of caste divisions among them at an earlier period is supported by the enumeration in the code of Manu of the manufacturing castes in the lower divisions of the Śūdra (astrologers, oil makers, leather workers, musical performers, etc.). It is inconceivable that the

Brahmans, when formulating the rules of Indian society, should have troubled to arrange these numerous subdivisions of the many castes of the Śūdra, the more so as they were accustomed to avoid any possible connection with this unclean stratum of society; far more probable is it that those differences of caste within the Śūdra which coincide with professions existed before the Aryan period.

The political relations of the Aryans to the non-Aryan natives also contributed to the development of the Aryan caste system. The deadly hatred of the black, snub-nosed people which inspires the hymns of the R̥g-Veda, was laid to rest; during the struggles between the several Aryan princes and States political necessities often led to acquaintance, alliance, and friendship, even to racial fusion with the native tribes. In the Mahābhārata we find a Nishāda prince appointed guardian of the important river ford at Prayāga (p. 371); we find Dravidian races fighting side by side as the equal allies of pure Aryan tribes, while the names of certain personalities famous in the great epos, together with peculiarities of character and custom, are evidence for the close connection between the distinguished Aryan warrior and the native inhabitant. Krishna, "the Black," is the name given to the Yādava prince who appears as the firm ally and friend of the Pāṇḍavas. The attempt has been made to explain this name by the hypothesis that his tribe had entered India earlier than the other Aryans, and had therefore been more deeply burned by the sun; to this, however, it may be replied that the complexion of a tribe may be deepened rather by fusion with a black race than by exposure to the sun. In character also, Krishna appears unlike the Aryans; he is full of treachery and deceit, gives deceitful counsel, and justifies ignoble deeds by equivocation methods wholly foreign to the knightly character of the Aryan warrior. The Pāṇḍhā princess is also entitled Krishna, "the Black;" the fact that she lived in true Dravidian style with the five Aryan princes in a polyandric marriage, shows the close relations existing between the Aryan and the native peoples. Similar relations are also apparent in the history of the colonisation of Ceylon; the Aryan ancestor Vijayas had married a Dravidian Kaliṅga princess, and his grandson, together with many of his companions, took native women to wife without any exhibition of racial prejudice. Thus, since the time of the Aryan immigration, an important change had taken place in the relations of the two races. The rapidity with which the racial fusion was carried out is apparent at the present time in the physical contrast between the peoples of the Northwest and the Ganges territory; in Five River Land, in Cashmir, and to some extent in Rajputana hardly a trace of the black population is to be found, a result of the deadly animosity with which the war of conquest was prosecuted; further to the East the mixed races reappear and the evidence of darker complexion, broader features and noses, increases proportionately from this point. Such a fusion, and particularly the incorporation of whole races of the native inhabitants within the Aryan society must obviously have increased the subdivisions within the castes.

The Brahmans, who took the utmost precaution to preserve their caste purity, were least affected by the entrance of foreign racial elements; at any rate in Northern India their caste, even at the present day, has changed but little from the Aryan type. However, in Orissa and to a greater extent further southwards, even this exclusive sect considered it expedient on different occasions to admit individuals or even whole tribes of the black race within their caste, if they could thereby attain any external advantage; thus at the present day in the Deccan many

more dark than fair Brahmans are to be met with (cf. the upper half of the plate facing p. 418).

In the warrior caste purity of blood was thought of less vital importance; among this caste there even existed a legal form of marriage, the "Rākshasa" marriage, which provided that the bride should be taken by force from a hostile (often dark-complexioned) tribe. The nobles thus being by no means averse to marriage with the natives, the common people naturally had the less inducement to preserve the purity of their Aryan blood. At the same time, however, such connections often led to disruption within the caste; the orthodox members refused to recognise the mixed families as pure Kshatriya or Vaiśya, avoided communication with them, and by this process a group which had been originally uniform was gradually broken into an increasing number of disconnected castes. The infusion of foreign blood thus acquired seems to have modified by slow degrees the larger part of the Kshatriya and practically the whole of the Vaiśya. Thus we have an intelligible explanation of the fact that only in comparatively few districts (for instance, Rajputana) could particular castes retrace their origin with any clearness to the old Aryan warrior nobility, their proud title of Kshatriya resting in many cases upon fictitious genealogies. At the present day there is absolutely no caste of the Vaiśya which can prove its connection with the early Vaiśya of the Aryan Ganges States.

The modern caste system of India is broken up into many hundreds or thousands of separate groups. However, in early Brahman times the four main divisions of society appointed by the legal codes had an actual existence. Of these the Śūdra led lives that can scarcely be qualified as human. Considered as once-born, a great gulf was fixed between them and those who had advanced to a higher state in virtue of a second birth. To them was forbidden the use of the sacred band with which the youth of the three higher castes were girded as a sign of manhood upon their coming of age (two threads of wool which passed over the left shoulder and the right hip; cf. above, p. 362). It was a mortal crime for any of the upper classes to teach a Śūdra anything of the sacred proverbs or prayers. "To the Śūdra no man may give counsel, nor is it lawful to give him the remnants of sacrifice, food, or butter. Similarly, it is unlawful to teach him the doctrine or the uses of religion. For whosoever teaches him the law, or gives him a share in religious ceremonies, he, like this Śūdra, sinks into the depth of the hell called Asamwatta." The very breath of the Śūdra contaminated the twice-born, even at a great distance. Consequently, the Śūdra had to live far away from the dwellings of other men, and to build their miserable huts away from the high-road in the jungle. Should they meet anybody of a higher caste, they must avoid him, keeping at a distance of one hundred paces. The worst rags, the most miserable food, the lowest and dirtiest labour were considered good enough for this poor, despised caste.

A great gulf divided the Śūdra from the Vaiśya. Upon this latter the two high castes of the priests and the warriors looked disdainfully. The Vaiśya was, however, a twice-born, wore the sacred band, and the knowledge of the Vedas was not forbidden to him. It was the common and monotonous nature of his calling that degraded him in comparison with the higher caste. He was not allowed to devote himself to the proud service of arms, or to deep spiritual and religious questions and interests. His lot was to till the soil throughout his life, and upon

that level he remained. He was the peasant, the shepherd, the lower-class citizen in the flourishing towns, the manufacturer, the merchant, the money-changer. He often attained to high prosperity, but could never pass the barrier which the stern laws of caste had set against his further progress.

Higher than the Vaiśya stood the warrior, the Kshatriya, in the social organism of the Brahmans. The splendour of his profession and of his influence was but the shadow of that which it had been during the first centuries of the settlement upon the Ganges. Moreover, in the more peaceful times which succeeded the period of establishment within that district, the profession of the warrior nobles decayed considerably. The more, however, his real importance decreased, the more anxious were the Brahmans that he should make a brilliant figure before the mass of the people, in order that he might thus become a valuable ally to themselves for the attainment of their own purposes. Thus the nobility continued to enjoy a predominant and honourable position. Their freedom was great compared with that of other castes, and large possessions in landed property secured to them the enjoyments of life, as well as respect and consideration. If the Kshatriya exhausted all the pleasures of his high position and was overcome by weariness of the world, he was allowed to join the company of hermits and to devote the remainder of his life to inward contemplation.

The Brahmans belonged to the same group of twice-born, and wore the same sacred band as the other high castes, but had succeeded none the less in securing for themselves a position that was infinitely the highest in the country. The tremendous principle that they were beings endowed with a special and divine wisdom and differing in kind from all other men, that they possessed divine power and corresponding privileges, is pushed in their legal books to its uttermost extreme. Their position may be explained by some few quotations from Manu: "What being can be higher than that through the mouth of which the gods eat their sacrifice, and the spirits of the dead receive their gifts?" "Therefore everything that is in the world is the property of the Brahmans; for the Brahman can claim it by his superiority and his lofty birth. Indeed, all that men have they enjoy only through the kindness and good-will of the Brahmans." "Who without danger could venture to destroy these sacred men, by whom the all-devouring fire was created, the infinite sea, the moon with its wanings and waxings?" "What princes could prosper who should resist them, who in their anger could build other worlds, and give them rulers, who could call new gods and new mortals into existence?" "Who that cares for his life would outrage those who alone permit the worlds and the gods to exist?" Compare with these the following phrases upon the Śūdra: "One duty has the law laid upon the Śūdra, to serve the higher castes without murmuring." "A Brahman may force a Śūdra, whether he be a bond slave or not, to serve as a slave, for the Śūdra was created by the supreme being for no other purpose than for the service of the Brahmans." "A Brahman may appropriate without the smallest scruple the whole property of a Śūdra, for he cannot have possessions of his own; he is a man whose possessions can be taken from him by his lord." Remarkable, also, is the difference between the penal code of the Brahmans and that of the Śūdra; the greatest penalty inflicted upon a Brahman in any case is the shaving of the head, whereas for other castes capital punishment is appointed in similar cases. "In no case may a king strike a Brahman, even though he catch him red-handed in some crime; the

king may only banish him from the land, but in possession of his whole property and unharmed." "Should a Brahman kill a cat, an ichneumon, a frog, a dog, a lizard, an owl, or a crow, he is to go through the same process of purification as if he had killed a Śûdra." Upon the Śûdra, however, a wholly different code is binding. "Should a once-born man speak insolently of the name or the caste of the twice-born, a red-hot iron ten fingers in length shall be thrust into his mouth." "If such a man should be so insolent as to criticise the behaviour of the priests, the king shall have boiling oil poured into his mouth and ears."

The outward appearance of the Brahman in no way represented the power of his caste, in which respect he is to be contrasted with the Kshatriya. Modesty, indeed, poverty characterised his appearance and his mode of life. Lucrative professions, which were in his eyes derogatory, were closed to him. On the other hand, it was the duty of every Brahman to found a family, and his great ambition was to beget sons who should revere his memory after his death, and provide prayer and sacrifice for his spirit. Consequently, the material possessions of the Brahmans became more and more divided. Moreover, the whole Brahman theory of existence was opposed to the temporal point of view. Not only physical existence, but also material possessions were considered by him as so many obstacles in the way to felicity which his soul would tread when after purification it became reunited with the universal element. Hence in the eyes of the Brahman the mendicant profession was in no way derogatory, since the whole world already belonged to him. Begging, on the contrary, seemed to him the loftiest of all professions, as it implied the least amount of hindrance in the prosecution of his high tasks. It is true that voluntary offerings, even when the Brahman power was at its height, by no means invariably sufficed to maintain the caste, many members of which were obliged for this reason to adopt one of the lucrative professions. Many gifts were made to them as payment for relief from spiritual duties, for religious instruction, prayer, sacrifice and judicial pronouncements. If the income from these sources proved insufficient, the Brahman was allowed to plough the fields or to tend the herds. He might also learn the arts of war and practise them (Droṇa and Aswatthâman, p. 374), or carry on commercial business, though money-lending upon interest, the sale of intoxicating liquors, or of milk and butter, the products of the sacred cow were forbidden to him. It was as impossible for a Brahman to get his living by the practice of the lower arts (music, song), or by unclean occupations, as by the practice of leather-working or any other degrading trade.

The life of a Brahman as a whole included several grades, that of the neophyte, the patriarch, the hermit, and the ascetic. Upon his coming of age the youth of this caste was girded with the sacred band and received into the community of the twice-born. His education was passed under the supervision of a spiritual teacher, the Guru, whom he was to reverence more highly than his own father. "If a Brahman pupil should blame his teacher, even though with justice, he will be born again as an ass; should he betray him falsely, as a dog; should he take his property without leave, he will be born as a small worm, and should he refuse him service, as an insect." Under the Guru the young Brahman learned during the long course of his education the sacred books, all the prayers, offerings, and ceremonial connected therewith, and all the laws governing Brahman society. Then came the stage of family life, a burden laid upon him as a member of the earth to maintain the prosperity of his tribe and caste by begetting sons. This

task accomplished, the rest of his life was to be devoted to the highest and most beautiful task, the work of redemption and purification of the soul from earthly elements. The Brahman, often accompanied by his wife, leaves his home and becomes a hermit in the forest. There he lives only upon such fruits or roots as his surroundings afford, or upon the scanty gifts of pious devotees, being entirely occupied with the fulfilment of religious precepts and with deep introspective speculation upon the evils of existence and the means of purification. The highest task of the Brahman's existence is pure and untroubled thought, far removed from all worldly interests, upon the deepest questions which can occupy the human mind. Brahmins of similar interests often united for pious practices; spiritual orders were formed with rulers to regulate their behaviour, and with the common object of entirely forgetting the world around them and devoting themselves to introspection. Others were not content with such intellectual submergence in the divine, and also sought to suppress and to destroy the earthly element, the flesh, while they still lived. The most ingenious tortures and penances were devised, and the universal ordinances of Manu did not leave this subject untouched: "The penitent is to roll upon the ground, to stand upon tip-toe all day, or to stand up and sit down alternately without cessation. During the hot season he is to sit under the burning rays of the sun between four fires; in time of rain he shall expose himself naked to the downpour, and wear wet clothes during the cold season. By increasing severity of his penance, he is gradually to wear away the temporal element. And when he is sick unto death, he is to rise and walk directly northeast with air and water for his sole nourishment, until his mortal powers give way and his soul is united with Brahman."

(δ) *The Brahman Philosophy.*—The subjection of the flesh was a task undertaken with different energy and success by different individuals, but before every Brahman a high ideal was placed. As the ceremonial aspect and magical effects of the sacrifice were especially emphasised upon the large mass of the people, so the best minds of the deepest thinkers could not fail to be proportionately convinced of the valuelessness of such ceremonies; the knowledge of the fictitious basis upon which the power of the Brahmans entirely rested must in many cases have destroyed the pleasures of their existence. Consequently even in the case of those who had made the profoundest speculation their peculiar profession, thought was coloured by a deep sense of the uselessness of existence; man and the whole world were but one great process of suffering, and the highest object of life could only be freedom from this suffering, while the highest object of intellect was to find the path to freedom. This path was only to be found by the understanding of suffering as an essential element in life, by the knowledge, that is, of the logical connection which unifies the cosmos. The path to redemption is the path to knowledge (*ñāna*). Thus the objects of Brahman philosophy are wholly different from those of European civilization; the latter would know the truth for itself alone, whereas the Brahman speculates with the practical aim of attaining freedom from the suffering which lies like a curse upon the whole world.

This Brahman philosophy has been reduced to writing in the Upanishads, the "mystical teaching of that which lies concealed beneath the surface." These also are considered as sacred writings, but are the exclusive possession of the highest castes, whereas the Vedas were open to the Vaiśya. Their teaching is spiritual

pantheism; the cosmos is one being, a world soul, *Ātman* or *Brahman*. The teaching of the *Upanishads* is explained in detail in the philosophic system of the "*Vedānta*."

The world soul in its original form, and in its ultimate condition, the "self," is impersonal (the *Brahman*, neuter) without consciousness, in absolute tranquillity, infinite, without beginning or end and existing by and for itself. As soon, however, as the desire for activity arises within it, it becomes the personal creator (*Brahmā*); this it is, which creates the world perceptible to the senses. Everything in the world, the heaven and the foundations of the earth, fire and water, air and earth, suns, plants and all living beings, animals, men and gods are the emanation of that all-pervading spirit, the *Brahman*, conceived as personally operative. When this latter desires to become creative, its objective appearance in the world implies the production of spirit (apperception, thought, and will) and of bodily form, which varies in the case of different living beings, consisting of a material body which disappears upon death, and a more immaterial form in which the soul remains upon the departure of the body; this latter survives until the soul which it clothes is again absorbed into the impersonal and unconscious *Brahman*. During the period of earthly existence the universal being by objectifying itself abandons that state of absolute passivity, which is its highest form; it sinks, that is, from the highest stage of perfection. Hence is derived the suffering inseparable from earthly existence, and return to the ideal condition of passivity enjoyed by the world soul is the great longing of every creature. The path of redemption is by no means easy; by the iron laws of causation, the operation of the world soul becomes a curse permanently imposed upon every physical being. Every act, bad or good, leads to some new act, to further separation from the highest existence, and hence to further unhappiness. Every death is followed by a new birth, the soul entering a higher or a lower plane of existence according to the merits of its previous life, becoming a god, a *Brahman* or a *Śūdra*, a four-footed animal, an insect or a worm.<sup>1</sup> The chain of transmigrations which the soul may thus undergo is of endless duration, including millions of new births. None the less, a definite goal is set before it and the reunion or absorption of the personal soul into the absolute passivity and unconsciousness of the primal *Brahman* is a definite possibility; the way leading to this end is the way of knowledge, the way of understanding, which can only be attained by absolute self-absorption.

This pantheistic teaching of the *Brahmans* emphasises the width of the distinction between the purely spiritual nature of the original *Brahman* and that of the existing world. Several philosophical systems and schools (six of which have found general recognition), have attempted to solve the great problem by different methods. Of these, two are of especial importance for the further development of Indian thought, the *Sāṃkhya* philosophy and the already mentioned *Vedānta* philosophy (the end or perfection of the *Vedas*). The former considers the external world as having an objective reality under certain aspects, a reality derived from the creative power of the world soul; whereas to the *Vedānta* philosophy material existence is purely illusory and has no value as such. According to this latter, as soon as the *Brahman* acquires consciousness and personality, it also assumes

---

<sup>1</sup> The more practical doctrine for popular consumption also inserted promises of purifactory fires and the punishments of hell, which were painted by Indian imagination in the liveliest possible colours.

an imaginary physical form. In its most refined form it appears as the chief divine personality, Īswara. But all such forms are necessarily subject to the conditions of activity (rajas), of goodness (sattwa), and of imperturbability or darkness (tamas), so that this highest god appears as a trinity. He is the personally active creator, Brahmā; the all-helping, ever operative Vishnu, or the Rudra Siva, the agent of dissolution and destruction. At the same time, however, these and all the other gods, together with mankind and the whole of the material world, are merely a dream, an idea of the world soul which is itself the sole existing reality.

It was not easy to appreciate all the difficulties which beset every Indian philosophical system, much less to pass judgment upon the results. The text of the sacred Vedas, the basis of all knowledge, was with the utmost difficulty harmonised with the philosophy. The interpreter was obliged to take refuge in comments and explanations, which are refinements of hair-splitting and miracles of ingenuity. Commentators were invariably anxious to surpass one another in learning and erudition, in readiness and brilliancy of exposition. The methodic and the formal finally strangled the material content of the system, and Indian philosophy was thus degraded into a scholasticism with every characteristic of that current in the thought of mediæval Europe.

(ε) *Brahman Theology.*—The teaching of Brahman philosophy was fully calculated to satisfy the introspective spirit of the Brahman weary of life and tormented by doubt. To him, bound fast in the chains of asceticism, this teaching appeared as truth of the highest and most indisputable order. To the great mass of the people, however, such teaching was unintelligible, and would in any case have proved unsatisfactory. The worker for his daily bread demands other spiritual food than the philosophic thinker. A popular divinity must be almighty and at the same time intelligible to mankind. If the Brahmans did not wish to lose their influence upon the people, a danger threatened by the appearance of Buddhism with its powerful spiritual influence, they were forced to offer to the people gods more definitely comprehensible to the ordinary mind.

The gods of the old Vedas of the military period had lost their splendour and power upon the downfall of the nobility. They had developed under other circumstances, and were unable to conform to the new conditions of life. But in legend and poetry other ideal figures had arisen, the heroes of the flourishing period of the Aryan domination in the west of the Ganges valley. Mythology provided them with a genealogy, bringing them into connection with those forms of nature which had ever been objects of especial reverence (the Sun and Moon dynasties). However, the Indian heroic period was historically too near in date to the development of Brahmanism for its figures to attain the position of supreme gods. Other divinities came forward from other directions. The diminution and the importance of the old Vedic gods was largely due to the conjunction and partial fusion of the two races which had originally opposed one another as deadly foes. At that period the Aryan gods had been primarily gods of battle and slaughter. Circumstances now had become more peaceful and tranquil. As, however, under Brahman influence the people lost the proud consciousness of their strength, as they also became penetrated with the sense of the miseries of existence, so did they become more inclined to receive the mysterious and repellent forms of the primeval Indian demonology, which had formed the shadowy spirit world of the original inhabitants.

This change in the belief of the great mass of the people was by no means unwelcome to the Brahmans. In the worship of these gods, in their magic formulæ and incantations, in their objective representations, they found a great deal which corresponded to their own worship; and they had, therefore, the less scruple in forming an alliance with the demon world of the Dravidians. Hence it is that in the later sacred books of the Brahmans, even in the Atharva Veda, the latest in date of the Vedas, numbers of alien and evil spirits leer upon us, of which the earlier books, the Rig Veda especially, knew nothing. For the Brahmans it was perfectly easy to include these spirits within their own Pantheon, for their theory of immanence and emanation enabled them to incorporate within their own system elements the most contrary to the divine nature. As their highest being, the Universal Soul, manifested himself in an infinite variety of forms, why should not these manifestations include evil demons and ghosts? Their own speculations upon the three manifestations assumed by the supreme being when personified, corresponded in two cases, at any rate, to the two characteristics of the gods of one and of the other race. In the kindly benevolent Vishṇu were personified the early Vedic gods, well disposed toward mankind; whereas the disruptive and destroying Rudra Śiva (see the upper plate, "Early Indian Sculpture," page 390) was the personification of all those hostile powers which were feared in the demoniacal deities of the Dravidians. The remaining manifestation of the Brahman supreme being, the personified and creative Brahmā, in no way corresponded with any part of the religious feelings and desires of the people, but has always remained a conception peculiar to the Brahmans. In many thousands of temples worship was paid to the other two personifications of the supreme being, whereas throughout India hardly two temples can be found in which a Brahman desirous of objectifying his conceptions, worships the creative power of the world soul under the image of a god.

(5) *The Extension of Brahmanism to South India.* — As the Aryan States on the Ganges flourished and extended, as life became more highly organised, so did the Brahmans become ever more inclined to the solitary life. In countries as yet untouched by Brahman teaching, in the jungle deserts and beyond the boundaries of foreign native States, whole colonies of hermits arose, living either in isolation or under some organised constitution. Often, indeed, they had to struggle with the attacks of hostile races. We hear a great deal of the evil Rākshasa, who harassed or disturbed the pious hermits. But they also met with more civilized and kindlier treatment, and men were found who would gladly make small offerings to the more highly educated foreigners, receiving instruction and stimulus in exchange. These men thus became the pioneers of Brahmanism, and their monasticism and influence steadily extended southward. The Mahābhārata describes how Arjuna, during his pilgrimage from hermitage to hermitage, at length reached the maidens' baths of Komarya at Cape Comorin. Similarly Rāma meets hermits everywhere. The name, however, that constantly recurs in all these reports, the man who is ever ready to help all Aryan-Brahman kinsmen with counsel and assistance, the man who possesses the greatest influence in the whole of the south is Agastya. In the myths he appears as one of the greatest sages (Rishi) of the primeval period, the son of Mitra and Varuna, the strong helper in the necessity of the old Aryan gods when they were threatened with conquest by the evil demons, the Asuras. In the

south, he is the incarnation of the victorious advance of Brahman culture. The Vindhya Mountains hitherto uncrossed bend before him. He is the sworn enemy of the evil demons, the Rākshasa (the gods of the original inhabitants) and the bringer of civilization to the Dravidian kingdoms, and consequently the Tamir Muni, the sage of the Tamils.

The history of the south before the Brahman period is hidden for us in darkness, only penetrated here and there by the feeblest rays of light. Native legends consider the starting point of the general development of civilization and politics to be Korkay (the Greek Colchi) at the mouth of the sacred river Tāmbraparnī in the Gulf of Manaar. This district, sheltered upon the east by the bridge of Adam from the inhospitable Sea of Bengal with its dangerous cyclones, forms a connection between the two rich lands of India and Ceylon on the north and south. Korkay was an old town even when the Greeks first visited it and brought news of its existence to the west. It owes its origin and its prosperity to the product of that gulf, the pearls, which were highly prized in antiquity, in which this Bay of Colchi has proved richer than any other part of the earth at any period of history. The age of that old trading station is probably identical with the date of the use of pearls for ornamentation among the peoples of antiquity. The ancient ruins of Korkay have been discovered at a distance of several miles from the present coast line, buried in the alluvial soil which the Tāmbraparni brings down, advancing its delta ever further into the sea (not far from the modern harbour of Tutikorin). The legend relates that Korkay was founded by three brothers, who lived in unity for a considerable period, afterward separating and founding three kingdoms (the Maṅḍalas), the Pāṇḍya kingdom (in Greek Pandion) in the extreme south, the Chola kingdom in the northeast, and the Chera kingdom in the north and northwest (see below). Of these, the most important was the Pāṇḍya kingdom, which for a long period held the harbour of Korkay as its capital. The totem sign or insignia of its kings was the Fish (carp), a fact confirming the legend, which states that the centre from which further civilization was developed lay upon the sea. At a later period the capital was placed more in the centre of the country at Mathurā. When the first Aryan-Brahman hermits advanced into that distant territory, they found flourishing and well-organised States in existence. The later introductions of northern civilization were collectively attributed to the name of Agastya. He arrived at the court of King Kulaśekhara, was well received, and wrote books in the language of the country, treating of every branch of science and culture.

Utterly different is the history of the introduction of Aryan civilization to the south. In the north, it had led to a racial struggle. The rude strength of races more powerful intellectually and physically had been pitted against backward tribes, the consequence being that the latter had disappeared or had been reduced to the lowest stage in the social organism; whereas in the south the struggle was fought with intellectual weapons, the higher knowledge and power of pre-eminent individuals. Brahmanism creeps in quietly and insinuatingly, makes concessions, leaves the people in possession of their language, increasing their vocabulary with elements of the sacred Brahman language (Sanskrit) only where it is incapable of expressing the terms of abstract thought and religious teaching. But even then this language is so highly respected that kings and towns consider it an honour to bear a Sanskrit together with their old Dravidian name, which former are known to us only from the later accounts of the Greeks. Moreover, the native name

Pāṇḍya (the sap of a palm-tree, one of the staple products of the country) so closely resembled the Pāṇḍava of Aryan legend (p. 370) that the two were considered identical, and the Pāṇḍya dynasty of the southern kingdom was identified with the Aryan gods who had sprung from the Pāṇḍu dynasty in the north. The Brahmans even left the people their system of writing. The original native Vattezhat alphabet (Vatteḷuttu), a wholly original creation, maintained its ground in the three kingdoms of Southern India until the end of the first millennium A. D., when it was replaced by a more modern system which may be traced back to the Southern Asoka inscriptions.

The date of the subjection of Southern India to Brahman influence is as uncertain as is the whole chronology of India before the Greek age. The Kshatriya play no part in this intellectual subjection of the south. The immigrants appear also to be in full possession of the pure Brahman civilization, facts which show that the struggles for supremacy between these two orders must have already come to an end. The Greeks under Alexander the Great and the Romans in the Augustan period found the social life of the people so penetrated with Brahmanism that several centuries must then have elapsed from the date of its introduction. Hence we, perhaps, conclude that the conversion of the south to Brahmanism took place in the first half of the first millennium B. C.

(7) *The Early Kingdoms in the South of India.* — The earliest historical mention of the Pāṇḍya kingdom of Southern India occurs in the Buddhist chronicles of Ceylon. The forerunners of the Aryans under Vijaya had already encountered a strong kingdom in that district, to which the north of Ceylon was probably tributary, and it appears that the new Aryan arrivals who took wives from that country were obliged to send the regular tribute of pearls and conchs to the Pāṇḍya princes. The reports of Megasthenes at the end of the fourth or beginning of the third century B. C. mention the Pāṇḍya kingdom as lying at the extreme south of the Indian peninsula, adding a word upon its productiveness in pearls. The kingdom is also mentioned in the inscriptions of Asoka in connection with the two neighbouring Tamil States (Pada = Pāṇḍya, Chuda = Chola, and Kera = Chera). Roman coins are occasionally found in this most southern portion of India, and confirm Strabo's references to the commercial relations existing between the Roman and the Pāṇḍya kingdoms and of the embassy sent by the latter to the emperor Augustus. The boundaries of this kingdom (see the map, p. 430) coincide upon the south and southeast with the north coast of the Gulf of Manaar and the Palk Straits. From the north end of these the frontier line advances in a westerly direction to the Palni hills. Upon the west the power of the Pāṇḍya king often extended to the Arabian Sea, and even at the present day the language of the east, Tamil, is spoken in the southernmost districts of the Malabar coast. During the whole of its existence the Pāṇḍya kingdom was distinguished by a brave and warlike spirit. It was continually at variance with its southern neighbours (the Singhalese) and also with the Chola in the north. Generally speaking, its civilization was far in advance of that possessed by any other State of Southern India.

The northeastern neighbour of this most southerly State was the State of the Chola (the name of the Koromandel coast is a corruption of Chola maṇḍalam or Chola kingdom), a tribe of almost equal antiquity to the Pāṇḍya. Ptolemy speaks

of the nomadic Sorai of this district, of the wandering Chola. The chief tribe was that of the Kurumba, a nomadic race of shepherds, and their restless life perhaps explains those warlike tendencies which brought them into continual discord with neighbouring tribes. They were also constantly involved in hostile undertakings against the more distant Ceylon. Their capital has often changed its position; Comba = Conum, Trichinopoly, Tanjore, now occupy the sites of their earlier capitals. The northern frontier originally lay more to the southward, but was extended in course of time to include part of the district of the Telugu languages. From this point as far northward as the Kistna (Krishna) succeeded a number of independent tribes, the most important of which were the Pallava. Beyond the Kistna as far as Orissa extended the primeval Dravidian Kalinga kingdom.

In the south of the peninsula the kingdom of the Chera, the third of the Dravidian kingdoms, occupied the coast of Malabar from about Calicut to Cape Comorin, though its frontiers at different periods extended eastward beyond the ghats (Mysore, Coimbatore, Salem), while during other periods portions even of the district on the Malabar coast were occupied by the Pāṇḍya kings. On the whole, this branch of the Dravidian States was more peacefully inclined than its eastern neighbours. The fertile character of the Malabar coast favoured a more restful course of development, and rather inclined the inhabitants to tranquillity. The vernacular diverged from the Tamil as lately as one thousand years ago, and must now be considered a special language, though the old Tamil alphabet, the Vattezhat (p. 387), still remains in use.

(θ) *The Advance of Brahmanism to the Malabar Coast.*— Upon the north of the Chera Kingdom Brahman civilization at an early period exercised a deeper influence upon the inhabitants of the Malabar coast than in any other part of Southern India. While the age of chivalry was at its height, the Aryans had advanced as far as Gujerat on the Gulf of Cambay (p. 371); from this point Aryan influence extended eastward. Between the native independent States of the Bhilla (Bhil) colonists were continually advancing, and Aryan manners were extended over the west of Central India (Mâlwa, reaching the land of the Mahrattas in course of time). The triumphant colonisation of the west coast, known by the Sanscrit name of Kerala (the land of the Chera), belongs to the later period of Brahman predominance. In the northern half of this district, especially in the modern Kanara and Malabar, a federation of sixty-four cantons seems to have existed before the Brahmans entered the country. The military protection of the country was intrusted to a sixth part of the members of this federation (ten and a half cantons), while the government was carried on by a council of five ministers, who were re-elected every four years. When the Brahmans pressed into this fruitful territory in greater numbers, they maintained the existing constitutional forms while securing their own recognition as the royal masters of the country. A legend of Brahman origin ascribes their arrival to the help of the Brahman god, Vishṇu, incarnate as Râma, with the battle axe (Parasu Râma, p. 373). The legend represents him as a son of the Brahman sage, Jamadagni. During the absence of this latter, a sacrificial calf was stolen from his cell by the Kshatriya Prince Kârtavîrya, and the son avenged his father by killing the Kshatriya. In the feud which resulted, Jamadagni fell a victim, and Râma swore vengeance upon the whole order of the Kshatriya, and exterminated them ("He purified the earth

twenty-one several times of the Kshatriya," *op. cit.*). The gods rewarded him for his piety with a promise that the country should be his as far as he could hurl his battle axe. The weapon flew from Gokama to Cape Comorin. Thus the whole of the Malabar coast was gained and settled by the Brahmans, to whom Paraśu Râma presented the district. At the present day the Malabar chronology begins with that throwing of the axe and the creation of the country, which is dated 1176 B. C. The legend was invented as a foundation for the claims which the Brahmans raised upon entering the country. Their theory was they were the actual possessors of the land which they had restored to its old masters only upon lease, and that therefore the warriors must reverence them and swear to them oaths of allegiance. Even at the present day the superior Brahman castes on the whole of the Malabar coast enjoy a far higher position than those upon the east coasts of the peninsula. The Namburi Brahmans on the west coast jealously maintain the purity of their Aryan blood, and look scornfully upon the other dark-complexioned Brahmans of Southern India, though these also are girdled with the sacred band.

(d) *Buddhism in India.* — An examination of the state of India about the middle of the first millennium B. C. shows the prevailing conditions to have been as follows: The Aryans had risen to a high prosperity, their social life had rapidly developed, States large and small had been formed, populous towns were adorned by the splendour of their royal courts and by the wealth of the inhabitants; agriculture, industry, and trade were flourishing. National feeling among the ruling race had also undergone a change, and in some respects a change for the worse; the bright spirit of youth, the sense of power, the pride of freedom are things of the past. Society was divided or cleft asunder by the institution of caste. Any feeling of equality has given way to the spirit of caste, which induces the lofty to look down with contempt upon the humble, which precludes all possibility of common action for the public good, which therefore makes national feeling impossible. For every caste its every action is accurately prescribed, while the highest activities, those of thought, are monopolised by the Brahmans. The latter claimed to have sprung from the head of the first man (p. 375), and in actual practice were they the head of society. But speculation had undergone a fundamental change since the period of Aryan immigration. The priests continued to offer formal prayers to the old gods in which no one any more believed. A deep sense of the futility of existence penetrated every thinking mind, while opinions were divided as to the means which should be adopted to gain release from existence. Schools and orders multiplied continually. It was as if one of the fierce cyclones of Bengal had burst upon the forest. The giant forms of the ancient gods lay dead upon the ground, and from this devastation new cults were rising, each struggling with the other for air, light, and space. Of these, one alone was fated to become a mighty tree, collecting almost the whole of Central and Eastern Asia beneath its branches — Buddhism.

The centres of Indo-Aryan development slowly changed in the course of ages from west to east. Advancing over the northwest passes in the third millennium B. C., the Aryans occupied Five River District during the second millennium; about the middle of this epoch may have occurred those struggles on the frontier between the Punjab and the Ganges district, when King Sudâs defeated the allied tribes of the west. The end of this epoch may be considered to include the flourishing period of the principalities on the Jumna and the upper Ganges, whose struggles

have provided a foundation of historical legend for the great heroic poem of the Bharata. Another five hundred years and the centre of gravity has again moved eastward to the countries which end where the Ganges delta begins and where the town of Benares rises. Here about this period were formed a number of principalities and free States, among them the powerful kingdom of Magadha with the old capital of Rājagriha (in that district of the modern Behar, which lies to the south of the Ganges). We should know but little of the different petty States on the northern side of the Ganges opposite Magadha were it not for the fact that here was the home of that religious teacher, Buddha, whose doctrine is to-day accepted by hundreds of millions of men. Upon the spurs of the Himalaya, on the stream of the Rohinī, the modern Kohani, had settled the tribe of the Śākya within which the Kshatriya nobility still played an important part in the continual friction that occurred with the neighbouring petty States. To this class belonged the chieftain of the tribe Śuddohana of the Gautama family, the father of Buddha, who resided in the capital of the country, Kapilavasthu.<sup>1</sup>

(a) *The Life of Buddha.*—According to the Buddhist legend, Śuddhodana had married two daughters of the neighbouring Kolya prince (on the other bank of the Rohinī), who was also a Kshatriya. For a long time he remained childless, but in his forty-fifth year the elder of his wives, Maya, became with child. As, according to the custom of the period and of her order, she was journeying homeward to her father's house, there to await her confinement, she was surprised on the way in the grove of Lumbini by the birth of a son, who was named Siddhārtha. This is the personal name of Buddha, who is often known by his family name of Gautama (Gotama). All his other titles are additional names, the number of which is proportionate to the reverence and admiration of his devotees. In every case, like the titles of Redeemer, Christ, etc., applied to Jesus, they are merely descriptions of his personal characteristics. For instance, Śākya Muni means the sage of the Śākya family; Śākya Śimha means the Śākya lion; Bhagavat means the reverend; Sattha, the teacher; Jina, the conqueror, etc. Buddha also is but one of these titles meaning "The Enlightened" (see the lower half of plate, "Early Indian Sculpture").

The birth of Siddhārtha is placed with some probability between the years 560 and 557, and his death between 480 and 477 B.C. On the seventh day after his birth his mother died, the child being now carefully tended and brought up by his aunt, Prajāpati (Pāli: Pajāpati). According to the custom of the time, the young Siddhārtha was married in his nineteenth year to his cousin, Wasodharā, a daughter of the Kolya prince, and their union was blessed by the birth of a son, Rāhula, after ten years. Any other man would probably have been contented and happy in the position of Siddhārtha. He had everything and was everything which a noble Kshatriya could desire to have or to be. But in his twenty-ninth year a sense of dissatisfaction came upon him. Amid all his external prosperity, his lofty and serious mind could not refrain from the contemplation of the futility of existence. His thoughts upon the misery of the world and the means of liberation therefrom take in the legend a personal and objective figure. A god appears to him first as an old man in his second childhood, then as a stern tyrant, again as a corrupting corpse,

<sup>1</sup> This is the Pāli form of the name; Sanscrit, Vapilavastu.

The god Śiva, dancing upon corpses and decorated with a garland of death's heads. Brahman sculpture in relief at Ellora.

(From a photograph.)

Buddha : (a) In clay,

(b) Stone sculpture. Both after A. Grünwedel.

and finally as a reverend hermit. It was the birth of his son which determined him to put into execution a long preconceived resolve. He saw in the child a new bond which would fetter him to the world. The story of Siddhârtha's flight is the most moving picture in the whole legend of his life. Only once was he willing to look upon that which is the dearest thing in this world, only once would he press his new-born son to his heart. Quietly he glided into the bedroom where his wife and child were resting; but the mother's hand lay upon her child's head and he could not take the child in his arms without waking her.

Thus he left wife and child without a word and went out into the night with no companion but his charioteer, whom he presented with all his ornaments and ordered to inform his family of his resolve. He then cut his hair short, exchanged his rich garments for the rags of a passing beggar, and made his way alone to the capital of the Magadha kingdom, Rājagriha, near which pious hermits had settled in the caves of the rock. To these he joined himself, hoping to learn from them the solution of the great riddle of existence. But Brahman metaphysics brought no consolation to his soul. Neither from Alara Kalana nor from Uddaka Rāmaputta could he obtain the object of his search,—the path to freedom from the pain of existence. He left both teachers and turned to the forests of Uruvela (near the modern Buddha-gayā), in which five Brahman hermits were already living a life of asceticism. For six years he surpassed them all in the cruelty of his penances until his former powerful and beautiful frame had been worn to a shadow. The reputation of his extraordinary self-torture spread far and wide, but he himself became the more unhappy in proportion as others esteemed him far advanced upon the road to salvation.

He fell in a swoon from weakness, but on his restoration to consciousness he had found strength to leave the path of error. When he again began to take food like other men he lost the belief and respect of his five companions. They left him and turned to the holy town of Benares to accomplish their purification in more sacred surroundings. The man they left behind had now to undergo a severe mental struggle. Buddhist legend represents the conflict between his intellect and his sympathies as a battle between bright and dark spirits who struggled in conflict so that the world trembled and was almost moved from its foundation. Meanwhile Siddhârtha was wrestling for enlightenment by the banks of the Nairanjara. The prospect cleared and the mysteries of suffering and of the road to salvation were laid open before him. He had now become "The Buddha," the Enlightened, who had attained knowledge of redemption not only for himself but for the whole world. For seven days Buddha remained in extreme exaltation of mind, in holy glorification under the sacred fig tree (*figus religiosa*; in Singhalese, Bo tree, the tree of knowledge; in Sanscrit, Bodhi). A pair of benevolent men brought him rice cakes and honey, and he in return gave them his greatest gift, his teaching. These two men, Tapussa and Bhallikā, were his first converts, who took "refuge with Buddha and knowledge." Doubt then came upon the enlightened sage as to whether the coarse mind of the masses was capable of realising the great truths he taught. But the world god Brahman urged him to preach his doctrine and Buddha gave way. He went to that very forest where the five companions of his former penance were staying and explained the main features of his doctrine to them in the "Sermon of Benares." Neither a life of pleasure nor the extirpation of all pleasure could lead to the goal, the true way

lying midway between these extremes. In broad outline he shows them the truth upon the question of suffering and the eightfold road to liberation.

From this point onward the life of Buddha is entirely occupied with the teaching and conversion of the people. The persuasion of five nobles of Benares brought about a rapid increase in his scanty congregation, to which fifty adherents were shortly added. The reputation of the new doctrine spread far and wide; the people thronged from every direction and from distant settlements to hear his teaching. Buddha sent out his sixty disciples as apostles: "Go forth, ye mendicants, upon your way, for the salvation of the people, for the good of the people, for the salvation, the advantage, and the prosperity both of gods and men." The Enlightened One did not remain alone after despatching his apostles. Shortly afterward thirty rich youths accepted his doctrine, who were followed by one thousand fire worshippers. The most important convert, however, was Bimbisāra, king of the great Magadha kingdom. In him Buddhism gained a powerful patron, and the conversions of lay brothers immediately due to this success were numbered by tens of thousands. Even more important converts were the two most famous pupils of the master, Sariputta and Mogallana.

The conversion of King Bimbisāra marks the first step of that policy which was characteristic of this religion in its later developments, namely, the policy of entering into relations with the ruling powers and invoking their protection. Henceforward Buddhism rises and falls in the several States as their ruling dynasties prosper or decay. The same phenomenon appears in Ceylon, where the Buddhist communities attained to extraordinary prosperity under powerful and fortunate kings, while the political disasters resulting from the war with the Dravidians repeatedly brought the doctrine to the point of annihilation. Toward its patrons Buddhism invariably displayed a considerable amount of adaptability. Its first chief patron, Bimbisāra, secured the introduction into the monastic communities of the monthly penances formerly practised by many Brahman monks (the strict observance of the four quarters of the moon; the Poya days of the modern Singhalese), and also of the Uposadha days. When Buddha returned, during his later wanderings, to his native town, where his son Rāhula entered the community, at the request of the old prince he added to the rules of the community the regulation that no son should become a monk without his father's consent. The fundamental objections of Buddha to the institution of orders of nuns were only overcome by the influence of his foster mother, Prajāpatī, who was of royal race and desired to found such an order. On the other hand, the new doctrine thus powerfully supported gained not only popular approval, but also material help. Poverty was as a rule obligatory only upon individual monks, and from the outset the order was always glad to receive rich presents. The first of such foundations was that of the Bamboo Grove, near the capital of Magadha; and even during the lifetime of the master, princes and rich men rivalled one another in making similar offerings. A long list of large gardens and parks were even then assigned to the order, one of the most famous of these being the garden of Jetavana at Sāvatthi. In Ceylon, where the history of Buddhism is more easily followed, the larger and more valuable part of all the arable land eventually fell into the hands of the order.

Among the pupils who gathered round the person of Buddha, one of the most human figures is his cousin Ananda, who, though not distinguished for intellectual

power, engages our sympathy by his loving devotion to his master. But even in that narrow circle which gathered round the enlightened one, the element of evil was to be found, even as in the apostolic band of Jesus. Devadatta, a personality swollen with pride and dominated by immeasurable ambition, is, during the time of Buddha, a type of that sectarian spirit which resulted in the repeated schisms of later years; even during the master's life time many believers were led astray by him. And as at a later period one sect invariably abuses and maligns another, so here legend even reproaches the ambitious disciple with attempts upon his master's life.

For forty-five years after his "enlightenment" Buddha traversed the country preaching his doctrine and making thousands of converts; at length a severe illness reminded him that the end of his life was approaching. In deep anxiety his congregation asked who was to follow him as their leader. But the master refers them to their own knowledge: "Be your own illumination, be yourselves your refuge, have no other refuge; for the doctrine shall be your light, the doctrine shall be your refuge, and have no other refuge." By sheer will-power the sick man was cured for the time; but he himself prophesied his death at the end of three months. The last days of Buddha are related by the legend with details so realistic that it is probable they contain some substratum of historical truth. He is said to have gone to Pāvā with his favourite pupil Ānanda, where, with other monks, he received hospitality from Kunda the smith. Tainted pork was set upon the table at their meal, and after partaking of this he fell ill. However, he continued his journey. But in the neighbourhood of Kusinara his strength failed him, and lying down under two beautiful amyris trees he awaited death. He thanks his faithful Ānanda for all his love and devotion, asks the monks gathered round him three times whether any feels doubt, and, when all have asserted their faith, he speaks his last words, "Of a truth, O monks, I say unto you, all that is must decay; strive for perfection and faint not." Then his life passed into nirvāṇa.

"As the mortal remains of the King of Kings are treated, so shall one treat the remains of him who has been perfected," so runs the saying of Ānanda when the Mallers of Kusinara questioned him upon the form of burial. The preparations lasted for six days, after which the funeral pyre was lighted with the utmost pomp. The ashes of the great departed were collected. Constant demands for relics came in, with proposals to guard them in fitting memorials (stūpas); and it was at last arranged that the remains should be divided into eight parts and presented to the eight most important States in which Buddha had lived and worked.

(β) *The "Three Councils."* — Later tradition relates that immediately after the funeral the most important monks met together in Rājagaha, under the presidency of Kāśyapa (Pāli, Kassapa), who defined as accurately as possible the formulæ of the doctrine (the first council of Rājagaha). It is said that the sayings of Buddha relating to the discipline of the order (Winaya) were related by Upāli, while the general teaching (sūtra; Pāli, sutta) upon the daily life of all, including the lay adherents, was recited by Ānanda; this teaching was then committed to memory by five hundred monks, and by them handed down to tradition. Exactly two hundred years after the death of the master it became necessary to call a second council, that of Vesāli (Vaiśāli). As a number of monks had supported

views which diverged in detail from the original doctrine, a committee met at Vesâli and determined the direction of Buddhist doctrine for the future.

The first council of historical authenticity is the third, that of Patna (about 250 B.C.). *Dīpawamśa*, the earliest chronicle of Ceylon, reports upon this as follows: "With the object of destroying infidelity many of the pupils of Buddha, sixty thousand sons of Jina, met together in council. Over this assembly presided Tissa Mogalliputta (also Moggaliputta, son of Mogalli). For the purpose of purifying the faith and formulating the doctrine for the future the president, Tissa, appointed one thousand Arahats, choosing the best members of the assembly, and held a synod. The third council was brought to an end after a space of nine months in the monastery of Aśokarâma, built by King Dhammâśoka." In order that the doctrines of the master might be the better transmitted to the disciples, the council formulated his teaching in the canonical books of the *tripiṭaka* ("three baskets"). This council was also responsible for the despatch of numerous missionaries who introduced Buddhism into Ceylon amongst other places; from this period begin the monastic annals of the Singhalese which, at a later period, were worked into the chronicles. In these there is mention made of the names of some of the missionaries who were then despatched, and the credibility of the chronicles has been considerably strengthened by the discovery of the tomb of one of those missionaries (*Madochhima*) in North India.

Granted that the council of Patna is historically authentic, the same can by no means be said of the two preceding councils. It is indeed true that the council of Vesâli was held two hundred years after the death of Buddha,—that is to say, less than fifty years before the conversion of Ceylon, and we may therefore suppose that later tradition was upon the whole well informed of the events of that time. But the narratives of Ceylon make it plain that that council was not called to formulate the doctrines of Buddhism, but was merely a gathering of Buddhist monks from a limited area to settle certain points of detail concerning monastic morality. Individual monks had put questions to the meeting, as for instance, whether it were lawful to eat solid food only at midday, or also in the afternoon until the sun had cast a shadow two ells in length, whether it was lawful to keep salt in buffalo horns, whether it was lawful to sit upon a chair covered with a plain cloth, etc. We can readily understand that such a gathering of monks may have ultimately grown to be considered a council, remembering the Buddhist method of emphasising important facts by the multiplication of them. Thus, according to later legends, there was not one Buddha only, but as many as twenty-four before him; the Buddha of the present age had not visited Ceylon once, but three times, and so on. Thus the canonical teaching required not one but several formulations, and it was not enough to magnify the synod of Vesâli into a council; it was necessary to presuppose another council held immediately after the death of Buddha, that of Râjagaha. This council indeed is mentioned only in appendices which were apparently added to the canonical writings at a much later date.

(γ) *The Historical Personality of Buddha.*—As the history of the Buddha doctrine previous to Asoka is thus uncertain, we are justified in asking what amount of historical truth is contained in the legends upon the personality of its founder. The attempt has been made to deny the personal existence of Buddha; and this view has been justified by the allegorical meaning of the chief names in

the personal history of Gotama. Śuddhodana (p. 390) means "The man whose food is pure," Mâyâ means illusion (Vedânta philosophy), Kapilavastu means the town of Kapila, the founder of the Sâṅkhya philosophy, Siddhârta means "He who has fulfilled his task." Such scepticism is, however, far too sweeping. In March, 1895, in the Terâi of Nepal, near the village of Nigliwa in the neighbourhood of Gorakhpur, about ten miles distant from the ruins of a memorial mound (stûpa), an inscription of King (Asoka) Piyadasi (the "Pious;" cf. p. 406) was discovered upon a pillar. This inscription states that Asoka in the fifteenth year of his reign (225 B. C.) had set up for the second time the stûpa of the Konâgamana Buddha (the mythical predecessor of the historical Buddha), and in the twenty-first year of his reign (249 B. C.) had himself visited the spot and there performed his devotions. The Chinese Hiuen Tsang (Yen tsung), who visited the shrines of the Buddhists about 636 A. D., mentions the stûpa and the inscription on the pillar. Moreover, on the 1st of December, 1896, a pillar was examined near the village of Paderia (thirteen miles from Nigliwa). This pillar had also been seen by Hiuen Tsang. It rose nine feet above the ground, was covered with inscriptions made by pilgrims, while upon the three feet of it below the level of the ground was found an inscription written in very ancient characters in the "Brahmî" (formerly and erroneously known as the "Maurya" or "Asoka") alphabet, dating at least from the year 800 A. D. The purport of the inscription was that Priyadarśin (Pâli, Piyadasi) after a reign of twenty years here makes his prayer in person, expressly designates the spot a birthplace of Buddha, and makes the fact known by the erection of a stone pillar. At the same time, he remits the taxes due from the village of Lummini (Pâli, Lumbinî: [p. 390] the modern Rumin-dei), and makes presents to the inhabitants. Finally, William Caxton Peppé while making excavations in January, 1898, on his property at Piprâwâ in the Terâi, that is to say, in the immediate neighbourhood of Kapilavastu, opened an ancient stûpa and discovered a finely worked sandstone chest covered by a giant slab, which, together with other objects, contained bone fragments in an urn, and bore the following inscription: "This resting place for the remains of the exalted Buddha is the pious offering of the Śâkyâs, the brother with his sisters, children and wives." There is no reason whatever for casting doubt upon the authenticity of the inscription, and therefore we may consider that this latter discovery (the objects are now in the museum of Calcutta, while the bone fragments were given to the king of Siam) included the actual remnants of Buddha himself, that is to say, one of the eight parts into which the carefully preserved remnants of the enlightened one were divided, which was handed over to the Śâkyâs of Kapilavastu after the death of Buddha and the cremation of his corpse (cf. R. Pischel, *die Echtheit der Buddha-reliquien*; supplement to the "Allgemeine Zeitung" of January 7, 1902). It is but a few years since methodical investigation into the field of Indian epigraphy was begun, and researches in this direction will no doubt speedily bring yet more valuable information to light.

For the rest of the life of Buddha we are forced to depend upon the internal probability of the legendary stories. Of these, the main features are far too simple and natural to have been evolved by the riotous imagination of later times. Especially is this true of the stories of his birth from a noble family, and his education, his early marriage, his sympathy with the general sense of the futility of life, his retirement from the world, the penances which he underwent, his renuncia-

tion of Brahmanism, and his death. His personality is undoubtedly to be conceived in strict accordance with tradition, for to that personality the new doctrine undoubtedly owed a great deal of its success. Especially credible is that part of the legend which tells us of his dignified bearing, of his high intellectual endowments, of his penetrating glance, the firmness of his convictions, his oratorical power, his gentleness, kindness, and liberality, and the attractiveness of his character. When Ananda informed his master of the fact that the Maller Raja was an influential man whose conversion would be highly advantageous to their party, "He poured such a flow of love upon the Maller that he could not but follow the teacher as the calf follows the cow."

The benevolence of Buddha's character more than anything else drew the hearts of mankind toward him. He had, no doubt, a carefully thought-out metaphysical system of his own; he made many rules to govern the life of his apostles, which were either borrowed from Brahman orders or were innovations of his own, but it was not to these that he owed his success. The great difference between him and the Brahmans was the deep warm love which he bore for his neighbours. In his system under its later form, which still continues in Ceylon, we see only the lifeless labours of his successors. In Buddha himself lived and worked the originality of a high and lofty mind, coupled with the benevolent power of purity and warmth of heart. The influence of these characteristics continued for at least a century after his death, as is proved by the edicts of Asoka. This man was not a Buddhist when he assumed the government of the powerful kingdom of Magadha (269 B. C.). About 261 he was converted, though he did not make public profession of his faith before 259. The humanitarianism of his master finds a strong echo in the decrees dictated by the glowing enthusiasm of his royal convert. Asoka gives expression of his warm love for the whole of humanity. "All men are to me as my children. As I wish my children welfare and prosperity in this and the next world, so I do to men." Many of his numerous inscriptions on rocks or pillars are intended for the instruction of his people upon the nature of true religion. "What is Dhamma? It is to flee from the evil and do the good, to be loving, true, patient, and pure in life." The king forgets none of the essential virtues, moral purity, truth, nobility of heart, kindness in word and deed, goodness to all, respect and obedience to parents, love to children, tenderness to the weak, kindness to all creatures, reverence to the priests, the utmost toleration for other faiths, liberality in almsgiving, the avoidance of anger, passion, and cruelty. How changed is Buddha's teaching in the dead conventionalism of its modern form!

One of Asoka's edicts, perhaps the last, gives us some indication of the date when Buddha's doctrines first became stereotyped. This is the inscription of Bairāt or Bhabra discovered in 1840 and assigned by Edmund Hardy to the year 249 B. C. Here the later teaching first makes itself heard, and in this inscription only occur the later expressions concerning Buddha, his doctrine and the community of his believers, together with the phrase, "Everything that has been said by the exalted Buddha is well said." Here alone is there any reference to the articles of a legal code. According to R. S. Copleston, the decree of Bhabra was issued after the Council of Patna, by which it was influenced, and in this council Buddhist teaching was definitely formulated. The theory is further supported by the despatch of many missionaries shortly after the conclusion of the council. A probable cause of this step was the reformulation of the doctrine. Thanks to this mission and

especially to that of Mahinda, the son of Asoka himself (p. 501) to Ceylon, where the doctrine has remained unchanged in all essentials, later Buddhism and its history are fairly plain to us.

(8) *Buddhism in the Period after Asoka.*—Buddhism after Asoka, like the doctrines of the Brahmins, is founded upon a metaphysical basis. The fundamental principle of every Buddhist doctrine is Bodhi (Budh = knowledge). The connotation, however, of this term is in no way profound or comprehensive. The Buddhist, unlike the Brahmin, philosophy does not seek to probe the reason of all existence, but while recognising that all life is suffering and that every act of suffering involves fresh suffering, it confines itself to the discovery of release from suffering. The fundamental pessimism thus characteristic of Buddhism is the natural product of the age. The doctrine, however, is content with the fact of suffering as it is. It does not seek to advance to the conception of a supreme being, or even to the thought of an original world soul in a state of passivity. It does not seek to explain suffering as did the Brahmins by supposing a descent on the part of the supreme being to the lower levels of action. Questions of this kind are beyond the sphere of that knowledge which it desires. Hence there is for Buddhism no supreme divinity. Gods certainly exist, but far from being able to help men, they suffer as men suffer. Thus for Buddha there are no thanks to be paid to God, no prayers or requests, and consequently no mediator between God and man, no priest, no sacrifice, no worship. The fact of a divine existence has been banished from the philosophy of this religion. The problem of life none the less remains to its adherents. What is the individual life? What is the process of its continuance by reincarnation? How can the suffering of life come to an end?

At this point Buddhist philosophy diverges from the Brahmin system, which posited an actual existence for the individual soul. According to Buddhism, there is no being which passes into another upon death. Personal existence is brought about by the conjuncture of a number of different elements which in themselves and separately have no personality or soul. These five elements of life are matter, feeling, imagination, will, and consciousness. The union of these is life, the division of them death. Upon death, one thing alone survives, the moral consequence, the final account of the good and the bad that has been done during life, the *Kamma*, an element of impulse driving the other elements to reunite after death and form another life. Like the beam of the scales, according to the nature of the final reckoning, the reunited elements rise or fall, to the formation of higher or lower beings. Thus not to be born again implies the extinction of that yearning for existence. The *Kamma* being the consequence of actions performed in life, it can only be destroyed if during life man avoids all temptation to action, that is, renounces all desire.

At this point knowledge comes by her own; he only who has this perfect insight into the true connection of life and suffering can reach this height; ignorance at the other end of the scale leads to continued action, to reincarnation and further suffering. Thus the most important point is, according to the Buddhist formula, the knowledge of the "four sacred truths." These embrace all that Buddha meant by knowledge. They are most concisely stated in the sermon of Benares (p. 391): "This, ye monks, is the sacred truth of suffering; birth is suffering, age is suffering, sickness is suffering, death is suffering; to be joined to

one thou dost not love is suffering, to be divided from thy love is suffering, to fail of thy desire is suffering; in short, the fivefold bonds that unite us to earth (those of the five elements) are suffering. This, ye monks, is the sacred truth upon the origin of suffering; it is a yearning (for existence) which leads from new birth to new birth, which finds its desire in different directions, the desire for pleasure, the desire for existence, the desire for power. This, ye monks, is the sacred truth concerning the release from suffering; this desire must be extirpated by the entire destruction of inclination, which must be avoided, put away, left behind, and driven out. This, ye monks, is the sacred truth concerning the way to release from suffering; it is this sacred eightfold path of right belief, right resolve, right speech, right action, right life, right desire, right thought, and right self-absorption."

He who seeks relief in "Enlightenment" must first of all be convinced of the truth about suffering, and must abhor all temporal attractions. Typical for him must be the horror which seized Buddha upon his flight from the world at the appearance of the old and broken man, of the man with a deadly disease, and of the putrefying corpse (p. 390). This feeling the Buddhist must carefully cherish. He must cultivate the habit of introspection by contemplation of the thirty-two elements in the human body which arouse disgust, and by meditation on death and corruption, for by these means only will he be brought to that frame of mind for which temporal affairs have no attraction. He alone who retires from the world — that is to say, the monk — can become a perfect Buddhist.

(e) *Buddhist Monasticism.* — Buddhist monasticism is in immediate connection with the Brahman monastic system; as in the latter case a band of learners gathers round a famous hermit, so also in the former. The yellow garment, the shaven head, the alms pot are borrowings from an earlier period, as also are the days of strict retirement during the phases of the moon, together with the solemn penances (Uposadha) and the cessation from activity during the three months of the rainy season. However from the very first the organisation of the order was as weak and loosely connected as that of Brahman monasticism. Here, too, the master left his pupils to their own resources, a process which might prove successful provided that some clear mind or powerful intellect could be found to command universal respect. This, however, was by no means invariably the case, and the looseness with which the order was organised resulted not only in schism, the chronic weakness of Buddhism, but also in its ultimate defeat upon the revival of Indian Brahmanism.

A necessary preliminary to the constitution of a monastic order was the existence of non-monastic friends of the Buddhist teaching — the Upāsakas. Any form of human activity was in some way a contradiction of the command to leave the Kamma in complete passivity. The laity could thus never become Buddhists in the full sense of the term, and belonged only to the second class of the order; the community properly so called consisted only of mendicant monks who depended for a living upon the benevolence of others, and who considered their name of beggar, or Bhikshu (Pāli, Bhikkhu), as a laudatory title. In the course of time certain rules of conduct were formulated for this class and stereotyped according to the usual Buddhist method; they are characterised by a spirit wholly alien to the strong humanitarianism which pervades the teaching of Buddha himself. Ten chief commands were binding upon the monk; it was unlawful to kill any living

thing ("either worm or ant"); nothing should be taken except what was given ("not even a blade of grass"); falsehood was forbidden and the use of intoxicating liquors; family ties were to be renounced ("a hateful thing"); food was not to be taken at the wrong time or at night; wreaths or scents were not to be used, and the monk was to sleep upon a mat spread upon the ground; dancing, music, singing or theatrical performances were to be avoided, and gold and silver were not to be used.

The order was open to any who desired to enter it (disqualifications were infectious diseases, such as leprosy, etc., slavery, official posts, the lack of parental consent, etc.). The would-be monk must be more than twelve years old, was obliged to pass a novitiate and receive full instruction upon the doctrine and morality under a monk in full orders; ordination, *Upasampada*, could not be undergone before the twentieth year. The discipline imposed upon the monk the "Middle way," as Buddha had already taught in the sermon of Benares (p. 391); that is to say, his life was not to be a course of mortification, but everything was to be excluded which passed the satisfaction of the simplest needs, or could in any way lead to strengthen the ties binding the monk to the world. The habitation was not to be placed too near villages or towns, the noise of which might disturb contemplation, though at the same time it was to be near enough to enable the mendicants to gain what they required. It was but rarely that a monk dwelt alone in a "Pansala;" in most cases several monks lived together. During the flourishing period of the order great monasteries often sheltered a considerable number of *Bhikkhus* within their walls. The clothing (the upper garment of yellow) was to be entirely simple, and food was to be received in the alms dish from those who were benevolent enough to give to the beggar. The first half of the day was to be occupied in the task of mendicancy, and for the rest of the time the monk was to devote himself to introspection and pious exercises. Twice during the month, at the full and the new moon, the monks living within any one district collected for their solemn confession; the articles of confession (*Patimokkha*) were then read aloud, and an opportunity was thus given to individuals to confess their transgressions of Buddha's commands; in these assemblies new monks were ordained and business questions discussed. During the three months of the rainy season (*warsha*; *Pāli*, *wassa*) the monk was not to wander about, but to remain quietly in one place, either in his monastery or with some prosperous patron.

Gautama consented with much unwillingness to the foundation of a female order (p. 392), considering that it involved great dangers to his doctrine. The supervision of the nuns and the ordinances binding upon them were much stricter than in the case of the monks who exercised a certain authority over the nuns. The inscriptions of Asoka make mention of many nuns; and under his government the female order was transferred to Ceylon by his daughter *Saṅghamittā*. However, it attained to no great importance, either in Ceylon or in India. According to the Singhalese chronicles, it seems to have entirely disappeared from the island as early as the end of the first millennium A. D.

(8) *Buddhism in its Importance to Indian Civilization.* — An attempt to estimate accurately the importance of Buddhism with reference to Indian civilization must begin by answering these two questions, Has this doctrine satisfied the religious requirements of the people? What has been the influence of its moral

teaching? The Buddhist doctrine of liberation could bring complete satisfaction only to a few dominant minds. It is a doctrine of cold and unsympathetic nature, inasmuch as it offers no recompense for the infinite suffering of which the true Buddhist must feel the sway. It offers no supreme being which can sympathise with and relieve the miseries of human existence; it can promise no state of beatitude where man will be recompensed for his sufferings upon earth; it can promise only mere annihilation and nonentity. The doctrine was of too abstract a character to satisfy the great mass of the people who desire gods made in the image of man and yearn for some supreme object of adoration which is at least comprehensible to mankind.

The immediate consequence of these desires was the transformation and elaboration of the legend concerning Buddha's life. It was not enough to attribute to Buddha's supreme wisdom, almighty power, and thousands of miracles; his personality was also multiplied (see pp. 187, 394). When the true doctrines have fallen into decay and mankind has become evil, there appears at long intervals a new Buddha to resume the teaching of the same doctrines of salvation. The Buddha Siddhârtha (Pâli, Siddhattha) is said to have been preceded by as many as twenty-four Buddhas, the last of which was Kaśyapa; and five thousand years after the passing of Buddha into Nirvâna a new Buddha, Maitreya, will arise. Of these personalities legends innumerable exist; the worshipper demands to see them in concrete form, and hence every Buddhist temple and palace is adorned with their likenesses and portraits, and especially with reproductions of Gautama (see the plates "Early Indian Sculpture" and "Buddha and his Disciples," p. 390 and p. 519). This desire for some tangible object of veneration appeared immediately upon the death of the master. A general demand arose for some sacred relic of the deceased, and his earthly remains were collected from the ashes of the funeral pyre and divided; in course of time the demand for relics increased in proportion to the distribution of the doctrine, and in every country of Buddhist faith there arose many thousands of shrines containing relics, stûpas, or Dâgobas (see the plate, p. 501) the goal of millions of pious pilgrims.

These relics were, however, purely symbolical. Buddha himself had entered the Nirvâna, into nothingness; the people, however, demanded living gods and Buddha himself had not denied the existence of these. The people as a whole were not so penetrated with the sense of the great suffering of existence, as were the philosophical monks, although they suffered more than these from the petty cares of life and their daily occurrences. Their old gods were called in to help in this department. The Buddhist mechanically repeats his formula of refuge; but in practice that refuge is made with the Aryan, Brahman, and Dravidian gods, including the sacred figtree and the Naga snake, the sun and the stars, the evil demons of the Dravidian faith and the bright forms of Vishnu or Śiva. All of these deities, together with Gautama, find a place in the broad creed of the Buddhist devotee, and during a solemn procession their grotesque images are carried side by side with the benevolent features of the Enlightened. In reality the earthly fate of the Buddhist is still guided by those old gods whom the master thought to set aside as of secondary importance. They are no doubt mere mechanical additions to the Buddhist faith in the southern districts of Buddhism, as for instance in Southern India about the year 1000 A. D. and in Ceylon, Burmah, and Siam at the present day (see the plates, pp. 501 and 519); on the other hand

in northern Buddhism (Tibet, Mongolia, etc.) the doctrine with which they have been incorporated has been so entirely transformed by their influence that the original system of Gautama is scarcely recognisable.

The ethical teaching of Buddhism is not based upon divine authority but upon individual egoism; moral duties or virtues as such are non-existent, utilitarianism being the guiding principle. This principle indeed inspires the commands respecting personal behaviour, self-restraint, the government of the senses, self-sufficiency, vigilance. Indeed every command explaining a man's duty to his neighbour, such as the exaggerated care against the taking even of animal life, the exhortations to sympathy, kindness, and benevolence, etc., spring not from the ground of the heart, but from the purely selfish desire to advance by their fulfilment toward the ultimate goal of liberation. The moral teaching of Buddha, as regards the manner in which it makes kindness and love binding upon all men, is high above the ethical system of the Brahmans and far below the purity and nobility of Christianity. Especially is it lacking in moral force. How indeed could a religion provide a strong and energetic ethical system when its chief duties consisted in the entire avoidance of action and its highest aim in total extinction (Nirvāna). The indolence of the system has been stamped upon the whole Buddhist world; stricken with fear at the thought of suffering, its strength lies rather in endurance and passivity than in action. In a people enervated by such beliefs it is impossible to expect any powerful bond of union, any feeling for the greatness of race or state, any sense of patriotism. We do not forget what the princes did for their people, but at the same time this could only be a drop in the ocean; they cared for the poor and the sick, planted fruit trees on the roads, constructed great works of irrigation, were liberal, especially toward the monastic orders. But this very liberality was a cause of further weakness; the best and the richest districts fell into the hands of the orders, and many strong arms were thereby condemned to inactivity. Meanwhile the people became impoverished, and bore their sad existence with resignation or indifference.

The caste system (p. 374) Buddha no more attempted to set aside than the gods; in his view both of these were necessary institutions as existing from the creation of the world. The great difference between his teaching and that of the Brahmans consists in the fact that he meant his precepts of humanitarianism to be binding upon all the castes. His followers were to be kind and benevolent even to the low-born Śūdra, and were not forbidden even to accept food from this caste. At the same time a caste feeling was deeply rooted in Buddha and the whole of his order; though we often hear of the reception of distinguished members of the higher and the highest castes by the master during his lifetime, instances of such treatment of the Śūdra Buddhists do not occur. Even at the present day the collective Buddhist sects of Ceylon are recruited solely from the highest castes.

Buddhism is also open to the further reproach of having done nothing to raise the social position of the woman. The founder showed the greatest reluctance, and was induced only by a strong pressure from without to admit the woman within his community, and even then she was not placed upon an equality with the man. Generally speaking, the only consolation he had to give to the woman in her subordinate position was that she must bear her burden because it was appointed by the order of things in the same way as the burden of a Śūdra or of a worm.

Severe but true is Bishop Copleston's criticism of Buddhism,—that it lowers mankind by the very assertion of man's supremacy.

(η) *Jainism*. — Buddhism, though the most successful, was not the only religious system which rose during that period of intellectual movement. Contemporary with Gautama was that personality to whom the now existing sect of the Jains refers the origin of its religion; his name was Nâtaputta (Sauserit, Jñâtri-putra) though he was known by his adherents as Mahāvīra Wardhamāna or the revered Jina (world conqueror). He too had his origin in that centre of intellectual movement on the lower Ganges, and his life and teaching are marked by many points of resemblance to his more important contemporary. Like Buddha he was the son (born 599 B. C.) of a distinguished Kshatriya, by name Siddhârta, who was apparently governor of the outlying town of Kandapura of Vesālī (p. 393) where the feudal aristocracy was as predominant as among the Śākya. On his mother's side he was related to King Bimbisāra of Magadha (p. 391) and like Gautama he found in this king a patron of his doctrine; indeed these two religious systems owe their prosperity primarily to the existence of that great kingdom and its ruler. Until his twenty-eighth year Nâtaputta lived with his parents; then, however, like Gautama, he joined the Brahman ascetics and lived for twelve years under their rules, surpassing all but one of these in the severest penances as a naked ascetic (gymnosophist). Thus he arrived at supreme knowledge or Kewala and so acquired for his soul freedom from its earthly trammels. The last thirty years of his life (until 527) were devoted to the dissemination of his teaching and to the organisation of the community he founded.

His honorary title of Jina has been taken by the sect which he founded, the Jains. They believe in a great number of prophets of their faith anterior to Nâtaputta, and pay special reverence to the last of these, Pârśva, or Pârśvanātha. Herein they are correct, in so far as this latter personality is more than mythical. He was indeed the royal founder of Jainism (776?), while his successor, Mahāvīra, was younger by many generations, and can only be considered as a reformer. As early as the time of Gautama, the religious confraternity founded by Pârśva, and known as the Niganṭha (Sauserit, Nigranṭha), was a formally established sect, and, according to the Buddhist chronicles, threw numerous difficulties in the way of the rising Buddhism. The numerous points of correspondence between Buddhism and Jainism are sufficiently explained by the fact that both systems originated in Brahman teaching and practice. The formation of the Jain canon dates from the fifth century A. D., during which period the "holy" scriptures were established at the Council of Valabhī, under the presidency of Devarddhiganin. But A. F. R. Hoernle puts this council as early as 154; and according to Hermann Jacobi the writings from which the canon has been formed are as early as the first and perhaps the second or third centuries B. C.

The Jains, like the Buddhists, accept the Brahman theory of the misery of existence and the necessity for liberation. Where, however, the Buddhist philosophy diverges from the Brahman, they follow the older creed. According to their system, the soul has a real and self-contained existence; during life it is fettered to the base elements of the material body, which it leaves upon death. The soul is then enclosed in a form of ethereal lightness until the Karma (Kamma, p. 397), the ethical resultant of the actions performed in life, obliges it to become reincar-

THE INTERIOR OF A JAIN TEMPLE AT MOUNT ABU IN RAJPUTANA

(From a photograph.)

### EXPLANATION OF THE PICTURE OVERLEAF

Abu is a lofty mountain about five thousand feet high, in Sirohi, one of the twenty States of the Rajputana district in Northwest India, lying on the northwest border of the Aravali chain, well known for its mineral wealth. Here, together with the summer quarters of the British government agent, are situated five temples, forming one of the most sacred spots visited by the Jain pilgrimages; two of these, built in white marble and erected in 1031 and 1200 A. D. respectively, are ranked among the most beautiful examples of Indian architectural skill.

nate and to resume the burden of suffering. Buddhist philosophy culminates in the release from this necessity of reincarnation,—that is to say, in nonentity; whereas the Jains assumed the existence of an elaborate system of higher and highest beings which claim veneration from mankind. In the different regions occupied by these divine personalities, the Jina, or all-conquerors, take the highest place. They alone, released from death and from new birth, live in eternal and absolute purity. They are the souls, freed from all earthly trammels, of the great prophets, who are far more numerous in this religion than in Buddhism. Time is divided into three parts,—present, past, and future; and in each of these divisions twenty-four Jinas appear at long intervals to bring knowledge to the world of those lofty truths leading to salvation. The twenty-third Jina of the present earthly period was Pârśvanâtha, and the twenty-fourth, Mahāvira. All of these, by precept and example, have shown to the world the path to liberation, which consists in purity of faith, in true insight, and in virtue undefiled.

True faith consists in belief in the Jina and in the whole system of higher beings; true insight is provided by the philosophical system of the Jains. According to this system, both the world and the soul have an eternal objective existence. The misfortune of the soul consists in its connection with the body, and when its desire for action is extinguished it becomes free. The precepts of pure virtue coincide almost entirely with those of the Buddhist teaching. The five fundamental precepts of the Jain monks are the same as the first four of the Brahmans, and run as follows: Thou shalt not kill any living being; thou shalt not lie; thou shalt not take what has not been given to thee; thou shalt refrain from intercourse with worldly relations. The fifth precept includes within itself the remaining precepts of the Buddhist monks: thou shalt renounce all earthly possessions, and chiefly shalt call nothing thine own. While insisting upon the importance of these commandments, the Jain teaching also recognises the value of asceticism in its severest form as an aid to liberation. About the year 80 A. D. this point led to the schism between the two main sects of this religion, which, however, agree upon fundamental principles,—the Digambara, “those who are clothed with the vault of heaven” (that is, the naked), and the Śvetāmbara, “those clothed in white.”

Centres and objects of worship are numerous, as might be expected from the high importance attached to the divine beings. All Jain temples are placed by preference upon lofty mountains, such as Mount Abu (see the plate, “The Interior of a Jain Temple at Mount Abu<sup>1</sup> in Rajputana”), Mount Girnar in Gujerat, etc. These buildings are adorned with rich decoration, and with a wealth of designs representing the different Jinas with their tokens (the ox, the ape, the fish, etc.).

This religion is in existence at the present day, and has enjoyed great prosperity at different periods, as, for instance, during the fifth century A. D. in the Deccan, the sixth century in Gujerat, etc. According to the last census (that of 1891), 1,417,000 Jains are found in India, nearly half per cent (0.49) of the whole population. They are also represented in places where a large number of Hindoos have immigrated, as in East Africa. Everywhere they enjoy the reputation of honourable and capable men. In the larger towns of Northern India and also in the Deccan their reliability and commercial industry has enabled them to acquire prosperity and often great wealth. Their benevolence often borders on the ludi-

<sup>1</sup> Temple, named Vimala Sali, erected in 1032, according to Fergusson.

crous. We refer to many of the hospitals for animals which they have founded, in their custom of wearing a respirator and carrying a small broom to avoid killing even insects by involuntarily swallowing or crushing them.

(c) *The Period from the Expedition of Alexander the Great to the Entrance of Mohammedanism.*—From the earliest times the inexhaustible natural riches of the great plains of the Ganges have been a source of prosperity and of misfortune to India. In every age this district has proved a strong attraction to foreign peoples. The great Aryan immigration was the first movement of the kind of which we hear, but by no means the last. Ktesias, Arrian, and others relate legends which speak of the invasion of Assyrian rulers, of Ninus and Semiramis; and though these may be purely mythical figures, yet those legends undoubtedly rest upon some historical foundation. Diodorus quotes the name of an Indian king (ii. 19), Stabrobates (the lord of draught animals). It is true that this name appears rather Iranian than Indian. However, upon Assyrian monuments (for example, the obelisk of Salmanassar II belonging to the year 842 B. C.) are representations of the Indian elephant and the rhinoceros which were led before the victorious king, together with his prisoners. At a later period the Persian Cyrus is said to have undertaken a fruitless campaign to India, and upon his defeat to have retired to the same desert of Gedrosia (see Vol. III, p. 137) through which Alexander retreated with his Macedonians. There is no doubt that Darius Hystaspes subdued the races north of the Cabul River and west of the Indus, and explored the course of this latter stream (about 510 B. C.). Those tribes formed a special satrapy of Persia (see Vol. III, p. 143), and their contingents are said by Herodotus to have fought under Xerxes against the Greeks.

(a) *Alexander's Expedition against India.*—The Indian expedition of Alexander the Great (see Vol. IV, p. 126) is the earliest established chronological fact in the history of India. In the year 327 B. C. he started from Sogdiana and Bactria with about one hundred thousand warriors. Advancing along the Cabul River he was repeatedly obliged to wage desperate conflicts with the bold mountain races and to destroy many of their fortified posts, but he arrived in the spring of the following year at the Indus frontier of the rich district of Five River Land.

The peoples there settled had changed but little since the time when their brothers had marched eastward into the Ganges district, had there founded States (p. 371), and had struggled with the rising power of Brahmanism, with which they had eventually compromised (p. 373). At that time the population was divided into a number of smaller tribes, the warrior caste holding the predominant position. Here Alexander met with a wholly unexpected resistance. Plutarch says of them that the bravest and most warlike of the Indians were the "mercenaries, who marched from one town to another defending each position to the last, and inflicting great loss upon Alexander." So intense was the animosity of the conqueror to this caste that, after promising unmolested retirement to the Kshatriya defenders of a town, he laid in ambush for them and destroyed them during their retreat. And "no less was the vexation caused him by the Indian philosophers, who reviled the kings who joined him and stirred up the free populations; for this cause he hanged many of them."

Though the old bravery remained, the old tribal feuds had by no means died

out, and Alexander was greatly helped by the strained relations subsisting between the Gandhâra and their eastern neighbours, the Puru, the most important race in Five River Land. The Gandhâra king Taxiles (also known as Omphis or Mōphis) joined with other chiefs in doing homage to the invader, and supported Alexander's army with his own troops. In the spring of 326 the Greeks crossed the Indus near the modern Attok (according to Fr. Pincott, at Amb), and after receiving the homage of the people of Taxila (Deri Shâhân, near Lahore; Sanscrit, Takshasîla, that is, the rock of the Takshas, a Scythian tribe), marched against the Puru prince Porus. This monarch awaited the Greek advance on the eastern bank of the Hydaspes (Jilam; p. 364). The Kshatriya fought with the courage of despair, and the greater portion of the Puru warriors were left upon the field of battle. The aged and heroic prince upon his war elephant only retreated when he found his army destroyed, his two sons slain, and himself seriously wounded. Not only did the Macedonians leave him his kingdom, but they added to it a number of conquered districts. After a rest of thirty days Alexander advanced upon a fresh campaign; he had received reliable information concerning the peoples of the fruitful Ganges district, their populous towns and splendid capitals. However, his army deserted him at Hyphasis (Bias) in the year 325, and the world conqueror had come to the end of his victorious career. In boats and rafts he sailed down stream to the mouth of the Indus, and there divided his army into two parts. One of these returned to Persia by sea under Nearchus, while he himself was forced to retreat through the waterless desert of Gedrosia under a burning August sun, and saved but a few remnants of the other half. Shortly afterward Alexander succumbed to his fatigues, his excesses, and the effects of the climate, in the summer of 323.

(β) *The Kingdom of Magadha; Chandragupta and Asoka.* — Alexander's Indian campaign had been of short duration, but the irresistible nature of his onset was only equalled by the importance of its consequences to the country; from the various tribes who had resisted the foreigners was formed the powerful Magadha kingdom. Among those who had been brought over to Alexander's side by the hope of personal advantage was an adventurer known as Chandragupta (the Sandrocottus of the Greeks). A Śûdra by birth (from his mother Murâ, a low caste woman, the royal family which succeeded the Nanda was known as the Maurya dynasty), his position upon the lower Ganges had become untenable for him by reason of his intrigues. The confusion caused by the advance of Alexander into Five River Land seemed to him a favourable occasion for the realisation of his ambitions, and he contrived to maintain connection with both of the two parties. After the retreat and death of Alexander dissensions broke out among the Greek party remaining in the country; Porus was murdered by a Greek leader, Eudemus, and the Diadochi began a series of bloody quarrels over the division of the empire. Chandragupta then placed himself at the head of the Indian movement, secured the predominance of the Punjab in 316 B. C., and in the following year gained possession of the Magadha kingdom, which, under his rule († 296 B. C.), extended from the mouth of the Indus to the mouth of the Ganges. Seleucus I Nicator found Magadha so powerful in 303 that he considered it more prudent to secure the alliance of his eastern neighbour by giving him his daughter in marriage and renouncing his claim to Eastern Gedrosia, Arachosia, and

Paropamisus. The excellent terms upon which these two princes lived is evidenced by their mutual despatch of ambassadors to the courts of Babylon and Pāṭaliputra (see Vol. IV, p. 147).

The first detailed description composed by an eye-witness of India and its people is that for which we have to thank the Greek representative Megasthenes. Only a few fragments remain to us of his work entitled "India;" but even from these we may learn many important details of the conditions of life in the Magadha kingdom. From a Greek point of view the description is highly prepossessing. Megasthenes praises the population for their honesty, uprightness, strength, moderation, and peaceful inclinations, though they are ready to repel invaders by force of arms. The prosperity of the State rested upon agriculture; this occupation was considered so sacred that it was not to be interrupted even in time of war, and the farmer could peacefully till his land while bloody battles were proceeding in the immediate neighbourhood. The kingdom was defended by a numerous well-organised and highly trained warrior class, — one of the seven classes (castes) of the people, between which so sharp a line of demarcation existed that they could not even eat together. The land was common property, and one-fourth of the produce was paid over to the State to meet government expenses. The Buddhist ascetics (Sramans) were then considered a subdivision of the Brahmans.

The grandson of Chandragupta, the son and successor of Bindusāra, Asoka (Sanskrit, Aśoka; 269 to 232 B. C.), was the most powerful ruler of ancient India; his kingdom extended over the greater half of the peninsula, and his influence far beyond these limits. After thousands of years no king has received such deep veneration as this Magadha ruler, whose name even to-day is deeply honoured from the shores of the Black Sea to the furthest islands of Eastern Asia, and from the shores of the polar ice to the equator. It is not to the greatness of his political power that he owes his fame, but to the gospel of human love, which he substituted for the teaching of Gautama (see above, p. 394).

The Magadha kingdom, with its capital of Pāṭaliputra (Patna), founded by Chandragupta in the year 315 B. C., was not destined to exist for long; its most brilliant period is the reign of Asoka, the grandson of its founder, under whom it extended from Afghanistan to the district of the modern Mysore, and from Kathiawad to Orissa (see the map, p. 430; cf. also p. 500). Less than a century after the accession of the great king, and one hundred and thirty-seven years after the founding of the Maurya dynasty, the last ruler, the tenth of the dynasty, was overthrown by his general, Brihadratha. The succeeding dynasty of the Shunga lasted only one hundred and twelve years (178 to 66 B. C.); the kingdom of the Kanwa, who succeeded, gradually diminished as the Scythians increased in importance.

(γ) *The Scythian Tibetan Kingdom in Northwest India.* — The natural conditions of the Asiatic Highlands impose a nomadic life upon the inhabitants (cf. above, Chapter II). Mongolian, Turko-Tartar, and Scythian peoples were continually struggling for the possession of the grass steppes and pasture lands after the immigration of the Aryans. Race collided with race, and, like a wave driven before the stormy blast, confusion reached the uttermost limits of the country. An unusually strong upheaval of this nature had disturbed these nomadic tribes in the

second century B. C. The Mongolian tribe of the Hiung nu, living east of the Oxus district in the steppes between Khiva and Khotan, had attacked the Tibetan Yue tshi (p. 140), who are, no doubt, to be identified with the Scythian Issedones (p. 146) upon their western frontier. This tribe they had defeated and forced to emigrate. The conquered nation then advanced upon the Græco-Bactrian kingdom, founded about 250 B. C. by Diodotus (Vol. IV, p. 159), a kingdom which had now advanced beyond the Indus to the Punjab. Before the onslaught of these invaders the predominance of the Greeks in Bactria proper came to an end shortly after the year 140 B. C. A Scythian offshoot, the Sakæ (see above, p. 135), under the leadership of the kings Maues (100 B. C.) and Azes (70 B. C.), turned toward the Indus, and following the course of this river southward to Sindh ultimately arrived at Gujerat. Another tribe, the Kushana (Kushans), followed the Cabul River into the Punjab under the prince Kozulo (Kujula) Kadphises. Here they destroyed the last remnants of the Greek supremacy (Hermæus) in the year 25 B. C., and the following king, Huemo Kadphises, extended his power over the larger part of Northwest India (p. 144).

The most important ruler of this dynasty was the next king, Kanishka, whose kingdom extended from Yarkand and Khokand to Gujerat, and from Afghanistan as far as the Jumna. From his anointing (the 15th of March, 78 A. D.) dates the "Saka Chronology." A. M. Boyer and others consider Nahapâna as the founder of this kingdom. Upon their advance into India the Scythian hordes came in contact with Buddhism, and enthusiastically embraced this new religion. Like Asoka, Kanishka called a special council at Kashmir to reformulate the doctrine of Buddha. Supplementary explanations were then added to the three Piṭakas of the Council of Patna (p. 393). From this council it appears that even at that time the old doctrines of Buddhism had not been preserved in their original purity in Northern India, but had undergone considerable changes under the influence of Brahman and Dravidian ideas. At the same time, it is probable that the deities introduced by the Scythians were not entirely without influence upon the conclusions drawn up by the council of the mighty Scythian ruler.

(8) *The Hindu Dynasty of North and Central India during the First Millennium A. D.* — The kingdom founded by Kadphises, like that of Chandragupta, reached its most flourishing period under the second successor of the founder, while its importance begins to decrease after the third century A. D., when other dynasties and States became more prominent. However, the history of India during the first millennium A. D. appears to the modern inquirer like a great mosaic picture, in which only individual or small related groups of stones are now recognisable. Coins, casual reports from travellers (especially Chinese), and inscriptions show us movement and counter movement, rise and decay among States both small and great, but in no case is it possible to reconstruct the history in detail. In many cases we have only the most scanty sources of information, a few isolated names and events; while other States certainly existed and have left not a trace of their career behind.

The famous Maurya dynasty began to decay shortly after the time of Asoka, but the old splendour reappeared for a moment under the dynasty founded by Gupta (290 A. D.). This king, who had formerly been a vassal of Magadha, made himself independent, and under his grandson Chandragupta I and his immediate

successors the prosperity of the kingdom advanced so rapidly that it included all the territory between Nepal and the Narbada, between Cutch and the Ganges delta. During the sixth century, however, the prosperity of the realm was shattered by the attack of the "White Huns" (Hûna; cf. p. 155 *ad fin.*) in the year 515. These invaders were utterly defeated about 530 near Kahrôr by Yaśodharma, a vassal of the Gupta kingdom. He himself assumed the predominance and further extended the boundaries of the kingdom, though its history from this point is only known to us by a number of royal titles.

A kingdom of larger extent further to the south was also formed during the struggle with the White Hûna, who had left their habitations on the Oxus after the year 435 A. D. and had invaded India. In the struggle against their king, Mihirakula Yaśodharma, had been anticipated by another vassal of the Gupta kingdom, Sanapati Bhaṭârka (495 A. D.). This prince was the founder of the Valabhî dynasty and kingdom, which attained a high measure of prosperity under his sixth successor, Dhruwasena. It included Gujerat, extending to the Narbada. The rulers at one time showed special favour to Buddhism, and at another transferred their preference to the Brahmans or to the Jains, who still count many adherents in the old Valabhî district. At the Council of Valabhi (p. 402) the canons of this latter doctrine were definitely formulated under the presidency of Devarddhiganin Kshamashramaṇa.

To the second half of the first millennium A. D. belongs the development of an important Hindu kingdom in the Deccan, that of the Châlukya (see the map, p. 430). This race is considered to have come from Northern India, and the founder of the dynasty, Jayasinhha I, established himself about 500 A. D. in the Deccan at the expense of the Dravidian Pallavas. The new Hindu kingdom rapidly increased in size and power, and in the following millennium embraced the greater portion of the Deccan. In the year 630 it was divided into an eastern and a western kingdom. The Châlukya prince, Vishṇuwardhana, obtained the kingdom on the east coast (Waiṅgi), which included the coast line between the mouths of the Krishna and Godaverî. For a long period he was at war with the Chola on the south, and eventually succumbed to their attacks in 1060. The western Châlukya were a flourishing kingdom until the year 747 A. D., and were then conquered and reduced to great weakness by the Râshtrakûṭa (Gujerat). After a long period of depression, Tailapa Deva, the son of Vikramâditya IV, conquered the Râshtrakûṭa of Malkhed and also Mâlava and the Chola in 973, and became the founder of the later Châlukya dynasty, whose kingdom disappears toward the end of the twelfth century, when it was divided among a number of branch dynasties.

(e) *Hinduism*.—This period of political change and complete racial fusion had gradually obliterated the points of contrast existing between the original races and peoples. The unity of the Indian people, Hinduism as it is in modern times, had been slowly formed from this former ethnical dualism. Its character is marked by two special peculiarities, — religious belief and social institutions (castes).

(1) *Buddhism ; its Extension and Division into Southern and Northern Types ; its End in India*. — During the time of Asoka we find great points of difference existing within the sphere of religious belief. The Brahman doctrine of the nature of the world and the Deity was a purely esoteric system of belief, the other castes,

and particularly the great mass of the Śūdra, believing in the power of demons. Within the Brahman school of thought a third faith had arisen, — Buddhism. This had been at first tolerated by the Brahmans, as they had failed to recognise the points of opposition to their system which its teaching involved. It has largely to thank Asoka for the vigour of its advance. It was preached throughout India by the royal missionaries, and introduced into Ceylon immediately after the Council of Patna. It also penetrated far beyond the boundaries of its Indian birth-place. During the first century of our era it reached China, where it was recognised as the State religion during the fourth century (p. 81). In 372 it was introduced from China into Korea (p. 116), reaching in the fourth and fifth centuries Cochin China, Ava, Formosa, Mongolia (p. 166), and Japan during the sixth century (p. 10). At an even earlier period that form of it established in the Pāli canon had passed from Ceylon to Burmah (450 B. C.), and afterward became the dominant faith in Siam (638); it was brought to Java from the Indian continent in the sixth or seventh century. We have a striking example of the powerful influence which its teaching of liberation and its humanitarianism exercised even upon uncivilized nations in the case of the Scythians (Kanishka). At the Council of Kashmir (p. 407) the doctrines formulated at Patna were reasserted.

But even at that time in the north of India a schismatic movement had begun, due to the introduction of a barren system of dialectic, and also to the perversion of the doctrine and worship by the Dravidian belief in demons. At a later period the belief underwent so great a transformation among the Tartar and Mongolian peoples that the northern Buddhism of the present day is merely a frightful caricature of the pure Buddhist doctrine (p. 186). The soul to which Gautama had denied an objective existence was reintroduced as an element of belief, and the soul of the future Buddhas, the Bodhisattvas, especially those of the Manjūśrī and the Avalokitesvara, were accorded divine veneration, becoming personifications of the mystical religious knowledge and of the spirit of the Buddhist churches, while almighty power was typified in a third divinity, Vajradhara. Thus the heaven of this Buddhist sect was provided with a Trimūrti (p. 367). To this trinity were attributed the most abhorrent characteristics of the lower gods, and Shamanist customs and incantations, together with bloody sacrifices, were introduced into the worship. This incorporation of Indian Dravidian ideas and customs with Buddhism is chiefly the work of the Indian monk Asaṅga, who lived in Peshawar in the Punjab during the sixth century A. D. The resulting doctrine, called by the northern Buddhists the "great chariot," to distinguish it from that which they contemptuously termed the "little chariot" (the earlier Buddhism), together with the conception that the spirit of the churches became incarnate in one temporal head, eventually led to the development of Lamaism in the countries to the north of India, for which compare p. 187.

Next to the Asoka inscriptions the most important sources of information upon Indian Buddhism are the accounts of the Chinese Buddhists who made pilgrimages to the sacred shrines of their religion, especially the reports of Fa hien (400–414 A. D.; p. 82) and of Hiuen Tsang (629–645; p. 83). From Fa hien we learn that in the whole of Nearer India the two doctrines, the "great chariot," Mahāyāna, and the "small chariot," Hinayāna, existed side by side, though at the same time the Brahman teaching counted numerous adherents. At the time of Hiuen Tsang, Kashmir was entirely given up to northern Buddhism, while the "small

chariot" was predominant in Western and Southern India; in the Ganges district Buddhism suffered greatly from the competition of Brahmanism. Hiuen Tsang was present at the Council of Kanauj, where the doctrines of the northern sect were formulated. Buddha's birthplace (p. 390) was at that time in ruins, but his religion was even then firmly established in those countries in which he had himself been personally active. In the rest of India the old doctrine was still highly flourishing, and only in Kalinga had it been driven back by the rise of Brahmanism.

Shortly after the pilgrimage of Hiuen Tsang serious misfortunes came upon the Buddhists. These are most probably to be explained by persecutions, which were at most purely local; Indian Buddhism collapsed more from internal weakness and diversity of growth than from the open hostility of other religions. Shortly after the conclusion of the first millennium A. D., about 1200, it had ceased to exist almost throughout India. The princes of Kashmir and Orissa supported it for a time; but about 1340 its last stronghold, Kashmir, also fell, and when the first Mohammedan kingdom of India was founded, nearly the whole population (with the exception of some few adherents in Bengal and Orissa, together with the Jains) acknowledged the gods of the Hindu religion.

(2) *The Hindu Religion.*—Those long-continued political disturbances which we have described proved unfavourable to the strengthening of religious conviction. Among the Brahmans a period of deep metaphysical speculation had been succeeded by a period of repose, while the lowest gods and the rudest forms of worship had been gradually accepted by the people at large. It was not until the eighth century that the reaction began. Tradition names Kumārila, who lived in the first half of that century, as at once the deadly enemy of the Buddhists and the reviver of the Brahman religion. But the first great reformer probably so called was Sañkara Âchârya (born in the Deccan in 788; chiefly active in Northern India, and died in the Himalayas, 820), who revived the Vedânta philosophy and created the new popular Hindu religion. The esoteric portion of his doctrine acknowledges one unique supreme god, the Brahmâ Para Brahmâ, the creator and governor of the world, who is to be worshipped by mystical introspection; the elements of religious thought extant in the people as a whole he united and inspired in the figure of Śiva. The great apostle of the worship of Vishṇu, on the other hand, was Râmânûja, who lived in the first half of the twelfth century. His doctrines were preached by Kabîr (1380–1420) in Bengal and Chaitanya (born 1485) in Orissa. From the time of those reformers onward Śiva and Vishṇu have been the cornerstones of Hindu worship. In the popular religion Brahmâ retires into the background.

The fundamental element in the philosophical conception of Vishṇu is immanence, so that this kindly helping god becomes properly the god of incarnations, of Avatâras. His being permeates all things, and hence he may appear in most different forms. Whenever gods or men are reduced to the extremities of need, Vishṇu brings them help in one or another of his manifestations. Legend numbers many of these incarnations (in all twenty-two), but the generally accepted number is ten. In the first three the god appears as the fish, the tortoise, the boar; in the fourth, as the male lion; and in the later incarnations in human form, first as a dwarf; afterward in the sixth, seventh, and eighth as Paraśurâma, as Râmatshandra, and as

Krishṇa,—that is, in forms taken from the heroic legends of Indian antiquity (see pp. 371, 374, 389). Of these incarnations Krishṇa has become the most popular, the people recognising a national characteristic in the amusing tricks assigned to Krishṇa by the legend. The representation of Buddha as the ninth incarnation of Viṣṇu no doubt belongs to a period when an attempt was made to unite Buddhism with the Hindu religion. A later theory also considers Buddha under this incarnation as an *agent provocateur*, who tempts the wicked to scorn the Vedas and the laws of caste in order to secure their eventual destruction, and so to free the world of them. Finally, the last incarnation of Viṣṇu belongs to the future; at the end of the present age the god will appear as Kalki and found a new kingdom of purity.

In the conception of Śiva, Brahman ideas of “darkness” meet the demon beliefs of the Dravidians. It is among the mountain tribes of the Himalaya (p. 358) that the figure of Śiva, the “mountain spirit,” originates, borrowed from Kirāṭa, a divinity given over to sensual pleasures, drinking, and dance (Natêśwara, lord of the dancers), and followed by a train of lower spirits. The fundamental conception of the Dravidian races of divinity as evil in nature is commingled with the Brahman ideas of darkness in the person of Śiva, the god of destruction. As Rudra he personifies the destructive forces of nature; as Mahākāla, the dissolving power of time; as Bahirava, he is the destroyer, or destruction as such; and as Bhûtêśwara, adorned with a garland of snakes and death’s-heads, he is the supreme deity of all the demons of the Dravidian belief (see the upper half of the plate, “Early Indian Sculpture,” p. 390). Thus Śiva is rather a Dravidian Viṣṇu than an Aryan creation, as indeed is manifested by the distribution of their several worships, the devotees of Śiva being more numerous in the south and those of Viṣṇu in the north. Thus in the northern districts of the Madras presidency the worshippers of Viṣṇu preponderate by a number varying from ten to one to four to one, while in the central districts of the presidency the number of adherents of either faith is almost equal; in the south the worshippers of Śiva surpass those of Viṣṇu by a number varying from four to one to sixty-seven to one. In the loftier conceptions of Śiva Brahman thought becomes more prominent: from death springs up fresh life, from destruction the new and more beautiful is restored. Thus the “destroyer” becomes a benefactor, Sadâ Śiva, Saṅkara, Śambhu; he personifies the reproductive forces of nature, and as such is worshipped under the name Mahâdeva, the great god, Îśvara, the chief lord. No image is of more frequent occurrence in India than his symbol, the Liṅgam (phallus). Yet more definitely Brahman is the idea of the power of the sacrifice and of asceticism, and in this connection Śiva appears in the form of the “Great Penitent” Mahâyogin.

Personification has not extended so far among the Hindu deities as it did among those of Greece and Rome, consequently the Hindu Pantheon is not composed of one great family of grandparents, fathers, mothers, and children. Brahman and Viṣṇu had no son, and only two sons exist loosely connected with Śiva, known as Subrahmanya or Skanda, the god of war, and Gaṇesa, the god of cunning and success, who is invoked upon every necessity of daily life, and whose deformed, stumpy figure with the elephant’s head is everywhere to be found.

Consorts are assigned to all the more important deities; yet the conception of wifehood has in this case been overshadowed by the personal attributes of the deity (śakti = might or power). According to Brahman philosophy, as soon as a

supreme being becomes personal, his attributes coalesce into male and female divisions, the latter of which, contrary to our conceptions, is the more operative of the two. In the case of the less active gods, Brahman and Vishṇu, this opposition is by no means so prominent: the consort of Brahman, Sarasvati, is the goddess of learning and knowledge; while Lakshmi, the wife of Vishṇu, is the goddess of the supreme good and beauty. However, in the worship of Śiva the female side of his existence plays a more important part, owing to the fact that the god himself occupies a position of greater activity and has absorbed a larger proportion of Dravidian deities who were essentially feminine. Each of the chief forms under which Śiva appears have been intensified by the addition of a wife; thus to the mountain god Kirāṭa the wife Pārvati has been given, to Mahākāla the blood-thirsty Kālī, to Bhāva the wife Bhāvinī, to Mahādeva the wife Mahādevī, and to the penitent Mahayōgin the wife Yogini.

To the narrow circle of the supreme gods is added a number of superior beings, partly drawn from prehistoric legend, such, for instance, as the sacred singers of the Vedas the Rishis, the Pāṇḍu brothers of the Bharata battles, and others drawn from the numerous band of lower deities worshipped by individual tribes. The Hindu heaven is spacious enough to contain any deity of the smallest importance or mystery, and includes stones and mountains, rivers and tanks, weeds and trees, useful and dangerous animals, the most different atmospherical phenomena, spirits of the deceased, individual demons, etc.

The wide differences, in fact the oppositions, which characterise the manifestations of the divine element are reflected in the worship; the lowest fetish worship exists side by side with the veneration of the purer and higher powers of heaven. Hinduism is particularly distinguished from all monotheistic religions by the fact that its votaries do not constitute a church, or indeed possess a universally accepted creed. A Hindu may worship Vishṇu or Śiva in one or other of their different forms, as also Gaṇeśa, or one of the many Śaktis, and his choice entirely depends on the forms of prayer and incantation (Mantra) which he has received from his spiritual tutor and adviser, the Guru. These formulæ vary in the case of individual gods, and any god can be transformed into the patron deity of the Hindu who bears upon his forehead the sign (Nāma) of this special god.<sup>1</sup> Under these circumstances common worship is impossible. Worship, like faith, is purely personal, and is composed of formulæ and spells of magic power, of purificatory rites and sacrifices which the worshipper offers to the gods or induces his priest to offer for him. Worship of this kind, therefore, demands no great space or building where the congregation may meet together before their god; the sanctuary proper is never more than a small shrine or an unimportant chapel with the symbol or image of the god. The temples, which have increased to enormous size, especially in Southern India, owe their dimensions to the addition of subordinate rooms such as pilgrim halls, side galleries (see the plate, "Colonnade<sup>2</sup> in the Interior of the Hindu Temple in the Island of Rameśvaram"), tanks surrounded by steps, etc.

Divine worship is carried on under three main different forms. Vishṇu of all the supreme gods is most like man in shape. Consequently his statue is tended

<sup>1</sup> In the case of Śiva this sign usually consists of three horizontal strokes of white, Vishṇu being designated by a design like a tuning-fork. See also the upper half of the plate, "Early Indian Painting and Architecture," p. 418.

<sup>2</sup> Seven hundred feet long; erected in the eleventh to twelfth century, according to Fergusson.

COLUMNED CORRIDOR WITHIN THE HINDU TEMPLE OF RAMSWARAM, SOUTHERN INDIA

(From a photograph.)

## EXPLANATION OF THE PLATE OVERLEAF

The island of Rameswaram (Ramesseram), a low sandy piece of land, lies in the Gulf of Manar, between India and Ceylon. In the northern part of it stands one of the most splendid monuments of Dravidian architecture, the immense Hindu temple with its lofty towers, the interior of which is traversed by gloomy pillared corridors. For centuries the shrine has been visited throughout the year by thousands of pilgrims, and the rich offerings made by these provide a livelihood for the inhabitants of the island, who are chiefly Brahmans.

like a human being by priests specially appointed for the purpose. The worship of his image may be compared to the playing of a small child with its doll, and the offerings made to him are those things which delight the Hindu heart, — rice, coraco, pastry, and flowers or decorations of pearls and precious stones. Śiva, on the other hand, the lofty and often terrible god, dwells at heights unattainable by humanity. It is exceptional for his temple to contain a statue. However, worship is rendered everywhere to his symbol, the Liṅgam, which is bathed in holy water, smeared with butter or covered with flowers. The worship of the third group of gods Dravidian in origin necessitates a bloody sacrifice. Goats are slaughtered before the altars of Kâlî and Durgâ, and the images and temple floor sprinkled with the blood of the animal; poorer people offer a cock to these, or to other lower divinities. The human sacrifices prevalent at an earlier period are now practically abolished, though survivals in a milder form occur even at the present day.

To these forms of daily worship, prayer and sacrifice, must be added the religious festivals which occur upon the days dedicated to numerous individual gods. Scarce a people or a religion can be found which celebrates so many pious festivals as the Hindus. Specially meritorious is a pilgrimage carried out under circumstances of unusual difficulty to the source of some holy stream (Ganges or Narbada) or to one of the great sanctuaries of Śiva or Vishṇu.

(3) *The Hindu Conception of Caste.* — As Brahmanism had already sowed the seed which was to develop into Hinduism and its religion, so upon the social side the Brahman caste regulations provided a practical basis for organisation. The caste system has been promoted by many influences and checked by many others. Even Buddhism showed a tendency to equalise and level the sharp barriers existing between the castes. When at a later period Mohammedanism was introduced, its adherents declined to recognise caste, and many Hindu sects in imitation laid down the social equality of all men as a fundamental principle.

On the other side influences existed which furthered the persistence and increase of the castes. During antiquity the incorporation of members of foreign races must have produced subdivisions within the several castes; newcomers would be regarded with some contempt by the older members, and differences of this nature grew in course of time to absolute division. Within the warrior caste this process was constantly repeated; and in the same way deep schisms often arose within the Brahman caste, especially in the south. It was a common occurrence for a caste or some part of it to claim and acquire a higher position by means of falsified genealogies or other evidence, though without obtaining absolute recognition. Local separation of the members of one and the same caste naturally results in an increase of caste. The divided parts mistrust one another, especially on the point of purity of descent, and ultimately the sense of their common unity is lost, and that which had been one caste becomes two. Caste divisions of this nature are especially common among nomadic shepherd tribes or gipsy tribes (cf. on the subject, Vol. V), among trading and agricultural castes, which are driven from time to time by outbreaks of famine to change their dwelling-place and to divide their forces; divisions may also be brought about by war and the shifting of political boundaries. A man who has arrived at high prosperity often attempts, and with success, to break away from his caste brothers and to assume the name and the special customs of a higher caste. Religious divisions are also a frequent

cause of caste disruption. One of the commonest causes of caste increase is change of profession, which often results in a change of circumstances or social conditions. Under European supremacy it is a phenomenon of daily occurrence that the Hindu who enters the service of a white man thinks himself better than his former caste brothers, and new castes of coachmen, water-bringers, grass-cutters are constantly arising in this way. At the present time separation of profession is the main characteristic of the caste system, profession being invariably hereditary. This custom tends to preserve the purity of blood; no one who belongs to one caste may marry with the member of another caste. Among the higher castes mere contact defiles, or the breath of a low-born man even at a considerable distance. Eating with a member of another caste is absolutely forbidden. Stern precepts thus regulate individual behaviour. Castes have their own presidents and inspectors, appoint pecuniary fines or expulsion as punishment for grievous offences, and also watch over the welfare of the whole (by maintaining the rate of wages, the hours of labour, organising strikes upon occasion, etc.) and also of the individual (by supporting the poor and maintaining widows and orphans, etc.).

(4) *The Position of the Woman.* — Almost as great an obstacle to national development as caste influence has been the low position held by the woman. Among the Aryans and also among the lower native tribes the woman was respected and honoured, and during the epic period was the central point of interest in the brilliant tournaments of the Kshatriya and the equal companion of man for the poets of the succeeding age; whereas now she is but a miserable creature, an oppressed and hard-worked slave. Here, too, Brahman influence is to be traced in the repression of the woman. The Brahmans considered that the safest means of securing racial purity, the fundamental precept of their social organisation, was to limit the freedom of the woman by the closest possible regulations. The only task left to her was to present her husband with descendants of pure blood, and to this task everything that may raise the esteem in which woman is held was ruthlessly sacrificed. Contempt and stern compulsion accompany her from birth to death. Should a son be born to a Hindu the festival conch-shell is blown, and the friends bring congratulations and cheerful offerings; but when the child is a girl, the father looks upon the ground in embarrassment, while his friends offer him condolences instead of congratulations. Special festivals are arranged only in honour of boys and never of girls. After the birth of a son the mother remains unclean for three weeks, but for four weeks after the birth of a daughter. The boy is instructed by his spiritual tutor in accordance with his father's position; the girl receives no instruction at all. Whatever she learns she learns from her mother, who knows nothing more than a few texts and prayers for the possession of a faithful husband, and a few curses against polygamy and infidelity.

At the age of seven to nine years old the girl is married to a boy of from twelve to fourteen years of age, or even to an old widower, without any attempt being made to consult her inclination; often she meets her husband at the ceremony for the first time. After the ceremony is concluded she remains for the moment in her parents' house, to be transferred to her husband upon the first signs of puberty. Mothers of thirteen and fourteen years of age are by no means exceptional in India. How unfavourable an influence must be exercised by early marriages of this kind upon the physical and intellectual welfare of the nation is sufficiently obvious.

Upon her marriage a girl begins a miserable life of slavery within the prison of the woman's apartments; she must cover her face before every male member of the family, she may not speak to her husband for days together, she may not call him by name or eat with him; her existence is passed in deadly monotony. Before the period of the English supremacy the woman's ideal was to be cremated with her dead husband. These suttees are now a thing of the past, but the lot of the widow is almost worse than death by fire. The death of her husband is ascribed to her ill deeds committed in a former state of existence, and her remaining days are weighed down by hatred, severe penance, mortification, and the burden of the heaviest tasks.

Such is the lot of woman in those strata of society which profess to fulfil the ideal of Hindu existence. In reality these severities are often tempered by mildness and affection. Among the poorer Hindus of the lower castes the wife is obliged to share the task of procuring sustenance for the family, and thus rises to be the equal of the man, and gains self-respect by the consciousness of being of some use in the world, though at the same time even in this class of society the wife is considered an inferior being.

(5) *The Pursuit of Science and Art by the Brahmans.* — In the subordination of civil society as arranged by themselves the Brahmans retained learning and science as their prerogative, and were themselves under the special protection of the goddess of learning, Sarasvatî, the chief wife of Brahmâ.

The Brahmans have left their special mark upon the whole religious, scientific, and artistic literature of India by the creation of a learned language, Sanscrit. The earliest hymns of the Vedas, dating perhaps from the third millennium B. C., are written in an ancient but highly developed language; from this the popular tongue gradually diverged as in course of time it was broken into different dialects. The priests considered it of high importance that the language in which they spoke to the gods should be higher and more perfect than the vulgar tongue. As they gradually rose above the common people to power and influence they transformed the language of religious thought and worship by a strictly logical and scientific procedure into the "Samskrita," the "perfect language," as distinguished from the vulgar tongue or "original" language, the "Prâkrita;" they can pride themselves upon including in their number the greatest grammarian of all time, Pânini (apparently about the middle of the fourth century B. C.). The contrast between the esoteric lore of the Brahmans and the more popular teaching of Buddha is expressed in the fact that Buddha and his disciples preached to the people in their own tongue in every country which they visited. It was not until Buddhaghosha (410-430) had transcribed into the Piṭakas (sacred books; see p. 402), in the language of Magadha, the commentaries (Atthakathâ) of the great Buddhist Mahinda that this language, the Pâli, became the sacred tongue of southern Buddhism. Brahman influence is also apparent in the formation of the southern branch in so far as this latter chose Sanscrit and not Pâli for purposes of religious writing.

The most important part of Brahman literature is concerned with religious questions. The Vedas are the foundation of all later religions and philosophical developments. Of the four collections of the Vedas, the Rig Veda belongs to a remote period of antiquity, parts of it undoubtedly dating from the third millennium

B. C., while two later collections, the Sâma and Yajur Vedas, belong to the period when the ritual had been formulated. The Vedas are collections of hymns and texts which the priest had to repeat during the performance of sacrifice. There were three orders of priests, and each of the three collections which we have mentioned was for the use of a particular order. To the Hohis, or highest of the three orders, belonged the Rig Veda, which they were required to recite in a loud voice. Next to them came the Udgahi priests; they used the Sâma Vedas, which they sang in chorus. The Yajur Vedas were for the use of the Adhvaryu priests, who were only allowed to mutter in a low voice. The fourth Veda, the Athar, contains magical formulæ against sickness and the attacks of enemies, together with extracts from the Rig Veda. The Brâhmaṇas also belong to pre-Buddhist times; these are prose compositions containing a substratum of historical truth interwoven with legendary narratives, and consist primarily of a description of the ritual employed in the great sacrifices as performed by the different priests. The Upanishads are works of a different character, and contain the results of Brahman philosophical speculation, together with religious and philosophical teaching upon the nature of the world and the world soul from a monotheistic point of view. They are marked by a profundity of speculation and a richness of thought which are evidence of the serious prosecution of the truth for its own sake. Wholly different are the Tantras, which belong to a much later period; these are a collection of mystical religious precepts, prayers, and magic formulæ for the service of Śiva in his more esoteric character and female personification (Durgâ). Though these writings were composed at a later date than those previously mentioned, they are none the less considerably older than the extant version of the eighteen Purâṇas, with their eighteen appendices, amounting in all to about four hundred thousand double lines, and dealing with the legends of Vishnu. These were also included by the Brahmans among the "Scriptures of Antiquity," though their age cannot certainly be determined. In their present form they are a later edition, but their fundamental elements exist in part in the Mahâbhârata.

Together with religious writings the Sanscrit literature includes all other departments of Brahman thought. The historical is their weakest side. In this respect the Brahmans are in strong contrast to the Mohammedans, who were ever ready to write the histories of their age and their rulers, and also to the Buddhists, in whose chronicles all important events affecting the monasteries were transmitted to later generations. These chronicles have entirely disappeared in the general ruin of Buddhist monasteries in India; in Kashmir alone, where Buddhism maintained its ground to a late date, the historical sense has not entirely vanished with the monasteries, and the book of the kings there written, the Râjataranginî, carries on the history of this district into the post-Buddhist period. In Ceylon, where Buddhism remains the dominant religion, the chronicles have been continued from the earliest period to the dissolution of the Singhalese kingdom and the English occupation.

Brahman thought was unequal to the task of scientific investigation into natural causes; in this department inquiry was checked by the conception of a divine element which penetrated the vegetable and animal worlds, and was even immanent in the stone. At the same time the duty of sacrifice gave them a certain knowledge of the parts of the body and their surgical treatment; indeed, this was a good school for empirical surgery, in which native practitioners acquired a high degree

of skill. Even such difficult operations as those for cataract, stone, rhinoplastic (that is, the reconstruction of the nose), removal of the foetus, etc., were successfully and skilfully performed, and the medical treatises of the Brahmans make mention of no less than one hundred and twenty-seven different surgical instruments. At a later date, when the Arabs became acquainted with Indian surgery they gave full recognition to their superior knowledge. The treatment of internal disease rested upon purely empirical methods; a large collection of specific remedies existed, and the chemists employed in the preparation of medicines had acquired scientific knowledge of a number of important chemical bodies.

Astronomy was a science in closest connection with the priestly calling; indeed the primeval religion of the Aryans had consisted in prayers to those powers which were manifested in heavenly phenomena, in the movements of the sun, the planets, and the fixed stars. Thus even in the earlier Vedas the solar year is calculated with a high degree of accuracy, the year consisting of twelve months of thirty days, an intercalary month being added to every fifth year. Religious sacrifices and festivals were also performed on dates previously fixed by means of astronomical calculation. Still, in the period of Alexander the Great astronomy as an exact science was at a comparatively low level, and much help was given by foreigners who had made further advances in these studies. However, toward the middle of the first century A. D. the science made a great advance, though it relapsed during the period of the formation of the great Mohammedan States. Only by individual princes (for example, those of Jaipur) has astronomy been studied in modern times with any degree of interest. Side by side with this science stands that of mathematics, for which the Brahmans showed high capacity. They developed independently the decimal system of notation, and the Arabs undoubtedly learnt very much from the mathematical studies of the Brahmans. The study of algebra reached its highest point in the person of Aryabhaṭa (born 476 A. D.).

Together with the Dharmasūtra, of early date and composed in short precepts, and the legal code of Manu written in verse (p. 374), other similar works, such as the Dharmaśāstra of Yājñavalkya and of Parāśara, also enjoyed a high reputation; these works treated of morality in social life, and also of judicial administration in a narrower sense. At a later period there arose in the different parts of India five legal schools which developed juridical systems, varying respectively as the characteristics of the population.

In art the Brahmans were the leaders of the people. Music and poetry were an integral part of divine worship, which was to be carried on with artistic words and solemn song; the same remarks apply to the architectural arts, for architecture and the decorative arts of painting and sculpture received their highest impulse from religion.

The musical scale of seven intervals is of primeval antiquity in India, and though their modern music is cacophonous to us, this fact is due to the introduction of numerous intervals inappreciable to our ears. The sacred hymns of the Indians are admirable compositions (cf. p. 368); of no less importance are the epic poems composed under Brahman influence, the Mahābhārata and Rāmāyāṇa (p. 369). Epic materials have also been incorporated with the Brāhmaṇas (p. 416). The development of the fable with characters from the animal world by the Indians is well known. One of the earliest collections of this nature, the Panchatantra, probably goes back to the second century B. C., and is at any rate earlier than the

sixth century B. C., when it was translated into Persian; in another form this collection enjoys greater popularity as the *Hitopadeśa*. The Indian fable has made its way over the whole world, and Æsop's fables, together with the story of Reynard the Fox, are but an echo of Indian poetry.

Of dramatic works the Indians have about sixty pieces of ancient date; almost all of these are rather comedies with happy dénouements, than tragedies ending in gloom. They are no longer characterised by the unrestrained power and the youthful heroic joy of the first Aryan period; the popular character had undergone a change under Brahman influence, and humanity as represented in these dramas had grown effeminate. Character is of less importance than sentiment, which latter shows a remarkable degree of tenderness and introspection, while the whole is marked by a feeling for external nature which is unrecognisable in the modern Hindu. Among the dramatic poets of India the most famous is Kālidāsa; a verse from his works is quoted on an inscription as early as 472 A. D. The culmination of Indian drama is seen in "Śakuntalā," "Wikramorwaśi" (Vikrama and Urvaśi), and also "Mālavikāgnimitra" (Mālavikā and Agnimitra). Writers of lesser importance are King Śrī Harsha in the seventh century A. D. ("Ratnāvalī," "Priyadarśikā," and the Buddhist drama "Nāgānanda"), Bhaṭṭa Bhavabhūti at the outset of the eighth century (dramas; "Mālatīmādhava" [Mālatī and Mādhava], "Mahāvīratsharita" and "Uttarāmatsharitra" [fate of the great hero and further fortune of Rāma]); King Sūdraka with "Mṛitshihhakaṭikā" (Vasantasenā) was probably of much earlier date; we may mention Viśākhadatta (perhaps not till 1100) with "Mudrārākshasa" (the minister's seal). As an epic ("Raghuvāṅśa" and "Kumārasambhava") and lyric poet ("Meghadūta," the cloud boat), Kālidāsa is again high above rival composers in these *genres*.

The plastic arts no less than the poetical receive their first impulse from religion, so that in this department also the Brahmans appear as patrons and supporters. Painting (see the upper half of the plate, "Early Indian Painting and Architecture") and sculpture hardly rose above the level of decorative art; the breath of pure beauty observable in the representations of Buddha is due to Greek influence (see the stone figure reproduced on the right beneath the plate, "Early Indian Sculpture," p. 390). Under the more artistic of the Mohammedan princes painters produced works of beauty though of small size in portraiture. In other respects, however, both arts were subordinated to architecture, and are characterised by the fantastical conjunction of human and animal forms, the multiplication of individual members of the body, by exaggeration of movement, a total lack of proportion, the desire to fill up space, and an ignorance of the laws of perspective.

Architecture produced more successful results and became monumental after stone had been introduced as a material by foreign influence (Greek). For more than one thousand years this art was confined to the erection of religious buildings; palaces of any size and splendour do not appear until the rise of the Mohammedan kingdoms. Hinduism in religion and worship has left its stamp upon architectural style; there being no congregations, no temples were required of any great size, and the sanctuary proper is but a narrow space to contain the statue or the symbol of the god. Round about the sanctuary, for the convenience of the pilgrims who arrived to make their offerings and to perform their pious vows, were erected long corridors, great pillared halls (see the plate "A Colonnade on Rameś-

Racial types : frescoes of the second century B. C. from the Cave X at Ajantâ. (After James Burgess.)  
 (The figures bear the Nāma of the Brahman divinities upon their foreheads. The type of face is rather Aryan than Dravidian; the ornaments and umbrella are not, as Fergusson and Burgess suppose, signs of low caste.)

The "Kailâsa" at Ellora. (After Gustave Le Bon.)

varam," p. 412) large tanks approached by flights of steps for ablution, etc. In this way temples which enjoyed a high reputation and were visited by tens of thousands of pilgrims during the year often grew to enormous size. Especially is this true of the Dravidian temples which are distinguished by their size and massiveness and by their towered gates with richly adorned pyramidal roofs rising in terraces. The buildings of the Châlukya kingdom (p. 408) are characterised by delicacy of decoration and those of the Jains by an oppressive wealth of ornament. To the earlier Buddhist period belong the huge temples, hewn out of the natural rock and left open, of Karli, Adjantâ, Ellorâ, etc. (see the lower half of the plate, p. 418). Noticeable in Buddhist architecture are the numerous buildings containing relics (stûpas) which are of enormous size, especially in Ceylon (see the plate "Early Buddhist Temple Foundations," p. 500). The Mohammedan period erected magnificent mosques and palaces (Delhi Agra, etc.). Horse-shoe curves and the cupola are here the distinguishing features, while the decoration is marked by the taste and wealth of Arab art under the influence of Persian contact.

#### B. THE MOHAMMEDAN PERIOD OF INDIA (1001-1740)

(a) *The Religious Struggle between Islam and Hinduism (1001-1526)*. — Historians are accustomed to detail the events of the Mohammedan period of India according to the succession of dynasties. This long period, however, upon a more careful examination of its content, falls into two main divisions which end and begin respectively with the year 1526. The first of these periods is characterised by continual ferment and confusion. Hindus and Mohammedans are in a state of uninterrupted and fierce struggle, kingdoms are founded and overthrown, dynasties rise and fall. During the second period, however, a greater stability prevails; the opposition between the two peoples gradually disappears, and for more than three hundred years the kingdom is ruled by seventeen monarchs of one and the same family, that of Timur, in unbroken succession.

During the first period the supremacy passed through the hands of six "dynasties:" the House of Ghazni, 1001 to 1186, that of Ghôr, 1186 to 1206, the Mameluke rulers, 1206 to 1290, the House of Khilji, 1290 to 1321, the House of Tughlak, 1321 to 1412, the Seiads, 1416 to 1451, and the dynasty of Behlûl Lâdhî, 1451 to 1526. The first of these "dynasties" was confined to the Punjab, while that of the Ghôrs extended the Mohammedan supremacy over the whole lowland district of Northern India, the Mamelukes advanced to the Vindhya Mountains, and the second of the Khilji rulers governed the whole of India almost to the southern point. The Mohammedan power in India then reached its first period of greatest prosperity. Then began the downfall; the Tughlak rulers lost the Deccan and Bengal, and under the two last dynasties the frontiers of the kingdom often extended but a few miles beyond the walls of the Capital of Delhi.

This period of five hundred years was a time of severe oppression for the Hindus, a time of cruel murder and bitter struggle. As the lightning flash announces the on-coming storm, so also a warning movement preceded that convulsion which burst upon the unhappy land and the impulse to which was given by India herself. In the year 979 A. D. Jaipâl, the Prince of Lahore in the Punjab, considered that the growing power of his western neighbour, Nâsir ed-dîn Sabuktegîn, lord of Ghazni (Ghazna; 976-997) threatened danger to himself, and sought to reduce this prince

by means of a crusade to Afghanistan; this effort resulted in a friendly settlement. When, however, Jaipāl, supported by the princes of Delhi, Ajmir, and Kanauj, resumed the offensive in 988 he was utterly defeated at Langān. Turko-Afghan hordes marched through his country murdering and plundering; Sabuktegin established himself at the confluence of the Cabul and the Indus, and thus got possession of the obvious base for an invasion of India. He was succeeded by his son Ismail; he, however, was dethroned in 998 by his brother Mahmud Yamīn ed Dowlah and imprisoned in a fortress.

(a) *The House of Ghazni.* — Mahmud (998–1030) also known as Bhut Shikan (“The Iconoclast”) was the most important ruler of the Ghazni dynasty. From his Tartar father he had inherited tenacity and military prowess, while his mother, a Persian woman, had given him a feeling for higher civilization. He was a clever, energetic, and enterprising man, and also a zealous patron of science and art (cf. Vol. III, p. 344); magnificent mosques and palaces arose within his capital, and the greatest scholars of the time were the adornment of his brilliant court (the chronologist el-Berūni and the universal historian Abu Alī el-Hussein, known as ibn-Sīna or Avicenna) and poets (Firdusi, 1020–1032). He founded and richly endowed a university in Ghazni; education was also supported by a museum of natural history. Splendid foundations were created by him to provide for men of high intellectual gifts. Although military operations almost invariably kept him away from his country, no internal disturbance took place during the thirty-three years of his reign. He had no comprehensive political insight; his Indian operations were by no means undertaken with the object of conquering that magnificent country and furthering the development of its material resources, but were mere raids and forays for the purpose of capturing gold, jewels, and slaves. The Mohammedan world is inclined to consider Mahmud of Ghazni one of the greatest rulers of all time, and his co-religionists and contemporaries consider his military achievements as unequalled by those of any ruler; but this belief was founded not only upon his military reputation, but also upon his religious fanaticism which overthrew the idols of hostile peoples and destroyed the temples of the unbelievers. In this respect also they overestimated their hero and his intentions; the devastation of the Indian temples was undertaken by Mahmud chiefly with the object of plundering the enormous treasures which had been gathered there in the course of centuries.

The first years of the new ruler were occupied by struggles with his smaller neighbours. Then he turned his face to India. In the year 1001 Jaipāl was defeated for the second time and ended his life upon the funeral pyre, the Western Punjab with Lahore falling into the hands of the conqueror. This, Mahmud’s first Indian campaign, was succeeded by sixteen furious raids upon Kashmir (1013), Multān (1006), the Ganges, and even the southern point of the peninsula of Gujerat; especially rich was the booty gained by the plunder of the temples of Nagarcot, Tanesar (Thanés-wara, 1014), Somnāt (Pattana Somanātha, 1016–1017), and Mattra (Mathurā, 1018), while the boundaries of the Ghazni kingdom extended no further than the Western Punjab. Its extension upon the west and north was far greater, for Mahmud found time in the intervals of these campaigns to conquer the country of Ghōr (West Afghanistan), Transoxania, and Persia.

When Mahmud died in 1030 at the age of sixty-three he left a powerful king-

dom behind him (see the map, p. 430). His fourteen successors, however, were unable to preserve it unimpaired, and the quarrels of pretenders to the throne, internal revolts, and the attacks of enemies upon the west and north (Seljuks), resulted in eventual disruption. In 1150 Ghazni fell into the hands of the princes of Ghôr; its numerous and magnificent buildings were utterly devastated and only the tombs of Mahmud and of two other princes remained intact. The last two members of the Ghazna house, Mo'izz ed-dowlet Khusrou Shah, 1152-1160, and Khusrou Malik, 1160-1186, continued a doubtful existence in Lahore until this last remnant of the once powerful Ghazni kingdom was swept away by the princes of Ghôr.

(β) *The House of Ghôr.*—Since the date of its subjugation by Mahmud (1010), Western Afghanistan had played a subordinate part; but in 1163, when Ghiyas (Ghayâth) ed-dîn Mohammed ibn-Sâm ascended the throne, the power of Ghôr rapidly increased. The new ruler appointed his brother, Mo'izz ed-dîn Ghôri, as co-regent, an unusual proceeding in a Mohammedan State, and upon the death of Ghiyas (December 10, 1203), the regent became sole ruler.

In 1186 the Ghazni monarch, Khusrou Malik, was attacked, conquered, and finally imprisoned, being ultimately murdered with his sons in 1192. With their death, the dynasty of the Ghazni princes became extinct, and the Western Punjab, with its capital of Lahore, was added to the kingdom of Mo'izz ed-dîn. The acquisition of these territories advanced the boundaries of Ghôr to the immediate neighbourhood of the Rajput States; in particular, the kingdom reached the frontiers of Ajmir, which was governed by Pithora Ray (Prithvirâja II). This State became the object of the next operations of Mo'izz ed-dîn. A battle was fought at Thanésvara within the narrow space between the Desert and the Mountains and between the streams of the Sarasvati and the Jumna Taraîn, in which the Afghan cavalry was utterly defeated by the Indian warrior castes (1191). In the next year, however, Mo'izz ed-dîn conquered Ajmir and the Hindu States attached to that kingdom. Pithora Rây was captured in flight and slain. Shortly afterward Ajmir fell into the conqueror's hands, who displayed even greater cruelty than Mahmud of Ghazni and massacred the inhabitants or sold them into slavery.

He then advanced upon Delhi (more properly Dehli, pronounced Dichli). This town after its capture by his field marshal Kuṭb (Kotub or Kutub) ed-dîn in 1193, remained henceforward the chief centre of the Mohammedan power in Hindustan. In 1194 Mo'izz ed-dîn defeated the prince Jei Chendra, of Benares and Kanauj, thus extending his frontiers to the neighbourhood of Behar. In the following years he was occupied with his brother in Merv, Kharizm, and Herat, until the death of the latter left him the sole ruler of the great kingdom. In the mean time, Kuṭb ed-dîn and the second in command, the Khilji chieftain, Mohammed ibn-Bachtyâr, had subdued Behar (1194) and Upper Bengal (1195), Gwalior (1196), Gujerat and Oudh. The dynasty of Ghôr then attained the zenith of its power. A defeat suffered by Mo'izz ed-dîn in the course of an undertaking against Kharizm in 1204 broke up the western part of the empire as far as the Punjab. The Sultan, indeed, succeeded in suppressing the revolts of his governors in those provinces; but he himself fell a victim on the Indus in 1206 to the dagger of an Ishmaelite (assassin), or a man of the wild mountain tribe of the Ghakkas.

(γ) *The Mameluke Rulers* ("the Slave or First Tartar Dynasty").— Mo'izz ed-dîn Ghôri left no male descendants, and had made no arrangements for the succession, the immediate consequence being great disorder. One of his nephews, Ghiyas ed-din II Mahmud, was, indeed, set up as heir to the throne, but four of his governors in the chief provinces made themselves practically independent. In India the experienced general and governor, Kuṭb ed-din Ibbek (Ibak), immediately grasped the reins of government (26th of June), while civil war continued for nine years (1206–1215) in the other provinces of the empire, until their incorporation with Kharizm. When Kuṭb declared himself independent, Hindustan,<sup>1</sup> which had hitherto merely been a province of the kingdoms of Ghazni and Ghôr, became independent also. The new ruler had originally been a Turkish slave of Mo'izz ed-dîn. From a subordinate position he had gradually risen to become commander-in-chief and governor, a career that was typical of the rise of many rulers in succeeding times. Though many of these ascended the throne by hereditary right, yet the whole of this line of rulers has received the common name of the "Slave Dynasty" (1206–1290).

Kuṭb had enjoyed his power for only four years, when an accident at polo caused his death in Lahore in 1210. His character has been thus well described by a Mohammedan historian: "The kingdom was full of the honourable and cleansed from the rebellious; his benevolence was as unceasing as his bloodshed." His religious zeal is evidenced at the present day by the splendid mosques and the proud minaret in old Delhi, which still bears his name (Kutub Minar). His son, Aram Shâh, was a weak-minded prince, and in the very year of his accession (1210) was defeated and apparently murdered by the revolted Shams ed-din Altamsh (or Altmysh, also Îltamish; properly Altytmysh). This latter personality had also been a Turkish slave, had found favour with Kuṭb, who had given him his daughter, Malikah Jihân, in marriage, and entrusted him with the governorship of Budaun. Altamsh did not immediately get the whole country into his power; a brother-in-law of Kuṭb had made himself independent in Sindh, Multan, Bhakar and Sivistan. The Punjab also revolted from him, and in Behar and Bengal in 1219 the governor, Hasan ed-din, of the family of the Khilji, laid claim to the territory. Before Altamsh was able to turn upon him, the invading armies of Genghis Khan burst upon Western Hindustan. This conqueror had utterly devastated the kingdom of Kharizm, and when the fugitive monarch, Jelal ed-din Mankburni (Mingburni), sought shelter in the Punjab, he was pursued by Genghis Khan, who devastated the provinces of Multan, Lahore, Peshawar and Malikipur (1221–1222; cf. p. 172). The fugitive prince of Kharizm had begged Altamsh for assistance; the latter, however, was careful not to irritate the Mongol bands, and remained inactive in Delhi, until at length the thunder clouds rolled away as rapidly as they had come. Thereupon Altamsh subjugated Bengal and Behar in 1225. In 1228 he got the Punjab and Sindh into his power, and also subdued the kingdom of Mâlva in the south after a long struggle (1226–1232; the destruction of the temples of Bhilsa, Ujain and Gwalior). Those Hindu States which had not appeared against him in open hostility were mildly treated and made dependent upon the kingdom under certain conditions. On the death of Altamsh (28th of

<sup>1</sup> Hindostan (Hindustan) includes in its narrower sense the district watered by the Ganges and Jumna, in its wider sense the whole of Mohammedan India.

April, 1236), his kingdom extended from the Indus to the Brahmaputra, and from the Himalaya to the Vindhya Mountains. His government was well organised, a spirit of vigorous intellectualism prevailed in his court, and the ruins of Ra' Pithira (old Delhi) are evidence not only of the wealth but also of the artistic taste of this highly gifted monarch.

A time of disturbance followed. In the next eleven years no less than five descendants of Altamsh sat upon the throne of Delhi. All the Mameluke princes were threatened by danger on three sides; from the Hindus, who were the more reluctant to submit to a foreign yoke in proportion to the pressure laid upon them by the fanatical Mohammedans, from the generals and governors who were attracted by the success which had attended the rising of the first Mameluke rulers, and from the Mongols, whose devastating campaigns were continually and rapidly repeated after the first advance of Gengis Khan. The immediate successor of Altamsh was his second son, Fêrôz Shâh Rukn ed-dîn, whose government (1236) came to an end after seven months in a palace revolution. His place was taken by his sister, Razîyah (Rezia, Rasî'a) Begum, a woman admirably fitted for supreme power, and the only Mohammedan queen who reigned upon the throne of Hindostan (1236-1239). Her powerful and masculine intellect, her strength and sense of justice, her spirit and courage, enabled her to fulfil the heavy responsibilities of her position; nor did she shrink from riding into battle upon her war elephant in male clothing. However, as says the historian, Mohammed Kâsim Hindûshâh Firishtah (about 1600), her only fault was that she was a woman. Her love for an Abyssinian slave made her unpopular among the people, and a series of revolts began, which ended in her downfall. The country was further disturbed both by internal dissensions and by Mongol invasions during the short reigns of the two following rulers (Bahram Shâh, 21st of April, 1240, and Mas'ûd, 1241-1246). Protection from these dangers was not forthcoming until the reign of the serious and upright Nasir-ed-dîn Mahmud Shâh (1246-1266), the sixth son of Altamsh, who left almost the entire business of government to his brother-in-law and father-in-law, the Grand Vizier Ghiyas ed-dîn Balbân. The Mongols were defeated in 1247. They had in the mean while overthrown the Abbassid kingdom of Bagdad (see p. 176). Hulagu confined his power to Persia, and expressed his friendly intentions by sending an embassy to the court of Delhi. The spirit of those times and the character of the all-powerful grand vizier can be inferred from the fact that on the entrance of that embassy the city gate of Delhi was decorated with the corpses of Hindu rebels. Of these there was indeed no lack. Hardly had a revolt been suppressed in one quarter than new disturbances broke out elsewhere, and it became necessary to crush the Hindus with measures of the sternest repression in the Duab, in Bandelkand, in Mewâr, Mâlwa, Utsh, Karrak, and Manikpur successively.

On the 18th of February, 1266, Mahmud died, and was succeeded by the grand vizier Ghiyâs ed-dîn Balbân, who had previously been the virtual ruler of the empire. He, too, had begun his career as a Turkoman slave. He inflicted severe punishment upon the bands of rebels in the northeast and upon the Hindus of Mewat, Behar, and Bengal, and is said to have slaughtered one hundred thousand men during his conquest of the Rajputs of Mewâr. Among military operations against foreign enemies, we must mention an invasion of the Mongols into the Punjab. They were defeated in two battles by the sultan's son, Mohammed Khan, who was, however, himself slain. Balbân was especially distinguished for his

fanaticism; and if Delhi under his rule gained a reputation as a centre of art and science, this is due not so much to the ruler as to the disturbances of the period, when every intellectually gifted man fled to the place of greatest security. The capital thus became a refuge for numbers of deposed princes and high dignitaries, and for a long time streets and squares were named after countries from which those rulers had been expelled. Balbân died at the age of eighty in 1287. He was succeeded by his grandson, Mo'izz ed-dîn Kei Kobâd, a youth of eighteen years of age, who had inherited his father's sternness and cruelty without his strength. He plunged into a life of dissipation and soon became a tool in the hands of his grand vizier, Nizâm ed-dîn. In 1290 he regained his freedom of action by poisoning the vizier, but shortly afterward was himself murdered in his palace by the new vizier, Jelal ed-dîn.

(δ) *The House of Khilji (the Second Tartar Dynasty).* — Even under the rule of Balbân a transformation in Mameluke manners had taken place. This monarch had abandoned the guiding principle of his predecessors of placing upstarts from among the slaves in the most important offices, and had given them to men of distinguished families of Afghan or Turko-Tartar origin. Of these families one of the most important had long been that of the Khilji (Chalji), which had been settled partly in the district at the sources of the Amu Daria during the tenth century, while other parts had advanced to Afghanistan. There, while retaining their Turkish dialect, they had embraced the Mohammedan belief, and gradually adopted the Turkish civilization.

Their tribal chieftain, Ielal ed-dîn Khilji, was seventy years of age when the above-mentioned palace revolution gave him the supreme power in Delhi in the year 1290. His dynastic title was Fêrôz (Fîrûs) Shâh II. To secure his position he put out of the way the son of Kei Kobâd, by name Gayômarth. In other respects, however, he was a man of mild character, well disposed to all men, moderate to weakness, even against his foes, a friend to the learned classes and the priests. He was soon forced to turn his attention to the Moguls (that is, Mongols). These he successfully overthrew in person in the Punjab (1292), while his nephew, Alâ ed-dîn Mohammed, whom he had appointed governor of the Duab between the Jumna and the Ganges, suppressed a revolt in Bundelkand and Malwa (1293). Alâ ed-dîn then advanced, on his own responsibility, in 1294, with six thousand horses upon a mad raid through the pathless mountains and forests of the Vindhya Mountains, seven hundred miles southward. On the way he plundered the temple of Somnât (p. 420). But the greatest booty he found in the well-watched fortress of Devagiri (Daulatabad), which he captured by treachery. Before the southern princes were able to collect their troops, he had returned to his own province by another road. Under the pretext of asking pardon from his uncle for his independent action, he enticed the aged Fêrôz Shâh into his own province, and there had him assassinated (July 19, 1295).

This deed is entirely characteristic of Alâ ed-dîn Mohammed Shâh I, who seized the government in 1296, after expelling his cousin, Ibrahim Shâh I, the lawful successor. Cruel, false, and treacherous, untroubled by the pricks of conscience, with a ruthless tenacity which made him secure of his object in every undertaking, he was an entire contrast to his benevolent uncle. To his subjects he was invariably a terror, although he won general popularity by his splendid

court, his liberality, and good order. Conspiracies and revolts of relations, viziers and Hindus, continued throughout the twenty years of his rule, but were always suppressed with fearful severity. The kingdom was also disturbed by three Mogul invasions. The first of these was vigorously repulsed in 1297, while the other two (1298 and 1303) created but a small impression, and were the last of their kind for a long period. It was not until 1310 that Mohammed Shâh was able to realise the desires he had formed upon his incursion to Devagiri of extending his power upon the south.

The history of the Deccan during the first Mohammedan century of North India is occupied by struggles between the Rajputs (p. 376) and Dravidians, by the foundation and disappearance of Aryan-Dravidian kingdoms in the Central Deccan, such as the Southern Mahratta kingdom, that of the Eastern Chalukya in Kaliṅga, of the Western Chalukya in the Northern Konkan. To these must be added from the thirteenth century the kingdoms of Gaupati and Bellala, further to the south that of Mysore, and the earlier kingdoms of the Pāṇḍya, Chola, and Chera (cf. above, p. 387).

Mohammed Shâh I entrusted the conquest of the Deccan to his favourite, Malik Kasur, a former Hindu slave, who had renounced his religion, embraced Mohammedanism, and risen to the highest offices in the kingdom. He overran the Mahratta country in a rapid series of victories; the capital of the Bellala, Dvârasamudra, was captured and plundered (1311); the kingdoms of Chola and Pāṇḍya were subjugated; and in two years the whole of India, as far as Cape Comorin, was subject to the rule of Delhi. The conquered princes became tributary vassals, and only when they revolted or declined to pay tribute (Devagiri) were they deposed and their territory incorporated with the empire.

This brilliant success in no way diminished the number of revolts which were called into existence by the universal unpopularity of the sultan and his favourite. Alî ed-dîn Mohammed Shâh contracted the vice of drunkenness, and after suffering from dropsy died on the 19th of December, 1316, perhaps from poison given him by Kasur. The latter was, however, overthrown in the same year, and after the eldest son, Shihâb ed-dîn ('Omar Shâh), had reigned for a short period, Mubârek Shâh, the third son of Alâ ed-dîn, ascended the throne on the 21st of March, 1317, and immediately secured his position by blinding his brother. Some statesmanlike regulations aroused general hopes of a good reign, but shortly afterward the young and voluptuous sultan left all state business to a Hindu renegade from the despised Parvari caste, by name Nâsir ed-dîn Khusrou Khan. On the 24th of March, 1321, the sultan, with all the members of his family, was murdered by his emir, who became sultan of Delhi, under the title of Khusrou Shâh. Unpopular as he had been while grand vizier, the animosity against him was raised to the highest point by the shameless outrages upon Hindu and Mohammedan religious feeling which he committed in giving the wives of the murdered sultan to his favourites in marriage; in setting up images of the Hindu gods in the mosques, and so forth. Failing a legitimate heir to the throne, the movement was headed by the Mohammedan governor of the Punjab, Ghiyis (Ghayâth) ed-dîn Tughlak; he attacked and slew the unpopular ruler at Delhi, after a reign of little more than four months.

The supremacy of the Khilji had lasted only one generation; and of this period of thirty years, two-thirds belong to the reign of Mohammed Shâh I. Under

his strong government the kingdom had undergone a great transformation. The hereditary enemies of the country, the Moguls, had been driven back for a long period, and after their conversion to Mohammedanism, had retired to the Asiatic highlands. Many of those who had remained behind embraced Mohammedanism and took service in the army, though in 1311 they were all put to death in consequence of a conspiracy. The Khilji showed themselves largely tolerant in religious questions, and the frequent revolts of the Hindus were inspired rather by national hatred than by religious oppression. Gradually the points of difference between the peoples began to disappear. The Mohammedans adopted many Hindu customs, and the latter also began to conform to those of the ruling race, as is proved by the case of the Hindu favourites, whose influence was constantly an important factor in the Indian history of that period. From this gradual fusion arose the commercial dialect of the country, Hindustani, or Urdu (the language of the camp). The different elements composing the vocabulary of this dialect (Prâkrit of the Duab, Persian, Turco-Tartar, etc.), indicate the extent of the racial fusion which then took place.

Under Mohammed Shâh I, the kingdom had attained its greatest extent abroad (see the map, p. 430). A decree issued in Delhi was valid as far as the southernmost point of India, and only a few Rajput princes continued to maintain their independence. The acquisitions, however, which had been made thus rapidly were never united by any firm bond of union, and even during Mohammed's time that process of disruption began which made terribly rapid progress under the following dynasties.

(e) *The House of Tughlak (the third Tartar Dynasty)*. — Ghiyas ed-din Tughlak I, the son of a Turcoman slave belonging to the sultan Balbân (p. 423) and a Hindu mother, had risen by his own merits to the position of a governor in the Punjab, and had shown himself no less capable during the short period of his sultanate (1321–1325). He directed his attention to the improvement of the country, to the security of the western frontier, to the recovery of those parts of the kingdom which had fallen away (Varangel), and to the suppression of rebels (Harasimha of Tirhat). Upon his return from Tirhat he and his eldest son were killed by the collapse of a pavilion erected for a festival, a catastrophe which had perhaps been brought about by his second son, Fakhr ed-din Junah Khan, who succeeded him in the government as Mohammed II, (ibn) Tughlak (1325–1351). His government was marked by the infinite misery which he brought upon the country. He was a man of high intellectual capacity and had enjoyed an excellent education, was learned as few were, a distinguished author and a patron of learning; at the same time he carefully observed all the precepts of his religion, was liberal to extravagance and founded hospitals, almshouses, and other benevolent institutions. But all these good qualities were entirely overshadowed by the madness, as of the Cæsars, which characterised his every political action. His whimsicality approached the point of insanity. He led a huge army against the Moguls with the object of inducing them to buy his retreat for an enormous sum, before swords had been so much as drawn on either side (1327); one hundred thousand men were sent to China, across the Tibetan passes of the Himalayas, which were utterly impassable for an army on this scale; they perished almost to the last man in ice and snow (1337; cf. p. 345). A third army was sent to Persia, but disbanded before

operations began, and the soldiers dispersed plundering over their own country. In 1339 a decree was suddenly issued to the effect that all the inhabitants of Delhi should emigrate to Devagiri, which was henceforward called Daulatabad (p. 424); twice they were allowed to return and twice was the emigration decree reissued, on one occasion during a fearful famine which carried off many thousands. The obligatory use of copper currency (instead of silver) brought financial disaster upon the country. At the monarch's pleasure man-hunting parties were organised throughout whole provinces, his own subjects were the quarry, and they were killed like animals. The taxes were raised to an impossible extent and extorted with such cruelty that large masses of the peasants fled to the forests and formed robber bands. The natural result was that revolts broke out in every direction against this mad ruler, and that the provinces strove their utmost to secure their independence. The empire, which had embraced almost the whole of India upon the accession of Mohammed Tughlak, was diminished at the time of his death, in the fever swamps of Sindh, by the loss of Bengal (since 1338), the coasts of Coromandel Devagiri, Gujerat, Sindh, and all the southern provinces (since 1347); of twenty-three provinces scarce half were left to him. Mohammed ibn Tughlak "left behind him the reputation of one of the most accomplished princes and furious tyrants who have ever adorned or disgraced humanity" (Mountstuart Elphinstone).

The damage which this mad ruler had inflicted upon the empire could not be repaired even by the upright government of his successor Fêrôz (Firuz) Shâh III, who was born about 1300 and reigned from 1351 to 1388. His attempts to recover the revolted provinces ended with the acquirement of only a nominal supremacy. The country was, however, largely benefited by his domestic policy, and he enabled the kingdom to recover its prosperity by a sensible and upright system of taxation, by the honesty of his judicial administration, by his regulations for military service, for which purpose he earmarked the revenue of certain districts (Jaagir), by the completion of useful public works such as irrigation, channels, reservoirs, dams, and canals (for instance, the great Jumna canal, which the English have recently restored in part), and by the foundation of schools, hospitals, caravanserais, etc.

The last five representatives of the House of Tughlak succeeded one another in rapid succession after the death of Fêrôz. The period from 1388 to 1394 was a time of incessant civil war and ultimately the once powerful kingdom was reduced to a few districts in the immediate neighbourhood of Delhi. At this juncture the Moguls made an invasion in larger numbers and with greater ferocity than they had ever previously attempted. They were no longer the undisciplined hordes of Genghis Khan, but the well-drilled bands of Timur (p. 184). While the last of the Tughlak princes, Mahmud Shâh II, found a safe refuge in Gujerat, the grey-haired conqueror advanced to Delhi, which opened its gates to him upon a promise of protection (December 18, 1398). But one of those "misunderstandings" which often occurred during the campaigns of Timur resulted in a fearful massacre of the population. The conqueror laden with booty returned to Samarkand in 1399, and Mahmud Tughlak then reappeared from his hiding-place. With his death, which closed an inglorious reign over an empire which was almost non-existent (February, 1412), the dynasty of Tughlak became extinct.

(ζ) *The Sciads.* — After the Afghan Doulat Khan Lôdi had ruled for a short period (1413-1414), Khizr Khan, who had formerly been a governor and then a revolted emir of Multân, seized what was left of Hindostan. His own province speedily revolted, and his attempts (he died May 20, 1421), as those of his three descendants, Mubârek Shâh II, who ruled till January 28, 1435, Mohammed Shâh IV, until 1445, and 'Alim Shâh, to recover the Punjab proved fruitless, and their dominion was practically confined to the town of Delhi. These rulers of Shiite belief and apparently of Alidish origin are collectively known as the dynasty of the Sciads (1414-1451). Under 'Alim Shâh the boundaries of the empire were distant about an English mile from the capital, and at no time did they extend further than a distance of twelve miles.

(η) *The House of Lôdi.* — In the year 1451 Bahlûl Lôdi, who ruled over the Punjab in Lahore, took possession of the town of Delhi. He died in 1488, but his son Nizâm Iskander (Sekander) II, who died in 1517, succeeded in extending the boundaries of the kingdom westward beyond Lahore and eastward beyond Benares and the Bundelkand. However, under the grandson of Bahlûl, Ibrâhîm II (1517-1526), a proud and tyrannical ruler, serious revolts broke out. The eastern districts were entirely separated from the kingdom, and his governors in the Punjab rose against him and called in his powerful neighbour Baber from Câbul to their assistance. These shocks put an end to the feeble rule of the Lôdi princes (p. 429) and a new period of brilliant prosperity then began for Hindostan.

(θ) *Political Changes in the South of India since 1347.* — Mohammed ibn Tughlak had undergone the mortification of seeing the southern province with its capital of Daulatabad secede during his lifetime, in spite of the partiality he had shown for it. The Viceroy of the district, Hasan Gangu, a Shiite Afghan, declared himself independent in 1347, transferred the capital to Kulbarga on the west of Haidarabad, and became the founder of the Bâhmanî dynasty. His frontiers extended from Berar to Kistna and from the Sea of Bengal to that of Arabia; to this empire were added Konkan, Khandesh, and Gujerat by his great-grandson, Alâ ed-dîn Ahmed Shâh II (1435-1457). The Bâhmanî dynasty attained its greatest power at the outset of the reign of Mahmud Shâh II (1482-1518), who ruled over the whole of the Deccan north of Mysore. This rapid rise was followed by an equally rapid fall; by the revolts of the provincial governors, the north was broken into five small Mohammedan States between 1484 and 1512, while in the south the kingdom of Bijayanagar rapidly rose to high prosperity.

Of those revolted governors the first was Fattah Ullah 'Imâd (Imad), Shâh of Berâr, a converted Hindu of Bijayanagar; his empire, which was founded in 1484 (capital town, Ellitshpur), continued until 1568 when it was absorbed by Akbar. In rapid succession followed the governors 'Âdil Shâh of Bijapûr, whose empire lasted from 1489 to 1686, and Nizâm Shâh of Ahmednazar, from 1490 to 1595. Two years later the governor Barîd Shâh of Bedâr made himself independent (his dynasty lasting until 1609), as did finally in 1512 Kutb Shâh of Golconda (Haidarabad; his dynasty lasting until 1687). None of these petty Mohammedan States was able to secure predominance, and after a varying period of prosperity all were reabsorbed into that Delhi kingdom from which they had originated.

In this rivalry of the Mohammedan Deccan States the greatest success was attained by a Hindu State in the south, the kingdom of Bijayanagar, which was founded in 1326 by two fugitives from the low caste tribe of the Kurumba (shepherds), though it was unable to attain any considerable importance in view of the overwhelming strength of its Mohammedan neighbours on the north. The first dynasty of Bijayanagar became extinct in 1479; the second, a side branch of Narasiṅha, founded about 1450, rapidly rose to prosperity. The Chola had long since lost their former importance and the power of the Pāṇḍya (p. 387) was then broken. At the end of the fifteenth century Bijayanagar was indisputably the predominant Hindu power in the south of the peninsula; the petty Hindu States from Kattak to Travancore were dependent upon this kingdom. At the beginning of the sixteenth century it was in possession of the whole of the east coast (see the map, p. 430). The importance of this great Hindu State and of its artistic rulers is evidenced by the magnificent ruins which are now buried in the jungles of Bellary. Bijayanagar was under no apprehension of attack from the Mohammedan States in the north, which held one another in check until the middle of the sixteenth century; when, however, they joined in common action against the Hindu State this latter inevitably collapsed.

(b) *The Mogul Empire of the Timurites until 'Ālamgīr II (1526-1759).*—  
 (a) *Baber.*—The series of the Mogul emperors begins with one of the most brilliant and attractive figures in the whole of Asiatic history, the sultan Baber (Zehīr ed-din Mohammed Babur or Babur II<sup>1</sup>) "The Lion." He was the son of Omar, four generations removed from Timur in direct descent, and one of the small princes in the magnificent mountain country of Ferghana (in the upper Oxus district), his mother being a Mongolian woman; on the death of his father (1493) he found himself surrounded by danger on every side. In 1494 he took up the reins of government in person, and the following ten years of his life are full of battles and dangers, bold exploits and severe defeats, brilliant successes and heavy losses; now he was on the throne of a great kingdom, and again an almost abandoned fugitive in the inaccessible gorges of his native mountains; his adventures during that period would of themselves suffice to make up the most eventful life that man could possibly desire. At the end of 1504 he was obliged to yield before the superior power of the Uzbeks (p. 186), and giving up all hope of territory from that side of the Hindu Kush he fled across the mountains to Afghanistan. Two months later (1505) he had taken Cābul which remained henceforward in his possession, but even then his life was a constant series of desperate efforts and remarkable changes of fortune. At the same time his personality is most

human, and for that reason most attractive; he was a man of pure and deep feeling, his love for his mother and his relations was as remarkable as his kindness to his conquered foes. The depth and the warmth of these sympathies he has expressed with every elaboration of style in Turkish and Persian songs, and his "Memoirs," written in East Turkish (Jagatai), reflect the character of that extraordinary man and certainly form one of the most remarkable works in the literary history of any nation.

The defeats which Baber had suffered in Transoxania and Bactria induced him to turn his gaze to India; he was able to claim the Punjab as the heir of Timur, and the invitation of Doulat Khan, the rebel Lōdī governor in Lahore, gave him both a pretext and a motive for attacking the neighbouring kingdom in 1524; he found no difficulty in overcoming such resistance as was offered in the Punjab. He was especially superior to his opponents in artillery, and crossed the Sutlej at the end of 1525. At Panipat (p. 421) between the Sutlej and the Jumna, ten miles north of Delhi, Ibrahim Lōdī took up a position on the 21st of April, 1526, with a force whose numbers are reported as 100,000 soldiers and 1,000 war elephants to oppose the 25,000 warriors of Baber, and lost both his throne and his life. Delhi (April 24) and Agra, which had been the residence of the Hindostan Afghans from 1503 to 1504, immediately fell into the hands of the conqueror, who divided the rich imperial treasures among his warriors, including the famous diamond, the Kohinoor ("the mountain of light"); this jewel, which had previously been taken from the Khilji Mohammed Shāh, now fell to the lot of Humāyūn, the son of Baber, and has been the glory of the English Crown jewels since 1850. The victory of Panipat gave Baber possession of North India to the northeast of Delhi and also the small strip of land along the Jumna as far as Agra. Shortly before the end of 1526 he was also master of the district south of the Jumna as far as Gwalior. He was now opposed by the Hindus. The princes of Rajputana led by Rana Sānka, the ruler of Chitor, Mewar, and Ajmir, marched against him with a powerful army to a point seven miles distant from the west of Agra. A battle was fought at Fattepur Sikri, or Kanwa, on the 16th of March, 1527, and the Rajputs were utterly defeated; Mewar fell into the hands of the conqueror who immediately proceeded to reorganise the administration of his new acquisitions. How the Rajputs could fight with the courage of despair, Baber was to learn in the following year when he besieged one of the princes who had escaped from the battle of Sikri in his fortress of Chandéri. As his troops were storming the walls on the second day, the enemies set fire to the town with their wives and children after the manner of the old Kshatriyas, and then rushed upon the foe with drawn swords; the body-guard of the prince killed one another, each man struggling for the first blow. In 1529, Mahmud Lōdī, a brother of Ibrāhim, was expelled from Oudh, the southern part of Behar on the right bank of the Ganges was captured, and the Rāja Nāsir ed-dīn Nasrat Shah of Bengal was forced to lay down his arms.

In three years Baber had conquered in a series of brilliant victories the whole of the North Indian Plains as far as Bengal (see the historical map, "India.") Now, however, his health, which had been undermined by the extraordinary privations of his life, began to fail. On the 26th of December, 1530, Baber the Lion died before the age of fifty; his last words to his son and heir Humāyūn were, "Do not kill your brothers, but watch over them tenderly."

(3) *Humâyûn and the Sûri Dynasty.*— Baber was succeeded by his son Nâsir ed-din Mohammed Humâyûn, who was born in 1507; he, however, had not inherited either his father's iron will or his pertinacity, much less his firm principles, his high ambition, his warmth of heart, and his unchanging fidelity. Baber had intended Humâyûn to become ruler of the kingdom, and had destined the governorship of Cābul and Kandahar for his second son, Kāmran. Humâyûn considered that his brother would be more closely united to himself if he also received the governorship of the Punjab. But by thus renouncing his native territory he also lost command of the stout warrior Afghan tribes, thereby considerably weakening his military power in India, and this moreover at a time when enemies rose against him on every side, after the disappearance of the powerful figure of Baber. His first duty was to crush the revolts raised by the generals of the last Afghan rulers, and then to punish Bahādur Shāh, the Rāja of Gujerat, for his intrigues. Bahādur was expelled by the emperor in person; hardly, however, had he returned to his capital to deal with an outbreak in Bengal when the troops he had left in Gujerat were driven out and he was even obliged to renounce his claims to Mālwa.

Meanwhile upon the east, in Bengal, a heavy storm was threatening the Mogul power. Ferid Khan, a Mohammedan of high talent, who apparently belonged to the Afghan royal family of the Sûri, had assumed the leadership of all the enemies of the Mogul rule and was speedily able to secure the possession of Bihar. Humâyûn was forced to besiege the strong fortress of Chunar, an operation which detained him for many months at Benares; meanwhile Bengal was conquered by his cunning opponent, who had in the meantime adopted the title of Shîr ("Lion") Shāh. He then defeated the descendant of Timur in two battles in 1539 (Chonsa) and 1540 (near Kanauj); after these misfortunes Humâyûn was obliged to abandon his kingdom and take refuge with his brother Kāmran at Lahore. Here, however, his position was equally unstable; Kāmran was terror-stricken at the unexpected success of Shîr Shāh, with whom he concluded peace, the price being the cession of the Punjab, while the deposed emperor was forced to spend a period of disappointment, terrible privation, and constant flight in Rajputana; on the 14th of October, 1542, his son Akbar was born to him in the desert of Thar at the time of his greatest need. In 1543 he turned to Kandahar. Shîr Shāh, who had been master of the whole Ganges district after his decisive victories over Humâyûn, now turned his attention to the improvement of domestic organisation, and did his best to foster the progress of agriculture, to provide for public peace and security, to improve communication by making long roads, and to reorganise the bureaucracy, the taxation system, and the administration of justice. He met with a violent death on the 22d of May, 1545, during the siege of a hostile fortress.

His successor, Selim (Islām) Shāh, attempted to continue his father's administration; his short reign (1545–1553) was largely occupied with the suppression of different revolts. Under the government of his incompetent or vicious successors, Feroz (1553), Mohammed (1553), Ibrahim (1554), and Secander (1555), the empire rapidly fell to pieces. Disturbances broke out in every quarter, and the way was opened for the return of Humâyûn. He defeated two armies at Sirhind, and returned to Delhi as king in the summer of 1555. However, almost exactly six months after his re-entry he died from an injury received by a fall (January, 1556).

(7) *Akbar*. — The young Abu 'l-fath Jelâl ed-dîn Akbar, who ascended the throne of Hindostan on the 23d of February, 1556, had been entrusted by his father to the care of the faithful Turcoman Bairam Khan, whose bold action had in the meantime inflicted a total defeat upon the armies of the Lôdîs, under Hemu on the 5th of November, 1556, in a second battle of Panîpat (p. 429), who had in the meantime advanced beyond Delhi and Agra. State administration was for the moment carried on also by Bairam, who made himself unpopular by his jealousy for the prestige of his title of Khan Babu (royal father). However during a hunting expedition Akbar suddenly returned to the capital, and issued a decree to the effect that he would henceforward take all State business under his own control (1560). Bairam in surprise attempted a revolt, but failing adherents was obliged to submit to the young emperor, who received him with all honour. In the same year Bairam was murdered by one of his enemies when on the point of making a pilgrimage to Mecca.

Akbar was then obliged to confront the task of uniting into one powerful kingdom the country of India, which had been devastated by centuries of war and was broken into hundreds of petty principalities. Before his time every conqueror had been the ruler of a foreign land whence he had drawn support and strength; Akbar at the age of eighteen was obliged to rely upon himself alone. The character of Baber had been inherited by his grandson; Akbar possessed his grandfather's intellectual powers, his iron will, and his great heart with all its warm benevolence. The son of a fugitive emperor, born in the desert, brought up in nominal confinement, he had known the bitter side of life from his youth up. Fortune had given him a powerful frame, which he trained to support the extremities of exertion. Physical exercise was with him a passion; he was devoted to the chase, and especially to the fierce excitement of catching the wild horse or elephant or slaying the dangerous tiger. On one occasion, when it was necessary to dissuade the Râja of Jotpur to abandon his intention of forcing the widow of his deceased son to mount the funeral pyre, Akbar rode two hundred and twenty miles in two days. In battle he displayed the utmost bravery. He led his troops in person during the dangerous part of a campaign, leaving to his generals the lighter task of finishing the war. In every victory he displayed humanity to the conquered, and decisively opposed any exhibition of cruelty. Free from all those prejudices which separate society and create dissension, tolerant to men of other beliefs, impartial to men of other races, whether Hindu or Dravidian, he was a man obviously marked out to weld the conflicting elements of his kingdom into a strong and prosperous whole.

In all seriousness he devoted himself to the work of peace. Moderate in all pleasures, needing but little sleep, and accustomed to divide his time with the utmost accuracy, he found leisure to devote himself to science and art after the completion of his State duties. The famous personages and scholars who adorned his capital were at the same time his friends; every Thursday evening a circle of these was collected for intellectual conversation and philosophical discussion. His closest friends were two highly talented brothers, Shekh Feizî and Abû'l Fazl, the sons of a learned free-thinker. The elder of these was a famous scholar in Hindu literature; with his help, and under his direction, Akbar had the most important of the Sanscrit works translated into Persian. Fazl, on the other hand, who was an especially close friend of Akbar, was a general, a statesman, and an organiser, and to his activity Akbar's kingdom chiefly owed the solidarity of its internal organisation.

For a long period in India authority of any description had been unknown, and the years of Humâyûn's exile had proved unfavourable to the introduction of severer measures among the Moguls. Under Akbar, also, many generals, after he had reduced a revolted province to order, attempted to keep back the taxes payable to Delhi and to claim the district for themselves; instances were Oudh, Mâlwa, Bengal, etc. Some were overthrown with a strong hand, others the emperor was able to bring over to himself by clemency. His own brother, Mohammed Hakîm, who attempted to occupy the Punjab in 1566, was expelled from the country. Akbar won over the Rajput princes by a display of kindness and concession. He himself married the two princesses of Amber and Marwar, and his eldest son, Selîm Jehângîr, had a princess of Amber to wife. The princes of those petty States who were treated by the powerful emperor as equals, gladly forgot that their ruler was an alien both by his creed and his descent, and considered it an honour to occupy high positions in Akbar's army. Of these one only, the Prince of Chitor, maintained an attitude of hostility. His capital was besieged by Akbar in 1567, and the bold commander was shot by the emperor himself upon the walls; after the old Rajput custom the garrison first killed their wives and children and then themselves, but the prince, who had fled, still declined to submit. At a later period during Akbar's lifetime the son of this expelled monarch succeeded in founding a new State in Udipur, whose rulers still pride themselves upon the fact that their genealogy remains unstained by any trace of connection with the emperors of Delhi.

The remnants of the last Mohammedan dynasty offered a yet more vigorous resistance to Akbar than the Rajputs. In 1559 these "Afghans" were expelled from Oudh and Mâlwa. In Gujerat various pretenders to the throne were quarrelling. One of these called in Akbar to his help, who expelled the combatants collectively and reconstituted the country as a province in the years 1572-1573; in 1581 fresh disturbances broke out, and an indecisive struggle was continued for a long period, until peace was secured by the death of Mozaffar III Habib (1593). Similarly much time elapsed before Bengal was definitely conquered; with the exception of the son of Sulaimân Khan Karârâni, Dâvûd Shâh, who had surrendered in 1576, neither the Mogul generals nor the Afghans were definitely pacified until 1592. Orissa also fell into the power of the ruler of Delhi. In Sindh military adventurers, stragglers left from the Afghan supremacy, also continued their intrigues; they were subdued in 1592, and pacified by the gift of high positions within the empire. A short campaign against Prince Yûsuf of Kashmir belonging to the Chak dynasty led in 1586-1587 to the incorporation of that province, which now became a favourite summer residence of the Mogul emperors. A harder struggle was fought with the tribes of the almost inaccessible Kafirstan (the Yusufsai); even at the present day the configuration of their district has enabled them to maintain their independence. The last conquest in the extreme west was Kandahar, which had been already occupied by Humâyûn, but had been retaken by the Persians in the first years of Akbar's reign; the emperor recovered this district in 1593-1594.

Thus the kingdom of Akbar extended from Afghanistan to Orissa and from the Himalaya to the Narbada (see the map, p. 430). Beyond this latter boundary the confusion was no less than it had previously been in the north. Akbar was called in by one of the disputants, and his army quickly got possession of

Berar, with its capital, Ellichpur; however, an unexpected resistance was encountered before Ahmednagar, the central point of the Mohammedan States of the Deccan. A woman of unusually strong character, by name Chând Bibî, who was regent for her great-nephew Bahâdur Nizâm Shâh during his minority, united several of the disputing princes before the approaching danger; when besieged in her capital, she succeeded in inspiring her adherents with so fierce a spirit of resistance that the Moguls were glad to conclude peace on the condition that the claims of Chând Bibî to Berar should be given up (1596). Fresh disturbances led to a renewed invasion of the Moguls. After an indecisive battle Akbar himself took command of his troops (1599), but Ahmednagar resisted until Chând Bibî was murdered by her own troops in 1600. Akbar now set up a nominal ruler, Mortedâ II, whose dynasty came to an end in 1637 under Shâh Jehân.

The last years of Akbar's life were troubled by severe domestic misfortunes and by his sorrow at the death of his friend Abû'l Fazl. The Prince Selim (Jehângir), who had been appointed his successor, was addicted to the pleasures of drink and opium, and was a passionate character and a deadly enemy of his father's chief counsellor, Fazl. Akbar had appointed his son as Viceroy of Ajmir; that, however, proved insufficient to satisfy his ambition. He aimed at the possession of the imperial throne, took possession of the State treasury, assumed the title of king, and occupied Oudh and Behar. Akbar, however, treated him kindly, and Selim made a show of submission, but revenged himself by a cowardly stroke; he incited one of the petty princes in Bundelkand to murder Abû'l Fazl by treachery (1602). This calamity was followed by the loss of Daniâl, the third prince, who succumbed to an attack of dropsy on the 8th of April, 1605, a disease which had already carried off his elder brother Murâd in 1599. By these heavy blows of adversity the emperor's powers were broken. After a long illness his condition rapidly grew worse, and on the 15th of October, 1605, died Akbar, the greatest ruler who ever sat upon the throne of India.

Under the rule of every Mohammedan conqueror who had invaded India from the northwest, the land had suffered by reason of the twofold antagonisms of religion and race. In either of these cases the Hindus, who formed the majority of the population, were considered as of no account; they repaid with their hatred the pride and scorn with which they were treated, and prosperity for India was obviously impossible under such rulers. History has justly honoured Akbar with the title of "The Great," but the honour is due less to his military success than to the insight with which he furthered the internal welfare of the country and to the manner in which he abrogated the antagonisms of religion and race by gradually obliterating the most salient differences.

At the time of his accession Akbar was a good Mohammedan, and in 1576 he projected a pilgrimage to Mecca to the grave of the Prophet. Shortly afterwards, however, the interchange of philosophical ideas during his evening gatherings (p. 432) was stimulated by the presence not only of the Mohammedan mollah, but also of the learned Brahman priest and even the Roman missionary. No one of these religions appeared to him as absolutely true. Under their influence and in the conversation of his confidential friends the conception of that jealous God which Mohammed had borrowed from Moses was transformed to the idea of a Supreme Being watching over all men with equal love, while the doctrine of the God incarnate became in him a pure belief, high above all material conceptions, to

the effect that the Deity can be apprehended not through any revelation in human shape, but only by the exercise of reason and understanding; a Deity, also, to be served not by all kinds of ceremonies and empty forms, but by moral purity of life. If weak humanity desires material symbols of the Supreme Being, then the loftiest to be found are the sun, the constellations, or the fire. Akbar's conception of God left no place for ritual precepts, for prophets or priests.

However, to support his dignity in the eyes of the people, he issued decrees announcing that the king was the head of the church, his formula of confession being as follows: "There is no God but God, and Akbar is his Caliph;" at the same time he never employed force to impose his religious views upon dissentients. These views indeed were too abstract and profound for popular consumption, and were unintelligible except to a small circle of philosophical adherents. Toleration was a fundamental principle in his character, and he was never anxious to convert the members of other religions. Every Mussulman was allowed the free exercise of his religious principles, but on the other hand such principles were binding upon no one else. Thus he was opposed to those many forms of compulsion which Mohammedanism lays upon public and private life; Akbar did nothing to further the study of the language of the Koran, and showed no preference for Arabic names such as Mohammed, Ahmed, etc.; the formula of greeting, "Peace be with you," was replaced by the sentence, "God is great," etc. Thus to a certain extent Akbar curtailed the privileges of his native religion. At the same time he removed many of the disabilities which burdened the Hindus and their religious practices; the poll tax upon unbelievers, a source of deep dissatisfaction among the Hindus, and the dues levied upon pilgrims during their journeys were entirely remitted; their religious practice was interfered with only in cases where the pronouncements of the priests were totally opposed to the principles of humanity, as for instance in cases of trial by ordeal, child marriage, compulsory death upon the funeral pyre, and the enforced celibacy of widows, etc. The civil rights of Mohammedans and Hindus in no way differed, and every position in the State, high or low, was open to members of either religion.

In the domestic administration of his great kingdom Akbar displayed the greatest foresight and energy. Former rulers had been accustomed to collect the taxes by methods inconceivably disastrous. The incomes of important districts had been appropriated to individual generals who were allowed to extort the utmost possible amount from the inhabitants, and for this purpose a large force of troops was permanently kept on foot. The imperial taxes properly so called were collected by an army of officials who were accessible to influence of every kind and appropriated no small portion of the receipts as they passed through their hands. Shîr Shah (p. 430) had been the only ruler to introduce a more equitable system of taxation, and the regulations made during his short reign were swept away in the confusion of the following years. In its main details Akbar's system was a further development and extension of that of Shîr Shah. He was fortunate in finding in the Hindu Todar Mal a man of stainless probity and admirable capacity for organisation, who did more than any one else to restore the administration and especially the taxation system. Todar Mal was the first official to make a complete and exact census of the whole territory north of the Narbada. A survey was taken of all arable land, an accurate estimate made of the products, and taxation calculated from these data, the amount being established at one-third

of the average produce for the previous ten years. Undue severity was thus avoided as far as possible, and in times of famine or failure of the crops taxes were remitted and advances made of gold or corn. Shir Shah had indeed appointed only one-fourth of the yearly produce as the unit of taxation; however, Akbar's regulations proved more advantageous both for the State and for the agricultural population, as speculation was prevented by a strict system of book-keeping and by the possibility of appeal to higher officials, while the fixity of the regulations enabled one-half of the revenue officials to be dispensed with. All officials, officers and soldiers included, received a fixed and liberal salary, and were no longer obliged to depend upon incomes drawn legally or illegally from subsidiary sources.

Trade and commerce were promoted, a strong impulse in this direction being given by the introduction of a uniform currency; the hundreds of different currencies which had hitherto been in circulation were called in, and an imperial coinage was struck in the mints of every province. The empire was divided into fifteen provinces (three of which were in the Deccan), and these were governed under imperial direction by governors who were invested with civil and military powers. The administration of justice, as far as the Mohammedans were concerned, lay in the hands of a supreme judge, Mir-i-adl, whose decision was final; he was assisted by a Kasi who undertook preliminary investigations and produced the legal codes bearing upon the case; the Hindus were judged by Brahmans with a legal training. The organisation of the army was, comparatively speaking, less vigorous and consistent. On the whole, however, the internal organisation of the State, which was laid down to the smallest detail in the "*Ayini-Akbari*" (the ordinances of Akbar) by Abû'l Fazl, marked a great step in advance, and proved a blessing to the country, which enjoyed a prosperity hitherto unexampled.

(8) *Jehângîr*.—When Akbar died he had appointed as his successor his son, Nûr ed-dîn Mohammed Selîm, who took the imperial title of *Jehângîr* (that is, World Conqueror). In previous years he had often been a sore anxiety to his father, chiefly by reason of his drunkenness and furious anger which provoked him to acts of cruelty and often broke out during his reign. When his chief general, Mahabat Khan, had married his daughter without previously announcing his intention, he had the newly wed couple flogged with thorns, and deprived the general of the dowry and of his private possessions; after the revolt of his son Khusrou, he had seven hundred of his adherents impaled along the road before the gates of Lahore, while his son in chains upon an elephant was conducted through this palisading.

Sir Thomas Roe made some stay at the Indian court from 1615 to 1618 as the ambassador of King James I, and has given us an account of the brilliancy of the court life, of the emperor's love for splendour and display, of his kindness to Europeans, numbers of whom came to his court, of his tolerance to other religions and especially to Christianity; two pearls in his crown were considered by him as representing the heads of Christ and Mary, and two of his nephews were allowed to embrace Christianity. However, the same ambassador also relates accounts of banquets that lasted through the night, of which drunkenness was the invariable result, the orgies being led by the emperor himself. At the same time the

emperor attempted to play the part of a stern Mohammedan; when during the day one of the initiated allowed a thoughtless reference to one of these orgies to escape him, the emperor asked seriously who had been guilty of such an offence against the law, and inflicted so severe a bastinado upon those who had been his guests at the forbidden entertainment that one of them died. Of the general condition of the empire Roe gives a description which compares unfavourably with the state of affairs under Akbar. He praises the financial arrangements, but characterises the administration as loose, the officials as tyrannical and corrupt, and mentions the decay of militarism in the army, the backbone of which was now the Rajput and Afghan contingents. "The time will come," he wrote, "when all in these kingdoms will be in great combustion." However, the reign of Jehângîr passed by without any great collapse; Akbar's institutions had been too firmly rooted to fall by the maladministration of one government only.

Jehângîr had been already married at an early date (1586-1587) to a daughter of Rây Singh of Amber; a Persian woman, however, by name Nûr Jehân, "The light of the world," gained complete influence over him. Her grandfather had occupied an important position in Teheran; her father, however, was so impoverished that the future empress upon her birth was exposed in the street, where a rich merchant found her, adopted her, and called in her own mother as foster nurse. Nûr Jehân received a good education, and by her wit and beauty she won the heart of the crown prince Selim (Jehângîr), whose attentions became so pressing that upon Akbar's advice a young Persian was given her hand together with an estate in Bengal. Hardly had Jehângîr been a year upon the throne when he made proposals to the husband, which the latter answered by killing the emissaries who brought them and was himself cut to pieces in consequence. In 1611 Nûr Jehân gave way, and henceforward her influence over the emperor was complete. As long as her excellent father, who had been made grand vizier of the empire, was alive, she exerted that influence for good; Jehângîr restrained his drunkenness, and ceased those inhumanities which had stained the imperial title in previous years.

A war with Udipur (p. 432) was rapidly brought to an end (1614) by the second prince, Shihâb ed-dîn Mohammed Khurram Shâh Jehân; his bold action also brought the war against the Mohammedan Deccan, which had opened unfavourably, to a successful conclusion. The emperor hated his eldest son, Khusrou, who died in imprisonment in 1622, but the second was both his favourite and that of the empress, who gave him her niece in marriage; he was publicly appointed successor to the throne. However, Nûr Jehân had consulted no one's pleasure but her own after her father's death, and she now gave her favour to the youngest of the princes, who was closely connected with herself by his marriage with her daughter. When his father fell seriously ill, Shâh Jehân, who had been placed in the background, marched upon Delhi, but was obliged to retreat to Telingana and Bengal, where he was defeated by Mahabat Khan. The latter then suddenly incurred the displeasure of the empress, and with a view of anticipating any act of hostility on her part, he seized the persons both of the emperor and the empress. They succeeded in escaping from imprisonment and in concluding a compact with Mahabat which provided that he should once more take the field against Shâh Jehân; but the general was afraid of the later vengeance of Nûr Jehân and deserted to the prince. There was no further collision between the two parties; the emperor died in 1627, while upon a journey from Kashmir to Lahore. Nûr

Jehân was treated with respect by the successor to the throne; she survived her husband by nineteen years, which she spent in dignified seclusion, winning universal affection by her benevolence.

(ε) *Shâh Jehân*. — Shâh Jehân I, after the slaughter of his brother Shahriyâr, who had formed an alliance with two sons of Daniâl (p. 433), and the suppression of a revolt in Bundelkand, put an end to the short rule of his nephew Dâwarbakhsh, the son of Khusrou, and found himself in undisputed possession of the throne in 1628; under his rule the Mogul Empire attained the zenith of its wealth and prosperity. The emperor displayed great perspicacity in the choice of capable officials, exercised a strong personal supervision over the administration, introduced many improvements, and in the course of twenty years extended the system of territorial occupation and taxation which had been created by Todar Mal (p. 434) to the districts on the far side of the Narbada. Though he is described as reserved and exclusive before his accession, he afterwards appeared kindly, courteous, and paternally benevolent to his subjects, and succeeded in winning over those Mohammedans whom Akbar had formerly affronted, without losing the good-will of the Hindus.

The best evidences for the brilliance of this period are the numberless private and public buildings which arose under his government, not only in the two capitals of Delhi and Agra, but also in all other important centres in the kingdom, even in places which are now abandoned. Under Shâh Jehân, Delhi was as entirely transformed as Rome under Nero or Paris under Napoleon III. The palaces of his period, with their reception rooms, their marble-pillared halls, their courts and private rooms, together with the mosques and mausoleums, marked the zenith of Mohammedan art in India. Of these monuments the most famous is the mausoleum called the Tâj-i-Mahal ("Crown of the harem;" see the plate, "The Taj Mahal at Agra"), the grave of Nûr-i-Mahal ("Light of the harem"), a favourite consort of the emperor. Opposite the imperial fortress of Agra rises this building, one of the most delicate constructions in the world, its outline clear and simple as crystal, built in marble, of wonderfully delicate colouring, with decorations which bear the mark of a fine and restrained taste. Symbolical of court life and splendour is the famous peacock throne, a decoration for the imperial chair, made of diamonds, emeralds, rubies, sapphires, etc., which represented in its form and colours a peacock's tail fully extended. The traveller Jean Baptiste Tavernier (1605–1689), a jeweller by profession, estimates the collective value of the precious stones employed in this ornament at 160,500,000 livres. Though such works of architecture and artistic skill must have cost enormous sums, and though many lives were sacrificed in the numerous wars of Shâh Jehân, the people enjoyed high prosperity under his rule; and the emperor, surpassing in this respect the Medicean Lorenzo "the Magnificent," left a vast quantity of State treasures behind him at his death.

Those disturbances which had broken out in the Deccan in 1629 were speedily suppressed by the emperor, who forced the State of Ahmednagar to conclude a peace favourable to Delhi. Upon a fresh outbreak four years later this province was incorporated with the Delhi kingdom (1637), and Abdallâh of Golconda, who was in alliance with this foe, was forced to pay tribute. Affairs beyond the Afghan frontier ran a less favourable course. The Uzbeqs, who had penetrated into Cabul, were at first driven back from Balkh; in 1637 Kandahar, which had been occupied by the Persians, was also reconquered. When, however, the Uzbeqs

## THE TAJ MAHAL AT AGRA

The Taj, "a dream in marble," is the jewel of Agra, lying close to the right bank of the Jumna and about a mile to the east of the fort. It is the mausoleum of the Mogul emperor Shah Jehan (1628-1658) and his consort Mumtaz-i-Mahal. A great wall of red sandstone encloses a rectangular space about three hundred yards long by one hundred broad. The building, of white polished alabaster, blazing in the sunlight, rises upon a platform reached by a flight of steps some seventy feet high: a right-angled square with the corners cut away supports the dome, which is visible from a great distance; the greatest diameter of the dome is forty feet, while it rises some three hundred and fifty feet above the level of the terrace; the pinnacle terminates in two golden balls and a half-moon. Within, surrounded by delicate lattice-work tracery in marble, stand two cenotaphs decorated, like the walls, with flowers carved of rare stone and tasteful ornamentation. The building is surrounded by an extensive garden, in which is a long, straight water-channel containing numerous fountains.

THE TAJ MAHAL AT AGRA.

New York: Dooly, Mead & Co.

renewed their advance in 1618, the emperor's third son, Mohammed Muhi ed-din Aurang zeb (Aurangzebe), was forced to retreat during the winter of 1647 over the Hindu Kush, and lost the greater part of his army in consequence; Kandahar was reconquered by the Persians in 1648, and remained in their possession, Shāh Jehān definitely renouncing the idea of reconquest in 1653. In the year 1655 fresh complications broke out in the Deccan. Aurang zeb, who had been sent there as governor, made a treacherous incursion into Golkonda: the capital was stormed, plundered, and burnt, and in 1656 Al lallāh was forced to conclude peace under conditions of great severity. Bijāpūr was then surprised on some trivial pretext. But before the subjugation of this district could be carried out, Aurang zeb received news of his father's sudden illness, and was obliged to conclude a treaty with Mohammed of Bijāpūr, on conditions favourable to the latter, in order that he might march northward with his army (1657).

Shāh Jehān had been prostrated by uremia. Four of the emperor's sons, who were equally brave but different in position and character, immediately appeared as rival claimants for the throne. Dārā Shukōh, born in 1613, was a man of Akbar's type, talented, liberal, well disposed to the Hindus, and friendly to Europeans and Christians; however, his manner was against him, he was passionate, often insulting, had no personal following and was especially unpopular among the Mohammedans. The second prince, Shojā, was a drunkard, and was hated by the Mohammedans for his leanings to the Shiite doctrine. On the other hand, Aurang zeb was a fanatical Mohammedan, beloved for his affability, with a halo of glory from his recent exploits, but ambitious and treacherous. The fourth prince, Murād bakhsh, was of a noble disposition, but was intellectually of no account and was marked by a leaning to sensuality. Aurang zeb, who was at the head of a well-trieved army, allowed his two elder brothers to destroy one another, while he gained over the short-sighted Murād by exaggerated praise and flattery and by promises of the succession. With the help of Murād he then defeated Dārā, who had emerged victorious from the struggle with Shojā, and invited the unsuspecting man, under a pretext of celebrating his victory, to a feast: on the next morning Murād awoke from his debauch to find himself a prisoner in the citadel of Delhi, but was afterwards transferred to the State prison of Gwalior.

Meanwhile Shāh Jehān I had recovered and again assumed the government. As, however, he favoured his eldest son, Aurang zeb made him prisoner in 1658, and kept him under honourable restraint in the citadel of Agra until his death in 1666. Shortly afterwards Aurang zeb succeeded in seizing the person of his eldest brother: and Dārā was condemned to death on a pretended charge of apostasy from the Mohammedan faith (1659). Murād met the same fate in 1661 as a result of an attempt to escape from his imprisonment. Shojā fled to Bengal, and perished in 1660 in the malarial district of Arakan, while his sons were kept prisoners until their death in Gwalior. Thus no further rival remained to the successor of Shāh Jehān among his brothers or relations.

(5) *The Early Years of Aurang zeb.* — Aurang zeb (Aurang zebe) 'Ālamgir I (1658-1707) had inherited none of the great talents of Baber and Akbar, neither their statesmanlike foresight nor their humanitarian disposition, and still less that religious toleration which had made the people prosperous and the State powerful. Those famous monarchs had been creative minds, capable of finding the right

measures to deal with every difficulty; whereas Aurang zêb was a narrow-minded monarch who displayed his good qualities invariably at the wrong time and the wrong place. He was careless where he should have been severe, severe where carelessness would have been the better policy, liberal where he should have saved, miserly when liberality was needed, and upright only toward his co-religionists. In war he displayed personal bravery, but he attempted to deal with great problems of statesmanship in a petty and narrow-minded spirit. His actions were dictated, not by love for his subjects, but by ambition, mistrust, and religious fanaticism. No one was ever better able to conceal his true feelings; no means were too contemptible or too arbitrary which could enable him to reach the goal of his ambition. His effort was to promote the one true faith of the Sunnah, and his ambition was to be the type of a true Mohammedan monarch. To his co-religionists he displayed a leniency which was a direct invitation to mismanagement, intrigue, and disobedience, while his hand was heavy upon the hated Hindus who formed the majority of his subjects. He was well read, especially in the Koran, and his private life was marked by moderation and simplicity; his public appearances were characterised by an excess of splendour and by painful observance of every religious duty.

At the beginning of his reign the emperor seemed inclined to model his behaviour upon the religious tolerance of his ancestor Akbar, and married his son Mohammed Mu'azzem to the daughter of a Hindu prince. But after a short interval his fanatical hostility to the alien religion made itself felt, and discord between the emperor and his subjects was the natural result. The tax upon all saleable articles, which was only  $2\frac{1}{2}$  per cent for the Mohammedans, was doubled by Aurang zêb in the case of the Hindus; the hated poll tax which Akbar had abolished was again imposed upon the Hindus, and while preference was shown to the Mohammedans, a double burden was laid upon the Hindus, who were also excluded from the administration and the army. In 1679 Aurang zêb pulled down the three most sacred temples of the Hindus in Multan, Mattra, and Benares, and erected a mosque upon the site of the temple of Krishna (Mattra). In Rajputana alone the Brahman sanctuaries which were devastated by his fanaticism might be counted by hundreds; the priests were killed and the temple treasures transferred to Delhi. Especially characteristic of the emperor's madness are his attempts to seize friendly Hindu princes and forcibly to convert them to Mohammedanism; their armed escorts were cut down to the last man, while they themselves escaped and with their co-religionists at once became the bitter enemies of Aurang zêb.

The Satnami, a purist Hindu sect on the left bank of the Sutlej, were the first to revolt against such oppression — a movement that was only repressed with difficulty. Their example was followed by the Rajput tribes, and the struggle was carried on with varying success and with such bitter cruelty that from that date the Rajputs have displayed a deadly hatred to every later ruler of Delhi.

Aurang zêb's own son, Mohammed Akbar (the fourth prince), enraged at the inhumanity of the imperial orders given him, joined the side of the oppressed, but was forced to flee; he first turned to the Mahrattas, who were at war with his father, and afterward retired to Persia, where he died in 1706.

(7) *The Foundation of the Mahratta Power.* — Aurang zêb had successfully led the army of Shâh Jehân against the Mohammedan States in the Deccan, and had

inflicted severe losses upon Golconda and Bijâpûr; but independent rulers were still powerful in that district. In the meantime a third State founded upon the basis of national religion had grown from insignificance to a power more formidable and coherent than any of the surrounding States; this was the Mahratta (Maratta) people, a powerful tribe descended from the old Kshatriya immigrants, inhabiting the district of Maharashtra and the country to the south; from this centre capable men had for many years migrated to the neighbouring Mohammedan principalities, especially to Bijâpûr, where they had occupied important positions in the administration and in the army. The head of one of these immigrant families, Shaj Bhonsla, had distinguished himself as a cavalry commander, and had been rewarded by the Mohammedan Sultan of Bijâpûr with the military fief of Poonah, and later with a more important district in the modern Mysore. From his marriage with a woman of noble birth sprang the founder of the Mahratta power, Sivaji. National and religious sentiment inspired him with deep hatred for Mohammedanism. During his father's absence in the southern parts of his fief the son, with the help of the troops under his command and other Mahratta allies, seized a number of the strongest fortresses, confiscated the taxes and plundered the lands of his lord far beyond the boundaries of his own district; his father was then suspected of complicity and imprisoned by the sultan of Bijâpûr. Sivaji entered into negotiations with the powerful emperor of Delhi, Shâh Jehân, and the fear of this mighty monarch procured the release of his father; the son then displayed even greater insolence to Bijâpûr. Ultimately an army was sent against him under Afzal Khan; Sivaji induced the hostile commander to agree to a friendly meeting before the fort of Pratapgad, where he murdered him; the army was taken by surprise and massacred in large part. Ultimately he secured the cession of additional territory and the right of maintaining a standing army of fifty thousand infantry and seven thousand cavalry.

These events had taken place shortly before the accession of Aurang zêb. The upstart now directed his attacks against this powerful empire. His marauding bands advanced into the neighbourhood of Surat in 1662, and an imperial army retreated before him in disgraceful cowardice. A new expedition succeeded in inducing Sivaji to appear in person at the court of the powerful emperor. Aurang zêb received the Hindu with almost contemptuous coldness, and proposed to confine him forcibly in Delhi. However, the cunning Mahratta and his son made good their escape, hidden in two provision-hampers. In the year 1674 Sivaji declared himself independent, assumed the title of Mahârâja, and proceeded to strike a coinage in his own name. Had Aurang zêb been a far-seeing ruler, he could not have failed to recognise a dangerous enemy in this rising Hindu State on the southwest, and would have entered into an alliance with the Mohammedan States in the Deccan. However, he hoped to secure sole supremacy over all the Mohammedans in India, and even furthered the action of the new Hindu prince when he extorted from Bijâpûr one-fourth of its yearly revenue as payment in lieu of his plundering raids, — a tax known as the Chout, which was later, under the name of the "Mahratta" tribute, to be a source of sore vexation to the Delhi kingdom.

The far-seeing opponent of the two Mohammedan powers availed himself of his favourable position to develop as far as possible the internal organisation of his Hindu State. Society was organised on the pattern supplied by the old traditions; the Brahmans, whose intellectual training and higher education had been

developed through long generations, were the born counsellors of the nation; the chief official posts were occupied by members of noble Brahman families, who saw that the administration was properly conducted. The warriors descended from the old Kshatriya immigrants formed the professional officers and the well-drilled and regularly paid army. The agricultural class (Kulbis) not only devoted their energies to production, but also formed the guerilla reserve of the standing army. All remaining handicraftsmen or merchants formed collectively the fourth class (Shankardachi). The State thus organised had a small standing army of cavalry armed with lances which, when necessity arose, could be rapidly increased to a powerful force by calling out the militia, and as rapidly be reduced to its former dimensions. The Mahratta army was a highly mobile force, and consequently far superior to the slow-moving troops of the Mogul emperor; when these latter appeared in overwhelming strength, they found only peaceful peasants tilling their fields; the moment the enemy divided his forces he was immediately attacked unawares. Plundering raids and the Mahratta tribute imposed upon neighbouring States brought in a large yearly revenue; the booty taken in war was in part divided among the soldiers and the militia, but the larger part had been distributed among the small and almost impregnable mountain fortresses which guarded the State chest and military treasuries. Thus Sivaji had at his command a strong army ever ready for action and self-supporting, while the expensive and incapable troops of his opponent devoured the riches of the empire; the Mahrattas had no lack of recruits to swell their ranks, while the Mogul army had great difficulty in maintaining its strength, though enlistment proceeded far and wide. Such was the opponent that Aurang zêb thought he could play off against the sultans of the Deccan; in reality the Mahratta power, joining now one and now another of these opponents, inflicted injury upon both and aggrandised itself at their expense.

(θ) *The Fall of Aurang zêb.* — In the year 1672 Sivaji surprised an imperial army, and inflicted so severe a defeat that for a long time the Mogul troops were forced to confine themselves to the defence of their headquarters in Aurangabad. Revolts in the north and the northwest of the empire had made it impossible to unite all the imperial forces for action upon the south. A favourable opportunity seemed, however, to have arisen in 1680, when Sivaji died and was succeeded by his son Sambaji, who was nearly his equal in energy. This was the date of the secession of Prince Akbar (p. 439). The emperor, who was by nature suspicious, now declined to trust anybody, and placed himself at the head of his southern army with the object of crushing his Mohammedan opponents 'Alî II of Bijâpûr, and Abû'l Hasan of Golconda, intending afterward to overthrow the Mahrattas. In 1683 he marched to the Deccan; in 1686 Bijâpûr was taken and Golconda fell in the next year. The last independent Mohammedan States in the Deccan thus disappeared.

In 1689 Sambaji and his son, who was six years of age, were captured by Aurang zêb; the father was killed after the most cruel tortures, and the child kept in strict confinement. This action, however, aroused the obstinate Mahratta race to yet more irresistible efforts. Aurang zêb was utterly defeated at Berampur, and his youngest son, Mohammed Câmbaklsh, with his commander-in-chief Zulfikar, suffered such heavy losses on the east coast that the prince was forced to

withdraw and unite his forces with his father's. Other imperial armies were repeatedly beaten or forced to surrender; the very forces of nature seemed to be conspiring with the enemy; a sudden inundation of the river Bhima cost Aurang zêb the whole of his baggage and twelve thousand cavalry. The Mogul emperor gathered all his forces for a final effort; strong citadels were captured and Mahratta troops scattered. But fresh fortresses were occupied, and the Mahrattas dispersed only to reunite at some other centre. Ultimately the queen regent, Tara Bai, the widow of Râjâ Ram, the brother of Sambaji, had recourse to desperate measures, and devastated the whole country in order to deprive the enemy of his supplies. At this moment the bodily powers of the old emperor gave way, and in 1707 Aurang zêb 'Âlamgir I died in a fainting fit.

(*l*) *The Later Mogul Emperors.* — On the death of Aurang zêb the finances of Delhi were in utter confusion; the greater proportion of the revenue existed only on paper, and had been diminished by embezzlement, by revolts, and the generally impoverished condition of the nation, while the expenditure had risen enormously during the long-continued war. The Hindu population, who were considered as subjects of the second class only, were inspired with deeper hatred for the Mohammedan dynasty. The strong foundations of the State had been shaken; a state of ferment existed at home, the south was threatened by the Mahratta power which Aurang zêb's blind policy had aggrandised, and the States on the northwest beheld the anxieties with delight. Moreover the dynasty upon the peacock throne of Delhi had degenerated; the power of the House of Timur had spent itself in a short succession of brilliant rulers, and the emperors of succeeding years were but miserable shadows of their great predecessors.

In the next twelve years no less than eight rulers succeeded one another on the throne.<sup>1</sup> The first, Mu'azzem Shâh 'Âlam Bahâdur Shâh I (1707–1712) displayed much tolerance, but his strength was unequal to the task of restoring the broken organisation. His vicious successor, Mo'izz ed-din Jihândâr Shâh (1712–1713), was an utterly insignificant figure. He was succeeded by Mohammed Farrukhsiyâr (Farokhsir, 1713–1719), a weakling who surrounded himself with foolish counsellors, and vainly attempted to curb the growing power of the nobles by clumsy intrigues; he was murdered in the palace. Two children were then placed in succession upon the throne; both succumbed to consumption, Rafi 'ed-darajât after three months and Rafi 'ed-doula Shâh Jehân II, in an even shorter time. The rule of Roshen-akhtar Mohammed Shâh (1719–1748) was of somewhat longer duration; he, however, was a voluptuary who cared only for his own

(After Stanley Lane-Poole and Ferdinand Justi)

pleasure and handed over the imperial seal to his chief wife to use as she pleased. His son Ahmed Shâh (1748-1754) was taken prisoner and blinded with his mother; he died in 1774. Even shorter was the rule of his aged successor 'Azîz ed-dîn 'Ālamgîr II, who was murdered by his grand vizier in 1759.

Such, during the first half-century after Aurang zêb's death, were the "wielders of the sceptre" in Hindostan, with the exception of a few unsuccessful candidates for the throne, such as 'Azîn Shâh (1707), Cāmbakhsh (1707-1708), Nêkûsiyâr (1719-1723), and Ibrâhim (1720). The royal power was in the hands of ambitious viziers, of harem favourites, of flatterers and parasites who pandered to the excesses and debauches of the rulers. Shâh 'Ālan Bahâdur suffered greatly from dependence upon Zulûkar, one of Aurang zêb's bravest generals during his wars in the Deccan, and Jehândâr Shâh was but a tool in the hands of this man; after the latter's accession, during a revolt of Zulûkar, he was handed over to the rebels, who killed both him and his betrayer. The next four rulers were elevated to the throne by the "king makers," two brothers who gave themselves out to be descendants of the Prophet; these were the Seiads, Hussein Ali and Abd ullâh, who murdered Farrukhsiyar, made two children emperors, and were finally suppressed a year after the accession of Mohammed Shâh, Hussein Ali falling under the dagger of an emissary of the emperor, while Abd ullâh was defeated with his army; his rank saved him from death, but he was kept in life-long imprisonment. Henceforward the business of State was conducted by women and parasites. Ahmed Shâh and 'Ālamgîr II were pure nonentities compared with their ambitions, faithless, and despotic commander-in-chief and grand vizier, Ghazi ed-dîn, grandson of Asaf Jah of Haidarabad.

Such were the hands that steered the ship of State, which was now tossed by wild waves amid dangerous reefs and began to strain in all its joints. The degenerate bureaucracy had but one desire,—to turn the weakness of the government to their own advantage; taxation became extortion and robbery, while bribery and corruption took the place of justice. Princes and vassals, generals and viziers tore away provinces from the empire, while warlike Hindu tribes threw off the Mohammedan yoke. Thus the Jabs in Rajputana gained their independence (capital town, Bhartpur). Thus, too, the principality of Jaipur seceded, the rulers of which, Jey Singh II in particular, were distinguished for their devotion to science (astronomy); Jaipur was built as a capital in 1728, the splendid town of Amber having been previously abandoned at the order of the above-named Jey Singh. In Oudh the Shiite Persian Sadat founded the kingdom of Lucknow, while a converted Brahman, Murshid Kuli Khan, formed a kingdom of Bengal, Orissa, and Behar; Malwa fell into the hands of the Mahrattas, and in the south Asaf Jah seized the whole province of the Hindostan Deccan.

(κ) *The Sikhs.*—To the many difficulties and troubles of the empire was added the outbreak of fanatical religious wars. In the extreme northwest of India, in the Punjab, Nânak (1469-1538), who had been under the influence of Kabîr (p. 410), preached, about 1500, a new doctrine of general peace and brotherly love. He had made an attempt to obliterate the differences between Brahmanism and Mohammedanism by representing all the points of divergence as matters of no importance, and emphasising the immanence of the Divine Being as the one material point. It was a pure reform, dissociated as far as possible from any

sensualism of theory or practice. All men were equal before God according to this theory, which did not recognise divisions of caste. The adherents of Nānak, whose numbers were at first but small, called themselves Sikhs, that is, disciples or scholars. During the next one hundred and fifty years they organised themselves as a federation of districts united by religious and political ties.

It was only to be expected that the denial of the authority of the Vedas should please the Hindus as little as the refusal to accept the Koran pleased the Moham-medans; one of the Sikh spiritual leaders (guru), Arjuni, was accused under Jehāngir of being implicated in a revolt; he was thrown into prison in 1606 and so cruelly tortured that he died. From this moment the character of the religious movement entirely changed. Har Govind, the son of Arjuni, thirsting for revenge, issued new proclamations and gave a new character to the sect in 1638; the disciples of peace now became warriors of fanatical fierceness and bold robber bands. However, the movement would perhaps have died out if the fanatical Aurang zēb had not executed the guru Tegh Bahādur in 1675. The hatred of the Moham-medans immediately flamed up afresh. Govind II, the son of the murdered man, declared himself the son of God sent by his Father to drive and extirpate evil from the world; warrior and Sikh were henceforth to be equivalent terms. "Ye shall no longer be called Sikh (disciples), but Singh (lions)." Govind maintained his ground with varying success against Aurang zēb, who was then occupied with the Mahrattas in the south. Shāh 'Ālam Bahādur attempted to win over the Sikhs by kindness; however, in 1708 Govind was murdered by a Mohammedan Afghan, and the anger of the Sikhs was boundless. Pillaging and murdering with appalling cruelty all who declined to accept their faith, they advanced upon Delhi; they were utterly defeated by Bahādur, and forced to retire to inaccessible hiding-places. The emperor, however, died suddenly at Lahore in 1712, perhaps from poison. The sect grew powerful during the disturbances which then broke out, and under Farrukhsiyār reoccupied a large part of the Punjab. Led by their chief Bandah, they again advanced in 1716, marking every step in their advance by ruthless devastations; Lahore was captured, the governor defeated, and an imperial army driven back. Fortune then declared against them; they were repeatedly beaten by the imperial troops and driven back with Bandah into one of the northern fortresses, where they were starved out and killed. Bandah escaped, owing to the devotion of a Hindu convert who personated his leader, and succeeded in duping his captors for some time. But of the once formidable sect there remained only a few scattered bands who gained a scanty livelihood in the inaccessible mountain valleys of the Punjab.

(λ) *The Invasions of Hindostan by Nādir Shāh and Ahmed Durrāni.*—At this period a foreign power swept over Hindostan like a scourge from heaven. The son of a Turcoman, though born in Persia, Nādir Shāh (Vol. III, p. 384) had begun his career as leader of a band of freebooters, and had seized the throne of Safavite dynasty on the 20th of March, 1736. The lack of ceremony with which the Persian ambassador was treated in Delhi gave him an excuse for invading Hindostan in 1738. After conquering the Mogul army which had been reinforced by the troops of Sadat (Oudh) and of Asaf Jah (Haiderabad), he marched into the capital in 1739. Strict discipline was preserved among the troops. A report suddenly spread among the Hindus that the Persian king was dead; the inhabitants

then threw themselves upon the soldiers who had dispersed throughout the town and slaughtered seven hundred. Nâdir Shâh attempted to restore order, but was himself attacked, and then commanded a general slaughter of the inhabitants. From sunrise to sunset the town was given over to pillage, fire, and murder, thirty thousand victims falling before the Persian thirst for vengeance. All the treasures and jewels of the royal treasury, including the peacock throne (p. 438), the pride of Delhi, were carried off, the bullion belonging to the empire, the higher officials, and private individuals was confiscated, and heavy war indemnities were laid upon the governors of the provinces. The sum total of the booty which Nâdir carried off from Hindostan has been estimated at £50,000,000.

Eight years later Nâdir Shâh was murdered (June 20, 1747); his kingdom immediately fell into a state of disruption. In Afghanistan the power was seized by Ahmed Khan Abdali (cf. Vol. III, p. 388), who styled himself Shâh Durrâni, adopting as his own the name of his tribe; he was strongly attracted by the rich booty which Nâdir had carried off from Hindostan. In six marauding raids between the years 1747 and 1761 he devastated the unhappy land and its capital. The massacre of Mattra, the sacred town of Krishna, which took place during the third invasion of Ahmed Shâh, was a terrible repetition of Nâdir's massacre at Delhi; during a festival of the inhabitants a detachment of Ahmed's army attacked the throng of harmless pilgrims in the defenceless town and slaughtered them by thousands.

(μ) *The Mahratta Kingdom at the Height of its Power.* — In less than a century after the death of Shâh Jehân, the once powerful Mogul kingdom had sunk to the lowest point of misery and weakness; it would undoubtedly have disappeared altogether had not the English become predominant in India about 1760; it was wholly to their interest to preserve at any rate a semblance of the empire. Meanwhile, important events had taken place in the south during the first half of the eighteenth century. Saho, the grandson of the Mahratta prince Sivaji (p. 441) was released shortly after the death of Aurang zêb; he was — and in this respect he became a pattern for the treatment of young Indian heirs to the throne — wholly estranged from the national interests of the Mahrattas. He had grown up in a harem under the influences of the Mohammedanism with which he had been surrounded, and his thoughts and feelings were rather Mohammedan than Hindu; his first act as king was to make a pilgrimage to the grave of his father's murderer.

Previous to the accession of Saho the Mahratta government had been in good hands; when Sambaji had been captured and killed, his young son, who was also a prisoner, had been declared king; meanwhile, the government had been carried on by the brother of Sambaji, Râja Ram, and after his death by his no less capable widow, the kingdom suffering no deterioration notwithstanding the imprisonment of the monarch. When, however, Saho took up the power in person a change occurred for the worse. Enervated in body and mind, he left all state business to the care of his prudent minister, (Peshwa) Balaji Wiswanath; and it was to the efforts of this man that he owed the establishment of his position with reference to the Mogul kingdom, though he would himself have been well content to become a vassal of Delhi. The chief work of the Peshwa was to reduce to order the whole organisation of the Mahratta state with its peculiar military basis. During the reigns of Hussein Ali and Abd ullah (p. 444) he marched upon Delhi and procured

not only the recognition of the sovereignty of the Mahratta princes, but also the formal right of levying upon the whole of the Deccan the Mahratta tax, one-fourth of the whole state revenue (p. 441). Thus, under Saho the power practically fell into the hands of the Peshwa; and when his post became recognised as hereditary the new Brahman Mahratta dynasty of the Peshwas grew up side by side with and rapidly overshadowed the dynasty of Sivaji.

Baji Rao (1720–1740), the son of Balaji Wiswanath, who united the intellect of a Brahman with the energy of a warrior, raised the Mahratta kingdom to its highest point. He was forced by the prince and his adherents to establish the power of the constitution upon a territorial basis. But he saw that the strength of his people consisted primarily in their military organisation; his country would be more powerful if its sphere of interest was marked by no fixed boundaries, and if it could gradually extend its claims to the Mahratta tribute over the whole of the fallen Mogul Empire and even further. In matters of domestic policy, the Peshwa conducted state business entirely upon his own responsibility, without consulting the prince, who had become a merely nominal ruler. A refusal to pay the Mahratta tribute, and the murder of the Mahratta general, Pilaji Gaekwar, gave Baji Rao the opportunity of subjugating Gujerat. In 1733 he captured the province of Málwa, and in the negotiations with Delhi he secured not only all the country south of the Chambal (see the map facing p. 430), but also gained the cession of the three most sacred towns of the Hindus: Mattra, Allahabad, and Benares. When the Mogul emperor raised objections, Baji Rao advanced to the walls of Delhi in 1737; at the beginning of 1738 he forced Asaf Jah of Haidarabad, the plenipotentiary of the Grand Mogul, to cede all the country south of the Chambal. However, before the agreement could be confirmed by Mohammed Shâh, the devastating invasion of Nâdir Shâh burst upon the country (p. 445), and even the Mahrattas shrank back in dismay. It was not until after the death of Baji Rao (1740) that his successor, Balaji, the third Peshwa, secured the formal completion by Delhi in 1743 of the contract proposed in 1738.

About the same period (1741–1743) the Mahrattas repeatedly advanced north-eastward against Bengal, the last of these movements being under the leadership of Raghujî Bhonsla; from this district they extorted the Mahratta tax and the cession of a part of Orissa (Kattak) in 1743. Called in by Delhi to bring help against the revolted Rohillas in Rohilkand, they completed the subjugation of this tribe and were rewarded with new concessions as to tribute; after the third invasion of the Afghan Ahmed Shâh, they penetrated to the northwest corner of India, captured Lahore, and drove the scanty Afghan garrison out of the Punjab. They had now reached the zenith of their power; wherever the Mogul kingdom had exercised dominion during the period of its prosperity, the Mahrattas now interposed upon all possible occasions; though not the recognised dominant power, they exacted their tribute almost everywhere. However, they met their match in Ahmed Shâh. The Mahratta general, Sindia, was defeated, and two-thirds of his troops slain, while the army of the general Holkar, who succeeded him, was shattered. A new and greater army advanced against the Afghans under the cousin of the Peshwa. The decisive battle was fought on the 6th of January, 1761, at Panipat (p. 429); the Mahrattas were utterly defeated, two hundred thousand falling in the battle or in flight, including the general, a son of the Peshwa, and a number of important leaders.

(v) *The Transformation of the Mahratta State into a Loose Confederacy.*—The Peshwa survived this disaster but a short time. The Mahrattas were obliged to withdraw from Hindostan, and never again did the Peshwas recover their former importance; the Mahratta kingdom was now transformed into a loosely united confederacy. The later successes of the people were gained by individual and almost independent Mahratta princes with the help of European officers and soldiers. The policy of Baji Rao had exactly suited the nature of the Mahratta state; the position of the prince had sunk to unimportance, and the Peshwa had been raised to the highest point. At the same time, however, individual commanders had tended to become more and more independent. The principle of rewarding the chief general with the Mahratta tax levied from a rich province, and thus enabling him to keep on foot a considerable body of troops, proved utterly destructive of the unity of the State; these commanders ultimately became provincial lords supported by the troops under their command. The independence thus acquired was also favoured by internal dissensions within the nominally ruling family and political discord with Haidarabad, Delhi, Bengal, etc.

Under the third Peshwa, Balaji (1740–1761), this process of disruption had made rapid strides, and the landed nobility which had hitherto been purposely kept in the background now reasserted itself to the detriment of the body politic. The king's power had decreased so much under the influence of the Peshwa, that his influence was gradually confined to the provinces of Satara and Kholapur; so also the actual power of the Peshwa ultimately coincided with the province of Poonah. Various Mahratta princes appear for the first time under Baji Rao, whose ancestors had previously held for the most part wholly subordinate positions; they now formed a confederacy, at the head of which the Peshwa was barely tolerated. About 1738 Raghujī Bhonsla, who had led the invasions of Bengal and Orissa, was recognised as the opponent of the Peshwa, and attained almost complete independence in the Province of Nagpur (nearly corresponding to the modern Central Provinces) until his death in 1755. The general Sindia who, though of good family, had once filled a menial position under Baji Rao, and Rao Holkar, who was originally a shepherd, became lords of the two principalities of Indore and Gwalior, formed from the new won province of Málwa. On the northwest the Gaekwar became chief of the province of Baroda. Thus the once powerful Mahratta kingdom had been broken into five great and several smaller principalities under the purely nominal supremacy of the Peshwa.

(ξ) *The Kingdom of the Nizám.*—On the other hand, the former Mogul province of Deccan, to gain which Aurang zēb had sacrificed the welfare of his kingdom (p. 442), gradually rose to an independent State of considerable importance. In the year 1713, Chin Kilikh Khan, better known by his earlier title of Asaf Jah, the son of a Turkoman general in the Mogul army, in which he had himself been an officer, was sent to the Deccan as Nizám ul mulk (governor), but was speedily recalled by the jealous Seiads (p. 427). On his own responsibility he then turned to his former province, where he had maintained good relations with the Mohammedans and Mahrattas. He defeated two armies which were sent out against him, and this success was speedily followed by the deaths of Hussein and Abd ullah (p. 444). Recalled to Delhi as grand vizier by Farrukhsiyār, he found the imperial court and the whole body politic in a hopeless condition of degeneracy, by

which he was the more impressed as his capacities had been trained in the stern school of Aurang zêb, and he immediately resigned his high position. Asaf Jah was dismissed by Farrukhsiyâr, with every mark of consideration and respect, but he was preceded by mounted messengers to Mobariz, who had taken his place as governor in the Deccan, with orders to depose the viceroy upon his return. This machination failed utterly. Mobariz was defeated in 1724, and Asaf Jah sent his head to Delhi with all good wishes for the rapid suppression of the "revolt."

To preserve some show of dependence, he repeatedly sent presents to the capital, but in reality his independence was complete. He was able to maintain his position against the Mahrattas; the chout (tribute) could not be refused, but he lightened the burden of this tribute by despatching his own officials to collect it, and transmit it personally to the Mahrattas. While the Mogul kingdom was hurrying ever more rapidly to its fall, this province rose to considerable importance and prosperity under Asaf Jah; a firm administration secured the maintenance of peace and order; agriculture, manufactures, and trade flourished and prosperity advanced. When the Mahrattas made their advance, Mohammed Shah appointed the capable Nizâm as dictator in 1737; however, the weakness of the empire was so great that even Asaf Jah was unable to bring help either against the Mahrattas or against Nâdir Shâh. In 1741 he returned to his own country. On his death in 1748, at the age of sixty-seven, he left behind to his dynasty a flourishing kingdom of the size of Spain, together with the supremacy of the smaller states in the south of India.

In the east, the Carnatic, that is to say, the lowland beneath the precipices of the ghats, formed one of the states under the supremacy of the Nizâm, and was governed by the Nuwab (Nabob) of Arcot.<sup>1</sup> The smaller principality of Tanjore to the south of Arcot was governed by a descendant of Sivaji, and to the northwest of this district, Mysore began to develop to an independent state (see the map facing p. 430). To these must be added a number of petty principalities, for the most part feudal holdings dating from the period of the kingdom of Bijayanagar (p. 428), or independent creations of adventurous Paligars or Nayaks, who established themselves in some mountain fortress and extended their influence over the surrounding district.

### C. THE OPENING OF INDIA BY EUROPEANS AND THE STRUGGLE FOR ECONOMIC SUPREMACY (1498-1858)

(a) *The Discovery of the Maritime Passage to India from West to East, and the consequent Commercial Enterprises of European States (1498-1740).* — Between India and the western civilizations of the old world commercial relations had subsisted for thousands of years, intercourse being carried on through the medium of the Semitic races, the Arabs in the Indian Ocean, and the Phœnicians in the Mediterranean. After the fall of Carthage (146 B. C.) Rome gradually became supreme over the western world, and her wealth and prosperity brought an increasing desire for the possession of India's products, its precious stones and pearls, and above all, its spices, which had become indispensable. Consequently, a great impetus was given to trade with that distant country, and the commerce thus

<sup>1</sup> Nawwâb or Nuwab, whence the incorrect form Nabob, is properly a plural noun, the plural of the Arabic Nâib or "governor."

developed suffered but a temporary check after the fall of Rome; to this trade the small coast republics of Amalfi, Pisa, Genoa, and Venice (Vol. VII, p. 4) owe their strength and prosperity.

However, the narrow Isthmus of Suez proved an impassable barrier to direct trade. The question arose as to how this obstacle could be circumvented, and how the merchant could himself gather that profit which the Arab acquired as middleman; such questions constantly presented themselves to the enterprising spirits of that age. The journeys of Marco Polo were an attempt to find a trade route to the rich and mysterious countries of the East, and though this explorer produced no tangible result, his accounts of the riches to be found in those regions heightened the desire to find direct maritime communication with the East.

(a) *The Portuguese in India.*—The Portuguese under Henry the Navigator (1394–1460; cf. Vol. IV, p. 539) were the first to solve the problem of the circumnavigation of Africa. Step by step they advanced southward along the west coast of Africa, and in 1487 Bartolomeo Diaz succeeded in sighting Cabo Tormentoso, the Tempestuous Cape. These efforts were then overshadowed by the exploits of Columbus; with unexampled boldness he attempted to find a direct route to India by striking straight across the Atlantic instead of following the coast (Vol. I, p. 349); thus on the 12th of October, 1492, he discovered a new world which he imagined to be the continent of India. In view of this discovery the greater honour is due to the Portuguese for their long and unwearied pursuit of the eastern route, by which they ultimately reached their goal; at the end of 1497 Vasco da Gama (Vol. III, p. 484) rounded the dreaded Cabo Tormentoso, henceforward called the Cape of Good Hope, and on the 20th of May, 1498, his little fleet cast anchor in the roadstead of Calicut. Thus the Portuguese were the first to advance from Europe to India by the maritime route, and for more than a century they held the monopoly of trade with the rich coasts of Southern and Eastern Asia.

Vasco da Gama after a stay of six months returned with the following letter from the Zamorin (ruler) of Calicut to the king of Portugal: "Vasco da Gama, a nobleman of your court, has visited my kingdom to my great joy; herein there is great wealth of cinnamon, spices, ginger, pepper, and precious stones. What I desire from your country is gold, silver, coral, and red cloth." The successful return of the bold seafarer roused a storm of enthusiasm and hope in his native land. Every year fresh enterprises were fitted out; in 1500 Pedro Alvarez Cabral made a second expedition to India, discovering the coast of Brazil in the course of his journey; in 1501 João da Nova made a third, while a fourth expedition was conducted by Vasco in 1502, and a fifth in 1503 by Francisco d'Albuquerque, a cousin of Alfonso the Great. With every expedition the relations of Portugal with India were further extended, and in the "Division of the World" by Pope Alexander VI in 1493–1494, Portugal was already styled "Lord of maritime commerce, conquest, and trade with Ethiopia, Arabia, Persia, and India," that is, with all the countries of Southern Asia. In 1505 the number of the factories that had been settled had become so important that Francisco d'Almeida was sent out to India as the first governor and viceroy.

The struggle with the Arabs for predominance in the Indian Ocean had begun to rage upon the very first appearance of the Portuguese within the boundaries of Asia; at the same time the haughty behaviour, the avarice, and the inconsiderate

cruelty of the Europeans brought them into serious collision with the territorial princes on the Malabar coast, who were by no means united among themselves. The Portuguese often suffered heavy defeats and great losses of men; however, thanks to the superiority of their ships, their armies, and tactics, they gradually gained ground. In 1509 Almeida destroyed an Egypto-Arabian fleet off the heights of Diu. However, Portugal owed her supremacy in the Indian waters to the next governor, Affonso d'Albuquerque (1509-1515); after capturing Socotra and Ormuz in 1507, positions which were soon lost again, he acquired Goa in 1510, Malacca in 1511, and regained Ormuz in 1515. Portugal thus had firm bases for her operations both in the east and west; in Goa she possessed a safe harbour accessible at all seasons of the year, and also a position which became the centre of her Asiatic power, and grew with wonderful rapidity to prosperity. Albuquerque, who was no less great as a man than as a warrior, died on the 16th of December, 1515, in the roadstead before the capital of the new Portuguese possessions; his country rewarded his exploits with suspicion and detraction, whereas the natives long after his death made pilgrimages to his grave and prayed his spirit to protect them from the cruel oppression of his successors.

The power of the Arabs was broken, their fleets were destroyed and their trade shattered; consequently the successors of the great Albuquerque found an easier task before them. In 1515 Soarez established himself in Ceylon; in 1518 trade was opened with Bengal, and in 1543 Salsette (near Bombay) and Baroda were ceded to the Europeans. Sixty years after their first appearance in India the Portuguese were in actual possession of that territory which the papal division had assigned to them. Their influence extended from Abyssinia to China (p. 102), where Macao had been in their hands since 1557, and to Japan (p. 24) which had given them permission to trade. In Arabia they were in alliance with several chiefs and were the dominant power in the Red Sea and in the Persian Gulf. The eastern and western coasts of India were surrounded by a girdle of their fortified trading stations extending from Cape Rames to the Bay of Bengal; their flag waved over Malacca; they were the sole recipients of the valuable products of Ceylon, Sumatra, Java, and the Moluccas.

The first glow of enthusiasm brought the best spirits of the age to share in the attractive enterprises in the far East, and the flower of the Portuguese nobility and the people now emigrated; they had learned bravery and endurance in their long struggle with the Moors, which, however, had also made them intolerant, cruel, and avaricious. Under such capable leaders as Vasco da Gama, Almeida, and Albuquerque, troops of this nature gained great successes; they did not, however, win the good-will of the natives and their trade prospered only under the protection of the sword. The best of the Portuguese were killed off by the murderous climate and the incessant struggle with the natives; the heroes were succeeded by men like Soarez, Sequeira, Menezes, Lopo Vaz, etc., who, in place of the brave and honourable soldiery of former times commanded the offscourings of the country; as early as 1538 it had been necessary to open the prisons in order to provide the Governor Garcia de Noronha with the necessary contingents of troops. The leaders and soldiers rivalled one another in rapacity and inhumanity, and no form of cruelty can be mentioned with which the name of Portugal was not then tarnished. Such action forced the territorial princes to unite for their common defence; in 1567 the Portuguese were opposed by an alliance of all the princes of the west

coast, and in 1578 it became necessary to suppress general revolts on the Malabar coast, in Ceylon, and in Amboina. Such conflicts were naturally not calculated to promote commercial success.

As the military character of the Portuguese expeditions had changed, so also did their religious successes undergo a transformation. After the first exploring journey of Vasco da Gama, Cabral had taken out monks to preach the gospel to the Indian heathen; the greatest of these, the apostle of Christianity to the Malabar coast, was Francis Xavier (p. 24 *ad fin.*); his diplomatic, humble, even timid, methods of action brought him many converts, and under Gabriel de Sa the Jesuits gained great influence. But shortly after Xavier's death (Dec. 2, 1552) the gloomy Dominicans brought into the country the Inquisition with its blighting influence upon all intellectual freedom. As long as every form of belief which differed from papal orthodoxy was persecuted, so long did a heavy weight of oppression lie upon the country.

These evils were further aggravated by the lack of foresight displayed in the commercial policy of the Portuguese. Only once (in 1731), when Portugal had already lost almost all of her Indian possessions, was a commercial company founded upon the model employed by more prudent states; but only once did the king allow the company to send a ship to Surat and to the coast of Coromandel. With this exception, Portuguese commerce with India remained the exclusive monopoly of the crown, which used the most pettifogging devices to protect its privilege of exporting Indian products, in order to raise the prices of them at home to an enormous height. The amount of cinnamon to be placed upon the market for any one year was prearranged, and any excess that might be imported was burnt, in order to maintain prices at their appointed height. At first Portugal made very large profits; while the splendour of Venice rapidly faded, Lisbon became the centre of almost the whole of the Asiatic trade in the sixteenth century, and the ships of every European state came up the Tagus to purchase these costly wares. The profits thus acquired proved, however, of little permanent benefit to the country (cf. Vol. IV, pp. 540 and 547); the crown grew rich, as did certain privileged families and most of the churches and monasteries, while the people were impoverished. As the Portuguese made enemies in India, the profits of their undertakings rapidly diminished and were eaten up by the necessity of providing armed contingents.

It was peculiarly unfortunate that in the year 1580 Portugal was united with Spain under Philip II; his attention was rather concentrated upon the goal of America and upon the religious quarrels in Europe than upon the affairs of the far East. The bigoted monarch exhausted the strength of the Iberian peninsula in disastrous undertakings against the Protestant English and Dutch. In 1588 the proud Armada perished in British waters (Vol. IV, p. 546); yet more disastrous for Portugal was Philip's short-sighted resolve to exclude the Dutch from trade in Lisbon, inasmuch as they had formerly been the carriers of the retail trade between Portugal and the northern countries of Europe; this regulation obliged the enterprising spirit of the Dutch to enter into direct relations with the countries which produced these much desired wares.

(B) *The Dutch in India.* — At first the Dutch hoped to find a new route by which they would avoid meeting the Portuguese, and this was to be a passage to

the northeast. Willem Barends(zon) in 1594-1596 led three expeditions to the Polar Sea, and gained lasting renown as the discoverer of Novaya Zemlya (Nova Zembla); otherwise the attempt led to no result, and cost him his life (June 20, 1597). Meanwhile, however, the Dutch had been directed to the Cape by their own countrymen. Jan Huygen van Linschoten, who had been in the service of the archbishop of Goa for thirteen years, published the account of his travels and his maps at the end of the sixteenth century. A still stronger influence was exerted by Cornelis de Houtman (Vol. VII, p. 88) upon his countrymen. While confined in a debtors' prison at Lisbon he had gained accurate information upon the secret of the Portuguese route round the Cape. Liberated by the voluntary contributions of rich Dutchmen (1594), he induced his patrons to send a Dutch expedition to India under his leadership. In the year 1595 he sailed out of the Texel, reached Sumatra and Java after seventeen months, and returned to Holland in 1598. The commercial success of the enterprise immediately brought about the formation of several commercial companies. Houtman led out a new expedition in person in 1599, which captured the Mauritius from the Portuguese in 1600; he himself was killed during the voyage and lost four ships. The remaining four, however, brought back a rich cargo.

In 1602 the different trading companies were incorporated into the Dutch East India Company. It was now possible to proceed with more energy against the previous masters of the East India trade, whose maritime incapacity soon became plainly obvious. In 1603 a strong Dutch fleet made an unsuccessful attempt to expel the Portuguese from the coast of Mozambique and from Goa; however, in the following years settlements were made upon districts which had previously been in the exclusive possession of the Portuguese, namely, on the coast between Mecca and China, and also on Java and Sumatra. In 1612 the Dutch established themselves in Ceylon and Timor, and in 1614 on the coast of Coromandel (Masulipatam) and Siam; in 1619, after a sharp struggle with the English, they secured the sovereignty of part of Java. Shortly afterwards they made an attempt to secure the sole supremacy of the valuable Spice Islands. In 1622 the English merchants in Amboina were accused, on the evidence of a Japanese soldier, of a conspiracy to surprise the fort of the local Dutch settlement. They were put to the torture until they confessed whatever was required of them; and ten among them were then beheaded without further proof. In spite of this outrage all serious rivalry for the possession of the Moluccas was avoided for a long period; Amboina became the central point of the Dutch East India trade, and from that base of operations the Portuguese were gradually expelled from such settlements as remained to them. The Dutch first advanced into Japan, where they gained the sole privilege of trade, and where, under certain limitations (p. 29), they maintained their ground for more than two centuries; in 1635 they deprived the Portuguese of Formosa, and of Malacca in 1640. Jaffna (see the map, p. 430), the last Portuguese fortress in Ceylon, fell into their hands in 1658. In 1664 Goa was almost the only town left to the Portuguese; Dutch forts and factories now occupied the coasts which had formerly been their exclusive holding. The stages of Dutch progress are marked by their occupation of the Cape, and of Mauritius, which was so-called after their Governor Moritz of Orange. In Persia they had two settlements, and the same number also in Gujerat; on the Malabar coast they had four, on the Coromandel coast three, in Orissa and Bengal five, and in Ceylon

six. Similarly the coasts of East Asia, as far as Japan and the Moluccas, were dotted with their fortified stations.

(7) *The Commercial Undertakings of other European States.*—The extension of Dutch power in the Old World was accompanied by a parallel rise in prosperity in the New World (Vol. VII, p. 89), and the Dutch became a dominant commercial and maritime power; their commercial marine included four-fifths of all the trading ships of Europe, and their trade was five times greater than that of England. The latter country was therefore obliged to summon up all its power if it was not to be left behind in the race for prosperity. The Navigation Acts of 1651 and 1660 (see Vol. VII, p. 98), which excluded the middleman from English colonial trade, dealt a successful blow at the power of Holland. The consequence was a bitter struggle; the two sea powers measured their strength in the three wars which took place in the years 1652–1654, 1664–1667, and 1672–1674. England proved the stronger, and Holland began irrevocably to decline; in consequence it was impossible any longer to insist upon the complete exclusion of all other commercial rivals from East Asia.

At the outset of the seventeenth century some states, roused by the success of the first Dutch undertakings in Asia, had followed the example of Holland. The foundation of smaller Dutch trading companies was followed on the 31st of December, 1600, by the foundation of the English East India Company (Vol. VII, p. 95); in 1604 a French company was founded, as was a Danish company in Copenhagen on the 17th of March, 1616. The Danish company lost one of their ships off the coast of Tanjore. Almost the whole of the crew were murdered by the natives; the captain alone succeeded in escaping to the court of the rājā of Tanjore, where he was hospitably received, and allowed to found a settlement in Tranquebar on the 19th of November, 1620. However, neither this settlement nor that which was made in the same year in Serampur on the Hugli (in Bengal) attained any political or commercial importance; the jealousy of earlier companies in the same locality excluded the newcomers from all business. These settlements, however, attained, as against the Dutch and the English, the fame of introducing the first Protestant mission into India in 1705 (cf. the explanation to the plate, p. 358 of Vol. VII). After a long period of gradual decay Tranquebar quietly surrendered to the English at the beginning of the nineteenth century; in the Peace of Vienna it was restored to the Danes, who sold it to the English in 1845, together with Serampur, for £125,000. The Danish mission was transferred to the Evangelical-Lutheran mission in Leipsic in 1847.

During the seventeenth century Germany, torn by the horrors of the Thirty Years' War and reduced to the extremity of weakness upon its conclusion, was unable to entertain any projects of enterprises beyond the seas. It was not until 1723 that the Imperial East India Company was founded in Ostend and given special privileges by Charles VI. In Coblen, near Madras, and in Banhipur, on the Hugli, two imperial German settlements rose to rapid prosperity and became a source of anxiety to their neighbours. Prince Eugene brought forward a proposal to found a German fleet, and to make Ostend and Trieste the two principal harbours of the empire. However, at the request of the sea powers the emperor withdrew for a period of seven years the privileges granted to the East India Trading Company at Ostend in 1727, a measure which immediately destroyed the

vitality of the undertaking. Further the Mohammedans in the north and south had been stirred up against the two fortified factories by rival traders. Banhipur was besieged in form, and after a heroic defence against overwhelming numbers, the garrison, which had been reduced to fourteen men, was forced to embark for Europe. In 1784 the Ostend India Company ended its existence in bankruptcy.

Upon the withdrawal of the privileges granted to the Ostend company the officials were left without means of subsistence; the Swede Heinrich von König (1686-1736) attempted to avail himself of their experience in commercial matters. However, the Swedish company, which was founded in 1731 and received a royal patent, became extinct after a short and troubled existence.

Frederick the Great of Prussia also turned his eyes toward the far East. He was anxious to make a great harbour and commercial centre at Emden, the capital of East Friesland, which he had gained in 1744; he therefore did his best to further the aims of the Asiatic Company which was founded in that town in 1750; the company sent six ships at intervals to China, but the profits were so small that it collapsed in three years. On the other hand, the Bengal Company, the foundation of which was inspired by the king himself, had been forced to struggle with the hostility of those European settlements which had long previously existed upon the Hugli. When their ships appeared before the Ganges Delta, every Dutch, French, and English pilot declined to give them any assistance upon their entry into the dangerous and difficult passage of the Hugli. However, the ships made their way up the river and, with the help of bribes bestowed upon the officials of the English Company, a vigorous secret trade was begun between the English and German officials; the latter had neither the experience nor the adroitness of the English, and came worst out of every bargain. The necessities of diplomaey which were forced upon Frederick the Great during the height of his struggle with Austria soon led to the dissolution of the Bengal Trading Company.

(δ) *The First English Settlements.* — The first Englishman who visited Indian waters with a fleet was Francis Drake. During his voyage round the world in 1578 he touched at the island of Ternate in the Moluccas, and gained a promise from the native chief that all the spice products of the island should be sold to the English. Drake did not touch the coast of India; the first to enter that land was the Catholic clergyman, Thomas Stephens, who arrived at Goa in 1579 in a Portuguese ship, and then became rector of the Jesuit college in Salsette. His letters excited some attention in England and induced three merchants, Ralph Fitch, J. Newberry, and Leedes, to travel to India overland by way of Tripoli and Ormuz. After many difficulties Fitch reached Ceylon, Bengal, and Farther India, and returned home as he had come, while Newberry set up as a merchant in Goa, and Leedes entered the service of the Grand Mogul.

After the destruction of the Spanish Armada in 1588, the greater English merchants sent private expeditions to East Indian waters which met with complete failure. It was not until the Dutch had proved more successful and had been so short-sighted as to raise the price of pepper, in 1599, to more than double the usual rate (from 3s. to 6s. and 8s.), that the first English East India Trading Company was formed in England, indirectly by the influence of Thomas Cavendish and Drake ("The Governor and Company of Merchants of London trading to the East Indies;" cf. above, p. 454). Queen Elizabeth granted, December 31, 1600,

this company the privilege of free trade with East India, Africa, and Asia, and gave it the right of making laws and exacting penalties in so far as these regulations did not conflict with the laws of the realm of England, together with exemption from taxation upon all exports. The charter of the company was issued only for a period of fifteen years, but contained a clause providing for its renewal "in the event of the undertaking proving advantageous to England;" and the queen recommended the expedition to the good-will of all rulers and peoples whose lands it might visit. As first founded its capital amounted to £72,000, in one hundred and twenty-five shares. For the moment, every voyage was an expedition in itself: the necessary money was provided and the profits were then shared, these amounting to more than one hundred per cent upon one expedition alone, though a change took place in 1612 when the capital of the company was raised to £400,000. Before that date the undertakings led by James Lancaster, Henry Middleton, and others had been little more than piratical raids upon Spanish and Portuguese ships. Middleton felt no pricks of conscience in stationing himself in 1609 at the straits of Bab el-Mandeb, seizing every ship laden with Indian wares, and transferring these valuables to his own vessels after giving in exchange the cargoes he had brought. Edward Michelborne, who was sent out by private individuals in 1605, also plundered the native caravans.

On the whole, these expeditions brought back immense profits, and as in this respect they contributed "to the welfare of England," the patent was readily renewed by James I in the year 1609. However, the Portuguese were predominant throughout India, and jealously resented all attempts at interference. England was therefore forced in 1612 to send four ships of war under Captain Best to protect her trade. Hardly had these arrived in Surat, when they were attacked by a numerous Portuguese fleet before the mouth of the Tapti. The Portuguese were defeated. Thereupon Jehângîr executed a compact permitting the English to trade throughout the Mogul Empire and extending his imperial protection to their settlement in Surat; branch factories from Surat were set up in Gogra, Ahmedabad, Cambay, and Ajmir, and an English ambassador was sent to the imperial court in Delhi (during the years 1615-1618; this was Sir Thomas Roe; cf. p. 436). It was to the favour of Jehângîr that the English owed their commercial settlements in Agra and Patna. They also established themselves in the south on the Malabar coast, in Calicut, and the important district of Cannanore; in 1619 a large area of land was acquired by purchase at Nellore on the Coromandel coast. The behaviour of the English to the native princes, especially to the rulers of the great Mogul kingdom, was at that time modest to the point of subservience; they appeared as peaceful traders, desirous neither of acquiring territory nor of interfering in the affairs of the country, anxious only to devote themselves to trade which was beneficial to India itself.

Shâh Jehân, when fleeing from his stepmother, Nûr Mahal, into the lower Ganges district, had summoned the Portuguese commanders on the Hugli to his help. His request had, however, been haughtily refused, and no sooner had he regained his power than he proceeded to revenge himself; in 1631 he stormed the fortified settlements of the Portuguese and drove them out of Bengal, while his father's good-will toward the English was continued by himself. The emperor's friendly bearing was, however, disturbed by the fact that the rival English company (founded in 1635 by Sir William Courten) piratically captured two Mogul ships,

and, as the report went, tortured the crews. The older company sent an embassy to Delhi in 1637 to recover the emperor's good-will. It so happened that one of the princesses had been severely burnt, and the ship's doctor, Gabriel Broughton, who was brought up from Surat, succeeded in curing her. When asked to name his reward, he requested and obtained from the emperor that the outrage above mentioned should produce no further consequences, and that the English Company should be allowed to extend its business throughout Bengal. A second service of this nature, performed by the same doctor, gained for the company the right of founding new factories on the Hugli and in Balasore in Orissa.

These excellent relations with the Mogul Empire did not long remain unimpaired. The insolence of the emperor's subordinates increased as the power of the empire diminished. During the years 1664-1677, and again from 1679 to 1689, the English settlement was hindered in its trade by the rapacity of a viceroy connected with the imperial house. In January, 1686, the directors in London decided that armed resistance was the only means of putting an end to this arbitrary and intolerable interference. The decision was taken with reluctance, because the policy of the company had been guided, up to this moment, by the principle that war with the native princes was the worst possible danger, and at all costs to be avoided. But when once a change of policy had been decided on, the war was vigorously pursued. Ten ships, mounting from ten to seventy cannon, and carrying seven companies of soldiers, about one thousand men, under the command of Sir John Child, "the Governor-General and Admiral of India," were to attack the Mogul kingdom on the west and on the east; in Bengal the Indian town of Hugli was bombarded; on the west coast the emperor's ships carrying harmless pilgrims to Mecca were confiscated and inland raids were made. The company made no attempt to stop these movements, but threw the responsibility on to the commander-in-chief. Anrang zēb then gave orders to expel the English from India; their factories were attacked and the agents were taken prisoners; Masulipatam, Vizagapatam, Chatanati, and Surat were captured and Bombay was threatened. Negotiations for peace were then begun, but the situation became even more strained when Captain Heath was sent over with orders to continue hostilities, and the agents, from fear of the Mogul, abandoned their posts in a body. At last, however, the company disowned the action of their own governor-general and admiral, who had to bear the whole of the blame; and after making representations of great humility and paying a fine of £150,000, they succeeded in softening the emperor's anger. A fresh rival company again infuriated the emperor by repeated acts of piracy upon his vessels; he deprived the old companies of their property, imprisoned all the English and Dutch in Surat, and blockaded Madras. Once again excuses were made, accompanied by the payment of heavy indemnities.

The company was beset with even more serious difficulties arising from the rivalry of its compatriots. Notwithstanding the privileges that had been granted, individual merchants constantly sent out expeditions on their own account. Moreover the government, disregarding the monopolies which it had given to the old company, often issued patents to new undertakings, which proceeded to exert pressure upon the older foundation until their incorporation with it followed. The old company was constantly obliged to pay for piracies committed by new societies. A rival company of this nature was that founded in 1635 by Sir William Courten, which was named Assada, from a place of settlement in Madagascar, and was in-

incorporated in 1650 with the old London company. Similar instances are the Company of Merchant Adventurers, founded in 1655 and also incorporated with the London company in 1657, and the General East Indian Trading Company, which started with a capital of £2,000,000 and joined the London company in 1709 under the title of "The United Company of Merchants of England trading to the East Indies." The following instance will show the nature of the rivalry then existent. In 1703 Aurang zeb had imprisoned the officials of the old company stationed at Surat. When the order of their release arrived, the agent of the Company of Merchant Adventurers bribed the imperial officials with £2,700 to prolong the imprisonment of his colleagues.

The company was also in constant difficulties with the parliament. Its patent had been issued for a specified period of years, and its renewal could only be brought about by pressure upon the national representatives, each of whom had his price. The company was accused of working its officials on insufficient pay, of lending itself to intrigue and to private trade, of neglecting to protect its Indian settlements, etc. When such charges had procured a sufficient amount of "gratifications" for the parliamentary leaders, the patent was renewed for a certain number of years. Judicial investigation has made it plain that the expenditure in this direction over a number of years amounted to £100,000, in which many personages of importance shared.

However, notwithstanding these disadvantages the prosperity of the East Indian company steadily increased. Its first settlement on the Coromandel coast was a small agency in Masulipatan; this was followed by a fort in Nellore in 1619, by Palipat in 1622, by Armagaon in 1626, and by Madras (Patam) in 1639. Armagaon was placed in an unfavourable position, and was abandoned in 1638; but Madras, protected by Fort Saint George (erected by Francis Day, March, 1639), soon became the chief centre of the company on the Coromandel coast. In 1634 Madras was separated from the presidency of Bantam in Java and became the centre of a special presidency, the boundaries of which soon included all the settlements of Bengal.

When the English first entered India, Surat was the main harbour of the Mogul kingdom, and naturally became the centre of Anglo-Indian trade. A rapidly growing number of agencies and factories sprang up about the town. Surat, however, was exposed to the southwest monsoon, and was unprotected against hostile attacks both by land and sea. For these reasons Bombay proved a more favourable settlement; it was provided with an excellent harbour, and the islands within the harbour mouth were a natural refuge to the inhabitants from the attacks of the Mahrattas. Bombay (Bom bahia, or Good Harbour) had originally been a small Portuguese settlement. Upon the marriage of Charles II with the Portuguese princess Catherine of Braganza, Bombay came into the possession of the English king as part of her dowry, and in 1668 Charles ceded this uninteresting fishing town to the company for a yearly rent of £10. After the Mahratta attack of 1670 the company determined to transfer to Bombay the presidency, the boundaries of which embraced the whole of the west coast together with the settlements on the Persian Gulf and the Euphrates.

The development of British trade in Bengal began at a later period than upon the eastern and western sides of the Deccan. Surat remained the harbour for the reception of that commerce which extended far into the Ganges district up to

Patna, situated near the beginning of the delta. Owing to their unpopularity the Portuguese had been unable to make any great use of their settlement in the Ganges delta, the town of Hugli, situated thirty English miles above the modern Calcutta. When Shâh Jehân drove out the Portuguese in 1631 and handed over the settlement to the English nine years later, the trade with Bengal naturally followed so admirable a route as this great waterway. Formerly British ships only ventured as far as Pippli in Orissa; now they passed up the Ganges as far as the tide would carry them, and collected in Hugli the wares brought down from every part of the great river system of Hindostan. After the good services rendered to the imperial court by the physician Dr. Broughton (p. 457), the English gained the exclusive right in 1645 of trading in Bengal, and prosperity followed rapidly. In 1681 the settlements in Bengal and Orissa were made an independent presidency distinct from Madras. However, in 1686 the governor, Charnock, and all the officials of the company were driven out of Bengal by the Mogul governor, Shaista Khan, and were obliged to take refuge upon a swampy island at the mouth of the river. At a later period they again advanced up stream to Chatanati, near which Fort William was erected for their protection. On the 24th of August, 1690, they effected a reconciliation with Aurang zêb, and permission to trade was restored to them, together with their factories. In 1700 the emperor's favourite son, 'Azîm Shâh, gained them a piece of territory, where the villages of Chatanati, Govindpur, and Kali Ghat as it is known in Akbar's memorials, became the nucleus of the rapidly growing Calcutta. The protection afforded to the inhabitants of the British district while the Mogul Empire was passing through its period of decay and the prospect of rich profit rapidly attracted Indian settlers. In sixty years the three villages had become a capital town, with a population estimated at four hundred thousand in 1752.

(b) *The Struggle of the English and French for Predominance in India (1740-1760).* — The English were now firmly established in India, and nothing seemed likely to disturb the rapid development of their influence. At this moment, however, their very existence was endangered by the appearance of a dangerous rival in the person of France. From the moment when the bitter struggle for predominance in Nearer India begins between England and France, a new period also opens for the population of those districts which became the seat of war. The Mohammedan age comes to an end, and the two following decades, at the end of which the struggle had been decided in favour of the British, form the first section of the "modern period" of East India.

As early as the sixteenth century the attention of France had been directed to India, but in vain. When the weakness of the Portuguese became apparent there was formed, almost simultaneously with the Dutch and English companies, a French company under royal patronage (1604; cf. p. 455). Henry IV conferred extensive privileges upon the company, which founded settlements in Madagascar, but attained no great success for more than sixty years. It was not until Colbert (Vol. VII, p. 104) interested himself in the company in 1664 that its real importance began. In 1668 the first settlements were founded in Surat and Goleonda; in 1672 San Thomé, near the modern Madras, was taken from the Dutch, and the islands of Mauritius and Bourbon were occupied as ports of call on the road to India. In 1674 the Dutch recovered San Thomé; but a portion of the French there

settled obtained from one of the petty princes the cession of a piece of territory on the Coromandel coast, where Pondicherry was founded by Martin (1706). The French were deprived of their new settlements by the Dutch, but these were restored at the peace of Ryswick (1697). In 1729 the town which had been founded by sixty Frenchmen already contained forty thousand inhabitants.

(a) *Dupleix*. — The French also entered into rivalry with the English and Dutch in Bengal. In 1676 Chandernagore was founded, and fortified in 1688. But the short-sighted commercial policy of 1687 forbade the importation into France of the most important Indian products. In 1719 the privileges granted were withdrawn, and the company was at the point of dissolution, when its reorganisation as a simple trading company gave it a new lease of life and revived the prosperity of Pondicherry. A period of great prosperity now followed between 1740 and 1750. In the year 1730 Joseph François Dupleix had been appointed director of the settlement of Chandernagore; he proved so capable a governor that ten years later this town with one hundred and three thousand inhabitants became one of the most important factories in Bengal. In 1742 Dupleix was promoted to the generalship of Pondicherry, and gained so great an influence over the native princes that in 1743, when the rumour came to the defenceless town of Pondicherry of a war between France and England, the Nuwab of the Carnatic (p. 449) forbade all hostilities among the Europeans in his district, at the request of Dupleix. However, in 1746 La Bourdonnais, governor of Bourbon and Mauritius, appeared off the town with a French fleet, and Dupleix persuaded the Nuwab to remove his prohibition of hostilities by a promise to secure for him the possession of Madras. La Bourdonnais first defeated an English fleet at Negapatam, and then captured Madras, which was unable to offer a resistance. An unusually strong monsoon and a quarrel with Dupleix, who was anxious to proceed to extremities against the English, determined La Bourdonnais to return to France with his fleet. Madras was then withheld from the Nuwab of the Carnatic, Anwar ed-dîn, notwithstanding the promise of Dupleix; this ruler, therefore, marched with ten thousand men to expel the French, who, however, repulsed his attack, though they could only oppose him with two hundred and thirty European soldiers and seven hundred Indians drilled in European fashion. This battle at San Thomé is not without importance in the history of India, for here for the first time native troops were employed by Europeans, — the sepoy<sup>1</sup>; in this battle also the European troops gained so great a reputation that henceforward the success of Europeans against the troops of native princes was practically assured.

Dupleix made a vain attempt to drive the English out of Fort David, which was defended by Major Stringer Lawrence; on the other hand the English commander-in-chief, Edward Boscawen, after losing one-fourth of his troops, was obliged to retire from Pondicherry (October 18, 1748), which he had besieged for fifty days with a strong fleet and four thousand men. Shortly afterward the war between England and France was ended by the peace of Aix la Chapelle, by which Madras was restored to the English.

Dupleix had now made for himself an enemy in the person of Anwar ed-dîn, and his immediate object was the removal of this foe. The prince Chanda Sahib

<sup>1</sup> From the modern Persian Sipahi = soldier.

of Trichinopoli, the most enterprising and therefore the most popular of all the princes of Southern India, had been made prisoner in 1741 by the Mahrattas; this man appeared to the diplomatic Frenchman as an eminently suitable implement for the expulsion of Anwar. Dupleix paid his ransom, and Chanda soon collected a force of six thousand men for the purpose of attacking the Nuwab of the Carnatic, who was hated by his own subjects. A fortunate event for Dupleix was the death of the old Nizâm ul-mulk, which occurred at this period (p. 449). He had named his grandson Mozaffar Jang as his successor in the Deccan; but immediately after his death Nâsir Jang, one of the five sons of the Nizâm, had seized the treasury and thereby won over the army. The legitimate successor had won over Chanda to his side by a promise to make him ruler of the Carnatic, and troops were now sent to him by the French under the Marquis de Bussy. Anwar ed-dîn was killed at Amber on the 3d of August, 1749, and his son Mohammed Ali fled to Trichinopoli. As a reward for this victory Mozaffar invested his ally Chanda with the possession of the Carnatic, and ceded to the French eighty-one villages in the neighbourhood of Pondicherry. Immediately afterward, however, he was defeated at Walathawur by his uncle Nâsir Jang, supported by the English troops under Major Lawrence, was taken prisoner and thrown into chains, while Chanda escaped. The conqueror declared Mohammed Ali, the son of the former Nuwab, to be ruler of the Carnatic. However, the fortune of war changed once more with no less rapidity; Mohammed was defeated by Dupleix at Gingen on the 4th of December, 1750, while Nâsir, after losing a battle to Bussy, was killed in a revolt. Thus Dupleix gained the rulers he had desired in the Deccan and Carnatic; the Frenchman received from Mozaffar, on the 15th of December, 1750, in the name of the Grand Mogul, the title of governor of all the land between Kistna (Krishna) and Cape Comorin. Mozaffar Jang was killed three weeks afterward by Europeans. Thanks, however, to the efforts of Bussy, his place was taken by a brother of Nâsir Jang, who was no less favourable to the French. Thus the influence of Dupleix extended over the larger part of the Deccan, and France was now at the height of her power in India.

(β) *Clive's First Appearance and Military Success.* — Robert Clive was born on September 29, 1725. The son of a county magistrate at Styche, in Shropshire, he went to India in 1743, where he was given the position of a writer, the duties of which he fulfilled as little to the satisfaction of his superiors as to himself. Upon the capitulation of Madras he was taken prisoner, escaped to Fort St. David, and was given an ensign's commission under Major Lawrence in 1746. After the battle of Amber, Mohammed Ali, the son of the deposed Nuwab of the Carnatic, had fled to the strong fortress of Trichinopoli, and there offered a brave resistance to the troops of Chanda. When Dupleix had sent a strong reinforcement of French soldiers to support Chanda, the besieged fortress was upon the point of surrender in 1751. Clive, who had already distinguished himself in an assault upon Dâvicotta (1749), made a proposal to his commander to draw off Chanda from the siege of Trichinopoli by advancing upon Arcot, his capital. Clive himself marched upon Arcot with a little force of two hundred European soldiers and three hundred sepoy, and established himself in the town on August 30, 1751. His plan was entirely successful; the Nuwab, with ten thousand men, abandoned Trichinopoli, and Clive held out for seven weeks in an inadequately fortified town against the

furious assaults of the enemy, to whom he could at last oppose only one hundred and twenty Europeans and two hundred sepoy; eventually Chanda retired upon the approach of a body of Mahrattas and English reinforcements. This brilliant exploit immediately placed Clive in the first rank of the heroes of Indian military history; his defence made a great impression upon the Indians, and the splendour of the French arms was dimmed. The French were defeated by Clive at Arni; their force besieging Trichinopoli was obliged to surrender at discretion to the English in June, 1752, and Chanda Sahib, who had surrendered at the same time, was murdered by Mohammed Ali, without interference on the part of Major Lawrence. During the next three years Clive was invalided home to England, which he reached in 1753, and the struggle between the English and the French continued with varying success, until Dupleix was recalled in August, 1754, and his ambitious schemes came to an end with the convention of October 11 and the great concessions which France then made.

The power of the French was now broken upon the coast. In the interior, however, the military and diplomatic skill of Bussy preserved their influence with the Nizâm. Bussy utterly defeated the Mahrattas, who attacked him with far superior forces, and compelled them to conclude a peace; he rose superior to dangerous intrigues and overcame the hostility of the fickle Nizâm with such success that he secured to the French the cession of the four northern Circars (in the northern part of the Kistna plain). However, in 1758 he also was recalled on the proposal of the count Lally-Tollendal, who was jealous of his success, and had meanwhile been appointed governor of Pondicherry.

Hitherto the struggle between the French and the English for predominance in India had been confined to the district of the two southern capitals; now, however, an unexpected danger threatened the victorious British on the north. The dynasty founded in Bengal by Murshid Kulî Khan had lasted but a short time. In 1740 Ali Wardi secured the supremaey, and upon an incursion of the Mahrattas allowed the English to fortify their settlements at Calcutta with a wall and trench, the so-called "Mahrattas' ditch." He died in 1756 and was succeeded by his grandson Surajah ed-dowlah, a passionate and fickle libertine of eighteen years, of low origin, who hated the English and feared their growing power. He immediately marched upon Calcutta. The English made a vain appeal for help to the neighbouring French and Dutch settlements; the town was insufficiently fortified, and was forced to surrender on June 20, 1756, after a defence of four days, during which the greater portion of the inhabitants had fled down stream in boats. Of the survivors, one hundred and forty-six men were confined for the night in the prison which has attained a gloomy notoriety under the name of the "Black Hole," a room a few yards square and ventilated only by two small barred windows; in the morning twenty-three survivors were alone able to stagger out of the contaminated atmosphere.

(c) *The Period of Extortion, 1760 to 1798.* — (a) *Clive's Second Appearance in India.* — News of the disaster at Calcutta reached Madras in August, 1756, where Clive had at that moment returned from England. As soon as the monsoon permitted, he sailed in October for the Ganges delta with Admiral Watson, who had been stationed at Madras, and they recovered Calcutta on January 2, 1757. Clive was anxious to continue his operations, but any further advance was pre-

vented by the news of an outbreak of war with France, at that period the most ill-omened tidings conceivable; he was also obliged to consider the neighbourhood of Bussy, and the influence of that general upon the Nizâm. A convention which the Nuwab of Bengal concluded with the British was immediately broken. With the object of intimidating the French, Clive stormed Chandernagore, the French settlement on the Hugli. To cope with the overwhelming forces of Surajah ed-dowlah he called conspiracy and treachery to his aid. The succession was promised to a relative at the court of the Nuwab, by name Mir Jafir, on condition that he should desert his master with his troops in the course of the expected battle. The Bengal army had taken up a fortified position, numbering fifty thousand men, at Plassey (Palashi, near Murshidabad; or Moxudabad); Clive delivered his attack with a force of only two thousand nine hundred men, and, thanks to the treachery of Mir Jafir and the cowardice of the Nuwab, gained a decisive victory (June 23, 1757). As a reward for his treachery, Mir Jafir was created Nuwab of Bengal, and as a matter of form his appointment was confirmed from Delhi. The Nuwab, who had been taken prisoner, was murdered by a son of Mir Jafir. As the price for his exalted position, the Nuwab paid to the English company and to its officials rich "presents," amounting in all to more than £3,000,000, Clive alone receiving £260,000. Moreover, he invested the company with the rights of Zemindar; that is, the right of raising taxes for the Nuwab over a district round Calcutta of eight hundred and eighty-two square miles (the modern twenty-four Perganas). In 1760 the amount of this tax, which rose to £30,000 yearly, was appropriated to Clive in person by the Grand Mogul. Clive thus became in a sense landlord to the company, which was thus raising taxes on his behalf. This monstrous state of affairs was altered in 1765 by the action of Parliament, which permitted Clive to retain the income for ten years, at the end of which period it was to be paid to the company for the future.

The newly appointed Nuwab of Bengal was speedily threatened by danger from the Hindus. 'Alî Gâhar, the son of the Grand Mogul 'Alamgîr II, had fled from his father's court and been well received in Oudh and Allahabad; after the emperor's murder in 1759, he declared himself emperor of Hindustan, and assumed the title of Shah 'Âlam II (cf. p. 443). With an army of forty thousand men, composed of Afghans and Mahrattas, he marched against Mir Jafir and won a victory over the troops of the Nuwab, which had been reinforced by British sêpoys, at Patna; afterward, however, he was repeatedly defeated with the help of English troops (1760), and was forced to renounce his projects of conquest in Bengal.

Meanwhile the Seven Years' War had broken out in Germany (Vol. VII, p. 537); France and Russia had joined Austria against Prussia, which was now in alliance with England. Count Lally-Tollendal (p. 462), who had been appointed French governor in Pondicherry in 1756, though a man of high military experience and bravery, continually made enemies by his want of tact, with the result that his enterprises invariably ended in disaster. After Bussy had been recalled through jealousy, Forde, who had been despatched by Clive, succeeded in taking the northern Circars from the French; on April 7, 1759, the English got possession of Masulipatam, the last French fortress in the Deccan.

Shortly after his arrival (April, 1758) Lally had seized the English fort of St. David on June 1; he had intended to lose no time in attacking Madras, which was in no position to make a defence, but the French admiral declined to co-

operate, and as the council in Pondicherry declined to vote the necessary supplies, the attempt came to nothing; he then made a vain effort to procure the necessary money by storming Tanjore. Ultimately he besieged Madras and breached the walls of the town, but his own officers then declined to advance to the assault, and the appearance of an English fleet before Madras forced the French to beat a hasty retreat, leaving the whole of their siege train behind (February, 1759). The Nizâm now concluded a convention with the English, and promised to take no more Frenchmen into his service. The appearance of a strong French fleet off Pondicherry raised some final sparks of hope; but after a vigorous and indecisive sea fight, the British remained in possession of the ground, and the French retired to the Isle de France. Lally made a last effort and attacked the English port of Wandewash; he was, however, opposed by Colonel Eyre Coote, who had been sent out by Clive, and defeated on January 22, 1760. Lally was besieged in Pondicherry by land and sea from March, 1760, and was forced to surrender on January 16, 1761. In 1764 he returned to Paris; there the invariably unfortunate general was thrown into the Bastille and beheaded, to the lasting disgrace of his judges, on May 17, 1766. His son owed much to the undaunted representations of Voltaire to Louis XVI, who cleared the honour of this wrongly condemned general in a decree of May 21, 1773.

Thus the second great rival for the supremacy of India had been crushed, although under the "Treaty of Paris" (February 10, 1763), Pondicherry and Chandernagore were restored to the French for a short period (cf. below, p. 470). Clive's activity also reduced the importance of the Dutch in India to a vanishing point. In 1760, when the British found themselves in an embarrassing situation, the Dutch East India Company came to a secret understanding with the treacherous Mir Jafir, and sent out seven large ships with troops from Java to the Hugli. Clive, however, captured these, marched upon the Dutch settlement of Chinsurah, and forced the Dutch to conclude a convention, in which they undertook to raise no further fortifications, and to disband all troops, with the exception of a small body of police. Any breach of these regulations was to be punished by their immediate expulsion.

(β) *Mir Kasim; Further Success on the Part of the Company (1761-1765), and Corruption of its Officials.*—Clive returned to England in 1760, was created Lord Clive of Plassey with an Irish Peerage in 1762, and became a popular hero. However, in India the need of his strong government was everywhere felt. "He had left no regular system of government in Bengal, but merely the tradition that by the terror of the English name, unlimited sums of money could be extorted from the natives." The success of his intrigues with Mir Jafir proved a bad example for the council at Calcutta. The installation of this Nuwab had been attended with such unexpected profits that nothing seemed easier than to renew the attempt. Pressure was brought to bear upon this self-created ruler until he abdicated. One of his relatives, Mir Kasim, was set up in his place. Besides giving immense sums of money to individual civil and military officials, he ceded the districts of Bardwan, Midnapur, and Chittagong to the company as a reward for their services. However, the new Nuwab was an independent, ambitious, and energetic man. He gave his attention to the creation of an independent army, organised and drilled upon European patterns. He showed no inclination to bow

to the aggression of the English traders. It had become a generally recognised custom for the officials of the company down to the poorest clerk to supplement their miserable pay by private enterprises of their own; the ruler of Bengal had remitted all taxes upon the commerce of the company in its corporate capacity, and similar privileges were now demanded for the private trade above mentioned. The Nuwab made complaints to the council; these were naturally unsuccessful, and yet further demands were made of him; he replied by reimposing the taxes upon the company in his own country. This action was equivalent to a declaration of war. The army of the Nuwab, which included the remnants of the French troops, numbered fifteen thousand men, but was defeated by the military skill of Major Tobias Adams at Katwa, Gharia, and Udwa Nala (Rajmahal). Mir Kasim fled to Patna with one hundred and fifty-five English prisoners, and when he was followed by the hostile army, murdered his prisoners and retired with the remnant of his troops to Oudh to the court of Shuja, the ruling Nuwab Wazir. The former Nuwab, Mir Jafir, was replaced upon the throne of Bengal, and once again his installation was accompanied by the usual stream of gifts to the company and its officials.

Meanwhile the storm of the Afghan invasion (p. 447) had burst upon the Delhi kingdom and had utterly defeated the Mogul army at Panipat on January 6, 1761, ten days before the fall of Pondicherry. Delhi was in a state of complete confusion; the emperor fled to Shuja ed-Doula, the Nuwab Wazir of Oudh. Both monarchs recognised the great danger to themselves in the rapidly growing power of the English on the lower Ganges, and Mir Kasim, who brought with him a considerable contingent, was well received at the court of the Nuwab Wazir. The united armies advanced against the English at the moment when the English sepoy troops mutinied; the rebellion, however, was quickly and sternly suppressed, and on October 23, 1764 (not 1761, as appears by a mistake on the map, p. 430) the English, under Major Hector Munro at Baksar (Buxar), utterly defeated the overwhelming forces of the allied Hindu princes. Mir Kasim died in obscurity and misery at Delhi in 1777.

The victory of Baksar was to prove even more fruitful in consequence to the English than that of Plassey. It brought them into direct contact with the ruler of Hindustan, who had hitherto maintained his dignity unimpaired, though his practical power had been reduced to nothing. In the treaties of peace the company was officially recognised as the vassal of Shah 'Ālam, as feudal owner of lower Bengal, Bahar, and Orissa; in 1765 it received the Diwanat, that is, the whole civil and military administration of the province. In return for this the company was obliged to make a yearly payment of £250,000 to the Mogul, to whom was secured the possession of the lower Duab (Allahabad and Kora). Shuja retained his power in Oudh in return for a war indemnity amounting to £500,000; the Nuwab of Bengal, the son of Mir Jafir, who had died in February, 1765, received as recompense for the loss of his Bengal income, £600,000 yearly and the Nizāmate, or right of criminal jurisdiction.

Notwithstanding the huge income which flowed into the coffers of the company, it was not possible to regard the further development of Indian affairs without some feelings of alarm. Every branch of the administration was utterly rotten; from the lowest to the highest, every official was wholly possessed with the desire of enriching himself in the shortest possible time, by any and every means, with the object of spending the rest of his days in England as a "nabob."

The resources of the country were drained with the most appalling rapidity; "Enormous fortunes were rapidly accumulated at Calcutta, while thirty millions of human beings were reduced to the extremity of wretchedness. They had been accustomed to live under tyranny, but never under tyranny like this. They found the little finger of the company thicker than the loins of Shuja ed-Doula" (Macaulay, *Essay on Clive*). The army also had been affected by the bad example of the officials; greed, luxury, and lack of discipline invaded its ranks.

(γ) *Clive's last Appearance in India, and his Death.* — Thus when Clive entered Calcutta in May, 1765, as governor for the second time, he was confronted with a heavy task. He had himself contributed to the abuses which he now desired to check; as an official of the company, he had acquired enormous wealth, and had contributed to the exhaustion of the country by the extortion of enormous treasures from its rulers. In spite of the resistance of every class of the officials, who openly mutinied against him, he put down many abuses with a strong hand, and checked the general corruption. Officials were firmly forbidden to accept presents, and their private trade came to an end; they were recompensed, though insufficiently, by a rise in salaries which was covered by the salt monopoly.

Clive was obliged to leave India in January, 1767, in consequence of illness, and he was never destined to see the country again. The animosity which his actions had aroused among all Europeans in Bengal reached his native land before his arrival home. He did not find the brilliant reception that had awaited his former arrival. Most extraordinary rumours were in circulation concerning him. Ultimately a parliamentary investigation was begun, and he was impeached, — a process which ended in a declaration by the House of Commons that Clive had performed "great and meritorious services to his country." None the less, Clive remained embittered in heart; excessive indulgence in opium undermined his health, and in a fit of despondency he committed suicide on November 22, 1774.

(δ) *The First War of the English Company with Hyder Ali of Mysore.* — After Clive's departure from the scene, embarrassments in India increased apace. His first political action had been the conclusion of peace with the Grand Mogul, and the acquisition of an enormous territory for exploitation by the company; European officials were, however, lacking to carry out the administration. Trained Englishmen were to be found only in the highest posts, and the administration of provincial districts was left to native officials, whose divergent theories upon questions of right and wrong naturally resulted in the greatest difficulties; the higher European authorities must be responsible for any disturbance arising from this cause, since they showed a complete inability to grasp the situation. Dishonesty and corruption had been for centuries the special privilege of inferior Hindu officials, and the Europeans also reverted to their old customs of private trade and the receipt of "presents" as soon as Clive's strong hand was removed. The revenues of the company diminished to an alarming extent, while the expenditure rapidly rose in consequence of military embarrassments in the south.

During the sixteenth and seventeenth centuries a native Hindu dynasty, the Wodeyar, had been settled in the modern Mysore and from comparative insignificance had risen to considerable power. However, during the struggle of the British and the French the Mohammedan General Hyder Ali (born 1728) had

expelled by means of treachery and armed force the weak ruler Chikka Krishṇa Râja Wodeyar; in 1761 he established himself at the head of the government and with the aid of French commanders extended his new dominions at the expense of his neighbours. In 1767 he threatened an attack upon the Nizâm, who secured a defensive alliance with the English at the price of the cession of the northern Circars (p. 463); hardly, however, had war broken out between the English and Hyder Ali, than the cunning Mohammedan won over the Nizâm to himself by promises of pecuniary help. The mounted troops of Mysore drove back the British to Trinomalai; at this point, however, in September, Hyder's career was checked by a defeat which forced him to withdraw his troops to the highlands. A vigorous advance upon the west coast relieved him from the troops of Bombay and secured him in the possession of Mangalore. For a considerable time the struggle continued with varying success upon either side until on the 3d and 4th of April, 1769, the English arranged a peace somewhat inglorious to themselves, upon the condition that almost all the acquisitions made by either party should be restored.

(ε) *Warren Hastings*.—So far from gaining any advantage from the war, the company found its expenses considerably increased. It was impossible to extort money, as previously, by changing the rulers of Bengal, and the larger proportion of the profits upon the ordinary trade flowed into the pockets of the officials. These embarrassments were further increased in 1770 by a terrible famine which swept away one-third of the population of Bengal and reduced the profits of the company to a vanishing point. In 1772 the company was threatened with bankruptcy and could only maintain its position with the help of a considerable subsidy from the English government. The truth was that only a fundamental reform could produce any lasting or beneficial result. During Clive's period Warren Hastings had been a member of the council of Calcutta from 1761 (born Dec. 6, 1732, at Churchill); he was distinguished for his discretion, integrity, and industry. After several years' absence in England he was sent out in 1769 to Madras as a member of the council; at the present moment (1772) he was appointed head of the council of Bengal. Owing to the previously mentioned embarrassments a regulating act, issued in February, 1773, had fundamentally changed the whole constitution of the Indian Trading Company, and Hastings found himself at the head of all the company's Indian settlements. By the new constitution the presidency of Bengal became of predominant importance, for the president as general governor assumed the political guidance of the other presidencies (Madras and Bombay). He was assisted by four councillors and had a casting vote in cases where their opinions were equally divided; in Calcutta, moreover, a supreme court of justice was established in complete independence of the council.

The first general governor found himself in an extremely difficult position. His task was to cleanse the whole Augean stable from the many malpractices which had grown up in every branch of the administration, and everywhere his efforts met with the strongest resistance. An even more serious obstacle was the opposition which Hastings encountered in the council itself; of the four members, three were utterly opposed to his views on every administrative subject, and of these the most vigorous was the capable but ambitious and somewhat jealous Philip Francis (the supposed author of the "Letters of Junius," 1768-1772). The powers and duties of the council and the supreme court of justice were ill defined

and often conflicted, thus increasing the embarrassment of the situation. The adroitness, energy, and perseverance displayed by Hastings ultimately conquered these obstacles. A distinguished Brahman, Nanda Kumar (Nuncemar), who hated the general governor, attempted to use the weakness of his position in the council to overthrow him by the production of false evidence; the governor, however, brought the Brahman to trial before the supreme court on an independent charge of forging a Hindu banker's signature. There is no doubt that Nanda Kumar was guilty on the charge which was brought against him. But it was something more than harsh to apply in his case the English law of forgery, which had never before been used against a native of India. He fell a victim to the resentment of the governor general, and his execution was a lesson to the Hindus not to meddle with the intrigues of Hastings' English enemies. Hastings rid himself of his most furious enemy in the council, Francis, by challenging him to a duel and shooting him through the body; Francis was obliged to return definitely to England in 1780. Henceforward Hastings had a majority in the council and was able to continue his task of reform without further interference in that quarter. The system of taxation was thoroughly reorganised, and Europeans were set over the administration of larger districts. The salaries of all officials were raised and they were strictly forbidden to engage in private trade; the administration of justice was improved by the institution of local courts, etc. In view of the depth of the prevailing corruption it was not to be expected that this process of reform could be completed during the lifetime of one man; but those administrative principles which are in force at the present day were then laid down and the ground was thus cleared for a course of healthier development.

Warren Hastings had been sent out to stop the abuses prevalent in the administration, but above all to wipe out the company's deficit and enable it to pay the highest possible dividend. The country, however, was exhausted, and the process of reform was expensive, and brought no immediate return. However, the governor-general, with his elastic standards of political morality and his ruthless perseverance, succeeded in bringing the second part of his task to a no less brilliant conclusion. Upon a change of rulers in 1766, Clive had reduced the yearly subsidy which the company paid to the Nuwab under the convention from £600,000 to £400,000, and on a similar occasion in 1768 a further reduction of £100,000 was made. Hastings reduced the subsidy by an additional £160,000. The Nuwab was a child in his minority, from whom there was nothing to fear, and the breach of convention implied in this action did not trouble anybody's conscience. The original convention had been concluded only with Mir Jafir, and his successor might well be satisfied that so much had been left to him.

The governor-general, who was never at a loss for means to accomplish his object, found a second rich source of income in the relations of the English to the Grand Mogul. In 1765 the two provinces of Allahabad and Kora and two and a half millions of rupees from the revenue of Bengal had been promised to the emperor Shâh 'Âlam. In 1765 the emperor ceded both provinces to the Mahrattas in exchange for his former province and capital of Delhi, to which he removed in 1771. Thereupon the English not only withheld the payments due to the emperor but sold the two provinces which did not even belong to them for hard cash to Shuja, the Nuwab Wazir of Oudh, the excuse being that the emperor was under the influence of the Mahrattas, who were hostile to England. There was a mixture of

political and pecuniary motives in this transaction. Hastings set the interests of the company above all other considerations. But he was far from thinking that its interests were limited to the pecuniary profit of the moment. He regarded the territory of the company as a State, and in his dealings with the native princes he played for political ascendancy of a lasting kind. This must be borne in mind when we criticise his policy toward the Rohillas. This tribe, living at the foot of the Himalayas, had never come into actual conflict with the English. When Hastings led troops to the Nuwab Wazir of Oudh to be employed against the Rohillas, his enemies saw in the move nothing but a device for raising money. The fact was, however, that the Rohillas had threatened to invade the company's territory, and might one day put their threat into action; and that by handing them over to Oudh the governor-general sowed dissension between the Nuwab Wazir and the Mahrattas, and secured the fidelity of the former in perpetuity. But there are some other transactions in which the pecuniary motive was the chief one. After Shuja's death in 1776 the company made a complaint against his mother and his widow (the two Begums), to whom the ruler had left ten millions of rupees, which, moreover, the council of Calcutta had adjudged to them on the occasion of a quarrel with the successor, Asaf ed-Doula. They were now charged with inciting the Râja of Benares to revolt against the English, were imprisoned and threatened with severe punishment until they surrendered their property. Finally, attention was paid to the rich Râja of Benares, Chait Sing. After he had submitted to an extraordinary course of extortion, he was asked without the smallest excuse to provide a special contingent of auxiliary troops. A dangerous rising of his people was suppressed, and a more pliable râja was set up in his place. By these means the yearly revenue of the company was raised some £200,000 sterling.

(5) *The First War of the English Company with the Mahrattas; the Second War with Mysore; the Return of Hastings.*— In 1761 Peshwa Balaji (p. 447) died in Poonah. His son and grandson soon followed him to the grave, and failing direct heirs to the succession, Raghnat Rao (commonly known as Raghuba) declared himself Peshwa. He was a brother of Balaji, but his succession was disputed, as a son posthumously born of the last Peshwa was shown to exist. Accordingly, Raghnat turned for help to the presidency of Bombay in 1774, promising the two harbours of Bassein and Salsette, which the presidency immediately annexed. When he was attacked by the Mahrattas under Sindia and Holkar, he immediately fled to Bombay and handed over the two harbours by the compact of Bassein (1775). By the new regulations (p. 467) the presidency was no longer allowed to conduct a foreign policy of its own. None the less, troops were sent out under Colonels Egerton, Cockburn, and Carnac, but were so utterly defeated by Sindia in Wargaoon in 1779 that the whole army was forced to surrender. The Calcutta government had not authorised this proceeding on the part of Bombay, but it now became a point of honour to support the defeated party. In 1780 troops were sent westward, Ahmedabad was captured, and on the 5th of August the Mahratta fortress of Gwalior, which had been reputed impregnable, was stormed by Major Popham, who surprised and defeated Sindia by a night attack. The convention of Saldai (1781) freed the English for the moment from this most dangerous adversary, his predominance in the Mahratta territory being practically recognised by the agreement. When peace was definitely concluded in 1782, the Mahrattas received Gujerat,

while the presidency of Bombay remained in possession of Bassein and Salsette, and Raghnat renounced the position of Peshwa in return for a yearly subsidy. A year before the defeat of Wargaon (1778), war had again broken out between England and France, and Pondicherry was captured in October (restored to France in the Peace of Versailles in 1783). The project was formed of taking Mahé on the west coast (see map, p. 430) from the French, and troops were sent to Madras through the State of Mysore without obtaining permission from the ruler. Hyder Ali, who was smarting under earlier provocations, invaded the Carnatic with a strong force in July, 1780, and on the 10th of December utterly defeated at Perambokam the army of Madras, which was inferior in numbers, and feebly commanded by Baillie. The commander had himself hoisted the white flag. However, when the Mohammedans advanced without precaution, they were received with a sharp fire. In their fury at this treachery they would have cut the English to pieces had they not been restrained by their French officers. Thomas Munroe, the leader of the second English army, threw his guns into a tank and fled to take shelter in Madras. The whole Carnatic was devastated by Hyder in order to deprive the English of the means of continuing the war. As soon as the news of these disasters reached Calcutta, Hastings concluded the war with the Mahrattas, and sent out fresh forces under Sir Eyre Coote (p. 464), which arrived at Madras at the end of 1780. On the 1st of July, 1781, the forces of Mysore were defeated at Porto Novo. After long manœuvring on either side, Coote defeated the enemy on the 2d of June, 1782, at Chittur. In the same year (10th of December) Hyder Ali met his death at the siege of Vellore. His son, Tippu Sahib, continued hostilities with much success (April, 1783, the investment of General Matthews in Bednar; 20th of June the victory of the French admiral Suffren, allied with Mysore, at Cuddalore). It was not until the 11th of March, 1784, that the peace of Mangalore was concluded on the condition of a mutual restoration of conquests.

In the spring of 1785 Warren Hastings returned to England. His financial measures met with the approbation of the company, though not of the public conscience. Under the India bill passed by Pitt on the 18th of May, 1784, which subjected the control of Indian affairs to a ministerial board, he was impeached before parliament in 1787 for various breaches of justice and acts of extortion. The trial ended in 1795 with his acquittal, after his property had been exhausted in legal expenses. However, after the payment of his debts, the company assigned to him a yearly pension of £4,000 for the relief of his old age. He died on the 22d of August, 1818, honoured by the king and restored to popular favour.

(7) *Lord Cornwallis; the Third War against Mysore.*—The governorship of John MacPherson was marked by no event of special importance (1785–1786); he was relieved by Lord Cornwallis (1786–1793). This governor had fought unsuccessfully in the North American war of independence (Vol. I, p. 472), but was reputed to be an honourable and benevolent gentleman, and for this reason was entrusted with the task of establishing a definite system of land taxation in Bengal. The new governor-general immediately arranged that the land tax should be established for ten years at a rate determined by the previous receipts. In 1793 this arrangement was made permanent. Opinions are divided as to the value of this reform, which fixed the revenue of Bengal from ground taxation at three millions of pounds sterling. Local rights and customs which could not be left out of con-

sideration in determining the amount of taxation were highly complicated, difficult to understand, and widely divergent in different districts. Injustice could, therefore, hardly be avoided. Generally speaking, the large landed proprietor (Zemindar) was too leniently, and the peasant (Ryot) too heavily taxed. Cornwallis introduced changes which made for progress in other branches of the administration. The officers of the company were placed on an equality with those of the military forces, courts of criminal justice were placed exclusively under European control, the salaries of the higher administrative officials (collectors) and of the judges in the provinces were raised, etc.

The foreign policy of Lord Cornwallis was not free from embarrassment. Tippu Sahib (Tipû Sultân), the new ruler of Mysore, was a passionate and revengeful character, brave, cunning, and persevering. In 1787 he had sent an embassy to Louis XVI, and had entered into relations with the governor of Pondicherry and with the Afghans, the Mohammedan power on the north. In December, 1789, he attacked the Râja of Travancore, who was in alliance with the English. Though his attempt proved unsuccessful, he was a dangerous neighbour for the English in Madras, and Cornwallis immediately allied himself with the Mahrattas and the Nizâm with the object of overthrowing Tippu and dividing his land among the allies. However, the war of 1790 was carried on without energy. Lord Cornwallis then took the lead of the English army in person, and in 1791 a victory was gained at Bangalore, followed by a rapid advance upon the capital of the enemy. Cornwallis, however, was abandoned by his allies and was forced to return, leaving his siege train behind. In 1792 he brought up reinforcements and stormed the fort at Tippu, captured his person in Seringapatam, and dictated conditions of peace to him on the 24th of February. Tippu was obliged to pay a war indemnity of three million pounds and to cede half his territory, Malabar and Kurg (Coorg), to the allies, who divided it among themselves.

(θ) *Sir John Shore and the Compulsory "Subsidiary Alliances."*—Lord Cornwallis was succeeded by a colleague who had taken the largest share in the work of reforming the taxation, and who also possessed a profound knowledge of Indian affairs, Sir John Shore (1793–1798; Baron Teignmouth since 1797). His government was chiefly remarkable for his introduction of the principle of "subsidiary treaties" into the Indian policy of the English. Upon similar devices to regulate the doubtful relations between the company and the States of India, see below, pp. 481 and 488. The Nuwab Asaf ed-Doula of Oudh (p. 469) had died in 1797, and the accession of his son, Wazir Ali, was cordially accepted by the government in Calcutta. It was, however, soon discovered that the youthful neighbour was not a pliable subject and might possibly be added to England's enemies. Shore hastened to the capital of Lucknow, and discovering that Wazir Ali was not of pure birth, transported the prince to British territory, and placed on the throne Asaf's brother, who seemed of a more pliant disposition. The price paid by this ruler was the cession of the fortress of Allahabad, the promise to enter into political relations with no other State, and to pay a yearly subsidy of £760,000 to support ten thousand British soldiers, who were intended rather to suppress any seditious movements on the part of the subsidised ally than to protect him against his foes.

(d) *The Imperialist Idea and the Age of great Territorial Acquisition (1799-1828).*—While the English power was thus rapidly growing in India, European politics had been shaken to their foundation. From the ruins of the French Revolution had risen the gigantic figure of Napoleon Bonaparte (Vol. VIII), a power apparently aiming at world supremacy. The English had good reason to tremble for the safety of their foreign possessions. Bonaparte advanced upon Egypt to subject Mohammedanism to his power (Vol. III, p. 691); Mauritius (1715-1810, French) and Bourbon (1646-1810) formed excellent calling stations on the road to India. French officers and soldiers, the remnants of the age of Dupleix (p. 460), were to be found in the different Hindu and Mohammedan States of India in the service of the native princes, whose armies they drilled upon European models. Thus the troops of the Nizâm had been excellently trained by Bussy (p. 460), and at a later period by his successor, Joachim Maria Raymond. In the service of the sultan of Mysore, and in the armies of the Mahrattas, numbers of Frenchmen were to be found in higher and lower positions (P. Perron, de Boigne, etc.). The more capable were the troops entrusted to their leadership, the more difficult was it for the English to secure their power in India from the attacks of the enemies which surrounded it.

(a) *Wellesley; the Death of Tippu; the Second Mahratta War.*—For such a task no more capable man could have been found than the successor of Shore, Richard Cowley, Baron Wellesley, Earl Mornington (1798-1805), a man "of the stuff of which conquerors are made," ambitious and not wholly unselfish, of lofty and far-reaching projects. A warm friend of Pitt, he hated the French no less bitterly than that statesman, and England's great enemy aroused in him the thought of world supremacy. Thus he was the first pioneer of British imperialism.

His views were largely helped by the state of political affairs in the native governments of India. The treaty proposed to the Nizâm of Haidarabad, providing that instead of French he should maintain English troops, and should enter into an offensive and defensive alliance, was accepted, after some hesitation, on the 1st of September, 1798. In February, 1799, Tippu, Sahib of Mysore, was requested to break off all connection with the French and the Mahrattas, a demand which he met with an emphatic refusal. Mornington reinforced the English army and assured himself of the neutrality of the Peshwa in Poonah. He then ordered his troops to advance in two divisions from Madras upon the enemy's capital, one division being under the command of General Stuart of Bombay, the other under his brother Arthur (the future Duke of Wellington, 1814). On the 4th and 6th of March the sultan was defeated, and on the 4th of May, 1799, General Harris took Seringapatam by storm; Tippu fell fighting bravely on the threshold of the palace. The State of Mysore was reduced in extent upon the north and east, and the confiscated territory divided between the allied Nizâm and the presidency of Madras. The throne thus vacant was occupied by a child of three years old, the grandson of the last Hindu ruler of the family of Wodeyar, who had been expelled by Hyder Ali (p. 466). Tippu's son received a yearly pension, and lived at first in Vellore and afterwards in Calcutta.

The imperialist views of the governor-general were not satisfied by these small successes. Between the earlier possessions on the coast of the Carnatic and the new acquisitions in the interior were situated two principalities, the acquisition of

which was wanted to complete the presidency of Madras. The Râja of Tanjore was deposed without ceremony (1799), and his place was given to a nominal ruler, who promised to surrender his territory on receipt of one-fifth of the gross revenue. In the Carnatic (Arcot) the old Nuwab, famous in Clive's first exploits (p. 461), had died in 1795. His feeble successor was unable to pay the large subsidies demanded by the English for their assistance against the Mahrattas in Mysore, and was therefore obliged to abdicate. The new ruler was forced to agree to a convention in 1801 which left the English in possession of the whole of the administration, military and civil.

The governor-general had meanwhile received the title of Marquis of Wellesley for his services in the war with Mysore; he now found a heavier task before him in the north of India. Shâh 'Âlam had returned to Delhi from Allahabad, but had been blinded by a Rohilla rebel. The few square miles which he possessed around the ancient palace buildings of his ancestor, Shâh Jehân, were in themselves of far less importance than his hereditary dignity of Grand Mogul, his possession of which was recognised or tolerated throughout India by the various claimants for supremacy, according as these were weak or strong. The Mahratta confederacy offered a much stronger opposition to the aims of Wellesley. In this case also the position of the Peshwa as commander-in-chief (p. 448) had long since disappeared. Individual princes were careful not to dissolve the confederacy, but did their best to obtain the utmost possible independence for themselves, while the stronger among them made continual efforts by treachery or force to secure a dominant position at the expense of the Peshwa. The overthrow of this system must necessarily begin with the destruction of the Peshwa.

After the death of Tukai Holkar in 1797 in the Mahratta State of Indore (Holkar dynasty, p. 449), a dispute concerning the succession had broken out between his two legitimate and one natural son, Jaswant Rao. Notwithstanding the hostility of his neighbour, Doulet Rao Sindia (at Gwalior since 1794), the last-named held the upper hand. His troops marched upon Poonah to secure the co-operation of the Peshwa by force. Wellesley now had an opportunity of proposing an offensive alliance to the weak Mahratta chief, and had already reinforced his troops against the company's desires in view of these approaching complications (1801). The Peshwa, however, shuffled and prevaricated. In the following year Wellesley repeated his proposals, but was unable to gain a hearing; the Peshwa preferred to trust himself to Sindia than to the English. When, however, his army was utterly defeated at Poonah by the bold Jaswant, the Peshwa in terror took refuge within the English lines at Bombay. Proposals were again offered to send British troops into his territory, for whose maintenance he should cede a district of some size. The Peshwa still hesitated. Two English armies were, however, approaching, and Wellesley threatened to raise his demands. The hard-pressed ruler therefore signed the Convention of Bassein on the 31st of December, 1802, in which the British were associated with him in a "defensive alliance" which implied the renunciation of all political independence on the part of the Peshwa.

The conclusion of this convention naturally aroused all the Mahratta princes to the highest point of excitement, especially Doulet Rao Sindia, who had acquired the greatest influence over the Peshwa. As things were, "the turban had been taken from his head." Wellesley left him little time for action. The English

troops advanced by forced marches and occupied Poonah in May, 1803. A similar offer of defensive alliance was now made to Sindia and Raghujî Bhonsla of Berar, and was in both cases refused. The English civil officials about Sindia's person were now withdrawn, and his adherents and his army were bribed to treachery. At the same time two English armies advanced against the two Mahratta princes,—one into Hindostan, under the leadership of the Indian commander-in-chief, Gerard, General Lake; the other into the Mahratta States, under Major-General Arthur Wellesley. Ahmadnagar was captured by the latter. A special division under Colonel Murray stormed Darotsh (Broach) on the lower Narbada. On the 23d of September, 1803, Sindia himself met with a severe defeat at Assaye (Berar). A force now advanced upon Raghujî Bhonsla of Berar. Kattak in Orissa was occupied, the fortress of Burhanpur was captured, as also was Asir, though reputed impregnable, and ultimately Bhonsla was himself totally defeated by Wellesley at Argaon. After several further disasters he sued for peace at the end of 1803. In the compact of Argaon on the 17th of December he was obliged to renounce his right to the Mahratta tribute, to cede Orissa to the British, and Northern Berar to the Nizâm.

Sindia, however, hesitated to conclude peace, hoping that affairs in the north would take a more favourable turn. On the 14th of September, Lake had stormed the Mahratta fortress of Aligarh (Alighur) which had been reinforced by the Frenchman Perron (p. 472); on the 11th of September the troops of Sindia under his second military adviser, de Boigne, had been defeated before Delhi, and the blind Shâh 'Âlam had been definitely freed from his dependency upon the Mahrattas. The English provided a monthly subsidy of ninety thousand rupees and the revenues of the old capital with its immediate surroundings for the support of the Mogul; however, they themselves had seized the whole of the Duab between the Jumna and Ganges. From Delhi, Lake marched to Agra and obliged a Mahratta garrison to surrender on the 17th of October, 1803. On the 1st of November the last Southern army of Sindia, under Ambaji, was finally defeated at Laswari. Sindia now consented to the treaty of Surgi Arjangaon, in which he resigned all claims to Hindostan and promised to take into his service no Europeans whose native countries might be in a state of war with England.

Hitherto Jaswant Rao Holkar had maintained an attitude of neutrality. Wellesley, however, demanded that he should renounce his right to the Mahratta tax, as not being the lawful governor of Indore. Holkar declined to agree, and a year of bitter struggle followed, in which the British suffered severe losses. General Monson, having pursued a retreating army too hotly into Central India, was cut off from his base, and threw away five battalions of sepoys; Lake himself fared little better at the siege of Bhartpur; Jaswant secured favourable conditions on the 10th of April, 1805. After a resumption of hostilities against the English, Holkar was forced definitely to submit; in the treaty of Amritsar (December, 1805) the town and district of Gwalior were left in his possession, but the Chambal River was fixed as the boundary of his territories.

(3) *Sir George Barlow.*—Richard Wellesley was in advance of his times. Even minds like Pitt, David Dundas, Canning, and Arthur Wellesley could not observe with equanimity the growth of the British power with such rapid strides; at the same time the general political conscience had not been sufficiently developed

to see no harm in the constraint laid upon foreign princes. The dangers that might be expected to arise from these actions were also a cause for apprehension. The peddling spirit of the company during this period of military action was occupied solely with the two facts of heavy expenditure and diminishing income. Criticised on more grounds than one, Wellesley was thus recalled by the British government. In 1805 Lord Cornwallis was again sent out to India as governor-general with orders to keep the peace at all costs.

Ten weeks after his arrival he died (the 5th of October) and his place was taken by a civilian, Sir George Barlow, who, from 1805 to 1807, conducted the course of affairs and attempted to complete his appointed task of restoring peace. Even then, however, the war with the Mahrattas had not been definitely ended, but Lord Lake (died February 21, 1808, as viscount and governor of Plymouth) was forbidden to undertake any further operations. The Mahratta princes were conciliated by a policy of concession; negotiations with Sindia reached their conclusion and Holkar (see p. 473) secured a peace by no means disadvantageous to himself. Both were left free to act against the Rajputs who were friendly to the English, and these powers were soon involved in mutual quarrels without English interference. The government having thus declared its weakness, the Mohammedan troops stationed at Vellore were easily induced by the sons of Tippu to revolt; on the 10th of July, 1806, a dangerous revolt broke out, which was only suppressed at the cost of considerable bloodshed. Barlow was shortly after removed in consequence and given the post of governor in Madras.

(7) *Lord Minto; the Opening of Political Relations with non-Indian States.* — Barlow's place was taken by Sir Gilbert Elliot, Baron Minto, a more vigorous and energetic ruler, who held his post from 1807 to 1813. His immediate task was the solution of small difficulties with robber hordes and unimportant princes, which was easily performed. French influence had raised greater fears. With Portuguese permission Minto occupied Goa and the Danish colonies (Tranquebar), and further proceeded to seize the French Asiatic Islands in order to place the maritime route to India in English hands. A welcome pretext to interference was provided by the growth of piracy in the Indian Ocean. Bourbon (Réunion) was easily captured on the 8th of July, 1810, as also was Mauritius (Isle de France) after a harder struggle, the latter remaining in English hands, while the former island was given back to France on the 2d of April, 1815, after the first Peace of Paris of 1814 had restored Minto's other conquests to their former owners. He then proceeded against the islands in the Malay Archipelago which the French had taken from the Dutch; a small English expedition seized Amboina, Celebes, and Ceylon in 1810, while a larger force, accompanied by the governor-general in person, occupied Java in 1811, which Napoleon had strengthened with reinforcements of French troops; in 1812 the Dutch colonies in Sumatra and Borneo suffered the same fate.

The fear of a possible French invasion also led to the opening of political relations with non-Indian States; Lord Minto sent ambassadors to his neighbours on the northwest. Of these the most successful was Sir Charles Metcalfe, whose calm bearing, supported by the approach of British troops, brought about the conclusion of a convention with Ranjit Singh, the prince of the Sikhs (p. 445) on the 25th of August, 1809; it was arranged that the treaty should remain in force for

thirty years to the mutual advantage of the contracting parties and to that of the Rajput States. On the other hand, Mountstuart Elphinstone secured little by the treaty which he concluded at Cabul on the 17th of June, 1809; the compact with the Prince of Sindh at Haidarabad on the 23d of August, 1809, led to no great result. Equally unsuccessful was Colonel John Malcolm at the court of Fath 'Ali of Persia, where he was anticipated by General Matthieu Claude de Gardane, who had been sent out by Napoleon I in February, 1807; however, the development of affairs in Europe speedily ended the prospect of a Franco-Russian alliance with Persia; Gardane left the country on the 16th of February, 1809; and in 1814 England secured the conclusion of a convention with the shah.

Minto's predecessor, Barlow, had been forced while general governor to suppress a bloody revolt of the troops; a similar and far more dangerous movement broke out under his governorship in Madras. Quarrels between him and his superior officers resulted in a general mutiny of the staff against his presidency which extended to Mysore and Haidarabad. More than a thousand officers were in open revolt, but Lord Minto by the exercise of considerable tact was able to recall the mutineers to their duty. Barlow, however, was deprived of his office as governor of Madras.

(δ) *Lord Moira (Hastings); the War with the Ghurkas, Pindaris, and Maharrattas.* — Lord Minto's policy had been directed almost exclusively against England's hereditary enemy; in accordance with his instructions he had attempted no interference in the affairs of India itself. Francis Rawdon, Lord Moira (1813–1823) was the first to re-enter the path which Wellesley had opened and to bring the imperialist policy which he had begun to a definite conclusion. He was a statesman of high capacity and excellent training, of lofty and benevolent ideas, with clear foresight, and enthusiastically determined to make England the paramount power in India.

The storm which was to definitely subjugate the yet independent parts of India to England under his government rose in a quarter where it had been least expected, in Nepal. This long stretch of territory on the southern slope of the Himalayas (see the map, p. 430) had been inhabited from the remotest ages of antiquity by a mixed race of Dravidians, Mongolians, and Aryans; the brave Gurkhali or Ghurkas situated in the western part of Nepal could not deny their mixed origin, though they also claimed to be descended from immigrant Rajputs. Their energetic rulers, Prithwi Narayan (1771) and Râja Bahadur Sahi (1775–1806) had made them the dominant power in Nepal, and they now required space for expansion; on the west their path was barred by the mountain ranges and the powerful States of the Sikhs; they therefore advanced southward, following the path of the river, and attempted to make the Ganges their frontier. War consequently broke out in 1814. Lord Moira sent out two divisions, which were to meet at Khatmandu, the western under Major-General Sir Robert Rollo Gillespie, the eastern under Major-General Sir David Ochterlony. The western army first came into action before Fort Kalanga, and was defeated by the Ghurkas with their short knives, Gillespie being slain; from that point disaster repeatedly overwhelmed the troops, which were led by officers who were either reckless, careless, or cowardly. The advance guard of Ochterlony's army was taken prisoner with its imprudent leader. Then, however, fortune changed. The Ghurkhas, numbering twelve

thousand only could not hold out for an indefinite time against the superior numbers of the English, their better armament and superior military science; one after another their fortresses fell, and most of them were forced to surrender in May, 1815. Peace, however, was not concluded until the 3d and 4th of March, 1816, in Segauli. The British thereby acquired Kamaon, a belt of land on the southern frontier of Nepal, where are now situated the health resorts in the Ganges territory for the recuperation of European officials (Simla, Dagoshan, Ranikhat, Naini Tal, etc.). The Mahratta princes whom Wellesley had reduced were inspired with malicious joy and increased hopes when they saw a handful of bold native warriors inflict heavy losses upon the English, and tarnish the halo of victory which had surrounded them since the time of Clive. Gloomy and portentous reports passed from the residency to the courts of the princes in defensive alliance with the company. Moreover, robber bands from the armies of the shattered Mogul kingdom had made their appearance, and had united into a powerful force under the leadership of dismissed officers. These Pindari, living like gipsies in the jungles, appeared from time to time to carry fire and murder, plunder and rapine throughout the prosperous districts. The Mahratta princes recognised their existence in so far as they exacted tribute from the robbers infesting their own country. Thus the bands of Amir Khan became a regular institution in the state of Holkar, while the Pindari of the robber chieftains Karim Khan, Dost Mohammed, Chitu, and others devastated the territories of Sindia, and paid tribute to the ruler for the privilege. They now turned their greedy gaze upon English territory. The government in London turned a deaf ear to the representations of the governor-general. It was not until the Pindari had made an incursion into the British Carnatic and inflicted damage to the extent of several thousand rupees that the more energetic George Canning came into office as president of the India Board of Control (p. 470); and after the Ghurka war had been brought to a prosperous conclusion, the governor-general, who had been created Marquis of Hastings, obtained permission to act vigorously.

With considerable prudence Hastings had already prepared two armies, the numbers of which (120,000) were far superior to the scantier hordes (23,000) of the Pindari; he contemplated a severer task, and intended to overthrow the sovereignty of all Indian princes once and forever. In his proclamation Hastings claimed general paramount power for England for the first time; lawlessness was to cease, and peace to be restored "under the protection and supreme power of the English government." Notwithstanding the Convention of Bassein (p. 473), the Peshwa, Baji Rao II, continued to lay claim to the leadership of the Mahrattas, and maintained a body of troops, a proceeding now contrary to rule. However, the watchfulness and the firm behaviour of the resident at his court, Mountstuart Elphinstone, forced him to sign a new convention in June, 1817; in this he recognised his position as dependent on the company for the future, renounced all political alliances, and gave up a piece of land, the revenue of which to the extent of two million five hundred thousand rupees was to maintain a body of English troops for his protection. It was an easier task to secure the promise of Sindia to observe neutrality, and the consent of Appa Sahib (Mudhaji II) of Berar to a subsidiary alliance.

In July, 1817, the two great armies, led by the governor-general in person, set out from north and south against the robber bands, with such circumspection that

they were equally able, in case of need, to turn upon a revolted Mahratta prince. As a matter of fact the Peshwa speedily regretted the compact that had been forced upon him, burnt the residency and made a furious but futile attack upon the sepoys of the resident. The British troops soon appeared, occupied Poonah, and drove out the Peshwa, who at once fled to Mudhaji II of Berar and induced him to attack Jenkins, the resident at his court, in like manner. The attempt proved no less unfortunate, and the attack ended with the imprisonment of Mudhaji. Sindia, whose behaviour was equally suspicious, was so closely blockaded in his capital of Gwalior by the English troops that he was unable to begin any aggressive movement; in 1827 he died and left the regulation of the succession to the British resident. Ultimately the Peshwa abandoned Holkar after his troops had been beaten by General Sir Thomas Hislop at Mahidpur. The Peshwa with the remnant of his troops suffered a last reverse at Ashta, not far from Satara; he himself escaped, but after a period of flight fell into the hands of the English. At a later period Nagpur, the capital of Mudhaji who had escaped the English, was captured and his troops defeated at Simajar; fortress after fortress was stormed, the stronghold of Asinghar being the last; the exiled prince ultimately took refuge in the Punjab with the Rajput prince of Jodhpur, where he ultimately died.

Thus in the year 1818 the three Mahratta princes who took part in the war against the English were all reduced. The possessions of the Peshwa (Poonah) were chiefly incorporated in the presidency of Bombay; a small district was made a principality, and a forgotten descendant of Sivaji (p. 440), was installed as ruler, while the deposed ruler of Poonah was confined to Bittur near Cawnpore, with a yearly income of eight hundred thousand rupees. As rulers of Indore (Holkar dynasty) and Nagpur (Bhonsla dynasty), children were appointed, with a British regent during their minority.

During the course of this struggle, the other task of destroying the Pindari was accomplished; it was an unceasing chase of an animal to be hunted to death. Bands of robbers were wiped out of existence; some of the leaders escaped into concealment (*c. g.* Chitu, who was devoured by a tiger). Those who escaped the persecution settled down as peaceful peasants; the happiest fate was that of Amir Khan, who made a timely surrender and received a part of the land taken from Holkar as a vassal of England.

(*ε*) *Lord Amherst and the First War with Burmah.* — By the prosperous conclusion of the last Mahratta war the boundaries of the British rule had been completed and determined for more than a quarter of a century. During this period no military disturbances of any importance took place in Central India, although the storm continued to mutter in small revolts for many years afterwards. On the other hand, the rule of the next governor, Lord Amherst (August, 1823–1828) was occupied by a great war with Burmah. In Assam, which Shembuan (p. 522) had incorporated with Burmah, dissensions had long existed concerning the delimitation of the extensive frontier, and the imposition of custom duties. Eventually (the new governor-general had not been two months in office) a sepoy outpost was destroyed by the Burmese, and Lord Amherst's request for indemnity was answered by a fresh incursion of the Burmese into the Island of Shajuri before the eastern mouth of the Ganges, and the capture of two British officers. War thus became inevitable, though the conduct of operations was careless, slack, and improvident.

Divisions were sent out from Bengal and Madras; these effected a junction on the Andaman Islands (see the map, p. 539). The troops, under Archibald Campbell, landed at the mouth of the Irawaddi and occupied Rangoon on May 11, 1824; this town, though only seventy years of age, had already risen to be the second most important city in Burmah. However, as it happened, the southwest monsoon had begun, and the whole country was transformed into a malarial swamp, in which movement was impossible; the Irawaddi was also so swollen as to be unnavigable; the soldiers died by thousands of malaria (forty-five per cent of the whole number perished without ever having seen an enemy). It was not until December that the most capable of the Burmese generals, Bandula, appeared before Rangoon and blockaded the town; the troops there stationed had improved in health, and had been strengthened by reinforcements; after a siege of several weeks the Burmese forces were driven back from Rangoon. The British, however, abandoned the plan of advancing by the river in ships, and proposed to send out two new expeditions from Assam and from Chittagong and to advance through the enemy's country upon his capital. The first division spent three months wandering in the forests of the frontier, and failing to discover the enemy returned home. The second division, even before its despatch in October, 1824, had been disturbed by the mutiny of a native Bengal regiment which was excited by the obvious lack of preparations. The mutineers were shot or cut down. The expedition then marched by land to Chittagong, reached Arakan, and captured the chief town of the province, but was then decimated by malaria. In February, 1825, the military authorities determined to send another army up the Irawaddi under Campbell. The brave Bandula was killed by a cannon-ball at Donabew; his troops were thrown into confusion and put to flight at Prome during the first three days of December; negotiations were then begun in Pagan. These, after many interruptions resulted in the peace of Yandabo on February 24, 1826, when the British troops were only a few days march from Ava. King Phagyi-dau was obliged to cede to the company the provinces of Assam, Arakan, and Tenasserim (two valuable rice-growing provinces) with a territory at the mouth of the Salwin (where Moulmein was founded); the war had cost the English five thousand men ( $72\frac{1}{2}$  per cent of the forces employed) and one hundred and thirty millions of rupees.

As in the case of the Nepal war, so also the disturbance of the Burmese war sent its last waves deep into the heart of India. With the exception of the earlier British possessions in Bengal and Madras, the country was in a state of ferment; robber bands appeared in many places, petty princes constantly showed hostile tendencies, while others broke into open revolt and were suppressed by force of arms. The unsuccessful siege of the capital of Bhartpur by Lake (1805; cf. p. 474) had spread the conviction of its impregnable power far beyond the boundaries of its petty State, and it became urgently necessary for the English to destroy this idea. The rāja who died in 1825 had left a son who was a minor; Durjan Sal, the brother of the deceased ruler, seized the regency on behalf of his nephew; the English then accused him of trying to supplant the lawful heir and invited him to abandon the country in return for an indemnity. Upon his refusal, the fortress was vigorously attacked and stormed after a siege of five weeks by Lord Combermere (1826); Durjan Sal was captured in flight and confined in British territories as a State prisoner.

(c) *Lord William Bentinck (1828-1835)*.— During the period between the last Mahratta and the first Sikh war, that is, the period between the year 1818 and 1845, those parts of India subject to English government enjoyed upon the whole the blessings of peace. This advantage was entirely due to the statesmanlike administration of William Henry Cavendish, Lord Bentinck (1828-1835), who had largely developed the excellent foundations laid by Lord Hastings in Central India. Comprehensive improvements had been brought about in the administration of justice (the installation of petty courts composed of natives for cases of minor importance, the beginning of a general criminal code, etc.). Indians were admitted in larger numbers to judicial and administrative posts, and their reliability was increased by a higher scale of salary; special official schools (in Agra) were set up to train natives for official posts, and English was made the official language. The taxation of the new provinces was also placed upon a better footing, and greater consideration was given to the old rights of territorial proprietors; the several villages were surveyed and ordnance maps made, cultivation was improved by European instruction, etc. Notwithstanding expensive wars, Hastings had raised the annual profits of the company to £3,500,000, while under his predecessor, Minto, they had amounted to £2,000,000. Under the somewhat careless administration of business under Lord Amherst considerable deficits had appeared, but under Bentinck's carefully calculated regulations (reduction of interest on government bonds, etc.), the profits soon recovered themselves. In short, the period when the maritime European States had gained fabulous profits by Indian trade (1600-1800) was passed for ever; the prosaic business-like methods of the English had destroyed the fairy-like splendour of the Great Mogul court as depicted to European imagination, and impossible expectations were no longer raised by the much read travels of Olfert Dappert and his imitators.

By an act of parliament of August 28, 1833, the privileges of the British East India Company, so often renewed, were decisively reduced. The company became and remained, until April 23, 1854, nothing but a political body for carrying on the government of India under the supervision of the Board of Control (p. 470); its existence as a commercial company with a monopoly thus came to an end. A further provision of this important act created a sinking fund with the object of redeeming the company's shares at their current value (two hundred per cent) within forty years; on the expiry of this period parliament would have to decide whether the patent of the company were to be renewed or not. The second of these alternatives was adopted; by the act of May 4, 1854, the supervisory power of the crown was extended, and a judicial investigation into the company's affairs was made possible at any time; this was the beginning of the end, which came in 1858 (cf. p. 493). The taxation regulations of the act of 1833 were abrogated by that of July 16, 1842, and its new regulations for British colonial trade.

Two successes will place Bentinck's name forever among the great benefactors of India: the abolition of widow burning (*Satî* or *Suttee*, p. 415), and the suppression of the Thugs. Before his government the only attempt at controlling the custom introduced by the Brahmans, had been the regulation that no widow should be burnt against her will. The supervisory power implied by this ordinance led to statistical calculations by which it was proved that the practice was on the decline; in Bengal, in 1828, out of sixty million inhabitants, only four hundred and twenty cases of self-sacrifice took place, whereas seven hundred had occurred in 1817.

Consequently, notwithstanding the resistance of the Brahmans, and the fears of the Europeans, Bentinck made a sudden end of the custom; on December 4, 1829, a decree was issued making it an offence punishable with death to be implicated in the burning of a widow. Thus the horrors of Satî, against which the great Akbar had fought in vain, came to an end in India. The last case of widow burning took place beyond the sphere of British influence in 1877 on the death of a ruler of Nepal, Sir Jang Bahadur.

Bentinck's second claim to honour was the suppression of the murderous sect of the Thugs. In that district where the Pindari (p. 477) had grown to power in Central India, there had existed for several hundred years a cult of the goddess of destruction, the bloody Kâlî (Bhâwinî; p. 412); her worshippers had become a hereditary sect or caste who made a living by the worship of the goddess, their business being the strangling and robbing of [non-European] travellers. Thuggism had spread throughout the country, was under a uniform organisation, and had a special form of initiation, and a thieves' language of its own (ramasyana); before each attempt, supplication was made to Kâlî for success, and part of the spoil taken from the victim was laid at her altar. The victim was never killed by bloodshed, but always by means of the noose (rumal or phansi). Bentinck vigorously strove to extirpate the Thugs. He was so admirably supported by excellent officials such as Molony, Wardlaw, Borthwick, and above all, Major Sleeman, that by 1835 no less than 1,526 of these pious murderers had been captured, and the remainder were forced to abandon their time-honoured trade of murder.

Upon two occasions only was England obliged under Lord Bentinck to interfere in the affairs of individual States. In Mysore, a Hindu prince whom the English had set up and educated, had governed so badly that a general revolt of his subjects broke out (1831). The Mahârâja was deposed and the government was henceforward carried on by a European with three coadjutors. At a later period Khama Râjendra Wodeyar, whom the deposed prince had adopted in 1865, was recognised as successor by the English, instructed by them in his new duties, and placed upon the throne of Mysore on March 25, 1881. In Kurg (Coorg) the three last princes, and particularly Wîra-râjendra Wodeyar, who was a homicidal maniac, had been distinguished by their cruelty. The paramount power of India was forced to maintain her good name by the despatch of troops, which occupied the capital, Merkara, and made the country British territory at the wish of the population (1834). The prince was sent to Benares with a good pension, and at a later period went to England, where he died in 1868.

(f) *Auckland, Ellenborough, and Hardinge (1836-1848)*. — With the governorship of Lord Metcalfe (1835-1836) ended the period of visible improvement in internal affairs. George Eden, Baron Auckland, a party candidate who replaced Lord William Heytesbury, appeared in India as general governor from 1838 to 1842, and with his rule begins a series of military operations lasting over twenty years. His first task was the settlement of a succession, and in doing so he found an opportunity to reduce the rights of the native ruler. In Oudh the "king" had been poisoned in 1837, and the mother of the prince desired to set her son upon the throne, to which his father had already destined him. Once again the Calcutta government discovered that this son was illegitimate; a distant relation was therefore chosen, who was likely to be more compliant, and to reign but a short time in

view of his advanced age. However, the hereditary prince had himself crowned, and the British resident ordered his troops to fire upon the people in the streets, to storm the coronation hall, and to set his own candidate upon the throne; the latter in return signed a convention in November, 1837, giving the resident full power "to enforce any regulation that might seem good to him, as supplementing the needs of the existing administration." Even in England there was a general conviction that these needs were partly imaginary, partly exaggerated, and largely due to British interference. In London the compact was not acknowledged. Lord Auckland, however, did not inform the prince of these facts, and he thencefore remained bound to his convention.

At the end of 1838, if small differences are taken into account, there were six different modes by which the Anglo-Indian government was in relation with the native States. These can be divided into the following classes, according to the nature of the conventions concluded: (1) offensive and defensive alliances, with a right to the company's protection when domestic affairs required it (Oudh, Mysore, Berâr, Travancore, and Cochin); (2) the same as 1, without the right of internal interference (Haidarabad, Gujerat, and Baroda); (3) as 2, with payment of tribute, and in most cases the supply of contingents (the Rajput States); (4) guarantees of good faith and a defensive alliance (Sikhs); (5) friendly convention (Gwalior); (6) a protectorate convention, with a more or less complete supervision of internal affairs (Delhi, Satra, and Kholapur).

(a) *The First War against Afghanistan.*—The most dangerous occurrence during Auckland's government was the struggle with Afghanistan. Following the method of his predecessors, he had hoped to acquire this country by setting up a ruler in dependence upon the English. A possible invasion on the part of Russia now became as dangerous a possibility as an overland march by Napoleon had formerly been. Russia was steadily advancing southward in Asia (cf. p. 222). From early ages Afghanistan had been divided into three parts, the northwestern part (Cabul) being under the influence of northern races (the Moguls, etc.), the western part (Herat) was for the most part dependent upon Persia, while the valley of the Hilment, with Kandahar in the south, was constantly subject to a change of rulers. The Persian Nâdir Shâh (p. 445) had been followed in the supremacy of Afghanistan by the Durrâni chieftain Ahmed Shâh. His grandson, Shâh Shuja, had been expelled by a younger brother in 1809, who was driven out in 1826 by Dost Mohammed of the tribe of the Barakzai; the latter was ruler of Cabul, while Herat remained in the power of a Durrâni prince. The directors of the company were glad to see Afghanistan, which had often threatened India with danger in earlier times, shattered and weakened by internal dissension. A further cause of satisfaction was the rise of the Sikh kingdom under Ranjit Singh (p. 485), which formed a barrier of defence between their west frontier and the territory of their unruly neighbour. Soon, however, they were to come into closer relations with Afghanistan.

The Persians sent out an army under Russian officers to Herat and besieged the capital. Ranjit then started from Lahore and took possession of Peshawar, the gate of entrance to Cabul. Dost Mohammed at once made friendly overtures to the English, and in September, 1836, Auckland sent a "commercial mission" to Cabul under Alexander Burnes. At the same time a Russian brought to Dost

Mohammed an autograph letter from the Czar. Dost Mohammed thereupon gave the English to understand that he would break with Russia if they would support his views concerning Peshawar; Auckland, however, returned a negative answer. Burnes was recalled and Dost naturally turned to the Russians (the spring of 1838). Auckland concluded an alliance with the Mahārāja of the Punjab, with the object of restoring the former ruler of Cabul, Shâh Shuja, and despatched the British agent, William Macnaghten, to accompany his future ruler, finally declaring war upon Dost Mohammed on the 1st of October, 1838. With the object of sparing the allies in the Punjab the expense that would be caused by the passage of an army through their territory, the authorities occupied the country of the Sindhs, a confederation of petty tribes on the Indus, a proceeding contrary to the will of the population and in defiance of earlier conventions; not content with this, they even demanded a monetary subsidy from the confederation. The advance was then made under the greatest difficulties through the Bolan Pass; the columns were constantly attacked by hostile tribes, and exposed to all the dangers and hardships of a cruel climate; they suffered at the same time from insufficient commissariat and ill-organised transport. Kandahar was reached at the beginning of May, 1839, and Shâh Shuja took solemn possession of his land. In June the army marched onward under John Keane to Ghazni; the gates were blown up by gunpowder and the town was stormed. Dost Mohammed was ultimately forced to fly to the Uzbegs beyond the Hindu Kush, and the new ruler marched into Cabul with the English army on the 7th of August, 1839. He was but coolly received by the native population; when, however, he proceeded to organise a lifeguard of the wildest races for his personal security, popular dislike found expression in repeated revolts. At the same time the Beluchis threatened the southerly line of retreat through the Bolan Pass. Dost Mohammed re-entered the country from the north. After a fruitless struggle he surrendered voluntarily to the British and was carried back to India as a State prisoner.

The government was by no means satisfied with the conduct of the campaign up to this point. William George Keith Elphinstone was sent out; a brigadier, old and past his prime, and, as he vainly represented to his superior, both bodily and mentally unfit for his task. In vain did far-seeing officers utter warnings and advise a retreat. Macnaghten considered it a point of honour for the troops to stand by the prince they had undertaken to protect. The expenses of the war rapidly rose and economy became imperative; it was determined to meet this necessity by reducing or withdrawing the sums that had been promised to hostile tribes as the price of peace; the only result was an outbreak of hostilities in every quarter. The heights of the Khyber Pass were occupied by the rebels, and the line of retreat through the other passes was threatened. On the 2d of November, 1841, Burnes, who had been appointed Macnaghten's successor, was murdered in Cabul. Macnaghten himself was also struck down on the 24th of December during a conversation with Akbar Khan, the son of the exiled Dost Mohammed. The forts of Cabul, containing the supplies for the army of occupation, fell into the enemy's hands, and the position of affairs became desperate. On the 28th of December it was ultimately determined to withdraw the garrison of Cabul, consisting of four thousand soldiers and twelve thousand camp-followers, and to abandon all the captured English officers, men, and women alike. Winter had now set in, the roads were covered with snow, provisions for men and animals were lacking, and a cruel

enemy surrounded the expedition. Under these circumstances the rapidly diminishing column traversed the passes of Kurd-Cabul, and Jagdalak in January, 1842; at the last halt at Gandamak only twenty officers and twenty soldiers remained. These ultimately succumbed, and only Dr. Brydon was left to bring the tale of utter destruction to Jellalabad, where the garrison still held out under General Robert Sale. Together with this post the garrisons of Ghazni and Kandahar under William Nott alone maintained their ground. The orders of the commander-in-chief (who had remained with Akbar Khan as a hostage, but soon died of the gout) to surrender the fortresses to the Afghans were disobeyed by the brave troops; however, Ghazni surrendered in March, 1842.

Meanwhile important changes had taken place in India. In 1839 the Mahârâjah of the Punjab, Ranjit Singh, had died, and the country was in a dangerous condition of lawlessness (cf. below, p. 485). In British India Auckland, whose lack of initiative was to blame for the whole of these misfortunes, was removed in October, 1841, in favour of Lord Ellenborough (1842-1844), a good-hearted ruler, but bumptious, careless, and lacking in firmness. He entered office on the 21st of February, 1842, and was immediately confronted with the urgent necessity of relieving as soon as possible the garrison shut up in Afghanistan. General Sir George Pollock forced the Khyber Pass and at Jellalabad was joined by Major-General Nott, who evacuated Kandahar on the 10th of August at the orders of Ellenborough. After blowing up the fortifications of Ghazni on the 6th of September Pollock advanced upon Cabul (September 16); however, he discovered that the British protégé, Shâh Shuja, had been murdered on the 5th of April. His son was placed upon the throne, the prisoners freed and the whole market-place blown into the air as a reminder of the British power. On the 12th of October the troops left Cabul, reached and destroyed Jellalabad on the 24th, and arrived at Peshawar without difficulty on the 6th of November, 1842. The price of the undertaking was a heavy loss of human life, pecuniary expense to the amount of £1,200,000, and a dangerous blow to the British prestige. Tragedy was followed by comedy: the governor-general made a solemn display throughout the country of specially made imitations of the gates belonging to the tomb of Mahmud Ghazni, which this ruler had stolen in 1017 from the temple of Somnât (p. 420), as "revenge for Somnât;" he also issued a boastful proclamation, and a commemorative medal was struck with the inscription "*Pax Asie restituta.*"

(β) *The Disturbances in Sindh and Gwalior; the First War with the Sikhs.* — Hardly had the medals been issued when a fresh war suddenly broke out. The news of the English disasters in Afghanistan had brought the greatest joy to the oppressed Sindh confederacy, the Amirs of which entered into secret negotiations with Lahore. The English threw masses of troops into Sindh under their bold warrior, Sir Charles James Napier. A convention, very comprehensive in its demands, was laid before the Amirs, who signed it, but the people rose against their leaders. On the 17th of February and the 24th of March, 1843, the Sindh tribes were defeated with great slaughter at Miani, and were forced to submit to the conditions of the conqueror; the Amirs were deposed and banished, the country was incorporated, and Napier was appointed governor. He himself characterised the whole proceeding as a "piece of rascality." The directory condemned the incorporation as too severe, expressed their dissatisfaction in a decree (August, 1843), and — retained the country.

Meanwhile the Mahârâja had died in Gwalior and had left behind an adopted son who was in his minority. The English naturally desired another ruler during the minority of the successor than the popular candidate of the time, uttered threats, and issued a demand for the reduction of the native army. When submission was refused a war broke out; at Mahârâjpur and at Panniar the native troops of Gwalior were utterly defeated after a brave resistance, reduced to two-thirds of their former number, and a British division was placed in the country under English officers.

Even greater danger broke out in the extreme northwest in the Sikh kingdom (cf. p. 445); this people had been cruelly persecuted and almost exterminated by the Persian king Nâdir Shâh and the Afghan prince, Ahmed Shâh Durrâni (1762, 1763, and 1767). They were, however, highly tenacious of life. Toward the end of the eighteenth century the Sikhs had again taken firm root in the Eastern Punjab between the Beas and the Sutlej. The chief of the Shukarcharya confederacy, the often mentioned Ranjît Singh, had been invested with the province of Lahore by the Afghans in 1798 and at the beginning of the next century had almost made himself independent during the quarrels about the succession which broke out between the grandsons of Ahmed Durrâni. He had transformed the loose federation of the Sikhs into a strong monarchical system, while the energies of European officers had changed the wild warrior hordes into a modern army (in this respect a special service was rendered by the Frenchmen Jean François Allard, Ventura, Avitabile, and Court). When, however, he attempted to extend his power eastward beyond the Sutlej, he came into contact with the British. Beaten in diplomacy by the British agent, Charles Metcalfe, he was forced on the 5th of April, 1809, to renounce all claims to the territory beyond the Sutlej in return for the British recognition of his sovereignty in the Punjab. This convention he faithfully observed until his death (27th of June, 1839); he extended his kingdom northward (Kashmir, 1819) and west (Peshawar, 1829). Upon his death a vigorous struggle began for the throne.<sup>1</sup> Three parties arose from the general disaster: the chief Sikh nobles (in particular Ghulab Singh and Peshora Singh); Rajputs living in the Punjab; and the chiefs of the army, the strongest of the three. Finding the compact of 1809 a troublesome burden, the Sikh army, after the British misfortunes in Afghanistan, conceived hopes of making a successful attack upon the British power.

Matters were in this condition when Ellenborough was deposed, the council having entertained well-founded doubts upon his capacity; his place was taken by Lieutenant-General Henry Hardinge (1844-1848), who had distinguished himself against Napoleon in Spain and at Ligny, and had twice been minister of war

(1828-1830, 1841-1844). In view of the threatening attitude of the Sikhs his predecessor had already reinforced the British troops in the northwest. The collision was not long delayed. The Sikhs dismissed their European leaders, in full consciousness of their own strength, and crossed the Sutlej in December, 1845, sixty thousand strong and well provided with artillery (one hundred and fifty guns): they surprised the English troops at breakfast on the 18th of December at Mudki, but were driven back. The attack of the English at Ferozshah on the 21st of December, where Sir Hugh Gough and Hardinge, who had taken the field in person, failed to co-operate, was a day of heavy losses that ended with the defeat of the Sikhs. On the 28th of January, 1846, they were again defeated at Aliwal and entrenched themselves on the Sutlej at Sohraon. Here, too, their power was broken on the 19th of February; after a vigorous resistance they were obliged to retire beyond the Sutlej, with a loss of eight thousand men, and the British entered Lahore. The conditions of peace which had been at first proposed were made more severe in consequence of the hostile attitude of the defeated enemy; at the conclusion of peace on the 9th of May, 1846, Dhulip Singh, who was ten years of age, was appointed rāja of part of the Sikh territory; the Sikh army was limited to a specified number and a British division was stationed in the country at the expense of the conquered inhabitants (amounting to two million, two hundred thousand rupees yearly). Henceforward, a British resident remained definitely in Lahore (Colonel Henry Lawrence, later succeeded by Sir Frederick Currie); the higher official posts were to be chiefly occupied by Englishmen. The whole of the Jalandhar Duab between the Beas and the Sutlej was ceded to the company, as also were Kohistan and Kashmir which the English immediately handed over to Ghulab Singh, a friendly rāja of Jammu, for ten million rupees.

Hardinge, who was made viscount of Lahore, devoted himself especially to the improvement of the internal administration; he was a man devoted to his work, exceedingly anxious for the welfare of the people entrusted to his charge, keen-sighted, and energetic. Under him the great Ganges Canal was begun which was intended to secure a fruitful harvest to millions of men. Preparations were made for the introduction of the telegraph and the construction of an extensive railway system; the trigonometrical survey of the whole of India was begun and an admirable series of taxation regulations were introduced. Excellent hygienic measures were introduced for the benefit of the army of occupation (health stations, etc.). The government erected experimental plantations for the cultivation of tea, cinchona, etc. The intellectual welfare of the natives was by no means neglected by the governor-general; instruction was improved and Hindus poured in hundreds to the government schools upon the announcement that the pupils of these schools would have the preference for all official posts. A polytechnic school at Rurki was erected for the natives in connection with the works upon the great Ganges Canal. From Hardinge's time Hindus began to overcome their caste prejudices so far as to conquer their horror of the "Black" Sea and visit the public schools of England. As Bentinck had suppressed those extravagances of Hindu belief which were expressed in the burning of widows and the religious murders of the Thugs (p. 480), so the efforts of Hardinge and his officials (Sir Colin Campbell and John MacPherson) suppressed the custom of human sacrifice among the Khonds (p. 353).

(g) *Dalhousie (1848-1856)*.—(a) *The Second War with the Sikhs and with Burmah*.—The new governor-general, Lord Dalhousie (1848-1856), had only entered office for a few months when the dissatisfaction of the Sikhs at their enforced submission broke out in open rebellion. On the 19th of April, 1848, Vans Agnew, an officer, and Anderson, a civil servant, were attacked and murdered in Multan: the Diwan (tributary prince) Mulraj declared himself independent. Two young captains, George Harris Edwardes and Lake, succeeded in offering some resistance at Ahmedpur on the 18th of June and at Sadusam on the 1st of July; however, the revolt spread with lightning rapidity. The Sikhs were further reinforced by Afghan bands of cavalry whose yearning for revenge upon the English surpassed their animosity to the Sikhs. General Whish began the siege of Multan on the 2d of September, but was forced to raise it on the 14th. Dalhousie then recognised that a thorough subjugation of the Sikh power was an absolute necessity. The British troops in the Punjab were concentrated about the middle of November in Lahore under Lord Gough (p. 485) but suffered severe losses at first, owing to incompetent leadership. Meanwhile the division of Whish came up from Sindh and began a second siege of Multan on 27th of December. After a week's bombardment the town was captured on the 2d of January, 1849, though the citadel did not surrender until the 21st of the month. A week earlier Gough's careless method of advance lost him the bloody battle of Chilianwala (or Russur) against the rebels; however, on the 21st of February he displayed better tactics and destroyed the enemy near the little town of Gujerat. The remainder of the Sikh troops were vigorously pursued by General W. R. Gilbert and forced to surrender on the 14th of March. An end was now made of the Sikh State. Dhulip Singh, whom the English had recognised three years earlier (p. 380), was banished on the 29th of March, 1849, and sent to Poonah; the crown treasures with the Kohi-nor (p. 429) and the royal demesnes were seized and the whole of the Sikh territory was made a British possession. The brothers Henry and John Lawrence were entrusted with the organisation of this valuable province and Dalhousie was made a marquis by his grateful sovereign.

The Sikh war thus prosperously ended had brought the British territory in the extreme northwest to its present limits and its natural frontier; to this territory a new province was added by the second war with Burmah in the east. King Pagan Meng (p. 523) could not console himself for the loss of his valuable provinces, and let no opportunity slip of harassing the English, especially the merchants in his territory. The commercial associations in Rangoon, therefore, directed a complaint to the governor-general in 1851, and he replied by sending a warship in November to the mouth of the Irawaddi to investigate their complaints. The ill-treatment of English officers provided an excuse for the declaration of war. In February, 1852, six thousand men were sent out on a fleet of steamers, and on the 14th of April Rangoon was stormed and the Burmese troops dispersed. The rainy season, which had proved so destructive in the first Burmese war (p. 478), inflicted but little damage on this occasion, thanks to careful preparations. After the resumption of operations the troops advanced by the river to Prome (the 3d of October). The king, however, declined to enter upon negotiations of peace, and on the 20th of December the whole of Lower Burmah (Pegu) was incorporated with the British Indian Empire. Its prosperity, commercial and general, has since wonderfully increased.

(3) *Dalhousie's Domestic Administration: the Incorporation of Native States on the Principle of "Devolution."* — In the conduct of his domestic administration, Dalhousie followed in the footsteps of his predecessors. To his government belong the completion of the great Ganges Canal (1854), the opening of the first railway (on his retirement two hundred English miles were in working order), the establishment of steam traffic upon the Indus and of a regular steamship line to the Red Sea (the overland route), the continuation of the trigonometrical survey, the patrolling of the coast-line by the navy, the erection of a system of telegraphs, the improvement of postal communication, the organisation of a central authority for public works, etc. In spite of expensive wars, the revenues rose so rapidly that a surplus was available after the fourth year of his administration. Education was also improved on the lines which his predecessor had begun.

There is a tendency in England to overestimate Dalhousie's administrative success at the expense of Hardinge; the latter had already planned and prepared most of these improvements. At the same time his successor deserves credit for the care and energy which he invariably employed to increase the general prosperity of India. English historians describe Dalhousie as "the greatest of all the Indian proconsuls," and are justified by the immediate success of his domestic and foreign policy. His wars with neighbouring States had added two rich provinces to the British dominions; the policy he employed in dealing with the Indian principalities considerably extended the territories of the East India Company, and this by means of the happy invention and execution of a political principle (the seventh; cf. p. 482, above), the doctrine of the "devolution" of States. Upon this principle the succession at the death of a prince was only recognised if a legitimate son of the deceased happened to exist. When an heir of this kind was lacking, adoptive sons were not considered in the succession as before, but the principality in question "devolved."

This theory was put into practical operation in eight cases. The first of these was the case of Satara, the last shadow of the once powerful Peshwa rule, which occurred in the first year of Dalhousie's government. In 1853 the Rajput States of Jhansi and Nagpur were incorporated, the last Bhonsla having died without heirs. In three other cases, which occurred in the same year, the succession of titular princes without territory came in question; their adopted sons were disregarded, their titles, together with the pensions appropriated to the princes, being declared null and void. This policy was carried out upon the death of the last Nuwab of the Carnatic, on the death of the Râja of Tanjore and of the former Peshwa, Baji Rao, whose adopted son, Dundhu Path, afterwards better known as Nana Sahib, was to revenge this disregard of his claims with such terrible ferocity upon the British some few years later. The last titular ruler was the last Grand Mogul, Mohammed Bahâdur Shâh II, with whom disappeared the last gleam of the former splendour and power of the Mogul kingdom (p. 443). He was forced to assent to an agreement whereby his descendants should abandon the imperial capital of Shâh Jehân and withdraw into private life. Ultimately the tender conscience of Dalhousie could no longer bear the sight of the misgovernment in Oudh, a district watered by numerous perennial streams, and the most thickly populated province of India. It is true that according to the convention of 1837 (p. 482) the prince was less to blame than the resident for the bad state of the country; the latter possessed the express right of introducing any regulation that he thought might

obviate misgovernment, and the present desperate condition of affairs was largely due in the first instance to British interference. Moreover, the ruling dynasty had been invariably favourable to the English, and had rendered them valuable services in many cases of necessity. These considerations, however, were far outweighed in the governor-general's eyes by the duty of furthering the prosperity of the people of Oudh, and on the 7th of February, 1856, he added the richest province of India to the British possessions. Certain districts were also taken from another ally, the Nizâm of Haidarabad (the "assigned districts" in Berar). This proceeding was justified by the fact that the Nizâm was unable to pay the debts which he had incurred for the maintenance of the British troops obligatory upon him.

Dalhousie was a pious Christian. No one appealed so emphatically to the will of the Almighty, and no one knew that will better than he. His first consideration was the subject races. As under heathen misgovernment the natives could never be so prosperous as under a Christian ruler of England, it was binding on his conscience to introduce the blessings of incorporation with England to devolved States. "It is to me inconceivable that any one could ever dispute the policy of using every opportunity to consolidate the districts in our hands by the occupation of intermediate States and the extension of our government over all, as by such extension their highest interests will be furthered. Millions of God's creatures will gain freedom and prosperity from the change."

The revolt of 1857 was a terrible recompense for the gifts of freedom and prosperity under British rule. Incorporation not only deprived the people of any possibility of obtaining higher posts; a more cogent argument was the suppression of those feelings of fidelity to the native ruling houses with which the people were connected by long tradition. It was impossible for them to accommodate themselves in a moment to a civilization which had developed under totally different conditions, and which was to them merely an object of hatred and fear. They preferred the oppression of their own kin to the favours of strangers who trampled upon their most sacred possessions without the smallest considerations for their feelings, deposed their princes, and carried boundless wealth out of their country. It was their religious sentiments that were most deeply wounded. Former governor-generals had spared the creed, the laws, and the customs of the Indians as far as possible; principles were now enforced and deeds committed which outraged every fundamental conception of the Hindu. To the Hindu the ideal of the present and the future life was to leave behind him a son upon his death, who should close his eyes and maintain the sanctity of his ancestors by pious worship. Should fate deny a man an heir of his body, his race might yet be continued by adoption, and a son thus taken to himself was equally capable of securing his everlasting salvation. Upon these convictions the strangers now trampled, with the insolent excuse that they were acting for the good of the people, and with the consequence that they outraged the inmost feelings of the Hindu while at the same time securing material advantage for themselves. In the profession that their work was pleasing to God, the Hindu could see nothing but scorn and hypocrisy.

(h) *Lord Canning; the Sepoy Revolt (1857)*. — Far-seeing men were well aware of the extent and intensity of the feeling among the natives; the directors, however, lent no ear to their voices, and the attention of Viscount Charles John

Canning (1856-1862), the successor of Dalhousie, was for the moment occupied by the eastward advance of the Persians. This nation had been encouraged to attack and occupy Herat by the weakness of the English troops, from which contingents had been drawn off to the Crimean War; however, at the end of 1856 a fleet from British India appeared in the Persian Gulf; the Persians were rapidly defeated and forced to evacuate Herat. In the Peace of Paris, on the 4th of March, 1857, they undertook to refrain from further interference in Afghan affairs.

Meanwhile the government continued to trample upon Hindu prejudice with a recklessness which seems inconceivable in the light of later events, but was in fact the natural result of the ignorance which prevailed in the highest administrative circles as to the thoughts and feelings of the subject races. The government, in its humane desire to ameliorate the lot of widows, legalised second marriages by an act of 1856. It abolished the privilege of polygamy which the Brahman class had hitherto enjoyed. It favoured the work of Christian missionaries and allowed military officers to undertake the enterprise of converting their own sepoy. It also attacked the sepoy on the point where he was most susceptible, by threatening him with loss of caste. In his first year of office, Lord Canning carried a measure known as the General Service Enlistment Act, under the terms of which all who enlisted as sepoys for the future were to be liable for foreign service. The classes which had hitherto taken the military career as their profession were thus confronted with the disagreeable alternatives of forfeiting their caste-rank or abandoning the soldier's life. No more unfortunate moment could have been chosen for these innovations than one at which the Indian possessions to be guarded had been enormously increased by the policy of Lord Dalhousie, while the European element in the army had been diminished by the drafting of regiments to the Crimea. The train was already laid for a revolt, and it only needed a spark to produce the explosion which a series of blunders had prepared. That spark was supplied in January, 1857, by the incident of the "greased cartridges." Owing to the substitution of rifles for muskets, it had become necessary to supply the troops with cartridges of a new kind. A fraudulent contractor contrived to make use of cow's fat as a lubricant for the cartridges, in spite of the pains which the government had taken to prevent the use of this or other objectionable substances. To the Hindu sepoy it was contamination to touch the fat of an animal which his religion held sacred; and when the secret leaked out the new cartridges were represented as a device of the government for depriving sepoys of their caste. It was rumoured that with a somewhat similar object, hog's lard had been used in the manufacture of the cartridges served out to Mohammedans. The government did its best to repair the blunder which had been committed, by calling in the suspected cartridges, and offering to let the sepoys manufacture their own in future, or to give any other proof which might be thought sufficient that the use of contaminating materials had been discontinued. It was too late. Before the end of April two regiments had to be disbanded at Barrackpur for refusing to use the government cartridges. On May 3 there was a similar incident at Oudh, which necessitated the disbanding of a third regiment. The crisis came when eighty-five native troopers were sentenced to imprisonment for refusing their cartridges. On May 10, the day after their imprisonment, the sepoys of Meerut rose in a body, shot down their officers, and released their comrades. The English garrison of Meerut,

commanded by an officer who should have been superannuated years before, remained inactive in its cantonments while the Europeans in other parts of the city were massacred. The sepoy left Meerut with impunity; some dispersed to their homes, but another part marched to Delhi, seized the emperor Bahadur Shah, and proclaimed the restoration of the Mogul Empire. With this step the mutiny may be said to have commenced.

The revolt spread like lightning through the country between the Tumna and Patna, and far beyond. It was confined to those districts which had been affected by Dalhousie's policy of "devolution." The presidencies of Bombay and Madras remained almost unaffected. It is true that in the kingdom of the Nizâm, which had been roused by the confiscation of certain provinces, the resident and the Madras troops on the spot were able to stifle the impending disaffection; and there was more serious trouble in Nagpore. But the really formidable movements originated to the north of the Nerbada (Nerbudda) River, among the Mahratta States, in the middle and upper Ganges valley, in Rohilcand and the Punjab; that is to say, in those parts of India where some sympathy with the Mogul cause was still to be found. Where this did not exist, as in Rajputana, the grievances caused by the policy of devolution were not in themselves sufficient to win support for the mutineers.

Within the disaffected districts, the three towns of Delhi, Cawnpore, and Lucknow were the main centres of rebellion. Fifty thousand sepoy rallied to the Mogul standard at Delhi in the summer of 1857. Cawnpore, where the English garrison was small and the commander, Sir Hugh Wheeler, had to the last refused to believe in the possibility of a general mutiny, or to take the necessary precautions, was besieged from the 8th to the 26th of June by Nana Sahib, and then, owing to want of provisions, capitulated on condition that a safe conduct should be given to all Europeans within the walls. On June 27 the garrison embarked, according to the agreement, with the idea of proceeding down the Ganges to Allahabad. Fire was opened on their flotilla, and of four hundred and fifty-four men only four escaped by swimming to the opposite shore, while the women and children, to the number of one hundred and fifty, were brought back to Cawnpore as prisoners, only to be massacred in July when the advance of Havelock forced Nana Sahib to evacuate the town. Meanwhile in Lucknow, where upwards of a thousand Europeans were collected under Sir Henry Lawrence, a staunch resistance was offered, the old residency being converted into a fortress. Lawrence was killed by a cannon ball on July 2, but the defence was continued by Colonel Inglis against overwhelming forces.

The troops which remained faithful to the English were concentrated in Allahabad under General Havelock, who reached India on June 17, and was at the head of his army by the 30th. From this base, and under this leader, the attempt was made to save the prisoners at Cawnpore and to raise the siege of Lucknow. Early in July Nana Sahib was beaten back from Cawnpore. It was too late to save the prisoners, but they were terribly avenged. Two marches upon Lucknow were frustrated by the rains and the diseases which they brought with them; but at length, on September 25, after reinforcements had been brought up, Outram and Havelock led the relieving force into Lucknow. The numbers of the relieving force were so small that the siege could not be raised, and for the moment the only effect of Havelock's entry was to strengthen the defending force. But the

danger of a capitulation had been averted. Havelock, unfortunately, did not live to see the fruit of his magnificent efforts. He died of dysentery in Lucknow on September 24, while the siege was still in progress.

Meanwhile, under able leaders, the army of the Punjab dealt a decisive blow at the heart of the rebellion. Under normal circumstances the Punjab could ill have spared troops for any purpose, however pressing. But the treaty which had been concluded in 1855 with Dost Mohammed of Afghanistan now bore its fruit. The Amir, though urged by his subjects to seize the opportunity of invading India, remained loyal to his engagements; and it was therefore possible to withdraw troops from the Afghan frontier; only in the all important post of Peshawar was any considerable force retained. The interior of the Punjab caused the less anxiety, because the Sikhs, who had never forgotten or forgiven the devastations of the Moguls, elected to stand by their European masters. Lawrence, in spite of sporadic mutinies among his sepoy, could send down eight thousand efficient troops, of whom nearly half were Europeans, to the siege of Delhi. The attack commenced in June with the occupation of the Ridge by the advance guard of the English army. But reinforcements were unavoidably slow in coming up, and, since the enemy's force numbered some thirty thousand, nothing decisive could be done before August. Then the scale was turned by the arrival of John Nicholson from the Punjab with his famous flying column. He led the assault on September 14, and though he fell mortally wounded, the breaches had been secured before his fall. After six days of desperate fighting the emperor's palace fell and the last positions of the mutineers were carried. The emperor, Bahâdur Shah, attempted flight, but got no further than the tomb of Humayun, some six miles from the city. He was pursued and captured, with two of his sons, by Hodson of Hodson's Horse. Hodson shot the two princes with his own hand, believing, as he stated, that it would be impossible to bring them in to Delhi through the crowds of natives by whom his road was thronged. The emperor escaped this fate, only to be banished to Rangoon, where he died in 1862.

By the fall of Delhi the issue of the mutiny was settled; but much had still to be done before the work could be regarded as complete. The residency at Lucknow was still closely besieged, and the supplies of the garrison were running short. In the Mahratta country, the Ranee Ganga Bai of Jhansi, one who, like Nana Sahib, had been robbed of the reversion to a principality by the principle of devolution, had a formidable army in the field. The arrival of troops from England and the Cape in October, 1857, made it possible to take energetic measures against both these centres of rebellion.

The credit of relieving Lucknow belongs to Sir Colin Campbell, a veteran who had served with distinction in the peninsula, in the Sikh wars, in China, and in the Crimea. He arrived at Calcutta in August, 1857, to assume the office of commander-in-chief, and organised an army of relief with such energy that on November 17 he was able to extricate the hard-pressed garrison of the residency at Lucknow. The advance of a large rebel force upon Cawnpore made it unadvisable to deal at once with the Lucknow mutineers, and leaving a small garrison under Outram in the Alum Bagh, four miles from Lucknow, as a sign that Oudh was not to be evacuated, he marched to Cawnpore, and there on December 6 inflicted a decisive defeat on the sepoy leader, Tantia Topee. Returning to Lucknow in the early part of 1858, he cleared the city of Nana Sahib's army after a series of

THE VICTORIA RAILWAY STATION AND TERMINUS IN BOMBAY

(Drawn by O. Schulz, from a photograph.)

attacks which lasted for a fortnight (March 2 to 16). Sir Colin Campbell has been criticised for want of decision in pressing and following up the assault, and it would have been a great advantage if the rebels had been surrounded and forced to surrender. But the victory was a great one, and gained with but a trifling loss of life on the English side. As the result of it Oudh and Rohilkhand were recovered without further difficulty. Nana Sahib fled into the jungle, where it is believed that he succumbed to fever.

Meanwhile the Mahratta district was being reduced by an army sent from Bombay under the command of Sir Hugh Rose. The Ranee Ganga Bai was expelled from her hill fort at Jhansi after a desperate siege (March 23 to April 3, 1858). She then joined forces with Tantia Topee, and though beaten at Kunch and Kalpi, contrived, when her pursuers had halted from sheer fatigue, to take advantage of an offer from the mutinous army of the loyalist rajah, Sindia of Gwalior, to expel Sindia, and to occupy his territories. Here, however, she fell in battle against Sir Hugh Rose on June 18. With her death the main conflagration ended. The power of the English in India was firmly re-established by the end of 1858.

(i) *The Incorporation of India with the British Empire (1858).*—The sepooy revolt was the last struggle for independence on the part of the Indian people, and its convulsions were the birth pangs of a new epoch. On August 3, 1858, Queen Victoria signed an act of parliament, which, completing the work of the acts of 1833 and 1854 (p. 480), dissolved the East India Company and set Her Majesty's government in its place, with the English crown at the head of the management. This act was carried out on September 1; Lord (since 1859 Earl) Canning, the first viceroy of India, continued a highly beneficial government until the spring of 1862. The pacification of the country was speedily completed; isolated revolts (in Patna, 1863) were rapidly suppressed without difficulty. The construction of railway lines, begun under the governor-generals, Hardinge and Dalhousie (cf. pp. 487 to 488), was energetically continued (see the plate, "The Victoria Railway Station Terminus in Bombay,"), and materially contributed to the expansion of European civilization. The new viceroys of India,<sup>1</sup> which was declared an empire by act of parliament April 29, 1876, devoted themselves to the care of the frontiers, and to the many tasks which domestic administration involved (reorganisation of the finances, of taxes and custom duties, of the administration of justice; mining and forestry, relief in cases of epidemic and famine, necessary in 1873-1874, 1877-1878, and 1899). The act of August, 1858, concludes the history of India as an independent whole; it was now a part of the great British world empire, and its later history belongs more properly to that of England (Vol. VI).

<sup>1</sup> 1862-63, James Bruce, Count of Elgin and Kincardine; 1863-68, John Laird Mair, Baron Lawrence; 1869-72, Richard Southwell Bourke, Count Mayo; 1872-76, Thomas George Baring, Baron Northbrook; 1876-80, Edward Robert, Baron Bulwer-Lytton; 1880-84, George Frederick Samuel Robinson, Marquis of Ripon; 1884-88, Frederic Temple Blackwood, Count of Dufferin; 1888-94, Henry Charles Kelth Petty Fitzmaurice, Marquis of Lansdowne; 1894-98, Victor Alexander Bruce, Count of Elgin and Kincardine, and since 1899, George Nathaniel, Baron Curzon of Kedleston.

## 3. CEYLON

## A. THE NATURE OF CEYLON

(a) *The Country.*—The history of India at the very earliest times known to us has been influenced by its position on the southern boundary of a great continent; its frontier mountain ranges, apparently impassable, have been repeatedly crossed by foreign nations, and these invasions constantly transformed the history of the country so richly dowered by nature. The case of Ceylon is wholly different; as the most southerly outpost of India, it is so far removed from the rest of Asia that no races have penetrated the island from the interior of the continent; every invasion within historical times started from the peninsula, from which Ceylon is divided by a narrow strait little broader than a river; as regards, therefore, its general characteristics, it forms an immediate continuation of India itself. The eastern and western ghats form an abrupt boundary to the Deccan. On the south lie the plains of the Carnatic, broken by several isolated plateaus (the Sivaroj, Palni, and other mountains), and by numerous small islands of granite and gneiss rock. This plain gradually sinks away southward to fall below the sea at the Coromandel coast. Beyond the narrow Palk Straits the island gradually rises above the sea level, the north of Ceylon being almost entirely flat (coral soil), while in general outline the island is formed like a shield. The centre of this immense shield, the highlands of Malaya, are crowned by the central mountain range of Ceylon, the most southerly and the greatest of those isolated mountain systems in Southern India. The narrow straits are interrupted by numerous islands placed like the pillars of a bridge (Adam's Bridge), and form rather a link of communication between the island and the mainland than an obstacle to intercourse, the characteristics of both countries being almost identical in consequence of this connection. In Ceylon, as in India, the rocky foundations of the soil consist of the same primeval stone, and on either side of the Palk Strait the characteristics of rocks and mountains are identical. The same winds blow upon both countries; in the summer the rainy southwest monsoon bringing a bountiful supply of moisture to the steep and mountainous west, while in winter the dry northeast monsoon refreshes the eastern side of the island.

The vegetable world of Ceylon is therefore a repetition of that of India. The west of either country is marked by luxuriant growth and inexhaustible fertility, while the east shows a poorer vegetation and a more niggardly soil; here, as in the flat north of the island, the population only attains to any density when the industry of man has succeeded by scientific works of irrigation in collecting the fertilising moisture against the times of long drought. The fauna of Southern India and of the island are again, generally speaking, identical. In both cases the forests are inhabited by the elephant, the great tiger cats (the Bengal tiger alone has not crossed the straits), apes, snakes, white ants, and leeches. The scanty means of livelihood produce the same epidemics in the dwellers of either country; sickness and death are due to cholera and especially to malaria, which is prevalent at the foot of the mountain ranges and of the many isolated peaks, with their blocks of stone thrown in wild confusion one upon another, as also in the jungles of the river beds.

(b) *The Original Population of Ceylon.* — It would be highly astonishing if this identity of natural characteristics were not also observable in the population which has inhabited the island from the remotest antiquity. At the present day Ceylon is inhabited by two main types anthropologically and ethnologically different, a dark and a fair race, who immigrated at a comparatively late time and were not the original inhabitants of the island. In primeval times India, like Ceylon, was the home of one race only, characterised by dark colouring, wavy hair, and small or even diminutive stature. The facts of geology, and of the distribution of plants and animals, prove that the continent and the island must have formed a continuous whole at no very remote epoch. Assuming, however, that the Palk Straits have always been situated where they are now, it would have been an easy task for people, even in the lowest stage of civilization, to have crossed from the plains of Southern India by the Adam's Bridge to the attractive districts of the island. It can be historically demonstrated that Tamil invasions took place at least two thousand years ago, and the plantations of Ceylon at the present day annually attract from the continent a Dravidian population which is to be numbered by thousands; it is, however, certain that before the first historical immigration, the island was inhabited by tribes standing in the closest possible relation, anthropologically and ethnologically, to the Dravidian peoples. The legendary woodland tribes of the wild Wakka are undoubtedly to be identified as the ancestors of the modern Veddas; it is, however, probable that the first Aryan immigrants into Ceylon found other Dravidian races in possession who had risen to a higher state of civilization in more favourably situated habitations. The "Tamils of Ceylon," who now inhabit the north and the east coasts of the island, are undoubtedly for the most part descendants of those Dravidians who overran the island from the north in numerous campaigns.

#### B. THE PRE-HISTORIC PERIOD OF CEYLON

TOGETHER with this dark race of Ceylon of primeval Indian origin, the island is inhabited chiefly in the more fertile southwest portion by the Singhalese, an entirely different race, both in civilization and physique. These were originally strangers to the country, with totally different physical characteristics, language, religion, manners, and customs. Where was the home of these strangers? Certainly not in the south of India which was then inhabited by pure Dravidians.

(a) *The Aryan Immigration.* — The geographical position of Ceylon obviously points to North India as the most probable point of departure for a migration of this nature. The southern part of the island is confronted by no country whatever, while in the east and west the mainland is far distant and divided from Ceylon by broad oceans only to be traversed by the exponents of a highly developed civilization. On the other hand, the coasts of Nearer India, curving inwards from the northwest and northeast, plainly point the mariner towards Ceylon. With the exception of a few Malays introduced within the last century, the island exhibits no trace of Indonesian or Malay blood which might in any way remind us of the African races; on the other hand, the nearest relations of the Singhalese are to be found by following the line of those coast routes, among the Aryans, who crossed the mountain frontier and entered India in the second or third century B. C., and in

the mixed tribes of the North Indian plains descended from them; physical characteristics, language, custom, and social organisation alike point to this origin. Evidence of this nature even enables us to define with some precision the date at which these immigrants entered the island and the road by which they came.

The highest castes of the Singhalese have always been the Goiwansa or Handuruwo, that is to say those of noble birth; Brahmans have never found a place among their various castes. Where they are mentioned by tradition, or in historical records, we have to deal with pure invention on the part of the chronicler, or with foreign Brahmans, references to whom occur, for example, in the accounts of the introduction of Buddhism into Ceylon; in no case, however, do the Brahmans appear as an essential element in Singhalese society. Thus the Singhalese branch must have broken away from the Aryan-Indian group of peoples at a time when the Brahmans had not yet secured their supremacy over social order, justice and morality, popular feeling, thought, and action; that is to say, before the period of the formation of the great states of the central Ganges (cf. p. 372). Hence the Singhalese migration cannot have started from the east of India, from the mouths of the Ganges, or from Orissa; for it was not until the Brahmans' supremacy had been assured that the Aryans advanced into those districts and within the last thousand years the Ganges delta has been a dangerous district of swamps avoided by settlers. At a much earlier period the Aryans on the west had advanced to the sea, starting from the Punjab and following the Indus to the mouths of that river, while at a later period they followed the Arawalli mountains to Gujerat (p. 372). The Indus was at that time, together with its mouths, of very little importance as a trade route for transmarine commerce; its current was too strong, its delta too soft and shifting, while the sea coast offered no protection against storms. On the other hand, an admirable base for transmarine enterprise was afforded by the sheltered Gulf of Cambay (p. 346 above), running far into the country with its rich hinterland; this from the first was the point where the Aryans took the sea during the flourishing period of the great Aryan States on the Ganges, and during the whole of the Mohammedan period it formed the chief harbour of India.

(b) *The Sources of the History of Ceylon.* — These conclusions, which point to an Aryan migration from the Gulf of Cambay as a highly probable and indeed as an irresistible inference, are well supported by tradition. In Ceylon human memory has been more tenacious than in the Indian continent, and has preserved a reliable historical record for more than two thousand years, and in some respects even earlier. It is true that the epic of Rāmāyana, which in its Singhalese form is a shorter imitation of the great work of Wālmīki (p. 370), a glorification of the mythical conqueror of Ceylon, is pure poetical invention. Unhistorical are all the legends there related of the expedition of Rāma, of the seduction of his faithful wife Sītā, of his alliance with the apes (the black races of the Southern Deccan), of his enemies the Rākshasa, of his bridge over the straits, his wonderful exploits, and his ultimate return to India. Rāma is a model of virtue from the Brahman point of view, and the many exploits related of him are only the scaffolding used by the artists in constructing the ideal of a Brahman royal son.

We have, however, more valuable historical sources. The monarchy lasted for more than two thousand years, as did the Buddhism which it protected, a

course of development more favourable to the muse of history than the political and religious revolutions which disturbed the history of Nearer India. In the monastic libraries everything was recorded which concerned the order itself and its patrons the kings, and the annals thus collected were from time to time condensed into literary works. Thus the oldest of the Ceylon monasteries, the Mahāvīra ("Great Monastery") in Anurādhapura, has preserved the tradition of the introduction of Buddhism, and the history of the "Great Family" of one hundred and seventy-four kings, in its chronicle, "Mahāwañśa." Two Pāli books, the Dīpa-wañśa ("History of the Island"), and the Mahāwañśa, which is later by one hundred and fifty years, are works diverging but little from the original, and like that original both are continued until the death of King Dhātusena (479 A. D.). At a later period, however, continuations were constantly added to the Mahāwañśa, which were carried on to the end of the Singhalese monarchy and the English occupation, 1816. For a long period these and similar works lay forgotten in the libraries of the monasteries, until in 1836 George Turnour made the first part of the Mahāwañśa known by a faithful translation, throwing a flood of light upon the early history of Buddhism. Other chronicles (Rājawali, Rāja Ratnātshari, etc.) display divergencies from the original source, which explain the difference between the views of the several monasteries to which they belong; they are shorter, less accurate, and moreover inadequately translated. A third class of documents, such as the Pūjāwali, the Nikayasamgraha, etc., is still hidden in the collections of manuscripts within the Buddhist monasteries.

(c) *The Legend of the Colonisation of Ceylon.* — In the case of every chronicle the light of history only dawns with the introduction of Buddhism into the island, that is, with the time of Asoka. The accounts given of earlier events in Ceylon are chiefly pure Buddhist invention, which attempted to increase the sanctity of the sacred places in the island by asserting the presence therein of Buddha or of his twenty-three predecessors. These improbabilities apart, the prehistoric portions of the chronicles contain secular stories of far greater importance for us. Here we find reduced to writing that tradition which for centuries had been handed down by the people, greatly transformed and decorated, the work of whole epochs being assigned to individual personalities, but on the whole plain and recognisable in its main features. The very first figure of Singhalese history can be supported from the evidence of historical ethnology. Wijaya ("Victory") led the foreign tribes across the straits, and his characteristics can be recognised in the Aryans who advanced to the sea before the epoch of Brahman supremacy.

(a) *Wijaya.* — In the country of Lāla (Gujerat), so runs the legend in chapter seven of the Mahāwañśa, a lion surprised a caravan which was escorting the daughter of the king of Waṅga and of a Kaliṅga princess; the lion carried off the king's daughter to his cave, and from their marriage was born a son, Sihabahu, and a daughter, Sihasiwali. Mother and children fled from the captivity of the lion; the lion's son grew up and, after killing his father, became the successor of his maternal grandfather, the king of Waṅga; at a later period, however, he returned to his native country of Lāla, and built towns and villages in the wilderness, in spots where irrigation was possible. His eldest son, Wijaya, was made viceroy when he came of age; however, he developed into an enemy of law, and his asso-

ciates committed innumerable acts of treachery and violence. Ultimately the people grew angry and complained to the king. He threw the blame on the friends of the prince, but censured his son severely. The offences were repeated, and upon the third occasion the people called out, "Punish thy son with death." The king then half shaved the heads of Wijaya and his seven hundred retainers, and put them on board a ship which was driven forth into the open sea. Wijaya first landed in the harbour of Supparaka, in Jambudîpa (India); fearing, however, that the reckless immorality of his followers would arouse the animosity of the natives, he continued his voyage. "This prince, by name Wijaya, who then became wise by experience, landed in the district of Tambapanni, of the country of Lañkā (Ceylon). As the king Sihabahu had killed the lion (Pāli, Siha; Sanscrit, Siñha), his sons and descendants were called Sihala (Singhalese), that is, lion slayers, and as this island of Lañkā was conquered and colonised by a Sihala, it was given the name of Sihala [Dîpa]" (that is, Lion Island, Sanscrit, Siñhala [Dwîpa]; in English pronunciation Silan, and in German, Ceylon).

The historical foundation of this legend carries us back to the starting point of the Singhalese settlement, to the country of Lāla; the name survived in the Greek Larike (or Surachtrene), the modern Gujerat; the solitary lion, who at the very outset inhabited the country, attacked and plundered the neighbours, is to be explained as an early Aryan settlement on the Gulf of Cambay; indeed, the nickname of "lion" was a favourite designation for all the warrior Aryans and their leaders, and in Gujerat itself a famous dynasty, known as "the Lions" (p. 485), continued till recent date. At that period the Aryan conquerors had not been subjected to the stern caste regulations of the Brahmans, and had no scruples of conscience in contracting alliances with native wives (the Kaliñga princess). The migration to Ceylon belongs to a somewhat later time. The lion prince made the former desert a populous country, with towns and villages; then further disturbances broke out. According to the Buddhists, who followed the Brahman version of Indian history, the lawlessness of Wijaya and his adherents merely consisted in resistance to the Brahman claims. The rulers attempted to use compulsion; however, the bold spirit of the warlike part of the Aryans continually revolted against Brahman predominance, until the warriors were defeated and sailed away to seek intellectual freedom in a new country. Driven back from the Malabar coast, where Brahman influence seems to have penetrated at an earlier period (p. 388), they found what they required on the northeast coast of Ceylon, an arable district untroubled by Brahmans.

Wijaya landed with his adherents, apparently in 543 B. C. (cf. p. 500), at Tambapanni (according to the Sanscrit name of the river, Tāmraparnî, p. 386, the Taprobane of the Greeks). His future history is adorned by tradition with features obviously belonging to the Odyssey (due to the intercourse of early European civilizations with the Spice Islands); the strangers first fell into the hands of an enchantress, Kuweni, who kept them fast in an underground place; they are then freed, as in Homer, by Wijaya, who is helped by a god well disposed to man (in this case Vishṇu). He marries the princess enchantress, and with her help becomes supreme over the country; then, however, he divorces her and marries the daughter of the powerful neighbouring king Pāṇḍu of Madura, while his comrades take wives from the daughters of distinguished families in the Pāṇḍu kingdom.

(β) *The Successors of Wijaya.* — The death of Wijaya, who left no legitimate descendant, was followed by a short interregnum ("the country of Laukā was without a king for a year"); however, a new influx of the Aryans arrived from Lāla, and Wijaya's nephew, Pāṇḍuwasudewa, seized the throne of the Singhalese king. After the death of his son Abhaya, the succession was interrupted for seventeen years by disputes about the kingship. Then, however, after the defeat and slaughter of his uncle, the most important of the legendary rulers ascended the throne, by name Pāṇḍukābhaya. Under his governorship the Singhalese State rose to considerable power; the different races of the island were reconciled ("the king favoured the wishes of the Yakkas") and lived peacefully together in the capital of Anurādhapura. This town had been founded by the first settlers; now, however, the tank which had been previously built was extended to form a great lake, and by the construction of a palace and shrines for the different religions and sects the settlement became highly important, and is spoken of by the chronicler as "delightful and well built." The oldest of the king's uncles, the former prince Abhaya, was installed as governor of the town; two Yakkas were appointed as overseers for every two of the four quarters into which the town was divided, another Yakka being made sentinel of the southern gate. The despised races, such as the Chandalas, were settled in the suburbs, where they were employed in street-cleaning, police work at night, and burials; outside the town, cemeteries and places for torture and execution were constructed. The royal hunters (the Veddas, who now dwell apart from the other inhabitants) had a street of their own. The king appears in the character of a benevolent monarch. Hospitals are erected for the sick, and the ruler attempts to meet the views of the various religious sects by assigning quarters to them, building them houses, and erecting temples.

The Singhalese rulers thus mentioned by tradition cannot be considered in any degree historical personages. Wijaya is as vague a personality as the founder of Rome, and Pāṇḍukābhaya was no more a legislator than Numa. It is probable that the characteristics of famous generals were interwoven with the picture of those legendary kings; the most we can say is that they represented successive stages of civilization. Wijaya is the personification of the first Aryan emigration, as Pāṇḍuwasudewa is of a second; his successor, Abhaya, represents the struggle of the princes for supremacy, while Pāṇḍukābhaya personifies the final victory of the individual over his rivals, and the introduction of social order, the reconciliation of the natives to the immigrants, the rise of general prosperity, and the development of the kingdom. Generally speaking, the Aryan development in Ceylon advanced on parallel lines with the development of the kindred tribes in the Ganges territory. The victorious conquest of the original inhabitants and the occupation of the country, the struggles of princes with one another, and the final formation of certain great towns, in which a high civilization rapidly developed, supported by the many natural products produced by cultivation or by a bountiful nature, and advanced by the peaceful incorporation of the subject tribes into the body politic, — such is the general course of development. In one respect only was the development of the island Aryans essentially different from that of their brothers on the mainland, — the Brahmans never asserted their fatal influence upon the intellectual development of Ceylon.

(γ) *The Chronology of the Legendary Period.* — The chronology of the legendary period suffers from the fact that the formation of the Singhalese kingdom has been compressed into the lifetime of a few persons. Chronological data in the Singhalese chronicles are, generally speaking, unreliable before the introduction of Buddhism. A calculation of their statements of the length of reign attributed to individual monarchs will carry the landing of Wijaya back to the year 543 B. C., the arrival of Pāṇduwasudewa to the year 504, the rule of Pāṇḍukābhaya between the years 437 and 367 B. C. Sixty years after the death of the latter the throne was ascended by his grandson Dewānampiya Tissa, who welcomed the first Buddhist missionaries to Ceylon. Thus the development of the kingdom occupied only two hundred and thirty-six years. Such a process naturally demands a far greater period of time. The first Aryan conquests may have been more or less contemporary with the occupation of Gujerat and the struggles between the spiritual and temporal power in the north of India, in which case Ceylon history will begin about the middle of the second millennium B. C.

### C. THE EARLY HISTORY OF CEYLON (300 B. C. TO 1500 A. D.)

THE early history of Ceylon assumes a more reliable character about the year 300 B. C. It is characterised by three main movements: Buddhism, internal struggles for the succession, and foreign wars with the Dravidians on the continent.

(a) *Buddhism in Ceylon.* — The first human figure in Singhalese history is Dewānampiya ("the delight of the gods") Tissa, the contemporary of Asoka. In the Singhalese chronicles his date is not yet accurately determined. While his own history is written in full detail, the scantiest account is given of his three successors, of whom we know little more than the facts that they were all younger brothers of Tissa, that each of them reigned ten years, and that they endowed many pious foundations to support the monks; similarly King Asela, who is distinguished from the above-mentioned rulers by the first entrance of the Tamils into the succession, is said to have reigned ten years (he is stated to be the son of King Mutasiwa, who had died a century earlier!). These accounts of the different reigns have often received wholly arbitrary additions. Consequently the great event in Ceylon, the introduction of Buddhism under Tissa, is to be placed at a later date than that assigned by the chronicles. The chroniclers supposed Tissa to have accepted the new doctrine shortly after his accession, which is stated to have occurred in 307, the actual date being 251 B. C., and placed his death in 267 B. C., whereas the despatch of Buddhist monks to Ceylon by Asoka did not take place before 250 B. C.

The monarch who gave the monk so hearty a reception was naturally painted by them in most brilliant colours. Tissa is placed at an equal height of piety to Asoka, who had extended his kingdom from Afghanistan to the modern Mysore (p. 407), and legend is even ready to retrace the friendship of the two monarchs to their association in a previous state of existence in which the kings were said to have been brothers. But all this brilliant description cannot entirely hide the truth that the Ceylon king was dependent in some degree upon Asoka. In his thirteenth rock inscription Asoka prides himself on the fact that he had disseminated the Dhamma (p. 396) "as far as Tambapanni;" moreover, Tissa, who

EARLY BUDDHIST TEMPLE BUILDINGS AND THE RUWANWELI-DAGOBA  
IN ANURADHAPURA

(After Henry W. Cave, "The Ruined Cities of Ceylon.")

## EXPLANATION OF THE BUDDHA TEMPLES AT ANURADHAPURA IN CEYLON REPRESENTED OVERLEAF

*Above* : The temple of Isurummiya is presumed to be a foundation of King Tissa (about 300 B. C.), and is built on a lake romantically situated and surrounded by lotus plants, but infested with crocodiles. The temple is hewn out of the rock, which is covered with sculptures in high relief, and is remarkable for the grotesque frescoes and sculptures in low relief on its terraces. Especially striking are the heads of four elephants at the corner of the lake, above which a sitting figure holding a horse is visible.

*Below* : The Ruwanweli, or Gold-dust Dagoba. In the second half of the second century B. C. Buddhist architecture underwent a revival under the Singhalese king Dutthagamani. The dagoba represented overleaf is almost three hundred feet in height ; though now overgrown with trees and climbers, it consists of a strong mass of masonry. In the foreground appear the ruins of the watch-house, the outlines of which are still marked by six parallel lines of columns. The artistic lion carvings to the left of the entrance deserve notice. Round the dagoba runs a wall almost one hundred feet broad, wide enough for the progress of processions, in which a great number of elephants usually took part. Above this rises a second platform about five hundred feet broad, supported by four hundred stone elephants each nine feet high, of which only the heads, fore-quarters, and fore feet are visible. Upon this foundation was built the temple proper, which rises to a height of two hundred feet.

(After Henry W. Cave, "The Ruined Cities of Ceylon." London, 1897.)

ascended the throne amid great festivities in 251 B. C., represents himself as being again crowned by special deputies of Asoka after the exchange of rich presents destined for coronation purposes. The surprising liberality with which the exponents of the new doctrine were received was probably due in part to the dependent position of Ceylon. Mahinda, the son of Asoka by Dewî, a woman of inferior birth, the daughter of a merchant in Wedisâ, was most kindly received by Tissa with six other missionaries a month after his second coronation. Magnificent endowments of land (the splendid park of Magamega in the capital, together with the mountain of Chetya) were the first gifts to the missionaries; the transference was made with the greatest pomp, and dwellings for the monks were immediately erected upon the lands. On the very first day the king and six thousand of his subjects were converted to the new teaching, which had long before lost its original simplicity and in which the worship of relics was an important element. Hence almost immediately two of the greatest objects of veneration were brought by special ambassadors from the country of the founder; these were the collar-bone of the "enlightened one," and a branch of the sacred Bo tree (p. 391). At the present day upon the island the shrines built for such relics with their cupola-shaped thûpas (stûpas) or dagobas (dhâtugarbhas), in some cases of enormous size, are to be found by thousands, and are a characteristic feature in the landscape (see the plate, "Early Buddhist Temple Buildings at Anurâdhapura"). The relics were accompanied by the order of nuns of Sainghamittâ (p. 399), who also found many adherents.

The introduction of Buddhism was fraught with the most important consequences to the whole development of the Singhalese people. Their ancestors had escaped the Brahman power by emigration to the island; their descendants voluntarily subjected themselves to Buddhism. The Indian Brahmans had attained their high position at the price of severe struggles; the Buddhist monks received theirs as a present from the Singhalese kings, and henceforward the people are under their spell. At the moment the order merely acquired sites for the erection of monasteries, of summer resorts, and shrines for relics. In other respects the command of complete poverty which Buddha had laid upon his bikkhus ("beggars;" p. 398) was strictly followed, and the monks obtained the necessaries of life as alms and in no other way; but after a little more than one hundred years this rule was broken, first by the king Duttha Gâmanî, who was celebrated for his services to the order, and afterward by his grandson Wattha. Extensive districts were now assigned to the monks for their support. Successive kings in like manner assigned the best land, the canals and tanks, indeed whole villages with their inhabitants, to the monks; by degrees if not the whole, at any rate the best part, of all arable and cultivated land passed into their possession.

Meanwhile the inhabitants became impoverished in every respect. The population increased in proportion to the land recovered for cultivation by means of irrigation, but the products of such land chiefly went to support the idle monks. Many villages were in a state of serfdom to the monasteries; the remainder, oppressed by the royal taxes and the alms which they were obliged to place in the pots of the men with the yellow robes (p. 398), were cut off from all hope of prosperity. A considerable proportion of the growing youth disappeared into the monasteries of monks and nuns; those who remained upon the land were oppressed by the teaching that activity in any form was an obstacle to true happiness, while

intellectual growth became impossible, and freedom or self-respect were unknown. The pious king who had introduced Buddhism to the island, with many of his successors, might well look with satisfaction upon the wealth of the country, the increase of agriculture, the growth of the population, and the boundless piety of his subjects. To the splendour of the capital, even in later times, testimony is borne not only by the admiring accounts of the Singhalese historians and Chinese pilgrims, but still more by the miles of ruins now hidden in the primeval forest which alone mark the sites of former temporal and ecclesiastical palaces. The extent of the arable land and the thickness of the population are shown by the enormous tanks now dry, almost as large as lakes, while the slavish subjugation of the people is evidenced by the gigantic shrines and the many miles of irrigation works which were constructed by the forced labour of the villages and districts. But the apparent greatness of the royal power was at the same time its weakness; the people over whom the king ruled was a people of subservient slaves. In the mountains only did a remnant of the former population survive; even there small ruins of monasteries are to be found; but there also lived strong and independent men. When a Tamil invasion overran "the royal domains" on the great northern plains and expelled the king from his capital, the wave of conquest was broken upon the mountains.

Almost all the kings were good rulers according to Buddhist ideas; but their praise entirely depends upon the extent of the gifts with which they endowed the order. Mahāwaṅśa in one and the same breath relates that Asoka, the great friend of the order, was the wisest and best of princes, and that he killed his ninety-nine brothers to secure his sole power in Jambudīpa (India); similarly later murderers of brothers and kings are described as "men who devoted themselves to works of love and piety," or as men "who after their death enter the community of the king of the gods," provided only that they were benevolent to the order during their reigns. In this respect extracts from the Mahāwaṅśa vividly recall certain descriptions of Gregory of Tours. Buddhism did nothing to stop the murder of kings by relations or ambitious ministers. A large proportion of the rulers disappeared by this means as though mown down by the plague, and the land was reduced to a state of the utmost confusion. But few kings appear who governed with any show of strength or were able to expel the Indian Dravidians from the country; the majority were unimportant weaklings in the hands of the monks. Many of them furthered the prosperity of their people from the Buddhist point of view (p. 309). They did their best to increase the extent of land available for agriculture, to plant fruit trees, to found hospitals (several kings were famous as physicians), to promote art and science, the theatre and dancing (individual kings are distinguished as admirable artists, as poets and sculptors). But the kings did as little as the monks to improve the material prosperity of their subjects or to educate their powers of independent thought and will.

The numbers, the riches, and influence of the order increased with extraordinary rapidity. However, the purity of life and doctrine deteriorated no less speedily. Buddha himself had not reduced his teaching to writing, and immediately after his death divergent opinions upon the meaning of the "enlightened one's" doctrine had appeared. Thus from the very outset the Buddhist church showed a strong and fatal tendency to sectarianism, and the theory that thought and action implied suffering was rapidly reduced to a series of external formalities.

Intolerance toward other faiths became bitter hatred and deadly animosity, as the avarice and malevolence of the order were increased by the growth of its interest in its rich possessions. Consequently the history of the order is a history of violent schism. From the time of King Wattha Gāmani, the brotherhoods of the monasteries of Mahāwihāra and Abhayagiri (cf. below, p. 504) were separated by bitter jealousy and hatred; the tension increased with the value of the possessions which the kings assigned to one or other of the parties, and bloody struggles broke out the moment the king definitely declared for either of the two rivals. Energetic rulers made attempts at reunion, which appeared successful for the moment, but the old hatred invariably broke out sooner or later and seriously impaired the prestige of the church. The disconnected nature of the doctrine itself was reflected in the looseness of monastic morality. Mahāwañśa complains, "In the villages which have been presented to the order, purity of life for the monks consists solely in taking wives and begetting children." The people gradually grew more indifferent to the order, for which their respect had long since ceased; and the order itself was so shattered by the long weary Tamil wars, that from 1065 A. D. onward scarce four monks in full orders could be found throughout the island, the number necessary by the laws of the church for the formation of a legal chapter and the creation of new members; monks, therefore, had to be imported from India or Burmah.

(b) *The First Historical Invasions of the Tamils.*—The list of successors to Dewānampiya Tissa provides a more intelligible but a far less pleasing picture than the obscurer figures of that monarch's predecessors. After the reigns of three kings, who appear but shadowy personalities in the chronicles, the Tamils invaded the country in the year 237 B. C., according to the Mahāwañśa, under the leadership of two young princes, who possessed numerous ships and a strong force of cavalry; after killing the king Sura Tissa they ruled over the kingdom for twenty years. The Buddhist historians describe them as righteous, and we may therefore assume them to have been tolerant. They were defeated and killed by Asela (p. 500). However, in 205 B. C., after the lapse of the usual ten years, the Tamil Elāra invaded Ceylon from the north, "a man of the famous tribe of the Uju;" he slew the king, and held the supremacy for forty-four years impartially against friend and foe. The only province that did not bow to the foreign yoke was the mountainous Rohana in the extreme south of the island; from that point a descendant of "the great family," Duttha Gāmani, again expelled the Tamils. One Tamil fortress after the other fell into his hands, and finally in 161, in a battle at Anurādhapura, he killed the Tamil king Elāra himself in single combat, and immediately afterward his nephew Bhalluka, who had brought up a fresh army too late from Malabar. This portion of the Mahāwañśa reads like a stirring epic. The monks had every reason to praise the pious and liberal conqueror of the Tamils. He refounded numerous monasteries and erected permanent memorials in the Palace of the Thousand Pillars of Lohapasada in the Marikawatti and the Ruwanweli dāgobas (see the lower half of the plate, p. 501).

Laji Tissa, a grandson of Duttha Gāmani, killed his uncle, Saddha Tissa, in 119 B. C. to secure the power for himself; his successor and younger brother, Khallata Naga, was murdered by his minister, Mahārattaka, in 109 B. C. Hardly had Wattha Gāmani Abhaya, the youngest grandson of Duttha Gāmani, revenged this treachery

than the Tamils, attracted by these quarrels about the succession, again invaded the country under seven leaders (103 B. C.) and forced the young king to seek refuge in the mountains. At that time purity of blood among the Aryan Singhalese kings had long been lost. Scornfully the Brahman Giri called after the flying king, the great "Black" Silaha is flying! Like his grandfather, Wattha Gâmani also raised in the highlands a force capable of liberating the throne of Wijaya from the hereditary foe (88 B. C.); afterward during his reign of twelve years he built many monasteries, and assigned large districts (Patta) for the support of the monks, who had hitherto lived on the alms gained by begging (p. 501). During the Tamil supremacy the population had been so impoverished and the contributions of alms had grown so scanty that the very existence of the order would have been endangered if forced to depend on these. At the point where he had been insulted by the Brahman Giri he founded a monastery which he called Abhaya Giri, after his own name and that of the Brahman. The elder monastery of Mahâwihâra, inspired by jealousy, soon found an excuse for quarrelling with its younger sister foundation. The dispute led to one good result, — the reduction to writing of the sacred doctrine which had hitherto been orally transmitted from generation to generation. The three Piṭakas (p. 393) and the commentaries to these, the Atthakathâs (p. 415), were written in the Singhalese language, and a wound was consequently inflicted upon the Buddhist church which has never since been healed.

(c) *The Last Kings of the House of Wijaya and their Successors (88 B. C. to 116½ A. D.)* — Melancholy is the picture which the historians of the monastery of Mahâwihâra have drawn of the immediate successors of Wattha Gâmani. His son Chola Naga is described as a robber and footpad from the very moment of his accession, and afterward as a cruel persecutor of the monks; apparently he had declared against the brotherhood. However, his wife Anulâ (47 to 42 B. C.) seems to have been a disgrace to the royal throne, and to have rivalled Messalina by her poisonings and voluptuousness. She poisoned her husband's successor to secure the throne for herself and to gain full license for her unbounded avarice. Henceforward death was active in the royal palace: Anulâ herself was killed in 42 B. C., while twelve years later Amanda Gâmani was assassinated by his younger brother, as also was Chandamukha Śiva in the year 44 B. C.

(a) *Disturbances upon the Throne and in the Church; Buddhaghosha.* — The last of "the great family," Yasalalaka Tissa, who had murdered his predecessor, had a warder by name Subha who closely resembled himself. The king would amuse himself by clothing his servant in the royal robes and setting him on the throne while he himself took the post of doorkeeper. Once, however, when he joked with the false king arrayed in his royal robes the latter called out, "How can this slave dare to laugh in my presence!" Yasalalaka was punished with death and Subha continued to play the part of legitimate king; however, after a year he was killed by Wasabha, a member of the Lambakanna caste, who seized the throne. The Lambakanna caste had displayed rebellious tendencies at an earlier period. Their caste pride had been wounded by King Ilanaga (38–44 A. D.); they had revolted and expelled this monarch for three years. On the present occasion they maintained their possession of the throne for three generations. Then ensued

a period of rebellion and murder, and the power passed into different hands, until in 248 A. D. three of the Lambakanna murdered the king Wijaya II and seized the power.

In the country at large times were hard, and the prevalence of robber bands made life and property alike uncertain; the royal prestige was greatly impaired, and the order was weakened by the dissensions of the two chief brotherhoods. The last of the three above-mentioned Lambakanna, by name Gothābhaya, vigorously attacked the Abhayagiri sect, and expelled from the church and banished from the island some sixty monks who "had adopted the false Wetula doctrine, and who were like thorns to the conqueror's religion." At a later period, however, he was persuaded to change his mind by Saṅghamitta, a pupil of the banished high priest, to whom he entrusted the education of his sons. In the case of the elder, Jettha Tissa I, this education proved unsuccessful; upon reaching the throne he persecuted the Abhayagiri monks, and his tutor in particular, who was forced to flee to the mainland. Twelve years later he was succeeded by his younger brother Mahāsenā (277–304 A. D.). This king was persuaded by his tutor, who had now returned, to begin a severe persecution of the Mahāvihāra brotherhood. He prohibited these monks from receiving alms, and thereby made it impossible for them to remain in the "royal domains;" they were forced to flee to the mountains. For nine years the venerable mother monastery remained entirely abandoned, and proposals were brought forward to dismantle it and to use the valuable materials for the improvement of the hostile Abhayagiri monastery, when at length the king revoked his decision against the persecuted monks. His adviser, Saṅghamitta, was killed in the course of a popular rising, the expelled monks were recalled, and their monastery was splendidly restored. Henceforward the king attempted to make amends to the brotherhood for the wrong which he had done to them by a special display of liberality.

The next four kings were good Buddhists, liberal to the church and benevolent to their subjects. Sirimeghawanna, the son of Mahāsenā (304–332), is lauded for the complete restoration of the Mahāvihāra monastery, and also as being the ruler under whom a princess of Dantapura, the capital of Kaliṅga, brought to Kandy in Ceylon the most sacred relic of the Buddhists, the tooth of Buddha (Dāthadhātu). Among the following monarchs Shettha Tissa II (332–341) is distinguished as a sculptor and a painter, while his son Buddhadhāsa (341–370) was famous as a physician and the author of a "Compendium of the Whole Science of Medicine." Then followed Upatissa II (370–412), who was murdered by his brother Mahānāma. Under the latter (412–434) an event took place of high importance to southern Buddhism,—the translation into the Pāli language of the Atthakathās emanating from Mahinda, which had hitherto existed only in Singhalese and were unknown in India. The monk Buddhaghosha (p. 406) was sent from Magadha to Ceylon by his teacher Rewata to translate this work "according to the rules of Māgadha, the root of all languages;" in the seclusion of the Ganthakara monastery at Anurādhapura he completed this great work. On the occasion of the twenty-fifth anniversary of his coronation King Chulalongkorn of Siam (p. 512) issued a new edition of this work in thirty-nine volumes (Bangkok, 1893–1894).

(β) *The Decline of the Royal Power and the Advance of the Tamils (434–1164 A. D.)*—The example set by Mahānāma in murdering his brother was rapidly fol-

lowed. Then the Tamils reappeared under their king Pāṇḍya and his sons, occupying the northern part of the island from 416 to 463; they were ultimately driven out of the country by Dhātusena, a great lauded proprietor and apparently a descendant of the family of Asoka (the Maurya dynasty). "He gave the country peace, and restored to religion those rights which the strangers had abolished;" however, he was imprisoned by his own son Kassapa and buried alive (479 A. D.).

This scandalous deed opened another period of misery for the country. In the next two centuries from 479 to 691 no less than twelve rulers died a violent death. Fratricide and the revolts of generals produced a rapid series of changes in the succession to the throne. The provincial viceroys tended to independence, and the sectarian warfare within the Buddhist church continued undiminished. The Tamils, who had formerly invaded the country for plunder and conquest upon their own initiative, were now constantly brought in by Singhalese princes or generals to overthrow the legitimate occupants of the throne. Temples and royal treasuries were plundered, religion was oppressed, and the people grew more and more impoverished. However, during the fifth and sixth centuries, the period of the king Kumāra Dāsa (515-524), to whom is ascribed the Sanscrit translation of the Rāmāyaṇa (p. 496), which remains only in the Singhalese translation, and Agrabhi I (564-598), who was famous as a poet, Chinese pilgrims describe the capital as a brilliant town; even at the outset of the seventh century a Singhalese historical work speaks of the beauty of Anurādhapura. Nevertheless, under Aggabodhi IV (673-689) the capital could no longer hold out against the hereditary enemy; the royal residence was removed to Polonnaruwa (Pulathi) at a greater distance from the point of Tamil invasion, the harbour of Mantotte on the Gulf of Manaar. This change became permanent about 846 A. D. The island gained some occasional relief from the internal wars of the different Dravidian races on the mainland. Sena I (846-866) was, however, obliged to take refuge in the inaccessible recesses of the highlands; the northern part of the island was cruelly devastated, the capital plundered, and its treasures carried off to India. Now, however, attracted by the rich booty, the Chola began war with their Tamil neighbours. Thus under Sena I the Singhalese crossed the Palk Straits; the Pāṇḍya king was killed, the hostile capital of Madura plundered, and the booty taken from Ceylon recovered. Under Kassapa IV (912-929) a Singhalese army even goes to the help of the Pāṇḍya king, though with little effect, and the Tamil ruler is forced to take refuge in Ceylon.

This rapid rise of Singhalese prosperity was of no long duration. Under Udaya III (964-972) and Mahinda IV (975-991) Ceylon was invaded by the Cholas; under the leadership of their king, Parakesariwarman (1052-1061), they overran the island to its southernmost extremity, the province of Rohana, carried away two sons of the king Mānābharaṇa, and killed the king Wira-Śalāmeḡa (about 1056). The plundering extortions and the religious animosity of this Malabar people reduced the country to an awful state of desolation. It was not until 1059 that a brave noble, Loka, succeeded in driving the Chola from his native province of Rohana, the last, though not the inviolate, bulwark of the Singhalese kingdom. His successor, Vijaya Bahu I, also known as Sirasanghabodhi (1065-1120), though at first defeated, repeatedly advanced into the lowlands, where he overthrew three Chola armies, captured their fortresses, recovered Anurādhapura, and shattered the last resistance of the enemy in a bloody conflict

under the walls of Polonnaruwa ; this victory permanently freed the country from the Chola.

The power of Ceylon was not yet, however, definitely established. When Vijaya Bahu endeavoured to enter into friendly relations with the enemy, and sent special ambassadors to the Chola king with rich presents, the noses and the ears of the emissaries were cut off. Further, when he ordered his troops to march against the Cholas, a mutiny broke out, and the whole of the south rose against the king, who had much difficulty in crushing the rebellion. The country was utterly exhausted, and the Buddhist order was in so feeble a state that not a single monk in full orders was to be found anywhere in the island ; monks, accordingly, had to be brought over from Ramanya (Martaban in lower Burmah). Under Vikkama Bahu I the southern provinces broke away entirely and were divided among different rulers. The king had the utmost difficulty in driving out an adventurer from Arya Land (North India), who had blockaded him in a mountain fortress, and in recovering Polonnaruwa. The population was completely exhausted, and the taxes were collected by measures of the severest oppression, "as the sugar-mill presses the juice from the cane." To meet his necessities, Vikkama Bahu was forced to appropriate church property, and thus made the monks his deadly enemies. They emigrated to Rohana, taking with them Buddha's tooth and his alms-dish. During the many wars the irrigation canals had been destroyed, and the once fruitful land had become a malarial desert. Towns and villages were abandoned, and had grown so desolate "that their sites were undiscoverable."

(d) *Parrakkama Bahu I the Great.*—Parrakkama Bahu I (in Sanscrit, Parākrama (1164–1197) was the greatest of all the monarchs who sat upon the Singhalese throne. Only by realising the misery under which the country almost succumbed during his youth can we duly estimate the results achieved by the intellectual force and patriotism of this ruler, whom history rightly names "the Great."

After the death of Vijaya Bahu I the Singhalese monarchy had almost entirely collapsed. The nominal ruler was still resident in Polonnaruwa, but the greater part of the country was broken into petty principalities. In the province of Rohana alone four such princes were to be found, including Manabharana, who laid claim to the little district "of the twelve thousand villages," and was the father of Parrakkama the Great. This ruler spent his youth in the mountains ; "he received a thorough instruction in religion, in the different legal systems, in rhetoric and poetry, dancing and music, in writing and in the use of sword and bow, and in these exercises he attained the highest degree of perfection" (Mahāvañśa). Upon the death of his uncle he became ruler of his principality. His administration was in every respect admirable ; he introduced a properly organised system of taxation, and endeavoured to make the utmost possible use of streams and rainfall for the irrigation of the soil. At the same time he drilled those of the male inhabitants capable of bearing arms, with a view to the reunion of his country as a whole. His first expedition was directed against the highland of Malaya, which he subdued with the support of a general of King Gaja Bahu IV. The court at Polonnaruwa was entirely denationalised ; it was thronged by crowds of foreigners, including princes from the mainland, who disseminated foreign influence, foreign customs, foreign religion, and "filled the land of the king like thorns in a bed."

For this reason he declared war upon Gaja Bahu, and advanced by a rapid series of victories to the land of pearls, "the coast of the Gulf of Manaar." Ultimately the king and the princes were captured. After thus attaining his object, the conqueror restored their country to his defeated foes. A chieftain of Rohana, Manabharana the younger, had attempted to turn the war between Parrakkama and Gaja Bahu to its own advantage; he was conquered in like manner, and also left in possession of his land. Both of these conquered princes appointed the victor as their successor. Thus Parrakkama became master of the whole island, although at first he had sternly to suppress repeated revolts, especially among the freedom-loving inhabitants of the south and in the western province of Mahatittha.

The king's strong hand soon made itself felt beyond the boundaries of his kingdom. For a long period he had been in friendly relations with Ramanya (Lower Burmah). Vijaya Bahu I had invited Burmese monks to Ceylon (p. 505), and both countries were united by peaceful commercial relations. However, during the gloomy period of the last Singhalese king, Arimaddana, the ruler of Ramanya had attempted to profit by the unfavourable condition of Ceylon. A tax was laid upon the exportation of elephants, which made the purchase of these animals almost impossible for the impoverished Ceylon. The usual presents were withheld from the Singhalese ambassadors, the ships of Ceylon were forbidden to land in Burmah, and the emissaries sent from Polonnaruwa were finally robbed and imprisoned. Parrakkama then sent a strong expedition to Ramanya; his ships were greatly damaged by a storm, but the army succeeded in defeating the Burmese troops, storming the capital, and killing the king. Parrakkama's supremacy was proclaimed, and peace was only granted upon the condition of an indemnity to compensate for former vexations, to which was added the obligation of a yearly tribute.

In Southern India also (cf. p. 387) Parrakkama avenged the wrongs that had been committed against Ceylon in former years. The struggles between the Cholas and the Pāṇḍyas (Tamils) had continued since the time of Vijaya Bahu I. Under their king Kulaśekhara the Cholas had fiercely besieged King Pāṇḍu in his capital of Madura. It was not to the interest of Ceylon to see a great Dravidian kingdom in place of the numerous petty States, who might wear one another out by internal struggles; Parrakkama therefore sent to the help of the Tamil king a strong army under Laṅkapura and Jagad Vijaya Nayaka. Before the arrival of this force, Madura had fallen and King Pāṇḍu had been killed; however, the Singhalese defeated the Cholas and devastated their country. King Kulaśekhara was besieged in his fortress of Rajina and was barely able to save himself by flight. He was forced to conclude peace upon terms highly disadvantageous to himself. The Pāṇḍya kingdom was restored, Prince Vira Pāṇḍu was installed in Madura as king, and a Tamil coinage with the head of Parrakkama was struck to commemorate the campaign. The captured Cholas were sent to Ceylon, where they were forced to work at the restoration of those same religious buildings which their forefathers had destroyed in their plundering raids.

True to the proverb of his choice, "What is there in the world that a persevering man cannot perform?" Parrakkama gave his devastated island a fresh lease of prosperity. As chieftain of a small district, he had once observed, "In a country like this not the least drop of water that falls from heaven should be allowed to run into the sea until it has first done good service to mankind." This principle

was now vigorously put into practice throughout his great kingdom. He had tanks built or restored by thousands; the greatest of these (for example, the "Sea of Parrakkama") was equal in extent to the lake of the Four Forest Cantons. More than five hundred new canals were made, and several thousand ruined waterways were reconstructed. Malarious swamps and impenetrable jungles were transformed into miles of flourishing rice fields and orchards; towns and villages arose from their ruins, with a dense and prosperous population. The decaying capital of Polonnaruwa rose to new splendour and was provided with everything that could conduce to comfort and luxury. The ruler was not forgetful of the old and famous capital of Anurâdhapura, the palaces which the founder of the empire had erected, the shrines consecrated by Mahinda and his successors; and the monasteries and relic shrines were cleared of their jungle overgrowth and restored. The administration of the country was reorganised, and a mild and equitable system of taxation introduced. The disorders which had broken out in the church were checked, and the morality of the priesthood improved. Parrakkama even succeeded in reconciling that feud between the chief sects which had lasted for a thousand years, and in unifying the doctrine; "the attempt to bring about this union seemed no less desperate than an attempt to raise the mountain of Meru from its foundations."

(e) *The Decay of the Kingdom and the Church (1200-1500).* — Parrakkama the Great was succeeded by his nephew Vijaya Bahu II (1197-1198), a weakling characterised by the monks as a great scholar and poet; after a reign of one year he was assassinated. Then began a period of the greatest confusion. During the eighteen years immediately following the death of the great king the empire saw no less than fifteen different rulers, with reigns of one, nine, and seventeen days, three, seven, nine, and twelve months. At least five were murdered, six were deposed, and in some cases blinded. A motley row of figures passes before us, Singhalese, Kaliṅgas (Telugu), Cholas, and Pāṇḍyas. The Kaliṅga prince, Magha (1215-1236), who seized the island with an army of twenty thousand warriors, was the first ruler able to secure his position upon the throne; at the same time his rule proved a devastating scourge to the unfortunate country which had never yet been subjected to so fearful a visitation. In the south alone a few capable leaders were able to maintain their independence in the mountain fortresses defended alike by nature and art. Of these petty principalities, the most important was Dambadenya, where Vijaya Bahu III (1236-1240), who traced his descent from Vijaya Bahu I, had established himself; from this base of operations he was able to subdue the province of Malaya. His son Parrakkama Bahu III (1240-1275) drove out the Dravidians in 1255, almost annihilating them, together with the Chola king, Someśwara. However, he was forced to struggle with other enemies, for the weakness of Ceylon had attracted the Malays, who were especially active at that period (p. 543). Their leader, Chandrabhanu, twice invaded the country and devastated "the whole of Laṅkā;" the Malays, however, never succeeded in permanently establishing themselves on the island. In the works of peace, Parrakkama II rivalled his great predecessor. During the Dravidian rule proprietary titles had been lost or confused, and a redistribution of the country among laity and monks was now undertaken. Roads were laid down, tanks and canals restored, and Polonnaruwa, which had been almost entirely ruined, was rebuilt; in

Anurâdhapura works of restoration were begun upon the main buildings, which had been severely damaged. Meanwhile the so-called monks had plunged into every kind of vice, and the old quarrel between the brotherhoods broke out with renewed fury. Here, too, the king's action improved the situation; the worst of the monks were removed, the hostile sects were reconciled, and the introduction of ordained monks from the Chola country gave the order an infusion of fresh blood.

Vijaya Bahu IV, the successor of Parrakkama II, was murdered by one of his generals two years later, though the murderer also received short shrift. In default of a powerful ruler, the people quickly relapsed into their former state of misery, and to complete the tale of their suffering a terrible famine broke out. A Pāṇḍu army so suddenly invaded the country that even the greatest relic of the Buddhist world, the tooth of Buddha (p. 505), could not be hidden, but was carried off to Madura with other booty. The tooth was not recovered until the reign of Parrakkama Bahu III (1288-1293), who made a pilgrimage in person to the Pāṇḍya court to beg for it, and was undoubtedly forced to make considerable concessions as the condition of its restoration.

This raid of the Pāṇḍyas seems to have been the last Dravidian invasion of Ceylon; a few years later (1311), the Mohammedans under Kafur advanced from the north to the Palk Straits (p. 425), and from the middle of the fourteenth century the Pāṇḍyas became tributary to the kingdom of Bijayanagar (p. 429). The Singhalese chronicles make no reference to wars with the Dravidians later than the year 1290, though that race were in possession of the extreme north of the island, where at a later period an independent Tamil kingdom arose with the capital of Jafna. The interior of the northern half of the island, the former royal domains (Pihittiratta), had become a desolate wilderness. In consequence of the incessant civil wars, the ruling kings removed their capitals further within the mountains, and, like themselves, Buddha's tooth was in an almost chronic condition of migration. Buddhism hardly existed even in name. Hence even up to the time of Parrakkama IV (about 1300), only the very scantiest historical record was kept in the monasteries, and from that date until the middle of the eighteenth century historical writing ceased entirely; it was not until the time of Kirti Śri rāja Siṃha (1747-1780) that the gaps were filled up with the scanty material to hand and with the aid of tradition.

#### D. THE LATER HISTORY OF CEYLON (SINCE 1500)

OF the twenty-three kings who reigned between the two above-mentioned monarchs, we have but very little information, and that for the most part unreliable. The records become somewhat more definite at the time of Rāja Siṃha I (1586-1592); he secured the throne by murdering his father, and being a fanatical worshipper of Śiva so persecuted the Buddhist doctrine and its adherents that many monks threw off the yellow robe.

(a) *The Portuguese in Ceylon.* — "In those days certain merchants carried on trade in the harbour of Kolamba, which they continued until in the course of time they had grown very powerful. The Parangi [Portuguese] were collectively base unbelievers, cruel and hard hearted" (Mahāwaṅśā). In the year 1498 Vasco da

Gaina had cast anchor before Calicut ; seventeen years later came the destruction of the Arab trade, which had hitherto monopolised the valuable products of Asia, especially the spice exports ; Ormuz, Malacca, and Goa became the foundations of the Portuguese power in the Indian seas (p. 450). Portuguese ships had visited Ceylon as early as 1505 ; in 1515 a fleet sailed to the island from Calicut under Lopez Soarez, and the Singhalese monarch in Kotta gave permission to the admiral to found a permanent trading station in the harbour of Colombo, near his residence. If the king hoped to gain powerful friends by this means, he was soon bitterly undeceived. He was forced to become a Portuguese vassal, and to agree to the payment of a yearly tribute of cinnamon, precious stones, and elephants. Hostilities were the early and the natural result. The kings removed their capitals to the mountains of the interior, first to Sitawaka, then to Kandy, but in vain ; the war continued without interruption, and every Portuguese campaign penetrated further into the country.

By degrees, however, the difficulties afforded by the precipitous highland slopes, the jungles of the primeval forest, the dangers of the climate, and the military strength of the highlanders increased. The latter learnt the arts of strategy, tactics, and the use of weapons from their enemies ; they had of old been famous for their skill in metal working, and were able to keep their guns and cannons in better repair. Mayadhana and his son Râja Siñha I vigorously repulsed the attacks of the Portuguese ; of Râja Siñha II, Mahâwañśa says, " As a lion bursts into a herd of elephants, or as flakes of wool are swept away by the wind, so was the enemy seized by fear and fled before the dauntless king." The Portuguese were never able to establish themselves in the interior ; their only established possessions were the fortresses of Negambo, Colombo, Galle, Batticaloa, Trincomali, with the land immediately adjoining these settlements. They operated with some success against the Tamil kingdom, which occupied the northern extremity of the island, and a small strip of land upon the east coast. The capital of Jafna was stormed in 1560, and the sacred tooth fell into the hands of the Portuguese. In vain did the king of Pegu offer four hundred thousand gold pieces for the relic. The Portuguese valued the destruction of that fragment of bone at a higher price ; it was pounded in a mortar by the Archbishop of Goa, Dom Gaspar, burnt in the fire, and the ashes thrown into the river. Tooth worship was, however, not extirpated by this means ; in no long time a second "tooth" appeared in Kandy, which was said to have been hidden and buried during a Portuguese invasion, while the conquerors were said to have destroyed only an imitation of the real tooth. On the first conquest of Jafna the Portuguese contented themselves with depriving the sultan of the island of Manaar and of all his treasures, and imposing a heavy tribute upon him. In 1617 the town was again stormed upon the reputed outbreak of hostilities against the Christians ; the sultan was beheaded and his land declared Portuguese territory.

The story of the destruction of Buddha's tooth is typical of the religious fanaticism of the Portuguese. Every ship brought, together with soldiers greedy for plunder, bands of monks who were anxious to spread Christianity by any means under their power. Their greatest success was the conversion of a Singhalese king to the bosom of the one true church. " The king Dharma Pauli Râja embraced the Christian religion and was baptised under the name of Don Juan Pandaura ; many nobles of Kotta were converted with him. From this time

onward the wives of the nobles, and also those of the lower castes, such as the barbers, fishers, humawas, and chalyas, became Christians, and lived with the Christians for the sake of the Portuguese money" (Rājāwālī). This apostate king appointed Philip II of Spain and Portugal his heir, and from that time the Portuguese kings have added to their many titles that of "Lord of Ceylon."

The soil was well prepared for the conversion of the Singhalese to Christianity. The old religion had degenerated to the lowest possible point; Rāja Sīnha, the worshipper of Siva (p. 510), had persecuted his Buddhist subjects. Repeated importations of foreign monks had been unable to check the decay of Singhalese Buddhism; the people had grown utterly indifferent to religious questions. Within the Portuguese districts members of the lower castes could only exist by keeping on good terms with their masters, and consequently the people came over to the Catholic Church in numbers. High-sounding Portuguese names are still to be found among the modern Singhalese, the descendants of those converts who adopted the family names of their masters upon their change of faith. The Portuguese exemplified their own interpretation of Christianity by practising inhuman extortion upon every subject within their domains. In this manner they hoped to indemnify themselves for the comparatively small profits accruing from their trade. The cultivation of the most valuable product of the island, cinnamon, was retarded by the bitter hatred of the foreigners, and confined to narrow districts in the immediate neighbourhood of the fortified settlements of Colombo and Galle. Spices "were collected sword in hand and exported under the guns of the fortresses" (J. E. Tennent). Trade rapidly decreased, and the receipts failed to balance the expenditure incurred by the Portuguese during one hundred and fifty years of unbroken war.

(b) *The Dutch in Ceylon.*—The decay of Portuguese trade in Ceylon was but one of the many phenomena apparent upon the decline of Portugal. The spirit of enterprise which had inspired the country during the fifteenth century and at the outset of the sixteenth had faded, the power of the little country was wasted by constant wars in deadly climates, the people were impoverished, and the oppression of the Inquisition lay upon all minds. Portugal's career as a colonial power was at an end. Her place in Ceylon was taken by the Dutch. In 1602 Joris van Spilbergen landed in the island with two ships to conclude an alliance with the angry Singhalese king against the Portuguese; the king sent two ambassadors "into their beautiful land" (Mahāwañśā) and persuaded the people to come to Ceylon with many ships. In the meanwhile the two powers concluded a convention in 1609 for the expulsion of the Portuguese from the island; however, neither the feeble king Vimīla Dhamma Surya I (1592–1620) nor the Dutch felt themselves strong enough for immediate action. The war was not prosecuted with any energy until the time of Rāja Sīnha II; the Dutch then captured one Portuguese fortress after another. Ultimately (1658), after an armistice of ten years Colombo and Jafna fell, and the Portuguese were definitely ousted by the Dutch.

The new nationality conducted their policy in a wholly different spirit; they were primarily merchants, and their chief object was to avoid any possible disturbance to their trade. They had originally agreed to send an embassy to the king at Kandy every year. The king treated these with contempt and scorn; on different occasions the ambassadors were beaten, imprisoned, or even put to death,

outrages which the Dutch patiently bore. On one occasion only, during the reign of Kīrti Śrī Rāja Siṃha, did they attempt a punitive expedition with Malay soldiers; Kandy was captured, and the king was forced to flee, taking with him the tooth of Buddha. However, sickness and famine broke out among the troops and their line of retreat was cut off; many soldiers succumbed to the attacks of the mountaineers, while others were scattered and lost their way in the inhospitable forests.

Rāja Siṃha II was succeeded by a number of weak rulers who favoured the monks, though they were unable to improve the position of the order. Śrī Wira Parakkama Narinda (1701-1734) built the Dalada Maligawa, a temple yet in existence, to enshrine the sacred tooth, and decorated its outer walls with thirty-two Jātakas (histories of the birth of Buddha); however, under his successor, Vijaya Rāja Siṃha (1734-1747), the monks had entirely disappeared. The doctrine itself had degenerated into a mixture of Hinduism, devil worship, and Buddhist conventionalities. The connection of the island with Southern India (a large number of the rulers of Kandy married princesses from Madura) had enabled the Brahman gods to gain the pre-eminence in Ceylon; their images were carried in procession in company with the statues of Buddha, and when a king built a Buddhist shrine he erected with it a temple dedicated to Śiva or Viṣṇu. It was not until the time of Kīrti Śrī Rāja Siṃha (1747-1780) that Buddhism was purified of its hollow formalities and revived; two embassies brought over each a chapter of ten monks (the first under the high priest Upali) from Siam. The religious toleration of the Dutch and the English has since enabled Buddhism to extend its area and regain some of its power in Ceylon, though at the same time the doctrine has been largely modified by the worship of Brahman gods and Dravidian demons.

The Dutch at first derived great profit from their trade in the products of Ceylon. The cinnamon plantations captured from the Portuguese were not increased; but the careful cultivation of the plants raised the value of the bark to an unprecedented height, and high prices were maintained by a strict monopoly. These measures, however, eventually led to the decay of the trade. The height of prices attracted the rivalry of other plantations upon other islands. An army of subordinate officials swallowed up a large proportion of the profit, and dishonesty was increased by the scanty salaries paid. The cinnamon trade, which originally brought such high profits, at length scarcely succeeded in paying its expenses.

(c) *The English in Ceylon.* — The trade of Ceylon chiefly suffered from the decline of Holland as a sea power. The capture of the Portuguese possessions marks the zenith of Dutch influence, and Dutch trade was at that time five times greater than that of England. While, however, the struggle for Colombo and Jafna was in progress, England dealt a deadly stroke at her rival; in 1651-1660 the Navigation Acts were passed, which forbade to all foreign ships the carrying of goods between England and her colonies (Vol. VII, p. 98). In the year 1792 the proportion of trade in the hands of these rivals was as two to five. When the French troops advanced upon Holland in 1794 England took from the Dutch not only its trading fleet, which was valued at ten million pounds, but also all its colonies at the Cape, in Malacca, in Cochin, in the Moluccas, etc. The occupation of Ceylon was not a difficult task for England. The British governor of Madras,

Lord Hobart (p. 272), sent a fleet to the island under Blankert in 1795. Several fortresses fell into the English hands forthwith, and Colombo, the seat of Dutch government, was surrendered without a blow by the governor, J. von Angelbeck, who had been bribed to this end, with all other fortresses as yet untouched and with all supplies and the chest (containing two and a half million pounds; February 15, 1796). However, the administration of the East India Company was at that time even worse than the last period of Dutch government. At the end of a year a general rising against the British broke out, whereupon England took possession of the colony and placed it immediately under the crown.

The first governor was Frederick North (afterward Earl of Guilford), who was sent out in 1798. He naturally could do nothing less than imitate the progress which had been attained on the mainland at that date (p. 472). For this purpose he entered into negotiations with Pelemeh Talaweh, the first minister of the Singhalese king, Sri Râja Adhirâja Simha, for the betrayal of the country (1780-1798). A strong division of English troops was to be sent to Kandy under the pretext of forming a peaceful escort to an ambassador, and, if necessary, the king was to be induced by force to grant the English desires. The troops, however, encountered many natural obstacles upon the march, not to speak of opposition on the part of the natives; a very small proportion reached Kandy, and were forced to retire without accomplishing their object. As this carefully engineered plan had been a failure, force was openly employed in 1802; at a more favourable season three thousand men under McDowell advanced upon the capital, which they occupied after the king had fled. The troops under Major Davie suffered greatly from fever, and the remnant was surprised and slaughtered to the last man by the Singhalese in 1803. The continuance of war in Europe prevented immediate reprisals by the English; but the Singhalese king, Sri Wikkama Râja Simha (1798-1815), had grown suspicious to the point of madness, after the treachery of his minister, and treated his subjects with the greatest cruelty, thus playing into the English hands. The animosity of his people rose to such a height that in 1815 the English were able to occupy Kandy with little trouble. The king was captured on the 18th of February in the village of Beaumury and confined in Madras until his death in 1832. A gathering of the chieftains transferred the Singhalese kingdom to the British crown in March, 1816. Since 1895 Sir Joseph West Ridgeway has been governor of the island.

#### 4. INDO-CHINA

##### A. CONFIGURATION

FURTHER India forms the most easterly of the three great projections which advance southward from Asia. Equal in area to the south of Nearer India (830,586 square miles) it is bounded by China on the north, by India on the northwest; the western frontier in all its length is formed by the east coast of the Sea of Bengal, its southern frontier is the sea between the mainland and the islands of Java and Borneo, while the China Sea washes its eastern frontier (see the map, p. 539). The course of its civilization has been inspired by impulses derived not from over seas, but from the two civilized countries of India and China; hence the justification for the name Indo-China.

(a) *The Country.*—The configuration of Further India regarded as a superficies is due to the existence of parallel mountain ranges running for the most part from north to south; these beginning in the mountain country between Eastern Tibet and Yunnan, Kwangsi and Kwangtung, the southern provinces of China to the north of the twenty-fifth degree of latitude, diverge southward. At the roots of these mountains, in gorges often three thousand feet deep, run those four mighty rivers which rise in Tibet, afterward diverging fan-wise to hurry on to the different seas. From its passage through the mountains eastward the Yang-tse-kiang naturally forms the most important line of communication in the Celestial Empire. The Brahmaputra turns westward through the broad valley of Assam to the Ganges delta, and only the Salwen and Mekong, running southward, can be said properly to belong to the peninsula of Indo-China. Eastward and westward and also between these rivers parallel streams are interspersed, the sources of which begin at a point somewhat to the south of the spot where the main streams pass the gorges; of these the most westward is the Irawaddi, which rises in the mountain land eastward of Assam; the greater part of its course is navigable and with its tributaries it facilitates communication with Yunnan, passing through the fruitful plains of Chittagong and Arakan and forming one of the greatest deltas in the world at its mouth in the Gulf of Pegu. This river is divided from the Salwen by no greater obstacle than a low-lying range of hills running north and south, which eventually turn it away from the narrow coast district of Tennasserim and direct its course to central Further India. Further to the east is the Menam, the main river of Siam, which also is the sole possession of Indo-China; its sources do not extend beyond the twentieth degree of latitude north; to these must be added the Mekong, rising in Tibet, the delta of which extends eastward into the China Sea. All these streams have fruitful deltas and plains upon their banks, but are impassable to communication, navigation on any large scale being excluded by the rapids and shallows immediately above their mouths. The mountain chain running from north to south forms a sharp line of demarcation to the east of the Mekong between Central and Eastern Further India, Cochin-China, Annam, and Tongking; the Songka or Red River is the only stream flowing northward in Tongking, a district generally narrow which forms the eastern third of Indo-China; it is, however, more navigable than the central rivers and forms the most convenient route of access to Yunnan and its mineral wealth.

The climate is that of a tropical Asiatic district under the monsoons. In the alluvial plains of the valleys and deltas all natural growths flourish with inexhaustible fertility, and these from an early age have been the points of departure for Indo-Chinese civilization. The highlands further to the north are less richly dowered by nature and have retained for thousands of years their influence upon tribal formation; here from a remote antiquity was the home of powerful half-barbaric tribes who were driven out by upheavals among the restless nomadic hordes of Central Asia or attracted by the riches of the southern lowlands, which they repeatedly invaded, bringing infusions of new blood and valuable material for the work of civilization.

(b) *The Peoples of Indo-China.*—Hence even at the present day racial stocks displaying anthropological and ethnological differences can be plainly recognised. As direct descendants of the earliest inhabitants we have three races belonging to

different anthropological groups: the Nigritic, the Malay, and Indonesian types. The Nigritic people, who are related to the inhabitants of the Andaman Islands, to the Aetas of the Philippines, etc., are now known as Sakai and Semangs and inhabit small districts within the peninsula of Malacca. The Malays are identical with the inhabitants of the islands, to which they were expelled at a comparatively late period (cf. below, p. 543); tribes which have maintained their purity of blood also occupy certain districts in the Malay peninsula, while others mixed with later invaders (Cham) occupy extensive tracts in the lowlands of Siam and Annam; their original settlements seem to have been the lowlands of Indo-China. On the other hand, the highlands were inhabited by Indonesians, whose nearest relations are now to be found in the Indonesian Archipelago, in the Philippines, Borneo (Dyaks), Sumatra (Batta), etc. The modern representatives of the Indonesian race within Indo-China are the Nagas on the frontier between Assam and Burmah, the Selongs (in the Mergui archipelago), the Moi (half-wild tribes between the Mekong and the coast of Assam and between Yunnan and Cochin-China), the Kui (in Southeastern Siam and Northwestern Cambodia), the Mons or Talaings (in the deltas of the Burmese rivers, formerly distributed throughout Lower Burmah).

The highlands, which extend further northward from Eastern Tibet to the southern provinces of China, were in antiquity inhabited by a powerful race closely allied to the Indonesians, who may be generally comprehended in the tribal families of the Thai ("Free"). From this point repeated invasions took place into the lowlands at a later period; about 1250 this people were settled in the principality of Xieng-Mai; under Râma Khomheng (1283) the more southerly kingdom of Sukhodaya is mentioned in inscriptions; driven westward by the resistance of the Brahman kings of Cambodia, the Thai are found in possession of the lower Menam (capital town, Ayuthia) about 1350. The descendants of these immigrants after fusion with the former inhabitants of the district form the chief element in the population of those States of Further India which reached any high degree of culture. It is impossible to decide whether the Cham are an early branch of the Thai or whether they originated from the Indonesians; they found the Malays settled in the lowlands and borrowed their language (which is in close relation to the different Malay dialects of the present day); at the same time their physical characteristics display marked divergences from the Malay type and approach more nearly to the Indonesian. The first glimmer of historical information shows them as the settled people of a kingdom which embraced South Tongking, Annam, and a great part of Central Indo-China. A second wave of migration advancing within our era brought the Khmers into the fruitful land; here they too mixed with the population in possession, the Malays (brachycephalous), and with the Indonesians (hence the wavy hair of the Kui), and raised their State of Cambodia to high prosperity at the expense of the Champa kingdom. By later invasions of the Thai their district was reduced to its present condition, the smaller State of Cambodia and Southern Cochin-China.

From this cradle of nations new races advanced east and south and expelled the Moi, the Malays, and Khmers from their settlements; these were the Annamese. At the present day they are settled from the delta of Tongking to Southern Cochin-China, and have been strongly modified by infusions of Chinese blood, while their civilization is almost entirely Chinese. Probably the same wave brought a second stream of the Thai forward about the same date, the Lao race in the moun-

tains of what is now North Siam, and a third tribe, the Burmese, who are linguistically related to the Tibetans; these tribes advanced from the mountain land at the east of Tibet to the lower courses of the Irawaddi, where they settled, driving to the coast the Mons, who show linguistic affinities with the Annamese. About 1000 A. D. they were followed by the Shan (now settled in the mountain districts of Upper Burmah) who still call themselves Thai ("Free"), and further to the east by the Siamese, who overthrew the supremacy of the former Khmer immigrants in Cambodia and formed a highly prosperous kingdom of their own. The physical characteristics of all these tribes show that they are not free from fusion with other races.

#### B. THE PREHISTORIC PERIOD AND EARLY HISTORY OF INDO-CHINA

THE prehistoric period of Further India is shrouded in gloom, though a few vague and general indications may be derived from the sciences of comparative philology and anthropology. These indications alike point to early racial commixture and fusion. From a philological point of view, several primordial groups stand out in isolation. The dialects of the dark inhabitants of the peninsula at the present day are as yet but little known. However, the special characteristics of the Malay group of languages show that this branch diverged from the original stem in a remote antiquity. The remaining dialects of the people of Further India belong to the isolating family of languages, and point to the existence at an extremely early age of two distinct tribes which may be designated as Tibeto-Burmese and as Thai-Chinese, according to their modern distribution. We have no means of deciding where the first ancestors of these groups may have dwelt. We can only venture to assert that the separation of these primitive peoples, with whom we are concerned in the history of Further India, took place in the north. During the later history of Indo-China, the Thai preserved their racial purity, as they do at the present day in the mountainous frontier between Further India and China. Philological evidence points to the fact that an early bifurcation of the Thai formed the tribes of Mon-Annam, which were driven into their present remote habitations by the invasions in later centuries of the Thai. They were then known as Mons (Pegu) and Annamites (the east coast of Indo-China; there they are known as Yuons). The Cham also broke away from the Thai at an early period, and were strongly influenced by the Malay population, with whom they came in contact, both in respect of language and physical structure. Within recent and historical times they were followed by the Khmers, the Laos, Shans, and Siamese.

Upon the dates and the history of these ancient racial movements we have no information whatever. Chinese histories refer, indeed, to an embassy sent from Indo-China, probably from Tongking, in the year 1110 B. C. to the imperial Chinese court of the Cham (p. 70). In 214 B. C. and 109 A. D. Chinese generals founded dynasties of their own in Tongking. However, we have no other information upon the general history of those ages. The wild imagination of the natives has so transformed the native legends that though these go back to the creation of the world, they give us no historical material of any value whatever.

It is not until the first centuries of our era that the general darkness is somewhat relieved. On the north frontier and in the east we find a restless movement and a process of struggle with varying success between the Chinese and the native

ances, while in the south and west Hindu civilization is everywhere victorious. The most important source of our knowledge upon the affairs of Further India in those ages is Ptolemy's description of the world, dating from the first half of the second century A. D. The explanation of many of his statements is due to the energy of G. E. Gerini (*Journal of the Royal Asiatic Society*, 1897). The larger part of the south was occupied by the Champa kingdom of the Chams, with its capital at Champapura. To the east and northeast were settled the Khmers, who, according to an ancient tradition of Cambodia, had advanced southwards from their northern settlements and come into connection with the Chams. However, Ptolemy also informs us that at his time the coast-line of Further India was inhabited throughout its length by the Sindoi (Hindus). As their importance in Indo-China was at that time great enough for the Alexandrine geographer to describe them as a race of wide distribution, the advance of Hindu civilization must have taken place at least some centuries previously.

The introduction of Brahman civilization was merely a victory for a few representatives of a higher culture. The physical characteristics of the population of Further India were but little influenced by this new infusion. The movement can hardly have begun before the period at which the Brahmans colonised Orissa (p. 372). From this point Brahmanism apparently made its way to Indo-China by sea. On the one hand, the Brahmans did not advance along the land route, long hidden and leading through the Ganges delta and Assam, until the second half of the present millennium, at which time Brahmanism had long since fallen into decay in Indo-China. On the other hand, a proof of the fact that the colonisation was of transmarine origin is the predominance of Hinduism upon the coast (cf. the statement of Ptolemy above). The movement to Indo-China cannot have started from Southern India for the reason that at that period Brahmanism had taken but little hold on the south, and the transmission of civilization from those shores is therefore extremely improbable. It was not until a much later period that communication between the two countries began, the results of which are apparent in the Dravidian influences visible in the later temple buildings of Indo-China. Further evidence for the northern origin of Indo-Chinese Brahmanism are the names of the more important towns of early Indonesia, which are almost entirely borrowed from the Sanscrit names of the towns in the Ganges district, and also the desire of the Indonesian rulers to retrace their origin to the mythical sun and moon dynasties of Madhya-desa (p. 371).

The maritime route led straight to Burmah, but Indian civilization at the moment found that district less favourable to its development than that of the great and more hospitable Champa kingdom in the central south. The Gulf of Ligor and the coast and the banks of the great rivers of Cambodia seem to have been the central points of Brahman influence. This influence was less important in the eastern part of the peninsula of Further India, which was both further from the Brahman starting point, and more subject to Chinese civilization. From Upper Burmah to Cochin-China countless temple ruins are to be found at the present day, with rich ornamental sculptures and Sanscrit inscriptions, bearing evidence of the force of Brahman influence in earlier ages. Every year important discoveries are made, especially in those districts which the French have opened up. According to E. Aymonier, most of the traditional names of the kings of Cambodia are to be read in inscriptions in their Sanscrit form from the third

BUDDHA AND HIS PUPPILS : STONE FIGURES FROM THE INTERIOR OF THE SIAMSE PAGODA OF WAT SUTHAT IN BANGKOK

(From a phototype in Vol. XXVII of the "Annales du Musée Guimet," Paris, 1895.)

### EXPLANATION OF THE PICTURE OVERLEAF

On passing through the gate opposite to the pagoda of Vât Saket in Bangkok, the capital of Siam, the street leads the visitor directly to the pagoda of Vât Suthât. Within this Buddha temple (Bôt Phra) we see the reverend ancient master of the three worlds (tri loka thera; Sanser., sthāvira) and the Buddha-pupils (sāvaka saṅgha) assembled round the Siamese Buddha, who is discoursing to them (samana Khôdom; Sanser., çramana Gautama = Asket Gautama, or the last Buddha, the fourth Buddha of the present dispensation, in short, the historical Buddha). The figures are life-size, dressed in the garment worn by the inferior Buddhist priests (talapoin), and are arranged in four rows. In the background is seated the figure, larger than life-size, of the Sakya-Muni. Each of the Sāvōks (Sanser., çravaka; Pâli, sāvaka) bears his name inscribed on a marble tablet, which is cemented to the lower part of his statue. The dialect of these Tai inscriptions is that of Sukhodaya.

(After Lucien Fournereau. "Le Siam ancien," in Vol. XXVII of the "Annales du Musée Guimet," Paris, 1895.)

century A. D. to 1108. At a later period within this district Sanscrit writing gave way to the native Khmer script. Inscribed memorials, carvings, and building generally, make it clear that Śiva and his son, Gaṇeśa (p. 411), the god with the elephant head, were the most widely distributed of the Brahman gods. The images and the symbols (Liṅgam) of these gods are far more numerous than those of the other figures of Hindu mythology. However, at the same time Viṣṇu was highly venerated. The most important and beautiful Brahman temples of Further India are dedicated to this god, instances being the temples of Angkor Thom and of Angkor Wat, built, as we learn from the evidence of the inscriptions, in 825.

At the time when the early exponents of Brahmanism advanced to China, Buddhism had also taken root in their native land, being then considered merely a special variant of the belief in the old gods. Hence, with the transmission of Brahmanism, the seeds of Buddhism were undoubtedly sown in Indo-China. As Buddha himself was received into the cult of Viṣṇu as being the incarnation of this god, so, during the flourishing period of Brahmanism in Champa and Cambodia, his images were erected and worshipped within the temples dedicated to Śiva or Viṣṇu.

Buddhism advanced to Indo-China by two routes. The first of these led straight from India and Ceylon to the opposite coast. According to the tradition, Buddhaghosha (pp. 415, 505) in the fifth century A. D. after making his translation of the sacred scriptures into Pāli, introduced the doctrine of Buddha into the country, starting from the island of Ceylon. Resemblances between the script of Cambodia and the Pāli of Ceylon testify to the contact of the civilization and religion of these two countries. Subsequently, however (previously, according to Taw Sein Tho), the northern or Sanscrit developments of Buddhism (p. 409) had advanced to Further India by way of Central and Eastern Asia. The doctrine in this form was first transmitted to the vigorous and half-barbaric tribes of the mountainous highlands, who seem to have accepted it readily. At any rate, the Thai races (Laos, Shans, and Siamese), who migrated southward at a later period, were undoubtedly zealous Buddhists. Their advance about the end of the first and second centuries A. D. implies a definite retrogression on the part of Brahmanism in Indo-China. The Brahman gods decay, and the temples sink into ruins. Upon their sites arise buildings which, in their poverty of decoration and artistic conception, correspond to the humility of Buddhist theology and metaphysics (see the plate, "Buddha and his Pupils, sculptured figures in the interior of a Siamese pagoda, Wat Sut hat"). In Cambodia alone did Brahmanism maintain its position for a time, as is evidenced by buildings and inscriptions from the sixth to the thirteenth centuries. About the year 700 the northern type of Buddhism made an unobtrusive entrance, and King Jayavarman V (968-1002) undertook reforms on behalf of Buddhism. However, it was not until 1295 that the schools fell into the hands of the Buddhists, and Buddhism did not become the State religion in Cambodia before 1320. At that date, the Southern, or Pāli, Buddhism had also found adherents in the country.

Brahmanism, however, had been very deeply rooted, as is proved by the numerous Sanscrit words borrowed by the modern languages of Further India, and also by many special practices which have persisted to the present day. Viṣṇu, Śiva, and Gaṇeśa, though no longer worshipped as gods, were honoured as heroes, and their images in bronze and stone decorated the temples side by side with the images of

Buddha, as, for instance, in the temple of Wat-Bot-Phram at Bangkok. Vishnu remains one of the heraldic devices on the royal banner of Siam, and the kings of this empire show special favour to the Brahmans in their districts who cling to the old beliefs. They alone are allowed to prepare the holy water, and play a predominant part in many palace ceremonies. The aristocracy of Cambodia still lays claim to certain privileges which remind us of the Brahman caste system (Kshatriyas).

### C. THE HISTORY OF INDO-CHINA

From the times when, thanks to Ptolemy, a more definite light is thrown upon the affairs of Further India, the general history of Indo-China appears characterised by a tripartite division corresponding to the three main geographical districts of the peninsula; we have to-day the western district facing the Indian Ocean, the central district watered by the rivers of the Salwen, Menam, and Mekong, and the eastern district most easily accessible from China, and facing the Chinese Sea.

(a) *Western Indo-China (Burmah).*—The earliest sources of Burmese history are of Chinese origin. From the Chinese annals we hear of struggles with the inhabitants of the northwest of Further India during the first century B. C. In these struggles the old capital of Tagong ceased to exist, and further Chinese incursions took place between 166 and 241 A. D. The earlier history of the country rests solely upon vague tradition. These traditions enable us dimly to observe the persistence of an incessant struggle between petty kingdoms which rise to power and again disappear. From this constant change a number of larger and more tenacious bodies politic originate. Such is the State of Arakan on the northern coast, which was colonised from Burmah, but strongly influenced by India by reason of its neighbourhood to that country. Under its king, Gaw-Laya, it held the predominance over Bengal, Pagan, Pegu, and Siam about 1138, and about 1450 it advanced from Sandoweh, beyond its central point of Akyab, to Chittagong. On the south we have the State of Malaya Desa, so called after the principal tribe, and, more important than either of the foregoing, the two States of Burmah and Pegu. The history of these latter is the history of an incessant struggle between two races,—the Burmese, who advanced from the north, and the native Mons (Talaing; Pegu).

The earliest mythology of the Burmese speaks of Prome in the fifth century A. D. as the capital of a primordial kingdom. At a later period certain rebels emigrated from Prome and founded Pagan, which became the central point of a new kingdom, and flourished from the seventh to the ninth centuries. About 1060 it was sufficiently powerful to conquer, under the leadership of Anuruddha, or Anòrat 'ázò, the Talaing kingdom of Śadôn, but was destroyed about 1300 by the dynasty of Panja. The period during which Tagong (Taung-gu) was the capital of the old Burmese kingdom coincides with the distribution of Indian civilization by the Brahmans. According to Brahman legends, Tagong on the Irawaddi was founded by King Abhirāja about five hundred years before our era. At any rate, the rulers of Tagong were entirely subject to the influence of foreign civilization. Tradition has preserved long lists of names belonging to different dynasties, in which there is an attempt to establish an original connection with the royal families of early

India. Individual members of these lists are still celebrated as mighty heroes in Burmese popular songs.

The scanty substratum of historical truth that can first be derived from the native legends displays the first thousand years of our era as an age of restless movement, and of struggles fought out between the individual States, and also against the Singhalese (p. 508), and in particular the Chinese, who attempted to reduce Burmah to their supremacy when they were not themselves occupied by internal disturbances. At a later period Chinese incursions were repeated, and as late as 1284 fierce battles against these powerful neighbours took place. It was not until 1305 that the Burmese ruler Minti succeeded in shaking off the supremacy of China, until the time of Shan supremacy in that country. The darkness in which the details of Burmese history are veiled begins to disperse in the second half of the fourteenth century. However, the character of the development remains unchanged: bloody wars between the two chief races, the Burmese and the Mons, brave and cruel rulers alternating with weaklings, and a general state of upheaval which affected the little States of the west, and even the kingdom of Central Indo-China.

In the year 1364, King Śatomenchin (Thadominbia), lord of the land of Sagoin (Sagany) and Panja, founded the Burmese capital of Ava (the classical Ratnapura), which for a long time was to be the central point of the history of the country. His successor, Mengyitsauke (Min-saw-mun), increased his kingdom by the conquest of Prome. He and the following kings defeated both the Arakanese (1413 and later) and the Chinese in 1424, 1449, and 1477. The centre of power then shifted from Ava to Pegu, the ruler of which, Mentara, after subduing Burmah and Arakan (1540), then stormed Ayuthia, the capital of Siam, in spite of a most vigorous defence, and thus became paramount over the great kingdom in Central Indo-China (1544). The Siamese repeatedly revolted, although their efforts were forcibly suppressed, and soon succeeded in freeing themselves from the supremacy of the Pegu king, Burankri Nauichan (1551–1581, also Bayin Naung; in Portuguese, Branginoço). Burmah, however, remained dependent upon Pegu for a longer period. Attempts to shake off the foreign yoke failed (1585); Ava became a provincial town, and was reduced to ruin by neglect. At the outset of the seventeenth century the forces of Pegu were expelled by Nyaung Mendarah; Ava was restored as the capital of Burmah in 1601; while Pegu and the northern Shan States in the neighbourhood were subjugated. However, in 1636 Pegu freed itself from Ava, which its rulers then subdued, and Ava became the capital of the two united States. The balance of fortune and power continued to oscillate between these States. In the second half of the seventeenth century Pegu was predominant; the turn of Burmah came at the outset of the eighteenth century. However, between 1740 and 1752 Burmah suffered several severe defeats and again became subject to Pegu. When Burmah finally threw off the yoke of Pegu in 1753, the last section of her history as an independent State begins (until 1885).

Europeans had set foot upon the soil of Indo-China several centuries previously; Malacca had been conquered by Albuquerque in 1511, and had become a stronghold of Portuguese influence in the Malay archipelago; trading stations had also been founded on the north and west coasts of Further India, but the development of these was hindered by the continual struggles between Pegu and Burmah. Upon occasion Portuguese knights and soldiers fought on one or the other side. Adven-

turers, both Portuguese (Fil de Brito y Nieote, 1600–1613) and Spanish (Sebaste Gonzalez de Tibao, about 1650), gained a temporary reputation at the cost of a miserable end. However, European relations with Further India went no further than this. At a later period the English and the Dutch also founded settlements on the Burmese coast, but were collectively expelled in consequence of their tactless behaviour to the Burmese officials. It was not until the middle of the eighteenth century that the English, in return for the help which they gave to Alompra, the Burmese liberator, and also by their undignified subservience, obtained permission to found a factory on the island of Negrais, at the mouth of the Bassein River, which carried on a considerable trade for some time (until October, 1759).

In 1740 Burmah was overrun by Beinga-Della of Pegu, and the royal family was utterly exterminated. However, in 1753 Alompra collected a number of adherents in the village of Mozzobo (Manchabu). This personage is also known as Alaungp 'ayá, Alunk P'Hura, "the huntsman." In a parable apparently emanating from Buddhaghosha we read the following contemptuous statement: "Of the twenty-one castes nineteen can be released from their sins by good works; but the huntsmen and fishers, though they visit the pagoda, hear the law, and keep the five commandments until the end of their lives, can never be released from their sins." Alompra drove out the governor of Pegu and the brother of its king, Aporazá, who appeared in 1754 before Ava with a fleet. In 1755 he advanced upon Pegu and gained possession of the hostile capital in 1757. In memory of the victory of Synyangong (April 21, 1755) Rangoon was founded, a town which rapidly rose to great commercial importance by reason of its favourable situation.

Pegu, which had struggled for so many centuries with Burmah for predominance, ceased to exist in 1757. From that date Burmah, which by the occupation of Mergui and Tenasserim, even encroached upon Siam, was indisputably the first power in the west of the peninsula of Further India. After the death of Alompra, May 15, 1760, his successor (Nandoji Prau or Phra, etc.) was confronted with the task of quelling revolts, repelling the attacks of the Chinese who declined to tolerate the growth of this new power on their southern frontier, and incorporating those petty States of Western Indo-China which had retained their independence. Shembaun (S'inbyáyin, Shang-Phra-Shang; 1763–1766), the second successor of Alompra, successfully defended his empire against the Chinese, almost destroying their army under General Chien lang before Ava; he temporarily (1771) conquered Siam and subdued Assam (Asám), which had hitherto maintained its independence both against India and Indo-China. Alompra's third son, the sixth king of the dynasty of 1757, Bhodau Phra (Bodaw p'ayá, that is, royal grandfather; more properly Baden-thaken, also Mentaragyi or Menderaji Prau), a brave ruler, though cruel and capricious, founded Amarapura (Ummarapura) as a new capital in 1783, and obliged all the inhabitants of Ava to emigrate thither. He suppressed revolts in Pegu with bloodthirsty severity, most cruelly persecuted the Buddhist doctrine of those priests, and in 1874 incorporated Arakan, which he had captured by treachery, with his kingdom. Thus upon his death (1819), Burmah had reached the zenith of its greatness and power.

Phagyi-dau (Ing-Sche-Men), the grandson and successor of Bhodau Phra, returned to residence in the capital of Ava. He inherited the capricious and irresponsible character of his father without any of his high talent. His exaggerated

estimate of his own powers led to the first war with England (1824-1826; cf. p. 478). By the peace of Yandabo (February 24, 1826) Burmah was deprived of most of its power, compelled to pay an indemnity of £1,000,000, to conclude a commercial treaty, to receive a British resident, and was confined to the basin of the Irawaddi; its possessions now hardly extend beyond the delta of that river (including Rangoon). However, the rulers of the country had been taught nothing by the severe punishment which they had received. In 1837 Phagyi-dau, having become totally insane, was deposed and placed in confinement. His successor Tharawadi, who was no less autocratic and short-sighted, declined to recognise the convention of Yandabo. The English missionaries were so badly treated that they were forced to evacuate the country, and the British resident was withdrawn in 1840 in consequence of the insolent treatment which he had experienced.

In 1845 Tharawadi also went mad, and was deposed by his son Pagan Meng; hostilities, however, still continued. British captains were insulted and payment was refused of the indemnities demanded. Burmah was voluntarily rushing into a new war with England. In rapid succession, though at the price of considerable loss, the British troops captured Martaban (Ramanya — April 5, 1852), Rangoon, Bassein, Prome, and Pegu (21st November). On the 20th of December Lord Dalhousie in person laid down the new frontier line, declaring Lower Burmah (Pegu) British territory (p. 488). This was a fatal blow to Burmese independence, as the country was cut off from the coast and from communications by sea, and deprived of its most fruitful rice territory. This peace, so favourable to England, placed her in complete possession of what had been the east coast of Burmah on the Sea of Bengal. The rest of the native kingdom was placed in a position of entire dependency upon British India, the maintenance of good relations with England being thus indispensable. This, however, was a condition impossible of fulfilment by the Burmese rulers.

Pagan Meng was deposed in 1853 and succeeded by Meng dan (dun) Meng (Menlung Men, Mindon-min), a well-meaning ruler, benevolent to his subjects; he was, however, wholly unable to grasp the situation, as is obvious from the fact that eighteen months after the incorporation of Pegu he sent an embassy to Calcutta requesting the restoration of the territory taken from the kingdom. For a long time he declined to sign the convention confirming the loss of Pegu. At the same time under this king, who removed his capital from Amarapura to Mandalay in 1857, highly profitable relations were begun between Burmah and British India. In 1862 Arakan, Martaban (Irawaddi), Pegu, and Tenasserim were united into "British Burmah" (under Arthur Phayre as chief commissioner), and in 1874 Queda in Malacca was voluntarily ceded by its prince, and united to Tenasserim. In 1871 Italy, and in 1873 France, concluded commercial treaties with Burmah, which manifested its interest in a definite connection with Europe by the despatch of ambassadors (1872, 1874, and 1877).

Meng dan Meng died on the 1st of October, 1878, and was succeeded by Thibau (Theebaw), a king of the type of Phagyi dau and Tharawadi. He was a bitter enemy to England, and drove out the resident from Burmah in September, 1879, by continual persecution. He then entered into negotiations with France, which had advanced the frontier of its colonies in Further India to the Burmese tributary States of the Shan, with the object of entering into closer relations with that country. Proposals were made for the construction upon French ground of a railway

to Mandalay, where a French bank was to be founded, etc. England thereupon sent an ultimatum to Thibau on the 17th of October, 1885, demanding the reception of a British ambassador and the renunciation of all attempts at an independent policy on the part of Burmah. The king was granted four days for consideration, and rejected the ultimatum. The English, however, had availed themselves of this short interval to concentrate eleven thousand troops on the Burmese frontier under Colonel Harry North Dalrymple. Thibau, in surprise, requested an armistice for negotiation. This was granted under the condition that the whole Burmese army should be surrendered, together with Mandalay. These conditions were faithfully observed and executed on the 28th of November, whereupon the defenceless king was immediately carried off as a state-prisoner to Madras by way of Rangoon on the 1st of December. The English name of these proceedings is "The Third Burmese War." In reality the storming of Minhla on the 17th of October was the only operation which cost any lives. By surprise they became masters of the west of Burmah which had remained free and which officially ceased its independent existence on the 31st of December, 1885. In April, 1886, an attempt was made at revolt and suppressed in November by General Roberts (Vol. III, p. 516). After the incorporation of the Shan States, which took place during the years 1887-1888 (cf. p. 529), the British became masters of the whole of Western Indo-China.

(b) *Central Indo-China.* — In Central Further India three kingdoms have successively secured predominance: Champa, Cambodia, and Siam. Our knowledge, however, of the early history of Central Indo-China is confined to the most general outlines.

(a) *Champa and Cambodia.* — The previous statement is especially true of Champa, the oldest of the three States above named; the earliest intelligible accounts display the Cham as a powerful people. At the time of its greatest prosperity, near the middle of the first century A. D., Champa was about the size of the modern Cambodia, though at different periods it also extended over Cochin-China, Annam, and even to Southern Tongking. At the time of Ptolemy the civilization was Brahman, early Sanscrit inscriptions covering the period from the third to the eleventh century A. D.; from that date inscriptions are written in Champa, a special dialect strongly influenced by Sanscrit elements. The religion of the country was, as everywhere in Further India, chiefly Śiva worship (Lingam); scarce a trace of Buddhism is to be discovered during that period, and it was not until the downfall of the Champa kingdom that Buddhism became more deeply rooted in the district (cf. p. 519 above).

Wars with the Chinese, who were extending their supremacy over Tongking, Annam, and Cochin-China, and drove out the Cham from those districts, occupy the period from the fourth to the tenth centuries of our era. The Champa were also forced to struggle with the Khmers, who had entered the country from the north according to the early traditions of Cambodia, and were settled in the northeast of the Champa kingdom in the days of Ptolemy. As early as the seventh century they pushed their way like a wedge between the Champa kingdom and the States of Annam and Cochin-China, which were subject to China. We find them in full possession of Brahman civilization; the earliest written records of the Khmer State of Cambodia are in Sanscrit and belong to the third century; in 626

(according to the Śaka chronology 549) this inscription mentions a King Ísinarman, whose three predecessors, Rudrawarman, Bhawawarman, and Mahendrawarman can be inferred from the oldest Buddhist inscription but one of the year 667 (according to the Śaka chronology 589); from the first of these kings the list of rulers is continued with but scanty interruption until the year 1108. A reliable eye-witness, the Chinese pilgrim Hiuen Tsang (p. 409) visited the two States of Cambodia and Champa in the years 631-633 and mentions their towns Dewarawati, Chamapura, and Champapura. At this period Cambodia was a State of equal power to the earlier Champa kingdom. However, even then a dangerous movement became perceptible upon the northern frontier. From the Chinese frontier mountains tribes of the Thai advanced southward to the borders of Cambodia. A branch of these immigrants, the Lao, settled upon the eighteenth degree of latitude in 547 and founded a State with the capital of Labong; at a later period other smaller kingdoms of the Thai were formed. At the outset of the seventh century the Lao (in Chinese annals Ai-Lao) made a vigorous advance upon Cambodia. There, however, their power was broken. Legend conjoins the defeat of the Thai with the name of the King Phra Ruang; the chronology dates from his government, the first year of which, 638 A. D., still forms a chronological starting-point throughout the whole of central Further India. The defeated enemy were absorbed into the local civilization and adopted the writing and the laws of Cambodia. However, their youthful strength could not thus be permanently constrained; in the year 959 A. D. the Thai freed themselves, as is unanimously related by the early records of Cambodia and Siam. Driven on, perhaps, by the movement of the Tatar Khitan, who had invaded China in 937 (p. 93) they pressed on under their king, also known as Phra Ruang, to the south and founded an independent kingdom at the expense of the Khmer State; this was the nucleus from which was formed the principality of Xieng-Mai (p. 516) about 1250, and the more modern Siam at a somewhat later date.

(β) *Siam.* — Like a flash in the darkness of the night Kublai Khan (p. 177), the Chinese governor of Mangu, burst upon the Thai in 1253-1254; the kingdom of Namchao, founded by a Thai tribe, was shattered, and the Shan were driven to their present habitations. The Thai kingdom of Sukhodaya on the Menam, which extended from Ligor to Wingchau and to the great Lake of Cambodia under the rule of Râma Khomheng suffered but little. The Thai of Siam continued their advance, hemming in the Cham and pressing hard upon the Khmer; at the end of the thirteenth century they had already reached the mouth of the Menam. Siam (Muong Thai, or "The land of the Thai") had then practically attained its present extension. The Champa kingdom had dwindled to a small district in the south, and Cambodia had been driven southeastward.

(1) *The First Period of Modern Siamese History (1344-1556).* — The first period of modern Siamese history begins with King Ramathibodi (Phra-Utong), who ascended the throne in 1344 and rapidly extended his kingdom by conquest over a large part of Cambodia, and as far as the Malacca peninsula on the southwest. As the centre of gravity in the kingdom had thus changed, the capital of Chaliang was removed further south in 1350 to Ayuthia, which was erected upon the ruins of the old Daona. Cambodia was again attacked and conquered in the years 1353

and 1357; the new founded capital was peopled with the prisoners, and the weakened neighbour kingdom was forced to cede the province of Chantabum to Siam. The successors to the great Phra-Utong were busied with the task of checking their northern neighbours (Lao 1382), of restraining the aggression of Champa, which had sunk to the position of a piratical State, of bringing the revolted Malacca under the supremacy of Siam, and punishing a revolt in Cambodia by the complete destruction of the capital town; the Khmer were, consequently, removed to the swampy lowlands on the coast.

A number of less important rulers then came to the throne, who had much difficulty in maintaining the power of the empire. In their period occurred the first occasion of that contact with the European world which has so deeply influenced the modern history of Indo-China. In 1511, King Borommarāja, while reconquering the revolted province of Malacca, came in contact with the Portuguese, who had occupied the town and fortress of Malacca in the same year; relations profitable to both parties were begun between the powers, and a commercial treaty was concluded. With this exception Siam remained for the moment untouched by European influence. The domestic history of the country is characterised by disturbances, quarrels for the succession, and the rule of favourites and women. So long as peace continued abroad, the weakness of the kingdom passed unnoticed. It collapsed, however, incontinently when the powerful Pegu turned against it after securing the predominance in Burmah; King Mentara invaded the country with a large force, and the inhabitants of Cambodia seized the opportunity of joining in the military operations. Notwithstanding a desperate resistance, the capital of Ayuthia surrendered in 1544 and Siam became a tributary vassal State of Pegu. Hardly had the country begun to recover from these disasters and to think of its lost independence when a new invasion by Mentara in 1547 checked its aspirations. The capital, defended by Portuguese knights, resisted all efforts at capture, and Mentara returned home without accomplishing his purpose; however, in 1556 Ayuthia was stormed by Chumigren, the successor of Mentara, and almost the whole population was carried into captivity; Siam then became a province of Pegu.

(2) *The Second Period of Modern Siamese History (1556-1767).* — Chumigren was so short-sighted as to set up the brother-in-law of the last King of Siam as governor of the country; he was a capable man, who transmitted his strong patriotism and love of independence to his highly gifted son, Phra Naret (Abhirāja Pramerit; 1558-1593), who was born in 1542. With him begins the gradual rise of the second great popular movement in modern Siamese history, and even at the present day he is honoured as the great national hero of Siam. In 1564 he utterly defeated the forces of Pegu and peopled the somewhat deserted capital with the prisoners (1566). In the north he reduced the Lao under his power in the two following years, and in the year 1569 he secured his recognition by China as the legitimate King of Siam. The high ambitions of Phra Naret were directed to extending the Siamese power over the whole of Indo-China. His first task was to shatter Pegu, the previous oppressor of his fatherland. For this campaign the King of Cambodia offered his help. However, when the Siamese troops had marched to Pegu, the ruler of Cambodia treacherously invaded the undefended land of his ally. He was beaten back, but the war of Phra Naret with Pegu proved long and arduous in consequence, and it was not until 1579 that the struggle ended

with the complete subjugation of Pegu to the power of Siam. Vengeance was now taken upon the ruler of Cambodia for his treachery; in 1583 he was defeated and captured, and his capital of Lawek was utterly destroyed. In 1587 the outbreak of disturbances in Pegu and Cambodia necessitated the presence of Phra Naret; when, however, after punishing the instigators of the movement, he proposed in 1593 to conquer the kingdom of Ava (Burmah) his victorious career was suddenly cut short by death.

The reign of this great king was followed by more than a century and a half of weak rulers, grievous confusion, bloody conflicts about the succession (the extermination in 1627 of the house of Phra Naret, where the minister, Kalahom, founded a new dynasty under the title of Phra Chau Phra-satthong), revolts among the people in the provinces (especially in 1615) and embarrassments abroad. Only upon one occasion did it appear as if Siam had any chance of advancing to higher prosperity. In the year 1656 a Venetian adventurer of Kephallenia, by name Constantine Phaulkon (in Siamese, Phra Klang; in French, M. Constance), entered the country. By his cleverness and capacity he gained the favour of the reigning king, Narai (Chau Noraga, or Naraya), who heaped honours upon him and appointed him to responsible positions, ultimately giving him almost unlimited power in every department of governmental business. Permission was given to the Dutch, the English, the Portuguese, and the French to found trading settlements. Communication was improved by the scientific construction of roads and canals, etc., and the prosperity of the country rapidly increased. The French received special favour from Phaulkon; in 1663 they were allowed to build a Catholic church in Ayuthia and to erect a mission under Lamotte Lambert. King Louis XIV and Pope Clement X sent an embassy to Siam in 1673 to further the prosperity of Christianity, a friendly movement answered in like manner by Phaulkon in 1684, which was received in the Roman Catholic Church by Ant. Thomas, S. J., in 1682, May 2. In 1685, Chevalier de Chaumont as ambassador, a fleet left France, to which Bangkok and Mergui were handed over under a convention in 1687; these places the French fortified, but the encroachments of the garrison under the command of Volantz du Bruant and des Farges soon aroused popular animosity. So far-reaching an organisation had been too rapidly initiated; Phaulkon fell a victim to a popular revolt, formed by the mandarins Phra Phet Ratscha (Pitsacha), Wisuta Söngtong, and others, and finished May 18 (capital punishment, June 5), in 1689; the reforms he had introduced were, as far as possible, abolished, the French were expelled in 1690, and the missions and native Christians subjected to severe oppression.

Under the weak rulers who succeeded (Phra Phet Racha, 1689-1700, succeeded by his sons and grandsons), the power of Siam rapidly decayed. Once again the deepest humiliation was to come from the west. In the neighbouring kingdom of Burmah, Alompra (p. 522) had led his people from victory to victory, and had overthrown his hereditary enemy of Pegu. He now proposed to conquer Siam, but after advancing almost to Ayuthia without meeting resistance, he suddenly died in 1760. However, his successor, Shembuan, again invaded the country in 1766; in 1767 the capital of Siam was captured and burnt, and the king, who was wounded, perished in the flames.

(3) *The Third Period of Modern Siamese History (since 1767).*—The fall of the capital and the death of the king left the country at the mercy of the conqueror. He, however, placed but a scanty garrison in occupation. Upon the north, where the strength of the Thai was, as ever, chiefly concentrated in its native soil, a Siamese governor was appointed, by name Phaya Tak (Phiatak, Pia-tak), a Chinese by birth. He gathered as many men capable of bearing arms as he could, drove back the Burmese, and secured the recognition of China after the extinction of the dynasty of 1627. As Ayuthia had been utterly destroyed, the capital was transferred to Bangkok (Bancasey), at the mouth of the Menam, in 1678, which rapidly rose to a great commercial town. This success brought power; in the same year Phaya Tak subdued both Cambodia and the smaller southern States and the Laos in the North (1777); he defeated the Burmese, who could not forget or forgive the loss of Siam. Eventually he became insane, and took sanctuary from a popular revolt in a monastery, where he was killed.

The position of Phaya Tak was taken in 1782 by his prime minister, Chakri, the ancestor of the present dynasty. At that period a French bishop, Béhaine (p. 531), had gained complete influence over the successor to the throne of the neighbouring kingdom of Annam, and France began to interfere more decisively in the domestic affairs of Eastern Indo-China. The growth of European influence and the action of ecclesiastical ambassadors excited the apprehension of the natives; in Siam the new king and his successors (Pierusing until 1809; Phendingkang, 1809–1824; Crom Chiat, or Kroma Mom Chit, 1824–April, 1851) manifested their ill-feeling to the foreigners. Embarrassments were constantly placed in the way of the missions and decrees hostile to the Christian religion were repeatedly promulgated. It was not until the years 1840–1850 that the French bishop, D. J. B. Pallegoix, to whom the education of the crown prince of Siam had been entrusted, succeeded in securing full religious toleration from the prince upon his accession in April, 1851. Ever since the brilliant career of Phaulkon a certain alarmed astonishment had been the prevailing spirit with which Siam regarded France. The young ruler, Chon Fa-Mongkut (a member of that branch of the ruling house which had been expelled in 1824), attempted in 1851 to enter into closer relations with the Emperor Napoleon through his ambassadors and under his brother and successor, Somdet Phra Paramindr Maha Mongkut (1852–September 30, 1868), and a commercial treaty was concluded with France in 1856 (with England in 1855; with Germany on the 7th of February, 1862; with Austria in 1858). Peaceful relations with France continued during the reign of King Paramindr Maha Chulalongkorn (-lankara), who ascended the throne of Siam at the age of fifteen, on the 1st of October, 1868, and took the power from the hands of his trusted minister, Chau Phraya Sri Suriyawongse, on the 16th of November, 1873. In 1884 France obtained a protectorate over Annam, and England secured the possession of the whole of Burmah in 1886, Siam being the only important State of Further India, which retained its independence. On the 8th of May, 1874, the constitution was reorganised, the legislative power being exercised by the king in concert with the great State council and the cabinet of ministers.

The small Shan States in the north became, however, a source of mischief to the two western powers struggling for predominance in Siam. The Shan States on the eastern bank of the Mekong, in particular Kianghung, had been, at different periods in the possession, or under the supremacy, of their more powerful neighbours.

Annam, like Siam and Burmah, had claimed these States in her prosperous period, and had never surrendered her putative rights. The confusion was completed by China, which from an early age had claimed predominance over these States, as over the whole of Further India. When England captured Burmah in 1886, and the Shan States in 1887 and 1888 (508), and was thereby able to lay claim to Kianghung on the left bank of the Mekong, France proceeded to interfere; the movements of the English had cut off her access to Yunnan by the Mekong, and she now claimed, as the protectorate power of Annam, the middle course of the Mekong as the old western frontier of Annam. England now forced Siam to become her advocate and concluded a convention in 1892, which assigned to Siam, as former mistress of those States, the town of Kianghung, which lay upon either bank of the Mekong. As England had expected, the tension between Siam and France broke into open war in 1893; however, this struggle ended on October 2d, when Siam surrendered to France all her claims to the territory east of the Mekong. England again declined openly to confront her powerful rival; she sheltered herself behind China, and agreed upon a frontier delimitation with that country by which China obtained the States of Mongleng (Muang lem) and Kianghung in return for an undertaking not to cede those provinces to any other power (France), either entirely or in part, without the assent of England. France was thereupon forced to conclude a frontier delimitation of her own with China; on July 20th, 1895, she granted China a considerable southward extension of her territory on the Mekong, in return for which important preferential advantages were secured for her commerce with Southern China.

It was not until the convention of January 15, 1896, that the war of intrigue between England and France was, temporarily at least, concluded. By this convention it was arranged that the central portion of Siam,<sup>1</sup> about two-thirds of the previous area of the State, should be secured by a joint protectorate of the two powers. By this guarantee, on the other hand, two sections of the country, the east, bordering upon French Annam, and to the west, near British Burmah, forming the remaining third of the Siamese territory, was left untouched. The contracting powers came to a tacit understanding not to stand in one another's way in view of later undertakings against unprotected districts. At the moment Siam still rules over her previous possessions.

(c) *Eastern Further India (Tongking, Annam, and Cochin-China).*—(a) *The Chinese Period.*—From an early period the history of eastern Further India, which is naturally conjoined to China by the configuration of the continent, has been inseparably bound up with that powerful kingdom, which developed a civilization at an unusually early period. Early reports speak of an embassy from Tongking to the imperial court in the second millennium before our era, and of the foundation of Chinese dynasties in that district in 214 B. C. and 109 A. D., etc. Chinese civilization, however, which was bound to expand, did not stop at Tongking. She had already established herself in Annam and Cochin-China, and had made con-

<sup>1</sup> The Siamese territory under the "protectorate" includes the river districts of the Pechaburi, Mekong, Menam, and Bang Pakam, with their tributaries; the coast line from Muang Bang Tapan to Muang Pase and the river valleys on which these towns are situated; and, finally, the district north of the valley of the Menam, between the Anglo-Siamese frontier, the Mekong, and the eastern frontier of the Me-ing valley.

siderable progress when the Brahman movement began to advance northward from Cambodia (p. 519). There the earlier civilization was predominant, and in a large degree determined the nature of the development of Annam. The forerunners of Brahmanism made no great progress, except in Cochin-China, and left but few traces in Annam, and practically none in Tongking.

From that remote epoch when the first dynasties were founded in Tongking, China for more than a thousand years (until 968) firmly established herself in eastern Indo-China, though her influence varied with the fortunes of Chinese history at large (p. 77 ff.). When China proper was in difficulties from internal disturbances, changes of dynasties, or the attack of powerful foes, she exercised little more than a shadowy predominance. Thus during the years 222–618 A. D. her powers in Annam were greatly limited, and the local governors availed themselves of the embarrassments of the empire to make themselves almost independent. At other periods China governed Eastern Further India with a firmer hand; thus in the first half-century A. D. revolts were suppressed in Cochin-China (which also made itself independent for a short period in 263), and after the powerful Tang dynasty had gained the Chinese throne (p. 90) China once again brought the larger part of Annam and Cochin-China into close dependence upon herself.

(β) *The Rise of National Feeling for Independence.* — In the tenth century, when China was again shattered by internal convulsions (p. 93 below), the movements for independence in Annam were again victorious, and their success was permanent from the year 968 to 981. During that period one of the Chinese governors, by name Li, founded in Annam the dynasty known by his name (1010–1225); Tongking threw off the Chinese yoke in 1164, as did Cochin-China in 1166. China again reduced the rebellious provinces, but only for a time; the emperor, Kublai Khan (pp. 96, 177, and 525) subdued Tongking and also Annam and Cambodia. However, the two last-named States speedily recovered their independence, and Tongking drove the Chinese out of the country in 1288. In the fourteenth, and at the beginning of the fifteenth century, China again secured a footing in eastern Further India; under the Ming dynasty Annam became tributary to China in 1368 (p. 101) and Tongking with Cochin-China became a Chinese province; then during the years 1418–1427 the nationalist movement in these States became so strong that the Chinese lost all semblance of power. The leader of this movement, Le Lo, was the founder of the Le dynasty which ruled for a long period in Annam and Tongking (capital town Hanoi, founded in 1427); by embassies and presents of homage, he made a formal recognition of Chinese supremacy, but henceforward China could no longer interfere in the domestic affairs of Annam.

The European advance to the east of Further India produced for the moment more important consequences in this district than in the south and west of Indo-China. Since 1511 Portuguese, and afterwards Dutch, factories had been founded, and from 1610 missions and small native Christian congregations existed (1610 in Cambodia, 1615 in Champa and Tongking, 1631 in Hainan, 1632 in Laos); the country and its rulers were at first indifferent, and afterwards generally hostile to all foreigners; trade came almost to an entire cessation in the eighteenth century, while the missions and Christian congregations were regarded with suspicion, often bitterly persecuted, and ultimately forced to continue a doubtful existence in secret.

The powerful rulers of the house of Le were succeeded by a succession of weaker princes in the sixteenth century. Under them some parts of Annam became independent (1558) and the Le dynasty would have collapsed entirely without the assistance of skilled officials, who became so important that they secured in 1545 the hereditary position of major domo (the dynasty of Trigne or Tringh; cf. the Peshwas in the Mahratta States; p. 446). Nguyễn Hoang (Tiên Vương; until 1614) in Cochin-China broke away from these officials, and from the nominal ruler in 1570, and became the ancestor of the present ruler of Annam. His successors increased their kingdom by incorporating the remnants of Champa and of Southern Cambodia (the six provinces of the modern lower Cochin-China), and were resident in Huế. These changes caused a considerable degree of complication in the political affairs of Eastern Indo-China during the seventeenth and most of the eighteenth century. China claimed a formal supremacy, though she exercised no actual interference. The Le dynasty continued to be the nominal rulers of Annam; in reality, however, Annam with Cochin-China and Tongking had become two separate States which were often involved in furious struggles with one another. The actual rulers of Annam were the descendants of Nguyễn Hoang, and in Tongking the major domos of the house of Trigne.

(γ) *The Age of French Influence in Eastern Further India.* — European relations with the country had entirely ceased in the eighteenth century; an English attempt under Catchpole, in 1702 to settle in the island of Pulo Condore, came to an end in 1704 with the murder of the settlers by the natives, and the destruction of the factory. It was not until the end of the eighteenth century that Annam came closely into connection with France.

A general rising, incited by three brothers of low birth, the Tay Son, entirely transformed the political situation of Annam in 1755; the old dynasties of the Le, and the major domo princes of the Trigne entirely disappeared, while the Nguyễn family became almost extinct. Only the grandson of the last king of this family, by name Nguyễn Angne, escaped to Siam, where he was educated by the French bishop, Pigneux de Béhaine; he then recovered the most southern portion of the kingdom of his ancestors (Phucuo). He sent his son to France with the bishop in 1787, and on November 18 secured the conclusion of an offensive and defensive alliance from Louis XVI; by this arrangement France was to receive the Gulf and the Peninsula of Turon, while Nguyễn Angne was to be helped by France to conquer the rest of Annam. The execution of this compact on the part of France was largely hindered by the French Revolution; however, Nguyễn Angne, who was supported by the Bishop Adrian, secured the assistance of many French officers, who drilled his troops in European fashion, and conducted the military operations. He was then able between the years 1792 and 1799 to subdue, not only Annam and the Tay Son, but also Tongking in 1802, which had meanwhile thrown off the rule of the Tay Son and secured the predominance in Cambodia.

The kingdom had long become a mere shadow of that larger empire which had existed at the time of the emigration of the Siam Thais. Since 1583, when Phra Naret had dipped his feet in the blood of its king who was beheaded before him (p. 526), the kingdom had been forced to submit to Siam. The misery of the country was increased by continuous disturbances at home and entanglements abroad with Siam, the Laos, and Annam; the kings continually retreated before

their powerful neighbour, and finally transferred their capital to Saigon on the coast, which occupied the site of the town known to Arrian as Thimai. An attempt on the part of Cambodia to avail itself of the Siamese disasters in the war with the Burmese, Alompra, came to nothing; in 1794 the vassal ruler, Somrath Phra Marai, who was set up by Siam, ceded Battambang and Siemrat to his patron in return. From 1806 onwards the impoverished country paid tribute both to Siam and Annam; it held two seals, one from each of the two neighbouring States, and the kings of Cambodia did homage to each of these powers.

Thanks to his French auxiliaries, Nguyễn Angne proved brilliantly successful, and henceforward to his title of "Emperor (or King) of Annam" he added the royal title of "Gia Long" (that is, the man favoured by fortune). Once in power, he became suspicious of the foreigners, whose importance he understood better than any other ruler in Further India. While removing his favour, he made no exhibition of open hostility. His minister of ecclesiastical affairs, Nguyễn Du Hun tam tri is said to have had translated into Annamese for the king's benefit about 1788 a somewhat immoral novel, which is of interest for the history of civilization, the "Kim Wân Kiêu Tân Truyen," a fact which throws much light upon the morality and the education prevalent in the court of Annam at that period.

His successor, Migne megne (Minhmang, 1720-1841), was at first tolerant toward foreigners. However the political intrigues of the French and Spanish missionaries roused him to animosity against the Europeans; in 1833 the missionaries were cruelly persecuted; in 1838 he forbade Europeans to enter his country, and the profession of Christianity was publicly declared a crime as heinous as high treason. In the same year thirty-three French priests fell victims to this decree. Thié utri (1841-1847), the son and successor of Migne megne, relaxed the persecution by merely imprisoning the missionaries, four of whom were liberated in 1843 upon the threats of the French. Generally speaking, however, the oppression continued, and in 1847 France demanded full religious toleration through Commodore Lapierre, which was granted after the fleet of Annam had been destroyed. In the same year the emperor died. He was succeeded by his son, Tuduk (Tuduc or Dukduk, originally Hoong Nham), who was at first well disposed toward the Christians, and reigned until July 17, 1853. Once again the missionaries interfered in a question as to the succession to the throne, and made the young emperor the furious enemy of foreigners and Christians alike. Severe persecutions broke out in 1848 and 1851. France, who considered herself the power responsible for the Christians in Asia, ultimately sent out ships and troops under Captain Lelieur de Ville-sur-arc in September, 1856. Turon was stormed in 1856, but the morning the ships had sailed away Annam replied with a fresh persecution of the Christians and the murder of the Spanish bishop, Diaz (1857).

France now made a vigorous effort in co-operation with Spain. On September 1, 1858, Commodore Charles Rigault de Genouilly again captured Turon and took the town of Saigon in February, 1859. The plan of campaign was then changed; in 1860 Napoleon III issued orders to evacuate Annam and to occupy only Cochin-China, the vassal State of Annam. Meanwhile war had broken out with China, and operations were thereby hindered, and were not resumed until after the peace of Peking (p. 109). In the beginning of 1861 the vice-admiral, Théogène François Page, destroyed the fortifications on the banks of the Mekong. Admiral Louis Adolphe Bonard, who had taken over the command in December, 1861, won a vic-

tory on January 19, 1862, at Monglap, conquered the whole province of Saigon, and captured several important towns in Cambodia. Tuduk was forced to conclude peace on June 15 at the price of the cession of the three provinces of Saigon, Bienhoa, and Mytho. Disturbances broke out in December, leading to fresh negotiations, and a definite peace was not concluded until July 15, 1864. France then returned the above-named provinces, retaining Saigon, and undertook a protectorate over Cambodia, in spite of the protestations of Siam, a tie which was drawn closer by the convention of June 17, 1884. The actual ruler is not King Norodom I (since 1860), but the French resident in Phnom Penh. Fresh outbreaks in Annam necessitated further military operations on the part of France in 1867. The result was the definite loss of those three provinces which now form French Cochin-China.

Meanwhile, a descendant of the Le dynasty, Le Phung, had made himself master of Eastern Tongking, and of the province of Vac Nigne (Bacninh). However, when Tuduk found himself free to act in 1864, he was cruelly put to death. Even then Tongking was not pacified. From 1850 the great neighbouring empire in the north had been shattered by the Taipings, and it was not until 1865 that the rebels in the southern provinces of Kwangsi and Kwangtung were overpowered (p. 110). Many of the rebels fled into the province of Annam under Ua Tsong, where under the "black flag" they disturbed the peace of this much tried country as banditti and river pirates.

When France established herself in Annam she had other views than the mere extension of her empire. Reports had long previously been in circulation concerning the fabulous natural wealth of the southern provinces of China and of Yunnan in particular. The English and the French were striving to intercept one another in the race for these treasures. Upon the incorporation of Burmah (507), England gained a water-way, enabling her to advance into the immediate neighbourhood of Yunnan. The French were now in possession of the mouth of a great river coming from the north to the Mekong, and proceeded to investigate the possibility of its navigation. For this purpose it proved impracticable. Captain Dontard de Lagrée (1866-1868) established the fact that the rapids in the immediate neighbourhood of the river mouth formed an impassable obstacle. The Songka (red river) in Tongking offered better prospects. Dupuis, an enterprising Frenchman, fitted out an expedition to this stream at his own expense. In 1870 he advanced up the river in ships as far as Yunnan, and entered into relations with the Chinese mandarins. Hostilities on the part of the Annamites made it necessary to despatch the naval lieutenant, Marie Jos. François (Francis) Garnier, in 1873, who with less than two hundred French troops subdued in a few months in Tongking a country populated by a million of inhabitants and twice the size of Belgium.

The French parliament declined, however, to sanction the results of those successes in Tongking. The troops were withdrawn (Garnier had been killed on December 31, 1873, by a treacherous attack of the pirates), and France contented herself with the conclusion of a treaty on March 15, 1874, obliging Annam to throw open to European trade three additional harbours (Ninh hai at Hai phong, Hanoi, and Thinai or Qui nhon), to grant full religious tolerance, and to apply to France alone for help in suppressing revolts. A commercial treaty was also concluded on August 31, which, however, was not kept by Annam in spite of its confirmation by that country (August 26, 1875). Annam displayed an unvarying spirit of hostility to France, until that power lost patience. Hanoi was bombarded

in 1882, and the French again advanced into Tongking, where the pirates caused a great deal of trouble (Major Henri Laurent Rivière being killed by an ambuscade on May 19, 1883). By degrees one fortress after another was captured by Rear-Admiral A. A. P. Courbet, including Sontay, which had been occupied by the Chinese (December 16 and 17, 1883). Vao Nigne was also taken by General Charles Theodore Millot (March 10-12, 1884). Tuduk, the ruler of Annam, had died in July, 1883, and had been succeeded by his brother, Hiephoa.<sup>1</sup> On August 21, 1883, by a treaty which was ratified and extended on June 6, 1884, he was forced to cede further provinces, to recognise the protectorate of France, and to renounce all political connection with other powers, China included, which had declared in Paris, through the Marquis Tseng, in 1882, its refusal to acknowledge the convention of 1874. However, in the convention of Tientsin, dated May, 1884, China, which had seriously entertained the project of armed interference in Tongking, fully recognised the French demands, including the protectorate of Annam and Tongking. China, however, did not withdraw its troops from Langson in Tongking, and the struggle continued with varying success for some time, the French suffering considerable losses at the hands of the pirates (General François Oscar de Négrier wounded at That-ke on March 24, 1885). Ultimately, British mediation brought about the Peace of London on April 4, 1885 (confirmed at Tientsin on June 9), whereby China withdrew all her troops from Tongking and recognised the French Protectorate over these States, which she had ruled or at any rate claimed for thousands of years. In May, 1886, the power of the pirates, who were no longer supported by China, was finally shattered. Thus the French were left in undisputed possession of the water-way leading to Yunnan. Since April 12, 1888, Cochin-China, Cambodia, Annam, and Tongking, to which Laos was added in 1893, have been under one uniform administration as "French Indo-China."

<sup>1</sup> The "emperor," Hiephoa, who was friendly to the French, poisoned himself on November 29, 1883. He was succeeded by three brothers, nephews of Tuduk: Kienphuk, to August, 1884, Ham Nghi, who fled in July, 1885, and was transported as a prisoner to Algiers in 1887, and Douc Khanh (Dougkhanh; originally Tshauh mong) September 19, 1885-January 31, 1889. The final ruler was Thanh Thái (originally Bun Lan), February 1, 1889, to September 27, 1897, under tutelage; since then self-dependent.

## V

## INDONESIA

BY LATE DR. HEINRICH SCHURTZ

## 1. ETHNOGRAPHICAL SURVEY

INDONESIA is the name by which we designate the largest group of islands in the world, which stretches out in front of Asia to the southeast, and forms the stepping-stone to the mainland of Australia on the one side, and to the Melanesian archipelagoes and the island-realm of Oceania on the other. The innumerable members of the group include the most gigantic islands of the globe, with mountain ranges and navigable rivers as well as diminutive islets, which hardly supply the sparsest population with the necessaries of life; we find, as we go toward the east, the first traces of Australian dryness and desolation as well as regions of tropical luxuriance and splendid fertility. For a long period there was no idea of any general name for all these islands and island groups, least of all among the natives themselves, who often have hardly recognised the larger islands to be connected territories or called them such. Their narrow horizon, on the other hand, has completely prevented them from realising the sharp contrast which exists between their own island homes, with extensive and deeply indented coast lines, and the neighbouring continents, of which only a small part is in contact with the sea. At least they have never thought of emphasising such a distinction by collective names. The geographers of Europe, having the whole picture of the world before their eyes, were the first to mark out the two large groups of the Sunda Islands and the Philippines; and lastly, though only in quite modern times, and not without opposition, they named these two "Indonesia,"<sup>1</sup> in contrast to the Japanese and Melanesian archipelagoes. It must be noticed that this division has given prominence to the ethnological point of view. Indonesia is the region inhabited by that peculiar brown, straight-haired race, to which we give the name Malayan, and which has been recognised from very early times as a distinct type of mankind.

As we are now concerned with the history of mankind, we may lay still greater stress on the ethnographical standpoint, and from this aspect attach to Indonesia a country which geographically considered belongs to a totally distinct quarter of the globe, namely, Madagascar. This large island seems to lie by chance to the east of the massive and limbless trunk of Africa, and in its peculiarities shows little affinity to the physical characteristics of the African continent. The contrast is not merely one of geological conditions or of fauna and flora. In respect of its population also Madagascar is an appanage of Indonesia rather than of Africa.

The Indian island world belongs as a whole to the tropics, and in its chief

<sup>1</sup> More rarely "Insulinde," particularly since the publication of Ed. Douwes Dekker's "Max Havelaar," in 1860.

parts to the moist and warm tropical plains. Highlands, which are of incalculable importance for the culture of tropical countries, as the ancient history of America in particular shows, are only found to any appreciable extent in Sumatra, although there is no lack of mountain ranges and lofty volcanic cones on the other islands. If we recall the doctrine of Oskar Peschel that the oldest civilized countries lay nearer the tropics than those of modern times, and that therefore the chief zones of civilization have withdrawn toward the poles, it can at least be conjectured that a region, so favourably situated as Indonesia, was not always of such trifling importance for the history of mankind as it is at present. We need not picture to ourselves a primitive highly developed culture, but one which, after reaching a certain level at an early period, remained stationary and was outstripped by the civilization of other regions. The Dyak in Central Borneo has reached, it is certain, no high grade of civilization, but a comparison with the reindeer-hunters of the European Ice-Age would certainly be to his advantage. The entire ethnical development of the country and the influence which it once asserted over wide regions of the world prove that at a remote period a comparatively noteworthy civilization was actually attained in the Malay Archipelago.

Indonesia, notwithstanding its place as a connecting link between Asia and Australia, occupies from the view of ethnology an outlying position. It is true that culture could radiate outwards from Indonesia in almost every direction; on the other hand, this region has almost exclusively been affected by movements from the north and west, from Asia, that is, and later from Europe, but hardly at all from Australia and Polynesia. These conditions find their true expression in the old racial displacements of the Malay Archipelago. The drawbacks of this geographical situation are almost balanced by the extraordinarily favourable position for purposes of intercourse which the Malay islands enjoy, — a position in its kind unrivalled throughout the world. The two greatest civilized regions of the world — the Indo-European on the one side, the East-Asiatic on the other — could only come into close communication by the route round the southeast extremity of Asia, since the Mongolian deserts constituted an almost insuperable barrier; but there in the southeast the island world of Indonesia offered its harbours and the riches of its soil to the seafarers wearied by the long voyage, and invited them to exchange wares and lay the foundation for prosperous trading-towns. This commercial intercourse has never died away since the time when it was first started; the nations alone who maintained it have changed. The present culture of the Archipelago has grown up under the influence of this constant intercourse; but the oldest conditions, which are so important for the history of mankind, have nowhere been left unimpaired. We need not commit the blunder of taking the rude forest tribes of Borneo or Mindanao for surviving types of the ancient civilization of Indonesia. The bold seamen, who steered their vessels to Easter Island and Madagascar, were assuredly of another stock than these degenerate denizens of the steamy primeval forests.

## 2. INDONESIAN HISTORY

It is difficult to give a short sketch of Indonesian history, because justifiable doubts may arise as to the correct method of statement. First, we have to deal with an insular and much divided region; and, secondly, a large, indeed the greater,

part of the historical events were produced and defined by external influences. The history of Indonesia is what we might expect from the insular nature of the region; it splits up into a narrative of numerous local developments, of which the most important at all events require to be treated and estimated separately. But, on the other hand, waves of migration and civilizing influences once more flood all the island-world and bring unity into the whole region by ending the natural isolation of the groups. And yet this unity is only apparent; for even if new immigrants gain a footing on the coasts of the larger islands and foreign civilizations strike root in the maritime towns, the tribes in the interior resist the swelling tide and preserve in hostile defiance their individuality, protected now by the mountainous nature of their homes, now by the fever-haunted forests of the valleys in which they seek an asylum.

#### A. THE PRIMITIVE HISTORICAL CONDITIONS

SINCE there no longer exists any doubt that man inhabited the earth even at the beginning of the Drift epoch, and since the opinion might be ventured that his first appearance falls into the Tertiary age it is no longer possible to deduce in a childlike fashion the primitive conditions of mankind from the present state of the world, and to look for its oldest home in one of the countries still existing. Least of all must we hazard hasty conclusions when we are dealing with a part of the earth so manifestly the scene of the most tremendous shocks and transformations, and so rent and shattered by volcanic agencies as Indonesia. In quite recent times, also, the discovery of some bones at Trinil in Java by E. Dubois (1891-92), which Othniel Charles Marsh ascribes to a link between man and the anthropoid apes, has caused a profound sensation in the scientific world and stimulated the search, in Indonesia itself, for the region where man first raised himself to his present position from a lower stage of existence. However this question may be answered, it is meanwhile calculated to discourage any discussion of origins; it especially helps us to reject those views which unhesitatingly look for the home of all Indonesian nationalities on the continent of Asia, and from this standpoint build up a fanciful foundation for Indonesian history. The linguistic conditions warn us against this misconception; on the mainland of southern Asia we find monosyllabic languages; but in the island region they are polysyllabic. There is thus a fundamental distinction between the two groups.

#### B. THE PRESENT DISTRIBUTION OF THE NATIONS OF INDONESIA

Two main races are represented in the Malay Archipelago, which in the number of their branches and in their distribution are extraordinarily divergent. They show in their reciprocal relations the unmistakable result of ancient historical occurrences. These are the brown, straight-haired Malays (in the wider sense) and the dark-skinned Negritos, who owe their name to their resemblance to the Negro. Since the whole manner in which the Negritos are at present scattered over the islands points to a retrogression, there will always be an inclination to regard them, when compared with the Malays, as the more ancient inhabitants of at least certain parts of the Archipelago.

The Negritos of Indonesia form a link in the chain of those equatorial dark-skinned peoples who occupy most part of Africa, Southern India, Melanesia, and Australia, and almost everywhere, as compared with lighter-skinned races, exhibit a retrogression which certainly did not begin in modern times, and suggests the conclusion that the homes of these dark racial elements were once more extensive than they are to-day. It is doubtful, indeed, whether we are justified in assuming these negroid races to be closely connected, or whether on the contrary several really independent branches of the dark-skinned type of mankind are represented among them. One point is, however, established; the Negritos of the Malay archipelago, by their geographical distribution, and still more by their physical characteristics, are most closely allied to the Papuans who inhabit New Guinea and the Melanesian groups of islands. It follows that the Papuan race once extended further to the west, and was worsted in the struggle with the Malay element. According to Alfred Grandidier's view, even the dark-skinned inhabitants of Madagascar would be closely akin to the Melanesians. The Negritos are in no respect pure Papuans; not only are they often so mixed with Malay tribes that their individuality has disappeared except for a few remnants, but many indications point to the fact that there have been frequent crossings with tribes of short stature, whose relation to the Papuans may perhaps be compared with that of the African pigmies to the genuine Negroes. These dwarf races cannot in any way be brought into line with the other dark peoples. Kinsfolk of the low-statured race, which has mixed with the Negritos, or perhaps formed their foundation, exist on the peninsula of Malacca, especially in its northern part, on the Andamans, and in Ceylon; there were also, in all probability, representatives of this dwarf race to be found on the larger Sunda Islands, and in East Asia (cf. p. 130).

At any rate it is a fact that some of the eastern islands of the Malay archipelago, particularly the Philippines, still contain dark tribes, although in consequence of numerous admixtures and the small numbers of these petty nations their existence has often been doubted. Karl Semper describes the Negritos or Antes of the Philippines as low-statured men, of a dark, copper-brown complexion, with flat noses and woolly black-brown hair. Where they have preserved to some degree their purity of race they are a characteristic type, easily distinguishable from the members of the Malay race. There appear to be hardly any Negritos on the Sunda Islands proper. But in the South, on Timor, Floris, the Moluccas and Celebes, more or less distinct traces point to an admixture of a dark-skinned race with the Malay population. The same fact seems to be shown on Java. Where the Negritos are more differentiated from the others, on the Philippines especially, they usually live in the inaccessible interior of the islands, far from the more densely peopled coasts, and avoid the civilization that prevails there. It is sufficiently clear that these conditions point to a retrogression and displacement of the Negritos; but it is difficult to arrive at any certainty on these points.

The Papuan strain, which is so often to be found in the vicinity of the dwarf race, may be traced to an immigration from Melanesia, which has had its parallels even in quite modern times. The Papuans of Western New Guinea, who were bold navigators and robbers, penetrated to the coasts of the eastern Sunda Islands, and planted settlements there, or possibly they immigrated to those parts as involuntary colonists, having been defeated and carried away by the Malays

in their punitive expeditions. On the whole the relation of the Papuan to the Malayan civilization is very remarkable. An explanation of it is much needed, and would prove of extreme value for the history of both races. The Papuan has not merely been receptive of Malay influences, but has also, to some extent, created and diffused an independent civilization.

### C. THE WANDERINGS OF THE MALAYS

ALTHOUGH a certain migratory impulse which is innate in the Papuan has caused considerable migrations of the race, yet these are completely overshadowed by the wanderings of the Malay peoples, which are distinctly the most extensive known to the earlier history of mankind, and doubly so, because the Malays, not content with spreading over a continent, took to the sea as well, and thus became a connecting link between the four quarters of the globe.

The expression "Malays," since it is used sometimes in a narrower, sometimes in a wider sense, has given rise to many misunderstandings and unprofitable disputes. The source of the confusion lies in the circumstance that the name of the people, which at the period of the European voyages of discovery seemed most vigorously engaged in war and trade, has been given to the whole ethnic group, of which it formed only a single, though characteristic, part. This group, for whose accepted name it is difficult to find a substitute, is a branch of the human race easily distinguishable from its neighbours and admirably adapted to the nature of its home, and its homogeneity is further attested by the affinity of the languages which are spoken by its various branches. We may assume that it was originally an amalgamation of various primitive races. In Indonesia as in Northern Asia (cf. p. 130), dolichocephalic peoples appear to have spread first, but soon to have received an admixture of brachycephalic immigrants. A proposal has been made to designate the first as Indonesians (Protomalays), the latter, as Malays proper, since traces of the differences between them are demonstrable even at the present day. The small nation of the Tenggereses on Java, for example, is, according to the view of J. H. F. Kohlbrugge, a still comparatively pure representative of the "Indonesian" stock.

It is an idle question to ask for the original home of the two component parts of the Malay race, in face of the incontestable fact that the kernel of the Malay nationality occupies at present, as it has occupied since early times, the island world of Melanesia; on the other hand, comparatively small fragments of the stock, with a larger proportion of mixed peoples of partly Malay partly Mongol elements, are found on the continent of Asia. In this sense Indonesia (see the accompanying map) is the cradle of the Malay race as a separate group of mankind. Indonesia was the starting-point of those marvellous migrations which it is our immediate intention to examine more closely. The larger islands within the Malay island world have exercised an isolating and warping influence on the inhabitants, and thus have produced nations as peculiar as the Batta(k)s on Sumatra, the Dyaks on Borneo, and the Tagales on the Philippines; but this fact must not shake our conviction that, taken as a whole, the Malay race, as we call it, is a comparatively definite idea. The later infusions of Indian and Chinese blood, which are now frequently observable, do not concern the earliest periods.

(a) *The Culture of the Earlier Period of Migration.* — At first sight, it ought not to be a difficult task to describe the culture of those racial elements which migrated from Indonesia in various directions; among the descendants of the emigrants there are many tribes, especially in Oceania, which have found little opportunity on solitary islands to acquire new wealth of civilization, and therefore may have preserved the old conditions in some degree of purity. It must also be possible even at the present day to determine, by the simple process of sifting and comparing the civilizations of the different branches which have differentiated themselves from the primitive stock, what was the original inheritance which all these had in common with one another.

But the conditions are by no means so simple. Quite apart from the possible continuance of changes and further developments in remote regions, we must take into account the losses of culture which are almost inseparable from extensive migrations. Polynesia in particular is a region where a settlement without such losses is almost inconceivable; the natural conditions are such that it is impossible to maintain some of the arts of civilization.

If we therefore at the present day, as we advance toward Oceania, cross the limits within which a large number of crafts and acquisitions are known, if on the eastern islands of Indonesia iron-smelting ends, if on the Micronesian realm of islands the knowledge of weaving and the circulation of old East Asiatic or European beads and on Fiji the potter's art cease, the cause of these phenomena is not immediately clear. It is indeed possible that the inhabitants of Polynesia emigrated from their old home at a period when smelting, weaving, and the potter's art were still unknown; but it is almost more probable that at least one part of the civilization possessed by the small coral islands of the oceans has been simply forgotten and lost, or finds a faint echo in linguistic traces, as the knowledge of iron on Fiji (according to W. Pleyte). And even in the first case the question may always remain open whether the different branches of knowledge reached their present spheres of extension in the suite of migratory tribes, or whether we may assume a gradual permeation of culture from people to people, which is possible without migrations on a large scale and may have continued to the present day.

The most valuable possession which can furnish information as to earlier times is the language, but unfortunately there is still an entire want of investigations which would be directly available for historical enquiry. So much may certainly be settled, that there are no demonstrable traces of Indian or Chinese elements in the Polynesian dialects any more than in those of Madagascar. It is thus at least clear that the great migrations must have taken place before the beginning of our era.

A proof that Indonesia in ancient times possessed a civilization of its own nearly independent of external influences is given by the supply of indigenous plants useful to man which were at the disposal of the inhabitants, even at the period of the migrations. Granted that the cultivation of useful growths was suggested from outside sources, still these suggestions were evidently followed out independently in Indonesia. Rice, the most valuable cereal of India and South China, is not an ancient possession of Indonesian culture, which is acquainted instead with the taro (*Arum esculentum*), the yam (*Dioscorca*), and sesame. Among useful trees may be mentioned the bread-fruit palm (*Artocarpus incisa*), and per-

haps the cocoa-nut palm, which are widely diffused in the Malayo-Polynesian region, at any rate. Of useful animals man appears in earlier times to have been only acquainted with the dog, possibly the pig, but neither the ox nor the horse. This is again an important fact. On a previous page notice has been called to the probability that the agriculture of the Old World was older than the cattle-breeding industry, which in its developed form was only introduced into India by the Aryans. While therefore in ancient times the practice of agriculture may have been brought to Indonesia from the mainland, the knowledge of cattle-breeding at the beginning of the migration had not reached the islands by that road. We are not able to settle any fixed date, but these facts at least confirm the view that the years of migration fall in a comparatively early period.

The seamanship of the immigrants and the fact that even in Polynesia they continued to inhabit the coasts and only sparsely peopled the interior of the islands justify the conclusion that the mass of the migratory bands were sent out from typical maritime nations. Java, possibly, which favoured the growth of population by the fertility of its soil, and where prehistoric weapons of polished stone lead us to assume the existence even in early times of a centre of some civilization, was the chief starting-point for the migrations, which split up into various, but now hardly distinguishable, subdivisions. For the most part it would not have been a question of enormous journeys, but of an advance from island to island, where the immigrants would have been content first to occupy a part of the coast, and then, in the traditional manner, to build up a new system of life by cultivating clearings in the primeval forests, by fishing, and by profitable raids. The arts of shipbuilding and navigation must have reached a comparatively high stage; double canoes and outriggers, which enabled boats to keep out at sea even in bad weather and to cross wide expanses of water, must have already been invented. Even at the present day the boats of the Polynesians, and of the Melanesians, who are closely connected with them in this respect, are the best which have been made by primitive races, while in the Malay Archipelago the imitation of foreign models has already changed and driven out the old style of shipbuilding. The sail must have been known to the ancient inhabitants of Indonesia, and it is more than probable that they understood how to steer their course by the stars and the movement of the waves, and that they possessed the rudiments of nautical cartography.

The social conditions of the early period certainly encouraged the spirit of adventure. No ethnic group in the world has shown a stronger tendency than the Malays and Polynesians to encourage the system of male associations as distinct from families and clans. The younger men, who usually live and sleep together in a separate bachelors' house, are everywhere organised as a military body, which often is the ruling force in the community, and, in any event, welcomes adventure and dangers in a quite different spirit from families or clans burdened with the anxiety of wives and children. These conditions create a warlike spirit in the people, which regards feuds and raids as the natural course of things, and finds its most tangible expression in head-hunting, a custom also peculiar to the Malayo-Polynesian stock. Originating in the habit of erecting the skulls of ancestors as sacred relics in the men's quarter, it has led to a morbid passion for collecting, which provokes continual wars and never allows neighbouring races to remain at peace. Thus Indonesia even now retains the traces of a former state of things in which bold tribes of navigators and freebooters were produced.

(b) *Migrations of Earlier Times.* — We are here dealing with such remote epochs that there can be no idea of assigning any precise dates to the different migrations; they can therefore only be briefly sketched, in an order which does not imply any necessary chronological sequence.

A first wave of migration flowed from Indonesia to the north. It is in the first place very probable that Malay tribes settled in the Philippines at a later period than in the great Sunda Islands, the proper home of the true Malay life; but for this nation of skilful seamen it was only a step across from the Philippines to Formosa, where tribes of unmistakably Malay origin are still living. This can hardly have been the ultimate goal. There are numerous traces on the mainland of South China which point to an immigration of Malays. Again, the peculiarity of the Japanese is best explained by an admixture of Malay blood; it is indeed not inconceivable (see p. 2) that the political evolution which began in the south was due to the seafaring Malays who first set foot on the southern islands and mixed with the existing inhabitants and with immigrants from Corea. Since this political organisation took place about 660 B. C., the migration might be assigned to a still earlier time. The first migration northward was also followed by a subsequent one, which reached as far at least as the Philippines, if not farther.

A second stream of emigrants was directed toward the east. On the Melanesian islands, which since early times were occupied by a dark-skinned race, numerous Malay colonies were founded, which exercised a marked influence on the Melanesians, but were gradually, and to some degree, absorbed. Even the continent of Australia must have received a strong infusion of Malay blood. The Malay migratory spirit found freer scope on the infinite island world of the Pacific, and weighty facts support the view that isolated settlers reached even the shores of Northwest America. How those voyages were made and what periods of time they required is not known to us. Only the tradition of New Zealand tells us in semi-mythical fashion how the first immigrants, with their families and gods, took the dangerous voyage from Sawaii and Rarotonga (p. 307) to their new home in their immense double canoes.

The third ethnic wave rose in Indonesia, where volcanic shocks and racial disturbances are equally abundant, swept over the Indian Ocean, and bore westward to Madagascar the first germs of a Malay population (cf. p. 573); the Arabic "Book of Miracles" relates an expedition of three hundred sails from Wa-kwak to Madagascar for the year 945. Possibly even the African coast was reached in this movement, although no permanent settlements were made there.

Thus we see that, at least a thousand years ago, the Malay race spread over a region which extends from the shores of America to the mainland of Africa over almost two-thirds of the circumference of the earth. The Malayo-Polynesians have kept aloof from the continents: the oceans studded with islands are the inheritance of their race, which has had no rival in the command of the seas except the European group of Aryan nations in our own days.

(c) *The Migrations of the Malays in the Stricter Sense.* — If the lessons of comparative philology and ethnology supply all our knowledge of the old migrations, we have, in compensation, another ethnic movement more directly under our eyes, which also began with members of the Malay race, and which, although it hardly crossed the boundaries of Indonesia, forms nevertheless a fitting counterpart

to earlier events. The name of Malays did not originally belong to the whole race, but only to one definite people of the Archipelago (p. 539), and it is this very people which by its migrations in more modern times has reproduced primitive history on a small scale, and thus shown itself worthy to give its name to the whole group of restless peoples. Probably, indeed, it was not even the whole stock with which we are at present concerned that bore the name of Malay, but only the most prominent subdivision of it.

The original home of the people lay on Sumatra in the district of Menangkabau. The name "Malayu" is applied to the island of Sumatra even by Ptolemy, and in 1150 the Arabian geographer Edrisi mentions an island Malai, which carried on a brisk trade in spices. Indian civilization, it would seem, had considerable influence on Menangkabau, for according to the native traditions of the Malays it was Sri Turi Bumana, a prince of Indian or Javanese descent (according to the legend he traced his lineage to Alexander the Great), who led a part of the people over the sea to the peninsula of Malacca and in 1160 founded the centre of his power in Singapore. The new State is said to have aroused the jealousy of a powerful Javanese realm, presumably Modyopahit, and Singapore was ultimately conquered in the year 1252 by the Javanese. A new Malay capital, Malacca, was subsequently founded on the mainland. In the year 1276 the reigning chief together with his people were converted to Islam. The Malays, who had found on the peninsula only timid forest tribes of poor physique, multiplied in course of time so enormously that it became necessary to send out new colonies, and Malay traders and settlers appeared on all the coast districts of West Indonesia. Toward the close of the thirteenth century the State of Malacca was far more powerful than the old Menangkabau, and became the political and ethnical centre of Malay life. The result was that the true insular Malays apparently spread from the mainland over the island world of the East Indies. The Malay settlers played to some extent the rôle of State builders, especially in Borneo, where Brunei in the north was a genuine Malay State; others were formed on the west coast. The Malays mixed everywhere with the aborigines, and made their language the common dialect of intercourse for the Sunda Islands.

The Bugi on the Celebes also spread over a wide area from their original homes. Trifling as all these modern events may be in comparison with those of old times, still they teach us to grasp the conditions prevailing in the past, and to realise the possibility of migrations as comprehensive as those which the Malayo-Polynesians accomplished.

#### D. FOREIGN INTERFERENCE

THE influences of the voyages and settlements were not so powerful as those foreign forces which were continually at work owing to the favourable position of the islands for purposes of intercourse. Asiatic nations had long sought out the Archipelago, had founded settlements, and had been able occasionally to exercise some political influence. The islands were, indeed, not only half-way houses for communication between Eastern Asia and the west, but they themselves offered coveted treasures; first and foremost among these were spices, the staple of the Indian trade; gold and diamonds were found in the mines of Borneo, and there were many other valuable products. The Chinese from East Asia obtained a

footing in the Malay Archipelago; from the west came the agents of the Indonesian and East Asiatic commerce, — the Hindus first, then the Arabs, and soon after them the first Europeans, the present rulers of the Indonesian island world.

(a) *The Chinese.* — The Chinese are not a seafaring nation in the correct acceptation of the word (cf. Vol. I, p. 575). It was only when they acquired, after the conquest of South China, a seaboard with good harbours, and mixed at the same time with the old seafaring population, that a maritime trade with the rich tropical regions of Indonesia began to flourish; only perhaps as a continuation of an older commerce, which had been originated by the northward migration of the Malayan race, and consequently lay in the hands of Malayan tribes. Since South China therefore came into the possession of China in 220 B. C. (p. 74), it must have been subsequent to that time, and probably much later, that the influence of the Chinese was fully felt by the inhabitants of the Archipelago. Permanent connections with Annam can hardly have been established before the Christian era (p. 529). It was not the love of a seafaring life that incited the Chinese to travel, but the commercial instinct, that appeared as soon as other nations commanded the commerce and sought out the Chinese in their own ports. The Chinese fleet then quickly dwindled, the number of voyages lessened, and the merchants of the Celestial Empire found it safer and more convenient to trade with foreigners at home, than to entrust their precious lives to the thin planks of a vessel (cf. p. 592). But the stream of emigration from overpopulated China developed independently of these occurrences, and turned by preference, whether in native or foreign ships, toward the East Indian Archipelago, in many countries of which it produced important ethnical changes.

Very contradictory views are entertained about the extent of the oldest Chinese maritime trade, and especially about the question, with which we are not here so much concerned, of the distance which Chinese vessels sailed toward the west. It appears from the annals of the Liang dynasty, which reigned in the first half of the sixth century of our era (p. 89), that the Chinese were already acquainted with some ports on the Malacca Straits which clearly served as marts for the trade between India and the farther East. As early as the fifth century commercial relations had been developed with Java, stimulated perhaps by the journeys of the Buddhist missionary Fa hien (pp. 82 and 409), who, driven out of his course by a storm to Java, brought back to China more precise information as to the island. The south of Sumatra also at that time maintained communications with China. The political system of Java was sufficiently well organised to facilitate the establishment of a comparatively secure and profitable trade. From these islands the Chinese obtained precious metals, tortoise shell, ivory, cocoa-nuts, and sugar-cane; and the commodities which they offered in return were mainly cotton and silk stuffs. There are constant allusions to presents sent by Indonesian princes, on whom the Chinese court bestowed high-sounding titles, seals of office, and occasionally diplomatic support. In the year 1129 one such prince received the title of king of Java. Disputes between the settled Chinese merchants (who plainly showed even thus early a tendency to form State within State) and the Javanese princes led, in later times, to not infrequent interruptions of this commercial intercourse; indeed, after the conquest of China by the Mongols (p. 95) hostile complications were produced. A Mongol-Chinese army

invaded Java in the year 1293, after it had secured a strategic base on the island of Billiton, but it was forced to sail away without any tangible results. During the age of the Ming dynasty the trade was once more flourishing, and we can even trace some political influence exercised by China (p. 101). In the years 1405-1407 a Chinese fleet was stationed in the Archipelago; its admiral enforced the submission of a number of chieftains, and brought the ruler of Palembang prisoner to China (cf. p. 557).

The coasts of Borneo, which were touched at on every voyage to and from Java, soon attracted a similar influx of Chinese merchants, to whom the wealth of Borneo in gold and diamonds was no secret. The kingdom of Polo, in the north of the island, which appears in the Chinese annals for the first time in the seventh century, was regularly visited by the Chinese in the tenth century. On the west coast, Pumi, whose prince sent an embassy to China for the first time in 977, was a much-frequented town, while Banjarmassin, now the most prosperous trading place, is not mentioned until 1368.

As the spread of Islam with its consequences more and more crippled the trade of the Chinese with the Sunda Islands, they turned their attention to a nearer but hitherto much-neglected sphere, the Philippines. There too the Malay tribes were carrying on a brisk commerce before the Chinese encroached and established themselves on different points along the coast. This step was taken in the fourteenth century at latest. But then the Chinese trader was already followed by emigrants, who settled in large numbers on the newly discovered territory, mixed with the aborigines, and in this way, just as in North Borneo, called into life new Chinese-Malay tribes. When, after the interference of the Spaniards, the Chinese traders withdrew or were restricted to definite localities, these mixed tribes remained behind in the country.

To sum up, it may be said that the Chinese, both here and in Indonesia, exercised a certain amount of political influence, and produced some minor ethnic changes, and that they are even now still working in this latter direction; on the other hand, the intellectual influence of China has not been great, and cannot be compared even remotely with that of the Indians and Arabs. Chinamen and Malays clearly are not in sympathy with each other. At the present day a large share of the trade of the Archipelago once more lies in Chinese hands, the immigration has enormously increased, and the "yellow peril" is nowhere so noticeable as there; but Indonesia must not, in any way, be called for this reason an offshoot of Chinese civilization. The Chinaman shares with the European the fate of exercising little influence on the intellectual life of the Malay. The cause in both cases was the same; both races appeared first and foremost as traders and rulers, but kindled no flame of religious zeal. The Chinaman failed because he was indifferent to all religious questions; the European, because Islam with its greater power of enlisting followers prevented Christianity, on which it had stolen a long march, from exerting any influence. It is possible that in earlier times the Chinese helped Buddhism to victory in Indonesia, but at present we possess no certain information on the subject.

(b) *The Inhabitants of India.* — The inhabitants of India have influenced their insular neighbours quite differently from the Chinese. They brought to them, together with an advanced civilization, a new religion, or rather two religions,

which were destined to strike root side by side in the Archipelago, — Brahmanism and Buddhism. The Hindus and the other inhabitants of India, who have gained their civilization from them, are as little devoted to seafaring as the Chinese, for the coasts of India are comparatively poor in good harbours. Probably the first to cross the Bay of Bengal were the sea-loving inhabitants of the Sunda Islands themselves, who first as bold pirates, like the Norwegian Vikings, ravaged the coasts, but also sowed the first seeds of commerce. But after this the inhabitants of the coasts of Nearer India, who hitherto had kept up a brisk intercourse only with Arabia and the Persian Gulf, found something very attractive in the intercourse with Indonesia, which first induced some enterprising merchants to sail to the islands with their store of spices, until at last an organised and profitable trade was opened. Many centuries, however, must needs pass before the spiritual influence of Indian culture really made itself felt.

Since the Hindu has as little taste for recording history as the Malay, the beginning of the intercourse between the two groups of peoples can only be settled by indirect evidence. John Crawford (1783-1868) in this connection relies on the fact that the two articles of trade peculiar to Indonesia, and in earlier times procurable from no other source, were the clove and the nutmeg. The first appearance of these products on the Western markets must, accordingly, give an indication of the latest date at which the intercourse of Nearer India with the Malay Archipelago can have been systematically developed. Both these spices were named among the articles imported to Alexandria for the first time in the age of Marcus Aurelius, that is to say, about 180 A. D., while a century earlier the "Periplus of the Erythraean Sea" does not mention them. If, then, we reflect that a certain time would have been required to familiarise the natives of India with these spices before there was any idea of shipping them further, and that perhaps on the first trading voyages, which must necessarily have been directed toward the straits of Malacca, products of that region first, and afterward the spices which flourish in the more distant parts of the Archipelago, had been exchanged, we are justified in placing the beginnings of the Indian-Malay trade in the first century of our chronology. This theory is supported by the mention in the "Periplus" of voyages by the inhabitants of India to the "Golden Chersonese," by which is probably meant the peninsula of Malacca. Chinese accounts lead us to suppose that at this time Indian merchants had even reached the south coast of China. At a later period more detailed accounts of Indonesia reached the Greco-Roman world. Even before cloves and nutmegs appeared in the trade-lists of Alexandria, Ptolemy, the geographer, had already inserted on his map of the world the names "Malayu" (p. 543) and "Jawa." Various other facts point to the position of the island of Java as the centre of the civilization of Indonesia, and the emporium for the commerce which some centuries later was destined to allure even the ponderous junks of the Chinese (cf. p. 544) to a voyage along their coasts.

Following in the tracks of the merchants, and perhaps themselves condescending to do a stroke of business, Indian priests gradually came to the islands and won reputation and importance there. India itself, however, at the beginning of the Christian era, was not a united country from the religious point of view. Buddhism, like an invading torrent, had destroyed the old Brahma creed, had shattered the caste system, and had then sent out its missionaries to achieve splendid success in almost all the surrounding countries (p. 409). But it had not

been able to overthrow the old religion of the land; Brahmanism once more asserted itself with an inexhaustible vitality. At the present day Buddhism has virtually disappeared in its first home, while the old creed has again obtained an almost exclusive dominion. The growth of Hindu influence in Indonesia falls in the transition period when the two forms of religion existed side by side, and the religious disputes with India are not without importance for this outpost of Indian culture. Buddhists and Brahmans come on the scene side by side, often avowedly as rivals, although it remains doubtful whether the schism led to any warlike complications. The fortunes of the two sects in the Malay Archipelago are remarkably like those of their co-religionists in India. In the former region Buddhism was temporarily victorious, and left its mark on the most glorious epoch of Javanese history; but Brahmanism showed greater vitality, and has not even yet been entirely quenched, while the Buddhist faith only speaks to us from the gigantic ruins of its temples.

The thought is suggested that the Brahman Hindus came from a different part of the peninsula to the Buddhist. James Fergusson conjectured the home of the Buddhist immigrants to be in Gujerat and at the mouth of the Indus, and that of the Brahman to be in Telingana and at the mouth of the Kistna. The architecture of the Indian temples on Java and the language of the Sanscrit inscriptions found there lend colour to this view. We may mention, however, that recently it has been asserted by H. Kern and J. Groneman, great authorities on Buddhism, that the celebrated temples of Boro-budur must have been erected 850–900 by followers of the southern Buddhists (Hīnayāna; figures of Buddha with the right shoulder bared), whose sect, for example, predominated on South Sumatra in the kingdom of Srī-Bhodja. Brahmans and Buddhists certainly did not appear contemporaneously in Java. The most ancient temples were certainly not erected by Buddhists, but by worshippers of Vishṇu (p. 410) in the fifth century A. D. Some inscriptions found in West Java, which may also be ascribed to followers of Vishṇu, date from the same century. The Chinese Buddhist Fa hien, who visited the island about this time, mentions the Hindus, but does not appear to have found any members of his own faith there. According to this view the Indians of the Coromandel coast would have first established commercial relations with Indonesia; it was only later that they were followed by the inhabitants of the northwest coast of India, who, being also connected with the civilized countries of the West, gave a great stimulus to trade, and became the leading spirits of the Indian colony in Java. This, then, explains the later predominance of Buddhism in the Malay Archipelago.

In the eighth century A. D. the immigration of the Hindus, including in their number many Buddhists, seems to have increased in Java to an extraordinary extent; the construction of a Buddhist temple at Kalasan in the year 779 is recorded in inscriptions. The victory of Indian civilization was then confirmed; the rulers turned with enthusiasm to the new forms of belief, and spent their accumulated riches in the erection of vast temples modelled upon those of India. From Java, which was then the political centre of the Archipelago, the culture and religion of the Hindus spread to the neighbouring islands, to Sumatra, South Borneo, and other parts of the Archipelago. The most easterly points where Buddhism achieved any results were the island of Ternate and the islet of Tobi, northeast of Halmahera, which already formed a stepping-stone to Micronesia.

At that time Pāli was the language of the educated classes. The Indian systems of writing stimulated the creation of native scripts even among those tribes which, like the Battaks in the interior of Sumatra, were but slightly affected in other respects by the wave of civilization. The influence of India subsequently diminished. In the fifteenth century it once more revived, a fact that may certainly be connected with the political condition of Java. Since Buddhism had at this time almost disappeared in Nearer India, this revival implies also a strengthening of the Brahman doctrine, which had survived, therefore, the fall of the Indian civilization (*vide* the figures from Bali illustrating a Brahman legend, p. 568).

(c) *The Arabs.* — In the meantime the victorious successors to Hinduism, the Islamic Arabs, had appeared upon the scene. The Arabian trade to Egypt and India had flourished before the time of Mahomet, and had received the products of Indonesia from the hands of the Indian merchants and transmitted them to the civilized peoples of the West. It is possible that Arabian traders may have early reached Java without gaining any influence there. It was Islam which first stamped the wanderings of the Arabs with their peculiar character; it changed harmless traders into the teachers of a new doctrine, whose simplicity stood in happy contrast to the elaborate theology of the Hindus, and to the degenerate creed of Buddha, which could have retained little of its original purity in the Malay Archipelago. The new duties which his religion now imposed on the Arabian merchant inspired him with a fresh spirit for adventure, and with a boldness that did not shrink from crossing the Indian Ocean. The rise of the Caliphate, which drew to itself all the wealth of the Orient, secured to the bold mariners and traders a market for their wares and handsome profits. Basra then attained prosperity, and was the point from which those daring voyages were made whose fame is re-echoed in the marvellous adventures of Sindbad the Sailor in the Arabian Nights, and Oman on the Persian Gulf became an important emporium; but even the older ports in Southern Arabia competed with their new rivals, and still retained the trade at least with Egypt.

The voyages of the Arabs at the time of the Caliphate form the first stage in the connections between Indonesia and the world of Islam, which seem at first to have been of a purely commercial character. The enterprising spirit of the Arabian merchants soon led them, after once the first steps had been taken, beyond the Malay Archipelago to the coasts of China, which, in the year 850, were already connected with Oman in the Persian Gulf by a flourishing maritime trade. This, however, necessitated the growth of stations for the transit trade in Indonesia itself, where Arabian traders permanently settled and, as we can easily understand, endeavoured to win supporters for Islam. Even then conversions on a large scale might have resulted had not the overthrow of the Caliphate gradually caused an extraordinary decline in the Arabian trade, and consequently in the influence of the Arabs throughout Indonesia.

A new stimulus was given to the intercourse between the States of Islam and the Malay Archipelago when, at the time of the Crusades, the Mohammedan world regained its power, and the kingdom of the Saracens flourished, about 1200 A. D. Nevertheless, Islam appears to have achieved little success at that time in Indonesia, apart possibly from the conversion of Mohammed Shāh, a Malay prince resident in Malacca; this event, which, according to a somewhat untrust-

worthy account, occurred in 1276, was of great importance for the future, since the Malays in the narrower sense became the most zealous Mohammedans of the Archipelago.

The third great revival of trade, produced by the prosperity of the Turkish and Egyptian empires in the fourteenth century, prepared the way for the victory of the new doctrine, which was permanently decided by the acquisition of Java. The first unsuccessful attempt at a Mohammedan movement on Java took place in 1328; a second, equally futile, was made in 1391. But little by little the continuous exertions of the Arabian merchants, who soon found ready helpers among the natives, and had won sympathisers in the Malays of Malacca, prepared the ground for the final victory of the Mohammedan doctrine. The Brahmans, whose religion, as now appeared, had struck no deep roots among the people, offered a feeble and ineffectual resistance to the new creed. The fall of the kingdom of Modyopahit, which had been the refuge of the Indian religious party, completely destroyed Brahmanism in Java in the year 1478.

(d) *The Europeans.* — Victory cheered the missionaries of Islam at the end. A few decades later the first Europeans appeared in the Archipelago. They, indeed, were fated to win the political supremacy, but their spiritual influence was not equal to that of Islam.

(a) *The Portuguese.* — The Portuguese admiral, Diogo Lopez de Sequeira (p. 482), and his men, when they appeared in the year 1509 on the coast of Sumatra, were certainly not the first navigators of European race to set foot on the shores of the Malay Islands. Many a bold trader may have pushed his way thus far in earlier times; but the first traveller in whom the European spirit of exploration and strength of purpose were embodied, the great Venetian, Marco Polo (p. 96), had visited the islands in the year 1295, and reached home safely after a prosperous voyage. No brisk intercourse with Europe could be maintained, however, until a successful attempt had been made, in 1497–1498, to circumnavigate the southern extremity of Africa, and thus discover the direct sea route to the East Indies (p. 450). After that, the region was soon opened up.

The first expedition under Sequeira with difficulty escaped annihilation, as it was attacked, by order of the native prince, while anchoring in the harbour of Malacca. In any case the governor Alfonso d'Albuquerque, when he was on his way to Malacca, in 1511, had a splendid excuse to hand for adopting a vigorous policy and plundering the Malay merchantmen as he passed. Since the sultan of Malacca offered no satisfactory indemnity, war was declared with him; the town was captured after a hard fight, and was made into a strong base for the Portuguese power. Albuquerque then attempted to establish communications with Java, and made preparations to enter into closer relations with the Spice Islands in the East, the Moluccas. After his departure repeated efforts were made to recover Malacca from the Portuguese, but the fort held out.

The Portuguese had followed on the tracks of the Arabs as far as Malacca, the crossing point of the Indian and East Asiatic trade, and they naturally cherished the wish of advancing to China and thus securing the trade with that country. A fleet under Fernao Perez d'Andrade sailed in the year 1516 from Malacca, and, after an unsuccessful preliminary attempt, reached Canton in 1517. Communica-

tions with the Moluccas had already been formed in 1512 through the efforts of Francisco Serrão, and since the Portuguese interfered in the disputes of the natives, the commander of their squadron, Antonio de Brito, soon succeeded in acquiring influence there, and in founding a fort on Ternate in 1522. They were unpleasantly disturbed in their plans by the small Spanish squadron of Magalhães (or Magellan), who had been killed on Matan on April 27 (Vol. I, p. 586); this fleet, after crossing the Pacific, appeared on November 8, 1521, off Tidor, and tried to enforce the claims of the king of Spain to the Moluccas.

Generally speaking, it was clear, even then, that the Portuguese could not possibly be in a position to make full use of the enormous tract of newly discovered territory, or even to colonise it. There was never any idea of a real conquest even of the coast districts. A large part of the available forces must have been employed in holding Malacca and keeping the small Malay predatory States in check, while the wars with China made further demands. The Malay prince of Bintang, in particular, with his large fleet continually threatened the Portuguese possessions on the strait of Malacca, and after 1523 caused great distress in the colony until his capital was destroyed in 1527. The position of the Portuguese on the Moluccas was also far from secure, since the State of Tidor, which was friendly to Spain, showed intense hostility. Commercial relations had been established since 1522 with the State of Sunda in western Java, but the permission to plant a settlement in the country itself was refused. On Sumatra, where Menangkabau was visited by the Portuguese as early as 1514, some petty States recognised the suzerainty of Portugal; Acheh (Achin), on the contrary, was able to assert its independence, while attempts to establish intercourse with Borneo were not made until 1530.

In the same year new disturbances broke out on the Moluccas, since the encroachments of the Portuguese commanders, who had taken the king of Ternate prisoner, had incensed the subjects of this ally. When the new commander-in-chief, Gonzalo Pereira, to crown all, declared that the clove trade was the monopoly of the Portuguese government, the indignation was so intense that the queen ordered him to be murdered, and the lives of the other Portuguese were in the greatest jeopardy. Peace was restored with the utmost difficulty. Fresh disorders were due to that corrupt mob of adventurers who ruled the islands in the name of the king of Portugal, abandoned themselves to the most licentious excesses, and undermined their authority by dissensions among themselves. The governor, Tristão de Taide, brought matters to such a pitch that all the princes of the Moluccas combined against him (1533); his successor, Antonio Galvão, at last ended the war with considerable good fortune, and restored the prestige of Portugal on the Spice Islands. His administration certainly marked the most prosperous epoch of Portuguese rule in those parts. Later, the struggles recommenced, and finally, in 1580, led to the evacuation of Ternate by the Portuguese and their settlement in Tidor.

Thus the influence of the Portuguese was restricted to parts of the Moluccas and some places on the strait of Malacca. Indonesia was in most respects only the thoroughfare for the Chino-Japanese trade, which at first developed with as much promise as the East-Asiatic missions (p. 102). The principal station of the trade continued to be Malacca, notwithstanding its dangerous position between States of Malay pirates and the powerful Acheh on Sumatra.

The history of Spanish colonisation in the Malay Archipelago is almost entirely bound up with the history of the Philippines; the reader will therefore consult pp. 569-572.

(*β*) *The Dutch.* — The Portuguese rule in Indonesia was as brief as that in India (p. 452). At the end of the sixteenth century the two nations which were destined to enter on the rich inheritance, the Dutch and the English, began their first attempts at commerce and colonisation in the Indian waters. The Dutch in particular, through their war with Spain, which crippled the hitherto prosperous trade with the American colonies, were compelled to seek new fields for their activity. Their eyes were turned to India when Portugal, weakened rather than strengthened by the union with Spain (1580), tried in vain to enforce its influence over a vast tract of territory; even without at once becoming hostile competitors to Portuguese trade, the Dutch merchants might hope to discover virgin lands, whose exploitation promised rich gains.

The first Dutch fleet set sail from Texel on April 2, 1595, under the command of Cornelis de Houtmans (p. 453), a rough adventurer, and anchored on June 2, 1596, off Bantam, the chief trading port of Java. This expedition did little to secure the friendship of the natives, owing to the bad qualities of the commander; but at the least it paved the way for further enterprise. In the course of a few years a number of small trading companies arose, which only succeeded in interfering with each other and causing mutual ruin, until they were finally combined, through the co-operation of Oldenbarneveld and Prince Maurice, on March 20, 1602, into a large company, "the Universal Dutch United East India Company." This company soon obtained possessions in the Malay Archipelago, and after 1632 exercised full sovereign sway over its territory.

The company founded a permanent settlement in Bantam, whose prince made friendly overtures, and took over the already existing trading enterprises in Ternate, Amboina, and Banda, the existence of which proves incidentally that even the Dutch had at once tried to win their share of the spice trade. Disputes in consequence arose on the Moluccas in 1603, when the natives, exasperated by the oppression of the Portuguese and Spaniards, took the side of the Dutch. The undertakings of the company were, however, first put on a systematic basis in the year 1609, when the office of a governor-general was created, at whose side the "Council of India" was placed, and thus a sort of independent government was established in the Archipelago. The Spaniards now suffered a complete defeat. And when in their place the English appeared and entered into serious competition with the company, they found themselves confronted by the governor-general, Jan Pieterszon Coen, a man who, competent to face all dangers, finally consolidated the supremacy of the Dutch. The English tried in vain to acquire influence on Java by help of the sultan of Bantam. Coen defeated his opponents, removed the Dutch settlement to Jacatra, where he founded in the year 1619 the future centre of Dutch power, Batavia, and compelled Bantam, whose trade was thus greatly damaged, to listen to terms. "We have set foot on Java and acquired power in the country," Coen wrote to the directors of the company; "see and reflect what bold courage can achieve!" To his chagrin the Dutch government, from considerations of European policy, determined to admit the English again to the Archipelago. This proceeding led to numerous complications,

and finally to the execution of a number of Englishmen, who had apparently tried to capture the Dutch ports on Amboina. Coen's whole energies were required to hold Batavia, which was besieged in 1628 by the Javanese. His death, which occurred in that same year, was a heavy blow to the Dutch power.

The influence of the company, however, was now sufficiently assured to withstand slight shocks. The Portuguese had been little by little driven back and forced almost entirely to abandon the East Asiatic trade. The English found a field for their activity in India, and the Spaniards retained the Philippines, but were compelled in 1663 definitely to waive all claim to the Moluccas. Java and the Spice Islands were the bases of the Dutch power, which reached its greatest prosperity under the governor-general, Anton van Diemen (1636-1645). Malacca was then conquered, a friendly understanding established with the princes of Java, and Batavia enlarged and fortified in every way. Soon afterward the sea route to the East Indies was secured by the founding of one station at the Cape of Good Hope and another on Mauritius. But in this connection the huckstering spirit of the trading company was unpleasantly shown in the regulations which were passed for the maintenance of the spice monopoly in the Moluccas, and were fraught with the most lamentable consequences for the native population.

Greater attention was now gradually paid to the hitherto neglected islands of the Archipelago, especially as Formosa (captured in 1624) in 1662 was lost to the Chinese. The attempts to set foot on Borneo met at first with little success; on the other hand, factories were founded on different points of the coast of Sumatra, and in the year 1667 the prince of Macassar on Celebes was conquered and compelled to conclude a treaty to the advantage of the company. In Java the influence of the Dutch continually increased; Bantam was humbled in 1684, and the final withdrawal of the English from Java was the result. But even in later times there were many severe struggles.

Like all the great sovereign trading companies of the age of discovery the Dutch East India Company enjoyed but a short period of prosperity. The old spirit of enterprise died away; a niggardly pettiness spread more and more, and produced a demoralising effect on the servants of the company, although their dangerous posts and the tropical climate must have served as an excuse in any case for numerous excesses. In 1731 the governor-general, Diederick Durven, had to be recalled, after barely two years of office, on account of unparalleled misconduct; but the state of things did not improve appreciably even after his departure. The misgovernment weighed most heavily on the Chinese merchants and workmen who were settled in the towns. At last, in Java, this part of the population which was essentially untrustworthy, and had always been aiming at political influence, was driven into open revolt. Since the Chinese rendered the vicinity of Batavia insecure, the citizens armed themselves, and at the order of the governor-general, Adrian Valckenier, massacred all the Chinese in the town (October, 1740). But it was only after a long series of fights that the insurgents, who had formed an alliance with Javanese princes, were completely defeated, and the opportunity was seized of once more extending the territory of the company.

The strength of the company was based on its jealously guarded trade monopoly; a blow directed at that was necessarily keenly felt. It was observed in Holland with a justifiable anxiety that the English, whose naval power was growing to be the first in the world, once more directed their activities to the East

Indies, and came into competition with the company not only on the mainland, but also on Sumatra and the Moluccas, answering all remonstrances with thinly veiled menaces. The mouldering officialism of the Dutch company was totally unable to cope with this fresh energy. While individuals amassed wealth, the income of the company diminished, and all profits had to be sacrificed on the unceasing wars with Malay pirates and similar costly undertakings.

Toward the close of the eighteenth century the States-General were compelled to aid the helpless sovereign company by sending a small fleet of warships. But when the Netherlands after their transformation into the "Batavian Republic" (January 26, 1795) were involved in war with England, the fate of the company was sealed; it fell as an indirect victim of the French Revolution. The Cape settlement first went; then Ceylon and all the possessions in India were lost. In 1795, Malacca also fell, and a year later Amboina and Banda were taken. Ternate alone offered any resistance. Java, which for the moment was not attacked by the English, was soon almost the only relic of the once wide realm of the company which, harassed with debts and enfeebled by the political situation at home, could only hold out a few years longer by desperate means. The company was dissolved in the year 1798, and the "Batavian Republic" took over its possessions in 1800.

The change of the republic into a kingdom held at the will of Napoleon (May 26, 1806), and the French occupation of Holland (July 9, 1810), involved further important consequences for the East Asiatic possessions. The English took advantage of the propitious moment to become masters of the colonies which had now become French, and in the year 1811, as a final blow, equipped an expedition against Java. Its success was complete; Batavia fell without any resistance, and the small Dutch army, which held out for a short time in the vicinity of the capital, was forced to surrender on September 18. England took possession of the Dutch colonies, and proved her loyalty to those great principles which have raised her to be the first maritime and commercial power of the world, by abolishing the monopolies and establishing free trade. But the precipitate introduction of these reforms and other injudicious measures soon led to all sorts of conflicts and disorders, which deprived the English government of any advantage which might otherwise have been gained from their new possession. After the fall of Napoleon the Netherlands, by the treaty of London of August 13, 1814, received back the colonies which had been taken from them, with the exception of the Cape and Ceylon. On June 24, 1816, the Dutch commissioners at Batavia took over the government from the hands of the English commander. Nevertheless, the English soon afterward struck a severe blow directly at the Dutch colony, by adding to their possessions on Malacca, which had been held since 1786, the island of Singapore, which they acquired by purchase, and by establishing there in a short time a flourishing emporium for world trade. Batavia was the chief loser by this, and its population soon sank to the half of what it had formerly been.

The dissolution of the company and the English reforms had broken down the narrow-spirited system of monopolies, and the Dutch government had no option but to conform to the altered conditions. A small country, however, like Holland could not, from economic reasons, adhere to the English system of free trade, nor waive all direct national revenue, and in its place await the indirect results of unrestricted commerce; the colonies were compelled not only to support themselves and the colonial army which had now been formed, but also to provide for a

surplus. Thus the spice monopoly on the Moluccas, which had been successfully abolished, was reintroduced, though in a somewhat modified form and less profitably than before, since in the interval the cultivation of spices had been introduced into other parts of the tropical world. The bulk of the revenue had to be supplied by the patient population of Java, which since 1830, in accordance with a scheme drawn up by the governor-general, Jan von den Bosch (*cultuurstelsel*), was employed on a large scale in forced labour on the government plantations, and was also burdened by heavy taxes. The Dutch possessions from that time were no longer menaced by foreign enemies; but the colonial army had to suppress many insurrections and conquer new territories for Holland. The Dutch, by slow degrees and in various ways, obtained the undisputed command of the Indian Archipelago. In the large islands of Sumatra and Borneo for a long time they only exercised a more or less acknowledged influence on the coasts, while the interior even at the present day does not everywhere obey their rule; in any case the coast districts gave them much work to do, as their desperate battles with Acheh (Achin) prove. The native princes were almost everywhere left in possession of their titles; but on many occasions the Dutch, not reluctantly perhaps, were forced to take different districts under their immediate government. The splendid training which their colonial officials received assured the success of the Dutch.

A great change in the internal conditions began in the year 1868. The situation of the natives on Java, which had become intolerable (and still more perhaps the knowledge that, in spite of all the forced labour, the profits of the government plantations did not realise expectations), led to the abolition of the *corvée* and the former unsound and extravagant methods of working. The campaign which the Dutch poet and former colonial official Eduard Douwes Dekker (Multatuli; cf. above, p. 535) had conducted since 1859 against the abuses in the government contributed to this result, although for a long time no direct effects of his attacks were noticeable. The coffee monopoly, indeed, was left, though somewhat modified; so, too, the principle that the native should be left to work on his own account, and that then the results of his labour be compulsorily bought from him at a very low price is still enforced, since the balance of the Indian finances must be maintained. It was possible to abandon the Javanese system of forced labour without excessive loss owing to the fact that the development of tobacco-growing on Sumatra (since 1864) and of coffee-growing on Celebes opened up new sources of revenue. Accordingly in 1873 the antiquated spice monopoly on the Moluccas was finally abolished without inflicting an insupportable blow on the State finances.

The scientific exploration of the region has been commenced and carried out in a very thorough fashion. From many points of view the Dutch possessions are models for the colonial administrator; and in spite of all mistakes the earlier development shows how a small European people can succeed in ruling an infinitely larger number of unstable Asiatics, and in making them profitable to itself.

#### E. THE SEVERAL PARTS OF INDONESIA IN THEIR INDIVIDUAL HISTORICAL DEVELOPMENT

(a) *Java*. — Java is far from being the largest island of the Archipelago, but it is certainly the most fertile, so that it can support a very dense population; it

is also the most accessible, and consequently was the first and favourite resort of traders. It is true that culture has only been able to take root easily on the comparatively flat north coast with its abundance of harbours, while the steep south coast, which looks out on a sea seldom navigated in old days, has never attained to any importance. The long, narrow island, through which a chain of lofty volcanoes runs, divides into a number of districts, in which independent political constitutions could be developed.

Apart from slight traces of a population resembling the Negritos, Java was originally inhabited by genuine Malays. No reliable early history of the island is forthcoming, since the first records, which are still untrustworthy, date from the Islamic Age. We are thus compelled to have recourse to the accounts supplied by other nations, and to the remains of buildings and inscriptions, which are still to be found plentifully on the island. In any case, Java was the focus of the Archipelago so far as civilization was concerned, and to some extent the political centre also, and it has retained this position down to the present day. Our oldest information about Java can be traced to the Indian traders, who had communication with the island since, perhaps, the beginning of the Christian era. The fact that the Indians turned special attention to Java, which was by no means the nearest island of the Archipelago, must certainly be due to the existence there of rudimentary political societies whose rulers protected the traders, and whose inhabitants had already passed that primitive stage when man had no wants. The Indian merchants by transplanting their culture to Java, and giving the princes an opportunity to increase their power and wealth through trade, had no small share in the work of political consolidation. We must treat as a mythical incarnation of these influences the Adyi Saka, who stands at the beginning of the native tradition, and is said to have come to Java in 78 A. D. (for this reason the Javanese chronology begins with this year); he gave them their culture and religion, organised their constitution, made laws, and introduced writing. The Javanese legend mentions the names of some of the kingdoms influenced by Hindu culture. Mendang Kamulan is said to have become important at the end of the sixth or beginning of the seventh century; in 896 the dynasty of Jangala, and in 1158 that of Pajajaram (Pajadsiran), are said to have succeeded.

The first immigrants to Java were worshippers of Vishnu, who were followed later by Buddhists; this fact appears from the inscriptions and ruins, and is confirmed by the accounts of the Chinese Fa hien. The oldest traces of the Hindus have been discovered in West Java, not far from the modern Batavia. There must have been a kingdom in that part, between 400 and 500 A. D., whose monarch was already favourable to the new culture and religion. It is possible that the first Buddhists then appeared on the island and acquired influence. Important inscriptions dating from the beginning of the seventh century tell us of a prince of West Java, Aditya dharma, an enthusiastic Buddhist and ruler of a kingdom which comprised parts of the neighbouring Sumatra; he conquered a Javanese prince, Siwaraga, whose name leads us to conclude that he was a supporter of the Brahman doctrines, and built a magnificent palace in a part of Java which can no longer be identified. It does not seem to have been any question of a religious war which led to this conflict, but merely of a political feud. We learn from Chinese sources that there was a kingdom of Java to which twenty-eight petty princes owed allegiance, and that in the year 674 a woman, Sima, was on the throne; this kingdom,

whose capital lay originally farther to the east, embraced, presumably, the central parts of the island, and was not therefore identical with that of Âditya dharma.

Buddhism, at all events, supported by a brisk immigration from India, increased rapidly in power at this time, especially in the central parts of Java, while in the east, and perhaps in the west also, Brahmanism held its own. In the eighth and ninth centuries there were flourishing Buddhist kingdoms, whose power and splendour may be conjectured from the magnificent architectural remains, above all, the ruins of temples in the centre of the island, and from numerous inscriptions. The fact that in the year 813 negro slaves from Zanzibar were sent by Java as a present to the Chinese court shows the extent of Javanese commerce of that time. If we may judge of the importance of the States by the remains of the temples, the kingdom of Boro-Budur must have surpassed all others, until it fell, probably at the close of the tenth century. After the first quarter of this century hardly any more temples or inscriptions seem to have been erected in central Java, a significant sign of the complete decay of the national forces. With this ended the golden age of Buddhism.

At the same time the centre of gravity of political power shifted to the east of the island. Inscriptions of the eleventh century tell of a king, Er-langa, whose hereditary realm must have lain in the region of the present Surabaya; by successful campaigns he brought a large part of Java under his rule, and seems to have stood at the zenith of his power in the year 1035. His purely Malay name proves that the dynasty from which he sprung was of native origin. He was, however, thoroughly imbued with Indian culture, as may be concluded from the increase of Sanscrit inscriptions in East Java after the beginning of the eleventh century. A Chinese account leads us to conjecture that about the same time a kingdom existed in the west of Java which was at war with a State in southern Sumatra.

The next centuries are somewhat obscure; this may be connected with a certain decline in the trade and thus in the influence of the civilization of India, but is principally due to the division and subdivision of Java into numerous petty States. But in spite of this want of union the attempt of the Mongol monarch Kublai (p. 177) to seize Java proved unsuccessful; only a part of the east was laid waste. That side of the island contained among others the States of Pasuruan, Kadiri, and Surabaya, the first of which gradually lost in importance. The States in Central Java apparently sank into insignificance as compared with those of the east; this condition of things lasted until the intercourse with Nearer India once more flourished, and the kingdoms of Solo and Semarang began in consequence to revive.

This new Hinduistic age, in which Brahmanism again became prominent, had however a stimulating influence on the east, where the kingdom of Modyopahit (Majapahit, Madhaput) rose to be a mighty power; in the west at that time the kingdom of Pajajaran (p. 555) was the foremost power. Javanese records give the year 1221 (according to the Saka reckoning, 1144) as the date of the founding of Modyopahit, or, more correctly, of the preceding kingdom of Tumapel, and name as the first sovereign Ken A(ng)rok, who took as king the title Rayasa, and is said to have died in 1247 Saka (1169). The kingdom of Modyopahit in the narrower sense was not probably founded before 1278; the first king was Kertarayasa.

Modyopahit is the best known of the earlier Javanese kingdoms, since it lasted almost to the arrival of the Europeans, and an offshoot survived destruction by Islam. A glance at the power of Modyopahit is therefore instructive, since it is typical of the peculiar conditions of the Malay Archipelago and all the seafaring population of the States on the coast or on the islands. Modyopahit never made an attempt to subjugate completely the island of Java and change it into a united nation, but it made its power felt on the coasts of the neighbouring islands, just as Sweden for a time ruled the shores of the Baltic without annexing Norway, or as England had long laid claim to the French coasts before Scotland was joined to the British realm. We may allude, in passing, to the colonies of Ancient Greece, to Carthage or Oman. In the west of Java a strong kingdom still stood, which for a time reduced Modyopahit to great straits. The advance of Modyopahit was naturally only possible when a large fleet was available; this is said to have destroyed, in 1252, the Malay capital Singapore. The kingdom attained its greatest size under the warlike king Ankawijaya, who mounted the throne in 1390, and is said to have subjugated thirty-six petty States. It is certain that the kingdom had possessions on Sumatra and settled Javanese colonists there, also that the south coast of Borneo stood partially under its influence. It is probable that the Javanese, who, it can be proved, settled on the Moluccas, had also gained political power there. The island of Bali in the east of Java formed an integral part of Modyopahit. The kingdom seldom formed a united nation, but it exercised a suzerainty over numerous petty States, which gladly seized every opportunity of regaining independence. A great war between West and East Java, which had no decisive results, broke out in the year 1403 and led to the interference of Chinese troops (cf. p. 546).

In spite of all the brilliance of the Hindu States, the seeds of corruption had been early sown in them. The immense prosperity of the Arabian people had centuries before brought into the country Arab merchants, who ended in permanently settling there, as the merchants of India had already done, and had won converts for Islam in different parts of the Archipelago, chiefly among the Malays on Malacca, but also among the Chinese traders. "The Oriental merchant," says Conrad Leemans, "is a man of quite different stamp from the European. While the latter always endeavours to return to his home, the Oriental prolongs his stay, easily becomes a permanent settler, takes a wife of the country, and has no difficulty in deciding never to revisit his own land. He is assimilated to the native population, and brings into it parts of his language, religion, customs, and habits." It was characteristic of the heroic age of Islam that the Arabian merchants had other aims beyond winning rich profits from trade: they tried to obtain political dominion by means of religious proselytism. Apparently the kingdom of Modyopahit, the bulwark of Hinduism, had early been fixed upon as the goal of their efforts.

The comparatively feeble resistance of the Buddhist and the Brahman doctrines is partly explained by the fact that both were really comprehended by the higher classes alone, while the people clung to outward forms only. A Chinese annalist at the beginning of the fifteenth century calls the natives of Java downright devil-worshippers (cf. p. 568); he does not therefore put them on a footing with the Buddhists of China or Further India, so familiar to him. The first victory of Islam was won in the Sumatran possessions of Modyopahit. The new doctrine found converts among the nobles of the kingdom; of these Arya Damar, the governor in Sumatra,

and, above all, his son Raden Patah are mentioned. The improbable Javanese account of the fall of Modyopahit only leads us to suppose that a revolt of the nobles who had been won over to Islam, probably assisted by female intrigues, cost the reigning monarch, Bromijoyo, his throne (1478). The Brahmanists who remained loyal withdrew to the island of Bali, whence for a long time they commanded a part of the east coast of Java, and when that was no longer possible, hindered at least the advance of Islam on Bali (cf. below, p. 562). The victory of Islam in Modyopahit soon had its counterparts in the other States of the island. Even in 1552 the ruler of Bantam sought to obtain the protection of the Portuguese against the Mohammedans; but it was too late. When two years afterward a Portuguese fleet appeared, the important trading town was in the hands of the Mohammedans. Since the conversions in the several districts of Java took place at different times, and were mostly associated with disturbances, a number of petty States soon arose, of which Pajang and Damak were the most powerful. On the island of Madura, whose destinies were always closely linked with those of Java, there were three independent kingdoms.

Some one hundred years after the triumph of Islam the situation was altered. The princes of Mataram had gradually attained greater and greater power, though their country had originally been only a province of Pajang; in the end they had subjugated most of the east and the centre of the island. In the west, on the contrary, Bantam, now Islamic, was still the predominant power. The Dutch, after 1596, tried to negotiate an alliance with it, which could not permanently prove advantageous to Bantam. The founding of Batavia and the interference of the English soon led to hostile complications, but the attempt to expel the Dutch once more from the island did not succeed. The Dutch Trading Company naturally also came in conflict with the ambitious kingdom of Mataram. The "Susuhunan," or Sultan, Agong of Mataram, had formed a scheme to subdue the west of Java, and had proposed an alliance to the Dutch; but he found no response from the cautious merchants, and consequently twice (in 1628 and 1629) made an attempt to seize Batavia. After his death his son Ingologo (1645-1670) concluded a treaty of peace and amity with the company (1646). Since the Dutch did not for a time try to extend their possessions on Java, the peace was one of some duration. Ingologo's successor, the sultan Amang Kurat, first invoked the help of the Dutch against a Buginese freebooter who had settled in Surabaya. He was expelled, and a rebellious prince, Truna Jaya, also succumbed to the attack of the Dutch fleet. The company in the treaty of Japara (1677) were well paid by concessions of territory and trading facilities for the help which they had rendered.

But the complications were not yet ended. Truna Jaya once more drew the sword against the apparently unpopular Amang Kurat, drove him out from his capital, and selected Kadiri as the capital of the kingdom, which he had the intention of founding. But the decision rested with the Dutch, and they were resolved to keep the old dynasty on the throne, for the good reason that the expelled prince was forced to submit to quite different terms from those offered by his victorious rival. They defeated the usurper and placed the son of Amang Kurat, who had died meanwhile, on the throne; a small Dutch garrison was left in the capital to protect him. In the year 1703 the death of the sultan gave rise to violent disputes about the succession. Once more naturally (cf. the English policy in India, pp. 467-493) Paku Buwono, the candidate who with the help of the company suc-

ceeded in establishing his claim to the throne, had to show his gratitude by surrenders and concessions of every kind (1705); the disputes, however, still lasted. Henceforth the sultans of Mataram could only hold the sceptre and avert the fall of their feudal sovereignty by the continuous support of the Dutch. Confusion reached its height when, by the revolt of the Chinese in the year 1740, the power of the company itself was shaken to its foundations. The reigning sultan as well as the princes of Bantam and Cheribon encouraged the rebellion, though they feigned devotion to the interests of the company; the result was that the sultan had to consent to fresh concessions after the defeat of the Chinese, and, what was most important, renounced his sovereignty over the island of Madura. The kingdom of Mataram, after the loss of the coast, became more and more an inland State, and consequently was left helpless against the maritime power of the Dutch. The seat of government was then removed to Solo (Surakarta).

But the greater the influence which the company acquired over Mataram, the more it saw itself dragged into the endless rebellions and wars of succession which had now become traditional in that kingdom. From 1749 to 1755 a war raged, which was finally decided by a partition of the kingdom. The sultan Paku Buwono III received the eastern part, with the capital Surakarta; his rival, Mangku Bumi, the western, with Jokjakarta as chief town; while a third claimant was granted some minor concessions (treaties of 1755 and 1758). Besides the two States formed out of the ancient Mataram, there still remained in the west the kingdoms of Bantam and Cheribon, both entirely subject to the company, which, in fact, possessed the greater part of Java. Under the conditions thus established the more important disputes were ended; but the maladministration of the company, together with its oppression of the natives, produced their natural result in a series of petty disturbances during which robbery and pillage were carried on without a check. The final collapse of the company and the chequered fortunes of the Netherlands in 1800 naturally increased the disorders on Java, and the reforms which General Herman Willem Daendels finally carried out in the year 1808 came too late. England took possession of the island in 1811 and held it till 1816. At this time the remaining territories of Bantam and Cheribon were taken away, and nothing was left to the two sultans beyond a pension and the empty title. Thus only the sultan of Surakarta and the sultan of Jokjakarta were left as semi-independent rulers; but both, as a penalty for their resistance to the English, were once more confined to their own territory, and watched by garrisons posted in their chief towns.

With the second occupation of Java by the Dutch a new, but on the whole hardly more prosperous, era opens for the island. The narrow-spirited monopolies and trading restrictions of the old company were, it is true, not revived, or only in a modified form; and since the government devoted its attention to the widest possible cultivation of useful plants, it not only enlarged its revenue, but promoted the increase of the population and of the general welfare. But all the heavier did the burden of the *corvée* weigh upon the natives. Insurrections were therefore still very frequent; one of them ended with the banishment of the discontented ex-sultan of Bantam (1832). An earlier rebellion, which broke out in 1825 in Jokjakarta, under the leadership of the illegitimate prince Dhigo Negoro, against the governor-general Godard van der Capellen, had been still more dangerous. As had happened in previous cases, the troops of the princes of Madura, who were

loyal to the Dutch, lent efficient aid in its suppression. Although this revolt exposed many weak points in the administration of the Dutch Indies, it is only since 1868 that radical changes have been made (cf. above, p. 554). The *corvée* was virtually abolished in case of the natives and a more equitable system of government introduced. Java, on the whole, since the Dutch government turned its attention successfully to the other islands of the Malay Archipelago, has no longer been able entirely to maintain its position as head of the Indonesian colonies.

(b) *Sumatra*.—Sumatra, which is far larger than Java, but of a similarly elongated shape, rises in the interior into numerous uplands possessing a comparatively cool climate; the east coast is flatter and more accessible than the west coast, in front of which lies a row of small islands. The political attitude of Sumatra has been determined by its geographical position; it has been connected on the one hand with the Strait of Malacca, on the other, with Java. But ethnographically it is a purely Malay country, the place probably from which the ancient migrations to the west started. In the Battas (Bataks) of the interior a people has been preserved which, although largely impregnated with the results of civilization, has still retained a considerable share of its original peculiarities, and has resisted the introduction of any religious teaching from without. Sumatra, as might be expected from its position, probably came into contact with India and its culture at a somewhat earlier period than Java, since the rich pepper-growing districts on the Strait of Malacca were the first to create a systematic commerce. It is quite in harmony with these conditions that the districts on the northern extremity, the modern Acheh (Achin), were the earliest which showed traces of Hindu influence and, consequently, the beginnings of an organised national life; thence this influence spread farther to the inland region, where signs of it are to be found even at the present day among the Battaks. The older kingdoms of the northern extremity were Poli (according to the Chinese transliteration) and Sumatra (according to Ibn Batuta, more correctly Samathra or Samuthra); the capital of the latter, situated east of the modern Acheh, has given its name to the entire island. In Java it was the culture and the religion of the Hindus which made themselves chiefly felt, while the political power remained in the hands of the natives; in North Sumatra, on the contrary, the immigrants from India seem completely to have assumed the lead in the State, and to have created a feudal kingdom quite in the Indian style. This kingdom, whose capital for many years was Pasir, held at times an extended sway and comprised a large part of the coasts of Sumatra. While the Indian civilization thus struck root in the north, and the political organisation of the kingdom of Menangkabau in the central districts was probably also due to its influence, it began indirectly to affect the south, where, according to Chinese accounts, a State had been formed as early as the fifth century. Southern Sumatra by its geographical position has always been fated to be in some degree dependent on the populous and powerful Java. In the earliest Hindu period of Java we learn of a prince whose territory lay on both sides of the Sunda Strait. It is possible that the inhabitants of Southern Sumatra enjoyed greater independence afterward, since we have no detailed accounts of the relations between the two islands, except Chinese accounts of wars between West Java and Southern Sumatra in the tenth century. In 1377 Southern Sumatra

tra, whose ruler actually appealed to China for help, was conquered by the Javanese; for a time it belonged to Modyopahit. Palembang was then founded by Javanese colonists; it has been already related how Islam found its first adherents there, and became a menace to the kingdom of Modyopahit.

In the north also Islam effected the overthrow of Hinduism. At the beginning of the thirteenth century the first preachers of the new doctrine appeared in the Strait of Malacca, and at first gained influence over the Malays, in the narrower sense of the word, who came originally from Sumatra and ruled the Peninsula of Malacca and the islands lying off it. In Aceh (Achin) itself, on the other hand, they won no success until the beginning of the sixteenth century, later, that is, than in Eastern Java. At any rate, the political supremacy of the Hindus seems already to have broken up, and to have given place to native dynasties. Ali Moghayat Shah was, according to a credible tradition, the first Mohammedan sultan of Aceh; Alo ed-din al-Kahar (1530-1552) seems to have completely reorganised the political system; he also conquered a Battak-Hindu kingdom, which continued to resist the new doctrine in the north. In the succeeding period Aceh blossomed out into a powerful State, and was naturally soon involved in the wars which raged almost without intermission on the Strait of Malacca between the Portuguese and the Malays. The fleets and armies of Aceh repeatedly appeared off Malacca and made unsuccessful attempts to capture the town from the Portuguese.

The Dutch, on entering upon the inheritance of the Portuguese, took over their unfriendly relations with Aceh. At first everything seemed to go well; the Dutch turned their attention more to Java and the Moluccas, and contented themselves with concluding a sort of commercial treaty with Aceh in the year 1602, and with obtaining the concession of a strip of territory for the establishment of factories; in the meantime, also, owing to internal disorders, the power of Aceh had greatly waned. But the keener the interest felt in Sumatra, the clearer it became that the originally despised Aceh was a formidable and almost invincible antagonist. After the middle of the nineteenth century it became the most dangerous piece on the chess-board of the Dutch colonial policy. A dynasty of Arabian stock, whose first ruler, Mahmud Shah, mounted the throne in the year 1760, resolutely resumed the struggle with the Dutch. Aceh had, it is true, been recognised as a sovereign State by the treaty of London on March 17, 1824; but the fact was gradually made evident that a free Malay State, with its inevitable encouragement or tolerance of piracy, could no longer be allowed to exist in so dangerous a place as the Strait of Malacca. Finally, therefore, in the year 1870 Holland, in return for a promise to resign its possessions in West Africa, received full permission to take any action it wished against Aceh. Negotiations with the sultan led to no result. The war, which began on March 25, 1873, proved unexpectedly difficult and costly, not merely from the obstinate resistance offered by the population on various occasions, and particularly when on January 24, 1874, the sultan's palace was stormed by the Dutch under Lieutenant-General J. van Swieten, but, above all, on account of the unfavourable nature of the scene of operations and the unhealthy climate. It was not until 1879 that the country could be considered subjugated, but it still required an unusually large garrison, and as recently as the year 1896 showed by a renewed insurrection on how uncertain a foundation the Dutch rule in these parts is reared.

The Dutch soon extended their influence from Java over the south of Sumatra, and also in Lampong, which paid tribute to the Javanese kingdom of Bantam. The most important kingdom, Palembang, appears to have enjoyed a short period of independence after the destruction of Modyopahit, but it was conquered by the Geding Souro, who originally came from Demak in Java in the year 1544, and thus received a Javanese dynasty, which reigned until 1649; after that a new line occupied the throne until 1824. A factory was set up in the vicinity of the town of Palembang by the Dutch as early as 1618, and events then took their usual course. After the natives in the year 1662 had attacked the factory and had massacred almost the entire garrison, the town of Palembang was destroyed by a Dutch fleet, and a favourable commercial treaty was exacted from the intimidated sultan, which remained in force until 1811. Palembang acquired new interest for the Dutch, who meanwhile had been forced on one occasion to end a civil war by their interference, when in 1710 immensely rich tin mines were discovered on the island of Banka, belonging to that kingdom; the company immediately secured for itself a share of the profits by a separate treaty. The usually friendly relations between the Dutch and Palembang were immediately destroyed when, after the occupation of Java by the English, the whole garrison of the Dutch factory at Palembang was murdered by the sultan's order in a most horrible manner. The English undertook a punitive expedition, but failed to restore order thoroughly; nor were the Dutch, after the restoration of their East Indian possessions (1816) more successful, until in 1823 they summarily incorporated Palembang as a province into their colonial empire.

Marco Polo mentions petty States on the west coast in his days. Among the more modern kingdoms may be mentioned Benkulen (Bangkahulu), which was subject to English influence after 1685 and was not ceded to Holland until August 13, 1814. The islands lying in front of the west coast, Nias especially, contain in parts a population which has received little of the effects of foreign civilization, and by its manners and customs recalls the old times of the roving Malay race.

(c) *Borneo*.—Borneo, the largest island of the Malay Archipelago, has not hitherto in the course of history attained anything like the importance to which its size should entitle it. A glance at the geographical features of this clumsily shaped island, which is surrounded on almost every side by damp, unhealthy lowlands, will satisfactorily account for this destiny; indeed Borneo would have probably drawn the notice of maritime nations to itself even less, had not its wealth in gold and diamonds proved so irresistibly alluring. If the physical characteristics of the huge island are unattractive to foreign visitants, they also inspire its inhabitants with little disposition for seafaring, migrations, and commerce. The Dyaks, who are the aborigines of Borneo, are mainly a genuine inland people, which in the course of history has shown little mobility and has tenaciously preserved its ancient customs.

There is no trace of political societies on a large scale in the interior of the island; the coasts alone, washed by the waves of foreign peoples, show the beginnings of national organisations, which from their position are far more influenced by the other islands of the Archipelago and the chief routes of maritime trade than by the land on which they are established. It would, for example, have been a less adventurous journey for an inhabitant of the north coast to visit the ports of China,

than to penetrate a dozen miles into the interior of his own island, or even to migrate as far as the south coast. Thus the old tradition, that originally the island was divided into three large kingdoms (Borneo or Brunei, Sukadana, and Banjarmassing), is untrustworthy in this form. The south coast of the island was influenced in a remarkable degree by the vicinity of Java. We have not only the remains of buildings and idols, but also literary evidence to prove that the Hindu kingdoms of Java affected, both by conquest and by example, the adjoining parts of Borneo. Modyopahit, in particular, received tribute from the kingdom of Banjarmassing, and other States on the south coast; even after the fall of the Brahman State the Islamitic princes of Java kept up this relation for some time. The legends of Borneo point in the same direction when they record that Banjarmassing was founded by Lembong Mangkurat, a native of Nearer India, who had immigrated from Java.

At the time of the fall of Modyopahit Banjarmassing was the most powerful State in Borneo. It certainly owed its prominence to the advanced civilization which, evoked by a large Javanese immigration, was naturally followed by the introduction of Hindu creeds. According to the legend a son of the royal house of Modyopahit founded in the fourteenth century a Hindu dynasty which reckoned thirteen princes down to Pangeran Samatra, the first Islamitic ruler; the daughter of Pangeran Samatra was married to a Dyak, who became the founder of a new dynasty. The circumstance that Banjarmassing became tributary to the Islamitic State of Demak on Java, while Sukadana and Landak, the other capitals of the south coast, were subject to Bantam, equally Islamitic, favoured the introduction of the Mohammedan faith, which first struck root in 1600. But all recollection of Modyopahit was not lost; most of the princely families of the south coast traced their descent from its royal house.

The north, on the other hand, was considerably influenced in early times by China; even at the present day pieces of Chinese porcelain, which evidently reached the island through ancient trading transactions, are highly valued by the Dyaks of the interior. The earliest mentioned kingdoms in Borneo, Polo in the north and Puni on the west coast, may have acquired power from the trade with China; in the fourteenth century certainly Puni also was subject to Javanese influence. In addition to the Javanese the Malays, in the stricter sense of the word, exercised great influence over Borneo, whose coasts in quite early times had become the favourite goal of their voyages and settlements. It was through them that Brunei, the chief State of the north coast, was founded, though the date cannot be accurately fixed; perhaps it was merely a continuation of the old kingdom of Polo. Malay immigrants had probably come to Brunei, even before their conversion to Islam, which took place in the middle of the thirteenth century. Modyopahit also gained a temporary influence over Brunei. When, however, the first Europeans visited the country, it was a powerful and completely independent kingdom, which for a time extended its sway over the Sulu Islands and as far as the Philippines. In the year 1577 the first war with the Spaniards broke out, and further collisions followed later. Other Malay States on the west coast were Pontianak (probably the ancient Puni), Matan, Mongama, and others. Banjarmassing, Sukadana, and Landak were also originally founded by Malays, and only subsequently brought under Javanese rule.

From the east the Bugi of Celebes sought new homes on the shores of Borneo,

and also founded a number of small kingdoms, whose existence depended originally on trade and piracy. All these immigrations have naturally produced the result that the coast population of Borneo is everywhere an inextricable tangle of the most various racial elements, and that the aboriginal Dyaks have intermixed freely with Malays, Javanese, Chinese, Bugi, and others. Which racial element predominates depends on various contingencies from time to time. In the mining districts of the kingdom of Samba in Western Borneo Chinese, for example, were settled after the second half of the eighteenth century in such large numbers that they were far too strong for the Malay sultan, and were only suppressed by the Dutch government in 1854.

The first Europeans who attempted to form connections with Borneo were the Portuguese (after 1521); they met, however, with little success, although they renewed their attempt in 1690. Meanwhile the Dutch East India Company had opened, in the year 1606, a factory in Banjermassing, whose business was to export pepper and gold-dust, but, owing to the vacillating and often hostile attitude of the sultan, it was no more successful than the Portuguese settlement, and was finally abandoned, in consequence of the murder of Dutch officials and merchants at Banjermassing in 1638 and 1669. The residence of the sultan, since Banjermassing had been destroyed by the Dutch in 1612, was removed to Martapura, and remained there, although Banjermassing soon rose from its ashes. In 1698 the English appeared upon the scene, and were at first successful, until the destruction of their factory in the year 1707 thoroughly discouraged them from further undertakings. The sultan of Banjermassing, in spite of his faithless behaviour, was in no way inclined to abandon the advantages of the European trade, but once more turned to the Dutch company. At length, in 1733, the company resolved on a new attempt. Since that date, notwithstanding frequent misunderstandings, the relations of the Dutch with the island have been practically unbroken. The interference of the company in a war about the succession to the throne turned the scale and procured for it the sovereignty over Banjermassing; and thus the greater part of the south coast of Borneo, as well as the coveted monopoly of the pepper trade, passed into its hands (1787). During the occupation of Java by the English the reigning sultan consented to make further concessions, which after January 1, 1817, benefited the Dutch. To this period belongs the romantic attempt of an Englishman, William Hare, to found an independent kingdom in South Borneo. The Dutch have considerably extended and consolidated their power by new treaties and by the wars which they fought from 1850 to 1854 on the west coast, and from 1859 to 1862 on the southeast coast. Banjermassing itself, after the interference of the Dutch in the succession to the throne in 1852 had caused a rebellion, was deprived of its dynasty in 1857 and completely annexed in 1864. A fresh rebellion in 1882 did not alter the position of affairs. At the beginning of the nineteenth century the sultanate of Brunei had lost much of its power; when therefore, in the year 1839, an insurrection was raging in the province of Sarawak, the governor gladly accepted the offer of Brooke, an Englishman, to come to his assistance. James Brooke, born on April 29, 1803, at Bandel, in Bengal, had then formed the plan of founding a colony in Borneo at his private cost; he appeared in June, 1839, with his crew on the coast, and actually conquered the opponents of the sultan, who in gratitude entrusted the governorship of Sarawak to him in 1840, and in 1842 formally invested him with the province.

Since Brooke was no ordinary adventurer, but a man of noble nature and strong character, his administration proved a blessing to the disorganised country. When the sultan showed signs of suspicion, the rajah relied upon England, and compelled the sultan in the year 1846 to cede the island of Labuan to the British, and finally, after he had suppressed various risings of the Malays and Chinese, made himself absolutely independent of Brunei. Shortly before his death he offered Sarawak to the English government. But the offer was refused, and after his death (1868) the State of Sarawak passed to his nephew, Sir Charles Brooke. Subsequently the English government reconsidered its former decision, and in 1888 both Brunei and Sarawak were received under British protection, on the terms that internal administration should be left entirely in the hands of their respective rulers, but that the foreign relations of both States should be controlled by England. The declaration of this protectorate came as a natural sequel to the acquisition of North Borneo (Sandakan). This province was granted to the British North Borneo Company as its private property in the year 1881. It passed under the protection of England at the same time and on the same terms as the States of Brunei and Sarawak.

(d) *Celebes*.—The fourth large island of the Archipelago, Celebes, is of quite a different character from Borneo. Instead of the clumsy contour of Borneo, we find here a most diversified coast line; immense plains, such as we find in Borneo, are wanting in Celebes, which is a land of mountainous peninsulas separated by deeply indented gulfs. If the island has not attracted commerce to its shores to the extent which might be expected from these favourable natural conditions, the reason, doubtless, is, that attention has been diverted from it by the proximity of the spice-bearing Moluccas. Celebes, although fertile and not actually poor in ore and precious metals, and for that reason a valuable possession at the present day, does not contain those tempting products which hold out to the merchant the prospect of rapid and splendid profits. But although the accessibility of the island has not been thoroughly appreciated by foreigners, it has exercised great influence on the fortunes of the native population,—it has sent them to the sea, and turned them into wandering pirates, traders, and settlers. Celebes has thus acquired for the eastern Malay Archipelago a significance similar to that of Malacca for the western. Celebes was not regarded by the old inhabitants of the Archipelago as a single united country. The northern peninsula with its aboriginal population of Alfur tribes had nothing in common with the southern parts, which were inhabited by the Macassars and Bugi; and even the Dutch have recognised this difference so far as to place the two districts under different Residencies (Macassar or Mangkassar and Menado). Celebes, on the whole, is a genuine Malay country, although there are many indications among the Alfurs that there was an admixture of dark-skinned men; but whether we must think of these latter as stunted negrito-like aborigines or as immigrant Papuans, is an insoluble problem for the time being. The Bugi and Macassars are pure Malays, who in their whole life and being probably most resemble those bold navigators of Malay race who have peopled Polynesia and Madagascar.

In view of the fact that the bulk of the population is still divided up into numerous small tribes, which show little inclination to amalgamate, we cannot venture to assign an early date for the rise of large kingdoms in Celebes. Tradi-

tion in the south can still tell how the shrines of separate localities, from which emigrants went to other parts of the island, first acted as a rallying point for small tribes, or hindered the disintegration of others which were increasing in numbers and extent of territory; the chiefs of the several localities recognised the possessor of the most ancient and most potent magic charm as their superior lord, assembled from time to time at council meetings in his village, and thus prepared the way for the erection of larger political communities. This process probably was carried out in Celebes with comparatively little interruption and without the help of foreigners; even of Hinduism only faint traces can have reached the island, as is shown, among other instances, from the absence of Sanscrit words in the original dialects of the Bugi. The small tribes were engaged in constant feuds among themselves before any States were formed, and after that epoch these wars were continued on a larger scale, and alternated with sanguinary conflicts within the still incompletely organised kingdoms. The annals of Macassar relate, for example, as a noteworthy fact that one of these princes died a natural death. The foremost power among the Macassars was Goa, later Macassar; among the Bugi, on the contrary, Boni. From this place the Bugi gradually spread far over the coasts of the eastern Malay islands and to some extent founded new States.

The Portuguese opened communications with Celebes in the year 1512. The kingdoms into which the island was then divided could hardly have been long established; for even if the annals of the Macassars enumerate thirty-nine princes, who occupied the throne in succession down to the year 1809, the average duration of a reign during those early days of barbarism and bloodshed must have been short. Assuming, therefore, that the records are fairly trustworthy, the State of Macassar may have been founded subsequently to the year 1400. The Portuguese first tried to secure a footing on the island in 1540, when they set up a factory in Menado, and later also in the south; they obtained, however, no better results than the English and Danes at a somewhat later period. The Dutch, who had turned their attention to Celebes after 1607, alone met with ultimate success. But meanwhile Islam had reached the island; in 1603 the prince of Macassar with his people adopted the new faith. The great ideas of this world-religion were here, as in so many other places, a stimulus to the prosperity of the country, so that the influence of the kingdom of Macassar made vast strides in the next few years, until its supremacy in Southern Celebes was indisputable. It was engaged in repeated wars with Boni, the State of the Bugi, since the people of that democratically organised kingdom refused to accept Islam, and resisted the new creed, first with their prince at their head, and then, when he was converted to the Mahommedan faith, in opposition to him. The sultan of Macassar interfered in these quarrels, and succeeded in the year 1640 in subduing Boni. The same fate was shared by numerous petty States. Macassar with its naval power partially conquered the coasts of Sumbawa and Buton (Butung); but it was destined soon to discover that the age of large native States was past.

The destruction of a Dutch factory on Buton compelled the East India Company to take active measures; in doing so it relied on the conquered, but still disaffected, Boni, whose royal family had found a friendly reception as fugitives among the Dutch. The sultan of Macassar was soon compelled to abandon his conquests, and resign the throne of Boni to Rajah Palaka, a *protégé* of the Dutch, who from the year 1672 onward raised Boni to be the ruling power in South

Celebes. After his death (1696) a part of his kingdom became the absolute possession of the company. Although the Dutch always took full advantage of the inveterate hatred between Macassar and Boni, yet their attempts to extend their rule still farther led to repeated and troublesome wars, until the temporary English occupation of the island (1814-1816) and the ensuing disorders resulted in drastic modifications of the political situation. A war with the princes of South Celebes ended in 1825 with the victory of the Dutch. The independence of the native States would then have ended for ever, had not the rebellion in Java diverted attention to another direction. It was only after new struggles in 1856 and 1859 that their annexation to the colonial empire of the Dutch East Indies was effected.

The history of North Celebes really belongs to that of the Moluccan archipelago. The State of Menado may be noticed as an important political entity. When the northern peninsula, and especially the hilly district of Minahassa, had proved to be suitable for coffee plantations, European influence easily became predominant there, and all the more so since Islam had not yet won a footing. Elsewhere in the Dutch East Indies there have been few or no conversions to Christianity; but a part of the inhabitants of Minahassa have been converted. The eastern and smallest peninsula of Celebes has also in its external life been subject to the influence of the Moluccas.

(c) *The Moluccas.* — The modern history of the Malay Archipelago centres in the west round Java, but in the east round the Molucca Islands. In the earlier period, when the trade in muscat nuts and cloves had not yet attracted foreign shipping to its shores, the group of the Moluccas may have been less conspicuous; small tribes and village communities probably fought against each other, and may have extended their warlike expeditions and raids to Celebes and New Guinea, and these visits were probably returned in kind. The flourishing trade in spices then raised the wealth and power of certain places to such a pitch that they were able to bring under their dominion large portions of the Archipelago. Jilolo, on the northernmost peninsula of Halmahera, is considered to be the oldest kingdom; in 1540 it was absorbed by Ternate. It is a remarkable fact that the influence of China on the Moluccas seems to have been very slight, since the islands are hardly mentioned in the Chinese annals before the fifteenth century.

The Portuguese on their arrival found two large kingdoms, Ternate and Tidor; both originally rose in small insular districts, their chief towns lay in close proximity, and as hostile rivals each was bent on eclipsing the other. The population of these two States was even then, probably, much mixed; in addition to the presumably oldest population, the Alfurs, who on Halmahera especially and Seram had preserved a large share of their independence, there were on the coasts Malays, Bugi, and the descendants of other nations occupied in the spice trade, namely, the Javanese, who seem at first to have been almost exclusively occupied in transporting spices to their native island, and the Arabs, probably also the Chinese and the Hindus. About Ternate we know that the seventh ruler mounted the throne in the year 1322; in his time Javanese and Arabs are said to have immigrated in exceptional numbers. Ternate and Tidor were maritime and insular States; they kept closely to the coast, and while their fleets were powerful they never possessed extensive territory on Halmahera and Seram. Since their power was entirely based on the spice trade, the princes of the two States courted

the favour of the Portuguese, who indeed first appeared as traders. When Ternate proved successful in this respect, the monarch of Tidor threw himself into the arms of the Spaniards, who then came forward with their claims on the Moluccas. The outrages of the Portuguese led to many rebellions and conflicts.

The Dutch first appeared on the scene in the year 1599, and planted a small settlement on Banda: another half-century, however, elapsed before they felt themselves strong enough to seize the monopoly of spice-growing and the spice trade. The sultanates of Ternate and Tidor, which had some power over the coast districts of Celebes and New Guinea, were allowed to remain, but the Spice Islands proper, Amboina (after 1605) and Banda especially, were placed under Dutch administration. As it seemed impracticable to watch over all the islands, the company determined to allow the cultivation of cloves and muscat nuts only in certain places, and everywhere else to effect a complete destruction of the spice-trees. The execution of this purpose necessitated a war, which in 1621 almost annihilated the population of the Banda Islands, so that henceforth the company was able to introduce slaves, and thus exercise a stricter supervision. But since the seeds of the spice-trees were continually being carried by birds to other islands, annual "Hongie expeditions" were undertaken in order to destroy the young plantations on prohibited soil, by force of arms if necessary, and unspeakable misery was in this way spread over the islands. These sad conditions, whose prime mover was the governor, Arnold de Vlaming, lasted down to the English occupation (1810; p. 475), and were afterward renewed, though in a modified form. In 1824 the Hongie expeditions were discontinued, but the last traces of the spice monopoly only disappeared in 1873, when the plantations were sold to private speculators. During the time when the small spice islands had so chequered a history, the main islands long remained neglected. The Dutch gradually succeeded in acquiring influence over the semi-civilized Alfurs, of whom those who live on Seram are organised in peculiar secret societies, which originated in the peculiar system of male associations to which we have already referred.

(f) *The Small Sunda Islands.* — Of all the districts of the Malay Archipelago, the "small" Sunda Islands play the least conspicuous part in history. Devoid of any political unity, they stagnated in their isolation until foreign immigration introduced a higher type of social life, and small kingdoms sprung into existence here and there along their coasts. The interior of the islands remained unsubdued and unaffected by this change.

Bali affords a solitary exception to the general rule. This island, although profoundly influenced in ancient times by Java, frequently enjoyed political independence. When the Brahman States of East Java increased in strength toward the close of the first millennium of the Christian era, Bali also was a State with Hindu culture (see the accompanying plate, "Two Illustrations of Hindu Mythology," etc.). Ugrasena ruled there in the year 923; in 1103 another prince, Jayapanga, is mentioned. Bali later formed a part of the kingdom of Modyopahit. It was impossible for Islam to convert the Balinese, who, at the time when they formed a united people, actually assumed the aggressive, oppressed the Mohammedan Sassaks on the temporarily conquered Lombok, and menaced Sumbawa. Brahmanism defied its rival in this case at least, and has lasted on Bali down to the present day. In consequence of the prevailing system of small

sovereigns complete political disintegration gradually set in; there were eight petty States in Bali in the nineteenth century, when the Dutch in the years 1846, 1848, 1849, and 1868 undertook campaigns against Balinese princes. Nevertheless the Dutch, even recently, have required a comparatively strong levy of troops to crush the resistance of one of the princes.

Javanese influence also temporarily touched Sumbawa, the development of which on the whole was affected by the seafaring inhabitants of Southern Celebes, the Macassars and Bugis. It was formerly split up into six small and independent States, Bima, Sumbawa, Dampo, Tambora, Sangar, and P(ap)ekat. The population of the "kingdoms" of Tambora and Papekat suffered terribly under the devastating eruption of Tambora (April 10, 1815), as, to a somewhat less degree, did those of Sangar, Dampo, and the town of Sumbawa. In the east of Floris (Flores; capital, Larantuka) Malay and Buginese immigrants predominated; the west, Mangerai, was dependent on Bima, one of the States on Sumbawa and connected with it by a common language. Timor may have been mostly influenced by the Moluccas, and saw small principalities formed on its coast at a comparatively early date; these principalities had mostly disappeared by 1600 in consequence of the advance of Timorese, in the stricter sense of the word, who inhabited the east of the island and originally perhaps had their homes in Seram. The most northeasterly part of Timor (Deli or Dilhi) is the last remnant of the Portuguese possessions in Indonesia; in the southwest (Kupang) the Dutch have had a footing since 1688 (with exception of the years of the English conquest, 1811-1816).

(g) *The Philippines.*—The large group of the Philippines, which in a geological as well as ethnological sense represents the link connecting Indonesia to the region of Eastern Asia, forms the northeastern portion of the Malay world of islands. Malayism is always predominant in the Philippines; it may indeed have prevailed in Formosa also, and from thence have made further conquests. The Philippines were not always in the possession of the Malays. In the earliest historical age we find the islands inhabited by the Negritos, who were only gradually driven back to the mountains of the interior by the immigrating brown race; it was only on the north shores of Luzon that they kept their position on the seacoast. There were probably two invasions of Malays; the tribes of the first intermixed very largely with Negritos and on the second immigration shared their destiny, since they too were forced to retreat to the mountainous interior of the islands, while the new-comers occupied the coasts. The second wave of immigration, like the first, chiefly flooded the south of the Archipelago, and ethnically changed it, while the Negritos on the coast in the northeast of Luzon once more escaped extermination. The Malays of the second migration brought to the Philippines an advanced civilization which shows traces of the influence of India; this event may have occurred, therefore, some centuries after the Christian era. Many, though not absolutely convincing, arguments support the view that the second immigrants came from Sumatra, the cradle of the Malay race; other features of resemblance point to the Dyaks of Borneo. The Tagals on the peninsula of Luzon became the representatives of the native semi-civilization.

A third immigration, which, however, was not so thoroughly carried out, is connected with the advance of Islam into the Malay island-world. The Malays of Brunei in Borneo undertook expeditions of conquest and conversion to the Philip-

pires about 1500. They subdued Palawan and firmly established themselves on Luzon. Almost simultaneously immigrants from the Moluccas settled on Mindanao and seized the Sulu (Jolo) Islands. A Mohammedan pirate State arose there, while previously, as we learn from Chinese records of 1417, the group of islands was divided into three kingdoms.

The Philippines were reached on March 16, 1521, from the east by the Portuguese, Magalhães, who was in the Spanish service, and were called St. Lazarus Isles; later the name *Islas de Poniente* was given them; the name of Philippines was not adopted until 1565. The islands excited little attention at first, while an obstinate struggle developed between the Spaniards and the Portuguese for the possession of the Moluccas. When Charles V abandoned the Moluccas on April 22, 1529, the Philippines also would probably have fallen into the hands of the Portuguese if private Spaniards had not set foot on them, and if Portugal had not attached slight importance to their possession. It was not until 1543 that a Spanish fleet appeared once more in the Archipelago with the commission to found a Spanish settlement. But this finally fell into the hands of the Portuguese, who theoretically still asserted their claims to the Philippines. A renewed attempt in the year 1565 met at last with success; the Spaniards established themselves first on Sebu, then on Panay. In 1570 they turned to Luzon, and founded in the ensuing year the town of Manila.

The Spaniards, after Portugal had been united to their kingdom in 1580, found two other rivals who endangered their existence, — the Mohammedans or Moros, advancing from the south, and the Chinese, who were largely represented, especially on Luzon. These latter had long maintained commercial intercourse with the Philippines, and seem sometimes also to have won political influence. They constituted a perpetual menace to the Spanish rule, but required nevertheless to be treated cautiously, since the revenues of the colonies depended almost wholly on the trade with China. In the year 1603 a terrible revolt of the Chinese broke out. It was quelled with great slaughter of the insurgents by the Spaniards with help of the natives and the Japanese, who were also resident on Luzon for trading purposes. A few years later, however, the number of Chinese settlers in Manila had once more risen to an alarming height. A new revolt was suppressed in 1639, and when in 1662 the Chinese freebooter, Cheng Ko chuang (Koy sung, p. 106), whose father, Cheng Cheng kung ("Koxinga"), had conquered Formosa, threatened the Philippines, there was once more a massacre, which, however, proved ineffective to exclude entirely the undesirable guests.

The Spaniards met with more success in their struggle against Islam. Christianity, thanks to the active zeal of the Spanish monks, completely outstripped it on Luzon, while on Mindanao and the other southern islands the progress of the Mohammedan teaching was at least checked. The task of ruling the natives was facilitated through the circumstance that no large kingdoms appear to have existed on the Philippines before the conquest. The Spanish government was most anxiously concerned to obtain the complete monopoly of the trade of the Philippines. Commerce was only permitted with the American colonies of Spain. A port was founded at Acapulco for the purpose of this trade, and once a year a great galleon sailed thither from the Philippines, bearing goods from China, Japan, and India, and the spices of the Philippines. The price of this cargo was usually paid in silver dollars. A definite maximum in goods and money was fixed, which might

not be exceeded. Direct trade with Europe was prohibited, notwithstanding frequent attempts of the merchants of Seville. The richly laden vessels, which were engaged in the commerce with America, naturally tempted all the pirates and admirals of unfriendly nations, and were not unfrequently plundered, as, for example, by George Anson on the coast of the island of Samar (1743). After 1785 the trade lay in the hands of the Real Compañía de Filipinas. The harbour of Manila was first opened to all maritime nations in 1803, in 1814 free trade was introduced, and in 1834 the company was dissolved. But even then foreign competition was checked as much as possible by all kinds of vexatious customs duties; the ruinous tobacco monopoly was not done away with until 1882.

Although these ridiculous restrictions on trade and the ascendancy of the clerical party hindered all progress, still the Philippines during the union of Portugal with Spain (1580–1640) formed the centre of a splendid colonial empire; but through the competition of the Netherlands, Spain was soon restricted to the Philippines proper, which now for a long time were anything but prosperous. Nevertheless the spread of Christianity among the natives helped to consolidate the colony. When an English fleet appeared off Manila in the year 1763, and the Chinese and Indians rose against the Spaniards, the latter received the help of the Christian native population. These allies could not save Manila from falling for the moment into the hands of the English, but the Treaty of Paris restored to the Spaniards all that had been conquered from them in the Philippines, and left their power unchallenged, except by such rebellions as the tyranny of the monastic and mendicant orders produced among the native races, and by the more formidable discontent of the Malayo-Spanish half-castes, who had received a tinge of European culture, but felt themselves slighted and were eager to play a leading part. Unrest showed itself in 1824. The mutiny of the troops in 1872 might have been most dangerous had it not been smothered by prompt action. The political power of Spain seemed on the whole to have been consolidated in the course of the nineteenth century; and Spain gradually succeeded in annexing to her sovereignty a part, at least, of the hitherto independent districts, such as Southern Mindanao and the Sulu Islands.

But that ineradicable tradition of treating the colonies as sources of profit for place-hunters and ecclesiastical orders prevented any real prosperity; it was equally impossible to treat the Tagals for all time as the Indians of Paraguay had been treated at the time of the Jesuit supremacy. The thought of freedom gradually gained ground; secret societies, resembling freemasonry, formed the rallying-point of discontented Filipinos, whose hatred was chiefly directed against the priestcraft. Minor insurrections in 1876 and 1882 were followed by a great rising in 1896, showing the power of these secret tendencies. The successes of Japan in Eastern Asia seem to have also roused the self-consciousness of the more enlightened natives, since, with some right, they regarded themselves as kinsmen of the Japanese. Once it seemed that the Spaniards, who made themselves hated and despised by shooting the patriotic poet, Dr. José Rizal (December 29, 1896), had succeeded by great sacrifices in effecting a peace with the Tagals under the leadership of Emilio Aguinaldo (peace of December 14, 1897). But the war with the United States of America had scarcely broken out when the insurrection again blazed up. Since, however, the victorious United States did not show themselves inclined to recognise the independence of the "Philippine

Republic" of June 23, 1898, they were obliged after the beginning of 1899 (February 5 and 17, futile attacks of the Filipinos on Manila) to take on themselves the war with the natives, in which the American Major-Generals Elwell Stephen Otis (until May 5, 1900), and Arthur MacArthur experienced many reverses. Even after the capture of Aguinaldo (March, 1901) the Tagals, in their love of liberty, under their subsequent dictator, San Dico, did not abandon the struggle, especially on Samar.

### 3. MADAGASCAR

FAR away from Indonesia lies another country of the Malay race, Madagascar. This island has had a less glorious history than the chief districts of Indonesia, a fact largely due to its outlying position and the few attractions which it offers to the enterprising merchant. Before the circumnavigation of Africa by the Portuguese, Madagascar lay off the great trade route which connected Western and Eastern Asia, and only the vessels which carried the product of the gold mines from Sofala to the north directed the notice of the Arabs to the coasts of the vast island, and conveyed indirectly news of it to the civilized countries of Asia and Europe. It is probable that the island of Menuthios, mentioned by Ptolemy, is identical with Madagascar. But all historical accounts in the stricter sense are up to the present so vague, that we could say little about the early history of the peoples of Madagascar, did not ethnographical research, aided by comparative philology and anthropology, allow us some insight into remote periods.

#### A. THE PRIMITIVE HISTORY OF MADAGASCAR

THE fauna and flora of Madagascar are remarkable from the circumstance that they have their nearest counterpart, not in the neighbouring continent of Africa, but in Malacca and Indonesia, possibly because the island represents the remains of an old continent ("Lemuria"), which once partially filled up the Indian Ocean. If we see then that a large part, if not the whole, of the earlier population of Madagascar traces its origin from the Malay island-region, as language, customs, and physique undoubtedly prove, we are tempted to think of the submerged Lemuria and to place the immigration of Melanesian and Malayan peoples into Madagascar in the very earliest prehistoric age. This supposition, in view of the remote antiquity of the human race, should not be simply rejected; if, nevertheless, it is generally denied, and the affinity of the population of Madagascar to that of Indonesia is regarded as an incidental counterpart to the geographical conditions of animal and plant life, the cause of this is found in the assumption that the Malay immigrants brought with them to Madagascar a comparatively developed civilization, such as was only acquired by the Malays of Indonesia in the course of history. Recently, however, Alfred Grandidier has adduced weighty reasons for the view that the dark-skinned inhabitants of Madagascar came originally from Melanesia, or were at any rate much more closely related to the Melanesians than to the negroes, and that Malays also found their way to Madagascar at a very early period. Grandidier relies on the fact that all the inhabitants, the light-complexioned as well as those of a negro type, belong linguistically to the Malay family of nations.

It is difficult to determine whether the remnants of an undersized population which are said to be found in the interior of the island are related to the Veddas in Ceylon (p. 495) and the forest tribes of Malacca, and have occupied their present home since primitive times, but it is not improbable. They might be, then, the descendants of the oldest people of Lemuria, or, since Africa also possesses its dwarf tribes, of some primitive and widely dispersed race. The half-mythical Wasimba in the highlands of the interior and the Kimos in the south of Madagascar, who have been visited by several French travellers, are supposed to be remains of such tribes.

The Malays were clearly brought to Madagascar by more than one of those marvellous migrations which have become of paramount importance for the history of Indonesia and Oceania. Certain similarities favour the view that Sumatra was the point from which the colonisation of Madagascar started. The date of the most important immigrations cannot be satisfactorily determined, but might be put anterior to the beginning of Hindu influence in Indonesia, since Sanscrit words are almost entirely absent in the languages of Madagascar. On the other hand, considering the comparatively high culture of the immigrants, we should not venture to place the beginning of the migration in a very remote age. The immigrants brought with them the art of iron-working, but do not seem to have been acquainted with cattle-breeding, since the Hova word for ox is borrowed from the East African Swahili language. They were not unfamiliar with the loom, but apparently employed it to weave palm fibre, not cotton. Their social divisions were hereditary nobles (Andrianes), free men, and slaves.

Since on the arrival of the Europeans the Mascarenes (cf. p. 612) which lie to the east of Madagascar were found uninhabited, these migrations could not have flowed over these fertile and attractive islands, but must have reached Madagascar by another route. It is possible that the seafaring Malays, who by piracy and trade commanded the shores of the Indian Ocean before the Christian era and until the beginning of the Hindu trading expeditions to Malacca and Java, may have reached the coasts of Madagascar in this way from the north, and founded settlements there in course of time. While other Malay settlements, of which there were many probably on the coast of the Indian Ocean, disappeared again later, since their inhabitants were either massacred, or fused with the aborigines, the Malay race found in the sparsely peopled Madagascar the possibility of an undisturbed expansion and of a gradual occupation of the greater portion of the island. All connection with their Indonesian home was then abandoned, and the settlers on Madagascar continued to develop independently of the mother country, but not without experiencing in a considerable degree the influence of Africa. Among the Hovas, who must be regarded as the latest immigrants, the legend is still current that their forefathers came from a distant island on a marvellous road of lotus leaves to the coasts of Madagascar, and that then, to escape the malarial fever, they penetrated far into the hill country. The legend says nothing of any aboriginal inhabitants.

The most pure-blooded Malays are the Hovas, who live in the central province of Imerina, and number at present a million souls. The Betsileo, some 1,200,000 strong, who inhabit the hill country south of Imerina, seem to be more contaminated by negro blood. The Betsimisaraka on the east coast are more nearly allied to the negroes than to the Malays. Besides the light-complexioned races of

Madagascar and the remnants of an undersized primitive people there are also, especially on the coasts and in the south, dark inhabitants of a negro type, although at present no hard and fast line can be drawn between the races. There are no longer any economic contrasts in Madagascar which might give a clue to earlier conditions. In every place where conditions are favourable rice-growing supplies the staple food, cattle-breeding comes next; even the Mascarenes are almost exclusively supplied with meat from Madagascar. Pigs are only bred by the Hovas, while the coast tribes, in consequence, doubtless, of Arabian influence, hold all swine in abhorrence. The Hova pig may have been introduced from Indonesia.

Curiously enough the questions, whence the Nigritian inhabitants have come, and how we are to picture to ourselves their immigration, have provoked an almost more lively controversy than the question of the origin of the Malay nations, although the close proximity of Africa seems at any rate to supply a satisfactory answer to the first. Nevertheless, such authorities on Madagascar as James Sibree and Grandidier prefer to consider the dark inhabitants of the island as a race related to the Papuans rather than as true negroes. Even if we provisionally reject this view and admit the negro nature of the dark Malagasies, still the other question, whether the negroes came into the island earlier or later than the Malays, is harder to decide. The Nigritian portion of the Malagasy population speak Malay dialects, and must have been long subject to a distinct Malay influence. The main body of the dark population, whose most important branch are the Sakalavas, inhabit the west coast of the island opposite Africa. The Africans of the mainland are inferior seamen and would, now at least, be unable to reach Madagascar unaided. These facts perhaps support the view that negroes only came to the island after the Malay immigration by the aid, or perhaps at the instigation, of the Malays themselves. The race of the Nigritian Malagasies was perhaps carried off from the East African coast by slave raids; perhaps the Malays enlisted black troops during their inter-tribal feuds, or possibly both these causes have co-operated to produce the existing state of affairs. It is conceivable, also, that coast tribes of East Africa, after the example of the Malays or led by Malay adventurers, may have acquired greater skill in navigation and finally settled on Madagascar. The Sakalavas long enjoyed notoriety as audacious pirates. The Nigritian population has been increased down to most recent times by the importation of African slaves.

#### B. THE AUTHENTICATED HISTORY OF MADAGASCAR

(a) *The Arabian Period.*—The people of the Arabs, which was destined to effect such great revolutions in the Malay Archipelago, made its influence felt on the coasts of Madagascar at a comparatively early period, possibly long before the growth of Islam, and evidently owing to the vicinity of the gold mines of Sofala. A clear knowledge of the existence of the islands was especially possessed by Edrisi (1153), one of the Arabian geographers, who alludes to it by the name *Chezbezat*; other Arabian writers call it *Serendah*, or *El Komr*. The name Madagascar is first mentioned by Marco Polo, who derived exact information about the island from the Arabian navigators, and heard in this connection of a gigantic bird, the roc. The fabulously exaggerated account may refer to those gigantic ostrich-like birds (*Aepyornis maximus* and *Aepyornis ingens*) which clearly inhabited

Madagascar down to historical times. The oldest Arab settlements of which we have accounts lay on the island Nossi Braha (Sainte Marie) on the northeast coast of Madagascar and on the east coast itself; probably the colonies also in the north-west of the island were formed at a quite early period. In view of the traditional history of Solomon, it is very remarkable that various quite noteworthy pieces of evidence argue an early immigration of Jews. The religious controversies after Mahomet led to further Arabian immigrations, principally of sectaries, such as the Zeidites, a branch of the Alides, who may have partly come to Madagascar at the close of the eighth century; also about the same time a number of Ismaelites immigrated. We know in any case that the Sunnite and Shiite Persians emigrated to East Africa. Grandidier maintains that descendants of all these immigrants can still be identified in Madagascar. The Arabs did not fail to influence the adjoining settlements; families of chieftains of Arabian blood were often at the head of native communities, although it cannot be said that Islam for that reason made appreciable progress.

The Portuguese, after the circumnavigation of South Africa, reached Madagascar also. The first of them to do so was Fernando Soarez, on February 1, 1506, St. Laurence's day, from which circumstance the island received the name of San Lourenço. It was repeatedly visited by Portuguese afterward, but no permanent settlements were founded. The Dutch also soon abandoned their attempts at colonisation, which were made in the years 1595-1598.

(b) *Political Organisation.* — At the earliest time of which some fairly credible accounts have come down to us, the dark-skinned Sakalavas on the west coast were the most powerful people of Madagascar, while the greater part of the island was inhabited by independent tribes. At the end of the sixteenth century, as an indirect consequence of Arabian influence, the great Sakalavan kingdom of Menabe arose, which, in the course of the seventeenth and eighteenth centuries, planted many offshoots, especially Iboina. The real founder of the power of Menabe was Andriandahifoteh, who died in 1680.

These conditions were first changed by the appearance of the Hovas, a genuine Malay people, in the heart of the island. The Hovas, whose homes lay, in historical times, in the central hill country, especially the province of Imerina, immigrated, as their own tradition relates, into their country from the east coast many ages before. A historical work, which appeared in 1873, gives a list of thirty-six kings who have filled the throne since. According to this, Sibree places the immigration into the highlands in the second half of the eleventh century. After all, the list of kings can only refer to a fragment of the people, since the Hovas in their new home soon split up into numerous small and independent tribes, some of which even paid tribute to the Sakalavas. Grandidier, in contrast to Sibree, assumes a very late immigration of the Hovas, or, more correctly, the Andrianas (feudal lords), in Imerina. The Hovas in the narrower sense, the free agricultural people of Imerina, are according to his view descendants of the old Indonesian colonists, while the Andrianas, who are Javanese or at least genuine Malays, are supposed not to have reached Madagascar until the middle of the sixteenth century, that is to say, after the time of the Portuguese voyages of discovery. The prosperity of the Hovas would thus be due to the stimulus given by these comparatively civilized invaders. In 1780 there still existed in Imerina various independent kingdoms, of which the most powerful was Tananarivo.

The eighteenth century saw the completion of the national union of the Hovas, who gradually realised their own strength and became a menace to the surrounding tribes. King Andrianimpóina began the first campaigns against the Betsileo who lived in the south. His son Radáma I (1810–1828) continued the operations with still more success, became master of the greater part of the northern highlands, and pressed on to the east coast, where he made a treaty with the English. Provided with firearms by the latter, he then commenced war on the Sakalavas, compelled them to recognise his suzerainty, nominally at least, and proceeded to assert his claim to the dominion over the whole of Madagascar, a claim which was still absolutely opposed to the actual state of affairs. The sovereignty of the Hovas was never really acknowledged in the south and southwest.

On the accession of a king the people took the oath of allegiance; laws and enactments were promulgated in large popular assemblies, which no longer, however, possessed any deliberative or decisive voice. The first minister was an important officer of state. If a princess or queen-widow came to the throne, he had to marry her, according to the settled custom, and then in most cases actually took the reins of government.

Radáma soon quarrelled with the European power which had long cast envious eyes on Madagascar, — with France, that is to say. The early French settlement, Fort Dauphin, had been founded in the year 1642, on the southeast coast of the island. A trading company, organised by a naval officer, Captain Ricault, of Dieppe, and encouraged by Cardinal Richelieu (who died on December 4, 1642), commenced operations, but after some decades went bankrupt. The hopeless conditions of this “colonisation” are illustrated by the fact that the governor, Etienne de Flacourt (the first historian of the island, † June 10, 1660), preferred to return to France after six years of fruitless struggle. The company transferred its rights to the French government, which even then regarded Madagascar as its property, but without taking much pleasure in the acquisition. An attempt of Colbert to form an immense colonial empire out of Madagascar and the surrounding islands, and to raise the necessary funds by founding an East India Company (1664), seemed to promise success at first, but in consequence of the arrogant behaviour of the governor, La Haye, it ended with the massacre of all the French settlers and the destruction of Fort Dauphin in the year 1672. All plans for the time being were thus stopped. The only Europeans who were left to influence the Malagasies were adventurers and numerous pirates of various nationalities.

The Mascarenes, where, as a result of the movements on Madagascar, prosperous French settlements had grown up, lay, however, so near to Madagascar that attention was constantly turned to that attractive and immense island. In the year 1750 the island of Sainte Marie was acquired, and the ruined Fort Dauphin regarrisoned in 1768. Soon afterward Count Moritz August Benjowski appeared as French governor of the possessions in Madagascar. He was an enterprising but untrustworthy character, who obtained from some chiefs on the coast the concession of the entire island, founded new settlements, and when he laid down his office regarded himself as owner of Madagascar, which he repeatedly but vainly offered to the French government. His adventurous life ended on June 4, 1786, and with it his dream of an empire of Madagascar.

After these unsuccessful efforts attempts were made to establish direct relations with the Hovas, who had meantime become powerful. In the course of these

negotiations the competition of the English, who had occupied (1810) Tamatave on the east coast, already made itself felt. The French claims outlasted the disorders of the Napoleonic era. England restored the possessions in Madagascar, so far as any existed, to France at the same time as the island of Réunion (1814), and it really seemed as if France was destined to find compensation in Madagascar for the numerous losses it had sustained. The wish to occupy the island could not fail to clash unpleasantly with the budding hopes of the Hovas for the overlordship. When, therefore, a settlement was once more founded on Sainte Marie in the year 1821, the Hova king, Radáma († July 27, 1828), assumed a threatening attitude. The French governor replied with a vigorous protest against the assumption of the title of King of Madagascar by Radáma. Through the energy of the English governor of Mauritius, Sir Robert Farquhar, the influence of England entirely won the day in Madagascar. The Hovas, whose army was organised on an European model, took Fort Dauphin from the French, while numerous trading advantages were granted to the English (1825).

Under the reign of Queen Ránaváloná matters came once more to open hostilities, which did not end gloriously for the French. Fortunately for France, the queen, who conquered parts of the southeast of the island, roused Great Britain also against her by her passionate hatred of foreigners and by her expulsion of the English missionaries (1835). In the years 1838–1841 the French, who had been called in by the princess Tsiumeik of Bueni (1839) and the prince Tsimiar of Ankara (1840), occupied some more points on the northwest coast, particularly the island Nossi Bé, and in this way consolidated their influence among the Sakalavas. But for the time being there was no idea of a decisive and consistent policy.

The intolerable misgovernment of Queen Ránaváloná finally forced the Hovas themselves to seek help from without. Once more the French and English began to intrigue one against the other, and dangerous complications had already been caused when the sudden death of the queen in 1861 and the accession of Radáma II, who was friendly to France, completely changed the aspect of affairs. An age of reforms then set in, which formed a feeble counterpart to the similar and almost contemporary process in Japan (p. 45). Even when Radáma had been murdered, on May 12, by the reactionary party, which was supported by England, reforms were continued by his widow and successor, Rásoahérina. The real power lay, however, in the hands of her husband, Rainitairivoy, the first minister, a member of the Hova family Rainiharo, which, with English support, founded a sort of palace government. The "reforms" gradually assumed a character which was very serious for France (June 27, 1865, treaty with England). When Rásoahérina died, on April 1, 1868, Ránaváloná II Mayonka mounted the throne. On February 21, 1869, she, together with her husband, again of course the first minister, adopted Christianity, and joined the Anglican Church, which had been in the meanwhile extending its influence among the Hovas, and now acquired complete ascendancy. The news of the French defeats in the war of 1870–1871 naturally caused a further diminution of French influence.

(c) *The French Period.*—The pretensions of the Hovas and the intrigues of the English finally compelled the French government, after long and unprofitable negotiations, to assert by force of arms their claims to Madagascar, which was

more and more inclining to the side of Great Britain. On June 13, 1883, Tamatave, on the east coast, was occupied. The death of the reigning queen (July 13) and the accession of Ránaválona III Manyake were followed by an abortive French expedition into the interior. But a treaty favourable to the French was concluded on December 17, 1885. By this treaty Madagascar became a French protectorate; a resident-general was placed in the capital, Antananarivo, to control the foreign relations of the State. This treaty was not, however, regarded very seriously by the Hovas, until in 1895 a new expedition, starting from the northwest coast, under Lieutenant-General Duchesne, took the capital on September 30, after a singularly feeble resistance on the part of the Hovas, and then asserted the French protectorate by force of arms (treaty of January 18, 1896). Madagascar was declared a French colony on August 6, 1896. Rainilairivony, the husband of the queen, was banished to Algiers; she herself was left for a time in possession of her title, but in 1897 she too was deposed and brought to Réunion. In this way the kingdom of the Hovas has been brought under French influence; but the island as a whole has yet to be subdued. Under the rule of France the trade of Madagascar has greatly improved, and a preferential tariff has succeeded in checking the English imports in favour of the French; the exports, of which the most important articles are gold, vanilla, and india-rubber, are now chiefly sent to France. The construction of railways has begun, roads are being made, and the harbours, of which Tamatave is still the most important, are the scene of busy life. For administrative purposes the island is divided into two military territories, two civil provinces, and a mixed territory. A small French army, partly consisting of Senegalese troops, and a native guard are under the orders of the governor-general (since 1896 General Jos. Simon Gallieni). The immigration from Europe is small, while in the coast towns Chinese and Indians are already settled in considerable numbers. The plan has lately been suggested of settling in the highlands of Madagascar Boers from South Africa, who are unwilling to remain in their country now that it has become English.

One of the Comoro islands, Mayotta, has been under French rule since 1841, and in 1886 the rest of the Comoro group was annexed.<sup>1</sup>

### C. THE MASCARENES

THE history of the French claims on Madagascar is closely connected with the fact that on the Mascarenes, in Mauritius and Réunion, French colonies were founded and plantations opened, with considerable success. The islands, when discovered by the Portuguese Pero Mascarenhas (1505), were totally uninhabited. Mauritius was for some time in possession of the Dutch (1640-1712), and was colonised by the French in 1715, who had held settlements since 1646 on Réunion.<sup>2</sup> In the interval between 1734 and 1746 Bertrand-François Mahé de la Bourdonnais, whom we have already met in India (p. 460), was French governor here. The introduction of the remunerative industry of coffee-planting increased the prosperity and the population of the Mascarenes during the course of the eighteenth century; afterward sugar-growing was extensively introduced.

<sup>1</sup> *Vide* the map of Africa in Vol. III.

<sup>2</sup> "Mascareigne" to 1649; "Isle-de-Bourbon" to the French Revolution, and again from 1814 to 1848; "Isle-de-Bonaparte," 1809-1814.

During the Napoleonic wars England, in spite of the resistance of the creoles, took possession of both islands, and after the conclusion of peace retained Mauritius, together with the Seychelles<sup>1</sup> and Rodriguez (cf. above, p. 475). The necessity of obtaining cheap labour for the plantations on Réunion continually directed the attention of the French to Madagascar, and accounts in some measure for the ultimate reduction of that great island beneath French rule. The abolition of slavery on Réunion in the years 1846 and 1848 produced no serious consequences. The French creole is as predominant in Mauritius now as before the English occupation. At the same time the immigration from India has assumed large proportions.

## VI

## THE HISTORICAL IMPORTANCE OF THE INDIAN OCEAN

BY PROFESSOR DR. KARL WEULE

## 1. THE POSITION AND SHAPE OF THE INDIAN OCEAN

"The history of trade is the history of international commerce and of geography, and both combined form the history of the civilization of our race." — O. PESCHEL.

OF all parts of the mighty ocean which encircles the earth none, next to the Mediterranean, seems by its position and shape more adapted to play a part in the history of the world than the Indian Ocean. Just as the Mediterranean basin, so important for the course of the history of the human race, parts the immense mass of the Old World on the west and breaks it up into numerous sections, so the Indian Ocean penetrates the same land mass from the south in the shape of an incomparably vaster and crescent-like gulf, having the continents of Africa and Australia on either side, while directly opposite its northern extremity lies the giant Asia. In the number, therefore, of the continents surrounding it, the Indian Ocean is inferior to none of the larger sea-basins, — neither to its two great companion oceans in the east and west, nor to the diminutive Mediterranean in the north; each of them is bounded by three continents.

It is, however, less the number than the relative position of the countries which border it that, apart from many other causes, determines the historical rôle of an ocean. In this respect the Pacific and the Atlantic are wonderfully alike. The elongated continent of America on the one side is common to both; while Asia and Australia frame the Pacific, Europe and Africa frame the Atlantic on the other side. In the case of the former the three continents enclose a wedge of enormous size, whose historical importance is not inconsiderable. The most remarkable characteristic of this historical rôle lies, however, in the fact that its centre of gravity has hitherto rested on the west side, the side that is bordered by two continents. Corresponding to this, the centre of gravity in the case of the Atlantic has up to the present moment always lain on the east side of that long and tortuous channel which was peculiarly adapted to lead the human race out from the enclosed basin of the Mediterranean into the ocean, and by so doing to enlarge the narrowly defined sphere of ancient history into one coextensive with the world.

In the Mediterranean the political centre of gravity has rarely or never lain at the geometrical centre; but it has always moved along the longitudinal axis of this basin. Sometimes it has moved from east to west. On the other hand, there have been epochs when the movement was unmistakably in the reverse direction. Apart from those powers of antiquity which lay in the eastern parts of the

Mediterranean — Egypt and the Greco-Macedonian world — all the others, from the time of ancient Rome to that of the Normans and the Crusades, from Venice and Genoa to the modern great powers of the Western Mediterranean, have often turned their faces toward the east. An apparent exception is only found in the Punic power of Carthage, which persistently remained in the West; yet the Phœnician mother country looked to the Far East for at least some portion of her work.

This repeated trend of the Mediterranean nations toward the East is nothing accidental or mysterious. Just as the most important events in the history of the Pacific have centred round the coast of Eastern Asia, so in the history of the Mediterranean, a considerable, and sometimes the leading, rôle has been played by the coast of Western Asia. So long has Asia been the nurse of civilization, so potent has been the attraction of her mysterious recesses and boundless treasures, that this continent could not fail to engross the attention of its neighbours. And there is no reason to be surprised if the spell of Asia has exercised an equal influence on the peoples of the Indian Ocean. This would be quite explicable, even if we thought of this sea in no connection with any other seas, and the fact is irresistibly forced upon us if we consider how the Mediterranean is linked to India, India to Eastern Asia, and Eastern Asia to the West, by ties of reciprocal intercourse. For the intercourse of the West with the Far East no more convenient or natural way can be offered than the Indian Ocean, and especially its northern part. Round this northern track the history of the Indian Ocean, so far as it has been affected by foreign incursions, has chiefly centred.

The frame in which the Indian Ocean is set shows a rich variety of configuration. Only the west side, the east coast, that is, of Africa, is massy and unbroken, except for the huge island of Madagascar and some groups of coastal islands. By contrast the eastern and northern coasts appear all the more indented; and yet they are absolutely different in their kind. The east side terminates to the south in the Australian continent, which for long ages was able to pass in lonely tranquillity an existence unknown to history, until modern times finally brought it within the range of politics. But Australia is directly connected on the north with a region that has no parallel on the face of the globe for the rich variety of its configuration, — the island world, that is, of Indonesia. This has been the natural “bridge of nations” toward the east from the earliest times to the present day.

The northern shore also, from its bulk, is unique in its conformation. Southern Asia, as indeed the whole continent, is a land of vast distances. Three immense peninsulas, on a scale of size that recurs nowhere else, jut out into the sea, and the ocean penetrates the land in gulfs of corresponding breadth and length which attain the dimensions of fair-sized seas. The formation seems at first sight almost too colossal to guarantee to the adjoining part of the sea an active rôle. But on this point we must always bear in mind that the two most important offshoots of the Indian Ocean, the Persian Gulf and the Red Sea, approach within a short distance of the Mediterranean, the centre of Western civilization. It stretches out to it, as it were, two feelers; it virtually becomes the eastern continuation of the Mediterranean.

The geometrical axis of the Indian Ocean runs, like that of the other two great oceans, from north to south; it thus follows a direction which at no time and in no place has been strongly marked in the history of mankind. It was by the Red Sea and the Persian Gulf that the Mediterranean peoples approached the Indian

Ocean. Thence their path lay southeast to Indonesia, or southwest to the coast of Africa. Similarly, then, the historical axis of the Indian Ocean runs in the direction of the circles of latitude. It is therefore parallel to the great routes by which communications have been maintained between Central Asia and Europe on the one hand, between Oceania and the Malay Archipelago on the other.

The Indian Ocean is, as Friedrich Ratzel justly argues, *physically* not a true ocean. The Pacific and the Atlantic are bounded by a continent only in the east and the west; toward the north and south they stretch away without any boundaries to the polar latitudes, so that all hydrospheric and atmospheric phenomena can be developed on their immense areas. The case of the Indian Ocean is different. It is unbounded only in the direction toward the Antarctic, to which it exposes its full breadth. On the north it is enclosed like an inland sea. The development, therefore, of oceanic phenomena is one-sided and incomplete; and thus the farther one goes to the north the more apparent is the transition to the character of an inland sea.

From the historical standpoint the Indian Ocean takes a far higher place. It is true that its historical importance is in no way equal to that of the Mediterranean, though the latter is tiny in comparison, and it certainly does not attain to that of the Atlantic, perhaps not even to that of the Pacific; but it far exceeds that of the seas of the second magnitude, such as those which border on Western Europe and Eastern Asia. It lies, indeed, exactly in the latitude where on the whole globe the "zone of greatest historical density" begins, being closed toward the north by the mighty barrier of the Asiatic continent, and therefore taking no share in that vast transoceanic international commerce which is so characteristic of its two more powerful neighbours. On the other hand, however, this ocean, lying as it does on the southern edge of the Old World, penetrating at so many points the lands of ancient history, and offering such facilities for international intercourse, has been the theatre of events which may indeed be disconnected and wanting in grandeur, but for all that are eminently suggestive. Even in the case of the other two large oceans, the scenes of historical events are not uniformly distributed over the area; in the Atlantic Ocean they are unusually numerous over its northern half, but trifling in the south; so, too, in the Pacific the historical centre of gravity lies on the northern hemisphere. But what there spreads over a space of gigantic breadth is contracted in the case of the Indian Ocean to a narrow border, which, both by sea and land, seldom deviates from the coast line.

The unbridged and unbroken expanse of the Pacific, and still more so that of the Atlantic, have made them both until a quite late epoch insuperable barriers to mankind. It is only when the means of communication have been highly perfected that, by connecting the nations, they have, to a degree unsuspected before, encouraged the impulse of the human race to expand. The Indian Ocean, from its shape, which is closed on the one side, has never proved a barrier. Its two corner pillars on the south, Australia and South Africa, have never felt the need to form relations one with the other, and for the countries lying to the north it has always been easier to avoid it, or to cross it, by hugging the coast or cautiously creeping from cape to cape. In this way the thoroughfares of the Indian Ocean are strangely unlike those of other seas.

These thoroughfares, so far as they are confined to the sea, resemble chords drawn from point to point of a great semicircle. They cut the circumference

of the ocean at the points where the population clusters most densely on the coasts. A regular sheaf of rays issues from Eastern Africa; one line to Arabia and the Red Sea, a second to India, a third diagonally through the semicircle from Madagascar to the Malay Archipelago. A fourth line connects Ceylon with Indonesia; another, the Indonesian medley of islands with Australia. But far more important than all these is that great chord which intersects the semicircle, almost parallel to the base, between the Red Sea and the Sunda Sea, and thus cuts all other lines. It is chiefly on this route that the history of the Indian Ocean has been made. Both the ancient and the modern world have used this path.

The land routes also which border upon this ocean form a comparatively simple system, although they are naturally less subject to general laws than the maritime routes. In Eastern Africa, in Arabia, and in the Malay Archipelago the chief land routes have followed the coasts; it is only in India and the Malay Peninsula that they strike inland. But there are many routes of minor importance, and these run in the most diverse directions. This is only what must be expected in countries of such widely different character as those which enclose the Indian Ocean.

It might be expected that the two deep indentations of the Red Sea and Persian Gulf would make coast routes inconvenient. But this is not the case. Both have entrances so narrow as to be crossed with ease by entire nations and races, and it is easy for the land traveller to pass round the head of either. But in the south the conformation of the land masses is such as to make many parts of them inaccessible. Both Africa and Australia possess a comparatively small coast line, and there are no natural highways to connect the interior of either continent with the sea. The north, however, with exception of the Arabian peninsula, is somewhat more favourably situated. It is true that the vast peninsula of the Deccan lacks any access to the sea; but to its base, where India proper lies in its full breadth, the Indus and the Ganges and their enormous river basins form the best international highways in the world. If fortune had ever smiled on these river basins sufficiently to allow them to be inhabited by energetic peoples, skilled in seamanship, nothing could have hindered these from making India predominant in the politics of the Indian Ocean and the Pacific, and impressing Indian civilization upon the whole of that vast area. This brings us to the salient point in the history of the Indian Ocean generally; the preliminary conditions to historical greatness are already existent, but the adjacent peoples have only shown local and spasmodic inclinations to make full use of them. The native races of this area have contributed little to history in comparison with the foreigners who at one time and another have invaded it. From millennium to millennium this condition has become worse. The importance of the Indian Ocean has declined, while that of the Atlantic and the Pacific has increased. In these the white race has triumphed over nature and the inferiors of its own species; but in the Indian Ocean white men have met, at the best of times, with only a qualified success. They have found the peoples by which this ocean is bordered too immense and too inert for conquest.

## 2. THE DAWN OF HISTORY

THE remote past of the Indian Ocean is wrapped in the same obscurity as that of most parts of the earth's surface. We are tempted to dwell on the enigma in this case because more than one investigator has been inclined to look for the

earliest home of primitive man in one part or another of this ocean. But it is idle to speculate when we have no materials for a conclusion. We must rather take as our starting-point the moment when pressure exerted from the heart of Asia drove out the inhabitants of its southern coasts to find a refuge and a new home in this ocean. Supposing this expelled people not to have already inhabited Ceylon, it could only diverge from the direction in which it was pushed as far as this easily accessible island; any further advance over the surface of the ocean was barred at once by the want of a bridge of islands leading out to it. On the other hand, this people might roam for vast distances toward the southwest or the southeast without let or hindrance; for neither the road to the southwestern part of the Old World nor the bridge of islands to the Pacific offered any appreciable obstacles, even for migrating peoples who possessed little knowledge of seamanship. Both paths, indeed, had been trodden by that dark race on its retreat before the wave of Asiatic nations rolling from north to south. Even at the present day we find scanty remnants of it on Ceylon, as in Southern India itself. We find additional traces in Farther India or Malacca, indeed with some certainty even in Southern Arabia. But it is far more strongly represented in the Indian Archipelago as far as the Philippines and Melanesia, and even still farther in the east. We find it on the largest scale, however, on the continent of Africa, where it forms the chief component element of the population.

These migrations gave the dark-skinned peoples hardly any occasion for great achievements in seamanship. The passage to Ceylon was simple enough; nor did the easterly path with its thickly sown clusters of islands require any pretensions to navigation. It is impossible to ascertain whether the early ancestors of the present negroes crossed the ocean on its lateral arms, the Persian Gulf and the Red Sea, or whether they went round them. Even if the negroes on their march to the new home chose the sea route, the few miles of the passage over those narrow arms of the sea were no more able to turn them into a nation of seafarers, than their old homes on the coasts of Asia had served to lure them out on to the open sea. Even in their new home they remained aloof from the ocean and averse to it. Was it the vastness of the spaces in Africa, in which they lost themselves, or were nautical skill and love of the sea foreign to the race? The last alternative would seem to be the true one; for at no time and in no place have members of the negro race performed noteworthy feats at sea. In Africa their efforts were exhausted by the occupation of Madagascar, which was close at hand, and of the coast islands from the mainland. In the island world of Indonesia and Melanesia even the admixture of Malay blood did not raise the dark-skinned man above the level of coasting navigation. We have therefore little to do with him in what follows; in the sphere of the Indian Ocean he is as unimportant a factor in the history of the world, as we shall afterward find him in the Atlantic Ocean (Vol. VIII). The lands which he inhabits may still play a part in history; but he has shown little or no ambition to share in the life of the outer world. The negro struggles toward the coast, and is contented when he has reached it.

In spite of the small historical importance of the black race, its diffusion over the countries round the Indian Ocean is an event of great significance; it creates in the island realm of Southeast Asia the preliminary conditions for those intricate mixtures and blendings the result of which we see in the motley conditions of the population of Indonesia and the Pacific world at the present day. The dark-

coloured races have never been numerous enough there to constitute any noticeable check on a wave of nations as it presses on. That island world is not an uninterrupted stretch of shore on which a surging wave of peoples may burst; it rather resembles a reef pierced and perforated, through which the tide rushes without finding any great resistance, but which it does not pass without leaving behind on it many objects brought with it. Thus when the Malay stream of nations, giving way before a pressure from north to south, was forced out to the sea from the southeast of the Asiatic continent, it did not touch the zone of Indonesia-Melanesia, without influencing the negroid race which it found there; nor did it leave the country without carrying with it the traces of this probably prolonged contact over the entire breadth of the Pacific to the east. The results of this contact vary according to the respective locality and the duration of the reciprocal action. Melanesians and Polynesians are the two ends of the scale: the former is the product of a complete fusion of the two races, the latter seems only to have a negroid tinge. The intermediate steps are numerous and varied,—Micronesians, Alfurs, and Negritos only mark sharply outlined groups in this medley. Indirectly the Australian may be reckoned in; for, in addition to Polynesian influences, Melanesian are not to be rejected.

The Pacific and the Atlantic have each in their turn contributed to develop these ethnic types. If we retain the customary division of the Malay race into an eastern and a western branch, this classification coincides more or less with the region of the two oceans. But while the eastern branch saw its historical task discharged by the occupation of the vast Pacific world, and made hardly any perceptible advances into the turmoil of the history of mankind, notwithstanding a skill in seamanship which approached the miraculous, the Western Malays, firmly planted on their native soil of Indonesia, and from the very first efficient and able seamen, presented a different picture. Not only did they advance over the Indian Ocean to Ceylon and Madagascar, but in the majority of the homes which they permanently occupied played a part whose significance is far greater than that of their eastern kinsmen and of nearly all the inhabitants of the Indian Ocean. They set foot nowhere on the mainland except in the peninsula of Malacca, and are the true children of the ocean; if they did not succeed in raising themselves to be its acknowledged masters, that is perhaps less due to deficiencies of character and natural ability than to the division and subdivision of their homes over so many islands, and to the position of the Malay Archipelago at the meeting point of two such mighty civilizations as the Chinese and the Indian. It is true that the influence of China was mainly confined to the field of commercial politics; but this only made the influence of India the wider in its day. This latter reacted with quite unprecedented vigour upon the culture and the spiritual life of the Western Archipelago; and although it could not bring the Malay, who was by temperament far keener, under the yoke of religious ideas, and thus bind him to the native soil in the way in which the Hindus were bound, still under the burning rays of Indian philosophy the political energy of the insular nation was more prejudicially influenced than we are ordinarily accustomed to suppose.

To fix the era of the migrations of the negroid and Malay peoples, and thus the beginning of the historical rôle of the Indian Ocean, is as impossible as it is unimportant. The problem of the causes of those ethnic movements is far weightier. The immediate causes of both may be assumed to be the efforts of Central Asiatic

nations to reach the south. It is very probable that Mongoloid peoples, always the disturbing element in Asia, were the prime factors; for Further India indeed, this assumption is certain, since in the modern Indo-Chinese with their countless groups we may see the descendants, much crossed in race, of that wave which, as it broke on the littoral of South Asia, drove the Malays to retreat to the sea that lay before them. The new population followed them down to the sea, but did not launch out on the sea in order to command it any more than any other branches of the great family, and thus never attained any place in the history either of the Pacific Ocean in the east, or of the Indian Ocean in the south and west. Even the local infusion of Malay blood never raised the inhabitants of Further India beyond the stage of piracy.

Difficult as it is in the northeast, it is still more difficult in the northwest of the ocean to gain even an imperfect idea of the conditions in remotest antiquity. If we are correct in assuming an immigration of African negroes from the northern edge of the Indian Ocean, and if the most natural explanation of this lies in the theory of pressure from the north, we still know nothing accurately of the period or the causes of that pressure, nor of the quarter whence these movements started. The only certain fact is that long ages have elapsed since the last negroid wave of nations crossed the axis of the Red Sea in the direction from northeast to southwest; for after it the whole Hamitic throng moved along the same road, and its last detachment, the ancient Egyptians, were a highly civilized people thousands of years before our chronology begins. The modest share of the Indian Ocean in this section of the history of mankind goes back to distant epochs, about which we shall probably never be able to express a definite opinion. It is in its length and breadth prehistoric. Long ages must have passed before the historically authenticated relations of the West and the East were formed through the instrumentality of those same Hamitic peoples, who formerly had barred the movement from the East to the West.

### 3. THE HISTORIC PERIOD DOWN TO THE APPEARANCE OF ISLAM

THERE is as great a difference between the histories as there is between the shapes of the three great oceans. In the case of the Pacific the chief interest attaching to its past history is ethnological; we wish to know how within this area new races have been evolved by the blending and intermixture of the old. Until comparatively recent times there has been little to interest the historian of economic or political developments. Even in the case of the Atlantic we have to deal with a sea which was primarily a high road of emigration from the Old World to the New; and though the political and commercial importance of America has increased by leaps and bounds in the course of the last two or three centuries, the importance of the Atlantic as an emigrant's pathway still equals its importance as a theatre of international relations. The Indian Ocean shows no such peculiarity. It too has sent out mighty armies of peoples eastward and westward; but those which went westward have mostly remained strangers to it and kept aloof; the others, in the east, passed rapidly from its dominion. It has certainly created nations; where this task faced it on a large scale, as in the

Archipelago and in Australia, it has had to share it with its larger neighbours ; while where the task appealed to it on a small scale, as on the coasts of East Africa and on Madagascar, there the result is not commensurate with the dignity and size of the ocean. Again, the political activity of the Indian Ocean has never been prominent. Where growing nations live, as in the western archipelago, on Madagascar, and on the coasts of South and East Arabia, there the great far-reaching empires are wanting ; and where these exist, as in the whole of Southern Asia from the Euphrates on the west to the Brahmaputra in the east, there is no nautical efficiency or liking for the open sea.

What life and movement there has been on the highways of the Indian Ocean is mainly due to commerce. The history of this ocean is predominantly economic, and there is no reason to think that if we could penetrate the darkness of the prehistoric period we should find a radically different state of things. Its activity in this sphere is the characteristic feature of its historical aspect ; many features of it may have been changed as millennia rolled on, but the general expression remains the same. All the nations which ventured out on to the Indian Ocean in times known to history were chiefly induced by commercial objects to make such voyages. The historical rôle of the Indian Ocean must therefore be regarded predominantly from the standpoint of the history of trade. The range of view is only apparently limited ; in reality it discloses prospects of remarkable depth and reveals glimpses of the rise and fall of nations, such as we never find on an equal scale in the far wider and more richly diversified fields of view presented by the two other great oceans. Here the history of trade is in fact the history of the civilization of our race.

It is impossible to picture to oneself the historical significance of the Indian Ocean without primarily thinking of the weighty part which the Red Sea and the Persian Gulf have been called on to play within this area. These two northwesterly lateral arms of the ocean are the natural canals and the obvious connecting links between east and west. But even more than the southern approach to the great Mesopotamian plain, whose value would be more clearly realised by us if we possessed greater details about the trade of the Elamites, the ditch-like Red Sea, which reaches close up to the Mediterranean world, has facilitated and maintained this connection. Not only was it quite early the scene of commercial intercourse in general, but it was also the pathway of international communications at an era when the Pacific, like the Atlantic, was an unnavigated waste of waters. And although in the course of human history there was a long period during which the Red Sea relapsed into a profound tranquillity, yet no proof of its historical value is clearer than the fact that an occurrence so simple as its union with the Mediterranean, which was accomplished between 1859 and 1869, restored to it at one blow its old rôle. It is not indeed any longer the only avenue of international trade, but its busy waters even now, when the East has been opened up to the widest extent, are the great link of connection between East and West.

#### A. THE PERIOD DOWN TO THE APPEARANCE OF THE CHINESE

(a) *The Ancient Egyptians.*—The commerce in the northwest of the Indian Ocean goes back far into remote antiquity. Although the ancient Egyptians, with

their invincible predilection for seclusion, never maintained a permanent fleet on the Red Sea, yet they repeatedly tried at the most different periods to bring themselves into direct communication with the countries producing the spices which they used so much and valued so highly,—that is to say, with Southern Arabia and the eastern horn of Africa. The last king of the eleventh dynasty, Senebkara, commissioned Henu to fit out an expedition from Coptos to “Punt”; a similar task was entrusted to the fleet of Queen Hathepfut (c. 1490 B. C.) on its voyage south. We must certainly regard the Egyptians as the earliest authenticated navigators of the Red Sea and the adjoining parts of the Indian Ocean. Although those isolated expeditions and even the fleet maintained by Ramses III (1200–1168) can hardly have served to point out the way to their Punic successors, they are, however, noteworthy as evidence of a nautical spirit in a people which otherwise was so firmly rooted to its own soil.

(b) *India*. — The magnet, however, which chiefly attracted navigators into this ocean was the peninsula of India. India and the Indian Ocean are two inseparable ideas, as is shown by the two names. And yet this close relationship only holds good in a limited sense. The peninsula to the south of the Himalayas is by its geographical position fitted to rule the surrounding seas more than any other country which bounds the Indian Ocean. Nevertheless during the course of its history it has never attained a commanding position, from its own unaided strength at any rate. Yet the peninsula is not so vast as to hinder the thorough development of its latent strength, represented by an excessively dense population; nor is the unfavourable configuration of its coast line the cause of the amazing dearth of historical influence. The fault lies simply and solely in the ethnographical conditions of India.

The Aryans on their descent from the highlands of Iran into the sultry plains of India were forced to take over another nature, and fell victims to it. While adapting themselves in the course of time to the new conditions, they paid the natural tribute to sub-tropical and tropical climates; they underwent an inner development which culminated in a religious expansion, and never felt the necessity of employing against the outside world the power of their overwhelming numbers and their superior intellectual endowments. The fact that the Vedic hymns and Manu's code mention Aryan voyages, for whose extent toward the West the ancient island Dioscorides (Socotra) is again and again brought forward as a proof, or the fact that from the use of camphor at the luxurious courts of Indian princes in the time of Buddha we may infer trade communications between India and China, go for very little. The Indian Aryans never made a permanent habit of navigation. India never felt the need of seeking the outside world; but it always was destined to be the goal for the other nations, by land as well as by sea. Its relations to the sea are close, but one-sided; the numerous routes which emanate from it in every direction are not its own possession, they merely prove that the attention of all the peoples to west and south and east was riveted upon this country. From its vast treasures it has given to the world more than any other country of the earth, but the world has had to fetch these treasures for itself.

(c) *The Phœnicians, the Hebrews, and Necho II of Egypt*. — The first attempts at direct maritime communication with India from the west were certainly made by

the Phœnicians. Even if we put aside the accounts given by Strabo of their early settlements on the Persian Gulf and of their emporia on Tylos and Arados, yet their trading voyages on the northwestern Indian Ocean go back to the second millennium B. C., since at the time of the expedition sent by Hiram and Solomon to Ophir from Eziongeber and Elath, the route to that mysterious land of gold was well known and regularly frequented. The ease with which they had acquired the monopoly for the Mediterranean must have encouraged the Phœnicians to gain a firm footing on the other expanse of sea lying within their sphere of power, especially since this new field for action, with its outlandish treasures, which then were so eagerly coveted by the civilized world of that time, promised advantages such as the Mediterranean, long since navigated by them, could hardly afford. It is certain that they strove to obtain the sole power on the Erythrean Sea, but they did not gain their object. Separated both from the Persian Gulf and the Red Sea by broad strips of land, they were always driven to make treaties with the inhabitants of the respective countries; and if, as in the case of Solomon and his successors, these treaties included the participation of the sovereigns, they were forced to comprise these latter in the bargain. They could acquiesce in this condition with more equanimity, since their great superiority at sea could not fail to secure to them the victory in the competition.

The advance of the Hebrews toward the Indian Ocean is, however, more noteworthy from the historical standpoint. Though at that early period and down to the Babylonian captivity they were far from being a commercial nation, and though their political fabric was barely consolidated by the end of that millennium, yet under their keen-sighted king David they already secured with set purpose the northern extremity of the Red Sea (Edom). The brilliant success which attended the friendly alliance of his son Solomon with Hiram, king of Tyre, owing to the above-mentioned expeditions, was only the natural consequences of David's policy. There is no better proof of the value which the Hebrews placed on the access to the Indian Ocean than the eagerness with which a whole series of subsequent sovereigns attempted to keep it open. As often as the kingdom of Judah was hard pressed and cut off from the sea, it was always one of the first tasks of its princes to subdue afresh the insubordinate Edomites (Idumæans), to rebuild the repeatedly destroyed town of Elath, and thus to command the gulf of Akabah. Judah, humiliated and hemmed in by Sheshonk I (Shishak) of Egypt during the reign of Rehoboam, showed once more a vigorous expansion under Jehoshaphat (860), who restored Elath and fitted out a new fleet. Then under Jehoram the Idumæans regained their independence, until Uzziah (Azariah), in the first half of the eighth century, subjugated them for the third time, and rebuilt Elath. Under Ahaz (c. 730) the star of Judah on the Indian Ocean paled for ever; the Idumæans henceforth permanently occupied their ancestral homes.

The loss by the Hebrew nation of its position on the Indian Ocean marks an important epoch in the history of both. In the history of the development of the policy and civilization of Judah it signifies the close of the first and only age of united, conscious, and willing efforts at expansion in the direction of the ocean. Being driven back into the interior, Judah was deprived for all succeeding time of the possibility of winning a position in the world as a political unity. For the Indian Ocean, however, that forced retreat of the Jewish people meant the conclusion of a period when for the first time a nation, to which no seamanlike qualities

could be attributed, learnt and recognised with full consciousness its own value to the history of the world. This view was the more weighty since that nation could not reach the coasts of the Indian Ocean except under the most laborious conditions, and could only hold them by displaying an energy which had a beneficent effect in the midst of the historical supineness of the majority of nations inhabiting those parts.

The Phœnicians cannot be compared with the Hebrews in this respect. This people, which always aimed at commercial profit without political power, was deterred by no obstacles from opening up new spheres. Never trusting to force for success, they were past masters of the art of reaching their goal, not by opposing an enemy or a rival, but by utilising him. They had made full use of the Hebrews for this end so long as these latter held a position on the gulf of Akabah, and they did not hesitate then for a moment, although from a purely political aspect they were not entirely free agents, to lend the Egyptians the support of their commercial policy. The results of this alliance culminated in the celebrated circumnavigation of Africa under Necho II in 608 B. C., a feat which throws the most vivid light on the boldness and skill of the Phœnician mariners; these qualities are exhibited also in the squadron which the Egyptian king, doubtless at the suggestion of the Phœnicians, maintained on the Mediterranean and the Arabian Seas.

(d) *The Transit Trade on the Indian Ocean, 600–30 B. C.*—The trade which in the last six centuries before the beginning of our present era never completely ceased, either on the Red Sea or the Persian Gulf or in the adjacent parts of the Indian Ocean, at no time went beyond the stage of transit trade which it had reached at an early time. Transmitted by the most varied nationalities, it remained for that reason insignificant, being carried on from one intermediate station to another. No change was effected in this respect when Darius, son of Hystaspes, completed the canal begun by Ramses II, from the Delta to the Red Sea, and when Ptolemy II Philadelphos (284–247) restored the work which had meantime fallen into ruin. What difference did it make that Nebuchadnezzar II founded Terebon at the mouth of the Euphrates, primarily for trading purposes, and improved the channels of the Euphrates and Tigris for navigation by the construction of numerous windings? The improvements which he had made were ruined by the rulers of the family of the Aehæmenids. Besides this, since one world empire after another enslaved Western Asia as far as the Nile, the Phœnicians had disappeared from the Indian Ocean, thus inflicting a loss to the wholesale commerce which the inhabitants of Southern Arabia (Hadramaut, etc.), with their still very deficient means of navigation, were, in spite of all their efforts, quite unable to replace.

Even the Indian campaign of Alexander the Great (p. 405), vast as is its historical importance, did not immediately bear the fruits, so far as maritime trade went, which the conqueror had endeavoured to obtain. Egyptian Alexandria itself only developed some centuries after his death into that which it ought to have become immediately after its foundation,—the focus, that is to say, for the trade between India and the Mediterranean, and consequently the emporium for the combined trade of the ancient world. But Alexander's own short maritime excursion into the region of the mouths of the Indus, which symbolised his

annexation of the ocean; further, the celebrated expedition of Nearchus from the Indus to the mouths of the Euphrates; then the attempt of the king to open once more the long-neglected route from the Persian Gulf round Arabia; his plan for the circumnavigation of Africa; finally, the improvement which he made in the navigation up to Babylon, and the founding of the port of Charax at the mouth of the Tigris,—all this bears eloquent testimony to the importance which Alexander attributed to the Indian Ocean, and to the part which the newly opened-up sea was intended to play in the future schemes of the conqueror. The early death of the monarch brought these plans to an abrupt end.

Nevertheless the magnificently displayed activity of the Macedonian ruler was not altogether barren of the results which had been expected from it; on the contrary, its subsequent effects drew India and the Indian Ocean out from the gloom of Oriental seclusion into the full light of Hellenistic culture. Babylon, indeed, which, after the removal of the Seleucid capital to Antiochia rapidly succumbed to the newly founded rival, Seleuceia (Ctesiphon), became neither the political nor the intellectual nor the commercial centre of the civilized world at that time. But while, before Alexander, India was known to the Greeks from the meagre accounts of a few travellers, after that brilliant epoch the maritime communication with the East continued uninterruptedly for nearly a thousand years. Favoured by the farseeing policy of the Ptolemies, which culminated in the construction of the canal to the Pelusiac arm of the Nile, in the founding of ports on the Red Sea, and in securing the old route to Coptos, the intercourse of the West with India now rose above the stage of transit trade practised for so many centuries: it became direct, and in its still modest dimensions formed the intermediate step to international commerce on a larger scale.

(c) *The Beginnings of an International Commerce in the Imperial Days of Rome.*—The year 30 B. C., when Egypt was proclaimed a Roman province, introduced quite new conditions of communication over the Indian Ocean. The way to India, so rich in treasures, now lay open and free to a nation whose material requirements in spite of all politic self-restraint had enormously increased. The Romans therefore made full and comprehensive use of the newly opened road. Yet even under these altered circumstances their intercourse with the East would not have gone far beyond the earlier stage, had not the new rulers by the utilisation of the monsoons profitably employed a new power which at once enabled them to renounce for ever the hitherto traditional coasting navigation. The discovery of this phenomenon, peculiar to the northern Indian Ocean, which was made about the middle of the first century A. D., is ascribed to the Greek navigator Hippalus, after whom, indeed, the southwest monsoon has been called. On the one hand, this for the first time rendered real voyages on the high seas possible, and on the other hand, the regular alternation of the two opposite winds compelled the traders to adopt a regulated system of navigation, which, besides, was too convenient to be abandoned. In the succeeding period Indian embassies are no longer a rarity in Rome, and the Arabian Sea was traversed to a degree hitherto unknown. Alexandria also now realised the intentions of its founder. One fact alone filled the hearts of the Roman economists with deep concern,—that this brisk trade did not swell the national revenue. Even then the Indian trade displayed the characteristic peculiarity that the exports were not balanced by any imports. Pliny, besides

Strabo, makes the observation, and under Tiberius the Senate seriously considered by what measures it could stem the constant outflow of Roman gold to the East.

### B. FROM THE APPEARANCE OF THE CHINESE ON THE SCENE TO MAHOMET

FROM the earliest times of which we have any authentic information the Indian Ocean has never served any other purpose than that of being the road to India, the eagerly sought for goal of the West. As might be expected from the scanty resources the results were meagre, nor did they become important until coasting navigation was abandoned. From that moment the aspect of the Indian Ocean immediately changed. India ceased to be the alternate goal of navigators and explorers. Ceylon and the Golden Chersonese (Malacca) were now reached from the West, and after the second half of the first century A. D. the merchants of the Roman Empire penetrated as far as Kattigara. Whether we are to identify this place, as Von Richthofen supposes, with Tongking, or, as others maintain, with Canton, there is no doubt that the Romans who reached Kattigara came into contact with the Chinese. So for the first time in the period of authenticated history this people is drawn into the affairs of the Indian Ocean, where it was afterward to play so prominent a rôle. The emperor 'Anton (= M. Aurelius Antoninus), from the empire of Ta tsin (cf. pp. 79 and 153), sent in 166 an embassy to the Far East; and besides other Roman expeditions, an Indian mission tried to form closer ties with China than mere commercial intercourse could obtain.

(a) *The Chinese.* — The efforts of the Chinese people at sea have already been shortly illustrated in Vol. I (pp. 576, 577). Chinese navigation, so far as it touched the Indian Ocean, presents the peculiar feature of always advancing toward the west, until it came into contact with that of the western peoples. This contact is what it required, but it avoided any further progress or overlapping. Accordingly, in the fourteen to eighteen centuries during which we have to consider the Chinese intercourse on the Indian Ocean, this latter has witnessed a drama such as no other sea can show. In all other cases where a new sphere for trade and intercourse has been obtained, the zone of contact always moves only in the direction of that new sphere. In complete contrast to this rule the sphere of contact of the intercourse between China and the West undergoes variations, which extend over the whole breadth of the Indian Ocean, from the coasts of Malacca on the east to the Persian Gulf, probably indeed to Aden on the west. If the western nations limit the domain of their voyages, the Chinese, in conformity with their undeniable commercial spirit, follow them with their merchantmen into more western regions; but if enterprising captains of Western Asia or Europe push further toward the east, the son of the Middle Kingdom gives way without demur. This was the case in the first centuries of the relations between West and East, and the dawn of modern times has seen the same course of events. These movements take place almost rhythmically. They follow one another with a regularity which tempts one to arrange in harmony with them the relations of the Chinese toward the Indian Ocean. The whole character of the Chinese deterred them from navigating it on their own initiative. They required the stimulus given by the circumstance that the mariners of Western Asia, about the year 250 A. D. at the latest, gradually discontinued voyages to Kattigara, and contented themselves with seeking nearer

ports. The threatened loss of trade compelled the Chinese to follow the barbarians to the West. In the middle of the fourth century A. D. we find them at Penang in the Malacca Straits. Toward the end of that century they reached for the first time Ceylon, the only point outside the region of their native ocean which had any great attraction for them. In Ceylon, however, they saw the germs of that Buddhist doctrine which exercised the most powerful formative influence on their own civilization. Not content with this goal, which they again and again strove to reach, they came by the middle of the fifth century as far as the Persian Gulf and the town of Hira on the Euphrates; later we find them, if we may believe Edrisi, even at Aden and other ports of the Red Sea. The expeditions of the Chinese to Persia and Mesopotamia ended about the year 700, while their ships did not withdraw from Ceylon, which in this interval had developed into a flourishing emporium between East and West, until the middle of the eighth century.

(b) *The Western Nations.*—The seven centuries in which we first notice the pendulum-like oscillations of Chinese maritime enterprise saw considerable changes in the powers of Western Asia, by whom the trade with China was conducted. Here too, as always in history, the Chinese were the permanent factor. Apart from the people known in later times under the name of the Malays, who, by sharing in the voyages to Ceylon, became important competitors with them in the second period, the Chinese were for the whole time the undisputed bearers of the trade directed toward the West. But in the West there were far-reaching revolutions. There the Greco-Roman trader was being ousted more and more by nations which, although long settled on the borders of the Indian Ocean, had only just turned their attention to sea traffic.

In the first place we must here mention the Indians themselves, who then, perhaps for the first time in the course of their history, so uneventful in foreign policy, ventured to any large extent upon the sea. We may form our own opinions as to their share in the expeditions to Malacca and the Archipelago, but there is no doubt that they did not passively look on at the splendid development of Western trade which was taking place at their own gates.

By far the greater part of this trade passed into the hands of Persia, after the powerful dynasty of the Sassanids (227–651) had raised that kingdom to the rank of a great power. The ruling dynasty, with the insight of true statesmen, had seen that in no way could more damage be inflicted upon the East Roman Empire than by cutting off its direct trade with the Far East. In fact the Persian nation, which we are apt to regard as ignorant of maritime matters, conceived the magnificent plan of concentrating in its own hands the entire trade of West and East. In spite of all its efforts it failed to carry out this purpose completely. It only commanded one of the two sea routes leading from India to the West, that across the Persian Gulf. Of this it soon gained absolute possession; and the monopoly remained for a long time in its hands, for neither the Indians nor the vigorous inhabitants of the kingdom of Hira (210–614), which, though small, was highly important for the trade of that time, had any other route available. Like the Persian ships themselves, the Indian and Arabian merchantmen sailed to Ceylon, where they received the wares brought thither by Chinese junks, more especially silk, cloves, aloes-wood, and sandal-wood, in order to carry them directly

across the Persian Gulf. On the other hand, the Persian dominion did not extend, either at the time of the Sassanids or later, over the second route to the West, that of the Red Sea. The traces, therefore, of Rome's former command of the seas were preserved here the longest. The far-famed city of Berenice Troglodytice flourished down to the fourth century; and even in the days of Justinian the ships of the East Roman Empire sailed yearly from Klisma and the ancient Elath to India. On economic grounds it had been the object of that shrewd emperor from the beginning of his reign to make himself commercially independent of the Persians. He succeeded in doing so by land (although not until 557 and after many failures), in so far that he was able to introduce into his own empire, by the assistance of monastic cunning, the silk-growing which was the most important matter of all (p. 149). Owing to the unusually firm position of the Persians in the Euphrates valley all attempts to break through their monopoly of the maritime trade on this, the shortest, route were always futile. The Red Sea presented itself as the only avenue of approach to the Far East. The small shipping industry of Klisma and Elath was quite unable to meet the immense requirements of the luxurious Byzantine court as well as those of the civilized world of the Mediterranean. Justinian looked for and found geographically more favoured allies in the Ethiopians of the friendly Axumitic kingdom, whose position at the entrance of the Indian Ocean as well as at that of the Red Sea naturally suggested the transit trade. The attempt nevertheless failed. Many Greek merchants indeed went down to Adulis, and actually crossed over to India in Ethiopian ships; and the dusky merchants certainly knew how to set a due value on their rôle of agents, yet they did not succeed in impairing the Persian monopoly to any appreciable extent. The Persians in the course of centuries had established themselves too firmly in the Indian ports to be ousted by the competition of an unadventurous and uninfluential people from the position which they had laboriously acquired. Even storms of such violence as that which the Islamic movement of the seventh century brought with it were unable to shake the Persian trade with India. So far as the Indian Ocean is concerned, the Persians seem rather to have derived fresh strength for further advances from every new attack and shock.

#### 4. FROM MAHOMET TO VASCO DA GAMA

In history there is no such thing as continuous and unbroken progress; periods of stagnation alternate with others in which every pulse beats faster under the influence of some great movement or event. The effect of such alternations is not confined to the continental peoples. Physical shocks and disturbances spread more rapidly through a liquid than a solid medium; and one might almost say that the ocean is more favourable than adverse to the diffusion of the ideas and movements which the great crises of history call into being.

What the western voyage of Columbus was for the Atlantic, or the descent of Balboa (p. 610) and the expedition of Magalhães for the Pacific, the eastern voyage of Vasco da Gama was for the Ocean,—an event, that is, of the most telling importance for all succeeding time. But while those events in the history of the first two oceans are unmatched for their far-reaching influence, the discovery of

the way round the Cape does not stand alone in its importance for the Indian Ocean. The pioneers of Europe found that they had been anticipated by Islam, which in its whole life and being belongs to the Indian Ocean. On a victorious march of incomparable swiftness it bore the flag of the prophet to the shores of the Atlantic, and it touched the Pacific with its most eastern offshoots; but only in the region of the Indian Ocean did it attain a vigorous and unhindered development of its strength, and, more important still, only there was it able to spread over the surface of the ocean. It is not to be assumed that the Arabs set foot upon the sea for the first time after the Hegira. Such a view is contradicted not only by the migration by sea of the Ge'ez nations of South Arabia to the highlands of Abyssinia but by the navigation of the peoples of Hira and Aden and by many other facts. But at no period before Mahomet do we find in them even an inclination to that deliberate oversea policy which is so characteristic of the Arabian world during the whole age of the caliphs and later. It seems as if it was only through Islam that the hitherto almost unknown people, when it became a world conqueror on land, attained also the consciousness of its own powers on the sea.

Four years after the prophet's death the Neo-Persian kingdom lay shattered on the ground, struck down by the powerful hand of Omar. It almost seemed as if, under the new conditions and in the warlike turmoil of that time, the Indian Ocean would relapse into that state of insignificance from which it had only slowly emerged in the course of the last few centuries; for at this same time the rest of Nearer Asia and even Egypt (641) fell a victim to the onslaught of the Mohammedans. The Indian Ocean thus had become an Arabian sea; from Suez and Massowah in the west as far as the Indus delta in the east its waves, at the time of the Ommeyyads and the Abbassids, beat on shores over which the caliphs ruled. In this way the whole commerce of West with East, the world commerce of that day, lay in the hands of the Arabs alone.

For the first time since the Indian Ocean has played a part in the authenticated history of mankind the appearance of the Arabs on the scene compels the observer to divide his field of view. In addition to the route from west to east, which hitherto has been exclusively treated, one of the routes which passes through the northern part of the ocean from north to south now claims serious consideration. We have, in fact, to deal with the encroachment of the Arabs on the coast of East Africa. It is on this particular region that the Arab people has longest asserted its capacity of resistance against the world powers of modern days. Here, strange to say, it has had to fight out its last conflict against the youngest colonial power of the Old World, the newly united German Empire.

#### A. THE EAST

THE expansion of the Arabs toward the East during the age of the Caliphate must still be regarded entirely from the standpoint of the reciprocal relations between Eastern and Western Asia. Possessing a large number of the best harbours of the Indian Ocean, among them those which commanded the East Indian trade, the Arabs saw themselves compelled to turn their attention more and more to the sea, and primarily to the eastern ocean. At one time the invasion of India was most practicable by this route. We find Arab fleets on the west coast of

India as early as 637; but then it was imperatively necessary to deprive the Persians, who even after the fall of the Sassanids were a formidable naval power, of the supremacy in the Indian Ocean. The Arabs did not conquer India by the sea route, nor did they succeed in driving out of the field the competition of the Persians, in spite of the founding of Basra (Bassora, 636) and Bagdad (754), which testifies to their political foresight and their knowledge of the geographical requirements of commerce. For more than two centuries their fleets ploughed the waters of the Indian Ocean in peaceful harmony with the Persian merchantmen. During the first decades of the Caliphate era this navigation followed the paths which had been handed down to them from the Sassanid age. It did not go beyond Ceylon; at that time, indeed, the voyages of the Chinese still extended to the Persian Gulf. About the year 700 Arabs and Persians, encouraged by improvements in ship-building and the knowledge of the compass which they then probably acquired, advanced boldly over the Bay of Bengal and reached the shores of China. In correspondence to this forward movement and true to their custom of penetrating only so far as was requisite for the maintenance of commercial intercourse, the Chinese at once proceeded to narrow the extent of their voyages more and more. In the first place they made Ceylon their terminus; but about the middle of the eighth century they abandoned that island, and by so doing disappeared completely from the Indian Ocean for more than five hundred years. It was not given either to the Persians or the Arabs during this long period to follow the Chinese over the confines of the Indian Ocean to the great ocean adjoining Eastern Asia. After one hundred and twenty thousand Mohammedans, Jews, Nestorians, and Magians had been massacred at Khansu in 878, all further voyages beyond Malacca toward the northwest were brought for ever to an abrupt termination. This concludes the period of the most busy traffic which, with the one exception of the Mediterranean, any considerable sea ever bore on its surface until the beginning of modern times. The nature and extent of this traffic is best exemplified by the fact that an Arabian writer of those days could speak of the Persian Gulf, which was the terminus and starting-point of all the commerce at that day with the East, as the "Chinese sea." One single large region of civilization presents itself to us here in the East. If we compare with this the darkness which even in the Carolingian time rested over the half-Christian, half-pagan lands of Europe, we understand what Oskar Peschel meant when he asserted that the foci of the intellectual and material civilization of that age lay south of latitude  $40^{\circ}$ , and farther to the east than any meridian of the Mediterranean.

Although the Chinese held aloof, the Indian Ocean by no means became deserted. For even if the Pacific was closed to the Persians and Arabs in the ensuing period, yet they found in Kalah, on the strait of Malacca, a place where the trade with the Chinese could be transacted until these latter once more sought out the old route to Ceylon and the ports of Malabar. This renewed advance of the Chinese is the last of their rhythmic movements on the surface of the Indian Ocean. It began in the second half of the thirteenth century, when Kubla Khan gave a great stimulus to navigation. The ponderous junks of the Chinese, just as in the second age, whose beginnings lay some nine hundred years back, once more sailed in large fleets toward the west. Ceylon remained their terminus, as of old, but the powerful and flourishing ports of Calicut and Ormuz became also the objects of their voyages. These were primarily intended for trade, without, however,

excluding other enterprises. The Chinese then attempted what they had never previously done on the waters of the Indian Ocean,—they actually undertook one voyage of discovery as far as Makdishu (East Africa), and in the first half of the fifteenth century the monarchs of the Ming dynasty subjugated Ceylon. This was the culminating point of Chinese activity in the Indian Ocean.

By the middle of the fifteenth century China disappeared again from the Indian Ocean, and, this time, for ever. The attempts repeatedly made by the Chinese during a period of more than one thousand years to remain in touch with the nations of the West bore but little fruit, either for the East or West. But the cause of this did not lie in the onesidedness of this purely commercial intercourse, which, on the contrary, bore abundant fruit in the exchange of material as well as intellectual culture, but rather in the excessive physical and psychical difference between the races and peoples concerned, which inevitably hindered any real fusion or assimilation of the two civilizations. During the whole of this period the Australian continent remained the silent, inert boundary pillar which it had been in remote antiquity. Even its north and northwest coasts, which were in sufficiently close proximity to Indonesia to favour colonisation and the opening of commerce, remained completely out of touch with the Indian Ocean.

On the other hand, the Malay people, which is characterised more than any other in the eastern hemisphere by nautical spirit and capabilities, began at this time to emerge from its previous obscurity. The voyages which the Malays had undertaken at that early period, when the Chinese for the first time advanced far beyond the straits of Malacca toward the west, were certainly not the first in their history; but we possess no exact information on the subject. We can, however, trace with tolerable clearness how the Western Archipelago, and Java in particular, early came into certain relations with India. Brahmanism and Buddhism had both found their way there. However momentous were the consequences of the introduction of these two religions for the spiritual development of this part of the Indonesian island-world, it was from reasons connected with the nature of those doctrines that their influence had not the effect of inducing the population of Indonesia to take in hand the tasks for the performance of which it must have long felt itself qualified by skill in seamanship. It was only at the moment when the Malays, from a correct appreciation of the narrowness of their political and economic basis, withdrew from the island-world to the long since abandoned mainland, that they acquired strength and opportunity to affect the destinies of their seas. The founding of Singapore from the old empire of Mengakabau in 1160 is in fact the starting-point of their power, which in the course of the next centuries extended to a large part of Indonesia, and found its most conspicuous expression in the prosperity of Malacca, founded in 1252, through which for many centuries the whole commerce from west to east passed.

An unkind dispensation ordained that the Malays should not succeed in developing on a larger scale their hereditary nautical abilities. They had missed the favourable moment. Hardly were they prepared for a more comprehensive oversea policy, when the era dawned which revolutionised all the existing conditions on the Indian Ocean,—the era of its opening up by the Europeans from west to east. The Malays, it is true, were not, like the Persians and Arabs, completely banished from the eastern Indian Ocean; they were too closely connected with it for that; but as the white conquerors encroached upon the Archipelago,

the Malays ceased to be the pioneers of navigation, and were degraded into pirates. Even before this, piracy had been greatly esteemed by the Malays, and it became henceforth their almost exclusive occupation; by this involuntary step the Malays relinquished any historical rôle in the higher sense.

Only one feat on a larger scale was performed by the Malays within the limits of the Indian Ocean; this was their settlement of the large island of Madagasear. This migration from their original homes in the Indian Archipelago is mainly "prehistoric;" the dates assigned to it vary between the first and the twelfth century A. D. The prehistoric darkness which then rested on the western Indian Ocean can hardly have been absolutely unilluminated. But the achievements of the ancients in this sphere have been lost; all that had been explored and discovered in the long period from the circumnavigation of Africa under King Necho to the periplus of the Erythraean Sea, had fallen into oblivion during the later disturbances, and had proved barren of results for the political and social development of the human race.

### B. THE WEST

(a) *The Arabs.*—The western coasts of the ocean even at this gloomy period did not share the fate of the east side, which continued to be a complete blank, so far as history is concerned. Although the Greek traders finally kept aloof, yet the Arabs, who had early sailed from their emporiums in Yemen to the south, did not cease, until past the second century A. D., to navigate energetically the east coast of Africa, even far below the equator. Before the advent of the Prophet their voyages were directed exclusively by commercial objects. But fully a century after the Hegira the connection with the south, which was formerly only loose, was drawn tighter; where previously simple factories had existed, one fortified town after another now sprang up. Round these towns were grouped kingdoms of small size, it is true, but nevertheless able largely to influence and change the nationality and customs, the religion and type, of the settled population. Makdichu and Barawa, Malindi and Mombasa, but especially Kilwa-Kisiwani, which flourished for many years, were the centres of these States, by whose maintenance for fully nine hundred years the Arab nation has given the most brilliant proof of historical strength and permanence.

If we examine the causes which directed the attention of the Arabs to East Africa, when their purpose was to change their oversea relations, which hitherto had merely rested upon trade, into a deliberate policy of aggrandisement, we find on the whole the same circumstances which, many centuries before, had induced their ancestors to engage in that commercial intercourse. The naturally trifling distance of the two countries from each other is shortened in an extraordinary degree by the periodical monsoons, which the inhabitants of the northwest Indian Ocean certainly utilised far earlier than their discovery and employment in the Roman age. An additional and perhaps decisive inducement to adopt a policy of aggrandisement was given further by the character of the inhabitants of the coast of Africa, who were incapable of competing with the intruders either on sea or land. As a last motive we must take into consideration the fanciful views entertained by the Arabs as to the position of Africa with respect to their own country, and their ideas of the shape of the Indian Ocean as a whole.

(b) *The Results of the Errors of the Ptolemaic Cosmography.* — Neither of the other oceans was so early traversed by ships as the Indian Ocean; but neither of them has, strangely enough, waited so long before its shape and size were rightly understood by mankind. The Pacific was only brought into the sphere of history at the beginning of the sixteenth century; but in less than two hundred and fifty years its whole gigantic triangular shape has been thoroughly explored. Even the Atlantic until the voyage of Columbus, or, if preferred, until the landing of the Norsemen on the coasts of Finland, was a waste of water stretching indefinitely toward the west, of which only the northerly east coast had become part and parcel of history. But the process which lasted for centuries in the case of the Pacific, continued only for decades in that of the Atlantic; by the beginning of the sixteenth century its channel-like form was known in its main outlines. The case was otherwise with the Indian Ocean. The seafaring nations of antiquity had already traversed it extensively; Persians and Arabs had become acquainted with it throughout its whole breadth from west to east; yet down to modern times its shape was completely misrepresented. The history of geography has no more striking example of blind and mistaken guesswork to record. The Indian Ocean was imagined to be an inland sea, a long, narrow channel, which joining the Red Sea, formed, as it were, a prolongation of the Mediterranean turned toward the south. While the north shore of this marvellous basin is represented by the south coast of Asia, it was supposed that the boundary on the south was supplied by the continent of Africa. The east coast of Africa was twisted round in early maps and made to run due east and west at its southern extremity, and to join the south of Asia somewhere in the Far East.

This erroneous conception in its beginnings goes back to Eratosthenes and Hipparchus, indeed to Aristotle. It did not, however, become momentous for the history of mankind until it was perpetuated by Ptolemy, whose cosmographic system was the main source of the geographical knowledge of the early Middle Ages. The Arabs, the direct heirs of the great geographer, adopted without criticism his facts and his blunders, and thus accepted the tradition that the Indian Ocean was an inland sea, although the direction of the Somali and Zanzibar coast must have been familiar to them. Their persistent belief in this shape of the Indian Ocean can only be explained by a combination of various circumstances. For one thing, Ptolemy was in high repute with them, chiefly in consequence of their lack of cartographic talent. In the next place, as followers of the Ptolemaic system, they supposed that the temperatures in the southern hemisphere at the season of the northern winter, when the sun is nearest the earth, reached a height which could not but be fatal to all living creatures. They therefore considered all land south of the equator to be uninhabitable, and the sea to be impracticable for navigation. Consequently they were confirmed in the delusion that the coast, which they had traversed as far down as Sofala, trended from west to east, and lay directly opposite South Asia.

The Indian Ocean in this Ptolemaic shape became important for the history of the human race in two ways. The one part of its rôle ended in the political achievements of the Arabs on the east coast of Africa, of which the extent was perhaps conditioned not only by the causes already mentioned, but also by the very natural desire of the conquerors to keep in touch with the mother country. Apart from these settlements the Indian Ocean is important for the fable of the *Terra Australis*,

the unknown southern land (cf. p. 253), with which it was associated. The idea of this continent, mainly derived from Ptolemy, who gave the name of the Ethiopian Australia to the supposed southern shore of his land-girdled Indian Ocean, was taken up by the Arabs, who gave the unknown land the name of the *Sendsh* coast. Then, partly through the agency of the Arabs, partly directly, the myth was adopted into the geography of the scholastics, and at the close of a troublous, but in many respects sterile, period remained as a problem which the Middle Ages had acquired no claim to solve.

During the two millenniums and a half through which the Indian Ocean has hitherto occupied our attention, it appears in fact merely as a prolongation of the Red Sea and the Persian Gulf, as a narrow inland sea, whose southern coast, existing only in the imagination of the men of that time, formed an insuperable barrier to any southward expansion. In reality the Indian Ocean of this whole period almost always coincides with the sea of Ptolemy. If it ever goes beyond those limits, that occurs only to a restricted degree and in a quite definite direction, as, for example, in the southern voyages of the Arabs. The opening up of larger portions either remains reserved for the civilized world, as happened in the southwest expeditions of the Chinese, or it lies from the first outside the field of authenticated history, as is the case with the migration of the Malays to Madagascar.

Although it was a mere fancy to think of the Indian Ocean as an inland sea, still its influence in history has practically corresponded to its imagined character. It did prove an insuperable barrier between the imperfectly developed civilizations which bordered on it. In early times, when the history of mankind even in this region was nothing more than a series of race migrations, it was simply avoided by a *détour*; later, men sailed along the coasts from harbour to harbour, or let themselves be driven by the monsoon eastward or westward. The direction of the circles of latitude is almost the only historical axis of the ancient Indian Ocean which comes before us. With the exception of the voyages to *Sendsh* and *Sofala* the whole intercourse takes this direction, from the enterprises of the Phœnicians in the second millennium B. C., down past the Greeks and Romans, the Persians and Arabs, to the last expeditions of the Chinese, whose aim was Ceylon, in the middle of the fifteenth century. One-sided as was this intercourse,—except for a few journeys undertaken by the Chinese from religious motives and the warlike expeditions of the Arabs against India, which stand by themselves, it was invariably devoted to purposes of trade,—it showed itself important for the development of the civilization of mankind.

In this exchange of the products of civilization between the East and the West, the latter was always the recipient, the former the giver. And for the last third of the period which we have surveyed the exchange was effected merely by the agency of West Asiatic peoples, by the Persians, and more particularly by the Arabs. At the moment when these latter swept forward from insignificance into the position of a political and intellectual world-power, the old direct connection between the sphere of Mediterranean culture and that of South and East Asia was snapped. Whether it is a question of obtaining rare spices, dyes, or luxuries, or of the introduction of the Indian system of numerals, or of the widening of the knowledge of medicine and mathematics, of geography and astronomy, the result is always the same; the nations that command the Red Sea and the Persian Gulf are inevitably the agents. As a matter of fact the Indian Ocean after the seventh

or eighth century bears the stamp of a purely Asiatic sea, with possibly a faint African admixture.

While the Arabs held the key to the Indian Ocean, it stood to the white races in the same relation as did the Pacific before the commencement of European exploration. Like the Pacific, the Indian Ocean was entirely removed from the field of vision of the western civilized nations; it required to be rediscovered and opened up no less than its great and virgin neighbours. That the opening up of the two oceans took place about the same time, simultaneously also with the lifting of the gloom which rested on the Atlantic, was partly the result of accidents, but much more due to the internal development of the western nations. But in each of the oceans the work of exploration ran a different course; for this diversity the facts of physical geography are responsible.

## 5. MODERN TIMES

THE same seismic or tidal wave which crosses the Pacific Ocean may cause the waters of the Indian and even of the Atlantic oceans to surge and swell; the same molecule of water which, in consequence of differences in gravity, changes its position and to-day moves from the Antarctic to the Pacific, can through similar causes traverse at a subsequent time the Indian Ocean or the Atlantic. Physically, therefore, the ocean that encircles the earth is a unity; but to the view of history it appears divided, for it is a "function of its shores." If many of the small inland seas, round which few nations dwell, have their own peculiar historical expression, how much more must large but sharply defined features stand out in the case of the mighty oceans, surrounded by whole races. Each of the three oceans appears in fact as a personality, an individual, in the frame of the history of mankind. This peculiarity is subject to one limitation common to them all: it is a thing of the past. To the men of to-day the difference between the physical and the historical ocean is no longer familiar. As the waves of the one ocean mingle freely with those of the other, so the currents of world commerce; and also of world history, flow unchecked from one to the other. Both indeed move on specially favoured paths, but these paths encircle the whole globe; they cross the seas in the direction which each man chooses, the essential feature of true international commerce.

### A. FROM VASCO DA GAMA TO THE BEGINNING OF THE BRITISH RULE IN INDIA (1498-1757)

FOUR hundred years have sped past since this change in the character of the oceans — not in men's ideas about them — was completed, a short span of time compared with the millenniums that preceded. They have brought infinitely much to the Atlantic as well as to the Pacific, to each certainly more than to the Indian Ocean; nevertheless, the sum total of the historical importance of the two former is not greater than that of the latter. In their case also a new era begins with the European voyages of discovery; but they had no great memories from the past to revive. All the maritime life of its own which the Pacific Ocean previously possessed either played its part on the northwestern margin, a minute field in comparison with the entire surface, or, as the influence of the Polynesians,

it fell outside the limits of the rest of man's history. The greater part of the Atlantic Ocean, on the other hand, was not yet roused to historical life; only the northeast, with its splendid configuration and the incomparable lateral basins, the Mediterranean, the Baltic, and the North Sea, had long been active, and lay waiting for the appointed moment to flood the globe with its teeming population, which centuries and tens of centuries of civilization had steeled for the work of discovery and conquest. Even the Indian Ocean before the dawning of the new age had long ceased to be historically important throughout its whole expanse; the great south lay indeed quite fallow. Nevertheless the narrow northern margin, with which alone we are concerned, must be regarded from other aspects than the corresponding parts of the two neighbouring seas. The sphere of the Mediterranean civilization is as much a world by itself as the East Asiatic sphere. Separated from each other by a full third of the earth's circumference, they are two powers which are in spirit absolutely different, but which, consciously or unconsciously, perpetually tend to approach and come in close contact one with the other. The gigantic continent of Asia, from its size, was not adapted to help this process; a promising attempt, when Rome established connections with China in the year 95 A. D., produced no results. The needed pathway was supplied by the waters of the Indian Ocean, and their function has been to link the East and West together.

(a) *The Importance of the Independent Advance of the White Race into the Indian Ocean.* — Further than this, the Indian Ocean produced a civilization of its own, which, though not so unyielding and vast as that of Eastern Asia nor so varied as that of the Mediterranean, possesses the peculiarity of comprising the entire ocean so far as it concerns the history of mankind at all. Spread by the teaching of the Prophet, it reaches almost without a gap from shore to shore, from the east coast of Africa in the west to the islands of the Archipelago in the Far East. Accordingly the inroad of the white race, on the development of whose culture it had so long exercised a successful influence, bears here a quite different significance from that which the dissemination of the Europeans had for the virgin waters of the Atlantic and the Pacific. These latter could in the end only win by it; the Indian Ocean, on the contrary, had much to lose. This is the standpoint from which the Indian Ocean must be regarded after the voyage of Vasco da Gama. To the superficial observer the destinies of the three oceans are completely similar. No one of them was able permanently to escape the influence of the white man. Even the Indian Ocean shared this fate, to a greater extent indeed than its eastern neighbour. Yet a great difference exists between the final results. The Atlantic and the Pacific, just as the Indian Ocean, lost at first some part of their own civilization; in America and Australia the spark of indigenous culture was completely extinguished. Everywhere, however, this temporary setback was only the prelude to an era of vigorous development in new directions. The value of the history which the immigrants in the United States and in Australia had made in an astonishingly brief period far outweighs the former losses.

With the Indian Ocean the matter from the very first lay distinctly otherwise. If we exclude extra-tropical South Africa, its surface washes no country which has ever served as the goal for a mass emigration of Europeans. Even at the present day the white man, according to numbers, is a completely insignificant factor com-

pared with the mass of natives, whether in the Archipelago, in India, or on the shores of East Africa. Three or four hundred years ago, in the early days of colonial activity, this disparity of numbers was certainly still more marked. Under these circumstances there could naturally be no idea of a complete destruction of the native civilizations, such as America experienced in those days, and of substituting in their place a constitution taken from the mother country in Europe. Such an idea lay as much outside the range of possibility as, for example, the eradication of the East Asiatic culture. The question could at most be that of destroying the economical and political strength of all opponents; and, unfortunately, the white man down to the present day has to regard every inhabitant of the Indian Ocean as such. The European was successful in both methods; for the opposition which Bali and Acheh, Madagascar and Arabian East Africa, had offered, even in our days, is like the last convulsions of a dying man. As might be expected from the dissimilarities of the nations, the struggle has assumed various shapes in different places and times; a handful of traders was able to crush a giant of clay like India, while the above-named branches of the Malays still defy the foreign yoke.

One is tempted at first sight to say that the opposition of the maritime nations to the white invader has been more determined than that of nations living inland or neglecting to use the sea. But such a generalisation must be qualified by exceptions so important as to rob it of nearly all its value. It is true that the Aztecs and Peruvians succumbed to the onslaught of the whites still more feebly than the Indians; but China, in spite of many storms, still stands unshaken in any respect. On the other side, the opposition was nowhere slighter than from the Polynesians; the distribution of a sparse population over an immense area from the very first prevented any war being waged. Again, the geographical conditions of India and Indonesia are similar on both the east and west; yet their dealings with the white races have been of the most different description. So far as the Indies are concerned, we must abandon the idea of treating the ocean as an important influence on the course of history. It is in the facts of religious and political development that we must seek for the reason why, in India proper, native civilisation succumbed to the slightest shock from without, while in Indonesia it found a safe refuge.

The Indian Ocean at that critical period of transition was not, however, quite unimportant for India. The States of the Malabar coast, under the influence of the brisk Arabian-Egyptian trade with the Red Sea, had aspired, toward the close of the fifteenth century, to create fleets of their own. These, with the constant help of Arabian warships, played an important part in the desperate struggle against the Portuguese invaders. It was not until the last ship of their own was destroyed that the resistance of the Indians began to flag. The Arabs alone of all the natural defenders of the Indian Ocean made some attempt to meet their responsibilities; for the Malays, at the beginning of the sixteenth century, were not sufficiently identified with the soil which they had only occupied a few generations earlier. They were also too few in numbers, and were scattered over so wide an area of islands that their resistance could not have proved permanently successful against the flood of Europeans which swept on simultaneously from east and west against their homes. It was due simply and solely to their seamanship, which enabled them to inflict great damage, especially by piracy, on the white intruders, that they could continue the war within certain limits for centuries.

The case of the Arabs was different at the time when Vasco da Gama, after his memorable voyage to Calicut, set foot on the soil of India; they represented the dominant religion of the Indian Ocean, and possessed the monopoly of commercial intercourse so far as it connected the Indian world with the West. Not merely did the fabulous prosperity of Cairo and Alexandria, the power of Venice, Genoa, and Pisa, of Barcelona and Florence, the splendour, in short, of the Mediterranean world of those times, rise and fall with this trade, but the economic life of Northern Europe as far as Germany and Flanders was materially affected by it. The whole West indeed between 1200 and 1500 lay under the spell of the trade with India. The assured prospect of enormous profits therefrom had once led the citizens of the Italian republics to vigorous co-operation in the crusades, and, long after that remarkable period, the prizes of the Indian trade exercised a magnetic fascination both on individuals and on peoples in the West. The face of Europe was then turned to the East far more markedly than it was from the sixteenth century onward to the West. Hence came the excitement, almost incomprehensible to us, which mastered all the western peoples, whenever there was a prospect that the narrow entrances to the Indian Ocean, the commercial routes of the Persian Gulf or the Red Sea, would be closed or hedged about with new obstacles.

(b) *The Struggle for the Supremacy in the Indian Ocean.* — At the moment of the landing of Vasco da Gama the Arabs recognised the desperate danger which threatened their supremacy. In the succeeding period their resistance to the intruders was more obstinate and lasting than that offered by the natives of India, who were unfamiliar with the sea. Even the Osmons, who in 1517 by the conquest of Egypt had entered upon the heritage of the Mamelukes, knew perfectly well that Egypt was worthless to them unless they possessed complete liberty of movement on the Indian Ocean. This truth was, however, first brought home to them by the Venetians and Genoese, who lost their main source of prosperity with the interruption of the Levantine trade. The attempts, accordingly, of the Turks to regain that liberty of movement were less persistent than would have been desirable in the interests of all the Mediterranean States. Far from overthrowing the power of the Portuguese, they were not even able to break through the blockade of the Red Sea, which the new-comers maintained for some decades. The Red Sea therefore relapsed temporarily into the condition of a backwater; at the same time the heavy hand of the Turk, spreading death everywhere, fell on its northern exit.

Politically speaking, the Indian Ocean in the seventeenth and eighteenth centuries, and for the greater part of the nineteenth, was no thoroughfare. The Dutch, it is true, followed the tracks of the Portuguese as far as Japan; but the east coast of Asia was still too closely guarded against intruders to allow that vigorous competition of the European colonising nations which characterises the northwest of the Pacific Ocean at the present day. Such competition was to be found at that day more on the coasts and on the surface of the Indian Ocean. The Portuguese had accustomed themselves for more than a century to regard it as their own sea. For while the famous bull of Alexander VI, limiting Spanish enterprise to the lands and seas west of the Azores, had been withdrawn in the very year when it was issued, still Portugal and Spain had, within a few years of this abortive attempt at demarcation, come to an agreement in which the principle

of the papal judgment was recognised, and the New World was partitioned between these, the two greatest maritime and colonising powers of the age, by the tracing of an imaginary frontier to the west of the Cape Verde Islands (cf. p. 451). The post-Columbian age did away with this, as with so many other ideas. Just as the Spaniards could not hold the Pacific, so the Portuguese were still less able to close the Indian Ocean to the pushing new colonial powers, since these latter, now realising their importance, advanced almost simultaneously and in dense masses. We now come to the age of the "*mare liberum*," the freedom of the oceans (Vol. VII, p. 92). In colonial history between 1600 and 1850 we hear of no considerable region, except the sea of Central America, which was more obstinately contested than the border lands and islands of the Indian Ocean. And as if it were not enough that the European nations should rush forward to secure for themselves the heritage of Portugal, the Arabs from Muscat stepped vigorously on the scene after 1660, and after eighty years of war wrested once more the central coast of East Africa from the detested European.

The place of the Indian Ocean in the history of the world is variously illustrated in the numerous stages of this competition. Until past the middle of the eighteenth century, the trading nations were intent, with equal zeal but unequal success, on securing their small settlements on its shores and islands. National interests were represented in the struggle by a series of small trading companies, among which we even find one, the Ostend company, of German origin. In the reign of the empress Maria Theresa there was an attempt to found a German colony in Delagoa Bay.

This international competition ends at the moment when the political equilibrium was disturbed in favour of England, under whose dominion it was now destined to pass for the whole succeeding period. This disturbance was produced by an occurrence, in itself unimportant, which in its later developments has marked the whole subsequent history of the ocean and the surrounding countries,—the first acquisition of territory in India by Britain. If we bear in mind that from 1498 to past the middle of the eighteenth century the political activity of the European powers was spent on the founding of mere factory colonies, which could not secure to any of the participating nations a broad economic basis or any supremacy, we may see in Robert Clive's decisive victory at Plassey, on June 23, 1757 (p. 463), the beginning of a new era both for India and for the Indian Ocean.

(c) *The Indian Ocean as Part of the Universal Ocean.* — With the discovery of the two sea routes to India the historical centre of gravity in the Indian Ocean also had been considerably displaced, but in an easterly direction, unlike that of the Atlantic, which moved steadily toward the west. We have here the beginning of the modern system of trade routes, and of the process, now slowly ripening to completion, by which the centre of gravity of international relations has moved toward the Pacific. Henceforth we have hardly to reckon with the northwest of the Indian Ocean, which had been for more than two thousand years the scene of so much political activity (Vol. I, p. 598). It was too remote for a commerce which, shifting its roads to the high sea, quickly forgot the narrow corners in which it had hitherto moved.

Now at length we reach the period when it is possible to speak of the ocean as an undivided whole, of which the several oceans are no more than segments artifi-

cially distinguished by geographers, and of which every part lies open to all the naval powers. Henceforth there is no such thing as a *mare clausum*; and if in some waters the balance of power is always shifting, it is never undisputed. One competitor for maritime ascendancy gains ground, another drops out of the race, but there is no part of the ocean which one power can treat as its monopoly. The change is one which dates from the sixteenth century. In the early part of that century the Portuguese monopolised the Indian Ocean, the Spaniards the Pacific. But the heritage of Spain has now been divided between England, Holland, France, Russia, Germany, Japan, and the United States. The first three of these nations have also invaded the Indian Ocean; and here they have had as imitators or as rivals the Arabs, the Germans, the Italians. The colonial empire of Portugal in the East has virtually disappeared; and no one power has inherited the Portuguese ascendancy in its full extent.

So far there is nothing singular in the history of the Indian as distinct from other oceans. What is singular is the dependence of the Indian upon the Pacific Ocean,—a dependence which was felt long before the civilized world learnt of the existence of the Pacific. The Pacific was an unknown sea to the white races until Balboa in the second decade of the sixteenth century descended from the heights of Darien to the southern sea (Vol. I, pp. 362, 585). Then first amazed Europe learnt that the newly discovered country was not the eastern coast of Asia, but that between it and the long-sought-for Cathay and Zipangu a new waste of waters lay, on whose extent the third decade was first to throw light by the expedition of Magelhães. Before, however, the Spaniards approached the solution of the Pacific question from the east, the Portuguese had taken the first steps toward it by the expeditions which they had sent for the last hundred years in order to find out the route to India round the Cape of Good Hope. Neither India itself nor any other definite district of the Western Indian Ocean was the real goal of the Portuguese mariners. Just as the discoveries of the Spaniards were bound up with the search for the presence of the precious metals, so the Portuguese expeditions were guided by the wish to reach the lands which produced spices and drugs. From this point of view the Portuguese colonies, both in Nearer and Further India, as well as on the east coast of Africa, were nothing more than stations on the dangerous route to the Spice Islands.

These efforts to reach the East across the Indian Ocean did not cease with the Portuguese. It is true, as we have seen, that their successors, the Dutch, British, French, and Danes, in the two centuries following the fall of the Portuguese colonial empire, attached primary importance to the maintenance of their possessions acquired in the Indian Ocean; but, besides this, the entire civilized world of Europe was occupied with the solution of a problem which, beginning on the surface of the Indian Ocean, drifted immediately eastward. This task is the search for the unknown southern land, the *Terra Australis incognita*. Although this creation of the fancy was exorcised from the south of the Atlantic and the Indian Ocean through the circumnavigation of Africa, only a few decades elapsed before it again appeared. In the Indian Ocean the *Terra Australis* was then supposed to lie in latitudes not far removed from those to which it had been referred by Hipparchus, who imagined Ceylon to be the northernmost point of this fabulous land. Accordingly, the efforts to reveal the position, situation, shape, and size of the southern land — efforts which belong to all three oceans — were most vigorously prosecuted

there. They commence with the voyages of Abel Tasman (1642–1643 and 1644), and end with James Cook's famous circumpolar voyage, 1772–1775. The former removed the phantom, at least for the Indian and Western Pacific, beyond the forty-fifth degree of southern latitude; but the latter absolutely destroyed it after it had disfigured the map of the world for two thousand years. Then for the first time some complete idea of the hydrography of the earth could be entertained, since an approximately correct notion of the distribution of land and water had been formed. The scientific establishment of these conditions exercised an important effect on the course of the world's history. The Southern Indian Ocean and the Australian seas then for the first time became serviceable to men, and New Holland was roused into historic life. Australia, opened to colonisation, began a new career, which may end by securing to the youngest continent the political and economic headship in the whole southern hemisphere.

*B. FROM THE BEGINNING OF THE BRITISH SOVEREIGNTY IN INDIA TO THE  
CUTTING OF THE ISTHMUS OF SUEZ (1757–1859)*

THE beginning of the age which started with the victory of Plassey was inaugurated, first by the Peace of Paris of February 10, 1763, when that very France, to which a Dupleix had opened out such glittering prospects, renounced for ever the possession of India and consequently the supremacy in the Indian Ocean; and next by the dissolution of the French East India Company in 1770. In this way the only European rival whom England had then to consider was finally driven from the field. England could now look to the realisation of her aim, which was to impress on the Indian Ocean the stamp of a British sea,—of a central sea, that is, round which the Asiatic, African, and Australian branches of the British world-empire might cluster. Gigantic as this beginning must have appeared to the eighteenth century, yet it was actually realised a hundred years after the withdrawal of the French from India. Immediately before the opening of the Suez Canal England did not, it is true, possess all the shores of the Indian Ocean; but there was no power which could dispute her supremacy single-handed.

The historical importance of the Indian Ocean during those hundred years culminates in the fact that it then was mainly sought and won for its own sake; it was only after the opening up of East Asia that it sank more and more into the position of a thoroughfare. The activity of its indigenous population, although it was not less vigorous than in the foregoing age, recedes into the background as compared with that of the invaders from outside. The theatre of events lay now, as earlier, exclusively on the west coast of the ocean, and it ended in the founding and growth of the sultanate of Zanzibar, the keystone to the fabric of politics and civilization raised by the Arabs in the Indian Ocean. Hardly was the structure completed, when it cracked in every joint. While the ocean previously had been a remote gulf, with one single approach far down at the Cape, it was brought, through the artificial strait of Suez, far nearer to the section of mankind which required expansion; and in place of the Latin nations, which, dogged as they were, had grown weary from the colonising work of centuries, the fresh and resolute Teuton stepped forward. Before the onrush of Britons and Germans the Moslem bulwark, laboriously reared by the work of a millennium at the eastern entrance to the Dark Continent, rapidly fell to the ground.

The inroads from without were then less restricted in their sphere of action. It is true that they only had two starting-points; but one of these at least was a base commanding the whole area of the Indian Ocean. These two points are India in the north, and the mainland of Australia in the southeast, of the Indian Ocean. If we reflect on the relative position of the two countries and to Europe, the possession of New Holland seems far from secure, unless India is simultaneously held, while on the other side the possession of India in no way implies that of the fifth continent. The acquisition and utilisation of Australia by the British really resulted from motives which have not the slightest connection with their Indian policy. Amongst other things, the coast of Australia which faces the Indian Ocean only experienced the first essays at colonisation in 1829, forty years after the landing in Botany Bay. The uninviting aspect of Western Australia is a partial, not a complete, explanation of this fact; it certainly would have been no hindrance to settlements if political necessities had required this coast as a base from which to control the Indian Ocean. Yet, even with the undue preference given to its eastern coast, Australia largely influenced the Indian policy of Great Britain. It is, geographically and historically, from the day of its discovery onward, an indivisible whole, and its connection with the Old World was bound to be closer than that of the Pacific coasts and islands, if only for the reason that it is less remote than they are from the original home of the white races. Thus Australia has ever since 1788 been a weighty factor in the Indian policy of Great Britain. Its interests have been bound up with those of the British possessions in India; and the vast accession of territory which was entailed by the colonisation of Australia has distinctly increased the vigour and persistence of English policy in this part of the globe.

The establishment of her position in India has marked out for England a definite road by which to maintain communications with her Australian colonies; she must endeavour to protect the approach at all possible points, as well as to command the surface of the adjacent sea. The Portuguese and Dutch, even the French, had already tried to do so. The Portuguese had laid their hands on numerous parts of the west coast of Africa, from Madeira and Arguin in the north as far as Benguela in the south, and had also made bases on the east coast from Sofala to Makdishu and Socotra. The Dutch, with better discernment, made the southern extremities of Africa and India, the Cape of Good Hope (1602 and 1652), and Ceylon (1602–1796) the centre of their system of defence, and at the same time took care to occupy Mauritius (1598–1710) and Delagoa Bay (1721). For France finally the islands, Madagascar and its neighbours, were intended to protect the road to India, at least in the south of the Indian Ocean. The British were far from following in these steps directly after the beginning of their Indian sovereignty; on the contrary, for decades St. Helena was still reckoned as a sufficient base on the long route round the Cape. Even the first occupation of Cape Colony (1795–1802), which was merely the result of jealousy of the French, had not yet opened the eyes of English ministers to the value of South Africa for the Indian Ocean; they would hardly otherwise have given it back to the Batavian Republic. It was only the agitation of keen-sighted politicians like Richard Wellesley, who as far back as 1798 had clearly expressed his opinion that India was untenable without the Cape, and still more the attacks on the British colonial empire, executed or planned by Napoleon I, which brought about this resolution.

England therefore in 1806, rapidly anticipating the intentions of Napoleon to occupy the Cape, planted her foot once more, and this time finally, on South Africa. This step decided the whole further course of events on the Indian Ocean. England is now supreme not only at the apex of the great inland sea, but also at the corner pillars at its base. In this way she has not only acquired an impregnable defensive position, but she, beyond all other nations, is in the position to guide the destinies of this ocean.

There have been at all times numerous attempts to shatter the British supremacy. These began with the Egyptian expedition of Napoleon, and his plan, which we have just mentioned, for the conquest of the Cape; they were continued in the Treaty of Vienna of 1815, in which England was required to give back a large part of the French and Dutch colonies, which she had taken away between 1810 and 1814, and were repeated more feebly in the perpetual efforts of France to make Madagascar the starting-point of a new Indian policy. Napoleon's expedition to Egypt, which undoubtedly would have attained the desired end, had France been a match for England by sea, must be considered as comparatively the most eventful of these operations. But its results were very different from what had been anticipated. It reminded England of the vulnerable point in her position; and from this time English policy was naturally guided by the hope of securing the Red Sea. Great events throw their shadows before, even in the history of the seas. The plan of cutting the isthmus of Suez was mooted during Napoleon's stay in Egypt, and was never again allowed to drop. The repose in which the Red Sea had been left for three hundred years was rudely shattered now that the interest of Europe was concentrated on it. It became apparent that direct communications were to be reopened between the Mediterranean and the Far East. Once more the attention of the colonial powers was concentrated on the northwest corner of the Indian Ocean. In 1839 the English occupied Aden, the emporium at the entrance to the Red Sea which had flourished in the old days of sailing-ships. At the moment when the construction of the canal could no longer be prevented, she firmly planted herself on Perim in the straits of Bab el Mandeb (1857), and almost at the same time included in her dominion the Persian Gulf.

### C. THE PRESENT DAY (AFTER 1859)

(a) *The Construction of the Suez Canal and its Results.*—The expedition of Napoleon had shown England how insecure her Indian possessions were, so soon as France or any other power set foot in Egypt. Accordingly, after the battle of the Pyramids (July 21, 1798), the chief object of her Indian policy was necessarily to prevent such a contingency, or even any political and economic strengthening of the country. There was no difficulty in carrying out this purpose, so long as the plan of the Suez Canal was still in the germ, and England continued to hold the undisputed sovereignty of the seas which she had won during the Revolutionary and Napoleonic wars. But later, as the plan of the canal assumed more definite shape, and the other powers, who had gained strength in the interval, once more advanced on to the seas, this sovereignty became more difficult, but at the same time more important. Lord Ellenborough was therefore justified in saying that England, if she wished to secure the supremacy of the world, must stand with one foot in India and the other in Egypt. Lord Palmerston privately informed

Count Ferdinand de Lesseps that if England was allowed to occupy Egypt permanently with an army and to superintend the traffic in the canal, he and England would be willing to aid the enterprise in every way (1855-1858); but it was found possible to complete the canal (1869) without this great concession. However, English policy soon found the means of making the canal a source of strength instead of weakness to her colonial empire. In 1875 Lord Beaconsfield seized the opportunity of the Khedive Ismail's pecuniary embarrassments to purchase his shares in the canal. The rebellion of Arabi Pasha afforded an unexpected opportunity of taking a still further step. Half against the will of the ministry of the moment, England crushed the revolt and effected the occupation of Egypt (1882). The great problem was thus solved; the way to the Indian Ocean as well as to the Pacific had become an English road. But at the same time the occupation of the old country of the Pharaohs brought Great Britain face to face with a new task, that of flanking the Indian Ocean by an Africa which was English from Capetown to the Nile.

The opposition of England to the construction of the Suez Canal is intelligible, when we consider her historical position during the first five or six decades of the nineteenth century and the geographical conditions of the country in question. England's intention, of which Lesseps was informed by Palmerston, was to retain the monopoly of the world's trade and the supremacy on every sea. Both these objects had their starting-point and their foundation, as determined by the course of history, in the Indian Ocean, which at that period was in fact an English sea. Although England could only anticipate that the cutting of the Isthmus of Suez would bring her immense profits by the noteworthy shortening of the sea route to India, yet she could not on the other hand disguise from herself the fact that this entrance from the Atlantic Ocean stood open to others besides herself, and would attract foreign competitors to a degree which could not yet be estimated. Such competition was hardly worth considering when the long route round the Cape was in use; but with the new road, which placed the once so distant East at the very doors of every people, it was only too much to be dreaded. Hence the obstinate resistance, continued by every possible expedient for decades, against the realisation of the plan. When England ultimately resigned herself to the inevitable, she had probably gained sufficient confidence in her own political capabilities to feel sure of resisting all competition, even under the new conditions. England had not deceived herself in these expectations. One error only had slipped into her calculations. She had omitted to take into account the always inseparable connection of economic and political interests in modern times. A classic example of this was seen in the Indian Ocean when Germany and Italy, the two new powers mainly to be considered, advanced after 1884 from merely economic activity to a political scheme of colonisation on the hitherto neglected western coast of that sea.

The opening of the new waterway brought with it also a mass of new results for mankind in general and for the Indian Ocean and the Mediterranean in particular. This latter now not only developed itself into one of the most crowded thoroughfares, but awoke slowly to a new life of its own, which in its most vigorous form stirred the Italians to oversea expansion. But still more wide were the effects of the completion of the Suez Canal on the Indian Ocean and the commerce of the world. The numerous routes which ran from the Cape of Good Hope to the north and northwest were suddenly deserted, except by a few sailing-

ships. On the other hand, the few routes which traversed the new commercial highway in the first years after its opening have been multiplied and differentiated; there are, at the present day, numbers of trunk lines which converge upon Port Said and diverge again from Aden eastward. The opening up of Australia and Madagasear has done something to restore the importance of the older routes. But old and new alike have the Pacific for their ultimate objective. The Indian Ocean at the present day has again become an anteroom to its larger neighbour.

In addition to the enormous commerce which the Indian Ocean of the present day transmits from Europe to the Pacific and in the reverse direction, the Indian Ocean has also some political developments to show, which are the result of indigenous development. There is of course nothing of the historical activity of early settled nations to be noticed at the present time, when the sultanate of Zanzibar and the empire of the Hovas have been blotted out from the list of States. But, in compensation, Britons and Germans, French and Italians, have so firmly rooted themselves on the coasts and the surface of the Indian Ocean, that we may now venture to speak of Europeans being domiciled there, and may regard their activity as being that of peoples native to this region.

(b) *The Consolidation of the British Supremacy in the Indian Ocean by the Capetown-Cairo Policy.*—England endeavoured in other ways to retrieve the losses which she had thus sustained. In 1866 she acquired British East Africa, a territory precisely equidistant between Cape Colony and Egypt. The idea of a junction of these three provinces must naturally have forced itself upon men's minds, especially since between them, on the south coast of the Gulf of Aden, on the Zambesi, on the Nyassa, and in the important Zanzibar Archipelago, at the same time or a little later, opportunities were offered for the expansion of the British power. The magnificent idea of an Africa which, on its eastern side at all events, shall be British from the Cape to the mouths of the Nile, loses some of its audacity under these circumstances; but it has been keenly taken up in England and has already approached its realisation. This idea alone caused the masters of Egypt to give Mahdism its well-deserved quietus on September 2, 1898, before Omdurman. In order to realise it the English have crushed the Matabele empire, and have moved their frontiers far beyond the Zambesi to the north. For its sake they are constructing through Africa a railroad system which not only testifies to economic sagacity, but by means of its northern branches, the Nile Valley and the Uganda railways, makes England independent of the Red Sea and the Arabian Gulf, in the event of these being blocked by a hostile fleet. In fact, combined with other motives, it led also to the defeat of the Boers. The Boers, it is true, were more African than the negroes, since they have never struggled, like these at least, to reach the sea, and so far could not disturb Great Britain by sea; but as a land power England was bound to remain defective on the Indian Ocean so long as the two Boer republics existed.

(c) *The Northern and Northeastern Indian Ocean.*—During the last thirty or fifty years the north and the northwest of the Indian Ocean have also attained an increased importance as the thoroughfare to the East at the moment when East Asia, violently roused from its lengthened seclusion, was opened to the enterprise of the European. England here, too, was victorious. At the first dawn of

this period (1824) she laid her grasp upon the Straits of Malacca, with Singapore, Malacca, and Pulo Penang. Since that time the Indian Ocean, so far as it comes into the question of modern world commerce, bears in that part, notwithstanding the extensive possessions of the Dutch, an English stamp.

In conclusion, the last act of this drama lies mostly in the womb of time. It brings us into contact with a nation which has often occupied our attention on the Pacific (Vol. I, p. 593), but which apparently has no right to meet us here, — the Russian nation. And yet their appearance on the Pacific implies their movement toward the Indian Ocean. If Russia wishes not to be stifled in the enormous expanse of her Asiatic possessions, if she wishes to guide the unwieldy mass, she must force a way to the nearest sea; her East Asiatic coast is in every respect insufficient, and above all too remote. Hence comes that onward movement, during the last decades, toward the south, toward Mesopotamia and the Persian Gulf, which in our days so often assumes tangible form in the question of the Western Asiatic railways and of a Russian harbour on that gulf. England has here a far more difficult position than anywhere else on the coasts of the Indian Ocean. In Further India the power of Holland is broken up over infinite islands, great and small; in East Africa England's colonial possessions lie firmly riveted round and behind the territories of the Portuguese, Germans, and Italians. But there she sees herself confined between the sea and an antagonist whose ponderous mass presses slowly, but with irresistible power, toward the south.

## 6. RETROSPECT AND OUTLOOK

THE Indian Ocean, from the first day that men reached it and ventured on its waters down to the present, has played the part of an intermediary, from the point of view of anthropology, commerce, religion, and more especially of culture. This peculiar property finds its truest expression, so far as the special history of this part is concerned, in the formation of an Indo-African sphere of civilization, which embraces the entire northwest of the ocean, and whose strongest representative we see before us in Islam. Even to-day it is still conceivable that Islam might recover for its civilization that pre-eminence which has been gradually lost in four centuries of conflict with the white races. The headship in this struggle would on purely numerical grounds fall solely and simply to the people of India, if they only chose to renounce their gloomy inertness in favour of a more active religion. Their choice might well fall on Christianity. But, to begin with, Islam has already a great advantage as compared with Christianity. Two million Christians are confronted by fifty-seven millions of Mohammedans in India alone; and, in the second place, Christianity seems to have no prosperity in store for it within the region of the Indian Ocean. It has not made any appreciable progress either on the southern coasts of Asia or in Africa, while Mohammedanism has spread rapidly in both continents. So long as India remains under English rule, it will never advance to independent expansion on the high seas, since, for this purpose, the influence of Europeanism on the inert mass of Hinduism in that tropical country is too insignificant.

This possibility is less remote in the case of the two other great English colonies on the Indian Ocean. Australia, at the present day, is developing into

a commonwealth under English suzerainty, which has already in its youth given vigorous signs of a tendency toward expansion. The direction of such expansion is indeed without exception toward the north and the northeast, to the island groups of Melanesia and Polynesia; but what should prevent the United States of Australia from turning their eyes at some future time on the Dutch archipelago? That South Africa, which is now embarking on a similar course of development, should turn its attention to the Pacific is a physical necessity, since the Antarctic and South Atlantic Ocean could not offer it any firm base.

The position of England in the Indian Ocean is greatly improved by such events; she is, indeed, since the successful inauguration of her Pau-African policy, stronger than ever, and her dominion is still wider. Nevertheless, this ocean can hardly become once again a closed English sea. There are too many powerful navies at present to admit of this, as well as too many approaches to the ocean. Among these means of access the Red Sea has from decade to decade grown in importance, owing partly to the pre-eminent value of Southeast and South Asia in the eyes of Europe and the United States, but partly also to the substitution of the steamer for the sailing-vessel as an instrument of commerce. Whether this change in navigation, which chronologically, almost precisely, coincides with the opening of the Suez Canal (1869), is a direct consequence of it must remain an undecided point, but it certainly was influenced by that event. The Indian Ocean thus testifies to its significance for a region which certainly will become a more important factor in shaping the world's history in the future than it is even at the present time.

On the other hand, the future of the Indian Ocean in the domain of anthropology cannot be anything but unimportant. There is no scope here for a mixture of such far-reaching significance as we were able to foresee in case of the Pacific Ocean (Vol. I, p. 595). The aborigines of Australia, doomed to destruction from the first, may be disregarded; but the Hindu, like the Africans of the mainland from the east horn to the Zambesi, will continue to live in such dense masses, that no infusion of foreign blood could produce noteworthy changes of this sort. It is only in South Africa and in the equatorial district of the east coast of that continent that the necessary conditions are found for a close intermixture of races. The latter region has no future, for the Arab immigration has lessened since the commencement of the new order of things. The Swahili country, therefore, is hopelessly abandoned to negro influences. The south, on the other hand, has better prospects anthropologically, since there a number of various racial elements are concentrated on a narrow space, — the Kaffir and the light-complexioned peoples of the Hottentots, and the Bushmen, the low-German Boer, and the Anglo-Saxon, the Malay and the Indian. It is questionable whether any mixture of all these various elements will ever take place, but the first step toward this result has been shown long ago in the case of the Bastards.
