CARROUSEL, ká'rōō'sēl' (Fr., a tilting match, from It. *carosello*, tournament, for *garosello*, from *garoso*, quarrelsome, *gara*, strife, from *guerra*, war, OHG. *wera*; connected by popular etymology with It. *carricello*, little car, dim. of *carro*, car). Originally, a species of knightly exercise which, even down to the beginning of the eighteenth century, was very common at all the courts of Europe. A carrousel was a kind of imitation of the tournament and for a time after the discontinuance of the latter seems to have supplied its place. The dresses, for the most part, were those of the knights of former times, and the combatants (or, rather, competitors) were divided into two parties, usually according to their different nationalities. One of the favorite exercises in France consisted in running with a lance at the pasteboard head of a Moor or Turk, cutting it down with a sword, or firing at it with a pistol. Another of these tests of skill and horsemanship, if not of courage, consisted in carrying off on a lance a whole line of rings, which were suspended for the purpose. The carrousel in France was not known before the reign of Henry IV, but it had existed for some little time previously in Italy. There were brilliant carrousels under Louis XIII, and two celebrated ones were given in honor of Mademoiselle de la Vallière—the one in Paris in 1662, the other in Versailles in 1664. The place where the first of these fêtes was held has ever since been called the Place du Carrousel. A revival of the carrousel was attempted in Berlin in 1750, and in 1828 the cavalry school in Saumur held one in honor of the Duchess of Berry. In the United States the name is applied to a "merry-go-round," or movable platform fitted with wooden horses and other animals, on which children ride.

CARRUTHERS, kār-rūth'ērz, ROBERT (1790–1878). A Scotch journalist and miscellaneous writer. He was born in Dumfries, Scotland, and in early life was apprenticed to a bookseller. In 1828 he became editor, and in 1831 proprietor, of the *Inverness Courier*. He is best known as the biographer and editor of Pope, his *Poetical Works of Alexander Pope* (1853), in 4 vols., with subsequent revisions, having been received with great favor. He was a friend of several of his eminent contemporaries, including Rogers, Macaulay, and Thackeray. In collaboration with Robert Chambers he published the *Cyclopædia of English Literature* (1843–44). His works include, also, a *History of Huntingdon* (1824) and an annotated edition of Boswell's *Journal of a Tour in the Hebrides* (1851).

CARRUTHERS, WILLIAM A. (c.1800–c.50). An American novelist, born in Virginia. He practiced medicine in Savannah, and wrote two romances dealing with Colonial times—*The Cavaliers of Virginia* (1834), a tale of Bacon's Rebellion, and *The Knights of the Horseshoe*

(1845), a tale dealing with Governor Spotswood's famous expedition. The latter book has been reprinted and was one of the best of the romances of its day. Carruthers also wrote *The Kentuckian in New York* (1834), a volume of sketches. Consult Trent, *Southern Writers* (New York, 1905).

CARS, RAILWAY. See RAILWAYS.

CARSON, ALEXANDER (1776–1844). A Scottish clergyman. He was born in county Tyrone, Ireland, was educated at Glasgow University, and in 1797 became pastor of a Presbyterian church in Tobermore, or Tubbermore, Ulster, Ireland. In 1805 he turned Independent, and finally (1831), after study of the New Testament for the purpose of refuting Baptist principles, he was converted to those very principles, and published *Baptism: Its Mode and Subjects*. Though agreeing with the Baptists in all other doctrines, he did not recognize "close" communion. Consult his *Life* by Moore (New York, 1853).

CARSON, CHRISTOPHER (generally known as "Kit Carson") (1809–68). A famous American hunter, trapper, and Western scout. He was born in Madison Co., Ky., but when only a year old was taken by his parents to Howard Co., Mo., where from 1824 to 1826 he served as a saddler's apprentice. In the latter year he accompanied a party of hunters to Santa Fe, N. Mex., and afterward devoted himself almost entirely to hunting and trapping. He accompanied an expedition to California in 1829, and another to the Rocky Mountains in the following year, and from 1832 to 1840 was employed as hunter for the garrison at Fort Bent, at the headwaters of the Arkansas. He accompanied Frémont on the latter's expeditions of 1842 and of 1843–44; then spent some time on a ranch, and in 1846–47 served as a guide in Frémont's famous expedition to California. In 1853 he, with a few Mexican drovers, succeeded in driving 6500 sheep to California, and on another occasion, this time unaided, he took 50 horses and mules to Fort Laramie, fully 500 miles from his ranch. In 1854 he was appointed Indian agent for the Utahs and Apaches, at Taos, N. Mex., and in this capacity was able, by reason of his remarkable influence over the Indians, to be of great service to the United States government. During the Civil War he served the government with great energy in New Mexico, Colorado, and the Indian Territory, especially against the Confederates in Texas and the Navajo Indians, and in 1865 was brevetted brigadier general. In the course of his career as a trapper, hunter, Indian fighter, scout, and Indian agent, he met with many remarkable adventures, some of which read like romance, and he soon came to be regarded throughout the country as the typical frontiersman, resourceful in danger, an adept with the rifle, and skilled even beyond the Indians in woodcraft and the knowledge of wild animals. Consult: Burdette, *Life of Kit Carson, the Great Western Hunter and Guide* (Philadelphia, 1869); Peters, *Kit Carson's Life and Adventures, from Facts Narrated by Himself* (Hartford, 1874); Bradley, *Winning the Southwest* (New York, 1912); Sabin, *With Carson and Frémont* (Philadelphia, 1912).

CARSON, RT. HON. SIR EDWARD HENRY (1854–). A prominent British barrister and statesman. He was born at Dublin, graduated from Trinity College, entered Parliament,

and in 1892 became Solicitor-General for Ireland. He was actively engaged on the side of the crown throughout the land troubles in Ireland, and became so closely identified with Unionist principles in the House of Commons that on Mr. Balfour's retirement he was spoken of as the leader of the Unionist party.

In 1912 Carson became by popular recognition the head and centre of the Ulster resistance to the Home Rule Bill for Ireland. (See UNITED KINGDOM, *History*.) Even before its introduction into Parliament Carson organized and presided over a huge mass meeting in Ulster, where from 80,000 to 100,000 men paraded in military array before Mr. Bonar Law, the Unionist leader, as an indication of forcible resistance to the government. The bill was introduced in Parliament on April 11, and Sir Edward Carson immediately became its foremost assailant throughout the memorable sessions of 1912-13. He was also indefatigable in Ireland, where, hailed as "general," he organized and reviewed Protestant volunteers. In Belfast he was given the Orange battle flag used by William III at the battle of the Boyne, and under it he signed, first of all the quarter million of Ulster men, the solemn covenant which pledged resistance to a Home Rule Bill for Ireland. In 1913 still more startling measures were taken. A provisional government for Ulster was determined upon, and Carson was put at the head of the Executive Committee, which in case of necessity was to administer Ulster. The Liberal government, apparently alarmed at this grim earnestness, made, in the autumn of 1913, a tentative proposal that Northeastern Ulster be excluded for the present from Home Rule. To this idea Carson remained unfriendly, although he agreed to abide by the majority of his fellow Irish Protestants, if they should approve the suggestion. Carson is a brilliant debater and so utterly without fear in both word and deed that many have looked for his arrest, while some of the suffragettes pointed out that the Ulster provisional army was as much a defiance of established government as was their propaganda.

CARSON CITY. The capital of Nevada and the county seat of Ormsby County, 31 miles by rail south of Reno, on the Virginia and Truckee Railroad (Map: Nevada, D 2). It is in a picturesque region, near the base of the Sierra Nevada, about 12 miles from Lake Tahoe, and contains the capitol, Federal building, library, orphans' home, and a branch mint, which receives immense deposits of silver and gold ore. The State prison is 2 miles southeast of the city, and a United States government Indian school is three miles to the south. Carson City is in a fertile agricultural region and is engaged principally in mining, stock raising, and agriculture. Founded in 1858, it became the capital of Nevada in 1861 and was chartered as a city in 1875. Pop., 1890, 3950; 1900, 2100; 1910, 2466.

CARSON RIVER. A stream in west Nevada. It rises in the Sierra Nevada Mountains, south of Lake Tahoe, and flows in a northeasterly course, passing a few miles to the south of Carson City (Map: Nevada, D 2). It is about 150 miles in length to where it divides, one branch flowing north and disappearing in Carson Sink, and the other flowing southward into Carson Lake, a small body of water which appears to have no outlet.

CARSTARES, kär'stärz, or **CARSTAIRS,** WILLIAM (1649-1715). A Scottish statesman

and divine, born at Cathcart, near Glasgow, Feb. 11, 1649. He was the son of the Rev. John Carstares, an extreme Covenanter, and was tutored by Sinclair, minister of Ormiston, East Lothian. He distinguished himself at Edinburgh University and graduated in 1667. Two years later he went to Utrecht to study theology, and there his accomplishments attracted the notice of the Prince of Orange, whose lifelong friend and confidential adviser on English matters he became. He returned to England in 1674, and on suspicion of being part author of a pamphlet on Scottish grievances, was first committed to the Tower, then transferred to Edinburgh, and kept in prison until 1679. In 1682 he went to London and negotiated between the English and Scottish conspirators in the Rye House Plot. He was arrested and put to the torture of the thumbscrew, but only partly confessed, when assured that his depositions would not be used against any one. Unfortunately, his evidence, notwithstanding his strenuous expostulations, led to the execution of Baillie of Jerviswood (q.v.). He returned to Holland in 1685, and, acting mainly on his advice, the Prince of Orange planned and carried out the invasion of England in 1688. He accompanied the Prince as chaplain and, when the Prince was established as William III, effected a reconciliation between him and the Scottish church. From 1693 to 1702 he wielded great influence in Scottish affairs and, owing to his authority in Church matters, was nicknamed "Cardinal Carstairs." He was elected principal of the Edinburgh University in 1704 and used his influence to increase the patronage of Scottish colleges. In the same year he became minister of Greyfriars Church and was appointed moderator of the General Assembly, an office to which he was four times elected in 11 years. On a visit to London in 1707 he received a medal and the personal thanks of Queen Anne for his assistance in passing the Act of Union. He succumbed to an attack of apoplexy Dec. 28, 1715, leaving a reputation for scholarship, piety, charity, and political sagacity.

Consult McCormick, "Life of Carstares," prefixed to *State Papers and Letters Addressed to William Carstares* (London, 1774), and Story, *Character and Career of William Carstares* (London, 1874).

CARSTENS, kär'stens, ASMUS (JAKOB ASMUS) (1754-98). A German painter and engraver. He was born at Sankt Jorgen (Schleswig), was early apprenticed to a wine merchant, and could not devote himself to art until the age of 22, when he enrolled at the Academy in Copenhagen. Refusing to follow the usual academic course, he educated himself by studying anatomy and the antique casts. In 1787 he came to Berlin, attracted notice with his drawing "The Fall of the Angels," and was made professor at the Academy. Finally, in 1792, he was able to realize his life's dream of going to Rome, where, in spite of continual illness, his best work was produced. The Weimar Museum possesses a fine collection of his cartoons and drawings, among them "Night with her Children" and "The Birth of the Light." Other important works are the "Argonaut" cycle of 24 plates (Copenhagen), "Priam and Achilles" (Berlin). Many of his drawings also represent scenes from Dante, Ossian, and Shakespeare. Carstens, by his noble drawings, was a worthy precursor of that revival of art in Germany which was to appear

later in the works of Cornelius and Overbeck. As a painter his rank is lower than as a draftsman; he is deficient in color and decorative facility. He followed a supposed Greek ideal, and his classical subjects represented qualities of simplicity and power that had been wanting in the works of his predecessors. Consult Fr. Pauli, *A. Carstens* (Berlin, 1876), and Fernow, *Carstens Leben und Werke* (new ed. by Riegel, Hanover, 1867).

CART (AS. *cræt*, Icel. *kartr*, from Welsh *cart*, Ir., Gael. *cairt*, cart, dim. of *carr*, car). A two-wheeled vehicle, usually without top or springs, designed in most cases to carry heavy loads and to be drawn by one horse. The cart is doubtless the oldest, as it is the simplest, form of carriage. In its primitive form it consisted of a box or platform mounted on a rude axletree at whose extremities wheels, formed by making transverse sections from a tree trunk, revolved. To this axletree the poles or shaft were also fastened. The earliest chariots, though elaborately ornamented, were constructed on this simple plan. In modern times carts are used in many countries for agricultural purposes. The one-horse cart is employed by carriers all over Scotland. In France and Germany the carrier's cart is a somewhat heavier vehicle. Long in the body, very strong in construction, and poised on two high wheels with broad rims, this continental cart carries enormous loads. The *dump cart* is a vehicle so constructed that it can be unloaded by simply tilting the body of the vehicle. It is much used in the United States for hauling dirt from excavations and for the removal of ashes and garbage in cities. There is another class of carts or two-wheeled vehicles which are used for pleasure carriages. An example of this class is the *dogcart*, so called because it was originally made for the conveyance of sporting dogs. Such carts are particularly available for tandem driving (see **DRIVING**), and there are many types for both town and country use. An essential feature of a good dogcart is a mechanical or other device whereby the body or weight may be shifted on the frame so as to secure a proper balance and consequent ease of traction for the horse by removing the weight as much as possible from his back. The *gadabout* is a somewhat low form of dogcart, while the *White-chapel cart* is generally built of considerable height and is largely used for tandem driving. The *gig*, a two-wheeled cart with a single seat, modern types of which are known as *tilburies* and *stanhopes*, also belongs to this class. The *calash* of Canada, where the driver sits in a low seat in front of his fares, is one of the older forms of cart which still survive. The Irish *jaunting car*, where two seats are placed back to back lengthwise of the car, and directly behind the driver, is also well known. The *trotting sulky*, which, like the trotting horse, is a peculiarly American product, is another important type of two-wheeled vehicles. In 1892 the pneumatic tire and ball bearings which had been used with such success on the bicycle were applied to the trotting sulky, and the diameters of the wheels were reduced. The result was a material lowering of the trotting records. There are also numerous other types of two-wheeled carts known as *road carts*, which, while not possessing a high degree of comfort, are useful and convenient and are easy on the horse. Certain of these are specially designed for breaking colts and others for exercising trotting horses. For a

discussion of vehicles in general, see **CARRIAGE**; **DRIVING**; and consult the authorities there cited.

CAR'TAGE'NA, *Sp. pron.* kār'tā-hā'nā. An important seaport and one of the chief naval stations of Spain, in the Province of Murcia, situated on a bay of the Mediterranean, 27 miles south-southeast of Murcia (Map: Spain, E 4). It is built partly on the slope of a hill and partly in a plain. The harbor is one of the best on the Mediterranean, capacious enough to hold the largest fleets, with a narrow entrance commanded by fortifications placed on the summits of two volcanic cliffs. There are other defenses nearer the city to the east and west. The city, which is surrounded by walls, is well built and has some wide and good streets, and several fine plazas, notably La Merced, La Constitución, and Del Rey. In the southeastern part of the city is the Castillo de la Concepción, at an elevation of over 225 feet, and of interest for its ruins and magnificent view. Among the more noteworthy structures are the Gothic cathedral, dating from the thirteenth century, which in the Middle Ages is said to have been one of the richest in Spain; the Hospital Militar, on a fine site overlooking the sea; the Hospital de la Caridad, which accommodates 600 patients; the Cuartel de Guardias Marinas, and the Presidio. The leading feature of the city is the arsenal, occupying a site on the southwest, which has an extensive equipment of foundries, machine shops, barracks, hospitals, dockyards, docks, etc., all of its facilities being on a large scale. A marine school also is maintained. Cartagena was, and in a sense still is, an episcopal see. In 1281 the see was transferred to Murcia and became officially and literally the see of Murcia-Cartagena; but after all these centuries it is still called most often Cartagena. The city contains a number of educational institutions, both public and private. Good water is supplied through a new aqueduct. With its suburbs Cartagena constitutes an important commercial and mining centre, and it is also the seat of considerable industrial interests. Lead, argentiferous ore, iron, manganiferous iron, and some copper and zinc are mined in the vicinity. There are extensive smelting works, glassworks, and manufactures of esparto grass wares, sailcloth, cordage, soap, pottery, liquors, etc. The tunny fishery and shipbuilding also are industries of importance. The commerce of the city consists of an export trade in minerals, esparto, oranges, and lemons, and imports of machinery, provisions, coal and coke, timber, etc. Pop., 1900, 99,871; 1910, 102,542.

Cartagena, anciently known as *Carthago Nova* and *Carthago Spartaria*, was founded in 228 B.C. by Hasdrubal. As the Carthaginian headquarters in Spain, it became a town of importance and had equal influence under the Romans after its capture by Scipio in 210 B.C. In 425 A.D. Cartagena was sacked by the Vandals; early in the eighth century it was taken by the Saracens. St. Ferdinand of Castile captured the city in 1244; but it was retaken, and not until it fell before the arms of James I of Aragon in 1276 did it come finally into Christian hands. In 1509 Cardinal Ximénez sailed from Cartagena on the famous expedition against Orán. In the War of the Spanish Succession it was taken (1706) by an English-Dutch fleet, but was recovered shortly afterward. It surrendered to the French in 1823. In the political struggles of the nineteenth century Cartagena played comparatively an unim-

portant part until 1873, when it proclaimed an independent cantonal government. The insurrection was soon put down, but not until the city had suffered a disastrous bombardment. As a naval station Cartagena suffered considerably in 1898 from the naval reverses of the Spanish-American War.

CARTAGENA, or **CARTHAGENA**. A fortified seaport and capital of the Colombian State of Bolívar, situated on a peninsula where the shore of the Caribbean Sea bends abruptly towards the south to form the Gulf of Darién (Map: Colombia, B 1). Its temperature averages 82° F., and its location is unhealthful. The city is surrounded by the old fortifications and possesses a cathedral, two fine churches, a government building, a college, seminary, and a theatre. The harbor is a good one, but has a difficult entrance and has lost its importance since the opening of the harbor at Sabanilla. The town manufactures chocolate and candles, and exports cattle, hides, fine woods, precious stones, and tobacco. Pop. (1905 official estimate), 14,000. Cartagena was founded by Dom Pedro de Heredia in 1533, and was an object of attack for English freebooters, who burned it under Drake in 1585; and in 1697 the French took it and obtained \$5,000,000, by way of ransom. It resisted an assault by the English in 1741, was captured by Bolívar, recaptured by Spain during the war for independence, 1815, and was retaken by the patriots in 1821.

CARTAGO, kár-tá'gō. The capital of the province of the same name in Costa Rica, Central America (Map: Central America, E 6). It lies about 14 miles southeast of San José, the capital, with which it is connected by rail. It is regularly built, but most of its public buildings bear marks of the earthquakes from which the city has suffered. The town has a considerable coffee trade, and derives much importance from its position on the interoceanic railway. Cartago was known in the sixteenth century, having been in existence as early as 1522. As the seat of government it attained to considerable prominence, and in 1823 is said to have contained 30,000 inhabitants. The civil wars and seismic disturbances, however, contributed to its decline, and the capital was moved to San José. Pop., 1903, 4536.

CARTAGO. A town of Colombia, in the Department of Cauca, on the Cauca River, 150 miles west of Bogotá (Map: Colombia, B 3). It has coffee, cocoa, and tobacco industries and a trade in cattle. Pop., 10,000.

CARTE, THOMAS (1686-1754). An English historian. He was a son of Samuel Carte, the antiquarian and divine, and was born at Clifton. He was educated at Oxford and took his B.A. degree in 1702, then proceeded to Cambridge and attained his M.A. in 1706. He received holy orders in 1707, and was appointed reader at the Abbey Church, Bath; but subsequently as a Stuart Loyalist refused allegiance to George I and resigned. Because he was secretary to Bishop Atterbury and a suspected accomplice in that prelate's conspiracy, £1000 was offered for his arrest, but he escaped to France. He was allowed to return in 1728, and in 1736 published a *Life of James, Duke of Ormonde* (2 vols.). In 1747-55 appeared his *History of England to 1654* (4 vols.), a valuable source for later historians. His other works include illustrations for the *History of Thuanus* (De Thou), edited by S. Buckley (7 vols., 1733); and 20

folio and 15 quarto manuscript volumes of valuable English historical remains to 1688 are preserved and have been much drawn upon in the Bodleian Library, Oxford. Carte died, April 2, 1754, at Caldecott House, near Abingdon. His *History of England* was republished at Oxford in 1851 (6 vols.). Consult Nichols, *Literary Anecdotes*, vol. ii (London, 1812-15), and his *Illustrations of Literary History* (London, 1817-58), vol. v, pp. 152-156.

CARTE BLANCHE, kárt blänsh (Fr., white paper). A blank paper authenticated with an authoritative signature and intrusted to some one to be filled up as he may think best. Thus, in 1649, Charles II tried to save his father's life by sending from The Hague to the Parliament a signed *carte blanche* to be filled up with any terms which they would accept as the price of his safety. The term has come to denote unlimited authority, freedom to do as one wills.

CARTEL, kár'tél or kár-tél' (Fr., It. *cartello*, ML. *cartellus*, dim. of *carta*, paper). An agreement relative to the exchange of prisoners. A *cartel ship*, or *cartel*, is one commissioned to carry prisoners or proposals of any kind between belligerents, and is not permitted to carry an armament (except a gun for making signals), cargo, ammunition, military stores, or instruments of warfare. A violation of the conditions imposed renders a cartel ship liable to capture and confiscation.

CARTEL, THE. The agreement by which the German Conservatives, Imperialists, and National Liberals united in 1887 in support of Bismarck and the Army Bill. See **POLITICAL PARTIES**, *Germany*.

CARTELLIER, kár't'-lyá', PIERRE (1757-1831). A French sculptor, born in Paris. He studied under Bridan, first exhibited in the Salon of 1796, and was appointed member of the Institute and professor at the Ecole des Beaux-Arts in 1816. His principal works are: "Napoleon I" and the "King of Holland" in Versailles; "Archbishop Juigne" in Notre Dame, Paris; mausoleum of the Empress Josephine in the church of Rueil; the bas-relief of "The Capitulation at Ulm," Arc du Carrousel, Paris; and the allegorical statues "Force" and "Prudence" in the Pantheon. Among his numerous and important pupils were François Rude, Petitot, and the two Leseuers. Consult the monograph by Eméric-David (Paris, 1836).

CARTER, ELIZABETH (1717-1806). An English poet and translator, born at Deal, Kent. She became an expert linguist, rendered into English De Crousaz's *Examen de l'essai de Monsieur Pope sur l'homme* (2 vols., 1739); Algarotti's *Newtonianismo per le dame*; and (1758) the works of Epictetus. Her poetry has slight value. She was a friend of many of the leading littérateurs of the time, including Johnson, to whose *Rambler* she contributed two papers.

CARTER, FRANKLIN (1837-). An American educator, born in Waterbury, Conn. He was educated at Yale, at Williams, and at the University of Berlin, and received several honorary degrees. He began his teaching career at Williams College, where he was professor of Latin and French from 1865 to 1868 and of Latin alone from 1868 to 1872. He was then professor of German at Yale from 1872 to 1881 and during this period studied theology and was licensed to preach. In 1881 he became president of Williams and administered the affairs of the college with great ability until 1901, when he

resigned. He became president of the Clarke School for the Deaf in 1896. His publications include an edition of Schiller's *Iphigenie auf Tauris* (1870), a *Life of Mark Hopkins* (1892), and various articles in the *New Englander* and in the *Transactions* of the American Philological Society and the Modern Languages Association.

CARTER, HENRY. See LESLIE, FRANK.

CARTER, JAMES COOLIDGE (1827-1905). A distinguished American lawyer, born in Lancaster, Mass. He graduated at Harvard in 1850 and in 1853 was admitted to the bar. He was appointed, in 1875, a member of the commission for devising a form of municipal administration for the cities of New York State, and in 1888 was a member of the constitutional commission. In 1892 he was appointed one of the counsel to present the claims of the United States before the Bering Sea tribunal. He was equally eminent for his skill as an advocate, his legal learning, and his fine public spirit, and for a dozen years before his death ranked as the leader of the New York bar. His publications include: *The Codification of our Common Law* (1883); *The Provinces of the Written and the Unwritten Law* (1889); *The Ideal and the Actual in the Law* (1890); *Law: Its Origin, Growth, and Function* (1907).

CARTER, JESSE BENEDICT (1872-). An American educator, born in New York City. He was educated at New York and Princeton universities and at the universities of Leipzig, Berlin, Göttingen, and Halle. He became instructor in Latin in 1895, assistant professor in 1898, and professor in 1902 at Princeton, and in the summer of 1900 he lectured at the University of Wisconsin on Roman religion. In 1904 he became professor of Latin at the American School of Classical Studies in Rome, and in 1907 director of the school. Besides translating Huelson's *Forum* (1906), he is author of *De Deorum Cognominibus* (1898); *The Roman Elegiac Poets* (1900); *Epitheta Deorum* (1902); *Virgil's Æneid* (1903); *The Religion of Numa* (1906); *The Religious Life of Ancient Rome* (1911); *Memorial Service to J. Pierpont Morgan* (1913).

CARTER, LOUISE LESLIE (1862-). An American actress. She was born at Lexington, Ky., and made her début in 1890 in *The Ugly Duckling* at the Broadway Theatre, New York. She was a pupil of David Belasco, the author of the play. After having appeared as the Quakeress in the musical comedy of *Miss Helyett* (1891-93), she retired from the stage for a year and a half more of laborious study at her home in New York. Then, in 1895, as Maryland Calvert in *The Heart of Maryland* (produced at Washington, October 9), she made a sensation. In April, 1898, with the same play in London, she repeated her American success. In December, 1898, she made her appearance in an adaptation of *Zaza*, which began its long run in New York at the Garrick Theatre, Jan. 9, 1899. In December, 1901, she had another success in Belasco and Long's play, *Du Barry*, in which she continued for three years. In 1906 she severed her connection with Belasco and began a series of performances under her own management, playing in *Du Barry* and *Zaza* and a revival of *La Tosca* (1907). In 1910 she played in New York in *Two Women*. Consult Strang, *Famous Actresses of the Day in America* (Boston, 1899), and Clapp and Edgett, *Players of the Present*, Dunlap Society Publications (New York, 1899).

CARTER, SAMUEL POWHATAN (1819-91). An American naval officer and soldier, born in Elizabethtown, Carter Co., Tenn. He attended Princeton for a time, and entered the navy in 1840 as a midshipman. Subsequently he was assistant instructor of infantry tactics at the Naval Academy (1851-53) and assistant instructor in seamanship there (1857-61). As a naval officer he served in the Mexican War and at the capture of the Barrier Forts (q.v.) near Canton, China, in 1856. In 1861 he was transferred to the War Department and organized the troops from East Tennessee. In the army he served with distinction throughout the Civil War, being brevetted major general in 1865. He then returned to the navy and from 1869 to 1872 served as commandant of the Naval Academy at Annapolis. He retired from the service in 1881 and received the rank of rear admiral on the retired list in 1882.

CARTER, THOMAS HENRY (1854-1911). An American politician, born in Scioto Co., Ohio. He studied law, was admitted to the bar in 1882, and in the same year moved to Helena, Mont. In 1889-91 he was delegate for the Territory of Montana in Congress, and upon its admission to statehood was elected its first representative in Congress. For two years he was Commissioner of the General Land Office, and from 1892 to 1896 chairman of the Republican National Committee. He served as United States Senator in 1895-1901 and in 1905-11, and in the latter year was appointed a member of the international boundary commission of the United States and Canada. In 1901 he talked to death in a 16-hour speech the river and harbor bill with appropriations for \$50,000,000.

CARTER-COTTON, FRANCIS L. (1847-). A Canadian journalist and statesman. He was born and educated in Yorkshire, England. Emigrating to Canada, he settled at Vancouver, British Columbia, where in 1886 he founded the *Daily News-Advertiser* and became its editor. In 1890 he was elected a Conservative member of the British Columbia Legislature, and in 1898-1900 was Minister of Finance in the administration of Charles Augustus Semlin (q.v.). He was early interested in financial questions, his writings and speeches in this field making him a recognized authority in the province. In 1904-10 he was Chief Commissioner of Lands and Works, and afterward President of the Council, in the ministry of Sir Richard McBride (q.v.). His interest in higher education led him in 1906 to endow a professorship of pure and applied mathematics in the McGill University College of British Columbia. In 1902 he was elected first chancellor of the University of British Columbia.

CARTERET, SIR GEORGE (?-1680). An English Royalist, Governor of the island of Jersey, and one of the original Lords Proprietors of the province of New Jersey in America. He early went to sea and by 1633 had risen to the rank of captain in the English navy. In 1639 he became comptroller of the navy, and in 1643, having previously, on the outbreak of the Revolution, espoused the Royalist side, he succeeded his uncle as bailiff of the island of Jersey, and was also appointed Lieutenant Governor. He soon expelled the parliamentary forces from the island, and was created a knight and baronet in 1646; but was forced to surrender to the Commonwealth forces in 1651, and for

several years thereafter served in the French navy under Vendôme. Returning to England at the time of the Restoration, he became a member of the Privy Council and Treasurer of the Navy, which latter position he held from 1661 to 1667, when he became Deputy Treasurer of Ireland. He took an active interest in the colonization of America, and in 1650 was granted "a certain island and adjacent islets in America in perpetual inheritance, to be called New Jersey," though no settlement was made at that time. In 1663 he was one of the original proprietors of Carolina, and in the following year the Duke of York granted to him and to John, Lord Berkeley, the territory now included in the State of New Jersey, the name *Nova Cæsarea*, or New Jersey, being given to the province in honor of Carteret's administration of Jersey. The proprietors received full governmental powers and were to pay an annual rental of one peppercorn, if legally demanded. After the surrender of the province by the Dutch in 1674, a regrant was made, this time with governmental reservations and limitations. On the division of New Jersey in 1676 Carteret became sole proprietor of East Jersey, which province he left by his will to his widow and to several designated trustees, by whom in 1682, in consideration of £3400, it was transferred to 12 purchasers, who combined with 12 others to form the "Twenty-four Proprietors of East New Jersey."

CARTERET, JOHN, EARL GRANVILLE (1690-1763). A British orator and statesman, born April 22, 1690. His father, first Baron Carteret of Hawnes, died in 1695, and he succeeded to the peerage at five years of age. He was educated at Westminster School and Christ Church, Oxford; in 1706 was created D.C.L., and, according to Dean Swift's humorous assertion, carried away more Greek, Latin, and philosophy than became a person of such high rank. He took his seat in the House of Lords in 1711, spoke in favor of the Protestant succession, received the notice of George I, and obtained some lucrative appointments. In 1719 he was Ambassador Extraordinary to Sweden, and in 1720 negotiated peace between Sweden, Prussia, and Hanover. In 1721 he was appointed Secretary of State, and in this capacity defended the proceedings of the government in the Atterbury conspiracy. In 1724 he became Lord Lieutenant of Ireland, and was in frequent consultation about public affairs with Dean Swift, who, in spite of numerous disagreements, praised his rule. His lord-lieutenancies (1724-26 and 1729-30) were particularly popular. From 1730 to 1742 he was one of the most determined leaders of the opposition in the House of Lords against Robert Walpole, and on his displacement was made a Secretary of State. He became Earl Granville at his mother's death in 1744. The same year he had to resign his seals of office, but continued to receive marks of royal favor, and in 1749-50 was elected and installed Knight of the Garter at Windsor. From 1751 to his death, Jan. 2, 1763, he was Lord President of the Council under Henry Pelham. Carteret was generally admired for his handsome presence, his classical and oratorical attainments, and for his patriotism, wit, and conviviality; but his opponents, including Pitt, hated him for his haughty contempt of their opinions. Consult: Ballantyne, *Lord Carteret: A Political Biography* (London, 1887); Lecky, *History of England in the Eight-*

eenth Century (New York, 1878-91); and Mahon, *History of England*, vols. ii-iv (London, 1836-54).

CARTERET, PHILIP (?-1682). First proprietary Governor of New Jersey, appointed by Sir George Carteret and Sir John Berkeley, Lords Proprietors, in 1664. He arrived in August, 1665, at the site of Elizabethtown, which settlement he founded and named in honor of Sir George Carteret's wife, and exerted himself to secure emigrants from the New England Colonies by circulating among them the liberal "concessions" granted by the proprietors. With the exception of 1673-74, when the western part of New Jersey was held by the Dutch, he acted as Governor of the whole province until its division into East Jersey and West Jersey in 1676, after which, until his death, he was Governor of East Jersey. The early part of his administration was marked by conflicts with Sir Edmund Andros, Governor of New York, who claimed that New Jersey belonged under his own jurisdiction.

CARTERET, PHILIP (?-1796). An English naval officer and navigator. In 1766 he reached the rank of commander, and in the same year sailed in command of the *Swallow*, in the expedition sent out under Capt. Samuel Wallis for the exploration of the Southern Hemisphere, a work that had been started by Byron. On April 11, 1767, while clearing the Straits of Magellan, he became separated from the *Dolphin*, the other vessel of the expedition. He thereupon proceeded in his unseaworthy ship, discovered Pitcairn Island and the Queen Charlotte Islands, explored the strait (named by him St. George's Channel) between New Britain (now Neu Pommern) and New Ireland (now Neu Mecklenburg), and corrected errors made in the survey of Mindanao. In 1794 he was retired from active service with a commission of rear admiral. In view of his small resources and many difficulties, he accomplished much for geographical discovery. His interesting journal is to be found in Hawkesworth, *An Account of the Voyages Undertaken for Making Discoveries in the Southern Hemisphere* (3 vols., 1773). His other writings are *The Inhabitants of the Coast of Patagonia* and *Account of Camelopardalis Found at the Cape of Good Hope*.

CARTEROMACO, kär'tâ-rô-mä'kô. See FORTEGUERRI, NICCOLÒ.

CAR'TERSVILLE. A city and the county seat of Bartow Co., Ga., 48 miles northwest of Atlanta, on the Western and Atlantic, the Nashville, Chattanooga, and St. Louis, and the Seaboard Air Line railroads (Map: Georgia, B 1). It is in a stock-raising and agricultural region, in which cotton, grain, and fruits are produced; there are valuable deposits of iron, manganese, gold, ochre, graphite, and other minerals; and manufactories of cotton goods, fertilizers, and cottonseed oil. The city contains a courthouse and library and owns its water works and electric light plant. In 1911 it adopted the commission form of government. Pop., 1900, 3135; 1910, 4067.

CARTERVILLE. A city in Williamson Co., Ill., 102 miles by rail southeast of St. Louis, Mo., on the Illinois Central and the St. Louis, Iron Mountain, and Southern railroads (Map: Illinois, C 6). The chief industry of the city is coal mining. Pop., 1900, 1749; 1910, 2971.

CAR'TERVILLE. A city in Jasper Co., Mo., 10 miles west by south of Carthage, the

county seat, on the Missouri Pacific and the Frisco Lines railroads (Map: Missouri, B 4). It is the centre of a highly productive zinc-silicate and lead-mining district, and has boiler works, ironworks, foundry and machine shops, stone quarries, etc. Carterville was settled in 1875. Pop., 1900, 4445; 1910, 4539.

CARTE'SIANISM. The system of philosophy advocated by Descartes (q.v.) and his followers. (See GEULINX; MALEBRANCHE; ARNAULD, ANTOINE.) Spinoza and Leibnitz had their point of departure in Cartesianism, but introduced modifications so significant that they are not generally reckoned in the school. The literature of the subject is enormous. Consult especially: Bouiller, *Histoire de la philosophie Cartésienne* (3d ed., Paris, 1868); Kuno Fischer, *Geschichte der neueren Philosophie*, Bd. I translated by J. P. Gordy, under the title of *Descartes and his School* (New York, 1887); Höffding, *History of Modern Philosophy*, Eng. trans. (London and New York, 1900); Windelband, *History of Philosophy*, Eng. trans. (New York, 1898); N. Smith, *Studies in the Cartesian Philosophy* (London, 1902). See also bibliography under DESCARTES.

CARTESIANS, kār-tē'zhans. The name of a group of curves discussed by Descartes in connection with the study of optics. In general they are curves of the fourth order, having two cusps. Common forms of these curves are the cardioid and limaçon (qq.v.). The Cartesian equation $(x^2 + y^2 - px)^2 = m^2(x^2 + y^2)$ shows the relation between these special forms.

The first case gives the curve marked (1), a limaçon; the second case gives the curve marked (2), a cardioid; and the third the curve marked (3), an outer oval. The Cartesians consisting of double ovals are curves of the sixth class;

- (1) If $p > m$, the origin is a double point.
- (2) If $p = m$, the origin is a cusp.
- (3) If $p < m$, the origin is a conjugate point.

those which reduce to limaçons are of the fourth class; and those which reduce to cardioids are of the third class. A curve in space defined as the locus of a point whose distances from three fixed points are connected by two linear relations is called a twisted Cartesian. See also CASSINI: CASSINIAN OVAL.

CARTESIUS. See DESCARTES.

CAR'THAGE (Lat. *Carthago*, Gk. *Καρθηδών*, *Karchēdōn*). A great city of antiquity on the north coast of Africa, situated in about lat. 36° 50' N. and long. 10° 20' E., near the modern Tunis, on a peninsula extending into a small

bay of the Mediterranean Sea. Recent excavations have shown that the city was laid out with streets regularly crossing each other at right angles. The long streets ran about 45 meters apart, parallel to the quays. Dido (q.v.) was its legendary founder, but it was probably a trading post established by merchants of Utica and Tyre. The native name of the city seems to have been Kart Hadshat, the 'new town,' probably with reference to Tyre, which the Carthaginians recognized as their mother city. Unfortunately, we know very little of the growth of Carthage. Our information begins after Carthage had become one of the greatest commercial cities of the world, and is even then scanty and one-sided, coming chiefly from the enemies of Carthage. The number of inhabitants in 149 B.C., just before the Third Punic War, is said to have been about 700,000. The population was partly of Phœnician, partly of Libyan descent. By the subjugation of the Libyan tribes, and by the ultimate annexation of other older Phœnician colonies, with which they had at first been simply in alliance, such as Utica, Hadrumetum, Hippo, the two Leptes, etc., the Carthaginians extended their territory in the middle of the fifth century B.C. southward to Lake Triton, eastward to the Great Syrta, and westward to the Atlantic. At first Carthage was essentially a mercantile city, and even paid a ground rent to the Libyan tribes until the fifth century. It was the maritime power of the Carthaginians which enabled them to extend their settlements and conquests to the other coasts of the Mediterranean. At the beginning of the sixth century B.C., Carthage appears as the ally of the Phœnicians in Sicily, now crowded by the Greeks into the western part of the island. After checking the Greek advance and founding colonies of their own, the Carthaginians reduced the coasts of Sardinia. Hanno (q.v.) founded colonies on the west coast of Africa beyond the Straits of Gibraltar, and Himilco visited the coasts of Spain and Gaul.

With the establishment of this control over the western Mediterranean, Carthage also established her trading policy. No foreign traders were allowed at any of her western colonies, and only the harbors of Carthage were open to foreign ships. All traders found elsewhere were drowned. This policy led the Carthaginians to form an alliance with the Etruscans, and in 540 B.C., in the battle of Alalia, they checked the attempts of the Greeks to encroach upon their territory. Massilia (Marseilles) alone held its position on the coast of Gaul. The first treaty with the Romans was concluded in 509 B.C., the second in 348 B.C., the third in 306 B.C. The connected history of Carthage begins with the fifth century B.C., a period of wars between the Carthaginians and the Greeks in Sicily. The Carthaginian army under Hamilcar was destroyed by Gelon, at Himera, in 480 B.C., and for a time the Greeks were free from attack. In 410 B.C. wars broke out anew, and the Greek cities of the southern coast of Sicily were plundered and destroyed. At Syracuse pestilence compelled the Carthaginians to raise the siege, and, under the leadership of Dionysius I, the tyrant of Syracuse, the Greeks recovered much of their lost territory. After several unsuccessful attempts to drive the Carthaginians from the island, Dionysius in 383 B.C. made a treaty which gave them the land west of the river Halycus. A later invasion of the Carthaginians was

repelled by Timoleon in 339 B.C., but 30 years later, when Agathocles was tyrant of Syracuse, the war began again, and Syracuse was once more besieged. Deserting his city, Agathocles crossed to Africa and for three years ravaged the almost defenseless territory of Carthage, though not strong enough to attack the city. After his death the Carthaginians again increased their dominions in Sicily. Although Pyrrhus contended successfully against them at first, he left that island entirely in 275 B.C.

The subjugation of southern Italy by the Romans brought the two great conquering nations into collision, and the First Punic War arose (264 B.C.), and, after a great naval victory of the Romans, terminated in 241 B.C.; the Carthaginians gave up Sicily and paid to the Romans a large sum of money. Soon a mutiny of the hired troops of Carthage, combined with an insurrection of the Libyan tribes, the ancient inhabitants of the country, who were kept down by the arbitrary rule of the Carthaginian colonists, threatened the entire ruin of the city. Hamilcar Barca brought this bloody war to a successful termination, but Carthage, crippled by the struggle, was unable to prevent the Romans from seizing Sardinia and Corsica. About 236 B.C. Hamilcar Barca led an army to Spain, where he, and after him his son-in-law, Hasdrubal, obtained great successes. Here was founded New Carthage, now Cartagena. After Hasdrubal's death (221 B.C.), Hannibal (q.v.), burning to avenge the defeat which his native city had sustained from the Romans, attacked and took Saguntum, a city on the Ebro, allied with Rome (219 B.C.). Thus began the Second Punic War, in which Hannibal pursued his career of conquest from Spain, through Gaul, and across the Alps into Italy itself, defeated the Romans with terrible slaughter in various battles, especially that at Cannæ, and brought Rome to the very brink of ruin. Yet the war terminated in the total defeat of the Carthaginians by Publius Cornelius Scipio, who overthrew their power in Spain and was victorious over Hannibal in the final and decisive battle of Zama, in Africa, in October, 202. A peace was then concluded, in which the Carthaginians were limited to their African territories, while most of their ships of war and war elephants were taken from them, besides an immense sum of money, and they were bound not to make war without permission of the Romans. Masinissa, King of Numidia, skillfully availed himself of dissensions which arose within Carthage between the nobles and the people, to advance his own interests at the expense of the Carthaginians; and as they (151 B.C.) opposed him and drove his adherents out of the city, the Romans seized the opportunity for a new declaration of war (149 B.C.), on the ground that the treaty was broken, and after a siege of two years Carthage was taken by Publius Cornelius Scipio Æmilianus (146 B.C.). For six days the combat was maintained in the streets of the city, and for 17 days the work of its destruction by fire was carried on by the conquerors. The country became a Roman province. Gaius Gracchus sent out 6000 colonists to found a new city on the site of Carthage. It was called Colonia Junonia Cathago, but it did not prosper. Augustus, carrying out the intention of his great uncle, restored the city in 29 B.C. In the second and third centuries of the Christian era the new Carthage had become one of the finest cities of the Roman Empire. In 439

Genseric made it the capital of the Vandal Kingdom; Belisarius conquered it in 533 and named it Colonia Justiniana Carthago; the Arabs under Hassan utterly destroyed it in 647; and now only two or three small hamlets and a few ruins mark its site. As the result of various excavations, especially those conducted by the French, under Père Delattre, remains of the ancient walls and of the harbors have been found; the citadel (called Byrsa), the forum, the amphitheatre, etc., have been more or less completely excavated. Many graves of Punic and Roman times, yielding many inscriptions and smaller objects, have been opened.

We have no satisfactory accounts of the constitution of the Carthaginian state. It was highly esteemed by Aristotle, but his account of it has perished, and our information is scattered. At the nominal head were two *suffetæ* (Hebrew, *shofetim*, 'judges' in the Bible), who seem to have been chosen annually by the people on nomination of the Senate. The nobles, who needed money more than birth to maintain their position, seem to have formed a Senate of 300, from whom a body of 30 (including the *suffetæ*) were chosen to carry on the ordinary government. Later we hear of the introduction of a body of 104 judges, who seem to have had supreme power over all officials, including the generals, and to have become the real rulers of the state. There was a popular assembly, composed of those citizens who had a certain property qualification. The Carthaginian oligarchy, while despising the multitude, was itself split up into factions and torn by family jealousies. On the other hand, the government, though undoubtedly oppressive to its subjects, was remarkably free from revolution or even popular uprising.

The Carthaginian army was raised from the conscription of the subjugated Libyans, from the hired Numidians, and mercenaries from Spain, Gaul, and, indeed, all parts of the world. The soldiers had no interest in the state, but were capable of becoming strongly attached to their generals, and in good hands were a formidable force, as is seen in the successful campaigns of Hamilcar Barca and Hannibal. In the time of Agathocles the city sent forth 40,000 heavy-armed infantry, 1000 cavalry, and 2000 war chariots, but the state could easily raise 100,000 troops. The fleet in the First Punic War consisted of 350 ships, carrying 150,000 men. The revenue needed to cover the enormous expense her military and naval organization involved was, in all likelihood, derived from tribute imposed on subject Libyan or Numidian races, in great part from mines in Spain, and from import duties derived from her maritime and inland trade, which was prodigious. Her merchantmen visited every coast and island of the Mediterranean and even ventured as far as the Azores, Britain, the Baltic, etc.; her caravans penetrated through Sahara to the gold-producing districts of the Niger, and through the Libyan Desert to the lands along the Nile. Still, Carthage was by no means an exclusively mercantile state. Many of her wealthiest citizens derived their income from large estates cultivated by bands of slaves, and the only Punic literature the Romans thought worth preservation was a treatise on agriculture by Mago, which was translated into Latin by order of the Senate, for the benefit of the Roman husbandmen.

The religion of the Carthaginians appears to

have been substantially the same as that of the Phœnicians—a worship of the stars and of fire. Moloch was the chief deity, and to him children and captives were sacrificed. The highest natural manifestation of this deity was the sun. Besides Moloch, the Carthaginians worshiped the Tyrian Melcart; Astarte, the moon goddess; Esmun, also called Asclepius by the Greeks; and a few of the Greek divinities, of whom a knowledge had been obtained in Sicily. It does not appear that there was a distinct sacerdotal order in Carthage. Probably religious ceremonies were performed by the dignitaries of the state, but our knowledge on this point is too meagre to permit any definite conclusion. Consult: A. Church, *Carthage, or the Empire of Africa* (New York, 1886); R. B. Smith, *Carthage and the Carthaginians* (London, 1877); Meltzer, *Geschichte der Karthager* (Berlin, 1879, 1896, 1913); Audollent, *Carthage romaine* (Paris, 1901); N. Davis, *Carthage and her Remains* (London, 1861); E. de Sainte-Marie, *Mission à Carthage* (Paris, 1884); *Atlas archéologique de la Tunisie* (Paris, 1893); Moore, *Carthage of the Phœnicians in the Light of Modern Excavation* (London, 1905). For recent discoveries, see *Comptes Rendus de l'Académie des Inscriptions et Belles Lettres*, vol. xxviii (Paris, 1901), and the map published in 1907 by the French Ministère de l'Instruction Publique.

CARTHAGE. A city and the county seat of Hancock Co., Ill., 32 miles south of Burlington, Iowa, on the Chicago, Burlington, and Quincy and the Wabash railroads (Map: Illinois, A 3). It is the seat of Carthage College (Lutheran), opened in 1872, and contains the jail in which the Mormon prophet, Joseph Smith, was killed in 1844. Settled in 1837, Carthage was chartered as a city in 1883. The water works are owned by the city. Pop., 1900, 2104; 1910, 2373.

CARTHAGE. A city and the county seat of Jasper Co., Mo., 20 miles east of Joplin, on the Missouri Pacific, the St. Louis and San Francisco, and the St. Louis, Iron Mountain, and Southern railroads, and on Spring River (Map: Missouri, B 4). The city has two parks, a fine county courthouse, and a Carnegie library. It has lead and zinc mines, stone quarries and limekilns, flour mills, and bed-spring, gate, broom, ice, and extract factories. The principal articles of export are stone, marble, grain, flour, fruit, poultry, and live stock. Settled in 1833, Carthage was destroyed during the Civil War and was entirely rebuilt after 1866. It was incorporated in 1873 and is governed under a charter of 1890, providing for a mayor, elected every two years, and a city council. The electric light plant and water works are owned and operated by the municipality. On July 5, 1861, a force of about 3500 Confederates, under Generals Jackson and Price, met a Union force of about 1500, under General Sigel, 7 miles east of Carthage, and in the battle which ensued the former lost about 200, and the latter about 50, in killed and wounded. After several hours of fighting General Sigel, to prevent the Confederate cavalry from outflanking him and cutting off his baggage train, fell back in good order to Carthage. Pop., 1890, 7981; 1900, 9416; 1910, 9483.

CARTHAGE. A village in Jefferson Co., N. Y., 18 miles east of Watertown, on the New York Central Railroad, and at the terminus of the Black River Canal (Map: New York, E 3). It is on the east bank of the Black River, con-

nected by a State bridge with West Carthage, a separately incorporated village, with which it forms a single community. There are a public library, several large paper mills, machine shops, foundries, and ice plants, and it manufactures furniture, map sticks, duster handles, sashes, doors, blinds, pulp, bricks, etc. The water works are owned by the village. Pop., 1900, 2895; 1910, 3563. Pop., West Carthage, 1900, 1135; 1910, 1393.

CARTHAGE. Formerly a town in Hamilton Co., Ohio, now annexed to Cincinnati. It is the seat of the Hamilton County Infirmary and the Longview Hospital for the Insane. There are manufactories of automobiles, soap, springs and axles, and steel. See CINCINNATI.

CAR'THAGE'NA, *Sp. pron.* kär'tá-hā'ná. See CARTAGENA.

CARTHAGO. See CARTHAGE (in Africa).

CARTHA'GO NO'VA, or **SPARTA'RIA**, *Spain.* See CARTAGENA.

CAR'THAMINE (Fr. *carthamine*, from Neo-Lat. *Carthamus*, from Ar. *qirtim*, *qurtum*, *Carthamus*, from *qartama*, to cut off), $C_{14}H_{16}O_7$. A natural dye obtained by a chemical process from safflower (*Carthamus tinctorius*) in crystals which are insoluble in water, but slightly soluble in alcohol and ether. When freshly precipitated, carthamine immediately and permanently attaches itself to cotton or silk (but not to wool) requiring no mordant, dyeing the fabric a fine red, which is changed to yellow on the addition of alkalis and may be returned to red again on being treated with acids. When fused with caustic potash, it is transformed into para-oxy-benzoic acid.

CARTHU'SIANS. A monastic order which owes its origin to St. Bruno (q.v.), who retired in 1086, with six companions, to the solitude of La Chartreuse (whence the name), near Grenoble, where they built hermitages, wore rude garments, and lived upon vegetables and coarse bread. The fifth prior, Guigo (died 1137), composed a body of rules, called the *Statuta Guigonis*, or *Consuetudines Cartusiæ*, but they have often been changed. After 1170, when the order received papal approbation, it extended rapidly. It dates from 1180 in England, where the name of Chartreuse Houses was corrupted into Charter Houses. The order is now conducted under the rules approved in 1682 by Pope Innocent XI. The Carthusians were divided into two classes—fathers (*patres*) and lay brothers (*conversi*). Each father occupied a separate cell, with a bed of straw, a pillow, a woolen coverlet, and the means of manual labor or of writing. They left their cell, even for meals, only on festivals and on days of the funeral of a brother of the order. Thrice a week they fasted on bread, water, and salt, and there were several lengthened fasts in the year. Flesh was forbidden at all times, and wine, unless mixed with water. Unbroken silence, except on rare occasions, was enforced, as well as frequent prayer and night watching. These austerities were continued, with little modification, by the modern Carthusians. The order at one time counted 16 provinces and boasted of the most magnificent convents in the world—as La Grande Chartreuse (see CHARTREUSE, LA GRANDE), in France, and in Italy the Certosa di Pavia, 18 miles south of Milan. The buildings of the former date from 1676. The buildings of the latter date from 1396, but are now preserved only as a national monument. The Carthusians

were given to hospitality and works of charity, and were, on the whole, better educated than the mendicant orders. Their principal seats were in Italy, France, and Switzerland; but they have shared the fate of the other monastic establishments, and their convents are now, for the most part, solitudes indeed. In 1900 they had 11 monasteries in France and 9 in other parts of Europe. The French houses have been suppressed, but four others opened in Italy and Spain. The Carthusian nuns arose at Salette, on the Rhône, in France, about 1229. They followed the rules of the Carthusian monks, but with some mitigations, of which the most notable is that they have a common refectory. When the monasteries were suppressed under Henry VIII, there were nine Carthusian monasteries in England. To-day there is one, near Steyning, 8 miles northwest of Brighton. See CHARTERHOUSE.

CARTIER, kär'tyá', SIR GEORGE ETIENNE (1814-73). A Canadian statesman. He was born at St. Antoine, in the Province of Lower Canada (now Quebec), was educated at the College of St. Sulpice, Montreal, and was admitted to the bar in 1835. He took part in the rebellion of 1837-38 and fled the country to avoid arrest, but after public feeling began to subside, he returned and resumed his law practice, which rapidly increased. He was keenly interested in the issues which resulted in the legislative union of Upper and Lower Canada in 1841, and in 1848 he was elected a Conservative member of the Legislative Assembly. He had modified his radical opinions and thenceforth adhered to the Conservative party. In 1856 he became Provincial Secretary, and in the same year was appointed Attorney-General for Lower Canada in the cabinet of which Sir Etienne Taché (q.v.) and John Alexander Macdonald (q.v.) were the chief members. Cartier became the firm political associate of the latter and was recognized as the leader of the Conservative party in Lower Canada. In 1858 the Macdonald-Cartier ministry obtained power, with the former as Premier; but in August of the same year, after a defeat which enabled the succeeding ministry of George Brown (q.v.) to hold office for two days, the two Conservative leaders returned to power as chiefs of the Cartier-Macdonald ministry, with Cartier as Premier,—an episode marked by a questionable interchange of portfolios and popularly characterized as "the double shuffle." Cartier's legislative career was notable for his part in abolishing seigniorial tenure and in secularizing the clergy reserves. (See CANADA, *History*.) He also vigorously supported railway building, procured the codification of the civil laws of Lower Canada and the establishment of normal schools. In the large issues which resulted in confederation in 1867 he took a strong interest. In 1865 he was one of the delegates to England to discuss that question with the Imperial government, and subsequently threw the weight of his influence to bring his province into the federal union. During the greater part of the first administration of Sir John A. Macdonald (1867-73) he was Minister of Militia and Defense; but in 1872 he was defeated in an electoral contest, and in failing health left for England, where he soon died. Consult Dent, *Canadian Portrait Gallery* (Toronto, 1880), and the *Life* by A. O. DeCelles (Toronto, 1904).

CARTIER, JACQUES (1494-c.1557). A French

explorer, born at Saint-Malo. He acquired a reputation as a bold navigator and was selected by Admiral Chabot to lead an expedition to the northeastern coast of North America for the purpose of discovering a passage to Cathay. With two ships he sailed from Saint-Malo in 1534. He sighted Newfoundland, near Cape Bonavista, and followed the coast southward to a point nearly opposite Cape Breton; then, turning westward, made Prince Edward Island and gave its name to the Bay of Chaleur. He then skirted the northern coast of Anticosti Island and returned along the shores of Labrador. At Cape Gaspé he landed, erected a cross, and took possession of the country in the name of France. The next year, with another fleet, under the royal commission, he sailed up the St. Lawrence. Leaving his ships moored near the Indian village of Stadacona, on the site of the modern Quebec, Cartier, with a few followers, pushed on to the fortified village of Hochelaga, which lay at the foot of an imposing hill called by the explorer Mount Royal (Montreal). The late season—it was October—made it imprudent to proceed farther. He returned to his ships and spent the winter amid much suffering from cold and illness among his crew. When spring came, the adventurers sailed for home, taking with them the Indian chieftain of Stadacona, whom they had kidnapped. Cartier's account of this voyage has survived and is known as the *Bref Récit*. European complications absorbed the immediate attention of the French King, but four years later (1540) he sent out to the New World Jean François de la Roche, Sieur de Roberval, as viceroy. Cartier was made captain general and pilot of the fleet. Owing to some delay in the equipment of the expedition, Cartier set sail with but three ships, in May, 1541. After waiting for Roberval in vain for six weeks on the coast of Newfoundland, he proceeded up the St. Lawrence and in August found himself once more at Stadacona. He fortified a position near Cape Rouge and called the post Charlesbourg. Two of his ships were sent back to meet Roberval, concerning whose movements the evidence is confused when not contradictory. What seems certain is that the viceroy and his fleet were off Newfoundland in June, 1542, and that he there met with Cartier, who was returning to France after the winter at Charlesbourg, taking with him what he erroneously supposed to be gold ore. He had seen little of the Indians during the winter. Cartier was well received by his sovereign, who presented him with a manor near his native town. Lescarbot tells us that Cartier made a later voyage to rescue Roberval; but if so, no data exist respecting it. The principal authority concerning Cartier is François Joüon des Longrais, *Jacques Cartier* (Paris, 1888), which contains the important documents throwing light on his career. For shorter biographies of Cartier, consult: Joseph Pope (Ottawa, 1890); Hiram B. Stephens (Montreal, 1890); N. E. Dionne (Quebec, 1889); Baxter, *Memoir of Jacques Cartier* (Portland, 1906). For studies of Cartier's route, see also *Transactions of the Royal Society of Canada* (Ottawa, 1897).

CAR'TILAGE (Fr., from Lat. *cartilago*, gristle). A firm elastic substance of a pearly whiteness, presenting to the unaided eye a uniform and homogeneous appearance. Cartilages may be divided into the *temporary* and the *permanent*. The *temporary* cartilages are

substitutes for bone in the earlier periods of life and after a certain time become replaced by bone. (See BONE.) At birth the extremities and larger eminences of the long bones and the margins of the flat bones are still cartilaginous, and this cartilage does not altogether disappear till the period of puberty. The *permanent* cartilages are either *articular* or *non-articular*. *Articular* cartilages are attached to the extremities of bones and enter into the formations of joints. *Nonarticular* cartilages are usually more flexible than the articular. They are sometimes attached to bones, to lengthen them out, as, for instance, in the nose or the auditory canal. (See EAR.) In other cases they form the basis of distinct organs, as the larynx, the trachea, and the eyelids.

Cartilage belongs to the group of tissues termed connective tissues. The matrix or intercellular portion of cartilage is dense and firm, and the different varieties of cartilage are recognized by the nature of the matrix. In the variety called *hyaline cartilage* the matrix is apparently homogeneous, though Leidy has shown that it is really composed of bundles of fine fibrous connective tissue. Lying in this matrix are the cartilage cells. These are oval or irregular, granular, nucleated bodies, and are arranged singly, in pairs, or in fours. The cartilage cell or group of cells is surrounded by a clear cell space. Hyaline cartilage makes up the skeleton in the embryo, and in it the bones of the body, with the exception of those of the head and face, are developed. In the adult it is found as articular cartilage, the cartilages of the nose, Eustachian tube, larynx, trachea bronchi, costal cartilages, etc. In the variety called *fibrocartilage* the matrix is composed of fibrous connective tissue, in which are imbedded the cartilage cells. These cells may occur singly or are more commonly arranged in rows of two or more, lengthwise of the bundles of fibres. Fibrocartilage is found in the intervertebral disks and around the edges of some joints. In the variety called *elastic cartilage* the matrix is rich in elastic fibres, giving the tissue a glistening yellow appearance. The cells occur singly or in pairs, resembling the arrangement noted in hyaline cartilage. Some of the smaller cartilages of the body are of this variety, the epiglottis, part of the Eustachian tube, the external auditory canal, the arytenoid cartilages, etc.

CARTILAGINOUS FISHES. See ELASMOBRANCHII; FISH.

CARTOGRAPHY. See MAP; CHART; SURVEYING.

CARTOMANCY. See SUPERSTITION.

CARTON, RICHARD CLAUDE (1856-). An English actor and dramatist, whose real name was R. D. Critchett. For a time he was on the stage in Bristol and in London. He collaborated with Cecil Raleigh on *The Great Pink Pearl* (1885), *The Pointsman* (1887), and *The Treasure* (1888). His sentimental manner in his own plays was exhibited in *Sunlight and Shadow* (1890) and in *Liberty Hall* (1892; revived, New York, 1913). His later light comedies, criticized for an artificiality of diction, include: *The Home Secretary* (1895); *The Tree of Knowledge* (1897); *Lord and Lady Algy* (1898); *The Ninth Waltz* (1900); *A Clean Slate* (1902); *The Rich Mrs. Repton* (1904); *Lorrimer Sabiston, Dramatist* (1909); *The Bear Leaders* (1911).

CARTON, SYDNEY. A character in Dickens's *Tale of Two Cities*, the friend of Charles Darnay, for whom he renounced his love for Lucy Manette and in whose stead he was guillotined.

CARTOON' (Fr. *carton*, from Lat. *carta*, paper). A design, on strong paper, of the full size of a work to be afterward executed in fresco, oil, tapestry, mosaic, or stained glass. The object of the artist in preparing a cartoon is to adjust the drawing and composition of his subject in circumstances in which alterations can be effected with facility, before proceeding to the execution of the work itself. Cartoons are generally composed of a number of sheets of stout paper pasted together at the edges and stretched on a frame. The cartoon, when finished, is transferred to the canvas or plaster on which the work is to be executed, either by tracing with a hard point or by pricking with pins (a process called "pouncing"), charcoal in both cases being rubbed on the back of the drawing. In fresco (q.v.) painting, the plaster on which the work is executed must be kept wet, in order that it may absorb the color, and subsequently only a small portion can be executed at a time. For this reason the cartoon must be traced in small compartments of the size that the artist can finish without stopping. It is here, consequently, above all, that the necessity for the previous execution of a cartoon is greatest, as it would be impossible to sketch the whole design on the plaster in the first instance. In weaving superior tapestries, like the Gobelins, it is the present practice to cut out all the figures represented, which are always in color, and place them behind or under the wool. The great masters of the Renaissance used such studies in chiaroscuro as guides to them in almost all their decorative works, and many of these monuments of their care, as well as of their genius, have been preserved. They are quite as interesting and often rise to the dignity of the fresco and oil work. The most celebrated surviving examples of the fifteenth century are Andrea Mantegna's nine cartoons of the "Triumph of Julius Cæsar," long used as hangings in the ducal palace at Mantua, but now at Hampton Court. They are probably the artist's greatest achievement and represent more adequately the antique feeling of the Renaissance than any work of the century. Epoch making in Italian painting were the cartoons of incidents from the war with Pisa, painted in rivalry for frescoes in the Palazzo Vecchio, Florence, by Michelangelo and Leonardo da Vinci. In neither case was the fresco completed, and the cartoons have been destroyed; but so great was their influence upon the younger artists, especially in the case of Michelangelo's, that they may be said to have revolutionized Florentine painting. The central feature of Michelangelo's cartoon was a group of bathing soldiers surprised by the enemy; of Leonardo's, a fierce battle over a standard. Less important in the history of painting, but equally well known by reason of their survival, are the cartoons which Raphael designed, at the command of Leo X, for the 12 tapestries of the Sistine Chapel. Of the originals, depicting scenes from the lives of Christ and the Apostles, seven survive in the South Kensington Museum; they were purchased by Rubens for Charles I, saved by Cromwell, who commanded that they should be purchased for the nation, and preserved from neglect by William III. Among the best subjects are "Paul Preaching at Athens."

cases, while formerly the larger sizes had to be built up of drawn tubing riveted to the head. In the United States land and naval service, and as a general rule abroad, guns of 4.7-inch calibre and less have cartridges of this sort. Six-inch guns have a metallic case for the powder charge, but on account of weight the projectile is inserted separately. Larger guns have the powder charge put up in bags, the projectile being separately loaded. Eight-inch guns have the powder charge put up in two sections; 10- and 12-inch in four, for convenience in handling. See AMMUNITION.

A *blank cartridge* is one which does not contain a projectile. It is used for salutes, for practice, and for signals.

A *dummy cartridge* contains no powder. It is used for drill purposes only. By practicing with dummies instead of loaded cartridges the danger of handling the latter is avoided without much loss of efficiency in the drill, if the dummies are properly designed.

A *guard cartridge* is like the *ball cartridge* above described, except that the muzzle velocity is 1200 instead of 2700 feet per second. This cartridge is used by sentinels guarding prisoners at military posts.

CARTRIDGE PAPER. A strong paper, originally manufactured for soldiers' cartridges, and also used by artists, its rough surface being useful for certain kinds of drawing; the name is also given to a class of wall papers of similar texture.

CARTWRIGHT, EDMUND (1743-1823). An English clergyman, inventor of the power loom. He was born, April 24, 1743, at Marnham, Nottinghamshire, England. Educated at Oxford, he obtained a living in the English church, and devoted himself to his ministerial duties and to literature until a casual conversation in 1784 directed his attention to machinery, and in 1785 he exhibited his first power loom (see LOOM), in an ingenious though very rude machine, upon which, however, he subsequently effected improvements. In the following year he invented self-acting temples or devices to keep the cloth stretched across the loom against the transverse pull of the filling. Its introduction was vehemently opposed, and a mill fitted up with 400 of his looms was ignorantly and maliciously burned down. Cartwright in 1789 took out a patent for a wool-carding machine and secured patents for various other improvements in manufacturing and other machinery. In 1797 he patented a steam engine in which alcohol was the fuel employed. He also assisted Robert Fulton in his steamboat experiments. But his patents yielded him little return, and in 1809 the British government, in consideration of his inventions, granted him £10,000. He died October, 1823. His daughter published a *Life* (London, 1843).

CARTWRIGHT, JOHN (1740-1824). An English politician and pamphleteer, popularly known as Major Cartwright, and surnamed "The Father of Reform." He was a brother of Edmund Cartwright the inventor, and born at Marnham, Nottinghamshire, Sept. 17, 1740. He entered the navy at 18; in 1758 was present at the capture of Cherbourg, and the following year fought in the action between Hawke and Conflans. Afterward he went to the Newfoundland station, and for five years ably discharged the duties of chief magistrate, to which he was appointed. At the outbreak of the American Revolution he espoused the cause of the Colonies;

declined to fight against them, resigned, and in 1774 published *American Independence the Glory and Interest of Great Britain*. He received an appointment as major in the Nottingham militia, but after 17 years of service, partly on account of his sympathy with the Revolution in France, was superseded. With honesty of purpose, by voice and pen he worked for manhood suffrage, the ballot, annual parliaments, the improvement of national defenses, the liberties of Spain and Greece, and other popular causes. In 1813 he was arrested for plain speaking, but soon released, and in 1820 was indicted for sedition and fined £100. He died Sept. 23, 1824. In 1831 a monument by Macdowell was erected to his memory in Burton Crescent, London. His writings are comprised in a list of 80 books and tracts given in *The Life and Correspondence of Major Cartwright*, ed. by his niece, F. D. Cartwright (2 vols., London, 1826).

CARTWRIGHT, PETER (1785-1872). An American clergyman. He was born in Virginia, but in early life settled in Kentucky, where, in 1806, he became a circuit rider in the Methodist Episcopal church, and in 1808 a presiding elder, preaching everywhere throughout Kentucky and Tennessee. In 1824 he removed to Illinois, where he continued his work. He was also a member of the Illinois Legislature, and an opponent of Abraham Lincoln in an election for Congressman in 1846. In the course of 33 years he preached as many as 15,000 sermons and baptized 12,000 converts. He was widely known for his homely but powerful preaching, and interesting stories are told of his daring and romantic adventures among the rough backwoodsmen. Many of these can be found in his *Fifty Years a Presiding Elder* (1871) and in the *Autobiography of Peter Cartwright* (New York, 1856). He published several pamphlets, of which the best known is *Controversy with the Devil* (1853). Consult also Stevens, *Observations on Dr. Cartwright* and *The Backwoods Preacher* (London, 1869).

CARTWRIGHT, SIR RICHARD JOHN (1835-1912). A Canadian statesman. He was born at Kingston, Ontario, and was educated at Trinity College, Dublin. On his return to Canada he studied law, but, having decided to enter politics, he relinquished his legal studies without being called to the bar. In 1863 he was elected a Conservative member of the Legislative Assembly, and after the federal union of the provinces in 1867 was elected to the House of Commons. He remained a Conservative during the greater part of the first administration of Sir John Alexander Macdonald (q.v.), but withdrew his support of that statesman by reason of disclosures connected with what was commonly known as the Pacific [Railway] Scandal, and in 1873 joined the Liberal party. In the same year he was appointed Minister of Finance in the cabinet of Alexander Mackenzie (q.v.), but upon the defeat of the Liberals in 1878 he went into opposition and until 1896 was chief critic of the Conservative fiscal and trade policy. He was a strong opponent of protection, and his many public speeches against it were remarkable for clear exposition and caustic wit. During the long period of opposition the Liberal tariff policy underwent various changes, the most notable being a declaration for commercial union with the United States, of which Cartwright was the most active advocate. After the general election of 1891, which went against the Liberals, and which was

contested on the question of reciprocity with the United States, the prestige of the Conservative administration began to weaken by reason of new leaders and divided counsels; the Opposition adopted new means of attack, and in 1896 Wilfrid Laurier (q.v.) became Premier. In the Laurier cabinet Cartwright was given the portfolio of Trade and Commerce, a new ministerial department. As he had remained a staunch free trader, favoring a tariff only for revenue, while the policy of his colleagues was that of moderate protection, his influence in shaping fiscal legislation was somewhat less than before; nevertheless his parliamentary experience and his mastery of economic and financial questions, together with his great strength and readiness in debate, made him, next to Laurier, the most prominent man in his party.

In 1897 he was a delegate to Washington in behalf of improved commercial relations with the United States, and in 1898-99 he was a member of the Anglo-American Joint High Commission for the settlement of outstanding matters of dispute between Britain and the United States. (See CANADA, *History*.) He was appointed a member of the Senate in 1904, and four years later secured the passage of a law in favor of old-age annuities—a measure which, in return for small stated payments resumable at any time after lapse, guaranteed to persons 55 years old or more an annuity free from forfeiture and exempt from seizure. Cartwright became government leader in the Senate in 1909. On several occasions, during Laurier's absence abroad, he was acting Premier. During the latter part of his career his influence in the Liberal party remained unabated. In 1879 he received the honor of knighthood and in 1902 was made a member of the Imperial Privy Council. He twice declined the office of Lieutenant Governor of Ontario. In his later years he held a strong conviction that Canada, by reason of its position and sympathetic knowledge of conditions both in the United States and Britain, was especially fitted to be the medium of an alliance between all English-speaking peoples. In 1912 he published his *Reminiscences*, a valuable retrospect and study of the events and of the public men with whom he came in contact in his political career down to the year 1896.

CARTWRIGHT, THOMAS (c.1535-1603). A Puritan leader of the time of Elizabeth. He was born in Hertfordshire and studied divinity at Cambridge, being entered as sizar at Clare Hall in 1547 and elected to a scholarship at St. John's College in 1550. Here he soon became an active defender of the new religious doctrines which were then in the ascendancy at Cambridge and of which St. John's was the stronghold. During Mary's reign he was forced to discontinue his studies at the university and became clerk to a counselor at law. Returning to Cambridge after the accession of Elizabeth, he came under the influence of the Puritan theologian Dr. James Pilkington, then master of St. John's, from which college he received a fellowship in 1560. Two years later the major fellowship in Trinity was conferred upon him. In 1564 he took part in a theological disputation before Queen Elizabeth, who, it is alleged, strongly favored his adversary. Five years later he became Lady Margaret professor of divinity; but in 1570 he was deprived of his professorship by Whitgift, then vice chancellor, who was offended by Cartwright's attacks on the

hierarchy and government of the Established church. The next year he lost his fellowship in Trinity by command of the same officer, and then made a visit to Geneva, where he met Theodore Beza, who greatly admired his learning. He returned to England in 1572 during the excitement caused by the publication of the famous *Admonition to the Parliament*, written by two London clergymen, John Field and Thomas Wilcox. This book gave definiteness to the Puritan movement, presenting the Calvinistic system of Geneva as a model for reforms of the English church. Cartwright gave aid and comfort to the authors, who were imprisoned, and defended the book in a second *Admonition to the Parliament*. To this Whitgift produced an *Answer*, which was followed by another paper by Cartwright, attacking the forms and ceremonies of the church, such as the use of the ring in the marriage celebration and the cross in baptism. An indirect result of the controversy was the production of one of the most remarkable books of that fruitful age, Hooker's *Ecclesiastical Polity* (consult introduction to edition by Hanbury, London, 1830). In 1573 the Court of High Commission issued an order for Cartwright's arrest. Accordingly he fled to the Continent, where for a time he preached before the English congregations in Antwerp and Middelburg. Returning without the Queen's consent in 1585, he was imprisoned in the Fleet without legal warrant by the bigoted Aylmer, Bishop of London; but he was presently set free. He was committed to the Fleet in 1590, and again in 1591, when he refused to take the infamous oath ex officio. From his liberation in 1592 until his death in 1603, he appears to have escaped persecution; but, as sometimes alleged, there is no evidence that he changed his views.

Consult: Isaac Maddox, *Vindication of the Government, Doctrine, and Worship of the Church of England Against Neal* (London, 1733); Hallam, *Constitutional History of England*, vol. i (new ed., London, 1876); Dexter, *Congregationalism* (New York, 1880); Mullinger, *History of the University of Cambridge*, vol. ii (London, 1873-84); id., in *Dictionary of National Biography*, vol. ix (New York, 1887); Cooper, *Athenæ Cantab.*, vol. ii (Cambridge, 1858-61); Strype, *Annals* (new ed., Oxford, 1824); id., *Life of Whitgift* (Oxford, 1822); and for the controversy over the *Admonition*, Whitgift, *Defense of the Answer*, in his *Works* (Cambridge, 1851-53), published by the Parker Society.

CARTWRIGHT, WILLIAM (1611-43). An English poet and divine, born at Northway, near Tewkesbury. He graduated M.A. at Christ Church, Oxford (1635), took orders, became precentor of Salisbury Cathedral, and junior proctor of Oxford (1643), and died a few months later (November 29). Cartwright was much beloved by many friends, among whom was King Charles I. He is a good example of a once large class of "florid and seraphical preachers." He wrote several plays, of which the *Ordinary*, ridiculing the Puritans, has considerable interest. His *Comedies, Tragi-Comedies, with Other Poems* were collected by Moseley (London, 1651). Consult: Ward, *English Poets*, vol. ii (London, 1881); Bullen, "William Cartwright," in *Dictionary of National Biography*, vol. ix (1887), an excellent article; Ward, *History of English Dramatic Literature* (1899).

CARUCATE, kār'û-kât (ML. *carucata*, from

caruca, plow. Lat. *carruea*, carriage, from *earrus*, car), or PLOWLAND. In the mediæval manor, the land which could be tilled in a year by one plow with its eight oxen. The carucate was used as a unit of measure, but varied in different localities from 120 to 180 acres. See HIDE.

CARUCCI, JACOPO. See PONTORMO.

CARÚPANO, ká-rōō'pá-nō. A seaport of the State of Bermúdez, Venezuela, situated on the north side of the peninsula of Paria (Map: Venezuela, E 1). The town manufactures straw hats, ropes, soap, brandy, sugar, and earthenware, and is besides an export centre for cotton, dyewoods, cacao, and coffee. It is the residence of a United States consular agent. Pop. (1908 est.), 8600.

CARUS, ká'rus, JULIUS VICTOR (1823-1903). A German zoölogist, born in Leipzig, Aug. 25, 1823. He was custodian of the Museum of Comparative Anatomy at Oxford from 1849 to 1851. In 1853 he became professor of comparative anatomy at Leipzig, where subsequently he was made professor extraordinarius of zoology. His more important works are: *Zur nähern Kenntniss des Generationswechsels* (1849); *System der tierischen Morphologie* (1853); *Icones Zootomicæ* (1857). He also translated Darwin's works into German, and in 1878 became editor of the *Zoologischen Anzeiger*.

CARUS, KARL GUSTAV (1789-1869). A German physician and physiologist, born in Leipzig. He studied medicine at the university of his native city and began in 1811 to give lectures on comparative anatomy. During the War of 1813 he was at the head of the military hospital at Pfaffendorf, near Leipzig, and in 1814 he was made professor of obstetrics at the Academy of Medicine and Surgery in Dresden. He was made royal physician in 1827 and called to the Privy Council in 1862. Following are the most important of his works: *Lehrbuch der Gynäkologie* (2 vols., 1820); *Erläuterungstafeln zur vergleichenden Anatomie* (1826-55); *Grundzüge der vergleichenden Anatomie und Physiologie* (3 vols., 1828); *System der Physiologie* (2d ed., 1847-49); *Erfahrungsergebnisse aus ärztlichen Studien und ärztlichem Wirken* (1859); *Ueber Lebensmagnetismus* (1857); *Lebenserinnerungen und Denkwürdigkeiten* (4 vols., 1865-66); *Natur und Idee* (1861); *Atlas der Kranioskopie* (1864); *Vergleichende Psychologie* (1866).

CA'RUS, MARCUS AURELIUS (?-283). Emperor of Rome 282 to 283. Of Illyrian origin, he had held many civil and military positions when the Emperor Probus made him prætorian prefect in 282; soon after, at the assassination of Probus, he was chosen Emperor by the legions. He was successful in campaigns against the Sarmatians and the Parthians, but died near Ctesiphon in August, 283.

CARUS, PAUL (1852-). A German-American editor, born at Ilsenburg, Germany, and educated at the universities of Strassburg and Tübingen. Afterward he came to this country and established himself in Chicago, where he became editor of the *Open Court* and the *Monist*. Under his direction the Open Court Publishing Company has done fine service in putting before the public valuable works on philosophy and religion. His publications include: *The Soul of Man* (1891); *Monism: Its Scope and Import* (1891); *Religion and Science* (1893); *The History of the Devil* (1900); *The*

Surd of Metaphysics (1903); *The Story of Samson* (1907); *Foundations of Mathematics* (1908); *God* (1908); *Pleroma* (1909); *The Philosophy of Form* (1911); *The Meehanistic Principle and the Non-Mechanical* (1913); *The Principle of Relativity in the Light of the Philosophy of Modern Science* (1913); *Nietzsche and Other Exponents of Individualism* (1914), in addition to several works on Buddhism and Chinese philosophy.

CARUSO, ká-rōō'zō, ENRICO (1873-). An Italian dramatic tenor. He was born in Naples, Feb. 25, 1873, and was a pupil of Lamperti and Concone. He attracted general attention in 1896 in *Traviata* at the Teatro del Fondo (Naples). Engagements followed at St. Petersburg, Buenos Aires (summers of 1899-1903), Monte Carlo, London (1903), Rome, Lisbon, and New York (1904). His repertoire includes more than 40 operas (chiefly Italian). He created rôles in Giordano's *Fedora*; Mascagni's *Le Masehere*; Franchetti's *Germania*; Puccini's *Bohème*, *Madame Butterfly*, and *The Girl of the Golden West*. From his first appearance in 1904 he became the chief attraction of the Metropolitan Opera House Company in New York, his voice being one of extraordinary beauty and power, though lacking in the highest artistic refinement, while his acting did not rise above the conventional. In 1913 he sang in three performances in Vienna, for each of which he received 15,000 crowns (about \$5000). Consult J. H. Wagenmann, *Enrico Caruso und das Problem der Stimmbildung* (Altenburg, 1911).

CARUTHERSVILLE, ká-rütH'ërz-vil. A city and the county seat of Pemiscot Co., Mo., 220 miles south by east of St. Louis, on the St. Louis and San Francisco Railroad, and on the Mississippi River (Map: Missouri, G 5). Caruthersville contains a hospital and a therapeutic institute. It is in a lumbering and cotton-growing section and has a cottonseed-oil mill, stave, heading, and hoop factories, cotton gins, grain elevator, egg-case factory, saw and planing mills, machine shop, bottling works, and harness and ice-cream factories. Caruthersville was settled in 1778 and was incorporated in 1894. Pop., 1900, 2513; 1910, 3655.

CARVAJAL, FRANCISCO DE. See CARBAJAL, FRANCISCO DE.

CARVAJAL, kár'vá-häl', GASPARD DE (c.1500-84). A Spanish missionary, born in Estremadura. He became a member of the Dominican brotherhood, and went as a missionary to Peru in 1533. When Gonzalo Pizarro organized his expedition to eastern Peru in 1540, Carvajal was selected as his chaplain. Afterward he became subprior of the convent of San Rosario, Lima, but later devoted himself to the conversion of the Indians in Tucuman. He greatly encouraged missionary labor and the development of colonization. He became provincial of his order in Peru in 1557, was named deputy to represent the religious province of Peru at Rome in 1565, but did not leave the country. He wrote *Deseubrimiento del Río de las Amazonas*, unedited until 1894.

CARVAJAL, or CARBAJAL, TOMÁS JOSÉ GONZÁLEZ. See GONZÁLEZ CARVAJAL, TOMÁS JOSÉ.

CARVALHO, kár-vä'lyō, JOSÉ DA SILVA (1782-1845). A Portuguese statesman, born in Castelbranco (Beira). Having studied law in the University of Coimbra, he became a judge in 1810. From 1817 he was busily devising

methods for the accomplishment of national freedom. He took a prominent part in the revolution of 1820 and became a member of the provisional government. On the accession of John VI he was appointed Vice President of Lisbon, and was granted the portfolio of Justice, which he retained until the revolt of 1823 forced him into exile. On the death of John VI and the accession of Dom Pedro, he returned to Portugal, in 1826; but was again exiled, in 1828, by Dom Miguel, the Usurper. Later, Carvalho organized in England an expedition against Dom Miguel and succeeded in driving out the Usurper. Thereupon Dom Pedro confided to him the portfolio of Finance, which he held 1832-36. In this latter year, on the occasion of the revolutionary reaction in favor of the constitution of 1820, he was compelled to go into exile, but in 1842 returned, assisted in the reestablishment of the constitution of Dom Pedro, and was appointed a Councilor of State.

CARVALHO, kär-vä'lyô, MARIE CAROLINE FÉLIX MIOLAN (1827-95). A French singer, born at Marseilles. She entered the Conservatory of Music in Paris and took the first prize, 1847. Her début was made at the Opéra Comique, where her voice, though small, had all the wonderful phrasing that afterward made her one of the greatest singers of her time. In 1856 she married M. Carvalho, who took the direction of the Théâtre Lyrique. In 1885 she left the stage.

CARVALHO E MELLO, SEBASTIÃO JOSÉ DE. See POMBAL, MARQUIS OF.

CAR'VEL-BUILT'. See BOAT.

CAR'VER, JOHN (c.1575-1621). A leader of the Pilgrim Fathers and the first Governor of Plymouth Colony. He was born in England, probably in Nottinghamshire, but with others removed to Holland in 1607 or 1608, on account of religious persecution, and in 1617 was sent by his companions, with Robert Cushman, to make arrangements with the Virginia Company for the establishment of a colony in America. A patent was finally secured by Bradford and Cushman in 1619, and with 100 other colonists Carver set sail from Plymouth on Sept. 6, 1620. When the famous Compact of Government was drawn up, Carver was made Governor, and during the hardships and privations of the next few months did much to encourage his associates and to promote the success of the Colony. On March 23, 1621, he was elected Governor of Plymouth for a second term, but died of a sunstroke in the following month.

CARVER, JONATHAN (1732-80). An American traveler. He was born in Stillwater, N. Y. After serving in the Colonial army, he began a voyage of exploration. According to his story he started from Boston in June, 1766, proceeded to Michilimackinac, 1300 miles away, arranged with the Governor there to furnish him at an early date with needed supplies at the Falls of St. Anthony, and then passed westward along the Fox and Wisconsin rivers to the Mississippi; but, the promised supplies not having been sent, he spent some time with the "Naudowessies of the Plains" (Sioux), explored much of the territory in the present State of Minnesota, and in October, 1768, again reached Boston. He went to England in 1769 to publish his journal, but failed to secure the expected assistance, and, having spent his whole fortune in furthering his explorations, was forced to earn a livelihood as a hack writer. In 1788 a book appeared under the title *Three Years' Travels Throughout the*

Interior Parts of North America, purporting to be of his authorship. It had a wide sale. Early critics suspected that it was not an original work, but the high regard in which it was universally held for many years is attested by Tyler's estimate in *The Literary History of the American Revolution* (New York, 1897). It is mainly a compilation from Charlevoix, Hennepin, Lahontan, and others, and contains inaccuracies of which a real traveler would not have been guilty. Carver furthermore was probably too ignorant a man to have written it, and even the claimed extensiveness of his travels is discredited. Carver wrote a pamphlet, *A Treatise on the Culture of the Tobacco Plant Adapted to Northern Climates* (1799), and published under his name a crude compilation entitled *The New Universal Traveler*. Consult *The Carver Centenary* (1867), published by the Minnesota Historical Society; and as to the spuriousness of the "Travels," consult E. G. Bourne in the *American Historical Review* (January, 1906).

CARVER, THOMAS NIXON (1865-). An American economist, born at Kirkville, Iowa. He was educated at Iowa Wesleyan University, the University of Southern California, Johns Hopkins, and Cornell. From 1894 to 1900 he was professor of economics at Oberlin College. In the latter year he became assistant professor of political economy at Harvard University, and in 1902 he was made full professor. When the Rural Organization Service of the Department of Agriculture was established in 1913 to investigate the marketing and distribution of farm products, Carver was appointed to take charge of the work. Besides his special articles in economic reviews, he is author of *The Theory of Wages Adjusted to Recent Theories of Value* (1894); *The Distribution of Wealth* (1904); *Sociology and Social Progress* (1905); *Principles of Rural Economics* (1911); *The Religion Worth Having* (1911, 1912).

CARVING (OE. *kervinge*, from *kerven*, to carve, AS. *ceorfan*, Icel. *kyrfa*, Ger. *kerben*, ultimately connected with Gk. *γράφειν*, *graphein*, to write, originally to cut). A subordinate branch of sculpture, usually performed on ivory or wood. The term is applied to sculpture of a decorative character, as distinguished from statuary or monumental relief. The use of carving by ancient, mediæval, and modern nations is described at some length in the articles in its two principal branches, viz., **IVORY CARVING** and **WOOD CARVING**.

CARY, ALICE (1820-71) and PHŒBE (1824-71). Two American poets, born near Cincinnati, Ohio. They gained their first success by *Poems of Alice and Phæbe Cary* (1850). In 1851 Alice issued *The Clovernook Papers* (2d series, 1853), and *Clovernook Children* (1854), tales of Western life. In 1850 the sisters moved to New York, where Alice published: *Lyra and Other Poems* (1852; enlarged 1855); *Lyrics and Other Hymns* (1866); *The Lover's Diary* (1867); *Snow Berries*, a book for young folks (1869); *Hagar: A Story of To-Day* (1852); *Married, Not Mated* (1856); *Pictures of Country Life* (1857); *The Bishop's Son* (1857); and *The Adopted Daughter* (1859). All these are excellent in domestic description. Phæbe published: *Poems and Parodies* (1854); *Poems of Faith, Hope, and Love* (1868); with numerous hymns (chiefly in *Hymns for All Christians*, edited by C. F. Deems, 1869), and occasional pieces. Her best-known hymn is

"Nearer Home." Under the friendship and patronage of Horace Greeley the sisters achieved literary and social success in New York and maintained it for nearly two decades. They died within three months of each other. A collected edition of their poems appeared posthumously. Consult Mary C. Ames, *Memorial of Alice and Phæbe Cary* (New York, 1873), and Trent, *A History of American Literature* (New York, 1903).

CARY, ANNIE LOUISE (1842-). An American contralto, born in Wayne, Me. After having studied in Milan with Giovanni Corsi (1866-68), she appeared in Italian opera in Copenhagen. Afterward she received instruction from Viardot-Garcia in Baden-Baden and sang with great success in Stockholm, Paris, Brussels, and London. She made her début in New York in 1870, singing with Nilsson, Brignoli, and Vieuxtemps. Her success with the public was instantaneous, and for a dozen years she was the favorite singer in the United States. She created, in New York, the part of Amneris in *Aïda* (1873). Her tours in Russia in 1875-77 were a series of continuous triumphs. In 1882 she married Charles M. Raymond, of Brooklyn, and retired from public life, only occasionally singing for charity.

CARY, ARCHIBALD (c.1730-86). An American patriot, born in Virginia. He was a member for several years of the House of Burgesses, where he was conspicuous as an opponent of the arbitrary measures of the British ministry. He was a member of the Committee of Correspondence in 1773, and in 1776, as a delegate to the famous Virginia Convention, introduced the resolutions by which the Virginia delegates in the Continental Congress were instructed to propose a declaration of independence. He was president of the Virginia Senate from the organization of the State government until his death.

CARY, ELISABETH LUTHER (1867-). An American author, born in Brooklyn, N. Y. She was educated privately and for ten years studied art. Until 1908 she was editor and owner of the *Serip*, and thereafter was editor of the art department of the *New York Times*. She translated many books from the French and wrote: *Alfred Tennyson: His Homes, his Friends, and his Work* (1898); *Robert Browning, Poet and Man* (1899); *The Rossettis, Dante Gabriel and Christina* (1900); *William Morris* (1902); *Ralph Waldo Emerson, Poet and Thinker* (1904); *Artists, Past and Present* (1908).

CARY, GEORGE LOVELL (1830-1910). An American theologian, born at Medway, Mass. He was educated at Harvard and at Allegheny College, was professor at Antioch College, Ohio, from 1852 to 1862 and professor of New Testament literature at Meadville Theological School from 1862 to 1902. His works include: *Introduction to the Greek of the New Testament* (1879; 2d ed., 1881); *The Synoptic Gospels, with a Chapter on the Text-Criticism of the New Testament* (1900); and the volume on "Matthew, Mark, and Luke," in the *International Handbooks to the New Testament* (1900).

CARY, HENRY FRANCIS (1772-1844). An English writer and clergyman, known for his admirable translation of Dante. He was born at Gibraltar, studied at Christ Church, Oxford, and became a clergyman of the Church of England. From 1826 to 1837 he was assistant keeper of printed books in the British Museum.

In 1805 he translated Dante's *Inferno*, and in 1814 the whole of the *Divina Commedia*, his translation being remarkable not only for its accuracy, but for its expressiveness and force. He afterward translated Pindar's *Odes* and Aristophanes' *Birds* and wrote a series of memoirs, in continuation of Dr. Johnson's *Lives of the Poets*. He was an intimate friend of Coleridge and Charles Lamb. Consult the *Memoir* by his son, Henry Cary (London, 1847).

CARY, LUCIUS. See FALKLAND, second VIS-COUNT.

CA'RYA. See HICKORY.

CARYATIDES, kār'i-āt'i-dēz (Lat., Gk. *Karyatides*, *Karyatides*, women of Caryæ). A name given in Greek architecture to female figures, when used instead of columns to support a roof. Vitruvius states that, since the inhabitants of Caryæ, a city in Laconia, had joined the Persians, the Greeks destroyed the town, slew the men, and carried the women into captivity. As a token of triumph, they introduced figures of the women and of the conquered Persians as supports in architecture. This story is pure invention. Such figures are found in Egypt and Greece from early times as supports of thrones or lustral vases. They were used also as columns for the treasuries of the Cnidians and the Siphnians at Delphi (sixth century B.C.). The female figures are always calm and dignified, in no way oppressed by the weight they sustain. The name properly denotes only a supporting figure, in which one hand is raised to help sustain the weight; others were called Canephoroi. The most celebrated Caryatides are the figures which support the southwest porch of the Erechtheum (q.v.) in Athens, called the "Porch of the Maidens." Male figures used for the same purpose, called Atlantes, clearly betray suffering under a heavy burden. Consult Homolle, in *Bulletin de Correspondance hellénique*, vols. xxiii, xxiv (Paris, 1899). The Greek word *caryatis* means not only a woman of Caryæ, but also a dancer in the peculiar dance with which the Laconian maidens honored Artemis Caryatis.

CARYL, JOSEPH (1602-73). An English Nonconformist clergyman during the revolutionary period. He was educated at Oxford, became preacher at Lincoln's Inn, and in 1643 was appointed a member of the Westminster Assembly of Divines. He was a moderate Independent, but zealous for the Covenant. By order of Cromwell he attended Charles I in Holmby House, and in 1650 he was sent with Dr. John Owen to accompany Cromwell to Scotland. His chief published work was a ponderous commentary on the Book of Job (12 vols.), in which, after the fashion of his time, he enlarged on every verse and almost on every word.

CARY'OCAR (Neo-Lat., from Gk. *κάρυον*, *karyon*, nut + *κάρα*, *kara*, head). A genus of a dozen species of large trees of the family Ternstroemiaceæ. They are all natives of Guiana and Brazil and are sometimes called pekea trees. They yield good timber for shipbuilding and produce the delicious nuts occasionally met with in markets, called *butternuts*, or *souari nuts*. The fruit is a sort of drupe, containing several nuts. The fleshy part of the drupe consists of a butter-like substance, which melts between the fingers, and is used in cookery instead of butter, on which account these trees are sometimes called butter trees. It forms merely a thin covering for the nuts. The kernels are

remarkably soft. An oil is extracted from them which is scarcely inferior to olive oil. *Caryocar nuciferum* is now cultivated in the island of St. Vincent; *Caryocar butyrosomum*, *Caryocar glabrum*, *Caryocar tomentosum*, and other species appear equally worthy of attention.

CAR'YOPHYLLA'CEÆ, kār'i-ō-fil-lā'sē-ē (Neo-Lat. nom pl., from *Caryophyllus*, from Gk. κάρυον, *karyon*, nut + φύλλον, *phyllon*, leaf). A family of dicotyledonous plants, containing about 50 genera and 1100 species, mostly herbaceous plants, a few half shrubby. The stems are often tumid at the joints; the leaves always opposite and entire, often uniting around the stem. The flowers are regular; the calyx persistent, of 4 or 5 sepals, either free or united into a tube; the corolla of 4 or 5 petals, which are frequently bifid, and generally terminate in a claw at the base, sometimes wanting; the stamens are many, or twice as many, as the petals; the ovary of 2 to 5 carpels; the styles are stigmatic along the inside; the fruit is a one-celled capsule, with central placenta, to which the seeds are attached. The plants of this family are mostly natives of temperate and cold countries; some of them are found only on mountains, near the limits of perpetual snow. Some of them are inconspicuous weeds, some showy flowers; almost all are insipid and inert; a few contain saponine and afford a substitute for soap. (See SOAP-WORT.) To this order belong the pink, carnation, sweet william, lychnis, and chickweed.

This family very naturally divides into two distinct groups which differ biologically and morphologically, the Silenoideæ and Alsinoideæ. In the first the flowers are gamosepalous; in the other they have distinct sepals, and the stamens are often perigynous. The chief genera of the first group are *Silene*, *Lychnis*, *Gypsophila*, and *Dianthus*, while of the second *Stellaria*, *Cerastium*, *Arenaria*, *Spergula*, *Paronychia*, and *Scleranthus* are the best known.

CAR'YOP'SIS (Neo-Lat., Fr. *caryopse*, from Gk. κάρυον, *karyon*, nut + ὄψις, *opsis*, appearance). The peculiar, seedlike fruit of grasses, as corn, wheat, etc., often called a "grain." The peculiarity consists in the fact that the ovary wall adheres to the inclosed seed so closely that it appears as the outermost layer of the seed. See FRUIT.

CAR'YO'TA, kār'i-ō'tā (Neo-Lat. nom. pl., from Gk. καρῳτός, *karyōtos*, nutlike, from κάρυον, *karyon*, nut). A genus of palms, natives of the East Indies. One species (*Caryota urens*) is remarkable for the acidity of its fruit, which produces a burning sensation when its pulp is applied to the skin. It is also highly valuable for the great quantity of juice which flows from the wounded spathes in the hot season, sometimes amounting to 100 pints in 24 hours from a single tree. Sugar (*jaggery*) is made from this juice by boiling it down, and on this account this palm is sometimes called the jaggery palm. Wine or toddy is also made by the fermentation of the juice. The trunks yield starch which is much used for food and is said to be equal to the best sago. The outer part of the stem, which is very hard, is applicable to many purposes. The fibres of the leafstalks are made into ropes, which are very strong and durable; the leafstalks, merely stripped of the leaflets, are used as fishing rods, being light, tapering, and elastic; and the woolly substance found at their base is sometimes used for calking ships. This palm is found in India and Ceylon and abounds chiefly

in mountainous districts. It rises to a height of 60 feet, with a trunk 1 foot in diameter and a magnificent spreading head of great, double-pinnate leaves and triangular leaflets, the apex of the triangle being their point of attachment. From this character of the leaflets the name fishtail palm has been given it.

CA'RYSFORT' REEF. A dangerous coral reef off the southeast coast of Florida, in lat. 25° 13' N., long. 80° 13' W., lying about 5 miles east of Key Largo (Map: Florida, D 4). It has a lighthouse with a flashing red and white light of the first order 100 feet above mean high water. It stands 106 feet above the sea.

CASA, kā'sā (from Lat. *casa*, cottage). The prefix to many names in Italian and Spanish, signifying 'house' or 'home.'

CASA, kā'sā, GIOVANNI DELLA (1503-56). An Italian prelate and poet, sometimes called the Chesterfield of Italy, from his *Galateo*, a manual of polite conduct. Of an old Florentine family, he studied in Bologna, Padua, and Rome, leading a gay and dissipated life, until he took orders in 1534. He found a friend and patron in Cardinal Alessandro Farnese, who later, as Paul III, appointed him successively apostolic envoy to Florence, Archbishop of Benevento, and Papal Nuncio to Venice. Under Paul IV he became Secretary of State and in 1555 had hopes of being made a cardinal, but lost his opportunity, as some believe, through the licentiousness of certain poems, notably his *Capitoli del forno*. As a prelate he took an active part in fighting the Italian Reformation, especially as an antagonist of Pier Paolo Vergerio. Della Casa was a prolific writer, in both Latin and Italian. The *Galateo* ranks with the *Cortegiano* of Castiglione as one of the most important books of its century. The classic elegance of its language made it one of the models for later purists. His works include a *Life of Pietro Bembo*, translations from Thucydides, and many poems distinguished for strength and polish. Translation of the *Galateo* in the *Humanists' Library* (Boston, 1914), with biography.

CASABIANCA, kā'zā-byān'kā, LOUIS (1755-98). A French naval officer. He was born at Bastia, Corsica, and with the Comte de Grasse took part in the American Revolution. He was a member of the National Convention, and later one of the Council of Five Hundred, in which assembly he occupied himself with the organization of the French navy. As captain he commanded the *Orient*, the flagship of the fleet which transported Napoleon and his army to Egypt. In the battle of Abukir, when the fleet was attacked by the English, Admiral Brueys was killed, and Casabianca had command of the fleet. Even when he was wounded and the ship caught fire he remained at his post. His ten-year-old son refused to leave his father, and both were killed by the blowing up of the ship. The story forms the theme of Mrs. Hemans's famous poem.

CASABLANCA, kā sā-blān'kā. See DAR-EL-BEIDA.

CASA D'ORO, dō'rō, or **CA' D'ORO**. A palace in Venice dating from the fourteenth century, noted for its elegance. The façade, unsymmetrically divided in two vertical sections, is inlaid with marbles of various colors and pierced by arches differing in size and arrangement, which are separated in the right division by paneling and in the left by arcades.

CASA GRANDE, grān'dā (Sp., great house). A ruined structure of prehistoric origin in the

valley of the Gila River, near Florence, Arizona, on the Southern Pacific Railway. It may have been seen by white men connected with the Coronado expedition in 1540; it was certainly discovered by Padre Kino in 1694, and was revisited by him in 1697, when he held a service within it, though it had been unoccupied during the period covered by tradition. It was again visited in 1775 by Padre Font, but remained little known until rediscovered by American emigrants about 1849; it was well described by John Russell Bartlett in 1854. In 1889, on the petition of citizens chiefly resident in Massachusetts, Congress provided for the protection of the ruin as a monument of antiquity; and in 1892 the structure and the adjacent grounds, bearing less imposing ruins, were set apart as a public reservation in care of a custodian. The structure as it stood about 1895 is shown in the plate. It is of cajon or pisé construction, i.e., adobe or mud, molded in place, in walls 3 to 5 feet thick at the ground, thinning upward; the surfaces were plastered, especially within, with a slip of adobe clay. There are five rooms in the ground plan; portions of three stories remain, and there may have been a fourth in part of the structure. Recent exploration under Dr. Fewkes has shown that the main structure described above is only a small part of the ruin. Most of the other buildings are seen only in wall plan after excavation. The buildings are assembled in great walled rectangles called compounds, of which four exist at this ruin. Compound *a* contains the main structure and many clustered groups of rooms for domiciliary and ceremonial uses. The Casa Grande ruin is almost in a class by itself, but in pottery, etc., it shows very strong affiliations with the pueblo ruins, of which it may perhaps be considered a frontier example. It may have been built by the ancestors of the modern Pima who inhabit the country to-day, but it seems more likely that its builders were other people of a more distinct Pueblo type. Good descriptions are by Mindeleff (*Bureau of American Ethnology, 13th Report, 1896*), McGee (*ib., 15th Report, 1897*), and by Fewkes (*ib., 28th Report, 1912*). It is not to be confounded with the still more extensive but less-known ruin of Casas Grandes in the State of Chihuahua, Mexico.

CASA GUIDI (kä'sá gwē'dé) **WINDOWS.** A poem in two parts by Elizabeth Barrett Browning (1851), the passionate voicings of her intense hopes for Italian liberty.

CASAL, kä-säl', or **CAZAL**, MANUEL AYRES DE (1754-1840). A Brazilian geographer and historian. He was born in Portugal, where he was ordained to the priesthood. Afterward he settled in the Province of Goyaz, Brazil, and traveled extensively through the country, collecting the information compiled in the valuable work entitled *Corografia brasileira, ou relação histórico-geográfica do reino do Brazil* (2 vols., Rio de Janeiro, 1817; 2d ed., 1845). This work, prepared under the auspices of King John VI, is distinguished by its exactitude and is the first circumstantial report on the interior provinces of South America. The name of the author appears on the title-page as *Um Presbytero secular do grão Priorado do Crato*. The work earned him the title of "Father of Brazilian Geography." Consult Pereira da Silva, *Plutarco Brasileiro* (1847).

CASALE MONFERRATO, kä-sä'lá môn'fēr-rä'tó. A fortified city of Piedmont, Italy, in

the Province of Alessandria, the ancient capital of the Duchy of Montferrat, on the right bank of the Po, 48 miles east of Turin (Map: Italy, C 2). It has a theatre, several palaces, a gymnasium, a technical institute, a seminary, and nine churches, among them the Romanesque cathedral founded in 741 by the Lombard King Liutprand. The old citadel, founded before 1500, was one of the strongest in Italy, and within recent years the fortifications have been greatly strengthened and extended. Casale is a centre of local trade, the chief industries being the culture and manufacture of silk and the making of Portland cement, machines, tools, liqueurs, and fertilizers. The town is the seat of a bishop. Pop. (commune), 1901, 31,793; 1911, 34,151.

Casale is on the site of the Roman Bodincomagus. It was founded by Liutprand in 730, and came into the possession of the marquises of Montferrat in the thirteenth century, and, after numerous changes of rulers, fell finally to the house of Savoy in 1703.

CASALMAGGIORE, kä-säl'má-jō'râ. A city in the Province of Cremona, Italy, 15 miles north of Parma, on the left bank of the Po, from whose frequent inundations it is protected by embankments (Map: Italy, E 3). It has large and beautiful churches, a theatre, a gymnasium, and a public library. It manufactures pottery, glass, leather, and chemicals, and markets the wine of the surrounding country. Pop. (commune), 1901, 16,400; 1911, 17,217.

CASALS, kä-säls', PABLO (1876-). A distinguished Spanish violoncellist. He was born in Vendrell, Catalonia, and received his first instruction from his father. In 1888-91 he studied at Barcelona with García ('cello) and Rodereda (composition), and in 1894-96 in Madrid with Breton. He made his début in 1898 at one of the Concerts Lamoureux in Paris, achieving such success that he devoted himself entirely to concertizing. His triumphs in Europe and both North and South America have been extraordinary. As a composer he has won recognition with two symphonic poems, several smaller works for orchestra, and numerous pieces for piano and 'cello and for piano and violin.

CASAMICCIOLA, kä'sá-mē'chô-lá. A watering place of Italy, noted for its alkaline-saline springs, its sand and sea baths, situated on the island of Ischia, and belonging to the Province of Naples (Map: Italy, B 11). During the earthquakes of 1881 and 1883 the place was almost completely destroyed, and even at present, although the government has aided in its rebuilding, a considerable part of the town is in ruins. Pop. (commune), 1901, 3731; 1911, 3490.

CASANOVA, kä'sá-nō'vâ, FRANCESCO (1727-1802). An Italian battle painter and etcher. He was born in London, was brought up in Venice, and studied in Florence under Simonini. Later he went to Paris, where he came under the influence of Parrocel and Bourguignon, and to Dresden, where he copied the works of Wou-vernman. At Paris, where he practiced 20 years, he was painter to the King and member of the Academy. His numerous pictures show vigor of execution and excellent movement, but the drawing is often faulty. Among those most popular in his day were: "Hannibal Crossing the Alps," the "Battle of Lons," and "Battle of Freiburg" (the last two in the Louvre), and a series exe-

AMERICAN PREHISTORIC DWELLINGS

1. CASA GRANDE.

2. CLIFF DWELLINGS IN THE MESA VERDE.

cuted for Catharine II of Russia, illustrating her victories over the Turks.

His brother, GIOVANNI BATTISTA (1728 or 30-95), was born in Venice and studied in Dresden under Silvester and Dietrich, in Venice under Piazzetta, and in Rome under Mengs. He gained the reputation of being a very correct draftsman and numbered among his pupils Angelica Kauffmann and Winckelmann. The latter commissioned him to make the drawings for his *Monumenti antichi*. He was appointed professor at the Dresden Academy in 1764 and director in 1776.

CASANOVA, kă'să-nō'vā, GIOVANNI GIACOMO, DE SEINGALT, de sän'gäl' (1725-1803). An Italian poet and adventurer, author of celebrated *Memoirs*. The story of his life is told with essential accuracy in his *Memoirs*. He was born in Venice in a family of actors. Educated in Padua for the priesthood, he early showed remarkable brilliance of intellect and charm of personality. At bottom a skeptic and a sensualist, with a full realization of his own instincts and capabilities and a wonderful insight into human nature, he set about making his way in the world with a curious blend of rectitude and unscrupulousness in his ethical code that makes of him one of the most interesting examples of eighteenth-century psychology. He began his work as a preacher in Venice when a mere boy. Various irregularities made it desirable for him to seek a post elsewhere, and he entered the service of Bishop Bernardis at Martorano, where he remained three days. Returning by way of Naples to Rome, he rapidly rose in favor with the Pope, as a ward of Cardinal Acquaviva. Here too he ultimately became embroiled, and after an adventurous journey to Venice he renounced the priesthood and entered the Venetian army at Corfu. Again in Venice on the recall of the troops, Casanova found himself in the direst poverty and accepted a position as a violin player in a cabaret. A fortunate accident enabled him to render a great personal service to a noble of the Bragadin family, who ultimately adopted him and assured him a certain income. However, new intrigues again forced Casanova to leave Venice, and not till late in life (1782) did he again have settled prospects before him. His wanderings led him to every capital of Europe, even as far as Constantinople. Living by gambling, by swindling and intrigue, by patronage won with his literary ability, his social grace and wit, his knowledge of feminine nature, he came to know intimately most of the important people of Europe, including Voltaire, Haller, Cardinal Bernis, Madame de Pompadour, etc. He acted as an agent for Louis XV and as a spy for the Venetian Republic. His life shows the most astonishing variations of fortune, alternations between wealth and distress, popularity and hatred. The fêted guest of Empress Catharine becomes the miserable convict of the Venetian Piombi, whence he made a marvelous escape, the relation of which became one of his social assets. The last years of his life were spent in peace at Dux in Bohemia, where he acted as librarian for the Duke of Waldstein.

Casanova has been regarded as one of the monstrous figures of literature for the gleeful frankness with which he portrays his own career in its most intimately immoral aspects. Recent criticism has treated him more kindly. His *Memoirs* have won recognition for their enor-

mous historical value as a picture of private life in the eighteenth century, and he is credited with no mean power as a literary artist. The *Memoirs* were written in French. The principal editions are those of Rosez (Brussels, 1860-63) and Garnier (Paris, 1879-80). But neither of these reproduces the original text, owned in manuscript by Brockhaus, Leipzig, who now has a complete critical edition in preparation. The marvelous character of the episodes of the *Memoirs* has brought their truthfulness often into question; but their general reliability has been demonstrated by a long list of studies, of which the most startling are *Lettere di donne a G. Casanova*, ed. by A. Ravà (Milan, 1912), and *G. Casanova's Briefwechsel* (Leipzig, 1913), ed. by Ravà and Gugitz. See also Ravà, *Contributo alla bibliografia di G. Casanova* (Turin, 1909-10), and Tage Bull-Ravà (Vienna, 1913); A. Symonds, "Casanova at Dux," in *North American Review* (1902); Maynial, *Casanova et son temps* (Paris, 1911); Molmenti, *Cartezzi casanoviani* (Florence, 1911). The latest edition of the story of the escape from the Piombi is that of S. di Giacomo (Naples, 1911). Eng. trans. of *Memoirs* by Villars (London, 1892).

CAS'AREEP, or **CASSAREEP** (South American word). A sauce or condiment made from the juice of the bitter cassava, or manioc root. It is in the highest esteem in Guiana, where it is employed to flavor almost every dish, and it is the basis of the favorite West Indian dish called *pepper pot*. It is a powerful antiseptic, and meat can by means of it be kept for a long time quite fresh, even in a tropical climate. It is made by evaporating and concentrating the juice, which is also mixed with various aromatics. The poisonous principle of the juice is dissipated in the evaporation, so that, although the juice in a fresh state is readily fatal to life, casareep is perfectly safe and wholesome. Casareep is imported into Holland and Britain and remains unimpaired in quality for several years.

CASAREGIS, kă'să-rā'jês, GIUSEPPE LORENZO MARIE (1670-1737). An Italian jurist, born in Genoa. He studied law at Pisa and was an auditor of the Rota (q.v.) at Siena and Florence. He was an authority in commercial law and one of the first important writers on that subject. His principal work is *Discursus legales de commercio* (2 vols., 1707; vol. iii, 1729).

CASAS, BARTOLOMÉ DE LAS. See LAS CASAS, BARTOLOMÉ DE.

CASAS, EMMANUEL. See LAS CASAS, MARQUIS DE.

CASAS GRANDES, kă'sās grän'dās (Sp., great houses). A village in Chihuahua, Mexico, 150 miles northwest of the city of Chihuahua, celebrated for the ruins of early Mexican buildings (Map: Mexico, E 2). In the vicinity are artificial mounds from which have been excavated stone axes and various other prehistoric utensils. Similar ruins are found near the Gila, the Salinas, and the Colorado rivers. They are supposed by Bancroft to be the work of the same people, the Moquis. Consult H. H. Bancroft, *The Native Races of the Pacific States of North America*. See CASA GRANDE.

CASATI, kă-să'tê, GAETANO (1838-1902). An African explorer, born at Lesmo in upper Italy. After studying at the Academy in Pavia he entered the Italian army in 1859 and served there till 1879. On December 24 of that year he sailed for Africa under commission from the

Società d'Esplorazione Commerciale d'Africa. He followed the course of the Welle River and explored the basin of the Bahr-el-Ghazal. In 1882 he was held prisoner for some time by a native chief; in 1883 he joined Emin Pasha and was shut in with him by the Mahdi insurrection. After their release he became "resident" for Emin Pasha in the Kingdom of Kabba Rega. Although that monarch was at first friendly, he subsequently seized Casati and condemned him to death; but he escaped to Lake Albert Nyanza, where Emin Pasha rescued him in 1888. In December, 1889, Casati reached the coast with Emin and Stanley. Besides reports, he published *Dieci anni in Equatoria* (2 vols., 1891; English, *Ten Years in Equatoria*, 1891), especially valuable for its account of the Niam-Niam, whom he visited in 1883.

CASAU'BON, *Fr. pron.* kâ'zô'bôn', ISAAC (1559-1614). A distinguished French classicist and theologian. He, Joseph Scaliger (q.v.), and Justus Lipsius (q.v.) formed the famous triumvirate of sixteenth-century classical scholars. He was born in Geneva. In 1582 he was appointed professor of Greek in his native town; in 1596 he was called to a similar position in Montpellier. In 1599 he was summoned to Paris by Henry IV. The influence of the Catholic opponents of Casaubon was strong enough, however, to prevent his receiving a professorship; instead he was appointed royal librarian. After the murder of the King he felt his position insecure and in 1610 crossed to England, where James I received him with favor, appointing him prebendary of Canterbury and Westminster. Casaubon was sharply attacked by his opponents because of the favor the English King showed him, and he was charged with having bartered his opinions for position. He died in Westminster, and was buried in the great Abbey. He possessed great industry, excellent critical and grammatical sense, and skill in illustration and exposition. He was the first to treat in systematic manner an important field of literary history. This he did in his masterly work, *De Satirica Græca Poesi et Romanorum Satira* (1605; last ed. by Rambach, Halle, 1774). Most of his labor was expended on editions and commentaries. The most important of these were on Strabo (1587); Suetonius (1595); Persius (1605; 4th ed., 1833, called by Scaliger "a divine book"); Polybius (1609); Polyænus, the editio princeps (1589), and especially Athenæus (1598); on this last-named commentary, his greatest work, he spent 10 years. He edited also Apuleius; Aristotle; Aristophanes; the *Historiæ Augustæ Scriptores*; Pliny the Younger, etc., and made important contributions to the criticism and interpretation of Dionysius of Halicarnassus; Diogenes Laërtius; Theocritus, etc. His theological interest gave rise to the works *De Libertate Ecclesiastica* (1607) and *Exercitationes Contra Baronium* (1614), in which he attacked the *Annales Ecclesiastici* of Cardinal Baronius (q.v.). These works appeal only to the scholar, but his characteristic diary, *Ephemerides*, may be relished by the general reader. It was edited by Russell (Oxford, 1850). Casaubon's *Letters* were published in Rotterdam, 1709. Consult Pattison, *Isaac Casaubon*, 2d ed. by Nettleship (Oxford, 1892), and Nazelle, *Isaac Casaubon, sa vie et son temps* (Paris, 1897).

The scholar lived on in his son, MÉRIC CASAUBON (1599-1671), born in Geneva and educated at Sedan and Oxford, who edited the works of

Marcus Aurelius, Terence, Epictetus, etc. Made successively prebendary of Canterbury, vicar of two charges, a rector, he suffered for devotion to Charles I. At the Restoration, however, he was again in favor. He wrote *De Enthusiasmo*; but perhaps his greatest work was the pious preservation of his father's manuscripts. He died at Oxford, where he had taught theology and, at the instance of Charles I, had received the degree of Doctor of Divinity.

CASAULT, kâ'zô', SIR LOUIS NAPOLEON (1822-1908). A Canadian jurist, born at St. Thomas. He was admitted to the bar in 1847 and from 1854 to 1858 was a member, for Montmagny, of the Canadian Legislative Assembly. From 1867 to 1870 he represented Bellechasse in the Canadian House of Commons. He was professor of commercial and maritime law in Laval University from 1858 to 1891, puisne judge of the Superior Court of Quebec in 1870-94, and in 1894-1904 Chief Justice. He was one of the three commissioners appointed to adjust accounts between Ontario and Quebec and between those provinces and the Dominion.

CASBIN, kâz-bên'. See KASBIN.

CAS'CA, PUBLIUS SERVILIUS. One of the assassins of Julius Cæsar, who, according to Plutarch, struck the first blow. This was done across the back of Cæsar's neck with a short sword, but the wound was not deadly.

CASCADE'. See WATERFALL.

CASCADE RANGE. A range of mountains in western United States and Canada, forming a northward continuation of the Sierra Nevada Range (Map: United States, A 2). It begins in northern California near the Oregon boundary and extends across the latter State and Washington into British Columbia, where the line of elevations is continued by many small groups which are deeply intersected and eroded by river and lake systems. Its direction in the United States is nearly north and south, parallel to the Pacific coast; in Oregon the main axis of elevation lies about 100 miles from the coast, while in Washington the distance increases to 150 miles. The limits of the Cascade Range in British Columbia are not clearly defined. The name, however, is commonly assigned to the entire plateau region stretching across the province from southeast to northwest, which is limited on the east by the lofty ranges of the Rocky Mountains and on the west by the Island Range. The southern section of the range is crossed by the Columbia River and by the Klamath River, both of which have cut deep gorges. In British Columbia the Fraser River occupies an extensive cañon, where it passes across the range to discharge into the Strait of Georgia.

The Cascade Range in its southern section is marked by extreme ruggedness of outline and by some of the loftiest summits in the United States. In the Shasta group of California, which defines its limit to the south, are Mount Shasta, 14,380 feet, and several other peaks over 10,000 feet in height. In Oregon it includes Mount Hood, 11,225 feet; Mount Jefferson, 10,200 feet; and Mount Pitt, 9760 feet; while in Washington is the magnificent cone of Mount Tacoma (Rainier), 14,408 feet, with many peaks of lesser altitude, including Mount Baker, 10,827 feet; Mount St. Helens, 10,000 feet; and Mount Adams, 12,307 feet. The British Columbian section contains no notable elevations, its character being rather that of a plateau dissected by numerous rivers, with a few prominences rising

above the surface to altitudes of 6000 or 7000 feet. Some summits of the Cascade Range are recently extinct volcanoes and carry heavy snow fields and glaciers. Igneous and volcanic rocks with Paleozoic strata constitute the central mass, while later sediments form the flanks. Its slopes, in part forested with firs, pine, and hard wood, are drained by the Columbia, Klamath, and Fraser rivers and by a large number of smaller streams, all of which discharge finally into the Pacific Ocean. See topography of OREGON, WASHINGTON, and BRITISH COLUMBIA.

CASCARA SEGRADA, kās-kā'rá or kās-kār'á (properly kās'ká-rá) sá-grá'dá (Sp., sacred bark), CHITTEM BARK, or SACRED BARK. The bark of *Rhamnus purshiana*, the Californian buckthorn, a tree of the natural order Rhamnaceæ. The bark contains a crystallizable substance (cascarin), resins, a volatile oil, and malic, tannic, and oxalic acids. A fluid extract of the bark, as well as cascarin, is used for the relief of chronic constipation and sometimes in gout. After prolonged use of it constipation is cured in many cases, as its action is to increase the peristaltic action of the muscular fibres of the intestine. It is generally combined with other laxatives, and is an ingredient of many proprietary purgative medicines. See BARK; BUCKTHORN.

CAS'CARIL'LA (Sp., little bark, dim. of *cascara*, bark, husk, from *cascar*, to fall, from Lat. *cassare*, *quassare*, to shake, from *quatire*, to shake; associated by popular etymology with Lat. *cadere*, to fall). A name given in South America to many different kinds of bitter medicinal barks which form articles of commerce. Peruvian bark itself bears no other name in the districts which produce it. The name "cascarilla" is often used in medicine to denote the bark of *Croton eluteria*. This plant is a small shrub found on the low hills of the Bahama Islands. The bark contains an essential oil, cascarillin, and a resin, and is a tonic, invigorating digestion and promoting the functions of the stomach. In large doses it is very nauseating.

In medicine, cascarilla is used in the form of an infusion or a tincture, in cases of fermentative dyspepsia, chronic bronchitis, and certain fevers. It is one of the aromatic bitters and stimulates the appetite and the digestive powers, increases the flow of the digestive juices, and is a mild astringent.

CASCINE, ká-shē'nâ, LE. A park about two miles long, in Florence, bordering the Arno. It is laid out in fine walks and drives and is the favorite afternoon resort of Florentine society.

CAS'CO BAY. A bay on the southwest coast of Maine, about 20 miles in width at its mouth, from Bald Head on the east to Cape Elizabeth on the west, and extending about 12 miles inland (Map: Maine, C 8). The bay contains hundreds of small islands, most of which are occupied as summer resorts, and affords an excellent harbor. Portland (q.v.) is located on the west side of Casco Bay.

CASE (Fr. *casse*, *caisse*, Catalan *capsa*, Portug. *caixa*, from Lat. *capsa*, box, from *capere*, to take). A receptacle for type used in printing, which is divided into compartments or "boxes," each of which contains type of one character or letter. A pair of cases consists of an upper and a lower case: the upper one contains the capitals, small capitals, and some other letters that are only occasionally required, the lower one

holding the small letters, figures, spaces, and most of the points. The places assigned to the several letters of the alphabet in the boxes of the case are not precisely the same in all printing offices, but the differences are few. The different sizes of the boxes in the lower case depend upon the comparative frequency with which the several letters occur in composition, and the position in the case allotted to each letter is

fi	fl	5Em Sp.	4Em Sp.	'	k		1	2	3	4	5	6	7	8

THE LOWER CASE.

such as to afford the greatest facility in composing. The letter *e*, which is most used in the English language, has a box much larger than any of the other compartments and is placed directly in front of the compositor. In the upper case the boxes are of uniform size, and the letters are placed in alphabetical order, the comparatively rare occurrence of capitals rendering it immaterial which letter is nearest the compositor's hand.

CASE. In law, primarily a cause, that is, an action or suit taken as a whole. The word is used in this general sense in the United States Constitution, which extends the judicial power of the United States to "cases in law and equity, cases affecting ambassadors, etc." In a more limited sense, a case is one side of a suit or action, the body of evidence and law presented by one of the parties. The word is also used to denote a decided cause of action already recorded and cited in argument; thus the phrase *case law* is used to designate the species of legal argument founded on the examination and citation of decided cases; hence also the phrase *leading cases*, meaning cases in which the decisions have a wide application and set forth general principles which may govern many subsequent decisions. In the United States the term *case* is often used in brief for *case on appeal*, meaning the statement laid before a court of appeal by an appellant, presenting the record and the entire evidence of the original trial, or a résumé of it. This allows the appellate court to review the findings of the jury as well as the law points involved, and in this the case differs from the *bill of exceptions*, which presents only the matters of law to the court of appeal. *Case agreed on*, or *case stated*, is a statement in which parties to a suit unite in laying before the court the facts of the case upon which they agree for a decision on the points of law involved. *Case reserved* is a statement drawn by counsel and certified to by the judge, to be used as a basis for argument on law points before a full bench of the court.

Action on the Case. A very important form of action, sometimes called *case*, in brief for *action on the case*, or, still more fully, *action of trespass on the case*. This action did not exist at early common law, but was introduced by the Statute of Westminster II, in the reign

of Edward I (1285). It was designed to remedy certain defects in the common-law practice which failed to provide an adequate remedy for some class of injuries by means of the common-law action of trespass and effected perhaps the greatest reform of legal procedure ever produced by a single statute. The phrase *action on the case* is really equivalent to *action on the circumstances*, and this form of suit avails when it is sought to recover damages for personal injuries not caused by an assault, or where the wrongful act was of such a kind that the injury was indirect or consequential. Actions to recover damages for libel or slander, for the conversion of personal property, for negligence, are examples of actions on the case. Assumpsit (q.v.) originated as a form of action on the case. In Great Britain the Judicature Acts have so classified injuries for which damages may be sought as in general to make this form of action obsolete; and in the United States the codes of civil procedure adopted in many States have generally abolished this and other special forms of action. In many of the States, however, the action on the case is still in common use. Consult the authorities referred to under PLEADING and PRACTICE.

CASE, AUGUSTUS LUDLOW (1813-93). An American naval officer, born in Newburgh, N. Y. He entered the navy as midshipman in 1828, served in the Mexican War, and upon the outbreak of the Civil War in 1861 was appointed fleet captain of the North Atlantic blockading squadron. Subsequently he was fleet captain of the European squadron in 1865-66, was chief of the ordnance bureau from 1869 to 1873, and in 1874, at the time of the *Virginius* affair, was placed in command of the fleet which had been assembled at Key West. In 1872 he received the rank of rear admiral and was retired in 1875.

CASE, THOMAS (1598-1682). An English divine, born in Kent. He graduated at Christ Church, Oxford, became rector of Stockport in 1645, and subsequently rector of St. Mary Magdalene, London. In 1649 he was removed from his benefice for refusal to pledge loyalty to the new system of government, and in 1651 was imprisoned in the Tower on a charge of high treason in having implicated himself in the Presbyterian plot for the Stuart restoration. During his imprisonment Case wrote a series of articles which were published afterward under the title of *Correction Instruction*. In the same year he was released, and subsequently became rector of St. Giles-in-the-Fields. He was a member of the deputation of Presbyterian clergymen sent in 1660 to congratulate the restored King, by whom he was appointed a royal chaplain. He was one of the most popular preachers of his day, and wrote several works, of which *Mount Pisgah* (1670; new abridged ed., 1836) is esteemed the best.

CASE, THOMAS. An English educator and philosopher. He was educated at Rugby and at Balliol College, Oxford (M.A., 1868), and was fellow of Brasenose (1868), tutor of Balliol (1870), lecturer at Christ Church, fellow and tutor of Corpus Christi (1882) and Waynflete professor of moral and metaphysical philosophy (1889-1910), and (after 1904) president of Corpus Christi College, Oxford. He wrote: *Materials for the History of the Athenian Democracy from Solon to Pericles* (1874); *Realism in Morals* (1877); *Physical Realism, being an Analytical Philosophy from the Physi-*

cal Objects of Science to the Physical Data of Sense (1888).

CASEHARDENING. The process of converting the surface of wrought-iron or soft-steel articles into steel of higher percentage of carbon, thereby making them harder, more resistant to abrasion, less liable to rust, and capable of taking on a better polish. Fire irons, portions of fine grate fronts, gunlocks, and other articles of limited size are commonly so treated, but the process is sometimes applied to large objects. The articles are first formed and, being heated to redness, are embedded without access of air in powdered yellow prussiate of potash and heated again. The result is that the heat decomposes the prussiate of potash, and the liberated carbon combines with the iron, forming a coating of hard high carbon steel on the surface of the articles. A former mode of casehardening was to heat the articles, along with some animal matter, such as the parings of horns and a little common salt, from a half-hour to several hours. After being treated as described the articles were cooled in cold water, or in oil when they were of a delicate nature. Charcoal alone is also employed. The coating of steel is very thin, in the case of small articles seldom exceeding one-sixteenth of an inch. Where a thicker coating is necessary, the articles are treated several times. The process called "Harveyizing" of steel armor plate, from the name of its proposer, is similar to casehardening in that a surface exceedingly resistant to penetration by projectiles is formed by heat treatment in carbon, while the back remains soft and tough to withstand the smashing effect when the projectile is arrested in its flight. See ARMOR PLATE.

CASEIN, kã'sê-in (Lat. *caseus*, cheese). An organic compound allied to albumin, found in the milk of the mammalia. The proportion of casein in milk varies, but averages about 3 per cent, and it may be coagulated and separated therefrom by the addition of acetic acid or of a little rennet, as in the manufacture of cheese (q.v.). In either case the casein separates as curd, which still retains attached to it some oil and salts, though the greater portion of these substances, along with the sugar, remains in the watery liquid or whey. The elementary bodies which enter into the composition of casein, and the proportion in which these are present in 100 parts, are: carbon, 53.83; hydrogen, 7.15; nitrogen, 15.65; oxygen, 22.52; and sulphur, 0.85. Casein is not affected by heat as readily as other albuminoid substances; it is not coagulated below the temperatures of 130°-150° C. It forms insoluble precipitates with solutions of the poisonous salts, acetate of lead, nitrate of silver, and bichloride of mercury, and is therefore used as their antidote.

A compound of casein with lime is now extensively used in calico printing as a substitute for albumin for the purpose of fixing certain mineral colors. The compound is prepared by dissolving casein in ammonia, evaporating the solution, and adding milk of lime to the residue. *Lactarin* is a commonly known commercial form of this compound. Solutions of casein, together with borax, in water, have been used as a substitute for gum arabic. Since 1903 casein has also been used for making *galalith*, an important substitute for ivory, celluloid, ebonite, etc. Galalith is made by treating pure casein under pressure with formaldehyde. Moist, fat-free

casein, mixed with quicklime, borax, or strong sodium silicate solution, sets to a hard insoluble mass; hence the use of casein as a cement for earthenware. The Swiss powder known as *Käseleim Pulver* is a ready-made mixture of this kind and will set to a hard mass on being moistened. Finally, as a basis of food preparations, casein is used in the form of its alkali or alkaline earth salts, which are obtained by dissolving casein in the required amount of caustic alkali, or milk of lime, or phosphate of lime, and evaporating to dryness in vacuo. See PROTEIN.

CASE IS ALTERED, THE. A comedy by Ben Jonson, produced in the winter of 1598-99 and printed in quarto in 1609 and in folio in 1692. Its sources are the *Captivi* and the *Aulularia* of Plautus. It received high praise from the author's contemporaries, but soon lost its appeal to the public. Consult Symonds, "Life of Ben Jonson" (*English Worthies Series*, London, 1886).

CASELLI, ká-sě'l'le, GIOVANNI (1815-91). An Italian abbot and physicist, born in Siena. He was an active popularizer of science, and in 1854 established *La Riconoscenza*, a popular journal of physical science. He invented a form of electric telegraph, the "pantelegraph," which for years was in use in France. In 1865 he built an electric motor for Napoleon III.

CASE/MATE (Fr., perhaps from It. *casa*, house, chamber + *matta*, fem. of *matto*, mad, weak; provincially, dark; or possibly connected with Sp. *matar*, to kill, from Lat. *mactare*, to slaughter). Originally the loopholed gallery of a bastion, constructed so that fire could be directed on an enemy with the maximum of effect and the minimum of risk. With the advent of shells the term came to be applied to the bombproof vaults of fortresses or defenses, used for shelter purposes only. Casemate batteries are bombproof vaults or galleries, containing embrasures for the guns. The most widely known examples of casemate batteries are in the British fortress of Gibraltar (q.v.). See FORTIFICATION; SIEGE AND SIEGE WORKS. In the latter article will be found illustrations of casemates in trenches.

CASE/MENT (abbreviation of *incasement*, from OF. *encasement*, casing, from Lat. *capsa*, box, from *capere*, to hold). A frame, or sash, with hinges to open and shut, forming the whole or part of the glazing of a window. German and English casements are made to open outward, and this is the usual form in the United States. French casements have two meeting leaves and open inward; they are used principally as doors opening on balconies or verandas. Also a name for a deep, hollow, circular molding, similar to the *scotia* of classical and the *cavetto* of Italian architecture. The casement is very prevalent in the Perpendicular style of Gothic architecture and is sometimes enriched with running foliage.

CASERTA, ká-zěr'tà. An episcopal city in south Italy, capital of the Province of Caserta, and a military centre (Map: Italy, J 6). It is 21 miles north of Naples, of which it might be called the Versailles or the Potsdam. The ancient town (Caserta Vecchia), founded in the eighth century by the Lombards, is on the slope of a hill and contains several deserted palaces and the twelfth-century church of San Michele; the modern town (Caserta Nuova) is on lower ground. Opposite the railway station is the

famous but now unoccupied royal palace, built by King Charles III and designed by Vanvitelli. This magnificent edifice, the construction of which was begun in 1752, forms with its four courts a huge rectangle, whose south side is 830 feet long and 134 feet high, and has 37 windows in each story. Through the middle of the rectangle runs a splendid colonnade 541 feet long, from the centre of which rises the beautiful marble stairway with 116 steps. The chapel of the palace is richly decorated and contains a number of works of art by well-known artists. The theatre of the palace has 40 boxes and 12 Corinthian columns of African marble from the palace of Serapis at Pozzuoli. Surrounding the rectangle are gardens laid out in the English fashion. The water for its fountains is brought 26 miles from Mount Taburno by an aqueduct which crosses the Maddaloni valley on a daringly constructed bridge, 1700 feet long and 190 feet high. In San Leucio, 2 miles north of the railway station, are a royal silk-spinning establishment and linen and tapestry weaving factories. In 1860 Caserta was the headquarters of Garibaldi and his army. The Province of Caserta is the ancient Campania Felix. Pop., 1881, 31,000; 1901, 33,000; 1911, 32,032.

CASE SCHOOL OF APPLIED SCIENCE.

An institution for technological education at Cleveland, Ohio. It was endowed by Leonard Case in 1877 and was opened to students in 1880. The buildings of the school consist of a main building used for general recitation purposes, and separate laboratories for chemistry, physics, mechanical engineering, electrical engineering, mining engineering, and astronomy. Courses are given in these subjects and in civil engineering. These courses lead to the degree of Bachelor of Science. In 1913 the faculty numbered 45, and the students enrolled were 531. The president is Charles Sumner Howe.

CASE SHOT. A projectile discharged from cannon and consisting of a number of balls or other particles inclosed in a case or covering from which they are released at the muzzle of the gun. Case shot consisted either of grape or canister (qq.v.). In modern artillery ammunition, *shrapnel* has entirely replaced *case shot*, which is no longer used. See ARTILLERY; ORDNANCE; PROJECTILES.

CASEWORM, or CADDIS WORM. See CADDIS FLY.

CA'SEY, EDWARD PEARCE (1864-). An American architect, born at Portland, Me. He was educated at Columbia University and the Ecole des Beaux-Arts, Paris. In 1892-97 he served as architect for completing the Congressional Library Building, Washington. In 1893 he was one of the prize winners on the City Hall Competition (New York). With W. H. Burr he made the accepted designs for the memorial bridge across the Potomac River, Washington, in 1900, and with H. M. Shradly he won first prize in competition for the Grant Monument in Washington in 1902. He was also architect of the Memorial Continental Hall and the Connecticut Avenue Viaduct in Washington, D. C.

CASEY, SILAS (1807-82). An American soldier, born at East Greenwich, R. I. He graduated from West Point in 1826, served in the Seminole and Mexican wars, and for services in the latter received the brevet rank of lieutenant colonel. In 1861, with the rank of brigadier general of volunteers, he organized and disciplined the recruits at Washington, D. C., and

later in the war saw service in the field and distinguished himself at the battle of Fair Oaks. From 1863 to 1865 he served as president of the board appointed to examine candidates for officers in the colored regiments, and in the latter year he was brevetted major general. He retired in 1868. He published *System of Infantry Tactics* (2 vols., 1861) and *Infantry Tactics for Colored Troops* (1863).

CASEY, THOMAS LINCOLN (1831-96). An American military engineer, born at Sacketts Harbor, N. Y. He graduated at West Point in 1852, entered the engineer corps of the army, and passed through all grades of the service until, in 1888, he became chief of engineers and brigadier general. As superintending engineer of public buildings and grounds in the District of Columbia, he had charge of the Potomac Aqueduct, the completion of the Washington Monument, and the State, War, and Navy Department buildings, and the construction of the Army Medical Museum and Library. In 1889 Congress charged him with the duty of constructing the new Congressional Library Building.

CASGRAIN, kās'grān', HENRI RAYMOND (1831-1904). A Canadian biographer and historian, born at Rivière Ouelle, Quebec. He was educated at the Collège Sainte-Anne, P. Q., studied theology at the Quebec Seminary, and was ordained a priest in 1856. He was a professor at St. Anne's until 1859 and priest at the Basilica, Quebec, from 1860 until 1873. In 1889 he was elected president of the Royal Society of Canada. Among his works may be mentioned: *Légendes canadiennes* (1861); *L'Histoire de la Mère Marie de l'Incarnation* (1864); *Histoire de l'Hôtel Dieu de Québec* (1878); *Biographies canadiennes* (1885); *Un pèlerinage au pays d'Évangéline* (1888); *Montcalm et Lévis* (2 vols., 1891). He prepared, in conjunction with Abbé Laverdière, Desbarats' edition of the *Œuvres de Champlain* and the *Journal des Jésuites*; and he wrote the introduction to the *Œuvres complètes d'Octave Crémazie*.

CASGRAIN, PHILIPPE BABY (1826-). A Canadian lawyer and historian. He was born in the city of Quebec, was educated at St. Anne's College, and was called to the bar in 1850. He was for several years deputy prothonotary of the Superior Court of the province, and later became clerk of the Circuit and Revision Court. In 1872 he was elected a Liberal member of the House of Commons, retaining his seat until 1891. In 1892 he was president of the royal commission to inquire into the Montreal and Sorel Railway grant and payment. He favored the formation of a Canadian navy, and was a member of the executive committee of the Quebec branch of the Navy League. In recognition of his literary abilities and of his historical investigations, chiefly concerning matters of local and French-Canadian interest, he was elected president of the Literary and Historical Society of Quebec in 1898, 1899, and 1906. His publications include: *Letellier de Saint Just et son temps* (1885); *La fontaine de Champlain à Québec* (1888); *La vie de Joseph-François Perrault* (1898); *Les Plaines d'Abraham* (1900); *Seconde bataille des Plaines d'Abraham et de Sainte-Foye* (1900); *La maison de Montcalm* (1902); *La maison de Borgia* (1904); *Le moulin de Dumont* (1905); *Cadet, sa maison et sa résidence à Québec* (1906); *A Few Remarks on Various Gallicisms and French Locutions in the Plays of Shakespeare* (1907); *La Chapelle et le tom-*

beau de Champlain (1907); *Notre système judiciaire* (1911); besides contributions to the *Transactions of the Royal Society of Canada* and the *Transactions of the Quebec Literary and Historical Society*.

CASGRAIN, THOMAS CHASE (1852-). A Canadian lawyer and statesman. He was born in Detroit, Mich., was educated at the Quebec Seminary and Laval University, and was called to the Quebec bar in 1877. In 1882 he was appointed crown prosecutor of the District of Quebec, but he afterward removed to Montreal and practiced his profession there. In 1885 he was junior crown counsel at the trial for high treason of Louis Riel (q.v.). He was a Conservative member of the Quebec Legislature in 1886-90 and again in 1892-96, during which period he was Attorney-General and procured the enactment of a law against corrupt practices at elections. In 1894 he became bâtonnier of the bar of Quebec and also bâtonnier-général of the provincial bar, and in the same year he was chairman of the royal commission to revise and amend the code of civil procedure. He was a member of the House of Commons in 1896-1904, was elected president of the provincial Conservative Association in 1909, and in 1912 became chairman of the Canadian section of the International Waterways Commission.

CASH. Formerly the unit of Chinese money and sole official coin of China. It is a small round copper coin, with a square hole in the centre, and is equal to about one-eleventh of a cent in United States money. It still circulates, but a law of May, 1910, created a new monetary system based upon the Mexican silver dollar, the smallest coin being one-tenth of a cent.

CASH CARRIER. See PNEUMATIC DISPATCH.

CASH'EL (Ir. *Carsiol*, habitation in the rock). A town in Tipperary Co., Ireland, 105 miles southwest of Dublin (Map: Ireland, D 4). It lies at the foot of the Rock of Cashel, a limestone elevation about 300 feet in height, on the summit of which are the most imposing ruins in Ireland. They consist of St. Patrick's Cathedral, the largest as well as the most remarkable in the country, founded 1169, burned 1495, and afterward repaired; a stone-roofed chapel, built in 1127 by Cormac McCarthy, King of Munster, the most perfect specimen of the kind in the country; a round tower 80 feet high and 50 in circumference; and the "Cross of Cashel." Hore Abbey, founded by the Cistercians in 1272, lies at the base of the rock. The round tower is built of freestone, but the other ruins of limestone. At Cashel, in 1172, the Irish princes first acknowledged the authority of the English King. Pop., 1901, 2938; 1911, 2813. Consult White, *Cashel of the Kings* (2 vols., Clonmel, 1863-66).

CASHEW (kā-shōō') **NUT** (Ger. *Acajounuss*, Sp. *cayou*, from Hind. *kājū*, *kānjū*). The fruit of a tree, *Anacardium occidentale*, of the family Anacardiaceæ. This is a spreading tree, 20 to 40 feet in height, and is a native of the tropical parts of both hemispheres, perhaps being primarily of American origin. It abounds in a milky juice, which turns black on exposure to the air and is used for varnishing, but is so acrid as to produce painful inflammation when it comes in contact with the skin of some persons, or when they are exposed to its fumes. It is sometimes used to protect books and woodwork against ants. The fruit of this tree is a

kidney-shaped nut about an inch long, seated on the thicker end of a pear-shaped, fleshy stalk, which varies in size from that of a cherry to a medium-sized pear. The shell is double; the outer shell is ash-colored and very smooth, and between it and the inner shell is a very caustic black juice. The kernel is oily and very pleasant and wholesome, and is in common use as an article of food in tropical countries when roasted, being made into puddings and in various ways prepared for the table. In the West Indies it is put into wine, particularly old Madeira wine, to which it is thought to communicate a peculiarly agreeable flavor, and for this use it is sometimes imported into Great Britain. It is also, for the same reason, sometimes an ingredient in chocolate. The fleshy stalk, sometimes called the cashew apple, varies in size and is white, yellow, or red. It is perfectly free from acidity, is acid and eatable, very pleasant and refreshing, and much used by the inhabitants of the countries in which the tree grows. A very pleasant vinous liquor is obtained from it by fermentation; and this, by distillation, yields a spirituous liquor which is highly esteemed for its flavor. A gum which exudes from the bark of the tree, quite distinct from the milky juice already mentioned, is bland and very similar to gum arabic. For illustration, see Plate of CARNATIONS.

CASHGAR, kâsh-gâr'. See KASHGAR.

CASHIBO, kâ-shê'bô. A savage and reputedly cannibal tribe of Panoan stock, on the Pachitea tributary of the Upper Ucayali, Peru. Subtribes are the Buninahuas and Puchanahuas. They are said to eat their old people at death, asserting that they do this in preference to having them become food for worms. Until recently they were at war with the whites and with all other tribes, having repeatedly killed the missionaries who attempted to civilize them. They are said to be of rather light complexion. Some of the men are bearded and wear long shirts. The women go entirely naked until after marriage. The name signifies a bat. Consult works cited under PANOAN.

CASHIER/ING (OF. *casser*, to discharge, from Lat. *cassare*, to destroy, from *cassus*, empty). The annulling or cancellation of the commission of a military or naval officer, as a punishment. Formerly it was a very severe form of dismissal from the service and usually was not resorted to except in cases of disgraceful conduct. It absolutely precluded reinstatement. At the present time, in the United States military service, there is no practical difference between the words *cashiered* and *dismissed from the service*. See ARTICLES OF WAR.

CASHMERE, kâsh-mêr'. See KASHMIR.

CASH'MERE GOAT, or SHAWL GOAT. See GOAT.

CASH REGISTER. See CALCULATING MACHINES.

CASILINUM. See CAPUA.

CASIMIR, kâs'î-mêr, properly KAZIMIERZ. The name of a number of Polish princes and kings.—CASIMIR I, the Restorer, King of Poland (1040-58), was the son of the Polish King, Mieczyslaw II, and a German princess, Ryxa, who ruled during Casimir's minority. He strengthened Christianity in his dominions and founded two monasteries. He married a Russian princess and so became the brother-in-law of Henry I of France.—CASIMIR II, known as the Just, was the youngest son of Boleslas III. His father,

who died in 1139, had divided the kingdom among his four sons, but he ruled over reunited Poland from 1178 and died in 1194. Casimir showed himself an able ruler and laid the foundations of the Senate. He died much beloved by his subjects.—CASIMIR III, the Great, was born about 1310 and succeeded his father, Ladislaus Lokietek, as King of Poland, in 1333 and ruled till 1370. His possessions were threatened by the Teutonic Knights and the King of Bohemia, but he succeeded in winning the friendship of both. He secured partial control of Red Russia in 1344 and repelled the Tatars who threatened Poland. He gave the Bishop of Galicia the title of Metropolitan. He developed commerce, protected the Jews and Germans, who made many settlements in his domains, and improved the condition of the peasants, so that he is known as King of the Peasants. In 1364 he founded the University of Cracow, after the model of Bologna. He reconstructed the whole administration and made Poland a power in Europe. He had three wives and two mistresses, one a Jewess. Casimir was the last of the dynasty of the Piasts.—CASIMIR IV (1427-92), King of Poland and Grand Duke of Lithuania, was the son of Ladislaus Jagiello. The Poles, after the death of King Ladislaus III in the disastrous battle of Varna in 1444, invited his brother, Casimir, to accept the crown. This he did reluctantly in 1447. His determination to strengthen the royal power led to a threat of deposition by the nobles, and from that time Poland became more and more an aristocracy. Casimir waged a long war with the Teutonic Knights, who were compelled in the Treaty of Thorn (1466) to cede West Prussia to Poland and to render homage for East Prussia. In this reign Latin became the official language and part of the curriculum of the schools. Of his six sons, three succeeded each other on the throne of Poland, the eldest became King of Bohemia and Hungary, a second was made a cardinal, and a third was canonized by Paul V. Consult Morfill, *Poland* (New York, 1893).

CASIMIR-PÉRIER, kâ'zê'mêr' pâ'ryâ', JEAN PAUL PIERRE (1847-1907). President of the French Republic in 1894 and 1895. He was born in Paris, Nov. 8, 1847. His father, Auguste Casimir-Périer, was Minister of the Interior in the administration of Thiers, and his grandfather was Premier under Louis Philippe. Jean Paul Casimir-Périer was decorated with the Legion of Honor for his conduct in the Franco-Prussian War. After the war he entered the public service and held office in the Department of the Interior, of which his father was then head. He was elected to the Chamber of Deputies in 1874, and from December, 1877, to January, 1879, served as Undersecretary in the departments of Public Instruction and War. Because of the traditions of his family, he was regarded as having Orleanist leanings, but he always acted as a moderate Republican. In 1890 he was elected Vice President of the Chamber of Deputies, and in 1893 he became President of the Chamber, resigning December 3, when he became President of the Council and Prime Minister under President Carnot. The ministry over which he presided distinguished itself by its firm attitude at a period of great disorder. He resigned May 22, 1894, and on June 27 he was elected, on the first ballot, to succeed the murdered Carnot as President of the Republic. He surprised the world by resigning, Jan. 15,

1895, and retiring from public life. He had been embarrassed by factional politics, and he chafed at the restrictions imposed by the French constitution upon the President. His own ministers snubbed him, and even transacted important business of state without consulting him. Many rumors were in circulation afterward connecting his resignation with the Dreyfus case, and complications with Germany growing out of the latter. The ex-President appeared as a witness in the Zola trial, a sequel to the Dreyfus affair, but the rulings of the court shut out all his testimony that was of any importance or public interest.

CASINO, ká-sē'nò (It. dim. of *casa*, house, Lat. *casa*, cottage). In Italy, a pleasure house, or summerhouse, or a place for social reunions. The Italian nobles have long had casinos detached from the palaces in which they live, whither they can retreat and enjoy themselves, and it is probable that the public casinos were the result of an attempt made by the middle classes to imitate their superiors. At the present time a casino is usually a place where musical or dancing soirées are held, containing a conversation room, billiard room, and café; but the name is very indefinitely applied in the United States.

CASINO. See CASSINO.

CASINO, MONTE. See MONTE CASSINO.

CASI'NUM. The name of a town in ancient Italy, on whose site stands the modern Cassino (q.v.).

CAS'LON, WILLIAM (1692-1766). An English type founder, born at Cradley, Worcestershire. He was recognized as the greatest stamp cutter and type founder of his day. The library of the American Antiquarian Society, at Worcester, Mass., contains the earliest specimen of his printing types in book form. It is entitled *A Specimen of Printing Types by William Caslon and Son* (1763).

CASORIA, ká-sò'rè-à. A city in south Italy, 6 miles north of Naples. It has many churches and beautiful streets (Map: Italy, D 10). The district produces silk and wine. Pop. (commune), 1881, 10,000; 1901, 12,905; 1911, 14,220.

CASPARI, ká-spä'rè, KARL PAUL (1814-92). A German Lutheran theologian and Orientalist. He was born, of Jewish parents, in Dessau, Anhalt, studied in Leipzig and Berlin, became a convert to Christianity in 1838, and was appointed instructor of theology in the University of Christiania, Norway, in 1847. In 1857 he was made full professor. He wrote many philological and theological works and made an especial study of the so-called ecumenical creeds. His principal publications are the *Grammatica Arabica* (1844-48); *Beiträge zur Einleitung in Jesaya* (1848); *Alte und neue Quellen zur Geschichte des Taufsymbols und der Glaubensregel* (1879).

CASPE, ká'spå. A town in the Province of Saragossa, Spain, on the Guadaloupe, almost at its confluence with the Ebro, 50 miles southeast of Saragossa (Map: Spain, E 2). It has a fine Gothic college building, an ancient castle, and several ecclesiastical establishments. Olive and mulberry trees are extensively cultivated, and coal and iron are mined in the neighborhood. A congress of Aragonians, Catalonians, and Valencians assembled here in 1412 to settle the royal succession. Pop., 1900, 7808; 1910, 8878.

CASPER. A town and the county seat of Natrona Co., Wyo., 150 miles (direct) northwest

of Cheyenne, on the Chicago and Northwestern and the Chicago, Burlington, and Quincy railroads, and on the Platte River. It is the site of old Fort Casper, is the seat of the Wyoming General Hospital, and has a Carnegie library. Casper carries on a large trade in wool, live stock, and oil, and has a large petroleum by-product plant. The water works are owned by the town. Pop., 1890, 544; 1900, 883; 1910, 2639.

CASPER, kás'pēr, JOHANN LUDWIG (1796-1864). A German physician. He was born in Berlin and studied at the university of that city and in Halle and Göttingen. In 1820 he became lecturer in the University of Berlin and in 1839 full professor. From 1841 he was in charge of the medico-legal institute connected with the university. He exerted great influence, and his advice was constantly sought by the government. His *Beiträge zur medizinischen Statistik und Staatsarzneikunde* (1825-35) marks the first serious attempt at the establishment of a science of medical statistics. This work was followed by the *Denkwürdigkeiten zur medizinischen Statistik und Staatsarzneikunde* (1846), by which Casper established himself as a high authority on this subject. A later work is entitled *Praktisches Handbuch der gerichtlichen Medizin* (1856; 8th ed., 1889). His other works include: *Klinische Novellen zur gerichtlichen Medizin* (1863); *Kritische Repertorium für die gesammte Heilkunde* (1823); *Vierteljahrschrift für gerichtliche und öffentliche Medizin* (1852).

CASPIAN SEA (trans. of Lat. *Mare Caspium*, Gk. *Κασπία θάλασσα*, *Kaspia thalassa*, *Κάσπιον πέλαγος*, *Kaspion pelagos*). A tideless inland sea, which is becoming saltier through evaporation and which is situated on the boundary between Europe and Asia, and bordered on the north by the Russian provinces of Astrakhan and Uralsk, on the east by Uralsk and Russian Turkestan, on the south by Persia, and on the west by Persia, Transcaucasia, northern Caucasia, and Astrakhan. The Caspian Sea is the largest inland body of water in the world. It extends about 700 miles in a north to south direction and has a width varying from more than 100 to nearly 300 miles, and an area estimated at 168,765 square miles. The coast line is diversified by numerous capes and by several bays or gulfs, of which the most prominent are Czarevitsa Bay and Kara Bogaz Gulf, on the east coast. The depression occupied by the Caspian Sea is a part of a great basin which in recent geological times included the Aral Sea and the Black Sea and probably connected by an arm with the Arctic Ocean. The northern part of the Caspian depression is shallow, the depth of water being generally less than 75 feet, but in the southwest part, where the shore line conforms to the slopes of the Great Balkan, the Elburz, and the Caucasus Mountains, the depth reaches 2000 feet and in places even 3000 feet. According to recent measurements, the water level is about 85 feet below that of the Black Sea, and while rising and falling periodically with the seasons, it experiences no appreciable permanent change. The waters in the southern part are saline, but in the northern shallow portion they are sufficiently fresh to freeze over in winter. The average salinity is by no means excessive. It has been estimated at three-eighths of that of the ocean. The Caspian Sea receives the drainage of

the Volga, whose basin covers an area of 550,000 square miles, of the Ural, Emba, Kur, and of many less important rivers. According to historical records, the Amu Darya also has been a feeder of the Caspian Sea, although now it flows into the Aral Sea. The Caspian Sea is of great commercial importance to the Russian Empire, as it forms, with the Volga River, a natural waterway between the European and Asiatic provinces. Communication has been established with the Baltic Sea by way of the Volga by means of canals. The great oil fields on the Apsheron Peninsula, near Baku, thus find an outlet to north Europe, while the crude and refined petroleum is also shipped by rail or transported through a pipe line to Batum, on the Black Sea. The Caspian Sea has great salmon and sturgeon fisheries. Its shores are noted for the caviar which is exported by the natives. The presence of seals and herring is an interesting zoölogical phenomenon. The most important Russian towns on the Caspian Sea are Astrakhan, at the embouchure of the Volga, Baku, Petrovsk, and Krasnovodsk, the last mentioned being the western terminal of the Transcaspian Railway. Enzeli, Khorrema, and Aliabad are Persian ports.

CASQUE, kâsk. See **HELMET**.

CASS, GEORGE WASHINGTON (1810-88). An American engineer and railway president. He was born at Dresden, Muskingum Co., Ohio, graduated in 1832 at the United States Military Academy, and resigned from the army in 1836 with the rank of first lieutenant of infantry. Between 1849 and 1854 he was active in extending and perfecting the service of the Adams Express Company from Boston to the South and West and in 1859-62 was president of the company. He was president from 1862 to 1884 of the Pittsburgh, Fort Wayne, and Chicago Railway, from 1869 to 1874 of the Grand Rapids and Indiana Railway, and from 1871 to 1873 of the Northern Pacific Railway.

CASS, LEWIS (1782-1866). An American statesman. He was born on Oct. 9, 1782, at Exeter, N. H., and was the son of Jonathan Cass, a blacksmith by trade, who joined the Revolutionary army, rose to the rank of captain before the close of the war, reëntered the military service, removed to Ohio, and attained the rank of major. The son attended Phillips Exeter Academy, taught school for several months at Wilmington, Del., and followed his father to Marietta, Ohio, in 1799 or 1800. He studied law in the office of R. J. Meigs, later Governor of Ohio, was admitted to the bar in 1802, and in 1804 was elected prosecuting attorney of Muskingum County. Two years later he was elected a member of the Ohio Legislature and in the same year married a daughter of the Revolutionary leader, General Spencer. As a member of the Legislature, Cass was active in the advocacy of measures to thwart the intrigues of Aaron Burr (q.v.), and, in recognition of his services, President Jefferson appointed him in 1807 to a Federal marshalship, which he held for six years. In the War of 1812 Cass entered the service as colonel of Ohio volunteers, took part in Hull's disastrous attempt to invade Canada, strongly condemned that officer's surrender of Detroit, and was the chief witness against the defendant in the Hull court-martial at Albany, N. Y. (See **HULL**, **WILLIAM**.) He was appointed major general of Ohio militia in December, 1812, a colonel in the regular army

in February, 1813, and a brigadier general in the regular army in March, 1813; took an active part in the campaign of 1813 under General Harrison (q.v.), and on October 29 of that year was appointed Governor of the Territory of Michigan. Relations with the English and the Indians, as well as the internal conditions of a frontier territory, made the office particularly burdensome and enhanced the value of his services therein. During his long term of office he administered the affairs of the territory under his jurisdiction (which even after the organization of Indiana in 1818 included all the land as far west as the Mississippi and north of the northern line of Illinois) with the greatest ability and good judgment, making as many as 22 important treaties with the Indians, establishing an orderly and efficient civil government, and steadily upholding the dignity of the national government against the frequent and unwarranted encroachments of the British authorities in Canada. In 1831, upon the reorganization of Jackson's cabinet, he was appointed Secretary of War, which office he held during the Black Hawk and first Seminole wars and the nullification movement in South Carolina. In 1836 he was sent by Jackson as Minister to France, and during his residence in Paris attracted attention abroad, besides winning great popularity at home, by protesting vigorously against the quintuple treaty for the suppression of the slave trade, which involved the right of search and which, owing largely to the influence of Cass, the French government refused to ratify. He resigned in 1842, owing to his emphatic disapproval of the Ashburton Treaty just negotiated by the Secretary of State, Mr. Webster. He was informally proposed for the presidency as early as 1842, but although, by favoring the annexation of Texas, he placed himself in harmony with the controlling element of his party, he failed to secure the Democratic nomination in 1844. Michigan, in the following February, elected him to the United States Senate, where he upheld the extreme American claims to the territory of the far Northwest. He opposed the Wilmot Proviso (q.v.) as untimely, and in a letter of Dec. 24, 1847, to A. O. P. Nicholson, of Nashville, Tenn., first definitely formulated the doctrine which later became known as that of "squatter sovereignty." The Democratic Convention of 1848 nominated him for the presidency, but the Van Burenites, or "Barnburners" (q.v.), of New York, bolted the Democratic ticket, and the Whig candidate, General Taylor, was elected.

In January, 1849, Cass was elected to the Senate, to fill the vacancy caused by his own resignation upon entering the presidential campaign, and two years later he was again elected for the full term. He favored Clay's compromise measures of 1850 (q.v.), upheld the Fugitive Slave Law (q.v.), and went with those of his party who voted for the Kansas-Nebraska Bill. He was a candidate for the presidential nomination in the Democratic Convention of 1856, and his defeat was intensified by the election in Michigan of a Legislature strongly Republican, which resulted in his retirement from the Senate. President Buchanan called him to the cabinet as Secretary of State, an office which he resigned in December, 1860, upon the President's refusal to reënforce the forts at Charleston, S. C. His closing years were spent in Detroit, where he was a pronounced supporter of

the Union in the face of those who were at war against it. He died in Detroit, June 17, 1866, in his eighty-fourth year.

His latest biographer, McLaughlin, estimates his character in the following words: "He was a great American statesman, building up and Americanizing an important section of his country, struggling in places of trust for the recognition of American dignity and for the development of generous nationalism. With the great slavery contest his name is inseparably connected; he stood with Webster and Clay for union, for conciliation, for the Constitution as it seemed to be established. He was one of those men whose broad love of country and pride in her greatness, however exaggerated, however absurd it may seem in these days of cynical self-restraint, lifted her from colonialism to national dignity, and imbued the people with a sense of their power. He has frequently been called a 'dough-face,' and a 'Northern man with Southern principles,' but, though he appears to have courted the Southern vote, his attitude seems never to have been one of weak subserviency. His persistent and thorough distrust and dislike of Great Britain, his belief in the doctrine of 'manifest destiny,' and the fact that he belonged to the older school of conservative statesmen, who put the integrity of the Union before everything else, are perhaps truer explanations of his political career." Besides numerous magazine articles on Western and Indian affairs, he published *Inquiries Concerning the History, Traditions, and Languages of the Indians Living within the United States* (1823), and *France: Its King, Court, and Government* (1840). Throughout his life he was deeply interested in American history, and his various publications are still of value, "real additions to knowledge," says his biographer. He was also an outspoken advocate of temperance. His life has been written in the *American Statesmen Series*, by Andrew C. McLaughlin (Boston, 1891), who studies his career as that of a "representative pioneer in the old Northwest," one of the chief purposes of the volume being to show the development of that region and to trace the growth of its political life. Before the death of General Cass, W. L. G. Smith wrote the *Life and Times of Lewis Cass* (New York, 1856), in the preparation of which he had access to a diary which was kept by Cass on a tour in the Levant. Schoolcraft published the *Outlines of Cass's Life and Character* (Albany, 1848); and Young, the *Life and Public Service of Gen. Lewis Cass* (Detroit, 1852).

CASSABA, kās-sā'ba, or **KASSABA**. A town in Asia Minor, 163 miles east of Smyrna (Map: Turkey in Asia, B 3). It carries on a flourishing trade with the surrounding district in cotton, silkworms, and melons. Recent excavations indicate that it stands on the site of the ruins of an ancient city. In 1865 a large portion of the town was destroyed by fire, and in the same year there were many deaths from cholera. Pop., about 23,000, three-fourths of whom are Mohammedans.

CASSAGNAC, kā'sā'nyāk'. See **GRANIER DE CASSAGNAC**.

CASSAN'DER (Gk. Κάσσανδρος, *Kassandros*) (c.354-297 B.C.). King of Macedonia, son of Antipater. In 323 B.C. he was sent to Alexander in Babylon to defend Antipater against the false accusations of his enemies. When Antipater, who was in charge of Macedonia, died in 319

B.C., he appointed, not Cassander, but Polysperchon, as his successor. Cassander determined to contest the succession and allied himself with Antigonos in Asia. Polysperchon joined with Olympias, the mother of Alexander. When Cassander appeared in Greece, many states joined his standard. He finally secured possession of Olympias, Roxana, and the young son of Alexander, and, after putting to death the first and imprisoning the others, he married, in 316 B.C., Thessalonica, half-sister of Alexander. In her honor he built and named the town of Thessalonica in Macedonia. Next year he rebuilt Thebes, which had been destroyed by Alexander, and immediately after entered upon a war with Antigonos. Peace was concluded in 312 B.C., and soon after Cassander strengthened his position as supreme ruler in Macedonia by causing Roxana and her son to be put to death. Later he joined forces with Lysimachus, Ptolemy, and Seleucus, to oppose Antigonos, and Antigonos was defeated and slain at the battle of Ipsus in 301 B.C. By this victory Cassander completely secured Macedonia and Greece. In 297 he was succeeded by his son Philip.

CASSAN'DRA (Gk. Κασσάνδρα, *Kassandra*). In Homer, daughter of Priam and Hecuba, carried to Greece by Agamemnon, and there murdered by Clytemnestra. Other early epics told how at the capture of Troy she fled to the temple of Athena and clasped the image of the goddess, whence she was torn by the Locrian Ajax, who paid dearly for his sacrilege. She first appears as a prophetess in Pindar. According to the usual story, Apollo had loved her and gave her prophetic art, but, when she refused to keep her promise and yield to his suit, he took away all belief in her prophecies. Accordingly her warnings against the keeping of Helen and the admittance of the wooden horse were disregarded. The story of her return with Agamemnon and her murder by Clytemnestra is told in the *Agamemnon* of Æschylus.

CASSANO AL JONIO, kās-sā'nō āl yō'nē-ō. A city in the Province of Cosenza, south Italy, 42 miles north of Cosenza (Map: Italy, L 8). It has sulphur springs, a cathedral, an Episcopal seminary, and an ancient castle in the heart of the city on a high rock. The country produces large quantities of olive oil. Pop., 1901, 8700; 1911, 8552.

CASSANO D'ADDA, kās-sā'nō dād'dā. A town in the Province of Milano, north Italy, on the right bank of the Adda, 16 miles east of Milan (Map: Italy, D 2). It has silk factories and has been the scene of three bloody battles—the first in 1158, between the Milanese and Emperor Frederick; the second, Aug. 16, 1705, when the French under the Duke of Vendôme inflicted on Prince Eugène his only defeat; the third, April 27, 1799, when the Russians and Austrians under Suvaroff defeated the French under Moreau. Pop. (commune), 1901, 8782; 1911, 9150.

CASSARD, kā'sār', JACQUES (1672-1740). A French naval officer, born in Nantes. During the famine of 1709, while commanding two ships in the Mediterranean, he successfully convoyed through the English squadrons 26 transports laden with wheat bought in Barbary and bound for Marseilles. In 1710 he released a convoy of wheat blockaded in Sicily by an English fleet and safely brought it to Toulon; and two years later, with eight vessels, he attacked the Portuguese colonies for ransom and, after seizing St.

Eustache, sailed for Martinique with spoil of great value. In 1713 Cassard was declared by Duguay-Trouin to be the greatest mariner of his day. Afterward he became involved in a quarrel with Cardinal Fleury, by whom he was accused of irregularity in his accounts, was imprisoned, and died after a captivity of 15 years.

CASSATION (Fr., from Lat. *cassare*, to annul, from *cassus*, empty), COURT OF. The supreme judicial tribunal of France. In French law the act of annulling the decision of a court is called *cassation*, and the function of cassation, as regards the judgments of all the other courts, is assigned to a special tribunal, called the Court of Cassation. The present organization and powers of the court date from the constitution of the revolutionary year VIII (1799-1800), which enacted that there should be "for the whole of France a tribunal of cassation, which shall pronounce on demands for cassation against judgments in the last resort pronounced by the tribunals," and that this supreme tribunal shall pronounce no judgment on the foundation or merits of the cause, but that, in case of its breaking the judgment pronounced, it shall remit the cause to the tribunal appealed from to pronounce another. Substantially the institution has retained its original character, notwithstanding all the changes of government which have occurred in France. The demand for cassation can be made only by the parties to the suit, or by the procureur-général of the Court of Cassation, acting in the public interest. Criminal as well as civil judgment may be reviewed by the court, even, under certain circumstances, the judgments of justices of the peace and of courts-martial, military and naval. The delay allowed for bringing a civil case before the Court of Cassation is three months for persons domiciled in France. In criminal matters the procedure is much more prompt, three full days only being allowed to the person condemned to bring his action of cassation, and the same space being given to the procureur-général. In all criminal and police cases the Court of Cassation may pronounce judgment immediately after the expiration of this time and must do so within a month. The court is divided into three sections, one of which deals exclusively with criminal matters. It consists of a president, who has the title of *first* president, and three vice presidents, who are called presidents, 45 counselors or ordinary judges, a procureur-général, or public prosecutor, 6 substitutes, who have the title of advocates-general, and several inferior officers. The presidents and counselors are named by the executive for life, the other officers being removable at pleasure. No judgment can be pronounced unless 11 judges are present, the decision being determined by the majority. Where the numbers are equally divided, five judges are called in, and cases of peculiar difficulty may be judged by the three sections united. The whole court, when presided over by the Minister of Justice, possesses also the right of discipline and censure over all judges for grave offenses not specially provided for by the law. When thus constituted, the Court of Cassation may suspend the judges of the ordinary courts from the exercise of their functions and call them to its bar. The procureur-général of the Court of Cassation likewise possesses a surveillance over the procureurs-généraux of the ordinary or inferior courts. See APPEAL; COURT.

CASSATT', ALEXANDER JOHNSTON (1839-1906). An American railway president, born in Pittsburgh, Pa. He studied at Heidelberg and at the Rensselaer Polytechnic Institute, and from 1861 to 1882 rose in the service of the Pennsylvania Railroad from rodman to first vice president. In 1899 he became president of the Pennsylvania Railroad, and it was due to his efforts that this road gained a terminal in New York City.

CASSATT, MARY (1845-). An American figure and portrait painter. She was born at Pittsburgh, Pa., and passed her youth in Chester County. In 1875, after a brief course at the Pennsylvania Academy of Fine Arts, Philadelphia, she went to Europe. She studied the masters of the Renaissance in Italy, and in Spain the paintings of Velasquez, who exercised a strong influence on her art. In 1879 she removed to Paris, where she thereafter resided. She allied herself with the Impressionists and is considered one of the principal representatives of that movement in France. She studied principally with Degas, from whom she learned her true and vigorous line; but also with Renoir, whose influence is seen in her brilliant and luminous color. Her subjects are almost invariably women and children, particularly mother and child, in the environment of home. The children, especially, are depicted with truth, originality, and a remarkable power of observation, but without prettiness. Among her best-known paintings are: "The Bath," "Breakfast in Bed," "Mother's Caress," "Children Playing with a Cat," "In the Garden," "At the Mirror," "Maternity," "Child Playing with a Dog," "Child's Toilet," "In the Box." At the Chicago Exposition of 1893 she decorated the north tympanum of the Woman's Building with a mural painting entitled "Modern Women." Miss Cassatt is represented in the Luxembourg by "The Young Mother," a pastel; in the Metropolitan Museum, New York, by "Mother and Child," and in the museums of Boston and Worcester by similar subjects. Avoiding the Salon, she exhibited only with the Impressionists. Special exhibitions of her work have been held in Paris, and twice in the United States—in New York in 1898, in New York and Boston, 1909. Of some celebrity also are her tinted etchings, the best known of which is a series of 10 entitled "Maternity."

CASSAVA, MANDIOC, or MANIOC (Neo-Lat., Fr. *cassave*, Sp. *casabe*, *cazabe*, from Haitian *kasabi*), *Manihot utilissima*. A large, shrubby plant belonging to the order Euphorbiaceæ. Cassava is the West Indian name and is used in the United States; manioc, or mandioc, the Brazilian; and in Peru and other parts of South America, it is called juca, or yuca. It is a native of tropical America, commonly grown in equatorial South America, in Central America, and the West Indies. Cassava is now also extensively grown in Africa and has been introduced into other tropical countries. In the United States it is cultivated in Florida. The plant grows in a bushy form, usually 6 to 8 feet high, and with a spread of about the same dimensions. Cassava grows best on light, sandy, dry soils. It is propagated by cuttings from the stems and branches, which are dropped into furrows and covered. The crop matures in about seven months. The roots, usually from 1 to 3 inches thick and from 1 to 3 feet long, are harvested by hand. See Plate of CARNATIONS.

Two varieties of cassava are recognized, the poisonous and the nonpoisonous, or sweet. The poisonous principle is hydrocyanic acid, which is contained in the juice of the plant. Both varieties yield a wholesome food, the volatile poison being driven off by heat in the process of preparation. In South America a sauce (see *CASAREEP*) and an intoxicating beverage are prepared from the juice, while the root, grated, dried on hot metal plates, and powdered, forms the food commonly known there as farinha (Portuguese for meal). It is made into thin cakes by the action of heat, which softens and agglutinates the particles of starch. The starch of cassava separated in the ordinary manner from the fibre is the Brazilian arrowroot of commerce. This starch, dried quickly under the action of intense heat when in a semisolid and moist condition, agglomerates into small irregular masses and then forms the well-known article of food called tapioca. Sago, or pearl tapioca, is a fine-grained form of the product. In Florida, where sweet cassava is grown, the roots are grated and used directly as a food for man. They are also fed to stock, and serve as a raw material in the manufacture of starch and glucose.

Feeding Value. The peeled root of fresh Florida-grown cassava contains, on an average, 61.3 per cent of water, 31.0 per cent of carbohydrates, largely starch, and a little protein, fat, and crude fibre. Cassava flour, made in Florida, contains about 11 per cent of water and 65 to 70 per cent of starch, in addition to small amounts of protein, fat, crude fibre, sugar, gum, ash, etc. Cassava starch, like other starch, contains some moisture. Cassava is fed to hogs and steers and sometimes to cows. Consult *United States Department of Agriculture, Bureau of Chemistry, Bulletins 44* (1894), *106* (1907), and *Farmers' Bulletin 167* (1903).

CASSAY'. See MANIPUR.

CASSEL, kās'sel. Until 1866 the capital of the former Electorate of Hesse, now the capital of the Prussian Province of Hesse-Nassau, situated on both sides of the Fulda, here navigable, in lat. 51° 19' N. and long. 9° 29' E., about 35 miles southwest of Göttingen (Map: Prussia, C 3).

The town consists of the Altstadt, the Oberneustadt, and the new Hohenzollern quarter, all on the left bank of the river, and of the Unterneustadt on the right bank. The streets of the old town are crooked and narrow, but those of the newer portion are regular and broad and among the handsomest in Germany. The principal street is the Königsstrasse, the upper and lower sections of which are separated by the circular Königsplatz, remarkable for its echo. On the Friedrichsplatz, the largest square in Germany, are the old Electoral Palace, erected in 1769 and enlarged in 1821, and the Museum Friedericianum, built in 1769 by Landgrave Frederick II. In the same building is the provincial library of 235,000 volumes and 1600 manuscripts, including the Hildebrandslied dating from the eighth century. The brothers Grimm were librarians here from 1814 to 1830. The Murhard Public Library contains (1913) 155,000 volumes. One of the handsomest buildings in the town is the Picture Gallery, of red sandstone, finished in 1877. It contains a fine collection of paintings accumulated by Landgrave William VIII. The Flemish and Dutch schools are particularly well represented, there being some fine paintings by Van Dyck, Rem-

brandt, and Hals. Among the other notable buildings are St. Martin's Church, the post office, and the Court Theatre, of which Louis Spohr was for some years conductor. Cassel is the seat of the provincial and district government and of the supreme provincial court. The town's affairs are administered by a municipal council of 48 and an executive board of 21 members. There is a paid as well as a volunteer fire department. The cost of keeping the streets clean is borne by the property owners. There is a modern sewerage system and a copious water supply, and the town owns and operates gas works, an electric light plant, and a slaughterhouse.

There are numerous educational institutions, including two gymnasia, three municipal high schools, and a score of technical schools. There are many hospitals and other charitable institutions. The industries include the manufacture of locomotives, machinery, ironware, surgical and other scientific instruments, etc. Cassel has excellent railway facilities, and two electric street-railway lines serve to accommodate the city traffic. It is the seat of a United States consulate. Pop., 1900, 106,000; 1910, 153,078. To the west of Cassel and connected with it by steam tramway lies the palace of Wilhelmshöhe, erected in the latter part of the eighteenth century, in which Napoleon III was detained as a prisoner from the fall of Sedan to the close of the Franco-Prussian War. The history of the town dates from the year 913, when, under the name of Chassala, it was the residence of King Conrad I. It received its first municipal rights in the thirteenth century from the landgraves of Thuringia. In the Seven Years' War it was several times captured by the French. Landgrave Frederick II sent 12,000 Hessians to aid the British in the American Revolution and was paid \$22,000,000. In 1807 Cassel was made the capital of the newly formed Kingdom of Westphalia. In 1866 it was occupied by Prussian troops and became a part of Prussia.

CASSEL, DAVID (1818-93). A German scholar. He was born in Glogau, of Jewish parentage, and was educated in Breslau and Berlin. From 1846 until the time of his death he was associated with several of the leading Jewish institutions of learning in Berlin. He was a prolific and popular author and published the following valuable contributions to Jewish literature: *Geschichte der jüdischen Litteratur* (2 vols., 1872-73); *Hebräisch-deutsches Wörterbuch* (1891); *Leitfaden für den Unterricht in der jüdischen Geschichte und Litteratur* (9th ed., 1895). His editions of the *Kusari* by Jehuda Hallevi and of the *Meor Enajim* by Rossi are also highly esteemed.

CASELL, JOHN (1817-65). An English publisher, born in Manchester, the son of an innkeeper. As a temperance lecturer he wandered to London, where he established himself as a dealer in tea, coffee, and patent medicines. In 1850 he began to act as publisher of his books, written to diffuse knowledge among the working classes. After carrying through many schemes he founded the publishing house of Cassell, Peter, and Galpin (1859).

CASSENA. See YAPON.

CASSIA, kās'hā (Lat., from Gk. *κασσία*, *κασία*, *kassia*, *kasia*, cassia, from Heb. *qetsi'ōth*, cassia, from *quatsa'*, to eut). A name given by the ancients to a kind of fragrant medicinal bark. Cassia is also the botanical name of a genus of

plants of the family Leguminosæ, containing many species, more than 400 having been described as trees, shrubs, and herbaceous plants, natives of Africa and of the warm parts of Asia and America. They have abruptly pinnate leaves, and flowers with deciduous calyx of five somewhat unequal sepals and corolla of five petals. The leaves and pods of many species have a peculiar sweetish but nauseous smell, and a nauseous, bitter taste. They contain a purgative principle, and the leaves of some of the Asiatic and African species are highly valued and are much used as a medicine under the name of senna, the species *Cassia acutifolia* and *Cassia angustifolia* supplying the Alexandria and Tinnevely senna of commerce. The pods of these species are also used and are milder than the leaves. The leaves of *Cassia marylandica* possess similar properties and are now used to some extent in the United States. *Cassia fistula* also yields the cassia pods, pipe cassia, or purging cassia, of the shops. It is a large tree, a native of Egypt and other parts of Africa, perhaps also of the East Indies, where it is widely diffused and cultivated, as well as in the West Indies and in the warm parts of America. Its pods, which have obtained for it the name of pudding-pipe tree, are sometimes 2 feet in length, cylindrical, black, consisting of thin, brittle woody valves, within which is a cavity divided by numerous thin transverse partitions, each cell containing a single seed embedded in a soft black pulp. It is this pulp that is the part used in medicine; it has a sweetish mucilaginous taste and in small doses acts as a mild laxative. It is sometimes removed from the pods when fresh, or an extract is obtained after they are dried, by boiling and evaporating. It is said to contain 61 to 69 per cent of sugar. The cassia pods of the West Indies contain much more pulp and are therefore more valuable than those imported from the East. Cassia bark, or cassia wood, sometimes called China cinnamon, is a bark very similar to cinnamon (q.v.). Cassia buds are believed to be the dried flower buds of the same tree which yields cassia bark. They are now imported into the United States in large quantities and are much used in confectionery. In flavor and other qualities they resemble cassia bark; in appearance they are very similar to cloves. See Plate of CARNATIONS.

CASSIAN GENS. A famous Roman clan, at first patrician, later plebeian. But one patrician member of the gens is mentioned, Spurius Cassius Viscellinus. Under the Republic the family names are Hemina, Longinus, Parmensis, Ravilla, Sabaco, Varus, and Viscellinus.

CASSIANUS, JOHANNES, also called Johannes Massiliensis, or Johannes Eremita (c.360–c.435). A monk who brought Eastern monasticism into the Western church. He was born probably in Provence. He received a good education, went on a pilgrimage to the Holy Land, and became a monk at Bethlehem; then removed to Egypt and lived there as an anchorite from 385 to 400. In the latter year he went to Constantinople and there was made a deacon by Chrysostom. After the exile of the latter he went to Rome to lay the case before the Bishop, Innocent I (405), and lived in Rome for some years. He next is found in Marseilles (415), where he established a monastery and a convent, and there died. His monastery was afterward known as that of St. Victor, of which the present church of St. Victor is

the relic. It served as a model to a multitude of monastic institutions in Gaul and Spain. He also employed his pen in the promotion of monasticism, and his great work, which dates from 420 and which has been strongly influential, is *The Institutes of the Cœnobia, and the Remedies for the Eight Principal Faults*, in 12 books, four on the monastic rule and eight on the sins against which the monks had to contend—gluttony, incontinence, covetousness, anger, dejection, distress of heart, vainglory, pride. His second chief work is his 24 *Conferences* with various eminent monks upon monastic interests and the vexed questions of theology. It is the supplement to the *Institutes*.

Cassianus took part in two doctrinal controversies. He wrote *The Incarnation of the Lord*, against Nestorius, and in it pointed out the connection between Nestorianism and Pelagianism. Deeming that St. Augustine had gone too far in his theory of irresistible grace, he utilized one of his *Conferences* to set forth his view that the grace of God always coöperates with our will for its advantage. This view certainly was an approach to that of Pelagius and later was called Semi-Pelagianism. (See PELAGIANISM.) As it gained support from the Massilian monks, St. Augustine, having been informed of it by his friend, Prosper of Aquitaine, wrote strongly against it in his treatises *The Predestination of the Saints* and *The Gift of Perseverance*. The distinction has been thus wittily expressed: St. Augustine regards the natural man as dead, Pelagius as sound and well, and Cassianus as sick.

Cassianus' works, which are all in Latin, appeared for the first time in satisfactory form edited by M. Petschenig (2 vols., Vienna, 1886–88), and in Eng. trans. by E. C. S. Gibson, in vol. xi of the *Nicene and Post-Nicene Fathers* (2d series, London and New York, 1884). For the life and teaching of Cassianus, see the prolegomena of the editions named, and also Lombard (Strassburg, 1863).

CASSIAN WAY. A Roman military road from Rome to Arretium, Florence, and Lucca, built after 187 B.C.

CAS'SIMERE (Fr. *casimir*, ultimately derived from Skt. *Kāsmīra*, Kashmir). A thin twilled cloth, plain or figured, of wool, or wool and cotton, much used in the manufacture of clothing. It was formerly known as *kersey* (q.v.) or *kerseymere*, a corruption of *cassimere*.

CAS'SIN, JOHN (1813–69). An American ornithologist, born near Chester, Pa. He was familiar with the birds of the Old World, as well as those of America. He wrote *Mammalogy and Ornithology of the Wilkes Exploring Expedition* (1858). He was ornithologist of Perry's expedition to Japan, and with Professor Baird and George N. Lawrence published a "Monograph of Birds of North America North of Texas," in *United States War Department Pacific Railroad Reports*, vol. ix (Washington, 1858); *The Birds of North America* (1860); *Illustrations of the Birds of California, Texas, Oregon, British and Russian America, 1853–55* (1862).

CASSINI, kās-sē'nē, ARTHUR PAVLOVITCH (1835–). A Russian diplomat. He entered the Department of Foreign Affairs in 1855. After holding various European posts he became, in 1891, Minister at Peking, where he represented Russian interests with aggressiveness and success during the critical period covering the war

between China and Japan. In 1897 he was made Minister at Washington, becoming later the first Russian Ambassador to the United States. In face of the general anti-Russian sentiment in this country aroused by the Jewish massacres at Kishinev in 1903 and the events of the war with Japan, he conducted himself with great adroitness. In 1905 he was transferred to Madrid and was Russia's representative at the Algeiras Conference in 1906.

CASSINI, kâ'sê'nê', CÉSAR FRANÇOIS, DE THURY (1714-84). A French astronomer, son of Jacques Cassini. He succeeded his father as director of the Paris Observatory. In 1744 he began the great topographical map of France, which was later completed by his son. Among his published works on geodesy may be mentioned *Description géométrique de la terre* (1775) and *Description géométrique de la France* (1784).

CASSINI, kâ-sê'nê', GIOVANNI DOMENICO (1625-1712). An Italian-French astronomer, born at Perinaldo, near Nice. He was professor of astronomy at Bologna, and first of the family which for four generations filled the post of director of the observatory in Paris. He determined the motions of Jupiter's satellites from observations of their eclipses and constructed tables of the latter; discovered (1671-84) four of Saturn's satellites and determined their periods of revolution, and determined (1664-67) the rotations of Jupiter, Venus, and Mars. To him is attributed the first systematic observation of the zodiacal light. Cassini made a close approximation (10") to the parallax of the sun, computed a table of refractions, gave a complete theory of the moon's libration, and gave as the obliquity of the ecliptic $23^{\circ} 28' 42''$, instead of $23\frac{1}{2}^{\circ}$, and the eccentricity of the earth's orbit as 0.017, instead of Kepler's value, 0.018. In pure mathematics he discovered the curve known as the Cassinian oval (q.v.).

CASSINI, kâ'sê'nê', JACQUES (1677-1756). A French astronomer, son of Giovanni Domenico Cassini. He was born in Paris and succeeded his father as director of the observatory in 1712. He wrote several treatises on physical subjects, and in his *De la grandeur et de la figure de la terre* (1720) attempted to show that the earth must be a spheroid elongated at the poles. He traveled extensively in Europe, making the acquaintance of the leading scientific men of the time. He was admitted to the membership of the French Académie des Sciences at the age of 17, and two years later was elected fellow of the Royal Society of London.

CASSINI, JACQUES DOMINIQUE, COUNT DE (1748-1845). A French astronomer, son of César François Cassini, whom he succeeded as director of the Paris Observatory in 1784. He was the fourth Cassini in succession to fill this post, the connection of the family with the observatory thus lasting over the long period of 122 years. In 1789 he completed the great topographical map of France begun by his father. He incurred the ill will of the National Assembly and resigned his post in 1793. In the following year he was imprisoned, but regained his liberty after seven months, retiring to his country seat at Thury, where he spent the remainder of his life.

CASSINIAN OVAL. A bicircular quartic curve, the locus of a moving point the product of whose distances from two fixed points is constant. Its Cartesian equation is

$(x^2 + y^2 + a^2)^2 - 4a^2x^2 = m^4$, where $2a = AB$. The polar equation is $r^4 - 2a^2r^2\cos 2\theta + a^4 = m^4$.

The curve is symmetric with respect to both coördinate axes. If $m < a$, the real curve consists of two ovals; if $m = a$, it becomes the lem-

CASSINIAN OVAL.

niscate; if $m > a$, it consists of a single oval. Cassinians are curves of the eighth class, except the lemniscate, which is of the sixth. In the case of two ovals, the curve is its own inverse

with respect to a circle of radius $\sqrt[4]{a^4 - m^4}$. The curves are fully discussed in Briot et Bouquet, *Géométrie analytique* (4th ed., Paris, 1890; Amer. ed., Chicago, 1896). For biography, consult Brocard, *Notes de bibliographie des courbes géométriques* (Bar-le-Duc, 1897). See CASSINI, G. D.; LEMNISCATE.

CASSINO, kâs-sê'nô. A city in the Province of Caserta, south Italy, called San Germano until 1871, on the Rapido, 85 miles southeast of Rome (Map: Italy, H 6). San Germano was a frequent residence of popes and emperors, and in 1230 Gregory IX and Frederick II concluded peace here. On March 16, 1815, Murat was defeated here by the Austrians. Half a mile to the south are the ruins of an amphitheatre erected by Ummidia Quadratilla, a Roman lady mentioned by Pliny in his letters (vii, 24). Farther on is the site of the villa of M. Terentius Varro, where Cicero (Phil. ii, 40) says Antony led a riotous life. On a hill above the city is the famous monastery of Monte Cassino (q.v.). Pop., 1881, 12,000; 1901, 13,473; 1911, 14,220.

CASSINO. A game at cards played by two, three, or four persons. Four cards are dealt, two at a time, to each player, and four are turned face up on the table in the same manner. After the hands are played, the greatest number of cards counts the holder three, the greatest number of spades one, big casino (the ten of diamonds) two, little casino (the deuce of spades) one, and each ace one, so that 11 can be possibly counted by one person; the whole game is 21. In cutting and in play the ace is low and counts one; the other cards rank upward in their usual value, the king being high. The play is to take from the table as many cards as possible, preferring spades, or aces, or big or little casino. The tricks are taken by pairing, i.e., by matching one card in the hand with another on the table; thus, a ten will take a ten, or a nine and an ace, or four aces and a six, or any other combination of spots that makes just 10. In "combining" the player may use any card in his hand—except a king, queen, or jack—to take two or more cards whose sum equals his card in value. Another part of the game is "building" cards on the board with one in hand: e.g., a player puts a four on a

six to make up 10, meaning to take both when his turn to play again comes; but any one having a ten may take them before him; or if he builds a six, the next player may make it a nine, and the next still may put on an ace and call it 10, but in building, the one who makes any particular number must hold the card that will take it. Some persons make a progressive build, i.e., if one has a nine and cannot at the time make a nine, he puts a four on a two and calls it six, having of course a three to make a nine when it is next his turn to play. But this kind of building is generally ruled out as irregular. A "sweep" (which counts one) is made when a player takes all of the cards with one card. In a modern variation of the game, the knave counts 11, the queen 12, the king 13, the ace 1 or 14, as the players may choose, and the "joker" 15. This plan greatly enlarges the number of combinations; as, e.g., an ace may possibly take three other aces, four deuces, and a tray, making 14 spots; or the ace may take the big and little casino and two aces, which would make six points in the game. Consult *Foster's Complete Hoyle* (New York, 1909).

CASSIO, kăsh'î-ô, MICHAEL. The successor of Iago to the position of lieutenant of Othello, in Shakespeare's tragedy of the latter name. He is a weak-minded but reputable soldier, whose love of wine enables his enraged predecessor to direct against him the jealousy of Othello. He is finally stabbed by Iago.

CAS'SIODO'RUS, FLAVIUS MAGNUS AURELIUS (c.490-c.580). A Latin statesman and writer, the most profound and enlightened scholar of his age. He was born at Scylaceum (Squillace), in Bruttii (now Calabria), of a noble family long settled in that region. First raised to position under Odoacer, he held many important offices under Theodoric the Ostrogoth. From the quæstorship he passed to the consulship in 514; during the following years, though engaged in public services, he devoted his leisure to literary work and study. At the command of Theodoric he prepared a *History of the Goths*, which has survived only in the epitome made by Jordanis. After the death of Theodoric, Cassiodorus published a collection of valuable historical state papers, under the title *Variarum Epistolarum Libri XII*, the most important of his many writings, which gives the best information we possess regarding the Ostrogothic rule in Italy. Consult Hodgkin, *Letters of Cassiodorus* (London, 1886). About 540 Cassiodorus retired from public life and founded upon his estates at Vivarium, near Squillace, a monastery, in which he spent the remainder of his long life in study and pious endeavor. He required of his monks not only meditation, but also scholarship, and this included, as part of their monastic duty, the copying of manuscripts. To the happy example thus instituted we owe the preservation of most of the classic literature. His works are published by Migne in the *Patrologia Latina* (1865), vol. lxxix. Consult Sandys, *A History of Classical Scholarship*, vol. i, especially pp. 258-270 (Cambridge, 1906).

CAS'SIOPE'IA (Gk. Κασσιόπεια, *Kassiopeia*, Κασσιόπεια, *Kassiepeia*). 1. An Ethiopian queen, mother of Andromeda. 2. A constellation in the Northern Hemisphere, near Cepheus, and not far from the North Pole. It is distinguished by a group of six stars of the second, third, and fourth magnitudes, arranged so as to form a somewhat straggling letter W. It was in this

constellation that the famous "new star" of Tycho Brahe blazed out in November, 1572. This star is one of the most remarkable in astronomical annals. The brilliancy of its light, surpassing that of the large planets, and the suddenness with which it was extinguished, bear eloquent testimony to the extreme power of cosmic forces. Tycho's star retained its maximum brightness about 10 days only. Sixteen months elapsed before it finally disappeared from view. Tycho's records, made before the invention of the telescope, do not fix his star's place on the sky with great precision, but it has been identified with a reddish star of the eleventh magnitude which is situated very near the place indicated by him.

CASSIQUIARE, kăs'sê-kyä'rá, or **CASSIQUIARI**, -rê. A river of Amazonas Territory, Venezuela, which leaves the Orinoco in lat. 3° 10' N., long. 66° 20' W., taking from it one-third of its water, and, after a rapid southwest course of about 250 miles, joins the river Guainia, a branch of the Río Negro, in lat. 2° 5' N., long. 67° 40' W. About 300 yards in breadth when it issues from the Orinoco, it gradually increases until at its union with the Río Negro it attains a width of 600 yards. By the means of this singular river, water communication is established between the systems of the Amazon and the Orinoco.

CASSIRER, kăs'sê-râr', ERNST (1874-). A German philosopher, born at Breslau. He was educated at the universities of Berlin, Leipzig, Munich, Heidelberg, and Marburg, and became lecturer in philosophy in the University of Berlin. His works include: *Descartes Kritik der mathematischen und naturwissenschaftlichen Erkenntnis* (1899); *Leibnitz System in seinen wissenschaftlichen Grundlagen* (1902); *Das Erkenntnisproblem in der Philosophie und Wissenschaft der neueren Zeit* (2 vols., 1906-07; 2d ed., 1911); *Substanzbegriff und Funktionsbegriff* (1910).

CASSITERIDES, kăs'sî-têr'î-dêz. See SCILLY ISLANDS.

CASSIT'ERITE (Lat. *cassiterum*, Gk. *κασσιτερος*, *kassiteros*, tin, of unknown origin, borrowed in O. Church Slav. *kositerŭ*, Skt. *kastira*, Ar. *qazdir*, tin). A tin dioxide that crystallizes in the tetragonal system. It occurs both massive and in the form of crystals, usually of a black or brown color, although sometimes red or yellow. Cassiterite is found in Cornwall, England (formerly in large quantities); in Bohemia and Saxony, on the Malay Peninsula, in Banca, Australia, and in Mexico. In the United States it is reported from Maine, Virginia, South Dakota, and California. It is an important ore of tin, as, when pure, it contains nearly 79 per cent of that metal. The ordinary massive cassiterite is called *tin stone*; when found in botryoidal or reniform shapes it is known as *wood tin*, and when in the state of pebbles or sand along the beds of streams it is called *stream tin*.

CASSIUS, kăsh'ŭs, AVIDIUS. A Roman general under Marcus Aurelius, from Cyrrhus, in Syria. He won much renown by victories over the Parthians (162-165 A.D.). Subsequently he quelled a dangerous insurrection in Egypt and was appointed governor of all the Eastern Provinces. He organized a revolt and attempted to seize the Imperial throne, but was assassinated by two of his own officers (175).

CASSIUS, DIO. See DIO CASSIUS.

CASSIUS, PURPLE OF. A dark-purple, red, or reddish-brown pigment. It was discovered by Andreas Cassius in the seventeenth century and may be obtained as a fine flocculent purple precipitate on adding a solution of stannous chloride containing stannic chloride to a solution of gold chloride. It may also be obtained by treating an alloy of gold (2 parts), tin (3.5 parts), and silver (15 parts) with nitric acid, which removes the silver and oxidizes the tin. The composition of purple of Cassius is variable, but it is believed that gold is present in it in the metallic state. Mixed with borax or some fusible glass, it is used by potters to produce a rich purple or rose tint in the finer qualities of pottery, and it has long been employed to give a ruby-red color to the better qualities of glass.

CASSIUS LONGINUS, GAIUS. 1. One of Cæsar's assassins. Though a tribune of the plebs, he sided with Pompeius and the aristocratic faction against Cæsar. He was taken prisoner by the latter, who pardoned him, and even made him one of his *legati*. In 44 B.C., through the influence of Cæsar, he was made *prætor peregrinus* and was promised the governorship of Syria for 43. Becoming incensed at Cæsar, because Cæsar appointed a younger man, M. Junius Brutus, *prætor urbanus*, he soon matured the conspiracy, and Cæsar fell by the daggers of assassins. Since popular feeling—as displayed by the riots that broke out at Cæsar's funeral—was strongly against the murderers, and the military power fell into the hands of Marcus Antonius, Cassius fled to the East and made himself master of Syria. Afterward he joined forces with Brutus. (See BRUTUS, MARCUS JUNIUS.) Cassius's wife, a half sister of Brutus, survived him upward of 60 years (to 22 A.D.).

2. A Roman jurist (c.3–75 A.D.), consul in 30, proconsul of Asia, 40–41, and governor of Syria in 45–50. He was banished to Sardinia in 65, because he revered the memory of the Cassius who had helped to slay Cæsar, but was recalled by Vespasian. He wrote *Libri Iuris Civilis*, in 10 books, which was one of the sources of the Digest of Justinian (q.v.).

CASSIUS LONGINUS, QUINTUS, brother or cousin of the Cassius who helped to kill Cæsar. He was quæstor in Spain in 54 B.C. In the critical year 49, as tribune of the people, he warmly supported Cæsar and was rewarded with the governorship of Hispania Ulterior. His tyrannical rule caused a rebellion, which he put down without mercy. When his own troops revolted, he was besieged in Ullia, a town of Hispania Bætica. Through the influence of Marcus Lepidus, the triumvir, he was allowed to go free. He sought to sail from Malaca, but perished in a storm near the mouth of the Ebro (48 or 47 B.C.).

CASSIUS PARMEN'SIS, or GAIUS CASSIUS SEVERUS. One of the conspirators against Julius Cæsar. He was an adherent of Gaius Cassius Longinus and fought with him at Philippi. Afterward he joined Sextus Pompeius and finally supported Antonius until the defeat at Actium. He went to Athens, but was arrested and executed, about 30 B.C., by order of Augustus. He wrote satires, elegies, epigrams, and tragedies.

CASSIUS VIS'CELLI'NUS, SPURIUS. A Roman, thrice consul—in 502, 493, and 486 B.C. Despite the strong opposition of the patricians,

led by his fellow consul, Virginius Tricostus, he effected, in 486, the passage of the first agrarian law, which was, however, never enforced. See AGRARIAN LAW.

CAS'SIVELLAU'NUS (c.50 B.C.). A native chieftain chosen by the Britons to be their commander when Cæsar made his second invasion, in 54 B.C. Cassivellaunus was routed in the first engagement, but continued to harass the Romans and to cut off all foragers or stragglers. Moved by reverses, he finally gave hostages to Cæsar, who commanded him also to pay a tribute and not to make war on the tribes who had aided the Romans. Consult Cæsar, *Gallie War*, bk. v.

CAS'SOCK. See COSTUME, ECCLESIASTICAL.

CASSOP'OLIS. A village and the county seat of Cass Co., Mich., 90 miles west by south of Jackson, on the Michigan Central and the Chicago and Grand Trunk railroads. It is known as a summer resort, being in a picturesque lake region, and contains a public library, museum, and fine courthouse. The industrial establishments include flour and saw mills and a telephone-supply factory, etc. Pop., 1890, 1369; 1900, 1330; 1910, 1358.

CAS'SOWARY (Fr. *casoar*, Sp. *casoario*, *casobar*, Dutch *casuaar*, from Malay *kassuwaris*). A family (Casuariidæ) with the single genus *Casuaris* of ratite, or palæognathous, birds allied to the ostrich, but distinctively characterized by still greater shortness of wing, by a bony crest, by pendent wattles on the naked neck, and by three toes on each foot, the inner toe short and armed with a very long and sharp claw. There are also very important anatomical differences (see Huxley, *Proceedings Zoölogical Society of London*, 1867), especially in its digestive organs, which are not adapted to the same coarse diet. Cassowaries are still more closely allied to the emus, and with them form a group (Megistanes) peculiar to the Australian region and the Papuan subregion, including New Guinea, Salwatty, New Britain, the Aru Islands, northern Queensland, and Ceram. About 20 forms of cassowary are known, of which the most familiar is that from Ceram (*Casuaris casuaris*, or *galeatus*), known since 1596 and frequently seen in zoölogical gardens. It is the largest known bird except the ostrich, and its height, when erect, is about 5 feet. The color is brownish black. The feathers are loosely webbed and hang down, so that at a little distance the bird seems clothed with hair. Those of the rump are 14 inches long, hanging down in place of a tail. The aftershaft is as long as the feather proper. The plumage of the chick is striped, of the immature brown, while the feathers are black in the adult. The head and upper part of the neck are naked and of a bluish color, and there are two pendent wattles, partly red and partly blue, on the front of the neck. On the breast is a callous bare part, on which the bird rests its body on the ground. The bony crest or helmet reaches from the base of the bill to the middle of the crown and is about 3 inches high, exhibiting the most intense blue, purple, and scarlet, blended together. When attacked, it defends itself by kicking forward and downward and also obliquely backward with its stout naked legs and feet. There are only about five quills in each wing, somewhat resembling the quills of a porcupine, and at the end of the last joint of the wing there is a spur.

The cassowary lays six to eight eggs, which

CASSOWARIES, ETC.

1. COMMON CASSOWARY (*Casuarius casuarius*).
2. BECCARI'S CASSOWARY (*Casuarius beccarii*).
3. MILNE-EDWARD'S CASSOWARY (*Casuarius edwardsii*).

4. EMEU (*Dromæus novæ-hollandiæ*).
5. GREAT TINAMOU (*Rhynchotes rufescens*).
6. OWEN'S KIWI (*Apteryx oweni*).

are rough, greenish, and are incubated by the cock. The cassowary is becoming more rare in its native regions, in which it is sometimes kept tame. Not much is known of the habits of any of these birds, which dwell in deep forests and feed on fruit and vegetables. They are diurnal, sleeping throughout the night. The voice differs in the various species, being a curious, moderately loud grunting, bellowing, and snorting. Their temper is treacherous in captivity, although occasionally a bird will permit familiarity. They are frequently tamed by the natives and but seldom breed in confinement. Their skin and feathers are widely used as clothing and ornament; their bones point spears; and their flesh, though tough and dark, is eaten. The fullest earlier account of the genus is that by Salvadori, in his great Italian work on the ornithology of the Papuan region; see Rothschild, "A Monograph of the Genus *Casuarus*" (*Trans. Zoöl. Soc. London*, xv, 1901). One species, having an excessively large helmet (*Casuarus australis*), occurs in northern Australia. Another (*Casuarus bennetti*), peculiar to New Britain, is known as "moorup" (not "mooruk," as usually spelled). See Plate of CASSOWARIES, ETC.

CASSOWARY TREE. See CASUARINA.

CAS'SUMU'NAR. See GINGER.

CAST (Icel., Swed. *kasta*, Dan. *kaste*, to throw). A work of art produced by a mold. The work is first modeled by hand, then covered with plaster so applied that it may be removed in sections when dry, thus forming a kind of shell to the sculptured form beneath. These sections are put together and form the mold, which is filled with liquid plaster, the interior of the shell being so lubricated as to prevent the plaster from adhering to the casing. When this interior plaster is hardened, the case is again removed, and the reproduction of the original appears. The first mold is made over the modeled clay figure or group of figures fresh from the sculptor's hand. As the clay is perishable, it is necessary to imitate the original, and from the plaster, which is more durable, a number of replicas may be made. Even though the mold should be broken, another can now be taken from one of the plaster figures. Many of the masterpieces of antiquity are thus repeated, and they supply museums and schools of art as models for study. When a figure or group is cast in bronze, it is more properly called founding. (See BRONZE, *Casting*.) Casting has been in use from early times, and was employed by the ancients for multiplying their statues.

CASTAGNO, kās-tā'nyō, ANDREA DEL (c.1410-57). A Florentine painter of the Renaissance. He was born at Castagno, in the Mugello district, near Florence, the son of a peasant. His ability attracted the attention of Bernadetto de' Medici, who placed him with a competent teacher in Florence, probably with Paolo Ucello, by whom he was certainly influenced. He was deeply affected by the sculptures of Donatello. His few surviving works reveal him as the most gifted and influential of the realists who followed Masaccio. His drawing is bold and firm, his color bright and crude, and the impression gained from his works is one of rugged strength and power. On the return of Cosimo de' Medici from exile in 1434, Castagno was commissioned to paint on the walls of the Palazzo del Podestà his banished adversaries, hanging by their feet, whence his nickname Andreino degli Impiccati ('the hanged men'). His principal works are

the frescoes of Sant' Apollonia: the "Last Supper" (a masterpiece), "Crucifixion," "Entombment," and "Resurrection." Here also are the nine more than life-size figures, formerly in the Villa Carducci at Legnara, including Dante, Petrarca, Boccaccio, the powerful Farinata degli Uberti, and the swaggering Pippo Spano. Other important works, likewise frescoes, are the equestrian portrait of Nicolo da Tolentino (1456) in the cathedral, a pendent of Ucello, a masterpiece; and a "Crucifixion" in Santa Maria Novella, painted with characteristic and brutal realism. The story, told by Vasari, that he murdered Domenico Veneziano to steal his secret of oil painting has long been proved a myth by the fact that his associate survived him several years. Castagno died in Florence, Aug. 19, 1457. Consult the monograph of Waldschmidt (Berlin, 1900).

CASTAGNOLE. See POMFRET.

CASTAIGNE, ká'stān', ANDRÉ (1861-). A French painter and illustrator. He was born at Angoulême and studied in Paris, principally at the Beaux-Arts with Gérôme and Cabanel. Among his notable pictures are "After the Combat" (1899; Peabody Gallery, Baltimore), "Alexander at the Temple of Memphis" (1900). He works with facility in oils, water colors, charcoal, and pen and ink, but his reputation rests principally upon his exceedingly clever illustrations, many of them dealing with Western subjects, such as Texas cowboy life. From 1890 to 1894 he was instructor of the Charcoal Club, an art school of Baltimore. Mention should be made of his illustrations of Western subjects, published in the *Century*, and of his illustrations of B. I. Wheeler's *Life of Alexander the Great* (1900). He published *Fata Morgana*, a novel dealing with the art life of Paris and illustrated by himself (1904). His work is characterized by spirited movement and dramatic feeling.

CASTALIA (Lat., Gk. *Κασταλία*, *Kastalia*). A fountain sacred to Apollo and the Muses, on Mount Parnassus, in the cleft between the great cliffs of the Phædriadæ, near Delphi. It was the "holy water" of the Delphian temple; all who consulted the oracle had to bathe, or at least to wash their hair, in its water. The Roman poets declared that its waters filled the mind of those who drank of it with poetic inspiration. Its waters are still pure and delightful.

CASTALIDES, kās-tāl'i-déz. A name given to the Muses, because Castalia (q.v.) was sacred to them.

CASTALIO, kās-tā'lyō, **CASTELLIO**, kās-těl'yō, or **CASTELLION**, SEBASTIAN (1515-63). A French Protestant theologian, born at Saint-Martin du Fresne, a Savoy village, near Geneva. He received a thorough humanistic training and about 1541 went to Strassburg, where he was befriended by Calvin, who, on his return to Geneva in 1541, appointed him rector of the high school and preacher; but, differing from Calvin on what were considered important points, he was compelled to resign in 1544 and went to Basel, where he lived in great poverty, as he had a large family to support, until in 1552 he was appointed professor of Greek literature. Among his writings may be mentioned *De Hæreticis*, a treatise which argues against the right of the magistrate to punish heretical opinions and which produced a reply from Beza; a Latin version of the Bible, published in 1551, and dedicated to Edward VI of England; and a French translation of the Bible, dedicated to Henry II

of France. See CALVIN. Consult Castalio's *Life*, by Buisson (Paris, 1892).

CASTA'NEA. See CHESTNUT.

CAS'TANETS (Fr. *castagnette*, from Lat. *castanea*, chestnut, so called from the shape). A musical instrument of percussion, usually in the form of two hollow nutshells, which are tied together by a band fastened on the thumb and struck by the fingers to produce a rattling sound in keeping with the rhythm of the music. The castanets were introduced into Spain by the Moors, where they retain the name of *castañuelas*, from their resemblance to the form of the chestnut. The castanets are now much used in the ballet and in the opera.

CASTAÑOS, kâ-stä'nyós, DON FRANCISCO XAVIER DE, DUKE OF BAILÉN (c.1756-1852). A celebrated Spanish general. He was born in Madrid and at the age of 10, as a reward for his father's services, was appointed captain of a company by Charles III. By virtue of a plan made by the same monarch for officers who were minors, he took his studies in El Seminario de Nobles de Madrid. At the age of 16 he was assigned to the Savoy Regiment as captain of Grenadiers, and did good service in the reconquest of Minorca. He served with distinction in the campaign of 1794 against the French. When the French invaded Spain, Castaños received the command of a division of the Spanish army, and on July 22, 1808, compelled 20,000 French under General Dupont to surrender at Bailén. It is asserted, however, by some, that the merit of this success belongs more to Aloys Reding, a Swiss by birth and the second in command. The honors of the fight itself belong in large part to Reding, but the plan for the campaign and for the battle had been made by Castaños. In November of the same year Castaños was in turn defeated by the French at Tudela. Upon the arrival of Wellington he was again placed at the head of the Spanish army, which he led, under Wellington, in the important battles of Albuera, Salamanca, and Vitoria, in the last of which particularly he distinguished himself. In 1815 he was placed at the head of 80,000 troops destined to invade France, some of which had already crossed the frontier when the news came of the battle of Waterloo. Although he was not a favorite with the court politicians, his talents could not be overlooked. In 1825 he was called to the State Council, where he became a decided opponent of the Carlist party. Castaños was made Duke of Bailén in 1833 and in 1843 became the guardian of Queen Isabella. He subsequently returned to his estates, and died at the age of 96.

CASTE, kâst. In a general sense, an hereditary division or arrangement of society on the basis of occupation or other arbitrary condition; specifically, a class or grade so established, particularly among the Hindus. The word is not native to India, where the distinctions are best developed and where the term was first applied specifically as well as in its more general sense, but is probably Portuguese (the earliest Occidental colonists in the Deccan and some other portions of India were from Portugal), in which language it denotes family, strain, breed, or race, the Portuguese (and Spanish) form being *casta*, the feminine of *casto* (Latin, *castus*, pure). Among earlier English writers the form was *cast*, used in the sense of aspect or mode (as in "cast of countenance"), or perhaps in the archaic sense of breed, derived from a stock breeder's term still colloquial in England; indeed,

there is some question whether the English term is not prior to the Portuguese. The Sanskrit term is *varṇa*, signifying 'color,' and denoted originally, no doubt, the distinction between the lighter-complexioned Aryan invaders who entered India from the northwest and the dark-skinned or colored aborigines whom they subjugated or drove onward before them. This fact throws considerable light on the origin of the social distinctions so highly developed in India and certain other countries. In any case the Occidental term is synonymous with "chaste" (early French and modern English), and hence connotes purity, continence, freedom from taint, exclusiveness, and in general the attributes of race sense or ethnocentric sentiment.

The four great castes of India—the Brahmans, or Priests, the Warriors, the Husbandmen, and the Serfs—are as old in fact, if not in name, as the ancient sacred collection of hymns known as the Rig-Veda (cf. R.-V. 10, 90, 12; 8, 35, 16-18). The system, however, in its developed form is not sharply defined until the so-called period of Brahmanism. (See INDIA, *Religion*.) The division of an early community into priests, warriors, and agriculturists, or third estate, is a natural one, and is found likewise in ancient Persia. The fourth caste in India came into being when the invading Aryans subjugated the natives and made them captives or slaves. They allowed them to become a part of the body politic, but they denied them all religious rights and privileges which the three Aryan castes enjoyed. Disregarding minor subdivisions, the four Hindu castes, commonly recognized, are as follows:

1. **The Brahman or Sacerdotal Class.** At the head of the elaborated Hindu caste system stands the Brahman, or Brahmin, the priest, in Sanskrit *Brāhmaṇa*, a term synonymous with sanctity and exaltation. The legendary account of Manu (q.v.) says that this class issued from the mouth of the god Brahma at the moment of creation. The business of the Brahmans, through their knowledge of the sacred Vedas, is to perform sacrifices for themselves and others and to give spiritual guidance to the rest of mankind, which has to rely on them for the favor of the gods. The Brahmans are the chief of all created beings, and other mortals enjoy life through them. They are to be treated with the most profound respect, even by kings. The person of a Brahman is sacred; and it is his privilege to enjoy almost all immunities and exemptions. Special rules, on the other hand, are laid down in the priestly codes, by which he shall preserve his sanctity.

2. **The Warrior Class.** This is the Kshatriya, Ksettri, Chuttree, or military class, corresponding especially to the Rajputs of Rajputana in recent times. The name is derived from Sanskrit *kshatra*, signifying 'rule, power,' and the Kshatriyas are said to have sprung from the arms of Brahma. Their duty is to fight and to protect the other classes. The relation between them and the priestly caste is a mutual one. The sacerdotal order cannot prosper without the military, nor the military without the sacerdotal; and the prosperity of both, in this world as well as in the next, is made to depend upon their cordial union. The priests allowed the Kshatriyas the cherished privilege of having the Veda imparted to them. In return the latter granted protection and support to the Brahmans. From necessity a warrior occasionally might assume the calling or duties

of a man of the lower caste, but in only the most exceptional instances is there a record of a soldier or king rising to the dignity of the priestly class.

3. **The Vaisya or Husbandman Class.** The third caste in the Hindu system is known as the Vaisya (later *Bais*, *Bice*) order, which forms the great industrial class of India. The members of this class make up the body of the people (Skt. *vaiśya*, from *viś*, folk), and they were first pastoral, then agricultural, and finally commercial—the third estate of the Aryans. They are described as being sprung from the belly and the thighs of Brahma at the time of creation. As an Aryan, the member of the Vaisya class shared with his warrior brother the privilege of having a knowledge of the Veda and of witnessing the sacrificial rites accorded to the ruling order. Upon his gains, won by industrial pursuits, the warrior largely depended for support. Cattle keeping, agriculture, trade, and business were his duties—in fact, the various branches of practical business life. Though superior to the Sudra or servile class, he was often closer in reality to this order than he was to the two higher castes.

4. **The Sudra or Servile Class.** The fourth or lowest caste of Hindu society is the class of Sudras, Sooder (Skt. *śūdra*)—a name of uncertain origin, but synonymous with “degradation.” Sprung from the feet of Brahma, according to the dictum of Manu, their duty was to serve the three superior classes, especially the Brahmans. Their condition from the earliest time was one of subjection. They were not even allowed to hear the Veda, as that would be a defilement of the sacred text; they never could be invested with the sacred cord which brought regeneration to the other three classes when they were admitted into religion and thus became “twice-born.” As originally non-Aryans or barbarians, they were allowed to come into contact with the upper classes only as menials, whose touch was equivalent to pollution and whose slightest offense was punishable with death. They form to-day the basis of the lower classes of Hindu society, those that perform the most degrading services, but many have been able to rise by degrees to a position of respect, coincidentally with a greater growth of laxity in observing caste restrictions.

The subdivisions and mutual relations of these four castes in early days, as in modern times, was quite complex. (See Hopkins, *The Mutual Relations of the Four Castes according to the Mānavadharmasāstram*, 1881; and Jogendra Nath Bhattacharya, *Hindu Castes and Sects*, 1896.) Mixed classes arose through forbidden marriages between the classes, and the utterly vile Pariahs or outcasts arose from their expulsion from the classes into which they were born. The additional castes and subcastes are likewise to be accounted for in various ways.

Regarding the castes as originally ethnic or tribal, and recalling the devices of primitive peoples for maintaining tribal purity, it is of interest to note the provisions of the Manavadharmasāstram (or Code of Manu) respecting marriage: (1) “The vow [of studying] the three Vedas under a teacher must be kept for 36 years, or for half that time, or for a quarter, or until the [student] has perfectly learnt them. (2) [A student] who has studied in due order the three Vedas, or two, or even one only, without breaking the [rules of] studentship, shall

enter the order of householders. . . . (4) Having bathed, with the permission of his teacher, and performed according to the rule the Samavartana [the rite on returning home], a twice-born man shall marry a woman of equal caste who is endowed with auspicious [bodily] marks.

(5) A [damsel] who is neither a Sapinda on the mother's side, nor belongs to the same family on the father's side, is recommended to twice-born men for wedlock and conjugal union.

(6) In connecting himself with a wife, let him carefully avoid the 10 following families, be they ever so great, or rich in kine, horses, sheep, grain, or [other] property (viz.):

(7) One which neglects the sacred rites, one in which no male children [are born], one in which the Veda is not studied, one [the members of] which have thick hair on the body, those which are subject to hæmorrhoids, phthisis, weakness of digestion, epilepsy, or white or black leprosy.

(8) Let him not marry a maiden [with] reddish [hair], nor one who is sickly, nor one either with no hair [on the body] or too much, nor one who is garrulous or has red [eyes].

(9) Nor one named after a constellation, a tree, or a river, nor one named after a bird, a snake, or a slave, nor one whose name inspires terror.

(10) Let him wed a female free from bodily defects, who has an agreeable name, the [graceful] gait of a Hamsa or of an elephant, a moderate [quantity of] hair on the body and on the head, small teeth, and soft limbs. . . .

(12) For the first marriage of twice-born men [wives] of equal caste are recommended; but for those who through desire proceed [to marry again] the following females [chosen] according to the

[direct] order [of the castes] are most approved. (13) It is declared that a Sudra woman alone [can be] the wife of a Sudra, she and one of his own caste [the wives] of a

Vaisya, those two and one of his own caste [the wives] of a Kshatriya, those three and one of his own caste [the wives] of a Brahmana.”

(“The Laws of Manu,” translated by Bühler, in *The Sacred Books of the East*, ed. by F. Max Müller, vol. xxv, pp. 74–77, 1886.)

There follow various other prohibitive and permissive provisions, with descriptions of the “eight marriage-rites used by the four castes (*varṇa*) which partly secure benefits and partly produce evil both in this life and after death.” These and other provisions and descriptions illumine the entire subjects of castes and prove that, whatever the origin of the distinctions, they are now primarily ecclesiastical, in somewhat less degree connected with occupation, and only subordinately ethnic (racial or tribal). True, Halhed (*A Code of Gentoo Laws*, 1776), writing early and with good opportunities for observation, assumed the division to represent tribes, and Risley (*The Tribes and Castes of Bengal*, 1892) more recently correlates caste with physical type, and the ethnic hypothesis seems to find support in the native term connoting caste and color; but it is manifest in the first place that the Code of Manu is not directed primarily towards the preservation of distinct race types so much as towards collective preservation of physique and elimination of the supposedly barbaric custom of totemism, etc., and in the second place that no aboriginal distinctions of type could survive the constant blending sanctioned by immemorial laws governing intermarriage. Moreover, the four or five castes commonly recognized represent but a

small part of the classes actually established by Brahmanical law in different parts of India; each province has its own more or less distinct groups defined by craft and fixed by custom, the aggregate reaching many hundreds in number—no less than 2000 according to some students. (See Crooke, *Tribes and Castes of the Northwestern Provinces and Oude*, 1896.) Still further, it is evident that the development of castes is long past its prime; for not only were the caste lines weakened by every foreign invasion from the time of Alexander to that of Warren Hastings, but they were burst from within by ecclesiastical schisms, and most notably by the rise of Buddhism, itself a reaction from, and protest against, the intolerable bondage of the caste system, as shown by Rhys-Davids and, still more recently, by Porter ("Caste in India," *American Anthropologist*, vol. viii, p. 23, 1895). While there is a presumption that the custom of caste was rooted in tribal or racial distinctions, it is inconceivable that such distinctions were ever so numerous and diverse as the arbitrary classes into which Indian society was divided before Buddhism arose.

With reference to caste at the present day in India, it may be added that English rule and Occidental influences have done much to break down the stringency of the caste system of the Hindus. The obligation of the son to follow the calling of his father is no longer so binding as it once was, unless it be in the case of a Brahman, and yet a Brahman may serve to-day as a soldier, and some even have become cooks. Men of lower castes have risen to higher ranks and to positions of power, and loss of caste is not so serious as it may once have been. In most cases it may be recovered and without much ado. With the spread of Christianity, the advance of education, and the extension of the railway system throughout India, the barrier of caste tends to give way, and the difficulties that arise from the old Brahmanical legislation are no longer so exaggerated but that certain points may not be brought out in its favor, whatever may rightly be urged against caste as an institution.

While the system of caste attained its highest development in India in pre-Buddhist times, it was by no means confined to that country and period. The Avesta (q.v.) shows for ancient Iran a like division of the community into priest, warrior, and husbandman, *Atharvan*, *Rathæsh-tar*, *Vastrya Fshuyant*. (See Geiger, *Civilization of the Eastern Iranians*, Eng. trans., 1885.) Indeed, the caste sentiment prevails in greater or less intensity among all peoples. In all monarchical countries there are class distinctions more or less closely analogous to the Hindu castes; in mediæval Europe class sentiment gained a hold the strength of which may be measured by the persistence of the guilds into which it grew on the one hand and the secret orders (Rosicrucians, Freemasons, etc.) on the other; yet here the sentiment was not inculcated by law and literature and seldom crystallized by belief. The most instructive analogues of the Indian castes are found in still lower culture than that of the half-literary Hindus. The Blackfellow of Australia have an elaborate system of social regimentation, maintained by intricate marriage regulations and other ceremonies, all expressing a sort of instinctive law so complete that Caucasians find difficulty in following its ramifications. Various African tribes have so-

cial customs of nearly as great complexity interwoven with crude beliefs. The native tribes of the Western Hemisphere are much given to "medicine societies" and other intratribal organizations of primarily ecclesiastical character which correspond roughly with certain of the Hindu caste distinctions. On the coast of Alaska and British Columbia, as well as in neighboring territory in the interior, distinctions of caste are strongly emphasized among the aboriginal tribes, who distinguish four classes,—chiefs, noblemen, the common people, and slaves. The social classes of China are suggestively similar to those of the neighboring country. It is notable that in the successive culture stages, from that represented by the Australian Blackfellow upward, the laws crystallized by the ceremonial observances grow simpler, more intelligible, and, excepting among the Hindus, where the primitive character is retained in social ordination by caste, more lax, or rather more subservient to current judgment. Accordingly caste may be defined as a primitive device for maintaining social organization by means of ecclesiastical ordinances.

Bibliography. The literature of caste is voluminous. In addition to the works above mentioned, attention may be directed to Senart, *Les castes dans l'Inde* (Paris, 1896); Muir, *Original Sanscrit Texts on the Origin and Progress of the Religion and Institutions of India* (London, 1867-75); and the several standard works referred to in these publications, notably the translations of the Laws of Manu, by Bühler in *The Sacred Books of the East*, vol. xxv (Oxford, 1886), and by Burnell and Hopkins, *The Ordinances of Manu* (London, 1884). It is interesting to compare with the foregoing the point of view of an educated native: Shridhar V. Ketkar, *History of Caste in India* (2 vols., London, 1909, 1911).

CASTE. A sentimental comedy by F. W. Robertson, produced at the Prince of Wales's Theatre on April 6, 1867, and published in London, 1889, in his son's edition of his principal dramatic works. It was originally presented by Marie Wilton (Mrs. Bancroft) and her company. F. C. Robertson, the author's brother, played the part of Captain Hawtree in a later production of the piece, and it was in the repertory of Mr. Hare on his American tour in 1897-98. It is regarded as the author's most successful work.

CASTEGGIO, kās-tēd'jō. See MONTEBELLO.

CASTEL, kās-tēl' (Fr., It. *castello*, Sp. *castillo*, Prov. *castelh*, from Lat. *castellum*, dim. of *castrum*, camp). A name prefixed to various places in Italy, France, Spain, and Portugal.

CASTEL. See CHÂTEAU.

CASTELAR Y RIPOLL, kās'tā-lār' ê rê-pōl', EMILIO (1832-99). A Spanish republican leader, born in Cadiz, Sept. 8, 1832. He was the son of a business man, and at the death of his father was left in poverty, but managed to study at the University of Madrid, first in the faculty of law and later in the faculty of philosophy and letters, where he was received as doctor in 1853. He then worked as a journalist and novelist until in 1854 a daring entrance into the field of political debate secured for him recognition as one of the most brilliant of Spanish orators. In 1856 he became professor of history in the University of Madrid, but lost the place in 1865, in consequence of an attack on the Queen in *La Democracia*, a radical journal. The paper was suppressed in 1866, and Castelar was sentenced to

death for participation in the disturbance of June in that year, but he escaped to Switzerland and subsequently went to France. At the beginning of the revolution of 1868 he returned to Spain and resumed his professorship, and in 1869 was one of the few republicans returned to the Cortes, going as deputy for Saragossa. In that body he advocated the establishment of a republic and vigorously opposed the schemes of a regency. Under the republic proclaimed by the Cortes after the abdication of Amadeus I (q.v.) Castelar was made Minister of Foreign Affairs (Feb. 11, 1873); but he resigned in June. On August 26 he was elected President of the Cortes, and on September 7 the Cortes chose him President of the Executive, investing him with extraordinary powers. His first act was to prorogue the Cortes and assume complete authority. He made energetic but ineffectual efforts to suppress the Carlists and sent the Minister of War to Cuba, in person, to protect Spanish interests in that island. When the Cortes reassembled, Jan. 2, 1874, a vote of confidence in Castelar was defeated, and he at once resigned. Thereupon Pavia, as captain general of Madrid, forcibly dissolved the Cortes and appointed a provisional government with Marshal Serrano at its head. Soon after the pronunciamiento in favor of Alfonso XII, in December, 1874, Castelar went to Switzerland, whence in March, 1875, he sent back his resignation of the chair of history in the University of Madrid. Early in 1876 he returned to Spain and was elected to the Cortes, of which he was a member until 1893. During the reign of Alfonso XII, Castelar vigorously defended the reforms of the revolution of 1868, but after the birth of King Alfonso XIII (1886), perceiving that revolutionary methods were ill-suited to Spanish progress, he sought the realization of the revolutionary programme through legal and pacific means. His active opposition to the state had changed to a philosophical republicanism, revolution in politics with him had given place to evolution, and in 1893 he admitted that the monarchy was the only form of government then possible in Spain. In that year, seeing that universal suffrage was firmly reestablished, he gave up politics for literary work. He was always, in fact, more of an orator than a man of action. He died in Murcia, May 25, 1899. Castelar was a prolific writer, like his political rival, Cánovas del Castillo. His published works include *La cuestión del oriente* (1876); *Historia del descubrimiento de America* (1892); *La politique européenne* (Paris, 1897-99); *A History of Civilization in the First Five Centuries of Christianity* (1859); *Historical Essays on the Middle Ages*; *Fra Filippo Lippi* (1877-79); *Life of Lord Byron* (1876); and several volumes of essays, speeches, novels, and travels. Consult: Hannay, *Don Emilio Castelar* (New York, 1896), discriminating and interesting; Madame Rattazzi, *Une époque*; *Emilio Castelar, sa vie, son œuvre, son rôle historique* (Paris, 1899), eulogistic but valuable chiefly for the extracts from Castelar's own letters; Araco, *Castelar, su vida y su muerte* (Madrid, 1900).

CASTELBUONO, kās'těl-bwō'nō. A town in the Province of Palermo, Sicily, Italy, 31 miles north of Caltanissetta (Map: Italy, J 10). It has noted mineral springs, and manna is cultivated and exported. Pop., 1901, 10,761; 1911, 10,531.

CASTEL FRANCO DELL' EMILIA, frän'kō dël ā-mē'lē-ā. A city in the Province of

Bologna, Italy, 8 miles northeast of Modena. It occupies the site of the ancient Forum Gallorum, where in 43 B.C. Marc Antony defeated the consul Pansa only to be defeated himself immediately afterward by Pansa's colleague, Hirtius. Important modern industries are match and paper making. Pop. (commune), 1901, 13,500; 1911, 15,300.

CASTEL FRANCO VENETO, vā-nā'tō. A city in the Province of Treviso, north Italy, 34 miles northwest of Venice, pleasantly situated on the Musone. It has an ancient castle, and in the principal church are frescoes by Paolo Veronese (q.v.) and an altarpiece by Giorgione (q.v.). Here the French, under Saint-Cyr, defeated the Austrians under Prince Rohan, Nov. 23, 1805. It is an important silk market. Pop. (commune), 1901, 12,551; 1911, 14,825.

CASTEL GANDOLFO, gān-dōl'fō. A town in the Province of Rome, Italy, on the west shore of Lake Albano, about 13 miles southeast of Rome (Map: Italy, M 2). It contains a papal palace and has been a favorite summer resort of the popes, and by a guaranty of the Italian government, given May 13, 1871, enjoys extra-territorial rights. Pop. (commune), 1901, 2316; 1911, 2245.

CAS'TELL, EDMUND (1606-85). An English Orientalist. He spent 18 years in compiling a lexicon of Hebrew, Chaldee, Syriac, Samaritan, Ethiopic, Arabic, and Persian, working from 16 to 18 hours a day and having 14 assistants. This lexicon was published in 1669 as a supplement to the London Polyglot. The outlay was £12,000, which reduced him to poverty, but his losses were in part compensated by a number of preferments, among them that of prebendary of Canterbury and professor of Arabic at Cambridge. Castell assisted Dr. Walton in the preparation of the London Polyglot Bible (1653-57).

CASTELLAMARE DEL GOLFO, kās-těl'lā-mā'rā dël gōl'fō. A seaport in the Province of Trapani, Sicily, near the mouth of the San Bartolommeo River and on the Gulf of Castellamare, 45 miles west of Palermo (Map: Italy, G 9). It was the port of the ancient Segesta, still carries on considerable commerce in grain, wine, and oil, and has tunny fisheries. Pop., 1901, 19,957; 1911, 17,367.

CASTELLAMARE DI STABIA, kās-těl'lā-mā'rā dē stā'byā (It., sea castle of Stabia). A leading city and seaport in the Province of Naples, south Italy, 17 miles southeast of Naples (Map: Italy, J 7). It has a cool, healthful climate, and the sea and mineral baths attract many visitors. On the hill to the south are the ruins of the castle to which the town owes its origin and its name—built in the thirteenth century by Emperor Frederick II and made stronger with towers and walls by Charles I of Anjou. The Villa Quisisana is on the site of a house erected by Charles II of Anjou and is surrounded by a beautiful park. Neighboring heights afford splendid views of the Bay of Naples and the surrounding country. Castellamare has an excellent fortified harbor and contains a technical school, a theatre, and a large royal arsenal for the building of warships. The principal imports are grain, coal, and iron; the principal exports wine and fruit. The fisheries are important, and there are macaroni, soap, leather, and cotton factories. Pop. (commune), 1901, 32,841; 1911, 33,579. Castellamare occupies the site of the ancient Stabiæ, which

was desolated by Sulla during the Social War and which, with Pompeii, was destroyed in 79 A.D. by lava from Vesuvius. The elder Pliny perished here while watching the eruption. Here, in 1799, the French General Macdonald defeated the allied English and Neapolitan forces.

CAS'TELLAN, or **CHÂTELAIN**, shà't'-län' (Fr. *châtelain*, OF. *castellain*, *chastelain*, from ML. *castellanus* from *castellum*, castle, dim. of *castrum*, camp). In the Middle Ages, the keeper of a castle or burg. The same name was used for the feudal lord of high rank and for the simple custodian of a castle; hence some confusion has arisen. When applied to those of high rank in France and Flanders, the title "castellan" belonged to the holders of certain demesnes and was next in order of rank to that of a baron. In the later Middle Ages it applied to a lord having a castle and a fief with feudal jurisdiction. In Germany the castellan had the jurisdiction of a burgrave. In the Kingdom of Poland the castellans were part of the Senate or superior legislative chamber. The castellan of Cracow was considered higher in rank than a palatine. Consult Luchaire, *Manuel des institutions francaises* (Paris, 1892).

CASTELLANETA, kàs-tèl'là-nà'tà. An episcopal city in the Province of Bari delle Puglie, south Italy, 24 miles northwest of Taranto. It has a cathedral and several convents and is a local market for fruit, olives, wool, and cotton. Pop., 1901, 10,196; 1911, 11,533.

CASTELLANOS, kàs'tà-lyä'nòs, JUAN DE. A Spanish soldier, priest, and poet, born in Seville about the middle of the sixteenth century. His principal claims to consideration are chronicles which he first wrote in prose and then turned into a poem, *Elegías de ilustres varones de Indias*, which gives a valuable historical account of the adventures of Columbus, Bobadilla, and Aguirre. It was published in 1588 and 1619. Afterward a second part and a third were added (1847-50). There was a fourth part, which has been lost, but not before the manuscript had been seen and used by Fray Pedro Simón and others. There has been some confusion concerning his birthplace. Consult Vergara y Vergara and Pinelo, *Bibliotheca occidentalis*. The works of Castellanos are to be found in vol. iv of the *Bibliotheca de autores españoles*. His name appears in the Royal Academy's *Catálogo de las autoridades de la lengua*.

CASTELLI, kàs-tèl'lè, IGNAZ FRANZ (1781-1862). An Austrian poet. He was born in Vienna, whence he was sent out of the way of the French to Hungary, because of the excitement aroused in 1809 by one of his patriotic songs, *Kriegslied für die österreichische Armee*. The success achieved with his opera, *Die Schweizerfamilie*, which was set to music by Weigl, obtained for him an appointment as court poet at the Kärntnerthor Theater. He was a typical representative of the jovial humor of the Viennese, as exemplified in his *Gedichte in nieder-österreichischer Mundart* (1828) and in his farces. He wrote more than 200 plays, principally translations and adaptations from the French. Perhaps his most popular drama was *Die Waise und der Mörder*. His collection of more than 12,000 plays, many portraits of celebrities, and a file of the playbills of the Viennese theatres from 1600 to 1862 is now in the Imperial Library in Vienna. His last publication was his *Memoiren meines Lebens* (4 vols., 1861-62).

CASTELLIO, or **CASTELLION**, SEBASTIAN. See CASTALIO.

CASTELLO. See PALEOLITHIC PERIOD.

CASTELLO, kàs-tèl'lò, GIOVANNI BATTISTA (c.1500-70). An Italian painter and architect, born near Bergamo and called Il Bergamasco. He was of the Genoese school, and his work has been confused with that of Cambiaso (q.v.), his friend and pupil. Philip II in 1567 called him to Spain to aid in the restoration of the Alcázar in Madrid and the building of the Escorial, the fine stairway of honor in which was designed by him. He painted a "Martyrdom of St. Sebastian" and a "Christ as Judge."

CASTELLO BRANCO, brän'kò (ancient *Castraleucus*). The capital of a district and an episcopal see in the Province of Beira, Portugal, 44 miles northeast of Abrantes (Map: Portugal, B 3). It is built on a hill crowned by a castle in ruins, is surrounded by walls, and has a cathedral and college. It has manufactures of cloth, and marble is quarried. Pop., 1900, 7292.

CASTELLÓN DE LA PLANA, kà'stá-lyön' dâ lá plä'nà (Sp., Castle of the Plain). A town of Spain, capital of the province of the same name, situated in a fertile plain, about 2½ miles from the Mediterranean, and 40 miles north-northeast of Valencia (Map: Spain, F 2). A magnificent aqueduct supplies the means of irrigation. Castellón de la Plana is, for the most part, regularly and well built and has a pretentious town hall and an octagonal bell tower, 260 feet high. The church of La Sangre contains fine examples of the works of Francisco Ribalta, the celebrated Spanish painter, who was a native of Castellón de la Plana. The town has manufactures of linen, woolen, sail cloth, paper, earthenware, and firearms, also brandy distilleries, and considerable trade. Pop., 1900, 29,966; 1910, 32,309. Castellón de la Plana, in earlier times, occupied an elevation a short distance to the north of the present site, where ruins are still extant, but in 1233 was moved to the plain by Jaime I. In 1837 the Carlists, commanded by Don Carlos in person, made an unsuccessful attack on the town.

CASTELNAU, kà'stel-nò', FRANCIS, COUNT DE (1812-80). A French traveler and naturalist. He traveled in North America (1837-41); was chief of a French government scientific expedition to equatorial South America (1843-47), and was French Consul in South America and elsewhere—after 1862 in Melbourne. He published *Expédition dans les parties centrales de l'Amérique du Sud* (1850-61).

CASTELNAU, MICHAEL DE, SIEUR DE LA MAUVISSIÈRE (1520-92). A French soldier and diplomat. He was thoroughly educated, traveled widely, and saw active service with the French army in Italy, where his courage and ability secured for him the friendship and patronage of the Cardinal of Lorraine. In 1557 he received a command in the navy, but soon rejoined the French army in Picardy. He was the bearer of messages from the Dauphin (afterward Francis II) to his betrothed, Mary Stuart, and after the death of Francis accompanied the Queen to Scotland. In 1562 he returned to France in consequence of the civil war and served against the Huguenots in Brittany. Within the next 10 years he was employed on important missions to Elizabeth of England and to the Duke of Alva. After the battle of Saint-Denis (1567) he was sent to Germany to solicit aid against the Huguenots and on his return was

made Governor of Saint-Dizier. From 1574 to 1584 he was Ambassador of the English court and in this office attempted to effect a marriage between Elizabeth and the Duc d'Alençon. On returning to France he fell out of favor with the League, lost his governorship of Saint-Dizier, and was reduced almost to destitution; but on the accession of Henry IV he was again intrusted with several important missions. The *Mémoires* of Castelnau, published in 1621, are accurate and impartial.

CASTELNAUDARY, ká'stél'nô'dá'rè'. A town in the Department of Aude, France, 22 miles north-northwest of Carcassonne, situated on a declivity, skirted at the base by the Canal du Midi, which here expands into a basin and serves as a harbor (Map: France, S., F 5). Among other old mediæval architecture it contains the church of St. Michel (fourteenth century) and the hôtel de ville. It has manufactures of woolen and silk fabrics and earthenware, and carries on an active trade in grain, wool, flour, tiles, shipbuilding, chemicals, cattle and farm implements. Pop. (commune), 1901, 9397; 1911, 9542. It suffered severely in the crusade against the Albigenses and was in 1212 the scene of a battle between Simon de Montfort and Raymond, Count of Toulouse.

CASTELNUOVO, kás'tél-nwô'vò, ENRICO (1839-). An Italian novelist. He was born in Florence and was educated in Venice. In 1870 he edited the journal *La Stampa*, and in 1872 he became professor of the school of commerce in Venice. In the same year he published his *Racconti e bozzetti*, which was followed by his first romance, *Il quaderno della zia*, and a long series of successful novels. He was a regular contributor to Venetian scholarly journals.

CASTELSARRASIN, ká'stél'sá'rá'sân' (from *Castel-sur-Azin*, the Latin *Castrum Cerrucium* or *Castellum Sarracenum*). The capital of an arrondissement in the Department of Tarn-et-Garonne, France, on the Garonne, 12 miles west of Montauban. It has ruins of a castle supposed to have been erected by the Saracens, and the church of St. Sauveur is an interesting twelfth to fifteenth century structure. Manufactures of serge, linen, hosiery, hats, lumber, flour, metals, and an agricultural trade are carried on. Pop. (commune), 1901, 7858; 1911, 6996.

CASTELTERMINI, ká'stél-tèr'mè-nè (ancient *Camicianæ Aquæ*). A town in the Province of Girgenti, Sicily, Italy, 23 miles southwest of Caltanissetta (Map: Italy, H 10). It is noted for its extensive mines of rock salt and sulphur. Pop. (commune), 1901, 13,022; 1911, 15,092.

CASTELVETRANO, ká'stél-vâ-trä'nò (Sicil. *Casteddu Vetrano*). A town in the Province of Trapani, Sicily, 20 miles southeast of Marsala (Map: Italy, G 10). It has an interesting old castle, some fine churches and convents, and a grammar school, in which is located the municipal museum of antiquities, many of whose objects were found at Selinus, in the vicinity. Grapevines, olives, and rice are extensively cultivated, and good wine is manufactured. There are also manufactures of coral and alabaster articles. Pop., 1901, 24,510; 1911, 24,674.

CASTELVETRO, ká'stél-vâ'trò, LODOVICO (1505-71). An Italian critic and philologist. Born at Modena, he passed a life of study and research, marked by bitter personal quarrels and by unusual freedom from traditional opinions,

which in 1561 led to charges of heresy against him. He fled to Chiavenna in the Protestant Alps, where he remained till his death. His energetic criticisms of Bembo (*Giunte alle prose di P. Bembo*), his commentaries on Dante and Petrarch, his virulent attack on the style of Annibal Caro, his translation and exegesis of Aristotle's *Poetics* and his *Correzioni* to Varchi's *Ercolano* stimulated much of that revival of the study of æsthetics, criticism, and philology which was so influential in Italy and later in France in the sixteenth century. Without the aid of modern philological tools, he attained a view of the relation between Latin and the neo-Latin tongues that is substantially correct and in every respect superior to current opinion in his time. In etymology he showed similar competence. He was traditional in criticism in the sense that he regarded language as based on logic and not on intuition, and hence he did not gain that freedom from the trammels of rhetorical rule attained by Pietro Aretino and Giordano Bruno. An Aristotelian in this respect, he nevertheless was aware to a certain extent of the limitations of the Aristotelian rhetoric, and in his commentary to the *Poetics* he stated some of the problems "better and with greater acumen than the modern editors of Aristotle, not excluding Saint-Hilaire." For bibliography, consult Trabalza, *Storia della grammatica italiana* (Milano, 1908), and Charlton, *Castelvetro's Theory of Poetry* (Manchester, 1913).

CASTI, ká'stè, GIOVANNI BATTISTA (1724-1803). An Italian poet, and an adventurer of the Da Ponte and Casanova type. Casti lived a life of wandering, with important residences at Vienna especially and Paris, living on his wit and social address. A vivacious portrait of him is drawn in Da Ponte's *Memoirs*. His principal work is the *Animali parlanti*, an extensive social satire still much read and frequently reprinted. He wrote librettos for the Viennese opera with Paisiello as composer. Noteworthy also are the *Novelle galanti*.

CASTIGLIONE, ká'stè-lyò'nà. A city in the Province of Catania, Sicily, on the north slope of Mount Etna, 2035 feet above the sea, on the right bank of the Alcántara, 25 miles north of Catania (Map: Italy, Sicily, K 10). It has a castle and is a local market for wine, olives, and the best hazelnuts in Sicily. Pop. (commune), 1881, 9473; 1901, 12,998; 1910, 14,308.

CASTIGLIONE, BALDASSARE, COUNT (1478-1529). An Italian author and statesman. He was born at Casanatico, near Mantua, and studied in Milan. After the fall of the Sforzas in 1499, he served at the Gonzaga court in Mantua, fighting at Garigliano (1503). In 1504 he joined the court of Urbino, the leading centre of elegance at the time in Italy, where he divided with Pietro Bembo the honors of primacy in courtesy and erudite brilliancy. He rendered various diplomatic services to his patrons, filling missions in England and notably in Rome, where he was a friend of Raphael and where he spent long intervals of residence. Clement VII sent him in 1524 to Spain. His failure to prevent the sack of Rome led to charges against him. He was cleared of these aspersions, but he never recovered his peace of mind, and though highly honored in Spain, he died there, it was said, of a broken heart.

His *Cortegiano*, one of the landmarks of Italian culture, exposes the theory of Italian courtly

life in the Renaissance. Itself conceived in the form of a typical social assembly, it outlines the requisite attainments and gifts of a perfect gentleman, discussing the art of conversation, of dress, of etiquette, questions of intellectual culture, the ethics of courtesy, and the ideals of life, all on the background of the aristocratic court life of the time. The latter part of the work is devoted to woman and love, in an exposition of Platonic idealism. Taken with Banello's tales and Ariosto's *Orlando Furioso*, the *Cortegiano* offers a picture of the times that is almost complete. Best edition by Cian (Florence, 1894); consult Julia Cartwright, *Baldassare Castiglione: His Life and Times* (New York, 1908); trans. by Opdycke (New York, 1903).

CASTIGLIONE, CARLO OTTAVIO, COUNT (1784-1849). An Italian philologist, born in Milan. With Angelo Mai, one of the founders of classical philology in Italy along modern lines. His most important contributions were in Oriental numismatics and literature, in the philological sources of Mediterranean history, and in the biblical translations of Ulfilas. Biography by Biondelli (Milan, 1856).

CASTIGLIONE, GIOVANNI BENEDETTO, called "in Grechetto" (1616-70). An Italian painter and etcher. He was born in Genoa and was a pupil of Paggi and Andrea de' Ferrari, but not, as was supposed, of Van Dyck. He is the best Italian animal painter with the exception of Bassano, and even his religious pictures usually represent scenes into which animals can be introduced; as, for example, "Noah Entering or Leaving the Ark" (Uffizi, Palazzo Bianco, Genoa, Dresden, Vienna), "Jacob with his Herds" (Madrid, Dresden, Genoa, Palazzo Bianco), "The Annunciation to the Shepherds" (Czernin Gallery, Vienna), etc. With a strong leaning to the fantastic, he painted also classic and mythological pieces, such as "Circe and Medea" (Uffizi), "Bacchanalian Scenes" (Turin), "Diogenes" (Madrid). His pictures are overflowing with life and spirit and crowded with living and inanimate objects; the contrasts of light and shadow are strong, the color rich and glowing. His numerous drawings are freer from mannerisms than those of any of his Italian contemporaries. His etchings (67 according to Bartsch, 72 according to Leblanc) are among the best produced in Italy during the seventeenth century. Although Rembrandt's influence is visible, they are essentially original in composition and management of light effects. In his so-called monotypes he printed freshly colored drawings directly on the paper. In 1564 he was appointed court painter to Duke Charles I of Mantua, and in that city he lived until his death.

CASTIGLIONE DELLE STIVIERE, dell'la stê-vyârâ. A town in the Province of Mantua, north Italy, 6 miles south of the south end of Lake Garda (Map: Italy, E 2). It is connected by street railway with Brescia and Mantua, has two churches, a technical school, and a castle. Its chief industry is silk spinning. On Aug. 5, 1796, Napoleon defeated the Austrians under Wurmsers here, and because of the victory Marshal Augereau (q.v.) received the title of Duke of Castiglione. Pop. (commune), 1901, 5967; 1911, 7124.

CASTIGLIONE, DUKE OF. See AUGEREAU, PIERRE FRANÇOIS CHARLES.

CASTILE, kâ-stêl' (Sp. *Castilla*, from *castillo*, castle, from Lat. *castellum*, fort, on account of the numerous castles erected on the fron-

tiers). A former kingdom of Spain, occupying an area of about 53,500 square miles in the central part of the peninsula (about one-fourth of the kingdom), and divided into the two old provinces of Old Castile, or *Castilla la Vieja*, and New Castile, or *Castilla la Nueva*. The former occupies the northern part and forms an elevated plateau, with an average elevation of about 2500 feet. It is walled in on almost all sides—on the north by the highest masses of the Cantabrian Mountains, which separate it from the Basque Provinces and Asturias (but at the centre of the northern boundary Castile extends beyond the mountains, through the district of Santander to the coast of the Bay of Biscay); on the south by the high ridge forming the watershed between the Duero and the Tagus; while the Sierras de Ocejón, de Urbión, and Moncayo, and the heights of León and Tras-os-Montes bound it on the east and west. The high plateau of Old Castile is but scantily watered, and its natural characteristics are far from inviting. The chief rivers are the Duero and its tributaries, which are generally shallow during the summer. In many parts nothing is presented to the eye but a wide, almost treeless waste of land, unrefreshed by streams, in some parts monotonously covered with stunted grasses and in others almost destitute of vegetation. The traveler may walk many miles without finding a village or even a solitary farmhouse. Not all of Old Castile is, however, an arid desert. In the southern part are found fertile tracts which yield fine grain, and even the olive can be cultivated under favorable climatic conditions. Iron and other minerals exist in plenty, but are not worked to any great extent, the chief industries being stock breeding and cotton and linen weaving.

New Castile constitutes the southern part of Castile and includes the Moorish Kingdom of Toledo. It lies between Aragon and Valencia on the east and Estremadura on the west, and has Murcia and Andalusia on the south. It belongs to the basins of the Tagus, Guadiana, and Júcar. It has a less elevated surface, but in many other respects is not unlike Old Castile. It is mostly sterile in the more elevated parts, such as the elevated plateau of Madrid or Toledo, but very fertile in the deep river valleys. Olives, corn, pulse, and saffron are cultivated in some neighborhoods, but more attention is paid to the raising of domestic animals. Industry is almost entirely restricted to manufactures of coarse woolen goods. The yield of the salt mines in the south is considerable, and quicksilver, especially at Almaden (q.v.), and iron are plentiful. The commerce is insignificant and is greatly impeded by the lack of adequate transportation facilities.

Under the present administrative division of Spain, Old Castile is divided into the eight provinces of Burgos, Logroño, Santander, Ávila, Segovia, Soria, Palencia, and Valladolid, with a total population of 1,785,400 in 1900, and in 1910, 1,851,286. Some authorities include also the provinces of León, Zamora, and Salamanca in Old Castile. New Castile is divided into the provinces of Madrid, Guadalajara, Toledo, Cuenca, and Ciudad Real, and had a total population of 1,923,310 in 1900, and 2,150,518 in 1910. Besides these provinces, the Principality of Asturias and the districts of Estremadura, Andalusia, Granada, and Murcia also belonged to the crown of Castile.

The early history of the Countship of Castile is shrouded in mystery. The kings of Asturias,

and later the kings of León, granted some such title as Count to their representatives in the various frontier cities as fast as they were won back from the Moors. But there seem to have been no counts of Castile before the time of the Count Fernán González. Little by little and with great difficulty did Fernán González win independence for his countship. After the battle of Simancas (Aug. 19, 939) and that of Zamora, which closed the campaign against Abderrahmán, Ramiro, King of León, quartered his troops in a burdensome way among the Castilian cities, to the great annoyance of the Castilians and of Count Fernán González, whose ideas of what made for the welfare of his subjects required their independence from León. The Count was a very skillful politician as well as a doughty warrior, and he weathered all storms until his death in 970, frequently exercising absolutely sovereign powers, and styling himself "Count by the Grace of God." As a result of various incidents and marriages and wars, the Countship of Castile, whose possessors had occasionally thought of raising it to the dignity of a kingdom, passed into the hands of the King of León, who at his death (1032) left Castile (with the title of King) to his son Fernando.

The Kingdom of Castile was thus an offshoot of the Kingdom of León, with which it was permanently reunited, so far as concerned the person of its sovereign, in 1230, when the death of Alfonso IX of León caused the crown of León to pass to the head of Ferdinand III of Castile, who thus became King of Castile and León. Castile played the leading part in the reconquest of the Iberian Peninsula from the Mohammedans, and as such its history is inseparably identified with that of Spain (q.v.). Consult: Ayala, *Crónicas de los Reyes de Castilla* (2 vols., Madrid, 1779-80), and *Historia de las comunidades de Castilla* (Madrid, 1897); for descriptions, J. M. Quadrado and V. de la Fuente, "Castilla la Nueva," 3 vols., in the series *España* (Barcelona, 1885-86); and Valverde y Alvarez, *Guía del antiguo reino de Castilla* (Madrid, 1886).

CASTILHO, kâ-stê'lyô, ANTONIO FELICIANO DE (1800-75), Viscount of Castilho, Knight of the Order of the Tower and Sword, and Knight Commander of the Order of the Rose of Brazil. A Portuguese poet, born in Lisbon. Although nearly blind from his sixth year, he was educated by a brother and early became well known for his learning. He published translations of the *Metamorphoses* of Ovid (1841) and other Latin translations and original poems. The first volume which attained success was *Cartas de Echo a Narciso* (1821). He also wrote *Amor e melancholia* (1882); *A primavera* (Lisbon, 1822; 2d ed., 1837); *A route do Castello* (Lisbon, 1836); *Escavações poeticas* (Lisbon, 1844); and an historical study or national poem concerning *Camoëns* (1849). Its subtitle, *Estudo historico-poetico liberrimamente fundado sobre um drama francez de Victor Perrot e Armand du Mesnil*, sets forth its provenience. In prose he wrote a treatise on Portuguese versification: *Tratado de metrificacão portugueza* (Lisbon, 1851); and *Quadros historicos de Portugal* (Lisbon, 1838; Rio de Janeiro, 1847).

CASTILLA, kâ-stê'lyâ, RAMÓN (1796-1867). A Peruvian general and statesman. He entered the Spanish army in 1816, but five years later joined the revolt against Spanish rule, and when independence had been secured he was appointed prefect of his native Province of Tarapacá

(1824). In 1830 he became chief of staff of the whole army, with the rank of brigadier general. After the treaty with the President of Bolivia, Castilla went to Chile, and in 1837 joined the Peruvians who marched against Santa Cruz, the President of Bolivia. When the Revolutionists late in 1837 proclaimed Gamarra President, Castilla was made Minister of War. In 1841 he was one of the leaders of the Peruvian force that invaded Bolivia, and in 1845 was elected President of Peru, at a moment when Peru's only salvation lay in a man, like Castilla, who had such power and force of character as would enable him to restore and maintain the reign of law and order. Castilla made many important reforms, and in his short term as President placed both the foreign and the internal debts of the country upon a sound basis and made regular payments of interest. His successor, Echenique, became unpopular through unscrupulous congressional manipulation of the country's finances, and Castilla started a revolution, overcame Echenique, and became, in 1855, sole ruler of the country. One of his most important reforms was the abolition of slavery, and another was the abolition of tribute paid by the Indians to the great landed proprietors. In 1858 he was re-elected President, and in 1860 proclaimed a new constitution which granted universal suffrage and prohibited the exercise of any religion except the Roman Catholic. In 1862 he resigned his office as President to his friend and successor, Grand Marshal Miguel San Román, and lived in retirement for the next three years. In 1865 he became President of the Senate. Peru owed him nearly 20 years of peace and of moral and material progress. Consult Markham, *History of Peru* (Chicago, 1892).

CASTILLEJO, kâ'stê-lyâ'hô, CRISTÓBAL DE (?1490-1550). A Spanish poet, born at Ciudad Rodrigo, Salamanca. He was early attached as a page to the person of the Infante Fernando, younger brother of Charles V, and subsequently Emperor of the Holy Roman Empire as Ferdinand I. After having taken orders he was in 1525 appointed secretary to that prince, who became successively King of Bohemia (1526), King of the Romans (1531), and King of Hungary (1540). He accompanied Ferdinand to the Diet of Augsburg, 1530, and almost everywhere throughout Austria and Bohemia. His family was ennobled in 1532, and in 1536 he was appointed to a benefice at Ardegge in the Bishopric of Passau, but resigned it in 1539 to accompany Mendoza, who went to Venice as Ambassador. Castillejo was never robust, and he aged early. Towards the end of his life, too, he was poor. His comedies have entirely disappeared, but his poems survive. Although some of his poems appeared in 1543-44, they were not collected until 1573, when the Inquisition issued, at Madrid, an expurgated edition. There is also a Madrid edition of 1792 in 2 vols. The most accessible edition is that by Adolfo de Castro, in vol. xxxii of the *Biblioteca de autores españoles* (Madrid, 1854), in which an attempt has been made to restore the original readings before the Inquisition had mutilated the text. The work is divided into three books, treating respectively *Obras de amores*, *Obras de conversación y pasatiempo*, and *Obras morales y de devoción*. In them he displays spontaneous gayety of mind and facility of execution. He adhered to the traditional native forms and stoutly resisted Boscán, Garcilaso de la Vega, and all the remaining inno-

vators who sought to introduce into Spanish literature the sonnet, the *terza rima*, the canzone, and other Italian measures. His opposition was in part indirect, through improvement upon the old Castilian masters, and in part direct, as expressed in a satire against the new school and the sneers of "Petrarquistas." He wrote many successful ballads and a "Dialogue with his Pen" (*Diálogo entre el autor y su pluma*), often referred to for its sprightly wit. Almost equally witty are the satirical poems: *El sermón de amores, del maestro Buen-talante, Fray Fidel, de la órden del Tristel*, and the *Diálogo que habla de las eondieiones de las mujeres*. Castillejo appears in the Academy's *Catálogo de las autoridades de la lengua*. Consult C. L. Nicolay, *Life and Works of Cristóbal de Castillejo* (Philadelphia, 1910).

CASTILLEJOS, MARQUIS DE LOS. See PRIM, JUAN.

CASTILLO. See CÁNOVAS DEL CASTILLO.

CASTILLO, kâ-stē'lyō, DOMINGO DEL. A Spanish pilot, one of the first European party to explore the Colorado of the West, in 1540. He left an excellent map of the Gulf of California and the lower course of the Colorado. See ALARCÓN, HERNANDO DE.

CASTILLON, kâ'stē'yôn'. A town in the Department of Gironde, France, on the right bank of the Dordogne, 26 miles east of Bordeaux. It is celebrated as the scene of the battle (July 17, 1453) between the forces of the English and the French, in which the former were defeated and their leader, Talbot, was slain. The battle led to the speedy reoccupation by Charles VII of all the territory held by the English except Calais. Pop., in 1901, of town, 2891; of commune, 3253. Consult Jouanett, *Statistique du département de la Gironde* (Paris, 1837-39).

CASTINE, kās-tēn'. A town and port of entry in Hancock Co., Me., on Penobscot Bay, 36 miles below Bangor (Map: Maine, D 4). It has a good harbor and steamship connections and some reputation as a summer resort. The chief industry is the manufacture of cordage, fishlines, etc., and a trade in fish is carried on. Castine has a library and a customhouse and is the seat of a State normal school. The government is administered by town meetings. Pop., 1890, 987; 1900, 925; 1910, 933. The French erected a fort here in 1613, and in 1667 Baron de Castine established a small colony, which was soon abandoned. The English made the first permanent settlement here in 1760, and during the American Revolution in 1779 took possession of it, evacuating four years later. It was again occupied by them in 1814.

CASTING. See FLY CASTING.

CASTING, METAL. See FOUNDING.

CASTING OUT NINES. See CHECKING.

CASTING VOTE. The final and decisive vote which the law in some cases confers on the presiding officer of a meeting in the case of an equality or tie vote. Whether such officer has the right to vote at all, or whether his right is limited to a casting vote, or whether, having the right to vote with the others, he may thereafter give a casting vote, is determined by the rules governing the particular assemblage. The President of the House of Lords votes with the other members, but has no casting vote; while the Speaker of the Commons votes only when there is a tie. By the American Constitution the Vice President is President of the Senate, but has no vote except in case of a tie (Art. I,

Sec. 3). State constitutions contain similar provisions relating to the lieutenant governor. The Speaker of the Federal House of Representatives is chosen from among its members, and in some cases has the casting vote in addition to his vote as a member of the House. In State legislatures the usage varies, the Speaker of the Lower House being limited, not infrequently, to a single vote which must be given with the votes of the other members. The same rule applies to the presiding officer at a meeting of a corporation, unless the charter expressly gives him the additional right of a casting vote. See PARLIAMENTARY LAW, and the authorities there cited.

CAST IRON. See IRON AND STEEL, METALLURGY OF; FOUNDING.

CASTLE (Lat. *castellum*, a fort). The mediæval castle was of double descent, on the one side from the Greek acropolis, the Roman Capitol, and the citadel of the Byzantines and Goths; and on the other from the Roman camp or fort, and the Romano-Frankish villa—the earliest feudal fief. (A general treatment of this subject will be found under MILITARY ARCHITECTURE.) The principal groups of such monuments are in Normandy and England; in northern France; along the Rhine; in northern Italy and the Roman province; and in a large part of the East, in a series belonging both to the Byzantine and Mohammedan Middle Ages.

A castle differs from a fort in being primarily the permanent residence of a feudal lord, his family and dependents, instead of merely a stronghold occupied by a garrison. Castles may be divided into two classes: castles built for the defense of cities and subordinate to them—as at Carcassonne; and castles either entirely independent or connected with towns of little importance which often grew up around them. This class is the most numerous and most characteristic of the times; it is, in fact, the great outward sign of feudalism. It will, therefore, be here treated almost exclusively.

Castle architecture ran its course from the tenth to the fifteenth century, and is representative of a large part of the life of the times. In the Orient it may be studied in three principal classes—Byzantine castles, Mohammedan castles, castles of the Crusaders. In the West its natural divisions are rather chronological—pre-Norman, Norman, Crusading, Feudal, and Palatial Château periods. As a class, castles are even more important for what they represent than for what they are. In the form with which we are most familiar they are the creation of the nations of the North, under early influences, typifying at first the stern, self-reliant individualism of feudal society, its absorption in the ideas of graded dominions and the fostering of strong men. In studying its history we can trace the gradual softening of these ideals until the self-indulgent life of the Renaissance château is finally reached. But the border wars of Scotland, the feuds of Richard Cœur de Lion and Philip Augustus, the Barons and Magna Charta, and such events and atmospheres are not the only kind illustrated. The border wars of the Byzantine emperors and the Mohammedan emirs, the struggles of the Knights Templars and those of St. John, the vicissitudes of the Old Man of the Mountain and his Assassins, also in their history crystallize around great castles in the East.

A word of explanation as to their origin. In the north of Europe, where timber abounded, the old Roman *castella* or detached military posts

were often at first used, reënforced by palisades and wooden towers. The Frankish fortified villa was a quadrangle like a Roman camp, surrounded by ditch and palisade and having a mound in its centre as a final place of defense, surrounded by a trench and topped by a circular or polygonal wooden donjon or keep from 10 to 30 meters in diameter and 3 to 13 meters high. This was the pre-Norman castle of the north (e.g., at Sainte-Eulalie d'Ambarès and at Friedberg). Sometimes the circular form was preferred for the outer works, as in the Pipin Burg near Lehr (Germany). Such works have of course left few traces, except of the roughest ground plan of their earthworks. When the Normans settled down in the north of France in the tenth century, they began to build castles of a new type: their keeps, instead of being in the centre of a rectangular inclosure, were at one of its edges, so that direct communication with the outer country could still be had in case the outer palisades were captured. The materials remained at first the same—earthworks with palisades and a bank; then an earthen *motte* or mound, and wooden towers at the highest point. It was with such castles that the Norman chiefs repelled the Hungarian hordes during the tenth century and kept the river courses open for their raids. They took advantage, however, of the natural strength of localities better than the Franks, who, like the Romans, had built usually on the plain. The Norman castles in France and England even for a generation after the Conquest were of this kind, e.g., at Builth in South Wales, Longtown, and Kilpeck in Herefordshire. The first advance was made late in the eleventh century by building the keep or donjon of stone masonry instead of earth and immeasurably increasing its importance in relation to the outer line of earthworks. The keep at Malling in Kent, and London's famous keep, the White Tower, are survivals of this stage, which lasted, for the majority of castles, well into the twelfth century. England was covered with them; they were the principal means of firmly establishing the Norman yoke. Thirty went up under William the Conqueror; many more under his sons, and under Stephen (1135-54) 1115 were built. Meanwhile a great innovation had begun, as usual not in England, but on the Continent. Earthworks were discarded altogether and a complex system of stone-wall defenses was connected with the stone keep. It is at Arques, in Normandy, that William, uncle of Duke William, erected on a strong rocky promontory an epoch-making castle, with a square donjon at the upper end and with the entrance at the lower end protected by a double gate, two flanking round towers, and advanced earthworks. The interior had two courts or baileys—lower and upper—separated by a palisade. The circuit of walls was defended by 11 towers—all but two round. The donjon was against the outer wall. The natural rise towards the castle was defended by a palisade in front of a "vallum"—called a *bailie* or *bailey*, in its primitive sense—back of which a wide fosse was cut in the soft rock from the scarp of which rose the castle walls. Along this scarp subterranean corridors were cut to detect and oppose mining approaches, and the whole substructure was honeycombed with subterranean passages for sallies and intercommunication between the various parts. But Arques remained for a century a great exception in the importance of its outer circuit. As soon as the

improved methods reached England many castles were rebuilt, such as "Dover and Rochester in Kent, Newcastle in Northumberland, Appleby and Carlisle in Cumberland, Brougham in Westmoreland, Richmond and Conisborough in Yorkshire, Portchester in Hampshire, Guildford in Surrey, Goodrich in Herefordshire, Norwich and Castle Rising in Norfolk, Hedingham and Colchester in Essex." (Parker.) They vary but slightly in plan, the keep being a massive square tower, with a square turret projecting from each angle. The entrance was quite high up, by a temporary wooden staircase, removed in time of danger. The interior was often divided by a vertical wall into two equal sections without communication except through passages cut in the upper part of this heavy division wall. The stories were divided by wooden floors, very seldom by vaults. These keeps were small, dark, and uncomfortable, and until the later period when the outer defenses were strengthened, they not infrequently succumbed to famine after the outer works were carried. This type, which has been described as "a strong post around which a fortified camp was traced," was followed in Normandy itself, at Chambois, Falaise, Nogent-le-Rotrou, and Le Pin; also in the French provinces under Norman influence, as at Chauvigny, Loches, Pouzanges, Montrichard, Montbazou, Beaugency, etc. Often the keeps of such castles were supplemented during the twelfth and thirteenth centuries, or even later, by stronger outer lines of defense than was customary when they were first built. The outer walls had been really only for the protection of the outbuildings from marauders, not to withstand an attack in force. Hitherto, even with these improvements, the castles of this type were incapable of offensive defense and became thoroughly insecure. Its abandonment in favor of a type with stronger external defenses came as a result of the Crusades. The Crusaders had brought experience in approaching and attacking fortifications and were familiar with advanced methods of sapping and mining, with heavy machines and towers or belfries, through contact with the skilled engineers and their works among the Byzantines and Mohammedans of the East. A revolution took place in the plans of European castles, especially in France, before the close of the twelfth century. It is connected, however, rather with royal castles built for national purposes with all the resources of the state, than with the private efforts of feudal nobles. This movement is individualized first at La Rocheguyon, built by Philip Augustus of France, and then, even more superbly, by its greater rival Château Gaillard, built by Richard Cœur de Lion, which defended all Normandy against France. At Gaillard the Eastern method of flanking constructions, by which an aggressive defense could be made, was first carried out; the type of square donjon, which enforced ignorance of exterior operations and was weak for defense at the angles, was abandoned for the circular form; in fact, curved lines were everywhere employed. Another important innovation was the double concentric line of defense of the main castle, beside the keep. This central fort had a strong, irregularly triangular advanced fort separated from it by a trench, and with its nose towards the narrow strip of land that was the only vulnerable point of approach. The river Seine, that flowed by its base, and by a short curve there formed a promontory, was for-

tified in various ways—by a fort on an island defending a bridge with a barbican (q.v.) at one end and a large fortified burg at the other, with another farther on, all near the water level, while above it a triple stockade barred the river. The whole system was, perhaps, the most perfectly devised of the feudal age; in it everything was sacrificed to military efficiency. It was by such works that the quality of masonry was perfected. Of the French donjons, or keeps, the most important of this period, now preserved, is that of Loches, still over 30 meters high. A little later was built (1223–30) the famous castle of Coucy, the most wonderful of mediæval private fortresses, exhibiting for the first time the tendency to unite artistic magnificence and comfort with perfect military strength. Other important French donjons are those of Foulques-Nerra at Langeais (very early), Provins, Hardan, and the double keep of Niort. The new principles of Gothic architecture, with its mastery of vaulted construction, alone made this possible. The chapels, halls of the knights, and halls of the feudal lords became structures of great size and high finish. Such were the old Louvre of Philip Augustus at Paris, the châteaux of Clisson and of Angers, and other royal castles of the thirteenth century. Under Oriental influence the old wooden balconies or hurdles (*hourds*) had long been replaced by stone-vaulted projections, galleries, and bartizans (*machicoulis*, *échauguettes*), thus doing away with the main defensive weakness of earlier castles. During this period the normal form and division of the most numerous class of castles, the Norman-English, was the following: A ditch, dike, fosse, or moat, surrounding the circuit, crossed by a bridge defended by a barbican and closed by a portcullis; then the outer wall or curtain, 20 to 25 feet high, with its towers and bastions, its terraced walk, with single or double parapet; then the gatehouse flanked with towers, leading into the outer bailey court with buildings for feeding, organizing, and lodging the garrison; then a second and higher inner line of defense with its fosse and gatehouse, within which is a second or inner bailey, at the end of which is the keep containing hall, chapel, and accommodations for the suzerain or lord. These arrangements are more or less completely exhibited at Carcassonne, Coucy, Krak des Chevaliers (Syria), Carnarvon and Conway castles, and many others. Under the Plantagenets a small mound, called cavalier, was often added. At this time in England, and under the Valois in France, a great change in arrangement took place, characteristic of the increasing luxury of the fourteenth century. The inner court or bailey, instead of being merely a part of the defensive system culminating in the keep, became a centre of architectural splendor which now showed itself for the first time on the exterior. This culminated in such famous royal structures as Pierrefonds and La Ferté-Milon in France and in such private castles as that of Vitré. Prominent English castles were Rochester, Windsor, and Alnwick.

An entirely distinct line of development had been meanwhile in progress in Italy, where it was not necessary, as in the North, to start from nothing. The feudal class established or encouraged by the Carlovingians could usually fortify themselves in ancient ruins of great strength, and they had before them Roman and Byzantine models which they carefully imitated. The

tenth century saw the founding of many feudal houses; and the great monasteries, such as Farfa, Subiaco, and Monte Cassino, in the fortresses by which they defended their possessions, furnished models to the barons. The Roman nobles were among the earliest to develop a type of castle; families like the Crescentii and Pierleoni, and later the Vico, Orsini, Colonna, etc., erected strongholds throughout the Roman province that far surpassed in size and magnificence any of the Norman or Rhenish castles, and were equaled only by the French and English castles of the thirteenth century. Such were Borghetto and Marozza. The dark, narrow, and unlivable Norman keeps would have seemed insufficient to families that held as their city fortresses such great antique buildings as the Colosseum, the Theatre of Marcellus, the Mausoleum of Augustus or of Hadrian, and the Circus Flaminius. Unfortunately nobody has ever studied this phase of Roman architecture. In most other parts of Italy the establishment of the free communes led to the destruction of such castles during the twelfth and thirteenth centuries, as dangerous to the liberties of the people, and the nobles were forced to come to the cities to live, abandoning their mountain strongholds. This was the case first in the North and then in Tuscany. Only when the age of tyrants set in, in the fourteenth century, with the Scalas, Viscontis, Sforzas, Castracanis, did a new era of feudal castles begin in the North: Still, in the extreme north—in Piedmont, Savoy, and Upper Lombardy—there had been great feudal strongholds from the tenth century, as at Bard and Challant. The famous castle of Canossa, where the Emperor Henry IV made his submission to Gregory VII, was one of these. Frederick II, largely through the Arab engineers he employed, introduced the advanced Oriental methods before 1250. His castles at Lucera, Barletta, Castel del Monte, and elsewhere were worthy, in size and magnificence, of their northern contemporaries. His French successors, the house of Anjou, added other features from beyond the Alps, and the south of Italy then saw the greatest development of military architecture in the peninsula (thirteenth and fourteenth centuries). Farther north the new style was exemplified in such structures as the castle of Castracane at Avenza (1322).

In Germany the architecture of the castle had remained during all this time in its infancy. It had retained the earthwork system up to the twelfth century and even the thirteenth century, as at Alt-Sternberg in Westphalia and the Prussian castles of the Knights of the Cross. In the twelfth century stonework was introduced in the more advanced regions. We admire the picturesque ruins of the castles along the Rhine, such as the Drachenfels, Ockenfels, Ehrenbreitstein, Lahneck, Rheinfels, and many more. They did not embody any of the improvements we have noticed. Even as late as the thirteenth century the German castles were unprovided with any flanking defenses for their outer fortifications, and they kept to the antiquated type of square donjon, rectilinear outer line of walls—in short, the simply passive system of the eleventh century—relying on the natural rocky situation. They were small, piratical aeries, never once entering the same class as Château Gaillard, or even Arques. Still, the elaborate network of these forts, their grouping to protect the whole Rhine valley, its cities and towns, make them

interesting as a social and political, if not as an engineering, study. Even socially, however, they did not show the concessions to comfort and magnificence in feudal life that we find in France, although it is stated that over 350 feudal castles were erected under the Hohenstaufens. Typical examples are the two castles at Rüdesheim, with three superposed terraces, but without wall towers or advanced works—with a typical *mota* in stone—a mere transformation of the old earthworks. At Egisheim the keep or *mota* is a regular octagon inscribed in the centre of a larger regular octagonal wall circuit—symmetrical, but absurdly inadequate in view of the advances made in contemporary modes of attack. A fuller development of this scheme is at Steinberg (twelfth century), with triple concentric lines of walls. There are, however, some interesting exceptions. Salzburg, near Neustadt (eleventh and twelfth centuries), bears certain resemblances to Arques, with its ditch cut along the crest of the hill, its two outer baileys and an inner one with a small keep; the wall towers, however, are square. Interesting, historically, is the famous Wartburg Castle (eleventh and twelfth centuries) of the landgraves of Thuringia, with its double bailey and its attempt to unite the great palatial residence with the fortress, a form in which the Germans anticipated the French of the thirteenth century. Here the palace hall was a long structure in the inner bailey quite distinct from the keep. The Frankenburg Castle in Alsace (eleventh to thirteenth century) is interesting for its two keeps—one of the primitive rectangular type, the other later and circular. At Landeck, near Klingenstein (twelfth and thirteenth centuries), we see not only the peculiar German scheme of superposed retreating platforms or baileys, but the unusual presence—for Germany—of square and round towers in the outer circuit. These and others are in Alsace and the Bavarian Palatinate. The castle at Münzenberg shows how in many cases of an extremely oblong plan there were two keeps in place of one, because as it became necessary to have a keep near the edge of the defenses, and often at the most vulnerable end, a second centre was required for the other end. Among the castles which, in the course of the advance made during the twelfth and thirteenth centuries, showed how even Germany had discarded all reminiscences of the Romano-Germanic *mota* or central earth mound is Fleckenstein in Alsace. Trifels and Neuscharffeneck further develop the combination of fortress with palatial halls, which was characteristic of the Wartburg, and no longer sacrifice the architectural beauty of their buildings to safety. The castle of Nuremberg is a superb example of a feudal structure commanding a great city (twelfth century). Its narrow, rocky setting gives it not only a strong walled advanced work towards the town and a double encircling wall, but three successive baileys on ascending levels, divided by deep ditches, heavy walls, and towered entrance gates. Like so many other German castles, the palace takes the place of the keep in the inner bailey. This tendency reaches its climax in such extensive castles as that of Friesach, in the thirteenth century, where the main palace is in the form of a quadrangle in the centre of a long and fairly fortified enceinte and double outlying baileys and a central keep adjoining the palace. But far surpassing all private and even all royal castles in

Germany is the central fortress of the Teutonic Knights, Schloss Marienburg, whence they extended their political power and the Christian religion over North Germany, and even flung down the gauntlet to Poland. It represents the highest efforts of the German Gothic style in the military field, surpassing in mere beauty its prototypes in Palestine, of which we shall speak. Its great chapel, knights' hall, refectory, and other structures of the inner bailey, superbly grouped, are works of art both without and within, the brunt of military defense being borne by the outer lines of fortification. In the South the castle of Karlstein (1347) in Bohemia is probably the most magnificent.

Spain was undoubtedly the last of Western countries to abandon the purely military castle; this was due to the long conflict between the Christians and the Moors, lasting to the very close of the fifteenth century. The Alhambra, at Granada, shows how the Moors ended by combining art and military science, and the immense piles at Coca and Olite show the permanence of the purely military architecture among the Spaniards. Feudalism of a certain kind had flourished in the Mohammedan East after the breaking up of the caliphates of Bagdad and Cordova into smaller independent principalities. The castle fortress had been developed by the Byzantines of the time of Justinian to a high degree of strength and scientific value, and they had inherited the old Oriental knowledge of double and triple lines of fortification and an overlooking acropolis, the specialty of the Hittite and Pelasgic peoples. The Arabs had borrowed from the Romans and Byzantines the idea of a frontier line of defense, but they outdid them in their scientific treatment and situation. The local chiefs on the frontier established real feudal dynasties. Syria and Asia Minor are full of these frontier castles, whose castellans held the safety of the Arabic and Byzantine empires respectively in their hands. The studies of Rey (*Architecture militaire de la Syrie*) have shown how superb were the fortifications erected in Syria by the Crusaders in the early twelfth century; those of M. Bourgoïn have proved that Mohammedan castles furnished the models for these works. While the Normans were putting up rudimentary earthworks, the chiefs of Syria were living in castles built of cut stone. This explains why the warriors returning from the first Crusades shortly after 1100 revolutionized the science of military architecture in the north of Europe, and why for the origin of the great French and English castles of the thirteenth century we must go, as for many other things, to the East. In fact, for the origin of the mediæval forms then adopted we must study the fortifications of Dana, Edessa, Antioch, and other places in Syria and Mesopotamia, built by Justinian and his successors.

The earliest of the remaining Crusaders' castles is supposed to be that of Giblet (Djebeil), a square plan with angle towers and a central square keep, and others like it at Blanche-Garde and Ibelin. A more advanced system is shown at Saona (c.1150), which is an example of the Syrian castles here planned to contain large garrisons. Its square Norman keep is supplemented by four bastions. Still further progress was made at Beaufort with two enceintes, two keeps, and some heavy bastions. These are followed at the close of the twelfth

century by a different class of castles, those of the orders of Christian Knights that were the strongest defenders of the Holy Land. The Knights Templars had their central stronghold at Tortosa (1183) on a rocky projection in the sea by the city, and surrounded on its elliptical land side by a wide double moat cut in the rock into which the sea could be turned, cutting off the fortress altogether. The two lines of defense separated by the moats were independent and both defended by square towers. The great keep on the farther side is also isolated by water. Although Tortosa is unsurpassed among Syrian fortresses in perfection of construction and is equal to the greatest in Europe, the castle of the Knights of the rival order of St. John built on the Orontes, and commanding the road between Homs-Hamah and Tripoli-Tortosa, is the most important of all, and still remains substantially perfect. It is commonly known by the name of Le Krak des Chevaliers, and stands in the same class as Château Gaillard, which it surpasses in size, is more advanced in scientific construction than Tortosa, and could easily hold a garrison of 4000 men. It should be compared with the great contemporary city castle of Carcassonne in France. It was provided with two large barbicans, with square and round towers, and is built with a high terraced inner bailey magnificently defended and commanded by a barbican keep. A fortified, inclined, winding esplanade connects it with the lower outer bailey. Architecturally these castles of the Knights afforded great opportunities. It was necessary to provide immense halls for the reunion of so large a mass of men—amounting often to a small army—men of equal rank, not underlings, as in the ordinary castle garrison. These edifices were military monasteries and had halls corresponding to the monastic churches, chapter houses, and refectories. Such castles presented altogether new problems to military architects, who for the first time worked out schemes for uniting outward strength with extensive interior halls. The result undoubtedly made possible the Valois-Plantagenet type in the West. Here, as in every other element of the castle, the type was created in the East. To the class of mere fortresses belong the two most interesting of Turkish castles, both built on Byzantine models—that of Rumeli-Hissar, built 1453 by Mehmet II, and that of Yedi-koulé (Seven Towers), a partial reconstruction of a Byzantine fortress at one end of the city walls. They are both in a fair state of preservation.

During the fifteenth century the castle was gradually becoming the palace. In Italy the change was rapid and complete; in France and Germany, very gradual. The fortress-like palace of the Louvre at Paris, even after its extensive reconstruction in the fourteenth century, retained the moat, machicolated towers and dungeon (demolished in 1446); Vincennes was another transitional palace. Indeed, until the latter part of the sixteenth century the French rural palaces retained the moat, machicolated round towers, thick walls, and high roofs of the mediæval castle, as at Chaumont, Chambord, Chenonceaux, Azay-le-Rideau. Under the Bourbon kings, however, the definitively Renaissance palace type finally lost the last vestige of mediævalism; but the name *château* is retained to this day to designate any important manor house or large residence in an extensive estate.

Bibliography. Very few books treat ade-

quately of this subject. For France, consult the articles "Architecture militaire," "Château," "Donjon," "Siège," and "Tour," in Viollet-le-Duc, *Dictionnaire raisonné de l'architecture française du XIe au XVIIe siècle* (10 vols., Paris, 1876), and the second volume of Enlart, *Manual d'archéologie française* (Paris, 1904). For Germany, a partial exposition is found in Cori, *Bau und Einrichtung der deutschen Burg in Mittelalter* (Linz, 1895); Naeher, *Die deutsche Burg* (Berlin, 1885); Essenwein, *Die Kriegsbaukunst* (Darmstadt, 1892); id., *Burgenkunde* (Munich, 1895); Salvisberg, *Die deutsche Kriegsarchitektur* (Stuttgart, 1887). For castles of the Crusades, consult Rey, *Etude sur les monuments de l'architecture militaire des croisés en Syrie* (Paris, 1871), and for England and Scotland, McGibbon and Ross, *Castellated and Domestic Architecture of Scotland from the Twelfth to the Eighteenth Century* (Edinburgh, 1887-97); Clark, *Mediæval Military Architecture* (London, 1884); Britton, *Architectural Antiquities*, vol. iii (London, 1807-26); and A. H. Thompson, *Military Architecture in England* (London, 1912).

CASTLE, EGERTON (1858-). An English novelist, born in London. He was educated at the universities of Paris and Glasgow, at Trinity College, Cambridge, where he took honors in science, and at the Royal Military College, Sandhurst. He served as lieutenant in the Second West India Regiment and as captain in the Royal Engineer Militia. From 1885 to 1894 he was on the staff of the *Saturday Review* and is now joint owner of the *Liverpool Mercury*. His novels, several of which have been dramatized, include: *Consequences* (1891); *The Light of Scarthey* (1895); *Young April* (1899); and in collaboration with his wife, Agnes Castle, *The Pride of Jennieo* (1898); *The Bath Comedy* (1899); *The House of Romance* (1901); *The Star-Dreamer* (1903); *If Youth but Knew* (1905). For Henry Irving he wrote the play *Saviolo*, and for Richard Mansfield *Desperate Remedies*. He also published two books on fencing and one on bookplates. *The Secret Orchard* (1900) was dramatized for Mr. and Mrs. Kendal (1901). Among other publications in which he collaborated with his wife are: *Incomparable Bellairs* (1904); *Wroth* (1908); *The Grip of Life* (1912); *The Golden Barrier* (1913).

CASTLE, WILLIAM ERNEST (1867-). An American zoölogist, born at Alexandria, Ohio. He was educated at Denison and Harvard universities. In 1889-92 he was instructor in Latin at Ottawa (Kans.) University, in 1895-96 instructor in vertebrate anatomy at the University of Wisconsin, and in 1896-97 instructor in biology at Knox College. He was then called to Harvard, where in 1908 he became professor of zoölogy. Besides his articles on embryology, animal morphology, and heredity in the *Contributions from the Zoölogical Laboratory of Harvard* and in the *Publications of the Carnegie Institution of Washington* he is author of *Heredity in Relation to Evolution and Animal Breeding* (1911); *Heredity and Eugenics* (1912); *Reversion in Guinea Pigs and its Explanation*, with C. C. Little (1913).

CASTLEBAR, kás'1-bär'. The capital of Mayo Co., Ireland, on the Castlebar River, 159 miles northwest of Dublin (Map: Ireland, B 3). It takes its name from the ancient castle, formerly the property of the De Burgh family. It

has manufactures of coarse linen and breweries. In the rebellion of 1641 the English parliamentary garrison was massacred by the Irish. In 1798 the French, under General Humbert, held the town for a fortnight. Pop., 1901, 3585; 1911, 3698.

CASTLE DANGEROUS. A novel by Sir Walter Scott, published in November, 1831, although the introduction printed in later editions was not forwarded from Naples until February, 1832. The scene is laid in the times of Robert Bruce and James, Earl of Douglas, and the plot centres about Douglas Castle, Douglas Dale, Scotland, a fortress which is now a ruin, but which in older days was known as Castle Dangerous.

CASTLEFORD, kās'l-fērd. A town in the West Riding of Yorkshire, England, on the Aire, 9 miles southeast of Leeds, with which it is connected by rail and canal. Its principal industry is glassworking, in particular the manufacture of bottles. Pop., 1901, 17,400; 1911, 23,090. Castleford was the Roman Legeolium.

CASTLE GARDEN. A large circular building in Battery Park, at the southern extremity of New York City. Built in 1807, originally as a fort, then 300 yards from the shore, and known as Castle Clinton, it was converted into a garden where civic receptions and other functions were held, whence its name. Subsequently it served as a concert hall, and in 1855 became a landing place and temporary headquarters for immigrants. At the close of the year 1890 it was ceded to the municipal authorities; and, under the control of the Park Department, has since been equipped as a large public aquarium, with over one hundred tanks, and an admirable collection of fresh-water and salt-water fishes and other aquatic life. Its present interest is overshadowed by its past, for with it are linked in history the names of Lafayette, Presidents Jackson and Tyler, and Jenny Lind. See **AQUARIUM.**

CASTLEMAINE, kās'l-mān. A town in the State of Victoria, Australia, 78 miles north-northwest of Melbourne (Map: Victoria, D 5). Pop., 1901, 5704; 1911, 5228 (exclusive of full-blooded Australian aboriginals). It was a place of much importance when gold mining began, the diggings near by being among the earliest opened. The Melbourne to Echuca Railroad passes through the town.

CASTLE OF INDOLENCE, THE. An allegorical and descriptive poem by James Thomson. It was first begun as a humorous autobiographical sketch, but soon outgrew the original conception. The first edition appeared in London, in quarto, 1748; the second, in octavo, in the same year and place. The piece is noteworthy for its revival of the Spenserian stanza and for its effective onomatopœia.

CASTLE OF OTRANTO, ò-trān'tō, THE. A "Gothic" novel by Horace Walpole, published anonymously in December, 1764, but appearing under the author's real name in the second edition. It professed, in the original mock-antiquarian introduction, to be a translation from the Italian. In later editions, however, the author frankly expounded his theory of the interest which a blending of the supernatural with a realistic setting must possess for the average reader.

CASTLE OF SAINT AN'GELO. See **HADRIAN, TOMB OF.**

CAS'TLE PEAK. One of the highest peaks

of the Sierra Nevada in California, rising to 12,500 feet above the sea, in lat. 38° 10' N. and long. 119° 30' W., about 25 miles northwest of Mono Lake (Map: California, F 4). The lower slopes are well wooded.

CASTLE RACKRENT. A novel by Maria Edgeworth, published first anonymously in 1800 and then under the author's real name. It is an Irish story, the scene of which is laid in the eighteenth century, and was doubtless suggested by Miss Edgeworth's visit to Ireland after her father's remarriage. Its principal characters are members of an Irish family on the downward grade. It is, however, interspersed with many humorous passages.

CASTLEREAGH, kās'l-rā', **VISCOUNT.** See **STEWART, ROBERT,** second **MARQUIS OF LONDON-DERRY.**

CASTLES. In heraldry, castles often figure as charges. The castle appears in the arms of Castile and of many cities, e.g., Bristol, Newcastle, and Carlisle.

CASTLETON, kās'l-ton. Formerly a town in Richmond Co., N. Y., in the northern portion of Staten Island, now included in the Borough of Richmond, New York City (Map: New York City, B 7).

CASTLETON. A town in Rutland Co., Vt., 11 miles west of Rutland, on the Delaware and Hudson Canal Company's Railroad and on Castleton River (Map: Vermont, B 6). The valuable slate quarries in the town constitute the principal industry; there are also some dairying interests. Castleton is the seat of a State normal school. Lake Bomoseen, the largest body of water entirely within the State, lies almost wholly within the town. The government is administered by town meetings, held annually and at special call. Pop., 1890, 2396; 1900, 2089; 1910, 1885.

CASTLETOWN, kās'l-toun. The ancient capital of the Isle of Man, situated on the margin of Castletown Bay, near the south extremity of the island (Map: England, B 2). In its midst rises Castle Rushen, a fortress of great strength, founded by Guthred II of the Orrys kings of Man, in 960. It was besieged by Robert Bruce in 1313 for about six months and almost completely destroyed. It is well built and has a few noteworthy public buildings, its chief educational institution being King William's College, an excellent school for boys. Being in the neighborhood of the bold coast scenery of the Calf of Man, Spanish Head, etc., Castletown is a favorite resort for the numerous tourists who frequent the Isle of Man. Pop., 1900, 2520; 1911, 3828. Consult Fitzgerald, "Castletown and its Owners," in *Kildare Archaeological Journal*, vol. ii (Dublin, 1898).

CASTLEWOOD, kās'l-wud, **COLONEL FRANCIS ESMOND, LORD.** The second Lord Castlewood in Thackeray's *Henry Esmond*, the father of Beatrix and Francis. He is a rollicking, hard-drinking spendthrift, who tires of his wife, spoils his children, leads a double life, and is killed in a duel with Lord Mohun.

CASTLEWOOD, LADY. Mother of Beatrix and Francis Esmond and wife of the second Lord Castlewood, in Thackeray's *Henry Esmond*. She becomes spiritually separated from her husband and children by her excessive goodness. At the close of the story she is married again to Henry Esmond, a cousin, who had been brought up in the Castlewood household and who had been long loved by her in secret.

CAS'TOR, TEMPLE OF. A temple on the south side of the Roman Forum, built at the Spring of Juturna, to commemorate the miraculous appearance of the Dioscuri to announce the victory of Lake Regillus in 496 B.C. The temple, of which the three remaining columns are among the most prominent remains in the Forum, was dedicated in 484 B.C. and reconstructed by Tiberius and dedicated again in 6 A.D. The last excavations, which completely freed the substructure on three sides, took place in 1901. It was used as a place of deposit for valuable articles and contained the standards of weights and measures. Consult Hülsen-Carter, *The Roman Forum*, pp. 151-154 (Rome, 1906).

CASTOR, ANTONIUS. A botanist of Rome, in the first century A.D., several times quoted and mentioned by Pliny. He had a botanical garden, probably the earliest on record.

CASTOR AND POLLUX (Gk. Κάστωρ, *Kastōr*, and Πολυδεύκης, *Polydeukēs*). Twin gods of Greece and Rome, known under the name of Dioscuri (Lat., from Gk. Δίσκουροι, *Dioskouroi*, from Δίος, *Dios*, of Zeus + κούρος, *kouros*, youth), i.e., children of Zeus and Leda, wife of Tyndareus, to whom the god came in the form of a swan. The Dioscuri were especially revered among the Dorians; their tomb was shown at Amyclæ, near Sparta. The Dorian divinities were later confused with similar twin brothers worshiped in other Greek states; hence we find a wide variety of functions ascribed to the Dioscuri. In general, they appear as saviors in time of need, whether in battle or at sea. In art they are usually represented with white horses, as in the fine group on Monte Cavallo in Rome. They often wear an egg-shaped cap in commemoration of their birth from the egg brought forth by Leda and are frequently crowned with stars and armed with lances. They appear as patrons of athletic sports—Castor of horsemanship and Pollux of boxing. Among their exploits were the invasion of Attica to rescue their sister Helen from Theseus; their part in the hunt of the Calydonian Boar; their participation in the Argonautic expedition; their abduction of the daughter of Leucippus; and, lastly, their battle with the sons of Aphareus, in which Castor (the mortal brother, son of Tyndareus) was slain by Idas and both the Apharidæ were killed by Pollux. Pollux, who was immortal, was allowed by Zeus to share his immortality with his brother, so that they sojourned one day in Hades and the next in Olympus. This is the version of the *Odyssey*, but later writers give other versions of the way in which this immortality was shared. The astronomical writers identify them with the zodiacal constellation of the Twins. (See GEMINI.) They were greatly venerated in Rome, where it was believed that at the battle of Lake Regillus they fought at the head of the Roman legions, and afterward, with incredible speed, carried to the city the news of the victory. Where they alighted, near a well in the Forum, a temple was built in their honor, and a great festival was held in their honor on the ides of Quintilis, the supposed anniversary of the battle. A part of the ceremonies was a grand muster of the equestrian body, when all the knights, clad in purple and crowned with olive, assembled at the temple of Mars, outside the city, and rode in state to the Forum.

The name Castor and Pollux was also given by sailors in classic times to twin balls of fire,

which attached themselves during thunderstorms to the masts of ships, and were considered to foretell fair weather. When only one ball of fire was seen, the meteor was called Helena and foreboded a storm. (See Shakespeare, *Tempest*, Act i, Scene 2. See ELMO'S FIRE, SAINT.) It was a favorable omen when the spears of the Roman armies were tipped with these lights. The Portuguese considered them as indicative of the presence of the body of Christ, whence they were called *Corposants* (compare *corpus sanctum*). Consult Albert, *Le culte de Castor et Pollux en Italie* (1883); Paton, *De Cultu Dioscurorum apud Græcos* (Bonn, 1894).

CASTOR AND POLLUX, HOUSE OF. The name given to a house at Pompeii, consisting of two distinct dwellings connected by a peristyle court, ornamented with frescoes, representing Castor and Pollux holding their horses by the bridles.

CASTO'REUM (Lat., Gk. καστόριον, *kastōrion*, castor, from Κάστωρ, *kastōr*, beaver). A substance secreted in two paired glandular sacs, closely connected with the organs of reproduction in both sexes of the beaver, and at one time held in high repute in medicine, although now chiefly used by perfumers, when any can be obtained for market from the disappearing animals. It was well known to the ancients. From the time of Hippocrates it was regarded as having a specific influence over the uterus, and was esteemed valuable in hysteria, catalepsy, and other spasmodic diseases. It has always been considered by trappers one of the most powerful of bait scents, under the name "barkstone."

CASTOR'IDÆ (Neo-Lat. nom pl., from Gk. Κάστωρ, *kastōr*, beaver). The beaver family. See BEAVER.

CASTOR OIL (so called from its fancied resemblance to castoreum). A fixed oil expressed from the seeds of *Ricinus communis* (Linné), which is cultivated in India. In extracting the oil the seeds are first bruised between heavy rollers and then pressed in hempen bags under a hydraulic or screw press. The best variety of oil is thus obtained and is known as *cold-drawn* castor oil; but if the bruised and pressed seeds be afterward steamed or heated and again pressed, a second quality of oil is obtained, which is apt to become partially solid or frozen in cold weather. In either case the crude oil is heated with water to 212° F. (100° C.), which coagulates and separates the albumen and other impurities. Exposure to the sunlight bleaches the oil. When pure and cold-drawn, castor oil is of a light-yellow color; but when of an inferior quality, it has a greenish, and occasionally a brownish, tinge. It is somewhat thick and viscid. Its specific gravity is high for an oil, being about .960. It is miscible with alcohol and ether. Reduced to a temperature of -15° C., it becomes solid; exposed to the air, it very slowly becomes rancid, then dry and hard, and serves as a connecting link between the drying and nondrying oils. It has a faint odor and a bland or slightly acrid, and to many persons sickening, taste, which may be overcome by the addition of a little magnesia. The principal acid present in it is ricinoleic acid, C₁₈H₃₄O₃, which is allied to oleic acid. It also contains palmitin, stearin, myristin, and an acrid principle.

Castor oil is largely used in medicine and the arts. As a simple purgative it acts in about five hours and empties the large intestine. It will purge even if rubbed into the skin. Its

secondary effect is sedative and slightly constipating. It is not suited for continued or repeated use, but should be employed in an emergency, or occasionally, for a single result. It is very useful in diarrhœa due to eating indigestible or irritative substances, in the constipation of alcoholism as well as of pregnancy, and in inflammatory diseases of the kidneys or of the generative organs. It may be administered in orange juice, or flavored with oil of bitter almonds, or given in coffee or in soda water, or in soft, elastic capsules of gelatin.

Castor oil may be variously adulterated, with several of the fixed oils or even lard. The best test of its purity is complete solubility in its own volume of alcohol, a test which other fixed oils do not stand.

CASTOR-OIL PLANT, CASTOR BEAN, PALMA CHRISTI, *Ricinus communis*. A member of the order Euphorbiaceæ, a native of tropical Asia and Africa now naturalized in most tropical and subtropical countries, and cultivated also in temperate climates. In the warmer climates it is a perennial and occurs as a small tree, but it does not endure frost and becomes an annual in temperate regions. It was known to the ancient Egyptians and to the Romans. There are many distinct forms, generally all regarded as varieties of a single species, which differ in stature, shape, and color of the leaves, and are very popular for ornamental planting. The leaves are large and broad, from 1 to 2 feet or even more in diameter, and palmately cleft. The flowers are unisexual and are borne upon the same plant. The fruit is a spiny capsule containing one seed in each of its three divisions. The seeds are oval, from one-third to one-half inch long, and often beautifully variegated. They are chiefly valued for the oil they yield, the common castor oil so generally used as a purgative, and also for lighting and lubricating purposes. The plant is cultivated for this oil in the United States, mainly in localities of Kansas, Oklahoma, Illinois, and Missouri, and in southern Europe, Asia, South America, the West Indies, and other tropical and warm temperate countries. The United States also imports seed, mainly from India, for the manufacture of the oil. A bushel of beans yields about two gallons of oil. The pomace which remains after the oil has been extracted from the seed is a valuable fertilizer, but is not used for feeding purposes on account of its poisonous character. British India, the principal producing country, exports over 3,000,000 bushels of the beans and over 2,000,000 gallons of the oil annually (*United States Department of Agriculture Yearbook, 1904*). For illustration, see Plate of CALABASH, ETC.

CAS'TRALEU'CUS. See CASTELLO BRANCO.

CASTRATION (Fr., Lat. *castratio*, from *castrare*, to emasculate; Skt. *śastra*, knife). The removal of the essential organs of generation in animals. In males castration consists in taking away the testicles. In females castration or spaying consists in removing the ovaries. The purpose of castration is, generally, to make domestic animals more docile and more valuable for meat as well as to restrict reproduction. These advantages are counterbalanced, at least in part, by the fact that castration diminishes the powers of endurance and lowers the intelligence. Castration may be performed at almost any age, but the effects of it are more pronounced if it is performed before the age

of puberty. In surgery castration is sometimes rendered necessary by disease of the testicle. In the female the operation is known as oöphorectomy. See EUNUCH.

CASTRÉN, *kä-strän'*, MATTHIAS ALEXANDER (1813-52). An eminent Finnish philologist. He was born at Tervola, Dec. 2, 1813, received his earliest instruction in the town of Torneå, and afterward studied at Helsingfors, where his dissertation *De Affinitate Declinationum in Lingua Fennica, Esthonica et Lapponica* (1839) won him the title of docent. About the year 1838 he undertook a pedestrian excursion through Finnish Lapland, in order to extend his knowledge of the language and literature, and in 1840 another through Karelia, to collect ballads, legends, etc., illustrative of Finnish mythology. On his return he published, in Swedish, a translation of the famous Finnish poem, "Kalevala," the metre and style of which were imitated by Longfellow in his poem of "Hiawatha." Aided by the government of his native province, he commenced his researches among the Finnish, Norwegian, and Russian Laplanders, as also among the European and Siberian Samoyeds. Appointed linguist and ethnographer to the St. Petersburg Academy, Castrén, between the years 1845 and 1849, prosecuted his laborious investigations as far east as China and as far north as the Arctic Ocean. On his return he was appointed first professor of the Finnish language and literature at the University of Helsingfors, and in 1851 became chancellor. He employed himself in preparing for publication the vast materials which he had collected, but died, May 7, 1852, from exhaustion—a martyr to science. Before his death appeared *Versuch einer ostjakischen Sprachlehre nebst kurzem Wörterverzeichnis* (1849), as the first installment of his *Nordiska Resor och Forskningar* ('Northern Travels and Researches'). Other works published by him are: *Elementa Grammatices Syrjaenæ* (1844) and *Elementa Grammatices T'scheremissæ* (1845); *Vom Einfluss des Accents in der Lappländischen Sprache* (1845); *De Affixis Personalibus Linguarum Altaicarum* (1850). An edition of his works in Swedish, in 5 vols., appeared in 1852-58, and was supplemented in 1870 by another volume containing a *Biography* of Castrén by I. V. Snellman; a German translation was published between 1853 and 1862, under the auspices of the Academy of St. Petersburg, by Anton Schiefner. They include, besides the works above enumerated, grammars of the Samoyed, Buryat, Tungus, Ostyak, and Koibalic languages.

CASTRES, *kàs'tr'*. A town of France, in the Department of Tarn, situated in the fertile valley on both sides of the river Agout, 24 miles east of Toulouse (Map: France, S., G 5). The principal features are the cathedral, the seminary, the communal college, the public library, and the artillery school. The western half of the town is traversed by wide boulevards and an aqueduct hewn in the solid rock. It is famed for its manufactures. Its fine dyed-wool goods are especially famous, and it has also manufactures of silk, linen, leather, paper, soap, earthenware, metal, furniture, and dyestuffs. Pop. (commune), 1901, 27,308; 1911, 27,830. In the Middle Ages Castres was founded by the Benedictines. In 1519 it was incorporated in the crown of Francis I, and was one of the first French towns to adopt Calvinistic doctrines. It is the seat of a Protestant consistory. It suf-

ferred heavily during the religious wars of the sixteenth century, and in 1629 Louis XIII razed its fortifications.

CASTRI, ká'strè, or **KASTRI**. A village of modern Greece, in the Nome of Phocis, on the southern declivity of Mount Parnassus, worthy of notice as formerly occupying a portion of the site of Delphi (q.v.). Since the French purchased the site to excavate Delphi, the inhabitants moved in 1893 to the new village, somewhat to the west.

CASTRIES, ká'strè', or **PORT CASTRIES**. The capital of the island of St. Lucia, West Indies (Map: West Indies, G 4), 300 miles southeast of Porto Rico. It is situated on the west coast, on Carenage Bay, the entrance to which is marked by a lighthouse visible 14 miles. Most of the trade of St. Lucia, in cocoa, coffee, sugar, rum, mahogany, logs, fruits, and timber, is carried on through this port. Pop., in 1903, 7757.

CASTRIOTA, kás'trè-ò'tà, **GEORGE**. See **SCANDERBEG**.

CASTRO, ká'strò, **CIPRIANO** (1861-). Ex-President of Venezuela. He was born near San Antonio in the Andean Province of Tachira. Little is known of his early life except that, after having been elected a senator from his state, he withdrew from Carácas when President Palacio fell in 1892. The year 1899 brings him to the attention of the public as leader of an insurrection against President Andrade. By some military successes and much bribery Andrade's supporters were soon won from him, and Castro entered Carácas the same year. In 1900 he was chosen provisional President, and in 1901 was formally elected for the balance of Andrade's constitutional term of six years. From the beginning of his rule the country hardly knew a moment of peace. The most important of the insurrections was that headed by Matos in 1902-03. Castro involved his country in dangerous quarrels abroad; the most important being those with the European creditor nations (1902-03), with the United States (1904-), with Colombia and France (1905). In the handling of these difficulties Castro exhibited an utterly unscrupulous shrewdness. In 1905 he was unanimously reelected for a full term, and in honor of the occasion a general amnesty for all political offenders was proclaimed. Congress conferred upon him at the same time the title of "Restaurador de Venezuela." Meanwhile, since 1904, there had been difficulty with the United States because of the confiscation, under suspicious circumstances, of the properties of the New York and Bermúdez Asphalt Company. In 1907 Castro had to deal with two serious rebellions, which he quelled by sweeping executions of the leaders and those closest to them in the plots. Difficulties with most of the foreign creditor powers continued, although in July of 1907 Venezuela met her obligations with British, German, and Italian creditors, as per The Hague Tribunal awards, while refusing to pay the Belgian award. Under Castro's instigation there was further trouble between Venezuela and the New York and Bermúdez Asphalt Company. An appeal by the company to the Venezuelan Supreme Court brought a verdict unfavorable to the company; but the verdict was so manifestly not in accordance with the facts presented that the State Department of the United States, recognizing that the Venezuelan Supreme Court was composed of judges appointed by and removable at pleasure by Castro himself, made

representations concerning the matter to the government of Venezuela. Castro held out, but in December, 1908, went to Europe to undergo a surgical operation. Shortly thereafter the dissatisfaction with him and his rule came to a head in the bloodless revolution that placed Vice President Juan Vicente Gómez in the presidency. Gómez reversed Castro's policy; the New York and Bermúdez Asphalt Company's case was settled by agreement and the company's property restored to it, and the disagreements with the Netherlands and France, which Castro had managed with a high hand, were placed by Gómez in a fair way for settlement. Castro made repeated attempts to return to Venezuela via various countries, but through 1913 had been unsuccessful.

CASTRO, **INEZ DE** (?-1355). A Spanish noblewoman whose unhappy fate has been made the subject of tragedies and poems. She was the daughter of Pedro Fernandez de Castro, a descendant of the royal family of Castile. After 1340 Inez lived with her cousin, Constantia, the betrothed wife of Dom Pedro, son of Alfonso the Proud of Portugal. Constantia died in 1345, and Dom Pedro, as she afterward claimed, secretly married Inez in 1354, in the presence of the Archbishop of Guarda. As the King feared that this union might prove injurious to the claims of Ferdinand, son of the deceased Constantia, it was determined in the King's Council that Inez must die. Accordingly, the King with three companions hastened to Coimbra to execute the sentence (1355); the King was so moved by the grief of Inez that he wished to spare her, but his companions murdered her. Dom Pedro attempted a revolt against his father, but finally became reconciled. According to a tradition, immortalized by Camoens, Pedro, who had succeeded his father, established the legality of his marriage with Inez, caused her body to be exhumed, and, placing it upon the throne, required all the nobles to do her homage.

CASTRO, **JOÃO DE** (1500-48). A Portuguese naval commander and explorer. He was born in Lisbon and as a youth distinguished himself in a number of campaigns against the Moors of Tangiers and Tunis. Upon his return from an expedition to the Red Sea, he was made, in 1543, commander of a fleet to clear the European seas of pirates. In 1545 he was sent out as Viceroy of the Indies to supplant Martin de Souza. He overthrew Mahmud, King of Cambodia, relieved the beleaguered town of Diu, and defeated the great army of Adhel Khan. He subsequently completed the subjugation of Malacca and prepared the way for the invasion of Ceylon. Shortly after receiving his full commission as Viceroy he died at Ormus. He wrote a description of the Red Sea entitled the *Roteiro*, which was very important for his day (latest ed. by Corvo, Lisbon, 1882). Aside from Vasco da Gama, João de Castro is the only one of those illustrious captains sent by Portugal to India to whom a statue has been erected. It stands over the gate of the principal entrance to Goa.

CASTRO, **JOSÉ MARÍA** (1818-93). A statesman of Costa Rica, born in San José. He graduated at the University of León, Nicaragua. He was President of Costa Rica from 1847 to 1849. He had always shown an intense interest in educational affairs, and it was he who proposed and obtained, while he was Minister under José María Alfaro, the creation of the University of Santo Tomás. One of his earliest acts as

President was the founding of a normal school, for the purpose of establishing later girls' schools throughout the country. During his administration he suppressed various rebellions and showed himself clement under extreme provocation, for he never resorted to the death penalty against his political foes. During this administration, too, the position of "City Physician" was created in all the provinces, and local charitable bureaus were inaugurated. He established the independence of Costa Rica from the Federation of Central American States, although remaining on friendly terms with the neighboring states. He established also diplomatic relations with foreign countries. For these services Congress on separate occasions voted him the following titles, "Benemérito ('Well-Deserving') de la República," "Commander in Chief of the Army"; and, when he resigned the presidency, Nov. 16, 1849, the Congress conferred upon him the title of "Founder of the Republic of Costa Rica." He was again President from 1866 to 1868, when he was superseded by Jiménez. Consult F. Montero Barrantes, *Historia de Costa Rica* (San José de Costa Rica, 1892 et seq.).

CASTRO ANDRADE Y PORTUGAL, andrã'dã ê pôr'tõ-gäl', PEDRO ANTONIO FERNÁNDEZ DE. tenth COUNT OF LEMOS and seventh MARQUIS OF SARRIÁ (1634-72). A viceroy of Peru, grandee of Spain, and son of the patron of Cervantes. He was appointed to succeed the recently deceased (March, 1666) Count of Santistevan, Diego Benavides y de la Cueva, and entered upon his office on Nov. 21, 1667. The lawlessness in the mining regions he met with severity. Particularly was this true in connection with the silver mine of one Gaspar de Salcedo at Laycacota, near Lake Titicaca. The enormous revenues derived by Salcedo from this mine angered other mining proprietors of the district. Bushwhacking bands were formed, and blood flowed freely. The Viceroy opened at Pancar-colla a court for the trial of such offenses, executed 42 persons, and banished or fined many more. Having been assured by his confessor, Francisco del Castillo, that he had been needlessly cruel, he had masses said for the souls of his victims, and himself performed menial duties in the conduct of the services. While engaged in these devotional exercises, he was seized with a dangerous illness that caused his death, Dec. 6, 1672.

CASTRO DEL RIO, kä'strõ dël rë'õ (Sp., castle of the river). A town of Spain, in the Province of Córdoba, situated on the right bank of the Guadajoz, about 21 miles southeast of Córdoba (Map: Spain, C 4). A portion of the old town is surrounded by ruined walls. In earlier times the city wall had only one gate, defended by a Moorish castle, which the Count of Castro and his followers repaired and used in the turbulent days of Henry IV (1425-74). The new town, lying outside of these, has some good streets. The municipal building is worthy of mention. The town has manufactures of woolen and linen fabrics, earthenware, etc., and carries on considerable trade in agricultural produce. Pop., 1900, 11,689; 1910, 11,734.

CASTROGIOVANNI, kä'strõ-jõ-vän'nè (It., castle of John). A city in the Province of Caltanissetta, Sicily, situated on the level top of a hill 2600 feet high, 55 miles west of Catania (Map: Italy, J 10). From the highest tower of the citadel La Rocca, which occupies the

highest part of the town, is obtained one of the finest views in Sicily. The cathedral, founded in 1307, has some treasures, and the public library contains valuable incunabula. There are also a museum, a technical institute, and a castle built by Frederick II of Aragon. The city is a local centre of trade, mainly in sulphur and rock salt. It occupies the site of the ancient Enna, called *inexpugnabilis* by Livy, and the modern name comes through the Arabic *Kasr-Yani*, the *Yani* being an Arabic corruption of *Enna*. In the Punic Wars Enna was a centre of combat, and ancient Roman missiles are still picked up in the vicinity. In 837 A.D. its walls defended the inhabitants of the whole district against the Saracens, but in 859 the fortress was captured by treachery. The Normans captured it in 1087. Pop., 1901, 26,081; 1911, 28,932.

CASTRO-URDIALES, -õr'dè-ä'lãs. A town of Spain, in the Province of Santander, situated on the Bay of Biscay (Map: Spain, D 1). It has a good roadstead and exports timber and fish to Madrid. Fishing and fish preserving, with some manufactures, constitute the principal industries. The town, after having repelled a previous attack, was sacked by the French in 1813. Pop., 1900, 13,068; 1910, 12,463.

CASTROVILLARI, kä'strõ-vël-lä'rè. A city in south Italy, 34 miles north of Cosenza, on the Coscile (Map: Italy, K 8). The ancient part of the town, about the Norman castle, is not inhabited because of the prevalence of malaria. Near by at Lungro are the only important salt mines of Italy. Fruit, wine, and cotton are marketed here. Pop., 1901, 9945; 1911, 9700.

CASTRO Y BELLVIS, è bël'vès, GUILLEM DE (1569-1631). A Spanish dramatist, the most brilliant writer in the so-called Valencian school. He was born of an exceedingly distinguished Valencian family, and enjoyed the friendship of many celebrated and powerful personages in society, in letters, and in statecraft. In 1591 he became a member of a local literary academy called the *Academia de los Nocturnos*. Already in 1593 we find him as captain of the coast guards of Valencia, a position that he seems to have held at least throughout the rest of the century. In 1602 he carried off a first prize in a literary tournament held in Valencia in honor of the canonization of the Catalan Fray Raymundo de Peñafort. Later he was the protégé of Juan Alonso Pimentel de Herrera, Count of Benavente, Viceroy and captain general of Naples, 1603-09, who in 1607 appointed him to the governorship of Scigliano. Still later in his career he was handsomely favored by the Duke of Osuna and by Olivares. In 1619 Lope de Vega, with whom he had long been on terms of intimate friendship, dedicated to him a famous play, *Las almenas de Toro*, while Castro had already dedicated to Lope's daughter the part of his *Comedias* (1618-21). In 1620 we find Castro at Madrid taking part in a literary tournament in honor of the beatification of San Isidro. The following year he again appears at court in a poetic tournament held in honor of the canonization of St. Ignatius Loyola and St. Francis Xavier. In 1622 the patron saint of Madrid, San Isidro, was canonized, and in the literary contest held in honor thereof, Guillem de Castro won a first prize. At this time he seems to have remained in Madrid, and on Aug. 22, 1623, there was conferred upon him the habit of the Order of Santiago. Some writers

have stated that for his waywardness he lost his powerful protectors, and that he died so poor that he had to be buried at public expense. There seems to be no foundation for this report. His will, dated three days before his death on July 28, 1631, has been found, and it disposes of a comfortable fortune. Castro's *Fuerza de la costumbre* is considered by some the source of *Love's Care*, which has been ascribed to Fletcher. Castro is said also to be the author of *El prodigio de los montes*, whence Calderón derived his *Mágico prodigioso*; but it is possible that the *Prodigio* is only another name for Lope de Vega's play *La bárbara del cielo*. Castro's most celebrated play is his *Mocedades del Cid*, from which Corneille confessedly derived his own *Le Cid*. Seven of his plays are to be found in vol. xliii of the *Biblioteca de autores españoles*. Consult: *Las mocedades del Cid* (ed. of W. Foerster, Bonn, 1878); *Première partie des mocedades del Cid* (ed. of E. Mérimée, Toulouse, 1890); *Ingratitud por amor* (ed. of H. A. Rennert, Philadelphia, 1899); *Comedia del pobre honrado* (ed. of M. Serrano y Sanz, in *Bulletin Hispanique*, vol. iv, 1902); *El ayo de su hijo* (ed. of H. Mérimée, in *Bulletin Hispanique*, vols. viii, ix, and xi, 1907-09); of all these editions of single plays only those by the two Mérimées and Rennert contain good introductions. Consult also C. Pérez Pastor, *Bibliografía Madrileña*, partiii, pp. 344-362; and for a biography and bibliography, with justificatory documents, consult the *Cancionero de la Academia de los Nocturnos de Valencia*, extracted from the *Actas* of the Academy by Pedro Salvá, and Francisco Martí Grajales, in 3 vols. (Valencia, 1905-06).

CASTRUCCIO CASTRACANI, kâ-strōōt'chō kâ'strâ-kâ'nê (c.1280-1328). An Italian soldier and Ghibelline leader, Duke of Lucca. A member of a prominent Ghibelline family of Lucca, he was exiled at an early age and served as a soldier in Flanders and Lombardy until 1314, when he conquered Lucca. Being placed at the head of his state, he played a prominent rôle in the struggle between the Ghibellines and Guelphs in Tuscany. He supported the German Emperor, Louis the Bavarian, whom he accompanied on his expedition to Rome in 1327, and who made him Imperial vicar of Lucca and master of Pisa. Machiavelli's life of Castruccio is untrustworthy. Consult Winkler, *Castruccio, Herzog von Lucca* (Berlin, 1897).

CAS'TRUM CERRU'CIUM. See CASTEL-SARRASIN.

CAST STEEL. See IRON AND STEEL, METALLURGY OF.

CASTUA, kâ'stwâ. A town in the Austrian Crownland of Istria, at the head of the Bay of Quarnero, near Fiume (Map: Austria, D 4). Pop. (commune), 1900, 18,000, mostly Serbo-Croatian. Castua, being a very old town, is noted solely for its former glories, when it was the capital of Liburnia. The ancient walls, towers, and a Roman aqueduct still remain.

CASUAL POOR. A term used in the administration of the English Poor Law to indicate persons temporarily relieved without being admitted to the roll of permanent paupers. See POOR LAWS.

CASUARINA, kâzh'û-â-rî'nâ (Neo-Lat., from *casuarius*, cassowary, from Dutch *kasuaar*, Malay, *kassuwaris*, so called from the resemblance of the branches to the feathers of the bird). A genus of the family Casuarinaceæ. The trees of this genus are almost exclusively Australian.

However, *Casuarina equisetifolia* is found in the South Sea Islands, the Indian Archipelago, the Malayan Peninsula, and on the east side of the Bay of Bengal, as far north as Arracan, and *Casuarina sumatrana* grows in the Philippine Islands. Some of them are large trees, producing timber of excellent quality, hard and heavy, as the beefwood of the Australian colonists, so called from the resemblance in color to raw beef. *Casuarina equisetifolia* is called in Australia the swamp oak. It is a lofty tree, attaining a height of 150 feet, the *toa* or *aitoa* of the Society Islands, where it grows chiefly on the sides of hills, and where its wood was formerly used for clubs and other implements of war. It has been introduced into India, where it grows rapidly upon even-poor, sandy soil, and where it is much valued, as its wood bears a great strain and is not readily injured by submersion in water. The hardness and durability of this wood led the earlier voyagers to the South Sea Islands to designate it ironwood. *Casuarina stricta* is the "coast she-oak" of New South Wales. In Australia, where the Casuarinas abound, they are considered among the most valuable trees. For the most part the wood is hard, compact, yet easily worked, and is used in many kinds of building, for implements, cabinetwork, etc. The foliage of most, if not all, species is of an acid nature and is often chewed to allay thirst. In periods of drought stock eat considerable quantities of the foliage. The first-mentioned species has been quite successfully introduced into parts of Florida and California. "Cassowary tree" is a popular generic name of the Casuarinas. Some of the species are scrubby bushes. All of them have a very peculiar appearance, their branches being long, slender, wiry, drooping, green, and jointed, with very small scalelike sheaths instead of leaves. They resemble arborescent equisetums, or horse-tail rushes. The fruit consists of hardened bracts, collected in a cone and inclosing small winged nuts. The flowers have neither calyx nor corolla; the stamens and pistils are on separate flowers. About 25 species are known. This genus is noteworthy as the first one in which chalazogamy (q.v.) was found.

CASUISTRY, kâzh'û-îs-trî (from *casuist*, Fr. *casuiste*, from Lat. *casus*, instance). A punctilious elaboration of a system of rules for the guidance of conscience, so that each particular action can be brought under some rule. That part of theology which deals with such matters is called moral theology. Casuistry developed as circumstances called for new and clearer interpretations of divine and human enactments. In the first centuries it was extremely simple, and the treatises on it consisted mainly of conciliar decrees, or collections of penitential canons such as those attributed to St. Gregory Thaumaturgus, St. Peter of Alexandria, St. Basil, and St. Gregory of Nyssa. From the seventh to the eleventh century the work known as *The Penitential Book*, which was a digest of canons, sentences, and decrees, was the manual commonly used. But moral theology proper began with the schoolmen of the thirteenth century. The most noteworthy of the treatises then written was the *Summa de Casibus Particularibus* (c.1238), of St. Raymond of Peñaforte. Other conspicuous casuists of the century were the Englishman Alexander of Hales, and Vincent of Beauvais. In the fourteenth century we have John of Freiburg, Astensis, Monal-

dus, Bartholomæus, Ranulphus Higdenus, and, most famous of all, Joannes de Burgo. In the fifteenth century Gerson's famous *Opusculum Tripartitum* enjoyed the greatest reputation. St. Bernardine of Siena, St. John Capistran, and St. Antoninus also wrote on moral subjects. But the one who has exercised the widest influence is, of course, St. Thomas Aquinas (1227-74), who in his *Secunda Secundæ* treats of moral theology in its organic connection with dogma. Its technical character, however, makes it somewhat unavailable as a manual for common use. Making this science practical was the achievement of the sixteenth century. The extraordinary development of this particular branch of theological knowledge was largely due to the doctrine of Probabilism.

This was not a new doctrine, but it was inaugurated as a system by a Spanish Dominican named Medina. The theory may be thus stated: A man in doubt about the lawfulness of an act has solid reasons for thinking it is lawful. These reasons may be intrinsic to the matter itself, or extrinsic, namely, the authority of some respectable theologian. But there may be contrary reasons of equal or greater weight than those in favor of it. Which course is he to elect? Probabilism teaches that he is free to do as he chooses, provided his reasons for acting be genuine and solid. He proceeds on the principle that, as the law is not certain, he is free; for no one is bound by a doubtful obligation. This liberty, however, is restricted if for some major obligation he is bound to take every reasonable means to achieve a certain object. A hunter may not discharge his rifle where it is merely probable no one will be hit; he must take every reasonable precaution; a Catholic priest may not act on the doctrine of probability where there is question of the validity of a sacrament. But apart from these antecedent obligations of justice, charity, and religion, Probabilism leaves a man free when he has good reasons for judging that he is doing right.

In the development of this casuistry four schools arose: the Tutorists or Rigorists, who were either absolute or mitigated—the former requiring absolute certainty, the latter the greatest probability; the Probabiliorists, who taught that in cases of doubt a man should always follow the safer course; the Æquiprobabilists, who allowed liberty of action only when the reasons *pro* and *con* were evenly balanced, but modified that concession by saying that when the existence of the law was certain or even more probable, there could be no liberty against it, for the law being certainly or more probably in possession exacted fulfillment; the Laxists, who contended that one is free to act if he has even a slight reason to conclude that he is in the right. The Laxists were condemned by Innocent XI, and the Absolute Tutorists by Alexander VII.

On these lines a fierce and protracted theological battle began, which finally narrowed down to a contest between the Probabiliorists and the Probabilists. From 1580 to 1650 Probabilism held possession. After that a reaction set in, and Probabiliorism was the favorite doctrine. At present the conditions have reverted to what they were in the beginning, and Probabilism almost everywhere prevails in the Roman Catholic church. The chief exponents are St. Alphonsus Liguori, Scavini, Gury, and Ballerini.

The acrimony of these debates gave rise to

the odious significations which have been affixed to the word "casuistry." After the accusations of the Jansenists (see PASCAL; JANSENISM) ceased, about the middle of the eighteenth century, many Protestant writers took them up and denounced the casuistry of Probabilism as lax, equivocating, permitting the most detestable crimes, and outraging the most sacred obligations. These charges, no longer seriously made by intelligent students, have given rise to the secondary meaning of the word "casuistry" as, according to some, a method of oversubtle, sophistical, and dishonest reasoning for the purpose of evading the law; others regard it as an elimination of individual reason and conscience and a blind submission to authority. Consult: Döllinger and Reusch, *Moralstreitigkeiten im siebzehnten Jahrhundert* (1889); Slater, *Cases of Conscience for English-Speaking Countries* (New York, 1911); also works on Ethics under ETHICS. See PROBABILISM.

CASUS BELLI (Lat., case of war). The ground alleged by one power to justify its going to war with another. The grounds which in international law are recognized as affording a justification for war are: (a) the defense of the sovereignty and independence of the state; (b) the redress of grave injuries inflicted by a foreign power on the citizens of a state; (c) to obtain satisfaction for violations of the honor of a state, as for insults to its flag or its ambassadors; (d) the enforcement in serious cases of treaty obligations; (e) the prevention of threatened or intended injury, as a sudden disturbance of the balance of power in Europe, or the disregard by a European power of the Monroe Doctrine of the United States; (f) in rare cases, the prevention of flagrant wrong against religion or liberty, or grave oppression of a colony or weaker state, as in the war of the United States against Spain for the liberation of Cuba. (See INTERVENTION.) The most frequent cause of war, the desire of a state to further its own interests, is not recognized by international law as a legitimate *casus belli*. The humane tendencies of modern international law seek to restrict the causes for war, and by moral pressure to induce an offended state patiently to seek every other means of effecting its object before resorting to the dire expedient of war. See INTERNATIONAL LAW; HAGUE PEACE CONFERENCE; WAR, and the authorities there referred to.

CASWELL, kăz'wel, ALEXIS (1799-1877). An American educator. He was born in Taunton, Mass., graduated at Brown University in 1822, and entered the Baptist ministry. He was professor of mathematics and natural philosophy in Brown University from 1828 to 1850 and of mathematics and astronomy from 1850 to 1864 and was president of that institution from 1868 to 1872. He was, besides, one of the founders of the American Association for the Advancement of Science. Besides a *Life of Francis Wayland* and a *Textbook on Astronomy*, he published several papers on meteorology in the *Reports of the Smithsonian Institution* and a *Memorial of John Barstow* (1864).

CASWELL, RICHARD (1729-89). A patriot soldier of the American Revolution and the first Governor of the State of North Carolina. He was born in Maryland, emigrated to North Carolina in 1746, studied and practiced law, and soon became prominent in Colonial politics. He was a member of the Colonial Assembly from

1754 to 1771, and was elected Speaker of the House of Commons in 1770 and 1771. He also attained prominence as an officer in the Colonial militia, and on May 16, 1771, commanded the right wing of Governor Tryon's forces in the battle of Alamance against the insurrectionary Regulators. He was active as a member of the Whig, or Patriot, party in the discussion which preceded the Revolution, and in 1774 and 1775 was a delegate to the Continental Congress. In September, 1775, he was appointed one of the treasurers of North Carolina. He commanded the minutemen, numbering about 1000, who, on Feb. 27, 1776, defeated a force of Loyalists, mostly Scotch emigrants, under Donald Macdonald, at Moore's Creek, N. C.; and for this victory, the effect of which, says Fiske, "was as contagious as that of Lexington had been in New England" (Fiske, *The American Revolution*, vol. i, p. 177), he was appointed brigadier general of the Newbern district. In 1776 he was a member of the committee of the Provincial Congress which drew up the State constitution—one tradition attributing the authorship of that document altogether to him—and in 1777-79 he served as Governor. In 1780 he commanded the North Carolina militia during the invasion of the State by the British and took part in the battle of Camden on August 16. He afterward served as Speaker of the State Senate and Controller General from 1782 to 1785, and as Governor, for a second term, in 1784-87, and in 1789 was a member of the State convention which ratified the Federal Constitution.

CAT (AS. *catt*, Ger. *Katze*, Fr. *chat*, OF. *cat*, It. *gatto*, Sp., Portug. *gato*, Welsh, *cath*, Corn. *cath*, Ir., Gael, *cat*, OChurch Slav. *kotelī*, OPruss. *catto*, cat, Lat. *catus*, cub; borrowed in Finn. *katti*, Turk. *qadi*, Ar. *qitt*, *qutt*, Hind. *katās*; of uncertain origin). The cats are typical æluroid carnivores, constituting the family Felidæ, and well represented by the ubiquitous house cat, which is considered at length below.

Cats in general, as a family, are distinguished among carnivores by their uniformity of structure, by the flexibility and strength of the spine, the small head, capable of being turned in any direction, the looseness of the skin, and the exceeding suppleness, quickness, and muscu-

claws, and a crushing bite. All the anatomy, therefore, represents agility and power in the highest degree; and all cats except two or three of the heaviest (lion, tiger) are arboreal to a greater or less degree. The skull is remarkable for the bony ridges which give attachment

DENTITION OF THE CAT.

Teeth of left side in both jaws: *m m*, molars; *pm pm*, pre-molars; *c c*, canines; *i i*, incisors.

to the great jaw muscles, the immense size of which causes a corresponding increase in the width of the zygomatic arches; and the facial portion, short in all carnivora as compared with herbivora, is here much shorter than in the dog or bear tribes, giving the characteristic roundness to the head. The lower jaw is strongly attached, and capable only of a simple hingelike motion. The dentition consists of six small incisors in each jaw, large canines and one permanent molar on each side, that in the upper jaw being small, the lower large and acting against the fully developed premolar in the upper. All are carnassial, for little "grinding" of the food is called for; and the canines of some, as especially of the extinct sabre-toothed tiger, are formidable tusks. The tongue is rough; the intestinal canal very short, being in some species only three times the length of the body. The most striking and characteristic peculiarity of cat structure, however (though imperfect in one genus—*Cynalurus*; see CHEETA), is the arrangement for the protrusion and retraction of the claws, by which they are made the principal instruments whereby these creatures get their living. Their plan, as has been said, is to get as near as possible to their animal prey, seize and hold it until they can overcome it by biting through the arteries of the neck (in the case of large quadrupeds) or otherwise put it to death; they cannot chase it down and worry it to death after the manner of dogs. This requires that their toes should be separated, flexible, and capable of a powerful grip, and their claws sharp and hooked. The acquirement of such tools has been accompanied by provision for keeping them out of the animal's way, in the ordinary use of its feet, and at the same time saving them from becoming blunted by contact with the ground, as happens to those of all other clawed animals, by a peculiar arrangement. In the cats, the last (third) phalanx, or tip bone, of the toe, which carries the claw, does not touch the ground, but it is so modified as to turn up beneath a hood of skin over the end of the bone (second phalanx) next behind it; this it does naturally, when at rest, by virtue of the elasticity of a ligament which passes from

SKULL OF CAT.

a, tongue bones of one side.

larity, the last especially exhibited in the jaws and in the wonderful arrangement of levers in the limbs. These are correlated with their predatory habits and manner of procuring their prey, which is by lying in wait, or by stealthy approach, followed by a spring, a clutch of the

WILD CATS

1. JUNGLE CAT OR CHAUS (*Felis chaus*).
2. MARBLED TIGER-CAT (*Felis marmorata*).
3. EYRA (*Felis eyra*).

4. HUNTING CAT OR CHEETA (*Cynælurus jubatus*).
5. JAGUAR (*Felis onca*).
6. OUNCE OR SNOW LEOPARD (*Felis uncia*).

it down to the second phalanx and holds it in place without any conscious effort. From the lower (proximal) end of this claw bone a powerful flexor tendon runs back beneath the bones of the toe to the leg muscles, the contraction of which pulls the claw down with a circular motion which drives it and hooks it into the flesh, where it will tear loose before it will let go. Such

MECHANISM OF CAT'S CLAWS.

a, Toe at rest (claw sheathed); *b*, toe in action (claw thrown forward). The illustration shows the elastic ligament which passes from above the root of the claw downward and backward to the distal part of the second phalanx; also the long flexor tendon (which by being pulled backward draws down the claw) passing through the ligamentous loop attached to the under surface of the middle phalanx. The sesamoid bone beneath the distal end of the metacarpal is also shown. (After Mivart.)

is the mechanism of the action so familiar and effective in the cat when she is angry and "shows her claws." The cheeta (q.v.) lacks this power, and correspondingly its predatory habits partake of much that characterizes dogs.

Cats are mainly nocturnal in their habits, and the pupils of their eyes, which, as a rule, are vertically linear, are capable of great expansion and contraction, according to the light about them; the lion, however, by virtue of his fearlessness and circumstances generally, is mainly diurnal and has round pupils. The eyesight is good, but at night is supplemented by the highly sensitive feelers (vibrissæ), long hairs projecting from the muzzle and above the eyes, each springing from a follicle from which a special nerve communicates with the brain. The sense of smell, though fairly developed, is inferior to that of dogs and various other animals. The hearing, however, is exceedingly sharp, the resonance of the sound being increased by the great size of the auditory bulla.

Cats are clothed in soft and usually rather long fur, longest in those, such as the ounce, or snow leopard, which live in cold regions, and shortest in the desert species, especially in the lion, which is further distinguished by a mane in the male sex. Little difference, as a rule, obtains between the sexes in size or appearance; but the kittens are often unlike their parents. Their pelts have never entered largely into the fur trade, however, except in the form of tiger-skin floor rugs, etc. The colors are mainly dark, with a prevalence of reddish or yellowish, and there is a universal and strong tendency towards spottedness (of which striping is another form), the young showing it even where the adult is concolorous, as in the lion, puma, eyra, etc. Arguments have been freely adduced for the value of this coloration in making the cats unnoticeable, but when it is learned that species almost oppositely colored and

marked live and hunt under identical circumstances with apparently equal success, the force of the speculation is seriously diminished.

Cats are not gregarious or coöperative, but live and hunt alone or in family parties; all are monogamous except the lion; and the reputation which some have for permanent mating is probably deserved only when an annual change of mate is impracticable because of scarcity or competition. They inhabit dens and lairs among rocks, in hollow trees, or dense thickets, without any special preparation, and the number of kittens does not usually exceed two in the large forms, but in the small species may be three, four, or five. These are usually born in the late spring of temperate latitudes or at the opening of the dry season in the tropics; and they remain under the guidance of the mother until nearly full-grown. Though many species are widely distributed, none are migratory, and few wander far, the tiger and leopard being the most inclined, perhaps, to wide ranging. The disposition of most cats is to remain near a settled lair—a disposition recognizable in the attachment to the house and to a favorite corner that distinguishes our house cats and makes them loath to change their location and customs. A certain inflexibility seems to characterize their minds, and the secrecy, noiseless stealth, patience, and ruthlessness which belong to their methods of life in the forest have affected their temperaments. The needful savagery of their nature is ingrained and as a rule unyielding to gentler influences in changed conditions. Hence they are, as a class, untamable, the very few exceptions having become the stock of the domesticated races. Most species can be made friendly to man only when kittens, asserting their feral natures and becoming untrustworthy as soon as growth brings sense of power and predacious instincts. Trainers have subjugated certain species, but they are kept in subjection by fear alone and make their performance unwillingly and without pride or joy in it. A few have been trained to hunt, but none to retrieve, and in general they approach sympathy with man and the attitude of companion and helper far less than dogs, which exceed them in certain directions of intelligence, as, for example, the understanding of mechanical appliances. A cat's expression of its emotions is mainly by "lashing" of the tail or a trembling of its tip, when excited; by spitting, yowls, and screams when very angry or sexually excited; by plaintive mewings when in trouble or desiring notice; and by a vibrating murmur deep in its throat (purring) when satisfied or contented. The position of the ears is very significant, as in most other animals; and the arching of the back, erection of the hair, and elevation of the tail, so familiar in our house cats, which thus try to make themselves look as large and terrible as possible in the presence of an enemy, are characteristic of all the smaller forms, though little indulged by the greater kinds. The relation of the cats to mankind generally is one of enmity—they are neighbors dangerous to him or his domestic animals which must be got rid of wherever civilization is to prevail. Hence they have mostly disappeared from thickly settled regions. The lion and tiger were inhabitants of Europe within historic times, but neither is now to be found near the Mediterranean on either side; and even the wild cat is rare in Europe,

except in wilder parts. The puma has been exterminated in the United States east of the plains, and lynxes are uncommon, while the jaguar has quite disappeared north of Central Mexico. In certain long-settled parts, however, jungles and mountain ranges furnish harbors for these beasts, which sally out to destroy human life, as in India and Africa, or to prey upon flocks and herds as in America.

Fossil Cats. The Felidæ seem to have been derived from somewhat primitive Miocene carnivores, the sabre-toothed tigers (q.v.) constituting the highly interesting family Nimravidæ, which were themselves evolved from some earlier Eocene creodonts, perhaps *Palæonictis* and *Patriofelis* (q.v.).

The true felines appear first in the Lower Miocene of France, where they are represented by *Proælorus*, and in the Middle Miocene by *Pseudoælorus*. The genus *Felis* appears first in the Middle and Upper Miocene of Europe and North America, and later in the Pliocene and Pleistocene of both these continents and also of Asia. As with several other races of animals, the Pliocene and Pleistocene members appear to have been of much larger size and to have inhabited more northerly countries than their modern descendants. The cave lion (*Felis spelæa*), whose remains are found in the cave deposits of Europe and England, was larger than the modern lion of Asia and Africa, of which species it seems to have been a variety. Equally large species are known from the American Pleistocene deposits. Fossil remains of many of the existing species of felines are found in the Pleistocene deposits of Europe and southern Asia.

Cats inhabit all parts of the world except Australia, New Zealand, southeast Malaysia, the Polynesian Islands, and Madagascar, the greater number being inhabitants of southern Asia. There are from 40 to 50 species (according to various views of specific rank in certain cases), divided by conservative zoölogists into only three genera—*Felis*, with 35 to 40 species; *Lyncus*, the short-tailed cats, 6 species; and *Cynælorus*, 1 or perhaps 2 species. Most of these will be found described elsewhere under their names, as LEOPARD, LION, LYNX, OUNCE, TIGER, ETC., or under WILD CAT.

Elliott, *Monograph of the Felidæ* (London, 1878-83); Mivart, *The Cat* (New York, 1892; anatomical and descriptive; illustrations of bones, muscles, etc., and of nearly all the species); Wilder and Gage, *Anatomical Technology, as Applied to the Domestic Cat* (New York, 1882); Richard and Jennings, *Anatomy of the Cat* (New York, 1901). See also bibliography at the end of this article.

The Domestic Cat. A cat, or cats, formed a part of the domestic circle in various parts of the world before the beginning of human record, and the question of the origin of the varied domestic races known within historic times may only be guessed at. Naturalists have attempted by a study of semifossil remains, mummies from ancient Egyptian tombs, a comparison of modern examples with wild forms of similar size, and a study of the reversionary tendencies exhibited by house cats that return to a feral life, to determine the origin of the race, but have learned nothing definite. The best opinion seems

to be that stated by J. E. Harting, F.L.S.: "Several wild species of Egyptian and Indian origin having been ages ago reclaimed, the interbreeding of their offspring and crossing with other wild species in the countries to which they have been at various times exported has resulted in the gradual production of the many varieties, so different in shape and color, with which we are now familiar."

Domesticated cats seem to have been common in Egypt before the time of the earliest records, for their mummies are coeval with the most ancient human remains and they are depicted on the oldest monuments. The same may, perhaps, be said of India, where they are mentioned in Sanskrit manuscripts at least 2000 years before Christ; and from India they were taken to China, where, however, they seem not to have been generally known until about 500 A.D. It was in Egypt, however, that the animal, which is considered to have been there, at least, the local gloved or Caffre cat (*Felis caffra*) domesticated, reached its highest importance, both as a mouser in that "granary of the world" and as an object of affection and veneration. It was naturally connected with the cat-headed moon goddess Pasht, both by its habits and by the fanciful resemblance of the gradual expansion of its pupil, as darkness came on, to the growth of the moon; was protected by priestly decrees and superstitions of great popular force, and was entombed in elaborate mummy cases. It is believed that the domestic cats of Europe, whence America received its stock, were derived from Egypt at a comparatively late day. It does not appear that they were known as domestic animals among the Assyrians or early Hebrews, and the mousers in the homes of the early classic Greeks were probably martens (*Martes foina*). Cats were possessed by the central Europeans of the Bronze age, and probably came to have more or less admixture with the European wild cats, but the basis of the stock from which our present varieties have descended is, no doubt, the Egyptian domesticated race. The Indian and Chinese may have originated quite separately from Asiatic species.

Domestic cats are now divided by the character and color of the coat, comparative length of tail, etc., into certain varieties recognized by fanciers, according to rules formulated by the societies which hold annual competitive exhibitions in New York, London, and other cities. The principal divisions are two—long-haired, or Asiatic, and short-haired, or European cats. The long-haired varieties are two, the Angora and Persian.

The *Angora* cat came originally from Angora and has a small head and rather large tufted ears; the long silky hair should hang in tufts and clusters, shortening towards the end of the tail. The colors are varied, but black and dark-slate colored ones with orange eyes, or blues and whites with light eyes, are most valued.

The *Persian* is also long-haired, but is larger in body and the fur is coarser, and increases towards the end of the long tail; the color may be almost any, but deep black with orange eyes is preferred; blue is the next best color.

The short-haired cats are mainly distinguished by their colors, as tortoise-shell, tabby, white, blue (or Maltese), etc. The hair may differ somewhat in length and texture, but in this respect the diversities are too slight and inconstant to count much. *Tortoise-shell* cats are rather small, long-bodied, and graceful; in color,

5. LONG-HAIRED, SILVER-HAIRED, OR ANGORA CAT.

black, red, and yellow, rich and deep, and disposed in sharply defined patches upon short, close, silky hair. Eyes, bright amber to orange-yellow. The presence of white sets the animal aside into a variety known as *Tortoise-shell and White*, where the white should be in a distinct blaze on the face and on the breast and legs. All these cats are good mousers, but less affectionate than some others.

Tabby is the name given to banded or brindled cats, in allusion to the wavy pattern of their coats, like the old-fashioned "watered" fabrics from the East once known in commerce as "attabi," and more lately as "taffety." Four varieties are recognized by fanciers—brown, spotted, blue (or silver), and red tabbies. Good examples of these types must conform to their standard; anything else is simply an unclassed "tabby cat." "The brown tabby," says Huidekoper, "has a ground color of a rich reddish dark brown, with no white, and even, regular bars and bands of solid shining black over every part of the body; these bands must be perfectly distinct, and there must be no spots." The *Spotted Tabby* may be of any base color, and is uniformly and equally spotted all over with black spots set in lines. The eyes of both these varieties should be orange. The *Blue or Silver Tabby* is a rather small, very slender, graceful, close-haired cat, bright blue or else silvery in color, setting off the jet-black narrow bands with great sharpness; cushion of the feet black; long tail, ringed; eyes orange for the blue, yellow for the silver race. The *Red Tabby* varies from reddish brown to red in base color, having well-defined bands of darker red and no white whatever; eyes, orange or yellow. This cat is an important factor in breeding tortoise-shells; in fact, 99 per cent of male tortoise-shell kittens are red tabbies, the females only, as a rule, being proper tortoise-shells. They are good-natured domestic cats, great mousers and hunters for birds; they are also expert fishers. *White* and short-haired cats form a special class, characterized by eyes of turquoise or clear sky-blue; or, if yellow, there must be no greenish tinge. These are quiet, affectionate cats, very often deaf. *Self-colored* cats include those which are of some one solid color, and their eyes should be orange yellow for the blue (or Maltese, as it is known in America), orange for the black, yellow for the gray, and gold for the red cat. The more uniform the color, the better. *Black* cats and *Black and White* cats are classed separately, and in the latter case the white should be only on the face, muzzle, breast, and paws; the eyes vary from orange yellow to sea green. The *Royal Cat of Siam* reverses this somewhat, being dun, or fawn color, with black face, ears, tail, and feet. The *Manx* cat differs from others not only in being tailless (as a rule), but also, like the Siamese variety, has the hind quarters decidedly elevated. A white *Manx* cat is almost unknown, and black ones are exceedingly rare.

CAT (in old ships the catfall led through the cathead, a projecting beam on the bow frequently ornamented with a cat's head). In nautical parlance, the *cat* or *cat purchase* is a device used in getting the anchor up in the securing position after it has been hoisted by the capstan as far as the hawse pipe. See **ANCHOR**.

CAT. In military engineering, a heavy beam with a sharp iron point, used during the Middle Ages in besieging castles or towns. It was provided with a movable cover of timber, for the protection of those who worked it, by swinging it back and forth. It was called a cat because it clawed into a wall. It was also known as a mouse or fox because it gnawed a round hole, and as a hog or sow, from the round back of its cover, or because it worked with its tusks, like a boar. The name "cat" was also used for a hurdle protection under which men could work at undermining walls.

CAT, THE. The instrument employed for the flogging of persons sentenced to that punishment. It consists of a whip with nine tails, and the punishment, as usually prescribed, is inflicted on the back of the offender. It was formerly employed in the British army in case of certain breaches of discipline by soldiers, but its use was abolished in 1881 by the Army Act (44 and 45 Vict., c. 58, § 44). It is still employed in the British navy. The punishment may in certain cases be imposed by the courts of England on offenders over 16 years of age, especially by a recent Act of Parliament (1912) on "white slavers," and it is still commonly employed in that country as a means of administering discipline in prisons. It has been generally done away with in the United States except in Delaware, where it is employed as a punishment for wife beating and some other offenses, and in a few States as a means of enforcing discipline in prisons. See **WHIPPING**.

CATABANGAN, kät-â-bâng'an, or **CAT-BAGANES**. See **KATABAGANES**.

CAT'ABAPT'ISTS (Gk. καταβαπτιστής, *katabaptistēs*, from κατά, *kata*, down + βαπτίζειν, *baptizein*, to baptize). A general name applied by Zwingli and others, instead of the more common term "Anabaptists," to those who baptized only believers and denied the validity of infant baptism. The term was defined by Zwingli as equivalent to "pseudo-baptist," but the fact that etymologically it means a *drowner* was not lost sight of.

CAT'ACAUS'TIC CURVE. See **CAUSTIC**.

CAT'ACHRE'SIS. See **RHETORIC, FIGURES OF**.

CAT'ACLYSM (Fr. *cataclysm*, Lat. *cataclysmos*, Gk. κατακλυσμός, *kataklysmos*, from κατά *kata*, down + κλύζειν, *klyzein*, to dash, of waves). A term used by some of the earlier geologists to denote sudden changes, such as those which might be produced by deluges, as

the Noachian Flood, or by sudden upheavals. They considered that deposits such as the drift were formed in this manner. The word has been dropped from geological terminology. See CATASTROPHISM.

CATACOMBS, kăt'â-kômz. A subterranean vault or excavation used for the burial of the dead. The term is of uncertain derivation and is used to designate a network of subterranean chambers and galleries excavated in the soft rock, and especially those used primarily for burial purposes by the early Christians, and, in times of persecution, for refuge and for religious services. They were called by contemporaries *cœmeteria*, 'cemeteries' (sleeping chambers), or *crypta*, 'hidden places'; the term "catacomb" (*catacumba*) is of mediæval origin. The lower classes of Romans were usually cremated, and their ashes put into urns in sepulchral chambers called *columbaria* (q.v.); but Christian usage forbade incineration, so separate burial was resorted to in property belonging to wealthy converts or purchased by association. Burial in cemeteries above ground was used generally, but where the subsoil consisted of some kind of easily worked, rocklike tufa, the burial was made in underground galleries, which we now call catacombs. Such catacombs exist in various parts of the early Christian world—the Crimea, Asia Minor, Syria, Egypt (Alexandria), Cyrenaica, Tunis (Sousse), Malta, Sicily (Syracuse), Italy (Rome, Naples, Chiusi).

By far the most important group is in Rome, and it is by the study of these Roman catacombs that we know anything of the Christian arts of the first four centuries and can better understand the life and feelings, manners and customs of the early Christians. About 60 of these are known. They are all outside the city walls, within a radius of 3 miles, excavated in the tufa wherever it was of the right kind, i.e., granular. The larger ones consist of a confusing maze of galleries, but this was by no means their original condition; rather, the result of gradual evolution. During the first and second centuries a Christian landowner would establish a small catacomb for the burial of his family, freedmen, and slaves, and would set aside for the purpose a small rectangular patch of ground, or *area*, measuring, say, 100 by 200 feet, which was registered as a family burying ground and became inviolable under common Roman law. A single gallery ran within the outer edge of this rectangle, about 8 feet high by 3 feet wide, in whose sides were cut *loculi*, one above another, to receive the bodies. The *loculus* was low, as long as the body, and its depth varied to contain from one to three or four members of the same family. Persons of distinction were buried in chambers, or *cubicula*, which opened out of these galleries, and for these burials carved sarcophagi were often used, placed in arched niches, or *arcosolia*. Usually some martyr was buried in such chambers, and his tomb served as an altar at which services were celebrated. As Christianity progressed and burials multiplied, the plot of ground was honeycombed with galleries, parallel and at right angles; and when one story of them was no longer sufficient, staircases were made and a second line of galleries excavated beneath. This was followed, if necessary, by a third, fourth, or even fifth story of galleries. Sometimes the extra room was gained by increasing the height of the galleries through

lowering the floor level. As persecutions increased in virulence, the catacombs became places of refuge and worship, where Christians could avoid arrest, as burial places had right of asylum by law, and when churches above ground were confiscated and destroyed by Imperial orders and religious meetings interdicted, it was always possible to use the catacomb chapels for services. Such importance did the catacombs, therefore, assume that in the third century their administration was no longer left in the hands of private persons, but was assumed by the Church. The city was divided into parishes—25 or more—and to each one was assigned a catacomb outside the walls for the burial of its church members. Above its entrance was a chapel for religious services. The head deacon of the church was their administrator, and under him were the body of *fossores*, or excavators, the artisans who executed the marble slabs with their inscriptions and symbols, the lamps and the symbolic wall paintings. The chief cemetery then became that of Calixtus, and here the bishops of the third century were buried in a special crypt. Passages were cut to connect the neighboring catacombs, but without allowing the burials to extend beyond the appointed legal limits. A new period began, however, in the middle of the third century, when the violence of popular hatred refused any longer to recognize the inviolability of the Christian places of burial, and persecuting mobs and officials invaded them. Christians then destroyed the entrances, with their oratories, feasting halls, and open staircases, filled up the front galleries, and made other and secret entrances, usually from neighboring sand pits (*arenariæ*). There was no longer any need to restrict the catacomb limits, as there was no longer any legal protection, so all the spaces between the various small catacombs were honeycombed with passages, and one immense catacomb was made out of many. Thus all regularity of arrangement was lost, and the present intricate type created. All the catacombs in a single high ridge, up to the low parts where excavation had to be stopped for fear of flooding, were thus joined, and a few large groups created around the city. The bloody persecution of Diocletian multiplied burials of martyrs and made wholesale enlargement necessary. Then came, with Constantine, the end of persecution. Soon Bishop Damasus voiced the universal reverence by his monumental restorations, clearing passages, identifying tombs of martyrs, and placing commemorating inscriptions in verse, building or decorating underground chapels and basilicas at the entrances. During the whole of the fourth century, and until about 410 A.D., burials continued to be numerous in the catacombs, through the desire of the faithful to rest near the martyrs; and then, finally, all burials were transferred to the surface cemeteries connected with churches. The catacombs, however, provided with small basilicas and chapels at their new entrances, remained objects of sacred pilgrimages and anniversary services, not only for Romans, but for pilgrims from the whole Christian world, and several literary records of such pilgrimages remain, from the poems of Prudentius to the *Itinerary* of Einsiedeln. Then came the disastrous invasions of the Goths, Vandals, Lombards, and Saracens, which involved the destruction, first or last, of all suburban buildings, the transporting to the city of the relics of

the most noted martyrs from the catacombs, the closing of their entrances, and the filling up of their galleries with earth to prevent desecration—especially at the time of the Saracen invasion in the ninth century. From that time until the sixteenth century the catacombs were entirely lost sight of. After that they were gradually reopened, and explored by such men as Bosio (1593–1629), Boldetti, Marchi, and especially by De Rossi; but their riches have by no means yet been exhausted.

The following is a list of the principal catacombs around Rome, arranged according to the Roman roads along which they are placed: *Via Appia*, Catacomb of Calixtus, Catacomb of Prætextatus, Catacomb at Catacumbas; *Via Ardeatina*, Catacomb of Domitilla; *Via Portuensis*, Catacomb of Pontianus; *Via Salaria Vetus*, Catacomb of Basilla, or St. Hermes; *Via Salaria Nova*, Catacomb of Maximus, or St. Felicitas, Catacomb of Thraso, Catacomb of Priscilla; *Via Nomentana*, Ostrian Catacomb, Catacomb of St. Agnes; *Via Tiburtina*, Catacomb of Hippolytus, Catacomb of St. Laurentius (also called Cyriaca); *Via Labicana*, Catacomb of St. Peter and Marcellinus. Of all these, that of Calixtus is by far the most important and has been the most fully illustrated. It contains the famous papal crypt, where the popes of the third century were buried, and an analysis of its component parts best illustrates the growth of a large catacomb from the union of many units—in this case some 12 in number. Its earliest nucleus was the crypt of Lucina, the private burying lot of that matron. Not only this and other parts of the catacomb date from the first century or early second century, but the same is true of parts of the catacombs of Domitilla and Priscilla, which almost rival that of Calixtus.

The historic interest of the Roman catacombs is incalculable. All the churches belonging to the pre-Constantinian period seem to have disappeared without leaving a trace behind; consequently, the chapels of the catacombs are alone in showing how the early liturgical prescriptions—e.g., those of the *Apostolic Constitutions*—were conformed to. The old theory that the catacombs had been really excavated as sand pits and for the extraction of tufa by the pagan Romans, and had been simply appropriated by the Christians, was first attacked by Marchi and totally disproved by De Rossi; they are entirely the work of the Christians themselves and were sometimes connected with the sand pits only as a matter of convenience in the third century, as already explained. Using ancient literature as a guide, De Rossi undertook a series of excavations by which he laid bare a large part of ancient subterranean Rome, at the expense of the papal government, aided by private subscriptions.

After the Italian government had occupied the Papal States, in 1870, Parliament decreed that not only should the Vatican, with St. Peter's, St. John Lateran, the summer residence of Castel Gandolfo, etc., remain under the jurisdiction of the Pope, but also the catacombs, which the government authorities cannot, therefore, excavate. It is partly from lack of funds, partly from the opposition of private landowners, that excavations are so slow and spasmodic. About 15,000 inscriptions have come to light, but this is only a fraction of what remains underground. De Rossi believes they once

numbered over 100,000. After the catacombs were rediscovered, in 1578, they were recklessly despoiled, especially of inscribed stones, which were collected as curiosities or used by hundreds as building material. In this way a large part of their epigraphic riches was dispersed and destroyed, and no systematic collection of early Christian epigraphy was ever made, such as was the case with classical inscriptions. Whatever could be done at so late a date was done by the late De Rossi, who grouped the available materials in one of the galleries of the Vatican, arranged according to their themes. In the Vatican Museum, also, are many of the small objects rescued from the catacombs (*Museo Cristiano*, etc.); others are in the Kircherian Museum over the Biblioteca Nazionale. The Lateran Museum has the greatest collection of sarcophagi, as well as some facsimiles of frescoes and many inscriptions—a collection made under Marchi and De Rossi. The catacombs themselves can be visited with ease in all important parts, and though most of the inscriptions, *tituli*, and small objects have been removed, enough remain in situ to show what the original condition must have been.

It was natural that the data furnished by the catacombs for the earliest Christian history should give food for heated partisan controversies between Roman Catholic and Protestant archaeologists, the latter denying the postapostolic age claimed by De Rossi for the earliest monuments, and disputing many interpretations of catacomb frescoes that seemed to support Catholic dogmas. Schultze has been the most vigorous of the Protestant archaeologists. However, the general unprejudiced consensus of opinion is in favor of De Rossi's views. The investigations of De Rossi have been continued under exceptionally favorable conditions by Joseph Wilpert, whose recent works, containing a careful discussion of all historical, artistic, and technical considerations with photographic illustrations, many of them reproducing actual color, is the final word upon this subject. It is a thorough revision of De Rossi's earlier work.

The decorative art of the catacombs is confined to the chambers where the most distinguished persons received burial; the long galleries, or *ambulacra*, where the masses were buried, remained perfectly plain, with straight sides and arched or pointed roof, roughly hewn. The burial cavity, the *locus* or *loculus*, was closed with a *tabella*, or slab, on which was cut the *titulus*, or funerary inscription, usually accompanied by one or more emblems, or even figures. To it were also attached a variety of objects in the shape of offerings, such as terra-cotta lamps, that were kept burning on anniversaries, as well as glass vases or bottles, medals, coins, etc. At intervals a shaft was cut connecting the gallery with the surface and letting in light and air. They were called *luminaria* and were funnel-shaped. They were also used for extracting the material excavated from a gallery and for letting down sarcophagi. The chambers opening at intervals from the galleries were either the smaller *cubicula*, which were private burial rooms for families or associations, or the larger *cryptæ*, used for religious services and for the burial of great personages and martyrs. These crypts were provided with altars and seats, and were often double, so as to provide for the separation of the sexes. Here are to be found the majority of the *graffiti*, scratched by

pious pilgrims; here are the monumental inscriptions and the pious desecration of earlier tombs to bury others near the martyr.

The small catacombs in their primitive arrangements can be studied in those of Domitilla (near the entrance), of Priscilla, the Ostrian, and that of Lucina, in the Calixtus group; to these must be compared the two superb halls of the catacombs of St. Januarius at Naples. They date almost certainly from the close of the first century, from the generation after the Apostles, and here some of the earliest converts were buried. In the second century comes the rich Catacomb of Prætextatus, with its superb ambulacrum, and three others that are not yet explored. This is, from the purely artistic point of view, the Golden age. The frescoes in the Catacomb of Domitilla are the most artistic yet found; the motif of the vine with cupids gathering the vintage, which afterward becomes stiff and geometric in its composition, is here free and gracefully naturalistic. The same decorative feeling is shown in some landscapes in the same chambers. There is a flavor of the Augustan age. The paintings that have a more definite religious character are also treated with naturalism—pastoral scenes of fishing and shepherding, symbolic of baptism and redemption; Noah and Daniel, both types of saved souls; two figures at a banquet of loaves and fishes, either of eucharistic significance or representing the joys of paradise. The crypt of Lucina has the most beautiful and well-preserved of painted crypt ceilings, which reminds one of such pagan ceilings as those of the baths of Titus. It has a graceful, symmetrical arrangement of compartments with single figures. Were it not for well-poised figures of the Good Shepherd and the *Orans* in the spandrels, and of Daniel in the centre, the rest of the decoration, with its flying genii, heads of the Seasons, doves, vases, fruits, and flowers, might very well belong to some pagan tomb of the Via Latina. Almost as charming is another ceiling of the same character in the Catacomb of Calixtus, with a decorative frame of concentric circles and spandrel ornaments, within which are peacocks, doves, winged genii, shells, and vases, and with nothing but the Good Shepherd in the centre as a proof of Christianity.

To understand the reason for the selection of certain themes for the frescoes, it must be remembered that their object was to commemorate the departed. The key is given in the prayer for the dying of an early liturgy: "Deliver, O Lord, the soul of thy servant, as Thou deliveredst Enoch and Elijah from the common death, . . . Noah from the deluge, . . . Job from his torments, . . . Isaac from the sacrifice, . . . Moses from the hand of Pharaoh, . . . Daniel from the den of lions, . . . the three youths from the fiery furnace," etc., to which other prayers add the examples of Tobit and Jonah. These are precisely the themes from the Old Testament most commonly depicted in the frescoes, always with this symbolic meaning.

The portrait of the deceased is very seldom given, either in painting or in outline on the slab, because it did not harmonize with the stress laid by Christian sentiment upon the future life. It was the soul, not the body, of the defunct that was, therefore, typified in different forms. The female figure, with both hands raised in prayer, is the main symbol both of the individual soul and of the whole body of be-

lievers—the Church. She is called the *Orans* (*orare*, to pray). The companion figure to the *Orans* is Christ as the Good Shepherd. These two—the Saviour and the saved, the Shepherd and the sheep—are substantially the whole of the significant part of earliest Christian imagery, as we see it on the ceiling of the crypt of Lucina. But the soul was also represented in other obvious ways—as a *lamb*, mainly emblematic of the elect on earth, not in heaven; as a *dove*, the soul in heaven; as a *fish*, in the image of Christ, the divine fish, who is called the *Fish of the Living*. In almost every such symbol the meaning is complex, and with subtle but simple transitions. Thus, the dove is: (1) the emblem of the Holy Ghost, and as such descends on Christ at baptism and on the Apostles at Pentecost; (2) the Divine Messenger, like the dove of the ark, and as such brings assurances of peace and salvation to the soul, as in the epitaph of Irene at St. Calixtus, where the soul, as an *Orans*, is receiving an olive branch from a dove; (3) as the transfigured soul after death, *palumbus sine felle*, in which sense the Twelve Apostles are represented as doves. Of all these facts the central idea is that the dove is the vehicle of the spirit, whether sent from God or returning to God. Two of these separate meanings are combined in some compositions, where in Noah's ark, representing the Church, stands, not Noah, but the soul of the deceased, towards which the dove is flying with the olive branch. Another series of symbols is that embodying the cardinal Christian beliefs—the anchor is hope and the cross; the fish is the divine food and Christ, as well as the believer; the peacocks are immortality; the phoenix is resurrection; flowers are paradise. The regeneration by baptism and by partaking of the Eucharist are also themes represented from first to last, beginning in the sacramental chamber of the Catacomb of Domitilla.

The sepulchral inscriptions or epitaphs discovered in the catacombs belong to every stage of their history and to every variety of technique. Some are beautifully engraved, others irregularly; some are scratched rather than cut on the marble slab; some of the earliest are not cut, but painted in red or black; while others are traced on the fresh mortar. At times the front of the *locus* is closed by a single inscribed slab, and the lettering is inclosed in a frame; at times the *tabella* is made up of two or three pieces, or is even of terra cotta. It is extremely interesting to note that the majority of the earliest inscriptions, before the middle of the third century, are not in Latin, but in Greek—a sign of the preponderance of Greeks among the early converts, and of Greek as the sacred tongue. The earliest are the simplest; they also are least often dated. Often the bare names of the deceased are given, without mention of age, day of death, or the relative who set up the memorial—facts that are very common in the third and fourth centuries. Very usual, in these earliest cases, are the exclamations of simple faith and prayer, which later go out of fashion. One feels that the early formulas were more personal; the later, in accordance with an official rubric. In Northcote's selected specimens (page 33) are examples where the one name stands alone as the whole inscription, "Honorata"; or the usual triple name, "C. Munatius Octavianus"; a simple acclamation, "O Eusebius, mayest thou live." Other acclama-

tions added to the name are: "May God refresh thy spirit"; or "Pray for thy husband"; "Sweet soul, mayest thou live"; "Live in Christ and pray for us." We obtain from these inscriptions the clearest conception of simple Christian faith and constancy. The early liturgies, when they say, "Gather them, Lord, in a green pasture, by waters of rest, in a paradise of joy, whence all trouble, all sadness, and sighs are banished," and the like, give a picture of which these inscriptions are the counterpart, and which find a naïf illustration in some catacomb frescoes which depict the elect in paradise. Such is a fresco in the catacombs of St. Soter.

The ancient authorities that help in identifying the catacombs, in tracing their historic stages and connecting them with different martyrs are: the *Acta Martyrum*, or reports on martyrdoms, more or less contemporary, which often relate where the bodies were placed; the *Liber Pontificalis*, early lives of the popes, which mention transformations and papal burials in the crypts; the inscriptions of the catacombs themselves; the early literature, such as the poems of Prudentius, the poetic inscriptions of Pope Damasus; the descriptions of pilgrims, such as the *itineraries* of the seventh and eighth centuries; the topographical monographs on Rome of the later Middle Ages, such as the *Mirabilia Urbis Romæ*.

Bibliography. The earliest important work on the subject, Bosio, *Roma sotterranea* (Rome, 1650), was a most reliable contribution. It was even used in the fundamental modern books on the subject, as those of Giovanni Battista de Rossi, who not only published descriptions of the most important catacombs and their contents, but established the correct method for studying and identifying them, determining their dates and history. He founded the science of early Christian archæology by his *Roma sotterranea cristiana* (3 vols., Rome, 1864-77); his *Inscriptiones Christianæ Urbis Romæ* (2 vols., Rome, 1857-88); his *Bulletini di archeologia cristiana*, published quarterly since 1863, and his part of the *Corpus Inscriptionum Latinarum* that refers to Christian inscriptions. His work has been ably continued by Mgr. Wilpert, whose *Le pitture delle catacombe romane* (Rome, 1903), published also in German (Freiburg, 1903), reproduces all the important frescoes in color. The English manual of Northcote and Brownlow, *Roma sotterranea* (2 vols., London, 1879), the French of Allard, *Les catacombes de Rome* (Paris, 1896), and De Richemont, *Nouvelles études sur les catacombes romaines* (Paris, 1870), the German of Kraus, *Roma sotterranea* (Freiburg, 1879), are all of them summaries of De Rossi's results. Each language has also had a Dictionary of Christian Antiquities which embodies the same materials, though it also treats of the later period: Martigny, *Dictionnaire des antiquités chrétiennes* (Paris, 1877); Smith and Cheetham, *Dictionary of Christian Antiquities* (London, 1875-80); Kraus, *Real-Encyklopädie der christlichen Alterthümer* (Freiburg, 1880-86). Still later handbooks have been issued—some more systematic, others more detailed, and usually showing some independence of judgment. Such are: Pératé, "L'Archéologie chrétienne" (Paris, 1892), in the *Quantin Series*; Schultz, *Die Katakomben* (Leipzig, 1882); Wilpert, *Prinzipienfragen der christlichen Archäologie* (Freiburg, 1892); and lastly Marucchi's two small volumes, which give the fullest and ablest

modern statement: Marucchi, *Le catacombe romane* (Rome, 1903), *Manuale di epigrafia cristiana* (Milan, 1904). See also Besnier, *Les catacombes de Rome* (Paris, 1909).

CATACOMBS OF PARIS. Vast excavations extending under the city of Paris, formerly subterranean quarries which furnished the building material for the city. In the latter part of the eighteenth century some portions of the city began to sink, and it was necessary to strengthen the roof of the quarries with masonry. In 1787 the catacombs were arranged to contain the bodies removed from other burying grounds, and it is estimated that upward of 6,000,000 bodies are now preserved in them. The bones are arranged in varied designs along the sides of the galleries.

CAT'AFALQUE (Fr., OF. *cadefant*), or **CATAFALCO**, kä'tä-fäl'kō (It., from It. dial. *catar*, to find, OSp. *catar*, to see, Lat. *captare*, to try, to seize, to watch, from *capere*, to hold + **falco* for *balco*, stage, Ger. *Balke*, AS. *balca*, beam). A temporary structure of carpentry, decorated with hangings, sculptures, and paintings, intended to represent a tomb or cenotaph. It was used for the lying in state of notable deceased persons and at commemorative services. (See CENOTAPH.) The catafalque was sometimes so extensive a structure as to become a mortuary chapel (*chappelle ardente*); it was usually erected inside a church. Movable catafalques are employed in funeral processions. A magnificent catafalque was used at the burial of Michelangelo in Florence. It was executed by the principal Florentine artists of the time.

CATALAN. See CATALONIA.

CATALAN GRAND COMPANY, THE. A powerful band of mercenaries noted for the part it played in the wars of the Byzantine Empire during the first half of the fourteenth century. It originally consisted of natives of Aragon and Catalonia, partly Christian and partly Moslem, who fought in Sicily during the wars that followed the famous Sicilian Vespers, in 1282. With the conclusion of peace in 1302, the Catalans, numbering some 6000 men, under the leadership of Roger de Flor, entered the service of Andronicus II, Emperor of Constantinople, and were sent against the Turkish armies which were then ravaging the Asiatic provinces of the Empire. The Catalans defeated them decisively and then entered upon a course of pillage and rapine, unchecked by the remonstrances of the Emperor, who was too weak to enforce obedience to his orders. In 1306 Andronicus caused Roger to be assassinated at Adrianople, and a great number of the Catalans fled. A band of 1500, however, consisting mostly of Frenchmen, after defeating an army of 43,000 men, seized the fortress of Gallipoli, on the Hellespont, and held it for four years against the Emperor, ravaging Thrace and levying tribute on trade. In 1310 they abandoned Gallipoli and, marching into Greece, entered the service of Gualtier de Brienne, Duke of Athens, whom, in the following year, they overthrew in a battle on the Cephissus, making themselves masters of Bœotia and Attica. The widows and daughters of the fallen Latin nobles became the wives of the Catalan officers. Subsequently the Duchy of Athens was made an appanage of Aragon. The power of the Catalans rapidly declined, and disappeared before the end of the fourteenth century. Consult Gibbon, *Decline and Fall*, chap. lxii.

CATALANI, kã'tã-lã'nê, ANGELICA (1780-1849). A celebrated Italian soprano, born at Sinigaglia. She was educated in the convent of Santa Lucia, Gubbio, where in her seventh year she displayed such wonderful vocal powers that strangers flocked from all quarters to hear her. After two years of study with Boselli she made her first appearance in Venice in her sixteenth year, and the furore she created was extraordinary even for Italy. She swept through the chief cities of Italy like a meteor, arousing enthusiasm everywhere. She sang in Lisbon from 1801 to 1806; married Captain Vallabrègue, then attaché in the French Embassy, and reaped a golden harvest in Madrid and Paris. Her success in London (1806) eclipsed all her previous efforts, and she stayed there from 1807 to 1814, worshiped by her audiences. She was then in the zenith of her vocal powers and fame. Napoleon's exile permitted her to go to Paris, where she was made directress of the Italian opera. Her husband was an incapable business man, and the venture absorbed the sums of money she had made. In 1817 the lease and subvention were withdrawn and Catalani found herself compelled again to turn to the operatic stage for a living. For 10 years she traveled all over Europe, her performances evoking ever-increasing enthusiasm. In 1828 she retired from the stage, lived for some time in Paris, and then (1830) settled at her villa near Florence, where she established a free singing school for talented girls. She died of cholera in Paris. Catalani was a woman of exceptional beauty, and, though large of frame, of infinite grace and majestic appearance. But her greatest gift was her voice, a soprano of nearly three octaves in range. Its unsurpassed power and flexibility made her one of the greatest bravura singers of all times. Consult: Edwards, *The Prima Donna*, vol. i (London, 1888); Ferris, *Great Singers* (New York, 1893); Needham, *Queens of Song* (London, 1863); H. C. Lahee, *Famous Singers of To-Day and Yesterday* (Boston, 1900).

CATALAN LANGUAGE AND LITERATURE. This language is an important member of the group of Romance languages (q.v.). It is spoken to-day by more than 3,500,000 people living (1) in France, in a territory embracing the former countships of Roussillon, Vallespir, Conflent, Cerdagne, and Capcir, or nearly the whole of the present Department of the Pyrénées Orientales, with about 200,000 inhabitants; (2) in the eastern portion of the Pyrenees and along the coast of the Iberian Peninsula, including the seven Spanish provinces of Gerona, Barcelona, Lérida, and Tarragona (comprising the former Principality of Catalonia), and Castellón de la Plana, Valencia, and Alicante (which formed the ancient Kingdom of Valencia); (3) in the Balearic and Pityusen islands (which constituted the former Kingdom of Majorca); (4) in the District of Alghero in Sardinia; and (5) in some parts of Cuba and the Republic of Argentina. For some years past it has been popular among philologists of a certain school to deny to Catalan an independent individuality, and to claim that instead of being independent of Provençal, it was merely a dialectal offshoot, which during the Middle Ages raised itself for a time to the dignity of a literary language. Diez and Milá y Fontanals saw more deeply beneath the surface than have some of their successors, and claimed for Catalan entire independence as a language. To-day the

latest school of philologists has found additional proof in support of that view. It must not be forgotten that whereas to this day Provençal is not spoken south of the Pyrenees (as has already been said), Catalan is spoken north of the Pyrenees in nearly the whole of the Department of the Pyrénées Orientales and that the line of demarcation is very clear. French phoneticians admit that one does not pass gradually from Provençal to Catalan; and Alart as long ago as 1877 (*Revue des langues romanes*) made the following remarkable statement: "The separation is especially marked between the cities of Estagell and La Tour de France, which are situated at the two extremities of a plain, at a distance of about three quarters of an hour one from the other; Catalan is spoken in the former, which has always belonged to Roussillon, and Provençal in the second." On the other hand, the boundary to the west of Catalan shows the twilight zone that is usual between two kindred speeches developing freely on neighboring soil; and we must definitively range Catalan in the group of the Hispanic languages, with a physiognomy as clearly outlined as is that of her sisters Castilian, Portuguese, and Gallegan. The chief peculiarities of Catalan are: (1) the prevailing use, in the conjugation in *-ir*, of the so-called inchoative form, a form known to some extent to all the Romance languages, excepting the rest of the Hispanic group (it should be noted in passing, however, that both Spanish and Portuguese make extensive use of inchoative forms, but that, instead of limiting them to certain parts of the conjugation, they have extended them throughout the entire paradigm); (2) the formation of a number of perfect participles from the perfect stem, instead of the infinitive stem; (3) the failure to merge into one the pronunciation of *b* and *v*, and the persistence of the voiced sound of intervocalic *s*; (4) the treatment of unaccented final vowels, *a* being retained and the other vowels dropped under the same circumstances as in French, Provençal, and Aragonese (which is a variation of Castilian); (5) Latin *au* becoming *o* as in Castilian, whereas Provençal retains *au*; (6) Latin initial *l* becoming mouillé, a change unknown to Provençal or Castilian; (7) occlusive consonants before *r* (e.g., *dr*) being treated as though intervocalic; and intervocalic *z* becoming, as early as the thirteenth century, a mere aspiration; (8) the vocalization of final dentals which, according to E. Bourciez (*Eléments de linguistique romane*, p. 337), is the essential characteristic of Classic Catalan, and assures to it its place apart; (9) the total absence of noun declensions, which sharply differentiates Catalan from the whole of the Gallic group and has seldom been accorded its due weight in considering the affiliation of Catalan with the neighboring languages (a few sporadic cases of Nominative and Accusative forms, nearly all of them direct borrowings from Provençal, were always treated, as were similar manifestations in Castilian, as convenient double forms to be used interchangeably, and they never had any morphological or syntactical significance); (10) the retention of the original pronunciation of the Latin *ū* where the French and Provençal have *ü*. This latter is an exceedingly important difference between Catalan and the Gallic group, and has not yet been satisfactorily explained.

In Catalan literature, more than in any other of the Romanic group, are prose and verse

sharply differentiated. Under the influence of the splendor to be found in the literary courts of the independent Provençal potentates, Catalan poets adopted the verse forms (and to a large extent also the artificial language suited thereto) of the Provençal troubadours and the Toulouse Academy. We must bear in mind, however, that at the time when this was done, and for several centuries thereafter, Catalonia and the Catalans owned and ruled an important bit of territory now in Provence's power. That this poetic imitation was not due entirely, nor even in large part, to heaviness or inflexibility of the Catalan language, is shown by two facts: first, that the prose of the period, while written almost exclusively in the vernacular, was effective; and second, that in later periods, when the language had become even more polished and flexible, the poets still continued to use the traditional forms. This state of affairs is all the more evident when we consider the works of later authors who were both poets and prose writers, e.g., Lull, whose poems show Provençalized Catalan, as against his prose works, which are more markedly native Catalan. Among other important names for this later period mention should be made of Muntaner, Pere March, and Bernat Metge; and there are a few important anonymous works, e.g., the *Sete Savis* and the *Facet* (a translation of a book on good breeding).

This state of things continued until the fifteenth century, which is the Golden age of Catalan poetry. Under encouragement from three successive rulers (John I, 1387-95; Martin I, 1395-1410; Ferdinand I, 1410-16) there was established at Barcelona a consistory of the "Gay Saber" or "Gaya Ciencia," copied from that of Toulouse. But the very existence of this new consistory on Catalan soil soon eliminated from Catalan poetry the worst of its servile imitation or adaptation of Provençal poetic customs. True, the new academy accepted the rules of versification set up by the older academy in the *Leys d'amors* of Guillaume Molinier, along with the names for the various types of stanza; but the language used in poetry shows a constantly increasing devotion to purely Catalan forms, until it becomes like that of the prose: an entirely native product. A few (there are about 100 poets represented in the various *cancioneros* that have come down to us) of the brilliant names of this period are: Pau de Bellviure, Jordi de Sant Jordi, Jaume March, Pere March, and Antoni Vallmanya. The one great light that outshone all the others, however, was Ausias March, the Valencian (died 1458), whose works first appeared in a Castilian translation in 1539 (by Baltasar de Romani and Jorge de Montemayor), and in their original Catalan form in 1543. Despite his deliberate obscurity, his work contains many poems of real beauty. In his *Cants d'amor* he is a frank follower of Petrarch, but in his *Cants de mort* there is a note that is peculiarly his own. Of a wholly different nature is Jaume Roig (died 1478), another Valencian, whose *Libre de les dones*, a bitter and caustic satire on women (purporting to be his own experiences in three different marriages), is exceedingly interesting as a brilliant and trustworthy picture of Valencian life and habits in the fifteenth century. The decline of Catalan poetry was due not to a cessation of genius on the part of Catalan poets, but to the loss of independence of Aragon and the triumphant rise and spread of Castilian.

One should not forget that it was a Catalan, Juan Boscán, who inaugurated and established in Castilian a new kind of poetry. One can but conjecture what would have been the effect on Catalan poetry if Boscán had consented to use his own native language; but it may safely be asserted that his defection marks the end of the Golden age of Catalan poetry.

Catalan prose works of note are not so ancient as the poetry, there being nothing of great importance earlier than the end of the thirteenth century, but they gain by being purely Catalan in language. Chronicles earn a high place in this literature, and there are at least four that can stand comparison with the four great French chronicles, viz., that of James I (died 1276); that of Bernat Desclot, which treats the reigns of James I and Pedro III (1276-86), the latter alone being a first-hand treatment; that of Ramón Muntaner, for the Catalan expedition to the Morea and the conquest of Sardinia by James II; and that of Pedro IV (1335-87). In the fourteenth century we have also the varied works of the Doctor Illuminatus, Ramón Lull (died 1315), who always wrote in Catalan (the Latin versions of his works being made by his disciples). His most important prose works, from a literary point of view, are the *Libre de les maravelles*, the *Libre del orde de cavalleria*, and the Utopian novel *Blanquerna*. Another important writer of religious, moral, and political works was Francesch Eximeniz (born about the middle of the fourteenth century), whose principal work was a large Christian encyclopædia, called *Lo libre appellat Crestiá*, which he probably never completed, and of which we have only a few entire parts or books (1, 3, 12, and possibly 2, of the 13 that were planned). Among his other works, his principal titles to fame are: *Vida de Jesucrist*, *Libre dels angels*, and *Libre de les dones*. This last-named work is from a literary as well as from a cultural and historical point of view the most interesting of all his works and is filled with details concerning the private life of the average Catalan woman, and gives us some idea of the luxury of the times. Lull and Eximeniz exercised influence beyond the borders of their own land, and their works were translated into French shortly after their appearance. In the fifteenth century we find translators and historians of worth. The spirit of research and control of material that permeate the *Libre dels feyts d'armes de Cathalunya* of Bernat Boades (died 1444) would make it remarkable even to-day, and in addition thereto it has style. As early as the fifteenth century there were also important romances of chivalry and romances of adventure, among which may be mentioned the *Tirant lo Blanch* (highly praised by Cervantes in *Don Quijote*) and the *Curial y Guelfa*. A facsimile reproduction of the Sapienza copy (now in the Hispanic Society) of the 1490 edition of the *Tirant lo Blanch* was published by A. M. Huntington in 1907. Consult also the *Discursos leídos en la Real Academia de Buenas Letras en Barcelona, en la Recepción Pública de D. Isidoro Bonsoms* (Barcelona, 1907). It is a very important treatment of the entire question of *Tirant lo Blanch*. *Curial y Guelfa* was made accessible in a good edition published in Barcelona (1901), by Antonio Rubió y Lluch for the aforementioned Barcelonense Academy of Letters. In the sixteenth century there are only

two poets whose works have lived: Joan Pujol (who must be considered one of the last of the real Catalan troubadours) and Pere Serafí (whose works are imitations of the style of Ausias March, without his obscurity, but written under the rising influence of Castilian). The prose of this period shows no great creative genius, and such good prose as we have is the work of scholars, antiquarians, and historians. The seventeenth and eighteenth centuries are a desert waste.

The nineteenth-century renaissance began with Carlos Buenaventura Aribau (whose *Oda à la patria*, written in 1833, is one of the best poems in Modern Catalan). Then came Joaquin Rubió y Ors, whose pen name was Lo Gayter del Llobregat, Antonio de Bofarull, who made celebrated the name of Lo Coblejador de Moncada, and Victor Balaguer (Lo Trovador de Montserrat). The movement spread rapidly to Valencia, which produced the poet Teodoro Llorente, and to Majorca, the birthplace of the poets Gerónimo Rosselló (Lo Joglar de Mallorca) and Mariano Aguiló. In 1859, largely under the influence of Balaguer, there were re-established at Barcelona the old-time floral games (*jochs florals*), and popular enthusiasm was aroused throughout the whole Catalan territory. The initial period of this renaissance was thus completed, and a flourishing period was ushered in. Other floral games were established, notably those of Valencia, known as the *Jochs Florals del Rat-Penat*. Other names also attained celebrity: Jacinto Verdaguer, author of two epics, *Atlántida* and *Canigó* (both of which were crowned), and of the exceedingly attractive *Idilis y cants místichs*; and Angel Guimerá, the poet and dramatist, whose powerful drama, *Terra Baixa*, Mrs. Fiske presented to the American public in 1903 under the title *Marta of the Lowlands*. Although true to its principality in local color, the passions of this play are so universal that it has won a triumphant welcome in Servia, Italy, France, Cuba, Mexico, and South America. We should remember, too, that on August 14 and 15 each year there is performed at Elche a celebrated religious play, comparable, *mutatis mutandis*, to the Passion Play of Oberammergau. This is the *Festa d'Elehe*, whose present form (a seventeenth-century version) is modeled upon a fourteenth-century Catalan drama on the same subject. Consult, for Catalan language: Milá y Fontanals, *Estudios de lengua catalana* (Barcelona, 1875); Morel-Fatio and Saroïhandy, in Gröber's *Grundriss der romanischen Philologie* (vol. i, Strassburg, 1904-06). For Catalan literature: Morel-Fatio, in Gröber's *Grundriss* (vol. ii, Strassburg, 1893); Denk, *Geschichte der alteatalanischen Litteratur* (München, 1893); and Fastenrath, *Catalanische Troubadoure der Gegenwart* (Leipzig, 1890); F. Blanco García, *Literatura Española en el Siglo XIX* (3 vols., Madrid, 1894, 1903, 1909), of which vol. iii contains a long study: *Literatura Catalana en el Siglo XIX*.

CAT'ALAU'NIAN PLAIN (Lat. *Campi Catalaunici*, named from the Gallic tribe of *Catalauni* or *Catelauni*). The ancient name of the wide plain surrounding Châlons-sur-Marne, in the old Province of Champagne, France, where the Visigoths and the Roman general Aëtius successfully encountered Attila in 451 A.D., thus arresting the westward progress of the Huns. A tradition (made the subject of a striking

picture by Kaulbach, "Die Hunnenschlacht," or 'The Battle of the Huns') tells that three days after the great fight the ghosts of the slain appeared on the plain and renewed the conflict. The battle, usually spoken of as the battle of Châlons, was probably fought at some distance from that city. See AËTIUS; ATTLA.

CATALDI, ká-täl'dé, PIETRO ANTONIO (1548-1626). An Italian mathematician. He was successively professor of mathematics in Florence (1563), Perugia (1572), and Bologna (1584), and is chiefly known as a pioneer in the use of continued fractions, the common form of which he invented (1613) and employed in the extraction of square roots. (See FRACTIONS.) His method, however, is more novel than practical and is quite inferior to that of Cardan. Besides a work on perfect numbers (1603), a treatise on Dürer's construction of regular pentagons (1620), and a three-volume edition of Euclid (1620-25), his chief works are: *Trattato del modo brevissimo di trovare la radice quadrata dei numeri* (1613); *Trattato dell'algebra proporzionale* (1619); *L'algebra discorsiva numerale et lineare* (1618); *L'algebra applicata* (1622).

CAT'ALEPSY (Lat., from Gk. κατάληψις, *katalēpsis*, seizure, from κατά, *kata*, down + λαμβάνειν, *lambanein*, to take). A condition of partial or complete unconsciousness, in which the patient voluntarily assumes, or may be caused to assume, an attitude which he retains for several minutes. It occurs in hysteria or under the influence of hypnotism but is also seen in atonic melancholia and other psychoses. The patient may assume the attitude of attention, with hand and forefinger raised as if to command silence, or may raise the arm as if to protect himself, etc. In all instances the facial expression comports with the gesture, and the whole body remains rigid till the arm falls slowly by gravity and relaxation. If the subconscious condition lasts over a day, as in the cases occurring in insane patients, they must be fed with the stomach pump. Circulation, respiration, urination, defæcation, and digestion continue normally. Trance, lethargy, and the sleep that is prolonged for days are all cataleptic states. It is within the range of possibility that this condition may be mistaken for death; but ordinary tests will easily decide, though the sensibility for pain or heat may be lost. In many cases the patients hear and respond to suggestion. All prolonged cases should be fed artificially, and close scrutiny will result in the detection of simulation in some instances. A pinch of snuff or an emetic, such as apomorphine, will sometimes abort or arrest an attack, or application of the faradic current may be effectual. In the intervals between attacks cold baths, tonics, and antispasmodic remedies are indicated, together with moral treatment. The immediate cause of catalepsy is unknown. Consult Dana, *Text-Book of Nervous Diseases* (New York, 1901).

CAT'ALI'NA. A town and port of entry on Trinity Bay, Newfoundland, 60 miles north-northwest of St. John's (Map: Newfoundland, G 4). It has a fine harbor of refuge, with a prominent lighthouse. Pop., 1700.

CATALOGUE OF SHIPS. A name commonly given to the passage in Homer's *Iliad*, ii, 494-878, in which the forces that fought at Troy, on both sides, are enumerated in detail.

CATALOGUING. The work of making cata-

logues and bibliographies, both of which deal with entire books as units. The cataloguing of books and literary material preserved in libraries is a matter of great importance. A large library contains a million or more different items, any of which may be wanted quickly by some reader. Much of the value of the collection depends on good catalogues, without which the material is of little more practical value than so much "pi" in a printing office. The seeker for some specific book may ask for such a work by such an author, or for a work of which only the subject is known, while not infrequently a reader has in mind some book which he has seen but of which he can give accurately neither author, title, nor subject, remembering merely some accident of language, size, binding, date, illustrations, or the literary form in which the subject is treated. While some libraries make many special catalogues and lists to enable them to answer unusual questions, only two catalogues are essential to meet all reasonable demands—that by authors and that by subjects. Most other questions can, by double reference, be answered by bibliographies, digests, and indexes, by finding in what book the desired matter is printed and then consulting the catalogue to see if the library contains that book. See BIBLIOGRAPHY; DIGEST; INDEX.

The title of every book in a library has three essential parts: (1) author; (2) title proper (as copied from the title-page or condensed by the omission of unimportant matter but never by rewording); (3) imprint and collation, or place, publisher, date, volumes, pages, illustrations, price, or other bibliographic details. The addition of descriptive notes, giving contents, standpoint of author, form of treatment or other facts, in the most condensed form, is a modern improvement, gaining ground with great rapidity, as it has proved a most substantial aid in getting into a reader's hands the work that is most valuable to him. Catalogue entries may be in manuscript or printed and may be either in book form or on separate cards or slips standing on edge in drawers or trays. Titles can be typewritten with recent improvements quickly and cheaply, and the greatly increased legibility and uniformity insure that hereafter most titles not regularly printed will be machine-written. In recent years there has been rapid increase in the number of libraries that print titles.

Coöperative Catalogues. Since 1876 the American Library Association has conducted numerous experiments seeking the great practical economy to be had from cataloguing a book in some central bureau, printing cards, and distributing them to all libraries buying that book, thus securing the highest grade of catalogue work and reducing cost in the department where it is most felt. The Library of Congress in 1901 took up the systematic preparation and printing of cards which are sold at two cents each for the first card and \$0.007 for additional copies. Through this agency catalogues have been immensely improved and their cost much reduced. The great expense of satisfactory cataloguing is the item oftenest criticized, because least understood. The public now properly demands not only convenient guides to the best books, but also analyses of their contents. If what a reader needs is found in an article or chapter, it is just as important that he should be guided to it as to an entire book. The pub-

lishing board of the American Library Association, endowed by Andrew Carnegie, is constantly preparing practical aids to readers for the common use of libraries, utilizing the experience of all libraries and focalizing and publishing the results for the benefit of all. George Iles of New York has borne the cost of much of this work and made possible several most valuable guides to readers.

The most helpful of these books is the A. L. A. Catalog, a classified and indexed list of the 8000 volumes most valuable for an average town library. This was originally prepared in the New York State Library, published by the United States Bureau of Education in 1893 for the Columbian Exposition, and while lacking the most important element, the notes, was of great service. A new edition was undertaken for the St. Louis Exposition with the director of the New York State Library as editor, in coöperation with the leading libraries of the country. The list gave not only the selection which represented the experience of prominent experts in books throughout the country, but notes were added to show in the fewest words the scope, character, and value of each book. The book thus prepared was published by the Library of Congress in 1904. A Supplement covering the years 1904-11 was published by the American Library Association in 1912. Many libraries use it as a catalogue, marking copies to show what is on their own shelves.

Catalogue Rules. Rigid adherence to a definite code of elaborate rules is necessary to secure satisfactory results. Repeated efforts by eminent scholars to get on without what they thought needlessly formidable codes of rules have uniformly resulted in failure. The three most important English codes are those of the British Museum, the Bodleian, and the Library Association of the United Kingdom. These are printed together by the New York State Library School as Bulletin No. 13. For instruction in library schools, all these rules have been carefully digested, revised and edited, with additions for accession and shelf work, and printed in a single volume as *Library School Rules* (Boston, 1894). Cutter's *Rules for a Dictionary Catalogue* (3d ed., Washington, 1904) was long the recognized authority and indispensable guide for that form of catalogue. Its authoritative position has more recently been taken by the *Catalog Rules* of the American and British Library Associations (Boston, 1908). With these should be used the American Library Association list of subject headings for use in dictionary catalogues, with hints on subject cataloguing and schemes for subheads under countries and other subjects (Chicago, 1912).

Shelf Lists. As practically all libraries are adopting close classification on the shelves, the shelf list, which is an inventory of the books as they stand on the shelves, becomes very useful as a subject catalogue. This list gives the class, book, and accession number, with very brief author and title. It is used for taking the annual inventory and is the most convenient short-entry classed catalogue. It is usually written on loose sheets laced into a binder so that sheets can be inserted or recopied as necessary, but may be written on cards.

Book versus Card Catalogues. While readers ordinarily prefer the book form, cards have practically superseded book catalogues. All libraries increase rapidly, and a new title

cannot be inserted in the book catalogue, while titles may be added at any moment to the card catalogue, thus keeping it absolutely up to date. A book catalogue of a growing library is out of date before it can be bound and delivered, and most libraries have adopted the card form, because it avoids entirely the necessity of rewriting as subjects grow.

Plan of Catalogue. The Author Catalogue is commonly found in all libraries. Authors are arranged in strict alphabetic order, as are the words of a dictionary, and under each author are further arranged alphabetically by titles all works by him which the library possesses. A separate title catalogue is rarely made; yet title cards are generally made for anonymous publications, and also for books having titles specially likely to be remembered. These are usually inserted in the same alphabet with authors. The Subject Catalogue also has now come to be regarded as essential. It alone can tell what the library has on any subject, and obviously its educative value is very great. There are three distinct types: 1. *Classed*.—This has all subjects arranged in logical order and to be conveniently usable must employ a system of notation with numbers or letters referring to each specific subject, and an alphabetic index where the most minute topic will be found followed by this number. 2. *Alphabetic-classed*.—In this the main subjects are in alphabetic order, and under each in subalphabets are divisions and sections, so that the catalogue is its own index. Cross references may be inserted at any point, so that a topic can surely be found from the main alphabet without a subordinate index. 3. *Dictionary*.—This is now the most common type of catalogue, and its use has been growing steadily for a generation. It introduces specific subject entries in the same alphabet with authors and titles, thus making simple dictionary order. The easy rule to consult it like a dictionary, whether author, title, or subject is sought, appeals strongly to most readers. In spite, however, of its apparent simplicity, it requires the greatest skill to make, and while unexcelled for reference to a single topic, which is the most common need in popular libraries, in its nature it cannot put before the reader the resources of the library on generic subjects with the clearness or helpfulness of the classed catalogue.

If one wishes to see all the geometries in a library, direct reference to this word under G in the dictionary catalogue gives them as well as would similar reference to "Geometry" in the classed catalogue, but in the dictionary form these are preceded by, e.g., "Geology" and followed by "Geoponicon in sermonem Syriacum versorum quæ supersunt." In the classed catalogue, however, geometry is preceded by algebra and arithmetic and followed by trigonometry, calculus, and the other subjects most nearly related. If one wishes to see the mathematical collections of the library, he must look in the dictionary catalogue under a dozen distinctly different heads to collect his titles, while in the classed catalogue they stand close together in logical order. If one makes a dictionary catalogue under the simple rule to write the apparent subject at the head of the card and drop it into alphabetic order, the result will be largely worthless. It requires, like the classed catalogue, a carefully elaborated system worked out in advance and scrupulously fol-

lowed, otherwise books on the identical subject will be scattered all over the alphabet by the accident of the first word or of the word that happened to be in the cataloguer's mind when writing the headings. A book discussing protection and free trade might appear under P, F, or T, or under Tariff, Revenues, Subsidies, Customs, Duties, or other heads. All things considered, the merits of the two systems are well balanced. In the smallest library the classed list appeals strongly to teachers and others interested in the educational work of the library, because they know what its influence will be on inexperienced readers. In large libraries the classed form appeals to students who study not only specific but generic subjects, and appreciate the advantages possible only with an arrangement which follows the natural relation of subjects to each other. Some of the largest, and practically all the smaller, American libraries employ, however, the dictionary form of catalogue.

CAT'ALO'NIA (Sp. *Cataluña*, Fr. *Catalogne*, ML. *Catalonia*, for *Gothalania*, from *Gothus*, Goth + *Alanus*, Alan). An old independent principality of Spain, later also a principality of the crown of Aragon, occupying the northeast corner of the kingdom, and bounded by France on the north (with the Pyrenees on the border) and the Mediterranean on the east and southeast (Map: Spain, F 2). Area, 12,430 square miles, comprising the modern provinces of Barcelona, Tarragona, Lérida, and Gerona. The coast is rugged and well indented. With the exception of a few low plains of limited extent, the surface of Catalonia is that of a wild, mountainous region, formed by numerous outliers or terraces of the Pyrenees, and by one great ridge or series of ridges extending through the centre of the district in a general southern direction. The chief rivers are the Segre, the Ter, the Llobregat, and the Ebro, all flowing into the Mediterranean and none navigable except the Ebro. The climate of Catalonia, in spite of its unsteadiness and the prevalence of fogs and rain, is, on the whole, healthful and favorable to vegetation. Near Barcelona oranges flourish in the open air; the fields in some parts are bounded by aloe hedges, and olives are found on Montserrat. Cork trees grow on the mountains, and thickets of thorn apple, laurel, myrtle, pomegranate, box, rosemary, etc., extend where the cork has no growth. Northern Catalonia has a more severe winter than the southern portion, but everywhere vineyards and olive gardens cover the slopes, and cornfields extend in the valleys. Among the other products are hemp,

flax, madder, barilla, and saffron. Hazelnuts, a variety called Barcelona nuts, are extensively grown. Meadowlands and pastures are comparatively rare, and horned cattle are, therefore, mostly confined to the districts bordering on the Pyrenees. Horses and mules are reared to a limited extent, but sheep, goats, and swine are bred in considerable numbers. Silkworms and bees also thrive. The coasts abound with fish, and game is plentiful. The minerals are coal, copper, manganese, zinc, lead, cobalt, salt, sulphur, and many varieties of marble. Catalonia is the principal manufacturing and commercial part of the kingdom and has the best transportation facilities in Spain. The leading manufactures are cotton, silk, woolen goods, paper, arms, etc. The principal city and the capital is Barcelona. Pop., 1887, 1,838,799; 1900, 1,966,382; 1910, 2,084,868. The Catalonians are a mixed people, having the combined features of Iberian and Goth; are of low stature, dark brunette in color, with wide, projecting foreheads, and dark hair and eyes (cranial index, 77.7-78.1; French Catalans, 78.6). (Ripley, *Races of Europe*, New York, 1899.) Catalonia has been in touch with most of the ethnic elements of western Europe. Upon its Iberian stock have been grafted the mixed race of Romans, the Scythian Alans, the Teutonic Goths, the Semitic Arabs, and the Alpine Franks. Nodoubt their progressive vitality is due to the mixture. In energy, industry, and intelligence they greatly surpass the rest of the Spaniards.

Catalonia, under the name of Hispania Tarraconensis, constituted a part of Roman Spain. It was invaded and subdued by the Alans, and, after them, by the Goths, who gave the country the name of Gothalandia, changed in the course of time to Catalonia. In the eighth century the Arabs gained possession of the southern part. When Charlemagne, in 788, subjugated Spain as far as the Ebro, Catalonia formed the central portion of the Spanish mark governed by Frankish counts who had Barcelona as their residence. They soon made themselves independent of France. In 1151 Earl Ramon Berenguer, by his marriage with the Princess Petronilla (1137), united Catalonia with Aragon, to the future greatness of which Catalonia contributed in a very great measure by reason of its wealth and the influence wielded by the citizens of Barcelona, its capital, in the western Mediterranean. CATAL'PA (Amer. Indian). A genus of trees of the family Bignoniaceæ. *Catalpa bignonioides* is a native of the southern portion of the United States and is cultivated there and in the cities of the Northern States as an ornamental shade tree. It may be known by the silver-gray bark, widespreading but few branches, and large, pale-green, heart-shaped leaves. The flowers are white, tinged with violet or purple, and dotted with the same colors. They are succeeded by long, beanlike pods, that sometimes hang on the otherwise bare limbs all

winter. The seeds are winged, the wings cut into a fringe. The wood is light and of fine texture, and useful in cabinetwork. (For illustrations see Plate of CALABASH, ETC.) A second species, *Catalpa speciosa*, is a larger and more hardy tree, indigenous in the United States from Indiana to Tennessee, and west through Arkansas and Missouri. It is readily distinguished from the former species by its thicker bark, and the flowers being very inconspicuously tinged or spotted. In rich lowlands this tree makes a very rapid growth, and it has been very successfully planted in Kansas and Oklahoma for its timber, the wood being valuable for railroad ties, posts, etc. In favored localities it is hardy in Minnesota. Other species are known from Japan and China.

The catalpa is subject to a leaf-spot disease, caused by *Phyllosticta catalpæ*, that sometimes causes the leaves to become brown and ragged and, as the disease progresses, brings about the partial defoliation of the trees.

CATALYSIS (coined by the Swedish chemist Berzelius, from Gk. *κατά*, *kata*, down + *λύειν*, *lyein*, to loose). The furthering or hindering effect exerted upon chemical reactions by various substances and not accounted for in the usual chemical equations. A classic case of catalysis is the so-called "inversion" of ordinary cane sugar by water and acids. This reaction is represented by the equation:

This might lead one to think that when cane sugar is dissolved in water, a chemical change sets in, resulting in the formation of the two simple sugars, glucose and fructose. In reality this change does not take place—at least (under ordinary conditions) not to any measurable extent—unless *acid* also is present. When the reaction is over, the acid is found to have itself undergone no change; not the slightest fraction of it has been used up. This is why the acid does not figure in the above equation. Yet, as stated, the reaction would not take place without it. And so, in accordance with the definition, we recognize the furthering effect of acids upon sugar inversion as catalytic, and we speak of the acids themselves as catalyzers, catalysts, or catalytic agents. Formerly catalysis was often spoken of as "contact action," the belief being that the furthering substance exerts its remarkable effect, not by chemical interaction with the reagents, but by its mere contact with them.

The same reaction, sugar inversion, presents also an example of the opposite sort of effect, viz., of hindering catalysis, or, as it is generally called, *negative catalysis*, or anticatalysis. Without the presence of water, which is one of the reagents, the reaction is, of course, unthinkable. Yet Rosanoff and Potter were able to show that, besides being a reagent, water also plays the rôle of a negative catalyzer of the reaction: the more dilute the solution, i.e., the more water is present, the slower is the reaction.

It will be noted that a catalyzer is not necessarily a substance foreign to the reaction (as the acid in sugar inversion), but that one of the reacting substances themselves may play the double part of reagent and catalyzer (or anticatalyzer, as the water in sugar inversion). Catalytic action exerted by one of the reacting substances, or one of the products of the reac-

tion, is termed *autocatalysis*. The retarding effect of water on sugar inversion may be described as negative autocatalysis. An example of positive or furthering autocatalysis is presented by the hydrolysis of methyl acetate (the ester of methyl alcohol with acetic acid). The hydrolysis of esters is, like sugar inversion, greatly catalyzed by acids. If methyl acetate is dissolved in pure water, a slow reaction sets in as follows:

But the acetic acid formed furthers the reaction catalytically, as would any foreign acid that might be introduced to begin with. So the effect of acetic acid, which is both a product and a catalyzer of the reaction, is classed as an autocatalysis. It is important to note that, according to the electrolytic dissociation theory (see DISSOCIATION; ELECTROLYTIC), the catalytic effect of acids is due to the free hydrogen ions present in their solutions.

As stated, the hydrolysis of esters takes place—slowly—in pure water. The presence of acids accelerates the process; but their absence does not preclude it. Wilhelm Ostwald, one of the leading thinkers on catalysis, believes that *all* catalytic phenomena are like this; that catalysis is always either an acceleration or a retardation of reactions, and never consists in rendering a reaction possible that could not take place at all without catalytic help. This view he forcibly expressed in an address at the time of receiving the Nobel prize in 1909. If questioned regarding sugar inversion, which appears not to occur in pure water, Ostwald would express the belief that inversion does take place in pure water, but so slowly that it cannot be detected. And as a matter of fact, in very hot water sugar inversion does actually set in, though even then at a barely appreciable speed.

Ostwald's conception of catalysis may best be grasped by comparing the occurrence of a chemical reaction with the flow of an electric current through a wire. The current is caused by the existence of a certain definite electromotive force; but the intensity of the current, i.e., the quantity of electricity that flows through the wire per unit of time, depends, for a given electromotive force, upon the electric resistance of the wire. Similarly, a chemical reaction may be considered as caused by the force of chemical affinity; but for a given affinity force the velocity of the reaction, i.e., the quantity of substance transformed per unit of time, depends upon the chemical resistance of the system. Just as the intensity of an electric current can be modified by changing either the electromotive force or the electric resistance, so the velocity of a chemical reaction might conceivably be modified by changing either the affinity or the chemical resistance. It is, however, a definitely established truth that foreign substances, including catalyzers, can have no effect at all upon the affinity force of a reaction under certain ideal conditions, and but a slight effect under actual working conditions. Hence the great changes in reaction velocity often caused by catalyzers can only be due to their affecting the chemical resistance. But, while the flow of electricity can be stopped altogether by making the resistance infinitely great (cutting the wire, as in switching out an electric light), the chemical resistance of a system, Ost-

wald would say, can never become infinite, and hence some slight chemical reaction will go on even in the total absence of catalyzer. We have seen that in a hot aqueous solution sugar actually undergoes inversion even in the total absence of acids, although it must be borne in mind that water itself happens to be a very weak acid, so that the statement about the "total absence" of acids is not strictly true.

Keen as these ideas are, there is a grave defect attaching to them,—at least, in the present state of chemical knowledge—namely, nothing whatever is known about this "chemical resistance," and not the vaguest conjecture can be formed as to the mechanism by which catalyzers might have a modifying effect upon it. While, therefore, Ostwald's theory has been far from fruitless, its capacity for scientific service is bound to be limited, after all. A different conception of "homogeneous" catalysis (i.e., where the catalyzer mixes with the reagents to a homogeneous solution) has been worked out by Rosanoff, on the basis of an extensive series of experimental researches. According to this new theory, there are two distinct kinds of catalysis and catalyzers—chemical and physical, or direct and indirect. A chemical or direct catalyzer really takes part in the reaction. In many cases, at least, its particles combine with those of one or more of the reagents into molecular complexes, and it is these that undergo the change involved in the given reaction. It is not all parts, however, of the complex molecule that undergo change: the part constituted by the catalyzer remains unchanged, and only the parts contributed by the "reagents" disappear, to give place to products of the reaction. But then, since the usual chemical equation of a reaction can keep account only of the net final changes, and not of the participation of substances that finally reappear unchanged, the participation of the catalyzer is not recorded by the chemical equation. A chemical catalyzer is thus really itself a reagent, but a reagent that happens to be re-formed in the reaction. Like every other reagent, it must obey the law of chemical mass action (see REACTION, CHEMICAL); i.e., the velocity of the reaction must be proportional to the concentration of the catalyzer (or to some power of that concentration). If that concentration is zero, the velocity of the reaction, too, must be zero: the reaction will not take place at all. In contradiction to Ostwald's general principle, a chemical catalyzer will, therefore, not merely *hasten* the reaction, but render it *possible*.

A physical or indirect catalyzer, according to Rosanoff's theory, does not itself take part in the reaction. It affects the speed of the reaction indirectly, by influencing the molecular condition of the reagents proper. Let, for instance, a given reaction depend for its occurrence upon the formation of a molecular complex. Then any soluble substance of high associating power, i.e., favoring the formation of complex, associated molecules, will hasten the reaction; i.e., it will act as a positive catalyzer. Any substance having high dissociating power, and therefore tending to disrupt the complex molecules upon which the reaction depends, will appear as a negative catalyzer. The effect will obviously be reversed in the case of a reaction that is furthered by the *dissociation* of molecules. It has long been known that one and the same reaction may take place rapidly in one sol-

vent and slowly in another. From the viewpoint of the theory under consideration, all such "solvent-catalysis" or "medium-catalysis" must be classed as physical or indirect catalysis. And if something is known, on the one hand, of the mechanism of a given reaction and, on the other hand, of the associating or dissociating power of a given set of soluble substances, the theory permits of foretelling which of the latter will act as positive and which as negative catalyzers. Experiment has borne out these ideas in all cases thus far examined, so that, for the first time in the history of the subject, the possibility is established of foreseeing the catalytic effect of substances before actual trial has been made.

Rosanoff and his collaborators have further found that physical or indirect catalyzers obey, not the law of chemical mass action (as do the chemical or direct catalyzers), but what is known in mathematics as the compound-interest law. Accordingly the percentage increase or decrease in the speed of a reaction is proportional to the amount of physical catalyzer added, and in the absence of the catalyzer the speed is by no means zero; if it were, then no amount of catalyzer could create an appreciable speed. Physical catalyzers, therefore, and only these, obey Ostwald's principle that catalyzers merely increase the speed of a reaction, but do not bring about reactions that could not at all occur without them.

It must, however, be borne in mind that the theory just outlined applies, as already stated, only to homogeneous catalysis, i.e., to those cases in which the catalyzer forms a homogeneous solution with the reagents and other substances that might be present. Some of the most important cases belong, not to this, but to the "heterogeneous" class. Thus, the combination of sulphur dioxide with oxygen to sulphur trioxide (from which sulphuric acid is now made on the largest industrial scale) is catalyzed by passing a mixture of the two *gases* over metallic platinum, ferric oxide, or certain other *solids*. Similarly, as Sabatier and Senderens have shown, a great variety of organic compounds can be reduced by passing their vapors mixed with hydrogen over finely divided metals, particularly nickel. In recent years this method has been modified in that the nickel is introduced into *liquids* to be reduced, the hydrogen gas being pumped in under pressure. Liquid vegetable oils, like cottonseed oil, are now commercially reduced in this manner to solid fats (like "Cresco") for culinary purposes. Again, ammonia (q.v.) is now manufactured synthetically from nitrogen and hydrogen by heating a mixture of the two gases over metallic iron. In this latter case, by the way, it has been found that substances like lime, common salt, and other salts, while not catalyzers themselves, greatly enhance the catalytic action of the iron. They have been called "promoters"; but their effect is even more mysterious than that of the catalyzer itself.

To mention one more celebrated case of heterogeneous catalysis, the combination of hydrogen and oxygen is greatly catalyzed by metallic platinum and to a lesser extent by various other solids, including glass. Other substances, too, are set burning (combining with oxygen) under the catalytic influence of platinum. Thus, lighters for illuminating gas have been made of small masses of finely divided platinum placed

near the outlet of gas burners; unfortunately, these devices rapidly deteriorate, owing to the platinum catalyzer being "poisoned" by the sulphur compounds contained as impurities in illuminating gas. Such "poisoning" of catalyzers is a very frequent phenomenon, and in the industries mentioned above no pains are spared in purifying the gases which are to be brought into contact with the catalyzing metals.

Perhaps Faraday was correct in assuming, in 1833, that in heterogeneous catalysis the reaction takes place near the surface of the solid, in the layer of "condensed" gas which adheres so tenaciously to solids that the removal of all air or moisture from a solid surface is a matter of the greatest difficulty. Berthelot, and many others, have believed that, at least in the catalysis of gaseous reactions by metals, the latter form true chemical compounds with one of the gases (such as hydrides with hydrogen), and that it is these "intermediate compounds" that yield the reaction products by further reacting with the other gases involved. But really nothing definite is known on the subject, and no single theory as yet advanced seems capable of adequately elucidating the chaotic variety of phenomena of heterogeneous catalysis.

In conclusion, mention must be made of some remarkable catalytic effects produced by the merest traces of moisture. As far back as 1794, Mrs. Fulhame, a brilliant English chemist, showed that carbonic oxide (carbon monoxide) will not combine with oxygen unless the gases are moist. The phenomenon was demonstrated anew, and with convincing thoroughness, by Dixon in 1884. Both Mrs. Fulhame and Dixon believed that the carbon monoxide reacts with the water (moisture) chemically, liberating hydrogen, which in turn combines with the oxygen, re-forming the original amount of water. If this is correct, then, from the viewpoint of Rosanoff's theory, the moisture effect would be classed as a chemical catalysis. A number of other cases in which perfectly dry substances refuse to interact were described in 1894 by Baker. For instance, ammonia and hydrochloric-acid gases, which ordinarily combine promptly, forming white fumes of ammonium chloride, refuse to combine if thoroughly freed from moisture.

Bibliography. The literature of catalysis is very extensive, and Ostwald is undoubtedly right in his belief that catalytic phenomena are quite general, that every reaction can be catalyzed by some substance, and that every substance can catalyze some reaction. A great number of catalytic phenomena are mentioned in Gertrude Woker's *Die Katalyse* (Stuttgart, 1910). Chapters on catalysis will be found in every general work on physical chemistry or chemical dynamics, e.g., in Mellor's *Chemical Dynamics* (London, 1909). Consult further: Mrs. Fulhame, *An Essay on Combustion* (London, 1794); Ostwald, "Ueber die Katalyse," in *Zeitschrift für Elektrochemie*, vol. vii, for 1901; also in *Nature*, vol. lxxv, for 1902; Rosanoff, "Outline of a Theory of Homogeneous Catalysis" in *Journal of the American Chemical Society*, vol. xxxv, for 1913. See also ENZYMES.

CAT'ALYTIC ACTION. See CATALYSIS.

CAT'AMARAN' (Fr. *catamaron*, Hind. *kaṭamaran*, Malayalam *keṭṭamaram*, logs bound together, from *keṭṭa*, binding, from *kaṭṭa*, to bind + *maram*, timber). In its original form, a craft consisting of three logs—the middle one being

longest—lashed together. It was used by the natives of the Coromandel coast, particularly Madras; also in the West Indies and on the coast of South America. The Fiji Islanders developed this idea in their war canoes, which consist of two parallel logs joined together with a platform, on which a mast is placed. These boats are safe and very swift, having a speed of about 14 miles an hour. This, again, is surpassed by the flying proa of the Ladrone Islanders, a boat with two hulls of unequal size. The larger hull, which carries all the rigging, is perfectly flat on one side and rounded on the other. On this are placed bamboo poles projecting beyond the rounded side, and to their ends is fastened a boat-shaped log one-half or one-third the size of the larger hull. This prevents capsizing as effectually as the Fiji double canoe. Both ends of the proa are made alike, and the boat is sailed with either end first; but the outrigger is always to windward. Against a head wind the proa is kept away till the stern approaches the wind, when the yard is swung round, and what was the stern becomes the bow. Proas are from 40 to 65 feet long and 6 or 7 feet wide, and are said to attain a speed of 20 miles an hour.

Double boats, or catamarans, have often been built in the United States, but have almost always proved very slow, because the water between the two bows is compressed into a narrowing space and offers great resistance. This defect is illustrated in the English twin steamer *Castalia*, which, in spite of her great engine power, was a slow boat. Another example of the steam catamaran was the *Henry W. Longfellow*, built about 1880. Two iron cylinders 200 feet long, shaped like cigars, sharp at both ends, were fastened to each other at a distance of 9 feet. On them rested a deck 125 feet long, like a ferryboat. She could carry 475 passengers, had 500 horse power, a displacement of 75 tons, and her entire weight was only 43 tons. In 1876 the *Amaryllis* was designed and built by Herreshoff. She consisted of two slender tubes connected by crossbeams loosely fastened together, and supporting a deck hardly more than large enough for two men. She was entered at the Centennial Regatta at New York, and easily beat all competitors, but was ruled out on account of her construction. In spite of her great speed, she was very uncomfortable and very unsafe. In 1877 Herreshoff patented a double-hulled boat combining the greatest stability with the least weight. The hulls were united by ball-and-socket joints, which obviated the unevenness in position of the two hulls in a rough sea, and were set 16 feet apart, each having a centreboard and rudder. The boat had a sloop rig, and with a strong wind abeam and a smooth sea made 20 miles an hour. Many catamarans have been built since, but generally with rigid connections, and prove unsatisfactory in rough water. In a racing catamaran 25 feet long, the proportion is 1 foot canvas to 8 pounds of water displacement. This shows the sailing powers of the catamaran. If in construction iron cylinders were used, in shape like the hulls of the flying proa, and placed with the flat sides towards each other, great speed would be secured with safety. Under proper conditions the catamaran is well adapted to summer sailing in smooth waters, being easy to handle, fast, and safe. In the United States navy the term "catamaran" is sometimes applied to the balsa

(q.v.), or to a float used for the men who clean the ship's side along the water line.

CATAMARCA, kä'tä-mär'kä. A province in the northwest part of Argentina, lying at the foot of the Andes and occupying an area of 47,444 square miles (Map: Argentina, D 9). The province is intersected by several mountain chains and by many small streams, most of them dry in the summer, but overflowing in the winter. It contains a number of salt lakes. The valleys in the mountainous parts are very fertile. Gold, silver, and copper are found, the latter in abundance, and nearly all the fruits and grains of tropical and temperate regions are grown. Pop., 1895, 90,161, mostly Indians; 1905 (est.), 104,228; 1910 (est.), 110,317. Capital, Catamarca.

CATAMARCA. The capital of the Province of Catamarca, Argentina, situated in a mountainous region in the extreme northwestern part of that country, about 250 miles northwest of Córdoba (Map: Argentina, D 9). It is regularly and moderately well built and contains a fine town hall, a Franciscan monastery, a national college, and a normal school for women. There are considerable imports of European goods, and the place is a centre of distribution for a flourishing district. Dried figs, wines, brandy, and cotton are the principal articles of export, together with the curious form of embroidery for which the women are celebrated. The town was founded in 1683. Pop., 1899, 7397; 1905 (est.), 8000, a large percentage of which are mestizos.

CAT'AME'NIA. See MENSTRUATION.

CAT'AMOUNT (also *catamountain*, for *cat o' mount*, *cat o' mountain*). An indefinite term for a wild cat or panther, formerly much used in the United States (and as *gata monte* in Spanish-speaking America), but now rarely heard.

CAT'ANA. See CATANIA.

CATANIA, kä-tä'nê-à (Gk. *Karάνη*, *Katanē*, Lat. *Catina*, and, less correctly, *Catana*). An episcopal city and seaport on the east coast of Sicily, at the southeast base of Mount Etna, 59 miles south-southwest of Messina and 5 miles west-northwest of Syracuse (Map: Italy, K 10). It is the capital of the Province of Catania, and the third largest city in Sicily, being outranked in population by Palermo and Messina. In front of the cathedral is a fountain, with an ancient statue of an elephant, made of lava, bearing an Egyptian granite obelisk. In the cathedral, begun by Roger I in 1091 with materials taken mostly from the ancient theatre, and of the original of which little besides the choir has been spared by earthquakes, is the chapel of Agatha, tutelary saint of Catania, who was martyred in 252 (legendary), and whose festival is celebrated February 5. In the cathedral also is the monument of the composer Bellini, a native of Catania. The Villa Bellini has an attractive garden, containing busts of Bellini and others, and a statue of Mazzini.

In summer Catania is hotter than Palermo, but in winter it is cooler, on account of the snow on Mount Etna. The city formerly had epidemics of cholera, but the sanitary conditions are now excellent and the water supply is good. The lack of promenades and gardens renders Catania less attractive to tourists than most Italian cities, although the streets are so broad and well kept, the private and public buildings so large and well built, and the situa-

tion so attractive, that it is commonly called "la bella." The chief attraction is Mount Etna, which may be seen to a good advantage from the tower of San Nicolò and from the Villa Bellini.

The remains of the ancient theatre, being mostly underground, can be inspected by torch-light only. The Roman structure was erected on the foundation of the Greek edifice, which is perhaps the one in which Alcibiades' eloquence, in 415 B.C., induced the Catanians to ally themselves with Athens against Syracuse. Another ancient Roman structure is the adjacent church of Santa Maria Rotonda. The Benedictine monastery of San Nicolò, formerly one of the most beautiful in Europe, was destroyed by an earthquake in 1693 and rebuilt by 1735. The institution was suppressed in 1866. The building has since been used for military and educational purposes. Its grand baroque church contains a famous organ by Donato del Piano, with 5 keyboards, 72 stops, and 2916 pipes; the museum contains antiquities in pottery, bronze, and marble, mediæval armor, and natural-history specimens; the library contains 50,000 volumes and 500 manuscripts, and the observatory is associated with that on Mount Etna. Under the Carmelite Church dell' Indirizzo is an ancient Roman bath almost completely preserved, and not far from it is a spring probably fed by the underground Aménanus, that emerges just before emptying into the harbor. The university (founded in 1445) has (1914) 1200 students (formerly over 2000), a school of pharmacy, a library of over 130,000 volumes (founded in 1755), and a fine collection of shells. The Academy of Natural Sciences (founded in 1823) has always been active in promoting the investigations of naturalists in Sicily.

The surrounding country, on account of its fertility, has been called the "granary of Sicily," and produces grain, hemp, flax, silk, cotton, wool, licorice, fruit, wine, and oil. It also has sulphur and salt mines and marble quarries, and Mount Etna supplies snow. The fisheries are extensive. The principal manufactures of Catania are linen, cotton, and silk goods, and objects in lava, wood, marble, and Sicilian amber. The terra-cotta figures of Sicilian peasants are interesting. Commercially the city is active, is a residence of a United States consul, and has regular communication by steamboat with the other ports of Sicily and of Italy, and with the eastern Mediterranean.

The classic Catana was founded by Greeks from Chalcis about 729 B.C. and soon became prosperous. Here, in the sixth century B.C., died Stesichorus (q.v.). In 476 B.C. its inhabitants were removed to Leontine by Hiero I, who named the town Ætna and gave it a new population of Syracusans and Peloponnesians, who were, however, expelled in 461 B.C. by the original inhabitants. In the war between Athens and Syracuse Catania was the Athenian headquarters. In 403 B.C. it was sacked by Dionysius; in 396 B.C. it was captured by the Carthaginians; it was one of the first Sicilian towns acquired by the Romans (263), under whom it flourished greatly. It suffered during the Servile and the Civil wars. It was taken from Belisarius by the Goths, plundered by the Saracens, fortified by the Normans, and in 1169 A.D. almost destroyed by an earthquake. Being restored and in 1232 equipped by Frederick II with the fortress of Rocca Orsina, it flourished

under the Aragonese rulers of the fourteenth century. On March 8, 1669, in a terrific eruption of Etna, a stream of lava turned its course from the town to the harbor, which it partly filled up. Catania also suffered greatly from the earthquake of 1693. The ancient ruins were excavated by Prince Biscari in the eighteenth century, and his collections, studied by Goethe in 1787, can be seen in the town, in the Museo Biscari. Pop., 1881, 100,000; 1901, 149,295; 1911, 211,699.

CATANIA. A gulf on the east coast of Sicily, extending in the form of a semicircle from Acireale to Cape Santa Croce, near Augusta, a distance of 18 miles (Map: Italy, K 10).

CATANANO. A village of Porto Rico in the municipality of Bayamon, opposite San Juan (Map: Porto Rico, E 2). Pop., 1899, 2331; 1910, 4786.

CATANZARO, kä'tän-zä'rò. An episcopal city in south Italy, capital of the province of the same name, situated on a rocky hill, 8 miles from the Gulf of Squillace (Map: Italy, L 9). The climate being cool and healthful in summer, many wealthy families reside here. The town contains a castle, built by Robert Guiscard, a museum, and a cathedral. The country is luxuriant with olive groves, and the town has silk and velvet factories. Pop., 1901, 32,000; 1911, 34,103.

CATAPH'ORE'SIS. A method of introducing drugs into the body through the skin by means of an electric current. A pad wet with a solution of the desired drug is placed over the part and connected with the negative pole of a galvanic battery, the positive pole being applied to another portion of the body. Local anæsthesia may be thus produced by the use of cocaine or a similar drug. Rheumatic joints may be treated by solutions of sodium salicylate or potassium iodide in the same way. The method is also called ionic medication. See IONIZATION.

CAT'APLASM. See POULTICE.

CAT'APULT (Lat. *catapulta*, Gk. *καταπέλτης*, *katapeltēs*, from Gk. *κατά*, *kata*, down + *πάλλειν*, *pallein*, to brandish). An engine of war used in ancient times for projecting stones, long darts, or javelins. There were different kinds and sizes of catapults, to which various names were given. The catapult was less powerful than the ballista, but more uniform in its range. Catapults were used occasionally in the latter part of the eighteenth century. There was one erected at Gibraltar during its siege by General Melville, for the purpose of throwing stones a short distance over the edge of the rock in a particular space frequented by the Spaniards where they could not be annoyed by shot or shell. For illustration, and its position in the development of artillery, see ARTILLERY.

CAT'ARACT. See WATERFALL.

CATARACT (Fr. *cataracte*, Lat. *cataracta*, from Gk. *καταρράκτης*, *katarrhaktēs*, waterfall, from *κατά*, *kata*, down + *ρήγνυμαι*, *rhēgnynai*, to break; or less probably from *ἀράσσειν*, *arassin*, to dash in pieces). An opaque condition of the lens of the eye or of its capsule. It is readily distinguished from opacities of the cornea by its position behind the pupil. Cataract is called *primary* when independent of other disease of the eye, and *secondary*, or complicated, when the reverse is true. The opacity of the capsule of the lens or of the lens itself, following opera-

tions for cataract, is known as secondary or after cataract. Cataract may affect the lens alone (*lenticular*), or the front or back of the capsule of the lens (*capsular*), or both lens and capsule (*capsulo-lenticular cataract*). A cataract is *partial* when limited to a portion of the lens; *complete* when involving the whole; *stationary* if it remains partial; *progressive* if it tends to include the entire lens. Cataracts may be either *senile*, *congenital*, *juvenile*, or *traumatic*.

Cataract is painless and unaccompanied by inflammation. It occasions blindness simply by obstructing the passage of the light, but even in complete cataract the patient can distinguish light from darkness. Cataract is accurately detected by concentrating light upon the eye and illuminating its interior by means of the ophthalmoscope, the eye being previously dilated by some mydriatic, such as atropine or homatropine.

No medical or other treatment has any influence in arresting the progress of cataract, nor can it be cured except by surgical operation.

Traumatic cataract results from a perforating wound of the capsule of the lens. The entire lens becomes opaque, and a portion of it usually remains so; but at times, unless inflammation of other portions follows, the cloudiness entirely disappears. Congenital cataract is due to imperfect development or intrauterine inflammation. Juvenile cataract may be hereditary, or its cause unknown. In both congenital and juvenile cataract the lens is soft and white. They are treated by "needling," an operation in which a needle-like knife is employed to cut and break up the lens at several operations. The injured lens is then absorbed. Senile cataract, the most important form, usually occurs in persons over 50, and generally involves both eyes. Its period of development may be a few months or many years. Beginning in the form of dark streaks extending from the periphery towards the centre of the lens, or as spots in any portion, it eventually renders the entire lens opaque. As the fluid of the lens is then absorbed, it becomes easily separated from its capsule, and is considered mature, or "ripe" for operation. Later, if not extracted, the lens undergoes degenerative changes, or liquefies, and the capsule becomes thickened and opaque, making the results of operation less satisfactory. The only method of relieving senile cataract is extraction of the lens, with or without excision of a portion of the iris (iridectomy). The cornea is opened along a little less than half its circumference, the capsule of the lens is cut, and the lens is expelled by gentle pressure. The lens may be extracted in capsule, a method practiced by Major Smith, of Jollundur, India, in many thousands of cases. The method is considered by American operators too hazardous for general use. Great care must be used in the dressing and later treatment to avoid accidents. After removal of the cataract, the natural lens being absent, its place must be supplied by strong glasses. The power of accommodation is lost. Consult: Herbert, *Cataract Extraction* (London, 1908); Smith, *The Treatment of Cataract* (London, 1910); Woodruff (ed.), *Symposium on the Extraction of Senile Cataract* (Cleveland, 1912).

CATARMAN, kâ'tär-män'. A town of Samar, Philippines, situated 55 miles north-northeast of Catbalogan. A disastrous volcanic eruption took place here in 1871. Pop., 1903, 9994.

CATARRH' (Fr. *catarrhe*, Lat. *catarrhus*, from Gk. *κατά, kata*, down + *ρεῖν, rhein*, to flow). A symptom of great frequency in temperate latitudes, especially in changeable, moist climates, in the winter season. It consists of an increase in the secretion naturally flowing from the mucous membrane, preceded by a congestion and a brief period of dryness. Popularly a catarrh is called a cold, because exposure to cold lowers the vital resistance so that toxins of bacteria, entangled in the mucus, become active and attack the system. More often it follows overheating, the breathing of foul air, or checking of perspiration. Catarrh is much increased by constipation, a full diet, and lack of exercise. It may affect the nasal passages (rhinitis), the throat (pharyngitis), the vocal cords and neighboring parts (laryngitis), the membrane covering the eyeball and lining the eyelids (conjunctivitis), the stomach (gastritis), the bowels (enteritis), the urinary bladder (cystitis), the bronchi (bronchitis), and other tracts lined by mucous membrane. Each of these forms is described under its own title.

CATARRH, EPIZOÖTIC. See EPIZOÖTIC.

CATARRH, NASAL. See GLANDERS.

CAT'ASAU'QUA. A borough in Lehigh Co., Pa., 3 miles north of Allentown, on the Lehigh River, and on the Lehigh Valley, the Central of New Jersey, and the Philadelphia and Reading railroads (Map: Pennsylvania, L 6). Manufacturing is the principal industry, the establishments including blast furnaces, foundry and machine shops, silk mills, horseshoe, car wheels, rubber goods, and hardware factories, etc. Catasaqua was settled in 1805, and was chartered as a borough in 1853. It is governed by a burgess, elected every three years, and a unicameral council. Pop., 1910, 5250. Anthracite pig iron was first successfully made here in 1839.

CATAS'TROPHISM (Fr. *catastrophisme*, from *catastrophe*, Lat. *catastrophā*, Gk. *καταστροφή, katastrophē*, overthrow, from *κατά, kata*, down + *στροφή, strophē*, a turning, from *στρέφειν, strephein*, to turn). The doctrine that the vast changes which the earth has undergone from the beginning to the present time were caused by the sudden action of powerful physical agencies. This hypothesis was maintained by some of the earlier geologists to explain the physical features and structure of the earth's crust; the upheaval of mountains and the elevations and depression of land areas were considered to be catastrophic phenomena. Its advocates also claimed that the changes which have taken place in life forms cannot be explained fully by the theory of evolution and natural selection as taught by Darwin, Huxley, and others. The doctrine of catastrophism has met with strong opposition from leading scientists, and its application in geology is no longer recognized. One of the ablest opponents was Sir Charles Lyell, who made use of the forces and processes working at the present time to explain the geological history of the earth (uniformitarianism). Consult Lyell, *Principles of Geology* (London, 1875).

CATAUXI, kâ-touks'é. A naked reputedly cannibal tribe of Arawakan stock, living on the middle Purús River in western Brazil. They are said to be handsome and of somewhat light complexion. They cultivate manioc, make pottery, use the blowgun with poisoned arrows, and powder the roasted seeds of *Acacia niopp* for use as a narcotic stimulant.

CATAW'BA. An Eastern tribe of Siouan

stock, formerly holding a large district on the river of the same name in South and North Carolina. They were once the ruling tribe of South Carolina, numbering 1500 warriors, or perhaps 6000 souls, but by the inveterate hostility of the Tuscaroras and other Northern tribes, with intemperance and smallpox, they declined rapidly, and in 1743 were reduced to less than 400 men in spite of the fact that they had incorporated several smaller tribes. In nearly all the early wars, including the Revolution, they fought on the American side. About 100, of whom a few speak their ancient language, still reside on a small State reservation on Catawba River, in York Co., S. C.

CATAWBA, or GREAT CATAWBA RIVER. See WATEREE RIVER.

CATBALOGAN, kät-bä'lô-gän'. The capital of the island Province of Samar, Philippines, situated at the mouth of the Antigas River on the west coast (Map: Philippine Islands, E 5). It lies 338 miles southeast of Manila, with which it carries on a considerable trade in hemp and coconut oil. Pop., 1903, 7758.

CATBIRD. In the United States, a common and familiar songster (*Dumetella*, or *Galeoscoptes carolinensis*), nearly related to the mocking bird. It is about 9 inches long, slate-gray in color, the crown and tail black. It is found in most of North America and is a general favorite. Although its call note resembles the mewling of a cat, its spring song is one of the most varied and brilliant heard in American woods; the bird is also a mimic. It feeds chiefly upon insects, nests in bushes, and lays four or five dark greenish-blue eggs. Although a migrant in the North, it breeds and also winters in the Southern States. It is usually to be found in gardens, along roadsides, and in bushy pastures. In Australia, the bower birds, especially *Ailurædus crassirostris*, are called catbirds because of their mewling notes.

CATBOAT (Icel. *kati*, small boat + *boat*). A small sailboat, usually not more than 30 feet in length, rigged with a large fore-and-aft mainsail only, set on a boom and gaff, and having the mast stepped as far forward as possible. Such a rig as this is called a *cat rig*. Catboats are very quick-working and are easily handled by one person, which quality has made them very popular. They usually draw but little water, depending on a centreboard to prevent their making leeway, and have great beam in proportion to their length.

CATCH (probably because the voices caught up the words in turn). A species of musical composition peculiar to England, without accompaniment and set to humorous words. The music is generally for three voices and in the canon (q.v.) style. As in the canon, each voice takes up the subject at a certain distance after the preceding has begun. One of the best specimens of a catch is by Calcott, on Hawkins's and Burney's histories of music, where the humor lies in one of the parts repeating "Burney's history"—sounding like "burn his history"—while the others are advocating Hawkins. In 1761 a Catch club was founded in London, which is still in existence. At various times prizes were offered for which the foremost English composers competed.

CATCH DRAINS, or CATCH-WATER DRAINS. Open drains constructed along a declivity to intercept and carry off surface water. The name is particularly applied to a drain which is built

to separate a district requiring artificial drainage from surrounding higher land, in order to keep the surface water from the higher land from running into it and so increasing the amount of water to be removed from the low land. In Holland this is accomplished by a dike and canal called "ungvart." See DRAINAGE.

CATCHFLY. The common English name of several plants of the family Caryophyllaceæ—which being clammy, in consequence of a peculiar exudation on the calyx and on the joints of the stem, often prove fatal to insects settling upon them. The most common American species of catchfly are *Silene virginica*, *Silene regia*, *Silene rotundifolia*, and *Silene antirrhina*. European species are *Silene armeria*, *Silene angelica*, and *Lychnis viscaria*. *Dionæa muscipula* is also sometimes called the Carolina catchfly, or Venus flytrap. See CARNIVOROUS PLANTS; DIONÆA; LYCHNIS; SILENE.

CATEAU, kâ'tô', LE. A town in the Department of the Nord, France, on the Selle, 14 miles east-southeast of Cambrai (Map: France, N., J 2). It manufactures shawls, merinos, silks, calicoes, and leather, has breweries and distilleries, and a considerable trade in iron, coal, and wine. Pop. (commune), 1901, 10,594; 1911, 10,212. The place derives its name from the château built by Herluin, Bishop of Cambrai, in the eleventh century. The Treaty of Cateau-Cambrésis (q.v.) between France, England, and Spain was signed here on April 3, 1559. Consult Miresse, *Le Cateau: ses origines, son abbaye* (Cambrai, 1905).

CATEAU-CAMBRÉSIS, TREATY OF. A treaty of peace concluded April 2-3, 1559, by Henry II of France with England and Spain. It confirmed the French in possession of Calais, which they had wrested from the English in 1558, after the latter had held it for more than 200 years. France surrendered her conquests in Savoy and Italy, but was allowed to retain the three bishoprics—Metz, Toul, and Verdun. The Treaty of Cateau-Cambrésis marks the definite abandonment on the part of France of the policy of Italian conquest initiated by Charles VIII in 1494.

CATECHETICAL (kät'è - kêt'i - kal) **SCHOOLS** (Fr. *catéchétique*, from Gk. *κατηχητικός*, *katēchētikos*, instructive, from *κατηχεῖν*, *katēchein*, to instruct orally, from *κατά*, *kata*, down + *ἤχεῖν*, *ēchein*, to sound). The name given to the ancient Christian schools of theology, of which the chief were those of Antioch (160-400) and Alexandria (c.200-500). Clement (q.v.) and Origen (q.v.) were the most famous of the teachers in the latter; Theodore (q.v.) of Mopsuestia of the former.

CATECHISM (Fr. *catéchisme*, Lat. *catechismus*, from Gk. *κατηχίζεω*, *katēchizein*, to catechise, from *κατηχεῖν*, *katēchein*, to instruct orally, from *κατά*, *kata*, down + *ἤχεῖν*, *ēchein*, to sound). A system of teaching by means of question and answer, employed for popular instruction in the truths and duties of the Christian religion. The composition of the first catechisms was, in all probability, suggested by the ordinary oral instruction of catechumens, and was intended for the help both of teachers and pupils. It appears to have been in the eighth and ninth centuries that the first regular catechisms were compiled, of which that by Kero, a monk of Saint-Gall, and that ascribed to Otfried of Weissenburg, are among the most noted. At later periods the use of catechisms prevailed chiefly among the op-

ponents of the hierarchy, as among the Waldenses, the Albigenses, the Wiclifites, and, above all, among the Bohemian Brethren. The term "catechism" appears to have been first employed in its present sense among the last-named. At an early period in the history of the Reformation the reformers began to avail themselves of this method of popular instruction, and their catechisms became important instruments in that great religious movement. In 1520 Luther published his first short catechism. In 1525 Justus Jonas and John Agricola were intrusted with the preparation of a catechism. In 1529 Luther published his larger and smaller catechisms, which found a place among the symbolical books or standards of the Lutheran churches. A number of catechisms were published also by the Swiss reformers and by those of England and other countries. The Geneva Catechisms, larger and smaller, were the work of Calvin. They were published in 1536, were speedily translated into various languages, and became acknowledged standards of the Reformed churches, not only in Switzerland, but in the Netherlands, in France, and in Hungary. The Church of Geneva has set aside the authority of these catechisms. The Zurich Catechism is received as a standard in the Church of Zurich. The Heidelberg or Palatinate Catechism is of greater importance, however, than any other as a standard of the German reformed churches. It was compiled by the Heidelberg theologians, Caspar Olevian and Zacharias Ursinus, at the request of the Elector Frederick III of the Palatinate; it was published in 1563, was approved by several synods, and was subjected to a revision by the Synod of Dort. In the Church of Rome the Tridentine Catechism is of high authority. It was prepared in accordance with the decrees of the Council of Trent, by Archbishops Leonardo Marino and Muzio Calini, Bishop Egidio Foscarini, and the Portuguese Dominican, Francesco Fureiro; revised by Cardinals Borromeo and Sirlet, and sanctioned by Pope Pius V. It was published in Rome in 1566. It is a manual of instruction for the clergy, to prepare them for their catechetical work. The catechism of the Orthodox Greek church was prepared by Peter Mogilas, Metropolitan in Kiev, and published in 1642. It received authority as a standard or symbolical book from a synod in Jerusalem in 1672. It is often called the Larger Russian Catechism, to distinguish it from the Smaller Catechism prepared by order of Peter the Great. Besides these catechisms, which have a historic interest, or are of importance from their symbolical character, there have appeared at all periods since the Reformation many others, both Protestant and Roman Catholic, some doctrinal, some controversial, some devoted to particular subjects, as the sacraments, or to particular purposes, as the preparation of candidates for admission to the Lord's Supper, some adapted to the mental capacity of very young children, etc.

The Catechism of the Church of England is published in the Book of Common Prayer. It is in two parts: the first contains and explains the baptismal covenant, the creed, the ten commandments, and the Lord's Prayer; the second explains the two sacraments, baptism, and the Lord's Supper. It is not known with absolute certainty who was the author of the first part; probably Thomas Cranmer and Nicholas Ridley had the principal hand in framing the questions and answers. It was originally put forth with

the 42 articles in the reign of Edward VI, and condemned as heretical in the reign of Mary. It must not be confounded with Cranmer's catechism, which was a larger work, differently arranged, and translated chiefly from the German catechism used in Nuremberg. This first part of the Church Catechism is spoken of as the *Shorter* Catechism. There was a *Larger* Church Catechism compiled also in the reign of Edward VI, by John Ponet, as is supposed, and it corresponds in some degree with the smaller work above described. It appeared in 1553, but was afterward revised and enlarged by Laurence Nowell, Dean of St. Paul's, and published in 1570; and though never officially promulgated by the Church, it has some authority from having been approved by the Lower House of Convocation. At the Hampton Court Conference (1604), at the beginning of the reign of James I, the *Shorter* Catechism was considered too short, and the larger one of Nowell's too long; and accordingly, at the King's suggestion, an addition was made to the former of that explanation of the two sacraments which now forms the second part of the Church Catechism. This was drawn up by Rev. Dr. John Overall. The rubrics in the Common Prayer Book enjoin the teaching of the Catechism in the church on Sundays and holy days after the second lesson at evening prayer; the 59th canon contains a like injunction, imposing penalties on the clergy who neglect this.

The Larger and the Shorter Catechisms, which, with the Westminster Confession of Faith, constitute the standards or symbolical books of the English-speaking Presbyterian churches, were compiled by the Assembly of Divines at Westminster; the Shorter Catechism "to be a directory for catechising such as are of weaker capacity"; the Larger, "for catechising such as have made some proficiency in the knowledge of the Christian religion." The Shorter Catechism was presented to the English House of Commons on Nov. 5, 1647; the Larger on April 14, 1648; and in July, 1648, both received the sanction of the General Assembly of the Church of Scotland, which, in the act of approving of the Larger Catechism, declared it to be "a rich treasure for increasing knowledge among the people of God," and that "they bless the Lord that so excellent a catechism has been prepared." The Shorter Catechism has, however, been far more generally used for the purpose of instruction than the Larger, which has been generally felt to be too minute in its statements and too burdensome to the memory to be employed as a catechism. The Westminster Catechisms differ from most in being more theological. Consult Schaff, *History of the Creeds of Christendom* (3 vols., New York, 1876-77).

CATECHU, kăt'ê-kū or -chū (Neo-Lat., from Kanarese, Malay *kāchu*, catechu). A substance of vegetable origin employed in tanning and dyeing, and medicinally as an astringent. In the East it is much used for chewing. The catechu of commerce is obtained chiefly from East Indian trees, such as the *Acacia catechu* and *Acacia suma*. It is known in India by the name Kutt; and catechu is said to be a name compounded of two words signifying 'the juice of a tree' (*cate*, a tree, and *chu*, juice). Cutch is another form of one or other of these two names, and is a common commercial name. Catechu is obtained from the heartwood of the trees by cutting it into small chips and boiling in water till the extract has the thickness of

tar. It is then allowed to harden for two days, so that it will not run, and is formed into balls about the size of oranges, which are placed on husks of rice or on leaves, and appear in commerce enveloped in them. The catechu manufacturers in northern India move to different parts of the country at different seasons, and erect temporary huts in the jungles, where they carry on their operations. *Pegu catechu* is the ordinary commercial variety and is used in medicine; it is soluble in hot water, in alcohol, acetic acid, and the strong alkalies; it is astringent and leaves a sweetish taste in the mouth. The active ingredients of catechu are catechuic acid or catechin, and a peculiar variety of tannic acid, of which it contains about 54 per cent. Catechu has been extensively employed in the dyeing of browns, fawns, drabs, and olives, and the development of logwood black on silks. It is much used for coloring stout canvas. See GAMB'ER.

CATECHUMENS, kăt'ê-kû'měnz (Fr. *catéchumène*, Lat. *catechumenus*, Gk. *κατηχούμενος*, *katēchoumenos*, from *κατηχεῖν*, *katēchein*, to instruct orally). The appellation commonly given, in the early ages of the Christian Church, to those converts who had not yet received baptism, but were undergoing a course of training and instruction preparatory to it. They had a place assigned them in the congregation, but were not permitted to be present at the dispensation of the Lord's Supper. In the apostolic age converts appear to have been at once admitted to the sacraments; but afterward this ceased to be the case, and a period of probation was required. The catechumens were divided into different classes or grades, according to their proficiency. Those of the lower grade were not permitted to be present during the prayers of the congregation; and those only of the higher who had been declared fit to be baptized at the next administration of the ordinance were permitted to witness the dispensation of the Lord's Supper. The term "catechumens" was afterward employed to designate young members of the Christian Church who were receiving instruction to prepare them for confirmation or for the Lord's Supper, and is still often used in this sense.

CATEGORICAL IMPERATIVE. A term much used by Kant (q.v.) and his followers to designate what they consider to be the absolutely unconditional character of the demands that morality makes upon every reasonable being. If we wish to preserve health, we must observe the laws of hygiene, but we may not wish to preserve health. The obligation of hygienic rules is thus conditional upon a certain wish which may or may not be cherished. But whether we wish it or not, we ought to respect another man's property. This obligation is thus conceived to be absolute. See ETHICS.

CATEGORY (Fr. *catégoric*, Lat. *categoria*, from Gk. *κατηγορία*, *katēgoria*, category, charge, from *κατηγορεῖν*, *katēgorēcin*, to accuse, from *κατά*, *kata*, down + *ἀγορεύειν*, *agoreuein*, to declaim, from *ἀγορά*, *agora*, assembly, from *ἄγειν*, *agein*, to lead). A philosophical term in use since the time of Aristotle. Aristotle used it to denote the highest classes under which all predicates of propositions concerning things can be subsumed. He recognized 10 such categories, viz., substance, quantity, quality, relation, place, time, situation, possession, action, and passivity. The Hindu philosopher Kavâda is said to have treated categories in such a way as to have

attained a result very much like Aristotle's. (See Thomson's *Laws of Thought*, appendix by Max Müller.) The Stoics recognized four ontological categories—substance, attribute, states, and relations. Plotinus recognized five—being, rest, motion, identity, and difference. The Scholastics accepted Aristotle's classification without any other change than to Latinize the word "category" into *predicamentum*, whence comes our word *predicament* in the sense of 'plight.' To be in a bad predicament is to be so circumstanced that the predicate of a judgment that adequately expresses one's situation falls under a bad class of predicates. Kant (q.v.) objected to Aristotle's classification as being uncritical, and proposed a new classification resting on the classification of judgments in traditional logic. But Kant did more than give a new classification of categories. He introduced a new conception of their nature. They were for him a priori (q.v.) principles of synthesis, whereby thought brings into definite intelligible form the chaotic manifold elements of sense. Kant recognized four categories—those of quantity, quality, relation, and modality. Each of these was subdivided into three classes, with 12 resulting categories, viz., unity, plurality, totality; reality, negation, limitation; substance and accident, cause and effect, reciprocity; possibility and impossibility, existence and nonexistence, necessity and contingency. (See KANT.) Hegel criticized Kant for doing what Kant criticized Aristotle for doing, and insisted that dialectic is the only method whereby the categories can be satisfactorily determined. (See DIALECTIC.) He also modified the Kantian view of categories by making them not so much forms imposed by thought on sense contents, themselves devoid of such forms, but rather principles obtaining in the unitary world of thought and things. They have thus both an objective and a subjective significance. Hegel in this way embodied in his treatment of categories both the Aristotelian realism and the Kantian idealism. As a result of his dialectic method, Hegel obtained three groups of categories—being, essence, and concrete thought (*Begriff*). Each of these has many subdivisions, so that the list he gives includes considerably more than 100 categories; but he does not claim absolute accuracy or exhaustiveness for the detailed results he obtains. J. S. Mill proposed as substitute for Aristotle's classification: (1) feelings, or states of consciousness; (2) the minds which experience those feelings; (3) bodies or external objects which excite certain of those feelings; (4) the successions and co-existences, the likenesses and unlikenesses, between feelings or states of consciousness. For Mill, categories were classes of namable things. In recent times Ed. von Hartmann has written a detailed work on categories (*Kategorienlehre*, 1896). He defines a category as an unconscious a priori intellectual function of a definite sort. This is very much like Kant's view; but categories are for him not so much part of the innate constitution of each individual as they are the ways in which the impersonal reason acts in individuals. Thus in origin they are superpersonal, but as concrete functions they belong to the individualized group of functions. There are three great divisions—categories of sensation, of perception, and of thought. Each division is more or less subdivided. It will thus be seen that one's views of categories are

determined by one's philosophical views. Consult Caird, *Critical Philosophy of Immanuel Kant* (New York, 1889), and Harris, *Hegel's Logic* (Chicago, 1890).

CATEL, ká'tél', CHARLES-SIMON (1773-1830). A French musician, born at L'Aigle. In 1787 he became accompanist of the Paris Ecole Royale de Chant (at which he had previously studied under Gossec), and upon its consolidation with the new Conservatory he was made professor of harmony. He later became an inspector of the Conservatory and in 1815 was elected to the Academy. Catel's most lasting work was his *Traité d'harmonie* (1802), an excellent textbook, and long a standard in France. Of his numerous compositions, only the operas *Sémiramis* (1802) and *Les Bayadères* (1810) are of any importance. Consult F. Hellouin and J. Picard, *Un musicien oublié, Catel* (Paris, 1911).

CATE'NA (Lat., chain). A commentary composed of extracts from different authors, elucidating a text, especially the text of the Bible. The composition of such commentaries dates from the fourth century. They became very common from the sixth century to the close of the Middle Ages. Prominent among the earliest compilers is Cassiodorus (c.480-580), and most famous is Thomas Aquinas (c.1226-74). Many extracts from otherwise unknown works have thus been preserved. Consult the English translation of the *Catena Aurea* on the Gospels by the latter (6 vols., new ed., Oxford, 1870). For a full list of catenæ, see Harnack, *Geschichte der altchristliche Litteratur* (Leipzig, 1897-1904).

CATENA, VINCENZO DI BIAGIO (c.1470-c.1531). A Venetian painter of the Renaissance. The exact date and place of his birth are not known, but he was a pupil of Giovanni Bellini, and his later works show the influence of Giorgione. To his early period belong "Madonna and Child" with landscape background (London); "Doge Leonardo Loredan Kneeling before the Madonna" (Ducal Palace, Venice), and "Holy Trinity" (San Simeone Grande, Venice); to a later period, "Knight Adoring the Christ Child" (National Gallery); "Christ Giving the Keys to Peter" (Gardner collection, Boston); "Count Raymond Fugger" (Berlin), and, finally, his masterpiece, "The Martyrdom of St. Christina" (1530, Santa Maria Mater Domini, Venice). Catena enjoyed the highest popularity among his contemporaries, who placed his works with those of Giorgione and Titian.

CAT'ENARY (Lat. *catenarius*, from *catena*, a chain). The curve formed by a flexible, homogeneous, and inextensible cord hanging freely between two points of support and acted on by no other force than gravity. If the cord is not homogeneous and the density varies, the cord hangs in a curve different in shape from the

CATENARY.

ordinary catenary; e.g., where the cord is such that the weight of any part of it is proportional to its horizontal projection, the curve is a parabola. The latter curve and the ordinary catenary are of importance in the theory of sus-

pension bridges. The catenary is represented algebraically by the equation:

$$y = \frac{c}{2} \left(e^{\frac{x}{c}} + e^{-\frac{x}{c}} \right)$$

It possesses several remarkable properties, one of which is that its centre of gravity is lower than that of any other curve of equal perimeter, and with the same fixed points for its extremities. The catenary seems first to have attracted the attention of Galileo, who attributed to it a parabolic form. Joachim Jungius (1669) showed the error of this supposition, but was unable to determine the equation of the curve, a result accomplished by Leibnitz (1691). The curve was also elaborately investigated by Jakob Bernoulli. The bibliography of the subject is given in Brocard, *Notes de bibliographie des courbes géométriques* (Bar-le-Duc, 1897). For a discussion of the mechanical properties of the curve, consult Price, *Analytical Mechanics*, vol. i (Oxford, 1868), and Minchin, *Treatise on Statics* (Oxford, 1880).

CAT'ENIP'ORA (Neo-Lat. nom. pl., from Lat. *catena*, chain + *porus*, pore). A generic name given by Lamarck in 1816 to the chain coral, a peculiar tabulate coral found in a fossil state in the Silurian rocks, to which the name "Halysites" had already been applied by Fischer in 1806. For description, see HALYSITES.

CATERPILLAR. See BUTTERFLIES AND MOTHS.

CATERPILLAR HUNTER. A predacious beetle of the family Carabidæ and genus *Calosoma*, of which several species prey upon caterpillars, earthworms, etc. To this genus belong a considerable number of species, of which a common one (*Calosoma scrutator*) is illustrated in the Colored Plate of INSECTS. See GROUND BEETLE.

CATESBY, kâts'bī, MARK (c.1679-1749). An English naturalist, born probably in London. He visited North America and the Bahamas in 1712-19 and afterward published *Natural History of Carolina, Florida, and the Bahama Islands*, with colored figures drawn and etched by himself (1722-26). These were the first drawings of North American animals to be published. He also published *Hortus Britanno-Americanus* (1737) and *Migration of Birds* (1747).

CATFISH (so called from the purring sound when the fish is taken from the water). One of a group of physostomous (soft-rayed) fishes of both salt and fresh waters, comprising the order Nematognathi and the family Siluridæ and its allies. "The fishes of this order," writes Dr. D. S. Jordan, "agree in having the maxillary bone imperfectly developed, and forming the basis of a long fleshy feeler or barbel [and in] . . . the presence, in most cases, of additional pairs of barbels about the mouth, near the tip of the upper or the lower jaw, or both; the absence of scales and the presence in many species, especially those found in tropical waters, of bony plates. These sometimes form a more or less perfect coat of mail on the sides of the body; at other times they form a shield on the top and back of the head. Another feature is the development, in most cases, of the first ray in the dorsal and pectoral fins as a strong, stiff, sharp, serrated spine which forms an effective weapon of defense. The spines of the pectoral fins are strongest, and they are usually 'set'—i.e., firmly erected—whenever the fish is caught

1. MAD TOM (*Schilbeodes miurus*).
2. GAFF-TOPSAIL CATFISH (*Felichthys felis*).
3. SEA CATFISH (*Galeichthys felis*).

4. EUROPEAN CATFISH OR WELS (*Silurus glanis*).
5. STONE CATFISH (*Noturus flavus*).
6. BLACK BULLHEAD (*Ameiurus melas*).

or attacked. These spines are a source of much annoyance to fishermen, and there are few persons . . . in the Eastern States who have not had some painful experience with the 'horns' of a catfish." The wounds made by these spines often heal with difficulty, owing to the jagged nature of the cut and to the slime introduced; in one genus (*Noturus*), moreover, a poison gland is connected with the pectoral spine. They use the spine in ugly fights among themselves. The catfishes inhabit the fresh waters and shallow coastal waters of the warmer parts of America, Africa, and the Orient, but are represented by only a single European species, the typical silurus of the Latins, and the sheatfish of English writers. (See SHEATFISH.) They vary from 2 inches to a dozen feet or more in length, and may exceed 200 pounds in weight. Most of them are good food and everywhere enter into the diet of the people. In habits they are comparatively sluggish, remain close to the bottom, and are carnivorous and voracious, eating eggs and fry of aquatic animals, and seizing such fishes, amphibians, and birds as they can overcome. Few are swift swimmers, but they lurk in wait for prey, being almost invisible by reason of their dull, dark colors, and making a quick rush; consequently the larger ones are among the most destructive enemies of aquatic life.

The North American catfishes have the skin wholly naked and are familiarly represented by the horned pout. (See BULLHEAD.) The same genus (*Amiurus*) contains several other species often termed mud cats. The stone cats belong to the genus *Noturus*, are small, comparatively slender, dark-hued, and inflict poisoned wounds. Another genus, the channel cats (*Ictalurus*), dwell in running streams and lakes and include many large forms, the fork-tailed catfish of the Great Lakes (*Ictalurus lacustris*) sometimes weighing 100 pounds; while the "white" channel cat (*Ictalurus ponderosus*, or *punctatus*) of the Mississippi River valley may grow to 150 pounds, and become the largest of our fresh-water fishes except the California sturgeon. An illustrated monograph of the fresh-water species, by Dr. D. S. Jordan, will be found in *Bulletin No. 10* (1877) of the United States National Museum at Washington. The sea catfish are closely allied to the channel cats, and two species are common along the Atlantic coast, both 2 to 5 feet long, and blue above the silvery bellies; but more than 100 species of this marine group, which haunt sandy bottoms near shore and furnish poor food, are scattered through the tropics, especially in the East Indies.

The South American fresh waters abound in catfishes of the genus *Pimelodus* and its allies, the largest species of which is the leopard cat, or suravi (*Pimelodus frati*), from rivers of Argentina and Uruguay, which is 6 to 7 feet long, and yellow, spotted with black. Another characteristic South American group is that of the mailed cats, of the genus *Callichthys*, in which the body is almost entirely covered by four rows of large, hard, narrow, scaly plates, two rows on each side, and the head is well covered with bony plates. They are said to be able to make their way over land from a pool which may be drying up to another some distance away; sometimes they bury themselves in the mud of wet meadows. They build their nests near the margin of the water, at the beginning of the rainy season, both sexes guarding them

until the eggs are hatched. The genera *Doras*, *Loricaria*, and *Arges* are allied groups of many species. Africa abounds in fishes of this family, of which the best known is the bayad (q.v.) of the Nile. A different Nile catfish (*Malapterurus electricus*) has the power of delivering an effective electric shock. (See ELECTRIC FISHES.) Many other species, some of large size, having the general characteristics outlined above, haunt the sluggish rivers and estuaries of India, Siam, China, and the larger islands thence to Australia, with varying importance as food. Among these is notable the eel-like genus *Clarias*, "eelpouts," about 30 species of which are known, some reaching 6 feet in length. The catfishes are known as fossils well back into the Tertiary.

The name applied to various fishes of other families; as, in England, to the wolf fish (*Anarrhichas lupus*), the cusk, and one or more small sharks. In Australasia the stargazers (*Kathetostoma*) are called catfish, and elsewhere the chimæras are called "sea cats."

CATGUT (probably a corruption, by popular confusion with *kit*, cat, of *kit*, fiddle, apparently from AS. *cytere*, from Lat. *cithara*, Gk. *κιθάρα*, *kithara*, guitar, and *gut*, Ger. *Gotte*, gutter, from AS. *géotan*, Goth. *giutan*, Ger. *geissen*, Lat. *fundere*, Gk. *χεῖν*, *chein*, to pour). A substance employed in the manufacture of the strings of violins, harps, guitars, and other musical instruments, and also used for the cords carrying clock weights, in the bows of archers, and for whip cord. It is generally prepared from the intestines of sheep, rarely from those of the horse, ass, or mule, but never from those of the cat. The first stage in the operation is the thorough cleansing of the intestines from adherent feculent and fatty matters, after which they are steeped in water for several days, so as to loosen the external membrane, which can then be removed by scraping with a blunt knife. The material which is thus scraped off is employed for the cords of battledores and rackets, and also as thread in sewing the ends of intestines together. The scraped intestines are then steeped in water and scraped again, treated with a dilute solution of alkali (4 oz. potash, 4 oz. carbonate of potash, and 3 to 4 gallons of water, with occasionally a little alum), drawn through a perforated brass thimble, and assorted into their respective sizes. In order to destroy any adherent animal matter, which would lead to putrefaction and the consequent development of offensive odors, it is customary to subject the catgut to the fumes of burning sulphur (sulphuric acid). The best strings are used for musical instruments, and those which come from Italy and are known as *Roman strings* are the strongest. They are remarkable for their clearness and transparency. The surgeon also uses the best grades of catgut in closing wounds. Cords for suspending clock weights are made up of catgut split longitudinally into several lengths. Whipcord is made from catgut which has been twisted in a manner somewhat similar to single-corded ropes.

CATH'ARI, or CATHARISTS (ML., from Gk. *καθαρός*, *katharos*, pure). A name very generally given to various sects which appeared in the Church during the Middle Ages. It appears to have been sometimes assumed in profession of a purity of doctrine and morals superior to that which generally prevailed in the Church, sometimes bestowed ironically in ridi-

cule of such a profession. It was used as a designation of the Novatians (q.v.) of the third century, the Paulicians (q.v.) of the seventh and succeeding centuries; but more usually of sects which appeared in Lombardy in the beginning of the eleventh century, and afterward in France and the west of Germany, and of the Bogomiles of the twelfth century. In the eleventh century the Patarenes appeared in Milan and were called Cathari. The names "Albigenses" and "Cathari" are often used as equivalent to one another; in fact, it is almost impossible to differentiate the various bodies known by different names and all called Cathari. Manicheism, Gnosticism, and Montanism are ascribed to the Cathari; but as their doctrines were a confused agglomeration of different doctrines, and consequently the descriptions of contemporary writers are not always concordant, it is difficult to make out their system in detail. It appears quite certain that the Cathari differed among themselves in their doctrines, and in the degree of their opposition to the dominant Church. Some of them advocated and practiced a rigid asceticism. There is no good evidence that any of them nearly approached to the doctrines of the Reformation, although in their rejection of tradition, of the authority of Rome, of the worship of saints and images, etc., there are notable points of agreement with the views of the reformers. Consult: C. Schmidt, *La secte des Cathares* (Strassburg, 1849); J. J. Döllinger, *Sektengeschichte*, vol. ii (Munich, 1890); also H. C. Lea, *History of the Inquisition* (3 vols., New York, 1888); and Molinier, "L'Eglise et la société Cathares," in *Revue Historique*, vols. xciv and xcv (Paris, 1907).

CATH'ARINE (Fr. *Catherine*, Lat. *Catharina*, Gk. *Καθαρίνη*, *Katharinē* from *καθαρός*, *katharos*, pure). The name of six saints of the Roman Catholic church. The simple designation of *St. Catharine*, however, is often given to CATHARINE OF ALEXANDRIA, said to have been of royal descent, who, publicly confessing Christianity at a sacrificial feast appointed by the Emperor Maximinus, was put to death in 307 A.D., after being tortured on a wheel. Hence the name of "St. Catharine's wheel." She is regarded as the patroness of girls' schools. Her day is November 25 or March 5. (See her life in the publications of the Early English Text Society; also in those of the Roxburghe Club, both London, 1884.)

SAINT CATHARINE OF SIENA, daughter of Giacomo Benincasa, a dyer of Siena, was born there in 1347; practiced extraordinary mortifications, and was said to have been favored with especial tokens of favor by Christ, whose wounds were impressed upon her body. (See **STIGMATIZATION**.) She became a Dominican, and died in Rome, April 29, 1380. She wrote devotional pieces, letters, and poems; the best edition appeared in Siena and Lucca, in 1707-54 (in 5 vols., 4to), under the title of *Opere della serafica Santa Catarina*. Her letters were published in French (Paris, 1854; best in the original, 4 vols., Florence, 1860). In English have appeared *Saint Catherine of Siena as Seen in her Letters* (London, 1905); *Dialogues of the Seraphic Virgin Catherine of Siena* (London, 1896); the dialogue *De Perfectione* is translated in Miss Drane's biography mentioned below. Consult her life by J. E. Butler (4th ed., London, 1895); Augusta I. Drane (London, 1880); Scudder (New York,

1905); Gardner (New York, 1908); Roberts (New York, 1906).

SAINT CATHARINE OF GENOA was born in 1447 of the distinguished Genoese family Fieschi. Her father was Viceroy of Naples under René of Anjou. She was very beautiful. Her own wish was to become a nun, but her parents gave her in marriage to a Genoese nobleman, Giuliano Adorno (Jan. 13, 1463), in order to heal the breach which had come between the two families. Her married life was unhappy, and she suffered much not only from her husband's personal treatment, but from his extravagance and licentiousness. At last bankruptcy overtook him and they were reduced to poverty. Then her spiritual nature showed itself. She started on a career of philanthropy as nurse (1479) and from 1491 to 1497 was chief nurse in a great hospital. Her husband was converted through her influence, entered the third order of St. Francis, and joined her in charitable labors. Her ascetic piety was extraordinary. It is said that from 1478 to 1500 she fasted all Advent and all Lent, and took no nourishment of any kind, but drank water mingled with vinegar and salt. She died Sept. 15, 1510, having won so high a reputation for piety that Pope Clement VII canonized her in 1737; and Benedict XIV put her in the Martyrology under March 22; but in the *Acta Sanctorum* she is found under September 5. She had many ardent disciples, and one of them wrote from her lips, in Italian, the *Treatise on Purgatory* (Eng. trans., London, 1878). Her life, written by T. de Bussiere, prefaced a French translation of her works (Paris, 1860). See also her life by Fliche (Eng. trans., New York, 1874), and Von Hugel, *The Mystical Element in Religion* (New York, 1909).

SAINT CATHARINE OF BOLOGNA and **SAINT CATHARINE OF SWEDEN** (1331-81), the fourth daughter of St. Birgitta (or Bridget) of Sweden, are of less note.

CATHARINE I (?-1727). Mistress and wife of Peter the Great, and Empress of Russia from 1725 to 1727. She was born between 1682 and 1685, the daughter of a Lithuanian peasant, Samuel Skavronski, or perhaps of a Baltic nobleman, Colonel Rosen. Her mother was undoubtedly a serf. She was brought up as a foundling by the pastor Glück, at Ringen and Marienburg, in Livonia, and was married to a dragoon, who was immediately ordered into active service. At the taking of Marienburg by the Russians, in 1702, Glück threw himself and his family on the mercy of the Russian commander, Sheremetieff, who was attracted by the beautiful face of the young peasant girl and kept her with him when the other captives were forwarded to Moscow. A few months later Menshikoff, the favorite of Peter, saw her, and took advantage of his rank and power to deprive Sheremetieff of his prize, only to be in turn despoiled by Peter himself. With a figure and bearing that bore testimony to her ignoble birth, she seems nevertheless to have had in her face a peculiar charm, and, unlettered though she was, she possessed an active and practical mind that appealed to Peter. She became his most influential adviser and confidant, exercising over this man of iron will and violent passions an influence such as no other person had. Peter profited by her resourceful intellect in the campaign against the Turks in 1711, and the colored accounts that have come down to us represent her as having saved the Czar and his army when they were hemmed

in at the river Pruth by bribing the Grand Vizier with jewels and money. In recognition of her services, Peter founded the Order of Love and Fidelity, or of St. Catharine, for women, and in 1712 made Catharine his wife. This was done only by setting aside his first wife and after much persuasion on Catharine's part. By a ukase of 1721 the Czar proclaimed his right to designate his successor, and in 1724 Catharine was crowned Empress. An intrigue which she carried on with one of the chamberlains of the royal household aroused Peter's jealousy, but he spared her life, and after his death, Feb. 8, 1725, it was alleged by Menshikoff and others that he had at the last moment forgiven the Empress and carried out his earlier intention of designating her as his successor. The claims of the grandson of Peter by the son of his first wife were set aside, although maintained by the Old Russian party, and Catharine became Empress. Of her brief reign Menshikoff was the controlling spirit. As Empress, Catharine lived a life of dissipation. Her death, which occurred on May 17, 1727, came suddenly. She had eight children by Peter, all of whom died in infancy except two daughters, Anna and Elizabeth. The latter afterward became Empress. There are studies and memoirs in Russian and French bearing upon the life of Catharine I. A good list may be found in Lavisse and Rambaud, *Histoire générale*, vol. vii (Paris, 1896). Consult also Schuyler, *Peter the Great* (New York, 1884).

CATHARINE II, THE GREAT (1729-96). Empress of Russia from 1762 to 1796. She was born at Stettin, May 2, 1729, the daughter of the Prince of Anhalt-Zerbst, and was baptized a Lutheran under the name Sophia Augusta. She was chosen by the Empress Elizabeth (q.v.) of Russia for the wife of her nephew, Peter of Holstein-Gottorp, heir to the Russian throne, and was rebaptized into the Greek church by the name of Catharine. She was married in 1745. Thrown at the age of 16 into the intrigues of the coarse and immoral Russian court, Catharine adapted herself with singular readiness to her surroundings. Indifference to her husband soon became contempt and hatred. While Peter alienated the Russians by his obstinate admiration of all things German, Catharine became a Russian of the Russians, and, anticipating the great part she was later to play, attached to herself a strong party, through her tact and matchless influence over men. Peter openly maintained a mistress, subjecting his wife to constant indignities, and Catharine's relations were equally notorious, at first with Count Soltikoff, and afterward with Count Stanislas Poniatowski. The Empress Elizabeth died in 1762, and Peter became Emperor. He now threatened to divorce Catharine, to declare her son Paul illegitimate, and to marry his mistress, the Princess Vorontsoff. Catharine, assisted by the Orloffs, the Princess Dashkoff (q.v.), and others who had long formed about her a coterie of conspirators, headed a rising of the troops in St. Petersburg, and, aided by the dilatoriness and weakness of Peter and his unpopularity, secured all the instruments of power and was declared Empress of Russia. Peter was seized and imprisoned, and was probably strangled by Gregory Orloff, Catharine's favorite at the time (July, 1762). As Empress, Catharine gave close personal attention to the work of government, and by liberal expenditure and the patronage of let-

ters and art made her court one of the most brilliant in Europe. It has been said that she found St. Petersburg a village of hovels and left it a city of brick and marble. Regarded at first as a usurper by the European governments, she compelled their recognition by the vigor of her policy. In 1780 she announced the principle of armed neutrality as an offset to the British treatment of neutrals, and, by securing the adherence of other states, fixed in international law the principle of "free ships, free goods." See INTERNATIONAL LAW.

The gross immorality of her private life was as notable as her administrative energy. Russia borrowed what culture it had from France, but at the same time the immoral life of the French court was reduced to a system in Russia. The rule of all the Empresses after Peter the Great was notorious for the influence possessed by favorites, but Catharine's wholesale methods are almost unique in history. She had a succession of recognized lovers, beginning with the brutal and domineering Gregory Orloff, who maintained his place until he dared to aspire to marriage with his royal mistress. After him came Vyscoki, Vassilshikoff, Alexis Orloff, and then the most powerful of them all, Gregory Potemkin (q.v.). Potemkin was banished from the court for the same presumption that led to Gregory Orloff's fall; but he was made practically Vice Emperor for southern Russia, and continued to play an important part in the government, retaining Catharine's affection to the day of his death. These men had all possessed some force and power, and had supported Catharine in the administration; but Potemkin was followed by a series of favorites who were little more than the temporary lovers of the Empress. Soon after her seizure of the throne Catharine secured the election of her early lover, Poniatowski, to the Polish throne, and later, in alliance with Prussia and Austria, took advantage of the dissensions among the Poles to bring about the three partitions of Poland (1772, 1793, and 1795). This was only one of the steps which enabled Catharine to accomplish one of her chief ambitions—to bring Russia into direct contact with the Western world. She was indeed the truest heir to the policy of Peter the Great, in its good and its evil. The war with Turkey (1768-1774) impressed Europe with the power of Russia and brought increase of territory, the Crimea, etc., and the free navigation of the Black and Mediterranean seas.

With all her defects of character, Catharine was one of the most remarkable rulers of modern times. Her boundless ambition and tireless energy served chiefly one aim—that of developing all the resources of Russia and transforming it into the most powerful and most splendid state of Europe. During the first 12 years of her reign, while under the influence of Orloff, her activity was almost wholly beneficent. She convoked representatives of all the provinces at Moscow to discuss plans for reforming the administration of justice, and as a result completely reorganized the laws of the Empire. She encouraged immigration, introduced inoculation for smallpox, and other sanitary measures, established elementary schools in all the cities and many small towns, founded institutions of learning, military and naval schools and hospitals, built canals and fortresses, and sent Russian scholars and artists abroad to profit by foreign

example. The principal defect of her methods lay in her seeking to adapt to the government of a half-civilized country like Russia the principles derived from her study of French models. She invariably turned to French thinkers as her source of inspiration and was flattered by their applause. She corresponded with Voltaire and invited him to her court; patronized Diderot, who lived some time in St. Petersburg; asked D'Alembert to complete the *Encyclopédie* there; made Grimm her literary agent in Paris; translated Marmontel's *Bélisaire* into Russian, and in reorganizing the laws of the Empire took Montesquieu as her model. Her foreign policy, fantastic as to her dream of expelling the Turks from Europe and founding a new Byzantine empire under a prince of her house, bore substantial fruit in securing for Russia the lion's share in the partitions of Poland, in humbling the Turks, annexing the Crimea and Courland, and extending the boundaries of Russia to the Dniester. During the early part of her reign she was called upon to frustrate the plots to place on the throne Ivan, son of Anna Carlovna, and, later, to suppress the formidable revolt, in the Volga region, of the Cossack Pugatcheff, a pseudo-Peter (1771-74) who had enlisted the support of the peasantry and the extreme orthodox party. Towards the end of her reign her extravagance and the corruption of her court brought her into discredit in Russia as well as among the sovereigns of Europe. The progress of the French Revolution checked her ardor for reform according to French models, and she finally prohibited the publication of French works in Russia. She died of an attack of apoplexy in November, 1796.

A good bibliography is contained in Lavisce and Rambaud, *Histoire générale*, vol. vii (Paris, 1896).

CATHARINE DE' MEDICI, dâ mǎ'dê-chê (1519-89). Queen of Henry II of France. She was the daughter of Lorenzo de' Medici, Duke of Urbino, and was born in Florence in 1519. In 1533 she married Henry, second son of Francis I of France. The death of her uncle, Pope Clement VII, who had arranged the marriage, left her without a powerful friend, but her submissive conduct won the favor of Francis, and in some measure that of her husband, who became King in 1547. She was the mother of four sons, of whom three became kings of France; and with the accession of the eldest, Francis II, in 1559, the Queen mother asserted herself in the government. On the death of Francis II, in 1560, and the accession of Charles IX, the government fell entirely into her hands. Her political principles were the selfish ones which obtained at the petty courts of Italy in the fifteenth and sixteenth centuries. Her fundamental plan was to elevate the royal power at all costs, and for this end she played off Catholics against Huguenots, deserting one or the other party if it became strong enough to

threaten the power of the King. She made a league with the Huguenots to overthrow the Guises (q.v.), and when this attempt failed, and the civil war which ensued ended in the Peace of Amboise, highly favorable to the Protestants, she became alarmed at the increase of their power and entered into a secret treaty with Spain for the extirpation of heretics. Subsequently she entered into a plot with the Guises, in which at first only the murder of the Protestant leaders was contemplated, but which resulted in the fearful massacre of St. Bartholomew. (See BARTHOLOMEW, MASSACRE OF SAINT.) The Queen mother boasted of this deed to the Roman Catholic governments, and palliated it to Protestants, for she now managed all the correspondence of the court. About this time she succeeded, by gold and intrigues, in having her third son, afterward Henry III, elected to the Polish throne (1573). Her arbitrary administration roused the opposition of a party among the Catholics, headed by her fourth son, the Duke of Alençon, who allied themselves with the Protestants. After the accession of Henry III Catharine continued to be the power behind the throne, the mainspring of all intrigues. The treachery of Catharine and her sons towards all who trusted them alienated all parties, and she died, in 1589, friendless and unmourned, at the castle of Blois. Her control had done much towards the demoralization of France. CATHARINE HOWARD. See HOWARD, CATHARINE.

CATHARINE OF ARAGON (1485-1536). Queen of England, the first wife of Henry VIII, and fourth daughter of Ferdinand and Isabella, King and Queen of Castile and Aragon. She was born in December, 1485. She occupies a prominent place in English history, because the question of her matrimonial relations with Henry was a factor in the English Reformation. In pursuance of his foreign policy, Henry VII negotiated a matrimonial alliance between Catharine and his son Arthur, Prince of Wales. She went to England in 1501, and on November 14, a few days after the public betrothal, the marriage was celebrated. Never a wife, except in name, Catharine was left a widow by the death of Arthur on April 2, 1502. A few months later, a second marriage was projected for her by her father-in-law, with his second son, Henry, as yet only a boy of 12 years. The Pope's dispensation enabling such near relatives to marry was obtained in 1504, and the marriage took place in June, 1509, immediately after Henry's accession to the crown as Henry VIII. The marriage was, on the whole, fairly successful, though the pro-Spanish sympathies of Catharine brought some difficulties during the periods of French alliance. But the great failure of the marriage lay in the fact that Catharine bore Henry but one daughter and no son that survived. The succession of a queen regent was doubtful, and, granted that were secured, the question of marriage, either with a foreign prince or a subject nobleman, brought in a distinct possibility of a revival of the trouble

of the Wars of the Roses. There are a number of indications that Henry was troubled by these thoughts long before the advent of Anne Boleyn (q.v.), but, at any rate, her appearance and the resultant passion it aroused in Henry brought them to the surface. From 1527 or perhaps earlier Henry worked to secure a decree of nullity as to his marriage with Catharine and a marriage with Anne that would bring him a son to secure the succession. He professed doubts as to the validity of his marriage, and in 1527 a collusive suit was secretly brought before Wolsey. Nothing came of this; but the question of divorce was openly raised. Pope Clement VII refused to declare the marriage void at Henry's request through the secretary, Knight, whom the King had sent to Rome for that purpose. He, however, granted a commission to Campeggio and Wolsey to inquire into the validity of the marriage; but before these prelates Queen Catharine refused to plead, and appealed to the Pope. The King craved judgment. The legates cited the Queen, and, declaring her contumacious when she did not appear, went on with the cause; but Cardinal Campeggio, anxious only to stay the proceedings when the King expected a decree, prorogued the court until a future day. The King consulted the universities of Europe, many of which declared the marriage invalid. The Pope now summoned the King to Rome, but Henry haughtily refused to appear either in person or by deputy, for he maintained that such obedience would be to sacrifice the prerogatives of his crown, and, setting the Pope at defiance, he married Anne Boleyn, Jan. 25, 1533. On the 23d of the following May Cranmer declared the first marriage void, and on March 23, 1534, Pope Clement pronounced it valid, thus bringing about the alienation of Henry VIII from the Roman see. Queen Catharine did not quit the kingdom, but was closely guarded at Ampthill, in Bedfordshire, afterward at Buckden, and then at Kimbolton Castle, Huntingdonshire, until her death on Jan. 8, 1536. In the meantime, although absolutely friendless and harassed by ceaseless persecution, she displayed heroic courage and surprising mental powers, defeating every base design of the King and his agents to induce her to sign away the rights of herself and her daughter Mary. Catharine was educated under her mother's direction and was a fair Latin scholar. Her character was unimpeachable, and her disposition sweet and gentle. Consult: *The Calendars of State Papers* for the reign, edited by Brewer and Gairdner (1880-90), and the Spanish series, edited by Bergenroth and Gayango, vol. ii (1868); Brewer and Gairdner, *Letters and Papers of the Reign of Henry VIII* (London, 1862); Hall, *Chronicle* (London, 1809); Pocock, *History of the Reformation* (new ed., London, 1873); *The Divorce, 1527-33* (2 vols., Oxford, 1870); Le Grand, *History of the Divorce of Henry VIII and Catharine*, with Burnet's answer (London, 1690); Nicholas Harpsfield, *Treatise on the Pretended Divorce*, ed. by Pocock (London, 1878); Froude, *The Divorce* (New York, 1891); Froude, *History of England*, vols. i-ii (New York, 1871); Cavendish, *Life of Cardinal Wolsey* (2d ed., London, 1827); Dixon, *Two Queens* (London, 1873-74); Lingard, *History of England*, vol. vi (Boston, 1853-55); and Brewer, *Reign of Henry VIII*, ed. by Gairdner (2 vols., London, 1884); Pollard, *Henry VIII* (London, 1905). An excellent bibliography of the divorce controversy is pro-

vided by Huth, *Marriage of Near Kin* (2d ed., London and New York, 1887).

CATHARINE OF BRAGANZA, brá-gän'zà (1638-1705). Queen of Charles II of England. She was the daughter of John IV, Duke of Braganza and King of Portugal. Her mother, Luisa de Guzmán, a daughter of the Duke of Medina Sidonia, was a woman of ability, who governed Portugal for several years after the death of her husband and who foresaw the Restoration in England and proposed the marriage of Catharine with Charles to gain an ally against Spain. That power tried to prevent the marriage; Portugal gave a dowry of £300,000 and the towns of Tangier and Bombay, besides many privileges of trade. After the marriage at Portsmouth, in May, 1662, Charles was pleased with the innocence and sweet disposition of his bride, who had been carefully trained in a convent. But he soon introduced mistresses into the court and, when the Queen expressed indignation, lectured her upon the duty of submission. After repeated humiliations of this kind, she passively acquiesced, and Charles, fickle as he was, showed her a certain attention and affection for which she was grateful. He shielded her from the calumny and plots of anti-Romish agitators, who charged her with a design to poison the King and propagate the Catholic faith in England. She truly mourned his death. After a life of seclusion during the reign of James II and the first years of William III, she returned to Portugal in 1692, and acted as regent to her brother, Dom Pedro, until her sudden death, Dec. 31, 1705. Consult: Strickland, *Lives of the Queens*, vol. iv (London, 1888); Jesse, *Memoirs of the Court of England*, vol. iii (London, 1876); Ranke, *History of England, Principally in the Seventeenth Century* (Oxford, 1875); Davidson, *Catherine of Bragança* (London and New York, 1908).

CATHARINE OF VALOIS, vâ'lvä', or OF FRANCE (1401-37). Queen of Henry V of England. She was the daughter of Charles VI. When she was 12 years old, Henry proposed to marry her and demanded as a dowry 2,000,000 crowns and the provinces ceded by the Treaty of Bretigny, together with Normandy. The proposition was rejected, but Henry soon afterward invaded France (1415) and forced a compliance with his terms. When he married Catharine at Troyes, June 2, 1420, he received immediate possession of the provinces claimed, the regency of France during the life of his father-in-law, and the reversion of the sovereignty after the death of Charles. On Feb. 24, 1421, Catharine was crowned at Westminster, and on December 2 of that year she became the mother of Henry VI. The next year she was in France, where her husband died, and she returned to London with his body. After the funeral little is heard of her history, the only notable event being her secret marriage to Owen Tudor, a poor Welsh gentleman in attendance on her son. The marriage was not openly proven until 1436. By Tudor she had four children, one of whom was made Earl of Richmond, and married Margaret Beaufort, heiress of the House of Somerset, and junior representative of the branch of John of Gaunt. Margaret became the mother of Henry VII. Consult Miss Strickland, *Lives of the Queens of England*, vol. iii (London, 1840).

CATHARINE PARR. See PARR, CATHARINE.

CATHARINE WHEEL (from the image of St. Catharine represented as being martyred

on the wheel). An heraldic device which is frequently used as a charge in coats of arms, when it is represented with teeth.

CATHARISTS. See CATHARI.

CATHARTIC (Fr. *eathartique*, from Gk. *καθαρτικός*, *kathartikos*, purgative, from *καθαρός*, *katharos*, clean). A name originally applied to any medicine that was supposed to purify the system from "disease material" (*materies morbi*), which was generally presumed by the ancients to exist in all cases of fever and acute disease (see CRISIS), and to require to be separated or thrown off by the different excretions of the body. Ultimately the term "cathartic" became limited in its signification to remedies capable of causing copious evacuation of the bowels and having a more pronounced effect than the "laxatives." The principal cathartics are aloes, colocynth, rhubarb, jalap, senna, Epsom and other salts, castor oil, croton oil, and elaterium. They are employed when it is desirable to terminate an attack of constipation, or to cause large, watery evacuations for the purpose of abstracting water from the blood, so that water in the pleural or abdominal cavities or in the cellular tissues may pass into the blood vessels and thereby reduce a dropsical condition. Cathartics act as irritants on the alimentary canal, provoking increased secretion to expel them, or as stimulants of the peristaltic action of the muscular coat of the intestine through reflex nervous disturbance. See the drugs mentioned, under their names. See also CONSTIPATION; PURGATIVES.

CATHAR'TIDÆ. See CONDOR.

CATHAY, *kāth-ā'*. A term which came into use in later mediæval times and was applied to the vaguely wondrous regions of the Far East. It was given to China by the first European explorer in that land, Marco Polo (q.v.). It is supposed to have been derived by him from the name of a race of mediæval conquerors of northern China, *Khitah* or *Khitan*, who had almost disappeared at the time of his visit, and who may have been conceived by him as having formed the original substratum of the Chinese people. It is an interesting fact that the name of this conquering tribe, which has long since disappeared in the place of its origin and mediæval use, is preserved in the modern Russian name for China, i.e., *Khitai*. Columbus reasoned that, since the earth is spherical and not flat, he could reach Cathay by sailing westward.

CATH' CART, SIR GEORGE (1794-1854). A British general, son of William, Earl Cathcart. Educated at Eton and Edinburgh, he joined the army in 1810; fought in the campaigns of 1812-13; served as aid-de-camp to the Duke of Wellington at Quatre Bras and Waterloo; and in 1852-53, as Governor of the Cape of Good Hope, granted the first constitution to the colony, ended the Kaffir War, and crushed the Basutos. He distinguished himself by his bravery in the Crimean War and fell at Inkermann on Nov. 5, 1854. He was buried at Cathcart's Hill, which was named after him. He was the author of *Commentaries on the War in Russia and Germany in 1812 and 1813* (London, 1850).

CATHCART, SIR WILLIAM SCHAW (1755-1843). First Viscount and Earl Cathcart of the United Kingdom (1814); previously tenth Baron Cathcart of Scotland (1807). A British general and diplomatist, son of Baron Cathcart of Cathcart, Renfrew. He was born Sept. 17, 1755. Educated at Petersham, he studied law at Dresden

and Glasgow, was admitted advocate, but at his father's death entered the army, took a prominent part in the American war, and fought with distinction in Flanders and Germany. In 1801 he was made lieutenant general and in 1803 commander in chief for Ireland and later for Scotland. In July, 1807, he commanded the land forces coöperating with the fleet in the British attack on Copenhagen. For his services he was raised to the peerage, with the title of Viscount, and received the thanks of Parliament. In 1813 he was Ambassador to St. Petersburg, accompanied the Czar Alexander in the campaigns of 1813 and 1814, and was present at the Congress of Vienna. He then returned to St. Petersburg, where he remained as Ambassador until 1820. In 1821 he retired from public life, and died June 16, 1843.

CATHCART, WILLIAM (1825-1908). An American Baptist clergyman. He was born at Londonderry, Ireland, and was educated at the University of Glasgow and at Horton (now Rawdon) College, Yorkshire, England. He came to the United States in 1853, held a pastorate in Philadelphia, and was elected president of the American Baptist Historical Society. His publications include the following: *The Baptists and the American Revolution*; *The Papal System*; *The Baptist Encyclopædia*, his most important work; *The Baptism of the Ages and of the Nations*.

CATHE'DRAL (from Gk. *καθέδρα*, *kathedra*, a seat). This word was used of the actual throne of the bishop in the apse of his church. Hence the episcopal church was called a cathedral church, *ecclesia cathedralis*; the residence of the bishop was a cathedral city, and a formal decision of the bishop was an *ex-cathedra* utterance. There could be but a single such church or city in the bishop's province. This was called originally a *parish*, but soon a *diocese*, corresponding exactly to the late Roman civil diocese or province. All churches within his diocese were consecrated by the bishop, and all except his one episcopal church were called parish churches. The extent to which the monastic churches came under the jurisdiction of the bishop varied greatly in different countries and at different times. The term used for the capital church of the diocese was in early times *ecclesia mater*, or *matrix*, and the term *ecclesia cathedralis* came later, and cathedral was first used as a substantive only in the tenth century and then only in the West, for in the East neither the name nor the power it represented ever existed. How the special body of cathedral clergy was formed by a gradual process from the diocesan clergy is a matter foreign to this article. But the prominence of cathedral churches at different times corresponds largely to the religious and political power of the episcopacy. Thus, cathedral churches were important in the fourth and fifth centuries, when such men as Augustine, Ambrose, Cyril, and John Chrysostom were bishops and ruled the Christian world. But when monasticism, under the followers of Benedict and Basil, was overwhelmingly ascendant, as it was from the seventh to the eleventh century in both East and West, monks occupied the cathedral thrones and filled the ranks of the canons. episcopal churches could not vie with those of the great monasteries, and the people, the government, and the papacy looked to abbots and not to bishops. Then arose that hybrid class of monastic cathedrals,

especially in countries converted by monks, such as England and Germany in Saxon and Carlovingian times. It was when the great communal movement came in the eleventh and twelfth centuries that three new social powers arose—centralized government, communal autonomy, episcopal independence. In the social struggle the kings and emperors usually sided with the free communes and their bishops—especially in France and Germany. The cathedral churches became for the cities the badge of civic autonomy, the centre of civil as well as of religious life, the outward sign of prosperity. The Rhenish cities—Speyer, Worms, and Mainz—were among the first; then the Hanseatic towns and the Saxon, Lübeck, Hanover, and Hildesheim, all in the tenth and eleventh centuries. They felt that great movement under the Othos and Henrys. Next came, in the eleventh and twelfth centuries, the great Italian communes—Pisa, Milan, Parma, Cremona, Bologna, and others in the north; with even southern cities, such as Benevento, Bari, Trani, Amalfi. Then the communal movement reached France in the middle of the twelfth century, and it bloomed with the rise of Gothic art at Sens, Senlis, Noyon, Laon, Paris, and Chartres. The lawlessness and arrogance of the wealthy monasteries and of the great abbots, who as feudal lords claimed practical independence both of kings and bishops, and sided with the feudal barons in the struggle for social, political, and religious supremacy, contributed to the union of the resources of king, bishops, and people in the building of these great cathedrals. In the thirteenth century the episcopal power and importance of the cathedral reached their zenith, and the important monuments then built throughout Europe are too many to enumerate (see the paragraph on *Gothic* under ARCHITECTURE, and GOTHIC ARCHITECTURE). New and more sumptuous churches replaced the smaller edifices of an earlier age, under the religious enthusiasm born of the Crusades, which led the entire people to give their work freely. A cathedral was usually erected by means of voluntary contributions solicited from all classes—rich and poor—not only throughout the diocese, but beyond. Previously the trend of munificence had been almost entirely directed towards the monastic orders. (See BENEDICTINES; MONASTERY.) But enthusiasm was now much more general for the erection of the cathedrals that were truly representative of the whole people. Contemporary chronicles are full of the way the people of both sexes and all ages brought and handled the stone, the timber, and other materials. When completed, the cathedral served (except in England) also as town hall for political meetings, as hall for the *mysteries* which were the theatrical performances of the Middle Ages, its square for the periodical fairs. It usually crowned the city, rising far above its roofs in a central and prominent position. In England, with no large cities and with an almost wholly agricultural population, many of the great monastic churches were at the same time cathedrals, the abbot being also the bishop of the diocese, so that there was no conflict of rival jurisdictions. These were the “regular” cathedrals, served by “regular” or monastic bishops, deans, and canons (Canterbury, Durham, Winchester, etc.). The others were “secular” cathedrals, as Salisbury and Wells. Among the most important cathedrals, architecturally speaking, are the following:

ITALY. Bari, Como, Ferrara, Florence, Lucca, Milan, Modena, Monreale, Orvieto, Palermo, Piacenza, Pisa, Siena.

GERMANY. Bonn, Cologne, Freiburg, Mainz, Ratisbon, Speyer, Strassburg, Worms.

SWITZERLAND. Basel, Zürich.

AUSTRIA-HUNGARY. Vienna.

FRANCE. Albi, Amiens, Auxerre, Beauvais, Bourges, Chartres, Laon, Le Puy, Lyons, Noyon, Orleans, Paris, Poitiers, Rouen, Rheims Senlis, Sens, Tours, Troyes.

ENGLAND. Canterbury, Durham, Exeter, Ely, Lichfield, Lincoln, St. Paul's, Salisbury, Southwell, Wells, Winchester, Worcester.

SPAIN. Ávila, Barcelona, Burgos, Granada, Jaén, León, Salamanca, Seville, Tarragona, Toledo.

BELGIUM. Antwerp, Brussels, Ghent, Louvain, Malines, Tournai, Ypres.

See Plates of AMIENS, CANTERBURY, COLOGNE, DURHAM, FLORENCE, GLOUCESTER, LINCOLN, LYONS, MEXICO, MILAN, MOSCOW, PISA, ST. PAUL'S (London), ST. PETER'S (Rome), STRASSBURG, WINCHESTER, and YORK.

It cannot be said that there was any special style or special form of plan used for cathedrals as distinct from other churches. The large body of canons connected with a cathedral made a large choir natural, and so the development of this part of the church (see CHURCH) in the monastic churches of the preceding age was adopted by the cathedral builders of the twelfth and succeeding centuries. The greater size and immense resources available made, however, the cathedrals the touchstones of artistic conditions; but the cathedral is not always the largest or finest church even in the cathedral town, as in Bologna (q.v.), where the cathedral is far inferior to the great parish church of San Petronio. It is a misnomer to apply the term “cathedral” to the basilica of St. Peter at Rome or of St. Mark at Venice. The minster at Ulm is not a cathedral, though commonly so miscalled. In France, where scholastic philosophy was seeking to synthesize life and knowledge, the cathedral was made the vehicle for the expression in material forms of its encyclopædic learning for the edification of the masses. The Church had always sought to make of art a great educational engine, and the effort, previously scattered in basilicas and churches of all kinds, was now more concentrated in the cathedrals.

In Italy the cathedral, the tower, and the baptistery frequently formed a group of three in the great square, and to them was often added the episcopal palace. Sometimes, especially in France and England, various dependent buildings, such as cloister, chapter house, and refectory, were attached to the cathedral after the monastic fashion, but usually it stood clear, on the most conspicuous site of the city. In England the entire group, with usually an extensive open space in front planted with trees, was enclosed within a high wall with several gates, whence the name *close*. Wells is the most complete example of such a group; it is a secular cathedral, but in every respect reproduces the grouping of a monastic cathedral. This arrangement is not found on the Continent, where the cathedral was the centre of the civic life. Rome occupied a unique position. St. John Lateran was more than the cathedral of Rome; it was the mother of all churches, being the seat of the Pope, but it was not called cathedral. St. Peter succeeded it in

the fifteenth century. The other great basilicas of Rome—St. Paul Without the Walls, Santa Maria Maggiore, Santa Croce in Gerusalemme—also had a rank superior to that of the ordinary cathedral.

Organization. The bishop in his church was surrounded by his college of presbyters, who served him as counselors, assistants, and missionaries. This college or chapter, in England sometimes consisted of "secular or non-monastic clergy," and sometimes of "regulars," who were under monastic rule and lived in buildings common to all. Of both kinds of chapters the bishop was the head—of the latter, as the abbot of the monastery to which his cathedral church belonged; and of the former, as having sole authority over it. In early times there was an archpresbyter, who had chief authority among the cathedral clergy, always in strict subordination to the bishop. He was gradually supplanted by the archdeacon, who was followed in the eighth and ninth centuries by the "præpositus" or provost. The "dean," the present head of all English cathedral chapters, first appears in the tenth or eleventh century. Often, if the bishop's diocesan duties increased and important political functions also were assigned him, he was obliged to leave the affairs of his cathedral to the head of the chapter. This is the explanation of the strange anomaly, sometimes witnessed in modern times, that in his own cathedral church the bishop has less authority than in any other church of his diocese. Under the bishop as its nominal head, the chapter of a fully organized cathedral, formed of secular priests, consisted of four chief dignitaries and a body of canons. I. The four high officers were: (1) the "dean," as the general head of the chapter charged with its internal discipline; (2) the precentor, presiding over the choir and musical arrangements; (3) the chancellor, who superintended the religious and literary instruction of the younger members, took care of the library, and wrote the letters; (4) the treasurer, to whom were intrusted, not the money of the church (as might appear from the modern use of the word), but its sacred vessels, altar furniture, reliquaries, and similar treasures. II. In addition to these dignitaries, a cathedral chapter consisted of a board of officers called canons; some of them who enjoyed a separate estate (præbenda) in addition to their share of the corporate funds were called prebendaries. In the Middle Ages an attempt was made to impose on them, in part, monastic rules with dining hall and lodging rooms in common; but the restriction was never acceptable and was gradually given up. Monastic cathedrals closely resembled other monasteries, except that in the almost constant absence of the bishop—their nominal abbot—they were governed by a prior. With the suppression of the monasteries by Henry VIII (1534–38) the monastic cathedrals were "secularized" and thus placed on a "new foundation," which characterization they still retain, the originally secular cathedrals being called "of the old foundation." The continental European cathedrals were governed in the same general manner as the English, but only in the rarest instances was a cathedral chapter monastic and its head at once an abbot and a bishop.

At present all dioceses of the Roman Catholic church in the United States, and many dioceses of the Protestant Episcopal church, have cathedrals. The finest specimen of cathedral archi-

itecture at present existing in this country is St. Patrick's Roman Catholic Cathedral, in New York City, begun in 1858 and practically completed in 1889, at a cost of some \$2,500,000. It will, however, be surpassed in size and in magnificence by the new Protestant Episcopal Cathedral of St. John the Divine, in the same city, of which the choir and apse chapels have been completed and the crossing inclosed. Consult article "Cathédrale" in Viollet-le-Duc, *Dictionnaire raisonné de l'architecture française* (Paris, 1876); Van Rensselaer, *English Cathedrals* (New York, 1893); Pratt, *Cathedral Churches of England* (New York, 1910); Scott, *An Essay on English Church Architecture* (London, 1881); Wilson, *French Cathedrals* (New York, 1900); Barr Ferree, *Chronology of French Cathedrals* (New York, 1894); Gade, *Spanish Cathedrals* (Boston and New York, 1911); Lübke, *Ecclesiastical Art in Germany* (Edinburgh, 1873).

CATHEDRAL, THE. A poem by James Russell Lowell, published in Boston in 1869. It is a description of a day spent before the famous cathedral in Chartres, France.

CATHELINÉAU, ká't'-lě'nó', JACQUES (1759–93). A leader of the insurgents in La Vendée during the French Revolution. He was born in very humble life, at Pin-en-Mauges, in the Department of Maine-et-Loire. For two years before the Vendean insurrection broke out at Saint-Florent, Cathelineau was busy organizing the peasants and providing them with weapons. When the open conflict came, he led a body of 3000 men, and in company with Bonchamp and Elbéés captured several towns. After the victory of Saumur (q.v.), the council of generals appointed him, as having the greatest influence over his countrymen, commander in chief. He immediately determined to make an attack upon Nantes and managed to penetrate into the town, where he was wounded by a musket ball, whereupon his troops dispersed. He was carried to Saint-Florent, where he died July 11, 1793. He was a man of great simplicity and honesty of character, and for his piety was called the "Saint of Anjou." Consult La Porte, *La légende de Cathelincau* (Paris, 1893), and Muret, *Vie populaire de Cathelincau* (Paris, 1845).

CATHERINE. See CATHARINE.

CATHERWOOD, MARY HARTWELL (1847–1902). An American novelist, born at Luray, Ohio. After graduating from the College at Granville, Ohio (1868), she settled at Newburgh-on-the-Hudson, where she began writing stories for the magazines. To this period belong several good novels, among which may be cited *Cracque o' Doom* (1881). Soon afterward she began a series of successful historical romances illustrating French Canada. They comprise mainly: *The Romance of Dollard* (1889); *The Story of Tonty*, into which is introduced La Salle (1890); *The Lady of Fort St. John* (1891); *The Chase of St. Castin, and Other Stories of the French in the New World* (1894); and *Macinac and Lake Stories*, dealing with the mixed settlements in the islands of the Great Lakes (1899). In a similar manner Mrs. Catherwood wrote of Illinois and the neighboring States in *Old Kaskaskia* (1893); *The Spirit of an Illinois Town*, a delightful story of two generations ago (1897); *Little Renault* (1897); *Spanish Peggy* (1899); *The Queen of the Swamp, and Other Plain Americans*, a collection of short stories of life in the Middle West a century ago (1899); and *Lazarre*

(1901). She also made a careful and appreciative study of the Maid of Orleans in *The Days of Jeanne D'Arc* (1897). Mrs. Catherwood's interest in French North America naturally led her from fiction to history. Her *Heroes of the Middle West* (1898) is an account of the French occupation from 1673 to 1763.

CATH'ETER (Lat., from Gk. καθήρ, *kathētēr*, from καθρός, *kathetos*, lowered, perpendicular, from κατά, *kata*, down + ἵεναι, *hienai*, to

CATHETER.

send). A surgical instrument in the form of a tube, used for insertion into a mucous canal. The term is generally applied to a tube used to pass through the urethra into the bladder, for the purpose of drawing the urine; but there is also a catheter which is passed into the Eustachian tube and a catheter which is passed from the bladder through the ureter into the pelvis of the kidney. Urinary catheters are made of silver, glass, or rubber. Woven linen, impregnated with gum elastic, is also used as a material for making catheters, and such an instrument is generally used with a stiff wire, called a stylet, in its lumen, the stylet being withdrawn after the instrument is in place. The catheter in ordinary use is made of silver or

soft rubber, the latter being less liable to do injury or to give pain in the male patient. For the male the length of a catheter should be about 10 inches with a curve of 2 inches at the extremity, if of metal. For the female, the catheter should measure about 5 inches, with a slight curve of half an inch at the extremity, if of metal.

CATH'ETOM'ETER (Gk. κάθετος, *kathetos*, vertical + μέτρον, *metron*, measure). A physical instrument employed in the exact measurement of vertical distances, such as the height of a column of liquid in a glass tube or the elongation of a wire. The cathetometer is employed extensively in the exact reading of a standard barometer and other measuring apparatus. It is constructed in numerous forms, but in general it consists of a vertical staff of metal so mounted on a base with foot screws that it can be leveled and

CATHETOMETER.

made to assume a truly vertical position. On this rod slides a carriage on which is mounted a small telescope with cross hairs accurately

adjusted in its axis. This telescope can be so arranged that it can move through any horizontal plane which is perpendicular to the axis of the upright supporting rod. The telescope is directed at an object or point whose vertical distance from another object or point it is desired to obtain. The adjustment is usually made by micrometer screws, and the carriage with its telescope raised and lowered until the point is bisected by cross hairs. The distance may be read off either on the rod itself by means of suitable microscopes and verniers or on an auxiliary scale on which the telescope or auxiliary microscope may be focused and whose graduations and coefficients of expansion are accurately known. The adjustments of the cathetometer are somewhat similar to those of an engineer's level, and the different instruments vary with different makers and investigators. A typical instrument is shown in the illustration.

CATH'ODE RAYS. These rays are described in that portion of the article which discusses discharge through gases. See **ELECTRICITY**.

CATHOLIC APOSTOLIC CHURCH. The proper designation of a body of Christians who object to any designation which implies sectarianism, and therefore to their common designation, "Irvingites," which is given to them from their connection with Rev. Edward Irving. In the winter of 1829-30 Irving, then a minister of the Scotch Church, Regent Square, London, delivered a series of lectures on spiritual gifts, in which he maintained that those which we are in the habit of calling "extraordinary" or "miraculous" were not meant to be confined to the primitive Church, but to be continued through the whole period of the present dispensation. About the same time, as if to confirm the views of the great preacher, there occurred at Port Glasgow, in the west of Scotland, certain strange phenomena. It was alleged that miraculous acts of healing had happened and that the gift of tongues had reappeared. After what seemed to be a sufficient investigation on the part of some of the members of Irving's church, it was concluded that the manifestations were genuine. Similar manifestations shortly after occurred in his own church, which were also pronounced to be genuine. They were held to be of two kinds: first, speaking in tongues, and, second, prophesying. As the former bore no resemblance to any language with which men were conversant, it was believed to be strictly an "unknown tongue," the Holy Ghost "using the tongue of man in a manner which neither his own intellect could dictate nor that of any other man comprehend." The latter, "prophesying," consisted chiefly of "exhortations to holiness, interpretations of Scripture, openings of prophecy, and explanations of symbols." After some time Irving was deposed from his office for heresy by the Church of Scotland, but meanwhile the religious opinions with which his name is associated had been assuming a more definite and ecclesiastical shape. The final result, after Irving's death, was the *Catholic Apostolic Church*, the constitution of which is briefly as follows:

There are, as in the apostolic times, *four* ministries: first, that of "apostle"; second, that of "prophet"; third, that of "evangelist"; and fourth, that of "angel." The apostles are invested with spiritual prerogatives; they alone can minister the Holy Ghost by the laying on

of hands; to them the mysteries of God are revealed and unfolded to the Church; and they decide on matters of order and discipline. Nothing that occurs in any church in the way of "prophetic utterance" can be authoritatively explained save by them; and the various "angels of the churches" are bound to bring all such utterances under their cognizance, in order that they may be rightly interpreted. The function of the "prophet" has been already indicated. The work of an "evangelist" mainly consists in endeavoring to bring in those who are without. The "angel" of the Catholic Apostolic church corresponds with the pastor of other Christian denominations. The ministers of each full congregation comprise an angel, with a four-fold ministry (consisting of elders, prophets, evangelists, and pastors), and a ministry of deacons to take charge of temporal matters. This ministry is supported by the tithes of the people. Church affairs are managed by a council of ministers of all classes, whose selection and arrangement are conceived to have been foreshadowed in the structure of the Mosaic tabernacle.

The Catholic Apostolic church holds with other Christian bodies the common doctrines of the Christian religion; it only accepts, in what it considers to be a fuller and more real sense, the *phenomena* of Christian life. It believes that the wonder, mystery, and miracle of the Apostolic times were not accidental, but are essential to the divinely instituted Church of God, and its main function is to prepare a people for the second advent of Christ. A very special feature of the Catholic Apostolic church is its extensive and elaborate symbolism. The doctrine of the objective presence in the sacrament of the Lord's Supper is held, but both transubstantiation and consubstantiation are repudiated.

The Catholic Apostolic church has spread from England to the Continent, but it continues a small body. In the United States (1913) it has 11 churches. Consult G. Miller, *History and Doctrines of Irvingism* (London, 1878), and Frommel, *Irvingianismus und Secte* (Bremen, 1885).

CATHOLIC BENEVOLENT LEGION. A fraternal organization in the United States whose object is to unite for social and benevolent purposes Roman Catholic men between the ages of 18 and 55. It was organized in 1881 and up to 1914 had distributed over \$22,000,000 to the beneficiaries of deceased members. It has five State and 358 subordinate councils; its membership in 1913 was 15,743. There is also an organization for women on parallel lines, known as the Catholic Women's Benevolent Legion.

CATHOLIC CHURCH (Lat. *catholicus*, Gk. *καθολικός*, *katholikos*, general, universal, from *κατά*, *kata*, according to + *ὅλος*, *holos*, whole). The phrase "Catholic Church" includes the two-fold idea of extension and complete possession of revealed truth, but, from the beginning of its history, has been used to mark the difference between the orthodox Christian Church and the various sects which sprang from it. The name has been retained by the Church of Rome in the West, and in the creeds of the Anglican communion, and by the "Orthodox" Greek church in the East, as being the historic successors of the ancient Catholic church. The Protestant churches have held that the etymological meaning is legitimate, and that the word may be used of the Church universal. The term "Catholic" applied to the church means that at

every period of her existence after the adequate diffusion of the gospel she must extend *morally* throughout the whole world and be everywhere the same.

CATHOLIC CREDITOR. In the law of Scotland, one whose debt is secured by a lien or charge on more than one item of property belonging to the debtor, e.g., on two or more heritable estates for the same debt. The Catholic creditor is bound so to exercise his right as not unnecessarily to injure the securities of other creditors. Thus, if he draw his whole debt from one piece of property, he must assign his security over the rest to the postponed creditors. The right of such a creditor is called a *Catholic right*. Consult Erskine, *Principles of the Laws of Scotland* (Edinburgh, 1881). For the corresponding principle of the English and American law, see MARSHALING.

CATHOLIC EMANCIPATION ACT. See ROMAN CATHOLIC EMANCIPATION ACT.

CATHOLIC EPISTLES. A group of seven letters in the New Testament (James, 1, 2 Peter, Jude, 1, 2, 3 John) which have been designated by this name, as denoting the comprehensive circle of the readers addressed, in distinction from the individual churches and persons addressed in the letters by Paul. The term was first used in the Eastern church, about the second century, and then only with reference to 1 John, which was so named in contrast with 2 and 3 John, as private letters. Later it was applied to 2 Peter and Jude, as relatively general in their addresses; then to James and 1 Peter, as addressed to large portions of the Church; and finally 2 and 3 John were included, either on the supposition that the names given in their addresses (2 John, "the elect lady and her children," 3 John, "Gaius, the beloved") were figurative designations of the Church, or under the impulse to gather all of John's letters in the same group. The term was also used of writings outside the canon (e.g., by Origen, of the Epistle of Barnabas) and even of heretical writings (e.g., by Apollonius [in Eusebius, H. E. vii, 25], of the Epistle of the Montanist Themiston). Cyril of Alexandria applies it to the letter of the Church of Jerusalem, given in Acts xv. By the fourth century it had come to designate in the East the present group of seven letters. In the West these writings were not known by any group name until the fifth or sixth century, and then the name which was given them was *Canonical*.

Bibliography. B. F. Westcott, *A General Survey of the History of the Canon of the New Testament* (6th ed., Cambridge, 1889); A. H. Charteris, *The New Testament Scriptures*, Croall Lectures for 1882 (New York, 1882). See JAMES, EPISTLE OF; PETER, EPISTLES OF; JOHN, EPISTLES OF; JUDE, EPISTLE OF.

CATHOLIC KNIGHTS OF AMERICA. A Roman Catholic fraternal order founded in 1877 at the suggestion of Archbishop Feehan, then Bishop of Nashville, for the purpose of providing Roman Catholic men with the same advantages as were offered to others in the fraternal organizations outside their church. It is the pioneer of the Roman Catholic assessment insurance organizations, and the only one which admits women to membership on the same footing as men. There were, in 1913, 540 subordinate councils, with a membership of 19,000; it also has a uniform rank, with a membership of 2000. Up to 1914 it has paid about \$18,000,000 to the

beneficiaries of its deceased members, and it was the first organization to adopt the plan of a reserve fund to insure the meeting of its obligations. Its membership is limited to Catholics in good standing.

CATHOLIC MAJESTY, HIS MOST. One of the formal designations of the King of Spain. It was given to Ferdinand V of Aragon and Castile by Pope Alexander VI and retained by later kings.

CATHOL'ICON AN'GLICON (Neo-Lat., from Gk. καθολικός, *katholikos*, universal + Ἀγγλικός, *Anglikos*, relating to England, from Lat. *Angli*, English). The title of an old Latin-English wordbook or dictionary, edited by S. J. H. Herrtage for the early English Text Society (London, 1881). The original text dates from 1483 and is supposed by the editor to have originated in the East Riding of Yorkshire.

CATHOL'ICOS (Neo-Lat., from Gk. καθολικός, *katholikos*, universal). The title of the chief ecclesiastic in the hierarchy of the Armenian, Nestorian, Abyssinian, and Jacobite churches and of the Christians of Georgia and Ethiopia.

CATHOLICS, ROMAN. See ROMAN CATHOLIC CHURCH.

CATHOLIC SUMMER SCHOOL OF AMERICA. A Roman Catholic school which was opened at New London, Conn., in the summer of 1892. Afterward a site was acquired at Cliff Haven, near Plattsburg, N. Y., on Lake Champlain, upon which adequate buildings were erected. The school is conducted in general along plans of the Chautauqua Summer School. (See CHAUTAUQUA.) It is designed to afford recreation and to give the Catholic point of view upon issues of the day in history, literature, philosophy, political science, and religion. It is in a measure an outgrowth of the Catholic Educational Union formed in 1889. The school is held annually from July to September, and its work is continued throughout the year by means of reading circles and study clubs on the University Extension Plan. The official organ is *Mosher's Magazine*. The president in 1914 was Rev. John F. Chidwick, D.D.

CATHOLIC TOTAL ABSTINENCE UNION OF AMERICA. A confederation of all the total abstinence organizations under Roman Catholic auspices, whether men's, women's, or juvenile. It was organized in 1872 on a strictly religious basis, requiring its members to go to Holy Communion at least once a year and recommending them to go four times. It was approved by Pope Leo XIII in 1887, and still earlier by the Third Plenary Council of Baltimore, which warned Catholics engaged in the sale of intoxicating drinks to consider seriously by how many and how great dangers, by how many and how great occasions of sin, their business, though in itself not unlawful, is surrounded. Urging them, if possible, to choose a more becoming way of making a living, it insisted that they should, at any rate, observe strictly certain regulations of decency and morality, and admonished them solemnly that "if through their culpable neglect or coöperation religion is brought into contempt or men brought to ruin, there is an Avenger in Heaven who will surely exact from them the severest penalties." Unlike many other societies, this Union does not assert that the use of intoxicants is wrong in itself, but maintains that for many it is a proximate occasion of sin, and must by them be abandoned altogether; and without insisting upon total abstinence as necessary for every one,

regards it as one of the strongest weapons against the widespread evil of intemperance and urges it upon those who wish to suppress this evil. At the present time the Union numbers over 100,000 members.

CATHOLIC UNIVERSITY OF AMERICA. An institution of higher learning at Washington, D. C., conducted under the auspices of the Roman Catholic church in the United States. The university was incorporated and received its apostolic constitution from Pope Leo XIII in 1887 and was opened for instruction in 1889. It is governed by a self-perpetuating board of trustees, chosen from the episcopate, clergy, and laity. The chief executive officers are the chancellor, the rector, and the treasurer. The courses of study are intended primarily to give professional training and to offer facilities for original research to graduates of Catholic seminaries and colleges. The faculties at present organized are those of theology, philosophy, letters, and sciences, comprising altogether 74 professors and instructors. In the Teachers' College (opened 1911) courses on academic and professional subjects are given by university instructors to members of the teaching sisterhoods. The Summer School (six weeks' session) is also organized to meet the needs of teachers. The total number of students in 1912-13 was 1037. The university has 20 endowed chairs, 4 endowed fellowships, and 40 endowed scholarships. The total value of its property and investments was \$2,682,600. Its library contains approximately 100,000 volumes, exclusive of pamphlets. Affiliated to the university, though retaining separate organizations, are the College of St. Thomas Aquinas, the Marist College, the Holy Cross College, the College of the Holy Land, the College of St. Austin, the Immaculate Conception College, and Trinity College (for women). St. Paul Seminary, St. Paul, Minn., is also affiliated under the clause of the university's constitution providing for the affiliation of Catholic seminaries and colleges in the United States. Cardinal Gibbons has been chancellor of the university since its foundation. The Right Rev. John J. Keane was rector till 1896, the Right Rev. Monsignor Thomas J. Conaty till 1902, Monsignor Dennis J. O'Connell till 1909. He was succeeded by the Right Rev. Thomas J. Shahan. Consult *Catholic University of America Year Book* (Washington, 1893 et seq.) and *Catholic University Bulletin* (Washington, 1895 et seq.).

CATHOLIC YOUNG MEN'S NATIONAL UNION. A federation of the diocesan unions of young men among Roman Catholics in the United States. It was organized at Newark, N. J., in 1875, and Monsignor George H. Doane, rector of the procathedral in that city, was elected its first president. It was formally approved by the Third Plenary Council of Baltimore in 1878 and had in 1914 about 35,000 members. Among its presidents have been such distinguished ecclesiastics as Archbishop Kain, of St. Louis, Monsignor Loughlin, of Philadelphia, and Monsignor Lavalley, of New York. It has shown its practical usefulness not only by consolidating and framing constitutions for diocesan unions, but by the establishment of libraries, reading rooms, and night schools, and the provision of good reading matter for soldiers and sailors.

CAT'ILINE (LUCIUS SERGIUS CATILINA) (c.108-62 B.C.). A Roman noble celebrated as the leader of a conspiracy against the Republic.

During his youth he attached himself to the party of Sulla. According to the ancient accounts, which all come from his opponents of the aristocratic party, his bodily constitution, allied to a mind which could stoop to every baseness and feared no crime, fitted him to take the lead in the conspiracy which has made his name infamous. In the year 68 B.C. he was elected prætor; in 67 he was Governor of Africa; and in 66 he was a candidate for the consulship, but was disqualified by accusations of maladministration in his province. Disappointed thus in his ambition and burdened with many and heavy debts he entered into a conspiracy, including many other young Roman nobles, in morals and circumstances greatly like himself, to effect a political revolution. A plan to murder the consuls of 65 B.C. at their inauguration, and a later effort to kill them in February, 65, failed. Presently a new plot was laid, but this was revealed to Cicero, then consul, by Fulvia, mistress of one of the conspirators. In the night of Nov. 6, 63, Catiline explained to his confederates his plans for assassinating Cicero; for bringing up the Tuscan army (which he had seduced from its allegiance), under Manlius, from the encampment at Fæsulæ (Fiesole); for setting fire to Rome and putting to death hostile senators and citizens. In a few hours everything was known to Cicero. Accordingly, when the chosen assassins came to his house, on pretense of a visit, they were immediately repulsed. On November 8, when Catiline audaciously appeared in the Senate, Cicero, who had learned that the insurrection had broken out in Etruria, delivered his First Oration Against Catiline. The accused was abashed by the minute knowledge Cicero displayed of the conspiracy. After an attempt at reply, he abruptly left the Senate and escaped from Rome during the night. Catiline and Manlius were now denounced as traitors, and an army under the consul Antonius was sent against them. The conspirators who remained in Rome, the chief of whom was Lentulus, were arrested, tried, condemned, and executed, December 5. The insurrections in several parts of Italy were meanwhile suppressed; many who had resorted to Catiline's camp in Etruria deserted when they heard what had taken place in Rome, and his intention to proceed into Gaul was frustrated. In January, 62, having returned by Pistorium (now Pistoja) into Etruria, he encountered the forces under Antonius, and after a desperate battle, in which he displayed almost superhuman courage and enthusiasm, was defeated and slain. For the conventional history of the conspiracy, consult: *Bellum Catilinæ* of Sallust; Cicero's four *Orations Against Catiline*; the biographies "Cæsar," and "Cicero," in Plutarch's *Lives*; in defense of Catiline consult E. S. Beesley, "Catiline as a Party Leader," *Fortnightly Review* (June, 1865).

CATILINE, HIS CONSPIRACY. A tragedy by Ben Jonson, played in 1611 and published in quarto the same year. A folio edition appeared in 1616 and a second quarto in 1635. It held the stage only to the close of the century and is a ponderous adaptation of the treasonous practices of Catiline.

CATILINE'S CONSPIRACIES. 1. A play by Stephen Gosson (q.v.), written and probably played in London about 1579. The piece has not come down to us, nor is there any record of its having ever been printed. 2. A play by Robert Wilson and Henry Chettle. It is not

extant, but a reference to it in Lodge's *Defense of Poetry*, published in 1580, would put its appearance before that date. There is a record of another *Catiline* by these authors.

CAT'INA, or **CAT'ANA**. See CATANIA.

CATINAT, kâ'té'nâ', NICOLAS DE (1637-1712). A French soldier, born in Paris. He distinguished himself at the sieges of Lille (1667) and of Maestricht (1673). In 1686, contrary to his wishes, he was sent against the Waldenses. He was made lieutenant general in 1688. The Duke of Savoy he defeated at Staffarda in 1690. He was promoted to be a marshal of France in 1693 for his victory at Marsaglia, but in 1701 was worsted by Prince Eugene at Carpi, and was superseded by Villeroy, under whom he served at Chiari. He was a follower of Turenne in strategy; in infantry tactics he attempted to perfect the charge, ordering his troops to endure the enemy's first discharge, coming to close quarters before firing. Consult his memoirs (Paris, 1819) and the biography (1902) by De Broglie.

CATIN'GA (South American word). The forests of the very dry lands of the interior of Brazil are called "catinga forests." They contain an unusual collection of trees with barrel-shaped trunks, as the cotton tree and many thorny trees. See FORESTS.

CAT ISLAND. One of the Bahama Islands, long and narrow in shape, but wide at its southern extremity. It was supposed by some to be the first landing place of Columbus on his voyage to the New World in 1492; but San Salvador, or Watling's, Island to the east has the better claim. It is 36 miles long and from 2½ to 7 wide.

CATKIN. See AMENT, and illustration in article ALDER.

CAT'LETTSBURG. A city and the county seat of Boyd Co., Ky., at the confluence of the Ohio and Big Sandy rivers, the latter forming the boundary between Kentucky and West Virginia (Map: Kentucky, H 2). The city is on the Chesapeake and Ohio Railroad. It has a considerable trade in lumber and contains wholesale groceries, shoe and hardware houses, saw and flour mills, machine shops, etc. Pop., 1890, 1374; 1900, 3081; 1910, 3520.

CAT'LIN, GEORGE (1796-1872). A traveler and writer and painter of Indian portraits, born in Wilkesbarre, Pa. He studied law, but, having a taste for art, became a portrait painter. Having conceived the idea of executing a gallery of Indian paintings in order to rescue from oblivion the various types and customs of the aborigines, he began in 1832 a series of travels extending over eight years among the wildest tribes of North and South America, resulting in a collection of some hundreds of Indian pictures painted by himself, together with several books descriptive of Indian scenes and customs. Most of the portraits, after having been exhibited by the artist in the United States and Europe, finally came into possession of the government and now constitute the famous "Catlin Gallery" of the National Museum. Some 400 sketches are owned by the American Museum of Natural History, New York City. Consult Miner, *George Catlin*, with an Annotated Bibliography of his Writings (New York, 1901); *My Life Among the Indians*, ed. by M. G. Humphreys (1909).

CATLINITE, kât'lin-it (after Catlin, the American traveler and artist). A hardened clay of reddish color found in Pipestone Co., Minn.,

which was used by the Dakota Indians for the manufacture of pipes.

CAT'NIP (probably a corruption of *catmint*, cat's mint, by popular confusion with *nip*, Ger. *kneifen*, Lith. *knėbti*, to pinch; hardly connected with Lat. *nepeta*, catnip), or **CATMINT** (*Nepeta cataria*). A plant of the family Labiatae, remarkable for the fondness which cats display for it. It is common in England, in chalky and gravelly soils, but less abundant in Scotland and Ireland, and is widely diffused throughout Europe and the middle latitudes of Asia and of North America. It affects cats in much the same manner as does valerian root, and when its leaves are bruised so as to be highly odoriferous, they are at once attracted to it, rub themselves on it, tear at it, and chew it. Its odor has been described as intermediate between that of mint and that of pennyroyal. It has erect stems, 2 to 3 feet high, dense whorls of many whitish flowers, tinged and spotted with rose color or purple, and stalked, heart-shaped leaves of a velvety softness, whitish and downy beneath. Other species are numerous in the south of Europe and middle latitudes of Asia. For illustration, see DICOTYLEDONS.

CA'TO. The title of a tragedy by Addison (1713), the scene of which was laid in Utica, whither Cato the Younger had retired after the successes of Cæsar.

CATO, DIONYSIUS. The name given to an imaginary person, long accounted author of a little volume of moral precepts in prose and verse, known as *Dionysii Catonis Disticha* (or *Dicta*) *de Moribus ad Filium*. In its present form it belongs, in general, to the third century A.D.; parts of it are much earlier, however. It begins with a preface addressed by the author to his son, after which come, in prose, 56 simple injunctions, such as *parentem ama*. This is followed by the main portion of the book—164 moral precepts, each in two dactylic hexameters. During the Middle Ages the work was a great favorite and was used as a textbook for young scholars. In the fifteenth century more than 30 editions were printed. An English translation was published by Caxton (1483). For a modern edition, consult Hauthal (Berlin, 1869) and G. Némethy (Budapest, 1905).

CATO, MARCUS PORCIUS (234–149 B.C.). A Roman statesman, surnamed *Censorius* and *Sapiens* (the wise), afterward known as **CATO PRISCUS**, or **CATO MAJOR** (Cato the Elder), to distinguish him from Cato of Utica. He was born near Tusculum, where the modern village of Monte Porzio Catone perpetuates his memory. Having inherited from his plebeian father a small farm in the Sabine country, he busied himself in agricultural operations and learned to love the simple and severe manners of his Roman forefathers. Induced by Lucius Valerius Flaccus to remove to Rome, Cato denounced the purposes and the degeneracy (so he called it) of the Philo-Hellenic party, then becoming prominent, and set a pattern of sterner and purer character. He soon distinguished himself as a pleader, and, after passing through minor offices, was elected consul (195 B.C.). In his Province of Hither Spain Cato was so successful in restoring order and displayed such military genius that he was honored by a triumph (194).

In 184 Cato was elected censor and discharged so rigorously the duties of his office that the epithet *Censorius*, formerly applied to all holders of that office, was made his distinctive surname.

He repaired the watercourses, bricked the reservoirs, cleansed the drains, increased the sums paid by the *publicani* (q.v.) for the farming of the taxes, and diminished the prices paid by the state to the contractors of public works. More questionable attempts at reforms were those in regard to restricting the prices that might legally be paid for slaves, dress, furniture, equipage, etc. Cato was a thoroughly dogmatic moralist, intolerant and stoical; great because he manfully contended with rapidly growing evils, yet not wise, because he opposed both bad and good innovations with equal animosity. He was always scrupulously honest.

In 175 B.C. Cato was sent to Carthage to help settle the differences between the Carthaginians and the Numidian King Masinissa; but having been offended by the Carthaginians, he returned to Rome, where, ever afterward, he described Carthage as the most formidable rival of the Empire, and concluded all his addresses in the Senate house—whatever the immediate subject might be—with the well-known words: "Ceterum censeo Carthaginem esse delendam" ('Moreover, I believe that Carthage must be destroyed').

Though Cato was early acquainted with the Greek language and its literature, his reactionary principles led him to denounce the latter as injurious to national morals. In his eightieth year his second wife, Salonia, bore him a son, the grandfather of Cato of Utica. He composed various literary works, such as *De Agri Cultura* (or *De Re Rustica*), which has been preserved entire. The best edition is by Keil (Leipzig, 1884). His greatest historical work, the *Origines*, in 7 books, has, unfortunately, perished. It was called *Origines* because, in addition to the history of Rome, it described the origins of the Italian towns with which Rome had come in contact. Fragments of Cato's orations—of which 150 were read by Cicero—are given in Meyer's *Oratorum Romanorum Fragmenta* (Zurich, 1842). As an orator, Cato was very famous, his style being natural, forcible, and racy to a degree. See Sears, *History of Oratory* (Chicago, 1896). For the fragments consult the edition by Jordan (Leipzig, 1860); also H. Peter, *Historicorum Romanorum Fragmenta* (Leipzig, 1870). For a translation of *De Agri Cultura*, see *Roman Farm Management: The Treatises of Varro and Cato done into English, by a Virginia Farmer* (New York, 1913).

CATO, MARCUS PORCIUS, known as **CATO THE YOUNGER**, or **CATO UTICENSIS** (from the place of his death) (95–46 B.C.). A Roman statesman and soldier. Having lost both parents during childhood, he was educated in the house of his uncle, M. Livius Drusus, and even in boyhood gave proofs of decision and strength of character. In 72 he served with distinction in the campaign against Spartacus, but without finding satisfaction in military life, though he proved himself a good soldier. From Macedonia, where he was military tribune in 67, he went to Pergamus. Thence he brought the Stoic philosopher Athenodorus to his camp and later to Rome, where he spent the time partly in philosophical studies and partly in forensic discussions. To qualify himself thoroughly for the quæstorship, he studied all the financial questions connected with it. Immediately after his election to this position (65) he introduced, in spite of violent opposition from those interested, a rigorous reform into the treasury offices. He quitted the quæstorship at the appointed time amid general approbation. In

63 he was elected tribune and delivered his famous speech on the Catilinarian conspiracy, in which he denounced Cæsar as an accomplice of Catiline and determined the sentence of the Senate. Strongly dreading the influence of unbridled greatness, he opposed consistently the most powerful men in Rome—Pompeius, Cæsar, and Crassus. Cato was a noble but strait-laced theorist, who lacked the intuition which belongs to men like Cæsar and Cromwell. His first opposition to Pompeius was successful; but his opposition to Cæsar's consulate for the year 59 was of no avail. Soon after the Triumvirs, to rid themselves of his interference, ordered him to proceed to Cyprus and take possession of that island for Rome (58). On his return (56) he was elected prætor, a position in which he fearlessly fought corruption. When the open breach came between Cæsar and Pompeius, Cato sided with the opponents of Cæsar. At the time of the battle of Pharsalus (48) he was holding Dyrrhægium for Pompey. After the disaster he sailed for Africa with his troops to join Pompey. Before his landing the Triumvir had been murdered. Cato was elected commander by the Pompeians in Africa, but resigned the post in favor of Metellus Scipio and undertook the defense of Utica. Here, when he had tidings of Cæsar's decisive victory over Scipio and Juba at Thapsus (April 6, 46), finding that his troops were wholly intimidated, he advised the Roman senators and knights to escape from Utica and make terms with the victor, but prohibited all intercessions in his own favor. Resolved to die rather than surrender, after spending the night in reading Plato's *Phædo*, he committed suicide by stabbing himself in the breast.

CATO, PUBLIUS VALERIUS, known as **CATO GRAMMATICUS**. A Roman grammarian and poet of the first century B.C. He lost his estate during the usurpation of Sulla, became an instructor to students of rank, and enjoyed great success, particularly as a trainer in the poetic art. Suetonius (*De Grammaticis*, 11) states that, in addition to works on grammar, he wrote a short autobiographical narrative entitled *Indignatio*, and some poems, of which two—*Lydia* and *Diana*—were chiefly esteemed. He favored the new school of poetry, which preferred mythological epics and elegies of the Alexandrian type to the national Latin epic and drama. The 183 hexameters called *Diræ in Batterum* were originally included in the minor poems of Vergil; later were attributed, with little reason, to Cato; and are now quite generally considered spurious. The text of the *Diræ* has been edited by Ribbeck (Kiel, 1867). Consult the essay by Næcke (Bonn, 1847).

CATOCHE, CAPE. See **CAPE CATOCHE**.

CATO MAJOR. See **DE SENECA**.

CATOP'TRICS (Fr. *catoptrique*, Gk. *κατοπτρικός*, *katoptrikos*, pertaining to a mirror, from *κάτοπτρον*, *katoptron*, mirror). That branch of geometrical optics which treats of the phenomena of light incident upon a surface and reflected therefrom. See **LIGHT**.

CATOP'TROMAN'CY (Gk. *κάτοπτρον*, *katoptron*, mirror + *μαντεία*, *manteia*, prophecy). Prophesying by means of a mirror or looking-glass. It originated at Patras, in Greece, where the death or recovery of the sick was foretold by means of a mirror let down with a thread until its base touched the water in a fountain before the Temple of Demeter. The face of the sick person appearing healthy in the mirror be-

tokened recovery; if it looked ghastly, death was sure to follow. More modern forms of this superstition are: attaching ill luck to the breaking of a looking-glass and to seeing one's face in a glass by candlelight. See **SUPERSTITION**.

CATORCE, *kâ-tôr'sâ*, *Sp. pron. kâ-tôr'thâ*, or **ALAMOS DE CATORCE**. A city of Mexico, situated in a barren district of the State of San Luis Potosí, 8700 feet above sea level, and 108 miles north of San Luis Potosí by rail (Map: Mexico, H 6). The town lies at the foot of a mountain 10,000 feet high and is famous for its silver mines, discovered in 1773. Pop., 1900, 17,820.

CA'TO STREET CONSPIRACY. See **THIS-TLEWOOD CONSPIRACY**.

CAT OWL (from the resemblance of the face to that of a cat). A name applied rather indiscriminately to several large owls, suggested by their eatlike eyes and feline habits. In the United States, probably the barred owl (*Syrnium nebulosum*, or *Strix varia* as it is now called) is the one most often so referred to. See **OWL**.

CATRON, THOMAS BENTON (1840—). An American legislator, born in Lafayette Co., Mo. After graduating from the University of Missouri he served four years in the Confederate army, took up the practice of law in New Mexico, and after two years as a member of the Legislative Assembly became Attorney-General of the Territory in 1869, resigning, however, to become United States Attorney. He was a member of the Legislative Council in 1884 and 1889, and in 1895-97 was delegate of New Mexico to the Fifty-fourth Congress. Upon the admission of New Mexico to the Union as a State he was elected United States Senator for the term 1912-17.

CATS, *kâts*, **JAKOB** (1577-1660). The best of the southern Dutch poets in the golden age of that literature, while it was being illustrated in the north by the varied genius of Vondel, Hooft, and Viseher. His poetry is characteristically Dutch in being extremely prosaic, commonplace in its metres, jejune in language, monotonous in rhythms, and platitudinous in morals. A Dutch critic, Huet, has called him bitterly "a personified mediocrity, a vulgar and vulgarizing spirit," somewhat suggestive of the English Tupper. But he so well expressed the average mental life of his countrymen that for nearly two centuries his works ranked in popularity next to the Bible. Cats was the youngest of four children, and his mother died in his infancy. He was adopted by an uncle, studied law in Leyden, Orléans, and Paris, and began to practice it at The Hague, where he won reputation, but lost his health. He went to England, where he found no relief, and was at last cured in Holland by an alchemist. In 1603 he moved to Middelburg, and presently married Elizabeth van Valkenburg, whom he calls "a foundation for a home." Cats became active in civic life, and wrote his *Emblemata* ('Emblems of Fancy and Love'); *Macchdenplicht* ('Maiden Duty,' 1618); *Selfstryt* ('Inward Strife,' 1620); *Mannelyke achtbarheyd* ('Manly Respectability'); and *Houwelyck* ('Marriage'). In 1621 he entered public life as pensionary of Middelburg, became pensionary of Dort in 1623, and curator of the University of Leyden in 1625. In 1632 appeared *Spiegel van den Ouden en Nieuwen Tyt* ('Mirror of the Old and New Time'). In 1627 Cats went on an embassy to England, became Grand Pensionary of Holland in 1638, and Keeper of the Great Seal in 1648. These offices he resigned in 1651, and after a second embassy to England

returned to literary work, in which for 30 years he had done little save the *Trouwingh* ('Bethrothal Ring,' 1637). He now wrote *Ouderdom en Buitenleven* ('Age and Country Life'); *Hofgedachten* ('Court Thoughts'); and an autobiography in verse, *Twice en tachtigjarig leven* ('A Life of Eighty-two'), growing old gracefully and keeping a joy in life to the last. His *Collected Works* were published in Amsterdam (19 vols., 1790-1800) and Zwolle (1856-62). Consult Derudder, *Un poète néerlandais, C., sa vie et ses œuvres* (The Hague, 1899), and the biography by Kalff (Haarlem, 1902).

CAT'S CRADLE. See CRATCH CRADLE.

CAT'S-EYE. A semitransparent mineral which, when cut with a convex face (*en cabochon*), shows a chatoyant effect. The name has been given to a greenish variety of chrysoberyl from Ceylon, where the Singhalese often carve it to resemble a monkey's face, taking advantage of the varying lights and colors of the stone to secure a grotesque likeness to that animal. Among the Hindus the cat's-eye was credited with the power of preserving and increasing its owner's wealth. The name "cat's-eye" was suggested by the peculiar play of light called *chatoyancy*, which is due to the internal striations of the composite crystals of which the mineral consists. The name is also given to an opalescent variety of quartz, especially when similarly cut, the effect in which is said to be due to the fibres of asbestos or actinolite. A *tiger-eye* variety from the Orange River of South Africa is an altered erocidolite in which the fibrous iron silicate has been replaced by a deposition of chaledonic quartz on the fibres.

CATS'KILL. A village and the county seat of Greene Co., N. Y., 34 miles south of Albany, on the Hudson River, at the mouth of Catskill Creek, and on the West Shore Railroad (Map: New York, G 6). It is connected by steamboat lines with New York and Albany, and is the starting point of the Catskill Mountain Railroad. The village, frequented as a summer resort, though important rather as the point of departure for the more popular mountain resorts, has a courthouse, opera house, free academy, and public library. It manufactures woolens, hosiery, cut glass, bricks, etc., and is in a productive fruit-growing region. Catskill was settled about 1680 by Derrick Teunis Van Vechten. The village owns its water works. Pop., 1890, 4920; 1900, 5484; 1910, 5296.

CATSKILL AQUEDUCT. See AQUEDUCT.

CATSKILL FORMATION. A series of sandstones and shales of Upper Devonian age exposed along the western slopes of the northern Appalachian Mountains and named from the Catskill Mountains of New York, where they were first studied. The series was formerly supposed to constitute a distinct geological group overlying the Chemung formation, but careful investigation has shown that the rocks of the Catskill formation are shallow-water deposits formed along the shore lines of the northeast bay of the interior Devonian sea during periods while the normal marine sediments of the Hamilton, Portage, and Chemung formations were being laid down in the open and deeper waters that filled the western parts of the same bay. The name "Catskill formation," then, signifies a local littoral development or facies of the normal Upper Devonian formations, and as such it has no place in the geological time scale. These Catskill conditions and sediments began in the De-

vonian of the eastern border of the basin at an earlier period than they did in the central and western portions, for the shoaling of the Devonian sea progressed from east to west. Because of this the Lower Catskill deposits of the Catskill Mountain region are of Hamilton age, the middle Catskill of the eastern border and the Catskill of the east-central part of New York State are of Portage age and known as the Oneonta formation, while the Upper Catskill of the eastern border and the Catskill rocks of the central part of the State are of Chemung age.

The rocks of the Catskill formation consist of shale and sandstone, with the latter often grading into coarse conglomerates, and their predominant colors are red, brown, greenish, and steel gray. The sandstone, especially that of steel-gray color, often splits readily into thin horizontal layers and is then quarried for flagstone. The entire output of flagstone known as "Hudson River bluestone" is obtained from the Catskill formation of Ulster, Delaware, and Greene counties, N. Y. As a rule the Catskill rocks are poor in fossil remains. Those most commonly found are the remains of land plants such as ferns, lepidodendrons, and trunks of coniferous trees. The most noteworthy fossil from this formation is a gigantic arthropod, *Stylonurus* (q.v.), an ally of the horseshoe crab (*Limulus*), which attained a length of 5 feet. Fragments, consisting of the dermal plates, spines, and teeth, of heavily armored fishes of the genera *Bothriolepis*, *Cocosteus*, and *Holoptychius*, which lived in the brackish and fresh waters of the coastal swamps, are found in certain red beds. A fresh-water clam, *Amnigenia*, is found in sandy shales of the Ononta formation, and occasional water-worn shells of marine mollusks and brachiopods occur in the lower beds of the Catskill Mountain region.

The Catskill sediments are approximately 3500 feet thick in the Catskill Mountains; they have their greatest development, with a thickness of 7500 feet, in the vicinity of Mauch Chunk, Pa., and from that region southward the formation diminishes in thickness until it disappears in Virginia. The formation is overlaid by the Pocono sandstones and conglomerates of similar origin, but of later (Carboniferous) age. The elevation of the continents that occurred towards the close of Devonian time was accompanied in Great Britain by the formation of very similar sediments there known as the Old Red Sandstone, made famous by the writings of Hugh Miller. This Old Red Sandstone bears to the normal marine Devonian of Great Britain the same relation as does the Catskill formation to the marine Devonian of eastern North America, and the similarity is still further marked in the identical physical characteristics of the rocks and the close resemblance of their contained fossil remains. See DEVONIAN SYSTEM; OLD RED SANDSTONE; STYLONURUS.

CATSKILL MOUNTAINS. A section of the Appalachian Mountain system, lying to the west of the Hudson River and mainly confined to Greene and Ulster counties, N. Y. They cover an area about 50 miles long, north and south, and 30 miles broad, east and west (Map: New York, F 6). They are of old geological formation, their sides consisting of the sandstones and shales of the Catskill group of the Devonian system. The main line of elevations, which begins about 8 miles west of the Hudson River, extends nearly north and south for a dis-

tance of 12 miles and sends off several spurs to the west. Unlike the southern ranges of the Appalachians, the Catskills are not formed by parallel groups of mountains, each peak being more or less isolated from the neighboring summits. The slopes on the eastern side are precipitous, but towards the west there is a gradual decline to the levels of the bordering highlands. The highest elevations are Slide Mountain, 4204 feet; Hunter Mountain, 4025 feet; Black Dome, 3990 feet; and Black Head, 3937 feet. Deep cloves, the Dutch name of gorges, have been eroded by the branches of the Schoharie and Esopus creeks, along the courses of which are many cascades. Railroads cross the region, giving access to all sections. The beautiful views, fine summer and autumnal climate, and high altitude make the region very popular as a resort. The mountains are for the most part covered with thick forests of oak, hickory, ash, maple, beech, pine, etc.

CATSKIN'S GARLAND, or **THE WANDERING YOUNG GENTLEWOMAN**. An old English ballad. It deals with the distress and restoration to happiness of a scullery maid, whose wretchedness is so great that she is obliged to clothe herself in catskins. It is really an Anglo-Saxon form of *Cinderella*.

CAT SNAKE. The English name of a venomous opisthoglyph serpent (*Tarbophis vivax*) of southeastern Europe and Asia Minor, remarkable for several peculiarities of structure. It is small, dull-colored, and sluggish, and has grooved poison fangs in the hinder part of the upper jaw. There are also long, recurved teeth in the lower jaw, which assist it in holding its prey (mainly lizards), while it chews at it until the venom stupefies the victim. See **OPISTHOGLYPHA**.

CAT'S-TAIL GRASS. See **TIMOTHY GRASS**.

CAT'S-TAIL REED. See **TYPHA**.

CATT, **CARRIE CHAPMAN**. An American suffrage leader and lecturer, born at Ripon, Wis. She was educated at the State Industrial College of Iowa and after graduation took a special course in law. For several years she was principal of the high school and general superintendent of schools at Mason City, Iowa. She was married in 1884 to Leo Chapman, who died two years later, and in 1890 to George William Catt, who died in 1905. From 1890 to 1892 she was State lecturer and organizer of the Iowa Woman Suffrage Association, and thereafter was identified with the National Woman Suffrage Association and the International Woman Suffrage Alliance, of which latter organization she became president. She lectured in nearly every State of the Union in behalf of woman suffrage, was especially prominent in the successful campaigns in Colorado and Idaho, aided in gaining for Louisiana women taxpayers the right to vote on all questions submitted to the taxpayers, and took an active part in the 1910 and 1911 State campaigns for woman suffrage. In addition to her work in the United States, she lectured in nearly every country in Europe. In April, 1913, she attended the International Woman Suffrage Congress at Budapest.

CATTARO, kät'tá-rō (Slav. *Kotór*). A seaport of the Austrian Crownland of Dalmatia, situated at the head of the picturesque Gulf of Cattaro, close to the Montenegrin frontier, and about 36 miles east-southeast of Ragusa (Map: Austria, F 5). It is protected on the gulf side by powerful batteries and at its back tower lofty mountains on which stands the almost inaccessi-

ble Fort San Giovanni, almost 1000 feet above the town, with which it is connected by a series of defensive works. The principal trade is with Montenegro, with whose capital it is connected by a steep highway known as the Ladder or Stairs of Cattaro. Pop., 1890, 5400; 1900, 5700; in 1910, 6040. Cattaro, which was at one time a Roman colony under the name of Ascrivium, came in 1420 under the dominion of the Republic of Venice. In 1797 it passed to Austria, and in 1805 to the Kingdom of Italy, but was restored to Austria in 1814. The town has twice been demolished by earthquakes. See Verbonié, *History of the Gulf of Cattaro* (Agram, 1889).

CATTARO, GULF OF, or **BOCCHÉ DI CATTARO**. An inlet of the Adriatic, near the southern extremity of the Dalmatian coast, in lat. 42° 27' N. (Map: Austria, F 5). It consists of three basins connected by straits of about half a mile in breadth. The outer entrance is only a mile and a half wide, and the total length of the gulf is about 18 miles. Mountains protect it from all winds, and it has sufficient depth to make it an excellent harbor. The scenery is magnificent.

CAT'TEGAT, or **KATTEGAT** (ancient Lat. *Sinus Codanus*), THE. The strait or sound separating the east coast of Jutland, Denmark, from the west coast of Sweden, and, by joining the Skagerrak on the west and the Little and Great Belts and the Sound on the east, forming the middle link in the chain of waters connecting the Baltic with the North Sea (Map: Denmark, E 2). It is about 150 miles long and has a greatest width of about 90 miles. Its depths are very unequal, varying in the deepest portions in the western part from 40 to 65 feet and in the eastern part from 100 to 200 feet. It offers dangers to navigation on account of its numerous shoals and the frequency of stormy winds. Its principal islands are Läsö at the north, Anholt near the middle, and Samsö at the south. The eastern shores are steep and rocky, but those on the west are low.

CATTELL, **HENRY WARE** (1862-). An American pathologist, born at Harrisburg, Pa. He was educated at Lafayette College and at the universities of Leipzig, Pennsylvania, and Freiburg (Baden). In 1892-97 he was demonstrator of morbid anatomy at the University of Pennsylvania, and in 1899-1901 director of the Ayer Chemical Laboratory in the Pennsylvania Hospital. He served as pathologist to various Philadelphia hospitals and was also called as an expert in several murder trials. He edited the *International Medical Magazine* in 1894-97; *International Clinics* in 1900-03 and after 1910; *Medical Notes and Queries* after 1905. Besides translating *Ziegler's Special Pathological Anatomy* (1896-97), and editing *Lippincott's Medical Dictionary* (1910; 3d ed., 1913), he is also author of *Notes on the Demonstrations in Morbid Anatomy* (1899-1901); *Post-Mortem Pathology* (1903; 3d ed., 1906); "606" (1910).

CATTELL, **JAMES MCKEEN** (1860-). An American psychologist, born at Easton, Pa. He graduated at Lafayette College in 1880 and at the University of Leipzig in 1886 and was a lecturer at the University of Cambridge in 1888. From 1888 to 1891 he was professor of psychology at the University of Pennsylvania, from 1891 to 1896 professor of experimental psychology at Columbia University, from 1896 to 1902 head of the department of anthropology, and from 1902 to 1905 professor in the department of philosophy. After 1891 he served as pro-

DAIRY CATTLE

1. AYRESHIRE COW, "Red Rose" No. 5566.
2. HOLSTEIN-FRISIAN COW, "Jamaica," No. 1336.
3. JERSEY COW, Modern type.

4. SHORT-HORN COW, "Kitty Clay," 4th.
5. BROWN SWISS COW, "Brienzi," No. 168.
6. GUERNSEY BULL, Modern type.

WILD CATTLE

1. YAK (*Bos grunniens*),
2. CHILLINGHAM WHITE BULL,
3. HEAD OF HIGHLAND BULL.

4. BANTENG (*Bos sondaicus*)
5. GAUR (*Bos gaurus*),
6. GAYAL (*Bos frontalis*).

fessor of psychology at Columbia. He became editor of *Science*, *The Popular Science Monthly*, *American Men of Science* (1906; 2d ed., 1910), and *The American Naturalist*.

CATTELL, WILLIAM CASSIDY (1827-98). An American Presbyterian divine and educator. He was born at Salem, N. J., Aug. 30, 1827; graduated at Princeton College (1848) and at the theological seminary (1852); was professor of Latin and Greek in Lafayette College, Pa., 1855-60, and president from 1863 to 1883. His presidency evinced executive ability of a high order. He was secretary of the Board of Ministerial Relief of the Presbyterian Church from 1883 until his death, in Philadelphia, Feb. 11, 1898.

CATTERMOLE, GEORGE (1800-68). An English painter in water color. He was born at Dickleborough, Norfolk, and studied in London under the architectural draftsman, John Britton. His fame rests chiefly on the 100 or more historical and genre pictures, landscapes, and portraits which he exhibited at the Society for Painters in Water Color from 1822 to 1850. Many of these, as "The Diet at Spires," his masterpiece, "Grace in the Refectory," "The Monk's Library" are in the Victoria and Albert Museum. Others are in the National Gallery, in Glasgow, Edinburgh, Dublin, etc. He also furnished illustrations for Scott's novels and poems, several of Dickens's novels, the *Historical Annual*, with text by his brother Richard, and for other works. Cattermole is one of the most important representatives of the Romantic movement in English art. His aquarelles show refined, artistic taste, a gift of color, original and dramatic conception, and spirited execution. Among his intimate friends were Dickens, Thackeray, Landseer, and Browning.

CAT THYME, tim. See GERMANDER.

CAT'TI, or **CHAT'TI**, kät'ti. A German people who inhabited a country included in the present Hesse and the Prussian Province of Hesse-Nassau. The southwestern part of their territory, around Mattiacum, was conquered by the Romans under Drusus. The Catti took part in the general rising of the Germans under Arminius. Tacitus praises them as excellent foot soldiers. During the reign of Marcus Aurelius they made incursions into Roman Germany and Rhætia. Caracalla failed in an expedition against them and the Alemanni. About the middle of that century their name began to give place to that of the Franks, and is last mentioned by Claudian in the latter part of the fourth century. See SUEVI.

CATTLE (OF. *catel*, from ML. *capitale*, *capitalis*, goods, property, from Lat. *capitalis*, important, relating to the head, from *caput*, head). The term "cattle" is usually applied to domesticated bovine animals, principally of two species, *Bos taurus*, European cattle, and *Bos indicus*, the humped cattle of India and Africa, commonly called the zebu (q.v.). The older writers in England used "cattle" or "cattell" as a collective name for all kinds of live animals held as property or reared to serve for food or beasts of burden, including horses, sheep, swine, and by some writers even bees and poultry. Bovine animals were then designated as "horned cattle," and at later periods as "black cattle" and "neat cattle." "Black cattle" was probably first applied to the black breeds of Scotland and Wales. Later it had a more general application. "Neat cattle" were so called because they were useful, "neat" being

derived from the Anglo-Saxon word *neótan* ('to make use of'). The word "cattle" is another form of the words "chattel" and "capital," meaning property, cattle among many primitive peoples being the most valuable goods, and frequently the measure of value of other kinds of property. The old English equivalent for cattle is "kine" or "kyan," derived from *cy*, the plural of *cu*, Anglo-Saxon for "cow." The term "ox" is often used for cattle in general, but in a restricted sense it signifies mature castrated male cattle used for draft purposes, though in continental Europe the term has sometimes been applied to a male not castrated.

Cattle were among the first animals domesticated by man in the early period of the world's history, and have been the most valuable and necessary to his highest welfare in all ages and stages of civilization since that time. It was formerly thought that European breeds of cattle were domesticated from a wild form (*Bos primigenius*) which roamed over Europe and a large part of Asia in prehistoric times. But the oldest forms of domesticated cattle appear to be of a different type (*Bos longifrons*), and it is still an open question as to whether *longifrons* is a domesticated form of *primigenius* or a distinct species which originated in Asia and was taken to Europe during the great Aryan migration. Variations evidently began at an early period, although no very high degree of development was effected by the ancients. Within the last two centuries especially, much attention has been paid to selecting and breeding cattle adapted to special conditions and purposes and to developing the beef and milk producing qualities. It is stated that there are now in various parts of the world over 300 distinct breeds of cattle. The principal and most valuable breeds of America have been derived from Great Britain and other portions of northwestern Europe. The most important results of man's agency in improving cattle by breeding, care, and management have been a tendency of the animals to mature at an earlier age, and readily to lay on flesh and fat, and an increase of the milk production far beyond the needs of the calf, and prolongation of the natural period of milk flow. At present the various recognized breeds of domestic cattle may be classified as beef cattle and dairy cattle. Breeds that are good for both beef and milk productions are often referred to as "dual-purpose cattle."

The cattle industry has assumed very large proportions in the United States. At the close of 1913 there were estimated to be 20,497,000 milch cows worth \$922,783,000, and 36,030,000 other cattle valued at \$949,645,000. Only a small proportion of these were pure-bred registered stock.

Beef Cattle. The principal breeds of beef cattle in Great Britain and the United States are the Shorthorn, Hereford, Galloway, Devon, Polled Durham, and Aberdeen-Angus. These breeds all originated in Great Britain and for the most part took their names from the county or district whence they came. The cattle which have been most famous as a breed in England and America, which have received the longest and closest attention of breeders and improvers, are the Shorthorns or Durhams. The name *Shorthorns* was probably given to distinguish them from the rival race of Bakewell's Longhorns, which they soon surpassed. They are red and white cattle (the colors being variously blended and often roan), are rectangular in out-

line, and have horns of moderate length. They are notable for early maturity, beauty of form, quick-fattening qualities, and minimum amount of waste in slaughtering. Although excellent beef cattle, many of the cows are good milkers, and the breed is considered the best of all for the dual purpose of producing meat and milk. The *Herefords*, originated in the county of Hereford, are red with white on face, chest, belly, feet, and over the tops of the shoulders. They are close rivals of Shorthorns as beef cattle, but are inferior dairy cattle, many giving scarcely enough milk to raise a calf. The *Galloways* are jet-black and hornless, strongly built and rather low in stature. They are hardy in constitution and much esteemed for beef, but very poor dairy cattle. The *Aberdeen-Angus* are also hornless and black, and bear a general resemblance to the Galloways, but mature earlier and are superior as beef animals. For a number of years animals of this breed have won the grand championship at the International Stock Show held at Chicago. The *Devons* are an exceedingly symmetrical, beautiful race, originated in North and South Devonshire. They are of a rich red color, and although the bulls and cows are rather small, the oxen grow to great size. The Devon oxen have long been prized as work animals. There are good examples of the beef and dairy types in this breed. The *Polled Durham* breed originated in the United States by the selection of "sports" which occurred in the Shorthorn breed. As to size, form, color, and general appearance they resemble the typical Shorthorn beef form without the horns. The native cattle of the Southwest, known as the "Texas steer," was originally from Spanish stock imported during Colonial times. This type is fast disappearing because of the introduction of better breeds. The beef animal has been specifically designed for the most favorable production of the best cuts, and while there are many cows which combine milk and beef production to a profitable degree, a good carcass of beef from a steer of a pronounced dairy type or breed is rarely seen. The beef type of animals is rectangular in outline, low, broad, deep, smooth, and even—no wedge-shape or sharp protruding spinal column is wanted for the block. Broad, well-covered backs and ribs are absolutely necessary to a good carcass of beef, and no other excellences will compensate for the lack of this essential. It is necessary both to breed and feed for thickness in these parts. Animals that are soft and patchy, or hard and rolled on the back, are sure to give defective and objectionable carcasses, even though they are thick, and they also cut up with correspondingly greater waste. A marked and important change has taken place in the profitable type of cattle within comparatively recent years. The present demand is for quality and finish rather than size. The modern type makes beef at decidedly more profit and economy to both the producer and the butcher, and furnishes the consumer a far superior article.

Dairy Cattle. In no line of improvement of live stock have more remarkable results been attained than in the case of the dairy cow. This improvement has taken place in the earliness of maturity, the length of the milking period, the quantity and richness of the milk produced and the general economy of production. In the modern dairy cow the tendency to lay on flesh, so highly developed in beef animals, has been largely eliminated, and in its place the ability to

convert economically the food eaten into milk has been cultivated in a high degree. Continued breeding to a special purpose and better methods of feeding have changed the former short milking period, limited almost to the pasture season, to a comparatively even flow of milk during 10 or 11 months of every year. A cow that does not average six or seven quarts of milk a day for 300 days in the year, aggregating 4000 pounds, is not considered very profitable. There are many herds having an average yearly production of 5000 pounds per cow, and single animals are numerous which give 10 or 12 times their own weight in milk during a year. Quality has been so improved that the milk of many a cow will make as much butter in a week as did that of three or four average cows of the middle of the last century.

The points observed in judging dairy cows are shown in the accompanying illustration, taken from a publication of the United States Department of Agriculture:

DIAGRAM OF COW SHOWING POINTS.

1. Head.	12. Withers.	23. Shoulder.	34. Fore udder.
2. Muzzle.	13. Back.	24. Elbow.	35. Hind udder.

7. Horn.	18. Tail.	29. Heart girtb.	40. Leg or gaskin.
8. Ear.	19. Switch.	30. Side or barrel.	41. Hock.
9. Cheek.	20. Chest.	31. Belly.	42. Shank.
10. Throat.	21. Brisket.	32. Flank.	43. Dew claw.
11. Neck.	22. Dewlap.	33. Milk vein.	

Different scales of points have been adopted by the various breeders' associations.

The breeds of dairy cattle most common in the United States and England at the present time are Ayrshire, Holstein, Guernsey, Jersey, Red Poll, French Canadian, Dutch Belted, Brown Swiss, and Shorthorns. The *Ayrshires*, named for the county of that name in the southwest of Scotland, are medium-sized cows, short-legged, fine-boned, and very active. The general form is the wedge shape, regarded as typical of cows of dairy excellence, and good specimens are thin when in milk. The prevailing color is red and white, in spots variously proportioned, but not mixed. The cows are large and persistent milkers, but the fat globules are small, which causes the cream to rise slowly. An average yield of 5500 pounds of milk a year per cow for a working herd is often realized. One noted herd has an average for 19 years of over 6400 pounds per cow, and individuals produce over 15,000 pounds a year. Butter records are not numerous, but herds average 300 to 400 pounds a year, and there are individual records of as high as 900 pounds.

The *Jersey* and *Guernsey* breeds were both originated in the Channel Islands, but in the development of the latter more of the characteristics of the parent stock of Normandy have been retained. They were both formerly called *Alderneys*. The *Guernseys* are rather larger than the *Jerseys*, strong-boned, and are claimed to be hardier. They are light in color,

with darker shades approaching brown, and have a yellow skin. The milk of both breeds is unusually rich in fat, the fat globules being large and separating readily in creaming. The Guernseys are liberal milkers. At home the average cow is expected to produce 5000 pounds of milk and 300 pounds of butter a year without high feeding. In the United States they are usually fed higher and respond accordingly. There are records of several herds which have averaged over 6000 pounds of milk and 350 pounds of butter a year. Individual cows have produced over 18,000 pounds of milk and 1000 pounds of butter a year. The *Jerseys* are the smallest of the better dairy breeds, though in the United States they have been considerably

SKULL AND TEETH OF THE COW.

Dentition of a young Jersey cow, showing the small incisors and canines crowded in the extremity of the lower jaw (none in the upper jaw), and the great grinders (molars and premolars).

increased in size. The color varies from cream to various shades of fawn, tan, and mouse color, dark brown and even black. They have beautiful heads, with intelligent faces, and rather small, close horns. The body is well rounded, and the udder is of good size, with highly developed milk veins. They are irregular in outline and thin in flesh. Like the Guernseys, they are not large, but are persistent milkers, and their milk is the richest of all breeds. For many years they have been bred especially for butter production, although American breeders have striven with considerable success to increase the milk yield without diminishing the quality. Good herds produce from 3500 to 4500 pounds of milk a year, and several herd records show averages of 6000 and 7000 pounds per cow. Single cows produce over 1000 pounds of butter a year, and there are numerous records of 25 to 30 pounds of butter a week. Jerseys are heavy feeders, and as a rule will bear high feeding and forcing for long periods unusually well. Brown Bessie, the famous champion butter cow of the Chicago World's Fair dairy test, averaged over 40 pounds of milk a day for five months, and made 3 pounds of butter a day several times. The *Holsteins*, or *Holstein-Friesians*, of north Holland

and Friesland, are black and white, irregularly marked, but not mixed, large in frame, strong, and usually in good flesh. The udder is often of extraordinary size in conformity with the reputation of the breed for enormous milk production. It is not unusual for a cow to give more than her own weight in milk every month for 10 or 12 consecutive months, and there are numerous instances of yields of 100 pounds or more a day, and 20,000 to 30,000 pounds a year, although 40 to 60 pounds a day, or 7500 to 8000 pounds a year, is considered an average. But the milk is usually poorer in fat than that of some breeds. The fat globules are quite small, and the cream does not rise readily on setting. There are some families of *Holsteins*, however, which give milk of fully average richness and are profitable butter producers.

The *Red Polls* are a comparatively new breed, resembling the *Devons*, but are hornless. They are only fair dairy cattle, being in the class of breeds which aim to serve the dual purpose of milk and beef production. The *Shorthorns*, described above as beef cattle, include many individuals notable for milk production. In the best milking strains the cows are rather more angular in outline than the beef types and have large, hairy udders. The *Shorthorns* made a surprisingly good showing in the World's Fair breed test (1893), and records of several herds in the United States show a milking period of 275 days and an average production of 6500 pounds of milk.

French Canadians are a breed developed in Canada from native stock, most of which came originally from France. They resemble the *Jerseys* in type and are very hardy. The *Brown Swiss*, which originated in Switzerland, also resemble the *Jerseys* in color, but are much coarser than most dairy breeds. Many of them, however, are excellent milkers. The *Dutch Belted* are a small type of *Holsteins* with a broad white band about the middle of the body, the remainder of the animal being black in color. Cattle of several other European breeds have been brought to the United States, but not in sufficient numbers to be of any significance to the cattle industry. Recently zebu from India to be used in crossing with breeds in Texas because of their resistance to tick fever have been introduced.

Formerly certain dairy breeds were considered especially adapted to cheese making, and others to butter making, and the two qualities were supposed to be to a certain extent incompatible. The agricultural experiment stations have shown, however, that this is not the case, but that the value of milk for cheese making as well as for butter making is measured by its fat content. The richness of the milk in fat is to some extent a breed characteristic, although within the breed the variations in this respect are quite wide in the case of different cows. The following averages of a large number of analyses of milk from cows of different breeds are something of an indication of the composition:

COMPOSITION OF MILK OF DIFFERENT BREEDS

BREED	Water	Total solids	Fat	Casein and albumin	Milk sugar	Ash
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
Avrshire	86.93	13.07	3.58	3.42	5.43	0.64
Holstein	87.62	12.38	3.46	3.39	4.84	0.74
Guernsey	85.39	14.61	5.12	3.61	5.11	0.75
Jersey	84.60	15.40	5.61	3.91	5.15	0.74
Shorthorn	87.20	12.80	3.47	3.21	5.43	0.69

Attempts to determine by experiment which is the best dairy breed have not been entirely satisfactory or convincing, on account of the large number of factors which have to be taken into account in determining this, aside from the yield and composition of the milk, such as hardiness, constitution, adaptability to given conditions, feed requirements and economy, ultimate value for beef, etc.

In the Chicago World's Fair breed test, although open to all, only the Guernsey, Jersey, and Shorthorn breeders' associations entered the competition, and they selected the best cows of their respective breeds to be found. The results of the butter and cheese tests with these three breeds are summarized as follows:

"Breeds of Dairy Cattle," in *United States Department of Agriculture, Farmer's Bulletin 106* (Washington, 1898); T. McKenny Hughes, *On the more Important Breeds of Cattle which have been Recognized in the British Isles, and their Relation to Other Archæological and Historical Discoveries* (Westminster, 1896); Richard Lydekker, *Wild Oxen, Sheep, and Goats of All Lands, Living and Extinct* (London, 1898); Craig, *Judging Live Stock* (1901); Lane, "Records of Dairy Cows in the United States," *Bulletin 75, Bureau of Animal Industry* (Washington, 1905); Lydekker, *The Ox and its Kindred* (London, 1912); Keller, *Naturgeschichte der Haustiere* (Berlin, 1905); Morse, "The Ancestry of Domesticated Cattle," *Report Bu-*

WORLD'S FAIR BREED TESTS, 1893

No. 1, CHEESE TEST, 15 DAYS, MAY

COWS IN TEST	Milk produced	Fat in milk	Cheese made	Price of cheese per pound	Cost of feed	Net gain
	<i>Pounds</i>	<i>Pounds</i>	<i>Pounds</i>	<i>Cents</i>	<i>Dollars</i>	<i>Dollars</i>
25 Jerseys	13,296.4	601.91	1451.8	13.36	98.14	119.82
25 Guernseys	10,938.6	488.42	1130.6	11.95	76.25	88.30
25 Shorthorns	12,186.9	436.60	1077.6	13.00	99.36	81.36

No. 2, 90-DAY BUTTER TEST, JUNE, JULY, AUGUST

COWS IN TEST	Milk produced	Fat in milk	Butter credited	Proceeds of butter	Cost of feed	Net gain
	<i>Pounds</i>	<i>Pounds</i>	<i>Pounds</i>	<i>Dollars</i>	<i>Dollars</i>	<i>Dollars</i>
25 Jerseys	73,488.8	3,516.08	4,274.01	1,747.37	587.50	1,323.81
25 Guernseys	61,781.7	2,784.56	3,360.43	1,355.44	439.14	997.64
24 Shorthorns	66,263.2	2,409.97	2,890.87	1,171.77	501.79	910.12

The breed test at the Pan-American Exposition held at Buffalo in 1900 lasted six months. The results are summarized in the following table:

reau of Animal Industry (Washington, 1910); Plumb, *Types and Breeds of Farm Animals* (Boston, 1906); Pusch, *Die Beurteilungen des Rindes* (Berlin, 1896); Rommel, "American

RECORD OF 5 COWS EACH OF 10 BREEDS FOR 6 MONTHS, SHOWING TOTAL PRODUCTION, COST OF FOOD, AND NET PROFIT BY BREEDS

BREED	Yield of milk	Yield of fat	Yield of solids	Cost of feed	Profit in butter	Profit in solids
	<i>Pounds</i>	<i>Pounds</i>	<i>Pounds</i>	<i>Dollars</i>	<i>Dollars</i>	<i>Dollars</i>
Jersey	26,986.3	1,223.88	3,770.08	137.77	225.41	200.63
Guernsey	27,134.5	1,248.09	3,754.99	136.99	230.11	202.56
Ayrshire	32,998.2	1,219.44	4,185.32	140.74	217.91	235.87
Shorthorn	31,986.2	1,129.77	4,086.59	162.08	171.82	205.64
Holstein	39,059.9	1,275.85	4,760.57	164.57	210.62	262.15
Polled Jersey	20,326.6	948.31	2,831.73	109.62	169.24	145.18
French Canadian	24,615.2	984.11	3,277.36	113.11	176.45	181.83
Brown Swiss	30,890.3	1,123.15	3,943.03	147.30	182.99	207.51
Red Polled	28,713.0	1,141.81	3,773.73	138.15	198.15	201.15
Dutch Belted	24,893.3	847.50	3,066.50	132.48	116.79	132.00

The various breeds continue to have their advocates and admirers, and each breed has some points of advantage. The pure-bred stock, however, comprise only a very small fraction of the dairy cows of the United States and Canada. The larger part of the cows are *grades*, i.e., crosses of natives or ordinary cows with pure breeds. Among these are many excellent animals, rivaling the thoroughbreds in amount and economy of milk production. Much attention is now being given by dairymen to testing the individual cows of their herds, determining which are the most profitable ones, and gradually eliminating the inferior ones. In this way an improvement of the ordinary stock is going on which in some sections has already raised the cows to a high degree of excellence and will ultimately result in a much higher standard for good dairy cows.

CATTLE, CHILLINGHAM. A breed of the so-called wild cattle of Great Britain (*Bos taurus*, var. *scoticus*), preserved in Chillingham Park, Northumberland, England. This park, the property of the Earl of Tankerville, is a remnant of one of the great forests of Great Britain. It was formerly believed that these cattle and other herds which are found at Cadzow, near Chillingham, at Chartley (Staffordshire), Som-

erford and Lyme (Cheshire), and Kilmory (Argyllshire), were descended from the urus (q.v.) without contact with any domesticated breed, but it is now generally believed that they are descendants of domesticated animals which have become feral. The Chillingham cattle, which approach most nearly to the true *primigenius* type, number about 60, and are described as of medium size, compact in body, and dingy white in color, with black-tipped horns, brownish muzzle, and red ears. They are timorous, unless hard-pressed, and feed by night. The cows conceal the calves under tall ferns and undergrowth and resist all approach to them. It is said that these cattle refuse to mingle with any other. This prevents degeneracy of breed, and the accepted characteristics are also maintained by destroying any calf that shows deviations of color. For illustration, see Plate of WILD CATTLE.

CATTLE GUARDS. See RAILWAYS.

CATTLE PLAGUE, RINDERPEST (Ger.), or **STEPPE MURRAIN** (Fr. *peste bovine*). An acute febrile contagious disease of cattle, sheep, goats, camels, the wild ruminants, and occasionally swine caused by an ultramicroscopic organism. The disease is characterized by its short period of incubation, sudden appearance of high temperature, a croupous diphtheritic inflammation of the mucous membranes, and the high rate of mortality. Horses, carnivora, and man are immune to the disease. It occurs indigenously on the plains of western Russia and throughout Asia, whence it has at various times overspread most parts of the Old World. The disease runs a tolerably fixed and definite course, which is not materially altered by any known remedial measures. It seldom attacks the same individual a second time.

History. Cattle plague has been recognized for upward of 1000 years. It appears to have destroyed the herds of the warlike tribes that overran the Roman Empire during the fourth and fifth centuries. About 810 it traveled with the armies of Charlemagne into France, and about the same period is also supposed to have visited England. Several times throughout the course of every century it spread from the plains of Russia over the western countries of Europe, and is stated to have visited England again about 1225. Although causing every few years great losses on the continent of Europe, the plague does not appear to have shown itself again in England until 1714, when it appeared at Islington, about the middle of July, and was very destructive for about three months, but was got rid of towards the end of the year. In 1744 it was in Holland, destroying there in two years 200,000 cattle; in Denmark, from 1745 to 1749, it killed 280,000; in some provinces of Sweden it spared only 2 per cent of the horned cattle. It made terrible havoc throughout Italy, destroying 400,000 animals in Piedmont alone. In April, 1745, the plague was again imported into England, probably by some white calves from Holland. It continued its devastation for 12 years, but it is now impossible accurately to determine the losses it occasioned. In the third and fourth years of its ravages, 80,000 cattle were slaughtered, and double that number are supposed to have died. In 1747, 40,000 cattle died in Nottingham and Lancashire alone; while so late as 1757, 30,000 perished in Cheshire in six months. In March, 1770, the disease was brought with some hay from Holland to Portsoy, in the Moray Firth;

several cattle died, and others to the value of about £800 being destroyed, the further spread of the pest was prevented. By the wars which wasted Europe towards the close of the eighteenth and in the first eighteen years of the nineteenth century, cattle plague was spread widely over the Continent, and occasioned, wherever it occurred, terrible losses. Since then, at short intervals, it has spread—always being traceable to its source on the Russian plains—over Poland, Hungary, Austria, Prussia, portions of Germany, and Italy, and has extended to Egypt. The following are the records of its destructive career during this outbreak:

	Attacked	Killed	Died	Recovered
England.....	223,672	102,740	90,450	21,589
Wales	8,388	1,180	5,794	1,117
Scotland	46,863	6,263	28,088	10,707
Total	278,923	110,183	124,332	33,413

To this total must be added 11,000 cases known to have been attacked and unaccounted for, and upward of 60,000 healthy cattle slaughtered to prevent the spread of the disease. Plague was again imported into Hull in 1872 with cattle from Cronstadt; it spread into several districts of the East Riding, attacked 72 animals, 51 of which were killed and 21 died. The last outbreak in England occurred in 1877, resulting in the loss of 1198 animals. The most extensive losses, however, have occurred on the steppes of Russia, and in Turkestan, Persia, China, Japan, Java, Egypt, and South Africa. In Africa the disease spread south from Egypt along the Nile during the Italian invasion in 1890 and within five years reached the South African States and the West African Colonies of Germany. In Cape Colony alone 1,300,000 animals died of the disease in the year 1897-98. During recent years it has been considerably limited by the persistent employment of protective vaccination. In the Philippines it is the most important disease, attacking common cattle, Indian cattle, and carabao. In 1902, 629,176 cattle and carabao died, principally of this disease; during the year 1911-12, 4312 new cases were reported with 2847 deaths. The disease has never yet invaded the Western Hemisphere nor Australia.

Cause. The disease has been shown to be caused by a virus that will pass through the finest porcelain filters, and thus belongs to the group of ultramicroscopic microorganisms. This virus occurs abundantly in the blood of every plague-stricken beast, in the discharge from its nostrils, mouth, or eyes, in the urine, in the excrement, probably even in the breath. It may be transferred to healthy beasts by inoculation. A little of the blood or nasal or other mucous discharges of a plague case, if introduced underneath the skin of a healthy cow, develops the disease within a few days. The transference of the virus or contagion from the sick to the sound animal is not always so direct and evident. As with other contagious diseases, the virus may be conveyed by insects; it may adhere to the food that has lain before infected beasts or may gain entrance in the drinking water; it may adhere to the litter from the stalls, even after it has been heaped for weeks; to the clothes of attendants; to the floors, walls, or stalling of buildings; or to imperfectly cleansed

cattle cars. It usually gains access to the blood through the digestive tract, perhaps also by absorption through the skin.

Symptoms. In from three to nine days after an animal has been exposed to the virus of cattle plague, or from 36 to 48 hours after being purposely inoculated, the temperature of the body is raised several degrees. A delicate thermometer introduced into the vagina or rectum, instead of marking about 101° F., indicates 104° to 106°. Two or three days later a striking dullness is manifested, and the animal becomes indifferent to surroundings. The pupils of the eyes are contracted, and the animal may be in a state of vertigo or coma. Within 12 to 24 hours the milk secretion is diminished by one-half or two-thirds, the mucous membrane of the mouth is generally observed to be slightly reddened, and soon a granular, yellowish-white eruption, consisting of thickened epithelium cells and granules, appears on the gums round the incisor teeth, and by and by on the lips and dental pad. Some hours later the same eruption extends to the cheeks, tongue, and hard palate. Within 48 hours a crust of epithelium covers the gums, lips, and mouth, and then, wiped away or accidentally rubbed off, leaves the abraded membrane red and vascular and exhibiting patches of erosion. The membrane lining the vagina indicates very similar appearances; it is reddened and vascular, dotted with grayish, translucent elevations about the size of rape-seeds, covered with a whitish-yellow, usually sticky discharge, and occasionally marked with patches of excoriation. The skin is dry; there is hence a perverted development of scarfskin, and of the oleaginous secretion of the irritated sebaceous glands. The skin is thus invested with yellowish scales; while on its thinner portions—about the lips, between the thighs, and on the udder—there are papular eruptions or elevations. The animal hangs its head, arches its back, the eyes are leaden and watery, and from both eyes and nose there latterly comes a dirty, slimy discharge. Appetite and rumination are irregular. The breathing is oppressed; expiration is prolonged and accompanied by a peculiar grunt. The pulse is small and thready, and is quickened as death approaches. The bowels, usually confined at first, become, toward the sixth or seventh day, much relaxed; the discharges passed, often with pain and straining, are profuse and liquid, offensive, acrid, pale-colored, and occasionally mixed with blood. The patient loses weight and strength, totters if it attempts to walk, and prefers to lie rather than to stand. Death usually occurs within from two to seven days, and is preceded by muscular twitchings, a peculiar, offensive smell, a cold, clammy state of body, moaning, grinding of the teeth, and rapidly increasing prostration.

Diagnosis. The sudden appearance and rapid development of the symptoms, among which the characteristic affection of the mucous membranes is of great importance, aid in the recognition of the disease. The diseases to be differentiated are coccidiosis, or red scour, malignant catarrhal fever, foot-and-mouth disease, and piroplasmiasis.

Prognosis. Cases usually terminate unfavorably when the animal's temperature falls rapidly; the pulse becomes small, quick, and weak; the breathing more difficult, distressed, and moaning; the diarrhœa increased, and the depression more notable. A more favorable termi-

nation may be anticipated when, after the fifth day, the heightened temperature, so notable even from the earliest stages, abates gradually; the breathing becomes easier, the pulse firmer, the visible mucous membranes appear healthier, and patches of extravasation or erosion speedily disappear.

Sheep do not take rinderpest spontaneously, and even when kept with diseased cattle, or inoculated with cattle-plague virus, they do not catch the disease so certainly as do cattle. When diseased, they exhibit, however, very similar symptoms; but Professor Röhl and other observers record that about 55 per cent resist artificial infection. The mortality in sheep and goats rarely exceeds 25–30 per cent. Goats, deer, carabao, gazelles, yaks, and, indeed, all animals affected with rinderpest, exhibit with tolerable uniformity the same characteristic symptoms.

Post-mortem Appearances. The mucous membranes are generally deeper-colored than natural, are congested, softened, marked in places with the same granular patches discoverable during life within the mouth of the vagina, and in bad cases exhibit œdema, hemorrhage, and sloughing. The first three stomachs sometimes contain a good deal of food, but show less declension from health than does the fourth stomach, the mucous membrane of which is dotted with spots of congestion and extravasation. The coats of the bowels are thinned and easily torn. The mucous coat, especially towards the middle of the small intestine, the opening into the cæcum and posterior half of the rectum, is much congested, bared of epithelium, and sometimes marked with blood spots, but never ulcerated. Peyer's glands, so generally inflamed in the somewhat analogous typhoid fever of man, are perfectly healthy. The liver is yellow, and the gall bladder contains an abundance of fluid. The respiratory mucous membrane, like the digestive, is vascular, and marked with submucous hemorrhage; the lungs are generally emphysematous, the heart often marked with blood spots. The urinogenital, like the other mucous membranes, is congested in females, especially toward the lower part of the vagina and vulva; the kidneys are enlarged and hemorrhagic in the cortical zone; the serous membranes and nervous centres are perfectly unchanged. As in other septicæmic diseases, a considerable increase in the number of white blood corpuscles is observed. The blood itself is dark in color; in the later stages it contains less water, probably owing to the draining diarrhœa, and about double its usual proportion of fibrin. The muscular tissues are softened, easily broken down, and contain an abnormal amount of soluble albumen. The urine is little altered in quantity, but from the first rise in the animal's temperature it contains an increase of urea varying from 5 to 15 per cent. The chief change in the milk is its rapid diminution in quantity and the increase of its fatty matters. The bile is watery, offensive, and prone to decomposition.

Treatment. In countries where the disease is not endemic treatment is prohibited by law, owing to the fact that all therapeutic measures are without avail and to the serious danger of extensive outbreaks occurring. In countries where treatment is not prohibited all affected animals should be given large quantities of anti-rinderpest serum intravenously and stimulants by mouth. All animals in contact should be in-

jected subcutaneously with serum and allowed to mix with the diseased animals in order that they may contract a mild form and obtain an active immunity.

Prevention. Prophylactic measures consist in (1) exclusion and (2) extinction. The former is brought about by prohibiting the importation of susceptible animals or products thereof, unless properly disinfected, from countries where the disease is known to occur into a country that is free from the disease. Extinction may be brought about by the destruction of all affected and exposed animals, followed by a thorough disinfection of the surroundings and a precautionary quarantine of the district.

Protective Inoculation. The earlier attempts to immunize against this disease date from the middle of the eighteenth century, when the secretions of affected animals—the nasal discharges or lachrymal secretions—were introduced under the skin. This practice was given up on account of the severe affection and the large losses resulting. The principal methods of vaccination are (1) Koch's fresh bile method, (2) the glycerinated bile method, (3) the serum-alone method, and (4) Kolle and Turner's serum-simultaneous method. The first method consists in the taking of blood-free bile of affected animals from the sixth to the eighth day of the disease and injecting non-immune animals therewith. This results in the establishment of an immunity after 10 days. The several drawbacks to this method are that the immunity lasts for but a few months, that a large quantity of bile is required to inoculate large herds, and that a large number of fatalities have at times resulted. The second method is a modification of the first in that one-half the quantity of glycerine is added to the bile and kept for eight days. From 20 to 50 cubic centimeters of the glycerinated bile is injected, followed about two weeks later by a small dose of virulent blood. This results in an active immunity becoming established after 14 to 16 days, which lasts for a long time. The third, or serum-alone, method consists in the injection of a protective dose of antirinderpest serum. Such an immunity, a passive immunity, lasts two to six weeks, but increased doses may extend it for a longer period. This method is made use of to confer a temporary immunity upon stock to tide them through an outbreak or to safeguard them when traveling through infected districts. The fourth, or serum-simultaneous, method consists in the injection of antirinderpest serum on one side and virulent blood on the other. A mild form of the disease results, and a lasting immunity is established after 14 to 16 days.

In localities where piroplasmiasis and trypanosomiasis are prevalent there is danger that these diseases may be transmitted with the blood from cattle affected with rinderpest, and this must be guarded against.

Consult: Dieckerhoff, *History of Rinderpest and its Literature* (Berlin, 1890); Hutyra and Marek, *Pathology and Therapeutics of the Diseases of Domestic Animals*, vol. i (Chicago, 1912); Hoare, *A System of Veterinary Medicine*, vol. i (Chicago, 1913).

CATTLE TICK. See TEXAS FEVER.

CAT'TY (Malay, Javanese *kātī*, *katī*, pound). The unit of weight largely used throughout Chinese and Malayan Asia, and by the Chinese all over the world. A catty equals $1\frac{1}{3}$ pounds avoirdupois, or 625 grams.

CAT'TYWAR'. See KATHIAWAR.

CATUL'LUS, GAIUS VALERIUS (c.87-c.54 B.C.). The greatest of the Roman lyric poets. He was born in Verona, of a respected and well-to-do family. He settled in Rome in early life, and was on terms of familiarity with the leading men of the day—Cicero among them—though he was himself in rather moderate circumstances. In Rome he formed a passionate attachment for a woman whom he celebrates under the name of "Lesbia." There is little doubt that she was Clodia, the sister of Cicero's enemy, P. Clodius Pulcher. This was the consuming passion of his life, and the theme of many of his finest lyrics, in which we have the throbbing life of an emotional yet not quite mature genius. In them we read the story of his earlier hopes and joys, then his jealousy, his quarrels and reconciliations, and at last his despair when he fully came to recognize the open infidelity of the woman whom he loved. Catullus is intensely personal in his poetry and utterly without reserve; many of his shorter poems breathe the deepest affection for his friends, with the most stinging invective for his enemies. His longer poems are largely based on Alexandrian Greek models. The most notable are the two *epithalamia*, or marriage songs (61, 62), the *Epyllion*, entitled the *Nuptials of Peleus and Thetis* (64), and the weird, imaginative poem *Attis*, in strange Gallian verse (63). The *Attis* has no parallel in Roman literature, and its spirit shows a subtle Oriental influence. (For its story see ATTIS.) Catullus was a master of poetic diction, and the most original of the Roman poets, if we except Lucretius. His shorter verse, however, is often marred by gross sensuality and even frank obscenity.

The best editions of Catullus are those by Bährens (Leipzig, 1885), R. Ellis (Oxford, 1889), E. T. Merrill (Boston, 1893), and Friedrich (Leipzig, 1908). He has been often translated into English—by Lamb (1821), Martin (1861), Cranstoun (1867), Ellis (1871), Hart Davies (1879), Grant Allen (the *Attis* only, 1892), Cornish (1912).

CAT'ULUS. The name of several distinguished Romans. 1. GAIUS LUTATIUS CATULUS, the admiral whose fleet defeated the Carthaginians near the Ægates Insulæ, off the Sicilian coast, in 241 B.C., thus closing the First Punic War. 2. QUINTUS LUTATIUS CATULUS, consul with Marius in 102 B.C., when he was unsuccessful in checking the advance of the Cimbri (q.v.) to the Po. In 101, with Marius, he defeated them in a great battle on the Raudian Fields. In the proscription of Sulla (87 B.C.) his name was included; but he preferred suicide and suffocated himself with charcoal fumes. He was an excellent orator. 3. QUINTUS LUTATIUS CATULUS, son of the preceding, consul in 78 B.C., censor in 65. He quelled the revolutionary uprising of M. Æmilius Lepidus, his colleague in the consulship (78), who had tried to overthrow Sulla's constitution, and assisted Cicero in the prosecution of Catiline.

CAUCA, kou'ká. A river of Colombia, South America, the chief tributary of the Magdalena (Map: Colombia, B 2). It rises in the southern portion of the Central Cordillera and flows in a northerly direction between the Western and the Central Cordilleras, forming numerous waterfalls, but becoming navigable at Antioquia. It joins the Magdalena north of Mompos, about 150 miles from the sea, after a course of nearly 700 miles.

CAUCA. A department of Colombia, embracing the west coast of the Republic, the three chains of the Andes, and the valley of the Río Cauca, as well as a large part of the interior (Map: Colombia, B 3). Its original area was 31,388 square miles, but in 1905 was reduced to 20,403 square miles. It is divided by the Andes into two parts, of which the western is alone developed. The territory of Caquetá, which occupies by far the larger portion of the department, belongs to the basin of the Amazon and is almost uninhabited. The formation of the surface and the climatic conditions of Cauca present an extraordinary variety, ranging from the lofty, snow-clad peaks of the Andes to the fertile valleys along the rivers. The centre of population and cultivation is along the Cauca valley, where corn, sugar cane, cacao, tobacco, etc., are grown with success. The mineral wealth, especially gold and silver, is extensive. The forests, which cover a large section of the department, yield large quantities of rubber and cinchona. Pop., including aborigines, 1912, 211,756. The capital is Popayan, with a population of 18,724.

CAUCASIA, ka-kā'shī-ā. See CAUCASUS.

CAUCASIAN, ka-kā'shan, or **CAUCASIC**, ka-kās'ik, **RACE**, **THE**. The name applied by Blumenbach (1795) to the white division of mankind, as distinguished from the yellow, the brown, and the black. Whether these divisions be called species, subspecies, varieties, or races, they exist and have separate names. The objection is made to the word that it is not sufficiently connotive, because the peoples of the Caucasus do not fairly represent the grandest division of humanity. But the term is fixed in literature and will doubtless remain. Another controversy is waged over the original area of development and dispersion of the Caucasian race. Within a quarter of a century opinions have shifted from southern Asia to northern Africa. Keane says that the Caucasic progenitor originated in Africa, north of the Sudan, and quotes Sergi as saying that Africa is the cradle land whence this Caucasic family spread northward to Europe, where it still persists, and eastward to western Asia. The whole of northern Africa, connected by land with Europe in the Quaternary epoch, formed part of the geographical area of the ancient white race. The last word has not been said on this point. The cradle land of the human species may have been in southeastern Asia. In that event new difficulties with reference to the formation of the great subspecies arise.

Various classifications of the members of the Caucasic race have been made. Huxley (1870) made two separate races of whites—the Xanthochroid of northern Europe, and the Melanochroid of southern Europe, northern Africa, and Asia. A much later tabulation is that of Deniker, here given:

In this table the Littoral European (called also Atlanto-Mediterranean) corresponds with the Iberian of English writers; the Western European, or Cévenole, is the Celtic, or Alpine, of authors; the Adriatic type is the tall, brachycephalic population of the northwest Balkan Peninsula; Northern European corresponds with Teutonic, or Nordic, and Eastern European with White Russian, or Lithuanian.

Compare this scheme with Keane's divisions of the Caucasian peoples: (1) *Homo europæus*.—Scandinavians, North Germans, Dutch, Flemings, most English, Scotch, and Irish; Thrako-Hellenes, some Kurds, most West Persians, Afghans, Dards, and Siah-posh Kafirs; many Hindus. (2) *Homo alpinus*.—Most French and Welsh, South Germans, Swiss, and Tyrolese; Russians, Poles, Czechs, Yugo-Slavs; some Albanians and Rumanians; Armenians, many Kurds, Tajiks (East Persians), Galchas, Indonesians. (3) *Homo mediterraneus*.—Most Iberians, Corsicans, Sards, Sicilians, Italians, Greeks, Berbers, and other Hamites; Arabs and other Semites; some Hindus; Dravidas, Todas, Ainus.

The best modern works on the subject are: Keane, *Ethnology* (Cambridge, 1896); id., *Man: Past and Present* (Cambridge, 1899); Ripley, *Races of Europe* (New York, 1899); Deniker, *Races of Man* (London, 1900); Sergi, *Mediterranean Race* (London, 1901); Giuffrida-Ruggeri, *Homo Sapiens* (Leipzig and Vienna, 1913).

CAUCASUS, ka'ka-sūs (Lat., from Gk. Καύκασος, *Kaukasos*, Fr. *Caucase*, Ger. *Kaukasus*, Russ. *Kavkas*). A region occupying the southeast corner of Europe and extending into Asia (Map: Russia, F 6). It extends from about lat. 38° to 46° 30' N., constituting the isthmus separating the Caspian from the Black Sea and the Sea of Azov. Its area is about 180,000 square miles. Russian Armenia is included in the southern part. The famous Apsheron Peninsula, the site of the celebrated Baku oil fields, lies in its southeastern section.

Considered ethnologically and physically, the Caucasus is the most interesting part of the Russian Empire and one of the most interesting countries. The surface presents a wide diversity of aspects, since it comprises a low and marshy region in the north, as well as the snow-clad peaks of the Caucasus Range. This range crosses the territory from northwest to southeast and, with its offshoots, occupies the larger part.

The main range divides the country into northern Caucasia (Ciscaucasia) and Transcaucasia. The former is, in the main, a level country, the prolongation of the Russian plains, having lagoons, marshes, and steppes and peopled mainly by nomad Kalmuks. Its central elevation lies between the head streams of the Kuma and the Terek, which flow into the Caspian, and those of the Kaban, an affluent of the Black

I. BRUNETTE TYPE: WAVY BROWN OR BLACK HAIR, DARK EYES

Clear brown skin, black hair, narrow, straight, or convex nose, tall stature, dolichocephalic	INDO-AFGHAN.
Tawny white skin, black hair { Tall stature, long face { Aquiline nose, prominent occiput, elliptical face, dolichocephalic	ARAB OR SEMITE.
	BERBER (4 subraces).
	LITTORAL EUROPEAN.
	IBERO-INSULAR.
Dull white skin, brown hair { Short stature, dolichocephalic	WESTERN EUROPEAN.
	ADRIATIC.
	{ Short stature, round face, strongly brachycephalic
	{ Tall stature, elongated face, brachycephalic

II. FAIR TYPE: WAVY OR STRAIGHT HAIR, LIGHT EYES

Reddish white skin { Hair somewhat wavy, reddish; tall stature, dolichocephalic	NORTHERN EUROPEAN.
	{ Hair somewhat straight, flaxen; short stature, sub-brachycephalic
	EASTERN EUROPEAN.

Sea. Transcaucasia, or the region south of the main Caucasus Range, forms a striking contrast to the northern part. It is occupied chiefly by lines of mountains running parallel with the great central range. The river Kur, together with its affluent, the Arax, drains a great part of Transcaucasia, emptying into the Caspian. The much smaller Rion flows into the Black Sea.

The water system of the Caucasus belongs wholly to these two seas. Lakes are found only in Transcaucasia. The chief of them is the Gokcha, or Sevanga, situated in Erivan. Its altitude is above 6000 feet, its area over 500 square miles. For further physiographical details, see CAUCASUS MOUNTAINS.

The varieties of climate effect sharp contrasts in flora and fauna. From the northern pine on the lofty altitudes to the unusually luxuriant growths in the basin of the Rion, where figs, pomegranates, etc., flourish, there is an extraordinary range of vegetation. The fauna ranges from the leopard, and even the tiger, to the common European species of wild animals.

The mineral deposits of the Caucasus are among the richest in Russia, and its oil wells are second only to those of the United States. Despite lack of adequate transportation facilities and want of enterprise and equipment, production has increased and the mining industry has developed. Coal, of inferior quality, is extracted—3,380,000 poods in 1911; 2,400,000 (1910); 3,220,000 (1908); 2,862,000 (1907) (pood = 36,113 lbs.). Other products are copper, manganese, mercury, sulphur, iron, cobalt, and salt. Baku (q.v.) is the centre of the petroleum industry.

The settled population is agricultural. In Ciscaucasia wheat, rye, and other grains give large returns in the irrigated districts; in Transcaucasia, corn, rice, cotton, and tobacco. There were reported in 1911, in both divisions, 22,073,000 acres under cereals, and 5,676,000 under meadows; the total cereal yield was 338,680,300 poods (winter wheat, 108,750,700; summer wheat, 52,784,100; barley, 92,938,600; oats, 21,238,000, etc.), and the total hay yield, 183,554,800 poods. In 1910 the cereal yield was 462,467,400 poods; hay, 186,059,200. Under vines are some 54,000 acres in Ciscaucasia and 150,000 in Transcaucasia, yielding in all about 30,000,000 gallons of wine per annum. There are about 150,000 acres under mulberry trees and the silk worm industry is important. The nomadic tribes carry on grazing; the live stock was estimated in 1911 as follows: 1,943,000 horses, 5,915,000 cattle, 11,600,000 sheep and goats, 1,181,000 swine, besides considerable herds of camels. The forest area (1911) was about 13,311,000 acres.

The manufacturing industries of the Caucasus are but poorly developed. The natives make rugs and long woolen cloaks, also harness, which is usually richly and tastefully trimmed with silver; these articles show no little skill and artistic sense and are exported to some extent. In the manufacture of wine primitive methods are mostly used, and the product is hardly known outside of Russia. The serious disturbances centring round Baku and Batum (1904-06) as a consequence of the Tatar-Armenian feud affected injuriously all manufacturing industries.

The transportation facilities of the Caucasus, although considerably improved since the completion of the Transcaucasian Railway, are yet

far from adequate. In many parts the pack horse is still used for transporting freight. The northern of the two chief lines of railway extends along the Caspian coast from Baku to Petrovsk; thence inland to a point near Vladikavkaz, and north into the province of the Don Cossacks to its terminations at the Sea of Azov. A branch connects the main line with Novorossiysk on the Black Sea. The southern line (560 miles) connects Baku, on the Caspian, with Batum and Poti, on the Black Sea. The most important of the other lines is that from Tiflis to Erivan (234 miles), with a branch (48) to Kars. The exports of petroleum and grain from the Caucasus to western Europe across the Black Sea are important. The petroleum flotilla on the Caspian numbers over 300 vessels.

Administratively the Caucasus forms one of the general governments of the Russian Empire and is divided into Ciscaucasia (northern Caucasia), containing two provinces and one government; and Transcaucasia, containing six governments, three provinces, and two districts. See RUSSIA, *Population*.

The population of the Caucasus in 1897 was 9,289,364; the greatest density being 53.5 per square verst in Koutais, the least 17.2 in the Black Sea Government. The Aryans numbered 4,901,412; the Caucasians, 2,439,071 (Georgians, 1,350,275); the Uralo-Altaians, 1,902,142 (Turko-Tatars, 1,879,908); Semites, 46,739. Members of the Orthodox Greek church numbered over 4,000,000; Mohammedans of the Sunnite sect, 2,021,300, and of the Shiite sect, 884,100; the Armenians are Christians; the Kalmycks and others of the Turko-Tatar tribes are Lamaists. The total population as estimated Jan. 1, 1911, was 12,037,200. The chief cities are Tiflis (q.v.), the government capital, and Baku (q.v.), famous for its petroleum industries. There are reported 5443 schools in the Caucasus.

Keane (*Man: Past and Present*, 1899) divides the inhabitants of the Caucasus, on linguistic grounds, into four groups: (1) *Southern*—Georgians, Imeritians, Chechens, Lazes, Mingrelians, Pshavs, Swanittians, collectively called the Kartvelian family. (2) *Western*—Abkhasians, Circassians, and Kabardians. (3) *Central*—Ossetes, or Irons. (4) *Eastern*—Avars, Chechins, Daigs, Ingush, Kazy-Kumyksh, Kist, Lesghians, Tush, collectively called Daghestani, 'highlanders.' Nowhere else in the world, according to Ripley (*Races of Europe*, 1899), is such a heterogeneous confusion of peoples, languages, and religions gathered in one area. The number of dialects is rated at 68, representing all stages of development. The Ossete is put down as Aryan; the Circassian, including Abkhasian and Kabardian, is incorporative; some are purely agglutinative; and to these must be added later intrusions of Semitic and Aryan speech. Into the closed valleys of the Caucasian Mountains, during the migrations of peoples, came representatives of all tongues and nations, sufficiently isolated within their confined environments to preserve both physical and linguistic traits or to develop new ones.

Little is known of the early history of the Caucasus. The ancient Greeks perhaps carried on commercial relations with the tribes along the west coast, and Cape Iskuria may have received its name from the colony of Dioscurias, established in the seventh century B.C. As shown in the writings of Æschylus and Herodotus, the Greeks knew the location of the

Caucasus Range. Georgia, the chief state, was conquered by Alexander the Great. Other portions of the Caucasus were incorporated in the Roman, and thereafter the Byzantine Empire through the control of Armenia. Muscovite interest began under Peter the Great, but not until about 1770 did Russia actively enter the region. Kuban and Terek became theirs in 1774, and Derbent, Kuba, and Baku in 1796; so that by the end of the century Russia had acquired practically all of northern Caucasia. The annexation of Georgia in 1801, after the death of George XIII, gave Russia a foothold in Transcaucasia. By cessions secured from Persia and Turkey, as well as by voluntary submissions on the part of the more peacefully inclined native tribes, Russia had obtained, by 1829, nominal control over nearly the entire country.

The courageous mountain tribes, however, aided by the general inaccessibility of the region, retained their independence, and it was only after 30 years of continuous fighting that their subjugation was accomplished. Shamyl was the chief leader of the natives in whom religious zeal was combined with marvelous bravery. He gave to the resistance of the Caucasians a more organized character, defeating the Russian conquest. At last Shamyl was forced to surrender at Ghunib in 1859, and Russian dominion was virtually assured. The operations in the west ended in complete success at last in 1865. A great exodus of Circassians to Turkish territory ensued. During the Russo-Turkish War in 1877-78, there was an uprising against Russian control, and the Turks lent active assistance, but the attempt proved wholly futile. Russia's success in this war secured to her a section of Turkish Armenia, which was annexed to the Caucasus. In 1905 the Caucasus was the scene of violent disturbances, racial and revolutionary. Consult: Keane, *Man: Past and Present* (New York, 1899); Ripley, *Races of Europe* (ib., 1899); Erkert, *Der Kaukasus und seine Völker* (Leipzig, 1887); Freshfield, *The Exploration of the Caucasus* (London, 1902); Wirth, *Kaukasische Zusammenhänge* (Leipzig, 1907). See RUSSIA.

CAUCASUS MOUNTAINS. A mountain range on the Caucasian Isthmus, forming part of the boundary between Europe and Asia. It extends in a west-northwest direction from the peninsula of Apsheron, in the Caspian Sea, to the peninsula of Taman, between the Black Sea and the Sea of Azov, being separated here from the mountains of the Crimea by the narrow Strait of Kertch. The range is about 750 miles in length and from 60 to 125 miles in width. The narrowest section is almost in the middle of the isthmus, where the basin of the Terek River occupies a depression that leads into the Dariel Pass. While formed by several chains running parallel, or diverging and again uniting in mountain knots, the range is remarkable for its geographical and geological unity. West of the Dariel Pass there is an almost unbroken line of mountains exceeding the Alps in elevation, which forms a veritable barrier between the regions to the north and south. Eastward the Caucasus is lower, more broken, and is cut by numerous transversal valleys. The southern slopes of the mountains are generally much sharper than the northern, which fall by gradual stages to the level of the Terek and Kuban valleys. The range includes many massive peaks of great altitude. Elbruz (18,470

feet), Koshtantau (16,900), Dikhtau (17,000), Kasbek (16,546), and other peaks overtop Mont Blanc. Elbruz and Kasbek are probably of volcanic origin. The loftier mountains carry fields of snow and ice, but the glaciers are not so extensive as in the Alps, where they have greater breadth and a lower snow line. Most of the central ranges are composed of granite and crystalline schists. On the northern slopes Jurassic and Cretaceous sediments predominate, and are continued into the Caucasian steppes, where they dip below the Tertiary and Quaternary formations. The Kuban and Rion rivers drain the western Caucasus into the Black Sea, while the eastern region is drained by the Terek and Kur into the Caspian. There are but few practicable routes across the range, the most important being from Vladikavkaz, on the northern side, through the Dariel Pass to Tiflis, which is used as a commercial and military highway.

Little Caucasus. To the south of the valleys of the Kur and Rion, in Transcaucasia, there are several mountain groups forming a broken chain that extends from near Poti on the Black Sea southeast to the Persian frontier. These groups are collectively known as the "Little Caucasus," or as the "Mountains of Transcaucasia." The highest point is Alaghez, over 13,000 feet.

CAUCHON, kō'shōn' JOSEPH EDWARD (1816-85). A Canadian journalist and politician, born at St. Rochs, Quebec. In 1842 he established *Le Journal de Québec* and conducted it until his death. He entered the Legislative Assembly in 1844 and served in it and in the Dominion Parliament after the formation of the Confederation until 1877. During 1867-72 he was Speaker of the Senate. He held cabinet offices in the Provincial and Dominion governments, and was Lieutenant Governor of Manitoba from 1877 to 1882. He published *L'Union des provinces de l'Amérique Britannique du Nord* (1865).

CAUCHY, kō'shê', AUGUSTIN LOUIS (1789-1857). A French mathematician. He was born in Paris and was educated at the Ecole Polytechnique. In 1810 he went to Cherbourg, in the capacity of an engineer, but, his health failing, he returned to Paris in 1813, renounced engineering, and chose pure science for his life work. His *Mémoire sur la théorie des ondes* was crowned by the Institute in 1815, and in 1816 he became a member of the Academy of Sciences. Later he became professor at the Polytechnic School. In 1830 he refused to take the oath required by Louis Philippe and went into voluntary exile. During his stay abroad he held for a short time the chair of mathematics in Turin, and later (1834) went to Prague as tutor of the Comte de Chambord. He returned to France in 1837, but his political views were such as to bar him from the higher professorships until the advent of the government of 1848. In that year Cauchy was made professor of mathematical astronomy at the Sorbonne, a chair which he held with a brief interruption until his death. In politics Cauchy was a Legitimist. He was known as a man of piety and was a defender of the Jesuits.

The works of Cauchy occupy a leading place in science. All parts of pure and applied mathematics, including geometry, algebra, the theory of numbers, integral calculus, mechanics, astronomy, and mathematical physics, are indebted to his discoveries. He verified the periodicity

of elliptic functions, gave the first impetus to the general theory of functions, contributed to determinants, and laid the foundation for the modern treatment of the convergence of infinite series. He emphasized the imaginary as a fundamental, not subsidiary, quantity, perfected the method of integration of linear differential equations (see CALCULUS), advanced the theory of substitutions, invented the calculus of residues, and, in general, was one of the leaders of the nineteenth century in infusing vigor into analysis. The propagation of light and the theory of elasticity also received his attention.

Consult Valson, *La vie et les travaux de Cauchy* (Paris, 1868), and Terquem, "Analyse des travaux de Cauchy," in the *Nouvelles annales de mathématiques* (Paris, 1857). *Les œuvres complètes d'Augustin Cauchy* (Paris, 1882-1901) were published under the direction of the Academy of Sciences.

CAUCUS (of uncertain origin; possibly from ML. *caucus*, Gk. *καῦκος*, *kaukos*, cup, as being originally an informal festal gathering). A term applied (1) to an informal meeting of the voters of a political party within a limited district for the purpose of nominating candidates for office or of naming delegates to a nominating convention, and (2) to a conference of the members of a political party in a legislative body for the purpose of determining in detail the course to be pursued by the members of the body belonging to such party. In its former application the word is said to have been derived from the "Caulkers' Club," a political organization of some prominence in Boston during the activity of Samuel Adams. Until within a comparatively brief period this informal meeting of voters was a well-recognized and widely established feature of the American political system. In the party caucus all "regular" members of the party were considered entitled to be present and to be heard. Its participants named the party's candidates for local office and determined the policy of the party in the political district from which the members of the caucus were drawn. From the caucus of a small political unit, such as the town or the assembly district, were sent the various constituent members of a larger and similar conference representing, and acting for, the voters of a congressional district or of an entire State. Within the past two decades the caucus has assumed a new form through the statutory control of nominations to office, especially in the establishment of a system of so-called "primaries," the composition and procedure of which have in several States been made the object of as detailed and specific legislative control as are the elections themselves. The informalities which earlier made possible many questionable practices in the effort to "capture" a caucus have thus gradually disappeared and have been superseded by the routine of secret balloting by the legally registered members of a party. The nominating caucus appeared also in American politics in a conspicuous form, until 1824, in the caucus of members of Congress of each party which for a couple of decades named the candidates for the presidency and vice presidency, until the system of national nominating conventions was introduced.

The second type of caucus has not only survived, but has increased in influence and has become recognized as a legitimate feature of legislative procedure. Both in local legislative bodies and also in the various State legislatures,

and still more conspicuously in Congress, the members of each party participate in a caucus, by which are named the party's candidates for the offices of the body and by which are determined the lines of policy to be followed within the larger body. Such action is considered as binding not only upon all the participants in the caucus, but also upon all members of the legislature belonging to the party holding the caucus; and very rarely do any dissentient members of a party have the will, or the desire, to "bolt" the action of their caucus.

CAU'DA-GAL'LI GRIT. See DEVONIAN SYSTEM.

CAUDEBEC - LES - ELBEUF, kôd'bêk' lâ-zêl'bêf'. A town in the Department of Seine-Inférieure, France, on the left bank of the Seine, an industrial suburb of Elbeuf, 12 miles south of Rouen. It has woolen mills, cloth factories, and dye works. Pop. (commune), 1901, 9751; 1911, 9079.

CAU'DINE FORKS (Lat. *Furculæ Caudinæ*). Two high, narrow, and wooded mountain gorges near the town of Caudium, in ancient Samnium, on the boundary towards Campania, celebrated for the defeat here suffered by the Romans in the Second Samnite War (321 B.C.). Four Roman legions commanded by the two consuls, Titus Veturius and Spurius Postunius, after marching through a narrow pass, found themselves locked in a spacious valley, surrounded on all sides by lofty mountains, with no way out save that by which they entered, and another pass on the opposite side. Attempting to defile through the latter, they found it blocked up with trees and stones and commanded by the Samnites, who had also in the meantime made themselves masters of the other pass. After some days famine compelled them to surrender unconditionally. The Samnite general, Gaius Pontius, according to old custom, compelled the Romans to pass under the yoke and then permitted them to march back to Rome.

CAU'DLE'S CURTAIN LECTURES, MRS. A series of farcical papers contributed by Douglas Jerrold to the London *Punch* and published in 1846. They also form vol. iii of the author's *Collected Works*, London, 1852. They consist of a series of marital monologues delivered after retiring by a woman of decided views to her meek and sleepy husband.

CAUER, kou'ër. A family of German sculptors.—EMIL the elder (1800-67) is chiefly known as the inventor of the so-called "Cauersche Masse," a substitute for plaster, which it excels in durability and cleanliness, in the reproduction of statuary. He modeled many small genre figures, hundreds of which were cast in this medium. The latter part of his life was spent at Kreuznach on the Rhine, where his sons and grandsons also practiced his art.—His son, KARL CAUER (1828-85), was born in Bonn, studied technique with Rauch and Albert Wolf in Berlin, and the antique in Rome and in the British Museum. His portrait busts, among which are many of the royal princes and aristocracy of Europe, are lifelike and full of charm. "The Witch" (National Gallery, Berlin), "The Olympian Victor" (Sans Souci and Kensington Museum), "The Dying Achilles," and the Schiller Monument in Mannheim, are among the best known of his other works. He also designed the tomb of President Garfield at Cleveland.—ROBERT (1831-93), a younger brother of Karl, was born in Dresden. He first studied

painting at Düsseldorf, then sculpture with his father in Kreuznach and afterward in Rome. He is best known by the charming little statuettes and groups executed by the hundreds in the "Cauersche Masse," the motifs of which are taken from romantic or classic tales and poems, such as "The Sleeping Beauty," "Puss in Boots," "Hermann and Dorothea," "Paul and Virginia." He and his brother Karl were commissioned by the Prussian Ministry of Public Instruction to superintend the reproduction in plaster casts of the principal sculptures of Italy.—EMIL THE YOUNGER, HUGO, LUDWIG, and ROBERT THE YOUNGER, sons of Karl, and STANISLAS, son of Robert the Elder, are all sculptors.

CAUGHNAWAGA, ka'ná-wá'gá. See SAULT ST. LOUIS.

CAUK, or **CAWK** (provincial variant of *chalk*). The massive variety of the mineral barite, so called originally by miners in the Derbyshire lead mines. See BARIUM.

CAUL (OF. *cale*, a sort of cap, Ir. *calla*, OGael. *call*, veil, hood; ultimately connected with Lat. *celare*, to hide, Skt. *sarana*, refuge). A thin membrane encompassing the heads of some children when born. It is merely the amniotic membrane (see EMBRYOLOGY; AMNION), which envelops every child before birth and which, on account of unusual strength or for other reasons, has escaped rupture during the act of delivery. Extraordinary superstitions have been connected with it from very early ages down to the present day. (See SUPERSTITION.) It was a popular belief that children so born would be very fortunate, and that the caul brought fortune to those purchasing it. This superstition was so common in the primitive Church that St. Chrysostom felt it his duty to inveigh against it in many of his homilies. In later times midwives sold the caul to advocates at enormous prices, "as an especial means of making them eloquent," and to seamen as an infallible preservative against drowning. It was also supposed that the health of the person born with it could be told by the caul which, if firm and crisp, betokened health, but if relaxed and flaccid, sickness or death. During the eighteenth century it was common to find advertisements in the newspapers of cauls to be sold. Similar advertisements appeared from time to time also during the nineteenth century. Consult: Brand, *Popular Antiquities* (London, 1870); *Notes and Queries*, vol. vii (London, 1849 et seq.); Jones, *Credulities, Past and Present* (London, 1898).

CAULAINCOURT, kó'lán'kōōr', ARMAND AUGUSTIN LOUIS DE, DUKE OF VICENZA (1772–1827). A statesman of the first French Empire, born at Caulaincourt, in the Department of Aisne, Dec. 9, 1772. He entered the army at the age of 15, rapidly attained promotion, and as colonel of a regiment of carbineers distinguished himself in the campaign of 1800. He was made a general of division in 1805 and in 1808 was created Duke of Vicenza. In 1807 he was appointed Ambassador to St. Petersburg, where he soon gained the confidence of the Czar, Alexander I. In 1811, on the eve of the outbreak of hostilities between Russia and France, he resigned his post, as he disapproved of Napoleon's policy. He opposed the invasion of Russia. After the burning of Moscow Napoleon selected him as his companion in his flight to France. In 1813 he was plenipotentiary to the allied sovereigns during the campaign of Saxony, and as Minister of Foreign Affairs attended the

congress at Châtillon, February, 1814. After the abdication of Napoleon Caulaincourt endeavored to make use of his influence with Alexander to obtain the most favorable conditions for the fallen Emperor, and chiefly through his intervention the island of Elba was given to Napoleon. During the Hundred Days Caulaincourt resumed office as Minister of Foreign Affairs and was made a peer. On the Second Restoration he retired to private life. He died in Paris, Feb. 19, 1827. Consult Eileraux, *Souvenirs du duc de Vicence* (Paris, 1837–40).

CAU'LIFLO'RY (from Lat. *caulis*, Gk. *καυλός*, *kaulos*, stalk + *flos*, flower). The production of flowers from the old wood, as in the redbud (*Cercis*). This habit is very characteristic of tropical forests, in which case possibly the thin bark explains its common occurrence.

CAU'LIFLOW'ER (Lat. *caulis*, stalk, especially of the cabbage, Gk. *καυλός*, *kaulos*, stalk + *flower*, from Lat. *flos*, flower), *Brassica oleracea* var. *botrytis*. A form of cabbage in which the inflorescence, modified into a flattened head or compact mass, is the edible part. It is a less strongly flavored and more delicate vegetable than cabbage and is eaten boiled with sauce or pickled. Its culture is similar to that of cabbage, but the plant is not so hardy and requires a richer and more moist soil. When the head begins to form, the outer leaves of the plant are drawn up over it and fastened. This produces a whiter and more marketable head. (For illustration, see CABBAGE.) Cauliflower seed, formerly produced almost entirely in Europe, is now grown in commercial quantities in the vicinity of Puget Sound, Washington. There are a number of varieties of cauliflower, but without marked differences between them. Early Dwarf Erfurt and Snowball are among the best. Broccoli is simply a late maturing and more hardy form of cauliflower.

CAULO'NIA (Lat., from Gk. *Καυλωνία*, *Kaulōnia*). An ancient Achæan city in Italy, near the Gulf of Syllaceum. It was a town of importance five centuries before Christ. In 389 B.C. it was destroyed by Dionysius the Elder. Though mentioned later, it never again attained prominence.

CAULOP'TERIS (Neo-Lat., from Gk. *καυλός*, *kaulos*, stalk + *πτερίς*, *pteris*, fern, from *πτερόν*, *pteron*, wing, from *πέτεσθαι*, *petesthai*, to fly). A genus of fossil tree ferns usually recognized by their trunks and found in rocks of Upper Paleozoic and Lower Mesozoic age of many parts of the world. The name was first given by Lindley and Hutton to erect trunks found in the Carboniferous rocks. More recently the genus has been found also in the Lower Devonian of America and in the Permian and Trias of the Old World. The trunks show the places of attachment of the leaves, marked by scars, and these scars are arranged spirally about the axis. The various species are recognized by the form and size of the scars, which are generally large and of a circular or oval outline with an inner mark shaped like a horseshoe. Some of the finest examples found in America were obtained from the Carboniferous limestones of the Lower Devonian of Ohio. These were described by Newberry, who considered that they grew upon an island which occupied the vicinity of Cincinnati during a time when the remainder of Ohio and the Mississippi valley was covered by a shallow arm of the ocean. The leaves known as Pecopteris in the coal measures of the Ap-

palachian region are thought to be the foliage of *Caulopteris*.

CAULX, SALOMON DE. See CAUS, SALOMON.

CAUMONT, kō'mōn', ARCISSE DE (1801-73). A French archæologist, born in Bayeux (Calvados). He founded (1834) the Société Française d'Archéologie pour la Conservation et Description des Monuments Nationaux. Among his chief works are *Statistique monumentale du Calvados* (5 vols., 1846-47), and the valuable *Rudiment d'archéologie* (1850). Consult the biography by Beaurepaire (Caen, 1874).

CAUQUENES, kou-kā'nēs. Capital of the Province of Maule, Chile, about 187 miles southwest of Santiago (Map: Chile, C 11). Pop., 1903, 10,119; 1907, 30,073.

CAURA, kou'rá. A river of South America, a tributary of the Orinoco, which rises in the southern part of Venezuela on the northern slopes of the Sierra Pacaraima, in a number of head streams, chief of which is the Merevari, and flows generally north-northwest through the Department of Bolívar (Map: Venezuela, E 2). It is over 400 miles long.

CAUS, kō, or **CAULX**, SALOMON DE (1576-1626). A French engineer and physicist who resided in England and in Heidelberg and later in Paris. Little was known of him until Arago exhumed his works, from a study of which he reached the conclusion that he was the real inventor of the steam engine, for in one of these works he gave the plan of an apparatus for raising water by the power of steam.

CAUSALITY (Fr. *causalité*, from Lat. *causalis*, causal, from *causa*, cause). The relation in which cause stands to effect and effect to cause. Causation is causality in a temporally forward direction, i.e., the relation of cause to effect.

Of cause, causation, and causality, many views have been held. Aristotle was the first to devote much attention to the nature of causality, whereas many of his predecessors had spent much time on trying to discover particular causes for particular effects or some one general cause for the universe as a whole. But even Aristotle's contribution to the subject consisted rather in classification of various kinds of causality than in any satisfactory discussion of the ultimate nature of the relation between cause and effect. He enumerated four different kinds of causes, which have ever since had a place in philosophy. These are the material, the formal, the efficient, and the final. The material cause is what anything is made of; e.g., brass or marble is the material cause of a given statue. The formal cause is the form, type, or pattern, according to which anything is made; e.g., the style of architecture would be the formal cause of a house. Again, the efficient cause is the power acting to produce the work, e.g., the manual energy of the workmen. The final cause is the end or motive for the sake of which the work is produced, e.g., the pleasure of the owner. Aristotle mentions the case of a physician curing himself, as exemplifying all the causes in one and the same subject. Important as this classification has proved itself to be in the subsequent development of thought, it does not touch upon the problem of causality as it presents itself to the modern mind. This was due to the *naïveté* that in so many ways characterized the Greek thinkers. Aristotle *assumes* that there are causes and that they *produce* effects; but he does not help us to conceive the nature of the power—if power there be—exer-

cised by the cause in the production of the effect. Sextus Empiricus, probably following Ænesidemus, raised some of the problems that have ever since busied the thoughts of philosophers. First of all, he pointed out the relativity of the notion of cause, since cause has no meaning apart from effect. But, he argued, the relation has no real existence, but is merely a thought product. We *think* causality into things which are themselves free from any such relation. Furthermore, there is a difficulty about the temporal relation of cause and effect. Cause cannot be prior to the effect, for it is not cause till the effect arises. It cannot be simultaneous with, nor subsequent to, the effect, for in either case it would not be what we mean by cause. This is a subtle sophism that has puzzled many thinkers even to the present day, and has conduced much to a clearer understanding of the time relation involved in causality.

In early modern philosophy there were two rival notions of cause. Descartes and his school made cause identical with substance, while the physical scientists reduced cause to a motion or change followed by other motion or change with a mathematical equality between measures of motion. But it was Hume who first in modern times took up the problem of causality where the skeptics had laid it down. He carried out to its logical conclusion the contention of Sextus Empiricus that causality is not a real relation, but a fiction of the mind, and he used the doctrine of association to account for the origin of the fiction. Any necessary tie binding cause and effect, he pointed out, is undiscoverable by the senses; and as ideas are merely copies of sense impressions, we have no idea of causality. But we have a fiction of the imagination in regard to causality, and the fiction arises from the ease with which we pass from one perception to another perception which in past experience has been constantly and unvaryingly associated with it. "We have no other notion of cause and effect, but that of certain objects, which have been always conjoined together, and which in all past instances have been found inseparable. We cannot penetrate into the reason of the conjunction. We only observe the thing itself, and always find that from the constant conjunction the objects acquire a union in the imagination." Hence "a cause is an object precedent and contiguous to another, and so united with it that the idea of the one determines the mind to form the idea of the other, and the impression of the one to form a more lively idea of the other."

Hume's explanation of cause as a fiction which has no discoverable objective correlate led Kant to the position that the only knowable objective world is, so far as all the relations obtaining within it go, the product of mind's synthetic activity. Kant accepted Hume's skeptical result as far as it concerned itself with the world of things-in-themselves; but not being satisfied that experience is only a succession of perceptions without any discoverable coherence, he made causality one of the principles of coherence obtaining in the world of phenomena, and universally present there because always put there by thought as a part of its contribution to the nature of that world. (See KANT; CATEGORY.) Thus both Hume and Kant agree in denying independent objectivity to causality; they disagree in that the former denies also a relative objectivity to causality, while the latter asserts

such objectivity. The difference is due to the fact that for Hume the world of experience (the bundle of perceptions) is comparatively unorganized and chaotic; for Kant it is so thoroughly organized that it is regarded as a universe with relative objectivity and the relations obtaining therein as thoroughly knowable, inasmuch as they are contributions by the knower. Hegel, denying outright a transcendent world beyond experience, and recognizing, as Kant did, the universal prevalence of causality within experience, made causality thoroughly objective. But the question arises, How is it known that causality is universal within the world of experience? We have not always experienced a cause for every experienced effect; in fact, the whole problem of physical science is to discover causes for known events. How do we know they have any causes at all? Kant, as we have already seen, answers: We know, because we have made our world in such a way that everything has a cause. Hegel's answer to this question cannot be given here, as it would require too minute a discussion. J. S. Mill took up the problem here; denying the fundamental postulate of Kant's transcendentalism, viz., that the order of this world is thought-made, he seeks to justify our belief in universal causation by tracing it back to an induction (q.v.) which rests upon a larger experience than any other induction can have. The difficulty with this view is that for Mill all induction rests upon the principle of causality, and it is a circular procedure to make causality rest on induction. But circularity is in the last resort inevitable in all reasoning. (See KNOWLEDGE, THEORY OF; LOGIC.) But the difference between valid logical circularity and vicious circularity is the difference between a systematic support given to each part of experience by all other parts, and an attempt to make two judgments support each other while neglecting the concrete experience upon which all judgments must rest. Mill's circularity in the present instance is fundamentally sound, but the form in which he presents his reasoning is inadequate, and hence has led to severe criticism. Perhaps it would answer all purposes concerned to say that the tendency to make induction from observed fact is natural to a thinker. But whether any particular induction is valid is another question, to be answered only by carefully studying all the inductions that have reached satisfactory results and finding what characteristics they have in common and wherein they differ from inductions admittedly erroneous. Such a study shows that satisfactory inductions, i.e., inductions upon which we have learned that we can rely, have in common the assumption of the principle of causality as obtaining within the sphere covered by the induction. This assumption, at first and for a long time, was not consciously made, but none the less we can now see that it was made. Gradually, in certain spheres, the principle of causality came to be clearly recognized as obtaining. As time went on, the prevalence of causality in still other and other spheres was ascertained. Then the natural tendency of thought to generalize caused men to make inductions to the universal prevalence of causality. Then when the question arose as to the foundation of induction, it was finally discovered that it rested upon an unrecognized assumption of causality, even in the case where the universal prevalence of causality was the subject matter

of induction. Is this vicious? No, unless it can be shown that the assumption has led to results that are untenable. On the contrary, in this case the assumption lies at the foundation of every valuable structure raised by thought, and the tenability of the assumption is guaranteed by the validity of all that follows from the assumption and that would be invalidated were the assumption unjustifiable. See INDUCTION; KNOWLEDGE, THEORY OF.

Along with this account of the origin of knowledge of cause goes a definition of cause which is at the present day quite widely accepted. The cause of any event is a preceding event without which the event in question would not have occurred. Both causes and effects are always events; i.e., *things* in the process of change. The complete cause would be all the indispensable previous events. But as all inquiry that is of any value is confined within limits, the question as to the cause of an event is not generally a demand for a complete inventory of indispensable previous events, but for some event which, in connection with other events taken for granted, is needed to secure the occurrence of the event under discussion. According to this view of cause neither the "material cause" nor the "formal cause" is a cause; and the "final cause" is a cause only in the sense that the *idea* of the end to be obtained, together with all the desires this idea evokes, may, as an event, be an indispensable temporal prerequisite to an action that terminates in the attainment of the end. A final cause is then not a future event as an event that in time will take place, but as one now anticipated. And the anticipation precedes the effect it produces.

This brings up again the question as to the temporal relation of cause and effect. Some philosophers of to-day, following Sextus Empiricus, maintain that cause cannot be anterior to effect. This, however, is a mistake resting upon a failure to appreciate the continuous character of time (q.v.). The cause exists before the effect, but continues itself into the effect. It is to some extent an arbitrary matter where the line be drawn that divides cause from effect; but drawn it must be somewhere if one is to be clear-headed in talking about causality, and, when drawn, all the part of the continuous cause-effect process that precedes the line is cause, and all the part that follows is effect. And the line itself does not exist as a *gap* between cause and effect, but simply as the line of *junction* of cause and effect. See CONTINUITY, LAW OF.

After all that has been said the relation between cause and effect is still left unknown, *provided* one assumes that the indispensableness of cause to effect is the result of an unknown something in the nature of the cause and of the effect. But such an assumption is ungrounded, if by nature one means a mysterious constitution of qualities. A simple view which seems to satisfy all the conditions of the case, and to leave no insoluble mystery, is that the causal relations in which an event stands are constitutive factors of the universe of which the event is a part. We do not have two self-subsistent and originally unrelated events, which are then in some incomprehensible way made to depend one on the other, as effect upon cause. Neither event is adequately thought unless its discoverable causal relation to the other is thought of as being just as real as each distinct event itself.

Thus we think of cause and effect not as magically conditioning each other, but as being different steps in a continuous process, within which each step is what it is by virtue of its relation to all other steps. Cause and effect are organically interrelated, and the organic whole within which they interact is the *ground* of their interaction.

Many philosophers deny the ultimate reality, or at least the fundamental validity, of the causal relation. Thus Josiah Royce (q.v.) maintains that the category of serial order, of which the category of cause is a particular case, is itself subordinate to the ultimate category of purpose. The world with all its relations is "there to express a perfectly definite and absolute purpose." Bergson (q.v.) is the most recent denier of the ultimate validity of scientific explanation by causes. Cause for him has indeed a practical value, but has no metaphysical significance. When we wish to secure an end, we must go about it by finding a means; the means is the cause of the realization of the end. It is a part cut out from the integral whole; the excision is artificial and subserves our ends, but does not correspond to any distinction that actually obtains apart from our interference with reality. Ultimate reality or life is not bound down by exact causal sequences. It is a process of growth in which the unpredictable and therefore the uncaused constantly occurs. There is no exact repetition in real time; and where there is no repetition there is no cause, for cause means the antecedent that *repeatedly* is followed by the same consequent.

Consult: Bosanquet, *Logic*, vol. i (Oxford, 1888); Bradley, *Principles of Logic* (London, 1883); Hobhouse, *Theory of Knowledge* (London, 1896), consulting index for pertinent passages; Mill, *System of Logic*, bk. iii (London, 1856); Hume, *Treatise of Human Nature*, bk. i, part iii (London, 1882); and id., *An Enquiry Concerning the Human Understanding* (Oxford, 1894); Kant, "Transcendental Logic," in *Critique of Pure Reason*, translated by Max Müller (London, 1881); and Kant's commentators, among whom may be mentioned Caird, *The Critical Philosophy of Immanuel Kant* (Glasgow, 1889), and Watson, *Kant and his English Critics* (Glasgow, 1881); Royce, *The World and the Individual* (New York and London, 1901); Bergson, *Creative Evolution* (Eng. trans., New York, 1911); Sigwart, *Logic* (Eng. trans., 1895).

CAUSATION. See CAUSALITY.

CAUSE. See CAUSALITY.

CAUSE CÉLÈBRE, kôz sâ'lêb'r' (Fr., celebrated case). A term for any specially interesting or important legal case, criminal or civil. During the seventeenth and eighteenth centuries the phrase was more particularly applied to the state trials in France. There is a French collection of *Causes célèbres et intéressantes*, by Gayot de Pitaval (20 vols., 1734), with later continuation, and Desessarts also contributed a valuable work (1785) to this branch of legal literature. Typical examples of modern cases to which the term is applied are that of Calas, who was broken on the wheel at Toulouse in 1762 on a baseless charge of having put his son to death to prevent his becoming a Roman Catholic; the Tichborne trial, in which for years (1871) all England was interested, involving the identity of a claimant to title and estates; and the recent trial of Captain Dreyfus in France, which attracted world-wide attention.

CAUSERIE, kôz'rê' (Fr., chat, from *causer*, to chat, gossip, from Lat. *causari*, to plead, from *causa*, cause, case). A term first used in a literary way by Sainte-Beuve in his famous *Causeries du Lundi*. It signifies a short, familiar paper on any subject, usually published in magazines or newspapers. As the writer is generally well known, its style is convenient where readers are interested in the author as well as in what he says. It is less formal than the generally accepted style of essay.

CAUSERIES DU LUNDI, du lën'dê' (Monday Chats). The modest title of collections of critiques by Sainte-Beuve, beginning with 1851. They are distinguished by brilliancy and keen analysis and are concerned not only with French authors, but also with prominent writers of other nations.

CAUSSES, kôs, PLATEAUX DES. A name applied to a barren plateau region of Cretaceous formation in south-central France, lying chiefly in the departments of Lozère, Aveyron, Hérault, and Gard. It is crossed by mountains and ravines, resembling cañons, which add to its forbidding aspect, and is very sparsely inhabited.

CAUSSIN DE PERCEVAL, kô'sân' de pěr's-vâl', ARMAND PIERRE (1795-1871). A French Orientalist, born in Paris. In 1833 he became professor of Arabic at the Collège de France, a chair formerly held by his father, Jean Jacques Antoine Caussin de Perceval (1759-1835), and in 1849 was elected to the Academy of Inscriptions. His *Essai sur l'histoire des Arabes avant l'Islamisme* (3 vols., 1847-49) is a noteworthy study. His *Grammaire arabe vulgaire* (1828) went through many editions; and he revised Boethor's *Dictionnaire française-arabe* (1827).

CAUSTIC, or ESCHAROTIC (Lat. *causticus*, Gk. *καυστικός*, *kaustikos*, from *καυστός*, *kaustos*, burned, from *καίειν*, *kaiein*, to burn). A term used in medicine and chemistry in connection with substances that disorganize or destroy living tissues. Caustics are chiefly used to destroy unhealthy growths, such as warts, granulations, or superficial tumors. *Lunar caustic* is silver nitrate fused and cast into the form of small pointed sticks. *Caustic potash* is, chemically, potassium hydroxide; *caustic soda* is sodium hydroxide; *caustic lime* is calcium hydroxide. Other caustics in common use are glacial acetic acid, the mineral acids, carbolic acid, chromic acid, arsenic, and the hot iron. See CAUTERY.

CAUSTIC. In mathematics, an envelope of rays radiating from a point and reflected or

refracted by a given curve. One form of the caustic may be readily observed by letting sunlight fall on milk, in a glass or cup not quite filled with it. Caustics are distinguished as

catacaustics (caustics by reflection) and diacaustics (caustics by refraction). The names "catoptric caustics" and "dioptric caustics" have also been applied to the two classes. The figure represents both branches of the catacaustic of a circle. The curve has four cusps C_1, C_2, C_3, C_4 , and the lines PP^1, QQ^1 , are asymptotes to its two branches. The cardioid (q.v.) is a catacaustic of a circle for luminous rays proceeding from a point on the circumference. Consult Cayley, "Memoir on Caustics," *Phil. Trans.*, vol. cxlvii (London, 1857, pp. 273-312. See also vol. clvii). For further bibliography, consult the *Intermédiaire des mathématiciens* (Paris, 1894-95). See also ABERRATION, SPHERICAL; LIGHT, *Geometrical Optics*.

CAUTERETS, kôk't'-rà' (formerly *Cauldres*, from its hot springs, Fr. *chaud*, Lat. *caldus*, *ealidus*, hot, from *ealere*, to be hot). A watering place in the Département of Hautes-Pyrénées, France, 26 miles southwest of Tarbes (Map: France, S., D 6). It is in a basin called the Gave de Cauterets, 3254 feet above sea level, and is visited yearly, between May and October, by about 50,000 people, for its 24 hot sulphur springs, which range from 102° to 104° F. and are the most abundant in the Pyrenees. Pop. (commune), 1901, 1547; 1911, 1424. Consult Moinet, *Les eaux thermales sulfureuses de Cauterets* (Paris, 1878), and Senac-Lagrange, *Les eaux sulfureuses de Cauterets* (1884).

CAUTERY. A surgical procedure employed for counterirritation, to arrest bleeding, or to destroy tissue. The desired effects may be obtained by means of chemical agents, called caustics or escharotics. The term is now applied more especially to the "actual cautery," a platinum wire heated by electricity (galvano-cautery) or iron heated in a flame. In the Pacquelin cautery, invented by a surgeon of that name, the heat is maintained by a fine vapor of benzine thrown upon a platinum point after this has been heated. When employed to destroy tissue or as a counterirritant, the cautery is used at white heat; when the object is to arrest hemorrhage, it is heated to a dull or cherry-red color. If employed below this temperature, the tissue will adhere to the iron and cause unnecessary pain.

CAUTIN, kou'tên. A province of Chile, bounded by the Pacific on the west, Argentina on the east, and the Chilean provinces of Malleco and Valdivia on the north and south respectively (Map: Chile, C 11). Area, 5832 square miles. It has mountains of considerable elevation in the western part, including the active volcano Llaimas, nearly 9800 feet high. The Cautin is the chief river, the fertile basin of which yields grain and fruit in abundance. The chief export is wheat. Pop., 1885, 33,291; 1895, 78,221; 1907, 140,159; (est. Dec. 31, 1910) 161,935. Capital, Temuco (q.v.), and chief port Tolten.

CAUTIO, kâ'shî-ô (from *cavere*, to safeguard, to assure). In Roman law (1) a formal undertaking to fulfill a legal obligation, especially an obligation imposed by the court upon a party to a suit. Such a judicial *cautio* was usually established in the form of a stipulation, i.e., by question and answer (see STIPULATION), with security in the form of an identical undertaking by a surety (*fidejussor*). Of such undertakings a memorandum was usually made in writing; and thus *cautio* came to mean: (2) a written acknowledgment that a promise had been made upon oral stipulation. By further

extension, *cautio* came to mean: (3) a written acknowledgment in general, and in particular an acknowledgment of the receipt of money.

Cautio damni infecti. Literally, assurance against damage not yet done. At Roman law, when land or a building was threatened with injury in consequence of the defective condition of a neighbor's land or building, the injured person could demand from the neighbor an undertaking to make good any damages that might ensue. If the neighbor refused to give the *cautio*, the party imperiled was put in possession, and, in case of continued contumacy on the neighbor's part, was made owner of the neighboring premises. A similar *cautio* could be demanded when "new work" had been begun; and if the *cautio* was refused, the work was arrested by injunction (*interdictum*).

CAUTO, kou'tô. The largest river in Cuba. It rises in the Province of Santiago de Cuba, at a point in the Sierra de Cobre about 12 miles north of the city of Santiago de Cuba, and after a northwesterly course of about 20 miles flows west into Buena Esperanza Bay. It is nearly 125 miles long and of considerable depth and is navigable to small boats for about 75 miles.

CAUVERY, kâ'vêr-î. See KAVERY.

CAVA DEI TIRRENI, dâ'ê têr-rên'ê. An episcopal city in the Province of Salerno, south Italy, 6 miles northwest of the city of Salerno. It is a resort for Neapolitans in summer and for foreigners in spring and autumn. A short distance southwest of the town is the famous La Trinità della Cava, a Benedictine abbey founded, in 1025, by St. Alferius over the cavern he had occupied. It is now national property and contains a lyceum and a boarding school. The principal manufactures of Cava dei Tirreni are linen, silk, and woolen fabrics. Pop., 1901, 23,681; 1911, 23,817.

CAVAIGNAC, kâ'vâ'nyâk', ELÉONORE LOUIS GODEFROY (1801-45). A French journalist and politician, son of Jean Baptiste Cavaignac. He opposed Louis Philippe and was one of the founders of the Société des Amis du Peuple, and of the Société des Droits de l'Homme (1832), becoming its president in 1843. He was often arrested and finally imprisoned for his part in the risings of 1830, 1832, and 1834, but escaped in 1835 and went to England. In 1841 he returned to Paris and became one of the editors of *La Réforme*, the ablest of the opposition newspapers. His statue at Montmartre is one of the best works of Rude.

CAVAIGNAC, JACQUES MARIE EUGÈNE GODEFROY (1853-1905). A French politician. He was born in Paris, May 21, 1853, the son of General Cavaignac, the opponent of Louis Napoleon. In 1868, when young Cavaignac had won a prize in the Paris schools, which was to be bestowed by the Prince Imperial, he drew back, saying: "I do not care to be rewarded by a gentleman whose father put mine into prison." The youth fought bravely in the Franco-Prussian War, and in 1872 he became an engineer. Afterward he studied law and followed this profession with success until 1882, when he entered the Chamber of Deputies from the District of Saint-Calais. From that time he had a distinguished political career. He was Undersecretary in the Department of War in 1885, Minister of Marine in 1892 and in 1895-96, and Minister of War in 1898, at a critical period of the Dreyfus affair. On July 7, 1898, he announced in the Chamber his certain belief in the guilt of Captain Dreyfus,

basing his statements on a document which a few weeks later he was compelled to confess had been forged by the notorious Colonel Henry. (See DREYFUS.) Cavaignac was the victim of his own credulity. He was defeated as a candidate for the presidency of the Republic and several years afterward withdrew from political life. Shortly after this incident he died, in September, 1905. He wrote *La formation de la Prusse contemporaine* (1897-98).

CAVAIGNAC, LOUIS EUGÈNE (1802-57). A French general. He was born in Paris, Oct. 15, 1802, and was educated in the Polytechnic School, and the Ecole d'Application in Metz. Entering the army, he rendered efficient service in Algeria, where he went in 1832, and rose rapidly in rank, becoming a brigadier general in 1844, Governor of the Province of Oran in 1847, and Governor-General of Algeria in the following year. He was, however, almost immediately recalled to Paris after the February revolution, and in May was made Minister of War. Called upon to defend the republican government during the June insurrection, he displayed energy, courage, and coolness. His operations were successful, and his clemency was as meritorious as his generalship. Though he might have made himself dictator, he resigned his power into the hands of the National Assembly, which appointed him chief of the executive body. As a candidate for the presidency of the Republic in December, against Louis Napoleon, he received about 1,500,000 votes to the latter's 5,500,000. After the coup d'état of December 2, 1851, Cavaignac was arrested, but was released after a short detention; and though he consistently refused to give his adhesion to the Empire, he was permitted to reside in France without molestation. He died of heart disease, Oct. 28, 1857, at his country house near Tours. Consult Montfort, *Biographie du général Cavaignac* (Paris, 1848), and Deschamps, *Vie de Cavaignac* (Paris, 1870).

CAVAILLÉ-COLL, kâ'vâ'lyâ'kôl', ARISTIDE (1811-99). A French organ builder, born in Montpellier (Hérault). In 1834 he obtained the commission in open competition for the organ in the church of Saint-Denis. He constructed many other important instruments for churches in France and Belgium, and introduced several excellent devices used in modern organ building. His writings include a *Projet d'orgue monumental pour la basilique de Saint-Pierre de Rome* (1875). Consult Lefebvre, *Le grand orgue de l'église Saint-Michel du Havre* (Havre, 1888), an account of a work executed by Cavaillé-Coll in 1887-89.

CAVAILLON, kâ'vâ'yôn' (anciently, *Cabelio*). A town of France in the Department of Vaucluse, situated 20½ miles by rail southeast of Avignon (Map: France, S., K 5). It is situated on the right bank of the river Durance near its junction with the Coulon. Mont Saint-Jacques towers above it. It is the centre of a rich agricultural region, also devoted to silkworm culture, and the manufacture of straw hats and leather. It is interesting chiefly for the remains of a triumphal arch of about the time of Constantine, and other relics of the Roman period found in the neighborhood. It has also a Romanesque cathedral dating from the twelfth and thirteenth centuries. From that time until it became a part of France in 1791, it was ruled successively by the counts of Venaissin and Toulouse. Pop. (commune), 1901, 9850; 1911, 9416.

CAVALCANTI, kâ'vâl-kân'tê, GUIDO (c.1250-1300). An early Florentine poet of the school of "the sweet new style," and the "first friend" of Dante, in whose judgment (*Purg.*, xi, 97) he bore off from Guinicelli the palm for lyric verse. His betrothal as a lad, and subsequent marriage to Beatrice, daughter of the Ghibelline leader, Farinata degli Uberti, seems to have been due to political considerations only, as he was one of the sons of nobility chosen to cement the hostile families by marriage. The love poems, which form the major part of his verse, are inspired by the less familiar charms of a certain Vanna mentioned by Dante, by a Mandetta of Toulouse, a Pinella of Bologna, and others, whom he celebrated in verses that evolve a philosophy of idealistic love. When the Guelph party became divided into the contending factions of Cercheschi and Donateschi, Guido, in common with the other Cavalcanti, espoused the cause of the former, and together with the other leaders suffered exile, Dante, who was then one of the *priori*, being forced to assent to the decree. The malarial climate of Sarzana, to which he was banished, so shattered his health that, though recalled soon after, he died in August of the same year. Of Cavalcanti's poems various editions have appeared: those of Arnone (Florence, 1881), of Ercole (Leghorn, 1885), of Rivalta (Bologna, 1902), and of E. C. (Lanciano, 1910). Translations by Ezra Pound (Boston, 1912), by Fletcher (in *Modern Philology*, 1910). Consult J. B. Fletcher, *The Religion of Beauty in Women* (New York, 1911).

CAVALCASELLE, kâ-vâl'kâ-sêl'lâ, GIOVANNI BATTISTA (1820-97). An Italian art historian and critic. He was born in Legnago and studied painting at the Academy of Venice, but was attracted to the history of art. He studied also in Munich. He joined the revolution of 1848, and after a heroic career escaped to England. There he wrote with J. A. Crowe an important work on *The Early Flemish Painters* (1857; 2d ed., 1872) and a five-volume *History of Painting in Italy* (1864-71). This monumental work laid the foundations of the scientific criticism of Italian art and is still considered an authority. A new edition with annotations by Edward Hutton appeared in 3 vols., 1909, and a revision in 6 vols., begun by Crowe and continued by S. A. Strong and Langdon Douglas (3d vol., 1909), is in course of publication. Other important works by Crowe and Cavalcaselle are *The Life of Titian* (London, 1876), and *The Life of Raphael* (ib., 1883). The criticisms and attributions in their joint works on Italian art are usually credited to Cavalcaselle, who also wrote independently on art subjects. He was subsequently inspector of the National Museum in Florence, and director general of fine arts in Rome.

CAVALIER, kâv'â-lêr' (OF. *cavalier*, Fr. *chevalier*, from It. *cavaliere*, Sp. *caballero*, ML. *cabellarius*, horseman, knight, from Lat. *caballus*, horse, from the Celtic or Welsh *caffyl*, horse, Gael. *capull*, mare). A horse soldier. In English history, a name applied to the adherents of King Charles I as opposed to "Roundheads" (q.v.), or friends of the Parliament.

CAVALIER. In fortification, a defense work constructed on the *terreplein*, or level ground of a bastion, so as to overlook the main parapet and thus increase the volume of fire without interfering with that of the men below and in front. See FORTIFICATION.

CAVALIER, ká'vá'lyá', JEAN (1681–1740). The famous chief of the Camisards (q.v.). He was a native of Lower Languedoc, the son of a peasant, and was first a shepherd and afterward a baker, and was born Nov. 28, 1681. He was driven from home by the pitiless persecution of Protestants that followed upon the revocation of the Edict of Nantes and took refuge in Geneva. When the persecution under Louis XIV drove the Protestants of the Cévennes to revolt, Cavalier returned in 1702 to his own country, where he became one of the leaders of the insurrection which broke out in July of that year. Roland was put in chief command, but Cavalier soon rose to be his equal and, though untrained in arms, he displayed extraordinary skill as well as courage. Although the "Children of God," as the insurgents were called, numbered at the most not more than 3000 men, they coped successfully with the far greater forces of the king and were never entirely conquered. After several conflicts Cavalier changed the seat of war to Vivarais, and on Feb. 10, 1703, defeated the royal troops at Ardèche. A few days later he was himself defeated, but was successful in subsequent encounters, invaded the region of the plains, and even threatened Nîmes. In April, 1704, he was defeated by Marshal Montrevel, but retreated with two-thirds of his forces. When Marshal Villars was sent against the Camisards, Roland remained obdurate, but Cavalier agreed to treat and received a colonel's commission and a pension, while his father and other Protestant prisoners were liberated. As this treaty did not secure general liberty of conscience, Cavalier was denounced as a traitor and was so disheartened by his treatment everywhere that he left France for Switzerland and from there passed to Holland, where he married. He then entered the service of England, became the head of a regiment of French refugees, and served with the English forces in Spain in 1705. After his return to England he was made a major general and Governor of Jersey, and finally Governor of the Isle of Wight. He died at Chelsea in 1740. Cavalier published in 1726 his *Memoirs of the Wars of the Cévennes*. Consult F. Piaux, *Vie de Jean Cavalier* (Paris, 1868).

CAVALIERI, ká'vá-lyá'rè, BONAVENTURA FRANCESCO (1598–1647). An Italian mathematician and astronomer. He was educated at Pisa and was a pupil of Castelli. In 1629 he was made professor at Bologna, where he died. His chief contribution to mathematics is the method of indivisibles, first conceived in 1629 and published in 1635. This method forms a connecting link between the Greek method of exhaustions and the methods of Newton and Leibnitz. The basal idea of the method consists in considering a line as composed of a series of points (or small line segments of equal length), a surface as composed of a series of adjacent lines (or strips of area of equal width), and a solid as composed of a series of planes (or laminae of equal thickness). In general, however, a summation of such elements, if they are finite (no matter how small), only approximates, but does not equal, the length, area, or volume of a given magnitude. E.g., consider a triangle as composed of a series of very narrow rectangles constructed on its base; the sum of such elements will differ the less from the area of the triangle, the smaller the width of the rectangles; but as long as that

width remains a finite quantity, the difference in area will, evidently, likewise remain finite.

Nevertheless, with the aid of limits, the method may be used to determine the ratio of the area of a given figure to that of another figure whose area is known. In fact,

FIG. 1.

it was thus actually employed for measuring areas and volumes for more than half a century before the introduction of the integral calculus.

For example, it was used to prove the proposition that two solids lying between two parallel planes, and such that the two sections made by any plane parallel to the given planes are equal, are themselves equal; as, for example, S and S' in the accompanying Fig. 1. Such solids are called Cavalieri bodies. This forms one of the best bases for proving that the volume of a sphere is $\frac{4}{3} \pi r^3$; for, as may be seen from Fig. 2, the area of the ring CD is easily shown to be $\pi(r^2 - x^2)$, and this is also easily shown to be the area of the circle AB . Hence the sphere and the difference between the cone and cylinder are two Cavalieri bodies, and are therefore equal. Hence

$$v = \pi r^2 \cdot 2r - \pi r^2 \cdot \frac{2}{3}r = \frac{4}{3} \pi r^3.$$

This method solved many difficult problems and enabled Cavalieri to give a satisfactory demonstration of Guldin's theorem, published in the *Exercitationes Geometricæ Sex* (1647). By means of it, also, Torricelli proved that the area of a cycloid (q.v.) is three times the area of the generating circle. Since the method of Cavalieri, combined with the modern theory of limits, offers an easy and correct way of expressing the areas and volumes of several elementary forms, and since it is a natural stepping-stone to the methods of integral calculus, it is desirable material for elementary instruction. Cavalieri's chief works are: *Geometria Indivisibilium Continuum Nova Quadam Ratione Promota* (Bologna, 1635); *Exercitationes Geometricæ Sex* (Bologna, 1647); *Speechio ustorio ovvero trattato delle settioni coniche* (Bologna, 1632); *Trigonometria Plana et Spherica* (Bologna, 1635).

CAVALIERI, ká'vá-lyá'rè, or **CAVALIERE**, -rà, EMILIO DEL (c.1550–1602). An Italian composer. He was born in Rome of excellent family, received a good education, and was called, in 1589, to the court of the Medici in Florence as "Inspector General of Art and Artists." He had a dislike for contrapuntal music and aimed at giving expression to the monodic style by supplying an accompaniment in figured bass (*basso continuo*) and laying particular stress on the melody, which he embellished with grupettos and trills. He wrote numerous madrigals and musical plays, of which *Dispera-*

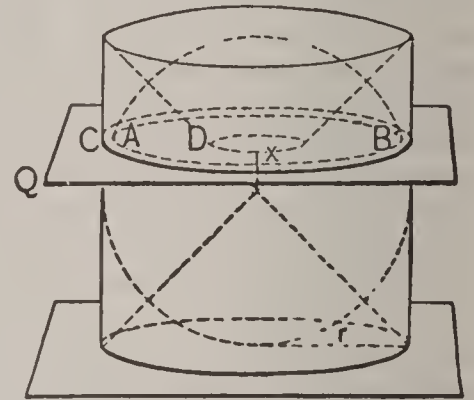

FIG. 2.

zione di Filene, *Il satiro* (both 1590), and *Guioco della cieca* (1595) are among the very first operas. His great work *Rappresentazione di anima e di corpo*, which was performed in Rome in 1600, is also regarded as the first oratorio. He died in Florence. Consult D. Alaleona, *Su Emilio Cavalcanti* (Florence, 1905).

CAVALLARI, kă'vâl-lä'rê, FRANCESCO SAVERIO (1809-96). An Italian archæologist, born in Palermo. He is principally known for his discoveries of Sicilian antiquities. He was director of the School of Fine Arts in the City of Mexico from 1856 until 1863. Then he returned to Sicily and became director of antiquities there. His publications include: *Ritratti Messicani* (1866); *Belle arti e civiltà* (1868); and *Relazione sullo stato delle antichità di Sicilia, sulle scoperte e sui restauri fatti dal 1860 al 1872* (1873).

CAVALLERIA RUSTICANA, kâ-vâl'lâ-rê'â rōō'stê-kâ'nâ (It., Rustic Chivalry). An opera by Mascagni (q.v.), first produced in Rome, May 17, 1890; in the United States, Oct. 1, 1891 (New York).

CAVALLI, kâ-vâl'lê, FRANCESCO (c.1600-76). An Italian composer of music, whose real name was Pietro Francesco Caletti Bruni. He was born in Crema. His father was *maestro di cappella* at the church of Santa Maria, and the boy's talent gained him the patronage of Federico Cavalli, podestà of Crema, whose name he assumed. He studied under Monteverde, and was his greatest pupil and follower. He was made organist in San Marco in 1665, and in 1668 became *maestro di cappella*, holding this post until his death, in Venice, in 1676. A collection of Cavalli's church music was published in Venice in 1656, some vespers for eight voices in 1675, and an 8-part *Requiem*. But it is as a dramatic composer that Cavalli is celebrated. He treated the style developed by Caccini, Peri, and Monteverde with greater freedom in rhythm, and, though his harmony is crude, he gave greater dramatic expression to the whole. By introducing solos and set numbers into the opera, he prepared the way for Alessandro Scarlatti, the real creator of modern opera. His operas (42 in number) contain much music that is admirable even from a modern point of view. His operas include: *Le Nozze di Tetide e di Peleo* (1639); *La Didone* (1641); *Il Giasone* (1649); *Alessandro* (1651); *Il Serse* (1654); *L'Artemisia* (1656). Consult Ambros, *Geschichte der Musik*, vol. iv (Leipzig, 1878). For a sketch of Cavalli's importance in the development of dramatic composition, see OPERA.

CAVALLI, GIOVANNI (1809-79). An Italian soldier and inventor, born in Turin. Sent by the Piedmontese government to Sweden to investigate the manufacture of cannon, he began important experiments and in 1845 invented a breech-loading gun (6.5 in. bore), called by his name and far superior to anything then made. This gun was first used by the Piedmontese artillery at the siege of Gaeta in 1860-61. In 1865 Cavalli became commandant of the Military Academy in Turin. Besides technical papers on ordnance, he wrote on ethics, *Morale per tutti*.

CAVALLINI, kâ'vâl-lê'nê, PIETRO (c.1250-c.1330). A Roman painter and mosaicist. Although the traditional account of Vasari concerning him has been proved erroneous, his works show him to have been one of the greatest Italian masters of the trecento. His art is the

culmination of Roman mediæval painting, and while it is not free from Byzantine influence, it represents a revival of art based directly upon nature. By his influence upon Cimabue and Giotto, who saw his frescoes in Rome and Assisi, he aided in transforming the painting of Florence and incidentally of Italy. Among his frescoes in the upper church of St. Francis in Assisi are "The Adoration of the Shepherds," "Christ's Arrest," "The Building of the Ark," "The Sacrifice of Isaac," and "The Angel Visiting Abraham"; but those of the Passion in the lower church, wrongfully ascribed to him, are of the Sienese school. He painted also a number of important frescoes (now destroyed) at Rome, in old St. Peter's, Santa Maria in Trastevere, in Santa Cecilia in Trastevere (executed about 1293, newly uncovered 1901), and in the apse of San Giorgio in Velabro. Finally, he designed the mosaics of the façade and painted the frescoes in San Paolo fuori le Mura, unfortunately destroyed in the fire of 1823. His important cycle of frescoes in Naples (c.1308) has likewise perished, and so have all his panel pieces; but panels by his pupils survive in the museums of Munich, Perugia, and London.

CAVAL'LY (Sp. *caballa*, horse mackerel, from *caballo*, horse, from Lat. *caballus*, horse). See CREVALLE.

CAVALOTTI, kâ'vâl-lôt'tê, FELICE (1842-98). An Italian dramatist and politician, born in Milan. When only 18 years of age, he published *Germania e Italia*, an attack on Germany, and joined the forces of Garibaldi. Subsequently he turned his pen against the Italian monarchy and was repeatedly sentenced to imprisonment. After his release he wrote his first successful play, *I Pezzenti* (1871). This was followed by *Alcibiade* (1874), which met with extraordinary success. He was elected deputy in 1872 and frequently reelected, and was leader of the extreme Left. He edited the *Secolo*, with Rudini secured the overthrow of Crispi after Adowa, and bitterly opposed the Triple Alliance. He was killed in a duel with a Conservative editor in Rome—one of more than 30 that he fought.

CAVALRY (Fr. *cavalerie*, It. *cavalleria*, from Lat. *caballus*, horse). A name given to soldiers trained to fight mounted, or also on foot.

ANCIENT CAVALRY

The earliest mention of military horsemen is found in the Bible. In Genesis and Isaiah the horses and horsemanship of Palestine and among the Arabs are highly extolled. Diodorus, the historian, mentions an expedition of 20,000 horsemen to put down a rebellion in Bactria. It is probable that the war chariot antedated cavalry as a fighting arm; with scythe blades attached to the end of the axles the chariot became not only a terrible engine, but was also useful to transport foot soldiers quickly to the battlefield. The creation of regular cavalry is ascribed to the Egyptian King Rameses II, about 1330 B.C.

The earliest cavalry arms were the lance, the javelin, and the bow. Of these the first named has alone survived the changes of centuries and is used to-day, side by side with the latest arms of precision and the newest weapons of war. "In a barbarous country" (says Marshal Marmont), "where industry has not yet found its way, where there exist neither manufactories

nor armories, nor money wherewithal to buy arms abroad, a man mounts his horse and wants a weapon. He cuts a long branch of light wood, sharpens the point, hardens it in the fire, and

GREEK CAVALRY ARMS AND ARMOR.

there is his lance. Later he procures a nail and fastens it to the end; his weapon has already become more dangerous. Finally, this staff is furnished with an iron tip regularly shaped, and behold the lance which is now generally adopted." A javelin or dart is a small lance to be thrown, and was often made so as to break or bend upon piercing an enemy's body.

An early writer on horsemanship is Xenophon; he states that the Greeks used cavalry in war as early as 743 B.C. Epaminondas did much to develop this arm as a military force, raising and training a body of 5000 mounted men. The Grecian cavalry under Philip of Macedon and Alexander the Great won great renown. It was divided at first into two classes—heavy and light—to which Alexander added a third, trained to fight either on foot or on horseback. The heavy cavalry consisted of men carefully selected and who supplied their own horses; the remainder were mounted by the state. The heavy horsemen wore cuirasses of mail, and carried a long lance and a short sword; the light horse were without armor, and carried javelins, daggers, and bows; all rode bareback.

CAVALRY ILE.

The tactical unit of this force was the "ile" (ἵλη) of 64 men; the formation of the ile was

16 front and 4 deep, or 8 front and deep. They sometimes charged in line, but generally in oblong, wedge-shaped columns, the head of which was driven against the enemy like the point of a spear to penetrate their line; two of these triangles were sometimes joined in the shape of a lozenge, as above.

This formation was abandoned by Alexander for a more open order and extended front—that which he applied at Arbela, where he defeated Darius, King of Persia. The Greek cavalry numbered 7000, divided into two wings. The Persians, clad in armor, outnumbered their opponents, who were dressed and armed as light cavalry. Alexander, leading his right wing, rapidly extended his lines so as to overlap the enemy's front, who, in trying to meet this unexpected movement, left a gap which Alexander promptly occupied, separating the Persian forces and driving them back in confusion. Having thus disposed of part of the enemy, Alexander concentrated his force upon the remainder of Darius' army, which he routed and pursued a distance of 75 miles in 24 hours. The tactical principles illustrated in this engagement form the basis of the best modern cavalry methods. After the death of Alexander, the Greek cavalry gradually sank into insignificance.

The Romans gave more attention to their infantry than to their cavalry, which, indeed, suffered from want of horses and competent leaders. Their system resembled that of the Greeks in that it comprised the heavy, the light, and a kind called *velites*, trained to fight on foot as well as on horseback. In fact, by reason of their close union with the infantry on the battlefield they were inclined to dismount upon the slightest pretext. "At Cannæ," says Polybius, "when the Spanish and Gallic cavalry, advancing from the left wing of the Carthaginians, encountered the Romans, the conflict that ensued was, indeed, most warm and vehement, such as resembled rather the combat of barbarians than a battle fought by disciplined and experienced troops. For, instead of falling back and again returning to the charge, as the custom was in such engagements, they had scarcely joined, when, leaping from their horses, each man seized his enemy." Roman writers assert that their cavalry were often successful with this method of fighting, although the modern light cavalryman would make short work of such imprudence. In their encounters with the Carthaginian cavalry the Romans sustained crushing defeats. Hannibal appreciated the value of cavalry. His favorite methods of employing the arm were (1) to turn the enemy's wings and attack him in flank and rear, and (2) to place a mounted corps in ambush and suddenly fall upon his rear. The best Roman generals, lacking cavalry, were forced to avoid the plains and take up positions upon the hills, as safer for their operations.

Eventually the Romans, whose proportion of cavalry to infantry had been one-tenth, increased it to one-fourth, with which increase and improved training, at the battle of Zama, they were enabled to drive back the Carthaginian cavalry and thereupon attacked Hannibal's infantry in flank and rear, defeating it with a loss of 20,000 men. The Roman cavalry rode without saddles, but their horses were equipped with leather housings. They were armed like the Greeks, although the sword had a very broad, sharp blade, and was worn on the right side, suspended by a belt from the shoulder; under

Vespasian the sword was removed to the left side, and its place was taken by a dagger. A helmet, a cuirass (of leather or metal), and a

stantine, nor stirrups, which were invented by the Franks. For that reason cases of hernia were quite common among these troops.

ARMS AND ARMOR OF ROMAN CAVALRY.

1 and 2, helmets; 3, cavalry sword; 4, cuirass of general officer; 5, coat of mail of soldier.

small round buckler completed the soldier's equipment.

The Romans fought with face uncovered; some of the opposing allies wore a leathern helmet closed in front, and said to be the prototype of the knight's helmet, with visor down, of mediæval times. The cavalry, when first organized in the regal period, was composed of the better class of citizens, and the *celeræ*, or king's body-guard, consisted exclusively of young noblemen. Towards the end of the Republic the knights began to withdraw from the army, and it was thereafter recruited largely from foreigners. The Roman legion originally consisted of 3000 infantry and 300 cavalry. This mounted body was, by Servius Tullius, increased to 2400. "The cavalry was divided into 10 troops (*turmæ*); the first, as the companion of the first cohort, consisted of 132 men, while each of the other nine comprised 66. The entire establishment formed a regiment of 726 horses, naturally connected with its respective legion, but occasionally separated to act in the line and to compose a part of the wings of an army." (Gibbon.) These companies, or *turmæ*, were formed in various ways—at one time in eight files and four ranks; afterward in three sections of three files or three ranks, each section commanded by its *decurio* (lieutenant), and followed by its *uragus* (file closer); and at a later period into 10 files and three ranks, commanded by the first *decurio*, the two others being posted, one on either flank.

Hannibal's auxiliaries included both Numidian and Gallic horsemen. The first were small men, on small, active horses, which were managed solely with a leather thong. In their manner of fighting the Numidians resembled the Cossacks. "In his formation for battle, Hannibal threw into the centre of his line all the bridled and heavy cavalry, and placed the Numidians on the wing, that they might be ready to surround the Romans." (Polybius.) The Gallic cavalry were perhaps the most efficient of the auxiliaries. Like the Greeks and Romans, they had no saddles, which date only from the time of Con-

MEDIÆVAL CAVALRY

In the so-called "age of chivalry" war became to a great extent a matter of individual combat. Military science languished during a period devoted to knights in armor—tournaments at which fair ladies encouraged champions to "break a lance." Indeed, that weapon became the real badge of nobility; and in France at one time serfs were forbidden to use it. The lance was reserved, under the laws instituted by William the Conqueror, for the use of "freemen." Eventually, in consideration of its practical value, the lords permitted their vassals to use, in time of war, a lance, the head of which was never burnished, and at the close of the war was hung on the wall and allowed to rust, "lest the vassals should grow too proud." To this day, in France, the old gun blackened with smoke or the rusty sword may be seen over the fireplace of the peasant, as in mediæval times rested the smoked lance of his forefathers. Other arms of this period were the long, heavy sword, two-edged, often straight on one side and waved on the other; an axe added to the pike became the forerunner of the halberd—the "morgenstern" (morning star) of the Germans, used by the Swiss at the battle of Morgarten (1315 A.D.), and the "goaden dag" (good day), which the Flemings used with terrible effect at the battle of Courtrai (1302). Other rude weapons, inventions of the blacksmith, were called gisarms or bisarms. The nature of these weapons caused a revival of the heavy plate armor of the ancients, vastly improved in point of flexibility, and worn both by horse and rider. The expense of this outfit was of course enormous. At the siege of Harfleur (1415), Comte Saint-Pol's "chanfrain" (horse-head armor) cost \$30,000, and that of Comte Saint-Foix \$15,000; both were inlaid with gold and jewels. The horses were more vulnerable than their riders, as their legs were exposed to attack. The rider, when dismounted, was assailed with mace, battle-axe, or stones, in the attempt to crack his shell. At the storming of fortresses the knights dismounted and fought on foot, and Père Daniel says "that the splendor and extent of victories was always denoted by the number of knights, squires, and other gentlemen who had been killed or taken." Tactics were unknown among the early knights. In battle they formed in single rank, and each sought out his opponent and rode against him with couched lance, in order to disable or capture him.

While one may smile at the mediæval horseman with his cumbrous armor, still his training in the use of arms, management of his horse, and self-reliance were valuable from the cavalry point of view. While that arm as a force in war had lost prominence, it was by no means dead. At the beginning of the eighth century the Frankish army was largely composed of mounted men. In the tenth century Europe suffered greatly from the incursions of the Hungarian horsemen until Henry I of Germany, reorganizing his cavalry and adopting the methods of the common enemy, finally defeated them. In 1241 the Mongols invaded central Europe and encountered the heavy, armor-clad cavalry of those regions, and the struggle between the two sys-

tems ended in victory for the light horsemen. The Mongols would not stand a charge, but, dispersing, would exhaust their opponents in pursuit, and then, rallying, would turn and, rush-

KNIGHT MOUNTED, 1558.

ing upon the broken masses, speedily decide the contest.

The application of gunpowder to war purposes in Europe early in the fourteenth century (although its origin is variously ascribed to the Chinese and to the Arabs) wrought a revolution in things civil as well as military. War became a science, and in 1445 Charles VII of France first organized a standing army and infused new life into the cavalry arm. The soldiers were assigned to permanent quarters and placed under rigid discipline. The men who formed

GERMAN REITER, 1640.

the retinue of the knight (called "ser-vientes," the original of our "sergeant"), took the name of gens d'armes. The King divided his cavalry into 15 companies of 100 lances each, the term "lance" meaning a "squad"; thus each company numbered 600 mounted men, making an aggregate of 9000. There were also volunteers attached to the gendarmerie on probation. Each homme d'armes had four horses, including his war charger, mounted only when battle was imminent. Thus, it is

said, originated the expression, "mounting one's high horse," or showing a readiness to quarrel.

The towns and provinces, in return for the protection afforded by this force, bore the expense of their support. In 1559 the last vestige of the romance of war (the tournament) was destroyed by the death of King Henry II of

France, who, while engaged in a joust, was unhorsed and accidentally pierced through the visor of his helmet by a lance in the hands of a courtier, Count Gabriel de Montgomerie.

About the beginning of the fifteenth century we find mention for the first time of certain kinds of cavalry whose names are familiar at the present day. In Hungary the "hussars" so called from the Hungarian word *húsz* (signifying "twenty") and *ár* (pay), were organized under a state ordinance requiring every twentieth man to take the field. They were armed with a sword (sometimes two), rode small horses with light saddles, were well disciplined, and very mobile in battle. Mahan well describes the type: "The dashing, bold hussar, that epitome of military impudence and recklessness at the tavern, should present these qualities in a sublimated form on the field. Regardless of fatigue and danger, his imagination should never present to itself an obstacle as insurmountable." The hussar has always been noted for extravagance in dress, but the Polish hussars at the time of the war with Charles XII were unique. "They march," says Voltaire, "attended by several valets, who lead their horses, which are adorned with bridles, plaited with silver and silver nails, embroidered saddles, saddle bows and

"CHANFRAINS"—HORSE-HEAD ARMOR.

stirrups gilt, and sometimes made of massive silver."

Long before this we hear of "carabineers" (from the Arab word *Karab*). They were armed with an arquebuse, a pistol, and a long, straight sword; they were drilled to load at full speed

and to fire from the saddle. Placed on the flanks of squadrons, they prepared the way for the charge by their effective fire. In England they were called "hargobusiers." They occasionally took up infantrymen behind them. This use of horsemen to move infantry rapidly in an emergency originated the term "dragoons." See MOUNTED INFANTRY.

CAVALRY IN MODERN TIMES

The War of Independence of the Netherlands (1568-1609) marked the beginning of a new era in cavalry history. Maurice of Nassau drilled his German mercenaries, more lightly armed and mounted than their Spanish opponents, to form in two or three lines, to move rapidly, and to make direct charges, after first firing their pistols at the enemy. He it was who first organized regiments of 1000 men, raised by selected recruiting officers who became the colonels; their commissioned subordinates were called lieutenant colonels and majors, as in the armies of to-day.

The great improvement begun by Prince Maurice was continued and enlarged by the great soldier Gustavus Adolphus. He made important changes in the discipline, armament, pay, clothing, and training of his cavalry. They were formed in four ranks, of which one was held in reserve during a charge. Unlike their foes, they were frequently paid, and to a certain extent restrained from such excesses as were common in those times. Captain Dalgetty's view, "A cavalier of honor is free to take any part which

(1631) and Lützen (1632). They became models for all European states, and Louis XIII of France still further reduced cavalry formation to three ranks. The armament and equipment

ORNAMENTED CAVALRY STIRRUPS.

were also lightened, but movements were not so rapid in action.

In the reign of Louis XIV there appeared a galaxy of stars military in the persons of Turenne, Luxembourg, and Condé on one side, and

EARLY CAVALRY PISTOL, "THE DRAGON."

Marlborough, Montecuculi, and Eugène on the other, and a decided advance was made in the movements of armies, but no important changes in cavalry methods. Again, the Swedes came to the front under the rule of Charles XII, and radical alterations were instituted. He made the cavalry independent of the infantry and taught it to rely upon the sword and bold and impetuous charges for success. "His daring and chivalrous character was suited to the spirit of cavalry tactics; he led his horsemen, sword in hand, against cavalry, against infantry, against fortified positions, over any country. . . . Untiring in pursuit, he followed up the Saxons under Marshal Schulenburg in their retreat into Silesia for nine consecutive days without unsaddling, overtook them at Sänitz, near Punitz, and, with two regiments of cavalry only, charged them, 10,000 strong, rode over their infantry, who lay down to avoid the impetuous rush of the Swedes, defeated and drove the Saxon cavalry off the field, and then returned to attack the infantry and guns." (Nolan.)

After Poltava (1709), war ensued between Russia and Turkey, in which the cavalry of the latter power, which had long been the best in Europe, bore a conspicuous part. Their horses, admirably trained, their sharp scimitars, and skill in harassing the enemy made them a terror to the less mobile Russians, whose infantry were compelled to carry with them portable chevaux de frise and add pikes to their armament in order to hold their own against the Turks. In the Polish army, about 1717, there were the Tatar hussars who bore a cuirass covered with a panther's skin slung over the back, the head being fastened on the left shoulder. The back-

SADDLES OF MEDIEVAL CAVALRY.

he may find most convenient for his own peculiar," was the popular one. The Austrian cavalry was heavier than the Swedish, with a more massive formation (8 to 10 ranks), and thus his mounted troops contributed greatly to Gustavus' successes at the battles of Leipzig

piece of the cuirass was adorned with feather wings. They carried a gilt lance 14 feet long with a small flag near the point which, fluttering in the attack together with the rustling of the wings, was intended to frighten the enemy's horses. The French in the meanwhile, under Louis XV, restored the lance, but otherwise lightened the equipment of their mounted troops. The brilliant Marshal Saxe recognized and applied the experience of the Austrians and Russians to the development of the French cavalry. As to the importance of mobility, he held that "the secret of victory resides in the legs of the soldiers," and as to horsemen, "such as cannot go at speed over a couple of thousand yards to pounce upon the foe is good for nothing in the field."

Frederick the Great ushered in a brilliant cavalry epoch. At the commencement of his reign his army of 80,000 contained 60 squadrons of heavy and 51 of light cavalry—about 13,000 men. They were "heavy" in every sense—their quietest gait the trot, their most serious performance a pipe-clay parade. At the battle of Mollwitz they received a lesson from the Austrians, who charged them in the Turkish manner and drove them, including their royal master, in confusion from the field. Frederick profited by this example to reorganize his cavalry after the methods of Saxe, laying down a rule that "all evolutions are to be made at the greatest speed . . . the cuirassiers to be as handy and expert on horseback as a hussar, and well exercised in the use of the sword. Every squadron as it advances to the charge must attack the enemy sword in hand, and no commander shall be allowed to fire under penalty of infamous cashiering. . . . Every officer of cavalry must ever bear in mind that there are but two things required to beat the enemy: first, to charge him with the greatest possible speed and force; and second, to outflank him." With these admonitions, and led by the invincible Seydlitz and Ziethen, the Prussian cavalry performed wonderful feats in the historic battles of Strigau, Rossbach, Leuthen, and Zorndorf. The Prussian leaders combined great boldness with skill in manœuvring in the presence of the enemy, of which Rossbach (1757) was an instance. The French and Imperialists, confident in their numbers, approached carelessly, exposing their flank to the Prussian advance under Seydlitz, who instantly, without waiting for his infantry, charged with his 4000 mounted men and completely routed the allies, who lost 3000 killed and wounded, 5000 prisoners, and 70 guns. (Wagner.) At Zorndorf (1758) the success was still greater. There Seydlitz with 26 squadrons not only turned the fortunes of the day, but checked the victorious Russian cavalry, drove it from the field, returned, fell upon the Russian infantry, which stoutly resisted, and when broken by the Prussian horsemen rallied, again and again, but finally gave way with immense loss. Ziethen was equally distinguished, and by his vigilance at Hochkirch (1758) saved Frederick and his army from a surprise. It is said that of 22 general engagements Frederick's cavalry won 15. "In reviewing the deeds of the Prussian cavalry of those days it must be borne in mind that they dealt with infantry which sought the open plain, advanced in long lines—avoiding obstacles of all descriptions, because such obstacles disturbed their array. Their fire was quick, but not true in its aim, and their

squares seldom held out long against the horsemen." (Nolan.)

Napoleon endeavored to introduce Frederick's methods into the French cavalry. In 1806, at Jena and Auerstädt, he first pitted his cavalry against the Prussians with brilliant results. The boldness which characterized the Prussian system was reproduced, but the speed in the charge, skill in manœuvres, and good judgment on the battlefield were often lacking. The French, with 80,000 cavalry, were badly mounted, not good horsemen, heavily equipped, and, while employed in masses, seldom provided reserves. A notable instance of the last-named defect occurred in 1813 near Leipzig. Murat, at the head of 5000 horse, charged the centre of the allied army, rode down the Russian cavalry of the guard, took 30 guns, and pierced the enemy's centre; but 400 Cossacks, skillfully handled, attacked the French cavalry, gaining their flank by a narrow bypath, retook the guns, and caused Murat to retire in disorder. A similar error at La Rothaire resulted in the loss of 28 guns to Napoleon. There were some brilliant exceptions to these failures, the most important being Kellermann's decisive charge at Marengo (1800), when the Austrians, having practically defeated the French army, were advancing with more zeal than care; suddenly a French battery, hitherto concealed by an accident of ground, fired a parting shot at the head of the Austrian column which caused great confusion. General Kellermann, at the head of 200 sabres, seized the opportunity to fall upon the enemy's exposed flank, rode over the leading battalions, and produced a panic in the entire allied force, which fled from the field, leaving behind them their commander and 2000 prisoners. But if less fortunate in operations en masse, Napoleon surpassed Frederick in the use of cavalry on outpost and scouting duty. His troopers were ubiquitous as the "eyes and ears" of his army. While Napoleon's cavalry was taught to place its principal dependence upon the sabre, he authorized, on occasions, the use of firearms. At Eylau (1807) the colonel of the Twentieth Chasseurs à Cheval observed a large force of cavalry advancing towards his position, moving slowly through the snow and heavy ground. Ordering his officers into the ranks and his men to "advance carbine," the colonel waited until the enemy's leading files were within six paces, when the command to fire was given with great effect. Although in the *mêlée* which ensued the French regiment lost 100 men, the Russians left nearly 300 on the spot from which they were forced to retire. (Wagner.) At Somo Sierra, in the Peninsular campaign (1808), the Third Polish Light Cavalry charged directly in front of an intrenched battery strongly supported by infantry guarding a mountain defile, drove back the Spaniards, and captured 16 guns. This desperate but successful feat was accomplished by General Montbrun, who led the regiment in person.

In Spain, at that time, there were many gallant actions. Under Wellington the cavalry of the German legion attached to the British army was conspicuous, making, on one occasion, according to the French general Foy, "the most daring charge during the Peninsular War." At Garcia Hernandez (1812), when the French army was retreating, three squadrons of Bock's German brigade, which had been ordered to charge the cavalry of the enemy's rear guard,

unexpectedly encountered three battalions of infantry formed in squares. Without hesitation Bock's cavalry charged these squares, successfully penetrating them at places where wounded horses or falling men had caused a gap in the side of the square. The vigor and skill with which this small force (about 110 sabres) was handled resulted in the dispersion of the French infantry with a loss of 1 general officer and 1000 men; the German casualties were 4 officers, 48 men, 67 horses killed, and 2 officers, 56 men, 46 horses wounded, with 6 men missing.

Napoleon's disastrous Russian campaign demoralized his cavalry. The intense cold, deep snows, want of food for horses and men, and ceaseless encounters with the Cossacks reduced the French horsemen in numbers and spirit. General Morand says of the Cossacks: "These natural horsemen are not organized in divisions, pay no attention to regular alignments, rest their feet in great stirrups which serve as supports when using their weapons; trained to pass at once from the halt to the gallop and from the gallop to the halt, their horses second their dexterity. These ungroomed animals of irregular size, supplied by their riders, possess wonderful endurance, are guided entirely by the snaffle, and easily accomplish 100 verst (66 miles) in 24 hours." Their method of attack, in Napoleon's time called "the lava," consisted of a charge in small, irregular groups—in open or close order as circumstances seemed to require—these "groups" hovering around the enemy until launched at a vulnerable point. Since then the close association with the regular system of the Russian army has caused the lava to degenerate into a simple "charge as foragers." In some respects the Cossack methods are not unlike those of the North American Indian of the plains.

The Crimean War was remarkable for the cavalry errors committed. Neither the Russians nor the allies employed the arm effectively either for reconnaissance, outpost, or in large bodies on the battlefield. The most unfortunate instance of this nature, the charge of the Light Brigade at Balaklava (1854)—where gallant men were sacrificed through the folly of their commander and the ambiguity of an order gained undying fame by a poet's pen. On the same field the heavy cavalymen of both armies met—the one body at a slow pace, the other at a halt—with negative results. From the experience of the Crimea and that of the Italian campaign of 1859 doubts arose as to the value of cavalry in future operations, Austria making a decided reduction in that arm. "The awakening from this transient period of theory came from a nation not trained to arms, and it is to the American Civil War that we owe the revival that took place in the use of the cavalry arm." (Liddell.)

The experience gained in the Civil War in the United States (1861-65) laid the foundation for renewed confidence in the value of mounted troops and led to many changes in the armament, equipment, and instruction of European cavalry. At the outset the aged General Scott and the new commander of the United States forces (McClellan) did not expect that a large mounted force would be needed. In the North and West people were not accustomed to the saddle; in the South the majority were good horsemen. So it happened that the Confederates, at the beginning of the war, displayed greater mobility in

their operations, screened them effectually, and were better informed as to the enemy's movements than were the Union troops. The lesson of the first year taught the United States government the importance of a due proportion of cavalry in the composition of its armies, and by the spring of 1863 the Union cavalry were able to cope with the Southern horse. The mounted service of the United States in 1861 consisted of two regiments of dragoons, one of mounted rifles, and two of cavalry, variously armed, but later in that year another regiment was created and all were armed alike, with carbine, pistol, and sabre, were taught to fight as "dragoons," and were denominated "cavalry." On this basis was organized a great body of volunteer horsemen, eventually aggregating 300,000. The Confederates created their mounted force principally from the many mounted militia regiments and the thousands of good horsemen with which their section of the country abounded; these were officered in many cases by ex-officers of the United States army and by young planters. For want of carbines and sabres many Southern organizations were armed with rifles, but as a rule with sabre and pistol. It has been said that these troops were not "cavalry" in the European sense. On the other hand, it has been urged that they were cavalry of the most efficient and versatile description.

In 1862 the Confederate cavalry leader Stuart, with a small brigade and a battery, made a reconnaissance (or so-called "raid") from Richmond, Va., passing entirely around the Army of the Potomac, in position near that city, obtaining valuable information as to McClellan's position, destroying supplies, driving in outposts, swimming swollen streams, and returning home by a swift *détour* with the loss of one officer killed. In 1863 the Union general Pleasanton made a reconnaissance in force with 7981 cavalry, 3000 infantry, and 24 horse-artillery guns to discover, if practicable, General Lee's intentions. The movement was carried out with so much secrecy that upon crossing the Rappahannock River early in the morning of June 9, the enemy's cavalry—8500 strong, with 20 guns—was surprised, but, recovering, engaged Pleasanton's command near Brandy Station, and a great cavalry battle ensued which lasted ten hours and ended with the ultimate withdrawal of the Union troops unmolested, at nightfall, having accomplished their purpose. The action was spirited, and a number of mounted charges were made in which the sabre was freely used, although there was some dismounted work with the carbine. The infantry did not take an active part, but remained in reserve, covering Beverly Ford in the rear of the Union force. Pleasanton's casualties aggregated 932; those of Stuart about 500; the loss in commissioned officers was heavy. The occasion marked a new departure in the history of the war; in the language of Colonel McClellan, chief of staff to General Stuart, "It *made* the Federal cavalry. Up to this time confessedly inferior to the Southern horsemen, they gained, on this day, that confidence in themselves and their commanders which enabled them to contest so fiercely the subsequent battlefields."

At Gettysburg (1863) General Buford, in advance of the Union army with two small brigades of cavalry, 2500 strong (dismounted), and a battery of 6 rifled guns, defended the approaches to that field, delaying the advance of a corps of

Confederate infantry, who believed that they were opposed to an infantry force. Buford's skill and boldness enabled Reynolds's corps to reach the field in time to secure the advantage of position for the Union army. The Comte de Paris, writing of this affair, says: "This first inspiration of a cavalry officer and a true soldier decided, in every respect, the fate of the campaign. It was Buford who selected the battlefield where two armies were about to measure their strength." On the third day of the battle an encounter took place between the cavalry of Stuart (6000 sabres) and Gregg (5000), in which the former was thwarted in an effort to gain the rear of the Union line, simultaneously with Pickett's famous charge upon its front. Each cavalry division was accompanied by 3 batteries (about 12 guns) and engaged in a series of mounted charges and individual combats with mediæval ferocity, resulting in the withdrawal of the Southern horse and casualties of 10 per cent of the forces engaged. The nature of the fight was shown when a fatigue party detailed to bury the dead "found two men, who had cut each other down with their sabres and were lying with their feet together, their heads in opposite directions, and the blood-stained sabre of each still tightly held in his grip." At another point lay "two men, one a Virginian, the other a Pennsylvanian, who fought on horseback with their sabres until they finally clinched and their horses ran from under them. Their heads and shoulders were severely cut and their fingers so firmly embedded in each other's flesh that they could not be removed without force." (Miller.) Another typical instance of the value of cavalry trained after "the American fashion" follows. At Cold Harbor, Va. (1864), during the Wilderness campaign, Merritt's brigade of 800 (regulars and volunteers) Union cavalry were dismounted at the edge of a wood, with orders to hold the position at all hazards. The horses were hidden in a ravine in the rear. One-half of this force was armed with Springfield breech-loading carbines, the other half with Spencer magazine carbines; all had pistols and sabres. Behind a barricade of fence rails, carbine in hand and ammunition by his side, each cavalryman awaited the enemy. Soon after, the head of an infantry force (McLaw's Confederate division) was discovered moving through the woods in column of companies, armed with Austrian muskets and sword bayonets. They advanced unsuspectingly until within 100 yards, when a volley from the cavalry met them. The incessant fire from the magazine carbines made a terrific noise, set the woods on fire, killed and wounded many of the enemy, threw them into confusion, and, believing themselves in the presence of a superior infantry force, they fell back out of range. This delay enabled Grant to occupy the ground upon which was fought the great battle of the following day. The Civil War contains numerous examples of brilliant cavalry operations which have served to place the names of Sheridan, Buford, and Stuart by the side of Seydlitz and Ziethen on the cavalry roll of fame.

In 1866 the "Seven Weeks' War" between Germany and Austria was too brief to furnish any new cavalry lesson. One or two brilliant actions occurred; at Benatek, where a squadron of Prussian hussars surprised a Hungarian battalion as it emerged from a wood and captured a flag, 16 officers and 665 men, and at Tobit-

schau, where three Prussian squadrons attacked batteries in position and captured 16 guns. The greater war between France and Prussia (1870-71) was distinguished for the excellence of the German mounted scouts and the failure of the French cavalry. Three famous charges equally desperate (one French, two German) against the enemy's infantry marked this war. That of the French failed, but the Germans were successful, although the French formations remained intact. The cavalry casualties were very heavy. The German cavalry was inferior to the French in fire action, and the Uhlans were powerless in presence of the "Franc-tireurs" (Home Guards). At Vitray a whole Prussian cavalry brigade was detained for 12 hours by 12 chasseurs d'Afrique armed with carbines, who by dexterous dismounted tactics successfully posed as infantry. In 1877-78 the war between Russia and Turkey was comparatively barren in cavalry results, if we except the famous Balkan expedition under Gurko. The Spanish-American War (1898) was uneventful from the mounted point of view. The South African War and the operations in the Philippines have shown how important and indispensable a well-mounted and trained cavalry is. The theoretical views as to the disappearance of cavalry in face of modern firearms have vanished. The influence of the South African War of 1899-1902 on the future organization, equipment, and employment of cavalry will be found treated under MOUNTED INFANTRY.

The work of the cavalry in the Russo-Japanese War (1904-1905) was, in general, disappointing on both sides. The Russians had about 30,000 men, the difficulty of transporting horses limiting their numbers; the Japanese had about 6000 men, probably because their horses are not suited to the work and their men but little accustomed to riding. The Russian cavalry was poorly handled, and no real cavalry leader was developed among their commanders. The Japanese cavalry was so weak in numbers that it had to keep within supporting distance of its infantry and artillery, but rendered important service in securing information.

The cavalry regiments of the European armies, with the exception of the Austrian, by 1914 for the most part were equipped with the lance; this was more largely due to the example of the German army than to actual demonstration of superiority in recent wars. The modern tendency, however, is to attach increased importance to dismounted fire action, consequently the rifle and the bayonet have been adopted by the cavalry of the principal Powers; only France and Italy retain the carbine. The campaigns of Sheridan and Stuart are studied at the cavalry schools of Europe, and the lessons derived therefrom were being applied to an unusual extent at recent manœuvres.

In the wars in North Africa and the Balkans (1912-13) the cavalry rendered important service, but there were no noteworthy examples of shock action. To-day all armies are working with great energy on the improvement of the organization and tactical instruction of their cavalry, showing that the importance attached to this arm has not been diminished. In the United States army the cavalry, which for over 50 years has had a single-rank formation and an organization differing materially from European types, in 1913 was experimenting with the French drill and with a regimental organization resembling the Austrian, in which the regiment

consists of six squadrons. This would be a return to the organization of the American cavalry in force more than 70 years ago, except that both the squadrons and the regiment are considerably larger, whereas in nearly all of the European armies the number of squadrons in a regiment has been reduced to four. The British cavalry regiment in 1913 consisted of three squadrons.

The voices which, after the first favorable experiments with dirigible balloons and aëroplanes, declared that cavalry could be dispensed with in reconnaissance, are silent, and it is now recognized that these technical developments serve to increase the opportunities and enhance the value of cavalry as the fighting force of greatest mobility.

THE CAVALRY OF TO-DAY

The condition of this arm of service in the principal nations of the world (1913-14) may be summarized as follows:

AUSTRIA has 42 regiments of regulars (15 dragoons, 16 hussars, 11 Uhlans); total, 46,910 (all are light cavalry). Also, 6 regiments of Imperial Landwehr, 4350, and 10 regiments of Hungarian Landwehr, 5736. Arms: sabre and repeating Mannlicher carbine. Each man carries water bottle and 2 ammunition pouches. Total weight carried by horse, 297 pounds. There are three remount depots; peace effective, 78,000 horses and mules; Imperial resources, 3,500,000 animals. On mobilization, 250,000 horses would be required.

BELGIUM, 8 regiments; total, 7608.

BRAZIL, 12 regiments of 4 squadrons each, and 5 regiments of 2 squadrons each; total, 3732.

BULGARIA, 11 regiments.

CHILE, 8 regiments.

DENMARK, 4 regiments of 3 squadrons each, and 5 reserve squadrons. Peace strength varies greatly according to season. War strength is not known.

EGYPT, 10 squadrons—1100. Arms: lance (front rank), sabre, and Martini carbine.

ENGLAND, 31 regiments regular (5 heavy, 13 medium, 13 light)—20,472. Regiment consists of 3 squadrons of 4 troops each. Household regiments are of 24 officers, 430 men, 275 horses. Line regiments (home), 26 officers, 696 men, 465 horses and mules; (India), 29 officers, 624 men, 592 horses. Arms: Lee-Metford carbine, sword; also lance in lancers and front rank of dragoons. Total weight carried by horse, 252 to 276 pounds. The Yeomanry (volunteer horse), 10,000, largely recruited from young farmers. In Great Britain and Ireland about 3,000,000 horses, of which 70,000 are fit for military purposes; about one-fifth of these are registered. The Anglo-Indian cavalry consists of 40 regiments (native)—24,937—besides the 9 regiments (British) already mentioned. Each regiment consists of 4 squadrons, 10 British officers, and 625 natives (all ranks). India supplies its own horses.

FRANCE has 91 regiments (12 cuirassiers, 32 dragoons, 23 chasseurs, 14 hussars, 4 chasseurs d'Afrique, 6 Spahis)—71,200 (all ranks). Four squadrons and 1 depot squadron, 37 officers and 792 men to each regiment. Arms: sabre and magazine carbine; also lance, except for cuirassiers. Sabre and dynamite cartridge on saddle, carbine over shoulder. Cuirassiers wear cuirass weighing 13 to 16 pounds. Horses required on mobilization (all arms), 480,000. There are 8

remount companies, total strength 2392, and 20 remount depots.

GERMANY has 103 regiments of cavalry, as follows: Prussia—10 cuirassiers, 26 dragoons, 19 hussars, 21 Uhlans, 1 heavy cavalry, and 6 Jäger zu Pferde; Saxony—1 heavy cavalry, 2 hussars, 2 Uhlans; Württemberg—2 dragoons, 2 Uhlans; Bavaria—2 heavy cavalry, 2 Uhlans, 8 chevaux-légers. Total strength, 2585 officers, 70,370 men. Regimental organization: 4 squadrons and 1 depot squadron. Peace strength of squadron: 5 officers, 142 men. Arms: lance, sword, and carbine; noncommissioned officers carry a pistol. The carbine, which is practically a rifle, is carried in bucket on off side of saddle. Horses available (peace), 70,000. Seven new regiments have been added (1913), bringing the total up to 110 regiments. Armament with rifle and bayonet appears to be experimental.

GREECE has 3 regiments (12 squadrons), about 1400 men. Arms: Gra's carbine and sword.

ITALY has 29 regiments, each of 5 squadrons. Arms: carbine, bayonet, long sword; the first 10 regiments carry a 9-foot 9-inch lance. There are about 750,000 horses and 300,000 mules in Italy. The cavalry in peace requires 23,000.

JAPAN has 89 squadrons of cavalry, formed into 19 regiments of 3 squadrons and 8 regiments of 4 squadrons each. The strength of the squadron is 5 officers and 136 men. In time of war each regiment is to be augmented by 2 reserve squadrons. Total peace strength is kept secret, probably about 15,000.

MEXICO, 14 regiments and 4 skeleton regiments—634 officers, 7166 men. (Returns before the disturbances of 1913.)

THE NETHERLANDS, 4 regiments of 4 squadrons each.

NORWAY, 16 squadrons formed into 3 regiments.

PORTUGAL, 8 regiments—270 officers, 4920 men (peace).

RUMANIA, 20 regiments of 4 squadrons each; 21 depot squadrons, and 3 squadrons in the escort regiment.

RUSSIA'S cavalry consists of 66 regiments (4 guard cuirassiers, 4 guard light cavalry, 58 line dragoons) and 2 regiments of 6 sotnias in the Crimea and Daghestan, and 4 independent sotnias; the cuirassier regiments are 4 squadrons; the others, 6 squadrons. Each regiment (peace), 816-1143; (war), 708-1015; to each will be attached 1 officer, 16 men trained for scouting and courier duty; also another detachment 2 officers, 16 men for pioneers and signal duty. Arms: curved sword, rifle, and bayonet; the rifle slung over shoulder—is similar to infantry rifle. Each man carries 40 rounds. Saddle packed with two "wallets," forage sack, cloak, intrenching tool, picket pin, spare horse-shoes, canvas water bucket, etc.; total weight carried by horse (exclusive of rider), 119 pounds. The Cossacks number (peace) 54 regiments or 323 squadrons; or (war) 152 regiments and 42 independent squadrons—935 squadrons in all, by adding the 2d and 3d levies of the Cossack reserve; strength of regiments varies from 660 to 1100 (all ranks). Arms: sword without guard, rifle, and (front rank) lance—except Kuban Cossacks. Each man carries 2 bandoleer pouches, containing 40 rounds; only snaffle bridle and light saddletree resting on felt pads. Weight carried (exclusive of rider), 97 pounds. The aggregate (peace) strength of the Russian cavalry is 5600 officers, 125,000 men.

The number of horses available is 23,000,000; required in war by all mounted troops estimated at 450,000. On mobilization, 80 squadrons of Imperial militia cavalry may be called out.

SERVIA, 4 regiments, 1674 men and horses. Arms: Mauser carbine and sword. War strength, about 9000.

SPAIN has 29 regiments of 4 squadrons and 1 depot squadron each, and some special squadrons, making 154 squadrons. Effective total: 1671 officers, 14,402 men. Arms: 7 millimeters carbine and sword; 8 regiments carry lances.

SWEDEN has 8 regiments (3 bodyguard, 5 line)—250 officers, 3366 men.

SWITZERLAND has no standing army, but provides a permanent corps of instructors, 15 being authorized for cavalry militia instruction. In war the cavalry force first mobilized is estimated at 5107, armed with Mannlicher carbine and sword.

TURKEY has (war) 203 squadrons—32,300 (all ranks). Arms: carbine and sword. The "Hamidieh" (military cavalry) is organized under tribal leaders and officered by officers of the regular army.

THE UNITED STATES regular cavalry consists of 15 regiments of 3 squadrons of 4 troops; each troop (war), 100 noncommissioned officers and privates; aggregate strength of regiment (peace footing), 866 (all ranks). Arms: rifle (Springfield, 1903), sabre, and revolver. Saddle (McClellan) packed with blanket, greatcoat rolled, side lines, picket pin, canteen, meat can, knife, fork, and spoon, forage sack, spare shoes, etc.

CAVALRY AND LIGHT ARTILLERY SCHOOL, UNITED STATES. Until 1907, the popular name of a service school of application for the cavalry and field artillery arms of the United States army; located at Fort Riley, Kansas.

In 1907 the name was changed to "Mounted Service School." Its object and courses of instruction were radically changed at that time. See **MOUNTED SERVICE SCHOOL**; **SERVICE SCHOOLS**; **MILITARY EDUCATION**.

CAVALRY SCREEN. One of the important duties of cavalry is to obscure and cover the designs or direction of the army for which they are acting as a screen. Reconnaissance to find the enemy is usually made by cavalry, ranging in strength according to the situation, but in large commands appearing, generally, as *independent* brigades or divisions. On such duty cavalry not only gathers information, but also *screens* the main command by keeping the enemy at a distance. These bodies of *independent* cavalry usually push forward one or two marches ahead of the main command. A brigade of three regiments will normally form a screen of 10 miles front. The success of the German troops during the War of 1870 was greatly facilitated by the conspicuous efficiency of the Uhlan cavalry in this particular branch of cavalry service. See **ADVANCE GUARD**; **TACTICS, MILITARY**.

CAVAN. An inland county in the south of Ulster, Ireland (Map: Ireland, D 3). It lies in the narrowest part of Ireland, 20 miles from the Atlantic and 18 miles from the Irish Sea. Area, 746 square miles. About three-fourths is arable, and considerable quantities of grain are produced. Of minerals, Cavan affords coal, iron, lead, and copper, and there are many mineral springs. Agriculture forms the chief industry, but linen is manufactured to some extent. The capital is the little town of Cavan. The population, which numbered 243,260 in 1841, has decreased steadily—to 97,541 in 1901, and 91,173 in 1911.

CAVANILLES, kä'vá-nē'lyās, ANTONIO (1805-64). A Spanish historian and jurist. He was born at Corunna and was educated at Alcalá. His greatest work is the *Historia de España* (1861-63), a history of Spain to the reign of Philip II. It combines conciseness and clearness with eloquence of diction and is ranked among the best works of its kind. Its author became in 1841 a member of the Royal Academy of History, and in 1857 was elected to membership in the Royal Academy of Moral and Political Sciences.

CAVATINA, kä'vá-tē'ná (It., short air, arietta). Originally a vocal, generally an operatic, air, usually sentimental in character and differing from the aria in consisting of one division only and in maintaining the same tempo throughout. *Salut demeure* in Gounod's *Faust* is a familiar example of a cavatina. The term is also applied to short instrumental pieces of that character. Generally they are written for a solo instrument with piano. Perhaps the best-known piece of this kind is Raff's cavatina for violin.

CAVAZZOLA, kä'vá-tsō'lá, IL, properly, PAOLO MORANDO (1486-1522). A Veronese painter of the Renaissance. He was born in Verona, where he studied under Bonsignori and Francesco Morone, and where practically all of his life was spent. He was the most typical representative of the Veronese school, excelling all of its masters in sureness of line, beauty of form, in movement and power of expression. Uninfluenced by Venetian color, he painted in the gray harmonies of his home, with fine tonal and atmospheric effect. In the composition of

his later works the influence of Raphael appears. His masterpiece is a series of five scenes from the Passion, now in the Verona Gallery, one of which, "The Descent from the Cross," is probably the most beautiful painting of the Veronese school of that period. Other fine works are "St. Rocco" (National Gallery), "Madonna with the Baptist" (ib.), "The Doubting Thomas" (Verona), "Christ Crowned with Thorns" (ib.), and a large altarpiece of the "Madonna in Glory" (ib.), his last picture. Cavazzola's portraits are expressive and strongly modeled; excellent examples are those of Emilio degli Emili (Dresden Gallery), Emilia Trivulzio (Milan), and the "Warrior and his Page" (Uffizi), formerly ascribed to Giorgione. Consult Aleari, Paolo Morando (Verona, 1853).

CAVE, or **CAVERN** (OF. *cave*, *caive*, from Lat. *cavea*, cave, from Lat. *cavus*, hollow, Gk. *κῆρα*, *kyar*, hole, from *κῆειν*, *kyein*, to swell, to contain). A hollow place in the earth's crust. Aside from the subterranean excavations made by man, caves are produced by the fracture and dislocation of strata during periods of upheaval, by the action of water, or by both causes combined. The eroding and dissolving power of water has formed caverns along river courses and on seacoasts. The moving waters enter natural crevices and enlarge them by the abrasive action of the suspended sand and gravel, or they attack the softer portions of the strata and form cavities that are inclosed by the more indurated rock. Wave action is a prominent agency in this process. Caves most frequently occur in limestone regions, where they are usually the result of the solvent action of water and the contained chemical agents, such as carbon dioxide and humic acid. The surface waters in percolating downward through the joint fissures and along the planes of stratification enlarge the channels by solution. Rivers sometimes plunge into the caves through openings known as *sink holes*. In some limestone regions, as portions of Kentucky and Florida, these holes are a marked surface feature. Many caves are of enormous size. The cave of Gailenreuth in Franconia, Germany, that of Kirkdale in Yorkshire, the Mammoth Cave of Kentucky, and Luray Cavern of Virginia, as well as many others, are celebrated for their magnitude or scientific features. Rock formations containing beds of salt, a material easily removed by water, may also abound in caverns. They are also frequently met with in igneous rocks—the picturesque cave of Fingal, in Staffa, is formed in basalt; and in South America and Iceland the recent lava contains large caverns.

Many caverns have a calcareous incrustation lining their interior, giving them a gorgeous appearance. Sometimes this deposit is pure white, and has, when the cave is lighted up, a richness and transparency that cannot be imagined. It is, however, more generally colored by the impurities which the water has taken up from the superincumbent strata. To the incrustations which are suspended from the roof, like icicles, the name *stalactite* is given, while those rising from the floor are designated *stalagmites*. Sometimes the pendent stalactites are produced so as to meet the ascending stalagmites and form pillars, as if to support the roof, as in the "organ" in the Blue John Mine, Derbyshire, and the columns of the Mammoth Cave. The source and origin of this deposit has been satisfactorily explained by Liebig as follows: "The

mold of the superficial soil, being acted upon by moisture and air, evolves carbonic acid, which is dissolved by rain. The rain water thus impregnated, permeating the calcareous strata, has the power of taking up a portion of the lime, which it retains in a liquid condition, until from evaporation the excess of carbonic acid is parted with, when the lime again returns to its solid state, and forms the incrustation."

Caves serve as places of shelter for animals, some of which have taken therein permanent abodes and have acquired in their changed surroundings certain characters that differentiate them from related types living in the open. (See CAVE ANIMALS.) Man also has made use of caves for shelter or permanent habitation, very frequently, it would appear, in the early period of human development included within the Paleolithic and Neolithic ages. The records of his occupancy, as well as the presence of animals, during past ages are found in the remains that have been preserved by burial in the cave earth which results from disintegration of the wall rocks or that have been incrustated with a deposit of stalagmitic limestone and thus protected from decay. Bones of animals are frequently uncovered, some of them representing types that lived in late Tertiary and Pleistocene times. Human bones are less common, but other evidences of man's occupancy are supplied by domestic utensils, charred wood, and implements of various sorts. The so-called bone caves of western Europe have yielded a wealth of material relating to prehistoric man and his contemporaries. The more noted examples of the kind are in England, France, Belgium, and western Germany; their exploration has been carried on very actively within the last century with results of great importance to archæology, anthropology, and the geological sciences.

In the successive layers of deposits in these European caves have been dug up relics relating to the Roman, Iron, Bronze, Neolithic, and Paleolithic cultures, of which the last dates back into the Pleistocene, if not so far back as the first ice invasion, at least to late Glacial time. The occurrence of bones of the reindeer, musk ox, and Arctic fox indicates a cold climate during a part of the earliest or Paleolithic stage, and man at that time may have found caves a welcome shelter from the cold. On the other hand, it has been found that the cave man was also a contemporary of such animals as the mammoth, rhinoceros, hippopotamus, cave hyena, lion, and other types which we are accustomed to associate with warm climates and which have long since become extinct or have retreated from European territory. No complete skeleton of Paleolithic cave man has yet been discovered, only fragments of skulls and bones; but the abundant relics of his handiwork give a fairly good representation of certain features of his mode of life and stage of social development. They show that he subsisted for the most part on animal food obtained by hunting and fishing, for he had no domestic animals and apparently knew nothing of agriculture. His knives, spearheads, and other implements were rudely fashioned of flint or bone, and he clothed himself in skins. In short, he lived much as do the Esquimaux who have been unaffected by civilization. Among the most interesting objects of the cave man are the pictures which he traced upon the walls

of his abode or chiseled upon fragments of bone and antler. These refer mainly to animals like the reindeer or mammoth with which he came in contact, although a few show human heads and figures, such having been found in the caves of southern France, e.g., the Grotte des Fées and the cave of La Colombière. In the Neolithic caverns the advance of culture is already very marked, so much so as to lead to the inference that Neolithic man belonged to a distinct race, one that perhaps migrated from the East. The implements are of more varied pattern and more neatly turned, although they still consist mainly of stone. There are attempts at pottery making, and the art of weaving may have been discovered. Of the extraordinary group of Pleistocene mammals that have been named in connection with Paleolithic man, nearly all had died out or had migrated, the musk ox and reindeer retreating to the north; the Irish elk remained on and probably lived in historical times. In the place of those animals came the domestic kinds—the horse, cow, sheep, and goat—and with them, no doubt, the beginnings of agriculture.

Among the famous bone caves may be mentioned those of Kirkdale in Yorkshire; Kent's Hole in Devonshire; Gailenreuth in Franconia, Germany; Spy, Belgium; and those in the valleys of the Dordogne, Vézère, and Ain rivers in southern France. The Kirkdale cavern was made famous by the work of Buckland in 1820, who was one of the first to employ scientific principles in the exploration of cave deposits. The cave yielded great numbers of mammal bones, including over 300 individuals of the cave hyena. In the Kent's Hole cave, investigated by McEnery between the years 1825 and 1841, was made one of the first authentic discoveries of human relics in association with bones of Pleistocene mammals, and the evidences brought forward by McEnery in support of the view of a contemporaneous burial were hotly contested at the time, but have since gained acceptance on the part of scientists. The cave showed a series of deposits dating back through the Roman and earlier periods to the Paleolithic, of which the remains buried in a stalagmitic layer included those of the lion, hyena, mammoth, and others, with flint implements and an engraved reindeer antler. Other caves which have yielded relics of Paleolithic man include the grotto of Spy in Belgium, and Cromagnon, Comberelles, La Madeleine, Le Moustier, and La Solutré of France. In the cave of La Colombière, beside the river Ain, France, a remarkable series of Paleolithic sketches engraved on bone and smoothed stones was unearthed in 1913. The bone caves of America have less interest from the standpoint of archæology and anthropology, though they have afforded some interesting animal remains of Pleistocene age. In most of them, however, the bones are of more recent date. Consult Badin, *Grottes et Cavernes* (Paris, 1870); Boyd Dawkins, *Cave-Hunting* (London, 1874); Hovey, *Celebrated American Caverns* (Cincinnati, 1882); Baring-Gould, *Cliff Castles and Cave Dwellings of Europe* (Philadelphia, 1911). See COLOSSAL CAVERN; JACOBS CAVERN; LURAY CAVERN; MAMMOTH CAVE; WYANDOTTE CAVE.

CAVE, ALFRED (1847–1900). An English clergyman and educator, born in London. He was educated at New College there, held pastorates at Berkhamstead and Waterford from 1872

to 1880, was professor of Hebrew and Church history in Hackney College (1880–82), and later he served this institution as president and professor of theology. He was vice chairman of the London Board of Congregational Ministers in 1888 and 1898. He published *Scriptural Doctrine of Sacrifice and Atonement* (1877); *An Introduction to Theology* (1886); *The Inspiration of the Old Testament* (1888); *The Battle of the Standpoints* (1890); *The Spiritual World* (1894).

CAVE, EDWARD (1691–1754). The founder and editor of the *Gentleman's Magazine*, the first literary journal of its kind ever published. He was born at Newton, in Warwickshire, was educated at Rugby, and became a printer's apprentice in London. For a time he held a parliamentary clerkship, and from the information gained through his official position he furnished country news to a London newspaper and weekly news-letters to country papers. In 1727 he and Robert Raikes were fined and imprisoned for breach of privilege. In 1731 he was able to set up a small printing office and established the *Gentleman's Magazine*, which he conducted the rest of his life and which is still published. Dr. Johnson was among the early contributors to the magazine, and Cave published several of his earlier works, including *Irene* and the *Life of Savage*. Cave began, in 1732, the publication of a regular series of the parliamentary debates of both Houses, Johnson writing many of the speeches reported in the series. Following a reprimand in 1745 for publishing an account of the trial of Lord Lovat, Cave discontinued these reports until 1752.

CAVE, WILLIAM (1637–1713). An English clergyman and scholar. He was born at Pickwell, Leicestershire, studied at Cambridge, and held various ecclesiastical appointments, among them the rectory of All-Hallows the Great, London (1679), and of Isleworth in Middlesex (1690). He was chaplain to Charles II, and in 1684 became canon of Windsor. His fame rests on his voluminous writings on Church history, the most important of which are: *Primitive Christianity* (1672); *Lives of the Apostles* (1676); *Lives of the Fathers* (1677); and *Scriptorum Ecclesiasticorum Historia Literaria* (1688–98), which were once standard works.

CAVE ANIMALS. A name given to a peculiar assemblage of animals living in the total darkness of caverns. Cave animals usually differ from their epigæan or out-of-door allies in being blind and either partially or totally eyeless, in having the loss of sight compensated for by greatly developed feelers and other appendages or by tactile hairs, and in being whitish or colorless, the coloring matter or pigment in the skin having undergone degeneration.

Cave Faunæ. The richest cave faunæ occur in southern France, in limestone deposits near or at the base of the Pyrenees, though the great grotto of Adelsberg, near Triest, is the classic abode of cavernicolous forms, including the blind triton, eyeless beetles, etc. In North America Mammoth and Wyandotte caves, with many smaller ones in their vicinity, as well as the caves in Carter Co., Ky., also Weyer's Cave and the Luray Cavern in Virginia, have been especially explored, and have yielded a most varied and interesting fauna. These regions have been honeycombed by the action of subterranean streams now mostly dried up. With these systems of subterranean drainage are

associated sink holes, and deep, dark wells inhabited by blind fish, crayfish, and other crustacea of the same species as those inhabiting the caves. Other caves more or less tenanted by blind forms are situated in Mexico, at Cacuamilpa, in open sink holes in Cuba, as well as in caves and wells in New Zealand. The caverns inhabited by permanent assemblages of blind animals both in America and Europe lie south of the ice sheet of the Glacial period. The cave fauna probably became established at the beginning of the Quaternary epoch, i.e., very soon after the close of the Tertiary period.

Taking the Mammoth Cave as the type of a great system of underground passages and chambers, let us consider the conditions under which these blind animals live. The total length of the avenues is about 150 miles. In the older and dry passages and chambers there is little life; the animals are mostly congregated in the newer or comparatively damp places, the aquatic forms living in the streams and pools. There is no vegetation, except a few scattered molds and fungi. The food is scanty, and the animals are all carnivorous, preying on one another. The temperature is very equable, the mean for the winter months being 53° F., and for the summer 54° F., the variation throughout the year being scarcely more than 1°.

The number of species thus far detected in Mammoth Cave is about 75, and in other American caves about 40 or 50 more, while there are several hundred kinds existing in European caverns.

Blind Fishes. The most striking and interesting form in Mammoth Cave is the blind fish (*Amblyopsis spelæus*). It is about 4 inches long, pale or colorless, blind, the eyes being vestigial. According to Prof. C. H. Eigenmann, who has made the latest and most thorough studies on this and other blind fishes, *Amblyopsis* seeks the dark and shuns the light. A ray of light or a lighted match will cause them to dash away, and bright sunlight appears to be irritating; if exposed to it, the fishes swim about uneasily. In well-fed adult specimens there is no external indication of an eye; but in young ones, before reaching a length of 2 inches (50 mm.), the eyes can be distinctly seen, owing to their pigment, which is lost in the adult. The optic nerve can be traced in examples under an inch (25 mm.) in length, but in larger specimens "it is no longer possible to follow the nerve to the brain." In only one instance could Eigenmann trace the nerve into the brain cavity. The lens is much reduced, and, in fact, the vestiges of the eyes are exceedingly variable, "in striking contrast to the condition in normal fishes." (Eigenmann.) This will apply to the eyes of other blind fishes and blind insects, crustacea, etc. While the sense of sight is lost, that of touch in the blind fish, as in most other cave animals, is exalted. *Amblyopsis* is provided with series of tactile papillæ, arranged in ridges on the front and sides of the head. Though the ears of this blind fish are said by Wyman to be largely developed, Dr. Sloan, who kept several of these fishes in an aquarium for 20 months, states that they "manifested total indifference to light and sound." They are said to show in their movements extreme timidity and caution. Eigenmann has proved that, contrary to early views, *Amblyopsis* is not viviparous; the eggs, however, are laid by the female under her gill membrane, and the

breeding period extends at least from the first of March to November. The young feed on minute crustaceans and other microscopic animals, and the older ones feed greedily on the blind asellus (*Cæcidotæa*). Like all other cave animals, the body is colorless, and the blind fishes glide through the aquatic shades like "white aquatic ghosts." There are four other species of blind fishes, and with *Amblyopsis* is associated *Typhlichthys subterraneus*, which lives in caves east of the Mississippi, while *Typhlichthys rosæ* inhabits caverns west of this river.

Subterranean Salamanders.—A still higher type of vertebrate, two species of salamanders, have become adapted to cave life, losing their eyesight by disuse. The species of the genus *Spelerpes* frequent damp, dark situations and the entrance to caves. An allied form (*Typhlotriton spelæus* of Stejneger) is distinctly a cavernicolous as distinguished from a twilight species, and has never been found outside of caves. Its eyes show early stages of degeneration. It inhabits caves in southwestern Missouri and occurs under rocks in and out of water. Still another salamander, whose eyes are the most degenerate known among amphibians, is the *Typhlomolge rathbuni* of Stejneger. It lives in subterranean streams, tapped by an artesian and also a surface well, near San Marcos, Tex., and likewise occurs in one of the caves near that town. Its remarkably long and slender legs are too weak to support its body when out of water. The eyes of this salamander are in many respects much more degenerate than those of the *Proteus* of Austrian caves. It has no eye muscles, the retina is more reduced, no trace of the lens could be found except in one individual, and no blood vessels enter the eye, the shape of the eye itself, which lies just beneath the skin, being very variable. (Eigenmann.)

The *Proteus* of Adelsberg Cave is a salamander-like form, allied to our mud puppy (*Necturus*). It has external gills, very weak legs, ending in three toes in the fore and two in the hinder pair. Its body is remarkably slender, white or colorless, and the eyes are minute, just visible beneath the skin. It is noticeable that when this animal is kept in the laboratory, exposed to daylight, the stimulus of the light rays causes the pigment to develop so that the skin turns slightly dark.

The lower animals tell the same story of degeneration, blindness, and total or partial atrophy of the eye, together with loss of color, and, in a more striking way, the compensation for the loss of vision by a great increase in length of the antennæ and other appendages, or the growth of long, slender tactile bristles.

Blind Crayfish and Insects.—A notable inhabitant of Mammoth and other caves is the blind crayfish (*Orconectes pellucidus*). It differs from its out-of-door allies in being blind, slender-bodied, and colorless. The eyes are present, but they are much reduced in size and destitute of a cornea and of black pigment, while the colorless body is slender. It is not only blind, but deaf, as A. S. Packard discovered that the auditory sacs are a third smaller, and the auditory hairs in the ears also a third shorter and smaller; hence it is to be inferred that the ears of the blind crayfish are degenerate, and the sense of hearing nearly, if not quite, obsolete. This creature is also exceedingly timid and cautious in its movements.

The eyeless beetles of caves (*Anophthalmus*)

have no vestige of eye or of optic nerves and ganglia; but in their movements they closely resemble their epigean allies. While their bodies and appendages are slender, they grope their way about by means of very long tactile bristles. They act exactly as if enjoying good eyesight. They walk, run, stop to explore the ground, seek their food, and run from the fingers of the insect hunter who tries to seize them, with the same agility as beetles provided with eyes. Other beetles, such as *Adelops*, which have retained vestiges of the outer eye; some spiders, comprising an eyeless species, and others with eyes varying in size, some much reduced, spin little webs on the walls of the chambers. Among the harvestmen some have extraordinarily long legs; while the *Campodea*, a wingless insect of the Mammoth and other caves both of the United States and Europe, differs from the outdoor form in its antennæ and abdominal appendages being greatly exaggerated in length. The cave crickets have eyes, but they do not extend into the remoter parts of the cave, and hence are twilight species, and probably cross with other twilight individuals. Besides these, there are many eyeless crustacea of different groups—mites, myriapods, primitive wingless insects, a few flies, worms, and infusoria which go to make up this assemblage of sightless troglodytes.

Origin and History. The fauna of caves is evidently composed of the descendants of individuals which have been carried by various means into the subterranean passages, have become adapted to life in perpetual darkness, becoming isolated, and thus, so long as they are subjected to their peculiar environment, breed true to their species, and show no tendency to relapse to their originally eyed condition. There are, moreover, many blind or eyeless animals, fishes, insects, and crustacea which live in holes, ant nests, or in the abysses of the ocean, which, from the same general cause, i.e., absence of the stimulus of light, have become eyeless and otherwise modified in compensation for the loss of vision.

The fauna of caves is indeed a most simple and intelligible object lesson in establishing the truth of the evolution theory and the doctrine of use inheritance. Lamarck, in 1809, cited the cases of the mole and burrowing sphalax, as well as the *Proteus* of Austrian caves, as examples of the impoverishment and disappearance of these organs through constant lack of exercise. Darwin candidly admitted that natural selection did not operate in the case of cave animals, but that the loss of eyes was due to disuse.

Indeed, the main interest in studies of cave life centres in the obvious bearing of the facts on the theory of descent. The conditions of existence in caverns, subterranean streams, and deep wells are so marked and unlike those which environ the great majority of organisms, that their effects on the animals which have been able to adapt themselves to such conditions at once arrest the attention of the observer.

It is obvious that the action of the Lamarckian or primary factors of organic evolution, i.e., change in the environment and use and disuse, are amply sufficient, when coupled with isolation and heredity, and that form of it called "use inheritance," to produce the blind forms. Here, also, we have a case where the transmission by heredity of eyes adapted for vision lapses, owing to the profound change of en-

vironment, and the animals, after becoming adapted to a life in total darkness, inherit the degenerate eyes as well as the specialized tactile organs, elongated appendages, etc., acquired by the modified organisms—a clear example of the transmission of acquired characters. The absence of the stimulus of light causes the eye, through disuse, to undergo reduction and atrophy. With this goes, in certain forms, the loss of the optic ganglia and optic nerves. Packard has found and stated the following effects of disuse in the invertebrate animals of Mammoth and other caves, and it will be realized how profoundly the organisms have been modified:

1. Total atrophy of optic lobes and optic nerves, with or without the persistence in part of the pigment or retina and the crystalline lens (certain crustacea, harvestmen, *Adelops* beetle, and the myriapod *Pseudotremia*).

2. Persistence of the optic lobes and optic nerves, but total atrophy of the rods and cones, retina (pigment), and facets (blind crayfish).

3. Total atrophy of the optic lobes, optic nerves, and all the optic elements, including rods and cones, retina (pigment) and facets (*Anophthalmus* beetle and the myriapod *Scoterpes*).

An interesting fact, confirmatory of the theory of occasional rapid evolution, as opposed to invariably slow action involved in pure Darwinism, is that we never find any vestiges of the optic lobes or optic nerves; if they are wanting at all, they are totally abolished. The atrophy is comparatively rapid, sudden, and wholesale. It was probably so with the loss by disuse of the thumb of the thumbless monkey of South America, which has retained no vestige of the lost member.

The varying degrees of development in the external parts of certain blind animals prove that these forms entered the caves at different periods and have been exposed for different lengths of time to the loss of light. The completely eyeless forms are the oldest inhabitants of these regions of Cimmerian darkness. The imperfect lenses and retinae, the abolishment of visual nerves and portions of the brain, are, like all vestigial structures in highly specialized or modified animals of various kinds, like ancient, decayed signposts pointing out some nearly obliterated paths now unworn and disused.

On the other hand, certain other parts of the body, as the result of use, become extraordinarily developed; such are the tactile papillæ of the blind fish, the greatly lengthened feelers and legs, the long, delicate tactile hairs of various crustacea and insects. It is plainly the case that the enhanced development of these organs is the result of frequent use or exercise. There is no need of invoking natural selection, these parts developing as the direct result of the change of habits, of the new needs of the animals to feel their way about, forced to adopt such habits by the abnormal conditions of their existence. Although the animals are members of very different groups, inheriting very different structures and habits, yet all genuine cave animals resemble each other in being pale, ghost-like, in the exaltation of the tactile sense, and the corresponding increase in length and delicacy of the extremities.

Yet some naturalists of the Neo-Darwinian school reject the operation of the Lamarckian factors and rather illogically attribute the cre-

ation of this wonderful assemblage of blind forms to natural selection, and others to panmixia, i.e., the cessation of natural selection.

Balance of Theories.—In his elaborate work on the eyes of blind fishes Eigenmann fully and candidly discusses the conflicting views, and concludes as follows: "The Lamarckian view, that through disuse the organ is diminished during the life of the individual, in part at least on account of the diminution of the amount of blood going to a resting organ, and that this effect is transmitted to succeeding generations, not only would theoretically account for unlimited progressive degeneration, but is the only view so far examined that does not on the face of it present serious objections."

It would be a thorough test of the theory of descent if we could keep these creatures in confinement, exposed first to twilight and then to the full light of day, and endeavor to breed a series of generations of these blind animals and ascertain whether their descendants would not revert to their original ancestral eyed forms.

Fortunately an underground laboratory for the study of cave animals has been established by M. Viré in the old catacombs and underground quarries extending under the Jardin des Plantes in Paris. Here are all the conditions of a cave, viz., perpetual darkness, an unvarying temperature, and running water for aquatic forms. M. Viré has introduced various blind or eyed species, and eventually we may expect to have much light thrown on the interesting problems suggested by such studies as these.

Great activity has been shown in France in the exploration of the caves and subterranean streams of the Midi. A Société de Spéléologie has been organized for several years.

Eigenmann, "The Eyes of the Blind Vertebrates of North America" (*Archiv für Entwicklungsmechanik der Organismen*, viii, 1899); and especially the same author's "Cave Vertebrates of America" (*Carnegie Institution*, Washington, 1909). Consult also the writings of Tellkamp, Schiödt, Cope, Putnam, Garman, Henshaw, Joseph, Chilton, and others.

CA'VEAT (Lat., let him beware, from *cavere*, to take heed). A formal notice addressed to a judicial or administrative officer, warning him not to take certain proceedings, which may or may not be in contemplation, without first giving due notice to the person filing the caveat. The object of the notification is to secure to the person giving it an opportunity to be heard in opposition to the action or proceeding in question, and it operates as a stay upon such proceeding. Caveats are available in England for a variety of purposes, as to restrain the enrollment of a decree in chancery, the issuing of a lunacy commission, the grant of a marriage license, the probate of a will, etc. In the United States they are not so common, though they may in some States be employed for some of these purposes, especially to stay the probate of wills and the issuing of letters testamentary.

In this country, till 1910, the term was employed in connection with proceedings for securing patents for inventions. The laws regulating the granting of patents provided that a caveat might be filed by an inventor to give notice to the Patent Office of inchoate inventions. Such a caveat set forth the purpose of the inven-

tion or discovery, and its distinguishing characteristics, and prayed protection of the inventor's right until he should have matured his invention. It was required to be filed in the confidential archives of the office and to be preserved in secrecy, and it had to be renewed from year to year in order to be kept in force. The person filing it was entitled to be notified of any application for a patent made during the lifetime of the caveat, which application, if granted, would interfere with the invention claimed therein, and was entitled to priority by reason thereof. Consult: *Rules of United States Patent Office*; Merwin, *Patentability of Inventions* (Boston, 1883); Luby, *Patent Office Practice* (Kalamazoo, 1897). See PATENT.

CA'VEAT EMP'TOR (Lat., let the buyer beware). A common-law maxim signifying that the purchaser of land or goods takes his chances as to the title or the quality of the property acquired by him. There is great difference of opinion as to the extent to which this maxim really represents the law. A learned English judge expressed the opinion, in 1849, that "the result of the older authorities is that there is by the law of England no warranty of title in the actual contract of sale, any more than there is of quality." A few years later an equally learned judge declared that "the only semblance of authority for this doctrine from the time of Noy and Lord Coke consists of mere dicta." The application of the doctrine to title to chattels has been done away with in England by the Sale of Goods Act, 1893 (56-57 Vict., c. 71), by which the law relating to the sale of goods was codified, while in the United States this application of the doctrine has never had any judicial sanction, so far as the sale of personal property is concerned. The mere act of A's selling property to B amounts to an undertaking on his part that the title was in him. B does not buy at his peril. It is the seller, not the buyer, who must take care of the title. However, the maxim "Caveat emptor" does apply to sales of land. In the absence of fraud or of covenant as to title by the vendor, the vendee buys at his peril.

With respect to the quality of chattels, the common-law maxim "Caveat emptor" still applies, although its scope has been narrowed greatly during the last 100 years. Indeed, an eminent judge has declared that the exceptions have well-nigh eaten up the rule. By the English Sale of Goods Act referred to above, the civil-law rule "Caveat venditor" (let the seller beware) is in many cases substituted for "Caveat emptor." For example, if the buyer notifies the seller that the goods for which he is treating are required for a special purpose, and that he relies on the seller's skill or judgment, and the goods are of a description which it is in the course of the seller's business to supply, the seller impliedly engages that they shall be reasonably fit for such purpose. Again a person who sells goods by description or sample impliedly engages that they shall correspond with the description or sample and shall be of a merchantable quality. While neither legislation nor judicial decisions in the United States accord entirely with the provisions of the English statute, their tendency is towards the same goal.

In Rome the rule of early law was, in effect, "Caveat emptor." With the growth of commerce, however, the inadequacy and injustice

of this rule became apparent, and it was modified from time to time by edict and by the reasoning of jurists, until it was transformed into "Caveat venditor." This maxim of primitive law has been undergoing a similar modification in England and in the United States during the last century. Consult the authorities referred to under SALE; TITLE; WARRANTY.

CAVE BEAR. See BEAR.

CAVE DWELLERS. A general term, usually, but loosely, applied to a largely hypothetical class of troglodytes, or primeval inhabitants of given countries or of the world. The most decisive evidences of cave life by early man are derived from western Europe, both continental and insular, where human remains and artifacts are found in certain caverns associated with bones and teeth of various extinct animals, including the cave bear, the sabre-toothed tiger, etc., as well as of animals no longer occupying the same habitat, such as the reindeer, hyena, etc. Such remains are frequently found in a distinctive earthy deposit ("red cave earth") beneath a floor of stalagmite. The sequence of deposits and the character of the fossils attest great antiquity, probably antedating the later Glacial periods of the Pleistocene. Several of the most instructive examples of early prehistoric man (Man of Spy, Man of Cro-Magnon, Man of Mentone, etc.) may be regarded as representing the period of European cave dwellers. In various parts of the world, notably in Asia and southeastern Europe, are found habitations excavated in cañon walls or other precipices; the rock-hewn tombs at Petra, in northern Arabia, are plausibly supposed to have been designed as places of residence; in China and Mongolia whole villages are excavated in bluffs of loess, as noted by Pumpelly and others; but nowhere do mankind now occupy natural caves as permanent habitations, so far as known. Many of the American races temporarily occupied natural shelves or niches in precipices ("rock houses," as they are sometimes called), and some inclosed these with walls of masonry or other material to form permanent cliff dwellings, while others excavated the cliff faces to form cavate lodges (see CLIFF DWELLERS); it is known, too, that individuals and families, or even small bands, found temporary refuge in caverns; yet the term "cave dwellers" is inapplicable in America, either as a specific designation for any people or period or as a descriptive term. The general tendency of recent researches is to show that primeval men were arboreal and orarian, i.e., forest rangers and shore dwellers, rather than cave dwellers, and that cave life was secondary and due to peculiar conditions rather than primary and characteristic.

CAVELIER, ká'v'-lyá', PIERRE JULES (1814-94). A French sculptor. He was born in Paris, studied under David d'Angers and Delacroix, and first gained celebrity in 1849 by a statue of "Penelope" (Château Dampierre), for which he received the medal of honor. Although he is no great original genius, his sculpture shows careful execution, a harmonious style, and the strong influence of classical sculpture. Among his best works are numerous decorative figures on the exterior of the Louvre; "Labor" and "Happiness," in the Hôtel de Ville; "St. Remy," Panthéon; the statue of Gluck, Opera House; "St. Matthew," portal of Notre Dame; "Truth," "The Mother of the Gracchi," and "The

Neophyte," in the Luxembourg. He was appointed professor at the Beaux-Arts in 1864 and member of the Institute in 1865. Among his numerous pupils were Barrias, Desbois, and Charpentier.

CAVELIER DE CUVERVILLE, de ku'vër'-vêl', JULES MARIE ARMAND (1834-1904). A French naval officer. He was born near Alleneuc, Côtes-du-Nord, and studied in Rennes and in Paris. He took part in the Crimean campaign, was professor at the Naval Academy from 1861 to 1863, naval attaché of the French Embassy at London, and commander of the naval division in the southern Atlantic. After his promotion to the rank of rear admiral in 1888 he was, in 1890, intrusted with the chief command of the Atlantic squadron, in which capacity he terminated the affair with Dahomey and signed a treaty of peace with the King of that country. His contributions to naval literature include: *Le canon de quinze pouces des Etats-Unis* (1866); *Progrès réalisés par l'artillerie navale de 1855 à 1800* (1881); *La marine aux Etats-Unis, rapport adressé au président Johnson* (1867).

CAVE MAN. See CAVE; CAVE DWELLERS.

CA'VEN, WILLIAM (1830-1904). A Canadian Presbyterian divinc. He was born at Kirkcolm in Wigtownshire, Scotland, Dec. 26, 1830, graduated at the theological seminary of the United Presbyterian Church, Toronto, Canada, 1852, entered the ministry, became professor of exegetical theology and biblical criticism, Knox College, Toronto, 1866, and principal of the college, 1873. He was prominent in the movement which led to the union of the different branches of the Presbyterian church in Canada.

CAVENDISH, käv'en-dish or kân'dish. The pseudonym of Henry Jones, who wrote on whist and other games of cards.

CAVENDISH, FREDERICK CHARLES, LORD (1836-82). An English statesman, the second son of William Cavendish, seventh Duke of Devonshire. He was born at Eastbourne, graduated at Cambridge in 1858, was private secretary to Lord Granville from 1859 to 1864, and entered Parliament in 1865. After serving as private secretary to Mr. Gladstone (1872-73) he entered the Treasury Department, in which he was Financial Secretary from 1880 to 1882, when he was appointed chief secretary to Earl Spencer, Lord Lieutenant of Ireland. He accompanied the latter to Dublin, and took the oath as chief secretary at the castle, May 6, 1882. On the afternoon of the same day, while walking in Phoenix Park with Thomas Henry Burke, Undersecretary, he and his companion were assassinated. It was afterward shown that the plot had been laid against Mr. Burke, and that Cavendish was killed because he was in the company of the Undersecretary. Three of the conspirators turned state's evidence, five were hanged, and 17 were otherwise punished.

CAVENDISH, can'dish, GEORGE (1500-c.1561). An English author, the biographer of Cardinal Wolsey. In 1526 he entered the service of Wolsey and remained his constant friend, in prosperity and adversity, until the end. His *Life of Wolsey* is one of the most interesting books of the time. It was written in 1557 and was first published, in a garbled state, in 1641. The full text first appeared (a small edition) in 1761, and again in 1815, but not until 1905 (Boston) did it appear in a suitable form.

CAVENDISH, HENRY (1731–1810). An English natural philosopher and chemist. He was born in Nice, the eldest son of Lord Charles Cavendish and a nephew of the third Duke of Devonshire. He was educated at Peterhouse College, Cambridge, but left without taking his degree, and devoted his entire life to the study of mathematics and physical science. He inherited considerable means from his uncle and was thus able to gratify his taste for scientific investigation. He was unmarried and lived in quiet retirement, having intercourse with few persons, and having no interests beyond his scientific studies and investigations. His first published work was entitled *Experiments on Arsenic* (1764), but his earliest experiments of interest were on heat and were not published for a number of years after they were performed. These experiments included the study of the evolution of heat when a liquid is solidified or a gas condensed, as well as an investigation into the subject of specific heats of substances.

The first scientific paper of importance published by Cavendish was on *Faetitious Air*, and was communicated to the Royal Society in 1766, while later he undertook the study of carbonic-acid gas, determining its specific gravity and showing that a small amount would so vitiate common air as to make it impossible to support either combustion or life. The most celebrated work of Cavendish was his ascertaining "that water consists of dephlogisticated air (oxygen) united with phlogiston (hydrogen)." One of the most celebrated of the experiments performed by Cavendish was the determination of the density of the earth (*Philosophical Transactions*, 1798), by a method to which his name has been given. This plan had been suggested by the Rev. John Mitchell and consisted of having a suspended rod with two lead balls at its extremities. When masses of metal were placed near these balls, the force of attraction exerted between the masses could be measured. Accordingly it was possible to compute the attraction exerted on a mass the size of the earth and thus determine its density. Cavendish ascertained this quantity to be 5.45, a figure that has been slightly raised by subsequent experiments. Cavendish lived almost in solitude, and died leaving a fortune of £1,175,000. *The Electrical Researches of Henry Cavendish*, ed. by J. Clerk-Maxwell, were published (Cambridge, England, 1879). Consult Wilson, *Life of Cavendish* (London, 1846). See CHEMISTRY.

CAVENDISH, MARGARET, DUCHESS OF NEWCASTLE (c.1624–74). An English writer, born near Colchester in Essex. She was educated at home; became a maid of honor to Queen Henrietta Maria (1643–45); married, in Paris, William Cavendish, afterward Duke of Newcastle (1645), and lived abroad with him till the Restoration. She died in London and was buried in Westminster Abbey. The famous inscription on her tomb declares that she belonged to a family of which "all the brothers were valiant and all the sisters virtuous." Her writings, consisting of plays, poems, sketches, letters, an autobiography, and a memoir of her husband, are exceedingly interesting. *Selections* were edited by Lower, in *Smith's Library of Old Authors* (London, 1872), by Jenkins (London, 1872), and by C. H. Firth (London, 1886). Consult also C. H. Firth, *The Life of William Cavendish, Duke of Newcastle; to which is added The Life of Margaret, Duchess of Newcastle*

(London, 1886); and Gosse, *Seventeenth Century Studies* (London, 1895).

CAVENDISH, SPENCER COMPTON. See DEVONSHIRE, SPENCER COMPTON CAVENDISH.

CAVENDISH, THOMAS (c.1555–92). The second English circumnavigator of the globe and a noted freebooter. He was born in the parish of Trimlay St. Martin, Suffolk, studied for a brief period at Cambridge, but left without a degree, followed the court, and soon squandered his inheritance. To repair his fortunes he turned to maritime adventure and fitted out a ship that accompanied Sir Richard Grenville's expedition to Virginia in 1585. On this voyage he captured three rich Spanish ships. In July, 1586, he sailed from Plymouth with three vessels on a predatory expedition, passed through the Straits of Magellan, cruised along the west coast of South America and Mexico, and burned or sank 19 vessels, among which was the *Santa Anna*, belonging to the King of Spain and having an immensely valuable cargo, which he seized off California. He returned to Plymouth Sept. 9, 1588, with his plunder, having gone around the globe in two years and 50 days. When he came home, it was said that his seamen were clothed in silk, his sails were of damask, and his topmast was covered with cloth of gold. Within three years he wasted his wealth, and, accompanied by John Davis, started upon another voyage. The venture was a failure, and Cavendish died on the way home. Accounts of all three voyages are to be found in Hakluyt.

CAVENDISH, SIR WILLIAM (1505–57). An English courtier. He was a younger brother of George Cavendish, Cardinal Wolsey's biographer, with whom he is often confused. He enjoyed the favor of Henry VIII, who in 1530 appointed him one of the commissioners to seize monasteries for the crown, by which he added greatly to his wealth. In 1546 he was made treasurer of the King's chamber, was knighted, and became a Privy Councilor. Both Henry and Edward VI largely increased his landed property by grants of monastic estates. Conforming under Mary, he also received rewards from her. His great property became the foundation of the immense estates of the dukes of Devonshire.

CAVENDISH, WILLIAM, DUKE OF NEWCASTLE (1592–1676). An English statesman and author. He was the son of Sir Charles Cavendish, younger brother of the first Earl of Devonshire, and was educated at St. John's College, Cambridge. His accomplishments and bearing gained him the favor of James I, who in 1610 made him a knight of the Bath, and in 1620 raised him to the peerage as Viscount Mansfield. In 1628 he was created Earl of Newcastle by Charles I, and on the royal visit to Scotland entertained the monarch with two banquets of historical repute, at a cost of £20,000. In 1638 the King intrusted him with the tuition of his son, afterward Charles II. He munificently supported the King during the Civil War and raised a troop of 200 knights, who served at their own cost. As general of the northern forces, he had the power to issue declarations, confer knighthood, coin money, and raise men. After the battle of Marston Moor, Cavendish retired to the Continent, where he resided in poverty until the Restoration. On his return he was created Duke of Newcastle. He wrote poems, plays, and veterinary works. *La méthode et invention nouvelle de dresser les chevaux*

(Antwerp, 1657) was written in English, translated by a Walloon, and published in French; afterward it was amplified as *A New Method and Extraordinary Invention to Dress Horses and Work Them According to Nature, etc.* (London, 1667). He was a skillful horse trainer and made an accomplished horseman of his pupil, Charles II. He died Dec. 25, 1676. Consult *Life of the Duke of Newcastle*, by his second wife, Margaret Lucas (London, 1667; new ed. by C. H. Firth, London, 1886). This work is ridiculed by Pepys in his *Diary*, March 18, 1668.

CAVENDISH COLLEGE. A college founded in 1873 by the County College Association of Cambridge University, England, in order to enable undergraduates to pass through a university course at the least possible cost of money and time and to make a specialty of the art of teaching. The present buildings of the college were begun in 1876. There were in 1890 about 33 students in residence. It was closed the following year and is at present a Nonconformist training college and, of course, not connected with the university.

CAVE OF ADUL'LAM. See ADULLAM, CAVE OF.

CAVE OF MACHPELAH, māk-pē'lá. See MACHPELAH, CAVE OF.

CAVE OF THE NATIVITY. The supposed birthplace of Christ, a winding cave in Bethlehem, beneath the Church of the Nativity, built over it by the Empress Helena and the Emperor Constantine. The position of the manger and the precise spot where Christ was born are marked. The grotto is beautified with marbles and candles are constantly burning.

CAVE OF THE WINDS. See NIAGARA FALLS.

CAVE OF TROPHO'NIUS. See TROPHONIUS.

CAVE PAINTINGS. See PALEOLITHIC PERIOD.

CAVERNE DE L'HOMME MORT, ká'vèrn' de lóm môr (Fr., cavern of the dead man). A cave in the Department of Lozère, France, in which skeletons of a prehistoric race have been discovered.

CAVET'TO (It., dim. of *cavo*, hollow, from Lat. *cavus*, hollow, Gk. *κῦαρ*, *kyar*, hole, from Gk. *κύνειν*, *kyein*, to swell, to contain). In architecture, a simple concave molding, to be distinguished from the scotia because it is only a quarter round, whereas the scotia's curve embraces at least the half of a circle or ellipse.

CAVIANA, ká-vyá'ná. An island of Brazil, lying across the main mouth of the river Amazon. It is about 35 miles long by 20 wide, fertile, and well stocked with cattle (Map: Brazil, H 3). The little town of the Roberdello, on the southeast coast of the island, is almost exactly under the equator.

CAVIAR, ká'vî-är, or **CAVIARE** (Fr., from Turk. *hâvyâr*, caviar, probably of Tatar origin). The roe of a sturgeon prepared as a piquant table delicacy, especially in Russia. (For the various sturgeons, see STURGEON.) The process of making caviar is as follows: The ovaries, having been removed from the fish, are beaten to loosen the eggs, which are then separated from the muscular tissue by being pressed through a sieve. The liquor is then pressed out, salt is well mixed in, and the whole packed in small kegs. The quality of the result depends upon the care in clearing and drying it. The best is

prepared by granulating the roe in linen sacks, which are laid in the brine and then hung up in the sun to dry. The Russian caviar comes principally from the neighborhood of the Caspian Sea; but caviar is prepared in the Danube provinces and elsewhere, and lately has been made extensively in the western United States.

CAVITE, ká-vé'tá. The capital of the Province of Cavite, and the naval headquarters of the archipelago in Luzon, Philippines, on Manila Bay, about 8 miles southwest of Manila (Map: Luzon Island, E 8). It is built of stone, and has a theatre and several government buildings of note. The leading industrial establishment is a large tobacco factory. During the Spanish administration Cavite was one of the principal strongholds in the archipelago, and since the Spanish-American War has been made even stronger. There are an arsenal, well-equipped repair shops, and good docking facilities. Pop., 1903, 4494.

CAVITE. A province of Luzon, Philippines, south of the Province of Manila, and bounded by Manila Bay on the west (Map: Luzon, E 9). It covers, with its dependent islands (100 sq. m.), an area of 610 square miles. It has wooded mountains and well-watered valleys and is of commercial importance on account of its advantageous situation. Rice, sugar, and coffee are grown extensively, and grazing is an important occupation. Fine fruit abounds throughout the province. The only manufactures of importance are sugar and hemp and cotton cloth. Pop., 1903, 134,779.

CAVO, ká'vò, ANDRÉS (1739-c.1800). A Mexican Jesuit historian, born in Guadalajara. He entered the Jesuit Order in 1759 and was sent as a missionary to the Northwest. In 1767 he was compelled to leave Mexico by the decree of Charles III expelling the Jesuits. He prepared in Rome a work on Mexican history, which remained inedited until recovered by C. M. Bustamante, who published it as *Los tres siglos de Méjico durante el gobierno español* (1836). H. H. Bancroft, in his *History of Mexico*, gives a favorable estimate of the narrative as such, and of its general historic spirit, although recognizing its strongly anti-Spanish leaning.

CAVO-RILIEVO, ká'vò-rè-lyá'vò (It. *cavo*, hollow + *rilievo*, relief). A kind of depressed bas-relief, in which the carving is sunk below the level of the surface of the background. It was used extensively by the Egyptian wall decorators. It makes possible the execution of sculptured wall panels after erection of a building in stone or marble, without the trouble of leaving bossed spaces in course of construction.

CAVOUR, ká-vōōr', CAMILLO BENSO DI, COUNT (1810-61). The great constructive statesman of modern Italy. He was born in Turin, Aug. 10, 1810, the son of the Marquis Michele Benso di Cavour and Adèle, second daughter of the Count de Sellon of Geneva. As a younger son, Camillo was educated for the army in the military academy in Turin, serving at the same time as a page in the royal household of King Charles Albert. After graduating at the head of his class in 1826, he entered the army as a lieutenant of engineers. Even at this early period he showed the earnestness, concentration, and ability which made the brilliant statesman of later years. He was proficient in the study of mathematics, the languages, and history. His mind was extremely practical, and he never cared for art or romance. He had no taste for

military life and devoted himself while in garrison in the fortress of Bard to the study of economics and English politics. In 1831 he resigned his commission and undertook the management of his father's estate at Leri, in Piedmont. Without any previous knowledge of farming, Cavour soon mastered agriculture in all its details, restored the estate, which had been much neglected, and became a leader in the introduction of progressive methods of agriculture into Piedmont. He ever afterward loved the work and found at Leri throughout his life rest from the cares of state. In this occupation and in travel Cavour spent 15 busy and profitable years. The democratic monarchy of England was always his ideal, and he was a great admirer of Anglo-Saxon liberty. In England he made a thorough study of the political, social, and industrial institutions. In 1847, when the censorship of the press had been abolished in Piedmont, Cavour, realizing the power that this agency might have in the great struggle for which Italy was preparing, established in Turin, with Cesare Balbo and others, a journal, *Il Risorgimento*, which declared for independence, unity, and reform. A moderate Conservative in his views, a staunch supporter of the monarchy, but a constitutionalist, he satisfied the extremists of neither party and was far from being a popular leader; but his ability, independence, and courage commanded respect. His greatness was in nothing more marked than in the impersonality of his work. In 1848, when Genoa was about to send a deputation to Turin to ask for a civic guard and the expulsion of the Jesuits, Cavour, at a meeting of journalists held to decide on a course of action, declared that the demands of the Genoese were too moderate, and that a constitution was the only remedy for existing evils. This was, for the times, a revolutionary declaration, and especially startling as coming from a Conservative. Cavour had, indeed, been regarded as almost a reactionary, so little was his moderation understood in the passionate politics of the time. Events justified Cavour; in February Charles Albert (q.v.) set his signature to the famous *Statuto*, the constitution of Piedmont around which, under Cavour's leadership, all the advocates of Italian liberty and unity gradually rallied. He entered Parliament in 1848, a pronounced advocate of a free and united Italy. This platform was sufficient for him during his whole career. He never separated the two ideals, and he decided at the outset that they could be attained only under the royal house of Savoy. He never sympathized with Mazzini and the Republicans, whose theories he believed ill adapted to Italian conditions. On March 7, 1850, Cavour, speaking on the proposition to abolish the special jurisdiction of the ecclesiastical courts, declared that by persevering in her reform policy Piedmont would be "gathering to herself all the living forces in Italy and would be in a position to lead the mother country to those high destinies whereunto she is called." This expression of an aggressive national Italian policy brought Cavour into still greater prominence, and upon the death of the Count of Santa Rosa he was called into the cabinet, then headed by Massimo d'Azeglio (q.v.), at first as Minister of Agriculture, then as Minister of Commerce and of the Marine. He now gave up his journalistic connections and entered upon his great career as a state builder. He also dis-

posed of all his holdings in agricultural and industrial companies. In April, 1851, he was made Minister of Finance, and in the same year, having already become the dominating force in the ministry, he made the famous alliance with Urbano Rattazzi (q.v.), leader of the Left Centre, by which the two parties of the Centre united in support of the ministry, in opposition to the Extreme Right and the Extreme Left. It was through this union of moderate parties that Cavour proposed to foster the new Italy. He was never a party man and looked only to the good of the state. The compact with Rattazzi, known as the *connubio*, was discountenanced by D'Azeglio and led to a rupture in the cabinet (April 15, 1852). Cavour retired temporarily from office and went to France and England, to find out how the *connubio* was regarded among those whose aid he hoped to obtain in realizing Italian aspirations. He was reassured by his reception in both countries; but he made up his mind that, of the two, it was France that must be looked to for active support in establishing the new Italy as against Austria. He therefore devoted his energy to winning the man who was then directing the destinies of France—the new Emperor Napoleon. A ministerial crisis occurred on his return to Piedmont, and Cavour became the head of the government, holding the posts of Minister of Finance and President of the Council. He gave his immediate attention to the material development of the kingdom, the rehabilitation of its finances, and to various reforms, such as the legalization of civil marriage, the suppression of the mendicant orders, and the encouragement of secular education. In 1854 he saw, in an alliance with France and England against Russia, an opportunity to bring Sardinia into the councils of Europe. He brought about the alliance, in spite of the opposition of every one in the country excepting the King and the ministers. Ten thousand troops of the reorganized Sardinian army were dispatched to the Crimea. It was a dangerous game and might have failed but for the fatuous policy of Austria, upon which Cavour had counted. The Sardinian contingent won the respect of their allies, Austria's weak course destroyed her primacy in continental affairs, and at the Congress of Paris (see PARIS, CONGRESS OF), in 1856, Cavour accomplished his great object in compelling the representatives of the Powers to admit Sardinia to their councils and to take up the condition of Italy for international consideration. At the congress Cavour stood for the aspirations of Italy, and while he gained nothing directly for Sardinia, he secured recognition as an Italian leader, which he desired more. It was Italy, rather than Sardinia or Piedmont, of which he always spoke and thought. While these events were passing he was also engaged in a struggle with the Church over the disestablishment of the religious orders.

The Congress of Paris left the issue between Austria and Sardinia very sharply defined and made war almost inevitable. Cavour's energies were devoted to preparing for the struggle. He increased taxation, but developed the resources of the country to meet the new burdens. In 1858 he severed political relations with Rattazzi, who supported the King in the affair of the Countess Mirafiori. (See VICTOR EMMANUEL I.) After the unsuccessful attempt of the Italian fanatic Orsini upon the life of Napoleon III, the secret meeting at Plombières was held.

between the French Emperor and Cavour (July, 1858), at which the agreement was made which was to bring France to the side of Italy in the contest with Austria. Cavour's masterful diplomacy is well illustrated in connection with the Austrian War. To the Englishman, Mr. Odo Russell, who did not believe Austria would be so unwise as to declare war, Cavour said, in the spring of 1859, that he would force her to do so, and named the first week in May as the time. A few days before that time Austria had actually committed the desired indiscretion. The royal speech to Parliament, Jan. 10, 1859, prepared by the King, but revised by Cavour and Napoleon III, voiced the spirit of united Italy against the foreign oppressor. Napoleon hesitated on the verge of war and sought to have a congress held, and England proposed that all the Italian States should be admitted; but Austria lost its chance of retaining its hold on Italy by refusing to accede to the English proposal, and demanding the unconditional disarmament of Sardinia. Austria's offensive ultimatum to Sardinia left no alternative for Napoleon but to support his ally. In the campaign of 1859 (see ITALY) the War Minister, La Marmora (q.v.), took command of the Sardinian forces, and Cavour assumed the onerous duties of Minister of War. When Napoleon, who had declared that Italy should be free "from the Alps to the Adriatic," made with Austria the Peace of Villafranca without consulting his ally, and thus abandoned the Italian cause at a time when the expulsion of Austria from the peninsula seemed certain, Cavour was frantic with rage and grief. He resigned his office and went into retirement at Leri, feeling that this betrayal of Italy had disgraced him; but in reality he had become the idol of an Italy which now learned to know the depth of his patriotism and the farsightedness of his policy. The new ministry under Rattazzi proved unequal to the situation; in England, the return of the Whigs to power under Lord Palmerston enlisted that country more actively in the Italian interest; and in January, 1860, Cavour returned to his post at the head of the government. The cession of Savoy and Nice to France, in return for the union of northern Italy, had been agreed upon at Plombières, and Cavour now took his stand upon the execution of the pledge. It was one of the hardest tasks of his life, and the act for which he has been most criticized.

The next move in the campaign for the union of Italy came from southern Italy, in the form of an insurrection in Sicily against the Bourbon government. This, and Garibaldi's violation of international comity in conducting an expedition in aid of the Sicilian revolutionists, were not planned or promoted by Cavour; but when they had become facts he characteristically winked at their irregularity and prepared to check excesses and to make the most of any opportunity they might offer. When Garibaldi crossed the Straits of Messina and entered the Neapolitan mainland, Cavour sent a Sardinian army into Umbria and the Marches, and another great step towards Italian unity was taken in the contest for southern Italy and the papal domains. Garibaldi's arbitrary methods made him Cavour's antagonist at this time, though the two men always respected and appreciated each other. (See GARIBALDI.) On Oct. 11, 1860, true to his lifelong principles, Cavour secured the passage of a bill by the Piedmontese Parliament author-

izing the government to incorporate such provinces in central and southern Italy as should express their desire therefor by a plébiscite. At the beginning of 1861 all Italy, except Venetia and Rome, was united, and on February 18 the first Italian Parliament met in Turin. Cavour now sought to complete the historic Italy by having Rome made the capital, and in May a vote of Parliament to that effect was passed; but Cavour did not live to see this consummation brought about, nor to see the annexation of Venetia. He died in Turin, June 6, 1861, worn out by the excessive labors and cares of his public life.

Count Cavour never married. The one brief romance of his youth brought color and inspiration into his life through a woman's devoted and unselfish love, but not even her name is known, and the attachment was far greater on her part than on his. He was beloved by the peasants on his estates and trusted by the common people generally. His King, whom he served so faithfully, never felt quite comfortable when his masterful subject was in power, but he had implicit confidence in him and believed in his success; and it was so with all his associates—his power lay in the assurance of success. He was admired by European statesmen. Napoleon said at Plombières: "There are only three men in Europe—we two and then a third whom I will not name." And the veteran Metternich is reported to have remarked: "There is only one diplomatist in Europe; but unfortunately he is against us—it is M. de Cavour." With all his determination, and his frequent disregard of the nature of the means used to attain his ends, Cavour held firmly to the principles of civil liberty and constitutional government. He was equally distrustful of the doctrinaire republicanism of Mazzini, whom he never liked, and of autocracy in any guise. It is a fine testimonial to his patriotism that he enjoyed the confidence of the exiled Venetian patriot and devoted republican, Manin, in spite of his distrust of Manin's political doctrines. From their first meeting in Paris Manin saw in Cavour the regenerator of Italy. Cavour's writings and speeches on political subjects have been published as *Opere politico-economiche del conte Camillo di Cavour* (Coneo, 1855), and *Discorsi parlamentari del conte Camillo di Cavour*, published by order of the Chamber of Deputies (Turin, 1863-80).

A full bibliography will be found in Stillman, *The Union of Italy* (Cambridge, 1898).

CAVY, kă'vī (Neo-Lat., Port. *cavia*, from native Indian word). A small South American rodent of the family Caviidæ, allied to the capybara and the agoutis, exclusively neotropical, and represented familiarly by the guinea pig. The cavies are restless, seminocturnal, herbage-eating creatures, dwelling in burrows or crevices, increasing rapidly, and furnishing

CAVIES, ETC.

1. JAMAICAN SHORT-TAILED HUTIA (*Capromys brachyurus*).
2. SOLENODON (*Solenodon cubanas*).
3. CHINCHILLA (*Chinchilla lanigera*).

4. CARPINCHO or CAPYBARA (*Hydrochoerus capybara*).
5. VIZCACHA (*Lagostomus trichodactylus*).
6. PATAGONIAN CAVY (*Dolichotis patagonica*).
7. AGOUTI (*Dasyprocta aguti*).

food for both man and beast throughout the plains and unforested highlands of that continent. The largest species (*Cavia patchonica*), sometimes called "agouti," formerly spread throughout the plains of all Argentina, but now nearly extinct, resembles a hare standing upon terrier-like legs; it is a foot in height, and rusty red in general color. It digs deep burrows of its own and also occupies those of the viscacha. The restless cavy (*Cavia porcellus*), or "aperea," and Cutler's cavy (*Cavia cutleri*) are common in burrowing colonies in the La Plata valley and seem to be the ancestors of the guinea pig, though uniformly colored—the former grayish brown, the latter nearly black. Other species inhabit rocky places to a considerable altitude in Brazil and Bolivia. Consult Hudson, *Naturalist in La Plata* (London, 1892). See GUINEA PIG, and Plate of CAVIES, ETC.

CAWDOR, ka'dēr. A parish in county Nairn, Scotland, 10 miles east by north of Inverness, noted as the site of Cawdor Castle, in which Shakespeare places the murder of Duncan by Macbeth. Pop., 1901, 925; 1911, 847. During the rebellion of 1745 Lord Lovat was, according to tradition, for a time concealed in this castle. It is in an excellent state of preservation and presents a fine specimen of a true baronial stronghold of feudal times.

CAWDOR, THANE OF. A character in Shakespeare's *Macbeth*, who does not appear on the stage, but whose title is coveted by Macbeth and secured by his causing him to be executed for treason. The description of the character, especially as to his bearing at the hour of death, has led Shakespearean editors to find here a reference on the part of the author to the unfortunate Earl of Essex.

CAWEIN, kā-wīn', MADISON JULIUS (1865–1914). A prolific American poet, born and educated in Louisville, Ky. He is the author of, among other books, *Blooms of the Berry* (1887); *The Triumph of Music* (1888); *Lyrics and Idyls* (1890); *Moods and Memories* (1892); *Poems of Nature and Love* (1893); *The Garden of Dreams* (1896); *Shapes and Shadows* (1898); *One Day and Another* (1901); *Kentucky Poems* (1902); *Complete Poetical Works* (5 vols., 1907); *New Poems* (1909); *The Shadow Garden*, etc. (plays, 1910); *Poems* (1911); *The Republic* (1913). A selection of his poems has been made by him, with a brief introduction by W. D. Howells.

CAWNPORE, kaṅ-pōr', or **CAWNPUR**, kaṅ-pōr', or **KANPUR** (Hind. *Kanhpur*, city of Krishna, from *kanh*, Skt. *krsna*, *krishna*, black + *pur*, Skt. *pura*, city). A city, capital of a district of the same name in the Allahabad division of the United Provinces, British India, on the right bank of the Ganges, 140 miles above Allahabad (Map: India, D 3). Cawnpore's modern importance is due to its commercial facilities and partly to military and political considerations. Since 1888 it has been brought into direct communication with Bombay, through the opening of the railway to Jhansi, and, at the junction of four lines, it is one of the chief railway stations in India. It has an extensive trade in grain and agricultural produce, and important manufactures of home commodities, such as cotton, leather, harness, woodenware, sugar, jute, iron products, chemicals, and cabinetwork. The town contains mission churches, schools, zenanas, a club, and good hotels. It owns municipal water works. It has

belonged to the English since 1801. The name of Cawnpore is associated with the events of the Sepoy Mutiny, one of the most terrible episodes of which was enacted here in July, 1857, the massacre of the European women and children by Nana Sahib. A prominent feature of Cawnpore is the memorial garden, covering the scene of the massacre. Marochetti's angel in white marble, under the Gothic monument over the well in which the dead and dying were cast, is a superb piece of sculpture. Though Cawnpore is only 379 feet above the sea, yet during winter considerable quantities of ice are made for preservation, by exposing water in shallow vessels at night. Pop., 1891, 163,800; 1901, 202,797; 1911, 175,557. Area of district, 12,384 square miles. Pop., 1891, 1,209,695; 1901, 1,258,868; 1911, 1,142,286. Consult Trevelyan, *Cawnpore* (London, 1865).

CAXAMARCA, kā'há-mär'ká. See CAJAMARCA.

CAXIAS, kā'shē-äsh'. A town in Brazil, situated in the State of Maranhão (Map: Brazil, J 5), on the river Itapicurú, about 200 miles southeast of Maranhão. It has a large trade in cattle, rice, and cotton, the river being navigable. It is the birthplace of the poet Luis Gonçalves Dias. Pop., about 10,000.

CAXIAS, LUIZ ALVES DE LIMA E SILVA, DUKE OF (1803–80). A Brazilian general and statesman. He was born in Rio de Janeiro and entered the army at the age of 12. After a brilliant military experience, he was in 1850 appointed Minister of War and President of the Council, and afterward, as commander in chief of the Brazilian army, he conducted the war against Argentina, 1851–52. In this war he earned his title as Marquis. In 1867–69 he stood in the forefront of the war against Paraguay and captured its capital, Asunción. The state of his health after this laborious undertaking was such that he had to retire at once to Montevideo. The Emperor Dom Pedro I, as a reward for his services as Minister and general, created him Duke (the only title of this nature that was ever conferred upon a Brazilian) and presented him with the Grand Cross of the Order of Pedro I. From 1875 to 1878 he was again President of the Council and Minister of War.

CAXIAS, MARQUES AND DUKE OF. See LIMA E SILVA, LUIZ ALVES DE.

CAX'TON, WILLIAM (c.1422–91). The first English printer. He was born in the Weald of Kent, and the particulars of his life are scanty. He was apprenticed in 1438 to Robert Large, a wealthy London mercer. At the death of the latter, in 1441, he went to Bruges, where from 1462 to 1470 he was governor of a chartered association of English adventurers trading in foreign lands. In 1471 Caxton entered the service of Margaret, Duchess of Burgundy, formerly an English princess; and, apparently towards the end of 1476, he set up his wooden printing press at the Sign of the Red Pale, in the Almonry, at Westminster. The art of printing he had acquired while abroad, either at Cologne or at Bruges, more likely at the latter place, from Colard Mansion, a well-known printer of that city; and in 1474 he put through the press (without much doubt Mansion's) the first book printed in English, the *Recuyell of the Historyes of Troye*, a translation of Raoul de Fèvre's work. The *Game and Playe of the Chesse* (probably 1475) was another of Caxton's earliest publications; but the *Dictes and No-*

table *Wise Sayings of the Philosophers* (published Nov. 18, 1477) is the first book which can with certainty be maintained to have been printed in England. All the six fonts of type from which Caxton printed may be called black letter. Of the 99 known distinct productions of Caxton's press, no fewer than 38 survive in single copies or in fragments only. Caxton, who was an accomplished linguist and translated many of the works that issued from his press, was diligent in the exercise of his craft or in translation until within a few hours of his death, which occurred in 1491. By his numerous translations he helped fix the English speech and his many books prepared the way for the literary efflorescence of the Elizabethan era. In 1877 the great printer and his work were fittingly commemorated by a typographical exhibition in London. Consult: Knight, *The Old Printer and Modern Press* (London, 1861); Blades, *Life and Typography of William Caxton* (London, 1861-63), *A Catalogue of Books Printed by or Ascribed to . . . William Caxton* (London, 1865); *Biography and Typography of Caxton* (London, 1882). See, too, in *Cambridge History of English Literature* (Cambridge and New York, 1907-13), two excellent studies in vol. ii: Duff, "Introduction of Printing into England and the Early Work of the Press"; and Greenwood, "English Prose in the Fifteenth Century." The publications of the Caxton Club may be consulted to advantage.

CAXTON MEMORIAL BIBLE. See BIBLE, CURIOUS EDITIONS OF.

CAXTONS, THE. A novel by Bulwer Lytton, published in 1850 (3 vols. octavo). It was originally published in *Blackwood's Magazine*. The scene is chiefly laid in the midst of English country life, and the interest consists largely in the conversations which are held between the members of the Caxton family. Pisistratus Caxton, the *ego* of the story, also appears in *My Novel* and other later works of the author.

CAXTON SOCIETY. An association formed in London, in 1845, for the purpose of publishing mediæval chronicles and other works. Of these it issued 16 vols. before its dissolution in 1854.

CAYAMBÉ, kä'yám-bā', or **CAYAMBÉ-URCU,** -ōōr'kōō. A volcanic peak of the Andes, in Ecuador, about 60 miles east-northeast of Quito and almost directly under the equator (Map: Ecuador, B 3). It has an altitude of about 19,200 feet and is covered with perpetual snow.

CAYAPAS, kä'ya-päs. A tribe of the Barbacoan stock, residing on the coast, near Tola, in Ecuador. Von Buchwald has sought to identify them with the ancient Caras (q.v.). Consult Barrett, "The Cayapo Numeral System" in *Putnam Anniv. Vol.*, pp. 395-404 (New York, 1909), and Beuchat and Rivet, *Affinités des langues du sud de la Colombie et du nord de l'Equateur* (Louvain, 1910).

CAYAPÓS, kä'yá-pös. A tribe of Tapuyan stock, situated north of the Rio Pardo. See TAPUYAN.

CAYCOS, kī'kōs. See CAICOS.

CAYENNE, kā-èn' or kī-èn'. The capital of French Guiana (Map: Guiana, G 3). It is situated on an island of the same name in the Atlantic, in lat. 4° 56' N. and long. 52° 20' W. It has a well-protected though shallow harbor, several fine churches, two hospitals, a bank, and an ecclesiastical college. Cayenne is the only outlet for the products of French Guiana and

has direct steamer communication with France. The climate is moist, but not very unhealthful. There are about 13,000 inhabitants. Cayenne was founded in 1604 and became a French possession in 1675. It was formerly used as a penal settlement.

CAYENNE PEPPER. See CAPSICUM.

CAYES, kā. See AUX CAYES.

CAYEY, kī-ā'. A town of Porto Rico in the municipality of the same name, 37 miles south of San Juan (Map: Porto Rico, E 3). Situated at an altitude of 2300 feet, its cool climate and sanitary conditions make it a popular local summer resort. There are schools, a church, a hospital, and old Spanish barracks. The chief industry is the manufacture of excellent cigars. The tobacco raised in the surrounding country is of the best cultivated on the island. Pop., 1899, 3763; 1910, 4498.

CAYLEY, kā'li, ARTHUR (1821-95). An English mathematician. He was born at Richmond, Surrey, and was educated at King's College, London, and at Trinity College, Cambridge. In early life he devoted much time to the study and practice of law, being admitted to the bar in 1849, and some of his most brilliant mathematical discoveries were made during this period. Finally, in 1863, he left the legal profession to accept the Sadlerian professorship of mathematics at Cambridge. Cayley's most important contribution to mathematics is the theory of invariants. (See FORMS.) He also discovered an interesting higher curve, known as the Cayleyan, and the principal proposition of matrices, known as Cayley's Theorem. Many of his numerous memoirs were published in the *Cambridge Mathematical Journal*. His collected mathematical papers have been published in book form (13 vols. and supplement, Cambridge, 1889-98).

CAYLUS, kā'lus', ANNE CLAUDE PHILIPPE DE TUBIÈRES, COUNT DE (1692-1765). A French archæologist. He entered the army, served in the Spanish War of Succession, and after 1714 traveled in Italy, Greece, England, Germany, and the East, making collections of antiquities on which he published several learned works in French and Latin, the most important being the *Recueil d'antiquités égyptiennes, étrusques, grecques, romaines, et gauloises* (7 vols., Paris, 1752-67). He was a patron of art, and especially of engraving, which he himself practiced. In this field he wrote *Nouveaux sujets de peinture et de sculpture* (1755) and *Tableaux tirés de l'Illiade, de l'Odyssée et de l'Enéide* (1757). He claimed to have rediscovered the method of encaustic painting on wax mentioned by Pliny. He also wrote fiction, which has the kindly humor and attractive simplicity that characterized his own personality. His stories of Parisian life were collected together under the title *Œuvres badines complètes* (Amsterdam, 1787). Some of his stories were translated into English under the title "Oriental Tales" in Gueulette's *Chinese Tales* (1817). Consult: Rocheblave, *Essai sur le comte de Caylus* (Paris, 1889); Nisard's ed. of the *Correspondance du comte de Caylus avec le père Paciaudi* (1877); "Notice" of Uzanne in his *Facéties* (1879); and the preface of Jamet to the *Nocrion: conte allobroge d'après l'édition originale de 1747*, attributed to Caylus (Brussels, 1881).

CAYLUS, MARIE MARGUERITE LE VALOIS DE VILLETTE DE MURCAY, MARQUISE DE (1673-1729). A French court lady and author, mother of the

preceding. She was a descendant of the Protestant family of D'Aubigné, but was converted by her aunt, Madame Maintenon, to the Roman Catholic faith. She was one of the leaders of court society. Racine so admired her abilities that he wrote the prologue to his tragedy of *Esther* as a compliment to her. Her *Souvenirs*, full of interesting anecdotes of the court of Louis XIV, were edited by Voltaire (1770), and often since—notably by Raunié (1881).

CAYMAN, kâ'man, or **CAIMAN** (Sp. *caiman*, from the Caribbean name). A native name applied loosely to various alligators, especially the South American, also called jacarés (q.v.). Most systematists now put *Alligator palpebrosus* and *Alligator trigonatus* into the genus *Cayman*, on account of the three thick bony plates which make their eye orbits stand out prominently, so that the former is called the eyebrowed cayman. Their habits are substantially the same as those of the common alligator (q.v.).

CAYMANS, kî-mänz'. A group of three low islets in the British West Indies 150 miles northwest of Jamaica, of which they are an administrative dependency governed by a commissioner (Map: Cuba, D 7). It consists of Grand Cayman (17 miles long and 4 to 7 miles broad), Little Cayman, and Cayman Brac, with a total area of 225 square miles. The chief town is Boddentown. The pasturage is good and the chief exports are coconuts, turtles, mahogany logs, and dyewood. Pop., 1901, 5287; 1911, 5564.

CAYUBABA, kâ'yôô-bâ'bâ. A tribe constituting a distinct linguistic stock, now gathered into the mission of Exaltación, on Mamoré River, Bolivia. They are of good physique and are fine boatmen. In spite of Christianity, they have retained some of their strange primitive customs. A man does no work during his wife's menstrual period, neither will a widower undertake any important enterprise until he remarries. Consult Chamberlain in *Journal de la Société des Américanistes de Paris*, N. S., vol. vii, p. 182 (1910).

CAYUGA, kâ-yôô'gâ (N. Amer. Indian *Gwé-u-qweh-o-nó*, people of the mucky land). The smallest of the five tribes of the original Iroquois Confederacy. They formerly dwelt on Cayuga Lake, New York, but on the outbreak of the Revolution most of them, together with the Mohawks, joined the British side and removed to Canada, whence they never returned. They may number perhaps 1000 souls, of whom about 170 are living with the Senecas in New York, a few are with the Senecas in Indian Territory and the Oneidas in Wisconsin, while the main body is on the Six Nations Reserve on Grand River, Ontario. The name seems to refer to a cranberry swamp.

CAYUGA DUCK. See **DUCK**.

CAYUGA LAKE. A beautiful sheet of water in west central New York (Map: New York, D 3). It is 38 miles long, from 1 to 3½ miles wide, and enters Tompkins County, but lies between portions of Tompkins and Cayuga counties on the east and Seneca County on the west. It is 381 feet above tidewater, and 140 feet higher than Lake Ontario, into which it empties through the Seneca and Oswego rivers. At the north end the lake is shallow, but in other places reaches a depth of 400 feet. It is navigable for 30 miles. Along its clifflike banks are several thriving towns. Ithaca, near the south end of the lake, Aurora, near the middle of the east

shore, and Cayuga, near the north end, are the chief cities. The lake is much frequented by tourists and pleasure seekers.

CAYUSE, kî-ūs'. A warlike tribe formerly occupying the Blue Mountain region, adjoining the Columbia River, in northwestern Oregon, and now gathered upon the Umatilla Reservation in the same country. In 1847 the smallpox, before unknown among them, carried off a large portion of the tribe, and, believing that it had been introduced by the missionaries, they attacked and destroyed Waiilatpu Mission, which had been established among them a few years before. They are now officially reported to number 298, most of them intermarried with other tribes, and only some half dozen individuals speak their own old language, which belongs to the Waiilatpuan stock. They acquired the horse at an early day, probably through Mexico and California, and were instrumental in its distribution among other tribes, whence the application of their name to the Indian pony of the northwest United States.

CAYVAN', GEORGIA (1858-1906). An American actress, born at Bath, Me. She was educated in Boston and was for a time a professional reader. As an actress she first appeared as Hebe in *Pinafore* at the Boston Theatre, 1879. In 1880 she began playing the part of Dolly Dutton in *Hazel Kirke* at the Madison Square Theatre, New York. The next year, at the Globe Theatre, Boston, she made a considerable sensation as Iocasta in *Œdipus Tyrannus* with George Riddle. In 1882 she was Lisa in the melodrama *The White Slave*, at the Fourteenth Street Theatre, New York, and Luxa in *The Romany Rye*, at Booth's Theatre. From 1887 to 1894 she was leading lady of the Lyceum Theatre stock company, winning successes in *The Wife*, *The Charity Ball*, *Squire Kate*, and numerous other plays. An illness obliged her to leave the stage in 1894, and though in the season of 1896-97 she returned and starred for a time, the failure of her health compelled her final retirement. Consult Clapp and Edgett, *Players of the Present* (Dunlap Society, New York, 1899), and Edmunds, in *Famous American Actors of To-Day*, edited by McKay and Wingate (New York, 1896).

CAZAL, MANUEL A. See **CASAL**, MANUEL A.

CAZALÈS, kâ'zà'lès', EDMOND DE (1804-76). A French political writer, son of Jacques Antoine Marie de Cazalès. He studied law and received a legal appointment, but soon gave his chief attention to political affairs, and was largely occupied with the question of the reconciliation of the Roman Catholic church with the principles of the Revolution. In 1843 he took holy orders and two years later became director of the ecclesiastical seminary of Nîmes and later of that at Montauban. He was active during the revolution of 1848 and in the events of 1871-72. During the first Republic he served in the Constituent Assembly. He contributed to the *Revue des Deux Mondes* and other periodicals, and published *Etudes historiques et critiques sur l'Allemagne contemporaine* (1853), and *Nos maux et leur remède* (1874).

CAZALÈS, JACQUES ANTOINE MARIE DE (1758-1805). A French politician. He was captain of dragoons at the assembling of the States General, in which he was an eloquent defender of royal and clerical authority. In the Constituent Assembly he argued for a government intermediate between an absolute and constitutional

monarchy, and with Mirabeau tried to organize a conservative liberal party. He was among the first to formulate the principles of the legitimists. In August, 1790, he fought a duel with Barnave (q.v.). After the arrest of Louis XVI he left France, fled to Italy, and thence went to Spain and England. He returned to Paris in 1803. Consult Chare's introduction to his *Discours de Cazalès* (Paris, 1821), and Aulard, *Les Orateurs de la Constituante* (2d ed., 1905).

CAZALLA DE LA SIERRA, ká-thä'lyá dá lá syâr'rá. A mining town of Spain, in the Province of Seville, 53 miles by rail from Seville (Map: Spain, C 4). It is in a rich mineral region which yields silver, copper, iron, and sulphur and has also quarries of marble and jasper, as well as iron foundries and distilleries. Pop., 1900, 7782; 1910, 8044.

CAZEMBE, ká-zēm'be, or **KAZEMBE**. A country in Central Africa, north of Lake Bangweolo, divided in 1894 between Great Britain and Belgian Congo (Map: Central Africa, E 4). The name is the hereditary title of an African chief, to whose territory it was applied. The British half is now included in Rhodesia, and Cazembe is its chief town. Livingstone visited the Cazembe in 1868. Copper mines are being exploited in the territory under Congo rule. Consult *The Lands of the Cazembe*, published by the Royal Geographical Society (1873).

CAZIN, ká'zän', JEAN CHARLES (1841-1901). A French landscape painter and designer of ceramics. He was born at Samer, Pas-de-Calais, and studied under Lecoq de Boisbaudran and Trélat. In 1868 he was appointed director of the Ecole des Beaux-Arts and conservator of the Museum at Tours. In 1871 he removed to England, devoting himself to designing ceramics for the Fulham pottery. These were of charming decorative effect, especially in their plant decorations. Returning to France, he exhibited for the first time in the Salon of 1876. His subjects are chiefly landscapes—moonlight, twilight, and dusk effects, invested with chastened melancholy and a tender charm. In such subjects he has few, if any, superiors in modern landscape painting. The figures introduced are subordinated to the landscape that environs them, forming with it a harmonious whole. Through such works as "Judith" (1883), "La terre" (Adam and Eve), "Tobit" (1878, Lille), and "Hagar and Ishmael" (1880, Luxembourg), Cazin became the exponent of the landscape of religious sentiment. In his later landscapes the figures are even more incidental. Excellent examples are "Souvenir de fête" (1881, Petit Palais, Paris), "The Journey's End" (1888, Lyons), and a series of river scenes like "The Marne" and "The Bathers." In 1898 he was commissioned to complete the decorations of Puvis de Chavannes in the Pantheon. He received numerous medals and distinctions and was an officer of the Legion of Honor. Besides the paintings above mentioned, the Luxembourg possesses two others and a select collection of his ceramics. He is also represented in the National Gallery, Berlin, the Metropolitan Museum, New York, and the Art Institute, Chicago. He was an ardent champion of encaustic painting, which, especially in his early works, like the "Flight into Egypt," he sought to revive. Consult his biography by Bénédite (Paris, 1901), and Marcel, *La Peinture française au XIXe siècle* (ib., 1905).

CAZORLA, ká-thôr'lá. A town of Andalusia, Spain, 40 miles east-northeast of Jaén. It is a

place of considerable antiquity and figured in many incidents of considerable historic interest and importance in the Frontier Wars, the War of Independence, and the Carlist Wars. It is pleasantly situated on a declivity and watered by the Vega. It has two old castles—one an Arab structure. Manufactures of leather, earthenware, soap, and bricks, and a trade in agricultural produce are carried on. Pop., 1900, 7936; 1910, 8866.

CAZOT, ká'zô', THÉODORE JOSEPH JULES (1821-1912). A French politician and jurist, born at Alais (Gard). He was elected to the National Assembly in 1871 and in 1875 became a permanent member of the Senate. In 1879-82 he served as Minister of Justice, and in that capacity he was prominent in the execution of the decrees against the Jesuits and unauthorized congregations. He became president of the Court of Cassation in 1883, but resigned in the following year.

CAZOTTE, ká'zôt', JACQUES (1719-92). A French writer of humorous tales. He wrote a romance, *Ollivier* (1762), in prose and in verse; the tales, *Le lord impromptu* (1771) and *Le diable amoureux* (1771); coarse popular songs; and some philosophical works. He joined the fanatic Illuminati about 1775. He opposed the Revolution and was guillotined as a Royalist by the Revolutionary Tribunal. Consult De Nerval, *Illuminés* (Paris, 1852).

CEADDA, käd'dá, or **CHAD**, SAINT (?672). An English prelate, Bishop of York, and afterward of Lichfield. His boyhood was spent in Ireland in the monastery of Rathmelsige, now Melfont. In 664 he succeeded his brother Cedd in the office of Bishop of the East Saxons in the monastery of Lastingham. Subsequently he was called by Theodore to the South Humbrian diocese and spent his last years in the Mercian see, which he himself fixed. Bede, in the *Historia Ecclesiastica Gentis Anglorum*, gives many beautiful examples of this holy man's simplicity and "zealous love of pious toil."

CEAN-BERMUDEZ, thā-än' bër-mō'dáth, JUAN AGUSTIN (1749-1829). A Spanish art historian and painter. He was born at Gijón, Asturias, and studied in Seville under Juan Espinals and in Madrid with Mengs. He painted portraits and decorative compositions, but is best known for his valuable works on art: *Diccionario histórico de los mas ilustres profesores de las bellas artes en España* (1800); *Descripción artística de Sevilla* (1804); *Diálogo sobre el arte de la pintura* (1819); *Noticias de los arquitectos y arquitectura de España* (1829).

CE'ANO'THUS (Neo-Lat., from Gk. κείνωθος, *kcanōthos*, thistle). A genus of American shrubs or small trees, belonging to the family Rhamnaceæ. There are about 40 species, most of which are found in the Pacific Coast States. Many are in cultivation as ornaments, but the most desirable species are only semihardy in the eastern and northern United States. New Jersey tea, or redroot (*Ceanothus americanus*), is a hardy shrub attaining a height of about 3 feet, with ovate, irregularly serrate, bright-green leaves and abundant white flowers in large panicles. The flowers are short-lived, but from their abundance are very ornamental. This species is found in dry woods from Canada to Texas. The leaves are said to have been used as a substitute for tea during the war of the American Revolution and are still so used by poor farmers of the Southern States. Some of the Pacific

species have pink or blue flowers which are very attractive.

CEARÁ, sã'á-rã'. A state of Brazil, on the north coast, bounded by the states of Rio Grande do Norte and Parahyba on the east, Pernambuco on the south, and Piauhy and Maranhão on the west (Map: Brazil, K 4). It has an area of 40,250 square miles. The coast regions are sandy and unproductive; the centre is occupied by an elevated plateau, sparsely watered and fit only for pasture. In the mountainous regions the slopes are well adapted for coffee cultivation. The climate is hot and dry. The chief products are corn, rice, sugar, coffee, watermelons, and pineapples. Pop., 1890, 805,687; 1900, 849,127; 1908 (est.), 886,000. Capital, Fortaleza (q.v.). Consult Fontenelle, *The State of Ceará* (Chicago, 1893).

CEARÁ. See FORTALEZA.

CEARÁ MIRIM, sã'á-rã' mē-rēn'. A town of Brazil, in the State of Rio Grande do Norte, on the Ceará Mirim River. It has sugar and cotton manufactures and is in a cattle-grazing district. Pop., 18,000.

CEB'ADIL'LA. See SABADILLA.

CEBALLOS, sã-bã'lyôs, JOSÉ (1831-93). A Mexican soldier. He was born in the city of Durango, defended the plaza of Nazatlán against the French, and was appointed brigadier general in 1870, in which capacity he commanded the First Division of the federal troops of Mexico in the campaign against the bandit Losada, who had placed himself at the head of a force of 10,000 Indians. Upon the installation of Lerdo de Tejada as President of Mexico, Ceballos had Camarena, the Governor of Jalisco, deposed after a long and sanguinary engagement between the federal and state troops. Ceballos remained as Governor of Jalisco until 1876, when Lerdo's government was superseded by that of Diaz. He later went to California and then to Guatemala, where he was appointed director of the Military School. After plotting a revolution against Diaz, he suddenly espoused the cause of the latter, went to Mexico, and was appointed Governor of the Federal District, the highest office after the presidency. He frequently antagonized the press, and in 1885 a number of journalists and students were imprisoned by him.

CEBALLOS, JUAN BAUTISTA (1811-c.1854). A Mexican jurist, born at Durango. He was made president of the Supreme Court in 1852. Upon the resignation of Arista, in 1853, he became President of Mexico *ad interim*, with extraordinary powers for three months. A month later he resigned. His failure was chiefly due to conditions beyond his control. Still his administration of one month produced two important measures. The first concerned a new Tehuantepec interoceanic contract that brought money into the treasury; and the second gave official recognition to civil marriages with foreigners, against which the Church fought as an infringement of its rights.

CEBALLOS, PEDRO. See CEVALLOS.

CEBENNA. See CEVENNES.

CE'BES (Gk. Κέβης). A Greek philosopher, born at Thebes in Bœotia. He was a disciple of Socrates, at whose death he was present, and also of Philolaus. He is represented by Plato as a serious-minded thinker eager for philosophical knowledge. He is reported to have written three dialogues in the Socratic style—the *Phrynichus*,

the *Hebdome*, and the *Pinax*, or *Tabula*. A work named *Pinax*, now extant, was probably written, however, in the first century A.D. by a Stoic or a Cynic. It professes to be the explanation of an allegorical picture in a temple of Cronus representing human life and the condition of the soul before its union with the body. It inculcates the Socratic doctrine that only education of the mind and consciousness of virtue can lead to happiness. Edited by Prächter (Marburg, 1893).

CEBETIS TABULA. See CEBES.

CEB'IDÆ (Neo-Lat. nom. pl., from *Cebus*, from Gk. κῆβος, *kēbos*, long-tailed monkey). A family of Primates embracing all the American monkeys (formerly designated as platyrrhine) except the marmosets. The features in which they differ from the monkeys of the Old World are stated under MONKEY. The family includes several genera described under DOUROCOLI; HOWLER; SAKI MONKEY; SAPAJOU; SPIDER MONKEY; SQUIRREL MONKEY; TITI MONKEY; UAKARI.

CEBU. See HUMPED CATTLE.

CEBÚ, sê-bōō', *Sp. pron. thã-bōō'*, or **ZEBU**. One of the Philippine Islands, situated between the islands of Bohol and Leyte on the east and Negros on the west, and lying between lat. 9° 25' and 11° 20' N. and long. 123° 10' and 124° 5' E. (Map: Philippine Islands, D 5). It is of an oblong form and has a length of about 130 miles, but does not exceed 20 miles in breadth. Area, 1782 square miles. Its surface is very mountainous, but only moderate altitudes are reached. The soil is fertile and produces tobacco, cotton, sugar, vegetables, rice, and hemp. The reported minerals are coal, gold, lead, silver, and iron. Some petroleum is found on the west coast. Manufactures include native wine, sugar, cloth, pottery, and cheeses. Fishing, especially for sponges, is an important industry. The population of the island is (1903) 592,242, and of the province, which includes the neighboring islands of Camotes, Mactan, Bantayan, and others, is 653,727, consisting of Visayas, Mundos, and some Negritos. Capital, Cebú (q.v.).

CEBÚ. The capital of the island Province of Cebú, Philippines, formerly the seat of government of the entire Visayan group (Map: Philippine Islands, D 5). The town, which is situated on the east coast of the island and fortified by a triangular fort, is well built and contains an episcopal palace, a post office, and the cathedral of San Nicolás. It is the chief commercial centre of the Visayan Islands. Cebú is regarded as the oldest city in the Philippines, and was the capital of the archipelago from 1565 to 1571. Magellan is said to have died on the island of Mactán, to the east of the city, and in the Rizál, a small building in the plaza, is a cross which, according to tradition, was planted in Cebú by Magellan when he took possession. Pop., 1903, 31,079.

CECCHI, chék'kê, ANTONIO (1849-96). An Italian explorer. He was born in Pesaro and was educated in Pesaro, Trieste, and Venice. In 1877 he joined the Italian geographical expedition to Abyssinia, and in 1885 he accompanied the first Italian military expedition to Massowah and later concluded a naval and commercial treaty with the Sultan of Zanzibar. In 1894 he became Consul General in Zanzibar. He was murdered by the Somalis. He wrote *Da Zeila alle frontiere del Caffa* (1887) and *L'Abissinia settentrionale* (1887).

CECCO D' ASCOLI, chĕk'kō dās'kō-lĕ (c.1257-1327). The popular name of Francesco degli Stabili, a learned Italian astrologer and poet. He studied mathematics and astrology and was professor in the University of Bologna. Having published a commentary on Sacrobosco's *Sphæra Mundi*, in which he propounded bold theories concerning the employment and agency of demons, the Clerical party caused him to be condemned to certain fasts, prayers, and fines; but he eluded punishment by going to Florence. His freethinking and plain speaking, however, procured him many enemies. They took advantage of the fact that he had attacked Dante's *Commedia*. He was again tried for heresy, sentenced, and burned at the stake in Florence, in the seventieth year of his age. Consult W. S. C. Baddely, *Charles III . . . also Cecco d' Ascoli, Poet, Astrologer, Physician* (London, 1894).

ČECH, chĕk, SVATOPLUK (1846-). A Czech poet. He was born at Ostředek and was educated at Prague. As a poet, Cech is the foremost representative of the distinctively national Czech poetry. He excels more particularly in the epic genre, while his numerous tales, sketches, personal reminiscences, satires, and novels constitute the finest prose productions in the national literature of Bohemia. In 1895 he was elected to the Austrian Reichsrat. The following are a few of his principal works: *Poems* (1874), containing, among others, the epics entitled "The Angels" and "The Dreams"; *New Collection* (4th ed., 1896); *The Circassian* (1883); *The Candidate for Immortality* (1884). Consult J. Sutnar, *S. Cechs Leben und Werke* (1898).

CECID'IUM. See GALL; MALFORMATION.

CECIDOMYIIDÆ, sĕs'ī-dō-mī'yī-dĕ (Neo-Lat. nom. pl., from Gk. κηκίς, *kĕkis*, gallnut, from κηκίειν, *kĕkiein*, to gush forth + *μύια*, *myia*, fly). A family of minute flies, with hairy bodies, sparsely veined wings, and many-jointed antennæ, furnished with whorls of hair. Most of the larvæ make galls. See GALL INSECTS.

CECIL, sĕs'īl or sīs'īl, RICHARD (1748-1810). An English evangelical divine of the Established church, born in London. He originally professed skeptical views, but in 1772 was converted, and from 1773 studied at Queen's College, Oxford. In 1777 he was ordained priest, and in 1780 he became rector of St. John's, Bedford Row, London. He was distinguished for his eloquence, and was considered the most prominent evangelist of his time. His collected works (4 vols., 1811) have been often reprinted (e.g., in New York in 1845, 3 vols.), and contain, particularly in vol. iv, valuable contributions to the discussion of various religious questions. Consult Pratt, "A Memoir of the Character of the Rev. R. Cecil," vol. i of the *Works* (London, 1811).

CECIL, ROBERT, EARL OF SALISBURY (c. 1563-1612). An English statesman and son of William Cecil, Lord Burghley (q.v.). He was born probably about 1563, although both the exact date and place of his birth are unknown. A sickly child, he was educated at home, but spent some years at Cambridge and in travel on the Continent. In 1588 he went with Lord Derby in his unsuccessful attempt to arrange a treaty of peace with the Duke of Parma. In 1589 he entered Parliament and was a member of the succeeding Parliaments of the reign of Elizabeth. At about the same time he took up the duties of Secretary of State, although he was not actually appointed to this post until

1596. In 1591 he was knighted, and a few months later he entered the Privy Council. The main direction of foreign affairs was in his hands, and in 1598 he headed an embassy to France to negotiate against peace between France and Spain. On August 4 of that year his father died, and Cecil inherited much of his father's influence, which, however, he had to defend against the Earl of Essex (q.v.). The mistakes of the latter, culminating in his trial and execution in 1601, freed Cecil from danger on this side, and during the last two years of the Queen's life he engaged in secret negotiations with James VI of Scotland, which greatly facilitated the latter's accession to the English throne in 1603 as James I. The grateful King showered honors on him, culminating in his creation as Earl of Salisbury in 1605, and he remained until his death the leading minister of the crown. The old Elizabethan, however, was out of his element. Cold, methodical, and versed in business, he made few friends, and with the people he was distinctly unpopular. Worst of all, he utterly failed to perceive, as did Bacon, the change of atmosphere that had come over England since the death of Elizabeth. Intent on securing revenue, he urged James on in his attempt to secure money without parliamentary grant, thus raising the storm that was to ruin the Stuart dynasty. In 1608 he became Lord Treasurer, and his management of the finances was extremely able, but all his ability was thrown away in the face of James's stupid prodigality. An attempt to come to terms with Parliament in 1610 failed, although Salisbury was willing to make vital concessions. His many labors broke down his never rugged health, and he died, worn out, May 24, 1612.

Bibliography. There is no life of Cecil. Many of his letters are in the *Cecil Papers* published in 8 vols. by the Historical Manuscripts Commission. The best account of Cecil's career (1603-12) is in Gardner, *History of England*, vols. i, ii (London, 1883-84).

CECIL, WILLIAM, LORD BURLEIGH or BURGHLEY (1520-98). One of England's foremost statesmen, the son of Richard Cecil, Master of the Robes to Henry VIII. He was born at Bourne, Sept. 13, 1520. He was educated at Grantham and Stamford grammar schools, and at St. John's College, Cambridge, where he distinguished himself, especially in Greek. Before he could take his degree he was removed by his father, and entered as a law student at Gray's Inn, to prevent his marriage with Mary, the sister of Cheke, the Greek professor. William, however, married her two months after his advent in London; but his happiness was short-lived, for she died on Feb. 22, 1544. The following year (Dec. 21, 1545) he married Mildred, daughter of Sir Anthony Cooke, a union which increased his political influence. In 1547 he became *Custos Brevium* in the Court of Common Pleas, the reversion of which Henry VIII had previously given him, and in 1548 his friend, the Lord Protector Somerset, appointed him his secretary. He shared in Somerset's downfall and imprisonment; but two years later, by his wisdom and prudence, was appointed Secretary of State by the Duke of Northumberland, Somerset's enemy. When Queen Mary ascended the throne, Cecil, as a Protestant, resigned office, but maintained good relations with the Roman Catholic party, and was one of the few eminent Protestants who escaped in purse and person

during her reign. Owing to his freedom from persecution, he has been unjustly accused of being a "trimmer." Cecil was cautious and politic, and averse to extremes in religion, and his essentially Erastian frame of mind inclined him to support the religion of the state. The rejection of the bill which the Roman Catholics introduced into Parliament, to confiscate the estates of Protestants, was mainly due to him. Cecil was merciful and tolerant, as compared with the narrow Whitgift or the bigoted Aylmer; but he was not guiltless of the cruel religious persecutions which disgraced Elizabeth's reign. The use of the torture and the employment of spies are a dishonor to his memory. Prior to Mary's death, Cecil corresponded with Elizabeth, who recognized his capacity for government and appointed him Secretary of State on her accession to the throne (Nov. 16, 1558). For 40 years he was the originator and director of that policy which made Elizabeth's reign memorable, and although Elizabeth occasionally favored other courtiers, Cecil was the statesman whose judgment she relied on in all matters of importance. His policy at home and abroad was shrewd, cautious, liberal, and comprehensive, and the quality of prompt decision was also his. As a statesman he was above animosities and favoritism; his enemies never suffered and his friends profited nothing by his power. He was a man of classical attainments and a voluminous writer. In 1564 Cambridge created him M.A., and Oxford conferred the same honor in 1566. The Queen created him Baron Burleigh, Knight of the Garter, and Lord High Treasurer. He died Aug. 15, 1598. Consult: Nares, *Memoirs of Lord Burghley* (3 vols., London, 1828-31), and Macaulay's famous review of it (*Burleigh and his Times*); Hume, *Great Lord Burleigh* (London, 1898). Much of his correspondence is to be found in the *Cecil Correspondence at Hatfield House* (published by the Historical Manuscripts Commission, 8 vols., London, 1883-99). Consult also the *Calendar of State Papers Foreign*, which had in 1913 published the documents down to 1582.

CECIL, or **GASCOYNE-CECIL**, gās-koin', ROBERT ARTHUR TALBOT GASCOYNE. See SALISBURY, MARQUIS OF.

CECIL'IA. The second of Frances Burney D'Arblay's novels, dealing with domestic life. See D'ARBLAY, MADAME.

CECILIA, SAINT. The patroness of music, who is said to have suffered martyrdom in 230 A.D. Her heathen parents, as we are told, belonged to a noble Roman family and betrothed their daughter, who had been converted to Christianity, to a heathen youth named Valerian. This youth and his brother, Tiberius, became Christian converts and suffered martyrdom. Cecilia, when commanded to sacrifice to idols, firmly refused and was condemned to death. Her persecutors, it is said, first threw her into a boiling bath, but on the following day they found her unhurt. The executioner next attempted to cut off her head, but when he did not succeed in three strokes he was obliged by the law to abandon the attempt. She lived three days longer. As early as the fifth century there is mention of a church dedicated to her at Rome; and in 821, by order of Pope Paschal, her bones were deposited there. Since her story speaks of her singing to God in her heart, she came to be regarded as the patroness of Church

music, and even as the inventor of the organ. Her festival is celebrated on November 22. Chaucer, Dryden, and Pope have celebrated St. Cecilia, and the painters Raphael, Domenichino, Carlo Dolce, and others have represented her in art. Consult Guéranger, *Sainte Cécile et la société romaine* (Paris, 1873).—Another St. Cecilia was born in Africa and suffered martyrdom by starvation under Diocletian. The Roman Catholic church celebrates her festival on February 11.

CECILIA, SAINT. A favorite subject with religious painters. She is represented as a young woman, either at the organ or with some musical instrument, attended by saints or angels. The finest and most famous painting of the subject is by Raphael, in the Gallery of Bologna, in which St. Cecilia, standing in the midst of four saints and holding in her hands a small organ, listens enraptured to the angels above. Well known also is the painting by Rubens in the Berlin Gallery, in which his second wife is represented as St. Cecilia, singing and playing the harpsichord and attended by four angels. Other well-known pictures of her are by Guercino and Domenichino, both in the Louvre, and, among moderns, by Ary Scheffer, Sir Joshua Reynolds, John Singleton Copley, and F. S. Church. Above her tomb in Santa Cecilia-in-Trastevere, Rome, is a beautiful recumbent marble figure by Stefano Maderna, representing the saint after her martyrdom, with head partially severed.

CECILIA, THE STORY OF SAINT. A series of frescoes (1588-89), five in number, by Domenichino (q.v.), representing the charity, fervor, martyrdom, and final rewards of St. Cecilia. They are in the church of San Luigi dei Francesi, Rome.

CECRO'PIA (Neo-Lat., from Gk. Κέκροψ, *Kekrops*, according to Greek myth founder of Athens). A genus of trees of the family Artocarpaceæ. *Ceeropia peltata*, a native of the West Indies and of South America, sometimes called trumpetwood and snakewood, is remarkable for its hollow stem and branches, exhibiting merely membranous partitions at the nodes. The small branches, these partitions being removed, are made into wind instruments. The wood is very light, readily ignites by friction against a harder piece of wood, and is much used by the Indians for procuring fire in this way. The fruit is agreeable and resembles a raspberry. Both the trunk and branches yield a large quantity of saline matter, which is employed by the French planters in the purification of sugar. The bark is strong and fibrous and is much used for cordage. It is also astringent and is applied in diarrhœa and other diseases. This species is an example of myrmecophily in which ants dwell in the hollow stems. In return for the service of the tree in affording them shelter and food, they protect the tree from attacks of leaf-cutting ants, which abound in the tropics.

CECROPIA MOTH. The largest of the silk-worm moths (*Samia eeropia*), with wings expanding 5 to 6 inches, brown, marked by white, red, and buff. The caterpillar has coral-red tubercles on the second and third thoracic segments, and other tubercles, yellow and blue; it feeds on a great variety of forest and fruit trees. The cocoon is elongated, brown, papery, and unprotected by leaves. See SILKWORM.

CE'CROPS (Lat., Gk. Κέκροψ, *Kekrops*).

The first King of Attica, who figures in Greek mythology as an autochthon, half man and half serpent. At first probably the eponymous hero and ancestor of the people, he seems to have been crowded aside later by the figure of Erechtheus, though whether we have here the heroes of separate tribes may well be doubted. Later legend attributed to him, as the first King of Attica, the formation of a confederacy of 12 cities, the introduction of marriage, burial of the dead, writing, and other arts. Made umpire in the contest of Athena and Poseidon over Attica, he decided for Athena. See PARTHENON.

CEDAR (OF. *cedre*, Lat. *cedrus*, from Gk. *κέδρος*, *kedros*, cedar tree). A name applied to several species of coniferous evergreen trees, as well as to the wood of a number of trees in no way related to the conifers. The name properly belongs to the genus *Cedrus*, of which there are three species generally recognized—*Cedrus libani*, the cedar of Lebanon; *Cedrus deodara*, the deodar tree of India; and *Cedrus atlantica*, of the mountains of northern Africa. By some botanists the first and last are considered as one species. All are characterized by their fragrant, light-red, durable wood. The cedars of Lebanon have been famous from early times, being frequently mentioned in sacred and profane writings. The original groves mentioned in the Bible have become greatly reduced through various causes, and the largest grove now known contains only about 400 trees, some of which are evidently of great age. The trees are noted for the size of their trunks rather than for their height. They differ from most conifers in that their branches are widespreading. The cones and leaves resemble those of the larch more than any other tree, except that the leaves are persistent. The cedar of Lebanon was introduced into England in the seventeenth century, and a number of noble specimens are now growing in that country. (For detailed illustration, see Plate of CALABASH.) It is hardy in the United States only in the South and in California. In its natural home the cedar of Lebanon is found at elevations of 6000 feet or less, but it thrives best in sandy loam, where the roots can reach water. A white resin, called cedar resin, is exuded by the trunks and was formerly employed in embalming. A sort of oil or turpentine was also prepared from it, but neither the oil nor the resin is much known now. The deodar, or God tree, and the *Cedrus atlantica* resemble *Cedrus libani* in appearance and have similar uses. They are more abundant, and their timber is very valuable. The deodar forms extensive forests in the Himalayas at elevations of from 7000 to 10,000 feet. The trees often attain a height of 150 feet and a diameter of 8 feet. The wood takes a high polish and is in demand for cabinetwork. *Cedrus atlantica* is most abundant in the Atlas Mountains and is used for the same purposes. Many other coniferous trees are given the name "cedar." The Siberian cedar is *Pinus cembra*; Goa cedar, a species of cypress; red cedar, species of *Juniperus* (see JUNIPER), etc.

The white cedar of the United States is *Chamaecyparis thyoides*, a tree 30 to 90 feet high, found growing in swampy situations from Maine to Mississippi. The trees are evergreen, with small, scalelike leaves. The wood is exceedingly durable, especially when in contact with moisture. The tree resembles the arbor vitæ, which is also sometimes called white cedar. The yel-

low cedar of the Pacific coast is *Chamaecyparis nootkatensis*. It is found from northern California to Alaska. The wood when seasoned is a beautiful light yellow and takes a high polish, on which account it is highly esteemed for finishing lumber and cabinetwork. The Port Orford cedar (*Chamaecyparis lawsoniana*) is quite similar and is found in Oregon and California. There are many horticultural varieties of these cedars in cultivation, that vary in their habit of growth and color of foliage. Among trees not allied to the conifers to which the name "cedar" is given are species of *Cedrela*, which furnish the wood from which cigar boxes are so extensively made. The Australian cedar is of the same genus, the species being *Cedrela toona* or *Cedrela australis*. This is an important timber tree which is put to many uses. It yields gum, a resin, and tanbark, in addition to timber. This or a similar species is found in India. The cedar wood of Guiana is from *Protium altissimum*. In Australia *Melia composita* is called white cedar.

CEDAR, BARBADOS (*Cedrela odorata*). A tree of the family Cedrelaceæ, and of the same genus with the toona, a native of the West Indies and warm parts of America. It is called "cedar" in the West Indies. It is often upward of 80 feet high, with a trunk remarkable for thickness. It has panicles of flowers resembling those of the hyacinth. The fruit, bark, and leaves have the smell of asafœtida, but the wood has an agreeable fragrance. Being soft and light, it is used for canoes and for shingles. Cigar boxes are very generally made of it, and it supplies some of the wood used in the manufacture of lead pencils.

CEDAR APPLES. Outgrowths of frequent occurrence upon the red cedar or juniper. They are caused by fungi, *Gymnosporangium macropus* and other species. (For illustration, see FUNGI.) During most of the season they may be seen as warts or knots of greater or less size on the twigs. At first they have about the same color as the branch, but later become brown. In the spring of the year they undergo a marked transformation and appear as horn-shaped masses of orange or yellow colored jelly. These contain the spores of the fungus, and upon drying they are blown about. Lighting upon an apple tree, they cause apple rust. See also *Apple Diseases*, under APPLE.

CEDAR BIRD, or CHERRY BIRD. See WAX-WING.

CEDAR CREEK. A stream in Shenandoah Co., Va., falling into the Shenandoah River. On its banks, on Oct. 19, 1864, during the Civil War, a Confederate force under General Early completely surprised Sheridan's army at day-break, during its leader's absence, and forced it to retreat in considerable disorder back through Middletown; but about 10 o'clock the cavalry and part of Wright's corps (the Sixth) succeeded in checking the advance of the Confederates. General Sheridan, who was just returning from Washington, was at Winchester when the firing began, but hastened to the front and, rallying his troops, ordered a counter-charge at about three o'clock in the afternoon. Many of the Confederates had left their ranks to plunder the Federal camp, and in turn they broke and fled and were pursued as far as Fisher's Hill. Next day the retreat was continued to New Market. Sheridan's forces then returned to Kernstown for winter quarters.

CEDARS OF LEBANON

Sheridan had about 31,000 troops, and Early 18,500. The Federal loss was 644 killed, 3430 wounded, 1590 missing; the Confederate, 320 killed, 1540 wounded, 1050 missing. Sheridan recaptured his lost guns and 23 of Early's. This battle ended the last attempt on the part of the Confederates to strike the North through the Shenandoah valley. Sheridan's famous ride from Winchester, his enthusiastic reception at the hands of his troops, and his remarkable success in turning a disastrous rout into a brilliant victory, form, perhaps, the most dramatic episode of the Civil War. They furnished the theme of a stirring poem by T. Buchanan Read, "Sheridan's Ride." Consult Pond, *The Shenandoah Valley in 1864* (New York, 1883), and Sheridan, *Personal Memoirs* (3 vols., New York, 1888).

CEDAR FALLS. A city in Black Hawk Co., Iowa, 100 miles west of Dubuque, on the Illinois Central, the Chicago, Rock Island, and Pacific, Chicago Great Western, and the Waterloo, Cedar Falls, and Northern railroads, and on Cedar River (Map: Iowa, E 2). The city has a Carnegie library, State normal library, a hospital, and two parks, and is the seat of the Iowa State Teachers' College. It is a manufacturing place of importance, having good water power, and possesses flour, feed, oatmeal, and planing mills, clothing, wagon, and gate factories, corn-canning works, foundry, house-furnishing factory, feeder and stacker works, etc. Settled in 1845, Cedar Falls was first incorporated as a village in 1853. At present it is governed under the charter of 1865, which provides for a mayor, elected every two years, and a city council. The water works and electric light plant are owned by the city. Pop., 1900, 5319; 1910, 5012.

CEDAR KEY. A town and seaport in Levy Co., Fla., on a small island just off the coast in the Gulf of Mexico, and on the Seaboard Air Line Railroad (Map: Florida, C 2). The harbor, which admits vessels of light draft, is formed by several small keys, on one of which is a tall lighthouse with a fixed white light, varied by a white flash every minute. The town has several saw mills, most of which cut red cedar wood for pencils, which is a leading export. It has a considerable trade also in fish, oysters, sponges, palmetto fibre, and lumber. Pop., 1910, 864.

CEDAR MOUNTAIN. A hill in Culpeper Co., Va., near which on Aug. 9, 1862, a sharp battle was fought between 8000 Federals of Pope's army, under General Banks, and about 24,000 Confederates, under General Jackson. Banks gained a slight advantage at first, but was swept from the field by the spirited attack of Jackson's reserves. Pope's whole force advancing, Jackson fell back towards Gordonsville to join General Lee. The reported losses were, for the Federals, 1661 killed and wounded and 723 missing; for the Confederates, 1283 killed and wounded and 31 missing. It was the first serious engagement fought by the Army of Virginia under Pope. Consult Ropes, *The Army under Pope* (New York, 1881).

CEDAR MOUNTAINS. A mountain range of southwest Cape Colony, South Africa, lying parallel with the Atlantic, and separating the valley of the Olifante River on the west from its tributary the Doorn on the east. The highest summit is Sneeuwkop, about 6300 feet altitude.

CEDAR OF GO'A. See CYPRESS.

CEDAR RAPIDS. A city of Linn Co., Iowa, 79 miles (direct) southwest of Dubuque, on the Cedar River, and on the Chicago, Rock Island, and Pacific, the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, and the Illinois Central railroads (Map: Iowa, F 2). Several bridges, including four railroad bridges, cross the river at this point. Cedar Rapids is the seat of the Coe College (Presbyterian), founded 1881, and has Carnegie and Masonic libraries, a government building, an auditorium, two theatres, several parks, and the Holly system of water works, owned municipally. It is the headquarters of the Order of Railway Conductors. The city, which lies in a rich agricultural country, has extensive wholesale houses and pork-packing establishments, and large railroad machine shops. The manufacturing plants include two large cereal mills, barley and flour mills, starch factory, machine shops, planing mills, agricultural-implement works, carriage factories, windmill and pump factories, tanneries, cement brick and block plants, etc. The rapids furnish water power for many factories. Settled in 1845, Cedar Rapids was incorporated in 1856. It has adopted the commission form of government. Pop., 1900, 25,656; 1910, 32,811.

CEDAR, or RED CEDAR, RIVER. A river rising in Freeborn and Mower counties, southern Minnesota (Map: Minnesota, F 7). It flows southeast across Iowa from the northern to the southeastern boundary, emptying into the Iowa River at Columbus Junction, Louisa County, about 30 miles above where the latter stream joins the Mississippi. It is about 275 miles long and drains a beautiful and fertile region. The chief cities along its course are Waterloo, Vinton, and Cedar Rapids.

CEDARTOWN. A city and the county seat of Polk Co., Ga., 60 miles northwest of Atlanta, on the Seaboard Air Line, the Central of Georgia, and the Louisville and Nashville railroads (Map: Georgia, A 1). Cedar and pine timber and valuable mineral deposits are found in the vicinity, and the city has a box factory, marble works, planing, cotton-yarn, and knitting mills, charcoal iron furnaces, foundries, iron mines, oil and fertilizer works, and railroad repair shops. The water works and lighting plant are owned by the municipality. Pop., 1900, 2823; 1910, 3551.

CEDD, kēd, or CEDDA, kēd'dà, SAINT (?-664). A brother of St. Chad or Ceadda, with whom he is often confused. He was born in Northumbria, brought up by Bishop Aidan, Christianized Essex and other parts of England, was made Bishop of the East Saxons (654), founded two monasteries, and was famed for learning and sanctity. He died in the monastery at Laestingaen, now Lastingham, a village about 25 miles northeast of York. His day is January 7.

CEDIL/LA. See DIACRITICAL MARKS.

CEDROS, sā'thrōs, or CERROS, sēr'rōs. An island of Mexico, situated in the Pacific off the west coast of Lower California, where it forms part of the western boundary of San Sebastián Viscaïno Bay (Map: Mexico, A 3). It lies between lat. 28° 5' and 28° 35' N. Its total area is estimated at 120 square miles. The surface is mountainous and partly barren. The climate is dry. Mineral deposits of importance are supposed to exist.

CÉDULA, thā'dōō-lá (obsolete Eng. *cedule*,

Fr. *cédula*, It. *cedola*, *cedula*, whence Ger. *Zettel*, slip of paper; variant of *schedule*, OF. *schedule*, *scedule*, *cedule*, from Lat. *schedula*, small sheet of paper, from *scheda*, sheet of paper, from *scindere*, to split). In Spanish, a written or printed paper of any sort, including blank forms. In Spanish law, any kind of a legal document, public or private, the exact nature of the document being indicated by supplementary words; e.g., *cédula real*, a royal order promulgating a law or decree; *cédula hipotecaria*, a mortgage loan certificate; *cédula ante diem*, a summons to a meeting of a society.

Cédula personal is a certificate of identification. Under the Spanish régime every inhabitant or resident of the Philippine Islands was required to take out, annually, such a certificate, and (unless legally exempt) to pay for it at a rate varying, according to his resources, from 2 pesos to 37.50 pesos. The graduated poll tax thus established yielded an annual revenue of 7,000,000 pesos. The American military government found it necessary, for administrative purposes, to retain the *cédula personal*, but decided to issue it at the nominal and uniform rate of 1 peseta.

CEFALÚ, ehā'fā-lōō' (ancient Lat. *Cephalædium*). An episcopal city and seaport in the Province of Palermo, north Sicily, 42 miles east by south of Palermo (Map: Italy, J 9). It is grouped around the cathedral begun by Roger II in the twelfth century. Its mosaics are the most ancient and perfect in Sicily and resemble those of Mount Athos. The town lies at the base of the steep limestone promontory which towers to the height of over 1200 feet, and which bears the ruins of the ancient town. Fisheries and commerce are engaged in by the inhabitants. Pop., 1901, 13,273; 1911, 14,341.

CEGLIE MESSAPICA, ehā'lyā mēs'sā-pē'kā. A city in the Province of Lecce, south Italy, 18 miles northeast of Taranto, and 27 miles from Brindisi (Map: Italy, M 7). It markets large quantities of wine, fruit, and oil, and quarries stone. Pop., 1901, 16,867; 1911, 17,844.

CEHEGÍN, thā'ā-hēn'. A town of Spain, in the Province of Mureia, 37 miles west-northwest of the city of that name (Map: Spain, E 3). It has some spacious streets, with handsome buildings. The town is in a fertile region, has a trade in grain, oil, wine, fruits, etc., and has manufactures of paper, cloth, and pottery. Pop., 1900, 11,523; 1910, 13,313.

CEIBA, sā'bā. A small and growing port on the Atlantic coast of Honduras, 60 miles southwest of Trujillo. The chief trade is in bananas, Ceiba being in the midst of a large plantation district. Other exports are coconuts, soap, rubber, sarsaparilla, hides, tropical fruits, and mahogany logs. There are several experimental plantations of cotton and cacao.

CEILING (OF., Fr. *ciel*, Lat. *cælum*, sky). The inner lining of an inclosed structure when distinct from the structural walls and roof; and by extension and restriction, the top covering of a room or hall. In the first sense, however, it is not used of plastering, tiling, or flooring. A ceiling in this sense may be partial, like a wainscot, or a complete sheathing internally with wood or metal (e.g., Solomon's Temple: consult 1 Kings vi. 9, 15). In the second sense it may be either the underside of the floor or roof immediately above the room; or, as is more often the case, a wholly inde-

pendent decorative construction, merely suspended from or attached to the roof or floor above it. Vaulted and domed ceilings are more often termed "vaults" and "domes" than "ceilings."

In Egyptian temples the underside of the flat stone roofs formed the ceiling and was generally painted blue, with yellow stars, bands of hieroglyphs, and emblems of the heavens. The ceilings of Babylon and Assyria were stuccoed and painted, and apparently gilding was used in the sanctuaries. The horizontal ceilings of Greek art were deeply paneled (coffered), and the flat surfaces of the panels were painted, but with ornaments, not figures. Roman ceiling decoration combined to perfection both types—the flat and the curved surfaces. The pictorial sense of Græco-Roman artists seized on the decorative possibilities of the ceiling. From the great domes, tunnel vaults, and groin vaults of the Imperial baths and the flat ceilings of the temples and basilicas, down to the minor ceilings of tombs and private houses, all were covered according to one of three systems: (1) coffering or paneling, or combinations of them used both on flat and curved surfaces; (2) stucco reliefs, mainly on curved surfaces; (3) decoration by simple painting, also on curved surfaces. The stuccoed ceilings of the Pompeian baths, of the tombs on the Via Latina, and of the "House of Livia" in Rome show the exquisite taste and dash of these facile works. The elaborate painted ceilings of the substructions of the baths of Titus, discovered in the sixteenth century, furnished the models for the arabesques and grotesques which Raphael made so popular in his Vatican *Loggia* and which have been ever since in continual use. With the fall of Roman art, ceiling decoration disappeared entirely in the West, to be revived only after six centuries in the Romanesque period. But in the Orient there was no such intermission. On the contrary, Byzantine art, with its discovery of marble, glass, and mosaic incrustation as a covering for the surfaces of vaults, added a previously unknown element of deep and rich color, which gave a mysteriously impressive effect to the ceilings; and this was helped by its use of curved ceilings, wherever possible, even in civil structures. Such are the domes of the Ravenna baptisteries, of St. Mark's in Venice, and the churches of Salonica and Constantinople. This mosaic decoration strikes a note of seriousness in contrast to the playfulness of Roman decoration. One important fact is that Byzantine ceilings always present an unbroken surface. This same ideal—of curves and of deep surface coloring—was developed by Mohammedan art; but in the buildings erected in the Mohammedan style there were few unbroken lines and surfaces, and flat ceilings on carved beams were often used. Stalactite corbeling and geometric surface decoration were combined with coloring even more brilliant than that of the Byzantines. When, in the West, mediæval art gave up its severe simplicity of unconcealed beams and rafters, ceiling design followed two different lines of development—that of the stone vault and that of the wooden ceiling. Both of these reached their highest development in England, where the simpler forms of groined vaulting with molded ribs, which the French always preferred, were exchanged for an increasingly elaborate system of multiple ribs that finally developed into the superb fan vaulting of

the sixteenth century (see VAULTING); while the wooden ceiling, with the trusses and entire framework of the roof supports, were made richly decorative in the splendid hammer-beam types of English churches and halls—a type which lasted well into the seventeenth century. The Renaissance abandoned the ribbed vault and in Italy developed three principal types of ceiling: the smooth vaulted ceiling with or without “penetrations” plastered and painted in fresco or tempera, as in the Sistine Chapel at Rome; the coved ceiling with penetrations, having a flat central field and curves (coving) along the sides and ends penetrated by lunettes, the whole richly painted; and the flat paneled ceiling of wood or plaster, in endless variety of decoration, which reached its highest splendor in Venice (Doge’s Palace), with sumptuously carved panels framing paintings by Titian, Tintoretto, and Veronese. Plaster and stucco came into general use throughout Europe, and in England a very charming type of flat ceiling was developed with all-over decorations modeled in low relief in the plaster. See PAINTING; STUCCO.

CEILLIER, sâ’yâ’, RÉMY (1688–1761). A French Benedictine scholar. He was born in Bar-le-Duc, France, became titular prior of the Benedictine monastery of Flavigny, near Nancy, and there died. His enduring fame rests upon his laborious and exhaustive analysis of ecclesiastical literature down to the middle of the thirteenth century, *Histoire générale des auteurs saerés et eeclesiastiques* (23 vols., 1729–63; new ed., 14 vols., 1858–65).

CELAE’NAE (Gk. Κελαιναί, *Kelainai*). A flourishing commercial city of ancient Phrygia, at the sources of the Marsyas and the Mæander, with a citadel and a royal palace. Cyrus the Younger had a park there. The city passed into the power of Alexander the Great in 333 B.C. His successors occupied it till Antiochus Soter refounded it as the Phrygian Apamea.

CELÆ’NO. See HARPY.

ČELAKOVSKÝ, chě’lá-kôf’skē, FRANTIŠEK LADISLAV (1799–1852). A Czech poet and Paulslavist. He was born in Strakonitz and was educated at the University of Prague. In 1842 he held the chair of Slavonic philology at Breslau. He exercised a considerable influence upon the development of Czech literature, made numerous translations from the German, Russian, and English, and published a large number of poetic and other works, among which are the following: *Echoes of Russian Folksongs* (1829); *Echoes of Bohemian Folksongs* (1840); *The Centifolious Rose* (1840), a cycle of didactic, political, and love poems. Besides, he edited a collection of Slavonic proverbs, *The Wisdom of Slavonic Peoples in Proverb* (1852).

ČELAKOVSKÝ, LADISLAV (1834–1902). An Austrian botanist, son of the preceding. He was born and educated in Prague and in 1860 was appointed custodian of the botanical department in the Bohemian Museum in that city. In 1882 he became professor of botany at the Czech University of Prague. Among his numerous and valuable works are the following: *Prodromus der Flora von Böhmen* (1867–81); *Ueber die morphologische Bedeutung der Samenknospen* (1874); *Vergleichende Darstellung der Placenta in den Fruchtknoten der Phanerogamen* (1876); *Die Gymnospermen* (1890); *Das Reduktionsgesetz der Blüten* (1895).

CEL’ANDINE (OF. *celidoine*, Fr. *chélidoine*.

Lat. *chelidonia*, from Gk. χελιδόνιον, *chelidonium*, swallowwort, from χελιδών, *chelidōn*, swallow), *Chelidonium*. A genus of plants of the family Papaveraceæ (the poppy family), having a corolla of four petals and a podlike capsule. The common celandine (*Chelidonium majus*) is a perennial, with pinnate leaves, lobed leaflets, and yellow flowers in simple umbels, frequent under hedges, in waste places, etc., in Great Britain and most parts of Europe. It is also introduced in various places in the United States. It flowers from May to September. The root, stem, and leaves, when fresh, have a disagreeable smell and are full of a yellow juice, which is very acrid, causing inflammation when applied to the skin. Celandine is sometimes used in medicine; it is a drastic purgative, and in large doses an active poison; in small doses it is said to act beneficially on the lymphatic system and on the organs of secretion, and to be useful in jaundice, scrofulous diseases, disease of the mesenteric glands, etc. The most prominent constituents of the plant are sanguinarin, chelerythrin, chelidonin, protopin, chclidoxanthin, and chelidonic acid.

CELANO, chā-lä’nō. A town in the Province of Aquila degli Abruzzi, south Italy, 25 miles south-southeast of Aquila (Map: Italy, H 5). It is situated on a hill at the north end of Lake Fucino (q.v.), the ancient *Lacus Fucinus*. It was the seat of a count and a place of importance prior to 1223, when it was devastated by Frederick II. The castle, founded in 1450, was the prison of Countess Covella, who was there immured by her son Rugierotto. The author of *Dies iræ*, *dies illa*, Beato Tommaso, was born in Celano. Pop. (commune), 1901, 9904; 1911, 1065.

CELAS’TRUS. See WAXWORK.

CELAYA, sâ-lä’yâ. A city in the State of Guanajuato, Mexico, 34 miles south of San Miguel de Allende, on the Río Grande de San Jago, at the junction of the Mexican Central and Mexican National railroads (Map: Mexico, J 7). It has a fine public square and the splendid church of Our Lady of Carmen, completed in 1798, which has a portico with handsome Corinthian columns and a spacious interior in the form of a Latin cross. The city manufactures soap, woolen goods, and saddles, and is noted for its candies. Near the city are thermal springs. Celaya was founded in 1570 and in 1655 was raised to the dignity of a city by Philip IV. It was sacked by the Revolutionists in 1810. Pop., 1895, 21,245; 1900, 25,565.

CEL’EBES (the name of a native tribe). One of the larger islands of the Dutch East Indies, situated east of Borneo between lat. 1° 45’ N. and 5° 45’ S. and between long. 118° 49’ and 125° 5’ E. (Map: East Indies, F 5). It is surrounded by the Celebes Sea on the north, the Molucca Sea on the east, the Flores Sea on the south, and the Strait of Macassar on the west. Its area is 69,273 square miles; including the dependent islands, 77,750 square miles.

In its shape Celebes is not unlike a starfish, the same general form being found also in the adjacent island of Gilolo. It consists of four mountainous peninsulas, of which the northern, Menado, has a length of about 400 miles. Its extraordinary conformation gives it a coast line of 3500 miles, which is longer than that of France and the Iberian Peninsula together. The surface is largely mountainous and reaches

one of its highest elevations in Mount Bonthain, an extinct volcano, situated in the southern part of the island, 10,088 feet high. There are also a number of active volcanoes in the eastern end of the peninsula of Menado, ranging in altitude from 5000 to over 8000 feet. Most of the volcanoes, however, have reached the solfataric stage. The largest river is the Sadang, which rises in the central part of the island and flows through the southern peninsula. It is navigable by small boats, but most of the streams are mere mountain torrents. Lakes are abundant, and hot springs also are found. The west coast is without any very deep indentations, while the eastern and southern coasts have the three spacious inlets of the gulfs of Tomini, Tomori, and Boni.

The climate is tropical, but somewhat modified by the elevation of the surface and the influence of the sea. The rainfall is more abundant in the north than in the rest of the island. Lying in the centre of the East Indies Archipelago, Celebes has great tropical variety and wealth of both fauna and flora. Among the animals peculiar to the island are the tailless baboon, the babirussa, with upper canines curved backward and nearly touching the forehead, and shorter, curving lower canines, the marsupial cuscus, and the sapi-utan, or wild cow, besides several species of small birds. Deer, wild and tame buffaloes, wild swine, sheep, goats, etc., abound, and monkeys are innumerable. The forests include oak, teak, palm, cedar, and upas trees, while the bamboo, which furnishes material for habitations and every sort of implement, and even articles of dress, is everywhere found. Cloves, nutmeg, spices, the tropical fruits, maize, rice, tobacco, sugar, and indigo are easily raised. The coffee crop is not large, but of superior quality. The geological composition of Celebes is only slightly known. The larger part is probably composed of sandstone and limestone resting upon igneous rocks. The minerals of Celebes are gold, iron, salt, copper, zinc, and coal. The coal, however, is of poor quality. The gold is in quartz veins and occurs in deposits of sufficient richness moderately to reward the mining companies, of which there are several. The largest port, Macassar (pop., 26,000), at the south end of the island, commands most of the trade. The second port in importance is Menado (pop., 9000), on the north side of the northern peninsula.

For administrative purposes the northern arm, Menado (and Minahassa), is organized, with the Sangir and Talaut islands, into Residency No. XII, while the west, centre, and south of Celebes, with Sumbawa and other islands, are included in Residency No. XI or Insulinde, or Island India. Residency No. XIII includes eastern Celebes, Gilolo, and the Moluccas and other islands between Celebes and New Guinea. The princes of Celebes have pretty much their own way, being little interfered with by their Dutch residents as long as they pay tribute or bring forward the crops or forest products. Dutch missionary operations have been very successful in this island. The coffee plantations established on the mountain slopes by the Dutch about 80 years ago, together with the revival of cacao culture, have brought much wealth to the natives and their masters. No part of Insulinde has shown better the results of peace, good government, and missionary operations than certain portions of Celebes, especially Minahassa. Of late

years, apart from the business of the government, the imports in the ports, not including Macassar, have averaged over \$3,000,000 and the exports over \$3,580,000, the commerce of the port of Macassar reaching an annual total of \$6,400,000. The chief towns of the island are Macassar, Menado, and Gorontalo.

The population of the island is estimated at 2,000,000, including about 2400 Europeans.

All the natives of Celebes speak languages belonging to the Malay stock. That of the Minahassans in the northeast, however, differs notably from the tongues found in other parts of the island and shows considerable proximity to Philippine dialects, as proved by Professor Brandstetter in the Sarasins' monograph (see below). Culturally the northeast is likewise separated from the rest of the island taken as a unit. This linguistic and ethnographic result is confirmed by somatological study, according to which the Minahassans appear to be related to the Tagalog and other Philippine tribes and even suggest Japanese features. At all events, they may safely be regarded as alien immigrants from the north. So far as the remainder of the population is concerned, it may be positively stated that nowadays there are no traces of any Negroid or Papuan race. On the other hand, the Sarasin cousins distinguish the predominant Toradja type from the Toala, whom they regard as survivors of a very ancient migration from Asia. The Toradja are very closely related to the Dyak of Borneo, the Battak of Sumatra, and the Philippine Igorotes. They include the Bugi and Macassar of the southern peninsula of Celebes, who have indeed founded feudal monarchies and become affected by Mohammedan influence, but are nevertheless physically of the same stock with the pagan Toradja of the central region. The Toala are perhaps the most interesting of all the tribes of Celebes. They are of very short stature (males, 156.1; females, 145.4 cm.), have wavy hair, and present other traits proving kinship with the Veddahs of Ceylon and the Senoi of Malacca. Although somewhat Islamized, they preserve several cultural traits shared with these tribes, such as cave dwellings, ignorance of pottery and metallurgy, while an examination of their old caves by the Sarasins indicates, as further proof of connection, that the Toala were once economically dependent only on the chase and the collection of wild vegetables, and lacked all domestic animals save the dog. The Macassars practice Mohammedanism, much degraded by local superstitions and beast worship, and the abject fear of a local deity. Many are skillful craftsmen and excel in native manufactures, especially rich personal adornments. They have a literature, chiefly romance and drama, besides works of religion and law, translated from the Arabic and originally brought to them by the missionaries of Islam. In Menado 36 tribes were confederated, under Dutch direction, against an aggressive chief, and it is among these people, especially the Minahassans, that Dutch civilization has accomplished valuable results. The Javanese appear to have exerted not a little influence upon the southern portions of Celebes, and certain Hindu traces are also due to them as intermediaries. The women of Celebes are celebrated for the fine bark cloth made by them. Celebes has furnished many settlers for other regions of the Malay Archipelago, the Bugis, in particular, being great travelers

and colonizers, merchants, and seamen. The island was first discovered and named by the Portuguese in 1512, but from about 1607 the Dutch gradually obtained the supremacy, though it was not until well into the nineteenth century that every district was under their control. Consult: Lahure, *L'Île de Célèbes* (Paris, 1879); Wallace, *The Malay Archipelago* (London, 1880); Van der Lith, *Nederlandsch Oost-Indie*, vol. i; Hickson, *A Naturalist in North Celebes* (London, 1889); Staden der Brink, *Zuid-Celebes* (Utrecht, 1884); Fritz and Paul Sarasin, *Versuch einer Anthropologie der Insel Celebes* (2 vols., Wiesbaden, 1905, 1906); id., *Reisen in Celebes* (2 vols., 1905).

CE'LER. One of the two architects—the other one is Severus—mentioned by Tacitus as employed by the Emperor Nero in his great constructive works. They undoubtedly carried out Nero's scheme for a general reconstruction of Rome on a regular plan after the great fire, and were the architects of his colossal "Golden House," the most immense of all Imperial palaces, which swallowed up a large quarter of the city.

CEL'ER'ES. See LEGION.

CELER/IPEDE. See BICYCLE.

CEL'ERY (Fr. *céleri*, Lat. *selinon*, parsley, from Gk. *σέλινον*, *selinon*, parsley) (*Apium graveolens*). A biennial plant of the family Umbelliferae, a native of Europe, now widely cultivated for its leafstalks, which are blanched and eaten raw with salt. One form, celeriac, is extensively grown on the continent of Europe for its turnip-like root. The whole plant has an aromatic flavor.

The celery industry has had a rapid development in the United States during recent years, owing largely to improved methods of culture and transportation. Florida and California now contribute a large supply of late celery to the leading markets. The method of culture now in general use is to sow the seed in a hotbed, or for the late crop, in the open, transplant once or twice, and set in the field in level rows 3 or 4 feet apart and 6 inches distant in the row. Celery intended for summer or fall use is blanched when the plants are well grown by setting up boards about a foot wide against the row on either side; that grown for winter use is blanched by heaping earth against the plants. It is taken up when cold weather comes on and set in pits or a cool cellar, the roots being packed in moist earth so that the plants may continue a slow growth while blanching. In the so-called "new celery culture" the rows are only 6 to 12 inches apart. The plants thus thickly grown are self-blanched and only the outside rows need protection from the light. Celery is generally grown on a moist, rich, peaty soil, well drained and heavily fertilized; but good crops have been grown on fertile clayey and sandy uplands. The crop requires an abundance of moisture and fertilizer. *Celeriac*, or the root form of celery, is handled about like celery, except that it does not require blanching. It is little grown in America except where there is a German settlement. It is cooked and eaten with sauce, used in salads, and pickled. For illustration, see Plate of SALAD PLANTS.

Some 60 varieties of celery are cultivated in the United States. Some are dwarf varieties, scarce 1 foot high, while others grow nearly 3 feet high. The leaves may be green, white, or yellow. Paris Golden or Golden Self-Blanching,

White Plume, Giant Pascal, and Boston Market are among the varieties that are most extensively grown.

Celery Diseases. Celery is subject to a number of destructive parasitic diseases. The rust or sun scald, due to *Cercospora apii*, is recognized by the gray or yellow spots upon the leaves. The spots enlarge, run together, and finally destroy the leaf. The disease is more prevalent in dry situations than in moist ones, and where celery is grown in very dry soils it should be given some shade to prevent this disease. A leaf blight, caused by *Septoria petroselinina apii*, attacks all parts of the plant above the ground, causing watery spots on stems and leaves. Black dots soon appear in these areas and the spores are widely scattered. Attention should be given to plants when setting them out that no diseased ones are used. If the plants are sound when planted, any good fungicide will prevent the spread of either of the above diseases. Damping off is especially troublesome in the South and in seed beds elsewhere. It is due to soil fungi and is favored by too much moisture, overcrowding, etc. A bacterial disease is said to attack some varieties, causing their stalks to become watery and worthless. It also spreads in market, quickly causing the hearts to melt away into a slimy, worthless mass. In the market celery should be kept very dry or else completely submerged in water to prevent this loss.

Consult: Duggar and Bailey, "Notes upon Celery," in *Cornell University Agricultural Experiment Station Bulletin 132* (Ithaca, 1897); Massey, "Growing Celery in the South," in *North Carolina Agricultural Experiment Station Bulletin 83* (Raleigh, 1892); Beattie, *Celery Culture* (New York, 1907).

CELES'TA. A musical instrument invented by August Mustel, of Paris, in 1886. Upon wooden resonators are fastened steel plates struck by hammers manipulated by means of a regular keyboard like that of a piano. The tones are of crystalline purity and have an ethereal quality. The range of the instrument is five octaves, from c^1 to c^5 . In order to avoid the use of many leger lines the music is always written an octave lower than the actual sound. R. Strauss, Tchaikowsky, Puccini, Mahler, and other composers have employed the celesta in some of their scores with much success.

CELES'TIAL CITY. In Bunyan's *Pilgrim's Progress*, the goal of the pilgrim's journey, which was reached by passing through the River of Death.

CELESTIAL EMPIRE, THE. An appellation for China, suggested by the title "Tien Chao" (Heavenly Dynasty), which the Chinese give to their country; whence, also, the term *Celestials*, often popularly applied to the population. See CHINA.

CELESTIAL MOUNTAINS. See TIAN-SHAN.

CELESTINA, thā'lēs-tē'nā. A Spanish prose drama in 21 acts, originally entitled *The Tragic-Comedy of Calisto and Melibœa*, probably begun by Rodrigo Cota, of Toledo, about the middle of the fifteenth century. It was finished by Fernando de Rojas and appeared about 1480. Consult Ticknor, *Spanish Literature* (Boston, 1863).

CEL'ESTINE. The name of five popes. 1. CELESTINE I, Pope 422-32, is supposed to have been a near relative of the Emperor Valentinian. Tradition attributes to him the addition to the

Angelical Salutation: *Sancta Maria, Mater Dei, ora pro nobis*. He sent Palladius to Ireland as the first bishop of that country. 2. CELESTINE II (Guido di Castello), Pope 1143-44. He gave absolution to Louis VII of France, on the King's humble subjection, and removed the papal interdiction from that country. 3. CELESTINE III (Giacinto Bobone Orsini), Pope 1191-98. He is supposed to have been 85 years old when chosen. He crowned the Emperor Henry VI of Germany and subsequently excommunicated him for keeping Richard I of England in prison. In 1192 he confirmed the statutes of the Teutonic Order of Knights. 4. CELESTINE IV (Goffredo Castiglione of Milan). A nephew of Urban III. He was elected Pope by only seven cardinals, Oct. 25, 1241, and died November 10 of the same year. He was the author of a history of Scotland, in which country he was once a monk. 5. CELESTINE V (Pietro di Morone), Pope in 1294. He was the son of a peasant of Naples, became a Benedictine monk, and lived many years in caves, after the manner of John the Baptist. Terrible stories are told of the severity of his penitential discipline. During his hermit life he founded the order that bears his name. (See CELESTINES.) After the death of Nicholas IV he was elected Pope, but refused to accept until persuaded by a deputation of cardinals, reinforced by the Kings of Naples and Hungary. He was chosen July 7, 1294, and was crowned August 29. He issued two decrees, one confirming that of Gregory X ordering the shutting up of the cardinals when in conclave, and one declaring the right of any Pope to abdicate at pleasure—a right which, after ruling five months and eight days, he exercised himself, Dec. 13, 1294. In his document of renunciation he assigned as the moving causes "the desire for humility, for a purer life, for a stainless conscience; the deficiencies of his own physical strength; his ignorance; the perverseness of the people, and his longing for the tranquillity of his former life." Having divested himself of every outward symbol of dignity, he returned to his old solitude; but he was not permitted to remain. His successor, Boniface VIII, sent for him, and, fearing a schism on his behalf, confined him, though with great respect, in the castle of Fumone, where after 10 months he died, May 19, 1296. He was canonized in 1313. Some hold that Dante places him in hell, in the famous passage: "I looked, and I beheld the shade of him who made through cowardice the great refusal" (*Inferno*, iii; and cf. xxvii); but it is not certain that the reference is to Celestine.

CELESTINES. A congregation within the Benedictine Order, founded by Pietro di Morone about 1254, and confirmed by Urban IV in 1264 and 1274. They were known at first as Hermits of St. Damian, but called themselves Celestines when their founder ascended the papal chair under the name of Celestine V. They wore a white garment with black hood and scapular and lived a purely contemplative life. In the thirteenth and fourteenth centuries the order rapidly spread through France, Italy, and Germany, but subsequently decayed. The German convents were mostly destroyed by the Reformation, and the French by the Revolution.

CEL'ESTITE (Lat. *cælestis*, of the sky, then blue, from *cælum*, sky). A strontium sulphate that crystallizes in the orthorhombic system. It is of a white color, though usually with a

faint blue tinge (from which it derives its name) and rarely reddish. The finest crystals are those from Girgenti in Sicily, where it is found with sulphur and gypsum, and from the Put-in-Bay Islands in Lake Erie. It has considerable commercial value as a source of strontium, many of whose salts are used for producing a red light in fireworks. *Barytocelestite* is a variety containing barium, and *calcioccelestite* is a variety containing calcium.

CE'LIA. 1. Mother of Faith, Hope, and Charity in Spenser's *Fairie Queene*. 2. Daughter of the usurper Frederick, and devoted cousin of Rosalind, in Shakespeare's *As You Like It*.

CEL'IBACY (from *celibate*, Fr. *célibat*, Lat. *cælibatus*, eelibacy, from *cælebs*, bachelor). In ecclesiastical history, the abstention from the married state by the clergy and those who have entered upon the monastic life. The Roman Catholic church requires eelibacy on the part of its clergy as a part of its ecclesiastical discipline. It holds that this practice is sanctioned, though not required, by the New Testament, basing this claim upon what it avers to have been the constant tradition of the Church and upon several biblical texts. Catholic writers make a careful distinction between the principles upon which the law of eelibacy is founded and the changes which have taken place in its application. These principles are: (1) that the clergy may serve God with more freedom and with undivided heart, and (2) that, being called to the altar, they may embrace the holier life of continence. This does not imply, it is declared, that matrimony is not a holy state, but simply that eelibacy is a state of greater perfection. Matt. xix. 12, 1 Cor. vii. 32-40, and Rev. xiv. 4 are cited in support of this contention: while the reference in 1 Tim. iv. 3 is taken as clearly directed against Manichean reprobation of marriage in general. It does not follow, however, that the Church is absolutely bound to impose a law of eelibacy upon its clergy.

In Apostolic times there seems to have been no legislation in regard to clerical eelibacy. In the second century the veneration for the virginal life had become widespread, and a continent life for the clergy was regarded as proper to the ecclesiastical office, at least in its major orders. The rule for clerics not to marry after ordination seems to have been in force from very early times, for we find Paphnutius, an Egyptian bishop at the Council of Nicæa (325), while resisting the imposition of a law of continence upon all clerics, declaring the ancient traditional law forbidding clerics to marry after ordination to be sufficient. That this was the recognized practice of the early Church seems well established. The Apostolic Constitutions forbid bishops, priests, and deacons to marry, and the twenty-seventh Apostolic canon contains the same prohibition. The Council of Neo-Cæsarea (between 314 and 325) decreed that a priest who married after ordination should be degraded to the lay state. A deacon could marry only if he had stipulated for such liberty at the time of his ordination, as provided for by the Council of Ancyra in 314. The Council of Elvira (305) legislated against the marriage of all those who served the altar in any way, requiring of bishops, priests, and minor clerics a life of continence, even if they had been already married. It was the application of this law throughout the entire Church against which Paphnutius protested at the Council of Nicæa. Nevertheless, it soon

afterward prevailed in the West. We find it so declared in a letter of Pope Siricius (384), addressed to Himerius, Bishop of Tarragona. The Third Synod of Carthage (397) embodied it in its canons. Pope Innocent I laid it down in his letter to Exuperius, Bishop of Toulouse, who had consulted him in regard to it. St. Jerome (*against Jovinian*) declares that a priest who has "always to offer sacrifice for the people must pray, and therefore always abstain from marriage." Leo, and Gregory the Great, and the Eighth Council of Toledo renewed the prohibitions against the marriage of subdeacons.

The strict enforcement of the law of celibacy in the pontificate of Gregory VII has occasioned much dispute. Protestant writers generally, such as Mosheim, Potter, and Ranke, condemn the action of Gregory as an innovation upon ancient discipline. Catholic writers defend this pontiff, and hold that Gregory's legislation was but the application of the ancient discipline with renewed vigor. There is no doubt that in Gregory's time concubinage was largely prevalent. His immediate predecessors, Leo IX, Nicholas II, and Alexander II, issued stringent decrees against it. But it was Gregory who most vigorously and successfully enforced this legislation. Priests living in concubinage were forbidden to say mass or even to serve at the altar; the faithful were warned not to hear their mass, and deposition was to be the punishment of priests who refused to obey. A series of synods from the beginning of the twelfth century declared the marriage of persons in holy orders to be not only unlawful, but invalid. It was now laid down that if persons in minor orders married they forfeited the privileges of the clerical state. However, Boniface VIII (1300) permitted them to act as clerics, if they had been married only once and then to a virgin, had episcopal permission, and wore the habit of clerics. The Council of Trent renewed this law and again decreed the marriage of clerks in holy orders null and void. In the Western church at the present time holy orders can be conferred on a married man only on the condition that his wife voluntarily and fully consents to a separation, and herself makes a vow of chastity.

The law of celibacy has never been so stringently applied in the East as in the West. Socrates (450) states that the same law of celibacy which prevailed among the Latins also obtained in Thessaly, Macedonia, and Achaia. In 620 the Trullan Synod enacted a decree which required married bishops to separate from their wives and forbade all clerics to marry after entering upon the subdiaconate. In the ninth century a law of Leo the Wise permitted subdeacons, deacons, and priests who had married after receiving orders to remain in the ranks of the clergy, but not to exercise any functions pertaining to their office save in matters of administration. The Russian church has modified the ancient Greek canons prohibiting priests and deacons from marrying after ordination. Up to the time of Peter the Great a priestly widower was obliged to enter a monastery, but this monarch allowed a second marriage, and permitted the man to be employed in a seminary or episcopal chancery. The common custom in the Greek church demands that the secular clergy shall be married once, but, if the wife dies, not a second time. The bishops are usually taken from the celibate monks. Among the United Greeks, Ruthenians, Maronites, and such other

followers of the Oriental rites, in communion with Rome, the following is the discipline: 1. A bishop cannot, after his consecration, either marry again or cohabit with the wife married before ordination. If he has a wife living, she must retire to a distant nunnery, and there be supported by her late husband. 2. Priests and deacons may, in accordance with the Trullan canon, keep the wives taken before their ordination, but they must abstain from marital intercourse for some time before officiating at the altar. Pope Clement VIII (1592-1605) ordered this abstinence to be if possible for seven, or at least for three days. 3. Priests and deacons cannot marry after ordination. Such was the decree of Benedict XIV issued May 6, 1742. Any such attempt at marriage was pronounced null and void. But in the case of converts from schism who were already in holy orders, the same pontiff decreed that the Holy See might permit the retention of a wife taken after ordination.

Celibacy has no doctrinal bearing in the Roman Catholic church, and is regarded as purely a disciplinary law, though as of prime importance in maintaining the character and dignity of the priesthood. Often a dispensation (q.v.) from the obligation of celibacy has been accorded to ecclesiastics under exceptional circumstances, which seemed to warrant a departure from the general law. These circumstances were very often connected with the necessity of providing heirs for noble families which were in danger of becoming extinct. Among others, the following may be mentioned: In 1040 Benedict IX dispensed Casimir, a monk of Cluny, for the sake of the Polish succession. Constance, daughter of King Roger of Sicily, was dispensed from her vows as a nun by Celestine III in 1191 in order to marry the Emperor Henry VI. In 1648 Innocent X dispensed a Jesuit father, John Casimir, who had been elected King of Poland, from the obligation of celibacy in order again to preserve the succession. In modern days the only instance of a validation of priestly marriages is that by Pius VII in the case of the French *Constitutionnels* (the priests who had accepted the civil constitution of the clergy and for a time had been practically separated from Rome), receiving back into regularity, on their submission, those who had married during the Revolution. Dispensations are quite numerous in cases of persons belonging to the military religious orders.

The celibacy of the clergy was rejected by the Protestant reformers. Luther set the example to his followers by marrying a former nun; and both the marriage of ministers and the abolition of monastic vows became a common feature of those bodies which threw off their allegiance to Rome. The Church of England in its articles of religion laid down the proposition that "bishops, priests, and deacons are not commanded by God's law, either to vow the estate of single life, or to abstain from marriage; therefore it is lawful for them, as for all other Christian men, to marry at their own discretion, as they shall judge the same to serve better to godliness." Consult: Schmitt, *Der Priestercölibat* (Münster, 1870); Lea, *Historical Sketch of Sacerdotal Celibacy* (Philadelphia, 1886); Carry, *Le Célibat ecclésiastique devant l'histoire et devant la Conscience* (Paris, 1905).

CELINA. A village and the county seat of Mercer Co., Ohio, 118 miles north of Cincinnati,

on the Cincinnati Northern, the Lake Erie and Western, the Western Ohio, and the Cincinnati, Hamilton, and Dayton railroads, and on the Grand Reservoir (Map: Ohio, A 4). It has a Carnegie library and manufactories of carriages, furniture, etc. The water works and electric light plant are owned by the village. Pop., 1890, 2702; 1900, 2815; 1910, 3493.

CELL (Fr. *celle*, Lat. *cella*). The general meaning, with the Romans as with us, was that of a storeroom or small apartment where objects of any kind were stowed away; the Latin *cella*, however, does not denote a subterranean storeroom, as does the English cellar. *Cella* was also used to denote the inner room of an ancient temple (Greek *ναός*), where the image of the god was placed. In modern architecture, the term "vaulting cell" signifies the hollow space between the principal ribs of a vaulted roof.

CELL. In early Christian usage, (1) a chapel erected over a tomb; or (2) a monastic dwelling either of a single monk or of a community subordinate to an abbey and compelled to pay tithes to it. Its occupants were obliged to present themselves at the abbey at stated times.

CELL (in animals). The morphological and physiological visible unit of the body of organisms. It is essentially the same in plants and animals and is usually of microscopic size. The yolk, or yellow, of a hen's egg is, however, one cell. The name "cell" is something of a misnomer, for it implies a wall-enclosed chamber. But though many cells, especially among plants, are provided with thick walls, these may be entirely absent, and, when present, are usually, in animals at least, exceedingly delicate. Consequently, we regard the cell wall as of less importance than the cell contents, which constitute the more active parts. The cell content is known as protoplasm. The protoplasm consists of two main parts—a centrally placed, usually more or less spherical or ellipsoidal body called the nucleus, and the rest of the protoplasm, called cytoplasm. Nucleus and cytoplasm are each dependent on the other, and both are necessary to cell life. The nucleus is easily distinguished by the circumstance that it contains much substance which is easily stained by various dyes. This stainable substance is known as chromatin. The cytoplasm usually contains relatively large water-filled spaces, called vacuoles, and small particles of food substance and other substances that are easily "stained," i.e., seize upon the coloring matter of dyestuffs when placed in them. In its general structure protoplasm consists typically of water and the truly vital substance called plasma. The plasma exists in a great variety of forms. Frequently it occurs in films surrounding little vesicles of water, as the films of foam surround air spaces, or as the wax of the honeycomb surrounds the honey. Sometimes it seems to extend in fine threads through the water spaces. Still, again, the water spaces may be almost entirely absent. The living, "active" protoplasm seems to be constantly in motion, as can be judged by the motion of the particles which flow in the transparent current. Besides these particles, larger masses, such as drops of oil, pigment bodies, food granules, and excretory bodies, may be seen in the plasma or lodged in the water spaces between the plasma walls.

The cell wall, or cell membrane, is produced

by the cell itself, usually by a transformation of its own substance. It is frequently, at least, to be regarded as still made up of living matter. In many cases, when the cell wall is thick, it can be seen to be perforated to permit of the passage of films of protoplasm by which the adjacent cells are organically connected. In plants where a great weight has to be borne and great rigidity given, the cell wall often gains a great thickness and constitutes the wood of the dead plant.

The *nucleus* is essential to the processes of assimilation and growth and probably controls in these operations. While its general form is subspherical, it may become greatly elongated, lobed, branched, form a series like a string of beads, or appear as two bodies or even as a mass of chromatin, scattered throughout the cell. In the chromatin network lie the chromatic particles and certain larger bodies called nucleoli. There may be many nucleoli, or only one large one. The typical nucleolus is regarded as an excretion product which is eventually cast out of the nucleus. The plasma films separating the nucleus from the cytoplasm are usually very evident, and, taken together, constitute the so-called nuclear membrane. It is of course a living membrane. Outside of the nuclear membrane is often found a minute particle, the centrosome.

Cell Division. The method by which the multicellular body is produced from the unicellular egg was long misunderstood. It was thought that cells crystallized out of a homogeneous matrix, or that new cells were formed inside of the preëxisting cells. It is now known that there is one process of cell multiplication and one only, viz., division of a cell into two equal parts. This division involves all parts of the cell—cytoplasm, nucleus, and centrosome. The method of cell division varies in different cases; two main types may, however, be distinguished—mitotic division, or "karyokinesis," and amitotic division. The mitotic division seems to be the more usual type; so it may be first considered. For purposes of description, four series of stages or phases may be recognized: (1) the prophase, or preparatory changes; (2) the metaphase, or acme of the division process; (3) the anaphase, or aggregation of nuclear material at the centres; (4) the telophase, or those in which the cytoplasm divides and the two new nuclei are established.

(1) *Prophases*.—In the cytoplasm the centrosome becomes double, if not so already, and the two centres move apart. A set of radiations now make their appearance in the cytoplasm—the asters—having the centrosomes at their centres. Between the centrosomes the asters pass over into each other, making a spindle-shaped figure composed of lines—the karyokinetic spindle. At the same time changes are occurring in the nucleus. The chromatin, which has previously consisted of scattered particles, becomes condensed into a deeply staining thread, which is coiled as a twisted or spiral thread within the nuclear membrane (skein or spireme stage). Eventually this thick thread, from which the mitotic process takes its name (Gk. *μῆτρος*, a thread), breaks into a number of deeply staining rods (centrosomes). The number of centrosomes is believed to be constant in each species throughout the whole series of cell divisions in the individual, and is always even. In the threadworm (*Ascaris*) there are 2 or 4 chromo-

somes; in certain liverworts, 8; in certain insects, 12, 16, 20, etc.; in the frog and mouse, 24; in the crustacean *Artemia*, 168; in man, probably 16. The nucleoli are either cast out into the cytoplasm or are gradually dissolved in place.

(2) *Metaphase*.—In this phase the spindle has come to lie in the equator of the nucleus, and the nuclear membrane has disappeared. Each chromosome splits lengthwise in equivalent parts, one-half of each going towards each pole. Consequently, each of the daughter nuclei receives exactly equivalent portions of the chromatic substance of the mother nucleus.

(3) *Anaphases*.—The separated parts of the chromosomes move to the two poles of the spindle, and these group themselves closely together. For a time the spindle fibres still persist as fine threads connecting the chromosomes, and in the middle of their course a plate of fine granules often appears lying across the fibres. The asters fade away, and the process of nuclear division is accomplished.

(4) *Telophases*.—The whole cell now divides, the division plane passing through the plate of granules, which plate helps form the new cell wall. The chromatophores seem to absorb water, swell up, press against each other, and form spherical nuclei. Alongside each nucleus is found the centrosome of the new cell. What are the purpose and the mechanism of mitosis? The purpose is quite certainly the exact division of the chromatic material. Concerning the mechanism there is still much difference of opinion. It seems probable that currents in the plasma films convey the chromosomes from each other and towards the opposite poles. The division of the cytoplasmic body may result from a centripetal flowing towards the centres of the two asters. But we are ignorant of the causes which determine the direction of flow.

Amitotic Division. This consists of a constriction of a nucleus without any formation of chromosomes. After two nuclei are formed the cytoplasmic body may divide. The significance of amitosis is very uncertain. It is especially common among cells that are about to perish; it seems to be induced by peculiar conditions of the cytoplasm.

The History of the Cell Theory. The first investigations into the finer structure of organisms were made by Malpighi and by Grew, at the end of the sixteenth century, upon plants. They discovered in them small, fluid-filled spaces with firm walls. But it was not until the early part of the nineteenth century that the general notion that the whole body of the higher organisms was composed of a mass of cells was gained. This generalization became established by Schleiden and by Schwann in 1838. The importance of the cell contents was not at first appreciated, but when they were found in constant motion in the live plant cell (Corti, 1772, and Treviranus, 1807), the idea that they were the essential living substance came to prevail. The name "protoplasm" was first assigned to the cell contents by Mohl (1846). Gradually, as cells without walls were discovered, the idea of cell took on this form—a mass of protoplasm possessing a single nucleus.

The *chemical composition* of protoplasm throws little light on vital action, although vital action is a chemical process. The reason is that the form of the molecules rather than the quantitative analysis or the enumeration of the

elements is at the basis of life. Carbon, hydrogen, oxygen, nitrogen, are always present, and sulphur, phosphorus, potassium, and certain other alkalies and metals are usually found in small quantities. The dead protoplasm consists chiefly of albuminous substances, including nuclein, 34 per cent; lecithin and fats, 14 per cent; various albuminoids, 14 per cent; and, for the rest, numerous other substances.

Cell Activity. Cells, apart from the process of division, show active processes in their protoplasm, especially by their capacity for movement and response to stimulus. Cell movement takes on diverse forms according to circumstances. In naked, free cells, like the amœba, the most evident movements are the throwing out of blunt, finger-like processes (pseudopodia). If one of these takes the lead, it determines the direction of locomotion of the whole cell, for the rest of the body flows into the pseudopod. Often the pseudopodia are numerous and extremely fine; under these circumstances minute particles may be seen streaming in the current of the protoplasm which moves along the thread. In the case of cells with a firm wall, the protoplasm often streams in fine threads through the fluid-filled cell space, or in other cases a marvelous rotatory movement is seen. The causes of protoplasmic movement are not altogether clear. Recently, however, attention has been called to the fact that other foamy masses—especially a drop of oil filled with vesicles of water—will send out pseudopodium-like processes. So that the constant movement of the protoplasm may be the physiological concomitant of its unstable structure. Other forms of cell movement are the lashing of whips (flagella) or little hairs (cilia) covering the free swimming cell (Protozoa and Protophyta).

Response to Stimulus. Irritability is a fundamental property of protoplasm, so we find it present in unicellular organisms and in the tissue cells. Protoplasm is active only within certain limits of temperature, beyond which quiescence—heat rigor or cold rigor—occurs. Protoplasm (of Myxomycetes) will flow with reference to a source of heat—towards that temperature to which it is most "attuned." The direction of light rays may also determine the direction of locomotion. When a ray of white light passes obliquely through an amœba, the latter moves from the source of light. Also, the chlorophyll bodies of a leaf will move away from the surface which is too intensely illuminated. Likewise the electric current, gravity, contact, and chemical agents may awaken definite responses in cell protoplasm.

The forms assumed by cells are most diverse. In the animal's body they are united to form tissues, and the cells of each kind of tissue have their peculiar form. The cells of the skin are flattened or cuboidal; those lining the food canal are columnar; muscles are composed of elongated compound cells, and nerves give rise to processes that may be 2 feet or more in length. These kinds of cells will be considered under HISTOLOGY.

The Germ Cell. The egg and the spermatozoön, the union of which is the initial act in sexual reproduction, are each single cells, derived, like the other cells of the body, by the division of preëxisting cells. The two kinds of germ cells are, however, very different in appearance and function. The egg cell (ovum) is of great size, due to the fact that it is stuffed full

of food material, the so-called yolk. The nucleus is large, and is commonly called the germinative vesicle, and in its open-meshed films the chromatic material is lodged. The entire egg is often inclosed in one or more envelopes for its protection. The spermatozoon is of extremely small size. It is typically a threadlike cell, enlarged at one end to form the head. Behind the head is the middle piece, followed by the lash or tail. The head contains the nucleus, which is here dense, without water, but consisting almost wholly of chromatin. The middle piece seems to contain the centrosome. The outer envelope of head and middle piece and the whole of the tail are cytoplasmic, and play only an incidental part in the fertilization of the cell. See FERTILIZATION.

Seventh Inter. Zool. Congress* (Boston, 1912).

CELL (in plants). In its most fundamental characters the plant cell closely resembles the animal cell. Like that, it possesses a nucleus and cytoplasm, and may or may not be surrounded by a cell wall. Nearly all cells are microscopic in size, a fair average being about 0.004 to 0.002 inch in diameter. Some cells, however, become much elongated, bast cells over 0.2 inch in length having been reported, and the internodal cells of *Chara* sometimes reaching a

CELL: 1, a cell showing wall (*w*), cytoplasm (*j*), vacuoles (*v*), nucleus (*k*), and nucleolus (*n*); 2, cell with heavy wall (*w*), and an elongated nucleus (*k*) with two nucleoli (*n*); 3, cell in late stage of division, paranucleus (*p*), chromosomes (*x*), equatorial plate (*u*); 4-5, same lettering; 6, a spindle showing centrospheres (*z*), spindle fibres (*y*), and chromosomes (*a*).

length of 2 inches. On the other hand, the cells of the yeast plant are only 0.00032 inch in diameter, and the bacteria are much smaller. When cells are free, there is a tendency to assume the spherical form, and this is the most usual shape in one-celled plants; but where the cells are aggregated into tissues various modifications are met, the cells becoming compressed, elongated, flattened, star-shaped, etc.

In all except a few of the lowest plants the cell has a wall of cellulose, a substance derived from the protoplasm. As growth proceeds, the original wall of cellulose may become modified, the various changes being called lignification, suberization, etc. In spores the outer portion of the wall usually develops spines, furrows, and various sculpturings, that are sufficiently constant to be of value in classification. The internal modifications of the cell wall are no less numerous and striking. Sometimes there is a uniform thickening, but more commonly the thickening is irregular and results in the appearance of striations, spirals, rings, reticulations, and different forms of pits.

Contents. The most important contents of the cell are the nucleus and the cytoplasm, but besides these various other things may be present, such as plastids, starch grains, crystals, oil drops, sap, etc. *Plastids* are differentiated portions of the cytoplasm, and it has been believed by many that they are permanent organs of the cell, passed on from one cell generation to another, and it is undoubtedly true that they divide and may persist throughout the greater part of the life history of a plant; but whether they are present in the initial cell of the plant or not is a serious question, and if not, it must be admitted that they may be formed *de novo* from the cytoplasm. Colorless plastids are called "leucoplasts," and colored ones "chromatophores." If a chromatophore contains chlorophyll (the green pigment) it is called a "chloroplast," but if it contains any other coloring matter it is a "chromoplast." The function of the leucoplast is to produce starch, but if light conditions are favorable the leucoplast may be converted into a chloroplast. Chloroplasts vary greatly in form, in size, and in the number found in a single cell. In the higher plants they are small flattened or discoid bodies, and many are usually found in a single cell. However, in *Anthoceros* (a liverwort) and *Selaginella* (little club mosses), there is only one in a cell. The greatest variety of forms is found among the seaweeds (*Algæ*), where there are not only the small discoid forms, but also flattened plates, coiled bands, etc. The chloroplasts, like the leucoplasts, produce starch, but they are also able to manufacture carbohydrates in the presence of light (photosynthesis, q.v.). *Starch grains* vary in form and size. While the size may vary greatly with age, the form is usually characteristic of a given plant. The starch formed by the chloroplasts is in the form of very small granules, which do not become large grains, but disappear when light is removed, and are probably carried to other portions of the plant. The ordinary starch grains are developed in plastids. *Crystals* composed of calcium oxalate are widely distributed. In form they are prismatic, cubical, octohedral, acicular, etc. Those which are needle-like in form are called "raphides." *Cystoliths* composed of calcium carbonate are much less common.

Cytoplasm and Nucleus. These are the living portions of the cell. So far as known, there is no difference in the structure of the cytoplasm of animal and plant cells. The nutritive portion of the cytoplasm has been termed the "trophoplasm," and the threadlike portions which are particularly concerned in cell division and other phenomena of motion are called "kino-plasm." The bounding ("limiting") layer of the cytoplasm is called the "Hautschicht." While

cells are young, the cytoplasm fills the entire space between the nucleus and the cell wall, but as the cells increase in size vacuoles (apparently empty spaces) appear, and the cytoplasm merely forms a wall layer connected with the nucleus by constantly shifting strands.

Nucleus. The nucleus is an exceedingly complex structure. An undoubted nucleus has been demonstrated in all groups of plants except in the bacteria, and even here nuclei are being reported. From the seed plants down to the algæ a single nucleus in a cell is the rule, but there are many exceptions. The absolute size of nuclei is exceedingly variable. As a rule, it may be said that large cells have large nuclei. The nuclei of reproductive cells are generally larger than those of the vegetative cells of the same plant. The nuclei of the lilies, orchids, and conifers are usually large, while those of mosses and dicotyledons are small. For example, the nucleus of the egg of the common Austrian pine (*Pinus laricio*) can be seen with the naked eye, being 0.006 inch in diameter, and the nucleus of the egg in some cycads reaches a diameter of 0.02 of an inch; while the nuclei of some of the fungi are scarcely 0.00008 inch in diameter. The nuclei of the lilies, which are seldom more than 0.002 inch in diameter, may be regarded as unusually large, and they have been studied more than any other plant nuclei.

Form of Nucleus. The nucleus in young cells is usually spherical, but as cells grow older its form may change in innumerable ways. When cells become elongated, as in the development of vascular tissue, the nuclei may also elongate, the length becoming 100 times as great as the breadth. In the mucilaginous sap of some amaryllises nuclei have been observed in which the length had become more than 5000 times as great as the breadth. In the endosperm of Indian corn the nuclei acquire remarkable reticular forms, while in some of the stonecrops (*Sedum*) they become variously lobed. In some pollen grains one of the nuclei becomes so amœboid in form that it is easy to believe that it may be capable of amœboid movements, and in one of the slime molds such movements have actually been observed.

Division of Nucleus. It is accepted that a nucleus never arises *de novo*, but only by the division of a preëxisting nucleus. The principal structures concerned in division are the chromosomes, the spindle (achromatic figure), and, in some plants, the centrosome. The last structure, however, is not so constantly present as in animals, and many believe that it does not exist at all in the fern plants (pteridophytes) and seed plants (spermatophytes). In the cells which produce pollen grains the spindle first appears as a web of fibres surrounding the nucleus, which become grouped into cones forming a multipolar spindle, that gradually becomes bipolar. In ordinary vegetative cells the spindle is bipolar from the start, making its appearance as a pair of dome-shaped caps at opposite poles of the nucleus. The chromatin is generally regarded as the most important part of the nucleus, as it is believed to be the morphological basis of heredity. During division the chromatin assumes the form of a narrow band which divides into a definite number of more or less elongated pieces, the chromosomes. The number of chromosomes is constant in a given species, and the number in the sexless generation (sporophyte) is always double the number found in

the sexual generation (gametophyte). The reduction in number takes place during the formation of spores. When the nucleus of the sperm fuses with that of the egg, the double number is restored. The splitting of the chromosomes in the vegetative divisions, and perhaps also in the divisions concerned in the reduction of chromosomes, is longitudinal. Some of the fibres of the spindle become attached to the chromosomes, half the number being drawn to one pole and half to the other, while a series of granules, the beginning of a new cell wall, appears on the fibres which stretch between the young nuclei. The wall becomes completed as the fibres disappear. In the formation of the endosperm of seeds, and in some other cases, nuclear division may take place without being followed by the formation of a cell wall—a phenomenon called free nuclear division. See FERTILIZATION; CYTOLOGY.

CEL'LA (Lat., cell). The name applied to the central chamber, or *naos*, of a Greek or Græco-Roman temple. See CELL; TEMPLE.

CELLAMARE, thā'lyā-mā'rā, ANTONIO DEL GIUDICE, DUKE OF GIOVENAZZO, PRINCE OF (1657–1733). A Spanish diplomat, born in Naples, a grandee of Spain, son of the Duke of Giovenazzo, and nephew of the Cardinal del Giudice. He was trained at the Spanish court and during the War of the Spanish Succession was an active partisan of Philip V. In 1715 he was appointed Ambassador to France, where he was the leading figure in the conspiracy to effect the overthrow of the Duke of Orleans and obtain the French regency for Philip V. Although the plot was discovered in time to prevent its being carried out, the discovery brought to light such high offenses against the government of the regent that the latter was obliged to declare war on Spain, Jan. 9, 1719; a war which was disastrous for Philip V. When arrested, Cellamare appealed to the Corps of Diplomats to save his house from being examined by the authorities, but the Diplomats declined to interfere, as they recognized that the French government was acting well within its rights, and even generously, since, instead of keeping Cellamare in prison it conducted him to the frontier and set him at liberty. Consult Martens, *Causes célèbres du droit des gens* (2d ed., Leipzig, 1861).

CELLA'RIOUS, CHRISTOPH (1638–1707). A German classical scholar, born in Schmalkalden (Hesse-Nassau). He was educated at the universities of Jena and Giessen and, after holding posts as instructor or rector in various gymnasias, was appointed professor of history and eloquence at Halle in 1693. By his manuals he promoted the knowledge of ancient grammar, style, geography, and history, and by his editions of Latin authors greatly encouraged classical studies in Germany. Among his works are *Orthographia Latina* (new ed. by Harles, 2 vols., 1768) and *Notitia Orbis Antiqui* (new ed. by Schwarz, 2 vols., 1773). Consult Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

CELLE, tsël'le. A town in the Prussian Province of Hanover, situated on the left bank of the navigable Aller, 23 miles northeast of Hanover (Map: Prussia, D 2). It consists of the old town and of a number of suburbs annexed to it during the second half of the nineteenth century. Among the notable buildings are the castle, formerly (1369–1705) the residence of the dukes of Brunswick-Lüneburg; a

number of old churches with monuments of royal personages; the Rathaus, dating from the sixteenth century; and a museum with a complete collection of old army uniforms. A Catholic church contains the vault of the dukes of Brunswick-Lüneburg. The chief products of the town are woolen yarn, printer's ink, soap, tobacco, honey, and wax. It has a considerable trade in lumber and salt. Celle is the seat of the supreme court of the province, and has a forestry school, a gymnasium, a library of over 50,000 volumes, including a number of manuscripts. Pop., 1890, 18,901; 1900, 19,872; 1910, 23,300.

CEL'LIER, ALFRED (1844-91). An English musician, born at Hackney. He was appointed organist of All Saints', Blackheath, in 1862, and of St. Albans, London, in 1868. From 1877 to 1879 he was the conductor of the Opera Comique, London. His works include some popular songs and part songs, compositions for piano-forte and orchestra, and several operettas and operas, including *The Tower of London* (1875), *The Sultan of Mocha* (1876), *The Spectre Knight* (1876), *In the Sulks* (1880), and *The Mountebanks* (with book by W. S. Gilbert; presented in 1892). He also set to music (1881) Longfellow's *Masque of Pandora* and (1883) Gray's *Elegy*.

CELLINI, chĕl-lĕ'nĕ, BENVENUTO (1500-71). The most eminent Italian goldsmith of the high Renaissance; also one of its most important sculptors. He was born in Florence, Nov. 1, 1500. In compliance with the wishes of his father, Cellini devoted himself to music until his fifteenth year, but his desire to learn designing prevailed, and he became a pupil of the goldsmith Michelangelo Bandinelli, the father of his lifelong rival, and then of Marconi. He studied also after Michelangelo, copying his famous cartoon of the "Bathing Soldiers." After various adventures and further study, in 1523, as the result of a duel, he was forced to leave Florence, and after wandering from town to town finally went to Rome. Local goldsmiths gave him occupation, and he finally secured the patronage of Pope Clement VII. He soon became recognized as the greatest worker in precious metals of his time. From his autobiography we learn that he was also initiated in "the mysteries of the brass foundry, the methods of hammering iron, the secrets of chiseling steel for medals, and casting dies. . . . Enameling and niello formed special branches of his craft; nor could architecture be neglected." He was employed to fashion silver vases, to design medals and settings for jewels, to enamel book-bindings, cast portraits in bronze, and decorate sword blades—in fact, to exercise his perfect art on court trappings, palace decorations, and the personal adornment of those who figured in the splendid society that existed in the halcyon days of the Renaissance. Nor did his commissions prevent further artistic studies after Michelangelo, Raphael, and the antique. Cellini was in Rome when it was besieged by the Constable de Bourbon, and, according to his own account, it was he who killed both the constable and the Prince of Orange. After the sack of the city he went to Florence, where he was chiefly engaged in designing medals, to Mantua, and then returned to Rome. There he worked under Michelangelo and was again employed by the Pope, especially in designing coins. The murder of a rival in 1534 compelled him to flee from Rome. But after a brief visit to France he

again returned, only to be thrown, on a false accusation of defalcation, into the castle of St. Angelo, from which he escaped with great peril. Subsequently, in 1540, Francis I invited him to his court, and Cellini stayed in France five years, the recipient of a pension and title from the King. Aided by numerous assistants, he executed many commissions for the King, such as the bronze relief of the "Nymph of Fontainebleau" (now in the Louvre), a fine specimen of his work, and the celebrated saltcellar mentioned below.

Upon his return from France, where he had alienated himself from every one at the court by his quarrels and eccentricities, Cellini went to Florence, and found a friend there in Duke Cosimo de' Medici. The remainder of his life was spent in Florence, in constant rivalry with the sculptor Bandinelli and in various affrays and adventures. In his fifty-eighth year he began to write his autobiography, and during this time he shaved his unsanctimonious head and retired to a monastery. But two years afterward he returned to the reckless life of his youth. He died in Florence, Feb. 25, 1571, and was buried in the church of the Annunziata.

Most of his surviving sculptures were executed during this last Florentine period. The principal of these is the bronze statue of "Perseus with the Head of Medusa" (1445-54), which is still standing in the Loggia dei Lanzi, Florence. Although a marvel of technical excellence and beautiful in conception, the statue lacks in simplicity of modeling and breadth of treatment and is overwrought in detail. In the four niches of its highly decorative base are small figures of gods unexcelled by anything of the kind in Italian art—and a relief of "Perseus rescuing Andromeda," the original of which is now in the Bargello. The account in his *Autobiography* of the casting of this statue is a classic. Other important statues are the colossal bronze bust of Duke Cosimo I (1545-48, Museo Nazionale, Florence); the bronze bust of Bindo Aldoviti (1566, Gardner collection, Boston); the life-size "Crucifixion" intended for his own tomb, with the figure of Christ in white marble and the cross in black (1562), now in the Escorial. Of the many bronze statuettes ascribed to him we mention only the smaller version of the Perseus (Daviel collection, Paris), and "Ganymede with the Eagle" (Museo Nazionale, Florence).

As a goldsmith Cellini stands unrivaled among the sculptors of the Renaissance. Here his rich decoration and elaborate detail are in place. Unfortunately nearly all of his masterpieces have been melted down. The saltcellar of Francis I (now in the Museum of Vienna) is regarded as his greatest production. It is of embossed gold and enamel, ornamented with figures of Neptune and Cybele in high relief. It was in such examples of decorative work that Cellini excelled. That which required the skill of a perfect craftsman appealed most readily to his imagination. Many beautiful works of the goldsmith's art have been attributed to him with greater or less likelihood, among which are two exquisite cups in the J. P. Morgan and the Altman collections—both now in the Metropolitan Museum of Art, New York. Among his masterpieces, which through stress of time were melted down, was the gold cope button for Clement VII set with precious stones, including the second largest diamond in the world. Cellini

BENVENUTO CELLINI

“PERSEUS”

FROM THE STATUE IN THE LOGGIA DEI LANZI, FLORENCE

was also the first medalist of his day, in such works as "Hercules and the Nemean Lion," in gold repoussé; "Atlas supporting the Sphere," in chased gold; and medals of Clement VII and Francis I. But Cellini's greatest fame is due not to his art but to his well-known *Autobiography*—an invaluable narrative, not only as an account of his own turbulent, brilliant career, but as a vivid picture of the life and civilization of the Renaissance. The *Autobiography* is, moreover, a highly important monument of literature. Cellini lived in a time when the passions of men were uncontrolled, and Cellini himself embodied them all. His acts of hatred, theft, murder, and sensuality are all set forth in writing, and he also portrays in strong phraseology the scenes, political, social, and ecclesiastical, that made up the history of his contemporaries. Besides the *Autobiography* he wrote a valuable treatise on the goldsmith's craft and on sculpture (1568), with wood engraving after his own designs; modern edition by Milanese (Florence, 1857).

Bibliography. The best Italian edition of his *Autobiography* is by Bacci (Florence, 1900); Eng. trans., *The Life of Benvenuto Cellini*, by Symonds (London, 1896), and by Cust (2 vols., ib., 1910). The classic monograph on Cellini with illustrations of all his works is by Plon (Paris, 1882; supplement, 1884). Others are by Molinier in *Les artistes célèbres*; Focillon, in *Les grands artistes*; Supino (Florence, 1904); Torelli (1903); De Bouchard (Paris, 1903); Gailly de Taurines (ib., 1908), and Darvai (Budapest, 1907). See also the monographs on Italian medals and medalists by Heiss (Paris, 1887), Friedländer (Berlin, 1880–82), and Supino (Florence, 1899).

'CELLO. See VIOLONCELLO.

CELL OF PEAUCELLIER, pô's'-lyá'. See LINKAGES.

CELLULAR TISSUE. See CONNECTIVE TISSUE; HISTOLOGY.

CEL'LULI'TIS (Neo-Lat., from Lat. *cellula*, dim. of *cella*, cell). Inflammation of the subcutaneous areolar and connective tissue, presenting successively œdema, swelling, hardness, bogginess, fluctuation, suppuration, and sometimes sloughing. It is caused by pus germs, which find their way into the tissues through a wound, or septic matter as from snake bite. Cellulitis is peculiarly liable to follow scalp wounds and may complicate operative wounds, or injuries incident to parturition. The pain is severe, and there are generally somewhat grave constitutional symptoms, as fever, severe headache, nausea, prostration, loss of appetite, and general weakness. Salines, iron, and sometimes stimulants are useful, with incisions to relieve tension or let out pus. Disinfection of all small wounds is a valuable preventive. See PHLEGMASIA.

CELLULOID, sĕl'û-loid (Lat. *cellula*, little cell, dim. of *cella*, cell). A substance of modern invention widely used in the arts as a substitute for ivory, leather, and for many other purposes. It consists of a mixture of nitrocellulose in the form of pyroxylin and camphor. A substance derived from pyroxylin and intended to replace India rubber, gutta-percha, was first made in England by Alexander Parkes, of Burry Port, Wales, in 1855, and was given the name *parkesine*. The modern celluloid was invented and patented in America (U. S. Letters Patent No. 88,634) in 1869 by the Brothers Hyatt of Newark, N. J., and works conducted

by them under the name of the Celluloid Manufacturing Company were the first to manufacture the product on a large scale. Celluloid is obtained by mixing gum camphor with pyroxylin (guncotton pulp) in the proportion of about two parts of pyroxylin to one of camphor. There are two methods: the dry method, where the pyroxylin, after being well washed and dried, is ground fine under water, and after the removal of the water is subjected to great pressure. It is then well mixed with 40 to 50 per cent of camphor, while the coloring material is added. The mass is subjected again to very great pressure and heated by steam to about 130° C. The melted camphor dissolves the nitrocellulose, and celluloid is produced, which remains in the press for a while and is then dried. The second, or wet, process is to dissolve the finely admixed pyroxylin and camphor in methyl alcohol or in ether and then add alcohol, after which an antacid such as urea is added. The mass is then worked in a masticating machine until it becomes plastic, when it is worked for an hour between cold rollers, and then between rollers which are slightly heated. The mass is next subjected to hydraulic pressure for 24 hours in a room kept at a temperature of 70° F. It is then cut into sheets of the desired thickness and allowed to dry for 14 days. It is also applied to other materials, such as cotton, linen, or paper. Celluloid varnishes for lacquering on metal are also extensively manufactured. These are solutions of pyroxylin in mixtures of wood naphtha, acetone, and amyl acetate. Any color can be given to celluloid by the use of coloring matter during the process of manufacture. Some of the advantages of celluloid, besides its cheapness and durability, are that it takes a high polish, does not warp or discolor, and is impervious to moisture. As ordinarily manufactured, it is highly inflammable; but various modifications of the original processes of manufacture have been made, largely by the use of mineral fillers or other esters of cellulose in place of the very inflammable nitrate.

Bibliography. See Martin, *Industrial and Manufacturing Chemistry—Organic* (New York, 1913); Worden, *Nitrocellulose Industry* (London, 1911); Masselon, Roberts, Cellard, *Le celluloid* (Paris, 1910; Eng. trans. by Hodgson, London, 1912); Ertet, *Die Celluloid Industrie* (1909); Bockman, *Celluloid* (London, 1907); Lehner, *Imitationen* (Vienna and Leipzig, 1907).

CELLULOSE, sĕl'û-lōs (from Lat. *cellula*, dim. of *cella*, cell). The chief constituent of the cell wall of all vegetable cells. These walls constitute the plant skeleton and also form a protective covering for the sensitive, living protoplasm. The term "cellulose" covers a number of bodies of similar chemical nature, the relative composition of which may be represented by the empirical formula $C_6H_{10}O_5$; their molecular structures are, however, exceedingly complex, probably much more so than that of starch, to which the celluloses are chemically allied. In nature cellulose is normally combined with woody, fatty, or gummy substances. A typical form, from which pure cellulose can be easily isolated by chemical methods, exists in cotton and flax fibres. Certain plants, such as peas and beans, the *Coffea arabica* and the *Cocos nucifera*, store reserve food in their seed walls as a pseudocellulose, which in this form undergoes hydrolysis more readily than other cellu-

loses. With some exceptions in the insect world, true cellulose is not found in animal tissues. Although considerable quantities of it are digested and absorbed by the herbivora, the amount which man assimilates is usually relatively small. No digestive enzyme has been observed in the animal body having a specific action upon cellulose; it is considered probable that for its disintegration a coöperation of the living cell wall of the intestine and bacteria of the alimentary tract are necessary. The chief value of its digestion by the animal organism has been assumed to consist in this: that the true food-stuff of the plant cells is liberated and rendered available.

Cellulose makes up more than one-third of the entire vegetable matter in the world. Its stability is so great that considerable quantities are preserved unaltered through the process of formation of coal, in which its presence may be demonstrated by means of suitable reagents. It is manufactured on a large scale from wood, cotton, linen rags, hemp, flax, and similar materials of vegetable origin. Being insoluble in all ordinary solvents, it may be readily separated from the other constituents, which are soluble in water, alcohol, ether, dilute alkalies, or acids. It is soluble in an ammoniacal solution of cupric oxide (Schweitzer's reagent), from which it separates out in a pure state on addition of acid; the precipitate is washed with alcohol, and the cellulose is thus obtained in the form of a white, amorphous powder.

The action of sulphuric acid on cellulose depends largely on the concentration of the acid. Moderately dilute sulphuric acid transforms it in the cold into "hydrocellulose," a friable substance soluble in water. This fact is applied in a process called "carbonization," by which cotton fibres are removed from cast-off cotton-woolen material, the wool of which is to be rewoven. If cellulose is dissolved in strong sulphuric acid and the solution is diluted with water, a gelatinous mass separates out, known as *amyloid*, which, like starch, is colored blue by a solution of iodine. In the preparation of vegetable parchment unsized paper is immersed for a few seconds in concentrated sulphuric acid, and then immediately washed with water. A film of amyloid forms over the surface, which on pressing and drying gives a tough, durable paper, less permeable by liquids. Another transformation of cellulose, effected by sulphuric acid, may be mentioned here: if digested with strong acid, it is converted into glucose.

When cellulose has been treated with an alkali, as in the *mercerizing* process, and then exposed to the fumes of carbon disulphide, it goes into solution as cellulose xanthate. By further treatment this solution yields *viscose* films and threads, the latter known as "viscose silk." Viscose is used also for sizing, water-proofing, in textile printing, and mixed with metallic dust and coloring matter furnishes an artificial leather. *Viscoid*, which is a hard mass obtained by mixing viscose with various substances, is used for moldings, cornices, etc. *Cellulose acetates* are also obtained by the action of acetic anhydrides on cellulose in the presence of sulphuric acid. These acetates find numerous applications as films and insulating coatings.

With strong nitric acid cellulose forms explosive nitrates known as nitrocelluloses, the composition of which depends on the strength of the acid employed and the duration of the

reaction. *Collodion* is a solution mainly of the trinitrate and the tetranitrate of cellulose in a mixture of alcohol and ether. Besides its importance in medicine, photography, and in many other ways, collodion forms the basis for a well-known form of artificial silk, that of Chardonnet or Lehner. By dissolving in molten camphor the nitrates employed for collodion, *celluloid* is produced. *Guncotton* is a hexanitrate of cellulose, obtained by the prolonged action of a mixture of concentrated nitric and sulphuric acids. *Blasting gelatin* is guncotton mixed with nitroglycerin; mixed with other substances, guncotton enters into the composition of many smokeless powders.

If distilled in retorts, out of contact with air, cellulose is decomposed with formation of methyl alcohol, formic acid, acetic acid, acetone, and various hydrocarbons. All of these products are obtained also in the destructive distillation of wood. The most important use of cellulose, by far, is in the manufacture of paper. For cheaper grades of paper, the impure cellulose of wood pulp is employed; better grades are manufactured from cotton and linen rags. Consult Bersch, *Cellulose* (Philadelphia, 1904); Cross and Bevan, *Researches on Cellulose* (London, 1895, 1901, 1906, 1912); Cross, Bevan, and Sindall, *Woodpulp and its Uses* (London, 1911); Worden, *Nitrocellulose Industry* (London, 1911); Schwalbe, *Die Chemie der Cellulose* (Berlin, 1912).

CELMAN, sāl'mán, MIGUEL JUAREZ. See JUAREZ CELMAN, MIGUEL.

CELSIUS, sěl'sī-ŭs or sěl'shī-ŭs, ANDERS (1701-44). A Swedish astronomer, born at Upsala. From 1730 to 1744 he was professor of astronomy in Upsala University. He undertook a journey to prominent observatories of Europe in 1732 and in 1740 built the observatory at Upsala and was appointed its director. In 1733 he published a collection of 316 observations, most of which he had made himself, of the Aurora Borealis. In 1737 he took part in the French expedition sent to measure one degree of meridian in the polar regions. He was one of the first to call attention to the subsidence of the sea level off the northern coast of Sweden and urged the introduction of the Gregorian calendar to supersede the Julian. In his monograph *On the Measurement of Heat* (1742) he presented the first idea of the centigrade, also known as the Celsius, thermometer. He published, among other scientific treatises, *De observationibus pro figura Telluris determinanda in Gallia habitis disquisitio* (Upsala, 1738).

CELSIUS, OLOF VON (1716-94). A Swedish historian. He was born in Upsala, where he became professor of history in 1747. He was appointed Bishop of Lund in 1777. In 1742 he founded the first literary journal in Sweden. His works on Gustavus I and Eric XIV are characterized by careful investigation and strict truthfulness. He died while engaged upon his celebrated work, *Svea rikes kyrkohistoria*, which is the first attempt at a compilation of Swedish church history. Two of his best-known histories are *Konung Gustaf I's historia* (1746-53) and *Konung Erick XIV's historia* (1774).

CEL'SUS (Gk. Κέλσος, *Kelsos*). A Greek philosopher of the second century, the earliest literary opponent of Christianity. He wrote, in 177 or 178, an attack on Christianity, called *Λόγος Ἀληθής*, or *A True Discourse*. This work

has been lost, but by means of Origen's reply, the *Contra Celsum*, it has been ingeniously reconstructed by Keim (*Celsus wahres Wort wiederhergestellt*, 1873). See ORIGEN.

CELSUS. One of the adventurers, fancifully styled by Trebellius Pollio the "Thirty Tyrants," who, between 260 and 267 A.D., rose to usurp the Imperial throne of Rome. A military tribune, resident in Africa, he was proclaimed Emperor by Vibius Passienus, proconsul of the province, and others; but on the seventh day of his ill-starred reign he was murdered in Sicca.

CELSUS, AULUS CORNELIUS. A Latin physician and writer, who flourished probably in the reign of Tiberius. He was called the Roman Hippocrates (q.v.), because he generally followed the great "father of medicine," and introduced the Hippocratic system among the Romans. Celsus wrote not only on medicine, but also on rhetoric, history, philosophy, the art of war, and agriculture. His style is succinct and clear, but full of Græcisms. Only part of his encyclopædic work survives, the *De Medicina*, which is divided into eight books. The portions relating to surgery are exceedingly interesting and valuable, because Celsus has there given an account of the opinions and observations of the Alexandrian school of medicine. The standard edition is that of Daremberg (Leipzig, 1859). It has been translated into English by J. Grieve (3d ed., Edinburgh, 1837).

CELT. An implement used among the primitive peoples of every part of the world. The term is from the Welsh *cellt*, which signifies a flint, or flintstone—a typical form of the implement. In developed form it is a chisel or grooveless axe of any hard stone, used either with or without a haft, in the former case hafted either in line with or transverse to its length and edge. In its nascent form it is an elongated pebble or other stone of convenient size, used in the hand with centripetal (i.e., inward and downward) strokes. Next to the hammerstone it is the most primitive implement used by man. For illustration, see ARCHÆOLOGY, AMERICAN.

CEL'TIBE'RI (Lat. nom. pl., from *Celtus*, Celt + *Iberus*, Iberian, Gk. *Κελτιβηρες*, *Keltibêres*). A powerful people of ancient Spain, supposed to have sprung from a blending of the Iberians or Spanish aborigines with Celtic invaders from Gaul. They inhabited a large inland district, corresponding to the southwest half of Aragon and the northern and eastern parts of Castile, but the name "Celtiberia" had often a wider signification, including the country as far south as the sources of the Guadalquivir. The Celtiberi were divided into four tribes, and were unquestionably one of the bravest and noblest peoples in the peninsula. Their cavalry and infantry were equally excellent. They were finally conquered by the destruction of Numantia, one of their chief towns, by Scipio Africanus Minor in 133 B.C. They later joined Sertorius, but after his death became quite Romanized in customs, language, and dress.

CELTIC, sêl'tik, or **KELTIC**, kêl'tik, **CHURCH** (Lat. *Celticus*, from *Celtæ*, Gk. *Κέλται*, *Keltai*, or *Κελτοί*, *Keltoi*; originally meaning 'high' and probably connected with Lith. *kéltas*, high, *kálnas*, hill, Lat. *celsus*, high, Gk. *κολωνός*, *kolōnos*, hill, less plausibly connected with OIr. *Goidel*, Gael. *Gaidheal*, Gael, Gael). The earliest Christian church in Great Britain and Ireland. It is not definitely known

when Christianity was there introduced. Roman tradition puts it in the second century as the result of a request from King Lucius of Elcutherius, Bishop of Rome from 177 to 193; others argue for the same period, only they connect it with the fierce persecution at Lyons, which drove Christians across the English Channel. These fugitives carried with them the Eastern form of Christianity which the Lyons church had. In the third century Christianity existed in Britain; and in the fourth, bishops from that country signed conciliar rolls. In the fifth century the British Province of Britain was essentially Christian. In the sixth century the invading Saxons drove the Celts into the mountains of Wales, and there four bishoprics existed. Augustine was sent to England by Gregory I in 596, and so the Roman form of Christianity, which in some details differed from the Celtic form, especially as to the date of observing Easter, which the Celts in common with the Eastern church observed on the 14th of Nisan, on whatever day of the week it came, first found lodgment on British soil. In 603 a conference was held by Augustine with some Celtic bishops, but his haughty bearing alienated them. Gradually, however, the Roman form encroached upon the Celtic, and in 777 the last station in South Wales had conformed to Rome. Still the Celtic church was not extinct farther north, but it was declining; and in 1172 it was reformed upon the model of Rome.

Christianity existed in Ireland before the landing of St. Patrick on its shores (c.433), but he was the means of winning the greater part of the island to the Christian faith. The Scottish church was strengthened by Irish monks, who, coming with St. Columba about 563, carried on missionary operations from Iona as a centre, and especially in Northumbria. In 664 the Celtic church in Northumbria conformed to the Roman model, and so its separate history ended, as was the case in Scotland in 1153. In Ireland, the merging of the Celtic into the Roman rite was completed in the same year, and henceforth England, Scotland, and Ireland were Christian without variant rites and ceremonies. See CULDEES.

CELTIC LANGUAGES. A group of languages, both ancient and modern, belonging to the Indo-European family, and now comprising Welsh, Breton (Armoric), Irish, Scottish, Gaelic, and Manx. The connection of the Celtic languages with the Indo-European family has been recognized since the publications of Pietet (1837) and Bopp (1838), but the scientific study of them dates principally from Johann Caspar Zeuss, whose *Grammatica Celtica* (1853) laid the foundations of modern Celtic philology. His work has been continued by a series of distinguished scholars both in the British Isles and on the Continent, and rapid progress has been made in all departments of the subject. But in spite of the large number of contributions to this field of research made in recent years, Celtic studies may yet be called new, and it will be some time before these languages are as fully understood or the literatures as thoroughly analyzed as those, e.g., of the Germanic and Romance peoples. The main characteristic of the Celtic group, as distinguished from the other groups of the Indo-European family, is that, before it was separated into dialects, the letter *p*, which was preserved everywhere else, had

disappeared from it without leaving any trace whatever. Thus, a Latin, Greek, or Sanskrit word containing an initial or medial *p* will appear in that family without that consonant (e.g., Latin *porcus*, Old Irish *orc*; Latin *plenus*, Breton *leûn*). With regard to the other members of the Indo-European family, the Celtic group stands linguistically, as it does geographically, in closest relation with the Italic and Germanic. Certain common characteristics of the Celtic and Italic (e.g., the formation of the passive and deponent in *r*, as well as of the *b*-future and other tense stems) have led to the assumption of a common Italo-Celtic language. The Celtic languages themselves fall into two main divisions, the Continental and the Insular. Of the Continental Celtic, or Gaulish, we shall know very little beyond what is now known, because no literary monuments of them have been preserved. While, as late as the second century of the Christian era, Gaulish was still the universal language of ancient Gaul, it was so rapidly driven out by Latin that by the fourth century no more vestiges of it were left. The Armorican peninsula, however, was won back to the Celtic domain by invasions of Brythonic tribes from the British Isles. Inasmuch as the Druidical tradition was purely oral, the only remains of Gaulish that we possess consist of inscriptions and coins, which yield little besides proper names. Additional material of the same sort is found in the Greek and Latin historians, but at times so corrupted by the forms of these languages that it is difficult to determine the original Gaulish word. The Insular Celtic consists of two groups of languages—the Gaelic, or Goidelic (comprising Irish, Scottish Gaelic, and Manx), and the British, or Brythonic (comprising Welsh, Cornish, and Breton). The criterion according to which this classification is made is that an Indo-European *q* (preserved in Sanskrit and Slavic as *k*, in Greek as π or τ , in Latin *qu*, Gothic *hw*, etc.) appears in the Goidelic group as *k* (written *c*) and in the Brythonic group as *p*. Thus, to the Latin *quinque* corresponds in Old Irish *cóie*, but in Welsh *pump*, in Cornish *pymp*, and in Breton *pemp*. Furthermore, an Indo-European initial *s* persists in the Goidelic group, but becomes *h* in the Brythonic. Thus, Latin *serus*, primitive Celtic *sē-ro-*, becomes *sír* in Old Irish, but *hír* in Welsh, Cornish, and Breton. The Gaulish, or Continental Celtic, approaches the Brythonic in changing the *qu* to *p*, but at the same time it preserves the initial *s*. Hence it cannot be classified with either group. Pictish has sometimes been classed with the Celtic languages, but most scholars incline to regard it as not Indo-European. Of the six Insular Celtic languages, five are still living. Cornish died out towards the end of the eighteenth century. Welsh and Breton are each spoken to-day by more than a million of people; Irish by more than half a million; and Scottish Gaelic by somewhat fewer. These languages, however, do not constitute the sole vernacular of the people, most of whom speak also either English or French, according to their nationality. Manx seems likely to die out in the near future, unless it is rescued by the earnest agitation now going on in all the Celtic countries for the preservation of their national tongues. See NEO-CELTIC MOVEMENT.

Bibliography. Lhuyd, *Archæologia Britannica* (Oxford, 1703), is still useful. The *Grammatica Celtica* of Zeuss was much improved by

Ebel in its 2d ed. (Berlin, 1871). Windisch contributed an important general article on Celtic languages to Gröber's *Grundriss der romanischen Philologie*, vol. i (2d ed., Strassburg, 1904–06). For periodicals, see *Revue celtique* (Paris, 1870 et seq.); *Zeitschrift für celtische Philologie* (Halle, 1897 et seq.); and *Archiv für celtische Lexikographie*, vols. i–iii (Halle, 1898–1907). For grammars, consult D'Arbois de Jubainville, *Éléments de la grammaire celtique* (Paris, 1903), and Pedersen, *Vergleichende Grammatik der keltischen Sprachen* (2 vols., Göttingen, 1909–13). For comparative dictionaries, consult Stokes, *Urkeltscher Sprachschatz* (Göttingen, 1894); Malvezin, *Dictionnaire des racines celtiques* (Paris, 1903), and the modern etymological dictionaries. For the culture and history of the primitive Gauls, consult Grupp, *Kultur der alten Kelten und Germanen* (Munich, 1905); Jullian, *Histoire de Gaule* (3 vols., Paris, 1908–09); Déchelette, *Manuel d'Archéologie pré-historique celtique et gallo-romaine* (2 vols., Paris, 1908–10); D'Arbois de Jubainville, *Les premiers habitants de l'Europe* (2 vols., Paris, 1889–94); Dottin, *Manuel pour servir à l'étude de l'antiquité celtique* (Paris, 1906); Bertrand and Reinach, *Les Celtes dans les vallées du Pô et du Danube* (Paris, 1894). For the GAULISH language, consult Holder, *Alteeltischer Sprachschatz* (3 vols., Leipzig, 1896–1911); K. Meyer, *Zur celtischen Wortkunde* (Berlin, 1912–13); Blanchet, *Traité des monnaies gauloises* (2 vols., Paris, 1905); Rhys, *Celtic Inscriptions of France and Italy* (London, 1907); *Celtic Inscriptions of Gaul* (London, 1911). For the influence of the Celtic languages on the Romance languages, consult Thurneysen, *Keltoromanisches* (Halle, 1884). For IRISH, consult Windisch, *Kurzgefasste irische Grammatik* (Leipzig, 1879), of which English translations were made by Norman Moore (Cambridge, 1882) and McSwiney (Dublin, 1883); Vendryès, *Grammaire du Vieil-Irlandais* (Paris, 1908); Thurneysen, *Handbuch des Alt-Irischen, Grammatik, Texte und Wörterbuch* (Heidelberg, 1909); Strachan, *Old-Irish Paradigms and Selections from the Old-Irish Glosses* (2d ed., London, 1909); O'Connell, *Grammar of Old Irish* (London, 1912). For MODERN IRISH, O'Donovan, *Grammar of the Irish Language* (Dublin, 1845), is still one of the best works. Convenient manuals are those of O'Growney, *Simple Lessons in Irish* (Dublin, 1897); that of the Christian Brothers (Dublin, 1901); Henry, *Handbook of Modern Irish* (3 vols., Dublin, 1904–06); Joyce, *Grammar of the Irish Language* (New York, 1906); and Davis, *First Irish Book* (Boston, 1912). The best modern Irish dictionaries are those of Dinneen, *Irish-English Dictionary* (Dublin, 1904); Fournier d'Albe, *English-Irish Dictionary and Phrase Book* (Dublin, 1903); Lane and O'Neill, *Lanc's English-Irish Dictionary* (Dublin, 1904); and McKenna, *English-Irish Phrase Dictionary* (Dublin, 1911). MANX: Kelly, *Practical Grammar of Manx* (2d ed., London, 1870); Jenner, *Manx Language* (London, 1876); Goodwin, *First Lessons in Manx* (Dublin, 1901); Kelly, *English and Manx Dictionary* (Douglas, 1866); Rhys, *Outlines of the Phonology of Manx Gaelic* (Douglas, 1894). SCOTTISH GAELIC: Gillies, *Elements of Gaelic Grammar* (London, 1896), based on the earlier work of Alex. Stewart; MacBain, *Etymological Dictionary of the Gaelic Language* (Inverness, 1896); Jamieson, *Etymological Dictionary of the Scottish Language*, revised by

J. Longmuir and D. Donaldson (5 vols., Paisley, 1879-87); W. Meyer, *Flexionslehre der ältesten schottischen Urkunden, 1385-1440* (Halle, 1907); Warrack, *A Scots Dialect Dictionary* (London, 1911), which contains a dialect map. WELSH: Rowland, *Grammar of the Welsh Language* (4th ed., Wrexham, 1876); Anwyl, *Welsh Accidence and Welsh Syntax* (London, 1897-1900); Strachan, *Introduction to Early Welsh* (Manchester, 1909); J. M. Jones, *Welsh Grammar* (Oxford, 1913); D. S. Evans, *Dictionary of the Welsh Language* (Cardiff, 1887-1906), which is as yet incomplete, having only reached the letter *E*. Consult the additions and corrections of M. Loth in the *Arch. f. celt. Lex.*, vol. i. CORNISH: Jenner, *Cornish Language* (London, 1873-74); *Handbook of the Cornish Language* (London, 1904); Jago, *Ancient Language of Cornwall* (Truro, 1882); R. Williams, *Lexicon Cornu-Britannicum* (Llandovery, 1865); Stokes, *Cornish Glossary* (London, 1868-69); Loth, *Remarques et corrections au Lexicon de Williams* (Paris, 1902). BRETON: Besides the old grammars of Rostrenen (Rennes, 1738), Le Gonidec (Paris, 1807), Guillôme (Vannes, 1836), Hingant (Tréguier, 1868), there is the *Petite grammaire bretonne* of Ernault (Saint-Brieuc, 1897) and the *Grammaire bretonne du dialecte de Tréguier* of Le Clerc (Saint-Brieuc, 1908). The *Glossaire du parler de Pléchâtel* of Dottin and Langouët (Rennes, 1901) and the *Nouveau Dictionnaire français et breton du dialecte de Léon* by Froude (Brest, 1886) are useful. The *Annales de Bretagne* is a valuable review. See GAELIC; IRISH; MANX; WELSH.

CELTIC LITERATURE. See BRETON LITERATURE; CELTIC LANGUAGES; CORNISH LANGUAGE AND LITERATURE; IRISH (GAELIC) LITERATURE; MANX LITERATURE; SCOTTISH (GAELIC) LITERATURE; WELSH LANGUAGE AND LITERATURE; and the bibliography appended to each of these articles.

CELTIC MUSIC. Welsh and Irish music are inseparably connected, for although each country developed its music in accordance with its own traditions and local forms, the bard was the dominant influence which shaped its general character alike in both Wales and Ireland. Poetry was universally identified with music, and musical instruments were used independently only to furnish dance or march music. In the course of time these conditions were changed, but it was not until the decline of the bards that instrumental soloists became a factor in the development of Celtic music. From the earliest historical times, when in the eleventh century a Welsh chieftain summoned Welsh and Irish bards to a great music conference, down to the seventeenth century, when distinctive Celtic music ceased to be written, the musical histories of Ireland and of Wales follow much the same general plan; and, to a certain extent, early Scotch music (q.v.) may be associated with them.

Welsh music was founded by, and for centuries identified with, Druidism. Its influence is apparent even in the modified form of those old songs which still exist. The cadences are savage, weird, yet sad, and far superior artistically to their Irish parallels. The direct reason for this superiority is the fact that the Welsh harp had a perfect diatonic scale, while in Ireland the early scale had but five tones. This diatonic scale made possible the full cadences

and great range of melody which is noteworthy in the early pastoral music of Wales, and which distinguished it from both the Scotch, with its abrupt changes from major to minor, and the less complete Irish. Traditionally Celtic musical instruments were introduced into Britain by the Phœnicians, but there is no historical basis for such a belief. The principal Welsh musical instruments were the *telyn*, or harp; the *crwth*, or sort of a violin; the *pibgorn*, or hornpipe; the *pib-braich*, or bagpipe; the *tadwrdd*, a drum; and the *cornbuelin*, or bugle horn.

Irish Music.—The exact number and position of the tones in the original Irish scale have been long a subject of discussion. All that we can be sure of is that at first only five notes were used, and that later a sixth and a seventh were added. The melodies were very similar to the Scotch, with the important exception that the Irish avoided the abrupt and violent modulations so much used by the former. Dance music, of which there is a great variety, was mostly written in six-eight time. The seventeenth century marked the appearance of foreign musicians in Ireland and the rapid decline and final disappearance of a national music. The early Irish musical instruments were the harp; the bagpipe, distinguished from the Scotch pipe by being blown upon by bellows, instead of from the lips; the *ben-baubhill*, a horn of a wild ox or buffalo; the *buinne*, a metal trumpet; the *corn*, a long, curved tube; the *stoc* and the *sturgan*, small trumpets; the *musical branch*, an instrument adorned with single bells; and the *tympan*, a stringed instrument played with a bow. Of these, by far the most important was the harp, with its large number of strings and its scale of fixed semitones. In the latest period of Irish music (towards the end of the eighteenth century) there was great uniformity in the compass, the scale, and the method of playing the harp. The ordinary compass was from C below the bass staff to D above the treble staff; and the scale was generally that of G, though sometimes C was used. Almost certainly, however, this uniformity was of comparatively recent date. Some of the oldest harps are the so-called harp of Brian Boru, preserved at Trinity College, Dublin, and having 30 strings; that of Robin Adair at Hollybrooke, with 37 strings; and the Dallway harp, dating from 1621, and having 52 strings. Among the many famous harpists were: Turlogh O'Carolan; Carroll O'Daly, the author of "Eileen Aroon," appropriated by the Scotch as "Robin Adair"; Myles Reilly; and Thomas and William Conallon. Consult: Grove, *Dictionary of Music and Musicians* (London, 1906); D. MacDonald, *Irish Music and Irish Scales* (London, 1910); collections of Irish music by Bunting (1796, 1809, 1840), and by Petrie, in connection with the Society for the Preservation of Irish Music (1855); also collections of Welsh melodies by Parry and by J. Thompson.

CELTIC PEOPLES. A general designation applied to an ensemble of ethnic groups constituting the predominant element in central and western Europe before the rise of the Roman power and the influx of the German tribes, and speaking a language known to us as Celtic. See CELTIC LANGUAGES.

By various early writers the users of Celtic dialects or languages were treated as a distinct ethnic stock or race, known as the Celts or Kelts; but this view is now generally abandoned.

Thus, Keane (1899) observes that the languages are spoken by peoples of so many types that the word "Celt" "has long ceased to have any ethnical significance"; Ripley (1899) says of the term that "a very grave objection to its use pertains"; and Deniker (1900) declares "there is no 'Celtic' type or race."

The Celtic-speaking peoples occupied in antiquity a very wide territory. Radiating from central Europe, which is their earliest ascertainable seat, they spread far into the west, the south, and even the southeast. The date of their settlement in Gaul is doubtful, being variously estimated from 1200 to 700 B.C. They invaded Italy in the fourth century B.C., and in the third century made their way into Greece and as far as Asia Minor. It is inferred from a statement of St. Jerome that a Celtic language continued to be spoken in Galatia until the fourth century of our era. The height of the power of the Celtic peoples was probably about 400 B.C. Before that time they had begun to feel the pressure of the Germanic tribes to the north and east of them, and in the centuries that followed the Roman Empire succeeded in subjugating a large part of the Celtic territory. In the British Isles they continued for centuries to maintain their independence.

Beyond these few general facts our knowledge of the history of the Celtic-speaking peoples is obscure, as is indicated by the diverse views concerning their relations to other Eurasian groups. Their mythology embraced earth gods and various sylvan genii, together with sun or fire deities, and was peculiarly rich in elfin demons and tutelaries, which still pervade the lore of peoples of Celtic ancestry. There were traces also of zoic tutelaries, or beast gods, though this phase of mythologic development appears to have been practically past before the records began; and, as among other branches of the Aryan stock, tradition ran back into the haze of half-deified culture heroes. The social mechanism was dominated by fiducial or ecclesiastical factors, as illustrated by the hierarchic power of the Druids (see DRUID), an order of priests or shamans who performed sylvan rites and practiced magical ceremonies surviving long in the form of ordeal and augury, exorcism and obsession; and the clan system was so deep-rooted as still to survive with vestiges of maternal organization clearly traceable, not only in the avuncular descent of authority in the Highland clans, but in the witchcraft so vividly depicted by Shakespeare. The germ of literature appeared in the Oghams and Oghamic inscriptions of Ireland, i.e., in semiarbitrary characters incised in stone or wood or used in other ways in simple records of men and events. According to Logan (*The Scottish Gael*, 1855) and others, there was a definite Gaelic alphabet of 18 letters, each symbolizing a tree or shrub, and in still earlier times there was a widespread symbolic system embracing the cross, the fylfot or swastika, the trefoil or trivet, and other figures; while in some degree the symbolism ran into colors and weaves, as illustrated by the Highland tartans. In most of the Celtic groups the musical and poetic elements essential to literary and dramatic development were fostered by classes of popular entertainers—bards, pipers, minstrels—who chanted tribal traditions or played and sang patriotic airs, and at a later period sang folk ballads or recited folk tales, and thus prepared the way for that dramatic

and oratorical talent for which the Celtic peoples and their descendants are still distinguished. As summarized by Brinton, "The Irish possessed a sparse literature, going back to the eighth century, and the Welsh to the twelfth, while the oldest Scotch or Breton songs date at the farthest from the fourteenth century" (*Races and Peoples*, 1890, p. 155).

Briefly, then, the Celtic tongues flourished before the beginning of written history and contributed in important measure to the character and vigor of the Aryan tongues, as the vernacular of several of the most distinctive and diverse of the vigorous peoples of central and western Europe, up to a time well within the historical period. They give a stamp to early and even modern literature written in the English. Some of them survive as oral rather than literary languages, but all of them are gradually disappearing.

CELTIC VERSION. See BIBLE.

CEL'TIS. See HACKBERRY.

CEMBAL D'AMOUR, sān'bāl' dā'mōōr' (Fr., clavichord of love). A musical instrument belonging to the clavichord family, invented by Gottfried Silbermann early in the eighteenth century. Its form was that of an English spinet. The strings were twice as long as those of the ordinary clavichord; and when touched, the keys struck the central node of the string, both halves of which vibrated simultaneously, thus producing a double volume of sound. There were two bridges instead of one, as in the clavichord, and two sound boards, of unequal forms and dimensions. The cembal d'amour stands between the clavichord and the pianoforte.

CEM'BRA NUT. See PINE.

CEMENT, sē-mēnt' or sēm'ent (OF. *cement*, *ciment*, Sp., Portug., It., *cimento*, from Lat. *camentum*, rubble, from *cedere*, to cut). Any composition which at one temperature or degree of moisture is plastic and at another temperature and degree of moisture is tenacious, and which, because of these qualities, is employed for uniting metals, stone, glass, wood, or other materials. Solder, gums, putty, mucilage, glue, plaster of Paris, limes, and hydraulic cements are all comprehended in this definition. The most important class of cements, structurally and commercially, is that comprising lime, hydraulic lime, and hydraulic cement. The cements of this class will be described first. In engineering, the term "cement," when not qualified, is generally understood to signify Portland cement.

Lime. Lime, common lime, quicklime, or caustic lime, as it is variously named, is produced by burning limestone, generally in upright kilns, until the carbonic acid has been driven off. The clinker resulting from this burning possesses the property of disintegration or slaking upon being treated with a sufficient quantity of water. The slaking of lime is due to its rapid hydration when in contact with water, and the process is accompanied by a material increase in volume and a considerable evolution of heat. If the quantity of water be just sufficient to cause the hydration of the lime, it is reduced to a dry powder, while if the water be in excess it becomes a paste. The slaked lime thus formed, when mixed to a paste with water and allowed to stand in the air, has the property of hardening and firmly adhering to any surface with which it may be in contact. This hardening of common limes will take place only in air. When lime is very pure and its activity very great, it is known as rich, or fat, lime; if lime contains, either mixed with it or in combination, considerable amounts of inert impurities which lessen the activity of the lime, cause a partial loss of the property of slaking, and diminish its power of hardening, it is known as poor, or meagre, lime. The common method of slaking lime consists in covering it with from two to three times its volume of water, and allowing it to stand until all the lumps are reduced and the mixture is in the condition of a thick paste. Where mechanically hydrated, lump lime is first crushed or ground and to the granulated lime is added a definite quantity of water, sufficient to combine chemically with the lime. One type of hydrator (the Clyde) operates intermittently on separate batches of lime, and another (the Kritzer) operates continuously. The product of the mechanical hydrator is a fine, dry powder which may be shipped in paper bags. For use in construction, lime paste is mixed with from two to three times its volume of sand, when it is called lime mortar. The process of hardening of lime mortar consists in the gradual formation of carbonate of lime through the absorption of carbon dioxide from the air, accompanied by the crystallization of the mass of hydrated lime as it gradually dries out. The hardening process is a slow one at best, and the lime mortar used in the interior of thick masses of masonry, where the air cannot get at it, will take years to become hard. Lime mortar should be used only in masonry exposed to the air.

Hydraulic Lime. Hydraulic lime is obtained by burning limestone containing enough silica and alumina to impart to it the ability to harden under water. In calcination the silica and alumina combine with a portion of the lime to form silicates and aluminates of lime, leaving the remainder of the lime as free lime in an uncombined state. When treated with water, the free lime is slaked. The manufacture of hydraulic lime is practically confined to Europe, and consists, after the quarrying of the rock, of burning, slaking, and bolting the material. The burning is accomplished in kilns, and is a process requiring considerable skill and careful attention. To slake the clinker it is spread in layers from 4 inches to 8 inches deep and sprinkled with water. The object is to slake the free lime without hydrating the silicates and aluminates. After the lime has been reduced to powder by slaking, it is passed

through sieves and packed for shipment. Hydraulic lime is used in the same manner as common lime, being mixed with water and sand to a paste. When in the air hydraulic lime acts like common lime, slowly absorbing carbon dioxide, drying, and hardening. In water the action of hydraulic lime is altogether different from that of common lime, since, owing to the presence of the silicates and aluminates of lime, the hydraulic lime hardens under water, while the common lime does not.

Hydraulic Cements. Hydraulic cements are classified as natural cements, Portland cements, and puzzolanic cements. *Natural cement* is the product obtained by calcining at a low temperature a natural limestone without pulverization or admixture of other materials, and finely grinding the clinker. In Europe these cements are called Roman cements, and they were first manufactured in England in 1796, by James Parker. Natural cements began to be manufactured in France about 1825; in the United States natural-cement rock was discovered while building the Erie Canal in New York, in 1818, and cement manufactured from it was used in the construction of the locks and walls of the canal. France and the United States are the principal producers of natural cement, their respective outputs having been 2,000,000 barrels and 8,800,000 barrels in 1900. In 1910 the production in the United States had decreased to about 1,000,000 barrels, and in 1912 it was even less, but a large proportion of the cement made in France is still of the natural type. The principal centres of natural-cement manufacture in the United States are: Ulster County, N. Y.; the Lehigh valley, Pennsylvania; Mankato, Minn.; Louisville, Ky.; and Utica, Ill. The rock employed is an argillaceous limestone. The process of manufacture consists in mining and quarrying this limestone, breaking it into lumps about the size of one's hand, calcining these lumps with coal in kilns, and finally crushing and grinding the clinker. Natural cements are characterized by a very rapid set and slowness in gaining strength subsequently; they have less initial strength than Portland cement, but in some instances they have attained, after long periods, equal or even greater tensile strength than Portland cements.

Portland cement was made first by Joseph Aspdin, of Leeds, Eng., and was thus named from its resemblance, when set, to the then well-known building limestone quarried at Portland Isle, England. Portland cement is the product obtained by calcining to incipient vitrification an intimate artificial admixture of properly proportioned calcareous and argillaceous raw materials, and finely grinding the clinker. Chemically Portland cement is a combination consisting principally of silicates and aluminates of lime, and the raw materials must necessarily contain silica, alumina, and lime. Within these limitations a great variety of raw materials are capable of being utilized for cement making; in England chalk and clay are used principally; in Germany and France marl and clay and limestone and slate are employed. In the United States limestone and clay or shale, marl and clay, argillaceous limestone and purer limestone, as well as blast-furnace slag with limestone, are used. The first process in the manufacture of Portland cement is the grinding and mixing of the raw materials. This mixture must be uniform and homogeneous, and the respective ingredients properly proportioned, which requires that

they be reduced to a fine powder. The method of reduction practiced depends to some extent, although less now than formerly, upon the character of the raw materials; when readily disintegrable in water, they are usually reduced by one of the wet processes. The wet process proper, formerly extensively used in England, consists in applying an excess of water to the clay and chalk, mixing them in a sort of pug

monly employed artificial puzzolanic cement is made from blast-furnace slag and lime. The hot slag, as it comes from the furnace, is run into cold water and becomes granulated. It is ground to fine powder, and then this powder is ground with lime.

The general range in chemical composition of three principal classes of cement is about as follows:

INGREDIENT		Portland	Natural	Puzzolana
Silica (SiO ₂)	per cent.....	19. to 25.	19. to 35.5	19.5 to 30.
Alumina (Al ₂ O ₃)	" "	5. to 9.	4. to 14.5	9. to 15.
Iron oxide (Fe ₂ O ₃ , FeO)	" "	2. to 4.	1.5 to 5.1	0.33 to 3.5
Lime (CaO)	" "	60. to 64.	30. to 60.	45. to 52.
Magnesia (MgO)	" "	0.35 to 4.	1.44 to 25.	0.5 to 4.
Sulphur trioxide (SO ₃)	" "	1. to 1.75	0.18 to 2.7

mill to a thin paste, which is run into settling basins, where the water is decanted off as the solid matter settles until the mixture is dry enough to be cut into blocks or bricks. In the semiwet process only enough water is added to reduce the mixture to a plastic condition in the pug mill.

When hard materials incapable of dissolution by water are employed, they are ground dry in grinding mills, the powder being then either slightly moistened and made into bricks, or, where the rotary kiln is used, stored in powdered form. In the wet and semiwet processes the bricks or blocks are dried and then burned in kilns, of which there are several varieties. (See KILN.) In the dry process, drying preliminary to burning is usually unnecessary. In the United States, where the rotary kiln is used most extensively, the dry powder or the wet paste is run into the kiln without previous brick making or drying. Powdered coal is the kiln fuel at more than 80 per cent of the Portland-cement mills in the United States, and crude petroleum is used at nearly all the others. The powdered coal is blown through a tube into the lower end of the inclined rotating kiln, and the incandescent particles of coal constitute a long flame which heats the raw mixture as it travels slowly through the kiln against the flame. The burning or calcination is continued until incipient vitrification of the raw mixture occurs, the resulting clinker being dark green or black in color. To the clinker is usually added less than 3 per cent by weight of gypsum to serve as a retarder, after which the clinker is ground to an impalpable powder, when, after a period of curing, it is ready for use. (See CRUSHING AND GRINDING MACHINERY.) Extreme fineness of grinding is a prime essential of good Portland cement, many brands of which are ground so fine that from 92 to 96 per cent of the powder will pass through a sieve having 10,000 meshes per square inch, and 75 per cent will pass through a sieve having 40,000 meshes per square inch. Portland cement sets slower than natural cement, but attains its maximum strength more quickly.

Puzzolanic cement, or *puzzolana*, is a term applied to a combination of silica and alumina, which, when mixed with common lime and made into mortar, has the property of hardening under water. Natural puzzolanic cements have been used in Italy from very early times, and are made by grinding certain volcanic tuffs and mixing the powder with slaked lime. These cements are still made and used in Italy and some other parts of Europe. The most com-

Other Cements. In addition to the three principal classes of hydraulic cements just described, there are several other classes of minor importance. *Mixed*, or *blended*, *cements* include a considerable number of cements which are formed of admixtures of different grades of other cement; of the overburned or underburned portions of the clinker, or of foreign material added to the cement. *Grappier cements* are made by grinding to powder the grappiers left from the slaking and bolting of hydraulic lime. Mixed cements and grappier cements are principally European products. *Sand cement* is the name given to the material formed by grinding together Portland cement and sand to an extremely fine powder and a very intimate mixture. *Surki*, a cement much used in India, is made of one part slaked lime and one-half to one part of finely ground brick dust.

When hydraulic cement powder is mixed with water to a plastic condition and allowed to stand, it gradually combines into a solid mass, and this process of combination is known as the *setting* of the cement. Cements of different characters differ very widely in their rate and manner of setting; some occupy but a few minutes in the operation, while others require several hours; some begin setting immediately, and take considerable time to complete the set, while others stand for a considerable time with no apparent action, and then set very quickly. After the completion of the setting of the cement, the mixture continues to increase in cohesive strength for a considerable period of time, and this subsequent development of strength is called the *hardening* of the cement. The properties of setting and hardening of cement by which a plastic paste is transformed into a hard stone are those upon which the value of cement as a structural material depends. Setting and hardening proceed under water as effectively as in air.

Testing. Previous to its use in structural work, cement is usually tested. The usual tests made are for specific gravity, fineness, rapidity of setting, tensile strength, and soundness. Other tests sometimes made are for chemical composition, compressive and transverse strength, adhesive strength, resistance to abrasion, and permeability to water. The test for fineness consists in determining the proportion of the cement powder which will pass standard sieves. The sieves commonly employed have 2500, 10,000, and 40,000 meshes per square inch. The standard test for rate of setting consists in making cakes of neat

cement about 2 or 3 inches in diameter and 1/2 inch thick to a stiff paste with water, observing the time when they will bear a needle 1/2 inch in diameter, sustaining a weight of 1/4 of a pound, and noting this as the beginning of setting (initial set); then continuing the observations with a needle 3/4 inch in diameter, carrying a weight of 1 pound until the material is sufficiently firm to bear this, when it may be said to have attained its final set.

Tests for tensile strength are made by breaking test pieces, briquettes, whose smallest section is 1 inch square, in special tensile testing machines. The cement paste, or mortar, is made into briquettes in small molds and is allowed to remain in the molds until set; the briquettes are then removed and kept in a moist atmosphere for 24 hours and then immersed in water, where they remain until tested. Tests are usually made when the briquettes are 7 and 28 days old, and they consist in pulling the briquette in two and noting the pounds of pull required. The test for soundness consists in placing in air and in water cakes similar to those used in the test for setting, and noting, after a few days, whether checks or cracks have developed, which indicate a tendency to disintegration. This is called the normal test for soundness; accelerated tests for soundness are sometimes made, and consist in immersing the cement cake in either hot or boiling water, or heating it in a hot kiln or in flame, and observing whether cracks develop. Considerable doubt exists as to the value of accelerated tests. Chemical analyses of a cement are of value chiefly to determine uniformity in composition and as a check when the other tests indicate a doubtful cement.

The minimum tensile strengths required by specifications in the United States, based upon the recommendations of the American Society for Testing Materials, are the following values per square inch:

AGE OF BRIQUETTE	24 hours	7 days	28 days
Natural cement (neat)	75 lbs.	150 lbs.	250 lbs.
Portland " "	175 lbs.	500 lbs.	600 lbs.

United States Government Standard Specification. A standard specification agreed upon by United States government engineers, representative consumers and manufacturers of cement, and special committees of several engineering societies, was officially adopted as the United States Government Specification for Portland Cement by executive order, signed by President William H. Taft, April 30, 1912.

The important requirements of this specification are as follows:

Definition.—The cement shall be the product obtained by finely pulverizing clinker produced by calcining to incipient fusion, an intimate mixture of properly proportioned argillaceous and calcareous substances, with only such additions subsequent to calcining as may be necessary to control certain properties. Such additions shall not exceed 3 per cent by weight of the calcined product.

Composition.—In the finished cement the following limits shall not be exceeded:

	Per cent
Loss on ignition for 15 minutes	4
Insoluble residue	1
Sulphuric anhydride (SO ₃)	1.75
Magnesia (MgO)	4

Specific Gravity.—The specific gravity of the cement shall be not less than 3.10. Should the cement as received fall below this requirement, a second test may be made upon a sample heated for 30 minutes at a very dull red heat.

Fineness.—Ninety-two per cent of the cement, by weight, shall pass through the No. 100 sieve, and 75 per cent shall pass through the No. 200 sieve.

Soundness.—Pats of neat cement shall remain firm and hard and show no sign of distortion, checking, cracking, or disintegrating, after standing in air or in water for 28 days, and also after exposure to steam for 5 hours.

Time of Setting.—The cement shall not acquire its initial set in less than 45 minutes and must have acquired its final set within 10 hours.

Tensile Strength.—Briquettes made of neat cement, after being kept in moist air for 24 hours and the rest of the time in water, shall develop tensile strength per square inch as follows:

	Pounds
After 7 days	500
After 28 days	600

Briquettes made up of 1 part of cement and 3 parts standard Ottawa sand, by weight, shall develop tensile strength per square inch as follows:

	Pounds
After 7 days	200
After 28 days	275

The average of the tensile strengths developed at each age by the briquettes in any set made from one sample is to be considered the strength of the sample at that age, excluding any results that are manifestly faulty. The average strength of the sand-mortar briquettes at 28 days shall show an increase over the average strength at 7 days.

Brand.—Bids for furnishing cement or for doing work in which cement is to be used shall

state the brand of cement proposed to be furnished and the mill at which it is made. The right is reserved to reject any cement which has not established itself as a high-grade Portland cement and has not been made by the same mill for two years and given satisfaction in use for at least one year under climatic and other conditions at least equal in severity to those of the work proposed.

Packages.—The cement shall be delivered in sacks, barrels, or other suitable packages (to be specified by the engineer), and shall be dry and free from lumps. Each package shall be plainly labeled with the name of the brand and of the manufacturer. A sack of cement shall contain 94 pounds net. A barrel shall contain 376 pounds net. Any package that is short weight or broken or that contains damaged cement may be rejected, or accepted as a fractional package, at the option of the engineer.

Inspection.—The cement shall be tested in accordance with the standard methods prescribed in connection with the specification. In general the cement will be inspected and tested after delivery, but partial or complete inspection at the mill may be called for in the specifications

or contract. Tests may be made to determine the chemical composition, specific gravity, fineness, soundness, time of setting, and tensile strength, and a cement may be rejected in case it fails to meet any of the specified requirements.

Statistics. For use in structural work, cements are usually mixed with sand, to form mortar, or with sand and gravel or broken stone, to form concrete. The chief hydraulic-cement-producing countries of the world are the United States, Germany, England, and France, although it is manufactured to a greater or less extent by nearly all civilized countries. In 1900 the United States manufactured about 8,400,000 barrels of natural cement, 8,500,000 barrels of Portland cement, and 450,000 barrels of puzzolanic cement, valued at about \$17,000,000. In 1912 the quantities manufactured were approximately 820,000 barrels of natural cement, 82,440,000 barrels of Portland cement, and 92,000 barrels of puzzolanic cement, having a total value of \$67,500,000. Germany produces over 30,000,000 barrels of cement yearly, and England about 17,000,000 barrels. France makes annually about 8,000,000 barrels of cement. The principal uses of hydraulic cement are described in the articles on MORTAR and CONCRETE.

Compounds. Besides hydraulic cements, there are many cementing compounds used for various purposes and derived from animal, vegetable, and mineral substances. Animal cements have gelatin and albumin as their basis, while the binding materials of vegetable cements are gums, resins, and wax. Some of these different cements are the following: A cement used for uniting slabs of marble, alabaster, and for many similar purposes consists of plaster of Paris mixed with water to the consistency of thick cream and then applied. The plaster of Paris may be mixed with thin glue, with diluted white of egg, or a solution of gum, instead of with water, and is strengthened thereby. A cement for pipe joints is made of iron borings mixed with sal ammoniac and sulphur. This compound is mixed with enough water to moisten it and then rammed tightly into the joint. The proportions recommended are 1 pound of borings, 2 ounces of sal ammoniac, and 1 ounce of sulphur. For mending earthenware and china, etc., a variety of cements are recommended. For ornamental glass or china which is not subjected to heat or rough usage, Canada balsam that has evaporated until rather hard is a very useful cement; from its transparency it makes an almost invisible joint. The surfaces should be slightly warmed and the balsam brushed over them, after which they should be kept pressed together for a short time. Thick copal or mastic varnish may be used in the same manner. Gum shellac, dissolved in alcohol in sufficient quantity to form a treacly liquid, forms a stronger cement than the above, but its color is objectionable for some purposes. The shellac may be dissolved in naphtha, but the cement thus produced is not equal to that in alcohol. The liquid glue sold in the shops is usually prepared in this manner: another kind is made of a mixture of the solutions of shellac and India rubber. A cement which is sold in sticks consists of shellac or gum mastic fused and molded into a convenient form. It is applied by heating the surfaces to be joined just sufficiently to fuse the shellac and then smearing them thinly with it and pressing them together.

If shellac is heated much above its fusing point it becomes carbonized and rotten, and therefore great care must be used in fusing any composition of which it is an ingredient. *Marine glue*, a mixture of shellac and India rubber, is an excellent cement and, when applied with the precautions just alluded to, is so strong that glass or china cemented with it, and then allowed to fall or otherwise broken again, will give way in any part rather than that cemented. Ordinary glue, so much used by joiners and cabinetmakers, is common or impure gelatin (q.v.), obtained by boiling animal substances, as skins, hoofs, etc., in water. As glue dissolves in water, it is an efficient cement only in dry places. A cement which can be used for many purposes is made as follows: Curdle skim milk with rennet or vinegar, press out the whey, and dry the curd at a very gentle heat, but as quickly as possible. When it has become quite dry, grind it in a coffee or pepper mill and next triturate it in a mortar until reduced to a very fine powder. Mix this powder with one-tenth of its weight of new, dry quicklime, also in very fine powder, and to every ounce of the mixture add five or six grains of powdered camphor; triturate the whole well together and keep it in small, wide-mouthed vials, well corked. When required for use, make it into a paste with a little water and apply it immediately. *Cheese cement* is similar in composition and uses. Take two parts of grated cheese and one of quicklime, in fine powder; beat these together with white of egg to form a paste, and use immediately. *Cutler's cement*, used for fixing knives and forks in handles, is made of equal weights of rosin and brick dust melted together; or, for a superior quality, four parts of rosin, one of beeswax, and one of brick dust. *Mahogany cement*, used for stopping cracks and holes in mahogany, may be prepared by melting four parts of beeswax with one of Indian red, and as much yellow ochre as is found requisite to give the color. If shellac be substituted for the beeswax, and less red used, a much better cement is made. *Mucilage* is a name applied to a great variety of sticky or gummy preparations used for fastening paper and other light materials together. It is sometimes a thickened aqueous solution of gum, and sometimes a preparation of dextrin, glue, or other adhesive materials generally containing some preservative substance or compound, as creosote or salicylic acid.

CEMENTATION. In geology, the process by which loose materials, such as sands, gravels, and fossil casts, are consolidated into firm rocks. Cementation is caused by the deposition of mineral matter from solutions which have penetrated the loose materials. By this process sands and gravels become quartzites and conglomerates, while the shells of fossils, if calcareous, yield limestones. The most common cementing substances are quartz, calcite, and iron ores. See SANDSTONE; LIMESTONE; CONGLOMERATE.

CEMENTATION PROCESS, IN STEEL MAKING. See IRON AND STEEL, METALLURGY OF.

CEMENTITE. See CARBIDES.

CEM'ETERY (OF. *cemeticre*, Lat. *cæmiterium*, Gk. *κοιμητήριον*, *koimētērion*, sleeping place, later graveyard, from *κοιμᾶν*, *koiman*, to put to sleep, from *κεῖσθαι*, *keisthai*, to lie down). A graveyard or other place of deposit for the dead. The term is used with particular reference to those extensive ornamental burial grounds which have been established in the United States and other countries, as the practice of burying within and around churches has gradually been abandoned. (See BURIAL.) There was at first a natural feeling of regret at the prospect of deserting places of deposit for the dead so hallowed by ancient use and associations as the church and the churchyard, but in many instances such places were in reality surrounded by degrading, disgusting, and insanitary conditions. On the other hand, the new places of interment began to develop humanizing and elevating influences, in the way of beautiful trees and flowers, natural scenery, and artistic monuments. The fine burial grounds of the Turks, extending over large tracts and adorned by cypress and other trees, may have suggested the desirability of such cemeteries to Europeans. Around Constantinople the cemeteries are located in vast tracts of woods under whose branches stand thousands of tombstones. It is the custom never to reopen a grave, and a new resting place is given to every one, with the result that the dead now occupy a wider territory than that which is covered by the homes of the living. The Turks believe that until the body is buried the soul is in a state of discomfort, and the funeral therefore takes place as soon as possible after death. No coffin is used. The body is laid in the grave and a few rough boards placed about it and then the earth is shoveled in, care being taken to leave a small opening from the head of the corpse to the surface of the ground. This method, from a sanitary standpoint, is preferable to the custom of using double wood or even metallic coffins, for as little as possible should be done to interfere with the speedy dissolution of the body into its elements.

The famous Père Lachaise, in Paris, is the most celebrated of modern cemeteries, although by no means the largest. It was laid out in 1804 and comprises about 110 acres and about 20,000 monuments erected to the memory of nearly all the great men of France of the nineteenth century. Twice this cemetery and the neighboring heights have been the scene of desperate fighting. In 1814, during the attack on Paris by the allies, it was stormed by a Russian column; and in 1871 the Communists made their last stand among these tombs, where 900 of them were killed, 200 being buried in quicklime in one huge grave and 700 in another. Paris has also the cemeteries of Montparnasse and Montmartre, besides many smaller burial grounds. In 1874 a very large cemetery was laid out 16 miles north of Paris, covering nearly 1300 acres. In France every city and town is required by law to provide a burial ground beyond its barriers, properly laid out and planted, and each interment must take place in a separate grave. This law does not apply to Paris, however. There the dead are buried 40 or 50 at a time in the *fosses communes*, or the cemeteries outside of the city limits, the poor being interred gratuitously, and

a charge being made in all other cases. The *fosse*, when full, is left undisturbed for five years; then all the crosses and other memorials are removed, the level of the ground is raised four or five feet by fresh earth, and interments begin again. For 50 francs a grave can be leased for five years; but when permanent monuments are desired the ground must be purchased in fee. Pit burial is also practiced in Naples and in other cities of continental Europe. In one of the Neapolitan cemeteries a pit is opened each day in which all the burials of the day are made. At night a joint funeral service is held for all and the pit is filled, not to be opened for a year.

In English cities, about 1840, the people began to discuss the dangers to public health arising from the condition of the graveyards surrounding and the vaults within and underneath the great churches. In London these receptacles were literally crammed with coffins, and the surrounding air was polluted to a dangerous degree. Coffins were piled upon each other until they came within a few inches of the surface of the ground, and then the ground was raised from time to time until its level came nearly up to the lower windows of the church. To make room for new burials old bones were thrown out, and this led to systematic robbing of graves for the sake of the coffin plates and the ornaments sometimes buried with the bodies. The result of this action and of discussion was an entire change in the system. Burials within the limits of the cities and villages were prohibited, and as a necessity rural cemeteries were founded.

Of the cemeteries still in use in southern Europe, the catacombs of Sicily are the most remarkable. In one of these, near Palermo, under an old Capuchin monastery, there are four subterranean corridors, in which more than 2000 corpses are ranged in niches in the wall, many of them shrunk into the most grotesque attitudes, or hanging with pendent heads or limbs from their receptacles. As a preparation for its niche, the body is desiccated in an oven, and then dressed as in life and put in its place in the wall. At one end of this cemetery there is an altar, strangely ornamented with a mosaic of human skulls and bones.

Campo santo ('holy field') is the Italian designation for a cemetery or burying ground, but more especially for an inclosed place of interment, surrounded internally by an arcade, and designed to receive the remains of persons of distinction. The most famous *campo santo*, and that from which the others derived the name, is that of Pisa—in the neighborhood of the cathedral and leaning tower, and consecrated to the memory of men who had deserved well of the republic. It was founded by Archbishop Ubaldo, towards the end of the twelfth century. The Archbishop, having been driven out of Palestine by Saladin, brought his 53 vessels, which had been destined for the conquest, laden with the earth of the Holy Land. This he deposited on the spot which was thence called the holy field, and which, as has been said, gave its name as a generic term to the burying grounds of Italy. The architect of the existing building was Giovanni Pisano, under whose superintendence it was completed in 1283. It contains an area of over 400 feet in length and 118 feet in breadth, and is surrounded by a lofty wall, on the inner side of which a wide arcade runs round the whole inclosure, giving to it the character of one magnificent cloister. On the eastern side there is a

large chapel, and two smaller chapels on the northern side. The lofty circular arches of the arcade are filled with the richest Gothic tracery, which belongs, however, to a later date—the latter half of the fifteenth century. The walls are adorned with frescoes which are of great interest and value, both absolutely and with reference to the history of art. The oldest of those which have been preserved adorn one side of the eastern wall; they represent the passion of Christ, his resurrection, and other sacred subjects. These remarkable paintings are supposed to date from before the middle of the fourteenth century, and are ascribed to Buffalmaco. But the most marvelous productions are those of Giotto, of Simone Memmi, and of Andrea and Bernardo Orcagna.

America closely followed England in the sanitary reform of burial places, and many years ago burial within certain limits of cities was prohibited except in special cases, such as the use of private vaults in churchyards. Within the limits of Greater New York, however, in the territory included in the Borough of Queens, and once forming the town of Newtown, it was estimated in 1900 that there were 1800 acres of cemeteries, covering one-tenth part of a district which contains 25,000 living inhabitants and the remains of 1,000,000 dead.

The United States has more beautiful cemeteries than any other country. Conspicuous among these are the great national cemeteries located in a few Northern and many Southern cities, for the burial of soldiers, especially those who were killed in the Civil War. The oldest and one of the most beautiful of the great cemeteries in the United States is Mount Auburn, near Boston, which dates from 1831. Laurel Hill Cemetery, in Philadelphia, was opened in 1836. It is on the Schuylkill River, about 4 miles north of the centre of the city, and is part of a region of great beauty. Greenwood Cemetery, the first and one of the largest burial places for New York and Brooklyn, was opened in 1840 by a company chartered in 1838. The grounds occupy a fine situation of about 500 acres on the east side of New York Bay about 3 miles south of the Brooklyn Borough Hall. From the higher points of the cemetery the eye takes in New York and Brooklyn, the bay, half a dozen cities in New Jersey, the far-off Palisades, the broad lower bay, the Highlands near Sandy Hook, Coney Island, and a grand view of the Atlantic Ocean. Woodlawn Cemetery, also in New York City, is well known. Other notable cemeteries in the United States are Oakwood, overlooking the Hudson at Troy, N. Y., Rural, in Albany, which is the burial place of Chester A. Arthur, and Homewood, in Pittsburgh, Pa., noted for its many fine monuments and mausoleums. Lake View Cemetery, at Cleveland, Ohio, is one of the celebrated places of interment in the interior States, and contains the Garfield mausoleum. The largest cemetery in the United States is said to be Pine Lawn, on Long Island, which has an area of some 2000 acres.

The site of a cemetery is a matter of extreme importance. It should be situated as far as possible from any populous locality, in order that it may not interfere with the needs of the living, and so may remain undisturbed for the greatest possible length of time. The soil should be light and porous, permitting abundant entrance of water and accompanying air, to expe-

dite decomposition. There should be good, natural underdrainage, but care should be taken that the drainage from cemeteries does not discharge directly into drinking waters. The frequent proximity of cemeteries and reservoir sites is a fact to be deprecated. There should be strict municipal regulation of the depth and distance apart at which graves may be dug.

The ownership of cemeteries is divided among municipalities, churches, and private corporations. In the continental cities municipal ownership of cemeteries is the rule, although there are some private cemeteries, especially in Germany and Holland. In some cities, as Cologne, Naples, Dresden, and Rome, the management of funerals is also controlled by the municipality, the result being to decrease greatly burial expenses. British towns usually have municipal cemeteries, but most of them are old and little used, the newer burial grounds being privately owned. Manchester, Nottingham, and several other of the larger towns have recently taken steps to provide adequate municipal cemeteries.

In the United States the largest and most popular cemeteries are usually owned by private corporations, but many cities and towns own one or more cemeteries. The privately owned cemeteries are often of a mutual character, and in general, efforts to make large profits from cemeteries do not meet with approval.

The older cemeteries were usually laid out on the rectangular plan and when filled became a wilderness of tombstones, monuments, and lot markers, not always relieved even by trees or shrubs and showing no element of design or of unity save as regards the rectangular lots, paths, and drives. The modern cemetery of the rural or park type is often a notable example of landscape art, sometimes with few or no gravestones or lot markers extending above the grassed surface, which latter is not allowed to be broken by mounds above the graves. An office, a chapel, and a superintendent's residence, the latter in or near the cemetery, are commonly provided. Most of the crematories for burning the dead are located in cemeteries, joined with a chapel. Carefully planned and kept cemetery records are essential, especially as regards burial certificates, which have a most important relation to vital statistics. For information about ancient burial places, see *NECROPOLIS*; *GRAVEYARD*. For information concerning burial customs, see *BURIAL*. For an outline of the principles and practice of designing and managing cemeteries, consult Weed, *Modern Park Cemeteries* (Chicago, 1912). For many important papers on cemetery design, management, etc., consult annual proceedings Association American Cemetery Superintendents, a body organized in 1887; also consult *Park and Cemetery*, a monthly journal (Chicago). See *CREMATION*.

CEMETERY LAWS. Laws which have for their objects the selection, adornment, regulation, and protection of suitable burial places for the dead. Cemeteries may be so located as to endanger health by corrupting air or water, and hence their location may be controlled either by the courts or by the Legislature. In the United States cemetery associations are frequently incorporated under State statutes, and are generally exempted from taxation. The object of this exemption is not only to relieve such associations from the burden of taxation, but to secure burial grounds from sale for the non-payment of taxes. From similar reasons in

some States, a burial lot cannot be seized or sold for the debts of its owner, and if he executes a mortgage upon it, the transaction is void as against public policy, provided interments have been made therein. Cemetery lots in which burials have not been made, however, may be bought and sold, subject to the rules of the association controlling them. The desecration of cemeteries, as well as the unlawful interference with those who have vested rights in their use, are severely punishable. Consult Perley, *Mortuary Law* (Boston, 1896).

CENABUM. See CARNUTES; CHARTRES.

CÉNACLE, sâ'nâ'kl' (Fr., dinner chamber, from Lat. *cenaeulum*, dining room, from *eena*, *eesna*, Umb. *cesna*, dinner). A name given to a Parisian literary group of varying constituency that began about 1826 to gather around Charles Nodier (q.v.) and sought to revive in French literature the old monarchical spirit, the spirit of mediæval mystery and spiritual submission. Of the First Cénacle, as it is called, the chief members were Vigny and the brothers Deschamps. These were soon joined by Lamartine, Hugo, and Sainte-Beuve, who describes the group as "royalists by birth, Christians by convention and a vague sentimentality." Their organ was *La Muse Française*. They soon grew iconoclastic towards classicism, and were led by the exigencies of controversy from their monarchical position to a democratic attitude. Lamartine and Hugo had favored the Bourbons. They now turned even from the Orleanists to the Revolution and Napoleon. Thus the Cénacle won the alliance of Musset, Mérimée, and the elder Dumas, and, after the revolution of 1830, of Gautier and Gérard de Nerval. But with that year and the triumph of Hugo's *Hernani*, its reason for existence disappeared, and the spirit of individuality inherent in romanticism soon caused the Cénacle to dissolve in fact and as an influence. Consult the index (*Table*, Paris, 1881) to Sainte-Beuve's *Causeries du lundi*, etc., which refers to admirable studies in the latter work of various members of the Cénacle. See also ROMANTICISM; HUGO, VICTOR.

CÉNA TRIMALCHIONIS, tri-mäl'ki-õ'nis (Trimalchio's Dinner Party). The most important episode in the *Satiræ* of Petronius, a vivid description of a dinner party given by Trimalchio, a former slave, who had become very rich by trade. The lavish feast is described by a certain Encolpius, one of the guests, and the story is of value for the specimens of colloquial Latin, the *sermo plebeius*, preserved in it (most of the guests are ex-slaves and talk accordingly).

CEN'CHRUS. See BURGRASS.

CENCI, chën'chè, BEATRICE (1577-99). An Italian of the sixteenth century, the heroine of a celebrated tragedy in real life. She was the daughter of Francesco Cenci, a wealthy Roman nobleman, head of a family notorious for its crimes and profligacy. It had long been supposed that Beatrice was the victim of her father's brutal passion, and that this was her provocation for the murder of Francesco, a crime in which she was aided by several other members of the family. With her accomplices, she was executed in 1599. A famous portrait in the Barberini Palace, Rome, supposed to have been painted by Guido Reni, caused her to be known as the "beautiful parricide." One of Shelley's most powerful dramas, *The Cenci*, is founded upon the traditional story of Beatrice. It is now believed, however, owing to the re-

searches of Bertolotti, that Francesco was much less of a monster than was supposed, and that Beatrice, even aside from the question of her share in the murder, was in character far from innocent; it further appears, according to Bertolotti, that she was not beautiful, and that the famous painting is not of Beatrice, nor by Guido Reni. Consult Bertolotti, *Francesco Cenci e la sua famiglia* (Florence, 1879); and for the traditional account, Muratori, *Annali d'Italia* (Milan, 1744-49).

CENCI, THE. A powerful poetic tragedy by Shelley (1819). Though written for the stage, and offered for presentation, the nature of the drama is such as to make its acceptance impossible.

CENDRILLON. An opera by Massenet (q.v.), first produced in Paris, May 24, 1899; in the United States, Nov. 6, 1911 (Chicago).

CENEDA, châ-nâ'dâ. An Italian city. See VITTORIO.

CENIS, se-nè', MONT, or MONTE CENISIO. A mountain of the Alps, between Savoy and Piedmont, on the frontier between Italy and France, forming part of the watershed between the valleys of the Dora Riparia and the Arc (Map: France S., M 3). The culminating point of the pass over Mont Cenis reaches an elevation of about 6850 feet above sea level. The mountain is composed of schist, limestone, and gypsum, and is covered with a rich vegetation. The road over the pass, constructed in 1803-10, under Napoleon's orders, has a total length of 40 miles, and prior to the construction of the railway tunnel under the Col-de-Fréjus, about 14 miles southwest of Mont Cenis, was one of the most patronized routes across the Alps. The tunnel, constructed in 1857-70, is nearly 8 miles long and varies in altitude from 3775 to 4245 feet. The cost of construction was nearly 75,000,000 francs (\$14,475,000). See TUNNELS.

CEN'OMA'NI. The name of a people in ancient Gaul, a branch of the Auleri, who assisted Vercingetorix (q.v.) against Cæsar. Their chief city was Civitas Cenomanorum, known now as Le Mans. (See MANS, LE.) According to ancient writers, a part of the Cenomani invaded Italy as early as 400 B.C., drove out the Etruscans from a part of Gallia Transpadana, and settled there. These Cenomani were usually friendly to Rome.

CEN'NOMA'NIAN (so called from the ancient Celtic tribe of *Cenomani*). The name given by the French to the lower portion of the Upper Cretaceous period. It corresponds to the Dakota epoch of American geologists.

CEN'OTAPH (Fr. *cénotaphe*, Lat. *cenotaphium*, from Gk. *κενοτάφιον*, *kenotaphion*, empty tomb, from *κενός*, *kenos*, empty + *τάφος*, *taphos*, tomb). A monument which does not cover the remains of the deceased, erected originally for those whose bones could not be brought home for interment, as for those who died in foreign parts or had perished at sea. Consult Vergil, *Aeneid*, 3, 304; Xenophon, *Anabasis*, 6, 4, 9. In Suetonius, *Claudius*, 1, such a tomb is called *tumulus honorarius*.

CENOZOIC ERA (from Gk. *καινός*, *kainos*, new + *ζωή*, *zōē*, life). One of the main divisions of eras of geological time, preceded by the Mesozoic era and followed by the Recent era. The term is used by some geologists to include the Tertiary and Quaternary periods, while others limit it to the Tertiary alone. For description of the rocks and included life forms

characteristic of Cenozoic time, see TERTIARY SYSTEM; QUATERNARY SYSTEM.

CEN'SER (abbreviation of *encenser*, OF. *encenser*, from ML. *incensare*, to burn incense, from *incensum*, incense, from *incendere*, to burn, from *in*, in + *cendere*, to burn). A vessel for burning perfumes (see INCENSE), also called

CENSER.

"thurible," from *thus*, frankincense. It is swung in the air ceremonially during public worship to activate the burning of the incense and diffuse its perfume. Censers were used from very early times in the Jewish services, and have been always employed in those of the Roman Catholic and Eastern churches; also of recent years in some Episcopal churches. They are usually made of brass or copper; rarely of silver or gold.

Little is known of their precise shape before the twelfth century, at which time they were richly decorated, set with jewels, and sometimes made in the form of small churches, as, e.g., those in the cathedrals of Treves and Namur. They were also often shaped like a ball, with two hollow halves. In later specimens the upper half varies very much in form, being often surmounted by a turret. The lower half, resting on a foot, holds the charcoal and the incense, while the upper one is perforated to allow the smoke to escape, and can be moved up and down on three or four chains.

CEN'SO, *Sp. pron.* thān'sō. In Spanish law, an annual payment, in money or in produce, charged upon land for an indeterminate period. The Spanish civil code of 1889 (in force in Cuba, Porto Rico, and the Philippines) recognizes and regulates three classes of *censo*. *Censo enfiteutico* is the ground rent paid by the holder of a perpetual lease. (See EMPHYTEUSIS.) *Censo reservativo* is an annual payment reserved by the conveyor of land and made a perpetual charge upon the land conveyed. *Censo consignativo* is an annual payment which the owner of land, in consideration of a capital sum paid him, has placed as a perpetual charge upon his land. In the first of these cases the recipient of the annual payment is titular owner (*dueño directo*). In the second and third cases he is not owner, but a creditor of the land; his claim runs against every person who takes the land by purchase, devise, or inheritance, and it is a lien upon the land. In all cases the *censo* may be redeemed (i.e., the land may be freed from the annual charge) by payment of the corresponding capital. The right of redemption may, however, be suspended by contract in the case of the purchased rent charge (*censo consignativo*) for 20 years, and in the other cases for 60 years.

CEN'SOR (Lat., from *censere*, to assess, estimate). The name of two Roman officers of

state, first elected in 443 B.C. The office was filled by patricians till 351 B.C., when Gaius Marcius Rutilus, a plebeian, was elected censor. Twelve years later it was enacted that one of the censors must be a plebeian. In 131 B.C. both censors, for the first time, were plebeians. The censors were elected in the *comitia centuriata*, presided over by a consul (see COMITIA). The term at first lasted five years, but from 434 B.C. was limited to eighteen months and reëlection was forbidden. The censorship was regarded as the highest dignity in the state, except the dictatorship. It was a sacred and irresponsible magistracy, whose powers were vast and undefined, and whose decisions were received with solemn reverence. The duties of the censors were threefold: (1) the taking of the census, or register of the citizens and of their property; (2) the *regimen morum* (regulation of morals); (3) the administration of the finances of the state. The taking of the census was originally their sole function (hence their name) and was held in the Campus Martius, in a building called *villa publica*. The *regimen morum* was the most dreaded and absolute of their powers. It grew naturally out of the exercise of the previous duty, which compelled them to exclude unworthy persons from the lists of citizens. Gradually the superintendence of the censors extended from the public to the private life of citizens. They could inflict disgrace (*ignominia*) on any one whose conduct did not square with their notions of rectitude or duty. For instance, if a man neglected the cultivation of his fields, or carried on a disreputable trade, or refused to marry, or treated his family either too kindly or too harshly, or was extravagant, or guilty of bribery, cowardice, or the like, he might be degraded by removal from the Senate, exclusion from the tribes or the centuries, or loss of equestrian status. The administration of state finances included the regulation of the *tributum*, or property tax; of the *vectigalia*, such as the tithes paid for the public lands, salt works, mines, customs, etc., which were usually leased out to speculators for five years (see PUBLICANI); the preparation of the state budget, etc. Consult Leuze, *Zur Geschichte der römischen Censur* (Halle, 1912), and the article "Censor" in Smith, *A Dictionary of Greek and Roman Antiquities* (3d ed., London, 1890).

CEN'SORI'NUS. A chronologist and grammarian of the third century A.D., known by a work called *De Die Natali*, in which he treated of man's generations, his natal hour, and the influence that the stars and genii exercise over his fate. Its chief value to us lies in the facts and dates derived from earlier authors whose works are now lost, especially Varro and Suetonius. It has been edited by Hultsch (Leipzig, 1867) and translated by Maude (New York, 1900).

CEN'SORSHIP. In the widest sense, the general supervision and control of public morals and the public welfare, such as was exercised by the Roman censors. The term is now, however, almost exclusively applied to the examination of manuscripts, writings, and literary productions of all kinds as a condition of their publication, with the suppression of part or all, as may seem necessary to the censor or licenser, for the protection of public morals or the integrity of the government. While the censorship of private morals, as such, does not now exist among civilized nations in the arbitrary form

in which it was exercised by the Roman censors, humanity has not yet outgrown the disposition to force the private life of the individual into conformity with the prevailing standards of the community or of the official or ruling class of the state. Ordinarily this censorship is exercised by the legislative authority in the enactment of laws imposing penalties upon individuals who in the conduct of their private lives deviate from the standards so set up, or by police officials or magistrates who are charged with the duty of interpreting and enforcing such laws.

The advance of civilization and the development of the idea of the right to personal liberty may be expected to do away with the grosser forms of censorship still prevailing among civilized peoples. Those forms which are most in evidence at the present day are the censorship of the press and of the drama.

The censorship of the press was intended to prevent the publication and effect of literature supposed or believed to contain matter likely to corrupt morals or be subversive of the government. It came into existence with the invention of the printing press, although in all despotic governments in the history of man writings offensive to the government have been suppressed or destroyed, and in many cases the author punished as well, for the same motives as those which gave rise to the censorship of the press and of the drama. Literary censorship was rigidly maintained by the Roman Catholic church as early as the year 1515, and all books published within its control were and still are subjected to the strictest examination and expurgation or suppression when deemed necessary. (See INDEX; VATICAN.) The censorship of the press in England was strictly enforced as early as 1637 by order of the Star Chamber, which order was established by statute in 1662. It was against this statute that Milton wrote his *Areopagitica*, or "Plea for Unlicensed Printing," and the censorship was abolished in 1693. In France the censorship which had existed since the invention of the art of printing was abolished in 1789, and revived at intervals until 1830, when it was finally abolished. With the growth of constitutional government in the states of modern Europe the censorship of the press has been generally abolished, though it still exists in Russia, Turkey, and other backward states. For a fuller discussion and treatment of the subject, see FREEDOM OF THE PRESS.

Censorship of dramatic productions is based upon the assumed necessity of protecting the public from the influence of immoral plays. This is accomplished in the United States by the law which enables any public immorality to be suppressed as soon as an overt act has been committed, which can be shown to be an offense against public morals. In England, however, a censorship of the stage exists under the provisions of 6 and 7 Vict., c. 68. Formerly, in the seventeenth and eighteenth centuries, the performance of plays was controlled by the Master of Revels and the Lord Chamberlain; and the Statute of 10 Geo. II, c. 28. defined and established the duties and powers of the Lord Chamberlain in this capacity. Under this statute his powers were restricted as to their territorial limits; but by the Statute of 6 and 7 Vict. his jurisdiction is extended (by section 12) to the whole United Kingdom. Chapter 68 of this

statute provides that one copy of every new stage play, every new act, scene, part, prologue, or epilogue of a play, intended to be acted for hire at any theatre in Great Britain should be sent seven days previous to the Lord Chamberlain for his allowance, and he may license or refuse to license its production, and may revoke a license already granted, and forbid the production of the play whenever it appears to him advantageous for the preservation of good morals or decency or to preserve public peace. His authority is exercised upon the recommendation of his reader. He has no authority to license playhouses. This is vested in the County Council, who may delegate it to one of the justices of the peace, who formerly exercised it. See the *Law Magazine and Law Review*, 19, 220.

Something akin to censorship is to be found in the statutory and administrative restrictions on the use of the mails for the circulation of gambling and fraudulent circulars and obscene publications. The protection of the public, therefore, from wrongful publications is, in general, left in Great Britain and the United States to the enforcement of the laws protecting public and individual rights from violation; and so the circumstances under which a publication is made may be such that the publisher may be enjoined by the court from further publication of the same matter, if this be necessary for the protection of violated rights.

Where a territory or country is under martial law, censorship of the press by the military authorities is commonly exercised in all countries, so far as it is considered necessary by the military authorities. See COPYRIGHT; LIBEL; NEWSPAPER; MARTIAL LAW; and consult Dicey, *The Law of the Constitution* (London, 1908), chap. 6.

CEN'SUS (Lat., registration, from *censere*, to assess, to judge). The familiar use of the word "census" is to denote the periodical counting of the people, and this is its primary meaning. As the census of population has been usually accompanied by comprehensive investigations into agriculture, manufactures, etc., the term has come to be employed for any statistical investigation which proceeds by the method of direct interrogation. Used in this broad way the name "census" designates one of the two methods of statistical research, the other being registration. Census and registration are not interchangeable, but one is frequently used as a substitute for the other. A census portrays conditions at a given time, a register the changes which take place. As two successive censuses by comparison show the resultant of these changes, we can, under certain circumstances, by summing up the changes, arrive at the general condition of affairs without a direct enumeration.

Antecedents of the Census.—The origin of the American census in the well-known constitutional provision that representation and direct taxation should be proportional to population, suggests the intimate connection between census operations and government necessities. That similar necessities in early days gave rise to enumerations of the people will be readily understood. We find references to counting the people in our accounts of ancient peoples like the Hebrews and the Romans. China and Japan also have records of very early enumerations. These records seem to have been undertaken for fiscal or military purposes, to establish the ownership of landed property or to determine

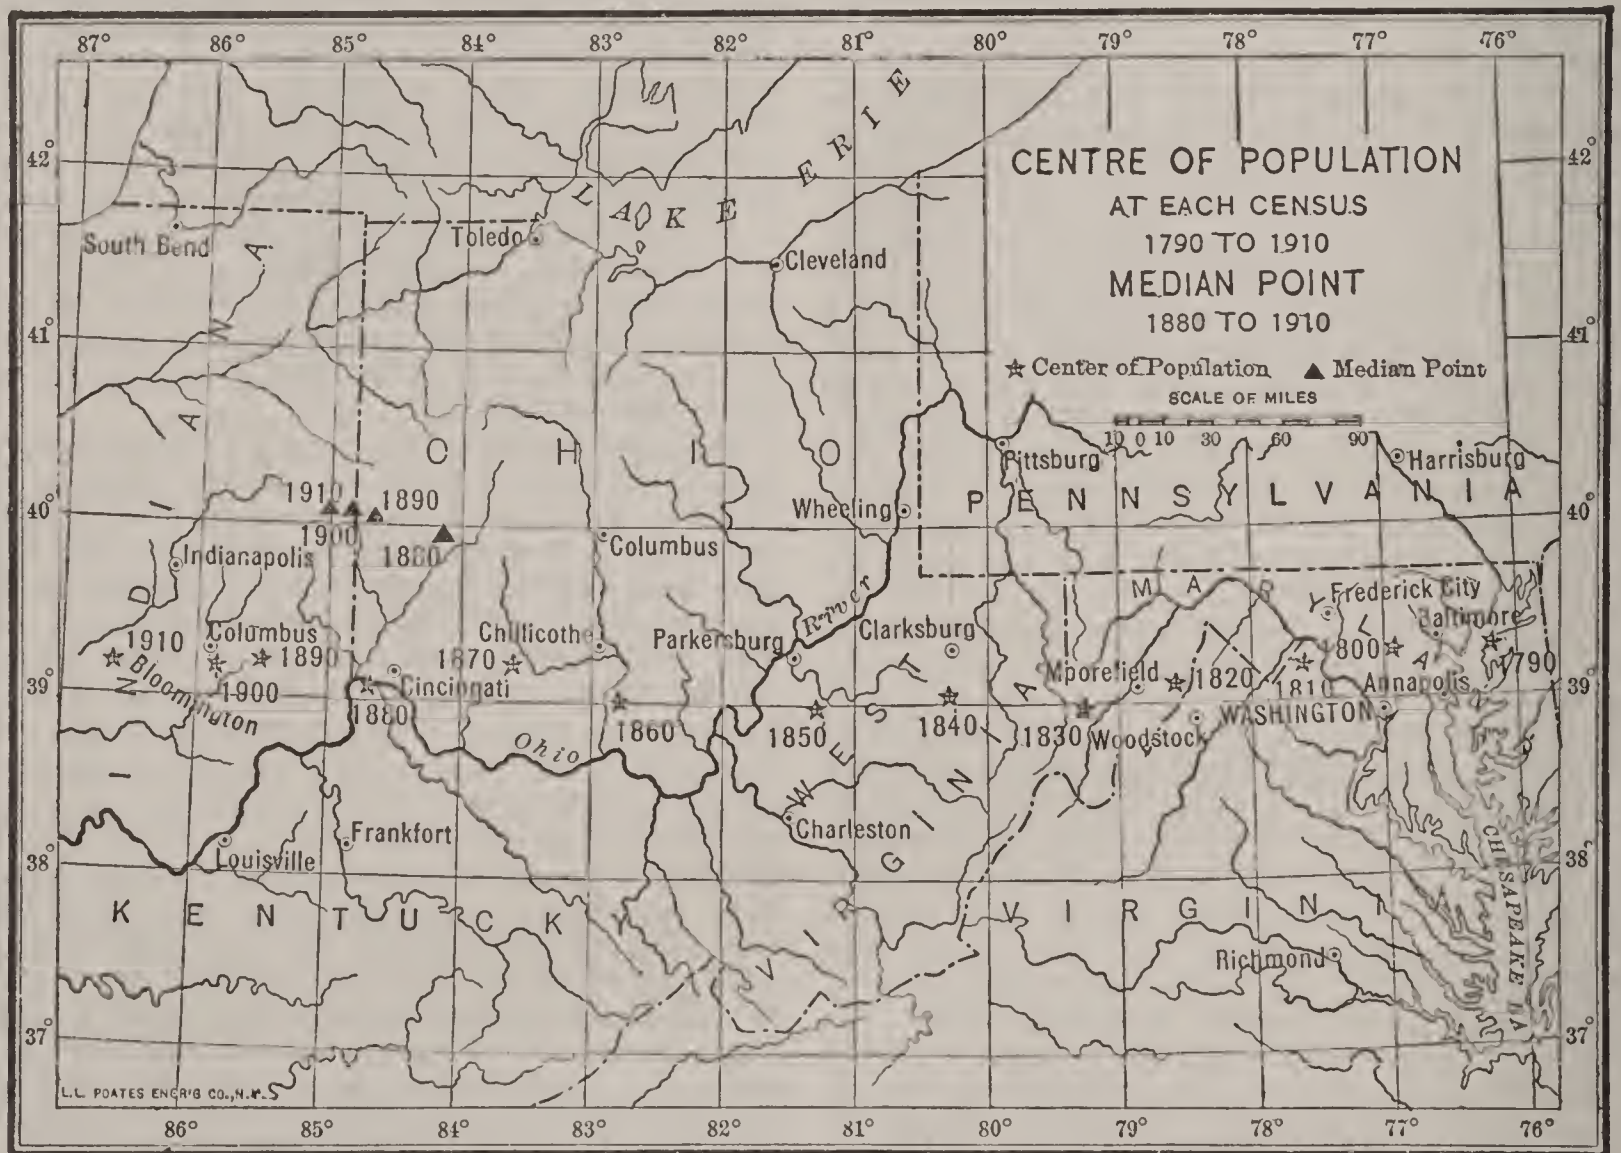

military contingents, and involved a count of the people not as the main issue but as an incident. In this they differed from the census operations of to-day.

This is likewise true of such records as that of the *Domesday Book* frequently pointed out as illustrations of statistical practice during the Middle Ages. Indeed, a direct enumeration of the whole people having no other object in view than to ascertain their number, first took place with the census of the United States in 1790, and the principal development of the census occurred in the nineteenth century. Before that time there had been, in several European states, efforts directed to ascertaining the number of the people or of particular classes. Perhaps the most comprehensive of these efforts took place in Sweden. In 1686 parish registers were intro-

duced, in which not only births and deaths, but also arrivals and departures were to be noted. By means of these registers the number of the population was ascertained, and beginning with 1749 comprehensive statements for the entire land were published. Such population registers from which, in lieu of an enumeration, the number of the population can be ascertained, exist to-day in many places. It was mainly from such registers that the early notices of the population of Prussia and Austria were gathered. To them should be added the reports made from time to time by the administrative offices of the various districts of the number of persons, especially of those capable of bearing arms, under their jurisdiction. In all this we see the beginnings of the modern census.

Enumeration of Population.—The census has been a matter of slow growth. In its present-day form it involves a record of the salient facts pertaining to every person in the community, these facts being summarized for territorial and other groups. But it was a long time in coming

to this point, and early records are oftentimes very summary. The most usual form of the census is the census of population, recurring at regular intervals of five or ten years, as the case may be. The inauguration of regular census taking by the United States in 1790 has already been noted. England, Holland, and Norway followed in 1801. In France a census took place in 1801, but after that irregularly until 1831, when the regular series begins. In Prussia a census was taken in 1816, but without any instructions to the local authorities, who were free to use their own discretion in the matter. It was hardly until the middle of the nineteenth century, as we shall see in reviewing the history of census taking in the United States, that methods acquired stability.

Development of Population Census.—The progress of census taking can be seen in an examination of the development of the census of the United States. That of 1790 was a model undertaking, whose results were fully stated in an octavo pamphlet of 56 pages, while the report upon population in the census of 1910 fills four quarto volumes. The census of 1790 recorded only the heads of families, dividing the members of the family into the following classes: free whites, males 16 years and over, males under 16 years, females, other free persons, and slaves. Until 1850 no essential change was made in the form of enumeration, though the classes were enlarged to embrace age, occupation, physical infirmity, and other data. By 1840 the schedule had grown so unwieldy that for each family there were as many as 70 spaces in which entries might be made. In this period there could be no tabulation of statistics in the modern sense of the word. No combinations other than those given in the original schedule could be made, and facts given under

one head, e.g., age, could not be combined with those given under another, e.g., illiteracy. In 1850 a radical change was introduced, and for the first time every inhabitant was recorded by name, the questions being answered for each person specifically, and not for the family group of which he was a part. This change in the manner of asking the questions necessitated the establishment of a central office in Washington in which all the schedules were gathered and the tabulations made. The collection of the figures was in the hands of the United States marshals until 1880, but since that date has been in charge of the Census Office, and considerable improvement in the quality of the returns has resulted.

Census Methods.—The operations of the census are manifold, and can be stated only in the briefest manner. Preliminary steps are the preparation of the schedules and the division of the country into enumeration districts. The schedules are sometimes minutely prescribed by law, but the better way is for the act to enumerate the points to be covered and leave the formulation of the questions to the experience and discretion of the census authorities. The country must be divided into well-defined enumeration districts, containing approximately the same number of persons, and not too extensive to be fully covered by the enumerator in the time allotted to him. In countries where the census is taken in a single day, the districts must of necessity be smaller than in the United States, where two weeks are given the enumerator in cities, and a month in rural districts. After he has completed his work his papers are sent to Washington for examination and tabulation. In 1890 the work of tabulation was done by electrical machines, the invention of Mr. Herman Hollenth. These machines have now acquired a permanent place in census work. The facts recorded on the schedules are drawn off by a punching machine on cards, where each perforation represents some one of the characteristics noted on the schedules. Such a card is prepared for each individual. The cards are placed in a holder and brought into contact with a large number of points corresponding in location to the perforations. If there is a hole in the card the point passes through, establishes a current, and makes a record upon a recording dial. The points which touch the cards at places where there are no perforations are pushed back by springs and return into place when the card is taken out. By means of this machine the count is made with unerring accuracy and the number of combinations of the different data is greatly increased. It will be readily understood, if it has not been expressly stated, that a modern census of population is something more than a statement of the number of the people. The facts usually embraced in census inquiries relate to sex, race, age, nativity, citizenship, conjugal condition, occupation, literacy, and, in foreign countries, religious belief. The geographical distribution of the people gives another and most important element. These various elements in conjunction with the geographical detail furnish an almost endless variety of combinations. The result is a minute analysis of the population from these various points of view.

The Scope of Census Enumerations.—The decennial census authorized by the Constitution has from the beginning been utilized to secure in-

formation beyond the mere number of inhabitants, which would have satisfied the constitutional requirement. This tendency showed itself first in the elaboration of the population schedules already noted, but as early as 1810 additional inquiries were introduced. As time progressed these became very numerous and reached their culmination in 1890, when, among 25 volumes which contained the results of the census, two only relate to the count of the population. The multiplication of inquiries was thought to retard the progress of the main investigations, and by the law governing the census of 1910 the enumeration was limited to population, agriculture, manufactures, mines, and quarries. The last subject had not been included in the census of 1900, but a special census of mines and quarries had been taken for 1902 under the provisions of the permanent census act. The inquiry as to mortality, first incorporated in the census in 1850, was abandoned in the census of 1910. Census returns on mortality are notoriously defective, except for the registration area, from which data are to be had by other than census methods.

The census of 1910 was taken under a law of 1909, entitled "An Act to provide for the Thirteenth and subsequent decennial Censuses." It provided for the expansion of the force of the permanent census bureau for the period July 1, 1909, to June 30, 1912. As a result of administrative difficulties and inadequate appropriations, the work of the census failed of completion in the period set by the law.

Agriculture first appeared as a subject of inquiry in 1840, when a few general questions as to the value of farm crops were asked. In 1850 we find a special schedule for farmers, but the range of the inquiry was not materially increased though the form of question was much improved. In 1880 the scope of the inquiry was greatly widened and special inquiries concerning cereals and forestry were undertaken. The development of the census has been more in the details of publication than in change of method.

The history of manufacturing statistics dates back to the census of 1810. Without instructions or definite schedules, the marshals were directed to report upon the manufactures in their districts. The mass of heterogeneous material which resulted could not be gathered together into statistics, though they formed the basis for a general statement by Mr. Tench Coxe, in which estimate and conjecture were freely used to supplement defects of the data. The following census of 1820 had a better schedule, but results were hardly more satisfactory. Indeed, so general was the discontent with the figures that in 1830 the inquiry was abandoned. While an attempt was again made in 1840 to collect such statistics, it was not until 1850, with a reorganized census service, that valuable results were secured. The separate schedule for manufacturing and mechanical industries adopted in 1850 was in form substantially the same as that now in use. It has been gradually expanded and improved. In 1880 the industrial schedules were confided to special agents in cities and manufacturing districts. With the census of 1880 was incorporated a large number of special inquiries, and for the more important industries a mass of specifically appropriate matter was collected.

A permanent census bureau, under the Director of the Census, was established by a law of

1902. It publishes bulletins, special reports giving further analysis of the data of the decennial census, and other statistical material.

Bibliography. The fullest account of the census of the United States is found in an official publication, Wright and Hunt, *The History and Growth of the United States Census* (Washington, 1900). Consult also W. R. Merriam, *American Census Taking from the First Census* (Washington, 1905), and *The Federal Census*, by a Committee of the American Economic Association (New York, 1899). For the methods of European countries, the most useful compilation is Bodio, *Studi preparatorii per il IV censimento decennale della popolazione del regno* (Rome, 1892), the author of which was the Director of the Italian Statistical Bureau. Dr. Bertillon, chief of the Municipal Statistics of Paris, has published *Statistique internationale résultant des recensements de la population dans les divers pays d'Europe* (Paris, 1899).

CENSUS, ROMAN. See CENSOR.

CENT (Fr. *cent*, from Lat. *centum*, hundred). A coin of the United States valued at the one-hundredth part of a dollar. The division of the coinage unit into hundredths is quite frequent; and names indicating this division are found in the *centime* of France, the *centesimo* of Italy, the *centavo* of the South American republics, and the *cent* of Holland. In Belgium the coins of one and two centimes are popularly known as cents. In the United States the use of the word "cent" dates from the Act of Congress of 1786 which adopted the dollar of one hundred cents as the coinage basis of the United States. While in Colonial times dollars (Spanish) were frequent in the circulation, the minor coins in use were either English coppers or homemade substitutes for them. In 1787 a mint established by Congress at New Haven, Conn., began coining what are known as the "Fregio" or "Franklin" cents, which were issued for many years. In 1791 a coin bearing a head of Washington and the words "one cent" was struck in England as a pattern piece, and in 1792 another, without the word "cent," both of these meeting with the President's modest disapproval. In 1792 (April 2) Congress authorized the issue of a copper cent of 264 grains, and a half-cent in proportion. These appeared in 1793, the cent being reduced to 208 grains. In 1796 (Act of January 26) the weight of the cent was reduced to 168 grains and the half-cent was proportionately reduced, a new design being adopted also. The head of Liberty was changed in 1808, and again in 1816. In 1815 and 1835 no copper coins were issued. By Act of March 3, 1851, a three-cent coin, three-fourths silver, was authorized, and in 1853 its weight was reduced from $12\frac{3}{8}$ grains to 11.52 grains. By Act of Feb. 21, 1857, the half-cent was discontinued, and the old copper cent was replaced by a smaller coin, composed of .88 copper and .12 nickel, and weighing 72 grains. In 1864 (Act of April 22) the bronze cent was introduced, weighing 48 grains, and consisting of .95 copper and .05 tin and zinc. By the same Act the one and two cent coins were made a legal tender for sums not exceeding 10 and 20 cents respectively, and the coinage of two-cent pieces to weigh 96 grains was authorized. In 1865 (Act of March 3) the one and two cent coins became each a legal tender to the amount of 4 cents only, and a three-cent coin was authorized,

to consist of three-fourths copper and one-fourth nickel, to weigh 30 grains, and to be legal tender for any sum not exceeding 60 cents. In 1866 (May 16) a new Act provided for the coinage of a five-cent piece, three-fourths copper and one-fourth nickel, to weigh 77.16 grains, and to be a legal tender for any sum not exceeding \$1. The "Coinage Act of 1873" (February 12) discarded the two-cent piece and limited the issue of coins of the denomination of cent to a five-cent piece and a three-cent piece (three-fourths copper and one-fourth nickel, and weighing 77.16 and 30 grains respectively), and a one-cent piece (.95 copper and .05 tin and zinc, weighing 48 grains). The coins authorized by this Act were made a legal tender at their nominal value for any amount not exceeding 25 cents in any one payment. The minor coinage was further simplified by the discontinuance of the three-cent piece by Act of Sept. 26, 1890. The cents issued in 1793, 1799, and 1804, and the copper cent of 1856 are very rare, as are the half-cents of 1793, 1831, 1840-48, and 1852. See NUMISMATICS.

CENTAUREA (Neo-Lat., from Lat. *centauria*, Gk. *κενταύρειον*, *kentaureion*, from Gk. *κένταυρος*, *kentauros*, centaur). A genus of plants of the family Compositæ, containing at least 400 species of annual and perennial herbaceous plants, chiefly natives of the Mediterranean regions and Australia. The cornflower, bluebottle, or corn bluebottle (*Centaurea cyanus*), is common in grain fields in Europe, and has escaped from gardens in parts of the United States. The juice of the florets of the disk, with a little alum, dyes a beautiful and permanent blue. The large bluebottle (*Centaurea montana*), a native of central Europe, is frequently cultivated in flower gardens. Its flowers are considerably larger, and it is a perennial. Sweet sultan (*Centaurea moschata*), a native of the Levant, with fragrant flowers, is also common in flower gardens. It is an annual or biennial. Several species having the involucre spiny bear the name of star thistle, *Centaurea calcitrapa* being most widely known.

CEN'TAURS (Lat. *Centauri*, Gk. *Κένταυροι*, *Kentauroi*, of uncertain etymology). A race of

CENTAUR.

monsters, half man and half horse, which Greek legend localized in Thessaly. Such monsters are very early represented in Greek art, armed with a double-headed axe or branches of trees, and frequently in combat with an archer. Two main types may be distinguished. In one a human body from the waist upward is joined to the body and four legs of a horse; in the earlier type the fore legs are also human, and the hinder parts only are equine. Greek legend knows two good centaurs, Chiron and Pholus; but the others are represented as savage and lustful. They appear most often in

monsters, half man and half horse, which Greek legend localized in Thessaly. Such monsters are very early represented in Greek art, armed with a double-headed axe or branches of trees, and frequently in combat with an archer. Two main types may be distinguished. In one a human body from the waist upward is joined to the body and four legs of a horse; in the earlier type the fore legs are also

battle with the Lapithæ (q.v.), or with Hereules. In later art they appear in the Dionysiae eirele, drawing the chariot of the god, plagued by cupids, or in company with satyrs and nymphs. Consult Baur, *Centaurus in Ancient Art, The Archaic Period* (Berlin, 1912).

CENTAURUS (Lat., from Gk. Κένταυρος, *Kentauros*). The Centaur, a southern constellation, represented on the celestial globe by a form half man and half horse. The principal star in this constellation, α Centauri, has been found to have a larger parallax (q.v.) than any other fixed star. In other words, α Centauri is nearer to us in space than any other star. The difficulty of measuring stellar distance is so great, on account of the extreme delicacy of the necessary observations, that it was not until 1838 that such measurements were rendered possible by Bessel, who determined the parallax of β Cygni with great precision. In the very next year Henderson, at the Cape of Good Hope Observatory, measured the parallax of α Centauri, but his results have since been replaced by the more accurate heliometric observations of Gill and Elkin, made at the same observatory in 1881-83. These astronomers make the distance 4.3 light years, a "light year" being the distance traversed by light in one year. When we remember that light moves with a velocity of 186,330 miles a second, we can form some idea of the immense distance separating us from our nearest neighbor among the fixed stars.

CEN'TAURY (Lat. *centauria*, Gk. κενταύρειον, *kentaureion*, from Gk. κένταυρος, *kentauros*, centaur; so called because it was supposed to have healed the wounded foot of the centaur Chiron), *Erythræa*. A genus of plants of the family Gentianaceæ, having a funnel-shaped regular five-parted corolla. The species are pretty little annuals, natives chiefly of the temperate parts of Europe and Asia, with pink or rose-colored flowers. They possess the tonic and other medicinal virtues of gentian, and although not frequently administered by physicians, are an important domestic medicine; and the tops are collected, when the plant is in flower, by the country people both in England and on the continent of Europe, to be employed in cases of dyspepsia, in intermittent fevers, and as a vermifuge. They contain a substance called *centaurin*, the hydrochlorate of which is said to be an excellent febrifuge. The common centaury (*Erythræa centaurium*) is the species most frequent in Great Britain, a plant of 8 inches to a foot in height, with flowers collected in loose heads, growing in dry pastures. Two or three other species are found on sandy seashores. Nearly allied to these is the American centaury (*Sabbatia angularis*), an annual plant with an erect, quadrangular stem, extensively distributed throughout the United States and Canada, and much used in the domestic practice of America as a prophylactic against autumnal fevers in strong infusions and large and repeated doses. There are more than a dozen species of *Sabbatia* in the United States, and the European species of centaury are introduced to some extent in waste grounds.

CEN'TENARY (Lat. *centenarius*, consisting of a hundred, from *centeni*, numbered by hundreds, from *centum*, hundred). A hundred of anything; a period of a hundred years; but usually employed to denote the commemoration of an important event. The centenary of Ameri-

can independence was celebrated by a *centennial* exhibition in 1876; the *bicentenary* of Pope's birth in 1888; the *tercentenary* of Shakespeare's birth in 1864; the *octo-centenary* of the Bologna University in 1888. See MILLENNARY.

CENTENNIAL EXHIBITION, INTERNATIONAL. An international exhibition of arts, manufactures, and products of the soil and mines, held in Philadelphia, Pa., from May 10 to Nov. 10, 1876. The exhibition was designed as a celebration of the one hundredth anniversary of the Declaration of Independence, and to illustrate the progress and industrial development which had taken place since that event. The project was originally proposed by an association of citizens of Philadelphia in 1870, and was officially authorized by Congress on March 3, 1871, when a centennial commission, of which Joseph R. Hawley became president, was named by President Grant. This commission, on May 12, 1873, appointed Alfred T. Goshorn director general, under whose immediate direction the various subordinate officers were then chosen. The funds for the exhibition were obtained from the following appropriations: City of Philadelphia, \$1,500,000; State of Pennsylvania, \$1,500,000; Congress, \$1,500,000; and private subscriptions, \$2,300,000. A site in Fairmount Park, comprising an area of 236 acres, was inclosed, within which more than 200 buildings were erected. Of these, the Main Building, a structure of iron and glass, was designed for the exhibition of manufactures, products of mines and metallurgy, and various objects showing the development of science and education of all nations. It covered an area of 20 acres, and was 1880 feet long by 464 feet wide; Machinery Hall, next in size, was 1402 feet long by 360 feet wide, and was constructed of wood, with iron ties and struts into large trusses upon tiers of solid masonry; Agricultural Hall was 820 feet long by 540 feet wide, and was of wood and glass; Horticultural Hall, of iron and glass, in the Moorish style of architecture, was 383 feet long by 193 feet wide; and Memorial Hall, of granite, glass, and iron, in the modern Renaissance style of architecture, was used as an art gallery, and was 365 feet long by 210 feet wide and 89 feet in height, costing \$1,500,000. This building was constructed in permanent form, and is now the Pennsylvania Museum of Art. The smaller buildings were erected at the expense of various countries, States, and individual firms. In accordance with an Act of Congress of June 5, 1874, the President invited foreign governments to be represented and take part in the international exhibition. Forty-nine foreign governments and dependencies responded to this invitation; and many, in addition to sending important exhibits of their products, erected buildings on the grounds for the use of their respective commissions.

The exhibits, of which there were upward of 50,000, were classified in 36 groups, each of which was subdivided into classes, and these in turn were again subdivided into smaller divisions. They were examined by a jury of awards, of which Francis A. Walker was chief, composed of 233 judges, of whom 118 were foreign and 115 American. Awards, consisting of a diploma and a medal, were granted to 13,104 exhibitors, 7802 being given to foreign countries and 5302 to the United States. The total number of admissions was 9,910,966, of which 8,004,274 were paid. The largest number of persons

admitted on any one day was on Pennsylvania Day (September 28), when 274,919 persons entered the grounds. During the exhibition the governors of the various States were invited to accompany excursions to the fair, where usually receptions were held in the State buildings. By such means, interest was stimulated, and citizens generally took advantage of these excursions to visit the exhibition. Representatives from each State and Territory were invited to deliver addresses upon its history, progress, present condition, and resources; also various organizations held meetings on the exhibition grounds on special days. There were, also, the following official ceremonies connected with the exhibition: Opening exercises, on May 10; centennial celebration of the Declaration of Independence, on July 4; distribution of awards to exhibitors, on September 27; and closing exercises, on November 10.

The Centennial Exhibition marked an important stage in the industrial development of the United States, as well as in the growth of industrial expositions generally. Coming, as it did, at a time of prosperity following the Civil War, it offered an opportunity for individual manufacturers to show the great advances that had been made under the stimulus of the demands of active trade. It was, moreover, the first opportunity where the products and manufactures of every section of the United States were so brought together as to give a concrete representation of the material resources and capacities of the nation as a whole. The international aspect given to the exhibition by the coöperation of foreign countries served to emphasize the closer commercial relations that were being established between the United States and various distant nations. From South America and the Far East came extensive exhibits; and it may be mentioned as a single consequence that articles of Japanese manufacture became well known in the United States for the first time, and soon entered into extensive use for decorative and other purposes. The fine quality of many goods exhibited by European makers was impressed upon American manufacturers, and an important result was the tendency to adapt their labor-saving and more rapid machinery to the manufacture of higher grades and more ornamental products. The bringing together of important works of art also was an event of importance to the American people, whose art galleries and academies were at that time in little more than a formative state. Greatest of all the lessons learned from the exhibition was the realization, not only of the great progress, but of the extended and diverse resources of the nation, together with its homogeneity and potentiality in industrial matters, in spite of the then recent war, devastating a large and important territory. As the exhibition was visited by numerous visitors from abroad, these facts were equally patent to them and served to demonstrate to the world the extent of the development of the United States. Regarded in its larger aspect, the Centennial Exhibition illustrated conditions existing at a time when the changes wrought by the development of rapid communication and the extended use of mechanical power in various industries were clearly indicated. The railway, telegraph, and post office had already bound the world closely together, so that a more intimate acquaintance among nations and easier inter-

change of goods was possible. The use of steam and inventive genius had effected transformations in manufacturing, and the methods in vogue in the United States were now brought to the serious attention of Europe. As an exhibition, the Centennial was organized on a larger scale and on a more truly international basis than any previously attempted, and as a result its success was extraordinary. Being the first exhibition of the kind in the United States, it paved the way for subsequent undertakings which have proved as successful. See EXHIBITIONS, INDUSTRIAL.

The history of the exhibition is given in a series of nine volumes published by the Department of State (Washington, 1880), of which vols. i and ii are devoted to the reports of the director general and the chiefs of the bureaus of administration; vols. iii to viii, which were edited by Francis A. Walker, to a description of the exhibits; and vol. ix, a quarto volume, by Dorsey Gardner, to the grounds and buildings.

CENTENNIAL STATE. Colorado. See STATES, POPULAR NAMES OF.

CENTENO, thán-tā'nō, DIEGO (c.1505-49). A Spanish soldier, born at Ciudad Rodrigo. In 1534 he went with Pedro de Alvarado to Peru, where he contended against the elder Almagro at Las Salinas (1538), and the younger Almagro at Chupas (1542); made himself master of part of the country by killing the tyrannical Almanzas; and in 1544 declared against Gonzalo Pizarro and on the side of the Viceroy. He was, however, several times defeated by Carbajal and, his army being disbanded, was compelled to seek refuge in a cave near Arequipa. On the arrival of Gasca, the envoy of Charles V, Centeno collected an army in support of the Royalist cause in Charcas, but was again defeated (Oct. 20, 1547) by Pizarro and Carbajal at Huarina. In the following year he contributed to the final defeat of Pizarro, towards whom he displayed more clemency than did the other Royalists. His death, at La Plata, just after he had been appointed Governor of the Río de la Plata, is said to have been caused by poison administered at a banquet by officers who feared the revelations which he had purposed to make to the King.

CENTER. See CENTRE.

CENTERING. See CENTRING.

CEN'TERVILLE. A city and the county seat of Appanoose Co., Iowa, 89 miles northwest of Keokuk, on the Chicago, Burlington, and Quincy, the Chicago, Rock Island, and Pacific, and the Southern Iowa Traction Company railroads (Map: Iowa, E 4). The city has a park, a public hospital, and a public library. Coal, gypsum, and limestone underlie the vicinity, and large quantities are shipped. The exportation of live stock is an important industry, and there are railway shops and manufactures of lumber, flour, iron, skirts, crushed rock, etc. Settled in 1847, Centerville was incorporated in the following year. Its government is administered by a mayor, elected biennially, and a city council. Pop., 1890, 3668; 1900, 5256; 1910, 6936.

CENTERVILLE. A town and the county seat of Queen Anne Co., Md., 30 miles (direct) east by north of Annapolis, on the Corcica River, at the head of navigation, and on the Maryland, Delaware, and Virginia, and the Philadelphia, Baltimore, and Washington railroads (Map: Maryland, N 4). The town is in

a fertile agricultural and peach-growing district, and has carriage works, machine shops, canning factory, and a creamery. Centerville has adopted the commission form of government and owns its electric lighting plant and water works. Pop., 1900, 1231; 1910, 1435.

CENT-GARDES, sän'gård'. The title of a special bodyguard instituted by Louis XI of France in 1474, consisting of 100 nobles, acting as guards of the palace, each of whom maintained two archers. The latter were later developed into the *gardes du corps*. The Cent-Gardes were disbanded in 1727 by Louis XV, restored by Napoleon III, and finally dissolved at the fall of the Empire.

CEN'TIGRADE SCALE (Fr., from Lat. *centum*, hundred + *gradus*, degree). A scale for thermometers where the zero is fixed at the freezing point of water, and the 100° point at the temperature at which water boils under an atmospheric pressure of 760 millimeters (30 inches). See THERMOMETRY and THERMOMETERS.

CENTIME, sän'têm' (from Lat. *centesimus*, hundredth, from *centum*, hundred). In the French monetary system, the hundredth part of a franc.

CENTIMETER-GRAM-SECOND SYSTEM. See C. G. S.

CEN'TIPEDE, or **CENTIPED** (Lat. *centipeda*, *centupeda*, from *centum*, hundred + *pes*, foot). Centipedes belong to the order Chilopoda, one of the two principal groups of the Myriapoda, and in some places are popularly known as "galleyworms." They have fewer segments in the body than the Chilognatha, the millipedes, in which respect they more closely approach spiders and insects; a centipede, indeed, is like a primitive insect in structure. The form of the body is flattened, has more concentration headward than in the millipedes, and each segment bears one pair of legs. In counting the segments, the ventral surface should be observed, for the dorsal shields often overlap. The head, covered by a flat shield, bears a pair of long antennæ, a pair of small, strong mandibles, and a pair of underjaws; and it contains poison glands, the venom being emitted through a pair of modified legs.

Habits and Habitat.—Centipedes are active and ferocious. All are fond of dark and damp places, and stay by day under stones and bark, in decaying wood and leaves, or in loose soil. They go in search of food by night, devouring worms, mollusks, and insects, which they are able to pursue with much persistence, guided almost wholly by the sense of touch, for their powers of vision are at the best poorly developed. Only one family, Scutigera, has compound eyes. In the other forms the eyes are simple or absent. According to Plateau, centipedes can distinguish light from dark, but, since they are night prowlers, the blind forms seem to get on as well as the others. As destroyers of insects, etc., centipedes are, therefore, of practical importance to agriculture. The smaller forms seldom, if ever, bite man, and the poison is never fatal. The bite of the large tropical forms, however, is painful and serious. According to Humboldt, the children of South American Indians tear off the head and eat the remainder of the body.

Classification and History.—Four families are distinguished—viz., Scutigera, Lithobii, Scolopendridæ, and Geophilidæ. To the Scuti-

geridæ belong long, stout myriapods, and the genus *Scutigera* is distinguished by its long legs, but is rare in the United States north of New York City. The body of the Lithobiidæ is unevenly jointed. The genus *Lithobius* is of world-wide distribution, *Lithobius forficatus* inhabiting both Europe and America. The Scolopendridæ usually have four ocelli and from 17 to 20 jointed antennæ. To the genus *Scolopendra* the large-jointed centipedes belong, such as the giant centipede (*Scelopendra gigantea*) of tropical America and the West Indies. The Geophilidæ have from 30 to 200 segments, the typical genus (*Geophilus*) inhabiting both Europe and America, under stones and decaying wood. One European species is phosphorescent. The centipedes appeared later in geological times than the millipedes. A *Geophilus* occurs in the Lower Carboniferous of Nova Scotia and the coal formations of Germany, and the order is well represented in Tertiary times. Compare MILLIPEDE; and for bibliography, etc., see MYRIAPODA.

CENTLIVRE, sënt-liv'ër or lë'vër, SUSANNA (c.1667–1723). An English dramatist, the daughter of a Lincolnshire gentleman named Freeman, born (most probably) in Ireland. Her early history is obscure; but when 16 years of age she won the heart of a nephew of Sir Stephen Fox, who, however, died shortly after their marriage. Her second husband (an officer named Carrol) lost his life in a duel. Left in extreme poverty, his widow endeavored to support herself by writing for the theatre, and after producing a tragedy called *The Perjured Husband*, made her appearance on the stage. She afterward married (1706) Joseph Centlivre, principal cook to Queen Anne. Of her plays, *The Busybody*, in which the leading character, Marplot, is highly amusing (1709); *A Bold Stroke for a Wife* (1718); and *The Wonder* (1714), in which Garrick found one of his best parts,—though not distinguished by purity of style or truthfulness of portraiture, are lively in their plots, and have kept their place on the stage. Her collected *Dramatic Works* appeared in 1761 (3 vols.); new edition containing an account of her life (London, 1872).

CENT NOUVELLES NOUVELLES, sän nōō'vël' (Fr., hundred new stories). A collection of French tales, many of them taken from the works of Italian novelists, first printed by Vêrard, in an undated folio, from a manuscript of the year 1456. Boccaccio and Poggio are the principal sources. The tales were originally written for the court of Burgundy, probably at the direction of Philip the Good. Antoine de la Salle had some part in collecting and editing them. They were republished in Paris in 1858, under the editorship of Thomas Wright. They are marked by an extremely cynical and obscene wit.

CEN'TO (Fr. *centon*, It. *centone*, from Lat. *cento*, patchwork, Gk. *κέντρον*, *kentrōn*, patchwork, from *κέντρον*, *kentron*, pin, from *κεντείν*, *kentein*, to prick). A name applied to poems manufactured by putting together distinct verses or passages of one author, or of several authors, so as to make a new meaning. After the decay of genuine poetry among the Greeks, this worthless verse manufacture came into vogue, as is proved by the *Centones Homericæ* (q.v.); but it was much more common among the Romans in the later times of the Empire, when Vergil was frequently abused in this fashion, as in the

Cento Nuptialis of Ausonius (who gives rules for the composition of the cento), and especially in the *Cento Vergilianus*, constructed in the fourth century by Proba Falconia, wife of the proconsul Adelfius, and giving, in Vergil's misplaced words, an epitome of sacred history. The cento was a favorite recreation in the Middle Ages. In the twelfth century a monk named Metellus contrived to make a cento of spiritual hymns out of Horace and Vergil. Consult Delepierre, *Tableau de la littérature du centon* (London, 1874-75).

CENTO, chĕn'tō. A city in northern Italy, 16 miles north of Bologna, situated in a fertile plain, on the left bank of the Reno (Map: Italy, F 3). It has a former palace of Count Chiavelli-Pannini, and in the churches are many paintings by Guercino (q.v.), whose interesting house is still shown, and whose statue adorns the principal square. Cento is connected by canal with San Giovanni and with Ferrara, and is a hemp and rice market. Pop. (commune), 1881, 17,000; 1901, 19,118; 1910, 23,907.

CENTO'NES HOMER'ICI, or HOME'ROCEN-TO'NES (Lat., Homeric centos, translation of Gk. Ὀμηροκέντρωνες, *Homērokontrōnes*, or Ὀμηρόκεντρα, *Homērokontra*, from Ὀμηρος, *Homēros*, Homer + κέντρον, *kentrōn*, cento). A cento (q.v.) on the life of Christ, made up of Homeric hexameters. It dates probably from the fifth century, and was printed by Aldus in 1501, by Stephens in 1568, and edited by Teucher (Leipzig, 1793). It has been ascribed to the Empress Eudocia.

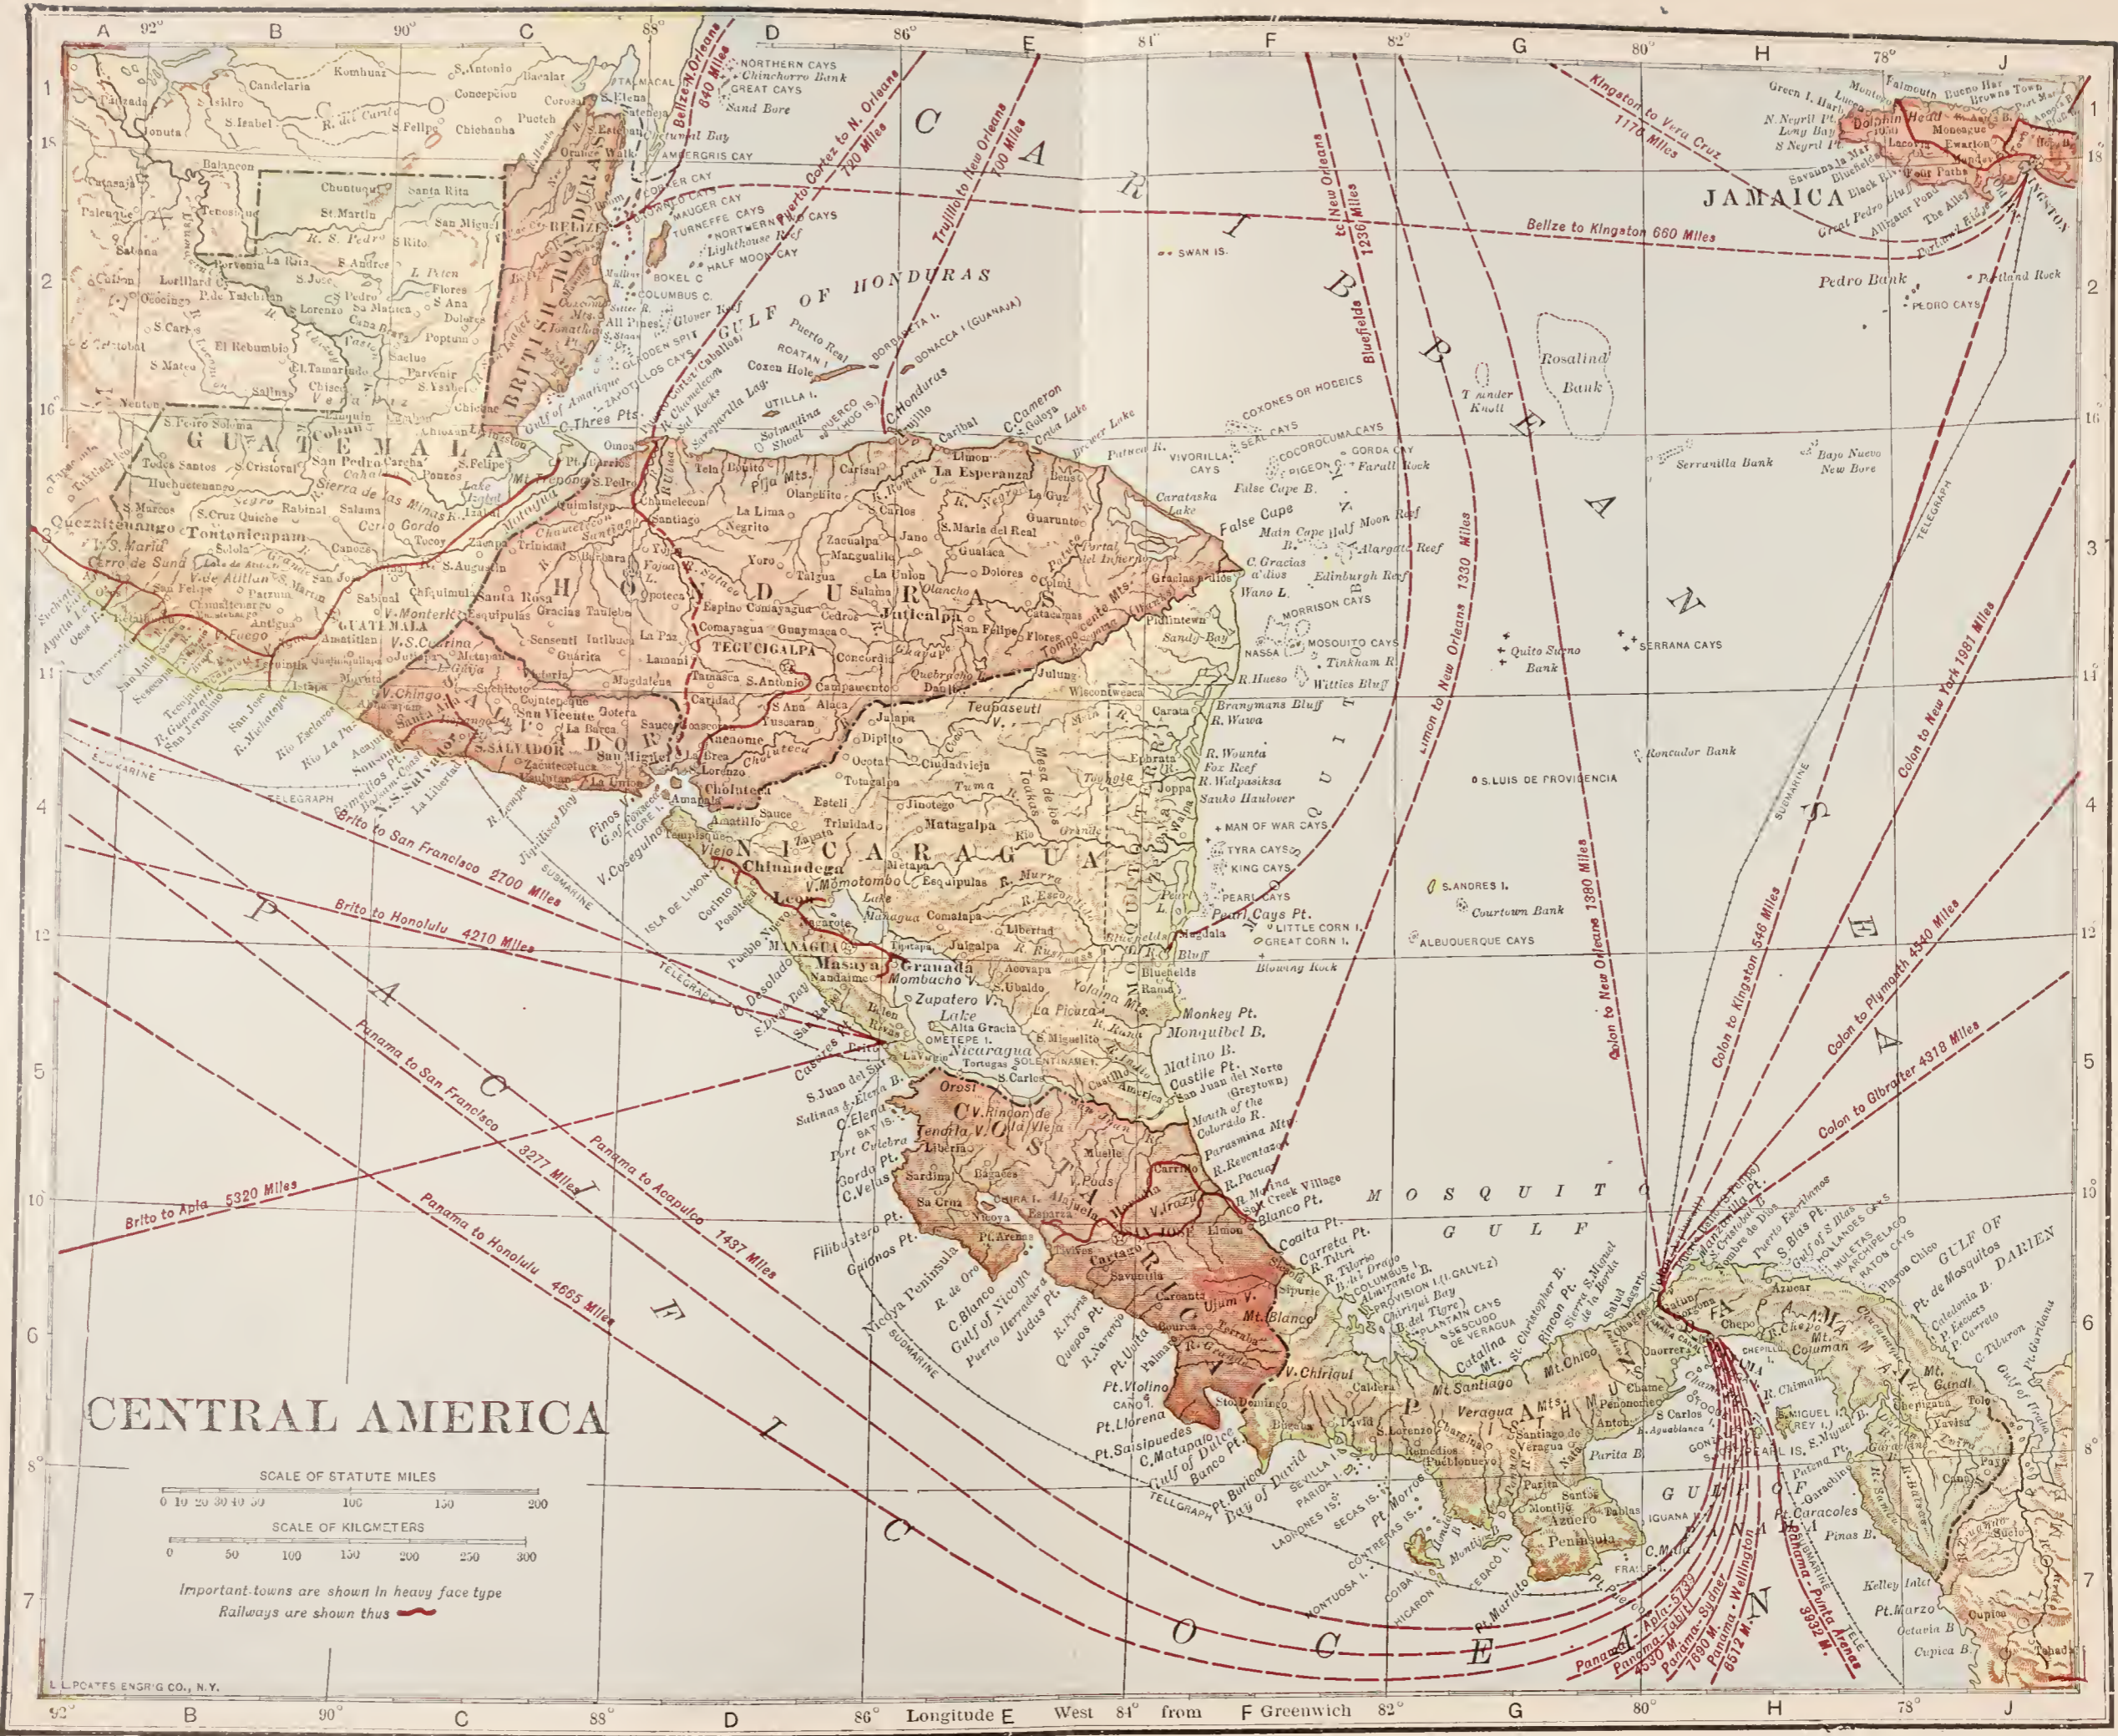

CENTO NOVELLE ANTICHE, chĕn'tō nô-vĕl'lâ ân-tĕ'kâ (It., hundred old stories). A collection of tales belonging to Italy and the thirteenth century. They are founded variously on historical events and mediæval romances and tableaux. See ITALIAN LANGUAGE AND LITERATURE.

CENTORBI, chĕn-tōr'bĕ. The former name of the Sicilian city Centuripe (q.v.).

CENTRAL AMERICA. That portion of the American continent between Mexico on the north and Colombia on the south, embracing the states of Costa Rica, Nicaragua, Salvador, Honduras, Guatemala, Panama, and the colony of British Honduras (Map: World, Countries, M 8—special map). It extends from lat. 8° to 18° 30' N., and has an area estimated at about 181,500 square miles. Where it joins the Isthmus of Panama, now crossed by the Panama Canal (q.v.), the distance between the Atlantic and the Pacific is reduced to about 75 miles. It is in general a mountainous region, the elevations reaching about 13,000 feet in the north, and over 11,000 feet in the south. The interrupted mountain chain along the west coast is, in a sense, the connecting link between the cordilleras of North and South America. The chain includes numerous volcanoes, which have ejected enormous quantities of lava and ashes. There are two extensive lakes, those of Nicaragua and Managua. The west coast of Central America is bold and steep, but most of the eastern coast lies at low altitudes. The population is chiefly of mixed Spanish and Indian blood. The prehistoric remains are of great interest. See ARCHÆOLOGY, AMERICAN.

History. The coast of Central America was first sighted by Columbus on his fourth voyage, in August, 1502. After 1513 a part of what is now Costa Rica was conquered by Pedro Arias de Ávila. From 1522 to 1525 the country was in

dispute between Ávila and Cortés, who, after the conquest of Mexico, dispatched Alvarado to subdue Guatemala (1523-24). Cortés himself invaded the country in 1524-25, completing its subjugation. All of Central America constituted the Captain-Generality of Guatemala until 1821. In that year Guatemala proclaimed its independence, and in 1822 the five audiencias, corresponding to the present five states, were united to the Mexican Empire of Iturbide. They regained their independence soon after, and in July, 1823, constituted themselves the Republic of the United States of Central America. From the first there was a bitter conflict between the Federalist element, which was strongest in Honduras, and the Conservative party, comprising the clergy and the old Spanish bureaucracy, which were opposed to centralization, their stronghold being Guatemala. The struggle between these two elements has persisted to the present day and has shown itself in the numerous unsuccessful attempts to establish a federated Central America. The Liberals were in the ascendant up to 1839, under the leadership of General Morazán. In 1839, however, the union was dissolved, as the result of the successful uprising of the Conservatives of Guatemala under Carrera. General Morazán made an attempt to restore the federal republic, but was captured and shot in Costa Rica in 1842. In that year a new union of all the states, excepting Costa Rica, was brought about, but this was dissolved in 1845. Costa Rica, in general, took very little part in the political affairs of Central America. In 1850 Honduras, Salvador, and Nicaragua endeavored to restore the republic by force, but their armies were overthrown in the following year by Carrera. It was during the period of disturbances which followed the victory of Guatemala that the filibuster Walker (q.v.) made his audacious attempts to seize the government of Nicaragua (1856) and Salvador (1860). Of subsequent efforts to establish a federated republic in Central America, the most important were those of Barrios, President of Guatemala, who resorted to force (1885) and perished in the attempt, and the peaceful union formed in 1895 by Nicaragua, Salvador, and Honduras, which combined to form the Greater Republic of Central America, with provisions for the admission of Guatemala and Costa Rica. A constitution was adopted in 1898, but owing to the dissatisfaction of Salvador, the union was soon dissolved. Great Britain, in 1665, extended her protection to the Mosquito Coast, which was relinquished in 1850. Through colonization British Honduras was established in that year. In 1903 the revolt and independence of Panama added another to the list of Central American republics. From the Washington Peace Conference of 1907 dates a new era of interstate relations in Central America. The organization of the Central American Court at Cartago in 1908, for which Andrew Carnegie provided the building, has solved disputes and promoted cooperation. The first decision was in 1909. In the same year the First Central America Conference laid the basis of a uniform monetary, metric, fiscal, and consular service agreement. The Sixth Conference meeting in January, 1914, carried these recommendations even further and added plans for agreements as to international highways, postal and telegraphic regulations, and coasting trade, as well as the establishing of a central pedagogic institute and a central com-

CENTRAL CITY. A city and the county seat of Gilpin Co., Colo., 40 miles west by north of Denver, on the Colorado and Southern Railroad (Map: Colorado, E 2). It is the centre of supply for a rich mining district, and has gold mines. The first discovery of gold in paying quantities in the State was made here. Central City was settled in 1859, and was incorporated in 1864. The government is administered by a mayor, biennially elected, and a city council. There are municipal water works. Pop., 1890, 2480; 1900, 3114; 1910, 1782.

CENTRAL CITY. A city in Muhlenberg Co., Ky., 35 miles northwest of Bowling Green, on the Illinois Central, the Louisville and Nashville, and the Kentucky and Midland railroads, and on the Green River (Map: Kentucky, C 5). It is in a coal-mining region, and is the commercial centre of the vast bituminous coal fields of western Kentucky. The city contains a public library and railway repair shops. Pop., 1890, 1144; 1900, 1348; 1910, 2545.

CENTRAL CITY. A city and the county seat of Merrick Co., Neb., 132 miles west of Omaha, on the Union Pacific and the Chicago, Burlington, and Quincy railroads, and on the Platte River (Map: Nebraska, G 3). It is in a productive agricultural and stock-raising region and ships cattle. The city contains the Nebraska Central College (Friends) and owns its water works and power plant. Pop., 1900, 1571; 1910, 2428.

CENTRAL FALLS. A city in Providence Co., R. I., 5 miles north of Providence, on the New York, New Haven, and Hartford Railroad, and on the Blackstone River (Map: Rhode Island, C 2). Central Falls has a public library and parks and obtains its water supply from Pawtucket, though it owns the pipe system by which the water is supplied. It has extensive manufactures of cotton, woolen, and silk goods, haircloth, glass, and machinery. The city, formerly included in the town of Lincoln, was incorporated in 1895. Under its present charter, the mayor and the city council are elected biennially, the latter being a bicameral assembly. The executive, with the consent of the board of aldermen, nominates police officers, and the

school committee is chosen by popular election; except in these departments, all officers are selected by the council. Pop., 1900, 18,167; 1910, 22,754.

CENTRAL FORCES. Forces which produce on a moving body an acceleration towards a fixed point called the "centre of force." Illustrations are afforded by the motion of a stone whirled in a sling, by the motion of the moon with reference to the earth, or of the earth with reference to the sun. It is evident, since the line of action of the force is through a fixed point, that the moving body will always move in a definite plane, and that the moment of the force around a line through the fixed point perpendicular to this plane being zero, there is no change in the angular momentum around this line. (See MECHANICS.) This leads at once to what is called the principle of the "conservation of areas," or the statement that, if a radius vector be drawn from the fixed point to the moving body, it will describe equal areas in equal intervals of time; thus, the nearer the body is to the centre, the greater must be its speed.

It can be shown further that, if the force is an attraction varying inversely as the square of the distance from the centre to the body, the orbit of the body will be an ellipse, hyperbola, or parabola, depending upon the conditions under which the motion may be regarded as being started, the centre of the force being a focus. If the orbit is elliptical, it may be shown that the square of the period of revolution of the body in its orbit is proportioned to the cube of the major axis of the ellipse. Consult Tait and Steele, *Dynamics of a Particle* (London, 1856).

The great astronomer Kepler, in 1609, by a careful consideration of the observations of Tycho Brahe on the motions of the planets, deduced the fact that these motions obey the three laws stated above; that is, they satisfy the conservation of areas, their orbits are elliptical about the sun as a focus, and the squares of their periods are proportional to the cubes of the major axes of the orbits. These are, therefore, often called "Kepler's laws." Sir Isaac Newton some years later showed that these laws were a necessary consequence of his principle of universal gravitation, which states that any two particles of matter act upon each other with a force of attraction which varies directly as the product of the masses of the particles and inversely as the square of their distance apart, and of the further principle that a large spherical body acts upon outside points as if its matter were concentrated at its centre.

CENTRALIA. A city in Marion Co., Ill., 62 miles (direct) east of St. Louis, Mo., on the Illinois Central, the Chicago, Burlington, and Quincy, the Southern, and the Illinois Southern railroads (Map: Illinois, C 5). Centralia has a large city hall, a Carnegie library, hospital, and parks. It is the centre of a noted fruit-growing country, in which commodity it has a large trade, especially apples and strawberries. Coal mining is an important industry, and there are also railway repair shops, flour mills, glass and bottling works, marble yards, a zinc smelter, shoe-heel factory, and manufactories of boxes, crates, shirts, overalls, envelopes, ice, and yeast. The water works are the property of the municipality. Settled in 1853, Centralia was incorporated in 1859, and is now governed under a general State law, which provides for a mayor,

elected biennially, and a city council. Pop., 1900, 6721; 1910, 9680.

CENTRALIA. A city in Lewis Co., Wash., situated midway between Seattle and Portland, on the Centralia Eastern, the Great Northern, the Northern Pacific, and the Oregon and Western railroads (Map: Washington, C 4). It contains a Carnegie library and a fine high-school building. The city is in a fertile agricultural and fruit-growing region, has coal and fire-clay mines, and there are manufactures of gloves, canned goods, lumber, and dairy products. Centralia has adopted the commission form of government and owns its water works and electric light plant. Pop., 1890, 2026; 1900, 1600; 1910, 7311.

CENTRAL INDIA POLITICAL AGENCY. The official name for a group of feudatory states in the centre of India, the principal of which are Gwalior, Indore, Rewah, Bhopal, Bhopawar, Bundelkhand, Baghelkhand, and Malwa. The total number in two residencies and six agencies includes 16 larger and 98 smaller states, covering 78,774 square miles. Pop., 1891, 10,318,812; 1901, 8,501,883; 1911, 9,356,980.

CENTRALISTS. A political party in Mexico, and some of the South American republics, which advocated the centralization of the government, as against a federalization of separate states. It has been a factor in Mexican politics since 1823; and the fight for the ascendancy between it and the Federalists has caused many revolutions in Spanish-American countries. See **CENTRALIZATION**; also **MEXICO**.

CENTRALIZATION. In political theory, a term used to denote the tendency on the part of a central authority to reserve to itself increasing powers of legislation and administration. More strictly interpreted, the word "centralization" is capable of bearing a double meaning. It may signify the complete unification of a political entity as opposed to a loose assemblage of quasi-independent members. In this sense we speak of a strongly centralized federal government as opposed to a mere confederation of states. In this sense, too, the term might be used to describe the absolute monarchy as contrasted with the lax organization of the mediæval state in which the element of nationality was practically made impossible by the feudal system. In its second meaning, centralization in a state already completely unified would describe the concentration of governmental functions in the supreme government in matters even of local interest. In no state, of course, is there any example of an absolutely centralized government, since in the nature of things some degree of power must be delegated to authorities provincial, municipal, and local, and thus in Russia, which stands as a type of autocracy, we find large powers of self-government enjoyed by the rural communes especially. In proportion only as the tendency towards centralization is stronger than the spirit of local self-government, can a government be spoken of as centralized or not. In ancient Rome the *municipia* possessed a very large measure of self-government under laws emanating from Rome. At the same time, so far as the broader aspects of government were concerned, the Empire was thoroughly centralized and was ruled from the Urbs as a unit. In the Middle Ages the power of the central governments, wherever there were such, was naturally small, and the privileges of provincial divisions, towns, and communes proportionately

large. Powers which are at present conceded to be within the province of the sovereign, even in the least centralized of modern states, such as the administration of public charity and public education and of justice, were, during the Middle Ages, relegated to the clergy and the territorial lords respectively. The growth of modern states has been in fact simply a great centralizing movement, but in certain countries the process of centralization has been more complete than in others. England stands as a type of the first class in which a way seems to have been found for reconciling a strong central organization with wide powers of local self-government. France may be taken as a type of the second class, where the administration even of communal affairs is in large measure regulated by the central government. In general, it may be said that the Latin countries, in which the traditions of the Roman Empire and the influence of the civil law are most strong, are more highly centralized than the northern nations of Europe.

CENTRAL PARK. See **NEW YORK CITY**.

CENTRAL PROVINCES AND BERÁR.

A chief commissionership of British India, created in 1861, and embracing the former Province of Nagpur, the two territories of Sagar and Nerbudda, and other territories added since (Map: India, D 4), the present designation dating from October, 1903. It is bounded by the Central India Agency and Chota-Nagpur on the north, Orissa on the east, Madras on the south-east, and Hyderabad and Bombay on the south-west and west. Its total area is 100,345 square miles, of which the portion under direct British administration contains 86,459 square miles. The surface is covered with numerous hilly ranges, among which the chief, the Satpura Range, enters from the west, runs in an easterly direction, and has numerous offshoots. The northern part belongs to the basin of the Nerbudda and forms a valley of about 10,000 square miles, with an average elevation of 1000 feet above sea level. The portion south of the Satpura Range is watered by the Wardha, Wain-ganga, and the Mahanadi rivers, and contains most of the cultivable land of the province. All of these rivers are navigable for some distance except during the dry season.

The climate is hot and dry, and the rainfall is generally satisfactory, but the soil absorbs the moisture so quickly that artificial irrigation becomes necessary in cultivation, and this is supplied mostly by tanks. Of the total area of the British possessions in the provinces, only about one-fourth is cultivated, while the rest is either unfit for cultivation or covered with forests and jungle. About one-third of the total area under cultivation consists of rice fields, while the remainder is under wheat and other food grains, oilseeds, and cotton. The mineral deposits consist chiefly of coal and iron. The manufacturing industries are but little developed and consist chiefly in the production of cotton goods and iron articles. The Central Provinces and Berár are traversed by the Indian Midland, Great Indian Peninsula, and Bengal railways.

The administration consists of a chief commissioner assisted by a secretary and a number of commissioners in charge of different departments. The British possessions are divided into the four divisions of Nagpur, Jabalpur, Nerbudda, and Chhattisgarh, each in charge of a commissioner. The tributary states are 15 in

number. In 1902 the government of India took Barár on lease in perpetuity at a rental of £167,000 annually to the Nizam of Hyderabad, incorporated the Hyderabad contingent in the Indian army, and in the next year annexed Berár to the Central Provinces under a resident commissioner.

Education is partly aided by the government and partly private. There are about 2300 schools of all kinds, of which only 300 are in the native states. The population of the British territory was 10,784,294 in 1891, 9,876,646 in 1901, and 13,916,308 in 1911. The native states had a population of 2,160,511 in 1891, 1,983,496 in 1901, and in 1911, 2,117,002. Nearly 82 per cent of the population is Hindu, over 16 per cent Animistic, and the remainder is made up of Mohammedans, Jains, and Christians. The chief town and seat of administration is Nagpur (q.v.).

CENTRAL STATE. Kansas. See STATES, POPULAR NAMES OF.

CENTRAL STATIONS. See ELECTRIC LIGHTING; TELEPHONE.

CENTRARCHIDÆ, sĕn-trär'kĭ-dĕ (Neo-Lat., from Gk. κέντρον, *kentron*, spine + ἀρχός, *archos*, anus). A family of fresh-water fishes of North America. It includes the various bass, sunfish, etc., all fishes of regular, well-balanced form, marked by a spot on the operculum. There are about 30 species, all gamey and voracious, and food fish of considerable importance. They build nests by cleaning away an area of gravel or sand, and watch them until the young are able to swim. See BASS; BREAM; CALICO BASS; CRAPPIE; ROCK BASS; SUNFISH.

CEN'TRE (Fr. *centre*, Lat. *centrum*, Gk. κέντρον, *kentron*, centre, from κεντείν, *kentein*, to prick). A term variously used in mathematics. (For *centre of a curve*, see CURVE.) *Centre of a pencil*, the vertex of a pencil of lines in a plane. Similarly the vertex of a sheaf of lines is called the centre. *Centre of involution*, a point in a range of points in involution such that the product of its distances from any two corresponding points is constant. *Centre of curvature* of a plane curve at any point, the centre of the osculating circle (q.v.). Similarly the centre of curvature of a surface is the centre of the osculating sphere. *Centre of perspective, homology, collineation*, the point in which all lines joining pairs of corresponding points in perspective figures are concurrent. In case the figures are congruent the centre of perspective is called the centre of symmetry. (For *centre of similarity*, or *similitude*, see SIMILARITY.) *Centre of mean position* or *mean centre of points on a line*, a point from which the algebraic sum of the distance to the given points is zero. The mathematical notion of centre of mean position corresponds to the mechanical idea of centre of mass and centre of gravity; e.g., the mean centre of the vertices of a triangle, i.e., the centroid, corresponds to the centre of mass of a homogeneous triangular plate.

CENTRE OF BUOYANCY. See BUOYANCY.

CENTRE OF GRAVITY. Owing to gravitation all bodies on the surface of the earth are being acted on by forces drawing them towards the centre of the earth. These forces are all sensibly parallel, owing to the large size of the earth compared with that of most natural objects, and produce what is ordinarily called "weight." The weight of any particle of matter whose mass is m is therefore equal to mg , where

g is the acceleration which the body would have towards the earth if allowed to fall freely. The value of g is proved by experiment to be the same for all kinds and quantities of matter, but to vary from point to point on the earth's surface. Any large body may be considered as made up of parts, all being acted upon by parallel forces, and the resultant of these forces will be the weight of the body and will be a force whose value, position, and direction are given by the ordinary laws for compounding parallel forces. (See MECHANICS.) The point in the body (or in space connected with the body)

through which this resultant always passes, however the body is turned or placed, is called its "centre of gravity." Thus, if m_1 and m_2 are the masses of two small bodies, which may be called "particles," kept at a distance h apart, their centre of gravity may be calculated as follows: Through any point O in the vertical plane including the particles, draw two straight lines, OX and OY , at right angles and parallel respectively to the vertical lines representing the weights of m_1 and m_2 . Let x_1 and x_2 be the perpendicular distances of m_1 and m_2 from OY ; then, by the law of parallel forces, the resultant of the two forces m_1g and m_2g is a parallel force $(m_1 + m_2)g$ at a distance x from OY , where

$$x = \frac{m_1gx_1 + m_2gx_2}{(m_1 + m_2)g}$$

Hence

$$x = \frac{m_1x_1 + m_2x_2}{m_1 + m_2}$$

Now, if the two bodies be moved in space, still keeping their distance h apart, OX and OY

moving with them, they can be so placed that OX is now vertical, as in the diagram. Call the distances of m_1 and m_2 from OX y_1 and y_2 .

The resultant now is a force $(m_1 + m_2)g$ parallel to OX , and at a distance y such that

$$y = \frac{m_1 g y_1 + m_2 g y_2}{(m_1 + m_2)g}$$

Hence

$$y = \frac{m_1 y_1 + m_2 y_2}{m_1 + m_2}$$

It is evident from geometry that in both cases the resultant passes through a point on the

line joining the two articles whose distance from the one of mass m_1 is

$$\frac{m_2}{m_1 + m_2} h.$$

This may be shown by choosing O to coincide with the particle whose mass is m_1 . In that case $x_1 = 0$, $y_1 = 0$, and therefore

$$x = \frac{m_2}{m_1 + m_2} x_2, \quad y = \frac{m_2}{m_1 + m_2} y_2.$$

And so, by similar triangle, these conditions are satisfied by a point C on the line OO_1 such that

$$\overline{OC} = \frac{m_2}{m_1 + m_2} \overline{OO_1}.$$

This point is, therefore, the centre of gravity, being independent of the direction of the line OO_1 . It is evident, further, from these equations for x and y , that the centre of gravity coincides with the "centre of inertia" (q.v.). The centre of gravity of any number of particles may be found in a perfectly similar way. For a uniform straight wire or rod the centre of gravity is its middle point; for a triangular plane figure it is the intersection of the three bisectors of the sides drawn from the opposite vertices; for a homogeneous pyramid it is the point of intersection of the lines drawn from each vertex to the centre of gravity of the opposite face.

If a solid body is suspended by a string fastened to it, or if it is balanced on a point, the line of action of this upward supporting force must pass through the centre of gravity, if the body is at rest. This gives, therefore, a direct method of determining the position of the centre of gravity of a solid by experiment: Suspend it by a string or balance it on a point, draw in the body a vertical line passing through the point of support; suspend the body by fastening the string to a different point, or balance it with another portion of the body resting on the pivot, draw in the body a vertical line through the new

point of support; the intersection of these two lines is the centre of gravity.

CENTRE OF GYRATION. It is proved in mechanics (q.v.) that the moment of inertia of any rigid body about an axis through the centre of inertia may be written Mk^2 , where M is the mass of the body. k is called the "radius of gyration" for that particular axis. A point in the body at a distance k from this axis, and so situated that the line joining it to the centre of inertia is perpendicular to the axis, is called the "centre of gyration." If the whole mass of the body were concentrated into a particle at this point and connected by a cord without mass to the axis, it would have the same energy of rotation as the original body if it had the same angular motion. It is obvious that there will be different radii and centres of gyration for different axes of rotation.

CENTRE OF IMPACT. The calculated mean position of the actual points of impact of a series of shots fired under identical conditions, all shots being referred to a common origin. The accuracy of a gunner is measured by the distance of the centre of impact from the point aimed at. See BALLISTICS; GUNNERY.

CENTRE OF INERTIA (Lat. *inertia*, inactivity, literally unskillfulness). The centre of inertia of two particles whose masses are m_1 and m_2 is defined as follows: Draw in the plane which includes the two particles two lines, OX and OY , at right angles to each other; let the distances of the particles from OX be y_1 and y_2 , and from OY be x_1 and x_2 ; then the centre of inertia is such a point that its distances from OY and OX are given by the equations

$$x = \frac{m_1 x_1 + m_2 x_2}{m_1 + m_2}$$

$$y = \frac{m_1 y_1 + m_2 y_2}{m_1 + m_2}$$

It is evident from these equations that this point coincides with the centre of gravity (q.v.);

and that if the distance between the particles is h , the centre of inertia is upon a line joining the two particles at a distance equal to $\frac{m_2}{m_1 + m_2} h$ from the particle m_1 .

This is at once evident if the line OX is chosen to pass through both particles, and if O is made to coincide with the particle whose mass is m_1 . In this case $y_1 = y_2 = 0$, hence $y = 0$;

$$x_1 = 0, \quad x = h, \quad \text{hence } x = \frac{m_2}{m_1 + m_2} h.$$

In a perfectly similar manner, the position of the centre of inertia of any number of par-

ticles or of a solid body made up of particles may be calculated.

The physical properties of the centre of inertia are most interesting. They are as follows: 1. If a blow or a force is applied to a body in such a direction that the line of action passes through the centre of inertia, the whole body will receive a velocity in the direction of the force; there will be no rotation, and the velocity and acceleration will be exactly what they would be if the same blow or force were applied to a single particle whose mass equals that of the body. 2. If the line of action does not pass through the centre of inertia, there will be rotation exactly as if the centre of inertia were pivoted; but the body will also move as a whole so that the centre of inertia will describe the same path as it would if the line of action of the force had passed through it. These two properties give a simple, self-evident method of locating the centre of inertia of a body by direct experiment: Place it on a smooth table, and by trying different directions determine one such that a blow in this direction produces no rotation, simply translation; draw a line in the body marking this direction; locate another similar line, and the centre of inertia is where these two lines intersect.

Illustrations of these two general properties of the centre of inertia are numerous. If a man falls from a building without striking the wall in his descent, his centre of inertia describes a vertical line, however he twists or turns. If a hammer is thrown obliquely upward in the air, it will revolve rapidly; but one point of the hammer—viz., its centre of inertia—will describe a smooth curve, called a parabola, which a single particle would describe if it were thrown upward in the same manner. When a shell explodes in its flight, the fragments fly off in different directions; but their centre of inertia at any instant is on a parabola, the same that it would have followed if there had been no explosion. See MECHANICS.

CENTRE OF OSCILLATION (Lat. *oscillatio*, a swinging). The period of oscillation of a simple pendulum—i.e., of a minute particle of matter vibrating through a small amplitude at the end of a fine thread which is supposed to be without weight—is given by the formula

$$T = 2\pi\sqrt{\frac{l}{g}},$$

where $\pi = 3.1416$, l is the length of the thread, and g is the acceleration of a falling body due to gravity. Thus, the period varies as the square root of the length of the pendulum. If, however, the vibrating body is a large solid oscillating about a fixed horizontal axis, the period of oscillation is given by the formula

$$T = 2\pi\sqrt{\frac{I}{Mgh}},$$

where I is the moment of inertia around the axis of suspension, M is the mass of the body, and h is the perpendicular distance from the axis of suspension to the centre of gravity of the body.

If any individual particle of the vibrating body were separately connected with the axis of suspension by a fine thread and entirely disconnected from the rest of the body, it would form a simple pendulum; but in general its period would not be that of the body itself. Those

particles nearest the axis of suspension would also vibrate in a shorter time than those farther away. As a rule it is possible, however, to find a series of particles which, vibrating as simple pendulums, would have the same period as that of the body. Their distance from the axis of suspension is evidently given by the condition

$$\frac{l}{g} = \frac{I}{Mgh}$$

or

$$l = \frac{I}{Mh}.$$

If a line can be drawn in the body parallel to the axis of suspension, at the distance l from it, and so that the plane of the two lines includes the centre of gravity, it is called the "axis of oscillation," with reference to the given axis of suspension. It may be shown that if the body be suspended so as to vibrate about the axis of oscillation, the former axis of suspension will be the new axis of oscillation, and the period of vibration is the same in both cases. The intersection of the axis of oscillation by a plane passing through the centre of gravity and perpendicular to the axis is called the "centre of oscillation."

CENTRE OF PERCUSSION (Lat. *percussio*, a beating, striking). If a rigid body is suspended so that it can turn freely about a fixed axis—e.g., a door—a "line of percussion" is such a line that a blow struck the body in that direction produces no reaction of any kind on the axis. In general, when a blow is struck the body in any chance direction, the axis experiences both a twist and a sidewise push; and, if the axis is held in fixed bearings, they must be strong enough to resist these. The point where the line of percussion intersects the plane which passes through the axis of suspension and the centre of inertia is called the "centre of percussion." This point may be proved to lie on the "axis of oscillation," with reference to the given axis of suspension. If the body is hanging freely from a point, so that the centre of gravity lies vertically below it, the centre of percussion coincides with the centre of oscillation.

CENTRE OF PRESSURE. The centre of pressure of any surface immersed in a fluid is the point in which the resultant of the pressures of the fluid on the several points meets the surface. The pressure of a fluid at a point is the "force per unit area" at that point, or the limiting value of the ratio of the force acting over a surface to the area of the surface, as the surface is taken smaller and smaller. This pressure is due to two things—the weight of the fluid and the reaction of the walls of the vessel which contains the fluid. (See HYDROSTATICS.) The pressure due to a gas is generally uniform over a surface, unless it is very large, and so the centre of pressure is the centre of gravity of the surface; but in liquids it is different. When the bottom of a vessel containing a liquid, or when a plane immersed in a liquid is horizontal, the pressures on all the points of it are the same; obviously they form a system of equal parallel forces, whose resultant will pass through the centre of gravity of the bottom or plane. But when the plane is inclined at an angle to the surface of the liquid, the pressure is not the same at all points, being greater at the lower than at the upper points. The resultant of the forces, then, will not pass through the

centre of gravity of the surface, but through a point below it. This point is the centre of pressure. In the case of a vessel with a rectangle for one side, the centre of pressure is at the distance of one-third of the height from the bottom. In the general case it must be found by calculation involving the calculus.

CENTRE PINTLE CARRIAGE. A gun carriage in which the chassis, or way on which the upper part of a seacoast gun moves, is attached to the pintle of the platform at its middle, and revolves around it through the entire circumference of the circle. The traverse circles are consequently continuous. By this arrangement an all-round horizontal field of fire is secured. See **ORDNANCE; COAST ARTILLERY.**

CENTRIFUGAL (Neo-Lat. *centrifugus*, from Lat. *centrum*, centre + *fugere*, to flee). A machine employed in the process of clarification and filtration. It consists of a circular vessel so constructed as to be capable of being made to revolve at a very high rate of speed. When the muddy liquid is placed in the vessel and the whole caused to revolve, it is found that the particles of dust, mud, or other matter fly to the circumference, leaving the liquid in the centre practically clear. In many centrifugal machines there is in the centre a cylindrical box or basket of fine wire gauze or perforated metal fixed on a vertical shaft. Upon revolution the clear liquid is thrown to the circumference and through the screen, leaving the material within the basket almost dry. By suitable arrangements the clear liquid can be drawn off. A machine of this kind is used in sugar refining, and on a smaller scale in chemical laboratories, while centrifugal separators are employed for separating cream from the skim milk.

CENTRIFUGAL and **CENTRIP'ETAL** (in botany). See **INFLORESCENCE.**

CENTRIFUGAL FORCE. See **CENTRAL FORCES; MECHANICS** (section on *Dynamics*).

CEN'TRING. The temporary framework either of timber or a combination of timber and iron, or of steel, upon which any arched structure is to be built whether of masonry or of steel.

A centre consists of a series of parallel templets called *ribs*, usually placed 5 to 6 feet apart, and so constructed as to have their upper edges conform in outline to the *soffit* or internal concave face of the arch. Transverse planks called *laggings* are fastened to these and upon them the *voussoirs* or arch stones directly rest.

In building the arch the centring should always be loaded symmetrically, and hence the work proceeds simultaneously from the two sides towards the middle. The stresses produced by the laying of the masonry are longitudinal rather than transverse, since under these conditions greater efficiency is secured from the timbering.

Transverse stresses will generally break the members under a very much smaller load than may be carried by the same members under a compressive thrust.

The centres should be allowed to remain in position as long as possible, even after the completion of the arch and even after the backing has been built, so that the mortar may have time to set completely. Where the arch forms one of several with intermediate piers, no centre should be removed or *struck* until it is symmetrically located with regard to two other and adjacent arches: as otherwise, unless the piers are abut-

ment piers, the thrust from one side will not be counteracted by a similar thrust from the other.

A centre should be absolutely stiff and settle as little as possible, since it is upon this templet that the structure is built. Generally the entire centre may be lowered simultaneously by removing the *wedges* in the *striking plates*, which latter perform the function of keeping the *lagging* in position close to the arch stones. The object of removing the entire centre at once is to avoid cross stresses in the arch itself.

In masonry arches of long span, where centres have reached their greatest development, three methods are used:

1. Direct supports from intermediate points.
2. Inclined struts in pairs.
3. Trussed girders.

The first is used wherever practicable, and the second and third when the supports in the first method cannot be brought close enough together.

In arches of great span, such as that of Waterloo Bridge, London, or the Cabin John Bridge, Washington, a longitudinal pulling strain is almost inevitable, as a beam of great length would bend to some extent under a thrusting strain. In such cases great skill is demanded in the designing and construction of the joints. As an arch is built from the piers towards the keystone, the weight upon the haunches during construction tends to push the crown upward, and therefore the problem of designing a framed centring involves the resistance of this tendency, as well as the supporting of the weight of the materials.

CENTRIPETAL FORCE. See **CENTRAL FORCES.**

CEN'TROSOME' (from Gk. *κέντρον*, *kentron*, centre + *σῶμα*, *sōma*, body). One of the two polar centres of the spindle, or "dynamic centres" from which the "archoplasmic" threads radiate and towards which the halves of the split chromatin elements are drawn at the time of cell division. The centrosome seems to be less frequently present in the plant than in the animal cell. See **CELL; EMBRYOLOGY.**

CENTUM CELLÆ. See **CIVITAVECCHIA.**

CENTUM'VIRI (Lat. nom. pl., board of 100 men, from *centum*, hundred + *vir*, man). In ancient Rome, a body of jurymen, three from each tribe, in charge of civil cases. Under the Empire the number was increased to 180, presided over by the *Decemviri*, and the sessions were held in the Basilica Julia (q.v.). Here the younger Pliny pleaded, and the Emperor Trajan sometimes listened to the arguments.

CENTU'RION (Lat. *centurio*, from *centuria*, company of 100, from *centum*, hundred). In the Roman army, the captain of a *centuria* or company. There were 60 centurions in each legion, a junior and a senior for each of the 30 *maniples*; the senior of the first *maniple* of the first *cohort* was the chief centurion, or *primipilus*, of the legion, and often had the real command of the entire body.

CENTURIFE, chèn'tōō-rē'pā. A city in the Province of Catania, Sicily, 28 miles northwest of Catania, formerly called Centorbi (Map: Italy, J 10). After removing the inhabitants to his new town of Agosta (q.v.), in 1233, Emperor Frederick II destroyed Centuripe, but it was rebuilt in 1548. Pop., 1901, 11,311; 1911, 13,111.

CENTURY (Lat. *centuria*, properly, a Hundred, a company numbering 100, then com-

pany in general). A division of the Roman people. See COMITIA; SERVIUS TULLIUS.

CENTURY PLANT. See AGAVE.

CEORL, kēōrl or chērl (AS., man, husband, Ger. *Kerl*, man, possibly ultimately connected with Skt. *jāra*, bridegroom, paramour), or CHURL. In the Anglo-Saxon social order, a common freeman, as distinguished from an eorl (earl), who was a privileged freeman. As the term *earl* did not originally imply a patent of nobility, nor even lordship or dominion, but only superior birth and social position, so the title *ceorl* implied no degradation or inferior status, but, on the contrary, marked its possessor off from the lower classes—the *laet*, or unfree man, and the *theow*, or slave. The *ceorl* was capable of owning land, and had a share in the common plowland and meadowland of his community. The *ceorls* were the citizens of the *mark* (q.v.), or *hundred* (q.v.), composing the *moot* (q.v.), or general assembly of the people, and administering the local justice and government. See VILLEINAGE, and consult the authorities there referred to; also Freeman, *History of the Norman Conquest of England*, vol. i (2d ed., Oxford, Eng., 1870-76).

CE'OS. See ZEA.

CEPH'ALĒ'LIS. See IPECACUANHA.

CEPH'ALAL'GIA. See HEADACHE.

CEPH'ALAS'PIS (Neo-Lat., from Gk. *κεφαλή*, *kephalē*, head + *ἀσπίς*, *aspis*, shield). A genus of primitive armored fossil fishes of the order Osteostraci and class Agnatha found in the brackish and fresh-water deposits of the British and North American Devonian formations. The body was elongated, triangular in section, and covered throughout with armor. The armor of the head region consists of a single heavy principal plate on the dorsal surface, which, when viewed from above, has the form of a horseshoe or the carapace of a king crab (*Limulus*). A ventral plate is opposed to the dorsal plate and there are a few small accessory plates. There are no jaws, for the mouth was of the same form as that of the modern lamprey, in which animal it is a sucking organ. Indeed, the lampreys are believed to be degenerate descendants from early heavily armored types like *Cephalaspis* and its associates among the Ostracodermi. The skeleton of *Cephalaspis* must have been wholly cartilaginous, for no traces of it have been preserved. The body was covered by bony scalelike rings, it had a single dorsal fin, and the tail fin was heterocercal as in the modern sharks. The best examples of *Cephalaspis* have been obtained in the Old Red Sandstone of Scotland and England. The American examples are of less satisfactory preservation and are found in the Devonian sandstones of the provinces of New Brunswick and Quebec, Canada. For illustration, see OSTRACODERMI.

CEPHAL'IC INDEX. See INDEX, CEPHALIC, ETC.

CEPH'ALIZA'TION (from Gk. *κεφαλή*, *kephalē*, head). The phenomena of progressive concentration and enlargement of the parts of the body belonging to the head; a phenomenon characteristic of segmented animals. Cephalization is only a special case of the law of division of labor. In the earlier metameric animals the head is only slightly different externally from the other segments, and consists of but 2 or 3 metameres. Already, however, the principal sense organs are located in the head, and the

central nervous system is enlarged there to form a brain. In the Arthropoda and the vertebrates the number of metameres in the head is increased, there being 6 head metameres in the crayfish, probably 6 in insects, and from 9 to 13 in vertebrates. The head now takes on the principal sensory and psychical functions, which are abandoned by the rest of the body. The sense organs become more and more concentrated at the head and they become larger; the nerve centres at the head become relatively more important, and so the brain increases in size, while the interrelation of parts becomes more intimate, so that the head not only becomes larger, but also more of a unit, and the brain more efficient as a controlling factor.

CEPHALLENIA. See CEPHALONIA.

CEPHALOCHORDA, sēf'al-ō-kōr'dā (Neo-Lat. nom. pl., from Gk. *κεφαλή*, *kephalē*, head + *χορδή*, *chordē*, cord). A small class of chordate animals, including the lancelet. These are usually regarded as offshoots of the primary vertebrate type, although some maintain that they are pioneer or ancestral types themselves and foreshadow fishes. See AMPHIOXUS.

CEPH'ALODIS'CUS. An extraordinary deep-sea animal, regarded as allied to *Balanoglossus* (q.v.), and classed, with a related genus, *Rhabdopleura*, among the Adelochoorda, as the lowest of the phylum Chordata. They were formerly regarded as polyzoans, but resemble *Balanoglossus* in structure, having a proboscis, a collar and collar cavity, and a trunk containing a structure resembling a notochord. "Cephalodiscus has an investment in the form of a branching gelatinous structure, which is beset with numerous short, filiform processes, and contains a number of cavities occupied by zooids. The latter are not in organic continuity, so that, though inclosed in a common investment, they do not form a colony in the sense in which the word is used of the Polyzoa or hydroid polyps. . . . They multiply by buds, but these become detached before they are mature. . . . *Rhabdopleura* occurs in colonies of zooids organically connected together, and inclosed in, though not in organic continuity with, a system of branching membranous tubes." Consult Parker and Haswell, *Text-Book of Zoölogy* (London and New York, 1910).

CEPHALÆDIUM. See CEFALU.

CEPH'ALO'NIA, or **KEPH'ALLE'NIA** (Gk. *Κεφαλληνία*, from *κεφαλή*, *kephalē*, head + *ὄνος*, *onos*, donkey). The largest of the Ionian Islands (q.v.), situated off the coast of Greece, between lat. 38° and 38° 30' N. and long. 20° 21' and 20° 49' E. (Map: Greece, B 3). Its greatest length is about 32 miles, and its total area 266 square miles. The surface is mountainous, Monte Negro attaining the height of 5313 feet. The soil is for the most part thin; fresh water is scarce and the rainfall slight. The climate is warm and dry, but agreeable. Earthquakes are not infrequent. The inhabitants are industrious and enterprising, and have planted vineyards wherever the grape will grow. There is little available land for the cultivation of grain, but the output of fruit is considerable. The chief products are olives, currants, and other southern fruits and vegetables, cotton, wine, and olive oil. The language spoken is a Greek dialect. The chief towns are Argostoli (q.v.), the capital, and Lixuri, on the Bay of Livada, on the southwest coast.

Cephalonia is called, by Homer, Same or

Samos. Later the island appears under the name of Cephallenia. It successively fell into the hands of the Athenians, Romans, Byzantines, Normans, and Venetians, from the last of whom it was repeatedly wrested by the Turks. On the fall of the Venetian Republic, in 1797, it was seized by the French. In 1809 it came into the possession of Great Britain. It was ceded to Greece in 1864. With Ithaca and some neighboring islets Cephalonia now forms a nome of Greece, with an area of about 315 square miles and a population (1907) of 71,235.

CEPH'ALOP'ODA (Neo-Lat. nom. pl., from Gk. *κεφαλή*, *kephalē*, head + *πούς*, *pous*, foot). The highest and most specialized class of Mollusca, characterized by the presence of a cirlet of fleshy arms surrounding the mouth on the front of the head. These arms, also called "tentacles" and "feet," are modifications of the "foot" which, as the muscular organ of locomotion of the Gastropoda and the Pelecypoda, occupies a ventral position on the body of the animal in those classes. In the Cephalopoda the foot has moved forward and become divided into two sections. The anterior section forms the cirlet of arms that serve both as accessory mouth parts, to catch and hold the prey, and as organs of creeping locomotion. The posterior section has become developed into part of a most efficient hydrostatic organ of propulsion, called the "hyponome" or "siphon." The body of the cephalopod is essentially a bag formed of the "mantle," which entirely incloses the visceral organs, and which is open only at the end to which the head is attached. In some genera this bag is almost spherical, and creeping locomotion is accomplished chiefly by the appendages of the head; in others, the body is elongated, and furnished with two finlike expansions on the sides, and the animal propels itself through the water by means of the hydrostatic organ, the hyponome. The ordinary position of the cephalopod in water is quite different from that of any other mollusk. A chiton, a snail, or a clam moves with the foot down, the mouth at the anterior end, and the visceral hump uppermost on the dorsal surface. A cephalopod when creeping has a very similar position, except that the mouth is ventral. In swimming, however, cephalopods have the mouth at the anterior end, and what was the anterior side is now the dorsal side of the animal. Thus the cephalopod, in taking to an active swimming life, has tipped backward through an angle of 90°. Cephalopods are able to swim forward or backward, often with great rapidity, the most important means of locomotion being the hyponome, near the underside of the head. The mantle is attached to the neck only on the dorsal side; elsewhere there is free communication between the mantle cavity and the outside. When the mantle relaxes, water fills the cavity; when it contracts, it closes tight about the neck; there is no exit for the contained water save through the hyponome, and, as contraction takes place suddenly and forcibly, a jet of water is expelled from the hyponome, causing the animal to dart backward through the water.

The head of a cephalopod is roundish, more distinct from the rest of the body than it is in other mollusks, and is generally furnished with two large and prominent eyes that are very similar in structure to those of vertebrate animals. The nervous system is very well developed and is more centralized than in other mollusks.

The ganglia are well concentrated in what may be called the brain, which lies above and around the œsophagus and is more or less wholly included within the cartilage of the head. From this brain nerves go to the various organs and parts of the body. The senses of hearing and smell are regarded as weak, but that of taste seems to be strong. The mouth opens in the midst of the cirlet of arms. It is furnished with a strong, horny beak of two jaws that move vertically like those of a parrot, but the upper jaw is the shorter of the two. In addition to the jaws, there is a lingual ribbon covered with minute teeth, like that of the odontophore of the gastropods. The digestive apparatus is very complicated. The gullet swells out into a crop, and there is a gizzard as muscular as that of a bird. The intestine, after a few convolutions, terminates in the cavity which contains the gills at the base of the hyponome, by which the water is ejected from the mantle cavity after having supplied air for respiration. There are two gills in most living cephalopods, one on each side, lying close to the body wall; the only exceptions to this rule are in the three species of nautilus which have four gills, a pair on each side. Each gill consists of many membranous plates fixed to two sides of a stalk. The heart in the Tetrabranchiata consists of a single ventricle only; but there are four auricles, one for each gill; the Dibranchiata have two auricles, one for each gill. In the latter group, moreover, are found two contractile reservoirs (branchial or respiratory hearts), one for each gill, by which the blood is pumped into these organs.

The arms or feet are very numerous in the Tetrabranchiata, and are not provided with suckers, but are hollow and furnished with long, retractile tentacles. In the Dibranchiata the arms are either 8 or 10 in number, are furnished with suckers (acetabula), and in the 10-armed genera two of the arms are much longer than the others and differ from them in form. The suckers are muscular disks, with cartilaginous rims, capable of exact application to any object, with central cavities the bottoms of which can be retracted at will to form a vacuum, and thus render the adhesion of the sucker close and firm after the manner of a cupping glass. The poulpe or octopus has each of its eight flexible arms crowded with 120 pairs of such suckers, and as animals of this kind, with arms several feet long, exist commonly in the tropics, they are considered dangerous neighbors. Still more formidable, however, are the hook squids of the south seas, the two long arms of which have suckers furnished in the centres with hooks that enter the flesh of any creature upon which the squid may lay hold.

The sexes are distinct in all cephalopods. In most cases the male is smaller than the female. He differs, moreover, in the asymmetry of his arms, one of which is more or less modified to form a copulatory organ. In two or three genera this modified arm breaks off from the body during copulation, and finds its way into the mantle cavity of the female, where it empties itself of the male sperm cells which it carries. The first zoölogist who found such an arm in the mantle cavity of a female argonaut mistook it for a parasitic worm and called it "hectocotylus" ('hundred cups'), from the numerous suckers which it bears. When its true nature was discovered, it was called a "hectocotylized"

arm, and the term is still used in that connection. The eggs have a horny covering, and after their extrusion from the parent they become agglutinated into masses of various forms. The young from the first very much resemble the mature animals, except in size.

All dibranchiates are provided with a peculiar organ of defense, called an "ink bag," which is absent in the tetrabranchiates. This ink bag is filled with a peculiar secretion, capable of being expelled at will through the hyponome to darken the surrounding water and thus facilitate the escape of the cephalopod. (See *SEPIA*.) The tetrabranchiate cephalopods have a chambered shell which is described in further detail below. (See also *NAUTILUS*.) The dibranchiates have no true external shells—the shell of the female argonaut being scarcely an exception—but they have an internal shell, homologous to the external tetrabranchiate shell, known as cuttlefish bone, etc., sometimes merely rudimentary, included between the folds of the mantle and apparently serving to support the organs and to give rigidity to the body while swimming.

The cephalopods are all very voracious; they are carnivorous, feeding on fish, mollusks, crustaceans, etc. Even a powerful crab is not safe from the attack of a dibranchiate cephalopod little bigger than itself; the arms of the octopus, so abundantly provided with suckers, seize the crab, trammel every movement, and the parrot-like beak is strong enough to break the hard shell. Cephalopods are all marine, and they are found in the temperate and tropical parts of all seas. *Nautilus*, the single modern genus of the tetrabranchiates, with three species, lives in the Indian and South Pacific oceans, where it creeps on the bottom, near the shore, in comparatively shallow water. The dibranchiates are quite abundantly represented at the present time. The members of the two living orders, Sepioidea and Octopoda, have rather different habits and correspondingly different habitats. The Octopoda, with round, saclike bodies and eight arms, are essentially creepers on the bottom, like the poulpe or octopus. They live in shallow water along the shore, hiding in cavities during the day and creeping about over the rocks of the bottom by night. They are also capable, when they find themselves in large bodies of water, of swimming rapidly by means of the hyponome. They are often handsomely colored creatures, but they are generally repulsive objects.

The Decapoda have long, slender bodies and 10 arms, of which two are much longer than the rest. They are found in all seas, often in deep water. Many of them congregate in hordes in the open sea, swimming about with great rapidity. Unlike the octopods, they seldom creep on the bottom, the hyponome being the principal organ of locomotion. Their motions are extremely graceful, and they are often beautifully colored. In size the living cephalopods range from a few inches in length (*Sepioida*) to many feet. The largest invertebrate is undoubtedly a giant squid (*Architeuthis*) of the Newfoundland banks, that often attains a length over all of 50 feet, of which the body has a length of 9 feet, with a thickness of 6 feet, and the arms the enormous length of 40 feet. This creature is indeed the "devilfish" about which so many thrilling stories have been told.

Fossil Cephalopoda. The shells of cephalopods are more or less common in the rocks of all ages, from the top of the Cambrian to the top

of the Mesozoic, while in the Tertiary deposits they are less frequently met with. In some formations they are so abundant as to constitute the greater part of the mass. They are objects of much interest to the geologist, in that they furnish excellent "index fossils" for the identification of the formations, as in the case of the Triassic and Jurassic rocks of Europe, which are subdivided into a great number of zones, according to the particular species of Ammonoidea that they contain. To the paleontologist they are also of very great interest, because, better than any other class of animals, they afford opportunity for studying the mode of evolution of races of animals and illustrations of the various laws of bioplastology, such as Agassiz's law of recapitulation or palingenesis, the inheritance of acquired characters, the laws of acceleration, etc. For some of the interesting and important results derived from the study of the fossil shells of tetrabranchiate cephalopods, the reader should consult the papers of Hyatt, Buckman, Foord, and others, which are cited at the end of this article. The philosophic bearings of the study of cephalopods can be dwelt upon only lightly in this article, as lack of space prevents a proper array of facts necessary for their elucidation.

The cephalopods were very important members of the faunæ that inhabited the early seas of our globe and were then far more abundant than they are now. The tetrabranchiates are represented by at least 7500 fossil species, of which number 5000 are members of the totally extinct order Ammonoidea, which began in the Silurian and culminated in the Cretaceous time. The remaining 2500 are Nautiloidea, which appeared in the late Cambrian time, and which have continued to the present day, though they enjoyed their climax during the early Paleozoic ages of the Ordovician and Silurian. The dibranchiates are far less important as fossils. They appeared in the early Mesozoic, where they were represented by numerous Belemnitoidea, which declined with the close of Cretaceous time, and they have continued to the present era, when they are represented by some 200 known species of the Sepioidea and Octopoda.

The study of fossil cephalopods is based almost entirely on the shell characters, for traces of the soft parts are only seldom found. The fossil ink bags, jaws, and hooks of certain dibranchiates are rare exceptions. (See *SQUID*; *SEPIA*.) As already indicated, cephalopods are divided, according to their gill structure, into two subclasses—Tetrabranchiata and Dibranchiata—which groups differ also in respect of their shell characters. The shell of the tetrabranch is built on the plan of that of the nautilus, though, instead of being closely coiled, it may be loosely coiled (*Gyroceras*), curved (*Cyrtoceras*), or straight (*Orthoceras*). In the dibranchiates the shell is internal and has the form of a pen or cuttlefish bone; or, in those early Mesozoic genera that show close relations to the tetrabranchs from which they have been recently evolved, the shape of a solid, limy, cigar-formed guard, into the larger end of which is inserted a chambered conical shell that resembles *Orthoceras*. (See *BELEMNITES*.) One modern dibranchiate (*Spirula*) has an internal shell remarkably like that of certain loosely coiled nautiloids of the Devonian.

The type of tetrabranchiate shell is found in the nautilus. Here the shell is coiled so closely

that the outer whorls to a considerable extent envelop or clasp the inner turns. In section, a nautilus shell is seen to be essentially a coiled, elongated cone with quite regular transverse walls, or "septa," dividing the internal cavity into a number of chambers, or "cameræ," of which the largest is the outermost or living chamber occupied by the animal. Extending from the living chamber through all the posterior chambers to the apex of the shell, and piercing each septum, is a slender tube, the "siphuncle," which occupies a position near the centre of the cone, and which serves to maintain communication between the living chamber and the posterior regions of the shell. Each of the septa represents a stage in the development of the individual, so that in each nautilus shell we have all the stages through which the shell has passed from the embryonic period, represented by the minute apex in the centre of the coil, to the adult or senile stage, represented by the living chamber on the outside of the coil. It will be readily recognized that this condition is of utmost value for the study of the evolution of the group, and that it is scarcely equaled in any other class of animals. For this reason the cephalopods have furnished greater contributions to the knowledge of bioplastology than have any other organisms.

At the apex of the nautilus shell is seen a scar that marks the place of attachment of a deciduous embryonic shell, or "protoconch," which probably fell off as soon as the true shell began to develop. The developmental stages of the living nautilus are less well known than are those of most of its extinct ancestors, but the existence of the deciduous embryonic sac is inferred from the presence of a thin-walled calcareous bulb on the apices of several Paleozoic relatives of *Nautilus*, and also in its descendants, the goniatitoids and ammonoids. The septa are united to the side walls of the cone along lines that show prominently in the fossil forms, which are nearly always filled solid with infiltrated calcite. These are the suture lines, which furnish characters of the greatest importance in determining the relationships, especially of the species of Ammonoidea. The lines of growth on the outside of the shell indicate the form of the margin of the aperture and vary with the habits of the animal. In living *Nautilus* the hyponome is near the outer ventral curve of the aperture of the shell, and there is on that side an emargination or sinus known as the "hyponomic sinus." The size of this sinus corresponds to the swimming activity of the animal; the larger the sinus, the more active the swimmer, and vice versa. The aperture of *Nautilus* is open wide, and the animal is considered to be a good crawler. In some of the Paleozoic nautiloids the aperture is much restricted, and the ability to crawl must have been greatly diminished, while the swimming power was increased, as evidenced by the somewhat larger size of the hyponomic sinus.

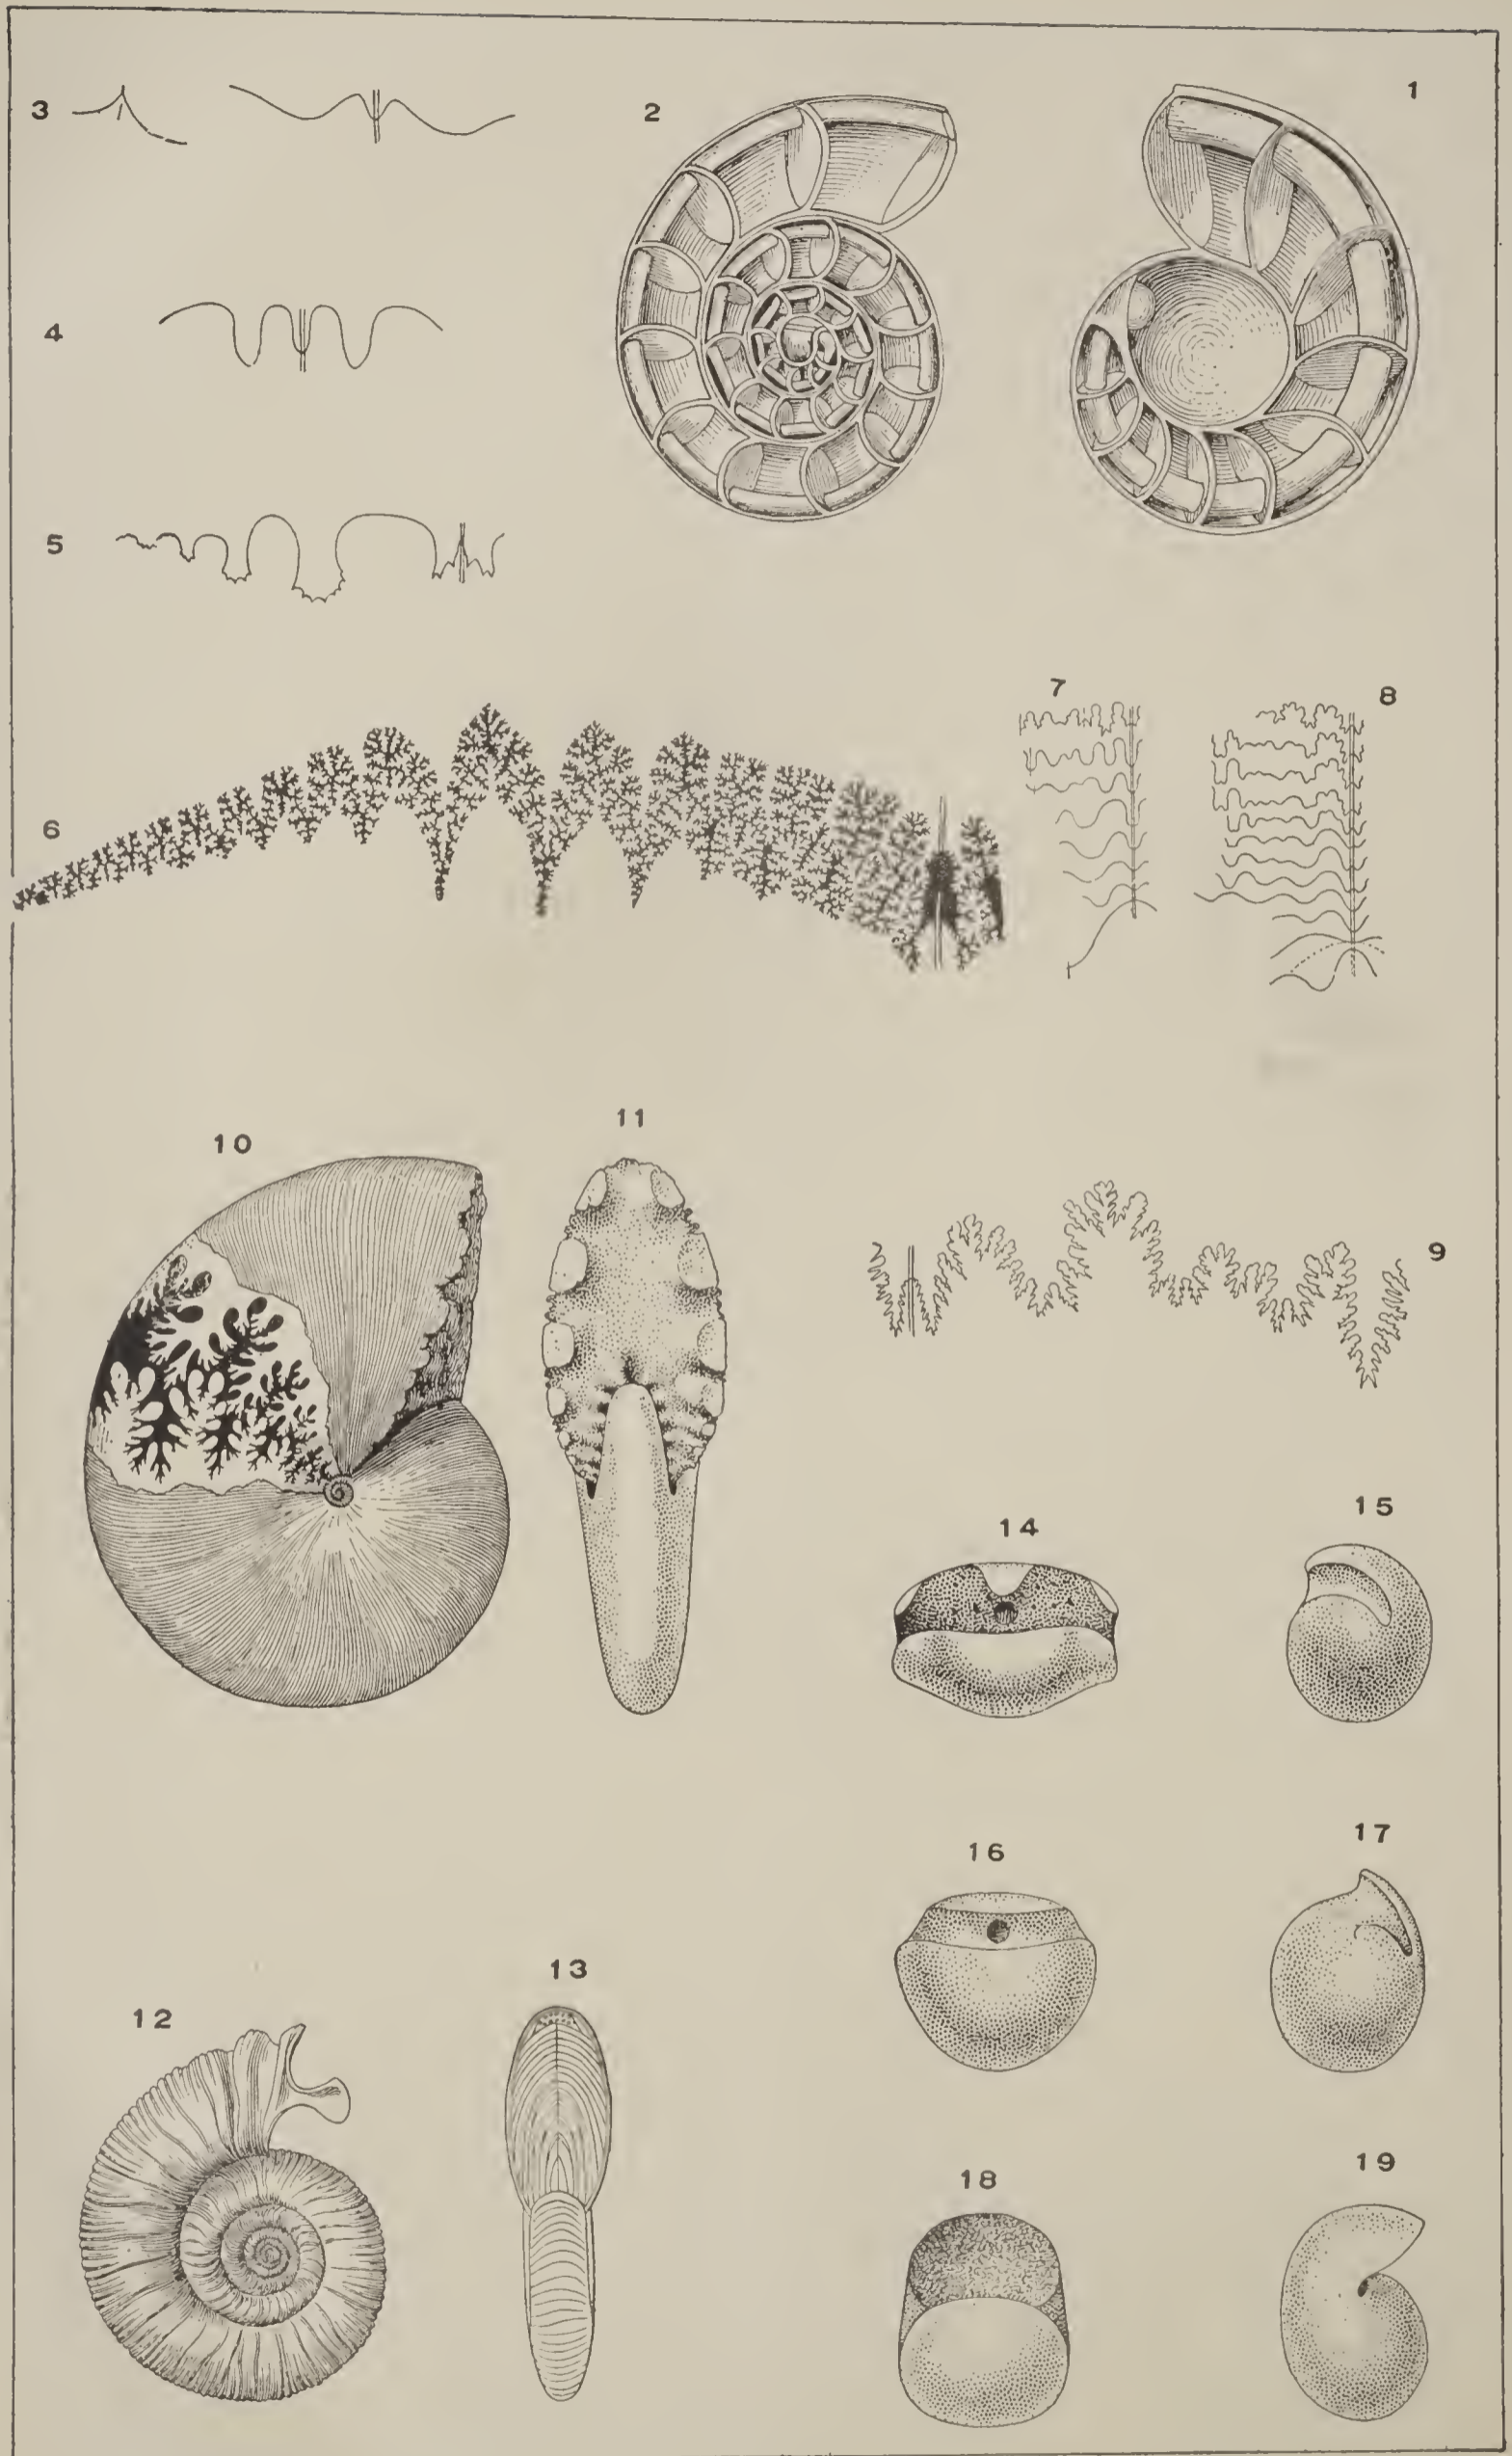

The degree of curvature of the shell is important. The earliest relatives of *Nautilus* were straight shells that had all the morphic characters of *Nautilus* itself; soon curved and coiled forms appeared, and the coiled forms were in all cases evolved from straight forms through intermediate curved forms. Accompanying the changes in curvature were also changes in the form and position of the siphuncle. (See ORTHOCERAS; CYRTOCERAS; NAUTILUS.) The coiled

forms, such as *Nautilus*, etc., appeared in considerable numbers at a very early age in the Lower Ordovician period, and certain nautilonic genera continued, often in abundance, in the late Paleozoic and Mesozoic periods, to the present time, *Nautilus* itself maintaining its early form without change. The straight cones (*Orthoceras* and its allies) began at an even earlier age in the Upper Cambrian. They reached a great expansion during the Ordovician and Silurian periods, when they gave rise to many peculiar genera, such as *Conoceras*, *Piloceras*, *Ascoceras*, *Sphyradoceras*, *Endoceras*, and *Lituites*; some of these, as *Endoceras*, attained a size of over 10 feet, surpassing in this respect all other shell-bearing Paleozoic invertebrates. They declined through the Devonian and Carboniferous periods, and became extinct in the Triassic.

Various stocks of straight shells, in assuming the habits of both crawlers and swimmers, assumed curved forms and gave rise to such genera as *Cyrtoceras*, *Phragmoceras*, *Gomphoceras*, etc., at various periods in the history of each stock. The shells of some of these curved forms, through adaptation to a crawling life on the ocean bottom, became more closely coiled, their organization changed, and a new order (the Ammonoidea) arose, which outnumbered its ancestors the Nautiloidea, enjoyed a pyrotechnic expansion during the early Mesozoic period, soon began to decline, and eventually, at the end of the Cretaceous, became suddenly totally extinct.

The ammonoidean shells differ from the nautiloidean in that they always have a calcareous protoconch of saclike form attached to the apex of the cone. On this protoconch is formed the early ammonoid shell with the septa of simple curves like those of the nautiloids. After a few chambers have been formed the septa become crimped or wrinkled, and the sutures wavy or with prominent curves. In the earliest Devonian members of the group, the goniatitoids, these simply curved or undulating sutures are the rule in adult shells. Later members of the Mesozoic age show sutures of great complexity. It is in these later forms—the ceratitoids and ammonitoids—that the illustrations of Agassiz's law of recapitulation are observed. If an adult ammonite shell, such as *Tropites*, be broken and the fragments be arranged in order from apex to living chamber, the sutures will be found to increase in complexity from simple curves to complex wavy lines. The simple suture will recall that of the Silurian nautilus, the wavy suture that of the Devonian goniatite, and the complex suture is that of the normal ammonoid. Together with the change in the form of the suture lines, there is a change in the position of the siphuncle. This is illustrated in the sections of *Paltoptoceras* and *Parkinsonia* (Cephalopoda, Plate I, Figs. 1 and 2), where in the first chamber the siphuncle is central, as in *Nautilus*, and in successive chambers approaches nearer to the outer ventral wall of the shell, with which it finally unites. We have here instances where the shell passes in its development from embryo to adult through stages that recall the forms of its past ancestors. Some of the more complex types of ammonitoid sutures are shown in Figs. 6, 9, and 10 of Plate I, where also the illustrations of *Phylloceras* (Figs. 10 and 11) show the relations between the crimping of the septum and the complexity of the suture line.

CEPHALOPODS

For names and description, see text.

CEPHALOPODS

For names and description, see text.

The embryos of ammonoids (Plate I, Figs. 14-19) exhibit three types, distinguished as asellate, latisellate, and angustisellate, which terms refer to the form of the first suture line. As a rule, the asellate protoconchs are the more primitive, as in the early goniatitoids. The later goniatitoids have latisellate embryos. The angustisellate embryos appear in the Triassic genera of ceratitoids, and nearly all of the ammonitoids of the Jurassic and Cretaceous have angustisellate protoconchs. Many ammonoids are known to have possessed opercular plates that served to close the aperture of the shell after the retreat of the animal, as shown in the illustration of *Oppelia* (Plate I, Fig. 13). This organ is known as the anaptychus when single, and aptychus when double, and examples of it were in early days supposed to be the earapaees of phyllopod crustaceans.

In form, the ammonoids vary from globular shells (*Cyclolobus*, Plate II, Fig. 4) to flattened discoids (*Pinacoceras*, Plate II, Figs. 10 and 11), and their surfaces are variously ornamented, from smooth *Gephyroceras* (Plate II, Fig. 16), costate *Dipoloceras* (Plate II, Fig. 6), to nodose *Trachyceras* (Plate II, Fig. 9), and in the phylogerontic (senile) stages of some races short spines are developed (*Ancyloceras*, Plate II, Fig. 17). The normal ammonoid shell is a flat, closely wound coil, but the latest members of several races in the Cretaceous rocks have the shell uncoiled or straight in the adult stages, though closely coiled in the early stages of their growth. In some the uncoiling begins only in old age (*Scaphites*, Plate II, Fig. 5, and *Macroscaphites*, Plate II, Fig. 3); in others it is accelerated and appears at relatively earlier periods in the development, as in *Baculites* (Plate II, Fig. 7), *Spiroceras* (Plate II, Fig. 1), *Hamites* (Plate II, Fig. 2), and *Ancyloceras* (Plate II, Fig. 17). The uncoiling sometimes produces a turreted shell, as in *Turrilites* (Plate II, Fig. 15). These uncoiled shells of the Cretaceous rocks are degenerate descendants from earlier normal Cretaceous or Jurassic ancestors, as can be demonstrated by the forms of their sutures. The degeneracy is exhibited also in the form of the sutures, which have become more simple, and in the shape of the cone, which has lost its flattened section due to the closely coiled condition, and assumed the rounded, cylindrical section of its earliest ancestors of the Paleozoic, though it retains the "impressed zone" to serve as evidence of its relationship. For notes on the fossil forms of dibranchiates, see articles referred to at end of the bibliography.

Bibliography. CEPHALUS, sĕf'ă-lŭs. In Athenian story, a grandson of Æolus, and the husband of Procris, whom he inadvertently killed while she was spying upon him in suspicion of his fidelity. After undergoing punishment for his unintentional crime, he settled in an island which was called, after him, Cephallenia.

CEPHEUS, sĕf'ŭs or sĕf'ĕ-ŭs (Lat., from Gk. Κηφείus, *Kĕpheus*, in Greek mythology a king of Ethiopia who was husband of Cassiope, father of Andromeda, and father-in-law of Perseus). A northern constellation situated between Cassiopeia and Draco. Its principal star, Alderamin, is of the third magnitude.

CEPHISODOTUS (Lat., from Gk. Κηφισόδοτος, *Kĕphisodotos*). The name of two Greek sculptors, who worked during the fourth century B.C. The younger was the son of the famous Praxiteles (q.v.), and of his works only scanty mention has been preserved. He and his brother Timarchos made a statue of Menander (q.v.), which was set up in the theatre at Athens; its base has been found bearing the signature of the artists. The elder Cephisodotus seems to have been the elder brother, or possibly the father, of Praxiteles, and his works mark the transition from the art of the fifth century to that of the fourth. His group of Irene (Peace) and the infant Plutus (Wealth) is probably reproduced in the so-called Leucothea in Munich; it was set up in Athens after the battle of Naxos in 376 B.C., and probably in celebration of the peace of 371 B.C. The group of Zeus, Artemis, and Megalopolis in the city of Megalopolis was certainly erected after 370 B.C., but the remains of the building seem to point to a much later date, and it is probable that the artist was the younger Cephisodotus. E. A. Gardner, *A Handbook of Greek Sculpture*, pp. 352-354 (London, 1911), holds that there was but one Cephisodotus, and leaves his relationship to Praxiteles undetermined.

CEPHISSUS (Lat., from Gk. Κηφισός, *Kĕphissos*). One of the two principal rivers of Attica, flowing into the Saronic Gulf between

Athens and the Piræus west of the Acropolis. It has a constant supply of water from springs on the side of Mount Parnes and Mount Pentelicus. The greater part of its water, however, is diverted into artificial channels for purposes of irrigation, and the exact course of the ancient bed can no longer be ascertained. The principal river of western Bœotia has the same name.

CERACCHI, châ-rä'kē, GIUSEPPE (c.1751-1802). An Italian sculptor. He was born in Rome and studied under Righi. In 1775 he went to London, worked at first in the studio of Carlini, and executed various commissions, including decorations for Somerset House, and many portrait busts, including one of Sir Joshua Reynolds. He visited America in 1790, and while there carved busts of Washington (Boston Athenæum), Benjamin Franklin and Alexander Hamilton (Pennsylvania Academy). He submitted a plan for a monument of Liberty, to which Congress refused the necessary funds. Ceracchi also worked for some time in the employ of the Austrian court. His masterpiece is the bust of the poet Metastasio, in which the severe realism of his style is combined with idealistic charm and refined treatment. In 1796, when in Milan, he modeled a bust of Napoleon, who invited him to Paris; but his republican sympathies led him to join a plot with Arena, Topino-Lebrun, and others to assassinate the First Consul. One of the conspirators revealed the plot to Fouché, and Ceracchi and all his fellow conspirators but one were executed. Consult Taft, *History of American Sculpture* (New York, 1905), and Hue, *La conspiration de Ceracchi et Arène* (Paris, 1909).

CERAM, or **ZERAM**, Portug. pron. se-rän'. After Halmahera, the largest island of the Moluccas (q.v.), Dutch East Indies, lying west of New Guinea between long. 127° 55' and 130° 50' E. and lat. 2° 45' and 3° 40' S. (Map: East Indies, H 5). Including adjacent small islands, it occupies an area of 6621 square miles. The surface is mountainous, a range of volcanic origin traversing its length, and reaching in its highest elevation an altitude of about 9800 feet. The interior is covered with thick forests of coco and sago palms. The cultivated portion on the coast yields rice, tobacco, and cacao. The population is estimated at 67,000, chiefly Alfurus, who, in spite of Dutch rule, still retain their original customs and mode of life; the coast inhabitants, Mohammedan or Christian Malays, are civilized.

CERAMBYCIDÆ, sēr'äm-bis'ī-dē (Neo-Lat. nom. pl., from Gk. κέραμβυξ, *kerambyx*, horned beetle). A prominent family of cryptopentamerous beetles, commonly known as longhorns, and including more than 14,000 described species, of which 700 belong to the United States. A few find nourishment in herbaceous plants, but in most the soft, white grubs, with powerful mandibles, and sometimes legless, live concealed in burrows in wood, feeding upon it, and there passing the pupal stage also. The life of these beetles may be very long. They have been found still inhabiting the wood of furniture several years in use, and, according to Sereno Watson, may live 45 years; but it is not certain whether this prolongation of life takes place in the pupal or larval stage—probably the latter, as larvæ entombed in dried wood are so poorly nourished that they must reach maturity slowly. Several kinds of these beetles produce sound by stridulation, and some even possess two sets of stridu-

lating organs. Several species greatly resemble Hymenoptera in appearance and behavior.

The family is subdivided into three subfamilies—the Prioninæ, Cerambycinæ, and Lamiinæ. The Prioninæ are the largest of the longhorns and have a thin, toothed margin on the thorax; the grubs infest the roots of the grape, apple, pear, poplar, pine, and other trees. Of the typical Cerambycinæ, 400 species occur in the United States, and adults may be found frequently on the goldenrod, feeding on the pollen. The locust borer (*Cyrtene robinia*) and the oak pruner (*Elaphidion villosum*), elsewhere described, are examples. Of the Lamiinæ, one form, the "sawyer," does much harm to pine trees; another destructive genus is *Saperda*, injurious to apples, raspberries, etc. The various bright-red beetles on milkweed also belong to this subfamily. For a synopsis of the classification and descriptive tables of genera, etc., consult Leng, *Bulletin Brooklyn Entomological Society*, vol. vii (Brooklyn, 1884), continued in *Entomologica Americana*, vols. i-iv (Brooklyn, 1885-89). See illustration under LONGICORN.

CERAMIC, sê-räm'ik (Fr. *céramique*, from Gk. κεραμικός, *keramikos*, ceramic, from κέραμος, *keramos*, potter's clay). A term used to designate the department of plastic art which comprises all objects made of clay, including terra cotta, porcelain, and all other forms of pottery (q.v.).

CER'AMI'CUS (Lat., from Gk. Κεραμεικός, *Kerameikos*, from κεραμεύς, *kerameus*, potter, from κέραμος, *keramos*, potter's clay). The potters' quarter at Athens, which was divided into the Outer and Inner Ceramicus. In the Outer Ceramicus were buried those who had fallen in battle, and hence were honored by the state with a public funeral and a monument. For an account of this ceremony consult *Thucydides*, ii, 34. See ATHENS.

CERAR'GYRITE (from Gk. κέρας, *keras*, horn + ἀργυρίτης, *argyritēs*, made of silver, from ἄργυρος, *argyros*, silver). A valuable ore of silver (AgCl) that crystallizes in the isometric system, and in color is light gray to light green. The name *horn silver* is frequently applied to cerargyrite in recognition of its resemblance to horn or wax. It is found largely in Peru, Chile, and Mexico, where the mineral occurs of a greenish color with native silver; also in the Ural Mountains and in Norway. In the United States it occurs in various localities in Colorado, Nevada, and Utah. This mineral is usually found in veins of clay slate, accompanied with other ores of silver, and chiefly in the higher parts of such veins.

CERAS'TES (Lat., Gk. κέραστis, *kerastēs*, horned snake, from κέρας, *keras*, horn). A genus of viperine serpents of northern Africa and Arabia, characterized especially by "the presence in the male, and sometimes in the female, of a pair of scale-covered, hornlike processes above the eyes." There are two species called "horned vipers." See VIPER.

CERAS'TIUM. See CHICKWEED.

CER'RATE (Lat. *ceratum*, wax plaster, from *ceratus*, p.p. of *cerare*, to wax, from *cera*, wax). A compound of wax with oily and medicinal substances in such proportions as to have the consistency of an unguent (q.v.). Cerates are intermediate between ointments and plasters, and their consistency should be such that when spread upon leather or cloth at ordinary temperatures and applied to the skin they will not be melted by its heat.

CERAT'IOCAR'IDÆ (Neo-Lat. nom. pl., from Gk. *κεράτιον*, *keration*, dim. of *κέρας*, *keras*, horn + *καρίς*, *karis*, shrimp). A family of interesting Paleozoic crustacea, of the order Phyllocarida, members of a group of synthetic forms that are intermediate between the Phyllopora on one hand and the Malacostraca on the other. See CRUSTACEA; PHYLLOCARIDA.

CERATITES, sēr'ā-tī'tēz (Neo-Lat. nom. pl., from Gk. *κέρας*, *keras*, horn). A genus of discoid ammonioidean cephalopod shells, found as fossils in the Triassic rocks of Europe and America. The principal points of distinction are afforded by the broad, low saddles and the short, narrow, simple lobes of the suture line. The form of the suture line of this genus is often used as typical of one of the stages through which the sutures of the higher Ammonoidea pass in their evolution from the simple curve of the early nautiloids to the complex sutures of the later ammonoids. See CEPHALOPODA; AMMONITES.

CER'ATO'DUS (Neo-Lat., from Gk. *κέρας*, *keras*, horn + *ὄδους*, *odous*, tooth). A fish. See BARRAMUNDA.

CER'ATO'NIA. See CAROB.

CER'ATO'SA (Neo-Lat. nom. pl., from Gk. *κέρας*, *keras*, horn). An order or group of sponges, in which the skeleton consists of elastic fibres of a horny substance (spongin). The toilet sponges are examples. See SPONGE.

CER'ATOSAU'RUS (Neo-Lat., from Gk. *κέρας*, *keras*, horn + *σαῦρος*, *sauros*, lizard). A carnivorous dinosaur from the Upper Jurassic deposits of Colorado, distinguished from all other dinosaurs by the horn on the front of its skull. The animal was about 18 or 20 feet long, with the hinder part of the trunk, and also the tail, heavily built. Its head was rather large, and besides the single horn on the nose there was a prominent bony ridge in front of each eye. The teeth were numerous and well fitted for cutting and chewing flesh. The neck was short and thick. The fore limbs were remarkably small and were probably of no aid in locomotion, though the beast may have used them for holding food while eating. In contrast with the tiny fore limbs, the hind limbs were large and powerful and were armed with sharp retractile claws. The feet were digitigrade, i.e., they rested on the ends of the fingers instead of on the palms. The pelvic bones are peculiar in that they are ankylosed or joined together by the soldering of the joints. The pubes are long and are united at their ends to form a solid, massive piece, which probably served as an accessory support for the animal while resting. Another point of peculiarity is the form of the vertebral centra, which are flat on their anterior and concave on their posterior faces. Only a single species, *Ceratosaurus nasicornis*, is known to belong to this genus. See DINOSAURIA, and Plate of DINOSAURS.

CER'ATOZA'MIA (Gk. *κέρας*, *keras*, horn + Lat. *zamia*, pine cone). A genus of Cycads, including two known species and occurring only in southern Mexico. The name refers to the occurrence of two conspicuous teeth or horns at the tip of each scale of the cone.

CERAUNIAN MOUNTAINS (Gk. *τὰ Κεραυνία ὄρη*, *ta Keraunia horē*, from *κεραυνός*, *keranos*, thunder, from their frequent storms). The ancient name of two mountain ranges. 1. A ridge of mountains in the northwest corner of Epirus, projecting into the Adriatic Sea, otherwise called Acroceraunian, now known as Khi-

mara. 2. The southeastern extremity of the Caucasus Range. There was also a mountain in Libya called Ceraunian.

CERAUNOGRAPH (Gk. *κεραυνός*, *keranos*, thunder and lightning, and *γράφειν*, *graphein*, to write). An instrument for indicating or recording lightning discharges by means of the Hertzian waves they produce. All types employ some form of "wireless" receiver, most of them also a coherer and a decoherer. The earliest recorded long-distance observations of lightning by this means seem to be those of Ducretet on June 11, 1898, when he found that his "wireless" instrument had indicated 311 discharges between 2.30 and 3.40 P.M., or some hours before the lightning was to be seen or the thunder heard.

In 1900 Father F. L. Odenbach, S.J., of St. Ignatius College, Cleveland, Ohio, perfected a trial "wireless" ceraunograph which announced and recorded lightning discharges with some distinctness. In this and his later patterns Father Odenbach employed the copper cap of the college tower as a receiver, thus securing a surface of over 400 square feet in contrast to the smaller surface of the usual wire antennæ. This cap he later connected to two coherers, much improved by using high-grade graphite rods in place of the easily oxidized steel sewing needles, and through these the Hertzian current passes to relays which open and close the recording circuits. The Odenbach recorder has its pen fixed to the armature of an electromagnet and resting against a strip of paper wrapped about a clock-driven drum. Each lightning discharge within range of the coherers causes the pen to make a mark or nick in the straight line drawn by the pen at rest. The object of two coherers in this instrument is to permit regulation of the range of the instrument. The "long-range set" comprises a coherer of four graphite rods with a 1000-ohm relay, and is able to record lightning discharges distant 600 miles from the instrument. The "short-range set" has a coherer with a variable number of rods and 150-ohm relay; it does not record discharges more than about 200 miles distant. Both coherers record on the same record sheet, using different pens and differently colored inks. On this ceraunograph sheet no record is made of the other meteorological elements making up the totality of a thunderstorm. See BRONTOMETER.

Professor Turpain, of the University of Poitiers, devised several instruments of this class. The simpler forms record the time of occurrence of the lightning discharge. These instruments use the low-resistance (3-ohms) milliamperemeter of Richard Frères instead of attaching the pen to the armature of an electromagnet. Slight modifications serve to combine this lightning recorder with the Richard barograph, thus securing simultaneously on the same sheet the barogram and ceraunogram of the storm. A great improvement was Turpain's application of the principle of the bolometer to the recording of lightning, thus securing a photographic record of the relative intensity of the different discharges.

Bibliography. 274 (Washington, June, 1904); *Scientific American*, vol. xciii, p. 278 (New York, 1905); *Richard Frères Catalogue*, "Instruments de précision—Météorologie" (Paris, 1913).

CERBERITE. See EXPLOSIVES.

CER'BERUS (Lat., from Gk. Κέρβερος, *Kerberos*). In Greek mythology, the name of the dog—the offspring (according to Hesiod) of Typhon and Echidna—who guarded the portal of the infernal regions. Cerberus appears in early literature and art in connection with the twelfth labor of Hercules (q.v.). In the poets Cerberus is described as many-headed (Hesiod gave him 50 heads), but the popular conception seems to have been that of a dog with three heads, with a tail ending in a serpent, or with a mane of serpents.

CERCA'RIA (Neo-Lat., from Gk. κέρκος, *kerkos*, tail of a beast). A larval trematode worm, in a particular stage of development. See TREMATODA.

CERCELÉE, sēr'slà' (OF. *cercel*, Fr. *cerceau*, Lat. *circellus*, a little ring, Lat. *circus*, circle), or RECERCELÉE. In heraldry, a cross circling or curling at the ends, like a ram's horn.

CER'CIS. See JUDAS TREE.

CERCO'PES (Gk. κέρκωπες, *kerkōpes*). The two monkey-like gnomes who worried and robbed Hercules in his sleep. A poem bearing their name is attributed to Homer. They are figured with Hercules on a metope of one of the temples at Selinus.

CER'COPI'HE'CIDÆ (Neo-Lat., from Gk. κερκοπιθήκος, *kerkopithēkos*, long-tailed ape, from κέρκος, *kerkos*, tail of a beast + πίθηκος, *pithēkos*, ape). A family of primates, containing all the Old World monkeys, other than anthropoid apes. (See MONKEY.) The several genera are described and illustrated under BABOON; LANGUR; MAQUAE, and many individual names.

CERDO'NIANS. A sect of Gnostics, founded by Cerdo, a Syrian who came to Rome about 140 A.D., and developed by his disciple Mareion (q.v.). They held that there were two primal causes—the perfectly good and the perfectly evil. The evil created the world, is the God of the Jews, and the author of the Old Testament. Jesus Christ is the son of the good Deity; He was sent into the world to redeem man from the evil Deity; but, since the material world is evil, his incarnation and sufferings were mere appearance. Deeming the human body the work of the evil Deity, the Cerdonians prohibited marriage, wine, and flesh eating, and advocated an ascetic life. Cerdo rejected the Old Testament, and all of the New except a part of Luke's Gospel and Paul's Epistles.

CEREALS, or **CEREAL PLANTS** (Fr. *cérééal*, Lat. *cerealis*, pertaining to *Ceres*, goddess of agriculture). The plants belonging to the Gramineæ, or grass family, cultivated for their seeds as an article of food. They are also called corn plants, or bread plants. The most common cereals are wheat (*Triticum*), barley (*Hordeum*), rye (*Secale*), oats (*Avena*), rice (*Oryza*), maize or Indian corn (*Zea*), different kinds of millets (*Setaria*, *Panicum*, etc.), and various sorghums (*Sorghum* or *Andropogon*). The word *Cercalia* is sometimes used to designate cereal plants. Consult Hunt, *The Cercals in America* (1905), and Percival, *Agricultural Botany* (1900).

CER'EBEL'LUM. See NERVOUS SYSTEM.

CER'EBRAL HEMORRHAGE. See APOPLEXY.

CER'EBRA'TION (from Lat. *cerebrum*, brain, connected with Gk. κάρα, *kara*, Skt. *śiras*, head, Ger. *Hirn*, brain, Eng. dial. *harns*, brains), UNCONSCIOUS. A supposed reflex, automatic, or unconscious action of the cerebrum, conditioning an involuntary and unconscious elaboration and association of ideas. It "is the precise parallel, in the higher sphere of cerebral or mental activity, to the movements of our limbs, and to the direction of those movements through our visual sense, which we put in train volitionally when we set out on some habitually repeated walk, but which then proceed not only automatically, but unconsciously, so long as our attention continues to be uninterruptedly diverted from them." (W. B. Carpenter, *Principles of Mental Physiology*, London, 1879.) An illustration would be the "cropping up" of some name or date which we have previously "tried to recall" without avail. The phrase has now fallen into disuse, some writers referring the phenomena to a subconscious (q.v.) incubation, others invoking the known laws of association (q.v.), or substituting such terms as "nervous predisposition," "nervous set," or "determining tendency." Consult James, *Psychology* (New York, 1890). See DETERMINING TENDENCY.

CER'EBRIN, C₈₀H₁₆₀N₂O₁₅ (from Lat. *cerebrum*, brain). An organic substance found in the brain, the nerves, and in pus corpuseles, from the substance of which it may be obtained by extracting with alcohol. The cerebrin thus obtained is freed from lecithin by treatment with barium hydroxide and purified by recrystallization from alcohol. Cerebrin is a colorless, transparent substance insoluble in water and in cold alcohol and ether. When heated with dilute acids, it is transformed into the monosaccharide (simple sugar) galactose and the nitrogenous substance known as sphingosin.

CER'EBROSPINAL FLUID. A clear, limpid, slightly albuminous fluid having a saltish taste, faintly alkaline, and containing about 1.5 per cent of solid matter, consisting of sodium chloride, potassium chloride, sulphates, carbonates, alkaline and earthy phosphates, with minute traces of urea, sugar, sodium lactate, fatty matter, cholesterin, and albumen. It is found between the arachnoid membrane and the pia mater of the brain and spinal cord, within the skull and the vertebral canal, enveloping them so as to afford mechanical support and also to serve as a cushion to prevent injury from concussion, and to equalize pressure when the body is in different positions or the vessels of the brain contain varying amounts of blood. In certain diseases the amount of the cerebrospinal fluid is vastly increased. See HYDROCEPHALUS; NERVOUS SYSTEM AND BRAIN, and bibliography thereunder.

CEREBROSPINAL MEN'INGI'TIS. See MENINGITIS.

CER'EBRUM. See NERVOUS SYSTEM.

CER'EMO'NIAL (Fr. *cérémoniale*, Lat. *cærimonialis*, from *cærimonia*, ceremony), COURT. The origin of elaborate formalities in the daily life of a monarchical court is to be traced to the Eastern nations, whose genius is in harmony with such external expressions of reverence. The Roman emperors were at first cautious in the introduction of such ceremonial, owing to the traditional aversion of their subjects to kingly pomp. Diocletian was the first to establish it on a large scale, and the later Byzantine emperors largely developed it. Charlemagne,

on assuming the title of Emperor, introduced a considerable amount of this formality into western Europe; and the whole spirit of the feudal system, with its regular gradations of rank and its complete theoretical organization, by which every member of the body politic had his own definite place, favored its extension. Some further impulse was given to such ceremonial by the marriage of the Emperor Otto II to the Greek Princess Theophano (972); but it reached a still more elaborate development at the court of Philip the Good, Duke of Burgundy (1419-67). This prince, whose power equaled that of the sovereigns of his time, but who yet could not place himself on a level with them, found satisfaction in establishing a ceremonial full of minute formalities. Through the marriage of Mary of Burgundy with Maximilian, these formalities found their way into the Austrian court, where they held their ground until the reign of Joseph II (1741-90), to whose modern ideas they were obnoxious. By dynastic connection they spread to Spain and found there a congenial soil, flourishing in all their fullness until comparatively recent times. In France ceremonial was not so elaborate before the reign of Francis II. Henry III also took great pleasure in the ordering of stately formalities; but their reestablishment dates from the marriage of Anne of Austria with Louis XIII (1615). Anne's son, Louis XIV, had only to put the finishing touches to the system, which is as inseparable from the idea of his reign as the wig is from any representation of his person. So burdensome did these ceremonies become at the French court that Frederick the Great declared that, were he King of France, he would appoint a deputy to attend to the ceremonies, so as to leave himself time for ruling. The Revolution destroyed ceremonial for a time, but Napoleon attempted to add to the prestige of his throne by its reestablishment. The Bourbon Restoration revived it still further, but the "July monarchy" adapted itself more to modern conditions. In England Queen Victoria's personal taste for simplicity abridged ceremonial observance during her reign, to be in a measure restored, however, by her successor, Edward VII. See PRECEDENCE; TITLES OF HONOR.

CER'EMONY (Fr. *cérémonie*, Lat. *cærimonia*, sacred rite, probably connected with Skt. *karman*, act, from *kar*, to do). Almost any act, when performed in a regular, orderly, and formal manner, and when viewed, not with reference to its object, but the mode of its performance, becomes a ceremony; and the more entirely the attention of the performers is withdrawn from the object of the act, and fixed upon the manner of its performance, the more *ceremonious* does it become. The purely formal character of ceremony is thus illustrated by Hooker: "The name ceremony," he says, "we do not use in so large a meaning as to bring sacraments within the compass and reach thereof, although things belonging to the outward form and seemly administration of them are contained in that name." The remark is applicable to the most trivial ceremonies of social life and of state pageantry, as well as to the most sacred rites of religion, for a ceremony which is its own object would scarcely be entitled to be regarded even as a ceremony.

Ceremonies may be divided into four classes: (1) religious ceremonies; (2) social ceremonies;

(3) state ceremonies; (4) international ceremonies.

Religious and state ceremonies will be treated respectively under their various denominations. See, for the first, LITURGY; MASS; RITE; for the second, CEREMONIAL, COURT; CORONATION; COURT; PARLIAMENT. Social ceremonies will, in a great measure, fall under the heads COURTESY; ETIQUETTE; FORMS OF ADDRESS; PRECEDENCE; and international ceremonies under AMBASSADOR; CONSUL; DIPLOMACY; ETC.

CEREMONY, MILITARY. A stated military exercise or formality, designed to show honor to an important person, to present the qualities of the troops concerned to advantage, or to facilitate their inspection. Ceremonies include reviews, musters, inspections, parades, guard mounting, funeral escorts, escort of the color and standard, and escorts of honor, which are described under their appropriate heads.

CERES (Lat., probably connected with *creare*, to create, *crescere*, to grow). The name given by the Romans to the Greek *Demeter* (*Δημήτηρ*), goddess of the grain, which she gave to mankind. In Greek mythology Demeter is daughter of Cronos and sister of Zeus, Poseidon, and Hades. By Zeus she became the mother of Persephone or Proserpina (q.v.). In Greek worship Demeter and Persephone (or Cora) are regularly united, as originally a dual impersonation of the "grain spirit," of whose worship many traces are still observable in the harvest customs of European peasants. Later, Demeter was goddess of vegetation and fruits in general. Etymologically, indeed, Demeter is "Mother Earth." At Eleusis (q.v.) they were goddesses also of souls. According to the Hymn to Demeter, Hades (Pluto) surprised Persephone as she was gathering flowers in a meadow, and bore her away to the lower world. Demeter sought her daughter, until at length she learned her fate from the all-seeing Helios (the sun). In her grief she hid herself, and the earth ceased to yield her fruit. At last Zeus sent Hermes to fetch Persephone, but Hades had persuaded her to eat a pomegranate and thus bound her to stay with him. At last the agreement was made that she should spend two-thirds of the year with her mother and one-third with her husband. In her wanderings Demeter was kindly entertained at Eleusis, and in requital extended her special blessing to the spot, and thence sent out Triptolemus (q.v.) to bear the knowledge of agriculture to the world. The worship of Demeter was nearly universal in the ancient world, but probably the most important cult was at Eleusis in Attica. (See ELEUSINIAN MYSTERIES.) There was also a very important cult at Athens, where the Thesmophoria (see GREEK FESTIVALS) were celebrated. In various districts, especially in Argolis, the goddesses were distinctly chthonic and were regarded as awful deities of the lower world. Swine and horses were especially connected with them. They are often distinguished in works of art by a bunch of grain, or a torch, or, somewhat rarely, by the mystic box. Demeter also appears as a *Courotrophos*, a guardian of children, represented as a seated figure holding a child. On vases representations of the Eleusinian story are not infrequent, and the rape of Persephone is frequent on sarcophagi, but statues of the goddesses are not common. The most striking is the beautiful seated figure from Cnidus (q.v.), now in the British Museum. Fragments of the

colossal cult statues at Lycosura in Arcadia, the work of Demophon, are now at Athens. Another statue, of different-colored stones, is in Munich. The Romans adopted the worship of the Greek Demeter about 493 B.C. and identified her with their own goddess of the growth of the harvest, Ceres, who along with Tellus, the earth, was honored with special sacrifices, both after seed time and just before the harvest. The plebeians especially worshiped her. Her great festival was the *Cerealia*, April 12-19, which was celebrated with games in the circus. Förster, *Der Raub und die Rückkehr der Persephone* (1874); Frazer, *The Golden Bough* (2d ed., London, 1900; 3d ed. is in progress); Jane Harrison, *Prolegomena to the Study of Greek Religion* (Cambridge, 1908); Preller, *Demeter und Persephone* (Hamburg, 1837); Lenormant in Daremberg and Saglio, *Dictionnaire des antiquités grecques et romaines* (Paris, 1892); Farnell, *Cults of the Greek States*, iii (Oxford, 1907).

CERES. The earliest known of the planetoids (q.v.). It was first seen by Piazzini at Palermo, Jan. 1, 1801, the first day of the nineteenth century. Piazzini continued to observe its motion till February 11, when illness obliged him to discontinue his observations. News traveled slowly in those days, and the continental astronomers did not hear of Ceres until the end of March. By that time the planet had approached too near the sun for observations to be possible. Nor did the astronomers of that day possess a method of computing planetary orbits, when the observations upon which such computations are based extended over a period of time as short as six weeks. Under these circumstances it was not possible to predict what would be the planet's exact position on the sky when it should become visible in the following winter. There was consequently great danger of the planetoid being lost again. Fortunately Gauss, then only 24 years of age, quickly devised a new method of orbit computation, and succeeded in predicting the planet's motions with sufficient accuracy to enable Von Zach and others to reobserve it at the end of the year, when Gauss's computations had become available. Ceres is the largest of the planetoids, its diameter, according to Barnard, being about 480 miles. Its orbit has a mean radius of 257,000,000 miles and is traversed in about four and a half years.

CE'REUS (Lat., waxy, from *cera*, wax). A genus of plants of the family Cactaceæ, containing 100 or more species, among which are some of the most splendid flowers of that family. The species abound in the southwestern part of the United States, extending through Mexico and Central America into South America. One of these is *Cereus speciosus*, one of the most common greenhouse plants in the United States, and sometimes cultivated even in windows. Its large flowers are of a fine scarlet color, the inner petals with a violet tinge. The fruit, when well ripened, is of a delicious flavor. The plant is a native of Mexico.

A number of species are grown under the name of night-blooming cereus. Of these, *Cereus nycticalus*, *Cereus triangularis*, and *Cereus grandiflorus* are the best known. Their large, fragrant, white flowers are exceedingly beautiful. Some of the species are truly arborescent—the Suwarro, *Cereus giganteus*, of Arizona, California,

and northern Mexico, attaining a height of 50 feet or more and 18 inches to 2 feet in diameter. The fruits of this species are eagerly sought for food by the natives. *Cereus pasacana*, of Argentina, is a similar treelike form. They branch sparingly and resemble huge candelabra in outline. The night-blooming forms have cylindrical or angled stems and are trailers or climbers. The others vary in form between these extremes. See Plates of CACTI and DESERT PLANTS.

CERIALIS, PETILIUS. A Roman general, legate of the ninth legion in Britain, defeated by Boadicea (q.v.), in 61 A.D. In 69 A.D., when Vespasian claimed the Empire, Cerialis hastened to join his army in Italy. Having crushed the revolt of Civilis (q.v.), he was sent in 71 A.D. to Britain as consular legate, and in great part subjugated the Brigantes. Agricola (q.v.) served under him as commander of the twentieth legion.

CERIGNOLA, chā'rê-nyō'lâ. An ancient city in the Province of Foggia, south Italy, 23 miles southeast of Foggia, on a hill in a fertile but treeless plain (Map: Italy, K 6). It markets cotton and oil and is celebrated for the victory won April 28, 1503, by the Spaniards over the French, which established Spanish authority in Naples. Pop., 1901, 34,195; 1911, 38,180.

CERIGO, chër'ê-gō, or KYTH'ERA (ancient *Cythera*, *Kythera*). One of the largest of the Ionian Islands, situated off the south coast of Greece, part of the Province of Arcadia, in about lat. 36° 15' N., long. 23° E. (Map: Greece, D 5). Area, 100 square miles. Its surface is mountainous, reaching an altitude of 1650 feet, and the soil is poor. Corn, wine, and olives are raised. It is noted for its cattle, of which it raises more than any other of the Ionian Isles. The island is noted for its two beautiful caverns. Its coast being steep and rocky, it has no good harbors. In ancient times Cythera was considered the sacred abode of Venus. Pop., 1889, 10,524; 1896, 12,306; 1907, 13,102. The port is Kapsali (pop., 1500).

CERIN'THUS (Lat., from Gk. *Κήρινθος*, *Kêrinthos*). A heretic who lived at the close of the Apostolic age, but of whom we have nothing better than uncertain and confused accounts. It is said that he was an Egyptian, perhaps also a Jew by birth, and studied philosophy in Alexandria. From Egypt he passed into Asia Minor, and lived in Ephesus contemporaneously (according to the belief of the Church) with the aged Apostle John. Tradition tells us that John held the heretic in such detestation that on a certain occasion, when he encountered Cerinthus in the baths of Ephesus, he immediately left the place, saying to those about him: "Let us flee, lest the bath should fall while Cerinthus, the enemy of the truth, is there" (Irenæus, *Heresies*, iii, 3, 4). The fathers contradict one another in their accounts of Cerinthus. Irenæus, who is the earliest source, gives the following description: "Cerinthus again, a man who was educated in the wisdom of the Egyptians, taught that the world was not made by the primary God, but by a certain Power far separated from Him, and at a distance from that Principality who is supreme over the universe, and ignorant of Him who is above all. He represented Jesus as having not been born of a virgin, but as being the son of Joseph and Mary according to the ordinary process of generation, while he nevertheless

was more righteous, prudent, and wise than other men. Moreover, after his baptism, Christ descended upon him in the form of a dove from the Supreme Ruler, and that then he proclaimed the unknown Father and performed miracles. But at last the Christ departed from Jesus, and that then Jesus suffered and rose again, while Christ remained impassible, inasmuch as he was a spiritual being." (*Heresies*, i, 26, l.) This description places Cerinthus among the Gnostics (q.v.). (Cf. CERDONIANS.) Later Gaius, a Roman presbyter, about the beginning of the third century, says he held that "after the resurrection the kingdom of Christ is an earthly kingdom, and again that men shall live in the flesh in Jerusalem and be the slaves of lusts and pleasures." On the basis of such statements it was sometimes held that Cerinthus was the author of the Apocalypse, and that the Gospel and Epistles of John were written to combat his views. Epiphanius represents him as a Judaizer, laying emphasis on circumcision and the observance of the law. The present tendency is to discredit the tradition of Judaism, and to regard him as a Gnostic, who agreed with the Jewish Ebionites (q.v.) in holding, as did some other Gnostics, that the divine Christ came into the human Jesus at his baptism and left him before his death. See Gnosticism.

CERITE (from Neo-Lat. *cerium*). A hydrated cerium silicate of complex composition containing other metals of the cerium group, as didymium and lanthanum. It crystallizes in the orthorhombic system and is of a brownish-red color. It is found at Bastnäs in Vestmanland, Sweden, and is the chief source of the element cerium. A partial separation of the metals contained in cerite may be effected by treating the mineral with sulphuric acid and separating the resulting sulphates by taking advantage of the differences in their solubility. Cerium may then be completely isolated from the insoluble portion by converting this into nitrate and subjecting to a process of decomposition, the nitrate of cerium being more readily broken up by heat (and hence rendered insoluble) than the other nitrates present.

CERIUM (Neo-Lat., named after the planet Ceres). A metallic element simultaneously discovered, in 1804, by Klaproth in Germany and by Berzelius and Hisinger in Sweden. The substance found by them was, however, impure, containing considerable quantities of the oxides of lanthanum and didymium. Pure cerium oxide was first isolated by Mosander in 1842. Cerium is not found native, but occurs combined in many Swedish minerals, especially as the silicate in cerite, which contains 56 per cent of cerium peroxide. It also occurs in samarskite, a mineral found in North Carolina. After cerium has been isolated from the other constituents of cerite (q.v.), it may be obtained in the metallic state by the electrolysis of its anhydrous chloride, or by fusing the latter with metallic sodium.

Cerium (symbol, Ce; atomic weight, 140.25) is a soft, steel-gray, ductile, and malleable metal whose melting point lies between that of silver and that of antimony. Its specific gravity is 6.786. Water is slowly decomposed by it at ordinary temperatures. It is but slightly attacked by sulphuric and nitric acids if these are highly concentrated; but dilute acids attack it with great violence. Unlike the other metals of the group of "rare earths," it forms two series of salts, the colorless cerous and the

orange-colored ceric salts. Cerous sulphate, $Ce(SO_4)_3$, is used to produce a deep, blue-black color on fabrics. Cerous oxalate is sometimes used in medicine, especially for the vomiting of pregnancy. In quantitative determinations cerium is weighed in the form of its dioxide, CeO_2 .

CERNUSCHI, chër-nōōs'kê, ENRICO (1821-96). An Italian economist. He was born in Milan and took part in the Italian revolution of 1848. In 1850 he took refuge in France and engaged in banking. He became a principal stockholder of *Le Siècle*, and in that journal discussed economic subjects and denounced socialism, so that his life was in peril from the Communists, in 1871. He visited Egypt, China, and Japan, bringing back valuable ethnological and art collections. These he bequeathed to the city of Paris, and they now form the Musée Cernuschi, opened in 1898. He visited the United States in 1877 and championed the cause of bimetallism—a word he is supposed to have originated. Among his works are: *Mécanique de l'échange* (1865); *Illusions des sociétés coopératives* (1866); *Or et argent* (1874); *Silver Vindicated* (1876); *Le Bland Bill* (1878); *Le bimétallisme à quinze et demi* (1881); *Le grand procès de l'union latine* (1884).

CERNY, chër'nê, FREDERICK. See GUTHRIE, FREDERICK.

CERO (from Sp. *sierra*, saw, sawfish, from Lat. *serra*, saw). An uncommon marine fish (*Scomberomorus regale*) similar to, but larger than, the Spanish mackerel, reaching 20 pounds in weight. It belongs to the western Atlantic. Another species, the sierra (*Scomberomorus caballa*), is called "king cero" and may weigh 100 pounds and is found in the warmer parts of the Atlantic. Both are good food.

CEROGRAPHY (from Gk. *κηρογραφία*, *kērographia*, encaustic painting, from *κηρογραφείν*, *kērographein*, to paint with wax, from *κηρός*, *kēros*, wax + *γράφειν*, *graphein*, to write). The art of writing or engraving on wax, as practiced by the ancients, especially the Romans, who wrote with the stylus on wax tablets. The term is also applied to wax painting, usually known as encaustic painting (q.v.).

CEROPLASTIC (Gk. *κηροπλαστικός*, *kēroplastikos*, modeling in wax, from *κηρόπλαστος*, *kēroplastos*, molded in wax, from *κηρός*, *kēros*, wax + *πλάσσειν*, *plassin*, to mold). The art of modeling in wax. See WAXWORK.

CERQUOZZI, chër-kwōt'sê, MICHELANGELO (1602-60), called from his subjects *delle Battaglie* or *delle Bambocciati*. An Italian battle and genre painter. He was born in Rome and studied under Cavaliere d'Arpino and Jakob de Hase. He began by painting battle scenes and still life, but later took up the so-called bambocciate style which Van Laer had made popular in Rome. His folk scenes are strong in color and line and show deep insight into the character and life of the people. His masterpiece is the "Insurrection of Masaniello in Naples" (Palazzo Spada, Rome). Other important paintings are "St. John the Baptist Preaching"; three interesting Roman folk scenes in the Galleria Nazionale, Rome, and two fine battle pieces in the Dresden Gallery. He is represented in nearly all the principal museums of Europe.

CERRITO, chër-rê'tô, FRANCESCA, called FANNY (1821-). A French ballet dancer, born in Naples. She made her début in Paris in a ballet, *La fille de marbre*, written by her hus-

band, M. Saint-Léon (1847). She also appeared in *La vivandière*, *Le violon du diable*, and in *Gemma*, the scenery of which she designed with Théophile Gautier. So great were her talents and charm that the Italians called her "the fourth of the Graces." She retired from the stage in 1854.

CERRO DE PASCO, sēr'rō dâ päs'kō. The capital of the Department of Junín, Peru, situated in the sterile region 14,000 feet above sea level, at the north end of Lake Chinchaycocha (Map: Peru, B 6). The temperature averages 40° the year round. The town is poorly built over the silver mines which make it famous. They are, however, not so productive as formerly. The companies concerned have since turned their attention to the copper and coal deposits in the neighborhood. The copper output alone amounted to 2,152,000 pounds in 1907, more than compensating for the slight decline in the silver output. Pop., about 14,000.

CERRO GORDO, sēr'rō gôr'dō (Sp., Big Mountain). A mountain pass near Jalapa, on the National Road between Vera Cruz and the city of Mexico. Here, on April 18, 1847, during the war between the United States and Mexico, General Scott, with a force of 8500, dislodged and defeated General Santa Anna, with a force of about 12,000. While Scott was advancing from Vera Cruz, the Mexicans had strongly entrenched themselves in a position which seemed impregnable, their right resting on a precipice rising above an almost impassable ravine, and their left occupying the heights of Atalaya and Cerro Gordo. Scott, arriving before the fortifications on April 14, spent two days in reconnoitring, and on the 17th sent General Twiggs by a precarious pathway to take the high ground on Santa Anna's left, and then, if possible, cut off his retreat by occupying the Jalapa road in his rear. Twiggs succeeded in taking Atalaya on the 17th, and on the following day the Americans attacked with great vigor in front and flank, taking the height of Cerro Gordo, capturing the Mexican camp, securing 3000 prisoners, and forcing the rest of the Mexican army in great confusion from the field. The Americans lost 63 killed and 368 wounded (General Shields being among the latter); the Mexicans probably as many as 1000, though the exact figures have never been ascertained. The victory enabled Scott to advance towards the city of Mexico and did much towards demoralizing the Mexican troops. Consult: Bancroft, *History of Mexico*, vol. v (San Francisco, 1885); Wright, *General Scott* (New York, 1894); and C. M. Wilcox, *History of the Mexican War* (Washington, 1892).

CERROS. See CEDROS.

CERTALDO, chēr-täl'dō. A town in the Province of Firenze, central Italy, 35 miles southwest of Florence (Map: Italy, F 4). It was the home of Boccaccio, and his house (restored in 1823) and tomb are of general interest. Pop., 1901, 9129; 1911, 10,439.

CERTHI'IDÆ. See CREEPER.

CERTIFICATE (Fr. *certificat*, from ML. *certificatus*, p.p. of *certificare*, to certify, from Lat. *certus*, sure + *facere*, to make). A written testimony to the truth of a certain fact or facts. It may be required or authorized by law, when it has an official character and is receivable as evidence of the facts therein stated; or it may be voluntary, when it has no greater value as evidence than any other private writing.

Examples of legally authorized certificates are certificates of an insolvent's or a bankrupt's discharge; certificate of the appointment and qualification of a person as the administrator of a decedent's estate, or as a notary public, or other officer; certificate that a ship has been registered; certificate by a notary public or similar officer that the execution of a document has been duly acknowledged before him. For the legal effect of such certificates as evidence, consult the authorities referred to under EVIDENCE.

CERTIFICATE OF MERIT, UNITED STATES ARMY. A certificate of merit, awarded by the President on the recommendation of his commanding officer to an enlisted man who has distinguished himself in the service. According to Article XXV, United States Army Regulations, recommendations for a certificate of merit must originate with an eyewitness, preferably the immediate commanding officer. Each case must be submitted separately, forwarded through the regular channels, and must be favorably indorsed by each commander. Extra pay at the rate of \$2 per month from the date of distinguished service is allowed to each enlisted man to whom a certificate of merit is granted.

CERTIORARI, sēr'shī-ō-rā'ri (Lat., to be certified, from *certior*, comparative of *certus*, sure). A common-law writ issued by a superior court to an inferior one, or by any court having jurisdiction to a body acting in a quasi-judicial capacity, such as commissioners, magistrates, assessors of taxes, etc., for the purpose of securing a review of the proceedings of the tribunal or body to which the writ is directed. The writ issues only when there is no other adequate remedy, and it is used in both criminal and civil cases. It requires the record of a proceeding in the inferior court or before the quasi-judicial body to be certified by that court or body and returned to the court issuing the writ for the purpose either of reviewing the same or of removing the action or proceeding to the higher court for trial. When certiorari is used as a means of review, it raises only a question of law for the consideration of the reviewing tribunal—the question, viz., whether or no the inferior tribunal had jurisdiction or proceeded in accordance with law. For example, if a board of assessors of taxes should decide that the property of a bank invested in United States bonds could be taxed under the authority of the State, they would decide a question of law which might, by means of a writ of certiorari, be reopened before superior tribunals, and ultimately before the Supreme Court of the United States. It would not, however, raise any question of fact or confer upon the superior court any ministerial power vested in the board of assessors of taxes. The writ is granted or refused at the discretion of the superior court, and the usual result is that the proceedings below are either affirmed or set aside. In courts of equity a similar use is made of certiorari, which may be granted on application by original bill under the "Evarts Act" of March 3, 1891. Certain decisions of the Circuit Court of Appeals may be reviewed by the United States Supreme Court by certiorari.

In England the writ of certiorari may in civil cases be issued by any judge or division of the High Court of Justice, and in criminal cases it issues out of the Crown Office Department of the central office, under the attestation of the Lord Chief Justice. It is now chiefly

used in the latter division and is the usual mode of correcting excesses of justices of the peace in miscellaneous matters. Consult: Spelling, *Treatise on Extraordinary Relief in Equity and at Law* (Boston, 1901); Wood, *Treatise on the Legal Remedies of Mandamus and Prohibition*, etc. (3d ed., Albany, 1896). Cf. APPEAL; ERROR, WRIT OF.

CERTOSA, chër-tō'zà (It.). A monastery of the Order of Carthusians, whence the Italian name is derived. The Certosa of Chiaravalle in Lombardy is an interesting example of thirteenth-century Lombard architecture in brick, and offers an early example of those Lombard domes which are externally covered by a many-storied arcaded structure, surmounted in this one example by a tower. Larger and far more splendid is the Certosa di Pavia, also in Lombardy, one of the most complete and beautiful monuments of Italian art, founded in 1396 by Gian Galeazzo Visconti, and begun in the same late Gothic style as the cathedral of Milan. Before the nave had been completed in this style, the influence of the early Renaissance had become supreme, and the dome (resembling somewhat that of Chiaravalle), the choir, and transept, as well as the beautiful cloisters, were executed in the new style, blended with features of the traditional earlier Lombard treatment, and with rich and artistic details in terra cotta, as was also the façade, begun in its present form in 1491. This is the masterpiece among Italian Renaissance façades, not only for the richness and perfection of its sculptures, but for the harmony of its design. It is, however, like most Italian church façades, a mere decorative screen or frontispiece, not organically related to the design of the church behind it. The interior of the church is a Latin cross (249 × 173 feet), with 14 chapels, apsidal transepts, and a dome over the intersection. It is a museum of Renaissance sculpture and painting, most of the latter the work of Borgognone, who also designed the choir stalls. The sepulchral monument of the founder is mainly by Cristoforo Romano. The most famous sculptors who worked on the cloisters and façade were the brothers Montegazza, Amadeo, Fusina (fifteenth century), Briosco, Giacomo della Porta, Busti, and Solari (sixteenth century). This monument strongly influenced Lombard sculpture throughout its golden age. Other valuable examples are the Certosa of the Val d'Ema, near Florence, with cloister by Brunelleschi; and that adjoining the baths of Diocletian at Rome, built in part from Michelangelo's plans and now used as a museum (Museo della Terme). The monastery of San Martino at Naples is also a Certosa, though not commonly known by that name. In all these Carthusian monasteries an essential feature was the cloister surrounded by the individual dwellings of the "Fathers," each with its small garden.

CERU'MEN (Neo-Lat., from Lat. *cera*, wax). Ear wax, a yellow, oily secretion from certain glands lying in the external auditory canal. Its function is to render the skin of this part pliable and to entangle dust, etc., which may enter the canal. Its bitter taste and sticky consistency are repellent to insects which might seek to enter the auditory canal. The motion of the jaw in eating and talking and the outward growth of the epithelium normally prevent its accumulation. When it does accumulate in sufficient quantities to block the ear

canal it is said to be "impacted" and causes partial deafness, and sometimes a buzzing noise in the head, from adhering to the eardrum. It must be removed by syringing in such cases.

CERUSITE (from *ceruse*, from Lat. *cerussa*, white lead). Natural lead carbonate ($PbCO_3$). It crystallizes in the orthorhombic system and has a vitreous or pearly lustre, and is of a gray or grayish-black color, sometimes tinged with blue or green, owing to the presence of salts of copper. Clusters of interlaced, fibrous crystals pass into silky aggregates and masses. Granular, compact, and earthy masses are common. It is formed by the alteration of galena or lead sulphide, which, as it oxidizes to sulphate, may be changed to a carbonate by means of solutions of calcium bicarbonate. The most famous localities are the lead mines of Siberia and the Altai region; also various places in Sweden and Germany, while fine crystals are found in Cornwall, England. In the United States it occurs at Phoenixville, Pa., and at lead deposits in Virginia, North Carolina, Missouri, Wisconsin, Colorado, Utah, and Arizona. Dana reports its observation as a recent formation at Pompeii, Italy, and at Laurium, Greece; also in stalactical crusts near Kommern, Rhenish Prussia.

CERVANTES SAAVEDRA, sër-vän'téz, *Sp. pron.* thër-vän'tàs sä'à-vā'drà, MIGUEL DE (1547-1616). The most famous of all Spanish writers, and author of the world-renowned *Don Quixote*. His early years are involved in much obscurity. It is known that he was of pure Castilian stock, being the second son and fourth child of Rodrigo de Cervantes and Leonor de Cortinas; that his birthplace was Alcalá de Henares, although for 200 years this was a matter of dispute, seven other cities claiming the honor (Seville, Toledo, Esquivias, Madrid, Lucena, Consuegra, and Alcázar de San Juan); and that he was baptized in the parish church of St. Mary the Greater, in Alcalá de Henares, Oct. 9, 1547, whence it is plausibly conjectured, in view of his name, that he was born on the Michaelmas Day preceding. Rodríguez Marín believes Cervantes studied in the Jesuit school at Seville, 1564-65; another tradition, long generally discredited, stated that Cervantes spent two years at the University of Salamanca. Recently Doña Blanca de los Ríos de Lampérez has defended this tradition, and would fix the period from about 1582 to 1584. Although it cannot be categorically asserted, there is some ground for believing that he studied under López de Hoyos, a teacher of some celebrity in Madrid, for when, on the occasion of the death of Isabel of Valois, Philip II's third wife, Hoyos edited a memorial volume of verse, six of the poems were contributed by Cervantes, whom Hoyos calls "his beloved pupil"; but this complimentary phrase must not be pressed too hard. Until 1899 these poems stood as his earliest-known essay in literature; but in that year Foulché-Delbos published a sonnet, written by Cervantes in honor of the same queen while she was still alive, although at exactly what date is not known. But his practical education in the knowledge of life—the education which comes from action and hardship and disappointment—still lay before him. In December, 1569, we find him in Italy, but how or why or when he went is unknown. For a while it was thought that he went with the special nuncio Giulio Acquaviva, who returned to Rome in December, 1568, but we have no evi-

dence to that effect, and it is now generally agreed that he probably entered the company of Diego de Urbino as supernumerary towards the end of 1568, and probably did not enter Acquaviva's service until after the latter had become a cardinal. This would place his service in Acquaviva's household between 1570 and 1574 (when the Cardinal died). But we have no positive evidence of his being in the army until we reach the battle of Lepanto (Oct. 7, 1570), in which, although seriously sick, he played a gallant part, receiving wounds one of which crippled his left hand for life, "for the greater glory of his right," as he phrased it. He also took part in engagements before Navarino, Corfu, Tunis—after which he was for a time again in Italy, and there presumably acquired that knowledge of the language which later bore fruit in the slight coloring of Italian idioms that are to be found here and there in his works. In 1574 we find him in the garrison at Palermo as *soldado aventajado*, which was a necessary step towards a captaincy, which he strove to attain. In order to press his claims thereto, he set sail (1575) for Spain, but the vessel was seized by Algerine pirates and all on board carried into Algiers as prisoners.

Cervantes' captivity lasted for five years, during which he showed noteworthy fortitude and intrepidity, offering himself as leader in all attempts of the Christians to escape, attempts always frustrated at the last moment; forced to witness the almost daily atrocities which his owner, Hassan Pasha, practiced upon his fellow prisoners, and often himself threatened with inhuman tortures, although, through some unexplained influence, the threats were never carried out. Finally the sum demanded for his ransom, painfully raised by his widowed mother and sister, and eked out by the efforts of a pious friar, Juan Gil, and some Christian merchants in Algiers, was paid, and Cervantes was free to return to Spain. This period of his career deserves to be dwelt upon, for it was here that his character was ripening and the foundation being laid for that wide understanding of human nature which makes his great work a delight to all peoples and at all times. It was this ordeal which waked the soldier, the "mutilated of Lepanto," from his dream of romance and prepared him for transition into the writer capable of the higher and finer humanity of the *Don Quixote*. The plays which he is said to have written in captivity are lost. The earliest-known literary efforts after his return to Spain are some sonnets published in 1583, the year before his marriage to Catalina de Salazar y Palacios, a young lady of good family from Esquivias, in New Castile. Little is known of the marriage beyond the fact that she bore him no children and that she outlived him by 10 years. It is said, however, that while courting her he found inspiration to write his pastoral novel, the *Galatea*, published in 1585. Extravagant, artificial, and affected, like others of its type, it nevertheless served to bring Cervantes into notice; and, although never finished, seems to have been regarded by him to the last with especial fondness, for in *Don Quixote* he makes the Barber say: "This book has some invention; it proposes something and concludes nothing; it behooves us to wait for the second part which he promises." To this and the following years belong a long line of dramas—20 or 30 according to his own account. Of most of these even the

titles have perished. We know of the *Gran Turquesca*; the *Jerusalén*; the *Batalla naval*; the *Amaranta*; the *Bosque amoroso*; the *Ar-sinda*, and the *Confusa*, which the author flattered himself was "good among the best of the comedies of the cloak and sword." The two surviving plays are *El trato de Argel* ('Life in Algiers') and *La Numancia*, which deals with the siege of Numantia and its capture by Scipio Africanus. Together these two plays show the best and the worst of Cervantes' dramatic talent. The former is an incoherent medley of personal reminiscences, in which demons and lions and such moral abstractions as Necessity and Opportunity are introduced side by side with real characters. *La Numancia* is a tragedy of heroic energy and intense pathos, which has justly excited the admiration of Shelley, Goethe, and August Schlegel, and is little less than remarkable when we remember that Shakespeare had not yet written, and neither Corneille nor Racine had been born. Nevertheless, it must be recognized that Cervantes was practically a failure as a dramatist and in 1587 was forced to leave the Madrid stage. It is true that Lope de Vega's earliest play dates from about 1574, when he was 12 years of age, and that the play seems to have been well received. But of Lope's plays previous to 1593 very few have survived and to almost none of these can a definite date be assigned. Consequently we are fairly safe in saying that it was Cervantes' own failure (and not Lope's popularity, as tradition says) that drove him from the stage. After forsaking Madrid he lived in straitened circumstances. In 1588 he received the position of commissary at Seville, under the Proveedor-General of the Invincible Armada. He seems to have held this place until 1593. In 1594 he was made taxgatherer in Granada, but three years later not only lost the position, through an absconding subordinate, but suffered a three months' imprisonment besides. On May 7, 1595, he won a prize in a poetical joust held at Saragossa in honor of St. Hyacinth. In 1602 it seems probable that he was imprisoned again, but there is no positive proof to that effect. In that year there appeared from his pen some laudatory verses (a sonnet) in Lope de Vega's *La Dragontea*. In 1605, while residing in Valladolid, he once more appeared as an author, this time destined to win immortal fame. In writing *Don Quixote*, which popular tradition (for which we have so far no foundation) says was begun in jail, Cervantes' avowed purpose was "to diminish the authority and acceptance that books of chivalry have in the world and among the vulgar." Yet he did not intend to burlesque the old Spanish knight-errantry, for this was already a thing of the past. He sought rather to put an end to the absurd and affected romances which it was then the fashion to read; and while it is significant that after the appearance of *Don Quixote* no new chivalresque romance was published in Spain, it is also significant that no romance of chivalry had been printed at Madrid during the entire reign of Philip II. What further purpose Cervantes had, and what hidden allegoric meaning lurks in *Don Quixote*, has provoked endless controversy. One of the latest critics of Spanish literature, Mr. Fitzmaurice-Kelly, has very sensibly said: "That an allegory of human life was intended is incredible. Cervantes presents the ingenious gentleman as a

CERVANTES

MIGUEL DE CERVANTES SAAVEDRA

FROM AN OLD PORTRAIT RECENTLY DISCOVERED AND NOW IN THE SPANISH ROYAL ACADEMY

prince of courtesy, affable, gallant, wise on all points save the trifling one which annihilates time and space and changes the aspects of the universe; and he attaches to him Sancho, self-seeking, cautious, practical in presence of vulgar opportunities. The types are eternal. But it were too much to assume that there exists any conscious symbolic or esoteric purpose in the dual presentation." Carlyle, with curious ineptitude, calls *Don Quixote* "our joyfulest modern book." He would have done well to recall that the Barber in *Don Quixote* speaks of Cervantes as "rather a man of sorrow," and to have heeded Landor, who says that readers who see nothing more than a burlesque in *Don Quixote* have but a shallow appreciation of the work.

Though received with enthusiasm, *Don Quixote* brought no pecuniary reward to the author. He lived wretchedly in squalid quarters in a poor section of Valladolid, having with him his wife, his sisters, and his natural daughter. One summer night in 1605 Gaspar de Ézpeleta was stabbed in what he himself called a fair fight in front of Cervantes' house. He was carried into the house (but not into the Cervantes apartment) and later died there, without having admitted that he knew the name of his adversary. All of the Cervantes family (except the wife, who was absent from the city at the time) and several other lodgers in the house were arrested and jailed for complicity in the crime, although there is not a scintilla of evidence to connect them therewith. Later they were all released, and for the rest of 1605 and until the summer of 1608 we have no trace of Cervantes personally. In 1608 he is present in Madrid at the marriage of his daughter and in April, 1609, joined the Confraternity of Slaves of the Most Blessed Sacrament. In 1610 appeared his sonnet on Diego Hurtado de Mendoza, who in the previous century had been a great patron of literature. We hear little else of him during the years 1610-12 except in connection with a lawsuit concerning the dowry of his natural daughter. In March, 1612, he was present at a riotous meeting of the Academia Selvaje. He seems to have received the habit of a tertiary of St. Francis in 1613 at Alcalá de Henares. To this same year belong his sonnet to Diego Rosel y Fuenllana, and certain verses to Gabriel Pérez del Barrio Angulo. But the most important event of the year 1613 was the appearance of the volume containing the 12 *Novelas Ejemplares*, dedicated to the Count of Lemos, who at this time became his patron and continued as such during the rest of Cervantes' life. These 12 Exemplary Tales are exquisite gems, masterpieces in little; and if Cervantes had not written *Don Quixote*, they by themselves would still entitle him to rank as the foremost novelist of Spain. Although probably finished before the *Novelas Ejemplares*, it was not until 1614 that Cervantes published, with a dedication to Rodrigo de Tapia (son of a Minister of State, Pedro de Tapia), his *Viaje al Parnaso* ('Journey to Parnassus'), a rhymed review of contemporary poets. Cervantes had for some time past been working on the Second Part of *Don Quixote*, and appears to have reached the fifty-ninth chapter before he learned of the spurious Second Part of *Don Quixote* which had been licensed at Tarragona, July 4, 1614, and claimed to be the work of Alonso Fernández de Avellaneda. He finished his own Second Part on

Feb. 25, 1615. It was approved two days later, and received a privilege for 20 years on March 31. The printing went along slowly, so that the *Fé de erratas* and the *Tassa* were not dispatched until October 21, and 10 days later Cervantes wrote his dedication to the Conde de Lemos. But on some technicality the book was still held back for a while. In the meantime he had put another volume through the press: *Ocho comedias y ocho entremeses nuevos, nunca representados*. This book was ready for the public before Nov. 1, 1615, whereas the final approbation of the Second Part of *Don Quixote* was not dated until November 5, so that the volume itself can hardly have appeared before December, making it the last of his books that Cervantes saw in print. With the exception of *Pedro de Urde-malas*, the comedias are not very successful; but the entremeses are brilliant little pictures of commonplace life. The volume contains also an interesting prologue setting forth Cervantes' own ideas of the drama and giving, so to say, a reminiscent history of the drama. In the dedicatory epistle to the Conde de Lemos, Cervantes shows that he realized he had not long to live. For more than two years he had been at work on *Pérsiles y Sigismunda*, and despite failing health he was able to finish it. On April 18, 1616, Extreme Unction was administered to him, and on the following day, making a supreme effort, he smilingly penned his moving valedictory dedication of this his last work to the Count of Lemos, adapting for his purpose the opening lines of certain *coplas antiguas*:

"Puesto ya el pie en el estriuo,
Con las ansias de la muerte,
Gran Señor, esta te escriuo."

Four days later, on April 23, 1616, Cervantes joined the great majority.

Bibliography. Of the many editions of *Don Quixote*, the following deserve special mention: The first edition (first part, Madrid, 1605; second part, Madrid, 1615); facsimile reproductions of these two by the Hispanic Society (New York, n. d.), together with a facsimile reproduction of another Madrid 1605 edition of the first part; that by Juan Antonio Pellicer in 5 vols. (Madrid, 1797); that by Diego Clemencín in 6 vols. with commentary (Madrid, 1833-39); a critical edition by J. Fitzmaurice-Kelly and J. Ormsby in 2 vols. (London, 1898-99); a critical edition by Clemente Cortejón, and continued by Juan Givanel Mas and Juan Suñé Benajes, with commentary (6 vols. have already appeared, Madrid, 1905, 1906, 1907, 1909, 1911, 1913); an edition meant for scientific vulgarization, with commentary, by Francisco Rodríguez Marín (in *Clásicos Castellanos*, 8 vols., Madrid, 1911-13); and a critical edition by R. Foulché-Delbosc, in 4 vols., in press. A critical reproduction of the Tarragona 1614 edition of Avellaneda's spurious Second Part of *Don Quixote* appeared, with a prologue by Marcelino Menéndez y Pelayo, at Barcelona, 1905. The earliest English version of *Don Quixote* (which is also the earliest complete translation of it into any foreign language) is that of Thomas Shelton (part i, London, 1612; part ii, London, 1620), which was reprinted, with an introduction by J. Fitzmaurice-Kelly, in the "Tudor Translations" (4 vols., London, 1896). Other English renderings deserving of mention are those by Jervas (1742), Smollett (1755), Duffield (1881), and Watts (1888); but the best

of all English translations is that by John Ormsby (1885), which has been reprinted with critical introduction and notes by J. Fitzmaurice-Kelly as vols. iii-vi (Glasgow, 1901) of his edition of the *Complete Works of Miguel de Cervantes Saavedra*. For the complete works of Cervantes the chief edition is the *Obras Completas*, ed. by J. E. Hartzenbusch in 12 vols. (Madrid, 1863-64). There is also an edition of the *Obras* (without the plays), which appeared as vol. i of the *Biblioteca de Autores Españoles* (Madrid, 1846). The dramas and farces appeared alone in the *Biblioteca Clásica*, under the title "Teatro Completo" (3 vols., Madrid, 1896-97). The complete works are appearing also in English (at Glasgow, 1901-), under the general editorship of James Fitzmaurice-Kelly, who furnishes the critical introductions and notes. The translation will be complete in 12 vols.; there have already appeared vol. ii, *Galatea*, by Oelsner and Welford, 1903; vols. iii-vi, *Don Quijote*, by Ormsby, 1901; vols. vii-viii, *Exemplary Novels*, by N. Maecoll, 1902. For a history of the biography of Cervantes through the varying degrees of uncertainty that have attended our knowledge of that subject, one should consult the accounts written by Mayans y Siscar (London, 1737-38), Pellicer (1778), Ríos (1780), Pellieer again (1797-98), Fernández de Navarrete (1819), who carefully collated all the available evidence and gave the first biography that was recognized as authoritative. It is the source of all the subsequent biographies published in many languages during the nineteenth century. Additional information concerning obscure points in Cervantes' life were supplied by Travadillo, Morán, Máinez, Asensio y Toledo, Sigüenza, and others. Everything that had previously appeared was utilized by Fitzmaurice-Kelly in his *Life of Cervantes* (1892). In 1897 and 1902 Pérez Pastor (*Documentos cervantinos hasta ahora inéditos*) published 161 new documents about Cervantes, making imperative a new life of the author. Except for the history of the biography of Cervantes, all these earlier accounts are now useless, for we have a work based on all the documentary evidence so far adduced: Fitzmaurice-Kelly, *Miguel de Cervantes Saavedra: A Memoir* (Oxford, 1913). For an exhaustive bibliography concerning Cervantes' works, see Leopoldo Ríos, *Bibliografía crítica de las obras de Miguel de Cervantes Saavedra* (3 vols., Madrid, 1895, 1899, 1905). Since the appearance thereof, the following important studies and editions have been made: Puyol y Alonso, *Estado social que refleja el Quijote* (Madrid, 1905); Salcedo Ruiz, *Estado social que refleja el Quijote* (Madrid, 1905); Givanel Mas, *Examen de Ingenios*, vol. i (deals with commentaries on *Don Quijote*, Madrid, 1912); Romero Quiñones, *Psicología del poema . . . Don Quijote de la Mancha* (Madrid, 1912); Rodríguez Marín, *El "Quijote" y Don Quijote en América* (Madrid, 1911); *Rinconete y Cortadillo* (critical edition by Rodríguez Marín, Sevilla, 1905); *La Tía fingida* (critical study and text by Apráiz, Madrid, 1906); *La Tía fingida* (ed. by Bonilla y San Martín, Madrid, 1911); *El casamiento engañoso* and *El coloquio de los perros* (critical annotated editions by Amezáa y Mayo, Madrid, 1912); *El Vizeaino fingido* (a critical study by Manuel José García, Madrid, 1905); Hazañas y la Rua, *Los Rufianes de Cervantes* (texts, preliminary study, and notes, Sevilla, 1906); Fitzmaurice-Kelly, *Cervantes in England*

(London, 1905); Cotarelo y Mori, *Efemérides Cervantinas* (Madrid, 1905).

CERVERA Y TOPETE, thër-vã'rá è tò-pã'tà, PASCUAL, CONDE DE JEREZ, MARQUÉS DE SANTA ANNA (1839-1909). A Spanish admiral, born in Jerez, in the Province of Cadiz. His father was one of the wealthiest wine merchants of Spain; his mother a daughter of Count Topete y Velle, a member of the royal family. Cervera was educated at San Fernando (1848-51), and after his graduation served on several training ships. He distinguished himself during the campaign against Morocco in 1859 and was appointed a first lieutenant. He was a member of the Spanish expedition against Cochin China in 1862 and afterward was appointed attaché of the Spanish Legation at Washington. Subsequently he was promoted to the rank of captain and was put in command of a vessel sent to Peru during the War of 1866. Upon the outbreak of the Ten Years' War in Cuba (1868-78) he was engaged in the blockade of Cuban ports, but was recalled by the government and appointed Secretary of the Navy in the Spanish cabinet. He was advanced to the rank of admiral, and soon thereafter placed in command of the *Pelayo*, the original first-class battleship of the Spanish navy. He was next appointed adjutant to the Queen Regent, and was made chief of the Spanish commission sent to the European Naval Conference held in London in 1891.

Upon the outbreak of the Spanish-American War he was placed in command of the squadron sent to America, consisting of the cruisers *Infanta María Teresa*, *Cristóbal Colon*, *Almirante Oquendo*, and *Vizeaya*, and the torpedo-boat destroyers *Terror*, *Furor*, and *Pluton*. The fleet left Cadiz April 8 and the Cape Verde Islands April 29. From this latter date Cervera eluded the American fleet, and his whereabouts caused much apprehension, especially in the cities along the Atlantic coast. He had shaped his course for Cuba, however, and about May 19 his squadron entered the harbor at Santiago, where it was blockaded by American vessels under the command of Admiral Sampson. On July 3—by the express orders of his government, it is said—Cervera made a bold dash from the harbor and gave battle to the American vessels; but in the running fight which ensued his fleet was destroyed and he was taken prisoner by Lieutenant Wainwright of the *Gloucester*. By reason of his exceptional bravery, his courteous and dignified bearing, and his generous conduct towards Lieutenant Hobson, he was made the object of much official and popular courtesy. Immediately after the battle President McKinley gave him permission to communicate with his family by cable, and he received many other personal attentions. On July 10 he was taken to Portsmouth, and thence to Annapolis (July 16). With the members of his staff he sailed for Spain on Sept. 12, 1898, and arrived at Santander September 21. Upon his return to Spain he was subjected to court-martial, a procedure usual in European countries, in order that all the facts relative to a defeat or other disaster may be fully known, and the blame or reason for such defeat or disaster fairly placed. He was acquitted and liberated July 7, 1899. Consult *Spanish American War . . . Documents Relative to the Squadron Operations in the West Indies* (trans. from the Spanish, Washington, 1899) and Cervera y Topete, *Views Regarding the Spanish Navy in the Late War* (Washington, 1898).

CERVÉTRI, chër-vâ'trê (the name is corrupted from *Cære Vetus*, Old Cære). A village on the site of ancient Cære, in south Etruria, near the Tyrrhenian Sea, in the District of Civita Vecchia, 20 miles northwest of Rome. The ancient town, which was said to have borne the name Agylla before the Etruscan conquest, became one of the 12 Etruscan cities. According to Roman tradition, it afforded refuge to the Tarquins after their expulsion from Rome, and was by the Romans chosen as the safest hiding place for the Vestals and the sacred treasures during the occupation of the capital by the Gauls (c.390 B.C.). Under the Republic and Empire the city continued to exist, but later steadily declined, and about 1250 was deserted by a large portion of its inhabitants, who removed to the present village of Ceri (Cære Novum). As Cære was said to be the first city admitted to the Roman state as a *municipium sine suffragio*, i.e., a *municipium* without the right of suffrage (c.350 B.C.), the name "Cærites" became typical for citizens of such *municipia*. Near the ancient city have been found a large number of fine Etruscan chamber tombs, many richly decorated with paintings and reliefs. The most famous are the Regolini-Galassi tomb, which yielded in 1836 many gold ornaments, arms, a chariot, etc., of the seventh century B.C., and the tomb of the Tarcna, the Etruscan name which the Romans transferred to Latin as Tarquinii. In 1886 many votive terra cottas, representing in part deities, in part portraits of the human body, were found near Ceri. Consult Dennis, *Cities and Cemeteries of Etruria*, vol. i (rev. ed., London, 1907). See ETRURIA, and authorities cited there.

CERVIA, chër'vê-â. A city in the Province of Ravenna, north Italy, 13 miles southeast of Ravenna, on the Adriatic (Map: Italy, G 3). It has a beautiful cathedral and a theatre, and markets salt from the lagoons east of the town. Pop., 1901, 7942; 1911, 9563.

CERVIDÆ (Neo-Lat., from Lat. *cervus*, stag). That family of ruminants which embraces all the deer. (For characteristics, see DEER.) It is subdivided into musk deer (*Moschinæ*) and true deer (*Cervinæ*), the latter including many genera, described under BROCKET; DEER; ELK; GUEMAL; MUNTJAC; REINDEER; or under individual names, as MOOSE; SAMBAR; WAPITI. For classification of genera and species, consult Brooke, in *Proceedings Zoölogical Society of London* (London, 1878, illustrated), and Lydekker, *Deer of All Lands* (London, 1898).

CERVIN, sër'vân', MONT. See MATTERHORN.

CERVUS. See DEER; ELK.

CESALPINO, ehâ'zâl-pê'nô, ANDREA (Lat. *CÆSALPINUS*) (1519-1603). An Italian botanist and physiologist. He was born in Arezzo, Tuscany, studied at the University of Pisa, and for many years was professor of botany there. Thence he was summoned to Rome in 1592 to become physician in ordinary to Pope Clement VIII and professor of medicine at the Sapienza College. He published a work of metaphysical speculation, *Quæstiones Peripateticæ* (1571), based on Aristotle. In his *Katoptron, sive Speculum Artis Medicæ Hippocraticum* (1601), he repeated what Galen and Servetus had said of the circulation of the blood, and there seems no reason for taking the honor of the actual discovery from William Harvey. His *De Plantis* (1583) presented the first botan-

ical system philosophically constructed according to a natural order of classification. Linnæus was considerably indebted to him.

CESANA, châ-zâ'nâ, GIUSEPPE AUGUSTO (1821-1903). An Italian journalist, born in Milan, founder at Turin of the *Espero* (1854), *Il Pasquino* (1856), the *Corriere italiano* (1865), and the old *Fanfulla* (1870), and editor (1888-93) of *L'Italie* of Rome. He wrote under the name of Tommaso Canella, the title of one of his novels, adopted also by his son Luigi Cesana, editor of the *Messaggero* till his retirement in 1905.

CESARI, châ'zâ-rê, ANTONIO (1760-1828). An Italian philologist, born in Verona. He is known by his attempt to restore to Italian the purity of the Renaissance and for his championship of the Tuscan dialect. His monumental edition of the *Vocabolario della Crusca* was published in 1806-09, and his other works include *Alcune novelle* (1810), *Bellezze della Commedia di Dante* (1824-26).

CESARI, GIUSEPPE, CAVALIERE D'ARPINO (c.1568-1640). An Italian painter. He was born in Rome and at the age of 17 was associated with the group of painters charged by Gregory XIII with the decoration of the Vatican. Of this group Roncalli probably influenced him the most. Cesari is the representative of the "later Mannerists," as distinguished from the Eclectic school, headed by the Carracci, and from the Naturalists, who followed Caravaggio. He acquired great fame and popularity in his day, although his work was criticized even then for its deficiency in color, roughness and carelessness of execution, and too great daring. He executed commissions for five popes and many princely families in Rome and Naples, and for Cardinal Richelieu in Paris. His best works include the frescoes of the Olgiati Chapel in Santa Prassede (1591); the gigantic "Ascension" in St. John Lateran; cartoons for the mosaics in the dome of St. Peter's; frescoes in the Borghese Chapel, Santa Maria Maggiore; and frescoes in the Capitol. His smaller pictures are in all the galleries of Europe.

CESAROTTI, châ'zâ-rôt'tê, MELCHIORE (1730-1808). An Italian poet. He was born and educated in Padua, where, at an early age, he won an appointment to teach rhetoric in the university, and in 1768 the chair of Greek and Hebrew. A great admirer of France, he wrote an adulatory poem, "Pronea," in praise of Napoleon, who gave him a pension and later made him Knight and then Commander of the Iron Crown. The influence of French culture is dominant in his reworkings of the *Iliad* and other classics. A reactionary in this respect, Cesarotti became a powerful influence towards freedom of expression in his translation and commentary on Macpherson's *Ossian*, which owed its great vogue in Italy to the novelty of its mingled chivalry and sentimentalism, and visibly affected the style of Alfieri, Monti, Foscolo, and other writers of the younger generation. Consult: Alemanni, *Un filosofo delle lettere* (Turin, 1894); ed. of selected works by Mazzoni (Bologna, 1882; complete works, Pisa-Florence, 1800-13).

CESENA, ehâ-zâ'nâ. A city in the Province of Forli, central Italy, 52 miles southeast of Bologna (Map: Italy, G 3). It is situated on the Savio and has a lyceum, a gymnasium, a technical school, and a seminary. The cathedral contains two fine marble fifteenth and sixteenth century altars, and the handsome city hall has

a colossal statue of Pius VI, who, like his successor, Pius VII, was born here. In the library (founded in 1452 by Domenico Malatesta Novello) are valuable manuscripts, many of which were used by Aldus Manutius. On a hill near the town is the church of Santa Maria del Monte, attributed to Bramante. Cesena markets hemp, wine, vegetables, silk, and refined sulphur. It was already famous for its wines in Roman times. In the Middle Ages it became subject to the Ghibelline family of Montefeltro, then to the Guelph family of Malatesta (see Dante, *Inferno*, xxvii, 53), and afterward it was seized by Cesare Borgia and incorporated with the papal territory. Pop., 1901, 42,240; 1911, 46,445.

CESNOLA, chēs'nō-là, LUIGI PALMA DI (1832-1904). An Italo-American archæologist. He was born near Turin, was educated at the Royal Military Academy there, and served in the Sardinian army against Austria in 1849, and as staff officer in the Crimean War. He came to New York in 1860, where he engaged in teaching languages. In the Civil War, as colonel of the Fourth New York Cavalry, he took part in many engagements until June, 1863, when he was wounded and taken prisoner. At the close of the war he was brevetted brigadier general, was naturalized, and served as Consul at Cyprus (1865-77). He made a valuable archæological collection, which in 1873 became the property of the Metropolitan Museum of Art, New York. In 1879 he was appointed director of that institution. The following year his collections were the subject of a long and bitter controversy, their genuineness being questioned by art critics, but in the end his work was generally accepted as trustworthy. He published *Cyprus: Its Ancient Cities, Tombs, and Temples* (1878); *Descriptive Atlas of the Cesnola Collection of Cypriote Antiquities* (1884-86); *The Metropolitan Museum of Art* (1882); and numerous pamphlets on art subjects.

CÉSPEDES, thās'pā-dās, PABLO DE (1538-1608). A Spanish painter and man of letters. He was born in Córdoba, of a noble Castilian family, and studied painting in Rome under Cesar de Arbasia, and later was associated there with Federico Zuccaro. In 1577 he was made a canon of the cathedral of Córdoba, where his principal works are found. The best of these is "The Last Supper." He is a somewhat tiresome and affected painter, who studiously avoided a natural treatment of his subject. He wrote several works on art, including a poem on painting (1604). Consult his biography by Tubino (Madrid, 1868).

CÉSPEDES Y BORGES, thās'pā-dās ē bôr'-hās, CARLOS MANUEL DE (1819-74). A Cuban poet and patriot. He was born at Bayamo, in the Province of Santiago de Cuba, and studied at the universities of Havana, Barcelona, and Madrid. In Spain he became involved with Prim in a conspiracy to overthrow the government and was compelled to flee. After traveling for some time on the Continent, he returned to Cuba and began the practice of law, publishing at the same time a play (*Las dos Dianas*) and minor poetical pieces. As early as 1852 he suffered imprisonment for his revolutionary sentiments, and he was the leader of the revolt which broke out in 1868. On Oct. 10, 1868, he proclaimed the independence of Cuba at Yara, and, with an army of some thousands, took possession of Bayamo. In January, 1869, he was

forced to retreat to Guaimaro, where the republic was formally organized, April 10, 1869, and he was elected President. After 1870 his popularity waned rapidly, and in 1873 he was deposed by the Cuban Congress. He perished the next year; whether slain by his own servant or Spanish soldiers is uncertain. For an entertaining novelistic, but not wholly reliable account of his deeds, consult Piron, *L'Île de Cuba* (Paris, 1876); and for greater light on certain phases of his life, V. García Verdugo, *Cuba contra España* (Madrid, 1869); F. J. Cisneros, *La Verdad histórica sobre sucesos de Cuba* (New York, 1871); A. Zambrana, *La República de Cuba* (New York, 1875); Capt. Joseph Fry, *Historia de la insurrección de Cuba* (New Orleans, 1877).

CESS. See LAND TAX.

CES'SIO BONO'RUM (Lat., surrender of goods). In the Roman law and under the modern systems derived from it, a process of voluntary bankruptcy whereby the debtor is permitted to escape the more painful personal and public consequences of insolvency by making a full and free surrender of all his goods or of all his property, real and personal. In the Roman law the consequences thus averted were comprehended under the term "infamy" (*infamia*), by which was meant the loss of certain civil rights—as the capacity to hold office, to act as guardian or trustee, and the like. In the Scottish law a *cessio bonorum* operates to relieve the debtor from the liability to arrest and imprisonment for debt. This indulgence is granted upon petition by the debtor setting forth the fact of his insolvency and his willingness to surrender his property to his creditors. If it appear, on hearing, that the indebtedness is legitimate and the application free from fraud, a decree of *cessio bonorum* is made, and this operates as an assignment of the debtor's estate to a trustee for the benefit of the creditors at large. As a general thing, a *cessio bonorum* does not, however, operate, like a decree in bankruptcy, to absolve the debtor from his liabilities, but is analogous in its results to the proceedings in insolvency common to most of the United States. See BANKRUPTCY; INSOLVENCY.

CESSION (Lat. *cessio*, surrender, from *cedere*, to yield). In international law, the formal transfer of territory by one state to another. It may be the result of a gift, or of a sale, or of the fortunes of war. Most cessions have been forced from the ceding states as conditions of peace. The effect of a cession of territory upon the civil and political rights of the inhabitants of the ceded territory is generally determined by the treaty under which the transfer is made. In the absence of special stipulations on the subject, the inhabitants of the ceded territory change their allegiance from one sovereignty to another as soon as the transfer is complete; but the old laws continue in force until abrogated or changed by the new sovereign. The relations of the people to each other and their titles to property are not affected by the cession. A state which is forced to cede a part of its territory is not bound to indemnify its citizens who may suffer a loss of property by the cession. See CONQUEST. Consult Lawrence, *Principles of International Law* (3d ed., Boston, 1900), and Kent, *Commentaries on American Law* (12th ed., Boston, 1873).

CESS'POOL (more correctly, *sess*; dialectic

Eng. *suss*, *soos*, puddle, from Gael. *sos*, coarse mixture). A well or pit, often inclosed by masonry or wood, for the reception of sewage and drainage from dwellings. Cesspools should be made water-tight and emptied at stated intervals. Sometimes, however, they are connected with a blind drain through which the liquid will soak into the soil. A sink hole, or leaching cesspool, has its bottom or sides so constructed that the contents soak readily into the soil.

CESTI, chās'tê, MARC' ANTONIO (1620-69). An Italian dramatic composer, born in Arezzo. He studied under Carissimi and became *maestro di cappella* to Ferdinand II and assistant kapellmeister to the Emperor Leopold I. His operas were uniformly successful, but only *La Dori* (1663) and *Il pomo d'oro* (1666) have come down to us. A number of his cantatas have been preserved, but they are important chiefly for having been the first cantatas performed on the stage. He died in Venice.

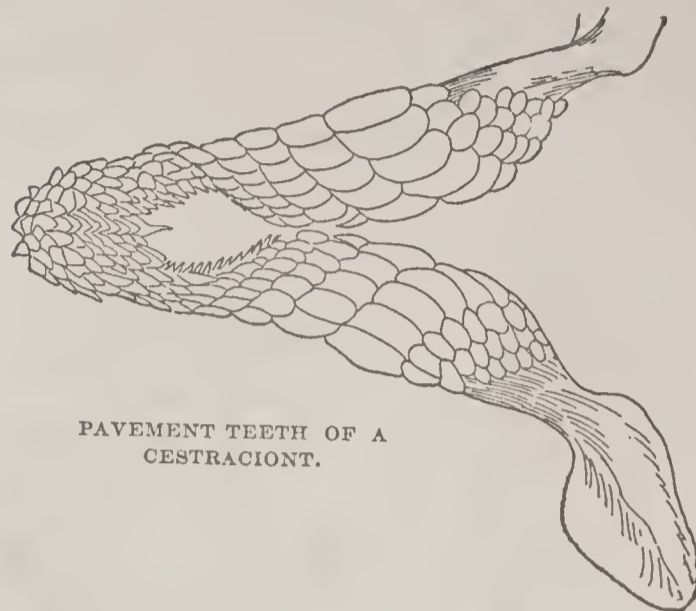

CESTIAN BRIDGE, sēs'chan. An ancient bridge at Rome joining the island of Æsculapius with the Trastevere, or Janiculan bank of the Tiber. It was built by Lucius Cestius, a prefect of the city, in 46 B.C., and restored by the Emperor Gratianus in 370 with material taken from the Theatre of Marcellus. Two modern arches were added when the bed of the river was widened in 1889; the middle arch dates from Gratianus' time. It is now called the Ponte di San Bartolomeo, from the neighboring church of that name.

CES'TIUS, PYRAMID OF. A Roman tomb of the Augustan age, near the Porta San Paolo, Rome. It is a unique imitation of Egyptian models. The exterior form is perfectly preserved, the pyramid rising 116 feet from a base 96 feet square. It is built of concrete, faced with slabs of white marble, and rests on a base of travertine. In the centre is a small sepulchral chamber whose surface of stucco was decorated with paintings of female figures and ornamental scrolls, quite perfect when the tomb was discovered and opened in 1663. The name and circumstances of Gaius Cestius, who was buried here, are given in inscriptions, but he is otherwise unknown.

CESTO'DA (Neo-Lat., variant of *Cestoidea*, from Gk. *κεστός*, *kestos*, girdle + *είδος*, *eidōs*, form). A subclass of Platyhelminthes (flatworms) consisting of tapeworms and similar endoparasites, without cilia, without intestine, but with numerous testes, ovaries, and one or two yolk glands. Cestodes are very widely distributed, but especially abundant in warm climates. They occur as intestinal parasites in species of all the classes of vertebrates, especially mammals, but the complete life history is known for comparatively few species. The group contains two orders, the Monozoa, unsegmented individuals (rare), and the Polyzoa, segmented tapeworms. For structure, habits, and effects upon the system of the host, see TAPEWORM.

CESTRACIANT, sēs-trá'shī-ōnt (Neo-Lat., from Neo-Lat. *cestracion*, from Gk. *κέστρα*, *kestra*, weapon, from *κεντεῖν*, *kentein*, to prick). A shark of the family Heterodontidæ, or Cestraciontidæ, whose three or four living species are chiefly interesting because they represent the oldest fossil sharks known, whose remains begin to be found in the Devonian, and in the Carboniferous become numerous and of larger size than the existing cestraciont. Thence the race declined somewhat, but may be traced to the

present. They are known as pavement-toothed sharks, because the many teeth in the back of the mouth have a pavement-like arrangement. The surviving species are confined to the warmer parts of the Pacific Ocean and are known as Port Jackson sharks. None exceed 5 feet in length, and they are distinguished by having

PAVEMENT TEETH OF A CESTRACIANT.

two dorsal fins, in front of each of which is a strong, sharp spine, now smooth, but in fossil forms variously sculptured. The best-known species is the nurse shark (*Heterodontus*, or *Cestracion philippi*). Little is known of their habits, but they are believed to subsist mainly on mollusks, whose shells are crushed between the "pavements" of teeth. See NURSE SHARK; PORT JACKSON SHARK; and Colored Plate of FISHES OF THE PHILIPPINES, accompanying the article PHILIPPINE ISLANDS.

CESTRO'TUM (Lat., from Gk. *κέστρον*, *kestron*, graving tool, from *κεντεῖν*, *kentein*, to prick). A species of encaustic painting (q.v.) on horn or ivory, the lines of the design being burned in with the *cestrum*, or burning needle, and wax introduced in the furrows thus made.

CES'TRUM (Lat., from Gk. *κέστρον*, *kestron*, graving tool, from *κεντεῖν*, *kentein*, to prick). The implement, or spatula, employed by the ancients in encaustic painting. The *cestrum* was made of metal, one end pointed, the other end flat. See ENCAUSTIC PAINTING.

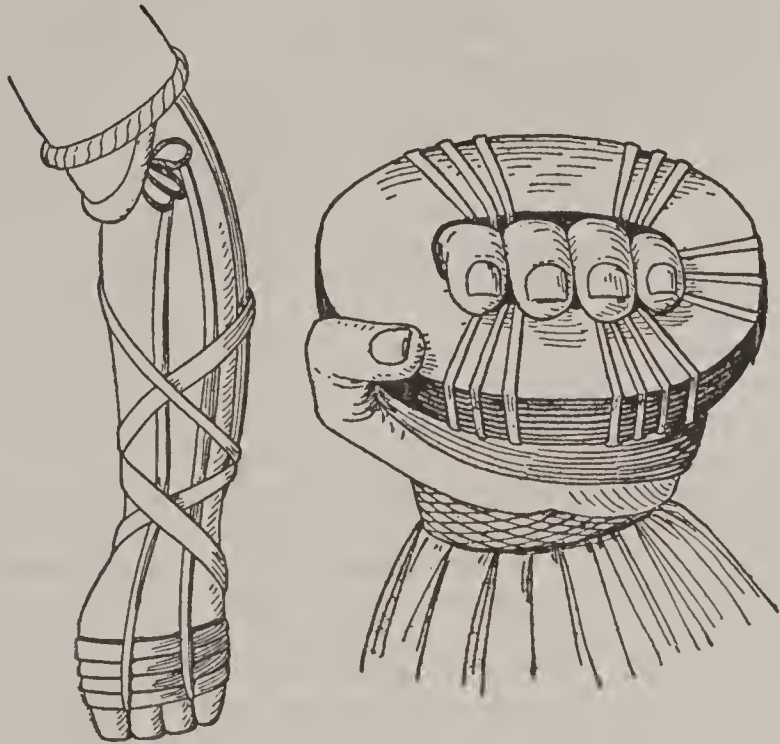

CESTUI QUE TRUST, sēs'twê ke or sēt'wê (OF., he for whom the trust). The technical legal term for the one for whose benefit a trust exists; the person who has the beneficial interest, as distinguished from the legal estate in lands or goods; the beneficiary of a trust. Cf. CESTUI QUE USE, and see TRUST.

CESTUI QUE USE (OF., he for whom the use). In English law, the person to whose use—i.e., for whose benefit—another holds the fee of lands or tenements. The term is nearly identical in meaning with the modern term *cestui que trust* (q.v.), and will be more fully explained under USES and TRUST.

CESTUI QUE VIE, vê (OF., he for whose life). In the English and American law of real property, a person whose life is the measure of the duration of an estate. A life estate, which was the characteristic estate of the early feudal law and is still of common occurrence, may be granted to one for his own life, or for the life of another, or even for the lives of several others. Thus, if a man by his last will devises lands to his daughter to have and to hold dur-

ing the life of the mother, the latter, though having no interest in the estate, is known as the *cestui que vie*. So, also, if a life tenant of an estate for his own life conveys the same to another, he thereby steps into the position of a *cestui que vie*. His life continues to be the measure of the estate, notwithstanding it is now held and enjoyed by another. When the *cestui que vie* dies, the estate comes to an end. See LIFE ESTATE.

CESTUS, or, more correctly, **CAES'TUS** (Lat., from *cædere*, to cut, smite, kill). The name of the covering for the hands worn by

CESTUS AS A PROTECTION.

CESTUS AS A WEAPON.

Roman pugilists. Among the Greeks, until about 400 B.C., pugilists wound long bands of soft leather about the fingers and hand to protect them from injury. By degrees this protection became a means of offense, as the leather thongs were made thicker and harder, and finally became a formidable weapon, as is shown, e.g., on the fine bronze statue of a seated pugilist now in the Museo delle Terme in Rome. In still later times the heavy leather thongs were further strengthened by metal bands, or even almost wholly replaced by metal. This dreadful weapon caused serious injury and even death.

CESTUS (Gk. *κεστός*, *kestos*, embroidered, from *κεντεῖν*, *kentein*, to prick, to broider). In Homer, properly an adjective, epithet of a magic band which Hera borrows from Aphrodite when she is anxious to lure Zeus to her side. Later, the word is used as a noun in the sense of "girdle."

CETACEA, sê-tā'shê-à (Neo-Lat. nom. pl., from Lat. *cetus*, Gk. *κῆτος*, *kētos*, whale). An order of aquatic mammals, comprising the whales, dolphins, and porpoises. The members of this order, in becoming more perfectly adapted to an aquatic life, have abandoned the original form and assumed the outward form and much of the external structure of fish. Their bodies are fishlike, with smooth skins. Their pectoral or fore limbs are reduced to paddles that perform the functions of the pectoral fins of fish; their pelvic or hind limbs have disappeared entirely, and the pelvis itself has become reduced to a pair of horizontal bones that are remnants of the ischia. The tail is provided with a horizontal caudal fin, and a posterior dorsal fin is usually present on the back. There are also important modifications in the vertebral column

and skull. The order comprises three suborders: Archæoceti, all extinct animals, with long snouts, forward nostrils, and heterodont teeth; Odontoceti, including several families and about 60 species, comprising the toothed whales, with porpoises, dolphins, belugas, killers, etc., of small size, and the huge sperm whales; and Mystacoceti, with nostrils far back, and their jaws bearing whalebone instead of teeth, as in the whalebone whale. For detailed descriptions and habits, see articles on the different members of the order.

Fossil Cetacea. Fossil forms of the Cetacea are not common, and the evolution of the order cannot be satisfactorily traced. The earliest representative is the genus *Zeuglodon*, the only member of the suborder Archæoceti. This genus appears in the Eocene rocks of Europe, North Africa, and North America, and its skull presents closer resemblances to the normal mammalian skull than are to be found in that of any other cetacean. Its teeth are of two kinds—conical simple incisors and compressed serrated two-rooted molars. In the Miocene rocks are found the earliest Odontoceti, or toothed whales, in which the skull tends to become asymmetrical and the teeth to multiply and become similar and conical; and in the Pliocene all the modern types of this suborder were evolved, although their mode of evolution is not known. In the Miocene there appeared also the earliest-known members of the Mystacoceti, or whalebone whales, which were of much smaller size and which had longer necks than have their modern descendants. The evolution of the Mystacoceti from Odontoceti is indicated by the presence, in the foetal stages of some genera of the former group, of rudimentary calcified teeth which soon drop out to be replaced, in the adult stages, by whalebone. The Tertiary deposits of Patagonia may be looked to for the discovery of interesting material bearing on the evolution of this aberrant group of mammals. See PHYSODON; PORPOISE; DOLPHIN; SQUALODON; WHALE; ZEUGLONDON.

CETEWAYO, kēch-wā'yō. See ZULULAND.

CETHE'GUS. The name of a Roman patrician family, of the Cornelia Gens. 1. MARCUS CORNELIUS CETHEGUS. Curule ædile, 213 B.C., censor in 209, and consul in 204. In 203, as proconsul in northern Italy, with the prætor P. Quintilius Varus, he defeated Mago, the brother of Hannibal, and compelled him to withdraw from Italy. According to Cicero, *Brutus*, 59, Ennius called Cethegus the *suadæ medulla*, 'the marrow of persuasiveness.' 2. GAIUS CORNELIUS CETHEGUS, the most efficient of the associates of Catiline. After Catiline's departure from Rome Cethegus remained in Rome to press the purposes of the conspirators. When he was arrested by Cicero, arms were found in his house. His guilt was further established by a letter which he had given to certain ambassadors of the Allobroges to carry to Catiline on their way home. With other conspirators he was executed, on Cicero's order, on Dec. 5, 63 B.C.

CETINA, thâ-tē'nâ, GUTIERRE DE (?1518-57). A Spanish lyric poet, born at Seville shortly before 1520. Uncertainty enshrouds most of his life, but we know that he served in the army in Italy, in Tunis, and in Flanders between 1542 and 1547, and won the patronage of the Prince of Ascoli (Antonio de Leyva), of Hurtado de Mendoza, and of the Duke of Sessa. About 1547 (perhaps somewhat earlier) he re-

tired from the army and settled in Seville. Shortly afterward he went to Mexico. How long he remained is not known (conjectures run as high as 10 years). From this point on, accounts of his life vary widely. According to some authorities he entered the Church, took a doctor's degree in theology, and accepted a vicariate in Madrid. Hazañas y la Rúa thinks this version due to a confusion of our author with another person of the same name, who lived a few years later and died in 1578. Other authorities make no mention of such ecclesiastical activities, but state that he seems to have revisited Seville about 1557 and to have returned to Mexico, where he died some time previous to 1575. Cetina's biographer and friend Pacheco says he died in Mexico in 1560. With this date some critics agree, although claiming that he died in Seville. This, too, is due to a confusion with a distinguished Sevillian of the same name who was Regidor de Puerto Real in 1635. Fitzmaurice-Kelly says that Cetina went to Mexico about 1547, revisited (at a date not given) Seville, where he must have written copiously, and finally returned to Mexico, where he died (at Los Angeles) as a result of wounds received by mistake in a nocturnal ambush in 1557. He has been recognized as one of the three patriarchs of Castilian poetry in Mexico, the other two being Cervantes Salazar and Salazar de Alarcón. He belonged to the Italianizing school and wrote in the smaller verse forms. Because of the number of his anacreontic verses he has been called the Spanish Anacreon. He handled the sonnet with even greater mastery than did Garcilasso. For years he was known chiefly for his exquisite madrigal *Ojos claros, serenos*. In 1854, at Madrid, Adolfo de Castro collected what was supposed to be all of his work that was still extant, and published it in vol. xxxii of the *Biblioteca de Autores Españoles*. Gallardo included some previously unpublished burlesques in his *Ensayo de una biblioteca española* (vol. ii, Madrid, 1866). Translations of several pieces are to be found in Hoffmann, *Blüten spanischer Poesie* (3d ed., Magdeburg, 1856). Cetina's works have been well edited, with a critical and biographical study as introduction, by J. Hazañas y la Rúa (2 vols., Seville, 1895). Consult also P. Savi-Lopez, *Un petrarchista spagnuolo* (Trani, 1896).

CETINJE, tsět'ën-yā. The capital of Montenegro and residence of the King and the higher secular and ecclesiastical authorities of the kingdom (Map: Balkan Peninsula, B 3). It is situated at an altitude of nearly 2000 feet, in a deep valley surrounded by mountains. In its general appearance it looks more like a village than the capital of a country. Even the palace of the King is an unpretentious, one-story house. The town has an old monastery, a number of institutions for secondary education, including a girls' institute, and a theatre. The population numbers about 4400. The town was destroyed by the Turks in 1683, 1714, and 1785. Consult Wyon and Prance, *Land of the Black Mountain* (London, 1903), and Passarge, *Montenegro und sein Herrenhaus* (Berlin, 1906).

CETIOSAU'RUS. A gigantic fossil reptile of the Dinosaurian family from the Jurassic and Cretaceous strata of Europe. Only fragments of the skeletons have been discovered, but these have been pieced together to give a fair representation of the proportions of the ani-

mal, which probably reached a length of 60 or 70 feet and a height of 10 feet. See DINOSAURIA.

CETOT'OLITH (from Gk. κῆτος, *kētos*, whale + οὖς, *ous*, ear + λίθος, *lithos*, stone). The fossil ear bone of a whale. Cetoliths are often found in the Tertiary deposits of Europe and North America, and in many parts of these formations they are the only remnants of the skeletons of whales that have been preserved. This is due to their harder consistency, which is greater than that of the rest of the skull and bones. See CETACEA; WHALE.

CETRA'RIA. See ICELAND MOSS.

CETTE, sět. A seaport town and fortress of the third class, in the Department of Hérault, France, on a neck of land between the lagoon of Thau and the Mediterranean, about 25 miles southwest of Montpellier (Map: France, S., H 5). The town is entered by a causeway raised above the Thau lagoon, and a bridge of 52 arches. The main features of its fortifications are the redoubt of Claire and the forts of St. Louis and St. Pierre. The depth of its harbor is from 16 to 19 feet. As a seaport it ranks second to Marseilles among those of the south coast of France. Its broad, deep canal, lined with excellent quays, connects the port with the lagoon of Thau, and so with the Canal du Midi and the Rhône, thus giving to Cete an extensive inland traffic; it has likewise an active foreign commerce. Its trade is in wine, brandy, salt, dyestuffs, perfumery, and verdigris. Cete is primarily a centre for the rectification, packing, and shipping of wines. It has large shipbuilding yards, cooperage works, manufactures of chemicals and perfumes, and fisheries of oysters and anchovies. It is popular as a seaside resort. The port was founded in 1666 by one of the ministers of Louis XIV. Pop. (commune), 1901, 33,246; 1911, 33,049.

CETTIGNE. See CETINJE.

CE'TUS (Lat., from Gk. κῆτος, *kētos*, whale). A southern constellation lying to the south of Aries. Among its stars is a very remarkable variable called σ Ceti. It has been named Mira (the wonderful), on account of its extraordinary changes of luminosity. Since 1596, when its variability was first discovered by Fabricius, it has blazed up sufficiently to be visible to the unaided eye once in about 11 months. It usually remains visible a number of days, and then sinks again into the comparative unimportance of a telescopic star of the ninth magnitude.

CEULEN, kē'len, or **KOILEN**, LUDOLPH VAN (1540-1610). A Dutch mathematician, who was born at Hildesheim and died in Holland. He is chiefly known for his computations of the value of π , which he finally carried to 35 decimal places. This value was inscribed on his tombstone in St. Peter's Church in Leyden. The number π is sometimes called the Ludolphian number.

CEUTA, thā'ōō-tā. The chief Spanish penal settlement or presidio, on the north coast of Africa, situated on a small promontory in Morocco, about 17 miles south of Gibraltar (Map: Africa, D 1). It is well fortified by a citadel and several batteries on Mount Acho, which with Gibraltar makes the two "pillars of Hercules." It has a cathedral and is the seat of a bishop and administratively belongs to the Province of Cadiz. A prison is in the old convent of San Francisco. Its harbor is small and unprotected. Pop., 1900, 13,843; 1910, 23,907. Ceuta is of Roman origin. It passed in 1415 from the Moors to the Portuguese,

and in 1580 was annexed with all the Portuguese territories to Spain, in whose possession it has since remained. Consult De Prado, *Recuerdos de Africa; historia de la plaza de Ceuta* (Madrid, 1859-60), and Budgett Meakin, *The Land of the Moors*, chap. xix (London, 1901).

CEVA, châ'vâ, TOMMASO (1648-1736). An Italian mathematician and poet, born in Milan. His *De Natura Gravium* (1669) was the first exposition of Newton's law of gravitation published in Italy. He invented an instrument for the trisection of angles and published valuable investigations in his *Opuscula Mathematica* (1699). His poem *Puer Jesus* (1699; ed. by Broxner, 1842), in epic manner, is of worth.

CEV'ADIL'LA. See SABADILLA.

CEVALLOS, thâ-vâl'yôs, or **CEBALLOS**, PEDRO (1761-1838). A Spanish politician and diplomat, born in Santander (in the province of that name). He was educated in Valladolid and appointed Secretary to the Embassy in Lisbon. In the confusion incident to Napoleon's interference in Spanish affairs, he took sides with the Crown Prince Ferdinand (afterward Ferdinand VII), whom he advised to arrange the interview with Napoleon at Bayonne. He was afterward a member of the Junta of the Spanish insurgents and acted as agent of that interest in London. In 1808 he published his *Exposition des faits et des trames, qui ont préparé l'occupation de la couronne d'Espagne*, descriptive of Napoleonic methods. He continued prominent during the struggle for independence and was for a time a cabinet minister under Ferdinand VII. He also held posts as Ambassador at Naples and Vienna. In 1820 he retired to private life.

CÉVENNES, sâ'vën' (ancient Cebenna). The chief mountain range in the south of France. Divided into two groups, the Northern and Southern Cévennes, they form the watershed between the river system of the Rhône on one side and those of the Garonne and Loire on the other. Their general direction is from northeast to southwest, commencing at the southern extremity of the Lyonnais Mountains, and extending under different local names as far as the Canal du Midi, where they approach the northern offsets of the Pyrenees. The central mass of the Cévennes lies in the departments Lozère and Ardèche, Mont Mézenc (the culminating point of the chain) having an elevation of 5754 feet. The average height is from 3000 to 4000 feet. The masses consist chiefly of amphibolic rocks, graywacke, and limestone, covered with Tertiary formations, which in many places are interrupted by volcanic rocks. The Cévennes have been celebrated as the arena of religious warfare. They were the scene of the persecutions of the Albigenses (q.v.) and the Waldenses (q.v.) in the Middle Ages and of the Camisards (q.v.) in the seventeenth century. Consult R. L. Stevenson, *Travels with a Donkey in the Cévennes* (9th ed., London, 1895), and Ribard, *L'Histoire évéénale d'après des documents* (Cazillac, 1898).

CÉVENOLE (sâ've-nôl') **RACE**. A term applied by Deniker to the Celtic or Alpine short-headed type of Europeans, also called Occidental. The name is derived from the Cévennes, in France, the locality of its most characteristic type. Consult Deniker, *Races of Man* (London, 1900).

CEYLON, sê-lôn' (Hind. *Silān*, Pāli *Sihalana*, from Skt. *Simhala*, Ceylon, from *simha*, lion; Lat. *Taprobane*, from Gk. *Ταπροβάνη*, from Skt. *tamraparna*, copper leaf, on account of the shape of the island, from *tamra*, copper + *parna*, leaf; the Skt. name of the island is *Lankā*). An island in the Indian Ocean, and a crown colony of Great Britain, situated about 60 miles southeast of the Indian peninsula, from which it is separated by Palk Strait and the Gulf of Manar (Map: India, D 7). Its location is between lat. 5° 55' and 9° 51' N., and between long. 79° 41' and 81° 54' E. It is almost pear-shaped, having a length of about 266 miles and a width varying from 32 to 140 miles, with a total area of over 25,300 square miles.

Physical Features. In its northern part Ceylon is a level country, interspersed here and there with low hill chains. The southern part, on the contrary, is mountainous in its character. The mountain masses of the island cover an area of over 4000 square miles and run in various directions with a gradual decline towards the north. The highest peaks are Pedro-tallagalla (8280 feet) and Adam's Peak (7420 feet), a famous place of pilgrimage among Oriental nations and especially held in high esteem by the Buddhists. Other peaks are Tolapella (7720 feet) and Kirrigalpota (7810 feet). Geologically the northern part of Ceylon shows a predominance of coral limestone, while the prevailing composition of the mountains is gneiss occasionally intersected with veins of quartz and sometimes overlaid with clay or limestone. Ceylon has numerous rivers, mostly dependent on the rains for their water. The principal of them is the Mahavela-ganga, rising in the mountains in the vicinity of Adam's Peak and falling into the ocean near Trincomalee Bay. It has a course 134 miles long, drains upward of 4000 square miles, and is abundantly timbered on its banks with halmalille, ebony, satinwood, etc. It is quite deep and even navigable for a short distance during the rainy season, but is easily forded in the dry season. There are ancient remains of dams and canals which formerly connected extensive lagoons along the east coast.

The climate of Ceylon, although superior to that of most tropical countries, is still sufficiently unhealthful, especially in the low regions, to prevent European immigration on a large scale. In some parts of the island there is practically only one season, a humid and oppressive heat interrupted now and then by copious showers. The average annual temperature ranges from about 70° to 90°, in accordance with the altitude of the locality. In the mountains the temperature is pleasantly cool and not infrequently cold in the night. In the valley of Nurwara-Eliya, situated at an altitude of nearly 6000 feet and used for a sanatorium, the temperature seldom rises above 70° and has an annual average of about 62°. The rainfall shows as much diversity as the temperature, ranging from 30 to 80 and sometimes 120 inches per year.

The flora of Ceylon is remarkable for its beauty as well as for its variety and constitutes one of the principal attractions of the island. It is especially rich in palms, of which the most prominent specimens are the coconut, arcca, and feathery palms. The elevated portions of the island were formerly covered with thick forests

of valuable trees, some of which cannot be found elsewhere in the world. Most of these forests are being destroyed to make way for the extensive tea plantations, which now constitute the most prominent feature of the island. Ceylon is also especially rich in ferns and flowers, of which there are endless varieties.

The animal kingdom of Ceylon is also remarkable for its variety. Chief among the quadrupeds is the elephant, which, although tuskless, is of much value as a beast of burden and is largely exported from the island. The bear, leopard, buffalo, several species of the monkey, and the Indian humped ox are also abundant. The island contains over 3000 species of birds and many varieties of reptiles, among which the most prominent is the crocodile.

Agriculture is the chief industry of Ceylon as well as the main source of its prosperity. About one-fourth of the total area (16,307,940 acres) is in crops and pastures. The acreage in 1912 under main crops follows: 942,621 acres under coconuts; 680,574 under rice and 101,708 under other grains; 580,845 under tea; 215,000 under rubber; 47,292 under cinnamon; 43,358 under cacao; 16,241 under tobacco; 1512 under coffee; 263 under cinchona. Upon the decline of the coffee industry in the island during the later years of the nineteenth century European enterprise established tea plantations, which developed rapidly and rendered remarkable returns, as shown by comparative export figures: 2,392,963 pounds in 1884; 7,849,888 in 1886; 23,820,471 in 1888; 45,799,518 in 1890; 149,264,602 in 1900; 182,070,094 in 1910; 186,594,055 in 1911. On the tea estates in 1911 there were about 440,000 Indian coolies. The price of tea having fallen, the planters began the development of the rubber industry. In 1898 only about 750 acres were under rubber; in 1901 there were 2500; 11,000 in 1904; 40,000 in 1905; 100,000 in 1906; 150,000 in 1907; 186,634 in 1910; 215,000 in 1911. Ceylon rubber is chiefly of the Pará variety, contains 94 to 95 per cent caoutchouc, and loses only 1 per cent in washing. Owing to the reluctance of the Singhalese to work on the plantations (a reluctance due partly to their satisfaction with their present condition and partly to their mistrust of foreigners), the planters depend for their labor on imported coolies, who come over to the island with their families and after a stay of several years generally return to India. The estimated number of laborers on plantations, including natives born of coolie parents, was 510,000 in 1912.

Ceylon is famous for its precious stones—rubies, sapphires, moonstones, etc. The gem quarries in operation in 1912 numbered 1986. The pearl fisheries, near Manar, were leased, Jan. 1, 1906, to an English company for 20 years, conditional upon the expenditure of stipulated sums for improvements; this lease was later terminated and control of the banks resumed by the government. They yielded a revenue of Rs.2,405,645 in 1905. The manufacture of salt is a government monopoly. Plumbago mines and pits numbered 609 in 1912, yielding, in 1910, 632,275 hundredweight (est.), valued at about Rs.9,484,125.

Commerce. Trade development during the decade 1902–12 is shown in the following figures: Rs.109,468,265 imports and 99,402,890 exports in 1902; 116,483,243 and 104,265,926 in 1904; 129,316,757 and 129,570,001 in 1907,

the first year in which the export value approximately equaled the import value; 133,782,127 and 146,899,631 in 1909; 164,405,788 and 182,028,968 in 1911; 181,999,991 and 198,954,902 in 1912. The wide swing from an unfavorable to a favorable balance of trade during the decade is noteworthy. Export of tea in 1911, Rs.84,900,300; rubber, Rs.36,427,290; coconut-palm products, Rs.38,086,242; plumbago, Rs.6,656,310; areca nuts, Rs.2,423,010; cacao, Rs.2,370,773; cinnamon, Rs.2,086,293. Of the total exports, those to the United Kingdom were valued at Rs.87,359,604 and to British possessions at Rs.25,492,383. Of the total imports, those from the United Kingdom were valued at Rs.43,443,786 and those from British possessions at Rs.100,095,273. Rice valued at Rs.45,409,525 came from India; from the United Kingdom the chief imports are textiles and coal. Colombo, the capital (213,396 inhabitants in 1911), Galle (40,187), and Trincomalee (9086) are important ports. The total tonnage entered and cleared in 1911 was 14,926,764, of which 9,571,159 tons were British; in 1902 the total tonnage was 9,955,256, of which 6,947,898 tons were British. The total railway mileage in operation was 603½ in 1912, all government owned and worked. Under construction there were 131 miles.

Administration. Ceylon has been administered since 1831 by a governor; he is assisted by an executive council of seven members and a legislative council of 21 members, including the ex-officio members of the executive council, the government agents for the Western, Central, and Southern provinces, the (principal) medical and one other officers, together with six nominated and four elected nonofficeholding members. For administrative purposes Ceylon is divided into nine provinces, each administered by a government agent. The code of the colony is a modification of the Roman-Dutch law, while the criminal law is based on the Indian Penal Code. Justice is administered by a supreme court, police and district courts, and courts of requests. Minor cases are dealt with by the village councils. The revenue and expenditure in 1911–12 were Rs.47,264,222 and Rs.48,643,687 respectively. The chief sources of revenue are customs duties, licenses, monopolies, stamps, land sales, and railways. The chief items of expenditure are administration, public works, service of the debt, military forces, fortifications, and pensions. The foreign public debt amounted, June 30, 1912, to Rs.92,073,409. Public instruction is in charge of a special department presided over by a director assisted by a staff of inspectors. The total attendance at government schools at the end of 1911 was 104,000; at government-aided schools, 222,000; at unaided schools, 34,375. Among the educational establishments of the island there are several high schools, one technical and one normal college, and a number of industrial schools.

Inhabitants. The total population, according to the census of March 10, 1911, inclusive of military, shipping, and estates, was 4,110,367 (an increase of 14.9 per cent over the returns of the census of 1901), detailed as follows: 8524 Europeans, 26,673 burghers and Eurasians, 2,715,686 Singhalese, 1,060,167 Tamils, 267,054 "Moors" (non-Malay Mohammedans), 12,992 Malays; others, 19,271. The Singhalese, who inhabit chiefly the Southern and Central divisions, are the descendants of colonists from the valley of the Ganges who first settled on

the island during the fifth century B.C. In their customs, costume, and general appearance they have remained unchanged since the days of Ptolemy. The dress of the men, who have delicate features and slender limbs, is singularly effeminate and consists of a comboy, fastened at the waist and hanging straight to the ankles, while a jacket of white linen or duck covers the upper part of the body. Their long hair, turned back from the forehead, is confined with combs, and earrings are worn by way of ornament. The women, in addition to the comboy, cover the upper part of the figure with a white muslin jacket, and adorn themselves with necklaces, bangles, rings, and jewelry. The Singhalese are Aryans by language, but in blood they are somewhat mixed, though fundamentally of the white race. The Kandians, or Highlanders, are a sturdy race and maintained their independence for centuries after the conquest of the low country by European settlers. They keep up more of their ancient customs than the coast Singhalese. Polyandry, which was formerly universal, still lingers among them, and is an ancient usage to which they strongly adhere. The Malabars, or Tamils, are Dravidians and sprung from those early invaders of Ceylon who from time to time swept across from southern India and contended with the Singhalese kings for the sovereignty. The Moormen, so called by the Portuguese, are the most energetic and intelligent of the native communities and are met with in every province as enterprising traders. They are a very distinct race from the Singhalese, but have no tradition of their origin. Europeans generally believe them to be of Arab descent, but Tennent is of the opinion that "they may be a remnant of the Persians, by whom the island was frequented in the fourth and fifth centuries." The Tamils are largely devotees of Hinduism, while the Singhalese are Buddhists; Ceylonese Buddhism, indeed, is the most vigorous branch of that faith.

The burghers are a people of European descent who have become naturalized. Those of Portuguese extraction hold the lowest place and are mostly tradesmen and artisans; but the Dutch burghers frequently fill responsible posts and are employed in government offices.

The aboriginal inhabitants of the country are the Veddas, a remarkable people representing one of the most primitive stages in human culture at the present time. They number over 5000 and occupy a district in the eastern part of the island, where they have preserved their ancient customs and manner of living for several thousand years. They are divided into the coast Veddas, rock Veddas, and village Veddas. The coast Veddas are a little more civilized than the others. The rock Veddas hide themselves in the jungle, live by the chase, and sleep in trees or caves. They use fire to cook their meat, and their greatest gastronomic treats are the iguana lizard and roasted monkey. The village Veddas locate themselves in the vicinity of European settlements on the eastern coast, living in rude huts of mud and bark, and are hardly more civilized than their brethren of the jungles. The exertions of the government to reclaim this people have been somewhat successful. The recent researches of the Sarains and of the Seligmanns have revealed many important facts concerning the sociology, language (Singhalese influences), religion (Indian

influences apparent in places), and folklore of the Veddas. Their "arrow dances" and songs are of especial interest. (See for details, Seligmann, *The Veddas*, Cambridge, 1911.) The Veddas may be regarded as remnants of a pre-Dravidian race, cognate, perhaps, with such other very primitive and isolated peoples as the Toalà of Celebes, the Batin of Sumatra, etc. See VEDDAS.

Language and Literature. The Ceylonese, Singhalese, or Sinhalese is a modern Indian dialect spoken in the south of Ceylon, while a Dravidian dialect, the Tamil, is the language of the northern part of the island. The Singhalese is allied most closely to the Māhārāshtri Prakrit and the Pāli, the most important Middle Indian dialects, and it seems to have come from the northwest of India. The Singhalese differs more from the Prakrit and Pāli than is the case with most of the modern Indian dialects. The change of vowels on account of a following *u*, or *i* ("umlaut"), the entire loss of the aspirates, and the change of *c* to *s* and *j* to *d*, while *s*, whether original or developed, may become *h* or remain unchanged, are noteworthy characteristics of this dialect. In its nominal system Singhalese has become analytic, like the other modern Indian dialects, but in its verbal system it represents a comparatively old stage of linguistic development. There was formerly much discussion whether Singhalese was an Indian or a Dravidian language. It is now, however, generally regarded as a true Aryan dialect, despite the many loan words which have been incorporated into its vocabulary. The older form of Singhalese is called Elu, which is still employed for poetical composition. Dialects of the Singhalese are Maldive and the jargon of the Rodiyas, which seems to be a slang of the standard language. Singhalese is written in a special, graceful character, apparently derived, like the epigraphical letters, from the Brahmi alphabet of the Asoka inscriptions.

Singhalese literature is rather scanty. The oldest monument of it is a glossary to the commentary on the *Dhammapada* in the tenth century. The prose literature is chiefly religious, but there are also grammatical works, such as the *Sidat-sangarāva*, and, what is especially noteworthy in Indian literature, histories, such as the *Dipavansa*. The golden period of Singhalese poetry was in the fifteenth century, when the *Sālahihini-sandēśaya* was written. Many of the poems deal with the Buddhist birth stories, or Jātakas, as the *Kusajātaka* of Alagiyavanna Mohottāla or Mukaveti, a poet of the Singhalese Renaissance at the beginning of the seventeenth century. There are many inscriptions in Singhalese, dating from the last centuries B.C. to the nineteenth century A.D. After the fifth century, however, they are comparatively infrequent.

Religion. The prevailing religion of Ceylon within historic times has been Buddhism; it is still the faith of almost the entire southern and central portions, or two-thirds of the island. Hinduism, or the sects of Brahmanism, is confined chiefly to the north. Christianity and Mohammedanism have a considerable representation throughout the land. The census of 1911 gives the following statistics: Buddhists, 2,474,393; Hindus, 939,701; Christians, 410,525; Mohammedans, 284,482. Singhalese Buddhism is the principal representative of Southern Buddhism, which includes also Siam and Burma,

in contrast to the Northern Buddhism of China, Japan, and Tibet. All have their origin, of course, in India. (See BUDDHISM; INDIA.) The history of the faith as a national religion in Ceylon is reserved in the Pāli chronicles of Ceylon, the *Mahāvansa* and the *Dīpavansa*. Tradition claims that Buddha himself visited the island (Lankā) on three different occasions. His sacred footprint, the *śrīpada*, on Adam's Peak (q.v.), is still a place of hallowed pilgrimage for the faithful. The real introduction of Buddhism into Ceylon, however, dates from the third century B.C., when Mahinda, son of the Indian King Asoka, came from India and established the faith under the patronage of King Tissa of Ceylon, a contemporary of the great Asoka (q.v.). Mahinda's own sister, the Princess Sanghamitta, brought from Buddha Gayā a branch of the sacred bo tree, or *Ficus religiosa*, from which the famous tree at Anurādhapura is directly descended. (See Bo TREE.) The faith thus established entered upon its history in the island. In the fourth century A.D. the great Buddhist scholar and commentator, Buddhaghosa, came from India to Ceylon and by his admirable treatise on the Buddhist doctrines, the *Visuddhi-magga*, or Way of Purity, set up a standard of interpretation of the sacred texts which has been authoritative since his time. Under Parkākrama Bāhu I, the greatest Buddhist of Ceylon, c.1200 A.D., was the time of the highest prosperity of the faith; but a depression, more or less great, followed later, and Brahmanism, which had contributed more than one admixture from the earliest Tamil invasions and the rule of the Malabar kings, proved a formidable rival. In spite, however, of all opposing claims, including Mohammedanism and Christianity, the title of Buddhism is still paramount, and it has been kept practically free from sects. Three divisions or societies, however, are recognizable. The largest of these in point of numbers, some 50 per cent, and the earliest to develop, is a division due to the influence of Siamese monks who were imported into the Kandyan territory about A.D. 1750 to restore decadent Buddhism. The second, or Amarapura society, was founded about A.D. 1800, when Buddhist missionaries from Burma were introduced. The third, or Ramany branch, represents a somewhat reactionary movement or tendency to stricter conformity to the faith of the ancient books. Only the Siamese society cultivates caste; the other two reject it as foreign to Buddhism, although of ancient origin. There are some other slight points of distinction between the three. In this connection it may be worth noting that Christianity has taken hold largely among the fisher class, who are regarded as among the lowest orders of the community. Hinduism, or Brahmanism, for the most part is the faith of the Tamil or Malabar population of Ceylon; the Moormen are Mohammedans. The first Protestant missionaries that went to Ceylon after the Portuguese and the Dutch supremacies had given place to the British were sent by the Baptists in 1813; the Wesleyan Methodists followed in 1814; the American missionaries entered the field in 1816; and the Church of England came in 1818. The Christian population, however, is mostly Roman Catholic. The progress of Christianity among the people has been very considerable; schools have been established; women's seminaries endowed; and collegiate institu-

tions founded, especially under the guidance of missionaries.

Antiquities. The buried cities and ruins of massive monuments in Ceylon make its antiquities a subject of importance to the student of art, archaeology, and history. These vestiges of early civilization are directly connected with Buddhism as the national faith of the island. In all Buddhist countries the sacred buildings present, with certain modifications, the same general character (see BUDDHISM; BURMA; ETC.), and in Ceylon we find the usual three classes represented by temples (*pansalas*), monasteries (*vihāras*), and relic shrines (*dāgabas*). The latter, from *dā*, *dhātu*, relic, and *gaba*, *garbha*, receptacle, denotes a casket, and then a large structure erected to contain some sacred relic of Buddha. The form of these is bell-shaped, on a square base. They answer in general to the pagodas of Burma and the topes of Afghanistan. The most famous of the *dāgabas* in Ceylon is the Daladā Māligava, the Temple of the Tooth, at Kandy, containing a tooth of Gautama Buddha brought from India to Ceylon about 300 A.D. The original relic was destroyed by the Portuguese, but its substitute, a piece of discolored ivory resembling a crocodile's tooth, is jealously guarded in a sacred shrine and shown only to royal personages or on the rarest occasions. The labor which must have been bestowed upon some of these shrines and edifices in the early ages of the Singhalese monarchy is astonishing. Some of the ruined structures in the half-buried cities of the north of the island almost rival the pyramids of Egypt or other monuments of antiquity in their desolate grandeur. The architectural remains of 2000 years ago, as seen at Anurādhapura, Polonnaruwa, Dambulla, Kalavewa, Mahintale, and Sigiri, are of the greatest interest alike to the traveler and to the antiquarian. The rock-hewn temple of Gal-vihāira at Polonnaruwa, the capital of ancient Ceylon, is much the same to-day as it was when described in the *Mahāvansa*. The massive pile of the Rankot Dāgaba and the Jetavanārāma Temple, in the same region, with the colossal statues of Buddha here and elsewhere, well repay a visit after Anurādhapura, with its famous bo tree alluded to above. Among the antiquities of Ceylon the ruined tanks must also be mentioned, as they are wonderful monuments; 30 enormous reservoirs and about 700 smaller tanks still exist, though for the most part in ruins. Some of these magnificent works of irrigation have been restored by the government, among them Minneri and the Giant's Tank. Works have been completed for the storage and supply of water for Colombo.

History. There are abundant allusions to Ceylon in ancient writers, and the island appears in early Sanskrit works under the name of Lankā; but no direct knowledge concerning its history was accessible in Europe until about the year 1826. The opening up of the records of Ceylon's early history was due to the labors of George Turnour (1794-1843), who devoted himself to a study of the Pāli chronicles and composed an *Epitome of the History of Ceylon* from the year 543 B.C. to 1798 A.D. His records give the reigns of 165 kings who reigned during this period of 2341 years. He based his work chiefly on the most famous of the Singhalese books, the *Mahāvansa*, a metrical chronicle, in the Pāli language, which gives an account of the island during the centuries named. The story begins with the invasion of Vijaya, or Wijayo

(543 B.C.), son of a petty Indian sovereign in the country watered by the Ganges. He subdued the Yakkhas, the aboriginal inhabitants; married a daughter of one of the native chiefs, whom he subsequently repudiated for an Indian princess; and founded a dynasty that held undivided sovereignty in Ceylon for nearly eight centuries. He bestowed on his kingdom his patrimonial name of Sīhala, or Sinhala—whence Sinhalese (Singhalese), Ceylon—and promoted the settlement of colonists from the mainland. In the reign of the great King Tissa, called Devānāmpiyatissa, or Devenipiatissa (307 B.C.), Buddhism was established as the national religion, and his reign was further remarkable by the planting of the sacred bo tree (288 B.C.), and now commenced the erection of those stupendous buildings already noticed. The next important epoch in Singhalese history is the usurpation of the Malabars (237 B.C.), foreign mercenaries from the Coromandel coast, to whom the native sovereigns had intrusted the defense of the island. Several Malabar invasions are chronicled in the history of Ceylon, and these foreigners long contended with the native princes for supreme authority. Passing on to 1071 A.D., a native dynasty was then reestablished in the person of Vijayā Bāhu, and his recovery of the throne delivered the country from the domination of the Malabars or Tamils for a time and prepared the way for the restoration of the royal race nearly a century later in the person of the illustrious Parākrama Bāhu. Parākrama's reign commenced in 1155 A.D., and it was one of the most renowned eras in the history of Ceylon. He devoted himself to religion and agriculture, and besides many notable religious edifices he caused no fewer than 1470 tanks to be constructed, subsequently known as the "seas of Parākrama." Thirty years after the death of this monarch the Malabars landed with a large army and speedily conquered the whole island. In 1235 a native dynasty recovered a part of the kingdom. During the reign of Dharma Parākrama IX the Portuguese first visited Ceylon (1505); but it was in 1517 that they first formed a permanent settlement at Colombo for trading purposes. Their encroachments soon aroused the opposition of the patriotic Kandyans, and it is a remarkable fact that, although they were even ignorant of the use of gunpowder when the Portuguese came, in 1505, they ultimately excelled their enemies as musketeers, and were finally able to bring 20,000 stand of arms to bear against them. "Amity, commerce, and religion" was the Portuguese motto; but their rule in Ceylon is a sad story of rapacity, bigotry, and cruelty. They were at last driven from the island by the Dutch in 1658, after a contest of 20 years, when, as Sir J. E. Tennent remarks, "the fanatical zeal of the Roman Catholic sovereign for the propagation of the faith was replaced by the earnest toil of the Dutch traders to intrench their trading monopolies; and the almost chivalrous energy with which the soldiers of Portugal resisted the attacks of the native princes was exchanged for the subdued humbleness with which the merchants of Holland endured the insults and outrages perpetrated by the tyrants of Kandy upon their envoys and officers." But the purely military tenure of the Dutch was destined to give place to the colonization of the British. It was during the great European war succeeding the French Revolution that the Eng-

lish gained possession of the island. On Aug. 1, 1795, an expedition under Col. James Stuart landed at Trincomalee, which was speedily captured, and finally the garrison of Colombo surrendered, on Feb. 16, 1796. By this capitulation all the Dutch settlements and strongholds in Ceylon were ceded to the English, though the island was not formally annexed to the British crown till the Treaty of Amiens, 1803. The native sovereigns, however, continued in the possession of their mountain territory; but at length the Kandyan King Vikrama Rāja Sinha, after perpetrating the most frightful atrocities on his own people, seized and murdered certain native merchants, British subjects, trading to Kandy. War followed; in January, 1815, Kandy was taken, and the tyrant was sent a captive to the fortress of Vellore. On March 2, 1815, a treaty was concluded with the native chiefs, by which the King was formally deposed and his territories annexed to the British crown. Since then the island has made rapid strides in material prosperity; many important public works have been completed, and others are still in progress.

CEYLON TEA TREE. See ELÆODENDRON.

CÉZANNE, sã'zãn', PAUL (1839-1906). One of the most striking and influential figures in modern French painting. He was born at Aix, Provence, the son of a banker. In the college of his native town he formed a friendship with Émile Zola, whom he followed to Paris, and on whose advice he took up painting. He failed in the entrance examinations to the Ecole des Beaux-Arts, but in the Ecole Suisse, in which he studied, he was associated with Pissaro, who introduced him to the art of Courbet and Manet. As a result, Cézanne joined the Impressionists, exhibiting with them in 1874 and again in 1877, when he sent in 17 oil paintings. Discouraged by the ridicule of critics and by his differences with the Impressionists, he retired in 1879 to Aix, where he spent the remainder of his life. He broke with all his old friends, even with Zola, and seemed forgotten by the world. But in this seclusion he developed a style of amazing originality, which has exercised a profound influence upon the radical younger generation, who hail him as a prophet and a leader. Not until the exposition of 1900 and the posthumous exhibitions of his works did the world realize his importance. For Cézanne differed from

both Impressionists and Academicians. He used the bright colors of the former, but objected to the flat appearance of their pictures, and attempted to render depth and modeling, and in his last works he sought for unity of composition. His aim was to unite Impressionism with the great art of the past, which he endeavored to accomplish by the use of dark shadows and outlines in conjunction with a particularly bright and melting color scheme. He excelled particularly in still life, but was also a great landscape painter, particularly when depicting his native Provence; he painted also forceful portraits and admirable nudes in landscape. His paintings are most numerous in the private collections of Paris. He is represented in the Luxembourg, Paris, in the Havemeyer collection, New York, and especially in the National Gallery, Berlin. The story of Cézanne's struggles and career is depicted in Zola's *L'Œuvre*, of which he is the hero. Consult: Duret, *Les Impressionistes* (Paris, 1906); Faure, *Portraits d'hier, Paul Cézanne* (ib., 1910); Meyer and Graefe, *Paul Cézanne* (Berlin, 1910); Puy, *L'Etat de la peinture moderne* (Paris, 1911); Burger, *Cézanne and Hodler* (Munich, 1913).

CEZIMBRA, sã-zēm'brã. A coast town of Portugal, in the Province of Estremadura, about 18 miles south of Lisbon (Map: Portugal, A 3). It has a good harbor and fisheries. Pop. (commune), 1890, 8438; 1900, 9066.

C. G. S., or CENTIMETER-GRAM-SECOND SYSTEM. That system of units or standards for the measurement of physical quantities which is based upon the *centimeter* as the unit of length, the *gram* as the unit of mass, and the mean solar *second* as the unit of time duration. It has been adopted by all scientific bodies, by most governments, and is in daily commercial use at the present time by all the leading nations of the world except Russia, Great Britain, and the United States.

The *centimeter* (cm.) has a length which is the one-hundredth of the distance between two fine lines on a certain platinum-iridium bar kept in Paris at the Bureau International des Poids et Mesures and known as the International Prototype Meter, the length being measured when the bar is at the temperature of 0° C. The *gram* (gm.) has a mass which is the one-thousandth of that of a platinum-iridium cylinder, kept in Paris, known as the International Kilogram. The mean solar *second* (sec.) is an interval of time such that $60 \times 60 \times 24$ of them compose a mean solar day—i.e., the length of time such that 365 of them compose a year.

It should be noted that the meter is nearly one ten-millionth of the distance from the pole of the earth to the equator, measured along any meridian on the earth's surface. Further, the gram has practically the same mass as one cubic centimeter of distilled water at 4° C. (its temperature of maximum density), and at normal atmospheric pressure, for the most accurate results give for this mass 0.99996 gram. A *liter* is the volume occupied by one kilogram of pure water at 4° and at normal pressure.

Various multiples and fractions of these units have received names. (See METRIC SYSTEM.) Thus, 1000 meters is called a *kilometer*; one-tenth of a centimeter a *millimeter*; one-thousandth of a millimeter a *micron*, whose abbreviation or symbol is "μ"; one-thousandth

of a micron, or one-millionth of a millimeter, has the symbol "μμ." The other divisions of the meter and those of the gram have the usual decimal names and notations. The words "minutes," "hours," etc., require no explanation. Units for the various mechanical quantities are based directly on the centimeter, gram, and second. Thus, a unit velocity on the C. G. S. system is a speed of one centimeter per second in a definite direction, etc. (See MECHANICS; MECHANICAL UNITS.) A unit force is called a *dyne*; a unit of energy an *erg*; but these units are inconveniently small, and so multiples of them are used in general. A *megadyne* is 1,000,000 or 10^6 dynes; a *joule* is 10,000,000 or 10^7 ergs. The practical unit of pressure is, therefore, 1 megadyne per square centimeter, and is called a *barie*; the practical unit of power or activity is 1 joule per second, and is called a *watt*.

There are also several sets of electrical units (q.v.), based on these mechanical ones, as are also the ordinary units for measuring heat energy and photometric quantities. (See HEAT; PHOTOMETRY.) Consult Everett, *Illustrations of the C. G. S. System of Units* (London, 1902); Hallock and Wade, *Evolution of Weights and Measures and the Metric System* (New York, 1906); Guillaume, *Les unités et étalons* (Paris, 1893).

CHABANEAU, shã'bã'nõ', CAMILLE (1831–1909). A French philologist, born at Nontron, Dordogne. His first work, *Histoire et théorie de la conjugaison française* (1868), attracted considerable attention, and he afterward (1879) became professor of the French language and literature of the Middle Ages at Montpellier and collaborator on the *Revue des langues romanes* (1872). In 1895 he was made a knight of the Legion of Honor, and later was the recipient of an honorary doctorate from the University of Halle-Wittenberg. He was not only a leading authority on Provençal philology, but made numerous valuable contributions to the history of Languedoc. Among his works are: *Grammaire limousine* (1876), still the most valuable work on this subject; *La langue et la littérature provençales* (1879); and *Biographies des troubadours en langue provençale* (1885). In 1907 the *Romanische Forschungen* published a very large *Festschrift* composed in honor of his seventy-fifth birthday (March 4, 1906) by his pupils and admirers. This volume contains a complete bibliography of his publications by E. Lefèvre (pp. 1093–1106). For a brief biography, consult necrology by E. Levy in *Zeitschrift für romanische Philologie*, pp. 71–73 (Halle, 1909).

CHABAS, shã'bã', FRANÇOIS JOSEPH (1817–82). A French Egyptologist. Though engaged in business as a wine merchant throughout most of his life, at Châlons-sur-Saône, he became a leading authority on Egyptian archæology. In 1873 he declined the chair of Egyptian language and archæology in the Collège de France. He published valuable translations of hieroglyphic and hieratic writings. Among them are: *Le papyrus magique Harris* (1861); *Voyage d'un Egyptien en Syrie, en Phénicie et en Palestine au XIVe siècle avant notre ère* (1866); and *Recherches pour servir à l'histoire de la XIXe dynastie* (1873). Horrack edited (1883) his uncompleted *Choix de textes égyptiens*.

CHABAZITE, kãb'ã-zît, or **CHABASITE**, kãb'ã-sît. A hydrous calcium, sodium, and alumi-

num silicate belonging in the zeolite group of minerals. It occurs in rhombohedral crystals with nearly square faces, which give to them somewhat the aspect of cubes. The lustre is vitreous, and the color white or flesh red. Chabazite, like the other zeolites, is generally found in basaltic rocks. It is abundant in several localities in Nova Scotia. See ZEOLITE.

CHABLAIS, shà'blâ'. An old division of the Province of Annecy, in Savoy, now the Arrondissement of Thonon, Department of Haute-Savoie, France, bordering on Lake Geneva. It was admitted to the participation in the Swiss neutrality by the "Final Act" of November, 1815.

CHABOT, shà'bô', FRANÇOIS (1759-94). A French Revolutionist, born at Saint-Geniez-d'Olt (Rouergue, now Aveyron). A Capuchin monk, he abandoned the order and identified himself with the Revolution. He was elected to the Legislative Assembly in 1791 and to the Convention in 1792. He joined the Cordeliers Club and became known as a violent extremist. On his motion Notre Dame was made the Temple of Reason; he originated the designation "La Montagne" for the rabid legislators occupying the topmost seats; and he called Jesus Christ "the first *sans-culotte*." He was accused of bribery and falsification, was condemned with the Dantonists, and, after an unsuccessful attempt at suicide, was guillotined.

CHABOT, PHILIPPE DE, SEIGNEUR (ADMIRAL) DE BRION and COMTE DE CHARNY (1480-1543). A French general and admiral. He defended Marseilles in 1524, and in 1525 was captured at Pavia. In 1526 he became admiral and Governor of Burgundy, and in 1535 commander in chief. In 1541 he was convicted of fraud against the national treasury, on charges preferred by the Constable Montmorency, but was pardoned by King Francis I. He was the patron of Jacques Cartier, and is said to have been the first to suggest the colonization of Canada, to which French adventurers were turned by his suppression of the trade to Brazil. He has a beautiful Renaissance tomb in the Louvre, with a recumbent statue by Jean Cousin.

CHABRIAS, kā'brī-as (Lat., from Gk. Χαβρίας) (?-357 B.C.). An Athenian general, the son of Ctesippus. As general in 390 B.C. he took part in the Thracian expedition of Thrasybulus. In 388, while on his way to Cyprus to support King Evagoras against the Persians, he defeated the Spartans at Ægina. In 378, by bringing into operation a new manoeuvre—that of awaiting the charge of the enemy with one knee braced against the shield, itself resting on the ground, and with the spear held in position for throwing—he compelled Agesilaus, who had invaded Bœotia, to withdraw without fighting. In 376 B.C. he defeated the Lacedæmonian fleet near Naxos. At this time many islands and towns were brought, through his efforts, into the new Athenian League. In 373 he was general with Iphicrates, and in 369 he fought the Thebans in Peloponnesus. In 367-366 he was charged with treason in connection with the seizure of Oropus by the Thebans, but was acquitted. In 357 he was tricrarch at the battle of Chios and was killed while fighting.

CHABRIER, shà'bré'â', ALEXIS EMMANUEL (1841-94). A French composer, born at Amberg. His first success was an operetta in three acts, *L'Etoile* (1877). He next attracted attention as a symphonist with *España* (1883), a

fine piece of instrumentation. *Gwendoline* (1886), another opera in three acts, was first sung in Brussels. His dramatic works include *Le roi malgré lui* (1887), *Briseïs* (1898), *Les muscadins*, and some symphonies, such as *Suite pastorale*, *Marche de cipayes*, and *Prélude et marche française*. Consult G. Servières, *Emmanuel Chabrier* (Paris, 1912).

CHABRILLAT, shà'bré'yâ', HENRI LOUIS (1842-93). A French dramatist and journalist. He was born in Marseilles and in 1866 founded the journal *Le gamin de Paris*. He was director of the Théâtre Ambigu Comique in 1878-82. His works include the operettas: *Mazeppa* (1872); *La belle Bourbonnaise* (1874); *L'Éléphant blanc* (1873); *Les trois margots* (1877); *La fiancée du roi de Garbe*.

CHACHALACA, chā'chā-lä'kâ (onomatopoeic word). A guan of the genus *Ortalis*, of which several species exist between Venezuela and northeastern Mexico; specifically, *Ortalis vetula mcalli*, the northern or McCall's chachalaca of the Rio Grande valley. See GUAN.

CHACMA, chāk'mâ (Hottentot). A baboon. See BABOON.

CHAC-MOOL, shāk'mool'. A name given by Le Plongeon to a statue which he discovered in 1876 in the uninhabited city of Chichen-Itza, Yucatan, and which he supposed to be a representation of one of the olden chiefs, named Chac-Mool, of the Maya Indians. The statue now stands in the National Museum, Mexico; but the accuracy of Le Plongeon's conjectural christening of it is questioned.

CHACO, chā'kō, EL. A territory of Argentina, situated in the northeastern part of the Republic, and bounded by the Territory of Formosa on the northeast, the river Paraná on the east, the Province of Santa Fé on the south, and Salta and Santiago del Estero on the west and north (Map: Argentina, E 8). Its area is estimated at over 52,000 square miles. The surface is even, but sparsely watered. The southern part is slightly higher and is covered with heavy forests of trees, whose wood is of great economic value. Pop., 1904, 13,937. The chief settlement is Resistencia, situated on the Paraná, near Corrientes, and connected by rail with Santa Fé, with a population of about 3500 in 1904.

CHACO, EL GRAN. A name applied to a region of central South America extending northward from the Salado River to about lat. 18° S. and included between the Paraguay and Paraná rivers on the east and the foothills of the Andes on the west. It thus comprises a large part of northern Argentina and western Paraguay and smaller portions of southeastern Bolivia and southwestern Brazil. The Chaco Boreal includes the section north of the Pilcomayo; the Chaco Central, the section between the Pilcomayo and the Bermejo; and the Chaco Austral, the section south of the latter river. The region is a vast plain, undulating in places, but for the most part flat, and sloping gently towards the southeast. Its mean elevation ranges from about 1000 feet on the western edge to 100 feet on the east. The large rivers which cross the Gran Chaco are subject to periodical freshets and inundate vast areas of the low-lying ground. With the subsidence of the waters numerous lakes and swamps are formed which may remain for a greater part of the year. These lowlands are covered with heavy forests and with thickets of vines and bushes,

while the more elevated areas support a luxuriant growth of grasses. A large part of the region lies within the great Tertiary basin of South America and has a sandy or clayey soil. The climate is generally hot, except in the winter months, and the daily range of temperature is extreme. The rainfall is rather low, the heaviest precipitation occurring in summer. Except on the borders, the entire area is uncultivated and thinly populated. A few nomadic and savage Indian tribes live in the interior and have resisted all attempts of the various governments towards their civilization. The hostility of the Indians and the dense, matted growth of vegetation along the streams have been serious obstacles to the exploration of the Gran Chaco. Argentina and Bolivia have undertaken the exploration and development of certain restricted areas, the principal article of value being the timber and especially the quebracho, which is largely exported for tanning. See ARGENTINA; BOLIVIA; PARAGUAY.

CHACONNE, shá'kūn' (Fr., from Sp. *chacóna*, usually derived from Basque *chucun*, pretty). An obsolete instrumental form, almost identical with the passacaglia (q.v.). It is built upon a theme not exceeding eight measures, which is held throughout as a *basso ostinato* (q.v.), while the other voices execute a series of variations. It is in $\frac{3}{4}$ time and slow tempo. The form was revived by Brahms, who employs it in the finale of his Fourth Symphony.

CHACORNAC, shá'kōr'nák', JEAN (1823-73). A French astronomer. He was born in Lyons, was a merchant in Marseilles, where he became interested in astronomy, and was astronomer at the Paris Observatory from 1857 to 1863. He discovered several planetoids (1854-60) and published the following works: *Atlas éclipse* (1856) and *Atlas des annales de l'observatoire impérial de Paris* (1860-63).

CHAD, chād, SAINT. See CEADDA.

CHAD, or **TCHAD**, LAKE. A large lake in Central Africa, lying at an altitude of about 900 feet (Map: Africa, F 3). Surrounded by the French dependencies of Kanem and Bagirmi, German Kamerun, and the British possession of Bornu, the lake is within the spheres of influence of these three powers. The size of the lake varies greatly. During the dry season it is said to cover an area of about 10,000 square miles; but the area is increased to 20,000 square miles or more during the rainy season, from July to October. The water is fresh and abounds in animal life, while the surface, except during the rainy season, is thickly covered with reeds and other aquatic plants. Lake Chad receives the waters of the river Shari from the south, the Komadugu-Waube from the west, and the wet-season stream Bahr-el-Ghazal from the east, but is without any visible outlet, and the fact of the water remaining fresh gives rise to the theory that it has a subterranean outflow. The coasts are, with the exception of the northeast portion, very low and swampy. In the eastern part of the lake there are a large number of small islands inhabited by native tribes, numbering perhaps 30,000 individuals. Islands also fringe the west shores. The lake is supposed to have been known to Ptolemy, and it was probably the Kura Lake of the Middle Ages. In modern times it was first visited by Denham and Clapperton in 1823, and later explored by Oberweg in 1851, Barth in 1852, and Nachtigal in 1871-72.

CHAD'BAND, REV. MR. An oily hypocrite in Dickens's *Bleak House*. He delivers impressive lectures to "Guster" and "Joe," the crossing sweeper, on the subject of "terewth" (truth). His wife had been nurse of Esther Summerson.

CHADBOURNE, chād'bērn, PAUL ANSEL (1823-83). An American educator. He was born in North Berwick, Me., graduated at Williams College in 1848, and became professor of chemistry and physics there in 1853. In 1858, without giving up his duties at Williams-town, he taught the same subjects at Bowdoin College and at the Berkshire Medical College. In 1866 he became first president of the Massachusetts Agricultural College, and in 1867 was chosen president of the University of Wisconsin. He was elected to succeed Mark Hopkins as president of Williams College in 1872, but resigned in 1881, and in the following year again became president of the Massachusetts Agricultural College. During all this time he took an active part in politics, sitting twice in the Massachusetts Senate, besides carrying on manufacturing enterprises. He wrote *Natural Theology Lectures on Natural History* (1860); *Relation of the Natural Sciences to the Intellect* (1860); *Instinct in Animals and Men* (1872), and edited *Public Service of the State of New York* (3 vols., 1881).

CHAD'DERTON. A manufacturing town in Lancashire, England, adjacent to Oldham (q.v.). Pop., 1901, 24,900; 1911, 28,299.

CHAD'RON. A city and the county seat of Dawes Co., Neb., 350 miles north of Denver, Col., on the Chicago and Northwestern Railroad (Map: Nebraska, B 2). It has considerable wholesale interests and an export trade in live stock. Chadron is the seat of a State normal school, and contains a Carnegie library, a city park, and municipal water works. Pop., 1890, 1867; 1900, 1665; 1910, 2689.

CHAD'WICK, SIR EDWIN (1800-90). An English social and sanitary reformer, born at Longsight, near Manchester. He studied law, but early gave his attention to social and sanitary questions. An article on "Life Assurance" gained him the friendship of George Grote, and one on "Preventive Police," of Jeremy Bentham, whose private secretary he became. In 1832 he received an appointment as assistant commissioner on the first English Poor Law Commission, and to him were largely due the radical reforms made in the system of poor relief. This was followed by his appointment as secretary of the Poor Law Board, in which office and on the Board of Health for 20 years he carried out beneficent reforms. To him England owed its first Sanitary Commission, organized in 1838, and the Registrar-General's office was established through his initiative. He retired on a pension in 1854. He subsequently took great interest in promoting competitive examinations for government offices and indeed in almost all questions of social economy. He was long an active member of the Association for the Promotion of Social Science, and of the British Association for the Advancement of Science. His best-known published work is *The Evils of Disunity in Central and Local Administration . . . and the New Centralization for the People* (1885).

CHADWICK, FRENCH ENSOR (1844-). A rear admiral (retired) in the United States navy, born at Morgantown, W. Va. He gradu-

ated from the United States Naval Academy in 1864; served on the *Marblehead*, the *Susquehanna*, and several other vessels; was on duty at the United States Naval Academy from 1872 to 1875, and at the New York Navy Yard in 1879-80. Subsequently he was naval attaché at the American Embassy in London, chief of the Intelligence Office, and chief of the Bureau of Equipment. During the Spanish-American War he commanded the battleship *New York* and was chief of staff for Admiral Sampson, participating in the most important engagements in the Atlantic during the war. From 1900 to 1903 he was president of the Naval War College, in 1904 was commander in chief of the South Atlantic squadron, and in 1906 was retired from active service. His writings on diplomacy and history are considered among the most important of their kind. He wrote: *Temperament, Disease, and Health* (1892); *An Unsolved Problem* (1896); *Causes of the Civil War*, in the "American Nation Series" (1906); *Relations of the United States and Spain, 1776-1898*; *Diplomacy*, vol. i (1909), and the *Spanish-American War*, vols. ii and iii (1911).

CHADWICK, GEORGE WHITEFIELD (1854-). An American composer, born in Lowell, Mass. He studied under Eugene Thayer in America and under Jadassohn, Reinecke, and Rheinberger in Europe, where he went in 1877. Returning to America in 1880, he became organist in the South Congregational Church, Boston, and instructor in harmony and composition in the New England Conservatory of Music, of which he became director in 1897. For several seasons he also was conductor of the Springfield and Worcester festivals. He was elected to the American Academy of Arts and Letters. With the exception of MacDowell, Chadwick is the most important composer America has produced so far. His leaning is towards the highest instrumental forms, which he handles with considerable skill. In the treatment of these larger forms and of his thematic material he easily surpasses MacDowell, while the latter shows a more striking individuality in the invention of the themes themselves. Chadwick's works are: for orchestra—three symphonies in C m, B flat, and F; six overtures, *Rip van Winkle*, *Thalia*, *The Miller's Daughter*, *Melpomene*, *Adonais*, *Euterpe*; Serenade in F; Suite in A; Sinfonietta; for chorus with orchestra—*The Viking's Last Voyage*, *The Pilgrim's Hymn*, *Lovely Rosabelle*, *Phoenix Expirans*, *The Lily-Nymph*, *Dedication Ode*, *Columbian Ode*; chamber music—six string quartets, a piano quintet, and a string trio. His most ambitious work is a lyric drama, *Judith*. Two other works for the stage are the comic operas *Tabasco* and *The Quiet Lodging*. He has also written about 50 songs and compositions for piano and organ.

CHADWICK, JAMES READ (1844-1905). An American gynecologist, born in Boston. He graduated at Harvard University in 1865 and at the Harvard Medical School in 1871. He founded the American Gynecological Society, was its secretary from 1876 to 1882, and became its president in 1897. He became librarian of the Boston Medical Library Association in 1875, and president of the Massachusetts Cremation Society in 1892. His works include: *The Boston Medical Library* (1876, 1903); *The Study and Practice of Medicine by Women* (1879);

Obstetric and Gynecological Literature, 1876-1880 (1881). Consult the sketch of his life by his grandson (Boston, 1905).

CHADWICK, JOHN WHITE (1840-1904). An American clergyman of the Unitarian Church, born in Marblehead, Mass. For a time he was a shoemaker. He graduated in 1864 at the Harvard Divinity School and was in the same year ordained to the Unitarian ministry and installed as pastor of the Second Unitarian Church of Brooklyn, N. Y. He was known as one of the leading preachers of his denomination, of whose most advanced thought he was a representative. His published discourses, including *Some Aspects of Religion* (1879), *Belief and Life* (1881), *Origin and Destiny* (1883), and *A Daring Faith* (1885), have been extensively read and have been characterized as constituting "a noble body of ethical literature." Best known, however, of his literary works, are his collections, *A Book of Poems* (1876; 7th ed., 1885); *In Nazareth Town*; *A Christmas Fantasy and Other Poems* (1883); *A Few Verses* (1900); *Later Poems* (1905). Among his other publications may be cited a biography of Rev. N. A. Staples (1870); *The Bible of To-Day* (1875); *The Faith of Reason* (1879); *Old and New Unitarian Belief* (1894); *Theodore Parker, Preacher, Reformer* (1900); *William Ellery Channing, Minister of Religion* (1903); *Cap'n Chadwick, Marblehead Skipper and Shoemaker* (1906).

CHÆNOMORPHÆ, kē'nō-mōr'fē (Neo-Lat. nom. pl., from Gk. χάλειν, *chainein*, to gape + μορφή, *morphē*, form). An order of birds, embracing the ducks, geese, swans, screamers, and flamingoes and their allies. They are characterized by cranial features in common, being desmognathous, with the palatal bones united across the median line.

CHÆREA, kē'rē-ā, GAIUS CASSIUS. The murderer of the Emperor Caligula (q.v.). He was tribune of the praetorian cohort. With Cornelius Sabinus and others he formed a conspiracy, and on Jan. 24, 41 A.D., the fourth day of the Palatine Games in honor of Augustus, was the first to strike down the Emperor as the latter returned through the palace. On the following day Claudius, who had been proclaimed Emperor by the soldiers, caused him to be executed.

CHÆREAS (kē'rē-ās) AND CALLIRHOË, kā-līr'ō-ē. A Greek romance, by Chariton (q.v.). The heroine is married to Chæreas, and soon apparently dies, but comes to life in the tomb. She is carried off by robbers and after various adventures is restored to her husband. The work was printed from the only known manuscript by James Philip d'Orville, at Amsterdam, in 1750, with a complete commentary. It has been translated into the principal modern languages.

CHÆREMON, (kē-rē'mōn) **OF ALEXANDRIA**. Stoic philosopher and grammarian, and custodian of the annex of the Alexandrian Library (q.v.) in the Serapeum. In 49 A.D. he was summoned to Rome, to become tutor of Nero. He was a priest of high rank and deeply interested in the religious history of Egypt, especially of the earlier times. He wrote a *History of Egypt*, on *Comets*, on *Egyptian Astrology*, and on the *Hieroglyphics*. He explained the Egyptian religious system as an allegory of the worship of nature. For his fragments, consult Müller, *Fragmenta Historicorum Græcorum*, vol. iii.
