Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

The copy filmed here has been reproduced thanks to the generosity of:

Library of the Public
Archives of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol \rightarrow (meaning "CONTINUED"), or the symbol ∇ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

La bibliothèque des Archives
publiques du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole \rightarrow signifie "A SUIVRE", le symbole ∇ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

AN
ALMANACK,

FOR THE YEAR OF OUR LORD

1830;

Being the second after Bissextile or Leap Year, and the Tenth
Year of the Reign of His Most Gracious Majesty, GEORGE IV.

Calculated for the Meridian of Hallowell, (Me.)

BUT WILL SERVE WITHOUT ANY ESSENTIAL ERROR FOR
THE PROVINCE OF NEW-BRUNSWICK.

Containing, besides various other useful articles—The Univer-
sal Calendar—Fasts and Fests of the Church—Eclipses of
the Luminaries—Rising and Setting of the Sun—Rising and
Setting of the Moon—the Sun's Declination—Time of
High Water—List of Provincial Officers—Sitting
of Courts, &c. &c. &c.

TOGETHER WITH A CORRECT LIST OF

MILITIA OFFICERS.

In the Province of New-Brunswick, &c. &c.

SAINT JOHN, N. B.

PRINTED AND SOLD BY HENRY CHURCH, AT THE
CORRIER OFFICE, MARKET-SQUARE.

TO THE READER.—The Publisher of the New-Brunswick Farmer's Almanack, for 1830, deems it proper to state in this place, that he has copied from the Maine Almanack, lately printed, the Calculations, &c. on account of their accuracy; they having been found, in several instances, to be more correct, than those, formerly calculated for our Meridian.

He has also been furnished with a "Table of the Moon's Phases," by a Gentleman of the Navy, extracted from the Nautical Almanack, with several other articles, which, it is hoped, will be interesting and useful to the Public generally. *November, 1829.*

Names and Characters of the signs of the Zodiac.

♈ Aries, head.	♌ Leo, heart.	♎ Sagittarius, thighs.
♉ Taurus, neck.	♍ Virgo, belly.	♏ Capricornus, knees.
♊ Gemini, arms.	♎ Libra, reins.	♐ Aquarius, legs.

SIGNALS

Made at Partridge Island, and repeated at the Tower, in Charleston, on the approach of vessels to this Harbour.

- One Ball close, for one square rigged vessel,
- One Ball half hoisted, for two ditto,
- Two Balls close, for three ditto,
- Two Balls separated, for four ditto,
- A Pendant of any colour for five ditto,
- A ditto under a Ball for six ditto,
- A ditto over a Ball half hoisted for seven ditto,
- A ditto under two Balls close, for eight ditto,
- A ditto between two Balls separate for nine, ditto,
- A flag of any colour, for ten or more ditto.

[The above are hoisted at the East or West Yard arm, according to the quarter the vessels first appear in, with the addition of a Ball at the centre of the Yard until the Rig of the vessel can be made out, when one or more of the following descriptions of colours will be hoisted at the mast head:—

- An Union Jack for a Flag Ship, with or without a squadron.
- Ditto with a red pendant over, for a two decker.
- Ditto with a blue Pendant over, for a Frigate.
- Ditto with a white ditto for a small armed vessel.
- A blue Pendant for a Merchant Ship.
- A red ditto for a Merchant Brig.
- A white ditto for a topsail schooner or sloop.
- A flag blue and white horizontally, a neutral fleet.
- A pendant white and blue, a neutral man of war.
- A blue flag, a neutral Merchant ship.
- A flag, red, white and blue, an enemy's fleet.
- A pendant, red, white and blue, an enemy's man of war.
- A red flag an enemy's merchant vessel. (tained, or a prize,
- An Union Jack, over Neutral or enemy's signals, the vessel do-
- A white flag over any signal, vessel bears a flag of truce.
- A red flag pierced white, for the Digby Packet.
- A Ball at the mast head, vessel is on shore, or in distress.

Should immediate aid be necessary guns to be fired.

In thick weather, a gun will be fired at Partridge Island, in answer to each gun heard at sea.—When a vessel requires a Pilot, her descriptive pendant will be shown at a yard arm, instead of a Ball.

Time of going through the Falls.

THE Falls are level (or still water) at about three hours and a half on the Flood, and at about two hours and a half on the Ebb, which makes it passable four times in twenty-four hours about ten or fifteen minutes each time.—No other rule can be given, as much depends on the floods in the river Saint John, and the time of high water or full sea, which is often hastened by winds, and in proportion to the height of them.

POST-OFFICE.

JOHN HOWE, Jun. Esq. Deputy Postmaster-General
for Nova-Scotia and New-Brunswick.

Post Masters throughout the Province.

Charles Drury, Esquire, Saint John.

William B. Phair, Esquire, Fredericton.

EXPLANATION.
 The Left Hand Column is the Moon's Age, and on the right, opposite to it, will be found the time of high Water.

R U L E

To find the Age of the Moon.

Take the number under the Month, and add it to the day of the month, rejecting 30, (or 29, according as it is noted in the columns,) if more than 30, and the remainder will be the Moon's Age.

ECLIPSES IN THE YEAR 1830.

TH**ERE** will be six Eclipses in the year 1830—four of the Sun and two of the Moon, in the manner following :

I. The first will be of the Sun, February 22d day, δ at 11h 57m in the evening ; of course invisible here, Moon's lat. $1^{\circ} 29\frac{1}{2}'$ N. and the Sun's long. $1^{\text{h}}. 4^{\circ} 7\frac{1}{2}'$.

II. The second will be of the moon, March 9th day, ecliptic δ at 8h 52m in the morning ; consequently invisible to us ; but she will be seen eclipsed 20° on her north limb, and in total darkness, by the dwellers on the northwest coast of America, and by the islanders of the Pacific, &c—the eclipse continuing 3h 54m.

III. The third will be of the Sun, march 24th day, δ at 10h 5m in the morning ; but invisible to us by reason of the moon's great southern latitude, which will be $1^{\circ} 17' S.$; and the sun's longitude, $0^{\text{h}}. 9^{\circ} 29'.$

IV. The fourth will be of the Sun, August 18th day, δ at 7h 44m. in the morning ; but invisible here, by reason of the moon's great southern latitude, which will be $1^{\circ} 23' s.$; and the Sun's lon. $4^{\text{h}}. 24^{\circ} 58'.$

V. The fifth will be of the moon, September 2d day, visible and total at London, and other parts of Europe, but only the latter part of it to be seen here, as follows :

Beginning of the Eclipse,	4h 11m	}	Appar. time, in the evening.
Do. of total Darkness	5 8		
Ecliptic δ	5 59		
middle	5 58		
moon rises totally obscured	6 32		
End of total darkness,	6 49		
End of the Eclipse,	7 47		
Duration,	3 36		

Digits eclipsed $21^{\circ} 40'$ on the moon's southern limb.

VI. The sixth will be of the Sun, september 16th day, δ at 9h 49m in the evening ; therefore invisible to us ; moon's lat $1^{\circ} 18' N.$ and the sun's long. $5^{\text{h}}. 23^{\circ} 39'.$

Morning and Evening Stars for 1830.

The Planet Venus (ρ) will be Evening star till march 7th ; thence morning star till December 20th ; thence Evening star.— Jupiter (μ) will be morning star till July 5th ; thence evening star to the end of the year.—mars (δ) will be the morning star till september 19th ; thence evening star to the end of the year.—Saturn (ν) will be morning star till February 3d ; thence evening star till August 14th ; thence morning star to the end of the year.

1690 JANUARY HATH XXXI DAYS.

A. D. 1654.—Guericke of Magdeburg invented the air-pump; he also gave the first idea of electricity, by means of balls of sulphur; and first thought of using Torricelli's tube as a barometer.

LONGEVITY OF TREES.—According to Masham, and other respected authorities, there are Trees in England, which may be supposed from the data which they furnish, to have existed a century or two before the Christian era. The celebrated Tortworth chesnut is considered not less than eleven hundred years old. In the reign of King John, more than seven hundred years ago, it was called the *old chesnut*.

USEFUL MEMORANDA.—London is distant from Edinburgh 395 miles S.—from Dublin 338 S. E.—Amsterdam 190 W.—Paris 225, N. N. W.—Copenhagen 610, S. W.—Vienna 320, N. W.—Madrid 860.

UPON THE TWELVE SIGNS.

- ♈ The Head and Face the RAM doth always rule :
- ♉ The Neck and Throat are govern'd by the BULL.
- ♊ O'er the Arms and Shoulders still the TWINS preside :
- ♋ Breast, Stomach, Ribs, the crooked CRAB doth guide.
- ♌ The noble LION rules the Back and Heart :
- ♍ The bashful VIRGIN claims the Belly Part.
- ♎ The Reins and Loins the equal BALANCE weigh :
- ♏ The SCAPION o'er the Secret Parts doth sway.
- ♐ The curious ARCHER doth the Thighs affect :
- ♑ So doth the GOAT our bended Knees protect.
- ♒ The Legs unto AQUARIUS' Lot do fall :
- ♓ The FISH our active Feet their Portion call.

Agricultural.

GOD ALMIGHTY first planted a *Garden*; and indeed it is the purest of human pleasures: it is the greatest refreshment to the spirits of man; without which buildings and palaces are but gross handy-works.

BACON'S ESSAYS.

ASPARAGUS.—**SOIL.**—Asparagus ground should be light, yet rich: a sandy loam, well mixed with rotten dung, or sea-weed is recommended.

Sown in April and May, in the same manner as onions, in rows, eighteen inches apart. Let it stand one or two years—transplant into trenches four feet wide, dug, if the soil will admit, fifteen inches deep—fill up six inches with rotten manure—place the roots fourteen inches apart.

Time of Cutting.—If you plant roots, the shoots may be cut the second year after; if seeds, they will not be fit to cut till the third year. All the shoots, which come up before the middle of June, may be cut off without injuring the roots; after which time the late shoots should be left to run up and go to seed; otherwise the roots will be weakened.

BARLEY.—The soil for Barley should be such as will grow good turnips, or other green crops, including clovers, and which embrace the varieties of loams and sands that are not wet, or very dry and poor. Barley cannot be cultivated to advantage upon stiff, heavy, and wet grounds, or on such as are of a cold and tenacious quality. This crop occupies the ground but about three months; and it is only in a dry, light, mellow soil, that its roots can extend with sufficient facility; and supply the food necessary to bring the grain to rapid and perfect maturity.

Previous crop.—Crops that precede this grain should be such as leave the ground mellow, and free from weeds; and for this reason hoed crops should be preferred, such as turnips, potatoes, peas, beans, &c. Small grains should not precede it; they impoverish the soil, leave it foul, and, besides, it is contravening one of the most salutary maxims of husbandry, to grow two dry crops in succession.

CABBAGE PLANTING.—The latter part of May is early enough to put the seed into the ground, whether the plants are to be removed or not. I have tried both ways, and, on the whole, I prefer transplanting. They are otherwise apt to be too tall, and to have crooked stems. Covering plants with leaves is not a good practice. They will be much heated through some sorts of leaves, the free circulation of air about them will be prevented, and their perspiration partly obstructed. If a hot sun cause them to droop,

a shingle, stuck into the ground, will be sufficient shelter, if it be on the south side of the plants. I commonly allow each plant two shingles, one on the south-east side, and one on the south-west, meeting at the south corner.

The act of planting should be performed carefully. Holes, of sufficient depth and width, should be dibbled, for the smaller sort of cabbages, at the distance of two feet and a half, and, for the larger sort, of three feet every way. In these the earth should be placed up to the lower leaves, and the earth brought closely about the roots, which is best done by pushing down the dibbler, at a small angle with the plant, and then bringing it up to it with a jerk. This leaves no chambering, (as gardeners call it,) no vacancy between the plant and the soil.

The state of the weather, when these operations are performed, is not a matter of indifference, and has been a subject of controversy; some recommending dry weather, others wet. As in many other cases of disputation, the truth lies between them—that is, moist weather is neither dry nor wet, and is precisely that which is best for setting out cabbages, or any other vegetable.—We ought not, however, to wait long for even this most favourable state of the atmosphere, since, with a little labour, we have the means of making up for its absence.

CAULIFLOWER.—The Cauliflower is one of the most delicate and curious of the whole of the brassica tribe; the flower buds forming a close, firm cluster or head, white and delicate, for the sake of which the plant is cultivated.

Propagation and soil.—The cauliflower is raised from seed, of which half an ounce is sufficient for a seed bed four feet and a half wide, by ten in length. The soil for the seed-bed may be light, but, for final transplanting, it can hardly be too rich, the cauliflower, like the vine, being reputed a “rough feeder.” Cleanings of streets, cesspools, &c. ought, therefore, to be liberally supplied during the growth of the plants, when very large heads are desired.

EGG PLANT.—There are two varieties of this plant, the white-fruited and the purple, cultivated for culinary purposes; the latter kind is preferable, and, when sliced and nicely fried, approaches, both in taste and flavour, nearer to that of a very nice fried oyster, than, perhaps, any other plant.

This delicious vegetable may be propagated by sowing the seed on a slight hot-bed, the beginning of April, or in March; and towards the latter part of May, they should be planted in a rich, warm piece of ground, at the distance of two feet and a half asunder, every way, for the purple, or two feet for the white kind; and if kept clean, and a little earth be drawn up to their stems, when about a foot high, they will produce plenty of fruit. Or,

the seed may be sown about the end of April, on a warm border, and planted out finally the beginning of June.

INDIAN CORN.—We shall not undertake to state the various methods employed for the field-culture of this valuable vegetable, with which it is presumed our readers are, generally, acquainted. But as it is often wanted as a culinary article, for early use, and cultivated in gardens for the supply of the table, we will give M^r Mahon's mode of raising it :—

“Procure some seed of the earliest kind, and select a piece of dry, sandy, and tolerably rich ground, in a warm exposure. After preparing it as for peas, &c. form shallow drills, about two inches deep, at the distance of six feet from each other; [four feet and a half, or five feet, will answer for the smallest sorts;] drop the seeds therein two feet and a half asunder, and two grains in each place; strew a little wood-ashes in the drills, and cover the seeds as you would peas. As the plants advance in growth, earth them up two or three times.

MINT.—All the species are raised by the same methods, viz. by parting the roots, by offset young plants, and by cuttings of the stalks. Spearmint and peppermint like a moist soil; penny-royal a strong loam. The plants set in spring or summer will come into use the same year. They may be placed about eight inches apart, on beds about four feet wide, allowing a path two feet broad. New beds should be made every three years.

Gathering the crop, and use.—“Mint should be cut for drying,” says Phillips, “just when it is in flower, and on a fine day; for if cut in damp weather, the leaves will turn black. It should be tied in small bunches, and dried in a shady place, out of the wind; but, to retain its natural virtues more effectually, it has been found better to place the mint in a screen, and to dry it quickly before a fire, so that it may be powdered and immediately put into glass bottles, and kept well stopped. Parsley, thyme, sage, and other herbs, retain their full fragrance when thus prepared, and are by this mode secured from dust, and always ready to the hands of the cook.

“A conserve made of Mint is grateful, and the distilled waters, both simple and spirituous, are much esteemed. The juice of spearmint, drank in vinegar, often stops the hiccup. Lewis observes, what has before been observed by Pliny, that mint prevents the coagulation of milk, and hence it is recommended in milk dists.”

MUSHROOM.—Mr. Armstrong gives the following directions for cultivating the garden mushroom :—“Prepare a bed, early in October, either in a corner of the hot-house, if you have one, or a dry and warm cellar. The width of the bed at bottom should not be less than four feet, and its length in proportion to the

spawn provided. Its side should rise perpendicularly one foot, and should afterwards decrease to the centre, forming four sloping surfaces. We need hardly say that the material of the bed at this stage of the business must be horse dung, well forked, and pressed together to prevent its settling unequally. It should then be covered with long straw, as well to exclude frost as to keep in the volatile parts of the mass, which would otherwise escape.— After ten days the temperature of the bed will be sufficiently moderated, when the straw is to be removed, and a covering of good mould to the depth of an inch laid over the dung. On this the seed or spawn of the mushroom [which are threads or fibres of a white colour, found in old pasture-grounds, in masses of rotten horse-dung, sometimes under stable-floors, and frequently in the remains of old hot-beds] is to be placed in rows six inches apart, occupying all the sloping parts of the bed, which is again to be covered with a second inch of fresh mould and a coat of straw. If your bed has been well constructed, your mushrooms will be fit for use at the end of five or six weeks, and will continue to be productive for several months. Should you, however, in the course of the winter, find its productiveness diminished, take off nearly all the original covering, and replace it with eight or ten inches of fresh dung and a coat of clean straw. This, by creating a new heat, will revive the action of the spawn, and give a long succession of mushrooms.

ONIONS.—A spot of ground should be chosen for them, which is moist and sandy; because they require much heat, and a considerable degree of moisture. A low situation, where the sand has been washed down from a neighbouring hill, is very proper for them. And if it be the wash of a sandy road, so much the better. The most suitable manures are old, rotten cow and horse dung mixed, ashes, but especially soot. A small quantity of ashes or sand, or both, should be spread over them after sowing, especially if the soil be not sandy. And it is not amiss to roll the ground after sowing; or harden the surface with the back of a shovel.

A writer for the *N. E. Farmer*, vol. iii, p. 249, recommends "a moist, black, soil," as best, but says "a free, deep loam will answer very well." The onion is not by nature inclined to root deep. You must give it a hard bottom to grow on, and keep your manure on the surface within reach of the roots; then they will grow large, flat and handsome."...Advises to sow the same piece for several successive years. "I have always sowed onions in drills, about eighteen inches apart, to give fair play to the hoe. Onions must be sowed as early as possible after the frost is out of the ground: in this climate, if the seed is not in the ground before the first of May, there is but little chance for a crop. It

must be covered slightly, and stamped well over with the hoe to close it well. I would recommend, as most essential, to sow the seed sparingly. Even the best gardeners are apt to put in too much seed. The consequence is, that the young plants come up so thick that they run up spiry and weak; and, when you come to thin them, you find great difficulty to pull up so many without injuring those that you leave; and the worst injury is what you do to the roots, which you tear and loosen. Therefore have seed of your own raising, or that you know is fresh, and sow sparingly."

Cultivation of drained Lands.—It is well known that swamps, marshes, and other low lands are commonly places of deposit for the lighter and more fertile parts of the soil, washed from the neighbouring hills. Many marshes are in fact intervale land, naturally too wet for profitable cultivation. Wet lands, which receive the wash of higher grounds of a tolerable quality, may be expected to be worth considerable expense in draining. A bog, however, on the top of a hill, not overlooked by high ground, we should suspect of barrenness, and would not be at great expense in draining it, without examining and analyzing the soil in various parts, and becoming satisfied of its fertility. But a drained marsh, which can be flooded at the will of its owner, by means of a dam at its outlet, with water, which has washed the neighbouring uplands, may be considered as inexhaustible, and, perhaps, had better be appropriated to the raising of hemp. That plant exhausts the soil very much, and it would, therefore be good economy to raise it where the land can be recruited without manure from the farm-yard, &c. If the land is rich, not very dry, or water can be set back in the ditches, in a dry time, to within three or four feet of the surface, it will be quite an object to introduce fowl meadow.

It is often advisable to let drained lands lie over one summer to ferment and rot, before any attempt to cultivate them. Flooding them completely in the winter, and drawing the water quite off rather late in the spring, will likewise assist in rotting the sod.

Potato Seed.—Early last spring in one of our agricultural articles, we made a few observations on the best mode of cutting and manuring potatoes meant for seed. We stated, that the very best practical agriculturists differed widely as to the length of time the seed should be cut prior to planting. While some farmers think it benefited by laying cut six or eight days, others wish to have the cutting and planting going on at the same time; but a decided advantage results from taking the seeds from the top end of the potatoes. On this subject a correspondent in the Dumfries Courier says:—"We had an opportunity of making several interesting experiments in a garden of limited extent situated on the fertile banks of the Annan, and we uniformly ascertained that plants cut from the top end of the parent potato, were fit for the use of the table about a fortnight earlier than those cut from near the root, though both were planted on the same

and in

day, and had the same management. The stems were much more healthy and vigorous, and the crop always more luxuriant. Another circumstance deserving of notice, is, that when the root end of the potato is planted with the others, in the course of a few years a very perceptible degeneracy ensues; and hence arise, what in common phraseology, are called *bastards*. To this we have paid particular attention, chiefly on our father's farm. When the first traces of degeneracy appeared, we were led to examine the sets, and were always satisfied that it originated in the root. The first of this degeneracy is easily detected by a careful observer, from the potato being of a smaller growth, and of a variegated color, commencing at the eyes, whence the stems germinate, and differing for the first year very little from genuine seed; but in a few years, when these are again planted, the degeneracy rapidly increases. Too much care cannot be taken by the farmer to preserve the original plant free from mixture.—*Edin. Scotsman*.

Preserving Grain.—A discovery of considerable importance has been announced, with regard to preserving Grain. To preserve rye, and secure it from insects and rats, nothing more is necessary than to fan it after it is threshed, and to stow it in the granaries mixed with the chaff. In this state, it has been kept more than three years, without experiencing the smallest alteration, and even without the necessity of being turned to preserve it from humidity and fermentation. The experiment has not yet been made with wheat and other kinds of grain, and they may probably be preserved in chaff with equal advantage.

GRUB IN SHEEP.—The first expedient which I adopt for a preventive, is to keep my sheep on dry and elevated pasture land in summer, and by all means let them range where they can have access to dust, like that of a dry road. Every farmer has observed that sheep, when flies are about them, will keep a continual stamping with the feet, with their heads near the ground, especially where it is dusty. This dust is inhaled at the nostrils and produces a sneezing, by which the fly or eggs are thrown out. It is a common remark, and experience has demonstrated to every farmer, that the low moist land does not answer the purpose for rearing sheep, and the reason is obvious. As a cure for this disease, let every farmer in the fall, before the winter sets in, look to his flock, and he will discover that those sheep which are likely to be affected by the grub, are discharging a water-like substance at the nose; let him take a goose quill, or any other similar tube, or a common hand bellows, and blow dry scotch snuff or pulverised salt, up the nostrils of the sheep, and, it will destroy the grub or eggs and render the sheep sound and healthy.—*Albany Dai. Adv.*

Uses of salt to cattle, when given so that they may eat as they please.

—1. By allowing sheep to lick it, the rot may be effectually prevented.
2. Cattle to whom lumps were given to lick, were thereby preserved from infectious disorders; cows are rendered more healthy, and by being induced to drink more, they give more milk.

3. A small quantity pounded, was found very beneficial to horses, when new oats were given them, if the oats were at all moist; and is useful, with all kinds of moist food.

4. It is said, that the mixing a little common salt with the seed of oats, when sown, is an *effectual preventive* against the attacks of the grub, so injurious to the crops of oats in some parts of Britain.—*Mosselman*.

Hoven Cattle.—As the distension is chiefly occasioned by carbonic acid gas, any substance which will combine with that gas will reduce it. Such a substance is readily found in ammonia, (hartshorn) a spoonful of which infused in water, & poured down the animal's throat will remove the distension.

H O R S E S.—*Observations on Bots.*—As early as the summer of the year 1801, I began a course of observations and experiments on the bots, a worm that infests the bowels of the horse, and often proves fatal to that useful animal. I took a large bot immediately after it was discharged from my horse, and enclosed it in dry horse dung, and put it into a bottle, and stopped it tight, and had the satisfaction to see it transform into a chrysalis in the course of three days, in which state it continued about five weeks, and was then hatched into a horse-bee, or hitters. I then carried the bottle to my horse and set the fly at liberty, and she immediately began to deposit her nits on the legs of the horse. The fly had not been with any other of her kind, and in what manner the nits had been fecundated was a mystery to me; but I soon found that the nits were impregnated after they were deposited on the hair of the horse. The male fly does not make its appearance until the latter part of August, and has every appearance of the female fly, except it is somewhat smaller, and has not the tail or the sting of the female. You will frequently see two male flies in September or October, contending for the chance of impregnating the nits, and they frequently engage and fight with the greatest obstinacy in order to obtain their favorite employment. The nits usually remain about eight days after impregnation, before the bot is fit to enter into the bowels of the horse, at which time they make a small hole in the end of the nit; but they frequently remain in the nits for weeks or even months after they have produced: yet if the lips or tongue of the horse, covered with warm saliva, come in contact with the nit, the bot immediately leaves the nit, and adheres to the tongue, and is swallowed with the food of the horse. You may wet the palm of your hand with warm spittle, and apply it to the nits of your horse for a few seconds of time, and you can see with the naked eye a number of small insects on your hand; but if you view them through a magnifying glass they exactly resemble the bot. It is an easy matter to scrape the nits off from a horse about once a week, in the months of September and October; and a horse that is so served will never be troubled with the bots. I have tried a great number of medicines, in order to dislodge the bots from the bowels of the horse, and find it a very hard thing to accomplish, but have found that a table-spoonful of the powder of the blue flag root, in a fresh state, would frequently expel a great number of bots from the bowels. The horse is a very useful animal, and every discovery that has a tendency to profit his life, is of public utility.—*Prov. pap.*

H O R S E S.—The following remarks upon horses, are copied from the publication of an eminent farrier in Europe, and we think them worth the perusal of the farmers generally :

• The pulse of a horse in health, is from 36 to 40 beats in a minute, and may be easily felt by fixing the fingers gently upon the temporal artery, which is situated about an inch and a half backwards from the fore corner of the eye.

• Horses have not the faculty of puking or even belching wind out of their stomachs, and therefore are peculiarly subject to the wind colick.

• When a horse has been over ridden, bloody spots may be seen in the whites of his eyes.

• A limber dock is a sure sign of a limber back, that is, a weak one.

• A horse that is hardy and good for business, has a short back bone, which terminates forward of the hip bones.

• A decoction of white oak bark, will kill bots by tanning them, and they become so shrivelled as scarcely to be discernable when discharged.

• The principal signs of a good horse are these : The eyes set far apart

in the head, and large and bright—the quirl high in the forehead, one or two in the neck is a good sign: the neck well set on, and high, the shoulder blades pretty high, and covering to a point, the breast full and large, and so also behind—the body round, for flat bodies or slab sided horses are weak natured; the dock stiff, going wide behind, for if the gambrels knock together, it shows that the horse is feeble; chewing the bit when provoked, is a good sign.

‘ It is a Spanish proverb that a dapple grey will sooner die than tire.’

Speaking of the eye-lids of birds, the writer remarks, “ a third eye-lid of the same kind is found in the horse; and called the *haw*; it is moistened with a pulpy substance (or mucilage,) to take hold of the dust on the eye-ball and wipe it clean off, so that the eye is hardly ever seen with any thing upon it, though greatly exposed from its size and posture. The swift motion of the haw is given to it by a gristle, so as to drive out the haw with great velocity over the eye, and let it come back as quickly. Ignorant persons when this haw is inflamed from colds and swells so as to appear, which it never does in a healthy state, often mistake it for an imperfection, and cut it off: so nearly does ignorance produce the same mischief as cruelty! They might as well cut out the pupil of the eye, taking it for a black spot.

The other extract relates to the horse’s hoof, and is as follows: “ The bones of the foot are not placed directly under the weight; if they were in an upright position, they would make a firm pillar, and every motion would cause a shock. They are placed slanting, or oblique, and tied together by an elastic binding on their lower surfaces, so as to form springs as exact as those which we make of leather or steel for carriages. Then the flatness of the hoof which stretches out on each side, and the frog coming down in the middle between the quarters, adds greatly to the elasticity of the machine. Ignorant of this, ill-informed farriers nail the shoe too far back, fixing the quarters, and causing permanent contraction—so that the contracted hoof loses its elasticity; every step is a shock; inflammation and lameness ensue.”

Hide-bound.—Horses often become hide-bound when they are poorly kept, and badly used. In this case the animal grows poor, his skin sticks to his ribs, and some boils break out upon his back. A method of treatment opposite to that which the horse has received will generally restore him;—that is, keep and feed him well, work him moderately, and loosen his skin by oiling it, and using the curry-comb frequently, but not too harshly:

Potatoes food for Horses.—To every three hundred pound of potatoes, washed and steamed, is added half a pint of salt, and occasionally a small portion of sulphur; this quantity will more than supply a horse kept constantly at work for six days. Horses thus fed, will perform with the greatest ease, all the common labour of a farm, without hay or oats.

Cows.—When cabbages are given to cows, the decayed and mushy leaves should be taken off, or they will impart a bad taste to the milk and butter.

Cattle cured.—One of my oxen was taken a few days ago very suddenly with very singular symptoms, such as I had never before seen. He appeared perfectly deprived of the use of his limbs, and was taken in very rapid succession with convulsions. They came on by a wild gaze of the eye, and very apparent sensations of horror, lasted generally from two to three, and sometimes as long as five minutes, and during the intervals the animal gave evident symptoms of weariness. Upon examination I found

his horns perfectly cold, which induced me to bore them, and into the holes (made four or five inches from the head,) I poured a strong mixture of black pepper, salt, and vinegar. Not more than fifteen minutes elapsed before the convulsions ceased: in less than an hour he fed as usual, and at this time, (three days since his attack,) is apparently as well as any animal on my farm. I am induced to make this public, as I apprehend the complaint (from the extreme dampness of the season,) will not be very uncommon, and also because of the simplicity of the remedy, and the fair promise it gives of efficacy.

A PLANTER.

Rules for making good butter.—If you have four or five cows, it is best to churn every day; and by no means less frequently than every other day. If you cannot churn every day, throw into the cream, when gathered, a handful of nice salt. In very warm weather, when milk sours soon, put two heaping table-spoonfulls of salt into every pail of milk, before straining. The quantity as well as the quality of Butter is greatly improved by this method. If you have ice, put a small piece in every pan of milk, and also into the cream when you churn. If you have no ice, put the cream into a pail, and hang it into the well twelve hours before churning. In the warm season, cream should be skimmed as soon as it is in the least sour, and in the coldest weather milk should not stand more than thirty six or forty-eight hours. The utmost care should be taken to keep every article used in making butter, perfectly sweet, by frequent and thorough scalding.—*Journal of Humanity.*

Eggs.—A Chemist of Geneva says, that eggs may be preserved fresh and eatable for six or seven years, if kept tightly corked in a round bottle with a short neck, filled with very strong *lime water*.

Domestic Economy.—Amongst the most useful and nutritious substitutes for wheat, and which has the advantage of correcting the unwholesome properties of bad flour, is rice. During the scarcity of wheat in July, 1795, one of the measures adopted in the Foundling Hospital, with a view of lessening the consumption of flour, was the substitution of rice puddings for that of flour; which by the table of diet, were used for the children's dinner twice a week. The flour puddings, for each day, have taken about 168lbs. weight of flour; the rice puddings substitute, in their place, required only 21lbs. of rice to make the same quantity of pudding; the result of the experiment being that, in a baked pudding made with milk one pound of rice would go very nearly as far as eight pounds of flour. Rice contains a great deal of nutriment in a small compass, and does not pass so quickly off the stomach, as some other substitutes for wheat flour do. It is a good ingredient in bread. Boil a quarter of a pound of rice till it is quite soft; then put it on the back part of a sieve to drain it; and when it is cold mix it with three quarters of a pound of flour, a tea cupful of yeast, a tea cupful of milk, and a small table spoonful of salt. Let it stand for three hours; then knead it up, and roll it in about a handful of flour, so as the outside be dry enough to put it into the oven. About an hour and a quarter will bake it, and it will produce one pound fourteen ounces of very good white bread. It should not be eaten till it is two days old.—*Comp. Brit. Alm.*

Wounds in cattle.—The treatment of wounds in brutes is much the same as that practised in healing those on the human body. The operations of nature are the same in both; and from these are derived the principles which direct the management of wounds. The cruelties which are practised by ignorant and unskillful persons, in applying their nostrums, and knives, and pincers, cords, and burning irons, to poor dumb animals, call loudly for the intervention of common sense and humanity.—*Mac.*

MISCELLANEOUS.

COCKROACHES.—An alarm has been sounded in various newspapers in different parts of the country, summoning the liege citizens of New England to unite their efforts for the suppression of *cockroaches*. The locust plague of Egypt, it is supposed, would not be more terrible than the unchecked inroads of these creatures, which are said to be more numerous during the present season, than at any previous point of time. We are happy to be able to announce the discovery of a method of destroying these intruders, at once simple and effective. It is as follows:—Procure from the herb woman, or apothecary, a moderate quantity of that odoriferous vegetable called **POKE ROOT**: boil it in water until the juices are extracted, and mingle the liquor with good West India Molasses, or if the spirit of patriotism be extravagant, with molasses from New Orleans; spread the liquid in large platters or soup plates, in the kitchen, pantry, closet, or watch house, or whatever apartment may have been the subject of invasion, and the enemy will be found slain in heaps, lying by hundreds, and fifties, before the following morning.—A gentleman to whom we are indebted for this information, states that he slaughtered 575 cockroaches in a single night, by means of the *poke root* and *molasses*, and that the root which had been boiled being thrown into a closet, thickly invested by the enemy, the place was quited entirely in a few days, great numbers being left dead upon the field.—*Boston Gazette*.

Weeds.—Many weeds are introduced into fields by the slovenly practice of suffering them to grow and go to seed in yards, or dung-heaps, on the borders of fields, &c.

One year of good weeding,
Will prevent the weeds seeding;
But one year of their seeding
Makes seven years weeding.

Early rising.—The two hours every morning between six and eight, make one day in every week; and in forty years, a man who gets up at six, lives ten years longer, in one sense, than a man who gets up at eight.

A physician has said, that a patient of his, a young person who was thought to be in a consumption, took the hint he gave him upon early rising, and every morning rose a few minutes earlier than before; and at length had time and strength to take a walk before breakfast, and completely recovered his health.

An eminent Physician in this country says—'that from personal knowledge *nineteen out of twenty* cases of consumption in females originate in *tight lacing*.'—Poh! there has been enough said upon this subject. None of our *fair* readers believe it. You might as well attempt to put the tail of a eel into curling paper, as to make them credit it.—*Bellows Fall pap.*

A hint to housewives.—A lady, who was fond of having her house well arranged, discovered to the amusement of her acquaintance, the art of making all her servants keep every thing in its place. Even in the kitchen, from the most minute article to the most unwieldy, every thing was invariably to be found in its allotted station; the servants were thought miracles of obedience; but, in fact, they obeyed because it was the easiest thing they could possibly do. Order was more convenient for them than discord; and with their utmost ingenuity to save themselves trouble, they could not invent places for every thing more appropriate than those which had been assigned by their mistress' legislative economy.

The following letters, it is said, were written over the ten commandments in a church in Wales, and remained unexplained more than a century.

To THE LOVERS OF GOOD BEER.—Put 2 quarts molasses into a keg with ten gallons cool water. Boil 2 oz. alspice, 2 oz. ginger, 2 oz. hops, and half pint indian meal, in two or three quarts of water about an hour—strain it into a keg while hot—add 1 pint yeast—shake it well together—stop the keg nearly air tight, and let it stand about 24 hours, when it will be fit for use. The whole expense of this quantity will not exceed three shillings.

AGRICULTURAL.

" See where the *Farmer*, with a master's eye,
 Surveys his little kingdom, and exults
 In sov'reign independence. At a word,
 His feathery subjects in obedience flock
 Around his feeding hand, who in return
 Yields a delicious tribute to his board,
 And o'er his couch their dawning plumage spread.
 The peacock here expands his eyesful plumes,
 A glittering pageant, to the mid-day sun :
 In the stiff awkwardness of foolish pride,
 The swelling turkey apes his stately step,
 And calls the bristling feathers round his head,
 There the loud herald of the morning struts
 Before his cackling dames, the passive slaves
 Of his promiscuous pleasure. O'er the pond,
 See the grey gander, with his female train,
 Bending their lofty necks ; and gabbling ducks,
 Rejoicing on the surface, clap their wings ;
 Whilst wheeling round, in airy wanton flights,
 The glossy pigeons chase their sportive loves,
 Or in soft cooings tell their amorous tale.
 Here stacks of hay, there pyramids of corn,
 Promise the future markets large supplies :
 While with an eye of triumph he surveys
 His piles of wood, and laughs at winter's frown.
 In silent rumination, see the kine,
 Beneath the leafy shade, patiently wait
 To pour into his pails their milky stores.
 While pent from mischief, far from sight remov'd,
 The bristly herd, within their fatt'ning styes,
 Remind him to prepare, in many a row,
 The gaily-blooming pea, the fragrant bean,
 And broad-leav'd cabbage, for the ploughman's feast.
 These his amusements, his employments these ;
 Which still arising in successive change,
 Give to each varied hour a new delight.
 Peace and contentment with their guardian wings
 Enclose his nightly slumbers. Rosy health,
 When the gay lark's sweet matin wakes the morn,
 Treads in his dewy foot-steps round the field ;
 And cheerfulness attends his closing day.
 No racking jealousy, nor sullen hate,
 Nor fear nor envy, discompose his breast."
