INTRODUCTION

This report is divided into two parts. Part I consists of an analytical survey of the Vital Statistics of the province in the form of narrative summaries, summary tables and charts. Its objectives are (1) to indicate (in so far as can be portrayed by vital statistics) the general trend over the past several years, in the general state of the health of the people of Ontario; (2) to assess the vital statistics of 1945 in the light of these general trends; and (3) to bring to light certain specific problems in the field of public health, such as infant and maternal mortality and deaths from specific diseases such as cancer and tuberculosis and those resulting from accidental causes. Part II consists of detailed tables covering vital statistics for the year 1945. In the interests of economy several tables are not printed in this report. These are listed in the Table of Contents and the information is available upon request providing that such requests, in the opinion of the Registrar-General, are sufficiently warranted and urgent in the public interest.

PART I.—COMPARATIVE AND ANALYTICAL SUMMARY

Population

For reference purposes the estimated population of the province over a period of about two decades is shown by sex in Table A, while a distribution by sex and age-groups of the estimated population of 1945 is provided in Table B.

TABLE A—POPULATION, CENSUSES 1921, 1931 AND 1941 AND ESTIMATED FOR INTERCENSAL YEARS, BY SEX, ONTARIO

Figures supplied by Social Analysis Branch, Dominion Bureau of Statistics.

*These estimates do not take into account interprovincial migration, figures for which are not available for intercensal years.

The rural and urban distribution of the 1945 estimated population was as follows:—

Population Group	Estimated Population	Per cent
Incorporated centres *10,000 population and over.....	1,816,331	45.3
Incorporated centres *5,000 to 10,000 population.....	227,622	5.7
Incorporated centres *1,000 to 5,000 population.....	304,984	7.6
Rural Population (including incorporated centres under 1,000*).....	1,655,063	41.3

*As at Census of 1941.

Births and deaths for the year 1945 are classified by place of residence. Marriages being classified by place of occurrence.

Tables 7, 8, 23 and 30 have totals by place of occurrence and place of residence.

Natural Increase

The natural increase in the population and the computed rates for the period 1923 to 1945 are shown in Table C.

TABLE C—NATURAL INCREASE AND NATURAL INCREASE RATES,

1945.....	78,974	39,499	39,475	9.8

The natural increase rate has shown a general downward trend during the past two decades with a considerable recovery taking place since 1939. This is attributable, to a large extent, to a sudden rise in the birth rate associated with the war, although the rate in 1944 and 1945 showed a slight decrease. The lowest rates were reached in the immediate post-depression period of 1933 to 1939, as is clearly shown in Chart 1. The main factors throughout were naturally a general falling birth rate and a relatively stable death rate for the total population despite an increase in the deaths among the higher ages which is directly associated with an ageing population.

Births

Table D presents an historical summary of births, stillbirths and illegitimate births, together with computed rates for each, while Chart 1 portrays the general trends over the same period.

The number of live births has shown a more or less general decrease from 1923 to approximately 1937 when 61,645 births were registered. There was some recovery up to the war period followed by a decided increase accompanying the war. The crude birth rate of 20.7 in 1943 was 20 per cent higher than in 1939, and was as high as that attained in 1929, a prosperity period. There was a slight decrease in 1945 when the rate was 19.7.

The stillbirth rate, on the other hand, has been on an extremely encouraging downward trend with a reduction of almost 45 per cent since 1923. In 1923 for every 1,000 babies born alive, 43 were stillborn, while in 1945 there were 24 still-born—a fact which may be taken as a partial reflection of the improved health of mothers in the province and the improvement in obstetrical services.

Illegitimacy, however, has been increasing at an alarming rate—4,075 illegitimate births being registered in 1945 as compared with 1,579 such births in 1923. The rate has more than doubled since 1923 with over 51 of every 1,000 births in 1945 being illegitimate as compared with 23 in 1923 and 40 in 1931. It will be noted, however, that in the period 1923-1931 the rate rose 78 per cent as compared with a rise of only 21 per cent since that period.

Tables E, F and G provide a breakdown of births by age of mothers for the same three groups, and indicate to some degree the extent to which age has contributed to the trends outlined above, while Chart 2 provides an interesting picture of the age distribution over the same period on the basis of five-year averages.

Chart 2

PERCENTAGE OF
LIVE BIRTHS, STILLBIRTHS AND ILLEGITIMATE BIRTHS
IN EACH AGE-GROUP OF MOTHERS
ONTARIO

There has been a general tendency during the past two decades towards younger motherhood. For example, of every 100 babies born alive in 1923, 6 were to mothers under 20 years of age, over 24 to mothers 20-24, and 28 to mothers 25-29 or a total of 58 children to mothers under 30 years of age. In 1945 of every 100 live births, 7 were born to mothers under 20, 29 to mothers 20-24, and 28 to mothers 25-29 or a total of 64 children to mothers under 30 years of age. The picture, however, is not complete without mentioning the fact that fewer children are now being born to each mother than was the case two decades ago, and these are being borne in the early years of married life.

As a partial effect of the trend towards younger motherhood, a greater percentage of stillbirths is now occurring at the younger ages than was the case in 1923. In 1945, 29 per cent were to mothers below 25 years of age as compared with 23.7 per cent in 1923. In 1945 of every 100 stillbirths, 48 were to mothers over 30 years of age as compared with 51 in 1923 and 47 in 1931.

There are indications that the number of stillbirths per 1,000 deliveries has been decreasing at an encouraging rate over the past two decades, and that this has been evident for each age-group of mothers, although the fact remains that the risk of stillbirth delivery increases with age. The following summary sufficiently indicates the general trend in this respect over the 20-year period. For example, of every 1,000 deliveries among mothers 15-19 in 1945, 17 were stillborn as compared with 29 in the period 1922-27; among mothers 20-24 years of age, 19 as compared with 30; among mothers 25-29 years of age, 19 as compared with 33, with similar encouraging figures for older mothers, although the risk of stillbirth delivery increases rapidly for mothers over 35 years of age.

AVERAGE NUMBER OF STILLBIRTHS PER 1,000 DELIVERIES

Years	AGE OF MOTHER

With respect to illegitimacy, Table G and Chart 2 indicate that the great majority of the illegitimate live births occur to mothers under 25 years of age.

Of every 100 such births in 1923, 78 were to this group of mothers, as compared with 67 in 1945.

In recent years a greater proportion of illegitimate births have been born to mothers in the older age-groups. Chart 2 illustrates this fact showing higher percentages for mothers in their 30's with proportionate reductions for mothers in the 'teen ages.

Infant Mortality

Table H and Chart 3 both show very clearly the declining trend in the number of deaths of children under one year of age. This decline in trend indicates, to a large extent, the success of a long range programme directed, during the last two decades, at the reduction of infant mortality.

Chart 3

INFANT MORTALITY
ONTARIO
DEATHS AT EACH AGE PERIOD
Five-year Averages 1931-1945
and for the year 1945

2400—

There was a reduction in the total number of infant deaths from 5,092 in the period 1926 to 1930 to 3,275 in the period 1941 to 1945. This reduction is apparent in every monthly age-group. The increases which are noted from 1941 to 1945 must be considered in comparison with the extensive increase in the number of births during the same years. The following summary indicating the number of infant deaths per 1,000 live births presents a picture of the rapid reduction in infant mortality:

Years	Infant Deaths per 1,000 Live Births
1926-30	74
1931-35	61
1936-40	50
1941	46
1942	40
1943	42
1944	43
1945	41

The rate of 40 per 1,000 live births in 1942 was the lowest ever recorded. The increase in the rates in 1943 and 1945 was due, for the most part, to an increase in the number of deaths from prematurity. In 1945 there was also an increase in the deaths from diseases of the respiratory organs. Table 1 which presents the deaths and rates for certain causes brings out the fact that there has been a notable reduction in deaths attributable to whooping cough. Diseases of the digestive tract also decreased in the period 1936 to 1943, increasing in 1944 and decreasing again in 1945. The group of diseases of early infancy showed a marked decrease in the period from 1936 to 1942, but due to the increase in deaths from prematurity the rate for this group increased in 1944 with a decrease in 1945. Influenza has fluctuated over the period showing the effect of minor epidemics and there was no improvement apparent in the death rate from malformations.

Maternal Mortality

From Table K, it will be noted that a considerable reduction in the number of deaths of mothers during childbirth has taken place during the past 20 years, and particularly during the past 5 years, with the 1945 rate being considerably below the average of the last decade. In general, the reduction in the rate seems to be more apparent in younger than in older mothers, although in 1942, and 1945, the latter group showed a marked decrease in the rate per 1,000 live births.

* Rates not computed because of small numbers.

The tables which follow present the distribution of maternal deaths during 1945 by locality, as well as deaths of women not directly classified as due to pregnancy or child-birth, but which were associated therewith.

The rates shown in Table L are of special interest in that they indicate clearly the general downward trend in maternal mortality in cities, towns and rural areas of the province. The rates for 1945 being 2.1 per 1,000 live births in cities, 2.0 in towns and 2.2 in the rural areas. The rural rates have been consistently lower than those for the urbanized communities with the exception of the years 1944 and 1945.

General Mortality

Table N presents a historical summary of deaths by sex in the province and the computed crude death rates over a 23-year period while Chart 1 presents a graphic picture of the general trend in the rate.

Over the past two decades two main trends are apparent. From 1923 to the early 1930's the rate averaged close to 11 deaths per 1,000 population. Dropping rapidly in 1931 and 1932, it has since stabilized at about 10 deaths per year per 1,000 population.

The death rate among males has been consistently higher than that among females and there are indications that this divergence between the two rates has been widening during the past decade or more.

Table O presents both male and female crude death rates for each 5-year age-group, based on the population as enumerated at the censuses of 1921, 1931 and 1941 and as estimated for the years 1942, 1943, 1944 and 1945. There are several features with respect to changing death rates which are worthy of comment, notable among which is the remarkable decrease in the death rate of children under 5 years of age from 21.2 in 1931 to 11.5 in 1945 for males and from 17.0 to 9.2 for females. Similar declines are apparent in the other age-groups up to middle life. After middle life an increase will be noted in the rate for males.

This latter fact is clearly portrayed in Chart 4 which depicts the percentage of deaths occurring in each age-group of the population.

Causes of Death

The deaths shown in Table P are for selected causes or groups of causes to which, during the past 10-year period, more than 75 per cent of total deaths have been recorded. A large part of the increase in 1941 in diseases of the heart and intracranial lesions of vascular origin and the decrease in diseases of the arteries is due to changes in classification in the "Fifth Revision of the International List of Causes of Death." The increase in diabetes in 1941 is partly due to a change in preference when two causes are mentioned on a death certificate.

NOTE: It should be noted that the effects of certain changes in classification and rearrangement of titles provided in the Fifth Revision of the International List of Causes of Death are apparent in the following: Tuberculosis, Diseases peculiar to the first year of life, Diseases of the heart, Diseases of the arteries and intracranial lesions of vascular origin.

The Four Chief Causes of Death in Each Age-Group

Table Q shows the four primary causes of death in each age group for 1945. It will be seen that violent or accidental deaths hold first place in every age group from 1 to 39 years of age. From 5 to 29 years of age tuberculosis is the second chief cause of death and fourth in the 30 to 49 year group. Pneumonia, bronchitis and influenza, taken as a group, are important in the younger age groups. Cancer does not appear as a main cause of death until the late 30's, the number of deaths increasing in each older age group. In general, diseases of the heart and arteries, cancer and intracranial lesions of vascular origin are the primary causes of death of persons over 50 years of age.

Mortality from Notifiable Diseases

A summary of deaths and death rates from notifiable diseases is shown in Tables R (1) and R (2) for the last 10-year period. In general, from 1936 to 1943 deaths from diphtheria, erysipelas, scarlet fever and typhoid fever have been on a general downward trend, but in 1945 there was an increase in diphtheria and typhoid fever. Deaths from influenza have shown a decided decline except for minor epidemics in 1937, 1939. Deaths from poliomyelitis have shown the same trend except for the years 1937 and 1944, as well as those from whooping cough except for the year 1941. Deaths from tuberculosis are discussed in detail in the section to follow.

Mortality from Tuberculosis

Table S(1) shows the deaths from all forms of tuberculosis in the province from 1936 to 1945. Table S(2) shows the death rates per 100,000 population classified by the age of the decedents for 1941, 1942, 1943, 1944 and 1945. There have been two main trends in the total number of those dying from tuberculosis; namely, a gradual decline from 1,327 deaths in 1936 to 1,011 in 1940, followed by a levelling off during the past four years, with an average of 1,069 deaths per year. On the other hand, the death rate shows a steady decline from 36.4 per 100,000 in 1935 to 26.9 in 1940, followed by slightly increased rates of 29.0 in 1941 and 28.1 in 1942 and 1943 and 26.9 in 1944. The rate in 1945 decreased to 25.3. Chart 5 illustrates the decided reduction in mortality from tuberculosis which has taken place since the beginning of the century.

The largest number of deaths occurred in 1945 in the age-groups 20 to 29 years, and 30 to 39 years, followed by the 40 to 49 year group. Since 1936 there has been a decline in the number of deaths in the younger age-groups, whereas, in the older age-groups there has not been much change in this period. The rates, however, in all instances, have been steadily declining. Although the number of deaths of children under four years of age has always been relatively small, since 1941 there has been a remarkable reduction in the death rate among this group of the population.

Table Z in Part I of this report, gives details of deaths and death rates for counties according to place of occurrence and place of residence for the year 1945.

Mortality from Cancer

Chart 5 illustrates the steady upward trend in the mortality rate from cancer since the beginning of the century. The increase in the total number of deaths since 1936 is shown in Table T (1) and is apparent in most of the age-groups particularly among older persons. In addition the general cancer death rate has increased over the past decade, standing at 132.2 deaths per 100,000 population in 1945, as compared with 130.2 in 1941 and 123.2 in 1936. Table T (2) shows the rate from 1936 to 1945 by sex and indicates that the female rate is higher than the male rate, but the death rate for males has increased more rapidly than that for females.

The number of deaths from cancer classified by sites affected is given in Table U for the period 1936 to 1945. Cancer of the digestive organs and peritoneum accounts for almost half of the deaths from this disease, with an increase of 11.8 per cent in the number of deaths occurring in this group since 1936. The number of deaths from cancer of the male and female genital and urinary organs has increased 26.6 per cent since 1936, cancer of the breast 8.6 per cent, while cancer of the respiratory organs has more than doubled during the same period.

Mortality from Pneumonia, Bronchitis and Influenza

In Chart 5 is a curve showing the trend in the death rate from pneumonia, a disease which may be affected by epidemics as illustrated by the peaks of 1907, 1916 and 1918. During the twenty years from 1925 to 1945 the death rate from this disease showed a general downward trend. The decrease was more noticeable after the introduction of the sulpha drugs for the treatment of respiratory diseases. The rate was 79.5 per 100,000 in 1924, 44.2 in 1941 and 40.8 in 1945.

Table U (1) shows the number of deaths from influenza, bronchitis and pneumonia and indicates the fluctuation in the number of deaths recorded as due to influenza.

Special Classes of Accidental Deaths

Table V shows that of the 2,292 deaths in 1945 cross-classified as to nature of injury, 841 were due to crushing, 847 to falls, 288 to drowning, 167 to burns and 149 to poisonous gas, suffocation, cutting or piercing instruments and electrocution. Of those injured by crushing 497 deaths were due to automobile accidents (excluding trains or street-cars), 88 to railway accidents (excluding motor vehicles) and 28 to air transport accidents.

Marriages

From Table W it will be noted that there have been significant fluctuations in the number of marriages in the province since 1924, each of which have reflected general economic trends. For example, there was a general increase in marriages and in the marriage rate leading up to 1929, a prosperity period, followed by a decline coincident with the depression period which continued until approximately 1933. This was followed by a return to a more stable economic condition which is reflected by an increase in both the total number of marriages and the marriage rates. The effect of the war is clearly apparent in the relatively high rates of 11.0, 11.4 and 11.7 per 1,000 population during the three years, 1940, 1941 and 1942. In 1943 the rate decreased to 9.2 followed by a further decrease to 7.9 in 1944, and an increase in 1945 to 8.5.

Divorces

In Ontario, divorced persons form a very small proportion of the population as compared with some of the other countries of the world. The following summary indicates the number and percentages of such persons in the population of the province as enumerated in the past three censuses.

	1921*	1931	1941

Female.....	1,369	1,015	2,865

Female.....	0.09	0.06	0.15

*Including legal separations.

An historical summary of the number of marriages dissolved in Ontario since 1919 is presented in Table X. Previous to 1920 very few divorces were granted in the province. There was no appreciable increase in the number till the late 1920's, but since the transfer in 1930 of jurisdiction from the Dominion Parliament to provincial courts there has been a steady annual increase (except in 1937) in the number of divorces. Previous to 1930 a record number of 213 (1928) divorces were granted. From an annual average of somewhat over 300 in the early 1930's the number has increased rapidly to 949 in 1941, 1,185 in 1942, 1,376 in 1943, 1,510 in 1944, and 1,948 in 1945, representing an increase in the rate per 100,000 population of from 9 or 10 to 48 in 1945.

In the early 1920's the majority of the successful applicants were husbands, but since that period dissolutions granted on the application of wives have been in the great majority. Since 1935 for every 1,000 divorces granted to wives, an average of 550 have been granted to husbands as applicants, the ratio in 1945 being 835 per 1,000 divorces granted to wives.
