CAKCHIQUEL, kāk'chê-kāl'. An important tribe or nation, of Mayan stock, formerly holding the central districts of southern Guatemala, where their descendants still reside. The name is that of a native tree, and their language is a dialect of the Quiché. At the time of their conquest by Alvarado, about 1524, they had attained a high degree of culture, as is evidenced by their architectural remains, their calendar and hieroglyphic systems, and their native literary productions. They had an intense religious veneration for maize, and there is even reason to suppose that they were the first people to reclaim it from its original wild condition. The best compendium of their history and culture is Brinton's *Annals of the Cakchiquels* (Philadelphia, 1885). Consult also Stoll, *Zur Ethnographie der Republik Guatemala* (Zürich, 1884), and Thomas and Swanton, *Indian Languages of Mexico and Central America* (Washington, 1911).

CAKES, THE LAND OF. A title applied to Scotland, on account of the baps, scones, and oatmeal cakes which, with porridge, form the principal food of the country people. The epithet was prevalent in the eighteenth century.

CAKE URCHIN. See SAND DOLLAR; SEA URCHIN.

CALABAR BEAN, ORDEAL NUT. The seed of *Physostigma venenosum*, a twining, half-shrubby plant, native of western Africa, of the natural order Leguminosæ, nearly allied to the kidney bean, but of a genus distinguished by the hood-shaped stigma and the deeply furrowed hilum of the seed. The bean itself is about the size of a large horse bean, with a firm, hard, brittle, shining integument, brownish red, pale chocolate, or ash gray in color; irregularly kidney-shaped, with two flat sides, and a furrow running longitudinally along its convex margin, ending in an aperture near one end of the seed. The kernel, consisting of two cotyledons, weighing about 46 grains is hard, white, and friable. It yields its virtues to alcohol and less perfectly to water. It is used in the form of an emulsion by the natives of Africa, as an ordeal when persons are suspected of witchcraft. It is believed that if the suspect vomits it he is innocent; if it is retained and death occurs, he is guilty. If the accused person is innocent, he will usually eat a large number without hesitation, and so cause vomiting; if

he hesitates and takes little, this does not occur. The bean contains two alkaloids—physostigmine, or eserine, which represents the chief activity of the drug and calabarine. In physiological doses physostigmine stimulates the secretion of the saliva, sweat, and tears; it stimulates also the involuntary muscles of the intestines, stomach, and bronchial tubes and diminishes the reflex activity of the spinal cord, being thus antagonistic to strychnine. Applied locally to the eye, it contracts the pupil, acting here as an antagonist to atropine (q.v.). In poisonous doses the activity of the respiratory centre in the cord and medulla is depressed or abolished, and death takes place from asphyxia. Physostigmine has been used medicinally in chorea, tetanus, and strychnine poisoning. It is employed in the form of the salicylate, to counteract the dilatation of the pupil caused by atropine, to lessen intraocular tension in glaucoma, and to alternate with atropine in breaking up adhesions in iritis.

CAL'ABAR RIVER. An estuary-like bay on the north side of the Bight of Biafra, which penetrates British Nigeria just west of the border line between it and Kamerun (Map: Congo Free State, A 2). It is about 10 miles wide and extends inland nearly 25 miles. Near the head of the bay the waters of three rivers—the Cross, the Calabar, and the Akpa—are received through a deltoid borderland. The chief towns bordering the delta and estuary are Old Calabar, Duketown, and Creek town. The name "Old Calabar," employed in contradistinction to "New Calabar," a port and river 100 miles east, was officially replaced in 1904 by "Calabar."

CALABASH GOURD (Fr. *calebasse*, Sp. *calabaza*, a dry gourd; cf. Pers. *kharbuz*, melon, Little Russ. *harbuz*, pumpkin, watermelon), or BOTTLE GOURD (*Lagenaria vulgaris*). A climbing annual plant of the family Cucurbitaceæ, cultivated in tropical countries. The angular leaves and the thin stem of the plant feel sticky to the touch and have a disagreeable odor. The odor of the white flowers resembles that of musk. The hard rind of the bottle-shaped fruit, called "calabash," is much used in tropical countries for holding liquids. The pulp of the common bottle gourd is worthless and cannot be used as an article of food. The calabash pipes imported from South Africa are made from the necks of these gourds. Other varieties of *Lagenaria*, however, bear an edible fruit, which is sometimes sweetened with sugar and offered for sale. For illustration, see Plate under CUCUMBERS.

CALABASH TREE (*Crescentia cujete*). An evergreen tree found in the West Indies and in the tropical parts of America, belonging to the family Bignoniaceæ. In height and size it resembles an apple tree, and has broad lanceolate leaves, tapering to the base; large, whitish, fleshy flowers scattered over the trunk and older branches; and a gourdlike fruit, sometimes a foot in diameter. The wood of the tree is tough and flexible and is well adapted for coach making. The most useful part is the hard shell of the fruit, after the outer skin is removed. Under the name of calabash, it is much used, in place of bottles, for holding liquids, and for goblets, cups, water cans, etc. These shells may even be used as kettles for boiling liquids. They are sometimes highly polished, carved with figures, tinged with various colors, and converted into ornamental vessels. The rinds of gourds

CALABASH, ETC.

1. CASTOR OIL PLANT (*Ricinus communis*).
2. CEDAR OF LEBANON, CONE AND FOLIAGE (*Cedrus Libani*).
3. CALABASH TREE (*Crescentia cujete*).

4. FRUIT OF CALABASH TREE.
5. CATALPA OR INDIAN BEAN TREE (*Catalpa bignonioides*).
5a. CATALPA FRUIT OR INDIAN BEAN.

are sometimes similarly used and called calabashes.

CALABAZAR, kă'lă-bă-thär'. An inland city of Cuba, in the Province of Santa Clara, about 20 miles north by east of Santa Clara. It lies in the valley of the Calabazar River, just where it is spanned by the most pretentious piece of railroad bridge construction in Cuba. Pop., 1899, 1575; municipal district, 13,419; 1907, 1496; municipal district, 16,979.

CALABOZO, kă'lă-bō'sō (Sp., dungeon). A town in Venezuela, capital of the state of Miranda, about 120 miles south-southwest of Carácas (Map: Venezuela, D 2). It is situated on the Guárico River, in the fertile grazing region of the great plains, and is an important commercial centre, with a trade in live stock, hides, cheese, timber, etc. Calabozo is the see of a bishop. The climate in this vicinity is excessively hot, and inundations are not infrequent. Calabozo was a humble native village until the early years of the eighteenth century, having been made in 1730 a trading station of the Compañía Guipuzcoana. Pop., about 6000.

CALABRIA (Gk. Καλαβρία, *Kalabria*). The southernmost peninsula of Italy, having the Ionian Sea and the Gulf of Taranto on the east, and the Tyrrhenian Sea on the west (Map: Italy, L 9). Its area is 5820 square miles. The surface is very mountainous, the peninsula being traversed through its entire length by the Apennine Mountains. Owing to its elevated surface, Calabria has a moderate and healthful climate. The flora is extremely rich and varied. The mountain slopes are covered with extensive forests of pine, oak, beech, and numerous other trees, interspersed with vineyards and olive gardens. Grain, rice, southern fruit, hemp, and flax are raised and exported in considerable quantities, and the raising of domestic animals is extensively engaged in by the inhabitants. Of mineral products Calabria yields marble, alabaster, gypsum, salt, and some copper. The compartment is purely agricultural, the manufacturing industries being only slightly represented. There are very few large towns, and the railway lines run chiefly along the coast. For administrative purposes Calabria is divided into the provinces of Catanzaro, Cosenza, and Reggio di Calabria, with a population of 1,370,208 in 1901 and 1,402,151 at the census of June 10, 1911. The Calabrians are mostly plain folk, quite superstitious, and generally ignorant.

In Roman times the name "Calabria" was given to the southeastern peninsula of Italy, nearly corresponding to the modern Province of Lecce, no portion of which is included in modern Calabria, which answers to the ancient Bruttium. The name "Calabria," as applied to the district now known by that name, appears to have originated with the Byzantines, in the eighth century, after the Byzantines had lost to the Lombards the "heel" of the Italian peninsula (they still retained control of the "toe"). Before the unification of Italy Calabria constituted a province of the Kingdom of the Two Sicilies. On Sept. 8, 1905, an earthquake destroyed numerous villages and caused great loss of life. A still more disastrous earthquake was that of Dec. 28, 1908, by which Messina (q.v.) was destroyed. See REGGIO DI CALABRIA.

CALA'DIUM (Neo-Lat.; possibly from Scotch *kale*, *kail*, cabbage—a variant of *eole*). A genus of plants belonging to the family Araceæ (aroids). There are about a dozen

species, and numerous varieties that are cultivated in hothouses for their large, beautifully variegated, arrow-shaped leaves. They are closely allied to the Colocasias, which, in addition to being highly ornamental bedding plants, furnish the Taro (q.v.) of the Pacific islands. See ELEPHANT'S EAR and Plate of EDELWEISS.

CALÁGANE, kă-lă'gá-nâ. A Malayan people on Dávao Bay, Mindanao. See PHILIPPINES.

CA'LAH. An Assyrian city mentioned in Gen. x. 12, and no doubt identical with Kalchu, which frequently occurs in the Assyrian inscriptions as the name of an important city. According to Asurnazirpal III (885-860 B.C.), Calah was built by Shalmaneser I (c.1320 B.C.). It was rebuilt by Asurnazirpal III in 880 B.C. He adorned it with a massive wall on the northern side, beautiful gardens along the banks of the Tigris, lofty temples, and huge palaces. In one of these palaces was found the "black obelisk," recording the tribute paid by "Jehu, the son of Omri," to Shalmaneser III (860-825). Building operations were carried on in Calah by Shalmaneser I, Asurnazirpal III, Shalmaneser III, Tiglath-pileser IV (745-728), Sargon (722-705), Esarhaddon (681-668), and Asur-ital-ilani-ukin (626-?). The largest zikkurat was 167 feet square and 140 feet high and had seven stages. During a number of reigns Calah was the residence of the court, but in population it probably never equaled Nineveh, or even Assur. It was the city that Layard discovered at Nimrud, 20 miles south of Kuyunjik, when he supposed that he had found Nineveh. Since very few tablets have been found at Nimrud, it has been assumed that Sennacherib (705-681) removed the temple library to Nineveh. Consult: Layard, *Nineveh and its Remains* (London, 1875); G. Smith, *Assyrian Discoveries* (London, 1875); id., *Chaldean Account of Genesis* (London, 1875); Winckler, *Geschichte Babyloniens und Assyriens* (Leipzig, 1892); Rogers, *History of Babylonia and Assyria* (New York, 1901); Hilprecht, *Explorations in Bible Lands during the Nineteenth Century* (Philadelphia, 1903); Hommel, *Grundriss der Geographie und Geschichte des alten Orients* (Munich, 1904); Zehnfund, *Babylonien in seinen wichtigsten Ruinenstätten* (Leipzig, 1913).

CALAHORRA, kă'lă-ōr'râ (anciently, Lat. *Calagurris*, later *Kalatharral* of the Saracens, from Ar. *Kalat*, castle, and *harral*, stone). A town of Spain, in the Province of Logroño, Old Castile, 24 miles southeast of the city of Logroño, situated on the small river Cidacos, about 2 miles from its confluence with the Ebro (Map: Spain, E 1). It is the seat of a bishopric, and the cathedral is the principal building. The town has a brisk trade in local agricultural products. Pop., 1900, 9475; 1910, 9871. Calahorra occupies the site of the ancient Calagurris, and one may still see remains of an aqueduct and amphitheatre. Calahorra first became famous in 76 B.C., when the followers of Sertorius successfully defended it against Pompey. Four years later it gained a new celebrity for the obstinate but unsuccessful resistance it offered to Afranius, Pompey's legate, when the citizens slaughtered their wives and children for food rather than surrender. Calahorra was the birthplace of Quintilian, the rhetorician.

CALAIS, kă'lă' (ML. *Calailia*, *Calaisis*). A seaport town and fortress of the first class in the Department of Pas-de-Calais, France, on the Strait of Dover, near its narrowest part, 20 miles

from Dover (Map: France, N., G 2). On the south and east, low, marshy grounds, which can be laid under water for the defense of the city, extend almost to the walls. The town, adjacent country, and port are commanded by the citadel, which is situated at the west end of the town, while seven forts, by their cross fire, defend the weakest points. The harbor, which was formerly shallow, has been greatly improved, has a lighthouse 190 feet high, and a port accessible to the largest vessels. As one of the chief ports of debarkation for travelers from England to France, it has frequent steam communication with Dover and London. The city is square in form; its streets are, for the most part, broad and well paved; and its ramparts form pleasant promenades. Among its objects of interest the most noticeable are the church of Notre Dame, the old Hôtel de Ville, and the Hôtel de Guise. It has become a manufacturing town of some importance. The chief manufactures are bobbinet (tulle), machine-made lace, hosiery, etc. A number of mills produce silk, wool, cotton, and linen goods, and hats and gloves are extensively made. Calais has also distilleries, salt refineries, and shipyards. Calais sends numerous boats to the herring and cod fisheries on the coasts of Scotland and Iceland. Its exports consist of eggs, corn, wine, brandy, etc., and it is the entrepôt for the produce of the district. It also does a large business in petroleum. In 1873 a school of artillery was established in Calais. It has an abundant water supply. Pop., 1896, 56,940; 1906, 66,627; 1911, 72,322.

In the ninth century Calais was a small fishing village. In the following century it was much improved by Baldwin IV, Count of Flanders, and enlarged and strengthened by the Count of Boulogne. In 1347, after a long siege, it was captured by Edward III of England, whose hard terms, and the self-devotion shown by six of the citizens, who were saved by Queen Philippa, form one of the most interesting passages of history. Under the English occupation Calais became a great trade centre, as location of the great wool "staple." The English retained it until 1558, when it was captured by the Duke of Guise, since which time (with the exception of two years, 1596-98, when it was in the possession of the Spaniards) it has remained in French hands. Consult: Calton, *Annals and Legends of Calais* (London, 1852); P. W. T., "Modern Calais" in *Nautical Magazine*, vol. lxxvii (London, 1898); Aron and others, *Notice sur le Port de Calais* (Paris, 1904).

CALAIS, käl'is. A city and port of entry in Washington Co., Me., 120 miles by rail east-northeast of Bangor, on the St. Croix River, at the head of tidewater, and opposite St. Stephen in New Brunswick (Map: Maine, E 3). The most northeasterly seaport in the United States, it is the terminus of the Maine Central Railroad, has railroad communication by the Canadian Pacific through St. Stephen, with which it is connected by an international bridge, and has steamship connection with Boston. The city contains a public library, Calais Academy, Memorial Park and a customhouse. The river furnishes abundant water power, to which is due the great lumber trade of the city. There are also foundries, machine shops, granite quarries, and manufactures of shoes, calcined plaster, etc. Pierre du Guast, Sieur de Monts, who in 1605 founded at Port Royal the first French settlement in Canada, spent the winter of 1604-

05 on Big Island, within the present city limits. Calais was settled in 1779, incorporated as a town in 1809, and chartered as a city in 1850. It was nearly destroyed by fire in August, 1870. The government is administered under a charter of 1883 (revised 1901), which provides for a mayor, elected annually, and a city council, which elects heads of all departments. Pop., 1890, 7290; 1900, 7655; 1910, 6116. Consult Knowlton, *Annals of Calais* (Calais, 1875).

CAL'AÏS and **ZETES**, zē'tēz. In Roman mythology, the two winged sons of Boreas. They took part in the Argonautic expedition, during which they rescued the blind King Phineus from the attacks of the Harpies. They were said to have been slain by Hercules on the island of Tenos, where their graves were shown. See ARGONAUTS; HARPY.

CAL'AMAN'DER WOOD. See EBONY.

CAL'AMARY (Neo-Lat. *calamarius*, from Lat. *calamus*, reed, pen). An Anglicized form of a European name for certain squids, given in allusion to the feather-penlike internal shell, often called a calamary. Pen-and-ink fish is another and similar name. See SQUID.

CALAMATTA, käl'mät'tä, LUIGI (1802-69). An Italian line engraver. He was born in Civitã Vecchia and studied in Rome under Marchetti and Ricciani. In 1822 he removed to Paris, where, as a follower of Ingres, he became one of the foremost engravers. In 1837 he was appointed professor at the Ecole des Beaux-Arts in Brussels, and developed an important activity as a teacher, numbering among his pupils Gustave Biot, Leopold Flameng, and Charles Blanc. In 1861 he was appointed instructor in the Brera Academy, Milan. Among his best-known plates are the death mask of Napoleon, after Dr. Antomarchi's cast taken at St. Helena, the portraits of Ingres and Paganini, after Ingres, Guizot after Delaroche, George Sand after an original drawing, "Francesca da Rimini" after Ary Scheffer, "La Gioconda" after Leonardo, and the "Madonna di Foligno" after Raphael. His engravings are characterized by correctness of drawing and finish. Consult Alvin, *Notice sur Luigi Calamatta* (Brussels, 1882).

CALAMBA, käl'läm'bä. A town of Luzon, Philippines, in the Province of Laguna. It lies on the south shore of Laguna de Bay, 27 miles southwest of Santa Cruz, and is connected by roads with several towns of the province. It has a telegraph station. Pop., 1903, 8058.

CALAMBUCO, käl'läm-bōō'kō (Sp., probably from Pers. *kalambak*, fragrant wood). A tree of uncertain relation found in the northern part of the island of Luzon and considered superior to teak or live oak for shipbuilding. The heart wood is dark and hard, like teak, and is proof against the destructive white ant of the Malay region. Warlike, mechanical, and agricultural tools and implements are made from it. The aloes wood is produced by *Aquilaria agallocha*, a large tree with heavy wood, shaded with green. It is aromatic and is burned as incense. This and *Aquilaria malaccensis* are said to yield the eagle wood. It is possible that calambuco is a product of the same or related species.

CALAME, käl'läm', ALEXANDRE (1810-64). A Swiss landscape painter. He was born in Vevey and studied in Geneva with Diday, whom he succeeded as head master of the art school. In 1837-38 he obtained gold medals in Paris. After traveling extensively for purposes of study he settled in Geneva, where he lived until

1863, and where a monument was dedicated to his memory, April 3, 1880. He was one of the best landscape painters of his day, and excelled in depicting Alpine scenery. His pictures are good in line and perspective but hard in color. Towards the end of his life popularity made his art commercial. Among his principal canvases are: "Bernese Oberland" (Leipzig Gallery); "Pass of Monte Cervino" (ib.); "Ruins of Pæstum" (ib.); "Wetterhorn" (Basel Museum); "Waterfall near Meiringen" (Bern Gallery); "A Storm on the Handeck" (ib.); "The Four Seasons" (Geneva Museum); "The Four Divisions of the Day" (Basel Museum); "Lake Lucerne" (Berlin Museum). He also produced numerous etchings and lithographs of Alpine subjects.

CALAMIANES, käl'lä-myä'näs, or CULIÓN ISLANDS. A group of islands in the western part of the Philippine Archipelago, in lat. 12° N. and long. 120° E., situated between the islands of Mindoro (from which it is separated by Mindoro Strait) and Palawan (Map: Philippine Islands, B 5). The islands are of volcanic origin, Busuanga, Culiön, and Corön being the largest. They are all hilly, but yield tropical fruits in abundance, and small quantities of sugar cane, rice, and tobacco. Cattle raising and fishing are leading occupations. The climate is hot and unhealthful. The 98 islands comprising the group have a total land area of 677 square miles, and a population (1901) of about 17,000.

CAL'AMINE (Fr., from ML. *calamina*, corrupted from Lat. *cadmia*). A hydrated zinc silicate that crystallizes in hemimorphic forms of the orthorhombic system, whence the name "hemimorphite" occasionally applied to it. The name was originally applied to mineral zinc carbonate, but this is now known as *smithsonite*, while *calamine* is restricted exclusively to the silicate. It occurs massive or crystalline, often in mammillary, botryoidal, and fibrous forms, generally white, although sometimes with a bluish or greenish shade, and less frequently yellowish to brown. Calamine is found in Germany, Austria, in Derbyshire, England, and at various localities in New Jersey, Pennsylvania, and elsewhere in the United States. A fairly large tonnage is mined in southwest Missouri and sold to the smelters under the name of "silicate." When pure it contains 52 per cent of zinc and is therefore a valuable ore of that metal.

CAL'AMINT (Lat. *calaminthe*, Gk. *καλαμίνθη*, *kalaminthē*, from *καλός*, *kalos*, beautiful + *μίνθη*, *minthē*, mint), *Calamintha*. A genus of plants of the family Labiatae, nearly allied to balm (*Melissa*). The common calamint (*Calamintha officinalis*) is not infrequent in England. It has whorls of flowers on forked, many-flowered stalks, and crenate leaves with an agreeable aromatic odor. It is used to make herb tea and as a pectoral medicine. A number of species to which similar virtues are attributed are found in the United States. Two or three species of shrubby calamints are sometimes planted in borders of flower gardens. See BALM; BASIL.

CAL'AMIS (Gk. *Κάλαμις*, *Kalamis*). A Greek sculptor who flourished in the second quarter of the fifth century B.C., famous for the delicacy and grace of his statues. His works, which included statues of Apollo, Hermes, and Aphrodite, and part of a chariot group for Hiero, King of Syracuse, were widely scattered

throughout Greece, but nothing definite is known of his life. He is the representative artist of the transition period between the archaic art before the Persian wars and the art of Phidias. No work of his has come down to us, though attempts have been made to identify several pre-Phidian types with some of his celebrated works. Consult E. A. Gardner, *A Handbook of Greek Sculpture*, pp. 232-236 (London, 1911).

CALAMITES, käl'ä-mī'tēz (Gk. *καλαμίτης*, *kalamitēs*, reedlike, from *κάλαμος*, *kalamos*, reed). A genus of fossil plants, appearing first in the Devonian rocks, and rising through the intermediate formations to the Jurassic, where it is represented by a single species. They reach their maximum development in the coal measures, where a large number of species have been determined. The tall, straight stems rose from a swampy clay soil in profusion in the forests of sigillaria, and formed a striking and characteristic feature of the coal flora, though they supplied little material for the structure of coal. They are hollow-jointed cylinders, with longitudinal furrows, giving the fossil the appearance of equiseta. From this resemblance botanists have generally considered them as huge "horsetails." They belong to the equiseta, and the study of many specimens, both macroscopically and microscopically, has developed a number of subgenera. The modern "horsetail rush" represents, according to Seward, a degenerate type of the calamitean group. Hooker was unable to detect any traces of structure, in carefully prepared specimens, or the presence of those siliceous stomata which characterize equiseta, and which should have been preserved in the fossil state; but later investigators have been more successful in finding specimens from which internal structures could be determined. Fleming has shown that the furrows are markings on the interior cavity. The lower portion of a calamites trunk would show rings of scars where branches had fallen off, while higher up the younger branches contained whorls of slender leaves and long, slender cones. The root termination was conical, the joints increasing upward in size and length. The foliage of calamites has been described under different names. *Asterophyllites* includes jointed and fluted stems, with branches proceeding from the joints and bearing long, pointed leaves. *Annularia* has closely arranged leaves, while in *Sphenophyllum* the leaves were wedge-shaped. See COAL; CARBONIFEROUS SYSTEM; Plate of CARNATIONS.

CAL'AMUS. See RATTAN; DRAGON'S BLOOD.

CALAMUS (Lat., Gk. *κάλαμος*, *kalamos*, reed; cf. AS. *healm*, Eng. *haulm*). A word applied not only to the reed, but also to objects made from it, and especially to the ancient pen, which was commonly a split reed. Egypt furnished most of these reeds, though those from Cnidus were also highly esteemed. They were trimmed and split with a knife so that they looked like a quill pen, and were generally kept in a case. Imitations in bronze of the reed pens have been found. Reed pens are still used in the East, the Arabic word being *kalām*. The same name is also applied to the reed pipe or pastoral flute. See SYRINX.

CALAMUS. A name sometimes given to the sweet flag (*Acorus calamus*). See ACORUS.

CAL'AMY, EDMUND (1600-66). An English divine. He was born at Walbrook, February, 1600; studied at Pembroke Hall, Cambridge,

where he attached himself to the Calvinistic party; and afterward became domestic chaplain to the Bishop of Ely. In 1626 he was appointed lecturer at Bury St. Edmunds, but resigned his office in 1636, when the order to read the *Book of Sports* began to be enforced. In 1639 he was chosen minister of St. Mary, Aldermanbury, London. He now entered warmly into the controversies of the time and became noted as a leading man on the side of the Presbyterians. He had a principal share in the composition of *Smectymnuus*, a work intended as a reply to Bishop Hall's *Episcopacie by Divine Right Asserted* (London, 1640), and one of the most able and popular polemics of the day. Like the mass of the Presbyterian clergy, he was monarchical and not republican in his political opinions. He disapproved, therefore, of the execution of Charles and the Protectorate of Cromwell, and did not hesitate to avow his attachment to the royal cause. He was one of the deputies appointed to meet Charles II in Holland and congratulate him on his restoration. His services were recognized by the offer of a bishopric, which he refused from conscientious scruples. He took part in the Savoy Conference (1661), but was ejected from his living by the Uniformity Act (1662); for venturing to preach in his church (Dec. 28, 1662) he was cast into prison, but Charles II secured his release. He died in London Oct. 29, 1666. Two of his sons were educated for a religious profession: the one, Rev. Dr. Benjamin Calamy, became a High Churchman, and wrote *A Discourse about a Scrupulous Conscience*; the other, Edmund Calamy, was ejected for nonconformity, and had a son, also named Edmund (1671-1732), who acquired reputation as the biographer of the ejected clergy. He was born in London, April 5, 1671; educated among the Dissenters and in Holland (1688-91); was pastor in London, 1692, and died there June 3, 1732. He was held in high regard, and his *Nonconformists' Memorial* (1778), as it is now called, a book which underwent important changes while in the author's hands, is the best source of knowledge respecting the 2000 ministers ejected from the Church of England by the Act of Conformity. Consult Palmer, *Abridgment of Nonconformists' Memorial* (London, 1802-03), and his autobiography, *Historical Account of my own Life* (London, 1830).

CALANCHA, ká-lán'chá, FRAY ANTONIO DE LA (1584-1654). A Peruvian chronicler and religious; son of Capt. Francisco de la Calancha and María de Benavides. At the age of 14 he entered the Augustinian Order at Lima, where he made his studies for the doctorate in theology, which was conferred upon him by the University of Lima. Afterward he traveled extensively through Peru for the purpose of examining the ancient ruins of that country and of recording its traditions. He wrote accounts of all the things he had seen (including descriptions of monuments that have since disappeared), which he used when, as chronicler of the Augustines at Lima he prepared the important history (completed in 1633), which has been badly translated into French, under the pompous title *Histoire de l'église du Pérou aux antipodes et d'un grand progrès de l'église en la conversion de Gentils par la prédication des religieux ermites de l'ordre Saint-Augustin* (Toulouse, 1653). This version omits much that is important and interesting. The original work ap-

peared at Barcelona, 1639, under the title *Crónica moralizada del orden de San-Agustín en el Perú*. At Lima, 1653, he published his *Crónica de los santuarios de Nuestra Señora de Copacabana y del Prado*.

CAL'AND, or **KAL'AND** (KALEND BRÜDER, or FRATRES CALENDARII). A brotherhood of Roman Catholics devoted to charitable and religious works, dating from the thirteenth century, and of considerable extent in Germany, Switzerland, and France. Banquets being introduced at their meetings, abuses arose, and the associations gradually diminished, most being suppressed before the Reformation.

CALANDO, ká-lán'dô (It., slackening, from *calare*, to lower, diminish, decrease). A musical term which means diminishing by degrees in power (from forte to piano) as well as in rapidity, thus combining both the *decrescendo* or *diminuendo* (q.v.) and *ritardando* (q.v.) effects.

CALANDRELLI, ká-lán-drél'lê, ALEXANDER (1834-1903). A German sculptor. He was born in Berlin, where he studied at the Academy and later under Friedrich Drake and August Fischer. In 1871 he received his first important commission, a bronze relief for the east side of the Column of Victory with scenes from the Franco-German War. In 1874 he was appointed professor, in 1883 a member of the Berlin Academy, and in 1887 member of the Academic Senate. Among his principal works are a marble statue of Peter Cornelius (entrance to Old Museum, Berlin); terra-cotta reliefs for the Berlin City Hall; the equestrian statue of Frederick William IV (entrance to Berlin National Gallery); a colossal statue of William II for the Teltower District Hall, Berlin. Calandrelli was a follower of Rauch, but he never achieved any distinct artistic personality, and notwithstanding important commissions contributed little to the development of German sculpture.

CALANDRONE, ká-lán-drô'nâ (It.). A small variety of clarinet used by the Italian peasants, on which they play simple melodies and also sometimes accompany their national songs.

CAL'ANUS (Gk. *Kálanos*, *Kalanos*, from Skt. *kalyāna*, the fortunate). A Hindu philosopher, apparently a Brahman ascetic, whose real name, according to Plutarch, was Sphines. He was for some time in the camp of Alexander the Great at the invitation of the conqueror, but, having become seriously ill, he was burned alive at his own request at Persepolis.

CALAPAN, ká-lá-pán'. The capital of the island of Mindoro, Philippines, situated at the northeast extremity of the island, 85 miles east-southeast of Manila (Map: Philippine Islands, C 4). It has a harbor, courthouse, jail, and a fort. The inhabitants of the town, which is of little commercial importance, are engaged chiefly in fishing and weaving. Pop., 1903, 5554.

CALAPE, ká-lá'pâ. A town of Bohol, Philippines, situated on the west coast, 19 miles north of Tagbilaran. Pop. 1903, 13,354.

CALAS, ká'lás' or ká'lá', JEAN (1698-1762). A Protestant merchant of Toulouse, whose judicial murder was the cause of an agitation in which Voltaire took the leading part. It resulted in the amelioration of the legal position of Protestants in France, and particularly discredited the administration of justice under the declining monarchy. Calas was accused of murdering his son because he wished to become a Roman Catholic. The son had probably com-

mitted suicide, and there was no evidence to support the accusation, which originated in a mob, and was fostered by Roman Catholic religious societies, the White Penitents, and the Franciscans, who treated the suicide with the honors due to a martyr. After a trial which lasted a whole winter, the Parliament of Toulouse, by a majority of eight to five, condemned Calas to death on the rack and confiscated the estate of the family. Calas's widow made Voltaire's acquaintance in Switzerland, and he actively took up her cause. After long labor he secured a rehearing of the case, and the Parliament of Paris declared Calas innocent and restored the estate to the family. The chief magistrate was degraded and fined. Consult Coquerel, *Jean Calas et sa famille* (Paris, 1858); *Causes célèbres*, vol. iv (1875); Kreiten, *Voltaire* (Freiburg, 1878); the studies of Voltaire by Morley (London, 1878) and Faguet (Paris, 1897); Raoul Allier, *Voltaire et Calas* (Paris, 1898); Masmonteil, *La législation criminelle dans l'œuvre de Voltaire* (Paris, 1901); Tallentyre, *Life of Voltaire* (2 vols., London, 1903; New York, 1905).

CALASCIONE, kă'lă-shō'nă. A national instrument of southern Italy, a variety of guitar. It has two strings, tuned a fifth apart, and is played with a plectrum. The finger board is provided with frets.

CALASIAO, kă-lă'sê-ä'ô. A town of Luzon, Philippines, in the Province of Pangasinan, 9 miles southeast of Lingayen, on the main highway to Manila. Pop., 1903, 16,539.

CALATAFIMI, kă-lă'tă-fē'mē. A city in the Province of Trapani, Sicily, 57 miles southwest of Palermo (Map: Italy, G 10). The town had its name, Kalat al-Fimi, from the Saracens, who captured it in 828. Near by are the ruins of the ancient Elymian town of Segesta, containing an unfinished temple of the fifth century. In 1860 Garibaldi won his first victory over the Neapolitan troops on a field 2 miles to the southwest, marked by a monument erected in 1892. The district about Calatafimi is well known for its cheeses. Pop. (commune), 1881, 10,000; 1901, 11,426; 1910, 10,486.

CALATAYUD, kă-lă'tă-yōōd' (Ar. *kalat*, castle + *Ayub*, a Moorish king). A city of Aragon, Spain, situated on the Jalón, near its junction with the Jiloca, about 48 miles southwest of Saragossa (Map: Spain, E 2). It is built at the base of two rocky ridges, 1700 feet in height, out of the ruins of ancient Bilbilis, which lay about 2 miles to the east and was the birthplace of the poet Martial. The city is divided into a new and an old portion, the former having several fine streets and handsome squares, the latter composed of mean buildings and narrow, crooked streets. Calatayud has ruins of a noble Moorish castle, two collegiate churches, and a Dominican convent. Of the collegiate churches, Santo Sepulcro, built in 1141 and restored in 1613, long served as the chief church of the Spanish Knights Templars. The city manufactures silk, linen, and hempen fabrics, woolens, paper, leather, etc., and carries on a trade in agricultural produce. In former times it was celebrated also for its fine horses, its armorers, and its gold and iron. Pop., 1897, 10,900; 1900, 11,526; 1910, 11,594.

CALATRAVA, kă'lă-tră'vâ. A military and religious order in Spain, instituted in 1158, in the reign of Sancho III of Castile. It received the town of Calatrava as a perpetual gift, on

condition that it should defend it against the Moors. The order was confirmed by Pope Alexander III in 1164 and very soon rendered effective service in the wars against the Mohammedans. While the Christian states in Spain were exhausting themselves by internal strife, the Order of Calatrava was the main bulwark against the Moors. In 1197 the latter captured Calatrava and the knights removed to Salvatierra. In 1212, however, they not only recovered Calatrava, but had an important share in the deadly blow which was struck at the power of the Almoravides. In 1213 Calatrava united with the Order of Avis. The power of the Knights of Calatrava was shown at the time they joined the orders of Alcántara and Santiago in exacting from Alfonso XI a guarantee of their liberties and customs. The later history of Calatrava is a series of civil wars between the grand masters, which became so troublesome to the government that Ferdinand and Isabella, in 1487-88, prohibited a new election and secured the grand mastership to the crown by a papal bull in 1493. Later Charles V made the order perpetual, with the King of Castile as head. In 1808 Calatrava became an order of merit. On March 13, 1872, the order was suppressed by the republican government, but was reorganized by Alfonso XII, June 13, 1874. Those who entered the order took the vows of poverty and obedience. At first marriage was forbidden, but Paul III in 1540 made this concession, and gradually the order lost most of its religious character. The original garb was black, but in 1396 Benedict XIII (antipope) allowed the knights to adopt the red cross. The present dress is a mantle of white, decorated with a red cross, cut out in the form of lilies.

CALATRAVA, JOSÉ MARÍA (1781-1846). A Spanish statesman, born at Mérida. He became known as an eminent orator of the Liberal party, and became a member of the Junta of Estremadura in 1808 and of the General Junta in 1810. Because of his radical views he was, upon the restoration of Ferdinand VII in 1814, arrested and condemned to eight years of penal servitude and exile at Melilla, but returned to Spain after the King's deposition. In 1821 he was elected to the Cortes, and in 1823 he became Minister of Justice, but when, through the intervention of the French, Ferdinand regained absolute power (1823), Calatrava was again banished. He lived in London until 1830, when he returned to Spain, became Minister of Foreign Affairs (1836), and was prominent in the parliamentary movement which resulted in the adoption of the more liberal constitution of 1837. When Queen Isabella assumed the government, in 1843, he was made a Senator. Because of his devotion to the cause of liberty and the personal suffering and sacrifice brought upon him thereby, we are justified in considering him one of the greatest figures in Spanish politics.

CALATRAVA LA VIEJA, lä vyä'hâ (Sp., Calatrava the Old, from Ar. *kalat*, castle + *Rabah*, a man's name), or OLD CALATRAVA. A ruined city of Spain, near Valdepeñas, situated on the Guadiana. In the Middle Ages it was a strongly fortified place, but nothing now remains save a single tower. Calatrava la Vieja was captured from the Moors by Alfonso VIII of Castile, and given to the Templars; unable to defend it, they returned the gift to Sancho III (1157). Raymond, Abbot of Fitero, and Diego Velasquez here instituted the Order of Calatrava

(q.v.) in 1158. In 1197 the Moors captured Calatrava la Vieja, but it was retaken in 1212. About 1217 the Knights of Calatrava la Vieja built a convent in the neighborhood, naming the place Calatrava la Nueva ('New Calatrava').

CALAVERAS (käl'ä-vä'räs) **GROVE.** The nearest to San Francisco of the California groves of big trees. The grove is 70 by 1100 yards in extent, and contains about 100 of the big trees, of which the "Keystone State," the highest now standing, has an altitude of 325 feet and a circumference of 45 feet. The "Mother of the Forest" is 61 feet, and the "Father of the Forest," not standing, is 112 feet in circumference. The grove is State property under a commissioner.

CALAVERAS RIVER. A small river of central California, and a tributary of the San Joaquin, which it joins just below Stockton (Map: California, C 2). It rises in the sierras of Calaveras County and pursues a southwesterly course.

CALAVERAS SKULL. A much-discussed human cranium reported to have been found in 1886 in auriferous gravels below lava beds near Angel, Calaveras Co., Cal. The specimen was described by J. D. Whitney, and is preserved in the Peabody Museum, Harvard University. Satisfactory accounts of the object and its associations have been published by Hrdlička in *Bulletin 33, Bureau of American Ethnology* (1907).

CALAVERITE, käl'ä-vä'rīt or -vē'rīt. A gold-silver telluride found in pale bronze-yellow masses in California and Colorado. It is a rich ore of gold and silver.

CALBAYOG, käl-bä'yōg. A town of Samar, Philippines, situated on the west coast, 28 miles northwest of Catbalogan (Map: Philippine Islands, E 4). Pop., 1903, 15,895.

CALBUR'GA. See GULBARGA.

CALCAIRE GROSSIER, käl'kär' grō'syâ' (Fr., coarse limestone). The middle Eocene stage of the Tertiary system of France. The strata of which it is composed are almost wholly limestones, and they outcrop in great force in the Paris basin. The strata are highly fossiliferous; the animal remains include mammalia, reptiles, and a large variety of lower-life forms. The Calcaire Grossier is represented in the English Tertiary by the Bracklesham beds; in the United States the Claiborne beds are equivalent to a portion of it.

CALCAR, käl'kär, HANS VON. See KALKAR, JOHANN STEPHANUS VON.

CALCA'REOUS ROCKS (Lat. *calcarius*, pertaining to lime, from *calx*, limestone, lime). Rocks containing much lime, especially those in which the lime occurs in the form of carbonate (CaCO₃). Calcareous rocks form one of the main groups of sedimentary rocks and are very widely distributed, being found in all the larger stratigraphical divisions from the earliest to recent times. They are generally aqueous rocks and have been deposited in bodies of either marine or fresh water; the calcareous content is often supplied by the fossilized remains of the hard parts of animals that inhabited these waters. Thus many Paleozoic limestones are composed of shells, corals, and crinoidal fragments, while others, like chalk, consist of foraminifera and fragments of other minute organisms. When calcareous rocks become involved in mountain-making processes the carbonates assume a crystalline structure and they

are then known as crystalline limestones or marbles. Oölite is a calcareous rock composed of small, concretionary, egglike grains, resembling the roe of fish. The existence of the carbonate in rocks can be readily detected by the application of dilute nitric or muriatic acid, which causes effervescence through the liberation of carbonic acid. Quicklime is obtained from calcareous rocks by calcining them, i.e., by driving off the carbonic acid and other volatile matter by heat. Calcareous soils, often of great fertility, are produced from the disintegration of calcareous rocks. See ROCK; OÖLITE; SOIL; LIMESTONE; CALCAREOUS TUFFA.

CALCAREOUS TUFFA (It. *tufa*, from Lat. *tufus*, tufa, tuff). A form of limestone deposited from solution in which it was held by an excess of carbon dioxide. Water absorbs this gas from the atmosphere and the soil, forming a weak acid which has a marked solvent effect upon calcareous materials, but with the escape of the gas on evaporation of the water they become insoluble and are precipitated as calcite or aragonite. Deposits of calcareous tuffa usually have a loose, cellular, or spongy texture; they are formed on the beds of streams and shallow lakes or ponds, where they often encrust the mosses and other plants that grow in the waters. They are thus of superficial occurrence, but may extend over considerable areas, as in some of the old lake beds of the West. Another name for the material is travertine, which, however, may be better applied to the denser sorts with a fibrous or concentric structure, such as occurred near Tivoli, Italy, an old Roman town that lent its name (*Tibur*) to the material (*lapis Tiburtinus*). It is a rather porous stone for building purposes, but has been used to some extent as a structural material, as in the old temples at Paestum, the Colosseum at Rome, etc. The stone acquires hardness and durable qualities with age. Calcareous tuffa and travertine are white when free of admixture; colors like gray, red, and yellow are common and are brought about by metallic oxides or organic matter. The so-called Mexican onyx, a favorite ornamental stone, is a translucent travertine, beautifully tinted in shades of red and yellow by iron oxides. See LIMESTONE; ONYX.

CALCASIEU, käl'kä-shū. A river of southwest Louisiana, its headstream, Cypress Branch, rising in the parish of Natchitoches (Map: Louisiana, B 3). It pursues a course at first southeast, then southwest, and empties into Lake Calcasieu (nearly 20 miles long and three to six miles wide), which is connected with the Gulf of Mexico by the narrow Calcasieu Pass. By means of numerous branches, chiefly from the west, it drains a large area in southwest Louisiana, and is navigable for small boats for about 130 miles.

CAL'CEOLA'RIA (Neo-Lat., from Lat. *calceolus*, a little shoe, referring to the part of the corolla resembling a slipper). A genus of plants of the family Scrophulariaceæ. There are numerous species, natives of South America, chiefly of that part of the Andes which is more than 9000 feet above the sea, a few of them reaching almost to the upper limits of vegetation. Some are found in lower and warmer situations, and some in the southern extremity of the American continent, others occurring in New Zealand and Mexico. They are so abundant in some parts of Chile and Peru as to give a

peculiar aspect to the landscape. The calyx in this genus is four-parted; the corolla, two-lipped, the lower lip remarkably inflated, so as to form a bag; and the shape of the whole in some species considerably resembling that of a slipper. Some of the species are shrubby, some herbaceous, almost all the herbaceous species being perennial. Many of them have corymbs of numerous showy flowers. Yellow is the color which chiefly prevails in the flowers, and next to it purple; but the art of the gardener has succeeded in producing varieties and hybrids which exhibit many other rich and delicate tints. Calceolarias have been prominent in floriculture since about 1830, the curious appearance of the flowers combining with their beauty to render them attractive, and in no genus is the production of hybrids more easily or frequently effected. They are easily propagated by cuttings. Few plants require more liberal supplies of water. They are generally treated in the United States as half hardy or as greenhouse plants, and only the herbaceous forms are well known. Some of the species are used in South America for dyeing. The roots of *Calceolaria arachnoidea*, which is claimed to be one of the parents of many of the hybrids, are largely employed in Chile, under the name of *relbun*, for dyeing woolen cloths crimson. For illustration, see GREENHOUSE PLANTS.

CAL'CEUS. See SHOES.

CALCHAQUI, käl'châ-kê'. An important Indian people, now nearly extinct, whose language (no longer spoken), termed Catamarcan, Catamareñan, or Cacan, probably formed a distinct stock. The Calchaquian culture, the remains of which have been studied by Ambrosetti, Léjeal, Boman, Quiroga, etc., which was influenced, but not originated, by the Incas, who conquered part of this region about 1450, extended over a good deal of the territory now included in the Argentine provinces of Jujuy, Salta, Tucumán, and Catamarca, with some of La Rioja and San Juan, southward to the borders of Mendoza. The Calchaqui civilization was practically a "desert culture," interesting for comparison with the culture of the pueblos in the arid region of Arizona and New Mexico. It is characterized by village settlements (indicated by stone inclosures, foundations, etc.), mounds, cemeteries (with urn burial, etc.), metallurgic art (gold, copper, bronze), pottery, pictographs. Consult Ambrosetti, *I Calchaqui* (Rome, 1903), and other writings; also the article on the Calchaqui by A. F. Chamberlain, in the *American Anthropologist*, N. S., vol. xiv, pp. 503-507 (1912).

CALCHAS, käl'käs (Gk. Κάλχας, *Kalchas*). The famous prophet of the Greek army before Troy, gifted by Apollo with knowledge of the past and the future. Through his counsel Achilles, Neoptolemus, and Philoctetes were brought to the army. At Aulis he advised the sacrifice of Iphigenia to appease Artemis and foretold the length of the war. The common tradition made him go from Troy to Colophon, where, at the oracle of Apollo at Clarus, he met the prophet Mopsus in a contest of prophecy; having been defeated, he died of grief. His grave was shown in Apulia, in Italy; he had a temple and an oracle there.

CAL'CHEDON. See CHALCEDON.

CALCIF'EROUS (Lat. *calx*, lime + *ferre*, to bear). The term given to a subdivision of the Ordovician system. It is usually a sandy

magnesian limestone, known as the calciferous sand rock. It is found in Canada and New York, extending southward through New Jersey and Pennsylvania. Its equivalent is also to be seen in the magnesian limestones of Iowa, Missouri, and Michigan. The formation is now known as the Beekmantown beds, from the locality near the village of that name in New York State. See ORDOVICIAN.

CALCIMINE (Lat. *calx*, limestone). See KALSOMINE.

CAL'CINING. The operation of heating an ore or mineral to such a temperature that some of its constituents, such as carbonic acid, or water either mechanically held or chemically combined, are driven off. It does not result in the addition of an element, as is the case with roasting. A familiar example is that of quicklime manufactured by calcining limestone as illustrated in the following equation:

The carbonic acid is driven off as a gas leaving the oxide of lime. Borax glass is the result of the elimination of water of crystallization by calcining:

Plaster of Paris and cements also are manufactured by calcining. The term "roasting" is frequently, but not properly, used interchangeably with calcining. Roasting is the oxidation of an ore or mineral by the addition of heat. See ROASTING; CEMENT; IRON AND STEEL.

CAL'CITE (Lat. *calx*, lime), CALCAREOUS SPAR, or CALC SPAR. An anhydrous calcium carbonate that crystallizes in the hexagonal system and differs from the mineral aragonite only in its form of crystallization. The massive and crystalline varieties are known as *limestone*, *marble*, and *chalk*, and are found almost universally and in all geological formations. As an accessory mineral, crystallized calcite is very widely distributed and quite universally present in a great variety of rocks. It is generally white or colorless, although pale shades of gray, red, green, blue, violet, and yellow are known, and, owing to the presence of impurities, even black and brown varieties are found. The crystallized varieties include the *dogtooth spar*, the acute schalenohedral crystals of which suggest its name; similarly, the name of *nailhead spar* has been suggested by the form of its short truncated crystals; *satin spar* is a fine fibrous variety with a silky lustre. *Iceland spar*, originally found in basalt rocks in Iceland, is a fine, colorless, transparent variety, with the property of double refraction; the finest specimens of this variety are used for making polarizing prisms which are quite generally used in certain optical instruments. Calcite is one of the vein-forming minerals.

CAL'CIUM (Neo-Lat., from Lat. *calx*, lime). A metallic element isolated by Sir Humphry Davy and, independently, by Berzelius and Pontin, in 1808. The name is derived from the Latin *calx*, lime, showing that calcium is the metal contained in lime. Calcium is not found native, but occurs extensively in combination with other elements in the forms of calcite (including limestone, marble, and chalk), aragonite, dolomite, selenite, gypsum, etc. It is also found in river and spring waters and in the bodies of plants and animals. Spectrum analysis has re-

vealed its presence in the sun. Davy obtained metallic calcium by the electrolysis of a moist paste made up of 3 parts of slaked lime and 1 part of oxide of mercury; the paste was laid on a foil of platinum, which formed the positive electrode, while metallic mercury, forming the negative electrode, was placed in a cavity in the paste itself. When the calcium amalgam so produced was distilled, it left a residue of moderately pure metallic calcium. At present, metallic calcium is made from calcium iodide, by the action of metallic sodium. According to a process improved by Moissan, 5 parts of anhydrous crystalline calcium iodide and 2 parts of metallic sodium are heated for an hour to a dull-red heat in a hermetically closed iron crucible. On cooling, the calcium crystallizes out of its solution in the sodium, and when lumps of the congealed mass are treated with absolute alcohol, the sodium dissolves, leaving behind calcium crystals that are 99 per cent pure.

Calcium (symbol, Ca; atomic weight, 40.07) is a lustrous, white, very ductile, and malleable metal of specific gravity 1.59. It melts at 780° C. (1436° F.). The metal itself has no commercial application, although it is capable of forming a crystalline alloy with zinc. It is readily oxidized in moist air, even at ordinary temperatures, and when heated to redness it burns with a very bright yellow flame. Like sodium and potassium, it decomposes water with evolution of hydrogen. With the nonmetallic elements it is capable of forming compounds which are generally colorless and have an acrid taste. The most important of these compounds are described under special names. Suffice it to mention here, in the first place, the *hydride* of calcium, CaH_2 , a white, insoluble crystalline solid produced by the action of hydrogen upon metallic calcium at a dull-red heat; *dilute* sulphuric and nitric acids are decomposed by it with explosive violence. A *nitride* of calcium, Ca_3N_2 , is produced by heating calcium itself or its amalgam in a current of nitrogen; water decomposes the nitride, giving ammonia (q.v.). Finally, calcium combines directly with ammonia gas, giving *calcium ammonium*, $\text{Ca}(\text{NH}_3)_4$, a bronze-colored substance that catches fire on exposure to the air.

CALCIUM CARBIDE, CaC_2 . A compound of calcium and carbon. It was originally discovered in 1836 by Edmund Davy, who produced it simply as a laboratory curiosity. In 1862 Wöhler prepared it in Göttingen, and about the same time Berthelot, in Paris, obtained it, but only in small quantities. Borchers, in 1891, was the first to prepare the carbide by the electric method. In 1894 Thomas L. Willson, in Spray, N. C., found that, by heating a mixture of lime and carbon in an electrical furnace, calcium carbide and carbon monoxide were formed. This was the beginning of its commercial preparation. Almost simultaneously Henri Moissan, in Paris, announced his discovery of a similar method for its production. Its property of decomposing water with the formation of acetylene gas had already long been known, and the foregoing method just described made possible the economical production of acetylene gas for illuminating purposes, and accordingly that industry has since been largely developed, especially in the United States. The calcium carbide—or carbide, as it is called commercially—is now largely manufactured at Niagara Falls, N. Y., and Sault Ste. Marie, Mich.; and also at various places in Europe. The process consists essen-

tially in submitting a mixture of powdered lime and coke dust to the action of carbon electrodes in a furnace at a temperature of about 3300° C. The fused material is allowed to cool and harden, after which it is removed. Calcium carbide is a hard, brownish, crystalline compound with a metallic lustre and a specific gravity of 2.22, that is noninflammable, infusible, and insoluble in most acids and all alkalies; is absolutely unaffected by jars, concussions, or time, and is an inert and stable substance, except when brought into contact with water. Its principal use is for the manufacture of acetylene. Since its commercial introduction into the United States its manufacture has passed into the control of a single corporation. The history and methods of production of calcium carbide have been largely described in the various technical journals, and the *Acetylene Gas Journal*, published in Buffalo, N. Y., is devoted entirely to the exploitation of the new illuminant. Consult, also, De Perrodit, *Le carbure de calcium et l'acétylène* (Paris, 1897); Thompson, *Acetylene Gas: Its Nature, Properties, and Uses*; also *Calcium Carbide: Its Composition, Properties, and Method of Manufacture* (London, 1899). See ACETYLENE.

CALCIUM LIGHT. See DRUMMOND LIGHT.

CALC-SINTER. See CALCAREOUS TUFFA.

CALCULATING MACHINES (from Lat. *calculare*, to reckon, compute; see CALCULUS). Mechanical contrivances designed to facilitate computations, to relieve the calculator from the mental strain of his work, and to insure greater accuracy in results. Calculating machines exist in various forms, and are now made in such perfection that many business houses and banks regard them as a necessity, while many scientific computations would have been abandoned but for their help. An instrument which is used for the purpose of illustration or instruction in number work is called a reckoning apparatus, but one which automatically produces the results of number combinations involving the union of different orders is called a calculating machine.

The earliest-known instrument of calculation of any importance is the *abacus*. (See illus. under ABACUS.) The Chinese lay claim to its invention. Its use by the Egyptians as early as 460 B.C. is definitely asserted by Herodotus. It was probably used by the Babylonians, and certainly by the Greeks and Romans, from whom it spread to all Europe. It has existed in various forms—the knotted strings, the sand board, the pebble tray, the counters, and the frame of beads. The last form is still in use, known as the Chinese *swan pan*, the Russian *stchoty*, or the Japanese *soroban*. The ordinary swan pan consists of a frame divided into two sections, holding several parallel rods, each containing several movable beads.

In the Chinese swan pan each bead on the bottom row in the right division represents one unit, and each on the bottom row in the left division represents five units. In the next higher row the value of each bead is 10 times as great, and so on.

The first improvement over the ancient abacus consisted in the use of counters, on a plan attributed, probably erroneously, to Boethius. Later these counters bore numbers and were attached to rods, disks, or cylinders, which could be moved so as to indicate the desired results. A notable example of this type is the set of rods invented by Napier and known as *virgulæ*; or,

popularly, as Napier's rods or bones. These consist of flat pieces of bone or ivory, divided into squares, which (on 10 of the rods) are subdivided by diagonals into triangles, except the squares at the upper ends of the rods, which spaces are numbered from 1 to 9.

To illustrate the process of multiplication, consider the product of 5978 by 937. Arrange the proper rods, as in the figure, so that the numbers at the top indicate the multiplicand, and on the left place the rod headed 1. In this

1	5	9	7	8	
2	1 0	1 8	1 4	1 6	
3	1 5	2 7	2 1	2 4	
4	2 0	3 6	2 8	3 2	
5	2 5	4 5	3 5	4 0	
6	3 0	5 4	4 2	4 8	
7	3 5	6 3	4 9	5 6	
8	4 0	7 2	5 6	6 4	
9	4 5	8 1	6 3	7 2	

ARRANGEMENT OF NAPIER'S RODS.

rod find the right-hand figure of the multiplier, which in this case is 7. Passing across this horizontal row, add obliquely the two rows of corresponding digits, writing the results in each case as the digits of the first partial product. For example, the first figure on the right is 6; this is written in the units place in the first partial product. Next add the 5 and 9 in the adjoining oblique row, which gives 4 in the tens place, with 1 to carry. This makes 8 in the hundreds column. Proceed in the same way with the other figures of the multiplier, and add the partial products as in ordinary multiplication.

The chief point of improvement over the primitive abacus consists in supplying the instrument with moving scales, which enable the calculator to form number combinations without actually counting together the different addends. Kummer (1847) accomplished this by running parallel rods in grooves; Lagrous (1828), by concentric rings; Djakoff and Webb, by bands on rollers.

Modern calculating machines may be divided into two large classes, (1) adding machines and (2) multiplying and dividing machines. These terms are somewhat misleading, since an adding machine will subtract, multiply, and divide, but it cannot perform these additional operations with great speed; the multiplying and dividing

machine will also add and subtract, but so slowly that it will never be used commercially for such work. Hence the classification refers to the operation for which the machine is best suited and primarily constructed.

A typical modern adding machine is the comptometer. Numbers are added on this machine by depressing keys on the top similar to those of the typewriter. The keys in the column on the extreme right represent units; those in the next column to the left, tens; those in the column next to that, hundreds; and so forth. \$3.57 is recorded by depressing 3 in the hundreds column, 5 in the tens column, and 7 in the units column. To add \$1.25 to this, proceed in a similar manner, the sum automatically appearing on the dials at the front of the machine. This process can be continued with any number of items, the sum always appearing immediately at the front.

The mechanism of this and all other adding machines is based on the principle that our system of writing numbers has place value, 10 units making 1 ten, 10 tens making 1 hundred, and so forth. The units are placed around the circumference of a wheel, the tens in the same manner on a second wheel, the hundreds on a third wheel, and so forth. These wheels are operated by the keys above mentioned, which cause the wheels to turn one-tenth, two-tenths, three-tenths, . . . of a revolution depending on whether the key depressed is 1, 2, 3, . . . At the end of a complete revolution the unit wheel engages the tens wheel, causing it to move forward one-tenth of a revolution. In the same manner at the end of each complete revolution of the tens wheel the hundreds wheel moves forward one-tenth of a revolution; thus *carrying* is provided for. It is possible to subtract on the machine, but not by reversing the mechanism, as we might suppose. We must subtract by adding—a process known as complementary subtraction. Instead of subtracting the number we add its complement. Mechanical aids are provided on the machine to obtain the complement. Multiplication can also be performed by considering it as continued addition. To multiply 27 by 43 we strike 27 three times and 270 four times, the result being the product.

Machines of the above type give all results on the dials at the front; but they give results only, and in no way show finally the items which made up the result. The above machine has no printing attachment by which it lists the items, as well as their total, on a ribbon of paper. Such a machine as the comptometer is therefore called a *nonlisting* machine. There is another type of adding machine which prints the items as well as the totals on a roll of paper; such a machine is called a *listing* machine. A typical machine of this type is the Burroughs adding machine. On this machine the arrangement of keys and the manner of operating them are the same as on the comptometer. As fast as each number item is recorded on the machine a lever is pulled at the right, or, if the machine is operated by electricity, a button is pressed. When the operation is finished, each of the items, together with their total, will appear in typewriting on a slip of paper. These machines are provided in different models, some printing on a narrow roll of paper and others on a wide sheet, the latter adapting itself peculiarly to the purposes of mechanical book-keeping. Machines using the narrow band of

paper are in use in practically every bank in the United States; those using the wide sheet of paper are in use in many of the larger business houses.

The usefulness of machines of the type just described has recently been greatly extended by combining the regular typewriter with the adding machine, thus making possible genuine mechanical bookkeeping. One of the representative machines of this kind is the Elliott-Fisher, which is extensively used in large business houses for making up monthly statements and accounts.

The Remington and Underwood Typewriter Companies offer a similar kind of machine which combines adding mechanism with the usual type-writing feature. All of these machines offer wide possibilities in the simplifying of modern accounting methods. Efforts are being made each day to extend the usefulness of this phase of work.

Cash Registers are a form of adding machine in general use in retail stores, whose chief functions are to make a record of money received from every sale of merchandise, as the money is placed in the cash drawer, and to add automatically this sum to the total previously placed in the drawer; it also indicates to the customers the record which has been made. The more complex cash registers have been further developed so that it is possible to include an automatic record of other transactions which take place in a retail store, including credit sales and the separate sales of individual clerks or of particular lines of goods, so that they may be referred to at the close of the day's business.

The first practical cash register was invented by James Ritty, of Dayton, Ohio, who secured his patent in 1879. In this first register the record was made on adding wheels and displayed by hands on a dial, but in later inventions the record is sometimes made by puncturing printed rolls of paper and is shown by indicators which rise and fall as the mechanism is operated, a number equal to the amount of the purchase rising as the cash paid is deposited in the drawer, the same operation causing the number which records the previous purchase to fall. In the "detail adders," manufactured by the National Cash Register Company, the mechanism is operated by pressing the proper registering key. A single pressure of the finger unlocks and throws open the cash drawer, rings a bell, drops the indicator showing the last transaction, raises an indicator showing the amount of the new transaction, and at the same time records it on the adding wheels inside the register. Each registering key is connected with a corresponding adding wheel inside the register, which shows the total amount of registrations made on that key. For example, if the "5-cent" key be pressed five times its corresponding adding wheel shows a total of 25 cents. Thus the total amount of the day's sales can be ascertained at any time by adding together the total amounts shown by the adding wheels. These registers can be arranged to keep separate record of "charge," "received on account," and "paid out" transactions, or to show separately the receipts from different classes of goods. A drawer cannot be opened without making both an indication to the customer and an inside record under lock and key.

The Electric Tabulating Machine, such as the one devised by Hollerith for recording and

summarizing the United States census returns, may be classed as an adding machine. This apparatus is in three parts. The first operation is to punch holes in a card, corresponding to the facts to be recorded for each individual, the punches being operated from a keyboard of 240 characters. After the cards are punched they are fed into a machine, which, by means of the holes and certain electric devices, adds one to the total record for the fact indicated by each hole, such as sex, color, or age. Next the cards are placed in sorting boxes, in order to secure a combination of facts, such as the number of black persons who are married, and by means of electric connections which are acted upon only by cards having holes corresponding to the facts to be tabulated, the record is made.

Multiplying and Dividing Machines may be separated into two classes, depending upon the principle by which the mechanism obtains results, i.e., whether the product is obtained as the result of repeated additions or as a direct multiplication. Machines of the first group will be considered first. Leibnitz conceived this type of machine in 1671 and made two models, but they were so mechanically imperfect that they were never practical. It is not until 1820 that we find a practical type of multiplying machine which worked with surety; Thomas de Colmar deserves the credit for producing it. The essential part of the mechanism of this machine is a drum with nine teeth of unequal length, which was invented by Leibnitz. To multiply 267 by 4 on such a machine, the operator sets the number 267 by sliding three knobs to their proper position; he then turns a small handle four times, and the product immediately appears on a special set of dials. Each turning of the handle adds the number to itself, thus performing continued addition. To multiply 267 by 54, the operator begins as described above to multiply by 4, then the carriage of the machine is shifted one space and the handle is turned five times, after which the product appears on the special set of dials. The distinct advantage of this type of machine lies in the fact that, besides the product, both of the factors can be left on the machine as a check upon the work. This type of machine is sometimes known as the Thomas Arithmometer. Burekhardt in Germany and Tate in England produced slight improvements on the Thomas machine. A modern machine of this type is the Saxonia Reckoning Machine. Division is performed on this machine by reversing the mechanism, making it a process of continued subtraction. Another form of multiplying machine which works on the principle of continued addition is the Brunsviga. In principle this machine differs slightly from that of Leibnitz in that it substitutes for the Leibnitz drum a single wheel on whose circumference one can cause to be projected 1, 2, 3, . . . to 9 teeth. The Brunsviga type of machine was originally invented by a Russian, Odhner.

The machines just described can perform multiplication only by repeated addition, and division only by repeated subtraction. We should do the same thing with pencil if it were not for the fact that we have learned the multiplication table. Is it possible to have a machine which will apply the multiplication table and thus perform multiplication directly? This question was answered in the affirmative by a French inventor, M. Bollée, who constructed a

practical machine of this kind and first presented it to the public in 1889. A more modern machine of this type commonly used in America is called the Millionaire, invented in 1892 by Otto Steiger and manufactured in Switzerland. The vital part of this machine is a mechanical multiplication table made up of a series of teeth of unequal length, all of which project perpendicularly from a common base. On this machine to multiply, say, 193 by 96, the operator sets 193 by sliding small knobs, turns a pointer to 9, and then presses an electric button. The pointer is then turned to 6, and the button pressed again, which completes the entire operation of multiplying by 96, the product appearing at once on a special row of dials. On the machines multiplying by continued addition it would have been necessary, in performing this multiplication, to turn the handle six times and then nine times, while on the Millionaire a single turn serves for each digit of the multiplier. Division is performed by reversing the mechanism by a small lever.

Multiplying machines of the types described above are used extensively in the actuarial departments of large insurance companies and in scientific laboratories, especially those of astronomers. The machine is also extensively used in large business houses for cost accounting, for making out invoices, and for general statistical work. It is also used in the calculations of engineering.

In small multiplications and divisions where approximate results will serve one frequently finds the *slide rule* used. This is an inexpensive type of multiplying machine and is more generally employed than any other class of calculating instruments, particularly by engineers and statisticians. In its simplest form it consists of two rules, arranged to slide on each other, and so divided into scales that by sliding the rules backward or forward until a selected number on one scale is made to coincide with a selected number on the other, the desired result is read off directly on a third scale. By means of a duplex slide rule, where the rule may be set for four factors instead of two, more complicated problems may be solved. *Revolving slide rules* are employed to increase the virtual length of the scales and the number of decimal places to which results may be read. In the Thacher calculating instrument, a cylinder 4 inches in diameter and 18 inches long revolves within a framework of triangular bars, each of which contains a scale on two sides. The scales contain 33,000 divisions and 17,000 engraved figures, executed on a dividing machine made expressly for the purpose. *Fuller's spiral slide rule* consists of a wooden cylinder containing a spiral scale 42 feet long.

Circular slide rules, resembling watches, are also made. The slide-rule principle is also employed in instruments used to work out specific problems, such as the flow of water in pipes, or the strength of beams. Such *computers* may be either like the ordinary slide rule, with scales in terms of the factors involved, or, as in the various Cox computers, there may be a foundation plate, revolving disk, revolving segment, and index or pointer, with proper scales. The various slide rules proper all depend on the mechanical use of logarithms, and the scales are graduated on a logarithmic basis. By referring to the article LOGARITHMS, the operation of a simple slide rule will readily be understood, as the various graduations correspond to the loga-

rithmic functions, and the appropriate length of each is determined from a table of logarithms. The figures inscribed on the scales, however, are those of the numbers corresponding to the logarithms. For example, to multiply 2 by 2, the number 2 on the scale is brought opposite the number 2 on the second scale, and, as a result, the zero of the latter is distant from the zero of the first by an amount equivalent to the sum of the two logarithmic graduations. The number corresponding to the point at which the zero or indicator stands is, of course, the product, which in this case is 4. The complexity of the problems which may be solved with the aid of the slide rule varies with the different rules; but, in general, it may be said that all problems involving multiplication and division may be solved by any of them, including powers, roots, and proportions, simply by setting the rule and reading off the indicated result. By providing scales with trigonometrical instead of arithmetical functions, the uses of the slide rule may be increased greatly, and often the two classes are engraved on reverse sides of the smaller slide rules. The rule is particularly valuable where the same operation is to be repeated many times, as in computing percentages, or where many long and wearisome calculations are to be made.

The small 10-inch slide rule gives results correct to two or three significant figures, while the 20-inch slide rule gives results generally correct to three figures. The Thacher or Fuller slide rules give still greater precision. More and more there is a tendency to introduce the slide rule in business practice, especially in cost accounting. By properly combining adding machines, adding typewriters, and multiplying machines many large business houses, such as department stores, are able to do all their bookkeeping mechanically. The next few years promise a wonderful development in this direction.

For descriptions of calculating machines, consult: Mehmke, *Numerisches Rechnen*, in *Encyclopädie der mathematischen Wissenschaften*, vol. i (Leipzig, 1901), containing numerous figures; Unger, "Einige Additionsmaschinen," *Abhandlungen zur Geschichte der Mathematik*, vol. ix (Leipzig, 1899); Shaw, "Theory of Continuous Calculating Machines," in *Phil. Transactions of Royal Society*, vol. clxxvi (London, 1885); D'Ocagne, *Le calcul simplifié* (Paris, 1905); Thompson, *Bookkeeping by Machinery* (New York, 1906); Seward, "Mechanical Aids in Factory-Office Economy," in *Engineering Magazine*, for July, 1904; Beach, *Tools of Business* (Detroit, 1905); Jacob, *Le calcul mécanique* (Paris, 1911); and especially the literature issued by the various companies selling modern calculating machines. On the abacus, consult Smith and Mikami, *History of Japanese Mathematics* (Chicago, 1914).

CALCULATORS (Lat. *calculator*, computer; see CALCULUS), REMARKABLE. Arithmetical prodigies, often spoken of as "lightning calculators," having an unusual capacity for combining numbers. The wonderful feats of these prodigies have been pronounced genuine by competent judges, although their psychological peculiarities have not been fully explained. Two peculiarities, however, seem characteristic of most of the known cases: an extraordinary memory for numerical combinations, and unusual methods of grouping numbers. That their ability is not entirely the result of special training is attested by the early age at which the power is mani-

fested. Thus, at the age of six, T. H. Safford computed mentally the number (617,760) of barleycorns in 1040 rods, and could extract the cube roots of numbers of 9 and 10 figures. Buxton solved the problem, to find the product of doubling a farthing 139 times, the result, expressed in pounds, being a number of 142 figures. Zerah Colburn, at nine years of age, gave at sight the factors of 294,967,297, and in 20 seconds found mentally the number of hours in 1811 years. Raising 991 to the fifth power in 13 operations, and giving the product of any pair of two-figure numbers in $1\frac{1}{2}$ seconds, are feats accomplished by Arthur Griffith, who also memorized the squares of all numbers up to 130 and the cubes up to 100. Other noted prodigies are Annich, Bidder, Vinckler, Pughiesi, Mondeux, Magimelle, and Inaudi. Consult Lahy, "Une calculatrice-prodige; étude expérimentale d'un cas de développement exceptionnel de la mémoire des chiffres," in *Archives de psychologie*, vol. xiii, pp. 209-243 (Geneva, 1913).

CAL'CULUS (Lat., a small stone, or pebble, which was used in reckoning, or calculations, by the Romans). A term applied in mathematics to any method of treating problems by means of a system of algebraic notation. Thus, the Calculus of Forms (see FORMS) is a symbolic treatment of the properties of invariants; Imaginary Calculus is the method of calculating by the use of the imaginary unit (see COMPLEX NUMBER), and the Calculus of Quaternions (see QUATERNIONS) is the method of treating certain problems with the aid of the quaternion symbolism. Usually, however, the term is employed to designate the Differential and Integral Calculus, a branch of mathematical science affording, by one general method, a solution for many of the most difficult problems of pure and applied mathematics.

The Differential and Integral Calculus. This is one of the most useful branches of mathematics. While elementary algebra and geometry deal with quantities whose value is fixed, the calculus investigates quantities whose value is continually changing. Considering that all nature in all its aspects varies continually, the importance of a mathematical method of dealing with variables is evident; and it is easy to see why science had made so little progress before the invention of the calculus, and why progress has been so rapid since.

Three simple examples may serve to show the kind of problems usually attacked by the calculus, and the manner in which it solves them. The first two of these examples can also, on account of their simplicity, be solved by means of elementary algebra, without resorting to the calculus. Nevertheless, they are typical calculus problems, and furnish as good examples of the calculus method as would be furnished by similar but much more complicated problems lying really beyond the power of elementary mathematics.

Problem I. Suppose the sum of two adjoining sides of a rectangle known. What must be the length of each side so that the rectangle may have the greatest possible area?

Problem II. A person in a boat 3 miles from the nearest point on a straight shore wishes to reach a place 5 miles away from that point. He can row 4 miles an hour and walk 5 miles an hour. Where should he land in order to reach his point in minimum time?

Problem III. To determine the work per-

formed when a gas is compressed at constant temperature is one of the fundamental problems of theoretical engineering. Work is generally defined as the force required to move a body, multiplied by the distance traversed. In the case of a gas compressed in a cylindrical vessel, the body moved is the piston. If at the beginning of the experiment the pressure exercised on the piston is, say, p pounds per square inch

of surface, and the area of the piston is a ; then $p \times a$ is evidently the force acting on the piston. This force, however, multiplied by the distance traversed by the piston during compression will not by any means give the work performed. For during compression the force will, of course, have to be continually increased; in other words, it will not retain its original value ap fixed, but will be a variable. In this case algebra and geometry fail to give a method of direct computation and the calculus has to be resorted to.

In order to understand how the calculus deals with problems of this nature, it is necessary to grasp clearly some fundamental ideas, which usually appear somewhat difficult to the beginner in calculus, just as the idea of any fixed number being represented by the letters a , b , c , appears difficult to the child first taking up the study of elementary algebra.

Fundamental Ideas: Function, Differential, Differential Coefficient, Limit.—Variables are represented in calculus by the Latin letters x , y , etc., or by the Greek letters ξ , ζ , etc., just as unknown quantities are represented in algebra. If the value of one variable y continually depends on that of another variable x the first variable is said to be a *function* of the second, and the fact is denoted by writing: $y = f(x)$. Thus, the variable area y of a square is said to be a function of the variable length x of its side, and in this case the expression $y = f(x)$ stands for the equation $y = x^2$. In investigating the functions and their variables, the calculus catches them at a given moment for the purpose of determining the relative rate of their variation at that moment. Consider the motion of a ball thrown up in the air. Its velocity changes from instant to instant. We might get a rough idea of its motion by measuring the distance traversed during the first second, during the second second, during the third second, etc. But our results would be far from precise; for, however small an interval of time a second is, the velocity of our ball, changing continually, must be different at the end of that interval from what it is at its beginning. Our results would be even rougher if instead of the second we employed as a unit of time the minute. To render the results mathematically precise, we should have to take for our unit not a finite, but an infinitely small interval of time, an instant. The distance traversed during such an interval would be called the *differential* of distance and would be denoted in calculus by the symbol dl , if l stand for distance. Similarly, our infinitely small interval of time would be called the *differential* of time and would be denoted by the symbol dt , if t stand for time. But as this idea of what a differential is is somewhat vague, owing to the difficulty of actually conceiving

something that is "infinitely small," the following considerations may be resorted to. Studying the motion of a ball thrown up in the air, we consider infinitely small intervals of time dt merely in order to be able to think of the motion as uniform; for within any finite interval the motion is variable. But if at a given instant the motion should actually become uniform and continue so, we might think of our differential dt as representing any finite length of time, be it 5 minutes, or 10 minutes, or 500 minutes. For when a body moves with perfectly uniform speed, that speed may be readily determined by ascertaining the distance traversed during any interval of time whatever; the result is the same whether we divide the distance traversed in 5 minutes by 5, or that traversed in 10 minutes by 10. We may, accordingly, define the differential of distance dl as the distance that would be traversed by the ball in an arbitrary, finite interval of time, dt , beginning at a given instant, if at that instant the motion became uniform. In this manner we may avoid thinking of infinitely small quantities. The velocity would then be $dl \div dt$, no matter how great or small dt is supposed to be. The ratio $\frac{dl}{dt}$ is called the *differential coefficient* of l with respect to t —the distance l being of course "a function" of the time t . This ratio represents a *limit*. For, considering again the ball thrown up in the air, the error introduced by choosing a finite instead of an infinitesimal interval of time is the less the smaller an interval is chosen, and finally the true velocity $\frac{dl}{dt}$ is approached as a limit, when the interval of time becomes infinitely small. All this is concisely represented by a few symbols, as follows:

$$\lim_{\Delta t \rightarrow 0} \left(\frac{\Delta l}{\Delta t} \right) = \frac{dl}{dt}.$$

In this expression Δt stands for some finite interval ("increment") of time, and Δl for the distance actually traversed during that interval. And the expression tells that when Δt approaches zero ($\Delta t \rightarrow 0$), i.e., when it becomes infinitely small, the ratio $\frac{\Delta l}{\Delta t}$ approaches as a limit the value $\frac{dl}{dt}$. It need hardly be remarked that while dl and dt are themselves infinitesimal quantities, their ratio may have any finite value, large or small.

Maxima and Minima.—Since $\frac{dl}{dt}$ represents the velocity of the ball at any moment of the flight, it is evidently itself a variable quality. For when, say, a rubber ball is thrown up in the air, the velocity of its motion becomes smaller and smaller until the highest point in its flight is reached; at that point the ball *pauses* for an instant and then begins to descend with increasing speed until it reaches the ground. At the instant the ball is at the highest point the velocity is therefore zero; i.e., $\frac{dl}{dt} = 0$. But as the point reached by the ball is the *highest* it may be said that when the function l has its maximum (or minimum) value, its differential coefficient with respect to its variable (i.e., $\frac{dl}{dt}$) is zero. This must be carefully remembered.

Bearing in mind the ideas explained in the preceding paragraphs, the problems cited at the beginning of the article may now be analyzed without any difficulty.

I. *Solution of the First Problem.*—In the problem of the maximum rectangle, let a be the known sum of two adjacent sides, let x be one of the sides, and let y be the area of the rectangle. Then

$$y = x(a - x), \text{ or } y = ax - x^2.$$

Seizing the rectangle at some point in its variation, let us lengthen the side x by some finite amount, Δx , and suppose that this causes the area to increase by a finite amount, Δy . Our equation then becomes

$$y + \Delta y = a(x + \Delta x) - (x + \Delta x)^2 = ax + a\Delta x - x^2 - 2x\Delta x - (\Delta x)^2.$$

Subtracting the original equation, $y = ax - x^2$, we get

$$\Delta y = a\Delta x - 2x\Delta x - (\Delta x)^2,$$

and, dividing throughout by Δx ,

$$\frac{\Delta y}{\Delta x} = a - 2x - \Delta x.$$

Making Δx smaller and smaller without limit, it will ultimately approach zero. Then $a - 2x - \Delta x$ will become simply $a - 2x$, while the ratio $\frac{\Delta y}{\Delta x}$ will approach its limit $\frac{dy}{dx}$ and hence we shall have

$$\frac{dy}{dx} = a - 2x.$$

Now, it was shown above that, at the instant a function passes through its maximum value, its differential coefficient is zero. Hence, when the area of our rectangle is the greatest possible, $\frac{dy}{dx} = 0$, and therefore, $a - 2x = 0$, or

$$x = \frac{1}{2}a.$$

But this tells us that each side must be one-half of the known sum, i.e., that the two adjoining sides must be made equal in order that the rectangle may have its maximum area.

The process just employed in solving the problem may be described as "differentiating with the aid of the theory of limits." Indeed, we started with the law that the area of a rectangle equals the product of two adjoining sides, a law expressed in our case by the equation $y = x(a - x)$. We then ascertained the ratio of the finite increment of area to an actual finite increment of the variable side x . Next we ascertained the limiting value of that ratio corresponding to an infinitely small increase of the side. This gave the value of the differential coefficient $\frac{dy}{dx}$ of our function as $a - 2x$. And as it had been shown before that the differential coefficient is zero at the point where a function has its maximum value, we wrote $a - 2x = 0$, which gave the value of the side x for that point.

By analogous processes of reasoning we may "differentiate" any function whatever, and thus determine the form of its differential coefficient. In practical work, however, it is not necessary to go through the whole process every time a function is differentiated, and the differential coefficient of a function is usually obtained directly by the use of a few general formulas, the demonstrations of which are given in all textbooks of

calculus. In solving our other problems we will make direct use of two such formulas.

II. *Solution of the Second Problem.*—In the problem of the person in a boat, call A the point

where he must land in order to reach his point P in the least time. An inspection of the accompanying figure shows that the distance of the boat from the point A is $\sqrt{3^2 + x^2}$ (hypotenuse of the right-angle triangle). To row this distance at the rate of 4 miles an hour requires $\frac{1}{4} \sqrt{3^2 + x^2}$ hours, or, as it may be written, $\frac{1}{4} (9 + x^2)^{\frac{1}{2}}$ hours. The distance of the landing point from the point of destination is denoted by $5 - x$. To walk this distance at the rate of 5 miles an hour requires $\frac{1}{5} (5 - x)$ hours. The total time (call it y) required to

reach the point is therefore $y = \frac{(9 + x^2)^{\frac{1}{2}}}{4} + \frac{5 - x}{5}$. The question is, what must be the

numerical value of x in order that this expression for time may have the smallest possible value? As in Example I, the question may be answered by ascertaining the form of the differential coefficient $\frac{dy}{dx}$ and making it equal zero, so that it may correspond to the minimum magnitude of y . The result is as follows:

$$\frac{dy}{dx} = \frac{x}{4\sqrt{9 + x^2}} - \frac{1}{5}$$

When y is a minimum, $\frac{dy}{dx} = 0$, and therefore,

$$\frac{x}{4\sqrt{9 + x^2}} - \frac{1}{5} = 0,$$

whence $x = 4$. To reach the point of destination in minimum time, the person must therefore land 1 mile ($5 - 4 = 1$) from that point.

Differentiation and Integration.—It may be seen from the examples thus far discussed that the problem of the differential calculus is to obtain for every function considered the differential coefficient $\frac{dy}{dx}$, i.e., the rate of change of the function y with respect to its variable x . The process may also be described as follows: To differentiate a given magnitude y , expressed in terms of its variable x , is to obtain the value of the infinitesimal element dy in terms of the infinitesimal element dx of the variable x . The converse process, called integration, may be described as follows: To integrate means to obtain the function itself, when its rate of change with respect to the variable is given, i.e., to find y in terms of x when $\frac{dy}{dx}$ is given. The problem of the integral calculus may also be stated in the following terms: To integrate is to find the magnitude y in terms of the variable x , when dy (an infinitesimal element of y) is given in terms of x and dx (an infinitesimal element of x). In the latter definition integration appears as a process of summation, the addends being an

infinite number of infinitely small elements. The symbol of integration is \int (the mediæval S , standing for *summa*). Thus, the symbol $\int dx$ indicates that it is required to integrate the differential of x .

The Constant of Integration.—Since a fixed (constant) quantity neither increases nor decreases, its differential is nothing at all. If, therefore, c denote any constant whatever, we may write $dc = 0$. For this reason the differential of $x + c$ is simply dx , the same as the differential of x . Comparing $x + c$ and x , we see that x is one of an infinite number of possible values of $x + c$; the latter, namely, equals x in the particular case where $c = 0$. When it is required to find in general the integral of dx , we therefore write not x , but $x + c$. So that $\int dx = x + c$. The constant c is then called the “constant of integration,” and may either have a finite fixed value, or else may equal zero.

III. *Solution of the Third Problem.*—The last of the cited problems may now be attacked, viz., to determine the work performed when a gas is compressed at constant temperature. The difficulty of this problem is in the fact that during compression the force is variable, i.e., it must be continually increased. If we were to suppose

the force constant, we should, in calculating the work, commit the greater an error, the greater the amount of compression. But suppose the piston to be moved inward only an infinitely small distance. If we then calculate the work required, on the hypothesis that within that distance the pressure remains constant, we commit only an infinitely small error. In other words, our result is infinitely near the truth. Let dl therefore stand for an infinitely small distance traversed by the piston, let the area of the piston be a , and let the variable pressure be denoted by p . The work is then $padl$. But as adl is the volume of the infinitely small cylinder traversed by the piston, it may be denoted by dv and regarded as an infinitesimal element of our cylindrical vessel. The work is thus $p dv$.

To determine now the finite amount of work required to compress the gas from some initial volume, v_1 , to some final volume, v_2 , we will first answer the question: How much work would be required in compressing a given amount of gas from any volume v to unit volume? This is accomplished by “integrating” $p dv$, i.e., by performing the operation denoted by the symbol $\int p dv$; and our result will be infinitely near the truth, because the error involved in assuming that the pressure p remains constant through the infinitesimal compression dv is infinitely small.

To integrate $p dv$ we must remember that at constant temperature the product of pressure and volume of a gas is constant: $pv = k$, whence

$p = \frac{k}{v}$. Substituting this in $\int p dv$, we have $\int \frac{k}{v} dv$. Now $\frac{k dv}{v}$ might be shown, by the method of limits repeatedly employed in this article, to be the exact differential of either

$k \log v$, or $k \log v + c$, c being any constant. We may therefore write, conversely,

$$\int \frac{k dv}{v} = k \log v + c,$$

the constant of integration c being retained so as to give the solution its more general form.

The integral calculus has thus performed for us a wonderful task. Figuratively speaking, it employed a cylinder of volume v filled with gas and compressed it, an infinitesimal amount at a time, until unit volume was attained; it then summed up the infinitesimal amounts of work performed, and it has told us that the total amount of work done is $k \log v + c$. The result is general, since v may have any finite value whatever. But to obtain a desired particular result, all we have to do is to substitute for v some numerical value. Thus, for $v = 1$ we have $\log v = 0$, and the work of compression to this stage is the constant c . Further, the work performed in compressing the gas from some particular volume v_1 to some particular volume v_2 evidently equals the difference between the work required to reduce the gas from volume v_1 to unit volume, and that required to reduce the gas from volume v_2 to unit volume. The required work, W , between the limits v_1 and v_2 is, therefore,

$$W = k \log v_1 + c - k \log v_2 - c \\ = k \log v_1 - k \log v_2.$$

The limits being defined, this "integral" is called a *Definite Integral*, and the operation is usually denoted as follows:

$$\int_{v_2}^{v_1} \frac{k dv}{v} = k \log v_1 - k \log v_2 = k \log \frac{v_1}{v_2}.$$

The constant k , coming from the law $pv = k$, depends on the amount of gas employed and on the temperature at which the compression is carried out. It may, of course, be found by actually measuring the pressure and volume of the given amount of gas at the given temperature, and multiplying the pressure by the volume. By substituting in the above expression this value of k , as well as the numerical values of the initial volume v_1 and the final volume v_2 , involved in an actual compression, we shall finally obtain the work which the problem required to calculate, and this is actually the way in which engineers determine that important quantity.

Another Way of Stating and Solving the Third Problem.—The relation $pv = k$ between the pres-

ures and volumes of a gas whose temperature is kept constant (i.e., the law of Boyle and Mariotte) may be represented geometrically by a

curve called an equilateral hyperbola, every point of the curve corresponding to a definite pressure and volume. (See ASYMPTOTE.) Further, it is shown in textbooks of natural philosophy that the work performed in compressing the gas from an initial volume represented by the line OA (see figure) to a final volume, OB , is represented by the area $AA'B'B$. The problem of determining the work may therefore be viewed as requiring to determine the area enclosed by the hyperbola and the axis OV between the limits $OA = v_1$ and $OB = v_2$. To solve this problem the area $AA'B'B$ may be imagined as made up of an infinite number of infinitely narrow strips. One such strip is roughly shown in the figure between the lines marked p and p' . The difference between p and p' would evidently be the greater, the greater the distance between them. But since the distance is supposed to be infinitely small, the two lines may be taken as equal and the strip may be considered as a rectangle. Calling its infinitely small base dv , the area of the rectangle is seen to be $p dv$. The total area $AA'B'B$ may now be obtained by summing up the infinite number of "differentials of area" like $p dv$ enclosed between the limits $OA = v_1$ and $OB = v_2$. The summation may be performed by the integral calculus and is denoted by a definite

integral, as follows: $AA'B'B = \int_{v_2}^{v_1} p dv$.

We have seen before that the result of this integration is $k \log \frac{v_1}{v_2}$. The required area there-

fore equals the natural logarithm of the ratio $\frac{OA}{OB}$, multiplied by the number (k) representing

the product of any pair of coördinates, such as $OB \times BB'$, or $OA \times AA'$, etc. The calculus method is analogously employed whenever it is required to find the area enclosed by a given curve, elementary geometry being in most cases powerless to furnish the desired answer; and thus the calculus finds extensive application in the solution of many important problems of geometry.

The above sketch outlines the methods of reasoning by which the calculus attacks problems involving variable quantities. As to its limitations, it must be observed that while the differential calculus teaches how to differentiate readily any function whatever, the converse problem, viz., that of integrating a given differential, is often very difficult, requiring all manner of algebraic artifices, and is sometimes altogether impossible. In other words, in their studies of nature, scientists are often led to construct differentials (just as in our third problem we constructed the differential $p dv$) which they cannot integrate, because they can conceive no function which, on differentiation, would yield the given differential. Finally, it may be observed that the flour is no better than the grain, and if data that are made to pass through the mill of the calculus lead to doubtful results, it is the fault not of the calculus, but of the data; the calculus itself is as exact as any other branch of mathematics, in spite of the fact that the things it deals with seem so often to dwindle away into nothing.

History. The invention of the calculus method is generally referred to the latter half of the seventeenth century, but the course of its early development really leads much farther back.

Thus, the "method of exhaustion," which, as first applied, consisted in comparing the area bounded by a given curve with the area of an inscribed or circumscribed polygon whose number of sides is continually increased, is related to the present calculus through the doctrine of limits. Similarly, the surfaces of the sphere, cylinder, and cone were compared with prismatic and pyramidal surfaces. By this method Archimedes calculated the value of π , obtained the areas of the parabola, ellipse, and one of the spirals, and found the ratio of a spherical surface to the surface of the circumscribed cylinder. Kepler (1615) was the first to improve this method by introducing into geometry the idea of infinity. He considered the circle as composed of an infinite number of triangles (with their vertices at the centre and with their bases on the circumference), and the cone as composed of an infinite number of pyramids. The next advance is due to Cavalieri (q.v.), who effected quadrature by summing the infinitesimal elements into which he divided his areas, and established the properties of the centre of gravity relating to solids of revolution. So far the end sought by mathematicians was the solution of particular problems, as the rectification and quadrature of certain curves. Thus, also, Wallis extended the application of Cavalieri's method of indivisibles, Descartes (1637) increased its power by the introduction of coördinate geometry (see ANALYTIC GEOMETRY), and Fermat applied it to maxima and minima (q.v.). But it remained for Leibnitz and Newton to devise a general notation and to organize existing principles into a comprehensive science. The principles of Newton, which later appeared under the title of Fluxions (q.v.), were first published in his *Principia* (1687). The basal idea of his calculus is that of velocity. A line, surface, or solid, is conceived as generated respectively by a moving point, line, or surface. The velocity of a moving point, and its components along the axes of coördinates for successive intervals, were called fluxions. The velocity of the moving point was called the fluxion of the arc generated, and the arc the fluent of the point's velocity. The velocity of a moving point being regarded as constant, the ratio of its component fluxions determined the nature of the path described. In general, the relation between the fluxions being given, the relations between the coördinates of the point were sought, and conversely. The component of velocity (fluxion) along the X-axis was designated by x' [\dot{x}], or \dot{x} ; along the Y-axis by y' , [\dot{y}], or \dot{y} . Leibnitz used the symbol dx for an infinitesimal change in x , a symbolism which has endured, while Newton's fluxional notation disappeared in the first half of the nineteenth century. The first publication of Leibnitz's principles appeared in the *Acta Eruditorum* (Leipzig, 1684). His method differed from Newton's, not only in its symbolism, but also in its relation to pure number. The instantaneous changes in any continuously varying magnitude, regarded by Leibnitz as taking place by infinitely small differences, savor less of mechanics than do Newton's components of velocity. The basal idea, however, in the two systems is the same, and each calculus consists of two parts—(1) differential calculus, which investigates the rules for deducing the relation between the infinitely small differences of quantities from the relation which exists between the quantities themselves; (2) the integral calculus, which treats of the inverse problem, i.e.,

to determine the relation of the quantities when that of their differences is known.

The influence of the calculus has been so extensive on nearly all branches of mathematics that no attempt will be made in what follows to give other than the most prominent names associated with its development. The theory of infinitesimals, which lies at the foundation of differential calculus, has received adequate treatment at the hands of Gauss, Cauchy, Jordan, and Picard. With the development of the general theory of functions are connected the names of Clairaut, D'Alembert, Euler, Lagrange, Gauss, Cayley, Cauchy, Riemann, Weierstrass, and Lie; with elliptic and Abelian functions the names of Landen, Jakob Bernoulli, Maclaurin, D'Alembert, Legendre, Clebsch, Abel, Jacobi, Eisenstein, and Brioschi; with the theory of the potential, Lagrange, Green, Gauss, Dirichlet, Riemann, Neumann, Heine, and Beltrami; with differential equations, the Bernoullis, Riccati, Clairaut, Euler, Lagrange, Monge, Cauchy, Clebsch, Boole, and Lie; and with the calculus of variations, Jakob Bernoulli, l'Hôpital, Lagrange, Sarrus, Cauchy, Hesse, Clebsch, and Weierstrass.

Calculus is essentially a branch of the science of number. It differs from other branches of this science, as arithmetic and algebra, by regarding number as continuous, i.e., as being capable of gradual growth and of infinitesimal increase, while they deal with finite and discontinuous number. It differs from ordinary algebra in another respect; in the latter, the values of unknown quantities, and their relations with one another, are detected by aid of equations established between these quantities directly; in the calculus, on the other hand, the equations between the quantities are obtained by means of other equations primarily established, not between the quantities themselves, but between certain derivatives from them, or elements of them. This is an artifice of great value, since the relations between the quantities involved in any problem can, in general, more easily be inferred from equations between their derivatives than from those between themselves.

Calculus of Variations. The basis of this calculus is also a method of differentiation, but of a peculiar kind. In ordinary differential calculus we seek the form which $f(x)$ assumes when x receives an indefinitely small increment, dx . In the calculus of variations, we seek the laws of the changes attending a slight alteration of the form of the function, or in the transformation of one function into another. This calculus treats the so-called isoperimetrical problems, many of which were formerly insoluble. The method has extended application in higher physics.

Calculus of Finite Differences is a calculus concerned with the changes of functions due to finite changes in the variables involved, hence without the assumption of continuity. E , Δ , and Σ are important symbols, E denoting the operation of increasing the independent variable of a function by unity, Δ the corresponding increment of the function, and Σ the summation of all values of the function for integral values of the variable from unity to any desired number.

Calculus of Operations, as the term indicates, is a systematic method of treating problems by operating algebraically upon symbols of operation. If the symbol ϕ and ψ prefixed to a quantity represent operations of the same class, the law of operations is distributive (see

DISTRIBUTIVE LAW) when $\phi(x + y) = \phi(x) + \phi(y)$; the law is commutative (see ASSOCIATIVE LAW) when $\phi\{\psi(x)\} = \psi\{\phi(x)\}$. If ϕ^m represents the repetition m times of the operation ϕ , the law of indices in ordinary algebra is expressed by

$$\phi^m\{\phi^n(x)\} = \phi^{m+n}(x) = \phi^{n+m}(x) = \phi^n\{\phi^m(x)\}.$$

These laws are true for differentiation, for

$$\frac{d}{dx}(u + v) = \frac{d}{dx}(u) + \frac{d}{dx}(v), \text{ (distributive law)}$$

$$\frac{d}{dx}\left\{\frac{d}{dy}(u)\right\} = \frac{d}{dy}\left\{\frac{d}{dx}(u)\right\}, \text{ (commutative law)}$$

$$\frac{d^m}{dx^m}\frac{d^n}{dx^n}(u) = \frac{d^{m+n}}{dx^{m+n}}(u). \text{ (index law).}$$

Calculus of Probabilities. A systematic analytic treatment of the doctrine of probability (q.v.) by use of the differential and integral calculus.

Calculus of Functions (q.v.). A systematic method of determining functions which satisfy given conditions.

Calculus, Barycentric. A method of treating geometric problems based on the mechanical theory of centres of gravity. In this calculus Möbius (1827) furnished the first example of homogeneous coördinates. See COÖRDINATES.

Residual Calculus. A branch of integral calculus due to Cauchy, in which the integration takes place in the plane of complex numbers around a contour inclosing points for which the function is infinite. The integral is called the residual, and in case the contour contains all the critical points, the integral is called the total or principal residual.

Bibliography. The literature on the subject of calculus is so extensive that any limited selection of references must be unsatisfactory. The best selection of important works will be found in the *Encyklopädie der mathematischen Wissenschaften*, vol. ii (Leipzig, 1900). Of the older works the most important are: Leibnitz, *Mathematische Schriften*, ed. by Gerhardt (Berlin and Halle, 1849-63); Newton, *Opuscula* (Lausanne, 1714); Euler, *Introductio in analysin infinitorum* (new ed., Lausanne, 1848); id., *Institutiones calculi differentialis* (new ed., St. Petersburg, 1885); id., *Institutiones calculi integralis* (3d ed., Vienna, 1830). Of the later works may be mentioned those of Cauchy (Paris, 1821-47); Bertrand, *Traité de calcul différentiel et de calcul intégral* (Paris, 1864-70); Serret, *Cours de calcul différentiel et intégral* (4th ed., Paris, 1894); Hermite, *Cours d'analyse de l'école polytechnique* (Paris, 1873); Laurent, *Traité d'analyse* (Paris, 1885-91); and Jordan, *Cours d'analyse* (2d ed., Paris, 1893-96), which may be taken as typical of the best French works. In Germany and Austria, Schlömilch, *Compendium der höheren Analysis* (4th ed., Brunswick, 1895); Schlömilch, *Uebungsbuch zum Studium der höheren Analysis* (4th ed., Leipzig, 1888); Lipschitz, *Lehrbuch der Analysis* (Bonn, 1877-80); Stolz, *Grundzüge der Differential- und Integralrechnung* (Leipzig, 1893-99); and Riemann, *Gesammelte Werke*, ed. by Weber and Dedekind (2d ed., Leipzig, 1892). In England, Price, *Treatise on Infinitesimal Calculus* (2d ed., 4 vols., Oxford, 1855-89); Todhunter, *Differential Calculus* (Cambridge, 1865) and *Integral Calculus* (Cambridge, 1868), are widely known. Italy has recently produced a work of merit, viz., Pascal, *Lezioni di analisi infinitesimale* (3 vols., Milan, 1895). Of the American works covering the general field, Byerly, *Elements of Differential*

Calculus and Elements of Integral Calculus (Boston, 1881), are representative. For the history of the subject, consult the *Encyklopädie* mentioned above; also, Cantor, *Geschichte der Mathematik*, vols. ii and iii (Leipzig, 1892-98); Ball, *History of Mathematics* (3d ed., New York, 1901); Fink, *History of Mathematics*, trans. by Beman and Smith (Chicago, 1900). The *Calculus of Variations* is treated historically, as well as mathematically, by Carll (New York, 1885). A recent treatise is Bolza, *Variationsrechnung* (Leipzig, 1909).

CALCULUS, or STONE. In medicine, a hard concretion formed within the animal body, in consequence of the deposition in the solid form of substances which usually remain in solution. (See CONCRETION.) The concretions most commonly termed "calculi" are those formed in the kidneys or bladder (urinary calculi), and those formed in the gall bladder or biliary ducts (biliary calculi). Both of these give rise to very painful symptoms and may even threaten life. Biliary calculi, or gallstones, are composed of cholesterin, lime salts, epithelial debris, and bacteria. The latter set up a low-grade inflammation of the lining of the gall bladder, which encourages the formation of calculus. The presence of stone in the gall bladder (cholelithiasis) gives rise to indefinite symptoms of indigestion, transient jaundice, and a feeling of uneasiness in this region, but when it becomes impacted in the cystic or common bile ducts there ensues an attack of biliary colic. This begins with a sharp pain in the right hypochondriac or epigastric region, radiating back to the right shoulder blade. The pain soon becomes agonizing, with nausea and vomiting, and grave depression. The attack continues for several hours until the stone escapes into the intestine, and only a feeling of soreness remains. The pain of biliary colic is best relieved by injections of morphine, but hot fomentations over the epigastrium sometimes afford relief. Cholelithiasis is more common in women than in men.

Urinary calculus occurs at all ages, but is most common in advanced life and in the male sex. It is very frequent in gouty persons, or among those who pursue sedentary occupations and live freely. It is rare among those who live much in the open air, or who take much exercise and animal food and wine in moderation. Among sailors it is believed to be peculiarly rare. In certain parts of England the disease is said to be frequent, as in Norfolk; and perhaps along the eastern coast of Scotland. In India, too, where some of the predisposing circumstances mentioned above can hardly be said to prevail, stone is common. The predisposing causes of calculus are still imperfectly understood. In its early stages the condition usually presents itself in the form of gravel, shown by the passage of numerous very small particles of gritty concretion, which may be observed in the urine as a deposit like sand or like small grains of Cayenne pepper. When such deposits occur frequently—especially if they are present at the time of passing the urine, and not merely after it has cooled—there is reason to apprehend the subsequent formation of calculus. Renal calculi are composed of uric acid, oxalate of lime, or the phosphates of calcium, magnesium, and potassium. Uric acid calculi are dark red or brown in color and very hard. Phosphatic calculi are softer and grayish white in color. They may be formed in the substance or

in the pelvis of the kidney. The most common symptom of renal calculus is dull pain in the loins, aggravated by sudden shocks or jars. When the stone escapes into the ureter, there ensues an attack of agonizing pain starting in the lumbar region and radiating toward the umbilicus and downward and inward in the direction of the ureters. The attack often begins with a severe chill. Later, nausea and vomiting come on, feeble pulse and symptoms of collapse. After the paroxysm has ended, blood may be found in the urine. Subsequently the stone may escape through the urethra or remain lodged in the bladder.

Calculus in the bladder is at first attended with little suffering, as compared with that caused by the stone in its passage downward from the kidney; but unless removed or evacuated, the calculus is sure to enlarge, and it then becomes the cause of one of the most painful diseases that afflict humanity. The existence of a stone in the bladder, however, should never be assumed without a surgical examination, as all the symptoms are deceptive in certain cases. The most striking (and, perhaps, the most trustworthy) evidence of stone in the bladder, apart from the testimony of the sound (see LITHOTOMY), is smarting and burning pain experienced after the bladder has been emptied, together with occasional temporary stoppage in the flow of urine. The correct appreciation of all the symptoms, however, comes only from surgical experience.

The chief varieties of urinary deposits, with respect to chemical composition, are: (1) Uric acid (red deposit); (2) urates of ammonia, soda, lime, etc. (brick-dust sediment); (3) phosphates of ammonia and magnesia, lime, etc.; (4) oxalate of lime; (5) carbonate of lime (chiefly in domestic animals); (6) cystin; (7) xanthic oxide (a very rare form, discovered by Dr. Marcet). Calculi are frequently composed of numerous successive layers, each having a perfectly distinct chemical composition. Urates and phosphates in particular frequently succeed each other and form what is called an alternating calculus. When calculus has once fairly formed in the urinary passages, no absolute cure exists except removal (see LITHOTOMY; LITHOTOMY; NEPHROTOMY); but in the stage of gravel, and still more in the earlier stages detected by careful examination of the urine, much may be done to check the tendency to this distressing and dangerous malady. The chief remedies consist in careful regulation of the diet and mode of living, together with the use of solvents adapted to the particular form of deposit found to be habitually present. Consult Park, *Surgery by American Authors* (New York, 1901). See URINE.

Salivary calculi form in the glands or in their ducts, usually the latter. These concretions are rarely larger than a pea, and are composed chiefly of calcium phosphate or calcium carbonate. As in gallstone, the impetus to stone formation is given by bacterial irritation. The only treatment is surgical removal.

CALCUTTA (Hind. *Kali Ghātā*, the *ghāt*, or landing place leading to the temple of the goddess Kali). The capital of the Presidency of Bengal and metropolis of British India, situated on the east, or left, bank of the river Hooghly, an arm of the Ganges, in lat. 22° 34' N. and long. 88° 22' E., about 86 miles from the sea by the river (Map: India, E 4). Calcutta was,

until 1912, the headquarters of the government of India. In that year Delhi became the capital. Calcutta is built on a soil formed at a comparatively recent date by the alluvial deposits of the Gangetic delta. The climate is hot and moist; the average annual rainfall is 60 inches. Cyclones are frequent, the most disastrous occurring in 1737, when St. Anne's Church steeple was blown down; in 1842; in 1864, when 49 persons were killed and 172 vessels in the harbor were damaged. In the earthquake of June 12, 1897, the cathedral steeple was wrecked and 1300 houses were damaged.

Next to London, Calcutta with suburbs is the most populous city in the British Empire, and covers an area of 20,547 acres, of which only 1792 are rural, and 1113 acres form the Maidan. Calcutta proper includes the "old town" (3766 acres) and the "added area" (8188). Fort William stands in the centre of the town, surrounded by the beautiful park known as the Maidan. East of it is the European residential quarter and north of it the business district; south and east the European suburbs of Ballygunge and Alipore (the residence of the Governor of Bengal). Immediately surrounding the European quarters lies the native town, three-fifths of whose population live in tiled huts with mud or wattle walls crowded into narrow lanes which are tortuous, badly lighted, and amazingly dirty.

In strong contrast with this native city of hovels is the European town, proudly called the "city of palaces." Here stand the government house, built at the instance of the Marquis Wellesley at a cost of 13 lakhs of rupees and completed in 1804; to the west, the high court, a somewhat florid Gothic structure (1872); the town hall, Doric (1804); the mint, Doric, covering 18½ acres in the north of the town (1830); Victoria Memorial Hall, at the south end of the Maidan, a recent undertaking. Other buildings of interest are the post office (1870), Writers' Building, the Bank of Bengal, Metcalfe Hall, and various government offices. The Hindu temples and Mohammedan mosques have few claims to architectural merit, the only one of any pretensions being the one built (1842) by Prince Ghulam Muhammad. St. Paul's Cathedral (1839-47), which cost 7½ lakhs to build, is practically the work of Bishop Wilson. It is modified Gothic—Indo-Gothic. St. John's (begun 1784) occupies the site of the old church of St. Anne's, demolished 1756. There is a Roman Catholic cathedral (1797), a Greek church (1780), an Armenian (1790), and a Scottish church.

The Maidan contains numerous monuments. Other open spaces are Eden Gardens, Beadon Square, the Zoölogical Gardens (founded 1876) at Alipore, the Botanical Gardens at Sibpur (1786), beautifully laid out along the Hooghly, covering 272 acres, and stocked with rare tropical plants.

The supply of drinking water is obtained from the Hooghly River at Palta, 17 miles north of Calcutta, where it is filtered and piped to the city. Inaugurated in 1860 and designed to care for 6,000,000 gallons per diem, the works have been extended till they now furnish to Calcutta and the adjacent towns a per capita supply per diem of 21½ gallons. The streets are watered and the drains flushed with unfiltered water pumped up in the city. The underground drainage system (begun 1859) took 16 years to complete. Although additions have been made, the

system is inadequate, and considerable areas remain unsewered. The lighting system is good, gas and electricity being both used. There is an efficient street railway system, which has been electrified. In 1905 there were 300.43 miles of road, of which 117 were metaled. Four main roads running parallel with the river intersect the city—the Strand, Chowringhee, Russa, and Lower Circular roads. A spacious roadway marks the landward boundary of the city proper. Beyond this road there lie extensive suburbs, the chief of which are Cossipur-Chitpur, on the north; Maniktola, Ballygunge, Sealdah, and Intally on the east; Bhawanipur, Alipore, and Kidderpore on the south. The municipality of Howrah, situated on the opposite side of the river and connected with Calcutta by a pontoon bridge, contains the salt golahs or warehouses of the government, extensive manufactories, dockyards, shipbuilding establishments, and the depot of the East India Railway.

Fort William is included in the Lucknow division of the Eastern Command; the garrison, in addition to volunteer forces, includes a battalion of British infantry, a battery of garrison artillery, a company of the Indian submarine mining corps, and a regiment of native infantry in the fort, besides half a squadron of native cavalry and a regiment of native infantry at Alipore.

The principal scientific and literary societies of Calcutta are the Bengal Asiatic Society, founded in 1784 by Sir William Jones, possessing a fine library, and a valuable and extensive museum; the Bethune Society; the Dalhousie Institute, and the Bengal Social Science Association. The University of Calcutta, though only an examining body, exercises paramount influence over English education throughout Bengal. Colleges are established to prepare candidates for examination. Other educational institutions are numerous in Calcutta. The principal places for religious instruction are Bishop's College, intended chiefly for the education of missionaries and teachers, and the institutions of the Established and Free churches of Scotland for the same purpose.

Three great railways converge on Calcutta. The East Indian Railway connects with Bombay, the United Provinces, and the Punjab, and is the outlet for the Ganges valley trade. The Bengal-Nagpur Railway runs through Orissa to Madras and west to Bombay. The Eastern Bengal State Railway connects with north and east Bengal and Assam and with Diamond Harbor. The first and last of these lines terminate on the west bank of the river at Howrah, whence a bridge and ferries connect with Calcutta.

Traffic is not monopolized by the railways. Besides native craft, the vessels of several large steamship companies navigate the inland waters and carry an extensive coasting trade to the Orissa ports. Continuous communication, greatly facilitated by the Suez Canal, is kept up with Great Britain by numerous well-appointed steamers and by sailing vessels. The river adjacent to the city varies in breadth from a quarter of a mile to nearly a mile. There are dry docks and wet docks. The city has water communication in three directions—to the east by various rivers leading to the Brahmaputra; to the north by the Hooghly and the Nadiya rivers leading to the Ganges; to the west by the Midnapur Canal. The port was transferred from government management to that of a port

trust of 12 (now 15) commissioners in 1870. There are six unloading berths for seagoing vessels at the jetties, with a frontage of 2982 feet, and all the loading is done separately at the Kidderpore docks. The petroleum wharf was established in 1886 and the tea warehouse in 1887. The port commissioners (made in 1889 conservators of the port) have their own dockyard and workshop; they maintain a staff of assistant harbor masters, who take over the pilotage of all vessels from Garden Reach; they license all cargo boats, pay three-fourths of the cost of the harbor police, survey and prepare charts of the river, from Calcutta to the sea, and are responsible for the lighting of the Hooghly. They levy a toll of 4 annas a ton on all goods shipped or discharged. The shipping, estimated at 10,000 tons in 1727, increased to 1,553,575 tons entered in 1886-87, 1,912,681 in 1891-92, 2,869,700 in 1901-02, 3,174,946 in 1903-04. Steamers have largely replaced sailing vessels, of which there were 465 in 1886-87, and only 87 in 1903-04. The coasting trade increased from 1,410,000 tons in 1886-87 to 3,317,000 tons in 1903-04.

Over a third of the entire foreign trade of India passes through Calcutta. The imports increased from £21,773,290 in 1902-03 to £34,651,817 in 1911-12, and the exports from £34,691,389 to £57,247,815. It was as the only seaport from which the rich products of Bengal could be exported that Calcutta came into prominence as a trading town. The export of jute has increased enormously since 1850, as has also that of oil seeds and tea. Bengal coal is in demand throughout India. Other exported products are opium, hides and skins, grain and pulse, indigo, lac, raw cotton and silk, saltpetre, and oils. More than half the export trade is with Europe; the United Kingdom, Germany, the United States, and China are important countries of destination. About seven-eighths of the imports (cotton textiles, treasure, metals, oil, sugar, machinery, woolen goods, hardware, railway materials, etc.) come from Europe—three-fourths from the United Kingdom. The coasting trade is enormous, and in the internal trade Calcutta is the distributing centre for Bengal. The principal industrial establishments include sugar refineries, cotton manufactories, flour, saw, and oil mills, and shipbuilding docks. Several newspapers are published. There are a few banks and numerous insurance and other companies, with a chamber of commerce. Living is comparatively cheap, and most of the luxuries of life, as well as its necessaries, are to be had as readily as in most European towns.

The first complete census was taken in 1876, when the population numbered 611,784; it grew to 612,307 in 1881, 682,305 in 1891, and 847,796 in 1901. In 1911 the total population with suburbs was 1,222,313 (1,106,738 in 1901), detailed as follows: Calcutta proper, 896,061 (847,796 in 1901); Howrah, 179,006 (157,594); Cossipur-Chitpur, 48,178 (40,750); Maniktola, 53,767 (32,387); Garden Reach, 45,295 (28,211). The preponderance of males (812,433 in 1911 to 409,880 females; 607,674 to 288,393 in Calcutta proper) is due to the large number of immigrants. Judged by European standards, the city is seriously overcrowded. Though in normal years the city is fairly healthy, the mortality is frequently greatly increased by plague, which in 1903 accounted for 8222 deaths out of 29,765. Fever, dysentery, cholera, and respiratory dis-

eases prevail. Of the total inhabitants, 65 per cent are Hindu, 29.4 Mohammedan, 4 Christian, the remainder Buddhists, Jews, etc. Europeans, Eurasians, Chinese, and negroes figure in the population, which is largely recruited from Bengal and other parts of India. Calcutta is the birthplace of William Makepeace Thackeray.

Job Charnock, of the English East India Company, laid the foundation, in 1690, of modern Calcutta, by invitation of the Nawab. In 1698 the East India Company purchased it, with two other villages, from the Governor of Hooghly, and in 1707 declared it a separate presidency. The chief event in its early history was its capture in 1756 by Suraj-ud-Dowlah, then Nawab of Bengal. The native troops deserted, and the whites were driven into the fort, whence the Governor and many of his staff escaped to the ships. The garrison, under Holwell, surrendered June 20, and were crowded into the Black Hole (q.v.)—a room 18 × 14 feet with two tiny grated windows to give air to the packed mass of humanity—during a night of extreme heat. In the morning, out of 146 persons, only 23 were found alive. The town was recaptured by Clive and Admiral Watson early in 1757, since which time it has enjoyed uninterrupted prosperity. The history of municipal administration dates from 1727, when its first corporation came into existence. In 1876 a new corporation was created, replaced in 1900 by a corporation, general committee, and chairman, as provided in the Bengal Act III of 1899. Consult Stevens, "The Port of Calcutta," in *Society of Arts Journal*, vol. xlvii (London, 1899); Stevenson, "Calcutta," in *Outing*, vol. xxxi (New York, 1900); Cotton, *Calcutta Old and New* (Calcutta, 1907).

CALDANI, käl-dä'nê, LEOPOLDO MARC ANTONIO (1725-1813). An Italian anatomist, born in Bologna, where for several years he taught practical medicine. In 1771, on the death of Morgagni, the celebrated anatomist of Padua, Caldani was chosen his successor in the professorship, and continued to lecture until 1805. At the age of 76 he published his principal work, *Icones Anatomicæ*, a series of anatomical plates. He also published *Institutiones Physiologicæ* (1772) and other works.

CALDARA, käl-dä'ra, ANTONIO (1670-1736). An Italian composer, born in Venice. He studied there under Legrenzi and became a singer in the chapel of San Marco. In 1714 he was appointed *maestro di cappella* in Mantua, and from there went to Vienna, where Charles VI made him one of his vice chapelmasters and took lessons from him. Caldara is noted rather for the quantity than the quality of his works. He was a prolific composer, and his orchestration was often very elaborate. He composed 74 operas and 32 oratorios, all forgotten to-day. But his masses, motets, and chamber music are on a higher level.

CALDARA, POLIDORO. See POLIDORO DA CARAVAGGIO.

CALDARIUM. A town in ancient Italy. See CALDIERO.

CALDARIUM, or **CALIDARIUM**. See BATH, Rome.

CALDAS, käl'däs (Sp. plur. of *ealda*, Lat. *calida*, warm water, Lat. *calidus*, hot). A Spanish term for warm springs applied to numerous places on the Iberian Peninsula on account of their thermal springs. The chief of them are Caldas de Malavella, Caldas d'Estrach, and Caldas de Montbuy, in Catalonia; Caldas de Reyes,

Caldas de Taipas, Caldas de Faveios, Caldas de Rainha, Caldas de Gerez, in Portugal. The name is also common in the topography of South America, as Caldas de Minas Geraes, Brazil.

CALDAS, FRANCISCO JOSÉ DE (1771-1816). A Colombian naturalist, born at Popayan, New Granada. He traveled extensively through that country and Peru and in 1804, by means of a barometer and a sextant constructed by himself, measured Mount Chimborazo, Mount Tungueragua, and several other peaks. He was in charge of the observatory established at the beginning of the century at Santa Fé de Bogotá, and his valuable observations were published in the *Semenario de la Nueva Granada*, the first number of which was issued in 1807 (republished by A. Lasserre, Paris, 1849). In the revolution of 1816 Caldas was condemned to death by Morillo and executed for championing the cause of independence.

CALDAS-BARBO'SA, DOMINGOS (1740-1800). A Brazilian poet. He was born in Rio de Janeiro and was the son of a freed negress. He entered the army, participated in the siege of Colonia do Sacramento in 1762, and afterward went to Lisbon, where he took holy orders and was protected by the Count of Pombeiro, in whose palace he lived. He was endowed with a considerable gift for improvisation and became very popular in high society in Lisbon. His poems are tinged with melancholy and are somewhat pessimistic in tone. Many of them have been collected and published under the title, *A Viola de Loreno*.

CALDECOTT, käl'de-kot, ALFRED (1850-). An English educator, born in Chester. Educated at the universities of Edinburgh, Cambridge, and London, he was principal in Codrington College, Barbados, Tripos examiner at Cambridge, and for a time examining chaplain to the Bishop of St. Albans. Later he became professor of philosophy, and dean (1912) of King's College, London. His publications include: *English Colonisation and Empire* (1890; Jap. trans., 1909); *English Church in the West Indies* (1898); *The Philosophy of Religion in England* (1901); *Selections from the Literature of Theism* (1904); also essays in *Cambridge Theological Essays* (1905) and *London Theological Essays* (1911).

CALDECOTT, käl'de-kot, RANDOLPH (1846-86). An English illustrator, born in Chester. In early life he was a bank clerk in Manchester. He came to London in 1872 and studied painting at the Slade School of Art under Poynter, and modeling with Jules Dalou at Chelsea, contributing regularly to the magazines. His first important illustrations were done for Washington Irving's *Old Christmas* (1875). Among others are those for Irving's *Braecbridge Hall* (1876), and for books by Mrs. Ewing and Mrs. Locker. But his best work is a series of children's picture books, illustrated in color. The series began with *John Gilpin* (1878) and ended with *The Great Panjandrum Himself* (1885). He excelled especially in portraying English country life, especially of the latter half of the eighteenth century. His illustrations are simple and effective, full of humor and quaint fancies. The British Museum contains a large collection of them.

CALDER, käl'dêr, ALEXANDER STIRLING (1870-). An American sculptor. He was born in Philadelphia, studied at the Pennsylvania Academy and in Paris under Chapu and

Falguière. After his return to Philadelphia he became instructor in the School of Industrial Art in that city. He combines technical ability with originality of conception and a fine discrimination in the choice of simple decorative motives, and is always plain and straightforward both in his treatment of material and grasp of subject. His first important commission was the statue of Dr. Samuel D. Gross, in front of the Army and Medical Museum, Washington, one of the finest monuments in that city. The six heroic figures of representative Presbyterian theologians, over the entrance to the Witherspoon Building in Philadelphia, are full of character and individuality. His fountain for the class of 1892, University of Pennsylvania, is a good example of his style, and among his ideal works "Narcissus," "The Man Cub," "The Dozing Hercules," "The Miner," "Primeval Discontent" (a powerful study of the nude), are especially deserving of mention. He is represented in the St. Louis Museum of Fine Arts, the Philadelphia Academy, Franklin Inn Club, and Throop Institute, Pasadena. One of the best designs for a figure and pedestal ever produced in America is his sketch model for a monument to Matthias W. Baldwin. His father, ALEXANDER MILNE CALDER (1846-), born in Aberdeen, Scotland, came to America at the age of 22. He furnished most of the sculptural decorations in the City Hall, Philadelphia, and a statue of General Meade in Fairmount Park, Philadelphia.

CALDER, JAMES ALEXANDER (1868-). A Canadian lawyer and statesman, born at Ingersoll, Ont. He studied at the Ingersoll high school and at Manitoba College, Winnipeg. He was principal of the Moosejaw, Saskatchewan, high school in 1891-94, inspector of schools in the Northwest Territories in 1894-1900, and of that region also deputy commissioner of education in 1901-05. He entered politics in 1905 and was called to the bar in 1906. He first sat as a Liberal member for Regina, the capital of Saskatchewan, in the Legislative Assembly (1905-08) and in 1908 became member for Saltcoats. In the Liberal administration of Walter Scott (q.v.) he was in 1905 appointed Provincial Treasurer and Commissioner of Education. He was a member of the Interprovincial Conference at Ottawa in 1906, and in 1909 a member of the Royal Conservation Commission.

CALDERA, kál-dā'rá (Sp., kettle, Eng. *cal-dron*, referring to the hollow depression of volcanic origin). A seaport of Chile, in the Province of Atacama, 25 miles from Copiapó, lat. 27° 5' S. (Map: Chile, C 9). It has an excellent harbor, protected by breakwaters, and exports silver and copper, being the port for the productive mining district centring at Copiapó, with which it is connected by railroad, the first constructed in Chile, and one of the first in South America. There are silver and copper smelters here. The town is the seat of a United States consular agent. Pop., 1903, 2130.

CALDERON, BRIDGE OF. See PUENTE DE CALDERON.

CALDERÓN, DON SERAFÍN ESTÉBANEZ. See ESTÉBANEZ CALDERÓN, DON SERAFÍN.

CALDERÓN, kál'dâ-rôn', FRANCISCO GARCÍA (1832-1905). A Peruvian statesman, born in Arequipa. He was elected to the Peruvian Congress (1867), and became Minister of the Treasury (1868). After the occupation of Lima by the Chilean army (1881), and the flight of Presi-

dent Piérola, Calderón was elected Provisional President of Peru. In this capacity he attempted to treat with the Chileans and to secure the cooperation of the United States, which, along with Switzerland and the Central American Republics, had recognized his government. These plans were frustrated by the Chileans, who sent him to Valparaiso as a prisoner. Upon his return to Lima in 1886, he became President of the Senate and rector of the University of San Marcos, the most ancient university in the New World. Aided zealously by the professors, he worked hard for its restoration, and by the end of 1886 the buildings were again in use and there was a solemn distribution of prizes to the students. He was influential in arranging the Grace contract, by means of which great improvements were made in the finances of Peru, to such an extent that her foreign debt was wiped out and her future prosperity, in all human probability, assured. His principal publication is the *Dictionary of Peruvian Jurisprudence*, a standard work of great erudition. Consult C. R. Markham, *History of Peru* (Chicago, 1892).

CALDERON, käl'dēr-on, PHILIPPE HERMOGÈNE (1833-98). An historical, genre, and portrait painter. He was born in Poitiers, of Spanish parentage, but passed most of his life in England. He studied under J. M. Leigh in London and under Picot in Paris. In 1858 he made his début at the Royal Academy with "By the Waters of Babylon." "Broken Vows," exhibited in 1857, shows a leaning towards the Pre-Raphaelite style, which he temporarily adopted. His best works include "Her Most High Noble and Puissant Grace" (Leeds), "British Embassy in Paris during the Massacre of St. Bartholomew" (1863), "Renunciation of St. Elizabeth of Hungary" (1891, National Gallery of British Art)—his masterpiece. Calderon belongs to the group of the painters of St. John's Wood School, and was keeper of the Royal Academy from 1867 to his death. His pictures are a combination of French technique and English sentiment, rendered with good dramatic effect.

CALDERÓN DE LA BARCA, käl'dâ-rôn' dâ là bär'ká, PEDRO (1600-81). An eminent Spanish dramatic poet, next to Lope de Vega, Spain's greatest dramatist, and the most typically national Spanish writer of his century. He came of a good old family, and was born Jan. 17, 1600, in Madrid, where his father was secretary in the Department of the Treasury. His mother, who was descended from a distinguished family in Hainaut, died in 1610; and his father died in 1615. The poet was educated at the Jesuit college of his native city, and later studied law for a time in Salamanca. His first play was written at the age of 13, and at 22 he took part in a poetical contest held in honor of St. Isidore at Madrid, and won a prize with a poem which called forth warm praise from Lope de Vega. His biographer, Vera Tassis, states that the 10 years from 1625 to 1635, or thereabouts (there is some discrepancy in the dates), were spent doing military service in Italy and Flanders, but this statement cannot be maintained in the face of numerous legal documents that prove Calderón's presence in Madrid during those years. In 1636 his brother José edited a volume of his *comedias*, which contains some of the plays that have enjoyed the most enduring fame: *La vida es sueño*, *El purgatorio de San Patricio*, *La devoción de la cruz*, *La dama duende*, and *Peor*

está que estaba. In 1637 Philip IV, who had already commissioned him for a series of plays for the royal theatre in the Bucn Retiro, made him a Knight of the Order of Santiago. In 1640 he had to interrupt the composition of a play in order to join his fellow knights in a campaign against the Catalan rebels. He rendered conspicuous and gallant service at Tarragona, which led to his receiving a special military pension in 1645, three years after he had retired from the army through ill health. The deep grief that he felt at the death (1648) of his mistress drove him to religion for consolation, and in 1650 he became a tertiary of the Order of St. Francis. In 1651 he followed the example of Lope de Vega and entered the priesthood, becoming successively chaplain at Toledo, honorary chaplain to Philip IV and superior of the Brotherhood of San Pedro in Madrid. Yet he still continued to write for the stage, and when he died, May 5, 1681, he was engaged upon a new *auto sacramental*, a form of religious play in which he excelled all his predecessors. His last secular play, *Hado y Divisa de Leonido y Marfisa*, to celebrate the marriage of Charles II to Marie-Louise de Bourbon, was also written during the last year of his life. His friend De Solís wrote of him, "He died, as they say the swan dies, singing."

With Calderón the golden period of Spanish drama comes to a close. He found it at its height, and he exhausted, one after another, the possibilities of its several types. As to the rank which should be assigned him, it must be borne in mind that he wrote not for the world, but for the narrow circle of his own age and country. He was essentially, fundamentally local; he lacked the universality, the wide humanity of Shakespeare, to whom, curiously enough, Friedrich Schlegel found him superior. He lacked the gift of finely differentiating his characters. They stand less for individuals than for personifications of certain primitive and dominant passions, love, hate, pride, charity, revenge, and above all else, for the personification of those fundamental passions as found in cultural conditions of the time and society in which he lived. And yet, despite all this, he has created some characters that stand out in splendid individuality. His leading motives are limited in number; they almost narrow down to the three sentiments of loyalty to the King, devotion to the Church, and the "point of honor," or vengeance inflicted by husband, father, or brother upon an erring woman. Perhaps nothing serves better to illustrate his circumscribed outlook upon life than the plays in which this last theme is treated. His heroes have nothing of the lofty passion of an Othello, the sublimity of a noble nature gone astray. They are likely to impress one rather as cold-blooded executioners, sensitive only to the fear of being made to appear absurd. And yet, if we would only take time and trouble thoroughly to absorb the idea that to a Spaniard's mind a Christian gentleman must be *eristiano, valiente y comedido*, not merely Christian and valiant, but also "measured" and "self-controlled"; that the height of absurdity was the failure to remain *comedido*; and that one could not be considered "measured" or "self-controlled" if he had not a calm and due regard for his honor as then understood—if we would only take time properly to weigh all these elements, we should probably conclude that this fear of being, or of

being made to appear, absurd is after all a legitimate dramatic force; and we all do recognize that, *mutatis mutandis*, it is one of the most potent forces with which we work in modern society.

Many critics think that Calderón was at his best as a writer of *autos*, or religious plays, which closely resemble the mystery plays of the Middle Ages, and in their more specialized form are a sort of dramatized exposition of the mystery of the blessed eucharist, intended for performance on Corpus Christi Day. Of these *autos*, nearly 80 are extant, although the number varies in different authorities, who sometimes fail to distinguish between the *auto* and the more secular *comedia devota*. Of the regular dramas, there are about 120 surviving, among which are *El Alealde de Zalamea*; *El príncipe constante*; *La dama duende*; *El médico de su honra*; *El pintor de su deshonra*; *El mayor monstruo los celos*, and *La vida es sueño*.

Editions of Calderón are: Kcil's (Leipzig, 1827); Hartzbusch's (Madrid, Rivadeneyra, 4 vols., 1872-74); and García Ramón (Madrid, 1882); a German translation of the plays, by J. D. Gries (9 vols., Berlin, 1862). There are English translations of selected plays by M'Carthy (1854-73); Edward FitzGerald (3 vols., 1853), and *Six Dramas of Calderón freely translated by E. FitzGerald, edited by H. Oelsner* (London, 1903). There is also an annotated edition of three plays, made by N. MacColl (London, 1888). Consult: Schmidt, *Die Schauspiele Calderóns* (Elberfeld, 1857); Trench, *Essay on the Life and Genius of Calderón* (London, 1880); Menéndez y Pelayo, *Calderón y su teatro* (Madrid, 1881); Rubió y Lluch, *El sentimiento del honor en el teatro de Calderón* (Barcelona, 1882); Günthner, *Calderón und seine Werke* (Freiburg, 1888); C. Pérez Pastor, *Documentos para la Biografía de D. P. Calderón de la Barca* vol. i (Madrid, 1905); H. Breymann, *Calderón-Studien, I: Die Calderón Literatur* (Munich, 1905).

CALDERON THE COURTIER. A story of Spanish romance by Bulwer Lytton (1838).

CALDERWOOD, kəl'dēr-wud, DAVID (1575-1650). A Scottish divine and ecclesiastical historian. He was born in Dalkeith, of a good family, and about 1604 was settled as Presbyterian minister of Crailing, Roxburghshire, a few miles southeast of Edinburgh. Opposed to the designs of James VI for the establishment of episcopacy in Scotland, on that monarch's visit to his native country in 1617, he and other ministers signed a protest against a bill, then before the Scottish Parliament, for granting the power of framing new laws for the Church to an ecclesiastical council appointed by the King, and in consequence he was summoned before the high commission of St. Andrews. Refusing to submit, he was committed to prison for contumacy and then banished the kingdom. He retired to Holland, 1619, and in 1621, in English, and in 1623, in Latin, published at Leyden, under the pseudonym Edwardus Didoclavus, an anagram on his name, Latinized, his celebrated controversial work, entitled *Altare Damaseenum* etc., in which he rigorously examined the origin and authority of episcopacy, and which has been a storehouse of information and argument in favor of Presbyterianism. After King James's death, in 1625, he returned to Scotland, and for some years was engaged collecting all the memorials relating to the ecclesiastical affairs of

Scotland, from the beginning of the Reformation there to the death of James VI. In 1640 he became minister of Peneaitland, near Edinburgh, and in 1643 was appointed one of the committee for drawing up the Directory for Public Worship in Scotland. He died at Jedburg, Oct. 29, 1650. From the original manuscript of his *History of the Kirk of Scotland*, preserved in the British Museum, an edition, with a life, by the Rev. Thomas Thomson, was printed for the Woodrow Society (in 8 vols., Edinburgh, 1842-49).

CALDERWOOD, HENRY (1830-97). A Scottish United Presbyterian clergyman and philosopher, born at Peebles. He was educated at Edinburgh University in 1847-52, studied theology, 1852-56, and was minister of Greyfriars Church, Glasgow, in 1856-58. He was examiner in mental philosophy at Glasgow from 1861 to 1864, and from 1868 until his death was professor of moral philosophy at Edinburgh. His metaphysics were of the Scottish intuitive realist school, but his *Philosophy of the Infinite* (1854) criticises Hamilton's dictum that the infinite is unknowable. Among his other works were: *Handbook of Moral Philosophy* (1872); *The Relations of Mind and Brain* (1879); *The Relations of Science and Religion* (1881); and a *Life of David Hume* (1898) with a particularly valuable treatment of Hume's attitude towards religion. He was an earnest worker for educational and temperance reform. Consult the biography (London, 1900) by his son, W. C. Calderwood, and D. Woodside, containing a chapter on Calderwood's philosophy by A. S. Pringle-Pattison.

CALDICOTT, kal'dī-kot, ALFRED JAMES (1842-97). An English musician and composer, born in Worcester. He studied at the Leipzig Conservatory under Riehter, Moscheles, and others; became organist of St. Stephen's Church, Worcester, and in 1882 was appointed to a professorship at the Royal College of Music, London. From 1892 until his death he was director of the London College of Music. His works include many songs and glees; the cantatas *The Widow of Nain* (1881) and *A Rhine Legend* (1883); and the operettas *A Moss-Rose Rent* (1883) and *Old Knockles* (1884).

CALDIERO, kál-dyā'rō (anciently, Lat. *Caldarium*, hot baths, from *calidus*, warm). A decayed town in the Province of Verona, north Italy, 8 miles east of Verona (Map: Italy, F 2). Its hot sulphur springs were known to the Romans, hence the name "Caldarium." Here on Nov. 12, 1796, the Austrians repulsed Napoleon, and on Oct. 29-31, 1805, a series of bloody battles between the Austrians under Archduke Charles and the French under Masséna occurred. Pop., 1910, 2729.

CALDWELL. A city and the county seat of Canyon Co., Idaho, 26 miles (direct) west of Boise, on the Oregon Short Line Railroad (Map: Idaho, B 6). It is the seat of the College of Idaho and contains a Carnegie library, a fine courthouse, and a city hall building. The city is in a rich agricultural region, included in the Payett-Boise Reclamation project, and produces fruit, flour, cereals, live stock, potatoes, and cattle. The water works are owned by the municipality. Pop., 1900, 997; 1910, 3543. It was here that ex-Governor Steunenberg was assassinated, on Dec. 30, 1906, by Harry Orchard, who later confessed and was sentenced to life imprisonment.

CALDWELL. A village and the county seat of Noble Co., Ohio, 35 miles north of Marietta, on the Cleveland and Marietta and the Ohio River and Western railroads (Map: Ohio, H 6). It is in a coal-mining and oil-producing region. The water works and electric light plant are owned by the village. Pop., 1900, 927; 1910, 1430.

CALDWELL. A town and the county seat of Burleson Co., Tex., 87 miles east-northeast of Austin, on the Gulf, Colorado, and Santa Fe Railroad (Map: Texas, F 4). It is in a cotton and stock-raising region, and contains brickyards, cotton-gin, grist and oil mills, ice factory, etc. Pop., 1900, 1535; 1910, 1476.

CALDWELL, CHARLES HENRY BROMEDGE (1823-77). An American naval officer. He was born in Hingham, Mass., and entered the United States navy in 1838. He took part in the bombardment of Forts Jackson and St. Philip in 1862, and commanded the mortar flotilla in the operations at Port Hudson in 1863. In 1870 he became chief of staff in the North Atlantic squadron, and commodore in 1874.

CALDWELL, EUGENE WILSON (1870-). An American physician, born at Savannah, Mo. He was educated at the University of Kansas, and at the Bellevue Hospital Medical College. In 1893-95 he engaged in wireless telephony experiments for the United States Lighthouse Establishment. He invented the Caldwell Liquid Interrupter, experimented widely with Röntgen rays, and is joint author of *The Röntgen Rays in Therapeutics and Diagnosis*, with W. A. Pusey (1903).

CALDWELL, JAMES (1734-81). An American clergyman, called "the soldier's parson." He was born in Virginia, graduated at Princeton in 1759, became pastor of the Presbyterian Church at Elizabethtown, N. J., in 1762, and was a trustee of Princeton from 1769 to his death. He was a zealous patriot during the Revolution and served in 1776 as chaplain of the Third New Jersey battalion and later as assistant quartermaster-general. In 1780 the Tories burned his house and church, and soon afterward a British force from Staten Island murdered his wife at Connecticut Farms (now Union), N. J. Caldwell is said to have distributed hymn books to soldiers who were short of wadding, with the exhortation, "Now, boys, put Watts into them." He was shot and killed by a sentinel during a dispute about a package that the soldier declared it his duty to examine. The soldier was tried by the civil authorities for murder and was convicted and executed. A monument to Caldwell was dedicated at Elizabethtown in 1846.

CALDWELL, OTIS WILLIAM (1869-). An American botanist, born at Lebanon, Ind. He was educated at Franklin (Ind.) College, and the University of Chicago, was professor of botany at the Eastern Illinois State Normal School from 1899 to 1907, and in the latter year became associate professor of botany at the University of Chicago. He was also professor of botany in the University of Indiana Summer School in 1904. His publications include: *A Laboratory Manual of Botany* (1901; rev. ed., 1902); *Plant Morphology* (1903; rev. ed., 1904); *The High School Course in Botany* (1909); *Practical Botany* (1911); also a number of special articles in the National Educational Association's *Journal of Proceedings and Addresses*, including "The Influence of Prolonged and Carefully Directed Work" (1912).

CALDWELL, SAMUEL LUNT (1820–89). An American Baptist educator. He was born in Newburyport, Mass., and graduated from Waterville (now Colby) College in 1839, and from Newton Theological Institution in 1845. He held pastorates in Bangor, Me., and Providence, R. I., and was professor of church history at the Newton Seminary from 1873 to 1878. He then became the second president of Vassar College, and held this position until 1885. He was secretary to the corporation of Brown University in 1875–89.

CALDWELL, WILLIAM (1863–). A Canadian educator, born in Edinburgh, Scotland, and educated at Edinburgh University. He took postgraduate studies in German, French, and English universities, and in 1887 was appointed assistant professor of logic and metaphysics in Edinburgh University. He was government examiner in philosophy in the University of St. Andrews in 1889–92. In 1891 he received a call to a professorship in the Sage School of Philosophy, Cornell University. He joined the faculty of Chicago University the following year, in 1894–1903 was professor of moral and social philosophy in Northwestern University, and was then appointed Macdonald professor of moral philosophy in McGill University, Montreal. His principal publications are: *Schopenhauer's System in its Philosophical Significance* (1896); *Pragmatism and Idealism* (1913); and contributions to the leading psychological and philosophical reviews.

CA'LEB (dog). The name both of an individual and of a Kenizzite clan, mentioned in 1 Sam. xxv. 3; Num. xxxii. 12; Judg. i. 15; 1 Chron. ii. 9 et seq. The clan was probably of Edomitic origin. Before the time of David (c.1033–993 B.C.) it was established in Hebron and its neighborhood. Caleb ben Jephunneh is the eponymous hero of the clan, representing its advance from Arabia into the Negeb. In the story of the spies (Num. xiii. 6) it even represents Judah. Post-exilic genealogies connect Caleb closely with Jerahmeel, as a younger brother, and both through Hezron and Perez with Judah. It is possible that these genealogies reflect vaguely the outlines of a history, of which northwestern Arabia and the Negeb were the scenes, before the different elements were welded together into the Kingdom of Judah by David. Consult: Moore, *Judges* (1895); Ed. Meyer, *Die Entstehung des Judentums* (1896); id., *Die Israeliten und ihre Nachbarstämme* (1906).

CALEB WILLIAMS. A novel by William Godwin, published in May, 1794. It is a study in the relativity of ethics. For the plot, see FALKLAND. It was dramatized by Colman the Younger. See IRON CHEST, THE.

CAL'EDO'NIA (Lat., Gk. Καληδονία, *Kalēdonia*, still retained in Cymr. *Coed Celyddon*, Caledonian Forest). The name given to the northern part of Britannia, beyond the firths of Forth and Clyde, by Tacitus and the later Romans. The derivation is very uncertain. Agricola attempted the conquest of Caledonia, which he invaded in 82 A.D. and the following years. In 84 he defeated Calgacus, who had formed a union of all the tribes, but was prevented, by his recall, from pursuing the conquest. Later Hadrian, Septimius Severus, and others attempted to subdue Caledonia, but the inhabitants succeeded in maintaining their independence. The natives made constant incursions into Britain. In the fourth and fifth centuries, under the names of

Scots and Picts, they preyed upon the Britons, especially after the withdrawal of the Roman legions, until the island was occupied by the Angles and Saxons. See BRITANNIA; SCOTLAND.

CALEDONIA, NEW. See NEW CALEDONIA.

CAL'EDO'NIAN CANAL. A chain of natural lakes in Scotland, 62 miles long, united by artificial canals and traversing the Great Glen of Albin, in Inverness-shire, from northeast to southwest, from Beaully Firth to near Fort William, and connecting the North Sea with the Irish Sea. The lakes are Beaully, Ness, Oich, Lochy, Eil, and Linnhe (Map: Scotland, D 2). They communicate by cuts 120 feet broad at the surface, 50 feet at the bottom, and 17 feet deep, the total length of these artificial channels being 23 miles. The canal was formed to avoid dangerous and tedious navigation by the Pentland Firth, Cape Wrath, and the Hebrides; the distance between Kinnaird's Head and the Sound of Mull by this route being 500 miles, but by the canal 250, with an average saving of 9½ days for sailing vessels. The highest part is Loch Oich, 105 feet above the sea. There are 28 locks, each 170 to 180 feet long, and 40 feet wide, with a rise or lift of water of 8 feet. Eight of the locks, called Neptune's Staircase, occur in succession near the west end of the canal. Begun under Telford, in 1803, the canal was opened in 1823. Ships of 500 to 600 tons can pass through. It is chiefly used by fishing boats and for local traffic, and in the summer season is much frequented by tourists attracted by the picturesque scenery and points of interest on both sides of the canal.

CAL'EDO'NIA SPRINGS. A health resort in Prescott Co., Ontario, Canada, and 66 miles west of Montreal on the Canadian Pacific Railroad. The town is famous for its alkaline springs.

CALEF, or CALFE, ROBERT (c.1648–1719). A Boston merchant, who published in 1700 *More Wonders of the Invisible World*, a reply to Cotton Mather's *Wonders of the Invisible World* (1692). His argument against the witchcraft persecutions and his attack on Mather were prompted, in part at least, by political reasons and had the backing of the Liberal party in Boston, especially William and Thomas Brattle. Mather's parishioners published a defense of him. Calef's book was publicly burned at Cambridge by order of Increase Mather, then president of Harvard College.

CAL'ENDAR (Lat. *calendarium*, account-book, interest falling due on the calends, from *calendæ*, calends). The mode of adjusting the months and other divisions of the civil year to the natural or solar year. The necessity of some division and measurement of time must have been early felt. The phases or changes of the moon supplied a natural and very obvious mode of dividing and reckoning time, and hence the division into months (q.v.; see also WEEK) of 29 or 30 days was, perhaps, the earliest and most universal. But it would soon be observed that for many purposes the changes of the seasons were more serviceable as marks of division; and thus arose the division into years (q.v.), determined by the motions of the sun. It was soon, however, discovered that the year, or larger division, did not contain an exact number of the smaller divisions or months, and that an accommodation was necessary; and various not very dissimilar expedients were employed for correcting the error that arose. The ancient Egyptians

had a year determined by the changes of the seasons, without reference to the changes of the moon, and containing 365 days, divided into 12 months of 30 days each, with five supplementary days at the end of the year. The Jewish year consisted in the earliest periods, as it still does, of 12 lunar months, a thirteenth being from time to time introduced, to accommodate it to the sun and seasons. This was also the case with the ancient Syrians, Macedonians, etc. The Jewish months have alternately 29 and 30 days; the years are arranged in cycles of 19 years, seven of which, viz., the 3d, 6th, 8th, 11th, 14th, 17th, and 19th, have the intercalary month, and are known as "embolismic" years. Some of these years have one, and some two days more than others, so that the length of the year varies from 353 to 385 days. The beginning of the Jewish civil year falls between September 5 and October 5, and corresponds to the period of seedtime in Palestine. The names of the months in order are Tishri, Heshwan, Kislew, Tebet, Shebat, Adar, Nisan, Iyyar, Siwan, Tammuz, Ab, and Elul, the intercalary month, We-Adar, being inserted between Adar and Nisan. The seventh civil month, Nisan, which comes at the time of harvest in Palestine, is regarded as the first month of the Jewish sacred year. The Greeks, in the most ancient periods, reckoned according to real lunar months, 12 making a year; and about 594 B.C. Solon introduced in Athens the mode of reckoning alternately 30 and 29 days to the month, accommodating this civil year of 354 days to the solar year by occasional introduction of an intercalary month. A change was afterward made, by which three times in eight years a month of 30 days was intercalated, making the average length of the year $365\frac{1}{4}$ days. See METONIC CYCLE.

The Romans are said to have had originally a year of 10 months; but in the time of their kings they adopted a lunar year of 355 days, divided into 12 months, with an occasional intercalary month. Through the ignorance of the priests, who had the charge of this matter, the utmost confusion gradually arose, which Julius Cæsar remedied (46 B.C.) by the introduction of the Julian Calendar, according to which the year has ordinarily 365 days, and every fourth year is a leap year of 366 days—the length of the year being assumed as $365\frac{1}{4}$ days, while it is in reality 365 days, 5 hours, 48 minutes, and 46 seconds; or 11 minutes, 14 seconds less. See KALENDS; MONTH.

So perfect was the Julian style of reckoning that it prevailed generally among Christian nations, and remained undisturbed till the accumulation of the remaining error of 11 minutes or so had amounted, in 1582, to 10 complete days, the vernal equinox falling on the 11th instead of the 21st of March, as it did at the time of the Council of Nice, 325 A.D. This shifting of days had caused great disturbances, by unfixing the times of the celebration of Easter, and hence of all the other movable feasts, and accordingly, Pope Gregory XIII, after careful study, with the aid of Clavius, the astronomer, ordained that 10 days should be deducted from the year 1582, by calling what, according to the old calendar, would have been reckoned the 5th of October the 15th of October, 1582; and, in order that this displacement might not recur, it was further ordained that every hundredth year (1700, 1800, 1900, etc.) should not be counted a leap year, excepting every fourth hundredth, beginning

with 1600. In this way the difference between the civil and natural year will not amount to a day in 3000 years. In Spain, Portugal, and part of Italy, the Pope was exactly obeyed. In France the change took place in the same year, by calling the 10th the 20th of December. In the Low Countries the change was from the 15th December to the 25th; but it was resisted by the Protestant part of the community till the year 1700. The Catholic nations, in general, adopted the style ordained by their sovereign pontiff; but the Protestants were then too much inflamed against Catholicism in all its relations to receive even a purely scientific improvement from such hands. The Lutherans of Germany, Switzerland, and, as already mentioned, of the Low Countries, at length gave way in 1700, when it had become necessary to omit 11 instead of 10 days. A bill to this effect had been brought before the Parliament of England in 1585, but does not appear to have gone beyond a second reading in the House of Lords. It was not till 1751, and after great inconveniences had been experienced for nearly two centuries, from the differences of the reckoning, that an act was passed for equalizing the style in Great Britain and Ireland with that used in other countries of Europe. It was then enacted that 11 days should be omitted after the 2d of September, 1752, so that the ensuing day should be the 14th. A similar change was made about the same time in Sweden and Tuscany, and Russia and Greece are now the only countries using the old style; a practice which renders it necessary, when a letter is thence addressed to a person in another country, that the date should be given thus: April $\frac{1}{4}$ or June 27. It will be observed that the years 1800 and 1900, not being considered by us as leap years, have interjected two more days, making the difference 13 days between old and new style.

Mohammedan Calendar. The Mohammedan world employs a lunar year of 354 days, divided into 12 lunar months which have alternately 30 and 29 days. The names of the months are Muharram, Saphar, Rabia I, Rabia II, Jomada I, Jomada II, Rajab, Shaaban, Ramadan, Shawall, Dulkaada, and Dulheggia. Eleven times in every cycle of 30 years, an extra day is added at the end of the year, but no attempt is made to regulate the calendar to the solar year. Consequently there can be no correspondence between the months and the seasons, and the beginning of the year may fall at any time during the solar year. The Mohammedan year which began on Nov. 30, 1913, was the 12th year in the 45th cycle, or the year 1332 of the Mohammedan era. See CHRONOLOGY; HEJIRA.

French Revolutionary Calendar. The French nation, in 1793, undertook the task of making a new calendar, professedly upon philosophical principles. The new era was dated from the minute of the autumnal equinox (Sept. 22, 1792), which was also the day from which the existence of the republic was reckoned (although the formal proclamation of the republic was on September 21). There were 12 months of 30 days each, divided into decades, in which the days were named numerically—Primidi, Duodi, and so on, up to Decadi. The remaining five days were grouped as festal days at the end of the year and known as *Sansculottides*. The months, seasons, and festivals were arranged as follows (the table being for the years I, II, III,

V, VI, VII, the dates varying by one or two days in the remaining years) :

AUTUMN

Vendémiaire.....Vintage month..22 Sept to 21 Oct.
 Brumaire.....Fog month.....22 Oct. to 20 Nov.
 Frimaire.....Sleet month....21 Nov. to 20 Dec.

WINTER

Nivôse.....Snow month....21 Dec. to 19 Jan.
 Pluviôse.....Rain month....20 Jan. to 18 Feb.
 Ventôse.....Wind month....19 Feb. to 20 Mar.

SPRING

Germinal.....Seed month....21 Mar. to 19 April
 Floréal.....Blossom month..20 April to 19 May
 Prairial.....Pasture month..20 May to 18 June

SUMMER

Messidor.....Harvest month..19 June to 18 July
 Fervidor, or Thermidor..Heat month...19 July to 17 Aug.
 Fructidor.....Fruit month....18 Aug. to 16 Sept.

SANSCULOTTIDES, OR FEASTS DEDICATED TO

Les Vertus.....The Virtues.....17 Sept.
 Le Génie.....Genius.....18 Sept.
 Le Travail.....Labor.....19 Sept.
 L'Opinion.....Opinion.....20 Sept.
 Les Récompenses.....Rewards.....21 Sept.

A sixth additional day in leap years was named *le jour de la Révolution*. This calendar was a product of the revolt against Christianity, and it existed until the old system was restored by Napoleon, Jan. 1, 1806.

Perpetual Calendar. An arrangement for ascertaining the day of the week corresponding to any desired date, and for solving other similar problems. The following form of perpetual calendar was arranged by Capt. J. Herschel and is probably the best yet devised. As here given, it covers the period from 1798 to 2000, but it can be extended easily in either direction.

Every date is composed of four elements, viz.:

- (1) Day of the week.
- (2) Day of the month.
- (3) Name of the month.
- (4) Number of the year.

Any three of these elements being given, we can find the fourth from the perpetual calendar. Thus, suppose we wish to find what day of the week corresponded to March 4, 1865, on which day Lincoln was inaugurated President of the United States for the second time. Entering the calendar in the column headed "March," and opposite the "day of the month" 4, we find the sign +. Now, entering the column containing the year 1865, and going up it to the same sign +, we find opposite that sign, on the right, the "day of the week" Saturday. Accordingly, Lincoln was inaugurated on a Saturday.

Again, suppose it is required to find in what years March 4 (inauguration day) can fall on a Sunday. As before, for March

PERPETUAL CALENDAR

DAY OF THE MONTH					Jan. Oct.	Apr. July Jan.	Sept. Dec.	June	Feb. Mar. Nov.	Aug. Feb.	May

					<i>1996</i>	1997	1998	1999	<i>2000</i>	

4 we find the sign +. Opposite Sunday we find that sign in the first column of years, beginning with 1798, 1804, etc. In all the years in this column, therefore, March 4 will fall on a Sunday. But presidential inaugurations usually occur only in years following leap years, which latter are indicated by *italics* in the perpetual calendar. Consequently, Sunday inaugurations occurred in 1821, 1849, 1877, and will occur in 1917, 1945, 1973.

Primitive Calendar. Among Amerind tribes, inchoate writing in the form of a rude inscription, sometimes called "winter count," recording notable events in the life of an individual or the history of a tribe. The woodland tribes made the inscriptions on trees or on birch bark; dressed skins were used by the tribes of the prairies; some of the tribes of the arid regions (e.g., the Prina) incised rude mnemonic symbols on canes or wands; while in Mexico and Yucatan calendric inscriptions of related character, although recorded in more or less arbitrary glyphs, rather than rude ideographs or ikonographs, were preserved in scrolls or books of maguey paper.

Consult Burnaby, *Elements of the Jewish and Muhammedan Calendar* (London, 1901); Plunket, *Ancient Calendars and Constellations* (London, 1903); Mahler, *Etudes sur le calendrier égyptien* (Paris, 1907); Schram, *Kalendarographische und chronologische Tafeln* (Leipzig, 1908); Boll, *Griechische Kalendar* (Heidelberg, 1910); Bowditch, *Numeration, Calendar Systems and Astronomical Knowledge of the Mayas* (Cambridge, Mass., 1910); Langdon, *Tablets from the Archives of Draham, with a Complete Account of the Origin of the Sumerian Calendar* (Paris, 1911). See ARCHÆOLOGY, AMERICAN; MAN, SCIENCE OF.

CAL'ENDAR. In law, an official list or schedule of cases, arranged in the order in which they are to be taken up and disposed of.

Court Calendar. The official list of causes pending in a court for trial or argument. It generally contains the names of the parties and of their attorneys, as well as the date and nature of the issue, i.e., whether of fact or of law. Ordinarily, the causes are entered in the order of their date of issue (q.v.), the first one being that in which issue has been joined the longest; but the statutes and court rules give precedence to some cases over others. Certain actions brought by the United States or by a State may be advanced and tried out of their chronological order. Criminal cases are entitled to a preference over civil suits, and among criminal cases capital offenses have precedence over others. In English legal procedure such a calendar of cases is known as a Cause List.

Calendar of Prisoners. In England, a sheriff's certified list of all prisoners in his custody awaiting trial for felony, prepared for a court sitting under a commission of jail delivery (q.v.). Recent legislation has transferred this duty from sheriffs to gaolers and keepers of prisons in which persons awaiting trial are confined. In the United States similar lists are often required, either of the sheriff or of the keeper of a prison.

CALENDERING (Fr. *calandre*, roller, from Lat. *cylindrus*, Gk. *κύλινδρος*, *kylindros*, cylinder, roller). The term applied to the finishing process by which a glazed or polished surface is given to paper and various textile fabrics, such as linen and cotton. It is usually done by pass-

ing the fabric between cylinders or rolls under pressure; hence the origin of the term, which is a corruption of cylindering. The familiar domestic process of starching and ironing illustrates in a simple form the object and result of calendering, and the common domestic mangle is a near approach in a simple form of the large calendering machines used in paper and textile manufacture. These machines consist of a series of from 3 to 12 rolls or "bowls" set one above the other in a strong iron frame and so arranged that heavy pressures can be brought to bear on the rolls, and therefore on the fabric which is passed between them. The rolls were formerly made of wood, but this material proved unsatisfactory because it warped. At present, when metal rolls are not used, the rolls are made of paper or cotton rendered solid by hydraulic pressure. Metal rolls are made of steel, chilled cast-iron, or brass, and are often made hollow, to allow them to be heated internally where hot calendering is required. The process of calendering consists in passing the fabric between the rolls a number of times, depending upon the material and the finish required. Often cloths are starched before being calendered, and for a highly glazed surface a little paraffin or soap may be added. To impart a glaze or polish one of the pair of rolls is made to revolve faster than the other, which causes it to slide on the fabric, with exactly the same effect as results from the sliding back and forth of the flatiron in "ironing" or polishing the domestic linen. Sometimes the surfaces of the rolls have slightly raised patterns which produce the effect known as watering. In making the rolls for calendering the utmost accuracy of workmanship is exercised to secure a truly cylindrical surface; metal rolls are turned on a lathe, then ground and finally polished. Great care has also to be taken in setting the rolls in the frame and in adjusting them to each other. The method of applying the pressure is by using weights or by hydraulic presses, or by means of screws. Consult Beaumont, *The Finishing of Textile Fabrics* (London, 1909); Edge, *Practical Cotton Finishing* (London, 1911). See BEETLING; PAPER.

CAL'ENDS. See KALENDS.

CALENTES AQUÆ. See CHAUDESAIGUES.

CALENTURA, *kä'lén-tōō'ra* (Sp., from Lat. *calere*, to glow, to be hot). A medical term formerly applied to a tropical fever with acute delirium, never fully described, but supposed to attack sailors in hot climates. The word was revived during the Spanish-American War, and applied to a fever prevalent in Cuba and the Philippine Islands; also called Cuban fever. It is said to begin without prodromal symptoms, a chill and a temperature of 103° F. ushering in the disease. The temperature is likely to rise higher; muscular pains supervene, with headache, loss of appetite, nausea, and marked weakness. Many cases recover spontaneously in a week. Calomel, followed by a saline cathartic, is given with success. Quinine is said to possess no efficacy.

CALEPINO, *kä'lâ-pē'nō*, AMBROGIO (1435-1511). An Italian lexicographer, born at Capelio, Bergamo. He was an Augustinian monk, and devoted his entire life until he became blind to the making of a polyglot dictionary (1502), the vocabulary being Latin and the explanations or definitions in seven languages. The Aldi published 18 editions of it in a half-

century (1542-92). That of 1590 comprises 11 languages. A revision undertaken in the eighteenth century resulted in the great *Totius Latinitatis Lexicon* (1771) of Forcellini and Facciolati (qq.v.).

CALGARY. The largest city in the Province of Alberta, Canada, situated on the Bow River, and on the main line of the Canadian Pacific Railway, 2262 miles west of Montreal and 860 miles west of Winnipeg (Map: Alberta, F 7). Branch lines of the Canadian Pacific running north and south connect it with Edmonton, the capital of the province, and with Lethbridge and the Kootenay district to the south. It is the centre of a large stock-raising region, and the chief supply station of mining districts in the Rocky Mountains and British Columbia. It is also the chief distributing point between Winnipeg and the Pacific coast, its geographical position enabling expeditious handling. Large shipments of cattle, horses, and wheat are regularly made, and a notable auction sale of cattle is annually held. Calgary is one of the chief stations of the Royal Northwest Mounted Police. It is within easy distance of several famous mountain resorts and attracts large numbers of tourists. The city is laid out in rectangular form, with wide streets, whose buildings are chiefly of a fine quality of stone found in the vicinity. The educational facilities are excellent. The University of Calgary was organized in 1913. There are also Mount Royal College (Methodist), a Roman Catholic convent, 28 high and public schools, and three Roman Catholic separate schools. There are over 50 churches, some of them of fine architectural design; and the civic buildings are handsome and well constructed. Calgary is a divisional point on the Canadian Pacific Railway, and contains large repair shops costing over \$3,000,000 with an estimated pay roll of nearly \$2,000,000. It is an important milling centre, and the output of its manufacturing industries includes biscuits, boxes, cereal foods, bricks, beds, building materials, confectionery, cigars, cement, cement blocks, ground coffee and spice, electric light and power, gas, harness, iron and metal works, lumber, leather goods, mattresses, meat products, soap, show cases, tools, carriages and wagons, aerated waters, beer, etc. The value of the manufactured products for 1910 was \$7,751,011 as compared with \$599,444 in 1900 and \$258,900 in 1890. In the neighborhood are extensive coal beds (lignite, bituminous, and anthracite), lime, brick, clay, and building stone. Electric power for manufacturing purposes is developed on Bow River, west of the city, and natural gas is supplied from Bow Island, 100 miles distant. The city owns its electric street railway, water works (gravity system), a complete sewage system, and an asphalt plant. It was founded in 1883 and incorporated as a city in 1894. Pop., 1901, 4392; 1911, 43,704; local directory estimate (1913), 89,935.

CALHOUN, käl-hōōn', JOHN CALDWELL (1782-1850). A distinguished American statesman, born in Abbeville District, S. C., on March 18, 1782; of Scotch-Irish descent, the third son of Patrick Calhoun, his mother having been before marriage Martha Caldwell. Calhoun early showed that he possessed a thoughtful turn of mind, and, though he had little teaching when a boy, he began to study law at the age of 18, supplementing this with other reading which enabled him to enter the junior class at Yale

College in 1802. While at college he was known as a hard student, especially of political and historical subjects, and graduated in 1804 with high honors. He then resumed the study of law, in Litchfield, Conn., and in a law office in Charleston, and was admitted to the bar in 1807, beginning practice at Abbeville, S. C. In 1808 he was sent to the State Legislature, where he attracted so much attention as to secure an election to Congress in 1811. In the same year he married his cousin, Floride Calhoun, who had a moderate fortune, and this enabled him to pursue for a time an independent course in national politics. During this period Calhoun took a broader view of the American Constitution than that with which his name is now identified. American political parties were then in a transition period; and Calhoun, chafing at the arrogance of Great Britain, ranged himself with Henry Clay (q.v.) and favored a warlike policy, so that he and Clay were popularly known as "the War Hawks." His intense personality, when joined with Clay's magnetic qualities, forced Madison's administration into a declaration of war on Great Britain, and throughout that war he both spoke and voted for its vigorous prosecution. Later, in 1816, he favored the establishment of a national bank, an increase of the navy, extensive internal improvements at the national cost, especially in providing great highways with the express purpose of uniting more closely all the members of the American Republic. He even advocated a protective tariff. All this was wholly inconsistent with his later views of strict construction and separatism; but it showed him at that period of his career to have had a wise and far-seeing conception of national unity.

In March 1817, Calhoun was appointed Secretary of War by President Monroe. The War of 1812 had left the department in great disorder. This gave Calhoun an opportunity of showing his admirable qualities as an administrator, and he soon established system in place of chaos. He prepared, for submission to the House, extremely able reports on the subject of highways and canals and on Indian affairs. Although the army was reduced from 10,000 to 6000 men, it was made more efficient than it had ever been before, and Calhoun insisted upon expenditures that were almost lavish, but that showed his conception of an effective military establishment. Furthermore, during his tenure of this office every cent was honestly expended, and not a single defalcation occurred. When he retired from the secretaryship, his chief subordinates in an address (1825) said: "The degree of perfection to which you have carried the several branches of this department is believed to be without parallel"; and Joseph Story had already written (1823): "I have great admiration for Mr. Calhoun, and think few men have more large and liberal views of the true policy of the national government." He conceded the right of the United States to regulate slavery in the territories at the time of the Missouri Compromise of 1820 (q.v.), indicating a spirit of Nationalism which he retained up to the tariff agitation of 1827. In 1824 Calhoun received 182 electoral votes for Vice President as against 79 scattering ballots, and was elected. No one having a majority of votes for the presidency, the election devolved upon the House of Representatives, and John Quincy Adams was made President. In 1828 Calhoun was reelected

under Jackson as President, and now became an extreme advocate of States' rights, because a protective tariff had been passed, some of whose features were injurious to the agricultural interests of South Carolina. This so-called "Tariff of Abominations" led to the preparation by Calhoun of an elaborate document setting forth the principle of State sovereignty in an extreme form. This was approved and issued by the Legislature of South Carolina and is known as "The South Carolina Exposition." Three years later his doctrine was expanded to include the theory that each State had the right to nullify any United States law which the State might regard as unconstitutional. Calhoun had already broken off all personal relations with President Jackson, who regarded him as treacherous both to himself and to the country. A policy of pin pricks widened the breach between Jackson and Calhoun, and their personal animosity was intensified by the notorious Eaton affair. (See EATON, MARGARET.) From this time Calhoun's chance for election to the presidency was extinguished, since Jackson, "the Hero of New Orleans," so dominated the nation as to enable him to choose his successor in the person of Martin Van Buren (q.v.).

On Aug. 28, 1832, Calhoun wrote to Governor Hamilton of South Carolina a final statement of the theory of nullification (q.v.) in these words: "There is no direct and immediate connection between the individual citizens of a State and the general government," adding somewhat paradoxically that nullification is the great conservative principle of union. President Jackson with characteristic grimness threatened to hang Calhoun and at a public banquet uttered the memorable words: "The Union must and shall be preserved." When another South Carolina convention, on Nov. 24, 1832, passed an ordinance nullifying the tariff, Calhoun immediately resigned the vice presidency and entered the Senate. By a compromise, arranged by Clay, an armed conflict was avoided. South Carolina won the particular point as to the tariff, but failed to secure the establishment of nullification as a principle. Acting with the Whigs, but still independent, Calhoun now became a scathing critic of Jackson's administration, though suppressing in his public utterances any personal animus. He condemned severely Jackson's removal of the government deposits from the United States Bank and his development of the spoils system. Foreseeing more clearly than any one else the conflict between the North and the South on the slavery question, he sought to avert it by checking all discussion of the issue. When, after the financial crisis of 1837, Van Buren proposed the so-called sub-treasury scheme, by which the United States should avoid all connection with banks and should control its own deposits, Calhoun supported the President, much to the chagrin of the Whigs, with whom he had been acting. He was in favor of Van Buren's reelection and secured for him the vote of South Carolina. When Tyler, who became President on the death of William H. Harrison, vetoed the bill for rechartering the United States Bank, Calhoun defended him. He denounced the tariff of 1842 and supported the Webster-Ashburton Treaty (q.v.). After having declined reelection to the Senate in 1843, he was, in March of the next year, through a clever move on the part of Henry A. Wise, appointed Secretary of State by

Tyler and was chiefly instrumental in bringing about the annexation of Texas in order to extend slave territory, thus practically necessitating the Mexican War, which he strove later to avert. In 1845 he was again elected to the Senate. In order to check the antislavery movement at the North he proposed in 1847 a convention of Southern States to prevent Northern commerce from entering their ports. Slavery he had come to advocate as a positive good. In 1849 he proposed a Southern convention to set forth the grievances of the slave States, looking towards "dissolving the partnership," if the only course left open seemed submission. His last speech in connection with the Compromise of 1850 was read, on account of his weakness, by another Senator. In this he asserted that an amendment to the Constitution would be necessary to restore a proper political equilibrium. He died on March 31, 1850, having spent his last few months in writing his "Disquisition on Government," and his "Discourse on the Constitution and Government of the United States," probably the most remarkable discussion ever written on the rights of minorities.

Calhoun's personality was attractive, and his morals were irreproachable. His power of logical analysis seems to entitle him to rank as one of the most original of American political theorists. He was probably too much of a political theorist and philosopher to be regarded as a statesman of the first order. It must be conceded, however, that throughout his long political career he impressed both friends and foes as none but a man of extraordinary powers can do, and it is quite clear that he believed that the only way to preserve the Union was to reduce its strength almost to the vanishing point.

CALHOUN, käl-hōn', SIMON HOWARD (1804-76). An American Congregational missionary. He was born in Boston, graduated from Williams College in 1829, and in 1836 went as missionary to the Levant and later to Syria, where he labored till 1874. He was an authority on Arabic and Turkish, and worked on the first Turkish translation of the Bible with William Goodell (q.v.).

CALHOUN, WILLIAM JAMES (1848-1916). An American diplomat, born in Pittsburgh, Pa. He studied law, was admitted to the bar in 1875 at Danville, Ill., and in that city practiced until 1898. Two years later he removed to Chicago, becoming senior member of the law firm of Calhoun, Lyford & Sheean. In 1897 he was appointed by President McKinley special commissioner to Cuba and in the year following a member of the Interstate Commerce Commission, in which position he served for two years. He was special commissioner for President Roosevelt to Venezuela in 1905, and, being appointed (1909) Minister to China, served at this post until the spring of 1913. In May of that year he attracted some attention by

severely criticising the Chinese policy of President Wilson.

CALÍ, ká-lé'. A city of Colombia, in the Department of Cauca (Map: Colombia, B 3). It is situated on the Calí, near its junction with the Río Cauca, 3100 feet above sea level, and contains the fine Ionic church of San Francisco and a college. A noteworthy bridge crosses the Río Calí at this point. The city is of considerable commercial and industrial importance, and is well equipped with business facilities: bank, telegraph, government post office, United States consular agent, etc. Calí was founded in 1536 by Sebastián de Belalcázar, and obtained its coat of arms in 1559. Pop., in 1912 (est.), 27,746.

CAL'IBAN. 1. A deformed monster in Shakespeare's *Tempest*. He is the son of the witch Sycorax and a devil, and originally laid claim to the sovereignty of the enchanted isle. Prospero soon obtained complete mastery over his small mind, however, and has made a servant of him at the beginning of the play.

2. A cynical philosophic drama by Ernest Renan (q.v.), published in 1878. It professes to take up the story of Caliban from where he is left in Shakespeare's *Tempest*.

3. The nom de plume of Emile Bergerat.

CALIBAN UPON SET'EBOS, or **NATURAL THEOLOGY ON THE ISLAND**. A characteristic psychological poem by Robert Browning. In it Shakespeare's amorphous creature, Caliban, discourses "touching that other, whom his dam called God." The text, "Thou thoughtest that I was altogether such a one as thyself," is a subtly ironical comment on the savage's words.

CALIBO, ká-lé'bô. A town of Panay, Philippines, in the Province of Capiz, situated on the north coast of the island, 40 miles west of Capiz. Pop., 1903, 14,574.

CALIBRE (Fr., perhaps from Lat. abl. sing. *qua libra*, of what weight, measure). The calibre of a smoothbore gun is the diameter of the bore. The calibre of a modern rifle of ordinary type is the diameter of a cylinder which will just touch the highest points of all the lands (the part of the surface of the bore between the grooves). In the case of rib-rifled guns, which have relatively very narrow lands, the calibre is the diameter of a cylinder which would just touch the bottom of all the grooves. The old smoothbore cannon were designated by the weight of the shot they threw, as 24-pounder, 68-pounder, etc.; modern rifled cannon are described by the calibre, such as 10-inch, etc. The length of a piece is now designated by the number of calibres; for example, a 12-inch gun 40 calibres long is 40 feet in length, etc. In small arms, in the United States and Great Britain, calibre is expressed in decimals of an inch, thus, .30 cal. is the customary way of expressing a diameter of 30/100 of an inch. In other European countries the calibre of small arms is stated in millimeters. See **ARTILLERY**; **GUNS, NAVAL**; **ORDNANCE**; **PROJECTILES**; **SMALL ARMS**.

CAL'IBURN. Another name of King Arthur's sword Excalibur.

CALICOBACK, or **CALICO BIRD**. See **TURNSTONE**.

CALICO BASS (possibly so called because of its variegated color). A sunfish-like, mottled-olive bass (*Pomoxis sparoides*) of the whole Mississippi valley and Great Lakes, highly prized as a food fish and as game for youthful anglers. It reaches a length of 12 inches,

weighing 2 pounds, haunts grassy streams and ponds, and bears transplanting well. It is a near relative of the crappie (q.v.) and is also known as grass bass, strawberry bass, and bar-fish. For illustration, see Plate of **BASS, AMERICAN FRESH WATER**.

CALICO BUSH. See **KALMIA**.

CALICO PRINTING. See **TEXTILE PRINTING**.

CAL'ICUT (Hind. *kolikodu*, *kolikotta*). A seaport of the Malabar District, British India, in lat. 11° 15' N. and long. 75° 47' E., 566 miles south-southeast of Bombay, on the Indian Ocean and at the terminus of the southwest branch of the Madras Railway (Map: India, C 6). It was the first spot in India visited by the Portuguese trader, Covilham (1486), and it was here that Vasco da Gama reached the shores of India in 1498, having come by the way of the Cape of Good Hope. Calicut was at that time prosperous and powerful. The natives twice repulsed the Portuguese in 1500, slaying their commander in 1509. The city stands near the mouth of a small river of the same name and possessed at one time a good haven. Now its anchorage is merely an open roadstead. Aside from this physical disadvantage, the ravages of war and the competition of superior localities contributed to its decay. In 1792, when it fell into the hands of the English, the city was little better than a ruin, Hyder Ali, in 1765, having laid it waste to chastise European cupidity. Since then it has made considerable progress. Pop., 1891, 66,078; 1901, 76,981; 1911, 78,417. From Calicut, *calico* derived its name, although the manufacture of that article has now declined. It has an important export trade in timber, spices, cotton yarns, coffee, oil, and tiles.

CALIDARIUM, or **CALDARIUM**. See **BATH, Rome**.

CALID'IUS, MARCUS (?-48 B.C.). A Roman orator, contemporary with Cicero, whose recall from exile he advocated. He was prætor in 57 B.C. and about 49 B.C. was made Governor of Cisalpine Gaul. He died at Placentia in 48 B.C. His oratory is praised by Cicero (*Brutus*, chap. 79-80). For the fragments of his orations, consult Meyer, *Fragmenta Oratorum Romanorum* (2d ed., Zurich, 1842). Consult also Quintilian (10, 1, 23, and 12, 10, 11).

CALIF DE BAGDAD, ká'léf' de bág'dád', LE. See **BOIELDIEU, F. A.**

CAL'IFOR'NIA. A city and the county seat of Moniteau Co., Mo., 150 miles west of St. Louis, on the Missouri Pacific Railroad (Map: Missouri, D 3). It manufactures harness and saddlery, woolen goods, carriages, and wagons, men's clothing, flour, and pottery. California was settled about 1845, and is governed as a city of the fourth class. There are municipal water works and sewage system. Pop., 1900, 2181; 1910, 2154.

CALIFORNIA (it is fairly well established that the name was taken from Montaloo's romance *Las Sergas de Esplanadian*, but is supposed by some to be a contraction of Sp. *caliente*, *forno*, or 'hot furnace,' applied by the early navigators to the southern sections of the State). A Pacific State of the United States of America, consisting of 58 counties and ranking second in area (not reckoning the Territory of Alaska), twelfth in population, and eighteenth in order of admission, and popularly known as the "Golden State" (Map: United States, Western part, E 2; also special map with article). Its capital is

...fairly well established
...from Montaloo's ro-
...splanadian, but is sup-
...traction of Sp. caliente,
...plied by the early navi-
...tions of the State). A
...ted States of America,
...and ranking second in
...Territory of Alaska),
...eighteenth in order of
...known as the "Golden
...res, Western part, E 2;
...rticle). Its capital is

Sacramento; pop., 44,696. The principal cities are San Francisco, 416,912; Los Angeles, 319,198; Oakland, 150,174. The State is bounded on the north by Oregon, on the east by Nevada and a small portion of Arizona, on the south by Lower California (Mexico), and on the west by the Pacific Ocean. It stretches along the coast from lat. 32° 40' N. to lat. 42°—a distance, measured along the centre of the State, of 750 miles—and its eastern boundary conforms to the curve of the seacoast, so that its breadth is approximately the same throughout, averaging about 200 miles. The meridian of 120° W. long. marks the eastern boundary of the northern third of the State and bisects the eastward-trending southern part, dividing the whole into two nearly equal parts. The total land area is 155,652 square miles. The population of the State is 2,377,549, according to the census of 1910.

Topography. The physiography of this immense State is strikingly varied, but, broadly stated, consists of two parallel mountain systems, extending northwest and southeast, inclosing between them a very extensive valley, in addition to which is included in the east a part of the Great Basin. Of the two mountain systems the longer is that known collectively as the Coast Range, being a part of the uplift extending from the extremity of Lower California to the edge of Oregon and reappearing in the Olympic Range of Washington, the islands of British Columbia and southern Alaska. Within the limits of California, beginning at the south, it is made up of the San Jacinto, Santa Ana, San Bernardino, and San Gabriel ranges, then of the San Rafael and Santa Lucia mountains along the lofty coast between Los Angeles and Santa Cruz. East of these ranges is a second lesser range, called by the Mexican settlers Sierra Madre, which becomes more prominent northward and extends thence to the border of Oregon, where the watershed bends eastward and forms the very lofty Shasta and Salmon River ranges; but Shasta belongs orographically to the Cascade system of Oregon. Notable altitudes in this system are as follows: San Bernardino Mountain, 10,630 feet; San Jacinto Peak, 10,805 feet; San Gabriel Peak, 6152 feet; Tehachapi Mountain, 9214 feet; Pinos Mountain, 9214 feet; Monte Diablo, 3849 feet; Thunder Mountain, 9121 feet; Eddy Mountain, 9151 feet; Mount Scott, 7850 feet. The altitude of Mount Shasta, a volcanic mass in Siskiyou County, in the extreme northern part of the State, is 14,380 feet.

East of the coast ranges, and parallel with them, lies the Sierra Nevada ('Snowy Range'), at a distance of 100 to 140 miles, stretching from the 36th parallel northwestward nearly to the 41st, where it ends at the valley of Pitt River, which separates it from the Shasta Range. This system consists of a massive uplift of sedimentary and igneous rocks, which have been worn into an area of clustered peaks, averaging 50 miles wide and over 400 miles long. The eastern side is abrupt and rises from the plateau of Nevada, but the western slope, receiving nearly all the rainfall and delivering all the drainage, has been worn into a series of tremendous cañons, of which those of the Merced (Yosemite), Kings, Tuolumne, and American rivers are far-famed. The Sierra Nevada is characterized by its ruggedness and by the great average altitude of its central mass. The principal peaks and their measurements are as follows, beginning with the highest mountain

in the United States proper: Mount Whitney, 14,502 feet; Fisherman Peak, 14,448 feet; Mount Coreoran, 14,093 feet; Kaweah Peak, 13,752 feet; Mount Brewer, 13,886 feet; Mount Lyell, 13,090 feet; Merced Peak, 11,722 feet; Gray Peak, 11,518 feet; Dunderberg Peak, 12,320 feet; Twin Peak, 8924 feet; Mount Matterhorn, 12,260 feet; Tower Peak, 11,704 feet; Leavitt Peak, 11,575 feet; Sonora Peak, 11,429 feet; Stanislaus Peak, 11,202 feet; Pyramid Peak, 10,020 feet. In the northeastern corner of the State there runs straight northward along the Nevada boundary a line of elevations of igneous origin, called the Warner Range. West of this line of peaks a plateau formed by a lava overflow and averaging 5000 feet above the sea, stretches to the Shasta and Siskiyou mountains and northward into the Klamath region of Oregon.

Between these two mountain systems, the Coast Range and the Sierra Nevada, lies the great valley of California, broadly open for some 400 miles from where the Kern River Mountains connect the Sierra Nevada with the Coast Range at Tehachapi, to where Shasta closes it in the far north. This valley is divisible into three parts. The first is the basin of the Sacramento River, north of San Francisco Bay, into which the river empties. This stream is considered by some to begin as the Pitt River, which flows out of Goose Lake, in the northern part of the State, forces its way through the gorges that separate the Sierra Nevada from the Shasta Range, and turns southward into the Sacramento River. It is fed by many streams from the mountains on each side, of which the Indian, Feather, and American are largest, and in its lower course traverses a flood plain which is marshy in places annually overflowed. South of where the river turns into the sea and expands into Suisun and San Pablo bays, the valley is occupied by another large river, the San Joaquin, which gathers its waters in the heights of Fresno County. It is also swelled by the Merced, the La Grange, Stanislaus, Calaveras, Consumnes, and lesser streams, which periodically pour their floods down the valley. South of the head of the San Joaquin valley, and separated from it at Fresno by a low divide, begins a dry and fairly level plain, about 100 miles long by 80 broad, the western part of which is a low, alkaline desert, surrounding Tulare Lake—an expanse of marsh-girt waters, 25 miles broad. Into this basin pours Kings River, and towards it flow many other mountain streams, which mostly disappear in the sand. In the southern part of this valley plain the Kern River flows southwestward through a region some 500 feet above sea level and empties into Buena Vista Lake. South and east of the mountains the country becomes a hot and waterless waste, named Mohave and Colorado deserts, sloping gradually to the Río Colorado and the Gulf of California. In the northern half this waste is broken by ranges and groups of arid, volcanic hills, among which lie deep salt-covered valleys, the most forbidding of which is Death Valley (q.v.), a depression near the Nevada boundary and just north of the 36th parallel. The valley is from 200 to 350 feet below sea level. On the seaward side of the Sierra Madre, however, is an extensive region, narrowing northward to Santa Barbara, comprising the most populous part of southern California—the districts about San Diego, Los Angeles, Riverside, Ventura, and Santa Barbara. Coast districts

are repeated northward in Monterey and Santa Clara counties, and north of San Francisco Bay, in Sonoma and Mendocino counties, west of the Coast Range. Some important rivers descend to the sea in these coastal regions, such as Russian River, in Sonoma County; Eel River, in Mendocino and Humboldt counties; and Trinity River, in Trinity County, most of which have a northwest course. Flowing irregularly southwest across the northwest corner of the State is the Klamath River, which drains the Siskiyou, Salmon, and other coast ranges of that region.

The coast south of Santa Barbara is a plain, stretches of which are sandy. It has several large islands in the offing. But north of Santa Barbara it is high and rocky, bold cliffs facing the sea, almost unbroken by harbors, other than that of the Bay of San Francisco, entered through the rift in the coast, cut by the joint outflowing of the Sacramento and San Joaquin rivers, and called the Golden Gate.

Climate. No State of the United States—indeed, few of the most favored countries of the world—can boast of so delightful a climate as that of the valley lands of California. Low wind velocities and high percentage of sunshine are striking features. Two seasons, the wet and the dry, divide the year—the first, so called because it is the only period during which it rains, though rains are not continuous, and the average fall for the State, 23 inches, is less than at Chicago or St. Louis. Within the State relief causes a wide range in the amount of rainfall in different sections. It amounts to more than 75 inches annually on the windward slopes of the Sierras. Precipitation is light in the Great Valley and east of the Sierra Nevadas, often not exceeding 3 inches a year. The wet season lasts from about the middle of November till April or May.

At San Francisco snow is almost unknown, the mercury never remains below the freezing point for 24 hours, and flowers bloom in the gardens at Christmas time. The average mean temperature at San Francisco is 51°—summer, 60°; winter, 49°. The California coast is subject to trade winds from the southwest. Its climate is therefore mild and temperate and recalls Mediterranean conditions far better than the Gulf of Mexico, which is tropical and to which the name of the American Mediterranean is inaccurately applied. Owing to the cool summer climate of the coast between parallels 35 and 40, San Francisco in July is cooler than San Diego by 7°, and than New York by 17°. Its highest temperature is felt only when the trade winds cease in September.

In the inland valleys greater extremes of temperature are experienced than along the coast. The mean temperature for this belt is 64°. It varies little. In the north the summer is warmer and the winter cooler than in the south. The rainfall decreases gradually from north to south, being 51 inches at Cape Mendocino and 46.6 inches at Redding, in the interior, on the same parallel as Cape Mendocino, 23 inches at San Francisco and 7 inches at Bakersfield. In general the northern coast mountains receive an abundant supply of rainfall. These regions are therefore well forested, and lumbering is carried on extensively. In southern California the climate almost reaches perfection. At San Diego the mean winter temperature is 54°, summer, 68°, and at Santa Barbara, 53° and 68° respectively. At Mon-

terey the difference between the average temperature of January and July is 6°; at Los Angeles, 12°. San Diego is 6° or 7° cooler than Charleston and Vicksburg, which are nearly in the same latitude. The great heat of the interior and of the southwest, where, as at Fort Yuma, the average summer temperature is 92°, is due to the dryness, which is easily borne, and sunstrokes never occur. The rainfall over a large area in the southern desert of the State is less than 5 inches annually. Cyclonic storms occur at the approach of winter in California. Everywhere the nights are cool. Early spring, comprising the latter part of February through April, is the most delightful part of the year. The air is mild, the sky clear, and the landscape gay with flowers. Summers are dry even along the coast from 6 to 10 miles inland, where fogs are likely to occur. During the summer the earth becomes dried to a depth of several inches; the air is filled with dust, and the smaller streams disappear—a state of things that lasts until the autumn rains begin. Among prominent winter resorts are San Diego, noted for its fine harbor, on one side of which is the famous Coronado Beach; Santa Barbara, overlooking the Pacific, a favorite watering place; Santa Monica, noted for surf bathing throughout the year; Santa Cruz, with a fine beach and background of mountains; Monterey, on beautiful Monterey Bay, associated with the earlier history of the province under Spanish rule; Indio, over 100 feet below sea level, remarkable for cures effected by its air in pulmonary diseases; Los Angeles and adjoining places, including Pasadena, in a section that has been termed "the Italy" of the United States—a paradise of rose gardens, vineyards, and lemon and orange groves. Among other well-known resorts are the Arrowhead Hot Springs, Paso Roble, and Napa Soda Springs.

Climate, in California as elsewhere, is the most important factor in agricultural industries. Irrigation has to be resorted to in some sections because of light precipitation on the lowlands, except in the case of grain crops, deciduous fruits, and grapes. The irrigated farms are generally small. Dry weather in summer enables the grain crop to be harvested without loss. The absence of severe storms to damage the crop after it has been cut is an advantage. The citrus-fruit industry, which is valued at over \$20,000,000 annually, is restricted to areas having very mild winter temperatures. Oranges are grown as far north as Butte County. Several industries are due to the high temperatures on the Colorado Desert in southeastern California. A splendid farming country occupies the reclaimed areas of the Imperial valley. Long-staple cotton is grown here with success. Date culture has been taken up at Indio and Mecca.

Flora. As California presents almost every variation of temperate climate, it naturally presents a very wide variation in its flora. The influence of climate upon flora is nowhere more strongly marked than in this State. The tree flora of California, as of the entire western part of the country, consists largely of coniferæ, while broad-leafed trees are less abundant and consist of oaks, sycamores, California laurel, madroña, and a few other species. Over 20,000,000 acres of forest land are available for the lumber industry. The trees of all species are of great size. For illustration, see SEQUOIA.

Stretching along the coast ranges from the Oregon line southward nearly to the Bay of San Francisco, and in scattered groves even as far as Santa Cruz, is found the redwood, whose enormous trees form an extremely dense forest, extending to the lower part of Mendocino County. This forest occupies the foggy, wet stretch of land closely bordering the coast. The coast redwoods cover an area of 1,500,000 acres. East of this, in the northern coast ranges, is a mixed forest consisting of red fir and yellow and sugar pines. The coast ranges south of these forests are almost treeless, but are covered with grasses, and often with a variety of thorny bushes, cats-claw, manzanita, scrub oak, etc., which collectively are known as chaparral. Here and there among them are scattered oaks and digger pines. The ranges of southern California, which rise to greater altitudes, are, on their lower slopes, covered with chaparral, while above 5000 feet coniferous forests are found. The valleys of southern California contain some chaparral, with a little grass and many cacti and Spanish bayonet, being the vegetation which is peculiar to an arid region.

The great valley of California is, in its northern part, covered with a scattering growth of oaks, while the southern part is generally devoid of timber, and is more or less under cultivation. The marshes on the lower courses of the Sacramento are covered with tule reeds. The Sierra Nevada is, on its lower slopes, covered with a thick growth of chaparral, with a few oaks and digger pines, while above an altitude ranging from 3000 feet in the southern part to 1500 feet in the north begins the yellow-pine belt, which is composed mainly of trees of that species, with sugar pine, incense cedar, and red fir intermingled. This occupies a strip on the west slope of the range, extending up to an altitude of 8000 or 9000 feet, above which it is succeeded to the timber line, which ranges from 9000 to 10,000 feet, by trees of more Arctic character—firs, hemlock, and finally, at the timber line, by white-barked pine. On the east side of the range the succession is somewhat similar, but the belts are much narrower, owing to the abruptness of the range on this side. The plateau east of the range is a desert, with very little vegetation, and that of low shrubby growth. In the yellow-pine belt, upon the west slope of the sierra, there occur 10 groves of *Sequoia gigantea*, the largest and oldest tree on earth, ranging in size up to 33 or 34 feet in diameter, with heights of from 300 to 350 feet. These do not occur in pure growth, but scattered among the yellow pines. Most of the groves are within national forest reserves or national parks, but much of the land unfortunately is held in private hands, and the trees are being cut for lumber.

California may well be called the orchard of the United States. Many of the advantages of the Mediterranean zone are concentrated in the State. Frosts occur rarely. The fruit crop is generally abundant and of good quality. The coast section in particular is adapted to the culture of the vine, olive, orange, and lemon trees.

Fauna. As California extends north and south through nine degrees of latitude and ranges from arid deserts in the south to humid and forested mountains in the north, and from the lofty sierras on the east to the sea, it must not only embrace a large variety of animal life,

but include several distinct faunas adapted to its varied climates and terrenees, such as those of the coastal valleys and plains, of successive zones of altitude in the mountains, of the sandy southern semitropical deserts, etc. Few of its animals are of the same species as those found in the eastern half of the United States. California is closely allied, zoologically, to the interior basin and Rocky Mountain region. Among the characteristic mammals of the State are the grizzly and black bears; wolves, large and small, and several fur bearers; puma and lynx; varieties of the white-tailed and black-tailed deer, and in the extreme north the Columbian blacktail. The bison never entered the State; the wapiti did so formerly, but is no longer to be found there. The bighorn wanders in the high sierra, where also are found the peculiar little beaver-like sewellel and various picas. Several rodents, such as the golden and Douglas squirrels, are peculiar to these parts of the mountains, while the plains abound in burrowing rodents, among which are large hares that have increased since civilization reduced their enemies, until in the central and southerly parts of the State they have become a decided pest. The coast fauna comprises several representatives of the seal family. The birds of California include many species not known elsewhere. A species of vulture, the California condor, was the most remarkable, but is extinct save in Lower California. The two crested quails of the State are familiar to sportsmen, as also is the large ground cuckoo, called road runner. Another remarkable local bird is the California woodpecker, peculiar in storing great quantities of acorns in holes in the bark of trees for winter consumption. The islands off the coast, especially the Farallones, are well supplied with sea birds. Among reptiles two or three species of rattlesnakes occur all over the southern region, where also a great variety of lizards exists. The fishes of both the sea and fresh waters are numerous and valuable. Peculiar varieties are the rose fish, smelts, surf fish, herrings, rock trout, and various important food fishes of the cod family. The rivers of the north receive annually vast "runs" of salmon, which are different from the Eastern salmon. (See SALMON.) It is claimed that 130 varieties of fishes can be found in the markets of San Francisco. Few of these fishes are the same as Atlantic species, but many belong to groups well represented elsewhere. The care and protection of game animals and fish culture have received much attention. Oysters are cultivated to some extent, the California variety being small and having a peculiar flavor. Over 5000 persons are employed in the coast and river fisheries.

Geology. A large part of the area is underlain by sedimentary strata of a comparatively recent geometrical age. Triassic and Jurassic beds predominate in the northern and west-central parts, and Cretaceous and Tertiary beds in the coastal region as well as along the Nevada boundary. Along the Sierra Nevada and coast ranges volcanic rocks are strongly developed and cover wide areas. The central axes of these two great ranges are formed, however, by ancient igneous and metamorphic rocks. Granite is especially prominent in these localities and constitutes some of the highest peaks. The elevation of the Coast Range took place at the close of the Miocene period, while the sierras were formed largely by an uplift that occurred near the end

of the Jurassic period. Carboniferous strata occupy a large area in the central part of the State, but they inclose no coal seams of economic importance.

Mining. California is rich in mineral deposits, particularly gold, which is found in over 30 counties, and the rapid settlement and development of the State were due to this fact. Gold was obtained by washing as early as 1841, near San Fernando mission; but it was the discovery at Sutter's Mill, near Coloma, in 1848, that made evident the abundance of the metal and attracted the excited throngs of adventurers. Many of these engaged in river mining, i.e., washing in sheet-iron pans or wooden "rockers" the gold from the sands or gravels from or near river channels; others dug the gold "dry" from veins in the rocks. About 1851 sluices were introduced, by means of which the gravels or sands were run over the bottom of a wooden box provided with blocks of wood or round stones to catch the gold as it sank. Digging soon extended from the rivers and the gulches to the higher ground, where the difficulty of washing was increased; but in 1852 the hydraulic system was brought in. In this, continuous powerful streams of water are directed through nozzles upon a gold-bearing bank or deposit. This was so successful that whole hills were reduced and swept away, but this practice was soon forbidden by law, as the detritus threatened to choke the rivers and seriously damage the agricultural interests in the valleys below. Nearly all the mines are on the western slope and in the foothills of the Sierra Nevada in a belt of country about 220 miles long by 40 wide, extending into Oregon. The gold is found in a metallic condition, but is usually mixed with silver or other metals. In stream or alluvial deposits ("placers") it occurs as fine scales or coarse grains. In rocks it is found in quartz veins, and costly machinery must be used to crush the ore, from which the gold is extracted by amalgamation with quicksilver. Where, as often is the case, the gold-bearing gravels underlie volcanic rock several hundred feet thick, drift or tunnel mining combined with sluicing is necessary. The chief gravel-mining region extends from Mariposa County into Plumas County, or between parallels 37° and 41°. Most of the gold is now obtained from the quartz mines, especially in Nevada, Amador, Tuolumne, Calaveras, Kern, Shasta, and San Bernardino counties. Gold mining is to-day greatly facilitated by the application of electrical power, which the mountain streams are made to generate. The great prominence and significance of gold in the early years of the State are evident from the great size of the output, the annual average for the decade between 1850 and 1859 inclusive being estimated at over \$55,000,000, and constituting nearly the entire product of the United States. Following this period there was a constant decline in the output, which reached the minimum (\$12,000,000) in 1892; it then revived and for the last half-decade of the nineteenth century averaged over \$15,000,000 annually. The State continued to hold first place until 1897, when it was surpassed by Colorado, but it regained first place in 1910.

Mineral Production. The production of gold from the mines of the State in 1912 was 953,639.5 fine ounces, valued at \$19,713,478, compared with 954,869 fine ounces, valued at \$19,738,908 in 1911. The production in 1913

according to the figures of the Director of the Mint was valued at about \$20,000,000. In 1912 the total gold output from placers and from copper, lead, and zinc ores decreased, but the production from siliceous ores increased in nearly equal amount. Of the production in 1912, \$11,067,815 came from the deep mines, and of this amount \$10,771,759 was obtained from siliceous ores, \$293,946 from copper ores, \$1717 from lead ores, and \$393 from zinc ore. The placer mines of the State produced \$8,645,663, of which \$7,429,955 came from dredges, \$689,682 from hydraulic mines, and \$387,992 from drift mines, and \$138,134 from sluicing mines. The total output of the dredges from 1898 to 1912 has been \$55,415,191.

The leading counties in gold production are Amador, Yuba, Butte, Nevada, Sacramento, and Tuolumne. These counties in 1912 each produced gold valued at more than \$1,000,000. The largest amount was produced in Amador County. Of the counties named, Yuba and Sacramento are essentially dredging counties, while Amador and Tuolumne are mother-lode counties. The production from Shasta County is made from siliceous and copper ores, while from Nevada County it is mainly from the gold-quartz milling ores of the Grass Valley district. The five mother-lode counties—Amador, Calaveras, El Dorado, Mariposa, and Tuolumne—whose ores are mainly gold quartz, produced altogether in 1912 gold valued at \$4,741,497, compared with \$4,877,651 in 1911.

The silver produced in the State in 1912 was 1,300,136 fine ounces, compared with 1,270,445 ounces in 1911 and 1,840,085 ounces in 1910. Of the output in 1912, 792,445 ounces came from smelting copper ores, while siliceous gold-silver ores produced 409,873 ounces. The remainder came from placers, lead ores, and zinc ores. From the copper mines of Shasta County were produced 684,381 ounces of silver in 1912, compared with 706,445 in 1911, and 1,192,520 in 1910. The falling off is due to decreased copper smelting resulting from litigation by agricultural interests on account of smelter fumes. Mono and San Bernardino counties produced the largest quantity from silver-gold and dry or siliceous ores. In 1912 there were 12 siliceous mines and 25 silver-lead-zinc mines producing argentiferous ores in California. These were mainly in Inyo, Kern, Mono, and San Bernardino counties.

The production of copper in California in 1912 was 33,451,672 pounds, valued at \$5,519,526, a decrease of 2,864,464 pounds in quantity, but an increase of \$980,009 in value from the production of 1911. Copper is produced in Amador, Calaveras, Inyo, Kern, Medera, Mariposa, Mono, Placer, Plumas, San Bernardino, and Shasta counties. The heaviest production is from Shasta County, but the quantity of the output in recent years has materially decreased owing to the smelter-fume litigation and the resultant closing down of certain smelting plants. There were 45 mines producing copper in 1912. Altogether 408,622 tons of copper ore were treated, 85,659 tons less than in 1911. The decrease in the amount treated has been steady since 1909, from the causes noted above. The copper ores of the State in 1912 yielded, in addition to copper, 14,210.65 fine ounces of silver, valued at \$487,354.

There were produced in the State, in 1912, 1,144,731 pounds of lead, valued at \$51,512—a decrease of 253,380 pounds in quantity and of

\$11,403 in value from 1911. By far the greatest proportion of the lead is obtained in Inyo County, although some comes from Kern, Mono, Plumas, and San Bernardino counties. A small quantity of gold is obtained from the lead ore, and, in 1912, 35,492 ounces of silver, valued at \$21,838, were extracted from lead ores mined. The production of zinc in the State, in 1912, was 4,345,591, valued at \$299,846, compared with 2,807,035 pounds in 1911, valued at \$160,001. Most of this zinc comes from one mine, the ores of which are shipped for treatment to reduction works in other States. In 1912 there were three mines in the State which produced zinc.

The total value of the gold, silver, copper, lead, and zinc ores produced in the State in 1912 was \$26,383,946, compared with a value in 1911 of \$25,174,677 and in 1910 of \$27,020,405. In 1909 there was produced the largest value of these metals since 1905—\$28,841,050.

The remarkable increase in the production of petroleum in the State in recent years has been the most striking feature of that industry. In 1899 the production did not reach 2,000,000 barrels. In 1906 it had increased to 34,500,000 barrels, and in 1912 the wells of the State produced the stupendous total of 86,450,797 barrels, or about 39 per cent of the total output of the United States. This was an increase of over 5,000,000 barrels from the output of 1911, which was 81,134,391 barrels. The production of 1913 was about 98,000,000 barrels. The production of 1912 was valued at \$39,213,588, compared with \$38,719,080 for the product of 1911. There are three important oil fields in the State—the Coastal and Southern, the San Joaquin Valley, and the Kern County fields. The last named are the most productive. They include the famous Kern River and Midway fields, and the product in 1912 was 50,245,255 barrels. The San Joaquin Valley field, which includes Fresno County fields and the Coalingo fields, produced, in 1912, 19,911,320 barrels of oil. In the Coastal and Southern fields were produced 15,863,404 barrels. Several new fields of importance were opened in 1912 and 1913.

The production of coal in the State is not important. There were mined, in 1912, 10,978 short tons, valued at \$23,601. The coal fields are widely separated and are found chiefly in Contra Costa, Alameda, San Benito, and Monterey counties. The use of oil as a fuel has had the effect of reducing the demand for coal in the State and has hindered the developments of coal resources. In 1912 not less than 50,000,000 barrels of petroleum were used directly for fuel. Large quantities are used also in the place of coal for gas making. California oil is the principal fuel for locomotives as far north as Washington, and it has displaced coal on Puget Sound.

California is by far the largest producer of quicksilver. Out of a total product in the United States in 1912 of 25,064 flasks, 20,524 flasks were produced in this State. The value of the product in 1911 was \$1,053,941. From 1850 to 1912 the production of quicksilver was 2,124,732 flasks, valued at \$95,275,695. The greater part of the quicksilver is produced in San Benito County, which contains the New Idria mines, the most important producers of recent years in the Western Hemisphere. Considerable quantities are produced in Santa Clara County, in which are the new Almaden mines, credited with the greatest total output in the country, and the Guadalupe, which ranked after

the New Idria in 1912 as the greatest producer. In 1912 there were 17 producing quicksilver mines in California. There was a heavy falling off in production in 1913. The output in that year was about 15,400 flasks, valued at \$257,500.

California is one of the most important clay-working States. In the value of the products in 1912 it ranked eighth. It was the sixth State in the value of common brick, fifth in the value of front and fancy brick and terra cotta, third in the production of sewer pipe, and sixth in the value of fire brick. The total value of all the clay products in the State in 1912 was \$5,912,450. Of this, the common brick made was valued at \$2,198,303 and amounted to 349,796,000. Los Angeles and Alameda are the leading clay-working counties; the former leading in the manufacture of common brick. Alameda is the first in the manufacture of sewer pipe.

Agriculture. California has few equals among the States and, indeed, scarcely among the countries of the world, in natural agricultural possibilities. In no other part of the world is so great a variety of crops brought to so high a stage of development. Over the greater portion of the agricultural area the crops of both the temperate and the subtropical zones can be grown at will with equal success. Since 1850 the agricultural section of the population has increased more rapidly than any other. During the decade 1890–1900 the number of owners and tenants increased much more rapidly than did the total rural population, being contrary to the tendency shown in the two decades preceding. This is indicative of the movement now in process by which the large estates, under the influence of increased irrigation and intensive cultivation, are passing into the hands of smaller landowners. These large estates were partly the result of easy acquisition of land and partly of confirmation by the United States government of Mexican land grants to private individuals. The holders of these estates were at first opposed to subdividing them, and only recently have settlers been able to obtain desirable farms on them. Still the average size of the farms in 1910 (316.7 acres) was quite large, and there were 4693 farms which contained 1000 acres and over, constituting 61.9 per cent of the total farm acreage.

The earlier agricultural period was characterized by the great predominance of wheat raising. Many of the large holdings were almost exclusively devoted to this industry, giving rise to the large ranch or bonanza farms of world-wide fame. Thus the production of wheat became enormous, at one time exceeding that of any other State. This was accomplished for the most part without irrigation.

The total number of all farms in the State in 1910 was 88,197, compared with 72,542 in 1900—an increase of 15,655 in the decade. Out of an approximate land area of 99,617,280 acres, 27,931,444 acres were in farms in 1910. This was a decrease from the acreage in farms in 1900, which was 28,828,951. The improved land in farms in 1910 was 11,389,894 acres—also a decrease from the improved acreage in 1900, which was 11,958,837. The average acres per farm in 1910 was 316.7, compared with 398.4 in 1900. The total value of the farm product in the State, including land, buildings, implements, and machinery, domestic animals, poultry, and bees, in 1910 was \$1,614,694,584, compared with the value of 1900 of \$796,527,955, or

an increase of 102.7 per cent in the decade. The average value of all property per farm in 1910 was \$18,308, compared with the value of 1900 of \$10,980, and the average value of land per acre in 1910 was \$47.16 and, in 1900, \$21.87. The decrease in the percentage of improved lands noted above probably represents a change in the classification of land by many farmers, who in 1910 reported as "unimproved land" a large amount of acreage which was formerly called "improved." Of the farm operators in 1910 (who numbered 88,197), 66,632 were owners, 3417 were managers, and 18,148 were tenants. Of the 66,632 farms operated by their owners in 1910, 39,368 were free from mortgage. By far the larger number of farms in 1910 were between 20 and 49 acres, while over three-fifths of all the farms were from 10 to 174 acres in size. There were 58,926 native-born white farmers, 26,193 foreign-born white farmers, and 3078 negro and other farmers. Of the non-whites, 1816 were Japanese, 591 Indians, 512 Chinese, and 159 negroes.

Crops. The table below gives the acreage value and production of the principal crops in 1909 and in 1913. The figures for 1909 are from the thirteenth-census reports, and those of 1913 are estimates of the United States Department of Agriculture.

		Acreage	Prod. Bu.	Value
Corn.....	1913	55,000	1,815,000	\$1,597,000
	1909	51,935	1,273,901	1,077,411
Wheat.....	1913	300,000	4,200,000	3,990,000
	1909	478,217	6,203,206	6,323,983
Oats.....	1913	210,000	6,636,000	3,782,000
	1909	192,158	4,143,688	2,637,047
Rye.....	1913	8,000	120,000	90,000
	1909	7,027	70,683	65,846
Potatoes.....	1913	68,000	8,092,000	5,664,000
	1909	67,688	9,824,005	4,879,449
Hay.....	1913	2,400,000	3,600,000*	48,600,000
	1909	2,533,347	4,327,130	42,187,215
Cotton.....	1913	17,000	18,000†	1,119,000
	1909	324	183	11,744

* Tons.

† Bales of 500 pounds each.

The general character of agriculture in the State is indicated by the fact that in 1909 somewhat less than one-fifth of the total value of the crops was contributed by cereals, somewhat less than one-third by fruits and nuts, and more than one-fourth by hay and forage, the remainder representing 22.2 per cent of the total, consisting mostly of potatoes and other vegetables, grass and seeds other than cereals, sugar crops, flowers, plants, and nursery products. The total value of crops in 1909 was 60.6 per cent greater than in 1899, the increase being no doubt due in part to higher prices.

Of the principal cereals grown in the State, barley and oats showed a steady increase in the 30-year period from 1879 to 1909. On the other hand, corn shows a somewhat slow yet steady decline. The acres of corn harvested in 1879 were 71,781, compared with 51,935 in 1909. The acreage of wheat shows a still greater decline. In 1879 it was 1,832,429, while in 1909 it was 478,217. The crops showing the greatest increase in the period are hay and forage. In 1879 the acreage planted in these crops was 758,024, while in 1909 it was 2,533,347.

The total value of the live stock in the State in 1909 was \$123,024,652. The cattle numbered 2,077,025 and were valued at \$52,785,068; the

horses numbered 468,886, valued at \$47,099,196; mules, 69,761, valued at \$9,016,444; swine, 766,551, valued at \$5,106,803, and sheep 2,417,477, valued at \$8,348,997.

California is the chief beet-sugar-producing State in the Union. All the coast valleys are favorably situated in respect to temperature for the production of sugar beets. The first factory successfully operated was established at Alvarado in 1879. Since that time growth of the industry has been continuous. In 1912 there were 12 factories producing beet sugar. These used 1,037,283 tons of beets, producing 161,300 tons of sugar. The total production of beet sugar in the year was 317,363,000 pounds. In the Sacramento valley the acreage in sugar beets was 7800 and in southern California between 45,000 and 50,000.

About 12,000,000 pounds of hops were produced in 1909 from an acreage of about 9000. The value of the crop was \$1,731,110. Cotton is produced in Imperial County, and its development since 1909 has been rapid. Experiments in the growing of rice have been carried on, and results indicate the possibility of growing it in the Sacramento valley. Tobacco too has been within a few years fully established as an important product. For over four years extensive experiments in the production of Turkish seed were carried on in Tulare County. The total quantity produced in 1912 was 150,000 pounds, entirely in Fresno and Tulare counties. The agricultural lands of the State produce large quantities of vegetables, of which the most important is the potato. The acreage devoted to this crop in 1912 was 78,000, and the product was 10,140,000 bushels. Celery is an important vegetable and is grown on a large scale in Orange County. Nearly 1400 earloads were shipped in 1912. Lima beans, artichokes, cauliflower, lettuce, tomatoes, and onions are also raised extensively, as are flowers, plants, and nursery products.

Horticulture. Fruits were grown in California in the time of the Spanish possession, but outside the missions there were few serious attempts at horticulture. When the missions were broken up, the early fruit industry began to decline. After the American occupation, however, advantage was quickly taken of the conditions of climate and soil to develop fruit raising. Irrigation added large areas which previously had been impossible to cultivate. Many varieties of horticultural plants which are difficult or impossible to raise in other States are produced in California. This is especially true of the regions where rainfall is lightest and the advantages of irrigation are greatest, i.e., in the southern Pacific coast and in the San Joaquin valley. In recent years the development of fruit growing in the Sacramento valley has stimulated irrigation in that region.

The production of citrus fruits has become one of the chief industries of the State. California provides about 40 per cent of the total orange supply of the world and three-quarters of the total production of the United States. Although lemons have been grown in California for half a century, it is only during the last 20 years that they have attained commercial importance. The lemon is less hardy than the orange and comprises from 10 to 15 per cent of the citrus crop. The citrus-fruit industry has reached its largest development in southern California, which is made up largely of San Bernardino, San Gabriel,

and San Fernando valleys, and in the coast regions in Orange and Los Angeles counties. The first regular orchard was planted for the purpose of profit in 1886, and since then the progress of the industry has been very rapid. The orange crop of northern California matures from four to six weeks earlier than it does in the southern part of the State, notwithstanding the fact that it is from 200 to 500 miles farther north. This unusual condition is due to the topography of the Pacific coast. The two large San Joaquin and Sacramento valleys in central and northern California lie between the two great mountain ranges extending north and south. The Coast Range shuts off the modifying influences of the sea, causing relatively higher night temperatures during the summer months than prevail in the southern part of the State. In addition to oranges and lemons, pomelos are grown in considerable extent, as are also citrons, guavas, limes, and pineapples.

The lemon industry in the State has been developed by small landowners. There are a few groves which contain from 150 to 1000 acres, but the average grove contains less than 10 acres.

No attempt has been made to record the acreage devoted to fruit raising in the State. Statistics relate to the number of trees planted. The total number of fruit trees in 1909 was 30,895,257. Of these 22,484,195 were bearing. Orange trees numbered 8,709,215; lemon trees, 1,320,969; pomelos, or grape fruit, 1,256,262. The total number of trees of tropical fruits, including oranges, lemons, pomelos, mandarins, and tangerines, was 10,103,242. The quantity in bushels produced in 1909 was 15,319,052. The value was \$16,076,051.

One of the largest and most important branches of fruit growing in the State is the cultivation of the raisin grape, the acreage of which is now by far the largest in the world. The first introduction of the raisin vine in California was in 1851, and development has been steady from that time. Many counties which have produced raisins within the past 20 years no longer do so, as it has been found that conditions are better for growing wines and table grapes or other fruits. Of the 58 counties in California, less than a dozen produce raisins in commercial quantities at the present time. Strong organization has been formed to control the production of raisins and to stimulate their consumption and use. The efforts of this organization have greatly increased the sale of raisins throughout the United States. Fresno County is the centre of the seeded-raisin industry, which grew up as the result of the invention of a raisin-seeding machine about 1870.

The production of olives in the United States is confined largely to California. It was estimated that in 1911 there was a total of 18,000 acres planted in olives in the State. The counties of San Joaquin and Sacramento valleys produced about 75 per cent of the entire crop. Olive oil was first made in Santa Barbara in 1872. The output of olive oil in 1912 was scarcely one-third of that of 1911, and of pickled olives from one-half to one-third. In 1910 there were 958,006 olive trees—836,347 bearing and 121,659 nonbearing. The quantity produced was 16,132,412 pounds, and its value was \$401,277.

Orchard fruits are produced in large quantities. The total production in 1909 was 31,502,000 bushels, valued at \$18,359,000. Plums and prunes, peaches and nectarines, apples and

apricots, are the most important orchard fruits. California has a monopoly of apricot growing, and in canned and dried forms the apricot is one of the leading fruits exported. Other orchard fruits grown in large quantities are pears, cherries, quinces, and mulberries. The growing of figs is one of the important horticultural industries. There were, in 1910, 483,528 fig trees, of which 269,001 were bearing. The total quantity produced was 22,990,353 pounds, valued at \$260,753. Experiments in date growing have been carried on for many years, and the success of some of the tests has encouraged a larger cultivation.

Of the small fruits, strawberries are by far the most important. The others include raspberries, loganberries, blackberries, and dewberries. The total acreage of small fruits in 1909 was 9687 compared with 6281 in 1899. The production in 1909 was 26,824,000 quarts, compared with 14,582,000 quarts in 1889, and the value was \$1,789,000 in 1909, as compared with \$911,000 in 1899.

In the production of canned apricots, peaches, and pears, and dried peaches and prunes, California ranks first among the States. In 1909 the value of the canned fruits produced was \$7,248,342, and of dried fruits \$18,212,316.

Statistics for the production of the most important fruits of 1912 will be found in the following figures. There were shipped 40,673 carloads of oranges and lemons, of which about 35,000 were oranges and about 6000 lemons. The number of boxes per car of oranges and lemons is about 396 for oranges and 336 for lemons. The total production of dried peaches and nectarines in 1912 was 53,500,000 pounds; dried pears, 3,500,000 pounds; dried prunes, 200,000,000 pounds; plums, 750,000 pounds; raisins, 185,000,000 pounds; canned fruits, 5,005,950 cases.

Viticulture. The introduction of European wine into California dates back to 1771. It was first brought from Spain by way of Mexico to the Catholic Missions. The Mission of San Gabriel at Los Angeles planted the first vineyard, and the planting of vines extended from mission to mission, until vineyards of from 5 to 30 acres stretched from San Diego to Sonoma. With the downfall of the Spanish power the missions waned, and with them the viticulture declined also. Production of wine continued to some extent, and in 1850 about 60,000 gallons of wine were produced in two counties, Los Angeles and Santa Barbara. In 1861 about 1400 different varieties of grapevines of Europe were propagated in Sonoma County. Cuttings from these vines were distributed among the growers in different parts of the State. From that time the manufacture of wine in California has had a continuous and marvelous growth. In 1890 the vintage amounted to about 15,000,000 gallons. In 1900 the production was over 8,000,000 gallons of sweet wines and 15,000,000 gallons of dry wines, or a total of over 20,000,000 gallons.

Some of the California vineyards are among the largest and best cultivated in the world. The wine-producing areas of the State are usually classified into dry-wine districts and sweet-wine districts. Those included in the former are situated chiefly in the valleys and hills of the counties of the Coast Range from Mendocino to San Diego. The sweet-wine district includes the great central valleys of Sacra-

mento and San Joaquin. This classification is not strictly logical, because both sweet and dry wines can be made in nearly, if not all, the grape-growing districts. Practically all the principal wine grapes of Europe have been introduced and tested in California. About four-fifths of the wine, both sweet and dry, however, is made from about a dozen varieties. The Zinfandel is the typical red-wine grape of California, and it is grown in larger quantities than any other. From it the bulk of all dry and sweet red wines is made. The average yield of vineyards varies from 1 to 2 tons per acre to 8 or 10 tons. The difference depends principally on soil, climate, and the methods of the grape grower. The production of sweet wine in 1911 constituted a record. It amounted to 23,467,444 gallons, of which 9,522,237 gallons were port, 8,559,872 sherry, 2,609,518 angelica, and 2,247,279 muscatel. The remainder was malaga, madeira, and tokay.

The manufacture of sparkling wine has been undertaken in recent years and promises to be successful. The production of natural champagne in bottles in 1913 was about 1,000,000 compared with 800,000 in 1912 and 580,000 in 1911.

Nearly all the brandy made in the United States is produced in California.

The total production of all vintages of wine in the State in 1912 was 47,491,772 gallons, of which 25,000,000 were dry wine and 22,491,772 were sweet. The brandy produced in that year was 6,153,131 gallons. In 1913 the estimated total production of wine was 39,719,113 gallons, of which about 22,000,000 were dry wine. The production of brandy in that year was 7,373,013 gallons, of which 4,460,707 gallons were used in the fortification of wines.

Irrigation. In nearly all sections of the State there is sufficient rainfall for the maturing of some crops, although there are other sections where no crops can be grown without

irrigation. The normal annual precipitation ranges from about 2 inches in the Imperial valley in the southeast to about 60 inches along the coast in the northwestern part. Irrigation is practiced to some extent throughout the State, but the largest part of irrigated land lies in the southern part of the Sacramento and the San Joaquin valleys and in the north. In 24 of the 58 counties, more than half of the farms are irrigated. The total area irrigated in 1910 was 2,664,104 acres. Of this, by far the larger part was irrigated through private and commercial enterprises. The United States Reclamation Service had up to that time irrigated 400 acres and the United States Indian Service 3490.

As in other States, streams are the principal source of supply of water for irrigation, but in California wells supply much more land than in any other State. Of the entire acreage crops in the State, slightly less than one-fifth is irrigated, the proportion varying widely for the different crops. Cereals are very generally grown without irrigation. Of the entire acreage for potatoes, about 50 per cent is irrigated, and of small fruits 71 per cent. Sugar beets are grown for the most part without irrigation.

The increase in irrigation during the decade 1900-10 was very large. The total number of farms irrigated in the latter year was 39,352, compared with 25,657 in 1900. The Colorado River, which is the division line between California and Arizona, is of great value in irrigating lands which otherwise would be arid. This river has been called the "Nile of America," as it is subject to a large rise annually. Its waters have turned the desert lands of the Imperial valley into fertile lands, and more will be claimed by the Yuma project of the United States Reclamation Service. See IRRIGATION.

Manufactures. Although agriculture and mining are the principal industries in California, the State has shown a marked increase

MANUFACTURES — CALIFORNIA

TABLE. — COMPARATIVE SUMMARY FOR 1909 AND 1904

THE STATE — ALL INDUSTRIES COMBINED AND SELECTED INDUSTRIES

in manufactures during the last 40 years. The natural resources of the State give rise to several of its leading industries, such as the lumber industry, canning and preserving, flour and grist milling, petroleum refining, the refining of beet sugar, the wine industry, and the manufacture of cement. The high cost of fuel, the greater part of which had to be brought from outside of the State, retarded the early development of manufactures, but the discovery of an abundance of oil, the developments of the oil fields, and the utilization during recent years of electricity generated by water power, have given a decided impetus to manufactures.

The gross value of products per capita of the total population increased from \$119 in 1869 to \$223 in 1909, and the proportion which the manufactures of the State represented of the total value of the products of manufacturing industries in the United States advanced from 1.6 per cent to 2.6 per cent during the same period. In 1869 California ranked sixteenth among the States in gross value of manufacturing products. It had advanced to eleventh place in 1909. The table given on page 337 presents the most important details in relation to manufactures in California in 1909 in comparison with 1904. Only those industries the value of whose annual products is \$2,000,000 or more are given.

From this table it will be seen that the State had, in 1909, 7659 manufacturing establishments, which gave employment to an average of 141,576 persons during the year and paid out \$107,097,000 in salaries and wages. Of the persons employed, 115,296 were wage earners. These establishments turned out products to the value of \$529,761,000, to produce which materials costing \$325,238,000 were utilized. The value added by manufacture was thus \$204,523,000, which in general represents the net wealth created by manufacturing operations during the year. These totals do not include the statistics for an establishment operated by the Federal government, the United States Navy Yard at Mare Island. In 1909 this plant operated an average of 1917 wage earners, and the value of the work performed was \$4,335,000. The total brings out the fact, in general, that the manufacturing industries of California in most respects showed a higher rate of development during the five-year period 1899-1904 than during the succeeding five-year period 1904-09. During the period 1899-1904 the average number of wage earners increased 30 per cent; the value of the products, 42.7 per cent, and the value added by manufacture, 63.8 per cent. For the later period 1904-09 the corresponding percentages were 14.9, 44.3, and 35 respectively. Limits of space prevent the inclusion in this table of any industries the value of whose products is less than \$2,000,000 per year. This excludes a great many important industries, such as the beet-sugar industry, the manufacture of glass, shipbuilding, smelting and refining of copper, smelting and refining of lead, sugar refining, not including beet sugar, and the manufacture of woolen, worsted, and felt goods. The products of all these industries exceeded \$500,000 each in 1909.

The most important single industry in the State is that connected with lumber and timber products. It embraces logging operations, saw mills, planing mills, and establishments engaged in the manufacture of wooden packing

boxes. It does not include mills engaged exclusively in custom sawing. It gave employment in 1909 to 22,935 wage earners, or 19.9 per cent of the total for all manufacturing industries, and the value of its products amounted to \$45,000,000, or 8.5 per cent of the total. While the growth of this industry during the five-year period 1904-09 was considerable, its development was much less rapid during the earlier period 1899-1904. The production of rough timber in 1909 in millions of feet was 1,143,507, compared with 737,035 in 1899. The production of lath in thousands was 32,615 compared with 11,507 in 1909, and the shingles produced in thousands numbered 572,342, compared with 650,090 in 1899. The woods which supply the raw material are almost exclusively conifers. The hard wood cut in 1909, practically all of which was California or tan-bark oak, formed only $\frac{1}{5}$ of 1 per cent of the total lumber production during the year. More than 45.6 per cent of the lumber output in 1909 was California redwood, a species which does not occur in saw-log size outside of California. The chief among the other species sawed into lumber were Western pine, with a production of 364,748 M feet board measure, Douglas fir, with a production of 88,854 M feet, and sugar pine with a production of 88,822 M feet. The noteworthy peculiarity of the lumber industry in the State is the fact that the manufacture of shingles, while carried on to some extent in connection with that of lumber, nevertheless amounts practically to a separate and distinct industry. Over 88 per cent of the shingle output of the State for 1909 was manufactured from redwood, which lumber possesses in a very high degree the qualities most desirable for shingle material.

The second industry in point of importance is the slaughtering and meat packing. This classification includes wholesale slaughtering and meat-packing establishments and those engaged in the manufacture of sausage only. The animals slaughtered are mainly cattle and sheep from the foothills and lower mountain slopes and from the plateau regions of the north-eastern part of the State and southeastern Oregon. About half of the stock slaughtered is raised within the State.

The canning and preserving industry, the third in point of importance, dates from 1875, although its real importance and developments did not begin until several years later. See *Horticulture*. Canned fruits decreased in relative importance during both five-year periods, although the value of the output remained approximately the same. The value of the output in 1909 showed an increase of \$270,259, or 3.9 per cent, as compared with 1904; this increase, however, was not sufficient to make up for the decrease from 1899 to 1904, so that a decrease of \$91,717, or 1.2 per cent, is shown for the decade as a whole. The fruit most largely canned in 1909 was the peach, the value of which constituted 9.12 per cent of the total reported for the industry.

The value of the vegetables canned increased throughout the decade, the greater increase from 1904-1909 being much higher than during the preceding five-year period. The value of canned asparagus formed over one-half the value of all canned vegetables reported in 1909.

For notes on the production of petroleum in the State, see the paragraph *Mineral Production*.

The automobile industry shows a much higher rate of increase than any other of the large industries. The value of the product in 1909 was more than 40 times as great, and the value added by manufacture more than 33 times as great as in 1904. The distillery, cement, food-preparation, and petroleum-refining industries also show remarkable increases in both value of products and value added by manufacture during the same period.

As will be seen from the table, the average number of persons engaged in manufacturing during 1909 was 141,576, of which 115,296 were wage earners. Of the remaining, 13,640 were proprietors and officials and 12,640 were clerks. For all the industries combined, 86.9 per cent of the average number in 1909 were males, 16 years of age and over; 12.2 per cent females, 16 years of age and over; and $\frac{9}{10}$ of 1 per cent were children under the age of 16. A majority of the adult female wage earners were employed in the canning and preserving, men's clothing, printing, and publishing industries. The canning and preserving and the printing and publishing industries were the only ones giving employments to an average of more than 100 wage earners under 16 years of age. Together they employed one-third of the total number of such wage earners.

For a majority of wage earners employed in the manufacturing industries of the State, the usual hours of labor range from 54 to 60 a week; 21.1 per cent of the total were, however, employed in establishments where a week of less than 54 hours prevailed, and 8.8 per cent in establishments where the hours were more than 60 per week.

In 1909, 55.7 per cent of the total value of manufacturing products was reported for cities having over 10,000 inhabitants, and 60.4 per cent of the average number of wage earners in manufacturing industries were employed in such cities.

The only cities of the State having a population of over 100,000 inhabitants are San Francisco, Los Angeles, and Oakland. In San Francisco in 1909 there was an average of 28,244 wage earners, compared with 38,429 in 1904 and 32,555 in 1899. The value of the products of the manufacturing industries of the city in 1909 was \$133,044,069, compared with \$137,788,233 in 1904, and \$107,023,567 in 1899. The decrease in the five-year period 1904-09 is due chiefly to the conditions which followed the fire of 1906. In Los Angeles, in 1909, 17,327 wage earners were employed, compared with 10,424 in 1904 and 5173 in 1899. The value of the product of the industries in 1909 was \$68,586,274, compared with \$34,814,475 in 1904 and \$15,133,696 in 1899. In Oakland there were, in 1909, 6905 wage earners, compared with 3353 in 1904 and 2478 in 1899. The value of the product of the industries was \$22,342,926 in 1909, \$9,014,705 in 1904, and \$5,368,258 in 1899. Other cities having more than 1000 wage earners and a product valued at more than \$4,000,000 in 1909 were Sacramento, Stockton, Fresno, San José, San Diego, and Berkeley. With the exception of San Francisco, every city shows an increase in the value of products from 1904 to 1909.

Lumbering. See *Manufactures*.

Fisheries. The latest authoritative statistics for fisheries in the State are for the year 1908. Salmon stands first, both in quantity and value,

among the species of fish taken in California waters, the State ranking third in the country, both in quantity and in value of the salmon caught. The amount taken in 1908 was 9,211,000 pounds, valued at \$471,000. Of the total quantity, 79 per cent was taken from the Sacramento River. Striped bass ranks second in value, and cod third. The oyster industry has greatly advanced in recent years. The amount taken in 1908 was 729,000 pounds, valued at \$337,000. There has been a steady decrease in whale products for several years. Whalebone and oil were valued at \$119,000 in 1909, compared with \$393,000 in 1904. Other important fish taken are shinook, sardines, sole, flounders, white sea bass, and codfish. The total number of persons employed in fisheries in the State in 1908 was 4129. The value of the products was \$1,970,000.

Transportation. The Sacramento and San Joaquin rivers are the principal streams, the former navigable as far as Red Bluff, 262 miles above its mouth, and the San Joaquin navigable, at dry water, as far as Hills Ferry, 195 miles from its mouth. The channel up to Stockton is open throughout the year. Wheat and barley are shipped by steamboat and barges down these streams to tidewater. An Act of Congress approved March 1, 1903, created the California Débris Commission to regulate the hydraulic mining in the territory drained by these river systems and to adopt plans to improve and protect navigation on these streams. The State also has contributed towards the improvement of the Sacramento and Feather rivers. In 1911-13 the Federal government dredged the harbor of Los Angeles and built a breakwater. It also improved the San Francisco harbor by the removal of rock and made improvements in other harbors, including those of San Diego and Oakland. San Francisco Bay, which has an area of about 450 square miles, is by far the most important harbor in the State. In this bay are located the cities of San Francisco and Oakland. Los Angeles and San Diego in southern California are the ports of the State next in importance. Several trunk lines and local railways, which operated 7511 miles of track in 1912, furnish excellent transportation facilities by land. Two important transcontinental lines, the Southern Pacific and the Atchison, Topeka, and Santa Fe, enter the State from the south. The Southern Pacific has a line running through the central part of the State which connects with the Union Pacific at Ogden, Utah. Another line extending north connects with the line of the Oregon Railway Navigation Company at Portland, Oregon. In 1911 there were 46 steam railroads in the State and 22 electric railways, with a mileage of 1572.

Population. California is the most populous Western State. The population has increased steadily, and the percentage of increase between 1900 and 1910 was 60.1 per cent. In this decade the State rose from the rank of twenty-first to the rank of twelfth. The population by decades is as follows: 1850, 92,600; 1860, 379,900; 1870, 560,200; 1880, 864,700; 1890, 1,208,000; 1900, 1,485,053; 1910, 2,377,549. The estimated population on July 1, 1914, was 2,757,895. The population per square mile in 1910 was 15.2 compared with 9.5 in 1900 and 7.8 in 1890. Of the total population, 1,106,533, or 46.5 per cent, were in 1910 native whites of

native parentage; 635,889, or 26.8 per cent, were native whites of foreign or mixed parentage; 517,250, or 21.8 per cent, were foreign-born whites. The proportion of native whites of native parentage increased somewhat during the decade 1900-10. The Indians in 1910 numbered 16,371, compared with 15,377 in 1900. The Chinese numbered 36,248 in 1910, compared with 45,753 in 1900, and 72,472 in 1890. The Japanese numbered 41,356 in 1910, compared with 10,151 in 1900 and 1147 in 1890. Of the total population 1,322,978 were males and 1,054,571 females. There were about 125.5 males to 100 females in 1910. In 1900 the ratio was 123.5 to 100. Among native whites the ratio in 1910 was 108.7 to 100, and among foreign-born whites 169.9 to 100. The urban population in 1910 was 1,469,739, compared with 810,193 in 1900. The rural population was 907,810, compared with 674,860 in 1900. Therefore, while the percentage of urban population increased 81.4 over 1900, the rural population increased only 34.5. Males of voting age in 1910 numbered 920,397, compared with 544,087 in 1900. There were, in 1910, 43 incorporated towns, having a population above 4000, and their inhabitants constituted about 50 per cent of the total population. Following are the leading cities with their populations in 1910 and 1900: San Francisco, 416,912, 340,782; Los Angeles, 319,198, 102,479; Oakland, 150,174, 66,960; Sacramento, 44,696, 22,282; Berkeley, 40,434, 13,214; San José, 28,946, 21,500; Stockton, 24,892, 12,470; Alameda, 23,383, 16,463; Stockton, 23,253, 17,506. See also the separate articles on these cities.

Militia. The organized militia of the State includes three regiments of infantry of 12 companies each, one squadron of four troops of cavalry, two separate batteries of field artillery, one company of signal troops, 11 companies of coast-artillery corps, and detachments of sanitary troops. The total strength of the militia on June 30, 1912, was 3425, of whom 3191 were enlisted men, and 234 officers. The State designation is the National Guard of California. The State headquarters are at Sacramento, and the commander in chief is the Governor.

Education. The State has always been among the most progressive in its educational policy. Its system is wide in scope and thorough in administration. In the length of its school year (166 days) it exceeds that of any State west of the Alleghanies. The problem of small rural districts affords much difficulty, but in the yielding of this the State has succeeded better than most others. The Legislature of 1911 passed a new compulsory education law, which sets the age for school attendance in the State from 8 to 15. There are, however, many exceptions to this rule. According to the thirteenth census the school population of the State in 1910 was 555,554. The total number attending school in that year from the ages of 6 to 20 was 377,666. Of these, 205,043 were of native parentage, and 129,155 were of foreign or mixed parentage, and 17,815 were of foreign-born parentage. There were 2936 negroes in the schools. In 1913 the total enrollment in the public schools, according to the report of the State Superintendent, was about 430,000, with an average daily attendance of about 400,000. The teachers numbered about 14,500, of whom 10,000 were in the elementary schools.

Annual expenditures for education in recent years have exceeded \$20,000,000. The average yearly salary paid to teachers in the elementary schools in 1912 was \$1010.18 for men and \$726.94 for women. In that year there were 229 high schools maintained in 55 counties. There were, in 1910, 74,902 illiterates, or 3.7 per cent; in 1900 there were 58,959, or 4.8 per cent of the total population. The illiteracy among the native whites in 1910 was 5 per cent, among whites of foreign or mixed parentage, 6 per cent, among foreign-born whites, 10 per cent, and among negroes, 13.4 per cent. The increased number of illiterates in 1910 was due to the increase in the foreign-born population.

There are normal schools at Chico, Fresno, Los Angeles, San Diego, San Francisco, San José, and Santa Barbara. The last named is a State Normal School of Manual Arts and Home Economics. The most important universities are the University of California and the Leland Stanford Junior, which rank with the foremost institutions of the country. Other colleges are Pomona College, Claremont, Occidental College, St. Vincent's College, University of Southern California at Los Angeles, Mills College at Mills College, St. Mary's College at Oakland, Throop College of Technology at Pasadena, St. Ignatius University of San Francisco, College of the Pacific at San José, University of Santa Clara at Santa Clara, and Whittier College at Whittier. Theological seminaries include Berkeley Bible Seminary, the Pacific Coast Baptist Theological Seminary, the Pacific Theological Seminary, and the Pacific Unitarian School for the Ministry at Berkeley, the Maclay College of Theology of the University of Southern California at Los Angeles, St. Patrick's Seminary at Menlo Park, San Francisco Theological Seminary at San Anselmo, and the Church Divinity School of the Pacific at San Francisco. The summer schools include the Cathedral Oaks School of Art at Alma, California School of Arts and Crafts, and the University of California at Berkeley, Krotona Institute of Theosophy, the Public Vacation Schools, the University of Southern California, and Y. M. C. A. Summer School at Los Angeles, the Summer Institute of Mechanic and Household Arts at Mount Hermon, the San Diego State Normal School at San Diego.

Finance. In 1908 a constitutional amendment was passed, which provided for raising the revenue of the State, chiefly from a percentage tax, on the gross earnings of railroad, telegraphs, telephone, and other public-utility companies. Property tax is reserved exclusively for local purposes. The Legislature of 1911 created a State Board of Control, composed of three members, to be appointed by the Governor. In November, 1912, an amendment changing the system of depositing public funds was adopted. The cash receipts for the fiscal year ending June 30, 1912, were \$39,323,133. The disbursements for the same period were \$36,620,919. The balance at the beginning of the fiscal year was \$7,453,602, and at the end of the fiscal year \$9,903,533. The chief receipts are from county taxation and from the taxation of franchises and corporations. The chief expenditures are for education, expenses of State institutions, and for the administration of State officers.

Banking. On June 14, 1912, there were 519

State banks in California, with total resources amounting to \$666,598,510. The national banks, on Sept. 4, 1912, numbered 231, with total resources of \$501,213,995. In 1912 there were 132 savings banks with 597,159 depositors and deposits amounting to \$407,006,665. The State banks included 150 commercial banks, 166 departmental banks, and 7 trust companies. California stands fifth in banking strength among the States. It is surpassed only by New York, Pennsylvania, Massachusetts, and Illinois. In savings-bank deposits alone California outranks Illinois and is exceeded only by New York, Massachusetts, Pennsylvania, and Connecticut. The average amount of each deposit in the savings banks, in 1912, was \$681.16. The total deposits in all the banks in 1912 was \$795,604,872. Bank clearings of San Francisco in 1912 amounted to \$2,677,561,952 and of Los Angeles to \$1,168,941,700. Six other cities had bank clearings exceeding \$35,000,000 in 1912.

Charities and Corrections. The Legislature of the State has devoted much attention to improved methods of dealing with the problems relating to charities and corrections. In 1911 the State Board of Charities and Corrections received new and increased powers. In 1903 juvenile courts were first established. This law has been amended by successive legislatures. The Legislature in recent years has also passed successive measures relating to child labor. In 1905 a child-labor law was enacted, and this was amended in 1907, to forbid the employment of children under 14. It was further amended in 1911, when the age limit was raised from 14 to 15, and the employment of minors under 18 after 10 P.M. was forbidden. Children over 12 may work on a special permit from a judge of the juvenile courts. The Legislature of 1911 authorized the establishment of a State reformatory for first offenders, between 16 and 30 years of age. Penal institutions include the State prisons at Folsom City and San Quentin, a State Reform School at Whittier, and the Preston School of Industry at Ione. The charitable institutions include the Stockton State Hospital, the Napa State Hospital, the Agnew State Hospital, the Mendocino State Hospital, and the Southern California State Hospital. In addition to these are several insane asylums, a home for the care and training of feeble-minded children at Eldridge, Institute for the Deaf and Blind at Berkeley, and the Home for Adult Blind at Oakland. There are soldiers' homes at Yountville and near Santa Monica. The total number of persons in all State institutions in 1913 was 13,280. The Legislature of 1913 provided for two new State institutions, a State Training School for Boys and a Psychopathic State Hospital.

Government. The present constitution became operative in 1879. A proposed amendment must have a two-thirds vote of each house, and be approved by a vote of the State electors. A proposition to revise the constitution must likewise receive a two-thirds vote of the Legislature and the approval of the people, and the text drawn up in the resulting constitutional convention must also be submitted to the people for their approval.

There have been many amendments to the constitution, the most important of which will be noted in the various paragraphs below, to which they relate. In 1911, 21 constitutional amendments were adopted by popular vote. The

most important of these were amendments providing for the initiative and referendum and for woman suffrage.

Legislature.—Senators (40) hold office for four years, Assemblymen (80), for two years. The Legislature meets in biennial sessions on the first Monday after the first day of January of odd years, and the pay of the members (\$8 per day and 10 cents mileage) is limited to 60 days. The Governor may convene extra sessions, but the power to legislate at these is restricted to the specified subject. The House impeaches, while the Senate acts as a court of impeachment.

Among the amendments carried on Oct. 10, 1911, was a unique provision for two distinct sessions of the Legislature. There is, first, a session of 30 days in which bills may be introduced, followed by a recess of 30 days, and then another and final session of 30 days in which no bills can be introduced, except by a two-thirds vote.

Executive.—The Governor, Lieutenant Governor, Secretary of State, Comptroller, Treasurer, Attorney-General, and Surveyor-General are each elected for a term of four years. A two-thirds vote of each house overcomes the Governor's veto. Money appropriation bills may be vetoed in part. In case of a vacancy in the office of Governor, the Lieutenant Governor takes his place, and in turn is succeeded by the President pro tempore of the Senate. The Governor grants reprieves, pardons, and commutations of sentence.

Judicial.—The Supreme Court, the members of which are elected for a term of 12 years, consists of a Chief Justice and six associates, and is divided into two departments, which may sit separately or as one court. Each county has a Superior Court, whose members are elected for a term of six years. Inferior courts are established by the Legislature. No judge of Supreme or Superior Court can receive his salary unless he swears that no case in his court submitted 90 days previous remains unattended to.

Suffrage and Elections.—As a result of the adoption of a constitutional amendment on Oct. 10, 1911, women are admitted to the suffrage on an equal basis with men. The general qualifications for voters are that they shall have lived one year in the State, 90 days in the county, and 30 days in the voting precinct; that they shall not have been convicted of infamous crimes, embezzlement, or misappropriation of public money, and that they shall be able to read the constitution and write their names. Chinese are excluded from rights of citizenship. Elections are governed by a primary law which corresponds practically to the Oregon law. The direct primary law was simplified in 1911. Nominations other than by primary must be made by a petition with a certificate for each signer. At an extra session of the Legislature in 1911 the State was redistricted into senatorial, assembly, and congressional districts. At the regular session of 1911 provision was made for a presidential primary election to be held on the second Tuesday of May in the years of presidential elections. Voting by voting machines is permitted, and in 1911 the law in regard to such machines was revised. The ballot law provides for the office-group form in nominations, with names arranged in rotation and in alphabetical order for local officers, with the party name following the name of the

office, and with a blank space in each party group for the addition of the name of the elector. An assembly ballot and a card containing instructions must be mailed to each voter prior to the election, and pamphlets containing arguments for or against measures proposed for referendum must be distributed to voters. Pamphlets on proposed constitutional amendments must be distributed to public schools.

Local and Municipal Government.—There is a uniform system of county governments, and general laws are enacted for the organization of townships. Laws affecting municipal corporations must be general laws, applying to classes of municipalities made upon the basis of population. The towns and cities are permitted to adopt a commission form of government, and the following cities were governed by this plan in 1914; Berkeley, Modesto, Monterey, Oakland, Pasadena, Sacramento, San Diego, San Luis Obispo, San Mateo, Santa Cruz, Stockton, Vallejo, Pomona, Petaluma, and San Bernardino. The municipalities of the State were reclassified in 1911. Cities of over 400,000 are in the first class; those between 250,000 and 400,000 are in the first and one-half class; those between 100,000 and 250,000 are in the second class; those between 23,000 and 100,000, third class; between 20,000 and 23,000, fourth class; between 6000 and 20,000, fifth class; and those under 6000, sixth class. Cities already organized, however, are not included in this classification. In the cities in which the commission form of government prevails, the initiative referendum and recall are included in the plan of government. The recall of election officers and the initiative and referendum are also provided for in counties and subdivisions of counties. These methods of government are not limited to municipalities which have the commission form of government. Cities and towns are permitted to draw up their own charters.

Other Constitutional and Statutory Provisions.—No corporation formed under the laws of the State can employ, directly or indirectly, any Chinese or Mongolian, and contracts for coolie labor are void. Appropriations to sectarian schools are prohibited. The legal rate of interest is 7 per cent, but any rate is allowed by contract. Women may enter or pursue any lawful business, vocation, or profession, and the property of married women belongs to them alone. There are stringent measures for the regulation of trusts. A law provides for local option in incorporated towns and cities, and in supervisorial districts outside of cities or towns, on a petition of 25 per cent of the qualified voters. A public-utilities commission has general control over the public utilities of the State. The Legislature of 1911 reorganized the State Bureau of Labor and made the term of the commissioner during good behavior. The law requires all physicians to report on occupational diseases to the State Health Board, for the transmission to the commissioner of labor. There is a workmen's compensation law with liberal provisions. Giving or selling tobacco to minors is a misdemeanor. In 1911 a State flag was adopted. This shows a grizzly bear in dark brown on a white field, with a red stripe at the bottom of the flag and a red star in the upper left-hand corner. The flag bears the legend "California Republic." The Legislature of 1913 enacted, in addition to the alien land law, which is described in the section

History below, a "blue-sky" law, a State civil-service law, a law providing for mothers' pensions, a water-conservation act, a measure providing for minimum-wage commission for women and minors, with authority to fix wages and hours of labor, an eight-hour law for underground workers, a 16-hour law for train and engine men, a law providing for nonpartisan elections in counties, and an act providing for the creation of a legislative council bureau to advise and assist the Legislature.

Sacramento is the capital. The State has 11 Representatives in the Lower House of the national Congress, having gained 3 by the new apportionment based on the census of 1910.

Religion. From an early date the Roman Catholics have been very active in missionary work. Nearly all the Spanish element of the population and a large part of the Indian population are members of that church. The Methodists, Presbyterians, Congregationalists, and Baptists follow, in the order named, and the other leading denominations are represented.

History. The name "California" was originally applied to what is now Lower California, which was visited by the Spanish as early as 1533. Later the name was extended to the whole western coast of North America below the parallel of 42°, and the distinction of Upper and Lower California was introduced. The first exploration within the limits of the State was done in 1542 and 1543, when Cabrillo visited the coast and islands of the Santa Barbara region. In 1579 Sir Francis Drake sailed as far as the forty-third degree of latitude, and named the country New Albion, but did not, as is generally supposed, enter the Bay of San Francisco. In 1602 and 1603 Vizcaino explored the bays of San Diego and Monterey and sailed as far north as Point Reyes. The Spanish attempted to civilize the country by the establishment of missions along the coast. In 1769 the first mission in California proper was erected at San Diego by the Franciscans, and by 1823, when the last and most northerly station had been planted at Sonoma, these religious houses had grown to 21 in number and acquired great wealth in olive, orange, and grape plantations and cattle and horse ranches. The Indians were early converted to Christianity, gradually weaned from their nomadic and barbaric state, and induced to lead a settled life. They were taught farming and other civilized pursuits and became in time a peaceful and industrious people. The Spanish government, which intended eventually to turn the mission estates into administrative districts, never acknowledged the title of the priests to the land and in 1777 began the founding of pueblos or towns. Upper California was divided into the four provinces of San Diego, Santa Barbara, Monterey, and San Francisco. After the Mexican Revolution of 1821 the missions began to decline. The Indians were partly emancipated in 1826, and the process of secularization, which began in 1833, was completed by 1845. Commerce with foreign nations, which was at first forbidden, became very large after 1822. In 1826 the first American immigrant wagon train entered California. In 1840 Monterey was made the capital, and a year later the Russians, who had maintained a trading post north of Bodega Bay since 1812, abandoned it.

Under the Mexican Republic California enjoyed virtual autonomy, and after 1840 its independence was seen to be inevitable. A silent

conflict arose between those who favored ultimate annexation to the United States and the large class of property owners who were inclined to favor the establishment of a British protectorate. In the southern part of the State Larkin, the United States Consul, was secretly endeavoring to stir up a revolt against Mexico and to bring about the extension of the jurisdiction of the United States over the country. But before his schemes had attained full maturity, a rising of the American settlers in northern California took place. On June 14, 1846, a small party of Americans, aided by John C. Frémont, who was then in California at the head of an exploring expedition, seized the town of Sonoma, raised the Bear Flag, and on the Fourth of July proclaimed the independence of California. Commodore Sloat, acting under orders from the United States government, which was then preparing to go to war with Mexico, seized Monterey and Yerba Buena (San Francisco), and the conquest of the country was completed by Commodore Stockton, Colonel Frémont, and General Kearny. On Aug. 15, 1846, California was declared a Territory of the United States.

The discovery of gold at Sutter's Mill, near Coloma, on Jan. 24, 1848, gave an impetus to immigration from all parts of the globe. The great body of gold seekers, "the Argonauts," arrived in 1849, and by the end of the year the population exceeded 100,000. Nearly all the newcomers were unmarried men, in haste to get rich. Hence the organization of an authoritative body, responsible for public order, was neglected or hindered by the influx of lawless characters. There ensued reckless speculation, extravagant living, and easy-going morality in many localities. Stable elements, however, were not wanting—the mining camps had stringent laws of their own, and lynch law was resorted to in many quarters. Life and property, however, were not well secured. The people were heavily taxed without representation, and though San Francisco had been made a port of entry, no Territorial government had been granted. On Nov. 13, 1849, after several unsuccessful attempts at State making, a constitution, in which slavery was prohibited, was adopted, and on Sept. 9, 1850, California entered the Union. (For national events connected with the State's admission, see UNITED STATES, and COMPROMISE MEASURES.) In 1851 the citizens of San Francisco formed a vigilance committee to check lawlessness in that city. The committee tried offenders, banished and hanged at its discretion, and performed its duties so efficiently that in 1856 it was reorganized to meet a new outburst of public disorder and official corruption. When the Civil War broke out, California, which was thought to be contemplating secession, was exempted from furnishing troops. The Union party, however, became dominant, contributed nearly \$1,500,000 to the Federal government, and sent five companies of volunteers into the field.

Since the Civil War California has experienced a magnificent economic development. The completion of the Union Pacific Railroad furthered the prosperity of the State. Both from the Eastern States and from across the Pacific the tide of immigration flowed in steadily. So considerable, indeed, did the number of Chinese immigrants become that between 1870 and 1890 the Chinese question dominated State politics and influenced national legislation. In the min-

ing districts the Chinese reworked abandoned placer claims. In urban and suburban communities they became laundrymen, truck gardeners, hucksters, and domestic servants or, in the "Chinatown" which became a feature of the larger cities, pursued more varied callings. Their stolid patience and their capacity for long and sustained toil made them in one way ideal laborers for the development of a new country; but their extreme frugality and their willingness to work for a small wage made them formidable competitors of white labor. (See CHINESE IMMIGRATION.) In 1878 and 1879 Denis Kearney (q.v.), a vociferous agitator, taking advantage of the discontent prevailing among the lower classes of San Francisco, owing chiefly to the question of Chinese immigration, organized the Workingmen's party, which for a short time controlled State politics and brought into being the present constitution of California, with its many radical features. The conflict between the mining and agricultural interests over the disposition of mining debris or "slicens" and the utilization of the natural water power of the State was removed in a great measure by prolonged and elaborate legislation on the subjects of mineral debris and drainage. In 1887 a comprehensive system of irrigation was begun, which has yielded great results. The California International Midwinter Exposition, held at San Francisco in 1894, served to illustrate the progress and prosperity of the State. On April 18, 1906, an earthquake rocked the coast of California. The business section of San Francisco was almost entirely destroyed by the shock and by the fire, which broke out shortly after, and San José, Santa Rosa, and other coast towns were materially injured. (See SAN FRANCISCO EARTHQUAKE.) Before 1860 California was Democratic in national politics. Since that date it has been Republican, with the exception of the years 1880 and 1892. In State elections California has changed from Democratic to Republican repeatedly on local issues.

The hostility towards Orientals, which resulted in the passage of the Chinese Exclusion Act of 1881 (see CHINESE IMMIGRATION), manifested itself in attempts to limit the rights of the Japanese in 1906, 1909, and again in 1913. In the early years of the twentieth century large numbers of Japanese immigrated into California, where their presence soon came to be regarded as a menace, especially by organized labor. (See ORIENTAL EMIGRATION.) This feeling vented itself in a series of riots and outrages against the Japanese in San Francisco and other coast cities of California.

In consequence of the general anti-Japanese agitation, the school board of San Francisco, in October, 1906, passed an order excluding children of Japanese parents from the schools. The Japanese government protested to the government of the United States, on the ground that the rights guaranteed to its citizens by treaties with the United States had been violated. Under pressure from Washington the San Francisco school board rescinded its action, and an agreement was effected between the United States and Japan by the terms of which the latter country undertook to restrict the further emigration to the United States of Japanese laborers. In 1909 the anti-Japanese agitation was revived by rumors, more or less well founded, of a wide extension of Japanese control over the fruit and garden lands of the

State. Bills restricting the right of Orientals to own land were introduced in the Legislature in 1909 and would have become law but for pressure exerted by the Federal government. Again in 1913 drastic bills were introduced in both houses of the California Legislature, restricting the power of holding land of aliens, and of corporations of which a majority stock was held by aliens.

The Japanese government made strong protest to President Wilson against these measures. President Wilson, as a result of these protests, urged the California Legislature to amend the alien ownership bill so that they would apply to all aliens and not particularly to the Japanese. In addition to sending messages to the Governor and presiding officers of the two houses, he directed the Secretary of State to go to California for the purpose of conferring with Governor Johnson and the Legislature in regard to the proposed antialien laws. The two houses of the Legislature dropped the previous bills and gave their attention to a new bill which was framed by the Attorney-General of the State. The first provision of this bill is as follows: "All aliens eligible to citizenship under the laws of the United States may acquire, possess, enjoy, transfer, and inherit real property or any interest therein in this State in the same manner and to the same extent as citizens of the United States, except as otherwise provided by the laws of this State." The second provision provided that "all aliens other than those mentioned in section one may acquire, possess, enjoy, and transfer real property or any interest therein, in the manner and to the extent, and for the purpose prescribed by any treaty now existing between the government of the United States and the nation and country of which such alien is a citizen or subject, and not otherwise." It was held by the advocates of this bill, that, as it specifically guarded treaty rights and also affirmatively conferred rights on all aliens eligible to citizenship instead of debaring from existing rights those ineligible, it was free from objection or offense. This bill passed both houses of the Legislature on May 3, 1913, and was signed by Governor Johnson on May 18. See UNITED STATES, *History*.

The struggles of San Francisco to free itself from the domination of corrupt officials in the first decade of the twentieth century acquired national interest and importance. In 1902 rumors were circulated of a corrupt alliance between Mayor Eugene F. Schmitz, who had been elected in 1900 on a Labor ticket, and the notorious politician Abraham Ruef. In spite of these rumors Schmitz was reelected for two successive terms; but in 1905 Rudolph Spreckels provided \$100,000 to carry on an investigation of the charges. The investigation was conducted by F. J. Heney and W. J. Burns, then a detective in the employ of the United States government. After many months of secret investigation, enough evidence was found to indict Ruef and Schmitz on the charge of extortion, and on May 9, 1907, they were arrested. Four days later 17 city supervisors confessed to Mr. Burns that they had received bribes from the United Railways Company to grant a new franchise to the company. Other indictments were found against officials of the street railways and other corporations. Ruef pleaded guilty to the charges of extortion, and Schmitz, on trial, was convicted. On June 30 Schmitz was indicted for bribery

on 40 counts, and Ruef on 126. On November 5 an election for mayor was held, and so deeply had these investigations and their results stirred the people that Dr. Edward R. Taylor, a candidate of the Citizens' Reform ticket, was elected. On Jan. 9, 1908, the Supreme Court of the State set aside the verdict against Schmitz on a technicality. The same decision released Ruef from the charge of extortion. In the same month Ruef was put on trial for bribery. The jury disagreed, and he was released on bail of \$1,500,000. He was again brought to trial on Aug. 19, 1908. On November 13 Mr. Heney, who was conducting the prosecution, was shot while in the court room. The wound proved not serious, and the trial was continued. Ruef was found guilty on December 29 and was sentenced to 14 years' imprisonment. Schmitz was not brought to trial again, and the indictments against him were dismissed.

In the presidential election of 1908 Taft received 214,398 votes in California, and Bryan, 127,492. The elections of 1910 were conducted in accordance with a new primary law which went into effect that year. The insurgent or progressive element in the Republican party had gained great strength and was able in the Republican Convention to force the nomination of Hiram W. Johnson, a prominent lawyer who had taken an active part in the Ruef prosecution in San Francisco. Mr. Johnson was elected with the whole Republican State ticket. In the election held on Oct. 10, 1911, 21 amendments to the constitution were submitted to the voters. These included amendments for woman suffrage, for the initiative and referendum, and for the recall, including the recall of judges. They were all carried. The initiative and referendum received a majority of about 60,000, the recall about 100,000, and woman suffrage about 3000.

California was especially conspicuous in the presidential campaign of 1912. Governor Johnson was one of the most aggressive supporters of President Roosevelt and was nominated for the vice presidency on the national Progressive ticket. A presidential primary election was held in the State on May 14, in which Roosevelt received 183,563 votes, Taft 69,345, and LaFollette 45,876. Champ Clark received a large plurality of the Democratic votes. On October 3 the State Supreme Court by its interpretation of the primary law barred from the Republican ticket the electors pledged to Mr. Taft. The result of the elections showed 283,605 votes for Roosevelt, 283,444 for Wilson, 69,869 for Debs, 3943 for Taft. As two Roosevelt electors received fewer votes than Wilson electors, the electoral vote of the State was divided so that Roosevelt received 11 and Wilson 2.

The following is a list of Governors of the State:

MILITARY AND PROVISIONAL GOVERNORS

Col. Robert F. Stockton.....	1846-47
Col. John C. Frémont.....	1847
Gen. S. W. Kearny.....	1847

W. Audubon, *Audubon's Western Journal, 1849-50* (Cleveland, 1906); G. W. James, *In and Out of the Old Missions* (Boston, 1905); C. F. Holder, *Life in the Open: Sport in Southern California* (New York, 1906).

CALIFORNIA, GULF OF. An arm of the Pacific, separating the peninsula of Lower California from the rest of Mexico (Map: Mexico, C 4). It was originally known as the Sea of Cortés, having been discovered under his auspices and explored by himself. It is 700 miles in length, and varies in width from 30 to nearly 150 miles. It receives at its upper end the Colorado, and from the east several streams, chief of which are the Altar, Sonora, Yaqui, Mayo, and Fuerte. Both shores are bordered by highlands broken by the river valleys on the east, but on the west presenting an almost unbroken mountain wall. The coast line is irregular and forms numerous small bays. The gulf has a depth ranging from 600 feet near the head to over 6000 feet near its mouth, and contains many islands, particularly in the upper part, the largest of which are Ángel de la Guarda and Tiburón. On its west shores are the ports of San Felipe, San José, and La Paz; on its eastern, those of Mazatlan and Guaymas. There are pearl fisheries on the west coast.

CALIFORNIA, LOWER, or OLD (Sp. *Baja* or *Vieja California*). A peninsula in southwest North America, forming a territory of Mexico. It extends from about lat. 22° 40' to 32° 40' N. It is bounded by California on the north, the Pacific on the west, and the Gulf of California and the Mexican State of Sonora on the east. Its total length is over 750 miles, while its width varies from about 30 to 140 miles. Area, 58,343 square miles. The surface is generally mountainous, the peninsula being practically an extension of the Sierra Nevada and Coast Range region. At the centre is a plateau region interrupted by mountain peaks and short ranges, Santa Catalina, in the northern central part, attaining an altitude of over 10,000 feet. An eastern coast range borders the Gulf of California, and in places attains elevations consider-

ably exceeding 6000 feet. The western coast range, bordering the Pacific, is less elevated and seldom exceeds 3500 feet in altitude. At the extreme south the peninsula terminates in an immense mountain mass, rising in San Lázaro to 8000 feet altitude. The coasts are considerably indented, but there are not many really good harbors. The principal islands are Ángel de la Guarda, off the central eastern coast, and Cedros (Cerros), off the opposite western coast. Numerous smaller islands are scattered along the southeastern coast, and a few long, narrow islands fringe the southwestern coast. The climate and vegetation of the western portion resemble those of southern California. The climate is dry and warm, the rainfall in most of the region ranging from under 10 to 25 inches, which with a high temperature is a small amount. Few streams occur of any importance except as irrigators, and these are most numerous in the southwest. In the southern part are considerable areas of uninhabitable land. The largest and most important cities are La Paz (q.v.) and Ensenada de Todos Santos. Pop., 1895, 42,245; 1900, 47,624; 1910, 52,244.

CALIFORNIA, UNIVERSITY OF. A State University for higher education at Berkeley, Cal. The university was established in 1868, under the general provision for agricultural colleges made by the Congressional Act of 1862, which united with it the College of California, chartered in 1860. Instruction was begun in Oakland in 1869, and the university was transferred to its present location in 1873. The government is vested in the regents of the University of California, a corporation, consisting of the higher State officers, the presidents of the University of California, of the State Agricultural Society, and of the Mechanics' Institute of San Francisco, all acting as members ex officio, and of 16 other members appointed by the governor of the State for 16 years, two appointments expiring every second year. The university is a State institution, receiving various State appropriations for specific purposes. From year to year the university receives about two-thirds of its income from the State, and the balance from gifts, or from the income of former gifts, from the United States, from student fees, and from miscellaneous sources.

The university comprises the following departments of instruction: in Berkeley, the colleges of Letters, Social Sciences, Natural Sciences, Commerce, Agriculture, Mechanics, Mining, Civil Engineering, and Chemistry; the schools of Architecture, Jurisprudence, and Education, and the University Extension Division; on Mount Hamilton in Santa Clara County, the Lick Astronomical Department; in San Francisco, the California School of Design, Hastings College of the Law, College of Medicine, George Williams Hooper School for Medical Research, endowed with nearly \$2,000,000 for the exclusive purpose of medical investigation; College of Dentistry, California College of Pharmacy; in La Jolla, near San Diego, Cal., the Scripps Institution for Biological Research; in Riverside, Cal., the Graduate School of Tropical Agriculture; at Davis, Cal., the University Farm; in Santiago, Chile, the D. O. Mills Observatory (a branch of the Lick Observatory). The College of Medicine was organized in 1873 by the absorption of the Toland Medical College. The College of Dentistry was organized in 1888. The Lick Observatory on Mount Hamilton was

founded in 1875 by James Lick, who devoted \$700,000 to the purpose, among other things, of constructing "a telescope superior to and more powerful than any telescope ever made." The Department of Anthropology, organized primarily for research, has conducted excavations in Egypt, Peru, and North America, and pursues linguistic and ethnological investigations. It has published a dozen volumes on American ethnology and linguistics.

The University of California makes no charge to students resident in California for courses in the colleges of Letters, Social Sciences, Natural Sciences, Commerce, Agriculture, Mechanics, Mining, Civil Engineering, and Chemistry. The instruction in all the colleges is open to properly qualified persons, without distinction of sex. Students not residents of the State are charged a nominal fee for tuition. Since 1888, when its total student body numbered only 306, the university has grown very rapidly. For the year 1912-13 there were 7296 students enrolled in the University of California, of whom 4094 were academic undergraduates, 648 graduate students, 315 in the colleges of Law, Medicine, Dentistry, and Pharmacy, 191 University Farm, 294 San Francisco Institute of Art, 2275 Summer Session of 1912; 521 double registrations, to be deducted. The registration of academic undergraduates was distributed as follows: Letters 176, Social Sciences 1306, Natural Sciences 1077, Commerce 287, Agriculture 455, Mechanics 318, Mining 132, Civil Engineering 224, Chemistry 60, Medicine 59. Of the 648 graduate students 528 were enrolled in the colleges of Letters, Social Sciences, and Natural Sciences. At the same time there were 719 professors, instructors, lecturers, assistants, and administrative officers, of whom 460 were in the academic department. Omitting the summer session, approximately one-third were women. A relatively large proportion of the students pursue the general academic courses as compared with the technical or professional courses. The steady increase in registration in the College of Agriculture is also to be noted. Of the 1913-14 intrants in the academic colleges, 20 per cent entered from colleges or secondary schools outside the State; and of the 1580 such intrants, one in five entered with advanced standing.

Since the university possesses the liberally endowed research institutions for astronomy, biology, preventive medicine, agriculture, etc., and since research is regarded as one of the chief functions of the institution, its scientific publications have become of importance. They aggregate several thousand pages yearly. The University Press issues scientific series in some 30 different fields.

The university is beautifully situated on the lower slopes of the Berkeley Hills, overlooking San Francisco Bay and the Golden Gate. The site comprises about 270 acres of land, rising at first in a gentle, and then in a bolder slope from a height of 200 feet above sea level to one of over 900 feet. East of the campus, the chain of hills continues to rise 1000 feet higher.

A permanent plan for the development of the grounds and buildings was secured through the aid of Mrs. Phœbe A. Hearst, for many years a regent of the university. The plan designed by M. Emile Bénard of Paris, winner of an international competition (judged at Antwerp in 1898, and finally decided by vote of the jury in San Francisco in 1899), as developed by Mr.

John Galen Howard, professor of architecture in the university and supervising architect, recognizes the possibilities of the site and gives the amplest scope for the development of the university. The first buildings erected under the permanent plan have been the Hearst Memorial Mining Building, costing \$644,000; California Hall, a building costing \$270,000 and sheltering the administrative offices and the departments of history and economics; the University Library, given by Charles Franklin Doe, costing, including equipment, \$882,000; Agriculture Hall, \$200,000; Boalt Hall of Law, costing \$160,000; the Peder Salther Gateway, \$36,000; and the Jane K. Salther Campanile, a 300-foot granite bell tower, costing \$200,000, and containing the Salther Bells, a set of chimes for which \$25,000 was given by Mrs. Jane K. Salther; and the Greek Theatre, an open-air auditorium seating 8000 people.

The value of the buildings and grounds belonging to the University of California in 1913 was \$7,886,000. Its endowment funds aggregate \$5,570,000, and its total income derived from all sources was for the year ending June 30, 1913 (omitting moneys received for endowment or for buildings), \$1,730,000.

At the end of the year 1913 the library contained 300,000 volumes, and this is increasing by more than 20,000 volumes per annum. The library possesses also several hundred thousand manuscripts, which constitute the most important primary material extant for the history of California and the Pacific coast of the United States.

The presidents of the university have been Henry Durant, Daniel C. Gilman, John LeConte, W. T. Reid, E. S. Holden, Horace Davis, Martin Kellogg, and Benjamin Ide Wheeler, Ph.D., LL.D., formerly professor of Greek and comparative philology in Cornell University, who became president in 1899.

CALIFORNIA POPPY. See *ESCHSCHOLTZIA*.

CAL'IGA (Lat.). A strong sandal-like shoe, worn by private soldiers and by the centurion in the Roman army. It was secured to the foot by straps. Its sole was thickly studded with hobnails. See also *CALIGULA*.

CALIG'ULA. A tragedy by John Crowne, published in 1693 with a dedication to the Earl of Romney and written in rhymed heroics.

CALIGULA, BRIDGE OF. A so-called bridge of wood prepared by Caligula to facilitate his passage from his palace on the Palatine Hill to the Temple of Jupiter on the Capitol. It crossed the Forum valley, using the Temple of Augustus and the Basilica Julia as piers.

CALIGULA, GAIUS CÆSAR AUGUSTUS GERMANICUS (12-41 A.D.). Emperor of Rome from 37 to 41. He was the youngest son of Germanicus (nephew of Tiberius) by Agrippina, and was born Aug. 31, 12, at Antium, and was educated in the camp, in Germany, where the soldiers gave him the nickname Caligula, from the military shoes (*caligæ*) which he wore. On the death of his brother Drusus he was made augur in his stead. On the death of Tiberius (37), who, it was suspected, had received foul play at his hands, it was found that he had been appointed coheir along with the grandson of Tiberius, called Tiberius Gemellus, but the Senate and the people allowed Caligula supreme and sole authority. In the beginning of his reign he appeared hardly likely to fulfill the threat of Tiberius, who had talked of educating

Caligula "for the destruction of the Roman people." He seemed lavishly generous and merciful, pardoning even those who had been the instruments of cruelty against his own family. But this ostentatious magnanimity was itself a disease, an unwholesome affectation, founded on no principle, or even humanity of heart, and coexisted with the most savage voluptuousness and lust. Consequently, when, after he had ruled eight months, illness, the result of his vicious life, had weakened his faculties, the lower qualities of his nature obtained the complete mastery. In addition to the senseless prodigality with which he commenced his career—he expended in one year the enormous wealth left by Tiberius, 720,000,000 sesterces—he began to manifest the most barbarous propensities. He banished or murdered his relatives, except his uncle Claudius and his sister Drusilla; filled Rome with executions, confiscating the estates of his victims; amused himself, while dining, by having victims tortured and slain in his presence; and uttered the wish "that all the Roman people had but one neck, that he might decapitate Rome at a blow!" To vie with Xerxes, he made a bridge of ships over the bay between Baia and Puteoli (a distance of 3 Roman miles and 600 paces), and celebrated the exploit by a costly banquet on the middle of the bridge, and by collecting on it great numbers of people and causing them to be drowned. His favorite horse was stabled in a palace, fed at a marble manger, was made a member of the college of priests, and afterward raised to the consulship. As a climax to all his absurdities, he declared himself a god, and had temples erected and sacrifices offered to himself. At length a conspiracy was formed by the officers of his guards, and he was assassinated, 41 A.D. His life is told by Suetonius. Consult also Baring-Gould, *The Tragedy of the Cæsars* (London, 1892). See CHÆREA.

CALIGULA, PALACE OF. The residence of Caligula on the Palatine Hill overlooking the Forum. The palace was an extension, on the north, of the Palace of Tiberius. The superstructure has entirely disappeared, and the existing ruins over the Via Nova, long ascribed to the Palace of Caligula, are now regarded as belonging rather to the second and the third centuries. A cryptoporticus, about 140 meters long, led from the structures of Caligula along the east side of Tiberius' palace to the House of Livia, and, by a branch, to the House of Augustus. In this Caligula is said to have been murdered.

CALINGA, kâ-lên'gâ. See KALINGA.

CALIPERS (corrupted from *calibre*; see CALIBRE). An instrument for measuring the diameter or thickness of objects. If a pair of ordinary dividers have its legs curved into bows and be applied to an object so that the extreme points of the diverging legs embrace it, the distance between the points of the two legs will be the exact thickness of the object, and this distance can be determined in the usual units of length by applying the points to a scale and reading off the space subtended by them. This is the simplest form of calipers. If the dividers have a graduated arc attached, so arranged that it records exactly the distance apart of the points of the legs, we then have a registering calipers. Calipers of this general form are made in a variety of shapes and with a variety of registering and adjusting devices for special

purposes. The curving or bowing of the legs is done so that the measuring may be made at the maximum or meridian section of a cylindrical piece without errors that would arise from the angular relation of the two legs if these were

FIG. 1. SIMPLE CALIPERS.

straight and pivoted together. If the two legs are not in the same plane but made to pass each other, the caliper may be used to measure the inside diameter of holes or other openings. Calipers are therefore "outside" calipers, as in the illustration (Fig. 1), or "inside" calipers for the other use. Fig. 3 may be used for both outside and inside measurements. Fig. 1 shows a form of calipers for rough measurements, such as measuring the diameter of rolled rods or the thickness of rolled plates. Fig. 2 shows a form

FIG. 2. MICROMETER CALIPERS.

of calipers, known as micrometer calipers, for very precise measurements. The mechanical principle embodied in the construction is that of a screw of known pitch, advancing in a fixed nut. An opening to receive the work to be measured is afforded by the backward movement of the screw, and the size of the opening is indicated by the graduations. The pitch of the screw, or distance between its threads, is 40 to the inch in this particular calipers, and the graduations on the barrel are forty to the inch, and are figured 0, 1, 2, etc., at every fourth division. As these graduations conform to the pitch of the screw, each division equals the longitudinal distance traversed by the screw in one complete

FIG. 3. VERNIER CALIPERS.

revolution, and shows that the calipers has been opened $\frac{1}{40}$ or $\frac{25}{1000}$ of an inch. The beveled edge of the thimble is graduated into 25 parts and is figured at every fifth division, 0, 5, 10, 15, 20, etc. Each division when coincident with the base line of the divisions on the barrel indicates that the gauge screw has made $\frac{1}{25}$ of a revolution

and that the opening of the calipers has increased $\frac{1}{25}$ of $\frac{25}{1000}$ or $\frac{1}{1000}$ of an inch. Hence, to read the calipers, multiply the number of divisions visible on the scale of the barrel by 25, and add the number of divisions on the scale of the thimble from zero to the line coincident with the base line of the graduations on the barrel. For example, as the calipers is set in the illustration, there are three whole divisions visible on the barrel. Multiplying this number by 25 and adding 5, the number of divisions registered on the scale of the thimble, the result is $\frac{80}{1000}$ of an inch. There are also special forms of micrometer calipers for the accurate measurement of V-threads on screws, bolts, etc., and calipers for measuring the depths and thickness of gear teeth and other purposes. A common form of calipers, known as vernier calipers, is shown by Fig. 3, where the opening is read by a fixed scale to the nearest fortieth of an inch, and the finer dimension of the balance by the vernier which gives readings to $\frac{1}{25}$ of $\frac{1}{40}$, or $\frac{1}{1000}$ of an inch. See VERNIER; GAUGE.

CALIPH (Fr. *calife*, Ar. *khalifa*, successor, from *khalafa*, to succeed). The title of Mohammed's successors in temporal and spiritual power, from which the early Empire of Islam is known as the caliphate. While the first impulse of conquest given to the Arabs by the new faith endured, the power of the caliphs was vast, covering the whole world of Islam; but with time the usual consequence followed the combining of spiritual authority with temporal dominion. The caliphate became the subject of factional strife and a prize for ambitious leaders, and rival dynasties broke Islam up into independent powers united only in enmity to the unbeliever. The first four caliphs (632-661), Abu Bekr, Omar, Othman, and Ali, were generally recognized as true successors to the spiritual authority of the Prophet, all being members of his immediate family, though under Ali, who was assassinated, there were insurrectionary movements. The Ommiads (661-750) held a more doubtful title, but still one that was recognized. With the accession of the Abbassides the Mohammedan world was divided, a survivor of the Ommiads founding in Spain the emirate (later caliphate) of Córdoba. This was never a true caliphate according to Mohammedan law, but it was one of the greatest in wealth and civilization of all the Mohammedan empires. The Abbasside dynasty saw other rivals arise, the Aglabites and Edrisites in Africa, as well as minor claimants. It was the story of the feudal world everywhere—emirs seizing sovereign power whenever the opportunity offered. From the tenth century on, the Abbasside caliphs were mere creatures of the powerful Turkish guards, rashly organized by the Caliph Motassem (833-842). In 1258 another Motassem, the last Abbasside caliph, was put to death by Hulaku Khan. (See MONGOL DYNASTIES; PERSIA.) Nominal successors of the caliphs performed the spiritual functions of the office in Egypt as late as the sixteenth century, when the Turkish sultans reunited the spiritual and temporal headship of Islam in their own persons. There was a Shiite (q.v.) caliphate instituted in Persia in 1502. The first four caliphs had their capital at Medina; the 14 Asiatic Ommiads made Damascus their seat of power; while Bagdad was that of the 37 Abbassides. There was also established at Cairo in Egypt (909-1171) a dissenting caliphate, that of the Fatimites.

Twenty-two Ommiads (756-1031) of the Spanish line ruled in Córdoba. (See ABBASSIDES; FATIMITES; OMMIADS; and separate articles on the greater caliphs.) Consult also: Sir William Muir, *Annals of the Early Caliphate* (London, 1883), and *The Caliphate: Its Rise, Decline, and Fall* (London, 1891), an abridgment of the *Annals*, with a continuation to the fall of the Abbassides; Weil, *Geschichte der Chalifen* (5 vols., Mannheim and Stuttgart, 1846-62); Syed Ameer Ali, *A Short History of the Saracens* (New York, 1899); S. Lane Poole, *The Mohammedan Dynasties* (London, 1894).

CALIP'PIC CYCLE. See PERIOD.

CAL'ISA'YA BARK. See CINCHONA.

CALIS'TA. 1. The vengeful wife of Althamont and mistress of the "gay" Lothario, in Rowe's *Fair Penitent*. The rôle was a great favorite with eighteenth-century actresses. 2. The wife of Cleander in Massinger and Fletcher's *Lover's Progress*. She is possessed of an intense passion for Lysander, but still remains true to her husband. The character was largely suggested by Caliste, in Daudiguier's *Lysandre et Caliste*. 3. The lady in waiting and confidante of Queen Berengaria, in Scott's *Talisman*. She assists in a silly and dangerous trick against Sir Kenneth, by which he is lured away from guarding the royal standard.

CAL'ISTHEN'ICS. See GYMNASTICS.

CAL'IVER (from Fr. *calibre*, calibre, bore; see CALIBRE). A matchlock or firearm about midway in size and character between an arquebus and a musket, and small enough to be fired without a rest or support. It could be discharged much more rapidly than a musket, but did not do so much execution. It was introduced in the sixteenth century and received its name from the fact that the bore was of uniform *calibre*, so that the common stock of bullets for a company might fit all weapons.

CALIXTINES, kà-lik's'tinz. A name given (1) to the conservative wing of the Hussites (q.v.) (from Lat. *calix*, cup, chalice), because they contended for lay communion in both kinds; (2) to the followers of Georg Calixtus (q.v.) in the latter half of the seventeenth century.

CALIX'TUS. A name borne by three Popes.—**CALIXTUS I.** Bishop of Rome from 219 to 223 (or 517 to 522). He was born a slave.—**CALIXTUS II.** Guido of Vienne. Pope from 1119 to 1124. He was a son of the Count of Burgundy. He expelled the Antipope Gregory from Rome in 1120, stormed the castle in which he took refuge, and made him a prisoner. He concluded with Henry V of Germany the famous Concordat of Worms (1122), by which the long dispute over the question of investiture (q.v.) was adjusted.—**CALIXTUS III.** Alonzo de Borja or Borgia. Pope from 1455 to 1458. His leading idea was to institute a great crusade against the Turks, in which he failed. He was the uncle and patron of Rodrigo Borgia, afterward Pope Alexander VI.

CALIXTUS, GEORG (1586-1656). A German Lutheran theologian. He was born at Medelbye in Schleswig and studied at Flensburg and Helmstedt. After traveling as an earnest student for four years in Germany, Holland, England, and France, where he made the acquaintance of the most learned men of his time, he returned to Helmstedt in 1613, and in the following year was appointed professor of theology. His genius, the depth of his knowledge, and his large

experience of the world and of men, which he had acquired in his travels, developed in him a spirit of great tolerance towards all who held their religious opinions honestly, whatever these might be. Although his dissertations on the Holy Scripture, transubstantiation, communion in one kind, etc., are acknowledged by learned Catholics to be the most solid and admirable which have been composed by Protestants against the distinctive doctrines of Catholicism, he was, on account of some statements in his work entitled *De Præcipuis Religionis Christianæ Capitibus*, which seemed favorable to Catholic dogmas, and of others in his *Epitome Theologiæ Moralis, De Tolerantia Reformatorum*, etc., which approached too near to the Reformed or Calvinistic standpoint, declared guilty of abominable heresy by the adherents of the letter of the Concordienformel—i.e., the orthodox and dogmatically rigid Lutherans. Calixtus felt keenly that the polemical harshness of Lutheranism was a serious obstacle in the way of a great Catholic Christianity, and that Protestantism must assume another form before it could hope to become the religion of Europe. Under this conviction Calixtus endeavored to show that the oldest and most fundamental articles of the Christian faith—viz., the facts embodied in the "Apostles' Creed"—were common to all Christian sects. In subsequent dissertations, having stated that the doctrine of the Trinity was less distinctly taught in the Old than in the New Testament, and that good works were necessary to salvation, and finally, at the religious conference of Thorn in 1645, whither he was sent as a mediator by the Elector of Brandenburg, having been on more intimate terms with the Calvinistic than the Lutheran theologians, Calixtus was accused of apostasy. Fortunately, however, he had powerful friends, who stood firmly by him, and through their help he was enabled to retain his professorial chair till his death in Helmstedt, on March 19, 1656. The discussion which arose over his position was known as the syncretistic controversy. For his biography, consult: E. L. W. Henke, *Calixt und seine Zeit* (Halle, 1853-56); W. C. Dowding, *German Theology during the Thirty Years' War; The Life and Correspondence of G. Calixtus* (London, 1863).

CALKING, kək'ing (probably OF. *cauquer*, to tread, from Lat. *calcare*, to tread in, from *calx*, heel). This word is also very commonly mispronounced as though it were spelled corking. A process in which oakum is forced into the seams between the planks of a deck or the sides of a wooden ship in order to prevent the entrance of water. After the seams are spread, as much oakum is forced in as possible until they are nearly filled. They are then payed (i.e., filled up) with pitch, cement, or putty. Special chisel-shaped tools are used in calking, called *calking irons*, *making irons*, *raising irons*, and *reeming irons*. The edges of iron plates are also made water-tight by calking. In the case of flush edges or butts the calking tool commonly straddles the seam; but when one plate laps another its edge is driven down by the tool against the under plate.

CAL'KINS, FRANKLIN WELLES (1857-). An American writer, born in Iowa Co., Wis. He received a public-school and collegiate education, and educated himself in languages and literature. For three years he read law and was for a short time engaged in practice. He was successively a lawyer, contractor, real-estate

broker, and ranchman. In 1865 he removed to the extreme northwest frontier and was one of the early explorers of the Black Hills country. He visited many Indian tribes and became familiar with a number of Indian languages, and with animal and bird life in the plains and mountains. Among his writings are: *Frontier Sketches* (1893); *Indian Tales* (1893); *Hunting Stories* (1893); *Cougar-Tamer* (1899); *My Host the Enemy* (1901); *Two Wilderness Voyagers* (1902); *The Wooing of Tokala* (1907). His contributions to *The Youth's Companion* extend over more than a quarter century.

CALKINS, GARY NATHAN (1869-). An American zoölogist, born at Valparaiso, Ind. He was educated at the Massachusetts Institute of Technology and at Columbia University, where he was instructor in zoölogy in 1899-1903, adjunct professor in 1903-04, and professor of invertebrate zoölogy in 1904-06. In the latter year he became professor of protozoölogy. He is author of "The Protozoa," vol. vi, *Columbia University Biological Series* (1901), and *Protozoölogy* (1908).

CALKINS, MARY WHITON (1863-). An American educator, born at Hartford, Conn. Educated at Smith College and at Clark and Harvard universities, she became instructor in 1891 and later professor of philosophy and psychology at Wellesley College. Besides several monographs she is author of *Introduction to Psychology* (1901; 1905); *Der Doppelte Standpunkt in der Psychologie* (1905); *The Persistent Problems of Philosophy* (1907; 3d ed., 1912); *A First Book in Psychology* (1909; 2d ed., 1911).

CALKINS, RAYMOND (1869-). An American Congregational clergyman, born in Buffalo, N. Y. He graduated at Harvard in 1890, taught in Belmont, Cal., and in Iowa (now Grinnell) College, and then was instructor in German at Harvard and studied at the Harvard Divinity School in 1893-95. Ordained in 1896, he was assistant pastor of the First Church of Christ, Pittsfield, Mass., pastor of the Pilgrim Memorial Church of Pittsfield, of the State Street Church of Portland, Me., from 1903 to 1912, and subsequently of the First Church in Cambridge, Mass. He was prominent in the National Councils of the Congregational Church, wrote *Substitutes for the Saloon* (1901), and was one of the editors of *Hymns of the Church* (1912).

CALL. A term often used in reference to various theological and ecclesiastical subjects. 1. The command or invitation to believe in Jesus Christ is designated the *call of God*, or the *Gospel call*. Calvinistic theologians make a distinction between a *general* call and a *special* or *effectual* call; the former addressed to all to whom the word of God comes; but requiring for its efficacy to be accompanied by the special and irresistible grace of the Holy Spirit. They are careful, however, to state that the general or outward calling by the word always precedes and accompanies the special and effectual calling of the Spirit. The notion of an inward call by the Spirit of God in the soul, unconnected with outward calling by the word, belongs not to Calvinistic, but to mystic theology. 2. A call to office in the Church, and particularly to the ministry of the Gospel, is regarded by Christians generally as proceeding from God; and the Church of England requires of candidates for ordination an express profession that they trust they are

so moved of the Holy Ghost. Connected with this use is the wider application to any "vocation" or "calling." 3. A call by a local church to a minister whom it invites to its pastorate. In established churches, as the Church of England, the matter has been complicated by patronage rights. In Scotland the question has given rise to some of the principal ecclesiastical divisions. In America almost all denominations professedly give the call of the minister entirely into the hands of the local church or congregation; and where not professedly, it is still actually so placed in most bodies, and the tendency is every day stronger towards the complete autonomy of the local body in this matter. See PRESBYTERIANISM; CONGREGATIONALISM; METHODISM; CHURCH.

CALL. When subscriptions to a joint-stock enterprise do not require payment at once of the full amount of shares, it is frequently provided that a certain proportion shall be paid in cash, the remainder being subject to call upon the part of the management. The term "call" is also applied to the amount of these delayed payments. See STOCK EXCHANGE.

CALL, EDWARD PAYSON (1855-). An American newspaper publisher, born at West Cambridge, Mass. From 1884 to 1897 he was successively advertising manager of the *Boston Herald*, the Royal Baking Powder Company, and the *Philadelphia Press*. Taking up journalism in the city of New York, he published the *Evening Post* in 1897-1902, the *Mail and Express* in 1902-04, and the *Commercial* in 1904-07, and in 1909 became assistant business manager of the *New York Times*.

CALL, WILKINSON (1834-1910). An American lawyer and Democratic politician. He was born in Russellville, Ky., but early in life went to Florida, where he became a lawyer. In the Civil War he rose to the rank of adjutant general in the Confederate army. He was elected to the United States Senate in 1865, but was not permitted to take his seat. In 1879 he was again elected and served continuously until 1897.

CAL'LA (Lat., an uncertain plant). A genus of plants of the family Araceæ. The genus *Calla* is characterized by a flattened spathe within which is a cylindrical spadix covered with naked flowers, appearing as a mere mixture of stamens and pistils. The only species, *Calla palustris* (water arum), is found in cold bogs in Europe, Siberia, and North America, but not in Great Britain. It has a creeping rootstock, and heart-shaped, stalked leaves, prolonged into a point; the spathe is white, and the spadix yellow. The rootstock is extremely aerid; but, being deprived of its acidity by grinding, boiling, and macerating, is made by the Laplanders into a kind of bread called *misscbroed*, which they hold in high estimation. The well-known and beautiful calla lily (*Richardia æthiopica*) was formerly included in this genus.

CALLAHAN, JAMES MORTON (1864-). An American educator and author, born at Bedford, Ind. He was educated at Indiana and Johns Hopkins universities and at the University of Chicago. In 1897-98 he was professor of American history and constitutional law at Hamilton College. In 1898 he became lecturer at Johns Hopkins and in 1900 had charge of the bureau of historical research at Washington. He was appointed professor of history and political science at the West Virginia University

in 1902. His publications include: *Neutrality of the American Lakes* (1898); *Cuba and International Relations* (1899); *American Relations in the Pacific and the Far East* (1901); *Confederate Diplomacy* (1901); *An Introduction to the American Expansion Policy* (1908); *Evolution of Seward's Mexican Policy* (1909).

CALLAO, ká-lyä'ô (Sp. *cala*, creek, bay, from Celt. *cala*, harbor). The principal seaport of Peru and the capital of a small province of the same name; situated on Callao Bay, 7 miles west of Lima, with which it is connected by rail (Map: Peru, B 6). The modern city, a short distance to the north of the original town which was destroyed by earthquake and tidal wave in 1746, is divided into two sections, the older occupying the centre and having narrow and crooked streets, while the surrounding portion is well laid out with broad avenues crossing at right angles. The buildings of the city are not particularly notable from an architectural standpoint. The climate is temperate, but the city is unsanitary and fever-stricken. The harbor, though an open roadstead, is safe and spacious, being protected by the natural breakwater afforded by the island of San Lorenzo. It is fortified and possesses splendid docking and ship-repairing facilities, which include a floating dock, 300 feet in length. Railway lines approach the docks. Callao has manufactures of refined sugar, lumber, and iron, but is more important as a commercial centre, its exports comprising minerals, sugar, hides, wool, bone, cotton, cocoa, etc., and the chief imports, manufactured articles, coal, and beer. The commerce has shown a considerable decrease since the decline of the guano trade. In 1911 1106 foreign vessels, aggregating 2,672,021 tons, entered and cleared. The value of foreign commerce in 1908 was \$20,817,795, of which \$13,434,393 was imports and \$7,383,402 exports. Pop., 1908, 31,000.

Callao figures in history from the times of the early Spanish conquest. It was considered a fair prize by the pirates who infested the western coast of America in the sixteenth century and later and by them was attacked several times. By 1671 it had become of sufficient importance to merit the dignity of a city. An earthquake of 1630 was followed by the more disastrous commotion of 1746, which, with the accompanying tidal wave, destroyed the city and occasioned great loss of life. About the middle of the eighteenth century Callao was strongly fortified, San Felipe Castle playing a prominent part in subsequent wars. In 1826 the Spanish were driven from the city, their last foothold in continental America. Callao was bombarded by a Spanish fleet in 1866, and in 1880 by the Chileans, into whose power it fell the next year, after the battle of Miraflores. The Treaty of 1883 restored it to Peru.

CALLAWAY, kál'á-wā, SAMUEL RODGER (1850-1904). An American railway president, born in Toronto, Canada. In 1862 he entered the service of the Grand Trunk Railway, in 1874 became superintendent of the Detroit and Milwaukee Railway, and in 1881 became manager of the Chicago and Grand Trunk. He was vice president of the Union Pacific from 1884 to 1887; president of the Toledo, St. Louis, and Kansas City line in 1887-95; and of the New York, Chicago, and St. Louis in 1895-97. He was subsequently president of the Lake Shore and Michigan Southern, from 1897 to 1898, and of the New York Central and Hudson River

Railway from 1898 to 1901, and in 1901 was chosen president of the American Locomotive Company.

CALLCOTT, ka'l'kot, SIR AUGUSTUS WALL (1779-1844). An English landscape painter, born in London. He studied at the Royal Academy under John Hoppner, and first devoted himself to portrait painting. After 1804 he exhibited principally landscapes, many of them Italian subjects, which gained for him the title of the English Claude. His earlier paintings were good in line and warm in color, but later productions are cold and monotonous. He was elected to the Royal Academy in 1810, knighted in 1837, and appointed conservator of royal pictures in 1844. Characteristic examples of his landscapes are "The Mouth of the Tyne" (1820), and "Entrance to the Pool of London" (1816); a good example of his figure paintings is "Milton Dictating to his Daughters" (Leeds).

CALLCOTT, JOHN WALL (1766-1821). An English composer, born in Kensington. Too nervous to be a surgeon, as he had intended, he devoted his attention to music, and in 1785 won three of the four gold medals annually given by the Catch Club, the admired "O Sovereign of the Willing Soul" being one of the successful pieces. During the next 10 years he obtained 20 of the medals given by the same society. In 1784 he was made bachelor, and afterward (1800) doctor of music at Oxford. He studied composition with Haydn in 1790. In 1797 he issued a prospectus of an exhaustive musical dictionary, but because of his poor health could not undertake the work itself. In 1806 he published his *Musical Grammar*; in the following year his mind gave way under the continuous strain to which it had been subjected. He recovered again, but only for three years, when he relapsed, and continued insane until his death. He was especially celebrated for his glee compositions. His choicest productions were published in 2 vols. by his son-in-law, Mr. Horsley, in 1824.

CALL DUCK. A small beautiful breed of domestic ducks, bred in a gray and in a white variety, mainly for show purposes. The object is to make them as small and beautiful as possible. See DUCK.

CALLEJA DEL REY, ka'l-yā'há dēl rā'ē, FÉLIX MARÍA, CONDE DE CALDERÓN (1750-1820). A Spanish general, born at Medina del Campo. He was sent to Mexico and after Hidalgo revolted defeated him near Guadalajara in 1811. In 1812 he captured the fortress of Guanajuato and murdered the revolutionists. A little later he captured Hidalgo's successor, Father Morelos, who was shot. For his cruelty in these operations Calleja was called "the Butcher." He was Viceroy of Mexico in 1813-16, and was ennobled, with the title of Count of Calderón for his conduct of the battle of the Puente de Calderón, Jan. 17, 1811. In 1819 he was selected to conduct the expedition against the Independents of Paraguay, but along with the other generals of the expedition he was taken prisoner at Cadiz by his own soldiers, who were in revolt at the instigation of Riego and demanded the reestablishment of the Liberal constitution of 1812. He died soon after his release.

CALLENDER, GUY STEVENS (1865-1915). An American economist, born at Harts Grove, Ohio. He was educated at Oberlin College and at Harvard University. After serving as in-

structor in political economy at Wellesley College in 1895-96, and at Harvard in 1897-1900, he became professor of political economy and sociology at Bowdoin College in 1900, and professor of political economy at Yale in 1903. He is author of *Selections from the Economic History of the United States, 1765-1850* (1909).

CALLENDER, HUGH LONGBOURNE (1863-). An English physicist, born at Hatherop. He was educated at Trinity College, Cambridge, and was professor of physics at McGill University, Montreal, in 1893-98, at University College, London, from 1898 to 1902, and finally at the Imperial College of Science, London. His publications include *Law of Condensation of Steam* (1898) and *The Imperial College of Science, London* (1904).

CALLEY, WALTER (1858-). An American clergyman, born at Dover, Del. After graduating from Crozer Theological Seminary (Upland, Pa.) he was ordained to the Baptist ministry in 1880, and thereafter held pastorates at Bethlehem, Pa. (1880-82); Philadelphia (Lehigh Avenue Church, 1882-91); Cambridge, Mass. (Emmanuel Church, 1891-93); Boston (Tabernacle Church, 1893-1902); and at Upland (1905-09). He became pastor of the First Church, Jamaica Plain, Boston, in 1909. From 1902 to 1905 he was managing editor of *Service*, the official organ of the Baptist Young People's Union of America, at the same time acting as general secretary of this organization. He was also one of the founders of Prospect Union, an institution for educating workmen, in connection with Harvard University, and made a special study of penology and sociology.

CAL'LIAS (Gk. Καλλίας, *Kallias*). 1. The son of Phænippus, of a noble and wealthy Athenian family, the members of which were hereditary torchbearers at the Eleusinian Mysteries. He was an opponent of Pisistratus, and a successful contestant in the Olympic and the Pythian games. 2. The son of Hipponicus and grandson of the preceding. He was present, dressed in his priestly robes, at the battle of Marathon, in 490 B.C. He was sent, between 450 and 445 B.C., as an Ambassador of Athens to Artaxerxes, and, according to some authorities, negotiated a treaty most unfavorable to the Persians. On his return he was impeached for having taken bribes, and fined 50 talents. 3. The son of Hipponicus and grandson of the preceding, notorious for his extravagances and profligacy. In 392 B.C. he served at Corinth, on the occasion of the defeat of the Spartan *mora* by Iphicrates, and was one of the envoys who negotiated the peace with Sparta, known as the Peace of Callias, in 371 B.C. The scene of Xenophon's *Symposium*, and of Plato's *Protagoras*, is laid at his house. He died in poverty.

CALLIC'RATES (Gk. Καλλικράτης, *Kallikratēs*). A Greek architect of the fifth century B.C., who, together with Ictinus, built the Parthenon on the Acropolis at Athens.

CAL'LICRAT'IDAS (Gk. Καλλικρατίδας, *Kallikratidas*). A Spartan, the successor of Lysander in command of the Lacedæmonian fleet against the Athenians (406 B.C.), a man of vigorous character and Pan-Hellenic feeling. At first, he was greatly hampered by the impediments thrown in his way by his predecessor, but he overcame these, and defeated Conon in the harbor of Mitylene, taking 30 of his ships, and subsequently captured the fleet of Diomedon.

Later he was defeated and perished by drowning in the battle of Arginusæ (q.v.).

CALLIÈRES BONNEVUE, kâ'lyâr' bûn'vu', LOUIS HECTOR, CHEVALIER DE (1639–1703). A French army officer. He was Governor of Montreal in 1684, and in 1687 was leader of a part of the French and Indian forces which invaded the territory of the Five Nations in New York. He visited France to urge the seizure of New York as necessary to maintain French supremacy in Canada. In 1699 he succeeded Frontenac as Governor-General of Canada.

CALLIM'ACHUS (Gk. Καλλίμαχος, *Kallimachos*). An Athenian artist who lived near the close of the fifth century B.C. He made a famous gold lamp, which burned night and day in the Erechtheum, on the Athenian Acropolis, and he produced a group of dancing Laconian maidens. He is also said to have originated the Corinthian capital and to have been the first to use the running drill for cutting folds of drapery and other deep lines of modelling. His sculptures were marked by exceeding (some said excessive) delicacy and refinement of execution, and there is reason to believe that he was a follower of Calamis. Consult Furtwängler, *Meisterwerke der griechischen Plastik* (Leipzig, 1893), and Gardner, *A Handbook of Greek Sculpture* (London, 1911).

CALLIMACHUS (Gk. Καλλίμαχος, *Kallimachos*) (c.310–240 B.C.). A celebrated Alexandrine poet and grammarian. He was born in Cyrene, of a distinguished family, which traced its ancestry to Battus, the founder of that city. (See BATTIADÆ.) With Aratus of Soli he studied at Athens and then began teaching at Alexandria, where he enjoyed the favor of Ptolemy Philadelphus and his successor, Ptolemy Euergetes. About 260 B.C. he was appointed librarian and held the office for some 20 years. By his teaching and writing Callimachus exerted a great influence on his time. Among his pupils were some of the most celebrated scholars of the day—Eratosthenes, Aristophanes of Byzantium, Apollonius of Rhodes, and others.

According to Suidas, he left behind him over 800 books. Of his learned works in prose, the most important were his *Tablets* (Πίνακες, *Pinakes*), in 120 books, a great catalogue of the works contained in the library; the authors were arranged according to subject matter and date, with brief observations on the size and the genuineness of the works ascribed to them. Through this Callimachus became the founder of the critical study of Greek literature. We know, also, of a collection of glosses, of *Memorabilia* (ὑπομνήματα, *Hypomnēmata*), and other minor works. As a poet he won distinction chiefly through his elegies, so that Quintilian (10, 1, 58) calls him *elegiæ princeps*; in this field he greatly influenced the Romans, especially Catullus and Ovid, and, in even higher degree, Propertius. He wrote also excellent epigrams, preferring the short, highly elaborated poem to such lengthy works as the *Argonautica* of Apollonius Rhodius. His strength lay in his art and learning, not in poetic genius. As an illustration of his learning may be named his four books of *Causæ* (Αἴτια), in elegiac measure, which treated of the founding of cities, the origin of religious ceremonies, etc. One of the most famous of his elegies was *Berenice's Lock* (*Coma Berenices*), written 246 B.C., in honor of Queen Berenice, and preserved to us in Catullus' imi-

tation, No. 66. Ovid also imitated his *Ibis*, in which he had attacked his rival, Apollonius Rhodius. Famous, also, in antiquity, was his idyllic poem *Hecale*, reminiscences of which are preserved in Ovid's story of Philemon and Baucis (*Met.* 8, 610 et seq.). Some 50 verses of this were recovered from a wooden tablet found in Egypt in 1893. There are extant in a complete state only six hymns, one of which is in elegiac form, and 64 epigrams. These are best edited by Meineke (Berlin, 1861), Schneider (1870–73), and Wilamowitz (Berlin, 1897). For the newly discovered verses of the *Hecale*, consult: Gomperz, *Neue Bruchstücke aus der Hekale des Kallimachos* (Vienna, 1893); *Sammlung der Papyrus Erzherzog Rainer*, vol. vi; Kenyon, "Recent Greek Literary Discoveries," in *The Classical Review*, vol. vii, pp. 429–430 (1893). Consult also: A. Hamette, *Les épigrammes de Callimaque: étude critique et littéraire* (Paris, 1907); Sandys, *A History of Classical Scholarship*, vol. i, pp. 122–124 (Cambridge, 1906); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii (5th ed., Munich, 1911).

CALL'ING THE DI'ET. The term used in the Scotch criminal law as equivalent to arraignment (q.v.), although the forms are different from those followed in an arraignment. In Scotland, excepting in cases of high treason, there is no indictment by grand jury, but all prosecutions for criminal offenses before the High Court of Justiciary, and before the sheriff's court, where the sheriff is sitting with a jury, now proceed on indictment in the name of the Lord Advocate. Before a prisoner can be tried the charge preferred against him must have been served 15 days before the trial, with a list of witnesses to be examined against him, and also of the jury panel. When the accused is arraigned for trial the clerk reads the indictment aloud in open court, the same being a formal and orderly statement of the facts which the prosecutor is prepared to prove. The prisoner is then called upon to state his objections to the relevancy of the facts alleged, and is entitled to have the question of the sufficiency of the indictment disposed of by the court before being called on to plead to the facts. This is equivalent to the demurrer (q.v.) of the English and American criminal law. If the objection is sustained, the prosecution for the time fails, and the prisoner is sent back to jail to await another indictment, unless the prosecutor chooses to abandon the case against him altogether. See DIET; INDICTMENT; VERDICT.

CALLI'NUS (Gk. Καλλίνος, *Kallinos*). A Greek poet, born at Ephesus, an elder contemporary of Archilochus, who flourished in the first half of the seventh century B.C. He first gave Greek elegy a political turn. The remains of his verse urge his fellow citizens to resist the attacks of the Cimmerians, who had invaded Ionia from the north, and to fight bravely in the struggle with Magnesia (q.v.), a neighboring city of Caria. Consult Bergk, *Poetæ Lyrici Græci*, vol. ii (Leipzig, 1878), and Wright, *A Short History of Greek Literature* (New York, 1907).

CALLIOPE, kâl-li'ô-pē (Gk. Καλλιόπη, *Kalliope*, the lovely-voiced, the sweet-voiced). One of the Muses. When special functions were assigned to individual Muses, Calliope presided over poetry, especially epic poetry. In the later art she is represented with tablets or a roll. In

some mythographers Calliope is the mother of Orpheus or of Linus.

CALLIOPE HUMMER. A humming bird (*Stellula calliope*) of the United States west of the Rocky Mountains. The male is metallic green above and whitish below, with reddish flanks, and the short tail dusky; his gorget is white, the feathers tipped with metallic purplish. It is numerous and makes its nest upon pine branches near cones, which it is made to resemble. For many interesting facts and pictures illustrative of this bird and its nidification, consult Ridgway, *The Hummingbirds* (Smithsonian Institution, Washington, 1892), and Dawson, *Birds of Washington* (Seattle, 1909). See Plate of HUMMING BIRDS.

CALLIP'PUS, or CALIP'PUS, OF CYZICUS (Gk. Κάλλιππος, *Kallippos*). An astronomer of the fourth century B.C. He discovered the error in the Metonic Cycle (q.v.) of 19 years, and substituted a cycle of 76 years, which he supposed to equal 940 lunar months and 27,759 days.

CAL'LIPY'GUS VE'NUS. A famous statue in the National Museum in Naples, once regarded as that of Venus, and called Callipygus (cf. Gk. κάλλος, beauty, πυγή, rump), from the part of her body at which she is gazing. It was found in the imperial palaces at Rome, and is said to be the portrait of a hetæra. See HETÆRÆ.

CALLIRRHOË, kâl-lir'rô-ë (Gk. Καλλιρόη, *Kallirrhôë*). 1. A fountain in the bed of the Ilissus, near Athens. In early times the name seems to have been given also to a fountain near the market place, west of the Acropolis, where the tyrant Pisistratus erected his Enneaeouros, or fountain with nine streams. (See ATHENS.) From the fountain in the Ilissus was brought the water for the marriage bath. 2. The town of Edessa (q.v.) also was called Callirrhôë. 3. The wife of Alemæon, who, yielding to her importunities, obtained from Phegeus the necklace of Harmonia and lost his life in the enterprise. See ALCMÆON.

CAL'LISTE'IA. See GREEK FESTIVALS.

CALLIS'THENES (Gk. Καλλισθένης, *Kallisthenēs*) (c.360–328 B.C.). A Greek historian, born at Olynthus. He was a relative of Aristotle, by whom he was educated, in company with Alexander the Great. He lived chiefly at Athens and devoted himself to the study of history. Having accompanied Alexander to the East, he incurred the latter's displeasure, especially by opposing the worship of Alexander as a god (see APOTHEOSIS), and was put to death (328 B.C.) on a charge of treason. Callisthenes wrote several historical works, only fragments of which have come down to us. The extant work on Alexander once ascribed to him is a composition of a much later date (third century A.D.); its author is now referred to as the pseudo-Callisthenes. Of the latter's work there are four Greek versions belonging to the Middle Ages (consult Krumbacher, *Geschichte der byzantinischen Litteratur*, pp. 848–852, Munich, 1897); also Syrian, Armenian, and Slavonic versions. Translations into Latin were made in the fourth and the tenth centuries. Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii (5th ed., Munich, 1911).

CALLIS'TO (Gk. Καλλιστώ, *Kallistō*). An Arcadian maiden, attendant upon Artemis, whose story was told with many variations by the Greek poets. Zeus won her love, but Artemis, discovering her condition while she was bathing,

either transformed her into a bear or shot her. Her unborn child, Arcas, was saved by Hermes, at the command of Zeus, and became the ancestor of the Arcadians. (See ARCADIA.) The Alexandrian poet Callimachus seems to have been the first to tell how Zeus placed Callisto among the stars as the constellation of the Bear. Callisto was originally, it is believed, a name under which Artemis herself was worshiped.

CALLIS'TRATUS (Gk. Καλλίστρατος, *Kallistratos*). A famous Athenian orator, born at Aphidnæ. When Athens, in 377 B.C., undertook to form a new Athenian League, he played an active part in the movement. In 371 B.C. he accompanied the Athenian envoys to Sparta, where he urged the cause of peace. In 362 or 361 B.C. he was condemned to death, probably chiefly in consequence of disasters which had befallen the Athenians at Oropus; this city the Thebans, on the advice of Callistratus, had been allowed to occupy temporarily, but they refused to surrender it. He went into exile at Methone, on the Thermaic Gulf, but later returned to Athens and was put to death, 355 B.C. Callistratus was the most famous orator of his time, and his defense of the part he had played in the Oropus matter is said to have produced a profound impression on Demosthenes, who, as a boy, was present at its delivery, and to have led him to study oratory.

CALL OF THE HOUSE. In Great Britain a parliamentary proceeding pursued as late as 1838, for the purpose of insuring a full attendance of either House on occasions of extraordinary importance. It was the custom to give notice in advance that such a call would be made, and on the appointed day all members, under pain of incurring the displeasure of the House, were expected to answer to their names as the roll was read off by counties and boroughs. In the United States a call of the House is moved by the opponent of a measure which is about to be passed, for the purpose of showing that a quorum is not present.

CALLOS'ITIES. See CORN.

CALLOT, kâ'lô', JACQUES (1592–1635). A French etcher and draughtsman. He was born in Naney, the son of the king-at-arms to the Duke of Burgundy, and was educated for the Church. His predilection for art was such that as a boy he twice ran away to Italy. After studying with local masters, he was in 1606 allowed to go to Rome, where he worked with Tempesta and Thomassin of Troyes. He afterward studied with Parigi at Florence, and was for years in the service of the court of Tuscany. Returning to Nancy, he attained great celebrity at the ducal court, and was invited by the Infanta Isabella to Brussels to commemorate the surrender of Breda. In 1629 he was summoned by Louis XIII to etch the siege of Rochelle; but his patriotism would not permit him to depict in like manner the siege of Naney, when it was captured by Louis XIII. The war scenes enacted in France at this time were also portrayed by him with great vigor and freshness, in a series of etchings called "Misères et malheurs de la guerre." His reputation, however, rests on his genre subjects, generally small in size, which he treated with great originality, life, and humor. In his larger prints the figures are wooden and academic in character. His imagination was inexhaustible, his drawing spirited and sure. He was the first to raise etching to the rank of an in-

dependent art, and the first important creative genius to devote himself entirely to graphic art. The paintings attributed to him are spurious, and many of his supposed prints are really by his pupils and imitators; but he etched about 1450 plates, among the most celebrated of which are the "Pont-Neuf," the so-called "Madonna of the Impruneta," a fine example of his method of treating great crowds of people and the two series entitled "Caprieci" and "Le Gueux." Consult Méaume, *Recherches sur la vie et les ouvrages de J. Callot* (Paris, 1860), and J. H. Green, *A Catalogue and Description of the Works of the Celebrated J. Callot* (London, 1804).

CALL TO THE UN'CONVERT'ED, THE. See BAXTER, RICHARD.

CALLU'NA. See HEATH.

CAL'LUS (Lat. *callum*, *callus*, hardened skin, hard flesh). The substance that forms between the ends of broken bones during the process of repair, to hold the fragments together. It consists of new or embryonic tissue, and a large part of it is absorbed after union is complete. When the ends of the broken bones are closely approximated, there is only a small bridge of callus formed between them. When the ends of the broken bones move very freely upon one another and separate widely, a large cuff or flange of callus forms, encircling and immobilizing them as a splint would. Such an ensheathing mass of callus is sometimes known as a *temporary* or *provisional callus*, to distinguish it from that portion which lies directly between the apposed fragments of bone and which in time becomes replaced by true bony tissue. When the amount of callus thrown out is excessive, permanent injury may result to adjacent structures if subsequent absorption is only partial. Nerves and tendons may be included in the callus, or a joint may be invaded and rendered useless. Surgical operation is sometimes necessary to remove this excess of callus and restore the parts to their normal condition. See ANATOMY OF PLANTS.

CALLUS, IN PLANTS. When a plant is wounded, the exposed living cells are called into active division again, and the resulting tissue covering the wound is called the callus. One of the most prominent elements of callus is cork, and the cork which originates in the callus is known as wound cork.

CALMAN, WILLIAM THOMAS (1871-). A British zoölogist, born at Dundee, Scotland. He was educated at University College, Dundee (affiliated with St. Andrews), where he became assistant lecturer and demonstrator in zoölogy in 1895. In 1904 he was appointed assistant in the zoölogical department of the British Museum, and in 1905-08 he was examiner in zoölogy at the University of St. Andrews. His publications include: *The Cumacea of the Soboga Expedition* (1905); "Crustacea" in the *Treatise on Zoölogy*, ed. by Sir Ray Lankester (1909); *The Life of Crustacea* (1911).

CALMAR, käl'mär. See KALMAR.

CALMET, käl'mâ', AUGUSTIN (1672-1757). A French Benedictine, and exegetical and historical writer. He was born at Mesnil-la-Horgne, near Commercy, Feb. 26, 1672, and in 1689 entered the Order of Benedictines. In 1698 he was appointed teacher of philosophy and theology in the abbey Moyon-Moutier; in 1704, sub-prior of a convent of learned monks at Münster, in Alsace; and in 1706 he went to Paris, to

superintend the publication of his *Commentary on the Bible*. He was afterward appointed prior at Lay (1715), abbot of St. Leopold in Nancy (1718), abbot of Senones in Lorraine (1728), and died in Paris, Oct. 25, 1757. His exegetical writings have been commended and studied with advantage by both Roman Catholics and Protestants. The *Commentary on the Bible* (23 vols., Paris, 1707-16), though marred by the author's deficient knowledge of the Oriental languages, and by frequent neglect of real difficulties, contains valuable researches in biblical antiquities, and is valuable for a close adherence to the literal meaning of Scripture, rather than the pursuit of allegorical interpretations. Calmet's *Historical and Critical Dictionary of the Bible* (4 vols., Paris, 1722-28) was translated into English, German, and other languages, and has passed through many editions. His other works—a *History of the Bible*, and of the *Jews* (1718), and a *Universal History* (1735-71)—are mere compilations; but his *History of Lorraine* (4 vols., Nancy, 1728; 2d ed., 6 vols., 1745-47) is founded on original researches. For his life, consult: Fangé (Senones, 1762); A. Digot (Nancy, 1861); and on his correspondence, P. E. Guillaume (Nancy, 1875).

CALMETTE, GASTON (1858-1914). A French journalist, born at Montpellier, France, and educated at the lycées of Brest, Bordeaux, Clermont-Ferrand, and Mâcon. He early became connected with the *Figaro*, was secretary of the editorial board from 1894 to 1903, and from then until his death was editor in chief. He was made a chevalier of the Legion of Honor and was decorated by the Spanish government with the grand cross of the Order of Charles III. His collection of First Empire engravings and caricatures was considered notable. An aggressive and fearless writer, never hesitating to employ scandal to help gain his end, Calmette incurred the bitter enmity of many public men. Early in 1914 he began a sensational attack upon Joseph Caillaux, Minister of Finance and a former Premier (see CAILLAUX; FRANCE, *History*). This campaign, and especially the threat to publish letters written by Caillaux to Mme. Caillaux when she was the wife of another man, resulted in the murder of Calmette by Mme. Caillaux on March 16, 1914. She testified that she had feared her husband would himself kill the editor.

CALM LAT'ITUDES. The portion of the ocean which lies between the northern and southern trades, and where calms of long duration are likely to prevail. They vary with the season of the year and the consequent shifting of the trade-wind belts. The term is also applied to the region along the polar edge of the trade-wind belts, which is called the Horse Latitudes. See DOLDRUMS.

CALMON, käl'môn', MARC ANTOINE (1815-90). A French statesman. He studied law, and held office from 1836 until the Empire, when he refused the oath. In 1871 he became Under-secretary of State in the Department of the Interior, and in December, 1872, prefect of the Department of the Seine. In 1873 he was elected to the National Assembly and became leader of the Left Centre; and in 1875 was chosen life Senator. His works on finance include the following: *Les impôts avant 1789* (1865); *William Pitt* (1865); *Histoire parlementaire des finances de la Restauration* (1868-70); *Etude des finances de l'Angleterre depuis la réforme de Robert Peel, jusqu'en 1869* (1870), and *Histoire*

parlementaire des finances de la monarchie de Juillet (4 vols., 1899). He edited Thiers's *Discours parlementaires* (15 vols., Paris, 1879-83).

CAL'OCHOR'TUS (καλός, *kalos*, beautiful + χόρτος, *chortos*, grass). A genus of liliaceous plants nearly related to the tulips. The species, of which there are 30 or more, are natives of western North America, from Colorado and Montana to British Columbia and California and southward, where they are variously known as Mariposa lily, star tulip, globe tulip, and butterfly tulip. The plants have bulblike corms from which arise the more or less leafy, branched stems, bearing showy flowers of white, red, yellow, and lilac, often darker toward the centre, forming a distinct eye. The three outer parts of the perianth are small and sepal-like, while the inner three are larger, showy, and covered towards their bases with hairs.

Many of the species are in cultivation. *Calochortus venustus*, the butterfly tulip (for illustration, see Plate of CALIFORNIA FLORA), is one of the handsomest and most variable species. *Calochortus nuttallii*, the sego lily, is a beautiful desert species, the corms of which were formerly considered a delicacy by the Indians.

CALOMARDE, ká'lô-mär'dâ, FRANCISCO TADEO (1775-1842). A Spanish statesman. He was born at Villed, in Aragon, studied in Saragossa, and became an advocate. During the wars of Napoleon he remained loyal to the national cause, and after the expulsion of the French and the return of Ferdinand VII in 1814, Calomarde was among the first to hurry to Aragon and do homage to him as absolute monarch. As a reward of his obsequious celerity he obtained a post in the Secretariat of the Council for the Indies, and in 1815, when the Council for the Indies was abolished, he was transferred to a similar post in the Ministry of Justice. In the same year, upon the foundation of the American Order of Isabella the Catholic, he was made perpetual secretary thereof. This post he held through all his varying fortunes. Shortly thereafter he fell into disfavor and was confined in Pamplona as a suspect. On the restoration of the constitution in 1820 he unsuccessfully courted the favor of the Liberals; but when the French army in 1823 restored the authority of Ferdinand VII Calomarde was appointed secretary of the *cámara del real patronato*, one of the most influential offices in the kingdom. Not long after the King made him Minister of Justice. While he held this office he showed himself an uncompromising enemy of free thought and progress, and a friend of the old ecclesiastical supremacy, being the acknowledged leader of the Ultraroyal party. He secured the punishment of the Constitutionalists. He supported the Portuguese usurper Miguel against the Queen of Portugal and was rewarded with the title of Marqués de Almeida. He was decorated by Ferdinand VII with the Order of Charles III, and founded on Ferdinand's behalf the Pragmatic Sanction of Charles IV, whereby women were admitted to the succession. On the birth of Isabella II he was decorated with the Order of the Golden Fleece, and the King of Naples made him Duke of Santa Isabel. He also secretly favored the party of Don Carlos, but by treating any unseasonable outbreak with great cruelty he preserved himself from the suspicion of being implicated in Carlist schemes. In 1832, when Ferdinand was supposed to be on his deathbed,

he was prevailed on by Calomarde to reintroduce the Salic law, by which the Infanta Isabella was excluded from the throne, and Don Carlos, the favorite of the Absolutists, was appointed successor. The unexpected recovery of the King frustrated Calomarde's schemes, and he fled in disgrace to France. The 10 years of his ministry were known as the Ominous Decade of Calomarde. During the first Carlist war he returned to Tolosa, Spain, and offered his services to Don Carlos; but seeing that he was despised by Carlists and Liberals alike, he returned to Toulouse, where he died. Consult Cárdenas, *Vida de Calomarde*, which appeared as vol. iv of the *Galería de Españoles célebres contemporáneos*, 9 vols., by Pastor Diaz and F. de Cárdenas. (Madrid, 1841-49).

CAL'OMEL (Gk. καλός, *kalos*, beautiful + μέλας, *melas*, black; so called because white, though prepared from a black substance). One of the compounds of mercury and chlorine, known also as the subchloride or mild chloride of mercury, with the symbol Hg₂Cl₂. It is a heavy, white, tasteless, and odorless powder, insoluble in water, ether, or alcohol. It is used in medicine as a cholagogue cathartic. It stimulates the flow of bile. It acts principally upon the upper portion of the intestine and is therefore more effective when followed by a saline purge. It is a valuable adjunct to quinine in malarial fever. Calomel is an antiseptic and is dusted on foul wounds or ulcers, to stimulate and purify them. In the eye it promotes the absorption of corneal opacities. Calomel dissolved in lime water ("black wash") is a valuable lotion in syphilitic sores. The medicinal dose of calomel is from one-half a grain to 10 grains. Excessive doses, or the retention in the system of one large dose, cause swelling of the tongue and gums, and salivation. See MERCURY.

CALONNE, ká'lün', CHARLES ALEXANDRE DE (1734-1802). French Minister of Finance under Louis XVI. He was born Jan. 20, 1734, in Douai. As Advocate General, Procurator General, and Intendant, he had displayed many brilliant but unsubstantial qualities, when, in 1783, at the instance of his patron, Comte d'Artois, and of Vergennes, he was summoned by the King to become Comptroller-General of the Finances. The treasury then was in hopeless disorder, and the whole financial system of the kingdom was inadequate to meet the demands of the extravagant court and administration. Calonne's policy was, by extravagant display, to restore confidence and secure new loans. So for about three years the court revelled with the full approval of the Minister of Finance. But Calonne soon found that public credit requires some more substantial foundation than mere display. Both credit and taxation had reached their absolute limits. A crisis had arrived, with which neither Minister nor King could deal. An Assembly of Notables was therefore called and Calonne opened its session in February, 1787. He laid before them the enormous deficit in the treasury and proposed, as a means of meeting it, that all land in France, that of nobles and clergy included, should be taxed. This was a blow at the incomes of the very men to whom he was proposing it, so it failed of support. Calonne's accounts were examined, and to the great joy of all France he was removed. He left France, settled in England, and married a wealthy English widow. During the Revolution he supported the émigré party. Not until 1802 was he

allowed by Napoleon to return to France. He died in Paris about a month after his return. Consult the authorities referred to under FRANCE for this period; also Susane, *La tactique financière de Calonne*, with bibliography (Paris, 1902).

CAL'OPHYLLUM (Neo-Lat., from Gk. *καλός*, *kalos*, beautiful + *φύλλον*, *phyllon*, leaf). A genus of trees of the family Guttiferae, natives of warm climates. Some of the species yield valuable timber, as the piney tree (*Calophyllum angustifolium*), which grows at Penang and in the islands to the eastward of the Bay of Bengal, attaining large proportions in ravines and narrow, moist valleys, and furnishes the beautiful straight spars called "Poon." The resinous products of some species are valuable, and among them are some of the substances known by the name of Tacamahaca. *Calophyllum inophyllum* is a very large and beautiful umbrageous tree, often planted for its shade and the fragrance of its flowers, which are white and in loose axillary racemes. It is one of the most valuable timber trees of the South Sea Islands. The timber resembles mahogany, being of equally close texture, although of lighter color, and very durable. The leaves are oblong and obtuse; the fruit is a globose drupe or stone fruit, about the size of a walnut, and a fixed oil is expressed from its kernel, which is used for lamps, etc. In the Hawaiian Islands this oil is extensively applied to bruises and in rheumatism. A similar oil is expressed from the seed of *Calophyllum calaba*, a native of Ceylon, which also has white sweet-scented flowers, and whose timber is used for various purposes, particularly for staves, cask-headings, and housebuilding. Considerable difference of opinion exists as to the species producing the Tacamahaca resin and the Poon spars. The more recent authors state that *Calophyllum calaba* yields the true Tacamahaca and *Calophyllum inophyllum* a resin quite similar. Doubtless several species furnish the Poon spars. There are a number of other species, some of which yield heavy, durable timber that is valuable for engineering purposes.

CALOR'IC (Fr. *calorique*, from Lat. *calor*, heat). An early term for heat, when it was considered an invisible, imponderable fluid. See HEAT.

CALOR'IC EN'GINE. A trade or commercial name given by John Ericsson (q.v.) to a form of hot-air engine. See HOT-AIR ENGINE.

CAL'ORIE. See FUEL.

CAL'ORIM'ETRY (from Lat. *calor*, heat + Gk. *μέτρον*, *metron*, measure). The science of the measurement of quantities of energy, when manifested by heat effects. By the name "heat effects" is meant the changes produced in material bodies when they are exposed to what is called a "source of heat," e.g., a flame or the rays of the sun. Among these changes which may take place are expansion, fusion, evaporation, alteration in electrical and magnetic properties, etc. It is now believed that these changes are occasioned by increase in the energy of the smallest portions of the bodies. When a body is "heated" or "warmed," we mean that its minute parts gain energy; and opposite changes, e.g., freezing, condensation, cooling, etc., take place when these parts lose energy. It is the province of calorimetry to measure these amounts of energy gained or lost.

The *erg* (see MECHANICAL UNITS) is the unit of energy and work, and therefore all quantities

of energy should be measured in terms of it; but it rarely happens that heat effects are due directly to mechanical work except in case of friction. Consequently the erg is not a convenient unit. Heat effects and the energy required to produce them are almost invariably compared with one definite heat effect, viz., rise in temperature of water; and the practical unit employed for measuring thermal energy may be defined as the quantity of energy required to raise the temperature of one gram of water from 15° to 16° C. on the thermometric scale of the constant-pressure hydrogen thermometer. (Other definitions of a practical unit have been proposed, e.g., by the substitution of 20° to 21° in place of 15° to 16° C.; or the one-hundredth portion of the quantity of energy required to raise the temperature of one gram of water from the freezing point to the boiling point under normal pressure.) This practical unit is called the *calorie*, and its value is very nearly 4.187 joules, or 4.187×10^7 ergs. See HEAT.

By the "specific heat" of a substance at a given temperature and under definite conditions is meant the number of calories required to raise the temperature of one gram of the substance one degree by the hydrogen scale (see THERMOMETER), at that temperature and under those conditions. In general, however, we make use of the *average specific heat*, i.e., the number of calories required to raise the temperature of one gram through t degrees, divided by t . By the "latent heat" of a substance for a definite change of state (e.g., fusion, evaporation, sublimation, dissociation), under definite conditions, is meant the number of calories required to produce the particular change of state in one gram of the substance under the specified conditions. Thus we speak of the "specific heat of air at constant pressure," or the "latent heat of evaporation of water at normal atmospheric pressure." Calorimetry is, then, chiefly, the science of measuring specific and latent heats.

There are two general methods for the measurement of specific heats, which may be regarded as satisfactory—the method of mixtures and the use of an ice or a steam calorimeter. In the method of mixtures a known quantity of the substance at a known temperature is mixed with a known quantity of some liquid at a different known temperature and the temperature of the mixture is observed. The specific heat of the liquid for the given range of temperature being known, and allowance being made for losses by radiation and conduction, and for the calories spent in changing the temperature of the vessel containing the liquid, the specific heat of the substance may be at once deduced. The most improved form of apparatus for use in this method is that of Prof. F. A. Waterman, a full description of which is given in the *Physical Review*, vol. iv, p. 161 (1896).

In the ice calorimeter, the substance whose specific heat is desired is introduced into an apparatus which allows the heat energy withdrawn from the body to be spent entirely in melting ice. The change in temperature of the substance and the quantity of ice melted may be observed; and thus, assuming that the latent heat of ice is known, the specific heat of the substance may be calculated. This method is due to Black; and the most improved apparatus is that designed by the late Professor Bunsen of Heidelberg. The most accurate method of using

the "Bunsen calorimeter" is that of Dr. Dieterici, of Hanover. (Consult *Wiedemann's Annalen der Physik und der Chemie*, vol. xxxvii, p. 494, 1889.) Fairly satisfactory descriptions are given in almost all general textbooks on physics. In the "steam calorimeter" the substance whose specific heat is desired is suspended on one pan of a chemical balance, which is inclosed in a box connected with a steam boiler; if the steam is suddenly admitted, some of it will continue to condense on the pan and the substance until their temperature is raised to that of the steam. The quantity of steam thus condensed may be weighed by placing weights in the other pan of the balance, and, if the latent heat of condensation of steam is known, the specific heat may easily be calculated. This method is due to Professor Joly, of Dublin, and a full description of the latest improvements may be found in the *Philosophical Transactions of the Royal Society of London* (1894). In all these methods it should be noted that what is measured is the *average specific heat* of the substance over a given range of temperature. For other methods of measurement of specific heat, reference may be made to the larger treatises on physics.

To measure the latent heat of fusion two methods have been used successfully: one is an obvious application of the method of mixtures; the other is to secure the fusion by means of the heating action of an electric current, whose intensity and electromotive force may be measured, thus giving the quantity of energy consumed in producing the fusion.

To measure the latent heat of evaporation, two similar methods have been used, and a third also. If the vapor is conducted through a long spiral tube surrounded by water, the vapor will condense, the temperature of the water will be raised, and thus we have simply the method of mixtures. Or a liquid may be made to evaporate by means of a reduced pressure, and the consequent fall of temperature may be balanced by the heating action of a known electric current. Again, if a liquid inclosed in a Bunsen calorimeter is caused to evaporate, the surrounding water will be frozen—just the reverse of the general use of the apparatus—and the quantity frozen may be measured. For full description of these various methods for measuring latent heats of all kinds, reference should be made to general treatises on heat. Preston's *Theory of Heat* (London, 1894) is perhaps the best book of reference.

Another class of calorimeters is designed to enable the observer to ascertain the number of calories furnished when certain fuels, such as coals, oils, etc., are allowed to burn under definite conditions. In these the coal is placed in a hollow steel cylinder which can be tightly closed, oxygen is admitted under high pressure, and combustion is started by means of an electric current through a fuse wire. The cylinder is kept immersed in water, the rise of temperature of which is observed, and the energy generated thus measured. Calorimeters constructed on a large scale are used to measure the amount of heat given off by an animal or human being, the amount of food and air supplied to the subject of the test being recorded. Prof. W. O. Atwater, of Wesleyan University, carried on a number of experiments with such an instrument and ascertained the fuel value of various foods. His results are to be found in a series of bulle-

tins issued by the United States Department of Agriculture. Subsequent work in this field has been conducted with considerable success by the Nutrition Laboratory of the Carnegie Institution of Washington at Boston, Mass., under the direction of Dr. Benedict, where with improved apparatus and equipment much progress has been made. For an illustration of the Mahler calorimeter, see FUEL.

CALOTTISTES, ká'lô'têst' (Fr. *Calottiste*, from *calotte*, dimin. of OF. *cale*, cap). A society of wits and satirists in the time of Louis XIV and Louis XV, known as the Régiment de la Calotte. They were headed by two officers in the King's bodyguard, named Torsac and Aymond. Their amusement consisted in sending to any public character who had exposed himself to ridicule a "patent" authorizing him to wear the *calotte* as a covering for the weak part of his head. The armorial bearings of the Régiment de la Calotte consisted of various symbols of folly, with the mottoes *C'est regner que de savoir rire*, and *Favet Momus, Luna Influit*. When Torsac, its first "generalissimo," died, the society, which occupied a position of satirical hostility to the French Academy, drew up a burlesque funeral oration, manufactured out of the pompously eulogistic phrases which the academicians were in the habit of using. As the society became more audacious and did not spare even royalty itself, it was dissolved by the Minister, Fleury. The *Mémoires pour servir à l'histoire de la Calotte* (Basel, 1725) is an amusing little book. During the Bourbon Restoration the title *Régime de la Calotte* was applied to the priestly administration of affairs. Consult *Journal historique et anecdotique du règne de Louis XV de l'avocat Barbier* (ed. 1857).

CAL'OTYPE (Gk. *καλός*, *kalos*, beautiful + *τύπος*, *typos*, impression). A name applied to one of the earliest processes for producing photographic prints as well as to the prints themselves. The process was invented by William Henry Fox Talbot (q.v.) in 1840. It consists of the following operations. A sheet of good plain paper, with a smooth surface and a close and even texture, is washed by means of a soft brush with a solution of 100 grains of crystallized silver nitrate in 6 ounces of distilled water. The paper is allowed to dry in a dark room and is then dipped into a solution of potassium iodide made by dissolving 500 grains of that salt in a pint of water. After a few minutes it is removed and then dipped into water and dried. This "iodized paper" is exceedingly sensitive to light, and may be kept for some time if it is carefully protected from sunlight. When required for use, a sheet of it is washed in a mixture which Mr. Talbot called gallonitrate of silver. The mixture is obtained by adding a saturated solution of gallic acid to an equal volume of a solution of 100 grains of crystallized silver nitrate in 2 ounces of distilled water, to which one-sixth of its volume of strong acetic acid had been added. After the iodized paper has been washed over with this solution it is dipped into water and then cautiously dried with blotting paper. An exposure of less than a second in diffused daylight is sufficient to obtain an impression. In order to develop the impression the paper is again washed with gallo-nitrate of silver and dried near a fire, the exposed portions becoming brown, while the covered portions retain their original color. The picture is then fixed by consecutively

washing it in clean water, drying, washing in a solution of potassium bromide (100 grains in 8 ounces of water), washing in water to remove any surplus iodide solution, and finally drying. The calotype process has been superseded by other processes and is at present hardly ever used. See PHOTOGRAPHY.

CALOVIUS (KALAN), ABRAHAM (1612–86). A German Lutheran theologian, born in Mohrun-gen, East Prussia. He became rector of the gymnasium in Danzig (1643) and professor of theology in Wittenberg (1650). He was a strong polemical writer against Romanists, Socinians, and Calvinists, and in particular Georg Calixtus (q.v.). His chief works were *Systema Locorum Theologicorum* (12 vols., 1665–77) and *Biblia Illustrata* (4 vols.), defending the orthodox views of inspiration against Grotius.

CALPE, käl'pè. See HERCULES, PILLARS OF.

CALPEE, or **KALPI**, käl'pè. A city in the Jalaun district of the United Provinces, British India, on the right bank of the Jumna, in lat. 26° 7' N. and long. 79° 48' E. (Map: India, C 3). Pop., 1901, 10,139; 1911, 10,568. It is an entrepôt for the rice, cotton, and grain of the neighboring district, and has manufactures of cotton, paper, and sugar. After a long period of decay, it is beginning to revive. It is 51 miles southwest of Cawnpore and is closely linked with it in the history of the great mutiny of 1857–58.

CALPUR'NIA. See CALPURNIUS.

CALPURNIA GENS. See CALPURNIUS.

CALPUR'NIUS. The Calpurnia gens was, by its own account, one of the oldest plebeian clans in Rome; but it does not figure in history till the time of the First Punic War. The family names, in the time of the Republic, were Bestia, Bibulus, Flamma, and Piso.—MARCUS CALPURNIUS BIBULUS is known as the hostile and incapable colleague of Cæsar (59 B.C.) in the consulate (consult Suetonius, *Julius*, 20). He was put up by the aristocratic party, who spent vast sums to carry the election. He finally joined the Pompeian party, had command of the fleet intended to prevent Cæsar's passage to Greece, and died 48 B.C., before the battle of Dyrrhachium. Among the Roman women of this family, two are celebrated—CALPURNIA, the daughter of Lucius Calpurnius Piso (consul 58 B.C.), and the last wife of Cæsar (from 59 B.C.), who seems, from the scanty notices of her we possess, to have been a quiet domestic woman, full of love and solicitude for her great husband, whom she survived; and CALPURNIA, the daughter of L. Calpurnius Bestia, wife of P. Antistius, who killed herself when her husband was murdered by order of the younger Marius, 82 B.C.

CALPURNIUS, TITUS, surnamed SICULUS. A little-known pastoral poet of the reign of Nero (54–68 A.D.). He was the author of seven eclogues in close imitation of Vergil, not without poetical feeling, but exaggerated and artificial. These have been edited by Schenkl (Leipzig, 1885) and Keene (London, 1887), and translated by Scott (London, 1890). Consult Butler, *Post Augustan Poetry*, pp. 150–159 (Oxford, 1909).

CALTAGIRONE, käl'tà-jè-rō'nâ (from Ar. *Kalat-al-Girche*, fortress of Girche, a Saracen general, who captured the place in the eighth century). A city in the Province of Catania, Sicily, 57 miles southwest of Catania (Map: Italy, J 10). It is situated on two steep hills, 2000 feet above sea level, and is considered the

best-built city in Sicily. The streets are wide and well paved, and a stone stairway, dating from 1506, ascends from the large market place to the castle. The manufacture of terra-cotta figures, particularly of Sicilians and Calabrians in national costumes, is the chief industry. Mosaics and vases, disclosed by excavating, point to an ancient town of unknown origin. Pop. (commune), 1881, 32,000; 1901, 44,879; 1910, 43,169.

CALTANISSETTA, käl'tà-nè-sèt'tà (Ar. *Kalat-al-Nisa*, fortress of Nisa; Nisa was a Sicanian town). An episcopal city in central Sicily, capital of the Province of Caltanissetta, situated on a hill 1930 feet above sea level, near the Salso, about 80 miles west of Catania, and southeast of Palermo (Map: Italy, J 10). The town has a castle, a cathedral with paintings of the later Sicilian school, public gardens, a seminary and a gymnasium, a school of technology and a school of mines, and a theatre. Two miles to the east is a beautiful Norman monastery erected in 1153 by Roger II, and 2 miles farther is a mud volcano resembling the Maccaluba (q.v., under ARAGONA), and an oil well. Caltanissetta is the centre of the sulphur industry of Sicily. Pop., 1881 (commune), 30,000; 1901, 43,300; 1910, 40,927.

CAL'THA. See MARSH MARIGOLD.

CALTON (käl'ton) **HILL**. An elevation in the northeastern part of Edinburgh, overlooking the Forth. Three monuments surmount it—one in memory of Dugald Stewart, another in memory of Nelson, and a third in celebration of the battle of Waterloo.

CALUM'BA, or **COLOM'BA** (Neo-Lat., probably from Mozambique *Kalumb*; according to some, the name is derived from Colombo, in Ceylon). The root of *Jateorrhiza palmata*, a herbaceous plant of the natural order Menispermaceæ, a native of eastern Africa and cultivated in some East Indian islands. The flowers have 12 sepals and petals, similar in appearance, and disposed in four rows. The male and female flowers are on separate plants. The leaves are nearly circular, with five to seven lobes, on long hairy footstalks, and solitary axillary racemes of small green flowers, the racemes of the male plants branching. The fruit is a drupe, or one-seeded berry-like fruit, about the size of a hazel nut, densely clothed with long hairs. The stem is annual and twining; the root perennial, consisting of clustered, spindle-shaped, fleshy tubers, with a brown warty epidermis, internally deep yellow, with a bitter taste and faint aromatic odor. Its bitterness is ascribed to a somewhat narcotic principle called calumbine, and to berberine, an alkaloid originally discovered in the barberry. Calumba is a useful stomachic, or bitter tonic. As it contains no tannin, it may be taken with preparations of iron. It is sometimes given to allay vomiting and has been found useful in diarrhœa and dysentery. It is administered in the form of powder, fluid extract, or tincture. An infusion of calumba injected into the rectum is a sovereign remedy for thread worms. The poisonous seed known by the name of *Cocculus Indicus* (q.v.) belongs to a plant of a different but allied genus. The root of *Frasera walteri* is sometimes fraudulently substituted for calumba and has been called American calumba root. It differs from calumba in its properties and appearance; it undergoes no such change of color when touched with tincture of iodine,

whereas true calumba root turns blue owing to the presence of starch. See FRASERA.

CAL'UMET (Fr., Late Lat. *calamellus*, dim. of Lat. *calamus*, reed). The popular name for the Indian ceremonial pipe. The Indians had pipes of various shapes and sizes, made of clay, stone, or bone, but the ceremonial pipe was usually of large size, in the East and Southeast of white stone, and in the West of the red catlinite from the noted pipestone quarry in Minnesota. The stem was made long, of wood

CALUMET.

or reed ornamented with feathers and porcupine quillwork. Native tobacco, mixed with willow bark or sumac leaves, was used. Although frequently referred to as the "peace pipe," the ceremonial pipe was in fact used in the ratification of all solemn engagements, both of war and of peace.

CALUMET. A township in Houghton Co., Mich., 68 miles (direct) northwest of Marquette, on the Copper Range, the Keweenaw Central, and the Mineral Range railroads (Map: Michigan, A 1). It includes the villages of Laurium and Red Jacket. Calumet is in one of the most productive copper regions in the United States, and the mining of this metal is the chief industry. Immediately west of Laurium is the celebrated Calumet and Hecla mine. A ten-million-dollar water-power project on the Sturgeon River, 15 miles to the south, is now under way, and will, when completed, greatly enhance the industrial facilities of the district. Calumet was the scene of a prolonged labor dispute in 1913, beginning on July 23, when a strike was declared by the Western Federation of Miners. Pop., 1900, 25,991; 1910, 32,345.

CALUMET AND HECLA. See COPPER.

CALUMPIT, käl'loom-pët'. A town of Luzon, Philippines, in the Province of Bulacán. It is situated on the river Pampanga and is connected by rail with Manila, from which it is distant 27 miles. Pop., 1903, 13,897.

CALVADOS, käl'vâ'dôs' (from Calvados, corruption of *Salvador*, the name of a vessel of the Great Armada, which was wrecked here). A northern maritime department of France, bounded north by the English Channel, and east and west and south by the departments of Eure, Manche, and Orne (Map: France, N., E 3). It is the most historical section of the old Province of Normandy. The principal rivers are the Orne, Tocques, Dives, Solles, Dromme, and Vire. The coast is partly formed by bold ridges, cliffs, and reefs. The soil of the department is generally fertile, supplying wheat, barley, oats, and rich pasturage for cattle, sheep, and horses, which, with swine, constitute the principal wealth of Calvados. Fishing is also a thriving

industry. Calvados is famous for its cider. The climate is healthful, though changeable. Iron, marble, slate, and coal are found. Area, 2198 square miles. Population, 1901, 410,178; 1911, 396,318. Capital, Caen.

CALVAERT, käl'värt, or **CALUWAERT,** DENYS (DIONYSIUS) (1540-1619). A Flemish-Italian historical and landscape painter (called in Italy DIONISIO FIAMMINGO, 'the Fleming'). He was born in Antwerp, and was registered as an art pupil there in 1556; but he soon went to Italy and studied in Bologna under Prospero Fontana, and later under Sabbatini, assisting the latter in his frescoes in the Vatican. About 1574 he opened a school in Bologna and had among his students the celebrated Domenichino, Guido Reni, and Albani. Most of his pictures are still preserved in Bologna, where he died; others are to be found in England, Dresden, and Vienna.

CAL'VARY. In Roman Catholic countries, a representation of the various scenes of the passion and crucifixion of Jesus Christ, either in a chapel, or external to the church. It consists of three crosses with the figures of Christ and the thieves, usually as large as life, surrounded by a number of figures, representing the various personages who took part in the crucifixion. At Aix-la-Chapelle the calvary is a church on the top of a hill, surrounded by 12 sculptured stones, each marking an event which took place on the journey of Jesus to Mount Calvary. The approach to the calvary is called the *Via Dolorosa*, each of the stones marking a station (see STATIONS), at which the pious say a prayer in passing. See VIA DOLOROSA.

CALVÉ, käl'vä', EMMA, stage name of EMMA DE ROQUER (1864-). A French dramatic soprano. She was born in Decazeville, Department of Aveyron, France, of a Spanish father and a French mother, and was brought up in a convent school near her home. She studied under Rosine Laborde, and made her début in *Faust* at the La Monnaie, Brussels (1882). Though praised, she showed no trace of her now admired fiery temperament. She overexerted her voice and, on Gevaert's advice, went to Marchesi, reappearing (in 1884) in Dubois's *Aben Hamet* at the Théâtre des Italiens, then directed by Maurel. Since then she has sung at the Opéra Comique, at the Grand Opera, in England, Italy, Spain, Russia, and the United States. From 1893 to 1904 she was one of the greatest stars of the Metropolitan Opera House, her interpretation of Carmen being regarded as peerless. After 1909 she practically abandoned the stage, devoting her time to extensive concert tours. She created the leading parts in Joncières' *Chevalier Jean* (1885), Samara's *Flora Mirabilis* (1886), De Lara's *Messaline* (1900), Massenet's *Navarraise* (1895), and *Sapho* (1897), the last two written especially for her.

Calvé's voice is a rich soprano sfogato of 2½ octaves from *g* to *c*², perfectly even throughout, with a contralto-like low register. Her extraordinary dramatic powers have gained for her the title of the "Singing Duse."

CALVERLEY, käl'vēr-lī, CHARLES STUART (1831-84). An English humorist, born at Martley, Worcestershire. His father was the Rev. Henry Blayds, a name adopted near the first of the century, but in 1852 again changed to the ancestral Calverley. He was educated at Balliol College, Oxford, and at Christ's College, Cambridge, of which, after a brilliant career, he was

appointed fellow (1858). At this time he was famous among his friends for many parodies and an examination paper on *Pickwick*. His publications are *Verses and Translations* (1862); *Translations into English and Latin* (1866); *Theocritus Translated into English Verse* (1869); *The Idylls of Theocritus and the Eclogues of Vergil Translated into English Verse; with an Introduction by R. Y. Tyrell* (London, 1908); and *Fly Leaves* (1872). Calverley holds a high place among writers of light and humorous verse, and his Latin renderings are exceedingly felicitous. After years of ill health, he died Feb. 17, 1884. His *Complete Works* (London, 1901) contain a good biographical notice by Sir W. J. Sendall. Consult Sendall, *Literary Remains*, with memoir (London, 1885).

CALVERT. A city in Robertson Co., Tex., 128 miles northwest of Houston, on the Houston and Texas Central and the International and Great Northern railroads (Map: Texas, D 4). It is the shipping point for a cotton-growing and stock-raising region, and has a large cotton gin and cottonseed-oil mill. Lignite is mined also. Pop., 1890, 2632; 1900, 3322; 1910, 2579; 1914 (local est.), 5046. In December, 1913, the Brazos River, near here, overflowed its banks, causing a loss of 19 lives and property damages of \$1,000,000.

CALVERT, GEORGE and CECIL. See BALTIMORE, BARONS.

CALVERT, GEORGE HENRY (1803-89). An American journalist and author, born in Baltimore, Md., a descendant of Lord Baltimore. He graduated at Harvard in 1823, studied in Göttingen, and, on his return from Germany, became editor of the *Baltimore American*. In 1843 he removed to Newport, R. I., of which city he was elected mayor in 1853. He published both prose and verse, including dramas, translations, and critical essays. Among them were: *Illustrations of Phrenology* (1832), the first American treatise on the subject, published at the time of Spurzheim's visit; *Scenes and Thoughts in Europe* (1846-52); *The Gentleman* (1863); *Goethe: His Life and Work* (1872); and *Three Score, and Other Poems* (1883). He translated the correspondence of Schiller and Goethe (1845) and Schiller's *Don Carlos* (1836).

CALVERT, SIR HARRY (1763-1826). An English general. He was born at Hampton, and was educated at Harrow. He became second lieutenant of the Royal Welsh Fusiliers (1778), participated in the siege of Charleston and in the last campaign of Cornwallis, and was a prisoner in America until 1783. He took part in the war with France which began in 1793, and became lieutenant general in 1810, baronet in 1818, and general in 1821. As adjutant general (1799-1818) he carried through important army reforms, especially in training schools. Consult *Journals and Correspondence of Sir Harry Calvert, Bart.* (London, 1853), ed. by his son, Sir H. Verney.

CALVERT, LEONARD (c.1582-1647). The first Colonial Governor of Maryland. He was the brother of Cecil Calvert, the second Lord Baltimore, and by him was placed in charge, as Governor, of the small company of 200 men who in 1634 settled in Maryland under the charter secured from Charles I by George Calvert, first Lord Baltimore. He continued to act as Governor until his death. Perhaps the most noteworthy event during his term as Governor was his contest with William Clai-

borne (q.v.), who had settled on Kent Island in 1631, and denied the jurisdiction of the Maryland authorities. Calvert captured the island in 1638, when Claiborne was in England, but the latter in 1645 succeeded in expelling Calvert, who, however, again defeated him in 1646. Consult Mereness, *Maryland as a Proprietary Province* (New York, 1901).

CALVES' HEAD CLUB. An association whose purpose was to ridicule the memory of Charles I. Its history is very obscure. According to the *Secret History of the Calves' Head Club* (2d ed., 1703), probably written by the notorious Ned Ward, it was originated by John Milton, and its meetings were given over to unseemly orgies in contempt of the Stuarts; but this book is absolutely worthless. Apparently there was no fixed place of assembly. The principal gathering is said to have taken place each year on January 30, the anniversary of the King's execution. It is highly improbable that the organization long survived the Restoration. If so, its proceedings must have been entirely secret. In 1735 a meeting of some young men calling themselves the Calves' Head Club was held at a tavern in Suffolk Street, London. An accident gave rise to a riot. As usually explained, the disturbance was caused by scandalous toasts offered within hearing of the crowd; but this is denied by Lord Middlesex, who was present. The affair has recently been pronounced a hoax, having no connection with the original association, which had doubtless long since ceased to exist. Consult Timbs, *Clubs and Club Life in London* (new ed., London, 1898). Compare: Wilson, *Memoirs of the Life and Times of Daniel De Foe* (London, 1830); Spence, *Anecdotes* (2d ed., London, 1858); Walford, *Old and New London* (London, n. d.); *Harleian Miscellany*, vol. xii (London, 1811).

CALVI, käl've. A fortified seaport of Corsica (belonging to France), situated on a peninsula in the Gulf of Calvi, about 38 miles west-southwest of Bastia. It has an old cathedral and, though the harbor is poor, it is the nearest Corsican port to the French coast, and carries on some trade in fish and southern fruit (Map: France, S., M 6). Calvi was founded in the thirteenth century by the Genoese and was captured by the English in 1794, after a siege of 51 days. It was again acquired by France in the following century. Pop., 1901, 1998; 1911, 2269.

CALVILLE, Fr. pron. käl-vèl' (Fr., from Lat. *calvus*, bald, smooth surface). A kind of apple, of which there are numerous subvarieties. The Calvilles diminish in thickness from the middle towards the calyx, where they form a point; they have regular ribs and a large open seed chamber; also a pleasant smell, and are oily to the touch. They are never altogether streaked; they have a fine loose flesh, with a flavor somewhat resembling that of the raspberry or strawberry. The white winter Calville is in high repute, both as a culinary and dessert apple; it is very extensively cultivated on the continent of Europe. This class of apples was early introduced in America, but is not now listed in the catalogues.

CALVIN (in its French form *Cauvin*, or *Caulvin*), JOHN (1509-64). One of the most eminent of the reformers of the sixteenth century. He was born at Noyon, in Picardy, France, July 10, 1509. His father, Gérard Cauvin, was procureur-fiscal of the District of

Noyon, and secretary of the diocese. His mother was Jeanne Lefranc. He was one of six children—four sons and two daughters. All the three sons who survived were bred ecclesiastics; and the reformer himself, on May 29, 1521, while still only 12 years of age, was appointed to receive part of the revenue of a chapel in the cathedral church of Noyon. This he held as a means of support during the period of his education, and even for some short time after he had entered upon his reforming career. Calvin was educated in circumstances of ease and even of affluence. The noble family of Montmor, in the neighborhood, invited him to share in the studies of their children; he was in some measure adopted by them, and when the family went to Paris, in his fourteenth year (1523), he accompanied them, and participated in the benefits of the higher instruction which was there attainable. He was entered as a pupil in the Collège de la Marche, under the regency of Mathurin Cordier, better remembered, perhaps, by his Latin name of Corderius. It was under this distinguished master that Calvin laid the foundation of his own wonderful mastery of the Latin language. Not long afterward he left him for the strictly ecclesiastical college of Montaigu, in the same university. During this early period he was distinguished by the great activity of his mental powers and the grave severity of his manners. His companions, it is said, surnamed him the "Accusative."

Probably at first his father intended that he should study theology, for in 1527 he got him the curacy of St. Martin de Martheville (near Vermands, Aisne) in addition to that of the chapel, which, however, Calvin resigned in 1529, in favor of his younger brother, and the same year exchanged the curacy for another, that of Pont l'Evêque, where his father had been born. But in 1528 his father changed his mind and determined that he should become a lawyer. He therefore sent him, with the view to his studying law, to the University of Orleans, then adorned by Pierre de l'Etoile, one of the most famous jurists of his day. At Orleans he continued the same life of rigorous temperance and earnest studiousness for which he was already noted. Beza says that, after supping moderately, he would spend half the night in study and devote the morning to meditation on what he had acquired. His undue habits of study seem to have laid thus early the foundation of the ill health which marked his later years. It was while a law student in Orleans that he became acquainted with the Scriptures and received his first impulse to theological studies. A relative of his, Pierre Robert Olivetan, was there engaged in a translation of the Scriptures; and this attracted Calvin's attention, and awakened within him the religious instinct which was soon to prove the master principle of his life. We cannot say as yet that his traditional opinions were unsettled or that he had embraced with any decision Protestant opinions; but the seeds of the new faith were now beyond doubt sown, and from this time, although he still continued for a while longer to pursue his legal studies, his main interests appear to have been religious and theological. From Orleans he went to Bourges (1530), where he acquired a knowledge of Greek, under the tuition of a learned German, Melchior Wolmar, whose spiritual instructions influenced him. He began here to preach the reformed doctrines and

passed into the ranks of Protestantism, under the slow but sure growth of his new convictions rather than under the agitation of any violent feeling. Here, as everywhere, his life presents a marked contrast to that of Luther.

The death of his father in 1531 left him free to follow his inclinations, which were for theological and classical studies. He proceeded to Paris, which at this date had become a centre of the "new learning," under the teaching of Lefevre and Farel, and the influence of the Queen of Navarre, sister of Francis I. There he published, at his own expense, in 1532, his first book, a commentary on Seneca's essay *On Mercy*. But reformed notions in theology were in the air. The Sorbonne itself had not escaped the infection. There was a growing religious excitement in the university, in the court, and even among the bishops. This, however, was not to last. The King was soon stirred up to take active measures to quell this rising spirit. Calvin was himself converted to the new views, and when his friend, Nicholas Cop, had been elected to the rectorship of the University of Paris, he wrote the inaugural oration (1533) for him and took for his theme the necessity of a reformation of the Church and of theology on the basis of the New Testament. The result was that Calvin and Cop were obliged to flee for their lives. The story is that Calvin narrowly escaped, having descended from his window by means of his sheets, and fled, under the guise of a vinedresser, a friend of his, in whose clothes he concealed himself. After this he repaired for a short time to his native place, resigned the preferment he held in the Roman Catholic church, and for nearly three years led a wandering life, sheltered in various places. We find him at Saintonge; at Nérac, the residence of the Queen of Navarre; at Angoulême, with his friend, Louis Tillet; then for a brief period, while in Paris again, strangely enough expecting a meeting with Servetus, who had expressed a desire to see and confer with him. Persecution against the Protestants raged so hotly that Calvin was no longer safe in France; and he betook himself to Basel, where he prepared the first edition of the *Institutes of the Christian Religion* (1536), with the famous preface addressed to Francis I. The concentrated vigor of this address and its intensity of feeling make it one of the most memorable documents in connection with the Reformation. It is throughout a noble defense of the righteous character of the reformed doctrines, and their support alike in Scripture and in history. The energetic decisiveness and moral zeal of the future teacher and legislator of Geneva speak in every page of it. After completing this great service to the cause of Protestantism, he went for a short time to Italy, to visit Renée, the Duchess of Ferrara. Finally, he revisited his native town, sold the paternal estate, which had devolved to him on the death of his eldest brother, and then set out, in company with his younger brother and sister, on his way to Strassburg. The direct road being rendered dangerous by the armies of Charles V, which had penetrated into France, he sought a circuitous route through Savoy and Geneva.

The result of this journey was memorable for the cause of the Reformation. Arrived in Geneva (July, 1536), he met there his friend, Louis du Tillet, who communicated the fact of his arrival to Farel, then in the very midst of

his struggle to promote the Reformation in the city and neighborhood. Farel hastened to see him and urged upon him the duty of remaining and undertaking his share of the work of God, under the burden of which he himself was likely to sink. Calvin did not at first respond to the call. He was given, he himself says, to his "own thoughts and private studies." He wished to devote himself to the service of the reformed churches generally rather than to the care of any particular church. A life of intellectual and theological labor was at that time most congenial to him. By some strange insight, however, Farel discerned the higher fitness of the young stranger, and he ventured, in the spirit of that daring enthusiasm which characterized him, to lay the curse of God upon him and his studies if he refused his aid to the church of Geneva in her time of need. This seemed to Calvin a divine menace. "It was," he said, "as if God had seized me by His awful hand from heaven." He yielded, and joined eagerly with Farel in the work of reformation.

Such was the beginning of Calvin's great career in Geneva. Having abandoned his intention of pursuing his journey, he soon infused an energy into his task which crowned the struggling efforts of Farel with success. The hierarchical authority was already overturned before his arrival; the citizens had asserted their independence as against the Duke of Savoy, whose alliance with the ruling episcopate, which was the direct governing influence in the place, had called forth the patriotic as well as the religious feelings of the people. The magistrates and people eagerly joined with the reformers in the first heat of their freedom and zeal. A Protestant confession of faith was drawn up, approved of by the Council of Two Hundred, the largest governing board of the city, and then proclaimed in the cathedral church of St. Peter's as binding upon the whole body of the citizens. Great and marvelous changes were wrought in a short time upon the manners of the people; where license and frivolity had reigned, a strict moral severity began to characterize the whole aspect of society. The change, however, was too sudden and the strain was too extreme. A spirit of rebellion against the rule of Calvin and Farel broke forth. They, however, refused to yield to the wishes of a party animated by a more easy and liberal spirit than themselves (known in the history of Geneva under the nickname of Libertines); and the consequence was that they were both expelled from the city after less than two years' residence (April 23, 1538).

Calvin turned to Strassburg, where he had meant to go when arrested in his course in Geneva. Here he settled, and devoted himself to theological study and especially to his critical labors on the New Testament. Here, also, in October, 1539, he married a member of his congregation, Idelette de Bure, widow of Jean Stordem, of Liège, an Anabaptist, whom he had converted, and who had died in February, 1538. The marriage appears to have proved a happy one. His wife bore him one child, a son, who, being born prematurely, died shortly after his birth. (Consult his letters to Viret of July and Aug. 19, 1542.) She herself died in April, 1549.

The Genevans found, after a short time, that they could not well do without Calvin. His rule might be rigid; but an authority even such as

his, which might prove galling in its severity, was better than no settled authority at all; and the Libertine party were unable to construct any efficient form of government. Accordingly the citizens invited Calvin to return; and after some delay on his part, in order to test the spirit in which they were acting, he acceded to their invitation, and on Sept. 13, 1541, after three years' absence, once more made his entry into Geneva.

Now, at last, he succeeded in establishing his plan of church government in all its forms and details. By his college of pastors and doctors, and his consistorial court of discipline, he founded a theocracy, with himself at the head of it, which aimed virtually to direct all the affairs of the city, and to control and modify both the social and individual actions of the citizens. Not without a struggle, it may be supposed, did he succeed in his great autocratic scheme. The Libertines, although dishonored by their ineffectual attempts to maintain order in the city and uphold its rights and dignity, still remained a strong party, and were even augmented after Calvin's return by such men as Amy Perrin, who had strongly concurred in the invitation to Calvin, but who were afterward alienated from him by the arbitrary way in which he pursued his designs, no less than by their own schemes of ambition. The struggle with these opponents lasted for no less a period than 15 years, and was only terminated in 1555, after a somewhat ridiculous *émeute* in the streets. Amy Perrin and others, driven from the city, were executed in effigy, and the reformer's authority from this date strengthened into an absolute supremacy.

During the period of this long struggle with the Libertines, Calvin had many other disputes, in which he displayed equal zeal. The most remarkable of these were his controversies with Sebastian Castellio, Jerome Bolsec, and, above all, Michael Servetus.

Calvin had become acquainted with Castellio in Strassburg (1540). They entertained at first a warm friendship for each other, and Calvin showed great zeal in assisting Castellio, whose poverty and learning had attracted his sympathy. When he returned to Geneva, he invited Castellio to join him there and procured for him the rectorship in the Latin school of the city. There was little similarity, however, in the characters of the two men, and the diversity of their tastes and views soon became apparent. The learning of Castellio was intensely humanistic and opinionated. As soon as he began to apply himself to theology, he came into conflict with Calvin. In a letter to Viret, September 11, we find Calvin speaking of "the freaks of our friend Sebastian, which may both raise your bile and your laughter at the same time." These freaks relate to Castellio's notions of scriptural translation, and his refusal of Calvin's offer to revise the version which he had made of certain parts of Scripture. Then, two years later, when Castellio desired to enter the ministry, Calvin dissuaded the council from accepting him, on account of some peculiar opinions which he held. These were certain rationalistic views as to the authenticity and character of the Song of Solomon, the descent of Christ into hell, and also about election. After this, Castellio left Geneva for a while, but, soon returning, he attacked the views of Calvin openly (consult Calvin's letter to Farel, May 30, 1544), and was forced to leave

the city. The two old friends, now declared enemies, did not spare each other henceforth. Castellio died in Basel Dec. 29, 1563. (For his biography, consult F. Buisson, Paris, 1892.) The fate of Servetus drew forth an anonymous publication attacking with keen logic and sarcasm the Genevan doctrines. This publication was attributed by both Calvin and Beza to Castellio, and they replied to him in no measured terms, stigmatizing him as a "deceiver and vessel of Satan." One fact really disgraceful to Calvin in the controversy ought not to be passed over. Sunk in great poverty, Castellio was obliged, in his old age, to gather sticks on the banks of the Rhine at Basel, as a means of support. Calvin did not hesitate to accuse him of stealing the sticks. Such polemical truculence is a sad sight in a great man.

The controversy with Bolsec belongs to a later period. Jerome Bolsec was originally a Carmelite monk, but had thrown aside the habit and betaken himself to the practice of medicine in Geneva. He was led to attack Calvin's doctrine of predestination. As soon as Calvin heard of this he gave him to understand that he was not at liberty to question the Genevan doctrine. After repeated disputations, Bolsec was found incorrigible and was sentenced to banishment from the city (Dec. 25, 1551). Cast out of the theocratic community, he ultimately rejoined the Roman Catholic church and revenged himself upon Calvin by writing his life in a spirit of detraction and slander (Lyons, 1577).

Of all these contests, however, the most memorable is that with Servetus. A melancholy interest surrounds the name of this great heretic. The character of Servetus himself has little to do with this interest. He seems to have been a vain, restless, and enthusiastic dreamer rather than a calm and patient inquirer. In his very dreams, however, and the vague audacities of his speculation, there is a kind of simplicity and unconscious earnestness that win sympathy. He had entered into various relations with Calvin even from the time of his early residence in Paris; particularly he had sent him various documents containing the views later expressed in his work *Restitutio Christianismi* (1553). Calvin never concealed his abhorrence of these views; and in a letter to Farel on Feb. 13, 1546, he says: "Servetus lately wrote to me. . . . He takes it upon him to come hither, if it be agreeable to me, but I am unwilling to pledge my word for his safety, for if he shall come, I shall never permit him to depart alive, provided my authority be of any avail." The history of his seizure and condemnation at Vienne by the Catholic authorities, and especially of Calvin's share in the correspondence which led to his seizure, is very complicated and obscure. It has been maintained that Calvin was the instigator of the whole transaction; it is certain that he forwarded to the authorities private documents which Servetus had intrusted to him, with a view to the heretic's identification and as materials for his condemnation. Servetus was sentenced to be burned, but effected his escape, and after several months' wandering was found in Geneva. It was his intention to proceed to Italy, where he hoped his opinions might meet with some degree of toleration, and he passed through Geneva on his way. Having ventured to attend church, according to the common account, he was recognized, apprehended, and conveyed to prison by Calvin's order, just as he

was about to leave the city. The particulars of his trial are full of interest, but too detailed to be given here. It lasted, with various interruptions, for two months. He attacked Calvin with the most foul epithets, and Calvin retorted in the same terms. At length, on Oct. 26, 1553, sentence was passed upon Servetus, condemning him to death by fire. Calvin used his influence to have the mode of death altered to decapitation, but without success. On the very next morning the sentence was put into execution. Whatever apologies may be urged for this memorable crime, it must remain a mournful blot on the history of the Reformation. The disgrace of it has particularly attached to Calvin, and with justice; but many of the other reformers are no less implicated in it. The wise Bullinger defended it, and even the gentle Melancthon could see only cause for gratitude in the hideous tragedy. See *SERVETUS*.

After the execution of Servetus, and the expulsion of the Libertines, two years later, Calvin's power in Geneva was firmly established, and he used it vigorously and beneficently for the defense of Protestantism throughout Europe. By the mediation of Beza he made his influence felt in France in the great struggle there going on between the hierarchial party, with the Guises at its head, and the Protestants, led by Condé and Coligny. In 1561 his energies began to fail. He had long been suffering, but his strength of will and buoyancy of intellect sustained him amid all his bodily weakness. In the year now mentioned, his health failed, and although he survived for more than two years, he never regained his vigor. He died in Geneva on May 27, 1564.

Very different estimates have been formed of Calvin's character, according to the point of view from which it is contemplated. None, however, can dispute his intellectual greatness, or the powerful services which he rendered to the cause of Protestantism. Stern in spirit and unyielding in will, he was never selfish or petty in his motives. Nowhere amiable, he was everywhere strong. Arbitrary and cruel when it suited him, he was yet heroic in his aims and beneficent in the scope of his ambition. Earnest from the first, looking upon life as a serious reality, his moral purpose was always clear and definite—to live a life of duty, and, in whatever sphere he might be placed, to work out the glory of God.

He rendered a double service to Protestantism, which, apart from anything else, would have made his name illustrious: he systematized its doctrine and he organized its ecclesiastical discipline. He was at once the great theologian of the Reformation, and the founder of a new church polity, which did more than all other influences together to consolidate the scattered forces of the Reformation and give them an enduring strength. As a religious teacher, as a social legislator, and as a writer, especially of the French language, then in process of formation, his fame is second to none in his age and must always conspicuously adorn the history of civilization. Among Calvin's most important works are: *Christianæ Religionis Institutio* (1536); *De Necessitate Reformandæ Ecclesiæ* (1544); *Commentaires sur la concordance ou harmonie des Évangélistes* (1561); *In Novum Testamentum Commentarii*; *In Libros Psalmorum Commentarii*; *In Librum Geneseos Commentarii*. The first edition of Calvin's whole

works is that of Amsterdam, 1671, in 9 vols., fol., but this has been superseded by the definitive and critical edition begun by J. W. Baum, E. Cunitz, and E. Reuss, and finished by Lobstein and Erichson (59 vols., Brunswick and Berlin, 1863-1900). Consult A. Erichson, *Bibliographica Calviniana* (Berlin, 1900). By the Calvin Translation Society, in Edinburgh, his works have been collected, translated into English, and issued in 51 vols., 1843-55. For his biography, consult: T. de Beza (Geneva, 1564; new ed., Paris, 1869), the original life, written a few weeks after Calvin's death; J. Bolsec (Lyons, 1577; new ed., 1875); and J. M. V. Audin (Paris, 1841; 6th ed., 1873), written from the Roman Catholic standpoint; P. Henry (3 vols., Hamburg, 1835-44), Eng. trans. abridged and altered by Stebbing (London, 1851); T. H. Dyer (London, 1850); F. Bungener (Paris, 1863, Eng. trans., Edinburgh, 1863); E. Staehelin (Elberfeld, 1863); A. Pierson (Amsterdam, 1883-91); W. Walker (New York, 1906)—all of which are written from the Protestant point of view. A very valuable and impartial book from a Roman Catholic is F. W. Kamp-schulte, *Johann Calvin, seine Kirche und sein Staat in Genf* (Leipzig, 1869-99). An exhaustive work is that of E. Doumergue (Lausanne, 1899-1908). It contains many illustrations from original drawings, facsimiles, etc., and is the work of a lifetime. Consult also the biography of Calvin by Philip Schaff in his *History of the Christian Church*, vol. vii, pp. 257-844 (New York, 1892).

CALVINISM. The system of thought deriving its name from its greatest representative, John Calvin (1509-64). The central idea of the system is the conception of the sovereignty of God. This is not merely that God is the final cause in the physical world, but that every movement towards the right in the heart of man proceeds from him.

This central idea is far older than Calvin. It found its first prominent exponent in Augustine (q.v.), though the sovereignty of God is a familiar thought even in the Hebrew writings. It took its Augustinian form in consequence of the discussions of the Pelagian controversy (see PELAGIANISM), in which the point at issue was the originating source of conversion. Pelagius maintained that this was in the free will of man; Augustine that it was in the prevenient grace of God, turning man's will towards the right. From this position developed the most distinctive features of Augustinianism: original sin, bondage of the will, inability to be good, predestination, and the reference of all good to God alone. The tendency of the course of discussion in the Middle Ages was to weaken the Augustinian system, but it was restored by the reformers, Luther, Zwingli, and Calvin. The latter incorporated it in his *Institutes* (final ed., 1559), which was a most logical system of Christian doctrine. Calvinism differs from Augustinianism in the following particulars: 1. Its conception of predestination. Augustine thought of this as a predestination to life. Calvin, following the idea to its logical issue, held that predestination must be both to life in some and to death in others. This is the doctrine of reprobation. Later Calvinists often shrunk from this doctrine and retreated to Augustine's position. 2. Its conception of regeneration. For Augustine this is accomplished in baptism; for Calvin, through the spirit of God, acting

secretly upon the heart of man. 3. Its conception of perseverance. Augustine held that one may fall from baptismal grace. He is elect who perseveres. Calvin held that God will keep those to whom he has given regenerating grace. He who is elect will persevere. The five points of Calvinism are election, redemption, bondage of will, grace, perseverance of the saints. The decisive element of the Calvinistic system is its doctrine of God. It lays emphasis upon the immutable nature of God, and upon His unchangeable attributes of justice and love, each equally sovereign. God's design in the creation of the world was the manifestation of His own glorious attributes, of which these are the chief. Accordingly He forms in eternity the plan upon which He conducts both creation and the government of the created world. He "foreordains whatsoever cometh to pass." Two schools have arisen as to the order of the divine decrees: one, the "Supralapsarian," looking to the final result as the first thing contemplated in God's decree, and making their order, therefore, creation, election and reprobation, the fall, redemption by Christ, and application of redemption by the Holy Spirit; the other, the "Infralapsarian," which seeks to avoid the impression gained from Supralapsarianism, that men are condemned before they are guilty, by making the order of decrees, creation, fall, election, redemption, etc. The Supralapsarian holds that God decreed that man should fall; the Infralapsarian, that God permitted man to fall. The latter has been the prevailing view among Calvinists, though many regard the difference as merely logical.

The decree of the fall is the decree that man shall sin; but all understand that sin is man's own act, and not that of God. All the decrees equally preserve the freedom of man. This theological proposition is explained by various theories of the will and of the psychology of moral action. None of these can be regarded as essential to the system, which is independent of its psychological explanation. The first sin, the sin of Adam, did not affect him alone, but involved the race in sin and guilt. Every member of the race is so connected with its first member (whether by divine constitution, by a realistic identity, or by federal representation) that all sin in and with him and are justly condemned for that sin. Thus Adam's sin is said to be "imputed" to his descendants. Imputation is either "mediate," that is because of original depravity, or "immediate," by which original depravity is the penal result of original guilt directly imputed. Original sin results in actual and individual sin. The consequence of all this is a total inability to be good and the absolute necessity of regenerating grace before any soul can repent and receive the divine forgiveness. Hence the electing grace of God cannot be conditioned upon the foreseen faith of the elect, because, apart from God's activity, and thus apart from His purpose to act in their behalf, or apart from election, they have no faith and can have none.

Grace is the favor of God shown to the undeserving. It is the execution of the decrees of God. God, in forming the decree of election, is sovereign; that is, the motive which leads Him to set apart a certain and fixed number of souls unto eternal salvation resides in Himself alone, and not in them. Grace is of three kinds: "Common" grace is bestowed upon all men, tends to good, and results in the various natural

virtues, such as kindness, honesty. "Prevenient," "effectual," or "irresistible" grace is that by which the soul is regenerated. By it the will is moved to holy action, and repentance and faith are produced. "Coöperative" grace works with the will thus turned to God and is the cause of what degree of actual holiness the Christian attains. Grace also includes the "gift of perseverance," which secures the perseverance and final salvation of the soul.

Calvin's Institutes, logical as the work was, yet left certain problems unsolved. 1. Did God decree the fall of man, and become, in a sense, the cause of sin? This produced the Supra- and Infralapsarian schools. 2. How is man so connected with Adam that he "sins in him"? Augustine met this by Platonic realism, but that was a philosophy no longer held. The federal theology (q.v.) was one of the attempts to solve this problem. 3. How can man's will be free, if God has decreed whatever comes to pass? New England Theology (q.v.) discussed this, ranging from Edwards's determinism to Taylor's free will.

Calvinism appears in most of the great Protestant confessions, except that of Augsburg; in the Heidelberg, French, Belgic, Synod of Dort (on occasion of the controversy with the Arminians, q.v.), and the remarkable series of English confessions, beginning with the *Articles of the Church of England* (first issued in 1552), embracing the Lambeth (1595) and the Irish (1615) articles, and concluding with the Westminster (1647). It was represented by a long series of divines, of whom Beza, Bullinger, Ames, Turretin, John Owen, Jonathan Edwards, Charles Hodge, and Kuyper may be mentioned. It is now the confessional theology of the Presbyterian and so-called "Reformed" churches in all the Protestant nations. In New England, under the influence of Edwards and his pupils, there arose a school of "consistent" Calvinists, who variously modified the details of the system, principally in consequence of a new psychology of the will and of virtue.

The adherents of Calvinism claim for it a great and decisive influence for good upon the history of the world. As the religion of the French Huguenots, of the founders of the Dutch Republic, of Scotch Covenanters, and of English Puritans, it has its heroic period to point to, and its roll of martyrs second to none. Bancroft, the historian of the United States, himself not a Calvinist, refers modern republican liberty to the influence of the little Republic of Geneva and to Calvinism. Its influence in promoting the independence of the United States was indisputably great. It has proved one of the chief forces in promoting the education of the common people and in fostering higher education in the modern world. And its efforts in the department of foreign missions during the last century led and surpassed those of other schools of thought.

For the essential sources in the study of Calvinism, consult: Bright, *Select Anti-Pelagian Treatises of St. Augustine* (London, 1880) for the Latin text, or Warfield's "Augustine's Anti-Pelagian Treatises," in *Nicene and Post-Nicene Fathers*, vol. v (New York, 1886-88); Calvin, *Institutio Christianæ Religionis*, ed. by Tholuck (Berlin, 1846); Eng. trans., *The Institutes of the Christian Religion* (Philadelphia). Best modern presentations: Charles Hodge, *Systematic Theology* (3 vols., New York, 1872);

W. G. T. Shedd, *Dogmatic Theology* (3 vols., New York, 1888). Expositions, A. A. Hodge, *A Commentary on the Westminster Confession of Faith* (Philadelphia, 1869); A. Kuyper, "Calvinism," *The Stone Lectures* (New York, 1898). See ARMINIANISM.

CALVINISTIC (or PARTICULAR) **BAPTISTS**. See BAPTISTS.

CALVINISTIC METH'ODISTS. A body in Great Britain in three divisions: the Whitefield Connection, 1741; Lady Huntingdon Connection, 1748; and Welsh Methodists, 1750. See PRESBYTERIANISM.

CALVIS'IUS, SETHUS (1556-1615). A German composer and theorist, whose real name was Kallwitz. He was born at Gorschleben, Thuringia, as the son of a poor day laborer. As a boy he earned enough with his beautiful voice to enable him to attend the gymnasium at Frankenhäusen, and later the University of Leipzig. In 1581 he became musical director of St. Paul's in Leipzig. From 1594 until his death he was cantor of St. Thomas, which even before Bach's incumbency of the position was a very distinguished post. Calvisius was one of the greatest musical scholars of his time, and one of those whose investigations finally established Harmony as a separate branch from Counterpoint. His compositions include: The 150th Psalm for 12 voices; *Hymni Sacri*; *Tricinia* (1603); *Biciniorum libri duo* (1599, 1612); *Harmonia cantionum ecclesiasticarum a M. Luthero et aliis viris piis Germaniæ compositarum* (1597). His principal theoretical work is *Melopœia seu melodix condendæ ratio* (1582). Consult K. Benndorf, *Sethus Calvisius als Musiktheoretiker* (Leipzig, 1894).

CALVITIES. See BALDNESS.

CALVO, käl'vô, CARLOS (1824-1906). An Argentinian diplomat and writer on international law. He was born in Buenos Aires and early entered upon a diplomatic career abroad. In 1860 he represented the Paraguayan government on a special mission to London and Paris. At the Ghent congress of 1884 he was one of the founders of the Institut de Droit International, and later he became the Ambassador of the Argentine Republic to Berlin and to France. As early as 1863 he took rank as one of the greatest modern authorities on the subject of international law, by the publication of his *Derecho internaeional teórico y práctico de Europa y América* in 2 vols. At the same time he issued a French version thereof. By 1887-88 this first French version had reached a 4th ed. and been expanded to 6 vols. The 5th ed., also in 6 vols., appeared in Paris, 1896. Among his other principal works are the following: *Rccueil complet des traités, conventions, etc., de l'Amérique latine* (15 vols., 1862-69); *Annales historiques de la révolution de l'Amérique latine* (5 vols., 1864-75); *Manuel de droit international public et privé* (3d ed., 1892). He formulated the so-called Calvo doctrine which provided that "the collection of pecuniary claims made by the citizens of one country against the government of another country should never be made by force." This principle became known also as the Drago doctrine, from Dr. Luis Drago, Argentinian Minister for Foreign Affairs, who first advanced it in 1902 when the fleets of Great Britain, Germany, and Italy were blockading the Venezuelan coast to compel the payment of certain claims by President Castro. The Pan-American Congress at Rio Janeiro in August, 1906, submitted the

question to the contemplated Hague Peace Conference.

CAL'VUS, GAIUS LICINIUS MACER (82-47 B.C.). A Roman lyric poet and orator, friend of Catullus (q.v.). As orator he is often praised by Cicero (*Brutus*, 280-285; *Ep. ad Fam.*, 15, 21). He was the chief supporter of the so-called Attic style of Roman oratory (see ORATORY); for his attitude here, which he regarded as narrow, Cicero criticises Calvus (*Brutus*, 284-291; consult also Quintilian, 10, 1, 115). Of the 21 speeches mentioned by ancient writers as delivered by him, the most famous was that against Publius Vatinius. According to Catullus, 96; Propertius, 2, 34, 89, his poems were full of learning and grace. The fragments of Calvus's writings have been collected by Plessis (Paris, 1896).

CAL'YCAN'THUS (from Gk. κάλυξ, *kalyx*, cup + ἄνθος, *anthos*, flower, referring to the cups enclosing the pistils). A genus of Calycanthaceæ, a family of plants allied to Rosaceæ. Only about four species are known. They are shrubs with opposite entire leaves and are natives of North America. They have an aromatic fragrance and in the genus *Calycanthus* the bark and leaves possess it as well as the flowers. The bark has acquired the name of Carolina allspice, or American allspice. The flowers are of a chocolate or dull-purple color. The four American species are found wild along the Alleghanies, in Pennsylvania, Virginia, etc., except *Calycanthus occidentalis*, with brown flowers, which grows in California only.

CAL'YDON (Gk. Καλυδών, *Kalydōn*). An ancient city of Ætolia, 7½ Roman miles from the Ionian Sea, on the river Evenus. It was celebrated in Greek legend as the home of Meleager, Tydeus, and other heroes. (See CALYDONIAN BOAR.) In 391 B.C. it was in possession of the Achæans and was of strategic value in the war between Cæsar and Pompey. In 31 B.C. Augustus removed the inhabitants to Nicopolis, founded to commemorate the victory of Actium (q.v.). The site is generally believed to be at the Kastro of Kurtagá; there walls are to be seen, with a circuit of over 2 miles, on a hill on the bank of the Evenus. Consult Woodhouse, *Ætolia* (Oxford, 1897).

CALYDON. A great forest, supposed to have once existed in the north of England and mentioned in Arthurian romance.

CAL'YDO'NIAN BOAR. According to a Greek myth, a certain Ceneus, King of Calydon, in Ætolia, omitted a sacrifice to Artemis, whereupon the goddess in her rage sent into his fields a frightful boar, which committed great devastation. No one had the courage to hunt it except Meleager, the son of Ceneus, who, calling to his help the bravest heroes of Greece—Theseus, Jason, Nestor, and others—pursued and slew the monster. This hunt is a favorite subject in Greek art and was represented in the pediment of the Temple of Athena Alea at Tegea by the great sculptor Scopas; some fragments of this pediment are now in Athens. Consult E. A. Gardner, *A Handbook of Greek Sculpture*, pp. 378-381 (London, 1911).

CALYMMENE, or **CALYMENE**, ká-lím'è-nè (Gk. κεκαλυμμένη, *kēkalymmenē*, fem. perf. part. of καλύπτειν, *kalyptein*, to cover; refers to the thorax and shield). A genus of fossil trilobites characteristic of the Silurian system. It has a rather long body, of oval form, with a semicircular head shield and a thorax of 13 segments.

The tail shield is lobed like the thorax and is not clearly distinguishable from the latter. About 60 species of *Calymmene* have been described from the Silurian and Ordovician strata, and the largest have been found in the lower Devonian rocks. *Calymmene blumenbachi* and *Calymmene senaria* are prominent species.

CALYP'SO (Gk. Καλυψώ, *Kalypsō*). In Grecian legend, a nymph, dwelling alone on a remote island, who rescued the shipwrecked Odysseus, and kept him with her seven years, promising him immortality, but unable to make him cease his longing to return to Ithaca. She finally yielded to a command of Zeus, brought by Hermes, and allowed him to depart on a raft of his own building. She then died of grief. Calypso is a somewhat late addition to the Odysseus story; outside of the Homeric poems she is merely a name.

CALYP'TRA (Gk. καλύπτρα, *kalyptra*, from καλύπτειν, *kalyptein*, to conceal). A term commonly applied to the enlarged and ruptured archegonium (female organ) of the true mosses, which is carried up as a loose hood, capping the spore case. Its application is extended, however, to include any development of the archegonium which follows fertilization. See MUSCI.

CA'LYX (Lat., Gk. κάλυξ, *kalyx*, cup of a flower, from καλύπτειν, *kalyptein*, to cover). In flowers, the outer and sometimes the only set of floral leaves. The individual parts are called "sepals." The sepals are usually green and leaf-like and serve to protect the more delicate inner parts of the bud, but sometimes they are very much modified. See FLOWER.

CAM, kām (Kelt., crooked), or GRANTA. A river which rises in Essex, England, and is known as the Granta until it joins with the Rhee, 3 miles above Cambridge, to which city it gives its name. After a northeasterly course of about 40 miles through Cambridgeshire, it joins the Ouse, 3½ miles above Ely. It is a favorite boating river, famous in connection with the boat races of the students of Cambridge University.

CAM (dialectic form of W. I. Gael. *kam*, crooked, or unsymmetrical). A mechanical device for transforming a rotative motion, as around an axis, into a reciprocating one, or a translation, usually at right angles to the axis. The more common form of the cam is a disk or short cylinder whose external or cylindrical

CAM.

elements are at different radial distances from the axis around which the cam revolves. In the figure, e.g., as the cam disk A is revolved by the shaft to which it is keyed or otherwise secured, the roller D is compelled to move to distances farther from the axis of the shaft, or to return to positions nearer to such axis as the profile of the face in contact with the roller passes under the latter. The form shown is called the

"heart cam" from its symmetrical profile, which is that of two geometrical spirals back to back. These curves give a uniform motion of advance and return to the valve rod *C* or other mechanism which it may operate. Any profile may be given to the cam, which will produce any desired motion of the pivoted lever *B* and attached rod *C*. As shown, the motion of *C* in one direction takes place in one-half revolution. But the rates of ascent and return may be different; or the rod may be held stationary during a part of the revolution and then released suddenly to drop by its weight, or helped to rapid motion by a spring. Cams are much used in printing presses and automatic machines such as typesetting in order to produce quick sudden motions properly timed in relation to others to which these motions are to be definitely related, with stationary intervals or halts between. They are used in valve gears of many kinds, particularly in internal combustion motors, where there must be openings of inlet and exhaust valves at the beginnings of certain strokes of the piston, and a closure during other strokes. Such cams have a gradually changing profile on the opening face and an abrupt face for the closing side.

The cam shown is an external cam and operates by pushing. The roller can be fitted to a groove in the face or side of the disk: it then becomes a box cam and operates both by pushing and pulling. The roller has to reverse its motion when the direction of radial motion changes, and hence becomes noisy by wear. The varying profile may be made on the edge of the face of the cam, so that the motion of the roller *D* becomes parallel to the shaft. Variable cams have the actuating profile different in different planes at right angles to the shaft. By sliding the cam along the shaft under the roller these various profiles become the driving faces, and a different motion of roller *D* and rod *C* results from a uniform revolution of the cam shaft. Cams sometimes do not revolve continuously, but have a rocking or oscillating motion, such as appears in the valve gear of most beam engines which drive the paddle wheels of smooth and shallow water boats. The ordinary eccentric disk, or true cylinder revolving around an axis not in its centre of figure, and actuating a rod by means of a strap surrounding the cylindrical disk, is not properly a cam. Also, when what has been heretofore the cam and the roller are fitted with gear teeth and mesh together, the combination is to effect some other purpose, and the eccentric gear ceases to be properly called a cam. An important application of the cam is in the crushing of gold ores where the gravity stamp has been used for centuries. The stamp or stem is raised by a cam the surface of which is an involute of a circle having a radius equal to the distance between the centres of the stamp stem and the cam shaft.

CAM, kǎn', or **CÃO**, koun, DIOGO. A Portuguese navigator who flourished at the end of the fifteenth century, and continued the African discoveries inaugurated by Prince Henry the Navigator. In voyages made in 1482-84 and 1485-86, he sailed along the west coast of Africa as far as the Congo and then on down to Cape Cross. At four points he erected pillars, all of which have since been discovered where he placed them. The inscriptions on the two from Cape Santa María and Cape Cross, dated 1482 and 1485 respectively, have been found legible and

have been published. The pillar from Cape Cross is now at Kiel (its place having been taken by a granite facsimile), and the others are in the Museum of the Lisbon Geographical Society. On Cam's return from his first voyage, his grateful sovereign, Joan II, ennobled him (April, 1484). He had sufficient influence with one of the Congo chiefs to induce him to permit the establishment of Christianity among his people.

CAMAGÜEY. See PUERTO PRINCIPE.

CAMAIEU, CAMAYEU, *Fr. pron. ká'má'yē'*, or MONOCHROME (*Fr. camaieu*, cameo, a painting in one color, usually called monochrome (q.v.)). Paintings of several tints, but where the natural colors of the object are not copied, are said to be *en camayeu*. The term is also applied to wood engravings imitating pencil or pen and ink drawings.

CAMAJUANI, ká'má-hwä'ně. A city of Cuba, in the Province of Santa Clara, about 20 miles from the north coast of the island (Map: Cuba, F 4). It is connected by rail with Havana, Cardenas, and the coast. Pop., 1899, 5082 (municipal district, 14,495); 1907, 5316 (municipal district, 14,583).

CAMAL'DOLITES. A religious order, founded in the vale of Camaldoli (Neo-Lat. *Campus Madoli*), near Arezzo, in the Apennines, in 1012, by St. Romuald (c.950-1027), a Benedictine monk, and a member of the family of the dukes of Ravenna. It soon spread through Italy. The brethren, who wear white garments, are, and have always been, characterized by the excessive rigidity of their monastic rule. The order has greatly declined, but still has several monasteries in Italy, one in Poland, and one in Brazil. Its greatest ornaments have been Gratian, the great canonical jurist of the twelfth century, and Pope Gregory XVI (1831-46). There was an order of nuns of the name, which now has five convents in Italy.

CAMALIG, ká'mä'lég. An inland town of the Philippines, in the Province of Albay, Luzon. It lies 6 miles west-northwest of Albay, the capital, in a plain near the source of the Juaya River. Hemp growing is the leading industry. Pop., 1903, 14,153.

CAMARACUM. See CAMBRAI.

CÁMARA Y LIBERMOORE, ká'mä-rá é lē'bâr-mô-ō'râ, MANUEL DE LA (1836-). A Spanish naval officer. He was born in Málaga, graduated at the naval academy in San Fernando, and served in the Mexican campaign as staff officer of the French general, François Jurién de la Gravière, and later acted successively as lieutenant on the *Vencedora* and sailing master on the *Villa de Madrid*. He subsequently was a leader in the campaign against Peru and Chile, and in the struggle with Cuba (1868-78), and, with the rank of captain, commanded a squadron in the Philippines. He was then appointed chief of the naval commission to the United States and London, and as rear admiral commanded the squadron dispatched to the Philippines during the progress of the Spanish-American War. This squadron, consisting of the *Pelayo*, *Cárlos V*, *Audaz*, *Osado*, *Prosérpina*, *Rápido*, *Patriota*, *Buenos Aires*, *Isla de Panay*, *Colón*, *Covadonga*, and *San Francisco*, sailed from Cadiz, with 3000 soldiers, on June 16, 1898, and had already passed the Suez Canal en route for the Philippines, when the news of the destruction of Cervera's fleet compelled it to

return. Later he was chief of the training ships and captain general of the Department of Ferrol. He became vice admiral in 1903, and retired in the same year.

CAM'ARAL'ZAMAN. A prince in one of the tales of the *Arabian Nights* who fell in love with the Princess Badoura as soon as he caught sight of her.

CAMARGUE, kâ'märg', ISLE DE LA. See BOUCHES-DU-RHÔNE.

CAMARILLA, kâ'mâ-rē'lyâ (Sp., little room, from Lat. *cámara*, vault). As *cámara* is used to designate the chamber of the King of Spain, the royal chamber, so *camarilla* is used to designate his private chamber or cabinet, the place where he receives his most intimate friends, courtiers, and sycophants. In the political language of modern Europe it has come to signify the influence exercised on the state by secret and un-accredited counselors, in opposition to the opinions of the legitimate ministry. The *camarilla* is an old institution in Spain, but the word first began to be widely used in the time of Ferdinand VII.

CAMARINA, kâ'mâ-rē'nâ (Gk. *Καμάρινα*, *Kamarina*). A ruined city in Sicily, about 5 miles in circumference, about 100 miles southwest of Syracuse, not far from the sea, and 17 miles southeast of Gela (q.v.). It is east of the Camarina (ancient Hipparis) where, on a sand hill 100 feet high, now stands the chapel of the Madonna di Camarina. It was founded by Syracuse in 599 B.C., destroyed in 553 for rebellion, rebuilt by Hippocrates of Gela in 492 after the battle of the Helorus, again depopulated in 484 by Gelon, who transferred the inhabitants to Syracuse, and again colonized from Gela in 461. In 405 Dionysius compelled the inhabitants to accompany him on his retreat, and it was destroyed by the Carthaginians. In 339 it was recolonized by Timoleon, and in 258 fell into the hands of the Romans, who sold most of the citizens into slavery. In 853 A.D. it was destroyed by the Saracens, who left only the ruined walls and temples that now attest its ancient splendor.

CAM'ASS RAT (Am. Indian). The pocket rat of the northwestern United States, which feeds mainly on the camass (*Camassia esculenta*). See GOPHER.

CAMAYEU. See CAMAIEU.

CAMBACÉRÈS, kân'bâ'sâ'rēs', JEAN JACQUES RÉGIS, DUKE OF PARMA (1753-1824). A French statesman. He was born in Montpellier and became a member of the Convention, where his judicial training at once brought him into prominence. His moderation in the midst of stirring events was soon manifested, particularly in his attitude towards the condemnation of the King. After the fall of Robespierre he succeeded for a short time to the presidency of the Convention, and he at once began working for peace at home and abroad. Forced from office, he devoted himself to his *Projet de code civil et Discours préliminaire*, from which the Code Napoléon was derived. In October, 1796, he became President of the Council of Five Hundred, and in June, 1799, Minister of Justice. After the eighteenth Brumaire (Nov. 9, 1799) he became Second Consul under Napoleon, who, on ascending the throne, made him High Chancellor of the Empire and in 1808 Duke of Parma. In 1813-14, while Napoleon was absent in the field, Cambacérés directed

civil affairs as President of the Council of Regency, finally voting for Napoleon's abdication, but during the Hundred Days he reluctantly served Napoleon as Minister of Justice and President of the House of Peers. After the Second Restoration Cambacérés returned to Paris, but was exiled in 1816 as a "regicide." His legal and political rights were restored to him in 1818. He took no part in public life afterward and died March 8, 1824.

CAMBALUC, kâm'bâ-lōōk', or **CAMBALU**, kâm'bâ-lōō' (Mongol *Khan-Baligh*, city of the Khan). The former name of Peking (q.v.), China.

CAMBAY' (Hindi *Khambāt*, from Skt. *kham-bavatī*, possessing pillars). The capital of the native State of Cambay, Gujerat, India, standing at the head of a gulf of the same name, on the right bank of the Mahi, 76 miles to the north-northwest of Surat (Map: India B 4). Pop., 1901, 31,870, although it was at one time much more populous. Portions of a great brick wall which once surrounded the city, ruined palaces, mosques, and tombs, and an excavated temple of considerable pretensions, attest its former magnificence. It was one of the ports visited by Marco Polo in 1293. The gradual filling in of the gulf has contributed to its decline. The export of cotton is the staple trade and it has celebrated manufactures of onyx, agate, and carnelian ornaments. Pop. of the State of Cambay in 1891, 89,722; 1901, 75,225.

CAMBERT, kân'bâr', ROBERT (c.1628-77). A French composer. He was organist of the church of St. Honoré, and musical superintendent to Anne of Austria, the mother of Louis XIV. At the suggestion of the Abbé Perrin, he composed *La Pastorale* (1659), regarded as the first French musical comedy. Cambert may therefore be considered as the founder of French opera. Under the favor of Louis XIV and Mazarin, the *Pastorale* was followed by *Ariane et Bacchus* (1661), *Pomone* (1671), and *Les peines et les plaisirs de l'amour* (1672). Together with Perrin, who furnished the text for his operas, Cambert became director of the first French opera house, the Paris "Académie Royale de Musique," but was soon superseded by his rival Lully. After Lully became musical superintendent to the King, Cambert went (1673 or 1674) to London, where he became master of the music to Charles II.

CAM'BERWELL. A parliamentary borough of London, situated south of the Thames.

CAMBERWELL BEAUTY. The English name for the widespread butterfly *Vanessa*, or *Euvanessa antiopa*, called in the United States "mourning cloak."

CAMBEVA. See OMAGUA.

CAMBIER, kân'byâ', ERNEST (1844-1909). A Belgian explorer, born in Ath. In 1877 he accompanied the first expedition of the African International Association (q.v.) as astronomer and geographer, and upon the death of Crespel became chief of the expedition. He penetrated from Bagamoyo into the interior, proceeding to Unyamwezi, and to Karema on Lake Tanganyika, where, in September, 1879, he established the first post and scientific station of the International Association. He returned to Europe in 1882. He published (1879) a report of the expedition. Consult Wauters, *Le capitaine Cambier* (Brussels, 1881).

CAM'BIUM (Neo-Lat., from ML. *cambire*, to exchange). The name of a peculiar kind of

dividing cells (meristem). Any cells that are dividing and producing new cells are said to be meristematic, but ordinarily they produce cells that are uniform in kind. The peculiarity of the meristematic cells called "cambium" is that they produce different kinds of cells. The most familiar cambium is the plate of actively dividing cells that occurs between the xylem (wood) and phloem (cast) of dicotyledons and gymnosperms. This cambium produces new xylem cells on one side (inside) and new phloem cells upon the other side (outside). Another well-marked cambium is the cork cambium (phellogen), which is developed in the cortex of shrubs and trees, and produces upon the outside cork cells which give character to what is known as the outer bark. This cork cambium also produces another kind of cells within. See BARK and MORPHOLOGY.

CAMBO'DIA (Skt. *Kambōja*). A kingdom, once powerful, of southeastern Asia; since 1863 a French protectorate, and now part of French Indo-China. Cambodia is bounded on the north by Siam, on the west by Siam and the Gulf of Siam, on the south by the Gulf of Siam and Cochin-China, and on the east by Annam. It is crossed somewhat south of the middle by the parallel of 12° N. Its area is 67,741 square miles, inclusive of the territory acquired from Siam under the terms of the Franco-Siamese Treaty of March 23, 1907. The country is heavily timbered. The northern and northwestern portions of the Khmer Kingdom contain detached ramifications from the Central Asia Plateau—the wooded chain of Phnum-Dangrek, in the north of the Province of Kom Pong-Toat; to the south, Phnum-Dek; to the west of Tonlé-Sap, the Phnom-Prsat and the Phnom-Krevanh. The great waterway is the navigable Mekong, which annually overflows and richly fertilizes a wide territory. It divides at Pnom-Penh into two branches, the Tien-Giang and the Hau-Giang. An arm, the Tonlé-Sap, connects the Mekong with an extensive lake, called also Tonlé-Sap, though by the French the term ("river of Sweet Waters") is reserved for the stream and the names "Great" and "Little" are given to the two divisions of the lake. The waters of the Mekong back up into the lake through the Tonlé-Sap during the wet season; during the dry, the lake drains into the river through the same arm.

Despite the fact that Cambodia is in the torrid zone and on the whole a low-lying region, its climate is not so intolerably hot as might be expected, the heavy rains moderating the temperature. The main climatic features are determined by the monsoons. There are two seasons, the wet and the dry. Fever prevails in the mountain regions, which are in general less healthful for whites. The flora and fauna are characteristic of the Indo-Chinese region. Tigers, leopards, and elephants are found in many sections. Gold, silver-bearing lead, copper, slate, iron, and lime exist, but only the last two are profitably available. The fisheries form a notable industry, both along the islands of the coast and on the Tonlé-Sap (q.v.), where the fishermen are almost exclusively Chinese, Annamites, and Malays.

Agriculture is the leading occupation. The well-populated river plains and islands produce rice, the main food of the country. Cotton, tobacco, pepper, cardamoms, beans, sugar cane, maize, indigo, the mulberry, coffee, cacao, and vanilla are grown. Grazing is practiced. Some

80 kinds of valuable wood are found, such as ebony, rose, sapan, and pine. The gathering of these woods, together with palm sugar, wax, and gum, forms a noteworthy branch of industry. Silk weaving is a large domestic occupation. There are factories for shelling cotton seeds near the capital, Pnom-Penh (q.v.), a city of 54,621 inhabitants in 1911, situated in the heart of the country. Cambodia has no seaport of commercial importance, Kampot having merely a local or inland trade. Generally speaking, however, easy communication is had, both by land and by water, with the interior. Telegraph lines connect the principal towns with each other. But there are no railways, no modernized facilities for transporting articles of commerce. The export and import trade is through Saigon, the capital of Cochin-China. The exports include chiefly rice, salt fish (to the value of from 250,000 to 340,000 piasters annually), cotton, tobacco, gum, and wood. The imports embrace silk stuffs, salt, wine, opium, textiles, and arms.

Cambodia, founded upon the ancient kingdom of the Khmers, has been under French protection since 1863, when a French adviser was sent to the court of King Norodom, to prevent the permanent establishment of Siamese influence. Siam had previously exercised great power in the country, dating from the Siam-Annamese Treaty of 1846 which put an end to the strife of these two rivals for its possession. In 1866 Norodom transferred his capital from Oudong to Pnom-Penh, and the following year a Franco-Siamese treaty definitely established French protection. In 1904 Cambodia acquired from Siam Melupré, Bassac, and Krat; but the last was restored to Siam in 1907 in exchange for Battambang, Siem-Reap, and Sisophon.

The government is nominally in the hands of a king, aided by five ministers. The native functionaries are appointed by the king with the approval of the local French officials, who are under the direction of the Governor-General of French Indo-China, who is represented by a resident. The reigning King, Sisowath, succeeded his brother Norodom in 1904. The local budget is estimated at \$658,300, including \$133,300 for the civil list. The population in 1911 was 1,487,948; nearly four-fifths live in the river regions.

Outside of recent Annamite and Chinese immigrants and a considerable body of Malays, the population of Cambodia consists mainly of the Cambodians proper, or Khmers, formerly widespread over much of Indo-China, to whose half civilization belong the wonderful architectural remains of Angkor (now in Siamese territory), etc.; the Penong, or "savages," of the eastern table-lands and mountains, belonging, with the Mois of the adjacent regions, to a primitive element of the population; the Khois, or Kuis, another aboriginal group in the northwest; and lastly, the Tsiam, or Chiam, in the south, who seem to be the survivors of the extinct empire of Champa, once dominant over all eastern Indo-China. All these peoples are now considerably mixed (the Khmers most, the mountain aborigines least) with Aryan (Hindu), Dravidian, Malay, and Tibeto-Chinese blood; and the Hindu influence (the alphabet of the Cambodians and the sacerdotal vocabulary are of Pāli origin) predominates in religion, art, and literature among the more civilized sections. The Penong are rather short, dolichocephalic, much lighter-skinned than the surrounding peoples; the Khois, darker-skinned, taller, and inclined

to be short-headed; the Tsiam, dark-skinned and rather handsome in form and features, with some negroid suggestion in hair, etc. The Khmers are taller and less Mongoloid in appearance than the Annamese, Siamese, and closely related peoples. In speech the Penong and Khois probably represent a primitive variety of Indo-Chinese stock. The Khmer language differs in certain marked respects from the latter, and, like that of Tsiam, is said to have Malayan affinities, but this is not clearly made out, and the speech of the Khmers is largely *sui generis*. Buddhism is the prevailing religion. Some of the Tsiam profess Islam. Christianity and education have scarcely made a beginning. The Khmers are peaceful and teachable, but phlegmatic. Polygamy is practiced, but not more than three wives are permitted. The dwellings are mostly along the river banks. Slavery has almost disappeared, having been abolished in 1897 by royal ordinance. (See KHMERS.) Father W. Schmidt, in his *Die Mon-Khmer-Völker* (1906), has sought to establish the Mon-Khmer peoples as a link between the peoples of Central Asia and those of the Indo-Pacific area.

That Cambodia was once an extensive and powerful state and under a much higher grade of civilization than at present is shown by the superb architectural remains, the ruins of Angkor being especially noticeable. The early history of Cambodia, like that of Siam and Annam, with whose fortunes its own were often closely connected, is extremely obscure; but legend would seem to point to India as the source of the earliest migrations into the country. From Chinese notices it is known that a kingdom of Cambodia was already in existence not very long after the beginning of the Christian era, and that, after a short period of submission to China, in the sixth or seventh century, it attained to a high degree of splendor. With the beginning of the fourteenth century the period of decadence set in, the kingdom grew exhausted in continuous warfare against Siam and Annam, and was forced to pay tribute to each in turn, or to both. The first Europeans in Cambodia were the Portuguese, who founded a mission there in 1553. The attempts made by the Dutch and the English to establish themselves in the region proved unsuccessful, and when the French first turned their attention to the land, in the middle of the nineteenth century, European influence was non-existent there.

CAMBO'DIA RIV'ER. See MEKONG.

CAMBOGE, kām-bōj'. See GAMBOGE.

CAMBON, kân'bôn', JULES MARTIN (1845-). A French legislator and diplomat, brother of Pierre Paul Cambon. He was born in Paris and began the practice of law in 1866. After serving in the war of 1870-71, he was auditor of the provisional commission appointed in 1871 to replace the Council of State. In

1874 he became Director General of the civil affairs in Algeria; in 1879, Secretary General of the Prefecture of Police in the Department of the Seine; and in 1891, Governor-General of Algeria. He was Ambassador of France at Washington 1897-1902, and acted for Spain in the preliminaries of peace after the Spanish-American War. In 1902 he became Ambassador at Madrid, and in 1907 at Berlin, where he did much to tide over the Agadir crisis of 1911. He resigned in December, 1913.

CAMBON, PIERRE JOSEPH (1754-1820). A French financier and politician. He was born in Montpellier, and was a merchant there at the beginning of the French Revolution. He was a member of the Legislative Assembly in 1791, and its last President, and a member of the Convention in 1792. He devoted himself to financial questions, of which he speedily showed himself a master. The financial condition was desperate, due to the excessive number of assignats in circulation and their consequent depreciation, and also to the general ignorance as to the actual debt of the country. Cambon proposed, in his great *Rapport sur la dette publique* (Aug. 24, 1793), to prepare a "grand livre" of the national debt. He was a member of the first Committee of Public Safety. Throughout the Reign of Terror he was the real administrator of the finances. He opposed the financial measures of Robespierre, who attacked him by name in the Convention. Later he was accused of having defended Callot d'Herbois and other members of the Committee of Public Safety, and had to leave France, but returned after the general amnesty of 1795. In 1815 he sat in the Chamber during the Hundred Days. He was finally exiled as a regicide in 1816, and he died near Brussels.

CAMBON, PIERRE PAUL (1843-). A French legislator and diplomat, born in Paris. He became Chief of Cabinet of the Prefecture of the Seine, under Jules Ferry, in 1870, and thereafter Secretary General of the departments of Alpes-Maritimes and Bouches-du-Rhône (1871), and Prefect of Aube (1872). After holding several other prefectures, in 1882 he entered the diplomatic service, and was Minister of France to Tunis, then Ambassador to Madrid (1886), to Constantinople (1891), and to London after 1898. The Anglo-French entente was in large measure due to his diplomatic skill. Late in 1913 he announced that he would soon retire.

CAMBORNE. A market town of Cornwall, England, 10 miles west-northwest of Falmouth. It is surrounded by very productive copper, tin, and lead mines. Its parish church is a handsome Gothic structure. Pop., 1901, 14,700; 1911, 15,829.

CAMBRAI, or **CAMBRAY,** kân'brâ'. A town of France in the Department of the Nord (French Flanders), situated on the right bank of the Scheldt, 121 miles by rail north-northeast of Paris (Map: France, N., J 2). It is well built, and has a fine cathedral containing the remains of Fénelon, Archbishop of Cambrai, a magnificent town hall, and a number of other fine buildings. Cambrai is the seat of an extensive textile industry, and contains, besides, a number of sugar mills, soap factories, tanneries, and many other industrial establishments. Cambrai was known to the Romans under the name of Camaracum, and it was then one of the chief cities of the Nervii. It was fortified by Charlemagne

and was long governed by its own bishops. Here was formed in 1508 the celebrated League of Cambrai, consisting of the Pope, the Emperor of Germany, and the kings of France and Spain, whose object was the destruction of the Republic of Venice. Here, also, was concluded in 1529 the peace between Francis I and Charles V, known as the *Paix des Dames* ('Ladies' Peace'), the preliminary negotiations having been conducted by Louise, mother of the French King, and Margaret, aunt of the German Emperor. Cambrai has been in possession of France since 1677. Consult Bouly, *Histoire de Cambrai et du Cambrésis* (Cambrai, 1843), and Dinaux, *Bibliographie Cambrésienne* (Douai, 1822). Pop., 1896, 14,306; 1901, 18,415; 1906, 21,791.

CAM'BRIA. The ancient name of Wales, the Britannia Secunda of the Romans. The name is derived from that of the Cimbri, or Cymri, by which the Welsh have always called themselves.

CAM'BRIAN SYS'TEM. The name given to the great series of sedimentary deposits which comes next in order of succession to the Pre-Cambrian, the lower beds of the Cambrian system resting unconformably on its upturned edges. It is the earliest series of strata that exhibits a connected and orderly assemblage of fossil life forms. The name "Cambrian," derived from "Cambria," the ancient name of Wales, in which country the beds of this age were first recognized, was given by Adam Sedgwick, an eminent English geologist, who devoted his life to the study of this formation. The upper limits of the Cambrian, as there studied, were in much dispute for a time, since many of the beds placed by Sedgwick in the Upper Cambrian were claimed by Murchison to be Lower Silurian; and this, indeed, was subsequently found to be the case. To these disputed beds the name "Ordovician" was given by Lapworth (1879). Fossils are very scarce in the Cambrian rocks in many places, but in other localities, where different members of the formation are exposed, life remains abundant, showing a profusion of marine invertebrates and plants of low order. The animal remains include, in order of their importance, crustaceans, brachiopods, pteropods, worms, gastropods, hydrozoans, echinoderms, sponges, corals, lamellibranchs, and cephalopods. All of these, except the cephalopods, were represented in the earliest periods of the Cambrian system.

While the great thickness of Cambrian strata indicates a long period of sedimentation, still the great changes that we find in the faunas in passing from one division of the Cambrian system into another are considered remarkable, since they indicate a most complete revolution in the life forms in any one region. Thus, of the many trilobites found in the Lower Cambrian, but few are known in the middle division; and these, in turn, differ markedly from those in the Upper Cambrian. The reason for this absence of transitional types may be due to the fact that the intermediate beds containing them have not yet been discovered. The trilobites were a prominent feature of the Cambrian system, and varied much in size, from under an inch, like the small, blind ones, as agnostus, to others having a length of 2 feet, as paradoxides. No vertebrate remains have been found. There is no evidence of invertebrate life that existed on land in fresh water, although it is quite possible that some of the mollusks found may have

lived in estuaries of brackish water, for the character of many of the sedimentary rocks of Cambrian time, such as grits, with ripple marks, is indicative of shallow-water conditions.

The thickness of the Cambrian system is variable. In Newfoundland it is about 6000 feet; in Vermont and eastern New York, 7000 feet; in British Columbia it has been reported at 40,000 feet. The Cambrian rocks include sandstones, limestones, shales, slates, marbles, and quartzites, with occasional igneous rocks, as in southeastern Pennsylvania, and also in Great Britain. The sediments for the most part have the characteristics of shallow-water deposits, laid down on the shores of a gradually sinking land surface. The metamorphosed Cambrian rocks are found in areas of much-folded strata. In America the Cambrian rocks have been classified under: (1) *Georgian* series, or Lower Cambrian; in this the trilobite olenellus is often common. (2) *Acadian*, or Middle Cambrian, in which the trilobite paradoxides is abundant in places. (3) *Potsdam*, or Upper Cambrian; with the olenus fauna.

In North America Cambrian rocks are found in Newfoundland and Eastern Canada; also in New England and along the flanks of the Appalachians to Alabama, in Wisconsin, South Dakota, California, Colorado, Arizona. They are also known in Great Britain, Germany, Bohemia, Scandinavia, France, Spain, Sardinia, China, Australia, and India. The British, Bohemian, and Scandinavian areas are of classic interest. The economic products of the Cambrian system in the United States include the slates (q.v.), manganese, and limonite ore (q.v.) of the Appalachian States; sandstone in New York, and gold in the Black Hills.

Congrès Géologique Internationale*, 1897 (St. Petersburg, 1899); Chamberlin and Salisbury, *Geology*, vol. ii (New York, 1907). See GEOLOGY; POTSDAM SANDSTONE.

CAMBRIC, kām'brik. A general term applied to the finest and thinnest of plain woven linen fabrics. It is said to be derived from Cambrai (France), where such goods were first made. Some of the finest cambrics of the present day are produced in Switzerland. The term is also applied to cloth made of cotton with the fibre twisted very hard, to imitate real or linen cambric.

CAMBRIDGE, kām'brīj (Cam bridge; Neo-Lat. *Cantabrigia*). The county town of Cambridgeshire, England, situated on the Cam, about 57 miles north-northeast of London (Map: England, G 4). It is at the head of river navigation and has since Roman days been on a natural line of communication. Remains of a Roman town have been discovered near by. The town, as a whole, is less picturesque than its rival, Oxford, and its main street, Trumpington, does not compare favorably with the famous High Street of Oxford. On the other hand, many of its college buildings are, from an architectural standpoint, the equal of any which its sister university possesses; and the beautiful lawns and gardens behind the colleges, traversed by

the Cam, familiarly known as "the Backs," equal in beauty the justly praised Christ Church Meadow of Oxford. Besides the colleges Cambridge possesses few interesting features. The church of the Holy Sepulchre is one of the four existing round churches in England. Cambridge is a parliamentary borough and sends one member to the House of Commons. The city has a large public library and makes large grants to a number of schools. The earliest-known date in Cambridge history is when, in 1068, William the Conqueror built a castle on Castle Hill. During the thirteenth century it became the centre of a number of religious orders, and about these grew up the fame of Cambridge as a seat of learning. In 1281 the Bishop of Ely founded Peterhouse, the first college in Cambridge. Pop., 1891, 37,000; 1901, 38,379; 1911, 40,027.

Cambridge, probably on the site of the *Camboritum* of the Romans, takes its name from the river Cam, which was anciently, and is still in its upper reach, called the Granta. To the Saxons Cambridge appears to have been known as Grantabrydge. In 870 the Danes ravaged the country hereabouts and are said to have destroyed the town. The town received its first charter from Henry I in 1118. King John in 1200 granted a charter to the town, permitting it to have a guild of merchants and in 1207 confirmed the burgesses in their privileges in perpetuity. See CAMBRIDGE, UNIVERSITY OF.

Bibliography. Atkinson, *Cambridge described and Illustrated* (London, 1897); Stubbs, *Cambridge* (London, 1905); Maitland, *Cambridge Township and Borough* (Cambridge, 1898); Wood, "Cambridge in Early and Mediæval Times," in *Builder*, vol. lxxxi (London, 1901); Gray, *The Dual Origin of the Town of Cambridge* (Cambridge, 1908); Clark, *Cambridge* (London, 1890).

CAM'BRIDGE. A village and the county seat of Henry Co., Ill., 30 miles southeast of Rock Island, on the Rock Island and Peoria Railroad (Map: Illinois, B 2). It is the centre of a fertile agricultural region, and exports live stock and grain. Pop., 1890, 940; 1900, 1345; 1910, 1272.

CAMBRIDGE. A city and the county seat of Dorchester Co., Md., 57 miles (direct) southeast of Baltimore, on the Choptank River, and on the Cambridge and Seaford Railroad (Map: Maryland, N 6). It is the centre of a rich agricultural district and has an extensive oyster-packing industry, and important manufactures of underwear and lumber. Settled in 1684, Cambridge was incorporated as a Colonial town early in the eighteenth century; the present city charter dates from 1900. Under its provisions, the mayor is elected every two years by the city council, which consists of the executive and four aldermen, chosen by wards. Pop., 1890, 4192; 1900, 5747; 1910, 6407.

CAMBRIDGE. A city, the seat of Harvard University, and one of the county seats of Middlesex Co., Mass. It is the fifth city in rank in the State according to population. It lies on the Charles River opposite Boston, of which it is practically a suburb, being connected by several bridges (Map: Massachusetts, E 3). It is entered by the Boston and Albany and the Boston and Maine railroads, and electric railroads connect with Boston and adjacent towns. The Cambridge Main Street Tunnel, built by the Boston Elevated Railroad Company, and the Cambridge

Connection in Boston, including a tunnel under Beacon Hill, built by the city of Boston and leased to the operating company at $4\frac{7}{8}$ per cent upon the net cost (the line opened March 23, 1912), carry the trains of the operating company between Harvard Square and the Park Street station of the Boston subway and surface system. The historic divisions are still locally known as Old Cambridge, North Cambridge, East Cambridge, Cambridgeport, and Mount Auburn. The county courthouses are in East Cambridge. Cambridge is irregular in shape, generally level in surface, and covers an area of about $6\frac{1}{2}$ square miles. Several of its streets and avenues are shaded with beautiful old trees, and there are many handsome residences and a few well-preserved Colonial mansions, among them the Vassal-Craigie House, occupied by General Washington at the time of the Revolution and later the home of the poet Longfellow, now fronted by a memorial park, and Elmwood, the birthplace and lifelong home of James Russell Lowell. The principal features of Cambridge are Harvard University (q.v.), with its ample grounds and many buildings, Radcliffe College (q.v.), the buildings of the Protestant Episcopal Divinity School, the Andover Theological Seminary (erected here in 1910), the First Parish Church (Unitarian), the Shepard Memorial Church (Congregational), commemorating Rev. Thomas Shepard (q.v.), and Christ Church (Protestant Episcopal), dating from 1761. The old city common, with a memorial gateway, contains a soldiers' monument and a statue of John Bridge the Puritan, by Thomas R. Gould and his son Marshall S. Gould, placed in 1882. Less than a mile from the university are the Harvard Observatory and the Botanic Garden of eight acres, filled with a great variety of trees, shrubs, and plants, especially of native species. Mount Auburn Cemetery, partly in Cambridge, one of the most beautiful places of burial in the country, contains the graves of Longfellow, Lowell, Holmes, Sumner, William Ellery Channing, Phillips Brooks, and many other distinguished men and women. Among prominent buildings, other than those already mentioned, must be noted the public library, Cambridge Hospital, the Latin School, High School, Rindge Manual Training School, the city hall, the courthouse, jail, and other county buildings. On the river front, with entrance from Massachusetts Avenue, the Massachusetts Institute of Technology is erecting (1914) a noble group of buildings to which it will remove from Boston when completed. Cambridge has a fine system of public parks; besides interior parks, the river parkways include the entire river front and add greatly to the beauty of the city.

Among the industrial establishments of Cambridge are the Riverside, Athenæum, and University presses, the latter dating from the earliest printing house in America, founded in 1639, which are all widely known. There are also large foundries and machine shops, meat-packing houses, extensive bakeries, and large manufactories of soap and candles, pianos and organs, furniture, confectionery, rubber goods, boilers, chemicals, astronomical instruments, electrical machinery, carriages, steam pumps, bricks, and many other articles. It ranks ninth among the manufacturing cities of the State (United States census, 1910). The industries are centred principally in Cambridgeport and East Cambridge.

Cambridge is governed, under the charter of 1891, by a mayor, elected annually, and a bicameral municipal council, of which the board of aldermen is elected at large and the common council by wards. In the administrative departments the majority of officials are appointed by the mayor, subject to the confirmation of the board of aldermen; the city council, however, elects the city clerk and assistant treasurer, auditor, messenger, clerk of committees, solicitor, and overseers of the poor; and members of the school board are chosen by popular election. Cambridge owns and operates its water works. A feature of the municipal politics deserving of mention is the fact that Cambridge is the largest city in the world with no open saloons, and the no-license system, as operated under the Massachusetts local-option law, seems well established.

History. Cambridge originally included the present towns of Lexington and Arlington, parts of Bedford and Billerica, Newton, and the Brighton district of Boston. It was settled as Newe Towne, in 1630, by Governor Winthrop and others, the chief founder being Thomas Dudley, who intended it to be the chief place of the Colony, but found the peninsula of Shawmut (Boston) better adapted for commerce and for defense against the Indians. Resettled in 1631, it received in 1633 its first pastor and teacher, Rev. Thomas Hooker (q.v.) and Rev. Samuel Stone, who removed with their congregation to Connecticut in 1636, largely owing to ecclesiastical differences. In 1637 the General Court ordered that the college it had previously decided to found be established at Newe Towne, and in 1638 that Newe Towne become Cambridge. In the same year the first class began its studies, and the name "Harvard College" was given to the modest institution. (See HARVARD, JOHN.) During the time Boston was held by the British army (1775-76) Cambridge was occupied by the American army, and Washington assumed command in 1775 under a large elm, which is still standing. The city charter of incorporation was granted in 1846. Cambridge claims to have enlisted the first company of volunteers for service on the Federal side at the outbreak of the Civil War, and during that conflict it furnished 4588 men to the Union army and navy. The city has been the home of many famous literary men, notably of Longfellow, Lowell, Holmes, Higginson, and Fiske.

Pop., 1790, 2115; 1830, 6072; 1850, 15,215; 1880, 52,669; 1890, 70,028; 1900, 91,886; 1910, 104,839, including 34,608 persons of foreign birth and 4707 of negro descent.

Consult: Paige, *History of Cambridge* (Boston, 1877); *Two Hundred and Fiftieth Anniversary of the Settlement of Cambridge, December 28, 1880* (Cambridge, 1881); Hurd (ed.), *History of Middlesex County* (Philadelphia, 1890); Gilman (ed.), *The Cambridge of Eighteen Hundred and Ninety-six* (Cambridge, 1896); Powell, *Historic Towns of New England* (New York, 1898).

CAMBRIDGE. A village in Washington Co., N. Y., about 30 miles (direct) northeast of Albany, on the Delaware and Hudson Railroad (Map: New York, G 4). Cambridge is noted principally as the seat of the Cambridge Valley Agricultural and Stockbreeders' Association. It has a public library, and carries on a trade in seeds, plows, and dairy products. Pop., 1890, 1598; 1900, 1578; 1910, 1528.

CAMBRIDGE. A city and the county seat of Guernsey Co., Ohio, 85 miles east of Colum-

bus, on the Baltimore and Ohio and the Pennsylvania railroads (Map: Ohio, G 5). The surrounding region has deposits of fine pottery clay, natural gas, coal, and oil. Cambridge ships large quantities of coal and has sheet and tin plate mills, a large earthenware plant, division shops of the Pennsylvania Railroad, a bar mill, chair and glove factories, a glass plant, and planing mills. The city owns and operates its water works and has a public library. Settled in 1806, Cambridge was incorporated in 1837. It is governed by a charter of 1893 which provides for a mayor, elected biennially, and a city council. Pop., 1890, 4361; 1900, 8241; 1910, 11,327.

CAMBRIDGE, ADA (1844-). The pseudonym of Mrs. George Frederick Cross, novelist, born at Wiggshall, Norfolk, England, and after 1870 a resident of Victoria, Australia. She became widely known by *A Marked Man* (1891); *The Three Miss Kings* (1891); *A Little Minx* (1893); *Fidelis* (1895); *At Midnight* (1897); *Materfamilias* (1898); *Path and Goal* (1900); *The Devastators* (1901); *Thirty Years in Australia* (1903); *Sisters* (1904); *The Retrospect* (1912); *The Hand in the Dark* (1913). See AUSTRALIAN LITERATURE.

CAMBRIDGE, GEORGE WILLIAM FREDERICK CHARLES, second DUKE OF (1819-1904). An English soldier, son of Adolphus Frederick (1774-1850), the first Duke of Cambridge, who was a son of King George III. The second Duke was born in Hanover and succeeded in 1850. In 1837 he was colonel, and in 1854 as lieutenant general commanded the first division sent in aid of Turkey against Russia. He led the troops at the Alma and at Inkerman. In 1856 he became acting commander in chief of the British army. He was made field marshal and in 1887 received the patent of commander in chief. In 1895 he was retired. Many of the army reforms he personally opposed. In 1840 he married organically Miss Louisa Fairbrother, an actress, who was thereafter known as Mrs. FitzGeorge; and their relation as husband and wife remained unbroken for 50 years, until Mrs. FitzGeorge's death in 1890. Consult Sheppard, *Memoir of Private Life of Duke of Cambridge* (London, 1906), and Verner, *Military Life* (ib., 1905).

CAMBRIDGE, UNIVERSITY OF. The younger of the two ancient seats of learning in England. The origin of the university, like that of Oxford, is obscure. The old Benedictine establishment in Cambridge was swept away by the Danish invasions, and the university cannot boast the continuous existence beyond the Conquest assigned to it by the older writers. Though we may disregard the various fables of its foundation by a Spanish King, Cantaber, by King Arthur, by a Saxon King, Sigebert, and by Gislebert and his three companion monks of Croyland, it seems very probable that the university originated in some local educational movement during the twelfth century, augmented, as time went on, by such influences as the migration of Oxford students thither in 1209 and of students from Paris in 1229. As early as 1231 a chancellor is mentioned in a royal writ and two years later the university received papal recognition. Following the example of Paris, Cambridge maintained, besides the trivium and quadrivium (q.v.), or faculty of arts, the advanced faculties of theology, civil and canon law, and medicine. It was, however, not recognized formally as a Studium Generale

until the papal bull of 1318. Like Paris, too, Cambridge was governed by a guild or corporation of masters, resident teachers called regents, with whom resident masters not engaged in teaching, called nonregents, were later associated. The presiding officer, called the chancellor, was elected by the regents. To this new university the mendicant orders came very early—the Franciscans about 1224, the Dominicans half a century later. These, as well as other bodies of monks and of friars, established houses for their members, and for a time played a considerable part in university affairs, but their permanent influence was, save perhaps in one direction, not great. In the earlier stages of the university the students, here as elsewhere, had boarded and lodged independently. With the increasing size and importance of Cambridge there now arose, alongside these religious houses, voluntary associations of students, living together in independent hostels or halls. Private benefactors, finding in these fit subjects for encouragement, presently began to endow these halls, or to establish “colleges,” often by the consolidation of several halls. This new form of institution, providing for the support of deserving students, combined the idea of supervision and support of the religious houses with that of the independence of the halls. The collegiate system, beginning on the Continent, seems to have been carried to Cambridge by way of Oxford, and, though not original with either, has survived in them alone, giving them their unique place among the universities of the world. The first of the Cambridge colleges, Peterhouse, a purely academic organization with no monastic discipline, was founded in 1284 by Hugh of Balsham, Bishop of Ely, and from this time for almost exactly three centuries the foundation of colleges continued. With one exception, the Cambridge of to-day is formed of the colleges established during that period. In this, Cambridge differs much from Oxford, for though four colleges were founded in Oxford in the seventeenth and eighteenth centuries, the only permanent collegiate foundation in Cambridge since 1596 is Downing College, established in 1807. The short-lived Cavendish College (q.v.), Selwyn College (1882), a “hostel,” and the foundations for women, Girton (1869) and Newnham (1875), are not formally connected with the university. (A list of colleges, with the dates of their foundation, will be found at the end of this article, and separate notices of the colleges under their names in the body of the *ENCYCLOPÆDIA*.)

The university, thus constituted, played a great part in the Reformation. Humanism entered Cambridge early, associated with the names of Sir John Cheke, Sir Thomas Smith, and Bishop Fisher. Of those closely associated with the Reformation, Erasmus was Lady Margaret professor of divinity from 1511 to 1514 and translated the New Testament here. Here, too, William Tyndale and Hugh Latimer began their labors in the new cause, and from here came Cranmer, who, in more ways than one, shaped the English Reformation in later years. The Royal Injunctions of 1535 mark an epoch in the history of the university, for by them the new learning was finally established. The study of the canon law was discontinued, public lectures in Greek and Latin were established in the colleges, the Bible, studied in the light of the new learning, replaced the Sentences, and the human-

istic method took the place of the scholastic. As elsewhere, the recognition of the royal supremacy was enforced here, and with these sweeping changes, and the replacing of the clerical element in the university by lay students, the mediæval history of Cambridge may be said to close and its modern history to begin.

For the moment, however, here, as in all universities which took a leading part in the Reformation, the immediate effect of that movement was disastrous. It was not until the reign of Elizabeth that Cambridge began to recover from the shock. Then it became the stronghold of advanced Puritanism, as it had earlier been of advanced Protestantism, particularly under the influence of Cartwright, who was finally deprived of his official position in the university on this account. Largely owing to the disturbances arising from this, new statutes were enacted in 1570, which lasted till the middle of the nineteenth century. By these the government of the university was practically vested in the heads of the colleges, who alone elected the vice-chancellor and the *Caput*, or supervising board. This turned Cambridge into a close corporation, a misfortune not bettered by the fact that with it went a tendency to turn the university into a school of divinity. The reign of James I is memorable as the period when the university was granted the privilege of returning two members to Parliament (1604), which it still enjoys. The later seventeenth century saw the rise of the school of Cambridge Platonists, and, chiefly by the influence of Isaac Newton and Isaac Barrow, the beginnings of that tendency toward the cultivation of mathematics and the natural sciences, which is still one of the chief distinctions between Cambridge and Oxford. During the eighteenth century, until the rise of the Evangelical school, the same mediocrity and apathy in religious matters prevailed here as elsewhere, but scholarship was improved by the evolution of the tripos into something like its present position, the mathematical tripos being introduced in 1747. The nineteenth century saw sweeping changes, the reorganization of colleges and university, greater freedom in academic matters, the abolition of religious tests, and a more liberal idea of the importance of certain studies as well as of the relations between certain lines of work. Between 1840 and 1850 several colleges secured new charters from the crown, and in the latter year a commission began a revision of the statutes, which led to the replacing of the Elizabethan statutes by those of the new commission in 1858. These were in turn altered in 1869 and 1871–72, and in the latter year another commission was appointed, on the strength of whose report (1874), and of a memorial issued by an influential body in the university, the Universities of Oxford and Cambridge Act was passed in 1877 and approved by the crown in 1882. This effected a reorganization of the entire university system. Meanwhile various internal changes had been taking place. To the older triposes of classics and mathematics, were added the natural sciences tripos in 1850, the moral sciences tripos in 1851, the law tripos in 1858, divided into law and history in 1872, the Semitic language tripos in 1878, the Indian language tripos in 1879, the mediæval and modern language tripos in 1886, and in 1905 the economics tripos. There are at present 11 triposes in all.

The university at present is a self-governing

corporation, administered by a senate, consisting of all doctors and masters, of whom only those in Cambridge have electoral rights. The council of the senate, consisting of the chancellor, the vice chancellor, four heads of colleges, four university professors, and eight associates from the senate, prepares agenda for the senate, chooses the vice chancellor, and in general carries on the ordinary administration of the university. The funds are managed by a financial board, the curriculum is arranged by a general board of studies, separate departments being in the hands of subcommittees, or special boards. The chancellor is an honorary official, as at Oxford, usually some dignitary of the realm, as are also the steward and the deputy steward. The vice chancellor is the real head of the university, and is assisted by deputies and by two proctors, who, besides their duties in the senate, have charge of university discipline. There are, moreover, two esquire bedells, the public orator, a commissary, an assessor, and the registrar, who has charge of records. There are at present 17 colleges besides the two foundations for women, several special semicollegiate institutions not a part of the university, and a body of non-collegiate students. The university proper, as distinguished from the colleges, is possessed of several important institutions. The Fitzwilliam Museum, founded by Viscount Fitzwilliam in 1816, is one of the largest and finest institutions of its kind in England. The university library contains some 200,000 volumes, and a considerable collection of manuscripts. There are also fine geological and anatomical museums, an excellent observatory, and the university practically controls the extensive printing and publishing establishment of the Pitt Press, as well as Addenbrooke Hospital. Examinations are held and degrees are conferred in the Senate House, which contains also the public offices of the university, and is the meeting place of the senate.

The existence of the colleges in connection with the university forms a peculiar, and, save for Oxford, a unique educational organization, not easy for an outsider to understand. Briefly, it may be said that the college and the university are separate corporations, in large measure independent of each other, but connected very closely by the fact that they form interacting parts of an educational system, and that they are composed of, and managed by, the same individuals. The university is essentially an examining and degree-conferring body, which examines the candidate at entrance, during his residence, and at the conclusion of his work, and confers degrees on those men who meet its requirements. It regulates the system of education, with respect not only to subjects, but also to quality, and quantity of preparation; it enforces general discipline, and it offers certain educational advantages in its lectures, its libraries, its collections, and similar provisions. The college, on the other hand, receives the entering student, provides him with lodgings and meals, service, and the like, prepares him, by its tutors, for the university examinations, affords him society and recreation, and exercises somewhat more than paternal oversight of his actions. The administration of the colleges is in the hands of a master and fellows, from among whom are chosen the college officials, dean, bursar, and the like, as well as the teaching or tutorial force of the college. These men, as masters of arts

of the university, form a great part of the senate, and so virtually govern it as well as the colleges.

Undergraduate life at Cambridge differs somewhat from that at Oxford and very greatly from that in the United States. Formerly, all men belonged to colleges, and though since 1869 it has been possible for men to belong to the university without being members of a college, the class of noncollegiate students thus created has never been very large, most undergraduates being connected with a college. The great majority of men live in college, though many of those belonging to colleges, and all the noncollegiate students, live in licensed lodgings in the town. There are three terms in the university year—the Michaelmas, or October term; the Lent, or winter term; and the Easter, or spring term. These nominally include 227 days, but actually average each about eight weeks of required residence, leaving long vacations, during which much of the actual work, or “reading” as it is called, is done. The students are under the direct charge of the tutors, who maintain personal relations with each man under their charge and supervise his work, directing him in a way not known to the educational system in the United States with its large classes and entire or partial absence of personal relation between student and instructor.

The degree of B.A. may be conferred, after the required examinations have been passed, at the end of nine terms or three years of residence. The degree of M.A. is attainable three years later, the requirements being that a candidate give notice to his college, pay the college degree fee in person, pay the university degree fee in person, and sign the Registry’s Book. The university confers also degrees in law, theology, medicine, music, and an advanced degree in science, all of these latter being dependent on the possession of the bachelor’s degree. Certain honorary degrees are also conferred, notably that of Doctor of Laws (LL.D.).

There are no exact equivalents at either of the English universities for the course of study common in the United States. The system of education is based upon, and conditioned by, the examinations which a candidate for the degree of B.A. must take. These are three in number. The following, from the 1900–01 regulations, will give the best general idea of the system. The “previous” examination consists of two parts, one of the Gospels (Greek), one Latin classic, one Greek classic, one translation of English into Latin, and a paper on Latin and Greek accidence and syntax, forming the first part. The second consists of Paley’s *Evidences*, geometry, arithmetic, elementary algebra, and an English essay. Candidates for honors must take the additional subjects of mechanics, French, and German. After passing these requirements or some equivalent a student may at the proper time take the second or “general” examination and the special, which qualify him for the “ordinary” degree, or he may specialize in any of the subjects to be mentioned and after passing the final examination or tripos be entitled to an “honors” degree. The distinction between ordinary and honors degrees is not found in American colleges. The second or “general” examination consists of two parts, the first including one Greek classic, one Latin classic, algebra, elementary statics, a translation of English into Latin prose; the second, the *Acts of the Apostles* (Greek), some portion of English history, an

English essay on a subject connected with the history offered, elementary hydrostatics, and some play of Shakespeare or a portion of Milton's works. The special or final examination may be taken in any one of the following subjects: theology, logic, political economy, law, history, chemistry, physics, geology, botany, zoology, physiology, mechanics, and applied science, music, modern languages, mathematics, or classics. For those men who are candidates for honors, special examinations, called triposes, are provided in mathematics, classics, moral sciences, natural sciences, law, history, theology, Oriental languages, mediæval and modern languages, mechanical sciences, and economics. The successful candidates in the triposes are arranged in three classes, according to their standing, and have their names printed in the Calendar. These divisions are called simply first, second, and third class. The honor men in mathematics, however, were formerly known as wranglers, senior optimes, and junior optimes, and the head of the first list, the best man of the year, is known as the senior wrangler. Since 1908, however, the results of Part I of the mathematical tripos are published in the same form as of the other triposes; the results of Part II are still arranged in three classes of wranglers, senior optimes, and junior optimes, but in alphabetical order.

Women are admitted to the examinations, and their names appear in the Calendar, next to the tripos lists, with their rank attached, but they are not allowed degrees.

For further information consult: *College Histories* (Cambridge, 1898-1904); *Oxford and Cambridge Year Book, Part 2, Cambridge* (London, 1904); *The Student's Handbook to the University and Colleges of Cambridge* (Cambridge, 1909); *History of the University of Cambridge*, by J. Bass Mullinger, in 3 vols. (Cambridge, 1873-1911), the best as well as the fullest account up to the Platonist movement. There is an excellent, though briefer, account of the university and colleges before 1500 in H. Rashdall, *Universities of Europe in the Middle Ages* (Oxford, 1895). Official information may be obtained from the Cambridge University Calendar, and from the announcements of lectures and such publications as are issued from time to time. Much incidental information may be obtained from Sir G. M. Humphrey's *Guide to Cambridge* and J. W. Clark's *Concise Guide to the Town and University of Cambridge* (Cambridge, 1906).

See the articles in the present work on UNIVERSITY; EDUCATION; NATIONAL EDUCATION, and on the various colleges under their names.

The colleges in the order of their foundation, with dates and founders, are as follows:

Peterhouse, or St. Peter's College, 1284, by Hugh of Balsham. Clare, 1326, by Elizabeth, Countess of Clare. Pembroke, 1347, by Mary de St. Paul, Countess of Pembroke. Gonville and Cains, 1348, by Edmund Gonville; refounded by William Bateman, 1353, and later by John Caius, 1558. Trinity Hall, 1350, by William Bateman, Bishop of Norwich. Corpus Christi, 1352, by Guilds of Corpus Christi and Virgin Mary. King's, 1441, by Henry VI. Queens', 1448, by Margaret of Anjou; refounded, 1465, by Elizabeth Woodville. St. Catharine's, 1473, by Robert Wodelarke. Jesus, 1496, by John Alcock, Bishop of Ely. Christ's, 1505, by Margaret of Richmond and Derby. St. John the Evangelist,

1511, by Margaret of Richmond and Derby. Magdalen, 1519, by Thomas, Baron Audley of Walden. Trinity, 1546, by Henry VIII. Emmanuel, 1584, by Sir Walter Mildmay. Sidney Sussex, 1594, by Lady Frances Sidney, Countess Dowager of Sussex. Downing, 1800, by Sir George Downing.

Public Hostels.—Cavendish College (q.v.), extinct, 1873-91. Selwyn College, 1882, by subscription. Ayerst Hall, extinct, 1884-96.

CAMBRIDGE PLAT'FORM. See CONGREGATIONALISM.

CAMBRIDGE PLATONISTS. A school of writers in the English church, members of the University of Cambridge, in the latter part of the seventeenth century, who sought to exhibit the entire rationality of the doctrines of the Christian religion and drew largely from Plato in execution of this purpose. They were the liberals of their age and were often styled "Latitudinarians." They sought to emphasize the great Christian doctrines to the neglect of minor matters, often made the instruments of sectarian exclusiveness, and to show that these great doctrines were identical with the teachings of the soundest philosophy. With a single exception (More, educated at Emmanuel College and of the Puritan party) they worked in great harmony; while they naturally belonged to the party that had formulated the Puritan theology in the Westminster Confession, they were led, by the prevailing laxity of morals and the multiplication of sects, to endeavor to overcome the schism between divinity and morals. They were powerfully influenced by the philosophical currents of their time, particularly by the writings of Descartes (Cudworth and More), less so by those of Bacon. But as a school, they were formed by the study of Plato especially in its Neoplatonic form, and of the Christian Fathers who followed the Platonic course of thought—those of Alexandria. On the other hand, the school was largely determined by its fundamental antagonism to the doctrines of Hobbes, who founded his philosophy on the senses and ignored the moral and religious postulates of human nature. Against this philosophy the Cambridge Platonists waged uncompromising and unceasing war. Their liberalism, however, brought them into suspicion, and they were generally regarded with disfavor. They possessed great learning and a strong religious sense, but did not deal with their sources in a trained historic spirit.

The principal representatives of this school were the following:

Benjamin Whichcote, born in Shropshire, March 11, 1609-10, died at Easter, 1683, in Cambridge. His father was apparently a country squire, the owner of Whichcote Hall. He was sent to Emmanuel College in 1626, took his B.A. in 1629 and his M.A. in 1633, when he became fellow of his college. In 1636 he was ordained, in 1643 presented to the living of North Cadbury, where he probably married. He was made provost of King's College, Cambridge, in 1644, and continued to occupy this post till the Restoration, 1660, when he was displaced by the royal order. His great work here was performed as a teacher, and particularly as the preacher of the Sunday afternoon lecture in Trinity Church. In these sermons he sought to lift the plane of current religious thinking, and he exercised the great influence which belongs to those whom the sight of a receptive audience quickens to elo-

quence. After his removal he occupied two different charges in London, spending his last 15 years in St. Laurence Jewry, where he was attentively heard by a small but select congregation. He published nothing himself. After his death a few sheets of *Select Notions* were published in 1685, a *Treatise of Devotion* in 1697, then *Select Sermons* (1698) with a preface by the Earl of Shaftesbury (reprinted, Edinburgh, 1742); and in the years 1700 ff. a new edition of the sermons from the author's own manuscripts in 4 vols., with a volume of *Aphorisms* (1753).

John Smith, one of the most gifted of the school, born at Achurch, Northamptonshire, 1618, died Aug. 7, 1652, has left behind almost no materials for a biography. He entered Emmanuel College, Cambridge, in 1636, took his B.A. in 1640 and his M.A. in 1644, at which time he was chosen fellow of Queens' College. His health seems to have been precarious from the first. His labors were principally confined to his office as teacher, for which he had remarkable qualifications. His preaching was with a rare degree of eloquence, which can still be felt in the *Discourses* (1660), which remain to us. He gained much local fame as a lecturer on mathematics. His personal character was such as to excite the admiration and love of his associates in a remarkable degree. As a founder of the school, his special service was in developing the foundations of a Christian philosophy.

The two most famous of the Cambridge Platonists are *Ralph Cudworth* and *Henry More*, whose lives will be found in their alphabetical places in this ENCYCLOPÆDIA. More obscure were *Nathaniel Culverwel*, of a genius and eloquence like Smith's, who entered Emmanuel in 1633 and took his M.A. in 1640, was a fellow and preacher in the College Chapel, died about 1651, and whose *Discourse of the Light of Nature* was published 1652; *John Worthington*, a native of Manchester, educated at Emmanuel College, master of Jesus College till the Restoration, then held a succession of livings, and finally Hackney, where he was chosen lecturer in 1670, his *Discourses* being published in 1725 and *Miscellanies* in 1704; *George Rust*, fellow of Christ's College in 1657, after the Restoration in Ireland, where, in 1667, he became Bishop of Dromore, died in 1670, his *Discourse of Truth* appearing in 1682; *Simon Patrick* (1626-1707), Bishop of Chichester, 1689, and of Ely, 1691; *Edward Fowler*, took his M.A. in Trinity College, Cambridge, about 1655, finally Bishop of Gloucester; *Joseph Glanvill* and *John Norris*, both Oxford students, but impregnated with the spirit of the Cambridge Platonism. Consult *John Tulloch*, *Rational Theology and Christian Philosophy in England in the Seventeenth Century*, vol. ii (Edinburgh, 1872). Consult for selections from their writings, Campagnac, *Cambridge Platonists* (Oxford, 1901).

CAM'BRIDGESHIRE. An inland agricultural county of England (Map: England, G 4). Area, 858.9 square miles. Nearly nine-tenths of the county consists of arable land, meadow, and pasture, the rest being fens. The chief rivers are the Ouse, which crosses the middle of the county from west to east, with its tributary the Cam, the Nene, which borders the county on the north, and the Lark. These are all navigable to a certain extent. County town, Cambridge. Pop., 1891, 183,961; 1901, 184,759; 1911,

198,074. Consult Conybeare, *History of Cambridgeshire* (London, 1897).

CAMBRONNE, kân'brün', PIERRE JACQUES ETIENNE, COUNT OF (1770-1842). A brave and blunt soldier of Napoleon, most widely known, perhaps, for a phrase he never uttered. He was born at Saint-Sébastien, near Nantes, fought in the Vendée in 1792, distinguished himself at Zurich in 1799, and participated in the campaigns of the Empire between 1806 and 1813. He went with Napoleon to Elba, and at Waterloo led a division of the Old Guard. There, after fighting like a madman, he is reported to have cried in answer to General Halkett's demand for his surrender, *La garde meurt et ne se rend pas* ('The Guard dies, but never surrenders'). Cambronne did not say this, however, and he did surrender. Severely wounded, he was taken to London, but bravely returned to stand his trial before a court-martial, which acquitted him. In 1820 he was restored to his rank in the army. A statue has been erected in his memory in the town of Nantes, where he died in 1842. Consult Fournier, *Procès du général Cambronne* (Paris, 1816).

CAM'BUSCAN'. The King of Tartary in Chaucer's *Squire's Tale*. The King of Arabia and India sends him a brazen horse, a mirror, a ring, and a sword of magic properties. He is the father of two sons, Algarsif and Camballo, and of a daughter, Canace. The story stops after a sort of prologue which promises adventures to come, more especially for Camballo and Canace; so the later history of Cambuscan and his presents is unknown.

CAMBYSES, kām-bī'sēz, I (Gk. Καμβύσης, OPers. inscr. *Kambujiya*, of uncertain etymology). The father of Cyrus the Great and son and successor of Teispes in the line of Persian kings (Herod, vii, 11, and the Cyrus Cylinder).

CAMBYSES II (?-522 B.C.). King of the united realm of the Medes and Persians from 529 to 522 B.C. He was the grandson of Cambyses I and son of Cyrus the Great. Ascending the throne on the death of his father, he at once took the reins of government in his hands. His brother, Smerdis (OPers. *Bardiya*), was made Viceroy of the eastern provinces of Iran. Cambyses' first and chief design was the conquest of Egypt. He invaded this country with his armies, and in 525 B.C. defeated Psammetichus III, the King of Egypt, at Pelusium. Memphis, the capital, fell in the following year, 524 B.C., and Cambyses was soon master of the entire fertile valley of the Nile. Nubia was also subjugated, but not without great loss to his forces, and an attempt to conquer the Ethiopians proved a disastrous failure. An expedition likewise against Carthage had to be abandoned because his Phœnician allies refused to lend their naval power against their kindred. It was now that Cambyses received news that the throne of Persia had been seized, during his absence, by a Magian priest Gaumata, the Pseudo-Smerdis. The usurper impersonated Bardiya, or Smerdis, Cambyses' brother, who had been assassinated, though the people did not know it, at the instigation of Cambyses himself. Startled by this bold impersonation of one whom he believed to be dead, the guilty and crime-laden Cambyses hastened to retrace his steps to Persia, but died on the way (522 B.C.), at Ecbatana, which Herodotus (iii, 62-64) calls a city of Syria, but Josephus names Damascus. The oracle of Buto had prophesied he would die

at Agbatana, but Cambyses always supposed the Median Ecbatana to be meant by this. In certain respects the accounts of Herodotus (iii. 64) and Ctesias differ as to the manner of his death, but both attribute it to an accidental self-inflicted wound. In the great Behistun inscription (i. 43) Darius says that Cambyses died by a death self-inflicted, but the word *uvā-maršiyuš*, lit. 'self-death,' seems rather, though not necessarily, to imply suicide. Regarding the character of Cambyses, if we follow Herodotus, his behavior in Egypt was little short of that of a madman. His cruelties and sacrilegious acts, due principally to drunkenness, were atrocious. He is said to have violated the tombs of the Egyptians and even to have put some of their leading men to death, among them the captive King Psammetichus. In an outrageous manner he stabbed the sacred bull of Apis so that it died, and he caused the ministering priests to be scourged (Herod. iii. 29). But it must be added that this account is not easy to reconcile with an existing stele on which Cambyses is portrayed as giving an honorable burial to the dead god Apis. It is even claimed that he murdered his own sister, whom he had wished to marry. On the whole there can be no doubt that he was a dissolute and inhuman ruler. Consult Lincke, "Kambyses in der Sage, Litteratur und Kunst des Mittelalters" (Leipzig, 1897), in the Ebers *Festschrift*; and see also CYRUS; DARIUS; MEDIA; PERSIA.

CAMBYSES, KING OF PERSIA. A tragedy by Thomas Preston, published in London in 1569 by John Alde. An undated edition was later brought out by Edward Alde. It has been reprinted by Hawkins and Dodsley. It is important as marking the transition between the morality and the historical drama. It is written in Alexandrine rhymes, occasionally dropping into heroics in the comedy passages. The melodramatic treatment of its subject is probably referred to by Shakespeare in his now proverbial expression of "speaking in King Cambyses' vein."

CAM'DEN. A town and the county seat of Wilcox Co., Ala., 62 miles west by south of Montgomery, on the Louisville and Nashville Railroad (Map: Alabama, B 3). It is the fertile "Black Belt" of Alabama and has a cotton-oil mill and lumber, cotton, and stock-raising interests. Pop., 1890, 545; 1910, 648.

CAMDEN. A city and the county seat of Ouachita Co., Ark., 115 miles south by west of Little Rock, on the Ouachita River, and on the St. Louis Southwestern and the St. Louis, Iron Mountain, the Rock Island, and Southern railroads (Map: Arkansas, C 4). It has a fine courthouse and public library and carries on a considerable river trade, shipping cotton, lumber, poultry, and live stock, and contains machine shops, cotton compress, stone mills, cottonseed-oil mill, lumber mills, manufactories of oars, sashes and doors, handles, and spokes, a bottling plant, and wagon works. Pop., 1900, 2840; 1910, 3995.

CAMDEN. A town in Knox Co., Me., 37 miles east by south of Augusta, on the line of the Eastern Steamship Company (Map: Maine, C 4). It is an important wool-manufacturing town and carries on a considerable trade in felt goods. Camden is also a summer resort. Pop., 1890, 4621; 1900, 2825; 1910, 3015.

CAMDEN. A city and the county seat of Camden Co., N. J., on the Delaware River, opposite Philadelphia, with which it is connected

by several lines of steam ferries (Map: New Jersey, B 4). It is an important railroad centre, being the terminus of the Atlantic City and the West Jersey and Seashore railroads and of divisions of the Pennsylvania Railroad. The city, which occupies an area of about 10 square miles on level ground, contains, among its more notable features, a city hall and county buildings, four hospitals, an Elks Home, Carnegie libraries, Home for Friendless Children, the West Jersey Orphanage, and a school for manual training. Camden is an important shipping centre, has large market gardens in the suburban districts, and is noted for its manufacturing and shipbuilding interests, which in 1909 gave employment to 3682 persons, and whose products were valued at \$5,626,000. The other leading manufactures are talking machines, canned soups, machinery, foundry products, cotton and woolen goods, oil cloth, lumber, chemicals, paints, steel pens, candies, and boots and shoes. In 1909 the combined value of all the manufactured products was \$49,138,000. The government is vested in a mayor and a unicameral city council, with the usual staff of administrative officials. The annual income of Camden is \$2,752,900, while its payments amount to \$3,033,300, the main items of expenditure being \$481,000 for education, \$139,000 for the fire department, \$158,000 for the police department, and \$160,000 for water works. The sewerage system comprises about 140 miles of mains, and the water works, including two plants built by the city in 1870 and 1889, at a total cost of \$2,500,000, are under municipal operation. Pop., 1890, 58,313; 1900, 75,935; 1910, 94,538; 1914 (est.), 105,000. Camden was chartered as a city in 1828; the Camden and Amboy Railroad, incorporated in 1833, gave the city its early importance as a railroad terminus. It was the home of Walt Whitman from 1873 until his death in 1892. Consult Fisler, *A Local History of Camden* (Camden, 1858).

CAMDEN. A town and the county seat of Kershaw Co., S. C., 32 miles northeast of Columbia, on the Wateree River, and on the Seaboard Air Line, the Southern, and the Atlantic Coast Line systems (Map: South Carolina, D 2). It is known as a winter resort, carries on a trade in cotton, rice, and naval stores, and manufactures cotton cloths and yarns, cottonseed oil, lumber products, and bricks. Camden was settled in 1750 by Quakers from Ireland and in 1791 was incorporated as a town. It is governed under a charter of 1890, which provides for a mayor, elected every two years, and a municipal council. Here, on Aug. 16, 1780, an English force of 2000 under Lord Cornwallis defeated an American force of 3000 under General Gates, Baron DeKalb being wounded mortally in the engagement; and near here, at Hobkirk's Hill (see HOBKIRK'S HILL, BATTLE OF), an English force under General Rawdon repulsed an American force under General Green on April 25, 1781. In 1825 a monument was erected to the memory of DeKalb, Lafayette laying the corner stone. On Feb. 25, 1865, General Sherman entered Camden and destroyed 2000 bales of cotton, a large quantity of tobacco, and a number of buildings. Pop., 1900, 2441; 1910, 3569, including Kirkwood, which was annexed in 1905.

CAMDEN, CHARLES PRATT, first EARL (1714-94). An English chief justice and lord chancellor, third son of Sir John Pratt, a chief

justice under George I. He was born at Kensington and educated at Eton and Cambridge. In 1734 he became a fellow of his college, the next year obtained his B.A. degree and in 1740 that of M.A. He studied law and was admitted to the bar in 1738. His prospects were discouraging until 1752, when he successfully defended a bookseller for libel on the House of Commons. In 1757 he was appointed Attorney-General, and in 1762 Chief Justice of the Common Pleas. He presided over the trial of Wilkes and declared the action of government illegal, an opinion which, according with public sentiment, made him the most popular of judges. In 1765 he was created Baron Camden by the Rockingham administration, whose American policy and treatment of Wilkes, notwithstanding, he constantly opposed. The following year, although appointed Lord Chancellor, he did not abandon his principles; and four years after supported an amendment made by Chatham on the government address and resigned his office. Henceforth he was a political character. He took an active part against the ill-advised American policy pursued by Lord North, and in discussions on the law of libel was called "the maintainer of English constitutional liberty." During the Revolutionary War he was very popular in the United States, and his memory is perpetuated by many counties, towns, and villages named after him. He was President of the Council under Rockingham in 1782-83 and under Pitt from 1783 until his death, April 18, 1794. He was created Earl Camden and Viscount Bayham in 1786.

CAMDEN, WILLIAM (1551-1623). An antiquarian and historian, surnamed "The British Pausanias." He was born in London, where his father was a house painter, May 2, 1551. His education begun at Christ's Hospital, was completed at St. Paul's School and at Oxford. In 1575 he was appointed second master of Westminster School, and while discharging the duties of this office he undertook the work which made his name famous. His *Britannia*, written in elegant Latin and giving an account of the British Isles from the earliest ages, was first published in 1586, and it at once brought him into communication with the learned men of his time. Before 1607 the work had passed through six editions, being enlarged and improved by the industry of the author. At first a comparatively small volume, it received much additional matter from other writers. The best-known edition is that of Edmund Gibson, in English, 2 vols., folio (1722). The latest translation is that of Gough and Nichols (2d ed., 1806). Bishop Nicholson said of this work that it was "the common sun whereat our modern writers have all lighted their little torches." In 1593 Camden was appointed head master of Westminster School; and in 1597 Clarencieux King-at-Arms, an appointment which gave him more time for the pursuit of his favorite studies. His other important works are: *Annals of the Reign of Elizabeth* (latest ed., 1717); *A Collection of Aneient English Historians* (6th ed., 1607); *An Account of the Monuments and Inscriptions in Westminster Abbey* (1600); and a *Narrative of the Gunpowder Plot* (1607). He died Nov. 9, 1623, at Chislehurst, in the house which afterward belonged to Napoleon III, and was buried in Westminster Abbey. Before his death he endowed a professorship of history at Oxford.

CAMDEN SOCIETY. An English associa-

tion organized in London in 1838 and named in honor of William Camden. Its object is the publication of historical and literary remains of antiquarian and general interest. The publications began in 1847. After 105 volumes had been issued, a new series began (in 1871) which up to 1901 includes an additional 62 volumes. In 1901 began a new (3d) series in which 23 volumes have been published up to 1913.

CAMEL (OF., Lat. *camelus*, Gk. κάμηλος, *kamēlos*, from Heb. *gāmāl*, camel). A large desert-dwelling ruminant of two species, constituting the typical genus, *Camelus*, of the family Camelidæ. Both have been subjugated to man since prehistoric times, and neither is known or remembered in a wild state. The free camels which now roam in northern Turkestan, where they are hunted for their flesh, hides, and superior wool, are descendants of the few which survived the vast sand storms which, about 1700, overwhelmed the villages on the Gobi Plateau and killed all the people. The two species of camel are the true or Arabian camel (*Camelus dromedarius*), having one hump, and the Bactrian camel (*Camelus bactrianus*), with two humps. These humps are stores of flesh and fat, reabsorbed in support of the animal when overtaken by famine, as is so likely to happen.

The former is the common and widespread species, found from northwestern India and the lowlands of Afghanistan down to the extremity of Arabia east of the Red Sea and Somaliland to the south, and westward as far as the African deserts extend. They have also been introduced into Australia, Spain, Zanzibar, and the southwestern United States, but without permanent economic success. The United States government spent much money and pains to acclimatize them as an army transport service in the dry southwestern regions, about 1857; the Civil War interrupted the arrangements, but the attempts made by private hands to utilize the animals were not profitable. Many were turned loose and remained wild along the Mexican border, but multiplied very little, and they are now supposed to be extinct. The British government has made extensive use of them in its military operations in India and Upper Egypt, both as baggage animals and in hauling artillery, and as mounts for a division of "cavalry" known as the "camel corps." Consult Gleichen, *With the Camel Corps up the Nile* (London, 1888), wherein many interesting facts as to the habits and qualifications of the animal are given.

What country was the original home of this species is uncertain; it seems more thoroughly adapted to a sandy region than the Bactrian, and is presumed to have had a more southerly habitat than the latter, probably inhabiting Arabia and perhaps the Sahara when first enslaved by primitive men. It is singularly adapted to subsistence in the desert by the structural qualities elsewhere mentioned (see CAMELIDÆ), and by its ability to bite off and consume the tough shrubbery and even thorny plants which alone grow there, and to endure the burning heat and flying sand. To this end it has acquired not only the thick and broad sole pads, but the thick callosities on the joints of the legs and on the chest upon which it rests (in a kneeling posture) when it lies down; moreover, the nostrils may be closed against the flying dust, and the eyes are shaded and shielded by very long eyelashes. Its extremely acute sense of smell, especially for

water, is another life-saving provision. All these qualities have combined to render it so highly serviceable to man in the great wastes that separate the habitable regions south and east of the Mediterranean, Black, and Caspian seas, that it is safe to say these could never have been colonized and have been the scenes of the momentous incidents and impulses they have contributed to civilization had it not been for the assistance of this ungainly and unlovely creature. "I can speak from experience," remarks Captain Wellby (*Twixt Sirdar and Menelik*, New York, 1901), "of this marvelous endurance of camels, for on a previous trip in Somaliland I once marched with a string of camels for 11 days, during which time none of them had a drop [of water]."

The Bactrian camel is better adapted by its smaller size and heavier build, harder and more cloven feet, longer and finer wool, and other qualities, to a rocky and cooler region, and its home is Central Asia, from northern Turkestan to Mongolia. Its endurance is equally remarkable, under different circumstances, with that of its southern congener, for it withstands the awful climate of the Tibetan Plateau, where the temperature rises to 140° F. in summer and sinks to Arctic cold in winter; it tramps with burdens of tea or hauling wagons or sledges over the plains, and often through wintry snows, from Peking to Lake Baikal, and carries heavy loads over the lofty passes of the Hindu Kush, and across the flinty plains of Afghanistan, and thence to Persia. It is this ability to endure climatic extremes, variety of fare, and famine, which has perpetuated the camel through a longer generic history than that of almost any other animal and has made it of so much service to mankind in regions unendurable by most cattle or horses.

The Arabian camel carries twice the load of a mule. The Bactrian camel is sometimes loaded with 1000 or even 1500 pounds weight, although not generally with so much. A caravan sometimes contains 1000, sometimes even 4000 or 5000 camels. The supply of food carried with the caravan for the use of the camels is very scanty; a few beans, dates, carob pods, or the like, are all that they receive after a long day's march, when there is no herbage on which they may browse. The pace of the loaded camel is steady and uniform, but slow—about 2½ miles per hour. Some of the slight dromedaries, however, can carry a rider more than 100 miles in a day. The motion of the camel is peculiar, jolting the rider in a manner extremely disagreeable to those who are unaccustomed to it; both the feet on the same side being successively raised, so that one side is thrown forward and then the other.

The patience of the camel has been celebrated by some authors, but this is mainly indifference and stupidity. It submits because it knows no better, cares nothing for its master, is influenced to a very slight degree by either kindness or harshness, is unhappy when alone, and always untrustworthy; is cowardly, and, at the rutting season, is subject to sudden and violent fits of rage, when it uses its teeth with terrible effect.

The camel produces only one young one at a time, or rarely two. It lives 30 or 40 years. During the long ages it has been subjected (the word "domesticated" hardly applies) to man, almost as many breeds have been created as in the case of the rose, and there is a vast difference between those bred as baggage animals and those reared for the saddle; the latter, light

and swift, often capable of traversing 100 miles of desert a day, are "dromedaries," whether one-humped or two-humped.

The great value of the camel to the desert people is due to its manifold usefulness, for besides its utility as a carrier of both man and his burden, and as a means of trade, its flesh is good food, and the milk is excellent; from the hair, cloth, ropes, etc., are made; the hide is serviceable; the bones (in eastern Asia) serve as ivory; and the dung is in some regions almost the sole dependence of the nomads for fuel. The animal is nevertheless steadily decreasing in importance by the advance of railways, the opening of wagon roads, and other supersessions of its service, even in the remoter parts of its arid domain. Consult Leonard, *The Camel* (London, 1894). See Plate of CAMELS AND LLAMAS.

CAMEL (from *camel*, as carrying heavy burdens). A water-tight, boxlike contrivance designed for lifting ships, sunken weights, etc. The use of wooden floats for lightening the draft of a ship to permit her to pass over a shoal or bar is very old, but the invention of hollow floats, or camels, is ascribed to the Dutch, and their first use is said to have been about 1688. The ordinary camel is a simple rectangular box float, and is much used in navy yards and private shipbuilding establishments. The camels designed by the Dutch were sometimes a hundred feet or more in length, 20 feet broad, and made to fit the sides of the ship; they were allowed to fill with water, hauled up close to the vessel's sides, and secured in place by chains and lashings. When the ship reached the shoal or bar, the water was pumped out of the camels, and the increased buoyancy thus obtained raised the ship enough to materially decrease her draft. Modern camels which are used in wreck raising are generally built of steel and fitted with machinery for working the chains which support the wreck or attach it to the camel.

CAMEL BIRD. The ostrich; a book name.

CAMEL CRICKET, or CAMEL LOCUST. A mantis (q.v.).

CAMELIDÆ (Neo-Lat., from Gk. κάμηλος, *kamēlos*, camel). The camel family, constituting a section of the ruminants termed Tylopoda, in

SKULLS OF CAMELS.

1, *Poebrotherium*, an extinct primitive type; 2, Existing camel, showing change in dentition.

reference to the character of the feet. This family is composed of two genera—*Camelus*, with two species (see CAMEL), and *Llama*, the Amer-

CAMELS AND LLAMAS

1. VICUNA (*Lama vicugna*).

5. ARABIAN CAMEL, Dromedary type.
6. BACTRIAN or TWO-HUMPED CAMEL.

ican llamas, considered by some naturalists two species, by others four. (See LLAMA.) These animals agree in peculiarities of structure, which separate them from other ruminants, mainly as follows: Though a full set of incisor teeth are present in the young, only the outermost continue through life as isolated lanariform teeth;

canines are present in both jaws, and the molars are solenodont in type. The skeleton has many peculiarities, of which a striking one is the excessive comparative length of the thigh bone, and the detachment of the hind leg from the body. The limbs are long, the ankle bones peculiar, and all traces of phalanges are lost, except the third and fourth. These are not incased in matched hoofs, like other artiodactyls, but the foot consists of two elongated toes, each tipped with a small, naillike hoof, the feet resting not upon the hoofs, but upon elastic pads or cushions under the toes. In the camels the toes are united by a common sole, thus resting upon one extended pad, instead of having each a separate one, as in the llama group, the broader expanse of the foot enabling the animals of the one genus more easily to traverse the loose sand of the desert, while the narrow form and separation of the toes in the other

is suited to the uneven surface of rocky heights. The head is long, without any horns or antlers, the lips extended and mobile, the neck of unusual length; the blood corpuscles are oval instead of circular, as in all other mammals, and the digestive organs are characterized by a remarkable peculiarity in the structure of the stomach. "Though these animals ruminate," to quote Flower and Lydekker, "the . . . interior of the rumen or paunch [see RUMINANT] has no villi on its surface, and there is no distinct psalterium or manyplies. Both the first and second compartments are remarkable for the presence of a number of pouches or cells in their walls, with muscular septa, and a sphincter-like arrangement of their orifices, by which they can be shut off from the rest of the cavity, and into which the fluid portion only of the contents of the stomach is allowed to enter." Such is the celebrated arrangement by which the camel stores in its stomach more water than it can immediately use, and by gradually using it is able to make far longer journeys across arid regions than otherwise would be possible. This has customarily been regarded as a very striking special provision for the needs of the camel of the desert; but it is equally characteristic of the

llamas, which inhabit well-watered regions, and has evidently descended to both from a remote common ancestry, regardless of present environments. See ALIMENTARY SYSTEM.

The structural evolution of the camel recalls that of the horse. (See EQUIDÆ.) In the old-

FEET OF FOSSIL CAMELS.

Bones of the feet, showing progressive development towards increase of size, union of metapodials, etc.: 1, *Prototylopus* (Eocene); 2, *Poebrotherium* (Oligocene); 3, *Gomphotherium sternbergi* (John Day beds); 4, *Gomphotherium cameloide* (Loup Fork beds); 5, *Procamelus* (Loup Fork beds). (After Wortman.)

est Tertiary rocks of the ancient lake region of the Rocky Mountains, at the dawn of the Eocene, have been found diminutive remains suggesting this type, and in the Upper Eocene fossil skeletons undoubtedly cameloid. These belong to an animal (*Prototylops*) hardly larger than a jack rabbit, yet camel-like in many particulars. It had four distinct toes, of which the third and fourth were most useful, while the lateral second and fifth were smaller; the metapodial bones were disconnected, and there was no space between the bunodont molars and the front teeth, where the canines and incisors were alike. By changes that went on analogous to those in other ungulates, there is found in subsequent cameloid forms increase in size, and a constant tendency towards acquiring the dentition and pedal anatomy characterizing modern forms. The next advanced form is greater in size, and the lateral toes, no longer useful, hang to the side of the foot above the ground like a deer's. A steady increase of size goes through the ascending formations of the Miocene, until we reach *Procamelus*, at the top of the Miocene (Loup Fork beds of Wyoming), which was as big as a sheep and very llama-like, with teeth nearly of modern type and the metapodial bones

firmly united when fully adult. During the Miocene the western American plateau seems to have been an arid desert, and under such conditions were developed the large, splayed feet, bereft of the useless side toes, the great sole pads, and the pouched stomach that characterize the race. At the close of the Miocene, however, there came about a steady change towards a warmer, moister climate, inducing forest growth, which put an end to camel life in North America. Meanwhile they had migrated into South America, where fossil remains of great size are found, and where the family still survives, in the modified and perhaps degenerate forms of the llamas; and also northwestward to Siberia, and thence into Central Asia, where their remains are found in the Pliocene rocks of India, but not earlier. Here the conditions were favorable, and the modern camels seem to have developed. It thus appears that North America was the original home of the Camelidæ, and that they "were derived from piglike animals quite independently of the true ruminants." For particulars as to American fossil camels, consult Wortman, *Bulletin American Museum Natural History*, vol. x (New York, 1898).

CAM'ELI'NA (Neo-Lat., probably from Gk. *χαμαί*, *chamai*, on the ground + *λίνον*, *linon*, flax). A genus of cruciferous plants embracing about a dozen species, most of which are European. *Camelina sativa* is cultivated in Europe and Asia for the oil contained in the seed. The stalks contain a kind of fibre, which is sometimes used for making brooms. The plant has become introduced into the United States, where it is known as false flax, or gold of pleasure, and is considered a bad weed. See GOLD OF PLEASURE.

CAMEL'LIA (Neo-Lat., named after Joseph Kamel, a Moravian traveler of the seventeenth century, who first described the *Camellia japonica*, now *Thea japonica*). A species of plants of the family Theaceæ, nearly hardy evergreen shrubs or trees, and natives of China, Japan, and the north of India. Camellias are now extensively cultivated as greenhouse shrubs in Europe and in the United States. Many varieties are in cultivation. The best known and most esteemed is *Thea japonica*, a greenhouse shrub. Its leaves are ovate-elliptical, almost acuminate and serrate shining; the flowers are without stalks, mostly solitary, large, and roselike. It is a native of Japan, and there and in China it has been carefully cultivated from time immemorial. In its wild state it has red flowers, and the red single camellia is much used by gardeners as a stock on which to graft the fine varieties, the flowers of which are generally double. The colors of the cultivated forms are various, including red, white, and yellow, and the varieties also differ much in the form and position of the petals. The flowering time is in autumn, winter, and spring. Camellias grow best in cool houses. Free access of air is of great importance, and water must be given very liberally, yet, with such caution that the soil may never remain soaked after the immediate wants of the plant are supplied. The proper soil for camellias is a loose black mold; a little sand and peat are often advantageously mixed with loam to form it. Camellias are often propagated by cuttings, or layers, but generally by grafting or inarching. The single camellia is also propagated by seed, and in this way the best stocks for grafting are procured. Of the other species of camellia, the most hardy, and one of the most

beautiful is *Thea reticulata*. The seeds of certain varieties, as *Thea oleifera* and *drupifera*, are used in China for the production of an olive-like oil. The true tea plant (*Thea sinensis*) is a close ally of the camellia. See TEA.

CAMEL'OPARD. See GIRAFFE.

CAMEL'OPAR'DALIS (Gk. *καμηλοπάρδαλις*, *kamēlopardalis*, giraffe, literally camel-pard, from *κάμηλος*, *kamēlos*, camel + *πάρδαλις*, *pardalis*, pard). A northern constellation defined by Jakob Bartseh, Kepler's son-in-law and assistant. It is situated between the polestar, Auriga, Cassiopeia, and the head of Ursa Major, and consists of stars of moderate magnitudes, forming, in imagination, the shape of a giraffe.

CAM'ELOT, or **CALBURY**, *kał'bēr-ī*. A steep hill in the parish of Queen's Camel, Somersetshire, England, 5 miles from Ilchester (Map: England, D 5), identified by tradition with Camelot, one of the capitals of the legendary King Arthur (q.v.). Others state that Camelot was the name given in the mediæval romances to the city which grew up out of the permanent quarters of the second Augustan legion at Caerleon-upon-Usk.

CAMELOT. The legendary site of King Arthur's castle and court. It has been variously located in Somersetshire, at or near Winchester, Hampshire, and in Wales. Shakespeare favored the first, Tennyson and Capell the second, and Caxton the third site. The monks of Glastonbury were chiefly responsible for the "Somerset" theory, which they maintained, especially in the fourteenth century, for the purpose of attracting pilgrims and thus enriching their abbey. It is often mentioned in English literature, notably in *King Lear* and *The Lady of Shalott*.

CAMEL'S HAIR. A fabric woven from the hair of the camel, by Persians and Arabs. In early ages garments of this stuff were worn by monks for penance. It is now imported into Europe and used extensively in the manufacture of dress materials and rugs. Cow's hair is sometimes used as a substitute in the cheaper grades of so-called camel's-hair goods. A fine grade of camel's hair is used for artists' brushes. Camel's hair proper is longer than some sheep's wool and varies considerably in color, being chiefly red, white, or gray.

CAMEN, *kä'men*, or **KAMEN**. A town in the Province of Westphalia, Germany, on the Seseke, 10 miles southwest of Hamm. It is a thriving industrial centre, with coal mines, paper mills, shoe manufactories, and iron foundries. Pop., 1900, 9888; 1905, 10,429; 1910, 10,754.

CAME'NÆ (Lat.). In Roman mythology, nymphs possessing the power of prophecy. They had a sacred grove in Rome, just outside the Porta Capena. (See EGERIA.) Etymologists incline now to connect the name with a root signifying 'brightness,' and to regard the Camenæ as goddesses of fountains or springs. The Romans, however, connected the name with *car-men*, song, and *cano*, to sing; hence the Roman poets often apply the name *Camenæ* to the nine Muses of Grecian myth.

CAM'EO (It. *cammeo*, Fr. *camée*, ML. *camæus*, or *cammeus*). Gems cut in relief are called cameos. The term is applied more especially to those diminutive pieces of sculpture which are prepared from precious stones having two strata or layers of different colors, the undermost of which is left to form the background, the object to be represented being cut in the upper one.

True cameos were probably not made before

CAMELLIA, ETC.

1. CAPER PLANT (*Capparis spinosa*), showing edible buds.

2. CANARY SEED GRASS (*Phalaris Canariensis*).

3. BLUEBELLS (*Campanula rotundifolia*).

4. CARAWAY SEED (*Carum caria*).

5. CAMELLIAS (*Camellia Japonica*), single and double.

6. CANNAS OR INDIAN SHOT (*Canna Indica* var.).

the third century B.C., though in very early times we find the backs of seals decorated with figures in relief; so especially in the *scarabæi*, seals decorated on the back with the sacred beetle of Egypt. As precious stones were used in the Orient and among the Greeks after the conquests of Alexander for many decorative purposes, the Greek artistic sense sought to raise this decoration to a higher plane, and this seems to have led to the carving of the gems into reliefs. At this period cameos were very extensively used, not only as personal ornaments, but in cups, vases, candelabra, and other objects of domestic luxury. Pateræ and other vessels were frequently worked out of a single stone, upon which were exhibited a whole series of figures of the most exquisite workmanship. Many of the antique cameos which have been preserved are wonderfully beautiful, both in design and execution. Of the Alexandrian cameos, probably the finest is the "Tazza Farnese," a shallow dish (8 inches in diameter), cut from a single sardonyx, now in the National Museum at Naples. Within, this dish shows an allegorical design, relating to a flood of the Nile; outside, it bears a Gorgon on an ægis (q.v.). Other very fine specimens of the early period are the Gonzaga cameo in St. Petersburg and a companion in Vienna, containing the portraits in profile of a man and a woman. These are commonly said to be portraits of Ptolemy II and his Queen, Arsinoë, but Furtwängler held that they represented Alexander the Great and Olympias (see Plate 53, in his work named at the close of this article). Of cameos of the Roman time, many fine specimens are to be found in the continental museums. Especially noteworthy are the Gemma Augustea in Vienna, and the Sainte Chapelle onyx in Paris; both show Roman emperors, Augustus and Tiberius, triumphing over barbarians (see below). Very celebrated is the "Cupid and Psyche" formerly in the Marlborough collection, now in the Boston Museum of Fine Arts, by Tryphon, who is supposed to have lived in the time of Augustus. Many of these cameos are of surprising and, in modern times, unequalled size and perfection. Cameos do not seem to have been made in mediæval times; but the art was revived in Italy, under the auspices of the Medici, and the production of cameos, both in *pietra dura* and in shell, has there become a branch of art manufacture of considerable importance. Impressions from antique cameos in glass, sulphur, porcelain, and other materials are produced in many places and, for artistic purposes, possess all the value of the originals.

The manufacture of cameos from artificial substances was not unknown to the ancients. One of the most beautiful specimens of an imitation of cameo in glass is the famous Barberini or Portland vase, now in the British Museum. The ground is blue, the figures, which are in low relief, being of a delicate, half-transparent white. (See PORTLAND VASE.) Another example is a beautiful vase, similar in color, known as the Blue Glass Vase, now in the Naples Museum, the figures of which represent a Bacchanalian sacrifice. Consult Mau-Kelsey, *Pompeii: Its Life and Art*, pp. 415-416 (New York, 1902). The vase was found in a tomb, outside the Herculaneum Gate at Pompeii. Many fragments of the same kind of manufacture exist in other cabinets, and from it the modern Wedgwood ware was imitated,

A shell cameo is a cutting in relief on a precious stone or a shell. It is opposed in meaning to intaglio, which signifies a cutting into the stone or shell. In intaglio work, furthermore, only gems of a uniform color are used, while in cameo engraving or cutting it is desirable to choose such stones or shells as possess layers of varying colors, such as sardonyx, onyx, agate, or tropical sea shells. These differing tints are skillfully utilized by intelligent engravers, so that at different depths of the cutting very beautiful and effective gradations of color are obtained. Shell, perhaps, gives the most delicate results, owing to the nearness of the color to that of flesh, and the general use made of the human figure and head as subjects for cameo engraving.

Inasmuch as Egypt was the birthplace, as it were, of belief in amulets, charms, and phylacteries of all kinds, it naturally came to pass that it was the earliest country to develop and to encourage the production of these emblems which, for the individual, possessed a magical and religious significance. From the time of the dynasties of the first Pharaohs to the period of the domination of the Romans, the inhabitants of the valley of the Nile, men and women, all wore about the neck, on the finger, or hung somewhere on their garments, cut or engraved gems of a talismanic character, which also served in some sort as a personal seal. It is safe to say that no country of ancient times has produced in such profusion precious stones in relief and in intaglio. It was in the Greek and Roman period that the cameo reached its perfection. The century of Scopas, Praxiteles, Lysippus, and Apelles produced an artist in gems whom all antiquity praises, but from whom there has not come down to us a single signed work. This artist is Pyrgoteles. Pliny and many others speak of him as the ablest engraver of all time, and place him in the same rank as the above-mentioned sculptors and painters. Pyrgoteles probably engraved several portraits of Alexander in cameo and intaglio, though none can be authenticated. Although cameo is sculpture in miniature, we see by this that it engaged the talents of really great artists. Among the largest examples of ancient cameo work is the Sainte Chapelle agate in the Bibliothèque Nationale in Paris (of sardonyx, 12 × 10½ inches), representing the apotheosis of Augustus and the reception of Germanicus, after his return from Germany, by Tiberius, and the Vienna onyx (8⅝ × 7½ inches), bearing, in addition to other figures, an allegorical representation of the coronation of Augustus. These surpass, in size and delicacy of execution, the best modern productions in this art. See GEMS; AUGUSTUS, APOTHEOSIS OF.

Augustino* (Paris, 1685); Zanetti, *Le gemme antiche* (Venice, 1750); Marsh, *Cameo Cutting* (London, 1891); Thompson, "On the Working of Shell Cameos" in *Art Journal* (ib., 1898); Davenport, *Cameos* (ib., 1900); and especially Furtwängler, *Die Antiken Gemmen* (Leipzig and Berlin, 1900).

CAMERA (Lat., vault, from Gr. *kamara*, a vaulted inclosure, hence a chamber or room), IN. Behind closed doors, the phrase to describe judicial proceedings held in secret. The inquisitorial process of the civil law and of the ecclesiastical courts of England and the Continent was often and may yet in certain classes

of cases be conducted in secret. In the common law system of England and the United States, on the other hand, it has always been held to be of the essence of the administration of justice that it shall be conducted in public. Within reasonable limits of space and good order, any one who chooses may attend a trial or other judicial proceeding, and this characteristic of our judicial administration is jealously guarded as an invaluable safeguard of justice. It was one of the grounds of complaint against the famous or infamous English tribunal known as the Star Chamber (q.v.) that it violated this tradition and conducted many of its proceedings in secret. This requirement of publicity applies equally to civil and criminal cases but is not a necessary incident of the preliminary examination of an accused person before a magistrate, nor does it apply to the hearing upon which an indictment by a grand jury is founded. In the interests of public morality children may be excluded from certain classes of criminal hearings, and matrimonial proceedings of a scandalous nature may by consent of the parties or in some cases by order of the court be conducted *in camera*. Where proceedings are directed to be heard *in camera* it is in England a contempt of court to publish them. In the court of chancery it was formerly the practice to hold *in camera* proceedings affecting wards of court, lunatics, and, in some cases, family disputes. The practice is now, however, restricted to cases in which publicity would defeat the object of the suit, as in proceedings to restrain the publication of private letters or proceedings affecting a secret trade process.

CAM'ERA. See PHOTOGRAPHY.

CAMERA LUCIDA (Lat., light chamber). A device fitted to the eyepiece of a compound microscope to enable the observer to trace upon a sheet of paper the magnified image of the object as seen. It is constructed in various forms, the simplest of which is a small plate of glass attached to the eyepiece at an angle of 45° , as shown in Fig. 1. A portion of a slide or cover glass fixed to the eyepiece with wax can be employed for this purpose. In using the camera lucida, the tube of the microscope is placed in a nearly horizontal position, and a

FIG. 1. SIMPLE CAMERA LUCIDA.

sheet of paper laid on the table beneath the eyepiece. The rays coming through the eyepiece are reflected into the eye from the glass, though coming apparently from the paper below, where an enlarged image of the object is seen. The outline of the image can readily be traced with

a pencil, and in this way an accurate representation of the object can be quickly made. Instead of the simple mirror of glass, Sömmering employed a flat, circular piece of polished steel or speculum metal, whose diameter was somewhat smaller than that of the pupil of the eye. The rays are reflected vertically, and enter the eye,

FIG. 2. WOLLASTON'S CAMERA LUCIDA.

as do also those from the paper which come to the eye, after passing by the edges of the mirror. A prism, so constructed that total reflection occurs one or more times, is often employed, and the arrangement of Wollaston, which is frequently used, is illustrated in the figures and described below. It consists of a small quadrilateral prism of glass, which Fig. 2 shows in perpendicular section, held in a brass frame, which is fitted in front of the eyepiece by a suitable mounting, or attached to an upright rod, having at its lower end a screw clamp, to fix it to the edge of a table. The prism, being at the height of about a foot from the table, has its upper face horizontal. Two of its faces, as in the figure, are at right angles; the contiguous faces make respectively with them angles of $67\frac{1}{2}^\circ$, so that the remaining obtuse angle contains 135° . Rays coming from an object and falling nearly perpendicularly on the first surface enter the prism, and undergo total reflection at the contiguous surface; they then fall at the same angle on the next surface, and are totally reflected again; finally, they emerge nearly perpendicular to the remaining surface. An eye, as in the figure, then receives the emergent pencil through one part of the pupil, so that an image of the object is seen projected upon a sheet of paper upon the table. The rays from the paper and pencil passing the edge of the prism enter the other part of the pupil; and the pencil and image being seen together upon the paper, a sketch of the latter can be made. There is, however, a practical difficulty—the image and the drawing pencil are at distances sensibly different from the eye and so cannot be seen together distinctly at the same time. To obviate this, a plate of metal, with a small aperture, as an eyehole, is placed at the edge under the eye, so that the rays through the prism

and those from the drawing pencil, which both pass through the eyehole, form only very small pencils. A convex lens is also sometimes employed for this purpose. The form of camera lucida devised by Abbe is also used with the microscope. It consists of two right-angle

FIG. 3. ABBE'S CAMERA LUCIDA.

prisms with their hypotenusal faces placed together and a reflecting mirror, as shown in Fig. 3. The separating surface, *ad*, is formed by a thin film of silver, except a circular space at *bc*, through which the direct rays from the microscope pass, as indicated by the arrow *OM*. To an eye placed at *O*, the rays from the paper are reflected by the mirror *Sp*, and again at the silver film between the prisms, so that the image of the magnified object appears on the paper. This arrangement is so mounted that it can readily be moved to and from the eyepiece. By using a finely divided glass scale as an object, we may obtain projected on the paper a magnified image of the divisions, so that the width of the intervening spaces can be measured. A ratio between the scale divisions, unmagnified and as they appear on the paper at a distance of 10 inches from the eye, will give the magnifying power of the microscope. Consult Carpenter, *The Microscope and its Revelations*, 8th ed., edited by Dallinger (Philadelphia, 1901).

CAMERA OBSCURA (Lat., dark chamber). A light-tight box, with a convex lens at one end and a screen at the other, on which an image is produced. This screen is generally a piece of ground glass, or translucent paper, so that the image may be viewed from behind. The rays of light coming from an object pass through the lens, and when they reach the screen form an image which can be received on a sensitive plate and preserved in the form of a negative. If the screen is placed at the appropriate focal distance, a sharp representation of an object can be obtained. The human eye is a simple form of camera obscura, the crystalline lens and retina occupying the relative positions of lens and screen. The lens is not essential for the formation of an image, as with a small opening a picture is also produced. Such an image, while free from distortion, is not apt to be sharp, and a long exposure in making a negative is required.

The invention of the camera obscura is of importance on account of its being the prototype of the modern photographic camera and is

claimed for a number of celebrated men. The first of these is Roger Bacon, who lived in the thirteenth century, and after him comes Alberti, about two centuries later. Leonardo da Vinci, the famous painter and scientist, about the beginning of the sixteenth century, says that if you place yourself in an hermetically closed room, facing a building, landscape, or any other object directly lighted by the sun, and then cut a small circular hole in the shutter, images of the objects outside will be thrown on any surface facing the hole, and will be reversed. Such was the condition of the camera until the time of Cardan, about the middle of the sixteenth century, when he improved it by the addition of a convex lens at the aperture. The instrument in this form is described in his work *De Subtilitate*. In 1569 Giambattista della Porta, of Naples, to whom the invention is generally ascribed, in the seventh book of his work on Natural Magic, gives a detailed description of the apparatus, and in his instrument he placed an inclined mirror before the lens, with the result that the pictures were rendered brighter and erect instead of inverted. Porta's camera obscura attracted general attention, and the instrument was soon provided for the country houses of the wealthy, being placed usually in a small conical building, with a white table or surface in the centre, on which the pictures

FIG. 1. CAMERA OBSCURA.

were projected. A more modern form is shown in Fig. 1.

The camera obscura in the form of a box, with inclined mirror and a piece of ground glass or paper on which the images could be traced, was invented by Hooke in 1679. This instru-

ment has since become familiar in the form of an optical toy, shown in diagram in Fig. 2, though the same principle has been made use of in certain pieces of scientific apparatus. The camera obscura in its simple form of lens and screen, suitably incased, was first used for pho-

FIG. 2. CAMERA OBSCURA.

tographic work by Humphry Davy in 1802, at a time when he was engaged in experiments with Wedgwood. After this, the camera obscura was used by all the early experimenters in photography (q.v.), and the instrument has since then developed and amplified to a remarkable degree. The photographic camera is constructed in an almost infinite variety of styles, depending in the main on the purpose for which it is to be used. In general, it consists of two boxes, joined by a flexible and light-proof material, such as a bellows of leather, rubber, or

FIG. 3. SIMPLE PHOTOGRAPHIC CAMERA.

cloth, and susceptible of being moved towards or from each other, so that the distance between the lens and focal plane or position where the image is received can be varied. In one of these boxes, or on an upright board taking its place, the lens is mounted, and on the other there is a frame carrying a piece of ground glass which, at the time of taking the picture, is removed and the sensitive plate or film substituted. This is contained in a holder so constructed that the sensitive surface occupies the same position as the original focusing glass.

The construction of a camera varies with the use or process for which it is intended. Thus, for out-of-door work portability and rapidity of adjustment are essential, whereas in a studio or laboratory rigidity and adaptability are demanded. A view camera does not require any considerable length of bed, or base, as the ground glass is never distant from the lens a much greater amount than the principal focus (q.v.), as the pictures are generally on a reduced scale. If a camera, however, is designed for copying or enlarging, then it must have a long bed, as the distance from the lens to the ground glass will be as many times greater than the distance between the original object and the lens as it is desired to enlarge the picture. Frequently in the case of hand cameras the ground glass is omitted, and the proper focus is obtained by reference to a graduated scale on the bed, on

which are marked the foci corresponding to different distances.

The use of films and increased ease of manipulation has made photography universally popular, and there are almost as many styles of cameras as there are individual tastes. See PHOTOGRAPHY.

CAM'ERA'RIUS, JOACHIM (1500-74). A distinguished German classicist, born at Bamberg, of a family which originally bore the name Liebhard; for this Camerarius (Ger. *Kammermeister*) was substituted, since the office of chamberlain to the Prince-Bishop of Bamberg was hereditary in the family. At the age of 13 Camerarius entered the University of Leipzig. In 1518 he began to teach Greek at Erfurt, but in 1521 he moved to Wittenberg, where he attached himself to Melanchthon. At the latter's recommendation he was appointed to teach Greek and history in Nuremberg in 1526. Nine years later he was called to the University of Tübingen as professor of the Greek and the Latin literatures. In 1541 he went to Leipzig, where he continued to lecture until his death. He contributed to the eminence of this university, not only by his teaching and writing, but also by the practical measures of university reform which he, with certain associates, was able to carry through. He was especially distinguished for his critical judgment, in which he surpassed Melanchthon, while his knowledge of the classics was not inferior to that of his friend, so that he deserves to be regarded as the greatest German classicist of his century. His works were very numerous. Besides biographical and theological writings, the most important are the following editions: *Homerie Poesis*, with the so-called scholia of Didymus (Basel, 1541); *Greek Elegiac Poets* (Basel, 1550); *Theocritus* (Frankfurt, 1545); *Sophocles* (Basel, 1556); *Herodotus* (Basel, 1540 and 1557); *Thucydides*, with the scholia (Basel, 1540 and 1557); *Theophrastus* (Basel, 1541). He was also coeditor of the edition of Galen, published by Cratander (Basel, 1538 et seq.). After Camerarius' death a number of Greek works and Latin translations were published by his relatives. Among the Latin authors edited by him should be named Quintilian with Commentary; Cicero (Basel, 1540); many separate works between 1542 and 1558; above all, his edition of Plautus (Basel, 1552), for which he employed the so-called *Codex Vetus Camerarii* and the *Codex Decurtatus*, and thus for the first time secured a definite basis for the text. A full list of his works may be found in Pökel, *Philologisches Schriftstellerlexikon* (Leipzig, 1882). Consult Bursian, *Geschichte der klassischen Philologie in Deutschland*, pp. 185-90 (Munich, 1883), and Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

CAMERARIUS, RUDOLF JAKOB (1665-1721). A German botanist and physician, professor of medicine and director of the botanic garden at Tübingen. He was the first to recognize sexual differences in plants and make successful investigations of their reproductive organs.

CAMERINO, kä'mâ-rě'nô (Lat. *Camerinum*). A city in the Province of Macerata, central Italy, with a bishopric dating from 252 and an archbishopric dating from 1787, between the Chienti and the Potenza, about 35 miles southwest of Ancona (Map: Italy, H 4). The cathedral, built in 1832, occupies the site of a temple of Jupiter. The town possesses a university, founded in 1727. There are also the archie-

piscopal palace, the ducal palace, the new palace, and a bronze statue of Sixtus V, erected in 1587. The chief industry is silk growing. Pop., 1881, 12,000; 1901, 12,542; 1911, 11,689.

CAMERINUM. See CAMERINO.

CAM'ERLEN'GO, or **CAM'ERLIN'GO** (It., chamberlain). The Camerlengo of the Holy Roman church, generally a cardinal, controls the finances and the secular interests of the Pope. During a vacancy in the holy see he is sole head in things temporal and presides over the apostolic chamber or palace. In things spiritual, however, he is assisted by the other cardinals. There is also (2) a Camerlengo of the sacred college of cardinals, and (3) of the Roman clergy.

CAM'ERON. A city in Clinton Co., Mo., 50 miles north-northeast of Kansas City, on the Chicago, Burlington, and Quincy and the Chicago, Rock Island, and Pacific railroads (Map: Missouri, B 2). It is the seat of Missouri Wesleyan College. The city has a glove factory and dairying interests. The municipality owns the electric light and water works. Pop., 1900, 2979; 1910, 2980.

CAMERON. A city and the county seat of Milam Co., Tex., 53 miles south of Waco, on the San Antonio and Aransas Pass and the Gulf, Colorado, and Santa Fe railroads (Map: Texas, F 4). It is an agricultural region, containing deposits of timber and coal. The chief industries are cotton growing and stock raising. Cameron was settled about 1875. The government is administered by a mayor, elected biennially, and a unicameral council. Pop., 1900, 3341; 1910, 3263.

CAMERON, AGNES DEANS (1863-1912). A Canadian journalist and educator, born and educated at Victoria, British Columbia. She was a teacher for 18 years, but early manifested a keen interest in Canadian national development and exploration, contributing articles on these subjects to several American and British periodicals. Although appointed associate editor of the *Educational Journal of Western Canada*, she was led by a wide range of interests into various fields; she undertook and successfully accomplished a journey of 10,000 miles to the Arctic Ocean, starting from Chicago and reaching her destination by way of Athabasca, the Great Slave Lake, and Mackenzie River, and returning by way of Peace River and Lesser Slave Lake. Her study of Canadian natural resources and her traveled observation enabled her to become a well-known lecturer in the United States, Canada, and Britain. In 1909 she was elected vice president of the Canadian Women's Press Club. She published *The New North* (1909) and *The Outer Trail* (1910). She died at Victoria.

CAMERON, ARCHIBALD (c.1771-1836). An American Presbyterian clergyman, born in Scotland. He studied at Transylvania Seminary, Lexington, Ky., was licensed to preach in 1795, ordained in 1796, and was installed over the churches of Akron, Fox Run, and Big Spring. For many years the only Presbyterian clergyman in a wide extent of territory, he was occupied with itinerant labors until 1828, when he figured in a great revival and became pastor of churches at Shelbyville and Mulberry. With the Rev. David Rice (1733-1816), his teacher in theology, he was a pioneer of the Presbyterian church in Kentucky. Among his publications are: *The Faithful Steward* (1806); *An Appeal*

to the Scriptures (1811); *A Defense of the Doctrines of Grace* (1816); *A Reply to Some Arminian Questions on Divine Predestination* (1822).

CAMERON, A(RNOLD) GUYOT (1864-). An American college professor, born at Princeton, N. J., and educated at Princeton University. He was professor of the French and German languages and literatures at Miami University (1888-91), assistant professor of French at Yale University (1891-97), professor of French at Princeton (1897-1905), and professor in New York University Summer School (1909). He edited several French texts, including selections from Loti, Coppée, France, Zola, and Maupassant, and lectured on literary topics.

CAMERON, SIR CHARLES (1841-). A Scotch journalist and politician, born in Dublin. He studied at Madras College, St. Andrews, and Trinity College, Dublin, and at the medical schools of Paris, Berlin, and Vienna, and from 1864 to 1874 edited the *North British Daily Mail*. From 1874 to 1885 he was member of Parliament for Glasgow, from the subdivision of the constituency in 1885 until 1895 sat for the College division, and in 1897 was elected for the Bridgeton division. He introduced into the House the resolutions whose carriage effected the reduction of minimum telegram charges from one shilling to sixpence. In 1893 and 1894, in accordance with Gladstone's programme, he introduced into the House bills for the disestablishment of the Scotch church. He was knighted in 1893.

CAMERON, SIR CHARLES ALEXANDER (1830-). An Irish physician and chemist. He was born in Dublin and was educated in Dublin and Guernsey and in Germany. In 1862 he became public analyst for the city of Dublin and in 1867 was appointed professor of hygiene and chemistry in the Royal College of Surgeons in Ireland. The following are a few of his valuable publications: *Elements of Agricultural Chemistry* (in collaboration with J. S. W. Johnston, 10th ed., 1897); *A Manual of Hygiene, Public and Private* (1874); *Lectures on Public Health* (1868); *Handy Book on Food and Diet* (1871); *The Prevention of Contagious Diseases* (1871); *History of the Royal College of Surgeons, Ireland* (1886).

CAMERON, CHARLES DUNCAN (?-1870). An English soldier and explorer. He participated in the Kaffir War of 1846-47 and afterward in the Crimean War, and served with distinction at Kars and subsequently, on special duty, at Trebizond. In 1860 he was appointed British Consul in Abyssinia, but he did not assume the duties of this office until early in 1862. In June of this year he proceeded from his residence at Massowah to Gondar, to deliver a letter and presents from Queen Victoria to King Theodore, but he was here thrown into prison by the King in 1864 for alleged interference in Abyssinian politics, and was held for two years, when he was surrendered to Rassam, the agent of the British government. Almost immediately, with Rassam and others, he was again imprisoned by King Theodore and was released only when a British force advanced to their rescue. Cameron's account of his experiences was published in the *Parliamentary Printed Papers* (1868-69).

CAMERON, DONALD (c.1695-1748). A Scottish chief, known as "The Gentle Lochiel." He was born at Achnacarric, Lochiel, Inverness.

He supported the Young Pretender, Charles Edward, who landed in Scotland in 1745. When Lochiel suggested awaiting reinforcements from France, Charles taunted him into invasion of England. Lochiel took Edinburgh in September, 1745, distinguished himself at Prestonpans, marched as far south as Derby, returned to Scotland and captured Falkirk. Governed by his strict but just and humane discipline, his command gained honorable repute by their conduct and forbearance. He opposed the plan of the night attack on Cumberland's army at Culloden, where he was severely wounded. After vicissitudes, he escaped to France, where he was afterward master of horse to "the Young Chevalier." He is the hero of Campbell's poem, *Lochiel's Warning*.

CAMERON, SIR DOUGLAS COLIN (1854-). A Canadian manufacturer and politician, born at Hawkesbury, Ont. He was educated at the Vankleek Hill High School. In 1880 he removed to Manitoba, entered the lumber business, and soon had important mills in Manitoba, Ontario, and British Columbia. In 1902-05 he served as a Liberal member of the Ontario Legislature. He was afterward unsuccessful as a candidate for the Manitoba Legislature and also in 1908 failed to be elected for Winnipeg in the House of Commons. Notwithstanding these reverses his wealth and business standing made him prominent in provincial politics, and in 1911 he was appointed Lieutenant Governor of Manitoba. In 1914 he received the honor of knighthood.

CAMERON, SIR DUNCAN ALEXANDER (1808-88). An English soldier, son of Sir John Cameron (1773-1844), a distinguished general in the Peninsular War. He entered the Black Watch (42d Royal Highlanders) in 1825, became a colonel in 1854, and served with distinction in the Crimean War. He commanded the 42d at the Alma, and at Balaklava, and at the siege of Sebastopol took a prominent part in the assault upon the outworks. He commanded the troops in New Zealand in 1863, although he disapproved of the war, sympathizing with the natives. In 1864 he was made a knight commander of the Order of the Bath. He became lieutenant general in 1868 and general in 1874, and from 1868 to 1875 was governor of the Royal Military College at Sandhurst.

CAMERON, EDGAR SPIER (1862-). An American mural painter. He was born in Ottawa, Ill., and studied at the Academy of Design under Earle, at the Art Students' League, New York, under Dewing and Chase, and later in Paris, under several masters, especially Laurens, Benjamin-Constant, and Cabanel. On his return to the United States he was, together with Robert Reid and Walter McEwing, placed in charge of the execution of the mural paintings for the World's Fair in Chicago. His most important work has been mural painting, such as his decorations in the library of the Supreme Court, Springfield, Ill. Among his easel pictures are "Dreamland," exhibited at Berlin in 1910, "The Youth of Christ," his most important work, and "Glass Blowers." He was art critic and correspondent of the *Chicago Tribune* from 1891 to 1900, and a member of the international jury for the Paris Exposition in 1900. His wife, MARIE CAMERON, is a successful portrait and genre painter.

CAMERON, FRANK KENNETH (1869-).

An American chemist, born at Baltimore, Md., and educated at Johns Hopkins University. He was instructor in chemistry at Cornell in 1894-95, associate professor at the Catholic University of America in 1895-97, and instructor in physical chemistry at Cornell in 1897-98. In 1898 he was engaged as an expert by the United States Department of Agriculture, was made chemist to the division of soils in 1899, and later placed in charge of the laboratory of soil chemistry. Besides his bulletins of the division of soils his publications include: *An Introduction to the Study of the Soil Solution* (1910) and *The Soil Solution the Nutrient Medium for Plant Growth* (1911).

CAMERON, GEORGE FREDERICK (1854-85). A Canadian poet, born at New Glasgow, Nova Scotia. Educated at Queen's University, Kingston, he passed several years in the United States and then returned to Canada, becoming editor of the *Kingston News*. Cameron's verse was praised for its rhythm and cadence, by Swinburne, Tennyson, and Matthew Arnold. Consult: *Lyrics on Freedom, Love, and Death*, ed. by C. J. Cameron (Boston, 1887); J. E. Wetherell, *Later Canadian Poets* (1893); Stedman, *Victorian Anthology* (New York, 1895).

CAMERON, HUGH (1835-). A Scottish genre, portrait, and landscape painter. He was born in Edinburgh and studied at the Trustees' Academy under Scott Lander, and later at the Royal Scottish Academy, where he first exhibited in 1854 and became academician in 1869. His genre pictures represent interiors such as "Maternal Care" (Museum, Aberdeen), and "Auld Robin Gray"; or country idyls, like "The Village Well" (Aberdeen) and "Haymaker's Noon." They are carefully executed, warm in color, and full of naïve charm. He also painted a number of Italian scenes, of which "Peasants Returning from the Olive Groves," and "Child's Funeral on the Riviera" (Museum, Dundee), are especially deserving of mention. His later pictures are mostly beach scenes of far-reaching perspective flooded with sunlight and animated by bathers and children at play. One of the best known, "The Timid Bather" (Glasgow Museum), was exhibited at the Paris Exposition, 1900. Consult Caw, *Scottish Painting* (London, 1908).

CAMERON, IRVING HEWARD (1855-). A Canadian physician and surgeon. He was born in Toronto and was educated at Upper Canada College and Toronto University, where he graduated in 1874. Entering on practice in his native city he soon attained a high reputation as physician and surgeon. In 1898 he was elected president of the Canada Medical Association, in 1900 a fellow of the Royal College of Surgeons, London, and in 1905 a fellow of the Royal College of Surgeons, Edinburgh. He was also elected a member of the Société Internationale de Chirurgie, the American Academy of Political and Social Science, and the British Association for the Advancement of Science. He was one of the founders and early editors of the *Canadian Journal of Medical Sciences*, and became professor of surgery in the University of Toronto. He wrote the article on surgical tuberculosis in the *International System of Surgery*, and also various articles in the British and Canadian medical journals.

CAMERON, JAMES DONALD (1833-). An American capitalist and politician, known as "Don" Cameron. He was born in Middletown,

Pa., the eldest son of Simon Cameron (q.v.); graduated at Princeton in 1852, and engaged in banking and various industrial enterprises. As president of the Northern Central Railroad, he did great service to the Union cause during the Civil War. In 1876 he was appointed Secretary of War, and in March, 1877, succeeded his father as United States Senator. By successive reëlections he retained his seat until 1897, when he retired. He was prominent in the campaign of 1876, first as opposing the nomination of Blaine, and then in working for Hayes's election. But Hayes refused to continue him in the cabinet. In 1880 he was chairman of the Republican National Committee. Consult chapter 94 in McClure's *Old Time Notes of Pennsylvania* (Philadelphia, 1905).

CAMERON, JOHN (1579-1625). A Scottish scholar and divine. He was born in Glasgow and was educated at the university of that city, where, in his twentieth year, he held an appointment as reader in Greek. In 1600 he set out to travel in France, where his ability and erudition secured for him a philosophical professorship in the University of Sedan. He afterward acted as a Protestant clergyman in Bordeaux, and on the death of Gomarus (1618) was appointed to the divinity chair in the University of Saumur, an appointment he held until 1620, when, returning to Britain, he was appointed principal of the University of Glasgow (1622); but in less than a year he returned to Saumur; thence to Montauban, where he received a divinity professorship (1624). Here his opposition to the party who advocated a civil war made him many enemies, by one of whom he was stabbed in the street (May 13, 1625); and he died from the effects of the wound a few months later. He was considered one of the best scholars of his time; in biblical criticism he was inclined to be perverse; where there was a difficulty, he usually chose the opposite view to that held by other divines, especially Beza. He was a Calvinist, but less rigid than most of his contemporaries. His works are said to be the foundation of Amyraut's (q.v.) doctrine of universal grace; so he is called the founder of the moderate Calvinistic school of Saumur. His collected works were published with a memoir by L. Cappel (Geneva, 1642).

CAMERON, JOHN (1843-1908). A Canadian journalist. He was born at Markham, Ont., and was educated there and at London (Ont.). He engaged in the printing business and in 1863 founded the *Advertiser*, which became an influential organ of Liberal opinion in the western part of the province. In 1875 he also founded the *Liberal* in the interest of that section of the Liberal party led by Edward Blake (q.v.) in the earlier part of his career; but the paper was discontinued after a year. In 1882, after the death of George Brown (q.v.), he became editor of the *Globe*, Toronto, and continued in that position until 1890, when he returned to London. He was postmaster of that city at the time of his death.

CAMERON, JOHN DONALD (1858-). A Canadian jurist. He was born at East Nissouri, Ont., and was educated at Woodstock College and the University of Toronto, where he graduated in 1879 after an academic course of phenomenal range and brilliance. He studied law and was called to the Ontario bar in 1882; but removed to Manitoba, where he rapidly gained an extensive practice. In 1892-99 he

was a Liberal member of the Manitoba Legislature and also a member of the provincial administration, first as Provincial Secretary (1892-96) and afterward as Attorney-General (1896-99). At a time of much religious and political turbulence (1896) over the school question (see MANITOBA, *History*) he was one of the commissioners for Manitoba to arrange a settlement with the Dominion authorities. In 1908 he was appointed a judge of the Court of King's Bench, and in 1910 a judge of the Court of Appeal.

CAMERON, JOHN HILLYARD (1817-76). A Canadian lawyer and statesman. He was born in Beaucaire, Languedoc, France, but came to Upper Canada with his father in early youth and was educated at Upper Canada College, Toronto. He studied law, was admitted to the bar in 1838, and soon gained a high professional reputation. He was appointed reporter to the Court of Queen's Bench in 1843, and thus began the regular record of judicial decisions in Upper Canada. In 1840 he was a commissioner for revising the Upper Canada statutes, and in 1856 a commissioner for consolidating the statutes of Canada. In 1846 he was elected a Conservative member of the Legislative Assembly, and the same year was appointed Solicitor-General for Upper Canada in the administration of William Henry Draper (q.v.). An interesting occurrence in the history of Canadian cabinet government took place in 1847, when Cameron was admitted to a seat at the council board, the first instance of a solicitor-general being thus distinguished. During his legislative term he procured the exemption from the British income tax of the property of colonists in Britain, and also improved postal facilities by securing the carriage of American mails by Canadian packets. He was a staunch adherent of the Church of England in Canada, and effected the removal of disabilities which prevented the free action of its synods. He was one of the founders, and afterward a professor in the law faculty, of Trinity University, Toronto. He published: *Digest of Cases Determined in the Upper Canada Courts* (1844); *Rules of Court Relating to Pleading in the Court of Queen's Bench* (1845); *Reports of Cases Determined in the Queen's Bench* (1846).

CAMERON, MALCOLM (1808-76). A Canadian statesman. He was born in Three Rivers, Province of Quebec, and in his youth was denied all educational advantages, commonly so-called, except attendance during one winter at a district school. At different times farm boy, stable boy, brewery clerk, and country storekeeper, he improved every available interval by serious study, and before he was 21 years old had formed Radical opinions on Canadian political questions. He soon removed to Upper Canada and in 1836 was elected a Liberal member of the Legislative Assembly. He vigorously opposed the oligarchical rule, political and sectarian, which was then exercised by the Tories, and demanded responsible government and the secularization of the clergy reserves. (See CANADA, *History*.) He did all he could to promote the union of Upper and Lower Canada in 1841. In the second Baldwin-Lafontaine administration he became Assistant Commissioner of Public Works (1848), but resigned in 1849 and allied himself with the advanced wing of the Liberal party known as Clear Grits (see POLITICAL PARTIES, *Canada*), of which he was one of the founders. In the Hincks-Morin administration, in which

the more radical sections of Liberal opinion were represented, Cameron was appointed in 1851 President of the Council, and afterward Minister of Agriculture and then Postmaster-General. After the defeat of the Hincks-Morin government he was in political retirement for three years, and was then elected to the Legislative Assembly, in which he supported the moderate Conservative Macdonald-Cartier administration. After the Legislative Council was made elective, he became a member in 1860. Later he was again elected to the Legislative Assembly and remained a member until his death. Throughout his public life he was a firm advocate of the temperance cause.

CAMERON, SIR MATTHEW CROOKS (1822-91). A Canadian jurist and statesman. He was born in Dundas, Ontario, was educated at Upper Canada College, Toronto, and was called to the bar in 1849. He rose rapidly in his profession and gained a large practice. In 1861 he was elected a Conservative member of the Legislative Assembly. He was defeated in an electoral contest for that body in 1863, but was successful in the following year. After confederation in 1867 he was a candidate for election to the House of Commons, but was defeated and subsequently entered the cabinet of John Sandfield Macdonald (q.v.), the first Premier of Ontario, as Provincial Secretary and Registrar. In 1871 he became Commissioner of Crownlands, remaining in that office until the defeat of the Macdonald administration in 1871. He was then elected leader of the Ontario Conservative opposition, and held that position four years. In 1878 he was appointed a puisne judge of the Court of Queen's Bench, and in 1884 Chief Justice of the Court of Common Pleas, a position which he retained until his death.

CAMERON, RICHARD (?-1680). A Scotch minister, born in Falkland, Fife. He was founder of the sect of Cameronians, a term popularly applied to but declined by the Reformed Presbyterians. The son of a tradesman, he was an apt pupil at the village school, and while still a youth became schoolmaster and precentor. He espoused the cause of the itinerant field preachers and, possessing natural eloquence, was licensed and admitted to their numbers. In 1678 he joined banished friends in Holland, but returned in 1680, and with others strenuously resisted the measures that reinstated the Episcopal church in Scotland and proscribed the meetings for public worship of unauthorized religious bodies. He persisted in preaching in the fields and antagonized the government by an attitude of defiance. In June, 1680, with 20 well-armed companions, he entered the town of Sanquhar and in the market place formally renounced allegiance to Charles II, for abuse of power, and declared war against him and his adherents. He retired to the hills between Nithsdale and Ayrshire, and succeeded in evading capture for a month, though a price of 5000 marks was set upon Cameron's head by the government, and 3000 for the heads of the other leaders. They were surprised by a superior force in Aird's Moss, July 20, 1680, and after a brave fight Cameron was killed. His hands and head were cut off and fixed upon the Netherbow Port, Edinburgh. The followers who escaped were induced by the Edinburgh Convention of 1689 to assist in the revolution, and formed the nucleus of that renowned regiment of the British army called the Cameronians (q.v.). Consult

Herkless, "Richard Cameron," in *Famous Scots Series* (New York, 1896).

CAMERON, SIMON (1799-1889). An American politician. He was born in Donegal, Pa., was a painter and then an editor in Doylestown and Harrisburg, and early in life was prominent in politics, but, because of his iron interests, was a Protectionist. In 1838 he was commissioner to settle accounts with the Winnebago Indians and was accused of swindling them. When Buchanan resigned from the Senate to become Secretary of State, Cameron was elected (1845) his successor over George W. Woodward by a Democratic bolt and fusion with the Whigs. When his term expired (1849), he became a leader of the People's party and fused it with the new Republican party, and was again elected to the Senate in 1857, with the aid of several Democratic votes. In 1860 he was a prominent candidate for the presidency in the national Republican convention, and in 1861 was appointed Secretary of War, though his appointment was bitterly opposed by many men of prominence. Apparently Lincoln's managers in the nominating convention had secured Cameron's influence there by promising him a portfolio in Lincoln's cabinet. Soon after becoming a member of the cabinet he expressed himself in favor of arming fugitive slaves, a policy which President Lincoln then opposed, and, much evidence being adduced in Congress to prove corruption in the department in letting contracts, he was asked, in January, 1862, to resign his portfolio. (See UNITED STATES, *History*, Lincoln's Administration.) From then until November of the same year he was United States Minister to Russia. In Pennsylvania in 1864 he successfully opposed Stevens and others who sought to defeat Lincoln's renomination; and he aided Lincoln in bringing about the nomination of Andrew Johnson for Vice President. He was chosen United States Senator in 1867 (over Curtin) and again in 1873. During the Hayes administration he opposed the executive policy of civil-service reform, and in 1877 resigned his seat in order that his son, James Donald Cameron (q.v.), might be elected in his place, thereby virtually keeping in the family the almost entire control of the Republican party in Pennsylvania, which he had gained in 1866. The dictatorship was transferred in turn to M. S. Quay and Boies Penrose (qq.v.). Cameron was the first powerful State "boss" in American politics; his character is suggested by his definition of an honest politician as "one who will stay bought when he is bought." Consult McClure, *Old Time Notes of Pennsylvania* (2 vols., Philadelphia, 1905).

CAMERON, VERNEY LOVETT (1844-94). An English explorer. He was born near Weymouth, Dorsetshire, entered the British navy in 1857, and saw service on the east coast of Africa. In 1873 he was sent by the Royal Geographical Society on a second expedition to relieve Livingstone. In August Lieutenant Cameron met Livingstone's servants bearing their master's body to the coast. Cameron pushed on, and was the first European to cross tropical Africa from east to west, reaching the Atlantic in November, 1875. He found some of Livingstone's papers, explored the southern half of Lake Tanganyika, and learned that the Lualaba was really the Upper Congo. On his return he received many honors, was promoted to commander in the navy, and published *Across*

Africa (2 vols., 1876; 2d ed., 1885). In 1878-79 he traveled in Asiatic Turkey and on his return published *Our Future Highway* (1880), advocating a railway from Tripoli to India. In 1882, with Sir Richard Burton, he visited the African Gold Coast in search of gold, and he was joint author of Burton's *To the Gold Coast for Gold* (1883). He wrote several juveniles.

CAM'ERO'NIANS. Followers of Richard Cameron (q.v.), of Scotland; officially known as Reformed Presbyterians. The organization dates from 1681, and, except a few seceding congregations, united with the Free church in 1876. They refused to take the oath of allegiance, or to take office, under the existing government. (See PRESBYTERIANISM.) They were moderate Calvinists and asserted that the will of man is determined only by the practical judgment of the mind; that the cause of men's doing good or evil proceeds from the knowledge that God infuses into them; and that God does not move the will physically, but only morally, by virtue of its dependence on the mind.

CAMERONIANS (from Richard Cameron, q.v.). A celebrated regiment of Scotch infantry in the British army. In the British army list it is described as "The Cameronians (Scottish Rifles), Regimental District No. 26; Depot and Record Office, Hamilton, N. B." The regiment consists of two battalions, each of about 1000 men of all ranks, and belongs to the oldest division of the British army. In its origin it dates back to the time when the Covenanters were in arms for the defense of their faith and in many instances went armed to their public meetings. Consult Cunningham, *Church History of Scotland* (Edinburgh, 1883), and Burton, *History of Scotland* (London, 1873).

CAMEROON, kă'me-rōon'. See KAMERUN.

CAMICIANÆ AQUÆ. See CASTELTERMINI.

CAMILING, kă'mê-līng', SAN MIGUEL DE. A town of Luzon, Philippines, in the Province of Tarlac, 19 miles northwest of Tarlac. Pop., 1903, 25,243.

CAMIL'LA. In Roman fable, a virgin wonderfully swift of foot, who aided Turnus with Volscian forces against Æneas (Vergil, *Æneid*, vii. 803); she was slain by Arruns, an Etruscan ally of Æneas (see Vergil, *Æneid*, xi. 648-833). She was said to be a daughter of Metabus, King of the Volscian town Privernum (Piperno).

CAMILLE, kă'mêl' (Lat. *Camilla*). 1. The heroine of Corneille's *Les Horaces*. Her lover is one of the Curiatii killed by her brothers, as in the old Roman legend on which the play is founded. When she denounces the act, and the patriotism which caused it, she is stabbed by her brother. 2. The heroine and title character of the English adaptation of *La dame aux camélias*. Camille is Marguerite Gautier in the original.

CAMIL'LO (Lat. *Camillus*). 1. A Sicilian lord who, in Shakespeare's *Winter's Tale*, warns Polixenes of Leontes' designs against his life. He escapes to Bohemia with the former monarch and remains there until the reconciliation of Polixenes and Leontes at the close of the piece. He is instrumental in bringing about the marriage of Florizel and Perdita. 2. The husband of "the white devil" in Webster's play of the latter name. He meets his death through the agency of the Duke of Bracciano, who was the paramour of his wife. See ACCORAMBONI.

CAMIL'LUS and **CAMIL'LA** (Lat.). The

names applied in ancient Rome to the boys and girls who shared in sacrificial ceremonies, as attendants of priests and priestesses, especially the Flamen Dialis and his wife, the Flaminica. (See FLAMENS.) If they were designed for the priesthood, it was necessary that their parents should be still living and free-born.

CAMILLUS, MARCUS FURIUS (?-c.365 B.C.). A celebrated Roman patrician who first makes his appearance as consular tribune (403 B.C.). His military career was a series of unbroken successes, according to the accounts which have come down to us; but these accounts were shown by Niebuhr to possess a considerable admixture of mythological or poetic fiction. In 396 Camillus was made dictator, during the Veientine War, in which, in a siege of 10 years, he mined and captured the city of Veii; but the proud splendor of his subsequent triumph offended the Roman populace, who were still further displeased when Camillus demanded a tithe of the spoils of Veii, in order to fulfill a vow made to Apollo, on condition of victory. In 394 Camillus was again elected consular tribune, and besieged Falerii, whose inhabitants, after bravely defending themselves, were led, tradition said, by a magnanimous act of Camillus to yield unconditionally. Afterward Camillus, being accused of peculation and foreseeing certain condemnation, banished himself from Rome (391) and lived in retirement at Ardea, until Brennus, at the head of his wild Gauls, had swept through Etruria and captured and destroyed the whole of Rome except the Capitol. (See ALLIA; BRENNUS, 1; ROME, *History*.) Camillus was now recalled and appointed dictator a second time. He achieved a decisive victory over the invaders, rebuilt Rome, and obtained new victories over the Volsci and others. In 386 he was elected dictator for the third time, but refused the office. In 381 Camillus was victorious in the war of Rome against Præneste and other Latin towns; and in 368 he was elected to his fourth dictatorship, but abdicated during the same year. In 367, when war broke out with the Gauls, Camillus, though a very old man, accepted the dictatorship for the fifth time, defeated the barbarians near the site of Alba Longa, and made peace between patricians and plebeians, helping to pass the Licinian Laws. (See AGRARIAN LAW.) Consult Plutarch, *Camillus*. After this he erected near the Capitol a temple to Concord, and, having retired from public life, died about 365, of the plague, lamented by the whole Roman people.

CAMINATZIN, kă'mê-nâ-tsên', or **CACU-MAZIN** (?-1520). King of Texcuco, nephew or cousin of Montezuma (Emperor of Mexico), and one of the leaders of the war party among the Mexicans after the capture of the Emperor by the Spaniards. Caminatzin successfully opposed every effort of Cortés to make peace with the natives of the city of Mexico, but was finally taken captive through the instrumentality of Montezuma. He perished on the night of the evacuation of Mexico by the Spaniards (the *noche triste*), June 30, 1520.

CAMISARDS, kăm'î-zărdz (Fr., from OF. *camise*, smock, less probably from Fr. *camisade*, attack by night). The active participants in the Protestant revolt of 1702 in the Cévennes, a mountainous region in southern France, against the persecutions that followed the revocation of the Edict of Nantes. (See NANTES, EDICT OF.) The Camisards belonged to the Romance-speak-

ing people of Gothic descent, who took part in the earliest movements towards religious reform. Calvin was warmly welcomed when he preached at Nîmes, and Montpellier became the chief centre for the instruction of Huguenot youth; but it was in the triangular mountainous plateau called Cévennes, and chiefly among the small farmers, the cloth and silk weavers, and the vinedressers, that Protestantism was most widely diffused. These people, who were of a hardy and inflexible character, not unlike the Covenanters of the Scottish Highlands, were imbued with the stern principles of Calvinism, readily kindled to the exhortations of their preachers, and were capable of a stubborn resistance. The Edict of Nantes of 1598 and the moderate and conciliatory policy of Richelieu had brought France relief from religious strife, but a new policy was introduced under Louis XIV, who, conceiving that the internal political exigencies of the realm demanded a uniformity of worship throughout its extent, concluded that he would no longer tolerate heresy. A policy of gradually destroying the privileges of the dissenters was begun. They were shut out from public offices and trade corporations; they were forbidden to marry with Roman Catholics, and the conversion of their children seven years old and upward was encouraged and almost enforced. In October, 1685, the Edict of Nantes was finally revoked. All dissenting churches were to be destroyed, religious meetings were forbidden under pain of imprisonment and confiscation of property; all pastors who would not stop preaching at once and change their faith were to be banished within 15 days; exemption from taxes and increased salaries were promised to converted ministers. Huguenot schools were suppressed, and all children were to be baptized and brought up in the Roman Catholic faith. All Huguenots, except ministers, were prohibited from going abroad, and the property of those who had already gone was declared forfeited unless they returned within four months. In carrying out this harsh decree the most savage persecution was indulged in. Torture, hanging, insults worse than death to women, the galleys and imprisonment for life were the ordinary occurrences for the next 60 years. (See DRAGONNADES.) The number of Huguenots who fled from France at this period has been estimated as high as 600,000; but a more conservative and reliable figure would place it at 250,000.

In the Cévennes, however, the people were too poor to escape, and all over Languedoc the Huguenots assembled for purposes of worship in secret. A religious ecstasy ran through the country, and so-called prophets appeared among the people. In connection with this phase of the excitement, there were noted those abnormal physical and mental conditions which always follow prolonged fasting and vigils under strong religious excitement. Louvois, Louis XIV's War Minister, determined to put down this movement in an exemplary manner. An army of 40,000 was raised, and forts were erected at Nîmes, St. Hippolyte, Alais, and Anduze. The Abbé du Chaila, a Roman Catholic missionary from Siam, had been appointed inspector of missions in the Cévennes. He became an object of particular aversion to the fanatics on account of his repressive measures in retaliation for their excesses and bold defiance. His assassination, July 23, 1702, was the first blow in the war. There was to have been a general massacre

of Roman Catholic priests, but the plan failed, and the originator, Esprit Séguier, soon fell. He was succeeded by La Porte, an old soldier, who, as his forces increased, assumed the title of Colonel of the Children of God and named his country the Camp of the Eternal. His captains were selected from those on whom the prophetic influence had fallen, such as the forest ranger Castanet, the wool carders Condère and Mazel, and the soldiers Catinat, Joany, and Ravenel; but the most famous were Roland and Jean Cavalier, the baker's boy (see CAVALIER, JEAN). For three years the Camisards held out. Against them was sent an army of 60,000 men, among them an Irish brigade, which had just returned from the persecution of the Vaudois. A policy of extermination was commenced, and in the Upper Cévennes alone 466 villages were burned and nearly the entire population put to the sword. The insurgents, on the other hand, indulged in acts of violence against the Catholic population and priesthood, of whom more than 4000 are estimated to have perished. Catholic churches were burned in large numbers. Clement XI issued a bull against the "execrable race of the ancient Albigenses," promising remission of sins to the holy militia which was now formed among the Roman Catholic population under the name of Cadets of the Cross. The formidable force brought against them induced Cavalier to listen to proposals, and he finally assented to a surrender on being guaranteed liberty of conscience, the right of assembly outside of walled towns, the liberation of all his people then in durance, and the restitution to emigrants of their civil rights and property. Still the greater part of the army, under Roland, Ravenel, and Joany, refused, and insisted upon the complete restoration of the Edict of Nantes. The Camisards continued the war until the beginning of 1705, at which time their leaders had been killed or dispersed and they had become disorganized. In 1711 all outward signs of the Reformed religion had disappeared, and on March 8, 1715, a few months before his death, Louis XIV, by a special medal and by proclamation, announced the entire extinction of heresy. Fourteen years afterward, in spite of the strictest surveillance, aided by military occupation, there had been organized in Languedoc 120 churches, which were attended by 200,000 Protestants. Persecution could not utterly suppress them; but it was not until 1775 that the last galley slave from Languedoc was liberated, and not until 1789 that the National Assembly repealed all the penal laws against Protestantism. Consult: Baird, "The Camisard Uprising," in *Papers of the American Society of Church History*, vol. ii (New York, 1890); Bray, *The Revolt of the Protestants of the Cévennes* (London, 1870); Smiles, *The Huguenots in France after the Revocation of the Edict of Nantes* (London, 1877); Goiffon (ed.), *Rélation historique de la révolte des fanatiques ou des Camisards* (Nîmes, 1874); Louvreleuil, *Le fanatisme renouvelé* (Avignon, 1702-07); *Les bulletins de la Société de l'histoire du protestantisme français*. See CÉVENNES.

CAM'LAN. A famous battle in Arthurian legend. It saw the death of Arthur and the dissolution of the Round Table. Antiquarians place it in Cornwall, England, and set its date either in 537 or 542 A.D. See ARTHUR; also MODRED.

CAM'LET (Ar. *khamlat*, camlet, from *khaml*,

pile, plush; at an early period folk etymology wrongly referred it to *camel*). A fabric originally made of camel's hair, and more recently of the hair of the Angora goat, having a waved surface. Camlets are woven from wool alone, or from wool and cotton or linen mixed, and spun hard.

CAMMERHOFF, kām'mēr-hōf, JOHN CHRISTOPHE FREDERIC (1721-51). A Moravian bishop and missionary in America. He was born near Magdeburg, Germany; in 1746 became a bishop of the Moravian church and came to America, where until his death he acted as Bishop Spangenberg's assistant. He worked among the Indians, especially among the Iroquois, and made many converts. He was adopted into the Turtle tribe of the Oneidas, under the name "Gallichwio" ('A Good Message'), and for more than a generation was remembered with singular respect and veneration by the Indians of the Confederacy. His death was caused by exposures and hardships like those of his journey (1750) of 1600 miles to Onondaga.

CAMÕES, kâ-moinsh', commonly written in English CAMOENS, LUIZ VAZ DE (c.1524-80). The greatest poet of Portugal, who exerted an important influence on the national drama and developed the Portuguese lyric to its highest perfection, but owes his fame mainly to the celebrated historical epic, *Os Lusíadas*. Son of a sea captain, who was early lost in a shipwreck, and descendant of a family of distinction and rank, Camões was born in Lisbon (more probably than in Coimbra) in 1524 or 1525 (with probability strongly in favor of 1524), about the time of the death of Vasco da Gama, to whom he was related, and whom his grandfather, Antão Vaz, had accompanied on his first voyage to India. He attended the University of Coimbra, where his uncle Dom Bento de Camões, the learned prior of the Monastery of Santa Cruz, became chancellor, the year of Luiz's entrance, in 1539. He early showed remarkable proficiency in the classics and in contemporary literature, presumably due to the guidance of this uncle. It was during these early days in Coimbra that Camões was inspired by some fair but unknown maiden, whom he celebrated in a series of canzoni, sonnets, and elegies, Petrarchian in form and Platonic in spirit, but notable for their purity of diction and grace of form. Having finished his studies, Camões took leave of Coimbra in a poem filled with most tender *saudade* ('longing': the peculiar note of much of his verse), and in 1542 went to Lisbon, where he frequented the court and conceived a romantic passion for Caterina de Athaide, one of the Queen's ladies of honor, whom he celebrated under the anagram of Natercia. The beginning of all his troubles was brought about by his having shown his affection too openly, thereby infringing some rule of court etiquette. Banished from the court and separated from the woman he loved, Camões joined the expedition of John III against Morocco, where he served two years, losing an eye during a naval engagement in the Strait of Gibraltar. On his return to Lisbon he found no more praise for his bravery than formerly for his poems. Disappointed in all his hopes, he determined to leave his native land forever, said a last farewell to Caterina, and sailed for India as a common soldier. For 16 years he led an adventurous life in the East, unprosperous for the most part, though for a time he held a lucrative

position at Macao, as administrator of the effects of deceased persons. But he misused his powers, made enemies by his writings, incurred debts, and suffered misadventures in love. At last he turned his steps homeward, and after disheartening delays and countless hardships reached Lisbon once more, in 1570, only to find it overrun with the plague, in the throes of the Inquisition, and governed by a young, feeble, and visionary monarch. Nevertheless he published his epic, the *Lusiad*, the only valuable possession which he had brought back from all his wanderings, and dedicated it to the young King, Sebastian, who was very gracious; but all the patronage bestowed upon the author was a niggardly pension of about \$20, and permission to frequent the court. Camões survived a few more troubled years, living with his aged mother. When Sebastian undertook the African campaign, his patriotic zeal flamed up once more, though he could not accompany the King either as poet—since Diogo Bernardes and Cortereale were preferred to him—nor as soldier, because too old. The news of the defeat of Alcacer-Quebir broke his heart. In a letter, the last lines that he wrote, he says: "It was not enough that I should die in my fatherland; I am dying with it." He died in a hospital in 1580, and his interment passed almost unnoticed.

The *Lusiad* (*Os Lusíadas*, The Lusitanians) celebrates the chief events in the history of Portugal, and is remarkable among modern epics for the admirable manner in which it has imitated the true national and popular spirit of ancient epic poems. Among the most famous passages are the tragic story of Inés de Castro, and the apparition of the giant Adamastor, who appears as the Spirit of the Storm to Vasco da Gama when passing the Cape. The metre of the *Lusiad* is the familiar *ottava rima* of the Italian poets, and the treatment of it is full of charm. The chief interest of the poem is due to the fiery spirit of patriotism which pervades it, and its intrinsic beauty has made it one of the masterpieces of what Goethe termed the "world literature." It has been translated into all the principal languages of Europe. Besides his epic, Camões wrote sonnets, odes, elegies, satires, epigrams, epistles, and three comedies—*Os Amphitryões*, modeled upon Plautus; *King Seleucus*; and *Filodemo*. The most complete edition of his works is that of the Visconde de Juromenha (6 vols., Lisbon, 1860-69); a cheaper and more convenient edition is that of Theophile Braga (3 vols., Oporto, 1874), also the edition by Carl von Reinhardstoettner (Strassburg, 1874). For his biography, consult: Adamson, *Memoirs of the Life and Writings of Luis de Camões* (London, 1820); Braga, *Historia de Camões* (3 vols., Oporto, 1873-75); Castello Branco, *Luis de Camões* (Oporto, 1880); Burton, *Camões: His Life and his Lusíads* (London, 1881); Storek, *Luis de Camoens Leben* (Paderborn, 1890). This *Life* by Storek made useless, except as bibliographical and historical curiosities, all the biographies that had preceded it. Consult also the translation of some of the poems by the Viscount Strangford, *Poems from the Portuguese of Luis de Camoens, with Remarks on his Life and Writings, Notes, etc.* (6th ed., London, 1810). For good bibliographies, consult: Camillo Castello Branco, *Manual bibliographico portuguez* (Oporto, 1878); Innocencia Francisco da Silva, *Diccionario bibliographico portuguez*, vol. v, pp. 239-277 (Lisbon, 1860),

and vols. xiv and xv (vols. vii-viii of the continuation by Brito Aranha, Lisbon, 1886-88), which are devoted exclusively to Camões and Camoniana, the latter volume dealing at length with the tercentenary celebrations, and both volumes being fully illustrated.

CAM'OMILE. See CHAMOMILE.

CAMONICA, ká-mô'nê-kä, or VALLE CAMONICA. A picturesque valley in the Province of Brescia, north Italy, consisting of the basin of the Oglio River, inclosed by outlying and densely wooded ridges of the Rhaetian Alps. It extends for 50 miles from northeast to southwest to Lake Iseo (Map: Italy, E 2). It is a principal thoroughfare between Italy and the Tirol. It has iron, copper, and lead mines and marble and slate quarries. Its soil is fertile, and agriculture is well developed, maize, grapevines, and mulberry trees being extensively cultivated.

CAMORRA, ká-môr'rá (Sp., contest, quarrel). A secret society with ramifications throughout the former Kingdom of Naples, which exerts considerable influence among the lower classes in that part of Italy, and whose activity extends to higher official quarters. The members are called Camorristas. The society was not political in its origin, but rather a fraternal organization started among the Neapolitan prisoners about 1820. Its chief object has always been extortion in some form. Under the Bourbons, Camorristas appeared in public places on all occasions of popular amusement and levied contributions which their victims dared not refuse. They undertook the transport of smuggled goods and contracted for the commission of serious crimes. Their readiness for violence and murder, and their close association among themselves, made them so much dreaded that Camorristas who had been thrown into prison succeeded in exacting money from their fellow prisoners and from the jailer himself. When at the height of its power, the society had a central rendezvous in every large provincial town and 12 in the city of Naples. Those who belonged to each of these sections of the society were under the absolute government of a chief elected by themselves, with whom was associated a treasurer. The latter had the charge of the common fund into which all the Camorristas of that section paid their entire gains for distribution according to a carefully worked out scale of percentages due different members and officials. Candidates for membership were obliged to swear upon an iron crucifix a fearful oath of fidelity and secrecy. The candidate remained for a year, with the designation of *picciotto d'onore*, as a pupil under an old Camorrist; and having completed this probation, and given proof of his courage and obedience in circumstances involving danger of life, was advanced to the rank of a *picciotto di sgarro*. Finally, after a longer period, in which he had given proof of his fitness on a number of occasions, he was admitted to full membership of the society as a Camorrist. The members were held under the strictest discipline. Disobedience was punished by flogging, suspension from employment, or expulsion; treachery, by death. If two Camorristas quarreled, their chief decided the question between them; but in difficult cases a duel with daggers was the mode of decision. Under Ferdinand II the Camorra was tolerated for political reasons. The government of Francis II endeavored to put down the society, and the police received instructions to seize and transport all known members of it.

Those who remained entered into alliance with the Garibaldi Committee and rendered essential service in the expulsion of the Bourbons. When the Neapolitan and Sicilian influence became strong in the politics of the new Italy (see ITALY), the government attempted to use the Camorra in its struggle with brigandage, and thus strengthened the influence of the society by making it a political force, as it had often been under the Bourbons. For a number of years the Camorra tended to assume more of the nature of a political machine, manipulated for the purpose of plunder. For a time the society was in full control of the municipal government of Naples and included among its members the heads of the chief departments and practically the entire body of city employees. The association put up offices for sale, guaranteed officials immunity in the pursuit of peaceful speculation, and, in the last extreme, defended them in the courts. Conditions finally became so scandalous as to warrant (1899) the intervention of the Italian government. Municipal government in Naples was suspended, while a royal commission was appointed to investigate the operations of the Camorra. The revelations of the commission led to the formation of an Honest Government League, which succeeded in completely defeating the candidates of the Camorra in the municipal elections of 1901. Defeated in political life, the Camorra turned again to its private character of an organization of the strong and idle living on the weak through a process of extortion, blackmail, and robbery. In 1906 the society came into great prominence again through the murder of Gennaro Cuocolo and his wife. The crime was fastened upon the Camorra through the confession of one of its members. To secure a fair trial the case was transferred from Naples to Viterbo and, after 17 months' hearing by jury, on July 8, 1912, over 30 of the leading Camorristas were convicted and eight men were sentenced to prison on 30-year terms and 18 others for terms ranging from five to nine years. The existence of the Camorra is bound up with the economic conditions of Italy. Sanitary measures and improved educational facilities offer the best method of stamping out this plague of modern Italy. Consult: Ernest Serao, "The Truth about the Camorra," *Outlook*, vol. xxviii; Pasquale Villari, *Lettere Meridionali*; Monnier, *La Camorra* (Florence, 1863); Heckethorn, *The Secret Societies of All Ages and Countries* (New York, 1897); Umiltà, *Camorra et Mafia* (Neuchâtel, 1878); Blasio, *Usi e costumi dei camorriste* (Naples, 1897).

CAMOUFLET, ká'mōō'flé'. A small (military) mine which does not break the surface when exploded. It is sometimes used to demolish the enemy's galleries. See MINES AND MINING, MILITARY.

CAMP (Lat., campus, a field), MILITARY. A collection of tents or huts for the shelter of troops, in a position, or on a piece of ground, specially adapted or prepared for such occupation. When troops are sheltered under canvas, they are in *camp*. When resting on the ground without shelter, they are in *bivouac*. When occupying buildings in towns or villages, or huts specially erected, they are in *cantonment*. Cantonments often develop through improvements of camps, huts or temporary buildings taking the place of worn-out tents. The evolution of the modern camp, or military encampment, is practically the history of modern

armies, strategy, engineering, and sanitation. Of ancient camps the Romans give us the best example. The advance party consisted of a tribune and several centurions, whose duty it was to select a suitable site for the camp, marking out, first of all, a spot for the prætorium, or general's tent, round which, as a centre of the whole system, the rest of the camp was marked out. The camp streets were broad, measuring from 50 to 100 feet, and allowance was always made for the *forum*, or public market place. Polybius (in the second century B.C.) is authority for the full details of the Roman camp system. With regard to their general description, he states that the best conception which can be formed of a Roman camp of the more permanent kind is by regarding it as a military town. According to the same authority the Greeks trusted mainly to the judicious selection of their ground and regarded the natural advantages which they thus secured as supplying in a great measure the means of artificial defense. The Greeks, consequently, did not use the regulation type of camp so rigorously adhered to by the Romans. The Roman plan seems to have been the one most generally adopted through the Middle Ages, with such additions as new arms, new formations, and new branches necessitated. Modern camps, in home countries or possessions, are chosen for their particular local advantage and sanitation, the general health of the troops being the first consideration. In time of war, or when campaigning in an enemy's country, there must be added precautions against attack, locating the camp in a place giving every possible natural advantage. Care is taken that there are no commanding positions within range where an enemy's artillery could be effective; that it is capable of defense; that it is roomy and safe enough to assemble the troops or get under way without hindrance or confusion; and that there are water facilities for man and beast. These and such other rules as circumstances may dictate establish general principles for the selection of camp sites throughout armies of the civilized world. In the United States army camps are organized according to directions given in the regulations. See ENCAMPMENT; BIVOUAC; CANTONMENTS; BILLETING.

CAMP, kän, MAXIME DU. See DU CAMP, MAXIME.

CAMP, WALTER (1859—). An American athletic expert and author, born in New Haven, Conn. He graduated in 1880 from Yale University, where thereafter he was active in the management of athletics, giving especial attention to football. On this sport he became a leading American authority, and was in demand on various committees which undertook the revision of football rules and brought about the present system of play. He became a member of the Yale University Council. His writings include: *Drives and Puts*, with Lillian Brooks (1899); *The Substitute* (1908); *Jack Hall of Yale* (1909); *Old Ryerson* (1911); *Danny Fists* (1913)—all stories; *Football* (1886); *American Football* (1891, 1896); *Book of College Sports* (1893); *The Book of Football* (1910); *Football for the Spectator* (1911). He also acted as editor of the *Library of Young People*, and contributed on sporting subjects to leading magazines.

CAMPA, käm'pä. See ANTI.

CAMPAGNA, käm-pä'nyä, GEROLAMO (c.1550—

c.1626). A Venetian sculptor and architect of the Renaissance. He was born in Verona and there studied under Cattaneo, with whom he removed to Venice. His earliest-known work is the statue of Doge Leonardo Loredan on the tomb in Santi Giovanni e Paolo, Venice, after the designs of his master, whose reliefs in the famous chapel of Sant' Antonio, in the Santo, Padua, he likewise completed. He also carved the decorations of the high altar and the rich tabernacle in the choir of the Santo, the architectural features of which were designed by Cesare Franco. He then returned to Venice, where the remainder of his life was spent, and where his principal works are to be found. Among them are: the statue of "St. Justina" over the portal of the Arsenal; the altar of the Cappella della Rosario (SS. Giovanni e Paolo), which he designed, and in particular the statues of SS. Rose and Thomas Aquinas upon it; the high altar and other works in San Giorgio Maggiore (in which he was assisted by his brother Giuseppe); and the statue of St. Anthony in San Giacomo di Rialto, which is considered his chef d'œuvre. The statue of Duke Federico Montefeltro in the ducal palace, Urbino, and two bronze statues for the fine façade of the Palazzo del Consiglio, Verona, are also important works. Although Campagna was not free from the mannerisms of his age, he possessed technical ability of a high order, and great skill in the treatment of the nude and in decorative effects.

CAMPAGNA DI ROMA, käm-pä'nyä dē rō'mā (It., plain of Rome). An undulating, uncultivated, and unhealthy plain of Italy surrounding Rome, including the greater part of ancient Latium. Applying the name in a broad sense to the district extending from Cape Linaro, south of Cività Vecchia, to Terracina, beyond the Pontine Marshes, we find that its length is about 90 miles; its breadth inland, to the Alban and the Sabine hills, ranges from 25 to 40 miles. A broad strip of sandy plain skirts the Mediterranean. The ground, which never rises higher than 200 feet above the sea, is almost entirely volcanic; the lakes represent craters of extinct volcanoes. The vapors rising from this district, and especially from the Solfatara (q.v.), produce the pestilential atmosphere styled *aria cattiva*. In autumn herdsmen descend from the Apennines to the Campagna di Roma with their herds, the pasture in some parts being rich and abundant. Until the fifth and the sixth centuries A.D. the Campagna di Roma was well inhabited, though not very healthful. In the last century of the Roman Republic and under the emperors, it was filled with the luxurious villas of wealthy Romans. The insecurity of the region during the Middle Ages and the failure of the water supply led to its gradual depopulation and the increase of the malignant conditions. During recent years improved drainage, the planting of eucalyptus trees, and other works undertaken by the government have done much to make the Campagna di Roma more healthful and to lead to its gradual reclamation.

CAMPAGNOLA, käm'pä-nyō'lā, DOMENICO (c.1484—1563). A Paduan painter and engraver. He was born probably in Venice, but passed most of his life in Padua. He seems to have studied with his brother Giulio, and may have assisted Titian when the latter decorated the Scuola del Santo in Padua (1511); but his own frescoes there are of somewhat later date. Other

pictures of his early period are the "Birth of Christ" (Academy, Vienna), "Holy Family" (Pitti, Florence), "Four Prophets" (Academy, Venice); to a later period belong the three frescoes in the Scuola del Carmine, Padua, and a "Madonna" in the Museo Civico, Padua. Among his engravings are the "Descent of the Holy Spirit" and many woodcuts, one of the best known being the "Massacre of the Innocents." Some of these he even cut himself. He was probably the first artist to make a profession of drawing, as distinct from painting and engraving. Many of his numerous pen-and-ink drawings are in the Uffizi, the British Museum, and the Berlin Cabinet of Engravings. They resemble Titian's, and have often been attributed to him. Consult the monograph of E. Galichon (Paris, 1864).

CAMPAIGN, kām-pān' (Fr. *campagne*, *campagne*, open country, military operations; ML. *campania*, level stretch of country, from Lat. *campus*, field), MILITARY. A connected series of military operations having a definite purpose and object. It may apply to the whole field of hostilities or to each separate and distinct command, if such command is operating with its own programme. For example, in the Civil War of 1861-65 may be cited General Grant's campaign, General Sherman's campaign, General Lee's campaign; while, on the other hand, under the title of the Egyptian campaign (1882) was embraced every operation of the entire war.

CAMPAIGN, THE. A poem with a Latin version, by Joseph Addison, written at the instance of Lord Godolphin, to celebrate the battle of Blenheim in 1704. The amazing success of the piece was largely due to its happy description of Marlborough as one who "rides the whirlwind and directs the storm." It gained for the author first a commissionership of appeals and then the office of Undersecretary of State.

CAMPAN, kām'pān', JEANNE LOUISE HENRIETTE GENEST (1752-1822). A French author. She was first lady of the bedchamber to Marie Antoinette, and her faithful companion until they were separated at the sacking of the Tuileries, Aug. 10, 1792. She then established a school at Saint-Germain and later won the favor of Napoleon, who made her superintendent of an academy at Ecoen founded by him for the education of daughters and sisters of members of the Legion of Honor. On the abolition of the school in 1814, she retired to Mantes, where she died. She wrote *Mémoires sur la vie privée de Marie Antoinette* (1823); *Journal anecdotique* (1824); a treatise, *De l'éducation*; and some pedagogical essays, *Correspondance inédite avec la reine Hortense* (1835). Consult Jules Flammermont, *Les mémoires de Madame de Campan* (Paris, 1886).

CAMPAÑA, PEDRO. See KEMPENEER, PETER DE.

CAMPANARI, kām'pā-nā'rè, GIUSEPPE (1859-). An Italian dramatic barytone, born at Venice. He began his musical career as a 'cellist in the Scala orchestra of Milan, but at the same time he studied singing. In 1884 he joined the Boston Symphony Orchestra as 'cellist, and also appeared occasionally as a concert singer. In 1893 he resigned his position with the orchestra to become a member of the Hinrich's Grand Opera Company, when he immediately became famous through his striking impersonation of the rôle of Tonio in the first American production of *Pagliacci*. In 1895-98 he was a member of the

Metropolitan Opera Company. After that he devoted himself chiefly to concert work, appearing only occasionally in opera.

CAMPANELLA, kām'pā-nē'lā, TOMMASO (1568-1639). An Italian monk and philosopher. He was born in Stilo, Calabria, and studied in Naples and Cosenza. His *Philosophia Sensibus Demonstrata*, which included a defense of Teleseus against the scholasticism of the Aristotelians, was published in 1591. He was accused of heresy and of conspiring against the government, and spent 27 years in prison at Naples, during which time he wrote much, one of his works being his famous "City of the Sun," which has been translated into English by T. W. Halliday and published in "Ideal Commonwealths" (Morley's *Universal Library*). He was released through the intervention of Pope Urban VIII, but renewed persecutions compelled him to seek refuge in France, where he remained until his death. He was kindly received by Richelieu and granted a pension of 3000 livres by Louis XIII. He expounded a philosophy many of whose tenets resemble the views of Descartes and Kant. His works, 82 in all and treating of many different subjects, include: *De Sensu Rerum et Magia* (1620); the *Civitas Solis*, mentioned before (printed with his *Philosophia Epilogistica Realis*, 1623), a description of an ideal commonwealth similar in character to that outlined in Plato's *Republic*; and *Atheismus Triumphatus* (1636), which assumes the character of an apologia. His complete works have been edited by d'Ancona (Turin, 1854). His sonnets were translated by J. A. Symonds, in a volume with those of Michelangelo (1878). For his biography, consult: Baldacchini (Naples, 1840) and Amabile (Naples, 1883-87), as well as Dareste, *Morus et Campanella* (1843).

CAMPANERO, kām'pā-nā'rò (Sp., bellman, from *campana*, bell). The bell bird.

CAMPANERTHAL, kām-pā'nēr-täl, or **KAMPANERTHAL**, DAS. A work on the immortality of the soul by Jean Paul Richter, which derives its name from the beautiful valley of Campan in the Pyrenees, traversed by the Adour.

CAMPANHA, kām-pā'nyā (Portug., plain). A town of Brazil in the State of Minas Geraes, about 150 miles northwest of Rio de Janeiro (Map: Brazil, H 8). It is situated in a gold-mining region and has several churches, a Latin school, a hospital, theatre, etc., and is renowned for its spring of alkaline-gaseous water called *Agua Virtuosas*. Pop., nearly 7000.

CAMPANIA (Lat., from Lat. *campus*, plain, Gk. *Καμπανία*, *Kampania*). A district of ancient Italy lying along the Tyrrhenian Sea, bounded on the land side by Latium, Samnium, and Lucania (Map: Italy, J 6). Originally inhabited by people of Oscan race, it was early invaded by the more civilized Greeks, who founded there the cities of Cumæ and Neapolis (Naples). At a later period it came under the Etruscan domination, but the bulk of the population remained Oscan in race and language until Roman times (after 90 B.C.). At Naples, however, Greek was spoken to very late times. Here were the *Campi Phlegræi* of the Greek and the Latin writers, the modern *Solfatara* or sulphur field near Puteoli (Pozzuoli), and here, near Cumæ, was the Lake of Avernus, the fabled entrance to the lower world. The great plain of Campania was always noted for its wonderful fertility and its charming climate and scenery.

The wines of the Mons Massicus and the Ager Falernus were very famous; so, too, were the olives of Venafrum. The Romans, who overran it as early as 340 B.C., called it *Campania Felix* ('Happy Campania'). They did not, however, succeed in Romanizing the inhabitants until after the time of Sulla. The coast of Campania then became a favorite resort for the wealthy Romans, who built handsome villas at Baiæ, Puteoli, Misenum, and elsewhere. Cicero had a villa at Pompeii. In his reorganization of Italy Augustus made Campania, with Latium, his first district. The chief ancient towns were Capua, Cumæ, Puteoli, Neapolis, Nola, Pompeii, Nuceria, Teanum, Venafrum, and Salernum. The modern Department of Campania consists of the provinces of Avellino, Benevento, Caserta, Napoli, and Salerno, covering an area of 6290 square miles. Pop., 1901, 3,160,446; 1911, 3,311,990.

CAMPANILE, kām'pā-nē'lā (It., from Mid. Lat. *campana*, a bell). A bell tower (q.v.); especially an isolated bell tower of the Italian type. The earliest examples are circular, dating from the fifth century, at Ravenna, adjoining the basilicas of St. Apollinare Nuovo and St. Apollinare in Classe; but they are exceptional. From the eighth century on, the square plan prevailed with only rare exceptions. In Rome they were always of brick, in strongly marked stories without pilaster strips (St. Giorgio in Velabro, eighth century; Sta. Maria in Cosmedin, St. Alessio, etc.). In north Italy they were sometimes of stone or marble, oftener of brick with vertical pilaster strips, arcaded cornices, and only small openings except the grouped openings of the top or belfry stage. That of San Gottardo at Milan (twelfth century) is octagonal, of brick with stone corner shafts; it is one of the most elegant examples in Italy. The famous leaning tower at Pisa (1174) (q.v.) is of marble, circular in plan, the most remarkable of Italian leaning towers, and the only one decorated with open arcades at each story. It is, however, a watchtower rather than a bell tower. The very elegant campanile of the cathedral of Siena (thirteenth century) and of St. Zenone at Verona (1139) are of banded white and black marble, like the adjoining churches; so also those of Pistoia and Lucca. The campanile on the Piazza dei Signori at Verona is exceeded in height only by that at Cremona (400 feet); both have octagonal lanterns or top stories. The great campanile of St. Mark's (q.v.) in Venice, a rectangular tower of brick begun in 874, completed 1150, and remodeled 1517, the most conspicuous monument of the city, fell on July 14, 1902, owing partly to defective materials, partly to injudicious repairs; it has been reërected on a strengthened pile foundation, in the form it had presented since 1517. The most beautiful of all Italian campanili is that of the Duomo at Florence, designed by Giotto (1335) and completed by Gaddi and Talenti. It is about 300 feet high, incrustated with panels of colored marble; its details of incrustation, inlay, relief, sculpture, and tracery are unsurpassed in Italy. Like most of the Italian towers, it has a nearly flat roof. The Renaissance produced a few campanili of great beauty, especially in Venetia; of these the finest is that of San Giorgio Maggiore by Palladio and Scamozzi, of brick with a marble superstructure and low spire. Of more formal classic design is that of the Capitol (Campidoglio) at Rome. The magnificent Victoria Tower of the Westminster Houses of Parliament

by Barry, though not wholly isolated from the building, may be properly termed a campanile; so also the great tower of the Sacré Cœur Church in Montmartre (Paris) and the memorial tower erected in the campus of Brown University, Providence, R. I.

CAMPANINI, kām'pā-nē'nē, CLEOFONTE (1860-). An Italian conductor and operatic manager. He was born at Parma and received his musical education under Bazzini at the conservatory of his native town. In 1883 he began his career as conductor of the Parma Opera. Through the influence of his brother, the famous tenor, Italo Campanini, the young man was engaged as assistant conductor to Vianesi for the first season of Italian opera at the New Metropolitan Opera House in 1883. After his return to Italy he occupied the conductor's chair at Naples, Venice, and Rome. In 1887 he conducted in New York the first American performance of Verdi's *Otello*. In 1903-06 he was conductor at La Scala in Milan. When in 1906 Oscar Hammerstein opened his Manhattan Opera House, he chose Campanini not only as conductor, but as general artistic director. Here he had a splendid opportunity for the full development of his rare gifts, so that even at the end of his first season the new institution was regarded as a dangerous rival of the Metropolitan Company. During the three years of his directorship, 1906-09, Campanini produced eight novelties. When in 1910 the Chicago Opera Company was organized, Mr. Dippel engaged Campanini as general artistic director with practically autocratic power. Upon the retirement of Mr. Dippel in 1913, Campanini succeeded him as general manager. As a conductor Campanini occupies a foremost position among the world's greatest conductors, not only because of his dominating personality, but principally because of the catholicity of his taste. He is perfectly at home in the music of all schools and all nationalities.

CAMPANINI, kām'pā-nē'nē, ITALO (1845-96). An Italian tenor, born in Parma. He enlisted in the army of Garibaldi when 14 years of age and took part in the fight before Milazzo. Having discovered during the campaign that he had a fine voice, he studied singing in Parma, and made his first appearance as the notary in *La Sonnambula* in his native town. He sang with indifferent success in various opera companies until 1869. In that year he went to Milan and placed himself under the tuition of the celebrated Francesco Lamperti. After a thorough training, he made his début in *Faust* at La Scala in Milan, and was pronounced by a critical audience to be one of the finest tenors of the age. In 1872 he made his London début as Gennaro, in *Lucrezia Borgia*, and in 1873 sang with Christine Nilsson in New York. He was heard in the United States during several subsequent seasons and became the most popular operatic tenor of his day in the country. His repertoire included nearly 100 operas and oratorios. In later years, partly owing to an affliction of the throat, his voice failed; but his fine method of producing it and his intelligent singing and acting kept him high in popular favor until a few years before his death. He died in Vigatto, near Parma.

CAMPAN'ULA (ML., dim. from Late Lat. *campana*, bell). A genus of plants of the family Campanulaceæ, distinguished by a bell-shaped corolla with five broad segments. The species number nearly 300, and they are found mostly

in the higher latitudes of the Northern Hemisphere, at high elevations in temperate regions, and about the Mediterranean Sea. The species are mostly herbaceous and are grouped as annuals, biennials, and perennials. The flowers are blue, violet, or white, and many are cultivated as border plants. The name "bellflower" or "bellwort" is given to many and is sometimes extended to include all the species. One of the most common is the bellflower, *Campanula rotundifolia*, a perennial species indigenous to America, Europe, and Siberia. For illustration, see Plate of CAMELLIA, ETC., and MOUNTAIN PLANTS. The Canterbury bell, *Campanula medium*, is a biennial species frequently cultivated. It will flower the first season if sown early and transplanted. Among annual species in cultivation are *Campanula erinus*, *Campanula macrostyla*, and *Campanula americana*. *Campanula pyramidalis* with blue, lilac, or white flowers, *Campanula glomerata* with pale-blue flowers, and *Campanula muralis* are all worthy of cultivation. Formerly medicinal properties were ascribed to some species, and the name "throatwort" was given to *Campanula trachelium* in England, where it was held valuable in some affections of the throat.

CAMPAN'ULA'CEÆ (Neo-Lat., from ML. *campanula*, little bell), BLUEBELL FAMILY. A family of dicotyledonous plants, the species of which number about 600, embraced in about 35 genera. They are mostly herbaceous, a few only being trees or shrubs, and are characterized by alternate exstipulate leaves and usually by a bitter latex. The inflorescence is usually racemose; the flowers regular, five-parted; and the fruit a capsule or berry. The flowers of most of the species are comparatively large, but in *Phyteuma* and *Jasione* they are small and massed in heads like the Compositæ. The Campanulaceæ are mostly found in the temperate and colder climates of the Northern Hemisphere, and the flowers of many are quite ornamental. The fruits of one member of the family (*Canarina campanula*) which grows in the Canary Islands are edible. The chief genera are *Campanula*, *Phyteuma*, *Jasione*, and *Lobelia*.

CAMPAN'ULA'RIA (Neo-Lat., from ML. *campanula*, little bell). A "bell hydroid" of the siphonophorous family Campanularidæ, common about tide-covered rocks, and characterized by having the "hydroid heads inclosed in a calyx, [and] the medusæ, if free, with gonads on radial canals" (Davenport). These are known as bell hydroids and are numerous, the genus *Obelia* being specially common and well represented on the New England coast. See illustration under ALTERNATION OF GENERATIONS.

CAMPARDON, kãn'pãr'dôn', EMILE (1834-). A French author, born in Paris. He was educated at the Ecole des Chartes, and in 1884 became chief of a department in the national archives. He wrote much and illuminatingly on the history of the seventeenth and more especially the eighteenth century. The following are his principal publications: *Histoire du tribunal révolutionnaire de Paris* (2 vols., 1861); *Marie Antoinette à la conciergerie* (1862); *Madame de Pompadour et la cour de Louis XV* (1867); *Voltaire, documents inédits* (1880); *L'Académie royale de musique au XVIIIe siècle* (1884); and with Boutaric, *Mémoires de Frédérie II* (2 vols., 1866).

CAMPASPE, kãm-pãs'pê. A river of Victoria, Australia, which rises in the Great Divid-

ing Range and, flowing northward, joins the Murray at Echuea (Map: Victoria, D 4). The plains along its course are well cultivated. Length, about 150 miles.

CAMPAS'PE (Gk. Καμπάσπη). A mistress of Alexander the Great. Apelles is said to have taken her for the model of his "Venus Anadyomene." (See ANADYOMENE.)

CAMPBELL, kãm'b'l, or Scot. pron. kãm'l. See ARGYLL, MARQUIS OF.

CAMPBELL, ALEXANDER (1788-1866). An American clergyman, the chief founder of the Disciples of Christ (q.v.). He was born in Ireland and studied one year at the University of Glasgow. He came to the United States in 1809 and ultimately settled in Bethany, Va. At first he associated with the Baptists, but about 1827 he organized the society now known as the Disciples of Christ (q.v.). In 1840 he founded Bethany College (Bethany, W. Va.), and remained its president until his death. He established, in 1823, the *Christian Baptist*, which in 1829 became the *Millennial Harbinger*, and which he continued until 1863. He was an ardent believer in the imminent Second Coming of Christ and actually predicted that it would be in the year 1866. He engaged in many public debates and published no less than 60 volumes, including hymn books and a translation of the New Testament. His most typical doctrinal works were *The Christian System* and *Remission of Sin*. He published *Memoirs of Thomas Campbell* (1861), his father and associate in his work. Consult Richardson, *Memoir of Alexander Campbell* (Cincinnati, 1888), and Grafton, *Alexander Campbell, Leader of the Great Reformation of the Nineteenth Century* (St. Louis, 1897).

CAMPBELL, ALLAN (1815-94). An American civil engineer and railroad president. He was born in Albany, N. Y., and at the age of 21 was chief engineer of a railroad. He built the first railroad ever operated in South America; was prominent in the construction of the Harlem Railroad, the Pacific Railroad, and that from Callao to Lima, Peru, and was president of the Harlem Railroad until succeeded by "Commodore" Vanderbilt. He was appointed commissioner of public works of New York City in 1876, and during 1883 was comptroller of the city. In 1882 he was defeated as nominee of the Republicans and Independents for the office of mayor.

CAMPBELL, LADY ARCHIBALD (JANEY SEVILLA). An English actress and author. She was married to Lord Archibald Campbell in 1869. She played the part of Orlando in *As You Like It* in 1884-85; Shepherd Perigot in the *Faithful Shepherdess* in 1885; the title rôle in *Fair Rosamund* in 1886; and Oberon in *A Midsummer Night's Dream* in 1887. She introduced in Europe the acting of pastoral plays in the open air. In 1889 she set and played Banville's *Le Baiser* as a pastoral; in 1899 she wrote the Scottish ballad play, *Tam Lin*, which she produced at the Theatre Royal in Edinburgh, playing the chief rôle herself. In 1907 she dramatized and played as a monologue at the Edinburgh Berkeley Theatre, Yeats's poem, "Cap and Bells." Besides several articles in periodicals on the drama, she is author of *Rainbow Music, Treating of the Philosophy of Harmony in Color Grouping*.

CAMPBELL, BARTLEY (1843-88). An American dramatist. He was born in Allegheny City, Pa., became a journalist, and founded the *Evening Mail* in Pittsburgh (1868). In 1869 he started

a monthly magazine in New Orleans; but the success of his first play, *Through Fire* (1871), induced him to devote himself to dramatic authorship. *My Partner* (1879) was his greatest success. He was for a time manager of the Fourteenth Street Theatre, New York. He became insane in 1886 and died in an asylum.

CAMPBELL, BEATRICE STELLA TANNER (1867–). An English actress, born in London, and married in 1884 to Patrick Campbell, who fell in the South African War in 1900. She was already well known as an amateur before she made her début on the professional stage, at the Alexandra Theatre, Liverpool, in 1888. In March, 1890, she appeared in London at the Adelphi, where she afterward played again in 1891–93, creating several parts. She gained a wide reputation in *The Second Mrs. Tanqueray* (1893) at St. James's Theatre, where also she appeared in *The Masqueraders* (1894). As Kate Cloud in *John-a-Dreams*, produced by Beerbohm Tree at the Haymarket in 1894, she made another success, and again as Agnes in *The Notorious Mrs. Ebbsmith*, at the Garrick (1895). Among her later performances have been those in *Fédora* (1895), *Little Eyolf* (1896), and her notable performances with Forbes-Robertson at the Lyceum in the rôles of Juliet, Ophelia, and Lady Macbeth (1895–98). After this, visiting America several times, she appeared with marked success in *Magda* (1900), *The Joy of Living* (1902), as Mélisande to the Pelleas of Mme. Sarah Bernhardt (1904), in *The Whirlwind* and *The Bondman* (1906), *Hedda Gabler* (1907), *The Thunderbolt* (1908), *Lady Patricia* (1911), *Bella Donna* (1911), Shaw's *Pygmalion* (1914). In 1914 she married George Cornwallis West. Consult: Walkley, *Drama and Life* (London, 1907); Shaw, *Dramatic Opinions* (London, 1907); Archer, *The Theatrical World* (London, 1897).

CAMPBELL, CHARLES (1807–76). An American historian, born in Petersburg, Va. He graduated in 1825 at Princeton, was head of a classical school at Petersburg from 1842 to 1855, and afterward was principal of Anderson Seminary, Petersburg. He contributed to the *Southern Literary Messenger*, edited the *Orderly Book* of Gen. Andrew Lewis for 1776 (1860) and *The Bland Papers* (1840–43; see BLAND, THEODORIC), and wrote *History of the Colony and Ancient Dominion of Virginia* (1859).

CAMPBELL, SIR COLIN, LORD CLYDE (1792–1863). A British field marshal, born in Glasgow, Scotland, Oct. 20, 1792. He was the eldest son of Colin Macliver, a carpenter. His maternal uncle, Col. John Campbell, sent him to school at Gosport, and in 1807 introduced him to the Duke of York for an army commission. The Duke mistook him for a Campbell, and his uncle hushed the boy's half-uttered protest with the remark, "It is a good name to fight under." He was gazetted as Colin Campbell, ensign, in 1808 with a regiment which took part in Sir Arthur Wellesley's expedition to Portugal and later under Sir John Moore in Spain; served in the Walcheren expedition, 1809; and by 1813 attained a captaincy. He fought through the war in the Spanish Peninsula with distinction; took part in the expedition to the United States in 1814; and afterward spent nearly 30 years in garrison duty at various English stations. He served in China in 1842 and was present at the attack on Chusan. He next served in the Punjab, India, commanding the left at the battle of Chillianwallah, then for three years com-

manded in the Peshawur district with uniform success against the hill tribes. He was rewarded with the C.B. and K.C.B., and at the outbreak of the Crimean War in 1854 was appointed commander of the Highland Brigade. He took a prominent part at the battle of the Alma; and with the Ninety-third Highlanders, in the immortalized "thin red line," beat back the Russian cavalry in their attack on Balaklava. His services were rewarded with promotion to the rank of major general; he was created a knight grand cross of the Order of the Bath, and received the cross of the French Legion of Honor and other decorations. He was appointed inspector general of infantry, and in 1857, at 24 hours' notice, started for India to command the forces engaged in quelling the mutiny, which by his energy and judgment was soon utterly subdued, his relief of Lucknow being especially brilliant. A notable characteristic of Campbell's generalship was the care he took of his men, his victories being won with the minimum expenditure of the lives of his soldiers. For his exploits in India, Campbell, in 1858, was raised to the peerage as Baron Clyde, and the East India Company granted him an annuity of £2000. He returned to England in 1860 and in 1862 was made field marshal. He died Aug. 14, 1863, and was buried in Westminster Abbey. Consult: Shadwell, *Life of Colin Campbell* (London, 1881); Burne, *Clyde and Strathnairn* (Oxford, Eng., 1891); Forbes, *Colin Campbell, Lord Clyde* (London, 1895); Oswell, *Sketches of Rulers of India*, vol. i (Oxford, Eng., 1908).

CAMPBELL, COLIN (1848–). A Scottish biblical scholar and Egyptologist. He was born in Campbeltown, Argyllshire, and was educated at Glasgow University, where he studied divinity. Ordained in the Established church of Scotland in 1878, he was minister of St. Mary's Parish, Partick, and after 1882 of the parish of Dundee, and was a favorite preacher of Queen Victoria during her visits to Scotland. He was prominent in the volunteer militia movement and received several volunteer medals. He published: *The First Three Gospels in Greek, in Parallel Columns* (2d ed., 1900); *Critical Studies in St. Luke's Gospel* (1891); *Sen-nofer's Tomb at Thebes* (1908); *Two Theban Queens* (1909); *Two Theban Princesses* (1910); an English version (1909) of Naville's *La religion des anciens égyptiens*; *The Miraculous Birth of King Amon-hotep III* (1912).

CAMPBELL, COLIN H. (1859–1914). A Canadian lawyer and statesman, born at Burlington, Ontario. He was educated at the Oakville high school, was called to the bar in 1881, and removed to Manitoba the following year. He entered municipal politics, serving in the Winnipeg City Council, and in 1893 was the unsuccessful Conservative candidate to represent Winnipeg in the House of Commons. In 1899 he was elected to the Manitoba Legislature, and in 1900 became Attorney-General in the Conservative administration of Sir Rodmond Palen Roblin (q.v.). He was a delegate to the Interprovincial Conferences at Ottawa in 1906 and 1910, and also to the Imperial Conference on Education at London in 1907. In 1905 he introduced in the Manitoba Legislature a resolution for the extension of the boundaries of that province north and west, a change which took place in 1912. (See MANITOBA.) He resigned as Attorney-General in 1911 and in the same year was appointed Minister of Public Works.

CAMPBELL, DOUGLAS (1839-93). An American lawyer and historical writer, born in Otsego Co., N. Y. He graduated at Union College in 1860, studied law at Harvard, served for a time in the Civil War as captain of the 121st New York Volunteers, and was admitted to the New York bar in 1866. After about 20 years of practice he retired, partly on account of ill health, to devote himself exclusively to the study of American history. His book, *The Puritan in Holland, England, and America, an Introduction to American History* (2 vols., New York, 1892; 4th ed., 1902), attempts to prove that the legal and political institutions of the United States were ultimately derived, not from England, but from Holland—directly through the Dutch settlers of New York and indirectly through the English settlers of Plymouth, Mass., who, before coming to America, had spent some years in Amsterdam and Leyden. Though the book displays considerable erudition, its thesis has met with little support among historical scholars. Campbell also published two pamphlets entitled *Historical Fallacies Regarding Colonial New York* (1879) and *The Origin of American Institutions as Illustrated in the History of the Written Ballot* (1891).

CAMPBELL, DOUGLAS HOUGHTON (1859-). An American botanist, born in Detroit, Mich. He graduated at the University of Michigan in 1882 (Ph.D., 1886) and afterward took supplementary courses in Germany. In 1891 he became professor of botany at Leland Stanford Junior University. He published: *Elements of Structural and Systematic Botany* (1890); *Structure and Development of Mosses and Ferns* (1895); *Lectures on the Evolution of Plants* (1899); a *University Text-Book of Botany* (1902); *Plant Life and Evolution* (1911).

CAMPBELL, EDWARD DE MILLE (1863-). An American chemist, born at Detroit, Mich. He was educated at the University of Michigan and became chemist of the Ohio Iron Company in 1886, of the Sharon (Pa.) Iron Company in 1887, and the Dayton (Tenn.) Coal and Iron Company in 1888. In 1890 he was appointed assistant professor, in 1902 professor of chemical engineering and analytical chemistry, and in 1905 director of the chemical laboratory at the University of Michigan.

CAMPBELL, GEORGE (1719-96). A Scottish clergyman, born in Aberdeen. He was educated at Marischal College, studied divinity in Edinburgh and Aberdeen, and was ordained in 1748. He became pastor of a church in Aberdeen (1757), where he and Thomas Reid were fellow members of a philosophical society, principal of Marischal College (1759), and professor of divinity there (1771). His *Dissertation on Miracles* (1762) was a reply to Hume's essay (1748). He also wrote a *Philosophy of Rhetoric* (1776) which is superior to Blair's *Rhetoric*, if not so popular, and a *New Translation of the Gospels* (1778). Consult the biography by Keith prefixed to Campbell's *Lectures on Ecclesiastical History* (London, 1800).

CAMPBELL, SIR GEORGE (1824-92). An English statesman, nephew of John Campbell (1779-1861). He was educated at Edinburgh, St. Andrews, and Haileybury. He entered the Indian Civil Service in 1842; then studied law; and in 1858 was appointed judge of the High Court of Judicature in Calcutta, and in 1867 Chief Commissioner of the Central Provinces of India. The commission for relief

of the Orissa famine (1866), of which he was president, organized an effective method of famine relief. He served several years in Parliament, and in 1871 became Lieutenant Governor of Bengal. In 1874 he was chosen a member of the Council of India. In 1876 he supported Gladstone's Eastern policy. He wrote: *Modern India* (1852); *India as It May Be* (1853); *Handy Book on the Eastern Question* (1876); *White and Black in the United States* (1879); *The British Empire* (1887). Consult his *Memoirs of my Indian Career* (2 vols., London, 1893), edited by Sir Charles Bernard.

CAMPBELL, HELEN STUART (1839-). An American author, born at Lockport, N. Y. She wrote much for children, but her later work includes some fiction and books on social reform. Her publications include: *The Ainslie Series* (4 vols., 1864-77); *Six Sinners* (1877); *The Easiest Way in Housekeeping and Cooking* (1878); *His Grandmothers* (1878); *The Problem of the Poor* (1879); *Under Green Apple Boughs* (1881); *Mrs. Herndon's Income* (1885); *Prisoners of Poverty* (1888); *Darkness and Daylight* (1891; 3d ed., 1895); *Women Wage Earners* (1893); *Household Economics* (1896; rev. ed., 1907); *Ballantyne* (1901).

CAMPBELL, JAMES EDWIN (1843-). An American Democratic politician. He was born in Middletown, Ohio, studied law, and in 1863 enlisted as a gunner in the navy, serving with the Red River and Mississippi flotillas. He was prosecuting attorney of Butler County in 1873, served in Congress from 1884 to 1889; and in 1889 defeated Joseph B. Foraker for the governorship of Ohio. In 1891 he was defeated by William McKinley and in 1895 by Asa S. Bushnell. He practiced law in New York City.

CAMPBELL, JAMES VALENTINE (1823-90). An American jurist, born in Buffalo, N. Y. He lived in Detroit after 1826, graduated at St. Paul's College (College Point, L. I.) in 1841, and was admitted to the Michigan bar in 1844. Upon the establishment of the Michigan Supreme Court in 1857, he was elected an associate justice. He was a professor in the law school of the University of Michigan from 1859 to 1885 and was prominent in the Republican party and the Episcopal church of Michigan. He wrote valuable *Outlines of the Political History of Michigan* (1876).

CAMPBELL, JOHN (?-1806). A British soldier; born in Strachur, Scotland. He entered the army in 1745 and fought with distinction in the Scottish rebellion (1745) and in Flanders (1747). During the French and Indian War in America he served as captain of the Forty-second Highlanders and was wounded at Ticonderoga (1758). As lieutenant colonel of the Forty-seventh Infantry he again came to America with his regiment in 1776 and was successively appointed major general (1779), colonel of his regiment (1780), and commander of the British forces in West Florida, where he was eventually compelled to surrender Pensacola to the Spaniards, May 9, 1781. He was promoted general in 1797.

CAMPBELL, JOHN (1779-1861). Lord High Chancellor of England. He was born at Cupar, Fifeshire, Scotland, in 1779. He was at first destined for the ministry, and was sent to the University of St. Andrews. Having no inclination for a clerical life, after he had completed his academic studies, at the age of 19, he went

to London and engaged in newspaper work. At the same time he became a student in Lincoln's Inn, where he was a pupil of the distinguished special pleader Samuel Warren, and in 1806 was called to the bar. While waiting for clients he became a court reporter and published four volumes of reports with valuable notes. Notwithstanding his good sense and remarkable industry, professional success at the bar came slowly, probably owing to a certain hardness of disposition and a lack of attractive personal qualities. It was not until 1827 that he was made a King's counsel. From this time on, however, his promotion was rapid. In 1830 he entered Parliament, where his zeal, his capacity for hard work, and his attention to details made him a useful supporter of the Whig party. He devoted himself with characteristic energy and persistency to the amelioration of some of the cumbrous features of the law, and his name is associated with several beneficial statutes. He failed, however, in his favorite project of bringing about a general registry of land titles in England, such as exists in the United States, and this reform still remains to be effected. In 1827 he became the head of the great Real Property Commission, which made a searching inquiry into the real-estate laws of England, and whose reports and recommendations have proved of inestimable value to subsequent generations of law reformers.

Campbell was an ardent supporter of Lord John Russell's first Reform Bill in 1831, was made Solicitor-General in 1832, and two years later was knighted and promoted to the post of Attorney-General. In the same year he was sent to Parliament from Edinburgh. He continued to represent Edinburgh down to 1841, and remained in the office of Attorney-General during that period, with the exception of the short time in 1835 when the Conservatives were in power. In 1841 he was made Chancellor of Ireland and a peer of the United Kingdom with the title of Baron Campbell of St. Andrews, but held office for only a few months, when the Melbourne cabinet left office, necessitating his resignation. For the first time since boyhood he found himself without regular daily labor, and at the mature age of 60 set to work to win that literary fame which he professed always to have secretly coveted. His first publication was a collection of his speeches at the bar and in the House of Commons. For three or four years after the publication of his speeches Campbell was engaged in the preparation of the *Lives of the Chancellors*, the first series of which appeared in 1845. In 1846 he joined the Russell cabinet in the capacity of Chancellor of the Duchy of Lancaster. His ministerial duties were not sufficiently arduous to interrupt his literary labors, and he proceeded to complete the *Lives of the Chancellors* and to publish a supplemental series of *Lives of the Chief Justices of England*. Both works had great popularity, but leave no doubt that the author was more fitted to be a practical lawyer than a man of letters. Though executed in a sprightly manner, these writings are without style and represent the envy, the prejudices, and the want of sympathy which were leading traits of Campbell's character. He returned to more congenial labors in 1850, when he was appointed to succeed Denman as Chief Justice. He held the office for nine years, at the end of which he received the chancellorship of England. He

died in June, 1861. His *Life* has been written by his daughter (1881).

CAMPBELL, JOHN (1840-1904). A Canadian scholar, born in Edinburgh, Scotland. He was educated at the University of Toronto and at New College, Edinburgh, distinguishing himself in both institutions. In 1868 he became minister of the Charles Street Presbyterian Church in Toronto, and in 1873 he was appointed professor of Church history and apologetics in the Presbyterian College, Montreal. He contributed largely to learned societies and to Church reviews, and his work in theology and ethnology has been recognized both in America and in Europe. His chief single publication is *The Hittites: Their Inscriptions and their History* (2 vols., 1890). For certain statements in an address on *The Perfect Father or the Perfect Book*, Professor Campbell was tried for heresy before the Presbytery of Montreal in 1893 and convicted. He, however, appealed to the Synod of Montreal and Ottawa and was sustained.

CAMPBELL, JOHN ARCHIBALD (1811-89). An American jurist. He was born in Washington, Ga.; graduated in 1826 at the University of Georgia, and was admitted to the bar in 1829, before he was of age. He practiced in Alabama and was a member of the Legislature of that State. President Pierce in 1853 appointed him associate justice of the United States Supreme Court. At the outbreak of the Civil War he resigned, although he had opposed secession, became Assistant Secretary of War in the Confederate government, and was one of the peace commissioners at the Fortress Monroe conference in 1865. After the war he was imprisoned at Fort Pulaski, but was released upon parole, and afterward practiced law in New Orleans. He wrote *Reminiscences of the Civil War* (1887).

CAMPBELL, JOHN FRANCIS, of Islay (*Iain Neach*) (1822-85). A Scottish-Gaelic scholar. He was born in Edinburgh, Dec. 29, 1822, and was the eldest son of Walter Frederick Campbell and Lady Eleanor Charteris, eldest daughter of Francis, seventh Earl of Wemyss. He was educated at Eton and Edinburgh and occupied several minor government posts. He was a meteorologist of some distinction and invented an instrument for recording the intensity of the sun's rays. In 1865 he published *Frost and Fire, Natural Engines, Toolmarks and Chips, with Sketches Taken at Home and Abroad by a Traveler*, and in 1883 a book on *Thermography*. But he is chiefly remembered for his collections of Scottish-Gaelic folk tales and ballads. In 1860-62 he published his *Popular Tales of the West Highlands* in 4 vols., and in 1872 he brought out an important volume of Gaelic ballads under the title *Leabhar na Feinne*. The tales were taken down conscientiously from the mouths of the people and constitute one of the most valuable collections of the sort that have been made in the Celtic countries. The *Leabhar na Feinne* brings together all the accessible Scottish-Gaelic ballads on Ossianic subjects. It was Campbell's intention to publish other volumes containing additional cycles of ballads, but the plan was never carried out. A new edition of his *Celtic Dragon Myth* was published in 1911 (Edinburgh).

CAMPBELL, JOHN McLEOD (1800-72). A Scottish theologian. He was born at Kilninver and studied in Edinburgh and Glasgow from 1811 to 1821, when he was licensed. He was inducted into the parish of Row in 1825, was

tried for heresy in his doctrines regarding the Atonement, and was deposed in 1831. From 1833 to 1859 he preached to an independent congregation in Glasgow. His chief work is the *Nature of the Atonement* (1856; 4th ed., 1873), one of the most important works in English on the subject, in which he substituted for the legal and penal theory of the Atonement the explanation of "vicarious repentance"—that Christ identified himself with the sinner through perfect sympathy and brotherhood and thus offered an "equivalent repentance." Consult his *Reminiscences* (London, 1873) and the *Memorials* (ib., 1877), both edited by his son.

CAMPBELL, LEWIS (1830–1908). A Scottish Hellenist, born in Edinburgh and educated at the Edinburgh Academy and the universities of Glasgow and Oxford. He was fellow and tutor of Queen's College, Oxford (1855–58); vicar of Milford, Hampshire, for five years; professor of Greek at the University of St. Andrews (1863–94); and honorary fellow of Balliol College, Oxford (1894). One of the foremost British Platonists, he ranked with Adam and with Jowett, his friend at Oxford; and in Greek tragedy, especially Sophocles, Jebb alone of his British contemporaries ranked with him. Campbell edited (1904) a selection from Thomas Campbell, his father's cousin, in the *Golden Treasury Series*. Among his publications are: An edition of Sophocles (2d ed., 1879), Plato's *Sophistes and Politicus* (1867), the *Theætetus* (2d ed., 1883), and, with Jowett, the *Republic* (1894); *Life and Letters of Jowett* (1897, with E. A. Abbott) and *Letters of Jowett* (1899); a *Life* (with W. Garnett, 1882; new ed., 1884) of James Clerk Maxwell, the physicist, a school-mate and friend; *A Guide to Greek Tragedy for English Readers* (1891); *Religion in Greek Literature* (1898); versions in verse of Æschylus (1890) and Sophocles (1883); *Tragic Drama in Æschylus, Sophocles, and Shakespeare* (1904); and *Paralipomena Sophoclea* (1907).

CAMPBELL, REGINALD JOHN (1867–). A British Congregational minister, born in London of Scottish-Ulster stock. He was educated at University College, Nottingham, and in Belfast, and taught at Ashton, Cheshire. Later (1895) he graduated from Christ Church, Oxford, with honors in modern history. For several years he preached in the Union Street Church (Congregational), Brighton, in 1903 succeeding Joseph Parker as minister of the London City Temple. One of the most prominent and magnetic of English Nonconformist preachers and thinkers, and an ardent Imperialist, he published in 1907 *The New Theology*, and in 1908 *Christianity and the Social Order*. His *New Theology*, a popular book putting ethics above dogma, was attacked by P. T. Forsyth and other Congregationalists, but it occasioned no actual schism.

CAMPBELL, THOMAS (1777–1844). An English poet, born in Glasgow, July 27, 1777. He was educated at the University of Glasgow, where he was distinguished for his knowledge of Greek literature. In 1795 he went as tutor on the island of Mull. The scenery of the western Highlands, which made a deep impression on his mind, is reflected in his verse. Returning from Mull, he repaired to Edinburgh with the intention of studying law. This plan, however, he soon abandoned for literature. His first poem, *The Pleasures of Hope*, suggested to him while at Mull, was published in 1799, and

went through four editions in a twelvemonth. After its publication Campbell went to Germany, visiting Munich, Leipzig, and Hamburg, where he was staying at the time of the battle of Hohenlinden. During this period he wrote *The Exile of Erin* and *Ye Mariners of England*. Returning to Edinburgh, he published, in 1801, *Lochiel's Warning* and *Hohenlinden*. In 1803 he proceeded to London and adopted literature as a profession. In 1805, through the influence of Fox, he was granted a royal pension of £200 a year. It was in 1805, too, that his *Poems* appeared. In 1809 appeared *Gertrude of Wyoming*, which bears the same relation to *The Pleasures of Hope* that Thomson's *Castle of Indolence* bears to *The Seasons*—a less brilliant and striking, but more mature and finished performance. In 1819 he published his *Specimens of British Poets*, containing an excellent introductory essay on poetry and good biographies of the poets themselves. At this very time he was also delivering lectures on poetry. After this he edited the *New Monthly Magazine*, contributing to it several poems, among which is *The Last Man*. In 1824 he published *Theodoric and Other Poems*. In 1826 he was elected lord rector of the University of Glasgow and received the unusual honor of reelection in the two following years. He published *The Pilgrim of Glencoe and Other Poems* in 1842. His later publications added nothing to his fame. He died in Boulogne, France, June 15, 1844, and was buried in Westminster Abbey. His lasting fame rests on *Hohenlinden* and the patriotic lyrics *Ye Mariners of England* and *The Battle of the Baltic*, all of which are stirring and abound in lines that now belong to the literature of quotation. Consult: Beattie, *Life and Letters of Thomas Campbell* (London, 1849); Redding, *Literary Reminiscences of Campbell* (London, 1860); *Poetical Works*, ed. by Hill, with *Life* by Allingham (London, 1891); *Complete Works of Thomas Campbell* (Oxford Edition, 1908).

CAMPBELL, WILLIAM (1745–81). An American soldier, born in Augusta (then Orange) Co., Va. In 1767 he removed to the Holston valley, and in 1773 became one of the first justices of the peace in Fincastle County. He served under Colonel Christian in Lord Dunmore's War (q.v.) in 1774, joined Patrick Henry's Virginia forces in 1775, and in July, 1776, assisted in forcing Governor Dunmore from Gwynn's Island. In the same year he married a sister of Patrick Henry. He became lieutenant colonel of the newly organized Washington County in 1777. He served in the Virginia House of Delegates in 1780, but, obtaining a leave of absence in June, took an active part in numerous contests with the Tories, and in the famous battle of King's Mountain (q.v.) on October 7 was one of the American leaders. Early in 1781 he joined General Greene, and on March 15 took a conspicuous part in the battle of Guilford Courthouse (q.v.); but resenting the failure of Colonel Lee, commanding the cavalry, to come to his aid at a critical moment in this action, he withdrew in disgust from the service. He then again became a member of the House of Delegates, but in June was appointed brigadier general of militia and served under Lafayette until his death in August. His service was highly prized by Washington and Lafayette. Consult a sketch by E. D. Warfield in *Magazine of Western History*, January, 1887.

CAMPBELL, WILLIAM, LORD (?–1778). The

last English Governor of South Carolina, the youngest son of the fourth Duke of Argyll. He became a captain in the British navy in 1762; was a member of Parliament in 1764, was Governor of Nova Scotia from 1766 to 1773, and in 1775 became Governor of the Province of South Carolina. Here, on the outbreak of the Revolution, he was nearly successful in his attempts to keep the Colony loyal. He was trapped into divulging information of plans for conquering the Colonies by arms and had to take refuge on a British man-of-war. In 1776, during the British attack upon Fort Moultrie, he received a wound while aboard Sir Peter Parker's flagship, which afterward resulted in his death. Consult McCrady, *The History of South Carolina in the Revolution*, vol. i (1901).

CAMPBELL, WILLIAM WALLACE (1862-). An American astronomer, born in Hancock Co., Ohio. After graduating from the University of Michigan he was professor of mathematics at the University of Colorado in 1886-88, and instructor in astronomy at the former institution in 1888-91. He became astronomer in 1891 and director in 1901 of the Lick Observatory, and also had charge of eclipse expeditions to India, Georgia, Spain, and Flint Island. He received several medals in recognition of his work, including the Janssen prize of the Paris Academy of Sciences in 1910. Besides many papers on the motion of solar eclipses, stars, on comet orbits, and on the spectra of nebulae, comets, and stars, he is the author of *The Elements of Practical Astronomy* (1899), *The Return of Halley's Comet* (1909), and *Stellar Motions* (1913).

CAMPBELL, WILLIAM WILFRED (1861-). A Canadian poet, born in Berlin, West Ontario. Educated in Toronto and in Cambridge, Mass., Campbell was ordained to the Episcopal ministry (1885), and after some experience in a New England parish he became rector of a church in St. Stephen, New Brunswick (1888). In 1891 he removed to Ottawa, where he obtained a place in the civil service. In 1889 Campbell won attention by his fresh and musical *Lake Lyrics and Other Poems*. *The Dread Voyage* (1893) and *Beyond the Hills of Dreams* (1899) contain several impassioned poems on patriotic and Imperial themes. *Mordred and Hildebrand*, literary dramas, were published together in 1895. Among his other works are: *Collected Verse* (1906); *Canada* (1907), in collaboration with the artist, T. M. Martin, a work descriptive of the Dominion; the historical novel, *A Beautiful Rebel* (1909); *The Scotsman in Canada* (1911); and *The Oxford Book of Canadian Verse* (1914). See CANADIAN LITERATURE.

CAMPBELL-BANNERMAN, SIR HENRY (1836-1908). A British statesman born at Strathro, Forfarshire, Scotland, Sept. 7, 1836. He was the younger son of Sir James Campbell and assumed his additional surname under the will of a maternal uncle. He studied at Glasgow and Cambridge universities, was elected in 1868 to Parliament for Stirling, and was repeatedly reelected. In 1871-74 and again in 1880-82 he was Financial Secretary to the War Office; in 1882-84 Secretary to the Admiralty; in 1884-85 Chief Secretary for Ireland; in 1886 and 1892-95 Secretary for War. In December, 1898, he was chosen leader of the Liberal party in succession to Sir William Vernon Harcourt. Without displaying the preëminent abilities of his predecessors, Gladstone or Harcourt, he brought to the

difficult post of leader of a weak minority the qualities of patience, courage, persistence, and common-sense moderation. On the resignation of the Balfour cabinet in December, 1905, the King sent for the Liberal leader, and the new ministry was announced on December 11. Contrary to expectation, the Premier, who chose to act as First Lord of the Treasury, succeeded in gathering about himself a ministry of exceptional talent, representing all shades of Liberal opinions and including for the first time in parliamentary history a representative of labor in the person of Mr. John Burns. The Premier avoided the tactical error of attempting to rule without a majority and dissolved Parliament. The election resulted in an unprecedented triumph for the Liberals. Sir Henry's health failed in 1907, and he was obliged to resign the leadership on April 5, 1908, and died on the 22d. Consult McCarthy, *Sir Henry Campbell-Bannerman* (New York, 1903), and Channing, "Sir Henry Campbell-Bannerman," in the *Fortnightly Review*, vol. lxxxix (London, 1908). See GREAT BRITAIN.

CAMPBELLFORD. A town in Northumberland Co., Ontario, Canada, situated on the Grand Trunk Railway, 20 miles north of Brighton (Map: Ontario, G 5). It has excellent water power, which is utilized in the manufacturing industries. There are paper, woolen, pulp, saw, flour, and planing mills; also foundries, bridge works, a shoe factory, and a tannery. Pop., 1901, 2485; 1911, 3051.

CAMPBELL ISLANDS. A lonely group in the South Pacific, in lat. 52° 33' S. and long. 169° 8' E. (Map World: Western Hemisphere, P 1). Though they are mountainous and measure only 30 miles in circumference, they are valuable on account of their harbors. They belong to New Zealand, and are used as provision depots, but are not permanently inhabited. They are scientifically interesting, being volcanic and displaying a rich and varied flora.

CAMP'BELLITES, THE. 1. A religious denomination founded in the United States by the Rev. Alexander Campbell. Once called the New Lights, they are still variously known as the Christian Church, the Church of Christ, and even the Reformers, though the name preferred by them is Disciples of Christ (q.v.). 2. The followers of the Rev. John McLeod Campbell, who in 1831, because of difference of faith about the Atonement, left the Church of Scotland.

CAMPBELL'S (LORD) ACT. The English statute which created the cause of action for the negligent killing of a person. Prior to the enactment of this statute by Parliament in 1846 (9 and 10 Vict. c. 93), while a person injured through the negligence or default of another was entitled to maintain an action for damages against the person responsible for the injury, there was no redress if the accident resulted in the death of the person injured. This was due to the principle of the common law that such an injury was a purely personal matter, giving a right of redress only to the person injured, and that consequently the right of action died with the person. The fact that the death of a person might involve the loss of support or other financial loss to those whom he left behind did not, under the influence of this conception, afford a right of action to those by whom the loss was suffered. It was in order to remedy this grave defect in the common law that Lord Campbell, then a member of the British government, introduced and secured the

passage of the measure that bears his name. By its terms the wife, husband, parent, or child of a person whose death has been caused by the "wrongful act, neglect, or default" of another may maintain an action and recover damages in respect thereof. The principle of Lord Campbell's Act has been everywhere recognized in the United States, and similar legislation has been enacted in all the States and by the national Congress. See DEATH; NEGLIGENCE; TORT; and the authorities referred to under those titles.

CAMP'BELLTON. A town in Restigouche Co., New Brunswick, Canada, situated on Bay Chaleur, and on the International of New Brunswick and the Intercolonial railways, 12 miles southwest of Dalhousie and 140 miles north of Fredericton (Map: New Brunswick, C 1). It has lumbering and fishing industries and contains lumber and shingle mills, sash, woodworking, and door factories. Pop., 1901, 2652; 1911, 3817.

CAMP'BELTOWN. A royal burgh and seaport on the east coast of the peninsula of Kintyre, in Argyllshire, Scotland, 65 miles west-southwest of Glasgow, on a fine harbor or sea-loch (Map: Scotland, C 4). A sculptured granite cross stands in the principal street and is supposed to have been brought from Iona. The town is famous for its whisky distilleries and imports large quantities of barley. Coal is found in the vicinity. Its fisheries are important. Campbeltown is a favorite summer resort. Pop. of civil parish, 1901, 10,236; 1911, 9497.

CAMP BIRD, or **ROBBER.** The Canada jay. See JAY.

CAMPE, kām'pe, JOACHIM HEINRICH (1746-1818). A German teacher, lexicographer, and writer for children. He studied theology in Halle and became a warm partisan of the educational reforms of Basedow (q.v.), whose place he took during the year 1777 as the head of the Philanthropenum in Dessau. On account of trouble with Basedow he left Dessau and opened schools near Hamburg and then in Holstein. Called to Brunswick by the Duke, he tried to reorganize the school system according to his theories, but failed on account of trouble with the church and the government. A little later he devoted himself to the writing of educational works and also built up a prosperous business as a publisher of pedagogical works. In 1789 he visited Paris and became an ardent advocate of the principles of the Revolution. His juveniles, all written for the purpose of instruction, comprise 37 vols. His *Robinson Crusoe der Jüngere* ('Robinson Crusoe the Younger') has been translated into many languages. He also published some lexicographical works. Consult Leyser, *Joachim Heinrich Campe* (2 vols., 2d ed., 1896).

CAMPEADOR, kām'pā-ā-dôr'. An epithet used of warriors. In particular, a title of the Cid (q.v.).

CAMPECHE, Mex. pron. kām-pā'châ. One of the Atlantic states of Mexico, occupying the south part of the peninsula of Yucatan and bordering on Guatemala and the Gulf of Campeche (Map: Mexico, O 8). Its area is 18,087 square miles. The soil is for the most part sandy and unproductive, but there are good pasture lands in the north and large, heavily forested districts in the south. The main products are rice, sugar, salt, tobacco, mahogany, cedar, hides, and logwood, from which last product (*palo de campeche*) both the state and its capital derive their name. Pop., 1879, 90,413; 1900, 86,542.

The Indians form a considerable portion of the population.

CAMPE'CHE, or **CAMPEA'CHY.** The capital of the Mexican state of the same name and a fortified seaport town, situated on the Gulf of Campeche, in the Gulf of Mexico, at the mouth of the San Francisco River (Map: Mexico, O 8). Under the Spanish régime Campeche was one of the three open ports of this coast, and its general appearance still gives evidence of its former wealth and importance. Founded in 1540 on the site of a native village, of which there are interesting remains still extant, the city has witnessed many important events, down through the revolution of 1842. To-day the industries of Campeche are unimportant, with the exception of shipbuilding, but it is the centre of the trade in Campeche wood and also in wax. Its harbor is sheltered by a breakwater, but is too shallow for vessels of deep draft. The town has a college. Pop., 1900, 17,109.

CAMPEGGIO, kām-pěj'ô, or **CAMPEGGI,** kām-pěj'ê, LORENZO (1474-1539). An Italian prelate. In early life he was a lawyer, but after losing his wife he became an ecclesiastic and rapidly rose to the position of Cardinal. In 1518 he was sent to England to preach a crusade against the Turks, but was unsuccessful. Henry VIII made him Bishop of Salisbury in 1524, and he came again to England in 1528 to assist Wolsey in the case of Henry's divorce from Catharine. His efforts to bring about a reconciliation came to nothing, however, and the see of Salisbury was taken from him. At Nuremberg, in 1524, Campeggio tried to win back Luther to the Catholic church. At the Diet of Augsburg, in 1530, he advised Charles V to adopt a relentless policy towards the Protestants of Germany. He became Cardinal Bishop of Sabina in 1537, and died two years later in Rome.

CAMP EQUIPAGE. Articles and materials necessary for the proper equipment of a camp. It includes, among other things, tents, furniture, fittings, cooking utensils, and articles of common use. The description and quantity of camp equipage will depend on the purpose and location of the camp, its permanent or temporary character, and the number of troops accommodated. See ENCAMPMENT FIELD COOKING.

CAMPER, kām'pēr, PIETER (1722-89). A Dutch anatomist and naturalist. He was born in Leyden and studied medicine there, graduating in 1746 in medicine and philosophy. In 1750 he became professor in Francker, in 1755 in the Athenæum at Amsterdam, and in 1763 in Groningen, where he remained until 1773. On being elected a member of the State Council in 1789, he removed to The Hague, where he died. He was distinguished for the services he rendered both to human and comparative anatomy, to surgery, obstetrics, and medical jurisprudence, and was a skillful draftsman. His collected writings, with plates, appeared under the title *Œuvres qui ont pour objet l'histoire naturelle, la physiologie et l'anatomie comparée* (3 vols., Paris, 1803). For his observations on the facial angle, see ANGLE.

CAM'PERDOWN (Dutch, *Camperduin*, Downs of Kamp). A broad tract of low downs which borders the North Sea on the west side of the peninsula which separates it from the Zuider Zee (Map: Netherlands, C 2). It takes its name from the neighboring hamlet of Kamp, about 25 miles north of Haarlem. It gives its

name to the victory obtained off that part of the coast by the British Admiral Duncan over the Dutch fleet Oct. 11, 1797.

CAMPERIO, kām'pā-rē'ō, MANTREDO (1826-99). An Italian traveler, born in Milan. He traveled in Turkey, Australia, and the Sunda Islands; upon the opening of the Suez Canal explored the Nile as far as Assuan; went thence to the East Indies, Ceylon, and Java; and, in the service of the Society for the Commercial Exploration of Africa, which he founded, traveled through Tunis, Tripoli, and Bengasi. He established, in 1876, the review *Esploratore*. He wrote on commercial geography and colonization.

CAMPERO, kām-pā'rō, NARCISO (1815-96). A Bolivian soldier and politician, President of Bolivia from 1880 to 1884, born at Tojo (now in Argentina). He became a brigadier general in 1871 in the Bolivian army and for a brief period in 1872 was Minister of War. He was Minister in London. Upon the overthrow of Daza by a revolution in La Paz, he was proclaimed President on April 9, 1880. He assumed command of the combined armies of Bolivia and Peru, but on May 26, 1880, was routed at Tacna. His administration, a tranquil one so far as concerned internal affairs, came to an end on Aug. 1, 1884, when he retired to the private life of a farmer.

CAMP-FIRE CLUB OF AMERICA, THE. An organization (incorporated in New York in 1904) largely social in its character, but also expressly devoted to the preservation of forests and the protection of wild animals, birds, and fish. Its membership is limited to "those who have camped in the wilderness a total of at least thirty days, and have successfully hunted and killed at least two species of large game." Its Code of Ethics, formulated by Dr. William T. Hornaday, declares against the sale of wild game for food and against the killing of all female hoofed animals; pronounces a particularly fine photograph of a large wild animal in its haunts entitled to more credit than the dead trophy of a similar animal, and urges extreme conservatism in the killing of all kinds of game and strict observance of all legislation calculated to protect and increase the supply of game. Accordingly, the club actively supported the legislation for the preservation of the fur seal (q.v.); the Bayne bill prohibiting the sale of native wild game in New York (which became a law in 1911); the McLean bill, placing all migratory birds under the protection of the Federal government (passed in 1913); the Hornaday law (a clause in the Tariff Law of 1913), which prohibits the importation into the United States of wild birds' plumage for millinery purposes; and other national and State measures for the preservation of wild life and the forests. The club's headquarters are in New York City, and in 1913 its membership numbered 460, including many of the best known of American sportsmen, as well as painters and sculptors of mammals and birds, and writers about outdoor life.

CAMP FOLLOWERS. Sutlers, servants, dealers in small wares, and sometimes natives of the vicinity, who travel with, or follow in the train of, an army on the march. They are invariably a source of trouble and responsibility to the commander of the army to which they attach themselves and are often a source of danger.

They are not so much in evidence in modern campaigns as in the past, unless the campaign is being conducted in a wild or uncivilized coun-

try. Formerly, owing to the absence of railroads and steamships, armies had frequently to undertake long marches, with practically no base of supplies, or at the best having very meagre communication with such base, rendering necessary the carrying of great quantities of stores and supplies. Natives were employed for this work, and in instances where the roads were to be constructed or were in need of repairs, would also be used for that purpose. It has been stated that in February, 1839, when a Bengal army of 15,000 men left Shikapur for Afghanistan, it was accompanied by at least 85,000 camp followers. In European countries, and in modern times, the presence of railroads obviates a certain amount of marching, and in conjunction with steamships keeps the army well supplied, rendering any large number of camp followers unnecessary. Those who do exist, however, are provided for in regulations, are subject to the articles of war, and are under the control of the commanding officer.

CAMPHAUSEN, kämp'hōu-zen, OTTO VON (1812-96). A Prussian statesman. He was born in Hünshoven, studied at Bonn, Heidelberg, Munich, and Berlin, in 1844 was elected Councillor at Treves, and in 1845 became a member of the Ministry of Finance. In 1869 he was appointed Finance Minister, and in 1873 became Vice President of the Ministry. His administration marked a change from conditions of depression to those of great prosperity. Made accountable by his opponents for a subsequent reaction, attacked even by the Liberals, and at odds with Bismarck respecting the tobacco tax, he resigned (1878). He received the order of the Black Eagle shortly before his death.

CAMPHAUSEN, WILHELM (1818-85). A German military and battle painter. He was born in Düsseldorf, where he studied under Alfred Rethel, then at the Academy under Carl Solm. His first paintings are historical subjects such as "Tilly at Breitenfeld" (Cologne Museum), "Cromwellian Troopers" (National Gallery, Berlin), "Charles I at Naseby" (Kunst-halle, Hamburg). Almost all of his later works are concerned with the history of Prussia. Among these are "Blücher Greeting Wellington" (Königsberg), "Duppel after the Assault" (National Gallery, Berlin), "Napoleon III after Sedan," and a series of colossal equestrian portraits of "Old Fritz," Emperor William, etc. He is also known as an etcher and illustrator. His work was especially admired by his contemporaries on account of his realistic treatment of detail.

CAMPHINE, kām'fēn or kām-fēn' (*Camphor* + *ine*). The name applied to purified oil of turpentine, which has been used for burning in lamps. It is very volatile and burns freely, giving a white, brilliant light. Its vapors (like those of gasoline and similar combustibles) form a dangerously explosive mixture with air.

CAMPHOR, kām'fēr (ML. *camphora*, from Ar. *kāfūr*, camphor, which is derived through the Prakrit *kāpūra*, Skt. *karpūra*, camphor), C₁₀H₁₆O. A substance obtained by the action of steam on the chipped wood of the camphor tree (*Camphora officinarum*, or *Cinnamomum camphora*, Nees). The product of distillation with steam is freed from volatile oil by draining and pressing, and the crystalline mass remaining behind is purified by sublimation. Camphor has also been prepared artificially by oxidizing the hydrocarbon camphene, C₁₀H₁₆, which may be ob-

tained by first treating terebenthene (an ingredient of turpentine) with gaseous hydrochloric acid and then heating with sodium carbonate. An American process, introduced in 1904, consists in heating oil of turpentine with anhydrous oxalic acid and oxidizing the resulting products. Pure camphor is a colorless, transparent, crystalline substance, melting at 175° C. and boiling at 204° C. It has a characteristic odor and a somewhat pungent, aromatic taste. It is only sparingly soluble in water, but dissolves readily in ether, chloroform, carbon disulphide, and other organic liquids. It has a tough consistency, but if digested with alcohol becomes hard and may then be readily pulverized. It is now employed in the manufacture of celluloid and of explosives, and is often used in medicine.

The constitution of camphor long remained an unsolved problem, in spite of innumerable efforts on the part of some of the most skillful organic chemists of the second half of the nineteenth century. The constitutional formula of camphor now known to be the correct one was first proposed by Brecht in 1893. But Brecht was unable to establish his formula on a definite experimental basis, and the constitution of camphor did not become fully known until 1903, when Komppa, at the University of Helsingfors, in Finland, succeeded in building up the molecule of camphor by a genuinely synthetic process. Three years later, in 1906, Perkin and Thorpe, at the University of Manchester, England, successfully completed a second synthetic method for the production of camphor, and so to-day the celebrated camphor problem may be considered as solved. Brecht's formula is as follows:

Komppa's now celebrated synthesis of this substance involved a number of steps. He first synthesized camphoric acid by starting with a mixture of ethyl oxalate and the ethyl ester of $\beta\beta$ -dimethyl-glutaric acid. By the action of metallic sodium this mixture yields the ethyl ester of diketo-apocamphoric acid. By the action of metallic sodium and methyl iodide upon the latter, Komppa obtained the ethyl ester of diketo-camphoric acid. Gentle reduction of this with sodium amalgam yielded the ethyl ester of dihydroxy-camphoric acid. Red phosphorus and hydroiodic acid changed dihydroxy-camphoric into dehydro-camphoric acid. The latter was transformed into its hydrobromide by hydrobromic acid, and then nascent hydrogen changed the hydrobromide into camphoric acid. The synthesis of camphoric acid thus achieved, the transformation of this acid into camphor itself is comparatively easy. The anhydride of camphoric acid is readily reduced by sodium amalgam into campholide. The latter, treated with potassium cyanide and hydrocyanic acid, gives homo-camphoric acid, and the distillation of the calcium salt of homo-camphoric acid gives camphor. Any

one who would examine the series of changes just enumerated would find, first, that all the substances mentioned can be and have been produced synthetically, and, secondly, that the processes by which the molecule of camphor is thus gradually built up from simpler molecules leaves no possible doubt as to the correctness of the constitutional formula of camphor shown above. Consult: Aschan, *Die Konstitution des Kampfers und seiner wichtigsten Derivate* (Brunswick, 1903). For details of Komppa's synthesis, consult his original paper in the *Berichte der deutschen chemischen Gesellschaft*, vol. xxxvi, p. 4332 (1903). For details concerning Perkin and Thorpe's contribution, consult their original paper in the *Transactions of the London Chemical Society*, vol. lxxxix, p. 795 (1906). See also BORNEOL.

CAMPHOR'IC ACID, $C_8H_{14}(COOH)_2$. An organic substance obtained by the oxidation of camphor with nitric acid. It occurs in needle-shaped crystals, colorless, odorless, and of slightly acid taste. It is nearly insoluble in cold water, but dissolves readily in hot water as well as in alcohol, ether, fatty oils, and other organic liquids. Camphoric acid is a mildly stimulating and disinfecting astringent, and has been used in chronic inflammatory conditions of the respiratory mucous membrane and as an anhidrotic (q.v.) in the profuse night sweats of phthisis.

CAMPHUYSEN, kämp'hoi-zen, DIRK RAFFELSZ (1586-1627). A Dutch theologian and poet, born at Gorkum. He was a partisan of Arminius and was persecuted on that account. He wrote a compendium of the doctrine of the Socinians. He also left a number of religious poems, including a translation of the Psalms. He is said to have been a painter until his eighteenth year. The pictures attributed to him are probably by his nephew, RAPHAEL CAMPHUYSEN (1598-1657), an artist, or by his other nephew, Raphael's brother, GOVAERT CAMPHUYSEN (1624-74), who was court painter at Stockholm in 1653-63. Raphael painted moonlit scenes in the manner of Van der Neer. Govaert's works usually are landscapes with animals in Paul Potter's style. Consult Granberg, *Catalogue raisonné des collections privées de la Suède* (Stockholm, 1886).

CAMPI, kãm'pê, or **CAMPO**. A family of Italian painters, of the school of Cremona.—GALEAZZO (1477-1536), founder of the family, was an imitator of Perugino and Boccaccino. His son and pupil, GIULIO (1502-72), studied also with Sojaro and formed his early style under the influence of Romanino and Pordenone, but later imitated Giulio Romano. He has the most individuality of all of his family, and his best pictures, which are fine in color, have considerable merit. The greater number are in Cremona and Milan.—ANTONIO (?-c.1591), the second son of Galeazzo, studied with his father and executed numerous commissions in Milan, Piacenza, Lodi, Brescia, Mantua, Cremona, and Madrid, where he was called by Philip II. The composition of his pictures is good, but they are poor and hard in color. He was also known as an architect and a writer.—VINCENZO (c.1530-91), a pupil of Giulio, was less able than his brothers, and devoted himself to portraiture and still life.—BERNARDINO (1522-c.1590), probably a relative of the preceding, was the son of a goldsmith, Piero Campi, and studied with Giulio and with Ippolito Costa at Mantua. He was first under

the influence of Giulio Romano and later of Correggio. The best examples of his religious pictures and portraits are in Cremona, San Colombario, Milan, and Mantua. He excelled in decorative friezes, emblems, etc. He wrote a treatise on painting, *Parere sopra la pittura* (1584). Among his pupils was Sophonisba Angussola (q.v.). Consult the biographies of these painters by Malaguzzi-Valeri in Thieme, *Allgemeines Lexicon der bildenden Künste* (Leipzig, 1911).

CAMPIDOGGIO, kām'pê-dō'lyō (It. Capitoline Hill, Lat. *Capitolium*). The Piazza di Campidoglio, with the famous group of palaces erected from Michelangelo's designs, occupies a depression on the Capitoline Hill in Rome between the ancient sites of the Citadel and the Temple of Jupiter. The edifices consist of the Palace of the Senator, opposite the grand flight of steps leading up from the Piazza d'Araceli, the Palace of the Conservators on the right as one enters the square, and the Capitoline Museum on the left. In the centre of the Piazza di Campidoglio stands a splendid antique equestrian statue in bronze of the Emperor Marcus Aurelius; while behind the Palace of the Senator rises a handsome late Renaissance bell tower, or campanile.

CAMPINAS, or **SÃO CARLOS DE CAMPINAS**, souN kär'lôs dâ kâm-pē'nās (Portug., plains). A town of Brazil on the Piracicaba, 70 miles northwest of São Paulo (Map: Brazil, H 8). Campinas is the trade centre and outlet of the coffee and sugar producing region surrounding it. It is the starting point of the Mogyana Railway and is connected with the port of Santos by the Paulisto and São Paulo Railway. Pop. (1890) of the city and municipality, 33,921.

CAMPION. See LYCHNIS; SILENE.

CAMPION, EDMUND (1540-81). An English Jesuit. He was born in London, was educated at Oxford, and in 1567 was ordained deacon, but as he could not consent to the Protestant formulary as required by the English church, he went to Ireland, where it was expected that the University of Dublin would be revived. That plan failing, he went (1571) to Douai, and there joined the Society of Jesus (1572). In 1580, disguised as a jeweler, he was sent to England with Robert Parsons (q.v.) as a missionary by William Allen (q.v.). The next year he published *Deem Rationes*, an attack on Anglicanism, for which he was arrested, committed to the Tower, tortured several times on the rack, subjected to prolonged disputations, was tried for treason and convicted, and was hanged at Tyburn, London. Elizabeth had offered him advancement if he would recant. Pope Leo XIII beatified Campion in 1886. Consult Simpson, *Edmund Campion* (London, 1867).

CAMPION, THOMAS (c.1566-1620). Little is known of the life of this English poet, musician, and pioneer—if not to good purpose—in the art of English literary criticism, who, after enjoying considerable reputation in his day, was, with the triumph of Puritanism, almost forgotten for more than two centuries, until Mr. A. H. Bullen, in 1889, collected and published his poems in a volume which promptly put Campion in the front rank of Elizabethan lyrists, alike for freshness and depth of feeling, for the varied music of his shifting rhythms and flowing cadences, and for the felicity of his diction and phrasing. He himself, however, set little store by his rhymes, though literally dozens of them are amongst the most delightful

things in the language; and he spurned them in set terms in his *Observations in the Art of English Poesy* (1602), a misguided critical treatise, which pleads for rhymeless verse. The unmeasured enthusiasm, which displaced the neglect of Campion, now, as Bullen says, "runs the risk of making him the object of uncritical adulation" (prefatory note to *Songs and Masques*, 1903). Of Campion's life well-nigh all that is known is told when it is said that he studied at Cambridge and at the Inns of Court; that he became a popular physician in Elizabethan London; that he composed the music of songs, wrote English and Latin poems, masques for the court of James I, a treatise on poetry (named above) and another on counterpoint; and that he made friends and enemies among men of letters. His publications include, besides the *Art of English Poesy: Poemata* (1595); *A Book of Airs* (1601); *Two Books of Airs* (1612?); *Third and Fourth Book of Airs* (1617?); and *A New Way of Making Four Parts in Counterpoint* (1617?). Consult: *Works* (1889), ed. by A. H. Bullen, which excludes *A New Way*, etc.; *Songs and Masques* (1903), ed. by A. H. Bullen, and containing *The Art of English Poesy* and an introduction on Campion's music by Janet Dodge; *Complete Works* (Clarendon Press, 1908), ed. by P. Vivian.

CAMPISTRON, kân'pês'trôn', JEAN GALBERT DE (1656-1723). A French dramatic poet. He was born in Toulouse and at an early age went to Paris, where he became a follower of Racine. His works have neither well-marked character nor striking situations, but many of his tragedies had a contemporary success. Among his works are: *Virginie* (1683); the libretto for Lully's opera, *Acis et Galatée* (1686); *Andronic* (1685), which has the same historical background as Schiller's *Don Carlos*; and *Tiridate* (1691). The best edition of his works is that of 1750 (3 vols.), which contains a biography. *Œuvres choisies* (Paris, 1810) were published by Auger. In 1701 he was elected to the French Academy.

CAMP MEETING. A series of religious meetings held in the open air, usually in the woods, and participated in by families or groups of persons from a distance, who live in tents or in simply built houses during the sessions and devote the greater part of the time to listening to preaching, which is always direct and fervent and is usually accompanied by a "revival." The first held in the United States was in 1799, at a settlement on Red River in Kentucky, and was the outcome of the preaching of Rev. John M'Gee, a Methodist, his brother, a Presbyterian, and Rev. Mr. Hoge, also a Presbyterian, at a communion service. Their exhortations affected their audience so strongly that crowds came from the surrounding country to hear confessions and "testimonies," and the meeting, transferred from the small meetinghouse to the adjoining forest, was protracted for several days, and was followed by others in different places. The number of persons attending one camp meeting in Kentucky was estimated at 20,000. At first Presbyterians and Baptists united with the Methodists in holding these meetings, but they soon came to be confined to the last-named denomination, which in all its branches has been most enthusiastic in supporting them and in introducing them into all parts of the country. In many States camp meetings have lost some of the characteristics of early days, the places of meet-

ing being fixed and the life less simple. Not unfrequently secular instruction is a feature, schools of languages, music, art, etc., and lectures on various topics filling the time not occupied by religious services. Among the many popular camp-meeting grounds of the Methodist Episcopal church are Round Lake, N. Y., Ocean Grove, N. J., Martha's Vineyard, Mass., Lakeside, Ohio, Bartley, Neb., and Pacific Grove, Monterey, Cal.

Lorenzo Dow (q.v.) introduced camp meetings into England in 1807, but the Wesleyan Conference refused (as it still does) to sanction them, and to this attitude was partly due the organization of the Primitive Methodist denomination in 1810. Consult: *An Essay on Methodism* (New York, 1849); J. Porter, *Revivals of Religion* (1877); S. C. Swallow, *Camp-Meetings* (1878).

CAMPOAMOR Y CAMPOOSORIO, kām'pō-â-mōr' ē kām'pō-ō-sō'rê-ō, RAMÓN DE (1817-1901). A Spanish poet, politician, and philosopher. He was born in Navia, Sept. 24, 1817, and received a classical education in Santiago and at the Jesuit College of St. Thomas in Madrid, which he left without finishing his course. He then began the study of medicine at the College of San Carlos, but abandoned it to devote himself to journalism and literature. Throughout his life, however, he kept a strong interest in physiological and physical science and especially in chemistry. He entered political controversy with the *Historia crítica de las Cortes reformadoras* in 1837; was several times elected to the Cortes, where he distinguished himself as an orator; was appointed Governor of Alicante and Valencia in 1854; and engaged in a long controversy with Castelar which is represented by his *Polémicas con la democracia* (1862). He took no part in politics from the Revolution of 1868 until the succession of Alfonso XII in 1874, after which he held several subordinate offices, was made Councilor of State, and later life Senator. He refused the title of Grande de España. His attitude in politics was always that of a moderate conservative, distinguished for his eloquence and his chivalric faithfulness to the royal family.

His trend towards philosophical thought was shown in *La filosofía de las leyes* (1846) and confirmed in *El personalismo* (1850 and 1855); he attempted to expound his system in *Lo absoluto* (1862 and 1865) and *El idealismo* (1833), the two works by which he is best known outside of Spain, and which have an added interest through their bits of revelation of the author himself. His philosophy is a somewhat incoherent and often self-contradictory eclecticism, tending on the whole to subjective idealism.

By far his most important work was done in poetry. Lightness, grace, and delicate sensibility marked his early verse: *Ternezas y flores* (1840) and *Ayes del alma* (1842). The *Fábulas morales y políticas*, first published in 1842, were added to in many successive editions. His most characteristic short poems are to be found in the *Doloras* (1846-90, 18 eds., each containing new work), an ancient type of poem for which he invented a new name. This caught the fancy of the younger school of Spanish poets, who freely imitated him in the belief that he had created a wholly new type of poem. These poems condensed into brief lyric form the expression of philosophical, ethical, and social ideas, treated sometimes with bitter irony, but always with feeling. He attempted long narrative poems in his epic on Columbus (*Colón*, 16 cantos, 1853

and 1857) and *El drama universal* (1873), but these are less successful than the shorter narratives, which contain some of his best work: *Los pequeños poemas* (1879, 1886); *Los buenos y los sabios* (1881); *El amor y el río Piedra* (1882); *Los amores de Juana* (1882); *El trén express* (1885); *Nuevos pequeños poemas* (1887); *Humoradas* (1890). *La niña y el nido*, *Los grandes problemas*, and *Por donde viene la muerte* are among the best. He also wrote many plays in verse, none of which succeeded on the stage. They are full of humor and feeling and rich in ideas, but are lacking in dramatic movement. The best known are: *Una mujer generosa* (1838); *Dies Iræ* (1873); *El honor* (1874); *Guerra á la guerra*; *Así se escribe la historia* (1875); *Glorias humanas* (1885); *Cuerdos y locos* (1887); *El palacio de la verdad* (1871); etc. He published his theory of poetry in *La poética* (1883), completed in a new edition (1890), and in *La metafísica y la poética* (1891). His last poems of importance are *El licenciado Torralba*, a philosophico-ethical narrative poem, and *Nuevos poemas* (1892). He became a member of the Spanish Academy in 1861.

Campoamor's narrative poetry at its best may be compared with that of Victor Hugo. In his usual choice of subjects he rather resembles Coppée, to whom, however, he is distinctly superior in conception and treatment. In poems of sentiment and thought, such as the *Poesías y fábulas* and the *Doloras*, he has close affinity with Sully-Prudhomme, and the *Licenciado Torralba* attempts the same task as Sully-Prudhomme's *Bonheur*. In spite of these relations he is the most original and independent of nineteenth-century Spanish poets and is by many considered the greatest of the last half-century. He is the poet of subjectivity par excellence in all Spanish poetry and finds fit lyric expression for thought as do few poets of any country.

His *Obras completas* were edited by Montaner y Simon (Barcelona), and again by V. Serrano, V. Colorado, and M. Ordóñez (8 vols., Madrid, 1901-03). Selections from his poetry were published (Madrid, 1879, and Leipzig, 1885). Consult: Juan Valera, *Estudios críticos* (Madrid, 1864); Fr. Giner, *Estudios literarios* (Madrid, 1866); Melchior de Palau, *Acontecimientos literarios* (1889); Sánchez Pérez, *Ramón de Campoamor: estudio crítico-biográfico* (2d ed., Madrid, 1889); A. González-Blanco, *Campoamor: biografía y estudio crítico* (Madrid, 1912).

CAMPOBASSO, kām'pō-bäs'sō (It. *campo*, Lat. *campus*, field + *basso*, Late Lat. *bassus*, low). A city in south Italy, capital of the Province of Campobasso, 52 miles north of Benevento, on the east slope of Monteverde, in the heart of the Apennines, 2400 feet above sea level (Map: Italy, J 6). The climate is cool and healthy, and the town has a ruined castle and walls, a cathedral, a theatre, excellent institutions of learning, important manufactures of cutlery, and a famous market to which good roads lead from the surrounding country. Pop. (commune) 1881, 15,000; 1901, 15,030; 1911, 16,579.

CAM'POBEL'LO (It. *campo*, Lat. *campus*, plain + *bello*, Lat. *bellus*, beautiful). An island of New Brunswick, Canada, situated just outside of the Maine, United States, boundary, at the mouth of Passamaquoddy Bay, an inlet of the Bay of Fundy, in lat. 44° 57' N. and long. 66° 55' W. (Map: New Brunswick, C 4). The island, from nine to ten miles long and from

two to three miles wide, has a picturesque coast abounding in fiords, chasms, cliffs, and pleasant beaches. At the north end is a lighthouse 60 feet in height. The well-wooded interior is intersected in all directions by fine walks and drives. It contains copper and lead ores, but the industrial portion of the population is chiefly engaged in fisheries, and during the season in attending to the wants of the residents of the numerous summer homes and hotels, some of the best along the Atlantic coast. The island's development dates from its acquisition by a syndicate of Boston and New York capitalists in 1880. From 1767 it had been in the possession of Admiral William Owen's family. The United States is represented by a consular agent. Pop., 1910, 1230.

CAMPO-FORMIO, kām'pō-fōr'myō, now officially written CAMPOFORMIO. A village in the Province of Udine, northern Italy, about 7 miles southwest of the city of Udine. It is celebrated for the treaty of peace concluded there Oct. 17, 1797, between Austria and the French Republic. After overrunning Italy, Bonaparte had crossed the Alps and threatened Vienna. Austria therefore hastened to arrange preliminaries of peace at Leoben, April 18, 1797. In the treaty which was concluded by Bonaparte with the Count von Cobenzl at Campo-Formio, Austria ceded the Belgian Netherlands to France, and gave up Lombardy, to be incorporated into the Cisalpine Republic, and received as compensation most of the territories of the Republic of Venice (which Bonaparte had extinguished), including Venetia (with the city of Venice), Venetian Istria, and Dalmatia. France took the remaining territory of Venice, its possessions in Albania, and the Ionian Islands.

CAMPO MAJOR, kām'pō mā-zhōr'. A city in the Province of Alemtejo, Portugal, 11 miles northeast of Elvas (Map: Portugal, B 3). It is situated at an elevation of about 950 feet, has a meteorological observatory and manufactures wine and woolen goods. It was the scene of a siege in 1811 during the Peninsula War, which has been celebrated by Scott in his ballad entitled "The Bold Dragoon." Pop., 1890, 5864; 1900, 5895.

CAMPOMANES, kām'pō-mā'nās, PEDRO RODRIGUEZ, COUNT (1723-1802). A Spanish statesman and political economist. He was born in Asturias. His talents and learning were devoted to the advancement of his native country. He acquired a high reputation for legal attainments and was appointed fiscal and subsequently President (1788-93) of the Supreme Council of Castile. He held other high offices, among them that of director of the Royal Academy of History in Madrid. By his enlightened view of state policy as well as by his writings, which gave him a place among the most eminent Spanish authors, he obtained a great reputation throughout Europe. His attention was chiefly devoted to economic studies. He pointed out how the impoverishment of Spain was due to oppressive laws that tended to discourage commerce and industry. He sided with Count Aranda in his policy of expelling the Order of the Jesuits from the Spanish dominions. Campomanes was a man of great intelligence and the highest probity, and gained the affection and admiration of all his associates. At the suggestion of Benjamin Franklin, Campomanes was chosen an honorary member of the Philosophic Society of Philadelphia. He was also a corresponding member of the Académie des Inscriptions et Belles-Lettres, of Paris.

His chief works are: *Disertaciones históricas del order y caballería de los Templarios*, which was his first work (1737); *Antigüedad marítima de la república de Cartago* (Madrid, 1756); *Tratado de la regalia de amortización* (1765); *Discurso sobre el fomento de la industria popular* (1771); *Discurso sobre la educación popular de los artesanos* (1775). To this last work he published four important appendixes each larger than the original essay, and dealing respectively with the decline of arts and manufactures in Spain, with the measures necessary for a restoration thereof, with the guild laws, and with national commerce. These appeared in 5 vols., Madrid, 1774 and 1777. Consult the biographical notice by Antonio Rodriguez Villa, which serves as an introduction to the 1st ed. of his *Cartas político-económicas* (1878).

CAMPORI, kām-pō'rê, CESARE, MARQUIS (1814-80). An Italian historian, born in Modena. His masterpiece is *Raimondo Montecuculli i suoi tempi e la sua famiglia* (Florence, 1876). A posthumous collection of his works was entitled *Memorie patrie, storiche e biografiche* (Modena, 1882). In the Biblioteca Estense at Modena is the remarkable Campori collection of 10,000 autographs. Consult Ricci, "Cesare Campori," in *Ritratti e profili politici e letterari* (Florence, 1880).

CAMPOS, kām'pōsh (Portug., plains, Lat. *campus*, field). A city of Brazil, in the State of Rio de Janeiro, on the Parahyba River, which is navigable for small steamers to this point, about 30 miles from its mouth (Map: Brazil, J 8). It has good railroad connections, and canals extend to the coast. The city is lighted by electricity and contains several fine buildings. It has an important trade as the centre of a fertile region producing sugar cane, coffee, rice, and cotton, and has a number of sugar refineries. Campos was founded in 1730. Pop., 1890, 78,036, one-half of whom were negroes; 1902 (est.), 30,000.

CAMPOS. The Brazilian term for tropical prairies or savannas. Campos in which trees are common are called *campos cerrados*. See GRASSLAND; SAVANNA.

CAMPOS, ARSENIO MARTINEZ. See MARTINEZ CAMPOS.

CAMPO SANTO, kām'pō sän'tō (It. *campo*, Lat. *campus*, field + *santo*, Lat. *sanctus*, holy). The Italian designation of a cemetery or burying ground, but more especially for an inclosed place of interment, surrounded internally by an arcade, for the burial of persons of distinction. See CEMETERY.

CAMPOS SALLES, kām'pōsh, sã'lësh, MA-NOEL FERRAZ DE (1846-1913). A South American politician and President of Brazil, born in São Paulo. He was admitted to the bar, was elected in 1867 and frequently thereafter to the Legislature of São Paulo, and in 1844 became a member of the Chamber of Deputies. As Minister of Justice, upon the proclamation of the Republic, which he had done much to bring about, he thoroughly reorganized the Brazilian system of law along lines subsequently accepted by the Constituent Assembly. After having served for some time as Governor of the State of São Paulo, he was in 1898 elected President of Brazil, as candidate of the Republican party. He held this position until 1906. His administrations were characterized by many successful reforms in finance and administration, and by the peaceful settlement of boundary disputes with many of the adjacent countries, and by the

equally peaceful settlement through arbitration of various questions with European nations. During his presidency occurred, too, the first exchange of presidential visits between Argentina and Brazil. The results of this exchange were of importance in clearing up difficulties between the two countries.

CAMPO VACCINO, kām'pō vā-chē'nō. See FORUM, *Later History*.

CAMPRODON, kām'prō-dōn', FRANCISCO (1816-70). A Spanish dramatic poet. He was born at Vich, Barcelona, studied at the University of Cervera, and began the practice of law. He first attracted attention by his poem *La tornada de Titó*, written in the Catalan dialect, upon the return of the Spanish army from the African War. Some of his dramas are adaptations from foreign works. He was not what Spain would call a prolific writer, although he produced more than 30 dramas, comedies, and *zarzuelas*. The most important original work is *Flor de un día* (1851). The rights to this play he did not sell, introducing thus the custom, new to Spanish playwrights, of asking royalties on the performance of plays. This particular play earned him \$20,000. For a while he served in politics and sat in the Cortes of 1854 and during the five years of the régime of the *Unión Liberal*. Despite his public activities he loved home life and considered himself a master of the culinary art. He even invented a celebrated rice dish that his friends called *Arroz Camprodon*. He died in Havana, whither he had been sent to assume charge of an important position in public administration.

CAMP'TONITE. A variety of igneous rocks that occurs in dikes and is composed of hornblende, biotite, and augite in porphyritic crystals set in a ground mass of the same minerals and andesine. Its appearance in hand specimen is very similar to basalt, and its identification ordinarily requires the assistance of the microscope. Camptonite has been described from numerous localities in the Eastern States, chiefly within the central crystalline section of the Appalachian Range. The name is from the town of Campton, N. H., where dikes of the rock were first described by G. W. Hawes.

CAMP'TOSAURUS (Neo-Lat., Gk. *καμπτός*, *kamptos*, bent + *σαῦρος*, *sauros*, lizard). A genus of herbivorous, bird-footed dinosaurs of which remains are found in the Jurassic rocks of Wyoming. The genus is closely allied to the fossil genus *Iguanodon* of the European Jurassic, which it much resembles. The animal was lightly built, and as its five-toed fore limbs were small and apparently of little use in locomotion, it must have progressed on its three-toed hind limbs after the fashion of a bird. Its neck was rather short, but slender and birdlike, and its small head was provided with a horny beak. The tail was long and heavy. Three species have been recognized; of these the largest, *Camptosaurus amplus*, had a length of 30 feet and a height of 15 feet. See DINOSAURIA.

CÂMPULUNG, or **KIMPOLUNG**, kīm'pōō-lōng'. A town of Rumania, capital of a circle, situated on a small tributary of the Arjish. It forms the terminus of the railway line from Coleschi and had a population of 13,033 in 1899.

CAMPUS (Lat., field). In Roman times a vacant space in or near a city, used for public shows, combats, etc. There were eight around Rome, of which the Campus Martius (Field of Mars) was the most important. It was outside

the walls, occupying the level space north of the city, between the Pincian, the Quirinal, and the Capitoline hills on the east, and the Tiber on the west. In later times (especially from about 60 B.C.) this space was much reduced by private and public buildings, and the name was limited to the space between the river, the Circus Flaminius, and the Via Lata. In this met the *Comitia Centuriata* and the *Comitia Tributa* (see COMITIA); in it were the public hall for the use of the magistrates and foreign ambassadors, who were not permitted to enter the city, and the Ara Martis (Altar of Mars), said to have been erected by Romulus. The Campus Martius became in time a pleasure ground, with shaded walks, gardens, baths, three theatres, and a race course. Julius Cæsar began the change by erecting a stone structure called Sæpta, for the voting of the people, but Agrippa did most for the place by erecting many structures, among them his baths and the original Pantheon; Augustus added his own mausoleum and the Ara Pacis. Later emperors crowded this particular campus with public buildings and private residences. It was certainly not within the *pomerium* before the time of Hadrian, but whether it was included by him or by Aurelian is uncertain. Consult Platner, *The Topography and Monuments of Ancient Rome*, pp. 339-392 (New York, 1911). The district in which the old Campus was situated is now called Campo Marzo; the major part of the modern city of Rome lies here. Another ancient campus was the Campus Sceleratus, the polluted field, where vestals who had been untrue to their vows of chastity were buried alive. This lay inside the Servian Wall, southwest of the Porta Collina. (See COLLINE GATE; CAMPUS ESQUILINUS.) The open grounds around American colleges often bear the name of campus.

CAMPUS ES'QUILI'NUS. A tract of land outside of the Servian agger at Rome, 1000 feet long, 300 wide, once used as a burial place for slaves, the lower classes, and malefactors, whose bodies were thrown into common pits. Its unsanitary condition made it a menace to the city, and the cemetery was suppressed under Augustus. Mæcenus covered the whole region with clean earth to the depth of 25 feet, and on the new-made land laid out his famous gardens. Consult Horace, *Satires*, 1, 8, 8-13; Lanciani, *Ancient Rome in the Light of Recent Discoveries*, pp. 65-67 (New York, 1889); Platner, *The Topography and Monuments of Ancient Rome*, pp. 445-446 (New York, 1911).

CAMPUS MAR'TIUS. See CAMPUS.

CAMPUS SCEL'ERA'TUS. See CAMPUS.

CAM'PYLOT'ROPOUS (Gk. *καμπύλος*, *campylos*, curved + *τρόπος*, *tropos*, turn). A term used to indicate one of the characters of an ovule. When an ovule arises from the wall of an ovary, and the body becomes curved in such a way as to direct the micropyle towards the wall, it is campylotropous. The term really means a "curved ovule." The significance of the curving is that it places the micropyle in a more convenient position for the entrance of the pollen tube containing the sperms. The contrasted terms are anatotropous (straight ovule) and anatropous (inverted ovule).

CAMTOOS (kām-tōs' or kām-tōōs') **RIVER**. See GAMTOOS.

CAMUCCINI, kām'cōō-chē'nē, VINCENZO (1771-1844). An Italian historical and portrait painter. He was born in Rome and re-

ceived his first instruction from his brother Pietro, who apprenticed him to Domenico Corvi, an able draftsman; he also copied the works of Raphael and Michelangelo, and studied from the nude. On the advice of the archæologist Visconti, he made a deep study of classical antiquity and became the most important representative of the academic classical period in Italy, holding a similar position to that of David in France. He was a member of the Institute of France, and from 1806 princeps of the Academy of St. Luke at Rome. His most celebrated works are "Romulus and Remus" in the Academy of St. Luke; "The Death of Virginia" and "The Death of Cæsar" in the Capo di Monte Palace, Naples; "The Incredulity of St. Thomas," a mosaic at St. Peter's, and the "Conversion of St. Paul" in the basilica of St. Paul outside Rome. He was also celebrated for his portraits, numbering among his sitters Thorvaldsen, Pope Pius VII, and the King and Queen of Naples. He assembled a valuable collection of pictures and objects of art, 70 of which were purchased in 1876 by the Duke of Northumberland.

CAMUS, kâ'mu', ARMAND GASTON (1740-1804). A French politician, born in Paris. His legal ability and radical zeal brought him into prominence after 1789. He secured and published the so-called "Red Book," which contained a damaging record of court extravagance. He was, as member of the Convention, the most emphatic opponent of all secret orders and ecclesiastical privileges. In 1793, while attempting to capture Dumouriez, who was charged with treason, he was himself captured. After two years and a half the Austrians exchanged him for the daughter of Louis XVI, and on his arrival in Paris he evoked a great deal of sympathy by recounting the hardships of his confinement. The Council of Five Hundred made him a member by legislative enactment, and subsequently he became president of that body. His best service was performed when, as conservator of the national archives, he preserved from destruction the old documents of the abolished corporations and institutions. He wrote a number of valuable legal works. He died Nov. 2, 1804.

CAM'WOOD (African *kambe*, native name for the tree + Eng. *wood*), or **BARWOOD**. A dye-wood which yields a brilliant but not permanent red color and is used with sulphate of iron to produce the red color in English bandanna handkerchiefs. It is the wood of *Baphia nitida*, a tree of the family Leguminosæ, a native of Angola. It is preferred to brazilwood, as producing a finer and richer red.

CANA. See CANA OF GALILEE.

CANAAN, kâ'nân (Heb. *Kena'an*, Gk. *Xánaav*, *Chanaan*; Phœn. *Kena'an*, *Kena'*, Gk. *Xvã Chna*; Bab. *Kinahî*, *Kinahna*, corresponding to *Kena'* and *Kena'an*, Eg. *Kn'n*). The name of the putative ancestor of the Canaanites (q.v.) and a common designation in the Old Testament of the land to the west of the Jordan, most frequently limited to the territory occupied by the kingdoms of Judah and Israel, but sometimes including Philistia (e.g., Zeph. ii. 5) and Phœnicia (e.g., Isa. xxiii. 11; Obad. 20). According to Gen. x. 6 ff. Canaan was a son of Ham, a brother of Cush, Mizraim, and Put, and the father of Sidon and Heth. In Gen. ix. 20-27 the story is told of him that he was cursed because of a wrong done to Noah, not by him,

but by Ham. Noah, the first husbandman and cultivator of the vine, becoming drunk with wine, lay uncovered in his tent. Ham saw his father's nakedness and told his brothers, Shem and Japheth, who covered their father with a garment, walking backward so as not to see him in his exposed state. Since in the poem that is introduced (verses 25-27) the three brothers are Shem, Japheth, and Canaan, and it is Canaan, and not Ham, that is cursed, it is supposed by many students of the Bible that the story was originally told of Canaan, and that Ham is a later addition in verse 22. The purpose of the story, they think, was to illustrate the evils of agriculture in general (see ABEL) and of the cultivation of the vine in particular, to set forth the sexual immorality of the Canaanites, and to justify the occupation of their land by the Hebrews and the Philistines. Shem is regarded as an early name of a congeries of tribes belonging to the Hebrews in the wider sense, Japheth as a designation of the Philistines, Cretans, and kindred tribes, and Canaan as a representative of the Canaanites, one of the most important ethnic elements in the population of Syria before the immigration of Hebrews and Philistines. As the tradition grew so as to include all peoples known to the Judæan writers, Ham is supposed to have taken the place of Canaan. Some scholars consider it improbable that the Canaanites should have been grouped with Libyans, Egyptians, and Hittites, unless there actually was some racial connection between them. Against this view the objection has been raised that Elamites and Lydians are classed as descendants of Shem, in the table of nations (Gen. x.), though they can scarcely be regarded as Semites. But recently discovered inscriptions have not only shown an early and long-continued occupation of Elam by the Akkadians and of a part of Asia Minor by the Assyrians, but also rendered it probable that there was a considerable Semitic population in both of these regions. (See ELAM; ASSYRIA.) Similarly, the long Egyptian and Hittite rule in Syria must have left important traces in the Canaanitish population, and some striking similarity of appearance is all the more likely to have suggested a common origin, as the obvious difference of speech must have seemed to militate against it. It is possible, as Brinton, Keane, Sergi, Luschan, and other ethnologists have maintained, that in prehistoric times Egypt, Syria, and Asia Minor were peopled by the Libyan branch of the Mediterranean race, and that this ancient stock survived among, and greatly modified, the Semites settling in Canaan. If so, it may be supposed that this aboriginal element was most strongly represented along the littoral and in the coastal plains, but that the Amorites (q.v.) at an early age imposed their Semitic speech upon the whole country. But a tradition reaching back to so remote a period cannot well be assumed, while the Egyptian and Hittite sway may have been preserved in memory, especially as Hebrew tribes seem to have been in Palestine already in the Amarna period (c.1400 B.C.). The Phœnicians looked upon themselves as the descendants of Canaan, or Kna' (without the final *n*), according to the testimony of Philo Byblius preserved in Eusebius, *Præp. Ev.*, 1, 10, 39, and of Chæroboscus in *Anecdota græca*, ed. Bekker, iii. 1181.

The earliest mention of Canaan as the name of a country is found in the Tel el-Amarna tab-

lets. Kinahhi (Kena') occurs five times, Kinahni or Kinahna (Kena'an) six times. The name is used interchangeably with Amurru for the land subject to the Amorite Aziru (162, 41), but mostly as a general designation of Syria. In the Egyptian inscriptions a "city in Canaan (Kn'n)" is mentioned in the time of Seti I (c.1330-10), Canaan apparently as Phœnicia in Merenptah's "Israelstele" (c.1240), Canaan apparently as within the territory of Phœnicia in the days of Ramses III (c.1217-1186), and "the land of Canaan" apparently as Philistia in two papyri from the nineteenth dynasty. In the Old Testament there are passages, like Gen. 1. 11 and Josh. xi. 10 f., from which it has been inferred that Canaanites also lived on the east side of the Jordan, but the present text is far from certain. There seem to be indications that the name spread from the coastal plains to the interior, as that of the Canton Schwyz has been extended to the Swiss Republic, or that of the Philistine confederacy became the designation of the whole land of Palestine. Coins from the time of Antiochus IV and his successors bear the legend "of Laodicea, a metropolis in Canaan." Moore has shown (*Journal of the American Oriental Society*, 1893, pp. lvii ff.) that the once popular etymology of Canaan as "lowland" cannot be maintained. It is also possible that the land was named after the people, and not the people after the land. How old the name is cannot be determined. It is not safe to infer that it came into use shortly before its first appearance in the Tell el-Amarna letters; but neither can it be affirmed that the inhabitants of the coast must for ages have borne this name, or that it is necessarily of Semitic origin. We have unfortunately no paintings or sculptures that can with certainty be identified as representations of Canaanites, Phœnicians, or inhabitants of the Shephela before the Philistine invasion. What the original language of Canaan was is not known; in later times the term was understood to mean Hebrew or the closely allied Phœnician dialect. For the geology, geography, flora, and fauna of the land called Canaan, as well as for its history from the earliest times to the present day, see PALESTINE; PHŒNICIA; SYRIA.

CANAAANITES (Heb. *Kena'ani*, Bab. *Kina-Caiu*, Phœn. *Kena'ni*, Latinized *Chananaei*). The name of an ethnic element in the population of Syria, sometimes used as a designation of all the inhabitants of the country to the west of the Jordan and the Phœnician coast. In the Amarna tablets it occurs once (ix. 19, ed. Knudtzon) in the form *Ki-na-ha-a-a-u*. The Phœnicians called their country Canaan in the Hellenistic period (see CANAAN), and therefore are likely to have called themselves Canaanites. As the Carthaginians as late as in the time of Augustine referred to themselves as Canaanites (Augustine, *Ep. ad Roman. in eo hat expos.* 19), it is probable that this was the native name which the colonists carried with them to the west at the end of the second millennium B.C. In the Old Testament the Canaanites

are commonly enumerated in a group of peoples settled in Palestine before the Hebrew invasion. In Deut. vii. 1; Josh. iii. 10; xxiv. 11, this includes seven, viz., Amorites, Canaanites, Hittites, Perizzites, Hivites, Jebusites, and Girgashites; in Gen. xv. 19, 20, the Hivites are left out, but Kenites, Kenizzites, Kadmonites, and Rephaites are added, making the number 10; frequently one or more of the less important peoples are omitted; only Canaanites and Perizzites are mentioned in Gen. xiii. 7; xxiv. 30, and in imitation of these passages in 2 Esdras i. 21, and in Ezek. xvi. 3 Amorites and Hittites are said to be the ancestors of Jerusalem in "the land of the Canaanite." That the Amorites were essentially a Semitic people may be taken for granted, though it is possible that there was a considerable admixture of foreign blood through contact with, and absorption of, other elements in Syria. (See AMORITES.) The Hittites were a non-Semitic Asianic people. (See HITTITES.) It is not improbable that the Perizzites had a strain of Mitannian blood. (See MITANNIANS.) The Hivites seem to have been a branch of the Amorites, as may be inferred from a comparison of Gen. xxxiv. 2 with xlviii. 22 and Josh. ix. 7 with 2 Sam. xxi. 2, though here also there may have been a mixture of blood. Böhl suggests that the Jebusites were a mixture of Amorites and Hittites; this was indeed more than hinted at by Ezekiel. This people was clearly confined to Jerusalem and the district around the city. The Girgashites were probably settled around the Lake of Galilee, where Amorites and Canaanites met. Kenites (see CAIN), Kenizzites, and Kadmonites appear to have been Edomitish peoples—the two former in the Negeb (q.v.), the latter on the border of the Syro-Arabian Desert. As for the Rephaites and the Zuzites and Emities mentioned in connection with them in Gen. xiv. 5, they probably represent an earlier stratum of the population in the country east of the Jordan and the Dead Sea. Amorites, Canaanites, and Hittites were evidently the most important peoples with which the invading Hebrew tribes had to deal, the others being smaller tribes or clans mentioned because they held possession of cities like Jerusalem and Shechem. The use of *Amurru* and *Hatti* by the Babylonians and Assyrians, *Amor* and *Kenana* by the Egyptians, also points to the same conclusion. The extension of each of these terms to the whole likewise furnishes an instructive analogy to Hebrew usage. On the origin and ethnic character of the Canaanites, see CANAAN; on the nature of the civilization of the country before the coming of the Hebrews, see PALESTINE; PHŒNICIA; SYRIA. Meyer, *Die Israeliten und ihre Nachbarstämme* (1906); id., *Geschichte des Altertums*, i, 2 (3d ed., 1913); Benzinger, *Hebräische Archæologie* (2d ed., 1907); Kittel, *Geschichte des Volkes Israel*, i (2d ed., 1912); Böhl, *Kanaanäer und Hebräer* (1911); Procksch, *Die Völker Altpalästinas* (1914).

CANA-BOTA, *kā'nā-bō'tā*. A very large shark (*Hexanchus*, or *Notidanus, griseus*), inhabiting deep waters off the coast of Europe and in the Mediterranean and wandering to the West Indies. It reaches a length of 26 feet. See SHARK and Plate of LAMPREYS AND DOGFISH.

CANACE, *kān'ā-sē* (Lat., Gk. *Kavákη, Kanakē*). The offspring of Æolus, the king of the winds (see ÆOLUS), and Enarete, in Greek

mythology, who conceived an incestuous passion for her brother, Macareus, and was punished for it by death. The story is finely told by Ovid, *Heroides*, xi. Gower mentions her in the *Confessio Amantis*, and Chaucer in the *Man of Law's Tale*. She is not, however, to be confused with the Canace in the latter author's *Squire's Tale*, who is the daughter of King Cambuscan, and who, owing to the possession of a magic ring, can understand the love plaint of a female hawk.

CAN'ADA (probably from Iroquois *kanada*, eabin), DOMINION OF. A country occupying the whole of the continent of North America north of the United States, except Alaska. (See special map, accompanying this article.) The continental portion is about 2700 miles in greatest length, from the Atlantic to the Pacific, and measures about 1600 miles from north to south, which gives to it, with the outlying "lands" and islands, an area exceeding the United States with Alaska and nearly equal to that of all Europe; somewhat more than one-sixth of this is under water. The Dominion is divided for administrative purposes into nine provinces, the Yukon Territory, and the Northwest Territories. Provincial boundaries were revised in Manitoba and eastern Canada in 1912. By this revision Manitoba was increased by 178,100 square miles on the north and made to extend to the sixtieth parallel of north latitude and Hudson Bay. Ontario received 146,400 square miles of additional territory so as also to attain Hudson Bay. This new district is called Patricia. Quebec acquired 354,961 square miles of new area, made up of what was formerly known as the Territory of Ungava and the whole of Labrador situated within the Dominion. By this addition Quebec becomes the largest province in Canada instead of British Columbia, which drops to the third rank in area, Ontario being second. Excluding Hudson Bay (443,750 square miles) and the Gulf of St. Lawrence (101,562 square miles), but including inland waters, the area of the Dominion is 3,729,665 square miles, the surface of which is distributed among the component political divisions as follows:

	Square Miles
Prince Edward Island.....	2,184
Nova Scotia.....	21,428
New Brunswick.....	27,985
Quebec.....	706,834
Ontario.....	407,262
Manitoba.....	251,832
British Columbia.....	355,855
Saskatchewan.....	251,700
Alberta.....	255,285
Yukon.....	207,076
Northwest Territories.....	1,242,224
Total.....	3,729,665

The area under water, included in this total area, embraces 125,756 square miles. This includes the portions of the Great Lakes within the territorial limits of Canada.

The most northerly point of the domain is probably Cape Columbia, in Grant Land. The most westerly boundary is formed by the 141st meridian of west longitude. The population of the Dominion was 7,206,643 according to the census of 1911.

The Dominion has an exceedingly well-developed coast line, the southern sections of which are available to navigation. Commodious natural harbors exist in the coastal archipelago between Queen Charlotte and Vancouver islands on the west as well as in the broad gulf of the

St. Lawrence and the indented border of Nova Scotia.

Topography. Canada may be likened to an immense plain sloping towards high level from east to west and northwest. It may be divided into three regions: 1. The hilly, diversified eastern half, consisting of the Laurentian plateau and the northern extension of the Alleghanies. 2. The elevated interior plains, comparatively level, and largely treeless, sloping gently northeast and north. 3. The mountain region, between the plains and the Pacific coast, which consists of the northern extension of the Rocky Mountains of the United States, their included plateaus, and of various coast ranges. Each of these prime features is divisible into certain large, natural subdivisions.

1. The eastern part of Canada has a broken or hilly surface of generally low elevation. The highest points of the coast of Labrador approach 8000 feet, but the interior of northern Quebec, or of the region west of Hudson Bay, does not exceed 1500 to 3000 feet, and slopes steadily to the level of the shores of Hudson Bay. This whole vast region, embracing the Bay and continuing in a broad margin around it, is a succession of low, often bare or thinly forested ridges of hard rocks, between which are innumerable lakes, swamps ("muskegs"), and torrential rivers. Its recent release from universal glaciation, and the unfavorable climate, have not permitted much valuable soil to accumulate, except in small, isolated areas, and the region is not adapted to any considerable human habitation. Many large rivers flow into Hudson Bay from the east; some shorter, but copious, ones from the south, of which the Moose and Abitibi form canoe routes to James Bay; while the Albany River forms a canoe route from the Lake of the Woods region to the same inlet. In the west the drainage into Hudson Bay includes the whole basin of the Red, Saskatchewan, Churchill, and other rivers, thus embracing the southern half of the interior plains area; but this will be spoken of later. The Hudson Bay basin is defined south and southeast by a scarcely perceptible watershed, which is called "the height of land," and which divides the heads of the streams flowing northward from those draining southward into the St. Lawrence. This very ancient river valley, which includes the whole system of the Great Lakes (partly within the United States), is over 2000 miles long and forms the drainage outlet for an area of about 500,000 square miles. The surface of the St. Lawrence valley is broken in places by intrusive igneous rocks, which remain standing above the surface in such abrupt heights as Mount Royal, at Montreal, and the picturesque *buttes* south of that city.

Another topographic feature in this region is the Niagara Escarpment, the eastern edge of a plateau over the brink of which the waters of Lake Erie are poured into Niagara Falls (q.v.). As the escarpment is traced northward, it becomes more lofty, rising into high, rocky hills, which form the backbone of the triangular, very picturesque extension of land separating Lake Huron from Georgian Bay. The valley of the St. Lawrence narrows towards its mouth, where the northeastern extension of the Appalachians forms the mountainous Gaspé Peninsula. South of this lies the distinct region of the Maritime Provinces, whose features are largely similar to those of New England.

See NEW BRUNSWICK; NOVA SCOTIA; PRINCE EDWARD ISLAND.

2. The second great division of Canada—the Interior Plains—comprises the area, some 700 miles in breadth, which continues the plains of the United States northward to the shores of the Arctic Sea, between Hudson Bay and the Rocky Mountains. This region is, however, more broken, well watered, and has more forest than the high, open plateaus southward, and is lower, constantly diminishing in altitude northward, the international boundary (lat. 49° N.) nearly coinciding with the watershed between the drainage into the Gulf of Mexico and that into Hudson Bay. Referring to this Canadian plains region, George M. Dawson, former director of the Geological Survey of Canada, wrote:

“The whole interior region of the continent slopes gradually eastward from the elevated plains lying near the base of the Rocky Mountains to the foot of the Laurentian Highlands, and, though the inclination is more abrupt in approaching the mountains, it is not so much so as to attract special attention. Between the fifty-fourth and forty-ninth degrees of latitude, however, along the lines which are in a general way parallel and hold a northwest and southeast course across the plains, very remarkable step-like rises occur. These escarpments form the eastern boundaries of the two higher prairie plateaus, and the most eastern of them overlooks the lowest prairie level, or that of the Red River valley. The three prairie steppes thus outlined differ much in age and character, and have been impressed on the soft formations of the plains by the action of subaërial denudation of former great lakes and probably also of the sea. . . . The actual increase of elevation accounted for in the two escarpments, however, is slight compared with that due to the uniform eastward slope of the plains. The direction of greatest inclination is towards the northeast, and a line drawn from the intersection of the forty-ninth parallel and the mountains to a point on the first prairie level north of Lake Winnipeg will be found to cross the escarpments nearly at right angles, and to have an average slope of 5.38 feet to the mile. From the same initial point, in a due east line to the lowest part of the valley of the Red River, a distance of 750 miles, the plains have an average slope of 4.48 feet per mile. . . . Northwest of the North Saskatchewan no extensive treeless plains occur in the central region of the continent, and the forest country of the east forms a wide, unbroken connection with that of the northern portion of British Columbia.”

Along the edge of the lowest or easternmost of these levels lies that series of great lakes—Manitoba, Winnipeg, Winnipegosis, Reindeer, La Hache, and many other lesser ones—which form so striking a feature on the map, and empty by large, rapid rivers into Hudson Bay. Down from lakes on the second level flow such large rivers as the English, or Churchill, and Dubawnt, carrying to the northern part of Hudson Bay some overflow from Lake Athabaska; while from the foot of the Rocky Mountains, gathering the drainage of all three plains levels, comes the great Saskatchewan, in two branches, the North and the South, to enter Lake Winnipeg (which also receives from the south the large Red-Assiniboine affluent), and thence to flow through Nelson River to Hudson Bay. North of the North

Saskatchewan, on about the 55th parallel of north latitude, a line of rocky and forested highlands forms a watershed between its valley and that of the outflow towards the north. This begins with the great Athabaska and Peace rivers, which pass eastward from the base of the Rockies through a rough region to Athabaska Lake, and thence enlarged (as the Slave River) to Great Slave Lake, which also receives the powerful Liard from the west. This lake narrows westwardly into the Mackenzie, which flows northward to the Arctic Ocean, about 120 miles east of the border of Alaska. This great river is the equal of the Missouri in length, but discharges more water than does that stream, and is comparable to the mighty watercourses of Siberia. Its course lies near the base of the Rocky Mountains, west of which lie the head streams of the Yukon (q.v.), all of which are within Canadian territory. East of the Mackenzie, halfway between Great Slave Lake and the Arctic coast, lies the extensive Great Bear Lake, a feeder for the Mackenzie. Here the country is low, and a part of this lake's waters escapes into Coronation Bay by way of the Coppermine River. East of the head of the Coppermine a low divide turns the waters east of it into the Great Fish or Backs River, which flows through the desolate wastes, called the Barren Grounds, that lie between Hudson Bay and the Arctic Ocean (Victoria Strait), and empties into the latter at Elliot Bay. Of all these rivers, the greatest is the Mackenzie, but the most important are the Saskatchewan and the Red, for they have made available a wide area of habitable and valuable land. The Saskatchewan collects a large part of the waters of the provinces of Alberta and Saskatchewan, by the two main channels, each some 300 miles in length, and then flows 200 miles more to Lake Winnipeg. This lake also receives, besides the Red River and its tributary, the Assiniboine (which drains all southern Manitoba and much of North Dakota and Minnesota), the Winnipeg River, and the lakes Manitoba, Dauphin, and Winnipegosis, which together equal or exceed the bulk of Lake Erie. Lake Winnipeg itself is nearly as spacious as Lake Huron, and pours its waters through the great Nelson River, a series of rapids descending to Hudson Bay. The Saskatchewan and Red rivers were the former avenues of travel, and their valleys are now the seat of the principal population and industry in the Northwest.

3. The mountainous western border of Canada consists of a belt of snowy ranges from 500 to 600 miles in width. On the east are the Rocky Mountains, continuous with those of Montana, which consist of gigantic uplifts and foldings of the strata. Hence the scenery presents series of vast bedded cliffs, and weatherworn, jagged summits, instead of the rounded domes and slopes familiar in the southern Rockies. The ranges run northwest in approximately parallel lines, which are capped with snow and glaciers. This is due to their high latitude rather than to altitude, since there are but few peaks that exceed 11,000 feet, except between lat. 52° and 53°, where a number of peaks have recently been described whose elevations appear to exceed 13,000 and 14,000 feet. Mounts Robson, Columbia, Forbes, Bryce, Alberta, and Freshfield are seemingly the highest. A somewhat distinctive range west of the first is the Selkirk, in which are the headwaters of the

Columbia River, and which carries the Great or Illecillewaet Glacier. Then comes the Gold or Columbia Range, while farther west lies a broad, elevated plateau valley, drained by the Thompson and Fraser rivers and forming the centre of British Columbia. Between this valley and the Pacific coast extends a belt of intricate coast ranges, which northward form the boundary mountains between Canada and Alaska, and whose outermost summits constitute the line of islands—Vancouver, Queen Charlotte, and the Alexander Archipelago—which characterize that coast. (See BRITISH COLUMBIA; ALASKA.) It is through these coast ranges that the Fraser River (about equal to the Ohio) cuts its way in a series of magnificent cañons. These orographic features have had a very important bearing on both the climate and the economic value of this part of the country.

Climate and Soil. On account of the continental size of the country it is difficult to generalize in regard to the Canadian climate. Canada's southernmost latitude is the same as that of Constantinople, and its northernmost is the North Pole. It stretches westward from the Atlantic, where it has a coast line of 10,000 miles, to the Pacific, where its coast line is studded with islands and attains an almost equal length by reason of the deep indentations. Its climate ranges from the cold frigid zone of its northern part to the temperate zone which leads to its southern border, and from the mildness of its western coast to the cold of its eastern seaboard. The Canadian range of production extends from the staple corn and peach crops of the most southerly parts of the country to the hardier grains and vegetables far north, until vegetation dies out on the shores of the Arctic Ocean. In the northeastern region, the "Hudson Bay Country," the characteristics are Arctic or sub-Arctic—a brief, warm summer and a long, cold winter, with much fog at all seasons on the icebound coast. The current of cold water flowing down that coast past Greenland keeps the entrance to Hudson Bay frozen nearly two-thirds of the year, and often packs ice along the coast of Labrador so persistently as to make it inaccessible until midsummer; while the region of the Gulf of Newfoundland abounds in fog, and the air of New Brunswick and Nova Scotia is surprisingly cool, with much rain and snow. In the northern interior dry and severe cold prevails over half of the year, the mercury, even as far south as Manitoba, frequently dropping to 50° below zero of the Fahrenheit scale. The climate of the St. Lawrence valley, however, is excellent—cold, dry, and bracing, with much snow and occasional severe cold in winter, and in summer heat without much moisture, but usually an abundance of rain for crops, which are also nourished by the moisture given to the ground by the plentiful snow. In the Maritime Provinces the neighborhood of the ocean modifies the extremes both of winter cold and summer heat, but causes more rain and fog. As for soil, north of the Laurentian Hills, and through the Hudson Bay and northern Quebec regions, it is scanty, and little except garden vegetables can be grown, because of the liability to summer frosts. In the valley of the St. Lawrence, however, a belt of alluvial lowland near the river is extremely fertile; and the whole of southern Ontario, by reason of its moderate climate and varied soils, largely the result of glacial deposits, is exceed-

ingly well adapted to agriculture in all its phases and to the raising of all the hardier fruits. The grain crops and apples of Ontario are famous. In northern Ontario the winters are severe; nevertheless, about 24,500 square miles of land are admirably fitted for cultivation; but when the plains of Manitoba are reached, highly favorable conditions for agriculture are encountered. The provinces of Alberta and Saskatchewan are also renowned for the fertility of their soil. New areas are constantly given up to settlement by the government. One of the recent additions to the cultivated area of the Dominion is the Peace River district in Alberta, where 1420 square miles of excellent agricultural land have been thrown open by the Canadian government in the valley of the Peace River. Edson, on the Grand Trunk Pacific Railway, is the nearest station to this new farming region. The soil of the Red River valley, including the valleys of the Assiniboine and Souris (Mouse), is a deep black prairie loam of the highest fertility. The same may be said of the whole plains region, even on the high western steppes, where only water is needed to insure great productivity, and of all the valleys of British Columbia and its coast.

The climate of the more southerly, habitable part of the Canadian Northwest is much more favorable to life than one would suppose from a knowledge of its latitude merely. The isotherm of 65° F. mean summer heat, which is that of the St. Lawrence valley at Quebec, curves northward along the south shore of Lake Superior and through Manitoba to northern Alberta. This increase of warmth westward and northward, as the mountains are approached, is due to the effect of the mountains upon the prevailing air currents. There, as elsewhere, the usual winds blow from the west, and come to the coast expanded and saturated with warmth and moisture, after flowing for thousands of miles across the Pacific, whose waters are 20° warmer than are those of the North Atlantic. Vancouver Island and the coast of British Columbia have a climate, in consequence, much like that of the south of England, but warmer and even more moist. Flowers bloom in the gardens the year round, and fruit reaches the utmost excellence. Warmth and rainfall are derived from the latent heat and absorb moisture set free by condensation of the oceanic air against the high and cold Coast Range. Robbed of only a portion of their burden, but lifted and rarefied by elevation, the winds sweep across the interior valley of British Columbia and strike against the snowy Rockies, to deposit more rain or snow, but rain so rarely falls on the intervening Fraser-Thompson valley that agriculture there must depend upon irrigation. The reason for this is that the ever-ascending heat of the sun-baked plains buoys up the higher air currents and lifts them straight across to the Selkirks and eastern Rockies, to whose vast snow fields they give almost all of the moisture yet remaining. These once warm winds are now, however, cool winds, because they have become dry and rarefied. The eastern side of the Canadian Rocky Mountains has little snow and is sparsely provided with trees, as compared with its western side, or with the coast ranges, and the general temperature is cooler; yet the eastern foothills of the Rockies have a milder climate and earlier spring than the western, or than is enjoyed by Manitoba. This is due to the phenomenon called the chinook, which is a wind caused by the rarefied air rush-

ing down from the summits, necessarily increasing in density by compression as it strikes the plains level, absorbing moisture and giving up its latent heat to the extent of about 23° F. The chinook is not a wind that has come warm from the Pacific, but is of local origin. In summer the same breeze seems cool in comparison with the fierce radiation of the baked plains, but it is equally a chinook. (See CHINOOK WIND.) The genial influence of this warm, dry wind is seen in winter in the quick evaporation of the snow and the consequent exposure of pasturage to stock, and in producing early conditions of spring. On Peace River the winters are milder than those of Manitoba or Ontario, and everything that will grow near Toronto will ripen at Dunvegan, 13° of latitude north of it—the same latitude as the middle of Labrador. Its influence wanes with distance eastward, however, and Manitoba is subject to the extremes of its position at a high latitude in the centre of a continent, being subject to excessive noonday heats in summer and excessive cold in winter, with the nights always cool and the autumnal frosts liable to begin in August. In the extreme north a rigorous Arctic climate prevails, with the winter temperature descending to -75° F. The summers are, however, still favorable to plant growth. The whole Northwest, however, is healthful in a high degree.

Flora. The flora of all the northern part of Canada is Arctic and sub-Arctic, and this characterizes the scanty growth in the eastern part all the way down to the height of land which separates the basin of Hudson Bay from the St. Lawrence valley. A great space between Hudson Bay and the Arctic shores is almost a desert, and has been known from the earliest times as the Barren Grounds, or Tundra, yielding hardly anything more than mosses, lichens, and a few willows and hardy herbs. The flora of the St. Lawrence valley and of the Maritime Provinces differs little from that of the northeastern United States, the whole of that space having been originally covered with mixed forests of large and valuable trees, both coniferous and hard wood. The western plains are comparatively treeless as far north as the Saskatchewan, yet are covered with prairie grasses and herbage, which thin out towards the higher and drier steppes westward, where the plains are covered with the bunch grasses which once supported enormous herds of buffaloes and antelopes and now furnish sustenance for a rich stock-raising region. North of the Saskatchewan a broad belt of rather small and sparse trees extends from Hudson Bay to Great Slave Lake and the Rocky Mountains—chiefly spruce, tamarack, and poplar. The dry western slopes and valleys of the Rocky Mountains are thinly covered with woods, mainly pine; but the forest increases in density and the trees in size as one proceeds west towards the region of greater rainfall; and after passing the treeless Fraser-Thompson valley, the coast ranges, and especially their western slopes, are found covered with the dense forests of mighty evergreen trees that characterize the northwest coast of all North America. The principal trees are the Douglas spruce, or "Oregon pine" (*Pseudotsuga*); the white cedar (*Thuja*); a hemlock (*Tsuga mertensiana*), and Engelmann's spruce (*Picea engelmanni*). These coast forests are inconceivably dense and sombre, and their average height on the lowlands is not less than 200 feet, while the

Douglas spruces often exceed 300 feet, and the cedars are hardly less tall.

Fauna. The animals of Canada are as varied as its flora and characteristic of northern latitudes. All bear a close resemblance to those of northern Europe and Asia, and many species are identical, i.e., have a circumpolar range. (See AMERICA, *Fauna*.) The carnivora are represented by several species of the weasel family (such as the ermine, sable, fisher, wolverine, mink), whose abundance and value long ago gave the name "Fur Countries" to northern Canada. There are also the lynx, bear, fox, wolf, skunk, and in the Northwest the badger. The puma, or American lion, is still found in some parts. Among the rodents the beaver is so widespread and characteristic, and was so important to the beginnings of colonial civilization, that it became the national emblem of the Dominion. The Canadian porcupine, muskrat (locally called "musquash"), hares, and many smaller rodents are numerous, and on the western plains are a variety of burrowing "gophers" and the like. The Virginian and black-tailed deer enter the southern edge of Canada, and the elk is found in the Rocky Mountains, but the moose and various caribou range all over British North America; and in the mountains of British Columbia the wild sheep and the white goat antelope are numerous and highly characteristic. The pronghorn antelope is still abundant in some parts of the Saskatchewan valley, and the musk ox is found in the Arctic tracts. There is an immense variety of birds, many of which, characteristic of northern climates, are unknown southward; but the majority are migrants that go to the northern parts of Canada to breed and leave the country in the winter for warmer regions southward. Fishes are numerous in all the inland waters and about all the coasts (see *Fisheries*, below), but reptiles and the more delicate insects are scarce, except in the most southerly part. The gathering of furs, which played so striking a part in the colonization and earlier prosperity of the country, has been greatly diminished of late, owing to the extinction of the principal fur-bearing animals over a large part of their former range. The beaver, in particular, has disappeared from all but the remotest and wildest regions. The game animals are hunted by large numbers of sportsmen, and, in spite of protective laws, the supply of game is diminishing.

Geology. The most ancient rocks found in Canada, and in North America as well, are the granites, gneisses, and schists which underlie a great V-shaped area, having Hudson Bay in the centre, and extending from the Great Lakes northeast to the Labrador coast and northwest to the shores of the Arctic Sea. This area was once diversified by mountains, which are represented at the present time, after an immeasurably long period of erosion, by the Laurentian plateau. The age of the granites and banded rocks is Archæan. On the borders of this primitive land area stratified beds have been deposited during all the succeeding geological periods. The Cambrian and Silurian systems are represented by great thicknesses of strata that outcrop in Nova Scotia, New Brunswick, Newfoundland, along the St. Lawrence valley, and on the shores of Lake Ontario. They also appear farther west in Manitoba, extending thence in a northwesterly direction towards the Arctic regions and into British Columbia. The Devonian system is less

extensively developed in the eastern provinces, but it constitutes a wide belt in the prairie regions which border the Cambrian and Silurian strata. Between this Devonian belt and the eastern Rocky Mountains the surface is formed by Cretaceous and Tertiary beds that are a part of the great series reaching northward from Texas across the United States. The Rocky Mountains of Canada are similar in structure to the mountains of Colorado, Wyoming, and Montana, and have been built up by upheaval and folding of sediments, and, to a lesser extent, by volcanic action. The strata of which they are composed range in age from Paleozoic to Tertiary, while in the Selkirks even the Archæan may be present. The Carboniferous system is not especially important in respect to area, but it contains the valuable coal deposits of Nova Scotia and New Brunswick, and is known to occur also in the central prairie region, in British Columbia, and along the Arctic coast. The coal beds of Vancouver Island and those found in the Rocky Mountains are of Cretaceous and Tertiary age. In recent geological times nearly the entire area of Canada was covered by an ice sheet, the Laurentian glacier, that terminated in the northern United States. The surface features were profoundly modified by the erosive action of this vast mass of moving ice, as is evidenced by the numerous great lakes and by the extensive deposits of sands, gravels, and clays that rest upon the older geological formations. See also *Geology*, under BRITISH COLUMBIA; ONTARIO; ETC.

Resources. The following brief résumé of Canada's immense and extremely diversified natural resources is followed by detailed information and statistics under various headings. Adverse climate and distance have prevented the development of these resources until recent years, when man's growing ability to cope with natural disadvantages enabled Canadians to begin reaping the benefits accruing from the exploitation of the surface and subsoil of the Dominion. The vast expanses of the frigid zone provide favorable hunting grounds, notwithstanding the rigors of long wintry seasons. Within this area minerals are also found in abundance. Large deposits of bituminous coal are known in the Arctic islands. This frozen area is succeeded on the south by an arid belt. This section, although unavailable for agriculture, affords excellent grazing fields which may constitute the seat of a thriving cattle industry. The prairie zone which follows again to the south is a somewhat more propitious area for farming, although its climate varies abruptly between extremes of cold and heat. Farther south is a rich though not continuous culture belt, comprising the river valleys of southern British Columbia and, excepting the barren strip around Lake Superior, extending through southern Manitoba to the Atlantic coast. This is the part of Canada which is best developed. Owing to its fertility it has become an important wheat belt. Transportation to markets on the east is facilitated by the far inland penetration of the Great Lakes—St. Lawrence basin. On the west the Pacific seaboard affords an outlet for British Columbia's products.

The culture of cereals has progressed rapidly in this favored belt. Wheat is the chief crop in southern Ontario, Manitoba, and Saskatchewan. Oats are cultivated in all southeastern Canada, corn and barley in southern Ontario principally,

vegetables and fruits in the southern districts of Ontario and British Columbia.

Canada's forests constitute another source of the country's wealth. It is estimated that the forest area of Canada includes between 500,000,000 and 600,000,000 acres of land and that between 300,000,000 and 400,000,000 acres contain timber of commercial size. The lumber industry has been developed mainly in the basin of the Ottawa River. The most important Canadian wood is spruce. Pine, fir, maple, beech, poplar, and elm are among the varieties exploited.

The Dominion's cattle industry is susceptible of large development. The eastern districts of the Rocky Mountains area contain vast stretches where sheep are known to thrive. The country's wool production, which is at present insignificant, may eventually assume considerable proportions.

Mining is also an important source of wealth. Coal resources are abundant. The fuel is found in British Columbia, in Alberta, and in the Maritime Provinces. The reserves of bituminous and lignitic varieties are considerable. Gold, silver, copper, and lead are widely distributed. The Klondike is noted for its gold production. Silver lead is found in the Selkirks. Copper deposits have been found in the Klondike. Iron is found in large quantities in Nova Scotia, Quebec, Ontario, and Vancouver Island. Oil is known in the Great Lakes district.

Fishing is one of the great Canadian industries. It may be said that the world's most extensive fisheries are found in Canada. The industry provides sustenance for many of the inhabitants of Nova Scotia, New Brunswick, Quebec, and British Columbia. Over 91,000 persons are engaged in it. Cod, salmon, and herring are the chief products. Lobsters, mackerel, sardines, and haddock are also caught in Canadian waters. The numerous islands and bays of British Columbia and the deeply indented coast line of the Atlantic from the Bay of Fundy to the Strait of Belle Isle provide excellent fishing grounds. Both deep-sea and coastal fishing are pursued on the Atlantic coast, where the waters overlying the banks found within 100 miles from the Canadian coast are well stocked with various species.

Fur farming has been developed in Canada in recent years, and the industry has progressed rapidly, owing to the high prices which pelts command in the world's markets. Foxes, skunks, minks, raccoons, fishers, beavers, and muskrats are bred on the farms. The domestication of fur-bearing animals has been carried on mainly in the Maritime Provinces, although it is also undertaken in Ontario and Quebec and to a lesser extent in the western provinces. The northeastern portion of the Province of Quebec, formerly known as Ungava, is the last great reserve of fur-bearing animals in North America.

The question of the conservation of Canada's natural resources became urgent chiefly in connection with the development of the forests and fisheries. The result was the appointment of the Commission of Conservation, whose office is at Ottawa. It has a general chairman and also chairmen of committees specially organized to conserve various resources. The committees are those on: *Fisheries, Game, and Fur-Bearing Animals; Forests; Lands; Minerals; Press and Coöperating Organizations; Public Health; Water and Water Powers.*

Mineral Resources and Mining. Canada was long supposed to possess great mineral wealth, but only in recent years have the great variety, extent, and richness of its mineral resources been ascertained. The geological provinces which have been so productive of mineral wealth in the United States, viz., the Appalachians in the east, the Cordilleras in the west, and the Lake Superior region between the two, extend northward into Canada. A combination of adverse circumstances, however, has prevented the extensive development of the mining industry; among these are the sparse population, its dispersion over a very wide area, the isolation of the mining lands, and the lack of means of transportation. In addition to this is the severity of the climate. Moreover, the coal supply, so necessary in the smelting of metallic ores, while present in enormous deposits, is located at the two extremes of the country (Nova Scotia and British Columbia), leaving the middle region at a great disadvantage. That these disadvantages will not permanently check the development of the industry, however, has been clearly demonstrated by its steady growth. The mineral product of 1904 amounted to (approximately) \$60,082,771, and in 1912 its total value had increased to \$135,048,296, a growth of \$31,827,302 over the year 1911. The production per capita in 1912 was \$18.27.

Gold has long been mined in moderate quantities in Nova Scotia, where it is found in the quartzites and slates of the Cambrian rocks, but larger quantities were secured from the placer mines of British Columbia, in which work began about 1857, and whose output by 1863 had reached an annual value of \$3,913,000, but subsequently declined until in 1893 it reached its lowest point, \$356,131. The great revival of the industry came in 1897, when the placer mines of the Klondike and other Yukon regions were opened, the Yukon alone reaching \$22,275,000 in 1900. But the gold production of the Yukon district fell steadily until 1907, when it was only \$3,150,000, the figure for 1904 being (approximately) \$10,500,000. Then production began to rise again, and in 1912 amounted to 267,447 ounces, valued at \$5,549,296; the total value of gold produced in 1912 being \$12,559,443. (See YUKON GOLD FIELD.) Quartz and hydraulic mining has been undertaken in southern British Columbia (the Kootenay region) with a decided increase in the output. Gold exists at other points, notably on the north shore of Lake Superior, but mining operations there are still on a small scale.

Another decided increase is that of *coal*, which ranks next to gold in value of output. It more than doubled itself in the period between 1892 and 1904, and again by 1911, when the amount produced was 11,323,388 tons, valued at \$26,467,646. The greatest production was in 1912, when 14,699,953 tons were mined, valued at \$36,349,299. Of this, Nova Scotia produced about five-sevenths and British Columbia the greater part of the remainder, the main production in the latter province being on Vancouver Island. Most of the coal of British Columbia and Nova Scotia is bituminous, of good quality, while the vast fields of the interior plain, extending from southwestern Manitoba westward to the mountains, contain rich deposits of serviceable lignite, and anthracite is found on Queen Charlotte Island and near Calgary, Alberta. In 1906 extensive beds of anthracite

coal were discovered on the Hudson Bay slope in the neighborhood of the Albany River. In 1912 the production of coal had so increased in Alberta that its total was 3,446,349 tons against 3,220,899 tons in British Columbia. The production in Nova Scotia was but a little more than one-half of the total, being 7,791,440 tons out of a total production of 14,699,953 tons.

The *copper* product increased in value from \$818,000 in 1892 to approximately \$5,510,000 in 1904, most of it being mined in British Columbia and Ontario, and smaller quantities in Quebec. The value of the copper production had so increased in 1912 that it was more than double the production in 1904, it having reached a total of \$12,709,311. In British Columbia it is found in combination with gold and silver and is mined chiefly as a by-product. None of the Canadian copper ore is refined in Canada, but the ore matte is shipped into the United States for that purpose.

Silver and *lead* have likewise greatly increased. The value of the output of the former in 1892 was \$272,000, and by 1904 was increased by \$1,845,000; that of the latter was \$33,000, and increased by \$1,604,000 in the same period. In 1912 the value of silver was \$19,440,165, and lead \$1,597,554. Ontario produces the greater portion of silver. In British Columbia the two metals are united in the same ore, which is found in the clay schists and intrusive granites occurring in the Kootenay region.

Canada holds a position of special advantage in the production of two minerals, *nickel* and *asbestos*, having excelled her only rival (New Caledonia) in the production of the former, and having the field almost wholly to herself in the production of the latter. The nickel is mined in the Sudbury district, northeast of Lake Huron, where mining began in 1888, and in 1891 the output amounted to \$2,700,000, after which it decreased until 1900, when it rose to \$3,327,000. The highest point attained by this industry was in 1912, when the product amounted to \$13,452,463. The asbestos is mined in the eastern townships of Quebec, where it is found in veins which run through rocks of massive serpentine; the annual output has increased from \$390,000 worth in 1892 to \$2,979,384 in 1912.

Iron is perhaps the most widely distributed mineral, being found in every province, but its utilization has suffered from the lack of coal for smelting purposes and from the prohibitive tariffs of the United States. The Dominion government and also the government of Ontario has placed a bounty upon pig iron, which has stimulated its production, the value of the product exceeding \$1,212,000 in 1901, but falling in 1904 to approximately \$901,000. In 1912 the "pig iron from Canadian ore" was valued at \$450,886, and iron ore exports were valued at \$382,005. The total value of pig iron produced in 1912 was \$14,550,000, mostly from foreign ore. The prospects for the development of iron mining are greatest in Nova Scotia, inasmuch as coal and limestone are there found in close proximity to the iron ore.

The production of *petroleum* and of *salt* in the peninsular part of Ontario has long constituted well-established industries; the value of petroleum products in 1912 was \$345,050, and of salt about \$459,582. Natural gas is also found in this region, and in 1912 the value was \$2,311,126.

The production of the less important minerals in 1912 was as follows: corundum, \$239,091;

graphite, \$117,122; zinc ore, \$215,149; gypsum, \$1,320,883; mica, \$143,976; and pyrites, \$314,085. The production of cement in 1912 was valued at \$9,083,216. The value in 1912 of the granite limestone, marble, and sandstone quarried was \$4,675,851. There are enormous resources in the way of building stone and clays, which are extensively drawn upon. While the future holds in prospect an increasingly rapid exploitation of Canadian minerals, the supply is so great that the question of their final exhaustion scarcely presents itself, and the inhospitable Laurentian regions to the north will contain untouched hoards of wealth for centuries to come.

Fisheries. With oceans washing its shores on three sides, the Great Lakes, and numerous small lakes and rivers scattered throughout its domain, Canada has exceptional advantages for the development of the fishing industry. Naturally this was developed early, and in at least three of the four Maritime Provinces it has long ranked next to agriculture in importance. Later fishing became prominent in the lake waters adjoining Ontario, and still more recently in British Columbia and on Lake Winnipeg. The total value of the fish product had increased from \$6,577,000 in 1870 to \$17,714,000 in 1890, \$23,516,000 in 1904, and to \$34,667,872 in 1911-12. The gain has been almost wholly in the west, Nova Scotia leading the other provinces up to 1905, her yield having stood at about \$7,000,000 for a decade and a half. In 1911-12 Nova Scotia gave up her leadership to British Columbia. The following will show the value in 1911-12 of the fish products by provinces for those reporting over \$1,000,000: British Columbia, \$13,677,125; Nova Scotia, \$9,367,550; New Brunswick, \$4,886,157; Ontario, \$2,205,436; Quebec, \$1,868,136; Prince Edward Island, \$1,196,396; Manitoba, \$1,113,486. For 1911-12 the total value of the fish products marketed in Canada was \$34,667,872. Of this amount the sea fisheries contributed \$30,842,875 and the inland fisheries \$3,824,997. The values of the principal fish catches were: salmon, \$10,345,570; cod, \$4,201,760; lobster, \$4,790,203; halibut, \$2,278,824; herring, \$1,973,682. The total number of persons engaged in the industry is slowly increasing, having been 63,700 in 1890, 79,100 in 1903, and 91,132 in 1912. Of this number 65,926 were fishermen, 9056 in vessels and 56,870 in boats. The Dominion since 1882 has paid a bounty for deep-sea fisheries which amounts to nearly \$160,000 annually, almost two-thirds of which goes to Nova Scotia fishermen. In 1903, 25,230 men shared the bounty, and in 1912 the bounty was paid to 25,819 fishermen.

Of the east-coast fisheries, cod and lobster are the most important, each annually exceeding \$4,000,000 in value; the halibut catch exceeds \$2,000,000; the herring fisheries exceed \$1,500,000; and of a large variety of other kinds of fish the most important are mackerel, smelts, sardines, haddock, and hake. In the Great Lakes trout is the most important, followed by pickerel and pike. Whitefish leads in the lakes of Manitoba, and on the Pacific coast salmon is of greatest consequence. The seal fisheries have greatly declined, owing to the award after the Bering Sea Controversy (a.v.). In 1903, 20,496 seal skins (valued at \$307,400) were taken, of which 3865 were from the coast waters of British Columbia and 8161 from the Bering Sea.

In 1911-12 the number of seal skins marketed was 16,444, valued at \$95,284. The best whale-fishing region in the world extends along the north coast, from the mouth of the Mackenzie to Labrador, and vessels from many nations visit it annually. In 1911-12 the number of whales taken was 1244; value, \$391,200. The fishing industry is wisely guarded by the government, through the Minister of Marine and Fisheries. Artificial pisciculture is carried on in 44 hatcheries. There are also 3 sub-hatcheries and 5 retaining pounds for Atlantic salmon. The capital invested in fisheries in 1912 was nearly \$21,000,000.

Agriculture. Dating from the earliest permanent settlement, agriculture has stood pre-eminent among the Canadian industries, and 45 per cent of the population secures its livelihood directly from the soil. The fertile lands of the Maritime and St. Lawrence provinces were early brought under cultivation. On the other hand, the vast productive plains of the far west, owing to their isolation and their real and supposed inclemencies of climate, have only recently been utilized. A large portion of the fertile lands of southern Manitoba were taken up at the close of the nineteenth century, and the occupation and cultivation of the region farther west, now comprised in the provinces of Saskatchewan and Alberta, progress as it is made accessible by the construction of railroads. The practicability of agriculture in this section has been clearly demonstrated, the climatic conditions not being so unfavorable as they were formerly represented. It is only in the northern portions of the plains that the growing crop is endangered by summer frosts. And, though the rainfall is scant, it occurs during the growing spring months, and it is generally adequate for the needs of the crops. The driest portion of the plain is on the western border, but much of this is irrigable and even in its natural state is well adapted to grazing. The government exercises a close supervision over irrigation, and there are several hundreds of miles of ditches and canals.

The Alberta Railway and Irrigation Company holds water rights on the St. Mary, Milk, and Pelly rivers, and has constructed a canal with a capacity of 800 second feet, taking water from the St. Mary River near Cardston, Alberta. It has completed or under construction a system of canals and distributaries aggregating some 25 miles. Much of the work is of a very substantial character and represents an expenditure of some \$1,250,000. At the present time (1914) nearly 100,000 acres are actually irrigated by this system, but when fully developed at least 350,000 acres will be provided with irrigation.

The project of the Canadian Pacific Railway is the largest scheme in Canada. The tract to be irrigated contains some 3,000,000 acres along the main line of the company's railway between Calgary and Medicine Hat, chiefly north of the line. The soil is productive and easily worked, and much of it is well adapted to irrigated farming. Surveys so far indicate that about one-third of the whole tract, or 1,000,000 acres, can be irrigated. For administrative purposes the tract has been divided by north and south lines into three sections of about equal area. For the western and central sections water is taken from Bow River at Calgary. For the eastern section a dam is now (1914) under construction in the Bow River near "Horseshoe

Bend" in the vicinity of Bassano. A fairly complete system of canals and reservoirs has been built in the western section, and the system is being rapidly extended in the central section. From the Great Lakes eastward to the Atlantic the agricultural area is limited only by surface conditions, the climate being very favorable. There is in this area much hilly and broken territory which does not lend itself readily to profitable cultivation. But throughout a large portion of northern Canada, including the greater portion of the Laurentian region, the climatic conditions will never admit of agricultural development. See CLIMATE.

The districts in which agriculture has developed most are Prince Edward Island, the protected valleys of the Annapolis in Nova Scotia and the St. John in New Brunswick, the narrow valley of the St. Lawrence above Quebec City, peninsular Ontario, the Red River valley in Manitoba, and the plains of the Saskatchewan and Athabasca rivers in the provinces of Alberta and Saskatchewan.

In 1911 Saskatchewan, Manitoba, and Ontario were the leading agricultural provinces. Saskatchewan led in the acreage and production of wheat, with 4,704,660 acres and 97,962,000 bushels. Manitoba was second, with 2,979,734 acres and 60,275,000 bushels. The production of oats, in which Ontario had always led, changed in 1911, when, although Ontario had 2,699,230 acres, her yield of 84,829,000 bushels was less by nearly 13,000,000 bushels than that of Saskatchewan, with 2,124,057 acres and 97,665,000 bushels.

Manitoba led in the production of barley, with 433,067 acres, producing 14,477,000 bushels. The total production of barley in 1911 was 40,641,000 bushels, of which Manitoba, Saskatchewan, and Alberta produced 24,043,000. The following table shows for 1911 the total yield of Canada in wheat, oats, and barley, compared with the yield of the three Northwest Provinces (Manitoba, Saskatchewan, and Alberta), both collectively and separately. This shows the tremendous strides of the three provinces in agriculture in a few years.

		Wheat	Oats	Barley
Canada.....	Bu.	215,851,300	348,187,600	40,641,000
	Acres	10,373,958	9,219,920	1,404,352
Northwest Provinces..	Bu.	194,083,000	212,819,000	24,043,000
	Acres	9,301,293	4,563,203	761,738
Manitoba....	Bu.	60,275,000	57,893,000	14,447,000
	Acres	2,979,734	1,260,736	433,067
Saskatchewan	Bu.	97,665,000	97,962,000	5,445,000
	Acres	4,704,660	2,124,057	172,253
Alberta.....	Bu.	36,143,000	56,964,000	4,151,000
	Acres	1,616,899	1,178,410	156,418

The Maritime Provinces, excepting Prince Edward Island, have never entered so extensively into agricultural pursuits, but have become well known for the production of certain crops. Potatoes and turnips receive great attention, and the yield and quality of the product are remarkable. The same is true of the apple crop of the Annapolis valley in Nova Scotia, and, to a less degree, of the St. John valley, New Brunswick. The annual shipments of apples from these provinces, together with those from Ontario and Quebec, are enormous. The Lake Erie coast of

Ontario; and especially that part of the Ontario peninsula between Lake Ontario and Lake Erie, commonly known as the Niagara Peninsula, has become noted for its peaches and grapes. It has been found that larger fruits do not thrive well on the western plains, but throughout the whole of southern Canada and well to the northward various kinds of smaller fruits, particularly berries, thrive abundantly. British Columbia, though not possessed of such large tracts of arable land as the other provinces, can still boast of its greater adaptability for fruit raising, and the production of oats, potatoes, roots, and hops is being extensively engaged in.

On many farms throughout agricultural Canada, particularly in Manitoba, wheat formerly constituted almost the only crop, but more recently there has been a growing tendency towards mixed farming and the raising of cattle and other stock. Canadian stock has a wide reputation for the purity of its breeds, and great care is taken to prevent deterioration. The raising of beef for the English market has long been an important source of revenue. Probably no phase of agricultural development in the east is so remarkable, however, as the dairy industry. In Ontario alone the creameries increased from 74 in 1893 to 265 in 1903, and during the same period the cheese factories increased from 897 to 1126. In 1910 there were in Ontario 1248 factories for the making of butter and cheese. In all the eastern provinces poultry raising is attended to, and the exportation of eggs is very large.

The Dominion government has established the Central Experimental Farm at Ottawa, and four branch farms, respectively at Nappan, N. S.; Brandon, Man.; Indian Head, Sask.; and Agassiz, B. C.; the practical help they render to the farmers, particularly in the direction of diversifying production, is very great. Similar branches known as "experimental stations" have been established at Charlottetown, P. E. I.; Kentville, N. S.; Cap Rouge, P. Q.; Ste. Anne de la Pocatière, P. Q.; Rosthern and Scott, Sask.; Lethbridge and Lacombe, Alta.; and Invermere and Sidney, B. C. The several provinces have encouraged agriculture by grants to societies and fairs, bonuses to creameries and cheese factories, and in various other ways. Scientific instruction in agriculture is provided at the Ontario Agricultural College, Guelph, and the Macdonald Institute at the same place; also at agricultural colleges at Truro, N. S., Winnipeg, Man., and at the Macdonald College at Ste. Anne de Bellevue, P. Q. The following statistical data on Canadian agriculture relate to the Dominion as a whole; for a detailed study of the provinces the reader is referred to the respective articles.

In 1912 the estimated area under field crops was 32,449,420 acres. This is slightly under the previous year, when the acreage was 32,853,074. The decrease was due to bad weather, many farmers being unable to sow their crops; 326,000 acres of fall wheat were destroyed by the severe winter of 1911-12. The decrease in value of crops from \$565,711,600 in 1911 to \$511,951,100 in 1912 was partly due to lower prices. From 1911 to 1912 the three Northwest Provinces (Manitoba, Saskatchewan, and Alberta) showed an increase of 350,697 acres under oats and 48,062 acres under barley, while the acreage under wheat decreased 339,493. The following tables show the area and yield of the

most important field crops for the whole of Canada in 1901 and 1911 and also a comparison in area and yield for the years 1911 and 1912.

Oats, barley, buckwheat, flaxseed, potatoes, turnips, fodder corn, sugar beets, and alfalfa showed an increase in yield, although in some cases the acreage had decreased.

A comparison of the census returns for the leading field products of Canada for 1901-11 will be found below:

	1901		1911	
	AREA Acres	YIELD Bushels	AREA Acres	YIELD Bushels
Wheat.....	4,224,542	55,572,368	10,373,958	215,815,300
Barley.....	871,800	22,224,366	1,404,352	40,641,000
Oats.....	5,367,655	151,497,407	9,219,920	348,187,600
Rye.....	176,679	2,316,793	142,571	2,694,400
Corn.....	360,758	25,875,919	316,104*	18,772,700*
Buckwheat..	261,726	4,547,159	359,367	8,155,500
Peas.....	670,320	12,348,943	287,135	4,536,100
Potatoes...	448,743	55,362,635	459,097	66,023,000
		Tons		Tons
Hay.....	6,543,423	7,852,731	7,903,242	12,694,000

* Does not include fodder corn.

The two census records show a tremendous increase in the yield and acreage of wheat, oats, buckwheat, and barley. Peas, on the other hand, shows a large decrease.

A comparison of the census returns of 1901 with those of 1911 shows that all the grains, with the exception of corn, increased in yield. Wheat increased 146 per cent in acreage and 288 per cent in product; barley increased 61 per cent and 83 per cent respectively; oats, 72 per cent and 129 per cent; rye decreased 19 per cent in acreage and increased 12 per cent in yield; and corn decreased 12 per cent in acreage and decreased 27 per cent in yield. Buckwheat, which decreased from 1891 to 1901, increased in the decade from 1901 to 1911 in both acreage and yield—37 per cent in the former and 79 per cent in the latter.

AREA AND YIELD OF PRINCIPAL FIELD CROPS OF CANADA,
1911-1912

	1911		1912	
	AREA Acres	YIELD Bushels	AREA Acres	YIELD Bushels
Wheat.....	10,373,958	215,851,300	9,758,400	199,236,000
Oats.....	9,219,920	348,187,600	9,216,900	361,733,000
Barley.....	1,404,352	40,641,000	1,415,200	44,014,000
Rye.....	142,571	2,694,400	136,110	2,594,000
Peas.....	287,135	4,536,100	250,820	3,773,500
Buckwheat..	359,367	8,155,500	387,000	10,193,000
Flaxseed....	682,622	7,867,000	1,677,800	21,681,500

Turnips.....	227,141	84,933,000	217,400	87,505,000
		Tons		Tons
Hay.....	7,903,242	12,694,000	7,633,600	11,189,000
Fodder corn..	285,321	2,577,200	278,740	2,858,900
Sugar beets...	20,878	177,000	19,000	204,000
Alfalfa.....	101,781	227,900	111,300	310,000

The area in field crops for Canada fell off from 1911 to 1912 in nearly every instance. There was a decrease in acreage of oats but an increase in yield; wheat, rye, peas, beans, corn, and hay decreased in both acreage and products.

The wealth of the Dominion in farm stock of all kinds is shown in the following table:

FARM STOCK

	1901	1911	1912
Horses.....	1,577,493	2,266,400	2,336,800
Cows (milch).....	*	2,876,600	2,890,100
Sheep.....	2,511,239	2,389,300	2,360,600
Swine.....	2,353,838	2,792,200	2,656,400
Other cattle.....	*5,576,411	4,210,000	4,093,600

* In 1901 all cattle, whether milch or other, were returned as cattle, no distinction being made until 1908.

In 1910 there were, according to the latest official returns available in 1913, in Canada 3625 butter and cheese factories and 11 factories for condensed milk and cream. The number of persons employed in these establishments was 6513, who made 64,698,165 pounds of butter, valued at \$15,645,845, 199,904,205 pounds of cheese, valued at \$21,587,124, and 27,831,596 pounds of condensed milk and cream, valued at \$1,814,871. The total value of all dairy industries for 1910 was \$39,047,840, an increase in the decade of 31.33 per cent. The average selling price of cheese in 1910 was 10.8 cents compared with 10.06 in 1900, and of butter 24.18 in 1910 compared with 20.08 in 1900.

Manufactures. The great abundance of natural resources in Canada, including raw manufacturing material, affords a good basis for the upbuilding of the manufacturing industry. Additional advantages come from the abundance of fuel, particularly in Nova Scotia, where coal is plentiful, and from the widespread facilities for procuring water and electrical power afforded by the numerous rapids and falls characteristic of Canadian rivers. In Ontario electrical power for manufacturing and lighting purposes is now distributed to various towns from power works at Niagara Falls. The extensive forests supply material for the manufacture of furniture, doors, sashes, and other wooden articles. The spruce forests furnish wood pulp for the manufacture of paper. The abundance of hemlock is of great importance, in view of the growing demand for it in the tanning trade. Leather is another article of growing importance. Boot and shoe manufacturing is carried on at Montreal, Quebec, and St. Hyacinthe, a large part of the labor being done by French-Canadian girls. Cottons are manufactured in Quebec and woollens in Ontario. The manufacture of iron and steel products is another rapidly developing branch of industry, most promising in Nova Scotia, because iron ore, coal, and limestone are there found in close proximity. At Winnipeg, Toronto, and a few other points pork packing is carried on, and fish-curing and canning establishments are most numerous in British Columbia. The following statistical data present the salient features of the census of manufactures taken in 1910, compared with those for 1900:

	1900	1910	Increase
Establishments...	14,650	19,218	4,568
Employees on salaries.....	30,691	44,077	13,386
Capital.....	\$446,916,487	\$1,247,583,609	\$800,667,122
Salaries.....	\$23,676,146	\$43,779,715	\$20,103,569
Employees on wages.....	308,482	471,126	162,644
Wages.....	\$89,573,204	\$197,228,701	\$107,655,497
Raw and partly manufactured materials.....	\$266,527,858	\$601,509,018	\$334,981,160
Value of products.	\$481,053,375	\$1,165,975,639	\$684,922,264

The instructions for the census of manufactures of 1901 provided that no factory with less than five persons would be included, except butter and cheese factories and brick and tile works. But the same rule might have been applied to flour and grist mills and electric light plants, and in the census of 1911 the exceptions were extended to include the industries of flour and grist mills, saw and shingle mills, fish-curing plants, limekilns, and electric light and power plants. The merging of small industries continued, and though the number of establishments increased, the increase was not in proportion to the great increase in the value of products. The average value of products per establishment in 1900 was \$32,836, while in 1910 the average had grown to \$60,671.

As was stated above, the rule of the census of 1901 excluding industrial establishments with less than five employees did not apply to butter and cheese factories and to brick, tile, and pottery works. Including all of these, there were in Canada, in 1910, 19,218 establishments with a total capital of \$1,247,583,609 and a total product valued at \$1,165,975,639. The number of salaried officers, managers, salesmen, etc., was 44,077, of whom 6375 were women; and of wage earners, 471,126, of whom 462,725 were employed in the establishments and 8401 outside of them. Of the total number of wage earners working in establishments, 376,872 were men, 72,571 were women, and 13,276 were children under 16 years of age. In 1910 the average number of workers per establishment in the provinces were: British Columbia, 51; Manitoba, 39; Ontario, 30; Saskatchewan, 29; Quebec, 24; Alberta, 24; Prince Edward Island, 9; New Brunswick, 21; Nova Scotia, 19.

Compared with 1900, the most important branches of manufacture in Canada in 1910 were as follows:

working for wages in establishments, male, female, and children under 16; and the number, amount of wages, and average wage of piece workers outside of the establishments.

SALARIED OFFICERS

	MALE			FEMALE		
	No.	Salaries	Average	No.	Salaries	Average
1900	28,540	\$22,994,574	\$806	2,151	\$681,572	\$317
1910	37,702	40,927,955	1,093	6,375	2,851,760	449

WAGE EARNERS EMPLOYED IN ESTABLISHMENTS, INCLUDING CHILDREN UNDER 16

	MALE			FEMALE		
	No.	Wages	Average	No.	Wages	Average
1900	226,663	\$75,626,888	\$334	61,220	\$10,757,590	\$176
1910	376,872	173,435,642	460	72,571	18,970,212	261

CHILDREN UNDER 16

	No.	Wages	Average
1900	12,143	\$1,288,488	\$106
1910	13,282	2,112,648	159

PIECE WORKERS OUTSIDE OF ESTABLISHMENTS

	MALE			FEMALE		
	No.	Wages	Average	No.	Wages	Average
	5,938	\$2,166,683	\$365	2,463	\$543,516	\$221

The census of 1911, which covered the manufactures for the year 1910, was taken on the same basis as the census of 1901; the figures

MANUFACTURES		No. of establishments	Capital	Employees on wages	Wages paid	Cost of material	Value of products
Food products.....	1900	5,594	\$57,167,466	42,401	\$8,032,580	\$99,138,140	\$125,202,620

	1910	423	11,120,403	8,826	4,097,785	5,173,750	14,829,741

The following tables for 1900 and 1910 respectively show the total number of salaried persons, male and female, and the total and the average salary paid each; the number of persons

therefore are comparable and show great increase in every line as compared with the year 1900.

The average wage of the male inworker in

1910 was highest in Manitoba and lowest in Prince Edward Island; of the female, highest in Alberta and lowest in Prince Edward Island.

AVERAGE WAGE OF INWORKERS BY PROVINCES

PROVINCE	Men	Women	Children under 16
Alberta.....	\$577	\$398	\$142
British Columbia.....	496	136	167
Manitoba.....	598	328	140
New Brunswick.....	329	179	132
Nova Scotia.....	370	186	91
Ontario.....	485	260	175
Prince Edward Island.....	154	54	36
Quebec.....	434	267	162
Saskatchewan.....	413	303	114

The whole number of establishments reporting the employment of motive power (water, steam, gas, electricity, etc.) in 1911 was 19,218. The total horse power supplied to all establishments in Canada was 2,898,100, of which over 1,400,000 was electric. The highest average of horse power per establishment was employed in Quebec, and the lowest in Prince Edward Island. The highest aggregate horse power was employed in Quebec and Ontario, and the lowest in Prince Edward Island.

PROVINCE	Establishments	Total horse power	Average horse power
Alberta.....	290	41,766	144
British Columbia.....	651	134,106	206
Manitoba.....	439	65,776	150
New Brunswick.....	1,158	69,490	60
Nova Scotia.....	1,480	104,947	71

Prince Edward Island.....	442	7,405	17
Quebec.....	6,584	1,643,589 *	250
Saskatchewan.....	173	10,907	63

* Includes 1,044,636 horse power supplied to cars, car works, and electric works.

Lumber Industry. The forest area of Canada according to official estimates is between 500,000,000 and 600,000,000 acres. Timber of commercial size covers about three-fifths of this area, divided among the provinces as follows: Nova Scotia, 5,000,000 acres; New Brunswick, 9,000,000 acres; Quebec, 100,000,000 acres; Ontario, 70,000,000 acres; Northwest Provinces (Manitoba, Saskatchewan, and Alberta), 100,000,000 acres; British Columbia, 100,000,000 acres; an aggregate of 384,000,000 acres. The forests are partly under Dominion and partly under provincial control. For many years both the Dominion and the provincial governments have adopted the policy of setting aside forest reserves for the purpose of providing a permanent supply of timber. The total area of the forest reserves increased from 7,413,760 acres in 1901 to 139,068,480 acres in 1912.

From an early day the forests of Canada have been one of her main sources of wealth, and the making of lumber has been a leading factor in the industrial life of the people. In the eastern provinces the trees have been cut from large sections of the country, including almost the whole of Ontario south of the Canadian Pacific Railroad. Formerly little attention was given to judicious cutting, and the approach of the lumberman meant the destruction of the forest. Present laws furnish partial protection. Worse than the onslaughts of the lumbermen has been

the destruction by fires, but an effort is now being made to guard against that also; nevertheless, some of the most valuable varieties of forest trees—notably the white pine—stand in danger of extermination. Only of very recent years in the west have the fine forests of Douglas fir and other useful trees been worked to any extent. The great forests of the country are government property, and a large revenue is obtained therefrom. The lumberman must first buy at auction a license to cut, after which he pays an annual rent on the ground and a royalty on the timber cut. Winter is the cutting season, when the snow affords means of transporting the logs to the streams, and the amount of the winter's yield is therefore dependent upon the duration of the snow. In former years the export of timber to English markets was generally in the log, but more recently mills have been established, and the logs are sawed before shipment. The value of forest products, excluding furs, amounted to \$51,082,000 in 1901 and to \$182,300,000 in 1912. Most of the product from the Great Lake region goes to the United States, while that from the St. Lawrence and Maritime Provinces goes to Europe. White pine and spruce are the most important varieties. The following table shows the variety of timber produced in 1911 and 1912 with value of the products:

VARIETY OF TIMBER	1911	1912
Lumber, lath and shingles.....	\$82,000,000	\$84,000,000
Firewood.....	47,000,000	50,000,000
Pulpwood.....	10,000,000	12,000,000
Posts and rails.....	9,500,000	10,000,000
Cross ties.....	6,000,000	8,000,000
Square timber exported.....	800,000	1,900,000
Cooperage.....	1,800,000	1,700,000
Poles.....	1,100,000	1,200,000
Logs exported.....	800,000	1,100,000
Tanning material.....	900,000	1,000,000
Round-mining timber.....	500,000	600,000
Miscellaneous exports.....	200,000	300,000
Miscellaneous products.....	10,000,000	10,500,000

Transportation and Communication. Canada owes its commercial development in a great measure to its facilities for navigation, particularly on the St. Lawrence River and Great Lakes. These great natural waterways have been further improved by the government by means of a thoroughgoing canal system, so that vessels drawing 14 feet of water can now pass from Lake Superior to the Atlantic. It has been the ambition of the Canadians to make it possible for ocean steamers to pass directly to and from the lakes, but it has seemed impracticable so far to carry it out, and Montreal will probably continue to be the head of ocean navigation. There are six canal systems under control of the Canadian government: (1) between Port Arthur or Fort William and Montreal; (2) from Montreal to the international boundary near Lake Champlain; (3) from Montreal to Ottawa; (4) from Ottawa to Kingston and Perth; (5) Trenton, Lake Ontario, to Lake Huron (not completed); (6) and St. Peter's Canal, from the Atlantic Ocean to Bras d'Or Lakes, Cape Breton. The total length of the canals in these systems is about 1594 miles (statute). The total cost of construction and enlargement, up to March 31, 1912, was \$101,892,862. A project of very great importance is the construction of a canal from

Georgian Bay, in Lake Huron, to the ocean, by way of the Ottawa and St. Lawrence rivers. The proposed route has been surveyed by government engineers, and, should the project be carried out, it would save over three days in inland navigation each way. Of other waterways, the Saskatchewan of the western plains is destined to be of great importance as a means of transportation. It was in early days a canoe route to the Rocky Mountains, and now has steamboats running for long stretches on the North Saskatchewan. Steamboats also run for a long distance on the Red River. The Hudson's Bay Company keeps a line of steamers operating upon the Mackenzie River for the benefit of its posts, and during the brief summer they pass back and forth between the mouth of the Athabasca and the mouth of the Mackenzie. There are also steamboats on the upper Fraser and Thompson rivers. Finally, peopling of the Yukon district caused a frequent steam service to be operated on that river and its larger headwaters, enabling passengers to go to any of the towns along the river by steamboat from the terminus of the White Pass Railroad, at White Horse Rapids, to its mouth. (See ALASKA; YUKON GOLD FIELDS.) Thirty-five steamship lines connect Canadian ports with those of America, Europe, Africa, and the Far East.

The same zeal which has characterized Canada in the utilization of her waterways has led her to still greater efforts for the creation of an adequate railway system. It was realized that intercolonial and transcontinental railways were a necessity, not only for the opening up of the west and the commercial development of the whole country, but more particularly as a political measure, inasmuch as the railways would serve as a bond of union between the provinces. Thus it was that, among others, two of the principal lines—the Intercolonial and Canadian Pacific—were undertaken through government initiative, and the former, as well as the Prince Edward Island Railway, was completed and is still held by the government. The Canadian Pacific, however, as is true of most other lines, was turned over to private hands, the government conferring upon the company a grant of land and a cash subsidy, and the line thus provided for was successfully completed in 1885. With the development of the country the railroads are able to rely more and more on their own resources, although they still seem to be far from a position of entire financial independence of the government. Aid to the railroads has been given by the provincial and municipal governments, as well as by the Dominion.

The following table shows the track mileage of the principal railways:

NAME	Miles operating
Canadian Pacific.....	10,712.4
Canadian Northern.....	4,317.
Grand Trunk.....	3,103.91
Intercolonial and Prince Edward Island	1,732.22
Other railways.....	6,861.47
Total.....	26,727.00

The capital invested in Canadian steam railways on June 30, 1912, was \$1,588,937,526. From 1851 the total value of public aid to steam railways, exclusive of the capital of the two government-owned railways, was \$208,072,074. Of this sum Dominion aid was \$154,075,235;

provincial aid, \$35,945,515; and aid by municipalities, \$18,051,324. In addition to these money grants the railways were also given land to the amount of 56,052,055 acres. The total length of all steam railways in Canada on June 30, 1912, was 26,727 miles, an increase of 1327 miles during the year. Of this amount 83 per cent was built in the four western provinces.

The Canadian Northern system controls approximately 6600 miles of tracks, and the Grand Trunk system about 4765 miles.

During the year 1912 the steam railways carried 41,124,184 passengers and 89,444,331 tons of freight. The operating expenses amounted to \$150,726,540; the gross earnings were \$219,403,753; and the net earnings, \$68,667,213. In 1912, 568 persons were killed and 3780 injured on Canadian railways.

In 1912 the government railways had a total mileage of 1732 miles, of which the Intercolonial had 1462 and the Prince Edward Island 269 miles. The gross earnings of the government roads were \$11,382,184; the operating expenses, \$11,209,850; and the net earnings, \$170,334. Canadian lines connect with those of the United States by bridges across the St. Lawrence, Niagara, and St. Mary's rivers, by tunnels under Detroit River, and at several points on the southwestern frontier. As to regulation of railway rates by the Board of Railway Commissioners of Canada, see RAILWAYS, *Governmental Regulation of Railway Rates*.

The capital invested in Canadian electric railways on June 30, 1912, was \$122,841,946; the mileage, 1308; gross earnings, \$23,499,250; net earnings, \$9,232,576.

Shipping and Navigation. Since 1891 Canadian shipping has markedly declined. The number of vessels on the registry books of the Dominion on Dec. 31, 1904, was 7152, with a net tonnage of 672,838. In 1911 the registered shipping consisted of 4644 sailing vessels and 3444 steamers; total tonnage, 770,466 tons. The following statement shows the number and tonnage of seagoing vessels, vessels (except ferries) trading on the lakes and rivers between Canada and the United States, and vessels employed in the coasting trade in 1912:

SEAGOING VESSELS, 1912

	Number	Tons
Entered.....	16,642	12,768,191
Cleared.....	16,224	11,821,414

VESSELS TRADING ON LAKES AND RIVERS BETWEEN THE UNITED STATES AND CANADA, 1912

VESSELS	ENTERED		CLEARED	
	No.	Tons	No.	Tons
Canadian.....	8,636	7,213,370	8,347	6,238,450
American.....	14,599	7,283,545	15,666	7,648,157

VESSELS EMPLOYED IN COASTING TRADE, 1912

VESSELS	ENTERED		CLEARED	
	No.	Tons	No.	Tons
British.....	90,407	33,756,336	84,314	30,051,735
Foreign.....	775	1,219,340	807	1,244,251

In 1911, of the seagoing vessels entered and cleared, 10,607, with 3,341,998 tons, were Cana-

dian; and 6870, with 12,712,337 tons, were British. Of the total number of lake and river vessels, both entered and cleared, trading between Canada and the United States in 1911 19,063, with 13,038,148 tons, were Canadian and 28,425, with 12,094,211 tons, were American. In 1911, of the vessels employed in the coasting trade, there were entered 108,637, with a tonnage of 46,200,008; cleared, 103,033, with a tonnage of 42,725,112.

Commerce. The foreign trade of Canada shows a remarkable growth. The following table gives the total value (including coin and bullion) of imports and exports, and the total value of imports entered for domestic consumption, for the fiscal years 1871, 1881, 1891, 1901, 1911, and 1912:

YEAR	Total imports	Total exports	Imports for home consumption	Exports of home produce
1871....	\$96,092,000	\$74,173,000	\$86,947,000	\$64,320,000
1881....	105,330,000	98,290,000	91,611,000	83,944,000
1891....	119,967,000	98,417,000	113,345,000	88,801,000
1901....	190,415,000	196,487,000	181,237,000	177,431,000
1911....	492,247,540	297,196,365	461,951,318	274,316,553
1912....	559,320,544	315,317,250	547,482,190	290,223,857

The principal imports for home consumption for 1912 were: iron and steel and manufactures thereof, \$103,262,905; coal and coke, \$39,639,907; wool and manufactures of, \$24,420,165; cotton goods, \$21,351,537; sugar and molasses, \$16,914,748; drugs and chemicals, \$12,918,514; breadstuffs, \$13,433,455; forest products, \$15,201,526.

The principal exports in 1912 were: agricultural produce, \$107,143,375, including wheat valued at \$62,590,563 and wheat flour valued at \$16,034,064; animals and their produce, \$48,219,654, including cheese valued at \$20,888,818; produce of the fisheries, \$16,704,678; forest produce, \$40,892,674; manufactures, \$35,836,284, including wood pulp valued at \$5,094,305; and mineral produce, \$41,324,516.

For the fiscal year ending March 31, 1913, the aggregate trade of Canada was \$1,085,264,449, for the first time being in excess of a billion dollars. Of this the total imports were valued at \$692,032,392 and the total exports at \$393,232,057.

For the calendar year 1913 the total trade of Canada, exclusive of coin and bullion, was \$1,119,578,117, as compared with \$1,015,901,912 for 1912, an increase of \$103,676,205.

Great Britain and the United States are the two most important countries trading with Canada. The following table shows the comparative importance of the two countries to the foreign commerce of Canada, in their relation both as suppliers and as buyers, for the fiscal years 1871, 1881, 1891, 1901, 1911, and 1912:

YEAR	IMPORTS FOR HOME CONSUMPTION, MERCHANDISE ONLY			EXPORTS OF HOME PRODUCE, MERCHANDISE ONLY			TOTAL TRADE WITH	
	Total	Gt. Britain	United States	Total	Gt. Britain	United States	Gt. Britain	United States
1871...	\$84,214,000	\$48,498,000 % 57.58	\$27,185,000 % 32.28	\$55,181,000	\$21,733,000 % 39.38	\$26,715,000 % 48.41	\$70,231,000 % 50.4	\$53,900,000 % 31.5
1881...	90,488,000	\$42,885,142 % 47.39	\$36,338,701 % 40.15	80,921,000	\$42,637,219 % 52.69	\$31,015,109 % 38.32	\$85,522,361 % 49.8	\$67,353,810 % 39.3
1891...	111,533,000	\$42,018,943 % 37.67	\$52,033,477 % 46.65	85,757,000	\$43,243,784 % 50.42	\$34,829,436 % 40.61	\$85,262,727 % 42.2	\$86,862,913 % 40.4
1901...	177,700,000	\$42,819,995 % 24.10	\$107,149,000 % 60.30	177,431,000	\$92,857,525 % 52.33	\$67,983,000 % 38.32	\$135,671,520 % 38.2	\$175,132,000 % 49.3
1911...	451,745,108	\$109,934,665 % 22.12	\$274,844,858 % 60.8	274,316,553	\$132,156,924 % 48.2	\$104,115,823 % 37.9	\$242,091,589 % 33.3	\$378,960,681 % 52.1
1912...	521,448,309	\$116,906,212 % 22.4	\$330,428,502 % 63.3	290,223,857	\$147,240,413 % 50.7	\$102,041,222 % 35.15	\$264,146,625 % 32.5	\$432,469,724 % 53.2

Thus the total volume of commerce with Great Britain has fallen from 50 per cent in 1871 to 32 per cent in 1912, while the total commerce with the United States in the same time has risen from 31 per cent to 53 per cent. From the table it can be seen that, although the greater part of the exports of Canada go to England (50.7 per cent in 1912), much the larger part of the imports (63.3 per cent in 1912) come from the United States. The preferential tariff of 33 $\frac{1}{3}$ per cent in favor of British imports has retarded the falling off in British trade with Canada, but has not completely arrested the downward movement. There has been a falling off of exactly 20 per cent in the total trade between Canada and Great Britain since 1871.

Over 85 per cent of the foreign trade of Canada is with Great Britain and the United States.

The table following shows that the preferential tariff has not very materially affected the trade between Canada and countries other than Great Britain and the United States:

	1873	1891	1901	1912
Germany:				
Imports....	\$1,100,000	\$3,804,000	\$7,021,000	\$11,089,998
Exports....	77,000	532,000	2,142,000	3,577,847
France:				
Imports....	2,023,000	2,312,000	5,398,000	11,744,664
Exports....	32,000	254,000	1,581,000	2,048,768
Belgium:				
Imports....	347,000	655,000	3,828,000	3,686,419
Exports....	18,000	73,000	2,806,000	2,851,044
Newfoundland:				
Imports....	1,809,000	751,000	626,000	1,841,887
Exports....	2,801,000	1,468,000	2,260,000	4,131,602
West Indies:				
Imports....	2,175,000	3,238,000	1,802,000	2,743,801
Exports....	3,988,000	3,123,000	2,906,000	3,161,562
South America:				
Imports....	416,000	720,000	1,048,000	4,910,178
Exports....	1,285,000	1,063,000	1,519,000	4,139,520
China and Japan:				
Imports....	1,663,000	2,123,000	2,450,000	3,109,822
Exports....	46,000	79,000	700,000	900,330

Banking and Banks. Canadian banks are chartered by the Dominion Parliament, and are regulated by the Banking Act of 1890, which is subject to revision every 10 years. In order to be incorporated a bank must have a capital stock of \$500,000, of which at least \$250,000 must be paid up and deposited with the Minister of Finance before it begins business. Each shareholder of a failed bank is liable for a sum

equal to the amount which has been paid on his shares. There were, in 1914, 26 chartered banks, with 2950 branches. In the main the Canadian follows the lines of the Scottish banking system, providing an elastic currency which quickly responds to local needs wherever arising. By their numerous branches the banks gather up the money supply wherever not required for new enterprises and place it at the convenience of localities where most needed. The process is practically automatic, information of local business requirements being constantly sent in from the branches to the head offices, where an accurate survey of the financial field can at any time be taken. By reason of the ramifications of their business in every province, the banks, especially the larger ones, are national institutions and are perforce led to consider the business situation of the country as a whole.

Though the branch managers are allowed considerable independence, applications to them for loans beyond a fixed amount must, as a rule, be referred to the general manager at the head office, in whom supreme responsibility is placed. The banks are empowered to do a general banking business, discounting commercial paper, lending money on collateral security, accepting deposits, and are permitted to issue circulating notes, which are a first charge on their assets, up to the amount of their unimpaired paid-up capital in denominations of \$5 and multiples thereof. Since July 20, 1908, the banks have had a right to issue an emergency circulation during the crop-moving season (October 1 to January 1). The circulating notes, together with Dominion government notes, are practically the only currency, nearly all the gold being held in the bank reserves and silver being used for small change.

The security of the note holder is provided for, and the overissue of circulating notes is prevented, by the law compelling each bank to redeem its notes at its head office and in such commercial centres as are designated by the Treasury Board, whose head is the Minister of Finance. As a guaranty of the redemption of notes of failed banks, each bank must keep on deposit with the Minister of Finance a circulation redemption fund equal to 5 per cent of its average circulation. Banks are required to hold 40 per cent of their reserves in Dominion government notes, but they need not maintain a fixed minimum of cash reserves. Monthly returns are sent to the Finance Minister, and heavy penalties are exacted for false statements made in connection therewith. By the authority of the Bank Act, the Canadian Bankers' Association, an incorporated body in which each bank has one vote, supervises the issue of bank notes and the affairs of a failed bank. The notes of the latter may be redeemed by the Finance Minister out of the assets of the bank or out of the circulation redemption fund. These notes draw interest at 5 per cent from the day fixed for their redemption. An important fact is the solidarity of the Canadian system, the banks acting as a unit in cases of emergency and assuming the leadership and oversight which prevent a panic. The Dominion government maintains post-office savings banks and also savings banks managed by the Finance Department. Trust companies in Canada are not financial institutions. There are only two or three private banks in the Dominion.

The chartered banks of Canada on Dec. 31,

1912, had a total capital of \$114,881,914, with \$1,526,081,158 total assets and total liabilities of \$1,292,451,137. The deposits were \$1,012,418,559. The sum of \$58,219,328 was credited to the depositors in the post-office savings banks and the government savings banks. The post-office savings banks have been in operation since 1867.

Government. By the terms of the British North America Act of 1867, the provinces of Ontario and Quebec, known also as Upper and Lower Canada, joined with the Maritime Provinces of Nova Scotia and New Brunswick to form a federal government under the name of the Dominion of Canada. Since that time the original number of provinces has been increased to nine by the admission of Manitoba, British Columbia, Prince Edward Island, Alberta, and Saskatchewan, the last two formed out of the Northwest Territory which had been purchased from the Hudson's Bay Company; but the constitution drafted in 1864 and embodied in the Act of 1867 is still in force. Based upon the general principle of the definite division of powers between provincial and central governments, the Canadian constitution differs from that of the United States in the fact that all powers not explicitly assigned to the provinces are reserved to the central government. Under the exclusive jurisdiction of the federal legislature are the administration of the public debt and property, the imposition of taxes for general purposes, the organization of the public defense, including the militia; the subjects of banking, paper money, promissory notes, legal tender, currency, and coinage; the regulation of commerce, navigation, and shipping; the coast service, the postal service, census, statistics, patents, and copyright; naturalization, aliens, and Indians; marriage and divorce. The subjects within the scope of the provincial legislatures are, among others, those of taxation for local purposes, the regulation of local commerce, the erection of municipal corporations, the borrowing of money on the credit of the province. On the questions of agriculture and immigration, the federal and the provincial legislatures possess concurrent jurisdiction; but it is provided that in the contingency of a conflict of legislation, the law of the Dominion shall prevail. Although the powers of government have, in this manner, been definitely portioned out, there has been no lack of intrusion on the part of either party into the sphere of the other. On such occasions, when compromise has been found impossible, the principle of the superior authority inherent in the central government has been adhered to. Striking examples of this predominance are the right given the governor-general to disallow within a year any law enacted by the provincial legislatures and the power of appointing the lieutenant governors of the provinces.

The lawmaking power of the federal government is vested in the King of Great Britain or his representative and the Dominion Parliament. The Parliament, the seat of which is at Ottawa, is composed of an upper house, or Senate, and a lower house, or House of Commons. The members of the Senate, who are appointed for life by the governor-general in council, must be subjects of the king, 30 years of age, residing in the province whence they are summoned, and owning property there to the value of \$4000. There are 87 senators, of

whom 24 are from Ontario, 24 from Quebec, 10 from New Brunswick, 10 from Nova Scotia, 4 from Prince Edward Island, 4 from Manitoba, 3 from British Columbia, 4 from Alberta, and 4 from Saskatchewan. The House of Commons is elected practically by manhood suffrage for five years, on the basis of population. Officers of the civil service and government contractors may not sit in Parliament. It is provided that Quebec shall always have 65 representatives in the Commons, and the other provinces a number bearing the same ratio to their population as 65 bears to the population of Quebec. There were, in 1913, 86 members for Ontario, 65 for Quebec, 18 for Nova Scotia, 13 for New Brunswick, 10 for Manitoba, 7 for British Columbia, 4 for Prince Edward Island, 7 for Alberta, 10 for Saskatchewan, and 1 for Yukon Territory, a total of 221.

The executive power is vested in the King of England or his representative (the governor-general) and a privy council composed of a premier, who is likewise president of the privy council, 14 heads of departments, and 3 ministers of the cabinet, but without portfolios. The ministerial departments are those of State, Trade and Commerce, Justice, Marine and Fisheries, Railways and Canals, Militia and Defense, Finance, Posts, Agriculture, Public Works, Interior, Customs, Inland Revenue, and Labor. The relations of the executive to the legislature, and of the two branches of the legislature to each other, are the same as those of parliamentary government in Great Britain. The governor-general is guided by his ministers, who in turn are responsible to the House of Commons; and though the executive may reserve a law for the consideration of the home government, or disallow it altogether, the latter right is in practice never exercised, and the former is employed only when a measure concerns the interests of the Empire at large and tends to affect the relation of the Imperial government to foreign powers. Within Parliament the predominant power is wielded by the popular chamber. Not only must money bills originate in the Commons, but the Senate may not even amend a bill from the Lower House; its power of rejection is seldom employed, and though it possesses the right of initiative in many matters, its share in originating legislation is quite inconsiderable.

Of the provincial governments and of the differentiation between their scope of authority and that of the federal government, it may be said that in general they are endowed with the full power of control over local affairs, subject only to the consideration of the general welfare of the Empire. A detailed description of provincial governments will be found under the names of the several provinces. For the system of municipal government in Canada, see MUNICIPAL GOVERNMENT.

The judicial branch of the federal government consists of a supreme court at Ottawa, with appellate civil and criminal jurisdiction throughout the Dominion, and an exchequer court with powers of admiralty. There are no inferior federal courts, but the central government avails itself of the judicial machinery in each of the provinces, which comprises a superior court, county courts, police magistrates, and justices of the peace. To be precise, however, the superior and county courts are not exclusively provincial tribunals, in that their judges are ap-

pointed by the governor-general in council. The penitentiaries, too, are under the care of the federal government.

Army. The king is the commander in chief of the naval and military forces, but the control of them is in the hands of the Dominion Parliament. The Militia Act of 1868 was subsequently amended, especially in 1904, when a new Militia Act was passed, which intrusts the defense of Canada to all males between 18 and 60, excepting exempted or disqualified persons. The act places the Canadian land forces under a militia council, with the Minister of Militia and Defense as president. The council includes a civil member, four military members, and a financial member. There is also an inspector general, whose duty it is to inspect the forces and to report to the Minister of Militia and Defense in council on their readiness for war. The militia is divided into an active force serving for three years, and a reserve force, which includes all nonactive citizens liable to service. The active militia is raised by voluntary enlistment or by ballot. The new organization, exclusive of the permanent militia force, is designed to form peace training establishments which contain all the officers and noncommissioned officers of corps and part of the rank and file, and which, when expanded to war strength, constitute the first line of defense. They provide for enough officers and noncommissioned officers to train the corps to be formed in war time as duplicates of those sent to the front. These duplicates are the second line of defense. The permanent forces of Canada consist of 3118 officers, noncommissioned officers, and men. The active militia consist of 5259 officers and 60,755 noncommissioned officers and men. There are two royal schools of artillery, one of cavalry, one of mounted rifles, and five of infantry; also the Royal Military College at Kingston, Ontario, with a staff of nine professors and five instructors. The British garrison at Halifax, N. S., and the naval station at Esquimalt, B. C., were in 1905-06 abolished, and the control of both places was handed over to the Dominion government.

Navy. In 1910 the Naval Service Bill became a law. The act resembles the Militia Act, except that the naval service is to be voluntary, whereas the military law makes all males between 18 and 60 liable to military service. The bill provides for a Naval Service Department under the Department of Marine and Fisheries. The Royal Naval College has been established at Halifax, N. S. Two protected cruisers are being used for the training of officers and men—the *Niobe* at Halifax, N. S., and the *Rainbow* at Esquimalt, B. C. On March 31, 1911, the naval force consisted of 223 men. In 1913, while the Naval Service Bill remained in force, the *Niobe* and *Rainbow* were put out of commission.

Finances. The financial accounts of the Dominion of Canada are made up under three different headings, as follows: first, "Consolidated Fund," comprising general revenue and expenditure; secondly, "Loans" in revenue, and "Redemption" with "Premiums and Discounts" in expenditure, comprising the deposits and withdrawals from the post-office and government savings banks, the amount on deposit forming part of the floating or unfunded debt of the country; and, thirdly, "Open Accounts," comprising investments, trust funds, province

accounts, and capital expenditure on public works. The general revenue and expenditure, or Consolidated Fund, for the fiscal year ending June 30, 1912, were: receipts, \$136,108,217; expenditure, \$98,161,441. The chief items of revenue were: customs, \$85,051,872, and internal revenue (excise), \$19,261,662; post office, \$10,492,394; and railways, \$11,034,166. The chief items of expenditure were: interest on public debt and sinking funds, \$13,863,209; public works, \$10,344,487; collection of revenue, \$28,256,780; and defense, \$7,580,600. The net public debt of Canada on March 31, 1912, was \$339,919,461.

Population. In 1760 the French population amounted to about 70,000, confined to the immediate vicinity of the lower St. Lawrence and its tributaries; in 1791 Upper Canada had about 20,000 inhabitants and Lower Canada about 125,000. In 1861 the total population, exclusive of Indians, was 3,090,561; in 1871, 3,689,257. The population in 1911 was 7,204,838. The following table shows the growth of population for Canada and its provinces and territories from 1901 to 1911:

PROVINCES	1901	1911	Increase	Increase per cent	Land area square miles
Alberta.....	73,022	374,663	301,641	413.08	252,925
British Columbia.....	178,657	392,480	213,823	119.68	353,416
Manitoba.....	255,211	455,614	200,403	78.52	231,926
New Brunswick.....	331,120	351,889	20,769	6.27	27,911
Nova Scotia.....	459,574	492,338	32,764	7.13	21,068
Ontario.....	2,182,947	2,523,274	340,327	15.58	365,880
Prince Edward Island.....	103,259	93,728	-9,531	-9.23	2,184
Quebec.....	1,648,898	2,003,232	354,334	21.46	690,865
Saskatchewan.....	91,279	492,432	401,153	439.48	243,382
Yukon.....	27,219	8,512	-18,707	-68.73	206,427
Northwest Territories.....	20,129	18,481	-1,648	-15.79	1,207,926
Totals for Canada.....	5,371,315	7,206,643	1,835,328	34.17	3,603,910

In 1911 the density of the population of Canada per square mile was 1.93. The density of population per square mile of the provinces in that year was as follows: Alberta, 1.47; British Columbia, 1.09; Manitoba, 6.18; New Brunswick, 12.61; Nova Scotia, 22.98; Ontario, 9.67;

Quebec, 78,190, per cent 14; Halifax, 46,619, per cent 14; London, 46,300, per cent 22; Calgary, 43,704, per cent 894.

The increase of population is thus seen to have been smallest in those eastern provinces which have been settled by a population chiefly of British descent—there being in one case, that of Prince Edward Island, an actual decrease—and highest in the western region, where the mining and agricultural development attracted a large stream of population. In the last few years of the nineteenth and the opening years of the twentieth century there set in a large tide of agricultural settlers towards the Northwest Territories, resulting in the creation of two new provinces, Saskatchewan and Alberta, in 1905.

The populations of Alberta and Saskatchewan within their present limits were, respectively, 73,022 and 91,279 in 1901. According to the census of 1911 there were in the Dominion 1,586,154 foreign-born inhabitants, of whom 784,526 were born in Great Britain and 48,896 in other parts of the British Empire, 303,680 in the United States, 121,430 in Austria-Hungary, 100,971 in Russia, 49,194 in Norway and

Sweden, 39,577 in Germany, and 34,739 in Italy. The following table shows the volume of immigration into Canada, by provinces, during the fiscal years 1901-05 and 1912. In the returns for 1912 the two new provinces of Alberta and Saskatchewan appear.

DESTINATION OF IMMIGRANTS FOR FISCAL YEARS 1901-05 AND 1912

PROVINCES	1901	1902	1903	1904	1905	1912	Totals
Maritime Provinces.....	2,144	2,132	5,821	5,448	4,128	15,973	35,826

Prince Edward Island, 42.91; Quebec, 5.69; Saskatchewan, 1.95.

Cities.—The per cent of urban population increased greatly from 1901 to 1911. Winnipeg, Vancouver, and Calgary had the highest rate of increase during the last decade. The following gives the population of the principal cities, as returned by the census of 1911 and the per cent of increase: Montreal, 470,480, per cent 76; Toronto, 376,538, per cent 81; St. John, 42,511, per cent 4; Winnipeg, 136,035, per cent 221; Vancouver, 100,401, per cent 272; Ottawa, 87,062, per cent 45; Hamilton, 81,969, per cent 56;

During the fiscal years 1901-04 there settled in Canada 139,077 from the United States, 121,235 from the United Kingdom, 15,562 from Russia and Finland, and 6885 from Germany. During the calendar year 1905, 144,618 immigrants arrived in Canada. Of these 64,863 came from Great Britain, 44,424 from the United States, and 35,331 from continental Europe. During the calendar year 1912 the total number arrived was 395,804. Of these 145,859 were from the United Kingdom, 140,143 from the United States, and 109,802 from other countries. During the calendar year 1913 the total number

arrived was 418,870. Of these 156,984 were from the United Kingdom, 115,751 from the United States, and 146,135 from all other countries.

The following table shows the rate per 1000 of population of the births and deaths in the census years 1891, 1901, and 1911, the excess of the birth rate over the death rate giving the natural increase of the population for those years:

YEARS	Birth rate	Death rate
Canada:		
1891.....	28.95	14.10
1901.....	27.82	15.12
1911 (not reported).....
British Columbia:		
1891.....	23.16	13.94
1901.....	15.36	9.78
1911.....	14.88	5.56
Manitoba:		
1891.....	23.53	10.36
1901.....	31.07	12.21
1911.....	34.93	22.91
New Brunswick:		
1891.....	27.70	13.36
1901.....	25.98	11.54
1911.....

Manitoba.....	15,918	5,177	5,481
Saskatchewan.....	8,745	3,511	2,727
Alberta.....	8,813	3,630	3,618
British Columbia.....	5,841	4,509	3,660
Yukon.....	48	41	87

The population of Canada includes a large variety of race elements, and the process of amalgamation has been much less active than in the United States. The great expanse of area

and the sparseness of the inhabitants admit of isolation, and are largely responsible for the comparative lack of amalgamation. The French, who were the first settlers, located principally along the St. Lawrence in what is now the Province of Quebec, and their descendants still constitute a large majority of the inhabitants of that province. In the determination of the policy of the British government formerly, and of the Dominion to-day, the presence of this French element has been and is a main consideration. The French language is still commonly spoken and is often heard even in the Dominion Parliament. The French were the hunters and trappers of the early days, and in this capacity scattered throughout the vast domain, mingling freely and amalgamating with the Indians, which accounts for the population of half-breeds so largely represented in Manitoba and the Northwest Territories. The French Canadians are well represented also in the recent western colonization. In the other eastern provinces people of British descent are in the great majority—the Scotch in Nova Scotia and the English in the other three. The Irish are well represented in the larger cities. The eastern townships of Quebec and parts of Ontario, Nova Scotia, and New Brunswick were settled by Loyalists from the revolted American Colonies, who emigrated there during or following the time of the American Revolution. Ontario received a contingent of the New England opponents of the War of 1812.

In 1911 the Indians in Canada numbered 105,592; in 1913 they numbered 109,937. The care of the Indians is in the hands of the Indian Department of the Dominion government, which has special officers looking after Indian affairs in each province. Reservations are provided for the tribes, but the Indians are not necessarily confined to them. Special provisions, such as annuities and financial assistance, are provided for the Treaty Indians. Others, however, such as those of British Columbia, successfully support themselves. Acts passed by the chiefs and councilors for the regulation of local affairs may be enforced if approved by the government. Rights of franchise and full citizenship are given the tribes as they become sufficiently advanced in civilization. Much progress is being made in this direction, especially by the tribes of British Columbia, yet hunting and fishing remain their chief occupations, though they work in many saw mills, fisheries, etc. Intertribal conflicts are of rare occurrence, nor has their relation with the general government been characterized by so great a degree of friction as has prevailed in the United States.

Religion. There is no state church, but to the Roman Catholic church in Quebec are guaranteed the privileges enjoyed previous to British possession. This church was the first and for a long time practically the only church in the Canadian territory, and still includes the great mass of the population of Quebec, and over two-fifths of the total church membership of the Dominion and 39.71 per cent of the total population. The Catholics are of least relative importance in Ontario, Manitoba, and Alberta. The Presbyterians, Methodists, and Anglicans rank next in order of importance. While all these are well distributed throughout the various provinces except Quebec, the Methodists are far in the lead in Ontario, but are exceeded by the Presbyterians in some of the other provinces,

particularly Nova Scotia. Neither of the two latter denominations is divided into numerous factions, as in the United States. Of other denominations, the Baptists and the Lutherans are the strongest. The leading sects have each one or more divinity schools. The following table gives the membership of the leading denominations:

DENOMINATIONS	1891	1901	1911	Per cent of total pop., 1911
Anglicans.....	646,000	681,494	1,043,017	14.47
Baptists.....	257,400	318,005	382,666	5.31
Baptists (Freewill)..	45,100			
Congregationalists..	28,100	28,293	34,054	.47
Lutherans.....	63,900	92,524	229,864	3.19
Methodists.....	847,700	916,886	1,079,892	14.98
Presbyterians.....	755,300	842,442	1,115,324	15.48
Roman Catholics...	1,992,000	2,229,600	2,833,041	39.31

Education. There is no centralized system of education for the whole Dominion, each province being left to control its own educational matters. In all provinces the schools are free, and in most provinces attendance is compulsory. Local trustees are elected to look after the separate schools, but a careful supervision is exercised by the provincial superintendent and his council. Alberta, British Columbia, Manitoba, Ontario, and Saskatchewan each has a Minister of Education, who is a member of the provincial cabinet. Especially noteworthy is the thorough and comprehensive school system of Ontario. In provinces where Catholics have a strong representation (Quebec, Ontario, and Manitoba) the denominational problem has been the most important one that has confronted the educational system, and in the case of Manitoba it has been of a highly perplexing nature. In Quebec there is a complete cleavage between Protestants and Roman Catholics, extending even to the council of public instruction, which is divided into Catholic and Protestant committees, the former committee being controlled by Roman Catholic bishops. In Ontario the educational council is not divided, but either Protestant or Roman Catholic authorities, under certain conditions, can establish separate schools. In Manitoba there are no separate schools, but religious instruction may be given to those pupils whose parents may demand it. The expense of the schools is met by government grants and local taxation, the latter covering more than two-thirds of the expenditure for all the provinces, but differing greatly from province to province. In Ontario there are separate schools for Roman Catholics, and in Quebec for Protestants. In other provinces the schools are nonsectarian. The following table gives the number of public schools, teachers, pupils, and expenditure for 1911:

PROVINCES	Year ended	Schools	Teachers	Pupils	Expenditures
Ontario.....	Dec., 1910	6,575	11,873	514,774	\$10,979,268
Quebec.....	June, 1911	6,896	13,238	397,060	6,224,146
Nova Scotia..	July, 1911	2,657	2,855	104,994	1,329,674
New Brunswick	June, 1911	1,186	1,991	69,327	286,275
Manitoba.....	Dec., 1910	2,227	2,774	76,247	4,000,671
Brit. Columbia	June, 1911	533	1,163	44,945	2,641,522
P. E. Island...	June, 1911	478	591	17,397	181,177
Alberta.....	Dec., 1910	1,195	1,610	55,307	3,362,394
Saskatchewan.	Dec., 1910	1,925	2,726	65,382	3,655,428

Higher Education in Canada. In the development of higher education in Canada the racial differences and political conditions of early settlement produced strikingly contrasted results. After the establishment of British rule in Lower Canada (now the Province of Quebec), the French clergy, armed with a spiritual authority that included the educational supervision of their parishioners, adopted an attitude which has ever since shaped the character of the French-Canadian colleges and universities according to the doctrines and polity of the Roman Catholic church. To Upper Canada (now Ontario), and to the provinces of Nova Scotia and New Brunswick, there was a notable emigration of United Empire Loyalists from the United States during 1783-88. This was succeeded by an influx of English, Scotch, and Irish during the first half of the nineteenth century. From these two sources distinct and often contradictory tendencies in higher education were manifested with as much emphasis as in the case of French Canada. In the latter, elementary education was mostly religious; while in the early English-speaking provinces the common school was founded by the United Empire Loyalists on the New England pattern. In the founding of universities and colleges religious differences became at first even more numerous and accentuated, and remained so until toleration and the development of broader ideas as to university functions prepared the way for extensive changes. Canada has 21 universities and about 60 colleges, divinity schools, normal schools, conservatories of music, etc. There are also in the Province of Quebec a number of classical colleges under the control of the Roman Catholic hierarchy, and nearly all of them are in affiliation with Laval University. Several high-class technical schools have been established in Toronto.

Laval University, in Quebec, the outgrowth of the seminary founded by the famous Bishop of that name in 1663, and definitely established as a theological seminary in 1852, best illustrates the type of higher education prevalent in French Canada. In this university, as in its branch of the same name at Montreal, the appointment and removal of professors and the regulation of the curriculum are under ecclesiastical control. The dominant consideration is that the Roman Catholic church shall maintain in the college and university as complete supervision of doctrine and discipline as it does in the elementary separate school. The royal charter under which Laval University was founded observed the spirit and letter of the Treaty of 1763, by which the British government had guaranteed to French Canada the continued enjoyment of its religious privileges.

In English-speaking Canada the origin and development of universities illustrate (1) denominational exclusiveness and control; (2) the abolition of denominational tests and the growth of a more comprehensive university idea; (3) establishment of universities as provincial institutions to which colleges and universities originally sectarian have become affiliated; (4) the tendency of the strictly denominational college and university to emphasize the teaching of theology. It is not meant that these changes have characterized all the Canadian institutions of higher education, but they have been sufficiently numerous and influential to indicate cer-

tain general principles of progress. The University of Toronto, e.g., was founded as King's College in 1827; but its attempted control by sectarian persons aroused such opposition that religious restrictions were abolished, and the university became an unsectarian institution, representing the whole province, possessing teaching as well as degree-conferring powers, and having a large number of affiliated colleges. Women are admitted to its degrees. With it are federated Trinity (Anglican) and Victoria (Methodist) universities and St. Michael's College (Roman Catholic); and in affiliation with it are the theological colleges of Knox (Presbyterian), Wycliffe (Anglican), besides three conservatories of music and agricultural, dental, veterinary, and pharmaceutical colleges. McGill University, Montreal, founded in 1821 by private bequest and reorganized in 1852, is the chief university of the English-speaking population of Quebec. Its faculties of medicine and of practical and applied science are remarkably well organized. It presents a record of steady and unfettered growth under the combined influence of public-spirited citizens and far-sighted educators. With it is incorporated Macdonald College, at Ste. Anne de Bellevue, and in affiliation with it is the Congregational College of Canada and other educational institutions. McGill University has established a branch, named the McGill University College of British Columbia, with classes leading to degrees, at Vancouver and Victoria, B. C.

Of universities denominational in origin but unsectarian in requirements of admission may be mentioned Queen's (Presbyterian), Victoria (Methodist), McMaster (Baptist), Ottawa (Roman Catholic), Acadia (Baptist), Trinity (Church of England), New Brunswick (Church of England), now the provincial university, and Mount Allison (Methodist). Of these Victoria and Trinity have been federated with Toronto University. The University of King's College (Church of England), Nova Scotia, is an example of a Protestant and strictly denominational institution, which retains much of the character of its original foundation. The University of Bishop's College, Lennoxville, P. Q., though probably not so strictly denominational as King's College, leans towards that educational type. Dalhousie University at Halifax is undenominational and the most important seat of learning in the Maritime Provinces. Mention should also be made of the Western University and College, London, Ont., and the University of St. Francis Xavier's College, Antigonish, N. S. In some of the denominational institutions that are affiliated with such universities as Toronto and McGill, theological teaching retains a distinctive character and importance; and besides these there are several colleges which are chiefly or exclusively theological: St. John's, Wesley, St. Boniface, and Manitoba colleges, in Manitoba; Huron, Wycliffe, and Knox colleges, in Ontario; Congregational, Presbyterian, Wesleyan Theological, and Montreal Diocesan Theological, in Quebec; King's and Presbyterian colleges, in Nova Scotia; Alberta (Methodist), Robertson (Presbyterian)—both in affiliation with the University of Alberta—the Lutheran College, and Mount Royal College (Methodist) in the Province of Alberta; Ryerson College (Methodist), Latimer Hall (Anglican), Westminster Hall (Presbyterian), St. Mark's Hall (Anglican), Okanagan (Baptist), in British

Columbia; and Regina College (Methodist) in the Province of Saskatchewan.

In the newest portions of Canada the lesson and benefit of higher educational development in the older provinces were signally manifested in the organization of the University of Manitoba, which was founded in 1877, seven years after the province was constituted. The idea of a university which was to be not only an examining and degree-conferring body, but also in large part a teaching body, was speedily realized. With it are affiliated the denominational colleges of St. Boniface (Roman Catholic), St. John's (Anglican), Manitoba (Presbyterian), Wesley (Methodist), the Manitoba Medical College, and the Manitoba College of Pharmacy. The provincial universities of Alberta, British Columbia, and Saskatchewan are, in educational breadth and inclusiveness as well as in organization, similar to the University of Manitoba. The University of Calgary is likewise free from sectarian requirements. The Canadian universities, excepting those under Catholic control, are democratic in their form of government, and the majority admit women to their degrees. Organization for specialized research has thus far been undertaken chiefly in Toronto and McGill universities.

The principal scientific and art societies are the Royal Society of Canada; Ontario Society of Artists; Royal Canadian Academy of Arts; Law Society of Ontario; Natural History Society of Montreal; Canadian Society of Civil Engineers; Royal Canadian Institute, Toronto; Royal Ontario Museum; Nova Scotia Institute; Institut Canadien de Quebec; Natural History Institute, New Brunswick; Geographic Board of Canada, Ottawa; Scientific and Historical Society, Winnipeg; and Society of Natural History, Victoria, with a fine local museum.

Decrease of Illiteracy. From 1891 to 1901, and from 1901 to 1911, there was a notable decrease of illiteracy in Canada. The census returns of 1891 gave a population of 4,279,634 persons five years old and over. Of these 3,176,667 could read and write, and 207,126 could read only. There were, therefore, 3,383,793 persons who could read, or 79.1 per cent of the population of five years and over. The census returns of 1901 gave a population of 4,728,631 persons of five years old and over. Of these 3,918,915 persons could read and write, and 129,584 could read only. There were, therefore, 4,048,499 persons who could read, or 85.6 per cent of the population five years old and over. Thus there was not only a marked decrease of illiteracy, but there was also a very great decrease in the number of literate persons who could read only. The census of 1911 shows 6,319,160 persons five years old and over. Of these 5,622,844 can read and write; 32,863 can read only. The total who can read, 5,655,787, or 89.5 per cent of the total population—a gain of nearly 4 per cent. There was a greater decrease, in the number that could read only, than during the decade from 1891 to 1901.

The decrease of illiteracy was absolute as well as relative in the provinces of New Brunswick, Nova Scotia, Ontario, Prince Edward Island, Quebec, and in the Yukon Territory, being most marked in the eastern provinces; in the western provinces, on the other hand, the decrease was only relative, there being an actual absolute increase in the number of illiterates, due to the

great increase in population. The following table shows, by provinces, the number of illiterates, and their relation to the total population, in the two census years 1901 and 1911:

POPULATION FIVE YEARS OLD AND OVER IN 1901 AND 1911

PROVINCES	CANNOT READ OR WRITE			
	Year	Number	Per cent of total	Total
Alberta.....	1901	19,116	30.56	62,554

History. It is probable that Bjarni Herjulfson (q.v.), a Norseman, sighted the coast of Canada, opposite Greenland, in 986, and that Leif Ericson sailed along a considerable part of the east coast in 1000. John Cabot (q.v.) in 1497 reached the shores of the New World in the neighborhood of the Gulf of St. Lawrence. It is upon this voyage that England subsequently based her claim, in part, to the whole of North America. For the most part, however, the territory included within the present Dominion, excluding the former Northwest Territories and the Hudson Bay country, was explored and first settled by the French. Basque and Breton fishermen began to visit the eod banks of Newfoundland as early as 1504; Denys of Honfleur and Aubert of Dieppe explored the Gulf of St. Lawrence in 1506 and 1508, respectively; in 1518 the Baron de Léry attempted to found a colony in America and left some cattle on Sable Island; and in 1524 Verazzano sailed along the coast of North America from the thirty-fourth to the fiftieth parallel of north latitude. In 1534 Jacques Cartier (q.v.) entered the St. Lawrence and at Gaspé took formal possession of the country in the name of the King of France; and on a second voyage, in 1535-36, he ascended the river as far as Hochelaga (Montreal) and wintered at Stadaconé (Quebec). While passing up the gulf, he entered the present Pillage Bay and gave it the name St. Lawrence, which was afterward extended to the gulf and the river. Jean François de la Roque, Sieur de Roberval (q.v.), with the assistance of Cartier, made an abortive attempt to establish a colony at Cape Rouge in 1541-43. The Marquis de la Roche received a commission from the King as lieutenant general of Canada, and in 1598 failed in an effort to colonize New France, but left a number of his convict crew on Sable Island; and in the following year Pontgravé and Chauvin established a short-lived settlement at the mouth of

the Saguenay. In 1603 Champlain made the first of his voyages to Canada, and his name is inseparably connected with the history of New France from that date until the time of his death, in 1635. (See CHAMPLAIN, SAMUEL DE.) In 1604 he assisted Pierre du Guast, Sieur de Monts, in bringing out a colony which first settled on Dochet Island, in the St. Croix, and in the following year was moved to the site of the present Annapolis in Nova Scotia (q.v.). This colony was broken up temporarily by the English under Samuel Argall in 1613, and the first permanent settlement in Canada was made at Quebec in 1608 by Champlain, who within the next few years discovered lakes Champlain (1609), Huron (1615), and Ontario (1615), established a temporary trading post at Montreal (1611), and by taking part with the Hurons and Algonquins, the original inhabitants of Canada, against the Five Nations, in 1609 and 1615, committed France to a policy which was to be of the greatest significance in the history of New France, since it aroused the enmity of the powerful Iroquois, who united first with the Dutch and then with the English, and frequently thwarted the French in their schemes of expansion and conquest. In addition to making numerous inroads upon the settlements of the French themselves, they in time virtually annihilated the Hurons, who had allied themselves to France. "They ruined," says Parkman, "the trade which was the lifeblood of New France; they stopped the current of her arteries and made all her early years a misery and a terror." The French governors repeatedly attempted to overcome the confederacy and at times seemed on the point of meeting with success; but in spite of severe reverses and of the occasional destruction of their towns, the Iroquois continued to stand as a barrier to French encroachments and as a protection to the English colonists, though, largely as a result of the vigorous policy of Frontenac (q.v.), the ablest of the French governors after Champlain, their aggressions and inroads virtually ceased in the beginning of the eighteenth century. Catholic religious orders enthusiastically aided the colonizing energy of the French. In 1625 several Jesuits arrived at Quebec, and for almost half a century thereafter the order had a preponderating influence over secular as well as religious affairs, insomuch that during the early period of its history New France was in many respects essentially a mission. The Recollet fathers, the Sulpicians, and the Ursulines were scarcely less zealous to build up a Catholic New France. It was the misfortune of the Jesuits to acquire a predominant influence over the Hurons, whose virtual destruction in 1649 by their inveterate enemies, the Iroquois, involved the martyrdom of heroic missionaries. The affairs of the colony having been grossly mismanaged in the first two decades, Richelieu, in 1627, organized the Company of New France, better known as the Company of the Hundred Associates—a corporation which, under the quasi supervision of the crown, virtually ruled the whole of New France until 1663, besides exercising a monopoly over the immensely valuable fur trade. In 1642 Montreal was permanently founded by a company of religious enthusiasts headed by the Sieur de Maisonneuve, and in 1659 Laval-Montmorency (q.v.), the titular Bishop, by papal appointment, of Petrea in Arabia, was placed at the head of the Catholic church in New France, in

which capacity he had a powerful influence for many years over civil as well as ecclesiastical affairs.

In 1663 Louis XIV dissolved the Company of New France and placed Canada under the direct control of the crown, though for 10 years thereafter (1664-74) a new corporation, the Company of the West, exercised a virtual monopoly over the trade of the colony. Under the royal government, which lasted until 1760, the affairs of New France were administered by a governor, an intendant, and a superior council, all appointed by the crown, the governor being empowered to command the troops, conduct negotiations with foreign colonies and Indian tribes, and supervise all matters of administrative routine; the intendant to preside at the council, exercise independent legislative and judicial power, and supervise the expenditure of all public moneys, besides acting virtually as a spy on the governor; and the supreme council, composed of the governor, the intendant, the bishop, and five, later seven, and still later 13, councilors, to issue decrees for the government of the colony in civil and fiscal affairs, and to sit in judgment on various civil and criminal causes. The distinctive features of the government of Canada throughout the French régime were absolutism and paternalism, the individual settler being robbed of all initiative and forced to look for everything to the general government, which habitually intervened in the most trivial affairs of everyday life. During the period of royal control the celebrated feudal system of Canada, first established by Richelieu and based, with important modifications, upon the system which had obtained in ancient France, took definite form. Large grants, called *seignories*, were made to men of rank or prominence, known as *seigneurs*, who held, in many cases directly from the crown, by the "tenure of faith and homage," and who, in turn, made smaller grants to the *habitants* or *censitaires*, whose tenure rested upon their payment of annual rentals in money or produce, and in some cases upon their rendering to their overlords certain feudal services, such, e.g., as the *corvée*. The settlements, called *côtes*, were almost uniformly made along streams, the houses being built in long lines, instead of being arranged around a common centre, as was the case in many of the New England villages—each *habitant* receiving a narrow strip of land, fronting on a river or creek and extending for a considerable distance to the rear. The system was not interfered with at the time of the English conquest in 1760, and survived in Lower Canada (Quebec) until 1854, when it was finally abolished. The virtual monopoly enjoyed by the Company of the West did little more than that of its predecessor, the Company of the Hundred Associates, to establish a permanent commerce. The French King revoked the company's charter in 1674.

With the English colonists to the south the inhabitants of New France came into conflict during the last part of the seventeenth century. Such events as the destruction of the French settlement at Port Royal by Argall in 1613 and the capture and occupation of Quebec by David Kirke in 1629-32 may be regarded as sporadic; but with the outbreak of the first of the so-called French and Indian wars in 1689, the long contest between the French and English for supremacy in North America was initiated. (See

KING WILLIAM'S WAR; QUEEN ANNE'S WAR; KING GEORGE'S WAR; FRENCH AND INDIAN WAR.) Of these wars the first two especially, 1689-97 and 1702-13, may be differentiated from the last as being essentially the fighting out of European quarrels on American soil. On the part of the French the conflict took the form of sudden raids, with the help of their Indian allies, on the frontier settlements of New York and New England. Though no important victory was gained on either side, the English nevertheless acquired by the Treaty of Utrecht (1713) Acadia, Newfoundland, and the Hudson Bay Territory. Thirty-five years of peace followed, marked by rapid development both among the French and the English. The tide of English colonization, breaking through the passes of the Alleghanies, was checked by the French, who had made themselves masters of the great rivers of the west. The war which broke out in 1754 was essentially American, and though it later merged into the greater struggle of the Seven Years' War, the stake between England and France was the mastery in America. In the French and Indian War Canada experienced both the advantages and disadvantages of the absolute system of government under which it lived. Against the armies of Great Britain, weakened by incapacity on the part of their commanders and constant friction between British officers and the Colonials, it presented a force of trained fighters, under officers, for the most part, acquainted with the nature of the country, more skilled in forest lore and knowledge of Indian character. This would account for the ill success of the English during the first part of the war. When it came, however, to a test of endurance between the combatants, Canada, with its sparse population of fur traders and forest rangers, could never hope to hold out against the English colonists, if, as was the fact, it was forced to depend for help on distant France, with the British holding the mastery of the seas. The capture of Quebec by Wolfe in September, 1759, practically ended the war. By the Treaty of Paris (q.v.) in 1763, Canada, together with all the territory between the Alleghanies and the Mississippi River, claimed by France, was ceded to Great Britain.

Canada was under a military government from 1760 to 1764, and under a sort of provisional government, organized in pursuance of a proclamation by George III, from 1764 to 1774, when the British Parliament passed an important measure known as the Quebec Act (q.v.), which extended the province to the Ohio and Mississippi rivers, provided that Roman Catholics should not be interfered with in their religion, intrusted the administration of affairs to a governor and a legislative council appointed by the crown, and formally recognized the old civil laws and civil institutions of French Canada, though the English criminal laws were to be in force throughout the province. During the American Revolution the Continental Congress attempted to secure the active alliance of Canada, and to that end sent a commission, made up of Franklin, Chase, Charles Carroll, and John Carroll, to Montreal; but the province remained loyal throughout, and at the close of the war its population was augmented by the immigration from the United States of between 30,000 and 40,000 Loyalists, whose advent, says the Canadian historian Bourinot, "was the saving of British interests in the great region which England still happily retained in North Amer-

ica." It was these immigrants who founded New Brunswick and Upper Canada (Ontario), and their descendants have continued to the present day to constitute the most important and influential element in the population of English-speaking Canada.

By the Treaty of 1783 the area of Canada, as established by the Quebec Act, was reduced by the formal relinquishment to the United States of the territory now constituting the States of Wisconsin, Michigan, Ohio, Indiana, and Illinois, and in 1791 the province was divided by the so-called Constitutional Act into two sections, Upper Canada and Lower Canada, the former of which, then having a population of about 20,000, was inhabited almost entirely by men of English descent, and the latter, then having a population of about 125,000, mostly by men of French descent. Each section was to have a legislative council, to be appointed by the king, for life; an assembly, to be chosen by a popular vote; and a governor and executive council, to be appointed by the king; while French institutions were for the most part to obtain in the one and English institutions in the other. In Lower Canada the criminal law of England remained in force. The so-called Maritime Provinces—New Brunswick, Nova Scotia, Cape Breton, and Prince Edward Island—were placed under administrations very similar to that of Upper Canada. In Lower Canada a party of discontent almost immediately arose, and until the reorganization of the government, in 1841, there was almost continual friction between the popular assembly on the one side, representing the French element, and the governor and legislative council on the other, representing almost exclusively the English element. In spite of the unifying influence of the War of 1812 with the United States (see UNITED STATES, *History*), in which men of all races throughout Canada participated, this racial antagonism became more and more accentuated, until, in 1837, a certain element of the French population, under the leadership of Louis J. Papineau (q.v.), angered by the intervention of the British government, rose in revolt against the British authority, but were quickly suppressed.

Meanwhile in Upper Canada much discontent was caused by the dominance of a small class, descended mainly from the Loyalists and united, it was charged, under an alleged "family compact" for the purpose of monopolizing the public offices. The popular dissatisfaction with the prevailing state of affairs was greatly increased by religious antagonisms and by sectarian discrimination in the allotment of the public lands and the exposure of apparent frauds in their disposition. Under the Quebec Act of 1774 a large part of crownlands had been set apart for the maintenance of a Protestant clergy. The continuance of this provision under the Constitutional Act of 1791, and known as the Clergy Reserves, resulted in Upper Canada in the privileged position, with regard to land ownership and profits, enjoyed by the Church of England. In 1837, also, the more radical of the reformers, doubtless encouraged by the outbreak in Lower Canada, organized a "rebellion," under the leadership of William L. Mackenzie (q.v.), but were defeated and driven out of the province before the close of the following year. Mackenzie and his more radical adherents wanted independence, but many went no further than the demand for an executive council responsible

to the legislature. The "rebellion" in Upper Canada differed from that in the sister province by the greater emphasis which the popular party placed upon responsible government and by a clearer perception of its remedial uses. In Lower Canada, though reform of the executive council was likewise an essential issue, its full significance was less generally understood. There racial suspicion and hostility, with their accompanying passion for the inviolability of the Roman Catholic religion and the French language, were strong ingredients in the popular discontent.

Meanwhile Lord Durham had been sent out from England as Governor-General and High Commissioner "for the determining of certain important questions depending in the provinces of Upper and Lower Canada, respecting the form and future government of the said provinces," and, largely as a result of the famous report made by him in 1839, the two provinces were reunited, in 1841, by an Act of Parliament, which provided for a governor, to be appointed by the crown, a legislative council, also to be appointed (for life) by the crown; a legislative assembly, to which Upper and Lower Canada were to send an equal number of representatives, to be elected by popular vote; and an executive council, or cabinet, to be chosen by the governor from the legislative council and the legislative assembly. The Maritime Provinces retained their separate governments.

The composition and operation of the executive council, under the Act of Union in 1841, disappointed the Liberals, more especially those who had sympathized with the rebellion of 1837-38. Lord Durham's report was designed to prepare the way for the council's responsibility to the popular branch of Parliament; but the course of politics disclosed an influential and determined opposition to any such interpretation. This opposition was due partly to uncertainty in British government circles as to the effect of responsible government upon the Imperial connection with and control of Canada, and partly to the hostility of the Conservative party. It was only natural that the uncertainty should be reflected in the attitude of some Canadian governors, and that the hostility should be deepened by party struggles. The first governor of the province, Lord Sydenham, permitted men of opposed views to be members of his council, but with unsatisfactory results. His successor, the prudent and conciliatory Sir Charles Bagot (q.v.), was not able fully to establish the practice of conferring with advisers of one political complexion; and soon after the appointment of Sir Charles Metcalfe (q.v.) as Governor, his aversion to an executive council which was constituted to give him advice tantamount to a command produced a development of party violence which convulsed the country. Not until 1849, during the governorship of the Earl of Elgin (q.v.), when French pride was placated by a law granting compensation for losses of property in the rebellion in Lower Canada, was there certain promise of more peaceful conditions. The passage of the bill, for signing which Lord Elgin was stoned and rotten-egged at Montreal by a mob which also burned the Parliament House, marked the final acceptance of responsible government and the supremacy of the Canadian legislature in Canadian affairs.

From 1849 until 1867 the course of political

development was determined by the necessity of readjusting the unequal restrictions and responsibilities which irritated the united provinces under the Act of 1841. One notable result of the act, however, was the system of administration in which leaders from both provinces, respectively supported by their ablest associates, were represented. But this harmony was more than offset by the discord inherent in the provisions of the act. The plan of equal representation, together with the more rapid growth of the English-speaking province, threatened disruption. At the same time seignorial tenures in Lower Canada burdened the people, and the clergy reserves in Upper Canada remained unsecularized—an odious survival of ecclesiastical privilege.

A succession of ministries of short duration and of precarious tenure carried on the government while a larger national unity was rapidly maturing. In these changing ministries Sir Allan MacNab (q.v.), Sir Etienne Pascal Taché (q.v.), Sir Georges E. Cartier (q.v.), Sir John A. Macdonald (q.v.), Robert Baldwin (q.v.), George Brown (q.v.), Sir Francis Hincks (q.v.), Augustin Norbert Morin (q.v.), Sir Antoine Aimé Dorion (q.v.), Thomas D'Arcy McGee (q.v.), and John Sandfield Macdonald (q.v.) were the most prominent members. In the transitional and troubled state of the province no political party was strong enough to oppose successfully the reform of abuses originating in antiquated custom or in religious prejudice; and in 1854 the seignorial tenures were abolished and the clergy reserves were secularized. In the same year a reciprocity treaty, negotiated with the United States mainly by the tact and persistence of Lord Elgin, brought a large volume of trade which lasted for 11 years.

The difficulties of administration grew greater as the wealth and population of Upper Canada increased. Government was practically reduced to deadlock by the firm persistence of each of the united provinces in its rights and aspirations, and by its protest against the hampering Act of Union. The American Civil War, nearing its close in 1864, supplied motives for union which accentuated the alertness of the most capable leaders. The Trent Affair (q.v.), the certainty that the reciprocity treaty would be abrogated, the unfriendly attitude of the British government towards the North, and an apprehension of possible retaliation after the close of the war, combined to influence statesmen in all the larger and more influential British North American colonies to view the question of union in its largest aspect. Already the Maritime Provinces of Nova Scotia, New Brunswick, and, later, Prince Edward Island were deliberating on federation; and in the Province of Canada Sir John A. Macdonald and George Brown, laying aside political opposition and personal enmities, united to impart a strong impulse to the movement. In 1864 a convention of delegates representing the various provinces was held at Quebec for the purpose of considering the advisability of union, and under the leadership of Sir John A. Macdonald adopted a set of resolutions, which served as the basis of the British North America Act passed by the British Parliament in February, 1867. Under this act Upper and Lower Canada, Nova Scotia, and New Brunswick were formally united as the Dominion of Canada. Newfoundland refused to enter the

union and still continues to hold herself aloof. (See CANADA, *Government*.)

The formation of the Dominion relegated local questions to the control of local legislatures, but at first the national outlook resulting from it was obscured by sectional distrust and opposition. Lord Monck (q.v.) was appointed the first Governor-General, and the first Premier was John A. Macdonald, whose administration was a coalition intended to recognize the self-sacrificing efforts of Liberal and Conservative statesmen who had sunk their antagonisms in a desire to accomplish federation. Nova Scotia, deeming herself brought into the union by a vote of her legislature which was contrary to the will of the people, started a movement for repeal, its chief spokesman being Joseph Howe (q.v.), a statesman who had long before contemplated a project of union on the largest scale. An overwhelming vote against the Dominion was given by the province at the first general election held in August, 1867, and Howe headed a delegation to London pledged to repeal. The British government, which had already accepted the principle of Canada's control of her domestic legislation, would not reconsider the provisions of the British North America Act and discountenanced the movement for repeal, which was finally eliminated by financial aid to the province and a seat for Howe in the Dominion cabinet.

In this opening time of adjustment the government was hampered by an electoral system which allowed a member of the Dominion House of Commons to sit also in the legislature of his province, a defect remedied by the abolition of dual representation. The greater achievements contemplated were the rounding out of confederation by the admission of the remaining provinces and the acquisition and organization of the Northwest Territories; also the cementing of the political fabric by railways. Among the inducements which led New Brunswick and Nova Scotia to join the union was the agreement, incorporated in the British North America Act, to unite these provinces with Quebec and Ontario by a railway, a promise which was fulfilled by the completion of the Inter-Colonial Railway in 1876. The admission of British Columbia in 1871 was likewise effected by the offer of the Dominion to build within 10 years a railway connecting that province with the eastern part of Canada. Prince Edward Island, which at first peremptorily rejected union as outlined in the Quebec Resolutions, was compelled later by financial stringency to reconsider its advisability, and in 1873 joined its fortunes with those of the larger provinces.

Of commanding importance was the acquisition of the vast region known as Rupert's Land and the Northwest Territories, the great "Lone Land" famed in exploration and discovery, over which one of the greatest of historic monopolies, that of the Hudson's Bay Company, had held governmental and proprietary rights since 1670. It was one of the first questions to command the concern of the government, and in 1868 a deputation was sent to England to purchase the company's rights and effect the transfer of the territory. After difficult negotiations, which formed the basis of British and Canadian statutes, the company in November, 1869, surrendered its chartered rights and interests for £300,000, reserving one-twentieth of a fertile belt whose boundaries were defined, and also blocks

of land at the different trading posts. Government measures to take legal possession of and organize this region, designated the "Northwest Territories" by the Act of 1869, were destined to a rude shock. In the Red River settlement, a district now included in Manitoba, a considerable population of half-breeds of French and Indian origin looked upon the Canadian officials, surveyors, and bridge builders as intruders upon their rightful lands, and prepared for active resistance. Hon. William McDougall (q.v.), the Lieutenant Governor appointed to inaugurate the authority of the Dominion, was prevented from passing beyond the United States boundary line, and Louis Riel (q.v.), a half-breed leader of undoubted gifts, but a fanatic subject to religious delusions, became the head and dictator of a so-called provisional government. The suppression of the rebellion and the creation of the Province of Manitoba, with its admission into the Dominion, followed in 1870. The name of Fort Garry, the trading post where Riel had his seat of "government," was changed to that of Winnipeg, a place of strategic importance in the development of a vast grain region and destined to a phenomenal growth. Districts were subsequently created out of the Northwest Territories as follows: Keewatin, in 1876; Assiniboia, Saskatchewan, Alberta, and Athabasca, in 1882; and Ungava, Mackenzie, and Franklin, in 1895. From the districts created in 1882 the provinces of Alberta (q.v.) and Saskatchewan (q.v.) were constituted in 1905. The extension of the boundaries of Manitoba, Ontario, and Quebec in 1912 included the larger part of Keewatin and all of Ungava. The Northwest Territories (q.v.) now include the districts of Mackenzie, Franklin, and part of the former district of Keewatin.

A notable event in which the first administration of Sir John Macdonald participated was the procuring of a settlement by the Treaty of Washington (q.v.) of several outstanding disputes between Great Britain, the United States, and Canada concerning fishing rights, part of the Oregon boundary, the Alabama claims, and losses due to the Fenian raids of 1866 and 1870-71. The British government, in response to the solicitations of the Dominion cabinet, made overtures to the Washington government which were received in a friendly spirit, and also appointed Sir John Macdonald as one of the commissioners to conduct the negotiations and sign the treaty. (See ALABAMA CLAIMS; SAN JUAN BOUNDARY DISPUTE; FISHING LAWS, *International Aspect*.) The Dominion's contract with British Columbia began the true epic of Canadian railway building, though Sir John Macdonald, in striving to fulfill the terms, committed the fault of receiving large sums of money for election purposes from Sir Hugh Allan (q.v.) in return for the contract with the latter to construct the projected Canadian Pacific Railway. Macdonald resigned before a parliamentary vote on the charges against him could be given, and the Governor-General, the Earl (afterward Marquis) of Dufferin (q.v.), intrusted Alexander Mackenzie (q.v.), leader of the Liberal Opposition, with the task of forming a new administration, which was sustained by a very large majority in the general elections. Mackenzie took the helm of government at a time of deep business depression, aggravated by a tariff which permitted the easy entrance of American manufactured goods into an almost paralyzed market. Moreover, by a policy of piecemeal construction of the Cana-

dian Pacific Railway, he angered British Columbia to the point of a threatened withdrawal from confederation. In the meantime Macdonald, seizing the opportune moment, offered the "National Policy" of protection to Canadian industries and in 1878 regained power. From that year until his death, in 1891, he held the premiership. A protective tariff was established, the Canadian Pacific Railway was completed in 1885, and in the same year a rebellion of half-breed settlers in the Saskatchewan valley, again under the leadership of Louis Riel (q.v.), was suppressed by military force. The efforts of the Liberals to regain power by a varying policy of closer trade relations with the United States were unsuccessful at two general elections, but after Macdonald's death the Conservative party began to disintegrate. None of his successors in the premiership, Sir J. J. C. Abbott (q.v.), Sir John Thompson (q.v.), Sir Mackenzie Bowell (q.v.), and Sir Charles Tupper (q.v.), could stay the steady decline of the party's standing in the country. Quarrels in the cabinet and corrupt practices in the administration of the Department of Public Works hastened the disintegrating process, and the general elections of 1896 returned the Liberals to power under the leadership of Wilfrid (afterward Sir Wilfrid) Laurier.

The period of Liberal ascendancy lasted for 15 years and was one of remarkable economic development and a parallel growth in national self-confidence. These features of progress were naturally emphasized in relation to Britain and the United States, with whom the greater part of Canadian trade is done; but notable also was the recognition of the newly won importance of Canada among the nations of Europe and even in the remoter field of African and Asiatic affairs. Laurier grasped the long-delayed opportunity of proving Liberal loyalty to Britain, which had been aspersed in many election campaigns and in a section of the Canadian press; but his eagerness was perfectly consistent with a policy which combined Canadian supremacy in Canadian affairs with the demand that, if aid were given to the mother country and Canadian statesmen were called to her councils, a voice in determining the amount and direction of that aid should be granted to the colony. While this was his known policy, there were no hard and fast lines in applying it, as was shown by the attitude of the Dominion in the South African War (q.v.). The prompt dispatch of Canadian troops, soon followed by a regiment of horse equipped by Lord Strathcona (q.v.), High Commissioner of the Dominion in London, proved the spontaneity of the colony's loyalty, in whose enthusiasm the dissenting voices in Quebec were practically lost.

The economic development during the Liberal régime was based partly on a tariff policy which, though lowering duties on some manufactured articles and on the necessaries of life, did not repudiate the principle of moderate protection to Canadian industries; and partly on new domestic enterprises and the vigorous reaching out for trade with different countries. In harmony with this were the development of new lines of telegraphic and steamship communication. A notable feature was the favor shown to British interests. The famous British preference of 1897 granted a reduction which in three years became 33 $\frac{1}{3}$ per cent on important classes of British manufactured goods. The strong feeling

in favor of making, so far as Canada could contribute to that end, the British Empire self-sustaining in trade, communication, and defense was voiced by Liberal statesmen and by none more emphatically than by the Premier himself. The sincerity of these professions was proved, first, by the Canadian government's assumption, in September, 1905, of the defense of Halifax, whose British garrison was replaced by Canadian troops; again, by the maintenance of Esquimalt, on the coast of British Columbia, as a naval station, permitting British forces to withdraw; and also by Canadian coöperation with Imperial plans of defense proposed at councils in London. In return Britain denounced commercial treaties with Belgium and Germany, in order that Canada might be free to make a preference.

The settlement of outstanding differences between the United States, Britain, and Canada was strongly favored by Laurier. In 1898 the Anglo-American Joint High Commission, appointed for that purpose, met first at Quebec and afterward at Washington, but its deliberations were interrupted by disagreement on the Alaskan boundary. Notwithstanding the friendly feeling which promoted the appointment of the commission, there had been a change in the attitude of the Canadian government concerning reciprocity with the United States. Formerly deputations from Ottawa to Washington in behalf of freer trade assumed the frequency and solicitude of some pilgrimages; but with the Laurier administration there was in this behalf neither frequency nor solicitude. The persistent refusal of the Washington government to listen to proposals for reciprocity had produced its natural effect. Also great enterprises absorbed the public attention and stimulated the public spirit to the submergence of economic fears. The Grand Trunk Pacific Railway, a government transcontinental line, had begun to be built; the Canadian Pacific had largely increased its mileage; and the Canada Northern, a private enterprise conducted with remarkable vigor and prudence, was a third line of railway designed to span the continent from the Atlantic to the Pacific. See *Transportation and Communication*.

Economic progress was further assured by a fortunate conjunction of the hour and the man. Clifford Sifton (q.v.), Minister of the Interior in the Laurier cabinet, conceived a plan of advertising the rich vacant lands of Canada, which was a stroke of administrative genius, and brought the desirability of a free Canadian home to the notice of scores of thousands in Europe, who had never considered such a possibility. American settlers who had a keen perception of agricultural values began to cross the border in large numbers. The result of Sifton's work was a tide of immigration which revealed to the world the potential wealth of the Canadian Northwest (see *Population*). The appointment in 1904 of Earl Grey as Governor-General did much to promote Imperial feeling in Canada. His enthusiasm for the welfare of the people and his keen insight into the possibilities of the country made him remarkably popular—a result all the more unusual from the fact that his public appearances and addresses were in strict conformity with the somewhat neutral functions of his office.

In 1907 the Dominion entered on the development of foreign relations, in that it apparently assumed the position of sharing with the Im-

perial authorities the conduct of negotiations with Japan. This arose primarily from the inclusion of Canada in the commercial part of the treaty of alliance between Japan and Britain, but more immediately from the riots in 1907 in Vancouver, B. C., which were a protest against Japanese immigration and labor competition. They were, however, a violation of that part of the treaty which gave equal privileges of residence in either country to the citizens of the other. Also they were insults to the subjects of a sovereign ally of Britain. The Canadian government, having arranged with the Imperial authorities that Rodolphe Lemieux, a member of the Laurier cabinet, should be allowed to act as envoy according to his own discretion, though in conjunction with the British Ambassador at Tokyo, dispatched Lemieux on his mission. The result was an agreement with the authorities at the Japanese capital that Canada would prevent further aggressions upon subjects of the Emperor, while the latter agreed to restrict the emigration of his subjects to Canada. The mission of the Canadian envoy was notable for the practical independence exercised by the Dominion in settling a matter of Imperial foreign policy.

In the same year advantageous commercial treaties were made with France and Mexico. Also the Lemieux Act, a labor law designed to facilitate the conciliatory interference of government for the elimination of strikes and lockouts, was passed and proved to be so successful as to earn both hearty Canadian and American commendation. In July, 1908, the tercentenary of the founding of Quebec was celebrated with much pomp, including a series of historic pageants and the presence of a large body of Canadian troops. Britain, the United States, and France sent distinguished representatives. The death of King Edward VII and the accession of George V in 1910 drew forth renewed manifestations of loyalty to the throne, and in the same year the establishment of a department of naval service and the projected building of a fleet of Canadian cruisers attested the purpose of the Dominion to assist Britain in naval defense. Much concern, not to say alarm, had been shown in regard to German naval competition with Britain. The naval programme of the administration aroused some opposition in Quebec, but the Conservative party lent it a provisional support until later developments changed its attitude.

The Liberals were destined to defeat in 1911 by a revival of the issue of reciprocity with the United States, though in more limited form than proposed in 1887 and 1891. This time the initiative came from Washington. In 1910 an American deputation visited Ottawa in behalf of reciprocity; and the arguments of its members, together with subsequent friendly interviews between President W. H. Taft and representatives of the Canadian government, resulted in formal negotiations which were completed early in 1911. The agreement included a list of articles, chiefly restricted to live stock, agricultural products, timber, fish, and pulp wood, which were to be admitted free by both countries; also lists of articles to be admitted on the payment of low and identical duties, while other articles were to come in under special rates. The presentation of the Liberal programme, notwithstanding the friendly

feeling between the two countries, encountered smouldering prejudices which burst into flame, fed apparently by the fear that reciprocity would result in Canada becoming first a commercial, and finally a political, appanage of the United States. The Liberals were decisively defeated, and Robert Laird Borden (q.v.), leader of the Conservative Opposition, became Premier. Shortly after his accession to office the naval question became acute. The Borden administration, endeavoring to aid Britain, brought forward in 1912 a bill to appropriate \$35,000,000 for the building of three battle-ships to be placed at the disposal of the British Admiralty. After prolonged debate the measure passed the House of Commons, but in 1913 was defeated in the Senate.

The governors-general of the Dominion have been Lord Monck, 1867-68; Lord Lisgar, 1868-72; Earl of Dufferin, 1872-78; Marquis of Lorne, 1878-83; Marquis of Lansdowne, 1883-88; Lord Stanley of Preston (Earl of Derby), 1888-93; Earl of Aberdeen, 1893-98; Earl of Minto, 1898-1904; Earl Grey, 1904-11; Duke of Connaught, 1911-

The boundary line between Canada and the United States, which was determined with considerable vagueness by the Treaty of 1783, has formed the subject of much controversy between the United States and Great Britain, and was not finally settled for the northeast until 1842 (see WEBSTER-ASHBURTON TREATY; BARING, ALEXANDER) and for the northwest until 1846. (See NORTHWEST BOUNDARY DISPUTE; OREGON, History.) The question of the Alaskan boundary was rendered acute by the discovery of gold in the Yukon region. It was settled by an international commission in 1903 on terms that aroused keen dissatisfaction in Canada. (See ALASKA, *Boundary Dispute*.) The question of the right of the Americans to fish in Canadian waters has also been the subject of considerable controversy between the two governments (see SEALING; FISHING LAWS, *International Aspect*), as has also the right of the Canadians to participate in the seal fisheries in Bering Sea. See BERING SEA CONTROVERSY.

The *Canadian Annual Review of Public Affairs* (Toronto, 1902 et seq.) publishes an annual list of historical, political, and biographical works relating to Canada. For the French régime, consult: Charlevoix, *Histoire et description générale de la Nouvelle France* (3 vols., Paris, 1744; Eng. trans., 6 vols., New York, 1866-72); Thwaites (ed.), *Jesuit Relations and Allied Documents* (73 vols., Cleveland, 1896-1901); Faillon, *Histoire de la colonie française en Canada* (3 vols., Montreal, 1865-66); Miles, *History of Canada under the French Régime* (ib., 1881); Winsor, *Cartier to Frontenac* (Boston, 1894); and especially Parkman's works, *The Pioneers of France in the New World* (ib., 1865); *The Jesuits in North America* (ib., 1867); *La Salle and the Discovery of the Great West* (ib., 1869); *The Old Régime in Canada* (ib., 1874); *Frontenac and New France under Louis XIV*

(ib., 1877); *A Half Century of Conflict* (ib., 1892); *Montcalm and Wolfe* (ib., 1884). See also Casgrain, *Wolfe and Montcalm* (Toronto, 1905); Wood, *The Fight for Canada* (Boston, 1904); Munro, *Seignorial System in Canada* (New York, 1907); Colby, *Canadian Types of the Old Régime* (ib., 1908). For the period since 1760, see: Bourinot, *Canada under British Rule* (Cambridge, 1900); Lucas, *The Canadian War of 1812* (Oxford, 1906); Pope, *Memoirs of Sir John Alexander Macdonald* (2 vols., London, 1894); Lindsey, *Life and Times of William Lyon Mackenzie* (Toronto, 1862); Bibaud, *Histoire du Canada sous la domination anglaise* (3 vols., Montreal, 1837-78); Hincks, *Political History of Canada from 1840 to 1855* (ib., 1877) and *Reminiscences* (ib., 1884); Dent, *Story of the Upper Canadian Rebellion* (2 vols., Toronto, 1885), and *The Last Forty Years: Canada since the Union of 1841* (2 vols., ib., 1881); Durham, *Report on the Affairs of British North America* (London, 1838; ed. by Lucas, ib., 1912); Read, *The Canadian Rebellion of 1837* (Toronto, 1896); MacBeth, *The Making of the Canadian West* (ib., 1905). The best comprehensive histories are Kingsford, *History of Canada* (10 vols., Toronto, 1887-98), and Garneau, *Histoire du Canada* (4 vols., Quebec, 1845-52; Eng. trans., 2 vols., Montreal, 1860). Consult also Bryce, *Short History of the Canadian People* (London, 1887; new ed., 1913); Lucas, *A History of Canada* (Oxford, 1909); Bourinot, *The Story of Canada* (New York, 1896). In the *Makers of Canada Series* (Toronto), edited by Duncan Campbell Scott and Pelham Edgar, there is a wealth of historical and political material combined with the personal narrative. The *Series* contains the biographies of eminent Canadians, French and English, and was completed in 1911 by the publication of an *Index and Dictionary of Canadian History*. For geography, natural resources, and special features of descriptive, historical, and political interest, consult Greswell, *Geography of the Dominion of Canada* (London, 1891); Parkin, *The Great Dominion* (ib., 1895); *British America*, "British Empire Series" (ib., 1900); Lucas, *A Historical Geography of the British Colonies*, vol. v (Oxford, 1900-11); *The Dominion of Canada*, prepared by the British Association for the Advancement of Science (London, 1897); *Annual Reports of the Geological and Natural History Survey of Canada* (Ottawa, 1872 et seq.); *Annual Reports of the Commission of Conservation* (Ottawa); Coleman, *The Canadian Rockies: New and Old Trails* (Toronto, 1911); Adam, *The Canadian Northwest: Its History and its Troubles* (ib., 1885); Bryce, *Remarkable History of the Hudson's Bay Company* (New York, 1900); Herrington, *Evolution of the Prairie Provinces* (Toronto, 1911); Dawson, *Fifty Years' Work in Canada* (London, 1901); Willison, *Sir Wilfrid Laurier and the Liberal Party* (ib., 1903); Bradshaw, *Self-Government in Canada* (ib., 1903); Montagu and Herbert, *Canada and the Empire* (ib., 1904); Cockburn, *Political Annals of Canada* (Toronto, 1905); Fountain, *The Great Northwest and the Great Lake Region of North America* (London, 1904); Siegfried, *Le Canada: les deux races* (Paris, 1907); Vernede, *Dominion of Canada* (Toronto, 1911); Maxwell, *Canada of To-Day* (London, 1911); Cartwright, *Reminiscences* (Toronto, 1912); Willson, *Quebec: the Laurentian Prov-*

ince (New York, 1913); Shortt and Doughty, *Canada and Its Provinces* (22 vols., Toronto, 1913-14). Information as to the trade and natural resources of Canada is issued by the Bureau of Census and Statistics, Ottawa. *The Canadian Annual Review of Public Affairs* (Toronto), Morgan's *Canadian Men and Women of the Time* (ib., 1898; new ed., 1912), and *The Canada Year Book* (Ottawa) are standard works of reference. In earlier Canadian biography and history Morgan's *Sketches of Celebrated Canadians* (Quebec and London, 1862) has unique and permanent value.

CANADA, LOWER. See QUEBEC.

CAN'ADA BAL'SAM, or CANADA TURPENTINE. A kind of turpentine obtained from the Balm of Gilead fir (*Abies* or *Picea balsamea*), a native of Canada and the northern parts of the United States. It is a greenish yellow, transparent liquid, having an agreeable odor, resembling that of turpentine, and a bitterish, acrid taste. When freshly exuded from the tree, it has the consistency of thin honey; on exposure to the air, however, it gradually dries up, forming a solid, transparent mass. Canada balsam is an oleoresin, consisting of 20 to 30 per cent of a volatile oil, and 70 to 80 per cent of a solid, composed mainly of two varieties of resin. It is the finest kind of turpentine obtained from any of the coniferæ, and was formerly employed for medicinal purposes, particularly as a stimulant for the cure of mucous discharges, and as a detergent application to ulcers. It is now used for a variety of purposes in the arts—as an ingredient in varnishes, in mounting objects for the microscope, in photography, and by opticians as a cement, particularly for connecting the parts of achromatic lenses to the exclusion of moisture and dust. Its value for optical purposes is very great, and depends not only on its perfect transparency, but on its possessing a refractive power nearly equal to that of glass.

CANADIAN LITERATURE. A classification which includes the writers, both French and English, who are connected with Canada by birth or residence. The expression is open to some objection, but has been adopted for the sake of convenience. The literature designated "Canadian" has two currents which can never unite in a main stream. Its productions are divided into two classes, each amenable to its own standard of popular appreciation and literary judgment. French Canada, comprising, with respect to language and literature, the Province of Quebec and the overflow of its population into eastern Ontario and the Canadian Northwest, together with the descendants of the Acadians in the Maritime Provinces, continues the traditions of Old France, reproducing especially the religious and social conservatism of the north and northwestern portions from which French-Canadians came. English Canada has a history and traditions which are less dependent upon the example of the mother country and encourage the formation of distinct literary types with local variants that reflect an independent spirit answering to the political genius of

the race. The goal of the French-Canadian writer is the crown of the French Academy; the Canadian writer of English, while hoping that his work may live, perforce abides the decision of a slower though less arbitrary tribunal.

French Canada. Canada was first settled by the French, who established their largest colonies in the valley of the St. Lawrence. A Jesuit college was established in Quebec in 1635, a year before the founding of Harvard. Four years later an Ursuline convent was opened, and later in the century Laval, the famous Bishop of Quebec, founded the seminaries which have since developed into Laval University, the chief seat of Roman Catholic learning and culture in Canada, and one of the most influential on the continent. The first books, written by explorers and Roman Catholic missionaries, naturally deal with travel, discovery, and contact with the Indian life which was to play a memorable and tragic part in the early history of French Canada. Samuel Champlain (q.v.), the founder of Quebec (1608), published many admirable narratives, beginning with a description of his first voyage (1599-1601). His works, frequently issued in Paris during the seventeenth century, were carefully edited by Laverdière (6 vols., Quebec, 1870). Lescarbot (q.v.), who bore a part in the settlement of Port Royal (Annapolis, N. S.), published the interesting *Histoire de la Nouvelle France* (Paris, 1609; republished by the Champlain Society, Toronto, 1912), to which was added a collection of poems called *Les muses de la Nouvelle France*. Other works produced under the French régime are Gabriel Sagard's *Grand voyage* (Paris, 1632); Pierre Boucher's *Mœurs et productions de la Nouvelle France* (Paris, 1864); the narratives of missionary adventure known as the *Relations des Jésuites*, edited, with Eng. trans., by R. G. Thwaites (71 vols., Cleveland, Ohio, 1896-1901); La Potherie's *Histoire de l'Amérique septentrionale depuis 1534 jusqu'à 1701* (4 vols., Paris, 1722); the Jesuit Lafitau's *Mœurs des sauvages américains* (Paris, 1724); and Le Clercq's *Etablissement de la foy* (2 vols., Paris, 1691; Eng. trans. by J. G. Shea, New York, 1881). Charlevoix (q.v.), a Jesuit traveler, is the last of the line of these early writers, and his *Histoire et description générale de la Nouvelle France* (3 vols., Paris, 1744; Eng. trans. by J. G. Shea, 6 vols., New York, 1866-72) is a work of high merit. Taken altogether, the books of French priests and officials form a body of historical narrative and personal adventure unequalled in interest and style by anything produced elsewhere in America during the same period.

Of equal importance, as springing from the folklore in which the poetic genius of French Canada lay enshrined, were the songs which the Breton and Norman peasant brought with him from the old land and which in course of time became imbued with the scenery and spirit of the new. Whether sung at the fireside of the *habitant* on the banks of the St. Lawrence, or carried afar to the north and west by *coureur de bois* and *voyageur*, these songs voiced the deepest feelings, sustaining and gladdening the heart. Orally transmitted from generation to generation, they were written down at a later period, and a collection of them, *Les chansons populaires du Canada*, was edited, with music, by Ernest Gagnon (Quebec, 1865). A translation was made by William McLennan under the title *Songs of Old Canada* (Montreal, 1886). One of

the most beautiful is the famous love song, with interlocked stanzas, beginning "A la claire fontaine." Like "Le pont d'Avignon," it is a transplanted flower of purest primitive French poetry. The music and verse of such old songs now fill an humbler but no less cherished part in French-Canadian life. Though less known than before to race patriotism and race politics, they soothe the remoter village dweller and the toiler in field and furrow with memories springing from life in Normandy and Brittany of more than two hundred years ago, when the daily round of the lowly was not widely different from that of the Quebec *habitant* to-day.

When Canada passed under British rule by the Treaty of Paris (1763), the French spirit in the colony responded instantly to the summons for a contest of civilizations, when the armed struggle which had been going on for 150 years was changed to political rivalry under one flag. The French language and civil and religious rights were preserved, though the conflict did not cease until Confederation in 1867, and has echoes to-day among the Nationalists in the Province of Quebec. French Canada, awakened by the change of 1763, produced her first native-born writers, among them several historians of their country. The earliest was Michel Bibaud, with the *Histoire du Canada sous la domination française* (Montreal, 1837), and the *Histoire du Canada sous la domination anglaise* (Montreal, 1844). A third volume of his history appeared in 1878, some years after Bibaud's death. In 1845 appeared the first volume of the famous *Histoire du Canada* by François Xavier Garneau (q.v.) which was finished in 1852. Though written with great ability and with distinction of style, Garneau's work is largely a plea for and vindication of his race, and lacks the impartiality of history, though regarded by the French as their standard authority. Among the influences that emphasized the resolute and contentious attitude of French Canada there should be mentioned the fiery speeches of Louis Joseph Papineau (q.v.), whose eloquence responded to the aspirations of his compatriots in their favorite literary form. Other notable histories were written by J. B. A. Ferland, a priest and professor of Laval University; the Abbé Faillon, a Sulpician, of French birth but long resident in Canada; Louis Turcotte, of the library of the Quebec Legislature; Benjamin Sulte (q.v.), journalist and poet; the Abbé H. R. Casgrain (q.v.), a brilliant though sometimes prejudiced writer, whose *Pèlerinage au pays d'Évangéline*, a defense of the exiled Acadians, was crowned by the French Academy in 1888; and the Abbé Tanguay, sometime professor of archæology in Laval University and author of the *Dictionnaire généalogique des familles canadiennes*, a work of immense learning and research. Thomas Chapais, eminent as an orator and publicist, wrote admirable monographs on *Jean Talon* (1904) and *Montcalm* (1911). The latter is a fine tribute of historical justice to a hero who has suffered in the estimation of his compatriots less for his faults than for his honorable defeat.

French-Canadian writers have excelled in the essay, the biography, the descriptive sketch, and in political and literary criticism. Faucher de Saint-Maurice, who served in Mexico under Maximilian, wrote *De Québec à Mexico*, *Les Provinces Maritimes*, and many other volumes of de-

scription. Etienne Parent, the first editor of *Le Canadien*, was a writer of much distinction and power on economic, religious, and philosophic questions. Sir James MacPherson Le Moine wrote a large number of legendary and historical sketches, together with scientific monographs, both in French and in English, as *L'Ornithologie du Canada* (1860); *Quebec Past and Present* (1876); *Canadian Heroines* (1887); *Le premier gouverneur anglais de Québec* (1891); and *The Avi-Fauna of the Province of Quebec* (1902). Arthur Buies, the editor of several journals, published numerous volumes of popular *chroniques*, beginning in 1871, besides *Le Saguenay et la vallée du Lac Saint-Jean* (1880) and *L'Outaouais supérieur* (1889). Laurent Olivier David, journalist and senator, is considered by many to be the most brilliant of contemporary prose writers in the Province of Quebec. Independent in politics, an outspoken opponent of clerical interference in elections, as was proved by his *Le clergé canadien* (1896), a subtle and lucid exponent of contemporary life and character in French Canada, his works command a high degree of admiration. His *Patriotes de 1837-38* (1884) and *Les deux Papineau* (1896) are a defense of the French-Canadian rebellion of 1837. He has also written *Biographies et portraits* (1876); *Mes contemporains* (1894); *Laurier et son temps* (1905); and *Vingt biographies* (1910). Among other essayists and biographers trained in the school of journalism are Alfred Duclos DeCelles and Narcisse Eutrope Dionne. The former in 1896 gained the highest prize of the French Academy of Political and Moral Sciences for his *Etats-Unis: origine, institutions, développements*. He later wrote other historical and political works and contributed biographies of Sir Louis Hippolyte Lafontaine and Sir Georges Etienne Cartier to the *Makers of Canada Series*. The latter's *Life of Jacques Cartier* (1889); *Life of Samuel Champlain* (1891 et seq.); *Québec et Nouvelle France* (1909), and other historical works are written in lucid and finished style. The names of Joseph Charles Taché, Joseph E. Cauchon and Hector Fabre are famous in French-Canadian journalism. Later but equally eminent as journalists are Henri Bourassa, also notable as an orator; Omer Héroux, and the Abbé J. A. Damours. During the first 14 years of the twentieth century the number of journalistic and historical writings relating to French Canada greatly increased, but it is impossible here to do more than refer the reader to the biographies in this work and the bibliography to this article. Splendidly dramatic and of international recognition was the epitome of French-Canadian history presented in the Quebec Tercentenary pageants and celebrations of 1908, a complete and vivid account of which was given by the Abbé Joseph Camille Roy (b. 1870), a professor in Laval University, in *Les fêtes du troisième centenaire de Québec* (1911).

In fiction the pioneer work is Philippe de Gaspé's *Les anciens canadiens* (1863), which faithfully mirrored the old régime when *seigneur, euré, censitaire*, and *voyageur* mingled in a life of feudal loyalty, religious zeal, and stirring adventure, shocked often into rare heroism by an appeal for protection or by the imminence of massacre. De Gaspé was succeeded in the same field by Joseph Marmette, who wrote *François de Bienville* (1870), which passed through several editions; *L'Intendant Bigot*

(1872); *Le chevalier de Mornac* (1873); and *La fiancée du rebelle* (1875). P. J. O. Chauveau (q.v.), in his *Charles Guérin, roman de mœurs canadiennes* (1852), had attained a measure of success, as had also the poet Léon Pamphile Le May (b. 1837). A. Gérin-Lajoie's *Jean Rivard* (1874), dear to the heart of the French-Canadian farmer who reads it, portrays the struggles and success of a young man who, with professional honors and a city life within his reach, is suddenly confronted with the burden of caring for his fatherless brothers and sisters, and manfully assumes the life of a *habitant*, winning their sustenance and his own from the soil. Among later notable novels may be mentioned Jules Paul Tardivel's *Pour la Patrie* (1895), a religious novel with a purpose; Dr. Choquette's *Claude Paysan* (1899); Madame Laure Conan's *L'Oublié* (1902), crowned by the French Academy; Napoléon Bourassa's (b. 1827), *Jacques et Marie*, recalling the dramatic story of the exiled Acadians; Chief Justice Sir Adolphe B. Routhier's *Le centurion: roman des temps messianiques* (1909), a religious tale of great beauty and power; and Hector Bernier's *Au large de l'écueil* (1912).

In poetry, Joseph Quesnel and Joseph Mermet, who came from France in 1779 and 1813 respectively, strongly influenced the literary life of French Canada in the opening stages of its development. Quesnel, whose versatile muse was exercised in poem, epistle, epigram, hymn, and song, also produced a prose comedy, *Colas et Colinette*, and *L'Anglomanie*, a comedy in verse satirizing the affectation of English manners and customs in the upper classes of French-Canadian society during 1800-15. Mermet, a lieutenant in De Watteville's regiment which was prominent in the War of 1812, sang of the deeds of that conflict, notably the victory of Châteauguay; but he excelled also in poetic description, and his verses on Niagara, said to be the first written on that subject by a Canadian, have the merit of being no less poetic than precise. Nevertheless Quesnel and Mermet were only in part Canadian in spirit and product. To quote the words of Abbé Camille Roy, of Laval University, we see in them "the expression of the French muse, which has become Canadian for a brief period. In their poems, too, we see a reflection—dim though it be—of those light, graceful, terse forms of poetry, frequently idyllic, that flourished in France during the eighteenth century." Michel Bibaud, the historian, and Denis Benjamin Viger should be mentioned among the poets whose work was worthily aspiring during this formative period.

The name of Octave Crémazie ranks first in the arduous period between the Union of 1841 and Confederation in 1867. Intensely patriotic, his poems touched the popular heart with scenes and events stirring the elemental emotions that centre on love of country and the Roman Catholic faith. They were collected and published with an introduction by the Abbé Casgrain (Montreal, 1882). Among the best known are the elegy on *Les morts*; the ode to the first Bishop of Quebec, Laval; and, above all, the noble lines of *Le drapeau de Carillon*, celebrating the victory of Montcalm over Abercrombie and Howe at Ticonderoga. Léon Pamphile Le May, already mentioned as a novelist, wrote some fine lyrics of patriotism published in his *Essais poétiques* (1865). Also his translation of Longfellow's *Evangeline* (1870) won for

him a name far beyond his own country, while his *Les vengeances* (1875) was notably well received, and his poem on *Champlain* (1908) graced the Tercentenary celebration at Quebec. Benjamin Sulte, the historian, became equally well known as a poet by his *Les Laurentiennes* (1870) and *Les chants nouveaux* (1880). Adolphe Poisson's *Chants canadiens* (1880), *Heures perdues* (1894), *Sous les pins* (1902), and *Le sommeil de Montcalm* (1910) display deep poetic feeling; but his work, like that of P. J. O. Chauveau, Louis Fiset, and even Nérée Beauchemin, whose delicate art and subtle melody within the limited range of *Les floraisons matutinales* (1897) taxed the resources of critical praise, had not the breadth and power to compel more than provincial recognition. Louis Frechette surpassed all other Canadian poets in the ability to write both for French Canada and Old France. His *Les fleurs boréales* (1880) and *Les oiseaux de neige* (1880) were crowned by the Academy, though the poet without that aid would have become known and read in his mother country. In *La légende d'un peuple* (1887), an epic celebrating great characters and episodes in French-Canadian history, he reaches his highest level; notwithstanding occasional rhetorical exaggeration, thought and language are fused into the passion, strength, and high seriousness of great poetry. William Chapman's *Les aspirations* (1904) and *Les rayons du nord* (1910) were both crowned by the Academy. The Abbé Gingras, in the poems and songs entitled *Au foyer de mon Presbytère* (1881), belongs to the poetic school of Octave Crémazie. Alfred Garneau (1836-1904), son of the historian, in his volume entitled *Poésies*, proved his possession of subtle poetic art and delicacy of feeling. Albert Ferland's *Le Canada chanté* (1908) adds one more to the number of poetic tributes to the old régime. Among the younger writers there is, however, a noticeable tendency to seek for material in new poetic veins, whether in their own introspective imaginings or in symbolism and the legendary themes of Europe. In illustration of the former may be mentioned Albert Lozeau's *L'Âme solitaire* (1907), Louis J. Doucet's *La ehanson du passant* (1908), and Jean Charbonneau's *Les blessures* (1912); of the latter, Paul Morin's *Le paon d'émail* (1911) and the poems of Emile Nelligan, a gifted youth whose career was cut short by insanity in 1905 at the age of 19. The latter two naturally belonged to the poetic school whose master was Leconte de Lisle.

English Canada, settled by English, Irish, Scotch, and Germans, was really built up by the 40,000 or more United Empire Loyalists who left the United States at the close of the Revolutionary War. Some settled in Nova Scotia, and others founded New Brunswick and Upper Canada (now Ontario). As in the case of the French in Lower Canada, or Quebec, the first writers were explorers and historians. Samuel Hearne (born in London in 1745) made three voyages of exploration, under the auspices of the Hudson's Bay Company, traveling 1300 miles on foot to the Great Slave Lake. After his death appeared his *Account of a Journey from Prince of Wales's Fort in Hudson's Bay to the North-West* (1795; republished by the Champlain Society, Toronto, 1912). Alexander Mackenzie, entering the service of the Northwest Fur Company, pushed beyond the Great Slave Lake down the river now bearing his name to

the Arctic Ocean, and later crossed the Rocky Mountains to the Pacific. The narrative of these two perilous explorations was published under the title *Voyages on the River St. Lawrence and through the Continent of North America to the Frozen and Pacific Oceans* (1801; reprinted, New York, 1902). Equally important is Alexander Henry's *Travels and Adventures in Canada and the Indian Territories in 1760-1776* (1809). After heroic efforts and a bloody conflict, the Earl of Selkirk established a colony in the Red River valley, now the flourishing Province of Manitoba. While in Montreal he wrote his *Sketch of the British Fur Trade in North America* (1816). From Joseph Bouchette came two notable topographical descriptions of the Canadas (1815-32). The record of the adventures and explorations of these men and of Daniel W. Harmon, Paul Kane, and later, J. W. Tyrrell, who conducted an exploratory survey of nearly 5000 miles through the country lying between Great Slave Lake and Hudson Bay, is of the deepest literary interest. Tyrrell wrote *Across the Sub-Arctics of Canada* (1897; 3d ed., 1908). L. J. Burpee's *The Search for the Western Sea* (1907) is a fascinating narrative of travel and exploration. The earlier of these works were published in London; but by 1815 histories were beginning to issue from the Canadian press. We may cite William Smith's *History of Canada* (1815), and David Thompson's *War of 1812*. Interesting histories of that war were also written by Major John Richardson and Gilbert Auchinleck.

The struggle for responsible government in Upper Canada gave rise to a mass of controversial writing of a strongly partisan character, the Tory or oligarchical side being represented by Sir John Beverley Robinson and Bishop Strachan, and the Reform side by Robert Fleming Gourlay and William Lyon Mackenzie. After the union of the two Canadas in 1841 the struggle for responsible government was renewed, the literary protagonists on the Tory and Reform sides respectively being Egerton Ryerson and Robert Baldwin Sullivan, a brilliant and versatile Irishman who had risen to eminence in public life. The speeches of Joseph Howe, poet, journalist, and the greatest of Canadian political orators in English, were published in 1858. Howe was for many years a member of the Parliament of Nova Scotia, and was also editor of the *Nova Scotian*, for which he wrote two series of popular sketches, called "Western and Eastern Rambles" and "The Club." The former is based on observations made in travels through North America; the latter is an imitation of the *Noctes Ambrosianæ* (q.v.). To the *Nova Scotian* Thomas Chandler Haliburton, a native of Nova Scotia and a judge of the Supreme Court, contributed papers known as "The Clockmaker," or "Sayings and Doings of Sam Slick of Slickville" (1837). The hero is a Yankee peddler into whose mouth is placed much telling criticism. The sketches were widely read in America and England and were translated into several languages. Oddly enough, though the Canadian humorist has had few successors in his own country, he is the father of dialect humor in the United States. Haliburton also wrote the standard history of Nova Scotia and several books descriptive of his country.

The union of Upper and Lower Canada in 1841, and the subsequent federation of all the British provinces in North America except Newfoundland, mark a new era for Canada. A feel-

ing of nationality unknown in earlier times found impassioned expression in the verse of Charles G. D. Roberts, especially in the poem beginning, "O Child of Nations, giant-limbed!" The constitutional questions that came to the front after 1840 created a press which compares favorably with that of any English-speaking country. Of journalists, Goldwin Smith, who settled in Toronto in 1871, was known throughout the world for his work in political history and criticism; the editorial writings of George Brown were a potent factor in Canadian politics, as also were those of John Neilson and Robert Christie in the English journals of Quebec. Later journalists of eminence include such names as George Stewart, for some time editor of the *Quebec Chronicle*, William J. Rattray, Edward Farrer (b. 1850), sometime editorial writer on the *Toronto Mail* and the *Toronto Globe*, Sir Hugh Graham, Sir John S. Willison, James A. Macdonald, and William F. Maclean, editor of the *Toronto World*. The speeches of the well-known statesmen Sir Charles Tupper, Alexander Mackenzie, Sir John A. Macdonald, Sir Alexander T. Galt, Edward Blake, Sir Richard Cartwright, and Sir Wilfrid Laurier form a body of political discussion of which much has an enduring literary character. Especially noteworthy is the bilingual oratory of the last-named statesman, who became not only the most eloquent speaker of his country in French and English, but created a new standard for his racial compatriots, combining the emotional appeal of the French-Canadian with the reasoned presentment of constitutional precedents and principles immemorially known in English-speaking legislatures.

In the larger English-Canadian histories, with few exceptions, the abundant material available does not receive an artistic setting. In Robert Christie's *History of Lower Canada* (6 vols., 1849-55) the narrative of British rule is brought down to the Union of 1841. William Kingsford's *History of Canada* (10 vols., 1887-97) is the standard work, accurate in the main, but with few attractions of style. John Charles Dent's *The Last Forty Years* (1881) begins with the Union of 1841 and is written with grace and lucidity, as is also his interesting *Story of the Upper Canada Rebellion* (1886). James Hannay's *History of Acadia* (1879) modifies commonly received notions of English cruelty in the expulsion of the French. Col. William C. H. Wood's *The Fight for Canada* (1904) has been pronounced the best historical work written in the Dominion. The history of the Canadian Northwest was narrated by Alexander Ross (1783-1856), Alexander Begg, George Bryce, and G. M. Adam. Smaller Canadian histories were written by John McMullen, George Bryce, W. H. Withrow, and Charles G. D. Roberts. Sir John Bourinot published several books on Canadian history, literature, and government. Alpheus Todd's (1821-84) *Parliamentary Government in England* (1867-69) and *Parliamentary Government in the British Colonies* (1880) are widely known. In the field of local historical research, Arthur George Doughty (in collaboration with G. W. Parmelee) is the author of a scholarly and authoritative work on the siege of Quebec. More widely known are his *The Fortress of Quebec, 1608-1903* (1904) and *The Cradle of New France* (1908). Alexander Begg and R. E. Gosnell wrote excellent histories of British Columbia.

Among essayists, biographers, and mis-

cellaneous writers are Nicholas Flood Davin, whose *Culture and Practical Power* was praised by Gladstone; S. E. Dawson, known for his fine study of Tennyson's *Princess* (1884), his *St. Lawrence Basin and its Border Lands* (1905), and *A Plea for Literature* (1908); Sir William Dawson, a geologist and naturalist, who aimed in many books to reconcile science and religion; Sir Daniel Wilson, an eminent archæologist and literary critic, author of *Prehistoric Man* (1863; 3d ed., 1876), and *Caliban, the Missing Link* (1873); Rev. W. H. Withrow, author of *The Catacombs of Rome* and other books; Rev. G. M. Grant, author of *Ocean to Ocean* (1873), *Advantages of Imperial Federation* (1889), and of several other books; T. A. Haultain, author of brilliant literary brochures, as *A Critique of Cardinal Newman's Exposition of the Illative Sense*, *A Fragmentary Dialogue on Love and Religion*, *The Mystery of Golf*; J. Castell Hopkins, editor of *Canada; an Encyclopædia of the Country* (6 vols., 1897-1900), who wrote lives of Sir John Thompson, Gladstone, Queen Victoria, and Edward VII, besides many political pamphlets and articles; W. D. LeSueur, the author of notable essays on Matthew Arnold and Sainte-Beuve; Rev. John Maclean, whose books, as *Our Savage Folk* (1895), deal chiefly with the Indians; J. M. Oxley, the writer of delightful boy stories; and George Stewart, who wrote excellently of Alcott and Emerson. In philosophical criticism the writings of John Watson, and in politics and economics those of John Beattie Crozier, hold a high place.

The material progress and increased political importance of Canada since 1900 have gone far to change the quality and outlook of the literary product. Historical, biographical, and economic works have multiplied, the majority springing from a thoughtful consideration of Canada's new course of development, with its possibilities and dangers. In political biography the best works are Charles Lindsey's *Life and Times of William Lyon Mackenzie* (1862), Joseph Pope's *Memoirs of Sir John A. Macdonald* (1894), A. D. DeCelles' *Papineau and Cartier* (1904), John Lewis's *George Brown* (1906), Sir J. Bourinot's *Lord Elgin* (1905), Sir J. S. Willison's *Sir Wilfrid Laurier* (1903), J. W. Longley's *Joseph Howe* (1905), Miss J. N. McIlwraith's *Sir Frederick Haldimand* (1904), and A. Shortt's *Lord Sydenham* (1908). These biographies, the majority of which are included in the *Makers of Canada Series* (Toronto), are in large part serious studies of constitutional principles whose historic background is not far removed from rebellion and bitter partisan struggle. Other works expressing conflicting views of Canada's present and future are *The Kingdom of Canada* (1908) and *The Kingdom Papers* (1911) by John S. Ewart, *The Struggle for Imperial Unity* (1909), by G. T. Denison, and *Essays in Politics* (1909), by Andrew Macphail. For a full list of authors and books on Imperial federation and allied political and economic problems, see the bibliography to this article, and CANADA.

The first Canadian novels depicted phases of the soldier's and settler's life. John Galt, a Scottish novelist who lived three years in Canada, published, on his return home, *Lawrie Todd, or the Settlers in the Woods* (1830), giving graphic accounts of frontier life. Major John Richardson wrote *Wacousta, or the Prophecy* (1832), an exciting romance based on the siege of Detroit by

Pontiac. For nearly half a century following there was little or no Canadian fiction in English, until William Kirby, author of *The Golden Dog, a Legend of Quebec* (1877), opened a field from which some of his successors have abundantly reaped. James de Mille wrote *The Dodge Club* (1869), a humorous book of travel, and over 30 books of fiction, of which the best are *Helene's Household* (1868), *The American Baron* (1870), and the posthumous *A Strange Manuscript found in a Copper Cylinder* (1888). Mrs. Mary Catherwood in *The Romance of Dollard* (1889) and several other novels recalled stirring episodes of Canadian history. G. M. Adam's (in collaboration with Ethelwyn Wetherald) *An Algonquin Maiden* (1886), John Mackie's *Devil's Playground* (1894), and Mrs. K. E. Hayes's *Prairie Potpourri* (1895) are portrayals of Indian life and the far Northwest. Mrs. J. B. Hammond's *The Unexpected Bride* (1895) and Miss B. L. Macdonell's *Tales of the Soil* respectively treat of Canadian rural life and Canadian legends. Miss M. R. Charlton is said to have been a pioneer in the fairy tale with her *Wonder Web of Storics* (1892) and *With Printless Foot* (1894). Miss K. M. Barry depicted phases of modern life in Ottawa. Humor, inconspicuous in Canadian literature since Haliburton, reappeared in *The American Girl in London* and other novels of Mrs. S. J. Cotes, *The Major's Big Talk Stories* (1881) of F. B. Crofton, and with notable raciness and richness in the *Literary Lapses* (1910), *Nonsense Novels* (1911), and *Sunshine Sketches of a Little Town* (1912) by Stephen B. Leacock, professor of political economy in McGill University. In the *Madonna of a Day* (1896) Miss Lily Dougall drew a portrait of the modern woman. Equally brilliant is her *Beggars All* (1891). Tales and sketches by Mrs. S. F. Harrison, Miss R. Barry, Miss J. N. McIlwraith, Mrs. M. A. Sadlier, and W. McLennan depict various phases of Canadian life. Miss M. M. Saunders's *Beautiful Joe* (1894), the autobiography of a dog, had an immense sale throughout the United States, Canada, and Britain. Mrs. L. M. McDonald's (b. 1877) novels of Prince Edward Island life are widely read. Sir Gilbert Parker, working mainly in the vein of French-Canadian fiction opened up by William Kirby, ranks as the most distinguished Canadian novelist. Of other writers of fiction the most notable are C. W. Gordon (Ralph Connor), Agnes C. Laut, Ernest Thompson Seton (the nature writer), W. A. Fraser, Mrs. Leprohon (Rosanna Eleanor Mullins), Mrs. Catherine Parr Traill, Norman Duncan, William Douw Lighthall, and Arthur Stringer.

The earliest writers of English-Canadian verse are Oliver Goldsmith (a collateral descendant of the Irish poet and author of *The Rising Village*), Robert Sweeny, Adam Kidd, and Mrs. Susannah Moodie (d. 1885). Some of Mrs. Moodie's verses are found in the sketches entitled *Roughing it in the Bush* and *Life in the Clearings* (1853). Charles Heavyside is the author of a remarkable tragedy called *Saul* (1857). Other eminent names are Charles Sangster, Isabella Valancy Crawford, known for beautiful lyrics such as "The Master-BUILDER" and "The Axe of the Pioneer"; George Frederick Cameron, who wrote "What reck we of the creeds of men?"; Charles Mair; Archibald Lampman, a poet of great promise who, like G. F. Cameron, died young; C. G. D. Roberts, W. W. Campbell, Bliss Carman, Freder-

ick G. Scott, Sir Gilbert Parker, Duncan Campbell Scott, Joseph Howe, Sarah Anne Curzon, John Reade, Alexander McLachlan, Arthur Weir, John Hunter Duvar, E. Pauline Johnson, the gifted daughter of a Mohawk chief, and Marjorie L. C. Pickthall. Dr. W. H. Drummond's poems of the *habitant*, written in a dialect halfway between French and English, are unique and highly popular. Robert Service (b. 1876) wrote stirring ballads of struggle and adventure in the Far West and the Yukon Territory. A list of poets and writers of fiction will be found in the anthologies and other works of reference in the bibliography.

Bibliography. The scattered material for the history of French-Canadian and English-Canadian literature may be found in the published *Transactions of the Royal Society of Canada* (Ottawa, 1883 et seq.). The volume for 1893 contains a valuable paper by Sir J. G. Bourinot, "Canada's Intellectual Strength and Weakness," published in book form (Montreal, 1893). The volume for 1905 contains a list of publications ed. by Narcisse E. Dionne, from the beginning of Canadian history. Consult also: Henry James Morgan, *Bibliotheca Canadensis* (Ottawa, 1867) and *Canadian Men and Women of the Time* (Toronto, 1898; new ed., 1912); Edmund Lareau, *Histoire de la littérature canadienne* (1874); Philéas Gagnon, *Essai de bibliographie canadienne* (Montreal, 1895); C. G. V. ab der Halden, *Etude de littérature canadienne-française* (Paris, 1904); Horning and Burpee, *Bibliography of Canadian Fiction* (Toronto, 1904); *Canadian Annual Review* (Toronto, 1903 et seq.), which contains lists of Canadian authors and their latest works. For verse anthologies consult: Rand, *Treasury of Canadian Verse* (New York, 1900); Stedman, *Victorian Anthology* (Boston, 1895); Lighthall, *Songs of the Great Dominion*, "Windsor Series" (London, 1889), and *Canadian Poems and Lays*, "Canterbury Poets Series" (London, 1891); and Gagnon, *Chansons populaires du Canada* (Quebec, 1865). See CANADA; AMERICAN LITERATURE; ENGLISH LITERATURE.

CANADIAN PERIOD. See ORDOVICIAN SYSTEM.

CANADIAN POLITICAL PARTIES. See POLITICAL PARTIES, *Canada*.

CANADIAN RIVER. A river formed by the union of several branches flowing east from the Taos and Culebra range of the Rocky Mountains, at the border between New Mexico and Colorado, in Colfax Co., N. Mex., in long. 105° 20' W., and about 100 miles northeast of Santa Fe (Map: United States, Western Part, F 3). By local usage in New Mexico it is termed Red River. It flows nearly due south to lat. 35° 20' N., then east across the panhandle of Texas and into Oklahoma, where at Taloga it turns southeast, to a point about 6 miles south of Purcell, whence it flows east and northeast and joins the Arkansas River, of which it is the chief tributary, at Tamaha. It is nearly 900 miles long, but, owing to closely paralleling other rivers in the lower part of its course, it drains a relatively small territory. The volume of water varies greatly in the wet and dry seasons.

CANAIGRE, ká-nā'gēr (Fr.) (*Rumex hymenosepalus*). A tannin-producing plant related to the docks and quite resembling the sour dock. It grows wild in the southwestern United States. The stem is nearly smooth, often red-

dish in color, grows from 1 to 3 feet high, and terminates in a branched flower stalk. The leaves vary from about 2 to 16 inches in length. The roots are tuberous, somewhat resembling small sweet potatoes, and are clustered in an upright position 3 to 12 inches below the surface of the ground. The value of the plant consists in the amount of tannin contained in the roots. The tannin content in the air-dried tubers varies from about 10 to 35 per cent, a quantity exceeding that in any other tannin-producing plant. The rapid decrease in the supply of wild canaigre has caused its culture to be undertaken in the Southwest, but this enterprise has not assumed large proportions. It is propagated mainly from the roots, one ton being required to plant an acre. The land is prepared and cultivated as for other root crops. Harvesting may begin after the plant has made its full period of growth, but it has been found that the percentage of tannin increases as the roots lie dormant in the ground. In the wild state the plant makes its growth during the winter and early spring, and by early June has seeded and the tops are dead. About 15 tons of roots per acre is an average yield. The preparation for the market consists in slicing the roots and drying them in the sun. The extract obtained is especially adapted for tanning leather for uppers, fine saddlery, etc. Consult: *Arizona Experiment Sta. Bul. 2* (1896).

CANAL (Fr., from Lat. *canalis*, water pipe). An artificial channel for water, constructed for drainage, irrigation, supplying water power, or purposes of navigation. The design and construction of canals of large size are much the same whatever their purpose may be. In this article the general questions of design and construction for all kinds of canals will be discussed, but for specific examples of canals for other purposes than navigation the articles on DRAINAGE, IRRIGATION, and WATER POWER should be consulted.

Design and Construction. The two points which have mainly to be considered in canal design are the cross section of the channel and its longitudinal profile. Considering the longitudinal profile first, it will readily be understood that a canal cannot, like a road or railway, adapt itself to the irregularities of the country by means of ascending and descending grades, but must consist of one or more practically level sections or reaches. When two or more reaches are required at different levels, the adjoining extremities of two reaches cannot be, for obvious reasons, connected by a grade in the channel. The various means for making such connections are described in the following section; but the fact which needs to be noted here is that, since the profile in the canal must consist of a series of level reaches at different elevations, care has to be exercised to select a route which will provide long reaches and consequently few changes in level. As in railway work, however, depressions in the ground may be crossed by embankments or other structures upon which the channel is carried.

Another matter which has to be carefully provided for is a supply of water to the highest reach, or summit level, as it is usually called; the reason for this being that this reach is constantly losing its water to the reaches below, and this loss must be supplied by streams or reservoirs so located as to discharge into the summit level. Distances being equal, a canal

which connects two points with a single reach is preferable to one with two reaches. Indeed, a considerable increase in length is allowable to permit the canal to be constructed without a change of level. The reason for this is that transferring a boat from one level to another by locks or the other usual means is a slow operation, and, furthermore, locks are very expensive to construct compared with a similar length of the ordinary channel. The engineer carefully integrates these factors of time and cost and selects the route between the various points he wishes to connect which will give the minimum time of transit at the minimum cost. In deciding upon the cross section to be given to the channel, two things have to be considered, viz., its dimensions and its form. As regards dimensions, they are determined largely by the size of the vessels with which it is proposed to navigate the canal. The width must be at least sufficient to permit two vessels of the largest size to pass each other without fouling. Another influencing factor is that the resistance to traction is greater in a restricted waterway. Elaborate trials made in Germany on the Dortmund and Ems Canal showed that while increase of water section diminished traction resistance and injury to the banks, increase of depth was more beneficial than increase of breadth.

It is generally assumed that a width of bottom equal to twice the beam of the largest vessel navigating the canal regularly is necessary in order to permit of two boats passing, and that the depth of water should be about $1\frac{1}{2}$ feet greater than the draft of these vessels, if good results are to be obtained, though this may vary from a few inches to 4 feet or more, as in the case of the Suez Canal, or even a greater amount, as in the Panama Canal. The form of the cross section is determined very largely by the material through which the channel is cut, and by the location of the channel under certain circumstances. The bottom of the channel is always made flat; in soft ground the sides are made sloping, the angle of slope depending upon the stability of the material, being quite steep in firm materials and quite flat in unstable materials; and in rock the sides are made vertical or nearly so. The attempt is always made, for the sake of economy of excavation, to approach as nearly to a rectangular cross section as the conditions will permit. When the canal passes through towns, the sides are made vertical to save space and provide quays, retaining walls being used in soft ground to form vertical sides.

Canal construction consists chiefly of open-cut excavation, but embankments, aqueducts, tunnels, culverts, bridges, and a variety of other construction work may be involved. The plant used and methods adopted in excavating canals depend very largely upon the size of the canal section and the material encountered. In rock the practice is the same everywhere, and consists in the use of power drills and explosives for breaking up the rock, and derricks, conveyers, and cars hauled by animal or mechanical power for removing it. In a boat canal of small section, the plant required is small and simple, but in large ship-canal sections very large and powerful machinery and elaborate power plants supplying compressed air and electricity are employed. In small canals soft-ground excavation was commonly performed by means of shovels and plows for loosening the material, and scrapers and carts for carrying it from the ex-

cavation, but now power shovels are almost invariably used, as well as grading and excavating machines, the steam shovels loading into carts or cars hauled by horses or light locomotives. In ship canals of the largest section this plant is still further enlarged by the employment of special excavating and conveying machines and powerful dredges, both hydraulic and bucket or clamshell. Aqueducts are usually built in the form of masonry-arch bridges with the top formed into a channel for the water. Sometimes, however, masonry piers carry a wooden trough or, in later years, one of steel. In embankments the channel is formed by building up the sides and lining the bottom and slopes with concrete or a layer of clay or other impervious material. Tunnels for canals are built in the same manner as tunnels for other purposes. (See TUNNEL.) Culverts are provided for carrying streams underneath the canal and bridges for carrying highways and roadways over it. See BRIDGE; CABLEWAY; CRANE; DRILL; QUARRY.

Locks, Inclines, and Lifts. The usual methods of transferring vessels from one level or reach of a canal to another one are by locks, inclines, or lifts. Of these three devices, the lock is the one most extensively employed. A lock is a masonry chamber built at the junction of the two reaches, the bottom of which is a continuation of the bottom of the lower reach and the top of which is at the same level as the banks of the upper reach. Structurally this chamber consists of two parallel masonry side walls, closed near each end by a pair of folding gates or, more rarely, by sliding or lifting gates. When a vessel is passing from the lower reach to the upper reach through a lock, the sequence of operations is as follows: the lower gates being open and the water in the lock being at the same level as the water in the down reach, the vessel is floated into the lock chamber and the down gates are closed. By means of valves in the upper gates or culverts in the side walls or floor of the chamber, water from the upper reach is slowly admitted until the water levels in the chamber and in the upper reach are the same. The upper gates are then opened and the boat floated out into the upper reach to continue its journey. To lock a vessel from the upper reach to the lower reach, the operations described are merely reversed. The gates are usually made of wood or iron, and each leaf consists structurally of two vertical posts called the quoin post and the mitre post, connected by horizontal frames, which serve as a framework for carrying the water-tight boarding or plating. The quoin post has pivots at top and bottom which work in suitable fittings in the side wall, so that each gate leaf swings open and shuts like a door.

A gate consists of two leaves, the swinging edges of which meet on the centre line of the chamber; but as each leaf is somewhat wider than half the width of the chamber, they do not form a straight diaphragm across the chamber when closed, but are shaped like a very flat letter V with its point projecting towards the upper level or reach. This construction gives greater strength to resist the pressure of the water. The height between the bottom of the down reach and the bottom of the upper reach is called the lift of the lock. The practicable height of lift in lock construction is limited, and where great differences in level have to be over-

come, a series or flight of locks built end to end is employed.

Where a vessel passes through a lock from one level to another, a lockful of water is lost from the upper level to the lower level for each pair of boats passed. Where water is scarce and the total lift is large, therefore, resort is sometimes had to inclined planes up and down which the boats are transported in cradles or tanks running on wheels and hauled by cables or other power. Inclined planes for canals are of very early origin, being at one time quite extensively used for high lifts, and some of these old inclines on American canals are described in the following section, though these canals are now abandoned. In Europe they are still encountered, as the Grand Junction, England; at Ourcq, France; Shropshire, England; and Oberland, Germany.

A more important system of transferring canal boats from one level to another is the vertical lift or lift-lock system, which has been installed in a number of places and is proposed for several other places where very high and important differences of level occur. In the vertical lift-lock system the boat is floated into a movable trough, the ends of which are closed by gates, while similar gates close the ends of the canal approaches. When the gates are closed behind the boat, the trough is raised or lowered, as the case may be, until it coincides with the other level of the canal, when the front gates are opened and the boat proceeds upon its way. The trough is raised and lowered by means of hydraulic or other power, aided sometimes by counterweights or flotation tanks. The first vertical lift on a large scale was that built at Anderton, England, on the Trent and Mersey Canal, in 1875, and operated for several years with hydraulic machinery until in 1908 the plunger and hydraulic appliances were removed and each tank was counterweighted separately and the machinery was operated by electricity; a second was built at Les Fontinettes, France, on the Neuffossé, in 1885; a third at La Louvière, Belgium, in 1888; and a fourth at Heinrichenberg, Germany, in 1895. In 1895 a lift lock was designed to replace the flight of locks at Lockport, N. Y., on the Erie Canal. In 1904 an hydraulic lift lock was built at Peterborough, Canada, on the Trent Canal, and in 1906 another at Kirkfield on the same canal. The Heinrichenberg lift lock on the Dortmund and Ems Canal in Germany has a tank $229.6 \times 28.2 \times 8.2$ feet, with a lift of 52.45 feet.

Boat Canals. *History.*—Canals date from a period long anterior to the Christian era and were employed as means of navigation and communication by the Assyrians, Egyptians, Hindus, and Chinese. The royal canal of Babylon was built about 600 B.C. As an interesting instance of canal construction, previous to the fifteenth century, may be mentioned the Grand Canal of China, built in the thirteenth century to connect the Yang-tze-kiang and Pei-ho. This canal is 650 miles long; is largely composed of canalized rivers; is about 5 to 6 feet deep, and has inclined planes up which the boats are hauled by capstans and made to slide down a paved track. The lock is said to have been invented in 1481 by two Italian engineers, but the merit of this invention is also claimed by Holland. The known facts are that canal locks were used in both Holland and Italy in the fifteenth century, and that by their development a wonderful impetus was given to canal construction, which had

previously been confined to such countries as permitted canals of a single level or reach to be used. The first European country to take up the construction of navigation canals on a systematic plan and extensive scale was France. The Briare Canal, connecting the rivers Seine and Loire, was built from 1605 to 1642; the Orléans Canal was built in 1675, and the Languedoc Canal in 1666–81. For the time this last was an enormous work—the canal connecting the Bay of Biscay with the Mediterranean by an artificial waterway 148 miles long and $6\frac{1}{2}$ feet deep, with 119 locks having an aggregate rise of 600 feet, and capable of floating vessels of 100 tons. In Russia a great system of canals connecting St. Petersburg with the Caspian Sea was developed during the eighteenth century; a canal connecting the North Sea and Baltic, 100 miles long, was finished in 1785. The Gotha Canal, 280 miles long, connecting Stockholm and Gothenburg, in Sweden, was completed in 1832; and the Danube and Main Canal, 108 miles long, was constructed 1836–46. France, however, was the continental country which devoted the greatest attention to canal construction. Notable among recent works is the Marseilles-Rhône Canal, begun in 1904 and to be finished about 1918. It will be 48 miles long (approx.), 82 feet wide, 8 feet 2 inches to 9 feet 10 inches deep, with locks $52\frac{1}{2}$ feet wide and 525 feet long, and will cost about \$20,000,000. Barges of 600 tons can be accommodated. Under the Nerthe range will be a \$10,000,000 tunnel $4\frac{1}{2}$ miles long, the greatest of its kind. Marseilles, gaining direct water communication with the interior of France and northern Europe, expects to become the chief clearing house for the North African trade. It will be declared a free port, like Hamburg, which has long depended greatly on a network of canals. France now has upward of 3000 miles of canal and 2000 miles of canalized rivers.

Germany has spent much effort in developing its canal systems recently, and it was estimated in 1912 that the Rhine and Weser Canal then under construction would have a traffic capacity of 17,000,000 tons annually. Standard forms and sizes of barges of 600 tons and 400 tons capacity have been adopted as most advantageous after elaborate experiments. The former are 213.25 feet in length, 26.25 feet in beam, and draw loaded 5.74 feet of water. The 400-ton barges were 180.44 feet in length, but with other dimensions the same. Lock systems to accommodate barges of this size were recommended where they did not exist. In Belgium there has been a marked tendency to increase the dimensions of existing canal systems, so that, for example, the lower portion of the canal from Charleroi to Brussels extending from Clabecq to the latter city may accommodate 1000-ton boats. The countries of continental Europe continue to manifest considerable activity in enlarging and extending their boat-canal systems, while England and America have practically abandoned the development of their systems of navigable waterways. In Great Britain the boat canals have been criticized as being absolutely lacking in uniformity of management or design and dimensions and, generally speaking, being incapable of being worked by steam. Furthermore, the system of tolls has been unequal, and with the development of railways little thought has been given to the consistent evolution and increase of a natural canal system.

CANALS

THE NEW YORK STATE BARGE CANAL

LOCK No. 2 AT WATERFORD, THE EASTERN TERMINUS OF THE ERIE CANAL. This is the first of a series of high lift locks located within about a mile and a half, with a combined total lift of 169 feet, the greatest flight of high lift locks in the world. Three locks of the older canal may be seen on the right.

CANALS

THE NEW YORK STATE BARGE CANAL

1. SIPHON LOCK AT OSWEGO. The First Siphon Lock to be built in the United States, and the only lock of this type on the Barge Canal.
2. HIGH LIFT LOCK AT LITTLE FALLS. A Lock with a lift of $40\frac{1}{2}$ feet, with a lift type lower gate. The only instance of a lift gate on any Barge Canal lock except the guard locks at the Genesee River crossing.

The first canals in Great Britain are generally conceded to have been the Foss dike and Caes dike in Lincolnshire, 11 and 40 miles long respectively, the former of which is still navigable. These channels are stated to have been first excavated by the Romans and to have been enlarged in the twelfth century. It was not until the latter part of the eighteenth century, however, that canal building assumed importance in England through the energy and liberality of the Duke of Bridgewater and the skill of the engineer, James Brindley, the success of whose works stimulated others to engage in similar undertakings. The era of canal building, ushered in by the Duke of Bridgewater by the construction of the Bridgewater Canal in 1761, continued until 1834, when the last inland boat canal was built in Great Britain. It is interesting to note that from 1791 to 1794 speculation in canal shares became a mania in England and finally resulted in a financial crash and the ruin of many persons. At the end of 1834 there were about 3800 miles of canal in Great Britain, of which about 3000 miles were in England. The following may be mentioned as among the more notable of the British canals: Grand Canal, Dublin to Ballinasloe, Ireland, 164 miles long, 40 feet wide, 6 feet deep, built in 1765; Royal Canal, Dublin to Torinansburg, Ireland, built after the Grand Canal; Gloucester and Berkeley Canal, Sharpness to Gloucester, 17 miles; Caledonian Canal, crossing Scotland, 17 feet deep; Forth and Clyde Canal, 35 miles long and 10 feet deep; and the Crinan Canal across the peninsula of Kintyre, 12 feet deep. The depth of the great majority of British canals, however, varies from 3½ feet to 5 feet, and many of these are now owned by the railways. Various schemes to increase the facilities for internal waterways have been considered by parliamentary and other commissions, but beyond reports and discussions little has resulted.

In the United States the construction of the Erie Canal, begun in 1817, opened up the development of canal construction, which now aggregates upward of 4500 miles, located mostly in New York, Pennsylvania, Ohio, Illinois, Indiana, and Virginia. The first man who really saw the future of canal communication was George Washington, whose main efforts, however, were directed towards the connection of the Chesapeake and the Ohio River, but in 1808 Secretary Gallatin submitted a report recommending an extensive system of waterways, on which, however, no action was taken. Canal building continued active in the United States until about 1837. After this date attention was turned chiefly to railway construction. Space is not available here to trace the development of the canal system of the United States in detail, but the essential facts respecting some of the more important enterprises will be given. In 1793 a canal was built around the rapids of the Connecticut River at South Hadley, Mass., and another, 3 miles long, was built around Turners Falls on the same stream in 1790-96. The canal at South Hadley is interesting as being the first canal built in America, and as having the two levels connected by an incline, up and down which the boats were raised and lowered in a tank or caisson filled with water and propelled by cables operated by water wheels.

The Erie Canal, connecting the Hudson River at Albany and Troy with Lake Erie at Buffalo,

is 363 miles in length. It was begun in 1817 and completed in 1825, at a cost of \$7,602,000. Its construction was due chiefly to the foresight and energy of De Witt Clinton. The enterprise was undertaken and carried through by the State of New York, Clinton being Governor during nearly all the period of its progress. As its route lay chiefly through an uninhabited wilderness, it opened for settlement an immense territory. It was subsequently enlarged, until it was 70 feet broad at the surface and 56 feet at the bottom, with a depth of 7 feet. The canal was immensely successful, contributing largely to the growth of New York, Buffalo, and intermediate places, and serving for many years as the great artery of passenger as well as freight traffic between the northeastern sections of the United States and the newly settled States of what was then the West. Light packet boats, drawn by frequent relays of horses, which were made to proceed at a trot, made the trip from Albany to Buffalo in three and a half days. In 1896 it was estimated that the cost of construction and improvements had aggregated \$52,540,800. An expenditure of \$9,000,000 more for enlargement was authorized by popular vote in that year. Work was begun on this enlargement in the winter of 1896-97 and resumed again during the winter of 1897-98. In the spring of 1898 all of the \$9,000,000 had been consumed and only a part of the projected deepening to 9 feet was completed. See **ERIE CANAL**.

New York State Barge Canal. In 1900, in response to a demand for increasing the capacity of the Erie Canal and other waterways of the State of New York, an investigation was set on foot to determine the cost and proper plan for its enlargement so that boats or barges of 1000 to 1200 tons could be used. By laws enacted in 1903 an appropriation of \$101,000,000 was made to cover the cost of deepening and extending the canal system of the State. This involved the improvement of the Erie, Oswego, and Champlain canals, making a waterway 12 feet in depth and aggregating 431 miles, of which 27 miles was lake navigation, where Oneida, Onondaga, and Cross lakes were utilized. Forty-three per cent of the entire mileage was to have a minimum bottom width of 75 feet and the remainder not in lakes was to be constructed in canalized rivers and streams with a bottom width of channel ranging from 110 to 200 feet. If the full width of the locks that were constructed for the canal should be utilized, boats of 3000 tons could be accommodated, but for boats that could pass in the most restricted channels and be driven tandem or lifted together at one lockage a capacity of about 1600 tons was as much as could be provided for. The economic value of the New York State Barge Canal during its construction was a matter of considerable dispute, but it presented many interesting engineering problems which will be found discussed under **NEW YORK STATE BARGE CANAL** (q.v.).

The Illinois and Michigan Canal connects Lake Michigan and the navigable waters of the Illinois River, and allows the passage of vessels of limited size from the Gulf of Mexico to the Gulf of St. Lawrence by using also the Welland Canal, which forms a navigable channel from Lake Erie to Lake Ontario. In 1825 it was estimated that the canal, about 100 miles in length, would cost about \$700,000, but nothing definite was attempted till 1836, when estimates

were made for a canal 60 feet wide at the bottom and 6 feet deep, costing \$8,654,000. Work was commenced in June, 1836, and continued until March, 1841, when it was discontinued for want of available funds. In 1845 an additional \$1,800,000 was raised by the sale of lands owned by the canal. In consequence of a change of plans the entire cost fell within the estimates which had been made, so that at the opening of the canal in April, 1848, the entire expenditure had been \$6,170,226. When completed, the eastern terminus joined the south branch of the Chicago River, 5 miles from the mouth of the main stream. A direct line is pursued to the valley of the Des Plaines, the main eastern branch of the Illinois River, a distance of about 8 miles. The canal then traverses the valley to the mouth of the Kankakee River, a distance of 43 miles, passing through the towns of Lockport and Joliet and receiving water from four feeders—the Calumet, Des Plaines, Du Page, and Kankakee rivers. The canal now follows the valley of the Illinois River to its terminus, La Salle, passing through the towns of Morris and Ottawa, receiving water from Fox River; the whole length being 96 miles. From La Salle traffic can pass through the Illinois River to Grafton on the Mississippi, which has been improved by locks and dams by the national government and by the State of Illinois. The water at La Salle is 145 feet lower than Lake Michigan, and the descent is accomplished by means of 17 locks, varying in lift from $3\frac{1}{2}$ to 10 feet. The locks are 110 feet long and 18 feet wide, giving passage to boats of 150 tons. The canal, on account of its small dimensions, is inadequate for traffic conditions, and its volume of business is small.

Chicago Sanitary and Ship Canal. Lake Michigan is also connected with the Mississippi by the Chicago Sanitary and Ship Canal, completed in 1900. (See CHICAGO DRAINAGE CANAL.) This canal, 28 miles in length, was originally designed to carry the drainage of Chicago to the Mississippi instead of to Lake Michigan. It has a minimum depth of 22 feet, a width at the bottom of 160 feet, and a width at the top varying from 162 to 290 feet. The canal extends from the Chicago River in Chicago to Lockport, where it joins the Des Plaines River. It has been proposed to deepen the Chicago Drainage Canal and also the Illinois and Mississippi rivers, and construct locks so that barges and light-draft vessels can pass direct from the Great Lakes to the Gulf of Mexico; but the use of the water from the Great Lakes whereby their level may be lowered has been opposed by the national government. In 1913 there was put under construction a smaller canal extending from South Chicago to Sag Bridge, where it joined the Chicago Drainage Canal. This canal was designed to reverse the flow of the Calumet River and take care of the drainage of a rapidly growing district.

Besides the Erie and the Illinois and Michigan, the other large canals of the United States are the Delaware and Hudson (now abandoned), at one time the great coal route to New York from the Pennsylvania mines, 102 miles long, completed in 1820, cost \$6,946,455; the Chesapeake and Ohio, 185 miles, cost \$11,375,000; the Schuylkill Coal and Navigation Company's Canal, 108 miles, cost \$13,207,000; and the Wabash and Erie in Indiana, 274 miles, cost \$6,000,000. There were 13 canals in New York, 14 in Pennsylvania, 5 in Ohio, 4 in Virginia, 2 in

New Jersey, and 1 each in Delaware, Maryland, Indiana, Illinois, and Michigan, but now most of these are in disuse.

Chesapeake and Ohio Canal. This waterway originated in a project formed by Washington as early as 1774, to make the Potomac navigable from tidewater to Cumberland, and to connect it by common roads and portages with the affluents of the Ohio west of the Alleghanies. The War of the Revolution postponed the scheme, but in 1784 it was again broached by Washington, and Maryland and Virginia appointed a joint commission, with him at the head, to investigate the subject. The result was the incorporation of a company to make the Potomac navigable from the tidewater to the highest possible point by the construction of such locks as might be necessary for that purpose. Of this company Washington was the president until his election as President of the United States compelled his resignation. The project encountered many obstacles, until at last, in 1820, it was abandoned as impracticable, when the Board of Public Works of the State of Virginia took steps which led to the organization of a new company, which constructed the Chesapeake and Ohio Canal from Georgetown to Cumberland, completing it in 1850. It passes through the Potomac valley to Paw Paw Bend, from which point it passes through the mountains by a tunnel 3118 feet long. The whole length of the canal is 184 miles, its depth 6 feet, its width to Harper's Ferry 60 feet at the surface and 42 feet at the bottom. By means of 74 locks 100 feet long and 15 feet wide, an elevation of 609 feet is gained. All the water is supplied from the Potomac. At Georgetown the canal was led over the Potomac by means of a great wooden aqueduct bridge. The cost of the work was over \$11,000,000.

The Morris Canal connected the Delaware at Phillipsburg, N. J., with the Hudson at Jersey City. It was 102 miles long and accommodated vessels of 80 tons. An interesting feature of this canal was the use of inclines for connecting the different levels; there were 23 of these inclines, with an average rise of 58 feet.

These canals in many cases, however, played a prominent, if often a brief, rôle in the development of the commerce of the United States, and their history is well worthy of consideration.

Hennepin Canal. The only boat canal, strictly speaking, constructed in the United States since 1850 is the Illinois and Mississippi, or Hennepin, Canal in Illinois. This canal was begun in July, 1892, and it was completed in 1908, costing about \$75,000,000. It was designed as a short route from the upper Mississippi River to Lake Michigan in connection with the existing water routes of Illinois. It extends from the Illinois River at Great Bend, $1\frac{3}{4}$ miles from Hennepin, Ill., to Rock Island, Ill., 77 miles, of which 50 miles are canal and 27 miles are slack-water navigation down the Rock River. The canal proper and the summit-level feeder are 7 feet deep and 80 feet wide at water level. The feeder is 34.75 miles long. There are 37 concrete locks, 35×70 feet, with lifts of from 3 to 10 feet.

Proposed Canals in the United States. The advocates of an extensive system of canals in the United States, and especially a system of coast waterways consisting of canals connecting the various sounds and bays along the Atlantic seaboard, have not been discouraged with the lack

PANAMA CANAL

of success attending such canals. Various schemes have been proposed in Congress, and numerous examinations and surveys have been authorized by the Corps of Engineers of the United States army. The River and Harbors Act of March 3, 1905, provided an appropriation for a survey "for the construction of a continuous waterway, inland where practicable, from Boston, Massachusetts . . . to Beaufort, N. C., for the purpose of ascertaining the cost of a channel with a maximum depth of 25 feet, or such lesser depths along any section . . . as may be found to be sufficient for commercial, naval, or military purposes"; and General Bixby, the Chief of Engineers, in 1913 presented a detailed report with estimates showing how a canal 12 feet in depth could be constructed that would give communication from Boston to Beaufort in connection with existing waterways. An appropriation was made by Congress in 1912 for the purchase of the Albemarle and Chesapeake Canal and for its improvement, and General Bixby recommended that \$30,000,000 be appropriated for carrying out the scheme. In addition to the commercial importance claimed for such a system of canals, the military value was also urged, as such waterways would be beyond the range of a hostile fleet attacking the coast.

After this brief account of canal construction in the United States, it is necessary to note that, all things considered, transportation by internal artificial waterways has been far from successful. Of some 4500 miles of canal constructed in the United States at an approximate cost of well over \$200,000,000, over half, or some 2500 miles, costing in all about \$80,000,000, have been abandoned. These abandoned canals failed entirely to compete with the railways or to serve any useful purpose. This was due, in many cases, to the improvident original location of the canals, to which often were added mismanagement and a lack of provision and control of strategic connections and terminals. This was emphasized all the more with the introduction of the railroad and the failure of the tow-path canals, as constructed, to lend themselves to modern conditions of mechanical transportation, such as steam, or electrical haulage of the boats, or barges. In the report of the Commissioner of Corporations on Transportation by Water in the United States (Washington, 1909) it is stated that there was in operation a total mileage of 1360 miles, including branches and feeders of State canals in New York, Ohio, Illinois, and Louisiana. With the exception of the improvement of the canals in the State of New York, the majority of these are antiquated and inadequate, and the original cost of \$156,983,538 is giving but little return to the citizens of the States concerned. This report refers to but 16 private canals aggregating 632 miles in length, as possessing more than local importance and representing a capital stock of \$43,326,539. The construction of practically all the canals in the United States has rendered impossible the use of mechanical transportation, and their limited dimensions have restricted the size of boats or barges that can be used. Consequently there is practically no data on which to base opinions as to the success of steam or electric towed barges of 1000 or 1500 tons capacity, such as is required by the modern transportation conditions and such as is proposed for the New York State Barge Canal.

Canadian Canals. The Canadian canal system is one of the most important in the world, and comprises the St. Lawrence and Lake Navigation, the Ottawa and Rideau Navigation, the Richelieu and Champlain Navigation, and the River Trent Navigation. Of these the St. Lawrence system is the most important, as it gives a 14-foot waterway from the head of Lake Superior to the Gulf of St. Lawrence. The canals of the St. Lawrence system are the following:

NAME OF CANAL	Length Miles	Number of locks	Lockage Feet	Dist. from prec. canal
St. Mary's	0.66	1	18.	600 miles
Welland	26.75 *	25	362.75	226 "
Galops	7.625	3	15.5	4.5 "
Rapide Plat	4.	2	11.5	10.5 "
Farrans Point	0.75	1	4.	5. "
Cornwall	11.5	6	48.	32.75"
Soulanges	14.	4	82.5	15.25"
Lachine	8.5	5	45.	

* New and enlarged canal started in 1913.

Ship Canals. *Examples.*—In the last half of the nineteenth century, with the development of steam navigation and maritime trade, a demand arose for the construction of canals of large dimensions across isthmuses to shorten the route by sea between certain countries, to connect important internal manufacturing and commercial cities with the ocean, or to afford communication between bodies of water in the interior of a continent. Among the more notable examples of such ship canals are the Panama, Suez, Corinth, Manchester, St. Mary's, St. Petersburg and Kronstadt, Kiel, Amsterdam, and Cape Cod.

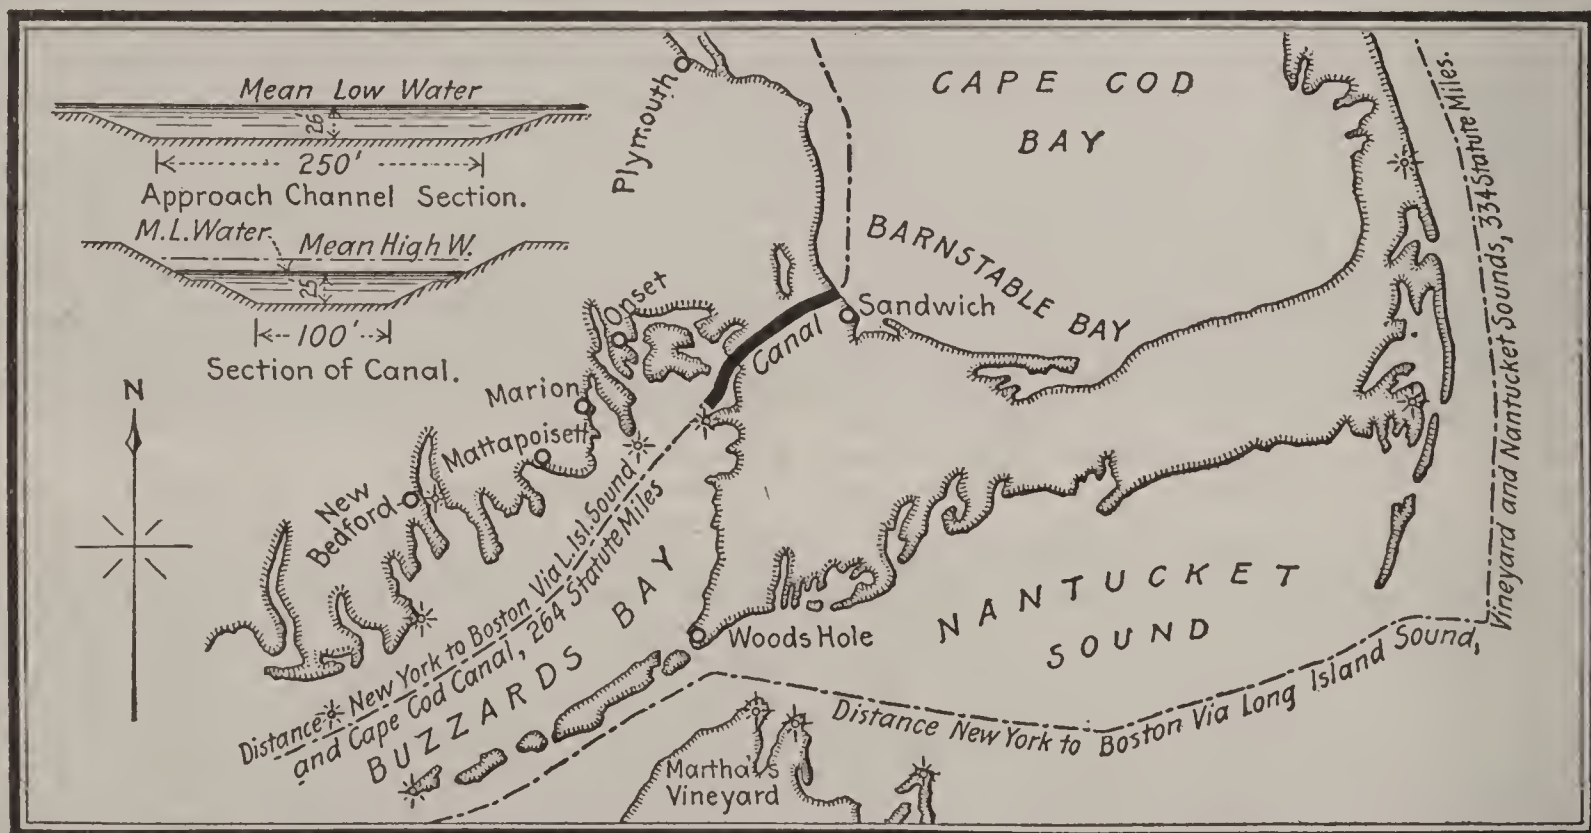

The Panama Canal (q.v.), completed in 1914, traverses the Isthmus of Panama from Colon on the Caribbean Sea to the Bay of Panama on the Pacific Ocean, and is about 49 miles in length. A portion of the waterway is formed by Gatun Lake, 85 feet above mean tidewater and reached by a flight of locks at Gatun 7 miles from Colon and at Pedro Miguel and Miraflores on the Pacific side. These locks have a usable width of 110 feet and a length of 1000 feet with a depth of 40 feet. *The Suez Canal* (q.v.) cuts through the Isthmus of Suez and connects the Mediterranean with the Red Sea. It is about 100 miles long, has a bottom width of 72 feet and a depth of 26 feet, and was built 1860-69. *The Manchester Canal* runs from the Mersey at Eastham, just above Liverpool, to Manchester, is 35.5 miles long, 26 feet deep, and has a minimum bottom width of 120 feet. It is built in four reaches connected by three sets of locks at Latchford, Islam, and Barton, the sizes of the locks of each set being 550 × 60 feet, 300 × 40 feet, and 100 × 20 feet. One of the notable structures of this canal, and the only one of its kind, is a swing aqueduct by which the Bridgewater Canal is carried over the Manchester Canal. This aqueduct opens exactly like a swing-span drawbridge to permit vessels with masts to pass through. *The Corinth Canal* is another of the transisthmian type, crossing the Isthmus of Corinth with a cut 4 miles long, 72 feet wide, and 26.5 feet deep. This canal was completed in 1893. It is stated that this canal was projected by Alexander the Great, determined upon by Julius Caesar, and actually begun by Nero, though his work never progressed beyond a few hundred yards.

The Saint Mary's Canal, commonly known as

the Sault Ste. Marie Canal, connecting the waters of Lake Superior with those of the St. Mary's River and Lake Huron, around the St. Mary's Falls in Michigan, is but a few thousand feet long, and is chiefly remarkable for its enormous traffic and for having the largest lock in the world. There are now two canals, or canal systems, one on either side of the national boundary maintained by the respective governments. The Canadian Canal, built by the Dominion government in 1888 to 1895, is $1\frac{1}{8}$ miles in length, 150 feet wide, 22 feet deep, and has a lock 900 feet long, 60 feet wide, with a depth of 20 feet 3 inches at extreme low-water level. This depth gave it an advantage of about 8 inches over the Poe lock of the United States Canal built in 1896, and at the time of its construction the largest in the world. Accordingly, in 1907, the widening and deepening of the old American Canal above the locks was begun, and a project involving the construction of a new canal and lock, 1350 feet in length, 80 feet in width, and 24.5 feet in depth at extreme low water, was

Baltic to Brunsbüttel on the Elbe. It is 60 miles long, had a bottom width of 85 feet and a depth of water of 28 feet. The bottom width subsequently was increased to 140 feet and the surface to 330 feet, while the depth was made 36 feet, so that the largest naval warships could pass through, the locks at either end being enlarged to 1140 feet long by 148 feet wide and 46 feet deep. By this canal seagoing vessels save over 200 miles in going from the Baltic to the North Sea. *The Amsterdam Canal*, like the Manchester, was built to connect an inland city with the sea. The total length of this canal is 16.5 miles from Amsterdam on the Zuyder Zee to the North Sea, but as the route lay through the inlet called the Y and the Wyker Meer, only 3 miles had to be excavated. This canal is 88 feet 7 inches wide on the bottom and 23 feet deep.

Cape Cod Canal. An artificial channel excavated across Cape Cod, connecting Buzzard's Bay with Barnstable Bay at Sandwich, Mass. This ship canal, which was practically completed

CAPE COD CANAL.

undertaken. This new, or Davis, lock was nearing completion in 1914, and a fourth lock of similar dimensions with a new canal was authorized by Congress, July 25, 1912. The tonnage passing through Sault Ste. Marie Canal is apt to run some $2\frac{1}{2}$ times greater than that passing through the Suez Canal, and in the year 1913 amounted to 79,718,344 short tons. The importance of this canal is shown by the fact that 70 per cent of the commerce of the Great Lakes, which is estimated at nearly 100,000,000 tons, passes through the canal and river. See SAINT MARY'S CANAL.

The Saint Petersburg and Kronstadt Canal was completed in 1884. Owing to the bar at the mouth of the Neva, ships were not able to reach St. Petersburg, and the canal from Kronstadt to the capital was built at a cost of \$7,200,000 to overcome this barrier. It is 18.75 miles long and 22 feet deep, with a bottom width of 275 feet, except near St. Petersburg, where it is only 207 feet. The channel was subsequently dredged to 28 feet in depth.

The North Sea and Baltic Canal, more commonly known as *The Kiel Canal* or *The Kaiser Wilhelm Canal*, runs from Holtenau on the

in 1914, saves shipping en route from Long Island Sound to Boston and other New England points, the distance through Vineyard Haven Sound, Nantucket Sound, and around Cape Cod, or a distance of about 70 miles. The canal is 25 feet in depth at mean low water and 100 feet wide at the bottom, the sides having a slope of 1 in 3 where the banks were of sand. In exposed soft places the banks were riprapped. There is an approach channel of 26-foot depth at mean low water, at least 200 feet wide at the bottom at either end. From shore to shore the length of canal is eight miles, but the entire channel excavated from 30-foot depth in either bay is 13 miles. The canal is practically straight with but a single turn of 7640-foot radius and the entrance at Barnstable Bay is protected by a breakwater 3000 feet in length. In the period from 1843 to 1903, 2131 vessels were wrecked in the region of Nantucket shoals, and of these 908 proved total losses, while about 700 lives were lost. The yearly tonnage passing through Vineyard Haven Sound previous to the construction of the canal was estimated at 25,000,000 tons, of which coal in barges amounted to about 9,000,000 tons. This means of transpor-

tation is a leading source of coal supply for New England.

The project for a canal across the sandy isthmus between Barnstable Bay and Buzzard's Bay was agitated as early as 1697, and in 1776 General Washington caused inquiry to be made as to moving troops across this point so as to avoid the enemy and save the hazardous voyage around Cape Cod. In 1780 General Knox made estimates for the construction of a canal at this point and in 1791 surveys were made by Winthrop and Hill. Actual work was commenced by a chartered corporation which made an assignment in 1890. In 1909 the construction of the breakwater at the Barnstable Bay end of the canal was commenced, and from that time the work was vigorously prosecuted. The excavation was done by means of hydraulic dredges, two of which were the largest in the world and were capable of removing over 4000 cubic yards per day from the canal. The excavation was simple as it was entirely through sand, although a deposit of bowlders was encountered. The excavation was made at the rate of about 400,000 cubic yards per month, and before it was completed the granite breakwater, 3000 feet long, in Barnstable Bay was finished and a four-mile approach in Buzzard's Bay had been dredged. It was thought that later the canal might be increased in depth.

Haulage on Canals. The universal method of hauling boats on canals until very recent times has been animal power exerted through a towrope attachment to the boat. In China the hauling is done by men who walk along a tow-path on the bank and pull the boat after them; in most other countries this work is done by horses and mules. Various attempts have been made to substitute steam power for hauling canal boats, and such power is considerably used, especially in Europe and on the large canals. In Europe a system of haulage has for some time been in successful operation in which a cable extends along the bottom of the canal, and traction is secured by means of a steam engine on the canal boat, which works a drum over which the cable is made to fall. By this system tugboats may be employed to haul several canal boats at a time. In Germany barges towed in trains have been found more economical than self-propelled barges, while, unless there is considerable traffic, steam haulage is cheaper than electricity. On the Teltow Canal boats are moved in trains of two by electric traction locomotives on the bank. In recent years numerous experiments have been made with electric power for haulage on canals, but it has not been adopted to any general extent, though it is believed to be the best form of traction. The remarks apply only to haulage on boat canals; the vessels using ship canals traverse them by their own power, except in passing through locks, where some mechanical means, such as the electric locomotives of the Panama Canal, or mechanical capstans or windlasses may be used.

CANAL DOVER. A city in Tuscarawas Co., Ohio, 70 miles (direct) south of Cleveland, on the Tuscarawas River, the Ohio Canal and the Baltimore and Ohio and Pennsylvania railroads (Map: Ohio, G 4). The city contains the County Orphans' Home and the Union Hospital. There are coal, iron, clay, and shale deposits in the vicinity, and the city manufactures sheet iron, steel, tin, pig iron, flour, racing wagons and sulkeys, sadirons, baby carriages, corrugated roofing, boiler plates, etc. Settled in 1807, Canal Dover was incorporated in 1865. The government, under a general law of 1902, is vested in a mayor, elected every two years, and a city council. The municipality owns and operates the water works and electric lighting plant. Pop., 1900, 5422; 1910, 6621.

CANAL DU MIDI, ká'nál' dý mè'dé', or CANAL DU LANGUEDOC. A canal in the south of France, connecting the Mediterranean Sea and the Atlantic Ocean. It extends for 150 miles from Toulouse on the Garonne River to Cette on the Mediterranean. It is 60 feet wide, 6½ feet deep, has 114 locks, 50 aqueducts, and reaches a maximum altitude of 600 feet. It is navigable for vessels of 100 tons. It was completed in 1681 at a cost of \$3,500,000.

CANALE, ká-ná'lá, MICHELE GIUSEPPE (1808-90). An Italian historian. He was born in Genoa, and through Cavour's influence secured the professorship of history and geography at the Polytechnic Institute of his native city. In 1858 he founded the Società Ligure di Storia Patria, for the study of national history. He wrote historical dramas and romances, but his important works were the *Storia dei Genovesi* (1844-54) and *Storia della repubblica di Genova* (1858-74).

CANALEJAS Y MÉNDEZ, ká'ná-lá'hás ē mán'dás, JOSÉ (1854-1912). A distinguished Spanish statesman. He was born July 31, 1854, at Ferrol, his parents early removing to Madrid. As a child he was precocious, when 10 years old translating and publishing a small French work, and when only 18 receiving his doctor's degree from the University of Madrid. He then began to take part in political agitations, showing himself a strong Radical, and in 1880 aiding in the publication of *El Demócrata*. The following year he represented Soria in the Cortes, becoming prominent from the first, despite his connection with the party of the Opposition. Later he was deputy for the District of Agreda; and in the Cortes of 1887, while representing Algeciras, he was made chairman of the military reform commission. During the existence of the ephemeral republic (1873-74) he had served as subsecretary to the President of the Council of Ministers, but this did not seem to affect his subsequent prominence, although it made him unwelcome at court. Canalejas was third vice president of the Cortes and was occupied also with his *Derecho parlamentario comparado* when called upon in 1888 to serve as Minister of Agriculture; in December of the same year he was transferred to the Ministry of

Justice, and this office he held until 1890. In 1894-95 he was Minister of Finance. It was not, however, until 1900, when he urged in the Cortes that war must be declared on clericalism, that he became a really important national figure. Immediately the Socialists and Republicans rallied to his support, and, after accepting the portfolio of agriculture in the cabinet of Sagasta (1902), he added to his popularity by his reforms for the working classes. In 1904, in an oration memorable in Spain, he defended the right of parliamentary immunity, which had been attacked by the Conservatives.

King Alphonso, who had shown himself hostile to Canalejas, became his warm friend after hearing an address made by the Radical leader at the Academy of Jurisprudence. Close on the gaining of the King's favor came the election of Canalejas to the presidency of the Cortes in 1906, when the Liberals were in power, and in 1910 King Alphonso surprised the nation by asking this advanced Radical to take the premiership. Although Canalejas set before himself a difficult programme in undertaking to accomplish the separation of church and state, in the end he completely controlled the situation. In this connection one of his most important measures was that known as the "Padlock Law," which provided for the temporary refusal to authorize the establishment of new religious orders. (See SPAIN, *History*.) He resigned on April 1, 1911, because of opposition to the decision in the case of Ferrer, the anarchist philosopher, but the King immediately directed him to form a new ministry. The troubles in Morocco in 1911, the antimilitarism agitation, strikes and disorders in Spain, and the opposition that the Prime Minister aroused among the extreme Radicals, somewhat dimmed his popularity, but seemed not to impair his general control of affairs. He was shot and killed by an anarchist in the streets of Madrid, Nov. 12, 1912.

Canalejas was without doubt one of the strongest figures in Spanish political history in modern times. Although an inborn Radical, he was practical in his reforms and moderate in his methods. His economic undertakings, including the building of railroads and the development of industries, gave promise of lifting Spain to the general level of European nations. Not alone through governmental positions were his great merits recognized. Elected (1900) a member of the Academy of Moral and Political Sciences, he became also, in 1904, a member of Spain's oldest and proudest academy, the Royal Spanish Academy, and, in 1907, dean of the Colegio de Abogados of Madrid and president of the Royal Academy of Jurisprudence. For complete texts of the discourses for and against his programme in the Cortes of 1910 consult *Canalejas gobernante: Discursos parlamentarios, Cortes de 1910 (Valencia)* and *La Ley llamada del "Candado," y la oposición católica en las Cortes (Madrid)*. Among the publications of Canalejas himself is *El partido liberal* (1912). Consult Luis Antón del Olmet and Arturo García Caraffa in *Los grandes Españoles*, vol. iv (Madrid, 1913).

CANALETTO, kã'nã-lët'tõ. The name applied to two Venetian architectural painters.—ANTONIO CANALETTO, properly DA CANAL or CANALE (1697-1768), was born at Venice and, after studying with his father, Bernardo, and with Carlevaris, acquired in Rome a high reputation

as a painter of antique ruins. Returning to Venice, he devoted himself to the Venetian scenes for which he has become justly famous. Correct in line and warm and true in color, he is the most important painter of the old Venetian school except Tiepolo, who is said to have often painted the figures for his landscapes. In 1746 he went to England and painted many charming English landscapes, together with views of Eton College and of Whitehall. His numerous works are found in all the principal European collections, and he is well represented in the Metropolitan Museum, New York, the Boston Museum, and the Art Institute of Chicago. His importance as a teacher is attested by such pupils as Francesco Guardi and his nephew, BERNARDO BELOTTO (1720-80), called Canaletto. He also was born in Venice and perfected himself in Rome. After laboring for some time for the Elector Charles Albert at Munich, he was appointed court painter at Dresden in 1747. In 1758 he went to Vienna, and about 1770, as painter to the King, to Warsaw, where he died. His paintings, mostly views in cities in which he lived, are very numerous, especially at Dresden and Vienna. While his art is similar, it is inferior, to Antonio's. Both are excellent etchers of Venetian subjects. Consult Meyer, *Die beiden Canaletti* (Dresden, 1878) and *Les deux Canaletti* (Paris, 1906).

CANAL RING. See NEW YORK, *History*; TILDEN, SAMUEL J.

CANANDAIGUA, kã'an-dã'gwã. A city and the county seat of Ontario Co., N. Y., at the north end of Canandaigua Lake, 29 miles southeast of Rochester, on the Pennsylvania and New York Central railroads and the Canandaigua Lake Steamboat Line (Map: New York, C 5). The city, a popular resort, is celebrated for picturesque scenery and fine private residences, and contains among the more noteworthy features a fine courthouse, an historical museum, a public library, an orphan asylum, public and private hospitals, private institutions for the aged and for the insane, and Canandaigua Academy. Its manufactures include enameled ware, tinware, and malt liquors. Settled about 1789 and incorporated as a village in 1815, Canandaigua became a city in 1913, and is governed by a mayor and a board of aldermen. The city owns its water works and sewage system. The abduction of William Morgan from the county jail in Canandaigua in 1826 caused an excitement that extended throughout the State and was the subject of heated political controversy. Pop., 1890, 5868; 1900, 6151; 1910, 7217.

CANANDAIGUA LAKE. A lake in Ontario County and forming part of the western border of Yates Co., N. Y. (Map: New York, C 3). It lies nearly north and south, is 15 miles long by nearly 2 miles wide, 668 feet above the tide, and 421 feet above Lake Ontario, into which it discharges its waters through the Canandaigua outlet, the Clyde, Seneca, and Oswego rivers. It receives its tributary waters mainly at the south end and has its outlet at the north end. It is surrounded by high banks and furnishes charming scenery, and its steamboats are extensively patronized by pleasure seekers.

CANANORE, kã'nã-nõr'. See KANANUR.

CANA OF GALILEE. A town mentioned several times in the Gospel of John. Here Jesus performed his first miracle, the changing of

water into wine (John ii. 1-11). When there again later in his ministry he healed with his word the nobleman's son, who was sick in Capernaum (John iv. 46-53). It was the home of Nathanael, one of his early disciples (John xxi. 2). The site is not certainly known, but as Jesus' mother and apparently the rest of the family (John ii. 12) were present at the wedding, it is not likely to have been far distant from Nazareth, and as they are said to have gone "down" from there to Capernaum, it was most probably situated among the hills. Some maintain that the conditions are best met by 'Ain Kānā, about 8 miles north of Nazareth, on the ridge back of the Plain of Asochis, while others hold to Kānat El-Jelil, north of Sephoris. The traditional site is Kēfr Kenna, 4 miles northeast of Nazareth, on the road to Tiberias. Philological reasons would be in favor of the first-named site.

CANARD, kā-nār'd' (*Fr. pron.* kā-nār', a hoax, cheat, literally a duck). An absurd and sensational story. The origin of this application of the word *canard* (duck) is uncertain. Some derive it from the old phrase *vendre un canard à moitié*, literally 'one who half-sells a duck,' that is, pretends to sell a duck, but does not complete the transaction; while others attribute its origin to the following marvelous tale circulated by Cornelissen in order to try the gullibility of the public: Having at one time twenty ducks in his possession, he killed them one by one and gave their bodies to the diminishing number of survivors, who successively devoured them, until one out of the twenty was all that remained, and this one had actually gobbled up his nineteen comrades. A corresponding expression in the United States is the term *roorback*, a fictitious narrative published to gain some political advantage. It originated in 1844 from a story of some notoriety purporting to be an extract from the *Travels of Baron Roorbach*.

CANARESE, kān'ā-rēz'. See KANARESE.

CAÑARI, kā-nyā'rē. One of several ancient tribes around the Gulf of Guayaquil, Ecuador, conquered and incorporated by the Incas, about 1450. The Cañaris occupied the inter-Andine region now included in the provinces of Cañar and Azuay, and their language, surviving only in place names, formed a distinct stock. They were skillful metal workers, their technique differing from that of the Quichua. Copper axes, curiously ornamented, are found in their tombs, and, according to Suarez, sometimes as much as 500 pounds weight in a single deposit. Some of the most beautiful gold ornaments of the Andean region have also been found in their territory. Mountain, lake, and serpent worship existed among them. They had also many festivals, dances, etc. Consult: F. G. Suarez, *Estudio historico sobre los Cañaris Antiguos* (Quito, 1878), and other writings; Saville, *Antiquities of Manabi, Ecuador* (New York, 1907-10); and R. Verneau and P. Rivet, *Ethnographie ancienne de l'Equateur* (Paris, 1912), especially pp. 29-36.

CANARIE, kā'nā'rē'. A dance, now obsolete, supposed to have come from the Canary Islands. It was a favorite dance in France in the time of Louis XIV, and it is mentioned by Shakespeare. The canarie was a species of gigue resembling the *loure*, only quicker in tempo, requiring two dancers and involving very extravagant gestures.

CANA'RIMUM (Neo-Lat., from East Indian

canari, from *Kanara*, or *Canara*, a district of southwestern India). A genus of trees of the family Burseraceæ, the species of which are natives of the southeastern parts of Asia, the Malayan archipelago, Australia, etc. The fruit is a drupe. The kernel of the fruit of *Canarium commune* is eaten both raw and roasted, and in Amboyna bread is made of it. An oil is expressed from it, which is used both for table purposes and for lamps. The tree is about 50 feet high and has a bark which yields a heavy oil that has the same properties as balsam copaiva and may be substituted for it. *Canarium sylvestre* also produces eatable kernels. The timber of this species is hard, tough, and close-grained, and is used for furniture. *Canarium commune* is supposed to be one of the trees which yield the resin called elemi, and *Canarium strictum* is a large tree in Bombay and Madras, where it grows at elevations up to 4500 feet. The foliage is very brilliant and attractive. From the trunk a gum exudes, the black dammar of commerce. It solidifies upon the tree into black lumps, but is amber colored by transmitted light. *Canarium australianum* furnishes a timber valuable in finishing houses.

CANA'RY (named after the Canary Islands). A small finch or scrib (*Serinus canarius canarius*), a native of the Canary Islands, Madeira, and the Cape Verde, but introduced into Europe as a cage bird in the latter part of the fifteenth or early in the sixteenth century, and now found as a captive in all parts of the world where Europeans have gone. So popular has the canary become as a cage bird, on account of its power of song and its gentle manners, that the breeding of canaries for the market is not only a popular avocation in some places, but even an important industry. In the wild state the plumage is dull greenish, streaked with darker shades, like a siskin (q.v.), and the yellow, orange, or red shades of the domesticated birds are entirely the result of man's artificial selection. The size of the canary, as well as its color, has been profoundly modified by domestication, and some varieties are half as large again as the wild bird, which is rather more than 5 inches in length. The musical powers of the bird have also been considerably modified and there is much variety in the different breeds in this particular, but it is doubtful whether in power or clearness the domestic birds are the equal of those which are wild. In their native haunts canaries frequent the vicinity of houses, build their nests of moss, hair, grass, feathers, etc., in bushes or trees, and raise two or more broods in the season. The eggs are four or five in a set, and are pale blue, generally unspotted. The birds feed chiefly upon seeds, especially of certain grasses, but they also eat soft green leaves, buds, and occasionally insects.

The breeding and training of canaries is a subject of much interest and no little importance. It has been carried on most extensively in northern England, Scotland, Belgium, and especially in the Harz Mountains in Germany. The various breeds of canaries take their names in part from the locality where bred, and in part from some characteristic of the breed which is specially notable. There are a large number of varieties, of which the following are the most important. To begin with the British breeds, the Norwich canary is famous for the beauty of its plumage, but not for its great powers of song. It is an inferior singer com-

pared to other breeds, especially some of the Harz Mountain birds. The Norwich canary is often crested, a pleasing addition to its appearance. The Manchester canaries are also notable, particularly the Manchester copy, which is the giant of canaries, sometimes reaching a length of 8 inches. They are not, however, remarkable songsters. Among the more curious breeds are the Yorkshire Don and Scotch Fancy, which are very slender, with long neck, trunk, and tail, gracefully curved, so that in extreme examples the bird is almost a half-circle. Among the handsomest breeds are the gold and silver "spangled" canaries, which, as their names imply, are not uniformly colored, but have a comparatively dull ground color, spangled with very bright or very pale feathers. These breeds are more valuable as ornaments than as musicians. The Belgian canaries are also bred especially for appearance, and some of them are almost monstrosities. The most notable of these is the variety known as "humped-backs," which have a small head, very short neck, and broad shoulders, a combination that gives a very odd appearance. They are usually yellow, but the color is a secondary matter. The Harz Mountain canaries are the most famous of all, and are especially noted for their powers of song. The color is regarded as of much less importance, and consequently they vary much from bright green to clear yellow. The best of all singers are the Saint Andreasberg canaries, and the choicest of these command a large price. Individual birds, with exceptional ability as singers, are used as instructors for young birds, and are known as "campaninis." There are two other breeds of canaries not confined to any special locality, but which take their names from their color. The most interesting of these are the natural *cinna-mons*, which are deep brownish yellow or reddish, and are often very beautiful. The others are known as *cayennes*, and are reddish, a color produced by judicious feeding of red pepper to the growing birds. They are sometimes nearly scarlet, and often handsome birds, but breeders of cinna-mons regard them as an abomination.

The price of a canary depends upon its approach to the ideal bird of its breed, but the females are usually the cheaper. From \$1 to \$75 is the range of value for the great majority of canaries, but exceptional individuals may bring as high as \$150. The highest prices are paid for the Saint Andreasberg campaninis. Canaries are often crossed, by fanciers, with other finches, and the hybrids thus produced are sometimes valuable as cage birds, either for appearance or peculiar qualities of song.

These hybrids are called "mules," and are usually the result of mating other cock birds with hen canaries, on account of the difficulty of persuading female linnets, goldfinches, etc., to sit on their eggs in captivity.

Canaries are the easiest of cage birds to care for, as almost the only essentials are cleanliness, food, and water. The cage and especially the food and water vessels should be kept scrupulously clean. A bath should be provided at least once a day, the water being made tepid in very cold weather, and occasional freedom from the cage in a closed room is a real benefit to the bird. Care should be taken not to expose the bird to cold drafts, hence it is usually unwise to hang the cage near windows during wintry weather. The principal articles of food should be canary seed and rape, but green leaves, such

as chickweed, are necessary to maintain perfect health. Hemp may be given in less quantities. Sugar is also greatly enjoyed by canaries, and is a proper food in small quantities; but acids, such as fresh apple, should be avoided. Lime is essential to the bird's welfare, and is best provided in the form of cuttlefish bone. The nails are apt to grow so long, in canaries kept in small cages, that they should be cut occasionally to prevent them from becoming troublesome to the bird. Many canaries and other birds are made uncomfortable or actually made to suffer from improper sized perches. Those usually furnished with brass cages, which are large in the centre and dwindle towards each end, are ill adapted for such small birds. The perches should be no thicker than a thin lead pencil, so that the bird's toes may meet around them. For further information in reference to the care of canaries and their breeding, consult: Wallace, *The Canary Book* (London, 1893); Holden, *Canaries and Cage-Birds* (New York, 1883); Belts, *The Pleasurable Art of Breeding Pet Canaries* (London, 1897); Blakston, Swaysland, and Miener, *The Book of Canaries and Cage Birds* (London); Robson, *Canaries, Hybrids and British Birds in Cage and Aviary* (London, 1912); *Cage-Birds*, a weekly paper published in London. See CAGE BIRDS; and Plate of CANARY BIRDS.

CANARY GRASS (*Phalaris canariensis*). An annual grass of which the seed is much used, under the name "canary seed," as food for cage birds, and which is, on that account, cultivated to some extent in the south of Europe and in certain districts of Germany and England. It is a native of the Canary Islands, the south of Europe, north of Africa, and Asia. It has been introduced and has become naturalized in England and various parts of the United States. It attains a height of 2 or 3 feet, and has a crowded, egg-shaped, spikelike panicle, from an inch to almost 2 inches long. A fine flour is prepared from canary seed, which is employed as glue or sizing in fine cotton weaving and for the finishing of silken stuffs. The groats and flour of this small kind of grain are also used in the Canary Islands, in Barbary, and in Italy as food, the flour being made into bread, which is very nutritious and pleasant. Other closely allied species of *Phalaris* produce a similar grain, but are inferior in productiveness and quality. Reed canary grass (*Phalaris arundinacea*) is very common on the banks of lakes and rivers and in other wet places in Great Britain, throughout southern and central Europe, and in the United States. It differs very much in appearance from canary grass, having a large, spreading panicle, generally of a reddish color, and the glumes are winged at the keel. It is a somewhat reedlike grass, 4 to 6 feet high, with creeping roots, which help to secure river banks, and yields a great bulk of hay, but has been very generally despised as a coarse grass. However, it is said to be very nutritious, and is readily eaten by both horses and cattle when cut early. A variety with curiously white-striped leaves is well known in gardens as ribbon grass. Southern canary grass (*Phalaris caroliniana*) and its variety, *angusta*, sometimes considered as a distinct species, range from South Carolina to Florida and westward through Texas to California and Oregon. The variety is called Apache timothy, from the resemblance the head bears to that of

timothy. It is valued for forage on account of its remaining green throughout most of the winter. For illustration, see Plate of CAMELLIA, ETC.

CANARY ISLANDS, or **CANA'RIES** (Lat. *Canaria*, from *canis*, dog, perhaps because of the shape of the largest island). A group of islands in the Atlantic, about 60 miles off the northwest coast of Africa, constituting a province of Spain (Map: Africa, C 2). They extend from about lat. 27° 40' to 29° 25' N., and from long. 13° 25' to 18° 16' W., forming a land area of 2808 square miles. The group consists of the seven large inhabited islands, Teneriffe (782 square miles), Gran Canaria (531 square miles), Palma (280 square miles), Gomera (144 square miles), Ferro or Hierro (107 square miles, the smallest of the large islands), Fuerteventura (665 square miles), and Lanzarote (326 square miles), and six islets. The entire group is of volcanic origin, and there are extinct volcanoes on all the islands. The volcanoes of Pico de Teyde on Teneriffe and the Mountain of Fire on Lanzarote are but slumbering. The former, the loftiest mountain of the Canaries, often called the Peak of Teneriffe, rises to a height of 12,190 feet.

The climate is generally mild and healthful. The average temperature for the year is about 65°, while the maximum and minimum are about 80° and 52° respectively. Precipitation is very scant and occurs mainly in winter; droughts are frequent. The hot east and southeast winds blowing from Africa dry up the vegetation. There are several zones of vegetation depending on the altitude, but in general the west slopes furnish a more abundant vegetation than those on the east. The vegetation of the lowest zone, extending up to 1200 and 1300 feet, is more or less African, and includes the date palm, sugar cane, the dragon's-blood tree, etc. In the second zone, between 1200 and 2800 feet, the flora resembles that of southern Europe and comprises the vine, the olive, the orange, and several kinds of European grain. In the third zone the vegetation is confined mostly to trees and includes the *Pinus canariensis*, evergreens, a few other conifers, and retama (*Cytisus rubigenus*), a fragrant broom. The native fauna offers little variety, and most of the animals have been imported either from Europe or Africa. The two easternmost islands, Fuerteventura and Lanzarote, possess a richer vegetation and are better wooded than the others.

The chief agricultural products are fruits (especially bananas), onions, and potatoes, which are exported to the West Indies. The production of wine, formerly of first importance, declined on account of disease in the vines in 1853, giving place to the cochineal industry, which in turn declined in favor of sugar-cane cultivation. Tobacco is grown. Land is high in value and is held mostly in large estates; the peasants are generally very poor and emigrate in considerable numbers to Cuba and to the other West Indian islands. The manufacturing industries are of little account and are confined chiefly to the production of some silk and cotton fabrics and coarse linen. The fisheries are important. Trade is largely with Great Britain and Spain. Interinsular communication is maintained by means of sailing vessels, and communication with Europe is effected by mail steamers. The group is a Spanish province, and for administrative purposes is divided into seven districts. There is a Spanish garrison and a native militia. The

towns of Santa Cruz de Tenerife (the capital) and Las Palmas are fortified. The de facto population of the province was in 1910 (census of December 31) 444,016. The island of Gran Canaria had 162,601; island of Palma, 45,782; island of Teneriffe, 180,327; Santa Cruz de Tenerife (commune), 63,004; Las Palmas (commune), 62,886.

The Canaries are regarded as the *Fortunatae Insulae* of the ancients and are supposed to have been known to the Phœnicians and the Carthaginians, judging from the description by Juba II, King of Mauretania. Before their annexation to Spain they were inhabited by the Guanches, a Berber tribe, now completely amalgamated with the Spanish settlers. Their discovery by Europeans in modern times dates from the fourteenth century, when a vessel was accidentally driven on the islands. In 1344 they were granted by the Pope to Luis de la Cerda, who, however, did not take possession of them. They were subsequently granted by Henry III of Castile to Robert of Bracamonte, and it was only in the beginning of the fifteenth century that an attempt was made to take possession of them. In 1402-05 Jean de Béthencourt, a French adventurer, to whom Robert of Bracamonte had transferred his title, conquered several of the islands, and by the end of the century the entire group was in the possession of Spain, Teneriffe, the largest, having been taken in 1496. Consult Brown, *Madeira and the Canary Islands* (London, 1894).

CANARY SEED. See CANARY GRASS.

CANARY WINE. A wine which is also known as Teneriffe, from one of the Canary Islands bearing that name, produced in these islands, and resembling Madeira. The name is applied properly only to the Bidogne wine, and must be distinguished from the Malvoisie of the Canaries, made from the Malvasia sweet grape. It increases in mildness with age, and becomes so much like Madeira that it is often sold for it.

CANASTOTA, kăn'á-stō'tá. A village in Madison Co., N. Y., 21 miles east of Syracuse, on the New York Central, the West Shore, and the Lehigh Valley railroads, and on the Erie Canal (Map: New York, E 4). It has a Carnegie library, a hospital, and a soldiers' monument. The principal manufactures are agricultural implements, canned goods, pickles, condensed milk, furniture, gasoline engines, cut glass, dumping wagons, and mutoscopes. Canastota was settled about 1806 and was first incorporated in 1835. The government is administered by a president, elected annually, and board of trustees. Seneca turnpike, built in 1790 and now a State road, runs along the southern boundary of Canastota. Pop., 1900, 3030; 1910, 3247.

CANAVERAL, CAPE. See CAPE CANAVERAL.

CANBERRA. See AUSTRALIAN FEDERATION.

CAN'BY, EDWARD RICHARD SPRIGG (1819-73). An American soldier. He was born in Kentucky, graduated at West Point in 1839, and was second lieutenant in the Seminole War from 1839 to 1842, and captain in the Mexican War in 1846-47, being brevetted major and lieutenant colonel for gallant conduct at Contreras, Churubusco, and Belen Gate. He then served as assistant adjutant general of the Pacific Division from 1849 to 1851, and in the adjutant general's office in 1851-55; participated in the Utah expedition of 1857-60, and commanded the Navajo expedition of 1860-61. During the Civil War he commanded the De-

partment of New Mexico from June, 1861, to September, 1862, successfully defending his territory from the attacks of the Confederate general, Henry Hopkins Sibley; was raised to the rank of brigadier general of volunteers in March, 1862; was in command of the Draft Rendezvous at Pittsburgh from November, 1862, to January, 1863; commanded the city and harbor of New York at the time of the Draft Riots (q.v.) in 1863; became a major general of volunteers in May, 1864, and commanded the military division of West Mississippi from May, 1864, to June, 1865, directing the Mobile campaign of March-April, 1865. In May, 1865, he received the surrender of the Confederate forces under Generals R. Taylor and E. K. Smith. At the close of the war he was brevetted brigadier general in the regular army for "gallant and meritorious services at the battle of Valverde, N. M.," and major general for "gallant and meritorious services in the capture of Fort Blakely and Mobile, Ala." In July, 1866, he was promoted to the regular rank of brigadier general. In 1868 he was military governor of South Carolina. Afterward he commanded various military divisions and departments, and on April 11, 1873, while commanding the Division of the Pacific, was treacherously killed by the Modoc Indians while holding a conference with them near Van Bremmer's Ranch, Siskiyou Co., Cal.

CANBY, HENRY SEIDEL (1878--). An American college professor, born at Wilmington, Del. He was educated at Yale, where he became assistant in English in 1900, instructor in 1903, and assistant professor in 1908. He was lecturer in English at Dartmouth College in the summers of 1910 and 1911. His publications include: *The Short Story* (1902; rev. ed., 1913); *The Book of the Short Story* (1903); *The Short Story in English* (1909); *English Composition in Theory and Practice* (1909); *Selections from Robert Louis Stevenson* (1911); *Elements of Composition for Secondary Schools*, with J. B. Opdycke (1913); *Study of the Short Story* (1913).

CANBY, WILLIAM MARRIOTT (1831-1904). An American botanist, born in Philadelphia and educated mainly in private schools. Although in business, he devoted much time to the study of botany and described many new species of plants. He made large collections in the United States and Canada and was one of the botanists of the Northern Pacific Transcontinental Survey. His activity in botanical research has included the collection, through purchase, exchange, and gift, of a fine herbarium of more than 30,000 species of plants, now the property of the College of Pharmacy in New York City, and a smaller collection made for the Society of Natural History of Delaware.

CANCALE, kän'käl'. The capital of a canton in the Department of Ille-et-Vilaine, France, situated on a height overlooking the Bay of Mont Saint-Michel, 10 miles east of Saint-Malo (Map: France, N., D 4). It is a favorite seaside resort and a busy fishing port. Oyster culture is an important industry. It also engages in ship-building. Its harbor is inclosed by a small island, the Rocher de Cancale. Pop. of commune, 1901, 6549; 1911, 7627.

CAN'CAN (Fr., origin obscure; OF. *caquehan*, tumultuous assembly, noise, quarrel. Romance scholars derive it from Lat. *quamquam*, *quanquam*, the pronunciation of which seems to have aroused considerable dispute among medi-

æval schoolmen, although the word may be purely onomatopoeic). A wild dance, or rather a series of violent choreographic movements, originated by the demimonde of Paris. It has some resemblance to the Bacchic or Dionysian dances of ancient Greece.

CANCAO, kän'kou', **KANG-KAO**, or **HATIEN**. A seaport of Cambodia, situated on the Gulf of Siam at the mouth of the river Cancao, on the frontier between Cambodia and Cochin China. The harbor is shallow, and the trade, once considerable, is now in a state of decline.

CAN'CELING (Lat. *cancelli*, latticework). The extinguishment of the rights or obligations created by a written instrument by obliterating or destroying the instrument itself. Originally the efficacy of the act depended on a strict compliance with the prescribed form of drawing transverse lines over the face of the document; but at the present time any mark or writing—as the word "canceled" indorsed on the back of the instrument—clearly showing the intention of the parties is equally valid. In general, the destruction, obliteration, or marking of an instrument creating property rights, whether accidentally or with the intention of canceling it, will not have the legal effect of extinguishing the rights or obligations created by it. Thus, the destruction of a deed by which real property has been conveyed will not operate to divest the title of the grantee and revest it in the grantor. The title, having passed by the deed, can be restored to the former owner only by another deed. So the tearing or obliterating of a written lease by the parties thereto will not have the effect of terminating the subsisting relation of landlord and tenant, as this can be effected only by a surrender made in writing or otherwise, as prescribed by law. The only exception to this rule is when the cancellation of an instrument—as a deed or letters patent—is ordered by a court for fraud or mistake, or because the instrument—a mortgage, for example—has answered its purpose and is entitled to be discharged. The case of a will, which may be canceled by the maker at his pleasure, is not a real exception to the rule, as a will does not go into effect and create property rights until the death of the testator. See **LETTERS PATENT**; **FRAUD**; **MISTAKE**; **WILL**.

Instruments creating mere contract rights, whether under seal or not—as written agreements for services or for the sale of goods, notes, and bills of exchange, and the like—may, on the other hand, usually be canceled by common consent of the parties thereto. Even where such contracts are required by law to be in writing, they are capable of being revoked by parol; and the cancellation of the instrument operates as a revocation or rescission of the contract, if made with that intention. Bonds were, and, to a certain extent, still are, instruments of a peculiar nature and are considered as comprehending within themselves all of the rights and obligations described in them. Even the accidental loss or destruction of such an instrument rendered it unenforceable at common law. While this is no longer true either in England or in the United States, a bond may always be extinguished by cancellation. See **CONTRACT**; **BOND**; **DEED**; and compare **ALTERATION** and **SPOLIATION**.

CAN'CELLA'RIOUS. See **CHANCELLOR**.

CAN'CELLA'TION (Lat. *cancellare*, to make like lattice, to strike out lattice-wise (X), to

cross out, cancel). The process of rejecting a common factor from both dividend and divisor, or a common term from both members of an equation. In reducing fractions any factor common to both numerator and denominator is rejected by cancellation; e.g.,

$$\frac{6}{8} = \frac{\cancel{2} \cdot 3}{\cancel{2} \cdot 4} = \frac{3}{4}.$$

Algebraic expressions are often simplified on the same principle; e.g.,

$$\frac{a^3 - b^3}{m + n} \cdot \frac{m^2 - n^2}{a - b} = \frac{(a - b)(a^2 + ab + b^2)}{m + n} \times \frac{(m + n)(m - n)}{a - b} = (a^2 + ab + b^2)(m - n).$$

The plan, formerly followed in textbooks, of treating cancellation as an independent chapter of elementary arithmetic has in recent years been discarded.

CANCELLERÍA, kân-châ'lâ-rê'â, PALAZZO DELLA. A Renaissance palace in Rome, once ascribed to Bramante; this ascription is now abandoned, since Bramante did not come to Rome till 1499. It was built in 1489 for Cardinal Riario, and is connected with the church of San Lorenzo in Damaso, built on the site of the basilica of Damasus I. The façade is of travertine blocks, taken from the Colosseum. The chief feature of the palace is the graceful court with a double row of red Egyptian granite pillars, removed by Damasus (about 370) from Pompey's Theatre to his basilica and thence to the palace.

CANCELLI. See CHANCEL; CHANCELLOR.

CAN' CER. See TUMOR.

CANCER (Lat., crab). The fourth of the 12 signs of the zodiac (q.v.), running from 90° to 120° on the ecliptic (q.v.). It is denoted by the sign ♋. The constellation Cancer contains the interesting cloudlike cluster called Præsepe, or the Manger, which lies between two stars of the fourth magnitude, known to the ancients as Aselli, or the Asses. The disappearance of the cluster was supposed to presage the occurrence of rain. Another interesting object in this constellation is the triple, possibly quadruple, star system, ζ Cancri, consisting of two close stars of the fifth and sixth magnitudes, which revolve about each other in a period of 60 years, and a third component which has a retrograde motion of unknown, but much longer, period. The motion of the latter is subject to a periodic variation, and it has been suggested that this component is the satellite of a massive dark body about which it revolves in 17.5 years and about which the other pair are also in revolution.

CANCER, TROPIC OF. See TROPIC.

CANCER-ROOT, or BEECHDROPS (*Epifagus virginiana*). A parasitic plant of the family Orobanchaceæ. It is a native of North America, growing almost exclusively on the roots of beech trees. Like all the other plants of its order, it has a curious appearance, having scales instead of leaves. Its stem is branching and produces distant alternate white flowers, streaked with purple. The whole plant is powerfully astringent, and the root is brownish, spongy, very bitter, and nauseous in taste. This plant at one time had quite a reputation as a cure for cancer, and, in conjunction with white oxide of arsenic, is believed to have formed a medicine once famous in the United States under the name of "Martin's Cancer Powder." The

same name is also given to *Conopholis*, another genus of the same family. Another American plant, the Indian pipe (*Monotropa uniflora*), is sometimes also called cancer-root and is used in the same way; and an infusion of the common broom rape (*Orobanche major*), a native of Great Britain and of the south of Europe, parasitic on the roots of broom, furze, and other leguminous plants, has been employed as a detergent application to foul sores. Being without functional leaves, *Epifagus* cannot make its own food, but penetrates the roots of beech trees and lives as a parasite. (See BROOM RAPE.) For illustration, see Colored Plate of PARASITIC FLOWERING PLANTS.

CANCRIN, kân-krên', GEORG, COUNT (1774-1845). A Russian statesman. He was born at Hanau, Germany, and studied law and political economy at Giessen and Marburg. In 1796 he went to Russia, where his father was director of the salt mines of Staraya Russa, was first employed by him and then in the Ministry of the Interior. He subsequently entered the army and attracted attention by his writings on military subjects. In 1812 he was appointed commissary general of all the forces and in 1814 accompanied the Czar Alexander I to Paris. He was Minister of Finance from 1823 until 1844. Being an extreme Protectionist, his policies greatly stimulated many Russian industries. Besides, his financial management brought order into the then existing financial chaos. The unlimited issue of paper money sanctioned by him, however, paved the way for subsequent financial disaster. His chief works are: *International Wealth, National Wealth, and Political Economy* (1820) and *The Economy of Human Societies* (1845).

CAN'CRINITE. An orthosilicate of sodium, calcium, and aluminum generally found in yellow to white masses in syenite and other volcanic rocks, associated with elæolite and blue sodalite. Cancrinite is found in the Urals, in Norway, and at Litchfield and Gardiner, Me.

CAN'CRUM O' RIS (Neo-Lat., from Lat. *cancer*, cancer + *oris*, Lat. gen. sing. of *os*, mouth), NOMA, or GANGRENOUS STOMATITIS. A gangrenous process which usually begins as an inflamed spot on the inside of the cheek near the corner of the mouth, whence it rapidly spreads, as a gangrenous process, involving the whole cheek, gums, jaw, and even the tongue and palate. It is fatal in 75 or 80 per cent of cases, death occurring from exhaustion or broncho-pneumonia. There are profound prostration, little or no fever, dullness, apathy, and sometimes diarrhœa, and an odor indescribably foul emanates from the ulcer. The disease occurs among children exhausted by severe illnesses, such as measles, scarlet fever, diphtheria, whooping cough, and principally in institutions. The immediate cause is infection from a fusiform bacillus and the spirillum of Vincent, associated with other pus-producing microorganisms. Some authorities consider noma and hospital gangrene identical. A similar process sometimes attacks the ear. Patients suffering from the affection should be isolated. The mouth should be carefully disinfected with peroxide of hydrogen or with a weak solution of potassium permanganate, and supporting and stimulating food and medicines should be given. Surgical treatment, if employed, consists in making a thorough excision of the diseased tissues with the knife or cautery. In nonfatal cases a line of de-

marcation appears, the dead tissue sloughs away, and healing takes place by granulation.

CANDABA, kán-dä-bá. A town of Luzon, Philippines, in the Province of Pampanga (Map: Luzon, E 6). It lies 12½ miles northeast of Bacolor, the capital of the province, and west of the Pinag de Candaba, an inland marsh of considerable size. The town was founded in 1578. Pop., 1903, 11,783.

CANDACE, kán'dá-sē. The name of two or more queens of Ethiopia (q.v.)—i.e., Nubia—in Roman times. According to Pliny, Candace was the usual name for Ethiopian queens, or, rather, for the mother of the King. Two Candaces are known to history. One, a one-eyed virago, attempted to invade Egypt in 22 B.C., but the Roman Governor, Petronius, defeated her and penetrated to her capital, Napata, which he destroyed. Another Candace, who seems to have been a contemporary of Nero, is mentioned in Acts viii. 27 et seq., where it is stated that her treasurer was converted by Philip. Her residence was at Meroë.

CANDAHAR, kán'dá-här'. See KANDAHAR.

CANDAULES, kán-dä'léz. See GYGES.

CANDEISH, kán-dāsh'. See KHANDESH.

CAN'DELA'BRUM (Lat., from *candela*, a candle). A word signifying properly a candleholder or candlestick, but frequently employed to mean a support for a lamp. The candelabra proper were of sufficient height to stand upon the floor. Though the forms vary greatly in details, the general shape is well defined. Those from Etruria have a base, usually formed of three feet of some animal, from which rises a slender shaft, often crowned by a statuette. Near the top four arms branch, terminating in spikes on which the candles were placed. A metal disk below the arms protected the hand, if it were needful to move the candelabrum. This pattern was easily modified to serve as a support for the small hand lamps, sometimes by placing flat plates on the top of the shaft and ends of the arms, sometimes by suspending the lamps by chains from the branches. Many bronze candelabra have been found in Etruria, Herculaneum, and Pompeii; these show great skill in the elaboration of the details. Among the most splendid examples are the great marble candelabra which seem to have been placed in temples or palaces or *thermæ*. These show a marble base, often richly decorated, from which rises a columnar shaft usually ending in a hollow, which may have served for oil or incense, or for the burning of resinous woods. Similar marble bases for the support of bronze candelabra are by no means infrequent. Examples of candelabra may be found in the plates of the *Museo Gregoriano* or in the works of Overbeck, *Pompeii in seinen Gebäuden, Alterthümern und Kunstwerken* (4th ed., Leipzig, 1884), and Maukelsey, *Pompeii: Its Life and Art* (New York, 1902).

CAN'DIA. See CRETE.

CANDIA, MEGALOKASTRO, or HERAKLEION. Formerly the capital of Candia, or Crete, on the north shore of the island, lat. 35° 20' N. and long. 25° 9' E. It is surrounded by fortifications built by the Venetians, but now out of repair; the town has been much injured by earthquakes. Candia occupies the site of the ancient Heracleion (Heracleum), the seaport of Cnosus. The present city was founded by the Saracens in the ninth century, was fortified in the twelfth century by the Genoese, and greatly strengthened by

the Venetians in the following three centuries. It was taken by the Turks in 1669, after a stubborn defense by the Venetians, who lost 30,000 men. Pop., 1900, 22,481.

CAN'DIDA. A play by George Bernard Shaw, produced in England in 1895, and considered generally his best drama. Candida, a warm-hearted woman, the wife of a clergyman totally absorbed in his work, is forced to choose between her husband and a young poet, who loves her. She displays a most astounding moral attitude, though remaining irreproachable in conduct.

CANDIDATE (Lat. *candidatus*, one dressed in the white toga, *toga candida*). In ancient Rome, an aspirant to one of the higher magistracies, as consul, tribune, *ædile*, or *prætor*. He was so called because of the white garment (of wool, made whiter by chalk) in which he appeared in public. During the period between the declaration of candidacy and the election—indeed, in many cases for a year or more before the election—occurred the *ambitio*, or canvassing of voters, which often gave occasion to enormous bribery (*ambitus*), in spite of severe enactments passed to prevent the corruption. The elected candidate was styled *designatus*. Consult the treatise known as *Quinti Ciceronis De Petitione Consulatus ad Marcum Tullium Fratrem*, printed with editions of Cicero's letters. Consult Greenidge, *Roman Public Life*, pp. 187, 188 (London, 1901).

In the early Christian Church newly baptized converts were styled candidates, on account of the white garments worn during the eight days after baptism. In modern times a German probationer or theological student who has been approved before the highest ecclesiastical authorities is called a candidate; but a still broader signification is, in English-speaking lands, also attached to the words, by which an applicant for any office whatever, religious or secular, is termed a candidate.

CANDIDE, OU L'OPTIMISME, kán'déd' oō löp'té'mé's'm (Lat. *candidus*, shining). A pessimistic novel by Voltaire (1759), so named from its philosophic hero, Candide.

CAN'DLE (Lat. *candela*, from *candere*, to be white, glow). A cylinder of wax or fatty matter, with a wick, intended for giving light. Candles are made of tallow, the solid portion of palm and coconut oils, bleached wax, spermaceti, paraffin, and other oily substances found in coal, shale, and gas tar. They are either dipped, molded, or rolled. "Dips" are made by stretching a number of wicks upon a suitable frame, so that they may hang down at a distance from each other equal to about double the intended thickness of the candle; these are then dipped in a trough of melted tallow and hung upon a rack until cooled, then dipped again and again, until the required thickness is obtained. The dipper has a number of frames prepared before commencing the operation, and by the time he has dipped the last the first is cool enough to dip again. The tallow in the trough has to be kept only a little above its melting point, for if it were much hotter it would melt away a portion of the tallow already on the wick, instead of adding to it. Molds, or mold candles, are made by pouring the tallow into a metal tube, along the axis of which the wick has been previously fixed. These tubes are well polished in the inside, and several are fitted in a frame, the upper part of which forms a trough,

into which the molds all open. Thus, by pouring into the trough, all the molds are filled at once. As tallow is soft and burns with a smoky flame, it is only used for the cheaper grades of candles. Machine molding is now used in the manufacture of candles of all materials except those of wax, and machines capable of producing 96 candles at one operation are now employed, and even multiple machines whereby 518 candles at one filling can be made, it being possible to refill three times an hour.

Wax and ceresin candles are not molded, on account of the great amount of contraction which wax undergoes on cooling and the difficulty of removing it from the molds. Thus, in making altar candles, the wicks are warmed and suspended over a basin of melted wax, which is poured over them until they acquire the proper thickness; they are then rolled, while hot, between two flat pieces of smooth, hard wood, kept moist to prevent adhesion.

Pure stearic acid, or stearin, the chief fatty acid of tallow so largely used for candles, is a hard, crystalline substance, perfectly dry and free from any greasiness, with a somewhat pearly lustre. Its crystalline structure presents a difficulty in the manufacture of candles, for when cast in molds it contracts on cooling and leaves small spaces between the crystals. This has been obviated by mixing the stearin with a little wax or paraffin and pouring into hot molds.

Paraffin (q.v.), a white, crystalline body, obtained by distillation from certain natural hydrocarbons, affords a beautiful white and clear material for candles, and having thus, in a great degree, the properties of wax at a much smaller expense, it is much used for this purpose. *Ozocerite* (q.v.) is another oily mineral substance used for candles. For candles as standards of illumination, see PHOTOMETRY.

To obviate the necessity of snuffing candles, several devices have been adopted. In all of them the object is effected by causing the wick to bend over and its end to fall outside of the flame; and thus, by coming in contact with the oxygen of the air, to be completely burned—for such combustion cannot take place within the flames. Consult Calderwood, *Manufacture of Candles* (London, 1891); Lamborn, *Modern Soaps, Candles, and Glycerine* (London, 1906); Lewkowitsch, *Chemical Technology and Analyses of Oils, Fats, and Waxes*, vol. ii (London and New York, 1909).

For the use and signification of candles in religious worship, see LIGHTS, USE OF, IN PUBLIC WORSHIP.

CANDLE, ELECTRIC. See ELECTRIC LIGHTING.

CAN'DLEBERRY, BAYBERRY, WAX MYRTLE, or TALLOW TREE (*Myrica cerifera*). A small tree or shrub 4 to 18 feet high, but generally a low-spreading shrub, a native of the eastern coast region of the United States, but most abundant and luxurious in the South. It belongs to the family Myricaceæ, distinguished by naked flowers, a drupaceous fruit (stone fruit)—the scales becoming fleshy—and a single seed. The candleberry has evergreen, oblong, lanceolate leaves, with two small serratures on each side at the point, sprinkled with resinous dots. The bark and leaves when bruised emit a delightful fragrance. The small, dry drupes or nuts when ripe are covered with a greenish-white wax, which is collected by boiling them and skinning it off, and is afterward melted and

refined. A bushel of berries will yield four or five pounds. It is used chiefly for candles, which burn slowly, with little smoke, and emit an agreeable, balsamic odor, but do not give a strong light. An excellent scented soap is made from it. *Myrica gale* is the sweet gale of the moors and bogs of Scotland, well known for its delightful fragrance, a native of the northern parts of the world. Several species are found at the Cape of Good Hope, one of which, *Myrica cordifolia*, bears the name of wax shrub, and candles are made from its berries. *Myrica nagi*, a Japanese species, is a tree from 40 to 50 feet high that will withstand some frost. It produces an edible fruit and is cultivated to some extent in California. *Myrica asplenifolia* is common in the United States, where it is known as sweet fern. See TALLOW TREE.

CANDLEFISH, or EULACHON or OOLACHAN.

1. A fish (*Thaleichthys pacificus*) of the smelt family (Argentinidæ), nearly allied to the caplin (q.v.), and found on the Pacific coast of America from Oregon northward. (For illustration, see Plate of WHITEFISH, SMELTS, ETC.) It is 12 to 15 inches in length, has a somewhat pointed and conical head, and a large mouth. The color is greenish olive on the back, passing into silvery white on the sides and belly, sparsely spotted with dirty yellow. The flesh is very oily, but the oil has a fine flavor. It is an excellent pan fish, its flesh being far superior to that of the trout. Its oil is sometimes extracted and used as a substitute for cod-liver oil. The Alaskan Indians often use the dried fish as a lamp, by merely drawing through it a piece of rush pith or a strip from the inner bark of the cypress tree as a wick. Immense shoals of candlefish approach the shores and mouths of streams in spring and summer, when they are taken in large quantities by the Indians in canoes, by means of a flattened pole 8 to 12 feet long, having teeth originally of sharpened bone, but now of iron, set thickly along the edge of its outer end. This is swept through the school of fish, pricking and catching many, which are then skillfully tossed into the boat. The Indians formerly made extensive use of the oil rudely compressed from these fishes. Consult Swan, in *Proceedings United States National Museum*, vol. iii (Washington, 1881).

2. A local name in San Francisco for the Pacific coalfish (*Anoploma fimbria*). In California it is useless for food, being dry and tasteless, but in Alaska it becomes fat and is delicious eating. See COALFISH.

CAN'DLEMAS (Eng. *candle + mass*). In its ecclesiastical meaning, the feast of the purification of the Virgin Mary, observed on the 2d of February. In the fourth century it was observed on February 14, a date still kept by the Armenian church. This festival is very strictly kept by the Roman Catholic church, there being a procession with many lighted candles, and those required for the service of the ensuing year being also on that occasion consecrated; hence the name "Candlemas Day." In Scotland this day is one of the four term days appointed for periodical annual payments of money, interest, taxes, etc., and of entry to premises, the three other term days there being Whitsunday, Lammas, and Martinmas. See TERM.

An old document of the time of Henry VIII, preserved in the archives of the Society of Antiquaries, London, concerning the rites and ceremonies in the English church, speaks thus of

the custom of carrying candles: "On Candlemas daye it shall be declared that the bearyinge of candles is done in the memorie of Christe, the spirituall lyghte whom Simeon dyd prophecy [a light to lighten the Gentiles'], as it is redde in the churche that daye." But an older and heathen origin is ascribed to the practice. The Romans were in the habit of burning candles on this day to the goddess Februa, the mother of Mars; and Pope Sergius, seeing it would be useless to prohibit a practice of so long standing, turned it to Christian account by enjoining a similar offering of candles to the Virgin. The candles were supposed to have the effect of frightening the devil and all evil spirits away from the persons who carried them or from the houses in which they were placed. An order of council in 1584 prohibited the ceremony in England. There is a tradition in most parts of Europe to the effect that a fine Candlemas portends a severe winter. In Scotland the prognostication is expressed in the following distich:

"If Candlemas is fair and clear,
There'll be twa winters in the year."

Christ's Presentation, the Holiday of St. Simeon, and, in the north of England, the Wives' Feast Day, were names given to Candlemas Day. Consult Brand, *Popular Antiquities*, Bohn's ed. (London, 1849), and Duchesne, *Christian Worship* (London, 1904).

CANDLENUT (*Alcurites triloba*). A tree of the family Euphorbiaceæ, a native of the South Sea Islands, Madagascar, Molucca, Java, etc., which produces a nut with a very hard shell and a kernel edible when roasted, although in a raw state it possesses in a slight degree some of the active properties so common in the Euphorbiaceæ and is apt to cause purging. It is about as large as a walnut. An excellent fixed oil is procured from it, used both for food and as a lamp oil. It is a drying oil and has been used by artists. It is known as country walnut oil and kekune oil. A valuable dye is obtained from the fruit. The inhabitants of the Society Islands, after slightly baking these nuts in an oven and removing the shell, string them on rushes to be used for torehes, which are made by inclosing four or five strings in a leaf of the screw pine (*Pandanus*). The lampblack used in tattooing was obtained from the shell of the candlenut. A gummy substance exudes from the candlenut tree, which the South Sea Islanders chew. The candlenut tree has been grown in Florida and California. *Aleurites cordata*, a species from the south of China, yields an excellent lac.

CAND'LER, WARREN AKIN (1857-). An American bishop, born in Carroll Co., Ga. Educated at Emory College, he entered the North Georgia Conference of the Methodist Episcopal Church, South, in 1875. He was editor of the *Christian Advocate* in 1886-88 and was president of Emory College from 1888 to 1898, when he became Bishop. He was a delegate to the Ecumenical Conferences of 1891 and 1911. His works include: *History of Sunday Schools* (1890); *Georgia's Educational Work* (1893); *Christus, Auctor* (1899; 1907); *High Living and High Lives* (1901); *Great Revivals and the Great Republic* (1904); *Dangerous Donations and Degrading Doles* (1909); *Wesley and his Work* (1912); *Practical Studies in the Fourth Gospel* (1913).

CAND'LISH, ROBERT SMITH (1806-73). A

founder and leader of the Free church of Scotland. He was born in Edinburgh, studied in Glasgow, was licensed to preach in 1828, and from 1834 until his death was minister of St. George's, Edinburgh. In the General Assembly of 1839 he strongly declared in favor of the Free church party of the Established church, and in 1843 took a leading part in the formation of the independent body. From the death of Chalmers (1847) he was the controlling spirit of the Free church. He was moderator in the Assembly of 1861. In 1862 he became professor of divinity at New College. He improved the Free church school system and aided in forming the Evangelical Alliance (1845). His preaching was a remarkable combination of the intellectual, emotional, and dramatic. He wrote: *Contributions towards the Exposition of the Book of Genesis* (1842); *On the Atonement* (1845); *Examination of Mr. Maurice's Theological Essays* (1854); *Reason and Revelation* (1859); *The Two Great Commandments* (1860); and a posthumous volume of *Sermons* (1874). Consult the biography by Wilson and Rainy (Edinburgh, 1888).

CANDOLLE, kân'döl', DE. See DE CANDOLLE.

CANDÓN, kân-dôn. A town of Luzon, Philippines, in the Province of Ilocos Sur (Map: Philippine Islands, C 2). It is situated 29 miles south of Vigan, near the coast, on which it has a port, and contains a telegraph station. The town dates from 1591. Pop., 1903, 18,828.

CAN'DOUR, MRS. A member of the *School for Scandal* in Sheridan's comedy of the latter title. Under the guise of a well-meaning frankness she is able to exceed even Backbite and Crabtree in acidity of speech.

CAN'DUC (N. African). A South African jaekal. See JACKAL.

CANDY. See CONFECTIONERY.

CAN'DYS (Gk. κάλυδος). A loose gown, worn by the Medes and Persians as well as the later Parthians over their other garments. It was a long flowing robe made of woolen cloth, which was either purple or of some other brilliant color, and had wide sleeves. In the sculptures at Persepolis, nearly all the personages are represented as so attired.

CANDYTUFT (Eng. *Candy*, archaic name for the island of Crete + *tuft*) (*Iberis*). A genus of plants of the family Cruciferæ. The species are chiefly found in the countries surrounding the Mediterranean Sea, and the name "candytuft" is supposed to be derived from that of the island of Candia, the name *Iberis* from Iberia (Spain). One species, *Iberis amara*, remarkable for its bitterness, is a doubtful native of England. Some species are slightly shrubby, some are herbaceous perennials, some annuals. Candytuft is among the most familiar ornaments of our flower gardens, as the annual white and purple candytuft (*Iberis umbellata*), the sweet-scented candytuft (*Iberis odorata*), and two slightly shrubby species, *Iberis sempervirens* and *Iberis semperflorens*, the latter of which, in sufficiently warm situations, continues to blossom throughout the whole winter and is prized for the abundance and the perfect whiteness of its flowers. There are about a dozen well-known species of *Iberis*, all of which are represented in gardens by numerous cultural varieties.

CANE, or **KEN**, kân. A river rising in Bundelkhand, India, near lat. 23° 54' N. and long. 80° 13' E., and after a north-northeast course of 230 miles entering the Jumna in lat. 25°

47' N. and long. 80° 35' E. (Map: India, C 4). It is generally too rapid and rugged for navigation, but during the rainy season is navigable from Banda, 30 miles above its confluence. It is remarkable for the matchless beauty of its pebbles. An important reservoir in its upper basin which impounds about 180,000,000 cubic feet of water irrigates about 374,000 acres in a region liable to drought.

CANEA, ká-nē'á, or **KHANIA**. The chief commercial town of Crete and capital of a province (Map: Greece, E 6). It is situated on the north coast and occupies the site of ancient Cydonia. The present city is of Venetian origin and dates from 1252 A.D., when a colony was sent from Venice to occupy it. The object of its foundation was to keep down the Greeks, who had been in arms and at open war with their Italian lords almost without intermission from the day when the Venetians first set foot on their shores. Venetian coats of arms are still observed over the doorways of some of the principal houses. Canea is surrounded by a strong wall and deep ditch, both of which, however, are in a state of great dilapidation; it has a good but very shallow harbor. Canea has large foundries, printing offices, and manufactures of oil, soap, wax, etc. Notable among its buildings are a number of Turkish mosques, Greek churches, a Jewish synagogue, and many relics of the Venetian period. Pop., 1906, 24,537.

CANE'BRAKE. A dense growth of *Arundinaria macrosperma*, a large kind of reedy grass, indigenous to the warmer parts of the United States. It grows in marshy situations, where it attains a height of 10 to 30 feet. The flowers are in panicles. The young growth of this cane is used as fodder, but the quality is rather poor. The stems supply fishing rods, pipestems, splints for baskets, chair bottoms, mats, etc. *Arundinaria tecta*, a related species, is smaller and more hardy. It is found as far north as Maryland and southern Illinois.

CANE DELLA SCALA, ká'ná dē'l'lá ská'lá. See **SCALA**.

CANEL'LA (Neo-Lat., from ML. *canella*, cinnamon) (*Canella alba*). A small tree common in the West Indies and in the south of Florida, where it is often called wild cinnamon. The fruit is a small black berry. The whole tree is very aromatic, and its flowers are extremely fragrant. The bark of the young branches is the *Canella bark* of apothecaries, also known in commerce as whitewood bark and sometimes called white cinnamon. It forms a considerable article of export from the Bahamas. It has an aromatic fragrance, regarded as intermediate between that of cinnamon and that of cloves, and a bitterish, acrid, pungent taste. It is employed as a stomachic and stimulant tonic, and as an aromatic addition to tonics or to purgatives, in debilitated conditions of the digestive organs.

CANEPH'ORI, **CANEPH'OROI** (Lat., from Gk. *κανηφόροι*, *kanēphoroi*, basket bearers, from Gk. *κάνειον*, *kaneon*, basket of cane + *φέρειν*, *pherein*, to bear). Girls of Athens annually selected from the highest families to walk in the Panathenaic and other festival processions (see **GREEK FESTIVALS**), carrying on their heads baskets containing the implements and the apparatus necessary for a sacrifice. Their graceful attitudes (see the friezes of the Parthenon in the British Museum) suggested subjects for sculpture to some of the great artists of Greece.

Similar statues are also used in architecture to support light entablatures and are sometimes identified with caryatides (q.v.).

CANE SUGAR. See **SUGARS**.

CANES VENATICI (Lat., hunting dogs). A constellation of the Northern Hemisphere, added by Hevelius and known generally as the greyhounds of Hevelius. It lies just below the handle of the Dipper. The dogs are distinguished by the names Asterion and Chara. On the celestial globe they are represented as being held in leash by Boötes, and apparently pursuing Ursa Major round the pole of the heavens. The chief objects of interest in this constellation are the great Whirlpool nebula discovered by Lord Rosse in 1845, and a fine globular cluster of stars of the eleventh magnitude and fainter, which is notable for the large proportion—nearly one-seventh—of variables among them. Its principal star, to which Halley gave the name *Cor Caroli* (the Heart of Charles II), is a double star with components of the third and sixth magnitudes.

CANETE, ká-nyā'tá, **MANUEL** (1822–91). A Spanish poet, dramatic writer, and critic, born in Seville. His works include his lyrics *Poesías* (1859), which possess the pathetic quality of the verses of the old Sevillian school, but are marred by their unnatural and declamatory tone; and a number of dramas, which have received high praise: *Un rebato en Granada* (1845); *El duque de Alba* (1845); and *La esperanza de la patria* (with Tamayo). He is celebrated chiefly, however, as a dramatic critic and served as such on the *Ilustración Española y Americana* from 1883 until his death. In this capacity, too, he published, among other works, editions of the *Farsas y églogas* of Lucas Fernandez (1867); of *La tragedia llamada Josefina* (1870); *Teatro español del siglo XVI* (1885); and *Escritores españoles é hispano-americanos* (1884). He held a leading position for years on two exceedingly important permanent commissions—that of historic and artistic monuments, and that of the inspection of museums in the Academia de Bellas Artes de San Fernando. In 1883 he was decorated with the Grand Cross of the Order of Isabella the Catholic, and for years before his death served as secretary to the Infanta Doña Isabel, sister of Alfonso XII.

CANEY, ká'nī. A city in Montgomery Co., Kans., 144 miles (direct) south by west of Topeka, on the Atchison, Topeka, and Santa Fe and the Missouri Pacific railroads (Map: Kansas, G 8). It contains glass works, smelting plants, oil refineries, flouring mills, and a brick factory. The water works are owned by the city. Pop., 1900, 887; 1910, 3597.

CANEY, ká'ná, **EL**. See **EL CANEY**.

CANFIELD, **JAMES HULME** (1847–1909). An American educator. He was born at Delaware, Ohio, graduated in 1868 at Williams College (which made him a doctor of laws in 1893), and in 1872 was admitted to the bar of Michigan. He practiced law from 1872 to 1877, was a professor at the University of Kansas from 1877 to 1891, and in 1891 became chancellor of the University of Nebraska. He was president of the Ohio State University from 1895 to 1899, and was then for a time librarian of Columbia University, New York. He received the degree of Litt.D. from Oxford in 1902. His publications include: *Taxation: A Plain Talk for Plain People* (1883); *A Short History of Kansas* (1885); *Local Government in Kansas*

(1887); *The College Student and his Problems* (1902).

CANG, CANGUE, or KIA. An instrument of degrading punishment in use in China. It consists of a large wooden collar fitting close round the neck, the weight of which is usually from 50 to 60 pounds. Over the parts where the cang fastens are pasted slips of paper, on which the mandarin places his seal, so that the culprit may not be relieved until the full term of his sentence has expired, which sometimes extends to 15 days. On the cang is also inscribed, in large letters, the offense and the duration of the punishment. The criminal, having been paraded through the streets by the police, is then left exposed in some thoroughfare of the city or at the place where the crime was committed. As he is incapable of using his hands, he has to be fed during the time he is suffering the penalty.

CANGA ARGÜELLES, kân'gâ är-gwâ'lyâs, José (1770-1843). A Spanish statesman. He was an active opponent of Napoleon, did his best to foment the Spanish insurrection against the French armies, and became an energetic member of the Cortes of 1812, but on the return of the Bourbons was exiled. Under the restoration of the Constitution of 1812 in 1820, he was made Minister of Finance, and in this position effected many important reforms. He resigned in 1821. After the overthrow of the Constitution in 1823 he went to England, but returned to Spain in 1829 and was appointed keeper of the archives at Simancas. He was the author of *Elementos de la ciencia de hacienda* (1825); *Diccionario de hacienda, con aplicación á España* (1827; 2d ed., 2 vols., Madrid, 1833-34); and *Observaciones sobre la guerra de la Península* (5 vols., 1833-36), under which modest title he challenged the statements of certain British historians of that war to the effect that all the credit for its conduct was due to the British troops; for he showed the infinite sacrifices that Spain had imposed upon herself during that memorable struggle. During his early youth he had given himself to poetry, and not the least of his achievements is a verse translation of the Odes of Sappho.

CÁNGAS DE ONÍS, kân'gâs dâ ô-nēs'. A town of Spain, in the Province of Oviedo, 35 miles east of the city of Oviedo (Map: Spain, C 1). It is known chiefly for its connection with the famous Pelayo (q.v.), and the reconquest of Spain from the Moors. A Latin inscription on the town hall states that this city was the first residence of Spanish kings after the Moors had overrun the land. The historic Cave of Covadonga, in which Pelayo took refuge, is only 8 miles away. There are interesting churches in this vicinity, one containing the tomb of Alfonso I. Inscriptions and remains of bridges indicate that Cángas de Onís was of some importance under the Romans, but its identity has not been fixed. Pop., 1900 (commune), 8559; 1910, 9103.

CÁNGAS DE TINEO, kân'gâs dâ tê-nā'ô. A town of north Spain, in the Province of Oviedo, on the Río Narcea, 37 miles southwest of Oviedo (Map: Spain, B 1). It is surrounded by high hills and possesses an interesting bridge. Though the adjacent region is rough and mountainous, it is well watered, and agriculture and stock raising are carried on. There are manufactures of liquors, flour, and linen and woolen goods. Pop., 1900 (commune), 23,658; 1910, 24,103.

CANGE, kânzh, DU. See DU CANGE.

CAN GRANDE DELLA SCALA, kân grân'dâ dël'lâ skâ'lâ. See SCALA.

CANICATTI, kâ'nê-kât'tê. A city in the Province of Girgenti, Sicily, 28 miles north of Licata, in a rocky valley 1500 feet above the sea (Map: Italy, H 10). It has a technical school, and the country produces grain, wine, and fruit, and contains sulphur mines. Pop. (commune), 1881, 20,000; 1901, 24,564; 1911, 31,204.

CANICHANA, kâ'nê-châ'nâ. A tribe formerly residing upon the Mamoré River, Bolivia, between 13° and 14° south, and on the Machupo from its mouth to the present mission of San Joaquin. They were once savage and brutal cannibals living in fortified villages, from which they made constant raids upon their more peaceable neighbors. Notwithstanding their savage character, they willingly accepted the Jesuit missionaries and are now gathered into the mission villages of San Pedro and Trinidad. They were visited by Heath in 1880, Balzan in 1892, and earlier by D'Orbigny in 1830. Their language forms a distinct stock. Consult "La langue Kaniçana," by G. de Créqui-Montfort and P. Rivet, in the *Mémoires de la Société de Linguistique de Paris*, 1913, vol. xviii, pp. 354-377.

CANIC'ULA (Lat. *canicularis*, from *caniculus*, little dog), **CANICULAR DAYS, or DOG DAYS, CANICULAR YEAR.** Canicula was an old name of the constellation Canis Minor; it was also used to denote Sirius, or the dog star, the largest and brightest of all the stars, which is situated in the mouth of Canis Major. From the heliacal rising (q.v.) of this star (Sirius) the ancients reckoned their dog days, or *dies caniculares*, which were 40 in number—20 before and 20 after the rising of the star. The rising of the dog star was supposed to be the occasion of the extreme heat and the diseases incidental to these days. It was by mere accident that the rising of the star coincided with the hottest season of the year, in the times and countries of the old astronomers. The time of its rising depends on the latitude of the place, and is later and later every year in all latitudes, owing to precession. In time the star may rise in the dead of winter. The canicular year was that known among the Egyptians and Ethiopians. It was computed from one heliacal rising of Sirius to the next, and consisted ordinarily of 365 days and every fourth year of 366. This year is sometimes called the heliacal year. The reason for computing the year from the rising of Sirius seems to have been that, at the time, the heliacal rising coincided with the greatest swelling of the Nile.

CAN'IDÆ (Neo-Lat., from Lat. *canis*, dog). A family of carnivores, the dog tribe, now usually classified between the hyenas and the bears. Their whole organization fits them to be less exclusively carnivorous than the feline tribe. They have generally three incisors or cutting teeth, with one large canine tooth, and four premolars on each side of the jaw, two true molars on each side in the upper jaw, and three in the lower. The true molars are adapted for crushing either bones or vegetable food. The last premolars in the upper jaw are remarkably large and particularly adapted for cutting flesh. The legs are comparatively long, the claws are nonretractile, and with one exception (Lycaon) the toes are five in front and four behind. The thumb is small and considerably above the other digits.

DOG FAMILY - CANIDÆ

1 BLUE FOX - VULPES LAGOPUS (SUMMER COAT) 3 GRAY WOLF - CANIS OCCIDENTALIS
2 RED FOX - VULPES FULVUS 4 COYOTE - CANIS LATRANS

ABOUT 1/10 NATURAL SIZE

COPYRIGHT, 1902, BY DODD, MEAD & COMPANY

JULIUS BIRN & CO. LITH N. Y.

The muzzle is long, the ears generally erect and pointed, and the tail more or less bushy. A peculiarity of the dogs is their habit of association in packs and of pursuing their prey mainly by scent. In this sense they are extremely keen, they have good eyesight and hearing, and most of them are diurnal. They frequent open uplands, by preference, some climbing trees, and, though mostly good swimmers, they avoid aquatic pursuits. Most of them occupy dens or burrows, often dug by themselves and sometimes placed in groups. See DOG; FENNEC; FOX; FOX DOG; JACKAL; HUNTING DOG; WOLF; ETC.

CANINA, kâ-nē'nâ, LUIGI (1795-1856). An Italian architect and archæologist, born at Casale. He was professor of architecture in Turin and superintended the excavation of Tusculum (Frascati) in 1839 and of the Appian Way in 1848. He wrote many works on ancient architecture and on Etruscan and Roman archæology, among which are: *Indicazione di Roma antica* (1830); *L'Architettura antica descritta e dimostrata coi monumenti* (1839-46); *Antica Etruria marittima* (1846-51); *Foro Romano* (1845); *Storia e topografia de Roma antica* (1839-48). He published also a number of plans and maps of his discoveries. His works are magnificently illustrated, but must be used with great caution, since his restorations are often wholly imaginative, and even his drawings of actual remains are marred by many inaccuracies.

CANINES, kâ'nînz, or **CANINE TEETH**. See **TEETH**.

CANINI, kâ-nē'nê, MARCO ANTONIO (1822-91). An Italian publicist and poet, born in Venice. He studied law at Padua, but the troubles of 1847-48 drove him into exile in Greece and the Balkan states, his knowledge of which was later of use to the Rattazzi ministry. He later fought with Garibaldi and as a journalist reported the Russo-Turkish War of 1877-78. He enjoyed a vogue in his own day for his verses, *Monte, fantasia e cuore* (1852), *Sonetti* (1873), *Odi saffiche* (1879), and *Amore e dolore* (1880). He also wrote various articles and books on Balkan questions. Consult his autobiography, *Vingt ans d'exil*.

CANISIUS, kâ-nîsh'i-ūs, PETRUS (a Latin translation of his Dutch name, De Hond) (1521-97). A Jesuit theologian who took a prominent part in the Council of Trent. He was born in Nimwegen, May 8, 1521, and was educated in Cologne and Louvain. He was the first German to join the Jesuit Order (1543); became professor of theology in Ingolstadt, 1549; was preacher to Ferdinand I in Vienna and became the first provincial of the Jesuits in Germany (1556). He established colleges of the order in Prague, Freiburg (Switzerland), Augsburg, and Dillingen and powerfully contributed to the check of the spread of Protestantism which the Counter Reformation effected. To this end he drew up in 1554, in Latin, a catechism which should take the same place as Luther's; it has been very widely used, has passed through more than 400 editions, and has been translated into French, German, and English. He died in Freiburg, Switzerland, Dec. 21, 1597, and was beatified in 1864. For his life, consult: Reiss (Freiburg, 1865); P. Drews (Halle, 1892); J. B. Mehler (Berlin, 1897); L. Michel (Lille, 1898); A. Kross, *Canisius in Oesterreich* (Vienna, 1898); also, his *Epistolæ et Acta*, ed. O. Braunsberger (8 vols., Freiburg, 1896 et seq.).

CA'NIS MA'JOR (Lat., the Greater Dog).

A constellation of the Southern Hemisphere, below the feet of Orion. It contains Sirius, the brightest of all the stars, and its place may be found by means of this star, which is on the continuation of the line through the belt of Orion.

CA'NIS MI'NOR (Lat., the Lesser Dog). A constellation of the Northern Hemisphere, lying to the east of Orion and just below Gemini. Procyon, of the first magnitude, is its principal star and lies almost in a direct line between Sirius and Pollux, so that the position of the constellation may be found by means of this star. Its parallax, as measured by Elkin at Yale, is 0."334, corresponding to a distance of almost 10 light years. Procyon is accompanied by a faint companion of the 13th magnitude, the period of revolution of the pair about each other being about 40 years.

CAN'ISTER (Lat. *canistrum*, reed basket, Gk. *κάνιστρον*, *kanistron*, wicker basket, from *κάννα*, *kanna*, reed). A form of projectile. For smoothbore guns and for the earlier rifles, canister consisted of a cylindrical tin or sheet-iron case filled with small cast-iron balls half an inch to one inch in diameter. The ends were usually wooden disks over which the tin or iron was crimped and tacked down; the interstices between the balls were either filled with sawdust or like material, or the balls were sunk in holes in soft wooden disks, which were piled one upon the other. When fired, the container broke and the balls were scattered very much in the manner of a charge of shot from a fowling piece. It is rarely used in modern rifled guns, though there is a tendency towards supplying canister for the close-range operations of gunboats in rivers and contracted waters, as well as for field pieces. See **ARTILLERY**; **FIELD ARTILLERY**; **GUNS, NAVAL**; **PROJECTILES**; **SHRAPNEL**; **ORDNANCE**; ETC.

CANITZ, kâ'nîts, FRIEDRICH RUDOLF LUDWIG, BARON VON (1654-99). A Prussian statesman and unimportant poet. He was born in Berlin and belonged to an ancient Brandenburg family. In 1698 he was made a baron, and, after serving in various diplomatic missions, was Minister Plenipotentiary of The Hague during the formation of the Grand Alliance (q.v., and see **SUCCESSION WARS**). His poems, consisting of odes, satires, and elegies, in imitation of Boileau, were published after his death by J. Lange, under the title of *Nebenstunden unterschiedener Gedichte* (1700, without the author's name; with Canitz's name, 1719). His most popular poem is his elegy written on the death of his wife, Dorothea or Doris von Arnim, who died in 1695. Consult: König, *Des Freiherrn von Canitz Gedichte*, with a biographical sketch (Leipzig, 1727); selections from his works in the *Bibliothek deutscher Dichter des 17 Jahrhunderts*, vol. xiv (Leipzig, 1838); Varnhagen von Ense, *Biographische Denkmale*, vol. iv (Berlin, 1824-45); and Lutz, *Canitz und sein Verhältnis zu dem französischen Klassicismus* (Munich, 1887).

CANKER (Lat. *cancer*, cancer). A disease of the horse's hoof caused by the rapid reproduction of a vegetable parasite. It not only destroys the sole and frog, but, through setting up a chronic inflammation in the deeper parts, prevents the growth of healthy horn by which the injury may be repaired. The disease is usually confined to one foot, but may attack two, three, or all of the feet at once or in succession.

Symptoms.—It usually commences by discharge from the heels or the cleft of the frog of the horse's foot. The horn becomes soft and disintegrated, the vascular structures beneath become inflamed, and the pain which the animal endures is severe, making it very lame. Though there is no constitutional fever, the horse becomes emaciated and unfit for work. During wet weather and on damp soil the symptoms increase in severity. The soft structures bleed on the least touch, and considerable fungous granulations form rapidly. Dirt, cold, and wet favor the production of the disease, and there is always a tendency to relapse when once an animal has been affected.

Treatment.—The foot should first be cleaned with warm baths, after which a poultice containing charcoal or carbolic acid is to be applied. The diseased portions of the horn should be pared away until only healthy horn borders the affected parts. In mild cases sprinkle powdered acetate of copper over the sore; apply over this pledgets of tow, fixed over the foot by strips of iron or wood passed between shoe and foot. In severe cases tar and nitric acid, creosote and turpentine, chloride of zinc paste, or other active caustics have to be used for a time, with the regular employment of pressure on the diseased surface. The animal requires to be treated constitutionally by periodical purgatives and tonics or alteratives. Good food, fresh air, and exercise often aid much in the treatment of the disease.

CANKER. A disease of forest and orchard trees characterized by the roughening and splitting of the bark and the gradual dying of the limb or tree. Originally only certain fungous diseases of trees were called by this name, but it has been extended to include many diseases of plants where there is a manifest wound or abnormal development of tissues. In Europe the larch canker, *Dasyscypha calycina*, is especially injurious to larch, fir, and pine trees. The fungus *Nectria ditissima* is the cause of the so-called European apple-tree canker; the Illinois apple-tree canker is due to *Nummularia discreta*; the Oregon apple canker to *Glucosporium malicorticis*; and the New York apple canker to *Sphaeropsis malorum*. The bitter rot fungus, *Glomerella rufomaculans*, forms cankers on apple trees from which the fungus spreads to the fruit. The bacterial blight of pears, apples, etc., has lately been found to form cankers on tree trunks, which become centres of infection. Cutting out the cankers, treatment of wounds, and timely spraying with Bordeaux mixture or lime sulphur is advised.

CANKER SORE. A small, yellow, round or linear ulcer, very tender, occurring on the under side of the tongue or inner surface of the lips or cheeks. It is temporary and only local and may be removed by the application of silver nitrate or pure carbolic acid. It develops chiefly among children and is generally caused by digestive derangements.

CAN'KERWORM'. A gregarious caterpillar of either of two moths of the geometrid family Monocteniidæ. One is on the wing in the autumn and the other in the spring. The moths of the spring cankerworm (*Palcaerita vernata*) come forth from the chrysalis in the spring, but a few of them appear in the fall or on warm days of winter. The moths of the autumn cankerworm (*Anisopteryx pometaria*) emerge during October. Some few may delay coming out

until warm days in winter. The moths of both sexes of the autumn cankerworm differ from those of the spring form in the absence of abdominal spines. The autumn form pupates in the ground in well-spun cocoons, while the cells of the spring forms are lined with only a few threads of silk. The body of the caterpillar of the autumn form is marked by six light longitudinal bands, and that of the spring form by eight. The eggs of the autumn form are laid in regular rows or masses and are truncated in form, while those of the spring brood are ovoid and are laid in irregular bunches. Both forms agree in that the caterpillars feed on the leaves of fruit and shade trees and descend to the ground to pupate. The female moths of both forms are wingless. The caterpillars are so voracious that they may denude whole orchards or groves of trees in a few days as though a flame had swept through, whence has arisen the local name "fireworm." This is the worm that strips currant bushes of leaves in the spring, and it was to combat this caterpillar that the English house sparrow was introduced into the United States; but it checked the cankerworms but little. (See HOUSE SPARROW.) The wingless females may be caught as they creep up the trunk of a tree by bands of tarred paper or other sticky substance wrapped about the trunk of the tree. Shade trees may be sprayed with Paris green in water, but this poison must be used with caution on fruit trees.

CAN'NA (Lat., Gk. *kávva*, *kanna*, reed). A genus of succulent herbs of the family Scitamineaceæ, natives of warm countries in both hemispheres, and extensively cultivated as foliage plants for heavy or mass effects. The stem is 3 to 14 feet high, unbranched; the leaves are large; the flowers are mostly red or yellow and borne irregularly in a terminal raceme or panicle. Many varieties are in cultivation. The dwarf (seldom exceeding 4 feet), large-flowered, French, and Italian varieties are most in favor, and are much used as centrepieces in formal beds and in small clumps in borders. Cannas are propagated either from seed (new varieties) or by dividing the rootstock and planting in pots. They are of easy culture. A rich, warm soil with plenty of moisture is desirable. When wanted for mass effects, they are set about 6 inches apart each way, after danger of frost is past. The flowers should be picked as soon as they wilt, to prevent the formation of seed, and thus prolong the flowering season. After the stalks are cut in the fall, the roots are stored and handled like potatoes until wanted for planting. The roots of some species of canna, especially *C. edulis*, contain considerable amounts of starch. *Canna coccinea* is sometimes used to supply starch. See Plate of CAMELLIA, ETC.

CANNABICH, kán'ná-bīk, CHRISTIAN (1731–98). A German composer and orchestral conductor. He was born in Mannheim, where his father was a flutist in the orchestra of the Elector. He studied violin with Jomelli and composition with Stamitz. In 1757 he became concert master and in 1775 conductor of the orchestra, which under his leadership became world famous for a variety of dynamic shading before then unheard of. He is practically the first conductor who introduced the crescendo and decrescendo as a means of expression. His compositions, though lacking both depth and originality, were important at the time because they materially

helped in spreading the new instrumental style and forms originated by Stamitz, the real father of modern instrumental music. Cannabich wrote much chamber music, several ballets and operas, and almost 100 symphonies.

CANNABICH, kán'ná-bīk, JOHANN GÜNTHER FRIEDRICH (1777-1859). A German geographer, born in Sondershausen. He studied at the University of Jena, was in 1807 appointed rector of the town school in Greussen, in 1819 became pastor in Niederbösa, and in 1835 in Bendeleben. His *Lehrbuch der Geographie* (1816; 18th ed., 2 vols., 1870-75) has been widely circulated in Germany. His other works include: *Statistische Beschreibung des Königreichs Württemberg* (1828); *Neuestes Gemälde von Frankreich* (1831); *Neustes Gemälde des europäischen Russland und des Königreichs Polen*; *Hilfsbuch beim Unterricht in der Geographie* (3 vols., 1833-38).

CAN'NABIS. See HEMP.

CANNÆ (Lat., Gk. *κάνναι*, *kannai*, reeds). An ancient town of south Italy, on the right bank of the Aufidus (Ofanto), the site of which is 9 miles west of Barletta. Here on Aug. 2, 216 B.C. (by the uncorrected calendar, which was two months in advance of the actual season), Hannibal, with 40,000 foot and 10,000 horse, inflicted a terrible defeat on a Roman army consisting of 80,000 foot and 6000 horse, under the consuls Lucius Æmilius Paulus and Gaius Terentius Varro. The contest began with the right Roman and the left Carthaginian wing resting on the river—on the left bank of the river, according to a well-supported view. Hannibal arrayed his forces in the form of a crescent, with the weakest part of his infantry, the Spaniards and the Gauls, in the centre; he commanded there in person. It was his purpose that when the strongest part of the Romans should attack the centre, they would repulse the Iberians and Gauls and press forward in thick column. His plan worked perfectly; the Romans charged, repulsed the Carthaginian centre, and pressed on in pursuit. The Libyans on the Carthaginian wings swung round and attacked the Romans on both flanks. The Carthaginian cavalry also soon overwhelmed the Roman horse, and then fell upon the Roman foot from the rear. Varro, with 70 knights, escaped to Venusia, and a few thousand Romans assembled at Canusium from the rout; but at least 10,000 were captured and an immense number killed, among them Æmilius Paulus. It is to be noted that some good authorities put the battle on the right bank of the river. Consult: Reusch, *Die Schlacht bei Cannae* (Altkirch, 1888); Solbesky, *Die Schlacht bei Cannae* (Weimar, 1888); Wilms, *Die Schlacht bei Cannae* (Hamburg, 1895); Fry, *English Historical Review*, xii, pp. 749 ff. (1897); Fried, *Ueber die Schlacht bei Cannae* (Leipzig, 1898); Schwab, *Das Schlachtfeld von Cannae* (Munich, 1898); and Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vii, p. 2235 (1912).

CAN'NAN, EDWIN (1861-). An English economist, educated at Balliol College, Oxford. He became lecturer at the London School of Economics in 1897, and professor of political economy in the University of London in 1907. Besides editing Adam Smith's *Lectures on Justice, Police, Revenue, and Arms* (1896), and his *Inquiry into the Nature and Causes of the Wealth of Nations* (2 vols., 1904), he is author of *Elementary Political Economy* (1888; 3d ed., 1903); *History of the Theories of Production*

and *Distribution* (1893; 2d ed., 1903); *History of Social Rates in England* (1896; 2d ed., 1912); *The Economic Outlook* (1912); *Wealth* (1914).

CAN'NEL COAL (said to have turned in the drawling pronunciation of the miners from *eandle-coal*, as it burns with a bright, candle-like flame). A dull, fine-grained variety of non-coking bituminous coal, which has a conchoidal fracture. Owing to its very high percentage of volatile hydrocarbons, it is specially valuable for gas making. An analysis of Kentucky cannel gave: volatile matter, 51.60; fixed carbon, 40.40; ash, 7.00; sulphur, .739; moisture, 1.00. It is considered by some to be derived from the accumulation of animal as well as plant remains. In the United States the Breckenridge cannel coal of eastern Kentucky is the most noted occurrence, though it is also found in Ohio and Indiana. Some is also found in Scotland and is there known as parrot coal. See COAL.

CAN'NELTON. A city and the county seat of Perry Co., Ind., 150 miles (direct) south by west of Indianapolis, on the Ohio River and on the Southern Railroad (Map: Indiana, C 5). It has fine county buildings. The city is an important industrial centre and has cotton mills, flour mills, a foundry and machine shop, and manufactures sewer pipe, pottery, bricks, etc. There are coal mines and sandstone quarries in the vicinity. Gas and oil also are found. The water works and electric light plant are owned by the city. Pop., 1900, 2188; 1910, 2136.

CANNES, kán. A seaport in the Department of Alpes-Maritimes, France, pleasantly situated on the Gulf de Napoule, an estuary of the Mediterranean, about 22 miles southwest of Nice (Map: France, S., M 5). The surrounding country is exceedingly picturesque and very fertile, and oranges, lemons, olives, almonds, figs, peaches, and grapes grow in profusion. Placed on an elevation that slopes towards the sea, it is sheltered from the northern winds by a range of hills. It is famed for its salubrious climate; its vogue as one of the most fashionable winter resorts in Europe was established by Lord Brougham. Architectural features include the Abbey Donjon, built about 1070 on the site of the Roman Castrum Marcellinum, the town hall, library, and museum of antiquities (1876). There is considerable trade in fruit, olive oil, soap, perfumery, and salt fish. Pop., of commune, 1901, 30,420; 1911, 29,656. Consult De Valcourt, *Cannes and its Climate* (1873).

CAN'NIBALISM. The practice of eating human flesh. The word is derived from Caniba, a variant of Carib, the name of the West Indian tribe among whom the Spanish discoverers first noticed the custom. The practice is very widespread, having been found within the historic period in both Americas, in Africa, India, Australia, New Zealand, and throughout the Polynesian islands. Some early European tribes, and even some of the more cultured early heathen nations, have also been accused of the same practice. By some students cannibalism has been ascribed to economic causes merely, but in most, if not all, cases the custom appears to have had its origin in the superstitious belief that in this manner the qualities of the person eaten, particularly if a brave enemy, might be acquired, or his post-mortem ghost existence utterly destroyed by leaving nothing in which the spirit might still find lodgment. In some tribes the first-mentioned idea even led children

to eat the bodies of their deceased parents. In isolated instances cannibalism appears to have been dictated by no other motive than that of mere savage revenge. Although cannibalism thus appears to have been originally almost a religious ceremonial, the depraved appetite sometimes grew to such an extent that in some tribes human flesh became a regular article of diet. This was especially the case in equatorial Africa, in some of the South Sea Islands, among the Tapuyan tribes of Brazil, and on the headwaters of the Amazon. The ancient Aztecs annually sacrificed thousands of human victims to their gods, the bodies being afterward eaten by the populace. Cannibal practices were until recently common among the tribes of Vancouver Island and the northwest coast of North America generally. Occasional ceremonial cannibalism was quite general among the Indians of the United States, but the only tribes which practiced it to any great extent were the Atakapa, Tonkawa, and some others of the western Gulf coast. Consult: Grimshaw, *From Figi to the Cannibal Islands* (London, 1907); Rannie, *My Adventures among South Sea Cannibals* (Philadelphia, 1912); Weeks, *Among Congo Cannibals* (London, 1913).

CAN'NIFF, WILLIAM (1830-1910). A Canadian author and physician, born at Thurlow, Ontario, Canada. He graduated at Victoria University and studied medicine in Toronto, New York, and London. In 1856 he passed the examination of the army medical board, serving for a time during the Crimean War in the Army Medical Department, and after his return to Canada became professor of general pathology, and subsequently of surgery, in Victoria University. He was with the Army of the Potomac during the Civil War, and at its close returned to Canada and resumed the practice of medicine. In 1867 he was a delegate to the International Medical Congress in Paris and contributed a paper on the Indians of British North America, and in the same year he assisted in the formation of the Canadian Medical Association. For many years he was on the editorial staff of the *Canadian Medical Journal*, and, besides contributions to various periodicals, he published: *Principles of Surgery* (1866); *Settlement of Upper Canada* (1869); *History of the Province of Ontario* (1872); *Canadian Nationality* (1875); *The Medical Profession in Upper Canada* (1894).

CAN'NING, CHARLES JOHN, EARL (1812-62). An English statesman, third son of the celebrated statesman George Canning. He was educated at Eton and Oxford and succeeded to the peerage as Viscount Canning in 1837. In 1841-46 he was Undersecretary of State for Foreign Affairs in Sir Robert Peel's ministry and in 1846 was chief commissioner of woods and forests. When Lord Aberdeen came into office (1853), he was made Postmaster-General, and in February, 1856, he became Governor-General of India. His conduct during the crisis of the Indian mutiny was described at the time by many as weak and pusillanimous, and he received the nickname of "Clemency Canning." Now, however, it is generally recognized that he displayed firmness and courage, magnanimity and impartial justice. In 1858 the government of India was transferred from the East India Company to the crown, and he became first Viceroy of India. In 1859 he was raised to an earldom. He died in London. Consult Cun-

ningham, "Earl Canning," in the *Rulers of India Series* (London, 1891).

CANNING, GEORGE (1770-1827). A distinguished British statesman and orator, born in London, April 11, 1770. His father, who died in poverty when his son was a year old, came of an ancient Bristol family, whose ill-will he incurred by marrying beneath his station. His mother earned a precarious subsistence on the stage, and married twice again, first an actor, and, after his death, a Plymouth linen draper. Through Canning's filial affection she subsequently lived in comfort and participated in his success and good fortune. When eight years of age, his uncle, Stratford Canning, a banker, provided for his education and sent him to Eton, where he soon distinguished himself. He founded a school magazine, *The Microcosm*, for the copyright of which a publisher paid him £50, an unparalleled remuneration for a schoolboy author. In 1788 he proceeded to Christ Church, Oxford; the following year he won the Chancellor's prize with his *Pilgrimage to Mecca*, and in 1790 graduated B.A. He entered Lincoln's Inn and studied law. At school and college he made influential friends, notably the Hon. Charles Jenkinson, afterward Lord Liverpool, and at his uncle's house met Fox and Sheridan, and through them Burke and other well-known men. Burke persuaded him to abandon law for a parliamentary career, and, under the ægis of Pitt, he entered Parliament as member for Newport, Isle of Wight, in 1793. In 1796 he became Undersecretary of State for Foreign Affairs, and in 1798 acquired fame as orator and statesman by his speeches for the abolition of the slave trade and against making peace with the French Directory. In debates on other important questions he supported the ministry, not only by voice but also by his pen in a satirical paper called the *Anti-Jacobin*, which, with more violence than good taste, lashed the "new philosophy" promulgated by the French Republicans. In 1800 he made a happy marriage with the wealthy heiress Joan Scott, sister to the Duchess of Portland. In 1801 Pitt resigned, and Canning joined the opposition against the Addington ministry, but excited serious and lifelong enmities by his caustic wit and criticisms. In 1804 Pitt returned to power, and Canning became Treasurer of the Navy, continuing in office until Pitt's death in 1806. Lord Grenville offered him an office in the All-the-Talents ministry, but Canning declined. In 1807 he was appointed Foreign Minister in the Portland cabinet and displayed brilliant qualifications. He originated Cathcart's secret expedition and seizure of the Danish fleet at Copenhagen, which upset Napoleon's northern confederacy. Differences, running through several years, with Lord Castlereagh culminated in 1809 and led to a duel, in which both were hit, though neither was seriously injured. In 1812 Canning's eloquence was enlisted in favor of Catholic emancipation. The same year Liverpool sent him to Parliament and repeated the honor three successive times. In 1814 he was Ambassador at Lisbon, and in 1816, on his return, became President of the Board of Control. He supported the Liverpool ministry in their repressive measures until 1820, when he resigned in consequence of the governmental action against Queen Caroline. He was on the eve of departure for India as Governor-General in 1822, when the suicide of his former antagonist Castlereagh called him to the

head of foreign affairs. In this capacity he infused a more liberal spirit into the cabinet, asserted the independence of British politics against entanglement with the Holy Alliance, and gave new direction and impetus to commerce by a gradual suspension of the prohibitive system. He arranged the relations of Brazil and Portugal, drew the French cabinet into agreement with the British respecting Spanish-American affairs, and was the first to recognize the free states of Spanish America, when he pronounced his famous dictum that "the New World had been called into existence to redress the balance of the Old, and would in time outweigh and topple over the fabrics of kingcraft, upon which so many wise men had labored for thousands of years." He promoted the treaty combining England, France, and Russia for the settlement of the affairs of Greece; protected Portugal from Spanish invasion and, among other important home measures, prepared the way for the repeal of the corn laws. In February, 1827, paralysis attacked his old friend the Earl of Liverpool, and Canning was called upon to form a new administration. His health, however, succumbed to the cares of office, and he died at Chiswick on August 8. He was buried in Westminster Abbey, near Pitt. Consult: *Canning's Speeches*, ed. by Therry (6 vols., 2d ed., London, 1830); Stapleton, *Political Life of Canning* (London, 1831); Stapleton, *George Canning and his Times* (London, 1859); Lord Dalling, *Historical Characters* (London, 1867); Temperley, *Life of Canning* (London, 1905); Marriott, *George Canning and his Times* (London, 1905); Bagot, *George Canning and his Friends* (London, 1909).

CANNING, SIR SAMUEL (1823-1908). An English telegraphic engineer, born in Wiltshire. He was a pioneer in the manufacture and submersion of cables for submarine telegraphy, was engineer in chief of the Atlantic-cable expeditions of 1865-66 and 1869, and laid lines from England to Malta, Alexandria, and Gibraltar.

CANNING, SIR STRATFORD. See STRATFORD DE REDCLIFFE, VISCOUNT.

CANNING IN'DUSTRY. See FOOD, PRESERVATION OF.

CANNIZZARO, kăn'nê-tsä'rô, STANISLAO (1826-1910). A celebrated Italian chemist. He was born in Palermo and studied medicine and chemistry in his native city and later in Pisa. He took part in the Sicilian revolution in 1848 and escaped to France in the following year. In 1851 he became professor of chemistry at Alexandria, in 1855 at Geneva, in 1861 at Palermo, and in 1871 at the University of Rome. In this latter year he was also made a senator. In 1891 he received the Copley medal of the Royal Society of London. Cannizzaro was one of the ablest defenders of Gerhardt's views, and the introduction of Avogadro's rule into science is due almost entirely to the clearness with which he grasped the distinction between atomic and molecular weights. His work has thus given a powerful impulse to the development of modern chemistry. Among his minor contributions may be mentioned the discovery of benzyl alcohol and of cyanamide. Ostwald's series of *Klassiker der exakten Wissenschaften* includes Cannizzaro's *Abriss eines Lehrganges der theoretischen Chemie* (Leipzig, 1891; first published in 1858). See also CHEMISTRY; AVOGADRO'S RULE; ATOMIC WEIGHTS; MOLECULES—MOLECULAR WEIGHTS.

CAN'NOCK. An important coal-mining and

iron-manufacturing town in Staffordshire, England, situated in the ancient royal forest of Cannock Chase, 7½ miles northwest of Walsall (Map: England, D 4). Pop., 1891, 20,600; 1901, 24,000; 1911, 28,586.

CANNON (Fr. *canon*, gun, from ML. *canon*, tube, Lat. *canna*, reed; confused with Gk. *κανών*, *kanōn*, straight rod, rule). Artillery weapons not capable of being carried and fired in the hands, from which projectiles are thrown by the expansive force of gases, produced by the combustion of an explosive. They are either smoothbore or rifled. The former class of cannon, which are now obsolete, were used to fire spherical projectiles, while from the latter oblong projectiles are discharged. Cannon may be divided into three classes: first, guns, or those cannon in which the length of the bore is relatively great in comparison to the calibre; second, mortars, or those cannon in which the length of the bore is relatively small in comparison with the calibre; third, howitzers, or those cannon whose relative length and calibre place them between the other two classes. Modern military usage prefers the word "gun" as the generic term to include howitzers and mortars as well as all types of guns. The word "cannon" has thus gradually become obsolete in technical military literature. They may also be classified according to their use into mountain or pack artillery, field artillery, heavy field artillery, siege or fortress artillery, and seacoast artillery—a classification which is observed in this ENCYCLOPÆDIA. Modern guns may also be classified according to the kind of ammunition used. Usually calibres up to and including the 4.7-inch gun use "fixed ammunition," in which a metallic cartridge case, containing the powder charge and primer, is permanently attached to the fused projectile, the whole forming a "round" of ammunition. Calibres above 4.7 inches use "separate loading ammunition," in which the powder charge is contained in a cartridge bag or in a metal cartridge case which is loaded separately after the projectile has been seated in the gun. The former group is subdivided into machine guns, revolving cannon, and rapid-fire guns. As to construction, cannon are divided into those made of a single piece and those built up of two or more pieces, as is now usually the case. Built-up cannon are either composed of steel forgings, having a tube extending through the length of the bore, with superposed concentric hoops, or a tube with the remainder of the wall composed entirely or in part of a rectangular, circular, or ribbon form of wire. Service cannon in the United States, excepting machine guns, are generally of the built-up, forged-steel type. See ORDNANCE; ARTILLERY; COAST ARTILLERY; FIELD ARTILLERY; HEAVY FIELD ARTILLERY; GUNS, NAVAL; HOWITZER; MACHINE GUN; RAPID-FIRE GUN; and SIEGE GUN for descriptions and illustrations of various forms of cannon.

CANNON, ANNIE JUMP (1863-). An American astronomer, born at Dover, Del. She was educated at Wellesley College, and became an assistant in Harvard College Observatory in 1897 and curator of astronomical photographs in 1911. Besides completing a bibliography of variable stars with 45,000 references, she discovered in her photographic work 150 variable stars, 3 new stars, and one spectroscopic binary. Her publications include: *Second Catalogue of Variable Stars* (1907); *Maxima and Minima of*

Variable Stars of Long Period (1909); *Williamina Paton Fleming* (1911).

CANNON, FRANK JENNE (1859-). An American legislator, born at Salt Lake City, Utah, a son of George Quale Cannon (q.v.), a leader in the Mormon church. He graduated from the University of Utah in 1878 and in the same year engaged in the printing business, acquiring interests also in mining enterprises in Utah and elsewhere. He was a delegate to the Republican National Convention in 1892 and 1896, and a delegate to Congress from the Territory of Utah in 1895. In the following year, against the wishes of the Mormon leaders, he became candidate for and was elected to the United States Senate, serving until 1899. As a result of political differences, he separated himself from the Mormon church and, joining the Democratic party in 1900, was State chairman from 1902 to 1904. He became managing editor of the *Rocky Mountain News* and contributed articles on political subjects to magazines. He wrote *Under the Prophet in Utah*, with Harvey J. O'Higgins (1911), and *Brigham Young and the Mormon Empire* (1913). Both these books were written as exposés of conditions in Utah under the Mormon domination.

CANNON, GEORGE QUALE (1827-1901). An American leader of the Latter-Day Saints. He was born in Liverpool, England, was early converted to Mormonism, and came to Nauvoo, Ill., about 1844. He was one of the first settlers in Salt Lake City, was sent on a mission to Hawaii in 1850, translated the *Book of Mormon* into Hawaiian, and after his return, in 1854, edited successively the *Western Standard* and the *Deseret News*. He was sent to Washington with W. H. Hooper in 1862 to urge the admission of Utah as a State, was in charge of the Mormon mission in England from 1862 to 1864, and from 1872 until 1881 was the Territorial delegate of Utah to Congress, where he was seated only after a long fight against him on the ground that he was a polygamist. He held various positions of importance in the church, including that of first councilor after 1880, was a member of the Legislative Council of Utah in 1865, 1866, 1869, 1870, 1871, and 1872, and wrote a number of pamphlets in support of Mormonism, and a biography of Joseph Smith (1888).

CANNON, HENRY WHITE (1850-). An American banker, born at Delhi, N. Y., brother of James Graham Cannon (q.v.). After working as a clerk and teller in the First National Bank at Delhi, he moved to St. Paul, Minn., where he became teller in the Second National Bank in 1870. From 1884 to 1886 he was United States Comptroller of the Currency, and from 1886 to 1904 president of the Chase National Bank. In 1911 he became president and chairman of the board of directors of the Pacific Coast Company. In 1892 he was a delegate to the International Monetary Conference at Brussels. His lecture delivered at Harvard on *The National Banking System* was published in 1910.

CANNON, JAMES GRAHAM (1858-1916). An American banker, born at Delhi, N. Y., brother of Henry White Cannon (q.v.). He became president and director of the Fourth National Bank of New York, and also director in many other banks and in important corporations. He published *Clearing Houses: Their History, Methods, and Administration* (1908), and an address, *Clearing Houses and Currency* (1913).

CANNON, JOSEPH GURNEY (1836-). An American lawyer and congressman, born at Guilford, N. C. From 1861 to 1868 he was State's attorney in Vermilion Co., Ill., and from 1873 to 1891 served as a Republican in the Federal House of Representatives. He held the same office from 1893 to 1903. In 1890, with Reed and McKinley, he drew up the "Reed rules" of the House. He was chairman of the Committee on Appropriations in the Fifty-fifth and Fifty-sixth Congresses, and was elected Speaker of the Fifty-ninth (1905) and many succeeding Congresses. His autocratic power was greatly limited by the House resolution of March 19, 1910, enlarging the Committee on Rules and taking its appointment from the Speaker and giving it to the House. In 1911 Champ Clark, Democrat, succeeded him as Speaker, and in November, 1912, he failed of reelection as Representative. He was a leader of the "stand-pat" or reactionary branch of the Republican party, to whose methods the downfall of the party in 1912 was generally attributed. He was somewhat quizzically known throughout the country as "Uncle Joe" Cannon. See UNITED STATES, *History* (Administrations of McKinley, Roosevelt, and Taft).

CANNON, WILLIAM AUSTIN (1870-). An American botanist, born at Washington, Mich. He was educated at the University of Michigan and at Columbia University. He became resident investigator in 1903-05 of the Desert Laboratory, staff member in 1905 and acting director in 1911-12 of the department of botanical research of the Carnegie Institution. His publications include: *Studies in Plant Hybrids* (1903); *Studies in Heredity as Illustrated by the Trichomes of Species and Hybrids of Juglans, Oenothera, Papaver, and Solanum* (1909); *Root Habits of Desert Plants* (1911); *Botanical Features of the Algerian Sahara* (1913).

CANNSTATT, or KANNSTATT, kân'shtát. Formerly a town of the Kingdom of Württemberg. In 1905 it was incorporated with Stuttgart, the capital. It is beautifully situated on both sides of the Neckar, which is crossed by three bridges (Map: Germany, C 4). The newer portion of the town is well built, with handsome streets and pleasant recreation grounds. It is chiefly notable on account of its saline and chalybeate springs. Overlooking the Neckar, near by, is the castle of Wilhelma, built in 1851. Of late years Cannstatt has entered to a considerable extent into industrial pursuits, and has railway shops and flourishing manufactures of machinery, cooking utensils, woolen goods, furniture, electrical supplies, etc. It owes its origin to the Romans, who founded baths here in the eighth century. It suffered much during the Thirty Years' War and through the repeated invasions of the French. It was the scene of the victory of the French under Moreau over the Austrians under Archduke Charles, July 21, 1796. Pop., 1890, 19,800; 1900, 26,500; 1905, 26,497. Consult Beck, *Cannstatt and the New Neckar-Bridge* (Cannstatt, 1893).

CANO, kâ'nô, ALONSO (1601-67). A Spanish painter, sculptor, and architect. He was born in Granada, but came early to Seville, where he studied sculpture under Montañes and painting under Pacheco. In 1637, in consequence of a duel, he fled to Madrid, where, through the influence of Velasquez, he was appointed court painter. In 1644, suspected of the murder of

his wife, he fled from Madrid, taking refuge at Valencia, for his talents found him protectors, and later in the Carthusian convent, Porta Cœli. Returning to Madrid, he proved his innocence on the rack. In 1651, at his own request, he was made a canon of Granada, where he resided until his death. His earliest years were devoted chiefly to the cathedral of Granada, of which he was named chief architect. He designed its characteristic façade—his architectural masterpiece. For the Capilla Mayor of the cathedral he carved statuettes of the Virgin, busts of Adam and Eve, and painted a cycle of pictures, "The Seven Joys of the Virgin," all of which are among his best works. Because of the versatility of his talents and the high character of his work, Cano has been frequently called the Spanish Michelangelo. His painting is characterized by extreme simplification of means and by careful design, as is witnessed by his admirable pen-and-ink studies, but his color is eclectic, like that of the Bolognese. Since the dissolution of the monasteries his numerous paintings have been much scattered. The cathedral of Granada possesses many fine examples, and there are 10 in the Prado. He is also represented at Munich, Berlin, Dresden, Paris (the Louvre), St. Petersburg, and other European cities. His sculpture, mostly of colored wood, is frankly realistic in technique, simple in pose, and intense in expression. It is still the custom in Spain to ascribe the better sculptures of the seventeenth century to him, irrespective of their real authorship. His strikingly original architecture subordinated everything to pictorial effect. Consult the article by Lafonde, in *Monatshefte für Kunstwissenschaft* (1909).

CANO, kã'nò, JUAN SEBASTIAN DEL (?-1526). A Spanish navigator, born in Guetaria. He became captain of a vessel trading with Africa and the Levant, and commanded one of the five vessels of Magellan's famous expedition. After Magellan's death (April 27, 1521) he succeeded the deposed Carabello as chief of the expedition, and, having visited the Moluccas, reached Spain with one ship in 1522, being thus the first to circumnavigate the globe. He was appointed second in command to Loaisa in another expedition of five vessels which set sail July 25, 1525. He died while cruising in the Pacific. The *Victoria*, in which he had accomplished his first voyage, was long preserved at Seville.

CANO, MELCHIOR (1509-60). A Spanish theologian. He was born at Tarançon in Spain, entered the Dominican Order at the age of 15, and was ordained priest in 1531. He was employed for years in teaching theology and gained the professorships at Alcántara (1543) and Salamanca (1546) over formidable competitors. He was a determined opponent of the newly founded Society of Jesus, objecting to its marked departures from the traditions of the older orders. Charles V sent him to the Council of Trent as theologian in 1551, and he took a prominent part in its deliberations. A year later, again on the Emperor's nomination, he was consecrated Bishop of the Canary Islands; but for some unknown reason he never took possession of his see, retiring to the monastery of Piedrahita, and spending the rest of his life in theological study and works of charity. The first edition of his epoch-making work, *De Locis Theologicis*, on the sources of theological knowledge,

appeared in Salamanca in 1563, followed by more than 30 other editions; his complete works were published in Padua in 1720. Consult Fermin Caballero, *Vida del ilustre Fray Melchior Cano* (Madrid, 1871).

CANOBUS. See CANOPUS.

CANOE, and **CANOEING** (Sp. *cano*, canoe, from Carib *canáoa*). Strictly speaking, a canoe is a light boat designed to be propelled by a paddle held in the hands, without any fixed support; and in the main that is correct, although in some cases canoes have an auxiliary sail, to be used under favorable conditions; and, for modern sporting purposes, some use sails only and no paddles.

Early canoes were merely a few thin strips of wood laid across each other at various angles, tied together, and bent upward, so as to form a frame much like an umbrella frame upside down. Over that a skin was stretched and sewn. With this primitive canoe rivers and estuaries were crossed. It existed until quite recent times in America and does so to-day in the Irish and Welsh coracle.

The tree, hollowed either by nature, fire, or tools, was the second stage of evolution, and canoes of this kind are common on the African rivers to-day. Upon them the bulk of the commerce of the continent was carried until lately, and it is therefore not surprising to find specimens of them in the familiar dugout of the Southern States. The islands of the Pacific, depending upon the adjacent seas for material sustenance and having little available timber, naturally produced the first builders who made a canoe out of planks. Those in Samoa are regularly built of several pieces of wood of irregular shape, fastened together with sennit and cemented all over with gum from the bark of the breadfruit tree, to prevent their leaking. Where the South Sea Islanders had larger timber, as did the Philippine Islanders, they built from a single tree trunk, with an outrigger, and sometimes two, excepting on the canals and rivers, where the space was too narrow for them. In some of the islands two canoes were lashed together, like the catamaran (q.v.); in others, fixed outriggers extended from each side. In fact, the design and method of propelling the canoes of Polynesia are endless in variety, but all masterpieces of adaptability to the conditions of their locality and their use. Wonderful sailors, too, are the natives who in them undertake even long sea voyages, far out of the sight of land, in passing from one group of islands to another. The coasts of the mainland of Siam, Burma, and China swarm with canoes. America, too, has a great variety, from the skin-covered bones which the Eskimo paddles in the Arctic seas to the shallow canoe which the Seminole poles in the Everglades of Florida. The birch-bark canoe of the American Indians was skillfully made and relatively light, and its counterpart is still frequently used in hunting and fishing trips, but the modern cedar boat is lighter, stronger, and more easily paddled.

Modern canoeing as a sport largely owes its popularity to two men in England who built canoes capable of being either paddled or sailed and took long pleasure journeys in them—John Macgregor in the *Rob Roy* between 1866 and 1869, and Baden-Powell in the *Nautilus*. The sport rapidly spread on both sides of the Atlantic, dividing itself into two schools, sailing and paddling, and naturally into two classes of de-

signs. The Canadian (or birch-bark pattern), open and undecked, built of basswood or cedar, or even paper or canvas, was chosen by the paddling fraternity. The sailors took for their first ideas the two English boats, the *Rob Roy*, a lapstreak built of cedar strips, about 14 feet long by 26 inches broad, excellent for easy rivers and coasting, but bad for rapids and portaging, or the *Nautilus*, which was designed exclusively for sailing. American ingenuity soon busied itself with inventions, and every device which could lessen weight was adopted. Charles B. Vaux invented the stationary deck seat and tiller about 1882. Paul Butler added, four years later, the sliding seat, on which the canoeist balances away out over the side of the boat, more like an acrobat than a sailor. Then followed years of elaboration in reefing and lowering sails, and experiments with folding centreboards without number. This tendency to convert the canoe into a machine, and the consequent winning of every contest by the few men who could handle them, has been largely responsible for the lessened interest in canoe-racing contests, but as a pleasant sport and summer pastime canoeing still numbers its devotees by thousands.

In America the New York Canoe Club was founded in 1871. The American Canoe Association was formed at Lake George, N. Y., in 1880, and holds an annual meeting extending over a fortnight, the first week of which is devoted to camping out and cruising, and the second to racing. It associates the Northern (Canadian Association, with 47 clubs), the Eastern (Atlantic, with 32 clubs), the Central (with 26 clubs), and the Western. Each of these divisions holds sectional meetings, but numerous clubs exist which do not belong to any association.

In Great Britain the Royal Canoe Club was formed in 1866, and it has ever since been the principal organization, with headquarters at Kingston-on-Thames, near London. There is another, the British Canoe Association, which devotes its attention entirely to cruising.

Consult: Macgregor, *A Thousand Miles in the Rob Roy*, *The Rob Roy on the Baltie*, and *The Rob Roy on the Jordan and the Red Sea* (London, 1874); Baden-Powell, *Canoe Traveling* (London, 1871); Holding, *Watery Wanderings* (London, 1886); Field, *Canvas Canoes and How to Build Them* (New York, 1887); *Canoeing and Camping Out* (Bell's Handbooks, London, 1893); Vaux, *Canoe Handling* (New York, 1888); Henshall, *Camping and Canoeing in Florida* (Cincinnati, 1884); Neide, *The Canoe Aurora's Cruise from the Adirondaeks to the Gulf* (New York, 1885); Stephens, *Canoe and Boat Building* (New York, 1891); Stanton, *Where the Sportsman Loves to Linger: A Narrative of the Most Popular Canoe Trips in Maine—the Allagash, the East and West Branches of the Penobscot* (New York, 1905); "Canoes and Canoeing," *Spalding's Athletic Library* (New York, issued annually).

CANON (OF. *canone*, Late Lat. *canonicus*, from Lat. *canon*, rule, Gk. *κανών*, *kanōn*, straight bar, rule, norm). An ecclesiastic not belonging to any of the religious orders, but living in a community under a definite rule of life. As early as the fourth century Eusebius of Vercelli (died c.371) united the clergy of his see city into such a community, and the example was followed in the fifth by St. Augustine at Hippo. There are indications of the early existence of

the institution at Tours, at Rheims, and at the Lateran in Rome; but it was not common until the end of the eighth century. Its origin is sometimes erroneously ascribed to Chrodegang, Bishop of Metz from 742 to 766; but his real service was the reduction to writing of a rule of life, which was adopted by many other bodies of canons. It was taken partly from the rule of St. Benedict (he was a Benedictine himself) and partly from the traditions of the Lateran canons. With some adaptations by the deacon Amalarius of Metz, it was confirmed by Louis le Débonnaire in the great council of Aix-la-Chapelle, in 816 or 817, as binding throughout the Frankish dominions. Under this rule the canons lived under one roof, with a common table; the regular employment of their whole time was prescribed, and a spirit of brotherhood fostered. They differed from monks in wearing no cowl and making no religious vows. The immediate head of the community, under the bishop, was in the rule of Chrodegang the archdeacon, in the constitution of Aix a provost, or in some churches an abbot.

The early fervor gradually decayed and disorders crept in, partly owing to the possession of private property and the growing wealth of certain chapters, and partly to the troubled condition of Europe in the decline of the Carolingian monarchy. Vigorous reforms were attempted, in harmony with the spirit of the time, in the eleventh century, notably by St. Peter Damian and by Roman synods under Nicholas II (1059) and Alexander II (1063). These councils not only laid down strict rules for the maintenance of a common life, but strongly urged the abandonment of private property. This counsel was soon followed in many places. As the newer organizations were largely based upon the example and writings of St. Augustine, his name was generally attached to their rule, perhaps first by Gervasius, Archbishop of Rheims, in 1067. (See AUGUSTINIANS.) At first, and even after there were as many as 4000 houses of the kind, they had no connection with each other; but in 1339 Benedict XII established a system of general and provincial chapters, whose decisions were to be binding on all houses under their jurisdiction. In spite of this, a century later these ties had been much relaxed and the spirit of poverty forgotten. No further attempt was made at general reformation, although various separate societies succeeded brilliantly in restoring the old standards. Many of the old foundations were destroyed at the Reformation, and many more by the revolutionary developments from the end of the eighteenth century, so that only a few congregations now exist. Of these the principal ones are Lateran canons, who possess a few houses in Austria, including Klosterneuburg, near Vienna (founded 1106), and the Premonstratensians (q.v.).

In modern times the title of canon is applied to the dignitaries, whether in the Roman Catholic church or in the Church of England, who form a sort of council to the bishop and perform certain duties in his cathedral church. For their organization, see more particularly CHAPTER.

CANON (Lat., from Gk. *κανών*, *kanōn*, straight bar, rule, norm). A particular form of part-music based on strictest imitation. The opening theme or melody, the *antecedent*, is repeated by the other part or parts, and is then called the *consequent*. There is severe observance of the in-

tervals of the melodic design, each part "coming in" after exactly the same number of measures or bars as the second part comes in after the beginning of the theme by the first part. In

this example the second voice imitates the theme in the interval of the fifth, the third voice in the interval of the second. But the imitation may occur in any interval. Nor is there any restriction regarding the number of voices. The imitation may also be given in augmentation (q.v.) or diminution (q.v.) or in inversion, so that the consequent appears in contrary motion to the antecedent. Some canons are written so that the imitation gives the theme read backwards. In fact, no other musical form lends itself so readily to mere mechanical trickery. It is safe to say that the complexity of a canon and its value as real music stand in the relation of inverse proportion to each other. This excess of contrapuntal trickery brought about the downfall of the famous school of the Netherlands (q.v. under MUSIC, SCHOOLS OF COMPOSITION). For details the reader may be referred to the excellent work of S. Jadassohn, *Die Lehre vom Kanon und von der Fuge* (Leipzig, 1884), translated into English by G. Wolff. Other treatises are those of E. F. Richter, S. W. Dehn, and J. C. Lobe (in German) and E. E. Ayres, H. A. Clarke, and E. Prout (in English). Consult O. Klauwell, *Der Canon in seiner geschichtlichen Entwicklung* (Leipzig, 1876).

CAÑON, kã'yon; *Sp. pron.* kã-nyõn', or **CANYON** (*Sp. cañon, caña, tube, funnel, cannon*). A term applied in the United States to a deep and extensive ravine along a watercourse. Cañons are formed by the erosive action of rivers on their beds and are usually limited to the upper portions of basins, where the water flows with considerable velocity and thus tends to deepen rather than widen its channel. They are typical of dry climates and of plateau regions which have been elevated in comparatively recent geological times. In moist climates rock decomposition and denudation keep pace with erosion, and the combined action of these agencies leads to the carving out of broad, open valleys, a result which may be produced after a very long period in a dry climate. But, unless the slope of the river bed has been greatly reduced, the erosive action of the water in regions of small rainfall will be more effective than the atmospheric agencies, and consequently the walls of the channel will have a precipitous

character. The nature of the rock over which the river flows is also a factor in the formation of cañons; hard rocks usually decompose slowly and thus preserve the contours of the channel as originally determined by erosion. There are many cañons in the western part of the United States, the most notable being the Grand Cañon of the Colorado, which is more than 300 miles long and has almost vertical walls rising by successive steps from 3000 to 7000 feet in height. The Rio Grande and Yellowstone have similar but less extensive cañons. The name is sometimes applied in the Western States to the narrow and deep channel of a river, by which the latter crosses a mountainous barrier, but in such instances it does not differ from a gorge. See RIVER; COLORADO RIVER; YELLOWSTONE NATIONAL PARK; ETC.

CANON, kã'nõn, JOHANN (properly JOHANN VON STRASCHIRIPKA) (1829-85). An Austrian historical, genre, and portrait painter. He was born in Vienna, where he studied with Rahl, but learned chiefly from the old masters and closely imitated Rubens's style. After long wanderings in Europe and the East he lived for a time in Karlsruhe and Stuttgart, and finally settled in Vienna, where his energetic personality soon gained for him a position of importance. He is perhaps most effective as a painter of portraits. Among the best are those of Frau Friedländer (1874), Count Eduard Zichy, Prince of Schwarzenberg—all in Vienna. His other works include "Cromwell," "The Johannes Lodge" (Stuttgart), "The Flamingo Hunt," "Maternal Love." His decorative paintings, of which there are examples in Vienna, Karlsruhe, and New York, are also important. He is commemorated by a bronze monument modeled by Weyr in the City Park, Vienna. Consult his obituary in *Zeitschrift für bildende Kunst* (1886).

CANON AL'EXANDRI'NUS (Lat.). Lists of the best Greek writers in the various fields of literature, commonly attributed to Aristophanes of Byzantium (q.v.) and Aristarchus (q.v.). The older parts of the extant lists may go back to these scholars, but the canon of the orators is as late as the Pergamene school, and indeed may have been prepared by the rhetor Cæcilius in the time of Augustus; the canon of the historians is not earlier than the second century B.C.; and the canons of the sophists, grammarians, and physicians all belong to our era. It has commonly been supposed that Aristophanes and Aristarchus selected the best authors in the several fields, and that this selection contributed to the loss of the works of other authors; but it has recently been shown by Wilamowitz-Möllendorff, *Textgeschichte der griechischen Lyriker* (Berlin, 1900), that for the lyric poets, at least, the list represents only a codification of the works of the nine poets included, which had already been selected as best by the judgment of preceding centuries. That this was the case with other parts of the canon can hardly be doubted. Three lists of the best authors have been preserved to us, which do not, however, agree in all details: (a) one first published by Montfaucon, now best edited by Usener in his *Dionysius of Halicarnassus, De Imitatione Reliquia* (Bonn, 1889); (b) the second, first edited by Cramer, *Anecdota Græca*, IV (Oxford, 1841); (c) a third, published, with the two already named, by Kroehnert, *Canonesne Poetarum Scriptorum Artificum per Antiquitatem fuerunt?* (Königsberg, 1897). Further information is

given by Dionysius of Halicarnassus in his rhetorical writings, Quintilian, bk. x, l. 54, Velleius Paterculus, i. 10, Proclus in his *Crestomathy*, and Tzetzes, in his introduction to Lycophron's *Alexandra*. The older part of the canon published by Montfaucon is as follows: *Epic Poets*.—Homer, Hesiod, Pisander, Panyasis, Antimachus. *Iambic Poets*.—Simonides, Archilochus, Hipponax. *Tragedians*.—Æschylus, Sophocles, Euripides, Ion, Archæus. *Comic Poets*.—*Old Comedy*: Epicharmus, Cratinus, Eupolis, Aristophanes, Pherecrates, Crates, Plato. *Middle Comedy*: Antiphanes, Alexis. *New Comedy*: Menander, Philippides, Diphilus, Philemon, Apollodorus. *Elegiac Poets*.—Callinus, Mimnermus, Philetas, Callimachus. *Lyric Poets*.—Alcman, Alcæus, Sappho, Stesichorus, Pindar, Bacchylides, Ibycus, Anacreon, Simonides. *Orators*.—Demosthenes, Lysias, Hyperides, Isocrates, Æschines, Lycurgus, Isæus, Antiphon, Andocides, Dinarchus. *Historians*.—Thucydides, Herodotus, Xenophon, Philistus, Theopompus, Ephorus, Anaximenes, Callisthenes, Hellanicus, Polybius. To the lists of older poets should be added the list of the Tragic Pleiades, embracing poets of the third century B.C.—Lycophron, Alexander the Ætolian, Sosiphanes, Sositheos, Dionysiades, Homer of Byzantium, Philiscus of Corcyra. The canon of the ten sophists cannot be earlier than the fifth century A.D., for it includes, besides Dio Chrysostom, Nicostratus, Polemon, Herodes Atticus, Philostratus, Aristides, the later Libanius, Themistius, Himerius, and Eunapius. Consult: Couat, *La Poésie Alexandrine* (Paris, 1882); Peterson's edition of Quintilian, bk. x, Introduction, xxviii-xxxvii (Oxford, 1891); Susemihl, *Geschichte der griechischen Litteratur in der Alexandriner-Zeit* (Leipzig, 1891-92); and the works quoted above. See ALEXANDRIAN AGE; ALEXANDRIAN LIBRARY.

CAÑON (kän'yon) **CITY**. A city and the county seat of Fremont Co., Colo., 41 miles west by north of Pueblo, on the Arkansas River, 1 mile from the Royal Gorge and Grand Cañon, and on the Denver and Rio Grande, the Atchison, Topeka, and Sante Fe, and the Florence and Cripple Creek railroads (Map: Colorado, D 3). It is a noted health resort, situated at an elevation of 5345 feet, and surrounded on three sides by mountains, and famed for its mineral springs and its attractive scenery. It is the seat of the State penitentiary, and Odd Fellows' sanitarium and home, an academy for young women, and has a Carnégie library, two hospitals, seven public parks, and a hot-water natorium. The city has abundant water power, with an excellent gravity system, owned by the city; the soil is fertile, and in the vicinity are rich deposits of iron, coal, silver, copper, marble, limestone, and petroleum. Fruit growing is an important industry, and there are canning and brick and tile factories, a large smelter, and a reduction mill. Pop., 1890, 2825; 1900, 3775; 1910, 5162.

CANONESS. In the early Christian Church the name *κανονικαί*, *canonicæ*, was applied to women who, living not in communities, but in their own homes, made a vow to remain unmarried and took charge of various works of charity; the name was derived from their being enrolled in the official list or *canon* of the particular church. (See DEACONESS.) In the ninth century, when the development of the canonical life became general (see CANON), communities of women living under the rule, but

not members of a religious order, were known by this name; education was their principal external function. Later, as in the case of the canons, they became differentiated into regular and secular. They mostly followed the rule of St. Augustine. The secular canonesses, especially in Germany, came to differ very little from women living in the world; their rules were few and not rigorously observed, and their houses merely safe and dignified homes for unmarried women, who were in many cases required to be of noble birth. Several such communities became Protestant at the Reformation, and still exist in Germany. For the more formal religious orders of women, see SISTERHOODS.

CAN'ONGATE, THE. A street in "Old" Edinburgh, which leads from Holyrood Palace up to the "Castle." It originally connected a distinct suburb, known as the Canongate and built in the twelfth century, with the town proper. It contains some tenements, a century or a century and a half old, which are notable for their extreme height. See Scott's *Chronicles of the Canongate*.

CANONICAL HOURS. The times fixed for divine service in the Catholic church, but no longer strictly adhered to. These have not always been the same, and it is not known when nor by whom they were settled; but they are now seven, viz., matins and lauds, prime, terce, sext, nones, vespers, and compline. These used to be observed as follows: Prime, terce, sext, and nones, at the first, third, sixth, and ninth hours of the day, counting from 6 in the morning; vespers at the eleventh hour; compline, or *completorium*, as completing the services of the day, at midnight; and matins shortly after midnight. The hours had mystical reference to certain occurrences in the history of the Passion of Christ. They are called canonical because according to the canon or rule of the Church. The proper offices for the canonical hours are to be found in the Breviary (q.v.). In England the term is also applied to the hours within which marriages may be lawfully celebrated. These used to be between 8 and 12 in the morning, but a recent act extended them until 3 P.M.

CANON'ICUS (c.1565-1647). A Narragansett Indian chief, the constant friend of the early colonists, and especially of Roger Williams, who obtained from him title to the lands that now constitute Rhode Island. He was uncle to Miantonomoh (q.v.).

CAN'ONIZA'TION. In the Roman Catholic church, the act of the Pope by which a deceased person is solemnly declared to be a saint. It had its origin in the practice in the early Church of inserting in the commemorative prayer of the liturgy the names of those who had died as martyrs or distinguished themselves as confessors of the faith. In the case of a doubtful claim to this honor, the decision at first rested with the bishop of the diocese, but was later reserved to the metropolitans. They were not seldom assisted by a council, and the question was sometimes referred to Rome. The first recorded papal canonization, however, is that of Ulrich, Bishop of Augsburg, by John XV, in 993; but no claim to exclusive right was made until Alexander III laid down in 1170 the principle which has ever since formed the basis of the law in the matter. Here and there holy men and women were revered as saints in their own neighborhoods, even after this, until Urban VIII put a stop to the practice in 1634.

Canonization, as understood in modern times, is the culmination of a lengthy process. The prospective saint must first pass through the earlier stages of being declared a "venerable servant of God," and of beatification (q.v.). The last step involves an exceedingly minute inquiry, conducted with the most elaborate legal formalities; the rules of evidence applied to the testimony in support of alleged miracles (at least two of which must be proved to have been wrought since the beatification) are more strict than in any American or English court. An ecclesiastic known as the *promotor fidei*, and sometimes as the *advocatus diaboli*, is specially appointed to urge every possible objection and test to the utmost the validity of the claims advanced. When a favorable decision is pronounced (which is never less than 50 years after the person's death), the ceremony of canonization is performed in St. Peter's with great pomp. Among the Eastern churches the principle of canonization is recognized. The right to perform the ceremony in the Greek church is vested in the Patriarch of Constantinople, but it is rarely exercised; in the Russian church the authority rests in the Holy Synod. For the rules and ceremonies of Roman Catholic canonization, consult the standard authority, Pope Benedict XIV, *De Servorum Dei Beatificatione et Beatorum Canonizatione* (Bologna, 1734-38). Consult also Boudinhon, *Les procès de béatification et de canonisation* (Paris, 1904), and Maeken, *Canonization of Saints* (New York, 1910).

CANON LAW. The law of the Roman Catholic church, embodied in the *Corpus Iuris Canonici*. Its sources are the Bible, the writings of the Fathers, the canons of the councils, the decretals of the popes, the manuals of penance, custom, and secular legislation, especially in the code of Justinian. Comparatively early, attempts were made to codify the rules which governed the conduct of the Church and its members. One of the earliest attempts gave rise to the Apostolic Constitutions and Canons (q.v.). There were many other compilations at various periods which were followed by portions of the Church. (See PSEUDO-ISIDORIAN DECRETALS.) But all earlier collections were superseded by the *Decretum Gratiani*. This was compiled probably between 1139 and 1143 and published at Bologna (c.1148), and was frequently known as the *Concordantia Discordantium Canonum*. This is a general treatise composed of three parts. The first, divided into 101 *distinctiones*, subdivided into canons, treats of the sources of canon law, the organization of the Church, the ordination and the hierarchy of the clergy, the election and consecration of the bishops, the authority of the legates and primates. The second, divided into 36 *causæ*, subdivided into *quæstiones*, under which are given the pertinent canons, treats of judicial matters. The third, divided into five *distinctiones*, under which are given the canons, treats of the sacrament and the liturgy. The *Decretum* forms the first part of the *Corpus Iuris Canonici*. The second part contains four collections of decretals.

1. The *Decretals* of Gregory IX, published in 1234, which contain the important decretals issued since the publication of the *Decretum*. No name was given to the collection by Gregory; the old authors called it *Liber Extravagantium*, or *Pentateuchus*, from its division into five books.

2. The *Liber Sextus*, published by Boniface VIII in 1298, containing decretals since 1234.

3. *Constitutiones Clementinæ*, published in 1313, withdrawn for revision and reissued in 1317. These contain the decretals of Clement V and two issued by preceding popes.

4. The *Extravagantes* of John XXII (1316-1334) and the *Extravagantes Communes*. The first contains 20 decretals of John; the second 73 issued by various popes between 1298 and 1484. The *Extravagantes* were never formally promulgated and have obtained a place in the canon law only by custom. All four collections follow the traditional order of subjects, *Iudex, Iudicium, Clerus, Connubia, Crimen*. The portions of the canon law are not all of equal authority, but the distinctions are too extensive to be discussed here. (See *Bibliography* at end.) In many editions of the canon law the *Institutiones* of Lancelottus are published as a supplement. The author states that he wrote this at the request of the Pope in order to make the canon law correspond more closely to the *Corpus Iuris Civilis* (q.v.). The *Decretum* corresponds to the Pandects; the *Decretals* of Gregory IX to the Code; the *Sextus, Clementinæ*, and *Extravagantes* to the Novellæ; his work to the *Institutiones*. It was published in 1563 and frequently since, but never approved authoritatively by the Pope. It is hardly necessary to add that, although the *Corpus* is still the authoritative collection, canon law has been constantly modified by later enactments.

During the Middle Ages the canon law was authoritative in all countries subject to the spiritual jurisdiction of Rome. The ecclesiastical courts embraced within their jurisdiction all members of the clergy and, as a privilege, widows, orphans, Crusaders, and students. But their jurisdiction extended over many other persons because they claimed the control over many cases, such as matters relative to the faith, sacraments, and vows; matters relative to marriage, ecclesiastical property, and wills; crimes against religion, or those committed in sacred places; violations of the truce of God (q.v.); the exaction of usury, i.e., interest, etc. Some of these subjects the civil authorities admitted to be wholly within the province of the ecclesiastical courts; with regard to other subjects, the civil courts claimed an equal or superior right of jurisdiction. As the royal authority became stronger in the different countries, the kings became jealous of an authority independent of their own, and attempted to bring the members of the clergy and certain classes of cases under their own jurisdiction. They were especially hostile to appeals to Rome. (See CLARENDON, CONSTITUTIONS OF.) Ultimately the royal authority triumphed, and canon law became restricted almost everywhere to purely religious and ecclesiastical questions. It is still authoritative in many countries on many subjects, and it has modified profoundly both international law and civil law in the various countries of Europe. It is impossible to state briefly, and yet accurately, its varying authority in modern times in the different countries. Until recently its importance in Germany was very great. Down to the end of the eighteenth century it was a constituent element of the common law; since that time its authority has been greatly restricted and confined in civil matters to a comparatively few states. In France it was abrogated in 1790 by the "Civil Constitution of the Clergy," and it has never regained its position. In England it has no direct authority,

but some portions of the English law are based upon canon law. In Scotland, curiously enough, when one considers Scotch history, the Roman canon law still prevails to a certain extent. Lord Stair said, in his *Institutes of the Scotch Law*, "So deep hath this canon law been rooted, that even where the Pope's authority is rejected, yet consideration must be had to these laws, not only as those by which church benefices have been erected and ordered, but as likewise containing many equitable and profitable laws, which, because of their weighty matter, and their being once received, may more fitly be retained than rejected." In two old Scotch Acts of Parliament, made in 1540 and 1551, the canon law is used in conjunction with the Roman law to denote the common law of the country, the expression used being "the common law, baith canon, civil, and statutes of the realme." In the United States some laws borrowed from the English common law are based upon the canon law.

The best edition of the *Corpus Iuris Canonici* is edited by Friedberg (2 vols., Leipzig, 1879-81). The number of good works on the canon law is very great. Tardif, *Histoire des sources du droit canonique* (Paris, 1887), gives an excellent bibliography down to that date. Consult also: Phillips, *Kirchenrecht* (7 vols., Regensburg, 1845-72, incomplete; continued by Vering, vol. viii, Regensburg, 1889); Schulte, *Geschichte der Quellen und Litteratur des canonischen Rechts von Gratian bis auf die Gegenwart* (3 vols., Stuttgart, 1875-83); Hinschius, *Das Kirchenrecht der Katholiken und Protestanten* (4 vols., Berlin, 1869-86); Maitland, *Roman Canon Law in the Church of England* (Cambridge, 1898); Taunton, *The Law of the Church* (London, 1903).

CANON OF MURATORI. See MURATORIAN FRAGMENT.

CANON OF THE BIBLE. See BIBLE.

CANON OF THE MASS. That part of the mass which contains the fixed ritual for celebrating the eucharist in the Roman Catholic church. The content and order of this ritual date from the seventh century, and the arrangement is ascribed by tradition to Pope Gregory I (590-604). It is regarded as the most sacred part of the ritual of worship.

CANONS, BOOK OF. In Scottish ecclesiastical history, a code of canons or rules for the Church of Scotland, prepared by the Scottish bishops in obedience to the command of Charles I, revised by Laud, confirmed by letters patent under the great seal May 23, 1635, and published in 1636. It tended to increase the dissatisfaction prevalent throughout Scotland, which soon broke out violently. It was considered objectionable as the work of Laud, and because it was promulgated by the King without consultation with either clergy or laity. The canons are printed in the fifth volume of the collected works of Laud, *Library of Anglo-Catholic Theology* (7 vols., Oxford, 1847-60). Consult Burton, *History of Scotland*, vol. vi (Edinburgh, 1873).

CAN'ONSBURG. A borough in Washington Co., Pa., 18 miles southwest of Pittsburgh, on the Pittsburgh, Cincinnati, Chicago, and St. Louis Railroad (Map: Pennsylvania, A 7). It contains the Pennsylvania Training School, the buildings of Jefferson College, founded in 1802, but now part of Washington and Jefferson College (q.v.), and the original building of the Rev. Dr. John McMillan's Latin School, founded

in 1780. The borough is in a rich coal district, and its manufactures, which have grown rapidly, include pottery, tin plate, structural steel, sheet iron, stove pipes, etc. Population, including South Canonsburg, annexed in 1911, 5588. Canonsburg was laid out by Col. John Canon in 1789 and incorporated as a borough in 1802. It was the central point of the whisky insurrection of 1794.

CANONS OF THE CHURCH OF ENGLAND. The so-called constitutions and canons ecclesiastical, agreed upon, with the King's license, in the synod held in London in 1604. They were drawn up by the convocation, in order to give effect to the decisions of the conference held at Hampton Court, and are, in the main, a digest of old canons, with some new ones added. They are 141 in number. By these canons every clergyman was obliged to swear to subscribe willingly to the royal supremacy, the Prayer Book, and the Articles. All who declared the Prayer Book or Articles to be in any way superstitious were condemned. This was a defeat for the Puritan party, but most of them took the test oath rather than go into exile. The canons are still authoritative except for the parts revised by later canons. Consult Walcott, *The Constitutions and Canons Ecclesiastical of the Church of England, etc.* (Oxford and London, 1874).

CANON'S YEOMAN'S TALE. One of the *Canterbury Tales*. It is told by an itinerant and disreputable canon's starving servant and guard, and consists of a description of the various trickeries practiced by the alchemists, of which the canon is one, upon their credulous and avaricious dupes.

CANO'PIC VASES. The name given to the four vases in which the ancient Egyptians used to place the viscera taken from the dead when embalming them. The vases were mostly of stone, and the lids represented, in later times, the heads of the four genii, the so-called sons of Osiris, who protected each a special part of the intestines (stomach and large intestines; small intestines; lungs and heart; liver and gall bladder). The modern name has no authorization from the classical writers.

CANO'PUS, or CANO'BUS. A city of ancient Egypt, about 14 miles east of Alexandria, at the Canopic mouth of the Nile, which was thus called after the city. It did not become a place of importance until after the foundation of Alexandria, when the Alexandrians used the town as a pleasure resort, and it had a rather bad reputation. Canopus was an important port, and although the Canopic channel is now filled up, there are still numerous ruins of the ancient town on the shore at Aboukir. The temple of Serapis, located in this town, possessed a famous oracle, much frequented by invalids in pursuit of health. The ruins of this temple were the field of successful excavations in 1893. The Greek name seems to be an assimilation of the name of the legendary helmsman of Menelaus with some unknown Egyptian word. There seems to have been a confusion between Osiris and Canopus.

CANOPUS (Lat., from Gk. Κάνωπος, Kanōpos, a city of lower Egypt). The principal star in the constellation of the ship *Argo*. According to the *Harvard Photometry*, it is the second most brilliant star in the heavens, being surpassed by Sirius alone. It is one of the few brilliant stars for which no sensible parallax has been found, indicating that it must lie at

a distance of at least 300 light years from the earth. According to Plutarch, it received its name from Canopus, the pilot of Menelaus.

CANOPY (Fr. *canapé*, It. *canope*, ML. *canopium*, gauze net, Gk. *κωνωπέιον*, *kōnōpeion*, perhaps from *κῶνος*, *kōnos*, cone + *ὤψ*, *ōps*, face). Originally, in classic literature, a tentlike mosquito netting (Herodotus, ii, 95; Horace, *Epistles*, ix, 9); hence any fixed hanging or projection over a bed, couch, or throne, or similar portable object carried over dignitaries in processions, as the baldachin (q.v.). The term has since passed into architectural terminology to designate also any overhanging covering or projection above an altar, tomb, or statue, whether

CANOPY.

(After Viollet-le-Duc.)

made of wood, stone, or metal—such a canopy as was termed “ciborium” in the Middle Ages.

In Gothic architecture canopies of considerable architectural richness, with cusped arches, gables, and pyramidal roofs were common over tombs, both in Italy (e.g., tombs of the Scaligers in Verona) and western Europe; and in Italy they were often placed over the high altar, supported on four columns. (See **CIBORIUM**.) This practice lasted from Byzantine times (Ravenna) to the late Renaissance (St. Peter's, Rome). In the middle and late Gothic of western Europe it became increasingly the practice to set over each niche containing a statue, and over each seat or stall in the choir of a church, an elaborately carved, spirelike canopy. In the fifteenth and sixteenth centuries such canopy work reached the acme of minute elaboration and complexity, forming one of the most prominent decorative features of the style not only in France, but throughout Europe. The canopy was much used in miniature form, in reliquaries, shrines, and other goldsmith work, and in works of industrial art, tapestries, stained glass, etc. Canopies occur less frequently in the Renaissance, but they are found over altars in Italy, over

pulpits, tombs, wells, fonts, and doors in various countries; among examples of these may be cited an early Renaissance font canopy at Bretnagolles, France; the canopy over St. Sebald's tomb in Nuremberg, and the carved wood canopies over many seventeenth-century pulpits in Belgium. Under Louis XIV and Napoleon I in France superb canopies of brocaded silk were placed over the royal thrones and bedsteads.

CANOSA DI PUGLIA, *kā-nō'sā dé pōō'lyā* (Lat. *Canusium*). A city in the Province of Bari delle Puglie, in south Italy, 15 miles southwest of Barletta, on the slope of a hill, near the Ofanto (Map: Italy, L 6). The cathedral of San Sabino, with pavement several feet below the surface of the street, was built about 1101. In an adjacent court is the tomb of Bohemond I, who died in 1111; it has bronze doors by Ruggieri of Amalfi. There is a ruined castle, built by Charles I of Naples. A gate and the ruins of a large amphitheatre and of an aqueduct testify to the prosperity of the ancient Canusium, while from the tombs in the vicinity, excavated in 1812-13, painted vases, painted busts, marble statues, and other magnificent funereal furniture have been transferred to the museum at Naples. The town was founded by the Greeks, and till the Second Punic War was an important commercial centre. Near by is the battle ground of Cannæ. The country produces wine and oil. Pop. (commune), 1881, 19,000; 1901, 24,169; 1911, 26,053.

CANOSSA, *kā-nōs'sā*. A ruined castle in north Italy, 12 miles southwest of Reggio, celebrated as the place where, in 1077, Emperor Henry IV obtained absolution from Pope Gregory VII after three days' humiliation (Map: Italy, E 3). Hence the expression “Go to Canossa” is proverbially used to denote a surrender to the claims of the Church. When Bismarck inaugurated his Kulturkampf (q.v.), he publicly boasted that he would never “go to Canossa,” but he did. The ivy-clad ruins of the castle of Canossa, which in the eleventh century belonged to Countess Matilda of Tuscany, Gregory's friend, and which was destroyed by the citizens of Reggio in 1255, crown the rock above the little village. From it there is a splendid view to the south of the castle of Rossena, with the Apennines in the background, and to the north, of the valley of the Po.

CANOT, *kā'nō'*, THEODORE (1807-50). An African slave trader. He was born in Florence, Italy, son of a French soldier, and after numerous adventures on American ships made his first voyage to Africa in 1826, sailing from Havana to Bangalang, on the river Pongo, Senegambia. After several successful voyages as the owner of a slave transport, he established a slave station at Kambia, which was destroyed by fire in May, 1828. Afterward he became the pioneer of the slave traffic at New Sestros, and in 1840 sent 749 slaves from that station to Cuba. Upon the destruction in 1847 of the settlement of New Florence, which he had established several years previously, ostensibly as an agricultural and trading centre, he removed to South America, whence he went to Baltimore, Md., and finally to France, where he was appointed an official in one of the French colonies of Oceania. Consult Mayer, *Captain Canot, or Twenty Years of an African Slaver* (New York, 1854).

CANOVA, *kā-nō'vā*, ANTONIO (1757-1822). An eminent Italian sculptor, the founder of the

modern classic school. He was born at Possagno in the Province of Treviso, Nov. 1, 1757. His family had been stonecutters for generations, and his grandfather taught him the use of the chisel. The lad's talent attracted the attention of the Venetian Senator Giovanni Falieri, who procured him admission, in his fourteenth year, to the atelier of the sculptor Torretti, who was working in the neighborhood. Canova accompanied the latter to Venice, and after Torretti's death he studied with his nephew Ferrari. He also attended the Venetian Academy of Art, studying especially the nude; but found little to inspire him in the debased Rococo of the day. His progress was rapid, and at the age of 15 he executed for his patron Falieri two statues, "Orpheus" and "Eurydice." His "Dædalus and Icarus," executed in his twenty-second year, and now in the Venetian Academy, was even more famous. While still in the Baroque style, these works show originality, and a careful study of the nude. In 1779, through the influence of Falieri, he received a pension from the Venetian government, entitling him to three years' study in Rome.

He arrived there at a time when the life work of Winckelmann (q.v.) and others was bearing fruit in a new enthusiasm for classical antiquity. Through the influence of the Venetian ambassador he was introduced into literary and artistic circles, where he formed his lifelong friendship with Quatremère de Quincy (q.v.), the celebrated French archæologist and critic, who exercised great influence upon his art. He threw himself with ardor into the study of the antique, and his "Theseus Vanquishing the Minotaur" showed the fruit of these studies. Exhibited in 1782, it was epoch-making in modern sculpture, as a return from Baroque to classic art. He at once rose to the rank of the first sculptor of his day. A commission for a monument to Pope Clement XIV, in Santi Apostoli, was assigned to him, and on the successful completion of this work, in 1787, he received a commission for a like monument to Pope Clement XIII, Rezzonico, in St. Peter's, completed in 1795—one of his best works. Upon the sarcophagus is a statue of the Pope kneeling in prayer, while on the left is a rather stiff figure of "Religion," with the cross, and on the right a genius, somewhat effeminate, with the torch of life reversed. Beneath are two splendid lions, the best part of his work.

During this period Canova also executed works of quite a different kind. His famous "Cupid and Psyche" (Louvre), in which the love god, bending over, raises Psyche from the earth, although not without charm, marks what might be called a departure from the antique, because of the constrained position. More attractive is his later representation of the same subject in the Louvre, where Cupid leans confidently on Psyche's shoulder, watching a butterfly. Among his other famous works executed before 1798 are his "Venus and Adonis," in the Naples Museum, celebrated for the caressing attitude of the goddess and "Hebe Pouring Nectar" (Berlin), a charming specimen of girlish beauty, and different representations of the same subject in the Royal Palace, Munich. He usually executed several replicas of works like these, and those cited are either the original or, failing these, the best-known copy.

In order to show his ability with more virile subjects he carved colossal figures of "Hercules

Throwing Lichas into the Sea," now in Palazzo Torlonia, Rome, and of the two Greek boxers, "Creugas and Damoxenos," in the Vatican. Although deemed successful by contemporaries, the exaggerated action of these statues displeases modern critics, notwithstanding the great anatomical knowledge displayed, especially in the inverted figure of Lichas.

While the Pope was expelled from Rome in the revolution of 1798, Canova spent two years traveling in Austria and Germany with Prince Rezzonico. He returned, however, with the new Pope, and soon afterward executed his "Perseus," which was purchased by the Pope, with general applause, and placed upon the empty pedestal of the "Apollo Belvedere," after which it had been modeled, in the Vatican. In 1805 the sculptor was commissioned to execute a substitute for the "Medicean Venus," which, like the Apollo, had been taken to Paris by Napoleon. His "Venus" now stands in the Pitti Palace. The "Three Graces" (St. Petersburg) were executed in rivalry to the antique subject in Siena. Compared with the antique these works seem lacking in simplicity and sentiment; they appear artificial and sentimental, like the age of Canova. Herein lies the importance of Canova as the characteristic representative of his time. His art is a transition from the Baroque to the purer classical taste of Thorvaldsen and his successors, and his position in the development of modern sculpture is like that of David in painting. He was the first to show the way to what became one of the most important factors in modern sculpture.

Canova was three times summoned to Paris by Napoleon, in 1802, 1805, and 1810. His patriotism would not permit him to accept the Emperor's brilliant inducements to remain in Paris. He pleaded with success for the support of the arts in Italy, but could not induce the Emperor to return the extorted art treasures. He carved the well-known ideal bust of Napoleon in the Pitti Palace, and in 1812 he finished a colossal marble statue, in which, according to Roman custom, the Emperor is represented nude, as a god. The original marble is lost, but an excellent bronze cast is in the court of the Brera Palace, Milan. He also represented Napoleon's sister, Pauline Borghese, as a reclining Venus, his mother as Agrippina, the Empress Maria Louisa as Concordia. In 1815, after the fall of Napoleon, he was sent as the Pope's ambassador to Paris, to bring about the return of the art treasures taken from Rome, and it was largely owing to his skill as a diplomat that they were returned. On his return to Rome the Pope made him Marquis of Ischia, the Academy of St. Luke chose him perpetual president, and the Roman Senate inscribed his name in the Golden Book of the Capitol. During his embassy to Paris he visited London and saw the Elgin marbles, but warmly rejected Lord Elgin's proposal to restore them.

One of Canova's most celebrated works was the monument ordered, in 1798, by Albert, Prince of Sachsen-Teschen, for his wife, Marie Christina, Archduchess of Austria, but not completed till 1805, and erected in the church of the Augustines in Vienna. It consists of a marble pyramid, in front of which are two groups of figures. On the left "Virtue," attended by two beautiful maidens, and bearing the cinerary urn, strides towards the door of the pyramid, followed by "Charity," leading a blind old man.

On the right recline a lion as guardian of the tomb, and a mourning genius. The composition is more adapted to a painting or relief than to a work of sculpture, and the figures, notwithstanding their beauty, have the effect of artificiality. Among his other sepulchral monuments are that of his friend Volpato, in Santi Apostoli, Rome; of the poet Alfieri, in Santa Croce, Florence; of the last three Stuarts, in St. Peter's, Rome, and of Pius VI, a praying figure, in St. Peter's. In these works he appears at his best. Among his classical subjects are an excellent "Paris" (1807) in Munich, "Theseus and the Centaur," in Vienna, and a "Mars and Venus" in London. His famous series of antique dancers are too studied in pose to be pleasing. One of the last works which may be seen in the museum in his native town was the plaster model of George Washington, clad as an antique hero, writing his last message. He seldom treated religious subjects, and when he did he represented them as beautiful, classical figures. The best-known example is a kneeling "Magdalen" in Villa Carlotta, Cadenabbia.

Canova also executed a large number of portrait busts of the celebrities of his day, his friends, and especially of ideal women, as Laura or Beatrice. They are too lacking in individualization to be good portraits. He was unsuccessful in relief work, owing to his inability to make a good composition. As a painter he is of little importance. But in his proper field of sculpture he is one of the most prominent figures of modern times. No one has treated the surface of marble with more delicacy and more skill than he.

Canova died in Venice, Oct. 13, 1822, and was buried at Passagno in a church which he had himself erected at the cost of his earnings of a lifetime. There is also a monument to him, after his own design, in the church of the Frari, Venice, near the tomb of Titian. He was a man of lovable character, kind and charitable, especially to young and needy artists. He was inspired by a lofty patriotism, and by a touching love for his native town, to which he returned whenever possible. His house there contains a museum of his works, with the original plaster models of the most remarkable. His works were engraved by Lasinio (Pisa, 1821-25), Moses (London, 1828), and Reveil (Paris, 1825).

Bibliography. Canova's memoirs were edited by D'Este (Florence, 1864), his letters by Malamani (Città di Castello, 1890). An excellent contemporary biography of him was written by his friend, Quatremère de Quincy (Paris, 1834), with which compare the more critical *Römische Studien*, by Fernow (Zürich, 1806). Other biographies are those of his friend Cicognara (Venice, 1823); Missirini (Prato, 1827); Rosini (Pisa, 1825); Lücke, in Dohme, *Kunst und Künstler des neunzehnten Jahrhunderts* (Leipzig, 1883); Meyer, in Knackfuss, *Künstlermonographien* (Bielefeld, 1898); and Malamani (Milan, 1911), the best and most detailed account.

CÁNOVAS DEL CASTILLO, ká'nô-vás dël ká-sté'lyô, ANTONIO (1828-97). A Spanish statesman, born in Málaga, June 5, 1828. He studied philosophy and law in Madrid, entered journalism, and soon became active in politics. In 1852 he represented his native city in the Cortes as a Liberal, and two years later was appointed chargé d'affaires at Rome, where he aided in preparing the concordat between Spain and the

holy see. After being Director General of the administration from 1858 to 1861 and Undersecretary of State in the latter year, he became, in 1864, Minister of the Interior in the Mon ministry, and Minister of Finance and the Colonies in the O'Donnell ministry the next year. He prepared at the time the law for the abolition of negro slavery. He was one of the last to defend in the Cortes the Liberal principles he espoused under the reactionary sway of Narváez and González Bravo and was banished shortly before the revolution of 1868, in which he had no share. Returning to active life in 1869, as the leader of the moderate Conservatives, he opposed in the Constituent Cortes the project of a democratic constitution and was one of the leaders of the movement which placed Alfonso XII on the throne. He became President of the Council and chief of the provisional cabinet Dec. 31, 1874, and remained at the head of the Liberal-Conservative ministry (the so-called Cabinet of Conciliation). He withdrew in September, 1875, before the attacks of the extreme Conservative party. He was recalled in December of the same year and charged with the direction of the first legislative elections under the new regulations. From this time he remained Premier until 1879, when Marshal Martínez Campos returned from Cuba and took his place, retaining the principal members of the cabinet. Martínez Campos was in turn obliged to resign in December, being defeated upon certain free-trade measures, and Cánovas returned to power. His Conservative cabinet was overthrown in 1881. He was again Premier in 1884-85, in 1890-92, and again in 1895-97, alternating in office with Sagasta, the leader of the Liberals. In time his ideas became decidedly Conservative, and to the Radical element in Spain Cánovas appeared in the light of a reactionary. He was assassinated by an anarchist, the Italian Michele Angiolillo, on Aug. 8, 1897. In the preceding April he had formulated and decreed a plan to grant autonomy to Cuba. Cánovas found time, even in the stir of Spanish political life, for considerable literary activity. In 1859 he was elected a member of the Royal Academy of History of Madrid, of which he later became director, and in 1865 he entered the Spanish Royal Academy of the Language. In 1890 he was president of the *Ateneo científico, literario y artístico* of Madrid. The *Academia matritense de jurisprudencia y legislación* in 1893 elected him "académico de mérito," the highest distinction conferred by that academy. The previous year he had been its president. Cánovas was also a member of the *Real academia de bellas artes (de San Fernando)* and of the *Real academia de ciencias morales y políticas*. Although Cánovas declined to accept a title of nobility offered to him by a grateful sovereign, he did accept knighthood in many orders. Among his writings are a volume of poems (1887), *Estudios del reinado de Felipe IV* (1888); *Artes y letras* (1887); *Problemas contemporáneos*, a collection of essays on economic and social questions (1884); *Biografía de Calderón* (2 vols., 1883); and several minor pieces. He also edited the works of a number of contemporary dramatists (2 vols., 1881-86), and an important historical work, the *Historia general de España* (10 vols., 1890-97). The most extended biography is by Pons y Humbert, *Cánovas del Castillo* (Madrid, 1901). Consult also Clarín, *Cánovas y su tiempo* (Madrid, 1887).

CANROBERT, kăn'rô'bâr', FRANÇOIS CERTAIN (1809-95). A marshal of France. He was born at Saint-Céré, June 27, 1809, studied in the military school of Saint-Cyr, and in 1828 entered the army. After 1835 he served in Algeria. In the storming of Constantine he was one of the first to enter the breach. In 1849 he commanded a successful expedition against the Kabyles. As general of brigade, in 1850, he led an expedition through the rocky country of Narah and destroyed the Arab stronghold there. In January, 1853, he became a general of division. In 1854 he commanded a division in the Crimea and upon the death of Saint-Arnaud he assumed control of the French operations. In 1856 he was made marshal of France and sent to Sweden and Denmark on diplomatic missions. In 1859 he was a corps commander in the Italian campaign against Austria and took part in the battles of Magenta and Solferino. At the outbreak of the Franco-German War he was in command of the Sixth Army Corps. He was shut up in Metz with Bazaine and became a prisoner. After the war Canrobert took up political life, subsequent to his appointment to membership of the Superior Council of War. He became a member of the Senate in 1876 and was returned in 1879 and again in 1885. Consult Martin, *Le maréchal Canrobert* (Paris, 1895).

CAN'SO. A port of entry in Guysborough Co., Nova Scotia, near the cape of the same name (Map: Nova Scotia, J 3). It has important fishing interests, being the port of call for the Gloucester fishing fleet. The annual trade in fish products is valued at between \$300,000 and \$400,000. Canso is the landing place of two cables of the Western Union and five of the Commercial Cable Company. The United States is represented by a consular agent. Pop., 1901, 1,479; 1911, 1,617.

CANSO, CAPE. See CAPE CANSO.

CANSTADT, kăn'shtät (from *Cannstatt*, or *Canstatt*, a city of Württemberg, now part of Stuttgart). The name applied to a long-headed type of Quaternary man in Germany, based on a fragment of skull found among relics dug up in the year 1700 by Duke Eberhard Ludwig. Consult Mortillet, *Le préhistorique* (Paris, 1900).

CANSTEIN, kăn'shtin, KARL HILDEBRAND, BARON VON (1667-1719). The founder, by his writings and by his will, of the famous Canstein Bible Institute in Halle, Germany, for the distribution of the Scriptures at the lowest rates. Consult his life by Platte (Halle, 1861).

CAN'TAB, or **CAN'TABRIG'IAN** (ML. *Cantabrigiensis*, from *Cantabrigia*, Cambridge). One who is either a student or a graduate of the University of Cambridge, England.

CANTABILE, kăn-tä'bê-lâ (It., singable, from Lat., It. *cantare*, to sing). In music, a term which signifies in a singing or vocal manner. When placed over a passage of music, it demands an easy, flowing execution, along with a clear-cut and well-defined delivery of the chief melody, so as to bring it distinctly out against the background of the accompaniment.

CANTA'BRI (a word of Iberian origin). Mountaineers of ancient Spain. They were of Iberian origin and lived in a district comprised in the modern provinces of Oviedo (eastern part), Santander, Vizcaya, and Guipúzcoa, on the coast of the Bay of Biscay, which derived from them its name, *Oceanus Cantabricus*. Their most important town was Iuliobriga (the Roman

form of its name). The Cantabri are described as like the Scythians and the Thracians in hardihood and martial character, sleeping on the bare earth, enduring extreme pain without a murmur, and, like most savages, leaving agricultural toil to their women. Their bravery is evinced by the fact that, though the Romans first attacked them in 150 B.C., they were finally subdued only by a 10 years' contest, begun by Augustus and concluded by Agrippa (29-19 B.C.). Tiberius afterward stationed garrisons in their towns, but some of them, retreating into their fastnesses among the mountains, preserved their independence. Some count them the ancestors of the Basque race.

CANTA'BRIA. The name anciently applied to a district of Spain, on the south coast of the Bay of Biscay, the home of the Cantabri (q.v.).

CANTA'BRIAN MOUNTAINS. A range of mountains extending for a distance of over 300 miles through northern Spain near the shores of the Bay of Biscay, from the west end of the Pyrenees to Cape Finisterre (Map: Spain, C 1). Less than 30 miles wide in the east in the Basque Provinces, the range broadens out towards the west and breaks up into a number of ranges, which, with their foothills, cover the whole northwest corner of the Iberian Peninsula; at the east the main range is less than 30 miles from the coast, but this increases to about 70 miles at the west. Extreme elevations of over 5000 feet in the eastern part increase to nearly 8800 feet near the centre (Peña de Cerredo, 2678 meters); but farther west the elevations decrease from 6000 and 7000 feet in Asturias to 3000 to 4000 feet in Galicia, and rapidly diminish towards the west coast. In general, the northern and western sides are steep, forming a bold seacoast, with promontories interrupted by short narrow sections of flat coast, but on the south and east the slope is more gradual, and the descent relatively slight to the great Castilian plateau. Different portions of the Cantabrian Mountains have local names. These mountains are very rich in coal and iron.

CANTABRIAN SEA. See BISCAY, BAY OF.

CANTABRIG'IA. See CAMBRIDGE.

CANTACUZE'NUS (Med. Gk. *Καντακούζη-νος*, *Kantakouzēnos*), JOHN VI (c.1292-c.1380). A Byzantine Emperor and historian, born in Constantinople. Under Andronicus III (1328-41), he had principal charge of the government, and when Andronicus died he was left Regent, the successor being John Palæologus, then only nine years old. The Empress was suspicious and finally, during his temporary absence from Constantinople, confiscated his property and imprisoned some of his family; this was in 1341, and Cantacuzenus immediately revolted and proclaimed himself Emperor. Six years of civil war followed, in which the rivals employed foreign mercenaries and nearly ruined the Empire. In 1347 Cantacuzenus entered Constantinople and became joint Emperor with John Palæologus, but monopolized the royal power. He governed the Empire until 1354, when John, aided by a popular revolt, overcame him. Cantacuzenus abdicated and entered a monastery, where he wrote his Memoirs, which cover the history of the period from 1320 to 1357 and are published in the collections of Byzantine historians. He strove during his regency and reign earnestly but unsuccessfully to preserve the Empire from further decline. One of his

daughters was married to the Sultan Orchan, the son of Othman; another to the Emperor John Palæologus. Consult Pears, *Destruction of the Greek Empire* (London, 1903).

CANTAL, kăn'tál'. A central department of France, formed out of the southern portion of the old Province of Auvergne (Map: France, S., C 3). Area, 2217 square miles. Principal rivers are the Alagnon, Truyère, and the Lot. Pop., 1896, 234,382; 1901, 230,511; 1906, 228,690; 1911, 223,361. Almost the whole area consists of the remains of an extinct volcano, intersected by gorges and diversified by peaks, the highest of which are the Plomb de Cantal (6095 feet) and the Puy Mary (5850 feet); the general level is 3000 feet above the sea. Cattle raising is the chief industry, only about one-quarter of the department yielding arable land, the rest being covered with volcano ash. Coal exists in the northwest and near Mauriac, and marble is quarried. Capital, Aurillac.

CANTAL'IAN. A culture epoch in the assumed eolithic period of man. See MAN, ANTIQUITY OF.

CAN'TALOUPE. A variety of muskmelon (q.v.).

CANTANI, kăn-tä'né, ARNOLDO (1837-93). An Italian physician, born in Hainsbach, Bohemia, and educated in Prague. In 1864 he became professor of pharmacology and toxicology in Pavia, in 1867 director of the Clinical Institute of Medicine in Milan, and in 1868 professor in Naples. His investigations were devoted chiefly to such diseases as malaria, cholera, typhoid, tuberculosis, and diabetes. His efforts in behalf of the introduction of German medical methods into Italy were especially commendable. Among his principal publications are the following: *Manuale di materia medica e terapeutica* (2 vols., 1865-77), and *Manuale di farmacologia clinica* (5 vols., 2d ed., Milan, 1885-90).

CANTATA, kăn-tä'tà (It., song, from Lat., It. *cantare*, to sing). In music, the name of a vocal composition of either a sacred or a secular character, for solo voices, ensembles, and chorus, with instrumental accompaniment. The sacred cantata differs from the oratorio in that it is less subjective, the solos representing individuals from a community or a congregation. The secular cantata differs from opera in the absence of stage accessories, and in this respect the name "lyric scene" is perhaps more appropriate. In mere matter of length the cantata is usually much shorter than the opera or the oratorio.

CANTEEN' (Fr. *cantine*, from It. *cantina*, cellar), MILITARY. A place of refreshment, set apart in every army post, wherever practicable, for the use of the rank and file of the troops stationed there. In the United States, the word *canteen* has been replaced officially by the term *post exchange*, an institution intended to combine the advantages of a gymnasium and reading and recreation rooms. There are also in the post exchange coöperative stores and restaurants, including lunch counters, where are sold nonintoxicants and tobacco. The primary purpose of the entire undertaking is to furnish the troops, at reasonable prices, with articles of ordinary use, wear, and consumption not supplied by the government and to afford them means of rational recreation and amusement. When the exchange is free from debt, the net profits are distributed among the various organizations stationed at the post, for the maintenance of athletic teams, improvement of

the company messes, and for other authorized necessities and amusements. Previous to 1901, when the sale of intoxicants was abolished, the canteen was permitted to sell beer and wine to the troops, the sale of spirits being, however, prohibited. This department was for the advantage of men confined by their duties to the post, or those not desiring to go outside. Strict regulations were made and enforced against possible abuses of the privilege; the beverages sold were generally the best procurable, and retailed to the soldier at the lowest possible price. As a result of public pressure, however, the sale of beer and wines was formally abolished by Act of Congress in 1901. There has been much controversy regarding this side of the post exchange, the majority of army officers being strongly in favor of the sale of beer and light wines, and the several national temperance societies as strongly against it. See POST EXCHANGE.

In England there is a canteen established in every post, barrack, and standing camp; in the latter instance each regiment stationed in the garrison or camp has its own regimental canteen, while there is in addition a separate establishment known as the garrison canteen. The canteen is divided into two parts—the wet canteen, where ale, porter, and mineral water are on sale; and the dry canteen, at which groceries may be purchased. A separate institution is installed in all permanent barracks, known as the "recreation rooms." This also is a regimental institution and generally contains pool and billiard tables, material and accommodations for the playing of cards, chess, dominoes, and similar games, for which no charge is made. There is a room in the same building set apart for library and reading room. In garrisons and standing camps there is a permanent library of considerable size, supplied with standard and current literature. British soldiers are allowed three-quarters of a pound of beef and one pound of bread per diem. This is the regular government ration; all other food is purchased by the soldier, for which an average allowance of three-pence halfpenny is deducted from his pay, the scale of pay being so arranged as to cover this deduction. The value of this system to the soldier is that it gives him so much increase of pay when away from his mess or regiment. All groceries are to be purchased from the dry canteen and are retailed to the different company messes at the lowest possible rate. Individual soldiers may also purchase foods and groceries in small quantities from the dry canteen, and cooked meals or goods from the regimental café or restaurant attached to the recreation rooms. The wet canteen is for the exclusive use of private soldiers; neither wines nor spirits are permitted to be sold, nor are men allowed to have credit with the steward, as they usually are in the dry canteen and invariably in the restaurant. A noncommissioned officer is always on duty, to maintain order and prevent the admission of men denied its privileges. Corporals have their separate canteen, and sergeants their own mess, military discipline not permitting the intermingling of the rank and file. All moneys over and above the expenses and working capital are divided among the various regimental organizations and funds.

The canteen as an article of equipment varies in the different armies. In the United States, as in most of the armies of continental Europe,

it is a metal, leather, or wooden flask or bottle, having an average capacity of two pints, in which the soldier carries his liquid refreshment on the march, in which case it is carried slung by a strap over the shoulder. In the British army such a vessel is called a water bottle, while the canteen is a combination of pan, dish, and plate, constructed of tin, covered, when not in use, with a thin leather material, and carried, on the march, strapped to the valise (knapsack), pack, or waistbelt, according to the order in which the men are equipped.

CANTEMIR, kăn'tye-mēr'. See **KANTEMIR**.

CANTERAC, kăn'tâ-râk', José (c.1775-1835).

A Spanish general. In 1818 he went to Peru, in command of a detachment sent to assist in quelling the revolt there. With General La Serna he fought several campaigns in Upper Peru. He was a member of the cabal which in 1821 obtained the deposition of Pezuela from the viceroyalty and the appointment of La Serna to that office. As lieutenant general and commander in chief of the Royalist forces, his splendid activities and successive victories for several years maintained the authority of Spain over the insurgents and over the whole territory known as Peru; but in August, 1824, he was utterly defeated by Bolívar at the Plain of Junin. He was subsequently in command of the reserves at the final battle of Ayacucho (Dec. 9, 1824). After his return to Spain he was appointed, on Jan. 15, 1835, captain general of New Castile. Three days later some of the troops in Madrid mutinied. Canterac presented himself alone before them in an attempt to quell the mutiny and was shot down. As a brave and efficient soldier and officer he won many decorations for gallantry under fire and was rewarded with knighthood in the orders of San Fernando and of San Hermenegildo, and the Grand Cross in that of San Fernando. He was not much in sympathy with liberal or progressive ideas, however, and the people knew it, as may be judged by the popular phrase during the lifetime of Ferdinand VII: "Who are the enemies of Liberty? Ferdinand VII, La Serna, and Canterac."

CANTERBURY, kăn'tēr-bēr'i (AS. *Cantwara-burh*, burg of the Kents, from *Cantwara*, gen. pl. of *Cantwar*, Kentish. man + *burh*, town). A municipal and parliamentary borough, civic county, and cathedral city in Kent, England, on the river Stour, 56 miles east-southeast of London, on the highroad from London to Dover (Map: England, H 5). It is the archiepiscopal see of the Primate of All England, the succession of archbishops beginning with St. Augustine in 597 and reaching the ninety-sixth incumbent of the see in Randall Thomas Davidson. The city, traversed by two main branches of the river, stands on an undulating plain between hills of moderate height. It dates from the early period of English history and retains many of the aspects of an old town, High Street containing several mediæval houses with gabled ends and projecting fronts. One of the gates and some remains of the ancient city wall still exist, and near the wall is an artificial mound, 80 feet high, known as the Dane John (probably Donjon), from the summit of which a fine view of the country around is obtained. Connected with this mound is a public garden, laid out in the end of the eighteenth century. The ruins of a Norman castle also stand near the city wall.

Christchurch Cathedral, the crowning architectural feature of Canterbury, occupies almost

the central point of the city. It stands amid its own precincts, to which admission is obtained through a beautiful gate of Perpendicular architecture erected in 1517. The cathedral is a magnificent building, 545 feet long and 156 feet broad at the eastern transepts. It presents, both externally and internally, examples of all the English mediæval styles from the Norman to the Perpendicular Gothic inclusive. The noble proportions of its nave, choir, corona, its lofty central tower, its double set of transepts, and its northwest and southwest towers are particularly impressive, as viewed from the entrance gateway.

When St. Augustine became Archbishop of Canterbury (about 600), he consecrated, under the name of Christ's Church, Queen Bertha's Church on St. Martin's Hill, which had been formerly used by Roman Christians. Upon a site a mile or so to the westward, another ancient church, replaced by a later edifice several times rebuilt or altered, was the first germ of the present edifice. The authentic history of this cathedral begins with the Norman conquest. Lanfranc, the first Norman Archbishop, erected a splendid church, of which the east end was rebuilt and enlarged by his successor, Anselm (1093), but was destroyed by fire in 1174. Its reconstruction was begun by William of Sens, and completed, with the round chapel called Becket's Crown, by William "the Englishman" after the death of William of Sens in 1178. In this new structure, comprising the choir, Trinity Chapel, and Becket's Crown, the transition to Early Gothic forms is clearly traced, with an interesting mixture of English and French details and of round and pointed arches. Lanfranc's Norman nave remained, though in a very ruinous state, intact until 1378, when, under Archbishop Sudbury and Prior Chillenden, its demolition was begun, and the present noble nave and transepts were erected, upon the old foundations, in a style foreshadowing the Perpendicular, with a richly ribbed lierne vault.

The church was rich in relics. Plegemund had brought hither the body of the martyr Blasius from Rome; there were the relics of St. Wilfred, St. Dunstan, and St. Elfege; while the murder of Thomas à Becket (q.v.) added a still more popular name to the list of martyrs. The offerings at these shrines, especially the last, contributed greatly to defray the expenses of the reconstruction under William of Sens, who did not, however, live to see its completion, dying from injuries received through a fall from the clerestory. The cathedral as reconstructed thus in the twelfth and fourteenth centuries was further embellished by the addition of the central tower (called the Angel Steeple), which was carried up (1486-1504) to about double its original height, also in the Perpendicular style; it is 234 feet high and 35 feet in diameter. The northwest tower, taken down in 1834, was replaced by the existing one to match its southwest neighbor; the old tower was 113 feet high and divided into five stories. The Norman plinth still remains on each side of the nave, in the side aisle, and portions of Norman ashlar may still be seen about the transepts outside the west wall, and on the eastern piers of the great tower. The Lady Chapel (now called the Dean's Chapel), with its beautiful fan-vaulted roof, stands on the north side of the church and was built in 1368. The northeast transept,

CANTERBURY CATHEDRAL

where Becket was murdered on Tuesday, Dec. 29, 1170, is called the Martyrdom. Fifty years later his remains were removed from the crypt to a shrine in the newly erected Trinity Chapel, eastward of the choir. About the year 1500 the yearly offerings at this shrine amounted to \$20,000; but they had then declined much in value. A mosaic pavement still remains in front of the place where the shrine stood, and the stone steps which lead up to it are worn by the knees of countless pilgrims; but during the Reformation period the shrine itself was demolished (1538) by Henry VIII's commissioners; and, according to tradition, the saint's remains were burned. In 1643 the building was further "purified," as it was called, by order of Parliament. Still many interesting monuments remain, such as the tomb of Stephen Langton; that which is commonly, but wrongly, supposed to be the tomb of Archbishop Theobald; with those of the Black Prince, of Henry IV, of various archbishops, and of Cardinal Pole. The crypt is of greater extent and loftier than any other in England, owing to the choir being raised by numerous steps at the east end. Here, in 1888, a stone coffin containing the remains of a skeleton, supposed to be Becket's, was discovered and reinterred. In 1561 a portion of this crypt was given up by Elizabeth to a congregation of French and Flemish Protestant refugees, and a French service is still held here. In 1872 the church narrowly escaped destruction for the fourth time by fire. Other buildings of the cathedral establishment include the deanery, the chapter house, the treasury, the cloisters, and the baptistery; while remains of the archiepiscopal palace, the prior's house, the dormitory, and hostelries of different grades are also seen in the precincts. Many of these were parts of the Norman monastic buildings; among them is the much admired exterior Norman stairway in the Green Court. The chapter house is of a type unusual in England; it is a stately hall, 90 by 35 feet, in Early Perpendicular style, dating from Chillenden's time.

Canterbury also contains a number of ancient churches, mostly built of rough flint, and other ecclesiastical buildings of considerable historical importance. The church of St. Martin is believed to date from pre-Saxon times, and in it King Ethelbert is said to have been baptized by St. Augustine. Near by is the Benedictine Abbey of St. Augustine, which has been restored and added to, and is now occupied as a missionary college in connection with the Anglican church. The church of St. Dunstan contains the burial vault of the Roper family, in which the head of Sir Thomas More is said to have been placed by his daughter. The secular buildings of interest are the guildhall, containing a collection of ancient arms, the corn exchange, military barracks for cavalry and infantry; the keep of the old castle, now utilized for gas works; King's School, founded, according to tradition, in the seventh century, and remodeled under Henry VIII; St. John's Hospital, founded by Archbishop Lanfranc; and, in the Chequers Inn, scanty traces of the original hostelry of the pilgrims in Chaucer's *Canterbury Tales*, the "dormitory of the hundred beds" having been destroyed by fire in 1865. Besides the two schools already mentioned, the educational institutions include the Simon Langton Schools, opened in 1882; the Clergy Orphan School, a mile outside the city; and a museum and art school.

The city carries on a considerable trade in hops and corn, has important malting and brewing establishments, and a specialty in the manufacture of brawn. The manufacture of silks, formerly a thriving industry, has been replaced by manufactures of damask linen and worsteds. The economic branch of Canterbury's history is interesting. The city returns one member to Parliament and is governed by a mayor, aldermen, and councilors. The civic spirit has always been distinguished by a combative tenaciousness for its rights and by progressiveness. The city owns real estate, markets, and electric power and lighting works, operated by the heat of a destructor, which consumes the city refuse; it provides technical instruction and maintains a museum, school of art, cemetery, and an irrigation farm, where the city sewage is deposited, chemically treated, and manufactured into manure and sold for fertilizing purposes.

Canterbury, the Roman *Durovernum*, was built on a ford of the river Stour, at the point where roads from the three fortified Roman ports—Dover, Lynne, and Richborough—joined the great Roman highway through Britain, later known as Watling Street. It subsequently became the Saxon *Cantwaraburh* ('burgh of the men of Kent'), the capital of that southeastern kingdom, and the centre from which England was Christianized. The Danes, in the ninth, tenth, and eleventh centuries, often ravaged and burned the city. After the murder and canonization of Thomas à Becket, Canterbury became of considerable importance as a place of pilgrimage. The poet Chaucer, who died in 1400, has furnished interesting contemporary accounts of these religious excursions in his *Canterbury Tales*. In 1215, during his invasion of England, Louis, Prince of France, took the castle. In 1381 Tyler's Rebellion (q.v.) originated in Canterbury. In 1538 the cathedral and other ecclesiastical institutions underwent extensive spoliation at the command of Henry VIII and later suffered from fresh exactions levied by Edward VI. During the Civil War Canterbury was the scene of exciting struggles between the Royalists and the victorious Parliamentarians, at whose hands the cathedral sustained considerable mutilation. Pop., 1901, 24,900; 1911, 24,628. Consult: Willis, *Architectural History of Canterbury Cathedral* (2 vols., London, 1845-69); Hook, *Lives of the Archbishops of Canterbury* (12 vols., ib., 1860-76); Brent, *Canterbury in the Olden Time* (ib., 1879); Jenkins, *Diocesan History of Canterbury* (ib., 1880); Stanley, *Canterbury Cathedral* (Philadelphia, 1895); White, *Canterbury Cathedral* (London, 1896); Evans and Goldney, *Canterbury* (Dover, 1899); id., "Canterbury as a Civic Centre," in *Municipal Journal*, vol. viii (London, 1899); Snow, "English History in Canterbury Cathedral," in *Canadian Magazine*, vol. xiv (Toronto, 1900). CAN'TERBURY. A provincial district of about 14,040 square miles, on the east coast of South Island, New Zealand, with Christchurch (q.v.) as its capital and Lyttelton (q.v.) as its port (Map: New Zealand, C 4). Pop., 1901, 143,040; 1911 (excluding Maoris), 173,185.

CAN'TERBURY, THOMAS RANDALL DAVIDSON, ARCHBISHOP OF. See DAVIDSON.

CAN'TERBURY BELLS. A name given to *Campanula medium*, a biennial plant growing to a height of 1 to 4 feet. The stems are erect,

very leafy, and the corolla is large, bell-shaped, and inflated. A variety, *calycanthema*, which is extensively cultivated, has its calyx colored like the corolla and is commonly known as cup-and-saucer, from the shape of the flower. Double-flowered forms are common, in which several cups are formed within one another. The Canterbury bells are among the most extensively cultivated of all the campanulas (q.v.).

CANTERBURY COLLEGE. See OXFORD UNIVERSITY.

CANTERBURY TALES. See CHAUCER.

CANTHAREL'LUS. See FUNGI, EDIBLE.

CANTHARIDES. See BLISTER BEETLE.

CANTHARUS. A kind of vase (q.v.) used in ancient times.

CANTICLES, kăn'ti-k'lz (Lat. *canticulum*, little song, from *canere*, to sing. The name of the book is in Lat. *canticum canticorum*, song of songs, Gk. ᾠμα ἀσματων, *asma asmatōn*, Heb. *shir hashshirim*). One of the books in the Hebrew canon. There is no reference to it in the Old Testament, the Deutero-Canonical books of the Old Testament, Philo, Josephus, or the New Testament. The age of the Greek version is unknown, but it cannot well be later than the first century A.D. The book is first mentioned in the Mishna (edited about 200 A.D.). At the assembly of Jamnia (about 100 A.D.) the rabbis are said to have been of different opinion as to its canonicity, some holding that it was not a sacred book, rendering the hands unclean so that they must be washed after contact with it (see BIBLE, *Canon*), while others strongly maintained its religious value, among these particularly R. Akiba, *Yadayim*, iii, 5, *Eduyoth*, v, 3. This scholar denounced the men who would sing the songs of Canticles in wine houses, *Tosephta Sanh*, xii. It is evident that the allegorical as well as the literal interpretation was in vogue in the first century A.D. Probably the ascription of Canticles to Solomon, the philosopher par excellence, caused the conviction that it must have a profound significance; and the allegorical method of the day led men to find in it a description of Yahwe's love for His people Israel. This interpretation passed from the synagogue to the Church, with the modification that the bridegroom became Christ and the bride either the Church or the individual soul. Origen understood the poem very much as Akiba had, and Cocceius found in it the history of the Church down to the Synod of Dort in 1618 A.D., just as the Targunist had found the history of Israel down to the exile of 586 B.C. Some adherents of this allegorical interpretation, such as Vatablé, Bossuet, and Lowth, assumed a double sense, a description of earthly love at the same time intended to be typical of spiritual love. In defense of this view, it has been argued that the poem may have precisely the mystical sense that has been claimed for the love songs of Hafiz and Jayadeva's *Gitagovinda*. It is not altogether inconceivable that a work which has furnished so rich nourishment to Christian mysticism itself may be the product of a similar Jewish mysticism. But where the mystical tendency and the allegorical method were most in evidence, in Philo's works, there is no trace of Canticles or anything like it. At the present time there is a practical agreement among scholars that the love depicted is solely that of man and woman.

The first Christian interpreter who discarded

all allegorizing was Theodore of Mopsuestia (died 429). For this he was condemned in 551. Luther, curiously enough, looked upon Canticles as a political allegory teaching obedience to civil authority. The secular character of the poem was fully recognized by Sébastien Chateillon (1544). For this offense he was driven out of Geneva by Calvin. Luis de Leon (died 1591) was incarcerated by the Inquisition five years for suggesting in his Latin translation a similar view. Hugo Grotius, somewhat cautiously, and Jean le Clerc, more decidedly, maintained that earthly love was depicted in the song. Observing what he deemed the immorality of some of the lyrics, J. D. Michaelis threw the book out of the canon, and J. S. Semler likewise questioned its canonicity. The conception of canonical authority prevalent in their time has now been generally abandoned; and the highly spiced descriptions of sexual passion have been justified, first by the supposed purpose of the author to protest against Solomon's harem life, and then by the assumption that wedded life is portrayed.

But is this poem of earthly love a drama or a mere collection of lyrics? And is the love described that of husband and wife, or of men and women who follow the promptings of passion regardless of social conventions? Already Origen says of Canticles, "Dramatis in modum mihi videtur." Cornelius a Lapide (Van den Steen, died 1637) divided the poem into five acts. Attempts at dramatic construction were made by Laurentius Petrus (1640), Hermann von der Hardt (before 1706), and an anonymous Breslau pastor (1720). Lowth (1753) regarded it as an imperfect drama lacking a regular plot. G. Wachter (1722) and J. F. Jacobi (1771) sought to indicate a plot. While the former made Solomon and the Shulamite the chief characters, the latter discovered in addition a shepherd lover. Delitzsch (1851-75) gave the classical expression to what has been called the "king theory," while the "shepherd theory" was especially developed by Velthusen (1786), Stäudlin (1792), and Ewald (1826, 1839, 1842). Through Ewald, this theory became widely accepted. Böttcher (1850) even more decidedly made the poem a modern operetta enacted on the stage. Hitzig (1855) discovered Solomon's wife, and Stickel (1888) was able to find two shepherds and two shepherdesses. The latest critic who has accepted this view is Duhm (1902). He regards Canticles as an operetta resembling the mediæval miracle plays, and divides it into 20 lyricodramatic passages. The plot is simple; true love wins the day over all the efforts of Solomon to part the lovers and make the maid of Sharon his favorite wife. The songs are sung partly by individuals, such as the Shulamite, Solomon, and the shepherd, partly by choruses of harem ladies, women of Zion, bridesmaids, and kinsfolk. Several objections have been urged against this theory. The ancient Hebrews possessed no theatre, and the Semitic race has produced no great dramatic genius; there is no intelligible plot in Canticles; there is a lack of verisimilitude in the King's character and behavior; there is something absurd in the idea that the heroine's answers to Solomon are in reality addresses to her absent lover; and the necessity of putting the Shulamite to sleep on the stage, to dream through entire scenes, is not less embarrassing.

Bossuet (1693) and Lowth thought that Canticles might have been written for a royal

wedding, and divided it into sections corresponding to the days of the feast. Renan (1860) made the important suggestion that it may be the libretto of a simple play performed privately at some rural wedding, where the singers took the parts of Solomon's guards, ladies of Jerusalem, and others. To this view he was led by the accounts of Schefer of such performances seen by him at Damietta and in Syria. Similar observations made by Wetzstein in the neighborhood of Damascus caused this scholar to think that Canticles is not a drama, but a collection of wedding songs, intended to set a standard of decency and good taste for wedding poets to follow. Certain features of the Syrian wedding, such as the bridal couple playing king and queen, the sword dance of the bride, and the *wasf* or song in praise of the bride, particularly impressed him (1873). Wetzstein's view was accepted by Stade (1887), and particularly elaborated by Budde (1894-98), Siegfried (1898), and Cheyne (1899), who strongly emphasize that the poems throughout describe wedded love. This theory, though more probable than the earlier views, is not wholly free from objection. It is difficult to see how a natural exegesis can find wedded love described in scenes that present the husband *ex hypothesi* as knocking at his wife's window and being refused admittance on the ground that she is not dressed, or the heroine as roaming through the streets of the city at midnight in search of him, or expressing a wish that he were her brother that she might kiss him without being reproved. The necessity of resorting to dreams is again suspicious.

The conception of Canticles as an anthology of love songs, idyls, eclogues, or madrigals was entertained by Luis de Leon (1569), René Rapin (1659), Charles Cotin (1662-63), Richard Simon (1678), Jean le Clerc (1685), and Claude Genest (1707). It was given special prominence through Herder (1778) and was accepted by Eichborn, Goethe, De Wette, Döpke, Magnus, Diestel, and Reuss (1879), who has treated Canticles from this point of view with much delicacy and insight, calling attention especially to the poet's peculiar manner of making the woman with whom he is in love the speaker by preference. Haupt (1907) adopted this view and threw much light on the meaning of obscure phrases, but deemed it necessary to assume transpositions on so large a scale that the result is an arrangement of the material into a new series of canticles. Schmidt (1911) regards the book as a *florilegium*, or anthology, of love lyrics, some eclogues, others madrigals, some composed originally for weddings, others written by the chief poet, after the fashion of the *Anthologia Palatina*, and possibly under the influence of Meleager, and in his division of the songs into 19 canticles and metrical translation, finds no difficulty in preserving the order of the Hebrew text.

A wholly satisfactory hypothesis must recognize the element of truth in each of these theories. There is, indeed, in Canticles a use of metaphor amounting at times to allegory. He who thinks that by gardens, fountains, trees, fruits, and wine these objects in nature are always meant, will not understand the songs. There is now and then an unmistakable *double entendre*, though to seek for one in every phrase is wholly unwarranted. To convert every innocent and delicate description of natural scenery

into an allusion to things sexual is to introduce a new allegorical method scarcely to be preferred to any of its predecessors. The love of the King and of the Shulamite is unquestionably of the same character. Yet there are, beyond a doubt, rustic lovers in the poem. It seems probable that here and there the poet has used language familiar from the marriage festivals where country folk were playing king and queen, bodyguard and harem during the wedding week. The dialogue gives the impression of an attempt to create a drama, but the monologue is more characteristic of the songs; and there is no movement, no action, no plot, no unity. As already Richard Simon (1678), and after him Herder, recognized, the songs do not all come from the same source. They do not describe the love of a married couple.

It is now generally acknowledged that Solomon cannot have been the author of Canticles. The language itself, with its Neo-Hebraisms, Aramaisms, and Persian and Greek loan words, indicates with sufficient clearness that the book is one of the latest in the Hebrew canon. Graetz regarded the author as dependent upon Theocritus (third century B.C.). Cheyne also thinks of the reign of one of the earlier Ptolemies. Siegfried is willing to go into the second century. Winckler has suggested that the book was written by a Jew in Damascus in the period of the Nabataean kings. There is indeed much that points to the trans-Jordanic region and particularly to the Decapolis. It is of no small significance that it is among the Greek lyric poets of the Decapolis that we find the first impassioned expression of a sense of beauty in nature. The reign of Aretas III or Aretas IV (c.85-63 B.C.) is, perhaps, the most probable date. Together with a strong emphasis upon the divine rights of passion, the supreme value of pure attachment between man and woman, it is the keen sense of beauty in nature that will always give to Canticles a distinguished place in ancient Hebrew literature. Consult: Herder, *Das Lied der Lieder* (Berlin, 1875); Ewald, *Dichter des alten Bundes* (Göttingen, 1839); Delitzsch, *Hoheslied und Koheleth* (Leipzig, 1875); Renan, *Le cantique des cantiques* (Paris, 1860); Siegfried, *Prediger und Hoheslied* (Leipzig, 1898); Duhm in *Encyclopædia Biblica* (1899); Reuss, *Le cantique des cantiques* (1879); A. Harper, *Song of Solomon* (1902); Margoliouth, *Song of Solomon* (1902); Paul Haupt, "Book of Canticles" in *Am. Journal of Semitic Languages* (1902); id., *Biblische Liebeslieder* (1907); Scholz, *Kommentar über das Hoheslied* (1904); E. C. Martin, *Song of Songs* (1908); W. Zapletal, *Song of Solomon* (1907); J. Hontheim, *Song of Solomon* (1908); N. Schmidt, in *Messages of the Poets* (1911), where there is a very extensive bibliography.

CAN'TILEVER (probably Lat. *quanta libra*, of what weight, from *quanta*, abl. fem. sing. of *quantus*, how much + *libra*, weight. The word may possibly be derived from Eng. *cant*, angle, and *lever*). The part of a beam or girder which projects bracketwise beyond the point of support, as the brackets supporting a balcony or the projecting girders which carry a sidewalk outside of the trusses of a bridge. In bridges a cantilever is a girder or truss anchored to a shore abutment and resting on a second outshore pier or tower beyond which it projects. Two such cantilevers extending out from the opposite shores of a stream and united by a truss consti-

tute a cantilever bridge. For examples of such structures, see BRIDGE.

CAN'TILLON, RICHARD (?1680-1734). An Irish merchant and economist. Little is known of his life beyond the fact that after spending his youth in trade in London he removed to Polycon, Paris, and organized a bank. His economic contributions are contained in a work published first in 1755 in French translation, under the title *Essai sur la nature de commerce en général*. This essay exerted a deep influence upon Mirabeau, Quesnay, and Turgot, and also upon Adam Smith. Its keen analysis of the principles of production, of value, and of distribution led W. S. Jevons to the conclusion that political economy as a science originated in Cantillon.

CANTIRE, kǎn'tír', or **KINTYRE**. A peninsula in Argyllshire, Scotland, 43 miles long, with an average width of 6½ miles (Map: Scotland, C 4). It extends north and south between Arran Isle and the Atlantic, and is united at the north end with the mainland by the isthmus of Tarbet, a mile broad, across which the cutting of a canal is contemplated. The southwest point, the Mull of Kintyre, Ptolemy's *Epidium Promontorium*, is crowned by a lighthouse 297 feet above sea level, visible for a distance of 24 miles. Consult White, *Archaeological Sketches in Scotland (Kintyre)* (London, 1873).

CAN'TON', *Fr. pron.* kǎn'tôn' (Fr., from ML. *canto*, *cantonum*, ultimately probably from Gk. *κάνθος*, *kanthos*, felly of a wheel). A political division varying in importance in different states. In Switzerland the cantons are legislative and administrative units, analogous in position with the several commonwealths of the United States. In France the canton is a judicial district, comprising, as a general rule, a number of communes, but constituting in the case of very large cities only a part of such commune.

CANTON in heraldry is a corner of the escutcheon cut off by straight lines in the dexter or sinister chief.

CANTON' (Chinese *Kuang-chou-fu*, or *Sheng-cheng*). One of the chief commercial cities of China, capital of the Province of Kuang-tung and residence of the viceroy or Tsung-tu, so called under the Manchu government, for the two provinces of Kuang-tung and Kuang-si. It is situated on the Chu-kiang, or Pearl River, about 70 miles from the sea, in lat. 23° 7' 10" N. and long. 113° 14' 30" E. The climate is hot, but not unhealthful for Europeans. Canton consists of the city proper and the suburbs extending along both sides of the river. There is also a large population living in boats on the river. The city proper is about 6 miles in circumference and is encircled by a brick wall laid on granite and sandstone foundations and measuring about 30 feet in thickness and from 25 to 40 feet in height. An inner wall divides the inclosed area into the new and the old city. The streets are long, narrow, and clean in comparison with the streets in most of the Chinese cities. The houses are mostly low, very few above two stories in height, and built of brick, stone, or wood. The pagodas are numerous and extensive; one of them, situated on the island of Honan on the opposite shore of the river, covering an area of seven acres. There is also a Mohammedan mosque dating from the ninth century. Among other interesting buildings are the Examination Hall, the arsenal, and the mint. There are a Gothic cathedral erected by the French mission; a hospital, founded in 1835 by

the American mission; and an ancient foundling asylum.

Canton is one of the principal seats of the Chinese silk industry; it also produces cotton goods, embroideries, paper, tea, and metal ware. A peculiar kind of porcelain, covered with golden and greenish patterns, known as Canton ware, is made in the factories of Kiang-si and merely painted in Canton. Owing to its advantageous position, Canton very early attracted the attention of foreign merchants. The Arabs traded there as early as the ninth century. The first attempt by European Powers to open commercial relations with Canton was made in 1517, when a Portuguese mission was sent to Peking with such an object in view. The Dutch began to trade with the city later in the century, but were soon superseded by the British, who after several unsuccessful attempts established a factory in Canton in 1684, when the entire foreign trade of China was confined to that city. From 1684 to 1834 the Chinese trade with Great Britain was a monopoly of the East India Company, when the British trade with China was confined to a few "hong" merchants, who acted as intermediaries in all matters affecting the government and aliens. The aversion of the natives to foreigners, coupled with the interference of the Chinese government with the importation of opium (amounting, in 1837, to 30,000 chests), brought about a declaration of war by Great Britain in 1839. In 1841 the Bogue forts, guarding the approach to Canton, were reduced by the British, and the occupation of the city itself was averted only by the payment of a ransom of \$6,087,500. The conclusion of the Treaty of Nanking in 1842 and the subsequent opening of new treaty ports had a detrimental effect on the commerce of Canton. Fresh outbreaks on the part of the natives in 1856 were followed by the military occupation of the city by French and British troops from 1857 to 1861, since when Canton has been practically open to foreign trade and residence.

The commercial relations of the United States with Canton and China date from 1784. The exportation of cotton from the United States to Canton began in the last decade of the eighteenth century, and the product has since become one of the chief exports from the United States to China. The chief exports from Canton are tea, silk, matting, firecrackers, oils, paper, and preserves. The chief imports are cotton and cotton goods, woolen and metal goods, petroleum, etc. Opium, which still figures among the principal staples, is liable to fluctuate according to the success of government prohibition with the population, counteracted by occasional revolutionary outbreaks. The direct foreign imports and exports of Canton in 1912 were \$19,089,000 and \$30,959,000 respectively. The total trade in 1912 amounted to approximately \$71,166,000. The harbor is shallow. Large vessels are obliged to discharge their cargoes at Whampoa, over 10 miles below Canton, from which place they are brought to the city by lighters and steam launches. The annual shipping of Canton amounts nearly to 5,000,000 tons, of which nearly three-fourths is in British bottoms. Canton has steam communication with Hongkong, Macao, and Shanghai, and practically every commodity brought into Canton from Europe and America passes through Hongkong. Estimates of the population vary greatly; one made in consular reports in 1909 placed it at 1,250,000, which is

probably too high. Canton is the principal port in the south of China and has during recent years been the seat of revolutionary movements, first against the dispossessed Imperial government and then against the present republic. Trade has suffered under the disturbances following these rebellions, but not in so high a degree as one might have expected. Since 1911 a scheme of opening near Macao a free port resembling the one at Kiaochow has been under discussion. This might become a rival to Hongkong, though it does not seem to afford harbor accommodations comparable to those of the British colony.

CANTON. A town in Hartford Co., Conn., including the village of Canton, Canton Centre, North Canton, and Collinsville, 15 miles (direct) northwest of Hartford, on the Central New England Railroad, and on Farmington River (Map: Connecticut, D 2). The chief industries are the bottling of plain and carbonated waters and the manufacture of edge tools. Pop., 1900, 2678; 1910, 2732.

CANTON. A city in Fulton Co., Ill., 28 miles west of Peoria, on the Toledo, Peoria, and Western, and the Chicago, Burlington, and Quincy railroads (Map: Illinois, B 3). It is the centre of a fertile agricultural district and has coal-mining interests, extensive agricultural implement works, patent racks, and cigar and cigar-box factories, foundries, tile, brick, and marble works, lumber yards, etc. The city has a public library, two theatres, parks, and a hospital. Settled about 1832, Canton was incorporated first in 1849. Under a charter of 1892 the government is vested in a mayor, elected every two years, and a city council. There are municipal water works. Pop., 1900, 6564; 1910, 10,453.

CANTON. A town, including several villages, in Norfolk Co., Mass., 14 miles (direct) southwest of Boston, on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 3). It is the seat of the Massachusetts Hospital School and has a public library. The manufactures include woolen, rubber, and felt goods, blacking, leather dressing, cotton padings, electrical supplies, patent and enameled leathers, fire hose, sizing compounds, etc. Settled about 1690, Canton was set off from Stoughton and incorporated in 1797. The government is administered by town meetings. The water works are owned by the town. Pop., 1890, 4538; 1900, 4584; 1910, 4797. Consult Huntoon, *History of the Town of Canton* (Cambridge, 1893).

CANTON. A city and the county seat of Madison Co., Miss., 23 miles north of Jackson, on the Illinois Central Railroad (Map: Mississippi, E 5). It is the centre of a fertile fruit and vegetable growing region, and has cotton gins and compresses, cottonseed-oil mills, and an ice factory, and manufactures brick, lumber, etc. The water works and electric light plant are owned by the city. Pop., 1890, 2131; 1900, 3404; 1910, 3929.

CANTON. A town in Lewis Co., Mo., 157 miles northwest of St. Louis, on the St. Louis, Hannibal, Quincy, and Burlington Railroad (Map: Missouri, E 1). Advantageously situated on the Mississippi River, it is an important lumber-shipping point and has a large planing mill, button factories, canning and pickle works, and a creamery; poultry raising and the shipping of fish are also important industries. The town

is the seat of Christian University (Christian), organized in 1853. Settled about 1831, Canton was incorporated 20 years later; the charter now governing the town dates from 1873, and provides for a mayor, elected annually, and a board of trustees. The town owns and operates its water works and electric light plant. Pop., 1900, 2365; 1910, 2218.

CANTON. A village and the county seat of St. Lawrence Co., N. Y., 18 miles (direct) southeast of Ogdensburg, on the De Grasse River, and on the New York Central Railroad (Map: New York, E 1). It is the seat of St. Lawrence University, established in 1856, a Universalist Theological School, a State school of agriculture, United States Weather Bureau station, county almshouse, and contains a public library. The village is engaged in the building of small boats and launches, skiffs and sailing yachts, and carries on a trade in farm and dairy products. Other industries are foundries, and flour and feed mills. Good water power is derived from the river. Canton was settled about 1803 and was incorporated in 1846; it was the home of Gov. Silas Wright, who is buried here. The water works are publicly owned and are operated by the municipality. Pop., 1890, 2580; 1900, 2757; 1910, 2701.

CANTON. A city and the county seat of Stark Co., Ohio, 58 miles by rail south-southeast of Cleveland, on the Nimishillen Creek, and on the Wheeling and Lake Erie, the Baltimore and Ohio, and the Pennsylvania railroads (Map: Ohio, H 4). Among the more noteworthy features of the city are the United States government building, city hall, large city auditorium, county courthouse, county workhouse, high school, Meyers Lake Park, Aultman Hospital, Mercy Hospital, Nimisilla Park, Carnegie library, the McKinley National Monument, and two monuments erected to the soldiers of the Spanish-American War. Canton was first settled about 1805, was incorporated as a village in 1822, and was chartered as a city in 1854. It was the home of President McKinley. Canton is in a fine wheat-growing district, and coal, limestone, and clay for pottery and brick are found in the vicinity. Its manufactures include watch cases and movements, iron bridges, and roofing, threshers, engines, mill machinery, rubber tires, metal ceilings, surgical chairs, plows, bookcases, steel, steel cars, cutlery, saddlery, hardware, stoves, safes, woolens, presses, pottery, tiles, and various kinds of brick; and besides these articles, large amounts of grain and coal are exported. Under a general law of 1902, the government is vested in a mayor, president of council, treasurer, solicitor, director of public service, auditor, and director of public safety, appointed by the mayor, with the consent of the council. This body consists of nine members, six being elected by wards and three by the electors of the city at large. The city's income and expenditures exceed \$660,000 annually. The principal items of expense are \$42,000 for the police department, including amounts for police courts, jails, reformatories, etc.; \$60,000 for the fire department; and \$320,000 for schools. The water works are owned by the municipality. Pop., 1860, 4041; 1900, 30,667; 1910, 50,217.

CANTON. A city and the county seat of Lincoln Co., S. Dak., 70 miles by rail north by west of Sioux City, Iowa, on the Big Sioux River, which affords fine water power, and on

the Chicago, Milwaukee, and St. Paul Railroad (Map: South Dakota, H 4). It is the seat of Augustana College and of the United States government asylum for insane Indians, and has a fine courthouse and a Carnegie library. The city contains several grain elevators, exports flour, grain, and live stock, and manufactures plows, gasolene engines, and cement-block machinery. The water works are owned by the municipality, which adopted the commission form of government in 1909. Pop., 1890, 1101; 1900, 1943; 1910, 2103.

CANTON, JOHN (1718-72). An English physicist, born at Stroud, Gloucestershire. He was apprenticed to a weaver and later was taken into partnership by a London schoolmaster, to whom, in 1837, he had artied himself. He began early to experiment with electricity, and in 1750 read a paper on the *Method of Making Artificial Magnets without the Use of Natural Ones*. In 1751 he was elected a fellow of the Royal Society and awarded the Copley medal. He and Franklin almost simultaneously discovered that some clouds were charged with positive and others with negative electricity. Canton determined the quantity of electricity stored up in Leyden jars, demonstrated the compressibility of water, and made several other important contributions to physical science.

CANTON, WILLIAM (1845-). An English author. He was born in the island of Chusan, off the coast of China, and was educated in Jamaica and at Douay, France, for the Catholic priesthood. He became a Protestant, however; and was for long a leader writer on the *Glasgow Herald* and in 1891-99 was subeditor of the *Contemporary Review*. He wrote: *The Shining Waif* (1879); *A Lost Epic and Other Poems* (1887); *The Invisible Playmate* (1894); *W. V., Her Book* (1896; enlarged, 1897); *In Memory of W. V.* (1901), a charming account of his short-lived daughter; *A Child's Book of Saints* (1898; published in America as *W. V.'s Golden Legend*); *Children's Sayings* (1900); *What is the Bible Society?* (1903); a valuable *History of the British and Foreign Bible Society* (5 vols., 1903-10); *The Story of the Bible Society* (1904); *The Bible and the English People* (1911); *A Child's Book of Warriors* (1912); *The Story of St. Elizabeth of Hungary* (1912). Consult a sketch by S. Bradbury in the *Manchester Quarterly*, xxv (1906).

CANTONI, kàn-tō'nē, CARLO (1840-1906). An Italian philosopher, born at Gropello in the Province of Pavia. He studied at the universities of Turin, Berlin, and Göttingen, and taught in Turin and Milan until 1878, when he was made professor of philosophy at the University of Pavia. Although a disciple of Kant, he sought to modify many of that philosopher's doctrines, and combated his theory of the dualism of *phenomenon* and *noumenon*. His works include: *Giovanni Battista Vico* (1864); *Corso elementare di filosofia* (3 vols., 1870, frequently reëdited); *Emanuele Kant* (3 vols., 1879-84); *Psicologia* (2d ed., 1897). Consult: Werner, *Kant in Italien* (Vienna, 1881) and his *Die italienische Philosophie des 19 Jahrhunderts* (Vienna, 1886).

CAN'TONMENTS (Fr. *cantonnement*, from *cantonner*, to quarter, from *eanton*, quarter), **MILITARY**. A more or less permanent camp or district, in which soldiers are quartered. In

Europe, before the era of railroads and modern scientific warfare and transport, there would be frequently long intervals between active operations, caused principally by the state of the weather, winter, etc.; impassable roads; local or general armistices; and the constantly recurring necessity of waiting for supplies. In such intervals the troops would go either into a permanent camp of huts, or else be quartered in the houses and villages of the district, when they were said to be in cantonments. *Billeting* is the assignment of troops to public or private buildings for quarters. (See **CAMP**; **BIVOUAC**.) Its most modern military usage is in India, where the cantonment is practically a military town, and in the majority of instances the district inside whose borders live the European part of the population, civil as well as military. Cantonments are built throughout British India, the larger examples containing barracks for European cavalry, infantry, and artillery; rows of bungalows or houses, each, as a rule, inclosed in a garden, for the officers; rows of huts for the native troops; magazines, gymnasiums, and parade grounds; public offices and administration buildings; and a bazar, more particularly for the accommodation of the native troops.

CANTOR, GEORG (1845-). A German mathematician, born at St. Petersburg. He became professor of mathematics at the University of Halle in 1879, and founded the mathematical theory of assemblages or systems of numbers. Such a system may contain a finite or an infinite number of numbers, or an infinity of such infinities. In the last case Cantor introduced the term "transfinite numbers." He also classified the systems according to their "potency," or degree of infinitude. Several of his papers are published in the *Mathematische Annalen*.

CANTOR, MORITZ (1829-). A German mathematician, born at Mannheim, and privat-docent and professor of mathematics in the University of Heidelberg after 1853. His most notable work is the great "History of Mathematics" (*Geschichte der Mathematik*), whose four volumes (Leipzig, 1880-1909) cover the subject down to the year 1799.

CANTÙ, kàn-tōō', CESARE (1804-95). A distinguished Italian historian and novelist, born at Brivio, near Milan, Dec. 5, 1804. He was educated at Sondrio, where at 17 he became instructor in belles-lettres, leaving after four years, to accept a professorship, first in Como and later in Milan. The liberal tendencies expressed in a work published in 1832, *Lombardy in the Seventeenth Century: An Historical Commentary on the "Promessi Sposi" of Manzoni*, resulted in an imprisonment of 13 months. Cantù spent his enforced leisure in describing the sorrows of prison life in the form of a widely read historical romance, *Margherita Pusterla* (1835). His great work is the *Storia Universale* (35 vols., Turin, 1837 et seq.), based largely upon French and German sources, but uniformly colored with a strong clerical bias. Next in importance is his *History of the Italians* (6 vols., Turin, 1854). The following also deserve mention: *History of Italian Literature* (1865); *Independence of Italy* (1872); *Milan: A History of the People for the People* (1871). He wrote, besides, many monographs upon Parini, Beccaria, Monti, and other men of letters. Cantù became director of the archives of Lombardy in 1874. He died in Milan,

March 11, 1895. Consult Bertolini, *Cesare Cantù e le sue opere* (Florence, 1895).

CANTUS FIRMUS (Lat., firm song). A term first applied in the twelfth century to any plain chant melody against which a higher part, the *discantus*, was written. Later on, especially in the fifteenth and sixteenth centuries, the masters of the *a cappella* style used such melodies, or even secular folk song, somewhat in the nature of a typical phrase or leading motive, on which they built up elaborate contrapuntal works. Thus Palestrina (q.v.) calls one of his masses *Assumpta est Maria*, because he begins each number with the Gregorian melody of that hymn in the tenor; in other words, he uses that melody as a *cantus firmus*. In like manner all of Bach's choral preludes are built upon some chorale as a *cantus firmus*.

CANUCK'. A name applied in the United States to any Canadian, while the English Canadians use it to denote a Canadian of French descent. According to Norton's *Political Americanisms*, it was first applied by the French to the English, and is a corruption of Connaught. Some scholars, however, believe the word to be of Indian origin.

CAN'ULE'IUS, GAIUS. A Roman tribune of the people. In 445 B.C. he proposed the *Lex Canuleia*, a law establishing the right of intermarriage between the patricians and the plebeians. He also proposed that one of the two consuls should be chosen annually from among the plebeians, but this proposal was not carried, and it was resolved instead that military tribunes with consular power should be elected from either the patricians or the plebeians in place of the consuls. Consult: Livy, iv, chaps. 1, 2, 3, 6; Cicero, *De Republica*, ii, 37, 63; Greenidge, *Roman Public Life*, pp. 112-114 (London, 1901).

CANUN, kà-nōn' (Arab. *qānūn*, borrowed from Gk. *κανών*, *kanōn*, straight bar, rule, norm). A Turkish musical instrument, provided with gut strings—a variety of the dulcimer or zither. The sounds are produced by striking the strings by means of plectra—tortoise-shell thimbles ending in pointed pieces of coconut. This instrument is a great favorite in the seraglios.

CANU'SIUM. See CANOSA DI PUGLIA.

CANUTE, ka-nūt', or **CNUT**, knōt (c.995-1035). King of the English, Danes, and Norwegians, and known as the Great. He was the son of Sweyn, King of the Danes, and on the death of his father, in 1014, was proclaimed King of England by the warriors of the Danish fleet who were then ravaging the country. The Witan, however, summoned the old King, Ethelred, from his exile in Normandy, where he had been driven by Sweyn, and Canute was forced to flee to Denmark. He returned in 1015 with a powerful fleet and within a year made himself master of all England, save London, being chosen King by a Rump Witan after the death of Ethelred in 1016. The citizens of London proclaimed Edmund Ironside, son of Ethelred, King, and a fierce contest ensued in which London was twice besieged and five battles were fought, the decisive engagement occurring at Ashington, or Assandun, in Essex in 1016. Though Edmund was defeated, Canute, to avoid further resistance on his part, agreed to share the sovereignty with him, most of the south of England going to Edmund and the north to Canute, with the stipulation that on the death of either without heirs the full power was to revert to the survivor. Edmund Ironside died within a few weeks, in

1016, not without the suspicion of foul play on the part of Canute, who lost no time in securing his position as sole ruler of England. He had been noted for his cruelty, and now, to remove all potential rivals out of his way, he entered upon a rapid but systematic course of murder and persecution. By 1018 he had thoroughly pacified the country and considered himself strong enough to dispense with the support of the fleet, which he sent home to Denmark, keeping only the crews of 40 ships as a sort of bodyguard. In 1019 Canute went to claim the Kingdom of Denmark, as his brother had died, but remained only a few months. After 1020 the character of Canute's rule underwent a remarkable change. Mildness was substituted for severity, and respect for the laws for violence. The ancient customs of the country were confirmed and elaborated, and the administration of justice was securely founded. Englishmen were admitted to the highest offices in the land, and soon after this time the Saxon Earl Godwin laid the beginnings of his great power. Canute showed himself especially kindly to the clergy, whose rights he scrupulously respected and whose favor he gained by numerous benefactions to churches and monasteries. With the mass of the people he was popular on account of his liberality and an air of bluff good nature which he knew well how to assume. In 1027 he made a pilgrimage to Rome, describing the events of his journey in a letter to his people replete with moral exhortations and expressions of religious humility, which may be the result either of great naïveté or of fine histrionic skill. Canute was King of both England and Denmark and in 1028 he became ruler, also, of Norway, although his rule was contested until the death of King Olaf in 1030. Together with his conquests in the Wendic lands of Germany, he was therefore the master of a powerful northern empire, which, however, fell to pieces at his death. This occurred at Shaftesbury, Nov. 12, 1035. As King of England, Canute had displayed high talents for rule. By nature cruel and violent, he knew how to subordinate his passions to the interests of his government and his people; and, though practically a heathen at the time of his accession to the throne, he succeeded in winning the favor of a church which has associated one of the most beautiful of mediæval legends, that of the King and the rising tide, with his name. Consult: Larson, *Canute the Great* (New York and London, 1912); Freeman, *The Norman Conquest*, vol. i (Oxford, 1870); Green, *The Conquest of England* (London, 1883).

CANUTE IV, THE SAINT (?-1086). King of Denmark after 1080. He was distinguished as a warrior and a builder of churches. He attempted to invade England in 1085; was murdered by rebels on July 10, 1086, and was canonized in 1100. He is the patron saint of Denmark.

CANVAS (OF. *canevas*, ML. *cannevasium*, from Lat. *cannabis*, hemp). A strong coarse cloth made of cotton, flax, or hemp. Canvas is used (1) on board ship for sails, awnings, hatch hoods, boat covers, tarpaulins, etc. Flax canvas is used for the sails of large vessels. It is woven in cloths 24 inches in width and 40 yards long, and is of several weights, denoted by numbers from 1 to 9. The heaviest, which is called number 1, is used for storm sails,

courses (foresail and mainsail of square-rigged vessels), and topsails, but numbers 2 and 3 are also used for all of these except the storm sails. The lighter weights are used for jibs, upper staysails, topgallant sails, royals, etc. Cotton canvas is used for boat sails, hammocks, etc. The term "canvas" is used in a figurative sense for the sails of a ship, *under canvas* signifying 'undersail'—i.e., under way, propelled by sails. See SAIL.

2. The canvas used by artists is commonly of linen, varying in density and thickness according to the size of the painting to be made. This is stretched upon a wooden mortised frame, which is called a stretcher, in the four inside corners of which are slits for receiving triangular wooden wedges. These wedges are called keys, and after the canvas is stretched they may be driven in, in order to tighten the canvas itself. Certain sizes of canvas, being in greater request than others, are kept ready stretched on frames. Those used for portraits are known by the names of *kit-cat*, which measures 28 or 29 inches by 36; *three-quarters*, 25 by 30 inches; *half length*, 40 by 50; *Bishop's half length*, 44 or 45 by 56; *Bishop's whole length*, 58 by 94.

CANVASBACK. An American fresh-water duck (*Marila vallisneria*), regarded as superior to all others for food. It breeds from Dakota northward, but most numerous in the far north, making its nest on the ground, in a marsh, and laying 6 to 10 greenish-buff eggs. (For illustration, see Plate of DUCKS, WILD.) The canvasbacks begin to come southward along inland waterways in November and spread over all the middle and southern United States. They are attracted in greatest numbers to the extensive marshes and river flats about Lakes Huron and Erie and around Chesapeake Bay, but are also irregularly numerous wherever their favorite food grows in the Mississippi valley and on the "slews" of the plains. This food is the wild celery (*Zostera vallisneria*), which grows densely on fresh-water shoals in from 7 to 9 feet of water, like a tall grass, the root of which is white and has some resemblance to small celery. "Wherever this plant grows in abundance, the canvasbacks may be expected," says Wilson; "while in waters unprovided with this nutritious plant they are altogether unknown. . . . They float about these shoals, diving and tearing up the grass by the roots, which is the only part they eat." It is not quite true to say that they will eat nothing else, for celery is not always available. They are extremely shy, quick and strong in flight, and remarkably expert in diving, so that all the skill and strategy at the disposal of the gunner is necessary to success in shooting them. They are so relentlessly pursued, however, that their numbers are far less in all their haunts than formerly; and very many of the alleged canvasbacks sent to market are really redheads (q.v.), a closely related and nearly as good duck, of similar habits, but less strongly addicted to the celery diet. The male canvasback has a head reddish, but much obscured with dusky tints, while that of the redhead is clear, bright chestnut, and the bill is blackish (not blue). The back and sides are whitish (less dark than that of the redhead), marked with sparse, wavy lines and dots, suggesting the surface of coarse canvas. The fore part of the body, rump, and tail coverts are black; speculum,

bluish gray; length, about 20 inches. Consult Elliot, *Wild Fowl of North America* (New York, 1898).

CANZONE, kàn-tsō'nâ (It., from Provençal *cansò* or *canson*, from Lat. *cantio*, song). The name of one of the oldest and most widely cultivated forms of the Italian lyric. In Provençal the word meant simply any verses to be set to music. The Italians gave it a more technical and specific meaning, as for instance, in the best early treatise on the subject in Dante's *De vulgari eloquentia* (bk. ii, chap. viii-x). This early canzone was a group of *stanze* (stanzas) or strophes not limited as to length or number, but following a systematic scheme. The "regular" strophe fell into two parts—the first called the *piedi* (feet), the second called the *sirima* (from Greek *σίρμα*, something dragged). The *sirima* was connected with the *piedi* usually by a single verse called the *chiave* (key). The *piedi*, or feet of the first part, were usually two in number, rhyming either *a, b, c, a, b, c*, or in the four verse "foot," *a, b, c, d, a, b, c, d*. The first part thus would contain either 6 or 8 verses. Then followed the *chiave* (key), rhyming with *c* or *d* (the last verse of the *piedi*), but belonging syntactically and in meaning to the second part of the stanza. Any order of rhymes was possible in the *sirima*, or second part, as for instance, *a, b, b, a, c, c*, or *a, a, b, c, b, c*, etc. At the end of the canzone came the *invio* (envoi or address), which usually followed the rhyme scheme of the *sirima*, save that often the first verse had no corresponding rhyme. The verses prevailing in the canzone were either of 7 or 11 syllables, alternating with more or less freedom. In general, the canzone was a much freer form than the sonnet. Dante and Petrarch themselves show great variety in its use. Later Italian poets were not slow in departing from all system even within the strophe, and the term *canzone* and its diminutive *canzonetta* came to mean any poem employing varied rhyme schemes or none at all, with alternations of verses of 7 and 11 syllables.

CAONABO, kã'ô-nã-bõ' (?-1496). A Carib Indian who was cacique of Maguana, Hispaniola (Haiti), in 1492, and a man of marked native ability. He was married to the famous Anacaona and in 1493 captured the fortress of La Navidad, Haiti, and massacred the Spaniards left there by Columbus. In command of 10,000 warriors he headed the general league against the whites in 1494, and long besieged Ojeda and a small band in the fortress of Santo Tomás, hoping and planning to repeat his victory of La Navidad. Columbus had returned in the meanwhile, and Caonabo, giving up the siege for the time being, devoted himself to strengthening the league. He was so engaged when captured by Ojeda, who had followed him with terms of peace from Columbus. In 1496 he was put on a vessel bound for Spain, but died during the voyage.

CAOUTCHOUC, kōō'chōōk. See RUBBER.

CAPACITY (Fr. *capacité*, Lat. *capacitas*, from *capax*, capacious, from *capere*, to hold), LEGAL. The power and competency to incur a legal obligation or to enjoy a legal right. Sometimes the test of capacity is natural, and at other times artificial. In the case of citizens of full age, the natural test of rationality or intelligence is usually applied. If one has the ability to understand the nature and effect of the act in which he is engaged, he is legally capable

of doing it. It is in this sense that the phrase *testamentary capacity* is commonly employed. With respect to the enjoyment of rights, however, the test is more often the artificial one of age, coverture, or marriage (in the case of a woman), alienage, and the like. Whether a particular person of full age and sound mind may hold an office or exercise the elective franchise, or acquire particular kinds of property, depends upon artificial rules established by law. See AGE; ALIEN; INFANT; MARRIED WOMEN; OFFICER; VOTER.

CAP À L'AIGLE, káp à lâ'gl'. See MURRAY BAY.

CAPA'NEUS. One of the Seven against Thebes (q.v.). He defied Jupiter and was struck by lightning while sealing the walls.

CAP-À-PIE, káp'à-pê' (Fr., head to foot). In the military language of the Middle Ages, a term applied to a knight or soldier armed at all points, or from head to foot, with armor for defense and weapons for attack.

CAPA Y ESPADA, káp'à ê ës-pá'dá (Sp., cloak and sword), COMEDIAS DE. A name given to the intrigue plays of Calderón and Lope de Vega, which deal with contemporary aristocratic life in Spain, and introduce the "cloak" and "sword" as stock articles of the dress of their principal characters.

CAP DE LA HAGUE, káp' de lá ág' (Fr., Cape of The Hague). A promontory of France, forming the northwest extremity of the peninsula of Cotentin, in the Department of Manche (Map: France, E 2). It juts into the English Channel, opposite the island of Alderney, about 16 miles northwest of Cherbourg. It protects, on the east, the roadstead of La Hogue, or Hougue, whence arises the frequent misnomer of Cape La Hogue. The roadstead gave its name to a great sea fight in which the English and Dutch fleets defeated the French in 1692.

CAPE AGULHAS, à-gōō'lyás. See AGULHAS, CAPE.

CAPE ANN. A cape on the northeast coast and marking the northern limit of Massachusetts Bay, Mass., 31 miles from Boston (Map: Massachusetts, F 2). The cape is marked by two fixed white lights on Thatchers Island, about 900 feet apart, in lat. 42° 38' N., and long. 70° 34' W., 161¾ and 165½ feet above mean high water, and visible for 19 nautical miles; there is also a ten-inch steam fog whistle. There are valuable stone quarries at the cape. The whole rocky peninsula, generally included under this name, projects about 10 miles into the Atlantic Ocean. The south and east shores have many attractive summer resorts.

CAPE AR'AGO, or GREGORY. A cape on the west coast of Coos Co., Oreg., on the south side of the outer entrance to Coos Bay (Map: Oregon, A 3). A lighthouse with light 84 feet above sea level is in lat. 43° 20' N. and long. 124° 22' W., on a small island 2½ miles north and ½ mile east of the western extremity of the cape. The light is fixed white, with white flash every two minutes.

CAPE BAB-EL-MANDEB, báb'el-mán'dëb. See BAB-EL-MANDEB.

CAPE BAR'ROW, or POINT BARROW (named after Sir John Barrow). The northernmost point of Alaska on the Arctic coast; lat. 71° 23' N., long. 156° 40' W. (Map: Alaska, D 1). It is a whaling station. In 1881-83 the United States Signal Service stationed at Point Barrow

a party of scientists, to take part in the series of international circumpolar observations instituted during 1882-83.

CAPE BLANCO, blän'kô (Sp., white). A name applied to several capes on the north and west coasts of Africa. The most remarkable of them is the one on the west coast of Sahara, in lat. 20° 45' N. and long. 17° W., near the boundary between the Spanish and French possessions on the west coast of Africa, which shelters the Galgo or Levrier Bay (Map: Africa, C 2). Its name is derived from the white color of the sand. A second Cape Blanco is the northernmost point of Africa, in lat. 37° 20' N. and long. 9° 50' E. (Map: Africa, E 1). A third Cape Blanco is on the west coast of Morocco, in lat. 33° 10' N. and long. 8° 30' W. The same name is also applied to a number of headlands in other parts of the world.

CAPE BLANCO. The westernmost point of Oregon on the Pacific coast in lat. 42° 50' N. and long. 124° 27' W., at the mouth of the Sixes River, and 30 miles north of the mouth of the Rogue River (Map: Oregon, A 7). There is a lighthouse with fixed white lights, 252 feet above sea level on the extreme western point of the cape.

CAPE BOEO, bô-ä'ô, or LILIBEO (possibly clipped from *Lilybæum*). The westernmost point of Sicily, a mile from Marsala, which occupies the site of the ancient Lilybæum (Map: Italy, G 10).

CAPE BRET'ON. A cape at the east extremity of Cape Breton Island, Cape Breton Co., Nova Scotia, Canada, in about lat. 45° 50' N. and long. 59° 46' W. (Map: Nova Scotia, K 3). It is at the entrance to Louisburg harbor, and has a lighthouse. It is the terminus of the submarine telegraph cable to St. Pierre.

CAPE BRETON ISLAND. A rocky island of irregular form in British North America, 110 miles long by about 87 miles broad, between lats. 45° and 47° N., and between longs. 60° and 61° 30' W. (Map: Nova Scotia, H 3). It derives its name from a cape at its eastern extremity. It is separated from the peninsula of Nova Scotia by Chebucto or Chedabucto Bay and the Gut of Canso, and is practically divided in two by the land-locked Bras d'Or Lakes and the canal of St. Peter's Isthmus. It contains 3120 square miles. Its picturesque scenery and bracing summer climate attract an annually increasing number of tourists. The principal exports are pine, oak, birch, maple, iron, and coal. The fisheries—of cod, mackerel, herring, and whitefish—employ more than 7,000 men. Though the island produces maize and other grains, it depends for its breadstuffs chiefly on the United States. It is divided into the four districts of Cape Breton, Inverness, Victoria, and Richmond. The towns are Sydney, Arichat, and Port Hood, the once famous Louisburg, stripped of its fortifications, having become a mere village. Cape Breton, originally a French possession, was taken by the English in 1745; but being subsequently restored to France, it was again captured in 1758 and ceded to England in 1763. After having been for a time a distinct colony, it now forms part of the Province of Nova Scotia. Pop., Cape Breton, N. and Victoria, 1891, 24,650; 1911, 29,888; Cape Breton, S., 1891, 35,087; 1911, 53,352. With the exception of several hundred Miemac Indians and 15,000 French Acadians, the inhabitants are chiefly of Scotch Highland descent. Consult: R. Brown, *History of the Island of Cape*

Breton (London, 1869), and *Coal Fields of Cape Breton* (London, 1871); Sir J. G. Bourinot, *Historical and Descriptive Account of the Island of Cape Breton* (Montreal, 1892).

CAPE CANAVERAL. A cape near the middle of the Atlantic coast of Florida in lat. $28^{\circ} 28' N.$ and long. $80^{\circ} 33' W.$, and about 20 miles southeast of Titusville (Map: Florida, H 3). The United States government maintains on the cape a coast signal station and a lighthouse with light 137 feet above sea level.

CAPE CANSO. The eastern extremity of Nova Scotia and the southern boundary of the entrance of Chebucto or Chedabucto Bay (Map: Nova Scotia, J 3). It is in lat. $45^{\circ} 21' N.$ and long. $61^{\circ} W.$

The GUT or STRAIT OF CANSO is a passage 17 miles long and $2\frac{1}{2}$ miles in average breadth, connecting the inlet just mentioned with the Gulf of St. Lawrence, and forming an island of Cape Breton. It is greatly used by local sailing vessels, but of the three channels between the Gulf of St. Lawrence and the open ocean, it is the one that is least frequently used by European vessels.

CAPE CATOCHE, *kä-tō'chä.* The northeast extremity of the Mexican State of Yucatan, in lat. $21^{\circ} 35' N.$ and long. $87^{\circ} 8' W.$ (Map: Mexico, P 7). It was here that in 1517 the Spaniards first saw the Mexican coast.

CAPE CHARLES. The point of land at the northeast side of the entrance of Chesapeake Bay, Va., near lat. $37^{\circ} 3' N.$ and long. $76^{\circ} W.$ (Map: Virginia, H 4). On Smith Island is a first-order flashing white light, signaling 45" every minute, 180 feet above mean high water. This cape is the extreme southern projection of the "Eastern Shore" (q.v.).

CAPE CHELYUSKIN. See SEVERO.

CAPE CLEAR. A headland of Clear Island, county Cork, the southernmost point of Ireland (Map: Ireland, B 5). It rises 400 feet above sea level, has a lighthouse with a bright revolving light 455 feet above the water level, and is usually the first land seen from American steamers approaching England. The Fastnet Rock, with a light 148 feet above high water, is $3\frac{1}{2}$ miles to the southwest.

CAPE COAST, or CAPE COAST CASTLE. A fortified seaport and formerly the capital of the British colony of the Gold Coast, situated southwest of Akkra, the capital of the colony (Map: Africa, D 4). The Portuguese made the first settlement here in 1610, and in 1652 the Swedes built the castle, which they called Carolusburg. It was taken in 1659 by the Dutch, and in 1664 by the English, who have since held it, though it was attacked in 1665 by De Ruyter and in 1757 by the French. It was the capital of the British settlements on the coast until 1876, when the seat of government was removed to Akkra (q.v.). In 1905 it was given municipal government. The port is of some commercial importance, and there is a considerable trade with the interior in palm oil, ivory, and gold. Pop., 1911, 11,364.

CAPE COD. The sickle-shaped peninsula forming the southeastern extremity of Massachusetts and constituting Barnstable County. It extends from Great Herring Pond to Race Point, in lat. $42^{\circ} 3' 40'' N.$, long. $70^{\circ} 4' 18'' W.$ (Map: Massachusetts, G 3). It is about 65 miles long from the head of Buzzards Bay and beyond Barnstable in a few places exceeds 8 miles in width. It more than half circles Cape Cod Bay and is

broken by many harbors, that of Provincetown being one of the best on the New England coast. On the seaward side at Highlands is a revolving light 183 feet above mean high water, and at Race Point is a fixed white light varied by a white flash every 90 seconds, 41 feet above high water. Cape Cod was probably visited a number of times by Europeans during the sixteenth century, and earlier maps show a variety of names; but it is usually said to have been discovered by Gosnold (q.v.) in 1602 and named from the abundance of the fish in its waters. Charles II, when Prince of Wales, attempted to change the name to Cape James, in honor of his brother. The cape is sandy and in part consists of rolling grass land; but there are fertile portions, and towards the north it is well wooded. Small ponds abound, and salt marshes border the southern shores. The Old Colony division of the New York, New Haven, and Hartford Railroad extends through the peninsula, and the construction of a ship canal to connect Barnstable and Buzzards bays, a project which has been contemplated since the Colonial days, was chartered in 1906, begun in 1909, and completed in 1914. Consult Thorcau, *Cape Cod* (Boston, 1865).

CAPE COD CANAL. See CANAL.

CAPE COLON'NA (It., column) (ancient *Sunium Promontorium*). A headland of Greece, 28 miles southeast of Athens, forming the southernmost point of Attica, in lat. $37^{\circ} 38' N.$, long. $24^{\circ} 1' E.$ (Map: Greece, F 4). Crowned by the ruins of a temple of Athene, its summit rising about 270 feet above the water, Cape Colonna is a conspicuous and remarkable object from the sea. It derives its name from the white marble columns of the temple, which are still standing.

CAPE COLONY. See CAPE OF GOOD HOPE.

CAPE COM'ORIN. The southernmost extremity of the peninsula of India. It is in Travancore, lat. $8^{\circ} 5' N.$, and long. $77^{\circ} 37' E.$ (Map: India, C 7).

CAPE DE GATA, *dä gä'tä,* or **CABO DE GATA,** *kä'bô dä gä'tä.* A promontory on the south coast of Spain marking the east side of the mouth of Almeria Bay, in about long. $2^{\circ} 15' W.$, and about lat. $36^{\circ} 40' N.$ (Map: Spain, D 4). The most notable of its rocks is the ancient Promontorium Charidemi, the Moorish Kheyran, formed chiefly of agates, spars, and crystals. The cape was once a resort for Moorish pirates.

CAPE DIAMOND. The high bluff, situated at the confluence of the St. Charles with the St. Lawrence River, on which stands the citadel of Quebec (Map: Quebec, in Quebec City, G 4). Its precipitous sides rise over 300 feet from the river level. It is just east of the Plains of Abraham.

CAPE DIS'APPOINT'MENT. The southwest point of the State of Washington, on the north side of the mouth of the Columbia River, in lat. $46^{\circ} 16' N.$, long. $124^{\circ} 3' W.$ It has a lighthouse with a light flashing alternately red and white (interval between flashes 15 seconds), at a height of 233 feet above sea level (Map: Washington, A 3).

CAPE DUKATO, *dōō-kä'tō* (probably a corruption of Gk. *Λευκάτης*, *Leukatēs*, by an interchange of *l* and *d*) (anciently Lucates). A headland at the south extremity of Santa Maura, one of the Ionian Islands, in lat. $38^{\circ} 34' N.$ and long. $20^{\circ} 32' E.$ (Map: Greece, B 3). The strong currents around the cape and frequent fierce gales make it very dangerous for naviga-

tion, and the place has long been dreaded by mariners. A cliff about 2000 feet high, on the western side of this Leucadian Promontory, is called Sappho's or Lover's Leap.

CAPE ELIZABETH. A headland in Cumberland Co., Maine, 6 miles southeast of Portland, and in lat. $43^{\circ} 33' N.$, long. $70^{\circ} 12' W.$ (Map: Maine, C 8). The United States government has established two lights on this cape.

CAPE ETERNITY. A headland on the left bank of the Saguenay River, Canada, about 40 miles from its mouth. It rises to a height of 1800 feet, and is the most impressive spectacle in the scenery of the Saguenay and lower St. Lawrence.

CAPE FAREWELL. The southernmost extremity of Greenland, and southern promontory of Egger Island, situated in lat. $59^{\circ} 49' N.$ and long. $43^{\circ} 56' W.$ (Map: North America, under AMERICA, O 4). It is seldom visited, on account of the ice and dangerous currents.

CAPE FEAR. A promontory extending into the Atlantic from Smith Island, N. C., near the mouth of Cape Fear River, in lat. $33^{\circ} 35' N.$ and long. $77^{\circ} 57' W.$ (Map: North Carolina, E 4). Navigation off this cape has long been dreaded by sailors, on account of the treacherous character of the surrounding waters.

CAPE FEAR RIVER. A river in North Carolina, rising in the north central part of the State, flowing southeast, and emptying into the Atlantic (Map: North Carolina, D 3). The largest tributaries are: from the west, Deep River; from the east, South River, and from the northeast, Northeast Cape Fear River. It is over 300 miles in length, and is the longest river wholly within the State. It is navigable to Fayetteville, 150 miles from its mouth. Along the lower region of the river rice growing is an important industry.

CAPEFIGUE, káp'fêg', BAPTISTE HONORÉ RAYMOND (1802-72). A French historical writer. He was born in Marseilles, and studied law in Paris. He then became a journalist, and contributed to a large number of publications, signing himself "Un homme d'état." He held a post in the Foreign Office until 1848, and in this way was enabled to use many documents access to which was closed to others. Besides his journalistic work, he produced no less than a hundred volumes of history, many being biographies of famous women and nearly all being hastily written and uncritical, and tinged with his Bourbon political views. The best of his works are the *Histoire de Philippe-Auguste* (4 vols., 1829), and the *Histoire de la réforme, de la ligue, et du règne de Henri IV* (8 vols., 1834-35).

CAPE FINISTERRE, fê'nê'stâr' (Fr., from Lat. *finis*, end + *terra*, earth), or LAND'S END (ancient *Promontorium Nerium*). A high promontory at the northwest extremity of Spain, in lat. $42^{\circ} 53' N.$ and long. about $9^{\circ} 16' W.$ (Map: Spain, A 1). It is noted as the scene of two naval victories of the English over the French, on May 3, 1747, and July 22, 1805.

CAPE FLATTERY. The extreme western point of the United States (not including Alaska), in the State of Washington, at the southern side of the entrance to the Strait of Juan de Fuca (Map: Washington, A 1). On Tatoosh Island, in lat. $48^{\circ} 23\frac{1}{2}' N.$ and long. $124^{\circ} 44' W.$, and one-half mile northwest of Cape Flattery, there is, at a height of 155 feet above sea level, a fixed white light, with a fixed red sector between southeast seven-sixteenths

south and south-southeast fifteen-sixteenths east.

CAPE FLORIDA. The southernmost extremity of Key Biscayne, in Dade Co., Fla., about 10 miles southeast of Miami, in lat. $25^{\circ} 38' N.$, long., $80^{\circ} 8' W.$ (Map: Florida, D 4). There is a fixed red beacon light, 31 feet above the sea level, on Cape Florida Shoal.

CAPE FOULWEATHER. A cape on the west coast of Lincoln Co., Ore., in about lat. $44^{\circ} 50' N.$ and about long. $124^{\circ} 5' W.$ (Map: Oregon, A 5).

CAPE GIRARDEAU, jê'râr'dô. A city in the county of the same name, Missouri, 50 miles above Cairo, Ill., on the Mississippi River, and on the Cape Girardeau Northern Railroad and the Frisco Lines (Map: Missouri, G 4). It is in a well-cultivated region and has a large commerce by river and railroad, in lumber, flour, lime, limestone, and mineral paints. There are also manufactories of Portland cement, shoes, bentwood, bricks, tobacco, washtubs, veneer, threshing machines, beer, etc. The notable institutions include St. Vincent College (Roman Catholic), St. Vincent Academy, the Southeast Missouri State Normal School, St. Francis Hospital, and the Convent of the Sisters of Loretto. The Common Pleas courthouse, Federal building, and city hall are pretentious structures. The government is administered by a mayor, elected biennially, and a city council. Pop., 1900, 4815; 1910, 8475. Cape Girardeau was named after Ensign Girardot, a French officer who established a trading post just above the present site of the city. A public park has been laid out at this place. Here was made the first settlement of English-speaking people in the upper territory of what later became the Louisiana Purchase. Many grants were given by Don Louis Lorimier, the Spanish commandant at Cape Girardeau (whose house is still standing), and between 1780 and 1803 large numbers of persons migrated from the southeastern states.

CAPE GREGORY. See CAPE ARAGO.

CAPE HAITIEN, à'é'tyân' (LE CAP). The second city of Haiti in importance and size (Map: West Indies, D 3). It is situated on the north coast, overlooking a spacious harbor and surrounded by picturesque mountains. The town is well laid out, and has the appearance of the older European towns. Before the earthquake of 1842, it was known as "Little Paris." but as most of the white settlers did not rebuild, the town has not recovered since. During the French occupation, Cape Haitien was the capital of the island. It was bombarded by the English in 1865. The commerce is very important, and the chief exports are coffee, logwood, cacao, hides, and honey. The population is estimated at 30,000.

CAPE HATTERAS. A cape in lat. $35^{\circ} 15' N.$ and long. $75^{\circ} 31' W.$, projecting into the Atlantic from Hatteras Island, a long, narrow, sandy island bordering Pamlico Sound (Map: North Carolina, G 2). It is a dangerous part of the American coast for navigators, on account of shoals and frequent gales and storms. Coasting vessels are apt to pass in toward this cape, on account of the Gulf Stream, which is only about 20 miles east. The cape has a light, flashing every 10 seconds, 191 feet above mean high water; also, about three-quarters of a mile south, a fixed white beacon light, 35 feet above the sea.

CAPE HENLO'PEN. A point of land on the east coast of Delaware, in lat. $38^{\circ} 47' N.$ and long. $75^{\circ} 5' W.$, at the south side of the entrance to Delaware Bay (Map: Delaware, Q 5). It is about 13 miles a little west of south of Cape May, on the opposite New Jersey shore. The Cape Henlopen light, 126 feet above sea level, is a fixed white light, with a fixed red sector between southeast one-eighth east and south one-eighth east.

CAPE HEN'RY. A point of land on the coast of Virginia, in lat. $36^{\circ} 56' N.$ and long. $76^{\circ} 1' W.$, at the south entrance to Chesapeake Bay, opposite Cape Charles (Map: Virginia, J 5). Cape Henry has a life-saving station and a lighthouse. The light is 157 feet above sea level, shows fixed white, with a fixed red sector between south-southeast and southwest by west.

CAPE HORN (from *Hoorn*, a city of Holland), or **HOORN.** The southernmost point of America, terminating an island of its own name, in the archipelago of Tierra del Fuego (Map: Chile, D 15). It is situated in lat. $55^{\circ} 59' S.$ and long. $67^{\circ} 16' W.$ It has a perennially Antarctic climate, and is merely a detached link, bare and rugged, of the chain of the Andes. It was discovered by Schouten, a native of Hoorn, in Holland, in 1616, about 90 years later than the Strait of Magellan, and since then the course of navigation of sailing vessels has been round the cape, instead of through the strait.

CAPE HUNT'ING DOG. See HUNTING DOG.

CAPE JASMINE. See JASMINE.

CAPE LA HOGE. See CAP DE LA HAGUE.

CAP'EL, ARTHUR, LORD (c.1610-49). An English Royalist leader during the Revolution. He represented Hertford in both the Short Parliament and the Long Parliament, and sided with the popular party under the leadership of Pym, in demanding merely a redress of grievances; but, strongly opposing revolution, he joined the Court party, and in August, 1641, was made Lord Capel of Hadham. He became an officer in the Royalist army, and in 1643 lieutenant general of Shropshire, Cheshire, and North Wales. He was a member of the advisory council of the Prince of Wales, and when the Parliament party succeeded retired to his estate at Hadham; but in 1648 he advocated the renewal of civil war, and attempted to hold Colchester against the forces of Lord Fairfax. He surrendered on assurance that his life would be spared. The civil authorities regarded the pledge given him as null, and they imprisoned him. He escaped from the Tower, was taken, tried and convicted of treason, and on March 9, 1649, was beheaded with the Duke of Hamilton and the Earl of Holland.

CAPEL, THOMAS JOHN (1836-1911). An English Roman Catholic priest, born Oct. 28, 1836. When but 17 years old he, with others, founded a normal training college in London for the education of school teachers, of which, in 1856, he was made vice principal. Being compelled to seek southern Europe on account of ill health, he founded at Pau a mission for English-speaking Roman Catholics, in consequence of which the Pope gave him the rank of "monsignore." Returning to England in 1873, he established the Roman Catholic University (1874-78) at Kensington, and devoted much of his time to preaching, becoming widely noted for his eloquence, and was particularly successful in making converts to Romanism among the gentry of the Church of England. In 1883 he

went to America and made his home in California. He is said to be the original of Catesby in Disraeli's *Lothair*. In 1874 he published a *Reply to Gladstone's Political Expostulation*, and in 1884 "*Catholic, an Essential and Exclusive Attribute of the True Church*."

CAP'ELL, EDWARD (1713-81). A critical editor of Shakespeare, born at Throston, near Bury St. Edmunds. He was educated at Catharine's Hall, Cambridge, appointed deputy inspector of plays in 1737, and devoted his life to the study of Shakespeare, whose plays he transcribed 10 times. In 1760 he published *Prolusions, or Select Pieces of Ancient Poetry*, including a reprint of *Edward III*, as possibly Shakespeare's. His edition of Shakespeare (10 vols., 1768) was followed by commentaries in three vols., which were not all published till 1783, two years after Capell's death. They bore the title, *Notes and Various Readings of Shakespeare*. Capell collated the quartos and the first two folios more carefully than any previous editor.

CAPEL'LA (Lat., kid). A bright star of the first magnitude, on the left shoulder of Auriga. In 1899, Campbell, of the Lick Observatory, and Newall, of the Cambridge Observatory, simultaneously discovered it to be a spectroscopic binary (q.v.) with a period of 104 days. It is one of Secchi's second type, or solar stars, so called because their spectra closely resemble that of the sun in being finely ruled with dark lines owing to the presence of metallic vapors. Its parallax, as determined by Elkin at New Haven, is $0''.08$, corresponding to a distance of nearly 26,000,000 times the distance of the earth from the sun, a distance so great that the light of the star takes about 40 years to reach us. Capella is also called Capra, or the *She-Goat*, a name also sometimes given to Capricorn. The poets fable Capella to be Amalthea's goat, which suckled Jupiter in his infancy.

CAPELLA, MARTIANUS MINNEUS FELIX. A learned author of the second half of the fifth century. He was born in Africa, perhaps at Madaura. Of his life nothing whatever is known. He wrote the *Satiricon*, a kind of encyclopædia, highly esteemed during the Middle Ages as a work of reference. It is written in a medley of prose and verse, and is full of curious learning, but possesses no literary value. The style has all the bombastic pomp of the African school of later Latinists. It consists of nine books. The first two constitute an allegory, *The Nuptials of Philology and Mercury*, while the remaining seven are devoted to the "liberal arts," the sum of all human knowledge—grammar, dialectics, rhetoric, geometry, arithmetic, astronomy, and music. Each art is represented as a courtier of Philology and Mercury. Capella was much indebted to Varro, Pliny the Elder, and other writers.

The book on astronomy (book viii) is remarkable as containing a hint of the true theory of the solar system. Mercury and Venus are there declared to move around the *sun*, and not around the *earth*, and their relation to these bodies is properly explained. It has been thought that Copernicus (q.v.) derived a hint of his own system from Capella's work, from which he quotes. The best edition is that of Eyssenhardt (Leipzig, 1866). Consult Teuffel, *Geschichte der römischen Litteratur* (6th ed., Leipzig, 1913).

CAPELLINI, kä'pël-lë'në, GIOVANNI (1833-). An Italian geologist, born in Spezia.

He studied at the University of Pisa, and in 1860 was appointed professor in Genoa. Subsequently he was called to be professor of geology and paleontology in Bologna. He was one of the first Italian scientists to accept the Darwinian theory. He founded in Bologna a geological museum, and originated the international congress for anthropology and prehistoric archaeology. His publications include: *Delfini fossili del Bolognese* (1864); *Relazione d'un viaggio scientifico nell' America settentrionale* (1867); and *Armi e utensili di pietra del Bolognese* (1870).

CAPELLO, kà-pèl'lò, or **CAPPELLO** (It., hair), **BIANCA** (1548-87). An Italian adventuress, wife of Francesco de' Medici. She was born of a noble Venetian family, and in 1563 eloped to Florence with Pietro Bonaventuri. Soon afterward she formed a liaison with Francesco de' Medici, who had recently married Joanna, Archduchess of Austria. Bonaventuri was appointed to a court position, and in 1572 was murdered—possibly at the order of Francesco. The lack of a male heir was a source of great sorrow to Francesco, and in 1576 Bianca foisted on him a child, whom the Duke named Antonio. To prevent detection, she caused the assassination of those who assisted her in the fraud. Three months after the death of Joanna in 1578, Bianca persuaded the Grand Duke to marry her publicly; they had been privately married immediately after Joanna's death. The marriage was approved by Philip II of Spain, and in October, 1579, Bianca was proclaimed Grand Duchess of Tuscany. She endeavored to secure the good will of the Medici family, and particularly of the Cardinal Ferdinand, brother and next heir to Francesco. In 1587 the two brothers and Bianca met at Poggio á Cajano, and a few days later the Grand Duke and his wife were suddenly taken ill and both died. Ferdinand has been accused of having poisoned them. Another story is that Bianca had prepared a poisoned tart for the Cardinal, who urged Francesco to taste it first, and that then Bianca swallowed some of it rather than survive her husband. Probably neither of the deaths was due to poison. Though she kept her power over the affections of her prince, Bianca did not succeed in making Antonio his successor. Many stories of her cruelty and propensity for magical arts are part of the popular tradition of Florence to-day. Consult: Saltini, *Della morte di Francesco de' Medici e di Bianca Capello* (Florence, 1863); *Tragedie Medicee domestiche* (ib., 1898); Steegman, *Bianca Cappello* (Baltimore, 1913).

CAPE LOOK'OUT. A point of land on the east coast of North Carolina, 63 miles southwest of Cape Hatteras, and 12 miles southeast of Beaufort, in lat. 34° 37' N. and long. 76° 31' W. (Map: North Carolina, F 3). The lighthouse on this point has a fixed white light 156 feet above mean high water.

CAPE MATAPAN, mà'tá-pán'. The southernmost extremity of Greece, between the gulfs of Laconia and Messenia, in lat. 36° 23' N. and long. 22° 29' E. (Map: Greece, D 5). The ancient Greeks called it Tænaron, and made it sacred to Neptune, whose temple stood near the cape.

CAPE MAY. The southern point of New Jersey, on the north side of the entrance to Delaware Bay (Map: New Jersey, C 5). A lighthouse with light flashing every thirty seconds, 164½ feet above mean high water, is located here.

CAPE MAY CITY. A popular seashore resort, one of the oldest along the coast, formerly called Cape Island. It is the southernmost city of New Jersey, situated in Cape May County, 82 miles by rail south of Philadelphia, on the Pennsylvania and the Philadelphia and Reading railroads (Map: New Jersey, C 5). Cape May City has a fine beach, with excellent bathing facilities, a board walk five miles in length, and a driveway along the ocean front. There are also numerous hotels and boarding houses. The industries include fishing, canning, oyster raising, gold beating, and sand washing. Its harbor has an area of 500 acres and an average depth of 35 feet. It is the only port of refuge south of Sandy Hook on the New Jersey coast and is the scene of many important yachting events. The water works are municipally owned. The government is vested in a mayor, elected every three years, and a city council. Pop., 1900, 2257; 1910, 2471.

CAPE MAY COURT HOUSE. A town and the county seat of Cape May Co., N. J., on the Atlantic City and the Pennsylvania railroads, 71 miles south of Philadelphia and 12 miles north of Cape May City (Map: New Jersey, C 5). It contains a prison and two churches and the chief industries are glass blowing, agriculture, and fishing. Pop., 1914 (est.), 1300.

CAPE MENDOCINO, mèn'dò-sē'nò. A cape in Humboldt Co., Cal., the extreme western point of the State, in lat. 40° 26' 24" N. and long. 124° 23' 27" W. (Map: California, A 1). On its highest point, 422 feet above sea level, is located a lighthouse of the first class.

CAPE MOLE. See **GOLDEN MOLE**.

CA'PEN, EDWARD WARREN (1870-). An American sociologist, born at Jamaica Plain, Mass. He was educated at Amherst College, Hartford Theological Seminary, and Columbia University. In 1902 he became lecturer on sociology at Hartford Theological Seminary, engaged in special sociological and missionary research in the Far East in 1907-09, and in 1910 was one of the organizers of the World Missionary Conference at Edinburgh. In 1911 he became organizing secretary of the Hartford School of Missions. He wrote "Historical Development of the Poor Law of Connecticut" in the *Columbia University Series* (New York, 1905).

CA'PEN, ELMER HEWITT (1838-1905). An American clergyman and educator, born at Stoughton, Mass. He graduated at Tufts College in 1860, and was admitted to the Suffolk bar in 1863. After studying theology, he was ordained pastor of the Independent Christian Church of Gloucester in 1865, and held pastorates at St. Paul, Minn., and Providence, R. I., from 1869 to 1875, when he became president of Tufts College. Consult A. Tombo, Jr., *In Memoriam E. H. Capen* (New York, 1905).

CAPE NOME. A projection from the western mainland of Alaska, extending into the northwest part of Norton Sound, in about lat. 64½° N. and long. 165° W. In the sands near the seacoast, and in the valleys of the streams, are found very rich deposits of gold, which are easily accessible (Map: Alaska, B 3). (See **NOME**.) Consult Dunham, "The Yukon and Nome Gold Regions," in *Department of Labor Bulletin 11* (Washington, 1900).

CAPE OF GOOD HOPE. A promontory of South Africa, rising 1000 feet above sea level, and popularly regarded as the southernmost point of the continent, though it is half a de-

gree to the north of Cape Agulhas (Map: Africa, F 8). The latter is merely a projection on a coast line, which diverges inconsiderably from a parallel; but the former is really the turning point from south to east on the voyage from Europe to India. It is situated in lat. $34^{\circ} 22'$ S. and long. $18^{\circ} 30'$ E., being the termination of Table Mountain (q.v.). The cape was discovered by Dias, a Portuguese navigator (who christened it the Cape of Storms), as early as 1486—six years before Columbus, in aiming at the same goal by a different route, led the way to America. But it was only in 1497 that Vasco da Gama realized the value of Dias's discovery, by rounding it on his adventurous voyage from Lisbon to Calicut. Besides opening a new channel for the traffic of the East, the discovery of the cape was partly instrumental in removing the trading superiority from the republics of Italy to the states of western Europe.

CAPE OF GOOD HOPE, formerly **CAPE COLONY**. A province of the Union of South Africa, and a British possession in South Africa, between lat. 26° and $34^{\circ} 50'$ S., and long. $16^{\circ} 25'$ and 30° E. (Map: Africa, G 8). It is bounded by German Southwest Africa, Bechuanaland Protectorate, the Orange River Colony, Basutoland, and Natal on the north, the Indian Ocean on the east and south, and the Atlantic on the west. Its area thus defined and including the British possession of Walfish Bay, on the west coast, is 276,995 square miles.

Topography. In its physical aspect Cape of Good Hope presents a series of elevated plateaus bounded by mountain ranges running parallel to the south coast and increasing in altitude towards the north. The first and most southern mountain chain has an altitude of 3000 to 5000 feet and runs along the south coast at a distance not exceeding 50 miles. Several small rivers intersect it in a direction from north to south and divide it into several sections called Swellendam, Lange, Ontenigma Mountains, and a few others. The second mountain chain runs parallel with the first and has an altitude of 5000 to 7000 feet. It is also divided into several sections, known as the White and the Great Black Mountains, and terminates in the summit of Cockscómb (6000 feet high), northwest of Algoa Bay. The third mountain range has an altitude of 6000 to 8000 feet, and reaches in the summit of Compass, which is the highest of Cape of Good Hope, an altitude of 8500 feet. It is also divided into several parts, the principal of which are the Roggeveld, Nieuwveld, Sneeuwbergen, and Stormberg. The plateau inclosed by the second and the third mountain ranges is known by the name of Great Karroo and has an average width of about 60 miles. The west coast of Cape of Good Hope is also traversed by a mountain chain, the Karree Bergen, an offshoot of the western section of the first mountain range. The east coast of the province is almost without a single indentation, in contrast to the south and west coasts, which form a considerable number of bays and capes. The most important are Algoa Bay, Mossel Bay, Cape St. Francis, Cape Agulhas, the southernmost point of Africa, False Bay, Cape of Good Hope, Table Bay, and Saldanha Bay. The chief river of Cape of Good Hope is the Orange River, which forms a great part of the northern boundary. The coast lands are intersected by numerous small rivers and streams, most of them very short and unnavigable, with the exception

of the Breede and the St. John. The inland rivers are very few in number and fall into the Orange River, the Sneeuwbergen marking the division between the Atlantic and the Indian Ocean. Certain indications, such as the numerous saurians and reptiles as well as the dry basins which occur in the Karroos, seem to point to the fact that this part of the province was in former times more abundantly watered.

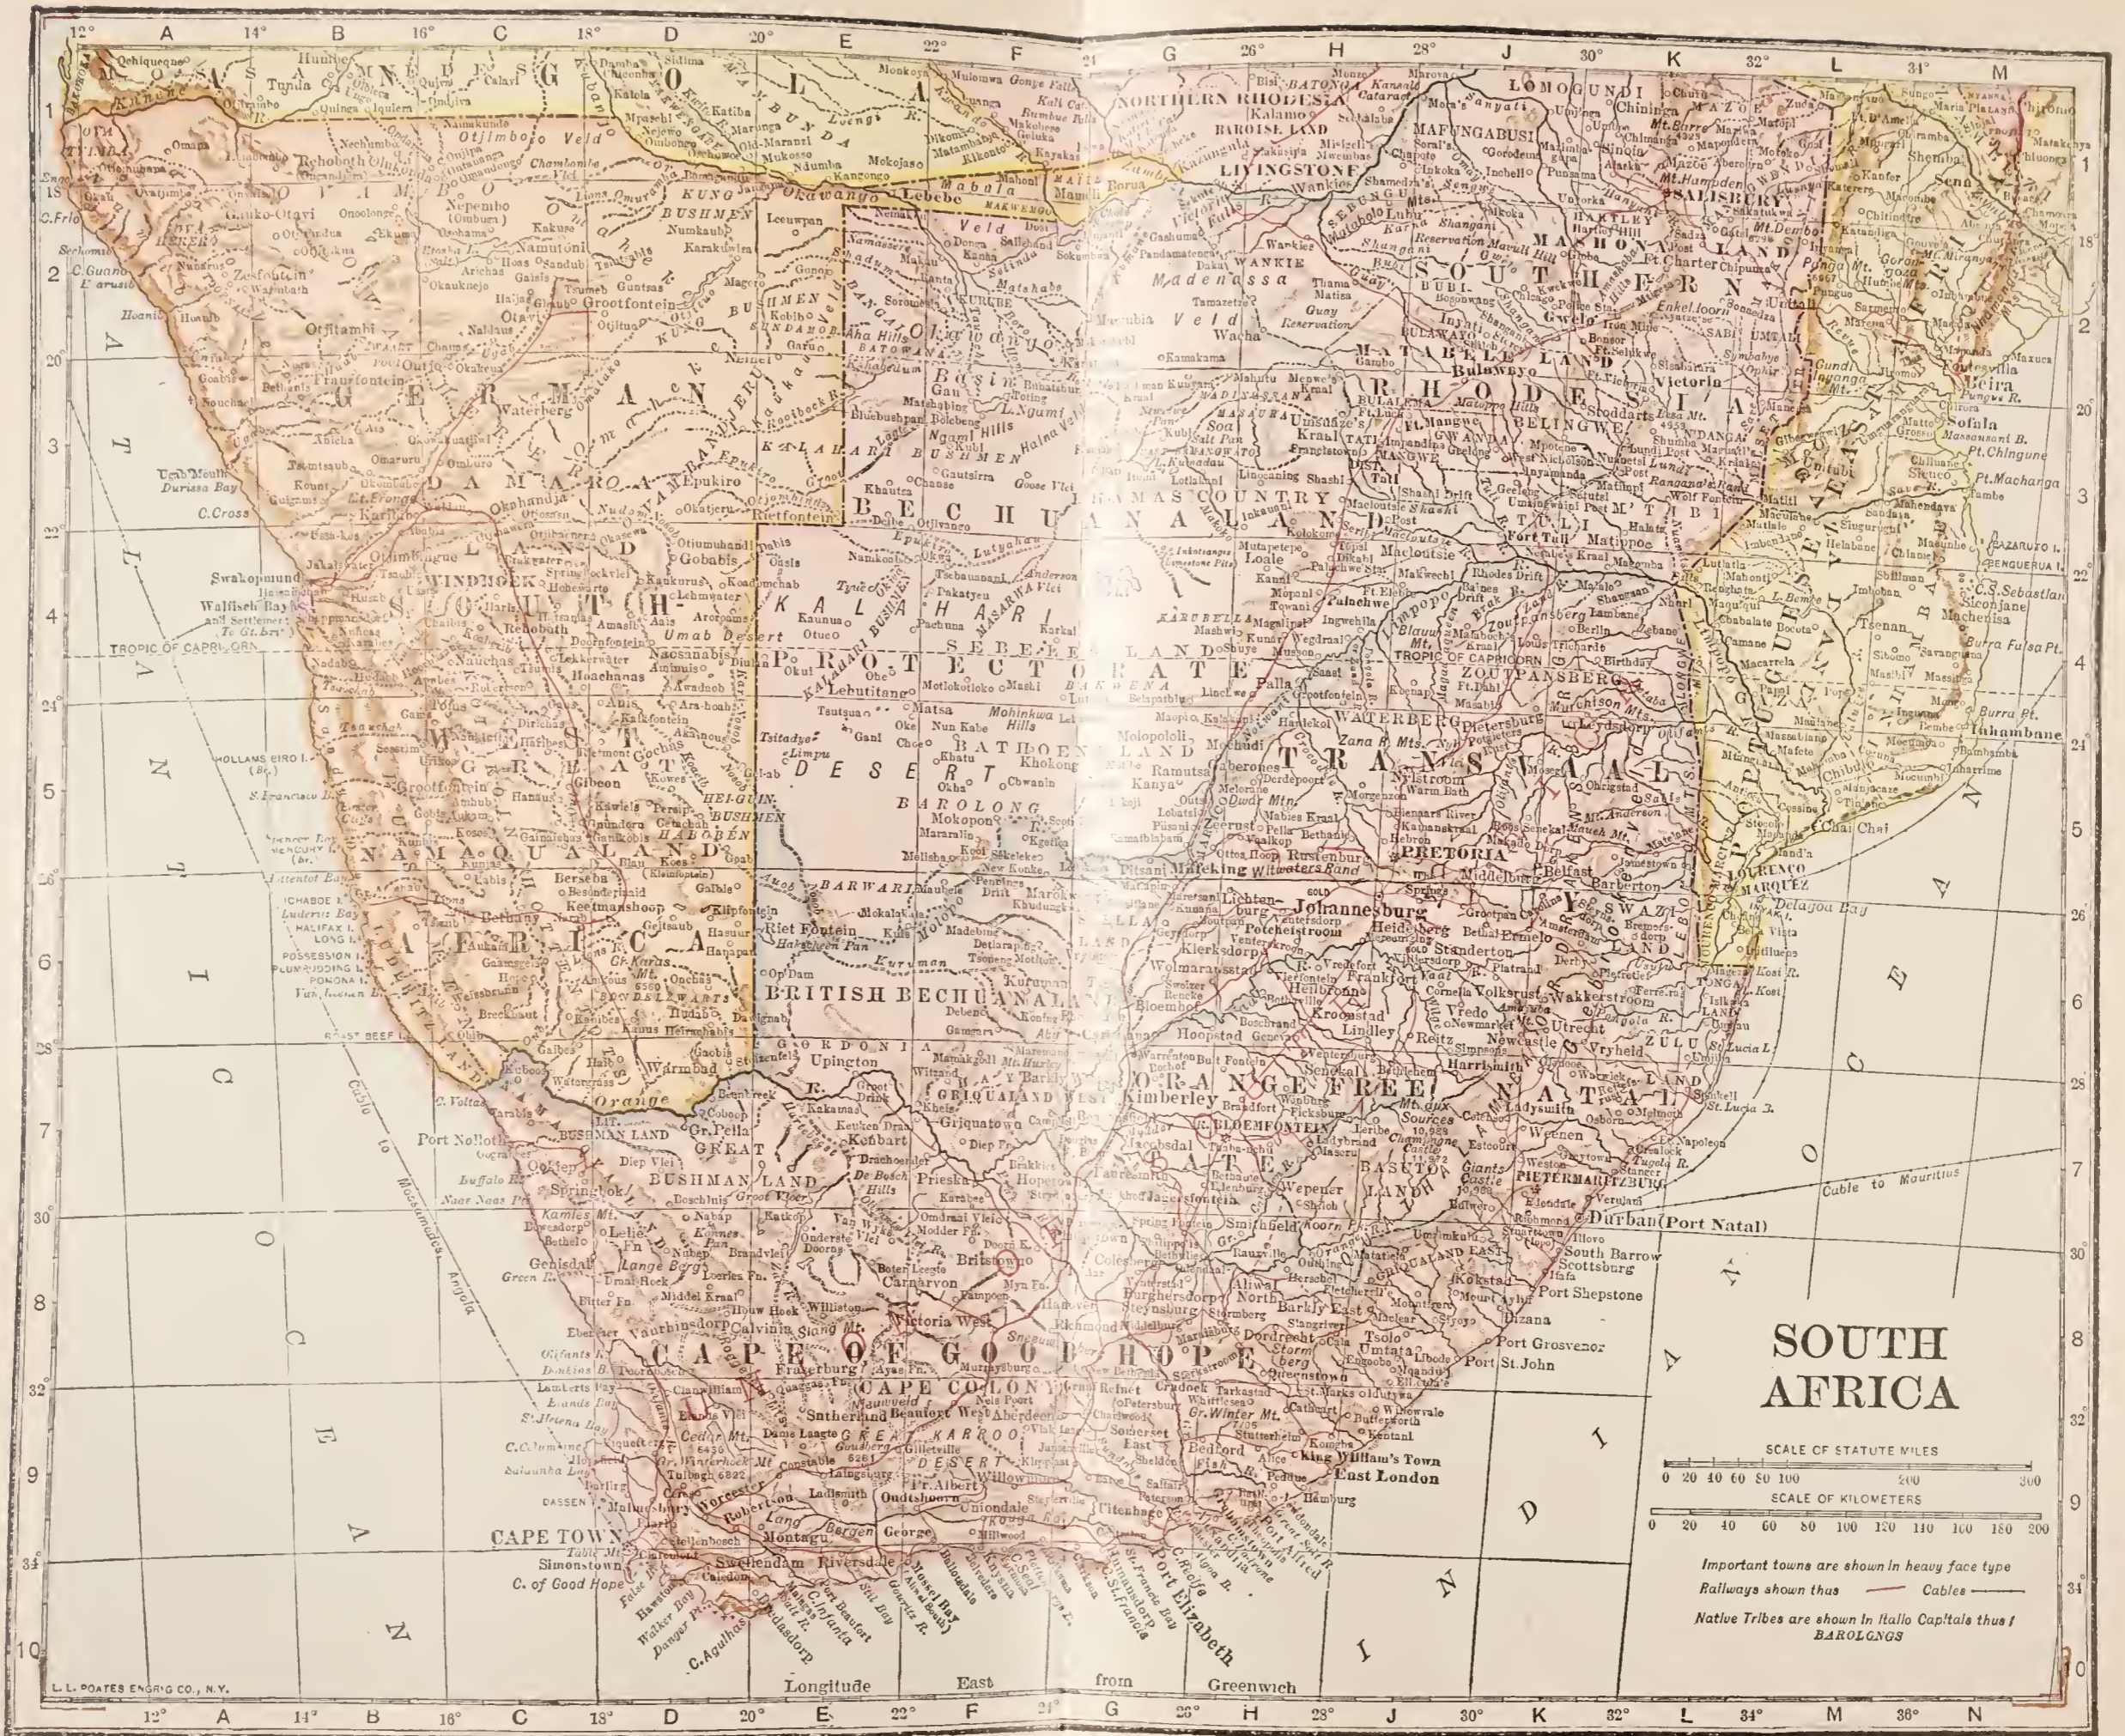

Climate. The climate of Cape of Good Hope is, on the whole, dry and very healthful. Rains are more abundant in the east than in the west. The winters are cold in the elevated regions, and some of the higher mountain tops are covered with snow for a considerable part of the year, but the air is dry and bracing. The annual average at Cape Town is over 62° F.

Flora. The flora of the province varies considerably in accordance with the soil and the climate of the locality. The Karroos are generally covered with many varieties of acacia, euphorbia, and aloe, and are especially rich in bulbous plants. Forests are generally found on the coast lands and furnish many useful varieties of wood, such as the yellow and the black ironwood and several species of palms. Among the cereals the most important is wheat, which is famous for its excellent quality. All the common European fruits grow in abundance, and the production of wine is a very important industry in the province.

Fauna. The fauna of Cape of Good Hope has undergone considerable changes since the settlement of the colony by Europeans, and many species which were formerly common and abundantly represented in that country have either entirely disappeared or are of rare occurrence. Among these may be mentioned the rhinoceros and the giraffe, while the lion and the elephant are found only in the eastern parts of the colony. The hippopotamus is still met with in the Orange and in some other rivers. The various species of the antelope family, as well as jackals, hyenas, and monkeys, are still abundant. Among the birds the most important is the ostrich, which is quite domesticated and furnishes large quantities of feathers, forming one of the staples of the province.

Geology. In their geological formation the mountain ranges of Cape of Good Hope are of almost a uniform character, the base being composed in most cases of granite and covered with quartzose sandstone, in some cases to a thickness of 1500 to 2000 feet. Some of the ranges, such as the Stormberg, still show some signs of comparatively recent volcanic action. The surface of the Karroo is generally composed of sand and clay, with a stratum of blue slaty rock underneath, which keeps it from drying up entirely during the rainless season.

Mineral Resources. The mining industry is of the utmost importance, and Cape of Good Hope is the greatest diamond-producing country in the world. The diamond fields are almost exclusively situated in Griqualand West, and the mining of diamonds has reached a very high degree of development, the output for 1910 amounting to 2,586,295 carats of \$25,653,500 value. It is estimated that from 1867 to 1913 diamonds of the value of over \$500,000,000 were exported. The first discovery of diamonds was made in the Hopetown district in 1867, and by 1870 there were about 10,000 men digging for diamonds along the Vaal River. In the same year the "dry diggings"

were discovered between the Vaal and the Modder rivers, which was soon followed by still richer discoveries in the same vicinity and by the foundation of Kimberley, which has since become one of the most important towns in the province. The mining of diamonds, which was at first largely carried on by individual diggers, has since been concentrated in the hands of a powerful company which controls the entire output of the Kimberley diamond fields, and consequently by far the largest part of the world's output, and in 1912 produced 2,325,549 carats, valued at \$30,150,000. The copper mines are mostly located in Namaqualand, and the ore found is of a very rich kind, yielding a percentage of from 32 to 36, but the output is comparatively small, amounting to 16,951 short tons in 1912. The same may be said of coal, which occurs almost everywhere, but is principally mined in the Stormberg Mountain Range and is used by the state railways; in 1912, 74,701 tons were produced. Gold, iron, lead, and salt have been found in small quantities in the Knysna district, at the southern end of the province. Outside of mining, the industries of the province are as yet of very little importance and are chiefly confined to the production of wool, ostrich feathers, mohair, hides, skins, flour, tobacco. The value of these products in 1911 amounted to \$36,166,500.

Agriculture. Both by the quality of its soil and its climatic conditions, Cape of Good Hope is better adapted for grazing than for the raising of grain. Wheat, oats, barley, corn, and other grains are raised in quantities hardly sufficient to meet the domestic demand. The rearing of cattle, sheep, goats, and ostriches is carried on very extensively, many of the sheep farms ranging in size from 3000 to 15,000 acres. In 1911 the live stock of the province comprised 2,715,330 head of cattle, 333,962 horses, 47,059 mules, 191,086 asses, 17,134,513 sheep, 7,953,414 Angora and other goats, and 728,087 ostriches.

Transportation and Communication. Owing to the deficiency of navigable waterways, the transportation problem very early attracted the attention of the colonial administration. The first railway line was constructed in 1859, 58 miles long, connecting Cape Town with Wellington. The main object was to connect the most important ports with the interior, and lines were started from East London, Port Elizabeth, and Cape Town in a northern direction. The opening of the diamond fields of the colony and the gold fields of the Transvaal gave a new impetus to railway building. Cape Town has been connected with Kimberley since 1885 and with Johannesburg since 1892. In 1894 the Cape Town line was extended to Mafeking, and since then through Southern and Northern Rhodesia, 376 miles beyond the Victoria Falls on the Zambezi River, to be extended ultimately to the southern end of Lake Tanganyika. Of the total mileage in operation in 1912 the government owned 3492 miles, and 500 miles were owned by private companies. The total capital expenditure of the state lines up to the end of 1912 was \$386,261,000. In 1912 the government owned 8731 miles of telegraph lines, and the mileage used for telephones was 7845.

Commerce. The commerce is very extensive in proportion to the population of the country, and in 1910 it amounted to \$342,818,000. The imports (including specie) rose from about \$46,000,000 in 1890 to over \$97,335,000 in 1905, and

the exports from about \$81,000,000 to over \$160,598,000. The imports in 1910, including specie, but excluding interstate trade, amounted to \$99,066,000, and the exports to \$243,752,000. While imports were not affected during the South African War (1899-1902), exports were greatly diminished; but there was an enormous expansion of imports during 1902 and 1903, the years immediately following the conclusion of the war, due to the importation of capital for the reopening of the mines and other industries. The principal imports are textiles, leather, food-stuffs, explosives, hardware, and machinery. The exports consist chiefly of gold, diamonds, copper ore, wool, ostrich feathers, hair, and hides. Nearly two-thirds of the imports come from Great Britain, and nearly the entire amount of exports goes there. The trade with the United States has increased considerably. During the year 1910 imports from the United States amounted to \$6,935,000, mostly food-stuffs, agricultural implements, and machinery. The shipping in foreign trade for 1910 amounted to 1,961,899 tons entered, and 1,808,553 tons cleared.

Government. During the first 30 years of the British occupation (1806-35) the Cape was administered from London as a crown colony. In 1835 a legislative council was established, consisting of six officials and six nominees of the crown. The introduction of parliamentary institutions was accomplished in 1854, and it was only after 1872 that the colony enjoyed a responsible government similar in all essentials to that of the mother country. At the head of the administration was the governor, who was also high commissioner for the British possessions in South Africa. He was appointed by the crown and assisted by a responsible cabinet. The Parliament consisted of two houses, the Legislative Council and the House of Assembly, which met at Cape Town, the capital. On the 31st of May, 1910, the colony was merged in the Union of South Africa, thereafter forming an original province of the Union. (See UNION OF SOUTH AFRICA.) In the province there is an administrator appointed by the governor-general for five years, and a provincial council of 51, elected for three years, the council having an executive committee of four, the administrator to preside at its meetings. Members of the provincial council are elected on the same system as members of the Parliament, but the restriction as to European descent does not apply. The law of the colony is the Roman-Dutch law modified in accordance with the local requirements and supplemented by special legislative acts. In cases where there is no provision in the Roman-Dutch code, the English law is followed. The highest local judicial authority is the court at Cape Town, consisting of the judge president and four puisne judges. In the separate divisions and towns justice is administered by resident magistrates, while in the outlying villages the same function is performed by periodical courts and justices of the peace. The central government is represented in each division and district by a civil commissioner or magistrate, whose functions include the collection of revenues and administration of justice. There are also divisional councils elected by local ratepayers, and most of the municipalities have municipal councils. According to the new Defence Act of 1912, service is compulsory on all citizens, but only a proportion of young men

will be enrolled annually. (See UNION OF SOUTH AFRICA.) There are a number of naval fortifications, and a strong British fleet is maintained at Simon's Bay. The capital of the province is Cape Town (q.v.). Principal ports and towns are Port Elizabeth, East London, Graham's Town, Kimberley, and Paarl.

Finance. The revenue is obtained chiefly from customs duties, licenses, public domains, and services rendered by the natives. In the fiscal year 1904 the revenue amounted to \$48,936,000, more than one-half consisting of "services rendered," and the expenditures over \$70,825,000. In 1905 the revenue amounted to about \$67,431,000, and the expenditure \$53,117,000. For 1906 they were estimated at \$43,201,000 and \$42,948,000 respectively. Since May 30, 1910, the revenue and expenditure for the province have not been shown separately. The ordinary public revenue for 11 months ended May 30, 1910, was \$37,702,390; expenditure, \$39,329,284. The indebtedness of the colony is very great when compared with the population, amounting on May 30, 1910, to over \$234,764,296. In addition to this amount there are treasury and deficiency bills or notes outstanding of \$21,048,313. The larger part, however, represents expenditures on public works.

Education in the province is assisted by the government and is not compulsory. Even among the Europeans illiteracy prevails to a considerable extent. The Department of Public Instruction is under the direction of the superintendent general, who has charge of the distribution of grants, while the inspection of the schools is conducted by deputy inspectors. In 1911 the number of scholars who attended school was 208,523. The proportion of those who could neither read nor write, of the white population, was 22.37 per cent, and for the population other than white, 85.75 per cent. At the head of the educational institutions is the University of the Cape of Good Hope, which is an examining university merely. There are a number of colleges.

Population. The population of the province in 1891 was 1,766,040; in 1904, 2,409,804; and in 1911, 2,564,965, of which 582,377 were white, and the rest is made up of Malays, Hottentots, Kaffirs, Bechuanas, and mixed races. The European population is mostly of English extraction. The descendants of the Dutch settlers are known as Afrikanders. The majority of the people belong to different Protestant denominations; 25,041 are Roman Catholics, 22,517 Mohammedans, and 14,617 Jews; no religion (so stated), 33,091.

History. It was towards the end of the fifteenth century that Dias, a Portuguese navigator, doubled the Cape of Good Hope, preparing the way for Vasco da Gama, who opened the sea route to India in 1497-98. The thriving trade in that quarter attracted both English and Dutch merchants, but, although their ships found frequent shelter in the bays of the coast of this region, it was not till the middle of the seventeenth century that an attempt was made permanently to occupy the country. In 1652 the Dutch East India Company sent out an expedition which landed in Table Bay and took possession of the region and set about converting it into a habitable land. Slowly the development went on, Dutch colonists and French Huguenots, fleeing from religious persecution, taking up their abodes there. During the eighteenth century the stream of immigration grew larger,

the Dutch scattering over a considerable area, busying themselves now with subduing the wilderness, now the aborigines. At the end of the century there were at the Cape about 27,000 souls of European descent and a slightly larger number of slaves. In January, 1806, for the second time during the wars against Napoleon, an English force captured Cape Colony, stipulating that the "burghers and inhabitants should preserve all the rights and privileges hitherto enjoyed by them." Since that date the Cape has been a colony of Great Britain, though not formally recognized as such until the Peace of 1815. During the ensuing 60 years the history of the colony was made up of chapters of war with the Kaffirs and other tribes, and of conflict with the Dutch inhabitants, who felt the rule of England to be oppressive. There occurred during these years the famous "treks" of the Dutch burghers into the wilderness. (See ORANGE RIVER PROVINCE; TRANSVAAL PROVINCE.) In 1853 parliamentary government was introduced, and a great increase of population followed the discovery of diamonds at Kimberley in 1867-69. Cecil Rhodes (q.v.), who was Premier from 1890 to 1895, had a leading hand in the causes that led to the South African War (q.v.). The colony was invaded in 1901 by Boer commanders, who were joined by large numbers of sympathizers. Martial law was declared in the affected districts, and the loyalists agitated for the suspension of the constitution. Peace was followed by the disfranchisement of large numbers of Dutch citizens. Dr. Jameson of raid fame was made Premier in 1904, and a redistribution of electorates threw the controlling influence from the Afrikander Bund (q.v.) to the loyalist Progressives, but the Amnesty Act of 1906 again altered the situation and led to a Bund victory in 1908. In 1910 a movement which had been initiated by Dr. Jameson in 1907 culminated in the Union of South Africa, into which the colony entered as the chief state. For the course of events since that date, see UNION OF SOUTH AFRICA.

CAPE ORTEGAL, ôr'tâ-gäl'. A northern extremity of Spain, projecting on the northwest coast into the Bay of Biscay in lat. 43° 47' N. and long. 7° 56' W., on a rugged and barren coast (Map: Spain, A 1).

CAPE PALINURO. See PALINURO.

CAPE PAL'MAS. The southernmost extremity of Liberia, Africa, in lat. 4° 22' N. and long. 7° 44' W., and marking the point at which the Maryland colony of free colored emigrants settled in 1834 (Map: Africa, D 4).

CAPE PIGEON, or CAPE PETREL. The pintado petrel, a large Antarctic petrel (*Daption capensis*) somewhat resembling a pigeon, common in large numbers about the Cape of Good

Hope, and of great interest to voyagers. See PETREL.

CAPE POGÉ, pōg. The extreme northeast point of the Martha's Vineyard Island group, and the north extremity of the east strip of Chappaquiddick Island (Map: Massachusetts, G 5). Cape Poge lighthouse is in lat. 41° 25' N. and long. 70° 27' W. The light flashes white and red, every third flash red, with five seconds' interval between flashes. It is 53¾ feet above sea level.

CAPE PRINCE OF WALES. The west point of the mainland of Alaska and of the American continent, opposite East Cape in Siberia. Bering Strait between the two is the narrowest water between America and Asia (Map: Alaska, B 2). The cape is slightly south of the Arctic Circle. It terminates in a bold bluff, north of which are dangerous shoals.

CAPER (Fr. *capre*, Lat. *capparis*, Gk. *κάππαρις*, *kapparis*). The pickled flower bud of the caper bush (*Capparis spinosa*). It has an agreeable pungency of taste, with a slight bitterness, and has long been in very general use as a condiment and ingredient of sauces. It possesses medicinal properties, being an antiscorbutic, stimulant, and laxative. It is of a grayish-green color, to improve which copper is sometimes used. The caper bush is a native of the Mediterranean countries. It is extensively cultivated in some parts of the south of France and in Italy, but most of all in Sicily. It succeeds in the open air even at Paris, but in Great Britain it requires the aid of artificial heat. In the northern United States capers are propagated by cuttings in greenhouses, but they are grown from seed in the South. It is a trailing, rambling shrub, loving dry places and often growing on rocks or walls. It begins to flower early in summer, and continues flowering till winter. The buds are gathered every morning, and are immediately put into vinegar and salt. At the end of the season they are sorted according to their size and color, the greenest and least expanded being the best, and are again put into vinegar, the finest being sent to the market in bottles, the coarser, in small barrels. The fruit, which is a small berry, is also pickled in the south of Italy. The flower buds of the caper of Mount Sinai (*Capparis sinaica*) are pickled like those of the common species; the seeds are also pickled and are called by a name signifying mountain pepper. The fruit of *Capparis aphylla* is made into a pickle in India. The species of *Capparis* number about 150, and are found in most tropical and subtropical regions, except North America. Various substitutes for caper are sometimes used, as the flower buds of the marsh marigold (*Caltha palustris*), those of the Indian cress, or so-called nasturtium (*Tropæolum majus*), and those of the bean caper (*Zygophyllum fabago*) and of the bladder nut (*Staphylea trifolia*). The caper tree (*Capparis jamaicensis*), which grows throughout the West Indies, in South America, and in Florida, is a small tree with a very hard wood. The caper of England is a spurge, belonging to the genus *Euphorbia*. It has no relationship with the foregoing. For illustration, see Plate of CAMELIA, ETC.

CAPE RACE. A cape forming the southeast extremity of Newfoundland, in lat. 46° 40' N. and long. 53° 4' W. (Map: Newfoundland, G 6). It has a lighthouse, with light 180 feet above the water. This is an important beacon for the

transatlantic vessels passing between Europe and northern North America.

CAPERCAILLIE, kā'pēr-kāl'yī, or **CAPERCAILZIE**, kā'pēr-kāl'zī or -kāl'yī (of uncertain etymology, possibly from Gael. *cabhar*, hawk + *coille*, wood; according to some, from Gael. *capull-coille*, from *capull*, mare, Lat. *caballus*, horse + *coille*, or from Gael. *cabhar* + *coileach*, wood), **WOOD GROUSE**, or **COCK OF THE WOODS**. A European grouse (*Tetrao urogallus*), almost equal in size to the turkey. The adult male is brownish black, minutely freckled with grayish white, and with lighter brown; quill feathers, dark brown; tail feathers, nearly black; chest, a shining dark green; there is a small scarlet patch of naked skin above the eye, and the bill is whitish. The general color of the smaller female and of young males is dark brown, freckled with yellowish brown; the front of the neck and the chest are yellowish chestnut, and the feathers of the under parts are generally edged with white; the feet are feathered to the toes. It is an inhabitant of pine woods; feeds on berries, seeds, worms, insects, etc., and on the young shoots of the pine, birch, and other trees. The female makes her nest on the ground, and lays from six to twelve eggs, of a pale reddish or yellowish brown, spotted with other shades of brown, and more than two inches long. Like the blackcock, the capercaillie is polygamous, and is noted for its extraordinary "dances" in courtship. In spring, on the approach of the breeding season, the cock "mounts to the topmost boughs of a tall tree, whence he challenges all comers by extraordinary sounds and gestures, while the hens . . . timidly abide below the result of the frequent duels, patiently submitting themselves to the victor." During these antics the bird seems oblivious to all else, and may easily be approached. The capercaillie is found on the pine-covered mountains of all parts of Europe and a related species (*Tetrao urogalloides*) is abundant in the northern parts of Asia. It once lived in Scotland and Ireland, where it was completely extirpated towards the end of the eighteenth century, but has been restored to the forests of northern Scotland by stock imported from Scandinavia. The capercaillie is readily domesticated, if allowed the range of a space containing a few pine trees, and is much esteemed for the table. It is hunted with the aid of dogs, who "tree" the birds, when they are shot down. Consult: Lloyd, *Game Birds of Sweden and Norway* (London, 1867); Morris, *British Game Birds* (London, 1891); Darwin, *Descent of Man* (London, 2d ed., 1874); and especially Millais, *The Natural History of British Game Birds* (London, 1909). See Plate of GROUSE, ETC.

CA'PERN, EDWARD (1819-94). An English poet, known as the "Rural Postman of Bideford." He was born at Tiverton, Devonshire, was a lace maker until his sight failed in 1847, and then was a postman at Bideford until, through Landor's influence, he obtained a pension from the English civil list. His productions, which are marked by freshness and melody, include: *Poems by the Bideford Rural Postman* (1856; often republished); *Ballads and Songs* (1858); *Wayside Warbles* (1865; 2d ed. 1870); *Sun-Gleams and Shadow-Pearls* (1881); and *The Devonshire Melodist*, which includes the author's own music to some of his songs.

CAPER'NAUM (Gk. *Καπερναούμ*, *Kapernaoum* or *Καφαρναούμ*, *Kapharnaoum*, Heb. *Kaphar Na-*

hum, village of Nahum). A town of Galilee frequently mentioned in the gospel history. When Jesus began his Galilean ministry He made it his home (Matt. iv. 13). In fact, so closely did He identify himself with it that it is called "his own city" (Matt. ix. 1). Though it was the scene of many of his miracles and wonderful discourses, it remained spiritually uninfluenced by his work, and with Chorazin and Bethsaida had its ruin foretold by Jesus (Matt. xi. 20-24). In the gospel times it was a place of considerable importance. It was the seat of a Roman garrison, whose commander had built the people a synagogue (Luke vii. 1-10), and the residence of a representative of Herod Antipas (John iv. 46). It was also a customs station, from which Matthew was called to be an Apostle (Matt. ix. 9). There has been much discussion as to its site, as it is mentioned only in the New Testament. Two localities are favored by authorities—*Tell Hûm* and *Khân Minyeh*, both on the northwest coast of the Sea of Galilee, not far distant from each other. At *Tell Hûm* many extensive ruins have been found, some of which have been supposed to be those of the synagogue in which Jesus taught. The opinion of scholars is increasingly favorable to this site, in view of the fact that the name Capernaum was not confined to the city but was applied to the general district surrounding it, which would bring the place into that connection with the plain of Gennesaret which is implied in the New Testament notices (cf. John vi. 17 with Mark vi. 53) and in statements by Josephus (*Wars*, iii, 10: 8). Consult, in behalf of the claims of *Tell Hûm*, Buhl, *Die Geographie des alten Palästine* (1896), and Sandiday, in *Journal of Theological Studies*, pp. 42 ff. (1904); for *Khân Minyeh*, G. A. Smith, *The Historical Geography of the Holy Land* (1895).

CA'PERS, WILLIAM (1790-1855). An American clergyman, Bishop of the Methodist Episcopal church, South. He was born in South Carolina, studied in South Carolina College, became an itinerant preacher, and was a missionary among the Indians in Georgia (1821-24). He was for four years presiding elder in Charleston, where he edited for a short time the *Wesleyan Journal* (founded 1825; in 1826 merged in the *New York Christian Advocate*). He did home missionary work, especially among the negroes. In 1837 he established and edited the *Southern Christian Advocate*. At the first general conference of the Methodist Episcopal church, South, in 1846, he was chosen Bishop. Consult the autobiography, with a memoir by Wightman (Nashville, Tenn., 1858).

CAPE SABLE. The southernmost point of the mainland of Florida, and of the mainland of the United States as well (Map: Florida, C 4). It is in lat. 25° 8' N. and long. 81° 7' W., and projects slightly into the Bay of Florida.

CAPE SABLE. The southernmost point of Cape Sable Island, off the south coast of Nova Scotia, Canada (Map: Nova Scotia, D 5).

CAPE SAINT GEORGE. A cape on the west end of St. George Island, off the west coast of Florida, about 10 miles south of Apalachicola, Franklin County (Map: Florida, D 2). The Cape St. George lighthouse is in lat. 29° 35' N. and long. 85° 2' W., about 3½ miles east of the west pass entrance to Apalachicola Bay on Flag Island. The light is 72 feet above sea level, and is fixed white.

CAPE SAINT VIN'CENT. A headland at the southwest extremity of Portugal in about

lat. 37° N. and long. 9° W. (Map: Portugal, A 4). Off this cape the British, under Admiral Jervis, defeated a Spanish fleet Feb. 14, 1797.

CAPE SAN BLAS, sãn blàs'. A cape on the west coast of Florida, in Calhoun County, the southern point of the neck of land which separates San Blas Bay from St. Joseph's Bay (Map: Florida, C 2). It is about 20 miles nearly west of Apalachicola. Cape San Blas lighthouse is at the southernmost point of the cape in lat. 29° 40' N. and long. 85° 21' W. The light is 98 feet above the sea level and flashes alternately red and white, the interval between flashes being 30 seconds.

CAPE SAN LUCAS, lōō'kas. The southernmost point of the peninsula of Lower California, Mexico, in about lat. 22° 50' N. and long. 109° 54' W. (Map: Mexico, D 6).

CAPE SAN ROQUE, sãn rō'kã. A promontory on the extreme northeast coast of Brazil, situated in lat. 5° 30' S. and long. 35° 14' W. (Map: Brazil, K 5).

CAPE SPAR'TIVEN'TO (ancient *Herculis Promontorium*). The southeast promontory of Italy, in lat. 37° 57' N., long. 16° 5' E., once regarded as the southernmost point of Italy (Map: Italy, L 10).

CAPET, HUGH. See HUGH CAPET.

CAPETIAN (kã-pē'shan) **DY'NASTY** (Fr. *Capétiens*). The royal line in France from 987 to 1328. On the death of Louis V, the last of the Carolingians, in 987, Hugh Capet was elected King by the aid of the clergy. From that time, for 341 years, all of the rulers of France belonged to the same family, and in almost every instance the son succeeded the father. The kings of the Capetian dynasty strengthened greatly the royal power in France by insisting upon the principles of heredity, primogeniture, and the indivisibility of the crownlands, which they strove to increase. In the same year that he was crowned, Hugh caused his son Robert to be elected as his associate, and his practice was followed until 1179, when Philip Augustus was crowned as his father's associate. By that time the hereditary principle was so firmly established that it was no longer necessary for the son to be chosen during his father's lifetime. The Capetians broke entirely away from the Merovingian and Carolingian custom of dividing the kingdom among all the sons. The eldest son alone became King and received the royal domain, except for appanages, and in this way the kingdom was saved from the divisions which had weakened the Carolingian Empire. The Capetians also by a forced interpretation of the Salic Law excluded females from the succession. (See HUNDRED YEARS' WAR.) Most of the Capetians endeavored to add to the royal domain by the incorporation of additional fiefs, large or small, and thus gradually obtained the direct lordship over almost all of France. This process was very rapid under Louis VI, Philip Augustus, Louis IX, and Philip IV. The Capetian dynasty was succeeded by the Valois dynasty.

The rulers of the line were: Hugh Capet, 987-996; Robert II, 996-1031; Henry I, 1031-60; Philip I, 1060-1108; Louis VI, 1108-1137; Louis VII, 1137-80; Philip II Augustus, 1180-1223; Louis VIII, 1223-26; Louis IX, 1226-70; Philip III, 1270-85; Philip IV, 1285-1314; Louis X, 1314-16; Philip V, 1316-22; Charles IV, 1322-28.

CAPE TOWN. The capital of the Province of the Cape of Good Hope and the foremost

seaport of British South Africa (Map: Cape Colony, F 8). It is situated on Table Bay, on a slope of Table Mountain, in lat. $33^{\circ} 56'$ S. and long. $18^{\circ} 28'$ E. It is well built with fine streets and squares and all the improvements of a modern city, including electric lighting. The public buildings as well as the private residences are in modern European style, and the entire aspect of the place, with the exception of the heterogeneous crowds in the streets, is essentially European. The climate is comparatively moderate and healthful, and the water supply excellent. There are a cathedral, several churches of different denominations, a synagogue, and several mosques. The houses of Parliament, the municipal buildings (completed in 1906), and those of the Supreme Court, and the banks are among the chief secular edifices. Cape Town has several colleges and an examining university, the South African Museum, a library, and an observatory, besides a number of schools for elementary and secondary education. The harbor has been improved by a breakwater of gigantic proportions and is divided into several parts, of which the inner harbor is sufficiently deep for the heaviest vessels. The entrance to the harbor is defended by a castle which is the headquarters of the military forces of the colony. Cape Town has an American consulate. The tonnage landed here in 1910 was 688,250; 1911, 732,732; shipped, 1910, 156,087; 1911, 262,630. The exports of merchandise to the United States in 1911 were valued at \$662,135.

Cape Town is the seat of a Catholic and an Anglican bishop, and of a number of consular representatives, including one from the United States. Pop. (white), 1904, 44,203; 1911 (white), 29,863; (white and colored), 67,170; (with suburbs), 149,461. Cape Town was founded in 1652 by the Dutch, in whose possession it remained until 1806, when it was taken possession of by England.

CAPE VERDE, vûrd. The most westerly headland of Africa, in Senegal, jutting out into the Atlantic Ocean, nearly midway between the rivers Gambia and Senegal, in lat. $14^{\circ} 43'$ N., long. $17^{\circ} 34'$ W. (Map: Africa, C 3). It was discovered by the Portuguese about 1445, and is said to have derived its name from a group of gigantic baobab trees which adorns its summit and forms a green spot on the white coast.

CAPE VERDE ISLANDS (*Ilhas de Cabo Verde*). A group of islands in the Atlantic Ocean, west of Africa, belonging to Portugal, situated between lat. $14^{\circ} 45'$ and $17^{\circ} 19'$ N., and between long. $22^{\circ} 45'$ and $25^{\circ} 25'$ W. (Map: Africa, B 3). The ten principal islands are Santiago (São Thiago), the largest and most important, Fogo, Brava, Maio, Boavista, São Nicolão, Santo Antão, São Vicente, Santa Luzia, and Sal. Including the four uninhabited islets, the total area of the group is officially given as 3927.5 square kilometers (1516 square miles). The islands are all very mountainous, and owe their origin to the action of submarine volcanoes. The only active volcano is situated on the island of Fogo and has an altitude of 9744 feet. The climate is hot and unhealthy, and the droughts which occasionally visit the islands are frequently followed by famines. Sugar, coffee, tobacco, indigo, and millet are cultivated, and some southern fruits are successfully grown. The physic nut (*Jatropha curcas*) is also produced for export. Several of the Euro-

pean domestic animals thrive well. Marine turtles abound. Great quantities of salt formed by solar evaporation are obtained from the lagoons on the shores, especially on the island of Sal. The total imports and exports for the year 1909 were valued at 1,909,634 and 235,894 milreis respectively. The exports consist of raw products, coffee, hides, salt, sugar, fish, etc.; while the imports include coal and all kinds of manufactured articles. The chief ports are Praia, the capital, on the island of Santiago, and Porto Grande, which has the best harbor in the whole group, on the island of São Vicente. The group is administered by a governor. The population was 142,552 in 1910 (4718 whites, 87,249 colored, 50,585 negroes). The islands were discovered in 1441 by the Genoese seafarers Antonio and Bartolomeo di Nolli, and were annexed to Portugal in 1456. Consult: Ellis, *West African Islands* (London, 1885); Fea, *Delle Isole del Capo Verde* (Rome, 1899); Lima, "Rapport sur les îles du Cap Vert," in *Recueil consulaire*, vol. cx (Brussels, 1900).

CAPE VIN'CENT. A village and port of entry in Jefferson Co., N. Y., 25 miles west by north of Watertown, on the St. Lawrence River, and on the New York Central and Hudson River Railroad (Map: New York, D 1). Steamers ply between this place and Kingston, Ontario. It is a popular summer resort, and contains a United States fish hatchery, a receiving station and storage plant for wood pulp, creamery, split-pea manufactory, and a government customs office. The water works and electric light plant are owned by the municipality. The value of its exports in 1912 was \$217,799, and its imports, \$303,486. Pop., 1900, 1310; 1910, 1155.

CAPE WRATH. The northwest extremity of Scotland, in Sutherlandshire, a pyramidal promontory 523 feet high (Map: Scotland, C 1). It is noted for its wildness and grandeur, and projects into the Atlantic in lat. $58^{\circ} 38'$ N. and long. $4^{\circ} 58' 5''$ W. Its lighthouse is visible 27 miles.

CAP'GRAVE, JOHN (1393-1464). An English historian and theologian. He was born at Lynn, was ordained a priest about 1418, and was afterward made provincial of the Augustinian Order in England. His works include Latin commentaries on the Bible; a *Life of Saint Katharine*, in English verse; *A Chronicle of England from the Creation to A.D. 1417*; *A Guide to the Antiquities of Rome*; and *De Illustribus Henricis*. The last work and the chronicle were edited by F. C. Hingeston, in the *Rolls Series* (London, 1858).

CAPH'TOR. The original home of the Philistines, Deut. ii. 23, Amos ix. 7, who are therefore called Caphtorim, Gen. x. 14, Deut. ii. 23. Crete is meant. Recent discoveries render this identification practically certain. The Chere-thites (q.v.) are so constantly coupled with the Philistines, or the Pelethites, that they would seem to form a branch of the same family, and there is no good reason to doubt that the Chere-thites are Cretans. The Zeus Cretagenes in Gaza also points to a connection of the Philistines with Crete. Caphtor is found in the form of Kptar, as the name of a people in an inscription at Ombos. The Eteocretans were called Kafti by the Egyptians. (See also JAPHETH.) Even if the original text in Jer. xlvii. 4 did not have Caphtor, as it is lacking in the Greek version, the Hebrew recension refers to Crete.

Consult: Hall, "Keftiu and the Peoples of the Sea," in *Annual of the British School*, vol. viii, pp. 157 ff. and cf. vol. x, p. 154, vol. xvi, p. 254; W. M. Müller, in *Mitteilungen der vorderasiatischen Gesellschaft* (1900); Ed. Meyer, *Geschichte des Altertums*, i, 2, pp. 798 ff. (3d ed., 1913).

CAPIAS (Lat., you may take, or seize, from *capere*, to take). A writ in a civil action ordering the officer to whom it is directed to seize and take into custody the person of the defendant. Strictly speaking, a *capias* issues only in a common-law proceeding, as distinguished from one in equity. The abolition of imprisonment for debt has greatly diminished the number of cases in which the defendant may be arrested in a civil action, but the right of an arrest in almost all, if not all, of the States still exists where a willful and malicious injury or a fraudulent concealment of property, or proposed evasion of the jurisdiction of the court, is alleged. Usually an affidavit must be presented on which to base the application for a writ of *capias*. Of the several kinds of *capias* the most common are: 1. The *capias ad respondendum*, which directs the sheriff to arrest the defendant and hold him until a certain day on which he is to be brought before the court. Formerly every action at law was instituted by this process; now the cases in which it is employed are rare and are strictly limited and defined by statute. When used alone the word *capias* usually refers to this form of writ. 2. *Capias ad satisfaciendum*; a writ directing the officer to seize the party to the suit named (this may possibly be a plaintiff, though usually a defendant) and bring his body on a fixed day before the court to satisfy a judgment already issued. It will be seen that this was at the end, as the former writ described was at the beginning, of lawsuits under the common law; though the use of this writ is now much restricted by statutory limitations, it is still a common-law process; it is familiarly known in the legal profession by the abbreviation *ca. sa.* 3. *Testatum capias*, a supplementary or second writ, issued when an ordinary *capias* has been placed in the hands of the sheriff and has been returned with the indorsement that the defendant could not be found. In such cases the new writ may be issued after a lapse of time without the introduction of other proof than the production of the original. None of these writs are common in England or in the United States at present. See ARREST; ATTACHMENT; EXECUTION; HABEAS CORPUS.

CAPILLARIES (Lat. *capillaris*, belonging to the hair, *capillus*, hair, from *caput*, head). The tubes which convey the blood from the left side of the heart to the various parts of the body are termed arteries, while those which return it to the right side of the heart, after it has discharged its various functions in the body, are known as veins. Capillaries are the minute vessels which form the connection between the terminal branches of the arteries and the commencements of the trunks of the veins. These little vessels vary in diameter from $\frac{1}{2000}$ to $\frac{1}{3000}$ of an inch; they are smallest in the brain and largest in the marrow of bone. Their arrangement also varies. In some cases, as in muscular tissue, they run parallel to one another; in other cases, as around fat cells, they have a spherical arrangement, and in the skin and in parts of the intestines they form loops. The walls of capillaries are exceedingly thin and

readily permeable; they are surrounded by lymph, and there is a constant interchange of material between the blood plasma within the capillaries and the lymph outside. It is thus that the processes of nutrition and elimination are carried on, and the necessary exchange of oxygen and carbonic acid takes place.

The circulation of the blood through the capillaries may be readily seen under the microscope in the web between the toes of the hind foot of the frog, in the tongue of that animal, in the tail or gills of the tadpole, in the wing of the bat, etc. See BLEEDING; BLOOD VESSELS; DIGESTION; SECRETION.

CAPILLARITY. That branch of physics which considers the properties of liquid surfaces. The fundamental property of such surfaces is their tendency to contract. This is shown by the fact that a liquid surface always assumes the smallest area compatible with the existing conditions. Thus falling drops of liquids are spherical; and it is known from geometry that the area of the surface of a sphere is less than that of any other solid of an equal volume. If a soap bubble is not detached from the pipe, it will contract when the mouth of the one who blows the bubble is removed. Again, it requires work to blow a bubble; and this proves that there is a force opposing the increase in area of the bubble. It should be noted that when a soap bubble is blown, it is not a question of *stretching* the surface, but of making more surface by forcing some of the liquid from the interior out to the surface. (The liquid film finally becomes so thin that this is impossible, and then the surface may be stretched.)

This contracting power of a liquid surface explains the phenomena observed when tubes of fine bore are partially lowered into a liquid. (The word "capillarity" is derived from this fact, because these tubes must be comparable with the size of a hair, the Latin word for which is *capillus*.) If the material of the tube is such that it is "wet" by the liquid, i.e., if when dipped into liquid and then withdrawn there is a liquid film sticking to it (e.g., glass and water), it will be observed that, if the tube is first immersed in the liquid and then placed vertical, only dipping into the surface, the level of the liquid in the tube is higher than that outside by an amount which varies inversely as the radius of the bore. The surface of water inside the tube is like the inside of the finger of a glove, being a lining of the upper portion of the tube and including the top of the liquid column. This surface contracts,

CAPILLARY ACTION BETWEEN GLASS AND WATER.

rounding off the corners so as to be concave upward, and drawing the column of liquid up the tube, until stopped by the action of the gravity on the portion of liquid above the general level. Illustrations of this capillary action are given by the use of blotting paper, the action of a lump of sugar on water, the action of wicks in lamps and candles, etc.

If, on the other hand, the solid is one which is not wet by the liquid (e.g., glass and mercury), the level of the liquid inside the tube will, under similar conditions, be lower than that of the level outside. In this case the surface of the liquid in the tube is like the outside of the finger of a glove; and, as it contracts, it rounds off the corners, makes the surface convex upward, and draws the level down. The depression will be found to vary inversely as the radius. The fact that the smaller the radius of a surface, so much the greater is the contracting is shown also by another experiment; a tube for blowing soap bubbles is so made that two bubbles can be blown at one time on opposite ends of a connecting tube; if one bubble is blown larger than the other, and if the bubbles are then left to themselves, it will be observed that the smaller increases in size, blowing out the larger one. This proves that the pressure produced inside the smaller bubble by its contraction is greater than that in the larger. It is seen, therefore, that the pressure varies inversely as the radius; and to start a bubble *ab initio*, i.e., with a radius infinitely small, would require an infinitely great pressure. In fact, it is observed that bubbles of vapor in a boiling liquid or of gas in aerated liquids nearly always have a minute nucleus of dissolved gas to begin on. The presence of a solid with sharp points also facilitates the formation of bubbles, because the liquid surface can start around them. Similarly, the pressure inside a liquid drop varies inversely as the radius; and to start a drop from an infinitely small radius presupposes an infinite pressure. Thus drops of liquid are always condensed around some nucleus, such as a particle of dust or the points of a solid. Drops of rain have, in general, bits of dust inside; dew is formed on rough objects more quickly than on smooth ones, etc.

This contracting power of a liquid surface is greatly affected by the introduction of impurities into the surface and by changes in temperature. Soapy water has less contracting power than pure water; and the motions of bits of camphor or of sodium or potassium on the surface of water are explained by the unequal rates of pollution of the surface at various points of the solid and the consequent unequal alterations in the surface forces, which thus pull the solid bit around in a most random path. If the temperature is raised, the surface forces decrease, as is shown by the fact that the height to which water stands in a glass tube decreases as the temperature increases.

These contracting tendencies of a liquid surface are due to the action of the minute particles of the surface; there are evidently forces holding these particles together. The force acting across a line of unit length is called the "surface tension," and it may be proved that if there is a spherical surface of radius r , there will be a contracting pressure given by the formula

$$p = 2T/r,$$

where T is the surface tension of the liquid. Thus, to keep a soap bubble of radius r from contracting, it is necessary to blow into it with a pressure $4T/r$, because there are *two* contracting surfaces in a soap bubble. Further, if the liquid stands in a tube of small bore at a height h above the general level of the liquid, the hydro-

static pressure due to this height must be counterbalanced by the contracting pressure of the concave surface of the water in the tube. This hydrostatic pressure is dgh , where d is the density of the liquid and g is the acceleration of a falling body. (See HYDROSTATICS.) Hence,

$$dgh = 2T/r$$

$$\text{or } h = \frac{2T}{dgr},$$

where r is the radius of the tube *at the point at the top of the column of water*, because, strictly speaking, r is the radius of the spherical concave surface of the water, and this equals the radius of the tube at this point if the liquid wets the tube. Therefore it is entirely immaterial what the radius of the tube is at other points below; the height h remains the same.

For most interesting and instructive descriptions of capillary phenomena, consult Boys, *Soap Bubbles, and How to Blow Them* (New York, 1900; new ed., London, 1912). Consult also: Raleigh, "Investigations in Capillarity," in *London, Edinburgh, and Dublin Philosophical Magazine and Journal of Science*, 5th series, vol. xlviii, pp. 321-337 (London, 1896); id., on "Laplace's Theory of Capillarity," in his *Scientific Papers*, vol. ii, and various other essays in the same series (Cambridge, 1900 et seq.); Mensbrugghe, "Sur les phénomènes capillaires," in *Congrès international de physique, Rapports*, vol. i, pp. 487-511 (Paris, 1900).

CAPISTRANO, kä'pê-strä'nô, GIOVANNI (c.1386-1456). An Italian friar, commander against the Turks. He was born at Capistrano, in the Abruzzi. In his early manhood he pursued the practice of the civil and canon law in Naples. In 1416 Capistrano entered the Franciscan Order, and soon attained prominence through the fiery zeal he displayed against nonbelievers and heretics. He was sent, in 1450, as papal delegate to Germany to preach against the Hussites and to urge a crusade against the Turks, who threatened western Europe. While in Germany, he instigated a persecution against the Jews of Silesia. Having failed in his efforts to unite the German princes in a crusade against the Turks, he is said to have collected an army of 60,000 men, which he led into Hungary to the relief of Belgrade, then besieged by the Turks (1456). He led the inhabitants in three successful sorties, cross in hand. He died as a result of his exertions during the siege; he was beatified in 1690 and canonized in 1724 by Benedict XIII. See HUNYADY, JÁNOS. Consult Jacob, *Johannes von Capistrano* (2 vols., Breslau, 1903-05).

CAPITAL (Lat. *capitellum*, dim. of *caput*, head). The head or top member of a column, pier, pilaster, etc., when treated as separate from the shaft. For the history and different types of the capital, see COLUMN; ORDERS OF ARCHITECTURE.

CAPITAL (Fr. *capital*, ML. *capitala*, from Lat. *capitalis*, pertaining to the head, from *caput*, head; for the origin of the meaning cf. *principal*, in the sense of capital). A stock or fund of wealth from which its owner expects to derive an income. As commonly used, the term "capital" is applicable only to wealth devoted to business purposes. Thus a man of affairs will place under the head of capital the land, buildings, stocks of raw materials, etc., through which he secures a money income. He will not describe as capital his dwelling and its accessories. This

distinction between wealth which yields a money income and wealth which yields its ultimate satisfactions directly to its owner has been rejected as fruitless by a school of modern economists, of whom Prof. Irving Fisher is the leading representative. Capital, according to this school, is the whole stock of wealth existing at a moment of time. It is to be contrasted with income, or the services derived from wealth through a period of time. It is to be noted that while this conception differs from that current among business men, it is essentially nothing more than a logical development of that conception.

In classical political economy the term "capital" designates, not the whole stock of wealth, but only such part of it as is itself the product of past industry and is employed as a means of further production of wealth. This excludes, on the one hand, finished goods in the possession of the ultimate consumer, and, on the other hand, productive goods not originating in human industry, such as land, ore deposits, etc. Income from capital, in this narrow sense of the term, was designated "profit" (in the terminology of later classical writers, interest), while the income from natural resources was termed "rent." Capital in the classical sense is further differentiated as "fixed" and "circulating." Fixed capital, according to Mill, consists of all the more or less durable instruments of production, such as buildings, machinery, etc. Circulating capital consists of instruments capable of only a single service, such as raw materials, fuel, and also the funds employed in the payment of wages. The distinction was regarded by the classical economists as of great social importance, since they believed that aggregate wages were limited by the amount of circulating capital. (See WAGES FUND.) With the general recognition of the fact that the relation between capital and wages is far less simple than the classical economists supposed, the distinction between fixed and circulating capital has fallen into disuse. Some economists follow Professor Clark in substituting therefor the distinction between active capital—that which imparts utility, as a machine—and passive capital—that which has utilities imparted to it, as raw material.

A further distinction that has gained currency among economic writers is that between productive capital and acquisitive capital. Productive capital is a category of production as well as of distribution; acquisitive capital is a category of distribution alone. An example of the former is a machine or a stock of materials; examples of the latter are shares in the public debt, possession of monopoly powers, etc. Destruction of productive capital would result in reduction of the social income; destruction of acquisitive capital would merely change the distribution of social income.

Present-day adherents of the narrow classical definition of capital defend their position, not on grounds of abstract logic, but on grounds of social policy. The capital which is the result of past industry originates, in a sense, in abstinence. It is only because some persons are willing to forego present consumption that productive power is diverted from the making of enjoyment goods to the making of instruments for further production. Lands, ore deposits, etc., exist independently of human choices; buildings and machinery do not. So long as private enterprise prevails, the man who chooses to forego

present consumption in order to increase the productive equipment of society can demand and receive a reward in the shape of profit (interest). Abolition of such rewards would be tantamount to the destruction of the system of private enterprise. The rewards received by the private owners of land and other natural resources are in no sense a condition of the employment in industry of such resources. It is contended by many that all such rewards should be confiscated by the state. (See SINGLE TAX.) Others, less extreme, believe, nevertheless, that a distinction should be made between the two forms of profit-yielding wealth in the fiscal policy of the state. On such grounds many economists cling to the classical distinction between land and capital, in spite of its discrepancy with business usage.

Among socialistic writers the term "capital" is used to designate any form of wealth that yields an income independently of the exertions of the owner. An artisan's tools, a small proprietor's holding of land, are not capital in this sense. Capital, as a social category, comes into existence when one body of men own the means of production, while another body of men, possessing nothing but their physical and mental powers, utilize the means of production for the owner's benefit, receiving bare wages as their reward. In the socialistic view capital is essentially a private monopoly of the means of production, and the return to capital is the surplus remaining after the claims of the laborer have been met. It is usual to define these claims in terms of the minimum of subsistence. The general social system in which capital dominates is designated as "capitalism."

Capital in this sense of the term reached a considerable development in classical antiquity, but practically disappeared in western Europe with the breakdown of the Western Empire. It gradually reasserted itself with the commercial development following the Crusades and developed rapidly in the era opened by the discovery of America. The Industrial Revolution (q.v.) greatly extended the domination of capital. Survivals of an earlier order remain in limited fields, such as the peasant holding of land and the handicrafts; but these are in many instances indirectly dominated by capital. According to the socialistic doctrine of social evolution, the domination of capital will finally become universal. When this point has been reached, it is predicted by the Socialists, a revolution, either sudden and violent or gradual and peaceful, will occur, which will vest all the means of production in a coöperative commonwealth. Such an event would involve the disappearance of capital, as defined by the Socialists. See SOCIALISM.

For the classical economic doctrine of capital, consult Mill, J. S., *Principles of Political Economy* (first published London, 1848; many subsequent editions). For a critical discussion of the relation between capital and wages, consult Taussig, *Wages and Capital* (New York, 1899). The current economic conceptions of capital and its functions are best expounded in Böhm-Bawerk, *Capital and Interest* (London, 1890) and *Positive Theory of Capital* (London, 1891); Marshall, *Principles of Economics* (3d ed., London, 1895); Clark, *The Distribution of Wealth* (New York, 1899); Fetter, *The Principles of Economics* (New York, 1904); Fisher, *The Nature of Capital and Income* (New York, 1906).

For the socialistic conception of capital, consult Marx, *Das Kapital* (1867-95; most available Eng. trans., Chicago, 1908-09). For the development of capital as a social system, consult Hobson, *The Evolution of Modern Capitalism* (London, 1896), and Sombart, *Der moderne Kapitalismus* (Leipzig, 1902). See CAPITAL ACCOUNT; POLITICAL ECONOMY; INTEREST.

CAPITAL ACCOUNT. A statement of the amount and value of the property of an enterprise at a given moment of time. Such an account consists of two columns, representing assets and liabilities. In arriving at the capital balance all property owned is placed in the assets column, while all debts and obligations, including the claims of the owners upon the enterprise for sums invested and profits earned, are entered in the liabilities column.

The term "capital," as employed in capital accounts, may represent the actual net balance of property owned less obligations other than those to the owners of the enterprise; it may represent the sums originally invested; or it may represent the par value of outstanding shares, or even of outstanding shares plus shares authorized but not issued. The first sense is common in the case of the individual enterprise; the second in the case of partnerships. In the latter case the capital account contains separate entries for the sums contributed by the several partners. Capital is employed in the sense of capitalization, outstanding or authorized, in corporation accounts. In the course of time the net balance of property of the corporation inevitably ceases to correspond with the book capital. Gains which are capital in the broader sense of the term are carried on the books of the corporation as "surplus" or "undivided profits." A similar procedure is not uncommon in partnership accounts. See CAPITAL.

CAPITAL OFFENSE. In English and American law a criminal offense for which, on conviction, the penalty of death may be awarded. The number of such offenses was formerly very large, especially in England, where, in the eighteenth century, every felony, with the exception of petit larceny and mayhem (qq.v.), was punishable with death. A series of legislative enactments dating from 1832 has gradually reduced the number of capital offenses in England to four (treason, willful murder, piracy, and the destruction or attempted destruction of royal arsenals, ships, etc.), and in the United States generally to two (treason and willful murder). In a few States, as in a few countries of western Europe, capital punishment has been wholly done away with. See CAPITAL PUNISHMENT, and consult the authorities there cited, especially Stephen, *History of the Criminal Law of England*, vol. i, p. 72, and Pollock and Maitland, *History of English Law*, vol. ii. chap. 8.

CAPITAL PUNISHMENT. Punishment by death. It is generally considered to be the severest penalty which the courts may prescribe, and the number of offenses for which it is inflicted is everywhere diminishing. Indeed, this extreme penalty, notwithstanding the practice of the world from the remotest times down to the present day, has frequently been opposed by philosophers and philanthropists upon religious and ethical grounds as well as upon those of expediency. Mr. Bentham points out that the death penalty naturally suggests itself in the infancy of a state as the best method of preventing crime, inasmuch as it extirpates the

criminals. Such Scripture passages as the words, "Whoso sheddeth man's blood, by man shall his blood be shed" (Gen. ix. 6), are urged in justification of the death penalty for murder. Beccaria, the first modern author of eminence to combat capital punishment, denies the right of government to take human life under any circumstances and maintains that it is a less efficacious method of deterring others than the continued example of a living culprit condemned to repair, by laboring as a slave, the injury he has done to society. The principles of punishment in general have been thus clearly stated by Plato (*Gorgias*, § 525): "Every one who undergoes punishment, if that punishment be rightly inflicted, ought either to be made better thereby and profit by it, or serve as an example to the rest of mankind, that others, seeing the sufferings he endures, may be brought by fear to amendment of life." The question arises, then, does capital punishment deter men from committing those crimes for which it is inflicted? This question cannot be answered conclusively, since in some cases the abolition of capital punishment has been followed by an increase in the more serious forms of crime, while in other cases a decrease has been established. In the United States, where murder is punished by death with comparative infrequency, the crime is far more common than in England, where conviction for murder is usually followed by execution. Death was in former times, in England, the ordinary punishment for all felonies. Blackstone refers to 160 offenses as punishable with death, some of them of a nature which appears to us trivial, e.g., cutting down a tree or personating a Greenwich pensioner. Thanks to the exertions of Sir Samuel Romilly, this severe criminal code gave way towards the end of the reign of George III to more humane conceptions. Since the Statute of 1861 there remain in England only four crimes punishable by death—setting fire to the royal dockyards or arsenals, piracy with violence, treason, and murder.

In William Penn's code of laws for Pennsylvania murder and treason were the only crimes punishable by death, while in the Colony of Massachusetts there were 12 capital offenses. In the United States each State has jurisdiction over its own territory, and the laws punishing crime differ in several respects. Capital punishment may be inflicted for treason, murder, arson, rape, piracy, robbery of the mails with jeopardy to the lives of persons in charge, rescue of a convict going to execution, burning a vessel of war, and corruptly destroying a private vessel. In Michigan, Wisconsin, Rhode Island, Maine, and Kansas capital punishment has been abolished. In Iowa the Legislature, having once abolished the death penalty, felt constrained by the alleged increase of crimes of violence to restore it. Capital punishment has, moreover, been done away with in Holland, Rumania, Italy, and Portugal, and since 1863 has been practically abandoned in Belgium. In Switzerland it was totally abolished in 1874, but owing to a marked increase in the number of murders, the cantons in 1879 recovered the right to reestablish it in their respective territories. Seven cantons again introduced it, although for a number of years no death sentence was passed. In the remaining 15 cantons, including more than four-fifths of the population, the death penalty remains totally abolished. In many European countries which still enforce this

penalty, only a very small per cent of those condemned are actually executed.

The method of execution is by hanging in Great Britain, Austria, Russia, and the great majority of commonwealths in the United States; by beheading in Germany and France; and in Spain by means of the garrote. Execution by electricity was introduced in New York by the law of June 4, 1888; it has been adopted in Massachusetts, and its adoption has been advocated in other States. In military law, owing to the necessity for enforcing strict discipline, capital punishment holds a more important place than in the ordinary criminal code. Consult: Copinger, *An Essay on the Abolition of Capital Punishment* (London, 1876); Moir, *Capital Punishment* (London, 1865); N. M. Curtis, *Capital Crimes* (New York, 1894); K. Olivecrona, *De la peine de mort* (Paris, 1893). See ELECTROCUTION; EXECUTION; GARROTE; GUILLOTINE; HANGING; PENOLOGY; PUNISHMENT.

CAPITALS. The name applied to letters of larger size than the smaller and more usual characters of the same value in a font of type. Besides differing in size the larger sizes vary somewhat in form from the smaller letters, as in B, b; G, g; R, r. Capitals are normally used only at the beginning of words, although in subject headings or other special cases they may be employed throughout. Historically capitals are older than small letters. The immediate ancestors of the European alphabets, the Greek and Roman letters, are not distinguished as to the two classes of letters, all being written alike in large, or majuscule, script. Not only the Greek and Latin inscriptions, but the oldest manuscripts were thus prepared. The same statement holds true still of all Oriental alphabets, in which there is no difference between large and small letters. The large letters, or majuscules, of the Greek and Latin alphabet show two forms—an angular, in which the composing strokes of the letters are perpendicular to one another, and an uncial, or rounded form. The angular letters, or capitals proper, are more convenient for inscriptions, while the uncials are preferred on papyrus manuscripts and on soft materials. Gradually there were evolved from the majuscules the small letters, or minuscules. The majuscules, being ill adapted to cursive writing, yielded more and more to the minuscules, which are the sources not only of the small letters, but of the characters employed in handwriting. The use of minuscules gained ground but slowly, and the distinction between capitals and small letters was therefore comparatively late. Gradually, however, after minuscule writing had become the rule, it was thought necessary to denote the initial letters of words which were for some reason especially important, as at the beginning of a sentence, by the proper one of the old majuscules, while the rest of the word, and probably of the sentence, retained minuscule script. In manuscripts the capitals are often richly illuminated, gilded, or made the centre of a small design, frequently of excellent taste. There is, however, no strict rule as to their employment. The same uncertainty holds in early printed books. In the very oldest the capitals were often represented by a space which was afterward filled in by hand, as in the case of the manuscripts, and in later books the capital, though printed, was colored in imitation of the older usage. In the course of time the capitals, which originally had been used mainly, although not

exclusively, at the beginning of a section or paragraph, became more frequent. First the initial word of a sentence began with a large letter to call attention to its importance. Then words within the sentence were treated in the same way. It is noteworthy, however, that it was practically only nouns which were capitalized initially. This usage still survives in Danish and German, which uniformly begin each noun with a capital letter. German, however, is beginning to break away from this rule. English stands in this regard between German and French, with the other Romance languages, Russian, and the like. Each sentence and line of poetry, as well as the first word of a direct quotation, must begin with a capital. Proper names, and all words considered as belonging even temporarily to that category, are similarly treated. This includes names of churches, works of art, religious denominations, societies, and in sporadic instances nouns so strongly individualized as to be practically proper names, etc. Examples are, Church of the Transfiguration, Holbein's Head of a Young Man, Mennonites, Liberal League, War of the Rebellion. Titles of books capitalize important words, although library usage departs from this rule. Capitals are also used in names of months and days and the like, as well as in adjectives derived from proper names, in all of which cases French and its cognate languages write the small letter. All names of the Deity and frequently personal pronouns referring to God and Christ begin with capitals. In natural science the names of branches, orders, families, and genera are capitalized, and abbreviations of substantives, excepting weights, measures, and the names of law writs, are written in capital letters. In the use of capitals in English, as in other languages, the individual usage of different writers may vary slightly without seriously contravening the general rules governing the use of this class of letters. Consult E. M. Thompson, *Greek and Latin Palæography* (Oxford, 1912), and Prou, *Manuel de paléographie latine* (3d ed., Paris, 1910).

CAPITAN, kă'pê-tän' (It., captain). A stock character in old Italian comedy, doubtless a development of the *miles gloriosus* of the Roman stage. He is a ludicrous blusterer, whose mouth reeks with blood and slaughter, but whose courage fails utterly when put to the test.

CAPITA'TION (Fr. *capitation*, ML. *capitatio*, numbering by heads, from *caput*, head). A tax levied on persons as individuals, either uniform for all citizens of a given age and sex group (poll taxes) or varying with specified social classes. Class capitation taxes, when differentiated according to fortune, become income taxes.

In France graduated capitation taxes were levied under Louis XIV and were intended to reach all classes in society. The privileged classes, however, succeeded eventually in escaping the tax, either through composition for a fixed capital sum or through control of the machinery of assessment and collection. The capitation taxes still resting upon the unprivileged were among the oppressions that gave rise to the Revolution. See TAXATION.

CAP'ITO, or **KÖPFEL**, kēp'fel, WOLFGANG FABRICIUS (1478–1541). A German Protestant reformer. He was born at Hagenau, Alsace, studied medicine, law, and theology at Freiburg, and became provost of the Benedictine abbey at

Bruchsal in 1512. In 1513 he was appointed preacher and professor of theology at Basel, and in 1523 provost of St. Thomas, Strassburg. Here he declared in favor of the Reformation and subsequently took a prominent part in the Synod of Bern (1532) and the Second Confession of Basel, or First Helvetic Confession. With Bucer he had drawn up in 1530 the *Confessio Tetrapolitana*, or Confession of the Four Cities (Strassburg, Constance, Memmingen, and London). He worked so earnestly for Christian unity that he was viewed with suspicion by his narrower Reformed brethren. Consult Baum, *Capito und Buccr* (Elberfeld, 1860).

CAPITOL (Lat. *Capitolium*, from *caput*, head). The citadel of ancient Rome and site of the national sanctuary, the temple of Jupiter, on the Mons Capitolinus the smallest but most famous of the hills on which Rome was built. The hill consists of two summits, of which the south was the Capitolium proper, containing the great temple of Jupiter, while the north was the citadel (*arx*), though the whole hill is often called Capitol. The natural abruptness of the sides was increased by artificial means, and the whole was strongly fortified. It does not seem to have been the site of the earliest settlement, but to have been chosen later as the common citadel for the Roman settlers of the Palatine and the Sabine settlers of the Quirinal, as the Forum was their common meeting place. The foundation of the great temple, consecrated to three gods, Jupiter Optimus Maximus, Juno, and Minerva, was attributed to Tarquinius Priscus, and its dedication to the consul Horatius (509 B.C.). For the foundations great substructures were needed, and in all later rebuildings the same general arrangement seems to have been retained. The building was nearly quadrangular, with three rows of columns in front and one at each side, but none in the rear; it consisted of three simple *cellæ*, one for each divinity. During the civil wars under Sulla the temple was burned. It was restored by Sulla and Catulus (83-69 B.C.), but was destroyed again during the Vitellian riots. It was rebuilt by Vespasian, after whose death it was again destroyed by fire, but was once more restored by Domitian. Domitian's structure lasted to a late period, but was finally so completely destroyed that little remains except the foundation walls. From that portion of the mount named the Tarpeian Rock (the southwest corner) state criminals were thrown down.

Besides the great temple of Jupiter, the most important structures on the Capitoline Mount were the temple of Jupiter Tonans, built by the Emperor Augustus, and the magnificent Tabularium, built by Quintus Catulus (73 B.C.) for the archives, of which the imposing foundations still remain. It lay in the depression between the Capitolium proper and the *arx*. On the *arx* was the temple of Juno Moneta, in which was the mint, down to the end of the first century B.C. The north summit is now occupied by the church of Santa Maria in Araceli; the south by dwellings, including the German embassy. Consult Platner, *Topography and Monuments of Ancient Rome*, pp. 291-308 (New York, 1911). See **CAMPIDOGGIO**.

In the United States the name is applied to the seat of the Federal Legislature (see **WASHINGTON**) and to the statehouses of the several States. Many of these are imposing and costly buildings, notably those at Albany, Hartford,

Providence, Austin, and the new one at Jefferson City. See illustrations accompanying **ALBANY** and **HARTFORD**.

CAPITOLINE GAMES. Annual games instituted 390 B.C., according to Livy (5, 40, 4), on motion of Camillus (q.v.), in commemoration of the preservation of the Roman capitol (citadel) from the Gauls. They were in charge of the guild of the Capitolini, whose members were chosen from those who lived on the Capitol. They seem to have been discontinued in later times. In 86 A.D. Domitian instituted Capitoline games on the Greek model, which were held every four years down to a late period of the Empire.

CAPITOLINE HILL. See **CAPITOL**.

CAPITOLINE MUSE'UM, THE. A small but valuable collection of sculpture in a palace built by Michelangelo and situated on the left of the Piazza di Campidoglio, Rome. It was founded towards the end of the fifteenth century by Sixtus IV, by the donation to the public of the papal art collection, and was greatly enriched by Innocent X, Benedict XIV, Clement XIII, and Pius VI. It contains many interesting sarcophagi, also some famous antique statues, among which latter are "The Dying Gaul," "The Resting Satyr" of Praxiteles, "Leda with the Swan," and "Cupid and Psyche," and, finally, one of the most complete collections in existence of busts of the Roman emperors. An extension has been made to the palace, to contain sculpture found on the Esquiline since 1870.

CAPITOLINE WOLF. An ancient bronze, of the sixth century B.C., since 1473 in the Conservatori Museum in Rome, representing the suckling of Romulus and Remus by the she-wolf. The figures of the boys are modern, but the wolf stood with other works of art near the Lateran from the fall of the Empire. The figure of the wolf is perhaps the very one referred to by Cicero, in his third Catilinarian oration, as struck by lightning in 65 B.C. From the eleventh to the fifteenth century trials and executions were held at the place where the wolf stood.

CAPITOLI'NUS, JULIUS. A Roman writer of the time of Diocletian and Constantine the Great. To him are ascribed the biographies of the emperors Antoninus Pius, M. Aurelius, L. Verus, Pertinax, Albinus, Macrinus, the Maximini, the Gordiani, Balbinus, and Pupienus, included in the *Augustan History* (q.v.).

CAPIT'ULARIES (Fr. *capitulaire*, ML. *capitulare*, from *capitulum*, chapter, from *caput*, head). A term used for the orders and constitutions published by the Frankish kings. The name was derived from the fact that these constitutions were divided into chapters (Lat. *capitula*). It is probable that the capitularies were usually the personal work of the ruler, assisted by his councilors; but in some cases the assembly of nobles was consulted, and for one class (see below) the assent of the people was necessary. Only nine capitularies of the Merovingian rulers are extant. Those of the Carolingians, especially those of Charles the Great, are very numerous. They may be divided roughly into three classes: (1) Constitutions for the whole Empire, regulating the military service, administration, finance, and justice, the relations with the Church, and the personal conduct of the subjects. (2) Special constitutions intended to complete or modify the law of some one of the

peoples in the Empire. These were called *Capitula per se scribenda*, and for them the assent of the people concerned was supposed to be necessary. (3) Capitularies for the *missi*, i.e., the special itinerant officials whose duty it was to act as the immediate representatives of the Emperor. Sometimes these were personal instructions; at other times, general orders to be promulgated to the people.

During the reign of Louis the Pious, Ansegisel, Abbot of Fontenelle, made a collection of the existing capitularies. A little later (before 858) Benedict the Levite published a second collection, which purported to contain the capitularies and some canons of councils. In reality it is made up of extracts from many sources, chiefly canon law, Roman law, and capitularies. There has been much controversy about this subject, and there seems to be some connection between his collection and the False Decretals. There were three other incomplete collections of little importance made soon after. Of modern editions four are worthy of note: Baluze, *Capitularia Regum Francorum* (Paris, 1677 and 1780); Walter, *Corpus Juris Germanici Antiqui* (3 vols., Berlin, 1824), in which the capitularies are contained in the second and third volumes; Pertz, *Monumenta Germanicæ Historica, Leges*, vols. i and ii (Hanover, 1835-37); and Boretius, id., *Legum Sectio II*, vols. i and ii (Hanover, 1883-97). The last is by far the best.

CAPIT'ULA'TION (Fr. *capitulation*, from ML. *capitulare*, to capitulate, from *caput*, head), MILITARY. The surrender of an armed force, fortress, or besieged town to another armed force on previously fixed terms or stipulations. When it is considered no longer advisable to maintain the defense, notification is made to the besiegers, either by signal, white flag, or messenger, and negotiations are entered into to decide on the basis of the surrender.

In international law *capitulations* are agreements or formal compacts entered into, in time of war, for the surrender of a fortified place or fleet, or of a defeated army. The word is also used to designate the instrument containing the terms of such compact. The proposition to surrender may originate either with the commander of the successful or of the defeated party. Based on the terms proposed by either, the conditions of surrender are agreed upon, being modified, during consideration, by the relative strength and resources of the belligerents. Every supreme commander in the field is presumed to have authority to enter into such compacts, subject usually to certain restrictions imposed by the sovereign authority. If such restrictions exist, a commander should notify his opponent before the capitulations are signed. *Capitulations*, like *cartels* and *truces*, are drawn up like *treaties*, though with fewer formalities, and are interpreted in accordance with the same rules. Article XXXV of the convention concerning the laws and usages of war on land, adopted by the Second Peace Conference at The Hague (1907), requires that "Articles of capitulation entered into between the Contracting Parties are to take into account the rules of military honor. Once decided upon, these capitulations are to be scrupulously observed by both Parties."

CAPIZ, kâ-pêth'. The capital of the province of the same name, on the island of Panay, Philippines (Map: Philippine Islands, G 8). It is on the Río Panay 4 miles from its mouth and

has the most important harbor in the province. Highroads connect the town with Iloilo and Antique. The chief trade is in rice. Capiz was founded in 1716. Pop., 1903, 18,525.

CAP'LIN, or **CAPELIN** (Fr. *caplan*, *capelan*, of unknown origin). A small fish (*Mallo-tus villosus*) of the smelt family (Argentinidæ), abundant on both shores of Arctic America, occurring south as far as Cape Cod. It is a very delicious food fish, and is dried and exported to Great Britain to some extent. The eggs are deposited in incredible numbers in the sand along the Arctic shores, are washed by the waves upon the shore, where they hatch, and where the fry are washed back into the sea. Incredible numbers of the adults are also washed ashore in the surf and perish. It is of great importance to the people of Labrador and Newfoundland and of southern Alaska. Fossil caplin have been found in abundance in Greenland, inclosed in clay nodules of recent shales. See Plate of WHITEFISH, SMELTS, ETC.

CAPMANY Y DE MONTPALAU, kâp-mä'nê ê de mōnt'pâ-lou', ANTONIO DE (1742-1813). A Spanish polygraph, philologist, and antiquarian, born in Barcelona. He at first entered the army and served in the campaign against Portugal. Afterward he assisted Pablo de Olavide in his attempt to colonize the Sierra Morena, an enterprise which terminated disastrously, however, and Capmany went to Madrid, where he was made secretary of the Royal Academy of History in 1790. When the French took possession of the city in 1808, he fled to Seville and assisted in the Spanish war of independence. In 1812 and 1813 he was a member of the Cortes of Cadiz. His numerous publications, which are widely read in Spain, include the historical works *Memorias históricas sobre la marina, comercio y artes de la antigua ciudad de Barcelona* (4 vols., 1779-92); *Código de las costumbres marítimas de Barcelona* (2 vols., 1791), a translation from the Catalan original; and *Cuestiones críticas sobre varios puntos de historia económica, política, y militar* (1807), all of which contain valuable details on the commerce, industry, and maritime laws of the Middle Ages. He is probably even more celebrated for his literary and philological works, chief among which are the *Disursos analíticos sobre la formación y perfección de las lenguas, y sobre la castellana en particular* (1776); the *Filosofía de la elocuencia* (1776, and often reprinted, especially London, 1812, and Gerona, 1826); *Teatro histórico-crítico de la elocuencia castellana* (5 vols., 1786-94), republished in large part as *Tesoro de prosadores españoles* (5 vols., 1841); and his *Diccionario francés-español* (1805). His works are considered models of pure Castilian, which he always strove to preserve. It is on this account that the Real Academia Española included his name in the *Catálogo de Autoridades del Idioma*. Consult Sempere y Guarinos, *Ensayo de una biblioteca española* (6 vols., Madrid, 1785-89).

CAP'NOMAN'CY (Fr. *capnomantie*, from Gk. *καπνός*, *kapnos*, smoke + *μαντεία*, *manteia*, divination). A form of divination practiced, from Greek days onward, either by observing the smoke from incense burned for this purpose, or more commonly in connection with a sacrifice. (See SUPERSTITION.) If the smoke was thin and ascended in a right line, instead of being blown back by the breeze or spreading over the altar, the augury was good.

CAPOBIANCO, kă'pō-byän'kō. The founder and leader of the Carbonari (q.v.).

CAPO DI MONTE, kă'pō dē mōn'tā (It., head of the mountain). A place near Naples, where, in 1736, Charles III, King of Naples, caused an establishment to be set up for the production of soft porcelain. The King took so lively an interest in ceramic art that he even worked with his artists. The first porcelains made at Capo di Monte are said to be such a perfect imitation of the finest Japanese products that they might be mistaken for them. Charles's son, Ferdinand IV, who succeeded him when he left the throne of the Two Sicilies for that of Spain, taking many of the staff of the porcelain works with him, failed in successfully continuing the fabrication, and it finally sank during the political crisis of 1821.

CAPODISTRIA, kă'pō-dēs'trê-â (Slav. *Ko-par*). A fortified seaport town of the Austrian Crownland of Istria, situated on a rocky island in the Gulf of Triest, 8 miles southwest of the city of Triest. It is connected with the mainland by a stone causeway. It shows marked Italian influence. The old buildings (cathedral, town hall, and loggia) are Venetian and the population largely Italian. Though declining, its principal industries are fishing and shipbuilding, and it still has a considerable trade in sea salt, oil, and wine. Pop., 1890, 10,706; 1900, 10,711; 1910, 11,765. Capodistria was known to the Romans as *Ægida*, and later as Justinopolis. In the thirteenth century it came into the possession of Venice, and in 1797 of Austria.

CAPO D'ISTRIA, or **CAPODISTRIAS**, GIOVANNI ANTONIO, COUNT (1776-1831). A Russian statesman who was the President of the Greek Republic from 1827 to 1831. He was born in Corfu, Feb. 11, 1776, of a family which had come from the Illyrian town of Capodistria, near Triest, in the fourteenth century. He devoted himself to political life, and after holding a high position in the Republic of the Ionian Islands (q.v.), he entered the diplomatic service of Russia. He took an active interest in the movement for the liberation of Greece, but was always identified with the Russian party. After the Treaty of Tilsit in 1807, when the Ionian Republic was handed over to Napoleon, he went to St. Petersburg and was appointed attaché to the Foreign Office. His services in the diplomatic corps of the Russian government were of such a high order that he became the Assistant Minister of Foreign Affairs and shortly after counsel to the Czar. (See GREECE.) In 1827 he was elected President of Greece; and in January, 1828, he entered upon the duties of his office. He was an able diplomat and was sincerely concerned for the welfare of his native country, but his intimate association with Russia, whose ambitious designs so complicated the whole Eastern Question, made him unfit for the place to which he was called. Greece was torn by factions, and the most patriotic Hellenes were suspicious of Russia and therefore of Capo d'Istria. The President had been much imbued with the centralizing principles prevalent at the Russian court, and some of his measures, especially that restricting the liberty of the press, gave offense to advocates of civil liberty. In the latter part of his administration he suspended the Constitution of 1827 and ruled as dictator. He was assassinated at Nauplia, Oct. 9, 1831, by George and Constan-

tine Mavromichalis, whose family were leaders in the revolt against his dictatorship and the Russian influence. Consult Mendelssohn-Bartholdy, *Graf Johann Kapodistrius* (Berlin, 1864), and Phillips, *The War of Greek Independence* (London, 1897).

CAPONIERE, kăp'ō-nēr', or **CAPONNIÈRE**, kă'pō'nyâr' (Fr. *caponnière*, Sp. *caponera*, cage for fattening fowls, from *capon*, capon). In fortification, a small stockaded inclosure or blockhouse so located as to fire along a dead angle. Such structures are usually found in the ditches of permanent fortifications. They are so disposed as to cover with their fire dead angles not otherwise provided for, and to afford a covered passageway between the ditch and the main parapets. *Caponieres* are also known as *tambours*, in recent works on field fortifications. See TAMBOUR; FORTIFICATION.

CAPOTE, kă-pōt' (Fr., dim. of *cape*, from ML. *cāpa*, cape). A long and shaggy outer garment with a hood, worn in southern Europe by soldiers, sailors, and travelers. In the Levant the capote is a mantle worn both by men and by women, and made either of rough cloth or of skins, retaining their hair. It is described by Curzon, in *Visits to the Monasteries of the Levant* (London, 1849), as "a sort of white frock coat, without sleeves, and embroidered in bright colors down the seams."

CAPOUL, kă'pōōl', JOSEPH AMÉDÉE VICTOR (1839-). A French tenor, born in Toulouse. He graduated at the Conservatoire in Paris and sang with brilliant success at the Opéra Comique. Subsequently he sang in London with Christine Nilsson, in New York with Patti, in Vienna and St. Petersburg. In 1892 he accepted the position of professor of operatic singing at the National Conservatory in New York. In 1898 he took up his residence in Paris, being in great demand as a singing teacher. In 1900 he became stage director of the Grand Opéra.

CAPPADOCIA, kăp'pâ-dō'shī-â (Gk. *Καππαδοκία*, *Kappadokia*, OPers. *Katpatuka*). In ancient geography, an extensive region in the eastern part of Asia Minor. It was for a time a Persian province; Alexander the Great received tribute from its ruler Ariarathes. After Alexander's death his successors sought to exercise dominion over Cappadocia, but the son of Ariarathes resigned the throne and founded a line of kings of Cappadocia. Later, supported by the Romans against Mithridates, the Cappadocians elected a native, Ariobarzanes, as King. During the civil wars between Cæsar and Pompey, Octavianus and Antony, Cappadocia changed sides frequently. Finally, in 17 A.D., it became a Roman province. It was bounded by Lycaonia and southern Galatia on the west, by Cilicia and Commagene on the south, by Armenia on the east, and by Galatia and Pontus on the north. While under the Persian Empire, however, Cappadocia included what was afterward Pontus, which was called Lesser Cappadocia. The northern part of Cappadocia (in the narrower sense) was traversed by the river Halys (Kizil Irmak), near whose banks the Argæus Mons (Arjish) towers to a height of over 13,000 feet. Among the towns were Mazaca (Cæsarea), Comana, Tyana, and Melitenc. The population of ancient Cappadocia and Lycia, represented now by the primitive mountain tribes called Taktadji, is of considerable anthropological interest, since some authorities have connected

them with the Hittites. They seem to have been Aryans closely related to the Armenians, although Brinton (1895) thought there was an element belonging to the peoples of the Caucasus revealed in their ancient inscriptions and local dialects. Sergi (1901) disputes the Hittite relationship on craniological grounds. The chief literature of the subject is to be found in Von Luschan and Petersen's *Reisen in Lykien* (Vienna, 1889); Von Luschan's article on the "Tachtadschy," in the *Archiv für Anthropologie* for 1901; and Chantre's *Recherches anthropologiques dans l'Asie occidentale* (Lyons, 1895). There is an interesting article by J. W. Crowfoot on "Survivals among the Kappadokian Kizilbash," in the *Journal of the Anthropological Institute* (London, 1900). Consult also Grothe, "Meine Schürfungen in Kappadokien," in his *Meine Vorderasienexpeditionen* (Leipzig, 1911).

CAPPEL, kà'pèl', LOUIS (1585-1658). A French Hebraist, born at St. Elier. He studied theology at Oxford and Saumur, was appointed professor of Hebrew at Saumur in 1613, and professor of theology there in 1633. In his *Arcanum Punctuationis Revelatum* (1624) he showed that vowel points had been introduced into Hebrew writing at a period comparatively late. As this theory and his doubt of the integrity of the Old Testament text seemed to attack the authority of the Scriptures, he was violently attacked, in particular by Buxtorf. He was one of the founders of biblical criticism, because of his *Critica Sacra* (written 1634; well known before its publication in 1650). He wrote a catechism (1619) that was used for a time in Huguenot churches. Consult Schneidemann, *Die Controverse des Ludovicus Capellus mit den Buxtorfen* (Leipzig, 1879).

CAP'PON, JAMES (1855-). A Canadian educator. He was born in Dundee, Scotland, and graduated from Glasgow University in 1881. After two years spent in the study of modern languages in Italy he returned to Scotland and became a tutor in St. Margaret's College, Glasgow, and later, extramural lecturer in connection with Glasgow University. In 1888 he went to Canada and was appointed professor of the English language and literature and dean of the faculty of arts in Queen's University, Kingston. He afterward became one of the editors of the *Queen's Quarterly Magazine*. He gained a high reputation as essayist and literary critic. His principal publications are: *Victor Hugo: A Study and a Memoir*; *Britain's Title in South Africa* (1901); *Studies in Canadian Poetry*; *What Classical Education Means*; *The Sectarian Principle in the Canadian Constitution*; *Roberts and the Influences of his Time* (1906).

CAPPONI, káp-pō'nè, GINO, MARCHESE (1792-1876). An Italian historian and statesman. He was born in Florence of an illustrious family. He traveled in England and made many acquaintances there. On his return to Italy he founded at Florence, with the help of Vieusseux, the *Antologia Italiana*, an Italian *Edinburgh Review*, which was suppressed in 1832, when he established the *Archivio Istorico Italiano*. Devoted to science and philanthropic endeavor, he early gained the confidence of the citizens, and in 1848, although blind, he was called to the head of the administration in Tuscany. Attacked by the Radicals, he retired to private life in a short time. After the War of 1859 he was made a senator. As a member of the Accademia

della Crusca he assisted in preparing new editions of the academical dictionary, and after he had become blind prepared, with Becchi, Borghi, and Niccolini, an improved edition of Dante's *Divina Commedia* (Florence, 1837). Among his other publications, the most important is *Storia della repubblica di Firenze* (2 vols., 1875), still a standard work. For his life, consult Tabarrini, *Gino Capponi* (Florence, 1879), and Von Reumont, *Gino Capponi, ein Zeit- und Lebensbild* (Gotha, 1880).

CAPPS, EDWARD (1866-). An American classical philologist, born Dec. 21, 1866. He received the degrees of A.B. at Illinois College (1887), and Ph.D., Yale University (1891). He was tutor in Latin at Yale from 1890 to 1892, assistant professor of Greek at the University of Chicago from 1892 to 1896, associate professor from 1896 to 1900, and professor in 1900. In 1907 he became professor of classics at Princeton University. He is the author of *From Homer to Theocritus* (New York, 1901), of an edition of *Four Plays of Menander* (Boston, 1910), which presents with introductions and commentary the four plays of Menander (q.v.) found after 1905, and of numerous papers. In 1913-14 he was president of the American Philological Association.

CAPPS, WASHINGTON LEE (1864-). An American naval officer, born at Portsmouth, Va. He graduated from the United States Naval Academy in 1884 and was promoted through the grades to be naval constructor in 1895. Nearly all of his service was connected with the designing and construction of ships. From 1896 to 1898 he was superintendent of construction for the navy at the Union Iron Works, and from 1899 to 1901 a member of the board of inspection and survey at Washington. He was appointed chief constructor of the navy and chief of the bureau of construction and repair, with the rank of rear admiral, in 1903. Four years later he was reappointed, but resigned in 1910 and was given a permanent commission as chief constructor with the rank of rear admiral. He served on special duty and as president of various boards for the construction of United States naval vessels building on the Atlantic coast.

CAPRARA, kà-prä'ra, ÆNEAS SYLVIUS, COUNT (1631-1701). An Austrian general, born in Bologna. He entered the army of the Empire, fought under his kinsman Montecuculi against the French and the Turks, and in 1674 received an independent cavalry command. He was vanquished by Turenne at Sinsheim, but distinguished himself at Ensisheim, and continued in the Rhine campaigns until 1678. In 1683 and succeeding years he was active in the defense of Hungary against Turkish invasion. Appointed vice president of the council of war at Vienna, he hindered Prince Eugene, of whom he was jealous.

CAPRARA, GIOVANNI BATTISTA, CARDINAL (1733-1810). An Italian ecclesiastic, of the family of the counts of Montecuculi. He was born in Bologna, and early entered the career of ecclesiastical diplomacy, acting as nuncio at Cologne, Lucerne, and Vienna. He was named Cardinal by Pius VII, in 1792, in recognition of his service in Austria, one of peculiar difficulty under Joseph II. In 1793 he was made Bishop of Jesi, and in 1801, on Napoleon's express request, *legato a latere* in Paris. Here he conducted the very arduous negotiations

which ended in the Concordat. Napoleon nominated him Archbishop of Milan (1802), and was himself crowned by him there with the Iron Crown of Lombardy in 1805. He remained in Paris as legate until the imprisonment of the Pope. His fortune he left to the hospital in Milan.

CAPREÆ. See CAPRI.

CAPRERA, kâ-prâ'rá (It., goat island). A rocky island off the north coast of Sardinia, 5 miles long and about 2 miles broad, connected with the island of La Maddalena by a causeway and drawbridge (Map: Italy, D 6). It is famous as having been the place of residence of Garibaldi, who died there June 2, 1882.

CAPRI, kâ'prê (Lat. *Capreæ*, from *caper*, goat). A beautiful rocky island in south Italy, at the southern entrance to the Bay of Naples, 3½ miles west of Cape Campanella—from which it is separated by the Bocca Piccola—and 20 miles southwest of the city of Naples (Map: Italy, D 12). It is 4½ miles long, 3 miles wide, 10½ miles in circumference, 5¾ square miles in area. The highest point is Mount Solaro, on the west coast, 1920 feet above the sea. Capri has always been celebrated for its delightful climate and pure air, and although the supply of drinking water is unsatisfactory, it is visited yearly by over 30,000 strangers. It is a favorite summer resort for residents of Naples. Capri, the capital of the island and an episcopal residence, is situated between two cliffs 460 feet high. Population of commune, 1901, 4114; 1910, 4462. From the Marina Grande, north of the town, where is found the only good landing place on the island, there is daily communication by steamboat with Naples and Sorrento. Anacapri, which is 880 feet above the sea, on a plateau in the western and more fertile part of the island, is reached by a winding road cut through the rock and completed in 1876. Population, 1901, 2110; 1910, 2376. The town is commanded by the ruins of the castle of Barbarossa, named after the pirate who destroyed it in 1544. On the shore north of Anacapri, and 1¼ miles west of the Marina Grande, is the famous Blue Grotto (Grotta Azzurra), which is entered from the sea by a narrow opening not more than 3 feet high. The grotto is 175 feet long, 100 feet broad, and 41 feet high, with water 48 feet deep. The ancient church of San Costanzo, the patron saint of the island, marks the site of the ancient town. In the northeast corner of the island are the precipitous rocks, 745 feet high, from which, tradition says, Tiberius hurled his victims into the sea, and the ruins of the twelve villas built by Tiberius in honor of the twelve gods. The English captured the island in 1806, during the Napoleonic wars, and built fortifications, some of which remain. In 1808 they lost it to the French under Lamarque; but recovering it in 1813, restored it to King Ferdinand IV of Sicily. Local products comprise fine white and red wine, oil, oranges, lemons, and figs, fish, and quail. The United States is represented by a consular agent. Consult: Gregorovius, *Die Insel Capri* (Leipzig, 1897); Allers, *Capri*, illustrated (Munich, 1894); Furchheim, *Bibliografia dell' isola di Capri* (Naples, 1899); Weichardt, *Das Schloss des Tiberius und andere Römerbauten auf Capri* (Leipzig, 1900).

CAPRICCIO, kâ-prêt'chô (It., caprice, probably from It. *caprio*, Lat. *caper*, goat). In art the term signifies a painting or engraving composed without regard to the ordinary rules of

pictorial art, whimsical and fanciful in idea and arrangement.

CAPRICCIO. In music, a species of free composition whose form is not subject to rigid rule. The fancy of the composer is allowed free play, his aim being to produce piquant and striking effects, in both melody and harmony. A shorter piece of this character is often termed *capricciotto*.

CAP'RICOR'NUS (Lat., goat-horned, from *caper*, goat + *cornu*, horn). The Goat, a southern constellation, and the tenth sign of the zodiac, denoted by the sign ♄, representing the crooked horns of a goat. It is usually represented on the globe as having the fore part of a goat, but the hinder part of a fish. It is one of the least striking of the zodiacal constellations. It was, however, celebrated among the ancients, who regarded it as the harbinger of good fortune and as marking the southern tropic (q.v.) or winter solstice (q.v.), wherefore they called it the "Southern Gate of the Sun." It contains no large stars, the two largest, which are situated in the horns, being only of the third magnitude.

CAP'RIFICA'TION (Lat. *caprificatio*, from *caprificare*, to ripen figs by the pollination of the gall insect, from *caper*, goat + *ficus*, fig). A method which has long been employed in the Orient for securing and hastening the maturation of figs, and which consists in suspending fruit-bearing branches of the wild fig or caprifig above or beside those of the cultivated tree. A small hymenopterous gnatlike insect (*Blastophaga grossorum*) crawls from the caprifig into the Smyrna fig of commerce and, being covered with the pollen of the wild fig, fertilizes therewith the cultivated fig. If pollen is not introduced, the figs may fail to develop, and finally fall to the ground. When pollenized, the seeds develop and the fruits grow to their proper size and mature. The fig insects were introduced into California in 1899, with the result that about 200 tons of Smyrna figs of excellent flavor were harvested in 1910. See FIG.

CAP'RIFOLIA'CEÆ (Neo-Lat., ML. *Caprifolium*, from Lat. *caper*, goat + *folium*, leaf). A family of dicotyledonous plants, consisting of shrubs and herbs which have opposite leaves without stipules, and flowers disposed in corymbs, in heads, or in whorls. The calyx is four to five cleft; the corolla, tubular or wheel-shaped, sometimes irregular. The stamens are inserted on the corolla at its base and alternate with its lobes. The ovary is free, one to five celled. The fruit is generally a berry, sometimes dry, but not splitting open when ripe. The family is very nearly related to Rubiaceæ, differing chiefly in the want of stipules. More than 300 species are known, chiefly natives of the temperate and colder parts of the Northern Hemisphere. To this order belong the honeysuckle, elder, viburnum, and snowberry (qq.v.), the chief genera being *Lonicera*, *Sambucus*, *Viburnum*, *Symphoricarpos*, *Linnæa*, *Diervilla*, etc.

CAP'RIMUL'GIDÆ (Neo-Lat., from Lat. *caper*, goat + *mulgere*, to milk). A family of birds, including the whippoorwills, nightjars, etc. The family is usually called "goatsuckers," but the name "nightjar" is better. See NIGHTJAR.

CAPRIVI, kâ-prê'vê, GEORG LEO, COUNT VON (1831-99). The second Chancellor of the German Empire. He was born Feb. 24, 1831, at Charlottenburg, studied in Berlin, and in 1849 volun-

teered in the Kaiser Franz Grenadiers. During the campaign in Bohemia in 1866 he was made a major and a member of the general staff of the First Army Corps. He distinguished himself during the Franco-Prussian War, and as chief of staff of the Tenth Army Corps served with distinction at Metz and Orléans and in the Loire campaigns. His advance in rank and in responsible commands was rapid. In 1882 he was appointed commander of the Thirtieth Infantry Division at Metz; in March, 1883, he was selected by Bismarck to succeed Admiral Stosch as Chief of the Admiralty, greatly to the dissatisfaction of the officers of the navy. He justified the judgment of the great Chancellor, however, by his mastery of the details of the department and his successful reorganization of the navy upon its present basis. In 1888 he resigned, and was made commander of the Tenth Army Corps, stationed in Hanover. He received the order of the Black Eagle, and in March, 1890, succeeded Bismarck as Chancellor of the Empire and President of the Prussian Ministry. He was made a count in 1891. Succeeding the most powerful statesman in Europe at the beginning of the reign of restless William II, Count Caprivi's position as Chancellor was one of many trials and great difficulty. Nevertheless, he showed himself an able and faithful administrator. He carried the bill for an increase in the army through the Imperial Reichstag; initiated a policy of reciprocity, through treaties with Austria-Hungary, Italy, Belgium, and Russia, in spite of the narrow opposition of the Prussian landowners; and maintained a moderate policy with reference to the growing Socialist party. In July, 1890, he arranged with Lord Salisbury, representing England, the so-called Anglo-German partition of East Africa. (See GERMANY.) He resigned the presidency of the Council in 1892, and the chancellorship in 1894. Caprivi was, like Bismarck, a man of great physical strength and possessed considerable mental power, with a great capacity for work. He died on his estate, Skyren, in Brandenburg, Feb. 6, 1899. Consult *Die Reden des Grafen von Caprivi . . . 1883-1893* (Berlin, 1894).

CAPRO'IC, CAPRYL'IC, and CAP'RIC ACIDS. Acids represented respectively by the formulæ $C_6H_{12}O_2$, $C_8H_{16}O_2$, and $C_{10}H_{20}O_2$, and members of the acetic or fatty acid series. They are found in butter and in other fats. They derive their names from *caper*, a goat, in consequence of their more or less resembling in smell the odor of that animal. They may be obtained, along with butyric acid, another member of the fatty-acid series, by boiling (saponifying) butter with caustic potash.

CA'PRON, ALLYN (1846-98). An American soldier, born in Tampa, Fla., son of an officer in the Mexican War. He graduated at West Point in 1867, and rose to be captain of artillery in 1888. During the Sioux campaign of 1890 he served with distinction, and in 1898 during the Spanish-American War participated in the invasion of Cuba. On July 1 he opened the battle of El Caney by firing, as commander of Battery E, First Artillery, upon the stone fortifications which lined the ridge. He died of typhoid fever contracted during the campaign.

CAPS and HATS (Swed. *Mössorna och Hattarne*). Names of political parties in Sweden in the early part of the eighteenth century. The Caps were in favor of stripping the monarch of all semblance of authority; the Hats wished

the King to retain some measure of power. In foreign affairs the Caps were friendly to Russia, while the Hats favored a French alliance. The Hats were the aristocrats, the Caps constituted the popular party.

CAPSEL'LA (Lat. *capsa*, box, hence *capsella* [dim.], from the shape of the fruit or pod). A genus of plants belonging to the family Cruciferae. *Capsella bursa-pastoris*, the common shepherd's-purse, is one of the most common weeds, having been naturalized everywhere from Europe. The common name is suggested by the flattened triangular pod. It is extremely variable in foliage, and these variations have been made the basis of 50 to 100 elementary species by various authors. Its rosette of leaves and raceme of small white flowers or pods may be observed in waste grounds everywhere from early spring until fall.

CAP'SICUM (Neo-Lat., from Lat. *capsa*, box, from *capere*, to hold). A genus of plants of the family Solanaceae, having a wheel-shaped corolla, projecting and converging stamens, and a dry berry. The species are all of a shrubby, bushy appearance, and have more or less woody stems, although they are annual or biennial plants. About 90 species have been named. They are natives of tropical America, have simple leaves and rather inconspicuous flowers, and some of them are in very general cultivation in tropical and subtropical countries for their fruit, which is extremely pungent and stimulant and is employed in sauces, mixed pickles, medicine, etc., often under its Mexican name of *chilies*. The fruits of different species differ in form, being round, oval, conical, heart-shaped, etc.; they vary from half an inch to 4 inches in length, and are sometimes of a bright red, sometimes of a yellow color. In all, the dry berry has an inflated appearance, and contains numerous whitish, flattened seeds, which are even more pungent than the leathery epidermis or the spongy pulp. Cayenne pepper consists of the ground seeds and pods. *Capsicum annuum*, sometimes called common capsicum or chili pepper, is perhaps the most common species in cultivation. *Capsicum frutescens*, sometimes called goat pepper, and *Capsicum baccatum*, sometimes called bird pepper, are perennial in tropical latitudes. They have great pungency, and the former is generally described as the true Cayenne pepper. *Capsicum cerasiforme*, which has a small, cherry-like fruit, is frequently grown as an ornamental. *Capsicum grossum*, with a large, oblong, or ovate fruit, known as bell pepper, is cultivated in many forms. The fruit is used either ripe or unripe, except for making Cayenne pepper, for which dried ripe fruit is employed. See PEPPER, and Plate of VEGETABLES, GARDEN.

CAP'STAN (Fr. *cabestan*, Sp. *cabestrante*, probably from Lat. *capistrare*, to tie with a halter, from *capistrum*, halter, from *capere*, to hold). A machine used on shipboard for handling the anchor and other heavy weights. It was formerly made of wood, with iron fittings, but is now generally of iron. It consists of the *barrel*, *drumhead*, *wildcat*, *pawl head*, and *spindle*. The axis of the capstan is vertical, and is formed of an iron or steel spindle. The barrel is not cylindrical, but is smaller at the centre, towards which the upper and lower ends curve. This curve causes a rope which is wound round the barrel to slip towards the centre as it is pulled in by the capstan in turning. To increase the friction around the

barrel, ridges, called *whelps*, extend up and down its surface. Around the circumference of the drumhead are square holes extending in towards the centre to a depth of several inches, forming sockets for inserting the capstan bars, which stand out when in place like the spokes of a wheel. The bars have scores or grooves in the outer ends, through which is passed a small rope called the *swifter*, that serves to keep the bars in place. A capstan bar of ordinary size is sufficiently long to permit three or four men to push against it in *heaving*. The wildcat is a deep groove between the lip on the lower end of the barrel and the pawl head, and is designed to grip the chain which rests in it for about half the circumference. To prevent the chain from slipping, there are, on the upper and lower sides of the groove, ridges or whelps extending radially, and growing thicker and higher as they

CAPSTAN.

a, whelps on the barrel; *b*, sockets or pigeonholes for capstan bars; *c*, drumhead; *d*, barrel; *e*, wildcat; *f*, pawls; *g*, pawl head; *h*, base containing pawl rack.

approach the axis. These whelps catch between the links of the chain that stand vertically, and so prevent the latter from slipping. On the circumference of the pawl head are pivoted the *pawls*, which are short bars of iron working in a *pawl rack* in the *capstan bed*, which is bolted to the deck. To *walk back* the capstan, or reverse the motion, it is necessary to lift these pawls and throw them over, so that they will act only in the opposite direction. Wooden capstans, of very similar form to those now used, but without the wildcat, were devised by Sir Thomas Moreland in 1661. In the days of rope anchor cables they were hauled in by means of a messenger, as the cable itself was too large to be worked around the capstan barrel. The messenger was a smaller rope, which was gripped to the cable by rope *nippers*. It led to the barrel of the capstan and back again to near the hawse pipe. The nippers were taken off one by one as they approached the capstan, and others put on farther forward. After the introduction of chain cables, messengers continued to be used until the invention of the wildcat enabled the chain to be brought directly to the capstan. In steamers, capstans are now generally worked by steam power; instead of capstans many ships

have steam *windlasses*, which resemble two capstans placed base to base, with the axes horizontal. In recent battleships and in some large merchant steamers the barrel and drumhead are omitted, leaving only the wildcat and a covering plate above it. See ANCHOR.

CAP'SULE (Fr., from Lat. *capsula*, little box, *capsa*, box, from *capere*, to hold). A dry, dehiscent fruit, made up of more than one carpel. Sometimes it contains but a single chamber; in other cases there are as many chambers as there are carpels. The methods of dehiscence are numerous, but quite uniform within a plant group. Capsules are often called "pods," a more inclusive term. The term is also sometimes applied in a general way to spore cases. See FRUIT.

CAPSULE. A term in medicine for a thin membranous covering, casing, or envelope, like a pouch or bag, containing some part or organ. The capsule of the kidney is a smooth, fibrous membrane closely investing the kidney and forming its outer coat. The capsule of the lens of the eye is a transparent, elastic, brittle, and structureless membrane. In bacteriology the term is applied to the thin envelope which surrounds certain microorganisms, e.g., the *streptococcus capsulatus*. The word is also extensively used for a small gelatinous case or envelope in which medicines are inclosed before administration, to prevent the patient's tasting an unpleasant drug, or for convenience of carrying, as well as to secure a more soluble coating than that of many pills.

CAPTAIN (OF. *capitain*, ML. *capitaneus*, from Lat. *caput*, head, chief). A title found in almost every language to denote a chief of a small number of men. In the United States army a captain ranks next above a first lieutenant and below a major, and commands a company, troop, or battery. A captain present for duty with his command is responsible for its discipline and efficiency. He is accountable for the public property that constitutes its equipment; for the proper performance of duties connected with the subsistence, pay, and clothing of its members; and for the correct keeping and rendition of all company accounts, reports, and returns. The captain recommends the noncommissioned officers of the company, who are appointed by the colonel, and from the sergeants he selects the first sergeant. In camp or barracks the captain maintains a careful supervision over the cooking and messing of his men, and is responsible for the camp and garrison equipage and the arms and the clothing of his company. See ARMY ORGANIZATION; RANK AND COMMAND.

A captain in the navy is the commanding officer of a man-of-war, and in most navies this title is given to officers next in rank to rear admirals. Its origin as a naval title is disputed, but it seems to have come into use about the time that war vessels took on their present character by combining the navigating with the fighting force; previous to this the master (which is still the designation of the commander of a merchant ship) had charge of the navigation, in which he had sailors to assist him; while the fighting was done by soldiers put on board for the purpose and commanded by a military officer. In the British navy the rank was first clearly defined in 1747, and those captains who commanded postship (i.e., rated ships), if of three years' standing, took rank with colonels of the army, and they appeared as post captains

in the royal navy list until 1824. Before and since this latter date, in the British navy and in that of the United States, the name post captain was used to distinguish commanding officers of frigates and larger ships from commanders and master commanders who were called captain, by courtesy. Until 1862 the rank of captain was the highest in the United States navy (see ADMIRAL), but captains who had commanded squadrons were addressed by the courtesy title of commodore. According to the order of the President of June 7, 1901, captains may be ordered to command a division of ships, a vessel of the first rate, or second rate, or one not rated. The number of captains on the active list of the United States navy is, by law, 70, but this number is exclusive of those, 25 in number, who have been promoted one or more numbers for service during the war with Spain. They rank with colonels of the army and receive the same pay (\$4000, with an addition of 10 per cent for each five years of service until the maximum of \$5000 is reached). On duty beyond the continental limits of the United States all officers receive a 10 per cent increase of pay.

CAPTAIN, THE. A play by Fletcher, assisted by either Jonson or Middleton, or both, published in folio in 1647. Its earliest recorded production is May 20, 1613, when Hemings's company appeared in it at court. It contains the dainty lyric "Come hither, ye that love."

CAPUA, kăp'û-â, *It. pron.* kă'pōō-â. An archiepiscopal city of south Italy, in the Province of Caserta, in a fertile but unhealthy situation on the left bank of the Volturno, 18 miles north of Naples (Map: Italy, J 6). As the only fortress guarding Naples on the north, it was of great importance to the former Kingdom of Naples. The cathedral, dating from the eleventh century, but almost entirely modernized, has in the entrance court granite columns from ancient Casilinum, on whose site Capua was built, in the ninth century; in the church of the Annunziata are ancient bas-reliefs; and beneath the arch of the Piazza de' Giudici—the market place—are many ancient inscriptions. The Musco Campano contains reliefs and inscriptions from the amphitheatre of ancient Capua, ancient and mediæval sarcophagi, and various statues, heads, coins, etc. On the bridge over the Volturno is a statue of St. Nepomuc; the Torre Mignana inside, and the Cappella de' Morti outside the town, commemorate the bloody attack on Capua in 1501 by Cæsar Borgia. Not far from the city is the field where the soldiers of Garibaldi and of Piedmont defeated King Francis II of Naples, Oct. 1, 1860. For ancient Capua, see SANTA MARIA CAPUA VETERE. Pop., 1881, 14,000; 1901, 14,285; 1911, 13,319.

CAPUANA, kă-pwä'nâ, LUIGI (1839–). An Italian journalist, novelist, and critic. In 1902 he became professor at Catania. With Verga he stands at the head of the Sicilian group of *veristi* or 'realists' who, with their vivid portrayals of Italian regional life with almost photographic exactness, represent one of the most virile branches of Italian fiction. In later years Capuana turned to the historical novel.

CAPUCHIN, kăp'û-chîn or kăp'û-shên', **THE.** A comedy by Samuel Foote, produced at the Haymarket, Aug. 17, 1776, and published in octavo, 1778. It is a modification of the same author's *Trip to Calais*, and is aimed at a creature of the Duchess of Kingston. (See article on KINGSTON, ELIZABETH, DUCHESS OF.)

Foote played the part of O'Donovan in it. Its performance was stopped by the public censor, but the attack was continued in *The Bankrupt*.

CAPUCHIN (kăp'û-shên') **MONKEY** (*It. cappuccino*, Franciscan friar, because of the cowl-like black spot on the head). Any sapajou of the genus *Cebus*, but more specifically the "wceper" (*Cebus apella* or less correctly *capucinus*), one of the common species in northern South America, and often kept in captivity. See SAPAJOU, and Plate of AMERICAN MONKEYS, under MONKEY.

CAPUCHINS (*Fr. capucin*, *Sp. capuchino*, from *It. cappuccio*, cowl, *ML. caputium, capitium*, from *caput*, head). A branch of the Franciscan Order of friars, whose rule is essentially the same as that of the Friar Minor, or Minorites. They were founded at Montefalco, in Umbria, by Matteo di Bassi, an Observantine Franciscan, who in 1525 left his monastery in order to live the stricter life of a hermit. This he was permitted to do by Pope Clement VII in 1526. Being imprisoned at Ancona for his alleged disobedience to monastic order, he was released through the influence of the Duchess of Camerino, niece of the Pope, and he and his companions, in 1528, were allowed to wear beards and peculiar, long-pointed hoods (hence the name), to impart their habit to any one who might be willing to join them, to live as hermits in wild and desolate places, to go barefoot, and to call themselves the "Hermit Friars Minor." They grew rapidly, and had great success in making converts. After the Jesuits, no order has attracted to itself so many men of the highest birth as this, in which poverty is pushed to its utmost extreme. They have always paid much attention to learning, and have produced a number of considerable theologians. Five have been canonized and six beatified. The order reached its greatest development in the eighteenth century; in 1775 it had 64 provinces with 31,000 members, a number which has never since been reached. They are most numerous in Austria, but have 22 apostolic mission districts in all parts of the world. In the United States they have two provinces, one with its chief house in Detroit, Mich., and the other centred in Pittsburgh, Pa., and a missionary district in California. To Protestants, the best-known Capuchins are Bernardino Ochino, who was converted to Protestantism in 1542, and Father Theobald Mathew, the famous Irish apostle of total abstinence. There are also Capuchin nuns, founded in Naples, 1538, who are properly a branch of the Clares (q.v.), insisting strongly on poverty, and following as far as possible the Capuchin constitution.

CAPULETI ED I MONTECCHI, kă'pōō-lēt'ê âd ê mōn-têk'kê (*It.*, Capulets and Montagues). See BELLINI.

CAPULETS and **MONTAGUES.** The English forms of the names of the Cappelletti and Montecchi, two noble families of Verona, chiefly memorable from their connection with the legend on which Shakespeare founded *Romco and Juliet*. They are mentioned by Dante (*Purgatorio*, vi, 106) in connection with Albert of Hapsburg, King of the Romans, who was murdered in 1308. This event has supplied the Veronese with a date for their legend. Implicitly believing the story, they point out the house of Juliet's parents and her tomb. The legend is undoubtedly Eastern in origin, having analogues in the stories of Pyramus and Thisbe, Hero and Leander,

and Abrocomas and Anthia (as related in the *Ephesiaca* of Xenophon of Ephesus, a writer of the second century A.D.). The incident of the sleeping potion was, moreover, quite common in late Greek romance. So far as is known, the essentials of the story reached Italy late in the fifteenth century, appearing in a short novel by Massuccio of Salerno, first published in 1476. The novel *La Giulietta*, by Luigi da Porto, printed in 1535, after the death of the author, follows more closely the outline of Shakespeare's play. He states, in an epistle prefixed to the work, that the story was told him "by one Peregrino, a man 50 years of age, much experienced in the art of war, a pleasant companion, and, like almost all the Veronese, a great talker." Da Porto, then, was the first to claim that the story was based on fact. This was a common make-believe of the sixteenth-century story-tellers. In 1554 Bandello published in his collection of tales another Italian version of the legend. It was entitled *The Unfortunate Death of Two Unhappy Lovers—One by Poison and the Other of Grief*. Both writers fix the date of the event by saying that it took place when Bartolommeo della Scala ruled Verona (1301-04). A French version of the tale was published by Pierre Borsteanu in his *Histoires tragiques* (1559). It was translated into English in 1567 and published in Painter's *Palace of Pleasure*. Five years before, Arthur Brooke published an English poem on the same subject, entitled *The Tragical History of Romeus and Juliet, written first in Italian by Bandell, and now in English*. Shakespeare seems to have founded his tragedy on Brooke's poem, with some use of Painter's version. Yet there is some evidence that the story had been dramatized before the appearance of Shakespeare's play. In that case Shakespeare probably made use of his predecessor. It was Brooke who first called the Montecchi "Montagues," and the Prince of Verona "Escalus," instead of Scala. Wright and Cary, in translating Dante, have followed the example of Shakespeare, and rendered the Italian names of the *Divina Commedia* into the familiar "Capulets and Montagues" of *Romeo and Juliet*. The historical date of the tragedy has not, however, been adopted by modern stage managers, who very properly bring down the action from the beginning to the close of the fourteenth century, when commercial opulence and the revival of arts and letters supply accessories more in keeping with the drama than the ruder age to which history must assign the "civil broils," and the fall of the Capulets and the Montagues. Consult: Daniel, "Originals and Analogues of Romeo and Juliet," in *New Shakespeare Society Publications* (London, 1875); or the New Variorum Edition of *Romeo and Juliet*, by H. H. Furness (Philadelphia, 1871; last rev., 1903).

CAPUS, ká'pú', ALFRED VINCENT (1858-). A French journalist and dramatist. He was born at Aix and received a technical education, being intended for the engineering profession. This he did not follow, however, devoting himself, instead, to literary work. After some experience in journalism gained on the *Figaro*, he made his name as a satirist who employed his mordant wit with telling effect in contemporary criticism. This reputation he gained soon after 1882. In 1890 came his first novel, *Qui perd gagne*, which showed his ability in the realm of imaginative literature. His other novels include *Faux départ* (1891), *Mon-*

sieur veut rire (1893), and *Années d'aventures* (1895). It was as a dramatist, however, that Capus found fullest scope for his creative fancy. His plays include: *Brignol et sa fille* (1895); *L'Innocent* (1896, in collaboration with Alphonse Allais); *Rosine* (1897); *Mariage bourgeois* (1898); *Les maris de Léontine* (1900); *La veine* (1901); *La petite fonctionnaire* (1901); *Les deux écoles* (1902); *La châtelaine* (1902); *L'Adversaire* (1903, in collaboration with Emmanuel Arène); *Notre jeunesse* (1904); *Monsieur Piégois* (1905), and *L'Attentat* (1906, in collaboration with Descaves); *Hélène Ardouin* (1913). In 1914 he was elected a member of the French Academy.

CA'PUT MOR'TUUM (Lat., dead head). In historical research, a term which denotes the residuum of a traditional narrative after all the supernatural or extraordinary incidents have been cast aside. What remains may be possible or likely, but rests on no evidence. In chemistry the term was formerly used of the residuum of chemicals after the volatile substances had escaped. It is still used metaphorically for a thing or institution which has been really destroyed by the elimination or abolition of its essential features or elements, the form alone remaining.

CAPYBARA, ká'pé-bá'rá (Sp., Portug., from the native name), or CARPINCHO. A large South American aquatic rodent (*Hydrochaeris capybara*) of the family Caviidæ. It is about 4 feet long and weighs nearly 100 pounds, thus making it the largest known rodent. It resembles a gigantic rough-coated guinea pig, having a heavy flat head, with small eyes and ears, and a blunt muzzle. The short, stout legs have hooflike claws on the feet; the tail is very short, and the brown hair is scant and bristly. The capybara feeds exclusively on vegetable food. It is easily tamed, and regarded as stupid. The flesh, except that of old males, is good. The capybara is known throughout Spanish South America as "carpincho," but is called in British Guiana "water hog" and "water horse," a corruption of the Dutch *waterhaas*, i.e., water hare. Consult *Proceedings of Zoölogical Society of London* (1894). See PLATE OF CAVIES, ETC.

CARABALLOS (ká'râ-bá'lyōs) **MOUNTAINS**. The chief mountain system of Luzon, Philippine Islands. It consists of three ranges: the Caraballos Occidentales, which divides into the Cordillera Norte and Cordillera Central; the Sierra Madre, or Cordillera Oriental; and the Caraballos Sur. They are of volcanic origin. Mayón, or Albay (8274 feet), and Bulusan (5100 feet) are the highest volcanoes.

CARABAO, ká'râ-bá'ō. The domestic water buffalo of the Philippines. See BUFFALO and TAMARAO.

CAR'ABAS, Fr. pron. ká'râ'bá', MARQUIS OF. The fortunate but not wholly obedient master of "Puss in Boots," in Perrault's fairy tale of the latter name. The name has also been used by Disraeli, in *Vivian Grey*.

CARAB'IDÆ (Neo-Lat. nom. pl., from Gk. κάραβος, *karabos*, horned beetle). One of the largest families of Coleoptera. See GROUND BEETLE.

CAR'ABINEERS'. See CARBINEERS.

CARACAL, kár'â-kāl (Fr., from Turk, *qara*, black + *qulaq*, ear). A red-brown cat of Africa and southern Asia, related to the lynx (q.v.).

CAR'ACAL'LA. An outer cloaklike garment

worn by the Gauls. It was close fitting, with long sleeves, reached to the knees, and was slit before and behind as is a modern overcoat. The Emperor Caracalla introduced it at Rome, in lengthened form, so that it reached to the ankles. From this latter form the modern easock derived its shape.

CARACALLA (188–217). Emperor of Rome from 211 to 217. His real name was Bassianus. He was the son of Septimius Severus and Julia Domna and was born at Lugdunum (Lyons). His father nicknamed him *Caracalla*, because he was fond of wearing a long, hooded mantle, so called in the Gallic language. In 193 his father became Emperor, and three years later, on the overthrow of Albinus, the last of the rivals to the throne, Caracalla was declared Caesar, or heir presumptive. He was made pontifex in 197 and became co-Emperor in 198, taking the name of Marcus Aurelius Antoninus. At this time he showed no signs of that reckless, brutal nature which characterized his later years. During the rest of his father's reign Caracalla accompanied him on his expeditions, notably to Britain, where Severus died at Eboracum (York) in 211. He now returned to Rome and associated his younger brother, Geta, in the government; but, unable to endure an equal, he killed Geta in the very arms of their mother on Feb. 27, 212, and ordered his name to be erased from all public monuments. Caracalla now vented his mad rage on all the friends and adherents of his brother by a wholesale butchery, in which the great jurist Papinianus perished. In 212 he gave citizenship to all free inhabitants of the Empire; it has been held, however, that his motive was to increase revenue from the taxes on inheritances, a tax to which only Roman citizens were liable. The rest of his reign as sole Emperor was occupied largely with military campaigns on the frontiers, and in the farther East. He was killed on the road to Carrhæ, in Mesopotamia, at the instigation of Macrinus, the prefect, who succeeded to the throne.

CARACALLA, BATHS OF, OR THERMÆ ANTONINIANÆ. See BATH.

CARACALU, kă'ra-kă'lōō. The capital of the District of Romanati, Rumania, 30 miles southeast of Krajova. It has some fine public buildings and a domestic trade. Pop., 1899, 12,035.

CARACARA, kă'ra-kă'ra (imitation of its harsh cry). The Brazilian name of certain large, vulture-like hawks of South and Central America, which have very long, naked legs, the head somewhat crested and the cheeks bristly, the plumage chiefly black and white and handsomely arranged. They walk about on the ground, feeding on carrion, and where food is abundant gather into vast flocks. Of much service as scavengers, in the cattle-herding regions of South America, they have increased greatly and developed many interesting traits. They erect in trees or on cliffs bulky nests of sticks and leaves and lay only two eggs, heavily blotched and spotted. They constitute a subfamily of the Falconidæ, which contains three genera, *Polyborus*, *Ibycter*, and *Milvago*. The former has four species, one of which, the carancho, is the common "carrion hawk" of Argentina and Brazil, while that now most commonly called "caracara" is *Polyborus cheriway*, which ranges from Ecuador to the southern border of the United States. Their names (compare CHI-

MANGO) are imitative of their hoarse cries. Consult Sclater and Hudson, *Argentine Ornithology*, vol. ii (London, 1889), and Darwin, *A Naturalist's Voyage* (London, 1860).

CARÁCAS, kă-ră'käs. The capital of Venezuela and an episcopal city, situated 6 miles south of La Guayra, its port, in lat. 10° 31' N. and long. 67° 5' W. (Map: Venezuela, D 1). The city lies in a fertile valley, 3000 feet above sea level, and enjoys a climate that is on the whole mild (temperatures ranging from 84° to 48° F.), but subject to sudden variations of temperature and humidity, and to other influences productive of malaria, biliousness, and rheumatism. Its streets are clean, although narrow and straight, crossing each other at right angles, and its principal square, the Plaza de Bolívar, with an equestrian statue of Bolívar in the centre, is surrounded by the government buildings, the university, the cathedral, and the episcopal palace. Other notable buildings are the national museum and the public library. Besides the university, there are numerous educational institutions, such as the medical school and the military school. There are also several learned societies, and associations for the promotion of agriculture and industry. Carácas does little manufacturing, but is the centre of the export trade of the district, which produces cacao, coffee, tobacco, etc. The city is the seat of a United States consular agent. Pop., 1904, c.90,000. Carácas was founded in 1567 as Santiago de León de Carácas and prospered greatly because of its favorable situation. It was twice destroyed—in 1595, when it was sacked by the English, under Preston, and in 1766, when the French put it to sack and pillage. But it continued to grow, and played an important part in the war of independence against Spain, claiming the honor of having been the first colony in South America that succeeded in throwing off the yoke of Spain. Carácas was the birthplace of Simón Bolívar. The great earthquake of 1812 killed 12,000 persons and laid half the city in ruins. The last serious shock occurred in 1900.

CARACCI, kă-răt'chê. See CARRACCI.

CARACCIOLI, kă'răt-chō'lē, FRANCESCO (1752–99). A Neapolitan admiral. He entered the navy at an early age and distinguished himself at Toulon in 1793. In the year 1798 he abandoned Ferdinand and entered into the service of the Parthenopean Republic, established by the French invaders, and with a few vessels prevented the attempted landing of a Sicilian and British fleet. In 1799, when Cardinal Ruffo took Naples, Caracciolo was arrested, contrary to the terms of capitulation, sentenced to death by the Junta, and hanged on the mast of a frigate. His corpse was thrown into the sea. For Caracciolo's fate Lord Nelson, influenced by the notorious Lady Hamilton, was largely responsible. Consult Colletta, *Storia del reame di Napoli* (bk. v).

CARAC'TACUS, or **CARAT'ACUS** (c.50 A.D.). A king of the Trinovantes who dwelt north of the Thames, and who were the masters of southeastern Britain when Claudius began his conquest in the year 43. When the Trinovantes were defeated and their capital, Camalodunum (Colchester), was taken by the Romans, Caractacus retreated, but kept up the struggle until 51. In that year he was overthrown in a pitched battle, his wife and children were captured, and he was delivered to the Romans by Cartimandua, Queen of the Brigantes, to whom he had

fled for refuge. Caractacus was sent to Rome, where he had to remain until his death. Tacitus in the *Annales*, bk. xii, chap. xxxvii, places an eloquent and dignified speech in the mouth of Caractacus when he stood in bonds before the Emperor.

CARACTÈRES DE THÉOPHRASTE, kâ'-râk'târ' de tâ'ô'frâst'. A work by La Bruyère based on his translation of the character sketches by Theophrastus, which he extended and adapted to the customs of his own day. These studies were increased from 386 to 1100 in number in the various editions from 1688 to 1696.

CARAD'OC, or **CRAD'OCK**. A member of the Round Table in Arthurian legend. One of the 31 knights selected by Merlin to accompany Arthur to Carohaise, to help King Leodegran against King Ryance of Ireland, who was about to attack that monarch with 15 tributary kings. His wife was the heroine of the episode of *The Boy and the Mantle*.

CARADOC SANDSTONE. A heavily bedded sandstone, so named from its development at Caer Caradoc in Shropshire. With the Bala slates and sandstones, which are geologically equivalent, it constitutes the uppermost division of the Ordovician system of England. The Caradoc and Bala beds are fossiliferous and have been used largely as the basis of comparison in geological study. Their formation was accompanied by extensive volcanic action; lavas and tufas are included within their limits, and in the Snowdon region these rocks attain a thickness of several thousand feet.

CARAFE, kâ-râf' (Fr., from It. *caraffa*, a decanter, probably from Ar. *ghirâf*, vessel, *gharafa*, to dip up water). A water bottle or decanter for the table or toilet, a term long in use in Scotland, but of later introduction into England and the United States.

CARAJÁS. See **CARAYAS**.

CARAMBOLA, kâ'râm-bô'la (East Indian word). An East Indian fruit, of the size and shape of a duck's egg, but with five acute angles or longitudinal ribs. It has a yellow, thin, smooth rind, and a clear, watery pulp, in some varieties sweet, in others acid, of very agreeable flavor. It is often used in making sherbets, and in tarts and preserves, and is known to the British in India as the *Coromandel gooseberry*. It is one of the most universally cultivated and abundant of the fruits of India. It is produced by the *Averrhoa carambola*, a small evergreen tree or bush of the family Oxalidaceæ. The bilimbi, blimbing, or eucumber tree, so called from the shape of the fruit, is the very acid fruit of another species of the same genus, *Averrhoa bilimbi*, also East Indian. Both species are now much cultivated in the tropical parts of America, the first to a limited extent in southern California. Both exhibit an irritability of leaf resembling that of a sensitive plant; they also display in a remarkable degree the phenomenon commonly known as the sleep of plants (q.v.). See **MOTOR ORGAN**; **MOVEMENT**.

CAR'AMEL (Fr., from ML. *calamellus*, strictly *cana mellis*, cane of honey, but considered to be dim. of Lat. *calamus*, cane). The name is applied to the dark-brown, slightly bitter, and faintly acid substance produced by the application of heat to sugar. It is likewise formed during the roasting of all materials containing sugar, such as coffee, chicory, and malt, and is

one cause of the dark color of porter and infusions of coffee. It is largely employed in the coloring of whisky, wines, vinegar, soups, gravies, etc. The name is also given to a kind of confectionery.

CARAMNASSA, kâ'râm-nâs'sâ. See **KARAMNASSA**.

CARANAIBA PALM. See **CARNAUBA PALM**.

CARANCHO, kâ-rân'chô, or **CARANCHA**, -chá. See **CARACARA**.

CAR'APA (Neo-Lat., from Guiana *caraiipi*). A genus of plants of the family Meliaceæ, natives of warm climates. *Carapa guianensis*, sometimes called the Anderaba, also the carapa tree, is a large tree with beautiful shining pinnate leaves, which have many leaflets. It is a native of Guiana and the adjacent countries, where its bark has a great reputation as a febrifuge, and the oil obtained from its seeds is much used for lamps. Masts of ships are made of its trunk. The oil, which is called oil of carapa, is thick and bitter and is anthelmintic. *Carapa procera*, an African species, yields a similar oil, which is employed by the negroes for making soap and for anointing their bodies, its bitterness protecting them from the bites of insects, a purpose to which the oil of carapa is also applied in South America.

CARAPANOS, kâ-râ'pâ-nôs, **CONSTANTINE** (1840-). A Greek archæologist. He was born at Arta and studied at Corfu and Athens. He became chief secretary of the Société Générale de l'Empire Ottoman, the first great financial institution to be established in Constantinople (1864). In 1876 he devoted himself to archæology and promoted the investigations which led to the discovery of the ruins of Dodona, described in his *Dodone et ses ruines* (1878).

CARAQUET, kâr'â-kêt'. A port of entry in Gloucester Co., New Brunswick, Canada, on the Bay of Chaleur and on the Caraqueet Railway (Map: New Brunswick, E 1). It has a good harbor and important fishing industries. The settlement consists of Upper and Lower Caraqueet. Pop., 1901, 4074; 1911, 4621.

CA'RAS. An important ancient Indian tribe of Ecuador, whose culture was centred about the region of Quito. Tradition makes them come from the Pacific coast, intruding upon an earlier people, the Quitus. They worshiped the sun and the moon and venerated two culture heroes, Paeha and Eacha. The Caras were a federation of independent states rather than a monarchy after the Incasic fashion. They long resisted Quichua power. Their language has long been extinct. Rivet thinks the Cara tongue belonged to the Barbacoan stock, which he affines to the Chibchan. Consult Saville, *Antiquities of Manabi, Ecuador* (New York, 1907-10), and Verneau and Rivet, *Ethnographie ancienne de l'Equateur* (Paris, 1912), especially pp. 14-21.

CAR'AT (Fr., from Ar. *qirât*, pod, husk, carat, from Gk. *κεράτιον*, *keration*, fruit of the locust tree, from *κέρας*, *keras*, horn). Originally the name given to the seeds of the Abyssinian coral flower or coral tree (*Erythrina abyssinica*). These, which are small and equal in size, having been used in weighing gold and precious stones, carat has become the designation of the weight commonly used for weighing jewels, particularly diamonds. The seeds of the carob (q.v.) tree have also been said to be the original carat weights of jewelers.

Jewelers and assayers divide the troy pound,

ounce, or any other weight, into 24 parts, and call each a carat, as a means of stating the proportion of pure gold contained in any alloy of gold with other metals. Thus, the gold of coinage, and of wedding rings, which contains $\frac{22}{24}$ of pure gold, is called 22 carats fine, or 22-carat gold. The lower standard used for watch cases, etc., which contains $\frac{18}{24}$ of pure gold, is called 18-carat, and so on. The carat used in this sense has therefore no absolute weight; it merely denotes a ratio. This, however, is not the case with the carat used for weighing diamonds and other precious stones, which has a fixed weight, and was divided into quarters, or "carat grains," eighths, sixteenths, thirty-seconds, and sixty-fourths, but since the adoption of the international metric carat is divided decimally.

This carat for many years varied in the various markets of Europe and Asia. At the beginning of the twentieth century at least 22 different carats, ranging from the Bologna carat of 188.5 milligrams to the Arabian carat of 254.6 milligrams, were in use. Accordingly dealers in precious stones in Germany in 1905 suggested an international carat based on the metric system and equal to 200 milligrams, or one-fifth of a gram (3.086 grains). This suggestion was straightway adopted by similar interests in France and other European countries and received the approval of the International Bureau of Weights and Measures. By 1912 it was in use in France, Germany, and practically all countries excepting the United States, Great Britain, Belgium, and Holland, where various carats corresponding approximately to 205 milligrams were employed, the American jeweler using a carat corresponding to 205.2 milligrams, or approximately that of the British Board of Trade and the jewelry trade of Antwerp. On Oct. 29, 1912, representatives of the American jewelry trade adopted a resolution providing for the use of the international carat after July 1, 1913, and requested the Secretary of the Treasury to employ this standard in levying the duty on imported diamonds and other gems. This recommendation was adopted by the Treasury Department, by the United States Bureau of Standards, as well as by the New York State Department of Weights and Measures, and other official agencies. By an order in council made on the recommendation of the English Board of Trade, the international metric carat of 200 milligrams was adopted for England, to take effect April 1, 1914, and the new weight has become practically universal.

CARATHEODORY, ká'rá'tá'ó'dó'ré', ALEXANDRE. See KARATHEODORI, ALEXANDER.

CARAUSIUS, ká-rá'shī-ūs (?-293). A Roman usurper, who made himself Emperor of Britain. He was a native of what is now Belgium and was placed by the Emperor Maximian in command of the Roman fleet at Boulogne. He used his office to secure wealth and power and was accused of conniving in the piratical expeditions of the Germans against Britain. In 286 Maximian ordered him to be put to death, but Carausius had already revolted. He went to Britain, secured the allegiance of the Roman soldiers there, and assumed the title of Emperor. For six years he maintained his position and with his ships commanded the British Channel. After the defeat of a Roman fleet in 289, Diocletian and Maximian recognized him as co-Emperor, but when Constantine was made Cæsar

he undertook the subjugation of Britain. Boulogne was taken in 293, and the same year Carausius was murdered by his chief minister, Allectus. The latter was easily conquered by Constantine in 296. Consult Gibbon, *Decline and Fall*, vol. i, chap. xiii, ed. by Bury, with notes (London, 1896), and Webb, *The Reign and Coinage of Carausius* (London, 1908).

CARAVACA, ká'rá-vá'ká. A city of Spain in the Province of Murcia, on a river of the same name, about 39 miles west by north of Murcia (Map: Spain, E 3). It is situated on the slope of a hill crowned with a fine old castle (Santa Cruz), and has broad and well-paved streets. The municipal building and the parish church, the latter an Ionic structure completed in 1600, are the more noteworthy edifices. The city is in a very fertile region and has manufactures of linen and woolen goods, brandy, soap, paper, leather, flour, chocolate, etc. Caravaca is a very old town, many ancient remains being found in the vicinity. It was held successively by the Goths, Moors, and Christians, but has occupied in history a place of comparative unimportance. Pop., 1900, 15,804; 1910, 17,349.

CARAVAGGIO, ká'rá-vá'jò. A town in the Province of Bergamo, Lombardy, Italy, 14 miles south of Bergamo. A steam tramway connects it with Monza and Milan. The site of its ancient fortified walls is now occupied by promenades, but the moat remains and is spanned by six bridges. The chief buildings are a parochial church with a lofty campanile and the church L' Apparizione della Madonna, a celebrated pilgrim resort. The artists Polidoro Caldara, Michelangelo Merisi, and Fermo Stella were born in this town and all received the surname da Caravaggio. Francesco Sforza, commanding the Milanese troops, here defeated a Venetian army in 1448. Pop. (commune), 1901, 8974.

CARAVAGGIO, ká'rá-vá'jò, properly MICHELANGELO MERISI or MERISIO (improperly AMERIGI, MERIGI, or MORIGI) DA (c.1565-1609). An eminent Italian painter, founder of the Naturalistic school. He is usually called after his birthplace Caravaggio, in the Province of Bergamo, where his father was master of the household and architect to the Marquis of Caravaggio. According to most recent research, he probably studied four or five years at Milan, perhaps with one of the Campi (q.v.), then passed some time in Venice. About 1585-87 he appeared in Rome, where he was for a time associated with Cesare d'Arpino and Prospero Orsi, but he persisted in going his own way. After much vicissitude he found a patron in Cardinal del Monte, which insured his success.

His talent developed with great rapidity. Throwing all traditions aside, and appealing only to nature, he became the head of the Naturalists, in opposition to the Mannerists. He became very popular, and even the Eclecticists imitated him. But the animosities which he excited and his own passionate disposition involved him in constant quarrels, although he certainly did not provoke all the quarrels attributed to him. Thus he is said to have challenged Guido Reni, who imitated his work, to a duel, and to have chased the inoffensive Guercino from Rome. It is true, however, that he killed a comrade in a quarrel over a game, and had to leave Rome for this offense. He was protected and concealed near Palestrina by Duke Marzio Colonna. He painted for that nobleman until he went to Naples. In this city he found

CARAVAGGIO
"THE ENTOMBMENT OF CHRIST"
FROM THE PAINTING IN THE VATICAN AT ROME

an appreciative public, and from his activity there arose a Naturalistic school of great importance. He afterward went to Malta, where he painted two portraits of the Grand Master of the Knights of St. John, one of which survives in the Louvre, besides other religious pictures for the same patron. As a reward he was made one of their number, but when Caravaggio again quarreled and wounded one of the knights, they threw him into prison. The painter escaped, and was for some time occupied in the churches of Catania, Syracuse, and other Sicilian cities. He was always desirous of returning to Rome, and on having been pardoned by the Pope, in 1609, he set out from Naples for the Eternal City. But he was waylaid on the road, and died at Porto Ercole, from the effects of a wound.

Caravaggio's art was like his character—fierce in mood, impetuous in expression. His pictures are full of action and of feeling, not mere painted models, like those of Courbet (q.v.), his nineteenth-century successor. They resemble his in that they are plebeian; both sought in the common types of the people the models for their pictures, and both insisted on the exact reproduction of these types. There was, however, this great difference, that while Caravaggio saw nature with the extravagant eyes of the seventeenth century, Courbet saw it with the matter-of-fact gaze of the nineteenth. Caravaggio was a good technician in drawing, color, and brushwork, and he handled light and shade with fine effect.

His work may be best divided into two periods. In the first he did not make such prominent use of the dark shadows and high lights which characterize his later period, and which became the most prominent characteristic of the Naturalistic school. Most of the works of this period are genre pieces, executed during his stay in Rome. One of the best examples is the "Card Players," in which the artist represents a wealthy, inexperienced young man being cheated by professionals. The best example of this picture is in the Sciarra Palace, Rome, although the Dresden replica has been most reproduced. Another fine specimen of his first period is the "Gipsy Fortune Teller," in the Palazzo dei Conservatori, on the Capitoline Hill. The cunning jade seems more anxious to win the young man's heart than to attend to professional duties. The Berlin Museum possesses two charming genre pieces, "Love as a Ruler," "Love Conquered," showing an admirable mastery over the nude.

The works of his second period were mostly larger religious compositions, the result of the reputation already established by his genre productions. They aroused great opposition, especially in Rome, on account of the ordinary types which he used to portray the saints whom the Church adored. Among those which had to be removed from the churches in Rome was "St. Matthew Writing the Gospel," now in the Berlin Museum, and the admirable "Death of Mary," in the Louvre. In the latter picture the body of the Virgin looks as if it had just come from the morgue, but the expression of grief in the mourners is most affecting. His masterpiece of this category is his "Burial of Christ," painted for the church of Santa Maria in Trastevere, but now in the Vatican. This work is excellent in composition, the women are noble in expression, and the men are full of character. The body of Christ, though entirely realistic, is a beautiful representation of the nude. Rubens thought this

picture worthy to copy and it has been often engraved.

The chief galleries of Europe abound in works of Caravaggio, but not nearly all of those ascribed to him are original. By its acquisition of the Giustiniani collection, Berlin is exceptionally rich, and London has a characteristic example in "Christ and the Apostles at Emmaus." Caravaggio also painted a few portraits of great realism and force. Of his portraits of himself, the youthful specimen in the Uffizi (Florence) is noted, but his finest piece of portraiture is probably the Grand Master of the Knights of Malta, in the Louvre.

Although he had no direct pupils, Caravaggio was of the greatest influence upon the development of modern art. Even the principal pupils of the Carracci, like Guido Reni and Guercino (q.v.), studied his art, and Domenichino (q.v.) was influenced by it. He may be justly considered the founder and head of the Naturalistic school (see PAINTING), and as the advocate of the return to nature, his influence extended beyond Italy into the North, where he influenced Rubens and was the forerunner of the great Dutch masters of light and shade.

Consult: Baglione, *Le vite de' pittori* (Rome, 1649); Bertolotti, *Artisti Lombardi a Roma* (Milan, 1881); Eisenmann, "Caravaggio," in Dohme's *Kunst und Künstler* (Leipzig, 1879); Venturi, in *L'Arte*, xiii (1910); Fornone, *Michelangelo Caravaggio* (Bergamo, 1907); Schmerber, *Betrachtungen über die italienische Malerei im 17ten Jahrhundert* (Strassburg, 1906); Rolfs, *Geschichte der Malerei Neapels* (Leipzig, 1910).

CARAVAN (Fr. *caravane*, Sp. *caravana*, from Pers. *kārvān*, from OPers. *kāra*, people, army). The name given to the great assemblages of travelers which, at stated times, traverse the deserts of Asia and Africa. Most caravans are formed for the purposes of trade, the merchants associating themselves for mutual help and protection. A caravan sometimes has as many as 1000 camels, which follow each other in single file, so that it may be a mile or more in length. The most celebrated caravans are those formed by pilgrims going to Mecca, particularly those which annually assemble at Cairo and at Damascus. The latter consists of thousands of pilgrims and stands under the special protection of the Turkish Sultan. The caravan by which the Persians travel to Mecca starts from Bagdad, and is the vehicle of a very important trade. The great Indian caravan to Mecca, which started from Muscat, has been long given up. The trade between Tripoli and the interior of Africa is exclusively carried on by caravans, likewise that between Darfur and Egypt, and a considerable trade between Russia and China is still carried on by caravan. In the East, caravans in which the camels have a load of 500 to 600 pounds are called heavy caravans; light caravans are those in which the camels have only half that weight, so that the daily journeys may be longer. Heavy caravans travel from 18 to 20 miles a day; light from 22 to 25. The caravans are generally conducted with great regularity, and assemble at and start from stated places on stated days. The leader of the Mecca caravans, of which there are two principal ones each year, is called *emir-el-hadj*, i.e., prince of the pilgrims. In trade caravans a leader, who is called *karwan-bashi*, is elected by the merchants from their own number. In addition to the leader, each caravan

has its servants, guides, military escorts, and priests. Obedience is enforced by the leader in the matter of internal discipline, but in trafficking each member is independent.

CARAVAN. See CARRIAGE.

CARAVANSERAI, kâ'rá-vân'sâ-rî (Pers. *kârvân*, caravan + *sarâi*, inn), or **CAR'AVAN'SERY**, or **KHAN**. An Oriental inn, resembling the dak bungalows of modern India, affording temporary shelter to merchants and others traveling in caravans. It is generally a very spacious, quadrangular building, its four wings inclosing a courtyard intended for the bales of merchandise and the beasts of burden and containing a well, spring, or water fountain. The interior accommodations consist of small and unfurnished rooms, rarely over 7 feet high, running about the courtyard. Some of these have no windows, but only a few narrow air holes. A large gateway, spacious enough to admit a loaded camel, leads into the inner court. When a caravanserai is too small to accommodate an entire caravan, the courtyard is used as a warehouse, while the mules or camels rest outside the gates. A porter, appointed and paid by the municipal authority of the place, is the official supervisor of the caravanserai. Aided by one or more assistants, he sees to the safety of the goods, animals, and travelers. These Eastern inns are very ancient institutions, being, in fact, the "inns" of Gen. xlii. 27, xliii. 21; and it was in the stable of some such place (there being no room for his parents in the lodging apartments) that Christ was born. These inns belong either to the government, to the church (mosques), or to private individuals. Such as are situated on the roads are usually free (save for small gratuities expected by porters), while at others a nominal fee is charged. At Cairo, Damascus, Beirut, Aleppo, and elsewhere there are some large and very handsome caravanserais built and maintained by charity when not supported through municipal pride.

CAR'AVEL, or **CAR'AVE'LA** (Sp., ML. *carabus*, a boat, Gk. *κάραβος*, *karabos*, light ship). 1. A small vessel formerly much used in Portugal. It was lateen rigged, with a single square sail on the foremast, and rarely exceeded 150 tons. 2. A small lateen-rigged fishing vessel of 10 or 15 tons used in Spain, Portugal, and the Azores. 3. A large Turkish ship of war. The name was, in Spain and Portugal, formerly applied to larger craft; the caravel of the fifteenth and sixteenth centuries was occasionally a ship of 200 or 300 tons' burden, with four masts, lateen rigged on three and square rigged on one, the foremast. As in vessels of the period, the poop and forecastle of a caravel were very high, especially the former. Two of the ships of Columbus were of the caravel type.

CARAVELLAS, kâ'rá-vâ'lâs. A town in the Brazilian State of Bahía, situated on the Caravellas River, 5 miles from its mouth (Map: Brazil, K 7) and connected with the coast by natural canals. It has a good harbor and is in communication by rail with the interior. The exports consist of fish oil, coffee, and coconuts. Pop., over 4000, within the town, and in 1890 the municipality had 5482.

CARAWALA, kâ'rá-wâ'lâ, or **CARAWILA**. See KARAWILA.

CAR'AWAY (Sp. *alcarahueya*, from Ar. *al*, the + *karavyâ*, *karaviya*, caraway plant; probably from Gk. *κάρων*, *karon*), *Carum carvi*. A plant of the family Umbelliferae, growing wild

in Europe and in some parts of Asia. It is cultivated in Europe and in America for its aromatic seeds (carpels), which are used medicinally, and as an aromatic condiment, by confectioners, distillers, and perfumers, in the preparation of liquors, cakes, sweetmeats, scented soaps, and similar products. It depends for its aromatic properties on a volatile oil called oil of caraway, which is obtained by bruising the seeds and distilling them with water. Caraway has a branching stem 1 to 2 feet high, with finely divided leaves, and dense umbels of whitish flowers. It is easy of cultivation. For illustration, see Plate of CAMELLIA, ETC.

CARAYÁS, cá'râ-yâs', or **CARAJÁS**, a tribe of South American Indians, situated on the Rio Araguaya and its affluents, in the Goyaz country of south-central Brazil, with another section on the right bank of the lower Xingú. They probably once extended much further to the south, though Ehrenreich thinks they migrated from the north. Their chief divisions are the Carayás proper, the Chambioas, and the Javahés. They number in all between 1500 and 1750 and are decreasing somewhat rapidly. They are a primitive people and strictly monogamous. They are said to have buried their dead upright, with the head out of the ground and food placed near it. Their language forms a distinct stock. Consult Coudreau, *Voyage au Tocantins-Araguaya* (Paris, 1897); Krause, *In den Wildnissen Brasiliens* (Leipzig, 1911); Chamberlain in *Science*, N. S., vol. xxxvii (1913).

CARBAJAL, FRANCISCO. See MEXICO, *History*.

CARBAJAL, kâr'bâ-hâl', FRANCISCO DE (1464-1548). A Spanish soldier, born in Arévalo, Avila. He is said to have been a natural son of Cæsar Borgia, Duke of Valentinois (and consequently a nephew of Pope Alexander VI). After serving a while in Spain, he took service under the Gran Capitán Gonzalvo de Córdoba, and was present at the battles of Ravenna and Pavia and the sack of Rome. He went to Mexico in 1528, was sent by Cortés to Peru in 1536 to assist Francisco Pizarro, and was field marshal to Vaca de Castro in his victory over Diego de Almagro the younger, on the plain of Chupas. He joined the party of Gonzalo Pizarro in the contest against Diego Centeno and Pedro de la Gasca, was taken prisoner with Pizarro at the battle of Sacsahuana (April 8, 1548), and was hanged and quartered. His extraordinary activity in this war, crossing the Andes six times and fighting countless battles, despite his more than 80 years, and his immense weight (many believed he had a familiar spirit that carried him through the air) led to his being known in history as the *Demonio de los Andes*. He was at the time of his death the most brilliant commander in Peru. "He was ruthlessly cruel, but brimming over with wit and humor, so that people said it was quite a pleasure to be hanged by him, for the sake of his witticisms on such occasions." Consult Markham, *A History of Peru* (Chicago, 1892).

CARBAJAL, kâr'bâ-hâl', GASPAR DE, and TOMÁS JOSÉ. See CARVAJAL.

CARBALLO, kâr-bâ'lyô. A town in the Province of Coruña, Galicia, Spain, 20 miles southwest of Coruña (Map: Spain, A 1). It is noted for its mineral springs and baths. Pop., 1900, 13,544; 1910, 13,513.

CAR'BARNIDE. See UREA.

CARBAZOT'IC ACID. See PICRIC ACID.

CAR'BIDES (*carbon* + *ide*). Compounds of

carbon and the metals or certain of the metalloids. The most important carbides are iron carbide and calcium carbide. Molten iron unites directly with carbon to form a series of definite chemical compounds, Fe_3C , known as *cementite*, Fe_4C , Fe_5C , FeC_2 , etc. The presence of these compounds, in variable quantities, in metallic iron causes important changes in certain properties of the latter; it becomes hard and brittle, and melts at a considerably lower temperature than pure iron. Next in practical importance to the carbides of iron is the carbide of calcium, now extensively employed in the manufacture of acetylene gas. When treated with water or dilute acids, most carbides are decomposed with formation of hydrocarbons. Thus, the carbide of aluminium yields methane, or marsh gas; the carbide of calcium yields acetylene. At present the carbides are made by the use of the electric furnace. In this furnace carbon is made to act on the oxide of the metal, when part of the carbon takes up the oxygen of the oxide, while another part combines with the metal. The carbides of the alkali metals, sodium and potassium, are best prepared by passing a current of pure and carefully dried acetylene gas over the melted metals, kept at a temperature of about 225°C ., out of contact with the air. The name *carbides* is also applied to compounds of carbon with certain nonmetallic elements, such as silicon. The carbide of silicon is a crystalline substance remarkable for its great hardness and used, under the name of carborundum, for making whetstones, polishing cloths, etc. The carbides of nonmetallic elements are not attacked by acids. For a full statement of the properties of the various carbides consult Moissan, *Traité de chimie minérale* (5 vols., Paris, 1904-06). See ACETYLENE; CALCIUM CARBIDE; CARBORUNDUM; ACHESON; MOISSAN.

CARBINE, kär'bin (Fr. *carabine*, It. *carabina*, ML. *calabra*, war engine). The fire-arm carried by mounted soldiers generally. It is the same in principle as the infantry rifle, but, owing to its shorter length, of more limited range than the rifle proper. It is carried, as a rule, attached to the saddle by straps, or by a pocket or bucket. In the United States army the cavalry and infantry use the same rifle. See SMALL ARMS.

CAR'BINEERS', or **CARABINEERS** (Fr. *carabinier*, from *carabine*). Formerly a separate and distinct type of cavalry, a distinction which no longer exists. As with many other obsolete types of military corps, the title, and in some instances the distinctive uniform, is still maintained by the various carbineer regiments throughout Europe, this distinction constituting their only real difference from other cavalry. The name is said by some authorities to have originated with the carbine, the firearm with which light cavalry was armed; by others they are said to have derived their designation from the Arabs, among whom the *Carabins* or *Karabins* were light horsemen, stationed at outposts to defend narrow passes, etc.; in action they took the place of skirmishers. Generally speaking, the name was commonly applied to light cavalry regiments, now known as hussars and lancers. See CAVALRY.

CAR'BO. The name of a plebeian family of the Gens Papiria at Rome. 1. GAIUS PAPIRIUS CARBO, statesman and orator. He aided Gaius Gracchus in carrying out the agrarian law of Tiberius Gracchus. (See AGRARIAN LAW.) In

13 B.C. as tribune of the people he carried a law by which voting by ballot was extended to the enactment and the repeal of laws. This law was important as tending to make the voters independent of wealthy patrons. Carbo proposed also a law making possible immediate reelection to the tribunate. This he failed to carry, because of the opposition of Scipio Africanus Minor. He was suspected as having been concerned in the sudden death of the latter in 129 B.C.; Carbo had been Scipio's bitter political enemy. In 120 he became Consul, and in that year successfully defended L. Opimius, who had killed Gaius Gracchus and was now under impeachment for having put citizens to death without a trial. Presently he was himself assailed by Lucius Crassus, the orator, and, fearing conviction, committed suicide, 119 B.C. 2. GAIUS PAPIRIUS CARBO, son of the foregoing, also statesman and orator. In 90 or 89 B.C. he, together with M. Plautius Silvanus, carried a law which conferred Roman citizenship on all persons who could prove (1) that at the time of the passage of the law their names had been enrolled as those of citizens of some *civitas fœderata* in Italy, that is, a state that had a formal treaty with Rome; (2) that at the time of the passage of the law they had a settled habitation in Italy, and who, within 60 days of the passage of the law, had their names inscribed on the books of one of the prætors for the year. The law, called the Lex Plautia Papiria, was a statesmanlike effort to win to Rome the loyal support of the *civitates fœderatæ*. It was under this law that the poet Archias claimed citizenship. Carbo supported the aristocracy and was killed by the Marian party in 82 B.C.

CARBOAZOTINE. See EXPLOSIVES.

CARBODYNAMITE. See EXPLOSIVES.

CAR'BOHY'DRATES (Lat. *carbo*, coal + Gk. *ὑδωρ*, *hydōr*, water). A name applied in chemistry to one of three groups of substances found in great quantities in the animal and vegetable kingdoms, the other two groups being the fats and the proteids. The carbohydrates should not be confounded with the hydrocarbons; for while the latter are composed exclusively of carbon and hydrogen, the carbohydrates all contain carbon, hydrogen, and oxygen. The last-named two elements are found in most carbohydrates in precisely the same proportion in which they exist in water; so that a molecule of a carbohydrate might usually be represented as made up of x atoms of carbon and y molecules of water ($x\text{C} + y\text{H}_2\text{O}$). However, the carbohydrates contain no water as such.

The carbohydrates include the different varieties of sugar, of starch, and of cellulose. It appears strange at first that such very different substances should be grouped together: the crystalline and soluble compounds called sugars and the amorphous, mostly insoluble substances called celluloses and starches. They are all, however, connected by their common capacity of giving simple sugars called monosaccharides, when treated with dilute acids. The latter cause the addition of the elements of water, and thus the more complex carbohydrates are known to be anhydrides of the monosaccharide sugars, just as ordinary ether is an anhydride of ordinary alcohol. A carbohydrate whose molecule contains *two* monosaccharide molecules (*minus* the elements of water) is called a disaccharide; one containing *three* monosaccharide molecules is called a trisaccharide; the term "polysaccha-

rides" is applied to the more complex carbohydrates.

The Monosaccharides. These include glucose (grape sugar), fructose (levulose), galactose, mannose, xylose, etc. Some of them may be transformed, by the fermentative action of yeast, into alcohol. They all reduce Fehling's solution (an alkaline solution of cupric oxide). The methods for the study of their chemical constitution were first proposed by Kiliani (1885-87). Emil Fischer extended these methods and applied them to the investigation of a large number of the monosaccharides, and as a result the chemical nature of these substances is at present perfectly clear. The monosaccharides may, accordingly, be defined as follows: They are optically active chemical compounds, containing several hydroxyl groups (OH), and one carbonyl group (CO) next to one of the hydroxyl groups; some are aldehydes (aldoses), others are ketones (ketoses). They are capable of existing in numerous optically isomeric forms, and a large number of them have been prepared artificially, after the possibility of their existence had been indicated by the theories of stereochemistry (q.v.), although many of these isomers are not known to exist ready-formed anywhere in nature. See SUGARS.

The Disaccharides. These include ordinary cane sugar, milk sugar, maltose, etc., and are composed of two molecules of some one monosaccharide, or of some two different monosaccharides. Their chemical nature is, however, as yet imperfectly understood. By the action of dilute acids, or by certain processes of fermentation, the disaccharoses may be broken up into monosaccharides. Unlike the monosaccharides, the disaccharides have no reducing effect on Fehling's solution. The formula $C_{12}H_{22}O_{11}$ represents the composition of any one of the disaccharides.

The Polysaccharides. These include starch, cellulose, etc., and are chemically very complex, and as yet very little understood. Like the disaccharides, they have no effect on Fehling's solution, and yeast has no direct action on them. The composition of the polysaccharides is usually represented by the general formula $(C_5H_{10}O_5)_n$.

The carbohydrates are among the most necessary constituents of food. Their presence has been shown to be indispensable to the formation of fats, and their own value as sources of muscular energy, though smaller than that of fats, is still very considerable.

The most important carbohydrates are discussed under their special names. See CELLULOSE; GLUTEN; STARCH; SUGARS. Consult Lippmann, *Chemie der Zuckerarten* (Brunswick, 1904), which is the most exhaustive treatise on the sugars in existence.

CARBOLIC (*carbon + ol + ic*) **ACID**, PHENIC ACID, or PHENOL, C_6H_5OH . An important organic substance largely used as an antiseptic, disinfectant, and deodorant, as well as in the manufacture of certain dyes. It is formed when various organic substances are strongly heated, and is, therefore, found in the tar produced by the destructive distillation of coal, wood, shale, etc. Carbolic acid was discovered in 1834 by Runge, among the products obtained in the distillation of coal tar. A few years later Laurent succeeded in preparing a pure crystalline carbolic acid which he named *phenic acid*, or *phenyl hydrate*, from the Greek *φαινεω*—to

give light. The commercial product known as *crude carbolic acid* contains, besides phenol, various other substances derived from coal tar; it has a creosote-like odor, and is composed chiefly of phenol and cresol. The chief material from which it is made on an industrial scale is the tar obtained in the manufacture of coal gas. Carbolic acid is extracted from the fraction of coal tar which distills over between the temperatures 170° and 230° C. This portion, called middle oil, or carbolic oil, is treated with a solution of caustic soda, which combines all the phenol, but at the same time takes up a certain amount of the hydrocarbons contained in the oil. The hydrocarbons are driven off by a current of steam passed through the alkaline solution, and then the still impure sodium salt of phenol is decomposed with dilute sulphuric acid, and the crude phenol thus obtained is rectified in wrought-iron stills. The fraction passing over between 175° and 205° is subjected to further fractional distillation, the final product being practically pure phenol. At ordinary temperatures pure phenol is solid, crystallizing in large, colorless prismatic crystals that melt at 42° C. The melting point is, however, considerably lowered by the presence of minute quantities of water. The boiling point of pure phenol is 183° C. If exposed to the air, carbolic acid gradually becomes red from the presence of minute traces of lead; a permanently colorless phenol may be obtained by oxidizing the impurity with a little potassium permanganate and sulphuric acid. Carbolic acid mixes in all proportions with alcohol, ether, chloroform, glycerin, olive oil, and other organic liquids. It is but sparingly soluble in water. Aqueous solutions have a sweetish taste and leave a slightly burning sensation in the mouth. Carbolic acid has the peculiar effect of rendering the urine dark, even in such small quantities as may enter the body by absorption from surgical dressings. Taken internally in concentrated form carbolic acid acts rapidly as a poison, producing a cold and clammy skin, feeble respiration, collapse, etc. The mouth, throat, œsophagus, and stomach exhibit white eschars, or sloughs. In cases of poisoning an emetic should be administered, followed by white of egg, or a dilute solution of magnesium or sodium sulphate; soluble sulphates combining with carbolic acid to form the harmless sulphocarbates. It is a frequent cause of death, and was formerly often employed by suicides until its sale was severely restricted by law. Whisky, an excellent antidote, should be given, by mouth, slightly diluted, and also hypodermatically for its stimulant effect. Alcohol is also a local antidote in carbolic acid burns. Ferric chloride solution is a test for carbolic acid, producing with it a violet color. The following, however, is a more sensitive test: Phenol combines directly with bromine to form tribromphenol bromide, a yellowish-white solid compound; to test a solution for phenol, bromine water may, therefore, be added, when, even if mere traces of phenol are present, a flocculent precipitate will form either immediately or in a short time. The bromine reaction is also used for the quantitative determination of phenol.

Carbolic acid is generally used to disinfect surgical instruments, bed linen, fecal discharges, walls and floors, drains, etc. The cresol contained in crude carbolic acid is itself quite efficient for these purposes. Carbolic acid is further used in itching of the skin, as a gargle,

and as a general antiseptic wash, and in its pure form as a caustic. It has been employed as an injection, in hemorrhoids, synovitis, inflamed bursæ, bubo, glandular swellings, etc. Internally it is given in flatulent dyspepsia (in the form of sulphocarbonate of soda).

CARBON (Lat. *carbo*, coal). One of the most important chemical elements. It exists in large quantities, both in the free state and in combination with other substances. It occurs uncombined in the mineral graphite, or black lead, and in the diamond, which is pure crystallized carbon. It is much more abundant, however, in a state of combination. United with oxygen, it occurs as carbonic acid in the atmosphere and in natural water, and it is similarly combined in limestone, dolomite, and ironstone. In coal it is found combined with hydrogen and oxygen, and in plants and animals it occurs as one of the component elements of wood, starch, gum, sugar, oil, bone (gelatin), and flesh (fibrin). Indeed, there is no other element which is so characteristic of plant and animal organisms as carbon. Carbon is often set free by the decomposition of organic matter. Thus charcoal forms during the imperfect combustion of wood. Many volatile organic substances, especially those rich in carbon, like benzene and acetylene, burn with a smoky flame, soot being nothing but finely divided carbon. The decomposition of vegetable refuse under water gives rise to the formation of peat. The formation of humus (black earth) is due to the carbonization of vegetable matter in moist air. At elevated temperatures carbon combines directly with oxygen, sulphur, silicon, and many metals. (See **CARBIDES**.) If heated with oxygen or with a strong oxidizing agent like nitric acid, carbon forms carbonic-acid gas; if the amount of available oxygen is, however, small, carbonic oxide is produced, which contains a much lower percentage of oxygen. (At ordinary temperatures carbon is, like nitrogen, extremely inert; so much so that it is customary to char the ends of piles of wood which are to be driven into the ground, so as by this coating of nondecaying carbon to preserve the wood. In a similar manner the interior of wooden vessels intended to hold water during sea voyages is charred (coated with carbon) to keep the wood from passing into decay and thus to preserve the water "sweet.")

Three allotropic modifications of carbon are known—viz., amorphous carbon, graphite, and diamond. The chemical identity of these substances is proved by burning them, equal quantities yielding precisely the same amount of carbonic acid, though there is a marked difference in the readiness with which they burn. Artificial amorphous carbon takes fire readily; graphite is so noncombustible that crucibles made of this material withstand a high heat for a considerable length of time; diamond completely resists most ordinary modes of setting fire to it; it can only be burned in an atmosphere of pure oxygen, by means of the electric current. The specific gravities, the hardness, and other physical properties of the three allotropic modifications of carbon are likewise very different. Many experiments have been made with the object of transforming the less valuable varieties of carbon into diamond. Only very minute quantities of diamond have hitherto been made artificially. After diamond was found to be accompanied in meteors by iron and sulphur,

the French chemist Charles Friedel endeavored to produce diamond by heating cast iron rich in carbon with sulphur, at 500° C., when a small amount of an exceedingly hard substance was produced; the quantity was, however, so slight that it was impossible to demonstrate conclusively the formation of diamond. Even by the use of the electric furnace, Moissan, in 1893, succeeded in obtaining only traces of diamond. Graphite, on the contrary, is readily formed from charcoal by heating; this is the effect, for instance, of the action of a powerful galvanic current on charcoal. Pure carbon may be prepared by charring organic substances, such as sugar, that leave no ash; to prepare it from lampblack, this substance is carefully washed with alcohol and ether and heated to a high temperature. Lampblack is largely used for making black paint, printer's ink, etc.; it is obtained by burning substances rich in carbon, such as tar, natural gas, etc. Graphite, which occurs in large quantities in nature, is used for the manufacture of pencils, after being powdered and freed from earthy matter. The carbons used in electric lighting are likewise made of graphite, which is obtained in a very dense form by mixing powdered coal with sirup to a pasty mass, giving the latter the desired shape, and applying an intense heat. A graphite far superior to the natural product in purity is now extensively made by a process invented by Acheson (q.v.). Charcoal has been utilized for making the carbonic acid used in sugar works, and for other purposes in the arts; it is employed for decolorizing solutions (see **BONE BLACK**); and as, when dry, it readily absorbs gases, it is used as a disinfectant and deodorant. It is also sometimes used in medicine as an antidote against vegetable poisons, such as opium, aconite, etc. Carbon is infusible and insoluble in any known liquid. The atomic weight of the element is 12, and it is denoted in chemical formulas by the symbol C. The molecule of carbon probably constitutes a complex system of atoms. See **CHARCOAL**; **COAL**; **GRAPHITE**; **DIAMOND**; **CARBON COMPOUNDS**; **VALENCY**.

CARBONARI, kâr'bô-nâ'rè (It., pl. of *carbonaro*, from Lat. *carbonarius*, charcoal burner, collier, from *carbo*, coal). The name of a secret political society which took an active part in the struggle for Italian liberty and unity. Its existence and character first became in some degree known in 1815. The constitution, as well as the precise objects of the Carbonari, still remains in a great measure secret, though there have been printed instructions, catechisms, statutes, and rituals of the society. Like other secret societies, it sought to dignify itself and rationally account for its existence by claiming a high antiquity, but such accounts are fabulous. There is every reason to believe that it originated during the last French régime in Naples. Botta, in his *Storia d' Italia*, states that under Murat's government the Neapolitan republicans, hating the French and King Ferdinand equally, escaped into the wild defiles of the Abruzzi and formed a secret society, naming themselves Carbonari. The peculiar phraseology of the Carbonari is taken from the vocation of charcoal burners. They were wont, for instance, to speak of "clearing the forest of wolves." The "wolves" probably meant at first foreign tyrants; but in the course of time the term was applied to the Neapolitan Bourbons. Among themselves the initiated were styled "good cousins," while the uninitiated were

"heathens" (*pagani*). The various societies do not seem to have possessed a common centre or to have been properly organized for combined action. A place of meeting was styled *baracca*, or "hut"; the external neighborhood "the forest"; and the interior of the hut was the *vendita*, or "place for selling coal." A union of several of these "huts" formed a "republic." The superior "huts" (*alte vendite*) at Naples and Salerno endeavored, but without success, to effect a centralization of the Carbonari. The society, soon after its institution, numbered from 24,000 to 30,000 adherents, and increased so rapidly in Italy that in March, 1820, it is said as many as 650,000 new members were initiated, including considerable numbers of the military and clergy.

After the restoration of the Bourbons, several secret political unions were formed in France, which in 1820 were confederated with the Carbonari. Paris was made the headquarters of a Carbonarism which, adopting all the symbolic phraseology, rules, and regulations of the Italian societies, received from the systematizing genius of the French an organic character which it had never before possessed. Written documents and communications were strictly prohibited, and treachery was punished by assassination. After the July Revolution, several of the leading French Carbonari attached themselves to the new régime, and their society was gradually dissolved. In its place the new *Charbonnerie démocratique* was founded, having for its object the establishment of a republican government, founded on the principles of Babeuf (q.v.). The endeavors of these new Carbonari to make Paris the centre of all political movements led to the secession of the Italian refugees. Napoleon III in his young republican days was a member of this society, and Charles Albert (q.v.) of Sardinia was persistently charged with being a Carbonaro. Though the Carbonari did some service in the cause of Italian unity by awakening the feeling of patriotism, it is doubtful if the results they accomplished were in proportion to their pretensions and to the vast resources which they commanded. When members were initiated in such large numbers it was inevitable that the fervor which actuated the original founders of the society should disappear. In the course of time the activity of the Carbonari degenerated into a mere spouting of symbolic catchwords and the celebration of an awe-inspiring ritual. It was as a revolt against this namby-pamby patriotism mixed with mummery that Mazzini founded the revolutionary society of Young Italy (q.v.). Consult: *Memoirs of the Secret Societies of the South of Italy, Particularly the Carbonari* (London, 1821); Saint-Edme, *Constitution des Carbonari* (Paris, 1821); Cantù, *Il conciliatore e i Carbonari* (Milan, 1878); R. M. Johnston, *Napoleonic Empire in Southern Italy, and the Rise of the Secret Societies* (London, 1904); Bandini, *Giornali e scritti politici clandestini della Carboneria Romagnola, 1819-21* (Rome, 1908).

CARBONATED, or ACID'ULOUS, WATERS. Natural waters containing a large amount of carbonic acid. While the quantity of the latter in spring and well water rarely exceeds 8 per cent by volume, its quantity in carbonated waters is usually as great as 30 to 60 per cent and is often much greater. The spring water at Saint-Nectaire in Puy de Dôme, France, is said

to contain in every 100 volumes as much as 400 volumes of carbonic acid. The carbonic acid exists in such waters in the free state, but is generally accompanied by either sodium bicarbonate or iron carbonate. Waters containing sodium bicarbonate are known as *carbonated alkaline* or *acidulous alkaline*; such are the famous German mineral springs at Altwasser, Pyrmont, Reinerz, Salzbrunn, and Seltzer, as well as the Navajo and Ute Springs, Manitou, Colo., the Napa Soda Springs, California, and the Hot Springs, Virginia, in the United States. Waters containing iron carbonate are called *carbonated chalybeate*, or *acidulous chalybeate*; such are the waters of the spring at Ilkeston, in Derbyshire, in England, as well as the Iron Ute Spring of Manitou, Colo., and the Rawley Springs of Virginia, in the United States. Carbonated waters are refreshing and may be useful in certain disordered conditions of the stomach; they relieve nausea, and generally increase the discharge of liquid from the system. See AERATED WATERS; CHALYBEATE WATERS; MINERAL WATERS.

CARBONATES. See CARBONIC-ACID GAS.

CARBON COMPOUNDS, or ORGANIC COMPOUNDS. A very large number of chemical substances that form the subject of the science of *Organic Chemistry*. The reason for terming the compounds of carbon "organic compounds," is that many of them could originally be obtained only from the bodies of animals and plants. For the same reason, their formation was for a long time supposed to require the agency of life. Since 1845, however, when Kolbe reproduced acetic acid artificially, every year has seen the artificial production of a host of carbon compounds; and not only have most of the natural animal and vegetable substances been reproduced artificially, but thousands of compounds have been prepared that are not known to exist ready-formed anywhere in nature. It is mainly on account of their large number that the chemistry of these compounds is treated as a branch distinct from the chemistry of the other elements. There is, however, another reason for this division of the science. Most of the compounds of carbon contain, besides carbon itself, only two or three other elements (hydrogen, oxygen, nitrogen), and those in relative quantities often the same, or very nearly the same, in different compounds. The cause of the great variety found among the carbon compounds is mainly in the great variety of ways in which the few elements are capable of combining with carbon. The theories of the constitution of carbon compounds are therefore somewhat complex, and for this reason "organic" chemistry is kept separated from and taught after "inorganic" chemistry.

Isolation of Compounds. The presence of one or more carbon compounds in a given substance may usually be detected by taking advantage of the fact that, on being heated, carbon compounds are charred, i.e., decomposed with separation of free carbon, which is readily recognized by its black color, or else give off combustible vapors. The next step in the examination of a given substance is to determine whether it consists of one single compound or of a mixture of two or more compounds. This is usually accomplished by subjecting the substance to some physical process, such as distillation or crystallization, by means of which the substance may be separated into two or more portions; if these portions are found to be identical in their physi-

cal and chemical properties, the conclusion is drawn that the substance consists of a single compound. (See CHEMISTRY.) In most cases distillation alone is capable of effecting the complete separation of compounds, and the same may be said of the crystallization of solid substances from their solutions—another process frequently employed by chemists for isolating and purifying compounds of carbon. Crystallization is, as a rule, more effective as a process of purification than distillation, and hence chemists are anxious, whenever possible, to obtain their compounds in a solid crystalline form.

Analysis. After a compound has been isolated and purified by repeated distillation or crystallization, its physical properties (especially the boiling or melting point) are carefully determined, and then it is analyzed. The analysis of carbon compounds usually involves the determination of carbon and hydrogen, often of nitrogen, and less frequently of halogens, sulphur, phosphorus, and certain other elements. Carbon and hydrogen are determined simultaneously by heating a known amount of the compound in a glass tube with copper oxide, which oxidizes all the hydrogen into water vapor and all the carbon into carbon dioxide. The process is for evident reasons termed a *combustion*. The products of the combustion are collected, respectively, in sulphuric acid and in caustic potash, and their weights are carefully determined, the percentages of hydrogen and of carbon in the given compound being calculated from those weights. A second combustion is required to determine the amount of nitrogen (q.v.) that may be present in the compound. The combustion yields the nitrogen in the free state, the gas being collected in a graduated tube, which shows the volume produced, and from this the percentage, by weight, of nitrogen in the given compound is found by a simple calculation. A direct determination of oxygen is unnecessary; after the percentages of carbon, hydrogen, and nitrogen have been determined, that of oxygen becomes evident. Halogens may be generally determined by heating the given compound with solid silver nitrate and fuming nitric acid in a sealed glass tube; all halogen thus appears in the form of silver-halogen salt, which is washed, dried, and weighed. In solid substances, both halogens and sulphur may be rapidly and accurately determined by mixing the substance with pure sugar and sodium peroxide and exploding the mixture in a steel crucible of a certain form: the halogen then appears in the form of soluble salts of sodium, sulphur appears as sodium sulphate. In the case of organic compounds of silver the amount of the latter may often be determined by simply heating a known quantity of the compound in a crucible; the metal then remains behind, as such, and is weighed directly, while the rest of the compound burns away. The amount of sodium or potassium in an organic compound may be determined by heating a known quantity of the latter with strong sulphuric acid, pure sodium or potassium sulphate being thus produced, and from the weight of this the percentage of metal in the compound is readily calculated. The determination of phosphorus and other elements that may sometimes be present in carbon compounds need not be described here, the purpose of the present sketch being merely to convey a general idea of the ways in which it is possible to ascertain the composition of

organic substances, and not to give detailed specific information; such information should be sought in special works on chemical analysis.

Molecular Formulas. After analysis has shown the percentage composition of a substance, the next step is to determine its molecular formula. For this purpose the percentages of the constituent elements must, first of all, be expressed in terms of their atomic weights. Let, for example, an analysis of pure acetic acid give the following results: carbon, 39.9 per cent; hydrogen, 6.7 per cent; and oxygen, 53.4 per cent. Since the atomic weights of the three elements are, respectively, 12, 1, and 16, the analytical results 39.9 : 6.7 : 53.4 are written in the form $(3.33 \times 12) : (6.7 \times 1) : (3.34 \times 16)$, or, using the symbols of the elements to denote their atomic weights, in the form $3.33C : 6.7H : 3.34O$. Allowing for the errors of analysis, it is therefore evident that, for every atom of carbon, acetic acid contains 2 atoms of hydrogen and 1 atom of oxygen—a relation expressed by any one of the formulas CH_2O , $C_2H_4O_2$, $C_3H_6O_3$, etc. According to the first of these formulas the molecular weight of acetic acid would be 30 (i.e., $12 \times 1 + 1 \times 2 + 16 \times 1$); according to the second it would be 60 (i.e., $12 \times 2 + 1 \times 4 + 16 \times 2$); according to the third it would be 90, etc. Now, according to Avogadro's rule, the molecular weight of a compound is twice as great as the density of its vapor (compared with hydrogen). Therefore, in order to fix the molecular weight of acetic acid, its vapor density must be determined; and this may be done by one of the methods described in the article MOLECULES—MOLECULAR WEIGHTS. The vapor density being found to be about 30, the molecular weight is taken to be 60, and hence the formula $C_2H_4O_2$ is accepted as representing a molecule of acetic acid.

Chemical Constitution. The molecular formula of a compound represents its composition and its smallest relative reacting weight. It is not, however, altogether characteristic of the compound, for *numerous cases are known in which a number of different compounds are represented by one and the same molecular formula*. Thus, both ordinary alcohol and dimethyl ether (a substance that may be obtained from wood alcohol) are represented by the formula C_2H_6O ; five compounds, viz., ordinary ether and the four different substances called butyl alcohols, are found to have in common the formula $C_4H_{10}O$, etc. Such compounds are said to be *isomeric*, or, more strictly, *metameric*, the term "isomeric" being often extended to include also the so-called *polymeric* compounds, i.e., those which have the same relative composition but not the same molecular weight, such as acetylene, C_2H_2 , and benzene, C_6H_6 . (Another kind of isomerism may be found discussed in the article STEREO-CHEMISTRY.)

The isomerism of carbon compounds shows plainly that the composition of a substance does not entirely determine its chemical individuality. For two or more molecules composed of the same kind and number of atoms may represent very different compounds. It is therefore evident that the character of a compound must depend to a great extent also upon the manner in which the atoms are held in combination within its molecule. This, at least, is the only possible explanation that presents itself to the mind, assuming that substances are really made up of atoms and molecules; and without this assump-

tion, i.e., without the atomic hypothesis, isomerism could not be explained at all. After, therefore, the composition and molecular weight of a newly isolated compound have been determined, a further and much more difficult problem remains to be solved; viz., to determine the *chemical constitution* of the compound, i.e., the manner in which the atoms are arranged in its molecules. This problem is solved by combining the results of a careful study of the chemical and physical properties of the compound with a theoretical assumption first induced independently by Kekulé and Couper. The following paragraphs may convey an idea as to how this is done.

Graphical Formulas. The theoretical assumption just referred to is (1) that an atom of carbon is quadrivalent, i.e., has four times the combining capacity of an atom of hydrogen, and therefore can hold in combination four univalent atoms like those of hydrogen and chlorine, or two divalent atoms like those of oxygen; (2) that two or more carbon atoms may be directly combined with one another and may thus partly satisfy one another's combining capacity. This assumption, together with a knowledge of the valencies (combining capacities) of other elements, makes it easy to determine a priori the several different combinations that are possible with a given set of atoms, each arrangement being represented by a scheme, called a graphical formula, in which the atoms are represented by the chemical symbols of the elements, and their combining capacities by dashes that link together the symbols. The set of atoms CH_4 can be represented, on the above assumption, by only one graphical formula, viz.,

The sets C_2H_6 and C_3H_8 can likewise be represented each by only one graphical formula, viz.,

The set C_4H_{10} can be represented by two different graphical formulas, viz.,

Similarly, the set C_5H_{12} can be represented by *three* different graphical formulas; the set C_6H_{14} by *five* formulas, etc.

When a compound is discovered whose molecular formula can be represented by only one such graphical scheme, the case is simple, and the structure of the molecule becomes known at once. Further, in such cases the inference from the theory is that only one compound of the given molecular formula is capable of existence. In this manner, for instance, the theory gives us the constitution of marsh gas, CH_4 , of ethane, C_2H_6 (a constituent of coal gas), of propane, C_3H_8 , etc.; the verdict of the theory being,

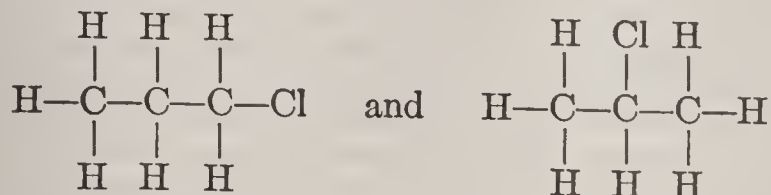

further, that only one compound CH_4 , only one compound C_2H_6 , and only one compound C_3H_8 , are capable of existing. The fact that the most careful researches have actually led chemists to the discovery of one, and only one, compound corresponding to each of these molecular formulas speaks strongly in favor of the structural theory. Again, in cases in which more than one graphical formula can be constructed from a given set of atoms, the number of compounds actually known is generally the same as the number of formulas. Thus, we have seen that two different structural formulas correspond to the molecular formula C_4H_{10} ; and, as a matter of fact, two, and only two, compounds of the formula C_4H_{10} can be obtained, viz., the substances known, respectively, as butane and isobutane, which have the same composition and the same molecular weight, yet differ considerably in their physical and chemical properties. Similarly, three different compounds of the formula C_5H_{12} are known, five different compounds of the formula C_6H_{14} , etc. In cases in which the number of isomeric compounds actually known was less than the number indicated as possible by the structural theory, earnest research has finally led to the discovery of the wanting isomerides.

The correspondence between the chemical properties of a compound and the relations exhibited by its graphical formula is usually capable of experimental demonstration. In the case of marsh gas the graphical formula is symmetrical, because the doctrine of valency assumes no difference between the several valencies of an atom. We may, accordingly, expect that the four portions of hydrogen contained in the compound exercise precisely the same function and are in all respects identical. If there were two different positions in the graphical formula, which we will call positions A and B, then we could obtain, for example, one derivative by substituting chlorine for hydrogen in position A while leaving hydrogen in position B; and we could obtain a different derivative by substituting chlorine in position B while leaving hydrogen in A. In other words, two different mono-chloro-substitution products of marsh gas would be possible. But the mono-chloro-substitution product has been obtained by many different methods, and the product was always found the same. All efforts to produce two different derivations have failed. The conclusion is that the several portions of hydrogen contained in marsh gas have really the same function. Henry has furnished a direct experimental demonstration of this principle, having employed methods by which the NO_2 group, for instance, could be made to change its place within the marsh-gas molecule: the nitro-methanes (CH_3NO_2) obtained by these methods were identically the same, although the NO_2 in them occupied demonstrably different positions.

When we examine the graphical formula of ethane, C_2H_6 (see above), we find again that the several positions of the hydrogen atoms are identical: each hydrogen atom is, namely, attached to a carbon atom to which two more hydrogens and one CH_3 group are linked at the same time. If we should substitute chlorine in the place of one of the hydrogen atoms, we should—the formula tells us—obtain the same derivative, no matter which particular portion of the hydrogen is displaced. In this case, too, different and ingenious methods have actually been employed by chemists, with a view to displacing

different portions of the hydrogen by chlorine and thus possibly producing two different mono-chloro-substitution products. Yet one, and only one, such product could be obtained.

Applying the same method to the graphical formula of propane, C_3H_8 (see above), we find that there are two different hydrogen positions in it; so that two other formulas can be derived from it by substituting a chlorine atom in place of one hydrogen atom, viz.,

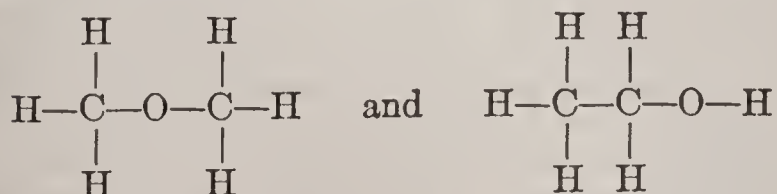

The difference between the two formulas, expressed in words, is as follows: In the first formula the chlorine is linked to a carbon atom to which two hydrogens and one C_2H_5 group are linked at the same time; in the second formula the chlorine is linked to a carbon atom to which one hydrogen atom and two CH_3 groups are linked at the same time. These are the only possible cases. If we consider a formula like the following,

which may seem, at first sight, to differ from either of the above two formulas, we have no difficulty in observing that it is characterized precisely as the first of those formulas; viz., its chlorine is linked to a carbon to which two hydrogens and one C_2H_5 group are linked at the same time. In general, a graphic formula is not meant to convey an image of the configuration of the atoms within a molecule; all it is expected to show is what atoms and groups of atoms exist in the molecule and how they are combined with one another. If we now turn to the facts of experimental chemistry, we find again that chemists have really been able to prepare two, and only two, mono-chloro-propanes having in common the molecular formula C_3H_7Cl , yet differing considerably in their properties.

The number of examples thus showing the perfect correspondence between theoretical formulas and the results of experimental investigation might be multiplied almost indefinitely. A further question, however, remains to be answered: Supposing two or more graphical formulas correspond to the same molecular formula, and the several thus possible compounds have actually been prepared, how do we know which formula corresponds to which compound?

This question is usually answered by a study of the reactions and methods of preparing the compounds. The two substances di-methyl ether and ordinary alcohol may serve as an example. Both have the same molecular formula, C_2H_6O . On the other hand, the set of atoms making up this molecule may be represented by two different graphical formulas, viz.,

Now, an experimental investigation of the alcohol reveals the following facts:

1. By the action of metallic sodium alcohol is transformed into a compound represented by the formula C_2H_5NaO . The molecular formula of the alcohol being C_2H_6O , it is evident that in this transformation one-sixth of the hydrogen contained in the alcohol is replaced by sodium. No matter how great an excess of sodium is used, no more than one-sixth of the hydrogen can thus be replaced. The transformation therefore speaks in favor of assigning to alcohol the second of the above graphical formulas, because the first shows no difference whatever in the relative positions of the several hydrogen atoms, and only the second formula shows one hydrogen atom in a different position from the other five hydrogens.

2. By the action of phosphorus penta-chloride one-sixth of the hydrogen, together with all the oxygen contained in the alcohol, is replaced by chlorine, according to the following equation:

This transformation, too, speaks in favor of assigning to the alcohol the second of the above graphical formulas, for it shows that one-sixth of the hydrogen is so intimately associated with the oxygen that they readily leave the compound together. And as, further, metallic sodium refuses to combine with the mono-chloro-ethane produced by the transformation, we conclude that the portion of the hydrogen of alcohol which is replaceable by sodium must be the same as the portion which we have just seen to be intimately associated with oxygen. That portion is evidently represented in the graphical formula by the hydrogen atom of the hydroxyl group OH.

Since, besides the two transformations just considered, all other reactions of ordinary alcohol bring out the perfect correspondence between the chemical properties of this substance and the relations exhibited by the second graphical formula, there remains no doubt as to which of the two formulas should be assigned to alcohol. But then the first formula remains the only possible one for our ether. The correspondence between the ether and the graphical formula thus chosen to represent it is, just as in the case of the alcohol, brought out by a number of reactions, but these cannot be discussed here. Suffice it to mention that the ether reacts neither with metallic sodium nor with phosphorus pentachloride; which indicates that the ether does not, like the alcohol, contain a hydroxyl group OH. The graphical formula shows the same thing very plainly.

Radicles. The example considered in the preceding paragraphs has led us, among other things, to the conclusion that a molecule of ordinary alcohol contains a hydroxyl group OH. The conclusion was based on the fact that a portion of the hydrogen of alcohol and the whole of its oxygen were seen to leave the compound together, while the rest of the molecule remained unchanged. The molecule of alcohol, C_2H_6O , is accordingly conceived as consisting of two atomic groups, C_2H_5 and OH, the constituent atoms of which tend to hold firmly together, although, of course, they are not altogether incapable of being separated. Such atomic groups, behaving during many transformations of the compound as if they were just single atoms, are called *radicles*.

An example may serve to show how the smallest radicles present in a given compound are de-

terminated by its chemical reactions. Let the problem be, To determine the atomic groups in a molecule of acetic acid, $C_2H_4O_2$. To solve the problem, acetic acid is caused to undergo a series of transformations and the following facts are brought to light:

1. By the action of phosphorus penta-chloride, acetic acid, $C_2H_4O_2$, is readily transformed into acetyl chloride, whose formula is C_2H_3OCl . In this reaction an atom of hydrogen and an atom of oxygen are together replaced by an atom of chlorine. We therefore conclude that acetic acid, like alcohol, contains a hydroxyl group, OH.

2. By passing chlorine gas into hot acetic acid exposed to the direct action of sunlight, a compound called tri-chloro-acetic acid is obtained. When boiled with water, this compound is split up and chloroform is produced. Chloroform has the formula CCl_3H and hence evidently contains the group CCl_3 . The formation, by a simple reaction, of a compound containing the group CCl_3 , out of tri-chloro-acetic acid, indicates that this acid itself must contain the group CCl_3 —a view fully confirmed by other reactions. And since the molecule of tri-chloro-acetic acid, $C_2HCl_3O_2$, contains three chlorine atoms altogether, it is evident that tri-chloro-acetic acid contains no chlorine but what is combined in its CCl_3 group.

3. When tri-chloro-acetic acid is treated with nascent hydrogen, all of its chlorine is replaced by hydrogen and acetic acid is reobtained. Since tri-chloro-acetic acid was just shown to contain no chlorine outside its CCl_3 group, it is evident that the substitution of hydrogen for chlorine must result in the formation of the group CH_3 . The resulting compound, i.e., acetic acid, must therefore contain a methyl group CH_3 .

4. From the above it is clear that acetic acid contains the radicles OH and CH_3 . Subtraction of these from the entire molecule, $C_2H_4O_2$, leaves the group CO, which is evidently the third and last group contained in acetic acid.

We may, therefore, assign to acetic acid the *rational*, or constitutional, formula $CH_3CO.OH$. And, remembering that according to the structural hypothesis a carbon atom is quadrivalent, and two or more carbon atoms can be linked to each other in a molecule, we can, further, combine the three radicles of acetic acid into the following graphical formula:

It is easy to see that although this is not the only possible graphical formula corresponding theoretically to the molecular formula of acetic acid, $C_2H_4O_2$, a knowledge of the radicles, derived by experimental investigation, eliminates the other possibilities and leaves no doubt as to what graphical formula must be accepted as representing the arrangement of the atoms within a molecule of acetic acid. Numerous facts might be cited in further support of this formula. For example, in the formula three hydrogens are seen to be linked to carbon immediately, while the fourth hydrogen is linked to carbon

through oxygen. The formula thus teaches that one of the four hydrogen atoms must have a different function from the other three hydrogens. But this is also the verdict of experiment. In fact, when acetic acid combines with alkalis to form the corresponding acetates, it is found that no matter how great the excess of alkali employed, one-quarter, and only one-quarter, of the hydrogen of acetic acid can be replaced by metal, which shows that the replaceable quarter of the hydrogen has a different function from the other three-quarters. In analogous ways, a correct graphical formula, constructed from a given set of facts with the aid of the structural hypothesis, is always found to agree with any other fact dependent on the nature of the compound, and this agreement permits the trained chemist to foretell what the principal chemical properties of a compound must be, by examining its graphical formula.

Unsaturated Compounds. Thus far we have referred only to compounds in which the valencies of the several atoms are completely satisfied, so that the molecules are incapable of taking on any more atoms. Thus, in marsh gas, CH_4 , the four valencies of the carbon atom are evidently satisfied by four atoms of hydrogen. In ethane, C_2H_6 , three valencies of each carbon atom are evidently satisfied by hydrogen atoms, while the fourth valency of each carbon atom is satisfied by the other carbon atom. Compounds thus containing the maximum possible number of atoms of hydrogen, or of other elements, are said to be *saturated*. Many other compounds; however, are known, in which this is not the case. Thus, while ethane, C_2H_6 , contains six hydrogen atoms, the gaseous compound known as ethylene contains only four hydrogen atoms in combination with two atoms of carbon, the formula of ethylene being C_2H_4 .

Three different graphical formulas might represent a molecule of ethylene; viz.,

According to the first, two valencies of each carbon atom are satisfied by the other carbon atom. According to the second, one valency of each carbon atom remains unsatisfied. According to the third, the carbon atom is not quadrivalent, but tri-valent. Now, the last two formulas might be rejected in view of the following fact: A great deal of ingenuity has been spent, by some of the most celebrated organic chemists, in efforts to produce a compound of molecular formula CH_3 , the existence of which would prove, either that one of the valencies of a carbon atom may remain unsatisfied, or that carbon may occur in the tri-valent state; but all such efforts have invariably failed. The view corresponding to the first of the above graphical formulas has therefore been universally adopted, viz., that in ethylene, and in similar compounds, carbon atoms satisfy two of each other's valencies. This view is further strongly supported by the facts of what is now termed "geometrical isomerism," a discussion of which may be found under STEREOCHEMISTRY. Nevertheless, in recent years these views have been losing something of their original rigidity. For while the substance CH_3

has not been isolated as yet, and perhaps never will be, an analogous substance, $C(C_6H_5)_3$, or

in which carbon is obviously tri-valent, has actually been prepared by Gomberg. Further, certain compounds (e.g., fulminic acid) even appear to contain *di*-valent carbon. These matters will be discussed in the article VALENCY. For the purposes of the present sketch it will be best to adhere to the double-bonded formula of ethylene, which is still generally used.

The formula, then, of ethylene suggests that the molecule of this compound would not be broken up if one of the two bonds between the atoms of carbon were dissolved, and two univalent atoms of some element were linked on by the two carbon affinities thus set free. As a matter of fact, ethylene combines directly with bromine and certain other elements, forming what is termed "additive compounds," the term suggesting that the atoms—say, of bromine—join the molecule of ethylene without displacing anything in it. Ethylene and its additive compound with bromine are represented, respectively, by the following two formulas:

In cases like that of ethylene, the correspondence between theory and experiments is again perfect. Whenever, namely, the formula of a compound is found, by the structural hypothesis, to contain a double bond between two carbon atoms, the compound represented by the formula is invariably found to be capable of forming additive products. Compounds like ethylene are, for obvious reasons, termed *unsaturated compounds*. In view of the perfect correspondence between theory and fact, such compounds may be defined either theoretically or empirically, as follows: (1) unsaturated compounds are compounds in whose molecules there is at least one pair of carbon atoms linked by a double bond; or else, (2) unsaturated compounds are compounds capable of forming additive products with bromine or other elements, i.e., capable of uniting with bromine without at the same time losing any of their own constituents.

The term *doubly unsaturated compounds* is often applied to acetylene and its derivatives, whose formulas are found to contain carbon atoms linked to each other by a triple bond, while the compounds themselves are found capable of taking on twice as much bromine as the corresponding quantities of compounds like ethylene. Further, in doubly unsaturated compounds this formation of additive products with bromine or other elements is found to take place in two steps, as is shown, in the case of acetylene, by the following chemical equations:

The following graphical formulas exhibit clearly the relation between the molecules of acetylene and of its additive products with bromine:

An important property of acetylene and many of its derivatives is their capacity for forming certain metallic compounds. (See ACETYLENE.) By this property many doubly unsaturated compounds may be readily distinguished from the unsaturated compounds of the ethylene series.

Benzene and its Derivatives. One of the most important of the compounds of carbon is benzene (q.v.), a liquid hydrocarbon found in coal tar. Thousands of substances are derived from benzene, thousands find extensive application in the arts. (See COAL-TAR COLORS.) An exact knowledge of the constitution of benzene is therefore highly desirable for theoretical as well as for immediate practical reasons, and so chemists have now for many years diligently searched for a graphical formula that might be in perfect correspondence with all the chemical properties of benzene. A perfect formula has not as yet been devised. Nevertheless, four different formulas, each of which exhibits well *some* of the properties of benzene, have been proposed and are commonly referred to, respectively, as "Kekulé's formula," "the prism formula," "the diagonal formula," and "the centric formula." The last of these is now supposed to be the best, but the first is still commonly used by chemists and therefore requires explanation in the present sketch. It is as follows:

Kekulé's formula for benzene

Unlike the formulas already considered in this article, the formula of benzene has its carbon atoms arranged, not in the form of a chain, but in a ring, with alternating single and double bonds between the atoms. The complete demonstration of this formula formed one of the most beautiful chapters of organic chemistry. Nothing astonishes the young student more than to find that in this demonstration an atom of bromine, substituted for one of the hydrogen atoms of benzene, is made to travel around the molecule exchanging places successively with each of the hydrogen atoms, and that this migration of the bromine atom is demonstrated beyond the slightest possibility of doubt. The demonstration cannot be repeated here, and an account of it must be sought for in one of the larger works on organic chemistry (or consult Marekwald's lecture on the theory of benzene published in Ahrens's *Sammlung chemischer und chemisch-technischer Vorträge*, Stuttgart, 1897). What

requires explanation in the present article is the isomerism of derivatives of benzene and the choice of the particular formula corresponding to each of a given set of isomeric compounds.

Kekulé's formula is based principally on two facts: 1. When one hydrogen atom of benzene is replaced by one atom of some other element, only one product is obtained; thus, only one mono-chloro-benzene, C_6H_5Cl , can be prepared. 2. When two hydrogen atoms of benzene are replaced by two atoms of some other element, three different products may be obtained; thus, three different di-chloro-benzenes, $C_6H_4Cl_2$, can be prepared. Corresponding to the first of these facts, the six hydrogen atoms occupy identical positions in Kekulé's formula, so that only one formula can be obtained by substituting, say, a chlorine atom for a hydrogen atom; for the following formulas are evidently identical:

The second of the facts just mentioned may be found to be expressed by Kekulé's formula, by examining all the imaginable arrangements that could be made in the formula by substituting two atoms, say, of chlorine for two of its hydrogen atoms. It is thus easy to find that only three different formulas can be constructed, as follows:

The position (1, 2) of the chlorine atoms in the first of these formulas is called the *ortho*-position; the position (1, 3) in the second formula is called the *meta*-position; the position (1, 4) of the third formula is called the *para*-position. Any other imaginable position would really be identical with one of these three; thus the position (2, 3) is found to be the same as the position (1, 2); the position (1, 5) is the same as the position (1, 3), etc. The three compounds corresponding to our three formulas are called, respectively, *ortho*-dichloro-benzene, *meta*-dichloro-benzene, and *para*-dichloro-benzene, and may be denoted as follows: $o-C_6H_4Cl_2$, $m-C_6H_4Cl_2$, and $p-C_6H_4Cl_2$; or as follows: $C_6H_4Cl_2$ (1, 2), $C_6H_4Cl_2$ (1, 3), and $C_6H_4Cl_2$ (1, 4).

But then how do we know which of these compounds is *ortho*, which is *meta*, and which is *para*? In other words, being given three different compounds and three different formulas corresponding to them, how do we decide which

formula is to be assigned to which compound? Several different methods are employed in deciding this important question—important because it presents itself in the case of thousands of valuable compounds. One of these methods, characterized by great simplicity, certainty, and elegance, was discovered by Körner. It is based on the following considerations. When an *ortho*-di-substitution product like *ortho*-dichloro-benzene is transformed into a tri-substitution product by the introduction of some group, say, the nitro-group NO_2 , *two*, and only *two*, different compounds may be obtained according to the formula of benzene, viz.:

A *meta*-di-substitution product would similarly yield *three*, and only *three*, tri-substitution products, as follows:

Finally, a *para*-di-substitution product would yield *one*, and only *one*, tri-substitution product, viz.:

In order, therefore, to determine whether a given di-substitution product is *ortho*, *meta*, or *para*, the given compound may be transformed into a tri-substitution product. If it is then found that the tri-substitution product is capable of existing in two isomeric modifications, the conclusion is that the particular di-substitution product from which it is derived corresponds to the *ortho* formula. Similarly, if the number of isomeric tri-substitution products is three, the corresponding di-substitution product is seen to be necessarily a *meta*-compound. And if only one tri-substitution product can possibly be obtained from a given di-substitution product, the latter is concluded to be a *para*-compound.

Organic Reactions. Now, in reality it would be a tremendous undertaking to go through a demonstration of the kind just described, in the case of every newly discovered compound. In many cases years would have to be spent in determining the constitution of a single compound. Chemists therefore make use of an additional working principle—a generalization made from the study of a large number of organic reactions.

According to this, when one compound is transformed into another by some simple reaction, the molecule—at least the principal part of it—remains unchanged. Once, therefore, the constitution of a certain number of substances has been determined, say, by Körner's method, the constitution of any new substance derived from one of them by a simple reaction becomes evident by the very fact that it is derived from a substance of known constitution, or by the fact that it may be transformed into a substance of known constitution; and it is in this manner that the constitution of a great majority of carbon compounds has been brought to light. Thus, if the di-chloro-benzene, $C_6H_4Cl_2$, which is shown by Körner's method to be an *ortho*-compound, were transformed into dioxy-benzene, $C_6H_4(OH)_2$, the latter, too, would be assumed to be an *ortho*-compound. It is easy to see that this principle is at the basis of Körner's method itself, and it may be considered as one of the fundamental principles of organic research.

The reason that Kekulé's formula for benzene is not adopted in a final manner, and other formulas have been proposed, is that benzene does *not* act as an unsaturated compound (as the formula shows it to be) and refuses to combine readily with bromine. A remedy for this discrepancy between the formula and the actual behavior of the compound is furnished by Thiele's general theory of "residual valencies," which will be discussed in the article VALENCY.

Classification of Carbon Compounds. The innumerable compounds that are said to be derived from benzene all resemble the latter in certain chemical properties—a fact which is in accordance with their formulas having in common the benzene ring, or "benzene nucleus," consisting of six carbon atoms. It is therefore convenient to treat the benzene derivatives, otherwise called "aromatic compounds," separately from the rest of the compounds of carbon; and hence the division of organic compounds into *fatty* (or aliphatic) and *aromatic*. Just as the aromatic compounds may be considered as derivatives of benzene, the fatty compounds may be considered as derivatives of methane, or marsh gas, the simplest of the compounds of carbon; and while the aromatic compounds are characterized by having in their formulas a nucleus of carbon atoms arranged in a ring, or *closed* chain, the fatty compounds have graphical formulas in which the carbon atoms are arranged along straight lines, or *open* chains. However, in spite of this constitutional distinction between fatty and aromatic compounds, it must be remembered that the compounds of the two classes are more or less closely related, and that compounds of one of these classes may, by suitable methods, be transformed into compounds of the other class. A classical example of such a transformation is Berthelot's celebrated synthesis of benzene itself from acetylene, effected by simply passing the latter through red-hot tubes. Again, the subdivisions of the two great classes present a notable parallelism. Thus, corresponding to the *fatty* acids, alcohols, aldehydes, ketones, etc., there are also *aromatic* acids, alcohols, aldehydes, ketones, etc. In recent years a third series of organic compounds, the so-called *hydro-aromatic series*, has attained an importance comparable with that of the two older series. The hydro-aromatic compounds may be considered as derived from hexahydro-benzene (hexamethylene or cyclo-hexane),

C_6H_{12} . The constituents of the essential or volatile oils so extensively contained in plants belong mostly to this series. The graphic formula of hexahydro-benzene itself is:

Just as the division of organic compounds into the series mentioned above is based on a difference in their chemical constitution, so is the further classification of the compounds belonging to each of the two great classes based on constitutional similarities and dissimilarities.

The most important classes of carbon compounds, as well as a large number of individual compounds that are interesting because of the important rôle that they play in the bodies of animals and plants, or because of their useful applications in medicine and the arts, are described under their special names. See HYDROCARBONS; ALCOHOLS; ETHERS; ALDEHYDES; KETONES; ACIDS; ESTERS; AMIDES; AMINES; ORGANOMETALLIC COMPOUNDS; CARBOHYDRATES; PHENOLS; DIAZO COMPOUNDS; ETC. Besides the derivatives of methane, benzene, and hexahydro-benzene, the derivatives of naphthalene, anthracene, pyridine, and quinoline (qq.v.) deserve mention here. For history and bibliography of organic chemistry, see CHEMISTRY.

CARBONDALE. A city in Jackson Co., Ill., 95 miles southeast of St. Louis, Mo., on the Illinois Central (Map: Illinois, C 6). It is the seat of the Southern Illinois Normal University. The city is a division point of the Illinois Central, and has flour mills, ice and brick plants, bottling works, and a large railroad-tie preserving establishment. It is in an agricultural and coal-mining region, and ships coal, fruit, flour, live stock, etc. Carbondale adopted the commission form of government in 1910. Pop., 1900, 3318; 1910, 5411.

CARBONDALE. A city in Lackawanna Co., Pa., 16 miles northeast of Scranton; near the head of the Lackawanna River, and on the Erie, the Delaware and Hudson, and the New York, Ontario, and Western railroads (Map: Pennsylvania, K 3). The city has a public library, emergency hospital, hospital for the criminal insane, city private hospital, fine Federal building, and a small park in the heart of the city, containing a soldiers' monument. It is in the centre of one of the most important anthracite coal-mining districts in the State, and has silk and knitting mills, foundries and machine shops, car shops, glass factories, metal works, etc. Settled in 1824, Carbondale was incorporated in 1851. It has adopted the commission form of government. Pop., 1900, 13,536; 1910, 17,040.

CARBON DISULPHIDE, or BISULPHIDE (*carbon + disulphide*, from Gk. $\delta\lambda$ -, *di*-, double + *sulphide*, and *bisulphide*, from Lat. *bi*-, double + *sulphide*), CS_2 . A compound of carbon and sulphur, analogous to carbon dioxide, whose formula is CO_2 . It may be prepared by passing the vapors of sulphur over charcoal kept at a red heat. On a large scale it is prepared as follows: A cast-iron cylinder containing charcoal is placed in a furnace and heated to the re-

quired temperature. The cylinder is provided with two tubes, through one of which sulphur vapors or pieces of sulphur are introduced, while the other serves as an exit for the vapors of carbon disulphide, which are liquefied in a suitable condenser. Pure carbon disulphide is a heavy, colorless liquid of a rather pleasant ethereal odor; the ordinary preparations, however, have a most sickening smell, owing to the presence of impurities. The specific gravity of the purified compound at 0° C. is 1.293. It has a high refracting power and mixes in all proportions with absolute alcohol, ether, hydrocarbons, and other organic liquids. It is an excellent solvent for many substances, such as sulphur, phosphorous, india rubber, gutta-percha, the resins, fats, etc. Water does not mix with it, and alcohol containing a considerable amount of water dissolves it only to a limited extent. The boiling point of carbon disulphide is 46° C. At high temperatures it dissociates into its constituents, carbon and sulphur. With the sulphides of the alkali metals in aqueous solution it forms compounds analogous to the carbonates and called thiocarbonates; the formula of potassium thiocarbonate is K_2CS_3 ; that of potassium carbonate being K_2CO_3 . The thiocarbonates are used for destroying vermin. Carbon disulphide is largely used as a solvent in preparing fats, extracting vegetable oils, etc. It may also be employed for the purpose of producing low temperatures; if evaporated rapidly, as by passing a current of dry air through it, its temperature is reduced as low as 60° below zero Centigrade. On account of its high refractive power, it is employed for scientific purposes in optics. Mixed with nitric oxide its vapors give a bright bluish-white flame which has been employed for photographic purposes.

CARBONEAR, kär'bō-nēr'. A port of entry on Conception Bay, Newfoundland, 25 miles northwest of St. John's (Map: Newfoundland, G 5). Pop., 1901, 3703; 1912, 3540.

CARBONIC-ACID GAS, CARBON DIOXIDE (*carbon + dioxide*, from Gk. *di-*, double + *oxide*), CHOKE DAMP, or FIXED AIR. A gaseous compound of carbon and oxygen represented by the formula CO_2 . It occurs in the free state as a constituent of atmospheric air, and in solution in sea water and mineral springs. It is largely evolved from fissures in the earth, especially in volcanic districts; in certain localities in Java and in the neighborhood of Lake Laach, near the Rhine, the amount of carbon dioxide evolved is so great that birds attempting to fly across the poisonous spots drop dead. The famous Dog Grotto, near Naples, is likewise filled to a certain height with carbonic-acid gas, by which dogs brought into the grotto are rendered insensible in a few seconds. The experiment is often performed, on payment of a small fee, for the amusement of tourists. The amount of carbonic acid normally contained in atmospheric air is relatively small—10,000 volumes of air contain about 3 volumes of carbon dioxide; or, which is the same, 10,000 parts by weight of air contain about 4.5 parts by weight of carbon dioxide. Animals constantly add to this by respiration; plants, on the contrary, absorb the gas, which they transform, with the aid of light, into oxidizable food matter. As a result, the amount of carbonic acid in the atmosphere tends to remain constant. However, the principal cause of the constancy of the composition of our atmosphere lies in the fact that the water of

the ocean contains immense quantities of free carbonic acid. If the amount of the latter in the air should rise above the normal, the excess would be dissolved in the sea; conversely, a certain amount of the gas would escape from the water if the amount in the air should fall below the normal. Slight variations, however, have been observed. Thus, in elevated places the amount of carbonic acid is usually smaller than near the level of the sea. In the vicinity of forests, too, especially in summer, the air contains somewhat less carbonic acid than the air in cities.

The average amount of carbonic acid produced in 24 hours by man is about 900 grams, the amount given out during the day being considerably greater than that produced during sleep. It has been recently suggested that the air in closed rooms may be continually purified and renewed by the use of sodium peroxide, a substance which has the property of absorbing carbonic acid and of giving off an equivalent amount of pure oxygen. The total amount of free carbonic acid in nature is obviously very great. But even larger quantities, probably, exist combined in the forms of carbonates, such as chalk and limestone, forming part of the solid crust of the earth. For experimental purposes carbon dioxide is most easily prepared by the action of dilute hydrochloric acid on chips of marble (calcium carbonate). The large quantities of carbonic acid employed in the arts are prepared in several different ways. Usually dilute sulphuric acid is made to act on some porous variety of calcium carbonate, such as chalk. In the manufacture of mineral waters, magnesite or the densest varieties of dolomite are employed, as they are liable to contain a smaller amount of organic matter than other materials. The carbonic acid used in sugar manufactories for precipitating lime is made by burning charcoal; the gas evolved from lime kilns, or that produced by fermentation, is largely used for the same purpose. Carbonic acid is also extensively used in the manufacture of soda. The gas employed in making artificial mineral waters (q.v.) must be carefully purified by passing it through solutions of potassium permanganate, which retains all organic impurities without attacking the gas itself. Carbonic acid does not support combustion; it is, therefore, used, highly compressed in iron cylinders, as a fire extinguisher. Besides the methods mentioned above, carbonic acid may be prepared by simply heating metallic carbonates; thus, in determining nitrogen, in organic analysis, the air is best expelled from the combustion tube by means of carbonic acid made by heating sodium bicarbonate or magnesium carbonate. Pure carbon dioxide is a colorless gas about one and a half times as heavy as air; it has a feeble odor and a slightly acid taste. Owing to its high density, it does not rapidly diffuse through air and may be poured like a liquid from one vessel into another. When absorbed by plants, its carbon is transformed into carbohydrates, while the whole of its oxygen is returned to the atmosphere. Taken into the stomach (say in the form of some mineral water), it has a refreshing effect and promotes digestion. If inhaled, however, it is supposed to decompose the hæmoglobin of the blood and to enter into combination with the colored product of decomposition called hæmochromogen. It has been shown, nevertheless, that the animal organ-

ism is capable of adapting itself in a peculiar way to the action of carbonic acid; birds confined within air-tight jars are capable of living in an atmosphere in which an animal introduced directly from fresh air would die in a very short time. The simplest way of testing the air in a room is to introduce a burning candle; if it continues to burn quietly and with a bright flame, the air is pure and respirable. The amount of carbonic acid in rooms should not exceed two grams to the cubic meter of air. Water containing free carbonic acid is capable of attacking many substances that pure water cannot dissolve. Many rock formations have been destroyed by the action of such water on the carbonate of lime contained in them. Under ordinary conditions of pressure and temperature, carbon dioxide dissolves in water in accordance with the law of Henry; i.e., the amount of gas absorbed is proportional to the pressure. This shows that carbonic acid proper, the compound of water and carbon dioxide ($H_2O + CO_2 = H_2CO_3$), forms in the solution in very small quantities only, most of the carbon dioxide being just physically dissolved, as would be nitrogen or any other inert gas. The salts of carbonic acid, the carbonates, are among the substances commonly met with in nature. At $0^\circ C.$ carbon dioxide is liquefied under a pressure of 36 atmospheres. The critical temperature was ascertained by Andrews and, more recently, by Dewar. The latter investigator found that at $31.9^\circ C.$ a pressure of 77 atmospheres is necessary and sufficient to liquefy it. Liquid carbon dioxide is now largely used in the arts. A mixture of liquid carbon dioxide and ether, if rapidly evaporated, attains a temperature of about $100^\circ C.$ below the freezing point of water. Liquid carbon dioxide is used in Linde's refrigerating machine, and Pictet has obtained low temperatures by the use of a mixture of liquid carbon dioxide with sulphurous acid. The principal industrial uses of carbon dioxide in the gaseous state have already been noted above.

Chemically, carbonic acid is a dibasic acid capable of forming salts in which metallic elements are substituted either for one or for both of the hydrogen atoms. These salts, called *carbonates*, are readily decomposed by most other acids known in chemistry, carbonic acid being one of the weakest acids known. Even the so-called *acid carbonates* of sodium and potassium have a feebly alkaline reaction, for in aqueous solution they "hydrolyze" with the formation of free alkali, and it is this (and not the salt itself) that causes the alkaline reaction. Carbon dioxide is the earliest known gas. Paracelsus and Van Helmont, who lived in the sixteenth century, knew that the gas produced in burning charcoal was identical with that evolved by limestone heated to a high temperature. About the middle of the eighteenth century Joseph Black isolated it in a perfectly pure state. In the latter part of the eighteenth century Priestley discovered it in the air, and Lavoisier showed that the same gas was produced during the combustion and decay of vegetable and animal matter, during respiration, etc. Faraday was the first to liquefy it. See CHEMISTRY.

CARBONIC-ACID SNOW. This substance may be obtained by the rapid evaporation of liquid carbonic acid, which is allowed to escape from pressure into a towel or specially prepared perforated receptacle. Snow or crystals are formed at a temperature of $-110^\circ F.$ Applied

to warts or other excrescences on the skin, it produces shrinkage and destruction with little or no scarring. Care must be observed as to the length of application, since prolonged contact with human tissues will set up necrosis and ulceration.

CARBONIC OXIDE. See CARBON MONOXIDE.

CAR'BONIF'EROUS LIMESTONE (Lat. *carbo*, coal + *ferre*, to bear), or MOUNTAIN LIMESTONE. A term used by Murchison, Lyell, and others to include much of the middle and lower portion of the Carboniferous system (q.v.), as now defined.

CARBONIFEROUS SYSTEM. One of the main divisions of the Paleozoic group of rocks, comprising all strata that lie between the Devonian and Permian systems. The name was first used in England, because of the coal seams contained in the strata, a characteristic now known to be of almost world-wide importance. The rocks of this system include a vast series of sandstones, shales, conglomerates, limestones, and beds of coal, which are of variable thickness and more or less interbedded. There is seldom any unconformity between the Carboniferous and underlying Devonian rocks in either Europe or America, and where isolated examples are known, as in parts of Nova Scotia, New Brunswick, Great Britain, and Bohemia, they indicate local disturbances. Coincident with this absence of any great stratigraphical break, there is also a gradual transition from the Devonian to the Carboniferous faunas. The rocks often show a basin-shaped arrangement, and in some areas, as in northeastern Pennsylvania, there is intense folding; but still there are thousands of square miles in China, western North America, and Russia which are underlain by nearly horizontal Carboniferous strata.

The different types of Carboniferous rocks mentioned above are divisible into two general groups, viz.: 1. Marine sediments, usually limestones, containing many invertebrate remains, such as corals, mollusks, encrinites, etc. The abundance of coral remains in some of them leads us to suppose that they represent fossil coral reefs. These Carboniferous limestones sometimes assume great thickness, as in Great Britain and western North America. 2. Shallow-water deposits, such as sandstones, conglomerates, or shales, deposited in shore waters or estuaries. These shallow estuaries or lagoons, by the formation of land across their mouth, often became converted into seacoast swamps in which there was a profuse growth of tall plants. These swamps were often of enormous extent, but at times the long-continued swamp growth became temporarily interrupted by the deposition of clay washed in either by flooded rivers or by the muddy waters of the sea breaking in. Or, again, the sinking of the area below the ocean level may have caused the accumulation of much sediment over the swamp growth. Subsequently the plant accumulation became changed to coal, and the clay to shale. We find records of these changes at the present day in the alternating coal and shale seams.

Carboniferous rocks are widely distributed over the globe, underlying wide areas in North America, South America, Europe, China, Africa, and Australia. In classifying the rocks of these areas, the divisions of the first order are the same, but the smaller divisions are commonly local ones. The first order division consists in grouping the Carboniferous into:

1. Lower Carboniferous, or Mississippian.

2. Upper Carboniferous, or Pennsylvanian.

The Permian is considered by some American geologists as a part of the Carboniferous, since the strata of that system follow upon the latter without a break, so far as they are exposed in this country, and the division between the two systems must be drawn from evidences afforded by fossils; but recent opinion favors their separation into independent members of the Palæozoic group. In the United States the Carboniferous sections along the Appalachians and in the Mississippi valley are divided as follows: Pennsylvania—Lower Carboniferous, (1) Pocono sandstone; (2) Mauch Chunk sandstone and shale; Upper Carboniferous, (1) Pottsville Conglomerate or Millstone Grit; (2) Lower productive measures, including coal, shale, and sandstones; (3) Lower barren measures, including sandstones and shales; (4) Upper productive measures, including coal, shale, and sandstones. Mississippi valley—Lower Carboniferous, (1) Kinderhook; (2) Osage, including (a) Burlington; (b) Keokuk; (c) Warsaw; (3) St. Louis group; (4) Chester or Kaskaskia group; Upper Carboniferous, (1) Millstone Grit; (2) Coal measures.

In the United States the Carboniferous is found underlying a number of areas. In Rhode Island there is a small one of highly metamorphosed rocks, in which the coal beds have been nearly changed to anthracite. A large area extends from Pennsylvania southward to Alabama and westward to Missouri and Arkansas and Texas. Along the Appalachians the prevailing rocks of this area are sandstones and shales, which contain many coal seams and are much folded; but westward the folds die out and limestones begin to predominate. Workable beds of coal are found in all the States of this area. In the Mississippi valley the crinoidal limestones are important members. The Carboniferous section shows a variable thickness, having a maximum of nearly 8000 feet in Pennsylvania and only 1200 to 1500 in Illinois; but the beds thicken again in the States west of the Rocky Mountains—in Utah, Nevada, and Arizona—where they are represented mainly by limestones and sandstones which contain no coal. Near Pottsville, Pa., there are 25 coal beds, whose aggregate thickness is 154 feet. In Alabama there are 17 in one field. In the Western interior region, especially near the summits of the Rocky Mountains, the Carboniferous strata consist mostly of marine limestones, with no coal. There are also scattered areas in the Black Hills and along the Pacific coast and in the Arctic region. The coal beds are usually underlain by clay beds, representing the ancient soils, in which are sometimes found the upright roots and trunks of trees that grew in the Carboniferous swamp.

In Europe the coal measures of England are 3000 to 5000 feet thick, increasing even to 12,000 feet in South Wales. Carboniferous rocks also occur in Germany, France, Belgium, Austria, and Russia. In China they extend over many thousand square miles as vast table-lands and contain perhaps the richest coal deposits of the world. In the Province of Shansi alone they cover an area of about 15,000 square miles and include seams of anthracite 30 feet or more thick. They are also extensively developed in India and in Australia and Africa.

Both animal and vegetable remains are abun-

dant in the Carboniferous, and are in many cases well preserved. The abundance of the latter is easily understood when we remember that coal has been formed by the accumulation of vegetable matter, and we consequently find the plant fossils in the coal itself as well as the inclosing beds. There is a great uniformity of character in the plant life, the same genera and often the same species occurring in widely separated regions. About 2000 species are known which, with the exception of a few plants of doubtful relationship, may be referred to the following families: Equisetaceæ, lycopods, conifera, and ferns. Of the Equisetaceæ the most abundant genus was *Calamites* (q.v.), which included several species of large, tapering, reedlike plants that apparently flourished on the borders of the coal swamps. The lycopods were represented by the *Sigillaria* (q.v.) and the *Lepidodendron* (q.v.), closely related genera that are believed to have furnished a large part of the material for the formation of coal. The *Sigillaria* had gently tapering, fluted stems, which grew to a height of 50 feet or more and had a diameter of 5 feet. The bases of the trunks, with their radiating roots, are often found in the clay that underlies the coal seams, and for a long time they were supposed to be a distinct species. (See STIGMARIA.) The *Lepidodendron* bore a great resemblance in structure and appearance to the club moss of the present day, but it attained gigantic proportions. Conifers were probably abundant in Carboniferous times; they differed widely, however, from existing conifers, and bore nutlike fruits, which have been frequently preserved. (See TRIGONOCARPUS.) The genus *Cordaites*, which appears to have been very abundant, is classed by some botanists with the conifers; by others, with the cycads. The fern family was represented by a large variety of species, some of which were tree ferns. The most common forms were *Sphenopteris*, *Cyclopteris*, *Neuropteris*, *Odontopteris*, and *Pecopteris*. The animal remains of the Carboniferous system are both numerous and well preserved, but they are found in greatest abundance in the Lower Carboniferous limestones. Corals and crinoids are numerous, both as regards individuals and species, and in places constitute great thicknesses of rock. More than 650 species of crinoids have been described from the Lower Carboniferous of America alone. Among the brachiopods, *Productus*, *Spirifer*, and *Chonetes* are most numerous, while mollusks are represented by cephalopods, gastropods, and lamellibranchs, some species of which pass out of existence at the close of the period. Trilobites are present, but not in such variety as in the earlier Paleozoic times, and they diminish rapidly towards the end. Crustaceans are abundant, especially *Beyrichia* and *Estheria*, and they show a rapid development. Insects appear to have flourished in great numbers; the known varieties include spiders, scorpions, dragon flies, grasshoppers, and cockroaches. Among fishes, the ganoids and selachians are represented. The ganoids, having their entire surface covered with scales, were numerous; some of them inhabited shallow water near the shore and fed on crustaceans and shellfish, for crushing which they had a formidable apparatus of conical teeth of a very complicated structure. Others were inhabitants of deep water and were more powerful and predacious and more rapid in their movements. Their jaws were produced into a long snout, like the croco-

dile of the Ganges, and armed with a double series of enormous teeth, which were sometimes as much as 4 inches long by 2 inches broad, as in *Megalichthys* (q.v.), dimensions rarely attained even by the largest known reptiles. Associated with these were a great number of sharks belonging to the Cestraciontidae, a family of which we have only a single living representative. (See CESTRACIONT.) They had a long, bony spine, to strengthen the dorsal fin, and this enabled them to turn speedily in the water, as they required to do in seizing their prey. These spines are often found fossil. The only remains referred to a higher division of the animal kingdom yet found belong to the saurian Stegocephalia (q.v.). The Carboniferous also contains the first traces of amphibians. Of these, only footprints are found in the Lower Carboniferous, but in the coal measures the actual bones are met with.

The alternation of rocks of different character shows that oscillations of the land surface must have been extensive and long continued, though not violent. Thus the great beds of coal indicate a period of inland shallow water in which swampy conditions existed. These must have continued for a long period, for the coal beds are often very thick, and it has been calculated that an eighth of an inch of coal means at least one inch of plant accumulation. That these swamp areas became at times submerged to some depth, due to the sinking of the land, is indicated by the presence of marine limestone beds over them. The climate that predominated during the Carboniferous was one of warmth and moisture, with the percentage of carbon dioxide in the atmosphere somewhat greater than it is now, but not necessarily excessive.

The great importance of the economic minerals in the Carboniferous has had much to do with our extensive knowledge of it. The productive coal fields cover an area of many hundred thousands of square miles. (See COAL.) In addition to the coal deposits, many other useful minerals are found in the Carboniferous of the United States. The clay beds associated with the coal seams afford valuable supplies of fire clays, pottery clays, and brick clays; iron ores are found in Pennsylvania, Kentucky, and Ohio. Building stones are quarried in the Carboniferous of many States, the sandstones of Berea, Ohio, being specially important. The Lower Carboniferous strata furnish salt in Ohio, Michigan, and West Virginia, oil and gas in West Virginia, and zinc ore in Missouri, Kansas, and Arkansas. The rich deposits of copper ores in Arizona occur partly in Carboniferous limestones.

CARBONITE. See EXPLOSIVES.

CARBON MONOXIDE, or **CARBONIC OXIDE**, CO. A gaseous compound of carbon and oxygen. It does not occur naturally, but may be observed burning with a pale-blue flame in fireplaces and stoves. During the combustion of lower layers of the fuel the oxygen of the air unites with the carbon of the fuel to form carbonic-acid gas, CO₂; and this gas, rising through red-hot coal, has part of its oxygen abstracted by the latter, and, as a result, carbon monoxide is produced, which, taking fire on the top of the coals, burns,

abstracting more oxygen from the air and re-forming carbonic-acid gas, CO₂.

Carbonic oxide may be prepared by heating either potassium ferrocyanide or oxalic acid with strong sulphuric acid. It is a colorless gas somewhat lighter than air, in which it burns with a characteristic bluish flame. It is *exceedingly poisonous*, forming a chemical compound with the hæmoglobin of the blood, and thus preventing the latter from carrying the oxygen which is necessary for supporting the processes of life. The symptoms of carbon monoxide poisoning are headache, dizziness, and nausea, which, if the inhalation of the gas is continued, terminate in death. Hence the great danger arising from checking the escape of the products of combustion in stoves and furnaces, or of allowing illuminating gas to escape into rooms; for ordinary coal gas contains about 8 per cent, water gas about 40 per cent, of carbonic oxide. The presence of carbonic oxide in the air may be best detected by means of a solution of palladium chloride; if a cloth moistened with a strong solution of this salt is exposed to air containing traces of the poisonous gas, a distinct brown coloration is produced. Among the compounds of carbon, carbonic oxide is one of the comparatively few in which that element occurs in the bivalent state; in most compounds carbon is quadrivalent. See VALENCY.

CARBONS, ELECTRIC LIGHT. See ELECTRIC LIGHTING.

CAR'BOXYL CHLORIDE. See PHOSGENE GAS.

CAR'BORUN'DUM. See ABRASIVES.

CARBOY (Pers. *qarābah*, a sort of bottle). A large glass bottle, cased in wicker, or protected by a wooden box, used to contain acids or other corrosive liquids, such as sulphuric acid (oil of vitriol). A carboy for sulphuric acid usually has a capacity of 12 gallons and contains about 180 pounds of that acid.

CAR'BUNCLE (OF., from Lat. *carbunculus*, gem, from *carbo*, coal). A name applied to the scarlet and crimson varieties of garnet when cut with a convex face (*en cabochon*). The ancients applied the name indiscriminately to all red and fiery stones, as *spinel* and *Oriental ruby*. Carbuncles were highly prized for their supposed mysterious power of giving out light in darkness. According to the Talmud, the only light that Noah had in the ark was furnished by carbuncles and other precious stones. The famous necklace of Mary Queen of Scots had a lustrous carbuncle as a pendant. See GARNET; GEMS.

CARBUNCLE (Lat. *carbunculus*, a little coal). An acute inflammation of the cellular or connective tissue beneath the skin, that may occur on any part of the body, but is more frequent on dorsal surfaces, especially on the back of the neck and shoulders. It derives its name from the two most prominent symptoms—redness and burning pain. It quite closely resembles, especially in its early stages, the common furuncle, or boil, but the symptoms, both local and general, are much more severe. The development of the carbuncle is accompanied by constitutional disturbances, such as chills, fever, aching, and general malaise. The severity of the inflammation varies, and is regularly accompanied by death of a portion of the tissue. The first local manifestation consists in slight swelling and redness. The part feels hard, and this hardness extends deeply into the tissues. As the local lesion advances, the redness as-

sumes a dark purple or livid hue, and several small blisters appear on the surface. These open and discharge a thin, viscid fluid, rarely pus. At the centre of the carbuncle the tissue usually dies and becomes gangrenous. This central area is generally quite extensive and consists of an infiltration of a mass of tissue, all of which sloughs away in time and leaves a scar when healing is complete. The entire area of the carbuncle usually becomes fixed quite early in its development, and the carbuncle limits itself to that area. The treatment of carbuncle is both surgical and medical, the former consisting in free incisions, packing with gauze, and antiseptic dressings; the latter, in general, tonic and supportive treatment. See ANTHRAX.

CARBURETOR. See MOTOR VEHICLE.

CARCAGENTE, or **CARCAJENTE**, kär'-kâ-hân'tâ. A town of Valencia, Spain, situated about 25 miles south of the city of Valencia, and near the right bank of the Júcar (Map: Spain, E 3). It is well built, with good streets, and has a palace belonging to the Marquis of Calzada. It produces linen, silk, and wool, and especially rice. Pop., 1900, 12,351; 1910, 13,520.

CARCAJOU, kär'kâ-jōō (Fr. form of the American-Indian name). A Canadian name for the wolverine, sometimes improperly applied, especially by the older writers, to the panther.

CAR'CANET (LL. *carc[h]annum*, a collar of jewels, OHG. *querca*, throat). A jeweled chain or necklace. Venice was famous for the manufacture of carcanets in the fifteenth century.

CARCANO, kär-kä'nō, GIULIO (1812-84). An Italian author, born in Milan. He was appointed professor at the Academy of Fine Arts in Milan in 1859 and became a senator in 1876. His publications include tragedies, which met with little success; translations of Shakespeare's plays; volumes of poetry; and romances (for these he is chiefly celebrated) which are distinguished by their charming pictures of family life in Lombardy, and of which the best is *Angiola Maria* (1839). A complete edition of his works (Milan, 1892) appeared after his death. Consult Rizzi's preface in *Lettere di Giulio Carcano* (Milan, 1887).

CARCAR, kär'kär. A city of Cebú, Philippines, 23 miles southwest of Cebú, the capital of the province (Map: Philippine Islands, D 5). It is situated on the east coast of the island, near the Bay of Carcar. The city was founded in 1624. Pop., 1903, 31,895.

CAR'CASO. See CARCASSONNE.

CARCASS (OF. *carcois*, quiver, from ML. *carcassium*, a corruption of *tarcasius*, from Pers. *tarkash*, quiver, by association with ML. *carcassium*, carcass). An incendiary shell filled with a fiercely burning composition consisting of saltpetre, sulphur, resin, turpentine, antimony, and tallow, and generally designed to be fired from a mortar. It had usually three large vents, through which the flame escaped. In some carcasses the vents were fitted with short barrels loaded with balls, so arranged as to discharge their contents at the time desired. It is now seldom used.

CARCASSONNE, kär'kâ'sōn' (Lat. *Carcaso*). The capital of the Department of Aude (Languedoc), France, and see of a bishop, on the river Aude and the Canal du Midi, about 55 miles southeast of Toulouse (Map: France, S., G 5). It is divided into two parts—the old and new towns. The modern town is well built, although the old town, built on a height, and a picture of

decay, is much more picturesque, with its double line of walls and towers, some parts of them dating from the time of the Visigoths, and the rest from the eleventh or twelfth century. Principal buildings are the restored cathedral of Saint-Nazaire (eleventh century), the courthouse, the prefecture, the old market, and the cathedral of St. Michel and church of St. Vincent. The town contains a lyceum, a teachers' college, a seminary, a public library, and a museum. The cloth manufactures employ a large number of operatives. Carcassonne also manufactures paper, leather, linen, soap, ironware, and pottery, and has considerable trade in wine, brandy, and dried fruit. The whole department is represented at its November fair. Population of commune, 1901, 30,720; 1911, 30,689. The ancient city, Carcaso, in the Province of Gallia Narbonensis, fell into the hands of the Visigoths about 725; it was ruled by viscounts from the eleventh to the thirteenth century, and was united to France in 1209. In 1247 King Louis, the Saint, founded the lower town. It was pillaged and burned by the Black Prince in 1355, and in 1566 a Huguenot massacre took place within its walls. Consult: Viollet-le-Duc, *Carcassonne* (Paris, 1858); Peixotto, "Carcassonne," in *Scribner's Magazine*, vol. xxix (New York, 1901); L. Fedie, *History of Carcassonne* (Carcassonne, 1888).

CAR'CEL UNIT. A French lamp burning colza oil with a wick constructed according to certain specifications and used as a photometric standard unit. One Carcel unit is equal to 9.615 International candles, a standard which, in April, 1909, was adopted and defined as a common unit by the National Physical Laboratory of London, the Laboratoire Central d'Electricité, Paris, and the United States Bureau of Standards, Washington. See PHOTOMETRY.

CAR'CER, or **CARCER TUL'LIA'NUM.** See MAMERTINE PRISON.

CARCHEMISH, kär'kē-mish or kär-kē'mish (Heb. *Karkemish*, Bab. *Karkamishu*, Ass. *Kargamis*, or *Gargamis*, Eg. *Karakamisha*). An important Hittite city in northern Syria. It was situated on the western bank of the Euphrates. While the exact site has not been ascertained beyond all doubt, there is a practical unanimity of opinion among scholars to-day as to its probable location. Circesium, or Carciusium (Ammianus, xxiii, 5), at the mouth of the Chaboras, the modern Al Buzera, supposed by Bochart, Rosenmueller, Ewald, Hitzig, and Reuss to be identical with Carchemish, is too far south; Birejik (Bir, Apamea), suggested by Hincks, is too far north; Membij (Mabog, Bambuke, Hierapolis), favored by Rawlinson, Finzi, Maspero, and Wilson, is too far from the Euphrates; Kal'at Nijm, proposed by Nöldeke, does not seem to have any pre-Islamic ruins; but since George Smith in 1876 visited Jerablus and Jerabis and identified the former with Carchemish, Sayce, Schrader, Delitzsch, and all recent investigators have adopted this view. Maundrell, Skene, and Smith heard the name pronounced "Jerablus," and Benzinger in 1912 called the great mound of Carchemish "Jerablus Kal'a." On the other hand, the maps of Sachau and Oppenheim give two places with the name Jerabis, but no Jerablus, and Sachau declares that he never heard from the natives the latter name. Jerabis is the plural of Jirbas, representing *Εύρωπος*, *Eurōpos*; after Mabog-Membij had taken the place of Hierapolis, this name may, on account

of the similarity, have been occasionally used of one of the two Jerabis. The earliest-known references to Carchemish are found in *Cuneiform Texts in the British Museum*, ii, Bu. 88-5-12, 163. 11 and 88-5-12, 19, 8. They come from the beginning of the twentieth century B.C., before the reign of Ammizaduka (1977-57) and apparently mention measures or weights of Karkamishu, showing that the city was already at that time a centre of trade. Five centuries later Thotmes III (1501-1447) met the people of Carchemish in battle, and Amenemhebe mentions that he took some of them as prisoners. Tiglath-pileser I (c.1140-05) defeated the inhabitants but did not take the city. Asurnazirpal III (885-860) received tribute from Sangara, King of the Hittites, who apparently reigned in Carchemish, and so did Shalmaneser III (860-825), whose artists represented the famous fortress on the bronze walls of Balawat. Sargon II (722-705) finally conquered the city in 717, took its last king, Pisiris, prisoner, deported its people, and settled Assyrians in it. An Assyrian governor, Belimurani, is mentioned in the year 692 as *limmu*. According to the Hebrew text in 2 Chron. xxxv. 20, Neco went up to fight "against Carchemish," but the Greek version reads "against the king of Assyria," and 2 Kings xxiii. 29 does not mention Carchemish; Josiah died at Megiddo in 608. In an editorial superscription to two oracles against Egypt preserved in Jer. xlvi the army of Neco is said to have been defeated at Carchemish by King Nebuchadrezzar in the fourth year of Jehoiakim (605 B.C.). It is thought by many scholars that, in spite of its late date and the silence of the cuneiform inscriptions, Berosus, and the Greek historians, this editorial note has alone preserved the memory of one of the important battles of the world. The *maneh* of Carchemish was the most common unit of money in Assyria. On the site of Carchemish, or near it, the city of Europos seems to have flourished in Hellenistic times. As to the meaning of the name "Carchemish" nothing is known with certainty. Hoffmann suggested Kerak Mish, or 'Castle of Mish'; Johns, Kar Gamis, or 'Fortress of (the god) Gamis'; Sarsowsky, Kar (Gil)gamish, 'Stronghold of (the god) Gilgamish.' Against understanding it as the 'Stronghold of Chemosh' Sarsowsky urges the early appearance of the name and the Assyrian spelling Kamush for Chemosh. But the worship of this god may once have extended far beyond the limits of Moab, and the variations Kamish, Kamush, and Kamosh are not more strange than Asir, Asur, Yaho, Yahwe, and many other differences in the pronunciation of the same divine name. The excavations carried on by Henderson in 1878-79, and especially those by Hogarth in 1911, have brought to light many Hittite monuments and inscriptions. Consult: G. Rawlinson, *The Five Great Monarchies*, 2d ed., vol. ii, p. 67; Finzi, *Ricerche per lo studio dell' antichità Assira*, pp. 257 ff. (1872); Maspero, *De Carchemis Oppidi Situ et Historia Antiquissima* (1873); Schrader, *Keilinschriften und Geschichtsforschung*, pp. 221 ff. (1878); Delitzsch, *Wo lag das Paradies?* pp. 265 ff. (1881), contains also extracts from the notebooks of George Smith; G. Hoffmann, *Auszüge aus syrischen Acten persischer Märtyrer*, p. 163 (1880); Sachau, *Reise in Syrien und Mesopotamien*, pp. 168 f. (1883); W. Max Müller, *Asien und Europa*, p. 263 (1893); Johns, in *Proceedings of the Society*

CAR'CINO'MA. See TUMOR.

CAR'DAMINE. See CRESS.

CAR'DAMOM, or **CAR'DAMON** (Fr. *cardamome*, Lat. *cardamomum*, Gk. καρδάμωμον, *kardamōmon*, from Gk. κάρδαμον, *kardamon*, a cress + ἄμωμον, *amōmon*, a spice plant). The capsule of certain species of plants of the family Zingiberaceæ, and belonging to at least two genera—*Amomum* and *Elettaria*. Cardamoms are three-celled and contain numerous wrinkled seeds, which form an aromatic, pungent spice, weaker than pepper and with a peculiar but agreeable taste. On account of their cordial and stimulant properties, they are employed in medicine very generally, to qualify other medicines. They are also used in confectionery, although not to a great extent. In Asia they are a favorite condiment, and in the north of Germany they are used in almost every household to flavor pastry. The cardamom recognized in the British and American pharmacopœias and called true or official cardamom—also known in commerce as Malabar cardamom—is the product of *Elettaria cardamomum*, a native of the mountains of Malabar, and is cultivated in India, Ceylon, etc. The seeds depend for their qualities on a peculiar, pungent, essential oil, called oil of cardamom, which may be obtained from them by distilling with water, and which, when fresh, is colorless. They also contain 10 per cent fixed oil. Other kinds of cardamom occur in commerce, but none is equal to the true cardamom in commercial value. The different kinds of cardamom differ not only in strength, but in the character of their aroma, though the plants producing them have much general similarity. See Plate of CARNATIONS, ETC.

CAR'DAN, JEROME, often referred to as HIERONYMUS CARDANUS or GIROLAMO CARDANO (1501-76). An Italian mathematician, born at Pavia, the illegitimate son of Facio Cardan, a jurist. He was at once an astrologer and a genuine philosopher; a gambler and charlatan, and a true devotee of science. As early as 1523 Cardan taught mathematics at Pavia. In 1524 he took the degree of doctor of medicine at Padua and spent the following seven years practicing medicine at Sacco. Here Cardan met his wife and is said to have squandered her fortune in gambling. In 1534 he was appointed to the chair of mathematics at Milan, and while holding this post, and at the same time practicing and teaching medicine, he produced his principal works, which are noticed below.

In 1552 he started on an extensive journey through central and northern Europe, and in 1559 obtained the chair of medicine at Pavia and later at Bologna, remaining there from 1562 until 1570. While living in Bologna he was imprisoned for debt, or on the charge of heresy for having published the horoscope of Christ, and on his release resigned his professorship at the university. He then went to Rome and was admitted by Pope Gregory XIII to the College of Physicians and allowed a pension. He died in Rome in 1576.

The *Ars Magna* (1545), by far the greatest work of Cardan, contains the celebrated solution of the cubic equation. The solution had been discovered in 1541 by Tartaglia, who communicated it to Cardan under the most solemn

vows of secrecy. Cardan, nevertheless, published the solution under his own name, and hence arose a dispute over the authorship of the discovery. After 10 years of controversy, challenge, and counterchallenge, Tartaglia began publishing his own work (1556), but died before reaching the chapter on the cubic equation. Thus the greatest mathematical discovery of the sixteenth century came to be known as Cardan's method. The solution, as given by Cardan in geometrical terms, is, briefly, as follows: To solve the equation $x^3 + 6x = 20$, take two cubes such that the rectangle of their respective edges is 2 and the difference of their volumes is 20; then x is equal to the difference between the edges of the cubes. In the general equation $x^3 + px = q$, the rectangle of the edges is a third of p , and the difference of the volumes of the cubes is q . The publication of the *Ars Magna* stimulated mathematical research and hastened the general solution of biquadratic equations, of which Cardan himself had solved special cases, as $13x^3 = x^4 + 2x^3 + 2x + 1$; although the credit of producing the first general solution belongs to his pupil Ferrari. Cardan recognized negative roots, which he designated as fictitious; he also observed that imaginary roots occur in pairs, but discarded them as impossible, and failed to understand the irreducible case of the cubic. He found the relation of the roots to the coefficients of an equation, recognized that the change of sign of a function implies a root, and gave a method of approximating the roots of numerical equations. His discussions of quadratic equations were important.

Bibliography. Besides the *Ars Magna*, his most important works include: *Practica Arithmeticae Universalis* (1539); *De Subtilitate Rerum* (1551), and its sequel, *De Varietate Rerum, Artis Magnae sive de Regulis Algebraicis, lib. unus* (1545); *De Vita Propria* and *De Libris Propriis* (1571-75); *Encomium Geometriae* (1535); *De Regula Aliza, Exæreton Mathematicorum, Sermo de Plus et Minus* (1540-50). The standard collection of Cardan's works is that of Sponius (Lyons, 1663). Consult: Morley, *Jerome Cardan* (London, 1854); Rixner and Siber, *Leben und Lehrmeinungen berühmter Physiker am Ende des XVI. und am Anfange des XVII. Jahrhunderts* (Sulzbach, 1820); Firmiani, *Giro-lamo Cardano, la vita e l'opere* (Naples, 1904).

CARDBOARD. A material prepared by pasting together several layers of paper, according to the thickness and quality required. *Bristol board*, used by artists, is made entirely of white paper; ordinary cardboard, of fine white paper outside, with one or more sheets of coarse cartridge paper between. According to the number of layers, they are called *three, four, six, or eight sheet boards*. *Millboard*, used by bookbinders as the basis of book covers, is made of coarse brown paper, glued and strongly pressed.

The enameling of visiting cards and fine cardboard is produced by brushing over the cardboard a mixture of *China* or *Kremnitz white* (a fine variety of white lead) and size. After drying, this surface is rubbed lightly over with a piece of flannel, previously dipped in finely powdered talc; it is then polished by rubbing vigorously with a hard, close-set brush.

CARDEN, SIR LIONEL EDWARD GRESLEY (1851-1915). An English diplomat, educated at Eton College. He was appointed Vice Consul at Havana in 1877, was sent with Sir

S. St. John's special mission to Mexico in 1883, was made Consul in the city of Mexico in 1885, and for the next four years served as British Commissioner on the Mexican Mixed Claims Commission. He returned to Cuba to serve as Consul General in 1898-1902, and as Minister to Havana in 1902-05. In 1911 he was appointed Envoy Extraordinary and Minister Plenipotentiary in Central America, and in 1913 he was sent to Mexico as British Minister. The fact that the new Minister presented his credentials to General Huerta on his arrival in Mexico City was interpreted as recognition of the Huerta régime by the British government, and Sir Lionel Carden's attitude throughout the Mexican troubles was at times represented as strongly anti-American. See MEXICO, *History*. Sir Lionel Carden was created K.C.M.G. in 1912.

CARDENAL, kär'de-näl', or **CARDINAL, PIERRE** or **PEIRE** (c.1205-c.1305). A French troubadour, born at Puy-en-Velay. He lived to be nearly 100 years old and found especial favor with James I of Aragon. His poems are mostly sirventes, satirizing the clergy and nobles of his day. About 70 are published in Mahn's *Gedichte der Troubadours* (4 vols., Berlin, 1856-73). Consult Fauriel, *Histoire de la littérature provençale* (3 vols., Paris, 1846), and Diez, *Leben und Werke der Troubadours* (Leipzig, 1882).

CÁRDENAS, kär'dâ-näs. A seaport of Cuba, in the Province of Matanzas, situated on the north coast, about 80 miles east of Havana, with which it is connected by rail (Map: Cuba, D 3). Its harbor is wide but shallow. It is regularly built with wide streets and broad plazas, in one of which is a statue of Columbus. Cárdenas is one of the important commercial centres of the island, its chief exports being sugar and tobacco, largely by American firms. Asphalt has been taken from the bed of the harbor. On May 11, 1898, Cárdenas Bay was the scene of an engagement between the blockading vessels of the United States fleet and the Spanish batteries, in which Ensign Worth Bagley was killed, he being the first American officer to lose his life in the war. Pop., 1907, 24,280; of municipal district, 1907, 28,576.

CÁRDENAS, kär'dâ-näs, GARCÍA LÓPEZ DE. A Spanish adventurer, captain in the army of Vasquez Coronado (q.v.), in 1540, during the exploration of New Mexico and Arizona. In September, 1540, he led the first European expedition to the Grand Cañon of the Colorado. Consult H. H. Bancroft, *Works*, vols. xv-xvii (San Francisco, 1884-89).

CARDE'NIO, HISTORY OF. A play once ascribed to Fletcher and Shakespeare, on the authority of Moseley in the *Stationers' Register*. The date of the entry is Sept. 9, 1653. It has been thought to be identical with a lost play entitled *Cardenia*, or *Cardano*, acted in 1613, which Fleay also identifies with Fletcher's *Love's Pilgrimage*. Its history is purely conjectural, but later authorities are unanimous in questioning Shakespeare's collaboration in it.

CAR'DIA (Neo-Lat., from Gk. καρδία, *cardia*, heart). The orifice of the stomach which admits the œsophagus was called, on account of its vicinity to the heart, by the same Greek name, *cardia*, and was probably hardly distinguished from the heart in the earliest times of Greek medicine.

CAR'DIAL'GIA (Neo-Lat., from Gk. καρδία,

kardia, heart + *ἄλγος*, *algos*, pain). Pain of the heart or stomach. The name is commonly but loosely applied to pain occurring over the cardiac and epigastric regions, due to indigestion accompanied by *heartburn*, acid eructations and the presence of gas. The heart is not affected. See INDIGESTION.

CARDIFF (*Caer-Taff*, Fort of the Taff). A parliamentary and municipal borough, and capital of Glamorganshire, and the largest port of Wales, situated on the river Taff, near its mouth in the estuary of the Severn, 170 miles west of London by railway (Map: Wales, C 5). Its most notable building is the castle, built in the eleventh century, in which Robert Curthose, Duke of Normandy, died, after captivity in various fortresses during 28 years. It has been carefully restored and is occasionally used as a residence by its owner, the Marquis of Bute, to whose family Cardiff owes much of its prosperity. Other edifices of interest are the church of St. John, dating from the thirteenth century, with a fine Perpendicular tower, and the free library, erected in 1882, which contains a museum and art gallery.

Although the construction of the Glamorganshire Canal in 1794 may be taken as having marked the first step in the development of the town from an insignificant village to one of the most important ports of the United Kingdom, it was not until after the opening of the first great dock, in 1839, that its possibilities as an outlet for the mineral wealth of the surrounding region were fully realized. The docks and basins are five in number and cover an area of more than 160 acres and 7 miles of quays. In the same series of harbor works are included the Penarth docks, embracing 26 acres at the mouth of the river and 114 acres at Barry, 8 miles to the southwest. They are owned by Lord Bute, but the town derives a considerable annual revenue from harbor dues. The municipal authorities have kept pace with the rapid growth of the town by obtaining an excellent water supply, by introducing electric lighting, establishing public baths and a gymnasium, markets, slaughterhouses, a scwage farm, and a cemetery. In Cardiff is the University College of South Wales and Monmouthshire, wherewith is affiliated the woman's college of Aberdare Hall; technical schools and a higher grade school, and a central free library, with six branches, are all maintained by the corporation; a treasury grant supports a national museum of Welsh antiquities. The importance of the town lies in its commerce, especially in its coal and iron trade, although there are also shipbuilding yards, iron, steel, and tin plants. The export of coal to foreign countries increased from 1,451,000 tons in 1865 to 10,115,000 in 1891. In 1898 there was a temporary decline, on account of the great coal strike, the total export of coal and coke amounting to only 9,109,515 tons, but it has since risen again, and amounted in 1913 to 26,340,012 tons. The total tonnage entered in 1912 was 6,236,944; the clearances, 9,168,115. In clearances Cardiff was the first port of the United Kingdom, London coming second with 40,000 tons less; in entries it ranked fourth after London, Liverpool, and Newcastle. In 1913 the coal export was valued at about \$116,159,000. Besides coal, the chief exports are iron and steel manufactures, machinery and mill work, railway cars and wagons, sacks, etc. The imports comprise cattle, grain, copper, and iron

ores, petroleum, timber, and market produce. The total value of imports and exports during 1911 was \$91,003,026, and in 1906, \$71,174,654. The United States is represented by a consul. Cardiff is adequately provided with railway facilities, being connected by the Taff Vale and Rhymney lines with the mineral fields of South Wales, and by the Great Western with London. Pop., 1800, about 2000; 1850, 18,000; 1871, 56,911; 1881, 85,378; 1891, 128,915; 1901, 164,333; 1911, 184,663.

The town probably existed during the Roman occupation. It was a place of importance under the Normans. During the Civil War the castle was alternately in the hands of the Royalists and the Parliamentarians. In 1648 Cromwell captured it after a bombardment lasting three days.

Consult Stuart, "History of Cardiff," in *Archæological Journal*, vol. xxviii (London, 1871), and "Architecture of Cardiff," in *Builder* (ib., March, 1897).

CARDIFF, IRA D. (1873-). An American botanist, born in Stark Co., Ill. He was educated at Knox College, at the University of Chicago, and at Columbia University. In 1906-07 he was assistant professor of botany, and in 1907-08 professor, at the University of Utah. He became professor of botany at Washburn College, Topeka, Kans., in 1908, and director of the Washburn Summer School in 1909. In 1911 he was professor of botany in the University of Kansas Summer School. His writings consist of contributions to the *Botanical Gazette*, *Bulletin of the Torrey Botanical Club*, and *Plant World*.

CARDIFF GIANT. A rude statue of a man 10½ feet high, cut (in Chicago) from a block of gypsum quarried from the great beds of that mineral near Fort Dodge, Iowa, in 1868, and buried near Cardiff, Onondaga Co., N. Y., where it was "discovered" late in the following year and for some time exhibited as a "petrified giant." The hoax, subsequently exposed by Prof. O. C. Marsh, of Yale, was perpetrated by George Hall, of Binghamton, N. Y., his purpose being to ridicule the belief in "giants" professed by some religious folk, on the strength of the mention of such creatures in Genesis vi. 4,— "There were giants in the earth in those days." Consult "The Cardiff Giant: The True Story of a Remarkable Deception," by Dr. Andrew D. White, in the *Century Magazine*, vol. xliii (1902).

CARDIGAN (anciently, *Aberteifi*, Mouth of the Teifi). The capital of Cardiganshire, Wales, a municipal borough and seaport, on the right bank of the Teifi, about 3 miles from its mouth and about 75 miles west-northwest of Cardiff (Map: Wales, B 4). The town has a considerable coasting trade, largely in produce and slate. It owns its water works and maintains markets and a cemetery. Pop., 1901, 3500; 1911, 3578. Cardigan became an important town about the time of the Norman Conquest. There are the remains of a castle supposed to have been built about the year 1091 by Roger de Montgomery, a Norman baron. The town suffered much in the struggles between the Welsh and the English.

CARDIGAN, JAMES THOMAS BRUDENELL, seventh EARL OF (1797-1868). An English general. He was educated at Christ Church, Oxford, and became a member of Parliament in 1818. In 1824 he entered the army, and by 1832 had risen, through lavish expenditure in pur-

chasing his grades, to the rank of lieutenant colonel. As an officer he was overbearing and quarrelsome. In 1837 he succeeded to the peerage. In 1840 he fought a duel with one of his officers, was tried by the Lords and acquitted on a technicality. In the Crimean War, as major general in command of the light cavalry, he led the famous charge at Balaklava, Oct. 25, 1854, in obedience to an order which he misunderstood. He was promoted lieutenant general (1861) and received many honors. He published *Cavalry Brigade Movements* (1861).

CARDIGANSHIRE. A maritime county of Wales, on Cardigan Bay, with an area of 688 square miles, half being waste (Map: Wales, B 4). It is an agricultural county; the chief branch of industry is the rearing of live stock. There are some manufactures of coarse woollens, gloves, stockings, and hats. Cardigan is the county town. Among other towns are Aberystwith and Lampeter. Pop., 1891, 63,467; 1901, 61,078; 1911, 59,877.

CARDINAL (Lat. *cardinalis*, pivotal, principal, from *cardo*, a hinge). The highest dignity in the Church of Rome after the Pope, whose elector and councilor he is. The title in the ante-Nicene period was applied to the clergy who were permanently attached to a cathedral church anywhere; but the usage was later restricted to particular members of the clergy in Rome. In the fourth century the priests permanently ruling the parish churches in Rome were styled *cardinal* priests, the deacons permanently administering the charities of a particular "region" of the city were styled *cardinal* deacons, while the bishops in charge of the suburban sees of Rome—viz., Porto and Santa Rufina, Ostia and Velletri, Palestrina, Sabina, Frascati, and Albano—and who were called in consultation by the Bishop of Rome, were called *cardinal* bishops. The word "cardinal" in each case means that the person was, so to speak, one on whom ecclesiastical affairs *hinged*. Till the late Middle Ages the term was used of prominent priests in important churches, as Constantinople, Naples, Milan.

The cardinals are now all appointed by the Pope, and constitute the Sacred College. The Pope is not obliged to consult them, but as a matter of fact does so, and so they share with him in the government of the church. Their number has varied at different times, and was fixed by Sixtus V, in 1586, at 70, i.e., 6 cardinal bishops, 50 cardinal priests, and 14 cardinal deacons. The Pope is not obliged to maintain this number, and there are generally from 10 to 15 vacancies. In 1914 there were but 54 cardinals, of whom 28 were Italian and 26 foreign. The bishops take their names from the suburban sees mentioned above, the priests their titles from the churches in Rome to which they are appointed, while the deacons are appointed to other churches called "deaconries." The first cardinal bishop is the dean of the College, and has the right to consecrate the Pope if he be not at the time of his enthronement a bishop; the first cardinal deacon is first deacon of the College, and he has the right to proclaim and crown the new Pope. The camerlengo, who rules the church during a papal vacancy, also is a cardinal. All the cardinal bishops, and all but one of the cardinal deacons, live in Rome, but only 11 of the cardinal priests. Most of the cardinals are bishops. A few belong to monastic orders, including one Jesuit.

The cardinals are chief members of the 21 Sacred Congregations, or standing ecclesiastical committees, of the papal government, such as Holy Office, Propagation of the Faith, Index, Rites, and Studies. They meet in consistory, over which the Pope presides. But they are most prominent before the world on the death of the Pope, as they are the electors of his successor, and usually, though this is not obligatory, choose one of their own number. They are princes of the church, enjoying extraordinary privileges and honors, and are entitled "Most Eminent Prince." They wear a distinctive scarlet dress and a red cap, which is put upon their heads by the Pope. They have also a red hat, which is given to them in a public consistory, but is not worn. They enjoy an income out of the papal treasury. They are frequently sent by the Pope as his representatives upon delicate missions, when they are styled *legati a latere*. See DEAN.

CARDINAL, PIERRE. See CARDENAL.

CARDINAL BIRD, or REDBIRD. A large and brilliant finch or grosbeak (*Cardinalis cardinalis*), one of the finest song birds of America, common throughout the southern part of the United States. The general color of the male is red, the head being vermilion, with a small portion around the base of the bill black. The feathers of the crown are long, and erected into a conical crest. The cardinal bird migrates northward in spring, but never farther than Massachusetts, where only a few stragglers are seen. Its loud, clear, sweet, and varied song is to be heard chiefly in the mornings and evenings. Partly because of the song, and partly from its beautiful plumage, the cardinal is a popular cage bird. During the breeding season the male is very devoted to his mate and to the young. The nest is built in bushes, and consists of twigs, rootlets, and strips of bark, lined with grasses and other finer material. The eggs are usually four in number, white or bluish, speckled and spotted with brown. Geographical races of this species extend its range westward to southern California and Mexico, and allied species exist in Mexico and Central America. See Plate of BUNTINGS AND GROSBEAKS.

CARDINAL DE LUGO'S (dā lō'gōz) POWDER. See CINCHONA.

CARDINAL FLOWER. See LOBELIA.

CARDINAL POINTS. See COMPASS.

CARDINAL VIRTUES. According to the ancients, the virtues of justice, prudence, temperance, fortitude. They were so called because the whole of human virtue was supposed to hinge or turn upon them. In other words, they were considered as a full and comprehensive classification of a man's various duties.

This mode of dividing the virtues is to be found as far back as Socrates. The ancient moralists treated under ethics the whole sum of human duty and virtue. Thus, Aristotle considers the great problem of the science to be the determination of man's highest good, together with the means of realizing it. Hence, he includes both the social virtues and the prudential regard to the welfare of the individual in the same scheme. Of the four cardinal virtues, it will be seen that the first, justice, is the social virtue; that prudence (which, properly speaking, includes temperance also) regards the well-being of the individual; while fortitude is necessary to both. This last was a virtue greatly esteemed in the ancient world; each one's

lot being much less secure than with us in the present day, it was impossible to say what sufferings might be in store for the most prosperously situated of men.

Dr. Whewell has made an attempt to correct the more obvious defects of the classification, and has substituted one which he deems free from those defects. The most notable omission in the ancient scheme, judged from the modern point of view, is the absence of all reference, either expressly or by implication, to the virtue of goodness or benevolence. Accordingly, to adapt the classification to the altered point of view, benevolence has to be added to the list. This is Dr. Whewell's first virtue; the others are justice, truth, purity, and order. But the scheme, as thus amended, is scarcely less objectionable than before. The virtue named last, order, which means obedience to authority, cannot but contain a very large portion of all the rest; seeing that justice, truth, etc., are enjoined by positive law. Then, what is understood by purity, including the control of the two powerful appetites—hunger and sex—is partly prudential and partly social.

In Roman Catholic systems of theology there are declared to be four *cardinal virtues*—"prudence, fortitude, temperance, and justice"—from which all other "moral" virtues are represented as flowing. But there is a prior division of virtues into the two classes of *theological* and *moral*, the theological virtues being faith, hope, and charity. The distinction between these two classes is represented as consisting in this, that the theological virtues "*immediately* regard God," and the moral virtues do not immediately regard God, but are commanded and rewarded by God, and are beneficial to ourselves.

This method of discussion may be said to be engaged upon the form of the virtues. There is need of one which shall touch their matter. The tendency of ethics during the nineteenth century in America was to emphasize love as the true "cardinal" virtue or as the element which must enter into every moral act in order that it may acquire the character of virtue. Even forms of philosophy which have seemed to ignore this principle have brought it in again under other names, such as "altruism." That modern tendency which has emphasized "self-realization" as the watchword of ethics has plainly seen that the true realization of self is its fullest adjustment to all its environment, and that this involves regard to the self-realization of every other moral being, which is what is meant by love.

Considered under the light of this principle, as the informing and controlling principle of all action that is really good, the cardinal virtues assume more distinctness. Love regards the fundamental interests of all moral agents as the object of moral effort, or it seeks to do in every case that which will give the fullest possible amount of good to all concerned. But this is exactly what justice is—not the apportioning out of something good or bad upon the basis of an abstract and unreal standard, but the rendering to each that which shall now and here promote most fully the best good of each, while also promoting the best good of all. The same is true, *mutatis mutandis*, of the remaining virtues. A classification of virtues into the personal and the social may be valuable for certain purposes, but personal acts are virtues only as they have respect also to social relations, and vice versa.

In fact, no virtue is such in isolation from others, or in disregard of the totality of concrete conditions. See ETHICS.

CARDINAL VON WID'DERN, kär'dê-näl' fôn vid'dêrn, GEORG (1841–). A German writer on military science, born at Wollstein (Posen). He fought in the Prussian army in the campaign of 1866 and in the Franco-Prussian War. Subsequently he was head of the military school at Neisse. He retired from the service with the rank of colonel in 1890. His numerous publications include *Handbuch für Truppenführung* (3d ed., 1881–84), which appeared in a fourth edition as *Heeresbewegungen und Märsche* (1892); *Das Gefecht an Flussübergängen, und der Kampf an Flusslinien* (1890); and *Kritische Tage* (part i, vols. i–iii, 1897–1900); *Verwendung und Führung der Kavallerie 1870–71* (1903); *Eroberungszüge der Polen im heutigen Deutschland* (1912).

CARD'ING. The process of disentangling and arranging in parallel rows the fibres of cotton, wool, or flax, by the action of wire-toothed cylinders, and the first important mechanical operation in the treatment of fibres preparatory to yarn making. This operation may be compared to the combing and brushing of one's hair, and the *card* combines the properties of the comb and brush, being a brush with wire teeth instead of bristles. These teeth are inserted in strips of leather, called card clothing, which are fixed upon the surface of a revolving cylinder. This arrangement, known as a carding engine, was invented in 1738 by Lewis Paul, a Birmingham mechanic. In the modern machine several such cylinders are arranged so that the ends of the teeth are nearly in contact; and the material, which has previously been formed into *laps*, the width of the cylinders, being brought to them, is caught up, passed from one to the other, and combed out as the cylinders revolve, in the form of beautiful films or fleeces, which are removed by a smaller drum card, called the "doffer," and again from this by the "doffing knife." These films, which are of the width of the drum, are next contracted to a narrow rope or ribbon by being passed through a funnel; and are called the "card ends" or "slivers," and are now ready for "drawing" or "doubling." Carding machines for wool are usually arranged in series of three, called *first breaker*, *second breaker*, and *finisher*. For cotton there is one main cylinder with revolving flats. A double-cylinder arrangement is used for worsted. For coarser materials, fewer small cylinders are required. Consult Murphy, *The Textile Industries*, vol. ii (London, 1912). See SPINNING, and the authorities there mentioned.

CARDIN'IA (Neo-Lat. nom. pl., from Gk. *καρδία*, *kardia*, heart). An extinct genus of lamellibranchs found fossil in rocks of Triassic and Jurassic age in Europe. Its shell resembles in form that of the common little-neck clam, but is slightly longer and of more solid build, with a smooth or concentrically marked outer surface, and without the pearly inner surface. In cross section the two valves are heart-shaped, whence the name. The shells of this genus, of which less than a dozen species are known, are common in the lower Lias of Great Britain.

CAR'DIOGRAPH. An instrument for registering the heart's action. It is adjusted over the heart's apex as a sphygmograph (q.v.) is adjusted over an artery.

CAR'DIROID (Gk. *καρδία*, *kardia*, heart + *εἶδος*, *eidos*, shape, form). A heart-shaped curve traced by a point of the circumference of a circle that rolls around another circle of the same diameter. The curve was first studied early in the eighteenth century, and is a special case of Pascal's limaçon (q.v.). Referring the

CARDIROID.

cardioid to rectangular coördinates so that the *x*-axis coincides with the diameter of the fixed circle and the *y*-axis is tangent to it, the equation of the cardioid is $(x^2 + y^2 - ax)^2 = a^2(x^2 + y^2)$ where *a* denotes the diameter of the circle. The polar equation is $OP = \rho = a(1 + \cos \theta)$. The origin is a cusp. (See CURVE.) The curve is symmetric with regard to the *x*-axis, and its area is $\frac{3}{2}\pi a^2$, or six times the area of one of the circles. See CYCLOID.

CARDI'TIS (Neo-Lat., from Gk. *καρδία*, *kardia*, heart). An old name for degeneration of the muscles of the heart. It is now termed myocarditis. See HEART, DISEASES OF THE.

CARDO'NA. A town of Spain, in the Province of Barcelona. It is situated on the right bank of the Cardoner, about 44 miles northwest of Barcelona, and is surrounded by walls, pierced with six gates and commanded by a castle (Map: Spain, F 2). It has an old church, and in its vicinity is situated the celebrated Montaña de Sal, a hill about 265 feet high, composed of rock salt, which shines brilliantly under the rays of the sun. The salt is worked on a large scale and gives employment to many of the inhabitants. Pop., 1900, 3900; 1910, 4002.

CARDON' FORESTS. See CACTUS; CARDOON.

CARDOON' (OF. *cardon*, from ML. *cardo*, thistle, Lat. *carduus*, thistle), *Cynara cardunculus*. A perennial plant of the same genus with the artichoke (see illustration in article SALAD PLANTS). It is a native of the southern part of Europe and the northern part of Africa. It has long been in cultivation in Europe as an annual for the sake of the blanched leafstalks and midribs of the leaves, which are used as a salad, or more generally as a boiled vegetable during winter. It is but little grown in the United States.

CARDOSO, kär-dō'sō, JOSÉ JOAQUÍN (1802-78). A Mexican jurist and botanist. He was born at Puebla, and graduated as a lawyer at the Colegio de San Ildefonso, Mexico City, in 1828. When the secret society *Los Polkos* was organized by the Conservatives, during Santa Anna's administration, Cardoso established a lodge in opposition to it, which he called *La*

Escocesa, and which exerted considerable influence. From 1851 to 1854 he was professor of Latin. In 1854 he was a member of the Liberal convention which prepared the plan of Ayutla, and in 1857 he became a deputy to the First Congress. He repeatedly declined the portfolio of justice tendered to him by his friend, President Juárez, preferring to devote himself to botanical investigations and literary studies. In 1868 he became director of the San Augustin Library (now the National Library), an institution containing thousands of books acquired largely from the convents of Mexico. Cardoso also made several scientific excursions to Popocatepetl and Orizaba, discovering and collecting many plants which he subsequently classified. Among his botanical and biographical works may be mentioned: *La herbolaria mejicana*; *La flora entre los Aztecas*; *El método de Humboldt*; *Linneo el Joven*; *Cuál fué la primera planta medicinal entre los antiguos*; *Autobiografías mejicanas*.

CARDS (Fr. *carte*, card, ML. *carta*, *charta*, card, Lat. *charta*, paper, from Gk. *χάρτη*, *chartē*, leaf of paper). Cards for playing games of chance are of the most remote antiquity and of almost universal usage. There is evidence that they were in use in Egypt in the time of Joseph, but they did not appear among the Jews until after their return from the Babylonian exile. That their use extended as far east as Hindustan and China at a period long before their introduction into Europe is well attested. The Chinese dictionary, *Ching-tze-tung* (1678), states that they were invented for the amusement of Sèun-ho's concubines in the year 1120 A.D. Though it is rather likely that they were known to a few individuals in Europe about the middle of the fourteenth century, probably they were not commonly used until about the first of the fifteenth. There are two theories as to who brought them into Europe. Some antiquarians maintain that they followed in the wake of the invading Saracens, who, after having spread over Asia and Africa, crossed the Mediterranean in 711. Others claim that the Crusaders brought the practice of playing cards from the East, where they had of course come in contact with the Saracens. Gambling was certainly rife among the Crusaders. From whatever source playing cards came, every nation of Europe used them, and that they had the same point of origin is pretty conclusively proved by the uniformity of the words by which they are known, both among Teutonic and Latin races. When, however, the details of a pack are named, the nomenclature varies, just as the design and the number of cards in a pack have varied. With the Anglo-Saxons the world over it is 52 in four suits of 13 each, i.e., king, queen, jack, and 10 cards, from 10 to 1, according to the number of pips. In Italy 36 cards formed a pack, and the older characteristically German cards were only 32. In China, where the early Portuguese missionaries found cards in common use, a pack consisted of 30 cards in three suits of 9 each, and three superior cards. Their cards were not more than half as wide as the European variety, and were called by the very expressive word *shen*, meaning a fan, evidently a suggestion taken from an outspread hand of cards. In Hindustan the early pack consisted of 10 suits of 12 each, the marks of each of the 10 suits being emblematic of one of their avatars or incarnations of Vishnu. In this sym-

bolistic respect the cards of all nations have varied from time to time. Some have been historic, some have been political satires; some have lampooned particular people; some have represented class distinctions—for instance, the early Italian and Spanish packs, instead of the modern hearts, clubs, diamonds, and spades, had swords to represent the nobility, chalices for the clergy, coins for the citizens, and clubs or staves for the peasantry. A description of the artistic embellishment of the faces of cards would alone form a volume; among the devices were horsemen, elephants, hawks, bells, flowers, many birds, tumblers, and a host of other subjects. The four kings seemed at one time likely to lose their sway over the New World, for cards were manufactured in New York in 1848 which had neither kings nor queens, the president of hearts being Washington, of diamonds John Adams, of clubs Franklin, and of spades Lafayette. The queens were Venus, Fortune, Ceres, and Minerva, and the knaves Indian chiefs.

Spain introduced cards into the New World. Herrera mentions that when Cortés conquered Mexico King Montezuma took great pleasure in watching the Spanish soldiers play cards. Spain was more devoted to cards at that time than any other European nation. Although generally known, they were not common. Neither Petrarch, who described the social life of the first half of the fourteenth century, nor Chaucer, who depicted the second half, mentions cards, although they describe many other games of chance. By the middle of the next century their manufacture, even in England, had become quite a trade, for on the rolls of Parliament there is a petition, which was complied with, prohibiting their importation from abroad.

Even the names of most of the old games are only to be found in antiquarian works. Chief among them was one named, in every country where it was played, "primero." It found its way into Shakespeare, whose Falstaff says: "I never prospered since I forswore primero." It long continued a fashionable game, but was succeeded in general estimation by mauve, and piquet still survives. "Loadam," "Noddy," "Macke," "Oubre," "Gleek," "Post and pan," and "Bank-rout" are but ghosts out of the writers of the eighteenth and early nineteenth centuries.

A detailed description of the modern games of cards will be found under their distinctive titles. Consult: Singer, *Researches into the History of Playing Cards* (London, 1816); Chatto, *Origin and History of Playing Cards* (London, 1848); Willshire, *Descriptive Catalogue of Playing and Other Cards in the British Museum* (London, 1876); Taylor, *The History of Playing Cards* (London, 1865); R. Merlin, *Origine des cartes à jouer* (Paris, 1869); Van Rensselaer, *The Devil's Picture Books* (New York, 1890); id., *Prophetic, Educational and Playing Cards* (Philadelphia, 1912); Jessel, *Bibliography of Works in English on Playing Cards and Gaming* (London, 1905); D'Allemagne, *Les cartes à jouer* (Paris, 1906), a very detailed account.

CARDUCCI, kār-dōō'chè, GIOSUÈ (1835-1907). The greatest Italian poet of the second half of the nineteenth century, professor at Bologna, senator of the kingdom, winner of the Nobel prize for literature in 1906. As a critic he passed in review the whole course of Italian literature, raising unsuspected problems of history and criticism, himself making important contributions to knowledge and stimulating a whole

school of investigators to sounder methods of research and to keener appreciation of Italian letters. Meanwhile Carducci was producing a richly varied series of poems which reveal him as one of the solidest and most fibrous spirits of modern Italy. In *Juvenilia* (1850-60) we find already hints of the various motives that in more elaborate working become distinctive of his later poetry; a passionate devotion to the classic world; a determination to assimilate again the ancient spirit, which with fiery arrogance he exalts over the indolence and mediocrity he sensed about him. So with Italy before him as the modern Athens and the modern Rome, he glorifies the great writers and the great patriots of his country. In *Levia gravia* (1861-71), with greater composure and a freer lyric hand, he continued much in the same manner. In 1863 appeared the sensational, impudent, and eloquent *Ode to Satan*, where Carducci, identifying Hellenic beauty, the spirit of learning and revolt, human heroism, modern scientific triumph, in short all progress, with the Spirit of Evil, celebrates the victory of Satan over the "Jehovah of the priests," who symbolizes ignorance, tyranny, and oppression. And with greater violence still in *Giambi ed epodi* (1867-79) he assails the temporal power of the Pope in alliance with the oppressors of Italy. Mingling in the *Intermezzo* the most biting satire against the romantics with some of the mellowest cadences of modern Italian poetry, Carducci passes (1861-87) to the *Rime nuove*, where, now free from the strife of the revolution, he unfolds with greater amplitude the manifold aspects of his genius, enthroning his beloved "antichità serena" in the "Hellenic Springtimes" (*Primavera elleniche*), chiseling the most graphic portraits of material reality in "The Ox" (*Il bove*), expressing the deepest sorrows of death (*Pianto antico* and *Funere mersit acerbo*), extracting from history, literary, and art essences of varied personality and subject. One of the most remarkable of this remarkable series is the *Ca ira*, where, in 12 sonnets, he sums up in its most crucial moments the French Revolution, producing a startling effect of movement, violence, and enthusiasm.

It is, however, in the *Odi barbare* and in their continuance, *Rime e ritmi* (1880-1900), that Carducci's full power was shown. The suppression of rhyme and the first great adaptations of classic metres in Italian literature aroused among critics wide discussion of these poems. Recently they have provoked a searching critical literature far exceeding in bulk that devoted to any modern poet, and though their richness in substance and depth of coloring make them almost beyond translation, they have been rendered into all the great languages of Europe. Here all the motives of the earlier poems reappear, but they are now worked out to their fullest possibilities. The classic spirit is here given a living body, arrayed in a splendor of imagery (*All' Aurora*) and assimilating in itself all the passions and ideals of a modern man. The whole essence of Italian history is concentrated in the ode *Alle fonti del Clitumno*. Here, as in the *Ode to Satan*, Christianity is portrayed as a destructive force extinguishing the light of ancient civilization and the greatness of Rome. In the ode *In una chiesa gotica*, also, Carducci contrasts the airy visions of paganism with the terrors of Christian asceticism and the horrors of the Christian hell. The poet himself seems

to have been conscious of some one-sidedness in these views, for in the ode to *La chiesa di Polenta* he credits Christianity with being the amalgamating force of ancient and modern, of barbarian and Roman, in Italian history, and, following out a motive of Aleardi, works around the *Ave Maria* of the ritual all the emotional tenderness of faith. *Alla stazione* ('At the Railroad Station') is considered one of the masterpieces of realistic poetry. Most of these odes are densely packed with substance; they call out all the emotional and intellectual resources of the reader, invariably reflecting a vast erudition, a keen interpretation, and a vivid application to life, on the part of the author. Carducci as a personality represents the highest ideals of the new Italian nation; coming before the most recent developments of the revolutionary spirit, he stood for free individualism under just government, free thought guided by sound learning, sincerity in art and breadth of culture. The best translation of Carducci's poems is by Bickersteth (New York, 1913). Consult: Jeanroy, *Giosuè Carducci* (Paris, 1910); Chiarini, *Memoire della vita di Giosuè Carducci* (Florence, 1903); B. Croce, *Giosuè Carducci* (series of articles in the *Critica*, with bibliography).

CARDWELL, EDWARD (1787-1861). An English clergyman and ecclesiastical historian. He was born at Blackburn, Lancashire, 1787; educated at Oxford, received the degree of M.A. in 1812 and of D.D. in 1831. In 1826 he was chosen Camden professor of ancient history. He edited the *Ethics* of Aristotle (2 vols., 1828-30), with notes, and wrote lectures on *The Coinage of the Ancient Greeks and Romans* (1833). In 1831 he was made principal of St. Alban Hall, and held the place until his death there, May 23, 1861. Among his other publications were a student's edition of the Greek Testament (1837); Josephus' history in Greek and Latin (1837); *Documentary Annals of the Reformed Church of England from 1546 to 1716* (1839); *History of Conferences, etc., Connected with the Revision of the Book of Common Prayer, 1558 to 1690* (1840); *Synodalia, a Collection of Religious Canons, and Proceedings of Convocation from 1547 to 1717* (1842); and *Reformatio Legum Ecclesiasticarum* (under Henry VIII-Elizabeth) (1850).

CARDWELL, EDWARD, VISCOUNT (1813-86). An English politician. He was born in Liverpool, the son of a merchant, was educated at Winchester and at Balliol College, Oxford, and was admitted to the bar in 1838. He devoted himself to politics, however, and entered Parliament in 1842. There he attached himself to Sir Robert Peel, who chose him Secretary of the Treasury in 1845 and President of the Board of Trade in 1852. He was subsequently Chief Secretary of Ireland (1859), Chancellor of the Duchy of Lancaster (1861), and Secretary of State for the Colonies (1864), working towards Canadian federation in the last-named post. In Gladstone's cabinet (1868) he became Secretary of War; and his reforms included the abolition of the purchase of commissions, the retirement of officers, short terms of service, the localization of regiments, and improvements in military education. In 1874 he was raised to the peerage. With Earl Stanhope, he was one of the literary executors of Sir Robert Peel, and one of the editors of the *Peel Memoirs* (1856-57).

CARELESS HUSBAND, THE. A comedy

of intrigue by Cibber, produced Dec. 7, 1704, at Drury Lane, and printed in quarto in 1705. It treats of the straying of Sir Charles Easy from the paths of virtue and his final restoration to them through the patient forbearance of his excellent wife.

CARELESS LOVERS, THE. A comedy by Edward Ravenscroft, produced at Dorset Garden in 1673 and published the same year. It is partly founded on *Monsieur de Pourceaugnac* and contains an attack on Dryden's *Assignment*.

CARÊME, kâ'râm', MARIE ANTOINE (1784-1833). A famous French cook. He was born in Paris and became *chef de cuisine* to many celebrated persons, including Talleyrand, King George IV, and one of the Rothschilds. He cooked for the Congress of Aix-la-Chapelle, Vienna, and Laibach. He left several works on subjects connected with cookery, which include: *Le pâtissier pittoresque* (1815); *Le pâtissier royal parisien* (1825); *Le maître d'hôtel français* (2 vols.); *Le cuisinier parisien* (1828).

CARET, kâ'râ' (Neo-Lat. *caretta*, from Sp. *careta*, pasteboard mask, dim. of *cara*, face, Gk. *kápa*, *kara*, Skt. *siras*, head). A turtle. See HAWKSBILL TURTLE.

CAREW, kâ-rōō', GEORGE, BARON CAREW OF CLOPTON and EARL OF TOTNES (1555-1629). An English soldier and statesman. He was educated at Oxford and joined the army, holding an important command in the Irish wars against the Earl of Desmond. He filled several offices, among them that of President of Munster, and was an intimate friend of Sir Walter Raleigh, whose life he tried to save in 1618. The powerful support that he gave to Lord Mountjoy enabled the latter to overcome O'Neil, Earl of Tyrone, and his Spanish allies. For these services he was raised to the peerage and made a privy councilor, and in 1626 Charles I created him Earl of Totnes. He had antiquarian tastes and carefully preserved many manuscripts relating to Ireland. *Pacata Hibernia, or the History of the Late Wars in Ireland*, published after his death, is often ascribed to him, though it was written by his secretary (probably not his natural son), Sir Thomas Stafford, from Carew's papers.

CAREW, RICHARD (1555-1620). An English poet and antiquarian. At Oxford, when he was only 14, he disputed extemporaneously with Sir Philip Sidney, in the presence of an audience of noblemen. He was a member of Parliament, high sheriff of Cornwall, and the author of a *Survey* (1602) of that county, which still has considerable value, topographic and philological. He translated from the Italian in crabbedly close English the first five cantos of Tasso's *Jerusalem Delivered* (1594) and from an Italian version of Huarte de San Juan *The Examination of Men's Wits*.

CAREW, THOMAS (?1598-?1638). An English poet. Of his life very little is known. He was a son of Sir Matthew Carew, of Middle-Littleton, Worcestershire, a master in chancery, and was born probably in 1598. From Westminster School he went to Corpus Christi College, Oxford, but left about 1615, without a degree. "Afterwards," says Anthony Wood, "improving his parts by traveling and conversation with ingenious men in the metropolis, he became reckoned among the chiefest of his time for delicacy of wit and poetic fancy. About which time, being taken into the Royal Court for his most admirable ingenuity, he was made Gentleman of

the Privy-Chamber . . . to King Charles I." The King bestowed on him the royal domain of Sunning Hill, a part of Windsor Forest. He was the first of a group of lyrists, often classed as Cavalier poets, to the making of whom two influences contributed: the Elizabethan lyrists, especially Ben Jonson, and Dr. Donne (q.v.). Carew's theme is love, which is treated with great frankness and with a luxuriant imagination. His verses are often very sweet and beautiful. He published, in 1634, a masque entitled *Cœlum Britannicum*; but his poems did not appear until 1640, some time after his death. Recent editions are by Hazlitt, for the Roxburghe Library (London, 1870); by Ebsworth (London, 1893); and by Vincent for the Muses Library (London, 1899). The last-named editor would identify the subject of this sketch with the Thomas Carew who entered Merton College, Oxford, in 1608, at the age of 13, and received the degree of B.A. in 1611. He also argues for 1639 as date of death. *Poems*, edited by Arthur Vincent in 1899, is the best edition of Carew.

CA'REX. See CYPERACEÆ.

CA'REY, HENRY (c.1692-1743). An English humorous poet and musician, born in London. He was a reputed son of George Saville, the famous Marquis of Halifax. After studying music under Linnert, Roseingrave, and Geminiani, he taught for a living, and wrote a number of musical dramas and ballad operas. He was the author of the libretto of *The Dragon of Wantley*, music by Lampe (London, Oct. 26, 1737), and he also published six cantatas (1732) and *The Musical Century, or a Hundred English Ballads* (1737; 3d ed., 1743). He will be remembered as the author of the ballad "Sally in our Alley" and of "God Save the King" (1740), the authorship of which latter was long regarded as doubtful until Chrysanter substantiated the claims first brought forward by Carey's son.

CAREY, HENRY CHARLES (1793-1879). An American economist, born in Philadelphia, son of Mathew Carey. In 1835 he published an essay on the *Rate of Wages*, which was expanded into the *Principles of Political Economy* (1837-40). This work, which accepted in the main the free-trade principles of the English school, rejected the Ricardian doctrine of rent and the Malthusian doctrine of population. It defended the theorem of the fundamental harmony of economic interests and by its optimistic note captivated Frédéric Bastiat, whose work was deeply influenced by it. The work also exerted a great influence upon Dühring, who devoted himself for a long period to the dissemination in Germany of Carey's views. In 1838 Carey published *The Credit System of France, Great Britain, and the United States*; and in 1848, *The Past, the Present, and the Future*. In this work Carey abandons the doctrine of free trade. In the *Harmony of Interests, Agricultural, Manufacturing and Commercial* (1851) Carey commits himself to the defense of protection as practiced at the time in the United States. For nearly half a century Protectionists drew heavily upon these and later writings of Carey for the defense of their policy. In 1853 Carey published the *Letters on the International Copyright*; in 1858-59 *Principles of Social Science*; in 1867 *Review of the Decade 1857-67*; and in 1873 *The Unity of Law*. Carey's economic writings are characterized by originality and fervor of conviction, but are very defective in logic. Their

direct influence upon economic science has been negligible; indirectly they have assisted in breaking down the dogmatism with which English economic doctrines were expounded in America.

CAREY, MATHEW (1760-1839). An American author and publisher, born in Ireland. In consequence of publishing an address to the Irish Roman Catholics on their oppression by the penal code (about 1778), he was compelled to leave Ireland, but returned within a year and established, in 1783, the *Volunteer's Journal*. His attacks upon Parliament and the ministry caused his imprisonment in Newgate until the dissolution of Parliament. In 1788 he was aided by Lafayette to emigrate to the United States and settled in Philadelphia, where he founded the *Pennsylvania Herald*, one of the first papers in the country to furnish accurate reports of legislative debates. He was subsequently connected with the *Columbian Magazine* and the *American Museum*. In 1791 he began trade as a bookseller, and, with his sons, built up a prosperous business. During the epidemic of yellow fever in 1793 he was active in the work of relief, and afterward wrote a history of the disease. In 1793 he, with others, founded the Hibernian Society, and in 1796 he assisted Bishop White in establishing the first Sunday-school Society. Carey was a constant writer and published a great number of essays on party politics, political economy, and social questions. Among his favorite ideas were internal improvements and a protective tariff. He died in Philadelphia.

CAREY, ROSA NOUCHETTE (?-1909). An English novelist, born and educated in London, died 1909. Beginning in 1868, she produced a large number of wholesome if not brilliant novels. Various fashions in novel writing have come and gone, but she held throughout to a simple and unaffected chronicle of commonplace folk. Of her work a good specimen is *Other People's Lives* (1897), a collection of short stories. Others are: *Nellie's Memories* (1868); *Robert Ord's Atonement* (1873); *Wood and Married* (1875); *Mrs. Romney* (1894); *My Lady Frivol* (1899); *Life's Trivial Round* (1900); *At the Moorings* (1904); *The Mistress of Brae Farm* (London, 1908).

CAREY, WILLIAM (1761-1834). An English Baptist missionary and Orientalist, born near Northampton, England. At the age of 14 he was apprenticed to a shoemaker, but in 1786 was chosen minister of a Baptist congregation at Moulton, and in 1789 at Leicester. While preaching, he studied Greek, Latin, and Hebrew by himself, and in 1793 was sent as the first Baptist missionary to India by the Baptist Missionary Society, which he had helped to organize. At first he had to accept employment as superintendent of an indigo factory. Nevertheless, he established a church near the factory at Maldah. Five years later he removed to Serampur, a Danish colony. Under his direction this mission before 1832 issued about 200,000 Bibles, or portions thereof, in about 40 Oriental languages or dialects, besides a great number of tracts and other religious works in various languages. A great proportion of the actual literary labor involved in these undertakings was performed by Carey himself, whose *Kashmiri New Testament* (1821) was the first book published in that language. His translations into six Rajasthani dialects were particularly important. His Sanskrit and other Ori-

ental grammars and dictionaries were important works. A valuable Sanskrit dictionary was burned in his printing shop in 1812. Carey's translations of the Bible gave distinctly Baptist versions for words meaning "baptize," etc., and the subsequent controversy with the British and Foreign Bible Society resulted in the foundation (1839) of a (Baptist) Bible Translation Society. He was professor of Oriental languages at Fort William College, Calcutta, from 1800 to 1830. For his biography, consult Culross (London, 1882) and George Smith (London, 1885).

CAR'GILE MEM'BRANE is a sterile membrane prepared from the peritoneum of the ox, and is used in abdominal surgery to interpose between raw surfaces and thus prevent the formation of adhesions. It is also used to envelop freshly sutured nerves or tendons, and to protect wounds.

CARGILL, kär'gîl, DONALD (1610-81). A Scottish covenanting preacher. He was educated at Aberdeen and St. Andrews, and in 1655 became pastor of a church in Glasgow. For calling the restoration of Charles II a public calamity he was deprived of his church and banished beyond the Tay. He was wounded in the battle of Bothwell Bridge, but made his escape; and soon he joined Richard Cameron in publishing the Sanquhar declaration, excommunicating Charles II, the Duke of York, and various high officials. He was arrested and beheaded in Edinburgh.

CARGO (Sp., burden, Fr. *charge*, from ML. *carricare*, to load a car, from Lat. *carrus*, car). A general term for all merchandise carried on board a trading ship. Sometimes it is applied also to the invoice of the cargo. The term *deck cargo* is given to the commodities on deck, which are not usually included in the policy of insurance. For the security of the customs revenue, the master of every coasting vessel is bound to keep a *cargo book* recording the name of the vessel, the name of the owner, the port of departure, the port of destination, the goods taken, the names of the shippers and consignees, the time of departure, and other particulars. The customs officers may demand to see this book at any time. See FREIGHT; MEASUREMENT OF SHIPS FOR TONNAGE; SHIP'S PAPERS; ETC.

CAR'HART, HENRY SMITH (1844-). An American physicist and university professor. He was born at Coeymans, N. Y., March 27, 1844, and graduated from Wesleyan University in 1869. He pursued graduate studies at Yale, Harvard, and Berlin, and after serving as professor at Northwestern University, was appointed to the faculty of the University of Michigan in 1886, where he remained until his retirement as professor emeritus in 1909. Professor Carhart devoted himself largely to the study of electricity, particularly the subject of standard cells and primary batteries, one of the best types of the former having been devised by him and known as the Carhart-Clark cell. (See VOLTAIC CELL.) Professor Carhart has been a delegate from the United States to several international electrical congresses, including those at Chicago, 1893, and at St. Louis, 1904, and was delegate of the United States to international conferences on electrical units and standards at Berlin, 1905, and London, 1908. He was president of the board of judges in the department of electricity at the World's Columbian Exposition in Chicago in 1893. He

is the author of *Primary Batteries* (1891), a standard treatise on this subject; *University Physics* (1894-96); *Electrical Measurements* (1895); *High School Physics*, with H. N. Chute (1901); *College Physics* (1910); and other textbooks and treatises.

CARHEIL, kâ'râ'y', ETIENNE DE (?-1726). A Jesuit missionary among the Huron and Iroquois Indians of Canada from about 1668 to about 1721. For many years he was superior of the Indian mission at Michillimackinae, but, in spite of his knowledge of Indian languages, he met with little success, and in 1701 most of his converts left him to live in the new settlement at Detroit.

CA'RIA (Lat., Gk. *Kapla*, *Karia*). In ancient geography, the southwesternmost country of Asia Minor, bounded on the north by Lydia, on the east by Phrygia, on the southeast by Lyeia, and on the west and southwest by the Mediterranean. Before the Macedonian conquest, Caria was cut off from the sea on the west by Ionia and on the southwest by the Dorian colonies. A large portion of Caria is mountainous. The chief ranges were the Cadmian and the Latmian. The chief river was the Mæander, famous for its windings. Caria was, at an early date, governed by petty princes or kings; it afterward became a part of the Persian Empire, the former princes continuing to rule as satraps; later it came into the hands of the Macedonian kings of Egypt; and, finally, into those of the Romans. The chief towns were Cnidus, Halicarnassus, Priene, and Miletus. In the early history of the Ægean lands, the Carians are frequently mentioned, and the Greek writers seem to have believed that they were of the same race as the pre-Hellenic inhabitants of Attica and some of the islands. Many modern ethnologists also hold that the Carians were the remnant of the early population of the Ægean.

CARIACO, kâ-ryü'kô. A seaport of Venezuela, situated 5 miles from the head of the Gulf of Cariaco, 40 miles east of Cumaná (Map: Venezuela, E 1). It is the centre of a fertile district and has considerable eastwise trade. The gulf is very well sheltered, being open only to the westward. Cariaco was founded about 1600. Pop., about 7000.

ÇARIAMA, sä'rê-ä'mâ (Brazilian), or SERIEMA. A bird, *Cariama cristata*, allied to the cranes, but also resembling certain raptorial birds, and now generally ranked in a separate suborder, DICHOLOPHI, placed near the cranes and bustards and more precisely between the trumpeters and the extinct Phororhæos. It is a native of Guiana, Brazil, and Paraguay, inhabiting open plains and the outskirts of forests, where it feeds chiefly on serpents, lizards, and insects. It is larger than the common heron; the plumage is brown, finely waved with darker brown, whitish on the lower parts. When pursued, the çariama seeks safety by running and does not readily attempt to use its wings. Its low notes resemble those of a young turkey, but it has the power of making a most tremendous outburst, thereby giving it the well-deserved name of "screamer." This is a series of metallic, high, harsh cries which can carry for many hundreds of yards. Two birds usually unite in giving this performance. It is much esteemed for the table and is sometimes reared in a domesticated state. W. H. Hudson, the Argentine naturalist, considers it related to one of the great extinct birds of Patagonia, *Phoro-*

rhacos inflatus, as closely as armadillos are related to *Glyptodon*. Consult *Proceedings Zoological Society of London* for 1889 and 1899. See Plate of CRANES, ETC.

CAR'IB. A predatory and warlike people from whom the Cariban stock takes its name, formerly occupying most of the Lesser Antilles, by conquest or expulsion of the original Arawakan tribes. They had come from the southern mainland, being expert seamen. Like nearly all the tribes of this stock, they were distinguished for ferocity and cruelty, and were also addicted to cannibalism, the very word *cannibal* being a derivative from their tribal name. To put an end to the chronic disturbances occasioned by their presence, the English government, in 1796, deported almost all the members of the tribe from Dominica and St. Vincent to the island of Ruatan on the coast of Honduras, whence they have since spread over the neighboring mainland to the number of several thousand. From admixture with the negroes, a part of them are distinguished as Black Caribs. Consult Adam, "Le Caraïbe du Honduras et le Caraïbe des Isles," in *Internat. Amerik.-Kongr.*, vol. xiv, pp. 357-371 (1904); J. N. Rat, "The Carib Language as now Spoken in Dominica," in *Journ. Anthropol. Inst.*, vol. xxvii, pp. 293-315 (London, 1897-98).

CAR'IBAN STOCK. One of the most important linguistic stocks of South America, its tribes holding at the time of the discovery nearly the whole coast and midland region of Venezuela and British Guiana, including the lower Orinoco, together with the Lesser Antilles. Everywhere they were distinguished as a warlike race, the terror of their weaker neighbors, who were steadily retiring before them. In spite of their exceptional cruelty, they are described as "the strongest, handsomest, and most intelligent" of all the natives of that portion of the continent. They were expert boatmen, making use of the sail, a thing unknown among the other tribes, and, in fleets sometimes numbering 100 canoes, were accustomed to ascend the Orinoco, destroying everything before them. They were partly agricultural and made excellent pottery. The present distribution of the principal Cariban tribes is as follows: On the river Guaporé in the State of Matto Grosso, Brazil, are the Palmellas, the most southerly members of the stock. The Bakafiris and the Nahuquas dwell on the upper Xingú; on the lower Tocantins, the Apiaca; on the Paranahyba, the Pimenteira. In Brazilian Guiana are the Apalai and Wayawai; in French Guiana, the Roucouyennes and Galibis; in Dutch Guiana, the Trio, Upurui, and Kalinas; in British Guiana, the Macusi, the Accawai, etc.; and in Venezuela, the Maquiritares, Ipuricotos, Maionkongks, Kirishanas, and Motilones; in Colombia, the Carijonas, Hianacotos. The modern Caribs differ from the ancient Caribs of the Antilles in their more peaceful mode of life, the absence of cannibalism, and a less highly developed system of social relations. In place of the communal dwelling which formerly prevailed among them, each family at present occupies a separate house, sometimes built on piles as a safeguard against flood. They have a ceremonial religion and practice the couvade (q.v.). Their favorite weapon is a battle-axe of polished stone. On the Cariban stock the writings of Adam, Coudreau, Crevaux, Ehrenreich, Ernst, De Goeje, Koch-Grünberg, von den Steinen, etc., should be consulted. In

Dr. Koch-Grünberg's monograph "Die Hiánakoto-Umaua," in *Anthropos*, vol. iii, pp. 83-104, 297-335, 952-982 (1908), is a list (pp. 90-95) of vocabularies and dictionaries in the various Cariban dialects. Consult also the same author's *Zwei Jahre unter den Indianern* (Berlin, 1909-10) for some of the less-known tribes of southwestern Venezuela, northwestern Brazil, and southeastern Colombia.

CAR'IBBE'AN SEA. A portion of the north Atlantic, bordered on the south by Central America, Colombia, and Venezuela, on the west by Central America and Yucatan, and partially inclosed from the ocean on the north and east by the island loop of the Greater and Lesser Antilles. It communicates at its northwestern extremity with the Gulf of Mexico by the Yucatan Channel—a passage 120 miles wide between Cuba and the Peninsula of Yucatan. The South American coast of the Caribbean Sea is diversified by the gulfs of Paria, Cariaco, Triste, Venezuela, and Darien, while on the west coast there are the larger embayments of the Mosquito Gulf and the Gulf of Honduras. The Gulf of Venezuela, between the Goajira Peninsula in Colombia and the Paraguana Peninsula in Venezuela, connects by means of a shallow channel with the Lake of Maracaibo, the basin of which is the most prominent indentation on the north coast of South America. Although the Caribbean is a partially inclosed sea and lies on the border of a great land mass, it occupies a very deep depression. With the exception of a narrow shelf along the Venezuelan coast and a bank that reaches from Jamaica to Honduras and Nicaragua, the entire basin exceeds 6000 feet in depth, and a large portion is more than 12,000 feet. Extreme depths exceeding 16,000 feet have been found off the south coast of Cuba and between Haiti and Venezuela. The waters of the Caribbean Sea are influenced in their circulation by oceanic currents, and particularly by the north equatorial current, which enters the sea from the southeast. There is also a marked current in the northern part, which passes through the Yucatan Channel into the Gulf of Mexico. The Caribbean Sea receives the drainage of a great portion of Central America, but of only an inconsiderable portion of South America, as the Andean Cordillera of Colombia and Venezuela turns the drainage of these countries towards the Orinoco, which enters the Atlantic. The islands of the Caribbean are grouped along the South American coast and along the bank from Jamaica to Honduras. They are small and unimportant. With the opening of the Panama Canal the Caribbean Sea comes into new prominence. The points available for naval strategy are the following: the naval base which the United States occupies at Guantanamo Bay, Cuba; the British base of Bermuda, with Jamaica as a secondary station, which has been restored to the active line; the Danish West Indies, at present unoccupied, but offered twice to the United States and regarded as within the sphere of American influence. The Caribbean has become the object of popular winter voyages from New York.

CAR'IBBEE BARK. See EXOSTEMMA.

CAR'IBBEE ISLANDS. A name sometimes given to the Lesser Antilles. See ANTILLES.

CARIBE, ká-ré'bã (Sp., Portug., from West Indian *carib*, valiant man). Any of several voracious serrasalmonine fresh-water fishes of South America, often of strange form and dis-

tinguished by having the belly serrated with sharp spines. The best known is the piraya (*Serrasalmo piraya*). Gunther (*Introduction to the Study of Fishes*, Edinburgh, 1880) says that though most are of small size, their voracity, fearlessness, and number render them a perfect pest in many rivers of tropical America. "In all the teeth are strong, short, sharp, sometimes lobed incisors, arranged in one or more series; by means of them they cut off a mouthful of flesh as with a pair of scissors, and any animal falling into the water where these fishes abound is immediately attacked and cut to pieces in an incredibly short time. They assail persons entering the water, inflicting dangerous wounds before the victims are able to make their escape. In some localities it is scarcely possible to catch fishes with the hook and line, as the fish hooked is . . . torn to pieces before it can be withdrawn from the water. The caribes themselves are rarely hooked, as they snap the hook or cut the line. The smell of blood is said to attract at once thousands of these fishes to the spot."

CARIBOU, kä'rī-bōō. A lake in Maine. See CHESUNCOOK LAKES.

CARIBOU, kär'ī-bōō (Canadian Fr., Amer. Indian). A French-Canadian name for the American forms of the reindeer, regarded by zoölogists as varieties of the European *Rangifer tarandus*. (See REINDEER.) Four quite distinct species exist—the common middle-sized, gray, woodland caribou (*Rangifer caribou*), the very small, gray, barren-ground caribou (*Rangifer arcticus*) with about six races, *grænlandicus*, *pearyi*, *arcticus*, *granti*, *dawsoni*, and *stonei*. Then comes the huge, black, mountain caribou (*Rangifer montanus*) with its two races, *montanus* and *osborni*, and the white Newfoundland caribou (*Rangifer terrænovæ*). The first is found throughout the forested region of northern America, where it formerly extended as far south as Connecticut, Pennsylvania, and Colorado, but since the middle of the nineteenth century extends south of Canada only in Maine and Michigan. (See Plate of DEER OF NORTH AMERICA.) This has much the same haunts as the mountain and Newfoundland animals. They range the woods and swamps and are especially numerous in Newfoundland, Labrador, and British Columbia; and in winter gather into herds of several hundred, which are able to traverse the snow upon their broad and hairy hoofs and find an abundance of food in leaves and berries (especially cranberries), lichens, etc. In the summer they move about a great deal to escape the flies and at all seasons are the principal dependence of northern tribes of Indians.

The barren-ground caribou is a smaller and paler form, with disproportionately large antlers, and occupies the open country of continental North America to an extreme distance north of the tree growth. It is named *Rangifer arcticus* and is regarded as having a better claim to independent specific rank than any other American form. It is to be found in vast herds in the desolate plains between Great Slave Lake and Hudson Bay, where it subsists upon lichens and migrates southward in the fall to the margin of the forest, returning northward each spring. The Indians and Eskimo gather about these migrations and obtain a winter's supply of meat and skins. The white caribou inhabits the coastal valleys of Greenland. Consult: Shields, *Big Game of*

North America (Chicago, 1890); Roosevelt (et al.), *The Deer Family* (New York, 1902); Grant, "The Caribou," *Seventh Annual Report, New York Zoölogical Society* (New York, 1902); Millais, *Newfoundland and its Untrodden Ways* (London, 1907); Thompson Seton, *Life Histories of Northern Animals* (New York, 1909); and especially Dugmore, *The Romance of the Newfoundland Caribou*, with remarkable photographs, by the author, of the animals in their wild state (Philadelphia, 1913).

CAR'ICA. See PAPA'W.

CARICATURE (Fr., It. *caricatura*, from ML. *caricare*, to overload, exaggerate, from Lat. *carrus*, car). A representation, descriptive or pictorial, in which the peculiarities or natural characteristics of an individual or class are exaggerated, so as to make the object ridiculous. In this article the term is used in its usual significance as applied to the plastic and graphic arts, especially the latter. The two principal kinds of caricature are moral, directed against the habits and customs of individuals and of society, and political, directed against corruption and bad government in the state. To be good, a caricature must possess real traits of the original, exaggerated in a ridiculous sense, but easy to recognize. The artist should have a good sense of form, a ready pencil, and keen observation. To this must be added a considerable knowledge of human nature and of the influences of the passions, habits of life, and modes of thought upon mankind. As caricature does not enter into very high and serious art, neither should the medium or method employed be too dignified or heavy. The use of oil colors might be out of place here, and a certain inattention to studied and accurate drawing is permissible. The touch should be light and skillful, and the medium best employed is perhaps pen or pencil. Caricature probably is as old as man's ability to express himself in the graphic arts. It is said to have existed in Assyria, and certain grotesque figures in the Egyptian papyri are probably caricatures. Though averse to distorting the human figure, the Greeks caricatured their gods and heroes. On a Greek vase "Apollo Arriving at Delphi" is represented as a charlatan of the Greek theatre, and on another, Achilles, intoxicated, is borne on the shoulders of Ajax. We know from the statements of Horace and Cicero that caricature was common in Rome. A fresco found at Gragnano represents Æneas, his father and his son, with dogs' heads and otherwise caricatured. Another like the preceding in the Museo Gregoriano, Rome, represents a philosopher as a pygmy preaching to a fox. Some of the designs called "graffiti," found at Herculaneum and Pompeii, are caricatures. Such a design, found near the Palatine Hill, Rome, represents "Christ on the Cross," with an ass's head, adored by a believer, with the inscription, "Alexamenus, adore thy God."

The grotesque was a marked feature of the art of the Middle Ages, especially during the Gothic period. Caricatures abounded in the illuminations of manuscripts and in the thousands of statues which ornamented the church portals. Satan, Death, and unpopular personages were much satirized, but the Church was by no means spared, the monks receiving an unusual share. The "Dance of Death" (q.v.) was a caricature, on a large scale, of Death dominating all classes of society.

The painters of the Renaissance frequently

made use of caricatures. Those of Leonardo da Vinci, most wonderful drawings, were purely artistic, and without reference to morals or politics. Annibale Carracci used caricature as a weapon against the Naturalists when, in his picture of the Naples Museum, he portrayed Caravaggio, his great rival, as a dwarf with monkeys and parrot. The school of the Carracci produced a number of good caricaturists. Other distinguished Italians of the seventeenth century were Bacio del Bianco in Florence, and Pietro Bellotti in Venice; of the eighteenth century, the Roman artist Pierleone Ghezzi. In Germany, Hans Holbein's "Dance of Death" and his illustrations of Erasmus' *Praise of Folly* were caricatures of the highest artistic order, and Lucas Cranach's prints ridiculing the Pope and Catholicism were of the widest influence. The pictures of Brouwer, Teniers, and Ostade, though high works of art, are real caricatures of peasant life.

The invention of the printing press gave to caricature a new power, but it was hindered from using this power by the lack of freedom of the press. In France, each party made use of caricature during the wars of the Reformation, and the well-known "Songes Drôlatiques," attributed to Rabelais, ridiculed both parties. A really great caricaturist of the seventeenth century was Callot, but he devoted himself to satirizing general types. In his famous prints, the "Miseries of War," he may be said to have founded the modern school of ironical genre. Under Louis XIII and his successor, caricature was active, especially at the close of the reign of Louis XIV, who was much annoyed by the Dutch artist Romain de Hoghe, a pupil of Callot, in the service of William of Orange. The caricaturists lashed, with a merciless hand, the immoralities of Louis XV, and the clerical régime. During the Revolution caricature became a means of political propaganda and was especially used by the Republicans. Each event of the Revolution was lauded or attacked, the King and Queen being especially noticed. Napoleon I confined caricature to manners and customs, but the English lampooned him all the more for the repression in France. After the Restoration the returned aristocracy and the clerical tendencies of the kings formed excellent butts of ridicule, even such artists as Delacroix and Decamps taking part. The Revolution of 1830 brought greater liberty of the press and, aided by the invention of lithography, caricature flourished as never before. In that year Charles Philippon founded *La Caricature*, which was followed by *Charivari* and the *Journal pour Rire*. Louis Philippe was the most caricatured of all French monarchs, his pear-shaped head forming a peculiarly tempting butt of ridicule. A brilliant group of caricaturists arose, who were of great importance in the history of art and did much to bring art back from classicism to real life. Honoré Daumier, in particular, lashed the Chamber of Deputies, the peers, and the kings, as he afterward ridiculed Napoleon III. Among other artists were Carle Vernet, Gavarni, Henri Monnier, and Cham, probably the most important group of caricaturists the world has seen. Under Napoleon political caricature was confined to external politics, but the third republic brought liberty and saw the development of such talents as Grévin, Willette, Caran d'Ache, Pille, Boutet de Monvel, Forain, Hermann Paul, and others.

In England both Puritan and Cavalier made frequent use of caricature in their great struggle, but the artists were mainly foreign, especially Dutch. For under the free government of Holland political caricature flourished in the seventeenth and early eighteenth centuries as nowhere else in Europe. The first great English caricaturist was Hogarth (1697-1764), who satirized social vice with realism and force. Political caricature was rife with the ministry of Walpole in 1721, but the artists were mainly foreign. In the latter half of the century an important group of native artists arose, chief among whom were James Gillray and Thomas Rowlandson. They reflected political sentiments in the minutest manner, and are, in fact, a valuable source of history for the period. Their work is, however, rather coarse, in comparison with that of the present. Chief among the artists of the early half of the nineteenth century were George Cruikshank, for "moral comedies," and the brothers John and Richard Doyle for political caricature. In 1841 was founded *Punch, or the London Charivari*, in which the more refined modern caricature of Leech and Tenniel flourished. The most important of its contributors was Du Maurier, the refined portrayer of English aristocratic society. Mention should also be made of Phil May and of Harry Furniss, E. D. Reed, and Sir F. C. Gould among more recent cartoonists.

In Germany political caricature began with the Congress of Vienna, but was restrained by the lack of freedom of the press. The *Fliegende Blätter*, a humorous but nonpolitical journal, was founded in Munich in 1844. It employed such artists as Harburger, Oberländer, and Megendorfer, and the standard of work in its pages is very high. With the Revolution of 1848 the Berlin *Kladderadatsch* began its activity, and soon became famous by its political caricatures. Those on Bismarck, by Wilhelm Scholz, have become historic. The *Düsseldorfer Monatshefte* was carried on by artists of the Düsseldorf school. Vienna has a number of comic journals, chief among which are *Kikeriki* and the *Figaro*, for which Wilhelm Busch and Schliessmann have done good work. More recent publications are the *Jugend*, to which Thöny, Pankok, Dietz, Fidus, and Wilke are contributors, and *Simplicissimus*, both originally printed in Munich. On account of its extremely radical tendencies the latter is now published in Zurich. It is well known through the drawings of Paul, T. T. Heine, and Thöny. The principal comic publications of Berlin are the *Narrenschiff* ('Ship of Fools'), with Hans Baluschek as most important contributor, and *Lüstige Blätter*.

The greatest Spanish caricaturist was Goya (1746-1828), whose masterly satirical talent, in both painting and print, was directed against the foibles and vices of society. Political caricature exists in nearly all European countries, and it has become a mighty force in politics. The American revolution called forth a host of caricatures in England and on the Continent, and in the Colonies the engravers Paul Revere and Benjamin Franklin, among others, published political cartoons. The War of 1812 gave occasion for the satirical prints of William Charles and Doolittle; but it was the Civil War that developed the full power of caricature in the United States, beginning with the *Currier* and *Ives* lithographs and culminating later in the brilliant series of cartoons in which Thomas

Nast satirized the Canal ring and the Tweed ring in New York. Nast's best work was done for *Harper's Weekly*, in which he was succeeded by Bush. *Puck*, the first comic weekly paper in the United States, was established in 1876 by Joseph Keppler, a German, who was its chief caricaturist. Its rival, *Judge*, was founded in 1877. Among their most important contributors were F. B. Opper, Zimmerman, Gillam, Mortimer Flagg, and J. H. S. Smith. *Life*, devoted especially to social caricature, was established in 1883. Its most important contributor was Charles Dana Gibson, whose inimitable representations of American girlhood and womanhood and characterization of American society are world famous. Mention should also be made of Oliver Herford, James Swinnerton, and A. B. Frost. Of late years the daily newspapers have made increasing use of caricature. Supplements devoted to caricatures accompany the Sunday papers, and nearly all prominent journals issue daily political cartoons. Among recent American caricaturists are T. E. Powers, R. F. Outcault, Homer Davenport, John T. McCutcheon, Louis Dalrymple, Carl Schultze, Kate Carew, A. B. Frost, and C. Nelan.

Bibliography. The chief authority on caricature is Champfleury, *Histoire générale de la caricature* (5 vols., Paris, 1865-80), with supplementary volume in 1885. See also Wright, *History of Caricature and Grotesque in Literature and in Art* (London, 1875); Parton, *Caricature and Other Comic Art* (New York, 1887); Everitt, *English Caricaturists of the Nineteenth Century* (London, 1886); the works of Grand Carteret; Bayard, *La caricature et les caricaturistes* (Paris, 1900); Hermann, *Die deutsche Karikatur im Neunzehnten Jahrhundert* (Bielefeld, 1901); Brinton, *The Eighteenth Century in English Caricature* (New York, 1905); Gould, *Political Caricatures, 1905* (London, 1905); Wright, *Art of Caricature* (New York, 1904); Maurice and Cooper, *History of the Nineteenth Century in Caricature* (New York, 1905). See also the articles on the principal caricaturists in the text.

CARIES, kār'ī-ēz (Lat., rottenness). A disease of bone analogous to the ulceration of soft tissues. It is characterized by a gradual loss of substance, suppuration occurring, and the bone breaking down and coming away in granular detritus. This finds its way to the surface, and an opening occurs through which the purulent fluid discharges. Caries may attack any bone, but it usually selects the vertebræ, bones of the wrist and foot, and the articular ends of long bones. The ossicles of the middle ear and the temporal bone are often the seat of caries. In spinal caries the disintegrating process attacks the cartilaginous disks between the vertebræ as well as the bone. The various vertebræ yield under the weight of the trunk, and the spine curves forward or to one side. Frequently the pus and detritus find their way to a point in the groin, passing down between the sheaths of various muscles, before opening at the surface and discharging. When caries attacks the joint ends of bones, the part enlarges, the cartilages become affected, pus forms, and amputation of the limb or excision of the joint is frequently necessary to save the patient's life. The common causes of caries are injuries, infected wounds, tuberculosis, and syphilis. If affecting a small bone, the latter may be entirely removed; and if limited to articular extremities, these

may be excised. The extent and severity of the process may now be accurately determined by X-ray photographs. Constitutional treatment to improve assimilation and nutrition and combat any accompanying cachexia must be employed. See NECROSIS; POTT'S DISEASE.

Caries of the Teeth. This depends either on an original faulty formation of the substance of the teeth, or microbic infection, generally due to neglect. The carious portions should in all cases be removed, and replaced by gold, platinum, porcelain, or other filling. If the pulp be exposed and pain be present, the cavity may be filled with cotton wet with oil of cloves, tincture of capsicum, or a strong solution of cocaine, or chloroform, for temporary relief. Ten grains of tannin and five grains of gum mastic dissolved in a dram of ether, applied after the cavity is wiped dry, will often control pain for many hours.

CARIGARA, kā'rê-gä'rá. A town of Leyte, Philippines, 21 miles west-northwest of Tacloban (Map: Philippine Islands, E 5). It is situated on a bayou on the north coast of the island and is a landing place for steamers from Manila. Pop., 1903, 16,382.

CARIGNANO, kā'rê-nyä'nô. A city in the Province of Turin, north Italy, in a fertile but damp locality on the left bank of the Po, 11 miles south of Turin. The church of San Giovanni Battista is the work of Benedetto Alfieri. The church of Santa Maria delle Grazie contains a monument to Bianca Palæologus, wife of Duke Charles I of Savoy. After the death of Prince Ludovico of Acaia in 1418, Carignano fell to the dukes of Savoy and was given by Charles Emmanuel I as a principality to his youngest son Tommaso, who was an ancestor of the present King of Italy. The principal occupations of the people of Carignano are the culture and manufacture of silk. Pop., 1901 (commune), 7129; 1911, 7034.

CARILIS. See CAGLIARI.

CAR'ILLON, Fr. pron. kā'rê'yôn'. See CHIMES.

CARIMATA, kā'rê-mä'tà, or **KARIMATA**. A name applied to the strait between Borneo and Billiton in the Dutch East Indies; also to a cluster of isles in the same passage; and lastly to the principal member of the group, whose highest point, a peak of 2000 feet, is in lat. 1° 36' S. and long. 108° 54' E. (Map: East Indies, C 5).

CAR'INA'TÆ (Neo-Lat., nom. pl. of Lat. *carinatus*, keel-shaped, from *carina*, keel). One of the two great subclasses of living birds, the other being Ratitæ, distinguished by the presence of a more or less well-developed "keel" on the sternum. Associated with this character is the condition of the wings, which are well formed and almost always fitted for flight. The Carinata include more than 14,000 known species of birds. See BIRD.

CARINI, kā-rē'nê. A city in the Province of Palermo, Sicily, situated on a steep hill, 4 miles from the sea, in a country rich in corn and wine, 17 miles west of Palermo (Map: Italy, H 9). The castle was built by the Chiamonti, in the fourteenth century. In the vicinity are caves in which animal fossils are found. The Sicilian Revolutionists were defeated here, April 18, 1860, by the Bourbon troops. North of the town was the ancient Hyccara, from which the Athenians carried off the 12-year-old Laïs, who grew up to be so famous a courtesan. Pop.,

1881 (commune), 12,037; 1901, 13,931; 1911, 13,586.

CARIN'THIA (Ger. *Kärnten*, from the Celtic tribe of *Carni*). A crownland and duchy of Austria-Hungary, bounded by Salzburg and Styria on the north, Styria on the east, Italy, Görz and Gradisca, and Carniola on the south, and Tirol on the west (Map: Austria, C 3). Its area is 3989 square miles.

Carinthia is a very mountainous country. Its northern part is traversed from west to east by a portion of the Hohe Tauern and the Styrian Alps, while its eastern end is covered by other Alpine ranges. South of the Drave rise the Carnic Alps and the Karawanken, a continuation of the former chain. In the interior there is the important valley of the Drave, which separates the two mountain systems of the north and south. There are a number of large and very attractive lakes; among them are the Wörther, Millstätter, and the Weissen. There are also some valuable mineral springs. The climate is not unlike that of Tirol, and cretinism is frequent.

Industries. Owing to its mountainous surface, only 14 per cent of the land of Carinthia is adapted for tillage, the larger part of the productive land being covered with forests or used for pasture. Large quantities of timber are floated down the Drave. Nearly all the surface of the country has been made remunerative. Rye, oats, wheat, buckwheat, and clover hay are leading crops. The raising of live stock is carried on extensively in the mountain ranges, and the horses of Carinthia are highly valued. The mountains are rich in minerals, especially lead, of which Carinthia is considered one of the chief producers in Europe. In 1910 there were mined 53,389 tons of iron, 18,368 tons of lead, 32,105 tons of zinc, and 132,143 tons of coal. The total value of the products of mine and forge amounted to \$2,014,600. The chief manufacturing industry is the production of iron and steel goods. Bessemer steel rails, wire, wire nails, and bar iron are produced in great quantities. Some machinery, firearms, textiles, leather goods, cement, and wood pulp are exported. Considering the configuration of its surface, Carinthia is well provided with roads; also waterways, among which the most important is the Drave. Klagenfurt is the centre of the railway lines, of which there are about 385 miles, or 1.01 per cent of the total mileage of Austria.

Government. The Diet of Carinthia consists of 37 members, consisting of the Prince-Bishop of Gurk, 10 representatives of the landed aristocracy, 9 representatives of the towns, 3 representatives of the chambers of commerce and industry of Klagenfurt, and 14 representatives of the rural communities. In the Lower House of the Austrian Reichsrat Carinthia is represented by 9 members. For administrative purposes, Carinthia is divided into 7 counties and the city of Klagenfurt. There are nearly 400 elementary schools, with a total attendance of about 60,000, constituting over 91 per cent of the total school population.

The population of Carinthia in 1900 was 367,344. In 1910 it was 396,200. About 72 per cent of the people are Germans, and 28 per cent Slovenes near the Carniola border. Ninety-five per cent belong to the Roman Catholic church, while the remainder are Protestants. The capital, Klagenfurt (q.v.), has a population, 1910, of 24,284.

History. Under the Roman Empire Carinthia formed part of the Province of Noricum. Its ancient inhabitants were the Carni, a Celtic people, who during the period of the migrations were overwhelmed by a race of Slavs. The Kingdom of Carentania, which the invaders founded under the leadership of Samo, an energetic Frank, proved of short duration, and the region was annexed by Charlemagne to the Frankish Empire. In 843 it passed to Louis the German, and was ruled for 500 years by dukes of different lines, until it came into the possession of the archdukes of Austria in 1335. Upper Carinthia was held by the French from 1809 to 1813.

Consult: Ankershofen, *Geschichte des Herzogtums Kärnten* (Klagenfurt, 1850); Schlechter, *Alte Geschichte des Obergailthales in Kärnten* (Vienna, 1885); *Kärnten und Krain* (ib., 1891); Aelschker, *Geschichte Kärntens* (Klagenfurt, 1885).

CARINUS, MARCUS AURELIUS (?-285). Emperor of Rome from 283 to 284, son of the Emperor Carus. Made Cæsar (heir presumptive) in 282, with his brother, Numerianus, he was associated in the Empire in August, 283, and reigned alone after the murder of his father. When Diocletian seized the chief power in Mæsia, Carinus marched against him, but was killed by his own soldiers.

CARIPE, kâ-rê'pâ. A town of Venezuela, situated in a fertile valley of the same name, 50 miles southeast of Cumaná. It contains an old church formerly belonging to the Capuchin monastery, since ruined. The valley is noted for a cavern (2800 feet from front to back and from 70 to 80 feet high) inhabited by the remarkable bird called guacharo (q.v.), from which it received its name: Cueva del Guácharo. Pop. of town and valley, about 5000.

CARIRI, kâ-rê-rê', or KIRIRI. A former powerful tribe residing on São Francisco River, in the Province of Bahía, eastern Brazil. They were "Christianized" in 1650, and, at the end of the century, were recorded as living in the region of Cochoeira (modern Caraquejo and Villa da Pedra Branca) and in the old missions of Canabrava, Saco, Natuva, and Yuru. With the Cariri belonged the Sabujá to the south. They were one of the most progressive of the Brazilian tribes, cultivating the ground and excelling in weaving. In 1699 the Jesuit Mamiani published a grammar of their language, which constitutes a distinct stock. They are now reduced to less than 500 souls dwelling in the valley of the lower São Francisco. Consult Adam, *Matériaux pour servir à l'établissement d'un grammaire comparé des dialectes de la famille Kariri* (Paris, 1897), and Chamberlain, in *Science*, N. S., vol. xxxvii, p. 344 (1913).

CARISBROOKE, kâr'is-bruk. A village in the Isle of Wight, adjoining Newport (Map: England, E 6), which was formerly the "new port" of Carisbrooke. It is chiefly noted for its castle, which is supposed to have been built by the Saxons. It was enlarged in the eleventh century by the first Lord of Wight, was captured by Stephen in 1136, and in the time of Richard II successfully resisted attacks by the French. During the reign of Elizabeth it was enlarged and the present outer works added. It was in this castle that Charles I took refuge in November, 1647, and was imprisoned for 14 months. After his execution his two youngest children were confined in the castle, and Princess Elizabeth died there, 19 months later. The re-

mains of the castle are still extensive. Near by are the ruins of a Cistercian priory founded in the twelfth century and vestiges of a Roman villa. The population of Carisbrooke is about 8300. Consult Beattie, "Carisbrooke Castle and its Ancient Lords," in *British Archæological Journal*, vol. x (London, 1855).

CARISSIMI, kâ-rês'sê-mê, GIACOMO (c.1604-74). An Italian church composer. He was born at Marino, where he acquired his first knowledge of music. In 1624-28 he was kapellmeister at Assisi, and from that time until his death at the church of St. Apollinaris in Rome. His works mark a turning point from the polyphonic style of the Palestrina school to the monodic style of the founders of opera. In his search for expression he produced a freer recitative that fitted the accents of ordinary speech, and he gave prominence to the instrumental accompaniment. He was the creator of the chamber cantata and added an instrumental accompaniment to the motet. His style is more animated and graceful than that of his predecessors. His numerous compositions included cantatas, oratorios, masses, motets, and even music of a comic character. The greater part of them has perished, but enough has been preserved in various libraries (chiefly in manuscript) to entitle Carissimi to a rank among the most important figures in the history of the oratorio. Among his published works were the following: "Jephthah," "Judicium Salomonis," "Baltazar," "Jonas," in vol. ii of Chrysander's *Denkmäler der Tonkunst* (1856); motets (1664 and 1667); masses (1663 and 1667); *Arie da camera* (1667); and *Ars Cantandi* (3d ed., 1696). As a teacher Carissimi was greatly esteemed, Alessandro Scarlatti, Buononcini, Cesti, Kerll, Krieger, and Charpentier being the most noted of his pupils.

CARITAT. See CONDORCET.

CARL, PHILIPP (1837-91). A German astronomer and physicist, born at Neustadt, Middle Franconia. He studied the exact sciences in Munich and spent several years in astrophysical researches at the observatory of that city. In 1865 he established, and for several years thereafter directed, a workshop for the manufacture of mathematical instruments. In that year he established also the *Repertorium für Experimentalphysik*, which he edited until 1882. His published works include: *Die Principien der astronomischen Instrumentenkunde* (1863) and *Repertorium der Kometenastronomie* (1864).

CARL, WILLIAM CRANE (1865-). An American organist, born at Bloomfield, N. J. He studied music under Samuel P. Warren and Madeline Schiller in New York, and under Alexandre Guilmant in Paris. He made several organ tours in Europe and the United States and one to Alaska. For five seasons he was director of the Baton Club and for two seasons of the Gamut Club. He became director of the Guilmant Organ School of New York, and also organist and musical director of the Old First Presbyterian Church, where he frequently gave organ recitals. His publications include: *Several Songs and Organ Arrangements* (1892); *Masterpieces for the Organ* (1898); *Thirty Postludes for the Organ* (1900).

CARLÉN, kâr-lân', EMILIA SMITH FLYGARE (1807-92). A Swedish novelist, noted for her stories of seafaring folk, fishermen, and smugglers, with whom as a child she had come in frequent contact, through the trading voyages

of her father, Rutger Smith. She was born at Strömstad and married, at the age of 20, the physician A. Flygare. After his death, in 1833, she decided to devote herself to literature. Her first novel, *Waldemar Klein* (1838), was followed by her marriage (1841) to Johan Gabriel Carlén, a lawyer and poet of Stockholm. Popular tales followed in rapid succession until 1852, when she lost a son and wrote no more until 1858. With her husband's death in 1875 her literary activity ceased altogether, although until that time her salon had been the literary centre of the capital. She founded charitable endowments in aid of students and of teachers, and of fishermen and their widows. Of her works (30 vols.), many are translated into German, French, and English. Characteristic are *Gustav Lindorm* (1839), *The Rose of Tistelön* (1842), and *The Maiden's Tower* (1848), all translated into English. She wrote, also, a bright autobiography, *Reminiscences of Swedish Literary Life* (1878). Consult Svanberg, *E. F. Carlén; en studie* (Stockholm, 1912), and Schoeldstroem, *E. F. Carlén* (ib., 1888).

CARLES, kâr'lâs, or **CARLOS**. A town of Panay, Philippines, District of Concepción, Province of Iloilo, situated at the northeast extremity of the island, 25 miles north of Concepción. Pop., 1903, 6676.

CARLETON, kârl'ton, BUKK G. (1856-1914). An American surgeon, born at Whitefield, N. H. He was educated at the New York Homœopathic Medical College and in the medical department of the University of the City of New York. In 1876 he joined the house staff, was pathologist in 1877, visiting physician in 1881, and genito-urinary surgeon in 1895 at the Homœopathic and Metropolitan hospitals. In addition he served as demonstrator in anatomy in 1879-80, adjunct professor of anatomy in 1880-82, professor of genito-urinary surgery in 1902-10, and of medical ethics and clinical urology after 1910, in the New York Homœopathic Medical College. His publications include: *Genito-Urinary and Venereal Diseases* (1895); *Medical and Surgical Diseases of the Kidneys and Ureters* (1898); *Sexual Disorders of Men* (2d ed., 1899); *Uropoietic Diseases* (3d ed., 1902); *Classified Index of Homœopathic Materia Medica for Urogenital Diseases* (1903); *Urological and Venereal Diseases* (1905).

CARLETON, kârl'ton, SIR GUY, first LORD DORCHESTER (1724-1808). A British soldier and administrator, born in county Tyrone, Ireland. He served at Louisburg, Quebec, and Belle Isle, and was wounded in the siege of Havana in 1762. In 1766 he was appointed Lieutenant Governor, and in 1775 Governor of Quebec. Soon afterward he took command of the British forces in Canada, repelled the attack of Montgomery and Benedict Arnold in 1775-76, defeated Arnold on Lake Champlain, and captured Crown Point (1776). For these services he was made Knight of the Bath and lieutenant general. In 1777 he was superseded by Burgoyne. In 1782 he succeeded Sir Henry Clinton as commander in chief in America. Carleton remained in New York until the treaty of peace had been signed. On his return home he was granted a pension of £1000 a year and was created Baron Dorchester. In 1786 he again became Governor of Quebec and was very popular as an administrator of that province. He objected to the division (1791) into the provinces of Upper and Lower Canada. He returned to

England in 1796. See the biography by A. G. Bradley in *Makers of Canada Series*.

CARLETON, HENRY GUY (1856-1910). An American journalist and dramatist. He is best known as a playwright, and among his principal dramas are *The Pembertons* (1889), *Victor Durand* (1885), *The Gilded Fool* (1892), and *Ambition* (1896). His tragedy *Memnon* (1881; never produced) is a play of great strength and contains many lines of exceptional beauty.

CARLETON, JAMES HENRY (1814-73). An American soldier, born in Maine. He was a volunteer in the Aroostook War over the disputed northeastern frontier of the United States (1838-39); then entered the regular army; was with Kearny's expedition to the Rocky Mountains (1846), and served on the staff of General Wool in Mexico, distinguishing himself at Buena Vista, where he was brevetted major. He was the organizer and commander of the "California Column" of troops, which in the spring of 1862 undertook the march across the Yuma and Gila deserts to the Rio Grande. In April of that year he was commissioned brigadier general of volunteers, with orders to relieve General Canby as commander of the Department of New Mexico. In recognition of his services there, he was at the close of the war raised by brevet through all ranks in the regular army up to that of major general. He wrote *The Battle of Buena Vista, with the Operations of the Army of Occupation for One Month* (1848).

CARLETON, MARK ALFRED (1866-). An American cerealist, born at Jerusalem, Ohio, and educated at the Kansas Agricultural College. He became cerealist in the United States Department of Agriculture in 1894, conducted agricultural investigations for the United States in Russia and Siberia in 1898-99, and introduced several new cereal grain crops from abroad, including the durum wheat. This grain rapidly displaced the soft spring wheat varieties, especially in Nebraska, Kansas, Oklahoma, and Texas, and soon reached an annual yield valued at \$40,000,000. Carleton was chairman of the jury of awards at the St. Louis Exposition in 1904. His publications include the following bulletins of the United States Department of Agriculture: *Cereal Rusts of the United States* (1899); *The Basis for the Improvement of American Wheats* (1900); *The Commercial Status of Durum Wheat* (1904); *Barley Culture* (1908); *Ten Years' Experience with Swedish Select Oat* (1910); *Winter Emmer* (1911).

CARLETON, WILL (1845-1912). An American poet, noted for his ballads of domestic life, which have been very popular. He was born at Hudson, Mich., Oct. 21, 1845. Soon after his graduation at Hillsdale, in 1869, he traveled widely as a lecturer in the Northern and Western States, Great Britain, and Canada. His first *Poems* appeared in 1871. These were followed by *Farm Ballads* (1873); *Farm Legends* (1876); *Young Folk's Centennial Rhymes* (1876); *Farm Festivals* (1881); *City Ballads* (1885); *City Festivals* (1892); *Rhymes of our Planet* (1895); *Songs of Two Centuries* (1902); *Poems for Young Americans* (1906); *Drifted In* (1908); *A Thousand Thoughts* (1908). He was also for a time editor of *Everywhere*, an illustrated magazine.

CARLETON, WILLIAM (1798-1869). The best of Irish novelists of Irish life, born at Prillisk, Ireland. Bred and educated, or half educated, among the peasantry, he passed

through the common sufferings and privations of Irish poverty. After receiving some scanty instruction in hedge schools, a longing to see the world seized him, and he made his way to Dublin, where he continued the necessitous life from which to the end of his days he escaped only at intervals. He soon began writing, for a Dublin periodical, sketches of Irish life, wonderful in their faithful presentation of the manners and customs, the tricky humor, the tragedies, and the pure and delicate sentiment of the class from which he sprung. Some of these he published in 1830, under the title of *Traits and Stories of the Irish Peasantry*. The book pleased the public and won the favor of critics. The year 1833 saw the publication of a second series of the *Traits and Stories*, which was also well received. In 1839 he published *Fardarougha, the Miser*, his first attempt at a long novel of Irish manners. This was followed by a volume of *Tales* (1841), predominantly tragic or pathetic. In 1845 appeared *Valentine M'Clutchy*, a powerful novel attacking that prime curse of Irish life, the middleman, and showing up the bigotries and barbarities of the worst of the Orangemen. Other narratives, notably *Rody, the Rover* (1845), *The Black Prophet* (1847), and *The Tithe Proctor* (1849), contain ample evidence of the author's gifts as a novelist—his sustained narrative interest and his rare faculty for making vivid, realistic transcripts of Ireland as he knew it. His *Willie Reilly* was published in 1855, and the *Evil Eye* in 1860. Carleton is, before all others, the historian in fiction of the Celtic-Irish people. Sharing their qualities of mind and temperament and their peculiar defects, he had genuine sympathy with all their joys and sorrows, and the graphic pen to describe them. Carleton's stories are still fresh and absorbing, and his work is less read and known than it deserves to be. D. J. O'Donoghue's *Life of Carleton* (1896) contains, besides the biography, a full bibliography. The best edition of *Traits and Stories* is that of O'Donoghue (New York and London, 1896). American and English editions of most of his works are still in print. Consult *Representative Irish Tales* (New York and London, 1894), ed. by W. B. Yeats; and H. S. Krams, *Irish Life in Irish Fiction* (New York and London, 1903), which includes a critical estimate and a bibliography.

CARLETON COLLEGE. An undenominational institution of higher learning, founded in 1866 at Northfield, Minn., under the auspices of the Congregational denomination. It received its name from William Carleton, of Charlestown, Mass., who gave it \$50,000. The campus and grounds of the college include over 120 acres, and its property is valued at about \$600,000. It has well-equipped chemical, physical, and biological laboratories and an efficient astronomical department. The endowment of the college in 1913 amounted to over a million dollars. The library contained in that year about 30,000 volumes. The college faculty numbered 30 and the conservatory faculty 4. In the regular college department were 398 students and in the conservatory of music 27. The president is Donald J. Cowling, D.D.

CARLETON PLACE. A town in Lanark Co., Ontario, Canada, on the (Canadian) Mississippi River and the Canadian Pacific Railroad, 28 miles southwest of Ottawa (Map: Ontario, H 2). Carleton Place is a division point of the

Canadian Pacific, with railway shops, and manufactures foundry products, woolen goods, launches, and lumber products. Pop., 1901, 4059; 1911, 4435.

CARLI, kăr'lê, or **CARLI-RUBBI**, GIOVANNI RINALDO, COUNT (1720-95). An Italian economist and antiquarian, born at Capo d'Istria. In 1743 the Senate of Venice appointed him professor of astronomy and navigation there. In 1753 he was appointed president of the newly established Council of Commerce in Milan. Soon afterward he published the first volume of his celebrated work on the coins of Italy, under the title *Delle monete e dell' istituzione delle zeche d'Italia* (3 vols., 1754-60). He wrote a pamphlet favoring a protective tariff, and a work entitled *Delle antichità italiane* (5 vols., 1788-91). His complete works appeared in 18 vols. (1784-94).

CARLILE, RICHARD (1790-1843). An English freethinker, born at Ashburton. He was apprentice in a chemist's shop, worked as a journeyman tinman, and, through the reading of Paine's *Rights of Man*, became a Radical. He peddled in London a weekly called the *Black Dwarf*, printed and disposed of 25,000 copies of Southey's *Wat Tyler*, reprinted the *Parodies* of William Horne, and wrote, in imitation of them, *The Political Litany* (1817); for this he spent 18 weeks in the King's Bench Prison. For publishing Paine's works (1818) and others of like character, in 1819 he was condemned to pay £1500 and was imprisoned in Dorchester jail for three years. Here he published the first 12 volumes of his periodical, *The Republican* (1819-26). A public subscription of £6000 was raised for the prosecution of his assistants, and his imprisonment was increased by three years, in lieu of the fines. Upon his release he edited a weekly, *The Gorgon*, and conducted public discussions in the Rotunda, Blackfriars Road. Subsequently he suffered something more than three years of additional imprisonment for not paying church rates. He did more than any other Englishman of his time for the freedom of the press.

CAR'LIN (probably dim. of *carl*, AS. *carl*, Icel. OHG. *karl*, Ger. *Kerl*, fellow, Eng. *churl*, otherwise explained as a corruption of Fr. *harlequin*, It. *arlequino*, harlequin). An inferior variety of pug dog. See PUG.

CAR'LINES, or **CAR'LINGS** (Fr. *earlingue*, Russ. *karlinsü*). In shipbuilding, small beams laid fore and aft and resting upon the main or deck beams. These, with other pieces called *ledges*, laid at right angles to them, form a framework by which the deck is supported.

CAR'LING, SIR JOHN (1828-1911). A Canadian capitalist and statesman. He was born in Middlesex Co., Ontario, was educated at the local schools, and removed to London (Ontario) in 1839. At an early age he joined his father in the brewing and malting business, and also was interested in municipal politics and educational affairs, serving as school trustee and alderman. In 1857 he was elected Conservative member for London in the Legislative Assembly of Canada. After Confederation in 1867, he represented London in both the House of Commons and the Ontario Legislature, resigning his seat in the latter in 1872 when dual representation was abolished. In the Cartier-Macdonald government he was Receiver-General in 1862, and in the first Ontario government, of which John Sandfield Macdonald (q.v.) was Premier,

Carling was in 1867-71 Commissioner of Agriculture and Public Works. In the Dominion administration of Sir John A. Macdonald he was Postmaster-General from 1882 to 1885, when he was appointed Minister of Agriculture. This office he held until Macdonald's death in 1891, during the administration of Sir J. J. C. Abbott (q.v.), and also during part of the administration of Sir John D. S. Thompson (q.v.). Carling was appointed to the Senate in 1891, but resigned in 1892, and was reappointed in 1896. In 1893 he was knighted. As Commissioner of Agriculture in 1867-71 he was largely instrumental in establishing provincial government instruction in and aid to agriculture, and later, as Dominion Minister of Agriculture, in establishing the system of government experimental farms for Canada.

CAR'LINGFORD, CHICHESTER SAMUEL FORTESCUE, BARON (1823-98). A British statesman, born in county Louth, Ireland. He graduated at Christ Church, Oxford, and from 1847 to 1874 sat in Parliament for county Louth. He became a member of the Privy Council in 1864, and Chief Secretary for Ireland, succeeding Sir Robert Peel in 1865. This secretaryship he held again in 1868-70 under Gladstone, and in the preparation of the Land Bill of 1870 he rendered invaluable assistance. He became President of the Board of Trade in 1871, Lord Privy Seal in 1881, and in 1883 President of the Council. He rejected the Home Rule cause in 1886 and was thenceforth a Liberal Unionist. Many of Edward Lear's amusing letters were addressed to him. Consult Lady Strachey, *Lear's Letters* (2 vols., London, 1907, 1911).

CARLINI, kăr-lê'nê, FRANCESCO (1783-1862). An Italian astronomer, born in Milan. He devoted himself to the study of astronomy and during the last 30 years of his life acted as director of the astronomical observatory of Milan, the *Ephemerides* of which he edited. On Mont Blanc in 1821 he made valuable studies of the attraction of mountain masses. His published works include *Esposizione di un nuovo metodo di costruire de tavole astronomiche applicato alle tavole del sole* (1810) and *Nuove tavole dei moti apparenti del sole* (1832).

CAR'LINVILLE. A city and the county seat of Macoupin Co., Ill., 60 miles north by east of St. Louis, Mo., on the Chicago and Alton and the Illinois Traction railroads (Map: Illinois, B 4). It is the seat of Blackburn University (Presbyterian), opened in 1859, and contains a fine county courthouse. The city is an important centre for local trade, has coal-mining interests, and in the vicinity are oil and natural-gas wells. Settled in 1833, Carlinville was incorporated in 1865. The government is administered by a mayor, elected biennially, and a municipal council. Pop., 1890, 3293; 1900, 3502; 1910, 3616.

CARLI-RUBBI. See CARLI.

CARLISLE, kăr-lil' (Brit. *Caer Luel*, from *eaer*, city, and *Luel*, connected with Irish *Lug*, name of a god, OHG. *lochōn*, to lure, Lett. *lúgt*, to pray; cf. the Lat. form, probably a translation, *Luguvallum*). A parliamentary and municipal borough and an episcopal city, the capital of the County of Cumberland, England, 7 miles from Solway Firth, 300 miles north-northwest of London, 101 miles south of Edinburgh, and 60 miles west-southwest of Newcastle (Map: England, D 2). It is situated on an eminence, on the south bank of the river Eden, 8 miles

above its mouth in the Solway Firth, at its confluence with the Caldew and the Petteril. The cathedral, a red freestone structure, was founded by William Rufus, and dedicated in 1101 by Henry I; in 1133 it was made the cathedral church of the newly formed diocese. A great part of the original Norman building was destroyed by fire in 1292. Two-thirds of the fine Norman nave, originally 141 feet long, were destroyed by Cromwell; the portion that was left has long been used as a parish church. The choir is one of the finest in England, 138 feet long and 72 feet high, and consists of eight pointed arches. The east window, consisting of nine lights, is considered the finest decorated window in England. The castle was founded in 1092 and is now used as barracks; the remains of the keep form a massive lofty tower, with a very deep well. Mary, Queen of Scots, was confined in the castle after the battle of Langside. In spite of its antiquity, Carlisle is a thoroughly modern town in its appearance and facilities. Many fine new streets and buildings have been recently constructed, and the city has gradually come into possession of all the quasi-public works. It owns its water and gas works, and since 1899 has operated an electric light plant. Its markets and slaughterhouses are a profitable source of municipal revenue, and it maintains a library, a museum, and technical schools. It sends one member to Parliament, and the municipal borough is governed by a mayor, 10 aldermen, and 31 councilors. Seven railway lines enter Carlisle, which is connected by rail with the port of Silloth, 20 miles distant, where an extensive dock has been constructed on the Solway. The chief industries are the manufacture of cottons and calicoes, ironworks, tanneries, and dyeing establishments. The salmon fishing in the Eden is also of some importance. The United States has a resident consular agent. Pop., 1851, 26,310; 1891, 39,200; 1901, 45,480; 1911, 46,420. Carlisle was a Roman station, under the name of Luguwallum. It was the seat of the ancient kings of Cumbria and bore the British name of Caer Luel. It was frequently ravaged by the Picts and Scots, and about 875 it was destroyed by the Danes, after which it remained desolate for 200 years. Thence, to the union of England and Scotland, it was closely connected with the border wars and underwent many sieges. During the Civil War it declared for King Charles and suffered severely at the hands of the Parliamentarians. Carlisle, in 1745, surrendered to the Pretender. The Duke of Cumberland afterward took the city and punished the leaders with death. The Carlisle tables of mortality, based on the deaths which occurred in Carlisle, 1779-87, were drawn up by Dr. Heysham and have been ever since much used as a basis for life-insurance policies.

Consult: Creighton, *Carlisle* (London, 1889); Freeman, "Carlisle in English History," in *Archæological Journal*, vol. xxxix (ib., 1882); Marks, "Public Works in Carlisle," in *The Surveyor*, vol. xvii (ib., 1900); *Victoria History of Cumberland* (2 vols., ib., 1901-05).

CARLISLE. A borough and the county seat of Cumberland Co., Pa., 18 miles west-southwest of Harrisburg, on the Cumberland Valley and the Philadelphia and Reading railroads (Map: Pennsylvania, D 3). It is in a highly productive agricultural region, is well built, with broad streets, and has several fine public buildings. It is the seat of Dickinson College (nonsec-

tarian) (q.v.), of the United States Indian Training and Industrial School, and of the Metzger Institute for Girls, now part of Dickinson College. The industries include machine shops, chain and frog-switch works, axle factory, cotton-weaving and silk-throwster mills, body and gear works, ribbon mills, shoe factories, flour mills, hosiery, paper-box and carpet factories, etc. Mount Holly Springs, in the mountains just outside the city, is a popular summer resort. The government, as authorized by a general borough law of 1851, revised the following year, is administered by a burgess, elected for three years, and a borough council. Carlisle was laid out and settled in 1751; in 1794, during the Whisky Rebellion, the Pennsylvania and New Jersey troops assembled here; and on July 1, 1863, the borough was shelled by the Confederates. Pop., 1900, 9626; 1910, 10,303. Consult Wing, *History of Cumberland County, Pa.* (Philadelphia, 1879) and *History of Cumberland and Adams Counties, Pa.* (Chicago, 1886).

CARLISLE, GEORGE WILLIAM FREDERICK HOWARD, seventh EARL OF (1802-64). An English statesman and author. He was born in London, April 18, 1802. The eldest son of the sixth Earl, he bore the courtesy title of Lord Morpeth. He was educated at Eton and at Christ Church, Oxford, where, in 1821, he won the Chancellor's and the Newdigate prizes with a Latin and an English poem. In 1826 he was attaché to his uncle, the Duke of Devonshire, in Russia; while abroad he was elected to Parliament as a Whig, and on his return supported the repeal of the Catholic disabilities in his maiden speech on March 5, 1827. In 1830 he was elected representative for Yorkshire, and, after the Reform Bill, for the West Riding. Under Lord Melbourne, he was Chief Secretary for Ireland (1835-41), and his impartial distribution of patronage made him popular in Dublin. Rejected in 1841 by the West Riding, he was reëlected in 1846, and remained one of its representatives until his father's death (1848) seated him in the House of Lords. Under Lord John Russell's ministry (1846-52), he was Chief Commissioner of Woods and Forests and afterward Chancellor of the Duchy of Lancaster. When Lord Palmerston was made Prime Minister in 1855, Carlisle was appointed Lord Lieutenant of Ireland, a post which he held until the advent of the Earl of Derby's government in 1858. He succeeded to the same office again when Lord Palmerston was reinstated in 1859. In 1841-42 he traveled in the United States and Canada and on his return described his visit in a series of popular lectures. He obtained fame as a literary man by these lectures and by another, *The Life and Writings of Pope* (1851). He published a tragedy, *The Last of the Greeks* (1828); *A Diary in Turkish and Greek Waters* (1854); and a volume of *Poems* was issued after his death. He died at Castle Howard, Dec. 5, 1864. His *Viceregal Speeches*, ed. by J. Gaskin, appeared in 1866.

CARLISLE, JOHN GRIFFIN (1835-1910). An American lawyer and politician. He was born in Kentucky, received a common-school education, taught school, was admitted to the bar in 1858. In State politics he took a prominent part, serving as Democratic member of the Kentucky House of Representatives (1859-63), as State Senator (1868-71), and as Lieutenant Governor (1871-75), and from 1876 to 1890

he was a member of the National House of Representatives, being Speaker from 1883 to 1889. As Speaker, he showed himself an able parliamentarian and greatly extended the use of the Speaker's power of "recognition." In 1890 he was elected United States Senator. He advocated revenue reform, but favored only an approximation to the free-trade standard. He was Secretary of the Treasury during President Cleveland's second administration (1893-97), and afterward settled in New York to resume the practice of law. In 1896 he opposed Bryan and made able "sound money" speeches. He was prominent among the opponents of Imperialism.

CARLISLE COLLEGE. See INDIAN INDUSTRIAL AND TRAINING SCHOOL.

CARLISTS. The supporters of Don Carlos and his descendants in their pretensions to the Spanish crown after the death of Ferdinand VII. Their opponents who supported the Queen Regent Christina (see **MARÍA CHRISTINA**) and her daughter Isabel II were known as Cristinos and Isabelinos. See **CARLOS, DON**.

CAR'LOMAN, or KARLMANN (751-71). A king of the Franks, younger brother of Charlemagne. He was anointed in 754 by Pope Stephen III, with Charlemagne, and at the division of territory between himself and Charlemagne in 768 received Burgundy, Alsace, Provence, Alemannia, and southeastern Aquitaine, being crowned in the same year at Soissons. See **CHARLES THE GREAT**.

CARLOS, kär'lös, DON (1545-68). The son of Philip II and his first wife, María de Portugal. He was born July 8, 1545, at Valladolid. For a long while it was thought that he would be dumb, as he could not pronounce a word before he was five years of age. He was weak of constitution and physically malformed; and in addition was of unsound intellect and of a temper both vicious and untrustworthy. Opinions have differed considerably concerning the character of Don Carlos, but recent historical research has proved that he was afflicted with hereditary insanity, which was advanced to a much more violent state by his accident in falling down stairs in 1562 and fracturing his skull. His viciousness reached a climax with his disappointment at not being permitted to accompany the Duke of Alba to the Netherlands. His attempt to stab the Duke, when the latter was taking leave of him, estranged his father. The Prince's conduct grew rapidly worse. At Christmas, 1567, he talked wildly, to his half uncle Don Juan, of escaping from Spain and killing a man with whom he had quarreled. In the confession it was discovered that he meant his father. Philip was informed and had the Prince closely watched. In the middle of January, 1568, he made preparations for his escape, and, thinking Don Juan had betrayed him, he tried to kill him. That same night (January 18) Philip himself in full armor entered his son's room with guards and placed him under arrest. From that time the Prince was kept in close confinement, and for months some sort of trial or examination dragged on. It was rumored by Philip's enemies that Carlos was to be sacrificed for heresy by the Inquisition; but there is no evidence that such was the case. The Prince's madness grew rapidly worse. He attempted to kill himself in various ways. For long periods he fasted and then suddenly would eat and drink like a glutton. The French ambassador understood the situation and wrote, on

July 21, 1568, that the Prince was dying of weakness. "The King is much grieved," says the ambassador, "because if he die the world will talk." The next day the Prince died. Philip's enemies, and especially the traitor Antonio Pérez, asserted that he had been killed at the King's own orders. Authorities are now agreed that the balance of evidence shows that he died as a result of his own maniacal practices.

The traditional romantic story is preserved in works by Lord John Russell and M. J. Chénier, and in the following: C. V. de Saint-Réal, *Don Carlos, nouvelle historique* (Paris, 1672); Schiller, *Don Carlos*; Alfieri, *Philip the Second*; J. G. de Campistron, *Andronic*; Thomas Otway, *Don Carlos, Prince of Spain*; Núñez de Arce, *Haz de Leña*. For a discussion of plays on this same subject, by Ximénez de Enciso and Juan Pérez de Montalván, consult G. W. Bacon, "The Life and Dramatic Works of Doctor Juan Pérez de Montalván" (1602-38), in *Revue Hispanique*, vol. xxvi, pp. 1-474 (1912). This traditional story was challenged by Llorente, the Spanish historian of the Inquisition; but not until the appearance in 1867 of the researches of Louis P. Gachard (who had been sent to Spain in 1863 by the Belgian government) were the real facts made known. Consult: Ranke, in *Wiener Jahrbücher der Litteratur*, vol. xlvi (Vienna, 1829); L. P. Gachard, *Don Carlos et Philippe II* (Paris, 1867); Maurenbrecher, *Don Carlos* (Berlin, 1876); Prescott, *Philip II* (Boston, 1855); Hume, *Spain: Its Greatness and Decay, 1479-1788* (Cambridge, 1st ed., 1898; 2d ed., 1899; reprinted, 1905); Hume, *The Spanish People* (London, 1901).

CARLOS, DON. The name of several pretenders to the Spanish crown. **DON CARLOS MARÍA JOSÉ ISIDORO DE BORBÓN, COUNT OF MOLINA (1788-1855)**, was the second son of Charles IV of Spain and his wife Luisa María of Parma. He was educated chiefly by priests. After the expulsion of the French from Spain, his brother, Ferdinand VII, reascended the throne (1814), but as Ferdinand had married thrice without issue, Don Carlos hoped to succeed his brother. An insurrection in his interest broke out in 1823 in Catalonia, but was put down, Don Carlos himself not participating in it. Ferdinand, however, married for a fourth wife Maria Christina of Naples, who bore him a daughter, the Infanta Maria Isabella, Oct. 10, 1830. As the Salic Law, excluding females from the succession to the throne, had been abrogated on March 29 of the same year, the hopes of the Carlists were destroyed. During the illness of the King, in September, 1832, the Carlists succeeded in obtaining from him the reinstatement of the Salic Law; but this he revoked as soon as he had partially recovered. As Don Carlos still continued his protestations against its revocation, he was banished, in 1833, to Portugal, and soon afterward was commanded to reside in the Papal States. But before Carlos had embarked for Italy, King Ferdinand VII died, Sept. 29, 1833. Don Carlos was now recognized by his party as heir to the throne of Spain, and the usurper Dom Miguel of Portugal supported his claim. In 1834 a quadruple treaty was concluded between England, France, Spain, and Portugal, directed against Dom Miguel and Don Carlos, which resulted in the dethronement of Dom Miguel. In June, 1834, Don Carlos embarked for England. In the following month he

returned to the Continent, and passed in disguise through France into Spain, where he excited an insurrection in the northern provinces. The conflict raged till 1839, when the power of Don Carlos was broken by the surrender of General Maroto, and the pretender was compelled to escape into France. In 1834 he was deprived of his rights as infante by a royal decree, which was confirmed by the Cortes in 1837. In 1845 he abdicated in favor of his eldest son, and died at Triest, March 10, 1855.—DON CARLOS LUÍS FERNANDO DE BORBÓN, COUNT OF MONTEMOLÍN (1818-61), son of the preceding, succeeded to his claims and was recognized by the Carlists as Charles VI. In 1860 a Carlist insurrection was once more attempted, in which he was made a prisoner, and released only after signing a renunciation of his claims to the Spanish throne. As Charles VI died without issue (as did also his younger brother Ferdinand), his rights devolved upon his youngest brother, Don Juan, who had married the Archduchess Maria Beatrix of Austria, Princess of Modena. Their son, Don Carlos, was educated principally in Austria, and in 1867 married Margaret of Bourbon, Princess of Parma, after whose death, in 1893, he married Marie-Berthe, Princess of Rohan. In October, 1868, Don Juan, who because of his liberal views had never been popular with his party, abdicated in favor of his son, whose standard was raised by some of his partisans in the north of Spain in April, 1872.—DON CARLOS MARÍA DE LOS DOLORES JUAN ISIDORO JOSÉ FRANCISCO QUIRINO ANTONIO MIGUEL GABRIEL RAFAEL DE BORBÓN, DUKE OF MADRID (1848-1909), claimant to the throne of Spain as Don Carlos VII, published a proclamation, July 16, 1872, calling upon the people of Catalonia, Aragon, and Valencia to take up arms in his cause, promising to restore their ancient liberties, and in December his brother, Don Alfonso, assumed command of the Carlist forces in Catalonia. Don Carlos himself entered Spain, July 15, 1873, announcing that he came for the purpose of saving the country. Thenceforward there was incessant war in the northern part of the country, but for the most part the struggle was unfavorable to the Carlists, and in February, 1876, when their last stronghold, Estella, had fallen, Don Carlos fled into France. He went to Paris, where, March 3, 1876, he issued a proclamation giving up the struggle but refusing to relinquish his claims. He was expelled from France, in 1881, for ostentatiously supporting the claim of the Comte de Chambord to the French throne. Don Carlos had five children, four daughters and a son. Some time before his death in 1909 Don Carlos abdicated in favor of this son, Don Jaime de Borbón (1870-), Duke of Madrid, who is the present Carlist pretender. Consult: Baumgarten, *Geschichte Spaniens* (Leipzig, 1861); Butler-Clarke, *Modern Spain* (Cambridge, 1906), with a useful bibliography; Hume, *Modern Spain* (London, 1906), an account by one whose family took a considerable part in the events of the first half of the book, and who himself witnessed much of what is related in the last half.

CARLOTA, kär-lō'tá, LA. A town of Negros, Philippines, in the Province of Western Negros, situated 35 miles from Bacólod. Pop., 1903, 13,097.

CARLOT'TA (Sp., Charlotte) (1840-). The name generally applied to the ex-Empress of Mexico, Marie Charlotte Amélie, the daughter of

Leopold I, King of the Belgians. She was married at the age of 17 to Archduke Maximilian, of Austria, afterward Emperor of Mexico. She accompanied him to Mexico in 1864, whither, at the suggestion of Napoleon III, he had been invited by the Assembly of Notables. The Empress remained with him until he found it imperative to send her to France (1866) to seek aid from Napoleon III. Her mission was fruitless. She then applied to the Pope, who had blessed Maximilian previous to his departure for his new empire in the Western Hemisphere, but she was again doomed to disappointment. Her failure and the consequences attending the closing days of the Mexican Empire shattered her reason. She was taken to the Château of Laeken, and later to the Château de Bouchoute, not far from Brussels. Some years later, reports stated that she had recovered her reason, but as she continued in seclusion diplomatic investigations were instituted. In 1914 she was still living in retirement.

CARLOVIN'GIAN CY'CLE, THE. A series of poems centred about Charlemagne and his knights, composed chiefly during the tenth and eleventh centuries.

CARLOVINGIANS. See CAROLINGIANS.

CARLOW, kär'lō (Celtic). A small inland county of Ireland, in Leinster Province, with an area of about 346 square miles, of which six-sevenths are arable (Map: Ireland, E 4). The chief towns are Carlow, Tullow, and Bagenalstown. Pop., 1901, 37,700; 1911, 32,910. Consult Ryan, *History and Antiquities of the County of Carlow* (Dublin, 1833).

CARLOW. The capital town of Carlow Co., Ireland, at the confluence of the Burren and the Barrow (which here is navigable), 56 miles southwest of Dublin by rail (Map: Ireland, E 4). It is well built and, with its extensive flour mills, serves as the emporium for the agricultural produce of the district. Pop., 1901, 6513; 1911, 6619. There are remains of a castle, picturesquely situated on an eminence on the Barrow, founded in 1180 by Sir Hugh de Lacy (or perhaps by King John). The town grew up around the castle, which was several times besieged by, and alternately in the possession of, the English and Irish. In the Irish insurrection of 1798 the insurgents attacked the town, but were repulsed with a loss of 600 men. Consult Ryan, *History and Antiquities of the County of Carlow* (Dublin, 1833).

CARLSBAD, kärls'bät. See KARLSBAD.

CARLS'BAD. A town and the county seat of Eddy Co., N. Mex., about 230 miles (direct) south-southeast of Albuquerque, on the Pecos River, and on the Pecos Valley and Northeastern Railroad (Map: New Mexico, E 6). It has mineral springs, similar to those of Karlsbad, Bohemia, a county hospital, a public library, and a sanitarium for consumptives. Extensive irrigation projects are being carried on in the vicinity by the United States Reclamation Service. The town has a considerable trade in cattle, sheep, wool, peaches, mohair, and cotton. Carlsbad was settled in 1888. The government is administered by a mayor, elected biennially, and a board of trustees. Pop., 1910, 1736.

CARLSBAD DECREES. The resolutions adopted by a conference of delegates of the principal German states at Karlsbad in 1819 and promptly ratified by the Federal Assembly. They were aimed at the liberal agitation then rampant and were a part of the reactionary policy

of Prince Metternich. The press was put under a strict censorship and the universities under police supervision. The *Burschenschaft* was to be suppressed, and a federal committee of seven was appointed to inquire into "the origin and ramifications of revolutionary conspiracies and demagogic associations." At the Conference of Vienna in the following year constitutions were declared incompatible with the rights of the sovereigns. Consult M. de Martius, *Nouveau recueil général de traités* (Göttingen, 1846). See BURSCHENSCHAFT; METTERNICH.

CARLSBURG, kärls'böörk. See KARLSBURG.

CARLSKRONA, kärls'krö-nä. See KARLSKRONA.

CARLSEN, kärl'zen, EMIL (1853-). An American landscape and marine painter. He was born in Copenhagen, Denmark, where he studied architecture at the Royal Academy, and came to the United States in 1872. He was first known as a still-life painter, somewhat in the manner of Chartran, whose cool tints strongly appealed to him. His landscapes are sincere and direct in presentation, and his marines are particularly good in the movement of the water, although their luminous Delft-blue color is not always convincing. He excels especially in line and in arrangement. Among his best-known works are "Sooty Kettle," "A Connecticut Hill-top," "The Rising Storm," "Night—Old Wyndham" (1905, Webb prize, Society of American Artists), "Wind in the East," "A Lazy Sea," "A Stormy Afternoon" (1909), "The Sky and the Ocean" (1914). He is represented in the Metropolitan Museum, New York, by a still life and two marines, of which "Surf Breaking" is especially fine; also in the Brooklyn Institute Museum and the Worcester Museum. He received a gold medal at the St. Louis Exposition in 1904, was an influential member of the Society of American Artists till its dissolution, and became a member of the National Academy of Design and of the National Institute of Arts and Letters.

CARLSHAMN, kärls'häm. See KARLSHAMN.

CARLSON, kärl'sön, ANTON JULIUS (1875-). An American physiologist, born at Bohuslän, Sweden. He came to the United States in 1891 and was educated at Augustana College (Ill.) and Leland Stanford Junior University. In 1904 he became instructor at Woods Hole laboratories and in the same year assistant professor in physiology, and in 1909 professor at the University of Chicago. He contributed to journals of physiology papers on saliva and saliva secretion, lymph and lymph formation, heart and circulation, the thyroids, pancreas, and parathyroids, and in 1904 he published *Physiology of the Nervous System of the Snake and the California Hagfish*.

CARLSON, kärl'sön, FREDERIK FERDINAND (1811-87). A distinguished Swedish statesman and historian. He was born June 13, 1811, at Kungshamn, in Upland, and was educated at the University of Upsala. In 1837 he was appointed tutor to the royal princes at Stockholm, a post he held until 1846. In 1849 Carlson succeeded Geijer as professor of history in the University of Upsala, and in 1860 he was chosen rector. From 1850 to 1865 Carlson sat in the national Diet as the representative first of his university and later of the Swedish Academy of Sciences, to which he had been chosen in 1858, and from 1873 on he had a seat in the first Chamber as the representative of Gefleborg. From 1863 to 1870,

and from 1875 to 1880, he was head of the Department of Public Worship. Carlson continued Geijer's seven-volume history of Sweden, *Sveriges Historia under konungarne af Pfalziska huset* (Stockholm, 1855-85). The work has also been published in German, in the Heeren, Ukert, and Giesbrecht series, *Geschichte der europäischen Staaten*.

CARLSRUHE, kärls'röo-e. See KARLSRUHE.

CARLSTAD, kärl'städ. See KARLSTAD.

CARLSTADT, kärl'shtät. See KARLSTADT.

CARLSTADT. A borough in Bergen Co., N. J., 9 miles north by west of Jersey City, on the Erie Railroad (Map: New Jersey, D 2). The industrial establishments include brass, marble, and onyx works, silk mills, and manufactories of white goods, sable cloths, and air valves. The government is vested in a mayor, elected biennially, and a unicameral council. Pop., 1900, 2574; 1910, 3807.

CARLSTADT, kärl'shtät, **KARLSTADT**, or **KAROLSTADT**, kär'öl-shtät (c.1480-1541). A German reformer whose real name was Andreas Rudolf Bodenstein, and who was at first a friend, but later an opponent of Luther. He was born at Karlstadt, Franconia; studied at the universities of Erfurt (1500-03), Cologne (1503), and Wittenberg (1504), and in the last became a professor, first in philosophy and then in theology. He became a personal friend of Luther. In 1515 Carlstadt went to Rome to study canon law and took the degree of LL.D. Returning to Wittenberg in 1516, he openly broke with scholasticism and defended Reuchlin, against whom a violent persecution was raging. When Luther, on Oct. 31, 1517, nailed his theses to the door of the town church of Wittenberg, Carlstadt supported him. In 1518 he published arguments asserting the supreme authority of the Scriptures, and declaring that in the silence of the Scripture appeals from the fathers of the Church must be made to reason. He participated in the Leipzig Disputation of 1519 on the side of Luther, and in the bull against Luther (1520) Carlstadt was condemned. He was the first to appeal from the Pope to a general council. In 1521, by invitation of the King, he went to Denmark to teach the doctrines of the Reformation; but he returned after a few weeks. On Dec. 26, 1521, he married Anna von Mochau. About this time differences sprang up between Carlstadt and Luther, owing to the former's desire to break at once and entirely with the old church, whereas Luther would go more slowly. While Luther was at the Wartburg (1521), Carlstadt took the lead and, supported by the city government, restored the cup to the laity, abolished the fasting regulations, the elevation of the host, and auricular confession. These changes were very distasteful to the Elector, and so Luther left the Wartburg and opposed them in Wittenberg and restored the old order. Finding his position uncomfortable, Carlstadt became pastor at Orlamünde, in Thuringia (1523), where his radical Church reforms, joined to his well-known independence of Luther, created a suspicion that he was associated with the Anabaptists and that he might be implicated in the schemes of the peasant revolt. The Elector sent Luther to find out the true state of affairs; and when Luther preached against Carlstadt at Jena, the two reformers held a discussion upon the Real Presence, which Carlstadt was the first to deny; and an open quarrel broke out between them. Carlstadt was ordered out of Saxony

(1524) and wandered from place to place, preaching Protestantism. He was at Rothenburg when the Peasant War broke out (1525), and he acted as mediator with the peasants, but in vain. He was pursued and exposed to hardships and even danger to his life. In this extremity he appealed to Luther, who, on condition that he would not advocate his sacramental views, used his influence so successfully that he was permitted to return to Saxony (1525), where for some years he led a life of humble toil and poverty. But controversies again arose over the Lord's Supper, and Carlstadt, who was no longer permitted to dwell in Saxony, fled to Friesland (1530), and finally to Zurich, where Zwingli kindly received him. From 1534 until his death he was professor of theology in Basel. His character was very differently judged in his own times and since, according to whether the sympathies of the person speaking were with Luther or Zwingli. For his life, consult J. C. Jäger (Stuttgart, 1856), and Lindsay, *History of the Reformation*, vol. i (New York, 1906). Many of his letters are in Olearius, *Serinium Antiquarium* (Halle, 1698).

CARLTON. A town in Nottinghamshire, England, 2½ miles northeast of Nottingham, noted for its manufactures of hosiery. Pop., 1901, 10,000; 1911, 15,581.

CARLTON, THE. The leading Conservative political club in London. It was founded in 1832 by the Duke of Wellington, and it now numbers about 2000 members. Its headquarters are at No. 94 Pall Mall, the building being remarkable for its polished granite pillars, which are in imitation of Sansovino's Library of St. Mark at Venice.

CARLTON HOUSE. A house erected for Lord Carlton in the present Carlton House Terrace, London, in 1709, and demolished in 1827. It was made famous by being occupied by the Prince of Wales in 1732, and later by George IV, when he was Prince Regent. The intimates of the Prince of Wales were known as "The Carlton House Set."

CARLU'DOVI'CA PALMA'TA (Neo-Lat., in honor of Charles IV of Spain, Lat. *Carolus Ludovicus* and Neo-Lat. fem. sing. of Lat. *palmatus*, marked like the palm of the hand, from *palma*, palm of the hand). A South American palmlike plant of the family Cyclanthaceæ. It bears palmate leaves 4 feet across, from which Panama hats are woven, the best of which are plaited from a single leaf stripped in such a manner as to require no joining. In addition to *Carludovica palmata* there are about 40 species, all of them natives of America. They have leaves resembling the fan palms, are very ornamental, and are usually considered by growers as palms, and are treated similarly. See PANAMA HATS.

CARLYLE, kär-lil'. A city and the county seat of Clinton Co., Ill., 48 miles east of St. Louis, on the Kaskaskia River, and on the Baltimore and Ohio Southwestern Railroad (Map: Illinois, C 5). The city contains a courthouse and hospital, and owns its water works and electric light plant. It has manufactures of flour and paper, and a trade in grain and flour. Carlyle was a stopping point for stagecoaches along the route of the old Vincennes trail in the early days. Pop., 1890, 1784; 1900, 1874; 1910, 1982.

CARLYLE, JANE BAILLIE (WELSH) (1801-66). The wife of Thomas Carlyle. She was de-

scended through her father from John Knox and on her mother's side claimed relationship with William Wallace. When Edward Irving was a teacher at Haddington, she was his private pupil, and the friendship thus begun would have culminated in their marriage had it not been for Irving's previous engagement to Miss Martin. When only 14 she had written a tragedy and for many years continued to write poetry. In 1821 Irving introduced Carlyle (who was ignorant of his friend's attachment) to Miss Welsh. They began a correspondence and soon became intimate, although she refused to consider him otherwise than as a friend. In 1822 Irving wrote to her his final letters of farewell, and three years later she and Carlyle were engaged. They were married Oct. 17, 1826. Though there is no doubt that Carlyle sincerely loved his wife or that she reciprocated the feeling, their married life was marred by his uncertain temper, his dyspepsia, the interference of his family, and her critical disposition, which was stimulated by her jealousy and her addiction to the use of opium and other narcotics. Consult Ireland, *Life* (London, 1891) and *New Letters and Memorials* (London, 1903).

CARLYLE, JOHN AITKEN (1801-79). An English physician, brother of Thomas Carlyle. He studied medicine at Edinburgh University, was traveling physician to the Countess of Clare and afterward to the Duke of Buccleuch. After abandoning his practice (1848) he lived for a time at Chelsea near his brother. He made an excellent prose translation of Dante's *Inferno* (1849; rev. 1867). See CARLYLE, THOMAS, the bibliography, and passim.

CARLYLE, JOSEPH DACRE (1759-1804). A Scottish Orientalist. He was born at Carlisle, graduated at Cambridge, and in 1793 succeeded Dr. Paley as chancellor of Carlisle. In 1795 he was appointed professor of Arabic at Cambridge. He had already published (1792) a Latin translation of an Arabic history of Egypt, and in 1796 he issued a volume of *Specimens of Arabic Poetry*. Lord Elgin procured Carlyle's appointment (1799) in the Turkish embassy, so that he traveled in the East, where he collected Greek and Syriac manuscripts for a contemplated revision of the New Testament, but he did not live to do the work. His Arabic Bible, edited and completed by H. Ford, professor of Arabic at Oxford, was published in 1811. His *Poems* were published posthumously (1805).

CARLYLE, THOMAS (1795-1881). A Scottish man of letters born at Ecclefechan, Dumfriesshire, Scotland, Dec. 4, 1795. Educated first at the village school and afterward at Annan, he passed, in 1809, to Edinburgh University, with a view to entering the Scottish church. Here he studied irregularly, but with amazing avidity. The stories which are related of his immense reading are almost fabulous. About the middle of his theological curriculum Carlyle felt wholly disinclined to become a clergyman, and, after a short period spent in teaching at Annan and later at Kirkcaldy, where he formed a lifelong friendship with Edward Irving, he went to Edinburgh and embraced literature as a profession. His first efforts were contributions to Brewster's *Encyclopædia*. In 1824 he published a translation of Legendre's *Geometry*, to which he prefixed an essay on proportion, mathematics having during his college years been a favorite study with him. In 1823-24 appeared in the *London Magazine* his *Life of Schiller*,

and in 1824 his translation of Goethe's *Wilhelm Meister*. In 1825 the *Life of Schiller* was recast and published in a separate form. It was very highly praised; indeed, one can discern in the criticisms of the book a dawning recognition of the genius of Carlyle. The translation of *Wilhelm Meister* met with a somewhat different fate. De Quincey, in one of his acrid and capricious moods, attacked both Goethe and his translator; while Jeffrey, in the *Edinburgh Review*, admitting Carlyle to be "a person of talents," treated the book in a slashing manner. It is one of the most excellent translations of a foreign work in the English language. In 1826 Carlyle married Jane Baillie Welsh (see CARLYLE, JANE BAILLIE), a lineal descendant of John Knox, and during the same year appeared his *Specimens of German Romance*. From 1828 to 1834 he resided at Craigenputtoch, a small estate in Dumfriesshire, belonging to his wife—the "loneliest nook in Britain," as he says himself in a letter to Goethe. Here Carlyle revolved in his mind great questions in philosophy, literature, social life, and politics, to the elucidation of which—after his own singular fashion—he earnestly dedicated his whole life. Here also he continued to write, for various magazines, the splendid series of critical and biographical essays which he had begun two years before. For this work he was admirably equipped. Besides possessing an exact knowledge of the German language, he was also inspired by a conviction that the literature of Germany, in depth, truthfulness, sincerity, and earnestness of purpose, was greatly superior to what was admired and relished at home. He had, moreover, a genius for writing literary portraits. Through him England discovered Germany. One of his most beautiful, eloquent, and solid essays, written at Craigenputtoch, was that on Burns (*Edinburgh Review*, 1828). It has given the tone to all subsequent criticism of the Scottish poet. But his chef d'œuvre, written on the moorland farm, was *Sartor Resartus* ("The Tailor Done Over," the title of an old Scottish song). This work, which first appeared in *Fraser's Magazine* (1833-34), is, like most of Carlyle's later productions, an indescribable mixture of the sublime and the grotesque. It professes to be a history or biography of a certain Herr Teufelsdröckh ("Devil's Dirt"), professor in the University of Weissnichtwo ("Kennaquhair"), and contains the manifold opinions, speculations, inward agonies, and trials of that strange personage—or rather of Carlyle himself. The whole book quivers with tragic pathos, solemn aspiration, or riotous humor. In 1834 Carlyle removed to London, taking a house in Cheyne Row, Chelsea. In 1837 appeared *The French Revolution*. Nothing can be more gorgeous than the style of this "prose epic." A fiery enthusiasm pervades it, now softened with tenderness and again darkened with grim mockery, making it throughout the most wonderful image of that wild epoch. Carlyle looks on the explosion of national wrath as a work of the divine Nemesis, who "in the fullness of times" destroys with sacred fury the accumulated falsehoods of centuries. To him, therefore, the Revolution is a "truth clad in hell-fire."

During the same year he delivered in London a series of lectures on German literature; in 1838 another series on *The History of Literature, or the Successive Periods of European Culture*; in 1839, another on *The Revolutions of Modern Europe*; and a fourth in 1840, on *Heroes, Hero-*

Worship, and the Heroic in History. Of these Carlyle prepared only the last for publication (1841). In the meantime he had published *Chartism* (1839). In 1843 followed *Past and Present*, which, like its predecessor, showed the deep, anxious, sorrowful interest Carlyle was taking in the actual condition of his countrymen. In 1845 he published what is considered by many his masterpiece, *Oliver Cromwell's Letters and Speeches, with Elucidations and a Connecting Narrative*. The research displayed in this book is marvelous, but the author was nobly rewarded for his toil by the abundant admiration given to his work. In 1850 appeared the *Latter-Day Pamphlets*, the fiercest, most sardonic, most furious of all his writings. These vehement papers were followed in the next year by the *Life of Sterling*, calm and tender in tone. For many years Carlyle had been at work on the *History of Frederick the Great*. The vast undertaking, resulting in 6 vols., was at length carried through (1858-65). In 1865 Carlyle was elected lord rector of Edinburgh University.

The sudden death of Mrs. Carlyle, in 1866, overwhelmed her husband with grief. Henceforth his life became more and more secluded. His work was now done. In 1867 Carlyle visited Mentone, where he composed part of his personal *Reminiscences*; then returning to London, contributed to *Macmillan's Magazine* an article entitled "Shooting Niagara," in which he gave his views of democracy. In 1875 appeared the *Early Kings of Norway*. In 1874 he received the Prussian royal order *Pour le Mérite* in recognition of his having written the life of Frederick the Great; and in the same year he was offered by Disraeli the Grand Cross of the Bath and a liberal pension, but he declined them both. On Feb. 4, 1881, he died at his house in Chelsea and was buried among his kindred at Ecclefechan. His wife rests beside her father at Haddington. Carlyle appointed James Anthony Froude his literary executor, who, in conforming with the terms of the trust, published *Carlyle's Reminiscences* (1881); *History of First Forty Years of Carlyle's Life* (1882); *Letters of Jane Welsh Carlyle* (1883), exhibiting her as an accomplished woman and brilliant letter writer and giving an insight into her moments of unhappiness and jealousy; and *History of Carlyle's Life in London* (1884). A revulsion of feeling regarding Carlyle's character followed, the literary world being shocked by the bitterness and spite abounding in these records, and Froude was attacked with great violence for his indiscretion. A curious and not wholly edifying controversy arose as to whether Carlyle's troubled relations with his wife were due to his physical incapacity as a husband; and this topic, as was the case with a like discussion regarding John Ruskin (q.v.), brought forth a swarm of books and monographs. But time has revived the former admiration for Carlyle's genius. In 1882 a statue was erected to his memory on the Chelsea embankment, and in 1895 his house in Cheyne Row was purchased and opened to the public.

Bibliography. Carlyle's *Collected Works* first appeared in 1857-58. A centenary edition of his works was published in London and New York, 1896-99. Earlier and later editions abound, both of the collected works and of individual works. Shepherd's *Bibliography of Thomas Carlyle* was published in 1882. For a list of articles on Carlyle and his work, see

THOMAS CARLYLE
FROM THE PAINTING BY P. KRÄMER

Notes and Queries, 6th series, vol. iv. Indispensable books for a study of Carlyle's life are his own *Reminiscences* (1881); *Letters and Memorials of Jane Welsh Carlyle* (1883); *Love Letters of Thomas Carlyle and Jane Welsh* (ed. A. Carlyle, 1909); J. A. Froude, *History of First Forty Years of Carlyle's Life* (1882); *History of Carlyle's Life in London* (1884). Consult also: *New Letters and Memorials of Jane Welsh Carlyle*, with introduction by Sir James Crichton-Browne (1903); J. A. Froude's *My Relations with Thomas Carlyle*; *The Nemesis of Froude* (1903), in which Sir J. Crichton-Browne and Alexander Carlyle collaborated; Herbert Paul's *Life of Froude* (1905). Important biographical and other material is included in these collections of letters: *The Correspondence of Thomas Carlyle with Ralph Waldo Emerson* (1883), *Early Letters of Thomas Carlyle* (1886; 2d series, 1888), *Correspondence between Goethe and Carlyle* (1887)—all edited by C. E. Norton; also Copeland, *Carlyle's Letters to his Youngest Sister* (1889). Consult also: Shepherd and Williamson, *Memoirs of the Life and Writings of Thomas Carlyle* (1881); Wylie, *Thomas Carlyle, the Man and his Books* (1881); Masson, *Carlyle Personally and in his Writings* (1885); Garnett, *Life* (1887); Nicoll, *Life* (1894); Wilson, *Froude and Carlyle* (1898); R. S. Craig, *The Making of Carlyle* (1909), a book of uneven value; *Letters of Carlyle to the Socialists of 1830* (1909); F. W. Roe, *Carlyle as a Critic of Literature* (1910), a competent and useful work.

CARLYLE, WILLIAM ARTHUR (1862—). A Canadian mining engineer, born in Hamilton, Ontario. In 1887 he graduated at McGill University, where he was later special lecturer in mining and metallurgy (1891–95) and professor of mining and engineering (1895). For three years he was provincial mineralogist and director of the Department of Mines, British Columbia. In 1898 he went to Rio Tinto, Spain, where he was general manager of the Rio Tinto Company until 1908. In the latter year he went to London, England, where he became a consulting engineer, and in 1909 was appointed professor of technology and metallurgy in the Imperial College of Science.

CAR'MACK, EDWARD WARD (1858–1908). An American journalist and politician, born near Castalian Springs, Tenn. He practiced law at Columbia, Tenn., and became a member of the State Legislature in 1884. In 1886 he entered journalism on the editorial staff of the *Nashville American*, two years later founded the *Nashville Democrat*, and when the *American* absorbed the *Democrat* he became editor in chief. He moved to Memphis in 1892 and undertook the editorship of the *Memphis Commercial*. From 1897 to 1907 he was a member of Congress, and from 1901 to 1907 United States Senator. In 1906 on a platform of State-wide prohibition he bitterly contested with Governor Patterson the Democratic nomination for governor, but was defeated. The caustic editorials by Carmack in his newspaper, the *Tennessean*, during this fight, resulted in his assassination by Robin J. Cooper, the son of his long-time bitter political opponent, Col. Duncan B. Cooper. He published *Character; or, the Making of the Man* (1909).

CARMAGNOLA, kâr'mâ-nyô'lâ (from the Italian town *Carmagnola*) (c.1390–1432). An Italian condottiere, whose real name was FRAN-

CESCO BUSSONE. For Filippo Maria Visconti, Duke of Milan, he subdued Bergamo, Brescia, Parma, Genoa, and other cities. Brought by his enemies into ill favor with the Duke, he offered his services (1425) to Venice and led a most successful campaign against Milan. After the defeats of a second campaign, the Republic, suspecting treason, caused him to be beheaded, in spite of the Doge's interposition. His fate has been celebrated in Manzoni's tragedy, *Il conte di Carmagnola* (1820). Consult Horatio Brown, *Studies in Venetian History* (London, 1907).

CARMAGNOLE, kâr'mâ'nyôl' (Fr., perhaps from the Italian town *Carmagnola*). The name of a popular song and dance during the French Revolution, rivaling in popularity among patriots and soldiers the "Marseillaise" and the famous "Ça Ira" (qq.v.). It first became well known after the storming of the Tuileries, Aug. 10, 1792. The song began with:

"Madame Vêto avait promis,"

and every verse ended with the refrain:

"Dansons la Carmagnole,
Vive le son, vive le son;
Dansons la Carmagnole
Vive le son du canon!"

The words, however, did not always remain the same; couplets were added from time to time descriptive of the famous incidents of the Revolution, so that the Carmagnole became a typical song of the streets. Fashion soon adopted the word, which was next applied to a sort of jacket worn as a symbol of patriotism. Afterward it was applied to the bombastic and fanatical reports of the successes and glory of the French arms. With the passing of the Reign of Terror the song practically disappeared.

CAR'MAN, ALBERT (1833—). A Canadian Methodist clergyman, educator, and administrator, born at Iroquois, Ontario. He was educated at the Dundas Grammar School and at Victoria University, Cobourg, where he graduated in 1855. In 1857 he was appointed professor of mathematics in Albert College, Belleville, becoming principal in 1858. Through his exertions the college was affiliated with Toronto University in 1860, received a university charter in arts in 1866, and in 1868 was created Albert University, with a charter in all the faculties, Carman becoming its first chancellor. In 1859 he was ordained a minister of the Methodist Episcopal church in Canada, and in 1874–83 was its Bishop. For some time previous to the latter year the organic union of the various Methodist denominations in Canada had been discussed, and after it had been accomplished in 1883, and the united body given the name of The Methodist Church, Carman became general superintendent, an office which he held more than 30 years. He was prominently identified with the founding of Alma Ladies' College, St. Thomas, and was appointed a senator of Toronto and Victoria universities and a governor of Wesleyan Theological College, Montreal. He early became a strong advocate of prohibition. In 1906 he made a tour of the world in the interest of missions.

CAR'MAN, WILLIAM BLISS (1861—). A Canadian journalist and poet. He was born at Fredericton, New Brunswick, April 15, 1861. He was graduated at the University of New Brunswick (1881), studied at the University of Edinburgh (1882–83), at Harvard (1886–88), prac-

ticed engineering, taught, and became literary editor of the *New York Independent* (1890-92). His first volume of verse, *Low Tide on Grand Pré* (1893), commanded general and favorable attention. It was followed by *Songs from Vagabondia* (1894), in which a number of the lyrics were by Richard Hovey; *A Sea-Mark* (1895); *Ballads of Lost Haven* (1897); *By the Aurelian Wall* (1898); *More Songs from Vagabondia* (1896); *Last Songs from Vagabondia* (1900); *Kinship of Nature* (1903); *Pipes of Pan* (1904-05); *From the Book of Valentines* (1905); *The Making of Personality* (1908); *Daughters of Dawn* (London, 1912; New York, 1913). See CANADIAN LITERATURE.

CARMARTHEN, or **CAERMARTHEN**, kär-mär'then (Welsh, *Caer Fyrddyn*, the *Maridunum* of Ptolemy). A seaport town, capital of Carmarthenshire, south Wales, on the right bank of the Towy, 25 miles north-northwest of Swansea (Map: Wales, B 5). It lies in a picturesque situation, but the streets are irregular, steep, and often narrow. The Towy is navigable for vessels of 200 tons up to the town. There are tin and iron works in the neighborhood, and the town carries on a considerable export trade in tin plates, cast iron, timber, marble, slates, lead ore, grain, butter, and eggs. Pop., 1901, 10,025; 1911, 10,221. Near Carmarthen are the remains of two Roman camps. The neighborhood along the banks of the river was, according to tradition, one of the favorite haunts of Merlin the Enchanter. It was long the residence of the native princes of south Wales.

CARMARTHENSHIRE, or **CAERMARTHENSHIRE**. A maritime county in south Wales, on the Bristol Channel. It is bounded north by Cardigan, from which it is separated by the Teifi; east by Brecon; south by Carmarthen Bay; and west by Pembroke (Map: Wales, B 5). It is the largest of the south Welsh counties; area, 918 square miles, nearly a third of which is waste. Iron, coal, copper, and lead mining, stone quarrying, cattle raising, grain culture, hide curing, and woolen manufactures are the chief industries. The chief towns are Carmarthen (the county town), Llanelly, Llandeilo-Fawr, Llandovery, Newcastle-in-Emlyn, and Kidwelly. Pop., 1901, 135,251; 1911, 160,430.

CAR/MEL. 1. A mountain range rising abruptly from the plain of Dothan, near Jenin, and extending in a northwest direction for about 25 miles (Map: Palestine, B 2). The northwest end is almost at the Mediterranean Sea and terminates as abruptly as the eastern. The highest point of the range is 1810 feet above sea level. On the east side is the Plain of Esdraelon, watered by the brook Kishon, and on the southwest side the Plain of Sharon. Carmel was always productive, so that some prophetic writers mention it along with Sharon and Bashan as a type of a land that is richly blessed (Isa. xxxv. 2; Jer. i. 19; Mic. vii. 14). Pliny mentions a city on the mountain (*Historia naturalis*, v, xvii), and it is not improbable that in earlier days there were towns in this district. The mountain formed a natural barrier affecting the course taken by invaders, but did not itself play any part in the military history of Syria. It was important, however, as a sacred mountain. According to the story told in 1 Kings xviii. 19-40, it was on Carmel that, in answer to Elijah's prayer, "the fire of Yahwe fell and consumed the burnt offering,

and the wood, and the stones, and the dust, and licked up the water that was in the trench," and from Carmel that "Elijah brought the prophets of Baal down to the brook Kishon and slew them there." (See ELIJAH.) This story shows that Carmel was deemed an appropriate place for the erection of an altar to Yahwe as well as an altar to Baal. Elisha also is said to have visited Carmel (2 Kings ii. 25) and to have resided there when the Shunammite woman called upon him and he went with her and raised her son from the dead (2 Kings iv. 25). Whatever may be the truth as to the visit of Pythagoras to Carmel related by Jamblichus (*De vita Pythagoræ*, ed. Arcer, 1598, iii, pp. 33 f.), the reference to Carmel as a mountain and sanctuary of Zeus in the *Periplus* of Scylax (ed. Hudson, p. 42) shows that a pagan religious cult was carried on there c.400 B.C. Tacitus describes it as the site of an oracle, without an image (*Hist.* ii. 78), and Suetonius relates that Vespasian offered a sacrifice there and received from the priests an oracle predicting that he would become Emperor (*Vita Vespasiani*, 5). Anchorites established themselves there in the early days of Christianity, and many monasteries were built along the range in the course of time. Phocas saw the ruins of such a monastery in 1185; Brocard, in 1209, persuaded the Patriarch of Jerusalem, Albert, to formulate the rules of the Carmelite monks. Napoleon used a monastery on Carmel in 1799 as a hospital for the sick and wounded in his army. This monastery was destroyed by Abdallah Pasha in 1821, but was soon rebuilt in a splendid manner through the efforts of Frascati. A German colony now cultivates a portion of the range and has built a sanitarium upon the highest part. At the traditional site of Elijah's sacrifice, Al Mahraka, or "the burning," the Druses (q.v.) still have a sanctuary and are said to perform a sacrifice there every year. Consult: Guérin, *Description de la Palestine: Samarie*, vol. ii, pp. 260 ff. (1875); Conder, *Tent Work in Palestine*, vol. i, pp. 169 ff. (1878); Laurence Oliphant, in *Palestine Exploration Fund, Quarterly* (1882-86 passim); G. A. Smith, *Historical Geography of the Holy Land* (1895); Buhl, *Geographie des Alten Palästinas* (1896); Benzinger, in *Baedeker's Palestine and Syria* (5th ed., 1912).

2. A city of Judah about 8 miles south-southwest of Hebron. After his conquest of the Amalekites (q.v.) Saul erected a triumphal stele in this place (1 Sam. xv. 12). Here Nabal lived, whose widow, Abigail, became a wife of David (1 Sam. xxv. 2). It is spoken of as a very great town by Eusebius. Amalric camped there when he went to meet Saladin in 1172 (William of Tyre, xx, xxx). It is represented by Khirbet Kurmul, where there are ruins left of the twelfth century. See Robinson, *Biblical Researches in Palestine*, vol. i (2d ed., 1856), pp. 496 ff.; Guérin, *Description de la Palestine: Judée*, vol. iii, pp. 166 ff. (1869).

CARMEL. A town and the county seat of Putnam Co., N. Y., 50 miles (direct) north by east of New York City; on Lake Gleneida and on the New York Central and Hudson River Railroad (Map: New York, B 2). It is the seat of Drew Seminary for Young Women, and has a Literary Union Library. Carmel is in a rich agricultural and dairying region. Within the limits of the town is the celebrated summer resort, Lake Mahopac. Carmel was the birth-

place of Daniel Drew (q.v.), and here Enoch Crosby, the "spy" of Cooper's celebrated novel, is buried. Pop., 1890, 2912; 1900, 2598; 1910, 2610.

CARMEL, KNIGHTS OF THE ORDER OF OUR LADY OF MOUNT. An order instituted by Henry IV of France to take the place of the Knights of St. Lazarus of Jerusalem, suppressed by him. It consisted of 100 gentlemen, all French, who were required to follow in general the Carmelite rule, as far as their life in the world would allow. The order was confirmed by bull by Pope Paul V in 1608. The first grand master was Philibert de Nerestang, who had held the same position in the Order of St. Lazarus. Louis XIV restored the earlier name and combined it with the later. In his time the order numbered 145 commanderies, but the French Revolution put an end to it.

CAR'MELITES, or ORDER OF OUR LADY OF MOUNT CARMEL. One of the four great orders of mendicants. A monastic order about whose origin there has been no little controversy. At one time it was piously believed to have been founded by the prophet Elijah; but this belief was dissipated by the learned editors of the *Acta Sanctorum*, who were able to demonstrate that it owed its origin to the Crusader Berthold. He had become a monk in Calabria in fulfillment of a vow made on the eve of a battle in which he was victorious. In 1156, with 10 companions, he took up his abode on Mount Carmel; their first definite rule was given them in 1208 by Albert, Patriarch of Jerusalem. In 1240 the pressure of Mohammedan domination induced them to abandon their settlement. Offshoots had already (1238) been founded in Cyprus and Messina; and now some went to Provence and some to England. Innocent IV, in 1245, sanctioned the change from a hermit to a community life and ranked them with the mendicant orders. At a general chapter held at Aylesford, in Kent, the same year, an Englishman, Saint-Simon Stock, was elected the first general. Under his leadership the order, with some modifications adapting it to climatic and other differences, spread throughout central and western Europe. It is to him that the Virgin Mary is said to have revealed in a vision the scapular which became a distinctive mark of the order and those who were affiliated to it. From the white cloak which they wore, they received in England the popular name of White Friars. The rigidity of their rule was somewhat relaxed by Eugenius IV in 1431; but some communities, objecting to this change, adhered to the stricter rule and were known as Observantines, while the more lax were called Conventuals. The most thoroughgoing reform was that instituted by St. Theresa (q.v.), who became a Carmelite novice in 1531 and labored unceasingly for a stricter discipline among the nuns. With the aid of St. John of the Cross, she thus affected the male members of the order also. At her death, in 1582, there were 17 houses of women and 15 of men who followed the stricter rule and were known as Discalced or Barefooted Carmelites. The order had 52 houses in England at the time of the dissolution of the monasteries. They have been active in missions and in the spread of mystical theology. There are at present about 500 Carmelite convents and nunneries.

CAR'MEN. An opera by Bizet, based on the Spanish gypsy romance by Mérimée. It was

first produced in Paris, March 3, 1875; in the United States, October 23, 1878 (New York). See BIZET; MÉRIMÉE.

CARMEN SÆCULARE, sæk'û-lâ'rê. An ode by Horace, sung at the Secular Games in 17 B.C. by a chorus of boys and one of girls. It was written at the request of Augustus.

CARMEN SYLVA, sil'vá. See ELIZABETH, QUEEN OF RUMANIA.

CARMENTAL GATE. A gate of ancient Rome named after the Italian goddess Carmenta, near the Capitoline Hill. Since through it the Fabii marched against Veii the gate was called Scelerata, the accursed. See FABIUS.

CARMI, kär'mî. A city and the county seat of White Co., Ill., 38 miles west by north of Evansville, Ind., on the Louisville and Nashville and the Cleveland, Cincinnati, Chicago, and St. Louis railroads and on the Little Wabash River (Map: Illinois, D 5). It is the centre of an agricultural region and exports fruit, grain, flour, tile, and lumber, and has flouring and saw mills, brick and tile works, machine shops, a stave and heading factory, an ice factory, etc. The water works and lighting plant are owned by the city. Pop., 1890, 2785; 1900, 2939; 1910, 2833.

CAR'MICHAEL, JAMES (1832?-1908). A Canadian Anglican bishop. He was born in Dublin, Ireland, and was partly educated in that city, but in early manhood came to Canada, and after a course of theological study was ordained priest in 1859. After filling a number of minor appointments he became, in 1882, rector of St. George's, Montreal. His sermons were remarkable for eloquence and for the wide acquaintance manifested with the phases of modern scientific thought and the higher criticism. In 1883 he was appointed dean of Montreal; in 1892 he became prolocutor of the Provincial Synod, and in 1893 prolocutor of the General Anglican Synod of Canada. In recognition of his scientific attainments he was twice appointed president of the Montreal Microscopical Society and also twice president of the Natural History Society. For several years he delivered annual courses of lectures to men, principally on the relations between science and religion. He became Bishop of Montreal and remained in that position until his death.

CAR'MINA BURA'NA. See GOLIARDIC LITERATURE.

CARMIN'ATIVES (Fr. *carminatif*, Neo-Lat. *carminativus*, from Lat. *carminare*, to card wool). Medicines which relieve flatulence and pain in the stomach or bowels by stimulating the circulation, increasing peristalsis, and imparting a sense of warmth and comfort. Among the principal carminatives are asafetida, ginger, camphor, cardamoms, fennel, valerian, and the oils of anise, cajeput, caraway, coriander, and peppermint.

CAR'MINE (Fr., ML. *carmesinus*, Pers. *qirmizî*, crimson, from Skt. *krmijâ*, produced by a worm, from *krmi*, worm + *janati*, *jāyatē*, to be born). A beautiful red pigment obtained from cochineal and employed in the manufacture of the finer red inks, in the dyeing of silk, in coloring artificial flowers, and in miniature and water-color painting. It was first prepared by a Franciscan monk at Pisa, who discovered it accidentally while compounding some medicine containing cochineal, and in 1656 it began to be manufactured. One process for its preparation is as follows: Digest 1 pound of cochineal in 3

gallons of water for 15 minutes, add 1 ounce of cream of tartar, heat gently for 10 minutes, add half an ounce of alum, boil for 2 or 3 minutes, and, after allowing any impurities to settle, place the clear liquid in clean glass pans, in which the carmine will be slowly deposited; after a time drain off the liquid and let the carmine dry in the shade. An excellent quality of carmine may also be obtained by pulverizing cochineal, treating it with a solution of sodium carbonate, adding albumin to the solution, and then precipitating with dilute acid. The coloring principle of cochineal is carminic acid, $C_{17}H_{18}O_{10}$, an amorphous red substance soluble in water and in alcohol. With zinc oxide and alumina carminic acid forms the valuable coloring substance known as carmine lake, which is made from the residues of cochineal obtained in the manufacture of carmine. Carmine lake is still used in painting and in printing, but is being superseded by the coal-tar colors.

CARMO, kâr'mô. See **KARMÖ**.

CARMO. See **CARMONA**.

CARMO'NA (Sp., of Celtiberian origin).

A city of Spain, in the Province of Seville, 20 miles northeast of Seville (Map: Spain, C 4). It is situated on an elevated ridge overlooking a fertile plain, and with its Moorish walls and castle has a very picturesque appearance. It contains the fine Gothic church of Santa María; the church of San Pedro, with a tower similar to the Giralda of Seville; a ruined Alcázar; and the interesting gates leading to Córdoba and Seville. A short distance from the city to the west is a Roman necropolis of great archaeological value. An amphitheatre and additional tombs were discovered in 1881, and all belong to the first four centuries A.D. A small museum, supported by the local archaeological society, takes care of these antiquities. The city has flour and oil mills, manufactures of woolen cloth, hats, leather, etc., and an important annual fair, at which one may study satisfactorily the habits and costumes of southern Spain unspoiled by too much modernity. Pop., 1900, 16,338; 1910, 18,855. Carmona (known as Carmo) was of considerable importance under the Romans, a prominence which it retained in the Middle Ages. It fell into the power of the Moors, from whom St. Ferdinand of Castile took it in 1247. Consult M. Sales y Ferré, *Estudios arqueológicos é históricos* (Madrid, 1887).

CARMONTELLE, kâr'môn'tèl' (1717-1806).

A French dramatist, really named **LOUIS CARROGIS**. He was born in Paris, and for several years was reader to the Duke of Orleans, grandson of the Regent. His literary reputation rests chiefly on his *Proverbes dramatiques* (10 vols., Paris, 1768-81; new ed., 4 vols., Paris, 1822), a series of short comedies adapted for private theatricals. In addition to this work, which has been freely borrowed from by later comic writers, his *Théâtre de campagne*, a collection of more than 25 comedies (4 vols., 1775), should be mentioned. He painted portraits, mostly profiles, of some of the most eminent persons of the eighteenth century. *Proverbes et comédies posthumes de Carmontelle* was published, with a memoir by Mme. de Genlis (3 vols., Paris, 1825).

CARNAC, kâr'nâk' (Celtic). A Breton parish and village in the Department of Morbihan, France, 17 miles southeast of Lorient (Map: France, C 4). The village, situated on a gentle slope overlooking the Bay of Quiberon, has an

interesting archaeological museum and a church built in 1639. The latter contains some fine marble altarpieces of the Renaissance period. The inhabitants are engaged in agricultural and fishing pursuits and coasting trade. Pop., 1901, village, 646, commune, 3125; 1911, village, 780, commune, 3269. The parish has world-wide fame in connection with some of the most remarkable megalithic monuments extant and with the remains of a Gallo-Roman town. The chief megalithic relics are situated about half a mile to the north of the village, near the road leading to Auray, on a spacious desolate plain bordering the seashore. They consist of long lines of roughly hewn granitic menhirs or standing stones, varying from 3 to 18 feet in height, which, weather-beaten and covered with minute white lichens, present a succession of weird avenues.

There are three groups, containing 1991 menhirs; in the sixteenth century they numbered more than 15,000. Their exploitation for building purposes and to make room for agricultural improvements during the succeeding three centuries has been arrested by their becoming national property and being authoritatively classed among historical monuments. A fine view of the lines is obtained from the summit of Mont Saint-Michel, a grass-grown "galgal" or tumulus, 65 feet high and 260 feet in diameter, consisting of blocks of stone piled over a dolmen and crowned with a chapel dedicated to the Archangel Michael.

The origin and object of these ancient monuments remain a mystery. They have been the subject of much archaeological speculation and are generally considered to be the Celtic monuments of a Druidical cult, traces of which exist in some of the primitive customs of the natives.

In the year 56 B.C., from these shores Cæsar watched the naval victory of Decimus Brutus the younger over the Veneti in the Bay of Quiberon. The Romans occupied Brittany during five centuries, and considerable remains of Gallo-Roman habitations, with interesting relics, have been excavated at the Bossenno, i.e., mounds, on the plain, 1 mile to the east of Carnac, and also at the base of the artificial Mont Saint-Michel. Consult: Galles, *Fouilles du Mont Saint-Michel en Carnac* (Paris, 1864) and *Tumulus et dolmens de Kercado* (Paris, 1864); Fouquet, *Des monuments celtiques et ruines romaines dans le Morbihan* (Paris, 1873); Lukis, *Chambered Barrows and Other Prehistoric Monuments in Morbihan* (London, 1875); Miln, *Excavations at Carnac* (2 vols., Edinburgh, 1877-81); Worsfold, "The French Stonehenge," in *British Archaeological Association Journal*, vol. iv (London, 1898). See Plate of **MEGALITHIC MONUMENTS**.

CAR'NALL, **RUDOLPH VON** (1804-74). A German mining engineer, born at Glatz (Silesia). He studied in Berlin in 1823-24, began an active connection with the mining industry in Upper Silesia, and by 1855 had risen to be a superintendent of mines and director of the general mining office in Breslau. In 1848 he assisted in founding the German Geological Society, and from 1849 to 1855 lectured at the University of Berlin on the science of mining engineering. He was a councilor in the mines and mining section of the Prussian Ministry of Commerce from 1855 to 1861. The *Zeitschrift für das Berg-, Hütten- und Salinenwesen im preussischen Staate* was founded by him, and he

rendered other important services to the development of German mining.

CARNARVON, or **CAERNARVON**, kär-när'von (Welsh, *Caer-yn-ar-Fon*, fort opposite Mona or Anglesey). A parliamentary and municipal borough and seaport in north Wales, the capital of Carnarvonshire, situated near the south end of the Menai Strait, on the right bank of the Seiont, about 69 miles west of Chester (Map: England, B 3). The castle, which was begun in the reign of Edward I, about 1283, is generally considered the handsomest and most extensive mediæval fortress in the United Kingdom. It is built of red stone and is an irregular oblong in shape. The outer walls, from 8 to 14 feet in thickness, containing a passageway, are fortified by 13 polygonal towers. In the Eagle Tower the first Prince of Wales (afterward Edward II) is said to have been born. The town itself was once surrounded by walls and round towers. These walls, with several of the gates, still exist and form a pleasant promenade. The streets are narrow, but regular, and at right angles to each other. The town is well lighted, and has a good water supply. It is an important commercial centre. The harbor admits ships of 400 tons. The chief exports are copper ore, coal, and slates, which are brought into the town by rail from the quarries in the neighborhood. There is also a great iron and brass foundry. There are manufactures of writing slates, enameled slate slabs, and tobacco. Carnarvon is a bathing place and is much frequented by tourists on account of its vicinity to the grandest scenery in north Wales. Pop., 1891, 9804; 1901, 9760; 1911, 9119. Half a mile from Carnarvon are the remains of Segontium, or Cær Seiont, a Roman station or city. There is a Roman fort on the left bank of the Seiont, still almost complete. The Earl of Chester fortified the place in 1098. In 1294 the town and castle were burned and the English inhabitants massacred by the Welsh under Madoc, the son of Llewelyn. Consult Hartshorne, "Carnarvon Castle," *Archæological Journal*, vol. vii (London, 1850).

CARNARVON, HENRY HOWARD MOLYNEUX HERBERT, fourth EARL OF (1831-90). An English Conservative statesman. He was born in London, June 24, 1831, and succeeded to the peerage in 1849. Educated at Eton and Christ Church, Oxford, in 1852 he obtained a first class in classics, and, after taking his degree the following year, traveled through the Orient. In 1860, as a souvenir of the journey, he published a work entitled *The Druses of the Lebanon*. At his majority he took his seat in the House of Lords, and in 1858 Earl Derby made him Colonial Undersecretary. In 1859 he was elected high steward of Oxford University and created D.C.L. In 1866 he was appointed Colonial Secretary, and his policy met with the warmest approval. He framed a bill for the confederation of the British North American colonies, and had moved the second reading when he resigned office upon the Reform Bill of 1867, which he condemned as democratic and dangerous. On Disraeli's return to office, in 1874, Lord Carnarvon again became Colonial Secretary, but resigned in 1878. He was Lord Lieutenant of Ireland (1885-86) and died in London, June 28, 1890. He was the author of an address on *Berkshire Archæology* (1859); in 1869 edited *Reminiscences of Athens and the Morca, by the late Earl of Carnarvon*, his father, and published translations of the *Aga-*

memnon (1879), the *Odyssey* (1886), and *Prometheus Vincetus* (1893).

CARNARVONSHIRE. A maritime county in north Wales, bounded north by the Irish Sea, east by Denbigh, with the Conway between, south by Merioneth and Cardigan Bay, and west by Carnarvon Bay and the Menai Strait, the latter separating it from Anglesey (Map: England, B 3). Area, 565 square miles, of which one-half is in pasture and only one-fortieth in tillage. The surface is mountainous. The mineral products of Carnarvonshire are copper, lead, zinc, coal, roofing and writing slates, slabs, chimney piers, and honestone. The slate quarries employ many thousands of workmen. The chief branch of rural industry is the rearing of black cattle for the dairy and of small sheep. Wheat, oats, barley, and potatoes are raised in the valleys. The chief towns include Carnarvon (the county town), Bangor, Pwllheli, and Conway. Pop., 1901, 125,649; 1911, 125,049.

CARNATIC (from Skt. *Karnāta*, name of a people in southern India). A political division on the eastern or Coromandel coast of the presidency of Madras, peninsula of India. The name formerly applied only to the Karonese country between the Eastern and Western Ghats; the Carnatic now includes the districts of Belgaum, Dharwar, Byapur, part of North Kanara, and the native states of the Southern Mahratta agency of the Kolhapur. The old Carnatic is famous in history as the grand theatre of the struggle in the middle of the eighteenth century between France and England for supremacy in India. It was at that time ruled by the Nawab of Arcot, who was a vassal of the Nizam of Hyderabad. The region was annexed by the British in 1801. See Robert Sewell, *A Forgotten Empire* (London, 1900).

CARNATION (Fr., Lat. *carnatio*, from *caro*, flesh). The common name of the various, usually double-flowering cultivated forms of the clove pink (*Dianthus caryophyllus*). This species is a native of the south of Europe and has been in cultivation for more than 2000 years. It is a semihardy perennial (generally cultivated as an annual in America), 2 to 3½ feet high, with a branching stem, opposite linear leaves, terminal flowers, and blossoming in England from June to August. The clovelike fragrance of the flowers gave to the plant its specific name *caryophyllus* (clove tree, *Caryophyllus aromaticus*, now *Eugenia caryophyllata*). Many varieties, with various forms and colors, are in cultivation. Red, white, pink, and yellow varieties predominate. Variations usually occur on body colors of white or yellow and are known as *flakes*, when striped with only one color; *bizarres*, when striped with two or three colors, and *picotees*, when the petals are merely edged or bordered with another color.

The monthly, tree, or perpetual-flowering carnations are the varieties so extensively grown under glass in the United States for winter cut flowers. Hundreds of improved forms have been bred in America during the past 20 years. American carnations are now being grown in Europe with increasing favor. These are propagated from cuttings taken from December to May, rooted in sand, transplanted to plats or pots, and kept in a cool house until danger from heavy frost is past, when they are set in the field.

Sandy loam soil heavily fertilized is preferred. The plants are set in rows 12 inches apart and

10 inches distant in the row when cultivated by hand, and in 3-foot rows when worked with a horse. If winter flowers are wanted, the rising shoots of the plants are regularly pruned back to 2 to 4 inches during the summer. In September the plants are lifted and transplanted to the forcing-house benches. The soil here is 4 to 5 inches deep, and consists usually of three-fourths loam and one-fourth well-rotted manure. The plants are set 8 to 12 inches apart each way, heavily fertilized, and watered frequently with liquid manure. The temperature of the carnation house during the winter is maintained at 60° to 65° in the daytime and 10 degrees lower at night. Instead of being set in benches, the plants are sometimes set in pots, and may either be forced at once or set in cold frames and carried over for spring flowering. The Marguerite carnation, a comparatively new, dwarf, and free-flowering strain, is now extensively grown, both as a garden annual and as a pot plant. The Malmaison carnation, a very large-flowered strain, is frequently grown by European florists. It is not a perpetual bloomer and does not force as well as the American carnation. Consult Sanders, *Carnations, Pieotees and Pinks* (London, 1910), and Ward, *The American Carnation* (New York, 1903). See FLORICULTURE.

Carnation Diseases.—Carnations are liable to a number of diseases, the more common and troublesome being anthracnose, rust, blight or spot, and a disease caused by the punctures of minute insects. The anthracnose, which is caused by the fungus *Volutella*, is widespread and causes grayish-brown spots on the leaves. Later the stems are invaded by the parasite and the supply of nourishment for the plant cut off. Diseased cuttings will spread the infection, hence all such should be rejected. The rust is caused by *Uromyces caryophyllinus* and may be recognized by the blisters on the leaves. A diseased plant cannot be cured and should be dug out and destroyed. The spot, or blight, is due to the fungus *Septoria dianthi*. It may be recognized by the light-brown spots, which later bear black dots near their centre. The stems also are attacked, and the plant is unable to perform its proper functions. A bud rot due to *Sporotrichum poæ*, wilt due to *Fusarium* (sp.), and a root rot caused by *Corticium vagum solani* often cause losses. The popular names of these diseases are sufficient for their identification. In combating carnation diseases greenhouse management is of prime importance. If the soil is sterilized and attention given to ventilation and watering, much loss may be avoided. Where anthracnose, rust, and leaf spot become troublesome, spraying with Bordeaux mixture or other fungicides may be practiced to advantage. The disease caused by insect punctures may be recognized by the pellucid spots in the leaves. The name "stigmonose" has been lately given it. Anything keeping thrips, etc., in check will prevent the disease. Great variation in liability to all the diseases is noticed in different varieties.

CARNAUBA (kär-nou'ba) **PALM** (Brazilian), or CARANAIBA PALM (*Copernicia cerifera*). A very beautiful species of South American palm. It ranges from the northern parts of Brazil to Argentina, and in some places forms vast forests. It attains a height of 20 to 40 feet, with a diameter of 8 inches; its timber is valuable, is used in Brazil for a great variety of

purposes, and is exported for veneering. The fruit is black and about the size of an olive; it is sweet and is eaten both raw and prepared in various ways. Scales of wax cover the under side of the young leaves and drop off when shaken. Being collected in this way, the wax is melted into masses and is often used to adulterate beeswax. It is exported and used in the manufacture of candles. Starch is obtained from the stems of the trees, and sugar from the sap. The fibres obtained from the leaves are valuable, being used for cordage, mats, hats, etc. The tree withstands drought to a remarkable degree and is said to flourish on slightly saline soil. It is hardy only in the warmest parts of the United States.

CARNÉ, kâr'nâ', LOUIS MARCIEN, COUNT DE (1804-76). A French publicist, born at Quimper. In 1839 he was elected to the Chamber of Deputies, and, though opposed to Guizot's foreign policy, he accepted the presidency of the Commercial Department of Foreign Affairs in 1847, but lost this post after the Revolution of 1848. He became a member of the Academy in 1863. Carné was a frequent contributor to the *Revue des Deux Mondes* and other journals. Of his books the best known are *Vues sur l'histoire contemporaine* (2 vols., 1833); *Du gouvernement représentatif en France et en Angleterre* (1841); *Etudes sur les fondateurs de l'unité française* (2 vols., 1856); *Etudes sur l'histoire du gouvernement représentatif en France, de 1789 à 1848* (2 vols., 1855); *L'Europe et le Second Empire* (1865); *Les états de Bretagne et l'administration de cette province jusqu'en 1789* (2 vols., 1868); *Souvenirs de ma jeunesse* (1872).

CARNEADES (Gk. Καρνεάδης) (c.214-129 B.C.). A famous Greek philosopher, the founder of the New Academy. He was born at Cyrene, in Africa, and studied in Athens under Diogenes the Stoic, but attached himself to the Academy and opposed the dogmatism of the Stoa. He held that probability, which alone is attainable in knowledge, is a sufficient guide for life, for the common agreement in men's sensations and experiences must represent in some degree the truth. He was thus largely in harmony with Arcesilaus. In 155 B.C. he was sent with the Stoic Diogenes and the Peripatetic Critolaus on an embassy to Rome, where he attracted great attention by his eloquence. He argued before Galba and Cato the Censor in praise of justice, and the next day undertook to disprove his arguments of the previous day and so to establish his doctrine of the uncertainty of knowledge. To Cato such intellectual jugglery seemed dangerous, and he therefore had the Ambassador dismissed, that the Roman youth might not be corrupted. Consult Hicks, *Stoic and Epicurean* (New York, 1910). See NEW ACADEMY.

CARNEGIE, kär-nëg'î. A borough in Allegheny Co., Pa., 5 miles (direct) southwest of Pittsburgh, on the Pittsburgh, Cincinnati, Chicago, and St. Louis, the Pittsburgh, Chartiers, and Youghiogheny, and the Wabash Pittsburgh Terminal railroads (Map: Pennsylvania, A 6). The Carnegie library, Elks Home, high school building, and St. Paul's Orphan Asylum are noteworthy features. Carnegie is an important coal-mining centre, but is chiefly noted for its extensive steel-manufacturing interests. There are also lead works and manufactories of stoves and granite ware. The borough was formed in 1894 by the consolidation of Chartiers and Mansfield. It is governed by a burgess, elected every

CARNATIONS, ETC.

1. CASSAVA or MANIOC (*Manihot utilissima*).
2. CARNATION (*Dianthus Caryophyllus*).

5. CARDAMON SEED (*Elettaria Cardamomum*).
6. CASHEW NUT (*Anacardium occidentale*).

three years, and a unicameral council. Pop., 1900, 7330; 1910, 10,009.

CARNEGIE, kār-nĕg'ī, ANDREW (1835-). An American manufacturer and philanthropist, born in Dunfermline, Fifeshire, Scotland. He came to the United States in 1848 and worked as a weaver's assistant in a cotton factory at Allegheny, Pa., for little more than one dollar a week. At the age of 14 he became a messenger boy in the Pittsburgh (Pa.) office of the Ohio Telegraph Company. He soon learned telegraphy, entered the service of the Pennsylvania Railroad, and received a position as a telegraph operator. He advanced by successive promotions until he was superintendent of the Pittsburgh division. His interest in the organization of the Woodruff Sleeping Car Company laid the foundation of his fortune, and careful investments in oil lands near Oil City, Pa., increased his means. During the Civil War he rendered valuable services to the War Department as superintendent of military railroads and government telegraph lines in the East. After the war he entered actively into the development of ironworks of various kinds, and established at Pittsburgh the Keystone Bridge Works and the Union Iron Works. In 1868 he introduced into this country the Bessemer process of making steel. In 1888 he was the principal owner of the Homestead Steel Works and had a controlling interest in seven other large steel plants. His interests were consolidated in 1899 in the Carnegie Steel Company, which was merged into the United States Steel Corporation in 1901, when he retired from business.

Mr. Carnegie's benefactions have exceeded in amount those of any other American. In 1912 alone he gave \$130,403,000. Among his donations may be mentioned: to the Carnegie Institute of Technology (q.v.), Pittsburgh, \$10,000,000; to the Carnegie Foundation for the Advancement of Teaching (q.v.), \$15,000,000; (for his library benefactions, see LIBRARIES;) to universities of Scotland, \$10,000,000; to the fund for the benefit of the employees of the Carnegie Steel Company, \$5,000,000. In 1902 he gave \$10,000,000 (more than that amount since) to found the Carnegie Institution (q.v.) of Washington, D.C. In 1904 Mr. Carnegie established what has been termed the "Hero fund," of \$5,000,000. (See **CARNEGIE HERO FUND COMMISSION**.) For the United Kingdom he established a hero fund in 1908. He built a Palace of Peace for the International Court of Arbitration at The Hague, besides creating (1910) the \$10,000,000 Carnegie Endowment for International Peace (q.v.); and he built a home for the International Bureau of American Republics in Washington, D. C. In 1912 he announced that he had given all his fortune except \$25,000,000 to the Carnegie Corporation (organized in New York, Nov. 10, 1911). He was lord rector of St. Andrews University in 1901, 1902, and 1906, and of Aberdeen University in 1912. Mr. Carnegie's publications include: *An American Four-in-Hand in Britain* (1883); *Round the World* (1884); *Triumphant Democracy* (1886); *The Gospel of Wealth* (1900); *Empire of Business* (1902); *James Watt* (1905); *Problems of To-Day* (1909). Consult Alderson, *Andrew Carnegie: The Man and his Work* (New York, 1902).

CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE. A fund created by gift of Andrew Carnegie with an endowment of

\$10,000,000, the income of which is to be expended for the hastening of the abolition of international war. The organization of the endowment was formally effected Dec. 14, 1910, when the control of the fund was vested in a board of trustees under the presidency of Elihu Root. The formulation of a definite programme was left to the discretion of the trustees. The work of the endowment is organized under three divisions: the Division of Intercourse and Education, the Division of Economics and History, and the Division of International Law, under the directorship, respectively, of President Nicholas Murray Butler, Professor John B. Clark, and Dr. James Brown Scott. The Division of Intercourse and Education maintains, at the various capitals, agencies for the gathering of information with respect to international policies, and undertakes the work of promoting international good will. The division has arranged for the exchange of eminent scholars and men of letters between the several nations, and has interested itself in the propaganda for international peace through organizations already existing. It has been the aim of the endowment not to supplant such organizations, but to support them in their activities and to bring about more thorough coöperation between them. The American Peace Society, reorganized so as to serve as a representative of all the peace societies of the United States, receives from the endowment a liberal subvention, with which to assist its constituent societies in their work. Foreign peace societies are also subsidized through the Bureau International Permanent de la Paix at Bern and the Office Centrale des Associations Internationales at Brussels. A number of publications, both American and foreign, receive subventions from the endowment. Direct propaganda by the endowment is carried on through the Conciliation Internationale, with headquarters at Paris (American branch, the American Association for International Conciliation).

The Division of Economics and History has for its field an investigation of the conditions, political, social, and economic, having a bearing upon questions of peace and war. The programme of the division was worked out at a conference of scholars held at Bern in August, 1911. Arrangements were made for a large number of studies, to be conducted in the several countries by competent resident scholars. These studies are designed to furnish a solid basis for future propaganda work of the endowment.

The Division of International Law is intended to deal with the legal elements in international relations. Its work is primarily that of research into the principles of the existing body of international law, with a view to extending their application to an increasing range of international disputes. A further object of the division is the elaboration of programmes for submission to future Hague conferences. The division seeks to stimulate a broader interest among the legal profession in questions of international law. Consult *Year Books* of the Endowment (Washington, 1911 et seq.). See **WORLD PEACE MOVEMENT**.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. A corporation chartered in 1906 primarily to administer a fund transferred to five trustees in 1905 by Andrew Carnegie for the purpose of providing retiring allowances for the teachers in universities, colleges, and technical schools in

the United States, Canada, and Newfoundland. The fund consisted of \$10,000,000 of 5 per cent first mortgage bonds of the United States Steel Corporation, to which Mr. Carnegie in 1908 added another \$5,000,000 so that state and colonial institutions of the same standing as the above might be included. Colleges and universities which desire to be placed on the list of institutions to whose teaching staff pensions may be granted must meet certain requirements of educational standard, administration, and endowment. Hence the foundation, while established to administer the pension fund, has in the short period of its existence exercised an all-powerful influence on institutions of higher learning. The standards of the entrance requirements have thus been raised, and the functions of college and university have been defined; restrictive sectarian or denominational tests and control debar an institution from being placed on the accepted list. Each annual report takes up some educational topic of general and national interest for discussion. Among these have been the following topics: college entrance requirements and the relations of college and secondary schools; standards in professional education; college advertising; education and politics; sham universities, etc. Considerable influence has also been exercised through its special bulletins, the most important of these being the bulletins on Medical Education in the United States and Canada (1910), and Medical Education in Europe (1912), which have already produced vital reforms in the professional preparation of doctors in this continent. Similar reports are to be made in other branches of professional training. The foundation also conducted in 1913 a survey of educational conditions in Vermont and formulated a scheme for a reconstruction of the system. The exchange of secondary school teachers between the United States and Prussia is another of the activities undertaken by the foundation. Fruitful work in the interests of educational progress is promised as a result of a further grant from Mr. Carnegie of \$1,250,000 for the establishment of a division of Educational Research.

The administrative officers of the foundation are Henry S. Pritchett, president; Robert A. Franks, treasurer; and Clyde Furst, secretary.

CARNEGIE HERO FUND COMMISSION.

A body formed in 1904 for the administration of a fund of \$5,000,000 given by Andrew Carnegie. The general purpose of the fund is to aid financially, until able to return to work, those following peaceful vocations who have been injured in heroic efforts to save human life. In case of death, the widow and children or other dependents are to be provided for until the wife remarries and the children reach a self-supporting age. The commission is also permitted to grant sums of money to such persons as they select for heroic deeds, each case to be judged on its merits. A medal which recites the heroic deed it commemorates is given to hero, widow, or next of kin. The field embraced by the fund is the United States, the Dominion of Canada, the Colony of Newfoundland, and the waters thereof. From the foundation of the fund to the beginning of 1914 about 750 medals had been awarded. In most cases these were accompanied by gifts of money. Of the medals 15 were gold, 274 silver, and 434 bronze. The commission has also contributed liberally in cases of disaster. These have included the

California earthquake, the Monongah mines disaster of Dec. 6, 1907, and several other mine disasters. The total funds distributed in pecuniary awards up to Jan. 31, 1913, was \$1,045,503. Of this amount \$671,041 included payments and pensions to heroes and their dependents, \$174,462 went to funds for relief of sufferers from disasters, and \$200,000 for special purposes. The latter includes appropriations to the Carnegie Institute at Pittsburgh. In addition to the Carnegie Hero Fund of America, Mr. Carnegie has established similar funds in Great Britain and Ireland, France, Germany, Belgium, Netherlands, Sweden, Norway, Switzerland, Italy, and Denmark.

CARNEGIE INSTITUTE OF TECHNOLOGY. An institution for technical education, founded at Pittsburgh, Pa., in 1900, by Andrew Carnegie. Until 1912 it was known as the Carnegie Technical Schools, but in that year was incorporated under its present title. Mr. Carnegie's original gift for the foundation of the institute was \$1,000,000, but from time to time, as demands rose, he increased his benefactions until in 1913 they had reached a total of \$4,000,000 for buildings and equipment, and \$7,000,000 for endowment. The institute is located on a 32-acre site in Schenley Park, 3 miles from the business district of Pittsburgh. The site was a gift from the city. In 1914 eight buildings had been completed with a terraced campus in the centre. This represents only a portion of the ultimate building programme. The institution opened for actual work in October, 1905, with 765 students. The enrollment for 1912-13 was 2798 students from 39 States and 13 foreign countries. The officers of instruction and administration numbered 184. The institute consists of four separate schools, each with its own faculty, buildings, and student body. The School of Applied Science offers courses in chemical, civil, electrical, commercial, mechanical, metallurgical, mining, and sanitary engineering, leading to the degree of Bachelor of Science. There are in addition graduate courses. The enrollment in this school in 1912-13 was 752. The School of Applied Design offers courses in architecture, painting, decoration, illustration, and music. It is open to both men and women, and its courses lead to the degree of Bachelor of Arts. The enrollment in 1912-13 was 310. The School for Applied Industries offers industrial courses in machine construction, building construction, general equipment and installation, and also a course for the training of industrial teachers leading to the degree of Bachelor of Science in vocational education. Short courses of eight months are offered in machine shop, pattern making, mechanical drawing, electric wiring, plumbing, foundry, forging and bricklaying, for those who have had some experience in these trades. The enrollment in this school in 1912-13 was 1102. The Margaret Morrison Carnegie School for Women offers a regular day course embracing two years of general training with particular emphasis on home making, followed by two years of specialized training in household economics, secretarial work, costume economics, and home arts and crafts, leading to the degree of Bachelor of Science. There are also courses in the same subjects for the training of teachers. In this school the enrollment in 1912-13 was 574 students.

These four schools have also night courses in practically all of their subjects. The fees for

attendance at the institute are set at a nominal figure, as Mr. Carnegie's purpose in founding it was to place technical education of the most approved type within reach of students of moderate means. Tuition fees for day courses are \$20 a year for residents of Pittsburgh and \$30 for nonresidents. For the night courses the fees are \$5 a year for residents and \$7 for nonresidents. In connection with the institute there is operated a 750-acre engineering camp, called Camp Louise Carnegie. Here students in certain courses are stationed at different periods for their practical field work. The director of the institute is Arthur Arton Hamerschlag, Sc.D., LL.D.

CARNEGIE INSTITUTION OF WASHINGTON. An institution founded in 1902 at Washington, D. C., by Andrew Carnegie, "to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." At the time of its founding Mr. Carnegie gave to the board of trustees of the institution \$10,000,000. To this an addition of \$2,000,000 was made by him in 1907, and a further addition of \$10,000,000 in 1911, so that the endowment of the institution in 1913 was \$22,000,000. It was originally organized under the laws of the District of Columbia, and incorporated as The Carnegie Institution, but was reincorporated by an Act of Congress, approved April 28, 1904, under its present title. Under the articles of incorporation the institution was placed under the control of a board of 24 trustees, all of whom had been members of the original corporation. The trustees meet annually in December to consider the affairs of the institution in general, the progress of work already undertaken, the initiation of new projects, and to make the necessary appropriations for the ensuing year. During intervals between the meetings of trustees the affairs of the institution are conducted by an executive committee, chosen by and from the board of trustees, and acting through the president of the institution as chief executive officer.

To carry out the objects of its establishment three principal agencies have been developed. The first of these involves the formation of departments of research within the institution itself to attack larger problems requiring the collaboration of several investigators, special equipment, and continuous effort. The second provides means whereby individuals may undertake and carry to completion investigations not less important, but requiring less collaboration and less special equipment. The third agency, a division devoted to editing and printing books, aims to provide adequate publication of the results of research coming from the first two agencies, and to a limited extent also for worthy works not likely to be published under other auspices. These publications in 1914 numbered about 250 volumes. Copies of these are distributed freely to a selected list of libraries, and other copies are offered for sale at approximately the cost of publication.

The departments of research in the institution, organized up to 1914, are as follows: Department of Botanical Research (work carried on largely at Desert Laboratory, Tucson, Ariz.); Department of Economics and Sociology; Department of Experimental Evolution (laboratory at Cold Spring Harbor, N. Y.); Department of Historical Research; Department of Marine Bi-

ology (at Tortugas, Fla.); Department of Meridian Astrometry; the Mount Wilson Solar Observatory; Department of Terrestrial Magnetism and a Geophysical Laboratory (at Washington); and the Nutrition Laboratory (Boston). The president of the institution is Robert S. Woodward.

CARNEIA, kār-nē'á or -ní'á. See GREEK FESTIVALS.

CARNEIRO DE CAMPOS, kār-nā'rô dā kām'pôsh, JOSÉ JOAQUIM (1768-1836). A Brazilian politician, born at Bahía. He graduated at the University of Coimbra, Portugal, became a member of the Brazilian Constituent Assembly in 1823, and in the same year was appointed Minister of the Interior by the Emperor, Dom Pedro I. In 1826 he became Senator from the Province of Bahía and attained distinction as a debater on the important constitutional questions then under discussion. After the abdication of Dom Pedro I he was appointed one of the three members of the provisional regency.

CARNEIRO LEÃO, kār-nā'rô lâ-oun', HONORIO HERMETO (1801-56). A Brazilian politician, born at Jacahy. He studied law at the University of Coimbra, attained distinction in his profession, was elected deputy in 1830, and in 1832-33 was Minister of Justice. From Jan. 20, 1843, to February, 1844, he was Prime Minister, and again held the same office from 1854 until his death. He became President of Rio de Janeiro in 1841 and of Pernambuco in 1849. For the greater part of his political career he was known as a leader of the so-called "New Conservative" party.

CARNE'LIAN, or **CORNE'LIAN** (Fr. *cornaline*, from Lat. *cornu*, horn. *Carnelian* is a form influenced by popular etymology with Lat. *caro*, flesh). A semitransparent variety of chalcidony, varying in color from a pale to a deep red. Inferior varieties are yellow and brown. The finest specimens are red and come mostly from Cambay and Surat in India. Red and yellow specimens of excellent quality have also been found at Tampa Bay, Fla., and near Cape Split, Nova Scotia. The carnelian from India is found in nodules of a blackish-olive color, which turn red only after exposure to the heat of the sun for two years, the color gradually becoming brighter and deeper. Artificial heat is sometimes substituted for that of the sun's rays, but with less satisfactory results, as the stones frequently crack and seldom acquire a brilliant lustre. The blood-red varieties were greatly valued by the ancients, who executed beautiful engravings in carnelian. Among the extant specimens of this kind may be mentioned the portrait of Sextus Pompeius in the Berlin collection, that of Helen in Vienna, and several in the British Museum. The carnelian is still used by lapidaries for seal rings.

CARNERI, kār-nā'rê, BARTHOLOMÄUS VON (1821-1909). An Austrian politician and writer, born at Trient. In 1870 he was elected to the Austrian Chamber of Deputies, where, as a prominent Liberal, he retained a seat until 1890. His publications include, besides some political monographs, *Gefühl, Bewusstsein, Wille* (1876); *Grundlegung der Ethik* (1881); *Der moderne Mensch* (5th ed., 1901); a translation of the *Divina Commedia* (1901), and a volume of *Gedichte* (1850).

CAR'NIFEX FERRY. A ferry across the Gauley River, near the mouth of Meadow River,

in Nicholas Co., W. Va. Near here, on Sept. 10, 1861, during the Civil War, an engagement occurred between a Federal force under General Rosecrans and a smaller Confederate force of 5000 under General Floyd. The former lost 17 killed and 141 wounded, while Floyd reported his casualties at only 20. During the night, however, Floyd retreated across the Gauley. Consult Johnson and Buel (editors), *Battles and Leaders of the Civil War*, vol. i (New York, 1887); *Official Records*, vol. v.

CAR'NIN (Lat. *caro*, flesh), $C_7H_8N_4O_3$. An organic substance allied to xanthine and found in meat extract, from which it may be obtained in the form of small, irregular crystals, sparingly soluble in cold, but readily in hot water. To prepare carnin from meat extract, the latter is dissolved and the solution is precipitated with a moderate quantity of baryta water, filtered, and basic acetate of lead is added to the filtrate; the lead precipitate is carefully extracted with hot water, and the solution thus obtained is treated with sulphuretted hydrogen to precipitate the lead; on filtering and concentrating the solution, carnin crystallizes out after some time. By the action of bromine water or of nitric acid, carnin may be readily converted into hypoxanthine, or sarkin, another compound contained in flesh.

CAR'NIO'LA (Ger. *Krain*). An Austrian crownland, bounded by Carinthia on the north, Styria on the northeast, Croatia on the east, southeast, and south, and Istria and Görz on the west (Map: Austria, D 4). It covers an area of 3843 square miles. The surface of Carniola is mostly mountainous. The northern part is traversed by a portion of the Karawanken chain, while on the west it receives the Julian Alps, which form the chief mountain chain of Küstenland. Carniola belongs chiefly to the basin of the Save, which crosses its northern portion. In the south the main stream is the Gurk. There are not a few mountain caves and charming lakes. Although the proportion of productive land is very considerable (over 95 per cent), arable land is scarce (15 per cent) in Carniola on account of the numerous forests. The production of cereals is light. Vegetables constitute a very prominent element in the diet of the inhabitants. Silk, flax, and grapes are cultivated, and the exploitation of the forests is carried on extensively. The chief mineral is quicksilver, the mines of Idria being considered the most productive in Europe, with the exception of the Almaden mines in Spain. The other prominent minerals are iron and lignite. The chief manufacturing industries are the weaving of textiles and the making of leather goods. The trade is largely transit. Nearly 300 miles of railway lines, with Laibach, the capital, as the centre, facilitate the commerce of the crownland. The Diet of Carniola is composed of the Prince-Bishop of Laibach, 10 representatives of the landed aristocracy, 8 representatives of the towns and industrial centres, 2 representatives of the chamber of commerce of Laibach, and 16 representatives of the rural communities. In the Lower House of the monarchy Carniola is represented by 11 delegates, 2 from the landed aristocracy, 3 from the towns, 5 from the rural communities, and 1 elected by the people at large. For internal administration, the crownland is divided into 11 districts and the city of Laibach. There are about 380 elementary schools (283 Slav), at-

tended by over 75,000 children, or 89 per cent of the total school population.

Carniola had a population of 525,083 in 1910, against 508,150 in 1900, showing an increase of over 3 per cent for the decade. Nearly 94 per cent of the people are Slovenes, and the remainder consists of Germans, Serbo-Croatians, and Italians. Almost the entire population belongs to the Roman Catholic church. The capital, Laibach, had a population of 36,547 in 1910.

Carniola received its present name from the Slavonic Wends, who occupied the region after the fall of the Roman Empire. Charlemagne conquered it and gave it to the dukes of Friuli. From 972 it had margraves of its own, sometimes called dukes, who possessed, however, only a part of the country. On the extinction of the male line of the margraves, part of the territory passed to the dukes of Austria in the thirteenth century, and the remainder was acquired by them in the fourteenth. From 1809 to 1813 it formed part of the French Province of Illyria; in 1849 it became a crownland. See Dimitz, *Geschichte Krains* (4 vols., Laibach, 1874-76).

CAR'NIVAL (It. *carnevale*, or *carnovale*; probably from ML. *carnelevarium*, a release from the flesh. Incorrectly derived by popular etymology from Lat. *carni vale*, farewell to flesh, or It. *carne vale*, farewell, flesh). The days of revelry immediately before the beginning of Lent. The origin of this celebration is almost as obscure as the derivation of the name, for which several theories have been suggested, none of them entirely satisfactory. There is very little doubt that the custom is a survival of the old Roman festival of the Lupercalia (q.v.), which was held at the same season of the year, and that the Church, as in so many other instances (see BONFIRE), attempted to regulate and sanctify what it could not entirely suppress. The same spirit of compromise marked the attitude of the popes towards it throughout the Middle Ages. As secular rulers they were disinclined altogether to suppress an observance which promoted the material prosperity of the city; yet as pastors of souls they could not look with complacency upon the frequently unrestrained license attending its celebration. Several of the more spiritually minded popes made a practice of spending the season in strict retirement, to avoid witnessing the disorders which they could not altogether prevent: the time, which originally extended from the feast of the Epiphany (January 6) to Ash Wednesday, was restricted to eight and finally to three days; and a number of minute regulations have always reminded the populace of the existence of a superior authority. The celebration was usually suspended in the years of jubilee (q.v.), and the funds generally expended on the carnival diverted to the entertainment of needy pilgrims, the Jews being compelled to contribute to that purpose the tax in other years laid upon them for the purposes of the carnival.

In modern times Rome has continued the principal seat of these observances, although other Italian cities, notably Venice, have displayed great splendor, and the Parisians, never averse to an occasion for merrymaking, indulge in elaborate revels. A long-established custom in Paris has been to lead in the procession a fat ox (*bœuf gras*, whence *Mardi Gras*) followed in a triumphal car by a child called "the king of the butchers." Otherwise few of the traditional festivities are kept alive, except

the throwing of *confetti* or sweetmeats and flowers, the blowing of horns, the masked balls (see MASQUERADE), and the parades of allegorical chariots. In Italy, after the gayeties of the last day, *Mardi Gras*, the death of the carnival is symbolized by the burning of a huge effigy; and the crowds in the streets carry lighted tapers (*moccoletti*), each endeavoring to extinguish those of his neighbors and keep his own alight. In the United States the principal observance of *Mardi Gras* is that which has been carried out in New Orleans with great pomp and splendor since 1857. On this day the whole city is turned over to the rule of "King Rex, who passes through the streets escorted by his bodyguard, the mystic krewe of Comus," and various military and visiting organizations. In the evening occurs the great street pageant, in which are displayed elaborate tableaux, placed on moving forms and brilliantly illuminated. These represent noted scenes of history, poetry, or fiction, and are constructed at great expense and with artistic elegance. All the arrangements are under the control of societies composed of the best-known professional and business men of the city. Consult Rosières, *Histoire de la société française au moyen âge* (Paris, 1880), and Story, *Roba di Roma* (London, 1862). Byron's *Beppo* and the second part of Goethe's *Italienische Reisen* also contain vivid descriptions of the Italian carnival of a century ago. See BLUE MONDAY; COLLOP MONDAY; SHROVE-TIDE.

CARNIV'ORA (Lat. neut. pl., from *caro*, flesh + *vorare*, to devour). An order of mammals, more or less efficiently adapted for predatory life, and including most of the forms popularly known as beasts of prey. Not all animals carnivorous in diet are carnivora in structure, for the dasyure or Tasmanian devil is a marsupial, and the blood sucking *Desmodus* is a bat. Nor are all the members of the order Carnivora in diet purely carnivorous, for the polar bears eat grass greedily, the rats are very partial to honey, and many forms eat fruits, berries, insects, mollusks, or crustaceans in a highly omnivorous manner.

The carnivora dwell in all parts of the world except New Zealand and Australia, where their work is done by flesh-eating marsupials. They vary in size from the ermine which one may hide in his pocket to bears that may weigh 2000 pounds; and are fitted for the chase of almost every variety of living creature, not even the oceanic birds (in their breeding places) being exempt from their ravages. They thus serve as a check upon the otherwise too rapid multiplication of herbivores, rodents, etc., which, relieved from them, would soon swarm excessively. Their relations with mankind are mainly those of enmity. He pursues some for sport, others for their fur, and others in order to get rid of neighbors dangerous to him or his domestic animals. The carnivora therefore disappear to a great extent in areas of civilization, the effect of which is felt in the increase of such pests as mice and gophers; but in some parts of the world wild beasts carry on even warfare, tigers and leopards alone killing many thousands of human beings and cattle annually. From this class, however, mankind has derived two of his most valued domestic pets—the dog and cat.

General Characters. The dentition of most carnivora is very characteristic. There are in

each jaw six pointed cutting teeth, two strong, sharp, recurved canines, and molar teeth often adapted for cutting. The skull is short and dense. The lower jaw moves up and down in a deep, transverse, semicylindrical groove, and there are deep hollows on the sides and prominent crests on the roof of the skull for the attachment of the powerful muscles which work the jaw. As one would expect in animals with vigorous habits of life, the convolutions of the brain and olfactory lobes are well developed. The toes are clawed, with more or less pointed nails. In contrast to herbivorous animals, the stomach is simple, and the cæcum is either absent or small. Vagrant, predatory habits, a flesh diet, fierce disposition, and high intelligence are ordinal characteristics. While most of the families are more abundant in the tropics than elsewhere, some are more generally inhabitants of temperate regions, and a few are especially common in the Far North.

Classification. Two suborders are distinguished—*Fissipedia*, the typical terrestrial carnivora, and *Pinnipedia*, the aberrant, aquatic forms. The second suborder, with its numerous adaptive characters, has doubtless been derived from the first, and is divided into three families, with about 50 species: 1. *Otariidæ*, or eared seals, nearest to the typical carnivora, and characterized by the presence of external ears. The sea lions, sea bears, sea elephants, fur seals, etc., are well-known examples. 2. *Trichechidæ* (or *Rosmaridæ*), the walruses (q.v.), of which only two species, or perhaps one with two geographical subspecies, are known, characterized by the prolongation of the upper canine teeth into two powerful tusks. 3. *Phocidæ*, or earless seals, characterized by the absence of external ears and the lack of tusks; there are about 10 genera and some 20 species.

Cuvier proposed to divide the typical carnivores into *Plantigrades*, walking on the entire sole (e.g., bears), and *Digitigrades*, walking on finger tips (e.g., cats); but these functional differences are rendered useless by the multitude of transitional links connecting them, and it is more accurate and useful to divide the order into three sections, represented familiarly by bear, dog, and cat, and technically known as *Arctoidea*, *Cynoidea*, *Æluroidca*. The distinctions are based on certain features in the base of the skull, but are corroborated by other more general characteristics.

1. The *Arctoidea*, which are less specialized and nearest the aquatic suborder, are composed of six families, viz., the fur bearers (*Mustelidæ*), the bears (*Ursidæ*), the raccoons (*Procyonidæ*), and three small related families.

2. The *Cynoidea* resembles the *Arctoidea* in most respects, and are composed of the single family *Canidæ*—dogs, foxes, etc.

3. *Æluroidca* are the most specialized of carnivores, represented by cats, civets, etc., of which there are six families. The whole order of Carnivora embraces about 300 living species.

Pedigree and History. The fossil history of carnivora is of great interest, for not only have some remarkable forms like the sabre-toothed tiger (*Machærodus*) been unearthed, but the various families are linked together, as the cats and civets, by *Proviverra*, and the ancestors of at least the cats and the dogs are found in primitive generalized carnivores, such as *Miacis*, *Oxhyæna*, and *Arctocyon*. The group affords beautiful illustrations of increasing and of di-

vergent specialization, as illustrated in the passage from primitive forms to the lion on the one hand and to the seal on the other. As to the relations of the carnivora to other orders of mammals, speculation is rife, but firmly based conclusions are hard to find. Looking backward, some naturalists have discovered affinities with the marsupials; while others, looking forward, have, with more abundant evidence, regarded the primitive carnivores as ancestral to Insectivora, and through them to Cheiroptera. And now there seems to be some evidence of not very distant relationship between Carnivora and Primates.

Bibliography. Consult authorities referred to under MAMMALIA; BEAR; CAT; DOG; ETC.

CARNIVOROUS PLANTS. A peculiar group of plants, part of whose food consists of animals, especially insects, captured by various contrivances, hence called also "insectivorous plants," since the captured insects are used for food. Most of these plants live in undrained swamps where the soil is poor in nitrogen, and the capture of insects is one way of getting protein food without manufacturing it. At the same time the leaves of these plants are usually green, and therefore manufacture carbohydrate food. There are three conspicuous types of "insect-catching" plants. The pitcher plants (*Sarracenia*, *Nepenthes*, etc.) are so named because their leaves form tubes or urns of various kinds which contain water, and to these "pitchers" insects are attracted and then drowned. In some cases nectar is secreted around the mouth of the pitcher which attracts insects. Inside the pitcher, just below the rim, is a glazed zone, and below this another zone with thickly set downward-pointing hairs, so that when a fly slips upon the glazed zone and plunges into the liquid at the bottom of the pitcher, the zone of downward-pointing hairs effectually prevents any escape. The sundews (*Drosera*) are among the most common of the insectivorous plants, the leaves forming small

these glands excrete a clear sticky fluid which clings to them like dewdrops, and which, not being dried up by the sunlight, has suggested the name "sundew." If an insect alights on the

Pitcher-like leaves (ascidia) of the Pitcher Plant (*Sarracenia*). Insects are often present in the liquid within the ascidia.

leaf, or even brushes past it, it is held fast by the sticky hairs, which begin to curve inward, and presently press the victim down upon the surface of the blade, where it is digested. The Venus-fly-trap (*Dionaea*) is one of the most remarkable of insect-trapping plants, being found only in certain sandy swamps near Wilmington, N. C. The leaf blade is constructed so as to work like a steel trap, the two halves snapping together and the marginal bristles interlocking like the teeth of a trap. This trap is sprung by sensitive hairs, like feelers, that are developed on the leaf surface.

When one of these is touched by a small flying or hovering insect, the trap snaps shut, and the insect is caught. In all of these cases a digestive fluid is excreted and the food material utilized. The most noteworthy single book upon this subject is Darwin, *Insectivorous Plants* (London, 1875). See *DIONÆA*; *NEPENTHES*.

CARNOCHAN, kär'no-kan, JANET (1839-). A Canadian educator and writer. She was born in Stamford, Ontario, and was educated at Niagara, where for many years she was a teacher in the high school. After resigning that position she devoted herself mainly to historical investigations in connection with the town of Niagara (formerly Newark and the earliest seat of government in Ontario) and the Niagara peninsula. In the course of these investigations she made many valuable contributions to the press. Chosen president of the Niagara Historical Society, she collected valuable relics of various sorts relating to the early history of the town and peninsula, and especially to the War of 1812. She was also active in procuring the erection of stones to mark historic places in the peninsula, and was principally concerned in the establishment of the Niagara Memorial Hall in 1907. Besides prose writings she published several poems.

CARNOCHAN, kär'no-kan, JOHN MURRAY (1817-87). An American surgeon, born in Savannah, Ga. He was educated at Edinburgh University and at the College of Physicians and Surgeons of New York, and in 1847 began practice in New York. Dr. Carnochan rapidly rose to the first rank among practicing physicians and surgeons and acquired great celebrity for the boldness and success of his operations, such as the removal of the lower jaw; the cure of elephantiasis by ligature of the femoral artery; excision of the ulna while preserving to the arm most of its functions; amputating the thigh at the hip joint, and particularly for removing, in case of neuralgia, the entire trunk

A leaf of the Sundew (*Drosera*), showing the tentacles which capture insects; the tentacles at the right illustrate how they bend in towards an insect which has alighted on the leaf.

a. A bladder of the Bladderwort (*Utricularia*). Insects are captured here after the fashion of an eel trap.

b. Hairs (supposedly with digestive functions) within the bladder of *Utricularia*.

rosettes upon the ground in swampy regions. The margin of the leaf is beset by prominent glandular hairs, and over the inner surface of the blade shorter hairs are scattered. All of

of the second branch of the fifth pair of nerves. Dr. Carnochan added much to the renown of American surgery. He was professor of the principles and practice of surgery in the New York Medical College and health officer of the port of New York. Besides numerous monographs of value on subjects connected with his profession, he published *Treatise on Congenital Dislocations* (1850) and *Contributions to Operative Surgery* (1858 and 1877-86).

CARNOT, kâr'nô', LAZARE HIPPOLYTE (1801-88). A French politician and journalist, the son of the "Organizer of Victory." He was born at Saint-Omer, April 6, 1801. He studied for the law, but was debarred from practice for refusing to take the oath of allegiance to the Bourbons. Turning to journalism, he soon made a name for himself as a follower of Saint-Simon and his school, and became editor of *Le Producteur*, a radical journal of the day, but after the July Revolution forsook Saint-Simonism to a certain extent. In 1839 he entered the Chamber of Deputies as a representative from Paris and remained until 1848, voting with the radical extreme Left. After the February Revolution he accepted the post of Minister of Public Instruction, but held it only a few months. Elected to the Legislative Assembly in May, 1850, he took his place among the Republicans opposed to the schemes of Louis Napoleon. After the coup d'état of 1851 he refused to swear allegiance to Napoleon, and though several times elected to the Legislative Assembly, did not take his seat until 1864. In 1869 he was defeated in the elections by Gambetta and by Henri Rochefort, but in 1871 he was chosen deputy from Seine-et-Oise. Made a life senator in 1875, Carnot took a prominent part in the debates of the Upper House, and spoke for the last time in 1888, a few weeks after his son Sadi had been elected President of the Republic. He died March 16, 1888. He was the author of numerous magazine articles and reviews, the most important being *Exposé de la doctrine Saint-Simonienne* (1830); *Mémoires sur Carnot, par son fils* (2 vols., 1861-64); *La Révolution française* (2 vols., 1867); *Lazare Hoche* (1874); and, with M. d'Angers, *Mémoires de Bertrand Barère* (4 vols., 1842-43). For his biography, consult the *Proceedings of the Académie des Sciences, Morales et Politiques* (Paris, January, 1894); also Hubbard, *Une famille républicaine: les Carnot* (Paris, 1888).

CARNOT, LAZARE NICOLAS MARGUERITE (1753-1823). A French strategist and mathematician. He was born at Nolay, and became, in 1791, a member of the Legislative Assembly from Pas-de-Calais. In the Convention he voted for the death of Louis XVI. He was elected to the Committee of Public Safety, intrusted with the chief direction of military affairs, and greatly contributed to the success of the French arms. He displayed extraordinary ability in this position, alike as a strategist and as an organizer. He created 14 armies, placed them under the command of competent generals, and inspired the troops with an ardor which made them irresistible. Though he endeavored to restrict the power of Robespierre, he was impeached with others, after the Reign of Terror, but the charge was dismissed. Carnot became a member of the Directory in 1795, but having opposed the extreme measures of Barras, his colleague, he was suspected of being a Royalist and sentenced to deportation in 1797. Having escaped to Germany, he wrote his famous defense, in which he

laid bare the character of his associates in the Directory. The Eighteenth Brumaire brought him back to Paris. Bonaparte made him Minister of War in 1800. In this office he helped, by his energy, skill, and fertility of administrative resource, to achieve the brilliant results of the Italian and South-German campaigns; so that to him was given the name of "Organizer of Victory." Being unable to agree with Bonaparte, he resigned in the same year. In 1802 he became a member of the tribunate, in which capacity he voted against the establishment of the consulate for life and particularly against an empire. When the tribunate was abolished, he retired to private life and devoted himself to his studies. But when fortune ceased to favor Napoleon he placed his services at his command in 1814. The command of Antwerp was given to him, and the city was heroically defended. During the Hundred Days he held office as Minister of the Interior. The title of Count was conferred upon him, but he never bore it. After the second restoration he withdrew to Warsaw, and from thence to Magdeburg, where he died, Aug. 3, 1823. Carnot's chief contribution to mathematical science is a class of general theorems on the projective properties of figures, which later formed the basis for the important works of Poncelet and others. Among his numerous writings on mathematics and military tactics are: *Essai sur les machines en général* (1786); *Réflexions sur la métaphysique du calcul infinitésimal* (1797); *Géométrie de position* (1803). Consult Arago, "Eulogy of Carnot," in vol. i of Arago's *Œuvres complètes* (Paris, 1854).

CARNOT, MARIE FRANÇOIS SADI (1837-94). President of the French Republic from 1887 to 1894. He was the son of Lazare Hippolyte Carnot and was born at Limoges, Aug. 11, 1837. He received a scientific education, became an engineer, and advanced rapidly in his profession, acquiring a considerable reputation as the constructor of the large tubular bridge at Colonges-sur-Rhône. In 1870 he was stationed as government engineer at Annécly, and in 1871 Gambetta, who was then Minister of the Interior, made him the Prefect of the Department of Seine-Inférieure. In this capacity he rendered important services to the government, but after the capitulation of Paris resigned his office and sat as a deputy from Côte d'Or in the National Assembly. There he took a prominent part in all discussions concerning the future form of government for France, voting always with the Republicans of the Left, for whom he acted as secretary. He became a member of the new Chamber of Deputies in 1876, and in 1877 was Secretary to the Chamber, besides being prominent in connection with the Public Works Committee. In 1880-81 he was Minister of Public Works, and held the same office again in 1885, in the Brisson ministry, in which he later acted as Minister of Finance. On Dec. 3, 1887, he was elected to succeed Grévy as President of the Republic. In the performance of the high functions of this office Carnot won the respect of all by his tact and ability. He passed unscathed through the Panama disclosures of 1892. His term of office was almost over when he was stabbed by an Italian anarchist named Caserio, in Lyons, and died the next day, June 25, 1894. He was succeeded as President by Casimir-Périer. Consult Hubbard, *Une famille républicaine: les Carnot* (Paris, 1888).

CARNOT, NICOLAS LÉONARD SADI (1796-

1832). A French physicist, to whose early researches and theories must be ascribed the beginning of the modern science of thermodynamics (q.v.). He was born in Paris, the son of Lazare Nicolas Marguerite Carnot. He entered the Polytechnic School in 1812, from which he passed into the corps of engineers, where he served until 1828. Working in this capacity, he had time and opportunity for scientific research, and in 1824 published his famous work, *Réflexions sur la puissance motrice du feu*, in which is described his cycle and reversible engine. Carnot's work was based on the theory that heat was a substance, "caloric," but so perfect was his reasoning that the theory required but few modifications to adapt it to the dynamical theory, which was later accepted, even by Carnot himself. According to Carnot, the amount of work done by a heat engine depends on the amount of heat transferred and the difference in temperature between the source of heat and the receiver; work can be done only when heat passes from a warmer to a colder body. This is, in substance, the second law of thermodynamics, enunciated by Clausius in 1850, which stated that heat cannot of itself pass from a colder body to a hotter one, nor can it be so made to pass without any inanimate material mechanism; and no mechanism can be driven by a mere simple cooling of any material object below the temperature of surrounding objects. In order to study the efficiency of the steam engine, Carnot devised a reversible engine where the amount of energy produced and heat applied could be investigated under ideal conditions. Carnot also appreciated the important principle now known as conservation of energy, stating that motive power is in quantity invariable in nature; it is, correctly speaking, never either produced or destroyed. Carnot's work was greatly extended and adapted to modern theories by Sir William Thomson (later Lord Kelvin), who published important papers in 1848 and 1849 which indicated that from these researches could be evolved the absolute thermodynamic scale of temperature. Carnot's great essay was printed in German, in *Ostwald's Klassiker*, No. 37 (Leipzig, 1892), and an English translation was made by Prof. R. H. Thurston, to which was appended an *Account of Carnot's Theory*, by Lord Kelvin (New York, 1890).

CARNUN'TUM (Lat., from the Celtic). An ancient town in Upper Pannonia, on the Danube, a few miles east of Vienna, founded by the Celts, but at an early period a Roman post. Marcus Aurelius resided here in 172-175, during his wars with the Marcomanni. In the fourth century Carnuntum was destroyed by German invaders. It was afterward rebuilt, but was finally destroyed in the Magyar wars of the Middle Ages. There are numerous ruins from Roman days.

CARNU'TES. A people of central Gaul, between the Seine and the Loire. In 52 B.C. they joined Vereingetorix against Cæsar and sent 12,000 men to the aid of Alesia. Cæsar burnt their chief town, called Cenabum, or Genabum. (See ORLÉANS, France.) Augustus made the Carnutes a *civitas fœderata*, an allied state, permitting them to retain their own institutions. The name "Carnutes" was given also to their chief city. (See CHARTRES.) Consult Holmes, *Cæsar's Conquest of Gaul* (2d ed., Oxford, 1911).

CARNU'TUM CIV'ITAS. See CHARTRES.

CARO, kâr'ò. A village and the county seat of Tuscola Co., Mich., 26 miles (direct) east by south of Bay City, on the Cass River, and on the Michigan Central, and the Detroit, Bay City, the Western railroads (Map: Michigan, F 5). It is in an agricultural region, adapted particularly to the cultivation of sugar beets and beans, but has industrial interests represented by flour mills, grain elevators, a large beet-sugar refinery, lumber mills, brick and tile works, foundries and machine shops, fireless-cooker, horse-collar, and telephone factories, marble works, etc. Pop., 1890, 1701; 1900, 2006; 1910, 2272.

CARO, kâ'rò, ANNIBALE (1507-66). An Italian poet, best remembered for his felicitous translation of Vergil's *Æneid*. He was born at Civita Nuova, in Ancona; became at an early age tutor to the sons of Luigi Gaddi, in Florence; and in 1543 entered the service of Pier Luigi Farnese, nephew of Paul III, who sent him on numerous embassies, among others to the Emperor Charles V in Flanders. After the death of Pier Luigi, Caro served successively the Duke Ottavio Farnese and the latter's brothers, the cardinals Ranuccio and Alessandro, with whom he remained until his death, in 1566. Caro numbered among his friends many of the best-known men of letters of his day—Molza, Salviati, Vasari, and Tansillo. He was an accomplished letter writer, and his *Lettere familiari* are not only of great historical interest, but have often been reprinted as models of style. Important for its stimulating effect on interest in questions of literary criticism and philology was Caro's polemic with the celebrated Lodovico Castelvetro, who had criticized one of Caro's panegyrics. This bitter quarrel, resulting in the death of one man and in Castelvetro's banishment, gave rise to Varehi's *Ercolano* and to Castelvetro's famous *Correzioni* thereto. Caro's *Apologia* in this polemic well illustrates the spirit of scholarship at the time and is interesting as a sample of Italian eloquence. Caro's excellent translation of the *Æneid* was begun, he tells us, "in jest, and only as an experiment," but he continued it for the pleasure of "making trial of the language in comparison with Latin." The translation, which remained unfinished, is rather a skillful paraphrase than a faithful rendering; but, like all his writings, bears the stamp of a cultured and polished style. The best editions of Caro's works were published in Venice (1757), in Milan (1806), and a volume of selected works appeared in Florence (1864).

CARO, kâ'rò', ELME MARIE (1826-87). A French philosopher, born in Poitiers. He graduated at the École Normale in 1848, and was appointed professor of philosophy at the Sorbonne in 1864, and elected to the Académie in 1874. His writings, many of them in opposition to modern positivism, comprise: *Etudes morales sur le temps présent* (1855; 3d ed., 1875); *L'Idée de Dieu et ses nouveaux critiques* (1864; 7th ed., 1883); a study of Hartmann, Schopenhauer, and Leopardi in *Le pessimisme au XIXe siècle* (1878); *Mélanges et portraits* (1888). His wife, PAULINE CASSIN, was a well-known novelist and wrote, under the pseudonym "P. Albane," *Le péché de Madeleine* (1865).

CARO, kâ'rò, JAKOB (1836-1904). A German historian. He was born in Gnesen, and after studying in Berlin and Leipzig was professor of history in Jena until 1869, when he accepted a similar chair at the University of Breslau. His

publications, which deal chiefly with Polish and Hussite history, include the continuation of Röpell's *Geschichte Polens* (3 vols., ii-v, 1863-88), published in Ukert and Heeren's *Geschichte der europäischen Staaten; Das Interregnum Polens im Jahre 1587, und die Parteikämpfe der Häuser Zborowski und Zamojski* (1861); edited *Liber Cancellariæ Stanislai Ciolek, Ein Formelbuch der polnischen Königskanzlei aus der Zeit der hussitischen Bewegung* (2 vols., 1871-74); *Aus der Kanzlei Kaiser Sigismunds* (1879); and *Beata und Halszka, Eine polnisch-russische Geschichte aus dem 16. Jahrhundert* (1883).

CAR'OB, ALGARоба, SAINT JOHN'S BREAD, or LOCUST TREE (It. *carrubo*, from Ar. *kharrûb*, bean pods) (*Ceratonia siliqua*). A tree of the family Leguminosæ, a native of the countries around the Mediterranean Sea, in size and manner of growth much resembling the apple tree, but with abruptly pinnate, dark, evergreen leaves, which have two or three pairs of large oval leaflets. The flowers are destitute of corolla; the fruit is a brown, leathery pod 4 to 10 inches long and an inch or so wide, a little curved, and containing gummy pulp, of an agreeable, sweet taste, in which lie a number of shining brown seeds, somewhat resembling small flattened beans. The seeds are bitter and of no use, but the sweet pulp renders the pods an important article of food to the poorer classes of the countries in which the tree grows, as they contain as much as 60 per cent of sugar. They are very much used by the Moors and Arabs. They are also valuable as food for horses and cattle, for which they are much employed in the south of Europe, and have of late years begun to be extensively imported into Great Britain under the name of locust beans, or St. John's bread. The Arabs make of the pulp of the carob a preserve like tamarinds, which is gently aperient, and also a kind of liquor. The carob tree is too tender for the climate of Great Britain. At the California Experiment Station the tree is highly thought of for its shade. It grows well in dry, rocky situations and is considered a valuable acquisition. It will not stand frost. The wood is hard and much valued, and the bark and leaves are used for tanning. The locust tree of America is quite distinct from this. In Hawaii the mesquite tree is called "algaroba." In California this tree is frequently used for hedges. See CARAT.

CARO'BA. See JACARANDA.

CAR'OL (OF. *carole*, from Bret. *koroll*, dance, Gael. *carull*, melody, from *car*, bar of music, Ir. *car*, a turn, ultimately, perhaps, connected with Ir. *carr*, cart, Lat. *currus*, cart). In the stricter sense, a popular religious song intended to form part of the rejoicings connected with the great Christian festivals. The kinship of the earlier English carols with similar French compositions is evidenced by the frequent recurrence in them of the refrain "Nowell," a variant of the Fr. *Nöel*, Christmas (Lat. *natale*, birthday); though they had a wide popularity in the Middle Ages on the continent of Europe, they are especially associated with English tradition. Their use seems to have been at its height under the Tudors; the universal familiarity with them is shown by the specific prohibition in 1525, when Henry VIII lay seriously ill, of "carols, bells, or merry-making." In 1562 license was given to Thomas Tysdale to print "certayne goodly Carowles to be songe to the glory of God." The Puritans, in their general

onslaught on the observance of Christmas, when holly and ivy were made seditious badges, attempted to abolish them; but they came back with the Restoration, and in 1661 appeared *The New Carols for the Merry Time of Christmas, to Sundry Pleasant Tunes*. To this day it is the custom in many parts of England for troops of men and boys, known as "waits," to go about the villages for several nights before Christmas, singing carols in the open air. As a rule, the best carols are the oldest, although one of the most popular, "While Shepherds Watched their Flocks by Night," was composed in 1703 by no better a poet than Nahum Tate, and the ancient spirit has been successfully caught in recent times by Swinburne, William Morris, and John Mason Neale. The older carols, usually set to pleasing and not difficult melodies, have the characteristics of popular poetry in general. They are simple, picturesque, and often childlike in their naïveté to the point of seeming to persons of less unsophisticated training to border on irreverence. A manuscript of the fifteenth century now in the British Museum (ed. Thomas Wright, London, 1847) contains a number of the most famous early carols. The best collection, however, of both the ancient and modern types is *Christmas Carols, Old and New* (London, 1874), the words edited by H. R. Bramley, and the music by Sir John Stainer. An excellent collection is that of Martha E. Rickert, *Ancient English Christmas Carols, 1400-1700* (New York, 1910). Consult E. Duncan, *The Story of the Carol* (London, 1911).

CAROLAN, kär'ô-lan, or **O'CAROLAN**, ô-kär'ô-lan, TURLOGH. See O'CAROLAN, TURLOGH.

CAROLINA, kä'rô-lé'nà, LA. The capital of a district in the Province of Jaén, Andalusia, Spain, on the southern range of the Sierra Morena, 36 miles north-northeast of Jaén. It has lead and silver mining industries, vineyards, and olive plantations. The inhabitants, descendants of South Germans, who settled here in 1767 under the auspices of Count Olavides, the favorite of Charles III, exhibit an interesting assimilation, their origin being easily discernible, although the Teutonic language has been replaced by the Spanish. Pop., 1900, 9756; 1910, 11,943.

CAROLINA, kä'rô-lé'nà, MARIA (1752-1814). A daughter of Francis I, Emperor of Germany, and Maria Theresa of Austria, and Queen of Naples by her marriage with Ferdinand IV in 1768. She had great influence with the King, had Sir John Acton appointed Prime Minister in place of Tanucci in 1784, and caused the King, in 1798, to join the coalition against France, the consequence of which was the marching of the French upon Naples (1799) and the flight of Ferdinand and Carolina. After returning to Naples Carolina again conspired against Napoleon, and, with her husband, was, in 1806, dethroned and succeeded by Joseph Bonaparte. She died in Vienna.

CAROLINA (kär'ô-lí'nà) **ALLSPICE**. See CALYCANTHUS.

CAROLINA PINK. See SPIGELIA.

CAROLINA TEA. See YAPON.

CAROLINA TOWN. A town of Porto Rico in the Municipality of Carolina, 17 miles south-east of San Juan (Map: Porto Rico, F 2). Its climate and sanitary conditions are exceptional, and there are public schools, two churches, and a city hall. The neighboring country is taken up with sugar estates and dairy farms, and it is

a terminal of the railroad. Pop., 1899, 2177; 1910, 3244.

CAROLINE, THE. An American vessel, the seizure and destruction of which, off Grand Island, by a party of Canadians, on Dec. 29, 1837, during the rebellion in Upper Canada, threatened to cause a war between the United States and Great Britain. The steamer had been used for carrying supplies to a party of insurgents on Navy Island, and Great Britain asserted in 1840 that its destruction was a legitimate act of war, while the United States repeatedly demanded redress on the ground that the Canadians had invaded its territory in time of peace. The difficulty came to a crisis in the course of the same year when a Canadian named McLeod, who had boasted of participating in the affair, was tried in New York. The British ministry threatened war in case he were not released, but his trial was nevertheless continued, and his acquittal alone prevented serious trouble between the two governments.

CAROLINE, AMELIA ELIZABETH (1768-1821). Queen of George IV of England. She was the second daughter of Charles William Ferdinand, Duke of Brunswick-Wolfenbüttel, and Princess Augusta of Britain, sister of George III. She was born on May 17, 1768, and on April 8, 1795, was married to the Prince of Wales, who, with no love for his cousin, consented to the union for the sake of liquidating his debts. She soon complained of his intimacy with Mrs. Fitzherbert and Lady Jersey. The King sought to reconcile the royal pair; but after the birth of their daughter, Princess Charlotte, January, 1796, the Prince of Wales deserted his wife. She received public sympathy and support, especially when official attempts were made to discredit her. In 1814 she obtained leave to travel, and lived in Italy for some time, but acted imprudently in showing favor to her courier, Bergami, and his family. When her husband became King in 1820, she was offered an annuity of £50,000 sterling to renounce the title of Queen and live abroad; but she refused, and made a triumphal entry into London, whereupon the government instituted proceedings for divorce on a charge of adultery. Indiscreet conduct was proved; but the manner in which she had been used by her husband, and the splendid defense of Brougham, caused such a feeling in her favor that the ministry abandoned the divorce bill, after it had passed the House of Lords. She assumed the rank of royalty, but was repulsed from Westminster Abbey when she insisted on her right to coronation with her husband, July 29, 1821. Nine days afterward she died. In direct disregard of the King's desire, the funeral procession, on its way to Brunswick, where Caroline was buried, passed through the city of London; but not before lives had been lost in an encounter with the Life Guards at Hyde Park Corner. Consult: *Memoirs of Queen Caroline*, by Nightingale (London, 1820); Adolphus (London, 1821); Huish (London, 1821); Wilk (London, 1822); also Clerke, *Life of Her Majesty Queen Caroline* (London, 1821).

CAROLINE BOOKS (Lat. *Libri Carolini*). A work in four books, drawn up in 791 by the authority of Charles the Great, against the decrees of the Iconoclastic Council of 754 and of the Second Council of Nicæa in 787. The latter had been translated into Latin incorrectly, and the author of the Caroline Books supposed that

they ordered the same worship to be paid to the images as to the Trinity. The Caroline Books reject both iconoclasm and the worship of images. The author is unknown. Consult Hefele, *Conciliengeschichte*, vol. iii, bk. xx, chap. ii (2d ed., Freiburg, 1877).

CAROLINE ISLANDS. A group of small and widely scattered islands in the Pacific Ocean, extending from 0° 55' to 10° 6' N. lat. and from about long. 137° to about 164° E. (Map: Australasia, G 2); a German possession. They number about 525, including reefs and uninhabited rocks, and their area is estimated at 390 square miles. The larger islands have a considerable elevation; most of the rest are low, mainly of coral formation, and their soil is not above the average in fertility. The main islands of the group are Ruk, or Hogolu, Ponape, Kusaie, and Uap (Yap); these together cover 307 square miles. The chief product is copra, while some of the islands also yield shells. The commerce is mostly in the hands of the German Jaluit Company, which has stations on almost every important island. Administratively the group is a part of the German New Guinea Protectorate. The population of the Caroline Islands was estimated in 1911 at 55,000 and consists chiefly of Micronesians, with about 320 Europeans. Most of the natives have been converted to Christianity, the archipelago having early engaged the attention of the American Board of Commissioners of Foreign Missions. They are well developed physically and mentally, a little shorter than the eastern Polynesians, and dolichocephalic. Cyclopean stone walls are found on the islands of Tapak, Lele, and Ponape; the largest of these prehistoric structures is Nan Matal in Metalanim harbor on the east coast of Ponape. The stone structures of the Pacific are discussed in the article on Megalithic monuments (q.v.). The Carolines were discovered in 1527 by the Portuguese Diego da Rocha, visited in 1528 by Alvaro de Saavedra, who assumed possession for the King of Spain, and further explored in 1686 by the Spanish admiral Francisco Lazeano, who gave to the group its present name in honor of King Charles II. In the beginning of the eighteenth century, as a result of the final determination of a more northern course for the annual voyage of the galleon from Acapulco for Manila, the group was entirely abandoned by Spain, and it was not until the beginning of the nineteenth century that the existence of the Caroline archipelago was again brought to the attention of the civilized world by a number of scientific expeditions. At length German commercial interests became paramount in the Carolines, and the hoisting of the German flag over Yap in 1885 called forth the protest of Spain. A settlement reached in the same year, with the Pope as an arbitrator, recognized Spain's claim to the archipelago, but conferred special commercial privileges on Germany. In 1899 the Caroline, Pelew, and the Ladrones groups (except Guam) were ceded to Germany in consideration of the sum of 16,750,000 marks (about \$3,986,500). Consult: Christian, *The Caroline Islands* (London, 1899); Otto Finsch, *Karolinen und Marianen* (Hamburg, 1900); id., *Anthropologische Ergebnisse einer Reise in der Südsee* (Berlin, 1883); Furness, *The Island of Stone Money* (London, 1910); Salesius, *Die Karolinen-insel Jap* (Berlin, 1904).

CAROLINE MATILDA (1751-75). Queen of Denmark and Norway. She was the youngest

child of Frederick, Prince of Wales, and in 1766 married Christian VII, by whom she became the mother of Frederick VI. The King was a youth of feeble character and by self-indulgence had reduced himself almost to a state of imbecility. From the first he treated the Queen with coldness. In the course of time she became involved in an amour with Struensee, the court physician, who was appointed Cabinet Minister and created a count (1771), and who was generally supposed to be the father of her daughter born in 1771. Early in 1772, as the result of a court intrigue, the Queen and Struensee were arrested, each confessed guilt, and Struensee was executed. The royal marriage was declared dissolved, but when it was proposed to banish the Queen, the British government interfered. She received a pension of £5000, was allowed to retain the title of Queen, and spent her last years in a castle at Celle, Hanover. Consult Lagrèze, *La reine Caroline-Mathilde* (Paris, 1887), and Wilkins, *A Queen of Tears* (London, 1904).

CAROLINGIANS (Fr. *Carlovingiens*, ML. *Carolingi*, from OHG. *Karling*, descendant of Karl, particularly Charles Martel). The second dynasty of Frankish kings. The origin of the family is traced to St. Arnulf, Bishop of Metz, who died in 641. His son, Ansegisel, married a daughter of Pepin, of Landen in Austrasia. Their son, Pepin of Heristal, the greatest territorial lord in Austrasia, was called to the office of Mayor of the Palace in that kingdom. At the battle of Testry in 687, Pepin compelled the weak Merovingian King, Theuderich III, to invest him with the office of Mayor of the Palace in all the three Frankish states, Neustria, Austrasia, and Burgundy. Pepin allowed the Merovingian kings to remain upon the throne, but they were kings only in name. He died in 714, and left as his successor a grandson who was a mere child; but Charles Martel, a natural son of Pepin, was made Mayor of the Palace by the Austrasians, and in this capacity brought the three states under his power. He died in 741. His two sons, Carloman and Pepin the Short, divided the kingdom, although for a time the nominal Merovingian dynasty still existed. Carloman abdicated after a few years and entered a monastery. Pepin at last formally assumed the royal power and was crowned King of the Franks in 751. From this is dated the beginning of the Carolingian dynasty. Pepin was succeeded by his sons, Carloman and Charles the Great, or Charlemagne, of whom the latter soon reigned alone and prodigiously extended his dominions. In 800 Pope Leo III set upon his head the crown of the Western Roman Empire. He planned to divide his dominions among his sons, of whom, however, only one, Louis the Pious, survived him, who, in the list of the kings of France, appears as Louis I, but who was properly Emperor and King of the Franks. With Charlemagne the high abilities of his family disappeared, and his successors were comparatively weak. Family feuds broke out during the life of Louis the Pious, who had divided his dominions among his sons, and he terminated his troubled reign in 840. By a treaty concluded at Verdun in 843, Lothair I, the eldest son of Louis, obtained the Imperial crown and the Kingdom of Italy, with Lorraine, Franche Comté, Provence, and Lyonnais; Louis, his brother, called Louis the German, obtained the German part of his father's dominions; and

Charles the Bald, the son of a second marriage, obtained Neustria, Aquitania, and the Spanish Mark. The Emperor Lothair I died in 855, and his dominions were again divided—his eldest son, Louis II, becoming Emperor and King of Italy, and his two other sons kings of Lorraine and of Provence, the kingdoms of the two younger brothers later reverting to the Emperor. Charles II, the Fat, son of Louis the German, reigned over the reunited realm of Charles the Great from about 884 to 887, when he was deposed. Arnulf, King of Germany, obtained the Imperial dignity later, and Louis III, the Child, ruled in Germany from 899 to 911, when the Carolingian dynasty there became extinct. The French dynasty, of which Charles the Bald may be deemed the founder, continued a succession of weak monarchs and pretenders to the throne for about a century, till it terminated with the reign of Louis V, on whose death Hugh Capet, the most powerful nobleman in France, secured the crown in 987. The Carolingian kings had for some time possessed little real power. A subsequent marriage connected their family with that of the Capets and enabled the kings of the Capetian dynasty to trace their descent from Charlemagne. See FRANKS; FRANCE; GERMANY; HOLY ROMAN EMPIRE.

CAROLUS DURAN, ká'rô'lus' du'rân'. See DURAN, CHARLES AUGUSTE EMILE.

CARON, PIERRE AUGUSTIN. See BEAUMARCHAIS.

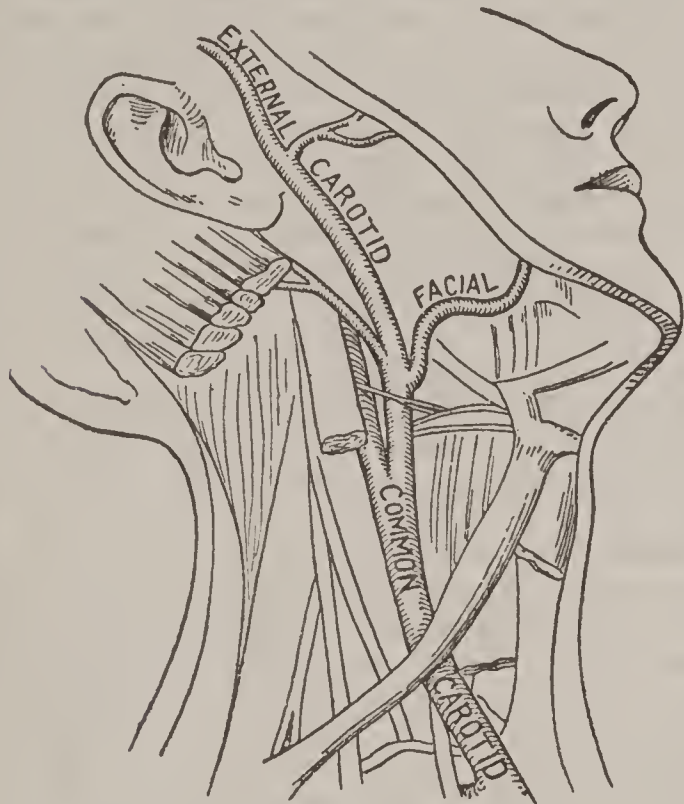

CARON, ká'rôn', RENÉ EDOUARD (1800-76). A Canadian statesman and jurist. He was educated at the Seminary of Quebec and at the College of St. Pierre and was admitted to the bar in 1826. He was mayor of Quebec from 1827 to 1837 and Speaker of the Legislative Council of Lower Canada from 1843 to 1847 and again from 1848 to 1853, when he was appointed judge of the Queen's Bench and abandoned politics. In 1857 he was commissioner for codifying the laws of Lower Canada, and from 1873 until his death was Lieutenant Governor of Quebec.

CARORA, ká-rô'rá. A town in the State of Lara, Venezuela, about 40 miles west by south of Barquisimeto, and midway between that city and Lake Maracaibo. Stock raising and tanneries are the chief industries, and there is a considerable trade in gums and rubber. The town was founded by Spaniards under Capt. Juan del Tejo, in 1569 or in 1572 (accounts vary as to the date). Pop. (1908 estimate), 6000.

CAROTID ARTERY (Fr. *carotide*, Lat. *carotis*, Gk. *καρωτις*, *karōtis*, carotid, from *κάπος*, *karos*, deep sleep). The great artery which on each side distributes blood to the different parts of the head. Each carotid artery consists of the primitive or common carotid, which, at a level with the upper margin of the larynx, separates into two great divisions of nearly equal size, the external and internal carotid. The external carotid supplies the larynx, tongue, face, and scalp with blood, its principal branches being the superior thyroid, the lingual, facial, occipital, posterior auricular, internal maxillary, and temporal. The internal carotid enters the cavity of the cranium through a somewhat tortuous canal in the temporal bone, and, after perforating the dura mater, divides into the anterior and middle cerebral arteries, which are the principal arteries of the brain; while in its course through the dura mater it gives off the

ophthalmic artery, which subdivides into several small branches that supply the eye and surrounding parts. See CIRCULATION.

Wounds of the carotid trunks are generally from stabs. Suicides have a vague desire to cut them, but rarely cut sufficiently deep by the side of the windpipe. Should either vessel be severed death would result almost immediately. Punctured wounds, however, may not be immediately fatal; they may heal, or a false aneurism (q.v.) may result. These arteries are sometimes the seat of spontaneous or true aneurism. Sir Astley Cooper was the first to tie the common carotid for spontaneous aneurism, in 1805, and since then the operation has been successfully performed many times. Owing to the numerous

CAROTID ARTERY.

interchanges (anastomoses) of branches between vessels of both sides of the head, cutting off the supply of blood through one carotid is seldom followed by impairment of brain structure or function. The common carotid in the horse is the termination of the right arteria innominata. It is a large vessel about an inch long, which emerges from the chest below the windpipe and divides into the right and left carotids. These bend upward, having the windpipe between them, gradually inclining inward at the upper part, where each divides into external and internal carotids, and a large anastomosing branch arising from between these two.

CAROTIN (Lat. *carota*, carrot). An orange-yellow pigment found in the form of amorphous masses in the root of the carrot and, along with xanthophyll, giving that organ its color. It also always accompanies chlorophyll and xanthophyll in the chloroplast, and is the coloring matter of some petals, fruits, and other plant organs. The substances described by the terms erythrophyll, chrysophyll, and etolin are probably carotin. Carotin is a hydrocarbon of the empirical formula $C_{40}H_{56}$, and is closely related to xanthophyll, which has the formula $C_{40}H_{54}O_2$ and is possibly an oxidation product of carotin. Carotin is an isomer of lycopin, the orange-red pigment of certain tomato skins. Carotin and xanthophyll both absorb oxygen readily up to 30-40 per cent of their weight, and are thereby transformed to colorless bodies. This has been taken as evidence that they function as oxygen car-

riers in respiration. It has also been claimed that they take part in photosynthesis in a similar way, but to a far less degree than chlorophyll. Though carotin closely resembles xanthophyll, it can be distinguished from it by such physical characters as ease of crystallization, solubility in various solvents, slightly different melting points, and spectra. In the Kraus two-phase (petrol ether-alcohol) system of chlorophyll extract, the carotin is largely held with chlorophyll in the petrol ether, while the xanthophyll is largely held by the alcohol phase.

CAROTO, ká-rō'tò, GIOVANNI FRANCESCO (1480-1555). A Veronese painter of the Renaissance. He was born in Verona, studied there under Liberale, and later in Mantua under Mantegna, who strongly influenced him. Other influences in his paintings are Bonsignori, Leonardo, Raphael, and Giulio Romano; but he never lost a certain individuality and his rich Veronese color, shown particularly in his landscape backgrounds. His works are numerous in Verona, the best being the much-damaged frescoes of the "History of Tobias" in St. Eufemia. Others are: the fresco of "The Annunciation," San Girolamo (1508); the altar of San Fermo Maggiore (1528); various frescoes and panels in San Giorgio in Braida and several panels in the Pinacoteca Comunale. Good examples of his art are in the Castello, Milan, the Chiesa di Carità, Mantua, in the Uffizi and Pitti, Florence, and in the museums of Dresden, Budapest, etc. His works are sometimes confused with those of his brother Giovanni, who was likewise a painter of no mean talent.

CAROUGE, ká'rōōzh'. A town of Switzerland, in the Canton of Geneva, a suburb about one mile south of Geneva, on the left bank of the Arve, at an altitude of 1200 feet (Map: Switzerland, A 2). It has many beautiful villas and a handsome church. There are manufactures of thread, clay pipes, leather, watches, and pottery, as well as of machinery and ironwork. A bridge across the Arve connects the town with Geneva. In 1780 the King of Sardinia, as ruler of Savoy, tried to make Carouge the industrial rival of Geneva, but failed. Pop., 1900, 7400; 1910, 7890.

CARP (Ger. *Karpfe*, OHG. *charpho*, Icel. *karfi*, Welsh *carp*, Russ. *karpü*, probably borrowed from the Germanic). A fresh-water fish (*Cyprinus carpio*), typical of the family Cyprinidæ (q.v.), now acclimated in all parts of the world. The body is robust, compressed, and covered with large scales; head naked; mouth rather small, toothless, with fleshy lips and four well-developed barbels. The dorsal fin is quite long, the anal much shorter. The color is a uniform dark brown above, growing quite light on the ventral side. The carp may attain a weight of 40 to 50 pounds, but the usual weight is much less than this. It thrives best in lakes and ponds, and in streams seeks the quiet, sluggish waters, where it feeds largely on vegetable matter, but will also eat insect larvæ, worms, etc. The carp may reach an age of 200 years. It spawns about June; the eggs, which are small, transparent, and number several hundred thousand, are fastened to aquatic weeds, where they will endure great vicissitudes of weather and temperature. During the winter months it hibernates and does not take food. So exceedingly hardy is it, that it may be kept alive even for days in moist moss if properly

1. CARP (*Cyprinus carpio*).
2. CRUCIAN OR GERMAN CARP (*Carassius carassius*).
3. BARBEL (*Barbus vulgaris*).
4. CHUB OR SKELLY (*Leuciscus cephalus*).

5. GROTESQUE VARIETY OF GOLD FISH.
6. LOACH OR GROUNDLING (*Nemacheilus barbatula*).
7. COMMON OR YELLOW BREEM (*Abramis brama*).
8. MINNOW (*Leuciscus phoxinus*).

fed, and consequently may be transported great distances with facility.

The original home of the carp was southeastern Asia, where it has been tamed and cultivated since the earliest times by the Chinese and where it is still found wild. It was introduced into northern Europe several centuries ago and transplanted about the fourteenth century to Great Britain, under the name of German carp. From Europe it has been brought casually to North America, and about 1870 a strong effort was made to plant it extensively in the still waters of the United States; this succeeded widely, but the extreme prolificacy of the fish, quickly overcrowding small ponds, and the comparative coarseness of its flesh, which is readily tainted by foul waters, have prevented it finding as great favor with the American public as in German Europe. There are three varieties of carp: (1) the scale carp, which, excepting the head, is entirely covered with scales; (2) the mirror carp (*Spiegelkarpfe* of the Germans), which has three to four rows of very large scales along the sides, the rest of the body remaining bare; (3) the leather carp (*Lederkarpfe*), in which the scales are entirely wanting. All these are equally good as food, although a preference is often shown for the scaled variety. To the angler the carp is not a very valuable fish, as he is by no means a free biter. Several other fishes are called carps, notably the European congener called Crucian (q.v.) and the closely allied goldfish; also some entirely different ones, as the sea-bream and the American carp suckers. Consult Gill, *Smithsonian Miscellaneous Collections*, vol. xlviii (Washington, 1907). See Plate of CARPS AND EUROPEAN ALLIES.

CARP, PETRACHE (1837-). A Rumanian statesman. He was born at Jassy, studied at Bonn, took part in the overthrow of Cuza, and, after Prince Charles had ascended the throne, entered the diplomatic service. With Blaremburg he founded an anti-liberal journal. In 1870-76 he was Minister of Foreign Affairs, in 1892-95 of Commerce, Agriculture, and Domains, and in 1900-01 Premier and Minister of Finance. In 1911 and 1912 he was again head of the ministry. Originally a Conservative, in 1876 he formed a party called the Young Conservatives, or Junimistes. He translated several of Shakespeare's plays into Rumanian.

CARPACCIO, kär-pät'chö, VITTORE (VETTOR), called Scarpaccia by Vasari (?-c.1525). A Venetian painter of the Renaissance, one of its greatest pageant painters. The researches of Dr. Ludwig in the Venetian archives have disproved the accepted view of his early life. He was not born in Capo d'Istria, where his house is still shown, but in Venice, where his family had lived. In Venice also he spent most of his life and passed his last years. The date of his death is unknown, but he is mentioned as deceased in 1526. It is now established that he studied first with Lazzaro Bastiani, whom Vasari calls his pupil; but he was greatly influenced by Gentile Bellini. He assisted the latter in important pageant pictures, and independently developed the same technical tendencies into a highly original style. His earliest works, "Saints Catharine and Veneranda" (Verona) and a Madonna (Frankfort-on-Main), are reminiscent of Bastiani. In 1490 he began the great series of nine pictures from the life of St. Ursula, for the Scuola di Sant' Ursula, now in the Venetian Academy.

These are not only his masterpiece, but the finest series of pageant pictures painted in Venice during the fifteenth century. Especially charming are the "Dismissal of the Ambassadors," with remarkable light effects; "The Departure of the Betrothed Pair," distinguished by beautiful and ideal types; and "St. Ursula's Dream," a young girl asleep in the quiet morning light. In quality they are unequal, which is in part due to the work of assistants and to repainting. Hardly less attractive is a second series of nine pictures for the Scuola degli Schiavoni (Slavonians). The episodes from the life of St. George, his battle with the dragon, triumph, and the baptism of the King and Queen are particularly attractive. "St. Jerome in his Study" is a charming representation of a Venetian scholar, while "St. Tryphonius Exorcising the Demon" is naive beyond expression. About the same time he painted (with the aid of his pupils) for the Scuola degli Albanesi (Albanians) six scenes from the life of Mary, now in the galleries of Bergamo, Milan, Venice, and Vienna. His last great cycle, painted (1511-20) for the Scuola di Santo Stefano and depicting scenes from the life of that saint, is now in Berlin, Stuttgart, the Brera, and the Louvre. Besides these great cycles Carpaccio painted many single subjects, such as the "Presentation in the Temple" (1510, Academy); a curious picture, "Two Courtesans on a Balcony" (Museo Civico, Venice); the high altar of San Vitale, Venice (1514); "St. George Killing the Dragon" (1516, San Giorgio Maggiore); the quaint Lion of St. Mark (Ducal Palace); three subjects in the cathedral of Capo d'Istria, and a polyptych in the city of Zara. Carpaccio is one of the most able and attractive painters of the early Renaissance in Venice. His pageant pictures are nothing more than delightful genre paintings filled with admirable portraits and illustrating in an incomparable manner Venetian life of his day. Nevertheless, they are rendered primarily for their pictorial qualities. Though sometimes faulty in drawing, they are clear and harmonious in color and show remarkable treatment of light and atmosphere. The authoritative monograph on Carpaccio is by Ludwig and Molmenti (Milan, 1906); Eng. trans. by Cust (London, 1907).

CARPATHIAN MOUNTAINS. A mountain system of central Europe, extending in the form of a broad arc along nearly the entire boundary of Hungary east of the Danube (Map: Austria, G 2). The arc embraces the plain of Hungary and the elevated basin of Transylvania (Siebenbürgen), separating the former from the Austrian provinces of Moravia, Silesia, Galicia, and Bukowina on the northwest, north, and northeast, and the latter from Rumania on the east and south. Both wings of the arc rest upon the Danube—the one terminating near Pressburg, where it is in juxtaposition to the Leitha Range of the Austrian Alps; the other ending at Orsova, where it confronts the northern extension of the Balkans. The length of the system, following the curve, is about 800 miles. The Carpathian system is composed of numerous mountain groups which exhibit a variety of orographic and geological features. On the northwest the main elevations are included in the Kleine Karpaten (Little Carpathians), the Weisses Gebirge (White Range), and the Neutra and Tâtra ranges. These ranges, with bordering ranges of the West Beskiden and the Hun-

garian Erzgebirge, converge in northern Hungary to form a mountain knot, near the centre of which are the Hohe Tatra Mountains, the loftiest in the entire system. Eastward and southward the Carpathians are continued in a broad curve by the Ost Beskiden and by the Waldgebirge into Transylvania, where the ranges widen out so as to surround on the east and west the basin of Transylvania, whose southern limit is the Transylvanian Alps.

The Carpathians include no summits that are comparable in elevation to the culminations of the Alps, but the mountains are frequently massive and imposing in appearance. The highest point of the system is the Gerlsdorferspitze of the Hohe Tatra Range, which is 8737 feet. In the same range are the Lomnitzerspitze, 8642 feet; the Eisthalerspitze, 8630 feet; and the Schlagendorferspitze and other peaks exceeding 8000 feet. In the eastern Carpathians there are many peaks from 5000 to over 7000 feet above the sea. The Transylvanian Alps, whose trend in the main is east and west, present an almost unbroken mountain barrier crowned by jagged summits that reach an extreme height of over 8000 feet, the loftiest peak, Negoi, being 8318 feet. In general, the higher elevations of the Carpathians are composed of granite and crystalline rocks, while the outlying lower ranges are formed by upturned and folded sedimentary strata. Mesozoic sandstone is the prevailing formation in the Beskiden, the granite, gneiss, and schist in the Transylvanian Alps. Eruptive igneous rocks are found along the whole system, but are most prominent in the Hungarian Erzgebirge and in the ranges of Transylvania. These regions are noted for their deposits of gold, silver, lead, copper, and other metallic ores, which have been worked for many centuries. The Carpathian system forms the water parting between the drainage basins of the Oder, Vistula, and Dniester, and of the middle Danube. Small lakes frequently occur in the interior of the mountains, particularly in the Hohe Tatra, where more than 100 have been found. Some of them are at great elevations, and many are very deep. These lakes are called by the Hungarians "Eyes of the Sea." There are no glaciers nor perennial snow fields. Numerous passes cross the system, facilitating communication between Hungary and the bordering countries. The Carpathians are clothed with extensive forests of oak, beech, chestnut, and fir, which harbor bears, wolves, and lynxes. See HUNGARY; TRANSYLVANIA.

CAR'PATHOS. See SCARPANTO.

CARPEAUX, kâr'pô', JEAN BAPTISTE (1827-75). One of the foremost French sculptors of the nineteenth century, also an able painter. He was born at Valenciennes, the son of a stonemason, and received his earliest instruction from a friendly local architect, Bernand, and from the sculptor Fernand. In 1842 he went to Paris, earning his way as a porter and messenger. He studied with Duret in the Ecole des Beaux-Arts, and with François Rude, whose influence was the strongest in forming his art. After a brilliant record at the Ecole, he received the Roman prize in 1845. In the five ensuing years of study at Rome he developed a strongly characteristic and personal style in painting as well as in sculpture. A typical example of his work of this period is the "Neapolitan Fisher Boy with a Shell" (Louvre). His chief work at Rome was "Ugolino and his Children" (1862), now in the garden of the Tuileries. Exhibited

at Paris, it was greeted with acclaim, except by the academicians. In 1865 he completed the group "Temperance" in the church of La Trinité, Paris, and in the following years the high relief in the pediment of the Pavilion of Flora in the Louvre. His most celebrated work—"The Dance" on the façade of the Paris Opéra (1869)—precipitated one of the bitterest contests in modern art when the nude figure of "The Dance" was indignantly rejected by the Salon as immoral. The group is a masterpiece of realistic presentation and dramatic movement. During the troubles of the Commune he practiced his art in London. He died at Bécon-Château, near Asnières, Oct. 11, 1875. The principal works of his last period are the "Four Quarters of the World Sustaining the Sphere," in the gardens of the Luxembourg; a monument to Watteau at Valenciennes; a painting representing "Napoleon in his Coffin," in the Museum of Valenciennes, and a bust of the Prince Imperial in the Museum of the City of Paris.

Carpeaux ranks with David d'Angers, Rude, and Rodin (qq.v.) as an epoch-making figure in French sculpture of the nineteenth century. His position is analogous to that held in painting by Delacroix, whom he greatly resembles. In his works naturalism for the first time in the nineteenth century achieves a definite and complete victory in sculpture. Academic smoothness of surface is replaced by a modeling based upon a real anatomical knowledge, the varied surface of which affords ample opportunity for contrast of light and shade. Although little known as a painter, he was very original also in this art. Influenced by the old Spanish masters, he foreshadowed in his contrast of light and shade, and the rendition of values, the achievements of Manet and the Impressionists. Three of his paintings are in the Louvre, which also possesses (besides the important works mentioned above) a fine collection of his portrait busts, including those of Alexandre Dumas fils, his wife, Napoleon III, and the Princess Mathilde. In Valenciennes the Musée Carpeaux, founded in his honor, rejoices in many of his sculptures of the early period and a number of paintings. Over 3000 of his spirited drawings are in the Louvre, the Ecole des Beaux-Arts, and the museums of Paris. Carpeaux's biography has been written by important critics, such as Salelles (Paris, 1869), Claretie (ib., 1875), Chesneau, (ib., 1880), and Riotor (ib., 1906). Consult also Blanc, *Les artistes de mon temps* (ib., 1875), and Gonse, *La sculpture française* (ib., 1895).

CAR'PEL (Fr. *carpelle*, Neo-Lat. *carpellum*, from Gk. *καρπός*, *karpos*, fruit). The name given to the megasporophyll of seed plants (gymnosperms and angiosperms). A sporophyll is the leaflike structure that bears the sporangium, and when there are two kinds of sporangia the two kinds of sporophylls are distinguished as megasporophylls and microsporophylls. In the older terminology the megasporophyll was called the carpel, and the microsporophyll was called the ovule. A carpel, therefore, is the unit structure which bears ovules. There is often confusion in the use of the words "carpel" and "pistil." Pistil is not a word of exactness, for it represents a structure organized into ovary, style, and stigma, whether it consists of one carpel or of several carpels. The so-called "scales" of a pine cone are also carpels which do not inclose the ovules. Ordinarily, however, the word "carpel" is used chiefly of

angiosperms (true flowering plants), and the carpels of gymnosperms are spoken of as scales. See FLOWER.

CAR'PENTA'RIA, GULF OF. A broad and deep indentation of the north coast of Australia, with an average length and breadth of 350 miles, stretching from lat. 11° to 17° 30' S. and from long. 136° to 142° E. (Map: Australia, F 4). It was named after Carpenter, a Dutchman, who discovered and partly explored it in 1627. The gulf contains many islands. The shores are generally low with extensive indentations on the west coast.

CAR'PENTER (OF. *carpentier*, ML. *carpentarius*, from Lat. *carpentum*, cart, from Ir. *carbhad*, *cairbh*, chariot, *carb*, basket), NAVY. An officer of warrant rank in the United States and British navies who acts as assistant to the executive officer or first lieutenant (in very large ships) in keeping the hull, spars, boats, etc., of a man-of-war in good condition. In the days of wooden ships he was a skilled mechanic in wooden shipbuilding, but since the advent of iron and steel ships he has been required to have a thorough knowledge of metal working and a practical knowledge of shipbuilding in iron and steel, as well as of woodworking. The carpenter of a ship of the navy is assisted by several artisans, called collectively the *carpenter's gang*, which includes shipwrights, plumbers, blacksmiths, painters, and carpenter's mates. When a carpenter has served six years as such, he is commissioned as a *chief carpenter*, with the rank of ensign. His pay and status are the same as those of the boatswain.

CARPENTER, EDMUND JANES (1845-). An American author, born at Attleboro, Mass. After graduating from Brown University in 1866 he engaged in business until 1878, when he entered journalism. In 1884-96 he was an editorial writer on the *Boston Daily Advertiser*. His works include: *A Woman of Shawmut* (1892); *America in Hawaii* (1898); *The American Advance* (1903); *Long Ago in Greece* (1906); *Roger Williams* (1909); *The Pilgrims and their Monument* (1911).

CARPENTER, EDWARD (1844-). An English author, born at Brighton, England. He was educated at Brighton College and at Trinity Hall, Cambridge, where he became fellow and lecturer. He also served as a curate, but in 1874 gave up his orders in the Church, left Cambridge, and lectured in the University Extension movement until 1881. In 1883 he became a street-corner agitator and lecturer in the Socialist movement. He visited Walt Whitman in the United States in 1884. His publications include: *Towards Democracy* (1883; 5th ed., 1913); *England's Ideal* (1887; 5th ed., 1906); *Civilization: Its Cause and Cure* (1889; 5th ed., 1897); *From Adam's Peak to Elephanta* (1892); *Homogenic Love* (1894); *An Unknown People* (1897); *Angels' Wings* (1898); *Ioläus* (1902); *The Art of Creation* (1904); *The Village and the Landlord* (1907); *Sketches from Life in Town and Country* (1908); *The Intermediate Sex* (2d ed., 1909); *The Promised Land* (1910); *Love's Coming-of-Age* (3d ed., 1911); *The Drama of Love and Death* (1912).

CARPENTER, FORD ASHMAN (1868-). An American meteorologist, born in Chicago. He was an assistant observer in the United States Army Signal Corps in 1888-91, and an observer for the United States Weather Bureau from 1892 to 1906, when he became local fore-

caster at San Diego, Cal. He participated in the Nordhoff exploring expedition to Lower California and Mexico in 1903. His works include: *Wind Velocities and Measurements* (1889); *Studies in the Physiography of Lake Tahoe* (1891); *Sunshine and Cloudiness* (1896); *Climatology of San Diego* (1910); *Aviation and Wind Movement* (1911); *Velo Clouds* (1911); *Photographing "Red Snow" in Natural Colors* (1911); *Over the Yosemite Trails* (1912); *The Climate and Weather of San Diego, California* (1913).

CARPENTER, FRANK GEORGE (1855-). An American traveler and journalist, born in Mansfield, Ohio. He graduated from the University of Wooster in 1877, two years later beginning his newspaper work as legislative correspondent of the *Cleveland Leader*. In 1881 he began a series of travels which continued for nearly 30 years and took him to all parts of the world. During these journeys he sent articles to newspapers and magazines. He was made a member of many scientific and learned societies and received the degree of Litt.D. from Wooster University in 1911. His published writings include an important series of geographical readers; *Our Colonies and Other Islands of the Sea* (1904); *Africa* (1905); *Carpenter's Readers of Commerce and Industry; South America—Social, Industrial, and Political* (1900); *How the World is Fed* (1907); *How the World is Clothed* (1909); *How the World is Housed* (1911). He also contributed a great number of articles to American journals and magazines.

CARPENTER, FRED WARNER (1873-). An American diplomat, born at Sauk Center, Minn., and educated in the public schools of Lake County. He studied law at the University of Minnesota, and after being admitted to the bar in 1898 was for several years stenographer in a law firm. In 1901 he became private secretary to William H. Taft, who was at the time Governor of the Philippines, and he continued to serve in this capacity while Mr. Taft was Secretary of War and during part of his administration as President. In 1910 he was appointed Minister to Morocco, and later Minister to Siam. The latter position he held until 1913.

CARPENTER, JOSEPH ESTLIN (1844-). An English Unitarian theologian, son of William Benjamin Carpenter. He was educated at University and Manchester New Colleges; was minister of the Oakfield Road Church, Clifton, in 1866-69, and of Mill Hill Chapel, Leeds, 1869-75; lectured in Manchester College, London and Oxford, until 1906; and then became principal of Manchester College, Oxford, one of the foremost independent theological seminaries in England. He translated Ewald's *History of Israel* (1867-74, with Russell Martineau) and Tiele's *Outlines of the History of Religion* (1877), and wrote: *The First Three Gospels: Their Origin and Relations* (1890); *The Composition of the Hexateuch* (1900); *The Bible in the Nineteenth Century* (1903); *The Historical Jesus and the Theological Christ*; and a manual on *Comparative Religion* (1913). With Rhys Davids he edited *Dīgha Nikāya* (1890; 1902) and the *Sumangala Vilāsini* (1886).

CARPENTER, LANT (1780-1840). An English Unitarian minister. He was born in Kidderminster, studied at the University of Glasgow, taught school from 1803 to 1805, and was employed in the Liverpool Athenæum. He then be-

came pastor of a church in Exeter and in 1817 removed to Bristol. He taught at Exeter and had Harriet and James Martineau among his pupils in Bristol. He was much interested in the religious instruction of children and established several Sunday schools. He did much to broaden the spirit of English Unitarianism. He rejected the rite of baptism as a superstition and substituted a form of infant dedication. Among his works are: *Unitarianism, the Doctrine of the Gospel* (1809); *Systematic Education* (2 vols., 1815); *Examination of the Charges Made against Unitarianism* (1820), a reply to William Magee, Archbishop of Dublin; and *Principles of Education* (1820). Consult his *Memoirs*, ed. by his son, R. L. Carpenter (London, 1842).

CARPENTER, LOUIS GEORGE (1861-). An American irrigation engineer, born in Orion, Mich. He graduated in 1879 at the Michigan Agricultural College, studied at Johns Hopkins University, and was assistant professor of mathematics and engineering at the former institution in 1881-88, when he was appointed professor of engineering and physics at the Colorado Agricultural College. He was special agent of the United States artesian-wells investigation in 1890; founded the American Society of Irrigation Engineers in 1891, and in 1899 was appointed director of the agricultural experiment station at the Colorado Agricultural College. The first systematic instruction in irrigation engineering given in any American college was organized by Professor Carpenter.

CARPENTER, MARY (1807-77). An English philanthropist, the eldest child of the Rev. Dr. Lant Carpenter (q.v.). She took an active part in the movement in behalf of orphaned or neglected children, and besides advocating their cause in her writings, founded several reformatories for girls, one of which, the Red Lodge Reformatory, she superintended. In the prosecution of her philanthropic labors she visited India three times, and in 1871 organized the National Indian Association, whose journal she edited. Among her intimate friends were Harriet Martineau and Frances Power Cobbe, the latter being for some time associated with her at Red Lodge. She published: *Reformatory Schools* (1881); *Juvenile Delinquents* (1853); *Our Convicts* (2 vols., 1864), a book which drew public attention to the treatment of young criminals; and *Six Months in India* (2 vols., 1868). Consult J. E. Carpenter, *Life and Work of Mary Carpenter* (London, 1879).

CARPENTER, MATTHEW HALE (1824-81). An American lawyer and politician, born in Moretown, Vt. He spent two years in the United States Military Academy, studied law with Rufus Choate, and in 1848 settled in Wisconsin. He was remarkably successful as a lawyer, and was especially notable for his defense of W. W. Belknap, Secretary of War, when the latter was impeached by the House of Representatives, and for his argument in favor of Samuel J. Tilden before the Electoral Commission (q.v.). Carpenter was twice elected United States Senator from Wisconsin, serving from 1869 to 1875 and again from 1879 until his death. Consult F. A. Flower, *Life of Matthew Hale Carpenter* (Madison, Wis., 1883).

CARPENTER, ROLLA CLINTON (1852-). An American engineer. He was born at Orion, Mich., and graduated from the University of Michigan in 1875. From 1875 to 1890 he was

professor of mathematics and civil engineering in the Michigan Agricultural College, where he also had charge of the mechanical department from its organization until 1888. In 1890 he was appointed professor of experimental engineering at Cornell University, also conducting the laboratory of the department of experimental mechanics and research. He was president of the Michigan Engineering Society in 1889; chairman of the national committee for the education of engineers in 1891; and president of the American Society of Heating and Ventilating Engineers (1898). In addition to numerous scientific papers, he has published the following works: *Instructions for Mechanical Laboratory Practice*; *Text-Book of Experimental Engineering* (1892); *Heating and Ventilating Buildings* (1910).

CARPENTER, WILLIAM BENJAMIN (1813-85). An English physiologist, born at Exeter, a son of Lant Carpenter. Soon after his graduation in Edinburgh, in 1839, he published his *Principles of General and Comparative Physiology*, afterward divided into *The Principles of Comparative Physiology* and *The Principles of General Physiology*. These works, together with *The Principles of Human Physiology* (1846) and *The Principles of Mental Physiology* (1874), form a perfect cyclopædia of the biological science of this period. Carpenter likewise published: *A Manual of Physiology*; *The Microscope: Its Revelations and its Uses* (6th ed., 1881); a prize essay upon *The Use and Abuse of Alcoholic Liquors* (1851). His most important original researches are: *On the Structure of Shells*; *On the Development of Purpura Lappillus*; *On the Structure, Functions, and General History of the Foraminifera*. His published works also include: *Zoölogy and the Instincts of Animals* (1857); *Physiology of Temperance* (1870); *Mesmerism and Spiritualism* (1877); *Nature and Man* (1888). He edited the *British and Foreign Medico-Chirurgical Review* and was one of the editors of the *Natural History Review*. He took a chief part in the government expedition sent out in 1868-70 for deep-sea exploration in the northern Atlantic, and contributed largely to the discussion of the vexed question of ocean circulation. He advocated the doctrine of a *vertical circulation*, sustained by opposition of temperature only, independent of and distinct from the *horizontal* currents produced by winds. This doctrine was first advanced by Professor Lenz, of St. Petersburg, in 1845; but Dr. Carpenter was ignorant of this when the deep-sea observations, begun in 1868, led him to an identical theory.

CARPENTER, SIR WILLIAM BOYD (1841-). An English clergyman of the Established church, Bishop of Ripon. He was born in Liverpool, was educated at the Royal Institution, Liverpool, and St. Catharine's College, Cambridge, and was appointed Hulsean lecturer at Cambridge in 1878. In 1887 he was appointed Bampton lecturer at Oxford, and in 1895 pastoral lecturer on theology at Cambridge. He held several curacies, was vicar of Christ Church, Lancaster Gate, from 1879 to 1884, canon of Windsor in 1882-84, and after 1884 Bishop of Ripon. In 1904 and 1913 he visited the United States and delivered the Noble lectures at Harvard. He was chaplain in ordinary to Queen Victoria, Edward VII, and George V. His publications include: a *Commentary on Revelation* (1879); *Permanent Elements of Religion*

(Bampton lectures, 1889); *Lectures on Preaching* (1895); *a Popular History of the Church of England* (1900); *Witness to the Influence of Christ* (1905); *Some Pages of my Life* (1911); *Life's Tangled Thread* (1912); *The Apology of Experience* (1913).

CARPENTER, WILLIAM HENRY (1853-). An American philologist, born at Utica, N. Y. He was educated at Cornell and Johns Hopkins, Leipzig and Freiburg universities. In 1883 he was instructor in rhetoric and lecturer on northern European literature at Cornell. In the same year he was called to Columbia and there he rose to be adjunct professor of Germanic languages and literature in 1890, professor in 1895, and Villard professor of Germanic philology in 1902, and later also provost of Columbia University. He was chosen vice president of the Germanistic Society of America. His publications include: *Grundriss der neuisländischen Grammatik* (1881); *Nikolasdrapa Halls Prest, An Icelandic Poem from A.D. 1400* (1881); *Some Conditions of American Education* (1911). Professor Carpenter was also a contributor to the NEW INTERNATIONAL ENCYCLOPÆDIA and other reference works.

CARPENTER BEE. A solitary bee that excavates its nest in solid wood, in a dead twig, or in the pith hollow of various plants; it represents in the United States various species of Ceratinidæ and Xylocopidæ. The former are smooth, active, flylike little bees, usually metallic blue or green, of which the *Ceratina dupla*, one-quarter inch long, is a familiar example. It bores tunnels into the stems of pithy plants, and especially of brambles. This tunnel is divided into small compartments by partitions made of agglutinated pith. An egg, together with some pollen, is inclosed in each compartment until the entire burrow is filled save a small space at the entrance just large enough to contain the parent female, where she awaits the hatching of her children. The hatching occurs in each compartment in succession, beginning with the bottom, each bee tearing out the partition of its own cell and awaiting the birth of the bee above it. When all are ready, the female sallies forth with her brood and soon after arranges for a second. The large carpenter bees of the family Xylocopidæ are represented all over the northern United States by *Xylocopa virginica*, which is as large and noisy as a bumblebee, but differently colored, and on its hind legs bearing tufts of hair instead of pollen baskets. This bee bores its tunnels, which are nearly half an inch in calibre, in solid wood, such as that of dead timber, dry stumps, fence posts, and unpainted woodwork about houses and outbuildings; it is therefore easy to observe the method in detail. A short perpendicular entrance made across the grain leads into the centre of a burrow following the grain, which may be 18 inches long, requiring a month's labor. The raspings formed in excavation are agglutinated, probably by salivary excretions, into partitions dividing the burrow into cells about two-thirds of an inch long, in which the eggs are placed together with balls of pollen and nectar. Several bees may use the same entrance to the tunnel and several chambers may run parallel, but usually they run in opposite directions from the common door. These bees will often utilize an old burrow to save the great labor of digging, and would do so more regularly, perhaps, did they not often find them already preempted by other kinds

of insects. See BEE, and see Plate of WILD BEES.

CARPEN'TORAC'TE. See CARPENTRAS.

CARPENTRAS, kâr'päN'träs' (ancient *Carpentoracte*, of Celtic origin). A town in the Department of Vaucluse, France, on the left bank of the Auzon, at the foot of Mount Ventoux, 16 miles by rail northeast of Avignon (Map: France, S., K 4). It contains a number of Roman remains, including a small triumphal arch. It has also an old cathedral, an episcopal palace (now used as a palais de justice), a museum containing a collection of Phœnician bas-reliefs, old fortifications, notable among which is the Port d'Orange, a theatre, and a library of 50,000 volumes. The chief products are leather, wax, chemicals, and fruit. Carpentras also has a considerable trade for its manufactures of silk, dyed fabrics, and hats. Pop. (commune), 1896, 8391; 1901, 10,443; 1911, 11,390.

CARPENTRY. The putting together the parts of a wooden building, or the wooden parts and members of a composite building. (See BUILDING.) It is distinguished from cabinet-work (q.v.) and joinery (q.v.) in that it deals with the larger and heavier sorts of woodwork, while these deal with the finer sorts of woodwork and the lighter forms of construction. The framework of a building and its covering and flooring, the casings of doors and windows, often the doors and windows themselves, are framed and set by the carpenter. In America he also puts in place much of the finer finish and cabinet-work, even when made by others—trim, wainscot, platforms, molds, etc. The carpenter is a skilled craftsman, as his work requires fine tools, careful measurement, and accurate adjustment. For fastening his work he uses chiefly nails and screws; the old-time wooden trenail or pin in heavy structural work has been generally replaced by spikes and bolts. A large part of the woodwork of modern buildings is now made in mills, especially doors, windows with their boxing, blinds and shutters, and moldings of all profiles; these the carpenter or contractor orders as needed, and they are set in place by the carpenter. Stairs and balustrades are also frequently made, and sometimes set up, by special craftsmen, called stair builders.

The mediæval half-timber (q.v.) construction is rarely employed in modern work, at least in America. Where wood abounds as the cheapest material for housebuilding, the carpenter constructs a framework of vertical timbers (the heavier ones called posts, the lighter ones studs) for the walls, resting upon heavy horizontal sleepers (sills) laid on the foundation walls or "underpinning," and of horizontal beams for the floors (the heavier ones called girders, the lighter ones joists), with inclined beams (rafters) for the roof. This framework is covered with boards (sheathing), over which is nailed the outer covering of overlapping boards (siding, clapboards) or shingles, sometimes with an intervening layer of tarred paper, "roofing felt," or like material. The outside trim of doors, windows, cornices, etc., is generally the last to be set up on the exterior. Underflooring of boards is nailed to the joists; "grounds" and laths to the inner faces of the studs, to receive the plastering, doors and windows are hung, the finished stairs set up, the finished flooring of hard wood or of softer wood in narrow strips is nailed to the underflooring, and after the plastering is finished the inside "standing finish" of trim, wain-

scot, baseboards, mantelpieces, etc., is put in place. Figures 1 and 2 show the commonest type of house framing used in the United States,

merely "toenailed" to them. In what is called the "full frame" heavy posts are set up at intervals and strongly braced to the sills and plates, and the intervening studs are interrupted at each story by heavy girders from post to post. In Europe heavier timbers are used than is customary in America. Joists in the United States are deep and thin (2×8 , 3×10 , 3×12 inches, etc.), spaced 12 or 16 inches apart and stiffened by cross bridging at every 6 feet; in Europe heavier joists, often square timbers, are sometimes used without bridging.

The various forms of joints for connecting timbers end to end (splicing, halving, scarfing, etc.) and for framing timbers to each other at right angles (mortise and tenon, notching, halving, mitre and tongue, etc.) are too numerous and complex to be described in a short article; a few of them are shown in Figs. 3 and 4; while Figs. 5 and 6 illustrate typical joints

FIG. 1. BALLOON SIDE AND FLOOR FRAMING.

known as the balloon frame, employing for the walls continuous light studs (2×4 or 3×4 inches in section) and posts (6×4 inches) at the corners. A ribbon or girt, "halved" into the studs, receives the wall ends of joists of intermediate stories, and a plate, usually of two 2×4 pieces superposed, receives the rafters and ties or joists of the roof. On such a frame the

FIG. 2. BALLOON ROOF FRAMING.

sheathing is often nailed diagonally to stiffen and brace it; but in a better class of work strong diagonal bracing is introduced into the frame itself, and the studs and posts are mortised into the sills and girders instead of being

employed in the finer kinds of carpentry as well as in cabinetwork.

Ship Carpentry is a distinct form of carpentry, dealing with large timbers, chiefly of oak, hackmatack, teak, and yellow pine, which

must be shaped to the curved lines of the vessel, partly by means of "steaming and bending," partly by hewing with the adze and axe. The planking with which the frame of keel, keelson, ribs, knees, and deck beams is covered is proportionately heavier than in house carpentry, and must be bent, adzed, and planed to the proper curved surface, after the edges have been hewn to the proper shape and bevel to make close joints. The development of iron and steel shipbuilding has resulted in confining ship carpentry chiefly to the construction of the smaller types of vessel, especially yachts, coasting schooners (some of these, however, of great size), and barges, canal boats, and scows. See SHIPBUILDING.

Bibliography. Consult bibliography of BUILDING; also Fletcher and Fletcher, *Carpentry and Joinery for Architects, etc.* (London, 1898); Hatfield, *The American House Carpenter* (New York, 1880); Hodgson, *Modern Carpentry and Joinery* (New York, 1906); Jacoby, *Structural Details, or Elements of Design in Heavy Framing* (New York, 1909); Riley, *Manual of Carpentry and Joinery* (New York, 1906). Also article "Charpente" in Viollet-le-Duc, *Dictionnaire raisonné de l'architecture française* (Paris, 1876).

CARPETBAGGERS. A term of contempt applied by the people of the Southern States to those who came from other parts of the Union to live in the South, or to transact business there, after the close of the Civil War; but applied particularly to those Northern political adventurers who, by the aid of the negro vote, gained control of the State governments in the South; the term also includes those who came to make money by irregular and sometimes criminal means out of the corrupt governments (called carpetbag governments) of the Reconstruction period. (See RECONSTRUCTION.) The term was originally used to designate the "wild-cat" bankers of the West, who defrauded the people and could never be found when wanted; and, by extension of meaning, is sometimes applied to those who drift about from place to place and have no fixed residence.

CARPET BEETLE or BUG, or BUFFALO MOTH. An imported dermestid (*Anthrenus scrophulariæ*), whose destructive larvæ, first noticed

wing covers; it is thus frequently confused with the much larger and harmless ladybird beetle, that also at times seeks refuge in houses during winter. It feeds on the pollen of flowers. The larvæ are short, fat, hairy grubs, and may be found under the edges of carpets, along seams, in floor cracks, and particularly beneath heavy furniture. They feed on the carpet materials, on the lint that collects under matting and in cracks, and on woolen clothing and furs. Pyrethrum powder sprinkled in places frequented by them is helpful. The carpets of infested houses should not be tacked down, but placed so that they may be examined frequently. Pieces of woolen cloth on closet floors act as traps to attract and collect the larvæ. Infested clothing may be cleared by shutting it up in tight boxes and subjecting it to the fumes of carbon bisulphide. Clothing packed away in tight receptacles with a plentiful supply of naphtha balls is rarely disturbed by the beetles. Two other species of this same genus (*Anthrenus varius* and *Anthrenus museorum*) are great pests of insect, bird, and other museum collections. Consult Howard and Marlatt, *Household Insects* (Department of Agriculture, Washington, 1896). See DERMESTID BEETLES.

CARPET MOTH, SNAKE, ETC. The word "carpet" is often adjectivally applied to animals in the sense of "variegated." Thus a "carpet moth" is one of the geometrids having varied and lively ornamentation; but a carpet-eating moth, as *Tinea tapetzella* (see CLOTHES MOTH), may also be meant. In Australia a scylloid shark (*Crossorhinus barbatus*) is called "carpet shark," and the big, harmless pythonoid snake (*Morelia variegata*), so common in the same country, is everywhere known as "carpet snake." An American instance is found in California, where the beautifully marked little edible clam (*Tapes staminea*) of the Pacific coast is known as the "carpet shell."

CARPETS AND RUGS. In the United States by carpets is usually meant carpeting 27 inches (ingrains 36 inches) wide, cut into lengths, sewed together, and tacked down, completely covering the floor of a room, except the space occupied by hot-air registers; by rugs is meant one-piece or seamless floor coverings, usually rectangular but sometimes round or oval, that leave part of the floor uncovered (at least a foot around the outside), and not being tacked down can be easily removed for cleaning. Imitations of one-piece rugs are also made out of strips of carpeting sewed together, usually so woven that these seamed rugs have an outside border like the seamless ones. In England large rugs are called "carpets," while in the United States they are often spoken of as "of carpet size."

The word "carpet" is derived from ML. *carpita*, meaning a "villose or thickish cloth," in other words, a heavy-pile fabric. In Chambers' Cyclopædia (1727-51) "carpet" is defined as "a sort of covering . . . to be spread on a table, trunk, an estrade, or even a passage or floor," "estrade" being an old word for "dais" or "raised platform"; so that we should not be surprised at finding that "on the carpet," like the French "sur le tapis," means not "on the floor," but "on the table"; and at the same time that "knight of the carpet" is so called because dubbed, not in the field, but on the "carpet or cloth usually spread," in the sixteenth century and earlier, before the throne of the sovereign or lord, and that once when servants were summoned before

CARPET BEETLE — LARVA AND ADULT STATES.

in the United States at Buffalo, N. Y., about 1872, have become a widely scattered household pest. The adult beetle is about one-eighth inch long, and covered with scales of black, white, and red, with white spots on the prothorax and

the master for reprimand, they were said "to walk the carpet."

In the Orient carpets, whether for floor, couch, table, or wall, have usually been pile fabrics knotted by hand, although soumaks and kelims (both flat without pile, the former made by twisting wefts around pairs of warps, forward over four, back under two; the latter figured reps in real tapestry weave) are also employed. In the Occident, during the Middle Ages and later, the most common floor coverings were coarse tapestries and ingrains.

For a long time the use of imported Oriental pile rugs and of domestic hand-knotted pile rugs was confined to the very rich. Finally, in the middle of the eighteenth century, the invention at Wilton in England of Brussels carpeting, in imitation of floor tapestries, of which Brussels was then the chief centre of production, as it had formerly been of pictured wall tapestries, and the later invention of Wilton carpeting, in imitation of hand-knotted pile rugs, extended the use of carpets widely. Both Brussels and Wilton carpeting are woven usually the width of the old Flemish ell (27 inches, or three-quarters of a yard, which explains why they are called "three-quarter goods"), and the wefts are carried by shuttles all the way across the warp, instead of by hand-passed bobbins only part way, as in tapestries. The back of both Brussels and Wilton carpeting consists of warp and weft of cotton or jute, whose function it is to bind fast and serve as an inexpensive body for the extra warps of worsted that, as the weaving progresses, are looped over wires forming the ridges or ribs of Brussels. The cutting of the loops makes Wilton. The figures are formed by six or fewer warps of different colors that are buried in the body when not wanted on the surface. Wilton carpets and rugs (the larger sizes usually seamed), though having a comparatively short pile, from one-quarter to three-eighths of an inch, are the best and most durable of the machine-made goods. They are woven in better qualities and with more wool than Brussels carpets and rugs and cost much less than the superior chenille Axminster. The Wilton patterns are largely Oriental, or at least adapted and simplified from Oriental originals, and average much better than those of Brussels, some of which are still French. However, it is to the spool Axminster that one must turn for Gallo-American designs of the pronounced and obtrusively Baroque and Rococo types. As far as other American carpets and rugs are concerned, the Orientals have things all their own way, with comparatively little competition even from simple modern designs of the type now favored in Germany and Austria. But solid colors are popular in Wiltons, and two and three tone effects in chenille Axminsters and hand-knotted rugs.

Tapestry and velvet carpets and rugs are in their origin merely cheaper imitations of Brussels and Wilton, having only one worsted warp instead of several, and consequently being most economical of the expensive material. Tapestries and velvets are of two types—warp printed and piece printed, or, as they say in the trade, drum printed and machine printed. Warp printing dates from the second quarter of the nineteenth century, while successful piece printing is comparatively recent. The warp prints, as the name implies, have the pattern printed on the warp before weaving, the distortion of the designs due to looping up over the wires having been

calculated against beforehand. The piece prints are woven plain or "in the natural" and printed in the piece after weaving. In order to emphasize the quality of Brussels and distinguish them from tapestries, they are often called "body Brussels," while velvets are sometimes dubbed "Wilton velvets" in order to make them sound better than they are. Tapestry and velvet rugs are usually seamless.

Besides Brussels, Wilton, tapestry, and velvet, the principal types of carpets and rugs found in the shops of to-day are ingrain, Aubusson, savonnerie, spool Axminster, chenille Axminster, Smyrna, rag, fibre, and grass. Rag rugs are seamless, with cotton string warps, and body and surface of coarse twisted-rag wefts. Fibre and grass rugs are similar in weave. Ingrains have cotton string warps that are entirely concealed by the two or three sets of heavy worsted weft threads in pairs. When there are two wefts, the red one appears on the face where the green one shows on the back. When there are three, one is always buried. Seamless ingrain rugs are called art squares. Solid-color ingrain carpeting is called terry, or filling. The use of figured ingrains that 60 years ago was common throughout the United States is now confined to the rural districts. Patterns once famous that still survive are Henry Clay, Eagle Head, and Martha Washington. Henry Clay shows a huge, conventionalized floral, evidently copied remotely from some ancient Roman floor of marble tiles with metal inlay. Eagle Head not only shows the two-headed bird that crowns the coats of arms of Russia, of Austria, and of the old Holy Roman Empire superseded by Napoleon in 1806, but also two lyres of classic shape and suggestion. Martha Washington is more modest, appealing to a less classic and less learned taste.

Of Brussels and Wilton carpets and rugs, the intricacy of the pattern is limited by the number of colored worsted warps (never more than six). Not so with moquettes and spool Axminsters, commonly called Axminster (without the spool). The ingenious loom on which they are woven makes it possible to insert a loop of any desired color at any point. The texture of these Axminsters is loose, soft, and very agreeable.

Smyrna rugs, on account of their Oriental patterns, luxurious texture, and seamlessness, were exceedingly popular 20 years ago. They are the result of two weavings—the first producing chenille cords, the second inserting these chenille cords as extra weft in a body of cotton or jute warp and weft, with the chenille fuzz or pile showing on both sides and making a double-faced fabric exactly alike on both sides. Smyrnas are woven without seam up to 12 by 18 feet, but of course the patterns are necessarily much simplified from even the coarsest Orientals.

Chenille Axminster rugs are made like Smyrnas, except that the chenille cord is steamed and flattened into a chenille braid with fuzz on one side only, so that they are one-faced like Oriental rugs and Wiltons and velvets. Although the weave is theoretically not limited as to colors, chenille Axminsters are made mostly with plain fields and in two and three tone effects and any size or shape. The pile of some is seven-eighths of an inch thick, with five-eighths as the average and three-eighths the least expensive. Although several American factories make them, they are

largely imported from England, Scotland, Germany, and Austria. The finest materials are used.

As most real-tapestry rugs are now woven in the little town of Aubusson in central France, Aubusson has become the trade name for them. Savonneries are hand-knotted pile rugs made in France in French patterns. They get their name from the factory founded by Pierre Dupont in 1627 in the ancient soap works (*savonnerie*) at Chaillot, transferred in 1827 to the Gobelins, where it is still active. The name is also given to hand-knotted pile French rugs made at Aubusson and elsewhere.

Hand-knotted rugs were made in Europe at least as early as the thirteenth century by the Saracens of southern Spain. That they were probably made in England as early as the sixteenth century is shown by the examples that survive. Lord Verulam has one with the letters E. R. (Elizabeth Regina) intertwined in the royal arms of England and dated 1570. In the Victoria and Albert Museum is one with the inscription "Feare God and Keep His Commandments, made in the yeare 1603." Hand-knotted rugs are now made at Wilton, but called Axminsters from the little Devonshire village where the factory was first established. About 30 years ago the industry was started in the United States, at Milwaukee, by a German weaver who had learned the art at home. A loom was brought from Germany, others were made like it, and finally all were moved from Milwaukee to New York, where they continued in operation for about 20 years, but with practically no profit. A branch factory established in Elizabethport, N. J., by the English proprietors of the English factory at Wilton was active about five years.

However, the history of the manufacture of carpets and rugs in the United States begins in Colonial days, when each village had its weaver to whom the thrifty housewives brought their parti-colored balls of rags sewed together in long strips. As late as 1890 there were in the United States 854 rag-carpet factories, with an annual output valued at \$1,714,480. To-day there are several important factories making carpets and rugs out of new rags and for the trade. The first American factory for the manufacture of yarn carpets was started in Philadelphia in 1791 by W. P. Sprague. A second factory was started in 1804 at Worcester, Mass., by Peter and Ebenezer Stowell. By 1840 about 1500 looms were in operation, the majority making ingrain. In 1841 came an invention that, combined with the Jacquard attachment already in use, transformed the industry. Erastus Bigelow, a young medical student of Boston, harnessed an ingrain loom successfully to steam power and increased the 8 yards a day possible on the hand loom to 10 yards and later to 25 yards. He also patented a power loom for weaving Brussels and Wilton carpeting and another for weaving tapestry carpeting.

In 1899 the United States had 133 carpet factories (not including rag carpets) operating 10,754 looms and producing 72,344,732 yards of carpet valued at \$48,192,351. In 1850 the value of the total output was only \$5401,234. In 1909 it was \$71,188,152, from 139 establishments, of which 93 were in Pennsylvania, 16 in New York, 11 in Massachusetts, 9 in New Jersey, and 10 in other States. In value of output New York led, with \$25,606,262 as against

\$24,879,232 for Pennsylvania and \$12,811,981 for Massachusetts.

Tapestry and velvet rugs contributed largely to the increase in the seamless-rug production from 12,171,289 square yards in 1899 to 24,042,152 in 1909, more than doubling, and in value increasing 50 per cent, while the production of carpeting declined. In 1909 the number of carpet and rug looms of all classes had increased to 11,943, of which only 207 were hand looms, decreasing from 9.7 per cent of the total in 1899 to 1.7 per cent in 1909. The feature of the decade was the increase in the production of Axminster carpets from 5,026,778 to 12,507,261 square yards (148.8 per cent) and from a value of \$4,762,269 to \$13,680,806 (187.3 per cent), and Axminster rugs from 327,598 to 3,184,097 square yards (872 per cent) and from a value of \$342,262 to \$3,691,900 (978.7 per cent), while ingrain carpeting decreased from 39,920,849 to 17,799,762 square yards (55.4 per cent) and from a value of \$14,368,930 to \$6,749,672 (53 per cent), and ingrain art squares increased from 2,722,323 to 6,131,862 square yards (125.2 per cent) and from a value of \$1,175,951 to \$2,408,960 (104.9 per cent). The production of Wilton carpets and rugs also increased largely to a total of 5,343,616 square yards and a value of \$10,019,330. See RUG.

Phillips Bevan* (London, 1876); Dareel et Guiffrey, *La stromaturgie de Pierre Dupont: Documents relatifs à la fabrication des tapis de Turquie en France au XVII^e siècle* (Paris, 1882); James Christie, *Catalogue of Elegant Brussels, Wilton, Venetian, and Kidderminster Carpets Sold by Auction by Mr. Christie* (London, 1800); "Oriental and Domestic Rugs: Their Origin, Manufacture, and Marketings," Supplement to the *American Carpet and Upholstery Journal* (Philadelphia, February, 1903); Fred. Bradbury, *Carpet Manufacture* (Boston, 1904); the chapters on "Carpets" and "Rugs" in G. L. Hunter's *Home Furnishing* (New York, 1913).

CARPET SWEEPER. A device for sweeping carpets, consisting of a revolving brush inclosed in a wooden or metal dustpan. Its obvious advantage, in addition to great ease of operation, is that it picks up and confines the dust as it is gathered. Where power or electric current is available, the mechanical carpet sweeper has been largely replaced by the vacuum cleaner, where the dust is removed by suction. See BRUSHES AND BROOMS; VACUUM CLEANER.

CARPI, kâr'pè. A town in the Province of Modena, Italy, 11 miles by rail northwest of Modena (Map: Italy, E 3). It contains two cathedrals, a castle, a theological seminary, and a theatre. It is the seat of a bishop and was once the capital of the Principality of Carpi. The chief industry is the cultivation of the silkworm. Pop. (commune), 1881, 5987; 1901, 18,788; 1911, 27,465.

CARPI, Ugo di (c.1480-c.1523). An Italian painter and engraver. His teachers in painting and engraving are unknown, and his paintings, none of which have survived, seem to have been of a mediocre character. His chief importance consists in his claim that he was the inventor of chiaroscuro engraving, as he asserted in a

letter to the Venetian Senate in 1516. (See WOOD ENGRAVING.) It is certain, however, that the art was practiced at an earlier date in Germany, for prints designed by both Lucas Cranach and Jobst de Negker antedate his. In any case the process received the name of chiaroscuro from him, and he greatly improved it artistically. Only 12 of the 18 plates ascribed to him are authenticated; among the best are "The Massacre of the Innocents" and "Man in Conversation with a Woman" after Raphael, and "Diogenes" after Parmigiano.

CARPINCHO, kār-pēn'chō. See CAPYBARA.

CARPIO, kār'pyō, BERNARDO DEL. See BERNARDO DEL CARPIO.

CARPIO, MANUEL (1791-1860). A Mexican poet, physician, and man of affairs, born at Cosamaloapán, a town in the Province of Vera Cruz. He studied medicine and translated the *Aphorisms* of Hippocrates (Mexico, 1823). He occupied the chair of physiology and hygiene in the Medical College of Mexico. Then he entered politics, represented his country in the Legislature of Vera Cruz, and became senator and Councilor of State, 1853. His *Poesías* and collected poems have gone through several editions; the best is that which appeared in Vera Cruz and Paris in 1883. In his poetic works he shows a cosmopolitan first-hand knowledge of the classics of Latin, Spanish, Italian, and French, which he read in the originals. At his funeral the public of Mexico City gave a spontaneous manifestation of its sense of loss.

CARPOCRATES, or **CARPOCRAS** (Gk. Καρποκράτης, *Karpokratēs*, or Κάρποκρας, *Karpo-kras*). The founder of the Gnostic sect of Carpocratians. He flourished under Hadrian (c.130 A.D.) at Alexandria. For him the essence of true religion consisted in the union of the soul with the Monas, the Supreme Unity, or highest God, by means of contemplation, which elevated it above the superstitions of the popular faith and liberated it from the necessity of submitting to the common laws of society. Only he is to be reckoned wise who attains this union. Among those who have done so are Jesus, Pythagoras, Plato, and Aristotle. He believed that the worlds were created by angels, who were out of harmony with the Supreme Unity. Carpocrates also held the doctrine of the transmigration of souls. His followers existed down to the sixth century.

CARPOLITH, or **CARPOLITES** (Fr. *carpolithe*, from Gk. καρπός, *karpos*, fruit + λίθος, *lithos*, stone). A fossil fruit of which the exact botanical relation is unknown. All these fruits and seeds of uncertain affinities are grouped together in the genus *Carpolites*, which comprises a very heterogeneous assemblage of fossils that vary greatly in respect of form and size. Many species from the Carboniferous rocks, originally described as *Carpolites*, have been more recently recognized as the seeds of gymnosperms, and have been distinguished under new generic names, such as *Cardiocarpum* and *Rhabdocarpum*, which are the seeds of the fossil *Cordaites*. Others from the Carboniferous and Permian rocks, and known as *Trigonocarpum*, may be the seeds of conifers allied to the modern ginkgo. Those *Carpolites* of Tertiary age comprise seeds of all forms, such as achenes, winged fruits, capsules, etc., and they occur in abundance in the Tertiary rocks of some regions of North America and Europe, as at Florissant in Colorado and at Oeningen in Saxony.

CARPOPHYTE (from Gk. καρπός, *karpos*, fruit + φυτόν, *phyton*, plant, from φέειν, *phyein*, to produce). An old term of classification. It includes all those thallophytes, whether algæ or fungi, that produce complex spore cases (sporangia). It would include, therefore, among the algæ, chiefly the stoneworts and the red algæ; and among the fungi, the ascomycetes and basidiomycetes.

CARPOSPORE (Gk. καρπός, *karpos*, fruit + σπορά, *spora*, seed, from σπείρειν, *speirein*, to scatter). The name of one of the spores produced in the life history of the red algæ. Among the red algæ in general, two kinds of spores appear, tetraspores and carpospores. The tetraspores produce plants that bear the sex organs, i.e., are sexual plants. As a result of the act of fertilization, a fruitlike body is produced, called a cystocarp, and it is within this body that the carpospores are produced. When carpospores germinate, they give rise to sexless plants that produce the tetraspores. See RHODOPHYCEÆ and ALGÆ.

CARP SUCKER (on account of the superficial resemblance to a carp). A fresh-water catostomid fish of the genus *Carpionodes*, found in the interior of the United States. It is allied to the suckers and buffalo fishes, of which the common *Carpionodes cyprinus*, called also quillback, spearfish, skimback, etc., is a prominent example. All are of carplike form and habits, plain olive green above and silvery beneath, and from 1 to 3 feet in length, and have no great value as food or for sport. See Plate of SUCKERS.

CARPUS, CARPAL BONES. See HAND; FOOT; SKELETON.

CARQUINEZ, kār-kē'nēs, **KARQUINES**, or **KARQUENAS**, kār-kē'nās. A strait in California forming a portion of the boundary line between Contra Costa and Solano counties, and connecting Suisun and San Pablo bays (Map: San Francisco). It is 7 miles in length and its width in some parts is nearly 2 miles. It is navigable for large vessels. Benicia is on the north and Martinez, Port Costa, and Crockett are on the south shore. The drainage from the valleys of the Sacramento and the San Joaquin passes through the strait.

CARR, EUGENE ASA (1830-1910). An American soldier, born in Erie Co., N. Y. He graduated at West Point in 1850, entered the mounted rifles, and served against the Indians until 1861, when he received command of the Third Illinois Volunteer Cavalry. During the Civil War he saw much service in the Southwest, led an assault at Port Gibson in the Vicksburg campaign in 1863, and rose in rank until, at the close of the war in 1865, he was brevetted major general. Subsequently he conducted successful operations on the frontier against the Indians, and became colonel in the regular service in 1879, and brigadier general in 1892, a rank which he held at the time of his retirement in 1893.

CARR, JOSEPH BRADFORD (1828-95). An American soldier, born in Albany, N. Y. He was appointed lieutenant colonel of the Second New York Volunteers in April, 1861, at the outbreak of the Civil War, took part in the engagement at Big Bethel, served under McClellan throughout the Peninsular campaign, and on Sept. 7, 1862, was promoted to be brigadier general for gallantry at Malvern Hill. He subsequently participated in the battles of

Fredericksburg and Chancellorsville, commanding a division during a part of the latter; was distinguished for gallantry at Gettysburg; and in 1865 was brevetted major general of volunteers. After the war he became a manufacturer in Troy, N. Y., and took an active part in State politics, being the candidate of the Republican party for several offices, and serving as Secretary of State from 1879 to 1885.

CARR, LUCIEN (1829-1915). An American archaeologist, born in Lincoln Co., Mo. From 1876 to 1894 he was assistant curator of the Peabody Museum of American Archaeology in Cambridge, Mass. With Prof. N. S. Shaler of the Lawrence Scientific School he wrote *Prehistoric Remains of Kentucky*. Among his independent publications are *The Mounds of the Mississippi Valley* (1883) and an historical volume on *Missouri* (1888).

CARR, ROBERT, VISCOUNT ROCHESTER, EARL OF SOMERSET (?-1645). The worthless favorite of James I of England. He was a younger son of Sir Thomas Ker (Carr), of Ferniehurst, Scotland. In 1603 he followed the King to England in the capacity of page; but he was presently discharged, retiring for a short time to France. He soon returned to the court, and in 1604 a mishap in a tilting match brought him to the attention of the King, who was struck by his pleasing appearance. James had a strong predilection for youthful male beauty; and besides he was desirous of freeing himself from the control of the Council, so that he might in effect become his own minister. To accomplish this purpose an old unconstitutional instrument was employed. He substituted a favorite for his constitutional adviser. Carr was loaded with wealth and honors. In 1607 he was knighted. Two years later he received Raleigh's confiscated manor of Sherborne. He became Viscount Rochester in 1611 and Earl of Somerset in 1613. He was the sole medium of the royal favor and authority, although he was devoid of every statesmanlike quality and had only his good looks and high animal spirits to commend him.

In the meantime he became enamored of Lady Frances Howard, wife of the Earl of Essex. Through the influence of the King and her relatives, the Earls of Suffolk and Northampton, heads of the powerful Howard family, Lady Frances succeeded in having her marriage with Essex annulled by a special commission; and soon thereafter, on Dec. 26, 1613, she married the newly created Earl of Somerset. The latter's influence had already begun to wane before that of George Villiers, when, in 1615, the murder of Sir Thomas Overbury, who had died of poison in the Tower in 1613, came to light. Overbury had enjoyed the confidence of Carr, then Viscount Rochester, during the amorous intrigue with Lady Essex, who later, actuated by fear or dislike, determined to put him out of the way. The Earl and Countess of Somerset were tried for the murder, and both were condemned to death. The Countess pleaded guilty; but the complicity of Somerset in the crime has never been clearly established. Both received the royal pardon. Somerset lived in obscurity until his death in 1645. Consult: Ranke, *History of England, Principally in the Seventeenth Century*, vol. i (Oxford, 1875); Gardiner, *History of England*, vol. ii (London and New York, 1889); the latter's article in *Dictionary of National Biography*, vol. ix; and

Archbishop Abbot, *The Case of Impotency . . . in that Remarkable Tryal An. 1613, Between Robert, Earl of Essex, and Lady Frances Howard* (London, 1715); Amos, *The Great Oyer of Poisoning* (London, 1846).

CARR, SIR ROBERT (?-1667). One of the English commissioners to New England, appointed by Charles II in 1664, his associates being Nichols, Maverick, and Cartwright. Nichols and Carr captured New Amsterdam from the Dutch in 1664 and changed its name to New York. Carr then forced the Dutch and Swedes on the Delaware to capitulate and afterward went to Boston, but when he attempted to supersede the constituted authorities he met with stubborn opposition from the people of Massachusetts, who refused to acknowledge the jurisdiction of the commissioners, as did also the people of New Hampshire. Maine, however, submitted and was governed separately from Massachusetts during 1666-68. In 1667 Carr returned to England and died on the day after his arrival.

CARRACCI, kâr-rät'chè, or **CARACCI**. A celebrated family of Bolognese painters, founders of the Eclectic school.—The chief representatives, **LODOVICO** (1555-1619), **AGOSTINO** (1557-1602), and **ANNIBALE** (1560-1609), worked and taught together; their style is similar, and they may therefore be treated together. Lodovico, the eldest, was born in Bologna on or shortly before April 21, 1555, the son of a butcher. He studied there under Prospero Fontana, the Mannerist, and in Florence under Passignano. In Florence he also became thoroughly acquainted with the works of Andrea del Sarto. He was influenced most of all by Correggio in Parma and by his pupil Parmegianino, and in Venice he studied chiefly Veronese and Tintoretto. With this equipment he returned to Bologna and was admitted into the guild of painters on March 23, 1578. He had in the meanwhile formed the ideal of an art which should unite the excellences of the chief Italian schools, and associated with himself the two sons of his father's cousin, who were to help him carry it out.

Agostino, the elder of the two, was born in Bologna, Aug. 15, 1557, the son of a tailor. He was intended for a goldsmith, but upon Lodovico's advice he studied painting under Fontana and engraving under Domenico Tibaldi. His brother Annibale, baptized Nov. 3, 1560, was to be a tailor, but was taken into Lodovico's house to learn painting. The latter sent both brothers to Parma and Venice to study. Annibale, in particular, was impressed by Correggio and has left admirable copies, now in the Pinacoteca of Parma, of that master's frescoes in the Tribune of San Giovanni. In Venice he studied Titian and Veronese, while Agostino became a friend of Tintoretto and occupied himself chiefly with engraving, as a pupil of Cornelis Cort (q.v.).

Upon their return to Bologna, in 1582, Lodovico, who had attained prominence, associated them with him in the decoration of Palazzo Fava. The subjects represented were "Scenes from the Æneid" and the "Voyage of the Argonauts"; and the frescoes, being first attempts, were of no great artistic merit. But the hostile criticism which they caused, especially by reason of their naturalism, caused the Carracci to found their famous academy. (See **BOLOGNESE SCHOOL OF PAINTING**.) They called it the "Accademia degli Incamminati" (i.e., of those on the right

road) and endeavored to give their pupils a theoretical and practical knowledge of painting instead of the mere manual dexterity of the Mannerists. Their means of instruction included living models, dissection of dead bodies, plaster casts, the antique, drawings and engravings of the great masters, lectures on perspective and color. This was, in fact, the first modern academy of art, and it soon became the most important in Italy. Its chief endeavor was to unite the excellences of all Italian schools of the great period. The idea was originally Lodovico's, but the scholarly Agostino gave the theoretical and antiquarian instruction. At this period the Carracci worked much together, and it is difficult to determine the part of each in the common result. Their styles of painting are very similar; good drawing, a certain generality of type, and color based upon a study of the Venetians, and especially of Correggio. In general, we can go no further than to say of this joint work that the design and composition are due to Agostino, but the execution to the other two. In 1589 they finished their second important work in common: the frieze of Palazzo Magnani, representing the "Story of Romulus." In their third joint commission, the decoration of Palazzo Sampieri, each painted a ceiling of a different room, Lodovico representing the "Battle of a Giant with Zeus"; Agostino, "Hercules and Atlas"; and Annibale, "Hercules Encouraged by Virtue." Thus we have a basis for the comparison of their individual styles. Lodovico's art is more virile and grander in form than that of the others; it contains more pathos, more violent action, reminding one somewhat of Michelangelo or Tintoretto. It has traces of mannerism, from which the others are free. His coloring is derived mostly from Correggio and is inferior to that of his cousins. Agostino's was exact in drawing, harmonious in composition, and delicate in color. His work is the most refined of the three and has greater intellectual content; for while his learning chastened his art, it did not interfere with it. Annibale was a more facile painter and executed a far larger number of pieces. His imagination was more spontaneous, and his art more natural and naïve. His colors are fresh and bright, but not so harmonious as those of Agostino.

These differences may be studied even better in their separate works, in which the Gallery of Bologna is richest. The earliest examples show the influence of the masters who were their models, and Lodovico's are strongly tinged with mannerism. His "Sermon of John the Baptist" (1591), in the Gallery of Bologna, shows strong naturalistic tendencies, while the "Vision of St. Hyacinth," now in the Louvre, is a charming combination of the influences composing eclecticism. In like manner, Annibale's "Assumption of the Virgin" (Dresden) and his "Pietà" (Gallery of Parma) show the influence of Correggio, while his "Assumption," in the Gallery of Bologna, reminds one of Veronese. But his "Santa Conversazione" (q.v.), also in Bologna, is a perfect specimen of eclecticism. Annibale executed a large number of small compositions of this description, charming in sentiment and execution. Among his larger canvases, the "Madonna Appearing to St. Luke and St. Catharine" (1592) and the "Resurrection," both in the Louvre, and his "St. Roche Giving Alms" (Dresden) show his highest development in oil painting. His "Three Marys" in Castle Howard

(Yorkshire) shows a wonderful pathos of grief.

Agostino was more occupied with engraving than with painting. In 1589 he engraved Tintoretto's "Crucifixion" in the Scuola di San Rocco with such success that Tintoretto himself pronounced the engraving better than the original. Agostino was fond of living in Venice, where his poetic and scholarly gifts were much appreciated and where his son was born. Upon his return to Bologna he devoted himself anew to painting. His celebrated "Last Communion of St. Jerome," painted for the church of San Michele in Bosco, now in the Pinacoteca of Bologna, dates from 1592. Though surpassed in some respects by Domenichino's picture of the same subject, which was modeled upon it, this composition is a masterpiece of careful drawing, delicate color, and truthfulness of expression. His "Adulteress before Christ," painted somewhat later, is also excellent in color and in action and has a fine architectural background.

Not the least among the achievements of the Carracci was the revival of the landscape (q.v.). They treated it not only as a background for figure painting, as their predecessors had done, but as an independent subject, in which the figures were accessories, thus becoming the originators of the modern landscape and the true predecessors of Gaspard Dughet and Claude Lorraine (see GELÉE, CLAUDE). This was done by Agostino, and especially by Annibale, who excelled in this work. His landscapes may be found in the galleries of Paris, St. Petersburg, Madrid, Florence, and especially in the Palazzo Doria-Pamfili, Rome.

In 1597 the Carracci were invited to undertake the most famous and extensive of their works, the decoration of the gallery of the Farnese Palace in Rome. After arranging the business details, Lodovico returned to Bologna, leaving the execution of the work to his cousins. Agostino, assisted by Monsignore Agucchi, determined the composition. The subject was mythological and represented the "Power of Love" over the strong, the proud, the chaste—over the universe. The frescoes show the influence of the Roman school, especially of Raphael; the disposition of space is modeled upon Michelangelo's ceiling of the Sistine Chapel. They are admirable pieces of decoration, the ornamental portion being particularly good. Agostino executed the two principal pictures of the long walls, the "Triumph of Galatea" and the "Rape of Cephalus," his chief works in fresco painting—both excellent compositions, rich and symmetrical in line, fresh and bright in color. Except a few subjects painted after his designs by his pupils, Annibale did the remaining frescoes, which occupied him until 1604. This is unquestionably his best fresco work; his bright and fanciful naturalism is everywhere present. Among the best of these are the admirable genre pieces "Juno with the Girdle of Graces before Jupiter," "Diana and Endymion," "Venus and Anchises," and the "Triumph of Bacchus." Annibale also decorated the ceiling of an adjoining room with mythological subjects, but this work is not so good as that in the gallery.

Agostino was compelled by the jealousy or ill will of his brother to leave Rome, but he was provided for by the Farnesi in Parma, where Duke Ranuccio protected him. He several times portrayed the Duke, but his chief work there

was the frescoes of the Palazzo del Giardino, four mythological love scenes. He lived to complete only three. The quarrel with his brother and his enforced withdrawal from Rome had destroyed his bright spirits. After an apoplectic stroke he withdrew to a Capuchin monastery, where he died, March 22, 1602. In his many-sided talent he resembles the greatest masters of the Renaissance. In addition to being a painter, he was a poet and scholar of high repute. As an engraver he stands in the very first rank of Italian artists. His work is similar to that of his master, Cornelis Cort, but shows more freedom and versatility. He excels in correctness of design and in beauty of execution, and his figures are very expressive. He executed about 278 plates in all, largely from his own designs and after the great Italian masters.

After finishing the frescoes in the Farnese Palace, Annibale suffered much from ill health. The recent researches of Tietze have shown the extent and importance of his Roman atelier. In it labored Domenichino, Albani, and many others, who carried out the designs for his later frescoes and pictures. One of his most beautiful independent canvases is "Christ and the Woman of Samaria" (Imperial Gallery, Vienna); among his portraits is the fine "Lute Player" (Dresden). He died on a brief journey to Naples, July 15, 1609, and was accorded the honor of burial in the Pantheon, Rome, near the resting place of Raphael.

Meanwhile Lodovico remained head of the academy in Bologna, busily engaged in teaching and in executing a number of his most important works. In 1604 and 1605 he decorated, with his pupils, the large court of the monastery Santa Maria in Bosco, near Bologna, with frescoes from the lives of St. Benedict and St. Cecilia. The seven frescoes which he himself executed are admirable pieces of decoration, and although much defaced, they may be studied from the engravings of Giovannini (Bologna, 1696) or Zanotti (ib., 1776). For the cathedral of Piacenza he painted, in 1608 and 1609, two large canvases representing the "Burial of Mary," which are now in the Galleria Farnese, Parma, and a series of fine frescoes; in the sanctuary, "Choruses of Angels" and a "Limbus," and in the arch over the tribune, "Angels Strewing Flowers," the latter work almost equaling Correggio in charm. Between 1609 and his death he executed other important canvases, among which is the "Conversion of St. Paul," in the Munich Gallery. His last works were in the cathedral of Bologna, and a slight mistake in his fresco of the "Annunciation," which he was not permitted to rectify, so troubled him that it brought on a fever, which resulted in his death on Nov. 13, 1619. He was buried with great splendor, noblemen of the city bearing his body to the tomb, for he was greatly beloved as a modest, just, and unselfish man.

ANTONIO MARZIALE CARRACCI (1583-1618), painter, was a natural son of Agostino, upon whom the family placed great hopes, which were thwarted by his early death. He studied under his father and uncle, and his art resembles theirs. His chief works in fresco were in the church of San Bartolommeo del Isola (Rome), but they have been ruined by time and restoration. His chief canvas is "The Flood," now in the Louvre.

Consult Bolognonini-Amorini, *Le vite di Lo-*

dovico, Agostino, Annibale ed altri dei Caracci (Bologna, 1842), and the works cited for BOLOGNESE SCHOOL OF PAINTING, especially that of Janitscheck. The most important publication on the Carracci is: Tietze, "Annibale Carracci's Gallerie im Palazzo Farnese und seine römische Werkstätte," in *Jahrbuch der kunsthistorischen Sammlungen des aller höchsten Kaiserhauses XXVI* (Vienna, 1906); Schmerber, *Betrachtungen über die italienische Malerei im 17 Jahrhundert* (Strassburg, 1906).

CARRAGEEN, kār'rā-gēn (so called from Carrageen in Ireland), CARRAGEEN MOSS, SEA MOSS, or IRISH MOSS. A seaweed, or rather several species of seaweed, used both medicinally and as an article of food. The use of these seaweeds appears to have been originally confined to the peasantry of the coasts of Ireland. They are, however, found on the rocky seashores of most parts of Europe and of the eastern shores of North America, large quantities being gathered for market on the Massachusetts coast. The species which principally constitutes the carrageen of commerce is *Chondrus crispus*, of which the varieties are remarkably numerous. It is 2 to 12 inches long, branched by repeated forking, cartilaginous, flexible, reddish brown. *Gigartina mamillosa* is also gathered as carrageen, and it is doubtless often mixed with the other species. After being collected, carrageen is washed, bleached by exposure to the sun, dried, and packed for the market. The chief nutrients are carbohydrates, though more or less nitrogenous material is also present, as well as small amounts of other nutrients. When treated for 10 minutes with cold water, in the proportion of half an ounce of carrageen to three pints of water, and then boiled and strained, it yields, with or without spices, a very pleasant drink. With a larger proportion of carrageen, a thickish liquid or muelage is obtained; and on boiling down this decoction and cooling, a stiff jelly is procured. Milk may be employed instead of water in the preparation of the various decoctions; and with the stronger one, along with sugar and spices, when cooled in a mold, a kind of *blanc mange* is obtained. A kind of gelatin is manufactured from sea moss. Other edible marine algæ are dulce (q.v.), or dylick (*Rhodymenia palmata*); sloke, or laver (*Porphyra lacinata*); tangle (*Laminaria digitata*), and many Japanese species. In Hawaii a number of species of edible seaweeds are used under the name "limus."

CARRANZA, V. See MEXICO, *History*.

CARRARA, kār-rā'rá. A city of north Italy, in the Province of Massa e Carrara, 3 miles from the little seaport of Avenza, which is 32 miles north of Pisa, in a valley surrounded by the marble hills to which it owes its celebrity (Map: Italy, E 3). From 400 quarries 4500 workmen cut and ship more than \$1,000,000 worth of marble yearly, and 600 quarries in the neighborhood help to swell the total. The finest and whitest Italian marble, of which the most valuable varieties are Polvaccio, Bettogli, and Crestola, is found in the valley of Torano, although in recent years the bluish marble of Bardiglio has come into favor. The Romans, whose tools are frequently discovered, called the stone *Marmor lunense*, from the city of Luni, whose ruins are north of Avenza. The United States is represented by a consular agent. Most of the buildings are of marble, and the churches of Sant' Andrea (thirteenth century)

and of the Madonna della Grazie have magnificent marble statues of Rossi, Garibaldi, and Mazzini. There is a museum containing numerous statues and Roman antiquities, and also an academy of sculpture instituted by Napoleon. Most of the marble is shipped via Avenza, which has a small harbor and near which is a fourteenth-century castle of Castruccio Castracani, with bold round towers and pinnacles. Pop. (commune), 1901, 42,097; 1911, 49,492.

CARRARA, kâr-râ'rá, FRANCESCO (1805-88). An Italian writer on criminal law, born in Lucca. He became an instructor in criminal law at the University of Pisa, was a deputy in 1865-70, and a senator from 1876. Blindness forced him to leave public life. He opposed capital punishment. His most important work is *Programma del corso di diritto criminale* (13 vols., 1879-86). His other publications include *Opuscoli di diritto criminale* (7 vols., 1878-80) and *Lineamenti di pratica legislativa penale* (2d ed., 1882).

CARRATRACA (kâr-râ-trä'ká) **SPRINGS**. A health resort of Prescott Co., Ontario, Canada, on the Ottawa River, 40 miles east of Ottawa. It is much frequented for the beneficial alterative effects of its mineral springs.

CARRÉ, kâ'râ', MICHEL (1819-72). A French dramatist, born in Paris. In 1842 he published a volume of verse, *Folles rimcs et poèmes*, which was followed by several poetic dramas, including *La jeunesse de Luther* (1843) and *Scaramouche et Pascariel* (1847). After 1849 he collaborated with Narrey, Battu, Lucas, and especially with Jules Barbier in the composition of numerous comedies, and librettos for vaudevilles and operas. Their joint productions include *Galatée* (1852); *Le pardon de Ploermel* (1859); *Faust et Marguerite* (1859); *Lalla Raukh* (1862); *Romeo et Juliette* (1867); *Mignon* (1867); *Hamlet* (1868); *Paul et Virginie* (1876).

CARREL, kâ'rêl', ALEXIS (1873-). A distinguished American biologist, widely known for his brilliant investigations and discoveries in the realm of experimental surgery. He was born June 28, 1873, at Sainte-Foy les Lyons, France, and was educated at the University of Lyons, where he received the degrees of L.B. in 1890, Sc.B. in 1891, and M.D. in 1900. He was interne of the Lyons hospital from 1896 to 1900 and prosector to the faculty of medicine from 1900 to 1902. Carrel went to the United States in 1905, where his laboratory work received prompt recognition, and in 1909 he was made fellow of the Rockefeller Institution for Medical Research in New York, where he thereafter continued his researches. In 1912 the Nobel prize for medicine was awarded to him. He published a great number of papers, chiefly brief scientific reports, a partial list of which will give some idea of the scope of his activities: *Anastomosis and Transplantation of Blood Vessels* (Philadelphia, 1905); *Doppelte Nephrectomie und Reimplantation einer Niere* (Berlin, 1909); *Graft of the Vena Cava on the Abdominal Aorta* (Philadelphia, 1901); *Heterotransplantation of Blood Vessels Preserved in Cold Storage* (New York, 1907); *On the Experimental Surgery of the Thoracic Aorta and the Heart* (Philadelphia, 1910); *The Preservation of Tissues and its Application to Surgery* (Chicago, 1912); *Rejuvenation of Culture of Tissues* (Chicago, 1911); *The Surgery of Blood Vessels* (Baltimore, 1907); *La transplantation*

des membres (Paris, 1908); *Visceral Organisms* (Chicago, 1912); *Artificial Stimulation and Inhibition of the Growth of Normal and Sarcomatous Tissues* (in collaboration with Montrose T. Burrows) (Chicago, 1911); *Anastomosis of the Blood Vessels by the Patching Method and Transplantation of the Kidney* (in collaboration with C. Guthrie) (Chicago, 1906); *Complete Amputation of the Thigh with Replantation* (Philadelphia, 1906); *Results of a Replantation of the Thigh* (New York, 1906); *Uniterminal and Biterminal Venous Transplantations* (Chicago, 1906); *Results of the Biterminal Transplantation of Veins* (Philadelphia, 1906); *Extirpation and Replantation of the Thyroid Gland with Reversal of the Circulation* (in collaboration with C. Guthrie) (New York, 1905); *A New Method for the Homoplastic Transplantation of the Ovary* (New York, 1906); *Successful Transplantation of Both Kidneys from a Dog into a Bitch with Removal of Both Normal Kidneys from the Latter* (New York, 1906); *The Transplantation of Veins and Organs* (Philadelphia, 1905).

CARREL, kâ'rêl', NICOLAS ARMAND (1800-36). A French journalist and Republican leader. He was born in Rouen, was educated in the military school of Saint-Cyr, and served for some years in the army. He then went to Paris, where he became the secretary of Augustin Thierry. In 1830, in connection with Thiers and Mignet, he became editor of the *National*, the most spirited and able of the journals opposed to the government of Charles X. His colleagues having entered the government of Louis Philippe, he was left to conduct the *National* himself, which he did with a spirit and a freedom such as had not been witnessed in France for many years. His attacks on more than one occasion checked the arbitrary power the government attempted to exercise and gained for him the admiration and esteem of the popular party. Government persecutions followed his outspokenness, and heavy fines were laid upon him; but these were paid by public subscription, and each conviction only made his journal more popular. Carrel, however, dreaded a revolution as much as he hated despotism and had no sympathy with many of those who looked up to him as a leader. He was mortally wounded in a duel with Emile de Girardin, who had made a violent attack on his personal character. His principal articles were republished by Littré, under the title *Œuvres politiques et littéraires* (5 vols., 1854-58).

CARREÑO, kâr-râ'nyô, TERESA (1853-). A Venezuelan pianist, born in Caracas. She studied first under her father, who was an amateur musician, and in 1862 appeared at a concert in New York, where she attracted the attention of Gottschalk, who taught her his own compositions. Later she was a pupil of Mathias in Paris. She played with great success in the chief cities of Europe and the United States. Carreño married and was divorced from Emile Sauret, the violinist, the baritone Tagliapietra, and Eugene d'Albert, the pianist. In 1902 she married the younger brother of her second husband. A woman of many talents, she composed a string quartet, piano pieces of the salon order, and the Venezuelan national hymn; she won admiration as a concert singer, and, while managing an opera company, successfully wielded the baton during the absence of the conductor. The chief traits of her playing are bril-

liancy, dash, and masculine vigor, for which she gained the appellation of "the Valkyr of the piano." The softer qualities are not greatly in evidence, but her intellectual grasp and breadth of interpretation place her among the greatest pianists.

CARREÑO DE MIRANDA, dâ mê-rân'dâ, JUAN (1614-85). A Spanish painter, born at Aviles, in Asturias. He studied in Madrid under Pedro de Las Cuevas and Bartolomé Roman, and became court painter to Philip IV and Charles II. After the death of Velasquez he ranked as the first portrait painter of the Spanish court. Many of his religious pictures, for the most part altarpieces, are still in the churches and galleries of Spain; others are in various European collections. They often show Flemish influence, especially that of Van Dyck, in color. His principal surviving frescoes, commissioned in 1669 by Velasquez, who thought well of his art, and painted with the assistance of Francesco Rizi, are in the cupola of Sant' Antonio de los Portugueses in Madrid and the octagon of the cathedral at Toledo. His chief importance, however, is in portraiture. Among his many portraits of Charles II are one of the King as a boy, in the Berlin Museum (also in the Prado, Aix-la-Chapelle, etc.), and as a man in the Museum of Vienna. His best portraits of Queen Mariana are in the Munich Pinakothek and the Prado. Other characteristic portraits are those of the court fool, Francisco Bazan, and the Russian Ambassador Potemkin. Carreño's art shows especially the influence of Velasquez. His color is richer and warmer, but not nearly so subtle and powerful as his great master's, nor does he approach him (although his drawing is good) in mastery of form. Consult Beruete y Moret, *The Madrid School of Painting* (London, 1909).

CARRER, kâr'rêr, LUIGI (1801-50). A Venetian poet and scholar. Abandoning the law for literature, he supported himself for a time as an assistant in a printing office, but later became successively secretary of the Instituto Veneto, professor of belles-lettres in the Scuola Tecnica, and director of the Museo Carrer. Ill health, aggravated by unfortunate domestic relations, resulted in his death at the age of 49. Carrer's erudition expressed itself in many critical and biographical works which adequately reflect the spirit of Venetian culture of the time, sentimental, idealistic, with a tendency towards romanticism, but tempered with classic sobriety and elegance (cf. the *Anello di sette gemme*, 1838, and *Prose*, 1855). He is still much read in his ballads, of romantic temper in subject but classic in their freedom from mysticism and in their clarity of conception. *Works* (Florence, 1854); biography by Crespan (Venice, 1869) and by Abrate, *L' opera poetica di L. Carrer* (Turin, 1905).

CARRERA, kâr-râ'ra, JOSÉ MIGUEL DE (1785-1821). A Chilean politician and revolutionist, the first President of Chile, born in Santiago de Chile. He served in Europe in the Spanish army, rose to the rank of major, went to Chile upon the outbreak there of the revolutionary movement, and became a member of the junta formed on Sept. 10, 1810. Dissatisfied with the methods of the first Congress, which had convened on July 4, 1811, he established a new government, and with the support of the army, himself usurped the presidency. On Dec. 2, 1811, he dissolved the Congress, and thenceforth ruled as a military dictator. During the next 18 months,

in addition to the military operations that had to be continued, he arranged questions concerning public rents, decreed the establishment of primary schools, imported from North America the first printing press that ever entered the country, and published Chile's first newspaper, *La Aurora*. In 1813 he was forcibly removed from authority by the Junta, which appointed Bernardo O'Higgins to succeed him. This change he bitterly resisted, and although he made pretense of coöperating with O'Higgins at the battle of Rancagua (Oct. 1 and 2, 1814), he really rendered that officer no assistance. He then fled to Buenos Aires and thence to the United States. In 1816 he returned to Buenos Aires, where he organized an outlaw band and sought to arouse a revolution against the government. He was finally captured, and was executed at Mendoza, Sept. 5, 1821. Posterity has recognized the real merits of Carrera, and a bronze monument in commemoration of his great worth was unveiled in the Alameda de las Delicias of Santiago (Chile), Sept. 17, 1864.

CARRERA, RAFAEL (1814-65). A Guatemalan revolutionist and politician. He was of Indian and negro descent and entirely without education. He first came into prominence in 1837, when he succeeded in placing himself at the head of a band of insurgents against Morazan and the Federalists. In 1838 he captured the city of Guatemala and in 1839 again held it by force. In 1847 he was elected President of the Republic and in 1851 was reëlected for life. He was supported by the landed proprietors and the Church party and recalled the Jesuits, who had been excluded for nearly a century. He always opposed the federation of the Central American states and was a thoroughgoing absolutist. In 1863 he made war on Salvador, took the capital, and expelled the President.

CARRERA, VALENTINO (1834-95). An Italian dramatist, born in Turin. Until his retirement from office in 1878, he was connected with the Italian customs department. His earliest notable success was the comedy *La quaderina di Nanni* (1870), an interesting depiction of life in Florence. The long list of his works includes further *Galateo nuovissimo* (1875), *Bastoni fra le ruote* (1884), and *La filosofia di Giannina* (1885). A collective edition appeared in Turin in 1887-90 (4 vols.).

CARRÈRE, kâ'râr', JOHN MERVEN (1858-1911). An American architect, born Nov. 7, 1858, in Rio de Janeiro, of American parents. His early education in Switzerland was followed by four years of study of architecture in the Ecole des Beaux-Arts, Paris. Here he first became acquainted with a fellow student, Thomas Hastings (q.v.), with whom he entered into partnership in New York in 1884, after two years spent in the office of McKim, Mead, and White. The firm of Carrère and Hastings rapidly acquired a distinguished reputation for the imaginative and artistic quality of its work, strongly colored by French influence. The first important commission of the young practitioners was the Ponce de Leon Hotel at St. Augustine, Fla.; this was followed by the Alcazar in the same place. Other early works were the Central Congregational Church at Providence, R. I., and the Mail and Express and Edison buildings in New York. The list of their later works is very long; by far the most notable is the Public Library of New York, erected at a cost of over \$8,000,000

from designs which won the prize in a competition in which many of the ablest architects of the country were employed. They designed important buildings for the St. Louis Purchase Exhibition in St. Louis (1904) and the great marble office building for the Senate at Washington. All this work was the joint product of the two members of the firm, so that it is not possible to separate Mr. Carrère's work from his partner's. He died March 1, 1911, as the result of an accident. The body was laid in state in the still unfinished Public Library, and the great throngs that pressed to view it attested the high regard in which he was held.

CARRETTA. See CARRIAGE.

CARREY, ká'rā', JACQUES. See PARTHENON.

CARRHÆ. An ancient town in Mesopotamia, near which Crassus, the triumvir, was defeated by the Parthians.

CARRIACOU, kār'rè-à-kōō'. One of the British West Indies, belonging to the Grenadine group of the Windward Islands (q.v.) (Map: West Indies, G 4). It lies nearly 20 miles north-east of the island of Grenada, and is 7 miles long by about 3 miles wide. Area, nearly 11 square miles. Cotton is the chief product. Pop., 1911, 6886.

CARRIAGE (OF. *cariage*, from *carier*, to carry, from Lat. *currus*, car. from Ir. *carr*, car). A wheeled vehicle of any kind. The word is commonly used in a more restricted sense to apply to vehicles for carrying persons as distinguished from those for carrying freight; in this article, however, the term is used in its broader sense. Probably the first instrument employed for drawing burdens was the *sledge*. In Egypt, where we have the earliest recorded development of the arts, we find sledges pictured upon the monuments. For the conveyance of enormous loads, such as the blocks required for the Egyptian monuments, rollers must also have been used. Possibly it was the combination of the sledge and roller which formed the first rude carriage. The next step in the evolution of the carriage would be the substitution of wheels connected by an axle for the rollers extending all the way across the box or platform. As the rollers were simply hewn tree trunks, so the first wheels were thin slices cut transversely from these trunks and connected by another of much smaller diameter. These primitive wheels revolved with their axles, like the wheels of railway trucks. The next step in advance was to mount the two wheels so that they revolved on their axle, while the latter either remained fixed, or moved from side to side only, in a horizontal plane. Another marked improvement was the substitution of wheels with spokes for the clumsy solid wheels.

The use of vehicles drawn by animals was probably introduced very soon after the domestication of the horse and ox. (See CART.) How rapidly the various improvements in the construction of these vehicles were made is uncertain, but they must have been completed at a very early period in the history of civilization. In the writings of Homer and in the early books of the Bible the terms "naves," "felloes," "tires," and "spokes" are used. Covers are said to have been introduced by the Etruscans. Homer tells us that Hera's car was suspended by cords, so as to decrease the jolting. In the later Roman carriages the seat was sometimes placed on long poles, midway between the wheels, to lessen the jar, on much the same plan as the modern buck-

board. During the Middle Ages vehicles were slung upon leather straps for the same purpose. Steel springs were not introduced until about 1700, and the elliptic spring was invented in 1804.

The simplest and earliest form of wheeled vehicle was the cart, or two-wheeled carriage. To its axle a pole was secured when it was destined to be drawn by two animals, or a pair of shafts when it was to be drawn by one animal. The chariots of ancient times, however elaborately ornamented, were of this simple construction. These chariots were used for war, for state purposes, for races, and for hunting; they were rarely used simply as a means of conveyance. War chariots were often armed with scythes, and on their sides were cases to hold the bow, sheafs of arrows, and other weapons of war. The bodies of chariots were small, usually holding but two persons. They were open for entrance at the back and had no seats. At first the wheels were very low, from 3 to 4 feet in diameter. As the chariot was adopted by different nations, its primitive form was greatly changed. The wheels were enlarged, it was made to hold many persons, and finally four wheels were used. Little remained of the original chariot but its name.

The chariot used by the Britons at the time of the Roman Conquest possessed certain characteristics which commended it to the conquerors. It was on higher wheels than the Roman chariot and was entered at the front instead of the back. The pole, instead of sloping upward to the horses' necks, went horizontally out between their bodies and was so broad that the driver could stand on it, and, if necessary, drive his horses from its outer end. But the most striking peculiarity of this chariot was that it possessed a seat. Cicero wrote to a friend in Britain that there appeared very little worth bringing away from Britain except the chariots, of which he wished his friend to bring him away one as a pattern. This form of chariot, called by the Romans the *essedum*, from having a seat, became very popular in Rome, and a diminutive form of the vehicle, with still larger wheels, was adopted for the conveyance of dispatches over the public roads. This carriage, called the *cisium*, resembled the modern gig.

In the National Museum in Washington is an interesting series of models showing the development of wheeled vehicles from the simplest and most primitive forms. Among these models is a reproduction of an Egyptian chariot, based on a wheel and forked brace, which were found at Dashur by H. Abbot, and are now in the museum of the Historical Society of New York. The wheel has six spokes with slots near the hub, through which to run a rope to secure the spokes more firmly. The felloe is in six pieces with scarfed joints. The tire of wood, also with scarfed joints, is attached to the felloe with a lacing of thongs. Near the reproduction of this ancient vehicle stands a miniature child's coach, or *bashkir*, used in Russia, which is probably the oldest surviving type of vehicle still in use. The wheels are of solid wood, through the centre of which holes are pierced by burning. In these holes is inserted a forked stick, which serves both as tongue or pole and axle. The covered body of the vehicle is made from the bark of trees sewn together. Another example, showing how the development of the arts repeats itself among different peoples, is given in the two full-sized carts on exhibition in the museum. The

first of these is a *caretta* or ox cart which was used by the Pueblo and other tribes of Indians of Arizona and New Mexico, as well as in parts of Spain, from which country it was introduced into America. The wheels, which are 3 feet 7 inches in diameter, are solidly built up of three pieces of thick timber, held together by dowels of wood. At the centre of the wheel the wood is left thicker to form the hub. The wheels revolve on an axle 7 feet 11 inches long, to which a tongue 8 feet 11 inches long is attached. A tall frame is constructed of light bows. No seat is provided. The second example of primitive wagon construction is the Red River cart, which was built and used by the half-breeds of British North America. These carts are constructed entirely of wood, including the axles and tires. Each consists of a light frame, poised on an axle connecting two strong wheels. These wheels are 5 feet 3 inches in diameter, and consist of 12 spokes and 6 felloes. The native driver sat on the bottom plank of the cart, and, as the bed of the vehicle is lower than the shafts, his heels were higher than his hips. Over the top of this cart the native attached a hide and made of it a tent. Underneath it he stretched the same hide and converted his vehicle into a boat by means of which he crossed streams. Huge trains of these carts were used for carrying produce over the northern plains, as they were the chief means of land transportation.

Four-wheeled carriages for the conveyance of heavy loads were used by the civilized nations of antiquity, but they are probably of more recent origin than the two-wheeled vehicles. Herodotus tells us that the Seythians used a four-wheeled vehicle, consisting of a rough platform on which was placed a covering like a beehive composed of basketwork and skins. This cover they removed from the wagon and used for a tent. The Romans had many varieties of four-wheeled vehicles. The earliest forms seem to have been used for agricultural purposes, for carrying loads of general merchandise, and for the conveyance of images and vestal virgins in religious processions. Sir William Gell, in his work on Pompeii, describes a wine cart, which is a four-wheeled wagon with an arch in the centre for the front wheels to turn under. During the later days of the Roman Empire chariots were mounted upon four wheels, and were so luxuriously equipped, even when owned by private citizens, that sumptuary laws were promulgated limiting the extent of their decorations. It must be remembered, however, that among the civilized nations of ancient times, as among modern Oriental nations, litters were used for the conveyance of persons from place to place. These litters were supported by poles, and were borne either by mules (*basternæ*) or by men (*lecticæ*). Their popularity undoubtedly retarded the development of pleasure carriages.

During the Dark Ages carriages fell into disuse. The old Roman roads, which had made their use possible, were ruined either willfully or by neglect, and riding upon the backs of horses and mules was the only alternative for those who did not go on foot. Even goods were conveyed chiefly in huge panniers hung on the sides of strong draft animals. Gradually the use of carriages was revived, at first by royalty and the nobility, and later by the families of wealthy citizens. One of the earliest of these vehicles was the *whirligote*, or eot upon wheels.

King Richard II and his mother rode in a *whirligote* in 1380, when she was ill. The *carretta* was another vehicle often mentioned in mediæval literature. It seems to have been simply a highly ornamented two-wheeled cart, the descendant of the ancient chariot. During the fifteenth century these were very popular on the Continent, and in Germany an edict was issued forbidding their use, "because the useful discipline and skill in riding has been almost lost." About the commencement of the sixteenth century the art of coach making assumed great importance in continental Europe. (See COACH.) It was in the construction of coaches, to enable them to turn in a shorter space, that the custom arose of making the front wheels smaller than the hind wheels. With their introduction, also, began the use of leather springs. Carriages were not introduced into England until long after they had become popular on the Continent. State coaches were first built in England during the reign of Elizabeth, and about the same time long wagons for transporting goods, called *caravans*, began to be used. Their introduction was at first vigorously opposed by the sedan chairmen and by the boatmen on the Thames. The general use of carriages dates from the eighteenth century, but their greatest development did not occur in England until the nineteenth century. In the early part of that century, as a result of the work of Telford and Macadam, the highways of Great Britain were put into a condition which made vehicular traffic easy and pleasant. About this time (in 1804) Obadiah Elliott, a coach maker of Lambeth, patented a device by which vehicles were hung upon elliptical springs, thus doing away with the heavy perch, or longitudinal wood or iron pole, which had always been used to connect the front and hind wheels of four-wheeled carriages. So important was this invention considered that Elliott was awarded a gold medal by the Society of Arts. With this invention modern methods of carriage construction began.

Fashion and utility produce frequent changes and developments in carriages, and to the many forms different names are applied in different countries and at different times. Shooting traps, golf carts, mail phaëtons, and spiders are instances of vehicles which in many cases are used for purposes widely different from those for which they were originally designed. Victoria and cabriolet are the names of open-hooded carriages with two seats, while the *vis-à-vis*, an open carriage often fitted with a canopy, has seats for four people in addition to the coachman and groom. The landau is a large carriage for four passengers, where the top may be folded back, thus transforming it from a closed to an open carriage. Somewhat resembling the brougham, but higher, lighter, and somewhat less pretentious and costly, thus making it particularly available for use in the country and smaller towns, is the rockaway. Of similar construction, but lacking the more solid frame and glass of this vehicle, is the depot wagon, a familiar American type. The wagonette, which may or may not have a roof, consists of a box seat for the coachman or driver in front of two longitudinal and parallel seats. The brake, which is well suited for four-in-hand driving, is a high vehicle with two, three, or four parallel and transverse seats, serving as a substitute for the road coach or drag. (See COACH; COACHING.) The brougham or coupé with little transformation becomes the "four-wheeler," which,

especially before the introduction of the hansom, in America, was known as a cab, while the French *fiacre* and the German and Russian *droschke* may be considered a modified form of the victoria or cabriolet. The chaise, a term for a two-wheeled covered carriage, now obsolete, was at one time extensively used, and in the United States was colloquially called a shay, the word being preserved in the familiar poem by Holmes, entitled "The One-Horse Shay."

Of the vehicles used for the convenience of the general public, the cab, the stagecoach, and the omnibus are the principal types. The hansom cab is a two-wheeled vehicle with the driver's seat behind and above the body of the carriage. It was invented in 1835 by an Englishman named Joseph Hansom. The development of the stagecoach is described under COACH. The omnibus is arranged with the entrance for passengers at the back, an aisle running lengthwise with a row of seats on each side facing each other. The omnibus came into use in England about 1829, and a few years later was extensively used in the larger American cities, where, as in New York, it was known as a stage. The introduction of the steam railway and the street railway has decreased the use of horse-drawn omnibuses more than any other class of vehicles, though for many years they formed an interesting feature of Paris and London street travel. To-day their place has been taken by the motor bus. The name and essential features of the omnibus, however, are preserved in a class of private carriage, which still is to be seen, constructed on a smaller scale and carrying more passengers than the usual three-seated vehicle.

A most notable feature in the construction of carriages at the beginning of the twentieth century was the increased use of rubber tires for both city and country vehicles. The pneumatic tire, first used about 1890, did not meet with universal use, being confined to trotting sulkies, runabouts, or heavy omnibuses. Later solid rubber tires were improved and made adaptable for all kinds of pleasure vehicles and are now found universally. The "good-roads" movement in the United States has caused a quite general adoption of broader tires, especially for wagons to carry heavy loads. The passing of the horse in the great cities and the extensive use of motor vehicles have attracted the attention and efforts of the more expert carriage and coach builders and designers, so that the skill that once was expended on the design and construction of carriages is now directed to the bodies of motor vehicles, under which title the more modern developments will be found discussed.

In the United States the carriage and wagon industry has been important since the times of the Colonies, and the growth, as recorded in successive censuses of manufactures up to 1904, was about proportional to the increase of population. That year, however, marked a turning point, as with the growth of motor vehicles there followed a corresponding decline in the manufacture of carriages and wagons. Where in 1899 there were 6792 establishments engaged in the manufacture of carriages, wagons, sleighs, and sleds, and materials entering into their construction, in 1909, as reported in a Bulletin of Manufactures of the Thirteenth Census of the United States, 1910, published in 1913, there were but 5492, although the capital invested in

the industry in the latter year was reported as \$175,473,728, as compared with \$128,961,660 in 1899. On the other hand, the value of the product had increased from \$138,261,763 to \$159,892,547 in 1909 for establishments primarily engaged in the manufacture of carriages and wagons, with an additional product in the latter year valued at \$4,528,011 made by establishments in other industries. The number of family and pleasure carriages manufactured in 1909 was 828,411, valued at \$47,756,118, as compared with 937,409, valued at \$55,750,276, in 1904, and 904,639, valued at \$51,295,393, in 1899. The production of wagons in 1909 and the values were classified as follows: Total number, 587,685, valued at \$39,932,910; business wagons, 154,631, valued at \$16,440,816; farm wagons, 429,952, valued at \$22,615,875; government, municipal, and similar wagons, 3102, valued at \$876,219; public conveyances, such as cabs, hansom, hacks, omnibuses, etc., were built to the number of 2243, valued at \$939,267. With the exception of business wagons, the various classes enumerated show a decrease over the returns obtained in the census of manufactures of 1904. (Consult Thirteenth Census of the United States, 1910, Statistics for the Carriage and Wagon Industry, Washington, 1913.) At the same time there was a notable increase in the number of automobiles built by establishments primarily engaged in the carriage and wagon industry, which doubtless will show a still greater increase in the years following the census period.

CARRIAGE, GUN. See ORDNANCE.

CARRICAL, ká'rê'kál'. See KARIKAL.

CARRICK BOROUGH. A borough in Allegheny Co., Pa., 3 miles from Pittsburgh, essentially residential. There are deposits of bituminous coal in the vicinity. Pop., 1900, 311; 1910, 6117.

CARRICKFERGUS, kár'rik-fēr'gūs (Ir., Rock of Fergus, named after *Fergus MacErch*). A seaport town of Ireland, on Belfast Lough, 9½ miles north-northeast of Belfast (Map: Ireland, F 2). It is situated within the County of Antrim, and under the Local Government Act (Ireland) of 1898 it forms an Urban District. Carrickfergus extends nearly a mile along the northwestern shore of the lough. Vessels of 500 tons may enter the harbor. The fishery of the bay, which is famous for oysters of an unusual size, employs a large number of the inhabitants. Salt of superior quality and in great abundance is mined. There are spinning mills, bleaching establishments, and manufactures of linen and cotton fabrics. Its chief feature is the picturesque castle, erected by De Courcy in the twelfth century, on a rock about 30 feet high, projecting boldly into the sea, by which it is surrounded on three sides. The balium or keep is 90 feet in height. From the summit a splendid view is obtained, extending in a clear atmosphere to the Mourne Mountains and the Scotch coast. The castle contains

a barrack, bombproof magazine, ordnance store-rooms, and cannon of large calibre command the entrance of the lough. A considerable portion of the town wall, completed in 1608, is still standing, as well as one of the four entrance gates. Many Protestants sought refuge at Carrickfergus during the Civil War, and the first presbytery assembled in Ireland met here in 1642. In 1690 King William III landed here with his army. The rock on which the King stepped in landing is at the end of the quay, projecting from it, and still forms the landing place. John Paul Jones, in 1778, captured the *Drake* war sloop in the bay, but left the town unmolested. The parish church (Protestant Episcopal), founded in 1164, on the site of a pagan temple, is a fine old building, dedicated to St. Nicholas. There is a literary and scientific society, with reading room, library, and museum. There are several barrows or tumuli in the vicinity. Pop., 1901, 4208; 1911, 4608. Consult S. MacSkimin, *History and Antiquities of Carrickfergus* (Belfast, 1811).

CARRICK-ON-SUIR, kār'rik-ōn-shōōr'. A town in the County of Tipperary, Ireland, 12 miles east of Clonmel, in the midst of fine scenery (Map: Ireland, D 4). There is considerable woolen manufacture, and also linen and flax factories. It exports much agricultural produce. In the vicinity are good slate quarries. Carrick-on-Suir became a place of note soon after the Norman Conquest. There are remains of a castle built in 1309. Pop., 1901, 5406; 1911, 5235.

CARRICK'S FORD. A ford over the Cheat River, in Tucker Co., W. Va. Here, on July 13, 1861, a small Confederate force, retreating from Laurel Hill, was defeated by the vanguard of McClellan's army, under Gen. T. A. Morris. Among the killed was the Confederate leader, Gen. R. B. Garnett.

CARRIER, COMMON. A carrier is a person who carries on the business of transporting goods or passengers, by land or water. A *common* carrier is one who performs that service only for hire and for all persons indifferently. The term is applicable to teamsters, truckmen, expressmen, and the like, as well as to railroad and steamboat companies, and the owners and masters of vessels of all kinds engaged in the business of transportation. It does not, however, ordinarily include proprietors of shops who deliver goods to purchasers, nor hotel keepers who maintain conveyances for the purpose of transporting their guests to and from their hotels. In consequence of the peculiar character of the common carrier's occupation, the opportunities which it affords for dishonest dealing with another's property, and its importance to the community, the common carrier of goods has been subjected by the common law to two stringent obligations. In the first place, his service is compulsory; i.e., he is compelled to carry for all who may apply to him, without discrimination; and, in the second place, he is liable for loss or injury to the goods intrusted to him irrespective of any negligence on his part.

It is commonly, though inaccurately, stated that common carriers are responsible for any loss or damage during transportation from whatever cause "except the act of God or of the public enemy." By the weight of authority, the act of God means only such inevitable accidents as occur without the intervention of any human agency, although the decisions do

not wholly agree in defining the phrase. The term public enemy embraces any *de facto* or *de jure* government engaged in an act of war or public hostility against the government of the common carrier. Pirates are also public enemies, but the term does not include robbers, bandits, rioters, or rebels against established governmental authority. In addition to these exemptions, the common carrier is not responsible for losses occurring by reason of acts done by public authority or the default of the shipper, or such as are due to the nature and character or inherent defects of the goods shipped, as, for example, losses by fermentation, evaporation, the ordinary decay of perishable articles, or the natural wear in the course of transportation, provided the carrier exercises reasonable care to make such dangers or the losses resulting therefrom as small as practicable. Railway companies, steamboat owners, and other carriers who allow express companies to carry packages on their cars, boats, or other vehicles are liable as common carriers to the owners of the goods for loss or damage.

The extraordinary common law liability of a carrier may now generally be qualified by special contract or acceptance, assented to by the shipper. The carrier cannot, however, generally exempt himself from liability for negligence, though the English and some American courts hold to a different rule. The special contract is usually, though not necessarily, contained in the bill of lading, baggage check, or passenger ticket. The carrier's common-law liability has also been modified by statute in some jurisdictions, and on Feb. 4, 1887, the Congress of the United States passed the Interstate Commerce Act (q.v.), which created the Interstate Commerce Commission and also provided for the regulation of commerce between the States carried on by carriers by rail or water.

Carriers who undertake general business are bound to accept all freight that is offered, under liability of legal action if they refuse without just excuse; but any carrier may restrict his business to certain goods, in which case he is not bound to accept other classes of goods for carriage. A carrier may require payment of freight in advance, and is entitled to a lien for his freight and for sums which he advances to other carriers in payment of freight. The responsibility of the carrier, as such, begins upon the delivery of the goods for immediate transportation. But where carriers have a warehouse at which they receive goods that are not to be forwarded until further order or a later time, they are in the meantime responsible only as warehousemen (see WAREHOUSEMAN), and where goods are received by persons as wharfingers, or warehousemen, or forwarders, and not as carriers, liability is incurred by them only for ordinary negligence. The responsibility of the carrier terminates in most jurisdictions when, after the arrival of the goods at their destination, a reasonable time has elapsed for the consignee to receive them in business hours. This rule, however, is subject to modification in several jurisdictions. Thus, in Massachusetts the carrier's liability terminates as soon as the goods are stored by him in safety, while in the State of New York his liability does not terminate until a reasonable time after notice of arrival is given to the consignee, or reasonable efforts have been made to give such notice. After that the carrier may store them, and is

responsible only for ordinary care. Generally speaking, the agents of corporations which are common carriers, such as railway and steamboat companies, bind their principals to the full extent of the business intrusted to their control, whether they follow their instructions or not; nor will it excuse the company to show that the agents acted willfully in disregard of instructions. The carrier is bound only to carry and deliver goods with reasonable dispatch, but, if a particular time is agreed upon for the delivery of goods, damages incurred through exceeding that time may be recovered.

Carriers of Passengers are not held responsible as insurers of the safety of their passengers. It is commonly said that they are held to the highest degree of watchfulness and care in the conduct of their business. By this it is not intended that the carrier of passengers should exercise all the care and diligence of which the human mind can conceive, but rather a care and diligence commensurate with the extraordinary duty which he assumes as carrier. An unexplained accident to the conveyance of the carrier, resulting in injury to the passenger, is prima facie evidence of negligence on the part of the carrier or his servants and throws upon the carrier the burden of showing that he has exercised the care required by law. Passenger carriers are not responsible for injuries caused by the contributory negligence of the passenger, but this rule does not apply when the passenger's negligent act was induced by any just sense of peril caused by the improper or negligent conduct of the carrier.

Carriers of passengers are absolutely responsible for the baggage of passengers intrusted to them, as carriers of goods; but with respect to luggage which the passenger keeps in his own custody the carrier is liable only if loss or injury occurs through his negligence. Carriers of passengers are bound to receive passengers and to make every reasonable effort to carry them the whole route for which they stipulate, and according to the public notices and general customs of their business, but they are not bound to carry persons disorderly in conduct or those having contagious diseases, or those who are otherwise offensive or dangerous to their fellow passengers. The passenger must comply with all reasonable rules or regulations of the carrier with regard to purchasing, showing, and giving up tickets, and in respect to trains, use of cars, etc. Upon his failing to do this the carrier may refuse to accept him as a passenger or eject him from his conveyance. It is under this rule that the carrier is enabled to exclude merchandise and articles known as "express matter" from its passenger cars.

The carrier is bound to carry the passenger to his destination with reasonable dispatch, and at a reasonable time according to the published schedule, and is liable to pay damages for his failure to do so. The passenger ticket, like the bill of lading, is both a receipt and a contract, and unless limited by its terms it is freely assignable. As in the case of the carrier of goods, the carrier of passengers may regulate or limit his liability as carrier by notice or stipulation printed on the ticket and actually or constructively assented to by the passenger. As in the case of carriers of goods also, it is the general rule that the carrier cannot thus exempt himself from liability for his own negligence or that of his servants.

Carriers of passengers by water are generally subject to strict statutory provisions regulating the number of passengers, the amount of provisions, the navigating of the ship, pilotage, etc.

Consult the authorities referred to under CONTRACT; BAILMENT; TORT; NEGLIGENCE; also Hutchinson, *Treatise on the Law of Carriers* (2d ed., Chicago, 1891); Carver, *Treatise on the Law Relating to the Carriage of Goods by Sea* (4th ed., London, 1905); Fetter, *The Law of Carriers of Passengers* (St. Paul, 1897); Judson, *The Law of Interstate Commerce* (Chicago, 1905).

CARRIER, kà'ryà', JEAN BAPTISTE (1756-94). A member of the French National Convention, born at the village of Yolet, in Upper Auvergne. He was procurator of the precinct of Aurillac when the Revolution began. In 1792 he represented Cantal in the Convention, where he soon became one of the most violent agitators. He took part, with Hébert, in the overthrow of the Girondist party, October, 1793, and immediately after was dispatched to Nantes and the Army of the West to assist in suppressing the uprising of La Vendée. Here he became practically an autocrat, although he at first acted in the name of a local committee which he himself selected. His acts were so fiendish as to awaken the horror of the most cruel of the Revolutionists. *Fusillades* and *noyades* (shooting and drowning parties) were his especial delight. Long lines of prisoners were ranged in front of open pits which they had been compelled to dig for their own graves, and were shot down so that their bodies fell by their own weight into the trenches. The hulks of vessels were filled with prisoners and scuttled. Men and women were tied together, hands and feet, and thrown into the Loire. This was called "republican marriage." It is said that during a single month 16,000 were shot or drowned at his orders. Robespierre finally recalled him, and, after the death of Robespierre, Carrier was called to account and vigorously defended himself before the Convention, contending that all his diabolical acts had been necessary under the circumstances and had been done under orders. He was, however, condemned and guillotined, Dec. 16, 1794.

CAR'RIER, or HOMING PIGEON. See PIGEON.

CARRIERA, kà-ryà'ra, ROSALBA (1675-1757). An Italian miniature and portrait painter, the most important of the eighteenth century. She was born in Venice, and at first learned lace making from her mother, but later applied herself to the decoration of snuffboxes under Jean Stève in Venice. She studied miniature and pastel with unimportant local masters and soon became celebrated throughout Italy, especially for her pastels. The portraits of her early period include those of Maximilian II of Bavaria, Frederick IV of Denmark, the 12 most beautiful Venetian court ladies, the "Artist and her Sister Naneta" (Uffizi), and August the Strong of Saxony, who acquired a large collection of her pastels. In 1720, already famous, she visited Paris and painted portraits of Watteau, the Regent, young Louis XV, and the nobles and ladies of his court. She was elected a member of the Academy by acclamation and presented as her "picture of reception" a "Muse Crowned with Laurel." While in Paris she kept a diary (published by the Abbé Vianelli in 1793), which gives a most entertaining account of her visit there. She returned to Venice in 1721, visited Modena, Parma, and Vienna, and

was everywhere received with much enthusiasm by rulers and courts. She was esteemed the greatest miniature and pastel painter of her day, and her works were compared with those of Correggio. They are delicate in handling and color, graceful in design and vivacious in expression, but often inaccurate in drawing. Towards the end of her life she became blind through overwork and died insane. Her art is represented in many private collections and nearly all the public galleries of Europe, especially in Dresden (143 specimens) and the Louvre. Of particular excellence are "The Four Seasons" (a pastel, Dresden Gallery), six admirable pastel portraits in the Royal Gallery, Venice, and another of the Princess Pia di Savoia-Valcarel. Consult the biographies of Sensier, with translation of her diary (Paris, 1865), Von Hoerschelmann (Leipzig, 1908), and Malamani (Milan, 1910).

CARRIER-BELLEUSE, kà'ryâ' be-léz' (properly CARRIER DE BELLEUZE), ALBERT ERNEST (1824-87). A French sculptor. He was born at Anizy-le-Château (Aisne) and studied at the Ecole des Beaux-Arts, Paris, under David d'Angers. He was first employed as a modeler for the industrial arts and was occupied for five years in this capacity at the Minton porcelain factory at Stoke-upon-Trent, England. His first important work of sculpture was the marble statue, "Death of General Desaix," in the Salon of 1859, which was followed by a Bacchante (1863), purchased by Napoleon III, and others. In 1867 he won the medal of honor with a group, "The Messiah," now in the church of St. Vincent de Paul, and was elected to the Legion of Honor. He carved many ideal figures, such as the "Sleeping Hebe" (Luxembourg), "Angelica," etc. He is seen at his best in his splendidly lifelike busts of Gauthier, About, Renan, as masterly in technique as they are in temperament and expression. During the last 10 years of his life Carrier-Belleuse was director of the art department of the porcelain factory at Sèvres.

CARRIÈRE, kâr'yâr', EUGÈNE ANATOLE (1849-1906). A French painter and lithographer. He was born at Gournay (Seine et Marne) and studied at Paris at the Ecole des Beaux-Arts and later under Cabanel. During the Franco-German War he passed some time as a prisoner in Dresden, where the art of Rubens made a lasting impression upon him, as may be seen in the glowing colors of his earlier pictures. About 1890 he adopted the gray, misty color scheme with contrasts of light and shadow, so characteristic of his art, but which no other artist has been able to imitate without affectation. His themes are usually scenes of his own domestic life, and he repeatedly introduces the likeness of his wife. The first of these, "The Young Mother" (1879), is now in the Museum of Avignon; it was followed by "The Sick Child" (Montargis), "The First Communion" (Toulon), and the excellent portrait of the sculptor Devillez. Carrière was one of the leaders in the secessionist movement, which led to the founding of the Société Nationale, in which he exhibited, among other works, "Sleep" (1890), the celebrated portrait of Paul Verlaine (1891, Luxembourg), "Maternity" (1892, ib.), "Christ on the Cross" (1897), and "Madame Menard-Dorian" (1906). He also modeled a monument to Verlaine in the style of Rodin, and wrote gracefully and interestingly on art

subjects. Most of his works are in French private collections. Consult the monographs by Séailles (Paris, 1901), Geffroy, a folio with 75 reproductions (ib., 1901), Morice (ib., 1906), and Faure (ib., 1908).

CARRIERE, MORITZ (1817-95). A German philosopher and writer on æsthetics, born at Griedel in Hessen and educated at Giessen, Göttingen, and Berlin. He was professor at Giessen, and later at Munich, and the author of many works on philosophy, religion, æsthetics, and poetry. He was an art critic of high rank. In philosophy he started as a Hegelian, but later followed more nearly the system of Fichte. With the latter, C. H. Weisse, J. U. Wirth, and others, he founded a theistic philosophy which endeavored to reconcile deism with pantheism. His chief works are: *Aesthetik* (2d ed., 1873); *Die Kunst im Zusammenhang der Kulturentwicklung und die Ideale der Menschheit* (5 vols., 3d ed., 1876-86); and *Die sittliche Weltordnung* (1877). His *Gesammelte Werke*, 14 vols., appeared in Leipzig in 1886-94.

CARRIERS. See ATHAPASCAN, TAKULLI.

CARRINGTON, FITZROY (1869-). A leading American print connoisseur, born at Surbiton, Surrey, England. He was educated at Victoria College, Jersey, and came to the United States in 1886. For 21 years (1892-1913) he was identified with Frederick Keppel & Co. (New York), dealers in etchings and engravings, being a member of the firm after 1899. During this period he made a specialty of selecting, arranging, and writing introductions for artistic editions of such works as Dante's *New Life*; *The Queen's Garland* (Elizabethan verse); Rossetti's *Pictures and Poems*; William Morris's *The Doom of King Aërisius*; *The King's Lyries* (1899); *The Shepherd's Pipe* (1903); *The Pilgrim's Staff* (1906). In 1911, the year before publishing *Prints and their Makers*, he had undertaken the editorship of the *Print-Collector's Quarterly*, a journal unique in the United States. He continued to be editor after 1913, although then giving up his business interests to become lecturer on the history and principles of engraving, at Harvard University, and curator of prints at the Museum of Fine Arts, Boston.

CARRINGTON, HENRY BEEBEE (1824-1912). An American soldier and military historian, born in Wallingford, Conn. He graduated at Yale in 1845 and afterward studied at the Yale Law School and practiced law in Columbia, Ohio. In 1857, while on the staff of Governor Chase, he helped to organize the State militia; and at the outbreak of the Civil War he was made colonel of the Eighteenth United States Infantry and soon afterward brigadier general of volunteers. After the close of the war he served in the West till 1869 and in 1870 was made professor of military science in Wabash College, Indiana. In 1890 he took a census of the Six Nations and the Cherokees. His principal writings are: *Battles of the American Revolution* (1876), regarded as one of the best military histories of the Revolutionary War; *Russia as a Nation* (1849); *The Washington Obelisk and its Voices* (1887); *Washington, the Soldier: Lafayette and American Independence*.

CARRINGTON, RICHARD CHRISTOPHER (1826-75). An English astronomer, born in London. He was educated at Trinity College, Cambridge, and from 1849 to 1852 held the post of observer at the University of Durham. From 1852 he

conducted valuable private investigations at an observatory erected by himself at Redhill, Surrey. He was secretary of the Royal Astronomical Society in 1857-62 and was elected a fellow of the Royal Society in 1860. His chief contributions to science were included in his *Catalogue of 3735 Circumpolar Stars* (1857) and *Observations of the Spots on the Sun from 1853 to 1861* (1863).

CARRION CROW. Any of various large black or dark-colored birds which feed on carrion; in the United States, and southward, the black vulture (*Catharista urubu*), a close relative of the turkey buzzard. It is considerably larger than a crow, the plumage is blackish, and the head is bare, but most of the neck is feathered. It is found abundantly along the Gulf coast and northward to North Carolina and is especially common in the cities and large towns, where it is protected as an indispensable scavenger, and often, as notably about the market in Charleston, becomes half domesticated. The nest is made on the ground under logs or bushes; the eggs are one to three in number, bluish white, more or less spotted with brown. In England the "carrion crow" is a true crow (*Corvus corone*). It is the most like the American crow of any of the five British species, but is a little larger; seldom appears in flocks, but is more of a solitary bird; and not only eats carrion, but even attacks weak animals, such as young lambs, and often eats the eggs and young of other birds.

CARRION FLOWER. See SMILAX.

CARRION HAWK. The birds so frequently referred to by this name in Darwin's *A Naturalist's Voyage* (London, 2d ed., 1877) are caracaras, especially the carancho (*Polyborus tharus*). See CARACARA.

CARRIZO, kâ-rê'thō (Sp., from Amer. Indian). The collective Spanish name for a group of tribes formerly occupying both sides of the lower Rio Grande, in Texas, and Tamaulipas, Mexico. They built homes thatched with reeds (*carrizo*), whence the name. They have been practically exterminated by the raiding tribes of Texas, among whom are still many Carrizo captives. Some years ago Gatschet found in the neighborhood of Camargo a few families still speaking their language, which, with others of the adjacent portion of Texas, constitutes a distinct stock, the Coahuiltecan.

CARROLL, kâr'ol. A city and the county seat of Carroll Co., Ia., about 97 miles northeast of Omaha, Neb., on the Chicago and Northwestern and the Chicago Great Western railroads (Map: Iowa, C 2). It has a Carnegie library, a domestic science school, and St. Anthony's Hospital. The principal manufactured products are tractor engines, barbed mesh and field fencing, wire novelties, dog muzzles, etc.; and there are roller and flour mills, an ice factory, marble, cement, and brick works, and a creamery. Carroll was settled in 1867. The government is vested in a mayor, elected biennially, and a unicameral council. The water works are the property of the municipality. Pop., 1900, 2882; 1910, 3546.

CARROLL, CHARLES, of Carrollton (1737-1832). An American patriot. He was born in Annapolis, Md., and was educated in the Jesuit colleges of Saint-Omer, Rheims, and Louis le Grand. He then studied law in Bourges, Paris, and London, and returned to America in 1765. He inherited the largest of the old manorial

estates of Maryland. In 1775 he was chosen a member of the "Committee of Observation" at Annapolis and in the same year was sent to the provincial convention. In 1776 he was one of the commissioners sent to persuade the Canadians to join in the war against England. Returning to Maryland, he became prominent as an advocate of union and independence, and in July, 1776, was sent to Congress, where on August 2 he signed the Declaration, writing "of Carrollton" after his name, so that there could be no doubt concerning his identity, "Carrollton" being the name of the family mansion. In Congress he was a member of the Board of War. In 1776 he was one of the committee that drafted the Maryland Constitution and was chosen to the State Senate. In 1777 he was again sent to Congress and in subsequent years was repeatedly elected to the State Legislature. In 1789 he was United States Senator and in 1799 was a member of the Maryland and Virginia boundary commission. He died in Baltimore on Nov. 14, 1832, aged 95, the last survivor of the 56 signers of the Declaration of Independence. Consult his *Life*, by J. H. B. Latrobe (Philadelphia, 1824). Consult also Mayer (ed.), *Journal of Charles Carroll of Carrollton during his Visit to Canada in 1776, as One of the Commissioners from Congress* (Baltimore, 1845), and Rowland, *Life of Charles Carroll of Carrollton* (2 vols., New York, 1898).

CARROLL, HENRY KING (1848-). An American clergyman, born in Dennisville, N. J. He was religious and political editor of the *Independent* (1876-98), and in 1890 had charge of the religious census of the United States. In 1898-99 he served as a special United States commissioner to Porto Rico, and later was made assistant secretary in the Methodist Episcopal Church Missionary Society. He was executive secretary of the western section of the Ecumenical Methodist Conference of 1911. Besides government reports and numerous reviews, he has published *The Religious Forces of the United States* (2d ed., 1896) and *Missionary Growth of the Methodist Episcopal Church* (1907).

CARROLL, JAMES (1854-1908). An American physician and army surgeon, born in England. He was educated at Albion House Academy, Woolwich, England, at the University of Maryland, and at Johns Hopkins Hospital. From 1897 to 1902 he was associated with Major Walter Reed in the study of Sanarelli's supposed yellow fever bacilli, submitting himself to the bite of an infected mosquito, and suffering a severe attack of the disease as a result. He was appointed first lieutenant and assistant surgeon in the United States army, became professor of bacteriology and clinical microscopy at the Army Medical School, professor of bacteriology at the Washington Post-Graduate School, and professor of bacteriology and pathology at George Washington University. He also served as curator of the Army Medical Museum and was finally promoted to brigadier general and surgeon-general in the United States army. He is author of *Yellow Fever* (1905).

CARROLL, JOHN (1735-1817). An American prelate, the first Roman Catholic Bishop in the United States. He was born in Maryland and was the cousin of the celebrated Charles Carroll of Carrollton (q.v.). He was educated in the Jesuit College of Saint-Omer's, Belgium, and was professor at Saint-Omer's College and

Liège from 1759 to 1771. He then became a Jesuit novice and was prefect of the Jesuit College of Bruges. When the Order of Jesus was suppressed on the Continent in 1774, he returned to America. In 1776 he was chosen by Congress, with Charles Carroll, Benjamin Franklin, and Samuel Chase, to urge the people of Canada to join the Colonies in the war against England. In 1784, on the recommendation of Franklin, Dr. Carroll was appointed by the Pope Prefect Apostolic of the Catholic Clergy in the United States. In 1789 he was appointed Bishop, and in 1808 his see was made the Archdiocese of Baltimore. He founded Georgetown College in 1791. Consult Shea, *Life and Times of the Most Rev. John Carroll* (New York, 1888), being vol. ii of his *History of the Catholic Church in the United States* (1888).

CARROLL, JOHN JOSEPH (1856-). An American priest and scholar, born in Ennis-crone, county Sligo, Ireland. He was taken to the United States as an infant and was educated at St. Michael's College (Toronto) and St. Joseph's Provincial Theological Seminary. He became rector of St. Thomas's Church, Chicago. His writings include: *Notes and Observations on the Aryan Race and Tongue* (1894); *Pre-Christian Occupation of Ireland by the Gaelic Aryans* (2 vols.); *Tale of the Wanderings of the Red Lance*, in Gaelic and English. He also translated *The Rubaiyat of Omar Khayyam* into Gaelic verse in 1909.

CARROLL, LEWIS. See DODGSON, C. L.

CARROLLTON. A city and the county seat of Carroll Co., Ga., 52 miles west by south of Atlanta, on the Little Tallapoosa River, and on the Central of Georgia Railroad (Map: Georgia, A 2). It is in an agricultural and stock-raising region, producing chiefly cotton, corn, and fruits, and has a large cotton trade. The industrial establishments include cotton, cottonseed oil, flour, rolling, and planing mills, foundry and machine shops, agricultural machinery, fertilizer and broom factories, brick-yards, and marble works. The water works are owned by the municipality. Pop., 1900, 1998; 1910, 3297.

CARROLLTON. A city and the county seat of Greene Co., Ill., 54 miles southwest of Springfield, on the Chicago and Alton Railroad (Map: Illinois, B 4). It contains a fine courthouse and a public library. The city is the commercial centre of a fertile region and has flouring mills. Carrollton was settled in 1819 and was surveyed two years later. The water works are operated by the city. Pop., 1900, 2355; 1910, 2323.

CARROLLTON. A city and the county seat of Carroll Co., Mo., 66 miles east by north of Kansas City, on the Atchison, Topeka, and Santa Fe, the Wabash, and the Chicago, Burlington, and Kansas City railroads (Map: Missouri, C 2). It is in a fertile agricultural region, of which it is the commercial centre, and has flour mills, a creamery, wagon and harness factories, foundry and machine shops, acetylene generator, furniture and farm-machinery factories, and a large poultry-feeding station. Carrollton was settled in 1819 and incorporated 12 years later. There is a monument there, erected by the Federal government, over the grave of Gen. James Shields, hero of the Mexican and Civil wars, and United States Senator from three States. Pop., 1900, 3854; 1910, 3453.

CARROLLTON. A village and the county seat of Carroll Co., Ohio, 27 miles southeast of

Canton, on the Wheeling and Lake Erie Railroad (Map: Ohio, H 4). Deposits of coal, natural gas, and clay are found in the surrounding region, which is largely agricultural. The principal industries are the manufacture of pottery, rubber, toys and novelties, and granite paving brick. The water works are owned by the village. Pop., 1900, 1271; 1910, 1730.

CAR'RON. A village in Stirlingshire, Scotland, on the right bank of the Carron Water, about 1 mile from Falkirk. It is celebrated for its ironworks, which were established in 1760 and are among the largest of the kind in Britain. The town gives its name to the obsolete *carronade*, a short cannon formerly used in naval service. Pop., 1500.

CAR'RONADE' (from the Scotch village *Carron*). A short, light gun of relatively large bore, which was carried by men-of-war about the beginning of the nineteenth century. The size of the shot used made them useful in close engagements, but they had slight range and little penetrative power. See **ORDNANCE**; **GUNS**, **NAVAL**.

CARRON OIL. A mixture of equal parts of lime water and linseed oil, employed as a dressing for burns. Its name is derived from that of the ironworks in Scotland at which its reputation was made. Carron oil is a soapy, thick, and inelegant mixture. It is often used in household emergencies, but has been largely superseded by cleanly antiseptic ointments. See **BURNS AND SCALDS**.

CAR'ROT (Fr. *carot*[t]e, Lat. *carota*, probably from Gk. *καρωτόν*, *karōton*, carrot), *Daucus*. A genus of plants of the natural order Umbelliferae. They are mostly natives of Europe. The common carrot (*Daucus carota*) is a biennial plant. The wild form is a bad weed. It has a slender, woody root of a very strong flavor. The improvement of the species is thought to have begun in Holland. It was introduced into England at the beginning of the sixteenth century and is now in general, though not extensive, cultivation as a stock food and for culinary purposes. The roots have a yellow, white, or reddish color. The culinary sorts are generally small, mature early, and vary as much in form as do radishes. The stock carrots have a long, tapering root and generally mature late, making their best growth during the cool weather of fall. For illustration, see Plate of **TANSY**. See also Plate of **ONIONS**.

Carrots for the table may be sown as soon as the weather is settled in the spring, in rows 1 to 2 feet apart, and the plants thinned to 2 to 3 inches in the row. A rich, sandy loam soil is best. The early crop requires about the same cultivation as do radishes. At maturity the roots are bunched and marketed like radishes. Carrots for stock are planted in the field in April or May, in rows 18 inches to 2 feet apart, and the plants thinned to 3 to 4 inches. See **DICOTYLEDONS**.

Feeding and Food Value.—Carrots contain, on an average, in addition to 88.6 per cent of water, 1.1 per cent of protein, 7.6 per cent of nitrogen-free extract, 1.3 per cent carbohydrate, and a little fat and ash. They are relished by horses and serve well for other stock, especially dairy cows. They are a very succulent feed. Carrots are often grown as a vegetable and are served boiled and seasoned in a variety of ways. As ordinarily prepared for the table, the refuse (skin, etc.) constitutes about 20 per cent of the

whole root. When carrots are boiled in water, there is usually a loss of nutritive material, consisting of sugar and other substances extracted by the water. If the whole carrots are cooked quickly, or cut in large pieces, the loss is less than is otherwise the case. Carrots contain a coloring matter which is used to some extent as a butter color. Consult: Percival, *Agricultural Botany* (1900); *N. Y. Cornell Experiment Station Bulletins* 243 (1906), 244 (1907), 317 (1912).
