Through the report and not absent from the message, is evident a desire to build up another department of persons drawing pay from the public purse and dependent on executive favor. The asked for regulating power of this department might, in impure hands, become particularly valuable before elections. Closely connected with the above mentioned object seems to be a desire to build up a combination or trust between railroads and water carriers, as evidenced by such phrases as: "With a view to equitable cooperation between waterway and railroad facilities for the promotion of commerce and the benefit of the people," "devising means of rendering the two systems complimentary and harmonious and making such fair division of traffic that rates and management may be co-ordinated economically and with benefit to this country." It is to be hoped that neither an additional "administrative agency with large powers," nor a control of rail and water transportation which might render a farmer taking a sack of corn into his dugout for transportation, liable to fine by some future Table Mountain will commend itself to the country.

Noticeably the report is without consideration of the effect of depth on the cost of transportation by water. "Co-ordination" with the railroads seems hardly second to the desire for large powers for the agency. To be sure, the President speaks enthusiastically for deep channels. But those who remember his decision in favor of a barge canal to handle the traffic of the Lakes will doubt the adequacy of his conception of depth. Under that decision, by the then Governor of this state, we are in the course of expending $101,000,000 on a canal so shallow and inadequate that on its completion it will probably not bring to the city of New York 5 per cent. of the 70,000,000 tons of freight now passing Detroit; two-thirds of which is said to be on its way to an increase of value by manufacture. Its only value will lie in its ability to keep lake vessels from competing for freight with the vessels already on the Atlantic, and the people at the head of Lake Michigan who think they are going to get their vessels out by way of the Mississippi must be resigned to waiting.

Notice also seems desirable of the fact that both the message and the report are surcharged with references to monopoly which seem intended to develop a spirit of national antagonism rather than of mutual helpfulness and to decrease commercial confidence in the future. Some 16 years ago the country was filled with the cries of calamity howlers, whose terminology was mostly drawn from tons of literature sent west from this city. This literature was on like lines of passification and progress as those inculcated in the document under consideration. The howlers, it will be remembered, got their calamity.

The influences on the prosperity of the country which would follow ignoring depth and capacity in improving waterways, and adopting the above mentioned plans of control and trust development are liable to be very serious. Senator Newlands' "co-ordinated" trusts will most surely result in lower prices for farm products and raw materials at points of production, and higher costs at points of consumption. No politically appointed commission can be expected to manage transportation as economically as those educated to the business and whose future is dependent on success. And as those who direct clamor against "monopoly" are, in fact, still more insistent against "ruinous competition," we may expect under their administration an orthodox and uniform system of railroading that will kill initiative and invention; which will imperatively demand higher rates, which higher rates will not bring increased profits to transporters.

Heretofore, with the highest wages paid in the world and with money and materials generally dearer than elsewhere, our railroads free to charge what the traffic would bear, to build into others' territory and to wage ruinous rate wars, have steadily reduced the cost of freightage until they have presented the people of this country with an unprecedented and unascertainable beneficence; unascertainable because with the high freight rates of Europe much of our merchandise could not have stood the cost of production and transportation. The wealth accompanying its production and the decreased cost to consumers from its abundance would have been lost to the country by European freight rates. Our phenomenally low freight rates on the lakes and the influence they have on production is admitted by all. There is a lack of reliable statistics as to our coastwise commerce, but experts assert that no other country has as cheap coastwise carriage as this. All these great traffics until lately have been free of control. Since our state and national governments have assumed and extended their control railroad freights have risen notably. Lake and coastwise freights, less controlled, have not.

One of our great sources of prosperity, if not the greatest, since about 1870, when our average freight rates were reduced below those of England, has been the advantage we have had over competing countries in the cost of assembling the raw materials for manufacture and distributing the finished product. Senate Doc. 325 seems to promise no further reduction in the cost of such service. All who wish the continued advance of this country and understand the function of transportation should examine the document with care. EDWARD P. NORTH, C.E.

Automatic Inspection of Car Wheels in Service.

Sacramento, Cal., March 16, 1908.

To the Editor of the Railroad Gazette:

The inspection of car wheels in service for defects that may lead to failure is an interesting and exceedingly important part of railroad work. On the thoroughness with which the inspection is made depends in considerable part the measure of safety guaranteed every train on leaving an inspection point, and many readers of the *Railroad Gazette* may take at least a passing interest in anything proposed as an improvement in this field.

As every railroad man knows, there are car repairers and inspectors stationed at terminals and also usually at two or three other points on a division, and one of the duties of these men is to allow no pair of wheels to pass that is defective. They are expected to examine every wheel carefully all the way around—plates, flange and tread, and on every flange that appears to the eye at any point to be worn nearly to the limit of vertical wear or thickness they are to try their gage to ascertain if it should be allowed to pass; on flat spots, shelled-out spots and chipped rim, the gage should be tried to see if these defects exceed in extent the limit allowed. Any wheel that has been pressed too loosely on the axle and has shifted place under pressure brought to bear in passing curves and frogs, should be discovered in the inspection as the defect is most dangerous. The difficulties of such a thorough inspection are obvious. The time allowed is often short; inspections must sometimes be made at night and in storms; the wheels are under the cars, partially hidden by brakes, boxes, frames and bolsters, and thorough inspection is at best difficult and often impossible, making the temptation great for an inspector to chance that all is right on a wheel, a truck, a car or even an entire train.

The application of gages for the defects described takes time, and the particular part of a wheel on which it is desired to try a gage may be hard to get at. For example, suppose there was in a freight train of say 40 cars, one pair of wheels that were out of gage, due to a wheel slipping on the axle or other cause. To locate this pair might require the gaging of most of the pairs of wheels in the train—a good sized task. If it was not known that the defective pair was in the train, the chances are great that with the ordinary methods of inspection it would not be discovered; yet to leave it undiscovered courts disaster.

It has occurred to me that it is possible to place in the track at terminals or inspection points, on the incoming track or on a siding in connection with it, an automatic means of applying the gages to the wheels as they pass, and to register the condition of the wheels in such a manner that it may be seen at a glance if flanges are missing or worn to the limit of wear; whether all wheels are correct in gage, and even whether or not flat spots or shelled-out spots or chipped rims exceed in extent the limit allowed. In short, I want to apply the M. C. B. gage by mechanism instead of by hand, for detection and location of all the defects that require the application of the gage.

It may be objected that such a device would make car inspectors careless. It should not; they should be held responsible more than ever for cracked plates and other defects of wheels and running gear that do not require the application of a gage to determine their extent.

Under ordinary inspection, the rejection of a wheel for flange worn to the limit of thickness or vertical wear by use of the hand gage is to a considerable extent a matter of the inspector's judgment. Flanges are seldom worn so that the gages apply either for thickness or vertical wear just as they are shown to do in the M. C. B. rules. A flange is worn thin, but the gage does not go down on the tread so as to exclude daylight under it at the center, as it is shown to do in the M. C. B. rules; a flange is worn vertically until considerably beyond the limit of safety, yet this wear is seldom absolutely vertical, and a question is raised in the inspector's mind whether or not the wheel should be condemned. An automatic machine for applying the gage would have a "personal" equation of its own, but one that should be more constant than that depending on the various judgments of several inspectors. Such a machine would require expert attention, but it would require many men to attain the efficiency of one machine in inspection for the defects referred to.

Freight cars, a large percentage of which are loaded at way stations, may for months at a time pass inspection points only in through trains; they are liable to pass these points in storms and at night, and even at best, with many trains of many cars each and the limited time available, thorough inspection is impossible. Repairers and inspectors are often called upon to repair some damage to some car in transit, and that, too, takes up the time that should be available for inspection.

Railroad authorities state that from 60 to 90 per cent. of all wheels removed are removed for worn flanges. Inspection would show that many of these are worn much beyond the limit, proving that many of them must pass inspectors time and again before they are discovered and removed. On every wheel removed, no doubt an inspector has tried his gage, perhaps a number of times. If this could be done automatically by machinery, in the aggregate it should represent a considerable saving of time, taking into account the fact that one thorough inspection by some device that would register several points of every wheel in the train without fail should be worth a dozen superficial inspections.

The idea is new and untried, and to develop an efficient machine for the purpose would require much experimenting, but with ultimate success it should result in saving to railroad companies the time required for thorough inspection for the defects referred to, and in saving to public and railroad alike some of the life and property now lost in wrecks. CHAS. BROWNING, JR.,

Office of Laboratory Foreman, Southern Pacific Co.

(Mr. Browning modestly omits to mention that he has himself taken out patents for such a device. We understand that no machine has been built, however.—Editor).

Locomotive Types and Weights.

Boston, Mass., March 30, 1908.

To the Editor of the Railroad Gazette:

The first of the following tables is a compilation from the reports of the Interstate Commerce Commission from 1902 to 1906, both inclusive. It serves to show the tendencies of modern practice as to the use of locomotives of several of the most important classes. It is evident that the four-wheel switching engines are giving way to the six-wheel engines, which clearly constitute the accepted class. While a number of eight-wheel and ten-wheel switchers are used, the number is not large, nor the increase significant.

The most striking feature of the table is the increase in numbers in the Consolidation type, nearly double in four years. This appears clearly to be the accepted type for a large part of the freight service. The next most important feature is the steady falling off, since 1903, in the American type. This type is evidently yielding on one side to its modification, the Atlantic, for light, fast service, and on the other to the 10-wheel or the Pacific where heavier service is demanded. The Mogul and its modification, the Prairie, seem not to gain much in favor. The ten-wheel and the Pacific (its modified type) show a very material gain. The ten-wheel appears to be used both as a passenger type and as a freight type.

There has probably been a more or less complex change going on. In replacing an American, when worn out, the tendency for light fast service is towards the Atlantic, but in many cases a heavier engine takes its place, a ten-wheel or a Pacific. In the meantime a ten-wheel freight engine, when worn out, is probably replaced, in many cases, by a heavier Consolidation. So that while the American type is decreasing and the Consolidation is increasing, the six-driver types are both increasing and decreasing in numbers, but show a substantial net increase. The six-driver types, the ten-wheel, the Mogul, the Pacific and the Prairie, still outnumber the eight-driver types, the Consolidation, the Mastodon and the Mikado. It is no doubt the fact that the four-driver types still lead for passenger traffic, but it is losing ground steadily; for freight service the eight-driver types are far in the lead and are gaining rapidly; the six-driver types, divided between freight and passenger service are still gaining substantially. The use of the trailing truck in the Atlantic, Columbia, Pacific, Prairie, Mikado and Santa Fé seems to meet with considerable favor.

The tractive force (depending on the loads on driving wheels) is still increasing notably; the average tractive force has increased as shown in Table II.

Table I.—*Number of Engines, and Increase in Number.*

		+ 54	+ 1	+ 85	..	
Total (all classes)		50,954	47,696	46,743	43,871	41,225
		+3,258	+ 953	+2,872	+2,646	

*Mainly.

Table II.—*Average Tractive Force.*

Class.	Tractive force 1902.	1906.	Per whl, 1906.
Six-wheel Switcher	20,300	23,400	3,900
American	13,900	14,700	3,700
Atlantic	21,800	23,400	5,800
Ten wheel	21,400	22,800	3,800
Pacific	28,300	30,200	5,000
Mogul	21,200	22,600	4,300
Prairie	25,300	29,500	4,900
Consolidation	29,400	34,200	4,300
Mikado	21,500	43,900	5,500
Mastodon	33,500	33,400	4,200
Santa Fe	......	62,800	6,300

The figures seem to indicate that many old (and light) American, ten-wheel and Mogul engines are still kept in service. The newer types appear to be of more powerful build, as shown by the greater tractive force.

C. FRANK ALLEN.

Committee Work of the Maintenance of Way Association.

The Board of Directors of the American Railway Engineering and Maintenance of Way Association has issued instructions to the various committees concerning their work for the coming year, an outline of which is given below. The committees have been rearranged and are thought to be unusually strong and efficient. The Board has established November 30 as the limiting date for receipt of committee reports by the secretary. Reports received after that date will not be presented for final action at the following annual convention.

I—ROADWAY.

(1) Continue the consideration of track elevation and depression inside of cities, and grade and curve improvement work outside of cities, and submit recommendations covering more particularly questions of detail relative to the handling of the work.

(2) Report on the best method for determining the size of waterways.

(3) Report on the protection of the roadbed in embankment and excavation from the action of water, more particularly with reference to protection from washouts or overflows and from slides, whether caused by surface or underground water.

(4) Report on the surface and sub-surface drainage of embankments and excavations.

(5) Report on the tiling of wet cuts and the curing of slides.

II—BALLASTING.

(1) Review the customary recommended practice for preparation and delivery of various classes of ballast, with cost of handling same, if practicable.

(2) Review the advantages and disadvantages of the various types of ballast, including stone of different kinds, slag and gravel, and the different qualities of gravel with reference to the amount of sand or clay contained.

(3) Report on the best method to be used in determining the wearing quality of crushed stone.

(4) Review the customary practice and practicability of treating rock ballast which has become foul under the ties.

(5) Prepare recommended principles of practice for slag ballast, chats ballast, cementing gravel ballast and chert ballast.

(6) Report on the necessity for and best material for subballast.

(7) Review of special literature on the subject of ballasting.

III—TIES.

(1) Continue the compilation of statistics upon the life of ties, both treated and untreated, and the causes of failure. Present summary compilation of reports received and draw such conclusions therefrom as the statistics warrant at the present time.

(2) Prepare critical review of the general question of the present and future status of the tie supply, the various methods heretofore adopted for reducing the yearly demands on the timber supply, and what general lines of investigation and change in existing methods may seem most desirable to be followed so as to secure the best results in the future.

(3) Collect statistics on the extent of the use and the life of metal or composite ties up to the present time, with illustrations and descriptions of the most successful designs, and draw such conclusions as the conditions may warrant.

IV—RAIL.

(1) Continue the investigation of the breakage and failure of rails and present summary of conclusions drawn from reports received.

(2) Report on the results obtained from the use of open hearth steel rails and the chemical composition of such rails.

(3) Report on any recommended changes in specifications for Bessemer steel rails as heretofore adopted by this association.

(4) Present recommendation as to standard rail sections.

(5) Present report showing diagrams or photographs of typical characteristic rail failures corresponding to the classification as given in form M. W. 1,200, Report of Rail Failures in Main Tracks.

V—TRACK.

(1) Review and revise the committee's report presented at the ninth annual convention, covering the following subjects:

(a) Report on the subject of turnouts and turnout material, including the best types of switchstands, switchpoints, frogs, guard rails and throat clearance, bearing in mind the possibility of an increase of the thickness of wheel flanges and the effect of worn ties and wheels upon the various parts of turnouts, frogs and crossings.

(b) Report on facing point switches for high speeds with a continuous main line rail.

(c) Confer with committee on signaling relative to switchstands.

(2) Continue investigations in connection with a sub-committee of the American Railway Master Mechanics' Association upon the subject of widening gage on curves and spacing of guard rails, as affected by the different lengths of engine wheel base, arrangement of flanged wheels and wheel wear.

(3) Report on whether wide gage which is due to worn rail should be corrected by closing in or replacing the rail.

(4) Report on the extent rail should be worn before it becomes unsafe.

(5) Consider revision of paragraph (3), under "Proper Method of Spiking," page 64, Manual of Recommended Practice, and report recommendation as to extent gage on curves should be worn open before closing in is necessary.

(6) Reconsider and report any recommended change in "Standard Drilling for Rails," as heretofore adopted by this association (Manual, 1907, p. 65).

VI—BUILDINGS.

(1) Reconsider amended conclusion No. 5, relative to locomotive coaling stations (Bulletin 95, pp. 69-70).

(2) Report on the use of reinforced concrete for coaling stations and storage bins.

(3) Collect data as to the actual use of reinforced concrete roofs for roundhouses, where located, life to date, results so far obtained, and critical analysis of advantages or possible defects; also diagrams of typical designs.

(4) Report on the best method for smoke removal, ventilation and heating of roundhouses.

(5) Report on the design and detail arrangement of oil houses at terminals.

VII—WOODEN BRIDGES AND TRESTLES.

(1) Continue the revision of the specifications for structural timbers, co-operating with Committee Q of the American Society for Testing Materials and other committees on the subject, with a view, if possible, of preparing a uniform standard specification.

(2) Prepare a list of recommended safe unit stresses for structural timbers.

(3) Revise the report on standard names for structural timbers.

(4) Study the principles and methods of pile-driving, and collect data relating to the current practice.

(5) Report on best method for classification of pine timber for structural purposes in place of classification by botanical names.

VIII—MASONRY.

(1) Reappoint a sub-committee to co-operate with the "joint committee" on Concrete and Reinforced Concrete.

(2) Collect data on the reported failures of concrete structures and the probable cause of same.

(3) Investigate and report upon the waterproofing of masonry, covering methods, results, cost and recommended practice.

(4) Report on the use of reinforced concrete trestles, typical designs, cost and recommended practice.

(5) Present typical plans of retaining walls and abutments, plain and reinforced, with comparison and recommended practice.

(6) Report on the desirability of all monolithic construction in arches or large abutments with wing walls.

(7) Submit specifications for reinforced concrete.

IX—SIGNS, FENCES, CROSSINGS AND CATTLE-GUARDS.

(1) Present such additional recommendations and conclusions covering the various subjects reported on in the previous reports of the committee as may be considered desirable.

(2) Report on snow fences, snow sheds and other means to prevent snow accumulating and best methods of clearing tracks and snow removal.

(3) Report on the use of concrete fenceposts, results obtained so far in actual service, designs and cost.

X—SIGNALING AND INTERLOCKING.

(1) Mechanical interlocking specifications.

(2) Electric interlocking specifications.

(3) Rubber-covered wire specifications.

(4) Prepare standard contract for signaling work.

(5) Prepare outline and description of a comprehensive system for universal signaling, suitable for general adoption.

(6) Confer with committee on Track relative to switchstands.

XI—RECORDS, REPORTS AND ACCOUNTS.

(1) Revise "Track Chart," form M. W. 1,016, so that the chart will show the conventional signs as adopted by the association.

(2) Recommend any desirable changes in conventional signs as heretofore adopted.

(3) Review the subject of "Time Book" and recommendations as to revising form M. W. 1,008, with a view to preparing a form that may be uniformly used for all maintenance of way departments, and offering a check against irregular practices and allowing the use of a daily time report.

(4) Recommend forms for use of maintenance of way departments for preparing preliminary detailed estimates of contemplated construction work, this form to be used preliminary to and form the basis for the summary estimate data embodied on form M. W. 1,017.

(5) Prepare forms for collecting and analyzing rail statistics.

XII—UNIFORM RULES, ORGANIZATION, TITLES, CODE, ETC.

(1) Supplement "General Rules for Government of Employees of Maintenance of Way Department."

(2) Prepare special rules for foremen and other employees, properly grouped and classified in accordance with and supplementary to the general rules heretofore adopted.

XIII—WATER SERVICE.

(1) Report on the use of coal and gasolene or other fuels as motive power for pumping plants, with relative economy and desirability of each system under different conditions.

(2) Report on the general principles of the water supply service, independent of the question of water treatment, and on typical installations for various characteristic conditions.

(3) Report on various types of track tanks, with designs of typical installations, and critical review.

XIV—YARDS AND TERMINALS.

(1) Report on the average and maximum classifying capacity of hump yards with one or two scales on the hump and the number of yard engines required under varying conditions.

(2) Report on terminal freight houses at large terminals and transfer points, more particularly with reference to general arrangement of buildings and platforms and the track layout.

(3) Development of mechanical handling as a means of promoting rapidity and economy in the handling of freight.

(4) The relation of the percentage or proportion of cars to be weighed to the location of scales on the hump or elsewhere, and if not placed on the hump, where should scales be placed, and the reasons therefor; also how weighing is done where cuts of cars are switched.

(5) Report on the feasibility of transferring freight by means of movable freight platforms, and outline of methods.

XV—IRON AND STEEL STRUCTURES.

(1) Continue investigations as to impact tests.

(2) Continue investigations in regard to injury to bridges and railroad structures caused by flat spots on wheels, conferring with committees of other associations.

(3) Report on the care of existing bridges, inspection, methods of field work and records of inspection.

(4) Report on the maintenance of bridges, including protection of steel structures from corrosion.

(5) Specifications for bridge erection.

(6) Report to what extent steel bridge construction for the main girders of bridges carrying heavy loads under high speeds is preferable to reinforced concrete construction.

XVI—ECONOMICS OF RAILROAD LOCATION.

(1) Continue the consideration of all questions connected with railroad location, grades, lines and improvement of grades and lines affecting the economic operation with relation to traffic, tonnage ratings, speed, density of traffic and financial considerations, with the special aim in view of establishing uniform methods and unit values for investigating and analyzing the relative changes and costs of comparative routes or proposed grade reductions and line corrections.

XVII—WOOD PRESERVATION.

The committee work is to cover in general the investigating and reporting on the preservation of wood used for ties and for railroad structures and buildings, confining the work of the committee more particularly to processes, methods and results obtained.

Present recommendation as to outline of work for the committee, with suggestion for classification to be followed.

Continue the work done heretofore by the committee on Ties and on Wooden Bridges and Trestles, relating to the special subjects of processes and methods of wood preservation.

UNIFORM GENERAL CONTRACT FORM.

Prepare uniform general contract forms and present recommendations on the subject.

Reciprocal Demurrage and Car Supply.*

BY ARTHUR HALE.

This is the first winter that I can remember—and my recollection goes back at least twenty-five years in transportation matters—that there has not been a car shortage.

A car shortage is a usual, I might almost say a healthy, symptom in the winter, but this winter of 1907-8 is the first winter that we know of when there has been a car surplus. The situation of the country and of the railroads is pretty well described in a recent Bulletin of the Department of Commerce and Labor, indicating a falling off in many of the leading trades in percentages from 10 and 15, up to 50 per cent. in the iron trade. That falling off in business is reflected in the business of the railroads. The reports of the roads for December are all in, and of some of the roads for January, and almost without exception those reports are showing fearful losses in gross earnings, losses which vary all the way up to 50 per cent. Some of the Pittsburgh roads are only earning 50 per cent. of what they earned last year.

The situation, so far as it regards cars, is indicated in the bulletins of our committee, showing surplus cars in this country on February 19 amounting to 320,000. That is a slight improvement, I am glad to say, over February 5, when the surplus cars reached their high water mark, 343,000. And I am glad to say that the next bulletin, which covers the situation on March 4, shows another slight decrease, although the totals will be over 300,000.

I am sorry to say that the decrease in surplus is largely caused by an event which I consider calamitous—the probable shutting down of the coal mines in the Middle West. The railroads in and about Chicago have a very strong feeling that the coal industry will suspend on April 1, and for that reason they are loading up all of the coal cars they can get, and there is on some of the railroads, for the first time in several months, a shortage of coal cars shown. But the reason of that is that they have loaded up all the coal cars they could get, either with their own coal or with somebody else's coal, in anticipation of this stoppage of labor on April 1. I do not think it will be called a strike. I hope it will not extend to the East, but everyone in Chicago who is familiar with the coal trade seems quite sure that on April 1 the mines in Indiana and Illinois will shut down, and they are taking precautions.

These figures, which have recently (and very much to my surprise), attained public interest, are figures which our committee has been collecting for about a year. We were appointed about a year ago to look into this car shortage question, for nobody knew what the car shortage was for the whole country. Every railroad knew what its own car shortage was, but there was no central body which knew what the car shortage of the whole country was. Our first

*Argument before the Railroad Committee of the Massachusetts State Legislature, March 11, 1908.

duty, therefore, was to find out what the car shortage was and where the car shortage was.

We, therefore, sent out circulars, but, in the first place, only to the larger railroads. We asked for their shortage, and we also asked for their surplus, although the request for the surplus was received with some derision by some of our friends. They said, "What are you asking for surpluses for? There aren't any surpluses and there never will be any surpluses." We got answers from about 61 of the leading railroads in January and in February, and in February on those railroads the shortage was over 100,000 cars. That was a shortage for one day. What the shortage would have been the next day, if that shortage had been filled, I don't quite know, but at any rate a shortage of 100,000 cars for one day was a serious thing—a serious thing in showing that there was more business than the railroads could handle.

I won't go into the question now as to whether that was a car shortage or an engine shortage, or a shortage of men or a shortage of brains. Men were very hard to get a year ago. It has been hinted by a great many people that it was a shortage of brains, and that the railroads ought to have done better than they did. Of course, that is something that railroad men cannot deny. But, unfortunately, there are only so many of us. We are running the railroads now, and while undoubtedly we can't run them as well as the theorists, yet we are trying to run them as well as we can, and we are about the only people you have got to run the railroads now —the only people who are willing to try to do it. So I will leave that part out, and I will call it a car shortage. Really, a transportation shortage would be a better term for it, because while cars were scarce in one place they were congested in another.

These reports were made to an office we have in Chicago. We gradually increased the number of roads reporting and now have about 160 reporting to us regularly, covering practically all the larger railroads. We had no idea that these reports would be of any interest to the public, and we did not publish them. When the spring came surpluses began, and we were able from our office in Chicago to indicate to the railroads which had a shortage that there were surpluses of cars on other railroads, and we did a good deal of shifting around and a great deal of good in that way.

When the summer came there were surpluses everywhere, and we could not do any work in that direction. In the meanwhile the American Railway Association had a meeting and had approved these plans of ours and had ordered us to publish, monthly or oftener, the results that we got from our reports. As the summer passed the supply became uneven again; there were surpluses on some roads and shortages on others, and again our bureau was somewhat efficient in indicating to railroads where cars could be sent to get the full use of them. When we came to October the shortage had increased so, that we were nearly in the same shape that we were in February, that is, there was a shortage of ninety thousand cars in the whole country. That was on October 30.

It was not until the middle of November that we began to feel the result of the panic, when the shortages dropped to 47,000. By the end of November the shortage had dropped to 17,000 and the surpluses jumped up to 40,000. Since that time, up to February 5, the surpluses steadily increased, and now they are about stationary, with the small diminutions I have spoken of.

I simply say this to show its bearing on the situation of the roads in general. A surplus of 300,000 cars means that 300,000 cars are not earning money. During times when cars were short, the cars of American railroads were earning nearly $2.50 a day gross; in some months it was less, but in September it was $2.50 exactly, as it happens, for all the cars. The railroads now have on their hands 300,000 cars which are not earning them anything a day. Those 300,000 cars were bought, practically all of them, in the last 12 months. Over 300,000 cars were bought in the year 1907, and they cost $300,000,000.

I hope this isn't to last very long. I hope the railroads are not going to lose that money; I hope that next fall there will be a revival; I hope this spring there will be a revival of business, but if there is, it will not use up the cars, because we always have a surplus in the summer. I hope, however, that next fall there will be such a revival of business that all these cars will be used; but meanwhile the railroads are already staggering under their loads, and I do not believe that you gentlemen will help to put another burden on them.

As regards the burdens which the passage of this bill will put upon the railroads, the proposers of bills like this uniformly say that the bills are for the good of the railroad, that they are reciprocal, that they are fair. Gentlemen, they are not for the good of the railroads, they are not reciprocal, they are not fair. This bill will give the railroads of Massachusetts nothing, no right which they do not now possess. And, furthermore, it crystallizes into a statute law a custom which all the rest of the country had hoped New England would voluntarily give up, and that this is the custom of giving the merchants of New England twice as long to unload their cars as it gives the merchants in all the rest of the United States.

The gentleman who has proposed this bill said truly that it was modeled on the laws of a number of other states, states I may say, in the South, in the Southwest and the extreme West. I think Vermont is the only one of the New England states that has a law of this character. But with the exception of Vermont—and the Vermont Act is a very recent one—everyone of these acts, and everyone of the rules framed by state commissions, gives a basic free time of 48 hours for the loading or unloading of freight cars. That is usual in the country.

The law of the state of Connecticut, which, by the way, is not a so-called reciprocal law, but simply a demurrage law—gives 96 hours. That, I am told by the lawyers, is only valid on intrastate traffic. But the railroads of Connecticut, not desiring to make a distinction, have always given freely, 96 hours to all traffic, interstate as well as intrastate, and the other railroads in New England have followed those of Connecticut. So that New England is peculiar in that it does not allow the railroads—well, I should not say that—in that two of its states do not allow the railroads to force an unloading in 48 hours, but give everyone 96 hours, and the other states of New England have followed them, so as to make no discrimination between the citizens of Massachusetts, for instance, and of Connecticut.

Based on that 48 hours, there are, to be sure, exceptions in a number of states, by which certain trades and certain kinds of goods, are allowed more time. For instance, in the South, people living so many miles from the station have an extra day. In certain states there is more time for certain commodities; for instance, in Chicago there is extra time for sampling grain, and so on. There is extra time for reconsigning coal and things of that kind which I dare say you undoubtedly have to have here, and do have here. Although this bill does not give the shipper the right to it, trade demands various exceptions of that kind. But the base of the whole thing is 48 hours throughout the United States, except in New England, where the basis is 96 hours free time.

I am sorry to say that extra privilege is reflected in your railroad performance. If you look at these figures in our reports, the reports of the Committee on Car Efficiency, you will see that freight cars in New England do not travel as fast as they do in the rest of the country. The average miles per car per day which the railroad men of New England are able to get out of their cars is not much more than 18 miles; and, taking the whole United States, you will find that there are some months where it runs up to 25 and 26 miles. You will find some railroads where it runs up to over 30. New England railroad men tell me, and I believe them, that one reason why freight cars in New England are less efficient, if you measure them by the miles per car per day, is because they are up against this four days for unloading and four days for loading. You can easily see how this is so. The average freight run, for instance, on the New Haven road, as I understand it, is 90 miles from point of shipment to point of destination. Now suppose the shipper takes four days in which to load a car, and the consignee takes four days in which to unload it, and the New Haven takes one day in which to run it 90 miles, you have 90 miles in nine days, and that is 10 miles a day. Now, I submit that that is unreasonable; I don't believe your merchants need it. I do not believe your merchants take it, all of them, but some of them do, undoubtedly, or else there would not be the large amounts for car service which are being collected. And that means, gentlemen, that there are some people in New England who are using cars for storehouses, and who did use cars for storehouses all through last winter when the country in general was crying for the use of cars.

I simply say that to explain my extreme surprise, when I happened in town a couple of weeks ago and found that one of these bills was up here. Why New Englanders, with their extra two days, could want a bill of this kind was more than I could possibly see. But I don't want to go into the reasons why this bill may have been brought in. I want to treat it on the broadest possible grounds, and I submit that this question of preference, of extra privilege that the Massachusetts and the New England merchant has over the merchants of all the rest of the country, is a very important thing, and one that should be considered very thoroughly. I hope if this matter ever does come to be a matter of legislative action or of commission action, that you gentlemen will say that 48 hours is a reasonable time in which to unload freight cars, and I hope that New England will voluntarily give up this privilege, which has caused the rest of the country so much car shortage. I would like to see Massachusetts and New England lead the way in this matter of demurrage by giving up a concession which they have had for many years, but which they at last realize is an unjust concession. I believe that the people of Massachusetts, if they only understood the case, would say to the railroads: "We don't want any special privileges. If the other merchants in the rest of the country can unload in 48 hours, we can; we don't want two extra days; we want to stand on the same basis as the people of the rest of the country."

Now, gentlemen, coming back to the hardship that a bill of this kind would put on the railroads, in the first place it demands that whenever a man orders a car, or cars, without limit—that is to say, whenever a man orders 100 cars or 1,000 cars, or 10,000 cars—of course, that seems absurd, but the bill allows it; when a man orders a car and he does not receive it in four days, that man gets a dollar; the next day he gets another dollar. He can name the points. He can take a siding, where you can only place five cars, and he can order ten cars there, and if they don't come he can collect his dollar. That is a hardship—I have called it that, but it really is an impossibility. But, leaving out the absurd side of the case, the railroads want to fill all orders; the railroads do fill all orders whenever they can, and when cars are scarce the railroads do their best to avoid discrimination in the filling of such orders as they can fill. The railroads want to fill orders for cars because they want to collect the freight money. Whenever a railroad cannot fill an order for a car it loses that freight money. There is one fine. Are you going to put another fine on of a dollar a day a car in addition to the losing of the freight money?

The question of car supply is not a simple one, it is a very complicated one. It is simple enough at a point where the same number of cars come in loaded and go out loaded. It is simple enough at the factory, which gets in so many cars loaded with one kind of material, manufactures the material and ships its goods out at about the same rate every day. It is simple enough when the trade is regular. But, in general, trade is not regular; trade is irregular. And that is the bottom of the difficulty with the question of freight car supply.

The regular trades, the factories where the receipts and shipments are practically regular, the great cities that consume about the same amount and ship out about the same amount, are pretty well taken care of in this country. The trades which pay a good rate of freight are pretty well taken care of in this country. The high class and the perishable freight is well looked after, but when you come to freight that moves irregularly, when you come to freight shipped, for which there is no storage, and which also moves irregularly, then there are difficulties with car supply, and there are difficulties which can only be gotten over by the expenditure of tremendous amounts of money, which would result in the providing of means for transportation that would only be used for a few weeks in the year.

In order to be entirely impersonal, I will speak of the coal trade first, because I think no coal man appeared for this bill; and, secondly, because being on the Baltimore & Ohio, I am familiar with the coal trade. There are no points of storage for bituminous coal at the mines; there is practically no storage for bituminous coal anywhere else except at certain docks on the Atlantic and the Great Lakes. There is a supply of coal in the mines all ready for shipment, three or four times the possible facilities for shipment. I am quite safe in saying that. There is coal in West Virginia on the Baltimore & Ohio, coal opened up, coal all ready to dig out of the mines and put in cars, in that one region, which would exhaust all the transportation facilities of the Baltimore & Ohio, and would leave us mines in Ohio, Pennsylvania and Maryland without a coal car.

The coal trade is all right in the summer, the regular coal trade goes along, everybody has all the cars they want and a lot of mines are shut down and a lot of mines are working half time. But when you come to the winter the price of coal goes up and every mine in the United States wants to ship coal. There is the coal; they take your inspector down and show him the coal, and they say: "There is the coal; give us cars. Here are contracts; we can sell this coal; give us the cars." It is a perfectly safe bluff for them to say that they can load the coal and sell the coal. They know perfectly well that there are not coal miners enough in the country to load all the cars; but we cannot prove that to them, because we have not got the transportation facilities, and it would be extremely stupid for the coal roads of the country to go ahead and provide transportation facilities to take care of the first winter rush, because after the first week's shipments there would be so much coal on the market that they could not ship any more for two weeks.

The coal trade is possibly an extreme case, but I have heard of cases where the live stock men in a region in Texas all wanted to ship the same week; they all had notes coming due about the same time, and they did overcrowd some of the roads out there in such a way that it was just as impossible for them to supply transportation for live stock in the time selected as it is for the Baltimore & Ohio to supply the cars for coal in the first cold snap of the winter. But the same thing is true of every one of the great staples which moves irregularly where the prices fluctuate, and where people want to ship when prices are high and do not want to ship when prices are low. A provision of this kind, fining the railroads so much a day for not supplying cars at any time, would be a tremendous burden on any railroad which originates traffic, at the time when prices happen to be high on the particular commodity which makes the bulk of the railroad's business. That is a perfectly genuine burden, and a burden which would infallibly fall on the railroads of this country. It would be a fine in addition to their losing the freight money, which is, I submit, a sufficient fine.

But if a real shortage occurs through different coal men wanting to get their coal in first in a time of high prices, you can easily see how several coal men could combine to put in orders that it would be absolutely impracticable for a railroad to fill. Suppose several men in one line of trade were to combine to put in orders at a certain point that could not possibly be filled by the railroad, the railroad goes ahead and pays its dollar a day, pays its fine and enlarges the facilities at that point. It would be perfectly easy for those men, when the facilities were put in, if the dollar a day felt warm in their pockets, to change their orders over to a siding ten miles away and insist on having the cars there. This is not an extreme case. When one of these bills was near passing in one of the western states, a representative of a large traffic industry came to a friend of mine and said: "Now, when this bill gets through we can readily shade that rate we were talking about by your simply failing to deliver our cars at such and such a place." Now, that is pretty bad, gentlemen, after we have sweat blood, after we have undergone all these losses in the hope that we are going to get rid of rebates, in the hope that we are going to be sustained by the government in treating everybody exactly alike, to have it proposed that something of this kind be introduced into the law which will open another door like that to rebates!

So much on the question of car supply. The other feature of this bill is the 50 miles a day. Well, that seems reasonable; we do move our freight 50 miles a day, and more; we average more per loaded car—a good deal more. But that is the average, and there is lots of high-class freight that we move a good deal quicker than that, and there is a lot of low-class freight that, while we may move it at that average, we do not move every car as fast as that, and we cannot move every car as fast as that without its costing us a great deal of money. The demand for this regular movement comes from men engaged in handling these staples to which I have alluded—coal, grain, hay—staples which are moved at very low rates of freight. And they pay us very little for moving these staples, and they do not get the best service. I suppose that on every railroad grain and coal are the cars that are moved last. Whenever a train pulls out of a yard they move everything else out and leave the grain and the coal, simply and solely because those pay us least. If you want the grain and the coal moved regularly they have got to be paid for.

I had this matter up in Washington with an official a little time ago. We were talking about grain. We were putting a reconsigning charge on grain of $2 a car, I think, and there had been a protest from Philadelphia people, and this gentleman said to me: "Now, Mr. Hale, these people say that if their freight was moved regularly they wouldn't have to consign it to intermediate points and reconsign it. If it moved regularly they could ship it straight through to destination, but they start a car of grain from Chicago or Kansas City and they don't know when it is going to get in." And he said: "Mr. Hale, we don't want to prescribe a rate, so many miles a day, but why don't you prescribe it on your tariffs? Put it as low as you like; but why don't you put on your tariffs a proposition that for this rate freight will be moved a minimum of so many miles a day!" I said: "That seems right, but I cannot consent to guarantee any time on freight which pays us less than three mills a ton mile." "What," he said, "does grain move for that?" "Yes," I said, "it does on the Baltimore & Ohio Railroad; it moves for less than three mills per ton mile." And he said: "I cannot believe it." So I sent him the figures the next day for the preceding month, and for other months.

New England coal pays us about the same rate. I don't know what hay pays, but I imagine that the hay from Michigan, which was alluded to here a couple of weeks ago, must pay a very low rate indeed. However, the hay question is another question which I will come to later.

I was comparing notes with one of your iron men here, when I was here a couple of weeks ago, and I found that our average rate on grain from Chicago was about the same as he was paying on iron from Pittsburgh. Now, I am not a rate man, I am not a traffic man, I am just a car man, but I have to get into rates occasionally, and I think if you look into the matter you will find that this grain, which is making all the trouble, can't be paying more than three mills per ton mile. And, honestly, I believe it costs the road that much to haul it. That rate, of course, is made in competition with the Gulf. Grain can go down the Mississippi very cheaply—I mean on the railroads paralleling the Mississippi river—for they have no hills and they can take long trains, and naturally they can do the work very cheaply, and so they cut under our lines and we have to bring the rate down.

I submit to you that for freight moving at rates of that kind it is impossible to guarantee time. And I want to tell you just what guaranteeing time means. Freight of high class is moved on schedule trains and is moved with approximate regularity. Whenever there is one of these special cases for which we get blackguarded occasionally, where a car of high class freight is moved very badly, it means either that the car has broken down, and broken down at a point where it cannot be repaired promptly, or that it gets into some kind of a congestion, and in order to keep the road open, the yard and trainmasters feel obliged to move other cars first and let this car stay, it being in an inconvenient point in the yard. Those are the only two occasions when freight of high class is moved slowly, and I think our claim departments always recognize that as to freight of high class; and if there is any real damage accruing, I think they are doing the right thing in the payment of claims.

But, when you come to freight of low class, it is moved in slow trains, it is moved in full trains, and if you are going to make us move that at any definite rate, say 50 miles a day, it means that in order to avoid our fines we will have to clear up every yard every day. That seems easy, it seems a simple thing to say that we must have enough power to move everything out of the yard by midnight. To clean it up and move everything out that has come in there during the day. It seems simple, but, gentlemen, it means a pretty expensive thing. It means a light train, a train not loaded to its full capacity, from, well, more than half the yards every day; and it means an expense which I have never felt justified in recommending to my management, even at times when we were making the most money, even at times when we needed cars most. To contemplate a law that will practically compel every railroad in this country to clear up every yard of all the slow freight every night, is something appalling to me. One could make figures on that, one could assume what it cost to move a train, and the amount that is lost in not moving a full train, and how many yards there are in the country. That would show as appalling figures as I have shown the railroads are loading. But that would be very largely speculative. The only point I want to make clear to you, gentlemen, is that this 50 miles a day, reasonable as it seems as an average, is very unreasonable as a minimum, when coupled with the extremely low rates of freight that the railroads are getting on the staple articles. And I submit to you that in the present situation of the railroads of the country, they are in no shape to bear burdens of that kind.

The real difficulty of which these gentlemen are complaining, if there is any, is one of discrimination. If any shipper is faring better than another shipper in the same line in his car supply, that is discrimination, and there is plenty of law to punish that. I do not believe that there is any conscious discrimination by the railroads of this country now. If any, there is at least so little that it does not show. I know that in order to avoid discrimination the railroads of the country are making the most strenuous efforts, and I know that in all its searching the Interstate Commerce Commission seems only to have caught a couple of cases. If they are real cases, I am very glad they are caught, and I think every railroad man in this country is glad that discrimination and rebates have ceased, as I believe they have. We do not want them. They were at one time considered a necessity, just as they are considered a necessity in almost every other line of trade. But it is very much more convenient for the railroad men to make a set of cast-iron rules and live up to them.

The Hepburn Act has helped us more in avoiding discrimination than anything else has. Prior to the passage of the Hepburn Act there were many shippers who would not pay demurrage, absolutely would not pay it at all—would hold our cars indefinitely and would not pay us demurrage, whereas other people were paying it. And the law was not clear that that was a discrimination. The Hepburn Act put demurrage on a plane with transportation, and to give a man a preference in demurrage is just the same as giving him a rebate. Since that time, we have had very little difficulty with the collection of demurrage as compared with what we had before.

I gather that the interest most concerned in this bill is the hay interest. Hay is an article which, when there are no demurrage rules, is usually handled on commission, and in the old days, when I was in Philadelphia and in Baltimore, before we were able to collect demurrage fully, the hay trade escaped demurrage very largely, because we had such frequent blockades of hay. Hay was at that time handled very largely on commission, which, of course, means that the commission merchant solicits shipments of hay, and that shipments are made at the owner's risk, practically, and often without notice to the merchant. The consequence used to be that whenever the price of hay went up, all the farmers who raised hay would send it in from all parts of the country, and before we knew anything about it, we would have more hay than we could deliver, and the hay would be backed off on sidings. I have known hay for Baltimore embargoed by all the railroads for three months, simply because the price happened to go up for a little while, and all the farmers in creation sent their hay to Baltimore in hopes of selling it on commission. That was, of course, a bad thing for the farmer, because the minute there was a glut of hay the price went down. I suppose the commission man finally got his commission out of it. I hope he did, but nobody else got much of anything out of it, and the railroads were very seriously embarrassed.

The difficulty with the demurrage was this: the hay men would not pay demurrage until the car was placed, until they could unload it, and so many cars of hay came in that it was absolutely impossible to place all the cars so they could be unloaded without filling up all the tracks which we needed for other freight, and there were always a lot of cars held in the outer yards, where the hay men could not get at them, and they would not pay demurrage on those cars which were held back. I notice someone has kindly put a provision in this bill, which will save the hay men paying demurrage on cars held back. The railroads are kindly allowed to collect demurrage on cars not unloaded within 96 hours, computing from 7 a.m. of the day after notice that the cars have been placed at a point accessible for unloading has been given. Now, if you pass this bill, it is a grave question whether the hay men cannot get an absolutely unlimited amount of hay into Boston, and by simply unloading the cars that are placed where they can get at them, compel the railroads to keep a supply back on which no demurrage is collected. After our difficulties in Baltimore and Philadelphia, we built hay warehouses to help out with the storage, and then we had it understood, and it is understood everywhere in the country for all classes of freight now, that if a man has a certain number of cars to unload, and if more cars come in so that they cannot be placed, demurrage accrues on those cars back in the outer yard just as much as it does on the cars which are placed. That is the principle of constructive placement, as we call it. We notify the man who has these cars standing that the cars are ready for him, and that constitutes a constructive placement. We give him two days (it would be four days here) from the time the car arrives in the outer yard, and then demurrage begins as long as he has cars which he can unload but which he does not unload. This bill takes away that power if it can be taken away, that is a question for the lawyers, of course. I hope it cannot be taken away. It would seem unreasonable to make a railroad hold cars out indefinitely when overshipments have been made.

The result of this action of ours in charging demurrage on those cars held in the outer yard, when there were cars which the shipper could unload, was to change the method of doing business very largely, and stop the handling of hay on commission, so that now hay coming to Philadelphia and to Baltimore, and I think to almost all other cities—I understand that it is increasing here now—is bought at the point of shipment, and does not come into the large terminal unless it is needed. Then it is not delayed. Of course when a merchant gets held up on a thing of this kind, when he is forced to pay demurrage, after he has for a long time been using cars for storage, he does not like it, and it is very natural for him to try to get back at the railroad. If he has to pay a dollar a day demurrage, it is very natural for him to say: "Can't I get the railroad to pay this dollar to me in some other way?" And I think the word "reciprocal" as applied to demurrage simply means an attempt to get back. It is not reciprocal in the way of giving something, but it is an attempt to be reciprocal in the way of getting something back, generally.

If the railroads do not charge demurrage on their cars, then there grows up a set of merchants who do business in their hats and use cars for free storage. That you all understand. I do not think I need dwell on that, but I would like to say a word about what the railroads are doing in this matter, and what they have done.

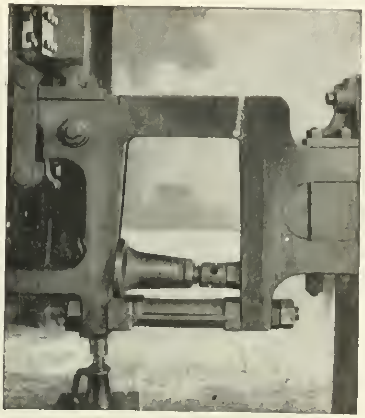
In the old days the car shortages were influenced and increased by the custom between railroads of charging each other for the use of cars by the mile. That put a premium on slow movement, and the movements of foreign cars in the country were then about what they were in New England; so the roads got together and decided to pay each other by the day. That was done about six years ago. They have increased the rate. During the extreme car shortage they got the rate up to 50 cents a day, and during that time they paid very considerable sums of money for our bureau in Chicago, which kept a very elaborate record to show where the cars were. The railroads have spent a great deal of money and taken a great deal of time to try to handle this matter properly. They are still at it. They have recently reduced the rate to 25 cents, because cars are not so scarce. They have appointed a commission of prominent railroad men to consider the subject and report, and I assure you that the railroads of this country have the question largely at heart. It is evoking more interest now than it ever has before.

The railroads understand now how important this thing is, and they are progressing toward a better method of car distribution much faster, I submit, than they will if one state attempts to tie them up in one way, and another state in another way.

A track watchman near Cologne, Hungary, for the substantial reward which the railroad usually pays to men who prevent accidents, unscrewed the nuts and removed the fish-plates at a rail joint, waited till an express train came in sight, and then laid torpedoes on the rails and brought the train up standing. The engineman, however, thought that the watchman had had plenty of time to fasten the joint after he saw him, and whispered his suspicions to a policeman. The next evening a tramp visited the watchman and said: "I saw your little game with the rail-joint. Bully for you! Of course I won't give you away; but when you get your hundred marks reward you'll let me have thirty, and then I'll be sure to remember." The watchman agreed, gave him a mark to bind the bargain, and agreed to meet him again the next day. The tramp was promptly on hand; but then he had his police uniform on. The watchman was tried and confessed. The State's Attorney said: "Judge, this is a serious matter. I ask for eight months in prison." The Judge said: "It is a serious matter indeed. Twelve months in prison and forever disqualified for any place in the railroad service."

Thermit Welding Instruction Book.

The Goldschmidt Thermit Co., New York, recently issued a book of instruction for the use of thermit in repair work, devoting particular attention to locomotive frame work. All through the book the writers urge the necessity of paying especial attention to the pre-heating of the parts before pouring the metal, and insist that the neglect of this precaution is apt to produce bad results.



Fracture on Locomotive Frame, Opened up by Drilling and Held in Place by Jacks in Preparation for Thermit Welding.

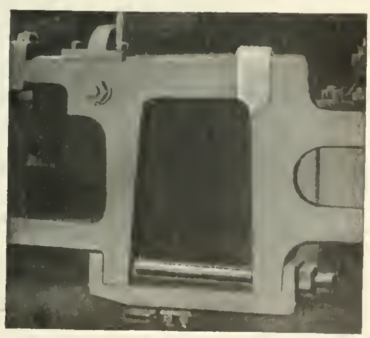
As the process has now become so extensively used for this class of repairs, the detailed instructions of the company cannot fail to be of interest to all who are called on to weld frames in division shops or roundhouses, where it is either impossible or undesirable to disconnect the frames from the cylinders and boiler. The instructions are as follows:

After having removed such parts of the engine as to make the fracture accessible and allow room for a mold box about 1 ft. wide, a series of holes should be drilled along the line of the break.

If the frame is a small one, ¾-in. holes should be drilled; if a large one, 1-in. holes.

Next clean the frame thoroughly at the fracture, as it is important that the thermit steel should come in contact with clean surfaces only.

The frame should now be placed in perfect alinement, and punch marks made on each side of the fracture within convenient reach of trammel points, yet far enough apart to be outside of the mold box, so that there may be no difficulty in regaining true alinement at the end of the welding operation.



Finished Thermit Weld on Locomotive Frame, with Reinforcing Collar Surrounding Fracture.

Jack the frame open about ⅛ in., to allow for contraction when the metal cast around the frame cools. The amount of this opening, however, must often be left to the judgment of the operator, as it depends on the width of the thermit steel collar.

Where the fracture occurs in a vertical member, or "leg" of the frame, it is necessary to construct a sand mold of such design as to cause the thermit steel to run through a gate to the lowest point of the mold and rise through and around the parts to be welded and into a large riser. The gate should not allow the thermit steel to impinge directly upon the metal of the frame, and the mold must allow for a band, or collar, of thermit steel to be cast around the defective parts or the ends of the pieces to be welded. The thermit steel flowing through this space in the mold will dissolve the metal with which it comes in contact and amalgamate with it, forming a reinforcement, which adds to the strength of the original piece, and must not be machined off entirely, although in case of necessity it may be removed from one or two sides.

The shape of this band, or collar, must resemble, in cross section, approximately the segment of a circle, the thickest part being directly over the fracture and sloping off gradually toward the edges. It should overlap the edges of the fracture at least 1 in.

The thicker the metal to be repaired the thicker must be the band of thermit steel, and the dimensions in general must make allowance for the nature of the repair.

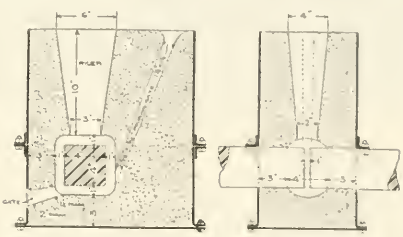
The matrix or pattern of the part to be repaired with the reinforcing band around it is first made, and from this a mold is constructed.

The best material for making molds is one part of fire sand, one part good fire clay and one part fire brick, thoroughly mixed in the dry state and moistened just enough to pack well.

As practically no two repairs are alike, the time and cost of making wooden patterns is considerable. A convenient way to make the molds for this class of work, therefore, is to use yellow wax as a matrix.

The parts to be welded are prepared for welding as previously described, and a wax pattern of the exact form desired in the final weld shaped about them, care being taken to fill up the opening between frame ends with wax. After this is done, molding sand is tamped around the matrix in the usual manner, except that a small hole is left at the very lowest part of the mold, as shown in the illustration. It is advisable to bend a small piece of copper tubing through the wax leading from the small hole at the bottom into the riser. This will make a passageway for the hot gases from the torch and greatly facilitate melting out the wax.

The patterns for runner and riser are best made of wood. Their volume should equal the volume of the reinforcement or collar which is cast around the fracture, as the first steel running out of the crucible into the mold becomes chilled when coming in contact with the metal of the frame, which, even when preheated, has a considerably lower temperature than the thermit steel. The chilling effect can only be overcome by a sufficient quantity of thermit steel, so that the chilled portion is driven up into the riser and is replaced in the reinforcement by metal which has practically the full temperature it received during the reaction.



Sectional Views of Mold for Thermit.

When the mold box is completely filled, the wooden runner and riser are withdrawn and the mold is then ready for the preheating and drying operation, which is performed without removing the mold from the frame, the wax running out during the preheating.

Place crucible in position with bottom directly over pouring gate and not more than 4 in. away. Charge crucible, but do not put in ignition powder.

Now direct the flame of a powerful gasolene-compressed air torch into the hole at the bottom of the mold and continue heating until the frame is red hot. It is important that the frame be red hot at the moment of pouring the thermit steel in order that blowholes and shrinking cavities in the weld be avoided.

When it is assured, therefore, that the frame is at a good red heat, quickly remove the torch and plug up the preheating hole with a dry sand core, backing it up with a few shovelfuls of sand packed thoroughly. Place one-half teaspoonful of ignition powder on top of the thermit in the crucible. (Thermit will not ignite from the heat of the torch and the reaction cannot be started without ignition powder. Ignite this with a storm match, applying same immediately after striking. When the reaction has ceased the thermit steel may be tapped into the mold by giving the tapping pin a sharp knock upward with the tapping spade.

In about five minutes from time of pour, release the screw jack and allow the frame to return into its original alinement, as shown by the punch marks. It is advisable, however, to draw up on the weld by means of clamps, jacks or other means, in order to relieve this section from the strains incident to the cooling of the metal in the weld and adjacent parts of the frame

Do not disturb molds for at least two hours after pour.

After removal of mold, drill through riser and knock off gate and riser.

It is important to remember that if the weld is to be made on one member of a double-barred frame, it is necessary to heat the other member with a torch in order to get equal expansion and contraction in both members and prevent unequal strains.

One cubic inch of steel weighs 4½ oz. To produce 4½ oz. of liquid steel requires 9 oz. of thermit. Therefore, to calculate the amount of thermit to use for any repair, first find as closely as possible the number of cubic inches in the reinforcement to be cast about the defective part. Double this to allow for metal in runner and riser. This number multiplied by nine gives the number of ounces of thermit to use.

A simple method of determining the amount of thermit necessary, when wax is used for a pattern or matrix, is to weigh (in pounds) the quantity of wax on hand before and after building up the matrix. The difference multiplied by 32 gives the weight of thermit required in pounds.

It is necessary, when more than 10 lbs. of thermit are to be used, to mix steel punchings or particles of steel, free from grease, into the thermit powder. The intensity of the heat of the reaction will be moderated thereby without interfering with the efficiency of the weld. In all cases the punchings should be preheated before mixing with the thermit. For 10 lbs. or more of thermit a proportion of 10 per cent. of punchings should be added. For quantities of over 50 lbs. of thermit, as much as 15 per cent. of small, mild steel rivets may be mixed in.

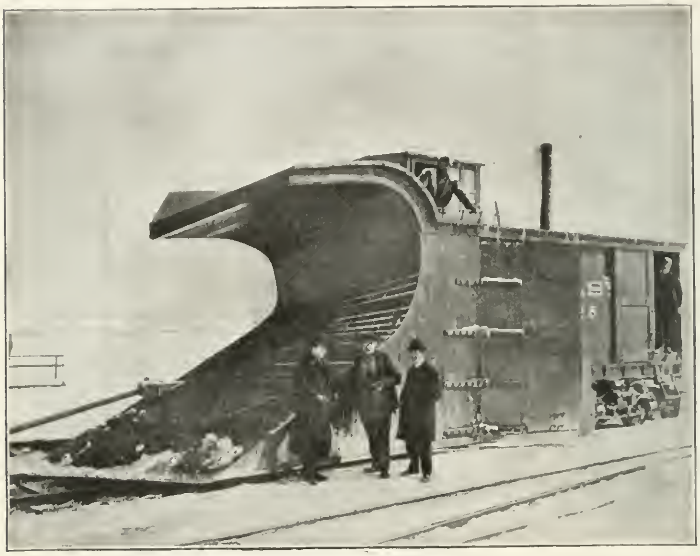
An addition of 2 per cent. of pure metallic manganese (based on weight of thermit) should in all cases be added, as this materially increases the strength of the thermit steel. Where metallic manganese cannot be had, however, ferro-manganese may be used, in which case 3 per cent. of the 20-80 alloy is recommended. The pure manganese is, nevertheless, preferred to the ferro-manganese, owing to the fact that where large quantities of thermit are used an addition of the latter tends to increase the violence of the chemical reaction.

The thermit reaction takes place in a magnesia-lined crucible, which has at the bottom a hard burnt magnesia stone. This latter again has a tubular opening, into which a small magnesia stone or so-called "thimble" of conical form is made to fit. This thimble provides the channel through which the liquid thermit steel is poured. The outlet must not be wider than ½in. After a few runs have been made the thimble should be replaced with a new one. It may be removed by carefully knocking upward and a new thimble, folded around with a layer of unereased paper, inserted in place.

The crucible is closed before charging with "plugging material," consisting of a tapping pin, asbestos washer, metal disk and refractory sand, made up in small paper packages and supplied ready for use.

First the tapping pin is suspended by its scarfed end, inside the "thimble." It must be cut down so that the end will project not more than 2 in. below the bottom of the crucible in order that it may be driven up when the crucible is to be tapped. With the pin cut to size and in place, close the top of the thimble first with asbestos washers and then with the metal disk. Ram firmly into place with the handle of a hammer, then cover with refractory sand. This is done to prevent the thermit steel from running out prematurely.

The crucible is tapped by knocking the tapping pin upward as previously described.



Type of Snow Plow Used on Quebec & Lake St. John.

Type of Snow Plow Used on Quebec & Lake St. John.

The Quebec & Lake St. John runs from Quebec north to Lake St. John, and from there east to the Saguenay river, crossing on the way several high ranges of hills. In this part of eastern Canada the winters are sometimes very severe. During the winter of 1907, for instance, there were very heavy snow falls, some great storms and almost continual drifting winds throughout most of the winter, yet through it all, while neighboring railroads were closed for days at a time, the Quebec & Lake St. John maintained its regular service.

This was accomplished by the efficiency of the snow plows used. One of these plows is shown herewith. They were designed and built by men on the road. They are built very solidly of heavy timbers. The wings and flanges are operated from the interior and thus form a combined head plow, wing plow and flanger. These plows exclusively have been used during the last 20 years and have done fine work.

For this information we are indebted to J. G. Scott, General Manager of the Quebec & Lake St. John, who built that road, as well as the Great Northern of Canada, now the Canadian Northern Quebec, which early in 1907 bought control of the Quebec & Lake St. John.

Car Surpluses and Shortages, March 18.

The following table is from bulletin No. 19-A of the American Railway Association's Committee on Car Efficiency. It summarizes the car surpluses and shortages from October 30, 1907, every two weeks to March 18, 1908, inclusive, being similar to the table published in the *Railroad Gazette* of March 27, 1908.

There is an apparent improvement in the general situation, the report for March 18 showing 17,950 less surplus cars. This decrease is more than covered in the coal car figures, the only other improvement of any consequence appearing in the flat cars, whose decreased surplus is more than offset by the increase in the surplus of miscellaneous cars. It is probable that a large proportion of the 20,000 less surplus coal cars can be accounted for by the action of railroads and coal operators in storing coal in anticipation of a suspension of labor at the coal mines on April 1.

The Southern, Middle Western and Southwestern groups show horizontal decreases in all classes of cars, indicating an actual improvement in all lines of traffic in those particular sections, which, however, have been somewhat behind the rest of the country in showing signs of a slight rally from the extreme depression shown in January and early in February. In the New England group the surplus equipment continues to increase. The Canadian roads also, which have heretofore shown the greatest improvement, are again accumulating idle cars. Except for those mentioned, there is little change in the group figures.

Surpluses and Shortages Bi-Weekly, from October 30, 1907, to March 18, 1908, Inclusive.

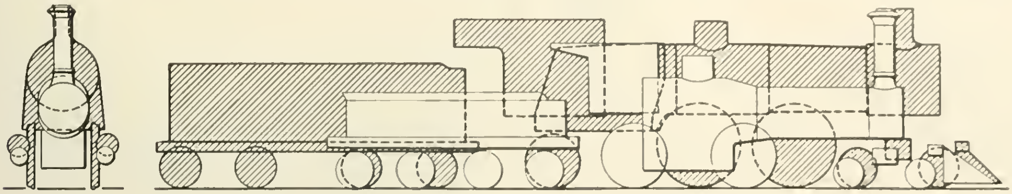
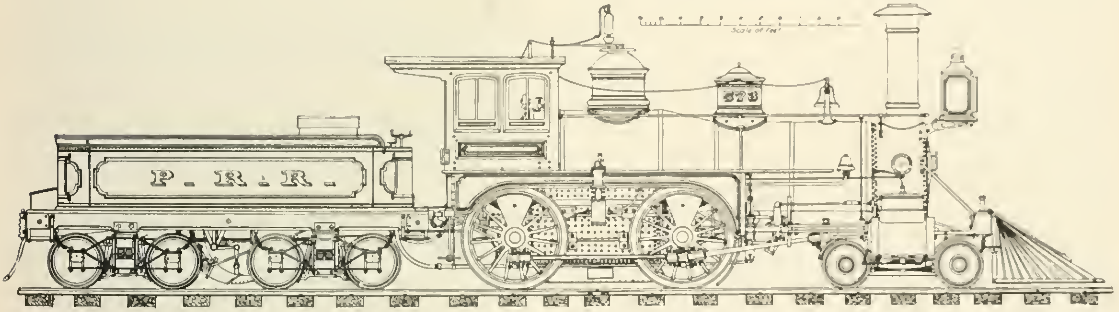
A Long Continuous Run of 1876, and the Engine That Made It.

BY C. H. CARUTHERS.

As early as 1875 the problem of making a run in 10 hours without a stop from Jersey City to Pittsburgh was considered by the officials of the Pennsylvania Railroad, and preparations were begun to carry out the idea. No. 573, one of the standard Class C^{III} (bituminous) passenger engines, the type at that time hauling nearly all through passenger trains on the various divisions of the road between Philadelphia and Pittsburgh, was selected for the trial. This engine had been built in 1872 at Altoona shops, and was in daily use on the Pittsburgh division. While exactly similar to all other engines of the class, it was believed to be a slightly freer steamer, and seemed to require less repairs than its mates. No particular changes were made on it except to equip the journal boxes of both engine and tender with rubber tubes which were carried to convenient locations to enable oiling to be done while running, and of course the entire engine was thoroughly examined and put in condition for such a run.



Comparative Sizes, Standard Passenger Engine of 1876 (C^{III}) and of 1908 (E3A).



P. R. R. No. 573. Built at Altoona Shops in 1872.

Cylinders, 17x24 in. Drivers, 62 in. Weight on drivers, 49,500 lbs. Total weight, 74,300 lbs. Firebox, 35x72⅝ in. Flues 155; 2¼ in. x 127½ in. Boiler, 48¾ in. diameter. Center above rails, 74½ in. Heating surface, 1,056.98 sq. ft.

To provide a sufficient amount of fuel, an ordinary baggage car was used as a storage room for coal and was also provided with a water tank. This latter was to enable the engine to maintain a sufficient supply of water between Huntingdon and Sang Hollow track tanks, a distance of about 75 miles, in which no provision had been made at that time for taking water without stopping, between the points named. The coal passers and other employees except those actually handling the engine also occupied this baggage car as a sort of waiting room.

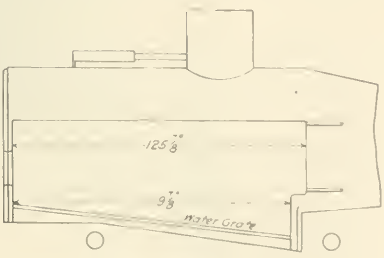
The coal used was especially mined for the purpose at one of the extensive bituminous coal mines near Irwin, in the famous "Pittsburgh" gas coal field. William Phillips, the regular engineman of 573, accompanied it during the entire trip but only ran it over his own division, as enginemen from each of the other divisions were on the train and ran it over their respective divisions.

The western enginemen were somewhat amused at hearing for the first time, during this trip, trips at a nomenclature prevailing at that time among some of the employees of the New York division, and which was evidently derived from the days of the hook motion, not then so very remote, when I believe it was customary for enginemen to say, "Hook her forward," or "Hook her back," and when these men referred to the position of the reverse lever in the quadrant, they substituted "Link her up" and "Link her down" for the western "Drop her down" and "Cut her back."

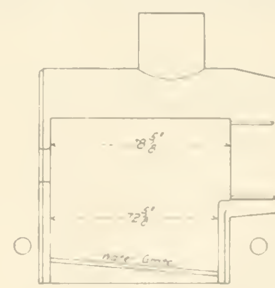
When the final preparations were completed, a start from Jersey City was made on an autumn day of 1875, and at first everything indicated a successful termination of the trip, but when the train was in the vicinity of Pomeroy, Pa., 131 miles west of Jersey City, a young man connected with the motive power department of the company, was struck by a milk shed and killed as he leaned from the car steps in an attempt to see a journal box which he thought was heating. Of course the train was stopped and the experiment was abandoned for the time, and it was not again attempted until during the early summer of 1876.

It was then taken up in connection with an attempt made by a theatrical organization to travel from New York to San Francisco in 84 hours. In addition to engine 573, and its special baggage car of the former trip, the train consisted of a P. R. R. combination car, a Pullman hotel car and one Pullman sleeping car. All the cars were fitted with rubber oiling tubes like the tender and engine, and also had openings provided in the floors to afford access to the journal boxes. The cars used on the first attempt were prepared in the same manner and it is singular that the young man who lost his life on that occasion should have attempted to watch a journal box from the steps instead of through these safe and convenient openings.

The start was made at 1.03 a.m. June 1, 1876, three minutes after the appointed time on account of waiting for some special newspapers which were to be sent along, and without any subsequent hindrance the train pulled into the Union Station in Pittsburgh promptly at 11 a.m.—just nine hours and 57 minutes after the start from Jersey City. The fastest time during the run was said to have been made over a strip of four miles on the New York division which was covered in three minutes, and the slowest speed was that of 20 miles an hour observed while passing through the Altoona yards.



Firebox of C^{IV} Anthracite.



Firebox of C^{III} Bituminous.

Engine 573 was disconnected from the train at Pittsburgh and also the three cars belonging to the Pennsylvania Railroad, but the Pullmans were in a few minutes started out over the Pittsburgh, Fort Wayne & Chicago Railway on their way to the Occident, the Pennsylvania Railroad conductor accompanying them. This latter part of the trip was claimed to have been made in such time as brought the entire trip within the 84 hours desired from coast to coast, but the interest of railroad men centered chiefly in the 10 hour run without stopping between Jersey City and Pittsburgh.

The line had been kept well cleared to insure success, and the long summer daylight prevailing at the time enabled over 300 miles of the distance to be run after sunrise, so that its progress was watched with enthusiasm by large numbers of people along that portion of the line.

The principal dimensions of 573 were:

Cylinders	17 x 24 in.
Driving wheels, diameter	62 "
Weight on drivers	(about) 49,500 lbs.
Total weight	74,300 "
Firebox	35 x 72⅝ in.
Flues	155
" outside, diameter	2¼ in.
" length	127¹/₁₆ "
Heating surface	1,056.98 sq. ft.
Boiler, diameter	48⅝ in.
Boiler, center above rails	74½ "
Driving wheel base	102 "
Total wheel base of engine	22 ft. 5⅝ "
Length over all of engine and tender	54 ft. 5⁹/₁₆ "
Steam pressure, maximum	125 lbs.
Fuel	Bituminous coal

A full-stroke pump on the right-hand side connected to the crosshead, and a non-lifting No. 7 Sellers injector on the left, furnished water to the boiler. Bridges had not come into use on the road when this engine was built and the tallow-cups, and valves for blower, heater and injector were tapped directly into the roof sheet at various points on its surface where it was projected into the cab. A surface cock, or "skimmer" as the men called it, was placed in the boiler head at about the same level as the upper compression gage cock. When first built the engine had no driver brake, but I think one had been put on before the time of this trip. It will also be noticed that the headlight numbers are wanting, that feature not having been introduced until two or three years later; and also that the smoke-box is of the pre-extension type, the extension having only been adopted on the road after 1880.

The stack, although of the straight type, contained a system of spark arresting devices invented by James Smith, an employee of the company, about 1870, and used thereafter on all passenger engines until the coming in of the extension front. The valves were of plain D type with a travel of 5 in. and ¾ in. lap.

Between 1873 and 1877 a large number of "C" engines were built to burn anthracite coal on the New York division, and only differed from the 573 in the firebox, which was 34½ in. x 119⅞ in., necessitating it being carried quite through the cab and against the cross frame at the rear, and in being furnished with bridges upon which the tallow cups, blower and valves for heater and injectors were placed. The throttle lever and glands were also on the rear end of this bridge, and the stem extended through the bridge and its pipe into the dome. These latter engines were known as Class Civ, anthracite.

All of both types have been off the road for several years, some having been scrapped and others sold. During the later years of their service several of the Civ type had 68 in. drivers substituted for the original ones of 62 in.

The writer is under obligation to Theo. N. Ely, Esq., Chief of Motive Power of the Pennsylvania Railroad, for courtesies which enabled the verification of a considerable portion of the data from which the foregoing article was compiled.

The Work of the Bureau of Explosives.

The report of the Chief Inspector of the Bureau of Explosives of the American Railway Association, Major B. W. Dunn, U.S.A., has been submitted, covering the work of the Bureau from June 10, 1907, to February 1, 1908. From the report we select the following extracts:

On June 10, 1907, the Chief Inspector's office was opened and there was presented to him the problem of organizing the work of the Bureau. In the many difficult situations that have arisen he has received from the executive committee, and especially from the President and Secretary, assistance and advice that have been invaluable and that have been given, not only without financial compensation, but without regard to the demand on their already overtaxed time.

A preliminary study indicated that sound judgment and tact would be necessary to secure success. The agents of the Bureau are invested with authority under specific circumstances, but it was realized that the unwise exercise of this authority would be more than objectionable. These agents are employees of each member of the Bureau and they work over any line under the direction and authority of its General Manager. It is a natural but a mistaken tendency to regard them as representatives of foreign authority. It was also appreciated that the Bureau would have to deal with both operating and traffic departments and that restrictions recommended by it might be unwelcome to those officials whose duties include the difficult one of placating customers. It affords me pleasure to report that, as a rule, hearty encouragement and support have been received from all railroad officials. It was also realized that manufacturers would suspect our motives in entering their property and criticising their methods. They are divided by competitive issues, and the fear that restrictions placed upon them may not apply with equal force to their competitors is natural.

Careful consideration of all these conditions led to the conclusion that while the policy of the Bureau would be to secure, ultimately, uniform enforcement of regulations, it would be necessary to recognize the fact that the introduction of radical changes requires time proportional to local conditions and obstacles. For example, to insist upon immediate correction of the custom of disregarding almost entirely the furnishing of cars that meet requirements, would paralyze the business of the shipper. After an appreciation of the facts by operating officials, some time is necessary for them to provide the necessary facilities for selection and preparation of cars. In a similar way, the manufacturer who has been violating most of the regulations, and shows a willingness to reform his methods as rapidly as possible, should be given a reasonable time to do so with the important provision that positively dangerous practices must cease at once, even if this requires an embargo on all of his shipments.

The organization of the Bureau includes a Special Agent and 17 Local Inspectors charged with the inspection service; a Chemist and one laboratory assistant and an office force of five in addition to the Chief Inspector.

The following statistics indicate the inspection service of the Bureau during the period stated:

Stations Inspected.	
Total number of stations inspected	1,116
Stations found not supplied with blanks and placards	628
Stations found where violations as to loading, handling, placarding, and forwarding explosives were observed	561
Stations found where leaking explosives had been accepted for shipment	30
Factory Inspections.	
Total number of factories inspected	141
Number found not complying fully with regulations	94
Number found failing only in minor details	47
Number found to be failing in important regulations, i. e., driers, boxes of less than required thickness, no lining to boxes, more than 60 per cent. dynamite made and shipped	47
Magazine Inspections.	
Total number of magazine inspections	583
Number of magazines in which black powder stored showed defects in marking	105
Number of magazines in which high explosives stored showed defective marking	60
Number magazines in which leaking kegs of black powder were found	9
Number of magazines in which high explosives were stored in boxes less than required thickness or not lined	134
Number of magazines showing dirty floors stained with nitroglycerine	119
Number of magazines in which high explosives stored were found in leaking and dangerous condition	59
Inspections of Cars in Transit.	
Total number of cars containing explosives inspected in transit or after arrival at terminals	178
Number of cars which did not comply with regulations as to preparation, loading, placarding, etc.	127
Number of cars showing movement of lading, account improper loading and staying, or conditions such as would permit an accident	99

The following are examples of cars inspected, showing some violations observed:

Car No. 69,333 containing over two tons of dynamite was inspected and found with cracks in roof, sides and ends; packages were insecurely braced, light material having been used, and this bracing had given away, permitting the packages to shift and slide about the car. Prohibited articles, consisting of loose iron pipe and roll of wire cable in upright position, were loaded in the car; placard on one side only.

Car No. 8,039 was inspected and following result shown. Car of 50,000 lbs. capacity, contained loose boards, cracks in roof and ends, doors not tight and not stripped to prevent entrance of sparks; floor not clean, and had projecting nails and bolts; king bolt not protected, extending ½ in. above car floor; packages of dynamite (6,850 lbs.) were not stayed in any way and had during transit been knocked about the car, one box having lid off and cartridges exposed. Prohibited articles, in form of blasting caps and fuse, were loaded with the dynamite. One door of car partly open, and car without required number of placards.

Car No. 1,060 on inspection was found to contain miscellaneous merchandise, black blasting powder, matches and oil; car had crack in end sufficiently large to permit entrance of sparks.

Car No. 88,513 loaded with 10,000 lbs. black powder (blasting) was found with large holes in end of car and over doors. Kegs had not been properly stayed and had shifted, breaking open some of the kegs and spilling powder on car floor.

Accidents in factories in 1907 are shown in the following table:

	Dynamite.	Black powder.	Other explosives.	Totals.
Number of accidents	26	20	20	66
No. of injured, but not fatally	15	33	14	62
Number killed	36	57	8	101
Property loss	$209,900	$17,100	$52,400	$279,400

It is difficult to get reliable information of the causes of accidental explosions, and especially difficult in factory explosions. The amounts stated as covering the property loss do not include many of the explosions and are therefore incomplete. The Bureau has no legal or other right to insist on investigations by its representatives, and manufacturers do not welcome the presence of strangers on such unfortunate occasions.

Among the accidents in transportation during the year 1907 were the following:

January 19, 1907. Sanford, Ind.—Car containing 500 kegs, 12,500 lbs. of black rifle powder, manufactured by American Powder Mills, West Acton, Mass., in train 21 cars from engine and 12 from caboose, between box cars loaded with merchandise—took siding at Sanford. A passing train, consisting of engine, express car and two coaches had reached point where express car was opposite car containing powder when it exploded. Six freight cars were destroyed; express and passenger cars destroyed. Fifteen persons killed; 30 injured; property loss, $30,000; equipment, $13,150; total loss, $43,150, exclusive of damages for loss of life.

Cause: Unknown. It was claimed to be due to criminal act of outside party. It is possible that cars had, during course of transportation, received shocks sufficient, with imperfect staying, to cause powder to leak from kegs, making a train of powder which was set on fire. It is stated lightning struck the car—no evidence.

March 24, 1907. Atlanta, Ga.—Eight boxes of blasting caps, weight 970 lbs., made by the Metallic Cap Mfg. Co., exploded while being handled by employees. Four killed; four injured.

Cause: Unknown. It is possible that one of the handlers used his hook and struck one of the caps which detonated and caused the others to explode. It is also possible that a box was dropped and exploded by concussion.

April, 1907. Covington, Va.—Car containing 16 bbls., 9,400 lbs., permanganate of potash caught fire and burned the car.

Cause: Probably caused by spilled material mixing on floor of car with some combustible substance. Such a mixture is inflammable and can be ignited by friction.

June 4, 1907. Reddick, Ill.—Six hundred (60-lb.) boxes of black powder exploded while in transit.

Cause: Tank car containing naphtha was derailed, causing a number of other cars to leave the rails; fire started and spread to car containing powder. Explosion occurred; three killed; 17 injured. Property loss, $25,279. Damages for loss of life, if any, not known.

July 21, 1907. Becks Hot Springs, Utah.—Car partly loaded with black powder on siding caught fire from spark of engine from train which passed about 3.28 p.m. Three other cars on siding contained dynamite (amount not stated, probably 2½ carloads), and these exploded at 4.15 p.m. Property and equipment loss $10,891.

Probable cause: Car with poor roof used.

Aug. 10, 1907. Boulder, Colo.—Two thousand one hundred lbs. Hercules dynamite and 200 lbs. Atlas du Pont powder. Hercules was manufactured July 25, 1907. Result: Three deaths; five injured; loss $200,000.

Cause: Fire started in freight depot which was destroyed; spread to car containing dynamite and explosion occurred. Regulations covering storage of cars containing explosives evidently not followed. This car should have been placed in safe place where there was no danger of fire. There were 38 freight cars destroyed.

Aug. 11, 1907. Essex, Ontario.—A shipment of 5,000 lbs. of 60 per cent. dynamite cartridges 18 in. long, exploded in a car located in a mixed train between the engine and a coal car.

Cause: During a hot wave of weather the shipment was loaded without staying, in a way car, at Black Rock, N. Y., consigned to Amherstburg, Ontario. During the trip conductor noticed several boxes standing on end, but did not correct the fault. About 24 hours after these boxes were observed to be on end, small explosions were heard which, by investigation subsequent to accident, were attributed to drops of nitroglycerine falling from car to wheel and exploding by pressure of wheel on rail. Conductor with two members of crew entered car and turned boxes on sides. It is probable that this uncovered some hole in car floor, previously partially closed by weight of box, and that a large enough quantity of nitroglycerine reached the wheel during the stop to make the next explosion, just after starting the car, strong enough to cause the explosion of entire lot. At this time the Bureau had not been able to inspect the railroad or instruct any of its employees in our regulations. It can be stated with confidence that a strict enforcement of these regulations would have prevented this unfortunate accident.

Aug. 17, 1907. Ohio street dock, Buffalo, steamer "Utica"—Barrel "liquid cement" in being loaded, fell, broke and scattered contents over floor of hold. Three men with shovels were being used to collect the cement, and a man was engaged in placing shavings around the wet floor. The gaseous vapors became so strong that some of the men complained and left the hold. One man stated he would put a head in the substituted barrel. An explosion then occurred and enveloped the hold of the steamer in flames. Three men killed; two injured.

Cause: Ignition of mixture of inflammable vapors and air by spark from hammer and nail or other source of fire.

Aug. 17, 1907. Kingston, N. Y.—Six barrels "cement" (rubber) loaded with merchandise, on arrival at Kingston were found to have leaked on car floor, and odor of naphtha was perceptible. Railroad employees entered car with lighted lanterns, fire started and burned freight house, several cars and contents, causing a loss of $139,841.

Test of cement from these shippers showed the solvent to be 80 deg. gasolene, the most volatile and inflammable grade on the market.

Recapitulation of the accidents in transportation in 1907 shows the following figures:

	Number			
	Accidents.	Injured, not fatally.	Killed.	Known property loss*
Dynamite and high explosives	6	27	9	$335,891
Black powder	3	47	18	68,429
Other explosives	2	2	..	
Inflammables	6	2	4	139,841
Totals	17	78	31	$544,161

*Including equipment

Respecting the relation of the Bureau to its members the Chief Inspector speaks as follows:

No friction of any kind has occurred in this relation. Our inspectors seem to have shown the good judgment and tact emphasized in the list of qualities that guided their nomination and appointment. Effort has been made to keep this relation as harmonious and intimate as possible. Several profitable conferences between the Chief Inspector and bodies of such important railroad employees as station agents and yardmasters have taken place with a view to perfecting the details of regulations. In many cases the Chief Inspector has served as a useful medium in conducting investigations to determine responsibility for violations, where the correspondence would otherwise have had to take place between the officials of different lines. The advisability of having a disinterested party conduct such correspondence is apparent.

In August, 1907, two cars containing a total of 40,000 lbs. of dynamite were held up in Buffalo, N. Y., because this dynamite was of the same grade and from the same factory as that which had exploded a few days previously while in transit at Essex, Ont. The switching road was unable to send the cars forward to destination or back to the factory; and in the meantime it was holding them illegally within the city limits. By report based upon careful inspections and chemical analysis of samples, the Bureau was able to secure forwarding of the cars to destination under immediate supervision of one of the local inspectors. If the shipments had been too dangerous to forward, it would have been necessary to destroy them, and this would have emphasized, to a still greater degree, the necessity for the services of experts of the Bureau.

It is intended to arrange to have the Chief Inspector, or a representative, attend as frequently as possible during the ensuing year, the stated meetings of operating officials of our membership lines, to discuss the transportation of explosives, answer questions concerning regulations, explain the general plans and policies of the Bureau, and in every proper way to stimulate interest in our work and increase knowledge of our regulations.

The relations of the Bureau to the Manufactures of Explosives are thus described:

It was soon appreciated that the good will and active co-operation of manufacturers are essential to an enforcement of our regulations among their employees. Without their co-operation we could not secure enforcement, even if we maintained an inspector at each of the 164 plants. The basic idea in seeking this co-operation has been to convince the manufacturers that our efforts for greater safety are in line with their interests and that we can be of material assistance to them. When we discover an explosive in bad condition, we endeavor to locate the cause and to furnish full information in regard to it to the manufacturer, with such suggestions as our experience may indicate to improve the product. Our broad experience, based on our connection with all manufacturers and many railroads, will also enable us to place at the disposal of each manufacturer the best methods for loading explosives in cars. We do not disclose, of course, to one plant the improved manufacturing practices in vogue at others, where the information given would be adverse to the interests of the more progressive manufacturer, nor do we violate in any other way the confidence under which information of this kind is imparted to us.

As was anticipated, we were met at the beginning with a frank statement of suspicion that we would not apply our restrictions impartially and uniformly. The small and independent manufacturer could not conceive that a Bureau of this kind would be operated otherwise than in the interests of the larger plants. By exercising proper patience in dealing with individual cases, it is believed that we now have the complete confidence of practically all of the manufacturers. In November, 1907, there was a general acceptance by them of an invitation to meet the Bureau for the purpose of discussing proposed changes in regulations. They appreciated this opportunity to express freely their objections to all proposed restrictions. Each restriction was taken up in turn in the spirit of impartial discussion and with a view to indicating clearly the reasons that prompted it. One result of this conference was the appointment by the manufacturers, at the request of the Bureau, of a committee to represent them in order that future conferences with the Bureau could take place promptly, each member of the committee representing a number of allied interests. The knowledge that through this committee they will have an opportunity to present, in friendly discussion, their side of any controversy, has had a very salutary effect. It has been made plain that, since the responsibility for any explosions in transit rests entirely on them, the railroads, through the American Railway Association, must retain the right to make a final decision on regulations.

The importance of proper staying of packages of explosives in cars is stated below:

The best of packages are liable to receive injury during transit if not properly stayed. While our regulations have required proper staying, no standard methods have been prescribed, and those in practice are almost as varied as the number of manufacturers. Different methods are used even by plants under the same general management. It is evident that some one method is the best for a particular style of package. The members of this committee of manufacturers were invited to study this subject and to bring to a conference that took place on January 17, 1908, detailed descriptions, drawings and photographs. A day was spent in discussing various suggestions, and arrangements were made for a practical test of what seemed to be the best methods. In these tests, cars loaded with dummy packages will be given as rough treatment as a car should receive in transit, and in due time we shall know what the best methods are. A pamphlet will then be prepared for general distribution describing these methods in order that all staying by manufacturers and railroad employees may be in accordance with them. The result will be a material increase in safety, and, in many cases, this will be obtained by a saving of some labor and material heretofore expended.

The regulations for the safe transportation of explosives and other dangerous articles in their present and in the proposed revised form are treated at length. In this connection the report has the following statement:

The exhaustive and able work of the committee on transportation of explosives during the spring and summer of 1905 resulted in the regulations that were adopted by the American Railway Association in November, 1905, and have been in force since that time. It is natural that an experience of about 2½ years should indicate a number of advisable changes. With the assistance and co-operation of the executive committee, the Chief Inspector has endeavored to revise these regulations. The first revision was published in the proceedings of the Association for October, 1907, and since that time additional changes have been made as a result of the various suggestions received. A galley proof embodying these changes has been distributed to General Managers, and it is anticipated that the final revision can take place in the near future. It is natural that the anticipation of revised regulations should interfere with the enforcement of the present ones, and it is earnestly hoped that the new regulations can be put in effect not later than March 1, 1908.

The following are some of the general ideas that governed the revision:

(1) Definitions and information to be used principally by manufacturers, shippers and inspectors have been collected in Section I. The rules governing the action of all concerned have been placed in Section II. All of the rules referring to packing and marking, and to preparation of a car for any particular explosive, have been brought under one head.

(2) Some relaxation of requirements affecting small shipments of the more dangerous explosives, and large shipments of the safer ones has been permitted in order to facilitate a more strict enforcement of precautions in handling the more dangerous shipments. Even if an explosion of one of these small shipments should occur as a result of this relaxation, the damage will be relatively small, and we shall be benefited, on the whole, if we prevent an explosion of a large shipment. When a large proportion of cars require special treatment it is natural that trouble should be experienced in securing it. The more limited the number of such cars, the easier will it be to secure it.

(3) Elements included under the general head of ammunition have been separated and will be shipped under their proper names.

(4) The authority to use an annual certificate, heretofore granted for small-arms ammunition, has been extended to all kinds of explosives. It is believed that a general certificate from a responsible party will be as effective as the special one so many of which have been required that their use has become perfunctory.

(5) Some relaxation has also been introduced in the requirements affecting the loading of different kinds of explosives in the same car. It is believed to be a correct general principle that any vacant space in a car containing explosives, with a certain attending risk, can properly be used for any other explosive having no greater risk and not bearing to the explosives in the car a special relation which would increase the risk for both. Such a relation is found in the transportation together of detonators and high explosives.

(6) At the end of the regulations is introduced a condensation of rules arranged for the various railroad employees. This should be of material assistance to them and will save the time required to extract the paragraphs referring to them.

It was intended to have the Bureau supervise the transportation of dangerous articles other than explosives. These articles are included under the general term "inflammables." It is well known that while many railroads have published regulations for this traffic, their employees as a rule treat these articles as ordinary merchandise. Where the regulations are enforced, it is usual to require employees to attach to packages labels conveying general cautions for handling. The attachment of these labels is followed by the attachment to the car of placards calling for special treatment of the car. For guidance of employees in labeling packages it is usual to furnish a list giving the trade names of various articles whose natures bring them within the class of inflammables. This list is long and, even if railroad agents were accomplished chemists, they would not have the time to determine accurately in any given case, whether a package required a label. The result is that they either neglect the regulations, or, to be on the safe side, they label all suspected packages. The latter is the usual case, and it results in placarding so many cars that the regulation defeats itself and special treatment for these cars is not obtained.

While adopting the general principle of labeling packages and placarding cars, the regulations proposed by the Bureau place on the shipper the duty of attaching labels and furnish him with definitions for his guidance. It will be the duty of our inspectors to check the performance of this duty by the shipper in conjunction with the check afforded by the general knowledge of station agents. It is manifestly impracticable to require these labels on all packages of the defined articles without recognizing the fact that very small quantities, even of some of the dangerous ones, can be carried without great risk, and without recognizing also the unnecessary hardship of requiring shipments from the retail drug trade and other sources, containing small quantities of inflammable materials, to have labels attached. At the same time a general limit for the maximum quantity that can be transported without a label will not be applicable in all cases, and some elasticity in the regulations is necessary. This has been obtained by the suggestion that the Chief Inspector be permitted to make an examination in any given case and, after consideration of all important factors, to prescribe for the given article, packed in a given way, the maximum quantity that can be received without a label. As in the case of explosives, it is permissible to transport limited quantities, even of labeled packages, without placarding the car. This limit has been placed at 100 lbs. gross weight.

Shipments from storage magazines form a considerable proportion of the explosives transported by the railroads. Concerning them, the report says:

So far as known, no attempt was made before the organization of this Bureau to locate these magazines, and the additional danger attending shipments of explosives offered by them was not thoroughly appreciated. To appreciate it it is only necessary to remember that many explosives are liable to deteriorate with age and at a rate dependent upon the conditions of storage. The shipments offered at factories are usually freshly made and comparatively safe. Shipments offered by magazines may have been stored for indefinite periods and under unfavorable conditions. It is recommended that Article VI. of the Constitution of the Bureau be amended to make storage magazines a basis for assessment.

The inspection service of the Bureau is its most valuable service. An idea of what has been and what is still to be accomplished may be had from the following extract:

In the first assignment of our inspectors one man was placed on duty on some railroad with instructions to make a general inspection of the whole line. These inspections included stations, factories, magazines and cars in transit. Separate blanks were prepared for his report under each head, and he made frequent summaries by letter of his observations, sending copies to the Chief Inspector and to the railroad officials under whose direction he was working. On completion of his general inspection of the entire line, a consolidated report of his observations was prepared in the office of the Chief Inspector and sent to the General Manager of the line for his information, and such action as seemed to him advisable. During this work the inspector acted somewhat as a skirmisher in advance of an army. It was his duty to locate the points where the inspection work of the Bureau is needed and his search for these points was frequently attended by loss of time, especially in sections of the country where train service is infrequent.

The second step in regulating the work of these inspectors, now in progress, is to divide the United States and Canada into 17 districts, assigning each man to a district and requiring him to become familiar, as soon as possible, with the conditions in his district, so that his time can be used to the greatest advantage. This system was started at the beginning of the present year. When an inspector becomes familiar with the points in his district where shipments of explosives originate, and acquainted with the railroad employees connected with these shipments, he will know where his services are needed and he will be able to follow up his inspections to secure correction of violations discovered by him. Experience shows that practically all of the violations of regulations that have been discovered at stations can be included in a comparatively short list of about 16 paragraphs. The blanks have been revised to show these violations and an inspector will have only to check off on the printed list the violations discovered at any station. Under the new system he will leave a copy of this checked list with the railroad agent in order that this agent may not forget the faults to be corrected. Copies will also be sent to the Superintendent, to any other railroad official who may be designated to receive them, and to the Chief Inspector. On subsequent inspection of the station the inspector will call for the previous list of checked violations and will ascertain whether they have been corrected.

With a district covering, in the case of one inspector, over 20,000 miles of railroad line, it is evident that an inspector cannot reach all of the points in these extended districts as often as is desirable. In some sections it is probable that little traffic takes place in explosives, and that the number of points requiring periodical visits from him will not be proportional to the mileage of his district. Until all of these districts are worked over, it will be impracticable for the Chief Inspector to state exactly where his inspectors are needed and how often. As soon as it becomes evident that the points in any one district are too numerous to be checked properly by one inspector, it will be advisable to put another inspector into this district, or to snb-divide it. This will mean an increase in our expenditures. It will be for the members of the Bureau to decide whether these increased expenditures will form a profitable investment.

The volume of inspection work necessary to secure uniform enforcement of regulations is shown by experience to be much larger than was appreciated when the organization of the Bureau was proposed. It was estimated that five or six inspectors might suffice. We now have 17 on duty. The following statements are instructive:

Total number of lines which are members of bureau.......	93
" lines which have received first general inspection....	32
" " " have received partial inspection	9
" " " are now being generally inspected and not included in above......	25
Lines assigned to inspectors and which will, as soon as practicable, receive inspection.	27

Based on data now available, it is estimated that, even with our present membership, the services of our inspectors will be required periodically at 3,000 widely distributed stations, factories and magazines. In 1,663 "one man working days" we have inspected, since August 1, 1907, 1,840 points, an average of over one point per man per day. If we have an inspector visit each point once in three months (see Section 2, Article IV. of by-laws) we shall need, at the above rate, 40 inspectors. With our present force we cannot expect to visit each point once in six months. We are about to issue regulations for the transportation of inflammables, and the volume of this traffic is many times that of explosives. The work of checking the proper use of labels by the shippers of inflammables is essential, and it cannot be done satisfactorily by station agents. Our inspectors should be numerous enough to secure periodical inspection of the packing departments of the large shippers of inflammables, and at least some supervision of the small ones. An increase in our force of inspectors will necessitate increases in our office and laboratory employees to meet the increases in correspondence and in number of samples submitted for analysis.

The questions opened by this glance into the future are serious. The Bureau has undertaken a work of unsuspected magnitude. If it does not secure the financial support required, how shall we decide what to neglect? If our neglect of the larger part of our natural work is evident to all, shall we not be voted a failure, irrespective of any excellence in our limited efforts? The Chief Inspector undertook the organization of the practical work of the Bureau under the impression that the task would be completed within a year, after which he would be free to return to the duties of his profession, and he views the matter now from a standpoint that would be entirely disinterested if it were not for a pardonable pride in his work and a desire, before surrendering this work to a successor, to see the Bureau well established in its field of usefulness. It must, at this critical stage, either advance or recede; it cannot stand still. It has not been forgotten that the executive committee authorized, on October 29, 1907, an increase of our inspecting force to 25. This has not been done because of the strong impression received from the treasurer, and confirmed by correspondence of this office, that a rapid increase in our assessments, while members were in doubt as to the value to them of our work, would seriously endanger the life of the Bureau.

Our records for 1907 show six major accidents from explosives and one large fire from a shipment of inflammable liquid. The total of the known losses was over $500,000. The value of property destroyed and damages paid do not represent by any means the total loss. We must consider, although we cannot evaluate, the losses to delays in traffic, loss of business and, most of all, loss of confidence and of prestige. To ensure the uniform enforcement of the regulations as adopted, regular inspection of the manner in which they are being enforced is necessary. The promulgation of the regulations, which has been wanting, however, in a few instances, is not by itself sufficient, as has been ascertained, to ensure uniformity or efficiency in their observance. Expert instruction in the requirements of the regulations has been and will be essential, in order that they may be understood and applied in their entirety by the different classes of railroad officials and employees responsible for their execution as well as by the manufacturers and shippers of explosives. Approved methods of handling, loading, etc., must be communicated by the inspectors. Stations at which explosives are received, forwarded or delivered, require inspection in every detail of the requirements for safe transportation. Factories and magazines must be located, their methods ascertained and brought up to the standard of the regulations. Violations of regulations, whether resulting from ignorance or negligence, must be discovered, corrected and provision made against their recurrence. In order to guard against the shipment of explosives in a dangerous condition, either through deterioration or by improper packing, station agents must be instructed in the methods by which deterioration may be known by its evidences, and compliance with the required specifications for the packages must be rigidly insisted upon. It is through the inspectors that the information is communicated, and it is by them that the Bureau is informed as to the observance of the regulations by the different lines.

There are more than 160,000 railroad employees whose duties bring them in contact with the handling of explosives. These men have been found, for the most part, anxious to be instructed and ready to profit by the instructions given them. The difficulties encountered in the construction of the regulations are often cleared up where the reasons for them have been explained. The determination of the condition of shipments of explosives presents little difficulty after the causes of bad condition have been explained, and instruction given as to the evidences of it. In this way knowledge produces confidence, and, at the same time, impresses the necessity for the careful observance of the safeguards prescribed for transportation. That the results obtained in the directions stated are what they are, is a high tribute to the zeal, intelligence and efficiency of the inspectors, the most of whom have acquired their experience in the transportation of explosives since their connection with the Bureau. The wide extent of the field covered by their inspection, the limited number of the inspectors, the organization of the system literally from the beginning during a period of only seven months, are all to be considered in estimating the value of their work, which is full of the promise of usefulness, enriched by experience, and under conditions of improvement already apparent in many directions. With its present force and necessary increases in clerical and laboratory force, the cost of the Bureau for the year 1908 will be about $80,000, with 25 inspectors, $105,000; with 40 inspectors, $150,000.

In the suggestion for a campaign for the education of railroad employees, the Chief Inspector reports that steps have been taken to have some of the traveling agents of the railroads assist the Bureau in the enforcement of the regulations. These agents are to receive instruction from the Local Inspectors and will be used to aid in the work of the inspectors on the lines on which they are employed. The employees who could assist in this way are Traveling Auditors, Traveling Freight Agents, Traveling Car Agents, Division Agents, Insurance Inspectors, etc. A majority of the membership has approved this suggestion, and has arranged to put it into effect. This will prove in time a valuable auxiliary to the inspection service of the Bureau.

Arrangements are also being made in a preliminary way for representatives of the Bureau to attend as often as practicable meetings of classes of railroad employees to be formed at the railroad branches of the Young Men's Christian Association, for the purpose of studying the general features of explosives and their safe transportation. Popular lectures will be given on these occasions and the opportunity afforded to have the employees ask questions in regard to the regulations and to be fully informed as to the reasons for them. Among the 160,000 railroad employees of this country a large percentage have duties in connection with the transportation and freight traffic departments and thus have to do with the direct handling of dangerous articles. Their education about dangers to be avoided and the way to get greater security for life and property can be thus readily afforded.

The report concludes with the recommendation that the present and prospective conditions be brought forcibly to the attention of the members in order to learn their wishes in regard to the amount they are willing to spend in the support of the Bureau. Assuming financial support, it is recommended that the Chief Inspector be directed to increase the force of inspectors at once to 25, and to make thereafter, during 1908, such further increase, not to exceed 40, as may be necessary to secure, as often as once in three months, a thorough inspection of all factories and storage magazines, and of all stations on the lines of the members where shipments of explosives are handled.

An interesting exhibit of the territory included in the assignment of the Local Inspectors accompanies the report.

Freight Tank Engine of the Prussian State Railroads with Schmidt Smoke-Tube Superheater.

The saving in water and coal by the use of highly superheated steam on locomotives is particularly important in tank locomotives, as in this way their radius of action can be considerably increased. The management of the Prussian State Railroads use highly superheated steam on tank engines extensively, having, already, 277 superheated steam tank engines in service and 120 building. One of the most successful types, an 0-10-0 simple engine with Schmidt smoke-tube superheater, is illustrated herewith. This engine was designed and constructed by the Berliner Maschinenbau-Akt.-Ges. vorm. L. Schwartzkopff, of Berlin, with the assistance, and under the supervision, of R. Garbe, of the Prussian State Railroads.

The principal dimensions of the engine are:

Boiler pressure	170 lbs.
Cylinders, diameter	24 in.
Piston, stroke	26 "
Diameter of drivers	53.2 "
Heating surface, firebox	120.0 sq. ft.
" " tubes	1,332.0 "
" " superheater	458.0 "
" " total	1,910.0 "
Grate area	24.2 "
Weight, empty	129,800 lbs.
Weight in service	162,800 "
Coal capacity	2 tons
Water capacity	2,520 gals.
Tubes, number, 5¼ in. diameter	21
Tubes, number, 1⅝ in. diameter	150
Tubes, length	14 ft. 9¼ in.
Tractive effort (American formula)	40,700 lbs.

$$\frac{\text{Weight on drivers}}{\text{Tractive effort}} = 4.00$$

$$\frac{\text{Tractive effort} \times \text{diameter of drivers}}{\text{Heating surface}} = 110.80$$

$$\frac{\text{Heating surface}}{\text{Grate area}} = 78.92$$

$$\frac{\text{Firebox heating surface}}{\text{Total heating surface}} = 6.28^{*}$$

$$\frac{\text{Weight on drivers}}{\text{Total heating surface}} = 85.23$$

Volume of 2 cylinders = 13.61 cu. ft.

$$\frac{\text{Total heating surface}}{\text{Volume of both cylinders}} = 140.34$$

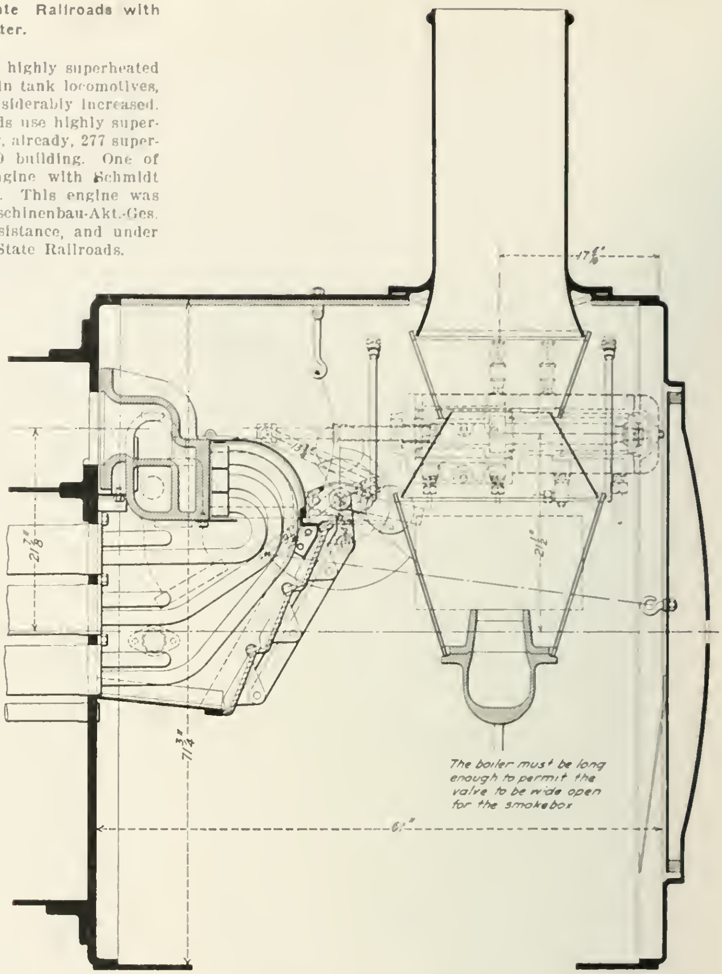
$$\frac{\text{Grate area}}{\text{Volume of both cylinders}} = 1.76$$

Tube heating surface equated to firebox heating surface (Vaughan formula), sq. ft. 346.00

Total equated firebox heating surface, exclusive of superheater, sq. ft. = 466.00

$$\frac{\text{Total actual heating surface}}{\text{Total equated firebox heating surface}} = 3.12$$

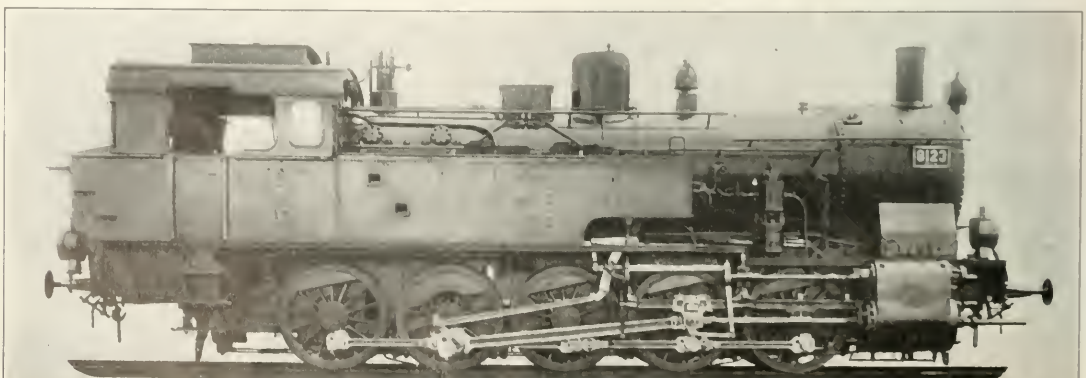
*Per cent.



Arrangement of Superheater Dampers.

The boiler has, except for the superheating arrangement, no feature of special interest.

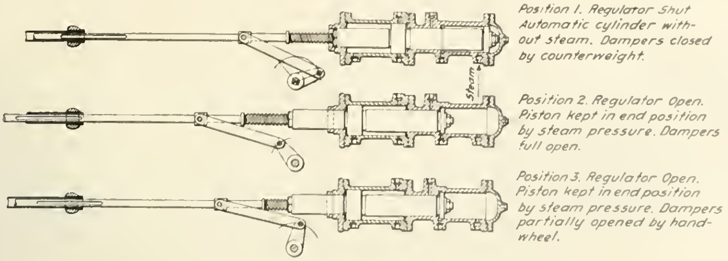
The upper part of the boiler barrel is fitted with three rows of large smoke-tubes of 4⅞ in. inside diameter, this being reduced to 4 in. near the firebox. Inserted in each of these smoke-tubes is a superheating unit, consisting of two sets of pipes, $1^{1}/_{16}$ in. in diameter and $^{5}/_{32}$ in. thick, bent in the form of an "U" and connected at the smoke-box end to a header, thus forming a continuous double-looped tube. The steam has to pass back and forth through each unit. The double looping of the superheater pipes has the advantage of increasing the velocity of the steam through the tubes, with the result that the temperature of the tubes is lowered, and their life correspondingly increased. The open ends of each unit in the smokebox are expanded into a common flange, which is in-



Tank Locomotive for Freight Service, with Schmidt Smoke-Tube Superheaters; Prussian State Railroads.

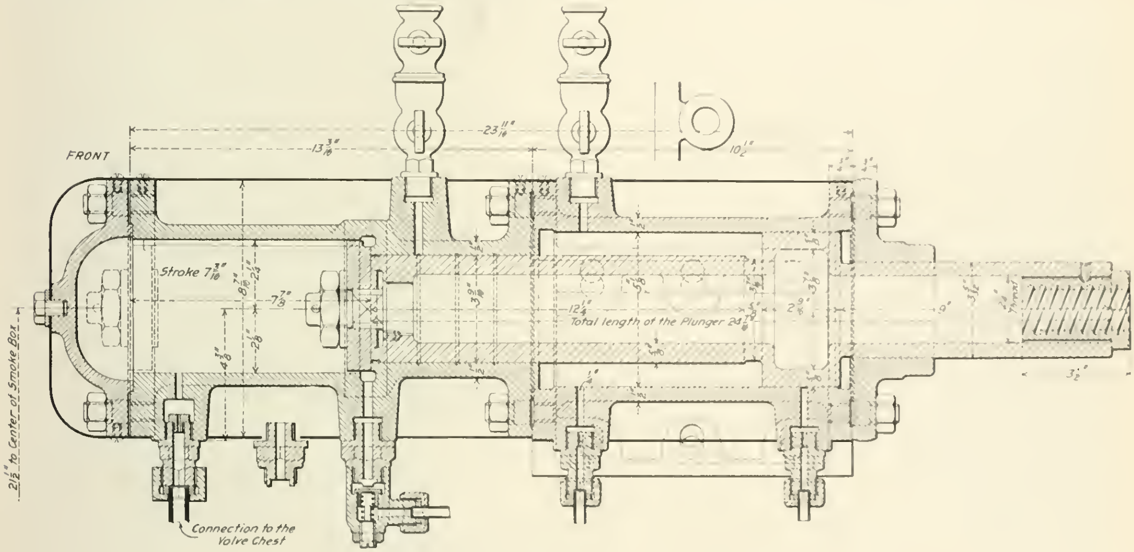
dependently secured to the face of the steam collector by a single stud. The stud is centered in the flange and thus makes, with two copper-asbestos rings, an even joint all round.

Most other railroads prefer a different method of arranging the superheater pipe ends in the smokebox. The pipes are bent upwards only, and the flanges are horizontal and fastened by vertical bolts, the heads of which are movable in slots in the bottom of the collector casting.



Damper Regulator.

There are only as many superheater elements as smoke-tubes, i.e., 21 on the engine illustrated and therefore only 21 1-in. bolts are needed to attach the whole superheating device to the collector casting.



Automatic Steam Cylinder for Superheater Dampers.

To regulate the amount of superheat and to protect the superheater pipes against overheating while the engine is standing or drifting, dampers are arranged in the smokebox which automatically close when the regulator is shut; but as soon as steam is turned on they are opened simultaneously by a piston working in a small steam cylinder which is connected with the valve chest by a small steam pipe. If desired, the superheater dampers can also be worked by hand from the footplate, so that any desired degree of superheat may be obtained. When open, the dampers allow a clear view through the superheater. The smoke-tubes can be cleaned from soot and ashes by either steam or compressed air with a hose and nozzle, the operation being carried out either from the firebox or from the smokebox. The superheater parts are all interchangeable and accessible. Each unit can be removed without disconnecting the whole arrangement by loosening a single nut.

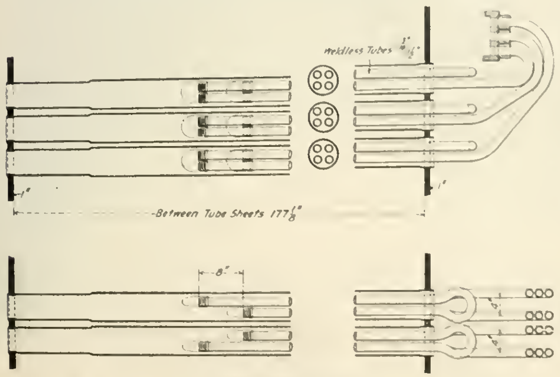
The engine is designed for heavy mountain service, especially on sharp curves. To get the necessary flexibility without excessive wear of either tires or rails, 1 in lateral play is given to the first, third and fifth axles, the second and fourth axles are rigid, the latter being the main driving axle. The piston rod is extended back of the front driver and supported by an intermediate slide bearing; an excessive length of connecting rod is thus avoided.

It is a two-cylinder simple engine with Schmidt patent piston valves and a by-pass connecting both cylinder ends. This passage is kept closed by a cylindrical cock when the engine is running under steam.

On trials with a 1,515-ton train behind a somewhat lighter engine of this type (67 tons) on an 0.83 per cent. grade, an indicated drawbar pull of 37,000 lbs. at 60 per cent. cut-off was obtained, this giving a factor of adhesion of almost 1·4. Another locomotive of this type has been tested near Erfurt, Germany, on long gradients of 3.33 per cent. and 2 per cent. in the presence of representatives of the most important railroads of France and Belgium. These trials were elaborately described in an article in the *Verkehrstechnische Woche*, 1907, page 1,317, by Mr. Muller, Privy Councillor of the Prussian Ministry of Public Works.

As the engine was being used in regular service, no special trial trains could be made up and therefore the greatest tractive power and highest speed could be demonstrated; nevertheless the results, as indicated in the following table, must be considered exceedingly satisfactorily:

Gradient, per cent.	2.00	2.00	2.00	3.33
Length of gradient, miles	7.0	7.0	7.0	5.5
Weight of cars, tons	400.0	460.0	500.0	282.0
Weight of locomotive, tons	72.8	72.8	72.8	72.8
Average speed, miles per hour	11.3	12.4	10.6	8.1



Superheater Pipes.

The graphical records of two of these trial runs are reproduced. Mr. Müller, in his summary of the trials, made the following statements:

(1) The boiler pressure of 170 lbs. could be easily maintained.

(2) Superheat of 570 deg. F. was obtained after a few miles run and from 600 to 650 deg. could be maintained with great ease.

(3) The valve chest pressure going up hill was 150 lbs. on an average, so that the relative superheat was between 180 deg. and 300 deg.

(4) During the three days trials the engine slipped only once.

(5) The engine is perfectly able to pull without a helping engine 300 tons (55 axles), at 12.5 miles an hour on a gradient of 2.5 per cent. and curves of 650 ft. radius.

Mr. Müller adds that the results obtained with this engine in regular service practically agree with these results of trials. As a consequence, 74 engines of this type have already been put in service on, or are being built for, the Prussian State Railroads. The Paris-Orléans Railroad and the Southern Railroad of France, which were represented at the trials near Erfurt, have already ordered five engines each of this type from a German locomotive builder. The Swedish State Railroads also ordered five of them. In the middle of November, 1907, the total number of Schmidt superheater engines in service or in course of construction amounted to 2,427, representing 78 railroads.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

XIV.

*Factors Affecting Ocean Line Freight Rates.**

The last article emphasized the freedom of competition and freedom of action that existed for the advantage of the man or firm who could load an entire ship. There is a radical difference in the rate question facing a man who would ship goods over sea in less than ship load lots. He is necessarily dependent upon some form of co-operative enterprise whereby his small freights may be combined with others. He is the natural meat of the line carrier and he must pay the current rates—the line traffic rates.

Rates in line traffic differ at many points from the full cargo traffic, yet they show the working out of the same principles. Competition is often present and the process of dickering in the bargain for each shipment is common. There is no more uniformity of rate for all the goods on a line steamer at one time than there is for all the many shipments that may fill a train. Valuable goods are charged a high rate and cheap ones a low rate, and different shipments of the same article often have different rates. A line steamer outward bound from an American port usually derives its freight profit from such commodities as machinery and manufactured articles, provisions, oil cake, flour and other prepared food-stuffs. Grain is also usually taken, but at rates that are rarely profitable and always below the full cargo rate for grain. Grain is heavy, but easily handled, because usually handled in bulk, and it makes very desirable ballast to steady the ship. Accordingly the policy is to fill the ship as full as possible with good paying freight and finish her off with grain, some hundreds or thousands of tons, as the case may be. The grain shipper does not especially desire these small irregular shipments. If the European grain market is favorable at all, it is favorable for a shipload of grain, and if the shipper must ship less he will have a concession in rates. This is the more easily obtained because he knows that the shipowner wants it to serve as ballast. Hence it comes about that the line steamers carry a certain and variable amount of grain at lower rates than the tramps.

The variety in rates is further increased by the practice of the managers of some lines to make as many long contracts as possible, sometimes for a year or a season, and secure other freight in advance during a certain month or within a certain week. The year contracts and the month contracts will probably differ in rate, and they are both likely to differ from the rate current at the time of sailing. The last shipments are contracted for in the light of the then existing market conditions, and may be high or low, according to the abundance or scarcity of freight at the time the vessel is finishing her cargo. If freight is scarce the final rate may be lower than the long contract rates, or if abundant the rate may rise. Freight may be shifted from one line to another so easily that it is actively sought. All the companies engaged in the trans-Atlantic trade have agents in the commercial centers like Buffalo, Chicago, St. Louis, and these agents in turn have their local connections. If freight promises to be scarce for a certain scheduled sailing, telegrams will be sent to the inland agents or sometimes a personal representative will be sent from New York, Boston or Philadelphia to Chicago or Minneapolis with power to make such contracts as he finds necessary to secure the freight for the otherwise empty space. So it is that competition dominates also in line traffic in those trades where combination has not relegated it to the limbo of history.

The fact that the steamship line represents an organized business gives it a tendency to greater steadiness of rates even in competition than prevails among the chartered vessels, but if fluctuations do not come as quickly they come as surely on routes where there is competition for the work.

As with the tramp, so with the liner—the controlling rate making fact is the fundamental freedom of the open sea, the highway of the nations. With the open roadway of the sea exists freedom of port facilities, and for all line traffic the fundamental rate-governing force is competition in the form of charter rates. If the line rate rises, tramps may flock in and even it up. This was clearly stated by Sir Thomas Sutherland at the sixty-third annual meeting of the stockholders of the Peninsular & Oriental Steamship Company in December, 1903. In commenting on the low rates received that year by the line steamers of his great company, he said:

"But as a matter of fact, it is the world's tonnage at large, the cargo carrying tonnage of the world at large, which dictates, or rather determines, the current rates of freight both by cargo steamers and by mail steamers and we are simply dragged into the wake of that great movement, as, I suppose, the great American combine* has already discovered by this time."

This statement of the influence of the charter vessels upon the rate for line ships is very easily understood by noting the ease with which a considerable share of line traffic may be diverted to charter vessels or charter traffic to line vessels if the gap between the two services becomes too great in one case or too small in the other. Within certain limits the two must rise and fall together.

This influence of charter upon line rates is the wide reaching influence of world rates upon each other. It should not be construed into any statement of similarity of service in general. The tramp competition exerts this influence by taking the line freight at the baser end of the traffic list. It also makes easy the formation of new lines, for the fact should not be overlooked that many freight lines are merely groups of chartered steamers, and if steamers get very cheap, and line rates stay high, there is the great temptation to rush in and get a share of the good things.

Despite this competitive influence line traffic upon the seas presents several distinct contrasts with the charter traffic in the matter of rates and the ease and extent of the competition which has been considered. One of these differences arises because of the size of the unit of competition. In charter traffic the unit is merely a ship, while in the line it is a number of ships—enough to give a rival service. This may include a number of large and expensive ships and an organization of agents on the land to manage and solicit traffic. This fact of the size of the unit is a deterring influence in competition merely because it is easier to do a small thing than a larger one of the same kind.

A second difference is that line competition has an element of vindictiveness, retaliation or penalization unknown in tramp competition. The tramp can cut under the current rates, get a cargo and go without suffering from the direct rate effects of her action, because there is no retaliation possible. If one line goes under the existing rate, it is almost certain that the others must do it also to get their share of the traffic. Then no one is any better off than before; all are worse off from the reduced income, and are ready to punish the party responsible for the loss. Consequently the rate-cut among lines usually leads to a rate war during the continuance of which both parties lose heavily. There is accordingly often a common rate without any formal agreement. No one wants to cut the rate and run the risk of a rate war. This situation thus resembles more closely an armed truce than any other relationship.

A third difference between the competition of the two types of service arises from the irresponsibility of the tramp manager with regard to demoralizing the market. As each bargain is a law unto itself, the manager may demoralize the market by his rate-making and sail his ship away into the great world. Her next contract may be made three months later in the antipodes, and under other conditions, probably little if at all affected by the rate resulting from the manager's last bargain. It is otherwise with the liner, which is practically fixed to a certain route, ordinarily sails from a certain port or series of ports, and comes back again to repeat the same voyage. The line manager who cuts rates must suffer the consequences, because his line continues to move upon the waters he has troubled, and he must do business in that port and must deal with the demoralized rates. The line has customers whose interests must be protected. Shippers, of course, prefer the regularity of the line; and the natural law which makes the tramp irresponsible and the liner responsible forces a certain amount of parallel if not united action among the managers of lines.

The common knowledge among a community of shippers drives to common action. It is necessary and inevitable that all ocean lines competing in the same port know what the others are doing. It is necessary because if they did not know of the actions of rivals, one carrier, by cutting the rate the smallest shade, would get the lion's share of the business. It is inevitable that they know,

*In this and the two succeeding numbers the writer has drawn upon two articles published by him, one in the *Political Science Quarterly*, and one in the *Journal of Political Economy*. Acknowledgment is hereby made of the assistance received from the Carnegie Institution, of Washington, in the collection and preparation of materials for this series of articles.

*A reference to the financial difficulties of the International Mercantile Marine Company, which, despite its great size, had had little or no beneficial effect on rates, to the great surprise and discomfiture of its organizers.

because of the constant search of the shippers and their brokers for cheap rates, and their diligent efforts to get contracts at the lowest possible rates.

Starting with this fact of common knowledge and parallel action among obstinate rivals there is great variety in the stages of mutual action among steamship lines, ranging from rate agreements and division of territory to freight and profit pools. Theoretically, it is easy to control the rates or traffic conditions among ocean lines. All that is needed is that the ocean lines that might compete shall agree on conditions and maintain them. In some trades, this is practised in all its simplicity, but the larger the trade the greater the difficulty, a difficulty amounting in the case of the trans-Atlantic trade to practical impossibility so far as rates are concerned.

This Atlantic situation, which will be presented in a special chapter, is an exception in the carrying trade.

The control of ocean line rates within certain limits by the carriers has been very widespread of late years. It may certainly be called the usual condition of affairs, for it prevails over much the greater part of the surface of the world's great sea. It should be noted that this reference is to the proportion of the ocean's surface, not to the proportion of its trade. The very heaviest trade is not controlled, as are the smaller trades which reach out to the remoter parts of the world.

The ocean steamer has made easier this line rate control, because it has enhanced the superiority of line sailings over independent sailings. In the old sailing vessel days, the superiority of the lines of uncertain packets over the tramp sailer was much slighter than that of the present precise steamer over the occasional rival. The slowness, irregularity and independable quality of the sailing vessel service gave the single ship an equality which it has lost in this day of steamer lines, when the importer is in instantaneous touch with the world through the cable, and knows when to count upon the arrival of the schedule steamer. Thus the importers of the world have become accustomed to an unprecedented speed and regularity in their business dealings which makes them less willing to abide by the service of the tramp, even though it should be a vessel of high efficiency. In its practical working out, this enhanced superiority of the line service over the tramp means that the shipper feels that he must have a line of steamers at his disposal.

Not only is the line service of the present possessed of a greater superiority over the tramp, but the three-fold to six-fold increase of carrying power of the modern steam tramp over its romantic but slow old prototype has limited its use to only the largest firms. The result is that the modern exporter of anything but a few bulky products like grain, ore, coal, oil and lumber is dependent upon the steamship line. This dependence will increase as the trade in manufactured articles increases, and with it the increase in ton value of goods, while at the same time the increase in the size of the tramp ship puts it more and more beyond the reach of the ordinary merchant.

It is easy to see that since it is harder for the individual to compete with the line than it was in earlier days, it is also harder for a line to compete with other lines over long routes than over short routes, for the evident reason that fewer steamers are required to make twelve 3,000-mile voyages than twelve 10,000-mile voyages. If there be added to this the fact that the trade to distant continents is sure to be lighter than to nearby continents, it becomes plain that the first and most natural stronghold of shipping trusts, rings and rate-controlling agreements is in the trade with the antipodes, where, at best, but a few lines suffice to do the work. A few men can agree easier than many men.

It is necessary for ocean carriers who might compete to be in one of four relations to each other: (1) They may be practically independent because they all have more goods than they can carry at profitable rates; (2) they may be active competitors; (3) they may be working under some mutually beneficial agreement with regard to rates or traffic; (4) they may be acting practically as though they had formally agreed, although the condition is only one of mere truce which none cares to break. The last is commonest in the Atlantic traffic where the barriers to agreement are greatest. The first condition—independence—is likely sooner or later to lead to the second—competition.

There is a peculiar ferocity attending a rate war among ocean line carriers, especially where the number of carriers is small and personal feeling can rise. It is primarily not competition to win trade, but to ruin the rival, to drive him off or bring him to terms. The competition literally hits the rival, whereas it often takes the form, in other enterprises, of being particularly attractive to customer or client. Lines rendering similar service are each acquainted with every move of the competitors, but each hesitates to make the move that starts a rate war, which can only make losses for all carriers and which can end only when one party surrenders or all agree to abide by mutual restrictions that will preserve peace. The element of warfare existing in rate competitions is evidenced by the fact that the competing companies often carry freight at heavy loss, when a general condition of world-prosperity exists among carriers. Competition causes temporary disregard of all relation between the cost of a ship and income from her. In November, 1902, it was stated that the 10s. rate then prevailing from New York to South Africa involved a loss of $10,000 to $15,000 per steamer.

The carriers evidently desire agreements if they can be had, and the shippers do not desire rate wars as much as the lay observer might at first think. "During an ocean rate war the rates are chaos, whereas trade thrives on regularity and certainty. The merchant in Cape Town, Buenos Ayres or Shanghai does not relish having in stock a large stock of goods secured at a normal rate and suddenly find his rival getting the same goods in at a much lower cut rate. The constant fluctuations of a rate war often cause neighboring merchants to receive the same kind of goods by the the same ship at different rates. One of them blames somebody, usually the export commission merchant, and he in turn blames his freight broker. It is no unusual practice for an importer to divide an order among several export commission men. If the goods come on the same vessel at different rates as they very likely may, he is dissatisfied. The irregularity and wildly fluctuating rates would make it difficult for the importer to calculate a "laying down" cost of goods without expensive telegraphing. An editorial in a shipping journal, defending European shipping agreements to control rates to the Orient, declares that "competition now based on careful lines would" (under conditions of non-agreement) "resolve itself into as hazardous a speculation as a chance in a lottery."*

Another thing unfavorable to the shipper is the common irregularity of sailing schedules in a rate war. The ships are managed, not to please the shipper, but to injure the rival, and with that object the sailing days are often made nearly to coincide. This does not give opportunity for an even flow of freight. The shippers prefer an even schedule, a rate as constant as possible, and the same for all shippers. These conditions are difficult to secure where lines do not agree.

The rate war sometimes disturbs distant trades, as when a quarrel among London owners in the United Kingdom-Australian trade is carried to New York-Australian trade where these same owners run steamers—an episode that occurred in 1905.

The combined result of all these influences is, that with the partial exception of the north Atlantic freight, there is in ocean line trades, both great and small, a normal condition of agreement among line carriers. This is disturbed by the frequent competitions that precede and end the agreements. The agreements are evidenced by the much greater constancy of line rates than of charter rates. These agreements are often reported in various journals, in consular reports, and in annual reports in the companies themselves. The annual report of the United Companies of Copenhagen (*Forenede Dampskibsselskab*) for 1901, stated, "that the continental lines in their war against the Cunard Line unfortunately chose territory of the Danish Company and cost it a round million. Peace was concluded in December, and the company made a friendly working agreement with the competing companies, so that the future in this territory may be looked upon with full confidence."

The 1903 report of the Kosmos Line, plying between Hamburg and the Pacific coast of both Americas, after stating that a combination of sailing-ship owners had helped the line by stiffening and steadying rates on Chilean nitrate, discussed in an annex to the report the announcement of a Hamburg firm's intention to run monthly sailings of English vessels from Antwerp to western South America. The Kosmos directors did not fear from this any successful encroachment upon their business. This would be prevented by the convention concluded a few years previously with the Hamburg-American Company and by the extensive system of rebates that had been established. Mr. Ellerman, one of the men who sold out to the International Mercantile Marine Company and afterward went into other shipping enterprises, told the stockholders of the Ellerman lines in annual meeting that six lines had recently been bought by the new company, and that in most cases there were working agreements with the other lines engaged in those trades. Sir Thomas Sutherland, chairman of the Peninsular & Oriental Company, told the stockholders in a recent annual meeting that his company was a party to conferences or working agreements with various lines rendering the same services, and that such had long been the common custom of shipping lines in nearly all trades.

The same forces that have produced these agreements have also driven to consolidation throughout the world, and made the carrying corporations grow, line upon line, service upon service. It has not been limited to the north Atlantic. Practically all of the German lines going to South America are consolidated or closely allied, so are also the German lines to East Asia. The North German Lloyd has recently bought out a Scotch and a German line that competed in the East Indies adjacent to Singapore. The two leading British South African lines have consolidated a host of

*Fairplay, July 31, 1902, p. 162.

small Danish lines have formed the United Companies of Copenhagen and the several long-struggling coasting lines of Finland have done the same thing. With the development of the telegraph, the simplification of direction and the reduction of number of owners, agreements become easier.

(To be continued.)

The Baltimore & Ohio's New Eastbound Freight Yard at Brunswick, Maryland.

The Baltimore & Ohio has recently opened a new classification yard for eastbound freight at Brunswick, Md., on the main line about 80 miles west of Baltimore. This yard is $3\frac{1}{2}$ miles long, has a capacity of 3,960 cars and extends from Knoxville, on the west, to East Brunswick, on the east, where it connects with the old 2,500-car yard at Brunswick, which extends $2\frac{1}{2}$ miles still further east. The total length, therefore, of the combined yards at Brunswick is six miles and the total capacity 6,460 cars.

The old yard at Brunswick, which has always been a classification point for both eastbound and westbound freight, was put in operation in 1891. The great increase in traffic during the last two or three years has made it necessary to more than double the yard facilities. The new yard is to be used entirely for eastbound freight and the old yard only for westbound business. The two yards together form, according to the Baltimore & Ohio officers, the largest individual freight terminal in the country.

Work on the new eastbound yard was begun in August, 1906, and finished in October, 1907, which is fast time for so large a piece of work. During these 14 months 900,000 cu. yds. of earth were removed, 3,000 cu. yds. of monolithic and 200,000 cu. yds. of concrete culverts built and 875 tons of cast-iron drain pipe laid.

The first work was to divert the old main tracks, which roughly bisected the new yard site, to temporary tracks around the south side of the yard. Since the excavation and embankment were about equal these were built on embankment on the permanent location of the eastbound passenger and freight tracks. This diversion was completed on December 1, 1906, and gave the contractor control, free from interference from trains, of the whole territory on which he was to work. The grade contour closely followed the location of the old tracks for a little over two miles. Two 70-ton Bucyrus steam shovels and two model A Marion steam shovels were put on this section and 12 locomotives and 160 dump cars were used in moving the material from the shovels. Star well-drilling machines were used to drill in advance of the shovels, the holes usually going to subgrade before being shot down to the shovel. There were 16 miles of narrow gage track laid to reach the various dumps. By January 1, 1907, the contractor had sufficient area graded to allow the company to begin tracklaying, which was carried on without interruption until all the track in the new yard was laid.

The slopes along the whole north side of the yard are $1\frac{1}{2}$ to 1. The surface ditch runs the whole length of the yard on top of the cut and concrete flumes have been built up the sides of the slope at the various ravines where the water flows down to the yard. Through them the water is carried down to cast iron pipes running under the yard and the canal on the south side of the yard. These flumes prevent the wash of the water from destroying the slopes.

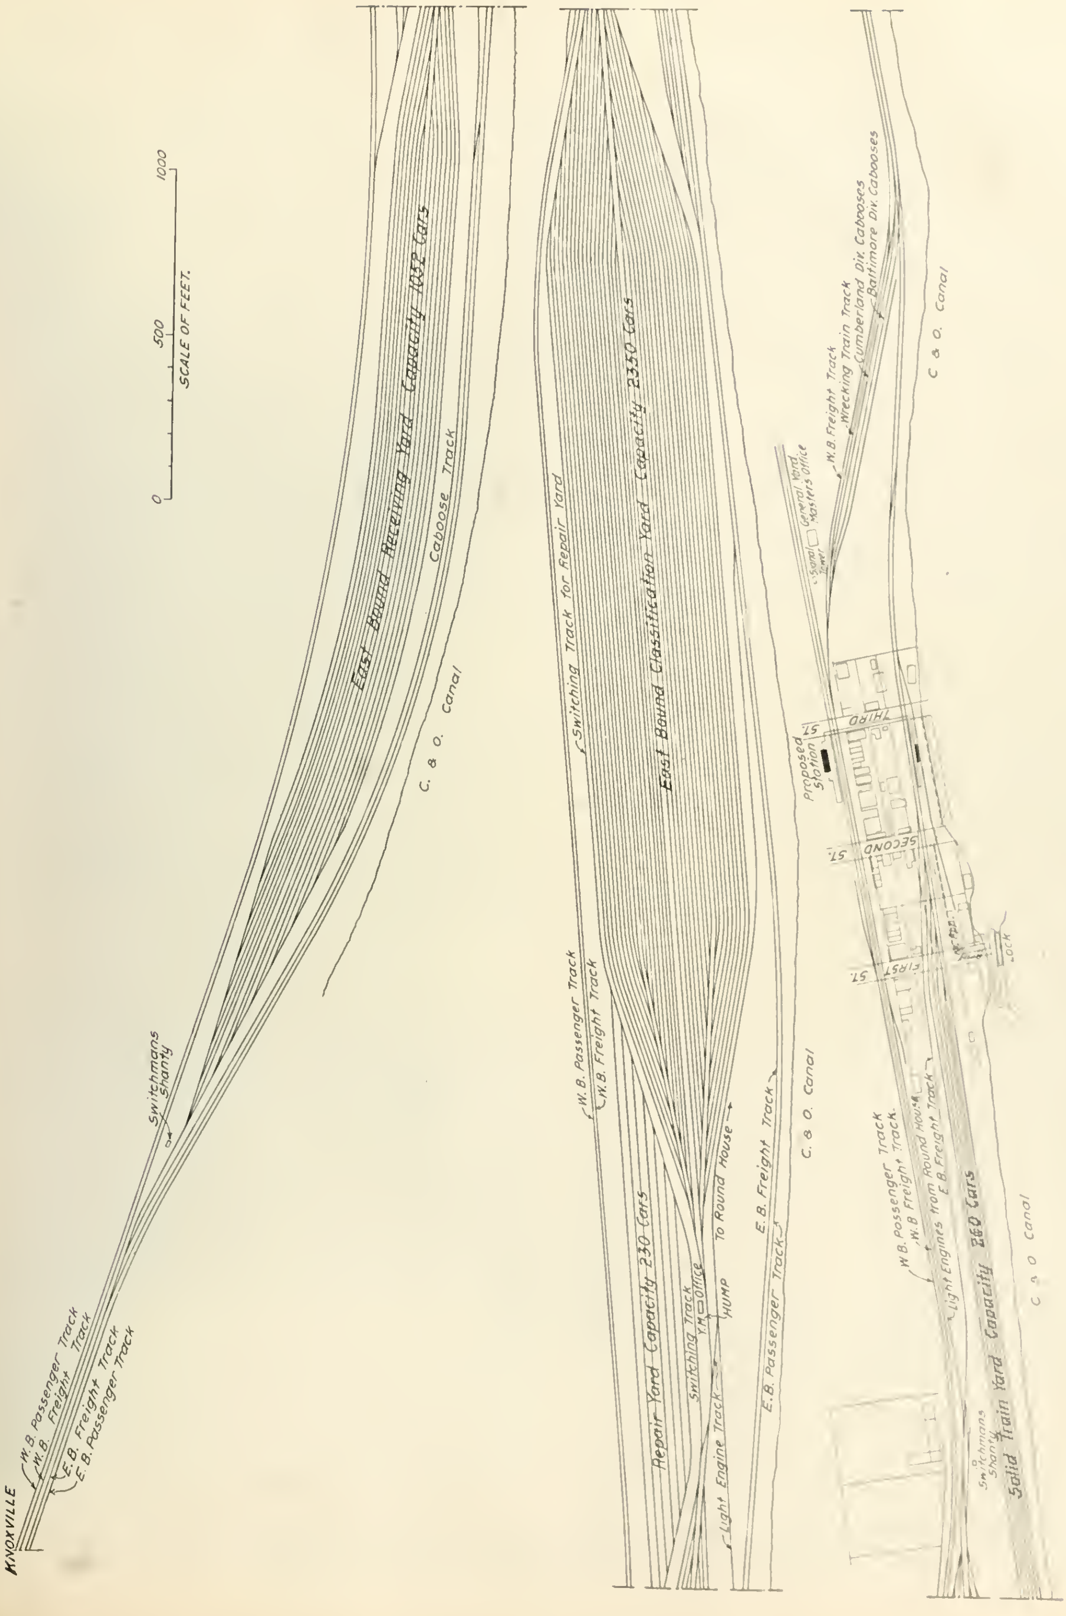
Brunswick is the eastern terminal of the Cumberland division and the western terminal of the Baltimore division. It is 102 miles east of Cumberland, W. Va., and 75 miles west of Baltimore, Md. All cars classified at Brunswick go through east to destination. Freight trains arriving at Brunswick from points west enter the new yard at Knoxville, the western end of the terminal, by a No. 20 turnout. The receiving yard has 16 tracks with a capacity of 66 cars each, or a total of 1,052 cars. It is reached by two outside ladders, one having eight switches, the other seven. On entering the receiving yard the caboose is cut off from the train. The caboose track turns off by a No. 16 turnout and the caboose is run by gravity around the receiving yard on the south. At the eastern end of the receiving yard it is picked up by the engine and run to the engine house by the engine track which runs to the south of classification yard. The western half of the receiving yard is on a $1\frac{1}{2}$ deg. curve and the east half is tangent.

The outlet of the receiving yard is by two inside ladders each containing seven switches. Cars from this yard are pushed up on a hump which is $14\frac{1}{2}$ ft. above the entrance and 12 ft. 5 in. above the general yard level of the receiving yard. Cars from the north half of the receiving yard reach the hump track by a No. 10 crossover connecting the two ladders, the south ladder leading directly over the hump. The grades leading to the hump are 3,600 ft. of 0.25 per cent., 1,050 ft. of level and 550 ft. through the south ladder of 1 per cent. grade. Pushers are used only on the hump grade. A road engine can pull a 65-car train into the yard without help.

New Eastbound Classification Yard at Brunswick, Maryland; Baltimore & Ohio.

The descent from the hump starts with 100 ft. of $3\frac{1}{2}$ per cent grade, then 1,000 ft. of 1 per cent. grade through the classification yard ladders and 0.3 per cent. grades through the classification yards. The hump is $22\frac{1}{2}$ ft. above the eastern end of the classification yard.

The eastbound classification yard has 36 tracks, 18 on the north and 18 on the south side, each with a capacity of 65 cars, or a total of 2,340 cars. It is set by two double ladders operated by an electro-pneumatic push button machine. Each ladder has nine switches. As the cars come from the receiving yard to the hump they are tagged by the brakeman which indicates to the switchman working the push button machine for which track they are bound. For example, if a train pulls into the receiving yard with the first 10 cars for Washington and the next 20 for Baltimore, a tag reading "10-4" is put on the front of the first 10 cars, indicating that there are 10 cars in the shift to go on the Washington track in the classification yard. The next 20 would be tagged in a similar way for Baltimore. The outlet from the classification yard is by double ladders through the center of the yard and a single ladder on each side, each ladder having nine switches. Trains from the northern half of the classification yard pull direct-



New Eastbound Yard System at Brunswick, Maryland; Baltimore & Ohio.

ly out on the eastbound freight track. Trains from the south half of the classification yard pull out on this track by a No. 10 turnout. The eastbound freight track runs along the north side of the solid train yard. The eastern end of this yard is joined to this track by a No. 16 turnout.

Through freight trains from the West run on a through track on the south of both the receiving yard and the classification yard and enter the solid train yard at a point southeast of the eastern end of the classification yard. The solid train yard has a capacity of 260 cars. Here the through trains are held while they are being inspected and changes of crews and engines made. The eastbound freight track is connected with the solid train yard at each end by a single ladder. In the receiving, classification and solid train yards No. 8 slide-wing frogs are used.

The repair yard is between the receiving yard and the classification yard on the north and opposite the hump. It consists of seven tracks spaced 25 ft. between centers and has a capacity of 230 cars. It is connected with the east end of the receiving yard. On the south of the repair yard is a switching track which is connected with the two ladders of the receiving yard and at its western end with the westbound freight tracks. By this, cars can be taken directly from the receiving yard or from the classification yard to the repair yard without fouling the tracks.

The old yard is located just east of Brunswick. It has 55 tracks, each with a capacity of 40 cars, or a total capacity of 2,200 cars. The increase in the train unit in the new over the old yard from 40 to 65 cars is notable as indicating the heavier train loads and consequent changes in yard design of 1907 over 1891. Now that the new eastbound yard has been finished, the old yard is used entirely as a westbound yard. The entrance to the old yard is at East Brunswick, where an interlocking tower is to be built. The exit is at West Brunswick, and is also controlled by an interlocking tower. At the western end of the yard are the worktrain track, the Cumberland division caboose track, the Baltimore division caboose track, and a coach track on which passenger cars are stored for local trains made up at Brunswick.

There are four main tracks running around the two yards from Weverton, which is one mile west of the western end of the eastbound receiving yard at Knoxville, to East Brunswick. A westbound passenger track and a westbound freight track run on the north side of the yards, and an eastbound passenger track and an eastbound freight track on the south side. There is an interlocking tower at Weverton governing the ends of this four-track system.

At Brunswick, between the eastbound and the westbound yards, is the office building for the Assistant Trainmaster, the General Yardmaster and the telegraph office. The building at the hump is 21 ft. x 34 ft., and is for the Trainmaster and the Assistant Yardmaster, who have offices on the first floor. The push-button machine is on the second floor and the compressor and batteries are in the cellar. The yard is lighted by electric arc lights, the line of which runs directly through the center of the yard where the tracks are spaced 18 ft. centers. The eastern end of the receiving yard, the double ladders, and both ends of the classification yard also have 18 ft. centers. The tracks are all laid with 85-lb. rail and cinder ballast, except the main tracks, which are laid with stone ballast. In accordance with the Baltimore & Ohio's policy of beautifying the right-of-way, the sloping elevation of the new yard has been sown with grass seed. As the yard is some feet higher than the main tracks which run around it, it will have the appearance from the passenger trains of the sides of a large banked flower bed.

The cost of the new eastbound classification yard, which covers 115 acres and contains 12 miles of main tracks and 40 miles of yard tracks, was $1,000,000. The contractors were F. H. Clement & Company, of Philadelphia, and the yard was built under the direction of the following officers of the Baltimore & Ohio: D. D. Carothers, Chief Engineer, A. M. Kinsman, Engineer of Construction, and J. T. Wilson, Assistant Engineer.

Passenger Rates in Russia.

The Russian Finance Minister reports that an investigation of the effects of the passenger tariff of 1894, which made extremely low rates for long distances, shows that it has had a very unfavorable influence on the net earnings of the railroads. The number of passengers carried has increased under this tariff from 44 to 103 millions, or 134 per cent., partly due to a large increase in the mileage of railroads; and even per mile of road the increase has been 38 per cent. Meanwhile the gross passenger earnings have increased about $30,000,000, and the expenses due to this traffic about $32,000,000, so that the net passenger earnings have decreased from $8,670,000 to $6,656,000. The much larger mileage has of course involved a much larger increase in capital. Taking in consideration the interest on the investment, the Russian passenger traffic nets a loss every year. The ministry estimates this loss to have been $7,530,000 even in 1894, rising to $24,355,000 in 1904. He purposes a new passenger tariff, which for distances of 200 miles and less would be slight for the third class, but considerable for the greater distances, and for the two higher classes large—for 265 miles 28½ per cent. for the second and 32 per cent. for the first class. The changes were still under discussion in January; but there seemed to be no opposition to an advance of some kind.

Pay of American Railroad Employees.

The report of the Interstate Commerce Commission for the year ended June 30, 1906 (full report just issued) gives the following table of the average daily pay of railroad employees for the years 1896-1906. The figures indicate dollars and cents.

Class.	United States.										
	1906.	1905.	1904.	1903.	1902.	1901.	1900.	1899.	1898.	1897.	1896.
General officers	11.81	11.74	11.61	11.27	11.17	10.97	10.45	10.03	9.73	9.54	9.19
Other officers	5.82	6.02	6.07	5.76	5.60	5.56	5.22	5.18	5.21	5.12	5.96
General office clerks	2.24	2.24	2.22	2.21	2.18	2.19	2.19	2.20	2.25	2.18	2.21

Foreign Railroad Notes.

Though there has been a noticeable slackening in business activity in Germany since October, traffic has kept up much better there than here. In December, the orders for open cars were nearly 11 per cent. greater than in 1906, and even for box cars they were 3.8 per cent. greater. There has been something like a coal famine, which partly accounts for this. The gross earnings of all German railroads in December, 1907, were 2 per cent. greater from freight and a trifle greater from passenger than in 1906. For the previous months of the year the freight earnings had been about 5 per cent. greater.

Further evidence of the industrial progress of Germany is given by its coal consumption, which increased nearly 40 per cent. from 1902 to 1907—from 163,663,000 to 228,984,000 short tons, and per head of population from 2.784 to 3.695 tons annually. There are considerable exports of German coal, but these are usually balanced by the imports. In 1907, the imports exceeded the exports. In that year the coal consumption was 9 per cent. greater than in 1906. More than a third of the consumption in 1907 was lignite, an inferior fuel.

During the year 1907 the additions to the Russian railroad system amounted to 1,167 miles, an increase of 3 per cent., bringing up the total to 40,438 miles. Of the whole mileage 67 per cent. belongs to the state. At the end of the year there were 1,600 miles under construction, included in which is a branch of the trans-Caspian line (Asiatic Midland), 118 miles, to the Persian border.

The new Italian passenger rates, which went into effect Nov. 1, 1906, made large reductions in the rates for long distances. The result has been for the first year an increase of 18 per cent. in journeys of more than 150 kilometers (93 miles), and an increase of 12.3 per cent. in passenger earnings.

GENERAL NEWS SECTION

NOTES.

The Missouri, Kansas & Texas shops at Sedalia, Mo., have been reopened with a force of 500 men.

Announcement is made that the Birmingham extension of the Illinois Central will be opened April 19.

The Canadian House of Commons has passed a resolution declaring that the time has arrived for building a railroad to Fort Churchill on Hudson bay.

The Wabash discontinued passenger traffic over its Pittsburgh West Side Belt line on April 4. An attempt to do the same thing was made two years ago but was given up.

Judge Lacombe, of the United States Circuit Court, has permitted the receivers of certain portions of the New York City Railway Co. to reduce materially the transfer privilege.

The brake-beam of an engine pulling out of the El Paso, Tex., yards dropped and wrecked the train. One of the five cars derailed was loaded with dynamite, but nothing happened.

The up-state New York Public Service Commission has denied the right of the New Haven to abandon 16 miles of the Central New England, which parallels the Poughkeepsie & Eastern.

The Canadian Society of Civil Engineers is urging upon the Canadian government the desirability of appointing a practical railroad engineer on the Board of Railway Commissioners.

A vote has been taken by employees of the Boston & Maine on the 5 per cent. reduction in wages proposed by President Tuttle, and the employees have declined to accept the reduction.

The Chapman & Dewey Lumber Co., of Kansas City, pleaded guilty on March 30 to the charge of having accepted rebates from the St. Louis & San Francisco and was fined $13,000 and costs.

A committee of the New York Assembly, on April 3, reported favorably a bill amending the New York City Rapid Transit law so that private capital can be interested in building new subways.

On March 31 Judge McPherson, in the federal court at Kansas City, held that the state officers can be enjoined from enforcing the Missouri 2-cent law if it is found to be unremunerative to the railroads.

The Oklahoma Corporation Commission has issued an order reducing express rates in Oklahoma about 40 per cent. Before this order goes into effect a hearing will be granted to all parties concerned.

On March 1, J. R. George was retired and placed on the pension list of the Lackawanna. Mr. George has been with the company 42 years and has been conductor on the same train for 32 years and 2 months.

The General Passenger Agent of the New York, Chicago & St. Louis announces that colonist tickets will be honored as first-class tickets from all points on that road to Chicago and will be accepted in Pullman cars.

At a meeting of the Kentucky Railroad Commission, April 3, attorneys for all railroads operating in the state made a motion that the Commission rescind its order of two years ago for a general reduction in freight rates.

On April 19 the New York Central will restore the 18-hour schedule between Chicago and New York for the Twentieth Century Limited. This schedule was temporarily abandoned last December, when one hour was added to the running time.

J. W. Midgley announces that the Railway Clearing House Bureau, of which he has been manager, has completed its seventh year and has gone out of existence. The bureau was supported by 18 railroads and by the banking house of J. P. Morgan & Co.

The chairman and engineer of the Texas Railroad Commission have recently completed their inspection of the 600-mile section of the Southern Pacific between El Paso and San Antonio, and are quoted as saying that this stretch of track is the finest in the Southwest.

President Roosevelt has made public a letter to Attorney-General Bonaparte directing proceedings by injunction to compel certain southern railroads to furnish colored passengers with as good accommodations as those furnished white passengers for the same money.

The Texas Health Department has accumulated some 2,000 cases against the Pullman Co. for alleged violation of the state health laws adopted a year ago, requiring fumigation of all sleeping cars at the end of each division and other extraordinary precautions.

The arbiters in the Southern Railway wage matter have reached an agreement by which the present wage scale for all organizations shall be continued until the first of July, with the understanding that if by that time the conditions shall not have improved the negotiations shall be resumed.

On April 3 the Senate Committee on Interstate Commerce, with the approval of the Interstate Commerce Commission, agreed to report favorably Senator Elkins' resolution extending the time for the application of penalties for violation of the commodity clause of the rate law until January 1, 1910.

The Massachusetts legislative committee on railroads on April 7 reported favorably on a bill accompanying a petition of the New York, New Haven & Hartford for the consolidation of the Milford & Woonsocket Railroad and the Milford, Franklin & Providence Railroad with the New England Railroad.

The New York, New Haven & Hartford is installing a fourth generating unit at the Cos Cob power station. Electric operation from Stamford to New York has been extended to include some of the through expresses; in all, 83 trains on week days and 33 on Sundays are now hauled over this section by electric locomotives.

Following a Supreme Court decision the Georgia Railroad will have to pay to the state of Georgia, to the city of Augusta and to Richmond county $335,000 in back taxes. The property upon which the taxes were claimed was 15,000 shares of Western Railway of Alabama stock, and the case has been in litigation for some six years.

Following the decision of Illinois railroads to test the constitutionality of the 2-cent passenger law in the state, George T. Nicholson, Third Vice-President of the Atchison, Topeka & Santa Fe; P. S. Eustis, Passenger Traffic Manager of the Burlington, and A. H. Hanson, Passenger Traffic Manager of the Illinois Central, have been appointed to manage the campaign.

The federal receiver of the International & Great Northern has been notified by the Texas Railroad Commission that he must invest every dollar of income of the property over actual operating expenses and fixed charges in making improvements ordered by the Commission prior to the receivership. Failure to obey will result in suit for forfeiture of the company's charter.

The threatened strike of the shopmen on the New York, New Haven & Hartford has been averted by an agreement on the part of the management not to enforce its order of March 10 extending the piece work system. Piece work will continue where it has been in operation, and as discharged men are re-employed the piece work plan will be extended gradually, but no radical change will be made.

The Missouri Supreme Court has denied Attorney-General Hadley's motion for the appointment of a commissioner to take testimony in his ouster suit against the Missouri Pacific, the Wabash and the Iron Mountain railroads; the Pacific Express Co., the Rich Hill Coal & Mining Co., and the Kansas & Missouri Elevator Co. for alleged violation of the state anti-trust laws. The case is set for argument in the April term.

The General Managers' Association has published figures showing that approximately 315,000 fewer employees are working for railroads in the United States than were working October 1, 1907. These statistics include actual figures of employees discharged by 17 roads having a mileage of 71,782. On these roads the decrease in employees amounted to 18 per cent. There is a lesson in these figures for people who make it difficult for the railroads to reduce wages.

The Great Northern was found guilty in the United States Circuit Court, April 7, of having paid rebates to the American Sugar Refining Co. in 1904 in violation of the Elkins Act, and was fined $5,000. The United States District Attorney called the court's attention to the fact that the transactions on the part of the railroad company did not involve to the same extent elements of fraudulent concealment as were disclosed in certain prior cases. In the case of the Great Northern the rebates had been entered in the regular books.

Chicago bankers have sent out a notice that after April 15 they will refuse to make advances against the usual "order" bill of lading containing the "care consignee" clause covering shipments of grain by lake, because this grain is delivered without surrender of the bill of lading. Trunk lines will be requested to discontinue forwarding lake grain without the surrender of the western carrier's bill of lading and in the meantime the Chicago banks are expected to suspend their notice until further consideration has been given the matter by a standing committee which has been formed.

Representative Esch, of Wisconsin, introduced a bill April 6, providing that no interstate railroad should, after it had been in operation for one year, issue any additional stocks, bonds or other instruments of indebtedness except when necessary for the acquisition of property, the extension or improvement of its lines and facilities, and the improvement and maintenance of its service. The bill forbids payment of dividends in anything but cash and the acquirement of control or interest in any other railroad corporation, except to establish, by consolidation of connecting lines, through transportation routes.

White Portland Cement.

Figures on two recent tests of White Portland cement are given below. These tests were made respectively by Robt. W. Hunt & Co., Chicago, and Henry S. Spackman Engineering Co., Philadelphia. In the former the sample showed a fineness through a No. 100 sieve of 95.56 and through a No. 200 sieve of 79.54. Initial set occurred in six hours and final set in 7 hrs. 5 min. The tensile strength for neat briquettes averaged at the end of 24 hrs. 368 lbs.; seven days, 710 lbs., and 28 days, 940 lbs.; the corresponding figures for a 1:3 mixture were 168, 223 and 310 lbs. respectively.

The second set of tests showed figures approximately the same as the foregoing as regards tensile strength and fineness. In addition there were constancy of volume tests which were all marked "good," steam and boiling water tests marked likewise, and a chemical analysis as follows, the figures being percentages: Silica, 25.1; alumina, 5.05; iron oxide, 0.43; lime, 65.68; magnesia, 1.54; sulphur anhydride, 0.96; loss on ignition, 1.24. It is also stated that this cement passes the specifications adopted by the American Society for Testing Materials.

It is claimed that this cement, which is of pure white color, will be found suitable for building ornamentation, concrete building blocks, interior decoration work, colored concrete, stainless mortar, and tile, mosaic, seats, railings, gateways, etc. It is made by the Sandusky Portland Cement Co., Sandusky, Ohio, a special factory having been built for its production at York, Pa.

Harriman Lines Reply to Government Suit.

The answers of the defendants in the suit of the United States to dissolve the Harriman system of railroads on the ground that the system is a monopoly in restraint of trade, were filed in the federal court at Salt Lake, Utah, April 6. Mr. Harriman denies in his answer that he with Jacob H. Schiff, Otto H. Kahn, James Stillman or others has owned or controlled a majority of the stock of the Union Pacific Railroad. He denies that the firm of Kuhn, Loeb & Co. was a fiscal agent of the Union Pacific Railroad. He denies that he and the other defendants conspired to restrain trade among the several states or foreign countries, to restrain competition among the defendants' steamship and railroad lines or to deprive the public of the advantages of trade and commerce through independent combination, if there was any such, or to effect a consolidation with the idea of monopoly, or restraining trade and commerce, admitting, however, that the Union Pacific acquired a majority of the capital stock of the various lines and steamship companies. He denies in each instance that acquisition of the stock was to kill competition or to monopolize trade, commerce or business. He denies that the Union Pacific has control in management of operation of the affiliated lines. He avers that in the transcontinental lines of railroads reaching the Pacific coast, south of Portland, the Union Pacific is but a link about 1,000 miles long, an intermediate carrier without any power to make rates on such traffic; that the Southern Pacific owns and controls lines between Ogden and the coast with no power to make rates for business east of Ogden; that no rates could be made from the Missouri river to the coast without the joint consent of the Southern Pacific and the Union Pacific; that, while the Union Pacific and its constituent companies separately owned connecting lines (operated as a single system from the Missouri river to Portland, Ore., and operated certain small steamships between Portland and San Francisco), yet such a route, via Portland, was not only impracticable as a competitor of the Southern Pacific, but any attempt to use it would have greatly injured the Union Pacific, because the Southern Pacific would thereupon have preferred the rivals of the Union Pacific in routing and interchanging traffic at Ogden, and the business in tonnage and revenue thus lost would have greatly exceeded the total volume of business received over such an impracticable route in competition with the Southern Pacific.

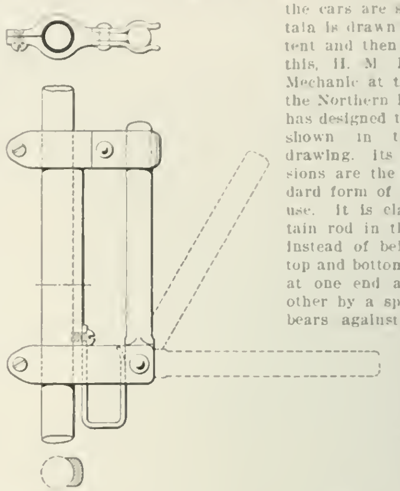
Mr. Harriman denies that the rail line of the Southern Pacific between San Francisco and Portland is in active competition with the ships of the Oregon Railroad & Navigation Company between the two cities, and explains that such competition is impracticable.

He denies that ships operated by the Portland & Asiatic Steamship Company between Portland and Asiatic ports, and connected with the rail lines of the Union Pacific, were ever in competition with the Pacific Mail Steamship Company. He denies that any competition ever existed between the system of railroads and steamships owned by the Union Pacific Railroad Company and the Southern Pacific, or if any such competition did ever exist, it was not substantial, or did not include a large volume of traffic of any kind.

He admits that the Union Pacific, in connection with the Central Pacific, is a competitor of the Atchison, Topeka & Santa Fe for a large volume of traffic to and from the Pacific Coast.

Self-Opening Handle for Vestibule Curtains.

There is considerable loss on all roads from the tearing of vestibule curtains when the trainmen do not detach the handles from the hooks of the next cars when the cars are uncoupled. When the cars are separated, the curtain is drawn out to its full extent and then torn. To prevent this, H. M. Robertson, Master Mechanic at the Como shops of the Northern Pacific at St. Paul, has designed the latching handle shown in the accompanying drawing. Its principal dimensions are the same as the standard form of handle in common use. It is clamped to the curtain rod in the same way, but, instead of being solid with the top and bottom clips, it is hinged at one end and caught at the other by a spring, which either bears against the heel of the handle bar or catches it at the end like a door holder. This spring is stiff enough to hold the handle in place when it is put on its hook. The rolling spring of the curtain is not strong enough to pull it out, but if left in place while the cars are being separated, the curtain when unrolled pulls the handle free, so that it straightens out as shown by the dotted lines. It then slips off the hook and the curtain rolls up in place.



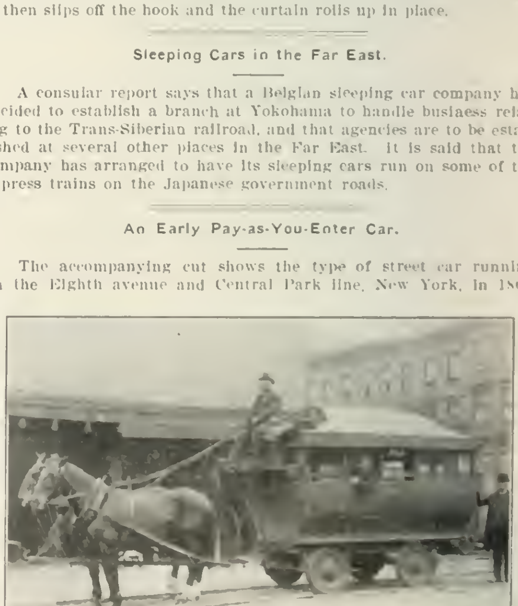
Self-Opening Handle for Vestibule Curtains.

Sleeping Cars in the Far East.

A consular report says that a Belgian sleeping car company has decided to establish a branch at Yokohama to handle business relating to the Trans-Siberian railroad, and that agencies are to be established at several other places in the Far East. It is said that the company has arranged to have its sleeping cars run on some of the express trains on the Japanese government roads.

An Early Pay-as-You-Enter Car.

The accompanying cut shows the type of street car running on the Eighth avenue and Central Park line, New York, in 1862.



A Pay-as-You-Enter Car of 1862.

There was no conductor, and the driver was responsible for the deposit of the passenger's fares.

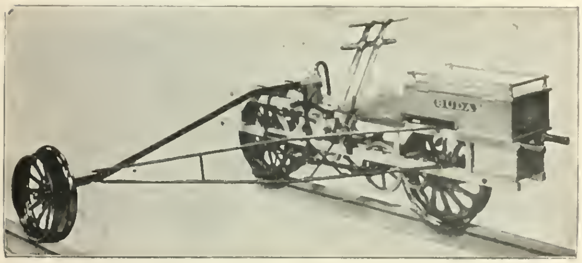
Principal Exports of 1907.

In the *Railroad Gazette* of January 24, the 1907 exports of wheat, beef and cotton, from the principal customs districts of the United States were given. The complete figures, compiled from the returns from all ports, are somewhat larger. There were 91,383,648 bushels of wheat exported valued at $86,089,946, an increase of 45 per cent. in bushels as compared with 1906, when 62,850,984 bushels, valued at $49,158,650, were exported. Wheat flour amounted to 15,276,506 bbls. as compared with 14,324,100 bbls. in 1906. Exports of canned beef decreased from 35,668,372 lbs. in 1906 to 22,145,993 lbs. in 1907: and of other preserved beef from 75,667,880 lbs. to 51,195,838 lbs. Cotton, unmanufactured, amounted to 4,192,054,144 lbs., which compares with 3,850,229,030 lbs. in the previous year. Exports of timber and unmanufactured wood were valued at $16,953,047 in 1907, and $17,471,670 in 1906. Lumber, however, increased, the values being $41,816,231 in 1907, and $34,598,304 in 1906. Logs and other unmanufactured wood imported, excluding pulp wood, decreased from $4,332,144 to $3,686,544. Imports of mahogany, however, increased from $2,895,825 to $3,365,727.

New Motor Inspection Car.

A new motor inspection car is shown herewith. One of its features is a method of limiting the speed to a predetermined maximum in accordance with the regulations of a road or the desires of department officers. This is done before the motor leaves the shop. Ordinarily, however, the speed can be graduated up to 30 m.p.h.

At starting, the car is propelled by the hand lever, until the car gets a certain momentum. Then the engine is started by throwing a switch and tightening a belt by a lever. The belt connects the front wheel of the car with the engine. Explosions start in the cylinder as soon as the flywheel of the engine begins to revolve. The hand lever is then thrown out of gear and may be locked in any position convenient for the operator as a hand grasp and foot rest.



Buda Gasolene Inspection Car.

The engine, which is 2¼-h.p., is air cooled, and has an automatic sight-feed lubricator. The air entering the carburetor is partially heated first, making the engine start more easily in damp or cold weather. Five dry cells supply ignition current. Enough gasolene is carried to run 200 miles. The wheels are pressed steel, with reinforced tread and M. C. B. flange. The main axles are ball-bearing. The car shown has three wheels, but it may be fitted with two guide wheels instead of one, if desired. The back brace on the guide wheel arm adds rigidity and strength, and, therefore, safety to the car.

The car is made by the Buda Foundry & Manufacturing Co., Chicago. It was exhibited at the recent Maintenance of Way convention.

Exhibit of Safety Devices.

The Exposition of Safety Devices at the American Museum of Safety Devices, 231 West Thirty-ninth street, New York, is to open April 13. Among the exhibitors are the Carnegie Steel Co., Pittsburgh, Pa.; Westinghouse Air Brake Co., Pittsburgh, Pa.; American Bridge Co., New York; Union Switch & Signal Co., Swissvale, Pa.; Yale & Towne Manufacturing Co., New York, and others.

Defects of Our Corporation Laws.

Dr. Woodrow Wilson, President of Princeton University, in an address before the Pittsburgh Traffic Club, April 3, objected to our corporation laws on the grounds that the methods of regulation are both inequitable and futile—inequitable because they impose penalties upon stockholders who are, in most cases entirely without legal blame, and futile because they do not stop the practices for which the fines and penalties are imposed. They strike at business instead of at transactions; they penalize bodies of persons instead of individuals, and they tend to accumulate discretionary power in the hands of the executive officers of the government.

Exports of Rails.

The shipments of rails to foreign countries during the eight months ended February 29, 1908, increased 25 per cent. over those of the corresponding period of last year. The average price was $31.84 a ton. The values of the exports were as follows:

Country.	1908.	1907.
Europe	$15,330	$12,859
British North America	1,055,692	806,373
Central America	601,267	169,017
Mexico	142,655	729,855
West Indies	493,866	532,433
South America	1,115,931	1,971,723
Japan	1,186,602	746,625
Other Asia and Oceania	2,135,251	600,118
British Africa	7,741	700
Other Africa	7,984	18,122
Total	$7,692,319	$5,588,125

The Development of Schenectady.

The following is from the *Troy Times:*

An event of historical importance was the charity ball recently given at Schenectady in the new Delaware & Hudson and New York Central & Hudson River union station. This celebration commemorated the beginning of steam railroading in this country as well as the elimination of all grade crossings in Schenectady. It is now the only city in New York state without a single dangerous railroad crossing.

It was on July 28, 1830, that ground was broken at Schnectady by Mayor Stephen Van Rensselaer for the Mohawk & Hudson Railroad. The first diminutive steam train made the trip between Schenectady and Albany, 17 miles, on August 3, 1831, in one hour and 45 minutes. In 1835 the Schenectady and Utica branch was constructed and in 1843 the Schenectady and Troy branch was built. In 1853 these roads were consolidated as the New York Central Railroad.

Since that time the historic old city has continued to occupy a large place in the annals of railroad history. As the site of the largest plant of the American Locomotive Company it became known the world over for its steam locomotives. Then the General Electric Company came, and a few years ago brought out the new electric locomotive. Not long ago this company introduced an innovation in short line railroading in the gas-electric motor car.

The work of eliminating the grade crossings at Schenectady took over three years and cost nearly $2,000,000. In excavating for the new union station and for the concrete work of the overhead crossings many old relics of pioneer railroading were brought to light. Among the finds were cedar ties of the old Utica & Schenectady road. Wooden rails, with streaks of rust along them showing that the wooden surface had been reinforced with iron plates, were found, which were used in the early days of the old Mohawk & Hudson. A number of these iron bands or strips are still preserved in the city and the old engine, the "DeWitt Clinton," and train is owned by the New York Central & Hudson River.

The new station is large and handsome and scientific. The celebration marked the first time that a new railroad station was opened with a charity ball and a public demonstration for the benefit of charitable institutions.

Still standing in Schenectady is the little, old, red brick building in which the travelers of the '30s anxiously awaited the tiny steam train from Albany. To-day the ancient building watches people waiting about the new union station for the Empire State Express and the Twentieth Century Limited, the electric engines going up to the test track above the city and the interurban trolley lines leading to the nearby cities of Troy, Watervliet, Saratoga Springs, Albany, Amsterdam and Gloversville.

Report on Brooklyn Bridge.

Bridge Commissioner Stevenson, of New York City, has transmitted reports on the Brooklyn Bridge by C. M. Ingersoll, Chief Engineer of the department; Professor Burr, of Columbia University, and L. S. Moisseiff, who reported for the United States government on the Quebec bridge failure. Professor Burr writes that the efficient system of inspection under which the structure is maintained has resulted in replacements, the correction of misfitting members originally placed in the stiffening trusses, and the improvement of many details, until it may now be confidently stated that the bridge has never been in as satisfactory condition of capacity to carry traffic as at present. Mr. Moisseiff likewise finds that the bridge is in as good a physical condition, if not a better one, than it ever has been since its opening. The following extract is from the report by Professor Burr.

"The heaviest Brooklyn Rapid Transit trains now running over the bridge consist of four motor cars and two trailers, the six cars loaded weighing 236 tons. This is the weight of train considered in the report of the Commission to which allusion has already been made. It was shown in that report that, with such trains moving at a maximum speed of fifteen miles per hour, with a headway of 45 seconds, and with trains separated by not less than 700 ft. between them, making a total of 80 per hour, the greatest stresses in the cables, suspenders, towers, anchorages and stiffening trusses would be 'safe and prudent,' it being the intention at that time to replace the floor system as soon as practicable, which work is now in progress. It is unnecessary to repeat here the details of this conclusion, as they will be found stated in full in the report of December 31, 1906. It is clear, therefore, that the present use of the bridge, with the Brooklyn Rapid Transit trains running in the manner described, up to a limit of 80 trains per hour, cannot be productive of any condition causing danger to the structure.

"It has been proposed to operate six loaded motor car trains, weighing 275 tons each, at the same maximum speed and with the same clear headway as with the trains consisting of four motor cars and two trailers. If this should be done, the resulting total cable stress would not be increased more than 2½ per cent., with other stresses throughout the structure increased in a somewhat greater percentage, but still remaining within safe limits."

INTERSTATE COMMERCE COMMISSION RULINGS.

Revised Tariff Regulations.

The Commission has issued tariff circular No. 15-A, containing the "Regulations Governing the Construction and Filing of Freight Tariffs and Classifications and Passenger Fare Schedules," as well as administrative rulings and opinions. This circular is a revision of and succeeds tariff circular No. 14-A and special circulars Nos. 1, 2, 3, 5 and 7, tariff department. It contains 90 pages of text and an 11-page index. It is effective April 15, 1908.

MANUFACTURING AND BUSINESS.

The offices of the Electric Welding Co., Pittsburgh, Pa., have been moved from 4 Smithfield street, to 316 Fourth avenue.

The offices of the Lehigh Valley Testing Laboratory, Pittsburgh, Pa., have been moved from 4 Smithfield street to 316 Fourth avenue.

The offices of Jacobs & Davies, Consulting Engineers, New York, will be moved on April 15 to the Hudson Terminal building, 30 Church street.

The office of Robert A. Cummings, Civil Engineer, M. Am. Soc. C. E., Pittsburgh, Pa., has been moved from 4 Smithfield street to 316 Fourth avenue.

William H. Donner has been elected Vice-President of the Westinghouse Machine Co., Pittsburgh, Pa., "in direct responsible charge of all of its activities."

All the bridges on the Guatemala Railroad, described in the *Railroad Gazette* of last week, were furnished by the Baltimore Bridge Co., Baltimore, Md.

A. E. Mitchell, heretofore Manager of Purchases and Supplies of the New York, New Haven & Hartford, has resigned to go to The Wyckoff Pipe & Creosoting Co., Stamford, Conn.

The offices of the United States Steel Products Export Co., New York, the foreign sales department of the United States Steel Corporation, will be moved on April 11 to the Hudson Terminal building, 30 Church street.

The A. Gilbert & Sons Brass Foundry Co., St. Louis, Mo., has moved into new quarters at 1015-1019 Forest Park boulevard. The new foundry is equipped with an overhead trolley system, oil furnaces, fireproof pattern vaults, etc. It has a daily capacity of 42,000 brass castings, and employs 50 men normally.

In a recent competitive test of track drills made on a large western railroad, the "Climax" drilled a hole in an 85-lb. rail, using a 1-in. flat bit at 168 r.p.m., in 2 min. 40 sec.; at 226 r.p.m., the time was 2 min. 25 sec. The drill was worked by two ordinary section men. These figures are furnished by Cook's Standard Tool Co., Kalamazoo, Mich., maker of "Climax" drills.

During the fiscal year ended February 1, 1908, the General Electric Co., Schenectady, N. Y., took orders for 325 Curtis turbines, aggregating 286,320 k.w. capacity. On December 31, 1907, there were orders on hand for 153, and up to that date 943 machines, in all, had been installed, their aggregate capacity being 867,610 k.w. Of all the plants for which Curtis turbines had been ordered or delivered up to the end of 1907, 201 were central station and electric traction plants, averaging 3,778 k.w. capacity, and 288 were industrial and miscellaneous plants, averaging 305 k.w. capacity.

A new plan of reorganization for the Westinghouse Electric & Mfg. Co., Pittsburgh, Pa., has been prepared by the creditors' committee and approved by the directors and the original reorganization committee. Under this plan no mortgage bonds will be issued, and the stockholders are to be required to subscribe to only $6,000,000 new stock instead of $7,000,000. In all $10,000,000 stock is to be issued, of which the creditors will take $4,000,000. Stockholders are to pay for new stock in instalments, the first due June 1, 1908, and the last, April 1, 1909. The cash accounts and bills receivable on February 29, 1908, amounted to $12,832,729, and working assets (materials and supplies, etc.), to $14,601,671.

Iron and Steel.

The Chicago, Burlington & Quincy, it is said, has ordered 900 tons of structural steel from the American Bridge Co.

The Isthmian Canal Commission has ordered 2,031 tons of rails for canal work from the R. C. Hoffman Co., Baltimore, Md.

The New South Wales Government has ordered 6,000 tons of rails from the Pennsylvania Steel Co., and it is understood that 20,000 tons more will be bought in the future.

OBITUARY NOTICES.

John G. Wilson, General Attorney of the Baltimore & Ohio, died on April 7 from cerebro-spinal meningitis.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Canadian Northern Quebec.—W. A. Kingsland, Auditor, with office at Quebec, has had his authority extended over the Quebec & Lake St. John, succeeding S. S. Oliver, who becomes Engineer of Maintenance of Way of both roads.

Georgia & Florida.—The offices of E. L. Bemiss, Second Vice-President; J. M. Turner, General Manager; A. Pope, Traffic Manager; W. H. Alexander, Auditor, and G. H. Hazlehurst, Chief Engineer, have been removed from Augusta, Ga., to Douglas, Ga.

Georgia Coast & Piedmont.—A. de Sola Mendes has been appointed Auditor, succeeding W. R. Basset, resigned.

Illinois Central.—B. A. Beck has been elected Assistant Secretary at Chicago, Ill., succeeding W. G. Bruen.
See Indianapolis Southern.

Indianapolis Southern.—O. F. Nau, Local Treasurer at Chicago, Ill., has been elected Treasurer, succeeding E. T. H. Gibson.

La Crosse & Southeastern.—P. Valier, Purchasing Agent and Superintendent, has been elected Vice-President and General Manager, with office at La Crosse, Wis.

Macon, Dublin & Savannah.—Homer Loring, President of the Fort Dodge, Des Moines & Southern, and of the Newton & Northwestern, has been elected also President of the Macon, Dublin & Savannah, with office at Boston, Mass., succeeding W. A. Garrett, Chief Executive officer for the Receivers of the Seaboard Air Line.

Missouri, Oklahoma & Gulf.—E. A. Chavannes has been appointed Auditor, with office at Muskogee, Okla., succeeding R. P. Dunbar.

National Railways of Mexico.—Pablo Macedo, Chairman of the Mexican Senate, has been elected temporary President of this new company, representing the Mexican government.

Oklahoma Central.—G. H. Parker, Assistant Auditor, has been appointed Auditor, with office at Purcell, Okla., succeeding E. I. Green. The office of Assistant Auditor has been abolished.

Panama Railroad.—Lieut.-Col. H. F. Hodges, General Purchasing Agent of the Panama Railroad, with headquarters at Washington, D. C., has been elected a Director, succeeding Gen. Peter C. Hains, retired.

Peoria & Pekin Union.—George E. Dayle has been appointed Auditor, relieving President H. K. Pinkney of duties temporarily assumed by him.

Quebec & Lake St. John.—See Canadian Northern Quebec.

Rio Grande, Sierra Madre & Pacific.—C. L. Montague has been appointed Secretary of the Sierra Madre & Pacific, succeeding J.

H. Martin, who remains Secretary of the Rio Grande, Sierra Madre & Pacific. D. J. Kerr has been appointed Auditor of the Sierra Madre & Pacific, succeeding W. Maurer, who remains Auditor of the Rio Grande, Sierra Madre & Pacific, both with offices at Madera, Chihuahua, Mex.

San Pete Valley.—J. W. Gilluly has been elected Treasurer, with office at Denver, Colo., succeeding E. A. Greenwood.

Seaboard Air Line.—See Macon, Dublin & Savannah.

Sierra Madre & Pacific.—See Rio Grande, Sierra Madre & Pacific.

Tampa Northern.—A. G. Brewer has been appointed to the new office of Auditor, with headquarters at Tampa, Fla.

Tonopah & Goldfield.—J. W. Reinhart has been appointed Assistant to the President, and Comptroller, with office at Tonopah, Nev. Mr. Reinhart will have direct control of the finances and accounts and will exercise executive powers over all departments, including operating and traffic, in the absence of the President.

Williamson, Greenville & St. Louis.—The officers of this company are now as follows: D. H. Glass, President; H. B. Montgomery, Vice-President; W. P. Druick, Secretary and Treasurer; C. A. Long, General Manager; G. A. Long, General Superintendent, and H. H. Rhodes, Auditor, all with offices at Greenville, Mo.

Operating Officers.

Ann Arbor.—K. A. Gohring has been appointed Superintendent, with office at Owosso, Mich., succeeding E. Hartenstein.

Arkansas Midland.—H. J. Schueing has been appointed Superintendent, with office at Wynn, Ark., succeeding J. F. Murphy.

Buffalo & Susquehanna.—G. H. Crissman has been appointed Assistant Superintendent, with office at DuBois, Pa. Mr. Crissman has direct charge of the despatcher's office at DuBois, the office of chief despatcher at that place having been abolished.

Canadian Northern Quebec.—John F. Spaidall, General Superintendent, with headquarters at Montreal, Que., has had his authority extended over the Quebec & Lake St. John and his office changed to Quebec.

Charlotte Harbor & Northern.—E. G. Bagwell has been appointed Superintendent, with office at Hull, Fla., succeeding C. B. McCall.

Chattahoochee Valley.—J. A. Avery is now General Manager as well as Traffic Manager of this road, with headquarters at West Point, Ga.

Chicago, Burlington & Quincy.—The appointments mentioned in the *Railroad Gazette* of March 27, in connection with the promotion of F. S. Ustick, Superintendent at Aurora, Ill., have not been made, owing to a change in plans. A. V. Brown remains Superintendent at Ottumwa, Iowa, and A. W. Newton, who has been General Inspector of Permanent Way and Structures, remains on the staff of the Second Vice-President, with headquarters at Chicago, Ill.

Cincinnati, New Orleans & Texas Pacific.—The office of Car Accountant has been abolished.

The office of W. S. Milton, Superintendent of Telegraph, has been removed from Chattanooga, Tenn., to Lexington, Ky.

Detroit, Toledo & Ironton.—H. E. Warner, Trainmaster at Springfield, Ohio, has been appointed Superintendent, with office at the same place.

Great Northern.—S. A. Walker, Superintendent at Havre, Mont., has been appointed Assistant Superintendent of the Willmar division, with office at Willmar, Minn., succeeding F. S. Elliott.

Illinois Central.—H. Battisford, Superintendent of Freight Terminals at Chicago, Ill., has been appointed Superintendent of the Chicago division, with office at Chicago, succeeding J. C. Dailey, now on the International & Great Northern. The title of H. P. Thrall has been changed from Superintendent of Mail Service to Mail Traffic Manager. Mr. Thrall also has the same position on the Indianapolis Southern.

P. Laden, Superintendent of the Peoria division, with headquarters at Mattoon, Ill., has had his authority extended over the Indianapolis Southern, succeeding L. W. Baldwin. Mr. Baldwin has been appointed Trainmaster of the Indianapolis Southern, with office at Indianapolis, Ind., succeeding R. A. Brown, appointed chief despatcher of that road, with office at Indianapolis, Ind.

Indianapolis Southern.—See Illinois Central.

Mexican Central.—D. F. Bucher, General Superintendent, has been appointed Car Service Superintendent, succeeding H. Putnam, who becomes Chief of Train Auditors, reporting to the General Manager. The office of Fuel Agent has been abolished, all reports being made direct to the General Manager.

Under the new divisional organization which went in effect April 1, Division Superintendents have charge of and are responsible for the discipline of all employees on their divisions, including those in the track department and the mechanical department, and all other employees except those directly under the traffic department. The employment of all forces on each division, increase or decrease in the number of men employed and all matters of discipline are handled by the Superintendents who are responsible to the General Manager in all such matters.

The El Pazo-Ciudad Juarez terminal is entirely in the charge of the Terminal Superintendent, reporting to the Superintendent of the Chihuahua division. The city ticket agent, station agent, customs agent, foreman, yardmaster, etc., report direct to the Terminal Superintendent. This does not, however, interfere with instructions that may be issued by the general freight department, general passenger department or auditing department in regard to freight or passenger rates or accounts. See Engineering and Rolling Stock officers.

Minneapolis & St. Louis.—H. G. Kruse, formerly Superintendent of the Peoria & Pekin Union, at Peoria, Ill., has been appointed Trainmaster of the Southern Des Moines division and of the Southwestern division of the Minneapolis & St. Louis, with office at Fort Dodge, Iowa, succeeding T. G. Hyland, resigned.

Quebec & Lake St. John.—See Canadian Northern Quebec.

Saratoga & Encampment.—B. F. Dunn, formerly division passenger agent of the St. Louis & San Francisco, at Wichita, Kan., and later Assistant to the Vice-President and General Manager of the Denver, Enid & Gulf, at Enid, Okla., has been appointed General Superintendent, with office at Saratoga, Wyo., succeeding LeGrand Young, Jr., resigned to go to another company.

Seaboard Air Line.—R. E. Boswell, Superintendent of Transportation at Portsmouth, Va., has been appointed Superintendent of the Sixth division, with office at Jacksonville, Fla., succeeding W. J. Jenks. H. W. Stanley, Assistant General Superintendent at Portsmouth, succeeds Mr. Boswell.

Tampa & Jacksonville.—A. L. Glass has been appointed General Superintendent, with office at Gainesville, Fla., succeeding J. B. Cutler, resigned.

Tennessee & North Carolina.—A. J. McMahon has been appointed Superintendent and Auditor, with office at Newport, Tenn., succeeding P. T. Bauman.

Traffic Officers.

Atchison, Topeka & Santa Fe.—H. B. Gregory, Acting General Agent at Santa Barbara, Cal., has been appointed General Agent at that place.

Beaumont & Great Northern.—G. R. Wansborough has been appointed General Freight and Passenger Agent, with office at Onalaska, Tex.

Canadian Northern Quebec.—Guy Tombs, General Freight and Passenger Agent of the Canadian Northern Quebec, with headquarters at Montreal, Quebec, has had his authority extended over the Quebec & Lake St. John, succeeding A. Hardy.

Central Vermont.—See Grand Trunk.

Chattahoochee Valley.—See under Operating Officers.

Colorado & Southern.—See Colorado Springs & Cripple Creek District.

Colorado Springs & Cripple Creek District.—F. C. Matthews has been appointed General Freight and Passenger Agent of the Colorado Springs & Cripple Creek District Railway, the Florence & Cripple Creek and the Midland Terminal, with office at Colorado Springs, Colo.

Florence & Cripple Creek.—See Colorado Springs & Cripple Creek District.

Grand Trunk.—Robert L. Burnap, General Freight Agent of the Central Vermont, has been appointed Assistant General Freight Agent of the Grand Trunk, with headquarters at Chicago, Ill., succeeding C. A. Hayes.

Maine Central.—The office of Fred V. Berry, Assistant General Passenger and Freight Agent of the Somerset Railway, has been abolished, and Mr. Berry has been assigned to special service in the general office of the Maine Central at Portland, Me.

Midland Terminal.—See Colorado Springs & Cripple Creek District.

Philadelphia & Reading.—B. H. Bail, General Freight Agent, has been appointed Freight Traffic Manager, a new office, with headquarters at Philadelphia, Pa.

Quebec & Lake St. John.—See Canadian Northern Quebec.

Rio Grande, Sierra Madre & Pacific.—W. T. O'Donnell has been appointed General Freight and Passenger Agent of the Sierra

Madre & Pacific with office at Madera, Chihuahua, Mex., succeeding B. F. Seggerson, who remains General Freight and Passenger Agent of the Rio Grande, Sierra Madre & Pacific.

Sierra Madre & Pacific.—See Rio Grande, Sierra Madre & Pacific

Somerset Railway. See Maine Central

Engineering and Rolling Stock Officers.

Ann Arbor.—See Detroit, Toledo & Ironton.

Canadian Northern Quebec.—A. E. Doucet, Chief Engineer of the Quebec & Lake St. John, has resigned to give his whole time to his work as District Engineer of the National Transcontinental Railway Commission, with headquarters at Quebec.

S. S. Oliver, Auditor of the Quebec & Lake St. John, has been appointed Engineer of Maintenance of Way of the Canadian Northern Quebec and the Quebec & Lake St. John.

Cincinnati, New Orleans & Texas Pacific.—The office of C. Dougherty, Assistant Chief Engineer at Cincinnati, Ohio, has been abolished.

Detroit, Toledo & Ironton.—The office of R. Tawse, Superintendent of Motive Power of the Detroit, Toledo & Ironton of the Ann Arbor, has been moved from Jackson, Ohio, to Toledo.

Idaho & Washington Northern.—W. C. Smith has been appointed Chief Engineer, with office at Coeur D'Alene, Idaho, succeeding L. F. McCoy, resigned.

W. J. Spearman has been appointed to the new office of Master Mechanic, with office at Coeur D'Alene, Idaho.

Mexican Central.—Under the new divisional organization which went in effect April 1, the authority of Ben Johnson, Superintendent of Machinery, is outlined as follows:

The Superintendent of Machinery will instruct the Master Mechanics in regard to methods of handling work in the mechanical department, will advise them fully from time to time of all standards adopted, and will see that these standards are followed. In order to preserve uniformity, the Superintendent of Machinery will have, through the Superintendents, general supervision over the wages paid in the different shops and to other employees in the mechanical department. He will also have charge of and be responsible for the stock of material carried on hand for the mechanical department, and will keep up the supply by requisition or by deliveries from the general store at Aguascalientes, as his judgment may dictate. The general shops at Aguascalientes and everything pertaining thereto within the shop walls, including the tie treating plant, will be under the direct charge of the Superintendent of Machinery. See Operating Officers.

National Transcontinental Railway Commission.—See Canadian Northern Quebec.

New York Central & Hudson River.—D. R. MacBain, Assistant Superintendent of Motive Power of the Michigan Central, at Detroit, Mich., has been appointed Assistant Superintendent of Motive Power of the New York Central & Hudson River, with headquarters at Albany, N. Y.

Quebec & Lake St. John.—See Canadian Northern Quebec.

Tehuantepec National.—Ernest H. Mitchell has been appointed Acting Chief Engineer, with office at Rincon Antonio, Oaxaca, succeeding D. Coe, Chief Engineer.

Purchasing Agents.

Algoma Central & Hudson Bay.—T. H. McGillivray has been appointed Purchasing Agent, succeeding W. H. Cowell.

New York, New Haven & Hartford.—The title of J. H. Sanford is Purchasing Agent. As previously announced, he succeeded to the duties of A. E. Mitchell, Manager of Purchases and Supplies, which title has been abolished.

LOCOMOTIVE BUILDING.

The Idaho & Washington Northern has ordered one 75-ton ten-wheel passenger locomotive, cylinders 19 in. x 26 in., from the Baldwin Locomotive Works. It will be a duplicate of two of those ordered last spring.

The New York Central Lines, as noted in the *Railroad Gazette* of March 27, have ordered from the American Locomotive Co. 12 electric locomotives, 20 Pacific, 22 in. x 28 in., 45 consolidation, 23 in. x 32 in., and 29 six-wheel switch engines, 21 in. x 28 in., for the N. Y. C. & H. R., and 12 Pacific, 20 consolidation and 10 six-wheel switch engines for the B. & A. These locomotives will be similar to those of the same types previously built.

The H. K. Porter Co. has the following recent orders: Winston-Dear Co., four 3 ft. gage contractors' locomotives, 11 in. x 16 in.; Pennsylvania Salt Manufacturing Co., two standard gage switch engines, one of which will have cylinders 14 in. x 20 in., and the other 16 in. x 24 in.; O'Brien & Mullarkey, Montreal Canada, one 3-ft. gage contractors' locomotive, cylinders 9 in. x 14 in.; Cummer Lumber Co., Newberry, Fla., one 3-ft gage, four-driver saddle tank locomotive, 8 in. x 14 in., Dugas & LeBlanc, Louisiana, one Forney locomotive for plantation service, cylinders 7 in. x 12 in.

CAR BUILDING.

An Argentine road has ordered 125 or more cars from the Middletown Car Works.

The Pennsylvania has ordered 200 all-steel class GLA gondolas from the Middletown Car Works.

The Idaho & Washington Northern has ordered 12 wooden frame refrigerator cars, 36 ft. 6 in. long, from Haskell & Barker.

The Mexican Central has ordered eight combination passenger and two combination baggage and express cars from the American Car & Foundry Co.

RAILROAD STRUCTURES.

BEAVER, PA.—The Pittsburgh & Lake Erie it is said, has started work on the proposed steel bridge over the Ohio river at the mouth of Beaver river. The plans call for a two-track structure instead of a three-track, reducing the amount of steel needed from 18,000 tons to 14,000 tons, contract for which has not yet been let. The bridge is to have a total length of 1,787 ft., and will cost, with the necessary changes in the tracks and approaches, about $2,000,000. Some of the work is reported let to the Dravo Construction Co., of Pittsburgh, Pa. The value of the contract is said to be about $500,000. (Jan. 24, p. 136.)

CALGARY, ALB.—The Canadian Pacific, according to reports, will this summer replace many of the wooden bridges on its main line between this place and Vancouver, B. C., with steel structures.

COEUR D'ALENE, IDAHO.—The Idaho & Washington Northern is building brick passenger stations 28 ft. x 70 ft. at Rathdrum, Idaho, and at Newport, Wash.

CULIACAN, MEXICO.—Work on the Southern Pacific's extension down the Pacific coast to Mexico involves the construction of 22 large bridges. Work is now under way on several of these structures. One of the largest is now being built over the Culiacan river, at Culiacan. It is to be steel, 1,500 ft. long.

KENORA, ONT.—Contract is reported let to Kelly Bros., of this place, to build 17 bridges on the section of the Grand Trunk Pacific from a point east of Winnipeg, east to the junction with the Lake Superior branch, under contract to J. D. MacArthur. Grant & MacDonald, it is said, have been given contracts for several bridges on the section from Saskatoon to Edmonton, under contract to Foley, Welch & Stewart.

NEW YORK, N. Y.—The Board of Aldermen has just appropriated $1,200,000 for paving the roadway, flooring the footpaths, placing tops on the towers, laying tracks and painting the Blackwell's Island bridge. It is thought that this will be sufficient to finish the construction of the superstructure.

The new subway terminal of the Williamsburg bridge, at Delancey street, Manhattan, has been finished. There are eight loops in the street terminal, separated by partitions, each with individual entrance and exit from the street.

SOUTH NORWALK, CONN.—The freight house of the New York, New Haven & Hartford here was destroyed by fire April 5, also 30 cars standing on the siding. The loss is estimated at $100,000.

WINNIPEG, MAN.—J. S. MacArthur, it is said, will sublet the contract for the large steel bridge over the Red river here. Soundings have been finished and the location definitely decided on. It is to run from the foot of Lombard street to St. Boniface. Work is to be started at once.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

BIENVILLE & QUITMAN.—An officer reports that contracts have been given by this company to Richardson-Taylor Lumber Company for work on the line it is building from Bienville, La., east to Quitman, 12 miles. Track has been laid on about two miles. D. C. Richardson, President, Shreveport, La.; E. E. Scott, Chief Engineer, Bienville, La. (Mar. 27, p. 461.)

COPPER RIVER & NORTHWESTERN.—According to reports from Seattle, Wash., about 1,500 men are to be put at work by M. J. Heeney, the contractor who is building this line from Catalla, Alaska, through Copper River valley to the interior of Alaska (Mar 13, p. 390.)

CHICAGO & MILWAUKEE ELECTRIC.—This company, building an electric line from Chicago, Ill., north to Milwaukee, Wis., for which contracts have been let to the MacArthur Bros. Co. and the Republic Construction Co., has received authority to issue receiver's certificates on the Wisconsin division to continue the line to Milwaukee, so that through trains from Evanston, Ill., can be put in operation by June. Two miles of track out of the 3½ to be built in the city of Milwaukee have been finished; track is also laid to a point 12 miles north of Racine, and grading is finished on eight miles additional. (Mar. 13, p. 390.)

Grand Trunk.—Surveys reported under way for a new double-track line from Midland, Ont., east to Port Hope. The proposed line is to be built north of the present line, with easy grades, to haul grain from the company's elevator at Midland, which has a capacity of 2,000,000 bushels.

Great Western.—This company has finished an extension from Liberty, Colo., southwest to Longmont, six miles.

Idaho Northern Railroad.—This company, which was organized to build 76 miles of line in the Coeur d'Alene district, Idaho, has work under way from Enaville on the Wallace-Tekoa branch of the Oregon Railroad & Navigation Company, near Kingston, Idaho, northeast to a point six miles east of Murray, 33 miles, of which about one-fifth is finished. This section is expected to be ready for operation this year. Branches aggregating 43 miles are to be built. B. F. O'Neil, President of the State Bank of Commerce, at Wallace, is President, and E. P. Spalding, 416 Lindell Block, Spokane, Wash., is Vice-President and General Manager. This company has no connection with the Idaho Northern Railway, operating 59 miles of railroad in Idaho.

Kentucky & Ohio River Interurban.—An agreement, it is said, has been made by this company with the Royal Investment Company, of Minneapolis, Minn., to build 50 miles of electric line to connect Cairo, Ill., with Paducah, Ky.

Missouri & North Arkansas.—This road has been extended from Seligman, Mo., northwest to Neosho, Mo., 41 miles (Mar. 13, p. 392.)

Nevada Northern.—This company has opened a new line from McGill Junction, Nev., to McGill, three miles.

Oklahoma Central.—This company has extended the operation of trains on its road from Blanchard, Okla., west to Chickasha, 22 miles. (Nov. 8, p. 573.)

Pittsburgh, Shawmut & Northern.—This company has finished the line between Brockwayville, Pa., and Brookville, 18.9 miles, and trains are now in operation between St. Marys and Ramsaytown.

Spokane, Portland & Seattle.—This company's line from Pasco, Wash., west to Vancouver, 221 miles, was opened for freight and passenger traffic on March 16. At Vancouver connection is made for passengers with the Portland Railway, Light & Power Company's electric line to Portland. A bridge is being built across the Columbia river at Vancouver, and the road is to be extended over this to Portland.

RAILROAD CORPORATION NEWS.

Buffalo, Rochester & Pittsburgh.—Gross earnings for the last week in March, 1908, were $206,000 against $210,000 in the corresponding period of 1907, a decrease of $4,000.

Canadian Pacific.—This company is reported to have recently sold 20,000 acres of irrigated land to settlers at $17.50 an acre, and 15,000 acres at $37.50 an acre, a total of $912,500 recently received from sale of irrigated lands.

Carolina, Clinchfield & Ohio.—This company, formerly the South & Western, is to make a mortgage covering $15,000,000 5 per cent. 30-year first mortgage bonds dated January 1, 1908, of which $3,000,000 will be reserved to retire the bonds of three constituent railroads, and another $3,000,000 reserved for equipment. The rest of the issue will be used in paying the cost of construction of the line. (Mar. 20, 1908, p. 130.)

Chesapeake & Ohio.—Gross earnings for February, 1908, were $1,576,000, against $1,931,000 in 1907. Net earnings were $446,000, against $582,000 in 1907. The operating ratio was 71.7 per cent., against 69.9 per cent. in 1907.

Chicago & Milwaukee Electric.—The receivers have been authorized by Judge Grosscup of the United States Court, of Chicago, to issue $900,000 receiver's certificates covering the amount necessary to finish the line into Milwaukee. These certificates will be issued by the Chicago & Milwaukee Electric Railroad of Wisconsin and will be a prior lien to all the other securities of that company. They will not be a prior lien, however, to the securities of the Chicago & Milwaukee Electric Railroad of Illinois, which is the controlling company.

Chicago City Railway.—E. H. Rollins & Sons, of Boston, Chicago, Denver and San Francisco, have offered at 96½, yielding about 5.3 per cent., $1,000,000 first mortgage 5 per cent. bonds due 1927, of the Chicago City Railway. These bonds are a first mortgage on 244 miles of track, covering the south side of the city of Chicago.

Chicago, Rock Island & Pacific.—Gross earnings for February were $4,270,000 against $4,630,000 in 1907, a decrease of $360,000. Net earnings were $670,000 against $1,200,000 in 1907, a decrease of $530,000. See Rock Island Company.

Cincinnati, Hamilton & Dayton.—The bondholders' committee announces that on April 2, 1908, over 74 per cent. of the holders of the 4 per cent. refunding mortgage bonds of 1954 had exchanged their bonds for the new 5½-year collateral trust 4 per cent. notes dated January 1, 1908. These notes are secured by the refunding mortgage bonds for which they are exchanged. (Jan. 10, 1908, p. 74; Mar. 27, 1908, p. 462.)

Delaware & Hudson.—The New York Public Service Commission, Second District, has granted the application of this company for authority to acquire the one outstanding share of the New York & Canada Railroad, not already owned by it. (April 3, 1908, p. 493.)

Gross railroad earnings for February were $1,340,000, against $1,270,000 in 1907, an increase of $70,000. Net railroad earnings after taxes were $449,000 against $427,000 in 1907, an increase of $22,000. The January gross and net earnings increased at about the same rate.

Erie.—At a meeting of the directors, held April 4, 1908, the following plan was adopted for meeting the $5,500,000 discount notes which fell due on April 8. The $15,000,000 three-year collateral notes authorized March 31, 1908, by the Public Service Commission, Second District (April 3, 1908, p. 494), were to be issued for the following purposes:

First, $5,500,000 to be exchanged at par for the same amount of discount notes.

Second, Not less than $5,000,000 to be sold at par for cash on condition that all of the $5,500,000 unsecured notes shall have been exchanged for the new notes.

Third, Not more than $4,500,000 to be reserved for future issue, according to the judgment of a committee, consisting of Charles Steele, George F. Baker and E. H. Harriman.

These new notes are secured by:

General lien 4 per cent. bonds	$9,457,000
Convertible 50-year 4 per cent. bonds, Series B	985,000
Mutual Terminal Co. of Buffalo, N. Y., first mortgage 4 per cent., 20-year bonds	625,000
Erie Railroad, Pennsylvania collateral 4 per cent. bonds	336,000
Hocking Valley common stock	1,154,000
Temple Iron Co. stock	145,700
Lehigh & Hudson River stock	134,000
Total, par value	$12,836,700

On April 8 considerable amounts of the discount notes were presented for payment, their holders refusing to exchange them for the new notes. During the day it became evident that the plan outlined above could not succeed. Toward the end of the day an offer was made by E. H. Harriman to buy not more than $5,500,000 of the new 6 per cent. collateral notes at 95 to the extent required for providing funds for payment of the discount notes. Holders of the discount notes now may receive cash for their notes or, until April 15, the same amount of the new 6 per cent. collateral notes and 5 per cent. in cash.

Hocking Valley.—For stock of this company pledged as collateral, see Erie.

Intercolonial.—The legislature of Nova Scotia has passed a resolution calling on the government of Canada to acquire all the railroad lines in that province and turn them over to the Intercolonial Railway.

Lehigh & Hudson River.—For stock of this company pledged as collateral, see Erie.

Louisville & Nashville.—Gross earnings for the eight months ended February 29, 1908, were $31,115,000, against $31,519,000 in 1907, a decrease of $404,000. Operating expenses increased from $21,346,000 to $23,639,000, a rise of $2,293,000. Net earnings after taxes were $6,560,000, against $9,357,000 in the eight months ended February 28, 1908. The operating ratio was 75.98 per cent., against 67.72 per cent. in the earlier year.

Macon, Dublin & Savannah.—W. A. Garrett, President of the Seaboard Air Line, has been succeeded as President of the Macon, Dublin & Savannah by Homer Loring, of Boston, Mass., President of the Fort Dodge, Des Moines & Southern, and of the Newton & Northwestern.

Metropolitan Street Railway.—See New York City Railway.

Mexican Central.—See National Railways of Mexico.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—Gross earnings for February were $680,000, against $702,000 in February, 1907, while operating expenses were $512,000, against $579,000 in 1907, leaving net earnings of $168,000, against $124,000 in 1907. The month of February 1907, was one of exceedingly severe winter weather in the territory of this road, as may be seen from the fact that maintenance of way and structures cost $127,000 in that month, as against $73,000 in February, 1908.

MISSOURI & NORTH ARKANSAS.—Francis Bro. & Co., of St. Louis, have offered at par, yielding 6 per cent., $300,000, and the Mercantile Trust Co., of St. Louis, on the same terms, $600,000 of the 6 per cent. "John Scullin collateral trust" 3½-year notes dated April 1, 1908. These two blocks comprise the total issue of these notes, which are secured by $1,123,000 5 per cent. collateral trust notes due October 1, 1911, of the Allegheny Improvement Co. This is a construction company which has the contract to build 211 miles of extensions of the Missouri & North Arkansas. The notes of the improvement company are secured by the securities of the 122 miles of the Missouri & North Arkansas now in operation. The bankers state that they have absolute confidence and belief in the ability of Mr. Scullin to pay these notes at maturity.

NATIONAL OF MEXICO.—See National Railways of Mexico.

NATIONAL RAILWAYS OF MEXICO.—The terms of exchange of securities of the Mexican Central and the National of Mexico for securities of this new company which is to take over these two roads, were announced on April 8, 1908. The securities of the National Railways of Mexico are as announced in this column on July 12, 1907, page 54, as follows:

Prior lien, 4½ per cent. bonds	*$225,000,000
General mortgage 4 per cent. bonds, guaranteed by the Republic of Mexico	†160,000,000
Non cumulative, 4 per cent., first preferred stock	30,000,000
Non cumulative 5 per cent., second preferred stock	125,000,000
Common stock	75,000,000
Total	$615,000,000

*$6,000,000 additional may be issued in exchange for $6,000,000 (£1,200,000) prior lien bonds of the Mexican International, or an equal amount of prior lien bonds of the National of Mexico, into which these may have been refunded.

†Additional bonds may be issued to refund an equal amount of consolidated mortgage bonds of the Mexican International or of consolidated mortgage bonds of the National of Mexico, into which these may have been refunded. Also to refund an equal amount of consolidated mortgage bonds of the National of Mexico into which prior lien bonds of that company may have been refunded.

No arrangements have yet been made for exchange of the following securities for payment of both principal and interest of which, however, the new company is to become liable:

National of Mexico:
Prior lien 4½ per cent. bonds.
First consolidated mortgage 4 per cent. mortgage bonds.
5 per cent. (extended) gold notes.
Mexican Central:
4 year 5 per cent. gold notes.

The basis of exchange of the other securities of the two companies to be merged is as follows:

National of Mexico. Stock per $100 share.
First preferred stock..$100 new 1st pref. stock and $10 cash.
Second " " ..$110 new 2d pref. stock.
Common stock (old)..$73⅓ new 2d pref. stock and $33⅓ new com. stock.
Deferred stock........$100 new common stock.

Mexican Central. Bonds, per $1,000.
Priority 5 per cent....$700 new 4½ per cent. prior lien bonds and $175 new 4 per cent. general mortgage bonds.
First mort 7 per cent bonds and scrip.*..1,000 4½ per cent. prior lien bonds.
Consolidated mortgage 4 per cent. bonds.. $600 4½ per cent prior lien bonds, $325 4 per cent general mortgage bonds and $75 new second preferred stock.
Reg income bonds and scrip ....$1,100 new second preferred stock.
2d cons. income bonds $1,000 new second preferred stock.
Stock ($100 shares)...$100 new second preferred stock.

*Assented.

The cash requirements of the consolidation plan, including the $3,200,000 to be paid on the first preferred stock of the National of Mexico as exchanged, the payment of floating debt amounting to about $5,500,000, the compensation of the bankers, and the provision of new working capital, are to be met by the purchase by the bankers of $10,000,000 prior lien 4½ per cent. bonds and $6,750,000 guaranteed general mortgage 4 per cent. bonds. The "readjustment managers" are: Kuhn, Loeb & Co.; Ladenburg, Thalmann & Co.; Hallgarten & Co., and Speyer & Co., of New York; Speyer Bros., of London; the Bank fur Handel und Industrie and the Berliner Handelsgesellschaft, of Berlin.

NEW YORK CITY RAILWAY.—The receivers of the Metropolitan Street Railway have announced that not including the dividends or interest on securities of the Third Avenue Railroad which is now being separated from the Metropolitan Street Railway, nor the guaranteed dividends on Metropolitan Street Railway stock, nor the interest on the general mortgage and collateral trust 5 per cent. bonds and the refunding mortgage 4 per cent. bonds now in default, nor expenses charged to construction, but only operating expenses, taxes, dividends, rentals and the interest on securities of lesser companies other than the Third Avenue there will be a deficit of about $1,000,000 for the year ended June 30, 1908.

The Metropolitan Street Railway was on March 31 authorized by Judge Lacombe in the United States Circuit Court to discontinue transfers between its lines and the lines of the Third Avenue Railroad and its subsidiary companies on 10 days' notice, except in certain places, where the lines are used in common for over 1,000 ft.

NEW YORK CENTRAL LINES.—The following table has been made by the *Wall Street Journal* from the annual reports of the five companies mentioned, showing the value of equipment received by each company through the sale in January of $30,000,000 fifteen-year 5 per cent. equipment notes. In each case 10 per cent of the total value of the equipment is to be paid in cash.

	Principal of certificates.	To be paid in cash	Total value of equipment
New York Central	$12,150,000	$1,350,000	$13,500,000
Lake Shore	6,750,000	750,000	7,500,000
Michigan Central	3,780,000	420,000	4,200,000
Cleve., Cin., Chic & St. L.	3,510,000	390,000	3,900,000
Chicago, Ind. & Southern	3,780,000	420,000	4,200,000
Totals	$29,970,000	$3,330,000	$33,300,000

A list of equipment covered by these certificates was published in this column on January 24, 1908, page 138.

The earnings for February of the four most important of the New York Central Lines are shown below. For purposes of comparison with the previous year these figures are compiled on the same basis as heretofore, and differ from those reported to the Interstate Commerce Commission under the new methods of accounting.

	1908.	Change	
New York Central & Hudson River.			
Gross earnings	$6,045,538	Dec.	$516,575
Expenses	5,199,766	"	374,907
Net earnings	$845,771	Dec.	$141,669
Lake Shore & Michigan Southern			
Gross earnings	$2,934,982	Dec.	$328,846
Expenses	2,065,306	"	288,221
Net earnings	$869,676	Dec.	$40,625
Michigan Central.			
Gross earnings	$1,786,391	Dec	$302,597
Expenses	1,523,623	"	142,003
Net earnings	$262,768	Dec.	$160,593
Cleveland, Cincinnati, Chicago & St Louis			
Gross earnings	$1,773,771	Dec	$47,480
Expenses	1,547,623	Inc.	112,958
Net earnings	$226,148	Dec.	$160,438

NEW YORK, ONTARIO & WESTERN.—Gross earnings for February were $515,000, against $519,000 in 1907. Net earnings were $72,000, against $104,000 in 1907. There was an increase of $12,000 in net charges, leaving a deficit of $14,000 against a surplus of $30,000 in February, 1907. The operating ratio, including taxes in operating expenses, was 86 per cent., against 80 per cent in 1907.

NORFOLK & WESTERN.—Gross earnings for February, 1908, were $1,818,000, against $2,439,000 in 1907, a decrease of $620,000. Operating expenses decreased from $1,570,000 to $1,193,000, a saving of $377,000. Net earnings were $625,000, against $868,000 in February, 1907, a decrease of $243,000. The operating ratio was 66 per cent., against 64 per cent. in 1907.

ROCK ISLAND COMPANY.—Gross earnings for February of all lines, including the Chicago, Rock Island & Pacific, the St Louis & San Francisco, the Chicago & Eastern Illinois and the Evansville & Terre Haute, were $7,910,000 against $8,860,000 in 1907, a decrease of $950,000. Operating expenses and taxes decreased $189,000 so that net earnings were $1,745,000 against $2,504,000 in 1907, a decrease of $759,000. For the eight months ended February 29, 1908, gross earnings were $75,976,000 against $73,456,000 in 1907, an increase of $2,520,000, and net earnings $19,660,000 against $24,000,000 in 1907, a decrease of $4,340,000.

SEABOARD AIR LINE.—See Macon, Dublin & Savannah.

SOUTHERN PACIFIC.—Gross earnings for February were $8,475,000, against $10,133,000 in 1907. Net earnings after taxes were $1,842,000, against $3,289,000 in 1907.

TEXAS & PACIFIC.—Gross earnings for the first three months of 1908 were $3,460,000, against $4,460,000 for the corresponding month of 1907, a decrease of $1,000,000.

THIRD AVENUE RAILROAD.—See New York City Railway.

TOLEDO & INDIANA (ELECTRIC).—C. F. M. Niles has been appointed receiver of this company, the January 1 interest on whose $1,650,000 first mortgage 5 per cent. bonds is in default. The road runs from Toledo, Ohio, west to Bryan, 55 miles. An extension and a branch have been under construction.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK

BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Prest. and Editor*
E. A. SIMMONS, *Vice-President*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 16. FRIDAY, APRIL 17, 1908.

The presence of "strong" state railroad commissions all over the country, active in making rates, and making them always on a distance basis, is so new a thing that we have as yet scarcely had opportunity to study the actual workings of the system. The paper by Robert Mather, which we print in full this week, takes up the interstate effect of state rates with admirable clearness, and the accompanying rate charts show the far-reaching effect of ignorant local tinkering with rates. It is entirely idle to assume any longer that a state is so isolated that its own special brand of railroad regulation has no effect on its neighbors. State rate-making has tremendous power to change traffic currents and to build up or break down one set of ports or distributing centers at the expense of another set. But the competition between states is always at the expense of the railroads. Rates are always changed down, and this process brings its own limit when confiscation is reached. Even the most casual examination of Mr. Mather's analysis shows what a chaos our national system of railroad regulation is in. The states have created a tangle of authority and of jurisdiction that it will require years of patient work by the courts to straighten out.

The information given in the Interstate Commerce Commission's report of block signal mileage, just issued, is so condensed and so varied as to defy both the editor and his blue pencil, and we print the tables in full. The roads which largely increased their signal equipment in 1907 are literally too numerous to mention, though the Union Pacific system and the Southern Pacific Company, reporting a total of 3,750 miles of road equipped with automatic block signals, almost three times as much as in the report of the preceding year, cannot escape being prominent. The second, third and fourth tables give highly interesting details never before published. The fourth, telling of imperfect practice, seems to be an imperfect table, for there are items which appear to indicate that the signaling on certain roads is much more thorough and complete than it really is. This is due, no doubt, to careless use of signaling terms by the railroad officers reporting, a thing which has made difficult the preparation of statistics on this subject in the *Railroad Gazette* office. To readers not familiar with the practices of some of the single-track western lines the last column of Table 4 should be explained as meaning stations where trains are allowed to disregard the stop signal to the extent of running past it far enough to make a convenient station stop. While this practice is unscientific, it is a money-saver; and by the enforcement of proper speed-limit rules and meeting-point regulations it has been managed with success. The extent to which controlled manual apparatus is used without track-circuit locks is one of the significant things shown by Table 3, though here again we suspect that there are errors, making the total too large. The other salient fact in this table is that there are now a dozen roads on which the Morse telegraph is no longer supreme in manual block signaling, telephones or electric bells being used.

An examination of the cases in our column of "Interstate Commerce Commission Rulings" this week will show any one who is not already aware of the fact that the Commission by no means always favors the shippers in its decisions, and also that it is not, as some of its critics declared in advance that it would be, making every effort to extend its powers to the uttermost. There are, to be sure, in the list decisions lowering classification, reducing rates and awarding reparation, as well as condemning the practice of inserting obscure and general clauses affecting rates in voluminous tariff publications. But, on the other hand, the Commission upholds a competitive rate adjustment between Trunk Line and Central Freight Association territory, in an important decision upholding the principle that the effect of competitive conditions must be taken into account in fixing rates and must often be held superior to the long and short haul clause. In three of the decisions the Commission definitely limits its authority. It declares that it has no authority over steamship lines to Cuba or to require roads to establish special passenger fares based on less than the normal rates, or any authority whatever over routes and shipments in Indian Territory and Oklahoma Territory before their incorporation as the state of Oklahoma. The work of the Commission under its extended powers is one gratifying result of the agitation for greater control of railroads. It is generally admitted by railroad men and by shippers that the Commission is attempting with all the fairness and ability at its command to work with even-handed justice as between shippers and carriers.

The annual report for the year ended December 31, 1907, of the Grand Rapids & Indiana, just issued, makes the following statements in regard to its passenger earnings for the year.

The total number of passengers carried was 2,340,475, an increase of 12,878, or 0.55 per cent. The average rate per passenger per mile was 2.08 cents, an increase of 0.02 cents. Reduction in passenger fares became effective in Indiana on April 10, 1907, and in Michigan on September 28, 1907. During the first nine months of the year, when the maximum legal intra-state rate on the Grand Rapids & Indiana, in the state of Michigan was $2\frac{1}{2}$ cents a mile, passenger earnings increased $77,189, or 8.39 per cent.; the number of passengers decreased 59,887, or 3.97 per cent.; the passenger mileage increased 3,017,737, or 6.90 per cent., and the passenger train mileage increased 3,759 or 0.12 per cent. In the three months ended December 31, during which the maximum legal intra-state was 2 cents per mile, the passenger earnings decreased $16,449, or 5.29 per cent.; the number of passengers increased 50,118, or 15.11 per cent.; passenger mileage decreased 387,033, or 2.51 per cent., and the passenger train mileage decreased 2,101, or 0.79 per cent. For the entire year there was an increase in passenger train miles of 1,658. It cannot, therefore, be maintained that the Grand Rapids & Indiana has suffered a decrease in its passenger earnings because of any diminution of service, and the results from passenger traffic as shown above do not bear out the prediction of the advocates of the 2-cent fare that the lower rate would be supplemented by such an addition to the travel as to compensate for the difference in charge.

THE ERIE SAVED FROM RECEIVERSHIP.

The Erie Railroad, owing to its financial history and to the nature of its geographical location, has perhaps to work harder for a living than any other American railroad system at all comparable in mileage or importance. It has a through line from New York to Chicago, with branches to Cleveland, Buffalo and Rochester, but the handicap of the capital charge placed upon it by former generations has kept it from perfecting its physical requirements to enable it really to meet on even terms the severe competition of its neighbors, particularly of the New York Central and Pennsylvania systems. In round figures the Erie is capitalized at $186,000 a mile and earns $23,800 a mile; the Pennsylvania Railroad is capitalized at $152,268 per mile and earns $42,719 a mile from operation, in addition to which there are very important earnings derived from interest on investments, and the New York Central is capitalized at $114,807 a mile and earns $26,010 from operation. In the case both of the New York Central and of the Pennsylvania important "other income" not included in the above figures is only partially offset by rentals.

The relation between the earning power of the Erie and its annual burden of interest, as compared with that of its principal competitors, is clearly shown by these figures. The road went into the hands of receivers at the outset of the 1893 panic and emerged in 1895. Prior to that and since the opening of the line from Piermont, N. Y., to Goshen in 1841, it went into receivers' hands in 1841, 1859 and 1875. In the last few years, under the very able administration of President Underwood, its earnings have surprised even its admirers, increasing from 38 millions in 1899 to 51 millions in 1907 on substantially unchanged mileage, while generous appropriations have been made annually out of income for the physical betterment of the property. In the last five fiscal years $8,847,733 have been added to the assets in this way without corresponding increases in the liabilities, while maintenance, both of way and structures and of equipment, has been above the strict necessities of upkeep; but, in spite of this good work, the line has been, and still is, far behind the physical standard necessary to enable competition to be met effectively, and it was necessary for the company to increase its capital pretty fast year by year and add new charges so that interest could be earned on old and new alike. It was estimated, doubtless very roughly, last year, that the requirements to put the property in really first-class shape were not far from $25,000,000.

The surplus above preferred dividends for the 1907 fiscal year was equal to almost 3 per cent. on Erie common stock if this surplus be credited with the sum charged off for betterments; otherwise it was equal to about $1\frac{1}{2}$ per cent. on the common stock. But at the same time that the road was making this good showing with its current earnings it was being very much embarrassed by the fact that some of its capital debt was maturing at a period when it was almost impossible to do any new financing. On April 8, 1907, $3,000,000 of notes matured, and $2,000,000 more had to be taken care of between April and July, 1907. The bond market at that time was in a deplorable condition, and it would have been manifestly impossible even for a strong road to finance long-term bonds on a basis that the directors would consider. The note market had also been glutted, because nobody cared to pay 6 per cent. or more for permanent funds, and notes had been issued in such abundance and by so many strong and thoroughly solvent companies that the outlook for the notes of a financially top-heavy company was not good.

Therefore, the Erie adopted the very unusual expedient of issuing notes discounted in advance, after the manner of commercial paper, and by this device it obtained the necessary $5,000,000, although at high cost. These notes fell due April 8, 1908, but no plan for taking care of them was announced until April 4. At that time the directors authorized a $15,000,000 issue of new 6 per cent. three-year notes to take up the old notes and provide additional cash, and they announced that the sale and purchase of these notes at par had been underwritten without commission or cost to the company, but upon the express (and impossible) condition that all the $5,500,000 notes of 1907 should be exchanged, par for par, for the new 6 per cent. notes within four days. The announcement laid great stress upon the requirements that all outstanding notes must be deposited before 3 o'clock on April 8, and as this gave the noteholders four days and a few hours in which to deposit their notes, European investors would have required a kind of rapid transit at present unknown, in order to fulfil the condition.

Consequently, when April 8, the day of the climax, arrived, only a small part of the notes had been deposited, and the Erie was perhaps as close to a receivership as any road avoiding one has ever been. It was not until late Wednesday afternoon that the public learned that E. H. Harriman had that day offered to purchase $5,500,000 of the new 6 per cent. collateral trust gold notes at 95, provided the Erie would pay all the old notes at par by April 15, allowing holders of the 1907 notes the choice of cash or new 6 per cent. collateral trust notes at par, together with a cash bonus to the amount of 5 per cent. This dramatic offer was promptly accepted by the railroad company, and the notes rose so fast on the market that they squeezed the shorts and sold at two or three points above par.

The receivership having thus been averted by Mr. Harriman, the syndicate headed by J. P. Morgan & Co. forthwith announced that it would take $5,000,000 of the new notes at par in accordance with its original plan, thus financing the company's requirements for the present. So far as can be humanly predicted, therefore, the Erie is safe from receivership this year, but what the future of the property is to be is a matter of the greatest interest. It may frankly be stated that the record of the last five years has been so good that the capitalization per mile does not look as high as it used to, and another long-continued period of prosperity with the same scrutinizing, careful management of the property might quite conceivably place it on a plane of earnings where it would be reasonably safe; but the physical disabilities have got to be overcome; money has got to be spent to overcome them, and it will be difficult to find any keen and eager purchasers for new Erie bond issues. The suggested "bloodless reorganization," by means of which it was proposed to change some of the interest-bearing debt into some other form of security, thus lessening the chance of insolvency and foreclosure in dull times, would doubtless furnish one kind of relief. Another kind of relief could be obtained if anybody could be found strong enough and rich enough to make the future of the road his personal interest, to finance its rehabilitation, and to give it traffic. Mr. Harriman is better able to do this, if he cares to, than anybody else in the country, and we have a strong impression that under vigorous Harriman methods a way could be found to make the Erie profitable. Whether or not his interest in it is anything more than temporary, assumed for the good of the general situation, is one of the interesting questions in railroad strategy which the near future is likely to determine.

THE NEW PENNSYLVANIA RAIL SECTION.

We show this week two new rail sections, one adopted by the Canadian Pacific, the other by the Pennsylvania. The Pennsylvania has been making an exhaustive examination of the entire art and practice of rail making, taking it up almost as if it were a new subject, and in June, 1907, it appointed an able committee, consisting of the ten men whose names are given in another column. To make a practical test of the work of the committee the company placed an experimental order for 10,000 tons of rails in December, 1907, to be rolled in accordance with the new sections and specifications. The experience with these rails has resulted in some slight changes in the specifications, but no change has been made in the sections, and the Pennsylvania system has adopted as a standard for its 1908 orders the new sections and specifications as revised

February 4, 1908. It will be observed that the angle of the line under the head of the rail has been increased to give more draw to the splice and to allow better work on the head; that the radius at the ends of the top of the head has been made as large as possible to reduce the strain on the overhanging part of the head and to occasion less wheel wear at the bottom of the flange, and that the width of the base has been reduced and its thickness has been increased in order to balance the section and to counteract, so far as possible, the rapid cooling of the base as compared with the head, which requires the head to be finished too hot. In calculating the depth of the base the committee worked with the size of the head and the width of the base as constants, and with the total height of the rail as a variable. The following table shows a comparison of the principal dimensions of the 100-lb. rail as compared with the present standard of the Pennsylvania Railroad and with the A. S. C. E. section used on the Lines West:

	Penn. R. R. New specificatn. (100 lb. rail).	Penn. R. R. Pres. standard. (100 lb. rail).	Am. Soc. C.E., Lines West. (100 lb. rail).
Head, area, sq. in.	4.09	4.48	4.15
Web, area, sq. in.	1.85	1.99	2.02
Base, area, sq. in.	4.03	3.49	3.65
Actual weight	.....	101.5	100.2
Moment of inertia	41.9	38.34	44.09
Section modulus, head	13.71	13.40	14.60
Section modulus, base	15.91	14.30	16.20
Width of head	2½ in.	2 13/16 in.	2 14/16 in.
Radius, top of head	10 in.	10 in.	12 in.
" top corners head	7/16 in.	7/16 in.	[illegible]/16 in.
" bottom head	1/16 in.	[illegible]/16 in.	1/16 in.
Angle, sides of head	....	4 degs.	Vertical.
Angle, under sides, head	15 degs.	13 degs.	13 degs.
Splice bearing under head	23/32 in.	23/32 in.	25/32 in.
Depth of head	1 52/64 in.	1 56/64 in.	1 45/64 in.
Depth of web	2 50/64 in.	2 41/64 in.	3 5/64 in.
Thickness of web, thinnest part	9/16 in.	10/16 in.	9/16 in.
Fillet where web joins head & base	5/16 in.	1/4 in.	1/4 in.
Radius of web	10 in.	8 in.	12 in.
Angle at top of base	13 degs.	13 degs.	13 degs.
Depth of base at center line	1 3/32 in.	30/32 in.	31/33 in.
Radius of fillets at corner of bars	1/16 in.	11/64 in.	1/64 in.
Width of base bearing	....	5 5/32 in.	5 20/32 in.
Width of base	5 in.	5 4/8 in.	5 6/8 in.
Depth of rail	5 11/16 in.	5 4/8 in.	5 6/8 in.

In preparing the new specifications the point of view which the company took was that nobody knows just how great the discard ought to be, hence that it is better to specify that "there shall be sheared from the end of the bloom formed from the top of the ingot sufficient discard to insure sound rails," than to attempt to describe this discard in detail. It is noteworthy that a drop of 15 feet is prescribed for the drop test, and that the dimensions of the testing machine are carefully set forth. The specifications are printed entire on page 539 of this issue.

THE FLAT-SPOT LIMIT ON CAR WHEELS.

The maximum allowable length of flat spots on car wheels was fixed at 2½ in. by the Master Car Builders' Association in 1878, and has never been changed. Recommendations to reduce this limit have been made at various times but the association has always rejected them. Last summer G. W. Kittredge, Chief Engineer of the New York Central, addressed a letter to the president of the American Railway Engineering and Maintenance of Way Association, stating it to be his belief that the present allowance is too great; that the effect of a spot of the maximum allowable dimension under a 100,000-lb. car at high speed must be very bad, and in the interest of safety the rule should be modified. He suggested that the Maintenance of Way Association indicate this feeling to the M. C. B. Association. President Johnson agreed with Mr. Kittredge and thought the relative effect of flat spots under light and heavy cars should be determined. The matter was taken up with the Executive Committee of the M. C. B. Association, who referred it to the Arbitration Committee with instructions to confer with a committee from the Maintenance of Way Association. The president of the latter association designated as this committee the one on Iron and Steel Structures, and from this a sub-committee of three members was appointed to take charge of the matter. This committee, consisting of A. J. Himes, C. D. Purdon and A. D. Page, made a progress report at the recent convention of the Maintenance of Way Association.

At the time the 2½ in. limit was set the largest freight cars carried 40,000 lbs. and weighed 22,000 lbs., giving a load of 7,750 lbs. per wheel. With present 100,000-lb. cars, which, with the permissible 10 per cent. overload will have a total gross weight around 150,000 lbs., the load per wheel will be about 18,750 lbs., or 2.4 times the load of 1878. While it is not easy to say what the increase in maximum speed of freight trains has been, the report assumes about 100 per cent. Two things must be known in order to determine the economic effect of reducing the M. C. B. limit: the probable increased expense, and the benefit to be received. The lack of records has made it impossible to estimate the increase in number of wheel renewals a change would cause, and the other expense incident thereto. It was decided at a joint meeting of the two committees in December to gather during January and February statistics from which to make such an estimate, but the results were not available at the time the report was prepared.

To estimate the benefits to accrue from such a reduction of the flat spot limit is probably impossible in figures. While it is known that a flat wheel delivers a pretty hard blow to the track at each revolution, the force of the blow and the damage done are hard to determine. On this point the report says: "It is easy to conceive of much possible damage to frogs and switches and to rails, and of occasional broken rails, and, likewise, of damage to rolling stock and delays to traffic and injuries to the surface of the track, but to collect statistics of specific cases of such damages, and conclusive evidence of the cause of the injury, is something that is very hard to accomplish. On many railroads numerous cases of broken rails are charged indefinitely to flat wheels, but, admitting the correctness of the charge, it generally appears that the wheels are those of a locomotive or tender carrying loads in excess of those on ordinary car wheels and having spots in excess of those specified by the M. C. B. rules. It is quite evident, however, that if a locomotive with 40,000 lbs. on an axle is the cause of broken rails, a heavily loaded gondola car, having about the same weight on the axles might just as readily produce the same effect."

The report contains a theoretical discussion of the force of the blow resulting from a flat spot, in which an expression for the impact is deduced. This impact is shown to be proportional to the square of the length of the flat spot, so that by reducing the latter one-half, the blow would be only one-fourth what it is at present. The reduction actually recommended to the M. C. B. Association is from 2½ in. to 1¾ in., which would reduce the impact approximately one-half. As regards the relative strength of wheels, load per wheel, and increased impact from flat spots, it is stated that the first drop test specified for car wheels, which was in 1889, was a 140-lb. weight falling 12 ft., or 1,680 ft.-lbs. At present for 700-lb. wheels it is a 200-lb. weight falling 12 ft., or 2,400 ft.-lbs., an increase of about 43 per cent. But since the flat-spot limit was established the load per wheel has increased 240 per cent. and the impact from a flat spot therefore 960 per cent.

Prof. Benjamin, of Purdue University, has devised a plan for an apparatus to measure the effect of flat spots. He proposes using only one wheel, on which flat spots of different lengths can be made and the effect of the impact recorded. An ordinary pair of wheels mounted on an axle will be used, with one wheel running on a friction wheel and the other—the one to be tested—running on a rail curved to circular form in a horizontal plane. Beneath this rail will be a recording mechanism in the form of a suitable hammer, which will indent a strip of soft metal. These indentations will be calibrated by an impact machine and the exact magnitude of the blow thus determined. The machine could be run any length of time, with different applied weights, lengths of spots and speeds, and any number of records taken. This sort of apparatus could also be used for determining the effect of counterbalance blows. The committee recommended that the association take some action with regard to carrying out such a series of tests. The cost of installing the apparatus was estimated at $1,500. The committee further suggested that the impact tests to determine the effect of moving loads on bridges include observations on the effects of flat spots. Tests such as are proposed to determine the force of impacts from flat spots might also be helpful in throwing light on the magnitude of service stresses in cast iron car wheels. These stresses are greatest, of course, when running through frogs and crossings, but there would seem to be no practical difficulty in producing these effects in the test apparatus.

NEW PUBLICATIONS.

Automatic Block Signals and Signal Circuits. By Ralph Scott. New York: McGraw Publishing Co. 243 pages, 6 in. x 9 in. Price, cloth, $2.50.

This is a copious collection of diagrams of electric circuits such as are used in automatic block signaling, including the complicated arrangements for electric locking by track circuit control at interlockings, with examples taken from many situations, few of which, however, are named. Circuits for controlled manual block signaling are also shown, together with an example of the Taylor electric interlocking. The author describes all these circuit combinations and gives some brief instructive comments, but his material appears to have been put together with little regard for any systematic plan, and many of his descriptions are useful only to readers already thoroughly versed in the subject treated. "Railroad terms have been omitted," he says, "because they are meaningless to the average reader", but the "average reader" would find less fault with railroad terms than he will at the absence of the elementary information that he needs on such a technical subject. The dozen pages on maintenance constitute perhaps the best chapter in the book; and maintenance is an important subject, for (we read) "when any serious trouble occurs, its results increase with great rapidity, owing to the momentous position which signals possess in a competent aggrandization."—(!)

An Italian Unit of Locomotive Performance.

BY LAWFORD H. FRY.

During the spring of last year the Italian Government Railroads introduced a unit previously employed on the Adriatic Railroad for use in the comparison of locomotive performances. For the purpose of instituting comparisons of fuel and water consumption between various classes of locomotives, and as a basis for the coal premiums of the enginemen, it was considered desirable to have a more logical unit of work done than is afforded by the "ton-mile." With this object in view, the idea of the "virtual kilometer" was introduced and the work done by the locomotives is now measured in "virtual ton-kilometers," which are found by multiplying the weight of the train in tons, not by the actual distance through which it is hauled, but by a virtual distance which brings into account the grades and curves over which the train is moved. This obviously gives a more logical measure of the work done than the actual ton-kilometrage does. The practice of measuring locomotive performance by the actual ton-mileage is widely extended, but in making any comparison of results on this basis, it must be borne in mind that the work done by a locomotive is dependent on the ton-mileage, on the class of service, and on the character of the road over which the ton-mileage is produced.

The American Railway Master Mechanics' Association decided in 1901 that while it is desirable to keep a record of locomotive performance on a ton-mileage basis, yet it is improper to make comparisons between the results on different railroads on this basis, or even between the results on different divisions of the same line; the only fair comparison on a ton-mileage basis being between locomotives on the same division of a railroad.

In calculating the virtual distances on the Italian railroads the mean train resistance on a straight and level track was assumed to be 4.5 kilog. per metric ton. This was, however, increased about 10 per cent. to 5.0 kilog. per ton in order to make an allowance for that part of the fuel which is consumed while running, but which is independent of the work done at the drawbar, as for example that which is required by the losses of heat by radiation from the boiler, by leakages and for the steam required by special appliances.

On this basis, on a falling gradient which is sufficient to keep the train in motion, the minimum virtual distance would be one-tenth of the actual distance, but to cover the coal burned while accelerating and stopping the train, the minimum virtual distance on any grade is taken as one-fifth of the actual distance, and as an allowance for starting, the minimum distance between any two successive stations is taken as one kilometer.

The train resistance on the level being taken as 5 kilog. per ton, or one-half of 1 per cent. of the train weight, it follows that the virtual distance, inclusive of the effect of curves, is the actual distance increased by one kilometer for each five meters of rise, or decreased by one kilometer for each five meters of fall between the points considered. In English measure this corresponds to a mile added or subtracted for each 24.1 ft. of difference of level.

The curves are taken into account by considering them as replaced by rising grades in accordance with the following table:

Radius of curve.	Equiv. rising grade in per 1,000 ft or resistance in kg. per metric ton.	Radius of curve	Equiv. rising grade in per 1,000 ft. or resistance in kg. per metric ton
1,000 meters	0.5	400 meters	2.0
900 "	0.6	350 "	2.4
800 "	0.8	300 "	2.8
700 "	1.0	250 "	3.4
600 "	1.2	200 "	4.2
500 "	1.5	180 "	4.5
450 "	1.7		

The foregoing is expressed in the formula—

$$L_v = L_a + \frac{h + \Sigma p l}{5}$$

where L_v is the virtual distance in kilometers,
L_a is the actual distance in kilometers,
h is the difference in level in meters, positive if the grade rises and negative if it falls,
l is the length in kilometers of each curve,
p is the grade corresponding to the curve in the table above.

In English measure this formula is

$$M_v = M_a + \frac{d}{26.4} + \frac{\Sigma p k}{26,400}$$

where M_v is the virtual distance in miles,
M_a is the actual distance in miles,
d is the difference in height in feet with the proper sign,
k is the length of each curve in feet,
p is the grade corresponding to the curve in the above table.

This formula is used to determine the virtual distances on rising grades and on falling grades less than 0.4 per cent., while on steeper descents the virtual distance is taken simply as one-fifth of the actual. For use on the Italian railroads a small book has been compiled showing the actual and virtual distances for all parts of the system. By means of this it is a simple matter to calculate the virtual ton-mileage of any train.

It may be of interest to analyze somewhat further this conception of the virtual distance, using for the purpose English measures. In the first place, to restate the definition. The virtual distance between two points is the distance through which a train must be drawn on a straight level track, with a train resistance of 11.2 lbs. per ton (0.5 per cent.) for the work done to be equal to that required to take the train over the actual distance with its grades and curves. Leaving for the moment the question of whether or no the figures chosen for the train resistance are correct, it is obvious that each virtual ton-mile represents a definite measured expenditure of work. To move one ton of train requires a force of 11.2 lbs., so that each virtual ton-mile requires the expenditure of 11.2 × 5,280 = 59,136 ft.-lbs. of work. If the train speed were 10 miles an hour, the rate of working would be very nearly 0.3 h.p. for each ton of train weight.

In this lies the value of the virtual distance as a basis of comparison; the virtual ton-mileage is a measure of the mechanical work required for the train movement and is, therefore, a logically correct standard by which to measure the coal and water consumption, etc. The coal consumption per virtual ton-mile is in a sense a measure of the mechanical efficiency of the locomotive, but it does not measure the commercial efficiency of the railroad.

In other words, the virtual ton-mileage measures the work performed by the locomotive, but does not measure the amount of transportation effected, which is the commercial product of the railroad.

For the latter purpose the actual ton-mileage is the proper measure.

Now, as to the accuracy of the assumption that the mean train resistance on straight and level track is 11.2 lbs. per ton. It is obvious that, as in all the attempts to express the conditions of railroad operation by a simple formula, no very high degree of accuracy can be attained.

For average results the assumed train resistance appears to be well chosen. It must be borne in mind that the ordinary service on the Italian railroads does not involve any very high train speeds, so that it is not likely that the actual train resistance will exceed the assumed figure.

The mean resistance on the level has been put at the rather high figure of 11.2 lbs. per ton, with the object of making allowance for the various heat losses which are not dependent on the work being done by the locomotive. As no corresponding increase has been made in the resistance due to grade curves, the virtual distances as calculated have a tendency to give too little weight to the effect of grades. This is to some extent compensated for by the fact that usually the speed is reduced on the grades and the rolling resistance is thus somewhat lower than it is on the straight and level track.

There seems to be no doubt but that the use of the "virtual ton-kilometer" is a valuable step in the direction of recording locomotive performance on a logical basis.

How the States Make Interstate Rates.*

BY ROBERT MATHER,
President Rock Island Company.

The widespread efforts of state legislatures and railroad commissions within the past two years to reduce railroad rates have presented many interesting phases to public observation. The extent and severity of the proposed reductions, the novel expedients adopted to prevent or to make difficult a review of the state action in the federal courts, the resulting conflict of judicial authority and the recent decision of the Supreme Court of the United States holding these expedients unconstitutional have kept the movement constantly in the public mind. Out of the many questions which discussion of the situation has evolved none are more interesting or important than those relating to the effect of state-made rates upon rates for interstate transportation. It is the purpose of this article† not to show that the rate-making power of the states should be diminished or destroyed, or that this object, if desirable, can or cannot be accomplished under the federal constitution, but merely

*Paper prepared for the American Academy of Political and Social Science, April 11, 1908.

†Much of the matter and all the maps for this article were prepared by Mr. Theodore Brent, of the Traffic Department, Rock Island-Frisco Lines, Chicago.

to state and to illustrate the proposition that, in fact, the states *do* make interstate rates.

The great movements of traffic in this country are eastward and westward. The volume of the westward movement has always been high-class merchandise—dry goods, wearing apparel, groceries, hardware and like articles. Formerly this was all produced in the East or imported through Atlantic ports; it is only within recent years that the larger cities in the West have become manufacturing centers.

When the evolution of our rate fabric began New York, Boston, Philadelphia and Baltimore were the bases of supply. Chicago, St.

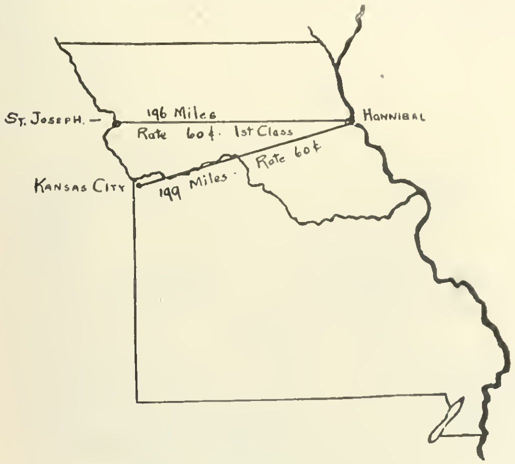


Fig. 1.

Louis, St. Paul, Omaha and Kansas City owe their development as trade centers primarily to strategic location at the head of navigation, or at points where the transcontinental trails left the watercourses for the West, Northwest and Southwest. They commenced as outfitting points for prospectors and settlers; their business was that of distributing through the new western country the articles of commerce manufactured in or imported through the East, and that still constitutes a large part of their trade.

When railroads found their way to Chicago and St. Louis their rates were fixed largely by the water competition which met them on

Fig. 2.

their arrival. Gradually railroads were constructed westward from these points and, as they reached common territory, the force of competition began to be felt. Intense rivalry developed between the distributing houses of Chicago and St. Louis, and pressure was brought to bear upon the railroads, both East and West, to keep the rate fabric so adjusted that goods, stored in and distributed from either city, might be laid down at any of the Missouri river points at substantially the same freight cost. The class rates from New York to Chicago thus became the basis of measurement for all class rates. The St. Louis rate was a fixed per cent. higher, approximating the difference in the cost of reaching that point by water. The rates between the Mississippi river and Chicago on the one hand and the Missouri river on the other were fixed not at what would be a reasonable rate for the distance, but at what it was necessary to maintain in order that St. Louis and the lines leading through St. Louis might compete with Chicago for the expanding business of Kansas City, Atchison, St. Joseph and Omaha.

In the territory west of the Missouri river the same process has been repeated, and rates are maintained in such relation not only that Kansas City, St. Joseph and Omaha may compete with each other, but that goods distributed from St. Louis and Chicago, as well as from the eastern cities, may be handled through Kansas City, St. Joseph or Omaha and laid down at the several consuming points at practically the same freight cost. In the Northwest this same competitive adjustment is maintained between Chicago, Duluth, Minneapolis and St. Paul. In the Southwest, Chicago, St. Louis and Kansas City must be kept on an even keel, and when Texas is reached the whole adjustment is modified to meet the competition of coastwise steamers plying from New York to Galveston. To Colorado and Utah the routes through all these gateways are kept in constant adjustment, and the rates so arranged that Denver and Pueblo are enabled to do a distributing business.

What is true of westbound merchandise is equally true of the

Fig. 3.

movement to the East of the great staples raised in the West. The grain territory is so divided and rates are so made that grain may move freely to the Mississippi river, the lakes and the gulf, through the great storage centers of Minneapolis, Duluth, Chicago, St. Louis, Omaha and Kansas City. In like manner live stock rates are so arranged that the traffic may move freely to the rival packing centers of Kansas City, St. Joseph, Omaha, St. Paul, Chicago and St. Louis.

These rate relations are not the work of the traffic departments of the railroads. They do not exist by virtue of acts of legislatures or of orders of commissions. They are the resultants of the commercial growth of the country. Trade is established along these lines, industries and communities are founded on the basis of these adjustments, and their existence and prosperity depend upon the continuance of these rate relations. They are the controlling facts in all rate disputes, more stubborn than disaster and as immovable as mountains.

There is hardly a rate on any article of commerce but feels the force of these competitive conditions. They absolutely dictate the traffic policy of the railroads operating in the territory affected by them. The carrier makes no rates that are not effectively controlled by these conditions, and the rate-making power of the Interstate Commerce Commission itself cannot ignore them. The only rate regulating body that makes rates without reference to these conmercial conditions is the legislature or the railroad commission of a single state. Its field of operations includes but a fraction of the territory whose traffic is controlled by these conditions; contains but few of the larger distributing centers which compete for that traffic, and is usually circumscribed, either wholly or in part, by imaginary boundaries fixed without regard to factors which exercise controlling influence upon the trend of traffic and of rates. The influence of lakes, of rivers and canals, the competition of rival markets, the relation between manufacturer and dealer, and other like forces that, in the making of rates, confront the traffic officer of an interstate railroad and the Interstate Commerce Commission itself, enter but slightly, if at all, into the calculations of the state. In every case, in the exercise of its rate-making power, distance is the one factor given serious consideration, and the result of its labors is invariably the production of a distance tariff.

This state distance tariff is, on its face, a simple and a harmless thing. The right of the state to make it and to change it at its will seems to be amply buttressed by the conceded principle of law that the power of Congress over interstate commerce leaves untouched the power of the states to regulate their purely internal commerce. And no simpler or less obnoxious method of exercising that power would seem possible than to describe the rates at which traffic shall move from point to point within the state.

But when the traffic officer of an interstate railroad comes to apply this state distance tariff, made for state use on purely local considerations, to the traffic that actually moves over his rails, he finds that he cannot confine its influence to traffic within the state, and that, against his will and without his action it readjusts his rates into and out of and through the state, and determines his revenues on traffic that never traverses the borders of the state. This is illustrated by the action of the following states:

MISSOURI AND IOWA.

Missouri has a far-reaching control over interstate rates by reason of the situation of the state at the point of least distance between the Mississippi river—the basing line for rates from the East—and the Missouri river, the base line for rates to the West.

There are three factors which go to make up the rates from the East to the western territory—whether or not they are published as through rates—namely, the rate from the seaboard to the Mississippi river or Chicago; the rate from the latter base line to the Missouri river, and the rate west of the Missouri river. Reduce the rate between the Mississippi river and the Missouri river and you reduce the rates on all business either locally or through or beyond these base lines.

The first-class rate between the Mississippi and Missouri rivers practically determines the interstate rates on all classified articles moving between the East and West. It is at present 60 cents per 100 lbs., this being the figure fixed by the Missouri Railroad & Warehouse Commission as a reasonable maximum rate for the short-line haul of approximately 200 miles across the state from the Mississippi to the Missouri river—the distance from Hannibal to St. Joseph being 196 miles—and from Hannibal to Kansas City 199 miles. Note the chart:

Though this rate is based on the distance of 200 miles, competitive conditions outside the state apply it at once to all hauls across the state, no matter what their distance. The short line from St. Louis to St. Joseph is 302 miles, and lines operating between these cities would be privileged, under the commission's maximum scale, to charge 74 cents, first class. The short line between St. Louis and Kansas City is 277 miles, for which distance the commission's scale is 71 cents, first class. But here considerations enter which are entirely outside the horizon of the Missouri commission. The rates from New York to Hannibal and St. Louis are the same. There are routes leading from New York to St. Joseph and Kansas City, through both Hannibal and St. Louis. Kansas City and St. Joseph, compete in the same territory, and the rates to both points from New York must be kept the same through all gateways. Consequently the commission's maximum rate for the shortest distance becomes the rate between all four crossings.

Thus the element of distance even between points within the state is immediately modified by outside forces, controlling with the carriers, but which exerted no influence upon the commission when it fixed the nominal measure of rates.

Just north of Missouri lies the state of Iowa. To the untutored mind there would seem to be no reason why traffic of the same class should move within the state of Iowa for a less charge than within the state of Missouri. Yet the maximum charge under the Iowa distance tariff for hauling first class merchandise 200 miles is 40 cents,

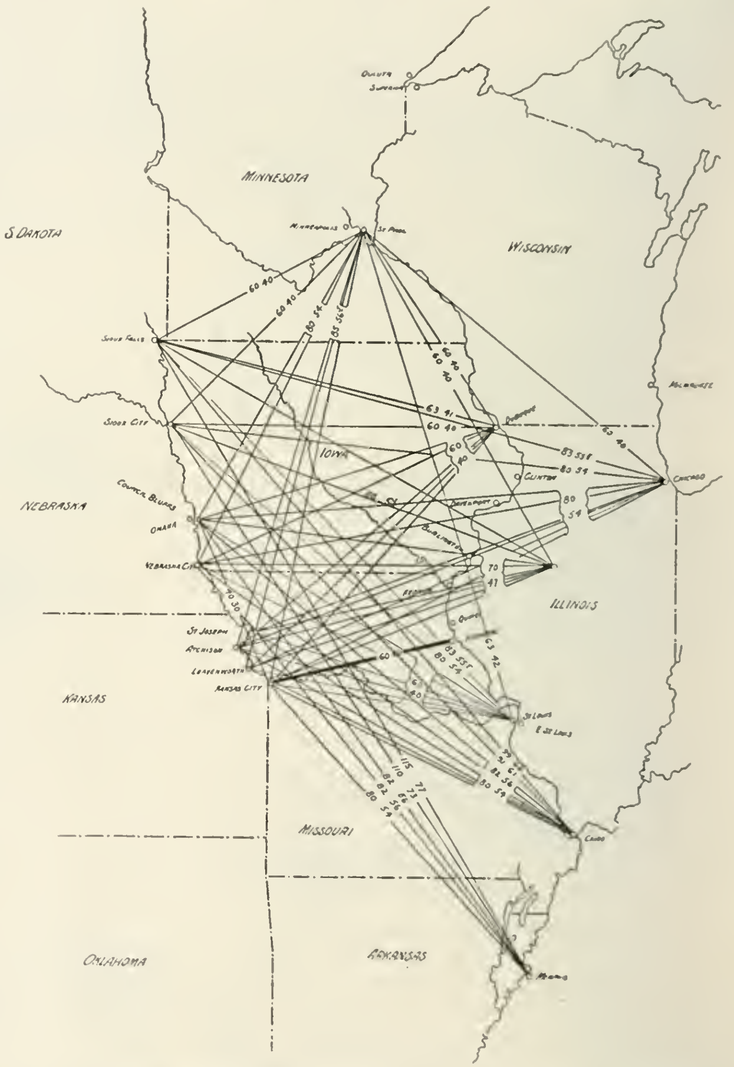

Fig. 4.

Broad line indicates short line distance of 199 miles across state of Missouri, between Hannibal and Kansas City, which measures and controls all western rates. Left hand figures are present rates. Right hand figures indicate approximate rates were Missouri commission to prescribe Iowa scale as the Missouri maximum.

as against 60 cents fixed by the Missouri tariff. The railroads in Iowa must haul the same class of merchandise 350 miles to be entitled to charge 60 cents, but, significantly enough, the 350 miles measure the distance in Iowa between the Mississippi and Missouri rivers, so that the rate between the two base lines is the same in both states. Should Missouri adopt the Iowa scale, the Missouri rate from the Mississippi river to the Missouri river, between all the points in Missouri that we have been considering, would, for the reasons already given, at once become 40 cents, regardless of distance.

The effect within the state of Missouri, however, is only the beginning. The rate between the Mississippi and Missouri rivers being, as previously explained, one of three factors of a through adjustment from points of production in the East; the rates from the East to all Mississippi river crossings being the same; there being competitive routes from the East to all Missouri river points passing through all of these Mississippi river crossings; and the merchants and manufacturers in the Mississippi river cities maintaining trade relations with all of the Missouri river cities and with the territory reached through them; it follows that the rate between Dubuque, Iowa, and Kansas City, Mo., cannot be higher than the rate between Dubuque and Council Bluffs (both points within the state of Iowa); nor can the rate between St. Louis, Mo., and Omaha, Neb., be higher than the rate between St. Louis and Kansas City or between St. Louis and St. Joseph (movements wholly within the state of Missouri).

Thus from the act of the Missouri commission in reducing its charge for its haul of 488 miles between St. Louis and Omaha through Missouri, Kansas and Nebraska, and in like manner the rate of the Illinois Central Railroad for its haul of 703 miles between the same points, through the states of Missouri, Illinois and Iowa. (See the map.)

Thus, within the territory enclosed by the Illinois Central, Missouri Pacific and Rock Island as outlined on the map, any reduction made by the Missouri commission in the class rates for the 200-mile distance between Hannibal, Mo., and Kansas City, Mo., has the effect of bringing all rates to the level so fixed, not only between the crossings themselves but, with very slight exceptions, between all intermediate points.

This, again, is but a preliminary glimpse at the inevitable results of this action of the Missouri State Commission.

The first class rate from Chicago to the Missouri river has for many years been 20 cents per 100 lbs. higher than the rate from

Fig. 5.

The shaded field indicates the territory immediately affected by any change in the Missouri Commission's maximum rate for the [illegible] of 199 miles between the Mississippi river and Missouri river base lines. [illegible] the controlling factor in western trunk line territory be [illegible] action in Missouri, the entire revenue on east and west business falls automatically in proportion. The water lines indicate the [illegible] rates operated by the rail and water carriers, which move upward or downward automatically with any fluctuation in the all-rail rates.

distance tariff from 60 cents to 40 cents for 200 miles, the following results directly flow:

(*a*) The local *Missouri* rate from points on the Mississippi river to points on the Missouri river, regardless of mileage, is reduced from 60 cents to 40 cents;

(*b*) The local *Iowa* rate from points on the Mississippi river to points on the Missouri river (say Clinton to Council Bluffs, 350 miles) is reduced from 60 cents to 40 cents;

(*c*) The *interstate* rate from points on the Mississippi river in Missouri to points on the Missouri river in Iowa or Nebraska (say St. Louis to Council Bluffs or Omaha) is reduced;

(*d*) The *interstate* rate from points on the Missouri river in Missouri to points on the Mississippi river in Iowa (say Kansas City to Davenport) is reduced.

Not only this, but this Missouri commission rate for 200 miles fixes the maximum rate which the Missouri Pacific Railway may

the Mississippi river. The competitive adjustment would require that there be no greater difference under the new scale. Indeed, the rates from the seaboard to Chicago and the Mississippi river remaining as at present, it is doubtful if Chicago and the routes through Chicago could compete should the present arbitrary difference be maintained under the reduced adjustment. The present rate of 80 cents, first class, from Chicago, is one-third higher than the rate from the Mississippi to the Missouri river. It is probable that not more than one-third greater would be practicable under the lowered scale, which would make the first class rate from Chicago 54 cents per 100 lbs.

Peoria must be maintained at one-half the difference between Chicago and the Mississippi river. Milwaukee must be kept on the same rate basis as Chicago. The rates from Minneapolis and St. Paul must be kept the same as Chicago to the upper Missouri river crossings (Omaha, Council Bluffs and Nebraska City), and 5 cents higher than Chicago to the lower crossings (St. Joseph, Atchison, Leavenworth and Kansas City). Duluth takes fixed arbitraries above St. Paul. The intervening territory in Wisconsin, between Milwaukee and St. Paul, is built on arbitraries over either Chicago, Milwaukee or St. Paul, and would call for readjustment accordingly. From Memphis, Tenn., not higher than Chicago rates can be maintained to lower Missouri river crossings, and to the upper crossings the first class rate from Memphis cannot be more than 2 cents higher than Chicago. To Sioux City the rate from Chicago, St. Louis and Peoria must be kept the same as from Chicago to Omaha. The first class rate from Memphis to Sioux City is to-day 30 cents higher, and from Minneapolis and St. Paul 20 cents less, than from Chicago to Sioux City, and the same percentage relation must be maintained on the lowered scale.

The immediate result, then, of the fixing by the Missouri Commission of a maximum charge of 40 cents, first class, for the distance of 200 miles between Hannibal, Mo., and Kansas City, Mo., is to fix interstate movements throughout the whole territory pictured in the outline.

The illustration thus far deals only with the change in rates on business which may be termed purely local to the territory immediately embraced in the illustration—that is, business which has both origin and destination within the territory. We have not yet touched upon that volume of eastern business to the Missouri river cities, to St. Paul and Duluth, and to the territory beyond as far West as the states of Utah, Idaho and Montana, or to the Southwest, including the state of Texas and territory of New Mexico. Yet the rates on this business are quite as vitally involved. The competitive adjustment between Chicago, Peoria, Memphis, the Mississippi river, and the head of the lakes, as previously described, was originally evolved and has since been maintained in a measure to permit this merchandise to move freely by all routes to this trans-Missouri, northwestern and southwestern territory. Whenever the western factors of the through rates to this territory are reduced,

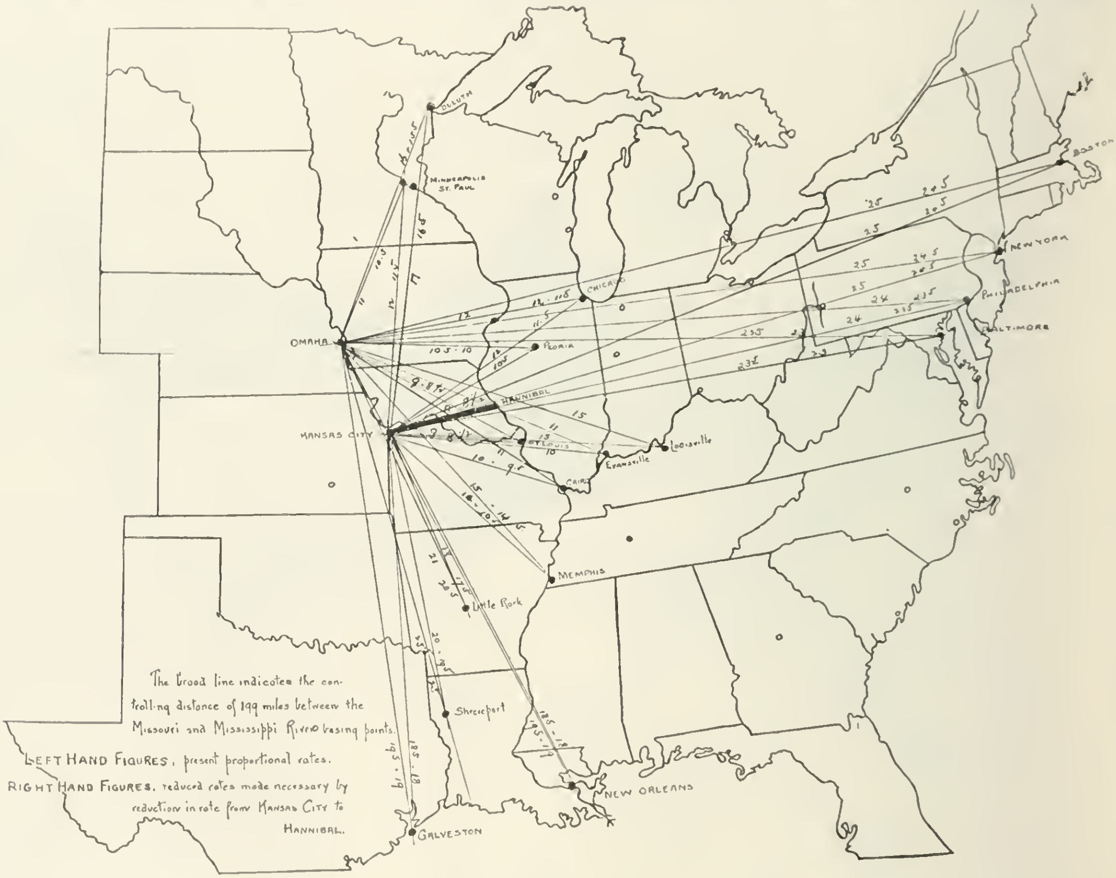

Fig. 6.

the rates for all routes shown on the accompanying map of what is termed western trunk line territory.

The foregoing outline illustrates only the adjustment of first class rates. In Western Classification territory there are five numbered and five lettered classes, and the other classes all bear a certain percentage relation to the first class rates. This is true to the extent that any considerable reduction in the rate on first class involves necessary proportionate reductions in the rates on other classes—the severity of any such reduction lessening, of course, as the rates themselves grow less; but the rates on all classes must go down if one goes down, so that the same fixed relation between the classes may be maintained on the lower as on the higher basis.

Similarly, the outline only illustrates the change in the adjustment between the principal basing points in western trunk line territory. But around these basing points are grouped all the adjacent cities and towns; so that an adjustment once reduced from Chicago, or Peoria, or the Mississippi river to the upper or lower Missouri river points, a corresponding reduction results from all points, both of origin and of destination, held common with these basing points. So the reductions become automatic covering all the rates on such through business fall simultaneously with the rates on the local business.

Merchandise for this western territory moves from the East by every conceivable route. Every all-rail line and every conceivable combination of rail lines publish the rates. During lake navigation daily boats carry this merchandise to Chicago, Milwaukee and the head of the lakes. It is handled by steamer in connection with rail lines from every South Atlantic port from Norfolk to Jacksonville. There is a steamer load despatched daily from New York and given to the rail lines at the port of Galveston, Texas. The rate fixed by the authority of the state of Missouri, between Hannibal and Kansas City, and based on purely local considerations, has its leveling effect upon the rates on every pound of this vast traffic. The next map shows the ultimate reach of the rate-making power of Missouri.

It is true that the illustration has proceeded thus far on the assumption that Missouri might make a reduction in its existing class rates, and not on the fact that such reduction has been made. But Iowa has precisely the same control over interstate adjustments that the illustration demonstrates Missouri to have, and as matter of fact East and West class rates are what they are to-day because Iowa some years ago prescribed 60 cents as the maximum charge, first class, for the haul within its borders between the Mississippi and the Missouri rivers. The Iowa distance tariff of 1887 actually measures to-day the revenues of the Interstate railroads on all interstate freight passing into or out of or beyond that state.

Besides, Missouri has actually made radical reductions in other rates that illustrate as well the principle of our contention. The legislature of 1905 ordered drastic reductions of rates on grain, flour, lime, salt, cement, stucco, lumber, agricultural implements, furniture, wagons and live stock, and the legislature of 1907 added 100 lbs. on all grain. The state's action also calls for a reduction of a half cent per 100 lbs. in the proportional rate on wheat between Kansas City and Hannibal. This proportional rate of 9 cents is the rate applied on all wheat coming from beyond the Missouri river, and, as in the case of the class rates, it is the pivotal rate in the whole adjustment. If the legislature's action is finally upheld, a readjustment of the whole rate fabric on western grain will result. There is no more sensitive adjustment in existence than the grain rates. No single part of any of the through rates can be disturbed without disturbing the revenue on a large part of the whole movement.

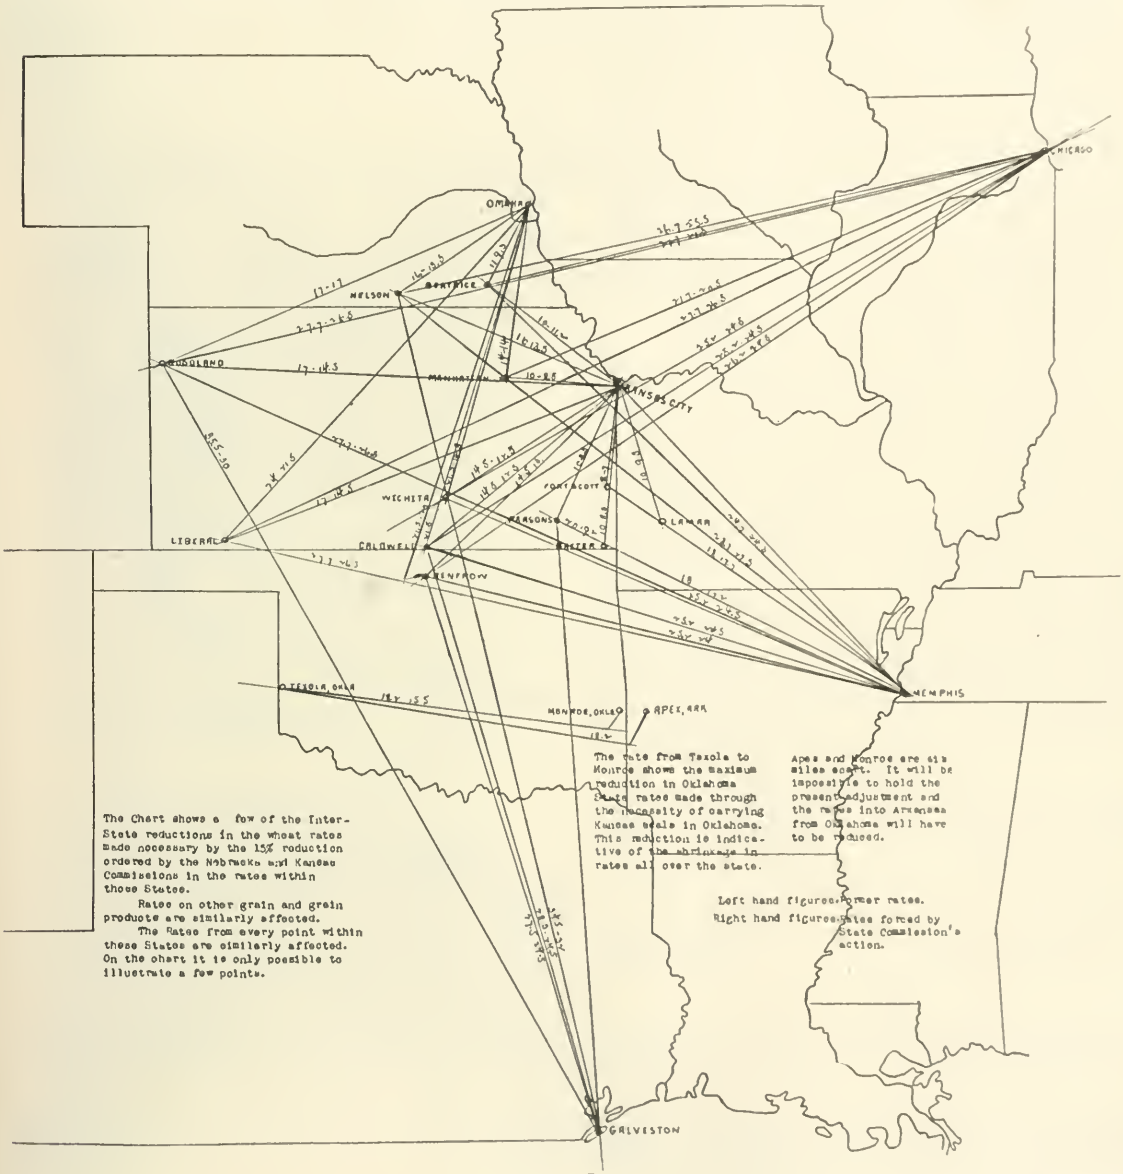

Fig. 7.

stone, gravel and other commodities. The rates have not been published, as the constitutionality of the legislation is in question before the courts, but if the state's right to order the reductions is finally established, the interstate rates on these bulk commodities, which constitute a large percentage of the carload tonnage of all western carriers, will come down with them.

The reductions which will result in rates on grain will illustrate. The short line distance rate between the Missouri and Mississippi rivers will be reduced from 13 cents per 100 lbs., on wheat, and 12 cents per 100 lbs. on corn and other grain, to 8½ cents per

Competition and market conditions require that the rates on grain from the states of Kansas and Nebraska shall be so adjusted that the grain raised in those states can move eastward freely through either of the primary markets at the Missouri river Kansas City or Omaha. When these markets are reached, not alone the grain markets of the United States, but the foreign markets as well must be open to the producer, so that the Nebraska or Kansas producer may have the benefit of the best prevailing market price of the world to-day; and the adjustment must be maintained from day to day so that the large grain buyers may take the surplus grain into elevator storage, not only at the Missouri river, but at the large storage points at the Mississippi river, the Ohio river, the Lake ports, the milling centers, and the Atlantic and Gulf seaboard, with the full assurance that when the demand makes eastern or southern shipment desirable he will have a parity of rates in either direction through any market. If the reduced rates are finally enforced the material reductions within the state will be insignificant compared with the automatic reductions in the interstate adjustment which must follow. The same reduction must be made from Omaha, not only to St. Louis but to the other Mississippi river crossings; to Peoria and Chicago, the gateways to the Central states; to Louisville, Evansville, Cairo and Memphis, the market points for all the Southeastern states; to Little Rock, Texarkana, Fort Worth, Dallas and Shreveport, the principal market gateways for the states of Arkansas, Louisiana and Texas; and to Minneapolis, the largest of the milling centers. Any reduction in the rate to the Mississippi river and Chicago means just that much reduction in the revenue on grain moving to Boston, New York, Philadelphia, Baltimore and Newport News for export, as these rates are all made on the Mississippi river combination. And when these rates go down, a similar reduction is forced in the rate to Pensacola, Fla., Mobile, Ala., New Orleans, La., and Port Arthur and Galveston, Tex., for export.

It has never been found feasible to carry local and proportional rates on the same basis, and there is therefore the probability of further reduction in the proportional basis. To what figure the proportional rate on wheat across Missouri might fall as the result of carrying a local rate of 8½ cents, is, of course, problematical. The rates up to this time have always been maintained about 4 cents lower than the local rates. The accompanying chart only illustrates the direct reductions in the existing proportional rates:

KANSAS AND NEBRASKA

During the year 1907 the Railroad Commission of Kansas forced a reduction of 15 per cent. in the existing rates on grain within the state. A reduction in grain rates always applies as well on flour, meal and other grain products. The Nebraska Commission forced a 15 per cent. reduction in state rates, not only on grain and grain products, but on live stock, coal, lumber and fruits and vegetables.

Kansas and Nebraska do not consume a hundredth part of what they produce, and the great bulk of the commodities consumed within these states is produced outside of them. The freight destined from points of origin within either state and moving under the state's mileage rates to points of consumption within the state, is as nothing to that which moves to points beyond the state. That is to say, nearly all the traffic of both the states is interstate, and subject to the influence of the competitive interstate rate adjustments.

Fig. 8.

This chart shows the reduction in interstate rates which would follow a reduction of 5 cents, in the Texas railroad commission's first-class rate from Galveston to Waco. (The rates shown apply only from the basing points.) All other towns group around these and the reduction from all is the same as from the basing point. Upper figures: Rates at present in effect. Lower figures: Rates which would apply following the above-mentioned reduction.

The products of Kansas and Nebraska find their primary markets (Kansas City, Kan., and Omaha, Neb.,) on the Missouri river at the extreme eastern boundary of the state, and the state regulation fixes the rate at which the product is hauled from points of production to these primary markets, no matter what the ultimate destination of the product may be. As a result, the 15 per cent. reductions in the grain rates required by both state commissions have called for a flat reduction of just that amount in all interstate rates, and a corresponding shrinkage in railroad revenues on practically all of the grain raised in both the states.

A contingent result is a horizontal reduction in the rates on Oklahoma grain. The Choctaw line of the Rock Island operates in Oklahoma under a charter which provides that its rates in that state must not be higher than they are in the states from which it enters Oklahoma. The line enters Oklahoma from Kansas, as well as from Arkansas, and the charter provision required an immediate adjustment of the Oklahoma rates on the Kansas scale. With the Oklahoma rates on the Kansas basis it was found impossible to maintain the adjustment formerly prevailing from points in southern Oklahoma to points in Texas, and a readjustment there was necessary. Similar reductions of the rates to Arkansas points will be required.

This situation clearly illustrates the interdependence of state and interstate rates. The accompanying chart will give a partial illustration of the situation. It can, of course, picture the effect only at a few points. The reductions are general, affecting every point:

TEXAS.

In Texas, state regulation of rates is deliberately designed to control the rates on interstate business both into and out of the state. There is, from the standpoint of the state, excellent reason for this policy; for, aside from its timber and a portion of its grain, little which Texas produces is consumed within the state, and the bulk

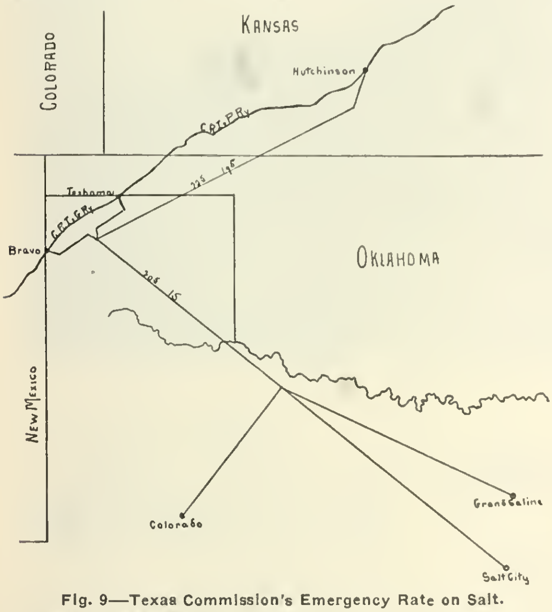

Fig. 9—Texas Commission's Emergency Rate on Salt.
Average mileage—From Hutchinson, 300; *from Colorado,* 660; *from Grand Saline,* 525; *from Salt City,* 690.

of the food stuffs, wearing apparel and manufactured articles which its citizens consume or use are imported from other states.

The state commission has always conceived it to be to the state's interest to link its fortunes with the coastwise steamship lines rather than with the all-rail carriers reaching the state through its northern gateways. Consequently the commission has made the port of Galveston the radiating point in its adjustment. The class rates from the eastern seaboard have always been made the exact combination of the steamship rates from New York, Boston, Philadelphia and Baltimore to the port of Galveston, plus the commission's local rates thence to every point in the state. This has forced the rail carriers to group all the producing territory west of seaboard territory, and to maintain a relative adjustment calculated to permit these territories to market their products in Texas in competition with the rates from the seaboard fixed for the rail carriers both in and outside the state by the Texas commission and the steamship lines.

It necessarily follows that whenever the Texas commission reduces a rate from Galveston the revenue of the state carrier on all Texas business originating at the Atlantic seaboard is lowered and the interstate carriers are compelled to make corresponding reductions from every other basing point. The immediate effect of a reduction of 5 cents in the commission's first class rate from Galveston to Waco is outlined in the accompanying chart:

Texas is above all a cotton-growing state. The wealth of its farming communities and the business of its cities is founded on the production and marketing of this staple. The revenues of the carriers within the state are largely dependent upon the movement of the cotton crop. Texas produces one-quarter of all the cotton grown within the United States. It has, however, no cotton-spinning industry worthy the name. Probably 99 per cent. of the cotton grown in the state is sent to New England and southeastern spinning points and to foreign countries. The revenues of the carriers on all this interstate and foreign cotton freight are absolutely dependent upon the rates fixed by the railroad commission of Texas to the port of Galveston.

Three years since, the commission ordered a reduction in cotton rates of 5 cents per 100 lbs., or $1 per ton. The movement from Texas to interstate and foreign destinations in the fiscal year ending June 30, 1906, was a million and a half tons. The direct result to interstate carriers from this one act of the Commission has been an annual shrinkage in their revenues of something like a million and a half of dollars.

A cardinal principle in the three principal classification territories is that valuable commodities such as dry goods, notions, boots and shoes, hats, etc., shall take first class rates, whether the goods are shipped in carloads or in less than carload quantities. There is no voluntary variation from this in any interstate adjustment. The principle has frequently been reviewed without disapproval by the Interstate Commerce Commission. The Texas commission, however, has taken the opposite view, and in its state classification has fixed class "A" basis on these commodities when shipped in carload quantities. This action on their part has no force or effect so far as concerns state traffic. None of these commodities are manufactured within the state and no house in the state jobs them in carload quantities. The state commission's action does, however, reduce the interstate rate on these commodities from New York to interior Texas towns 37 cents per 100 lbs. in carload lots.

That the Texas commission exercises its rate-making powers with deliberate intent to control the interstate rates for the benefit of its industries appears from the following illustration.

The Rock Island has a line running southwest from the state of Kansas, passing diagonally across the Panhandle of Texas into New Mexico and on to El Paso. There are large salt industries on this line at Hutchinson, Kan., and in the year 1905 the Rock Island, being asked to establish a reasonable rate from Hutchinson into its Panhandle towns, published an average rate of 19½ cents. The average distance is about 300 miles. There are salt plants of considerable importance at Grand Saline, Salt City and Colorado, Texas, and under the state commission's orders, the Rock Island, in connection with other lines, had in effect an average rate of 20½ cents per 100 lbs. from these state salt plants to the Panhandle towns. The average haul to these points is from Grand Saline, 525 miles; from Colorado, 660, and Salt City, Texas, 690 miles. When the Rock Island's interstate rate came to the attention of the Texas commission, it ordered the Rock Island's Texas line to non-concur in the reduction, threatening that if the interstate rate were allowed to stay in, they would compel the state carriers to haul salt from these state plants to the Panhandle points for 15 cents per 100 lbs. Needless to say, the interstate rate was withdrawn, and it remains today at the Texas maximum rate of 22½ cents. The map illustrates the situation.

ILLINOIS.

Recent reductions in class rates in Illinois have forced reductions of the interstate rates between St. Louis, Hannibal, Quincy, Keokuk, Davenport and Dubuque, and will eventually force similar reductions in rates between intermediate local points either wholly interstate or wholly within other states than Illinois.

ARKANSAS.

The Arkansas commission has prescribed a full line of class and commodity rates which produce an effect on all the rates on merchandise brought into the state from points beyond, similar to the results of the Texas commission's regulation of the rates in that state.

MINNESOTA.

The Minnesota commission has fixed a scale of class rates within the state which recently required the leveling down of all rates from Minneapolis, St. Paul and Duluth to Iowa and Dakota points. It was with respect to this situation that Judge Lochren said in the case before him involving the validity of these rates:

"It would seem to be very difficult to avoid . . . the conclusion that these rates fixed in respect to Minnesota do necessarily and directly affect interstate commerce. . . . I have no doubt that Congress might very properly, under the constitutional provision giving it the entire power of control over interstate commerce, assume control of the avenues of interstate commerce of the railroads which are engaged in interstate commerce, and of all rates which are collected by those railroads, whether within the states or without the states, because the matter of those rates would affect these avenues of interstate commerce, and might affect their ability to continue as avenues of interstate commerce."

And as to this argument, urged before the Supreme Court in the Minnesota rate case, recently decided, the opinion of Mr. Justice Peckham says:

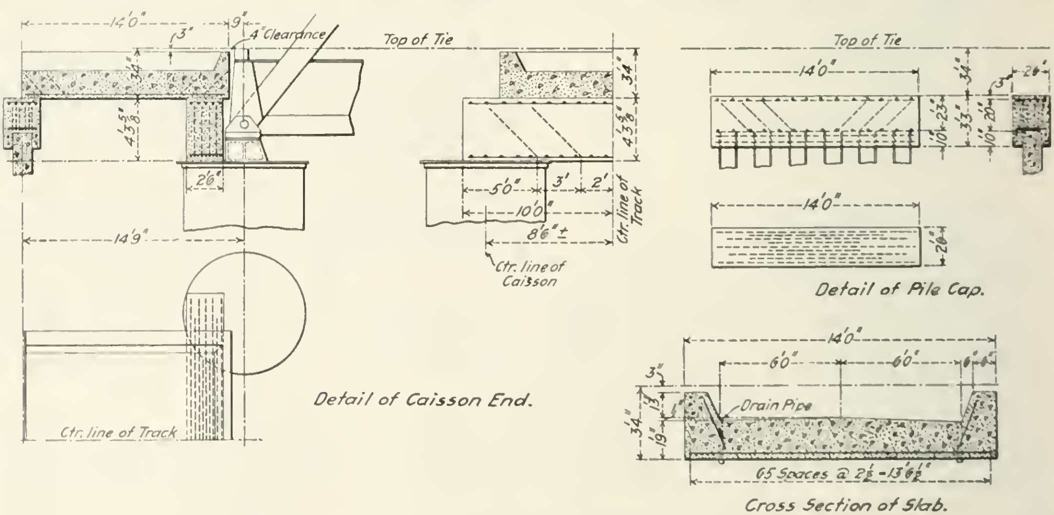
"Still another Federal question is urged growing out of the assertion that the laws are, by their necessary effect, an interference with and a regulation of interstate commerce, the grounds for which assertion it is not now necessary to enlarge upon. The question is not, at any rate, frivolous."

Reinforced Concrete Trestle on the Burlington.

The reinforced concrete trestle illustrated herewith was recently completed on the St. Louis-Hannibal line of the Burlington. The crossing of Salt river, about 100 miles north of St. Louis, is a three-span through truss bridge, with a trestle approach on the north nearly 500 ft. long. When it became necessary to renew this trestle, which was built of timber, it was decided to substitute reinforced concrete.

The structure had to be put up under traffic. A temporary trestle was built by driving piling on each side of the old bridge and capping it longitudinally. The stringers of the old bridge, together with some new material, were then placed across this and the rails spiked directly thereto. The old bridge was removed from underneath this structure and the new one built in its place without interference with traffic. This method is more expensive than is the case where the floor slabs are cast in a yard nearby and set in the bridge by a derrick, and its use is justified only where trains are frequent.

Reinforced Concrete Trestle Approach to Salt River Bridge.



Details of Reinforced Concrete Trestle; Chicago, Burlington & Quincy.

The north approach is 477 ft. 6 in. long. The bents are spaced 14 ft. centers and there are six piles to the bent; these piles, which are 22 ft. long, were molded on their sides. They are reinforced with eight ½-in. corrugated steel bars, wound spirally with No. 12 steel wire. They are 16 in. square at the top, are chamfered 3 in. on the corners and taper 8 in. in 30 ft. They were driven, for the most part, with an ordinary road pile-driver having a 3,000-lb. hammer. In driving the piles were capped with an 8-in. rubber cushion, and although, sometimes, several hundred blows were required, and in some cases the full 24-ft. drop of the hammer was used, none of the piles was injured. They were driven in gravelly sand and the penetration was from 14 to 16 ft.

After the piles were driven, molds were put around the tops and the caps cast in place. When these had set sufficiently, the forms for the slabs were put up and these likewise built in place. Building paper was put in the joints between slabs. There is no other provision for expansion. A pier, resting on wooden piling, is placed at every fifth span to take the longitudinal thrust. The end of the steel span adjoining the trestle rests on caissons. The floor slab of the trestle rests on a reinforced concrete beam, 4 ft. 3⅝ in. deep, on top of the caissons. The south approach has only three spans and is 42 ft. 9 in. long.

In the West and South there are many miles of wooden trestle bridges carrying tracks over overflow water only. They are a constant expense for maintenance and renewal, many of them being in swampy land, affording poor foundations. The advantages of concrete construction in such situations are obvious. Its low first cost—from $25 to $30 per foot of single track—the complete immunity from fire, the permanent character of the structure and the freedom from maintenance cost should commend it to maintenance engineers.

The Salt river trestle was designed by C. H. Cartlidge, Bridge Engineer of the Burlington, and was built by company forces.

The Pennsylvania's New Rail Sections and Specifications.

The accompanying rail sections and the following specifications are the results of the work of the rail committee of the Pennsylvania Railroad. The members of the committee are: Theo. N. Ely, Chief of Motive Power, Lines East and West, Chairman; A. C. Shand, Chief Engineer, Lines East; L. R. Zollinger, Engineer Maintenance of Way, Lines East; A. W. Gibbs, General Superintendent Motive Power, Lines East; C. B. Dudley, Chemist, Lines East; T. H. Johnson, Consulting Engineer, Lines East; Robt. Trimble, Chief Engineer Maintenance of Way, Lines West; W. C. Cushing, Chief Engineer Maintenance of Way, Lines West; J. C. Bland, Engineer of Bridges, Lines West; D. F. Crawford, General Superintendent Motive Power, Lines West.

Chemical Composition.

1. The steel of which the rails are rolled shall conform to the following limits in chemical composition:

Bessemer.

	Per cent. Lower limit.	Desired composition.	Upper limit
Carbon	0.45	0.50	0.55
Manganese	0.80	1.00	1.20
Silicon	0.05	0.12	0.20
Phosphorus	....	....	0.10

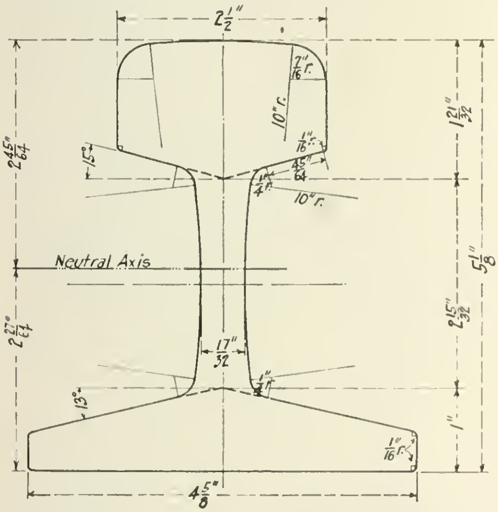
Open hearth.

	Lower limit.	Desired composition.	Upper limit
Carbon	0.70	0.75	0.80
Silicon	0.05	0.12	0.20
Manganese	....	....	0.80
Phosphorus	....	....	0.03

Process of Manufacture.

2. Ingots shall be kept in a vertical position until ready to be rolled, or until the metal in the interior has had time to solidify.

3. No "bled" ingots shall be used. ("Bled ingot"—one from the center of which the liquid steel has been permitted to escape.)



Area of head	3.57 sq. in.	42.2 per cent.
" web	1.51 "	17.8 "
" base	3.39 "	40.0 "
Total	8.47 sq. in.	100.0 per cent
Moment of inertia		29.1
Section modulus, head		10.77
Section modulus, base		12.02
Ratio periphery, head to area, head		1.73
" " web " " web		3.81
" " base " " base		2.69
" total periphery to total area		2.18

85-lb. Rail; Pennsylvania Railroad.

4. There shall be sheared from the end of the bloom formed from the top of the ingot sufficient discard to insure sound rails. (All metal from the top of the ingot, whether cut from bloom or rail, is the top discard.)

5. In reheating, care shall be taken to avoid burning the steel, and under no circumstances shall a "cinder heat" be used. ("Cinder heat"—one in which the scale on the sides of the ingot becomes fluid.)

6. The number of passes and speed of train shall be so regulated that on leaving the rolls at the final pass the temperature of the rail will not exceed that which requires a shrinkage allowance at the hot saws, for a rail 33 ft. in length, of $6\frac{1}{4}$ in. for 85-lb. section, and $6\frac{1}{2}$ in. for 100-lb. section. These allowances to be decreased at the rate of $\frac{1}{100}$ in. for each second of time elapsed between the rail leaving the finishing rolls and being sawed. The bars shall not be held for the purpose of reducing their temperature, nor shall any artificial means of cooling them be used between the leading and finishing passes, nor after they leave the finishing pass.

Mechanical Requirements.

7. The name of the maker, the weight and type of the rail, and the month and year of manufacture shall be rolled in raised letters and figures on the side of the web, and the number of the heat shall be plainly stamped on each rail where it will not subsequently be covered by the splice bars. A letter shall be stamped on the web to indicate the portion of the ingot from which the rail was rolled.

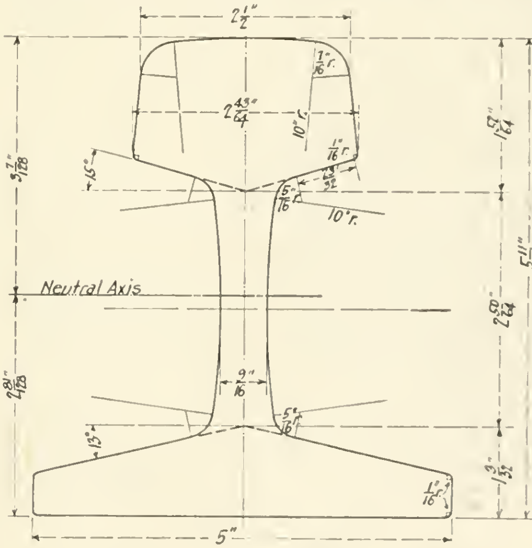
8. The section of rail shall conform as accurately as possible to the templet furnished by the railroad company. A variation in height of $\frac{1}{64}$ in. less or [illegible] in. greater than the specified height, and $\frac{1}{16}$ in. in width of flange, will be permitted; but no variations shall be allowed in the dimensions affecting the fit of the splice bars.

9. The weight of the rails specified in the order shall be maintained as nearly as possible, after complying with the preceding paragraph. A variation of one-half of 1 per cent. from the calculated weight of section, as applied to an entire order, will be allowed.

10. The standard length of rails, at a temperature of 60 deg. F., shall be 33 ft. Ten per cent. of the entire order will be accepted in shorter lengths, varying as follows: 30 ft., $27\frac{1}{2}$ ft. and 25 ft., and all No. 1 rails less than 33 ft. long shall be painted green on ends. A variation of ¼ in. in length from that specified will be allowed.

11. The rails must be free from injurious mechanical defects and flaws; shall be sawed square at the ends, a variation of not more than $\frac{1}{32}$ in. being allowed; and burrs shall be carefully removed.

12. The rails shall be smooth on the heads, straight in line and surface, and without any twists, waves or kinks; particular attention being given to having the ends without kinks or drop. The



Area of head	4.09 sq. in.	41.0 per cent
" web	1.85 "	18.6 "
" base	4.03 "	40.4 "
Total	9.97 sq. in.	100.0 per cent

" " web " " web		3.58
" " base " " base		2.43
" total periphery to total area		2.30

100-lb. Rail; Pennsylvania Railroad.

hot straightening shall be carefully done, so that gagging at the cold presses will be reduced to a minimum. Any rail coming to the straightening presses showing any sharp kinks or greater camber than that indicated by a middle ordinate of 4 in. in 33 ft. will be at once marked as a No. 2 rail, and only accepted as such. The distance between the supports of rails in the straightening presses shall not be less than 42 in.

13. Circular holes for splice bars shall be drilled to conform accurately in every respect to the drawing and dimensions furnished by the railroad company, and must be free from burrs.

Tests and Inspection.

14. One drop test shall be made on a piece of rail not less than 4 ft. and not more than 6 ft. long, selected by the inspector from each heat of steel, from any position in the ingot. The test piece shall be placed head upwards on solid supports, 5 in. radius, 3 ft.

between centers, and both 85-lb. and 100-lb. sections shall be subjected to an impact test from a weight of 2,000 lbs., falling 15 ft. The deflection for No. 1 classification rails must not exceed that indicated by a middle ordinate of 2 in. in 3 ft. for 100-lb. section and 2¼ in. for 85-lb. section. Test pieces shall be tested to destruction. The temperature of the test pieces shall be between 60 and 120 deg. F.

(*a*) If a test piece breaks without showing physical defect, all rails made from that heat shall be rejected absolutely.

(*b*) If, however, the test piece broken under test "*a*" shows physical defect, the top rail from each ingot of that heat shall be rejected; and

(*c*) A second test shall then be made of a test piece selected by the inspector. If this second test piece breaks, the remainder of the rails of the heat shall also be rejected. If this second piece does not break, the remainder of the rails of the heat will be accepted as either No. 1 or No. 2 classification, according as the deflection is less or more, respectively, than the prescribed limit.

(*d*) If the test piece, test "*a*," does not break, but when tested to destruction shows pipe, the top rail from each ingot shall be rejected. The remainder of the rails of the heat will be accepted as either No. 1 or No. 2 classification, according as the deflection is less or more, respectively, than the prescribed limit.

(*e*) If the test piece, test "*a*," does not break, and when tested to destruction does not show pipe, the rails of the heat will be accepted as either No. 1 or No. 2 classification, according as the deflection under test "*a*" is less or more, respectively, than the prescribed limit. Note—The drop test and the deflection requirements may be modified if considered advisable by the railroad company.

15. The drop-testing machine shall have a tup of 2,000 lbs. weight, the striking face of which shall have a radius of not more than 5 in. The anvil block of the drop testing machine shall weigh at least 20,000 lbs., and the supports shall be part of, or firmly secured to, the anvil. The foundations for the anvil block shall be such as will meet the approval of the railroad company.

16. No rails shall be accepted which contain any physical defects that impair their strength.

17. Rails improperly drilled or straightened, or from which the burrs have not been properly removed, shall be rejected, but may be accepted after being properly finished.

18. No. 2 rails to the extent of 5 per cent. of the whole order will be received. All rails accepted as No. 2 rails must have the ends painted white, and must be kept separate from No. 1 rails, and be shipped in separate cars.

19. Rails will be accepted and billed according to actual weights.

20. All rails must be loaded in the presence of the inspector.

21. The makers shall furnish the inspectors with the carbon determination of each heat, and, also, two complete analyses which shall represent the average steel of each day's work, before the rails are shipped. These analyses will be checked from time to time by the railroad company's chemist, and, on request of the inspector, the makers shall furnish a portion of the test ingot for check analyses.

22. Inspectors representing the railroad company shall have free entry to the works of the makers at all times when the contract is being filled, and shall have reasonable facilities afforded them by the makers to satisfy them that the finished material is furnished in accordance with these specifications. All tests and inspection shall be made at the place of manufacture, prior to shipment.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

XV.

Agreements Among Ocean Carriers to Control Rates.

As might be expected, the freedom of the sea conduces to variation in the forms of agreement among sea carriers. At least four kinds of agreements are clearly discernible: (1) division of territory; (2) freight pooling; (3) pooling of profits; (4) "conference" or agreement to maintain rates.

1. Division of territory, although not the most common, is probably the simplest form of agreement, as it is the easiest to operate. Each party is, within limits, free to do as it chooses within its own territory. The agreement between the German companies and the Morgan syndicate makes a precise division of territory, by limiting future new services and setting the number of sailings that might be made on some existing services. In the North Sea traffic, Wilson's of Hull, the great rivals of the United Danish Lines, agree with their rivals as to which ports each shall serve, and when they disagree the threat of either party to compete at all points is a strong argument for peace, as it was also in the recent (December, 1905) quarrel—or ostensible quarrel—between the Hamburg-American and North German Lloyd companies. There are many divisions of territory that are tacit rather than formal. A line performing a certain service desires to add to or extend its service, but fears to do so knowing that the move will be regarded as a practical declaration of war and treated accordingly. This is probably the commonest of all causes of rate wars. A new carrier enters a rich field for a share of the trade and a contest ensues.

One of the commonest ways of ending a rate war is for the contestants to divide up the territory. The following is an example: During 1902 and 1903 the trade from New York to Hayti and Cuba was competed for by the Hamburg-American Line and the Cameron Line. This was settled and competition ended by the Cameron Line withdrawing their ships from Hayti, but continuing their Mexico and Cuba services. The owners of the Cameron Line further acted as agents for the Hamburg company in Hayti, but the Hamburg company's ships did the carrying.

2. Freight pooling achieves a similar result by (a) the common method of alternate sailings or by (b) the more unusual method of actual division of the traffic on a basis of percentage or kinds of traffic.

(a) Alternate sailings is one of the most, if not the most, widespread of all forms of line agreements. It is simple in its development and really was the origin of line traffic on many routes. Two or three merchants who were in the habit of sending an occasional sailing vessel for themselves and others, naturally chose different times for the despatch of their ships, because there was then more freight offering. They almost inevitably worked out something as a schedule.* The same advantage holds true when two or more lines are running on the same route. As the advantages of this manifestly increase with the length of the route, it is natural that it should be prevalent in the trade to South America, Africa and the Orient.

To the Argentine Republic, one French and two English lines give a uniform rate with alternate sailings and exchange of passenger tickets. To the west coast of South America the Hamburg-American and the Hamburg-South American companies alternate the schedule and increase their ships together. But these lines have even a closer pooling alliance. In the Oriental trade two French lines operate together, taking turns, and the two great German companies have tried about all forms of combinations. This service has been double, consisting of the Imperial Mail line and a cargo line, the two companies joining in furnishing the vessels for these. This was followed by a period during which the Hamburg company managed the freight line and the Bremen company the mail line, each contributing ships to both. This was satisfactory to neither party, and by a Hamburg conference in November, 1903, it was agreed that the Bremen company should furnish as well as manage the mail line, and the Hamburg company the cargo line. The companies then exchanged vessels and agreed not to antagonize each other in this trade. A half-dozen companies along the Dalmatian coast recently made a similar arrangement by which passenger and express business was taken by one line and freight by the others. The contract between the German lines and the Morgan syndicate made provision for the sharing by the two interests of new trade or of extension when the enlargement amounted to doubling the number of sailings.

3. Pooling of profits seems to be quite common, if one may infer from the known number of these ordinarily secret arrangements. The two great German companies appear to have a money pool, and it is announced from time to time in the press that they have pools with some of the smaller German companies. There is a pool of passenger earnings between the two German companies, the Holland-American and the Red Star Line, which belongs to the International Mercantile Marine Company, and runs to Antwerp. The German East-Africa Company and the Austrian Lloyd got into competition because the Austrian line entered the East Africa trade, but after various negotiations† they announced a reported agreement by which "receipts from the passenger branches of the two services shall be divided at fixed intervals between the two companies, and that a mutual understanding shall also be arranged as regards the goods traffic."

The pooling of profits in ocean-carrying is comparatively simple if office expenses are left out, as is usually the case. The ships are often chartered, the owner furnishing the crew, so that the expense account, as well as income, can be calculated to a nicety. Even where ships are not chartered, it is common to have them surveyed when they enter pool service and the owner credited with the same amount of money that he would have received if he had chartered the vessel to outside parties at current rates.

There is a profit pool among the carriers from the United Kingdom to Australia. Within the past decade there have been profit pools in the line trade from New York to Australia and from New York to Brazil, and there was every outward sign that there was also one from New York to South Africa. Its existence was finally revealed in May, 1905, by a suit in the court of King's Bench, London.‡ Three British firms in the United Kingdom-South African

*The Hamburg-American and North German Lloyd companies were formed by such groups of merchants who desired a better service than their occasional independent ships gave, and, uniting, formed the now famous companies.

†*Fairplay*, January 28, 1904, p. 145.

‡See New York *Journal of Commerce*, June 7, 1905.

trade also had vessels in New York service. They were entitled to 21 per cent. in the pool; the German Hansa line had 16 per cent., and was sued because of the failure to maintain the agreement which was entered into October 23, 1901. During most of this period there was a rate war in progress, and the difficulty of operating a pool under these circumstances is shown by the fact that in 1902 there were 87 meetings and in 1903, 61.

Pools of both sorts are apt to be short-lived, as were most of those referred to above, because of their tendency to become non-progressive arrangements. They heal the difficulty of the hour, but they must be well arranged, indeed, if they can provide for the satisfactory division of increased trade among the participants. This is the rock upon which they all alike go to pieces. It matters little whether they be divisions of traffic or divisions of money. One line feels that its position, expenditures, or activity merit a large share of the increase in the trade. The line that has done less wants, of course, an equal share. An example will illustrate: In February, 1893, the British-India, Peninsular & Oriental, and Hansa steamship companies came to a clear-cut agreement about the trade between Middlesboro', London, Hamburg and Antwerp with India. In September, 1898, it was modified, apparently in favor of the stronger parties, so that if Antwerp freight exceeded the capacity of the Hansa steamers, each of the other lines could have six sailings a year from Antwerp, the amount of freight in each of these additional sailings being prescribed and limited. This lasted until January, 1905, when the P. & O. Company, again dissatisfied, threw the agreement to the winds, announced more frequent sailings from Antwerp, and a long rate war between the two British companies and the German company followed. Announcement of its end in the spring of 1907 did not give the terms of the agreement.

4. Shipping conferences. These are usually agreements to maintain rates upon a certain route. Once the carriers have agreed, they usually arrange a schedule of sailings, rendering the best possible service, and keep off competitors by a system of deferred rebates. This is usually 10 per cent. of the freight. It is calculated at the end of a long period, usually six months, and paid six months or a year later, *provided* the shipper has remained "loyal" to the members of the conference. Shipping by a rival line is, of course, "disloyalty," so that the conference carriers, by means of these deferred rebates, practically keep all regular shippers under bonds to let all rivals severely alone. Thus is the shipper bound. The starting of rival shipping lines is deterred by the certainty of fierce competition, and by the restraining tendency which the rebates will have on the people who would otherwise ship by the new line.

Despite this inner stay and outer prop, the way of the shipping conference is far from smooth. The prosperity that attends their success attracts the hungry outside shipowner who sets up competition, creates chaos and general loss in the hope of being admitted to the conference.

Owing to the oft and widely repeated fact that the United States has had few and poor shipping connections other than trans-Atlantic, the best place to see the shipping conference in full operation is in European trade, where the steamship lines are older and well established. The best single example is the South African Shipping Conference, which has successfully regulated the trade of a region that stood for some years in the glare of the world's attention. It is also an unprosperous region where discontent is rife and where there is diligent search for the causes of this lack of prosperity which leads to discontent. The fact that the conference has had long success and consequent freedom from rivals has produced a feeling of independence and made it less anxious to please the shipper in matters of detail. All these influences have combined to throw much light on the South African Shipping Conference.

A New York freight broker, well acquainted with European conditions, recently declared: "The steamship people in England ride the shippers; they *ride* them; they say "you can have so much space in such and such a ship." The British shippers seem to be of the same opinion. After the close of the Boer War the press was full of complaining letters. Such grave bodies as the Liverpool and Leeds Chambers of Commerce took the matter up and condemned it vigorously; the colonial premiers entered into correspondence with the head of the conference; and South African commercial bodies were quite as active as those of England.

The Leeds Chamber of Commerce showed that when a rival line had arisen and the rebates had failed to hold the shipper, the conference had quoted double (prohibitive) rates when the shipper persisted in patronizing the new company for that part of the freight which the new carrier could place. The British public was also enraged because the rates to Africa were from 21s. to 80s. per ton, and the same firms had steamers in the New York-South African service and were giving rates from New York at 10s. to 20s.*

American trade was naturally booming at the expense of the English. To this criticism the carriers replied that the New York rate was a heavy loss owing to competition, and that the rates from all continental points were the same as from British ports, a point that had been carefully stipulated in all arrangements with German and other lines.

From South Africa also came the charge of excessive rates, but the carriers declared their rates were reasonable, and that the African importers were suffering from the exactions of the colonial railroads. In this connection a paper before the Institute of Civil Engineers shows that on the basis of 1.54d. per ton per geographical mile for mineral trains in England, the total sea-borne rate was about one thirty-fifth of that figure. At the time of the African complaint against the shipping "ring," the rate on iron from the United Kingdom to Kimberley was as follows:

	Via Cape Town.		Via Port Elizabeth		Via Durban	
	Rail.	Ocean.	Rail.	Ocean.	Rail	Ocean
Distance	647	6,181	485	6,609	483	Circ 7,000
Rate per ton	218/5	22/6	166/2	22/6	110/-	25

Various persons and chambers of commerce were appealing to the British government to give them relief of some sort and one proposal was to give the mail and government contracts to an independent line that should be formed. An editorial in *Lloyd's Gazette* in August, 1904, stated that while monopoly had made the conference carriers a little autocratic in their manners, any government scheme to start another line "would just make it strong enough to join the conference." Occasionally, Sir Donald Currie, head of the largest British interests in the conference, would reply to the numerous attacks. One such long letter* made the challenging statement that "the South African trade is quite open." But owing to the rebate control and boycott rates it was practically open only to a line or combination that could offer as good a service, and that, as experience proved, was a heroic task. It is common for steamers to South Africa to skirt the coast, stopping at three or more ports. When competition did spring up, the conference lines eclipsed it by despatching a vessel directly to each of the three main ports, and it is currently reported that one of the lines in the conference got in only after losing a million dollars in a rate war which finally brought the conference to terms. So the statement that the trade "is quite open" may have needed a little interpretation.

In a letter to Mr. Chamberlain, Sir Donald Currie said (see *New York Journal of Commerce*, June 18, 1903): "This so-called rebate system prevails in every ocean steam trade, and while providing the necessary support which steamers, to be regularly employed, regularly require, it secures under suitable arrangements with the merchants regularity of rates, as well as the supply of sufficient steam tonnage."† *Fairplay* quoted Mr. Birchenough (who had been sent to South Africa by the government to investigate the matter) as saying: "The rebate system prevents the cutting of rates, and it is to that extent as much a protection to the shippers as to the 'ring' "; and the journal then stated editorially that, "as a simple matter of fact, the present very efficient service to the Cape could not possibly be worked otherwise than by a conference agreement."

The discussion of this rebate problem steadily continued, rose almost to the degree of ferment, and would not down. Finally, after special reports had been made to the British government upon it, a royal commission was appointed, in November, 1906, to inquire "into the operations of shipping rings or conferences generally, and more especially into the system of deferred rebates, and report whether such operations have ceased or are likely to cause injury to British or Colonial trade, and if so, what remedial action, if any, should be taken by legislation or otherwise."

The rather full accounts of hearings which were reported from time to time in *Lloyd's Gazette* and other maritime journals furnished much detailed information concerning the actual situation.

The disadvantages of the rebate system have been clearly pointed out. The Secretary of the Birmingham Chamber of Commerce testified that merchants have been so penalized that they were afraid to testify. The penalties have been doubled rates or no service. A representative of the London Chamber of Commerce testified that the heavier shippers got special secret rebates. But the most galling piece of testimony seems to have been the fact that the shipping ring lines charged higher rates from British ports than they did upon the same ships for continental or American goods going out to the British colonies and foreign lands. For example, the China Conference was inveighed against because the American rate was 25 shillings, and the London rate 45 shillings to China, and an offer of a 20 shilling rate from London, the British shipper dare not take, and kept on paying his 45 shillings, because he was tied with a heavy rebate shackle. Complaint was made that the British glassware paid 37 shillings and a half to New Zealand, while the same steamer took Continental glassware from Antwerp and Hamburg on a through rate at 22 shillings and a half. The defense of this by the part of the shipping company was that only by this means could they meet the competition of Continental steamers.

In answer to the direct question by the Commissioners, "Do you recommend the abolition of rebates by statute?" there was a surprising temperance of answer on the part of the aggrieved merchants; almost none of them favored such action. In the first place it was pointed out that the attempted prohibition by the United States

*This type of grievance still remains and is embodied in a strong resolution of the Associated Chambers of Commerce of Great Britain which met in London, March 7, 8, 1906.

**Syren and Shipping*, June 24, 1904.
†*Fairplay*, September 22, 1904, p. 444.

government while it had caused a temporary cessation of rebates, was really ineffective; because the rebate could be worked by a foreign corporation through its foreign offices.

The suggestion of the legal prohibition of rebates brought out a rather surprising statement of their advantages. It was shown that they permitted regularity and uniformity of rates, which enabled the merchant to make quotations for long times in the future, and, lastly, the shipping companies usually bound themselves to stop competing with the merchants by so-called "filling lines." This common practice has long been resorted to by shipping lines. When freight was dull, they would fill their ships with goods on their own account, to be sold in competition with merchants who were their patrons. Escape from this the merchants deemed a great gain.

A representative of the Ceylon Association of London testified that he thought the one year deferred rebate was too long a time for the money to be held by the carrier, and was therefore not liked by the shippers; but they didn't wish anything to interfere with the splendid, almost daily, service which the Ceylon shippers enjoyed by the 120 first class steamers which were returning from that island to European markets. Therefore, on the whole, they were against any legislation on rebates, for fear that the shipping lines might make something that bore more heavily upon them, since "a reasonable and regular rate seems to us more beneficial to the shipper and trader than one subject to violent fluctuations."

The consensus of opinion of the witnesses was similar to that of the Ceylon tea shippers; but great insistence was placed on the fact that something should be done to prevent lines carrying foreign goods more cheaply than British goods to the detriment of British trade. In this respect the conference of West Africa was held up as a shining example. The two British lines controlled by Elder-Dempster & Company had an agreement with the one rival German line, which they dominated, and as its result they had built up a splendid service, and to prevent the founding of a line directly with America, a rate was given to America, via Liverpool, which was identical with the rate to Liverpool only.

The China Conference is one of long standing, and, like numerous others from Europe outward, it has succeeded in keeping less before the public. One of the largest of these combinations is the reported agreement between two groups of west coast South American carriers—the Panama group, comprising eight companies, and the Magellan group of four companies. In the Panama group were companies representing America, England, Germany, France and Italy.

The founding of lines of steamers from New York to other than European and West Indian ports has had its largest and almost its entire development since 1890, and while these lines have not been long established, they have compassed practically all of the experiences in the catalogue of agreements among carriers. To South America, Africa, Australia and the east there were sailing-vessel lines that had grown up gradually from the operations of exporting merchants. This commerce has grown great enough to tempt the old-established firms of British shipowners to establish employment for some of their vessels by putting them into steam services from New York to the various coasts above mentioned. This was a direct blow at the trade of the American firms that had handled the trade from its inception, and strong rivalries have ensued. This has been further complicated by the coming of the German steamers upon the scene. Peculiar incidents have occurred in these contests. Firms agreeing in European conferences have competed here; at least one New York firm has been in both the east South American trade and the South African trade, but in one it fiercely competed with firms with which it had agreements in the other trade. The New York carrying combinations are well typified in all important respects by the happenings in the Australian trade.

The first of line service was in 1853, when two firms began taking turns in sending out their sailing vessels. In 1878 a Boston firm began, and in 1884 added a New York service, taking turns with the other two companies, and each got what rates it could at the agreed-upon time of sailing. In 1889 a fourth company essayed to enter this service and it was admitted, after a year of rate cutting, during which rates fell from 27½ cents per cubic foot to 7 cents.

The four companies now agreed and conducted their business without serious disturbances until 1896 and 1897, when some outside merchants chartered, loaded and despatched some ships to an Australian firm. This promised easily to become the origin of another line. Shortly thereafter the four carriers made rebate contracts, promising a 10 per cent. rebate if shipments were not sent by any outside line. The agreement was made with many firms, some for five years and others for shorter periods, down to one year and less. The shorter periods were apparently accepted because of the probability of opposition. At this time the charge was freely made that the four firms, by combining the functions of commission merchants and carriers, used their carrying functions to benefit their business as merchants to the detriment of other merchants. This very natural desire could be effected, as was then charged, by quoting rival commission houses higher rates, and by so-called "filling-orders"—filling up a ship, when cargo was scarce, with "bulk lines" to be sold in Australia in competition with their patrons who had paid full rates of freight.

In the spring of 1898 two London shipping firms, desiring return cargoes for ships carrying Australasian frozen meat to the United Kingdom, sent their steamers to New York to load outward. The four New York firms, which had been sending sailing vessels only, united in organizing the United States and Australasian Steamship Company, and placed at its head a man from one of their offices. This was done the very day that the advertisement of the British steamship service appeared, and the Americans succeeded in despatching the first steamer. The war was carried into the enemy's country by sending steamers to South Africa where the competing English firms had important services. This was a new venture for the Australasian shippers and was purely an incident of the lively war that raged from May until December, 1898. Rates were put down to 10s. a ton, about the cost of stevedoring and dunnage wood, and in December there was an agreement between the New York firms and the two London firms, but a third London line which had entered during the competition did not enter as a part of the agreement that formed the so-called Associated Line.

Before the beginning of the competition each of the four firms had taken its turn on the berth and had made what profits it could from its ship. The Associated Line worked on a profit pool said to have been divided equally between the New York and London interests. It, of course, had the rebate arrangement and the carriers' promised to do away with the obnoxious "filling lines." This Anglo-American agreement seems never to have run smoothly. Even the public press frequently mentioned the fact. Old-established American firms, accustomed to making their decisions on the spot, were dealing with the agents of British shipowners who are notorious for deciding in London everything for their agents in New York, whether they know the conditions in New York or not. That they do not know the New York situation is the consensus of American-New York opinion. In addition to internal troubles, the Associated Line had the strong competition of the one outside firm which was not well controlled by the rebates. Stronger measures were tried. In May, 1899, an Associated Line circular stated that if, after the first day of July, any commission house should consent to fill a buying order for any Australian or New Zealand merchant who insisted upon shipping by any line but the Associated Line, that commission house will not only lose its 10 per cent. deferred rebate for that client, but will in addition have to pay an additional rate of 5s. per ton upon all freight shipped to Australia, and 7s. 6d. per ton extra to New Zealand. This embraced all business done by the New York *commission firm* for clients "loyal" and "disloyal" to the Associated Line. The rival line continued to prosper, and in April, 1900, the penalties were increased to 12s. 6d. per ton, "on condition that they buy their goods from a loyal supplier, the consignee's name being subject to approval of one of the members of the Associated Line."

The attempts at coercion failed, and within a month the Associated Line had ceased to exist. It was resolved into its original elements, and rebates and penalties were declared off. During the exigencies of the fight it appears by the protests of merchants in both New York and Australia, that the rebates were withheld when due, and certainly were not paid for some months thereafter.* This was merely one more effort to hold trade away from the rival. The end of the combination was brought about quite as much by internal trouble as by competition, as is evidenced by the fact that the breakup of the combination caused no immediate break in rates.

Since the end of the pool in May, 1900, there has been a continuation of the ups and downs in the trade until the mere mention of the Australian trade makes a New York shipping man refer to primeval chaos. The steamship company owned by the four united New York companies is sending out both steamships and sailing vessels, and the three British firms are still in the business. In September, 1901, rate cutting apparently took the form of seeing who had the most money to lose. Weight cargo was carried for 5s. to 7s. 6d. per ton, and measurement cargo for 10s. The American company seems to have outgeneraled its opponent in this contest of loss. The shipping journals show that they advertised the same steamer from December 2 until March 27, when she finally sailed. In the interval she was making short voyages in nearby waters. The earlier cargoes that she should have taken to Australia got sent on the rivals' ship at the rivals' heavy loss. In May, 1902, there appears to have been an oral agreement that lasted till October, 1904, when one of the British lines started in to get a better share of the freight. This war lasted until August, 1905, after which time the carriers lived along for some months on day-to-day rate understandings, and efforts to pool the traffic or proceeds came to naught because the different parties could not see alike with regard to respective proportions that each should have. In February, 1906, one of the London companies suddenly made a great increase in the tonnage of its service. To secure freight for it, concessions in rates were made to some shippers on some classes of goods, but this had not resulted in a general disturbance of rates on April 8. This situation, like many another in the commercial world, is materially affected by bitter personal animosities existing

*New York *Journal of Commerce*, April 21, 1901.

between some of the principals, and rendering them oblivious to the ordinary economic impulses.

This detailed account of the recent developments in the New York-Australian trade, with its freight and money pools, its competitions, rebates and virtual boycotts, differs but little from the history of the trade to South Africa or East South America. In all of them the old American exporting firms have had to meet the competition of European shipowners who have competed by setting up new steamship lines. In the struggles that have followed, the pool, the rebate, and the boycott have been freely used. The boycott has not frankly borne that name, but the same practical result has been attained by indirect means. One method is the prohibitive rate described in the account of the Australian trade. A common device of the agent for the foreign-owned ship is the "inability" to name a rate. "I'll have to cable to headquarters," replies the agent. Upon application the next day or the next, the cable "hasn't come yet." Another method of achieving this result is for the ship's agent to tell the applicant that he has no space, although the next applicant, if friendly, may contract for 500 tons. In a recent conversation a New York freight broker said that he was boycotted by the carriers to four different parts of the world. It should be noted that it is the broker who is usually boycotted, not the actual consignor of the freight. He can get another broker and have his bargain made.

There is one broad difference between the recent American and British shipping conferences. Those in Europe are made by lines owning ships that they use. The American conferences have been upon the basis of hired ships or European ships being managed at long range by non-resident owners. The members of European conferences have therefore had more at stake, and in the freight depression prevailing since the Boer War most of the American conferences have gone to pieces from time to time, and most of the European conferences have survived.

One of the most successful of the American conferences is that of the four lines from New York to the Orient. Since the last peace in 1904 it seems to be getting stronger and displaying its strength day by day, until in July, 1907, it was declared by one shipper to exceed even the Hamburg-American in its independence. This appears to be strong language, as a later article will show.

The rebate system is comparatively new in the New York trades and seems to have had its chief growth since the coming of the British steamers to compete with the American sailing vessel merchant-carrier firms. The recent strenuous competition between carriers from New York to South Africa led to the withholding of rebates because of "disloyalty." The dissatisfaction of some of the penalized firms over the definitions of loyalty led to a suit being brought against the carriers in New York in 1904, and it is currently stated that a letter from the United States Attorney General's office so alarmed the foreign owners that they feared to risk trial under the Sherman law, and stopped all rebates for a time. The foreign shipping representatives are reported to have said that they would carry our freight for us, but they did not care to go to prison for us. There was shortly afterward a change in the head of the United States Department of Justice, and the rebates began again in some quarters. The suit did not come to trial.

(To be continued.)

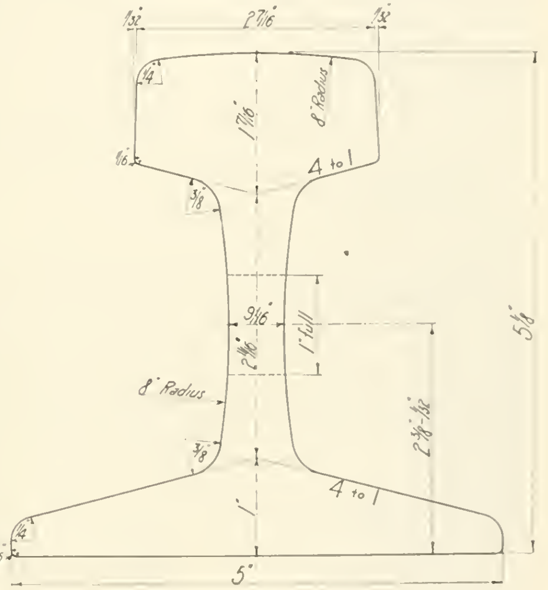
New Rails for the Canadian Pacific.

The Canadian Pacific recently ordered 40,000 tons of 85-lb. Bessemer and open hearth rails from the Dominion Iron & Steel Co., and the Algoma Steel Co. A new section has been adopted for these rails, in place of the A. S. C. E. section which the road has heretofore used. As may be seen from the accompanying drawing, this section is in general similar to the series A section recommended in the October, 1907, report of the American Railway Association's Committee on Standard Rail and Wheel Sections. Still more metal, however, has been taken from the head and added to the base, while the web has been reinforced. The head, though smaller, is shaped much like that of series A, except that the sides are more nearly vertical. The radius of the upper corners is ¼ in. instead of ⅜ in., and the radius of the top of the head is 8 in. instead of 14 in. The minimum thickness of the web is about the same, but it is reinforced at the top and bottom, the radius of the sides of the web being 8 in instead of 14 in. The base is somewhat deeper and is distinctly wider, being only ⅛ in. narrower than the rail is high, as it is believed that, although the road uses tie plates on all curves, it cannot sacrifice the added safety which the wider base gives. The base is, however, $\frac{3}{16}$ in. narrower than the A. S. C. E. section. The vertical moment of inertia is 29.492, and the horizontal, 7.139. Other figures are as follows:

	Area, per centages.	Cooling per centages.	—Section modulus— Vertical.	Horizontal.
Head	36.77	1.965	10.425	...
Web	22.21	3.081	...	...
Base	41.02	2.875	12.81	2.875
Total	100.00	2.586		...

The specifications for the manufacture of these rails follow the general principles laid down in the proposed and standard specifications of the American Railway Association, the Maintenance of Way Association, and the American Society for Testing Materials. There are several interesting differences. The carbon content in the Bessemer rail is the same as the A. S. C. E. and M. of W. specifications so far as the limiting percentage, but it is further required that it average between 0.57 and 0.59. The percentages of phosphorus and sulphur are the same as the A. S. C. E. and M. of W., but the limits of manganese are 0.80 and 1.00 instead of 0.80 and 1.05. The percentage of silicon is not to exceed 0.18 per cent.; the A. S. C. E. and M. of W. limit is 0.20. For the open hearth rail, the limits for carbon are 0.56 and 0.66 with an average of not less than 0.60. The A. S. C. E. limits are 0.58 and 0.68, and the M. of W. 0.68 and 0.78. The limit of phosphorus is 0.06, the A. S. C. E. limit being 0.05 and the M. of W., 0.03. Sulphur is not to exceed 0.055; the two societies make this 0.06. The limits for silicon are 0.075 and 0.018. The M. of W. limits are 0.075 and 0.020, while the A. S. C. E. gives only a maximum of 0.20. The manganese limits are 0.80 and 1.00; the A. S. C. E. are 0.80 and 1.05, and the M. of W. maximum is 0.90. An addition to the usual list of percentages is the requirement that the sum of sulphur plus copper plus other injurious elements be not more than 0.075.

In the branding specifications, aside from the requirements made by the three societies as to weight, name of maker, date of manu-



85-lb. Rail; Canadian Pacific.

facture and heat number, it is specified that the part of the ingot from which the rail is rolled be also indicated.

After cutting off or allowing for the "sand" or top end of each ingot, at least 12 in. more of seemingly hot steel shall be cut off that end of the bloom; if the steel does not then appear solid, the cutting shall continue until it does. No bled ingots or ingots from chilled heats, or from badly poured heats shall be used.

The drop tests of Bessemer rails are not quite as severe as the A. S. C. E. and M. of W. requirements. A section of rail is to be tested from every third heat, and the weight is to fall 18 ft. instead of 20 ft. It is, however, provided that should a heat be rejected, similar tests shall be made of rails from the preceding and succeeding heats. For open hearth rails, three sections of rail taken from the top of the first, middle and last ingots of each 50 ton heat are to be tested. The heat is to be rejected unless two of the tests stand.

From reports made to the company by its inspectors, it seems that the new rail requires less cold straightening and less camber, also, as is to be expected, the temperature is more uniform throughout the rail after leaving the rolls than in the old A. S. C. E. section.

Block Signals on the Railroads of the United States, Jan. 1, 1908.

The tables which appear on the following pages have just been issued by the Interstate Commerce Commission. Table 1 is an exhibit showing for each reporting company the aggregate length of its lines or parts of lines on which the block system is in use; Table 2 shows the kinds of automatic signals used; Table 3 is an exhibit of the methods and apparatus used in the operation of the

[a] Includes Cleveland, Lorain & Wheeling.
[b] Manual block system on 8.9 miles used exclusively by freight trains not shown in this table.
[c] Electric road.
[d] Includes Syracuse, Binghamton & New York.
[e] Includes Yazoo & Mississippi Valley.
[f] Automatic signals in addition to telegraph block on 6.6 miles. Automatic signals on 167.2 miles and nonautomatic signals on 57 miles used in whole or in part exclusively by freight trains.
[g] The Michigan Central has 243.5 miles automatic block signals in Canada not shown in this table.
[h] Includes Peoria & Eastern.
[i] Includes Northern Ohio.
[x] Includes 19.6 miles of road of more than four tracks.
[y] Automatic block signals on 16.3 miles used exclusively by freight trains not shown in this table.

Table 2.—Kinds of Automatic Signals in Use.

Names of railroads.	Uninclosed disks ("clockwork"). Miles of road.	Uninclosed disks. Miles of track.	Inclosed disks. Miles of road.	Inclosed disks. Miles of track.	Semaphores: Electro-pneumatic. Miles of road.	Electro-pneumatic. Miles of track.	Electric motor. Miles of road.	Electric motor. Miles of track.	Electro-gas. Miles of road.	Electro-gas. Miles of track.	Normal clear, miles of track.	Normal danger, miles of track.	Total automatic signals. Miles of road.	Total automatic signals. Miles of track.

a By dispatcher.
b Allowed by rule.
c Permissive movements allowed for westbound trains by dispatcher and three-position signal.
d For everything but passenger trains.
e By train order.
f In this mileage there are 58 signals opposite offices.
g Allowed in some cases.
h For passenger trains only. This company uses no block for freight trains on lines protected by manual block system.

x Camden Interstate, 16 miles electric road not shown in this table manual block system, and Table 4 shows the practice in vogue in the operation of the manual system. It appears that since September 30, 1906,* there has been an increase of 9,935.5 miles in block-signal mileage in the United States, the mileage now shown being 58,678.7, while in the earlier report it was 48,743.2. This increase represents 5,959.4 miles of manual and 3,976.1 miles of automatic. The increase in automatics on single-track lines is 2,331.1 miles. On the Lehigh Valley 79 miles of block-signal mileage is used exclusively for freight trains.

It appears from Table 4 that on 8,130.3 miles of road the block system is used for rear-end protection only.

China's Plans for New Railroads.

It is a fact worth noting that China now has a ministry of transportation, and that this ministry has reported in favor of a national railroad system, with its center at Pekin, the several lines to be built as means can be provided, those promising immediate profit first. The great north-and-south line will be that now open from Pekin south to the Yang-tze river at Hankow, with its extension south to Canton, together with the line now in operation from Pekin northeast to Hsin-min-tun (near Mukden), to be extended thence northward to the Amoor and the Russian border at Argun, crossing the Chinese Eastern at Tsitsikar. The road now under construction from Pekin northwest to the Great Wall at Kalgan should eventually be extended substantially over the caravan route through Urga to the Siberian border at Kiachta, which is not far from the Russian trans-Baikal railroad. The western line, beginning from a branch of the Pekin-Hankow railroad at a considerable distance south of Pekin, now under construction from Scheng-ting to Tai-juen, is planned for an indefinite western extension, largely through mountains and desert, towards Turkestan. With these main lines a number of branches would connect. The important thing in this report is that China at last desires to have railroads, and a whole system of railroads, and plans for a long time ahead, and for its own national needs.

Rail Committee of the Maintenance of Way Association.

The personnel of the American Railway Engineering and Maintenance of Way Association's committee on rail for this year is a notable one, both because of the rank and experience of the railroad officers composing it, and of the great mileage of the lines represented, the total miles being only a little under 100,000. The work which has been assigned to this committee by the Board of Directors of the association, which is given below, is subject to such change as action by the American Railway Association may dictate.

(1) Continue the investigation of the breakage and failure of rails and present summary of conclusions drawn from reports received.

(2) Report on the results obtained from the use of open-hearth steel rails and the chemical composition of such rails.

(3) Report on any recommended changes in specifications for Bessemer steel rails as heretofore adopted by this association.

(4) Present recommendation as to standard rail sections.

(5) Present report showing diagrams or photographs of typical characteristic rail failures corresponding to the classification as given in form M. W. 1,200, Report of Rail Failures in Main Tracks.

The committee is as follows: D. D. Carothers, Chief Engineer, Baltimore & Ohio, Chairman; R. Montfort, Consulting Engineer, Louisville & Nashville, Vice-Chairman; E. B. Ashby, Engineer Maintenance of Way, Lehigh Valley; J. A. Atwood, Chief Engineer, Pittsburg & Lake Erie; A. S. Baldwin, Chief Engineer, Illinois Central; J. B. Berry, Chief Engineer, Chicago, Rock Island & Pacific; Chas. S. Churchill, Chief Engineer, Norfolk & Western; W. C. Cushing, Chief Engineer Maintenance of Way Southwest System, Pennsylvania Lines West; F. A. Delano, President, Wabash Railroad; Dr. H. Dudley, Rail Expert, New York Central Lines; C. H. Ewing, ...ineer Maintenance of Way, Philadelphia & Reading; J. F. Hinck-... Chief Engineer, Frisco Railway System; John D. Isaacs, Con...g Engineer, Harriman Lines; Thos. H. Johnson, Consulting ...eer, Pennsylvania Lines West; Howard G. Kelley, Chief Engi... Grand Trunk Railway System; J. W. Kendrick, Second Vice-...ent, Atchison, Topeka & Santa Fe System; George W. Kitt-... Chief Engineer, New York Central & Hudson River; D. W. ...hief Engineer Maintenance of Way and Structures, Southern ...; Jos. T. Richards, Chief Engineer Maintenance of Way, ...ania Railroad; J. P. Snow, Bridge Engineer, Boston & ... Robert Trimble, Chief Engineer Maintenance of Way, North-...tem, Pennsylvania Lines.

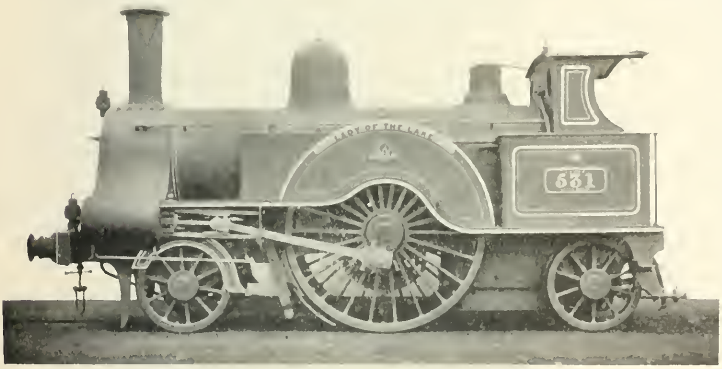
The Last of a Famous Class.

BY W. B. PALEY.

Historians of the locomotive engine all over the world will deplore the disappearance of the famous "Lady of the Lake" class of express engines on the London & North Western. After a career extending over no less than 48 years they have had to succumb to the inevitable, the class of work for which they were suited no longer existing. They had played many parts in their time; in fact, it was long since they had been able to run express trains single-handed, but work within their capacity had been found for them over and over again. This was largely due to the regard felt for them by the late Mr. F. W. Webb, so long the Chief Mechanical Engineer at Crewe, who assisted at preparing the working drawings for them under his predecessor, Mr. John Ramsbottom. In view of the projected acceleration of the Irish mail service between London and Holyhead, designs for an express engine capable of making longer runs than had hitherto been customary were prepared at Crewe in 1859, the first engine of the new type, No. 184, named "Problem," coming out in November of that year. To some extent Mr. Ramsbottom seems to have reproduced the principal features of a successful type of 7-ft. "single" express engines, designed by his predecessor, Mr. F. Trevithick, in 1847, but all the dimensions were enlarged and the important difference made that inside bearings only were used for all the wheels. In the 7-ft. class they had been outside for both pairs of carrying wheels. The cylinders were made 16 x 24, instead of 15 x 20, an additional 6 in. being added to the diameter of the driving wheels. The weight, full, was augmented from about 20 to 27 tons 6 cwts., of which 9 tons 8 cwts. were on the leading, 6 tons 8 cwt. on the trailing and $11\frac{1}{2}$ tons on the driving wheels. The boiler barrel was 10 ft. 5 in. long by 3 ft. 11 in., made of three rings ... iron plates, single riveted, the center line being $6\frac{1}{2}$ ft. above the rails. The firebox shell was flush at the crown with the barrel, 4 ft. 9 in. long by 4 ft., also of ... plates. The firebox itself was 4 ft. 2 in. long, 3 ft. 6 in. wide by 5 ft. 7 in deep, with sides of copper plates $\frac{1}{2}$ in. thick, the tube plate being of $\frac{3}{4}$-in. copper. These dimensions gave 85 sq. ft. of heating surface, and as the 192 brass tubes, $1\frac{7}{8}$ in. in diameter by 10 ft. 9 in. long, gave 1,013 ft. more on the outside, the total heating surface was 1,098 sq. ft. The grate area was 14.7 sq. ft., the firebar frame consisting of two round bars of iron 3 in. in diameter, resting at each end in a V-seat bolted against the ashpan side, with $\frac{3}{4}$-in. iron pegs screwed into them, at such distances as to provide an inch clear space for the bars. It was found that this spacing cured the troublesome tendency of the bars to run together. The smokebox was 2 ft. 8 in. long, provided with a door opening upward from the bottom, and also with a funnel-shaped chute to relieve it of ashes, an arrangement specially devised with a view to long runs. The stack was 16 in. in diameter and reached to 13 ft. 1 in. above the rails, an elaborate cap always used by Mr. Ramsbottom surrounding the top. Screw reversing gear was fitted on the left hand, which is the driver's side on the L. & N. W., the length of the links in the motion being 16 in. and the throw of the eccentrics $5\frac{1}{4}$ in. A large plain dome, of the type still used at Crewe, contained a double-beat regulator valve; the main steam pipe was $5\frac{1}{2}$ in. in diameter. The connecting rods were 6 ft. 3 in. long, with a short fork at the cylinder end, and had cross-head pins $2\frac{1}{4}$ in. x $2\frac{1}{4}$ in., the crank-pin bearing being 4 in. in diameter by $4\frac{1}{4}$ in. long. Single inside plate frames were used of iron 1 in. thick, 4 ft. 1 in. apart and 13 in. deep over the driving fork. Volute springs $5\frac{1}{2}$ in. in diameter, butting against the foot-plate, were used for the trailing wheels, laminated springs 2 ft. 8 in. span, of 11 plates, and 3-ft. span, of 18 plates, for the leading and driving wheels. These, with a wheel base of 7 ft. 7 in. in front of the drivers and of 7 ft. 10 in. behind, made a very steady riding engine only 24 ft. long over all. The cylinders had an internal back cover and were fitted with Ramsbottom's patent pistons, a type then new but now generally used in Great Britain. Two cast-iron rings, cut through so as to be slightly compressible, are sprung into recesses turned in the rim of the piston and kept from turning round by pins screwed into the rim. The engine was fitted with Gifford's injector, then very recently invented; in fact, it was the first engine on the L. & N. W. built with one. There was also a pump capable of supplying the boiler by itself, in case the injector proved unreliable. As to other dimensions the steam pipes were $3\frac{3}{4}$ in. in diameter, the steam ports $13\frac{1}{2}$ in. x $1\frac{1}{2}$ in., the exhaust ports $3\frac{1}{4}$ in. wide, lap $\frac{7}{8}$ in.; diameter of blast pipe at top $4\frac{1}{4}$ in. Two safety valves, each $2\frac{3}{4}$ in. diameter, were fitted on a manhole cover over the firebox, the brass pillars containing them having a strong coiled spring between and a steel lever, connected with both valves, extended over the top of the low weather-board. The blow-off pressure was 120 lbs. A similar engine, No. 229, "Watt," was built at the same time as the "Problem."

Eight others followed within about six months, so that when the improved Irish mail service commenced, on Oct. 1, 1860, the L. & N. W. Company was ready with suitable engines for it. The service comprised a day and a night train in each direction, only the night trains running on Sundays. The speeds were not high, but the runs were unusually long, including Euston to Rugby, $82\frac{3}{4}$ miles, and Chester to Holyhead, $84\frac{3}{4}$. First and second class passengers were taken for Ireland only, and strict clauses as to punctuality were enforced by the terms of the contract with the post office. It had been foreseen, however, that the old 4-wheel tenders, carrying but 1,500 gals. of water, could not be relied upon for covering the exposed stretch of line in North Wales. This led Mr. Ramsbottom to devise an ingenious system of taking up water without stopping the train from a long trough laid between the rails. He patented this in June, 1860, and in the following November a series of experiments was made with a trough laid near Colwyn, about midway between Chester and Holyhead. It was found that 1,200 gals. could easily be picked up from a trough one-quarter mile long, 18 in. wide by 7 deep and containing 5 in. depth of water.

The new engines were provided with 6-wheel tenders to hold 1,800 gals., and with the aid of the water-troughs were able to conduct the mail service with the greatest regularity and satisfaction. They ran between Holyhead and Stafford, $130\frac{1}{2}$ miles, with one stop of 10 minutes at Chester. This was for post office purposes mainly, the place being an important railroad center. South of Stafford the mails were for a short time worked by engines of different type belonging to the Southern Division of the line, but when the separate working of the two divisions was given up, in 1862, a fresh engine of the "Problem" class took up the running from Stafford to London. This arrangement continued for the best part of 20 years, till the trains got altogether too heavy for such light machines. In fact, before long it was often found necessary to use two of them, or a coupled engine, on the Holyhead section, which has some steep bits and is extremely exposed to gales of wind blowing in off the sea. The big 7 ft. 6 in. drivers were considerably affected by the high winds at times.



Express Passenger Locomotive, Lady of the Lake, 1862.

The year 1862 brought these engines prominently into notice in two respects. On January 7 No. 229, the "Watt," ran from Holyhead to Trent Valley Junction, Stafford, 131 miles, in 141 minutes without stopping, bearing despatches from Lord Lyons, the British Minister at Washington, to the effect that Messrs. Mason and Slidell, who had been taken out of the English steamer "Trent" by the United States ship "San Jacinto," had been released. Opinions were being much agitated by the occurrence; the greatest importance was attached to the quick transit of the despatches. The load was only three vehicles, weighing in all but 20 tons, and the run would have been made considerably faster but for a high wind and the necessity for slowing through such places as Chester and Crewe.

At the Great Exhibition of 1862 the L. & N. W. Company showed one of the "Problem" class, No. 531, "Lady of the Lake." It comprised some additional improvements, such as the tender with water lifter, and two openings through the front of the firebox, just under the ends of the brick arch and controllable from the foot plate, in order that air might be admitted to aid in consuming the smoke due to coal fuel. At that time the use of coal for passenger traffic was a new thing in this country, coke having been burned previously, and many devices were tried for securing its perfect combustion without making smoke. These openings were fitted to a large number of L. & N. W. engines at one time. They were about 7 in. square and permitted the fire to shine through them in a peculiar manner. They have long ago been entirely abandoned. The brick arch inclined downward somewhat toward the back of the firebox, instead of upward. Ramsbottom's pistons and his "gravity lubricators" were used, an invention patented in 1860. These were applied to the cylinders and slide-valves and consisted of round brass cups or vessels with narrow necks opening into or connected with the steam chest or cylinder, the vessel was filled with oil and the steam displacing a little from the neck or orifice became condensed. Water being heavier than oil it sank and displaced oil in the process, the action continuing so long as the engine was at work or there was any oil left. The lubricator was therefore always full of oil or water, or both, the latter under the oil. Two injectors fed the boiler, one on each side of the firebox. A bronze medal for excellence of design and workmanship, was awarded, and the engine carried it in a small glass case over the number-plate on the driver's side to the last day of her life.

One of this class, No. 291, "Prince of Wales," was working the down-day mail on Aug. 20, 1868, when near Abergele it was run into by some trucks loaded with casks of oil, which had broken loose from a goods train shunting at the top of an incline. The oil at once caught fire and a fearful holocaust resulted, no fewer than 33 persons being either burned to death or suffocated by the smoke and fumes of the blazing oil. Every scrap of paint was burned off the engine and the bearings melted out.

The average load with the Irish mails between Stafford and Holyhead in the sixties was 10 to 12 four-wheeled vehicles, weighing from 75 to 90 tons in all, taken at a speed of about 45 miles an hour on a consumption of $26\frac{1}{2}$ lbs. of good coal per mile.

In all 60 of the "Problem," or, as they were more often called, the "Lady of the Lake" class were built, the last 10 in 1865. No. 1,134, "Eunomia," the fifty-eighth, was the very last scrapped, just lately. About 1865, owing to increasing loads, Ramsbottom's 6 ft. 6 in. coupled engines, with inside cylinders, 16 x 24, began to replace them. When Mr. Webb's similar, but heavier, 17 x 24 coupled engines came out in 1874 the "Problems" soon got relegated to piloting and to light work off the main line. For some years, about 1890 to 1900, they worked the short fast three-quarter-hour expresses between Liverpool and Manchester with great success, and on the memorable occasion of the "race to Edinburgh," in 1888, No. 667, "Marmion" and 806, "Waverley," worked trains of four 8-wheeled coaches between London and Crewe at extraordinary speeds, $158\frac{1}{4}$ miles, without a stop.

Down to the time Mr. Webb resigned the whole of the 60 engines were running. They had, of course, all been rebuilt, most of them twice, and considerably modernized. As rebuilt, with larger fireboxes, boilers carrying 150 lbs. steam, their weight was increased about 4 tons to 31 tons 7 cwt., the original load on the drivers of $11\frac{1}{2}$ tons being raised to $14\frac{1}{4}$. Cabs were added in place of the miserable weather-boards which both Northern and Southern Division engines had so long carried in testimony to the old-fashioned ideas of the respective chiefs. The pattern of nine oval openings in the driving-splashers was done away with; Webb's plain funnel substituted, and the safety-valves enclosed in a neat iron case. Solemn black paint, instead of Ramsbottom's dark green, was used, but the engines remained about the prettiest little machines that ever ran in Great Britain, and their disappearance will make many a London & North Western man feel that in them he has lost some of his oldest friends.

Foreign Railroad Notes.

There died on February 3, 1908, a man who entered the railroad service in Austria in 1829. This man, Wagner von Wagensburg, reached the highest positions in the state railroad service, and was retired on a pension no less than 38 years ago. He was born in 1811.

The government of German Southwest Africa reports that among the difficulties accompanying the extension of its railroad towards Keetmanshoop is the necessity of importing water, which cost on the line just the same as beer in Munich—about 6 cents a quart. Laborers brought in from Upper Silesia wouldn't stay, and Croats were engaged in their place. Native prisoners of war could not stand the climate and the work, and more and more Cape "boys"—that is, natives reared among the Boers—must be depended on to do the earthwork.

Argentina has passed a general railroad law, which will form the uniform basis of all charters granted hereafter by the general government (there are a few state charters), and under which it is intended to bring the older companies as favorable provisions of their old special charters expire. By the new law the railroads will pay 3 per cent. of their net earnings, in lieu of all other taxes, and the proceeds of this tax will be used only for the construction and maintenance of roads and bridges, and particularly of roads leading to the railroad stations. Plans for work for which these expenditures are to be made are to be submitted to a commission consisting of the managers of the railroads.

The Kansas City Terminals of the Missouri, Kansas & Texas.

The Missouri, Kansas & Texas enters Kansas City, Mo., over the tracks of the St. Louis & San Francisco from Paola, Kan. For some years it used also the 'Frisco freight house and terminals at Kansas City, but on account of the growth of business the contract for joint use of these terminals when it expired was not renewed. Thereupon, the Missouri, Kansas & Texas Terminal Company of Kansas City, was organized and, after considerable difficulty, acquired 50 acres of ground in Rosedale, Kan., for a terminal yard and a tract of land, with a frontage of 1,600 ft., on Wyoming street between 14th and 17th streets, in Kansas City, Mo., for a freight house and house tracks.

This freight house location is near the freight houses of the Rock Island, the St. Paul, the Santa Fe, the Burlington, the Alton, the St. Louis & San Francisco and the Union Pacific, no two of these being more than a block or two apart. The Missouri, Kansas & Texas freight house was finished in the winter of 1906-1907. It consists of a one-story warehouse 34 ft. x 500 ft. and a two-story brick office building 44 ft. x 97 ft. It is used for both inbound and outbound freight and is served by five tracks, with a total length of about two miles. There is room for about the same amount of additional trackage in the future.

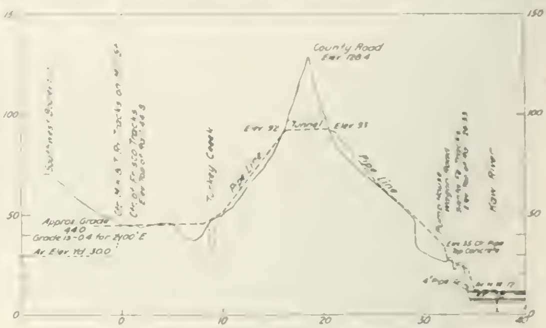
The improvements at Rosedale include a 10-story engine house, with an annex 45 ft. x 80 ft. for machine shop, a 70-ft. manually operated turntable, a 40-000-gal. steel water tank on a steel tower 100 ft. high, two cinder pits, a Robinson cinder conveyor, an ice station and six miles of yard tracks. The yard connects at each end with the main tracks of the St. Louis & San Francisco. Only about one-third of the space available for tracks is so occupied. A plan of the yard and other facilities at Rosedale is shown herewith.

The most interesting feature of the work at Rosedale was the filling of the site which, when acquired, was on an average about 12 ft. below the present grade of the yard. Furthermore, the east end of the track was badly cut up by Turkey creek. A new channel was excavated, involving removal by teams of about 35,000 cu. yds. of material which was deposited on the yard site. In addition 55,000 yds. of material were hauled by teams from neighboring high ground and put on the site. The filling done by teams, however, was less than one-sixth of the total embankment required.

A steam shovel pit was selected on the line of the St. Louis & San Francisco about three miles from the yard site, and it was at first planned to have work trains do most of the filling. This plan was abandoned because work teams would have had to pass over the main tracks of another railroad which might easily have led to frequent delays and perhaps serious accidents. Finally it was proposed to pump sand from the Kaw river. This is nearly one mile north of the new yard and nearly parallel to it, but separated from it by a bridge, which is about 120 ft. above low water in the river A contract was let for doing the filling in this way.

A tunnel 330 ft. long was cut through the ridge at an elevation 80 ft. above low water in the river and 48 ft. above the grade of the yard. A 12-in. wrought-iron spiral pipe of No. 14 B. W. G. was laid from the river to the tunnel and thence to the Rosedale yard. At way of Turkey creek. The cost of the contractor's plant was nearly the river end the pipe was carried on pontoons from the tank to a barge, where it was connected with a centrifugal pump driven by a 150-h.p. steam engine. A 250-h.p. engine and another centrifugal pump were put near the river bank. Natural gas was used for fuel. A dike was built along Turkey creek to retain the sand discharged by the pipe line the water finding its way back to the Kaw river by double and its capacity much less than had been estimated. The pump on the barge was able to deliver water and sand (about 90 per cent. of the water and 10 per cent. of sand) to the secondary pump on the bank of the river, faster than the latter could force it over the hill to the further end of the pipe line. After operating at a loss for two months, during which time about 20,000 cu. yds. of sand were deposited on the yard site, the contractor suspended work.

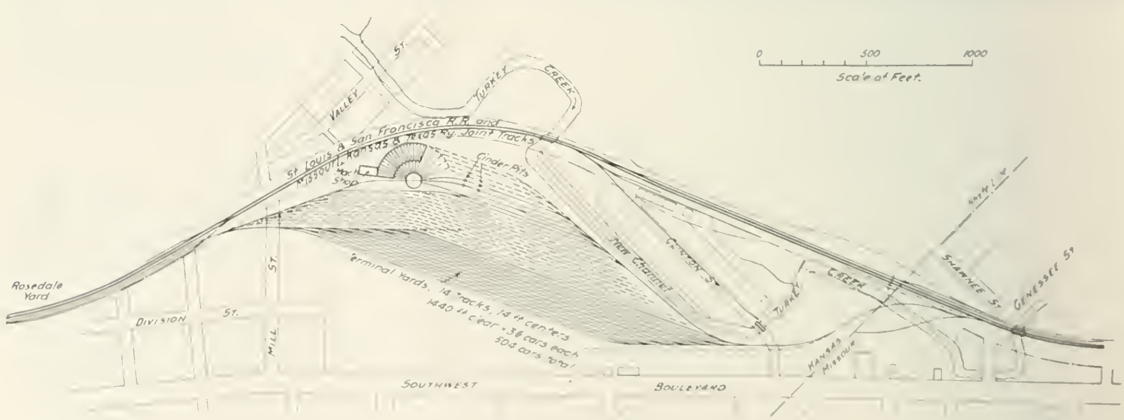
Because of these unfavorable results the man who had furnished the funds for the plant, lost faith in the venture. F. W. Fratt, the Chief Engineer of the terminal company, then offered to release the contractor, take charge of the equipment, operate it and pay the owners a certain amount per yard of filling for use of the plant. This proposal was accepted.



Profile Showing Location of Pipe Line Which Pumped Sand for Filling.

Soon after Mr. Fratt took charge he installed a centrifugal pump and a 175-h.p. gas engine on the south side of the hill at about the elevation of the grade of the yard and improved the other pumps. A plan of the pipe line is shown in the accompanying drawing. Work was resumed in April, 1906, and continued with little interruption, except during two winter months, until the filling was finished in October, 1907. There were short delays due to minor accidents to the pipe line and machinery, but on the whole the results of the operation of the plant by the terminal company were satisfactory to all concerned.

The total amount of sand deposited was approximately 480,000 yds., and the cost per yard of the work done by the terminal company, including royalty, but not including engineering, was slightly under the contract price. When filling was about half completed it was necessary to renew the pipe line throughout, and the second line was practically worthless at the close of the work. The average amount of filling per month was 30,000 cu. yds. The minimum amount per day of 24 hours was 800 yds. and the maximum 1,500 yds. The greatest distance sand was pumped was a little more than 6,000 ft.



New Kansas City Terminal Yard at Rosedale, Kan.; Missouri, Kansas & Texas.

The cost of the Missouri, Kansas & Texas terminals in Rosedale and Kansas City was about $1,250,000, more than half of which was for land. All of the work was in charge of F. W. Fratt, Chief Engineer, and N. M. Fitch, Assistant Engineer, of the Missouri, Kansas & Texas Terminal Company.

GENERAL NEWS SECTION

NOTES.

Soap and towels have been removed from the passenger cars of the Nashville, Chattanooga & St. Louis. This is the result of complaints of alleged discrimination against colored passengers.

The Cleveland, Cincinnati, Chicago & St. Louis has again put in service the "Knickerbocker Specials," running between New York and St. Louis in 27 hours, which were taken off last autumn.

In the Canadian Pacific shops at Montreal 800 men have been laid off, most of them being employees of the passenger car repair department. Work on new freight and passenger cars is active at the shops.

The Canadian Pacific Transfer Co. has just received from the builders the car ferry steamer "Charles Lyon," built at Toronto, for use in carrying cars between Prescott, Ont., and Ogdensburg, N. Y. The boat carries 14 cars.

The Nebraska State Supreme Court has granted a restraining order against the express companies doing business in the state, forbidding them to charge rates in excess of the tariffs prescribed by the Sibley act. The order goes into effect April 15. The Sibley act reduces express rates 25 per cent.

Indictments containing 58 counts against the Missouri Pacific and Iron Mountain roads, a former general freight traffic manager of the two companies, and a prominent grain dealer, were returned by the federal grand jury at Little Rock, April 11. They charge the granting and receiving of rebates.

The Canadian Pacific pension department has found that some of the pensions, calculated according to the regulations, were insufficient to protect the recipient against want during his declining years, and the company has modified the regulations so that henceforth the minimum pension shall be $20 a month.

The Long Island Railroad has filed with the New York State Public Service Commission new passenger tariffs for its Manhattan Beach and Rockaway divisions, increasing some of the fares to 3 cents a mile from 2½ cents. The fare from Long Island City to Manhattan Beach will be 33 cents each way instead of 23 cents as heretofore.

An officer of the Lake Shore & Michigan Southern says that the company will at once put up a telephone line between Buffalo and Erie; and, according to newspaper reports, the telephones are to be used in place of the telegraph for directing the movements of trains. This part of the road is all double-track or four-track and is equipped with automatic block signals.

Judge Calhoun, in a Texas state court, has enjoined the railroad commission of that state from enforcing the use of its new accounting system which it has proposed to require the railroads to use. The new system would be in conflict with that prescribed by the Interstate Commerce Commission, and it is held unreasonable in its requiring the use of averages deduced from theoretical bases.

The Ohio State Railroad Commission has made a rule governing the loading and unloading of cars, providing that when a consignee shall elect to work on a fixed standard of receipts his business shall be rated as to daily capacity and thereafter if the cars consigned to him exceed the rating, he shall be charged each day with 1½ times his rated daily capacity, 48 hours being allowed for unloading each day's placing, actual and constructive.

The Interstate Commerce Commission, ruling on a case where commercial travelers have been in the habit of borrowing tickets from fellow passengers and with them checking baggage on which otherwise excess would be charged, holds such practice to be illegal, as it creates a preference in favor of the passenger who is thus able to borrow, as compared with one who cannot do so. Borrowed tickets may not be used in any case to check baggage.

The State Tax Commission of Wisconsin has fixed the total taxes on railroad property for the present year at $3,083,720, an increase of $282,033 over last year. The property is taxed on an ad valorem basis, and the increase of taxes is due to an increase in the valuation from $255,850,000 to $267,861,500 and to an increase in the rate from $10.95 to $11.51 per $1,000 of valuation. The rate is the average paid by all other taxable property in the state.

A press despatch from Milwaukee says that Judge Tarrent has handed down a decision upholding the Wisconsin eight-hour law regulating the length of a day's labor by a railroad employee; and at the same time declaring unconstitutional the federal nine-hour law because it attempts to regulate commerce wholly within a state as well as interstate commerce within a state. The suit is one (begun as a test case) against the Chicago, Milwaukee & St. Paul, and it will be taken as soon as possible to the Supreme Court.

The competition between the transcontinental lines in the carriage of oranges and lemons from southern California to the East is now so sharp that the time to Chicago has been reduced, in the case of many shipments, to eight days, and in some cases to seven days, as against nine days a year ago. The line composed of the San Pedro, Los Angeles & Salt Lake, the Denver & Rio Grande and the Chicago, Burlington & Quincy is said to be making the best time.

The roads between Buffalo and New York have filed new tariffs on domestic grain, effective May 1, showing, on the principal grains, an increase of 8 and 10 per cent. The export grain rates have not been changed. The rates in cents per bushel are as follows:

	New rate.	Old rate.
Wheat	6½	6
Corn	5¼	4¾
Rye	6	5½
Barley	5¼	5
Oats	4	4
Flaxseed	5½	6

It is announced that the Pennsylvania Railroad in the year 1907 paid out $436,006 on claims for losses which were traced to thefts; and the number of arrests made on the company's premises for trespassing was 4,156. This record, which, though not a novel one, is indicative of a fact which receives far too little appreciation, may well justify the company in its renewed appeal to the public and to local magistrates to aid the road in ridding itself of trespassers. Over 800 men were killed or died from injuries received while trespassing on the Pennsylvania lines, east and west, during the year.

The Pennsylvania Railroad, which for several years has had its trains and freight yards well supplied with boxes of appliances for use in "First Aid to the Injured" is paying increased attention to that department this year, and at the lectures to be given to the employees on "first aid" the policemen and firemen of the cities where the lectures are given will be invited to attend. In promoting employees their records as regards attendance at the lectures will be considered. The stretcher which is used on the Pennsylvania Railroad can be taken apart and made into a bundle 3 ft. 6 in. long and 6 in. in diameter.

The New York State Public Service Commission, second district, announces that the complaint of the Watertown Chamber of Commerce against the freight rates charged by the New York Central on its Rome, Watertown and Ogdensburg division has been satisfied by the road, which has given notice of its intention to put in effect rates which will be satisfactory to residents in the northern part of the state. There is to be a new tariff which will reduce rates about 15½ per cent. from existing freight rates and it will be put in effect not later than July 1. In view of this notice the commission has adjourned the hearing indefinitely.

Railroad men in Chicago say that the uniform classification committee, which has been endeavoring since the first of the year to bring about a uniform classification for freight throughout the country, has disbanded. The task of formulating an acceptable uniform classification was found to be absolutely hopeless. No middle ground could be reached. The southern and western roads might possibly have agreed, but the central and eastern roads refused to raise their classification so as to make it conform to the southern and western. The Central Association roads said it would be impossible for them to increase rates, while the southern and western lines declared their inability to exist if they lowered their classification to conform to that of the official and eastern.

The Pennsylvania Railroad Employes' Relief Fund is now 22 years old, and about $18,000,000 has been paid out in benefits. As is well known the railroad company not only pays the operating expenses of the relief department, but also makes up deficiencies when, by reason of the small margin allowed in fixing the assessments, the income for any three-year period is insufficient to pay the benefits to which members are entitled under the rules. In the 22 years these deficiencies alone have amounted to $654,741. In addition to these payments, the company in the first 16 years of the life of the organization paid $33,919 to sick members whose sickness continued beyond the time (one year) to which they were entitled to benefits from the fund. The membership of the fund is now 95,089, nearly five times as many as in the first year of the organization.

The New York State Public Service Commission, second district has refused permission to abandon parts of the route of a line of railroad, even a line which parallels an established road and where the two are consolidated. Chairman Stevens says that if abandonment is assented to by the trustees of the mortgage covering the line, as well as the bondholders and all of the persons along the line of the route who would be affected injuriously, the application would be liable to receive favorable consideration, but the commission would not by any of its acts submit bondholders to possible litigation as to the value of securities. This ruling was given in denying an application of the Central New England for authority to abandon that portion of its line between West Pine Plains and Salt Point, 16 miles. The company by reason of a merger made last year has a line nearly paralleling the portion of road sought to be abandoned. Residents in the territory affected and trustees and holders of the company's income bonds contended that the proposed action would be detrimental to their interests.

Congress has passed an Employers' Liability Bill, but there was no adequate discussion of the measure, and the faults which the Supreme Court found in the former law do not appear to have been cured. Quite unexpectedly the Senate, on April 9, took up for discussion and finally passed without amendment, the bill which was sent over by the House two days before. This bill was quickly substituted for the La Follette measure, reported some time ago by the Senate Committee on Education and Labor. Democrats charged that the measure in the shape it left the House was unconstitutional and had been consciously left in this condition by the Judiciary Committee in order that it might be thrown out by the courts when it came to be put to the test later. This claim was sharply rebutted by Republicans. As passed, the bill is claimed to meet the objections of the Supreme Court to the law of 1896. The bill abolishes the strict common law liability which bars a recovery for personal injury or death of an employe occasioned by the negligence of a fellow servant. It also modifies the common law rule which makes contributory negligence a defense to claims for such injuries, and permits an employee to recover for an injury caused by the negligence of a co-employe. The bill does not bar recovery even though the injured one contributed by his own negligence to the injury, but the amount of the recovery is diminished in the same degree that the negligence of the injured one contributed to the injury.

Bethlehem Steel Company.

The third annual report of the Bethlehem Steel Co. shows the following results, with comparisons:

	1907.	1906.	1905.
Net manufacturing profit	$2,569,252	$1,859,353	$3,468,802
Total net income	2,638,957	1,364,175	3,372,475
Balance, after interest charges	$1,618,789	$762,749	$2,765,399
Depreciation	....	....	400,000
Net income for year	$1,618,789	$762,749	$2,365,399
Previous surplus	593,421	1,843,619	....
Total surp. before dividends	$2,212,210	$2,606,368	$2,365,399

Locomotive Exports.

Exports of locomotives in the first eight months of the current fiscal year were valued at 5,987,716, a decrease of $215,824, as shown in the following table:

	1908.	1907.
Europe	$134,552	$347,850
British North America	591,488	934,651
Central America	92,480	874,565
Mexico	571,442	988,696
Cuba	527,577	684,095
Other West Indies	48,696	12,900
Argentine	169,315	404,948
Brazil	525,885	135,580
Other South America	828,502	549,647
China	109,935	....
Japan	265,820	1,415,736
British Australasia	25,440	76,316
Philippines	63,882	48,437
Other Asia and Oceania	2,029,577	....
British Africa	3,425	....
Other Africa	....	30,119
Total	$5,987,716	$6,203,540

Steel Prices.

E. H. Gary, Chairman of the Board of the United States Steel Corporation, said last week that no reductions in the prevailing prices of steel are contemplated. Prices may be increased or decreased at any time if there is good reason. Prices should at all times be reasonable and fair. The mere fact that the demand is greater than the supply—that the necessities of the purchaser are great—does not justify an increase in price; nor does the fact that the demand is less than the supply furnish an argument for lowering the price. In neither case would the quantity bought and sold be more or less. What the manufacturers and purchasers both, as a rule, desire is stability of prices—the avoidance of violent and sudden fluctuations. If the question of reducing or increasing prices be raised at any time during the next few months, there will be deliberate and orderly consideration.

The Standard Storage Battery.

The storage battery shown in the accompanying illustrations is designed on the principle that buckling may be prevented by maintaining a firm contact between the active material and the lead while at the same time leaving the active material free to expand

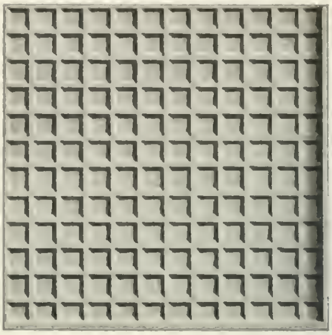


Fig. 1.

Each unit consists of a pair of plates of porous pottery. The inner surface of each has recesses molded in it as shown in Fig. 1, while the outer surface, as shown in Fig. 2, has vertical ribs, which strengthen the plate and also form passage ways for the free cir-

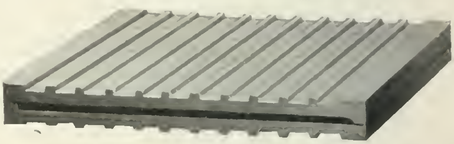

Fig. 2.

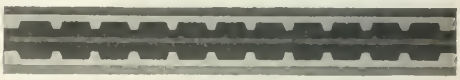

Fig. 3.

culation of the electrolyte. Each plate is filled with lead-oxide paste and between the two plates is a sheet of lead which is only thick enough to conduct the current and leave a margin of safety. A horizontal section of a complete unit is shown in Fig. 3. The walls of

Fig. 4.

the plate are only about $\frac{1}{32}$ in. thick and are so porous that the electrolyte passes through easily, although the pores are fine enough to retain the lead-oxide. Each unit, as described, is about 3½ in. square and ½ in. thick, having 2½ ampere hours capacity each. Large plates may be built up out of a number of the smaller plates, using a single sheet of lead as a conductor for all. In assembling the battery the separate units, or the larger built up plates, are connected in parallel, and hard lead bands are passed around them as shown in Fig. 4, tightly enough to hold the active material in close contact with the lead conductors. Rubber plugs are placed between the bands and the end plates, and the space at the ends of the plates is sealed with wax.

These batteries are made by the Standard Electric Accumulator Co., Jersey City, N. J. It is claimed that they show high efficiency and stand heavy, frequent overloads without noticeable damage.

Asbestos Protected Metal.

Annealed sheet steel, because of its lightness, ease of application and fire resisting qualities, has always been popular as a roofing material. Various means have been tried for protecting it from rust and the attack of acid fumes; many kinds of paint have been used, and the metal has been galvanized with zinc spelter or coated with tin, but none of these methods have been altogether satisfactory. Different light materials, such as prepared felt, saturated asbestos felt, etc., are also used as roofings. The desirable features of both these kinds of roofing are combined in asbestos protected metal. This is made as follows: Annealed sheet steel is immersed at a high temperature in a bath of cement compound, the expansion of the metal under heat allowing the preservative to penetrate it. The sheet is then passed through hot dripping rolls which take off the surplus compound and make the coating uniform. Asbestos felt is next applied to both sides, under heavy pressure, and the sheet is then cooled slowly. It is claimed that this protects the steel from all outside influences and that the bond between the asbestos and the cement coated steel is so strong that there is no danger of the materials becoming separated. The asbestos is not saturated, but has a clear white surface. It is also claimed that the material will resist fire, water, gas and sulphur fumes for an indefinite time, and that it has the strength, rigidity and lightness of sheet metal, as well as the convenience and ease of application of the best ready prepared roofing. It has been used for three or four years as roofing and siding on many kinds of railroad structures and other buildings, and has also been used for interior work. Because of the non-conductivity of the asbestos, the sheets will stand a great deal of heat without drawing or buckling. The accompanying illustration shows an installation in which the material is subjected to particularly severe treatment. This is the roof of a foundry building, wood planking being directly under the roofing. The cupola stack being short, live cinders and hot metal strike the roofing at its base before being in the air long enough to cool.

Foundry Roof Covered With Asbestos Protected Metal.

This roofing is made in flat or corrugated sheets, and also in the form of beaded siding, standing seam and other shapes. There are two qualities: Aspromet brand and Duckback brand. In the former, the texture of the asbestos is similar to the usual asbestos building felt and is absorbent. For outside work, this should be painted. In the other brand, the asbestos is waterproofed and has a glossy surface which does not require painting or other treatment. The Belen and Clovis coaling stations on the Belen cut-off of the Atchison, Topeka & Santa Fe (*Railroad Gazette*, March 13, 1908) are roofed and sheathed with Duckback brand, 24 gage corrugated steel being used for the roofing and 26 gage for the siding. The flooring of the conveyor at the Clovis plant is also of asbestos protected metal.

One use of asbestos protected metal is the Robertson car roof. This is an inside roof for box cars in which the joints between the sheets are made watertight. It is claimed that this roof is fireproof and rustproof, easy to apply, inexpensive and will minimize interior condensation.

These roofings are made by the Asbestos Protected Metal Co., Canton, Mass.

An English View of the Erie.

Robert Fleming, one of the best known English railroad experts, who is in this country representing the English security holders of the Chicago Great Western, has made the following statement in regard to the Erie Railroad:

"I don't know whether Erie is going into the hands of a receiver, but that would be the best thing that could happen to the security holders if it were followed by a sound reconstruction. Erie was, both bonds and stocks, mainly held in England thirty years ago, and my first experience in the reorganization of American railways was of the Erie in 1876. The committee were divided in opinion as to whether the then second mortgage bonds should be made a preferred stock. The majority unfortunately favored leaving it as a mortgage, but delaying its foreclosure powers. The result was that Erie never had credit and reconstruction after reconstruction followed.

"The reconstructions all had more or less the same fatal defect: no adequate provision for future capital requirements was made and the property was mortgaged almost up to its value. No big public service corporation in this go-ahead country is able to hold its place unless it has credit. Although the financial community is greatly indebted to Mr. Morgan for many things, his reorganizations have sometimes been dominated by too great an optimism.

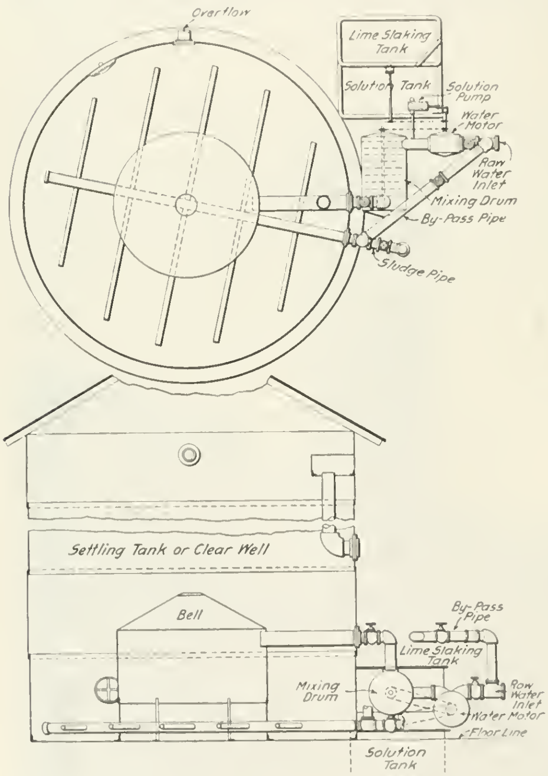
"If this time he will have courage enough to bring forth from present troubles a new Erie that will not want periodical reconstruction, he will have done a great thing for the security holders themselves and for the reputation abroad of American railroad securities.

"All that is wanted to enable Erie to hold a front place in the railroad system of the country is that its mandatory charge be reduced to an absolutely safe limit. With the exceptional standing of J. P. Morgan & Co., I believe a reconstruction can be carried out without an actual foreclosure, because new securities can be given that would have a greater market value than the existing ones.

"It is not for me to propose a scheme, but, beginning with the general lien bonds, should they be offered a 4½ per cent. first cumulative preferred stock instead of their present bonds, and so on according to the rank of the junior securities, complete solvency would be established and Erie would be able to borrow what money it wants on a security that would sell at a high price. I say nothing about assessment or reducing the stock. I think the investing public are beginning to realize that with able management it is better to have a good preference stock than a doubtful mortgage bond. Erie reorganized on a sound basis would be a distinct step towards improving the general situation."

The Holmen Water Softener.

The water softener illustrated herewith was built by the Southwest System of the Pennsylvania Lines West of Pittsburgh at the Indianapolis shops. It was designed by A. R. Holmen, chief draftsman of the motive power department. The capacity is 30,000 gals. an hour. It consists of a settling tank, mixing drum, solution tank with lime slaking tank above, an adjustable solution pump and a water motor, with the necessary piping. The motor drives stirring apparatus in the mixing drum and solution tank by chains and sprockets on its shaft, and drives the solution pump by an adjustable crank arm. Opening the raw water valve starts the motor and the apparatus which it drives. For each revolution of the motor the solution pump makes one stroke. The length of the stroke and



Plan and Section of Holmen Water Softening Plant.

the strength of the solution, which in this particular installation contains lime and soda ash, may be adjusted to inject the proper amount of chemicals into the raw water. The chemicals and water meet in the pipe between the motor and mixing drum, passing into the latter together. The mixture in the drum is agitated about a minute before passing into the bell in the settling tank. It passes out under the lower edge of the bell, and flows from the top of the settling tank to storage tanks through the overflow pipe.

It is claimed that the thorough mixing of the water and chemicals under pressure hastens the chemical action so that it is completed before the mixture leaves the bell; also that the precipitate is crowded together into more compact form, causing quick and complete clarification.

In the bottom of the tank there is a system of pipes connected to the waste pipe, for removing the sludge. The sludge pipe and raw water inlet are connected by a by-pass valve, so as to admit raw water directly to the settling tank for stirring the sludge or making repairs. No filter was installed, as it was thought the settling of the precipitate would be complete, but a pipe and the necessary floor space are provided so that sand filters may be put in if desired.

The softener has been in operation eight months with satisfactory results. The simplicity of the design, the few parts, and their accessibility, require little work for operation and maintenance.

Hanover Locomotive Works.

A consular report gives the following table of locomotives exported by the locomotive works at Hanover, Germany, to the year 1907.

Russia	251	Bulgaria	21	British Indies	74
Roumania	115	Holland	18	China	16
Spain	79	Greece	9	Siam	16
Denmark	55	Norway	5	Argentine Rep.	11
Turkey	54	France	5	Cochin China	5
Austria	48	Sweden	4	Chile	4
Portugal	40	Japan	93	Brazil	3
Italy	40	Dutch Indies	76		

The Pennsylvania in 1874 and in 1908.

The report of a committee of Pennsylvania Railroad stockholders which investigated the condition and prospects of the company in 1874 makes interesting reading in the light of the company's subsequent experiences. The year in which this committee performed its work offers some striking parallels with the present year, following as it did a year of severe panic and introducing an era of hard times the country over, and the fact that the committee, after probing into the fundamentals of the company's position with most surprising thoroughness and impartiality, reached some very cheerful conclusions, has its own lesson for railroad stockholders of to-day.

In retrospect, these conclusions are found to have been in many respects much too cheerful, even though the committee professed to have guarded itself sedulously against the natural human tendency toward exaggeration of future possibilities, and proved its professions by severely discounting the then book value of some of the company's assets. In the same way, the committee expressed the opinion that for many years no returns could be expected upon the stock of the Philadelphia & Erie, which has since become a highly important and profitable part of the system. Likewise, the committee said that the company's investments south of Baltimore were unfortunate and indefensible. So far as these investments represented ownership in what was afterward reorganized into the Southern Railway, the committee's judgment may have been well founded; yet it may be questioned whether the management of the Southern would have been just what it was if the Pennsylvania had retained an active interest in the property, while the Pennsylvania stockholders would regard it as unfortunate to-day if their road were without its entrance into Washington.

On the other hand, the committee declared that there was "no doubt of the ability of the company to earn not only its usual 10 per cent. dividend, but a surplus over and above expenses, liabilities and contingencies." The Pennsylvania was then paying 10 per cent. upon its stock, and had averaged 9.9 per cent. during all the twenty years since the main line was first opened to the public in 1853. The committee saw fit to warn the stockholders against the dangers of extension and expansion, a policy which it evidently thought the management had pursued to the point of recklessness. How much and how long circumstances allowed the management to take this warning to heart may be gathered from a comparison of mileage, capitalization and earnings of the Pennsylvania Railroad of 1873, with the same characteristics as they existed last year.

	1907	1873.
Miles of road	3,792	1,574
Bonded debt	$270,974,600	$43,145,700
Debt per mile	71,400	27,400
Capital stock	314,594,600	68,141,500
Stock per mile	83,000	43,300
All capitalization, per miles	154,400	70,700
Net capitalization of road	365,579,600*	61,579,200*
Net capitalization, per mile	96,400	39,100
Net capitalization per mile, all tr'ks	63,500†	30,700.
Gross earnings	164,812,800	39,983,100
Gross, per mile	43,400	25,400
Net earnings	45,205,500	13,745,300
Net, per mile	11,900	8,700

*Less book value of securities owned, carried at cost.
†On mileage of first, second, third and fourth tracks, excluding sidings and yardage.

In 1873 the Pennsylvania earned about 12 per cent. on its capital stock and paid 10 per cent. Its earnings last year were practically the same, yet the dividends were only 7 per cent. Back of these two dry facts lies the history of American railroading for a generation. The increase in net earnings shown above is surprisingly small in comparison with the increase in capital invested as represented by stocks and bonds, and the gain would probably look smaller still in comparison with the actual increase in capital value of the plant employed. Taking this period as a whole and the experience of the Pennsylvania as typical within certain territorial limitations, the trend of financial adjustment between railroad stockholders on one side and labor and the users of railroads on the other has been in favor of the latter.

But the stockholders has undoubtedly been favored by an influence which does not appear in the figures. Railroads are a much safer form of business undertaking now than they were then, and it would probably not be going too far to say that the increasing safety of railroad investment is directly related to capital's relinquishment of profits.—*Wall Street Journal.*

INTERSTATE COMMERCE COMMISSION RULINGS.

Classification of Multigraphs Lowered.

The Commission, opinion by Commissioner Prouty, has announced decision in the case of the Forest City Freight Bureau v. Atchison, Topeka & Santa Fe. It was held that inclusion by carriers operating under the Western Classification of multigraphs in cases in less than carloads, in double first class, is unreasonable. Defendants were ordered to classify such multigraphs as 1½ times first class.

Reparation on Shipment of Fruit Jars.

The Commission, opinion by Commissioner Cockrell, has announced decision in the case of the American Grocer Co. v. Pittsburg, Cincinnati, Chicago & St. Louis et al. The Commission granted reparation in this case against only the St. Louis, Iron Mountain & Southern for an excessive charge on one carload of glass fruit jars transported from Cairo, Ill., to Calico Rock, Ark. The rate charged was 37 cents per 100 lbs., but pending suit before the Commission it was reduced to 29 cents. The Commission also ordered that the 29-cent rate be maintained for one year from the date of the order.

No Authority Over Steamship Line to Cuba.

In Lykes Steamship Line v. Commercial Union and 13 railroads, opinion by Commissioner Cockrell, it was held that an ocean carrier established under the laws of Cuba and transporting traffic between Havana, Cuba, and Galveston, Tex., is not subject to the Rate Law. The rule laid down in the recent Cosmopolitan Shipping Company case was followed.

The Commission further declared that the word "adjacent" as used in the act to modify the words "foreign country," would seem to mean adjacent in the sense of the possibility of substantial continuity of rails.

Coal Rate Upheld.

The Commission, opinion by Commissioner Prouty, has announced decision in the case of Laning-Harris Coal & Grain Co. v. St. Joseph & Grand Island. In January, 1907, the complainant shipped a carload of coal weighing 50,000 lbs. from Springfield, Ill., to Leona, Kan., a station on the line of the St. Joseph & Grand Island. Defendant assessed on this shipment a rate of 10.0013 cents per 100 lbs. Complainant insists that the rate should have been 9.0013 cents per 100 lbs. This was the only question presented. The Commission held that the charge collected was correct and dismissed the complaint.

No Authority to Require Special Passenger Rates.

In A. G. Field v. Southern Railway et al., opinion by Commissioner Harlan, it was held that the Commission has no authority to require carriers to establish special fares, based on less than the normal passenger-mile revenue, for the use of passengers on particular occasions or for special purposes. On that ground, and also on the ground that the legal right of carriers to issue party rate tickets and confine their use to theatrical companies has been fully considered by the Commission, this complaint for an order requiring the defendants to re-establish such party rates is dismissed on motion of the Commission.

Reparation on Shipments of Iron Pyrites.

In Detroit Chemical Works v. Northern Central et al, opinion by Chairman Knapp, the rate of $2.32 per ton on imported iron pyrites from Baltimore to Detroit was held to be now and during the time it was in effect, unreasonable and unjust; it should not have exceeded $2.21 per ton. Reparation awarded.

In the similar case of Detroit Chemical Works v. Erie et al, opinion by Chairman Knapp, it was held that the rate of $3.32 per ton on imported iron pyrites in carloads from New York to Detroit is now and was during the time it was in effect unreasonable and unjust; it should not have exceeded $2.81 per ton. Reparation awarded.

Shippers' Instructions Govern Lower Rate by Another Route.

The Commission (opinion by Commissioner Lane) has announced decision in the case of the Larsen Canning Co. v. Chicago & North Western et al. It appeared that the complainant directed that its shipments of two carloads of canned vegetables from Green Bay, Wis., to Washington, Ohio, move via a certain route over which there was no joint through rate, and the sum of the locals was applied. The goods might have been shipped by complainant between these points over a route having a joint rate less than the sum of the locals. The Commission held the initial carrier was bound to observe the instructions of the consignor in this case. It was also bound to collect the published rate applicable to the designated route and entails no liability under the law for so doing. No evidence was introduced tending to show that the rate charged and collected was unreasonable and unjust in itself. The complaint was dismissed.

Coal Rates from Wyoming to Nebraska Reduced.

In Nebraska State Railway Commission v. Union Pacific, opinion by Commissioner Clements, the complaint alleged that rates on coal from Rock Springs and Hanna, Wyo., to points in Nebraska, are unreasonable. The Commission held that the fact that there is competition for the purchase of this coal between Nebraska communities and communities in Wyoming and Utah affords no justification to the carrier for charging more than a reasonable rate for the transportation of such coal as the Nebraska people may succeed in buying. No justification exists for the maintenance of a blanket rate on coal to all points on defendant's lines in Nebraska. The Commission held that the rates of $1.50 per ton applying on lump coal from Rock Springs, and $3.50 per ton from Hanna to points in Nebraska on the line of the Union Pacific between the Nebraska-Wyoming boundary and Grand Island Neb., including the latter point and points on the branch line from Kearney to Callaway Neb., are unjust and unreasonable, and prescribed just and reasonable rates therefor

Intra-State Rate Covering Part of Interstate Movement.

In Baer Bros. Mercantile Co. v. Missouri Pacific and Denver & Rio Grande, opinion by Commissioner Prouty, it was held that a railroad which lies entirely within the limits of a single state becomes subject to the act to regulate commerce by participating in a through movement of traffic from a point in another state to a point in the state within which it is located, although its own service is performed entirely within the latter state. To maintain a petition before the Commission for recovery of excessive freight charges it is not necessary that payment of the freight charges should have been made under protest. A rate of 45 cents on beer from Pueblo, Colo., to Leadville, which is part of a through transportation from St. Louis to Leadville is excessive; such rate should not exceed 30 cents per 100 lbs. Reparation awarded

The bringing of a suit in the United States Circuit Court for the recovery of excessive railroad charges is not a bar to a subsequent proceeding before the Commission where that suit was dismissed without prejudice, and for the reason that the Commission had never passed on the reasonableness of the rate involved

No Authority Whatever Inside Oklahoma.

The Commission, opinion by Commissioner Clements, has announced its decision in the case of D. B. Hussey v. Chicago Rock Island & Pacific. The complaint in this case asked for reparation on account of alleged unreasonable rates on shipments of cross ties moving between April 25 and August 12, 1907, from Barnett, Ind. Ter. to McAlester. Subsequent to movement of these shipments and filing of the petition this territory was admitted as a state into the Union and the points of origin and destination are now in the state of Oklahoma. By the act of Congress admitting Oklahoma to statehood the intraterritorial jurisdiction of the Commission ceased to apply to territory now embraced in that state. The Commission held that it can make no lawful order in any case of which it has no jurisdiction and dismissed the complaint for want of jurisdiction.

The Commission in coming to this conclusion declared that if the subject-matter itself is not still within its jurisdiction, the fact that the complaint was filed and served prior to the transformation from territory to a state is wholly immaterial. The acquirement of jurisdiction of the parties by the filing and service of the complaint in no way helps the Commission to retain the case if the law under which the jurisdiction over the subject-matter must be exercised has ceased to operate. If the Commission has jurisdiction now to award reparation in this case, it would seem that it would also have jurisdiction in all similar cases now or hereafter brought on causes of action which accrued in the territories from which the state was formed and which are not barred. Such a conclusion would create a situation in Oklahoma whereunder the Commission could be acting on one standard of rates as a basis for reparation on past shipments without power to alter the rates whereas the state authority, which alone has power to alter them might be acting on an entirely different basis for that purpose—a condition incompatible with the principles and purposes of the

Rate Law which is intended to secure uniformity of rates and equality of treatment to all shippers.

Commissioner Harlin rendered an elaborate dissenting opinion.

Storage on Inland Shipments at Lake Ports.

The Commission, opinion by Commissioner Lane, has decided the case of the Commercial Club of Duluth v. Northern Pacific et al. The privilege of free storage was involved. The carriers offer free storage in transit at Duluth, Minn., or Superior, Wis., on both eastbound and westbound lake freight during the closed season of navigation. The practice is for inland shippers to bring their traffic to the warehouses at such ports before the close of navigation, where they are held in free storage by defendants until ordered forward by rail at the balance of the through rate from eastern points of origin. The Duluth merchants, having their business houses at the point where the storage is given, are compelled to pay storage and also dockage and switching charges. Complainant alleges that this business deprives Duluth of its advantage of location at the head of the lakes and operates to transfer such advantage to inland points. It appears that the privilege is open to all shippers alike and that the practice is not confined to defendants, but is forced by competition of other lines operating through other lake ports. The Commission held that the facts do not at this time justify condemnation of a practice in which so many carriers and shippers not parties to this action are interested. The fact that the privilege of free storage is more valuable to inland merchants than to merchants at lake ports does not necessarily make the privilege unlawful. The position of complainant is that the privilege takes away from the lake ports an advantage of their location; but the better position seems to be that the inland jobbing centers, by reason of their location at points where the competition of several lake ports operates, also have advantage of location, one result of which is seen in the effect of this privilege of free storage.

Obscure Rates Condemned.

In Hydraulic Press Brick Co. v. St. Louis & San Francisco et al., opinion by Commissioner Clements, it was held that defendants' rate of 48 cents per 100 lbs. for transportation of enameled brick from Cheltenham, Mo., to New Iberia, La., is unjust and unreasonable and should not exceed 30 cents per 100 lbs. for the future. Reparation awarded.

The practice of inserting obscure and general clauses in voluminous tariff publications, to the effect that where a combination of locals, either general or in specific instances, will make a lower aggregate through rate than the specific joint through rate therein stated, the former will be used, has been found by long experience to result in gross misapplication of the tariffs and in unjust discriminations. Under this practice the individual or concern whose business is large enough to warrant the employment of a traffic or rate expert will be able to secure combinations resulting in lower aggregate charges than can be secured by the smaller or occasional shipper who is unable to employ such an expert and who is required to pay the joint through rate appearing on the face of the tariff. It is self-evident that if such discriminations are to be broken up there can be but one lawful rate in effect at a given point on any commodity in the one direction between two points.

The carrier may, in its own interest if it so desires, carry for a longer distance over its own line than would be necessary if carried between the same points over the line of its competitor, in order to obtain part of the competitive business, on terms that will afford some profit. It does not necessarily follow, however, that a carrier in competing for traffic in this way thereby subjects itself to an order compelling it to do so.

No Permanent Lien on Jobbing Territory.

The Commission, opinion by Commissioner Prouty, has announced decision in the case of the Lincoln Commercial Club v. Chicago, Rock Island & Pacific et al. The complaint alleged that the defendants exact unreasonably higher rates on coal, paving brick, cement, lumber, glass and glassware, salt, rice, egg-case fillers and sugar, to Lincoln than to Omaha, from the same points of origin in Kansas and territory south, and west of the Mississippi river, for substantially the same distances. The Commission held that it is apparent that the cost of handling traffic from Kansas City to Omaha and Lincoln is practically the same and that difference in expense does not justify the maintenance of a higher rate to Lincoln than to Omaha. Justification for these higher rates must be found, therefore, if at all, in commercial and competitive conditions rather than in added cost of service. The questions presented were considered by the Commission as to each of the above articles separately, and the conclusions of the Commission were that the rate on coal may properly be 15 cents per ton higher to Lincoln and on paving brick and cement 1½ cents per 100 lbs. higher to Lincoln than to Omaha, and that with respect to lumber, glass and glassware, salt, rice, egg-case fillers, and sugar, rates from said points of origin to Lincoln should not exceed those to Omaha. The Commission said:

"The defendants, with some earnestness, urged that the holding which we have made will require them to readjust their distributing rates from Lincoln and from Omaha, but we are unable to appreciate the force of this suggestion. Cities have no indefeasible lien upon any given jobbing territory. Changes in conditions are always likely to affect the boundaries of that territory. Conditions are not the same when Lincoln draws its supplies from points of production in the west or south that they were when these supplies came through Omaha from the east. It is no part of the business of a railroad to so adjust its tariffs as to artificially define the territory into which particular jobbing localities may sell."

Competitive Rate Adjustment Upheld.

In the case of the Railroad Commission of Kentucky v. Louisville & Nashville et al., opinion by Commissioner Clements, the complaint questioned reasonableness of rates between Owensboro and Henderson, Ky., and points in Trunk Line and Central Freight Association territories. It also alleged that such rates result in unjust discrimination against Owensboro and Henderson and give undue preference to Evansville, Ind.

The carriers most directly interested in the Evansville rates for the most part serve the territory north of the Ohio river, while those most directly interested in the rates to Owensboro and Henderson serve the territory south of the river. There is greater density of population and of traffic in the territory north of the Ohio river known as Central Freight Association territory in which Evansville is situated, than in territory south of the river, in which Owensboro and Henderson are situated. The general adjustment of rates throughout Central Freight Association territory has a forceful effect on the Evansville rates. The larger volume of traffic and greater number of carriers operating in that territory create a greater degree of competition and the rates generally have been adjusted with a view to meeting the conditions resulting therefrom.

It was held that it is not incumbent on a road to measure the rates to all points on its line from and to which it handles the bulk of the traffic, by lower rates fixed by competitors operating over a more direct route to some other point also on its line but to which it handles an unappreciable volume of traffic. So to hold would be totally to disregard the effect of competitive conditions which the Supreme Court has held in numerous cases to justify the application of lower rates to farther distant points over the same line in the same direction. The long and short haul clause as construed by the courts prohibits charging a higher rate to a less distant point only where the carrier responsible for both rates occupies a like relation to the more distant point to which the lower rate applies.

The record fails to show that the rates in question are, under present conditions, unreasonable in and of themselves, or that the circumstances and conditions under which the traffic is handled to and from Evansville are so substantially similar to those under which traffic is handled to and from Owensboro and Henderson as to make the charging of higher rates to and from the last mentioned points unjustly discriminatory as compared with the rates applying between Evansville and the same points in Trunk Line and Central Freight Association territories. The complaint was dismissed.

TRADE CATALOGUES.

Roofing.—A pamphlet issued by the Cortright Metal Roofing Co., Philadelphia, Pa., is entitled Rightly Roofed Buildings. The Cortright metal shingles are designed to give the advantages of the tin roof without the buckling and rattling of the ordinary tin roof. The shingles are locked together on the side in such a way as to allow for expansion and contraction, but without allowing water to get through; at the top they are molded in steps to prevent water from entering at this point. The pamphlet includes testimonials, and is illustrated with a number of photographs of buildings covered with this roofing.

Vises and Ratchet Drills.—Illustrated price list No. 5 of the Charles Parker Co., Meriden, Conn., shows a number of styles of vises for use in locomotive and car building plants and by metal workers and machinists generally. A new vise is described, made with a patented reinforced sliding jaw, in which a solid steel bar is inserted in the slide throughout its length, being thoroughly welded into the casting. The vises are made of a mixture of cast-iron and Bessemer steel. Ratchet drills and parts are also described, with dimensions, weights and prices.

Water Softeners.—Bulletin No. 120, of the Buda Foundry & Manufacturing Co., Chicago, describes the Buda intermittent and continuous systems of water softening. The method used in each is outlined and illustrations are shown. The adaptability of water treating plants and the economies of using soft water are pointed out. The motor meter and chemical pump used are illustrated and described, and there are a number of illustrations of installations of both systems of both wood and steel construction.

Asbestos Wood.—Catalogue No. 107, of the H. W. Johns-Manville Co., New York, describes, with illustrations, the many uses of asbestos wood. These include roofing, sheathing and interior wood work. Its advantages in electrical work for taking the place of slate, marble, etc., are noted. This material is made in sizes from ¼ in. thick to 2 in. thick, the standard size of sheet being 36 in. x 48 in. Price lists of different thickness and styles are given.

Thermit.—The Goldschmidt Thermit Co., New York, has begun the publication of a quarterly periodical, *Reactions*, the object of which is to make public the improvements made from time to time in the use of thermit. The first issue consists of a number of articles of this description, clearly illustrated with half-tones and drawings. There are also a few notes and short articles on other subjects of interest.

Graphite.—The April issue of *Graphite*, published by the Joseph Dixon Crucible Co., Jersey City, N. J., has a short note calling attention to Dixon's yellow crayons for engineers and surveyors. They are particularly useful for making marks on rails; it is claimed that the mark is not easily washed off by rain, but can be distinctly seen for several months.

Derails.—A circular of the Hayes Track Appliance Co., Geneva, N. Y., gives a condensed list of Hayes derails, illustrated with photographs of the different types.

MANUFACTURING AND BUSINESS.

The New York offices of the Crocker-Wheeler Co., Ampere, N. J., will be moved on April 24 to the Hudson Terminal buildings, 32 Cortlandt street.

The New York office of the Federal Signal Co., Albany, N. Y., has been moved from 42 Broadway to the Terminal building, Forty-first street and Park avenue.

The New York office of the Railroad Supply Co., Chicago, will be moved to the Hudson Terminal buildings on May 1. The address will be room 540, 32 Cortlandt street.

Porter Bros. & Welch, Railroad Contractors, Vancouver, Wash., have ordered, for work on the Northern Pacific, a number of 5,000 candle-power Milburn lights, manufactured by the Alexander Milburn Co., Baltimore, Md.

Robert C. Pruyn, President of the Consolidated Car Heating Co., New York, and Francis C. Green, General Manager, have declined re-election to their offices in the company. Their successors will be elected at the annual meeting in June.

The thirteenth annual convention of the International Association of Municipal Electricians will be held at Detroit, Mich., this summer. The Secretary, Frank P. Foster, Corning, N. Y., is asking members to suggest subjects to be presented and discussed at this meeting. Suggestions should be sent not later than April 20.

E. E. Keller, for over 20 years connected with the Westinghouse interests, and for 11 years Vice-President of the Westinghouse Machine Company, Pittsburgh, Pa., has completed his duties as Receiver and General Manager and resigned from the company. He will take a vacation and then devote most of his time to personal interests.

Nathaniel S. Bouton, President of the Maryland Car Wheel Co., died in Dunedin, Fla., April 3, aged 80 years. Mr. Bouton had lived, since 1852, in Chicago, where he established the Union Foundry Works. This concern was sold to the Pullman Company in 1886. At the time of his death, besides being the head of the Maryland Car Wheel Co., he had foundries at Aurora and Naperville, Ill., and Birmingham and Decatur, Ala.

John E. Greiner, Assistant Chief Engineer of the Baltimore & Ohio, has resigned, effective May 1, to become a Consulting Engineer. He will open offices in Baltimore, Md., New York and Chicago. Mr. Greiner has been building bridges on the Baltimore & Ohio for the last 20 years. He has designed, or had charge of the designing of, every bridge erected on this road since 1885. Among these structures are the Arthur Kill bridge, which, with a 520-ft. span, was at the time the largest bridge in the world; the Ohio river bridge at Benwood, W. Va., a 345 ft. span without false work; the Ohio river bridge at Parkersburg, W. Va., and the double-track bridge now being built at Havre-de-Grace, Md. Since 1899 he has also supervised the design of all stations and buildings on the road. He was born at Wilmington, Del., in 1859, and was educated at the Wilmington High School and Delaware College, where he took B.S. and C.E. degrees. From 1880 to 1883 he was a draftsman at the Edgemoor Bridge Works; he then went to the Keystone Bridge Works, and in 1885 had charge of the Seventh Avenue suspension bridge at Pittsburgh, Pa. Later in that year he went to the Baltimore & Ohio, where he was, successively, draftsman, inspector of bridges, chief draftsman, Assistant Bridge Engineer, Engineer of Bridges and Building, and finally Assistant Chief Engineer. He is a member of the American Society of Civil Engineers, the American Railway Engineering and Maintenance of Way Association, and the Association of Railway Superintendents of Bridges and Buildings, and is serving on various committees of these societies.

Iron and Steel.

The Pittsburg & Lake Erie is said to be in the market for 14,000 tons of bridge material.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 26.)

American Society of Civil Engineers.

At a meeting of this society on April 15, a paper on "Recent Developments in Pneumatic Foundations for Buildings," by D. A. Usina was presented for discussion, illustrated with lantern slides. This paper was printed in "Proceedings" for March, 1908.

Freight Claim Association.

The seventeenth annual meeting of this association is to be held at Atlantic City, N. J., June 17, this date having been fixed in place of the date formerly announced (May 20). The President of this association is R. C. Richards, of the Chicago & North-Western, and the Secretary is W. P. Taylor (R. F. & P.), Richmond, Va.

Western Railway Club.

At the April meeting, to be held in the Auditorium Hotel at 8 o'clock p.m., Tuesday, the 21st inst., the paper of Prof. Dewsnup, of the University of Illinois, on "Freight Car Efficiency," which was read at the March meeting, will be discussed. Also the committee on Recommended Changes in the Rules of Interchange will report.

Association Railway Telegraph Superintendents.

At the meeting of this association to be held in Montreal, Que., June 24-27, the papers to be read include the following: "Dry Batteries on Telegraph Wires," by U. J. Fry, of Milwaukee, "Reduction of Telegraphing by Use of Printed Forms," by O. C. Greene, of St. Paul; "Commercial Reports," by G. C. Kinsman, of Decatur, Ill.; "Wiring of Station Buildings from the Contractor's Standpoint," by J. H. Jacoby; "Adverse Railroad Legislation," by E. A. Chenery, of St. Louis; "Telegraph Work on the Isthmus," by C. F. Annett, of New Haven, Conn.; "Qualifying Operators for Train Despatching," by C. S. Rhoads, of Indianapolis, "Selecting Operators for Railroad Use," by L. H. Korty, of Omaha, "Moving Trains by Visible Signals," by L. B. Foley, of New York, "Block Signals," by H. C. Hope, of St. Paul, "Use of Telephones in Connection with Train Movements," by W. W. Ryder, of Chicago, "The Interstate Commerce Commission," by Charles Selden, of Baltimore, "The Association," by W. F. Williams, of Portsmouth, Va., "The Telephone," by F. F. Fowle, of Chicago.

International Master Boiler Makers' Association.

The second annual convention of this association is to be held in the Hotel Pontchartrain, Detroit, Mich., May 26-28. At this meeting there will be committee reports to be followed by topical discussions on the following subjects.

Best Method of Applying Flues. Best Method for Caring for Flues. E. J. Hennessy, Chairman.

Boiler Explosions. J. T. Goodwin, Chairman.

Best Method of Applying Flexible Staybolts. J. H. Smythe, Chairman.

Use of Oil in Boiler Shops, Its Use in Stationary and Locomotive Boilers.

Topical discussions will also take place on the following subjects:

"Standardizing of Shop Tools." T. C. Best.

"Standardizing Boiler Blue Prints." W. H. Laughridge.

"Modern Improvements and Physical Tests in Boiler Design and Materials." H. S. Jeffery.

Members of the convention on May 26 will visit the plants of the Chicago Pneumatic Tool Company and the Detroit Seamless Tube Company.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Grand Trunk.—M. M. Reynolds, heretofore Comptroller of the National lines of Mexico, has been appointed Fifth Vice-President of the Grand Trunk. He will have special supervision of the treasury and accounting departments of the Grand Trunk and general supervision of the finances of allied companies.

Houston & Texas Central.—S. F. Carter, Jesse H. Jones and E. B. Parker, all of Houston, have been elected directors, succeeding J. D. Bowne, T. W. House and A. P. Root.

C. C. Barry has been appointed Secretary, succeeding William H. Field, who remains Treasurer.

Isthmian Canal Commission.—Gen. Peter C. Hains has resigned as a member of the Commission.

National Railroad of Mexico.—W. L. Fritz, Assistant Auditor, has been appointed Auditor and his former position has been abolished.

New York, New Haven & Hartford.—Amory A. Lawrence, of Boston, Mass., has been elected a Director, succeeding Charles F. Choate, resigned.

New York Public Service Commission, Second District.—John B. Olmstead, of Buffalo, N. Y., President of the Municipal League, has been appointed Commissioner in the Second district to fill the vacancy caused by the resignation of Charles H. Keep to become President of the Knickerbocker Trust Co., New York City.

Philadelphia & Reading.—C. E. Henderson, Second Vice-President, has resigned on account of ill health.

Operating Officers.

Chicago & Eastern Illinois.—E. H. DeGroot, Superintendent of the Indiana division, has been appointed Superintendent of the St. Louis division, with office at St. Louis, Mo., in place of R. D. Miller, deceased. P. S. Sampson succeeds Mr. De Groot, with office at Brazil, Ind.

East Broad Top Railroad & Coal Co.—C. H. Ketcham, whose resignation as Superintendent of the Morris & Essex division of the Delaware, Lackawanna & Western was recently announced, has been appointed General Manager of the East Broad Top and of the Rockhill Iron & Coal Co., with office at Orbisonia, Pa. Mr. Ketcham was born in 1855, and began railroad work as a telegraph operator in 1872 on the Louisville, Cincinnati & Lexington Railway, now part of the Louisville & Nashville. He served as yardmaster, Trainmaster, local freight agent and Assistant Superintendent. In 1890 he went to the Dunkirk Allegheny Valley & Pittsburgh as Superintendent, where he served till 1896. In 1893 he was also made Superintendent of the Buffalo division of the West Shore, a position which he held till 1899. He then became terminal agent of the Delaware, Lackawanna & Western at New York, and a few months later was appointed Superintendent of the Morris & Essex division of that road, where he served until his present appointment.

C. H. Ketcham.

Missouri & North Arkansas.—A. V. Brown, formerly Superintendent of the Chicago, Burlington & Quincy at Ottumwa, Iowa, has been appointed to the new office of Manager of the M. & N. A., with office at Eureka Springs, Ark.

New York City Railway.—W. L. Derr, General Superintendent, has resigned to go into contracting work, and his former office has been abolished.

Tonopah & Goldfield.—H. R. Hanlin, who has resigned as Trainmaster of the Baltimore & Ohio at Connellsville, Pa., has been appointed General Superintendent of the T. & G., with office at Tonopah, Nev.

Traffic Officers.

Nevada Northern.—H. B. Tooker has been appointed General Freight and Passenger Agent, in place of H. G. Toll, resigned; office at Ely, Nev.

Tonopah & Goldfield.—W. D. Foster has been appointed General Freight and Passenger Agent in place of J. F. Hedden, resigned.

Engineering and Rolling Stock Officers.

Baltimore & Ohio.—John E. Greiner, Assistant Chief Engineer, has resigned, effective May 1. He will open offices in Baltimore, Md., New York and Chicago as a Consulting Engineer. The position of Assistant Chief Engineer will not be filled at present, but Mr. Greiner's duties will be performed by Walter S. Bouton, who will be promoted from Assistant Engineer of Bridges to Engineer of Bridges, and by M. A. Long, who will look after all work on buildings. Mr Bouton and Mr Long will both report directly to D. D. Carothers, Chief Engineer.

Gulf, Colorado & Santa Fe.—M. T. Pratt, Superintendent of the Texas & Gulf, has been appointed Division Engineer of the Gulf, Colorado & Santa Fe, with office at Beaumont, Tex.

Texas & Gulf.—See Gulf, Colorado & Santa Fe.

LOCOMOTIVE BUILDING.

Butler Brothers, Hibbing, Minn., have ordered two six-coupled switching locomotives from the Baldwin Locomotive Works instead of 30 as stated in the *Railroad Gazette* of March 27.

CAR BUILDING.

The Union R. R. is in the market for extensive passenger car repairing.

The Chicago, Milwaukee & St. Paul has ordered a number of cabooses from the Ralston Steel Car Co.

The Northern Pacific is again figuring on refrigerator cars, but has changed the number to 500 instead of the 200 noted in the *Railroad Gazette* of March 6.

The National Car Line Co., Chicago, has ordered five 31-ft. steel tank car underframes, mounted on Bettendorf cast-steel trucks, of 80,000 lbs. capacity, from the Bettendorf Axle Co.

The Milwaukee Refrigerator Transit Co. has ordered 100 36-ft. refrigerator cars of 60,000 lbs. capacity from the Milwaukee Car Manufacturing Co., for May 20 delivery, to weigh 40,000 lbs.

The Forest City Railway, Cleveland, Ohio, it is said, is in the market for 100 pay-as-you-enter cars, and will remodel 50 ordinary cars into the pay-as-you-enter type. This item is not yet confirmed.

The Pennsylvania's order for 200 gondolas, noted in the *Railroad Gazette* of April 10, is an old order. The Middletown Car Works is just now starting work on these cars, the carrying out of the order having been held up for some time.

The Panama Railroad has rejected all bids on the 300 thirty-ton box cars and the 100 forty-ton Rodger convertible ballast cars, for which specifications were given in the *Railroad Gazette* of February 21. New bids have not yet been asked, but it is expected that they will be.

The Ardmore Traction Co., Ardmore, Okla., has ordered four single-truck closed electric cars from the St. Louis Car Co. instead of the McGuire-Cummings Manufacturing Co., as stated in the *Railroad Gazette* of March 20. These cars will be 20 ft. ¾ in. long, 7 ft. 4 in. wide and 8 ft. 1½ in. high, inside measurements. The special equipment includes:

Brakes	St. Louis Car Co. vertical wheel hand brakes
Couplers	St. Louis Car Co. radial
Curtain fixtures	Burrows
Curtain material	Pantasote
Seats	St. Louis Car Co.
Trucks	St. Louis Car Co.

RAILROAD STRUCTURES.

BETHLEHEM, PA.—Contract has been given to Fine & Harris, of Philadelphia, at $27,000 for the steel superstructure of the Northampton Heights bridge. S. W. Childs, of Philadelphia, was given a contract for the sub-structure at $15,000. The proposed structure will be 378 ft. long and is to be built jointly by the Easton & South Bethlehem Transit Co., the Bethlehem Steel Co. and the Borough of Northampton Heights.

BOSTON, MASS.—The loss of the Boston Elevated in the recent Chelsea fire included a car barn, one car and seven snow-plows.

BROWNSVILLE, TEXAS.—President B. F. Yokum, speaking in behalf of the St. Louis, Brownsville & Mexico, confirms the report that this company has applied for permission to build a bridge over the Rio Grande river from Brownsville, Tex., to Matamoros, Mex.

Houston, Texas.—Contract, it is said, has been given to D. H. Barnes, of New Orleans, by the Houston Belt & Terminal Co., to build two freight sheds, each 400 ft. x 600 ft.; the work to be finished by September, and to cost about $200,000.

New Westminster, B. C.—A contract, it is said, has been given by the Canadian Pacific to W. W. Forrester to put up shops here, to cost $20,000.

Philadelphia, Pa.—Bids are wanted April 22 by the Department of Public Works for the construction of the following bridges: Over the Philadelphia, Newtown & New York Railroad, 60 ft. reinforced-concrete arch, 90 ft. wide; appropriation, $40,000. Over the North Pennsylvania Railroad 60 ft. reinforced-concrete arch, 80 ft. wide; appropriation, $10,000. Under Chestnut Hill branch of the Philadelphia & Reading Railway, double-track railroad bridge, plate girder through, 67 ft. span on concrete abutments; appropriation, $35,000. Under Richmond branch of the Philadelphia & Reading, three-track railroad bridge, plate girder through, 54 ft. span on concrete abutments; appropriation, $40,000. Over Schuylkill river, substructure work only, seven concrete piers; appropriation, $200,000. George R. Stearns is Director.

Vera Cruz, Mex.—The Vera Cruz Terminals Board recently held a meeting to dispose of the necessary preliminary arrangement so that bids can be asked for the proposed improvements. (March 20, p. 429.)

Winnipeg, Man.—Local reports state that the Canadian Northern is planning to build a double-track steel bridge over the Assiniboine river here.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Burrs Ferry, Browndell & Chester.—This company, it is said, has resumed work on the line from Chester, Tex., east to the Louisiana state line at Burrs Ferry, on Sabine river, 85 miles. A length of about 25 miles is finished, and the grade is ready for the rails for an additional 20 miles. (Mar. 13, p. 390.)

Canadian Northern.—This company is planning to finish the work on the Brandon-Regina branch, also to ballast the line from Rossburn to Russell this year. Ballasting is also expected to be done on the line to Pas Mission, and similar work is expected to be carried out on the extension towards Hudson Bay. On the line from Saskatoon to Goose Lake a large amount of track-laying will be done and it may be further extended. Track is to be laid on 25 miles of the line from Delmeny, on the main line, to Carelton, and grading and track-laying on 15 miles of the Oak Point line is to be finished. On the Oakland extension, along the western side of Lake Manitoba there will be ballasting and track-laying.

Canadian Pacific.—The plans of work to be carried out this year by the Canadian Pacific, it is said, include. Completion of double track between Winnipeg and Fort William, 418 miles, of which 222 miles is already finished. Extension of the Stonewall branch to Icelandic river, 36 miles. Track laying on the grade built last year between Weyburn and Stoughton. Completion of the line from Wolsley to Reston, in Manitoba, on which grading is finished, and about 39 miles of track remains to be laid. On the Sheho extension, 37 miles will be built (to Lanigan). On the Moosejaw extension work is to be continued from Tuxford northwest for 50 miles. From Swift Current, west to the Medicine Hat division, there is to be a large amount of grade revision work carried out. A new bridge will be built at Lethbridge, and a number of new steel bridges on the Pacific division in British Columbia.

Several large contracts are reported let to W. P. Tierney & Co., Nelson, B. C., for filling in trestles in eastern British Columbia.

Chicago, Lake Shore & South Bend (Electric).—Local reports state that this company recently put 300 additional men to work on the line it is building from South Bend, Ind., west to Chicago, Ill., 71 miles, to finish the work by the middle of May. (Mar. 13, p. 390.)

Chicago, South Bend & Northern Indiana.—This company, which is building a line from South Bend, Ind., west to Laporte, 28 miles, is said to be pushing the work so as to have the line in operation by July 1. (Mar. 13, p. 390.)

Colorado, Texas & Mexico.—This company is building from Mangum, Okla., south to Abilene, Tex., and also has projected a large number of branches. According to President Morris R. Locke of Mangum, about 76 miles of grading is finished, including that on a branch from Llano, Tex., to Fredericksburg, 18 miles; also at the yards in Abilene, Tex., and Merkel and Mangum, Okla.

El Paso & Southwestern.—See San Diego & Arizona.

Franklin & Clearfield.—See Lake Shore & Michigan Southern

Grand Trunk Pacific.—Work to be carried out by this company this year is as follows. Completion of the line from Portage la Prairie, Man., east to Winnipeg, 55 miles, closing the gap on the line between Winnipeg and Saskatoon, grading and track-laying from Saskatoon to Edmonton, grading 100 miles west of Edmonton, Foley, Welch & Stewart, contractors; grading 100 miles of line east from Prince Rupert, the Pacific terminus, on the contract of Foley, Welch & Stewart, completion of the line from Port Arthur to the junction with the main line at Superior Junction. Work is to be pushed on the section from Winnipeg east to the Lake Superior branch, J. D. MacArthur, Winnipeg contractor. About eight thousand men are expected to be at work on this section this summer. Extensive work is also to be carried out on the terminals in and around Winnipeg.

Vice-President F. W. Morse is quoted as saying that bids are being asked for grading 180 miles of line for this company west of Wolf Creek, from a point 120 miles west of Edmonton Alb., to a point 50 miles west of Yellowhead Pass.

Harrisville & Cornwallis.—Bids, it is said, are to be asked for in May by this company to build a line from Harrisville, W. Va., northwest to Cornwallis, six miles. Right-of way secured and surveys being made. W. S. Stout, President, and A. Wolverton, Chief Engineer, Harrisville.

Kansas City, Mexico & Orient.—President A. E. Stilwell is quoted as saying that all of the money has been subscribed to finish building the railroad between Wichita, Kan., and Sweetwater, Texas, a distance of 132 miles. This section of the road is now built except a 67-mile gap between Benjamin, Texas, and the Red river and the bridge across the Red river. It is expected to finish this work and begin operation by August. (Mar. 13, p. 391.)

Lake Shore & Michigan Southern.—Work, it is said, has been resumed on the Franklin & Clearfield, which has been building through Pennsylvania during the past two years. As projected the line is to run from Franklin, Penn., southeast to Brockville, 62 miles, thence east to Clearfield, a total of 110 miles. The eastern end of the line, from two miles west of Brookville to Clearfield, has not been finally located. The western end is finished from Polk Junction to the Clarion river, 37 miles and work is well advanced on the 23 miles from the river to two miles west of Brookville. The line is being built to secure a low grade route through the mountainous country bordering the Allegheny river, thence to the summit of the Alleghenies. There is to be one tunnel of 2,100 ft. and another of 1,700 ft. The extension to Clearfield will necessitate piercing a tunnel 2,500 ft. long. It is thought that the line will be in operation within a year. This will be made possible by traffic arrangements between Brookville and Clearfield. It is understood that such negotiations are under way with the Pennsylvania and the Buffalo, Rochester & Pittsburgh. In the event of such agreements it would only be necessary to build from Dubois to Clearfield. (Mar. 13, p. 392.)

Mexican Roads.—The Mexican Congress has under consideration the question of granting concessions to build a line from Matamoros south to Izucar and Acatlan, via Calacun, Tehuitzingo, Chinantla and San Pablo, thence to the boundary of Oaxaca and Guerrero. The names of the promoters are not given.

New Orleans Great Northern.—It is reported that this company has resumed work on the section from Monticello, Miss., north to Jackson. (Mar. 13, p. 392.)

Ohio Roads.—A company is being organized by R. K. Paige, of Painesville, Ohio, to build a line from Fairport Harbor, Ohio, south to Phalanx, on the Lake Erie, Alliance & Wheeling, about 45 miles. It is said that surveys are made, and much of the right-of way secured.

Pennsylvania.—The south tunnel of the two which this company is building under Bergen Hill, Hoboken, N. J., as a part of its New York City improvement, was recently driven through, and the company now has a continuous tunnel from the western end at the Hackensack Meadows to Long Island City, over five miles. The piercing of the north tunnel is expected to be finished in May by which time all the excavation work on the New York extension will be practically completed. Only a small part remains to be done. Altogether a total of about 3,000,000 cubic yards of earth, stone and sand will have been removed from the interior of tunnels having an aggregate length of 16.5 miles and from the space to be occupied by the terminal building.

Pittsburgh, Shawmut & Northern.—Surveys are reported being made by this company from the western terminus of its Kersey branch, at Weedville, Elk county Pa., for a proposed line from that place southeast about 20 miles to the headwaters of Sandy Run in Clearfield county, where connection is to be made with the projected Pittsburgh, Binghamton & Eastern. The work will include a bridge 80 ft. high and several hundred feet long.

Port O'Connor, Rio Grande & Northern.—This company, it is said, has suspended work on its proposed line projected from Port O'Connor, Tex., on the Gulf of Mexico, north to San Antonio, 190 miles, with a number of branch lines including one to Gonzales. About 100 miles of grading has been finished, but no track has been laid. (Mar. 13, p. 391.)

PRINCE RUPERT & PORT SIMPSON.—Organized to build a line from Prince Rupert, B. C., to Port Simpson, about 50 miles. Barnard & Robertson, Vancouver, B. C., are the attorneys.

ROSCOE, SNYDER & PACIFIC.—This company, which was organized to build a line from Roscoe, Tex., northwest to the New Mexico line, 200 miles, has 19 miles of track laid, and 11 miles additional graded. Beyond this point it is undecided when the work will be carried out. Martin Duval, Roscoe, Chief Engineer.

SAN DIEGO & ARIZONA.—This company, which proposes to build a line from San Diego, Cal., east to Yuma, Ariz., about 200 miles, has recently been granted a concession by the Mexican Government to build about 50 miles of this line; that part which parallels the international border through the northern part of lower California. J. D. Spreckels, the principal promoter of the project, is quoted as saying that the El Paso & Southwestern has under consideration the question of building an extension from Benson, Ariz., west to a connection with the proposed line at Yuma. (April 3, p. 493.)

WASHINGTON, BALTIMORE & ANNAPOLIS (ELECTRIC).—This company on April 2 opened its high speed electric line from Washington, D. C., northeast to Baltimore, 40 miles. (Nov. 29, p. 669.)

WESTERN CENTRAL.—This company proposes to build from London, Ont., to Guelph. English capitalists have become interested in the project, and it is now intended to continue the line to Toronto. C. B. Smith, Toronto, Ont., is the Consulting Engineer.

WISCONSIN CENTRAL.—President W. A. Bradford is quoted as saying that construction work on the extension to Duluth is proceeding at a rapid rate. Regular train service is now in operation between Owen and Ladysmith, 45 miles, and the line is built to South Superior, leaving only eight or nine miles to the northern terminus at Duluth. It is expected that the entire line will be in operation by July 1. This does not include the terminal at Duluth, where 1,800 feet of tunneling is necessary, considerable of it through solid rock. Contract for the tunnel has been let, it is reported, to the Lantry Construction Co., of Kansas City. (Mar. 13, p. 395.)

RAILROAD CORPORATION NEWS.

BALTIMORE & OHIO.—See Reading Company.

BUFFALO, ROCHESTER & PITTSBURGH.—For the first week in April, gross earnings were $111,000, a decrease of $55,000 from those of the first week in April, 1907.

CHICAGO & MILWAUKEE ELECTRIC.—Judge Grosscup has authorized the issue of $1,000,000 6 per cent. 3-year receivers' certificates. Of these, $122,000 will go to the parent company for construction materials to be used on the Milwaukee extension.

CUBA RAILROAD.—The New York Stock Exchange has listed the $6,800,000 of this company's first mortgage 5 per cent. 50-year bonds, due 1952, and also its $10,000,000 preferred stock. The company operates 128 miles of standard gage road, the main line extending from Santa Clara to Santiago. Its gross earnings for the seven months ended January 31, 1908, were $1,000,000, and net earnings, $107,000.

COLUMBIA RIVER & NORTHERN.—See Spokane, Portland & Seattle.

DELAWARE & HUDSON.—A special meeting of the shareholders is called for May 12 to authorize a $50,000,000 first refunding mortgage, securing 35-year 4 per cent. bonds. Of this, $20,000,000 will be issued at once to pay off the company's floating debt. On December 31, 1907, this debt was $10,800,000, of which $6,000,000 is in the form of notes maturing August 6. The remaining $30,000,000 bonds will be issued when needed.

ERIE.—See views of Robert Fleming on earlier page of General News Section.

GREAT NORTHERN.—Gross earnings for March were $3,200,000 against $4,400,000 in 1907. For the nine months ended March 31, the gross earnings were $44,100,000, which is an increase of $3,900,000 over 1907. The earnings in March, 1907, were unusually large because in this month much traffic moved that had been held up during the winter.

ILLINOIS CENTRAL.—A special meeting of the stockholders is called for May 18, to increase by $28,512,000 the capital stock of the company. At present the Illinois Central has a capital stock of $95,040,000, and if the new issue is agreed to by shareholders it will bring the total amount up to $123,552,000. The proceeds from its sale will be used to buy the property of the Kensington & Eastern, and the Memphis State Line, and for additions and improvements on the Illinois Central. Shareholders as registered on May 28, 1908, are to have the privilege of subscribing at par for the new stock to the amount of 15 per cent. of their holdings. The half of the new stock not offered to shareholders will be held in the treasury. The directors are to be authorized to offer this stock to shareholders later or to issue bonds convertible into this stock.

INTERNATIONAL & GREAT NORTHERN.—Gross earnings for the week ending April 7 were $124,000; in 1907 they were $138,000.

KANSAS CITY, MEXICO & ORIENT.—This company is seeking to place $700,000 2-year $6\frac{1}{2}$ per cent. notes to provide for completion of 77 miles of line from Sweetwater, Tex., south to San Angelo. These notes are secured by $1,400,000 first mortgage bonds.

LAKE SHORE & MICHIGAN SOUTHERN.—See Lehigh Valley and also Reading Company.

LEHIGH VALLEY.—It is reported that the $5,700,000 Lehigh Valley common stock owned by the Lake Shore & Michigan Southern is to be sold to a syndicate which plans to make the road a more independent property than it has been. The following table shows the holdings up to recently of Lehigh Valley common stock by other railroads:

Lake Shore & Michigan Southern	$5,700,000
Erie	1,000,000
Central of New Jersey	1,600,000
Reading Company	1,000,000
Delaware, Lackawanna & Western	1,000,000

The Erie has already sold its $1,000,000 holding. See Reading Company.

NATIONAL RAILWAYS OF MEXICO.—In return for guaranteeing unconditionally the principle and interest of the new $160,000,000, general mortgage bonds of the National Railways of Mexico, the government has been given outright the following securities:

Prior lien, $4\frac{1}{2}$ per cent. bonds	$6,000,000
General mortgage, 4 per cent. bonds	2,450,000
Common stock	63,730,000
Total value	$72,180,000

The government will use these bonds, or the proceeds of their sale, toward acquiring $30,337,900 stock of the National of Mexico and $20,000,000 stock of the Mexican Central. The government will then exchange this stock for the following securities of the National Railways of Mexico:

First preferred	$10,000,000
Second preferred	30,278,300
Common	10,994,000
Total	$51,272,300

This total added to the $63,730,000 common stock already allotted to the government will give it $115,002,300, which is a majority of the total $230,000,000 stock of the National Railways.

NORTHERN PACIFIC.—Gross earnings for March were $4,800,000, a decrease of 12 per cent. from the earnings of March, 1907. The loss was in freight and express, the passenger earnings having increased slightly. For the nine months ended March 31, gross earnings were $53,800,000, against $49,600,000 in 1907. The passenger earnings show an increase of 14 per cent.

PENNSYLVANIA.—The New York Bay Railroad, all of whose stock is owned by the Pennsylvania, has made a mortgage covering $6,000,000 40-year 4 per cent. bonds, dated January 1, 1908. The road runs from a point near Waverley, N. J., to the Greenville freight terminals, 7 miles, with 7 miles of branch lines.

READING COMPANY.—It is reported that the share of the Lake Shore & Michigan Southern in the $60,000,000 Reading stock (mostly first and second preferred) held by it and the Baltimore & Ohio, is to be sold to interests associated with the Baltimore & Ohio. The Philadelphia & Reading, with the Central of New Jersey which it controls, gives the Baltimore & Ohio its entrance to New York. See Lehigh Valley.

SPOKANE, PORTLAND & SEATTLE.—This company has increased its authorized capital stock from $5,000,000 to $25,000,000. The 221 miles of road from Pasco, Wash., to Vancouver, is now in operation. The company has acquired the Columbia River & Northern, extending from Lyle, Wash., to Goldendale, 43 miles, and will operate it as a branch.

UNDERGROUND ELECTRIC OF LONDON.—Sir George Gibb, Deputy Chairman and Managing Director, was, on April 15, appointed receiver of the Underground Electric Railways Co. of London, Ltd., on application of Speyer Bros., of London. It is probable that a reorganization plan will shortly be announced. In December last Speyer Bros., in London, and Speyer & Co., in New York, offered to purchase the defaulted coupons on the (about) $34,500,000 5-year profit-sharing notes which mature June 1, 1908.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay, EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of The Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Prest. and Editor*
E. A. SIMMONS, *Vice-President*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor*

VOL. XLIV., No. 17. FRIDAY, APRIL 24, 1908.

Some of the advantages of storing coal under water were referred to briefly in these columns on February 14. Since that time Bulletin No. 17 of the Engineering Experiment Station of the University of Illinois on "The Weathering of Coal" has been issued. According to the authors of this pamphlet, information concerning the behavior of coal in any sort of storage is very meager and there is much disagreement between recorded facts. These studies were made therefore to get a better understanding of all of the conditions attending the storage of coal in large quantities, such as weathering, spontaneous combustion, etc. Reference is made to the growing prominence of the under-water plan, and the studies of deterioration included samples maintained in a submerged condition, as well as in the open air, under cover at varying temperatures and in air-tight containers. The period covered by the experiments was nine months. The experiments were considered as being only preliminary in character, which would furnish information for more comprehensive and elaborate tests. They appeared, however, to justify certain conclusions. With reference to the submerged coal, it is stated that there is evidence of a distinct difference between this and the air-exposed. The values found for it during the nine months did not vary, with possibly one or two exceptions, by greater amounts than would occur in tests made on succeeding days by the same person. The coal was submerged in ordinary water at a temperature approximately 70 deg. F. The results showed that the processes which are active in air cease under water, these processes being the decomposition of the pyrites and the loss of volatile matter. This phenomenon suggested to the experimenters the idea of a displacement of hydrocarbon gases by oxygen, by some process akin to osmosis or catalysis, whereby a certain amount of oxidation of the carbon or hydrogen occurs. The results of the various experiments were considered of value both for what they revealed and for the suggestions for further studies which would yield fuller information on this important subject.

Stockholders of the Illinois Central living at Hartford, Conn., representing, it is said, some 10,000 shares, last week appointed a local committee to handle their proxies at future annual meetings of that corporation. The incident projects into sharper light the familiar infirmity of stockholders in great corporations. They are a host of disorganized units scattered far and wide through the land. They cannot attend meetings and, if they could and did, there wouldn't be a National convention hall large enough to hold them all. They do not and most of them cannot keep in touch with their own investments. Hence their proxies are duly signed and sent on or dropped in the waste-basket and the annual meeting of the big corporation usually resolves itself into a half dozen accidental stockholders at one end of the room and a president and secretary intrenched behind a huge pile of proxies at the other. This is the case when net earnings are good, dividends regular and the skies clear; and the stockholder only wakes up when calamity strikes in. Now and then there has been an exception. The late President C. P. Clark, of the New Haven company, used fitly to dub its annual gatherings "Town meetings"; but they ceased to be such when the annual free ride of his stockholders to the meeting was cancelled. The Hartford idea has perhaps a certain note of suggestion. It outlines as a kind of ideal ultimate the federating of stockholders into groups each with its representative committee and accents Aesop's fable of the collective strength of the bundle of sticks weak when single. But the idealism vanishes in the average temper and habit of the average shareholder. In his corporate relation he repeats the imbedded trait of the citizen whose civic ardor is a flash and not a flame. True, his investment touches directly the stockholder's pocket nerve. But does it more so than taxation? His treatment of his proxy is thus of much the same breed as his neglect of his party primary, and "committees of protection" in their various shapes will probably continue to be the fruit only of corporative disaster actual or feared—and a fruit not seldom harvested too late.

The record of the traffic and earnings of the whole Pennsylvania Railroad system for the last ten years presents some notable facts. This system, more than any other, benefits by the traffic of the primary iron industries, which in these ten years have had a phenomenal growth. These industries produce more weight per man employed than almost any other; and in fact the increase in freight traffic (ton-miles) of the Pennsylvania Railroad system was 130 per cent. from 1898 to 1907. But it is somewhat surprising to find that the increase in passenger traffic meanwhile was even greater—133 per cent. In the aggregate there was a considerable increase in the extent of the system, from 9,036 to 11,176 miles; yet, even so, the traffic per mile of road increased 86½ per cent. in freight and 88¼ per cent. in passengers in the ten years. It may be said, however, that there was (and is) more room for the passenger traffic to grow. For every 100 passenger-miles there were 991 ton-miles in 1898, and 985 ton miles in 1907, very nearly 10 ton-miles to every passenger-mile. For the whole railroad system of the United States in 1906 there were 857 ton-miles per 100 passenger-miles; on the New York Central in 1907, 594 ton-miles to 100 passenger miles. That proportionally to freight the passenger traffic on the Pennsylvania is less than the average is not because the passenger traffic is light, but because the freight traffic is overwhelmingly heavy. The average for the whole country per mile of road was 982,401 ton-miles; on the New York Central (3,782 miles of road), 2,855,610; on the Pennsylvania system, 3,371,019 ton-miles. This helps to account for the fact that with slightly less than 5 per cent. of the total mileage of United States railroads, the Pennsylvania system had more than 14 per cent. of its gross earnings—$29,240 per mile, against an average of $10,460 for the country. Though, as we have seen, both passenger and freight traffic have grown greatly in the last ten years on this great system, and on the whole, one about as fast as the other, they have not grown evenly, by any means, and the passenger much more evenly than the freight. In the latter we have such yearly gains as 20 per cent. from 1898 to 1899, followed by 3.8 per cent. from 1899 to 1900 and a decrease of 2¼ per cent. from 1903 to 1904, followed by successive yearly increases of 17, 11.6 and 14.4 per cent., the latter from 1906 to 1907. In passenger traffic the increase did not vary greatly from 10 per cent. in 1899, 1900, 1902, 1906 and 1907; and in the year when there was a decrease of 2¼ per cent. in freight there was an increase of 3.6 per cent. in passenger traffic.

THE USE AND MISUSE OF COAL.

At a meeting of the American Society of Mechanical Engineers held on the evening of April 14, to discuss the subject of the conservation of our natural resources, Prof. W. F. M. Goss presented some rather startling figures regarding the utilization of the coal supply, figures that we all are more or less familiar with, but which need to be presented occasionally in order to drive home a realization of what is being done and what we must face if the present wastefulness continues. After reviewing the methods of mining in which the thin upper veins are neglected in order to first take out the better paying material from the thicker veins below, allowing the cover to become dislocated and rendering subsequent mining operations impossible in the upper strata, Dr. Goss showed how coal that has slate seams or is high in sulphur is left below, and how much otherwise valuable fuel is destroyed by heavy and injudicious blasting. He directed attention especially to the enormous quantity of coal used in modern locomotive service. Starting with an annual production in 1850 of between 50,000,000 and 60,000,000 tons, the output has more than doubled every decade since that time, until, in 1906, it reached an astounding total of something more than 400 million tons. Of this, nearly 120 million tons are burned in locomotives—more than the total annual output 25 years ago. That this consumption is carried on wastefully, and that there is a marked distinction between the practices of the United States and of Europe, was clearly shown. In Europe every possible effort is made to effect economies by the use of compounding or of superheaters, standing out in strong contrast with the practices of this country, where these means of saving are almost wholly disregarded, and emphasizing the distinction so often drawn, that Americans are prodigal of material and saving of labor, while the foreign engineer reverses this, clearly indicating where the source of greatest saving exists on the two continents, respectively. It is estimated that, by the use of superheaters and of a more rational system of burning the coal, a total saving of from 25 to 30 per cent. could be effected. This, with coal at $1.50 per ton, would mean an annual saving to the railroads of about $45,000,000. The figures are startling and it is useless to raise the cry, more or less sneering, that we have plenty of coal, and so what's the use of troubling ourselves. That there is a limit, no one can deny, although exhaustion does not stare us in the face this year or next, or in the next decade. But no matter how rich we may be, reckless extravagance is not the course of wisdom. Twenty-five years ago, when the Michigan lumber industry was at the height of its prosperity and when its pine controlled the markets of the world, there were a few conservative old fogies who protested against the rampant wastefulness, and predicted an early destruction of the forests and the extinction of the industry. But they were laughed at for their pains, and it was proven very conclusively by the mill men, to their own satisfaction, that the pine would last for a hundred years. So they continued to waste more than 25 per cent. of the log in sawdust and slabs, and to burn or leave behind all the tops and branches. Then, fifteen years later, they closed their mills, or burned them for their insurance, and Michigan pine was a thing of the past. The great, primeval forests had been obliterated, and in their place we have wide expanses of denuded sand flats, barren and useless.

Lest we should forget this warning, so recently given, the movement now on foot to conserve our natural resources in timber, coal and ore, was originated. Surely no industry has a more vital interest in the matter than have the railroads, despite the apparently reckless manner in which they consider the subject of coal economies or refuse to consider it, unless it can be demonstrated to them by an incontrovertible Q. E. D. that they can save a dollar to-morrow by taking action to-day, on the principle of a quick return and big profits. There is such a thing as making provision for the more remote future, and one of the oldest and most familiar of the means to this end lies in the preservation of the things we have now in hand.

WRITTEN EXAMINATIONS ON TRAIN RULES.

The Aurora, Elgin & Chicago, an electric interurban road, recently adopted a plan for written examinations of trainmen on its rules and regulations. We understand that this is the first interurban road to follow this plan, and the suggestion has been made that the idea is one the steam roads might do well to adopt. While oral examinations are almost universal with the steam roads, the idea of written examinations is far from novel. The Chicago & North-Western has been requiring written examinations for six years—ever since the present book of rules has been in effect. The system of questions is most complete, there being a separate set of questions for each class of employees who must be familiar with the rules in part or in whole. Each set of questions is bound in pamphlet form, 8 in. x 10½ in. For conductors there are 384 questions; for enginemen, 347; train despatchers, 175; agents and operators, 170; brakemen and baggagemen, 143; yardmasters and switchmen, 74; track, bridge and building foremen, 61; signalmen at interlocking plants, 53; firemen, 48. Agents also have an additional list of 228 questions on accounting rules. Space is provided at the end of each set of questions for any additional questions the examiner may care to ask.

Before the present rules became effective, an examining board was appointed and all employees were given a written examination thereon. There are no periodic re-examinations, but the rules are now being revised to conform to recent changes in the Standard Code, and all employees will again be examined. The examination papers are numbered and filed in the superintendent's office. Once a month the list is checked over to see that all changes have been properly entered. At the end of each quarter the papers of men who have left the division are removed from the file and stored away. Occasionally a man from the general superintendent's office goes over the road and checks up the superintendents. Men taking the examination must answer all questions. If the examiner, in looking over the papers, finds answers to questions which give the impression that the man has not understood the matter clearly, he is called in and questioned, and either allowed to revise his answer or is required to study up on these points and answer the questions again later, as the examiner may decide. If a man fails on the first examination he is allowed to try again within 60 days. In the event of a second failure a final chance is given him within six months.

A good many advantages are claimed by the North-Western for this system as compared with oral examinations. First of all, it is systematic and thorough. The questions are formulated to cover all the rules. In oral examinations no one person in a class will be questioned on all the rules even should the class as a whole be asked regarding every rule. The fact that the written answers are a record for reference at any time is equally important. If a man violates a rule he is unable to plead that he was not asked about it in the examination and did not understand it properly. Furthermore, many men are nervous in oral examinations and may make an unfavorable showing, when in reality they may be sound on the rules. In the written examinations they have all the time they want. If a man is in doubt about the meaning of a question, the examiner is there to explain it and give such help as is permissible. At the same time, the opportunity for displaying partiality is minimized. A further important advantage of the written method is that it assures a uniform understanding of the rules and eliminates variations in interpretation of the rules due to changes in examiners. Naturally an examiner interprets the rules as he personally understands them, and no two men may put exactly the same construction on them. An employee brought up on a certain division and instructed and examined by a certain officer, will interpret the rules accordingly. But examiners change, and employees are constantly changing from one division or district to another, and are thus coming in contact with examiners and employees whose education in the rules probably has been somewhat different. With the written examinations the viewpoint is the same for all.

A number of roads have considered written examinations, but the majority believe oral examinations much better and more satisfactory. We understand that the Rock Island is preparing to adopt the written plan. The Southern Pacific used written and oral examinations for a time; that is, the employee would first answer certain questions in writing and then would be questioned orally afterward to ascertain his understanding of the rules. At present the examinations are largely oral, for the reasons given at the beginning of this paragraph.

The Aurora, Elgin & Chicago has 234 questions on its list. They are printed on loose sheets about the size of the North-Western's pamphlet. All trainmen must be re-examined once each year. The passing grade is 95 per cent. In case of failure the first time, another trial is allowed within two weeks. A second failure in the case of men already employed results in suspension from the service. Of the 234 questions, 41 are on the air brake, and are therefore only for motormen, or candidates for that position.

THE RAILROAD SHORT TERM NOTE

Speaking in a very general and somewhat rough way, borrowers of money from banks and trust companies may be divided into three groups. There is the borrower of high standing and credit, either in business or out of it, who borrows on the strength of an individual name or names. There is the borrower—the "commercial" borrower—who obtains his loan on the commercial bill payable, as collateral security; and, finally, there is the borrower on stock, bonds, realty or other securities, usually solid, of the same general kind. In the borrowing of funds by railroad corporations one finds similar analogies. The short term note may be said to represent single name paper. It shifts to a kind of commercial paper when it becomes partly secured either by future potential mortgage power or more immediately by collateral which is apt to be of uncertain quality; and, finally, in the shape of the senior railroad mortgage or the junior mortgage of a prosperous railroad corporation we have the analogue of the bank loan well secured by first-class collateral in stocks or bonds.

The panic period which struck the nation six months ago had been preceded by a somewhat longer period of rising investment rates seriously affecting the borrowing power of corporations, especially the railroads. During that earlier period of a year or more it was not so much a case where credit was shaken as of actual exhaustion of investment funds owing to great loans of big railroad corporations. "Prosperity" then of uncertain endurance had overloaded them. There was shortage of cars, public outcry over detained freight, complaints of inadequate switching yards and terminals, steps toward and to reciprocal demurrage, saying nothing of more overt anti-railroad legislation actual or threatened. Not many railroad financiers or managers were prescient or saw the storm ahead just beginning to lift over the far railroad horizon, and investors were, with few exceptions, in the same mental condition. Railroad improvements seemed and were, for the time, imperative, and the high interest rate was deemed but a temporary strain. Hence the "short term note" policy adopted as a transitory expedient of bridging what looked like a narrow gap and hence also the sequel of that policy in a huge volume issued of that class of security. At first, in competition with an ordinary mortgage investment rate of 4 per cent., the short-term railroad note found a market on a 5 per cent. basis, which increasing money stringency ere long forced up to 6 per cent. Most of the better class of notes now outstanding are at the former rate; but out of 32 such issues 23 become due during the coming two years; and the experience of the Erie in its crisis just past suggests the problem ahead for some of the weaker lines.

Pessimists are now drawing somber horoscopes on the future of the railroad short note which, indeed, has become a very important element in the railroad situation on its fiscal side. They point out the great volume of those notes, their early maturity, their character as a note of hand of a railroad corporation, often unsecured, and the existing shadow on the net earnings which are the basic test of a railroad's borrowing strength, and they point to the Erie episode as the precedent and prophecy of trouble ahead when the short notes mature. The prognosis has its savor of reality, and if hard times lengthen and deepen overmuch may, in some cases, be fulfilled. But the reassuring argument is much the stronger. The railroad short notes are many in number, great in mass and diverse in terms. But in general they have been issued by strong corporations with large equities in dividends even if the dividends are reduced. A great proportion of them can be renewed even though a 6 per cent. note replaces a 5 per cent. one; and, when paid, they release just that amount of money for reinvestment—a trite fact, but one apt to be forgotten. Another point likely to be overlooked is the present-day saving power of capital when held in powerful hands of the individual. That massing of capital under single control has its palpable dangers when the individual is speculative and unscrupulous. But one of its good sides is its protective force in a corporation's crisis where a host of stockholders or even a body of directors cannot act with either effectiveness or promptitude. The Erie case itself is a vivid illustration. In 1873 and the few years following a road in the plight of the Erie would inevitably have gone through bankruptcy, and so late as 1895 the Erie practically did so under the form of stock assessments. It is now, for the time being at least, saved by individual action and resources which seem likely to be used hereafter in the case of other embarrassed big lines even should the hard railroad times protract into a "long drag."

Another feature of the interesting and important short note situation calls for attention. The holder of a short note of a perfectly solvent railroad corporation has, so long as the corporation is absolutely solvent, what amounts to a mortgage security. Using an outside illustration, A holds B's note of hand. A knows that B holds a profitable business block worth say $50,000, but carrying a first mortgage of $10,000, a second mortgage of the same amount, and thus with an equity of $30,000 which at forced sale would be but slightly reduced. The judgment against the equity, in case of default on the note, is in such a case ample security for A. His peril is in B's possible addition of a third mortgage or extension of liabilities in other directions, among which A must take his chance. Substitute for A the holder of the short term railroad note and for B the railroad corporation and the peril at once becomes obvious. The instant any railroad corporation begins to impair the equities that secure its note of hand that note becomes shady and a single grave instance of the kind affects that security as a class. The temptation to such a policy is plain enough. The weak railroad corporation is led to it as an ultimate resort to prevent a receivership, the solvent company is tempted by the prospect of securing a loan at a lower interest rate. As a broad and general policy, therefore, the policy of the railroad corporation should be the conservation of the equities which secure the short note. It may sometimes be difficult, but it is the price to be paid if the short note is to be renewed, if the whole structure of short note credit is not to be roughly shaken and if new crises of the Erie type are not to ensue without the Erie solution. In the short note matter, as well as in other railroad affairs during the present stress, wisdom points toward fore-thoughtful conservatism. That the notes happen to be "short" thus compelling, in a sense, that policy of conservatism as a condition of payment or renewal is perhaps a benign ultimate fact for the railroad companies as well as for the investing public. Had the notes been "long" though the fiscal strain would be relaxed, the inducement to immediate prudence would be relaxed also.

Train Accidents in March.

In March as in February the number of train accidents occurring in the United States which were of sufficient magnitude to come within the definition of "serious," as used in this column, was very small. But, though the number is small there need be no fear that the full record of the month will lack variety, nor is there any warrant for relaxation of effort to provide safer service. It is gratifying to be able to record diminishing lists of deaths and injuries, and we shall hope to see still further improvement, but the losses of property in collisions and derailments will continue to aggregate large sums, we may be sure. Three of the collisions shown in the present list appear from the newspaper accounts to have been due to mistakes in giving or understanding telegraphic orders, showing that the expense of maintaining the block system is still grudged by some roads. And these are roads which know the value of the system, too. The worst accident in March, the derailment at Bristow, Oklahoma, causing the death of a mail clerk, a fireman and a trespasser, was caused by a large iron nut which had been placed on the rail. The front part of the train fell through a high trestle. It was running fast, but the passenger car that was wrecked carried few passengers, which accounts in part for small number of injuries. How the nut came on the rail is not known, and we have classed the accident as due to "malicious obstruction."

TRAIN ACCIDENTS IN THE UNITED STATES IN MARCH, 1908

Of the few electric car accidents reported in the newspapers as occurring in the month of March, none had fatal results, so far as we have observed, though one derailment (in Detroit, Mich., on the 24th) resulted in the injury of 20 persons, besides as many more who sustained minor hurts. A car running about 25 miles an hour was derailed (by a defect in the track, it is said) and it ran into and demolished the front of a two-story building.

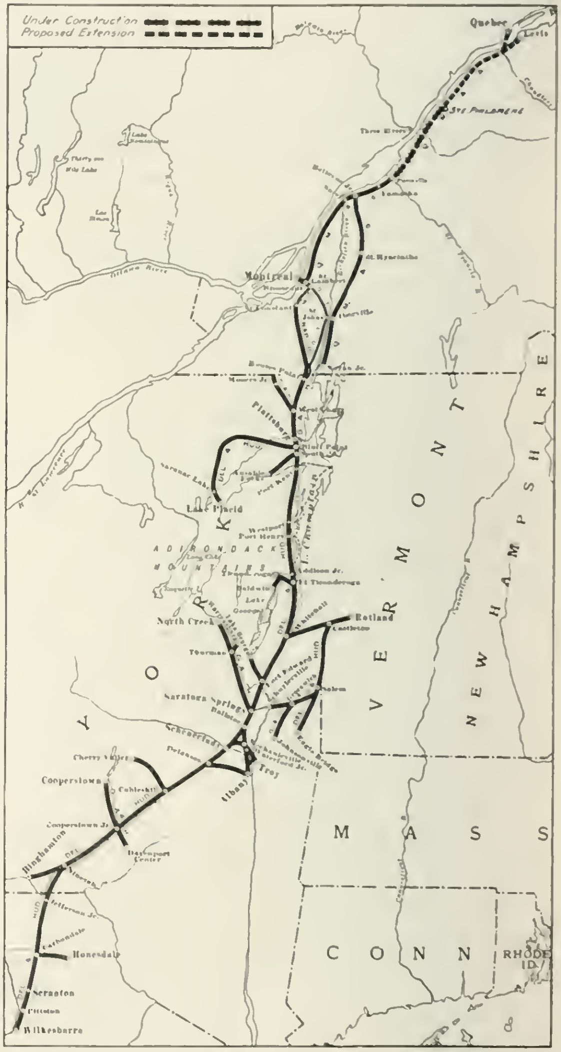
It must be remembered that no one has the least semblance of right to use a railroad as a public footpath or sidewalk. This salutary truth appears in Accident Bulletin No. 1, which has been issued by the State Railroad Commission of Indiana. It is not a novel declaration of truth, but it is especially welcome, coming, as it does, from an official body in one of those states where the lawless use of railroad rights-of-way has been glaringly common. People who have walked on the track all their lives and who deem the privilege a right, are not going to be subdued easily; but correction must come, some time, and it is well that a vigorous and authoritative warning should be sounded. The Indiana commission has issued two quarterly accident bulletins, which together cover the half year ending December 31, 1907. The statistics are not well arranged, and the commission has secured little or no useful information concerning the causes of the accidents reported, but the observations offered in the report show a commendable spirit. Attention is called to the fact that highway crossings, at which 28 persons were killed in the first three months, within the state of Indiana, are now in many cases more dangerous than formerly, because interurban electric railroads are laid parallel to the older steam roads, so that wayfarers have to cross two railroads practically at the same moment. The commissioners hear that enginemen do not sound the whistles for highways as clearly and regularly as they should, and they are going to issue a circular calling attention to the penalties prescribed by law for neglect to whistle, emphasizing the statement with a record of the number of deaths which have occurred at crossings. It is well that the engineman should be called to account in this matter, but it is to be hoped that the commissioners are not innocent enough to believe that a correction of this fault will have much effect in reducing the number of casualties at crossings. The first bulletin calls attention to the fact that in small towns the telegraph office, or the signal tower, often is made the village loafing place, though the rules of the railroads forbid it. It is suggested that the city and town police authorities ought to correct this bad practice.

[1] Abbreviations and marks used in Accident List:

rc........Rear collision.
bc........Butting collision.
xc........Other collisions; as at crossings or in yards. Where only one train is mentioned, it is usually a case of a train running into a standing car or cars, or a collision due to a train breaking in two on a descending grade.
b.........Broken.
d.........Defective.
dr........Defect of roadway.
eq........Defect in car or engine.
n.........Negligence.
unf.....Unforeseen obstruction.
unx......Unexplained.
derail. ...Open derailing switch (negligence of engineman or signalman).
ms........Misplaced switch.
acc obst..Accidental obstruction.
malice....Malicious obstruction of track or misplacement of switch.
boiler.....Explosion of boiler of locomotive on road.
fire.......Cars burned while running.
Pass......Passenger train.
Ft ......Freight train (includes empty engines, work trains, etc.).
*Wreck wholly or partly destroyed by fire.
†One or more passengers killed.

Delaware & Hudson Company.

The seventy-eighth annual report of the Delaware & Hudson Company has many points of difference from the company's previous statements. It reflects in many ways the new management of the property. The gross and net earnings and the net income are no longer given by divisions, nor are the assets and liabilities described in as great detail as formerly. On the other hand, more operating statistics, such as those for locomotive mileage and its cost, and home and foreign freight car mileage, are given. A new table shows the tonnage of different commodities carried during the years 1900 to 1907, inclusive. Over half of the 70 pages of the report are taken up with a description of the steam and electric

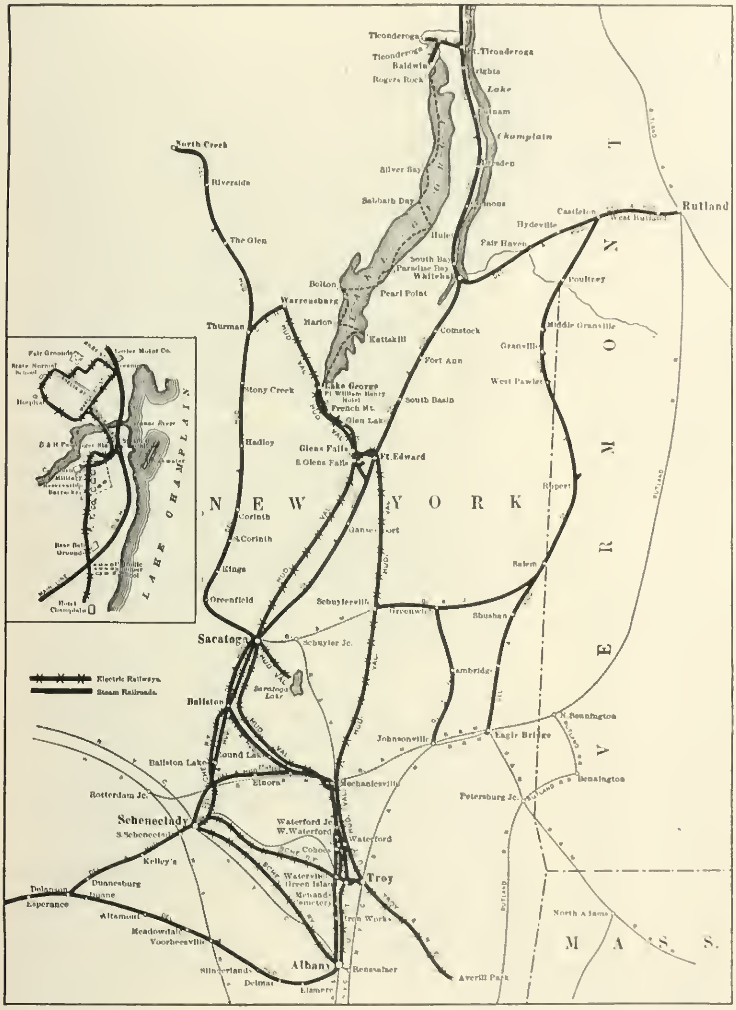


Delaware & Hudson Steam Lines.

railroads acquired during the last two years. The new coal properties during that time acquired are also described in detail.

The year was one of great activity in the company's operation. Its collieries and washeries were operated to their full capacity throughout the year, producing 6,600,000 tons of anthracite coal out of a total anthracite production of 67,100,000 tons. At the same time the railroad lines handled a much larger traffic than during any previous year. Gross railroad earnings increased 18 per cent., from $17,100,000 in 1906, the previous high record figure, to $20,200,000. The increase came largely in coal freight earnings, which rose from $6,700,000 in 1906 to $9,100,000 last year, an increase of 36 per cent. Merchandise freight earnings increased 8 per cent., and passenger earnings, 5 per cent.

Against the increase of $3,100,000 in gross earnings there was a rise of $1,500,000 in operating expenses. Of this increase, maintenance of way was responsible for $448,000, maintenance of equipment for $320,000, and conducting transportation for $723,000. The increased cost of operation was due both to the larger amount of traffic and the increased cost of materials and labor. The year marked the culmination of advances in prices of material that began in the fall of 1905. There was an increase in the price of ties in 1907 over 1906, ranging from 11 to 13 per cent.; of finished products of iron and steel, such as axles, gray iron castings, steel castings and malleable castings, from 12 to 20 per cent., while the prices of copper wire, brass castings, journal bearings, Babbitt metal and other material in which copper enters largely, increased approximately 22 per cent. The cost of miscellaneous supplies increased from 2 to 3 per cent. At the same time, in common with other railroads, the rates of pay in almost all branches of the track, shop, engine, train and yard service were increased during the early part of the year, the total increase being equal to about 7 per cent. of the aggregate pay roll. Yet net railroad earnings were $8,400,000, against $6,800,000 in 1906.



Electric Railway Properties of the Delaware & Hudson.

Gross receipts of the coal department increased $4,600,000, or 25 per cent., but operating expenses increased a little more than this amount, so that net earnings of the coal department were $36,000 less than in 1906, being just under $1,200,000. The combined net earnings of the railroad and coal departments, therefore, were $9,600,000. To this must be added $1,500,000 of other income, making a total fund of a little more than $11,000,000 from which to pay taxes, fixed charges and dividends, this being an increase of $1,700,000 over the similar amount available in the previous year.

Fixed charges were $500,000 larger than in 1906, chiefly because of interest payments on the new $10,000,000 first lien 15-year 4½ per cent. equipment bonds dated July 1, 1907, and a full year's interest on the debentures of 1906. Net income was $6,500,000, which is equal to 15.25 per cent. on the outstanding capital stock, against $5,200,000 in 1906, or 12.28 per cent. on the stock. Lacking the "general profit and loss" account it is not possible to follow the disposition of this net income in 1907. The company reports a surplus for the year, that is, an increase in the amount to the credit of profit and loss, of $3,025,218. There was paid in dividends $3,816,000 (9 per cent on $42,400,000), which, subtracted from net income leaves $2,650,173 surplus for the year, as shown in the table at the end of this review. No information whatever is given as to the charges to income (general profit and loss) for improvements in 1907 but from this showing it would appear that no such charges were made. The income account for 1906 has been similarly rearranged, as is explained in detail in the table, and it shows a deficit of $691,212, as against a reported surplus in that year of $493,891.

Maintenance of way expenditures per mile operated were considerably higher last year than in 1906. Unit maintenance of equipment expenditures were lower, as was naturally to be expected, because a large amount of new equipment was bought. Maintenance of way per mile cost $2,171, against $1,648 in 1906. "Expenditures on account of railroad department construction," amounting to $3,400,000, were charged to capital account. Repairs of equipment cost $1,907 per locomotive, against $1,917 in 1906, $303 per passenger car, against $311 in 1906, and $44 per freight car, against $55 in 1906. There were 53 locomotives, 48 passenger cars, and 7,678 freight cars added to the equipment during the year. Railroad equipment account on the balance sheet was increased $10,300,000. In December, 1907, an appraisement of the equipment of the company was made by a mechanical engineer who was until recently superintendent of motive power of one of the trunk lines. He spent five weeks in and about the various shops and yards personally inspecting a sufficient number of locomotives and cars in each class and series to give an accurate idea of the general average condition of the equipment. He reported that all classes of equipment were well maintained, and estimated the aggregate value on December 31, 1907, at $25,563,798, which exceeds by $598,295 the amount at which the equipment is carried in the accounts.

Freight earnings increased $3,000,000, or 22 per cent., and freight density from 2,550,000 to 2,970,000 tons one mile per mile of road. The ton mile rate rose from 6.33 mills to 6.6 mills, but this was largely due to a change in accounting. The practice of crediting to earnings a nominal rate per ton mile lower than the average rate for commercial freight, and charging to expenses an equal amount for the transportation of company material was discontinued on September 1, 1907. The practice necessitated considerable extra work by station and accounting forces, with no increase in net revenues. The train load was 452 tons, against 460 tons in 1906, and 455 tons in 1905. The average number of tons per loaded car, however, increased from 24.27 tons to 25.55 tons. The freight earnings per revenue train mile were $2.99, against $2.93 in 1906.

The following table shows in percentages the proportion of the various commodity groups to the total freight tonnage during the last eight years:

	1900.	1901	1902	1903.	1904	1905.	1906.	1907
Agricultural products	9.63	6.10	6.97	5.81	5.82	5.03	5.51	4.47
Animal products	1.09	.97	1.12	.83	1.26	1.35	1.43	1.22
Mineral products	65.79	68.78	60.46	70.38	67.15	68.12	65.16	68.39
Forest products	4.20	5.35	6.69	4.59	4.74	4.31	4.66	4.52
Manufactures	12.69	12.07	15.72	12.42	12.84	13.00	15.18	12.57
Merchandise	1.68	1.79	2.15	1.24	1.75	2.10	2.02	1.79
Miscellaneous	4.92	4.94	6.89	4.70	6.41	6.09	6.04	[illegible]

The two largest increases during the year were in anthracite and bituminous coal. The increased tonnage of the latter product, which does not originate on the Delaware & Hudson lines, suggests that the interchange business with the Pennsylvania at South Wilkesbarre increased during the year, and that the Delaware &

Hudson is becoming more important as a through route for carriage of bituminous coal from the Pennsylvania fields to the Albany, Adirondack and New England territory. The other principal increases of more than 50,000 tons in descending order of tonnage were: ores, miscellaneous, stone, etc., lumber and grain. There were three decreases of over 50,000 tons: rails, 133,000 tons; other mill products, 54,000 tons, and flour, 53,000 tons.

Important additions and betterments were made during the year. There were built five miles of new second track, 17 miles of third track, and 16 miles of fourth track, a total of 38 miles of new additional tracks, besides 51 miles of sidings. These included a third and fourth track between Ballston, N. Y., and Saratoga, which was electrified and is now being operated by the Schenectady Railway and the Hudson Valley Railway jointly. They also include third and fourth tracks from Green Ridge, just north of Scranton, Pa., north to Carbondale, a part of the line where coal, merchandise and passenger traffic is dense. Construction of second track between Watervliet, N. Y., and Waterford Junction is nearly finished. This line carries the heaviest passenger business of the company, amounting in summer to over 60 trains a day. The construction of second track between Delanson, N. Y., and Schenectady, including improvement of grades and alinement, is also nearly finished. All the northbound coal traffic and most of the merchandise traffic pass over this section of the road. This new second track will have a maximum and substantially uniform grade of 45 ft. to the mile southbound. Much expense for pusher engines will be done away with and an increase in the trainload will be possible, as well as a relief of the congestion of this strip, which has often hampered the rapidity of operation of the connecting sections. During the year, 45 miles of single track and 111 miles of double track were equipped with automatic block signals. Except for 25 miles between Rouse's Point and Plattsburg, the whole main line is now so equipped, also the Lake George branch, the Schenectady and Delanson branch, and the Schenectady and Mechanicville branch, a total of 408 miles of line, of which 177 miles is single track and 231 miles has two, three or four tracks. The work of grade crossing elimination at Schenectady has been finished, and the new union station, which is used jointly with the New York Central, was recently opened.

For the past year or more the Delaware & Hudson has been under fire from certain stockholders who have made general allegations of mismanagement and particular criticisms of recent purchases of steam and electric railways and of coal lands. In answer to the particular criticisms of recent purchases, the company devotes over half the report to a detailed description of the new properties and the reasons for buying them.

First, in regard to the new coal lands, President Loree states that it has been the company's policy for many years to acquire coal lands as opportunity offered. So far as could be ascertained there were no available tracts in the Lackawanna or the Wyoming valleys. The only tracts which could be found were in Schuylkill county, Pa., which is south of Wilkesbarre and is not now reached by the Delaware & Hudson lines. Here nine tracts were acquired, which are named and each described. They include 2,434 acres of surface area and 3,461 acres of coal land area, with an estimated mineable tonnage of 423,265,353 tons of coal. It was estimated that on December 31, 1904, the unmined tonnage of the Delaware & Hudson amounted to 218,644,286 tons, and mining has been going on rapidly since that time. It can easily be seen, therefore, that the new coal lands are a large and substantial reserve for the company to fall back upon as its previously owned supplies become exhausted. The total cost of the new properties was $5,219,-850, which amounts to 1.23 cents per estimated mineable ton. These new properties are owned by the Schuylkill Coal & Iron Company and the Shanferoke Coal Company, all of the stock of both of which is owned by the Hudson Coal Company, all of the stock of which is owned by the Delaware & Hudson.

Each of the new railroad properties which has been bought is described in detail, with a separate map, a chart showing earnings, and a description of its organization, property, mileage and traffic with, in the case of the electric roads, information under the additional heads of population and franchises.

Of the steam railroads bought, the largest is the Quebec, Montreal & Southern, which, as shown on the accompanying map, runs from Noyan Junction, at the northern end of Lake Champlain, and also from Montreal, to Pierreville on the St. Lawrence river below Montreal. From here an extension, which is to be finished about July 1, is being built to Ste. Philomene, 48½ miles. Eventually the line is to be extended to Levis and across the river to Quebec. Including the extension now under construction, the Quebec, Montreal & Southern has 206 miles of line. This road was bought "for the purpose of protecting the supply of pulp wood necessary for the continued operation and enlargement of the paper mills already located along the line of the Delaware & Hudson." The extension now building will draw supplies of wood both from the Lotbiniere & Megantic Railroad at St. Philomene and also from the northern side of the St. Lawrence by floats, thus tapping the great pulp supplies of that northern country. The line when finished to Quebec will also be, in connection with the Delaware & Hudson to Albany, and the New York Central from Albany to New York, the shortest line between Quebec and New York. As an unimportant local road the Quebec, Montreal & Southern is now earning a little over operating expenses, and the new extension should bring a large increase in earnings and in profits. Its gross earnings in 1907 were about $300,000. It is evident that the acquisition of this road was largely a protective measure. An estimate is given showing the total revenue of the Delaware & Hudson from the paper mill industry to be $2,800,000 a year. Unless the raw material supply of these manufacturers is protected their traffic cannot be retained by the road.

The Napierville Junction Railway, the second of the new properties, was organized to build a connecting line from the United States boundary one mile north of Rouse's Point, N. Y., to St. Constant, Que., 27 miles. St. Constant is about 20 miles southwest of Montreal. This connection from Rouse's Point to St. Constant has now been built, and negotiations are under way for trackage rights over the Grand Trunk from St. Constant to Montreal.

The Greenwich & Johnsonville runs from Johnsonville, Washington county, N. Y., on the Fitchburg division of the Boston & Maine, north to Greenwich, and from Greenwich, both east to Salem on the Rutland branch of the Delaware & Hudson, and west to Schuylerville on the Hudson Valley (electric) Railway, a total of 34 miles. In 1907 it had gross earnings of about $95,000 and net earnings of about $40,000. It runs through a farming country and there are about 20 manufacturing industries on the line, with numerous possibilities for further industrial development.

The electric roads controlled by the Delaware & Hudson are shown in the map on page 565, which also includes the Delaware & Hudson steam lines in their vicinity. The two services supplement each other in passenger service. President Loree states that the net income of all the electric lines controlled by the Delaware & Hudson is equivalent to a little over 4 per cent. on their cost. Returns on the Hudson Valley are only 3 per cent., but measures are actively under way to increase earnings and reduce expenses on this property, and it is believed that these results can be materially improved.

The United Traction Company operates the street railway service at Albany, Rensselaer, Watervliet, Troy, Lansingburg, Green Island, Cohoes and Waterford, N. Y., and maintains interurban service between these places, carrying freight and express as well as passengers. Its gross earnings in 1907 were about $2,000,000, and its net earnings about $900,000. By its ownership of the local lines it controls the entrance of other electric lines into Albany and Troy. The Albany & Hudson, the Schenectady Railway, and the Hudson Valley all have contracts for use of its tracks. It is evident that it is by far the most profitable of the Delaware & Hudson's electric railways.

The Hudson Valley Railway runs from Waterford, N. Y., from which it has entrance into Troy over the tracks of the United Traction Company, north to Warrensburg. Between Mechanicville and Glens Falls it has two lines, one via Schuylerville, the other via Saratoga. The Saratoga line is not continuous, but passengers have to walk across Broadway, in that city. The mileage operated, including short branches, is 127 miles, of which five miles is trackage rights of the United Traction Company, and six miles, Delaware & Hudson trackage. The company owns the Warren County Light, Heat & Power Company, which has valuable franchises for transmitting power across country which could not be acquired by an electric railway, the Fort William Henry Hotel and Park on the southern end of Lake George, and two other amusement parks. In 1903 its gross earnings were about $295,000 and its net earnings about $20,000. Last year its gross earnings were about $625,000 and its net earnings about $230,000.

The Schenectady Railway is owned by the Delaware & Hudson and the New York Central & Hudson River jointly, the New York Central interest being held by the Mohawk Valley Company. It owns the local street railway system of Schenectady and lines from Schenectady to Albany, from Schenectady to Troy, and from Schenectady to Saratoga, of which the Schenectady to Albany line is a strong competitor for passenger service of the main line of the New York Central. It gives the Fonda, Johnstown & Gloversville an entrance into Schenectady. It does a profitable package express business. Its gross earnings in 1907 were about $1,120,000, and its net earnings about $260,000.

The Troy & New England operates an unimportant electric line from Albion, a suburb of Troy, to Averill Park, a new "real estate" suburb further out. At Albion it connects with the United Traction Company. In 1907 its gross earnings were about $32,000 and its net earnings about $7,000. Its main value to the Delaware & Hudson is potential. It was chartered to build a line from Troy to State Line, Mass., and Pittsfield, on the Boston & Albany. This franchise would be valuable if the Delaware & Hudson should at any time desire to build a connection with the New York, New Haven & Hartford.

The Plattsburg Traction Company, which is shown separately on the map, operates eight miles of single-track electric line in the city of Plattsburg, N. Y., which has a population of about 10,000 people in addition to a large transient population. In the year ended June 30, 1907, its gross earnings were about $22,500 and its net earnings about $10,500.

It is evident that the various purchases of coal lands, railroads and electric railways recently made by the Delaware & Hudson are part of a policy of expansion. The value of most of them lies in the future rather than in the present. The report does not give the cost of these various properties, so that it is impossible to judge whether their probable value is commensurate with the price paid for them, but it would appear that each one of them is desirable in the future development of the company. Completion of the Canadian line will give the Delaware & Hudson shorter through lines to Canadian points and will protect sources of raw materials for one of its most important manufacturing industries. Ownership of the electric lines protects the most important local territory of the company. Ownership of the new coal lands insures a long extension of the most profitable part of the company's business. These purchases were made previous to the connection of Mr. Loree with the property; they are likely to be worked out to successful use under his direction.

In buying all these properties and making the various improvements mentioned, a considerable floating debt has been formed. Loans payable on December 31, 1907, amounted to $10,800,000, a new item, which did not appear on December 31, 1906. In order to meet these debts and other needs, the stockholders have been asked to authorize, on May 12, 1908, a first and refunding mortgage securing not more than $50,000,000 35-year (or longer) 4 per cent. bonds, the present issue of which is to be limited to $20,000,000. It is believed that these bonds will have a ready sale, for the credit of the Delaware & Hudson is high.

One of the strongest assets of the company at the present time is the fact that Mr. Loree is its president. His genius for railroad management has already been shown on the Delaware & Hudson, not only in the fine results obtained during the trying year of 1907, but by the monthly reports of earnings since the close of that year. The Delaware & Hudson is one of the very few roads to report increases in both gross and net earnings for the months of January and February, the latest months for which returns have yet been issued.

The results of the last two years' operation, not including the lines in Canada or the electric lines, are summarized below:

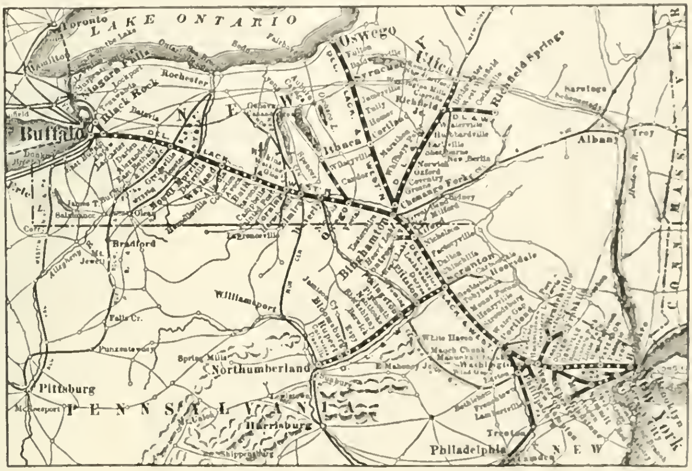
	1907.	1906.
Mileage worked	845	843
Passenger earnings	$2,945,408	$2,814,082
Coal freight earnings	9,081,664	6,665,732
Merchandise f't earnings.	7,533,169	6,949,898
Railroad gross earnings.	20,175,791	17,050,029
Maint. way and structures	1,836,871	1,388,884
Maint. of equipment	2,336,273	2,016,386
Conducting transportation.	7,227,310	6,504,653
General expenses	375,761	368,287
Railroad operating expenses	11,776,214	10,278,211
Railroad net earnings	8,399,579	6,771,819
Gross earnings, coal department	23,184,766	18,571,342
Net earnings, coal department.	1,173,206	1,209,519
Net earnings, railroad and coal	9,572,785	7,981,338
Other income	1,468,996	1,405,672
Net income	6,466,173	5,156,138
Dividends	3,816,000	2,867,174
*Improvement appropriations	....	2,980,176
Year's surplus	2,650,173	Def 691,212

*The sums charged in 1907 to income (general profit and loss) for improvements are not given either separately or in totals. The company, however, reports a surplus for the year (increase in amount at credit of profit and loss) of $3,025,218, which, added to dividend payments of $3,816,000, is $375,045 larger than the net income of 1907. In 1906 there was charged for new railroad construction $884,910, and for new railroad equipment $1,592,683, a total of $2,477,594 in the railroad department. In 1906 there was also charged for unmined coal $262,663, and for advances on unmined coal $239,919, a total of $502,582 in the coal department. There was, therefore, a total of $2,980,176 charged to income and credited to the various accounts mentioned in 1906. At the same time the company reported a surplus for the year of $493,801, which, added to the dividend payments of $2,867,174, is $691,212 larger than the net income for 1906. This difference is accordingly shown as a deficit for that year.

Delaware, Lackawanna & Western.

The Lackawanna to-day occupies probably a stronger financial position than any other American railroad. The profits from its anthracite coal mines are very large. They were particularly large during the year ended December 31, 1907. The production and the movement of anthracite coal has been little affected by the panic and industrial depression, so that the Lackawanna has had more favorable earnings than most other companies during the last few trying months. With a surplus for 1907 of $4,850,000 after a betterment appropriation of $3,820,000 the company is in a position to continue important improvements which were under way in more prosperous times.

This is a very great advantage for not only do materials and labor cost less than they would have one or two years ago, but improvements can be made more cheaply when there is not a rush of traffic. The average railroad makes large improvements only when forced to do so by pressing necessity of the breakdown of its facilities. New work is undertaken at a time when traffic is congested, costs are high and efficiency is low. When industrial depression comes, all improvements which have not progressed too far are indefinitely postponed. In this way the average railroad gets the least for its money and goes through the same experience on each recurring wave of increased traffic, never having sufficient facilities to meet its needs in busy times. By having sufficient resources to carry on improvement work during dull periods, a railroad gains a large advantage both in doing its new work better and more cheaply and also in being ready for great increases of traffic when they arrive. The Pennsylvania in carrying out the improvement work mapped out by Mr. Cassatt early in 1903 put itself in position to handle smoothly the immense traffic of 1906 and the first half of 1907. The Lackawanna is in an even stronger position in that it can continue improvement work even in the present trying times. It is probably the only railroad company, for instance, which is planning to begin work at once on an important cut-off.



Delaware, Lackawanna & Western.

This new line, 29 miles long, is to be built from a point between Dover, N. J., and Hackettstown, to a point near Portland, Pa. This section is the most congested part of the main line. The present line is crooked and hilly and has two tunnels, one of them a single-track tunnel operated on a gauntlet. The new line is to have reduced grades, light curvature and no tunnels and be 11½ miles shorter than the present line. About three years will be required for its construction. According to President Truesdale, "It is believed that contracts for the construction of this new line can be let to advantage in the near future, and that by the time it can be completed it will be urgently required to satisfactorily handle the company's traffic, which has been growing so rapidly in recent years that during the past year the capacity of the road for economical and satisfactory operation was reached for several months in succession."

Gross railroad earnings were $4,300,000 larger than ever before in the company's history. They were $37,300,000, against $33,000,000 in 1906, an increase of 13 per cent. Operating expenses increased $2,600,000, or 14 per cent., leaving net earnings of $15,700,000, against $14,100,000 in 1906, a gain of $1,700,000, or 12 per cent. Net earnings of the coal department were $4,200,000, against $2,700,000 in 1906, a rise of 56 per cent. The total income available for fixed charges and dividends was $20,900,000, against $17,600,000 in the previous year. During the year $438,000 first consolidated mortgage 7 per cent. bonds of the Oswego & Syracuse and also the outstanding $3,067,000 consolidated (then first) mortgage bonds of the Delaware, Lackawanna & Western matured, leaving the company without any bonded indebtedness of its own issue. There was a decrease in the item of interest on bonds of 32 per cent., and this item will disappear entirely in the income account for 1908. Net income was $13,900,000, which is equal to 53 per cent. on the stock, and this after including in operating expenses $2,000,000 for extraordinary expenditures. Dividends of 20 per cent. were paid. Last year renewals and betterments amounting to $3,800,000 were charged against income and in 1906 renewals and betterments amounting to $5,600,000. The surplus for 1907 was $4,850,000, against $590,000 in 1906.

As on the Delaware & Hudson, both gross and net earnings were the largest in the history of the company. One particularly favorable development was the fact that the increase in earnings from merchandise freight was larger than in any previous year, amounting to 18 per cent. This increase would have been larger if it had not been for the great falling off in general traffic during November and December. Coal freight earnings increased 11 per cent., passenger earnings 9 per cent., express earnings 7 per cent. and earnings from transportation of milk, which amounted to $786,000, or more than the express earnings, increased 2 per cent. Alone the mail earnings decreased, by 3 per cent., and Mr. Truesdale takes occasion to remark that the service required by the post office department is more expensive and exacting than ever before, while at the same time the pay has been reduced.

As against the increase of 13 per cent. in gross earnings, operating expenses increased 14 per cent. The cost of maintenance of way was substantially the same as in 1906. The cost of maintaining equipment increased 28 per cent. and of conducting transportation 17 per cent., while general expenses increased 6 per cent. The Lackawanna includes such a large proportion of improvements in its maintenance of way account that this division of operating expenses by no means represents the costs necessary to keep the road in condition for operation. Betterments and additions costing over $2,000,000 were included in operating expenses and most of these were in maintenance of way. Including these, maintenance of way cost $5,198 per mile in 1907 and $5,160 in 1906. These are very high figures. They indicate the extensive improvement work that is being carried out by the Lackawanna.

Unit maintenance of equipment expenditures are not high as compared with other roads, but the splendid condition of the company's equipment is responsible for this. Repairs cost $1,722 per locomotive, against $1,461 in 1906; $628 per passenger car, against $472 in 1906, and $59 per freight car, against $46 in 1906. The increase in the cost of each of these items was probably largely caused by higher prices for labor and materials. During the last two years there have been bought and paid for out of income, 75 new locomotives, 69 passenger train cars, and 6,688 freight cars. A reason for the increase in cost of locomotive repairs was the fact that during several months of the year the business handled taxed the capacity of the motive power to the utmost, a condition under which locomotive repairs increase disproportionately.

Although freight traffic has about doubled during the past nine years, the total number of freight cars owned is about the same as at the beginning of the year 1900. The modern cars have from 60 to 100 per cent. greater capacity than those generally in use in 1900. They are not, however, regularly loaded to their full capacity, so that to a considerable extent the large increase in tonnage handled, with no increase in the number of cars owned, has been due to more efficient handling of equipment.

Conducting transportation increased in every item but one, and that an unimportant one. Most of the increase was due to advance in wages. It cost more to mine anthracite coal, and bituminous coal bought was more expensive than during the previous year. Although there were no serious accidents during the year, the loss and damage account was considerably larger, due, Mr. Truesdale believes, to the fact that railroads are being constantly held to stricter responsibility for accidents to persons or damages to freight.

Under general expenses, salaries of clerks and attendants increased 31 per cent. This was partly due to an increase in pay and partly to the larger forces which had to be employed to meet the requirements of various railroad commissions. Mr. Truesdale remarks that, "The public generally little appreciates how great and onerous this burden is steadily growing upon the railroads."

There was an increase of 15 per cent. in the number of tons of coal carried one mile and of 19 per cent. in the number of tons of merchandise freight. The ton mile rate on coal was 8.48 mills, and on merchandise 6.82 mills, which is a reversal of this relation on most roads. The train load was 490 tons, against 466 tons in 1906. The earnings per freight train mile on all freight were $3.53, against $3.21 in 1906, and $3.01 in 1905.

Improvements which were carried on during the year included the general rebuilding of about 35 miles of the most important telegraph lines, work on the new terminal at Hoboken, both for passengers and freight; construction of a second double-track tunnel through Bergen Hill, which is to be finished by the end of the summer; new third track up the west side of the Pocono mountain, from Moscow, Pa., to Gouldsboro; new shops, passenger station and office building at Scranton, including general rearrangement of yards, and new block signals. The new locomotive repair shops at Kingsland, Pa., were put in service during the year.

Mr. Truesdale discusses the railroad outlook for 1908 at some length. Part of his remarks have already been quoted in the *Railroad Gazette* (March 6, 1908, page 325). It has always been his custom to speak frankly about these matters. He believes that the railroads are being used as the playthings of politicians.

The following table shows the income results for the past two years:

	1907	1906.
Mileage worked	957	957
Passenger earnings	$9,757,596	$8,216,224
Coal freight earnings	14,361,416	12,902,851
Mdse. freight earnings	12,235,868	10,342,423
Railroad gross earnings	37,264,473	32,962,880
Maint. way and structures	4,974,888	4,937,771
Maint. of equipment	3,731,082	2,909,335
Conducting transportation	12,254,278	10,563,943
General expenses	579,491	548,392
Railroad operating expenses	21,539,739	18,899,442
Railroad net earnings	15,724,734	14,063,438
Gross earnings, coal department	40,370,720	36,108,569
Net earnings, coal department	4,224,921	3,655,119
Net earnings, railroad and coal	19,949,655	17,718,557
Other income	940,234	844,256
Net income	13,909,415	11,378,691
Dividends	5,240,000	5,240,000
Improvement appropriations	3,820,088	5,551,619
Year's surplus	4,849,328	587,072

NEW PUBLICATIONS.

The History of State Regulation in New York. Being Appendix J to the Report of the Public Service Commission of the First District. New York: 1908. Paper; 20 pages; 5¾x9 in.

This pamphlet has a very considerable value to the historian, since it collates not only the facts of state regulation in New York in past years, but includes a brief history of the principal rapid transit enterprises in the state and a summary of the rapid transit acts.

The Earning Power of Railroads. 1908 edition. Compiled and edited by Floyd W. Mundy, of Jas. H. Oliphant & Co., New York. 376 pages, 5x7. Cloth.

This statistical volume presents in comparative form the income accounts of 131 railroads, comprising most of the mileage of the country, and adds notes on their financial and physical history. The careful student may not always fully concur in some of the methods of derivation, but the value of the book is intended rather to be in its usefulness for quick reference. Its approximations of earnings, different classes of expenses, and capital, on a per-mile basis, are readily available.

Interborough-Metropolitan Company. A chart compiled in the statistical department of Kountze Bros., Bankers, New York, by M. E. Hatfield, Statistician.

This chart, which is dated March 1, 1908, and has just been issued, was compiled from information obtained from authorized accounting officers of the Interborough-Metropolitan Company. It sums up in complete form the various companies in this merger of subway, elevated and surface lines in New York City and the territory north of it. The Interborough-Metropolitan Company is described as "a business corporation and not a railroad corporation." A summary shows in one table all the various companies, their mileage, their stocks and bonds and the proportion owned directly and indirectly by the Interborough-Metropolitan, annual interest charges, guaranteed rentals and total fixed charges of each company. The chart is an exceedingly painstaking piece of work and gives a clear view of the whole traction situation. A similar chart, though not as extensive in its information, which was compiled by the Public Service Commission, is published in another column.

Graphical Handbook for Reinforced Concrete Design. By John Hawksworth, C.E. New York: D. Van Nostrand Co. 61 pages, 9 in. x 11 in.; 15 plates; cloth. Price, $2.50.

The object of this book is to present a short cut to concrete designing, and it is intended chiefly for those architects and engineers whose work in this material is intermittent and does not warrant the steady employment of a concrete engineer. In such offices the use of a graphical handbook like this should render it unnecessary to call in expert assistance for the solution of the class of problems that are ordinarily encountered.

The book opens with an introduction in which there is a general discussion of the methods employed in the development of a reinforced concrete design and a broad statement of the basis for the several plates that follow. In the presentation of these plates, one scheme is invariably followed. A general and detailed description of the plate is first given, followed by discussion of what it is intended to accomplish. Usually some general data are assumed. For example, in the plates for the determination of the dimensions of hooped concrete columns, one plate assumes the longitudinal reinforcement at six equally spaced rods set around the outside; in another, the assumption is that there are to be eight such rods. With these data alone the plate is such that, for a given load, the diameter of the column, the diameter of the longitudinal rods, and the diameter and pitch of the hooping wires can be at once determined. The same thing can be done in the determination of the resisting moments, spacing of bars, bending moments, location of the neutral axis, shearing resistance of various combinations of concrete and steel, square columns with various unit stresses, square columns in accordance with the New York building code and various other matters concluding with the work of designing a reinforced concrete structure.

For those who are not disposed to accept such plates and tables as these on faith, there is an appendix in which the formulas upon which the plates are based are given and the methods of their determination fully discussed. The book will, therefore, serve two classes: those who do not care to check results, and those who are cautious and careful enough to be sure that they are right before going ahead. Hence its value for rapid calculations is very great, and in this respect will compare with the slide rule as a means for facilitating calculations where, if the instrument is properly graduated, the results are invariably accurate. In the same way, with a given plate, accurately drawn, the results must be true, and these plates ought to be useful in place of the elaborate and somewhat complicated calculations now employed.

The Strength of Chain Links.—This is the subject of Bulletin No. 18 of the Engineering Experiment Station of the University of Illinois. A series of experiments on chain links and circular rings, covering a period of two years, has been made for the purpose of confirming or disproving a theoretical analysis of the stresses in links and rings. A comparison of calculated and measured distortions affords the desired test. The result of the experiments is a complete confirmation of the analysis. Having a reliable theory, the bending moments and maximum stresses are calculated for links of various forms and the results of such calculations are applied to the formulas for the loading of chains given by Unwin, Bach and Weisbach. It is shown that the usual formulas for chain loads give maximum tensile stresses of 33,000 to 40,000 lbs. per sq. in., and maximum compressive stresses of 60,000 lbs. per sq. in. New formulas for safe loads are proposed. The bulletin has four appendices giving in full the theoretical discussion which is the basis of the experimental work. This bulletin will be of special interest to all engineers and manufacturers concerned in any way with hoisting and transmission. Copies may be had upon application to the Director, Engineering Experiment Station, Urbana, Ill.

Rolling a Compound Rail Section.

Crafton Station, Pittsburgh, Pa., April 6, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

During the recent Maintenance of Way convention, inquiries were made concerning the three bearing angles on the Heinle rail. A number of railroad men and rail manufacturers are as yet unable to see how these angles can be made practical.

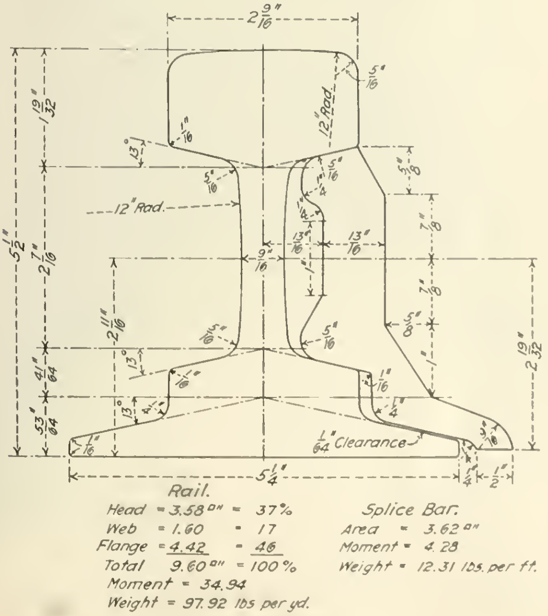
As explained in my communication in the *Railroad Gazette* of January 31, 1908, the standard flange is formed by lateral compression by the rolls, which churn the metal through the passes. The effect of this is to rapidly wear those roll surfaces depended on for accuracy, and, besides, to set up all kinds of internal strains in the metal while it is elongating. The mechanical disparities and the uneven cooling make the use of camber necessary; these influences also alter the relative position of all angles.

In rolling the Heinle section, no such mechanical difficulties are encountered; all angles are necessarily in the solid metal in the roll groove, and, therefore, all integral parts are elongated at the same rate of speed. This eliminates longitudinal tensions. There is no distortion, the cooling is uniform, and there is far less wear on the roll surfaces. Angles are not varied so much and there is more chance for accuracy, because there is less mechanical strain.

The conformation of the Heinle rail is easy on the rolls and material, and does not call for unnatural means to produce true sections. The purchaser will receive a structurally good article in spite of the present practice.

I intend that the third or lower angle on the splice bar shall be set off about 1/64 in. from the angle of the flange, so that the other two main bearing angles will engage the rail first. After they are drawn home, the third angle is brought to bear. This extra precaution will allow for variation in the section.

A. W. HEINLE,
Consulting Roll Turner



Heinle Rail and Splice Bar.

Record Steam Shovel Performance.

Abbottsford, B. C., April 3, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

I should like to call your attention to a record for March made by a one and one-quarter yard traction shovel now working on the V. V. & E. construction between Cloverdale, B. C., and Sumas, Wash. During the 26 working days this shovel loaded a total of 62,000 yards, making an average of nearly 2,400 yards per day. The best day's work totaled 3,340 yards and the poorest one was 1,536 yards, the day consisting of two 10-hour shifts. During this time the shovel made four cuts, necessitating four "move backs." The usual delays were experienced such as derailments, shooting down the bank, etc. The shovel was served by two 10-car trains making an average haul of 500 ft. The material handled was fine gravel with some loose rock, but at several points blue clay streaks were encountered making the dumping of the cars somewhat slow. The work was in charge of Mr. J. P. Livingston for the Puget Sound Bridge & Dredging Co., of Seattle. I should be glad to know if you have knowledge of any records equaling this for the same sized shovel.

W. J. COLVIN.

(The *Railroad Gazette* will welcome letters from any of its readers who know of any steam shovel performance as good as this. —EDITOR.)

Economy of Better Rails at Higher Cost.

Philadelphia, Pa., April 13, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

The problem of securing a better quality of steel in rails is one in which both the manufacturers and the consumers are always interested, particularly at this time, when wheel loads have apparently approached very closely to the limit of endurance of Bessemer steel. One of the elements in this problem is the question how far the price of steel can be increased to secure a given increase in the life of the rail. At first thought, one would say that a rail lasting 10 times as long as the ordinary rail would be worth 10 times as much. This off-hand conclusion, however, is quite erroneous.

Assuming the life of ordinary rail (costing $28 per ton at the mill) to be 5.8 years, and that its net cost per ton in track (including labor, and deducting the value of scrap received from track) is $23, its net cost for a period of 58 years (or 10 times the life of an ordinary rail) would be as follows:

10 tons ordinary rail at $23 per ton (in track)	$230
Compound interest, at 5 per cent, on ten successive investments of $23 each, intervals of 5.8 yrs.	1,257
	$1,487

Now, as $88 at compound interest for 58 years at 5 per cent. would = $1,491, it is evident that it would not be economical to pay more than $88 net cost in track (or $93 at the mill) for rail which would last 58 years. Hence, in this case, 10 times the life would not justify more than 3⅓ times the price.

Again, assuming the same figures as above for the cost and the life of ordinary rail, we find that $70 at compound interest at 5 per cent. would amount, in 5.8 years, to $93, so that this $70, invested, would perpetually renew the ordinary rail. Therefore, as we could pay $23 for a ton of ordinary rail and capitalize its perpetual renewal by a further investment of $70 making a total investment of $93, we could not afford to pay more than $93 net cost in track (or $98 at the mill) for rail which would last forever.

The formula below affords a convenient method of ascertaining what price could, economically, be paid for any special long-lived rail.

Let a = Net cost per ton of ordinary rail in track.
b = Life, in years, of ordinary rail.
c = Proportionate life of special rail.
("bc" would, of course, equal assumed life of special rail.)
x = Net cost per ton of special rail in track (to equal ordinary rail in economy).

Then,

$$\frac{\text{"ac" + comp. interest on "c" investments of "a" at "b" intervals}}{\text{Amount of \$1 at compound interest for "bc" years}} = x$$

Assuming that "a" = $23 and "b" = 5.8 years, and computing interest at 5 per cent., the corresponding values of "c" and "x" would be as follows:

"c"	"x"	"c"	"x"	"c"	"x"	"c"	"x"
2	$40	6	$76	10	$88	14	$91
3	54	7	80	11	89	15	92
4	63	8	83	12	90	z	93
5	70	9	86	13	91		

J. CRAIG CRAWFORD,
Assistant Engineer, Penna. R. R.

New Automatic Block Signals on the Erie Railroad.

The main line of the Erie Railroad between Jersey City and Middletown passes through Rutherford, Passaic, Paterson, Ridgewood, Suffern, Tuxedo and Goshen. There are two main tracks from Jersey City to Hackensack river bridge, 3.1 miles; four from Hackensack river bridge to Rutherford Junction, 4.8 miles; two from Rutherford Junction to Ridgewood Junction, 11.1 miles; four from Ridgewood Junction to Suffern, 11 miles, and two from Suffern to Middletown, 35.7 miles. The Bergen county cut-off, double-track, is a shorter line (10.3 miles) between Rutherford Junction and Ridgewood Junction.

Another division is the New Jersey & New York railroad, leaving the main line of the Erie about eight miles out of Jersey City, running north. It is double-tracked to Oradell, 19 miles. Automatic block signals, protecting the main tracks, have now been installed in all this territory, aggregating over 200 miles of track. The installation was made by The Hall Signal Company under the direction and specifications of W. H. Willis, the signal engineer of the railroad company.

The signals are of the electric motor semaphore type, with straight posts, set alongside the track, where there are two tracks, and carried either on overhead bridges or on bracket posts, where there are four tracks. The installation is the usual home and distant application without overlap. Between Jersey City and Suffern the average length of block is about one-half mile, and ordinarily a home and a distant signal arm are mounted on one post. Between Suffern and Middletown the average length of block is about 6,000 ft., and between stations some of the blocks are two miles long; and as a rule distant signals have separate posts. Pipe connected Hayes derailers are installed in all sidings leading to main track at about the fouling point, and there are indicators at all switches.

Within the territory protected by automatic signals are a large number of interlocking plants, the high signals of which are electrically slotted to work as block signals as well as interlocking signals. In each interlocking cabin there are annunciators, which indicate the approach of trains on the main tracks, and indicators, which repeat to the signalman the condition of each block controlled by a semi-automatic slotted signal. The signals are arranged on the normal danger plan. The home control wire is carried through a normally closed circuit contact on all facing switches. All switches, when moved from their normal position, shunt the track circuit. Wherever possible, switch indicators are operated in parallel, which permits the use of the same resistance for all electro-magnet windings.

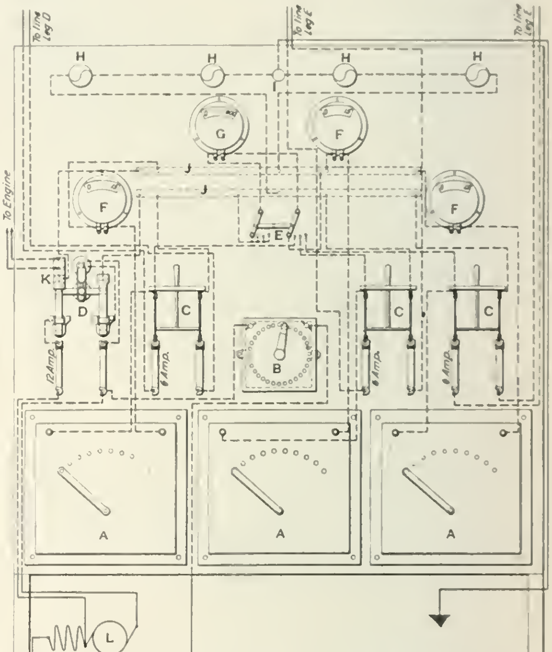
Indicator circuits are controlled from the home signal, which is at the entrance of the block in which the indicators are, in such manner that the indicators are set at stop when the home signal clears. The approach of a train to the home signal will not set the indicators at stop if the home signal remains at stop.

The line wires are carried on a line of cross-arms underneath the other wires on the telegraph pole line. They have triple braid weatherproof insulation. No. 10 B. & S. G. hard drawn copper wire is common for all signal circuits and No. 12 B. & S. G. hard drawn copper is used for all other purposes, except for battery charging wires. The charging wires are of various cross-sections, Nos. 10, 8 and 6 hard drawn copper, and are carried one at each end of the cross-arm for the signal wires.

All wires for connections to track and between pole line and instruments are soft drawn copper with okonite insulation and are carried in pine trunking supported on oak stakes. No. 14 B & S. G. wire with $^{5}/_{64}$ in. wall of rubber and one braid connects the pole line wires to the various instruments; No. 9 B. & S. G. wire with $^{5}/_{64}$ in. wall of rubber and one braid connects the charging wires on the pole line with the charging switches; and No. 6 B. & S. G. wire with ½ in. wall of rubber covered with one braid is used for all track connections. The braid on the common wire is red; on all other wire it is black.

Gravity battery, two cells for each section, operates all track circuits and is sheltered in cast iron chutes 7 ft. deep set in the ground in the usual manner.

Storage battery is used on all circuits other than track circuits. It is the Electric Storage Battery Company's Chloride Accumulator P T type box negative for 21 ampere hour capacity, excepting on the New Jersey & New York, where Westinghouse battery of a similar type is used. Each battery consists of five cells



A—Ward-Leonard special line resistance boxes, 61 ohms.

C—Charging line switches.
D—Double-pole underload circuit breaker — opens on 1 ampere.
E—Four circuit voltmeter switch
F—Charging circuit ammeter Weston Style 21 am.
G—Voltmeter.
H—Ground detector lamps, 250 volts.
I—Ground detector push button.
J—Bus bars.
K—Engine igniter, circuit breaker.
L—Generator.

Power Switchboard for Erie Railroad Block Signals, Ridgewood, N. J.

connected in series and there are only two plates in each cell. The positive plate of one cell is connected to the negative plate of the adjacent cell with one piece of heavy lead tape, the ends of which are welded into the plates. Thus there cannot be a poor contact in the connection between cells as is sometimes the case with bolted connections.

At signals the storage battery is sheltered in the iron case that supports the signal; at crossing bells, remote from signals, specially constructed iron cases are provided; in interlocking cabins the battery is in a cupboard in the basement of the building.

In no case are signal circuits operated from batteries that supply crossing bells. As a rule there is a battery at each one-arm or two-arm automatic signal. All storage battery is in duplicate, one set being charged while the other set is discharging.

Cells of 21 ampere-hour capacity were decided upon because it was desirable to charge them but once each week, and, on this basis for charging, this capacity was found to be sufficient for a possible maximum movement of 120 trains per day per track. At a few of the interlocking stations, however, because of the relatively large number of indicators and slots, it was found necessary to operate two sets of storage battery in parallel in order that the period of discharge be approximately the same as that for the battery on signals remote from the interlocking station.

The charging stations on the main line are at Rutherford Junction, Ridgewood Junction, Suffern, Oxford and Middletown; and on the New Jersey & New York, at Cherry Hill.

The illustrations show diagrammatically the location of the charging stations. It will be noted that the Middletown plant charges only one leg, or circuit, while all the others charge two, with the exception of the plant at Ridgewood Junction, which charges three legs, two on the main line and one on the Bergen County Railroad. It is expected that sometime in the future the automatic block signaling will be extended west to Port Jervis, in which event another charging leg will be added to the plant at Middletown. At Cherry Hill the limits of the north charging leg are to be extended with the signaling of the extension of the double-track north from Oradell.

Each charging leg, as shown, represents a maintainer's section, and the locations and limits for the charging plants were fixed upon mainly for this reason. Ordinarily all the legs, or circuits, served by one station are charged at the same time, but one leg can be charged at a time if so desired. Discharged battery is recharged as soon as it is cut out of service. Suitable switches are provided for cutting the discharged battery into the charging circuit and the reserve set, which is already charged, into the signal circuit. These charging switches are so constructed that the charging circuit cannot in any way become connected to the signal circuit; that both sets of battery may be cut in or cut out of the charging circuit at the same time; that one set of battery may be in the charging circuit while the other is in the signal circuit; or, that both batteries may be in parallel in the signal circuit.

Since the storage battery has a capacity of 24 ampere hours, the normal charging rate is three amperes. The circuits are designed so that the battery may be charged at this rate to a maximum of 2.6 volts per cell whenever it is considered desirable. The several legs of each charging plant are made to balance as nearly as possible so that there will be the same current in each. However, resistance rheostats are provided in series with the line so that, if for any reason the legs are out of balance, as would be the case if several sets of battery in one leg are cut out, balance could be obtained by throwing in resistance.

While the line loss in charging is considerable, it is not considered objectionable so long as the line voltage does not exceed 550.

The switchboard shown in the diagrammatic view is that at Ridgewood Junction. All the other switchboards are similar except that they provide for two charging legs whereas this board provides for three.

The electrical instruments and switches are of the usual isolated plant switchboard type mounted upon an extra quality heavy slate panel.

The circuit breaker, which is double pole, operates to open the generator circuit with a current of one ampere or less, and also takes the place of the usual generator circuit switch. Attached to one blade of the circuit breaker, as shown at K, is an insulated contact which opens the igniter circuit of the gasolene engine when the circuit breaker falls out. This avoids possible damage to machinery due to the engine racing when suddenly relieved of its load during the absence of the attendant.

The line rheostats have a total resistance of 64 ohms each, divided into equal steps. The resistance coils are built to withstand very high temperatures without injury.

All of the generators are of Crocker-Wheeler make. They are shunt wound, belt driven, and have a rated capacity sufficient to deliver six amperes at 550 volts, except at Ridgewood Junction, where the output is nine amperes at 550 volts. The gasolene engines driving the generators are Fairbanks, Morse & Company's vertical type. All of them are rated at 6 h.p., excepting that one at Ridgewood Junction, which is 9 h.p.

The storage-battery diagrams are as shown below. There are five cells of battery in each set and the maximum counter electromotive force is 2.6 volts per cell. The maximum current generated is 550 volts.

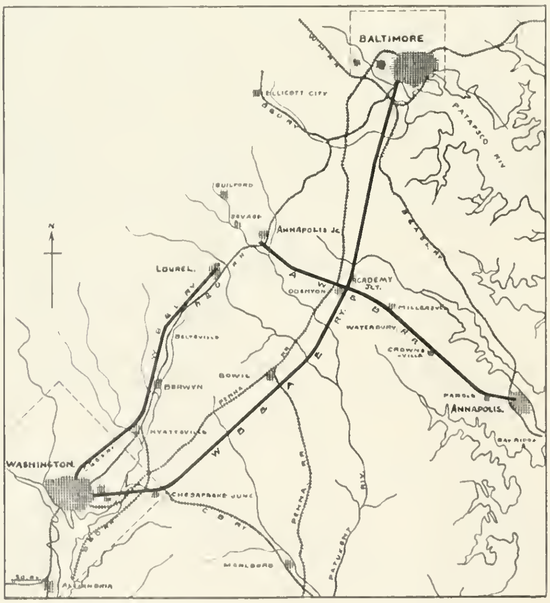
The Washington, Baltimore & Annapolis.

The Washington, Baltimore & Annapolis Electric Railway, the new 6,600-volt electric line which has been under construction (by three successive companies) for two or three years past, and which, on April 2, began running cars through between Baltimore and Washington, is now about finished. The company expects within a few weeks, in addition to the local cars, to run "limited" trains which will make no stops at way stations and will carry passengers from terminus to terminus, 38 miles, in one hour. This improvement in the service is delayed by the necessity of providing a number of additional cars and of further perfecting the track and roadbed. This improvement accomplished, the company, which thus far has not done much advertising, will actively bid for regular and excursion traffic between the two cities, and also from these cities to Annapolis, which, it is believed, should prove an attractive excursion resort. The officers of this road are not blind to the fact that the villages along the line between Baltimore and Washington are so small as to be almost beneath the notice of a passenger traffic manager, and they intend to pay special attention to the long-distance traffic, as just mentioned.

The cars now running, which start from either terminus every hour from 5.30 in the morning until 12.30 midnight, take one hour and 20 minutes, 25 minutes of this being consumed in the six miles of the line which lie in the streets of the cities. This low speed in the cities will, of course, be a limitation also on the express schedules, so that the 32 miles of the line which is on private right-of-way will have to be traversed by the expresses in 35 minutes. As the line is double-track and the track laid with 80-lb. rails, on good gravel ballast, this should be easily accomplished. As long as the business does not demand more than two trains an hour each way, the company proposes to continue to run by the time-interval and flagging system as at present; but the officers have in view the equipment of the line with automatic block signals, recognizing the necessity of using the space interval for dense traffic.



Washington, Baltimore & Annapolis Electric Railway.

The fare between Baltimore and Washington is 75 cents one way and $1.25 round trip. By the two existing steam railroads, the Baltimore & Ohio and the Pennsylvania, the one-way fare is $1.00 and the round trip $2.00, except on Saturday and Sunday, when it is $1.25. It is proposed to run the "limited" trains once an hour throughout the day. With such a service maintained with punctuality, and the freedom from smoke and cinders which constitutes such a strong "card" for electric lines in summer, the new line should be able soon to show what power it possesses to create new business and to take competitive business from its old and powerful neighbors.

The situation of the line as related to the steam railroads is shown in the sketch.

The length of the main line is 38 miles, which includes a trackage right over about four miles within the District of Columbia, owned by the Washington Railway & Electric Co. The Washington terminus is at 15th and H streets, N. E. From this terminus to the center of the city, at the Treasury Building, about two miles, passengers are carried on special cars of the Washington company.

The main line of the W., B. & A. is double track throughout and the tracks are laid with 33 ft. rails, weighing 80 lbs. to the yard. They are of A. S. C. E. section, and the ties are 6 in. x 8 in. All of the curves except one are of one degree or easier, and four-fifths of the main line is straight. There are no grade crossings, except in the case of two highways which are little used. The line at right angles to the main line, leading from the B. & O. to Annapolis, is a well-known and long-existing steam railroad, the Annapolis, Washington & Baltimore, now converted into an electric line. It is single track. From the junction with the B. & O. to that with the Pennsylvania this line has but a light traffic. From Academy Junction to Annapolis, 14 miles, the line is equipped with Blake electric signals, there being six meeting points. At Academy Junction the switches and signals are inter-locked by apparatus furnished by the General Railway Signal Co., of Rochester, N. Y.

The line between the District of Columbia and Laurel—the Washington, Berwyn & Laurel—is one which was bought by the present company, along with other properties, but it is operated by itself, having no traffic connection with the main line.

The capital stock of the W., B. & A. is $5,250,000, all owned in Cleveland, Ohio. The first mortgage bonds amount to $4,250,000, and the second mortgage bonds to $1,000,000. The President of the company is George T. Bishop, and the Vice-President and General Manager is J. W. Shannahan. Mr. Shannahan's office is at Baltimore, where the company has built a terminal station. This station, with offices in the second story, is at Liberty and Marion streets.

Special Shape Tool Steel.

The high cost of high-speed steels makes it necessary that these products should be used economically. It is in order to meet these requirements that the New Metal Tool Steel Co., Portland, Me., has put out a number of special shapes, so designed that the requisite strength to resist the imposed stresses is obtained, together with the necessary cutting surfaces and areas, while the metal is so disposed as greatly to reduce the weight as compared with the usual rectangular section. This steel is rolled in a wide range of sizes and in the seven general shapes shown by the illustration. By this means the saving effected amounts to about 43 per cent., in the case of the star section, as compared with round, and 57 per cent. as compared with square having the same over all dimensions.

Tools made from these profiles do not require any special tool holders with the exception of the V shape. This form is of especial interest to railroad officers as it is adapted for use in tire turning. With this shape, a holder or seat is used as shown, and it comes in bar form so that it can be cut off in lengths to suit requirements. The groove is made to fit the bottom of the steel, and the tool holder blocks in the lathe tighten down on the top of the tool, holding it in the usual manner, securely fastening it.

Profile High Speed Steel.

Foreign Railroad Notes.

The efforts to increase the performance of locomotives on the Prussian State Railroads have resulted in a comparatively short period in raising the average yearly mileage from 20,500 to 29,200 miles; but this has been attended, naturally, with a very large increase in the cost of repairs.

The Russian Ministry of Communications has introduced in the Duma a bill to provide for double-tracking the Trans-Siberian at an estimated cost of $80,000,000. The Ministry recently appropriated $5,500,000 for double-tracking about 400 miles of road from Slatoust, in the Ural mountains, east to Samara, on the Volga river.

The "Technolexikon," which the Society of German Engineers announced in 1901, inviting the co-operation of Americans and others, and which was to include the technical terms of all imaginable trades in German, French and English, is now given up, after an expenditure of $120,000, because it was found that it would need to be enormously large—an encyclopedia in size, rather than a dictionary. It is very true that to be complete it would need to be very large; but there is little doubt that, properly executed, it would be worth many times its cost. This is not saying that the money to pay for it could be had, however.

Two Freight Bills of 1858.

Two freight bills, one dated January 15, the other January 16, 1858, covering charges on a shipment of 35 barrels of flour from Chicago to New York, are reproduced herewith. The first covers the shipment from Suspension Bridge to Albany over the New York Central Railroad, including back charges from Chicago to Suspension Bridge, and the second covers shipment from East Albany to Twelfth street, New York City, over the Hudson River Railroad, the two parts of the present New York Central & Hudson River Railroad main line from Buffalo to New York being separate companies.

The striking thing about these freight bills is the difference between the freight charges 50 years ago and the freight charges now. These 35 barrels of flour were handled three times, and the freight charges were as follows:

Chicago to Suspension Bridge..........	per bbl.	$1.55	$53.90
Suspension Bridge to Albany	"	.51	17.85
Albany to New York	"	.29	10.15
		$2.35	$81.90

In contrast with this rate of $2.35 a barrel, the present freight rate on flour from Chicago to New York is 35 cents a barrel. The present cost of sending a full carload of flour from Chicago to New York is about the same as the cost of sending these 35 barrels in 1858.

Two Freight Bills of 1858; New York Central Railroad and Hudson River Railroad.

The railroad in eastern China from Tien-tsin (the port of Pekin) south to Nankin seems assured. The Germans are to raise £3,150,000 for the northern 425 miles, which will connect with their railroad in the province of Shantung; and the English £1,850,000 for the 250 miles north of Nankin. The road, however, is to be a government enterprise, the Germans and English having inspecting engineers and accountants to assure that the security for their loans is adequate. The bonds, bearing 5 per cent., are offered at 98. This line will be nearly parallel with the existing Pekin-Hankow Railroad, and will be nowhere very distant from the Imperial Canal, which unites the Yang-tze and the Hoang-ho, passing through a thickly peopled and productive country, which has suffered terribly from floods since the Hoang-ho changed its outlet to the sea in 1852 to a point some hundreds of miles north of its old one.

French Railroads in 1905 and 1906.*

BY C. COLSON,
Engineer in Chief of Roads and Bridges in France, Councilor of State.

In the 10-year period from 1896 to 1905, gross earnings increased 23 per cent. in France; 26 per cent. in England and 54 per cent. in Germany. This does not show exactly the comparative increase in business in the three countries as the average rate per ton-mile has fallen 12 per cent. in France and only 7 per cent. in Germany. This decrease is continuing in France, but in Germany freight rates have been stationary since 1899. There are no statistics available, which show the average rate in England. It is true, however, that the increase in business in Germany is double to what it is in France and England. This condition is to be expected since the essential factors in growth of traffic are increased in people and commodities to be carried in the number of consumers and in the production of coal. In the 10 years referred to the population of Germany has increased 15 per cent., that of England 10 per cent. and that of France only 2 per cent. Coal production has increased 56 per cent. in Germany, 21 per cent. in England and 27 per cent. in France. In the United States during this period, gross earnings have increased 89 per cent. while the population has increased 19, and coal production 87 per cent.

In 1905, expenses in England and in Germany increased proportionately slightly less than earnings and in France slightly more. The railroads in France had made particular efforts to reduce expenses in previous years, so that there was less room for improvement. The returns on capital invested remain at 4 per cent. in England; increased to 4.3 per cent. in France and was more than 6 per cent. in Germany, where construction has been much easier

*From a paper "Review of Traffic Questions" in the *Revue Politique et Parlementaire*. Reprinted in the *Bulletin of the International Railway Congress*.

and cheaper than in France. The accompanying table shows the comparative results of operation in France, England and Germany during 1903, 1904 and 1905.

The estimates for 1906 show that earnings have increased about $20,000,000* in England, $40,000,000 in Germany and $210,000,000 in the United States, to a less extent France has also profited by the rebound from the period of depression, which ended in 1905. Two special reasons, however, prevented the roads from making as good a showing as the general prosperity of business might have led one to hope. The Courrières accident and the strikes which succeeded it led to a serious decrease in production of coal in the north and the Pas-de-Calais and the imports which made good the deficit, mostly brought by sea, did not provide our lines with as much traffic. On the other hand, the vintages of 1905 and 1906 were poor in quantity, especially in the Midi, and yet the fall in the selling price, which had followed the exceptional 1904 supply, continued, because the supplies derived from it were not yet exhausted. Thus, both at the north and the south of the country, the two most important items of traffic were heavily handicapped. Decrease in long distance traffic of coal from the northern districts, carried at very low rates, explains why the average rate per ton-mile has remained stationary from 1905 to 1906, although, as happens each year, several reductions in rates have been made. Still it really seems as if suggestions for reductions were becoming less and less frequent, in face of the growing protests aroused by the confirmation of special reductions to meet individual trade conditions, and also by the new burdens imposed upon the companies by legislative enactments of which later on we quote two instances. For the first time in a long while the operating ratio has gone up slightly. This growth is due mainly to the causes that always make themselves felt when there is an exceptional glut of traffic. Fuel and all consumption materials rise in price at times of universal prosperity; as regards coal, the effects of the rise, which are usually spread over several years owing to the long run of contracts, was felt suddenly in 1906 when our northern coalmasters had to suspend promised consignments. When it is necessary to cope with unexpected needs by chance methods, to free stations as soon as possible and take care to forward consignments at once rather than load trains properly, when one has to throw in a fairly large number of inexperienced helpers, etc., it almost always happens that the extra traffic arriving unexpectedly costs more than it brings in.

Besides these temporary troubles, two new laws have led to an extra expenditure that will recur regularly. The Rabier law, which repeals the clauses till now inserted in the special rates involving reductions of rate to lessen the liabilities of the carrier, means an increase in claims for damage. The weekly holiday law, on the other hand, though not legally applicable to railroads (whose business lends itself still less than any other to the application of uniform regulations), must necessarily force the companies to grant to their staff an increase in the days of freedom allowed at a regular interval, without its being possible for them to make good entirely this permanent decrease in the work they get out of their men by abolishing the customary annual leave; under this head, the year 1906 has begun to be burdened with expenses that will grow very markedly in 1907. The agitation which is being manifested throughout the working classes is not unnoticeable in its effects upon railroad operation; though such lack of discipline and attempts at coercion are, among this select staff, far from exerting such ravages as in many businesses and especially in government owned industries, yet we find in various ways some slackening in the zeal of the men, less keenness to do well, fewer attempts to cope with temporary difficulties, and the result is that the service is not only more costly but also less efficiently carried on.

Far from exceeding the estimates of the companies, the purchases of rolling stock were well below the figures they would have wished to attain, because the builders, being overwhelmed with orders, could not supply the requisite number. In 1906 the stock was increased by about 160 locomotives, 500 passenger cars and 3,000 freight cars; to this must be added some 30 motor cars, the trial of which seems to give satisfactory results and which will probably make it possible to improve greatly the service on unimportant lines by making it more frequent without unjustifiable cost. The orders given out, which will be filled in 1907 and 1908, reach the enormous total of 900 locomotives, 1,200 passenger cars and 31,000 freight cars, costing between $40,000,000 and $50,000,000. The issues made by all the great companies during 1906 did not exceed $13,000,000. The exhaustion of reserves, payment for large orders of rolling stock and for additional construction necessitated by the growth of traffic, will oblige the companies to issue more capital this year and next, and if the money market does not improve, this borrowing will cost all the more, because it will force prices down further still.

The Northern Railroad's net profits increased $1,200,000; when they increase $300,000 more, the company will begin to share profits with the state. But the rise in the cost of fuel and labor may prevent this further increase. Under the combined action of all the influences that are converging to diminish the duration and vigor of labor, the average output per day's work of the pitmen has fallen in the Northern and Pas-de-Calais mines from 2,469 lbs. between 1895 and 1899 to 2,282 lbs. between 1901 and 1905.

The most brilliant results are those of the Eastern Railroad. gross earnings increased $2,800,000, or 7 per cent., and net earnings $1,600,000. Doubtless the exceptional prosperity of the metallurgical industry, which has provided 250,000 tons extra for transport (on the top of an increase of 271,000 tons already realized in 1905), will only prove temporary. But the opening up of iron mines, permitted a few years ago, means a source of lasting prosperity, and may some day render the Meurthe-et-Moselle district one of the main metallurgical centers of the world. At present the absence of local coal and the shortage of labor prevent the district from reducing more than a part of the ore extracted.

The Paris, Lyons & Mediterranean has also seen the returns of its line improve extraordinarily, with an increase of $4,600,000 in gross and $1,700,000 in net profit. A sinking fund terminated in 1906, so that $900,000 additional is saved for surplus. This amounted to $2,900,000, of which two-thirds go to the state; no profits to the government were earned in 1905.

COMPARATIVE RESULTS, RAILROADS IN FRANCE, ENGLAND AND GERMANY.

	France.			England			Germany.

In the companies serving the other half of France, the western side, we find a much less marked improvement. Running through what are mainly agricultural districts, they hardly benefit from the extra traffic which is brought about by a manufacturing boom, but they do feel the effects of the rise in prices that accompanies it, so that in years like 1906 their increased expenses absorb almost the whole of the increased earnings. More especially, in that particular year, the substitution of English coal, disembarked at the ports they serve, for the French coal which usually reaches them loaded on the Northern Company's cars, forced them to run, with their own resources and their own rolling stock, a service for which in normal times they have nothing to provide except hauling power for trains reaching them ready marshalled; the result was to increase greatly the difficulties of conducting transportation and they gained nothing because the mileage run on their own lines was no greater.

The Western Railroads with $2,000,000 more in gross earnings, found its net profit only $340,000 greater. The deficit after interest charges which the state had to make up according to its guarantee fell below $1,200,000 and precisely because the improvement is not dependent upon the sudden boom in manufacturing, we may hope it will last.

The Orleans Company realized nearly $2,200,000 more in gross earnings, with an increase in expenses of over $1,800,000, so that, after allowing for first charges, the payment made to the state for the repayment of its debt is only $120,000 more than before.

The Midi Company, with nearly $600,000, increased gross earnings, has an increase in expenditure of over $600,000, half of which is due to the extra charge relating to pensions. These new charges, coinciding with the crisis in the wine trade, cause a decrease of $60,000 in the net profit, which just leaves the company the income requisite to avoid its again beginning to call upon the guarantee of interest.

The State system has a still heavier decrease in net profit, amounting to $100,000, despite an increase in gross of nearly $400,000.

Despite these charges, three of the great companies are paying over to the state, out of the profits for 1906, a total of $7,500,000,

*Francs converted into dollars at $0.20.

whereas one only calls upon the guarantee, and that for $1,200,000 only. Doubtless this period of prosperity will be followed, like the others, by a period of bad times, and on the other hand we see already appearing increases of certain charges owing to the new construction and supplies of rolling stock requisite to carry on the service, for the weekly rest, etc. But the last year has already borne sufficiently heavy special charges to lead us to hope that its net profit does not correspond with any specially favorable situation. Moreover, 1907 commenced under favorable auspices. Even if we do not count fully upon the continuation of such high repayments as those which the treasury received last year, we may hope that the era of deficits is closed, and that we have definitely entered upon the period, once regarded as chimerical, when the guarantee and sharing accounts of the great companies, which showed in 1893 a balance against the state of $20,000,000, will show the state receiving a respectable sum, provided that no new law intervenes to add additional charges again to all those with which the working of railroads has been loaded.

The present question, in the matter of traffic, which for several months has upset the commercial community, filled the papers and occupied parliaments, is that of the rolling stock on railroads and the delays resulting therefrom in the service. The characteristic feature of this crisis is its generality. Those in favor of state operation have seized this opportunity for blaming the companies, and the companies' organs have taken a vindictive pleasure in exposing the shortcomings of state operation; the truth is that throughout the whole world, states and companies have found themselves coping with similar difficulties and have overcome them well or ill, more often ill than well, according to their individual resources and ability. We shall lay no stress on the facts pointed out in France, not in order to shirk them, but because they are not the ones that are likely to be forgotten at home. In Germany, in that pattern country of state working, complaints are universal and the Minister for Public Works in Prussia was obliged, in the budget debate, to acknowledge that they were well founded. Already, in the preceding winter, his predecessor had confessed that the service was in unprecedented confusion, and this winter the situation was no better; the coal owners affirmed that there was no assurance that their consignments would be forwarded and there were even some who requested leave from their French customers to deliver English coal by sea, for lack of trucks to despatch them German coal.

In Austria and in Hungary, some mines were on the point of closing down, some works had to be shut, for want of means of transport. In Belgium, traders and passengers continue to cry out. And if we take in the other hemisphere the country where company operation enjoys the most extensive liberty, we find that in the United States there is a clamor on all sides against the inability of the railroads to give a proper service, inquiries are opened on the causes of the trouble and the remedies necessary. But in this wholesale competition, the palm belongs unquestionably to Italy. Not doctrinally, but because they could not come to terms with the leasing companies to prolong their tenure, the state took over the operation of its roads in 1905; forgetful of the proverb, it changed horses, if not in mid-stream, at least on entering the water, just when the boom in industry in Lombardy and the approach of the Milan exhibition made exceptionally heavy traffic probable. The impossibility of coping with it, the resulting confusion, the block in Genoa where half the goods disembarked had to lie unattended to, and the closure of works for lack of fuel, are facts universally known.

The universal character of the crisis depends upon the fact that the underlying cause is itself universal; it is in fact the return of great activity in business which comes periodically with the regularity of the swing of a pendulum, and the coincidence of which throughout the whole world becomes more and more precise in proportion as the facility of communications renders the dependence of markets upon each other more complete. It should be added that, now that railroad traffic possesses an international character, as soon as the crisis becomes somewhat acute at any one point, it necessarily leaves its mark; countries which are short of rolling stock do not resist the temptation of using the cars that reach them loaded from foreign countries, instead of returning them immediately empty or full; those whose stations are blocked keep at the frontier trains which would accentuate this block still further, blocking in their turn thus the roads of their neighbors and laying idle their rolling stock. The Paris-Lyons-Mediterranean thus felt the effects at Modena of the confusion reigning in Italy, and Austria was on the point of ceasing sending cars to Italy.

If the crisis returns periodically, some one will say, nothing can be easier than to foresee it and make provision ahead. To a certain extent, that is true. The able investigations of Mr. Juglar have established the regular character of the waves of prosperity and of stagnation in business, and experience proves this law with astonishing precision. We have stated frequently that it would be wise on the part of railroads to provide themselves beforehand with rolling stock, when the builders would be only too happy to work for them at low prices and not expose themselves to the risk of having to give out late, when prices are at their highest orders which often will not be filled until the need is past. Dare we say it? The enormous orders being filled, instead of reassuring us, frighten us a little.

We know well that under pressure of the inspecting department, in face of the public clamor, the companies have no other way of shifting their responsibility, in times of traffic blocks, than to prove that they have hammered at all doors to increase their equipment. But in order to arrive at giving out their orders regularly, it is not a wiser way to overdo them during times of stress than to stop them when requirements slacken. In 1905, the Prussian Minister of Public Works, in order to excuse his management for not having bought during the lean times of 1901-1902 the rolling stock that he needed when times got better, recalled the plethora in which it found itself at that moment; having received delivery, towards the close of the preceding period of activity, of cars ordered to meet the previous deficiency, they had to build sidings to accommodate the idle cars. We had a similar experience in 1885 and 1886. It is to be feared that about 1908-1909, when all the rolling stock so impatiently awaited to-day is lying idle, orders will have to be stopped and that then, forgetting the noble resolutions everybody is now making for the future, they will delay too long in beginning to give out orders.

And it is not only cars that are deficient, everywhere professional men say that the fault lies less in the want of sufficient rolling stock than of siding and sorting yards, facilities suitable for hastening the handling and making up of the trains. In a remarkable article recently published in the *Revue du Mois*, Mr. Labastie showed how the rapid movement of rolling stock possesses as much and more importance than the increase in its quantity and what difficulties this offers. As regards fixed facilities too, it is during the peaceful times of stagnation that preparations ought to be made to carry on the war against coming difficulties. But in that case, forecasts are more uncertain; it is not sufficient to know that a recovery will surely come; one must know, moreover, at what points the new requirements will appear, and there is a serious risk, in putting down equipment beforehand, of not doing it at the right place.

But, do what one may, it will always be financially impossible to provide railroads with enough equipment to make the service run as well during times of exceptional business activity as in normal times. No country could stand paying interest on such an exorbitant capital. Every paper has been quoting a letter in which one of the American railroad kings, Mr. Hill, estimated $1,100,000,000 per year for five years as the sum needed to put the railroads of the United States in a position to meet their requirements. As we have not seen the original statement, we do not know whether Mr. Hill was posing as an ironical cynic or as a bragging millionaire; but it is anyway true that even if he lived among a group of financiers who could in five years find for the American railroads the $5,500,000,000 he wants, the contractors and laborers able to get through the money in so brief a time, provided only a pause ensued at the end of the five years, at the very first moment of revival that followed there would be a deficiency of rolling stock or men or yards and stations at some point or other. It is not possible always to keep standing idle but ready the equipment requisite to meet the maximum needs which will arise during one or two seasons, during the eight or ten years of the cycle which brings the periodical crises. The only reasonable method in practice is to regulate the growth of men and equipment according to the average increase, and to cope with sudden increase of traffic by a sudden surplus of energy.

But at the moments when this surplus is necessary, any accident is enough to bring about serious trouble. For a little time, one can get from the men and from rolling stock exceptional work. But suppose at a certain point, the abundance of traffic renders it impossible to balance the outgoing and incoming consignments, then promptly the lines get blocked and rolling stock accumulates; it is no longer possible to clear the loaded cars and take them to the point where they ought to be unloaded; there is no longer time to arrange them once they are empty to suit requirements, to make up trains when they are reloaded, so as to fully utilize the tractive power of the engines, one has to resort to pooling engines, running the same locomotives constantly with different crews, instead of leaving each under the control of the same engineman who is responsible for its condition; being less carefully inspected, despatched less often to the shops, because they cannot be dispensed with, the engines end by causing more irregularities and breakdowns in the service. Soon the work got out of them, instead of growing with requirements, decreases, and the difficulty of dealing with the increased traffic becomes an impossibility.

To escape this calamity, it is necessary, from the very commencement of periods of activity, to make demands upon everybody's good will and overwork the indolent a little. It is no longer upon the railroad that the public authorities can usefully make demands at this moment; naturally they intervene to keep it up to the mark during periods of stagnation, but at extra busy times, the needs it has to meet, and the responsibilities it incurs stimulate its zeal better than any abuse. Then it is the consignors and consignees who must be urged to facilitate the promptness of the public service, by cutting down, for instance, the time they are allowed for loading and unloading cars when this business depends upon them. Under these circumstances, the position of private companies is always more difficult than that of state systems, because the latter have always backing them public authority of which they are an emanation, whereas between the companies and the public, the inspecting department naturally tends to side with the public whose representative it is. During the present crisis, we have seen the government, in Italy, frequently suspend consignments to such or such overcrowded points—in Austria, suspend for several days the ordinary freight service between Vienna and Galicia; in Hungary, suspend entirely the consignment of freight from January 28 to February 8; in Belgium, close the frontier on January 30 and 31. In France, the companies could not get leave to make a few alterations they asked to be allowed to make temporarily in the regulations.

Not only has the state not come to their aid, but it has singularly aggravated their position by the law on the weekly rest-day. It is true, the law is not applicable to the railroads; but by stopping entirely the loading and unloading by private persons on Sunday, both at stations and on private sidings, it has seriously delayed the liberation of a number of cars. Those in favor of state intervention in the operation of railroads, frequently support their theories by adducing the necessity of alleviating periodic crises which give rise to speculative commitments; the moment selected for applying the new law is a typical instance of the small amount of foresight with which public authorities, when they intervene in economic phenomena, do it in a manner most likely to aggravate crises instead of alleviating them. Whatever opinions one may hold about the utility of measures which limit the hours of labor, it must be acknowledged that the act of putting them into force must always bring about transitory difficulties; the latter become particularly prominent when there is a scarcity of labor everywhere, as at the present moment. If originally applied at a time when the number of those involuntarily idle was considerable, the law on the weekly rest-day might have decreased distress, by obliging manufacturers to make good the decrease in days of labor by an increase of their employees; then, until the next revival, industry would have had breathing space to accustom itself to the new regime. The wise thing would be even to suspend or temporarily alleviate the stringency of laws of this kind, when hands are everywhere deficient; but by putting them into force just at these times, the legislator aggravates the difficulties of the service of which he then makes a grievance to traders.

Despite these difficulties, it really seems as if France is one of the countries in which the recent crisis was least felt. As far as can be judged, except in the case of England, which appears to have almost entirely escaped it, all the manufacturing countries have suffered more than we have. Our railroads are, moreover, among those best supplied with rolling stock, considering their traffic. The main difficulty in their management is the lack of elasticity in the regulations upon which we have insisted in this review on many former occasions. The intervals allowed under our special tariffs are certainly excessive in normal circumstances; but they equally apply in critical times, whereas in Germany, a railroad is only bound to supply rolling stock as and when it is at liberty. Of course we have no desire to see extended to France a regime under which the public is at the absolute discretion of the railroad management; but to grant some relief in the obligations of the companies in times of stress, to subject their customers to some hardships in order to set at liberty the rolling stock, would not be asking too much, and as some compensation for these easements, the time limits might be decreased under normal circumstances, once it was understood that lack of fulfilment did not render the company liable when it was due to an abnormal increase of traffic.

Our whole legislation is based on the notion that railroads ought at all times to insure under similar conditions the carriage of all the traffic entrusted to them; but this idea is contrary to the very nature of things. Unquestionably, railroads being invested with a monopoly, cannot be left free to grant or refuse their services according to their convenience, and it must be assumed as a principle that they are bound to meet all demands, so long as a judge has not decided that they were prevented by conditions beyond their control. But in order that the exceptional growth of traffic, at times of extreme business activity, may not produce these conditions, it is essential they should be given all the facilities compatible with the requirements of the public. No industry in the world, no traffic organization whether by land or water can be so equipped permanently as to satisfy all the clients who may offer themselves at a busy time in the same manner as in normal circumstances. When the blow comes, railroads submit to the terms of their contractors who only accept such orders as they can carry through; railroads too have to accept all the traffic that their usual competitors, barges and coastwise ships, refuse for lack of room, at least they should be helped to accommodate it.

In insisting upon these considerations we certainly do not intend to entirely shift the responsibility from the shoulders of the companies in the present crisis. We have often enough affirmed and reaffirmed that it would be wiser on their part not to reduce as much as they often have done the purchases of rolling stock in lean years. It is during these years that it would be well to remind them of the advisability of these measures of precaution. What is requisite at times of crisis, owing to superabundance of traffic, is to help them through with it, and not forget above all things that crises of this kind are an inevitable consequence of the irregularity of business, that all countries suffer therefrom like ours, and that we have been far this year from being the worst hit.

The Source of Internal Tire Defects.

Sometime ago there was a breakage of two tires under passenger cars and one under a locomotive on the Paris, Lyons & Mediterranean Railroad that disclosed some interesting peculiarities, as reported by Eug. Vanderhoeym, in the *Revue Generale des Chemins de Fer*. The two car wheel tires, designated B and C, had a tensile strength of 104.155 lbs. and 102.879 lbs. per sq. in., respectively, and an elongation of 17.1 and 15.6 per cent. The original thicknesses were 3 in. and 2.28 in.; and they had been worn down to 2.2 in. and 1.8 in. at the time of their rupture. The locomotive tire had a tensile strength of 106,425 lbs. with an elongation of 15.6 per cent., and is marked A.

An explanation of the formation of the defects found in these two tires was somewhat difficult to find, for it was not easy to understand how it was possible for the cavities, that are shown in the illustrations, to exist in the body of a mass of metal that has been rolled and drawn out as these tires had been. The investigators showed, however, that the cavities were due to internal flaws in the metal. That is to say a local dislocation, produced in the mass of the casting in the form of a disc as a result of internal stresses; and that these internal stresses were themselves due to a too sudden and unequal reheating of the ingot.

The granular and crystalline appearance of the interior surface of the cavities of the two tires supported this hypothesis. The local dislocation or flaw was produced at a rather low temperature, at which the material would still preserve its crystalline structure, with the result that the surfaces of separation would still preserve this structure, and if the subsequent forging operations should tend to still further separate these surfaces, they would, nevertheless, still retain their original appearance, since the temperatures, at which this work is done, are not sufficiently high to sensibly change the structure.

However attractive or even plausible such an explanation might be it could hardly be accepted without some further proof by direct experiment. An endeavor was made to artificially reproduce a local separation of surface, in an ingot of the same form and dimension as that forming the first phase in the manufacture of the tires. For this purpose it was suggested that a very thin plate of highly refractory material be put into the mold before pouring. This was to be chosen keeping in mind the very high temperature of steel in fusion and a very well known mineralogist suggested using a certain rock crystal. It was feared, however, that a rock crystal would crumble at the instant or pouring and the experiment thus be rendered valueless. It was then suggested that a plate of mortar formed of fine sand such as that employed in the lining of crucibles be used. The mortar was reinforced with iron and the whole bound together with a refractory clay. The plate thus obtained was suspended in the mold by a wire protected with a refractory covering, and after the steel was poured in and the metal cooled it was found that the plate had been neither broken nor deformed.

This encouragement led to a more definite experiment. The cores of refractory mortar were put in a mold shaped to make a cast-steel circle exactly like the ingot for the tires. The locations of these discs were as follows: Two thin refractory plates were located in a plate passing through the axis of revolution of the slab and on radii forming an angle of 90 deg. with each other as shown at *a a*.

One plate of the same shape was placed in a plane normal to this axis, and at the center of depth of the slab as at *b*. A ball of the same refractory material was put in at *c* as representing a blow hole or shrinkage cavity. Each of these pieces was suspended in the mold by a wire about 0.2 in. in diameter, surrounded by a refractory protection. The pouring was then done very carefully so as to avoid all injury to the refractory nodules, and, after casting, the ends of holes made by the supports were cleaned out and the iron wire with its refractory jacket was withdrawn. The support on one side of Nos. 1 and 2 was easily removed but on the other side the wire was welded to the metal so that it could not be withdrawn. The spherical sand nodule was entirely removed and the others partially removed.

This heavy disc of cast-steel was then reheated and rolled into a tire of the ordinary section, and after it had cooled an examina-

had been thus artificially created. For this purpose cross sections were cut from the tires, the left hand side of which are shown in the illustrations. The following observations were made of the four sections:

G 3 (Fig. 6). This section corresponds to the artificial defect at No. 1 produced by one of the plates set in the cast steel ingot in the plane of the axis. It will be seen that under the compressing action of rolling, the interior space has opened. The length of the cavity thus produced is about 2.75 in. in the direction of rolling, and its height is practically equal to that of the original plate, or about 2.93 in. This is explained by the fact that the disc as well as the ingot had a thickness equal to the width of the tire, and that the

Fig. 10.

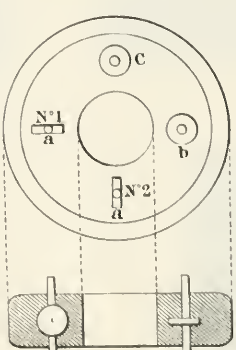
Fig. 11.
Section of defective bar forged from ingot containing a flaw.

rolling, as in the transformation of the ingot into a tire, acted only in the direction of the thickness and not in that of the width. Thus a flat space, representing a flaw, set in a plane passing through the axis of revolution of the disc, has produced a cavity of thickset form. This confirms the hypothesis as to the cause of the cavities in the original tires. Further, the two lines extending outward from the top and bottom of the cavity will be noticed. These indicate the location of the two supports of the plates.

G 33 (Fig. 7).—This section, corresponding to the artificial defect No. 2, shows that the rolling has transformed the flattened space, situated in the field of pressure like the preceding one, into a thickset cavity. This cavity has a breadth of 2.6 in. in the direction of the rolling and a height of 3.5 in., or exactly the same as the original diameter of the plate.



G 333 (Fig. 8).—This section, which corresponds to the defect B, produced by the plate set normal to the axis of revolution of the disc, and midway of its thickness, shows that the artificial flaw was compressed.

By cutting other sections 2.6 in. on either side of the first section, as indicated by Fig. 9, the same sort of cavity was found but of smaller dimensions, showing that the cavity extended over a length of at least 5.8 in., or twice 2.6 in. plus the thickness of the original section G 333, or 0.6 in.

We see, then, that a flat flaw would be crushed and elongated circularly in the direction of rolling, and it can be readily conceived that if the flaw is small enough, the amount of flattening produced by the rolling may be such as to close the cavity entirely, and leave merely a line of separation as shown in the illustration of the broken locomotive tire.

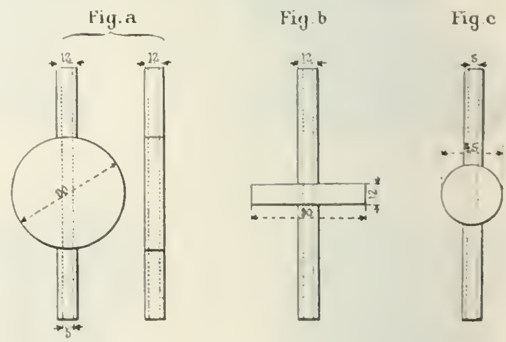
This goes to support what we have already said that a surface of separation existing in the body of a tire can produce, under the forging action a cavity corresponding to a cavity or a mere flaw previously existing in the ingot. It is to be presumed, however, that a flat flaw will be produced in the ingot, rather than in the disc, provided, of course, that it has been heated too rapidly.

G 3333 (Fig. 10).—This section corresponds to the artificial defect formed by the ball. It was found that the cavity was entirely crushed by the rolling, and that it was reduced in section to a simple line, situated on the prolongation of the lines formed by the flattening of the cavities in which the supporting bars of iron or chaplets were located. By cutting other sections on either side of the original one, it was found that the surface of separation, due to crushing of the original cavity, extended in a circle in the direction of the rolling. It may be remarked that a cavity of approximately circular form can only be produced in a casting by crushing out under a hammer a pre-existing cavity that was somewhat elongated vertically in the ingot, or by opening a vertical flaw, as may undoubtedly occur. A spherical cavity in an ingot will always be flattened under the hammer in the transformation of the ingot into a slab, and this will be found to be the case with defects of the character of a No. 1 and a No. 2, as indicated on the line engraving.

Now it will be readily understood how such cavities as those found in tires B and C, which broke in service, can be produced moreover from the experiments that have been detailed above, it must be acknowledged that an internal flaw is the most probable original cause of the formation of these cavities.

The conclusion to be drawn, therefore, is that the reheating of the slabs should be performed with the utmost care. The same precaution should be observed in the reheating of ingots, though the flaw caused by unskillful heating of the ingots seems to have a tendency to appear in the horizontal plane, causing a circular line of separation in the tire as shown in the broken locomotive tire. The consequences of this type of defect are less serious than those resulting from a defect which makes a considerable reduction in the section of resistance. More recent observations have tended to confirm the conclusions drawn from the experiments thus detailed.

At the steel works of St. Etienne an ingot weighing 3,960 lbs. of octagonal section measuring 20.47 in. at the base and 14.57 in. at the other end, cast by the Harmet compression process and consequently entirely free from cavities was forged into a bar 7.87 in square. When this had been done a cavity measuring 11.82 in in the direction of the length was found in the center of the bar. The interior surface of this cavity was coated with perfectly white crystals, whose form alone had been slightly changed by forging. These two characteristics, as well as the method of manufacture, by compression, make it impossible to attribute the formation of the hollow to any other cause than that of a flaw. The flaw was produced by



Method of Placing Cores in Ingots to Produce Tire Defects.

the too rapid heating of the ingot in a plane normal to the axis so that sufficient heat did not reach the inner surfaces. The drawing out under the hammer, after having compressed this flaw, and having transformed it into a cavity, had gradually elongated it so as to form a cavity with a final length of 11.82 in. as stated.

The illustration, Fig. 11, shows the appearance of a section of this 7.87 in. square bar on a plane normal to its axis and through the center of the cavity.

Interborough-Metropolitan Organization.

The accompanying chart was compiled for the New York City Public Service Commission to illustrate the organization of the Interborough-Metropolitan system. But the complexity of the organization is not fully shown by the connecting lines on the chart. The

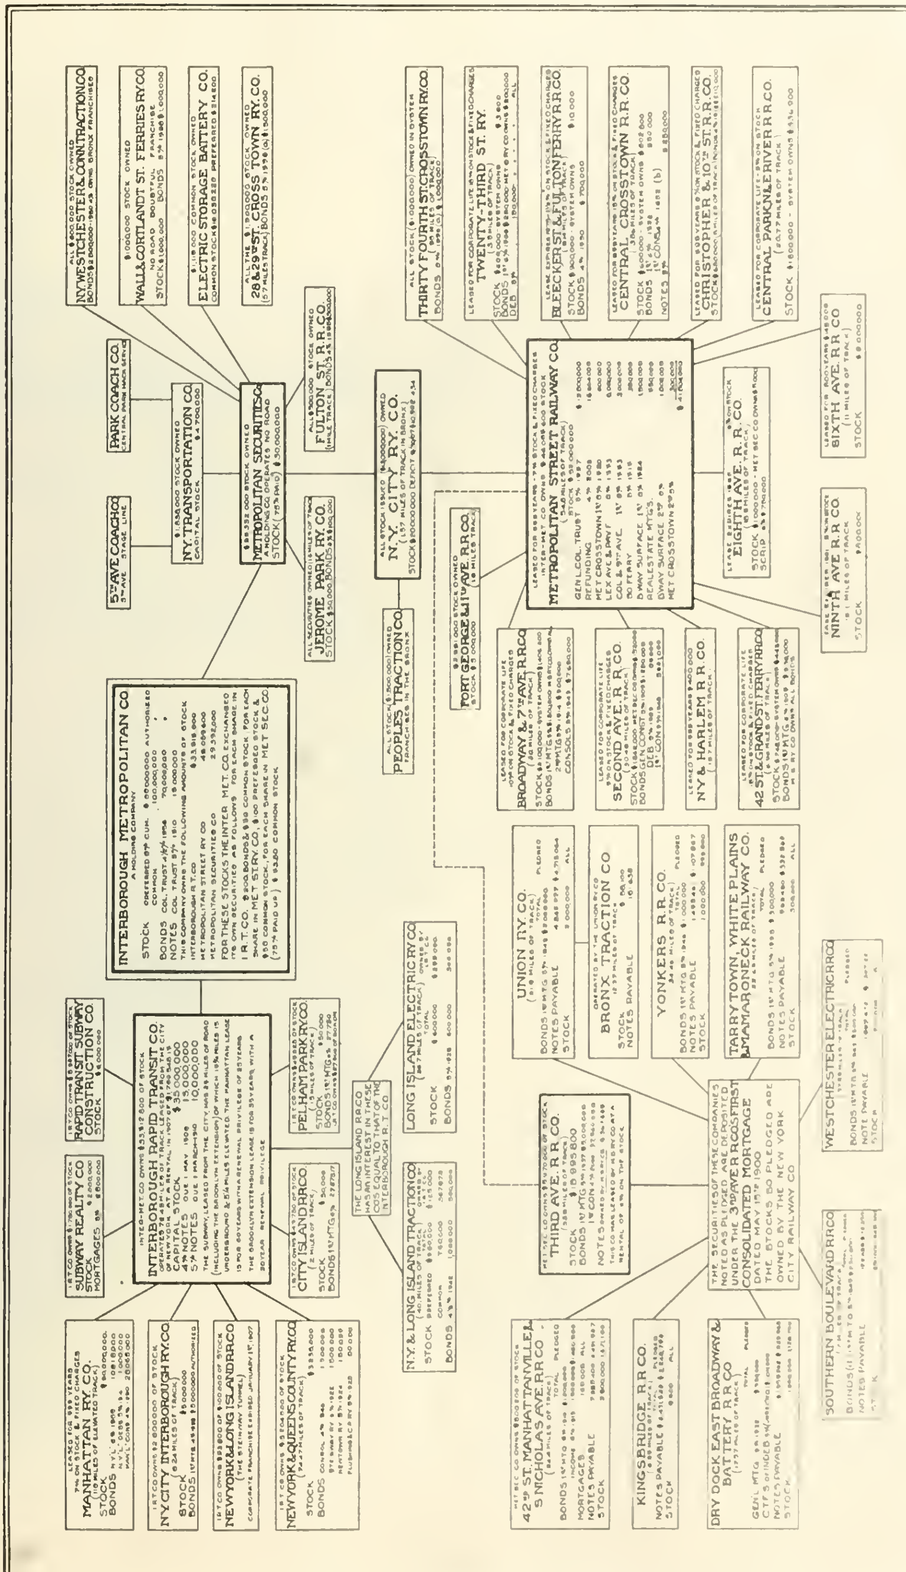


Chart of Interborough-Metropolitan System, Compiled for New York City Public Service Commission.

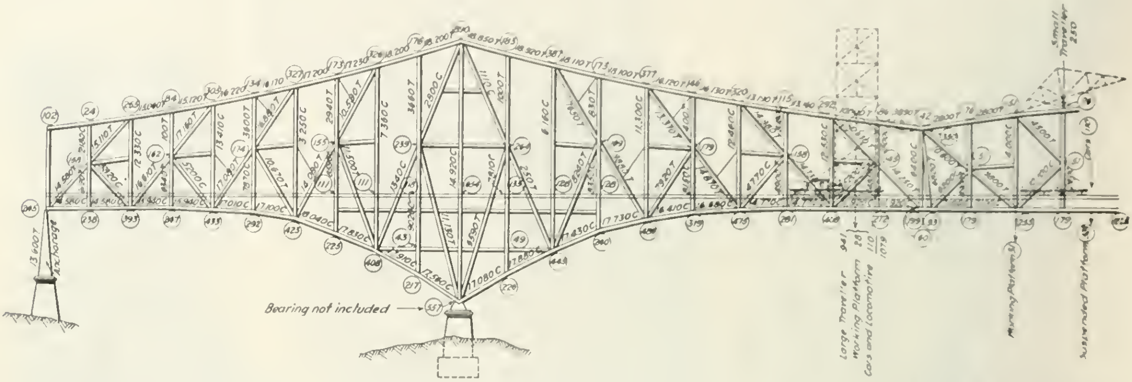
Interborough-Metropolitan Company controls the Metropolitan Street Railway Company because it owns all the stock of the Metropolitan Securities Company, which owns the stock of the New York City Railway Company, which is lessee of the Metropolitan Street Railway and guarantees dividends on its stock. But the Inter-Met. company also owns over 88 per cent. of Metropolitan Street Railway stock direct, that is to say, it rents to itself, through two brokers, a property which it already owns, and guarantees itself the rental.

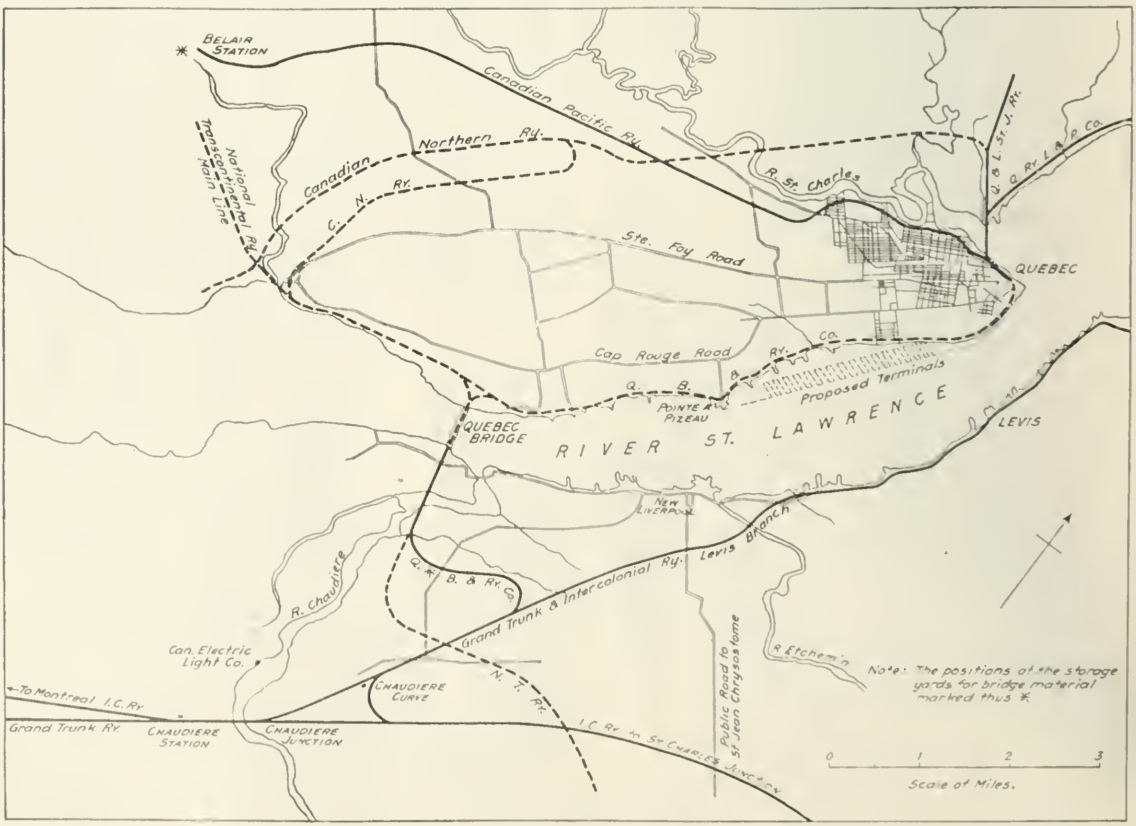
The Wreck of the Quebec Bridge.

Accompanying the report of the Royal Commission on the failure of the Quebec bridge across the St. Lawrence river were a number of blueprints illustrating the various stages of the structure and the stress sheets as calculated before and after the disaster, as well as a map showing the location and the proposed and existing railroad connections. Three of these drawings are reproduced herewith. The outline drawing of the location shows the



Note: Figures shown above thus ◯ are in units of one thousand pounds per truss and include weight of steel work only except as indicated. To these should be added 250 lbs. per lin. ft. per truss throughout entire bridge for weight of track, applied at floor line, giving a panel weight for Anchor Arm of (12.5) thousand per truss, and for Cant. Arm and Suspended Span of (14) thousand per truss.
In the unit stresses C = Compression and T = Tension. Figures from calculations of Phoenix Bridge Co. and verified by independent calculations by C. C. Schneider, Consulting Engineer.

Stress Sheet of Quebec Bridge at Time of Collapse.



Location of the Quebec Bridge.

position of the bridge with reference to Quebec. It is above the city and somewhat remote from the existing lines centering in the city. The crossing was to have been effected at the narrowest part of the river, about six miles above the point upon which the city is situated and nearly opposite the mouth of the Chaudiere river.

The stress sheet of the bridge is that calculated as existing at the time of the collapse with the locomotives, cars and travelers in position. This is fully self-explanatory and shows very clearly the conditions prevailing.

The diagram of the course of the members in falling is interesting, as indicative of the method of failure, and as conveying some slight idea of the probable entanglement of the mass of wreckage

that lay strewn on the ground immediately after. Accounts published at the time indicated that the inextricable confusion of this pile of debris was almost beyond the power of imagination.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

XVI.

Trans-Atlantic Freight Rates and Their Control.—1. The Lines Between America and Great Britain.

There is probably less organization and less general rate agreement among the carriers in the trans-Atlantic trade than in any other in the world.

All other important ocean trades differ from the North Atlantic in at least three respects: (1) none is so large and none is over so short a route; (2) none has such geographical unity on one end, making competition easy, nor so many nationalities on the other end, making agreement difficult; (3) none is so dependent on raw materials.

1. The first cause is a dual one producing one effect, many carriers. The shortness of the route permits a comparatively few vessels to render line service, while the magnitude of the Atlantic trade requires so many lines that they have never been able effectually to get together. The trade from America or from Europe to the commercial districts of other continents is smaller in volume and over routes so long that the formation of a line is relatively more difficult, and therefore the task of starting new competition is greater. Competition in line traffic, it should be noted, requires another line able to offer the same service. The trans-Atlantic voyage is but one-half to one-fourth the length of that from Europe or America to South America, South Africa, India, Australia or the Orient.

The stupendous size of the trade from America to Europe puts it almost or quite beyond the limits of what the human mind can grasp, control and weld into an agreeing whole. In 1902 when the International Mercantile Marine Company was forming it was stated that this trade was giving employment to about three million tons of shipping. The Morgan interests succeeded at great financial sacrifice in getting possession of but one-third of this, and with it they met losses for several years that threatened to engulf them. The remaining two million or more tons of shipping working here are possessed by many owners having little common interest.

2. The geographical and political conditions of America tend to weld the commerce of that continent with any particular part of Europe into one great unit by enabling it to reach the sea anywhere.

For this trade the United States and Canada are one. American goods go down the St. Lawrence, and Canadian goods go out by United States Middle Atlantic ports. The peculiar geographic form and transportation conditions of the center of North America make easy the access from the central region to the sea at any point between Montreal and New Orleans and Galveston. If Montreal rates do not suit, the shipper in the central basin will turn to Boston, or New York, or Philadelphia, or Baltimore, or Newport News, or New Orleans. The trans-Atlantic traffic is, at its American end, one traffic despite the variety of the geographic factors involved in the trade of all America with all Europe, and a rate agreement to be successful must cover the whole. Possibilities of effective combinations are very different in a trade like that from the same coasts to Australia, which requires five or six steamers per month all from one port instead of 15 or 20 per day from a long row of rival ports.

There is in Europe no such commercial unity. European land forms, politics and transportation conditions unite to produce commercial separateness. A half dozen different nations, each commercially independent and commercially hostile, give to the trade of Austria, Italy, France, Great Britain and Germany an isolation that is entirely unknown in America and make much easier the agreement of European carriers to the different corners of the world, because each group of carriers has a territory of origin in which rivals can not compete without coming to the same ports.

The lack of any geographic or commercial unity in Europe corresponding to that in America, causes the carrying trade with America to fall at its eastern end into three main divisions: (1) the United Kingdom; (2) the Continent, (3) the Mediterranean. The trade of each of these divisions with America makes a commonly used unit in rate problems and plans, although they sometimes apply to the smaller unit of the carriers to a certain European port.

3. The longer European and American trades stand apart from the trans-Atlantic, having less raw materials and more manufactures in their freight. The great quantities of manufactures going out from Europe require a fast, frequent and reliable service over long routes. Lines agreeing and co-operating can easily give such service, which, moreover, a new rival finds it hard to give. Competition from Europe to the more distant continents cannot, therefore, be so active a force as it is in the European trade with eastern North America.

The greatest factor of confusion in trans-Atlantic rates is grain, the great staple commodity in the trans-Atlantic cargo. To begin with, this is essentially charter vessel cargo and the liner that gets it must bid down to do it; hence the rate is constantly lower on line than on charter vessels. The line vessels make this sacrifice of space because grain serves as good ballast. A certain amount of it brings the ship down to her intended draught and causes her to sail better. In connection with higher class freight the difference is that between profit and loss. Grain therefore, brings the line vessel in direct competition with the tramp. If grain is abundant, the ships can usually fill up at good rates; but if it is scarce, many of the ships must have it at any price. There are cases on record of grain being carried for nothing. With such an imperative demand rate agreements are difficult to enforce. The frequent fluctuations in the grain supply are familiar to all. The shipping on the Atlantic must be able to handle, when it comes, the large surplus above America's growing requirements. This surplus varies. In 1901 the grain and flour exports from the United States to Europe amounted to about four and a half million tons.

The preceding year the same commodities furnished seven and one-half million tons of freight. Since the grain trade is irregular in quantity, it renders the trans-Atlantic trade hard to organize through rate agreements. The fact that the unit of shipment is large, usually tens of thousands of bushels, gives the smallest fraction of rate difference a deciding influence.

In a trade as great as that across the Atlantic there are possibilities of numerous small agreements which have limited scope but can yet do something to steady conditions in given grades of exports and benefit shipper and carrier alike. It is possible for two lines from the same port to have some kind of an understanding, and it is possible for the carriers to any one European port to get together, as do the London and Liverpool carriers. This is made easy and almost necessary by the fact that nearly all the freighting arrangements and final bargains for the New York lines are made on the floor of the Produce Exchange by freight brokers representing the shippers, and the agents or representatives of the steamship lines. Not only are New York freight bargains, and therefore rates, made there, but nearly every steamship line sailing from America, whether it be from Montreal or Galveston, is represented. Most of the important American railroads also have representatives there trying to get seaboard work for their lines. It is therefore physically easy for the representatives of any group of traders to get together, and temporary agreements without number have been made and constantly are made.

The carriers are always seeking agreement rather than competition. Where two principals of competing services send their representatives on "change" in the daily search for freight, it is with instructions to get the best rates that can be obtained, to work together to that common end and not rashly to disturb rates for the sake of a small lot of visible freight, as this causes dissatisfaction among shippers in addition to reducing income. Sane business methods demand as much.

The freight market is governed in the main by supply and demand, but the minor adjustments are made by continuous conference. One agent on the floor of the exchange says to the representative of a rival line: "We are holding for 8s. on flour for next week's sailing. What are you booking for?" "Seven shillings 6 pence." "Well, you are making a mistake, you had better hold for 8s." "All right, we will, if we can." A day later the second party may announce to the first that he is not getting any flour at 8s. and may declare his intention to quote a 7s. 6d. rate. The first may or may not adopt the same rate, but for one day at least there has been an attempt at an understanding. Not a stroke of writing is involved, no contract, no penalties, no time limit, and there is perfect freedom of secession. The traders to any city or country may get together daily or weekly and make agreements to last till the next meeting. Sometimes the agreements are more formal and may last for a considerable period, but their existence at best is precarious. For example, about 1880 there was a Liverpool agreement (minimum) on grain along the Atlantic seaboard. Port by port it was broken at all the "out ports" but still stood at New York until at last a firm of brokers bought a steamer badly in need of repairs which were to be made in England. She could get no freight at the agreed minimum and her owners cut the rate a farthing, took the cargo and ended the agreement which had until that time been observed.

It is more than accidental that the name of an ocean freight agreement is a "conference" as the "South African Shipping Conference" or the "Trans-Atlantic Shipping Conference." The name is indicative of the method of formation and often of the actual result. There has been a "Trans-Atlantic Shipping Conference" since 1868. As the date indicates, it was the outgrowth of the disturbances of the American Civil War and of the final triumph of the steam lines over the sailing lines in this trade. This conference has attempted little in the direction of the formation and regulation of rates. It has busied itself with numerous other matters of importance to all Atlantic carriers. For example, it has worked for changes in the printed form of bills of lading for the benefit of the carrier; it has secured a practically uniform bill of lading; it negotiated with the National Lumbermen's Association for certain improvements in the method of receiving and inspecting lumber for export; it acts in behalf of all in regard to legislation on quarantines, channels, etc. In 1902 this conference, with operating headquarters in New York, was made the mechanism for carrying out a minimum freight agreement to the United Kingdom which was made in Liverpool and planned for the relief of all interests. The trans-Atlantic carriers were suffering from a rate depression which in 12 months had cut their earnings from exceptional prosperity to hopeless loss. At one time this agreement included 46 lines and services.

The rate agreement involves of necessity a rate classification—a task beset with difficulties. One commodity may be incidental to one line and fundamental to another. For good loading and best income a ship must have a mixture of heavy and light goods. A ship full of wooden ware or furniture would ride high in the water with unused buoyancy. She would even be in grave danger of overturning. A shipload of steel rails would leave three-fourths of the hold space absolutely empty. By combining these two classes of freight a ship can carry at one time three-fourths of a full cargo of rails and three-fourths of a full cargo of light goods, and at the same time be in the best possible shape for safe navigation. This advantage of mixed cargo gives the loading agent a perennial but ever-changing problem. He is seeking some particular kind of freight to complete a ship's cargo; having already made enough contracts for light goods, he wants a thousand tons of heavy cargo to make the ship ride well. He must have it, and it may be that the contracts already made provide almost enough income for the voyage. He would willingly, therefore, cut the rate to get heavy cargo. But there stands the agreement, and the heavy goods can only be had at forbidden rates. The next month his desire may be to sacrifice on light goods. The attempt to lay down a classification for the numerous lines and services results every day in some firm having a strong desire to break the rate on some commodity, and in the course of time every shipper desires at some time to break almost every rate.

Shipowners are not prone to make public the details of their little-known business and it is fortunate for the writer's purpose that the Atlantic Shipping Conference got dragged into the Interstate Commerce Commission hearings on differential rates to the various Atlantic ports. The detailed history of this agreement as narrated in testimony before the Commission* reads like a description of an attempt at making ropes of sand. The original agreement, made in Liverpool, January, 1902, was signed by nearly all lines plying between the Atlantic seaboard and the United Kingdom, and the testimony showed that, at the beginning at least, the same rates were observed by lines, not signers. The agreement showed its inherent weakness by providing that:

> Any of the signers may withdraw from same at the expiration of fourteen days after the receipt by others of his or their desire to do so, and the withdrawal of one shall *ipso facto* release the others from their obligations under this agreement unless they may otherwise determine.

The inherently competitive nature of their business drove the companies to this device of unanimous consent to any action, and unanimous consent, as may easily be seen, reduced the sphere of action to small proportions, but without it no agreement was possible. The life of the agreement was one rapid series of adjustments and readjustments, concessions and compromises, made necessary to heal the dissatisfaction of some line which had served notice of its intention to withdraw. Finally, after an existence of two years and four days, a break in rates brought about such a condition that the final meeting of the conference found that there was no proposition upon which they could unite, although several of the many attempts were negatived by the votes of but one or two lines. The agreement was thereby ended, but the carriers to London met again the same day and continued the agreement so far as the American trade to that port was concerned.

During the life of the general agreement the committee of management had frequent meetings in New York and some changes were effected by correspondence through the secretary's office. Rates were promulgated for trial during two or three weeks, and the life of the agreement was continued from meeting to meeting. These extensions never covered so much as one month, and one week was the more common period of their duration. The rates were fixed with differentials to make living conditions for all ports. This included the right to adjust out of the rate any marine insurance differences between the port in question and New York and Boston. From time to time difficulties arose and concessions in rates would be granted, permitting the carriers from a certain port or ports to cut the rate a certain amount to secure a prescribed maximum amount of named articles of freight in order to get ballast, after which the usual rates were resumed. The converse of this was also practiced when lines from certain ports refused by agreement to carry certain commodities for a period so that other ports might get their share. This refusal to carry was brought about by the mere quotation of a rate sufficiently high to drive the freight to the ports agreed upon. Witnesses stoutly maintained that there was no percentage division of traffic, and minutes placed in evidence showed that the following motion was lost at the last meeting of the conferees: "That a committee be appointed to arrive at some equitable way of dividing the results of the traffic, if not by a physical division, then by pooling the earnings."

Special agreements to change temporarily the conditions of shipment from certain American ports were duplicated by similar agreements concerning the carrying of goods to certain of the European ports. The agreement covered only named articles; the list was occasionally changed, or the rates on single commodities altered. At times the desire to compete would be gratified by withdrawing the agreement on some article or articles for a named period, and when the London agreement succeeded the general agreement, February 4, 1904, it postponed the enforcement of its rate on flour until May 1. It must be borne in mind that these rates were minimum rates only. Higher rates were always hoped for, and in at

*Differential Freight Rate Case 746, N. Y., Vol. 1, May 18-20, 1904, pp. 303-502. See also N. Y., Vol. 2, June 20 and 21, pp. 1002-1042.

least one case they were definitely recommended by the conferees. The changing nature of ocean rates and the method of their making is indicated by the telegram from the Allan line at Montreal to the secretary of the conference, stating that "We are accustomed to revise our rates weekly on Fridays, in conference with the other lines (at Montreal). The rate on sacks (flour) to Liverpool will be discussed to-morrow, and the result will be communicated to you by telegraph."

In summary, it may be said that the minimum freight agreement did control rates from the Atlantic seaboard to the United Kingdom for two years. The agreement practically covered only articles essentially requisite as ballast cargo. The owners aver that they intended by this so-called minimum agreement to lay down the principle that they would rather not carry than go below the rates they named. To show the economy of trans-Atlantic service it is only necessary to state that the minimum on flour was 8 11 cents per 100 lbs., and on provisions (meats) $2.50 per ton.

Even this feeble minimum freight agreement was rendered nugatory by the American railroad differentials between the interior and the seaboard. Montreal, Philadelphia, Baltimore, Newport News and Norfolk have since the early eighties, as a result of railroad agreements, had a lower rate on heavy articles than New York, Boston or Portland. The ocean freight agreement had this differential to deal with. In the beginning the full differential of 3 cents per hundred on flour was equalized by adjusting ocean rates, thus establishing a common through rate to Europe via all ports. Later the inland differential was reduced gradually to one-half, but it was on this point that the 1902 agreement was wrecked. The end was due to the demand of a Boston line for full equalization in through rates by ocean adjustment. This was declined by a line from Baltimore, which refused to submit to sea differentials that absolutely wiped out the advantage of those by land.

As stated above, the disruption of the general agreement in February, 1904, was not the end of the practice of rate agreements. It was the end of the service of the Trans-Atlantic Shipping Conference as the means for conducting a rate agreement. The general federation broke up into practically the component parts that had formed it, and these went on as before. The London traders met immediately and continued the agreement so far as it affected them and their agreement is still in operation. The Glasgow traders and various other traders after the general break gathered themselves together as before and made and informally maintained their agreements. Forty-six services, embracing all the complications of the trade of a continent, were too many to be harmonized under one management, at least at the first attempt.*

A complicating element in any such rate agreement as that described above is the ownership of steamship lines by railroads. The Canadian-Pacific openly owns a trans-Atlantic steamship company and other trans-Atlantic lines are practically in the same condition. These lines are particularly hard to satisfy in any ocean rate agreement because the motives of their managers differ from those dominating the purely ocean carriers. The railroad steamship line (see chapters printed Feb. 21 and Feb. 28) is merely a feeder to the vastly more valuable railroad. The combined management can easily afford to lose some money on the ships to get more freight for the railroad. Private car lines and their mileage rebates and other indirect cuts in through rates have also entered in as factors here. The result is that satisfactory agreements are made with extreme difficulty between steamship lines that are *bona fide* investments and those that are mere props to a modern American railroad system.

This adjunct line—an ocean carrier with different and additional motives for cutting rates—has moreover easy means of hiding its policy. For practical purposes the through rate from the inland point to Europe may be easily cut. The other steamship lines may remonstrate, and be informed that the ocean rate is being maintained. This may be literally true; but since the railroad and the steamship line are financially one, a cut in the railroad rate has had the same effect upon competitors as a reduction in the steamship rate.

An effort at rate control was the fundamental motive back of the formation of the International Mercantile Marine Company. It was also intended to effect savings through consolidation but the control of trans-Atlantic rates was the most pressing point. During the period of the Boer war, ocean rates everywhere were prosperously high and all carriers made unwonted dividends and added phenomenal sums to their reserve funds. In the spring of 1901 rates went down to the loss point, and with large ship-building operations still in progress there was no relief in sight. Early in 1902 the minimum rate agreement was made, but it was never counted upon as a dividend earner. It was made merely to prevent rates from sinking below the cost of handling in and out of the ship. During this same winter and spring the Morgan combination was in process of negotiation and formation. The aim was to make it as large as possible; large enough to exercise, with the aid of its German allies, a controlling, supporting and steadying influence on rates for both passengers and freight. There was apparently no idea of excessive monopoly rates, but there was great confidence of easy control and of avoiding rapid fluctuations and the low points of depression that had at recurring intervals been bringing loss. The path to this goal was beset with difficulties. In the first place, some of the lines that were bought could be secured only at extravagant prices, and the capital was still further increased by stock-watering in the style of franchise-tenure finance. The Cunard line, one of the greatest factors in the North Atlantic and from this distance apparently an essential to the success of the venture, could not be bought because the stock was in strong hands. The alarmed British nation came to the rescue with new mail contracts and loans at low rates for new and faster ships. The general public thought this was a great aid to the Cunards. Some of the New York leaders in trans-Atlantic shipping think that the government agreement is a handicap to the Cunard line because in consequence of it $13,000,000 is tied up in two ships fastened to one route, and that a route of declining supremacy. The two great subsidized German lines, with the personal backing of the Emperor and the strong financial and moral support of the rest of the government, appear to have been impressed by the promising force of the new undertaking. They made an offensive and defensive alliance with the combine, and later joined with it in the purchase of the Holland-America line leaving the French line the only continental interest of the first rank remaining outside, and with it they have apparently since concluded a firm alliance.

As a rate controller the great corporation of Mr. Morgan and Mr. Griscom has been a failure. Ocean rates showed no indication of new influences in the autumn of 1902 when the new company went into operation. The combine and its allies have had to deal with a world condition of depression in ocean rates, and they have had the lively competition of the Cunard line, which has had a more independent attitude than any of the other and smaller independent lines. It is an old, well-established, conservatively financed and admirably located line, which is in a position to hit back with equal or better force after every move the Mercantile Marine or their associates may make in competition against it. The fast services of the combine are rivalled at Liverpool by that of the Cunard, and the continental emigrant business is drawn off at the Adriatic side door. The Cunards could not be absorbed at formation, they have not been coerced by competition and rate wars, and the conditions of truce under which the rivals have at times been acting in the intervals do not seem yet to have reached a basis for long duration. In addition to Atlantic competition, the International Mercantile Company, which is essentially a carrier from Atlantic ports, has had to meet the vigorous and uncompromising efforts of the Illinois Central and other Gulf railroads in building up Gulf commerce in bulk goods at the expense of the Atlantic ports.

(*To be continued.*)

*Space prohibits any detailed narration of the agreements and wars in the trade of the United States with the Mediterranean. It is one series of changing episodes similar to those that have been narrated in connection with other trades.

New Tracks and Signals at Broad Street Station.

The Pennsylvania Railroad has just completed the lengthening of the platforms in its Broad street terminal station, Philadelphia, by which the most important ones are made about 1,000 ft. long, and has entirely rebuilt the signals and signal apparatus of the station and its approaches; and has sent out photographs showing the principal features of the new plant, which are reproduced herewith. The signaling embraces five important new features, as follows:

1. The use of track circuits to lock the switch levers, and the complete elimination of mechanical detector bars (or "locking bars"). These track circuits, like those installed at Hoboken, N. J., and described in the *Railroad Gazette* of January 31, last, are arranged so as to lock all switches in a route when a train passes the signal governing that route. Each switch is released behind the train as the train clears the track circuit protecting that particular switch.

2. The use of small electric lights on the interlocking machine in connection with the switch levers, to indicate the passage of a train over a track circuit. Lights also show when each signal is free to be cleared.

3. Signal arms moving in the upper quadrant.

4. The use of "three-position" signals. Horizontal indicates stop. Inclined 45 degrees is used to indicate that the train has a clear track, but must expect to stop at the next signal; and an arm standing upward vertically indicates that the track is clear and also that the next signal is clear. The speed limit is 15 miles an hour, so that a single arm can be and is used to indicate for all of the routes leading from a given signal. The short arm fixed 12 ft. below the high arm, is used for movements where the speed of the train must be kept absolutely under control. The short arm is never raised except to the 15-degree position.

5. All high signals are semi-automatic. Every arm goes to "stop" immediately on the passage of a train, and it cannot be

Fig. 1—Outside of Broad Street Station, Philadelphia, Looking East.

Five of the platforms have been lengthened. That at the left is covered for a part of its length, outside the train shed, by a "butterfly" roof. A building was removed to admit of the extension of the tracks at the extreme right. In the foreground are seen double slip switches without detector ba

cleared until (a) the train has cleared the track circuit controlling that arm, and (b) until the lever has been put back normal. Thus all signals can be kept in the stop position, except as the signalman clears them, and he must clear the signal for each and every train movement.

The signal plant is electro-pneumatic, as before. There are 12 signal levers working 100 signals and 47 levers working 158

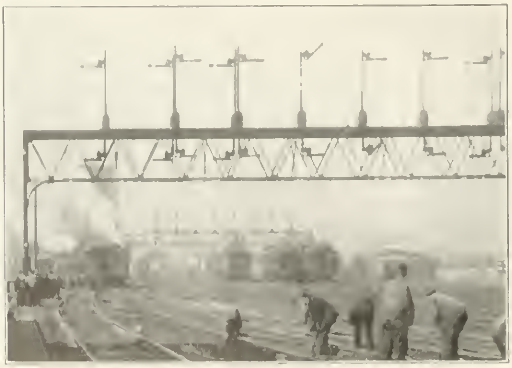

Fig. 2—Broad Street Station Looking West; Three-Position Signals, Upward Inclination.

Only one high speed signal arm on each post. On the signal bridges in the distance the old signals are still in use.

switches, frogs and facing point locks. There are in the plant 431 relays and about 800,000 ft. of electric conducting wire. The train-shed tracks will now accommodate 250 cars in the aggregate, as compared with 80 cars before the enlargement, and the shortest tracks are now 750 ft. long, while under the old arrangement the minimum length was 350 ft. The regular movement in and out is now 568 trains each week day. In the last five years the traffic at this station has increased 8 per cent. annually, and in 1907 the number of passengers, in and out, was 21,318,589.

Two ladders connecting eight of the tracks; double slips at all crossings.

GENERAL NEWS SECTION

NOTES.

The Erie canal is to be opened May 5.

F. A. Delano, President of the Wabash, has been chosen President of the American Railway Association.

At Chicago last Wednesday Judge Kohlsaat in the United States Circuit Court enjoined the five principal express companies from issuing franks or carrying interstate commerce in exchange for franks.

At a hearing before the State Tax Board at Indianapolis, Ind., April 15, an officer of the Standard Oil Co. testified that in the last year the business of the Union Tank Line had resulted in a net loss of $169,073.

A Chicago press despatch says that the Chicago Subway Company has lost the mail contract, and that the government will restore the old system of horse and wagon transportation between the post office and the railroad stations.

The New York Public Service Commission, First District, has begun proceedings to impose a fine of $2,400 on the Brooklyn Rapid Transit Co. for noncompliance with an order of the commission requiring that a wrecking car be kept at the Brooklyn Bridge terminal.

Canadian papers report that the number of emigrants going into western Canada is now the largest ever known, most of the people being bound for Saskatchewan and Alberta. Five special trains passed through St. Paul in one day. Home seekers are going to Canada from Iowa, Nebraska, Kansas and Oklahoma, and thousands are coming from Great Britain.

At the Master Mechanics' Convention at Atlantic City, June 22-24, the Committee on the Apprenticeship System will exhibit models, drawings and photographs to show the rapid advancement which is being made in this phase of railroad activity. The Central of New Jersey, the Grand Trunk, the New York Central Lines and the Atchison, Topeka & Santa Fe will be represented.

The New York, New Haven & Hartford is now using electric locomotives between New York and Stamford, 33½ miles, on some of its through express trains. The trains running through between New York and Boston are hauled between Stamford and Boston 199 miles, by one engine without change. Most of these runs take five hours or less, and the enginemen run five days in a week.

A press despatch from Helena, Montana, says that residents of the town of Big Timber, in that state, which was almost entirely destroyed by fire in March, have been notified by the Northern Pacific that they will be paid 50 cents on the dollar by the railroad toward their losses. The fire started from a spark from a locomotive and left hundreds of people homeless. This action of the railroad was voluntary.

Superintendent R. T. Morrow, of the Pittsburgh division of the Pennsylvania, has directed that circulars issued to trainmen announcing changes in tracks, switches or signals must hereafter show the new or changed part of the plant in red ink. It appears that there have been cases where an order was not fully understood, and the explanation proved to be that the employee had not fully comprehended the diagram of the tracks.

At Chicago last week the United States circuit court, on the application of the Beatrice Creamery Co. and others, issued a temporary injunction forbidding a proposed advance in freight rates on milk and butter to the Atlantic seaboard. The increased rates had been announced by the Michigan Central, the Grand Trunk and the Pere Marquette, and these companies are accused of conspiracy to raise rates in violation of the Anti-trust law.

Artesian wells have been successfully bored at Suwanee, Valencia county, N. Mex., on the Atchison, Topeka & Santa Fe, on land which belongs, under an old land grant, to the St. Louis & San Francisco. Every alternate section for some distance along the line of the Santa Fe in this region belongs to the St. Louis & San Francisco, which owns about 450,000 acres of land in this region, all of it supposed to be arid until this recent discovery was made.

The New York State Public Service Commission, First District, has issued an order to the Receivers of the New York City Railway specifying in detail the number of surface cars which the state will require to be run on the Twenty-third street crosstown and two other New York City lines. Inspectors of the commission will estimate the probable number of passengers desiring to board the cars at the principal points during various 15-minute periods of the day, and the road is called upon to provide seats for 10 per cent. more than the estimated demand. If the demand should be such as to require more cars than the track or street will accommodate, the company must run as many cars as can be accommodated.

According to press despatches from Washington, the Attorney-General has issued a circular intended to gather complete information throughout the country concerning the ownership by railroads of commodities such as coal, lumber, etc., which, according to the Act of 1906, it will be unlawful, after May 1, for the railroads to transport, except for their own use. Congress is expected to pass a resolution under which the constitutionality of this law, forbidding a railroad to transport its own products, can be tested without requiring a road to run the risk of incurring enormous penalties.

"Pay-as-you-enter" cars have now been in use on the Madison and Fourth avenue surface street line in New York City for several weeks, and the general manager of the line says that they are proving satisfactory to the passengers and to the company. The entrance, with a very large platform, enclosed, is separate from the exit, and 20 or more passengers can board the car and then pay the conductor after it has been started. The cars carry large placards requesting passengers to have the exact fare ready, and passengers are complying with this request. There are 155 cars in service on this line, providing considerably greater passenger capacity than has ever been provided on this line before.

Bonds and Notes Maturing in 1908.

Analysis of the outstanding funded obligations of the principal railroad systems of the country reveals the fact that between now and the end of the year there will mature only about $24,000,000 of bonds, very few, if any, of which will require the issuance of new securities for refunding purposes.

It is unquestionably a fortunate circumstance that during a year when requirements for other purposes are running up to considerable amounts, the railroads are under the necessity of arranging for a smaller amount of maturing obligations than they have been in the past four or five years. The nine largest maturing issues are as follows:

Chesapeake & Ohio 1st 6s, series A and B	$2,013,354
Erie-Buffalo & S. W. 1st 6s	1,500,000
Erie-S. W. Div. 5s	1,000,000
Maine Central-Portland & Ogdensburg 5s	2,119,000
Pennsylvania-Ashtabula & Pittsburgh 1st 6s	1,500,000
Kansas City, Fort Scott & Gulf 1st 7s	2,103,000
Alabama Great Southern 1st 6s	1,750,000
Utah & Northern 1st 6s	4,993,000
Fitchburg 5 per cent. plain bonds	2,000,000

With regard to short term obligations of the total amount of about $115,500,000, whose maturities fall within the current year something over $52,000,000 yet remains to be taken care of. Most of these are in considerably larger amounts than the maturing bonds, and will require financing of some sort. Since the arrangements made by E. H. Harriman to pay off the $5,500,000 Erie discount notes, which fell due on the 8th inst., and the action of the Public Service Commission in granting permission to the Interborough to issue new securities to refund the $15,000,000 notes maturing on May 1, the following are left unprovided for:

Cincinnati, Ham. & Dayton 4½s, due September 1	$15,000,000
Detroit, Toledo & Ironton 5s, due December 1	5,500,000
St. Louis & San Francisco 4½s, due December 1	7,013,831
Underground of London 5s, due June 1	16,550,000
Wheeling & Lake Erie 5s, due August 1	8,000,000

In addition to these short term obligations, Delaware & Hudson has a bank loan of $6,000,000 maturing about August 1, which will in all probability be paid off from the proceeds of the new bonds which the stockholders are asked to authorize at the meeting next month.—*Wall Street Journal*

Improved Street Car Service on Brooklyn Bridge.

The New York State Public Service Commission, First district, reports that since September last there has been a material diminution in the number of delays of trolley cars on the New York and Brooklyn bridge, and that there has been a large increase in the number of cars in service, particularly in the rush hours. The time of delays has been reduced from 1,060 minutes in September to 385 minutes in March.

During the month of March 133,000 surface cars crossed the bridge, being an increase of 11,000 over the preceding September, which means that about 396,000 more seats were provided in March than in September. The average number of surface cars passing over the bridge in September in the evening rush hour was 288. In March this average was increased to 310.

At this time one year ago the largest daily number of surface cars that crossed the bridge was approximately 1,000. Now it is approximately 1,700, an increase of 17½ per cent. At this time a year ago the average number of surface cars crossing the bridge between 5 and 6 p.m. was 236. Now it is 310, an increase of 33⅓ per cent.

The Commission has ordered, and effected, many improvements in cars, reducing the delays from defects, and has secured the exclusion of heavy wagons from the bridge roadways during the rush hours.

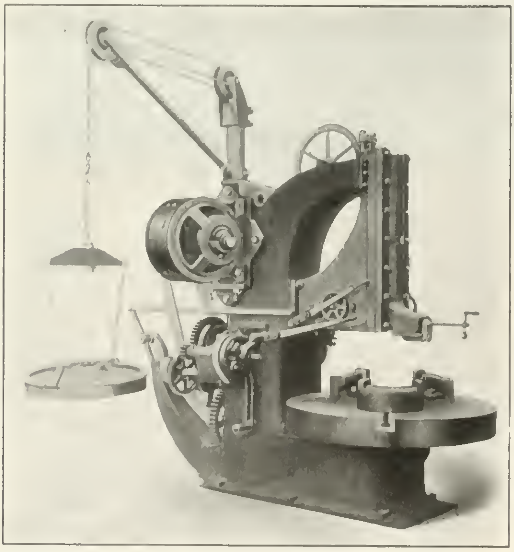
Disastrous Collision Near Melbourne, Australia.

Press despatches of April 20 report a rear collision of passenger trains at Braybrook, eight miles from Melbourne, Australia, on Sunday evening, April 19, in which 42 persons were killed and 80 or more injured. The leading train was just starting from the station. The wreck took fire and three of the cars, with many bodies of victims, were burned up.

Improved Motor Driven Car Wheel Boring Mill.

The illustration shows a motor-driven car wheel-boring mill with improved automatic chuck, friction feed discs and crane attachment. It is a 51-in. machine and its heavy construction and powerful gearing makes it capable of taking the heaviest cuts required for this class of work.

The automatic chuck is self-closing, self-opening and self-centering. It has three adjustable abutments, each provided with an equalizing steel jaw with two bearing points. The work is thus held and centered by six points on the circumference. The first movement of the driving shaft causes the jaws to close in on the



Motor Driven Boring Mill.

work, after which the table begins rotating. When the work is completed, the chuck is released by disengaging the driving clutch and retarding the driving shaft by the friction brake. The inertia of the table and work imparts the force necessary to open the jaws. The work is secured in position in the machine and released with no loss of time and without labor. Since the power of the clutch grip increases with the resistance of the cut, it is never necessary to stop the table to tighten the chuck.

The boring mill is especially arranged for electric drive; the motor is mounted on the vertical housing of the frame. The motor is a Westinghouse, 7½ h.p., type S with a speed variation of about two to one. The mill is made by William Sellers & Co., Inc., Philadelphia, Pa.

Corrugated Round Reinforcing Bars.

The Expanded Metal & Corrugated Bar Co., St. Louis, Mo., announces that, to meet the requirements of those who prefer a round bar for reinforcing purposes, it is prepared to furnish round corrugated steel bars in addition to its present type of squares and flats. The different sizes of these bars have the same net area as the corresponding sizes of plain round bars.

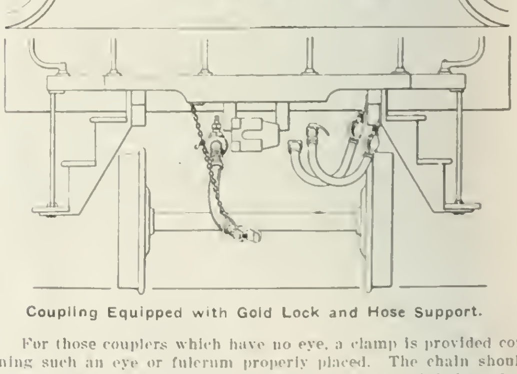
Combination Automatic Lock and Hose Support.

The Gold Car Heating & Lighting Co., New York, has designed a device for automatically locking steam hose couplers and properly supporting the hose and coupler. In this arrangement the hose is relieved of the weight of the couplers both when coupled and when separated, the life of the hose being thus lengthened. Each coupler is supported by a chain from the platform end sill, attached to the long arm of a lever hinged on the coupler. The short arm bears on the mating coupler of the adjacent car in such a manner as to force the gaskets into close contact. This takes all the weight from

Gold Combination Lock and Hose Support.

the hose and presses the gaskets together with a force much greater than that due to their weight and the action of the cam and wedge, which are still retained as integral parts of the coupler. With a coupler weighing 8 lbs. the pressure against the faces of the gaskets in contact is about 200 lbs. Additional pressure can, if desired, be produced by simply increasing the length of the long arm of the lever, but service during the past winter on several railroads has shown that the present proportions are ample for maintaining tight joints.

The locking lever is made of drop forged steel, and while light in construction is amply strong for the work required of it. It can be applied to existing Gold couplers with little or no labor. If the coupler has an eye cast integral with the body, the rocker of the lever is simply passed through this eye and secured with a cotter



Coupling Equipped with Gold Lock and Hose Support.

pin. For those couplers which have no eye, a clamp is provided containing such an eye or fulcrum properly placed. The chain should be of such length as will hold the couplers, when coupled, from 1 to 1½ in. higher than they would be if supported by the hose alone. This chain is provided with an extra hook to be used in case further adjustment be required. The hooking up of the couplers when they are separated is often neglected, causing damage to hose and couplers and sometimes serious accidents to trains. With the use of this device, this is absolutely impossible, as the chain is never detached from the lock, whether the couplers are coupled or uncoupled. In case the train parts, the couplers separate without damage; neither can they drag on the ties.

Ventilation of the Interborough Rapid Transit Subway.

Shortly after the opening of the New York subway it was decided to ventilate the station toilets by some positive means. Small-volume blowers were adopted, and 60 outfits were bought from the American Blower Co., Detroit, Mich. Later, the Rapid Transit Commission decided on a plan for ventilating the subway itself by centrifugal exhausters. "ABC" steel plate exhaust fans were adopted, 25 of which have been installed in vaults (Fig. 1) built in ventilating ducts under the sidewalks along the line of the subway, about midway between stations, from Fulton street to Fifty-ninth street. These exhausters draw the air from the subway, many thousand cubic feet a minute, causing an equal amount of fresh air to flow in at the stations. This action is helped by the plunger effect of the trains themselves forcing the air out through the ventilating ducts. Connection between the ducts and subway is governed by louvers or gills, balanced to open to let the air out, but to automatically close when the air tends to move in the opposite direction. These louvers are shown opened and closed, respectively, in Figs. 2 and 3.

Fig. 1.

Fig. 2.

Independent of the ventilating equipment, a cooling plant has been installed at the Brooklyn Bridge station, using four large "ABC" fans. A view of this installation is shown in Fig. 4.

In the tunnel extension under the East river from the Battery to Brooklyn fresh air is supplied by "ABC" blowers, two being installed at each end of the tunnel. They drive the air in the directions in which the trains run.

These blowers are also used for ventilating the Hudson & Manhattan tunnels between New York and Hoboken and for the Hudson Terminal buildings. Other buildings in New York using these blowers for ventilating are the Singer, the City Investment, the Trinity, the U. S. Realty, the West Street, the Bank of America, the Tribune, the St. Paul, the U. S. Express and the Flatiron buildings; also the Macy, the Wanamaker, the Altman, the McCreery and the Claflin stores, the New York *Press* and the Saks buildings, the Hippodrome, police headquarters, Fordham Hospital, the public baths, and many others.

Fig. 3.

Fig. 4.

A Trip on the South Manchuria Railway.

The following is taken from a recent folder of the South Manchuria Railway. It describes the pleasures and comforts of travel on that railroad:

> The locomotives have been supplied by the most popular American Locomotive Co., and the Pullman Car Company has furnished the passenger coaches with the unsurpassed equipments of the Grand American Express. Under the present plan, parlor cars are to be connected with the Grand Express, which are, by the way, sort of observation cars, provided in addition with the comforts of a superior drawing room so that the eye being fed on the shifting landscape, the tedium of a journey through wild Manchuria, which must be quite unbearable otherwise, will be reduced to an almost imperceptible burden.

After devoting 17 pages to describing in language and with pictures of various colors, the delights of the line, the following announcement is made:

> Before concluding, we are honor bound to inform the [illegible] to finishing the converting work of the line into the broad gage by the summer next year, the second-class accommodation in common vogue in Japan proper will be best at command, no first-class cars with dining equipments being run on the line before that time.

Location of Wheat Areas.

Kansas stands at the head of wheat states in percentage in acreage. The government report of April 1 gives that state 19.1 per cent. of the United States acreage in wheat. Indiana comes next with 8.9 per cent., Illinois with 7.7 per cent., Nebraska with 7.6 per cent., and Missouri with 7.3 per cent. Fully half of the acreage of the winter wheat belt lies beyond the Mississippi, south of Iowa, so completely has the great producing district shifted away from the west. Its first stronghold was in the Susquehanna Valley, then later in the Mohawk, and on the southern shore of Lake Erie. Finally its last stand east of the Mississippi was in the three states of Ohio, Indiana and Illinois, where something less than a quarter of the total winter wheat area is still to be found. Winter wheat is working southward to a warmer climate, while spring wheat is creeping farther north toward the Arctic circle, on the American continent.—*Wall Street Journal.*

INTERSTATE COMMERCE COMMISSION RULINGS.

Rate on Ground Iron Ore Reduced.

In Winter's Metallic Paint Co. v. Atchison, Topeka & Santa Fe et al., opinion by Commissioner Prouty, it was held that a rate of 90 cents per 100 lbs., minimum 60,000 lbs., for transportation of ground iron ore, from Chicago and Chicago points, to Pacific coast terminals, is excessive, and should not exceed 60 cents per 100 lbs.

Old Rate Restored Before Hearing.

The Commission, opinion by Commissioner Cockrell, has announced decision in the case of T. H. Bunch Co. and Merchants Freight Bureau of Little Rock, Ark., v. Chicago, Rock Island & Pacific and eight other railroads. The complainants informed the Commission that their complaint had been satisfied by the carriers by the re-establishment of the rate previously in force. The complaint was therefore dismissed.

Classification of Masurite.

In Masurite Explosive Co. v. Pittsburgh & Lake Erie et al., opinion by Commissioner Prouty, it was held that masurite, which is a high explosive but not dangerous to handle, should be accorded a lower rate than dynamite, the handling of which is attended with great danger. The Commission ordered masurite to be classified as 1½ times first class in Official Classification in less than carloads and second class in carloads, with a minimum weight of 20,000 lbs. to the car.

Demurrage on Private Cars.

The Commission, opinion by Commissioner Lane, has announced its decision "In the Matter of Demurrage Charges on Privately Owned Tank Cars." The conclusion reached is that private cars owned by shippers and hired to carriers on a mileage basis are subject to demurrage when such cars stand on the tracks of the carrier, either at point of origin or destination of shipment, but are not so subject when on either the private track of the owner of the car or the private track of the consignee. The carrier must charge demurrage in all cases where such demurrage is imposed by tariff provision on its own equipment, except when a privately owned car is on a privately owned siding or track, and the carrier is paying, or is responsible for, no rental or other charge on such cars. A privately owned car, in the sense in which that expression is here used, is a car owned and used by an individual, firm, or corporation for the transportation of commodities which they produce or in which they deal.

In expressing this opinion the Commission is not to be regarded as bound thereby, either to the recognition of the right of a carrier to refuse to furnish proper and appropriate facilities for the shipment of oil or any other commodity, or of the right of a carrier to so contract with a shipper for the use of facilities as to permit any discrimination as between shippers or consignees.

Loading Cars to Marked Capacity.

The Commission (opinion by Commissioner Clark) has decided the case of Georgia Rough & Cut Stone Co. v. Georgia Railroad et al. A lower rate on stone paving blocks was made to allow shippers to compete with producers in other states, on condition, which was expressed in the tariff, that the minimum weight should be the marked capacity of the car. Complainant knew the weight of a cubic foot of paving block and always counted the number placed in a car; never specified capacity of car desired, although on request he could have had cars ranging from 40,000 to 100,000 lbs. capacity; always had sufficient material to load to marked capacity of car received, which could have been easily loaded to and beyond that capacity; and from October 1, 1904, to November 30, 1907, found no difficulty in loading to marked capacity of the cars received. The Commission decided that on these facts the regulation making the minimum carload weight the marked capacity of the car was not unjust nor unreasonable, and reparation based thereon was denied. An order was entered dismissing the case, but if complainant and defendants are unable to reach an agreement as to the correct amount of overcharges unlawfully collected from complainant, or if such overcharge is not promptly refunded by defendants, the facts may be brought to the attention of the Commission and the case will, if necessary, be reopened for the entry of such order, or the inauguration of such proceeding as may be warranted.

TRADE CATALOGUES.

Trucks.—A circular issued by the Fairbanks Company, New York, gives the sizes, weights and prices of a number of warehouses and baggage trucks, and other trucks and similar carts for special uses.

Small Motors.—Bulletin No. 4,548, of the General Electric Co., Schenectady, N. Y., illustrates direct and alternating current motors installed for individual motor drive of a large number of machine tools.

Crossing Bells.—Supplement No. 2 to Bulletin No. 24 of the Union Switch & Signal Co., Swissvale, Pa., gives price lists of parts of the Union electric crossing bells, each part being illustrated.

Switch Indicator.—Bulletin No. 4,563, of the General Electric Co., Schenectady, N. Y., describes a switch indicator, type SI-104. This was described in the *Railroad Gazette* of January 3.

Ratchets.—A circular of the Ashcroft Manufacturing Co., New York, describes and illustrates, with sizes and price lists, several styles of Packer ratchets.

Staybolts.—The Falls Hollow Staybolt Co., Cuyahoga Falls, Ohio, is sending out a pamphlet on Staybolts, Their Use and Abuse, by John Hickey.

Gages.—A circular issued by the Ashcroft Manufacturing Co., New York, gives sizes and price lists of Scotch gage glasses.

MANUFACTURING AND BUSINESS.

P. H. Griffin has resigned as manager of the New York Car Wheel Co., Buffalo, N. Y.

The New York office of The Curtain Supply Co. has been moved to the Hudson Terminal buildings, 50 Church street.

William E. Moran, of the Moran Bolt and Nut Manufacturing Co., St. Louis, Mo., died Friday, April 10, aged 62 years.

The New York office of the Adams & Westlake Co., Chicago, has been moved to the Hudson Terminal buildings, 30 Church street.

The offices of the American Locomotive Co., New York, have been moved to the Hudson Terminal buildings, 30 Church street.

The New York office of the Duff Manufacturing Co., Allegheny, Pa., has been moved to the Hudson Terminal buildings, 50 Church street.

The Wells Light Manufacturing Co. has moved its main office from 46 Washington street, New York, to 14 Church street, corner Cortlandt street.

W. H. Cowell, formerly Purchasing Agent of the Algoma Central & Hudson Bay, is now with the Wellman-Seaver-Morgan Co., Cincinnati, Ohio.

E. G. Smith, Secretary of the Railroad Supply Manufacturers' Association, moved his headquarters from Chicago to Atlantic City, N. J., on April 20.

W. J. Fauth, formerly Assistant Engineer of the C., B. & Q. Ry., has been appointed Engineer of Sales of the W. K. Kenly Co., Chicago, dealer in rails and track materials.

Wesley Meeteer, 26 Cortlandt street, New York, is asking catalogues and prices on a complete line of machinery and equipment for a car building plant producing both wooden and steel cars.

Samuel M. Curwen, Second Vice-President and General Manager of the J. G. Brill Co., Philadelphia, Pa., has been elected Vice-President and General Manager and also a Director, succeeding, as Vice-President, the late John A. Brill.

The Vulcan Iron Works Co., Toledo, Ohio, hereafter will be known as The Vulcan Steam Shovel Co. This is to make the corporate name more fully indicative of the principal business of the concern, which is the manufacture of steam shovels.

The executive offices of the Westinghouse Electric & Manufacturing Co., heretofore at 111 Broadway, New York, and the New York sales offices and export offices, heretofore at 11 Pine street, have been moved to the City Investing building, 165 Broadway.

L. W. Horne & Co., New York, Consulting Engineers, announce that capital is being procured for building Boyes mono-rail structures, "scenic railways," at Coney Island and at 110th street and Fifth avenue, New York. It is expected that bids will soon be asked on steel castings and structural steel.

The American Car & Equipment Co., Chicago, announces the association with that company of H. H. Sessions and W. H. Horine. The officers are: H. H. Sessions, President; I. J. Kusel, First Vice-President and General Manager; C. R. Powell, Second Vice-President and General Superintendent; W. H. Horine, Secretary and Treasurer. The directors are: H. H. Sessions, M. A. Garrett, A. R. Warner, I. J. Kusel, C. R. Powell, Phillip Lawrence and S. T. Rowley.

A contract has been given to the Meriden Britannia Co. (International Silver Co., Successor), Meriden, Conn., for all the silverware for the cars, steamships, hotels and restaurants of the Union Pacific, the Oregon Short Line, the Oregon Railroad & Navigation, the Southern Pacific, the Northwestern Pacific, the Illinois Central, the Southern Pacific Company's Atlantic Steamship lines and, probably, the Pacific Mail Steamship Co. The contract runs for several years and is similar to those which the Harriman Lines make with makers of other supplies. At present, the Harriman Lines have 100 dining cars, 50 buffet cars and 50 private cars.

The General Railway Specialty Co., Chicago, H. U. Morton, Vice-President, advises that its metallic sheathing has been applied to a number of passenger coaches of the Chicago & North-Western and Atchison, Topeka & Santa Fe; to 31 baggage cars of the St. Louis & San Francisco, and to 82 Pullman sleeping cars. The Pullman Co. has adopted it as standard for all cars built hereafter. The "National" steel trap-door and lifting device has been applied to 35 coaches of the North-Western, to 15 coaches and three diners building for the C., M. & St. P., and to 10 coaches building for the N. Y., O. & W. "Schroyer" friction curtain rollers have been specified for the 350 street cars building by the Pullman Co. for the Chicago Railways Co., and 300 of this lot will have "National" standard roofing.

The Ajax Manufacturing Co., Cleveland, Ohio, has the following recent orders: from the New York Central, for its West Albany shops, one No. 9 Ajax motor-driven, reversing crosshead bulldozer, and two Ajax belt-driven heading, upsetting and forging machines, 3/4 in. and 1 in. respectively; from the Curtis Motor Truck Co., Decatur, Ill., one 4 in. Ajax motor-driven heading, upsetting and forging machine, one No. 8 motor-driven bulldozer with reversing crosshead, and one No. 4 motor driven bulldozer, from the Wyman & Gordon Co., Worcester, Mass., one 5 in. heading, upsetting and forging machine. Shipments have lately been made to the National Tube Co., McKeesport, Pa.; the Mulvey Manufacturing Co., Chicago; the Intercolonial Railway; the Atchison, Topeka & Santa Fe; the Egyptian State Railways, and the Japanese Government.

Iron and Steel.

The McClintic-Marshall Construction Co. has orders for 1,800 tons of bridge material for two viaducts on the Pacific extension of the St. Paul, and for 3,000 tons for track elevation on the Chicago & North-Western.

Orders for rails have been placed by the New York Central Lines as follows: Lake Shore, 20,000 tons; Michigan Central, 14,000 tons (8,000 tons for lines in the United States and 6,000 tons for lines in Canada); Chicago, Indiana & Southern, 2,000 tons; Lake Erie & Western, 1,000 tons, and Boston & Albany, 8,000 tons. These rails are in addition to the 24,000 tons recently ordered for the lines east of Buffalo.

OBITUARY NOTICES.

Henry C. Urner, Secretary and Treasurer of the Little Miami Railroad, and formerly United States Marshall, died on April 18 after a lingering illness. Mr. Urner was 78 years old.

Hall Wilson Watts, Master Car Builder and Car Accountant of the Monongahela Connecting Railroad, and President of the Railway Club of Pittsburgh, died on April 14, after several weeks illness.

John H. Ames, formerly Purchasing Agent at St. Paul, Minn., of the Northern Pacific, died at his home in Ware, Mass., on April 14. Mr. Ames was born in Housatonic, Mass., in 1838. He served throughout the war in the U. S. Navy, retiring in 1865 as assistant engineer. He was Superintendent of the Yale & Towne Manufacturing Co., New York, for 10 years, and later Superintendent of the Grant Locomotive Works, Paterson, N. J. In 1874 he took a consignment of export locomotives to Odessa, Russia. He was made Purchasing Agent of the Northern Pacific in 1879, in which office he served until 1890. He then retired, and had not been actively engaged in business since.

Everitte St. John, formerly Vice-President and General Manager of the Seaboard Air Line, died on April 21 at his home in Wellesley, Mass. Mr. St John served on the Rock Island for 32 years. He was born in 1844 at Kent, Conn., and began railroad work on the Housatonic Railroad, now part of the New Haven, and in 1862 went west to become clerk in the general ticket office of the Quincy & Toledo, now part of the Wabash. The next year he went to the Chicago & Rock Island, the predecessor of the Chicago, Rock Island & Pacific. In 1864 he was made chief clerk in charge of the general ticket department. In 1869, he was appointed General Ticket and Passenger Agent, and six years later was appointed also Assistant to the General Manager. After a year in these positions, he was made Assistant General Manager and in 1887 was appointed General Manager. He held this position until 1895 During the Pullman strike in 1894 he was Chairman of the General Managers' Association, representing all the roads entering Chicago. In 1895 he went to the Seaboard Air Line as Vice-President and in 1900 was appointed also General Manager of that road. He retired from railroad service in January, 1901.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

St. Louis Railway Club.

At the annual meeting of this club John J. Baulch (Manufacturers' Railway) was re-elected President; E. F. Kearney (Missouri Pacific) was elected First Vice-President; S. D. Webster (Terminal R. R. Assn.), Second Vice-President, and Charles Waughop, Third Vice-President; B. W. Frauenthal, Secretary, and C. H. Scarritt, Treasurer. The club has 1,148 members, of whom 160 were admitted during the past year. The treasurer reports a balance on hand at the end of the year of $3,968.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers

Grand Trunk Pacific.—M. M. Reynolds, Fifth Vice-President of the Grand Trunk, has been elected also Third Vice-President of the Grand Trunk Pacific, with headquarters at Montreal, Que. He will have special supervision of the treasury and accounting departments of this road.

Illinois Central.—E. F. Stovall has been appointed General Agent at Birmingham, Ala. He will perform such duties as may be assigned to him in the executive, financial and legal departments, effective April 18.

Long Island.—F. G. Bourne has been elected a Director, succeeding the late Franklin B. Lord.

Mexican International.—P. H. L. King, Assistant Auditor, has been made Auditor of Freight Receipts and his former position has been abolished.

Operating Officers.

Atlantic Coast Line.—After May 1 the road will be operated in three divisions instead of four. The First division will extend from Richmond, Va., to Florence, S. C. This is the same as the present First division. The Second division will extend from Florence, S. C., to Thomasville, Ga., thus merging the present Second and Third divisions. The new Third division will extend from Jacksonville, Fla., to Fort Meyers, taking the place of the present Fourth division. W. H. Newell, General Superintendent of the present First division, will be General Superintendent of the new First division, his headquarters remaining at Rocky Mount, N. C., succeeding C. L. Porter. General Superintendents of the present Third and Fourth divisions will retain their offices in Savannah, Ga., and Jacksonville, Fla., respectively, and act as General Superintendents of the new Second and Third divisions. A. W. Anderson, at present General Superintendent at Florence, S. C., will become General Superintendent of the Charleston & Western Carolina, with headquarters at Augusta, Ga. G. G. Lynch, General Superintendent of the Charleston & Western Carolina, has been appointed Superintendent of the Columbia district, First division of the Atlantic Coast Line, with headquarters at Florence, S. C.

Charleston & Western Carolina.—See Atlantic Coast Line.

Erie.—T. B. Duggan has been appointed Trainmaster at Salamanca, N. Y., succeeding W. H. Daley, transferred.

Louisville & Nashville.—J. B. Arbegust, formerly Trainmaster at the Louisville terminals, has been appointed Superintendent of the Louisville terminals, succeeding the late C. J. Klein, and the office of Trainmaster at the Louisville terminals has been discontinued.

Norfolk & Western.—W. J. Jenks, formerly Superintendent of the Seaboard Air Line at Jacksonville, Fla., is now Chairman of the Car Allotment Commission of the Norfolk & Western, with headquarters at Bluefield, W. Va.

Seaboard Air Line.—See Norfolk & Western.

Traffic Officers.

Canadian Pacific.—H. S. Carmichael, Acting General Passenger Agent at London, Eng., has been appointed General Passenger Agent for Great Britain and Europe, with office at Liverpool, Eng. Mr. Carmichael succeeds Mr. Flanagan, who retired some months ago on account of ill health. H. G. Dring will succeed Mr. Carmichael as Assistant General Passenger Agent, with office at London.

Central Vermont.—C. E. Dewey, Assistant General Freight Agent of the Grand Trunk at Montreal, Que., has been appointed General Freight Agent of the Central Vermont, succeeding Robert L. Burnap, transferred.

Grand Trunk.—A. E. Rosevear, freight claim agent at Montreal, Que., has been appointed Assistant General Freight Agent at Montreal, succeeding C. E. Dewey, who has been appointed General Freight Agent of the Central Vermont.

Pennsylvania Lines West.—Guy S. McCabe, division freight agent of the Richmond & Logansport division, has been appointed General Western and Division Freight Agent at Chicago, succeeding M. S. Connelly, promoted.

Engineering and Rolling Stock Officers.

Colorado Southern, New Orleans & Pacific.—B. B. Gordon, Chief Engineer, has resigned, and the position has been abolished. C. H. Fisk, Chief Engineer of Maintenance of Way, with headquarters at Beaumont, Tex., assumes the duties of Mr. Gordon's office.

LOCOMOTIVE BUILDING.

The Iowa Central is said to be in the market for six locomotives. This item is not yet confirmed.

The Lehigh & New England is said to have ordered three locomotives from the Baldwin Locomotive Works, for July delivery. This item has not yet been confirmed.

CAR BUILDING.

The New York City Railway expects to buy 150 pay-as-you-enter cars.

Morris & Co., Chicago, have ordered 200 refrigerator cars from Haskell & Barker.

The American Railway & Lighting Co., Dallas, Tex., is in the market for 10 electric cars.

The Northern Pacific is again figuring on the passenger cars mentioned in the *Railroad Gazette* of March 13.

The Northern Pacific has ordered from the American Car & Foundry Co. the 500 refrigerator cars mentioned in the *Railroad Gazette* of April 17.

The Chicago & North-Western has ordered 300 steel ore cars of 100,000 lbs. capacity from the Pullman Co. and 250 from the American Car & Foundry Co.

The Lehigh & New England is said to have ordered 50 gondolas from the Cambria Steel Co. in addition to the 250 forty-ton cars mentioned in the *Railroad Gazette* of April 3. This additional item has not yet been confirmed.

The Minneapolis & St. Louis has been figuring on two combination mail and express cars. These cars will be 70 ft. long and 9 ft. wide, inside, and 6 ft. 9½ in. high to top of plate. Platforms are to be equipped with the National centering device, and the cars are to have a 40-ft. mail compartment with two doors on each side and equipped with Harrison postal bag racks. The special equipment will include:

Brake beams	Simplex
Brake-shoes	Cast iron—Christy brake heads
Couplers	Tower
Draft rigging	Harvey tandem draw bar spring—Miner draft lug
Journal boxes	Symington
Light	Pintsch gas and oil
Platforms	Am. Car & F'dry Co. standard I beam construction
Springs	Crucible steel
Vestibules	Pullman dummy
Wheels	Davis sol'd steel

RAILROAD STRUCTURES.

BARRIE, ONT.—An agreement, it is said, has been reached between the city authorities and the Grand Trunk, under which the road will build new shops here. The work is to be finished within three years.

HAINSBURG JUNCTION, N. J.—The Lehigh & New England, it is said, has given a contract to the Pennsylvania Steel Co. for a 155-ft. bridge over Paulins Kill.

NEW WESTMINSTER, B. C.—The Victoria Terminal Railroad & Ferry Co. is applying for permission to build steel bridges across Serpentine and Nicomeki rivers, near this city.

PORTLAND, PA.—The Lehigh & New England is said to have given a contract to the Pennsylvania Steel Co. for a bridge over the Delaware river. The river spans will be 925 ft. long, and the viaduct approach, 934 ft.

RENSSELAER, N. Y.—It is said that the Boston & Albany will at once start work on a roundhouse here.

TEMISKAMING & NORTHERN ONTARIO.—Bids are wanted by A. J. McGee, Secretary and Treasurer, Toronto, Ont., May 7, for some station buildings, also other structures and a number of small concrete arches.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ARKANSAS ROADS.—Surveys are reported made for a line from Mountain Home, Ark., south to a connection with the St. Louis, Iron Mountain & Southern, 11 miles. W. L. Marshall, of Mountain Home is the principal promoter.

BAINBRIDGE NORTHEASTERN.—This company, organized last year to build a line from Bainbridge, Ga., northeast to Pelham, 35 miles, and eventually south through Florida to a point on the Gulf coast, has finished 18 miles of its proposed line, and has material for building three miles additional. (Sept. 20, p. 338.)

BUFFALO & LAKE ERIE TRACTION.—Bonds have recently been issued by this company to build a five-mile extension in Mill Creek township, Pa.

CANADIAN NORTHERN.—The Provincial Government of Ontario has undertaken to guarantee the bonds of this company to provide for the construction of 50 miles of new railroad at \$20,000 a mile, and of terminals in Toronto to the amount of \$1,500,000.

CANADIAN PACIFIC.—The company has decided not to proceed with the construction of the Moosejaw extension this spring, as was previously intended.

CANADIAN VALLEY (ELECTRIC).—An officer writes that the projected route of this line is from Fort Supply, Woodward county, Okla., southeast down the Canadian river to Oklahoma City, 150 miles. Thomas Martin, President, Mutual, Okla. (March 27, p. 161.)

CANANEA, YAQUI RIVER & PACIFIC.—See Southern Pacific.

CHICAGO, MILWAUKEE & GARY.—Bonds have recently been issued by this company to build an extension from Momence, Ill., north to Gary, 42 miles. Surveys made and rights of way being secured. Also to build from the northern terminus at Rockford, northeast through Beloit, Wis., and Janesville, to Milwaukee, 100 miles, and to secure large terminals at Gary and at Milwaukee. This company owns the railroad and property of the Illinois, Iowa & Minnesota, operating 125 miles of railroad from Momence, Ill., northwest to Rockford, and when the extensions and improvements are made will have a total length of 267 miles. It will form a complete belt line around Chicago, connecting with all of the 32 railroads entering that city. (March 20, p. 429.)

GRAND TRUNK PACIFIC.—According to a report recently made to the Dominion Parliament, the estimated cost of this line is now \$85,000,000. On the eastern division, Moncton, N. B., to Winnipeg, work amounting to \$44,389,393 is under contract, and \$19,030,173 is the estimated cost of lines for which contracts are yet to be let on this section. The Prairie section is to cost \$21,872,200. From a point 193 miles west of Quebec, west to Winnipeg, the surveyed distance is 1,147 miles, of which 571 miles is already let, leaving 576 miles not yet under contract. West of Winnipeg lines aggregating 1,014 miles are under contract, of which 415 miles is finished.

Hon. George P. Graham, Canadian Minister of Railways, recently stated that contracts have been let for all sections between Moncton, N. B., the eastern terminus, and a point known as Waymontachene, 193 miles west of Quebec.

Track laying, it is said, has been started from the terminus of the present track, four miles east of Portage la Prairie, Man., where a bridge is to be built over the Assiniboine river east to Winnipeg. It is expected to have all the track laid on this section by the middle of May, and that the line will be in operation between Fort William and Edmonton, Alb., this fall.

Contracts for grading the sections from Macleod river, Alb., west 100 miles, are to be let May 15, and for the next 80 miles on June 22. This 180 miles, in addition to the 120 miles now being graded, will carry the line through Yellowhead Pass in the Rocky Mountains. (April 17, p. 559.)

Foley, Welch & Stewart, who have the contract for the first 100 miles from Prince Rupert, B. C., east, have sublet one mile through solid rock at Prince Rupert to Ross & Carlson.

An extension of time of two years has been granted to the Grand Trunk Pacific Branch Lines Co. for the following branches from the main line of the Grand Trunk Pacific: Belt line around the city of Winnipeg, Man., to connect with the other railroads, and passing, if deemed advisable, through the outlying portions of that city. Winnipeg, Man., to a point on the international boundary within a distance of 25 miles east or west of the Red river. Neepawa, Man., to a junction with the Grand Trunk Pacific to Brandon and from thence to Regina, Sask. Line from Brandon to a point on the southern boundary of the province in the vicinity of Turtle mountains. From a point on the western division in the vicinity of township 22, range 6, west of the second meridian, to Yorkton, Sask, and from thence to a port on Hudson's Bay. From the same point as the above branch southward to Regina, Sask., and thence to the international boundary near North Portal. From a point on the western division between 105th and 107th degrees of longitude to Prince Albert, Sask. From a point on the western division between 108th and 109th degrees of longitude to Prince Albert, Sask. From a point on the western division between 111th and 113th degrees of longitude to Calgary, Alb., and from thence to the international boundary near Coutts, Alb. From Vancouver, B. C., to a junction with the Grand Trunk Pacific or to a junction with the Pacific Northern & Omineca, or both between the 122d and 124th degrees of longitude. From a point on the north shore of Vancouver Island southerly to Victoria, B. C. From a point on the western division between 127th and 129th degrees of longitude to Dawson City, Y. T.

Grand Valley (Electric).—It is said that this company, operating $21\frac{1}{2}$ miles of electric lines connecting Brantford, Ont.; Paris, Glen Morris and Galt, will build an extension to Port Dover, 35 miles; also an extension to Woodstock, 18 miles.

Kentucky North & South.—Projected from Greenup, Ky., south to Bristol, Tenn., 220 miles. Surveys reported made from Greenup to Palm Gap, 180 miles. L. E. Niles, President; T. J. Kirkpatrick, Treasurer, and E. E. Parsons, Chief Engineer, all of Springfield, Ohio. The office of the company is at Covington, Ky.

Lake Erie & Youngstown (Electric).—This company, incorporated to build an electric line from Conneaut, Ohio, south to Youngstown, about 60 miles, recently increased its capital from $10,000 to $3,500,000. J. H. Ruhman, of Youngstown, who is promoting the enterprise, is quoted as saying that 75 per cent. of the right of way is secured, and that construction work is to be started as soon as the remaining 25 per cent. has been obtained. The increased capital is to prepare for this work. (Aug. 30, p. 247.)

Laramie, Hahn's Peak & Pacific.—Additional grading contracts are reported let to J. F. White & Co., of Rock River, who previously had contracts for some of the work on the extension building from Centennial, Wyo., south to Hebron, Colo., 77 miles. Contract is also reported let to Peter Cain for some of the work. (March 13, p. 392.)

Minneapolis, St. Paul & Sault Ste. Marie.—Thomas Green, Chief Engineer of this road, is quoted as saying that about $6,000,000 is to be spent this year on extension and improvements, including a tunnel into the city of St. Paul, Minn., from Minneapolis. The company has work under way on an extension from Brooten, Minn., northeast to Duluth, 189 miles, of which 49.6 miles was built in 1907. At the Duluth end about 500 men are at work. Foley, Welch & Stewart, of St. Paul, contractors. (March 13, p. 392.)

Mexican Central.—According to reports from Mexico City, work has been suspended on the Tampico cut-off, building from Mexico City east to Tampico. This line is 304 miles long and about 191 miles remains to be built. (March 13, p. 396.)

This company, it is said, will begin work this summer on widening the gage and reconstructing the line from Colima to the Port of Manzanillo. (March 13, p. 396.)

Mexican Pacific Coast.—See Southern Pacific.

Mexican Roads.—Permission has been given by the Mexican Government to Carlos A. Hamilton, of Oaxaca, to transfer the concession granted to him, to a company to be organized in Oaxaca. It is to build a line from San Pablo, Huitepec, in the district of Zimatlin, Oaxaca, to San Juan Tavlche, Ocotlan. An extension of two years' time to finish the work has also been granted.

Contract, it is said, will shortly be let by Percy N. Furber, of Mexico City, President of the Oil Fields of Mexico Company, to build a line from its works at Furbero, Vera Cruz, to the port of Tuxpan, 50 miles. Contract also to be let for the construction of an oil pipe line parallel to the proposed railroad.

Panhandle Short Line.—This company was organized last year to build from Dalhart, Tex., south via Hereford and Midland, to San Antonio, also to Rockport, on the Gulf, with branches, a total of about 800 miles. According to statements credited to W. A. Squires, of Henrietta, Tex., General Manager, the work is to be pushed. The section from Carrizo Springs southeast to Artesia is being built by Asher Richardson. Grading south from Stanton has been finished for 22 miles, and north from Stanton for 24 miles; also from Dimmit, north to Hereford, 22 miles. Contracts are to be given to Suderman, Dolson & Co. for grading from Artesia east to Rockport; to Harris & Co. from Uvalde to Crystal City, and to the Southwest Texas Construction Co., north from Hereford. (March 13, p. 393.)

Pennsylvania Roads (Electric).—Horace Snyder, of Pittsburgh, is organizing a company to build an electric line from Franklin, Pa., north via Wyattville, Bradleytown and Townville, to Cambridge Springs, 36 miles.

Pleasantville Electric Traction.—Organized in Pennsylvania to build an electric line from Oil City, Pa., north via Rouseville, Pit Hole and Pleasantville to Titusville, 12 miles. The promoters are residents of Oil City and Pleasantville.

Southern Pacific.—J. Kruttschnitt, Vice-President, is quoted as saying that work on the Mexican Pacific Coast building from Navajo, Sonora, south of Coral on the Cananea, Yaqui River & Pacific, southeast to Guadalajara, Jalisco, is finished to Macerita river, about 270 miles south of Guaymas. About 15 miles additional is graded, and track laying is soon to be started on this section. It is expected to have the line finished as far as Culican early in July.

The Grant Bros. Construction Co., of Los Angeles, Cal., building the branch of the Cananea, Yaqui River & Pacific, from Rio Yaqui Sonora, north to Nacozari, 108 miles, has a large number of men at work, said to be about 1,000. (March 13, p. 396.)

Youghiogheny & Cheat River.—Incorporated in Pennsylvania with $200,000 capital, to build a line from Ohio Pyle, Pa., where connection is to be made with the Baltimore & Ohio, south 21 miles to the West Virginia state line. Contracts, it is said, are to be let at once. A charter is to be asked for in West Virginia to extend the line south to a point in Preston county. E. W. Mudge, President, Pittsburgh, Pa. J. V. Thompson, A. L. Keister and A. Overholt are said to be interested.

RAILROAD CORPORATION NEWS.

Bainbridge & Northeastern.—J. M. Wilkinson, as receiver of E. Swindell & Co., has taken entire charge of all the property of the Bainbridge Northeastern Railroad.

Baltimore & Ohio.—Commencing May 1, the Little Kanawha Railroad, which runs from Parkersburg, W. Va., to Owensport, 31 miles, from Owensport to Enterprise, three miles by steamer, and from Enterprise to Creston, 16 miles, will be operated by the Baltimore & Ohio. The Little Kanawha Railroad is owned jointly by the Pittsburgh & Lake Erie, the Baltimore & Ohio and the Pennsylvania, through the Little Kanawha syndicate.

Gross earnings for March were $5,300,000, a decrease of $1,200,000 from March, 1907. Net earnings were $1,150,000 for March, a decrease of $469,000 from March, 1907.

Boston & Maine.—A syndicate of six banking houses composed of R. L. Day & Co.; Lee, Higginson & Co.; Kidder, Peabody & Co., Estabrook & Co.; Blodget & Co., and Merritt & Co., are offering $2,400,000 Fitchburg Railroad $4\frac{1}{2}$ per cent. 20-year bonds at $103\frac{1}{2}$ to yield $4\frac{1}{4}$ per cent. The bonds were sold by the road to provide funds to take care of $2,000,000 bonds maturing the first of next month. The balance, $400,000, will be used to reimburse the Boston & Maine for construction money already spent on the Fitchburg.

Buffalo, Rochester & Pittsburg.—Gross earnings for the second week in April were $115,000, a decrease of $52,000 from the second week in April, 1907.

Chesapeake & Ohio.—This company will probably sell in the near future $2,000,000 5 per cent. consolidated mortgage bonds of 1889-1939, to meet an equal amount of 6 per cent. mortgage bonds which fall due on July 1. The new bonds are part of an authorized issue of $30,000,000, of which there are outstanding $25,858,000. The company also has $1,200,000 6 per cent. notes falling due on June 28. It is proposed to meet these by issuing new notes.

Chicago, Indiana & Southern.—J. P. Morgan & Co. are offering at 91 and interest, $15,150,000 of the Chicago, Indiana & Southern's $20,000,000 (authorized) 50-year 4 per cent. mort gage bonds, 1906-1956, guaranteed by the Lake Shore & Michigan Southern. These bonds are a first lien on 329 miles of road and equipment, except that there are outstanding $1,850,000 bonds of 1901-1950 of the Indiana, Illinois & Iowa, which are a first mortgage on the Kankakee division only, and to provide for which bonds of the new issue are reserved. On December 31, 1907, there were $7,000,000 Chicago, Indiana & Southern bonds in the treasury of the Lake Shore.

CHICAGO, MILWAUKEE & GARY.—This company has authorized $20,000,000 40-year 5 per cent first mortgage bonds. Of these $5,500,000 have been issued in exchange for the Illinois, Iowa & Minnesota Railway and its subsidiary lines, which operates 125 miles. The balance of the bonds will be issued to pay for extensions south to Gary and north to Milwaukee, and for terminals at Gary and at Milwaukee.

CHICAGO, MILWAUKEE & ST. PAUL.—The Milwaukee Terminal Railway was incorporated in the state of Washington last week, to act as a common carrier and to supply facilities for handling freight and passengers at railroad terminals.

ERIE.—Gross earnings for February were $3,200,000, a decrease of $500,000 from February, 1907. Net earnings for February were $196,000, a decrease of $516,000 from February, 1907.

FITCHBURG RAILROAD.—See Boston & Maine.

GALVESTON TERMINAL RAILWAY.—The stockholders have authorized $5,000,000 bonds to pay for improvements now under way. The company's facilities are to be used by the Trinity & Brazos Valley, the Colorado & Southern, the Chicago, Rock Island & Pacific, and the St. Louis & San Francisco.

GREAT NORTHERN.—It is said that the Northern Pacific is to give the Great Northern an entrance to Tacoma, Wash., and in return get an entrance into Vancouver, B. C., from the Great Northern.

GULF & SHIP ISLAND.—The $460,000 car trust certificates offered in January, 1908, by Cramp, Mitchell & Shober, of Philadelphia, were never issued, owing to a change in plans.

ILLINOIS CENTRAL.—A first lien equipment mortgage for $30,000,000 has been filed for record by this company. The mortgage is to secure an issue of 4 per cent. bonds 1908-1923. The mortgage covers the entire rolling stock of the company.

INTERBOROUGH RAPID TRANSIT.—The New York City Public Service Commission has authorized a mortgage securing $55,000,000 45-year bonds, of which $35,000,000 5 per cent. bonds are to be deposited as security for $25,000,000 three-year 6 per cent. notes, dated May 1, 1908. It is said that these notes have been sold to J. P. Morgan & Co. The proceeds of the sale will enable the company to redeem the $15,000,000 4 per cent. notes due May 1, 1908, and to pay off other obligations.

INTERNATIONAL & GREAT NORTHERN.—Steps have been taken to foreclose the company's second mortgage. This is the Texas Railroad which several months ago was placed in the hands of a receiver.

Gross earnings for the week ended April 14 were $118,000, a decrease of $35,000 from the corresponding week in 1907.

LAKE SHORE & MICHIGAN SOUTHERN.—See Chicago, Indiana & Southern; also Lehigh Valley.

LEHIGH VALLEY.—The Lake Shore & Michigan Southern has already disposed of approximately 50,000 shares of its Lehigh Valley stock. (April 17, p. 560.)

LITTLE KANAWHA.—See Baltimore & Ohio.

METROPOLITAN STREET RAILWAY.—See New York City Railway.

MEXICAN CENTRAL.—See National Railways of Mexico.

NATIONAL RAILWAYS OF MEXICO.—S. M. Felton, President of the Mexican Central, in discussing the Mexican Railroad merger, said that it does not mean a government ownership, but a control which is most desirable. The conditions there are entirely different from those in the United States. Mexico is undeveloped, and what it needs most is railroads. Through a government control railroad construction will be carried on so as to benefit the country as a whole, and thus avoid needless parallel lines and unnecessary expenditure for the purpose of competition.

NEW ENGLAND INVESTMENT & SECURITY CO.—See New York, New Haven & Hartford.

NEW YORK CENTRAL & HUDSON RIVER.—The Public Service Commission, Second District, has authorized the New York Central to issue $4,000,000 3½ per cent. refunding mortgage bonds of 1897-1997. There are outstanding $85,000,000 of a total authorized issue of $100,000,000. It also authorized the issue of $20,000,000 4 per cent. debenture bonds of 1904-1934. The total authorized issue of these bonds is $50,000,000, of which $30,000,000 are now outstanding. The proceeds of the bond sales are to be used for improvements.

NEW YORK CENTRAL LINES.—See Baltimore & Ohio.

NEW YORK CITY RAILWAY.—Judge Lacombe, of the United States Circuit Court, has filed a memorandum in which he states that the New York City Railway Co. should be held liable for the $3,500,000 which is needed to put the property of the Metropolitan Street Railway in good condition. The New York City Railway Co. is the lessee of the Metropolitan Street Railway.

NEW YORK CONNECTING.—Ralph Peters and John F. Stevens have been elected directors to succeed Thomas B. Rea and Charles S. Mellen, respectively. Other directors have been re-elected.

NEW YORK, NEW HAVEN & HARTFORD.—Mackay & Co., of New York, are offering at 81½, to yield 4.85 per cent., a small amount of the New England Investment & Security Co.'s cumulative preferred stock, which is guaranteed by the New York, New Haven & Hartford.

NORTHERN PACIFIC.—See Great Northern.

PATERSON RAILWAY (ELECTRIC).—F. K. McCully, of Paterson, N. J., and W. E. R. Smith & Co., of New York, are offering $202,000 6 per cent. consolidated mortgage bonds of the Paterson Railway Co. at 116½, yielding 4.80 per cent. These bonds will, after June 1, 1908, be a first mortgage on 39 miles of street railway in Paterson, N. J.

PENNSYLVANIA.—This company has sold to Kuhn, Loeb & Co., New York, and N. M. Rothschild & Co., and Baring Bros. & Co., Ltd., of London, $40,000,000 of its 40-year, 4 per cent. consolidated mortgage bonds, which is part of an authorized issue of $100,000,000 of 1873. There are now outstanding $12,500,000 of these consolidated mortgage bonds. These bonds are a first lien on all the main line and branches of the Pennsylvania Railroad between Pittsburgh and Philadelphia, subject only to $20,000,000 general mortgage bonds now issued, which mature in 1910 and which will be refunded by an issue of the consolidated mortgage bonds first mentioned. The new bonds also cover the lease of the United New Jersey Railroad & Canal Co., which forms the main line of the Pennsylvania from Philadelphia to Jersey City. Incidentally this is the first time in about 30 years that the Rothschilds have handled an American security. It is understood that the bonds will be issued at 96.

See Baltimore & Ohio.

PITTSBURGH & LAKE ERIE.—See Baltimore & Ohio.

PITTSBURGH, CINCINNATI, CHICAGO & ST. LOUIS.—Gross earnings decreased during March more than operating expenses and taxes, so that the net earnings after taxes were $30,000 less than in March, 1907.

TEXAS & PACIFIC.—Gross earnings for the week ended April 14, 1908, were $212,000, a decrease of $76,000 from 1907.

UNDERGROUND ELECTRIC RAILWAYS OF LONDON.—The directors have sent out circulars to the noteholders and shareholders giving them details of the reorganization plan. A receiver was appointed for the Underground Electric Railways of London on April 15. Under the plan of readjustment the holders of $35,000,000 5 per cent. profit sharing notes due June 1, 1908, will be given in exchange 40 per cent. in new 4½ per cent. bonds due 1933, and 70 per cent. in new 6 per cent. income bonds due 1948. No assessment is asked for from stockholders. Of the 4½ per cent. bonds there are to be issued $15,000,000 (£3,000,000), and of the income bonds there are to be issued $26,000,000 (£5,200,000). There are also to be sold to Speyer & Co. $5,500,000 (£1,100,000) prior lien 12-year 5 per cent. bonds to meet the cash requirements of the company. Speyer & Co. agree to provide $1,500,000 (£300,000), for any possible deficiency in fixed charges during the next few years "in order that the noteholders may not suffer so serious a reduction in their income as might otherwise be the case during the further developments of the enterprise." The three issues of bonds will be secured by a deposit of $17,500,000 (£3,500,000) par value of the Tube shares and the equity in the power house in addition to $55,000,000 (£11,000,000) par value of the stocks now held by the London and Westminster Bank as trustee for the noteholders, the prior lien bonds ranking before the other issues.

UNITED STATES EXPRESS.—A semi-annual dividend of $2 per share has been declared. This is a reduction of $1 per share from the dividend declared six months ago. Prior to that time $2 per share had been paid semi-annually.

WABASH.—The company has sold to Tailer & Company, New York, $889,000 first mortgage, 5 per cent. bonds, 1889-1939. With the sale of these bonds, the total authorized issue $34,000,000 is outstanding. Tailer & Company are offering these bonds to yield 4$^{70}/_{100}$ per cent.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N. Y., and the names of the officers and editors of the Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Pres't and Editor*
E. A. SIMMONS, *Vice President*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 18. FRIDAY, MAY 1, 1908.

THE MOVEMENT FOR HIGHER FREIGHT RATES.

In the aftermath of so-called hard times which follow a financial panic the rule and law of recovery is expressed curtly by the single word "contraction." There is contraction of the price of securities, contraction in the rate of wages and contraction in the cost of living. From the low and solid level thus resulting new prosperity is built up with greater or less speed. Low securities sooner or later induce buying of them. Low wages reduce the price of commodities and when they are low enough demand once again sets in. When demand sets in trade grows brisk, the commodities bought reach the railroads and pass over them, earnings increase and hard times shift into good times. Such is the sequence of events and the normal law of recuperation from panics in this and every other country. It may almost be called a historical as well as logical axiom. Here and there in the past one may find a modifying fact. In 1873, for instance, the recovery in this country was undoubtedly much delayed because gold imports could not be used for the relief of a market not then on a specie basis. But, in general, and up to our present depression the rule stated of relief of financial distress has held.

But in the panic and hard times of 1907-8 we are fronting certain new and strange conditions. For the first time three novel and unprecedented resistive forces are setting themselves athwart the law of healthy reaction from hard times. Organized labor, notably in the case of the railroads, refuses to accept reductions of wages—and does so with some strength in its plea that it faces cost of living reduced very slightly and, in many leading items, not at all. Labor even takes the short-sighted view that it will accept reduced hours and the privations of idleness rather than a lower wage-rate. Next we have the organized trusts, in tacit if not formal agreement not to lower prices and accepting smaller sales rather than lower the profit percentage—their position in the matter thus being strikingly similar to that of organized labor. Finally, on what seems the political motive, we have federal authority throwing all its influence against wage reduction and threatening investigation of alleged railroad "misconduct" if the distressed railroad corporation cuts down wages.

In the case of the railroads, as in other branches of commercial interest, three artificial influences—organized labor, the trusts and federal policy—have thus been set against natural law. Deprived of appeal to the normal elements of relief the thing easily foreseen has come to pass and the trunk line presidents have been taking counsel together for a general increase of freight rates. Three anomalies of a situation have thus produced a fourth, that is to say, a proposed rise of rates in a period of industrial depression and of natural drift to a lower scale of prices. The railroads say with a good deal of logical force "we have been deprived of certain regular forms of economy and relief. We must now move in the other line of least resistance and increase rates." The plan has one conspicuous peril. Its ultimate burden rests obviously on the consumer to whom every plus in the algebra of prices is at last charged up. The consumer's other name is the general public, not just now too friendly to the railroad corporations and certain not to be made less hostile by an increase of rates. A step not attended with much, if any, risk in a period of commercial prosperity changes its nature when taken in a period of commercial stress and may afford fresh text for the demagogue and politician against whose frothy, albeit fictitious, rage the cold facts of a situation are apt to be urged in vain. And a presidential campaign is not the time when their voices are hushed.

The policy of raising freight rates under such conditions is one which must be determined by the railroad corporations themselves. A good deal depends, doubtless, on the question of change in industrial conditions and the possibility of an outlet in the direction of reduced wages and cost of material attended, perhaps, with the reduced dividends which tend to diminish the burden by dividing it with the consumer and wage earner. But just now and in the immediate case the thing to be noted is the strange and anomalous economic situation in which three forces are crossing natural law and are compelling the railroads also to cross it. The outcome of the conflict of that law with resistive expedients will be a rich theme when the completed story is written.

METAL AND REINFORCED CONCRETE TIES.

In Europe the metal tie has passed the experimental stage, the principles being generally accepted and only the details remaining to be standardized. Conditions abroad, however, are entirely different from those in this country. We have not yet come to the point where it is immediately necessary to look for a substitute for the wooden tie. Several years ago Mr. Whinery showed that, on the basis of yearly cost of the original investment, a steel tie good for 25 years' service must not cost originally over $1.85 to be as economical as an untreated wooden tie costing 62 cents in track and lasting eight years. Similarly, a reinforced concrete tie lasting 14 years must not cost over $1.05.*

Last year the Maintenance of Way Association's committee on ties made a report covering the use of concrete ties, describing a number of designs and giving results of experiments with them. It did not report on steel ties. The committee called attention to three requisites in the design of either steel or concrete ties: First, an efficient method of fastening the rail to the tie; second, a considerable amount of elasticity in the tie itself; and, finally, satisfactory insulation. Difficulty with insulation occurs in concrete as well as steel ties, as short-circuits occur between the rails and the reinforcement. Fiber insulation wears out and track circuit maintenance becomes expensive. The first two requirements are closely related. There must be a certain amount of give between the rail and the sub-grade. Part of this, with wooden ties, is in the ballast, part in the tie and part in the fastening. This cushioning is necessary for easy riding track and to prevent rail breakage, since the rail must be allowed to take its proper curve or "wave" under load. The amplitude of the wave is ⅛ in. or more. In spiking a wooden tie, some play results, and the rest of the superstructure also lifts and falls somewhat. In designs of ties other than wood the rail is usually fastened firmly to the tie, and the tie itself is rigid. Dr. Haarmann, in the paper recently published in the *Railroad Gazette*, showed designs of metal ties in use in Germany which have more elasticity. This inverted trough type has, in this country, been found too weak to stand up under the much heavier trains which we use. The National of Mexico has for a long time been using ties of this sort on narrow gage road. The average life is given as 14 years before repairs were necessary. The ties were laid 16 to the rail in burnt volcanic clay ballast, the traffic was not heavy and the speed of trains very slow. Failures were due to breakage under the rail seat where the ties are weakened by cutting and bending up part of the metal to make lugs to hold the keys. The officers of the road recommend a U-bolt instead of the key, which will not remain tight. Rock ballast cannot be used with these ties, as it makes the track too rigid, resulting in frequent rail breakage and also damaging the rolling stock. The National of Mexico has not used any steel ties on standard gage track. A trough design was tried on the Pennsylvania Lines West a few years ago. These were Seitz iron ties, 49 of which were laid in the westbound passenger track of the Pittsburgh, Ft. Wayne & Chicago, near Emsworth, Pa., in October, 1904. Part of them were on a 2 deg. 10 min. curve, and part on tangent, 16 ties being used for each 30 ft. rail. These ties broke under the rail seats, and during 1905 they were removed. The Snyder steel tie is shaped somewhat like an ordinary wooden tie, the inside being filled with a cheap grade of asphaltum containing a large proportion of gravel. The Pennsylvania Lines East have about 3,000 of these in service on unimportant sidings. They seem to be satisfactory, but the company has never felt it wise to put them in main passenger tracks.

The Carnegie tie is the only steel tie which has been made in large numbers in this country. It is an I-beam section 5½ in. high; the top is 4½ in. wide and the base 8 in. wide. Smaller sections are rolled for electric lines and industrial railways. The rail is secured to the tie by two rolled steel clips at each rail seat bolted to the tie with ¾-in. bolts. There are indentations in the base to diminish lateral motion, and in the latest design the base is also crimped to tend to prevent shifting in the direction of traffic on heavy down grades. Up to the end of 1907, 248,914 of these ties had been sold to companies outside of the United States Steel Corporation and 593,550 to the corporation and its constituent companies. The first lot were sold in 1904. The experience of the Bessemer & Lake Erie, controlled by the Steel Corporation, on which a great number of these ties have been laid, seems to show that this design is practicable under very heavy traffic as long as it moves at low speed. Under high speed trains it is criticised for its rigidity and the design of the fastenings, the clips holding the rail so tightly that the wave in the rail under the wheel is resisted. The reaction of the steel tie as it returns to position after the wheel impact is much sharper than the cushioned reaction of a wooden tie; the shock, almost undiminished, is thus transmitted from the tie through the rails to the adjacent ties, resulting in secondary stresses which modify the impact and rail wave stresses at different points. Some of the roads which have used this tie report as follows. The Buffalo Rochester & Pittsburgh, in 1906, laid 1,500 in main track at Colden, N. Y., part on tangent and part on a 3-deg. curve, and 1,500 in southbound track near Ridgway, Pa., all on a 2-deg. curve. The track is ballasted with broken stone and slag and is subject to heavy, high-speed traffic. The company has had considerable trouble in keeping the fastenings in proper condition, but little trouble in keeping track in surface and line. The price paid, including clips, etc., was $2.08 per tie. The Cleveland, Cincinnati, Chicago & St Louis has had in track, for about a year, 3,000 ties laid on a 30 min. curve. At first the fastenings loosened, but this trouble is decreasing. Some of the bolts were removed and showed but little wear. The maintenance cost, as far as surfacing, has been no more than with wooden ties. The purchase price was $2.02. The Pittsburgh & Lake Erie also has 3,000 ties in track under 90-lb. rail, 22 ties to the rail. They are laid in the main northbound freight track, subject to low-speed traffic, partly on slight curvature and partly on tangent. The track is on stone ballast. The ties are insulated for track circuit and because of the number of points of insulation there has been some trouble, but not enough to seriously interrupt signal service. The officers of the road believe that by using a heavier rail and more ties to the rail they can be properly insulated and used in fast main track service. The cost, including insulation, was $2.50. The Pittsburgh, Shawmut & Northern has had 700 in track for about nine months. They are laid in gravel ballast on both curve and tangent under 85-lb. rail, 20 ties to the 33-ft. rail. They are under very heavy traffic at low speed, a 227-ton locomotive running over this track. The opinion of the engineering department of this road is that these ties are satisfactory under the above conditions on tangent and on curves up to possibly 3 or 4 degs., but that on greater curvatures they move laterally through the ballast. On 14-deg. curves some of the bolts have been sheared, but this has not happened on 12-deg. 30-min curves in spite of the heavy locomotive mentioned. The ties cost, delivered, $2.16. The Baltimore & Ohio has had 2,860 in main line freight track east of Marriottsville, Md., for over a year. They seem to hold line and surface somewhat better than wooden ties, but the design of the clip and the difficulty of getting good bearing on ballast are objectionable features. The New York Central laid some of these ties in rock ballast on straight and curved track under heavy traffic at high speed, using 18 ties to the rail. They were all removed because they complicated the maintenance of signal track circuits and because so many rails broke on them. The Pennsylvania Lines West laid 500 ties in westbound passenger track near Emsworth in the spring of 1905. About one-fifth were placed on a 2 deg. 10 min. curve, and the rest on tangent. They were laid in stone ballast, 22 ties to a 33-ft., 85-lb. rail, and subject to heavy traffic at high speed. They were removed in July, 1907, because it was reported that they were failing. Investigation showed, however, that, while there was some deterioration, the ties should not have been taken out. The company reports that the ties held the track in good line and surface, and comments on the fact that there was less noise under passenger trains than is the case with wooden ties. The insulation at first was not efficient, but before the ties had been removed this difficulty had been mostly overcome. The ties move more readily through the ballast with the creeping of the rails than do wooden ties, and, also, it was found hard to keep them at right angles to the rail. A serious objection is that when the tie is laid in rock ballast, the stone under the bottom flange becomes pulverized so that mud is formed; this occurs no matter how well the track was ballasted and surfaced in the first place. They cost, complete, $2.62. The Pennsylvania Lines East had some in service for a little less than a year in about a mile of main passenger and freight track at Mineral Point, Pa. After the derailment of a passenger train at that point last year, all these ties were taken out. A careful investigation indicated that their use was not in any way responsible for the derailment, but the resulting damage was greater than it would have been if wooden ties had been used. These ties were more expensive to maintain than wooden ties, and did not make such an easy riding track. The company believes that if the tie were made somewhat heavier, and a better fastening used, it would give good results.

The Buhrer reinforced concrete tie consists of a piece of 65-lb. scrap rail, laid in concrete shaped somewhat like a wooden tie, with flat bearing on the ballast. From 18 to 20 ties to the rail are used. In June, 1903, 50 were laid on the Lake Shore & Michigan Southern, the Lake Erie & Western and the Chicago & North-Western. These ties are still in track in good condition. In December,

*Railroad Gazette, November 11, 1904.

1903, 21 ties were laid on the Pittsburgh, Ft. Wayne & Chicago, partly on 2 deg. 10 min. curve and partly on tangent, 16 ties to the 30-ft. rail. They were removed the next month because the concrete broke away from the reinforcement. During the following spring 300 more were put in track at the same place. They began to break soon, and by August of that year 131 of the total 321 had been removed. During the fall 200 more were laid, but they continued to break, and by December, 1906, all had been taken out. In the spring of 1903, 50 were laid in main track near Toledo, Ohio, and 50 more at the same place in April, 1904. These were in stone ballast, 16 ties to the 30-ft., 85-lb. rail, under comparatively light, medium-speed traffic. They were all removed during the latter part of 1905 because they broke. In July, 1903, 550 ties were laid on 9 and 10 deg. curves on the Lake Side & Marble Head. They are subject to heavy traffic, but the speed is not over 30 miles an hour. In 1907, 37 ties were removed because the concrete failed. In September, 1903, 77 were laid by the Ann Arbor Railroad on a 6-deg. curve around which passenger trains run at 60 miles an hour. Of these ties, 10 have been removed because the concrete failed under the inner rail. The rest are in track and in good condition. In July, 1904, 1,000 ties were laid on a 6-deg. curve on the Lake Shore. Of these, three failed and were removed in 1905. The rest were taken out in the summer of 1907 because an electric track circuit was being installed. At the same time that these were laid, 1,000 were installed in the Lake Shore main track at Millsburg, Ind. In 1905, 110 of these failed, and in 1906, 105; the rest were removed in August, 1907, when electric track circuits were installed. In October, 1904, 1,000 ties were laid on the Sandusky Pier branch of the Lake Shore, in a city street. So far there have been no failures. During the same month, 500 were put in the Lake Shore switching leads in the Englewood yards. Of these, 31 have failed and the rest are in good condition. The cause of the above removals was, in general, that the concrete split and crumbled, partly because of defects in the concrete, partly through imperfect reinforcement, and partly because of high speed. It is considered that with proper reinforcement and clean, high-grade material, properly mixed, this tie is satisfactory for slow speed and yard track, and should have a very long life. The scrap rail should have the same scrap value after 20 or 30 years as it had in the beginning. The cost of the tie is 95 cents, plus fastenings and the price put on 180 lbs. of scrap rail.

The Percival reinforced concrete tie is, roughly, a three-sided prism, the rails being laid on one face. The lower edge is comparatively sharp in the middle, but is rounded beneath the rail seat to a shape nearer that of a wooden tie. The depth is about the same throughout its length. The rail rests on an impregnated hard wood block. Threaded sockets of Babbitt metal are cast in the tie to receive screw spikes; no clips are used. The reinforcement consists of three corrugated steel bars in the upper surface of the tie and one at the bottom close to the edge; the bars are bound together with wire. The object of blunting the lower edge under the rail seats is to give the tie more bearing surface on the ballast at these points. The comparatively sharper edge at the middle of the tie does not give such a firm bearing on the ballast, so that (considering the tie as a beam with the pressure on the ballast as its load) there is less bending moment at the middle, at which point concrete ties often crack. This tie costs about $1.85; the concrete is a 2:2:7 mixture, the aggregate being screened to ¾-in. size. The reinforcement weighs about 25 lbs. In the middle of 1905, 25 ties were laid in main line track of the Galveston, Houston & Henderson, at Galveston, Texas. They were laid in sand ballast and were subject to all the traffic of the road at that point, including switching, but not to high-speed trains. One of these was removed nine months later and showed no signs of deterioration, the spikes and cushions being in good condition. In the fall of 1906, three cars loaded with rails ran off the track, breaking the ends of three ties and badly shattering the centers of one or two. The track remained true to gage, and the ties were not removed at that time. In the spring of 1906 some of these ties were laid in the Florida East Coast Railway's track at St. Augustine, Fla., in coquina, or shell, ballast, but no report has as yet been made on them. In October, 1906, a number were laid in the tracks of the Galveston, Harrisburg & San Antonio at Edgewater, Texas, in Glidden gravel. From six to eight freight trains and four passenger trains a day run over this track, at speeds from 40 to 60 miles an hour. In the following February a freight train was derailed and the cars ran over 50 of these ties, breaking off the ends of about 25 of them. The track remained true to gage and only three of them were at that time removed. The rest were taken out 11 months later. The spiking was in good condition in spite of the derailment, and the ties were not cracked in the center; they were removed only because of their appearance and because the ends of the reinforcing bars were exposed, and so would ultimately corrode. At the same time that these ties were laid on the Galveston, Harrisburg & San Antonio, some were put in the track of the Pittsburgh & Lake Erie in heavy rock ballast. Two of these cracked in the center, and a rail broke, at a joint, between a concrete tie and a wooden tie.

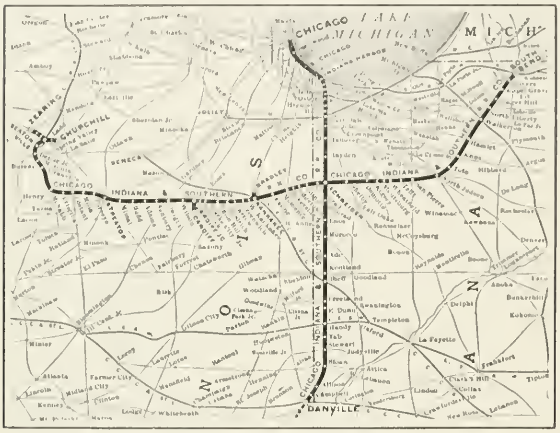
A number of designs of reinforced concrete ties have been tried on the Pennsylvania Lines West in addition to the Buhrer tie. In the summer of 1899, 30 Harrell ties were laid in the westbound main track near Harrison street, Chicago. This tie is about 8½ in. deep throughout; under the rail it is 9 in. wide, and narrows to 5 in. in the center. The reinforcement consists of a steel plate ¼ in. by 7 in., set on edge and running the length of the tie, with a number of lugs punched from it to get a grip on the concrete. These ties were put on a 6 deg. 10 min. curve, in stone ballast, 16 ties to the 30-ft., 85-lb. rail, under heavy traffic at high speed. They were all removed within a year because the fastening, a convenient device of spring steel, was too weak. Some of the ties also were badly broken. It does not appear that the design can be used for heavy traffic. The Affleck tie is 8 in. wide and 6 in deep, with I-beam reinforcement. In the fall of 1904, 100 of them were laid in the westbound passenger track west of Emsworth on tangent, 16 ties to the rail. They began to fail from the beginning, the concrete breaking and crumbling under and outside of the rail. Transverse cracks also developed at the bolts which held the rail clips. By April, 1905, they had all been removed. The Chenoweth tie is 6 in. deep by 8¼ in. wide. It is reinforced with six longitudinal ½-in. bars and with wire netting of ½-in. mesh. The rail rests on a steel tie plate, between which and the tie is a wooden plate ⅞ in. thick. The clips are held by screw spikes going entirely through the tie and engaging with a wire helix which is held in a white metal lining fitted in the hole through the concrete. In the fall of 1906, 101 were put in switching tracks in Scully Yard, Pa., on the P., C., C. & St. L. They were placed in cinder ballast, 16 ties to the 30-ft., 85-lb. rail, under heavy traffic at low speed. Up to the middle of January, 1908, four had been removed because they crumbled under the rail. There has been some trouble in keeping the bolts and clips tight. The creeping of the rail tends to turn the clips around, and in a few cases the rail has become unclamped in this way. Each of the three designs described above cost $1.50. The Keefer tie is reinforced with longitudinal twisted bars. In December, 1905, 44 of them were put in track at the same place as the Chenoweth ties. They began to break soon and were all taken out by June, 1906. On this design the rail rests on oak blocks. These did not hold the spikes firmly and the rails spread. The Bowman tie is 8 in. wide and 6 in. deep, reinforced with expanded metal near the top and on both sides. In December, 1905, five of them were put in freight track at Emsworth, under heavy, high-speed traffic. They all broke under the first train that passed over them. The designer believed that the reinforcement did not extend far enough under the base of the tie, so he furnished 25 improved ties in July, 1907, but they have not yet been put in track.

The Delaware & Hudson laid 99 reinforced concrete ties last fall on tangent in broken stone ballast under 90-lb. rail. Heavy trains are operating over this track at high speed. None of these have as yet been removed. They cost $1.80 apiece. Several designs of concrete ties have been used on the New York Central in yards, but none of them have been satisfactory. They disintegrate and their rigidity and lack of proper fastenings are also criticized.

The Buhrer cushion and insulation steel tie consists of a steel inverted T section with heavy wooden blocks set on it under the rail seats, the rails being spiked to the blocks in the ordinary way. With this design there is no more trouble with insulation than in an all-wood tie. The blocks are fastened to the steel by bolts passing through metal U straps which pass under the steel beam. This holds the fibers of the wood together and the spikes hold in the wood more solidly than in ordinary wooden ties. They cost, complete, from $2.25 to $2.50. The Lake Shore laid a hundred of these in main track at Sandusky Junction, Ohio, in the fall of 1905, and 1,400 more at the same point the following spring. They are laid in gravel ballast on a 1-deg. curve under 80-lb. and 100-lb. rail, 20 ties to the rail. All the westbound traffic of the road goes over this track at high speed. None of the ties have been removed so far.

Chicago, Indiana & Southern.

This company was formed by the consolidation of the Indiana, Illinois & Iowa, known as "the connecting link," with the Indiana Harbor. The Indiana, Illinois & Iowa could transfer through freight from eastern and western roads around the city of Chicago, so avoiding freight delays in Chicago. This road runs from Ladd, Ill., east to South Bend, Ind. The Indiana Harbor line runs from Indiana Harbor, on the lake shore 19 miles east of Chicago, south to Danville, Ill., which is the northern terminus of the Cairo division of the Big Four. It was built by New York Central interests to develop the Cairo division of the Big Four and to enable this division to compete for through traffic between New Orleans, La., and Chicago, and also to open up a new supply of bituminous coal for the western New York Central Lines. By the new Indiana Harbor-Danville line it is 389 miles from Chicago to Cairo against 365 miles by the Illinois Central. A new fast freight line, called the North & South Despatch, has been established, which handles traffic between Chicago, and New Orleans and Mobile. The Big Four runs through Sheff, Ind., on the Chicago, Indiana & Southern road, to Kankakee, Ill. From Kankakee it at present runs into Chicago over the Illinois Central tracks. It would be possible to run Big Four trains directly into Chicago by using the Chicago, Indiana & Southern's tracks and trackage rights.



Chicago, Indiana & Southern.

The second report of the Chicago, Indiana & Southern, and the first report which shows the combined roads operating as a single property for the entire year, shows gross earnings of $3,000,000, as compared with $2,300,000 in 1906, an increase of 29 per cent. Net earnings were $1,000,000 in 1907 and $500,000 in 1906, an increase of 100 per cent. Freight earnings were $2,700,000, an increase of $600,000. Passenger earnings were $200,000, an increase of $32,000, but this increase is not commensurate with the large number of passengers carried, owing to the reduction in passenger rates on intrastate business both in Indiana and in Illinois.

The cost of maintenance of way per mile operated was $1,300 in 1907 and $1,000 in 1906. This increase was mainly due to relaying the tracks of the Kankakee division with heavier rails and putting the roadbed in condition for increased traffic.

Freight earnings per mile were $8,400 in 1907 against $5,800 in 1906. Freight density was 1,850,000 tons one mile per mile of road in 1907, an increase of 750,000 tons. The trainload was 542 tons in 1907, an increase of 138 tons over 1906. The number of passengers carried one mile per mile of road in 1907 was 31,000, an increase of 6,000 over 1906. Almost all the other operating figures show increased efficiency in handling both freight and passengers.

During the past year the tonnage of bituminous coal carried by the road increased from 960,000 tons to 2,300,000 tons. The total number of tons of freight moved was 5,100,000 in 1907, an increase of 1,100,000 tons over 1906. This is less than the increase in the tonnage of bituminous coal. The only class of freight besides bituminous coal which shows any considerable increase during the year is dressed meats, which increased from 170,000 tons in 1906 to 214,000 tons in 1907.

During the year the company charged $212,000 for new equipment and $1,300,000 for new construction and improvements to property, to capital account. New yards, shops and general office buildings at Gibson, Ind., cost $779,000 and passing sidings and new construction on the Danville division cost $332,000.

The advantages of the consolidation of the Indiana, Illinois & Iowa and the Indiana Harbor line are shown by the increased traffic and the increased net earnings. The possibilities of the property seem to be good.

There have been authorized $20,000,000 fifty-year 4 per cent. bonds, of which $4,850,000 are reserved for the purpose of paying off the Indiana, Illinois & Iowa first mortgage bonds. Last week J. P. Morgan & Company offered $15,150,000 of these bonds at 91 and accrued interest. Last year's report showed $10,000,000 of these bonds outstanding. Besides the interest charge of $400,000 on these bonds, the company showed a further charge of $232,700 for interest on loans. These loans are to be paid off. The annual interest on the additional $5,150,000 will be $206,000. This is $26,700 less than the interest charges on the loans. The mortgage securing the bonds is a first lien on all property and equipment of the Chicago, Indiana & Southern, subject only to the underlying bonds of the Indiana, Illinois & Iowa

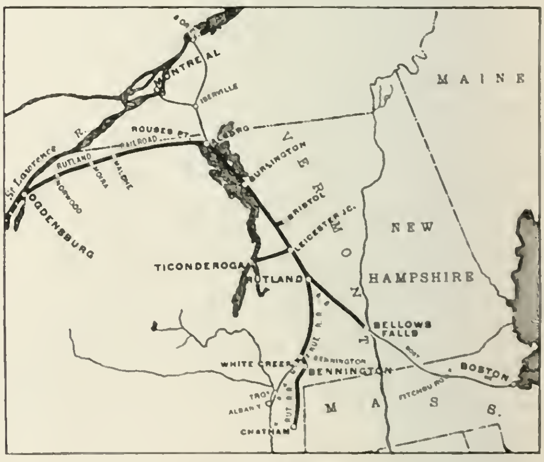
The following table summarizes the results:

	1907.	1906
Mileage worked	340	340
Passenger earnings	$206,864	$174,864
Freight earnings	2,679,876	2,080,406
Gross earnings	3,004,483	2,332,732
Maint. way and structures	443,553	348,596
Maint. of equipment	503,914	348,232
Conducting transportation	873,461	1,923,747
Operating expenses	1,943,130	1,851,808
Net earnings	1,061,353	505,780
Net income	223,180	258,304
Year's surplus	223,180	258,304

Rutland Railroad.

The Rutland Railroad has shown increased cost of operation during the last three years, since the New York Central has been in control, entirely out of proportion to its increase in earnings. The net earnings have increased only 10 per cent. during this period, while the gross earnings have increased 25 per cent. The history of the road explains this. Under the direction of Dr. Seward Webb the Rutland bought control of a number of small roads, and through ownership of the Rutland Transit Company, which operates a line of lake steamers from Ogdensburg, N. Y., to Chicago, was able to establish new through routes between Chicago and Boston. It was not able to compete successfully for through traffic, however, because these routes are neither the shortest nor the cheapest. The New York Central gained control of the Rutland through buying a majority of the preferred stock. It is said that the Central paid $100 a share, but most unwillingly.

The cost of maintenance of way and structures and maintenance of equipment have steadily increased since the Central took control, and last year maintenance of way per mile of road was $1,200, against



Rutland Railroad.

$1,000 in 1906. This is an ample but not at all excessive figure for such a road as the Rutland. About $40,000 of the sum spent for maintenance of way went toward relaying track with 80-lb. rails. The unit costs of repairs and renewals of equipment for 1907 were $2,119 per locomotive, against $1,708 in 1906; $662 per passenger car in 1907, compared with $564 in the previous year, and $51 per freight car in 1907, against $49 in 1906. These are no more than fair allowances, and they are large increases over the figures of 1904. The number of freight cars decreased by 176 last year, and the total capacity of freight cars was 3,740 tons less in 1907 than in 1906.

The policy of the New York Central has been to charge betterments and improvements to income account. In 1907 $41,000 was charged to income for new equipment, and in 1906 $29,000 for new construction. This policy has reduced the surplus, shown after the 1½ per cent. dividend, from $149,000 in 1904 to $7,000 in 1907.

Gross earnings in 1907 were $6,532 per mile of line operated, an increase of $624 per mile, while net earnings were $1,889 per mile of line operated, an increase of only about $70 per mile. In previous years passenger earnings generally increased more than freight earnings. In 1907, however, freight earnings increased 11 per cent., while passenger earnings increased only 6 per cent. In handling freight the company is making a fair showing. Freight density has increased during the three years from 417,000 to 598,000 tons one mile per mile of road. The revenue trainload increased last year from 223 to 248 tons. The average haul has increased from 95 to 108 miles. The tonnage of nearly all classes of freight increased in 1907. Bituminous coal showed an increase of 69,000 tons over 1906, but even with this increase it was less in 1907 than in 1904. The tonnage of grain increased 70,000 during the three years. The tonnage of stone, sand, etc., decreased materially in 1907.

The preferred stock of the Rutland is a 7 per cent. cumulative stock on which there is now due 171½ per cent. During the past year the minority stockholders called a meeting to protest against the policy of the directors, which charges additions and betterments to income. The proposal was made that common stock be issued to preferred stockholders to the extent of 25 per cent. of the profit and loss credit balance (which was $924,200 on December 31, 1907) and the dividend on the preferred stock be reduced to 5 per cent., the New York Central to guarantee this 5 per cent. No definite arrangements were made, but the proposal that the New York Central should guarantee anything on Rutland stock was laughed at by the railroad officers. The minority stockholders protested that the Rutland was being managed for the benefit of the New York Central system and not for its own best interests.

The principal statistics of operation, rearranged according to our usual classification, are as follows:

	1907.	1906.
*Mileage worked	415	415
Passenger earnings	$1,025,846	$967,298
Freight earnings	1,837,265	1,656,244
Gross earnings	3,058,087	2,799,209
Maint. way and structures	486,754	452,673
Maint. of equipment	428,851	380,640
Conducting transportation.	1,167,695	1,027,104
Operating expenses	2,173,978	1,948,199
Net earnings	884,109	851,011
Net income	186,492	179,625
Dividends	135,861	135,861
Year's surplus	50,628	44,761

*There are 53 additional miles operated for passenger trains only.

NEW PUBLICATIONS.

Experimental Electrical Engineering. By V. Karapetoff. New York: John Wiley & Sons. 790 pages, 6 in x 9 in.; 538 illustrations; cloth. Price, $6.00.

This book is professedly a laboratory manual for testing, adapted to the especial requiremente of students in their junior and senior years of such universities as Cornell. It presupposes a certain amount of electrical and physical knowledge on the part of the reader. But, given a familiarity with the basic principles of magnetism and the electric current there is no excuse for any one possessed of a mind of average intelligence not to comprehend every sentence contained within its covers. In his preface the author thanks certain of his associates upon the faculty of Cornell for assistance and moral support in the preparation of this book. If these associates were made familiar with the contents of the manuscript as it progressed, it is small wonder that they gave generous encouragement towards its completion, for it is a rare thing to find a writer upon a scientific or technical subject that brings to it such a mastery of the language and such a familiarity with the details coupled with the power to pick out the gist and essence of a subject and then express it in such clear and simple diction as we find in the book under consideration.

While presupposing a familiarity with the fundamentals the writer is never betrayed into an overweening confidence in that familiarity, but with the instincts of a true teacher he bases his work upon the value of line upon line and precept upon precept, advancing gradually and thoroughly until even the most casual and desultory reader would find himself steeped in the subject. And yet there are no vain repetitions. The statements are concise, remarkable for their lucidity, for their selection of the gist of the matter, and for discarding all extraneous and non-essential matter.

The book is too big to be covered by a brief review, for it takes in almost the whole wide range of electrical engineering practice as embodied in the measurement of resistances, the construction and operation of electrical instruments, electrostatic capacity, the magnetic circuit, permeability, photometry, illumination, transmission and distribution, generators and motors, transformers, converters, induction motors, windings, batteries, switchboards and controllers, railway work, heating and telephony. But it is noteworthy that the scheme upon which this is worked out is that of a division into chapters, each of which is complete and independent in itself. The book opens with an introduction intended to illustrate general principles, so that there is at once established a complete understanding between the writer and his reader as to what it is proposed to discuss. Diagrams and other illustrations are profusely used to make all things clear, and a series of experiments that are to be performed by the student in order to test the principles laid down, are included. These experiments increase in complexity and difficulty from the beginning to the end of the chapter, and thus each clusters about its own particular center. Under these circumstances the author recommends that the elementary experiments selected from nearly all the chapters be worked out first by the juniors and that the seniors follow with the others that are more complex. In each case the object of the experiment is stated, and this statement is followed by clear instructions regarding every step that is to be followed, down to the checking and the preparation of the report.

Schematically, the book is devised for student use, but broadly considered it can well find its place on the shelves of every electrical engineer, not only because of its intrinsic value as a comprehensive treatise, but because of the suggestiveness that every practical worker must find within its pages, to say nothing of the pleasure of reading an author who has so thoroughly mastered the art of expressing things.

The Engineering Index Annual for 1907. Published by the *Engineering Magazine*, Nassau street, New York.

In this volume, as in the Annual for 1906, the *Engineering Magazine* has adhered to the classified system which is followed in the monthly record of technical papers printed in the magazine. The company formerly published a five-year volume, but has found the annual volume more satisfactory from all points of view. The heartiest praise should be given to this kind of work. It cannot be an important source of profit to the publishers, but it presents an extremely valuable record for the engineer engaged in research work or desirous of obtaining all the detailed information which has recently been published about some branch of his profession.

CONTRIBUTIONS

Steam Shovel Performance.

Ottawa, Ont., April 27, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

I have noted the item about steam shovel performance in your issue of April 24, and was somewhat startled at Mr. Colvin's figures, until I saw that his day consisted of the full 24 hours, or two shifts of 10 hours each. I have been so long of the opinion that we held the world's champion record for small steam shovel performances that it never occurred to me we might have to defend it.

Our record was made while building the O. A. & P. S. Railway, now a portion of the Grand Trunk Railway System, and I submit the figures for one month in the summer of 1895, in sand and small gravel pit at M. P. 146.

Shovel used, Marion, Style A-1 yard dipper, served by two trains of 12 cars each. Haul, one-quarter mile to five miles. Work, filling trestles and raising dump. During 26 days of 11 hours shovel loaded a total of 65,000 yards, or an average of 2,500 yards per day. The best day's work was 3,070. To do this 307 34-ft. platform cars were put past shovel. The haul for this day was 1,000 ft. only, but I claim the world's record for this day with small shovel and platform cars.

The pit was a long one with good face, and the shovel was moved twice only in month. But the bank was not all good, and cemented sand had to be poled and blown down, while there was a spur of rock in middle of cut that gave considerable trouble. Work was in charge of Joseph Leslie, Roadmaster, and shovel was handled by George Holtby, both of Ottawa. Records kept by myself in the pit.

E. J. M'VEIGH,
Storekeeper, Grand Trunk Ry.

How Can We Get Better Conductors and Enginemen?

McCook, Neb., April 24, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

Much interest is being manifested of late on the subject of railroad accidents, and while the consensus of opinion seems to be that inattention to duty and violation of rules are the prime causes, and the remedy strict discipline and the enforcement of rules, few practical theories are advanced as to the best way to secure the desired results.

The rules of the operating department are safe and cover the ground so that with sufficient thoroughness very few accidents would occur; and there are only two factors to be taken into consideration to secure the proper observance of rules, namely:

to secure officials who are strict enough disciplinarians to enforce the rules impartially upon all, and to secure a class of men who can be made to realize that not only do the tenure of their positions and perhaps their personal liberty, but also their lives and the lives of others depend upon their strict observance of rules. It is not always possible to secure officials who are able to withstand the pressure brought upon them by the intercession of grievance committees and personal friends, and it is practically impossible to make the average man submit to discipline in the proper spirit.

It seems to me that the thing to do is to have a law passed by Congress empowering the Interstate Commerce Commission to appoint in each state a commission composed of trained experts in the railroad business, preferably one or more train despatchers, conductors and engineers, a part of whose duties shall consist in passing upon the competency of all employees who have charge of handling trains in interstate traffic. Or, this commission might be appointed by the state railroad commissions. Require each conductor, despatcher and engineer to pass an examination before this commission and to secure a certificate of efficiency before being allowed to take charge of a train; and to be re-examined every three or four years. Require each railroad corporation to include in their reports to the commission covering train accidents the past records of those employees who may have been concerned in the accident, in order that they may be in a position to determine what, if any, bearing the actions of the employee in the past may have on the question at issue. . . . Empower this commission to call before it for investigation any or all employees of the railroad corporation who may be concerned in an accident, which in the opinion of the commission is serious enough to call for investigation, and give the commission power to annul, upon sufficient assurance of guilt, the permits of any conductor, engineer or despatcher. . . . A marine engineer or the master of a ship must secure a license before being permitted to act in their respective positions. The stationary engineer is required to secure a license in most states. The dentist has to pass a rigid examination before he is allowed to pull your tooth. Is it out of reason that the man at the throttle or at the key, who has your life in his charge, shall be any more exempt from proving his competency than the doctor or the dentist?

The examinations that the railroads require their employees to pass are not rigid enough. In theory they are, but not always in fact. Too often the element of personality enters into the examination and men are allowed to pass because they were good brakemen or good firemen, and the examining official trusts, because of this fact, that they will succeed in the more responsible position. Too often the official who is conducting the examination is not a practical man in the handling of trains, so far as the outside work is concerned, and for this reason is handicapped when dealing with the many little things that come up in the daily life of a trainman or engineman which make for success or failure in those positions. Too often men are allowed to pass upon the request of someone with a pull, or upon the behest of a brotherhood.

The railroads should conduct an examination of their own, but the examination before the commission should be supplemental and serve as a check upon that given by the railroad company.

A better grade of men would be attracted to the train service on account of the greater immunity from danger guaranteed by having a more careful set of men. The necessity of reporting the past record of employees who are concerned in accidents will be a check upon the official with respect to his retaining in the service any employee whose past record stamps him as a dangerous or an undesirable man.

M. H. LEARNARD.

[We are glad to print Mr. Learnard's letter, not only because he has a right to be heard, but also because his views are shared, no doubt, by many other thoughtful railroad men. The letter speaks not only for the writer but also for many others who have not put their ideas on paper. But we must remind our correspondent that the main feature of his proposal, licensing men by the federal or state government, is a remedy which very likely would prove to be worse than the disease. The first essential in an examining board is integrity—high personal character. Add to this the necessary experience, judicial temperament and ability to issue decisions that would stand the fierce criticism that they would be subjected to, and you have a set of requirements that no political appointing power would measure up to, one time in fifty. Even if the appointing of examiners could by some good fortune be kept free from the influence of unworthy political motives, the limitations of salary which the lawmakers would impose, with the obvious limitations of human nature, which, as we can see all around us, keep the standard of ability low in public offices of all kinds, constitute such serious obstacles that any hope of effecting material improvement of the personnel of the train service by state examinations would be small indeed. Admitting that the government does do some good in its activities concerning doctors and steamboat captains, the present proposition is a doubtful one. Improving conductors' and enginemen's consciences is an intricate problem.—EDITOR.]

What Are We Going to Do About Accidents?

TO THE EDITOR OF THE RAILROAD GAZETTE:

"Faith without works is dead." A few months ago the *Railroad Gazette* contained an article signed by W. L. Park, and only a few weeks ago one signed Vice-President which contain an ample number of practical suggestions to about do away with those accidents which are due to failure to respect rules, if only they were carried out. Mr. Park is a stickler for drill and inculcation of safe habits. This position is taken, not, as I have heard him remark, because he deems it absolutely necessary for an engineman to actually stop every time he explodes a torpedo on straight track in broad daylight; but, to insure that he will do so when the conditions are not so favorable, Mr. Park insists that such signal should be respected. His reason for this is obviously so sound that the same principle should be applied to all rules which are necessary to enable trains to be handled safely.

"Vice-President" says: "Appoint one or more experienced railroad men as inspectors (not detectives), who shall report to the General Manager. Require inspectors to note not only how the men obey, or disobey the rules, but how officials enforce and understand the rules." This reminds us that not only must Mr. Park's rule be carried out; in addition we must show the rank and file wherein they have failed, and must instruct officers as may be necessary concerning matters which may not be known to them, owing to their having multitudinous duties. Officers should avoid formalities, writing up only such cases as may be needed for record, or to use as examples to assist in preventing others from committing the same errors. Treat all information furnished you by employees as strictly confidential, and decline to reveal the identity of the persons who help out by giving you pointers. I have read somewhere that "all intelligent people soon grow restive over too much and too many reminders of their being subject to discipline." Some other bright man remarked that "any old scheme will figure out all right on paper." I believe these "saws" to be correct in the main, and that better results would obtain were men talked with more and shown their erroneous reasoning or conclusions instead of being reported and suspended. I do not mean, however, that men who habitually sleep on duty, or indulge in intoxicants or narcotics, should not be disciplined. I would fire that gang bodily before they got a chance to make a mistake, and perhaps kill worthy employees.

I believe it is an economical investment to have a competent inspector of transportation and plenty of trainmasters; but how can the economy be proved? Possibly the problem for the general manager to solve is how to scrape up enough money to pay the men now on the rolls. While I have no doubt each such employee would effect a saving of fully $5,000 a year in accidents, overtime, etc., I cannot prove it, and am therefore left without anything tangible upon which to base an appeal. In some instances the employment of an additional set of despatchers on a crowded division would no doubt effect a saving in the overtime account much greater than their salaries would amount to, and would increase the mileage of engines; but, again, we are confronted with the same declaration, "prove it."

Too much attention is given to deep, intricate train-order problems and too little to such so-called unimportant matters as enforcement of signal rules and such others as prescribe clearance, protection, taking siding at initial switch, keeping away from switches while they are being used by trains, calling fixed signals, reading train orders, turning switch to run the inferior train in on siding at meeting points, drunkenness and sleeping on engines and in cabooses.

In nearly every investigation of accidents which I have taken part in trainmen state that they had not forgotten the meeting order; that they were just getting ready to take the necessary steps to prevent the collision when it occurred. Perhaps if such men were touched up to the extent of from $20 to $50 for not acting they would remember to do so next time.

On many roads enginemen are allowed to whistle about as they please—may whistle out flagmen, or not, just as they think best; may acknowledge a signal to start a freight train by two short blasts, instead of two medium long, and if they happen to fail to whistle for a station nothing is done about it. Failure to whistle for a station may mislead the men in the caboose and at least give them an opportunity to escape punishment (if an accident occurs) by claiming that they had lost their bearings. I think rules should forbid a freight train from going through a station without receiving a proceed signal from the rear. If signaled to proceed, engineman should answer by two medium long blasts. If the engineman knows that he must stop to meet a train, or can get no farther to clear a superior train, he should, after whistling for the station and waiting about two seconds, sound three short blasts. Under such an arrangement a failure to whistle, or to receive a proceed signal, would cause others interested to believe that something was wrong, or had been forgotten, and there would still be time to take the necessary steps to prevent a collision. The objection to allowing enginemen to sound two short blasts to start is that that signal is also an answer to a hand-stop signal given by a flagman, and it often has caused confusion and accidents. Perhaps it would not be a bad idea to alter the code rule to conform to the above suggestions. Rule 14 (b) could easily be changed to read: "Release brakes. Answer to a signal to start, or to indicate ready to start."

H. W. FORMAN.*

American Railway Association.

The spring session of the American Railway Association was held at the Hotel Belmont, New York City, April 22. There were present 225 delegates, representing 150 members. The Executive Committee reported that the membership of the association now comprises 338 members, operating 240,770 miles; and the associate membership 44 members, operating 1,630 miles.

A special Commission on Interchange of Freight Cars has been appointed by the Executive Committee, consisting of James McCrea (Pennsylvania), Lucius Tuttle (Boston & Maine), W. W. Finley (Southern), Howard Elliott (Northern Pacific). A report was presented by a sub-committee of the Executive Committee on the subject of bringing into relation with the American Railway Association the various voluntary associations of railroad officials. It is desired to harmonize the work and increase the usefulness of these other organizations, and the committees of the American Railway Association will be rearranged so as to provide for supervision when desirable and for facilitating co-operation.

A resolution was adopted requesting the Master Car Builders' Association to harmonize the terms used in designating different classes of cars and different kinds of cars in each class, according to their physical characteristics, and to report to the association.

Certain amendments to the Articles of Organization and By-Laws were adopted, including one changing the dates of meeting from April and October to May and November.

The Committee on Car Service submitted a decision in connection with Car Service Rule 10, which was approved, as were amendments to Car Service Rules 10 and 11, and Per Diem Rule 7.

The Arbitration Committee reported decisions rendered in connection with Arbitration Cases Nos. 37, 38, 39 and 40.

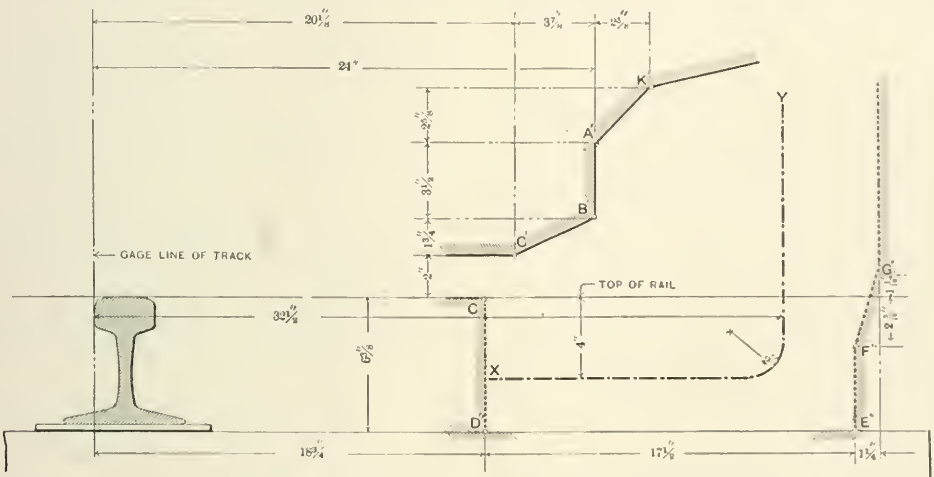
The Committee on Safety Appliances submitted a Code of Air-Brake and Train Air Signal Rules, which was adopted and made part of the Standard Code of the association.

The Committee on Accounting and Statistical Inquiry submitted a proposed classification of revenue and expense accounts, which was referred to the Executive Committee.

This committee recommends that the adoption of a system of physical statistics should be deferred, as the Interstate Commerce Commission intends to promulgate a system of classification of accounts to take effect July 1 of this year. The committee believes that the depreciation of the property may be fully covered by charges to operating expenses through the medium of "repairs," as directed by the Interstate Commerce Commission, and through "replacement." The application of measures of "depreciation" and of "renewals" as required by the Interstate Commerce Commission is at best a guess. The determination of a measure of depreciation must of necessity be based upon average life, which is impossible of accurate or even approximate determination. The relation between the equipment retired in past years and that in existence to-day, or that may be subsequently acquired, is too vague and too indefinite to admit of the application of the law of averages for the determination of measures of charges to operating expenses in anticipation of future requirements.

The committee approves the classification of operating expense accounts as promulgated by the Interstate Commerce Commission, with the following exceptions: The text for "loss and damage, freight" should read "including company's material." The text for the several renewal and depreciation accounts applicable to equipment should be abrogated and appropriate texts inserted under "replacement." There should be a provision for revenues from outside operations, so that the revenues from the operation of water lines, etc., may be included in the gross revenue of the company; and the committee recommends a separate primary account for this purpose.

On the subject of depreciation of equipment the committee does not approve the rule promulgated by the Interstate Commerce Commission; but it recognizes the fact that while that rule is in effect it is necessary for the depreciation charge to be made. If that rule be continued this committee recommends that, by reason of the fact that there is and will be under any rule of depreciation a duplicate charge made to operating expenses, railroad companies be permitted to charge against the depreciation reserve a proportion of the cost of repairs to equipment. The committee further recommends, if the depreciation rule is to be continued, the elimination of the accounts, equipment borrowed, debtor and equipment loaned, creditor, for the reason that through the medium of these accounts arbitrary charges and credits to operating expenses are made which are not justified. The net debit or credit through these two accounts is too small to justify the expense of keeping the accounts.



Recommended Clearances for Rolling Equipment and Structures; American Railway Association.

The Committee on Car Efficiency reported that its work in collecting and publishing statistics had been continued. There has been a more general compliance with the requests of the Committee for information, but there is still opportunity for improvement, especially in the line of promptness. The reports now regularly cover about 160 roads, including practically all the more important ones.

The reports concerning car shortages and surpluses have excited a general interest through the country, indicating as they do the present unfortunate railroad situation in a striking and concrete way. The figures showing the surplus cars have been widely reprinted, not only in the periodical press, but in government publications. It is pleasant to record the fact that the surplus has decreased since its high-water mark on February 5, but unfortunately, this decrease appears to be largely influenced by arrangements which have been made to hold large numbers of cars under load, which possibly should be counted as surplus.

Progress is being made in the more equal enforcement of car demurrage through the country, which will undoubtedly have a favorable effect on car efficiency, when business again increases. The committee has maintained relations with various government commissions, national and state, and has collected considerable information in regard to railroad legislation. The committees formed

*Author of "Rights of Trains on Single Track."

to supervise demurrage on coal at tidewater and on the lakes have continued their meetings and somewhat broadened their scope, and a committee is considering demurrage on and storage of export freight at the principal Atlantic ports. Meetings have also been held at certain points to determine proper switching reclaims.

Owing to the desirability of economy the work of the committee has been cut down to its lowest basis, and since the shortage of cars disappeared most of the railroads which were interested in the record feature of the Clearing House have discontinued this work which was done at their expense.

The clearing feature, however, under which Per Diem and mileage balances between railroads are handled, has shown a gradual and gratifying increase, and there are now 10 railroads using it in clearing their car service balances. This work is done at cost to the subscribers, and it is found that this cost is so inconsiderable that the plan has advantages both of convenience and economy. The committee will be glad to see further growth in this direction.

The Code of Car Demurrage Rules, which was adopted at the last meeting of the American Railway Association, has been under consideration by most of the Car Service Associations in different parts of the country. Some of the associations have already adopted, almost in their entirety, the rules as recommended, with exceptions to suit local conditions. Many of the associations have adopted the suggestion made to change their designation from "Car Service Association" to "Car Demurrage Bureau" or "Demurrage Bureau."

The committee has on file at its Chicago office the rules of all the Car Service Associations and Demurrage Bureaus in the United States, as well as those included in state laws and promulgated by state commissions. The committee also is collecting the Car Demurrage Rules of the railroads which have recently dropped out of Car Demurrage Bureaus. It is, therefore, ready to give full information in regard to the Car Demurrage situation throughout the country.

The matter of storage is still having the attention of the committee. Wherever storage is handled by car demurrage bureaus by the transportation departments of railroads and in accord with state laws or state commission rulings, the committee endeavors to keep itself fully informed on the subject.

The rules on export freight at the different Atlantic seaboard points are still unsatisfactory, but gratifying progress is being made toward harmonizing them. The rules governing bituminous coal at tidewater points have, at some points, been extended to cover anthracite coal, and these rules are working very satisfactorily, the equipment being released much more promptly than formerly. The rules which were in effect on bituminous coal transshipped by lake have now been in effect for a season, and results have proved them to be extremely beneficial. A new set of rules, including certain amendments, has been formulated to cover the current year.

In the last report mention was made of the great decrease in the delay to cars on account of the rule adopted by the Trunk Line Freight Association and the Central Traffic Association, imposing a charge for reconsignment. Since that time, the Western Trunk Line Association has adopted a rule in regard to a charge for reconsignment more stringent than the rule of the eastern roads. This has caused great relief in the yards, particularly at large centers, and in the coal traffic; one road reporting the saving of four switching engines at one point from this cause.

Your committee is endeavoring to keep in close touch with all national legislation and has made arrangements to be furnished with all bills introduced into Congress in any way affecting railroad interests. The progress of these bills is being closely watched. A synopsis of these bills is made and copies can be procured from the Secretary of the association at a nominal charge. Your committee is also endavoring to keep in close touch with the Railroad Commissioners of the different states, and has been in active correspondence with them.

On the Pacific coast the free time for unloading freight cars has been reduced to 48 hours on all articles except lumber, on which 72 hours is allowed.

The Committee on Transportation of Explosives urged all members to become members of the Bureau of Explosives. The membership of the bureau now comprises 94 companies, operating 149,669 miles of road. The committee submitted a revision of the Regulations for the Transportation of Explosives, and a set of Regulations for the Transportation of Inflammable Articles and Acids, both of which were adopted by the association.

The Committee on Standard Location for Third Rail Working Conductors has issued a circular giving suggested clearance diagrams for third rail working conductors, and the association adopted the following resolutions: (1) That the diagrams showing lines of clearance as presented in the report be approved and made the standard of the association. * * * (2) That in designs of new rolling equipment which is to be used in interchange, the clearance line K'A'B'C", including such horizontal and vertical variations which may in any reasonable probability occur in combination at one time, should not be exceeded. In determining this, the position of the equipment on a 20-deg. curve should be considered, making allowance for the side-throw of the bolster and the consequent effect on the location of such portions of the equipment that are attached to the car body. Variations in equipment should be allowed for as follows: Horizontal, 2½ in. in all; vertical, 4 in. in all. (3) That in design of new bridges, trestles, tunnels and platforms, no part that is continuous for more than 7 ft. should come within the space for third-rail structures,† and should preferably clear this line by at least 1 in., as is shown by the line C", D", E", F", G", but that structures which are not continuous for more than 7 ft. may be allowed to come to the line XY.

The report of the Rail Committee will be found under another head.

F. A. Delano, President of the Wabash, was elected President, and W. A. Gardner, Vice-President of the Chicago & North-western, was elected Second Vice-President of the association for the ensuing year.

The association decided to hold its next session at Chicago November 18.

Report on Standard Rails.

At the meeting of the American Railway Association in New York City April 22 the Committee on Standard Rail and Wheel Sections submitted a complete report including a series of rail sections of two types, and specifications for Bessemer and Open Hearth steel rails, which were adopted by the association as recommended practice. On the recommendation of the committee, the association adopted resolutions providing that gage of track be measured between the heads of rails, at right angles thereto, at a point ⅝ in. below the top of the rail; and that the standard distance between the main rail and guard rail and in the throat of all frogs be 1¾ in., measured at the gage line, for all tracks of standard gage. A resolution was also adopted by the association, providing that the two types of section and the specifications for the standard rail be referred to the American Railway Engineering and Maintenance of Way Association, with the request that that association study the question of drop tests, observe and record behavior of rails of the proposed sections, compare results from the two sections and submit to the American Railway Association a single standard for adoption.

The standard sections now adopted by the association are the same as those (Type A and Type B) recommended by the committee last October, and shown in the *Railroad Gazette* of Nov. 22, 1907, page 627 The specifications differ from those before reported (*Railroad Gazette*, Dec. 20, 1907) in the clauses covering discard and chemistry. These clauses, as now reported, are:

There shall be sheared from the end of the bloom formed from the top of the ingot, sufficient "discard" to insure sound rails. (All metal from the top of the ingot, whether cut from the bloom or the rail, is the "top discard.")

The chemical composition of the steel shall be within the following limits

Bessemer Steel Rails.

	60 lbs.	70 lbs.	80 lbs.	90 lbs.	100 lbs.
Carbon	0.37 to 0.47	0.40 to 0.50	0.43 to 0.53	0.45 to 0.55	0.46 to 0.56
Manganese	0.80 " 1.10	0.80 " 1.10	0.80 " 1.10	0.85 " 1.15	0.90 1.20
Silicon	0.10 " 0.20	0.10 " 0.20	0.10 " 0.20	0.10 " 0.20	0.10 " 0.20
Phosphorus* ..	0.10	0.10	0.10	0.10	0.10
Sulphur*	0.075	0.075	0.075	0.075	0.075

(When lower phosphorus can be secured, a proper proportionate increase in carbon should be made.)

Open Hearth Steel Rails.

	60 lbs.	70 lbs.	80 lbs.	90 lbs.	100 lbs.
Carbon	0.50 to 0.60	0.55 to 0.65	0.60 to 0.70	0.65 to 0.75	0.70 to 0.80
Manganese	0.75 " 1.00	0.75 " 1.00	0.75 " 1.00	0.75 " 1.00	0.75 " 1.00
Silicon	0.10 " 0.20	0.10 " 0.20	0.10 " 0.20	0.10 " 0.20	0.10 " 0.20
Phosphorus* ..	0.04	0.04	0.04	0.04	0.04
Sulphur*	0.06	0.06	0.06	0.06	0.06

(When higher phosphorus is used, a proper proportionate reduction in carbon should be made.)

*Not to exceed.

All rails are to be branded with the name of the maker, the weight of the rail, and the month and year; and the number of the heat and a letter indicating the portion of the ingot from which the rail was made, shall be plainly stamped on the web of each rail, where it will not be covered by the splice bars. Rails to be lettered consecutively "A," "B," "C,", etc., the rail from the top of the ingot being "A." In case of a top discard of 20 or more per cent., letter "A" will be omitted. All rails marked "A" shall be kept separate and be shipped in separate cars. All open hearth rails shall be marked o h; and the specifications for open hearth stipulate that the manufacturer shall, before the rails are shipped, furnish the inspector with a complete chemical determination for each heat.

In its report the committee says:

With regard to the discard question, the committee has always held that it would be preferable to test the finished product rather than specify as to details of mill manufacture, and the committee arranged for a trial lot of rails to be rolled from the ingot without any discard whatever except such as was necessary to enable the

†This space was indicated in diagrams showing the practice of the New York Central, the West Jersey & Seashore and the Long Island, printed, with the Committee's previous report, in the *Railroad Gazette* of Nov. 8, 1907, p. 559.

bloom to enter the rolls, and after these rails had been cut into small pieces, they were broken under the hammer and the fracture examined. This test proved to the satisfaction of the committee that if "pipes" or other physical defects were present they could be detected by this means. The test also proved quite conclusively that it is possible to so conduct the process of manufacture that the "pipes" or other physical defects will be reduced to a minimum, and that these defects may not occur at all, even in rails rolled from the top portion of the ingot.

In order to avoid an unnecessary waste of good material, the committee set about to devise means by which the rejection of defective material could be insured without requiring an arbitrary and definite percentage of discard in every case, and a committee of the Pennsylvania Railroad pursuing the same line of investigation, adopted a tentative specification which provided for a physical test of this nature, and which further provided that when physical defects were discovered, all top rails of the heat should be rejected. * * * A trial lot of rails, of a section corresponding to "Type B" submitted with the committee's report of last October, was recently rolled under this specification as to discard, and the results convinced the committee that a development of this idea would prove the best solution of the discard problem.

Some of the advocates of a fixed and arbitrary discard have argued that the mere provision of a discard to insure the elimination of "piped" rails, or rails containing physical defects, was not sufficient, and urged the rejection of a fixed percentage from the top of the ingot, because of the well known fact that segregation occurs in the upper portion. This question of segregation was given careful consideration by the committee, and while it is a fact that, due to the rearrangement of the constituent parts of the metal during the process of cooling and solidifying in the ingot mold, an analysis of the metal in the finished rail will often show a wide departure from the analysis required by the specifications, it is also true that an analysis of the metal taken from the different parts of the finished rail will frequently show similar wide variation. This discrepancy is due to the fact that the test ingot referred to in the specifications, and upon which the chemistry specification is based, is taken from the ladle before the metal is poured into the ingot mold, and consequently before the segregation takes place.

It has been assumed that, because of this variation from the standard composition of the metal in the finished rail, the rejection of all segregated metal would be warranted. But, on this assumption, it would be necessary to discard more than a third of the upper part of the ingot to be on the safe side, as the segregation frequently extends that far, and while our knowledge of the subject is not as complete as we could wish it to be, we have a great deal of evidence that rails of good physical condition can be made from the upper portion of the ingot.

Furthermore, the analyses of a large number of rails taken after years of service indicate that these wide variations in chemical composition may occur without apparently affecting the safety or wearing quality of the rail, and since it is impossible to check the analysis of the finished rail with that of the test ingot, the question arises as to what limits should be placed on the variation which will be permissible. None of the experts consulted are ready to say what this limit should be, and all admit that no facts are available as the result of actual experience which would warrant the adoption of any fixed limit to govern the rejection of material. The provision in the new specifications for stamping the rails to show their position in the ingot will enable us to obtain more definite information on this point in the future.

The committee conferred with a number of disinterested experts on both the discard and phosphorus questions, and among the principal authorities consulted were William Metcalf, of Pittsburgh; Robert Forsyth, of Chicago, and Professor Henry M. Howe of Columbia University. These gentlemen all agreed that it would be preferable to test the finished product rather than specify a fixed percentage of discard, and they also agreed that it would be unreasonable to require less than .10 phosphorus in a specification for Bessemer rails intended to cover purchases for all American railroads.

In the matter of rail sections, the committee, after considering criticisms and suggestions, and after visiting the mills and witnessing the rolling of rails of both the new types of section, are confirmed in their opinion that a change from the A. S. C. E. section is necessary in order to obtain the best results in manufacture. * * * So far as stability is concerned the recommended sections are well within the limits of safety, and with respect to the cutting of the ties it was felt that the increasing wheel loads of modern traffic necessitate the use of tie plates on curves and on soft wood ties in any event.

* * * Recently some important lines have shown a disposition to drop the 85-lb. standard; but as the committee has again been urgently importuned by the manufacturers to hold the rail roads in line on this matter, in order to prevent the multiplication of sections, your committee has determined to hold to its original recommendation (five weights), and trusts that the members will see the importance of subordinating personal preferences to the general good.

The committee feels that the main objects of the investigation have been accomplished, and that members are now in a position to secure the best rails which can be manufactured in the present state of the art. The adoption of the new and better balanced sections will enable the manufacturers to roll the rails at lower temperatures, thus ensuring a finer grain and better wearing quality, as well as reducing the internal stresses. The nearest approach to a single standard type has been arrived at consistent with present engineering knowledge and opinion. Provision has been made for the rejection of all rails containing dangerous physical defects, and means have been provided for keeping accurate records of the rails rolled from different parts of the ingot, and for uniform reports of rail failures, so that accurate information as to the cause of failure will be available in the future.

It will be noted that no reference is made in the specifications submitted, to the deflection under drop test, as definite figures can only be inserted after the new sections have been actually rolled and tested. * * * The committee has recommended the adoption of a new standard type of anvil which is very much heavier than those used heretofore, and a further revision of the drop test specification may be found necessary after observing the results of a sufficient number of tests under the conditions resulting from this change. * * *

In connection with the investigation of the cause of the excessive wear of rails in the London "tubes" since the installation of electric traction, certain experiments have been made in England, both on electric and steam lines, with the high-silicon rails advocated by Mr. C. Peter Sandberg. The results of these experiments seems to be quite favorable, and the subject should be followed up by the Committee of the American Railway Engineering and Maintenance of Way Association.

The experiments with canted rails, referred to in the report of April, 1907, have not been carried on long enough to enable your committee to arrive at any definite conclusion, but a recent inspection of these experimental rails indicates that the canting will cause a tendency to tighten up the gage, and it is also observed that on curves the metal of the top of the head "flows" to the inside of the low rail, instead of to the outside as in usual practice. This latter tendency will have to be reckoned with in considering the effect on flange wear.

Colonel Yorke on the Shrewsbury Derailment.

The British Board of Trade has issued its report, prepared by Lieut. Col. H. A. Yorke, on the disastrous derailment which occurred at Shrewsbury, Oct. 15, 1907, when 11 passengers and seven trainmen and mail clerks were killed. In this case, as in the Salisbury and Grantham accidents, the train was derailed by running at high speed through a curve at which safety required very low speed. The accident occurred on a Tuesday at 2:08 a. m. and the engineman, 52 years old, had been in the service of the company 37 years, and an engineman 10 years. He was not a teetotaler, but was described as a sober man. The record showed 13 entries against him, four for running past stations at which he was booked to stop, two for passing signals at danger, five for being absent without leave, two for losing time or allowing his engine to emit clouds of black smoke at a station. All these faults occurred between the years 1896 and 1905. After an exhaustive study, Colonel Yorke holds it extremely improbable that the disaster was due to any defect in the engine or the roadway, and he believes that the engineman had fallen asleep. The runner had been on duty all of Sunday night and from 8.15 p.m. on Monday, and though he had been in bed on Monday, the inspector could find no satisfactory evidence as to how much he slept. The inspector finds that the fireman, who had had to attend actively to his fire probably was not asleep (although he may have been so) but was unaware that the engineman was not wide awake. The fireman was 22 years younger than the engineman. The engineman and fireman were both killed. The body of the engineman was examined by a government physician and no traces of alcohol or malt liquor were found in the stomach.

Having found sleepiness as the most probable cause of this disaster, Colonel Yorke goes on to consider possible remedies. First, he suggests that the duties of drivers and firemen should be so arranged that they shall not be on duty during the whole of two consecutive nights. The proposal to have three men on the engine is condemned, but speed recorders are favored, although no such apparatus would have done any good in this case. Colonel Yorke hears that the French government is going to make the use of speed recorders compulsory. The report discusses cab signals and automatic stops, but the inspector contents himself with saying that the question of their desirability is not yet settled. "Pending the introduction of cab signals, or automatic train stops," Colonel Yorke recommends that the signal which was overrun in this case be moved back about 1,500 ft. (the block section is very short), and that signal boxes on descending grades approaching junctions or important stations be equipped with apparatus by which the signal man could put a torpedo on the track. Many signal boxes now have apparatus of this kind, but it is not used except in times of fog or falling snow.

As it is always difficult to get reliable testimony as to whether brakes have been tested when trains are made up, Colonel Yorke suggests that the testing should be witnessed by the station master in every case, who should sign a certificate, to be given to the man in charge of the train. It is also suggested that when enginemen sign for important notices or other documents their signatures should be witnessed, not by an engine wiper, as is the general practice, but by a responsible officer.

Westinghouse Horizontal Double-Acting Gas Engine.

The type of large gas engine described herewith is the result of about ten years' development of various sizes and types at East Pittsburgh. During this time orders for 1,054 engines have been taken, averaging a little over 140 h.p. Some of those now in operation are used for 25-cycle single-phase interurban railways, 60-cycle central stations, 25-cycle and 40-cycle industrial plants, all operating in electrical parallel, and there are also many direct-current plants.

While most of the engines are running on natural gas, the largest plants use some form of manufactured gas. By-product coke oven gas promises an excellent field for development, although little has been done as yet. Pooled coke oven gas averages above 50 per cent. hydrogen and often reaches 66 per cent. By-products from the stills in oil refineries consist almost entirely of the higher hydrocarbon gases, and are extremely rich, even double that of natural gas, 1,200 to 2,000 b.t.u. per cubic foot. For the leaner gases cylinder diameters are slightly increased, as well as compressions. Within the past year very material progress has been made in the application of producer gas to all classes of service, and it is probably true that the future of gas power rests with the corresponding development of the producer.

Parallel operation, except at excessive frequencies, is no longer a difficulty. Although spring couplings are used in the vertical type single-acting engine, they are unnecessary in the horizontal engine, except for special cases. Although a double or triple set of igniters is provided to insure positive ignition, the actual cyclical variation, due to the impressed crank effort, is but a fraction of that allowed in steam practice. In other words, the factor of safety in amplitude of cyclical variation is large enough in Westinghouse engines to provide for the contingency arising in case of displacement of one complete set of igniters. The governing system, as described later, makes accurate speed regulation possible.

Westinghouse gas engines are rated at 10 per cent. below the maximum load that the engine will sustain for a considerable period. Allowance is made for fluctuation in the heat value of gas, so an engine rated on 125 b.t.u. producer gas can sustain full load on gas as low as perhaps 100 b.t.u. A 200 or 300 h.p. engine is nearly as efficient in heat consumption as an engine of 1,000 or more horse-power. The efficiency is largely independent of the kind of gas used, because leaner gases will stand higher compression. A horizontal gas engine can make long, continuous runs. In the mills of the Iola Portland Cement Co. the record of eleven months shows actual operation 93.2 per cent. for the horizontals and 97 per cent. for the verticals.

The Westinghouse engines are four-cycle and the tandem cylinder arrangement is standard for all sizes, whether single or double crank. The former gives two power strokes per revolution, the latter four power strokes per revolution, with cranks at 90 deg. A solid concrete block extends the full length of the housing and some feet in front, but a clear space is left between the piers to allow access to the exhaust valves. By removing the inlet valve of a cylinder a man may enter to inspect the cylinder. One piston may be removed through each end of the engine without disturbing the other head or the engine alinement.

The main frame is of heavy box girder construction, with internal ribs to withstand transverse stresses arising from the side-crank construction. The smaller shafts are solid and the larger are bored hollow. On engines under 1,000 h.p. a three-part bearing is used and on larger sizes a four-part bearing.

The cylinders of the small engines are symmetrical, one-piece castings, with openings closed by split jacket bands with joints of flexible packing to allow the cylinders to expand independently of the jackets. The water spaces are easily accessible for cleaning. Cylinders of the large engines are cast in halves to insure sound castings with the best metal where most needed. The cylinder is supported at the ends only, and the weight of the pistons and piston-rods is carried by the front, center and rear crossheads.

The valves are in a vertical line at the center of the cylinder, so that heating and dilution of the incoming mixture is avoided. Exhaust gases discharge straight downward without encountering any pockets for the accumulation of foreign matter. Compression spaces of volumes suitable for the various qualities of gas can be arranged without changing the design of pistons or cylinders or the location of the valves.

Westinghouse Horizontal Double-Acting Gas Engine.

The pistons are cast in one piece, symmetrical in design, without internal ribs or sharp corners, and without the use of chaplets or other methods of core support. They are permanently mounted on the rod. Rods are made in two parts so as to be removed through front and rear housing. They are bored hollow for cooling water, except at the center of the piston where the ducts connect. The pistons float free from the cylinder walls, the rods not being cambered but designed stiff enough to support the weight without undue deflection. Pistons are kept tight by sectional rings with keepers and springs. For the rods, sectional metallic packing is used, consisting of a number of segments mounted in series along the rod, with two solid rings next to the cylinder. These segments are supported by springs to relieve the rods of their weight.

Instead of a single governor valve, gas is governed and mixed directly by each inlet valve. Only one eccentric is used to operate both inlet and exhaust valves. In the lay shaft drive, "hunting tooth" gears are used, the intermediate lay shaft running at an odd number of revolutions per minute. This distributes the wear evenly over all the gear teeth. Hollow water-cooled exhaust valves, of either cast iron or steel, are used in all sizes, or a combination valve with cast iron head and steel stem. Stems are lubricated about the middle of the bushing. To remove the valves it is only necessary to drop out the entire cage with the assistance of a rope swing. By means of an oil-pressure relay system the regulator is entirely relieved of the actual work of moving the heavy valves. The regulator is driven direct from the engine shaft and connected by means of reach rods to the various inlet valves. Oil pressure for the relay is supplied at about 50 lbs. pressure by a small pump driven from the engine lay shaft. If the governor is disabled, a safety device shuts down the engine by cutting off the ignition. A spring-balanced plunger in the rim of the fly wheel is projected by centrifugal force at a predetermined speed, and trips a pawl. In some plants an additional safety stop acts if the water supply to the jacket fails.

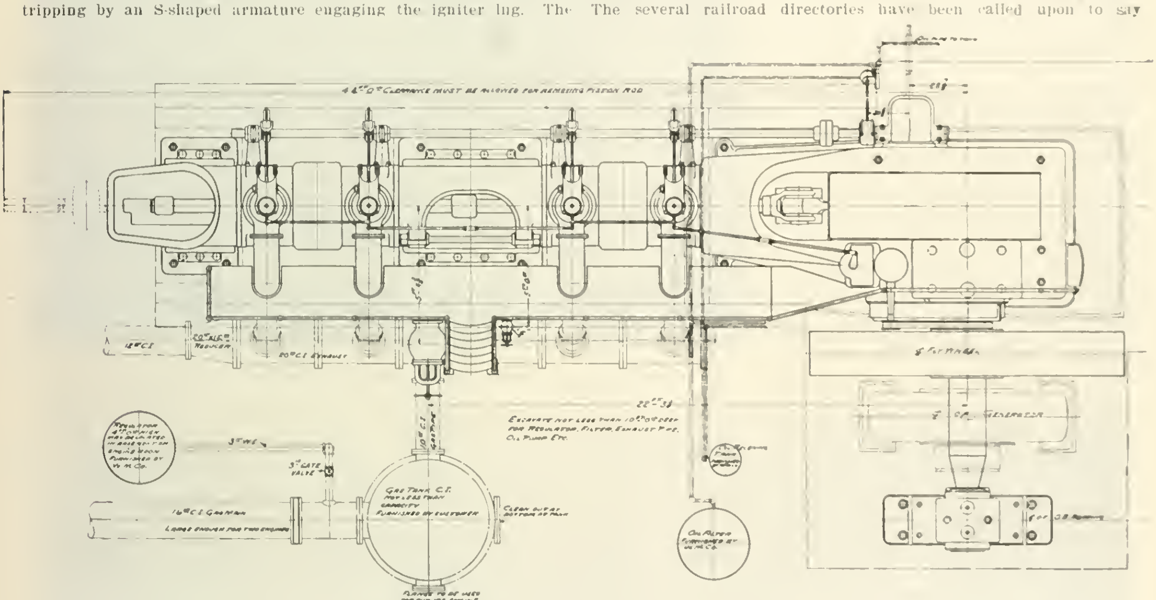
Make and break ignition with high voltage and low current furnished by a small motor-generator is used. Cast iron or special bronze points are used on the moving contacts, and the fixed terminals are steel. Both sides of the igniter circuit are insulated, making a double-ground necessary to put an igniter out of commission. In the event of a serious ground, the igniter on that circuit is immediately insulated by a fuse blowing out. Igniters can be removed while the engine is in operation by shutting off gas from the cylinder and relieving the compression by blocking open the exhaust valve. There are two or more igniters for each combustion chamber; in the larger sizes there are three, located at corners of an equilateral triangle. These make combustion more rapid and perfect. Two types of gears operate the igniters; the electro-magnetic, and the mechanical cut-off. The former consists of an electro-magnet connected in series with the igniter terminals, and tripping by an S-shaped armature engaging the igniter lug. The field coils furnish the inductance ordinarily provided by spark coils. The mechanical device carries the usual knock-off cams geared to the lay shaft.

For the cylinders, force-feed lubricators are used. The oil is accurately timed so as to reach the piston just at the close of the power stroke when it is covering the oil ports. In a number of 500-h.p. plants, cylinder oil consumption is as low as from three to five gallons per week, ten-hour day. These lubricators serve cylinders, packing glands, and exhaust valve stems. Engine oil is fed by a gravity system, including pump, filter and elevated reservoir with individual sight-feeds, all controlled by a single valve, so that individual adjustments, once set, need not be changed.

Particular attention has been given to reducing the quantity of water required for the engine. A series system of cooling has been used to some extent. Each cylinder, piston and exhaust valve have separate discharges. Water enters the piston through telescopic connections at the center crosshead, discharging front and rear into chambers cored out of front and rear housing. A water pressure of 25 lbs. is all that is required for supplying all parts, and, in some plants with exceptionally pure water, a 25-ft. static head is sufficient.

The engines are started by compressed air. With ignition on, the engine starts itself after opening compressed air and gas valves. As each cylinder picks up its ignition (after one or two revolutions) the compressed air supply is automatically cut off by a check valve held to its seat by the combustion pressure.

There is an automatic regulator in the gas supply line to maintain at the inlet valves the proper mixture. This is a butterfly disc valve, the position of which is controlled by a small gasometer connecting with the main on the engine side. The movement of the gasometer and the butterfly follows instantly upon the varying demand for gas by the engine. In some cases it is also desirable to install a receiving tank to further take care of the fluctuation in pressure.



Westinghouse Gas Engine.

Foreign Railroad Notes.

The Prussian State Railroad authorities direct that those in charge of workshops encourage the participation of apprentices in athletic exercises.

Mr. Zemp, since 1891 at the head of the Railroad Department of the Swiss Federal Council, has been chosen Vice-President of the Confederation for 1908.

The Italian railroads have let a contract for 165 passenger cars, costing more than $1,300,000, to works in Riga, Russia, which is perhaps the first time that Russia has exported rolling stock.

The Prussian State Railroads some time ago had a number of pressed steel coal cars built to carry 22 tons on four wheels. They had sides 6 ft. high, with two double doors on each side. The several railroad directories have been called upon to say whether more of this kind should be ordered. Most of them say no; the sides are so high that it is difficult to load them where there is no loading machinery, and the coal, etc., is liable to be much broken by falling so far. Moreover, the cars when loaded have so great a weight per wheel that they are not allowed on the Austrian and on some of the Saxon railroads.

The Austrian State Railroads, in view of the high rents in Vienna, have bought a piece of ground near one of the stations and built thereon nine three-story buildings containing in the aggregate 114 tenements, each of two rooms and closet, which are let to trainmen at low rents. The whole cost was $180,000, which is $1,250 per tenement. Gardens and playgrounds are attached.

The German engineer Frahm, who was for several years technical attaché of the German embassy in London, in a recent communication says that in England the advocacy of large cars of the American design, carrying 50 tons or so, which was much in evidence some seven years ago, has quite subsided. It came chiefly from men unfamiliar with the practical requirements in England, where the railroad officers themselves had already investigated the subject, and knew what they could do. They are now generally convinced that 20 tons is the limit, but a great many 12 and 15-ton cars have been built.

The Austrian Railroad Ministry has established a sanitary department. It will have charge of the administration of the sanitary service, will co-operate in determining all questions involving railroad hygiene, such as clothing of employees, provision for their meals when on the road away from home, hours of work and rest, and time of vacations; will criticize from a sanitary point of view all plans of buildings, and will give its opinions on signaling, the furnishing, lighting, heating, cleaning and disinfection of cars, the ventilation of tunnels and of railroad restaurants; and will keep the statistics of sickness and death in the state railroad service.

Bergen Hill Tunnels of the Pennsylvania.

The south tunnel of the two tunnels which the Pennsylvania is driving under Bergen Hill, west from Hoboken, N. J., was driven through on April 11. It is expected that excavation on the other will be finished next month. These tunnels are each 5,920 ft. long; they connect at the Weehawken shaft with the two tubes running under the North river. At this point the floor of the tunnel is about 75 ft. below the surface and about 60 ft. below mean high water. Under the crest of Bergen Hill, the floor is about 220 ft. below the surface. No unusual difficulties have been encountered in the work on these tunnels, but the progress has been slow because about 4,000 ft. had to be cut through Palisade trap rock. This is so hard that steam drills could not drill more than 1 ft. an hour. Work has been under way for about three years. About 260,000 cu. yds. of rock have been taken from the two tunnels, and over 680,000 lbs. of dynamite have been used.

One of the accompanying photographs shows the interior of the tunnel near the Hackensack, or western, portal, and the other shows the portal itself. From this point the tracks are to be carried on trestles and fills across the Jersey meadows to connect with the main line near Harrison.

Tunnel Interior near Hackensack Portal, Showing Use of Cross Section Rod.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

XVII.

Trans-Atlantic Freight Rates and Their Control.—II The Lines Between America and the Continent.

The independent, competitive and chaotic condition existing among the lines connecting the United Kingdom and the United States is in very marked contrast to the relationship of the Continental-American carriers with each other. There are but two German trans-Atlantic lines of importance—and there is but one interest, the North German Lloyd-Hamburg-American. They represent the culmination of a series of consolidations that ended competition in their respective ports. They never actually wage war on one another, and where their pockets are affected they are astonishingly agile in getting the best results for both, while standing together to prevent encroachment by any new concern. With their close traffic understanding and pooling arrangements, with their alliances with the International Mercantile Marine Company's Red Star Line and the French Line, and with the joint control of the Holland-America Line a remarkable front is presented by these five dominant companies in the continental freight and passenger business.

The Hamburg-American Company alone may really be considered as a vast and strong conference, the only difference being that it is all owned by one firm rather than managed by a conference of owners and its solidity is therefore absolute. It dominates the German and Scandinavian trade with America, having its own lines to all ports of importance from Montreal to Galveston, and transshipping at Hamburg to Baltic and Scandinavian ports. Any small lines that from time to time go to Hamburg do so by its consent. In its earlier days it competed, fought, won and consolidated until at present its competition is well nigh irresistible. The great force of its competition arises from the fact that having 57 services in nearly all parts of the world, it is in the identical position of an American trust which kills a small rival by doing business at a loss in his small territory while it is making profit in the other 95 or 98 per cent. of its own territory, and with this profit can pay dividends and also maintain a strangulation fund.

These two German companies in guarding their territory from competition have not only driven and kept rivals away from their own ports; but, for the last 10 years, the establishment of services to Scandinavia has been regarded as an undue and unpermissible encroachment; because it might carry directly the goods now handled by transshipment through Hamburg and Bremen, especially Hamburg.

The most recent of these episodes is the attempt of a Philadelphia firm to start a line from that city to Copenhagen. As soon as the service was begun they were advised by the Hamburg-American Company representatives to withdraw or take the consequences, and having maintained the service, very severe and damaging competition followed by both lines and by new ones especially created by them for the purpose. The American firm, one of the oldest and most reliable in the business, filed a complaint* before the Interstate Commerce Commission which may be taken as an excellent exhibit of rate and traffic control by an ocean carrier. It states that more than a decade ago the Hamburg Company established such a system of rebates that through its financial penalties * * *

shippers were not permitted to ship goods, whether they were interested directly or indirectly, either as owners of the goods or as agents, except by the lines of the Hamburg-American Packet Company, or by such lines as it might direct. This contract, when made with a German forwarding agent, covered whatever merchandise he might handle for any or all of his foreign or domestic principals, no matter by what route or routes he may have been instructed by the bona fide owners of said merchandise to forward their goods to ultimate destinations in the United States.

In other words, the Hamburg American Packet Company not only secured the right absolutely to fix freight rates from Hamburg to the United States North Atlantic ports of Boston, New York, Philadelphia, Baltimore, Norfolk, and Newport News, but, in like manner, peremptorily demanded as well the right to name the steamship lines by which the shipper should forward freight from Bremen or Rotterdam to the said United States North Atlantic ports, thereby preventing the shipper from sending his merchandise by any other lines than those specifically designated by the Hamburg American Packet Company.

If the goods were destined beyond the American seaboard, this arbitrary selection of trans-Atlantic lines frequently involved the determination by the Hamburg American Packet Company of the United States inland carrier by which the goods should be forwarded from the seaboard to their final destination, and a consequent restraint of trade within the United States.

This rebate contract first issued in 1895 has been withdrawn and a modified form issued. "Under this modified form of contract, the Hamburg-American Packet Company agrees to carry all the goods of the merchant at a certain rate, provided he will ship goods to the six United States North Atlantic ports only by lines of the Hamburg-American Packet Company, or such other steamship lines as that company may designate."

"This contract covers all shipments that may be routed via German or Dutch ports, the routing of which can in any way be controlled by the merchant. Both the goods of the merchant and those which may be ordered through him or transshipped under his direction are included in the contract. Though the principal may have goods to forward from different ports, the agent must submit to the Hamburg-American Packet Company the determination of the lines by which the goods in question are to be transported from the respective ports. The merchant in an interior distributing center of the United States, ordering goods through his German representative, who is under contract with the Hamburg-American Packet Company, must submit to have all his goods shipped via such lines as the Hamburg-American Packet Company may dictate.

"Thus the Hamburg-American Packet Company not only fixes the rates from Hamburg, but it controls the selection of the steamship lines by which shippers may transport their goods from Bremen and Rotterdam to the United States North Atlantic ports."

"The Hamburg-American Packet Company, after years of aggressive tactics, stands to-day the absolute dictator of the German-American trade. No steamship company in the United States, or elsewhere, dares to question its lofty supremacy; such temerity would be followed immediately by attempted extermination.

"Thus a company, foreign in its control, dictates the rates, the line, the manner, the method, the routes and every other condition of trade and traffic to which the United States producer, manufacturer or shipper must humbly submit if he aspires to introduce his goods to the foreign consumers *via* the three most northern important Continental ports."

The complaint then goes on to state that in addition to this contract control there is a further dominance through a pooling agreement which the strong hand of Hamburg also controls.

"We desire especially to make complaint against the eastbound or export Baltic pool dominated by the Hamburg-American Packet Company, and maintained and manipulated by them in New York, in conjunction with the North German Lloyd, Scandinavian-American Line and Wilson (Hull) Line. The Baltic pool comprises the eastbound merchandise traffic through the United States North Atlantic ports of Boston, New York, Philadelphia, Baltimore, Norfolk and Newport News destined to ports or places in the kingdoms of Denmark, Sweden and Norway, the province of Finland and the German ports on the Baltic. This pool arbitrarily determines the ultimate rates for forwarding merchandise on through and on local bills of lading from the cities of Chicago, St. Louis, Kansas City, Omaha, Minneapolis, Duluth, Cleveland and other manufacturing centers of the United States via the United States North Atlantic ports, either direct to the Baltic or via Hamburg, Germany; Bremen, Germany, or Hull, England."

The pool divisions were described as follows: "Routes to Baltic direct, and those via other nations, by which Baltic traffic is forced by the pool to travel, and percentages allotted each route:

The Hamburg-American Packet Company, via Germany	56 per cent
The North German Lloyd, via Germany	17½ "
The Wilson (Hull) Lines, via England	2½ "
	76 per cent
The Scandinavian American Line—direct to Denmark	24 "
	100 per cent

"To make easier and more certain the percentage division of the traffic, the field has been parceled out to members of the pool. The Hamburg-American Packet Company maintains a service to Hamburg from each of the six United States North Atlantic ports of Boston, New York, Philadelphia, Baltimore, Norfolk and Newport News. The North German Lloyd maintains a service to Bremen from New York and from Baltimore. The Scandinavian-American Line maintains a service to Copenhagen from Boston and from New York.

"The practical working of this pool was illustrated recently when one of the largest exporting concerns was approached and without solicitation advised as to what their ocean rate of freight would be for their output for the ensuing season. They were also informed that later they would be advised (1) over what trunk line their shipments should be made, (2) to what ports their shipments should be forwarded; (3) what volume would be assigned to each of the export centers. This is clearly a case where the pool undertook to control, direct and divert as best suited the interest of its members the output of the establishment.

"When a member of the pool is doing more than its apportioned share of the business, shippers are instructed to send their goods to ports from whence other lines make their sailings. A further balance is maintained by the Hamburg-American Packet Company for its own benefit. It orders the shipper to send his goods first to one and then to another of the six United States North Atlantic ports to which it maintains regular lines. Freight shipments are thus manipulated so that the services of the Hamburg-American Packet Company shall not be depleted at one port or overburdened at another."

These are the statements of a comparatively small but old and

*"Statement of Peter Wright & Sons in the matter of the complaint against the Hamburg American Packet Co. for pooling and maintaining monopolies in restraint of trade." June 19, 1907.

very reliable firm which the Hamburg-American Company is now attempting to beat off of the Baltic service. The statements contained in the complaint are common knowledge, although most of them have not been determined in a court of law. Nor were they in any way disproved by the rebuttal of the Hamburg Company's attorneys. The Interstate Commerce Commission did nothing to question or determine their correctness because the complaint was dismissed in March, 1908, on the grounds of lack of jurisdiction to control the ocean lines in any alleged restraint of trade.

The Hamburg Company is therefore allowed to go on undisturbed in its steady accretion of services and virtual control of rates. Unquestionably it has the strongest position and organization to be found among the world's great shipping companies. A virtual witness of this is its ten-fold increase of tonnage in 20 years and its prosperous financial condition.

The evidences of the strength of its position and that of its allies need not be drawn wholly from complaints before the Interstate Commerce Commission.

A freight classification in the ocean-carrying trade is a sign of great stability. The shipowner in the Liverpool-New York trade hardly knows what freight classifications are. His life is a turmoil and a scramble for freight. He cannot make a classification because the exigencies of his competitive business would make him break class *i* before he had completed class *vi*, so he does not classify. But the Germans do. The North German Lloyd and its partners just mentioned have a westbound freight classification of six classes. That for 1906 was printed and distributed in New York in November, 1905, so great is their fore knowledge. It divides freight into six classes and it is currently reported in shipping circles that the rates are maintained as announced.

The character of the goods has a profound influence on rate making and classifying as is shown by the different practices of the Germans in the east and westbound trade. They can maintain a rate going west but do not attempt to do so on eastbound traffic. The difference is largely due to the character of the freight. The trade to the west is largely valuable manufactures which pay high prices. It is in these goods that the classification holds. The six classes do not provide for all articles. Heavy freight is almost excluded from the classification and reserved for special arrangements which are estimated to cover at least 25 per cent. of the traffic of one of these lines. As the eastbound freight is nearly all heavy freight, it is all reserved for special arrangements. This is necessary because goods of this character cannot bear high freight charges and would go to their destination by transshipment from British, Dutch, Belgian or French ports if the German lines were not free to make some adjustment to the current rates. The freight rates on westbound goods, though high per ton, are really low in percentage of value of the goods. This high value makes it unprofitable for much of this class of freight to lose any time in following slower, more devious, but cheaper routes. Hence it becomes the easy prey of the carriers with agreements and classifications.

The London carriers are unique among British-American carriers in that they have a freight classification. It has seven classes and was formed in 1901 by crystalizing the results of long practice. It is instructive to note that it is in a trade controlled by few and strong hands, and that only an estimated 10 per cent. of the traffic is classified—the higher class manufactures. On the other 90 per cent. the agreeing London carriers feel that they must be free to meet the market, which sets the rate for all freight moving in great quantities.

Why do the ocean carriers from Germany to America agree so completely while those from Great Britain compete so constantly? There are at least three reasons that may be cited in partial explanation. The first is the much smaller size of German maritime operations and the shorter shore-line this commerce serves. In Germany there are but two ports engaged in Atlantic foreign trade and as these are almost twin ports, agreement is geographically simple. In England there are three different coasts and at least six ports of the first magnitude and many smaller ones, each striving to get a larger share of the national commerce. The second reason may be found in the national characteristics. The Englishman loves his independence and will undergo financial privations to have it. The German has submitted to the national will, has received military drill, has obeyed orders and has moved in companies and masses. He is thereby trained to common action. The third reason is the influence of the German government. The great German steamship companies are probably more nearly a part of the government than are any other important lines in the world. They receive direct or indirect government aid and are benefited by the great desire of Germany to be a sea power. A part of the subsidy is in the form of special railroad rates on export goods on the government railroads. The personal side of this government relation, the lively interest of the German Emperor, who uses the great force of his personal and social prestige to uphold this branch of German sea power, is also important.

The lines to the southern countries of Europe carry an important part of our trade with the continent, but it is not necessary to give any full account of the rate problems of the lines between the United States and the Mediterranean for the reason that while a complex array of incidents might be marshalled, they show no new principles. The long shore line, the several nations, the many ports combine to destroy any idea of homogeneity. Five jealous peoples have their outlet on the Mediterranean—the French, Spanish, Italians, Austrians and Hungarians, and to add to the variegated aspect the German and English companies have been important factors in the carrying trade to America, which now has at least 15 line services to the North Atlantic ports.

Their history this past 15 years has been as checkered as is the cosmopolitanism of the carriers, wars, agreements, pools—more wars, more readjustments—but nothing different in principle or practice from that which has been narrated in the previous numbers of this series.

(To be concluded.)

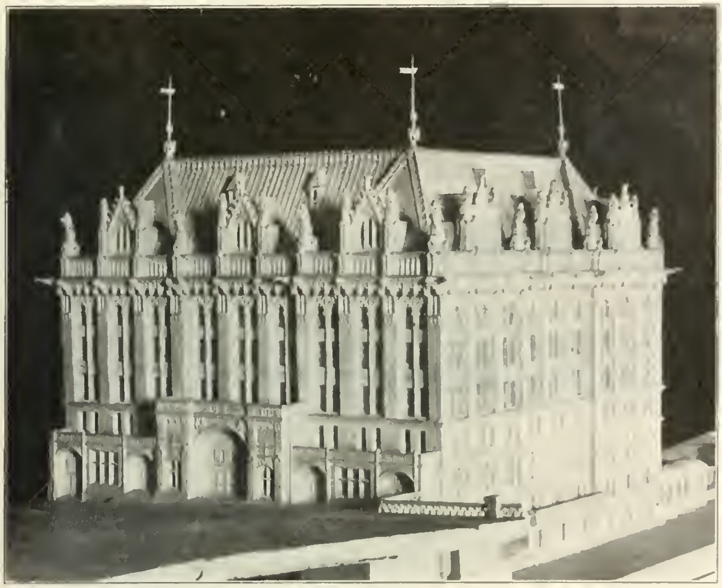
Ottawa Union Passenger Station.

The union passenger station at Ottawa, Ont., is being built by the Grand Trunk, to be used by that road, the Canadian Pacific, and the New York & Ottawa. As shown in the accompanying plan, the station will face the new plaza to be formed at the intersection of Dufferin and Sapper's bridges with Rideau street. In connection with the building of the station, a hotel will be erected, on the other side of the plaza, at the southwest corner of Major's Hill Park. This hotel is to be known as the Chateau Laurier.

View of Ottawa Union Station and Chateau Laurier, Looking Across Rideau Canal.

The present Canadian Pacific tracks, as well as those of an electric railway which runs to Hull and outlying points, run between the site of the new station and Rideau canal. The Canadian Pacific line is eventually to be double tracked. It will continue parallel to the canal, running under the plaza formed by roofing over the space between the two converging bridges over the canal. From this point, the line continues along the canal and to the Alexandra bridge across the Ottawa river, over which the through Canadian Pacific trains and the electric cars will operate. The terminus of the electric railway will be under the plaza. The original idea was to make the station a head on instead of a through station;

that is, to put the station at the end of a Y over which all trains would back in from the east and west. This would have made a shorter run to Hull station than the route across the Alexandra bridge, but as the government required that the bridge continue to be used the present plan was adopted. The tracks come into the station from the south, leaving the Canadian Pacific tracks about

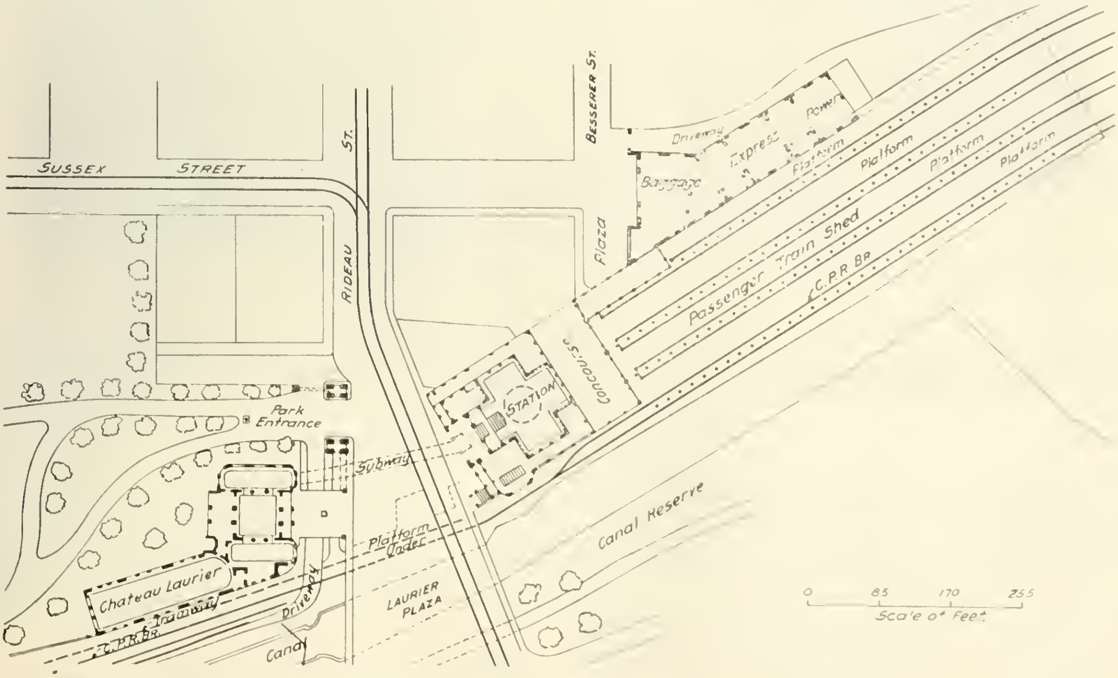


View of Station from Laurier Plaza.

2,000 ft. below the station. There will be nine station tracks, served by platforms 20 ft. wide. East of the train-shed is the baggage and express annex, about 350 ft. long, with separate tracks and platforms. This takes care of in and outbound baggage, express and mail. Adjoining it is the power plant and space for coal storage, also second class waiting rooms, the conductors' and trainmen's rooms, customs offices, etc. The ground area of this annex is about 28,000 sq. ft. At the north end of the annex there will be another new plaza at the intersection of Sussex and Besserer streets, wide enough to easily take care of carriage service and baggage wagons, while express and mail wagons are provided for in the driveway east of the annex.

Between the train shed and the station building is a concourse 170 ft. x 50 ft. This is at track level; it communicates on the east with the plaza just mentioned, and on the north it leads into the general waiting room, at the same level. The first four stories of the station building proper are used for the passenger station, while the upper stories will be railroad offices. These upper stories are built around a well, the bottom of which is the central dome over the waiting room. From the main waiting room open alcoves and rooms for the ticket office, sleeping car office, information bureau, parcel room, lunch room, etc. At the north end of the waiting room is a broad stairway leading up to the Laurier plaza, which is 22 ft. above the track level. The main waiting room is 52 ft. square, with wide wings each 50 ft. square and 40 ft. high. The women's room 52 ft. x 30 ft., is north of the main stairway, being under the entrance to the plaza, and is well lighted from open areas on each side of the entrance. The smoking room is 32 ft. square; the ticket office, 52 ft. square; the lunch room 52 ft. x 35 ft., and the sleeping car office, telegraph office and information bureau, each 15 ft. x 20 ft. On the mezzanine floor will be the offices of the train despatcher and the station master, and other rooms.

One of the accompanying photographs of models shows the main entrance of the station fronting on the plaza. A smaller entrance leads to a suite of private waiting rooms for the use of government officials and distinguished visitors. Another view of the model shows the station building and also the Chateau Laurier. The ground area of the hotel is about 25,000 sq. ft. The main entrance is from the plaza and the service entrance is underneath from the level of the roadway to the canal. There is also a large passenger subway connecting it with the station. The hotel will have over 300 outside rooms and connecting baths, aside from the ballroom, public and private banquet and dining-rooms, cafe, etc. Heat and electric current for light



Location of Ottawa Union Passenger Terminal.

will be furnished from the power plant in the baggage annex.

These buildings have been designed to harmonize with the adjacent parliament building and the proposed governmental buildings east of Major's Hill Park. The architecture is French Gothic with a predominating Norman motif. This style lends itself particularly to the construction of the station building, in which the vertical lines of the steel frame have been made prominent. The outside of the buildings will be of stone, and the detail of the upper stories will be in faience. The roofs are to be copper. The entire framework will be steel, and the floors and partitions of concrete or tile.

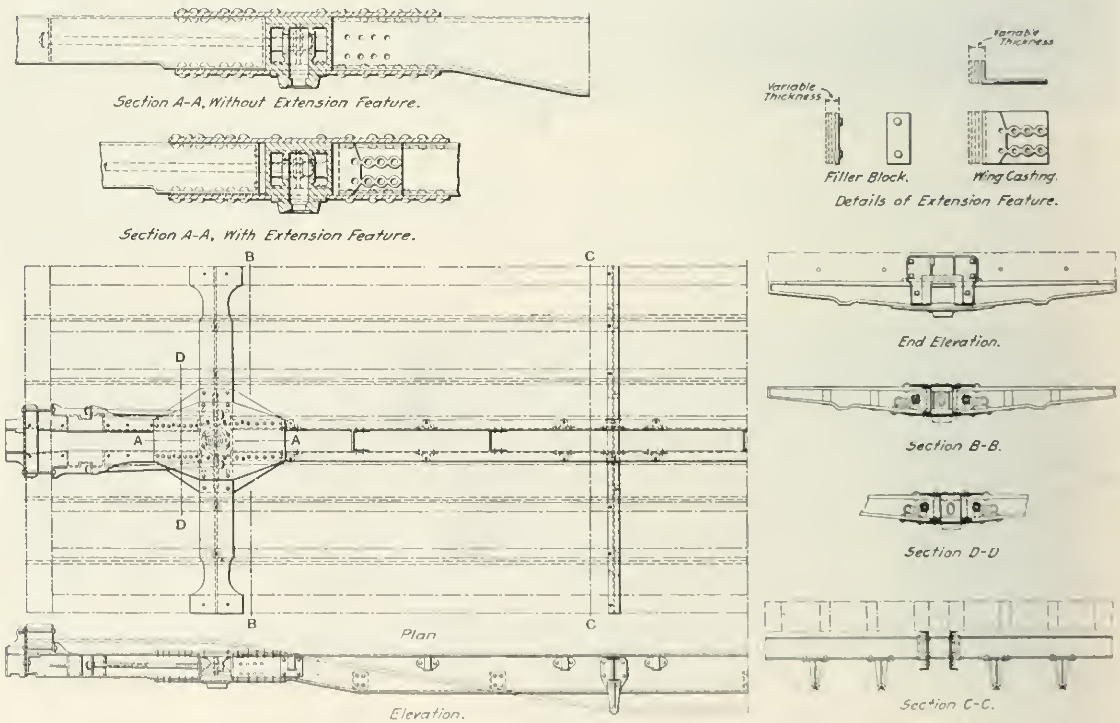
It used to be customary in working out plans for a terminal of this kind for the railroad's engineering department to prepare the general layout, deciding what areas should be used for station, baggage room and other purposes, and have the architect design the structure within these limits. More recently, better results have been obtained by submitting the problem to the architect, leaving it to him to work out the best layout for handling traffic; the details as to tracks, switches and connections being subject to the approval of the operating and engineering departments of the railroad. The Ottawa Terminal and the Chateau Laurier were designed in this way by Bradford L. Gilbert.

On the Austrian railroads, the rule since 1876 has been for trains to run on the left hand track, and signals, switches, etc., have been placed accordingly. Meanwhile, in the adjacent countries, Germany, Italy and even Hungary, the trains kept to the right. Now the Austrian authorities have determined to do as their neighbors do and new second tracks, etc., are to be constructed accordingly, and old lines are to be changed as occasion offers, but it must be many years before the change is completed. Running to the right was the rule on the first Austrian railroads; a change to the left was made in 1844, when there was not much to change, in 1851 there was a change back to the right, to be changed again as aforesaid.

Metal Draft Frame for Wooden Cars.

All-wood freight cars are subjected to treatment which greatly increases the cost of maintenance because of the use of high-capacity all-steel and steel underframe cars, heavy locomotives, hump switching yards, etc. To strengthen them so that they are better fitted to withstand these stresses, W. E. Sharp, Superintendent of the Armour Car Lines, Chicago, has designed a steel underframe to be applied to wooden cars now in service, which will give a continuous draft system, and which can be put on at low cost. Since cars of the same class, made at different times, may vary appreciably in such essential dimensions as the distance from end sill to body bolster or distance between truck centers, it was necessary that this frame be so designed that it could be applied without boring new holes and thus further weakening the wooden members of the car, and, also, that the original height of the car floor be left unchanged. Furthermore, it was desired to avoid cutting away the body bolster in making continuous center sills, it being considered that a large number of the failures of such bolsters in service are due to the weakness thus caused.

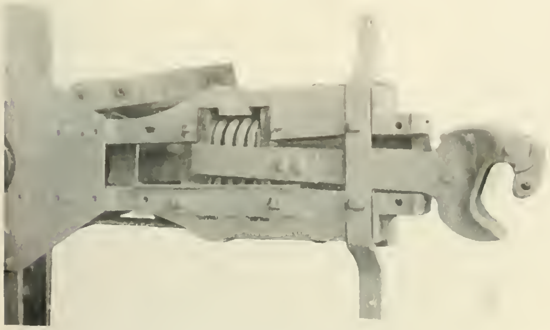
Detail drawings and photographs are shown herewith. Th



Sharp's Steel Center Sill and Draft Sills for Wooden Cars.

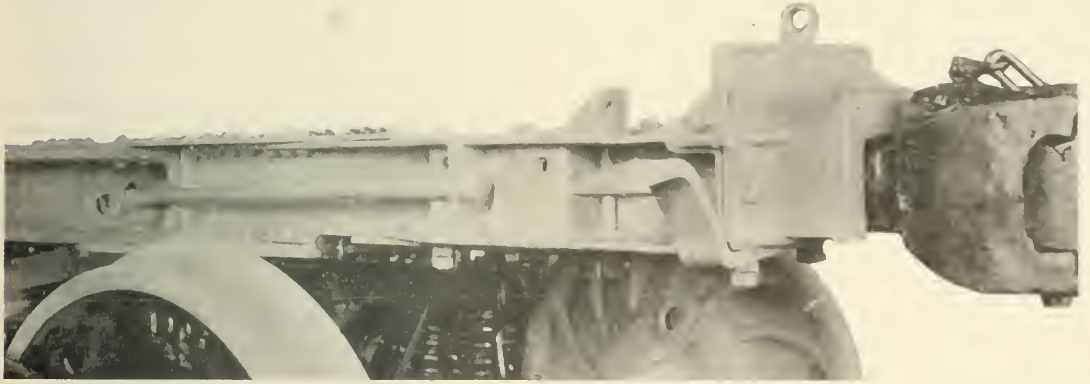
draft sills and the dead block are steel or malleable iron. The latter is bolted to the forward ends of the draft sills and extends up the outside face of the end sill. A bracket is cast on the top for the uncoupling lever. Each draft sill has a stop against which the inner face of the end sill bears, with a hole for bolting through the end sill to the dead block. The illustrations show draft sills designed for twin draft springs; they can, however, be made for any design of spring or friction gear.

The lengths of the draft sills and of the center sills are standard, the variations in essential dimensions noted above being met by



Bottom View of Draft Sills.

an extension feature, which is shown in detail in the drawings. To lengthen the distance between bolster and end sill, a filler block is put between each draft sill and the body bolster. To increase the distance between truck centers, a wing casting is riveted to each center sill, with its short arm fitting between the end of the sill and the bolster. The thickness of this wing casting arm and that of the filler blocks vary according to requirements. The filler blocks have lugs which fit into holes in the ends of the draft sills to hold them in place before the frame is riveted up. The draft sills and the center sill are made continuous by two plates passing



Side View of Draft Sills, Showing Buffer Block.

over the top and under bottom of the bolster and securely riveted to the different members. The lower plate is cut out for the top center plate, which is cast integral with the bolster. Each draft sill is strengthened by a rod passing through the body bolster and through a lug cast on the side of the draft sill.

Refrigerator cars of the Armour Car Lines have been equipped with this underframe for a year and no weakness has developed.

Foreign Railroad Notes.

The Austrian authorities have made a special rate on crude petroleum to be used as fuel, coming from the wells in Galicia. This rate is the same per pound as the coal rate. As oil has a fuel value equal to about 1¾ its weight of coal, and as the oil tank cars can take no return freight, the coal producers have an excuse for calling this unfair.

The contract has been made between the Chinese government and German and English capitalists for a railroad from Tientsin, the port of Pekin, south by east to the Yang-tse-Kiang river opposite Nankin, the distance in an air line being about 530 miles. The Chinese are to build and own the railroad themselves, under the observation and inspection of engineers and accountants selected by the Europeans, who are to provide £5,000,000 towards the cost. About 175 miles south of Tientsin the line will connect at Tsinan-fu with the German Shantung Railroad.

The railroad around the shoals of the Congo from Stanleyville to Ponthierville, 79 miles, has been completed and steamboats no longer ply on that part of the stream, there called the Lualaba. Stanleyville is about a thousand miles above Stanley Pool, the upper terminus of the old Congo Railroad, and between them steamboats of considerable tonnage ply. Above Ponthierville the Lualaba is navigated to Kindu, about 200 miles further up (south). Thence to Kongolo, 200 miles, south by east, another railroad is to be built, to reach a stretch of river which with a little improvement is said to be navigable for about 400 miles, to the falls of Kalengwe.

Effects of the 16-Hour Law on Trainmen.

From replies received in response to inquiries sent to the principal railroads, it appears that the most important result of the United States law limiting the working hours of trainmen, which went into effect on March 4, has been to equalize the rest periods of those crews who formerly took a long rest at the home end of their runs and a short one at the other end, and to reduce the average income of freight trainmen in numerous cases where the rearrangement of runs has necessitated the employment of additional crews. In a number of cases a run of, say, 160 miles, has been divided so as to leave 120 miles to be operated the same as before, while the other 40 miles is operated by having a crew go out and come back the same day. This arrangement as well as most of the other changes which have been made, makes some increase in the total time spent at terminals, and in this way makes necessary the employment of additional crews; and the payment for the time spent in this added terminal work has in a few cases increased the expense per train-mile to the companies.

Large numbers of roads have reported that no important change was found necessary on their lines; and in the cases of the few roads on which considerable expenditures have been made for new terminal buildings and tracks, we are informed that the changes had been planned before the passage of the law. Information received from roads on which changes have been made is given below.

Atchison, Topeka & Santa Fe.—The lengths of the divisions are quite uniform, so that probably the law will result in no serious changes; but crews that have heretofore made their runs in the direction of home after a rest of six or eight hours, will now have to make this rest-period longer.

Atlanta, Birmingham & Atlantic.—A few additional crews put on; only a small part of the whole force is affected by the change.

Baltimore & Ohio.—About 21 crews will have to take longer rest-periods at that end of their run which is farthest away from home. It was expected that not over a dozen men would have to change residence.

Central of New Jersey.—Some crews which have run out and back the same day will now be run farther and be required to take a rest, as required by law, at the far end.

Chicago, Burlington & Quincy.—A number of runs have been rearranged and additional freight crews are required.

Chicago & North-Western.—A few crews will have to take rest away from home who formerly made round trips.

Delaware & Hudson.—Heretofore freight trains have been running from Binghamton to Oneonta (61 miles) and return, total 122 miles; Albany to Oneonta (83 miles) and return, total 166 miles; Oneonta to Mohawk (72 miles) and return, total 144 miles; Oneonta to Mechanicsville (87 miles) and return, total 174 miles. Under the new arrangement the runs are from Oneonta to Saratoga, 92 miles; Binghamton to Mechanicville, 149 miles; Binghamton to Albany, 143 miles.

The number of crews who thus have their runs changed from round trip to straight away is 32. The company probably will have to provide new buildings at two points, costing $2,500, and about 100 men with families will change their residences.

Delaware, Lackawanna & Western.—On one division where traffic is dense the freight trains have been made lighter so as to insure the completion of trips within 16 hours. In numerous cases runs of 100 miles and less, formerly doubled in 15 to 20 hours, are no longer doubled.

Great Northern.—Business is now so light that no changes have been necessary, but, with the road working to its full capacity, some runs will have to be shortened. A number of passenger runs have been changed so that the rest periods of the crews will be more nearly equalized as between the two ends of the run.

International & Great Northern.—Changes were made some time ago to comply with the law of the state of Texas, in which the limit is 14 hours instead of 16, as in the federal law, but only a few changes were found necessary. One Y track had to be put in to be used for turning engines.

Illinois Central (freight runs).—

Old Arrangement.	*New Arrangement.*
Memphis to Mounds.......173 miles	Memphis to Fulton.... ...123 miles Fulton to Mounds ... . 50 "
Memphis to Paducah......169 miles	Memphis to Fulton ... .123 " Fulton to Paducah .... 46 "
Louisville to Paducah .....225 miles	Louisville to Central City..125 miles Central City to Paducah....100 "
Princeton to Nashville and return ....232 miles	Princeton to Nashville ....116 miles Nashville to Princeton.....116 "
Memphis to Gwin..........161 miles	Memphis to Tutwiler...... 92 miles Tutwiler to Gwin.......... 69 "
Vicksburg to New Orleans..228 miles	Vicksburg to Wilson ......113 miles Wilson to New Orleans....115 "

About 150 men are affected by these changes, about half of whom will change their residences.

Passenger Runs.—

Old Arrangement.	*New Arrangement.*
Evansville to Nashville....217 miles	Evansville to Princeton....101 miles Princeton to Nashville ....116 "

Kansas City, Mexico & Orient.—One new passenger crew had to be employed.

Kansas City Southern.—The run between Mena and Shreveport (178 miles) has been changed so that now the men will run from Mena to Texarkana, 107 miles; and from Texarkana to Shreveport, 71 miles (round trip, 142 miles). The line from Shreveport to De Quincy (161 miles) will be divided at Hornbeck, 94 miles from Shreveport, and the balance of 67 miles will be covered by a round trip (134 miles). Eighteen crews are affected by these changes. The buildings and tracks required at the new terminals cost $105,000, and about 50 men with families have changed their residences, or will change. The additional time paid to crews in consequence of the new arrangement is estimated at $105 a month. Six passenger crews have had to change the place of their principal away from home terminal.

Louisville & Nashville.—Few crews will have to change residence.

Michigan Central.—One freight run has been changed so that three crews will be required where formerly two handled the trains. Three passenger crews on the main line have been changed, but their aggregate mileage is the same. On the Bay City line a passenger run of 237 miles is divided so as to make one of 147 miles and another of 90 miles.

Oregon Railroad & Navigation Co.—The runs of the local freight trains between Starbuck, Wash., and Spokane, 156 miles, have heretofore been divided at Tekoa, 108 miles from Starbuck, but now are divided at Colfax, 69 miles from Starbuck. The fast freights between Starbuck and Spokane have heretofore run through (146 miles), but now the runs are divided at Tekoa. About 35 men have to change their residences.

Oregon Short Line.—No changes have been made in runs, but about $55,000 is being spent for new passing tracks, with a view to preventing delays in the movement of freight trains.

Philadelphia & Reading.—This company began some years ago to equalize the runs of trainmen so as to avoid the necessity of excessive hours, and 100 miles is now the maximum for practically all freight and coal trains. In connection with the changes decided on (before the law was passed) the company built two rest houses costing together about $10,000, one at Bridgeport and one at East Penn Junction. About 1,500 men now have to take rest away from home, though formerly in many cases they made a round trip in 16 hours.

Southern Railway.—On this company's lines many of the divisions are from 150 to 170 miles long, but it was found that to change the terminals would cost about $2,000,000, a sum which, on account of the business depression, was not available. It was decided, therefore, to have the crew which starts out with a train take it about 120 to 125 miles, and then have a relief crew take it the remaining third of the distance and make the round trip. While this crew is at work the other one has time to rest. The engines and cabooses are not changed at these temporary changing places.

Texas & Pacific.—Trains that heretofore ran from New Orleans to Boyce, 208 miles, now end their trips at Baton Rouge Junction, 89 miles.

Union Pacific.—Between Denver and North Platte, 277 miles, the line is to be divided at Sterling, exactly one-half, but this change was decided on before the passage of the 16-hour law. One freight run of 164 miles is divided into two, one 117 miles long and the other 47 miles. Some of the trainmen will earn 25 per cent. less than before. The headquarters of three passenger crews has been changed.

The Purchasing Department and Common Standards.*

This is a brief description of the present practice and policy of the purchasing department of the Union Pacific and the Southern Pacific and of the co-operation of other departments of the service, which has made its methods practicable and effective.

COMMON STANDARDS.

To obtain the most efficient, economical and satisfactory results for all the lines of these systems, comprising about 18,000 miles, the management realized several years ago the importance of selecting definite uniform standards of the best practicable designs for many articles used in large quantities by the different departments of the service.

In numerous conferences, which are held periodically, the chief

COMMON STANDARD FREIGHT CARS.

Kind of car.	Capacity Pounds.	Capacity Cu. Ft.	Inside Length.	Inside Width.	Inside Height.	Light Wt in lbs.	Light Wt pr ct of carrying capacity.	Light Wt in lbs. per 1,000 cu. ft. capacity, level full.	Remarks.

*Since 1903 it has not been considered advisable to purchase any 80,000 lbs. capacity box or flat cars, as the cost of these is only about $60 per car less than the cost of similar 100,000 lbs. capacity cars.

†No 60,000 lbs. capacity furniture cars have yet been purchased. ‡Level full.

*Abstract of a paper read before the New York Railroad Club on Feb. 21, 1908, by W. V. S. Thorne, Director of Purchases of the Union Pacific System and the Southern Pacific Company.

officials of each department concerned of the various associated companies have recommended exactly what many of these standards should be. Decisions have been made after considering the advantages from a mechanical and practical as well as from a commercial point of view and after opportunity has been given for argument or suggestions from many experienced and technical men, who have used or manufactured the devices or material in question. Later most of these recommended standards have been favorably passed on by a majority of the general managers of the companies concerned, and when formally approved by the Director of Maintenance and Operation of the associated systems have thus been adopted as common standards for all the associated lines. Where practicable and desirable, detailed and definite specifications and drawings have been prepared, describing and illustrating clearly each common standard.

When formally adopted, any article remains a common standard until it has been formally canceled or superseded by another device, which the officials concerned have voted to be preferable, either on account of greater efficiency, safety, economy, simplicity or other good and sufficient reason. This method has been found to work most satisfactorily in practice and without too much red tape to be objectionable.

When common standards were first considered, it was impracticable to adopt the then existing standards of any one company as common standards for the associated lines, as the various railroads had been under separate management and had different standards of their own. No one line had any design of freight car or passenger train car or locomotive, or more than a few maintenance of way department standards, that could not be greatly improved by suggestions from officials of the other associated lines, from car builders, locomotive builders or other manufacturers, to whom various parts of proposed common standard plans and specifications were submitted for criticisms and suggestions. It was found, however, that certain parts of cars or locomotives, heretofore used as standards by some of the lines, were entirely suitable as common standards, and these were accordingly adopted. Each common standard was therefore adopted strictly on its merits.

ADVANTAGES OF THIS SYSTEM IN MAKING PURCHASES.

Some advantages of this system to the purchasing department are as follows: The variety of similar articles to be purchased is reduced to a minimum. Many standards for all the associated lines being uniform, stocks of material carried on hand at different points are interchangeable to a much greater extent than formerly, and, in case of emergency, material can be drawn with little delay from other than the usual storehouses, thereby avoiding the necessity of carrying as much on hand as formerly.

Common Standard Wooden Passenger Train Cars.

Kind of car.	Length over end sills.	Seating capacity.	Light weight, car complete.
‡Coach	60 ft.	70	88,000
†Coach	*69 ft.	82	* .....

†Diner	72 ft. 6 in.	..	125,000
†Observation-smoker	72 ft. 6 in.	..	.....

*None of these yet built.
†6 Wheel all steel trucks. ‡4 Wheel all steel trucks.

**Common Standard All Steel Passenger Train Cars.*

Kind of car.	Length over end sills.	Seating capacity.	Light weight, car complete.
‡Coach	60 ft.	70	95,700
‡Baggage	60 ft.	..	90,000
†Postal	60 ft.	..	108,000
†Postal storage	60 ft.	..	106,000

*Up to the present time sample all steel passenger train cars only have been built, but it is probable such cars will be ordered exclusively in future and that some slight reduction can be made in weights shown.
†6-Wheel all steel trucks. ‡4 Wheel all steel trucks.

The light weights given above for common standard all-steel passenger train cars complete include the weights of an axle lighting device and storage batteries which amount to about 6,390 lbs. for each car. These axle lighting devices are to be given a trial, but none has yet been adopted as a common standard.

The weight complete in running order of each four-wheel all steel truck is about 14,400 lbs. and of each all steel six wheel truck about 20,000 lbs., not including the weight of any axle lighting device.

Many purchasing agents spend half their time trying to secure further definite information than is ordinarily furnished at first in regard to supplies they are asked to buy. They do this in order to have some specifications, even though crude, as a fair basis on which to compare bids and place orders, which will insure to some extent the railroad company's receiving the quality, sizes and kinds of supplies best suited for its requirements. If, therefore, a purchasing agent is supplied with definite and complete specifications and drawings prepared by experts, covering many of the most important articles purchased, the result is certainly a great relief to the purchasing department. It simplifies the work there, not only at the time purchases are made, but later also in lessening the amount of correspondence complaining about defective devices or inferior workmanship or material.

When competing manufacturers are furnished with carefully prepared specifications, and if necessary, drawings also, showing exactly what is wanted, they are then able to figure the closest prices they can afford to name without having to make any allowances for uncertainties. When definite specifications or drawings establish a fair and exact basis for comparing the relative merits of bids, manufacturers will ordinarily submit lower prices for material of the quality specified than they would otherwise. If a manufacturer feels that certain railroad companies will repeatedly purchase from him in large quantities articles of exactly the same kind, and will not change their standards without excellent reason, he will ordinarily quote very low figures hoping thereby to secure such business continuously. By concentrating orders for the same devices or materials with one, or in a few cases with two, well equipped and reliable manufacturers, more uniformity can be secured, and the ordering, inspection and forwarding of shipments are facilitated and accomplished with greater economy. Another great advantage in having intelligent and definite specifications and drawings is that it facilitates a fair inspection, and, when articles are furnished in accordance with definite conditions, there is far less uncertainty as to results that will be obtained by their use.

INSPECTION BUREAU.

An inspection bureau well equipped with mechanical and chemical testing laboratories and with a corps of experienced inspectors has proved most useful and necessary. To this department copies of many orders placed by purchasing agents are sent so that proper attention may be given to inspection of quality of workmanship and material of supplies and equipment furnished, and so that weights and conformity to standards, etc., may be properly checked. This department has also rendered much assistance in the preparation and revision of specifications and drawings.

The following examples will illustrate to what extent many of the articles purchased for the Union and Southern Pacific lines have been standardized by the operating and motive power departments.

ROLLING STOCK EQUIPMENT.

As all rolling stock is likely to be transferred from one line to another, and as new cars and locomotives and repair parts for such equipment form the largest items purchased by railroad companies, it was considered most important to have these of as uniform and good designs as possible for all the associated lines.

After several conferences, the officials concerned decided to have definite specifications and detailed drawings of what has been called

COMMON STANDARD LOCOMOTIVES.

Tractive power (M. E. P. considered 85 per cent. of boiler pressure ... lbs.	23,506	29,920	36,570	43,305	30,222	27,[illegible]76
Adhesive weight to tractive effort	4.47	4.71	4.38	4.32	4.63	5.11

*For mountain service.
The above weights and dimensions, etc., are for coal burning locomotives. Common standard oil burning locomotives are identical except that grates are omitted, and ash pan is modified, and oil burning apparatus and connections and fire brick are added without materially affecting weights.

common standard cars and locomotives as shown in the accompanying table. It was thought that these would include practically all of the different types of such equipment which it might be advisable to purchase in the near future for ordinary use on any of the lines.

Common Standard Locomotive Tenders.

	Shape of Tank			
	Cylindrical.	Cylindrical.	Rectangular	Sloping Rectangular
Water capacity . . . . gal.	7,000	9,000	9,000	4,000
Coal capacity . . . net tons	11	11	10	6
*Weight empty . . . . . . lbs.	48,720	53,980	63,000	39,770
*Wt. with coal and water. "	135,850	156,980	178,000	85,100
Fuel oil capacity of these tenders when fitted for use with oil burning locomotives . . . . . . gal.	2,910	2,940	2,850	1,020
Additional weight of such tenders empty, is in lbs. about	6,130	6,130	8,400	3,780

*For passenger service tenders are equipped with vestibule, which adds about 4,660 lbs. to the weight of cylindrical tenders, and about 3,240 lbs. to the weight of rectangular tenders.

Common standard tenders for oil burning locomotives are identical with those for coal burning locomotives, except that tank for fuel oil is placed in coal box, and piping connections to locomotive firebox are added. Having determined the general types of cars and locomotives to be purchased in future the question of detailed plans and specifications for each and every part, no matter how small, of all such equipment was then given the most careful consideration, and care was taken to follow M. C. B. or M. M. adopted or recommended standards.

UNIFORMITY OF PARTS.

In designing all types of common standard freight cars the principle was strictly adhered to of using identically the same parts in different types of cars wherever suitable, in order to minimize variety and to have as many parts as possible interchangeable. The same practice was also followed in designing common standard locomotives and passenger train cars.

This plan not only proves of great advantage to the railroad companies from a maintenance point of view, in facilitating the making of repairs without delay, but it also lessens the variety, amount and value of material necessary to carry in stock. Uniformity of parts, wherever practicable, is also of value to car and locomotive builders, as it reduces considerably the variety of patterns, dies, templets and blue-prints, which they would otherwise have to make if building more than one type of car or locomotive, thereby enabling them to make slightly lower prices.

SPECIALTIES FURNISHED BY THE RAILROAD COMPANY.

In making common standard plans and specifications for equipment, it was naturally found that there were numerous parts of cars or locomotives, among them many patented devices, which car or locomotive builders had no special facilities for making or could not make. These specialties the railroad companies could purchase direct from the manufacturer at lower prices and with better assurance of prompt deliveries than the car or locomotive builders could obtain, particularly if the railroad companies signified their willingness to adopt such specialties as their standards until they found something better, or just as good, and enough cheaper to justify a change. Another inducement to manufacturers to name low prices has been that if specialties made by them were used as common standard by any large railroad system, it would advertise their wares and assist them in getting business from other companies.

Therefore, in buying new equipment, the Union and Southern Pacific systems have found it advantageous to furnish free of charge to the car or locomotive builders the following specialties:

For Common Standard Freight Cars.

Air brake equipment
Bearings, journal
Bolsters, body, cast steel
Brake Adjuster equipments.
Brake beams
Door insulation for refrig. cars
Draft rigging
Journal boxes, M. C. B.
Refrigerator air syphons
Refrigerator car lining
Roofs, metal
Side bearings, truck
Brake shoes
Couplers, M. C. B.
Door bolt keepers for refrig. cars
Door fasteners
Door fixtures
Springs, truck and draft
Steel platforms for cabooses
Truck bolster, truck center plates and dead lever anchors
Truck side frames, cast steel
Wheels, rolled steel (in special cases only).

For Common Standard Passenger Train Cars.

Air brake equipment
Air signal equipment
Bag racks for postal cars
Bearings, journal
Brake adjuster equipments
Basket racks, metal
Body bolsters, cast steel
Brake beams
Brake handles
Brake shoes
Car couplers
Cinder guards for postal cars
Closets, Duner for observation and dining cars
Coffee urns for dining cars
Curtain and rollers, vestibule
Diaphragms and attachments, vestibule
Draft gear
Electric fans for dining and observation cars
Lid, bolt and spring for journal boxes
Lighting equipment
Mail catchers for postal cars
Ranges for dining cars
Refrigerators for dining cars
Steel platforms
Seats
Side bearings, truck
Springs, truck and draft
Steam heating system equipment
Trap door fixtures
Truck steel castings
Vestibule parts
Wash stands
Water coolers
Water heaters for dining cars
Water filters for dining cars
Wheels, rolled steel

For Common Standard Locomotives and Tenders.

Acetylene gas generators
Air brake equipment
Air signal equipment
Bearings, axle
Bell ringers
Brake adjuster equipment
Brake beams
Brake shoes
Couplers, M. C. B.
Draft rigging
Feed pipe strainers
Hose, tank
Headlights, acetylene and electric, and apparatus for the same
Injectors
Journal boxes, M. C. B.
Lubricators
Packing for piston rods
Packing for valve stems
Safety valves
Sanders
Side bearings, truck
Springs
Staybolts, flexible
Steam chest valves for [illegible] engines
Steam gages
Steam and air conduits
Steam heat equipment
Steam heat gages
Steam heat reducing valves
Throttle valves
Tires for driving and trailing wheels
Truck bolsters, truck center plates and dead lever anchors
Truck side frames, cast steel
Vestibule diaphragms and attachments for passenger locomotive tenders
Water gages
Wheels, rolled steel, engine and tender truck
Whistles

The cost of these specialties furnished by the railroad for new common standard freight cars is from 20 to 30 per cent. of the total cost of the car complete. For new common standard passenger train cars it averages from 30 to 40 per cent. of the cost of the car complete, and for new common standard locomotives it is approximately from 12 to 15 per cent. of the cost of the locomotive complete. This leaves to the car or locomotive builders only plain and regular work to figure on when requested to submit bids. As they should be well equipped to perform such work, they should be able to quote closer figures than if also required to secure quotations on short notice from other manufacturers, on the specialties referred to above, the close prices of which they are not always familiar with, and could not in many cases easily obtain.

FORM OF SPECIFICATIONS FOR CARS AND LOCOMOTIVES.

The Union Pacific and Southern Pacific have found it desirable to have all specifications for common standard cars and locomotives printed on pages M. C. B. size 8¼ in. by 10¾ in., to secure uniformity, correctness and compactness. It has been found convenient and desirable to bind under separate covers specifications for the following:

Approximate Number of Printed Pages in Each.

Each different type of freight car. . . .	14 to 21
Each different type of passenger train car body	23 to 38
Four wheel passenger train car trucks. .	5
Six wheel passenger train car trucks. . .	5
Each different type of locomotive.	15 to 18
Each different type of tender.	8 to 9

SCHEDULES.

As a part of common standard freight car specifications, separate schedules have been made describing in full detail each of the different kinds and parts of specialties furnished by the railroad f.o.b. the car builders' works. On each schedule is shown the name and address of the manufacturer of the article referred to and a list of the different types of common standard freight cars on which such specialties are used. The schedules also show on what common standard drawings the devices or parts thereof are illustrated, and with what common standard material specifications (if any) or with what other specifications the material furnished must comply. Information in regard to the weight of the device and the kinds of material and parts of which it is made, etc., is also indicated where desirable. By reference to these schedules officials of the railroad companies and car builders can see exactly what material the railroad is to furnish, and, when these specialties are ordered, if reference is made to schedule number and date and to the number of cars of specified types for which the material is wanted, manufacturers and inspectors will be fully informed as to what should be furnished.

NUMBERING OF SCHEDULES.

For purposes of easy reference, schedules are numbered consecutively and in alphabetical order.

PREFIXES TO SCHEDULE NUMBERS.

To designate the kind of equipment to which the schedules apply, the following prefixes are used in front of their numbers: P, for passenger train cars; L, for locomotives and tenders, for freight cars no prefix letter is used.

SUFFIXES TO SCHEDULE NUMBERS.

Where two or more schedules are necessary to clearly describe different varieties of the same kind of specialties, which may be furnished for different types of the same kind of equipment, the same schedule number is used, but the letter a, b or c, etc., is suffixed to the number for the purpose of identifying each variety of schedule. Thus, the schedule, describing air-brake equipment for freight cars weighing light more than 35,000 lbs. where combined air cylinder and reservoir is used, is numbered 1a. Schedule 1b describes air-brake equipment furnished for freight cars weighing light more than 35,000 lbs., where a detached air cylinder and reservoir are used. Schedule 1c describes air-brake equipment furnished for freight cars and cabooses weighing less than 35,000 lbs. light.

SCHEDULES BOUND UNDER SEPARATE COVER.

All of the 36 schedules applying to common standard freight cars, consisting of about 50 printed pages, are bound with an index under separate cover. As they apply to all or some types of common standard freight cars, this avoids the necessity of inserting and repeating this information in detail in the specifications of each different type of freight car. As the car builder does not furnish the specialties described in the schedules and is not responsible for them—only applying them to the cars—it is more convenient for him as well as for the officials of the railroad companies to have the schedules separated from that part of the specifications for which the car builder is responsible. Likewise, as a part of common standard passenger train car and locomotive and tender specifications, schedules describing specialties furnished by the railroad for such equipment are made and are bound with an index under separate cover for the same reasons. The 65 schedules for passenger train cars, consist of about 91 printed pages, and the 49 schedules for locomotives and tenders, of about 84 pages.

MATERIAL SPECIFICATIONS.

As a part of common standard specifications, the material specifications mentioned below have been printed, describing quality, workmanship or test requirements, etc., of each of the materials named. As these material specifications apply to all different types of cars or locomotives they are bound with an index in alphabetical order under separate covers to avoid the necessity of repeating this detailed information in specifications for each different type of car or locomotive.

	Frt. Cars.	Pass. Train Cars.	Locomotives.

Wheels, rolled steel, for engine and tender trucks and passenger train cars	..	x	x
Wheels, chilled cast iron	x		x

Material specifications for freight cars consist of about 40 printed pages, for passenger train cars of about 39 pages and for locomotives of 40 pages.

DRAWINGS.

To illustrate fully all details of different types of common standard equipment referred to above, the following number of working drawings have been found necessary:

For freight cars	about	1,300
For wood passenger train cars	"	800
For steel passenger train cars	"	625
For locomotives and tenders	"	1,100

These drawings are made of the following common standard outside dimensions, including border, so that they may be folded conveniently with correspondence. In the case of locomotive drawings the standard sizes used by the Baldwin Locomotive Works are followed:

For Freight Cars.	For Passenger Train Cars.	For Locomotives.
11 in. x 15 in.	11 in. x 15 in.	13¼ in. x 16¼ in.
15 in. x 20 in.	15 in. x 20 in.	16¼ in. x 22½ in.
23 in. x 30 in.	23 in. x 30 in.	19¼ in. x 23⅜ in.
	29½ in. x 41 in.	

In addition there are a few special sizes for drawings illustrating general designs, underframes and brake arrangements.

It is customary to show on each common standard car or locomotive drawing, in the upper right-hand corner, a list of each different type of car, locomotive or tender on which the device illustrated is used, and, in the upper left-hand corner of each drawing, the latest date of revision is indicated. The title and drawing number are shown in the lower right-hand corner. All common standard freight car drawings bear the prefix letter "C" in front of the number, locomotive drawings have the prefix "CA," and passenger train car drawings, the prefix "CB," for the purpose of indicating that they are common standard drawings and to what type of equipment they refer. Drawings illustrating articles referred to in any schedule bear a note referring to such schedule number. Notes are also placed on drawings, where advisable, referring to numbers of material specifications concerned.

PREFIXES TO PATTERN NUMBERS.

The following prefixes to common standard pattern numbers have been adopted and are shown on drawings illustrating articles concerned, and on patterns to designate the type of equipment on which castings referred to are used and the material of which castings are made.

Castings of	Frt. Cars	Passenger Train Cars.	Locomotives.	Maint. of Way Dept.
Cast iron	C	CB	CA	M.W.
Malleable iron	CM	CBM	CAM	M.W.M.
Steel	CS	CBS	CAS	M.W.S.
Brass	CF	CBF	CA[illegible]	M.W.F.

INDEXES OF COMMON STANDARD DRAWINGS FOR CARS OR LOCOMOTIVES.

The following are also a part of common standard specifications and are each bound under separate cover

Alphabetical index of freight car drawings	about	56	pages
Numerical index of freight car drawings	"	26	"
Alphabetical index of wood passenger train car drawings	"	79	"
Alphabetical index of [illegible] passenger train car drawings	"	51	"
Numerical index of wood passenger train car drawings	"	23	"
Numerical index of all steel passenger train car drawings	"	18	"
Alphabetical index of locomotive drawings	"	78	"
Numerical index of locomotive drawings	"	34	"

In the numerical and in the alphabetical index of common standard freight car drawings a separate vertical column is provided for each different type of car, and opposite each drawing number and title an "X" is placed in the respective vertical column or columns to indicate on which type or types of cars the details illustrated on each drawing referred to are used. In this way it is easy to see at a glance on how many and on which types of cars the articles illustrated on each drawing are required. A similar practice is followed in the case of indexes of drawings of common standard passenger train cars and locomotives. Numerical indexes of drawings also show the latest date of revision of each drawing.

SUPPLEMENTS TO SPECIFICATIONS AND REVISED DRAWINGS.

As it becomes advisable from time to time to revise specifications, material specifications, schedules or indexes of drawings, supplements thereto numbered and dated are issued, and when such supplements become too voluminous, the entire specifications, etc., are reprinted to include all corrections and additions and are given a new date. New or revised drawings are likewise made and distributed whenever changes or revisions are authorized.

DISTRIBUTION OF MECHANICAL DEPARTMENT DRAWINGS, SPECIFICATIONS, ETC.

Copies of common standard specifications and drawings of cars and locomotives, or any supplements or revisions of same, when issued, are distributed to the Director of Maintenance and Operation of the Union Pacific and Southern Pacific, to the general manager and superintendent of motive power of each associated line; and to the inspection bureau. Sufficient copies are also sent to the Director of Purchases for distribution at the same time to car or locomotive builders who may be asked in future to submit bids, so that when it is desired to order new equipment, prices can be obtained, orders placed and construction work commenced with the least possible delay.

In distributing such drawings it is customary to send negative prints to each superintendent of motive power and to the car or locomotive builders who may be successful bidders, to enable them to reprint from these negatives whatever additional white or blue prints may be needed by officials of their company or in their shops. The manufacturers of any common standard specialties are supplied with copies of schedules and negative prints of each common standard drawing referred to in the schedules describing the articles to be furnished by them, so that from these they may easily provide such additional copies as are needed by their employees, for reference in connection with orders or correspondence. Local purchasing agents are also furnished with copies of these schedules and drawings referred to therein, so that they have this information for reference in placing orders under agreements made with the manufacturers by the Director of Purchases.

OTHER ADVANTAGES OF DEFINITE SPECIFICATIONS FOR CARS AND LOCOMOTIVES.

In having definite and detailed specifications for cars and locomotives, which do not change very much from year to year, there are two other important advantages. One of these is that where a car or locomotive builder has once built equipment to these specifications he will have on hand most of the necessary dies, templets, patterns, etc., for use in duplicating such equipment, without incurring as much additional expense or delay as would be involved if entirely different designs of cars or locomotives were ordered from year to year. The other advantage is that having bought cars and locomotives under similar specifications for several years it is not difficult at any time for the railroad's representative to determine at what price it is fair to ask builders to furnish similar cars or locomotives, considering general conditions.

COMMON STANDARD PARTS USED WHERE PRACTICABLE IN REPAIRING OLD EQUIPMENT.

Wherever possible, common standard parts are used in making repairs to old equipment which was not originally built in accordance with common standard specifications. If this is not practicable, of course whatever is necessary must be purchased.

COMMON STANDARD CARS, LOCOMOTIVES AND RAILS PURCHASED.

Since the adoption of common standard specifications 1,140 locomotives, 459 passenger train cars and 31,845 freight cars have been built in accordance therewith and 860,000 gross tons of rails have been purchased.

MAINTENANCE OF WAY DEPARTMENT STANDARDS.

The following examples will illustrate how some of the articles purchased for the Union Pacific and Southern Pacific have in like manner been standardized by the maintenance of way and operating departments.

Common standard specifications have been prepared for

Angle bars	Steel rails
Battery material	Screw spikes
Chloride of zinc	Storage batteries
Creosote	Ties
Frogs, switches and crossings	Track bolts and nuts
Nut locks	Track spikes
Paint	Tie plates, rolled steel
Steel railway structures	Wire, rubber insulated copper signal

Common standard drawings have been prepared to illustrate fully all details of the following, which are supposed to include sufficient varieties of sizes and kinds of the articles mentioned to meet the requirements for new work in the near future of any of the associated lines, or for maintenance, where such standards are applicable:

Brackets, pins, cross arms and glass insulators for signal installations.
Bridges, single track:
  Deck girders, 20 ft. long.
  Deck plate girders, 30, 40, 50, 60, 70, 80, 90 and 100 ft. long.
  Through plate girders, 30, 40, 50, 60, 70, 80, 90 and 100 ft. long.
  Through riveted spans, 100, 110, 125, 140 and 150 ft. long.
  Through pin connected spans, 150, 160, 180 and 200 ft. long.
Bridges, double track:
  Through plate girders, 50, 60, 70, 80 and 90 ft. long.
  Through riveted spans, 100, 110, 125 and 140 ft. long.
  Through pin connected spans, 150, 160, 180 and 200 ft. long.
Steel deck turntable, 80 ft. long.
Frogs:
  Rigid frogs, No. 6 — 9 ft. long.
    No. 7 — 10 "
    No. 9 — 12 "
    No. 14 — 18 "
  Spring rail frogs, No. 10 — 15 ft. long.
    No. 12 — 16 ft. 6 in. long.
  Crossing frogs, when angle of crossing is less than 27 deg.
    when angle of crossing is 27 deg. or larger.
Guard rail with adjustable clamp.
Nut locks.
Rails:
  Common standard section steel rail, weighing 90 lbs. per yd.
  Common standard section steel rail, weighing 75 lbs. per yd.
Rail joints:
  Continuous rail joints, 27 in. long, with 4 bolt holes, weighing 86 lbs. per pair for 90-lb. rail.
  Continuous rail joints, 27 in. long, with 4 bolt holes, weighing 76 lbs. per pair for 75-lb. rail.
  Insulated continuous rail joints, 26 in. long, with 4 bolt holes, weighing 86 lbs. per joint for 90-lb. rail.
  Insulated continuous rail joints, 26 in. long, with 4 bolt holes, weighing 75 lbs. per joint for 75-lb. rail.
Split switches:
  10 ft. long, not insulated and insulated.
  15 ft. long, not insulated and insulated.
  24 ft. long, not insulated and insulated.
  20 ft. long, Wharton switch.
Steel water tanks and supports:
  65,000 gal. capacity for cold climates.
  65,000 gal. capacity for mild climates.
Screw spikes, $^{11}/_{16}$ in. x $5\frac{1}{8}$ in.
Semaphores:
  High semaphore with signal.
  Station semaphore signal.
Switch stands, high and low.
Track bolts and nuts, $\frac{3}{4}$ in. x $4\frac{1}{2}$ in. and $\frac{7}{8}$ in. x $4^{5}/_{16}$ in.
Track spikes, $^{9}/_{16}$ in. x $5\frac{3}{8}$ in.
Tie plates.
  Flat bottom, rolled steel, $^{7}/_{16}$ in. x 8 in. x $8\frac{3}{4}$ in., weighing 6.6 lbs. each, for use with 90-lb. rail.
  Flat bottom, rolled steel, $^{7}/_{16}$ in. x 8 in. x $8\frac{1}{2}$ in., weighing 6.4 lbs. each, for use with 75-lb. rail.
Taper rails, for connecting heavy with lighter rails.

DISTRIBUTION OF MAINTENANCE OF WAY DEPARTMENT DRAWINGS AND SPECIFICATIONS.

Copies of maintenance of way department common standard drawings and specifications, or any supplements or revisions thereof, are distributed to the Director of Maintenance and Operation; to the general manager, chief engineer and local purchasing agent of each associated line, and to the inspection bureau. Copies are also sent to the Director of Purchases for distribution to manufacturers who may be asked to submit bids in regard to furnishing the devices referred to. In distributing such drawings it is customary to send negative prints to each chief engineer and to each manufacturer, with whom the associated lines may have an agreement in regard to furnishing the articles illustrated on such drawings. This enables them to print whatever additional white or blue prints are needed by officials of their company or in their shops.

COMMON STANDARDS ADOPTED ON MANUFACTURERS RECOMMENDATIONS.

Besides the common standards already referred to, for which the railroads have prepared their own specifications and drawings, a number of other articles have been adopted as common standard by accepting the specifications, descriptions, drawings or illustrations offered by some manufacturer, and making an agreement with him to furnish such of these as the associated lines require or may desire to purchase. In such agreements the manufacturer recommends, in a manner satisfactory to the railroad's representative, what he thinks will be most suitable for use as common standards for all ordinary requirements and conditions, bearing in mind the advisability of having as few varieties of sizes and kinds as is consistent with good practice.

The following are examples of some of these articles:

Car seals and ratchet seal presses	Replacers, car and engine
Electric lamps, incandescent	Rubber bands,
Erasers, rubber and steel	Safes and vault doors
Fusees and torpedoes	Scales
Hand cars, push cars and track velocipedes	Soap
Inks and adhesives	Soda ash
Jacks	Signal material, mechanical interlocking
Lamps, engine and coach tail	Signal material, automatic block
Lamps, switch and semaphore	Storage cells for signal work, gravity zincs and coppers for same, battery connectors and lightning arresters.
Lanterns, hand	Telegraph and telephone line material and pole equipment
Mail cranes	Track tools
Nut and bolt fasteners	Tracing cloth, blue print paper, profile and drawing paper, etc.
Oil, illuminating, signal, lubricating, fuel, gasolene, etc.	Trucks, warehouse and baggage
Padlocks and keys for signal work	Typewriters, covers, ribbons, etc.
Padlocks and keys for switches	Wire rope
Pantasote	Wire, barbed and plain, and telegraph, telephone and signal pulling
Pens	
Penholders	
Pencils and pencil point protectors, timber crayons, etc.	

STATIONERY FORMS.

By conferences between representatives of the department concerned of each of the associated lines a very large number of stationery blanks, envelopes, blank books, etc., have been standardized as to quality, weight and size of paper and as to printed matter thereon. Thus the variety of these forms and papers heretofore used by all the associated lines has been greatly reduced and the arrangement of the blanks, quality of paper, etc., have been more intelligently suited to their purpose. Samples of each of these blanks as finally adopted with estimates of quantities of each required annually have been furnished to a number of the largest printing establishments for the purpose of securing bids.

Based on the most favorable propositions received, agreements have been made with certain printers covering specified blanks, whereby similar forms used by the associated lines are purchased from the same printer. Most of these agreements for stationery forms, etc., have been made to continue without expiration until a certain number of months notice by either party to the other, with the understanding that if the railroad companies cancel the agreement or change any of the forms referred to, they will take off the printer's hands all stock of such forms as he may have at the time, up to a maximum of one year's estimated requirements. This enables the printer to print forms in large quantities, and therefore economically. It is stipulated that when the printer's stock of any particular form becomes low he shall receive proper authority from the General Stationer of the associated lines as to what changes, if any, are to be made before the next supply of such forms is printed. If changes which involve increased or decreased cost are ordered in any forms, and these cannot be adjusted to mutual satisfaction, new bids on such revised forms are asked for, and new agreements or supplements to existing agreements are made accordingly.

These stationery forms, etc., are divided into three classes: Common standard forms, of which there are now about 600 different kinds, which are identical for all of the associated lines; standard forms, of which there are now about 500 different forms or 2,000 blanks, which are identical for all the associated lines, except as regards the name of the railroad company or titles of officials, etc.; and local forms, which are used by one line only, to meet local conditions.

PURCHASING AGENCIES.

The lines composing the Union Pacific and Southern Pacific systems have a Director of Purchases located at New York City, and seven local purchasing agents at different important points on the systems.

AGREEMENTS MADE BY DIRECTOR OF PURCHASES.

New cars, locomotives, miscellaneous equipment, rails and a few other supplies of importance are ordered by the Director of Purchases direct from the builders or manufacturers after securing competitive bids in each case, and copies of all such orders placed are sent to the various officials concerned. Continuing agreements with manufacturers, on behalf of all the associated lines are made by the Director of Purchases, covering the purchase of many articles, especially those heretofore mentioned, for which common standard specifications or drawings have been adopted. Copies of all such agreements are forwarded to the Director of Maintenance and Operation, to each general manager, local purchasing agent, and to the head of the department concerned of each associated line. Based on these agreements, the local purchasing agents may send their orders direct to the manufacturer, as soon as they receive requisitions, without having to waste further time or labor in correspondence regarding specifications, prices, etc.

Much labor can be saved and better results can usually be obtained by having one central agency negotiate such agreements, which can be used by all of the associated lines, rather than by obliging each local purchasing agent, who is not so well equipped or so well located for the purpose and has not so large a volume of business to offer, to act independently.

SUPPLEMENTS TO AGREEMENTS.

In case it is necessary from time to time to revise existing agreements, supplements to these are made and distributed to all concerned. Each agreement is given a different number and each supplement is numbered in numerical order for purposes of reference.

SLIDING SCALE AGREEMENTS.

In making agreements with manufacturers it has been found most satisfactory, where practicable, to have the price of the finished articles purchased based on the average price of the raw material from which such articles are produced, as quoted say every three months in the most reliable trade journal, with the understanding that when the price of any finished article has once been agreed to, such price will thereafter automatically fluctuate in some fair proportion with the price of the raw material:

For instance:

The price to be charged for the following articles on orders placed by the Railroad Companies with the manufacturer during each quarter of any calendar year during the term of the agreement.	May be based with proper differentials on the average price of the raw material mentioned below, as quoted in the most reliable trade journal during the month or quarter immediately preceding the quarter of the calendar year in which the finished material is ordered.
Boiler tubes, dry pipes, safe ends, water grates and arch pipes. Firebox steel. Castings, steel and malleable iron. Castings, gray iron. Steel or iron forgings, for locomotives, rough or finished. Rail joints. Stay bolt and boiler brace iron. Screw spikes. Track spikes. Track bolts and nuts. Wheels, rolled steel.	Average price per gross ton of Bessemer pig iron at Pittsburgh, Pa.
Brake-beams. Truck bolsters, if made of rolled steel.	Average price per 100 lbs. of beams and channels at Pittsburgh, Pa.
Axles, steel, for cars or locomotives.	Average price per net ton of steel forging-billets at Pittsburgh, Pa.
Tie-plates, rolled steel.	Average price per gross ton of Bessemer steel billets at Pittsburgh, Pa.
Steel plates, merchant steel bars, steel angles, tees, channels and beams.	Average price per 100 lbs. of steel plates, merchant steel bars, steel angles, channels and beams at Pittsburgh, Pa.
Switches, frogs and crossings frogs, and repair parts for same.	Price of steel rails per gross ton f. o. b. Chicago, as quoted by the Illinois Steel Co., and price per 100 lbs. of steel bars at Pittsburgh, Pa.
Guard rails with adjustable clamp. Taper rails.	Price of steel rails, as above.
New cast-iron car wheels and credit to be allowed for scrap wheels.	Average price per net ton of scrap cast iron car wheels f. o. b. Chicago.
Springs, elliptic and coil.	Average price per net ton of spring steel in 1,000 ton lots at Pittsburgh, Pa., as quoted by the Carnegie Steel Co.
Steel wire nails.	Average price per pound of steel wire nails f. o. b. Pittsburgh, Pa.
Wire: Barbed and plain; telegraph.	Average price per pound of plain fence wire f. o. b. Pittsburgh, Pa.
Box car metal roofs.	Average price per pound of galvanized iron sheets f. o. b. Pittsburgh, Pa.
White lead and red lead.	Average price per pound of refined corroding pig lead, in 50 ton lots at St. Louis, Mo., as quoted by the American Smelting & Refining Co.
Babbit metal. Car seals.	Average price per pound of desilverized refined pig lead in 50 ton lots at New York, as quoted by the American Smelting & Refining Co.
Journal bearings and brass castings and credit to be allowed for scrap brass, etc. Safety valves. Locomotive whistles.	Average price per pound of casting copper f. o. b. New York, as quoted on the New York Metal Exchange.
Gravity coppers.	Average price per pound of Lake copper at New York.
Gravity zincs.	Average price per pound of spelter at St. Louis, Mo.
Rubber insulated copper wire.	Average price per pound of Lake bar copper in 25 ton lots f. o. b. New York, and average price per pound of up-river fine Para new rubber, f. o. b. New York
Manilla rope.	Average price per pound at New York of current spot manilla hemp and good current spot manilla hemp.
Creosote.	Average price of creosote as quoted in London, England.

[illegible]aples show how it is often practicable to make agreem[illegible]n large consumers and producers, so that when mutual[illegible]ory prices have once been agreed to, some fair auto[illegible]thod can be used whereby prices will adjust themselves [illegible]re conditions with as little unnecessary labor and friction possible. Such a sliding scale basis mutually protects the purchasers and sellers, and in agreements extending over long periods avoids disputes and arguments as to how prices should be fairly adjusted when general conditions change. For the protection of the railroads a clause is embodied in nearly all such agreements, stating that in case the manufacturer at any time quotes lower prices on similar articles to any of his other customers he will likewise reduce prices to the railroads mentioned as regards orders they may place with him during the months in which he may have made lower prices to any of his other customers.

About one-quarter of all the continuing agreements thus far made by the Director of Purchases have had prices based on a sliding scale.

AGREEMENTS BASED ON FIXED PRICES.

In many cases, especially those in which labor is very much the largest item of expense, it may not be practicable to base prices on any sliding scale. In such instances agreements are made with the manufacturers at the lowest fixed prices that can be arranged, and the clause referred to above is inserted whereby the manufacturer agrees that, should he quote lower prices to other customers, he will reduce his price correspondingly to the railroads mentioned.

CONTINUING AGREEMENTS.

In order to avoid unnecessary labor, the agreements have been made, in nearly all cases, to continue without expiring until a certain number of months' notice by the railroads to the manufacturer or until two or there or more times as much notice to the contrary from the manufacturer to the railroads. In agreements covering patented devices, clauses have been inserted to protect the railroads as regards adverse claims that may be made on account of patents or royalties. As a rule, the railroads make such agreements to extend as long as they desire to use such patented devices as standard, reserving the right to cancel them by giving reasonable notice and to adopt other standards, if articles of sufficiently greater merit are offered to justify a change.

COMPANIES INCLUDED IN AGREEMENTS

In making agreements between manufacturers and the Union Pacific, Oregon Short Line, Oregon Railroad & Navigation Company, and Southern Pacific Company, it has been customary to arrange so that any of the present or future associated or proprietary companies of any of the railroad corporations named may be considered a party to these agreements if so desired.

AGREEMENTS WHICH ARE PRACTICALLY QUOTATIONS FROM MANUFACTURERS.

At times large manufacturers have made propositions to the Director of Purchases, quoting very favorable prices and other terms at which they would be willing to furnish certain materials to any of the associated lines until six months or one year's notice from the manufacturer to the representative of the railroads to the contrary. In submitting these quotations, the manufacturers have fully described and illustrated, if necessary, exactly what they proposed to furnish. Where the Director of Purchases has felt it advisable he has accepted these propositions on behalf of the associated lines, with the understanding that such agreements do not in any way obligate the railroads, except as regards orders they may choose to place with the manufacturer. Copies of these propositions have then been forwarded to officials concerned for their information and files. It is customary to have only one such proposition, covering the same kind of material, in effect at the same time.

Some examples of articles covered by such agreements are:

Asbestos pipe covering, magnesia, lagging, etc.
Carbon paper
Carriage and machine bolts, nuts and lag screws.
Glass.
Paint brushes.
Paper, roofing and building
Patented flange unions, ells, tees and other fittings.
Rivets, nuts and washers.
Tools, pneumatic; air compressors, air hoists, etc
Varnish.

ARTICLES WHICH CAN BE PURCHASED LOCALLY TO JUST AS GOOD OR BETTER ADVANTAGE THAN BY A CENTRAL PURCHASING AGENCY.

Besides those above-mentioned, there is, of course, an immense variety of staple or miscellaneous materials and supplies purchased by the railroads for distribution to many different points, some of which articles it may not be especially important to describe by definite specifications, or to illustrate by detailed drawings. Such supplies are, for instance, groceries, hardware, pipe and fittings, machinery and tools, drugs, dry goods and a great many other kinds of miscellaneous material.

Many of these supplies are carried in stock by local jobbers, who buy them from the manufacturers in larger lots than the railroads would buy, and, therefore, often to better advantage, and who can obtain the benefit of carload rates of freight from point of manufacture, which the railroads might not receive. On bids received from time to time from local jobbers, who can usually ship promptly out of stock, such articles can ordinarily be purchased by local purchasing agents to as good or better advantage than a central purchasing agency could buy them direct from the manufacturers in small quantities. Where such conditions exist, it is, of course, preferable for the railroads to stimulate local business by favoring the local jobbers who probably ship freight over their lines.

Such supplies as fuel lumber, timber, ties, fence posts telegraph poles, piling brick, lime cement etc., which form very large items of a railroad's consumption, can ordinarily be purchased by Local Purchasing Agents, or their representatives, from local sources to better advantage than they could be bought by any central purchasing agency for several different lines of railroad, if spread over a wide range of territory.

SUMMARY.

The examples previously mentioned refer to some of the different articles which have been adopted as common standard by the various lines of the Union Pacific and Southern Pacific systems, the purchase of which has been covered by agreements made by one central purchasing agency. Based on these agreements, the local purchasing agents of each of the associated lines may place orders direct with manufacturers. As fast as the officials of the mechanical, maintenance of way or operating departments adopt additional articles as common standards, and prepare the necessary specifications and drawings, new agreements covering the purchase of these articles are made in the same way.

The most important items, have, no doubt, already been standardized and covered by such agreements, but this policy has proved so successful and satisfactory to all concerned that the list of common standards will constantly increase, and new agreements in regard to the purchase of these articles by the various lines will continue to be made, as long as the associated lines are allowed to co-operate in such matters. Such methods of intelligent co-operation benefit not only the railroads, but also the general public because they tend to establish more efficient, safer and more economical standards of railroad practice throughout the world.

The following remarks by I. O. Rhoades, General Purchasing Agent at San Francisco, of the Southern Pacific Company, Pacific System, indicate the methods which may be used by an individual railroad in ordering, receiving and disbursing material purchased in accordance with agreements and standards referred to above, and some further benefits derived from such practice:

"When copies of these agreements are received in the office of the local purchasing agent, an abstract of such information as it is desirable to furnish, including references, if necessary, to common standard schedules, material specifications and drawings, is sent to the heads of the departments ordering, receiving and using the articles in question. This information is then forwarded by the general storekeeper to each division storekeeper concerned, and by the latter to the foreman in charge of such material. These officials are thus advised in regard to proper description of the standards adopted.

"For the purpose of facilitating the ordering, receiving, storing and shipping of different materials, they have been classified under the following 21 headings, and instructions have been given that separate requisitions must be made when materials from different sections are asked for."

Sectional Arrangement of Material in Storehouses.

Section.	Description of Material.
1.	Maintenance of way material, steam shovel parts, hand car, motor car and velocipede parts.
2.	Bolts, nuts, rivets, lag screws, washers, etc
3.	Sheet iron, brass, copper, zinc, lead, Eng. bars, springs, tubing, chain, wire rope, jack screws.
4	Boiler and firebox steel, steel tank ends, flues, pipe, bar iron, bar steel, piston rods.
5	Boiler lagging, pipe covering, nails, carbide, shovels, rope, building paper, wire staples, handles, etc.
6.	Finished and rough brass, pig metals, etc (Except journal bearings.)
7.	Air brakes, lubricators, injectors, automatic sanders, steam heat equipment, Pintsch and acetylene gas material, electric head light parts.
8.	Car trimmings and fixtures, shelf and building hardware, small tools, metal piston and valve stem packing
9.	Water service material, pipe fittings, globe, angle and gate valves, etc.
10.	Upholstering material, etc.
11.	Glass, brushes, painters' supplies, paints in packages
12.	Belting, hose, packing, rubber and leather goods
13.	Station and train supplies, lamps, lanterns, chairs, glassware, tin ware, etc
14.	Castings (rough iron and steel), except car castings.
15.	Car castings and forgings, journal bearings, bolsters, brake beams, car trucks, car bolts, couplers and parts, train chains, stoves and parts.
16.	Wheels and axles (mounted and unmounted) tires, centers, front ends, cylinders, etc
17.	Lumber, all kinds (rough and finished)
18.	Fire clay, brick, cement, coke, charcoal, Smithing and Blossburg coal.
19.	Oils, waste, grease, varnishes, candles, etc
20.	Signal, telegraph, telephone, interlocking and electrical material.
21.	Scrap, all kinds.

"A foreman is placed in charge of each section of material. When he orders, receives, cares for and issues material for his particular section, he becomes more of an expert on that class of material than if he, with others, attended to a greater variety of supplies.

"In order to have duplicate stocks at as few points as necessary for economy and convenience, it has been arranged to carry some classes of material only at certain stores. For example, track tools, signal, lighting and electrical material, piling, ties, lumber for track and bridges are carried on hand at West Oakland, Cal., for territory north of Tehachapi, and at Los Angeles for territory south and east of Tehachapi, instead of at every store on the Southern Pacific system. This systematizes and classifies the business, saves double hauling, handling and expense. A printed pamphlet has been distributed showing what divisions and what shops each store supplies, and to which storekeeper requisitions for certain kinds of material should be sent. This pamphlet also contains a list of about 1,000 different articles or kinds of material which may be asked for from time to time and shows what information should be furnished in ordering each of these, and whether they should be ordered by the pound, foot, ton, gallon, number, etc., and to what section of material, referred to above, they belong. A list of standard catalogues, to which frequent reference may be made on requisitions, is also given. In this manner much necessary detailed information is supplied to persons ordering receiving and using material. This enables them to know how it should be described on requisitions, what names and references should be given and how it should be properly checked when received.

"Under the old system material was ordered in many different ways: Wire by the foot, pound, miles, bundles, coils, tons, etc. Other material would sometimes be ordered by feet, number of pieces, carloads; or again by gallons, pints, barrels, cans, etc. Nearly all material is now ordered in one way by the individual making the original requisition, and by the store and purchasing departments. Heretofore, there was not so much uniformity of names for the same articles as at present. One man would make a requisition giving a thing a certain name, while someone in another department would call it something else. In this way a large amount of time, labor, expense and correspondence was consumed by the store or purchasing department in endeavoring to ascertain exact details. Even after all this trouble, occasionally the wrong article would be shipped, only to be returned to the store department and the work repeated. Much of this was due to the fact that often no reference was given to a drawing or schedule, or to the exact type of car, engine or other device, for which the article was required. There were also so many different kinds of brake-beams, hand-cars, lubricators, car trimmings, switch lamps, tail lights, lanterns, bolsters, forgings of all kinds, etc., that there was frequent liability of error and often great delay in obtaining definite information for requisitions.

"Under the present system of adopting and maintaining definite standards, this labor is being reduced. The foreman in charge of each section of material, and others who handle requisitions know not only what the common standards are, but also how to order them properly and check them when received. Although the saving in labor and expense by such practice cannot be expressed in dollars and cents, it is easily apparent to those who handle the material in question.

"One of the greatest objections to constant changing or unnecessary varieties of standards on a railroad, is the fact that for nearly every standard introduced, more or less special extra parts must ordinarily be carried in stock for purposes of repairs. Thus, if a railroad has three or four different makes of hand-cars in service it will be necessary for them to carry in stock repair parts worth two or three times as much as though they followed the policy of ordering only one make of hand-car in accordance with definite plans and specifications. It would be possible to cite many other similar examples of how the expense of maintaining many articles during their existence exceeded several times their original cost. The use of unnecessary varieties adds enormously to the amount of repair parts to be carried in stock at many points, and to the time such equipment or devices are apt to be out of use undergoing repairs.

"Before the adoption of common standards on the present extensive scale, foremen of different departments, following their own ideas or experiences, ordered many more classes and kinds of material than they do now. While one man would think a certain article was better than all others, another would think just the opposite; whereas, if a certain article is better on one division, all things considered, it should in most cases be entirely satisfactory and suitable elsewhere. For instance, at one time there were about 65 different kinds of packing furnished. This has now been reduced to 12. The indiscriminate purchase of many different kinds of equipment and other devices and supplies and the excessive amount of labor and expense involved in maintaining unsuitable and poorly chosen standards, is a matter to which most railroads could well afford to pay more attention than they have done heretofore.

"Many railroads find that they are constantly accumulating a large amount of material, which soon becomes obsolete and valueless except as scrap, although for some time they may carry it on their books at cost price. If more care is taken to maintain intelligent and definite standards, especially for articles purchased in large quantities, with the understanding that they will only be changed for good and sufficient reason, railroad companies will find that the accumulation of this obsolete material thereafter will be insignificant. At least such has been the experience of the Union Pacific and Southern Pacific."

GENERAL NEWS SECTION

NOTES.

The Chicago & North-Western has a gasolene motor car, leased from the Union Pacific, and is running it between Beloit, Wis., and Janesville, 14 miles.

The Pennsylvania Railroad announces that its Fifth avenue ticket office in New York City will henceforth be kept open until 10 p.m., including Sundays.

At White Plains, N. Y., last Monday, a jury brought in a verdict of $32,400 in favor of a woman who was injured in the derailment of the New York Central at Williams Bridge, in February, 1907.

A summary of 1,258 surprise tests on the Union Pacific and Southern Pacific for the month of March shows an efficiency percentage of 98.8 for the enginemen. The violations were not of a kind that would have caused serious accidents.

President Roosevelt has signed the Employers' Liability bill, which was passed by congress, April 9 (*Railroad Gazette*, April 17, page 552). Attorney-General Bonaparte advised the President that the bill was a sound one, having decided that it does not contain unconstitutional features, as had been asserted.

The Duluth, Rainy Lake & Winnipeg is to establish a through freight route between Duluth and Winnipeg. It will be over the Duluth, Missabe & Northern to Virginia, from that point to Ranier, over the Duluth, Rainy Lake & Winnipeg and from the Canadian boundary to Winnipeg, over the Canadian Northern. The bridge at Ranier, over the Rainy river, is about finished.

The New York State Court of Appeals has decided in favor of the New York City Railway a suit in which that company was prosecuted for a penalty for refusing to give a free transfer to a passenger who had paid a five-cent fare. The law requires the company to carry, for a single fare, to any point on its line, every passenger who boards its cars; but in this case the passenger rode south on Third avenue, westward on Chambers street, and then north on West Broadway; and the court sustains the company in limiting the transfer privilege to a continuous trip in one general direction.

By the extension of the Manhattan (New York) subway to Flatbush avenue, Brooklyn, the opening of which is announced for May 1, Jamaica, N. Y.; Garden City, Hempstead and other towns in that vicinity are brought within 35 to 45 minutes of Trinity Church—that is to say, of the corner of Broadway and Wall street, Manhattan. The extension of the subway under the East river, from Bowling Green to the Brooklyn Borough Hall, which has been in operation for the last four months, is now finished about three-quarters of a mile further to a connection with the Long Island Railroad, and is to be opened as before stated. Between the Flatbush avenue terminal and Jamaica, 10 miles, the Long Island Railroad is a four-track electric line, traversed by frequent trains, and by May 15 it is expected that the electric service will be extended to Hempstead, 10 miles beyond Jamaica.

Place Names on the North-Western Line.

A history of the origin of names of places in the states through which the Chicago & North-Western and the Chicago, St. Paul, Minneapolis & Omaha pass has been compiled by one "who for more than 34 years has been an officer in the employ of this company." Great pains have been taken to get all the information that the oldest inhabitants had in regard to the origin of names of the towns and cities, but the compiler has, as he tells us, ruthlessly disregarded local legends and travelers' stories. "While it is true that the investigations of the writer have shattered many pretty romances, it is not unlikely that others have escaped his notice and may yet be handed down as history." The most interesting feature in the history of place names, especially those with Indian origin, is the evolution of the spelling. Wyoming is a corruption of the Delaware Indian word Maugh-wa-wa-ma, meaning large plains. Chicago has been spelled Tzschago, Psceschaggo and Tschakka. It is thought to have meant river of garlic. Wherever possible the writer has given a short account of places historically interesting.

Control of Coal Mines in Oklahoma, Utah and Wyoming.

The Interstate Commerce Commission has reported to the Senate, pursuant to a joint resolution adopted on March 7, 1906, on alleged discrimination and monopolies in coal and oil. The report is the third on this subject. It affirms that the coal supply of Oklahoma, Utah and Wyoming is almost entirely in the control of a somewhat complex monopoly, consisting primarily of the Pleasant Valley Coal Company, which is owned by the Utah Fuel Company, a New Jersey corporation, with a capital of $10,000,000, this being owned in turn by the Rio Grande Western Railway, which is itself owned by the Denver & Rio Grande. All these roads are part of the Gould system.

The report charges that extensive frauds have been perpetrated by the Pleasant Valley Coal Company to acquire coal lands, which have been entered upon by "dummy" entrymen, and that the company has thus obtained all the coal lands worth having in its vicinity. Of 109 coal land leases in Oklahoma, 58 were controlled by railroads, and it is declared that the railroads, through the manipulation of cars and other methods, forced all the owners of leases into a combination known as the McAlester Fuel Company. As a result of this combination the price of coal in Oklahoma City, 120 miles from the mines, was forced up to $7 and $7.50 a ton. It does not appear that the officers of the Union Pacific Railroad have ever been personally interested in the development of any coal property, or that they have ever benefited from operations in coal along the line of that road, but the Union Pacific Railroad Company does absolutely dominate the mining, transportation and selling of coal along its line.

Chicago Agreement Under the 16-Hour Law.

Following is the agreement made at Chicago, April 19, between the general managers of thirty-two western railroads and representatives of the brotherhoods in the matter of interpreting the 16-hour law. The roads entering into the agreement are all those leading west from Chicago (except the Chicago Great Western and the Wisconsin Central) and the Illinois Central, the Missouri Pacific, the Northern Pacific, the Union Pacific, the Texas & Pacific and those allied with these.

Article 1. Under the laws limiting the hours on duty, crews in road service will not be tied up unless it is apparent that the trip cannot be completed within the lawful time, and not then, until after the expiration of 14 hours on duty under the Federal law, or within two hours of the time limit provided by state laws, if state laws govern.

Art. 2. If road crews are tied up in a less number of hours than provided in the preceding paragraph, they shall not be regarded as having been tied up under the law, and their services will be paid for under the individual schedules of the different roads.

Art. 3. When the road crews are tied up between terminals under the law, they shall again be considered on duty and under pay immediately upon the expiration of the minimum legal period off duty applicable to the crew, provided, the longest period of rest required by any member of the crew, either eight or ten hours, shall be the period of rest for the entire crew.

Art. 4. A continuous trip will cover movement straightaway or turn around, from initial point to the destination train is making when ordered to tie up. If any change is made in the destination after the crew is released for rest, a new trip will commence when the crew resumes duty.

Art. 5. Road crews tied up under the law will be paid the time or mileage of their schedules from initial point to tieup point. When such crew resume duty on a continuous trip they will be paid miles, or hours, which ever is the greater, from the tieup point to the next tieup point or to the terminal. It is understood that this article does not permit crews to be run through terminals unless such practice is permitted under their schedules.

Art. 6. Road crews tied up for rest under the law and then towed or deadheaded into terminal, with or without engine or caboose, will be paid therefor, as per Art. 5, the same as if they had run the train to such terminal.

Art. 7. If any service is required of an engine crew, or if held responsible for the engine during the tieup under the law, they will be paid for all such service.

Art. 8. The foregoing articles constitute an agreement for the above named campanies and their conductors, trainmen, engineers and firemen as to runs that are tied up in conformity with the law, and become a part of the schedules or agreements of these roads and subject to their provisions as to amendment by mutual consent. Nothing herein contained shall be construed to amend or annul any rule in the various agreements with individual roads.

Disastrous Collision at Maltrata, Mex.

Press despatches of April 25 report a butting collision between a freight train and an excursion passenger train, on the 24th, on the Mexican Railway, near Maltrata, Mex., in which 28 persons were killed and 15 seriously injured.

Passenger Earnings Under Two-Cent Fares.

The annual report of the Cincinnati & Muskingum Valley for the year ended December 31, 1907, just issued, makes the following statement in regard to passenger earnings for that year.

"The passenger earnings were $184,876, an increase of $2,546, or 1.40 per cent. The number of passengers carried decreased 17,181, or 2.95 per cent., with an increased passenger mileage of 242,615 miles, or 2.82 per cent., and a decrease in passenger train mileage of 1.15 per cent. The earnings per passenger mile were 2.05c., caused by an increase in the mileage of passengers carried under the two-cent maximum rate, as compared with the previous year, the new law being in effect only during the last nine months of 1906. The expenses per passenger per mile were 2.92c., an increase of .03c., due to increased rate of pay and increased cost of materials. There was a consequent loss per passenger per mile of .87c., an increase of .05c."

This should be compared with a similar statement for the Grand Rapids & Indiana, which was published in the *Railroad Gazette* of April 17 page 527.

Shaw Wrecking Crane.

The 100-ton steam wrecking crane shown in the accompanying photograph was recently built by the Shaw Electric Crane Co., Muskegon, Mich., and sold through Manning, Maxwell & Moore, New York, to the Illinois Central. An important feature in the design is the location of the engine, the cylinders being placed well back toward the rear, instead of toward the front of the crane. The piping is thus short and direct and is out of the way of the machinery and the engineer. The steam pipe branches at the throttle, the pipes passing down at each side, just in front of the coal bin and the water tank, to the engine cylinders. The exhaust pipes go back underneath and then up to the separator on the back of the boiler, from which the exhaust steam passes to the stack through tubes inside of the boiler. These pipes are thus entirely out of the way and are protected from shocks that may cause deflection, and from the vibration of that part of the frame carrying the boiler. This position of the engine makes it possible to put the side frames farther apart and keep the machinery low, so that the center of gravity is lower; also, the engineer can get a good view of the work without being in a dangerous position. The passage for the engineer to and from the cab on both sides is unobstructed.

In addition to the usual hand brakes on the main and auxiliary hoists, steam brakes are also used on them. The auxiliary hoist has 20 tons capacity using a single line, and 40 tons with one sheave. Parts of the main and auxiliary hoists are interchangeable; these include: clutches, all brake parts, gears, shafts, drums and ropes. The design of the jib is different from past practice. The combination of bending and compression strains is avoided and the structure is lighter and stiffer. The engines are provided with the Walschaerts valve gear. Features of the steam generator are: forced draft, telescoping stack, shaking and dumping grates and dumping ash pan. The boiler tubes are so arranged that the crown sheet may be easily cleaned. There is a dry pipe, and particular attention has been paid to getting dry steam under the worst conditions.

Steam Wrecking Crane; Shaw Electric Crane Company.

The crane is self-propelling, one axle of each truck being driven by gears in such a way as not to interfere with the free movement of the truck. There is friction drive in the gearing to compensate for unequal diameters of wheels. The center and side bearings are self-lubricating, so that the crane can take sharp curves without the danger of derailment which is common on self-propelling cranes when there are rigid pedestals carried by the car body. Since the car is driven from both trucks, it travels equally well with the load suspended at either end. The car is equipped with both automatic and straight air brakes, the pipe connections from crane to car being permanent. The machine is mostly steel, very little cast iron being used.

Atlanta, Birmingham & Atlantic.

The Atlanta, Birmingham & Atlantic is carrying on important improvement work at Brunswick, Ga., where it is building and equipping freight and steamer terminals. The land for the steamer terminals it has reclaimed from the marshes, and these terminals are said to be unequaled on the South Atlantic coast for modernness and facility of loading and unloading vessels. The railroad controls the Brunswick Steamship Company, which has recently put into commission five new freight steamers running between Brunswick and New York. These steamers are built of steel and designed especially for the trade, with their engines aft to facilitate lumber loading. The Atlanta, Birmingham & Atlantic is now said to have the largest lumber business of any road in the South, and it also touches the heart of the cotton country and owns important coal and iron mines. H. M. Atkinson is president both of the railroad company and of the steamship company.

Thor No. 9 Close-Quarter Air Drill.

The "Thor" No. 8 close-quarter piston air drill, made by the Independent Pneumatic Tool Co., Chicago, was described in the *Railroad Gazette* of Jan. 25, 1907. This drill, which can work within 1½ in. of a corner, can drill up to 2 in. in diameter and can ream and tap up to 1¼ in. in diameter. To meet a demand for a similar machine for heavier work, a No. 9 machine has been produced, with dimensions as follows:

Distance, throttle connection to outside of spindle case	15⅜ in.
Distance, point of feed screw to end of socket	8⅞ "
Radius from center of feed screw to outside of case	1 5/32"
Width of case at cylinder flanges	5 3/16"
Width of case at spindle	6¼ "
Weight	31 lbs.
Speed	122 r p m.

The spindle is at one end of the tool and the motor at the other. The motor consists of two parallel cylinders at right angles to the spindle, with their center line on the center of the spindle. The pistons are double-acting and work a two-throw crank. The eccentrics are between the crank arms, the whole being one forging. The eccentrics drive balanced cylindrical piston valves, having a reciprocating motion. The air is taken in centrally between the cylinders, and the clearance between valves and cylinders is the least practicable. Geared to the crank shaft is another two-throw crank, diametrically opposed. This crank works two oscillating levers centered on the drill spindle, with their bearings around the same. These levers are provided with pawls, of about the full thickness of the lever, which work on ratchet teeth sunk in the spindle. The outer circumference, or points of teeth, leaves ample stock for the bearings of the levers. The lever-moving crank has its power stroke on the part of the revolution farthest away from the spindle. This causes a more uniform speed of the lever, with a forward pull considerably more than half a revolution, and a quick return to action. The crank being opposed, the motion of the drill spindle is practically continuous. The engine crank is not on the usual 90 deg. angle, having instead an angle of 135 deg., thus allowing both pistons to pull when the position of the levers requires the greatest power. The drill is thus partly self-regulating, with a tendency to still further govern the speed of the full revolution of the spindle. The drill has a reversible-ratchet feed mechanism, working within the width of the body of the drill. The speed and power are controlled by a poppet-valve throttle, which also acts as a handle.

INTERSTATE COMMERCE COMMISSION RULINGS.

Through Routes and Joint Rates.

Cardiff Coal Co. v. Chicago & North-Western et al. Opinion by Commissioner Harlan.

A state of facts similar to that in the case of Cardiff Coal Co. v. Chicago, Milwaukee & St. Paul et al. (see below) appeared, and the Commission declared that complainant is entitled to an order establishing through routes and joint rates to all strictly local points on the line of the Chicago & North-Western to which no through routes now exist from Cardiff.

Cannel and Bituminous Coal.

Goff-Kirby Coal Co. v. Bessemer & Lake Erie and Butts Cannel Coal Co. v. the same carrier. Opinion by Commissioner Prouty.

It was held that where the carrier has a rate on bituminous coal it should apply that rate to cannel coal. The Commission said that there is nothing in the physical attributes of cannel coal to distinguish it from bituminous coal proper; indeed, it appeared that one mine on the line of the defendant had been shipping cannel coal as bituminous without the knowledge of the defendant. The questions of reparation raised in these cases are reserved, but the Commission declared that it does not follow that because a rate is reduced for the future, damages will be allowed in all cases where that rate has been exceeded in the past.

Differentials to Wichita.

Johnston & Larimer Dry Goods Co. and Cox-Blodgett Dry Goods Co. v. Atchison, Topeka & Santa Fe and 187 other carriers. Opinion by Commissioner Prouty.

It was held that rates on cotton piece goods from Atlantic seaboard territory to Wichita, Kan., via Galveston, Tex., should not exceed $1.25 per 100 lbs. This recognizes a differential of 32 cents against Wichita, which under normal conditions and on the present basis of rates ought not to be exceeded. The Commission further held that the present rate on knit goods from Atlantic seaboard territory to Wichita via Galveston of $1.64½, producing a differential against Wichita of 26½ cents, is not unjust nor unreasonable. The order in this case was issued against only those defendants which operate via Galveston.

Jurisdiction Within Oklahoma.

Chandler Cotton Oil Co. v. Fort Smith & Western. Opinion by Commissioner Clark.

The complaint involved reasonableness of rates on shipments of cotton seed over defendant's line from Prague, Okla., to Warwick, but it was dismissed for want of jurisdiction, following the decision of the Commission in the Hussey case.

The Commission said that in all controversies before it if there is lack of jurisdiction, either from the absence of essential facts or through want of power in the statute, it is the duty of the Commission, on its own motion, to deny jurisdiction. The provision of the Act to regulate commerce applying to carriers transporting property "from one place in a territory to another place in the same territory," so far as it related to the territory of Oklahoma, expired by its own force on November 16, 1907, when Oklahoma was admitted as a state.

Rates on Live Stock from the Southwest to Chicago.

Cattle Raisers' Association of Texas v. Missouri, Kansas & Texas and 57 other carriers. Opinion by Commissioner Prouty.

The conclusions announced by the Commission in its opinion of August 16, 1905, in this case are affirmed, and the rates therein pronounced excessive are held to be still excessive and unreasonable. The rates on live stock prescribed to Chicago from the southwest are held to be sufficient to carry a delivery at the Union Stock Yards, and the imposition of any terminal charge in excess of $1 is declared unreasonable; but reparation was allowed only from August 29, 1906, when the complainant presented its petition for further proceeding under the amended Rate Law.

These advances were made during the year 1903 and were generally 3 cents per 100 lbs. In a few cases they were as high as 5 cents and as low as ½ cent. It is evident that in such instances it was the purpose of the carriers to change the relation in rates. Presumably the old relation was wrong in the opinion of the carriers and the present relation is right. If the Commission were simply to order a reduction to the original basis the present relation would be disturbed in these instances, and yet the Commission cannot well make any different order since these rates have not been specifically referred to. The better way seems, therefore, to be to allow the carriers sufficient time within which to put in rates in substantial accord with this report, and the making of an order will be postponed until July 1, 1908. The questions as to reparation are reserved and will be dealt with as specific claims are presented.

Chairman Knapp filed a dissenting opinion in this case.

The Statute of Limitations.

Missouri & Kansas Shippers' Association v. Atchison, Topeka & Santa Fe, Missouri Pacific (two cases) and Kansas City Belt. Opinion by Commissioner Harlan.

The four complaints were dismissed. The findings of the Commission were:

"A complaint by a voluntary association demanding reparation under general averments which do not name the members on whose behalf it is filed and do not with reasonable particularity specify and describe the shipments as to which the complaint is made, does not operate to stop the running of the period of limitation provided in the law; and does not give the members of the association the opportunity subsequently to come in and take advantage of the complaint by proving up their shipments, which would be barred of relief upon separate and individual complaints if then filed by themselves.

"A statute of limitations is a wise method of forcing claimants either to assert their rights against others or definitely abandon them. Persons against whom claims may be made are fairly entitled to repose at some definite point of time, and this is especially true in connection with matters of transportation. Waybills and other papers accumulate in vast numbers in the course of a few months, and carriers are entitled, if claims are to be made, to have them made with reasonable promptness.

"The universal rule in the courts, also applicable to the Commission, seems to be that, under a system of pleading which permits a proceeding for damages to be instituted by filing a complaint, the statute of limitations does not cease to run against the demand until the complaint has been filed setting up the claim with sufficient particularity to make an issue. Until a definite cause of action has been pleaded there is nothing to arrest the running of the statute. All the elements fairly necessary to present the cause of action must be pleaded in a complaint filed with the Commission.

"Under Section 13 of the Rate Law a carrier has a definite *locus penitentiae* in order to determine whether it will yield to the demand made or contest it; and the carrier has the right to have the complaint so stated as to afford it the necessary information to enable it to determine whether to request the authority of the Commission to satisfy the demand or to make a formal answer. When the demand is made on behalf of unnamed shippers and on shipments that are not specified with reasonable particularity, this opportunity is not open to the carrier."

Distribution of Coal Cars Where Carrier's Coal Is Involved.

In the cases of Royal Coal & Coke Company, Tennessee Coal Company and Minersville Coal Company against the Southern Railway, rendered by Commissioner Cockrell, the Commission held that the only regulation in respect to the transportation of coal from mines that is just, fair and reasonable is to allow to each mine its fair and just proportion of the coal cars, estimated upon its justly ascertained capacity, and without regard to whether the mine furnished partly fuel coal for the carrier and partly commercial coal, or commercial coal only.

The Commission further decided that the carrier should publish or post for convenient inspection, at frequent and regular intervals, the rating of the various mines and the car tonnage received by them within the period covered by the report. In cases where commercial mines have received more or less than their equitable pro rata of the car tonnage during any particular period, the overplus or shortage for such mines should be adjusted, as far as possible, within the period next succeeding and such correction should be shown in the subsequent reports. The carrier must be free to contract for the total output of the mine, if it so desires, or it may contract for any part thereof less than the whole; and it is entitled to get its fuel first. If, however, a mine contracts to furnish only a part of its output to the carrier for fuel, and if the filling of its contract with the carrier calls for its full pro rata of cars or more, then it should receive no other cars for commercial shipments. If such a mine in filling its contract to supply fuel coal does not exhaust its equitable pro rata of cars, then cars should be given to it for commercial shipments sufficient to complete its full pro rata share of all available cars.

In the case of Traer, receiver of the Illinois Colliery Company against the Chicago & Alton, the same complainant against the Chicago, Peoria & St. Louis, and the same complainant against the Illinois Central, rendered by Commissioner Clark, the defendants claim that the necessity for fuel with which to operate their lines gives them the right to make private contracts therefor, and that the failure to count against the mines the cars furnished for such fuel supply permits them to make advantageous contracts and to get their coal at a lower price, and that if they counted their own fuel cars in the distribution they would not only have to pay a higher price for their coal, but might not be able to contract for it at all.

The Commission held that fuel is necessary and essential to the operation of a railroad, and the right of a carrier to contract for the purchase of its fuel supply with one mine or with a number of mines must be conceded; but if a carrier and a mine owner make a contract for the fuel supply of the carrier which does violence to the act to regulate commerce or to the decisions of the court or is opposed to public policy they are in no better position than the parties to any other contract which violates the legal principles relating thereto. A carrier cannot inject illegalities in such contract and have it upheld on the ground of compelling necessity.

In these cases the Commission is of the opinion that as to the privately owned or leased cars and the foreign railroad fuel cars the rule laid down by the Commission in the Railroad Commission of Ohio case should apply, and that cars used by defendants upon their own lines for transportation of their own necessary fuel supply may be given in any numbers to the mine or mines from which such fuel supply is received, but if such mine or mines also ship commercial coal the fuel cars so supplied must be counted against the mine or mines.

Right to Through Routes and Joint Rates.

Cardiff Coal Co. v. Chicago, Milwaukee & St. Paul et al. Opinion by Commissioner Harlan.

The complainant formerly was allowed through routes and joint rates from its mines to certain interstate points, but subsequently this privilege was withdrawn. Complainant's daily capacity is in excess of the requirements of the local markets, and the complaint is filed for the purpose of securing a wider market. While such through routes and joint rates were in force, complainant was able to sell coal to the interstate territory in question, but since such withdrawal the greater part of this trade has been lost. While denying to complainant such an outlet from its mines, through routes and joint rates are maintained to such interstate points from other nearby mines. On petition of complainant for an order re-establishing the through routes and joint rates, the Commission held that the routes over other lines referred to in the opinion are not reasonable or satisfactory; that complainant should again be accorded the through routes and joint rates, and that the refusal to establish through routes and joint rates from complainant's mines is an unlawful discrimination.

The Commission further held that an interstate carrier, in order to build up enterprises of the same character on its own line and to prevent the trade of its local industries from being displaced by the competition of manufacturers of the same commodities on connecting lines, cannot deny to industries on the lines of such connections the benefit of through routes and joint rates; nor is the fact that the revenues of the carrier may be reduced by establishing such through routes and joint rates a material consideration. It may be laid down as a general rule admitting of no qualification that a manufacturer or merchant who has traffic to move and is ready to pay a reasonable rate has the right to have it moved and to have reasonable rates established, regardless of the fact that the revenues of the carrier may be reduced by reason of his competition with other shippers in the distant markets; and he has the right also to have the benefit of through routes and joint rates to such distant markets if no "reasonable or satisfactory" through routes already exist.

Express Rates Between Denver and Missouri River.

George J. Kindel v. Adams Express Co. et al. Opinion by Commissioner Prouty.

The complaint alleges that express rates from New York, St. Louis and Omaha to Denver are unreasonable; that the rates between Denver and San Francisco and Salt Lake City are unreasonable; that the rates to Denver made by combination on the Missouri river from eastern points work unjust discrimination against Denver; and that the graduate scale of rates is unscientific and inconsistent. The Commission held that the base rates of $4 per 100 lbs. from Omaha to Denver and of $4.25 per 100 lbs. from Denver to Ogden should not exceed $3.50 and $4 respectively. Further, that the rates made by express companies on small packages in competition with the United States mail are not to be taken as standards by which to determine the reasonableness of their rates on larger packages. In making express rates, a base rate of so much per 100 lbs. was fixed, and to that is applied what is termed a "graduate" scale, giving the rates on smaller packages for a given base rate. All the defendants use the same scale, which was attacked by the complainant as "illogical and inconsistent." The only objection pointed out was that rates on small packages did not correspond with those on larger ones, which is due to competition with the mail in carrying small packages. The scale must be assumed to be a reasonable one in this proceeding, and the only inquiry as to the reasonableness of rates involved should be directed to the reasonableness of the base rate. The fact that express rates in and out of a particular business locality are higher than those in and out of a competing locality from a common source of supply is not of the same importance as in the case of freight rates, since the wholesaler ordinarily brings his merchandise in by freight and also distributes it by freight.

Within certain limits express rates and freight rates compete and to that extent express rates should be established with reference to freight rates. The main object of an express service is expedition, and express rates should not be so low as to attract business which might properly go by freight and thereby congest and interfere with the service by express. In determining the reasonableness of express rates little reference can be had to the value of the property employed, since the connection between the value of the service and the cost of the property employed in rendering it is slight. This is qually true of the capitalization of the defendants, which bears no relation whatever to the actual investment necessary to conduct the business. In determining whether the present charges of the defendants are reasonable, inquiry must be had into the character of the business, the amount of capital required for its conduct, the hazard involved, and especially the profits which these companies are now making under the rates attacked.

Since no reliable information as to results of operations of these defendants under existing rates was presented, no opinion was expressed as to the reasonableness of their rates in general. The inquiry is confined to rates in territory west of the Missouri river to and from Denver. A comparison of express rates in one locality with those in another is of a much greater value than a similar comparison between freight rates, since the character of the business and the conditions under which it is transacted are more nearly the same. Rates from eastern destinations to Denver are made by adding together rates to the Missouri river and from the Missouri river, and applying to the resulting base rate the graduate scale. The rate on small packages thus obtained is much less than the sum of the locals on the same package to and from the Missouri river and is somewhat less on packages up to 50 lbs. in weight. The great majority of packages handled are under 50 lbs. This method of making through rates is not unlawful, for while the rate on packages weighing 50 lbs. and over may be somewhat high, the total result is reasonable.

The practice of making rates from or to an exclusive office by combination of the full local rates through some junction point seems to be objectionable, but since there is not evidence in this case from which the effect of an order requiring the establishment of a through base rate and the application of the graduate scale to that rate can be determined, the Commission declines to interfere with the present practice at this time. The fact that under the postal regulations of England a package can be sent from London to Denver for 50 cents is no reason for pronouncing an express rate of 70 cents on a package of the same size from Denver to London unreasonable.

TRADE CATALOGUES.

Wire Rope, Insulated Wire and Cables.—Two pamphlets, 156 pages together, issued by the Hazard Manufacturing Co., Wilkes-barre, Pa., deal with wire rope and insulated wire. Section 1 gives sizes, weights, strength and prices of iron, steel and galvanized wire rope, wires and appliances connected with the use of wire rope. This is illustrated with a large number of photographs, showing the different styles of rope and cable, and of buildings, conveying and hoisting machinery, inclined planes, etc. The pamphlet gives tables and other information on such points as: tension on rope under varying loads and on inclined planes of different degrees, proper working loads on cables, amount of power transmitted by wire rope under different conditions, etc. Section 2 gives correspondingly full information concerning insulated and uninsulated wires and cables.

Chains.—Catalogue No. 75, of the Link-Belt Co., Philadelphia, Pa., fully illustrates, with brief descriptions, the Ewart detachable link belt, showing sizes, weights, strength and prices with various attachments. It also describes pintle chains, or chains whose links are connected with pins or rivets. These include chains of many styles for different uses. Roller chains, mono-bar chains, and the Renold silent chain gear are also described, as well as sprocket wheels and spiral gears, bevel gears, angle gears, worm gears, equalizing gears and clutches for use on sprockets. Catalogue 78 of the same company is a small pamphlet telling how and why to use the Ewart link belt. It is illustrated with line drawings showing the points involved.

The Maine Woods.—The Bangor & Aroostook has issued the 1908 edition of In the Maine Woods, a "vacationist's guide." This is a volume 9 x 6 in., with 128 pages of reading matter and photographs, and 65 pages of advertisements. Many of the photographs are exceedingly good, especially those which illustrate the fishing and hunting of the Maine woods. There are a number of pictures of wild deer and moose. There is full information about the various regions reached by the Bangor & Aroostook, the game, fishing and guide laws and maps of the various regions. Many of the advertisements set forth the hotels or camps available for visitors. The industrial development of northern Maine is also briefly described. The book is in all respects one of the best of its kind.

Boilers.—Catalogue No. 60, of the Murray Iron Works, Burlington, Iowa, describes the construction of the Murray water tube boilers. It is illustrated with many halftones of boilers and details, and of buildings in which they have been installed. They are designed for 160 lbs. working steam pressure, and are built in sizes from 50 to 500 h.p. They are rated, in general, on a basis of 10 sq. ft. of heating surface per horse-power.

Thermit.—A recent pamphlet issued by the Goldschmidt Thermit Co., New York, consists of shop instructions for the use of thermit in repair work. It shows the styles and sizes of molds for different jobs, and gives the prices of apparatus for making repairs. The repairs described include locomotive frames, driving wheels, connecting rods, motor cases, and flaws in castings and forgings.

Signals.—A catalogue of the Union Switch & Signal Co., Swissvale, Pa., fully describes, with price lists, a.c. block signaling appliances. It is illustrated with halftones and line drawings of separate devices, and diagrams of signal layouts. Bulletin 33 is a reprint from the *Railroad Gazette* of January 17, 1908, describing the a.c. automatic block signals on the New York, New Haven & Hartford.

Fan Motors.—Bulletin No. 4,560, of the General Electric Co., Schenectady, N. Y., describes a number of different styles and sizes of direct and alternating current fan motors, including ceiling fans, column fans, wall fans and exhaust fans. The bulletin also illustrates a number of small motors of from 1 to 30 h.p. for various uses.

Motors and Generators.—Pamphlet No. 226 of the Sprague Electric Co., New York, is an instruction book covering the installation and care of belted round type d.c. motors and generators. It is illustrated with halftones and line drawings of machines and parts. It also gives a number of wiring diagrams.

Locomotive Cranes.—Pamphlet K of the Brown Hoisting Machinery Co., Cleveland, Ohio, briefly describes, with a number of photographs and drawings, locomotive cranes for handling coal or ashes, etc. They are, as a rule, equipped with Brown patent grab buckets, which are also described.

Roofing.—A circular issued by the H. W. Johns-Manville Co., New York, calls attention to the advantages of J-M asbestos roofing, and also to a less expensive roofing known as the J-M-Oid. The latter is made of wool felt saturated with a water-proofing compound.

Brake-beams.—A folder issued by the Pennsylvania Brake-Beam Co., Danville, Pa., shows views of standard brake beams and standard I beams, and special reinforced brake-beams for heavy freight service.

MANUFACTURING AND BUSINESS.

J. A. Venable has been appointed General Manager of the New York Car Wheel Co., Buffalo, N. Y.

T. Kennard Thomson, Consulting Engineer, has moved to the Hudson Terminal buildings, 50 Church street, New York.

The offices of the Railway Steel-Spring Co., New York, have been moved to the Hudson Terminal buildings, 30 Church street.

The offices of the Atlantic Equipment Co., New York, have been moved to the Hudson Terminal buildings, 30 Church street.

The offices of the U. S. Metal & Manufacturing Co., New York, have been moved to the City Investing building, 165 Broadway.

The New York office of the Bettendorf Axle Co., Chicago, has been moved to the Hudson Terminal buildings, 30 Church street.

The New York office of the Union Spring & Manufacturing Co., Pittsburgh, Pa., has been moved to the Hudson Terminal buildings, 50 Church street.

Tho New York office of the American Brake Shoe & Foundry Co., Mahwah, N. J., has been moved to the Hudson Terminal buildings, 30 Church street.

The Canadian sales office of the National Malleable Castings Co., Cleveland, Ohio, has been moved to 710 Canadian Express building, Montreal, Que.

Isham Randolph, Consulting Engineer, Chicago, has moved his offices from the American Trust & Savings Bank building to the First National Bank building.

W. B. Crane, Sr., of W. B. Crane & Co., Chicago, dealers in hardwood lumber, died in Memphis, Tenn., on March 28. The business will be continued as heretofore.

The offices of the Eppinger & Russell Co., New York, dealer in yellow pine lumber and ties, creosoted lumber, ties and piles, have been moved to the City Investing building, 165 Broadway.

The New York offices of the General Electric Co., Schenectady, N. Y., have been moved to the Hudson Terminal buildings, 30 Church street. The entire seventeenth floor will be occupied by these offices.

H. H. Sessions, who, as noted in this column last week, has been made President of the American Car & Equipment Co., Chicago, a car repairing company, remains also Vice-President of the Standard Coupler Co., New York.

Among recent orders received by the Alexander Milburn Co., Baltimore, Md., was one for a number of lights for the United States Reclamation Service and one for a special 5,000 candle power light for an 85-ft. revolving derrick recently built for the Great Lakes Construction Co., Buffalo, N. Y.

The firm of Wood & Van Nest, 26 Cortlandt street, New York, has been formed to represent manufacturers of railroad materials. M. F. Wood has been for many years General Manager of the Eyeless Tool Co., Newark, N. J., and J. A. Van Nest served on the Pennsylvania Railroad for a long time. The firm is prepared, as sales agents, to quote on all materials used in the roadway department.

Ten Westinghouse turbo-electric generators, aggregating 25,000 h.p., are being shipped, or will soon be shipped, to the far East. Most of these machines will go to Japan. One, a 1,500 k.w. turbine unit, is for the Manila Electric Railway & Lighting Co., where four similar machines are in service. The large turbine station of the Osaka Electric Co., Osaka, Japan, now building, will have, for the present, 15,000 k.w. in five units. The remaining four units will be installed in a steel plant and in a ship building yard in Japan.

The Canadian Crocker-Wheeler Co., Ltd., has been organized for the manufacture and sale in Canada of the apparatus made in the United States by the Crocker-Wheeler Co., Ampere, N. J. F. E. Lovell, President of the new company, is a member of the lumbering firm of H. Lovell & Sons, Coaticook, Que. Russell A. Stinson and F. J. Bell, Vice-President and Secretary-Treasurer, respectively, have been employed in the manufacturing, construction and sales departments of the electrical trade in Canada for the past 15 years. The office of the new company has been opened at the Street Railway chambers, Place d'Armes Hill, Montreal, Que.

OBITUARY NOTICES.

Charles Drinkwater, Secretary and Assistant to the President of the Canadian Pacific, died at Montreal, on April 23, of pneumonia. Mr. Drinkwater was born November 17, 1843, at Ashton, Lancashire, England. He entered railroad service in 1859 on the Manchester, Sheffield & Lincolnshire in England, and was for three years in the service of the Great Northern at London. He then went to Canada and from 1864 to 1874 he was private secretary to Sir John A. MacDonald, then Prime Minister of Canada. From 1874 to 1881 he was Chief Assistant to the Managing Director of the Grand Trunk. Since 1881 he has been Secretary of the Canadian Pacific and since 1900 also Assistant to the President.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Franklin Institute.

At a section meeting of the Institute there was an address on "Recent Work in Metallography," by Dr. William Campbell, of School of Mines, Columbia University, New York.

American Society of Mechanical Engineers.

The next meeting of this society is to be held May 12 in the Engineering Societies building, New York. At this meeting a paper on "Clutches," with special reference to the types used on automobiles, by Henry Souther, Hartford, Conn., will be read. Their development will be shown by lantern slides. The meeting will be important also to those interested in the use of clutches for machine tool work, power transmission, hoisting machinery, textile and other classes of machinery, and will afford an opportunity for the full discussion of their design and use. The discussion will be continued at the semi-annual meeting of the society at Detroit, June 23-26.

Central Railway Club.

The next regular meeting of this club is to be held at the Lafayette Hotel, Buffalo, N. Y., May 8. At this meeting a paper on the "Possibilities of High Speed Tool Steel; a Review of Recorded Tests, H P. Requirements, etc.," by L. R. Pomeroy, of the Safety Car Heating & Lighting Company, will be presented.

Engineers' Club of Philadelphia.

At a business meeting of this club to be held May 2 a paper on "Construction Methods on the Market Street Subway," by S. M. Swaab, illustrated by lantern slides, will be presented.

At a business meeting of the junior section to be held May 11, a paper on "Experience in Operating a Diesel Engine," by John S. Haug, will be presented.

Railway Signal Association.

The May meeting of this association will be held at 29 West 39th street, New York City, on Tuesday the 12th, beginning at 10 a.m. The subject in the forenoon will be the Specifications for electric interlocking, beginning at paragraph No. 80, page 27, of advance notice No. 5, issued last year. In the afternoon there will be a paper on storage batteries, by H. M. Beck. Mr. Beck discusses the restoration of low cells. The Secretary announces that as Mr. Beck treats his subject with reference especially to a single type of storage battery, it is desirable that makers of other storage batteries which are used for signal purposes shall be represented at the meeting, with a view to bringing out the best methods of dealing with all kinds of storage batteries which may need restoration. It is expected that at the afternoon session there will also be preliminary reports from some of the committees.

Iron and Steel Institute.

The annual meeting of the Institute is to be held at the Institution of Civil Engineers, London, Eng., May 14 and 15. The Bessemer Gold Medal for 1908 will be presented to Benjamin Talbot. The annual dinner will take place at the Hotel Cecil on Thursday. Among the papers to be submitted at the meeting are the following:

Experimental Electric Furnace for the Smelting of Iron, by Professor B. Igewsky.

Improvements in Plate Rolling Mills, by A. Lemberton.

Application of Color Photography to Metallography, by E. F. Law.

Utilization of Blast-Furnace Slag for Portland Cement, by C. von Schwarz.

New Fatigue Test for Iron and Steel, by T. E. Stanton, D.Sc.

Physical Qualities of Steel in Relation to its Mechanical Treatment, by James E. York.

Reports on research work carried out during the past year are to be submitted by C. A. Edwards, J. A. N. Friend (Germany), D. M. Levy, A. M. Portevin (France), A. K. F. Hiorth (Norway), B. Saklatwalla (India), E. Hess, C. Benedicks (Sweden), and H. C. Boynton, Carnegie research scholars.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

National Lines of Mexico.—J. E. Dennison, Auditor, has been appointed General Auditor.

Union Pacific.—M. H. Loomis, General Solicitor for Kansas and Missouri, has been appointed General Solicitor of the company, with headquarters in Omaha, Neb., succeeding J. M. Baldwin, deceased.

Operating Officers.

Kalamazoo, Lake Shore & Chicago.—H. D. Swayze, Traffic Manager, has been appointed General Superintendent, with headquarters at South Haven, Mich., succeeding James Grant, assigned to other duties.

Mexican Railway.—W. Cockfield, Locomotive Superintendent, has resigned to go to the Peruvian Southern as Locomotive Superintendent.

Missouri Pacific.—See St. Louis & San Francisco.

New York, New Haven & Hartford.—William R. Martin, Superintendent of the Boston division, has been made also Superintendent of the South Station, Boston, Mass.

St. Louis & San Francisco.—H. H. Brown, Superintendent of the Ozark division, with office at Memphis, Tenn., has been appointed Superintendent of the Eastern division, with office at Springfield, Mo., succeeding A. O'Hara, resigned. J. F. Simms, Superintendent of the Missouri Pacific at Osawatomie, Kan., succeeds Mr. Brown.

Saratoga & Encampment.—B. F. Dunn, Superintendent, has resigned and Frank J. Cramer, Chief Engineer, succeeds Mr. Dunn.

Traffic Officers.

El Paso & Southwestern.—Charles M. D. Adams, formerly General Agent of the Missouri Pacific at Memphis, Tenn., has been appointed General Agent of the El Paso & Southwestern at St. Louis, Mo.

Grand Trunk.—See Grand Trunk Pacific.

Grand Trunk Pacific.—J. E. Dalrymple, General Freight Agent of the Grand Trunk, has been appointed Freight Traffic Manager of the Grand Trunk Pacific, with office at Winnipeg, Man.

Kalamazoo, Lake Shore & Chicago.—See this company under Operating Officers.

Missouri Pacific.—W. H. Reid, commercial agent of the Mobile & Ohio at New Orleans, has been appointed General Agent of the Missouri Pacific at New Orleans, La. This office had been temporarily closed.

St. Joseph & Grand Island.—H. W. Prickett, Traffic Manager of the Kansas City stock yards, has been appointed to the new office of General Agent at Salt Lake City, Utah.

Engineering and Rolling Stock Officers.

Erie.—George H. Burgess, Engineer of Terminal Improvements at Jersey City, has been appointed Principal Assistant Engineer, with office in New York. The office of Engineer of Terminal Improvements has been abolished.

Tehuantepec National.—D. Coe, Chief Engineer, having been given leave of absence, Ernest H. Mitchell, as recently noted in this column, is Acting Chief Engineer.

LOCOMOTIVE BUILDING.

The Lehigh & New England has ordered three consolidation locomotives from the Baldwin Locomotive Works.

The Delaware, Lackawanna & Western is said to have ordered 17 locomotives from the American Locomotive Co. This item is not yet confirmed.

The Chicago, Milwaukee & St. Paul will build 70 Prairie locomotives at its Milwaukee shops, and is said to have ordered 50 engines from the American Locomotive Co. The latter item is not yet confirmed.

The Lehigh Coal & Navigation Co. has ordered two consolidation locomotives from the Baldwin Locomotive Works, for June delivery. The specifications are as follows

Type of locomotive	Consolidation
Cylinders	22 in. x 28 in.
Diameter of drivers	56 in.
Boiler, type	Straight
" steam pressure	200 lbs.
" tubes, number	300
" " diameter	2 in.
" " length	12 ft. ½ "
Firebox, length	126 1/16 "
Firebox, width	108⅝ "
Heating surface, tubes	1,880 sq. ft
" " firebox	188 "
" " total	2,138 "
Grate area	95 "
Tender	Steel underframe
Water capacity	6,000 gals.
Coal capacity	12 tons

CAR BUILDING.

The Union Traction Co., Santa Cruz, Cal., is said to have ordered four double-truck motor cars and two trailers. This item is not yet confirmed.

The St. Louis, Brownsville & Mexico is said to have ordered 30 Rodger ballast cars of 80,000 lbs. capacity from the American Car & Foundry Co. This item is not yet confirmed.

The Chicago Railways cars, mentioned in the *Railroad Gazette* of March 27, will be equipped with trucks built by the Pullman Co., and air-brakes furnished by the National Air-Brake Co.

The Grand Trunk Pacific, it is said, has ordered 18 first class coaches, 10 second class coaches, six combination baggage and smoking cars, and six mail and express cars, from the Canada Car Co., and 12 baggage cars from Rhodes, Curry & Co. This item is not yet confirmed.

The Lehigh & New England, as mentioned in the *Railroad Gazette* of April 3 and April 24, has ordered 300 all-steel 40-ton gondolas, weighing 34,000 lbs., from the Cambria Steel Co., and 250 steel underframe 30-ton box cars, weighing 34,000 lbs., from the American Car & Foundry Co., both for June-July delivery. The gondolas will measure, inside, 36 ft. long, 9 ft. 3 in. wide and 4 ft. 2¼ in. high, and over all, 37 ft. long and 7 ft. 7½ in. high. The box cars will measure, inside, 36 ft. long, 8 ft. 6 in. wide and 7 ft. 9¼ in. high. The over-all measurements will be 37 ft. ½ in. long, 9 ft. 3¼ in. wide and 13 ft. 7 in. high to top of staff. The special equipment includes:

Bolsters, truck	Gould
Brakes	Westinghouse
Brake-beams	Davis Solid Truss
Brake-shoes	Steel back
Couplers	Gould
Door fastenings (box cars)	Security
Draft gear	Sessions-Standard
Journal boxes	Gould
Paint (gondolas)	Protectus
Paint (box cars)	Patterson Sargent "Nobrac" and liquid brown
Roofs (box cars)	Chicago Improved Winslow
Springs	Lehigh Valley Spring Co.
Trucks	Arch bar

RAILROAD STRUCTURES.

EAST SOMERVILLE, MASS.—The Boston & Maine roundhouse, with nine locomotives, was recently destroyed by fire.

HOUGHTON, MICH.—The Duluth, South Shore & Atlantic, it is said, will put up a concrete roundhouse in its yards here, to replace one destroyed by fire.

LANCASTER, PA.—The Conestoga Traction has plans made for putting up car repair shops.

MEXICO CITY, MEX.—The new bridges on the National Lines of Mexico include the following: Three span, deck girder bridge to replace a trestle; a five-span, similar type bridge recently finished over the Nazas river, at Los Herreras, also an eight-span bridge over the Sabinas river, near Sabinas. Work is under way on a five-span bridge at Rio Escondida, near Fuente. Contract for the last two let to the Torreon Construction Co., of Torreon, Coahuila. These bridges are to replace the Phoenix column trusses which are now too light for the traffic.

NEW YORK, N. Y.—The New York Central & Hudson River will shortly give a contract for the second of its new terminal buildings at the Forty-second street station. The building for which the new contract is to be given will be the first part of the terminal proper to be built and will constitute about one-fourth of the whole. It will adjoin the new building on Lexington avenue, used for offices, which is now nearly finished.

NORFOLK, VA.—F. S. Gannon, President of the Norfolk & Southern, it is said, has made an announcement that the land recently bought adjoining the present river terminus is to be used as a site for large freight terminals, and for the erection of a general office building. The work is to be started as soon as the general financial conditions improve.

POTTSVILLE, PA.—The Pottsville Union Traction Company, it is said, will at once put up a bridge over the Philadelphia & Reading tracks at Mauch Chunk street.

PRESIDIO DEL NORTE, MEXICO.—Contract, it is said, will shortly be let by the Kansas City, Mexico & Orient to build a bridge over the Rio Grande at the proposed crossing near this place.

READING, PA.—An ordinance is to be introduced to provide money for the erection of a bridge over the Lebanon Valley tracks of the Philadelphia & Reading, at Tulpehocken street.

SAN DIEGO, CAL.—The San Diego & Arizona, it is said, is planning to put up shops, also a roundhouse at a cost of $500,000.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ALTON, ST. LOUIS & CAIRO (ELECTRIC).—Incorporated in Illinois with $100,000 capital to build a line from Alton, Ill., south through Madison, St. Clair, Monroe, Randolph, Jackson and Union counties, to Cairo, in Alexander county, 130 miles. A branch is also to be built from the main line, west to Waterloo and Columbia, in Monroe county. The incorporators include T. N. Chase, J. F. Albrecht, D. W. Young, F. E. Orvis, W. L. Ensel and W. R. Brown.

ATLANTA, BIRMINGHAM & ATLANTIC.—Announcement is reported made that all the work is finished on the branch from the main line at Manchester, Ga., northwest to Atlanta, 71 miles, and that the line is now open for business.

BROWNSVILLE, MASONTOWN & SMITHFIELD STREET RAILWAY (ELECTRIC).—This company, organized to build 15 miles of line in Pennsylvania, has new plans ready for building 120 miles of electric lines in Fayette, Greene and Washington counties, Pa., and eventually into West Virginia. The company has a capital of $3,500,000, and its office is at Masontown. Work has been started on the section from Brownsville south to Masontown. The lines are eventually to connect Masontown, East Millsboro, Gates, Lambert, Edenborn, Ronco, New Geneva, Point Marion, Smithfield, Republic, Martin, Zollarsville, Clarksville, Beallsville and Bentleyville. Connections are to be made with lines entering Pittsburgh. W. J. Sheldon, President, McKeesport.

CANADIAN NORTHERN.—This company, it is said, has notified Hon. Robert Rogers, Minister of Public Works for Manitoba, that the following lines will be built this year: Adelpha, Man., west 10 miles; from a point north of Virden, Man., crossing the Canadian Pacific, 10 miles; from a point on the Rossburn branch through Rapid City, Man., to the Viola Dale district, 25 miles.

CHICAGO, MILWAUKEE & ST. PAUL.—The Milwaukee Terminal Railway Company, it is said, was recently incorporated in the state of Washington in the interest of the Chicago, Milwaukee & St. Paul. The incorporators include H. R. Williams and E. W. Cook, Seattle, and A. H. Barker.

GRAND TRUNK PACIFIC.—A. L. McHugh has been given a sub-contract, on four miles through rock, by Foley, Welch & Stewart. J. E. Craig, August Stewart and Dixon & Moore also have contracts near this section clearing the right of way.

HARRISVILLE & CORNWALLIS.—An officer writes that bids are to be asked for about May 1 to build a line from Cornwallis, W. Va., on the B. & O., southeast, six miles, to Harrisville. The work includes two steel bridges. W. S. Stout, President, and A. Wolverton, Chief Engineer, Harrisville, W. Va. (April 17, p. 559.)

HUDSON BAY PACIFIC.—This company, organized last year with a capital of $3,000,000, has recently been incorporated under an act of the British Columbia legislature. The company proposes to build a line from near Port Simpson, B. C., on the Pacific coast east along the Skeena river to Hazleton, thence via the head of Babine lake to the north end of Stuart lake; thence north of McLeod lake via Pine River Pass, along the Pine river; thence to Moberly lake and along Peace river valley to the eastern boundary of British Columbia. The articles provide also for building branch lines not over 20 miles long. The provincial directors include D. B. May, of Seattle, Wash.; J. McLachan, Los Angeles, Cal.; L. A. Benson, Goldfield, Nev.; N. H. Harding, Jr., and W. H. Duval, New York.

INTERBOROUGH RAPID TRANSIT, NEW YORK CITY.—Announcement is made that this company expects to begin operating, May 1, the extension of its subway from Borough Hall, Brooklyn, to Atlantic avenue, .89 mile. At this point connection is to be made with the Long Island Railroad.

KANSAS CITY, MEXICO & ORIENT.—The extension of this road, north from Chihuahua, Mex., is making good progress and is expected to be finished to the Rio Grande this fall. Work is now under way down the valley of the Conchos river. On the line from the north there remains about 300 miles yet to be built to reach the Rio Grande. The gap of 90 miles between Alpine on the Southern Pacific, and the Rio Grande crossing is to be built within one year. A large tract of land, it is said, has been secured by the company near the site of the proposed international bridge, at which point a town is to be established.

KENTUCKY & OHIO RIVER (ELECTRIC).—The Royal Investment Company, Globe Building, Minneapolis, Minn., is to have entire charge of building this projected line from Paducah, Ky., west to Cairo, Ill. Contracts are to be let at once. The work will include 18 small bridges. Nort Whitesides, President. Wm. C. Langdon & Co., of Minneapolis, Minn., may be addressed. (April 10, p. 525.)

MEXICAN INTERNATIONAL.—Contract has been given to Bartola Corrigan, of Sabinas, Cohuila, and work is under way on a short branch line about 2½ miles long from the Rosita branch at kilo 10 to the Cloete Coal Mines Works.

MILWAUKEE TERMINAL RAILWAY.—See Chicago, Milwaukee & St. Paul.

OREGON ELECTRIC.—This company, which has finished about 50 miles of line from Portland, Ore., via Tualitin and Wilsonville to Salem, except the ballasting, recently increased its capital stock from $2,000,000 to $10,000,000. On April 23 construction work was started on 283 miles of extension branches, and laterals, to the Portland-Seattle Electric line recently put in operation. Plans include lines as follows: Portland to Tillamook, Portland to Eugene, Salem to Mill City, Salem to Dallas, Salem to Albany and Albany to Cascadia. Charles M. Pratt, of New York, is President; N. Talbert, Manager, Portland, and Moffat & White of New York are the bankers.

ROCHESTER, CORNING & ELMIRA TRACTION.—This company, organized to build an electric line from Rochester, southwest to Elmira, 120 miles, is making surveys over a new route, it is said. This will necessitate securing a certificate of necessity from the New York State Public Service Commission, and as soon as this is granted it is promised that construction work will be started. W. C. Gray and S. Fuerstein, 20 Exchange street, Rochester, N. Y., Engineers; F. S. Breckingham, 12 Broadway, New York, is a director.

ROCKPORT, LANGDON & NORTHERN.—This company, operating a road from Langdon, Mo., northeast to Rockport, 5.6 miles, expects to build an extension from Rockport north to Shenandoah, Iowa, about 30 miles. The W. K. Palmer Company, Engineers, 717 Dwight Building, Kansas City, Mo., who will have charge of the engineering work and supervise the construction, want to hear from contractors.

ROME & OSCEOLA.—Incorporated in New York with $500,000 capital to build a line, to be operated either by steam or electricity, from Rome, Oneida county, N. Y., north to Osceola, Lewis county, 25 miles. Incorporators include J. H. Haselton, Rome, N. Y.; W. P. White and W. I. Taber, Utica, N. Y. (April 3, p. 493.)

RUSTON, NATCHITOCHES & NORTHEASTERN.—An officer writes that the route of this proposed line is from Farmerville, La., southwest via D'Arbonne, Ruston, Sallie, Natchitoches and Leesville to the Texas state line, thence through Texas to a point at tidewater not yet determined upon, probably at Port Arthur, about 260 miles. J. C. Nolan, President, and J. Wesley Hall, Chief Engineer, Ruston, La. (March 27, p. 462.)

SPOKANE, PORTLAND & SEATTLE.—On the extension building from Pasco, Wash., northeast to Spokane, work has been suspended from Spokane southwest to Cheney, awaiting settlement of the question whether a satisfactory franchise to enter the city of Spokane will be granted. No new contracts will be let until the franchise is granted.

STEUBENVILLE & EAST LIVERPOOL (ELECTRIC).—This company, operating 19 miles of electric line from Steubenville, Ohio, north to Toronto, recently put at work a large force of men to finish the double-track line on which work was started in the summer of 1907 and suspended last fall. This line is from Toronto, north via Wellsville, and East Liverpool, and thence east to Vanport, Pa., about 40 miles from Steubenville.

VANCOUVER ISLAND & EASTERN.—This company, organized last year with a capital of $2,000,000, is seeking incorporation from the Dominion parliament. The company proposes to build a line from Esquimalt harbor, Vancouver Island, B. C., north to Seymour's Narrows; and from Bute inlet or Frederick inlet on the mainland of British Columbia, east via Yellowhead Pass to Edmonton, Alb., about 900 miles. The provisional directors include T. W. Paterson, T. J. Jones, R. C. Lowe and H. A. Munn, Victoria, B. C.; James Smith, Edmonton, Alb., and M. J. Harvey, Toronto. (Nov. 1, p. 512.)

WASHINGTON ROADS (ELECTRIC).—A. M. Dewey, of Spokane, Wash., with the co-operation of English capitalists, is to finance a line to be built in the northern part of the state of Washington into the Okanogan country. In this section there are a large number of copper mines, 26 having recently been located, and a number of smelters are to be built as soon as the proposed line is assured.

WESTERN PACIFIC.—Track on this line, it is said, is now laid from Stockton, Cal., to a considerable distance north of Sacramento, and it is expected to have trains in operation from Oakland to Oroville this fall. On the section above Oroville the work is very heavy. On 35 miles along the Feather river, about 1,200 men are at work. They recently finished 10 tunnels, each from 200 to 1,200 ft. long, and are now at work on 16 others. The line from this section runs through almost solid rock and it will cost to build through this section about $100,000 a mile. Track is laid from Oroville to Big Bend, 17 miles, and three miles additional will shortly be finished.

RAILROAD CORPORATION NEWS.

BUFFALO, ROCHESTER & PITTSBURGH.—Gross earnings for the third week in April, 1908, were $102,000, a decrease of $64,000 from the corresponding week in April, 1907.

BOSTON & ALBANY.—N. W. Harris & Co. and Bond & Goodwin, both of New York, have sold $3,500,000 25-year 4 per cent. bonds of May 1, 1908-1933, at 98.45, yielding 4.10 per cent. These bonds are guaranteed by the New York Central & Hudson River. The Boston & Albany has no mortgage indebtedness, its total bonded debt being $15,485,000, against which it has in its treasury a New York Central 3½ per cent. bond of 1900-2000 for $5,500,000.

CANADIAN PACIFIC.—During the six months ended December 31, 1907, the Minneapolis, St. Paul & Sault Ste. Marie bought $1,601,600 stocks and bonds of other corporations. Nearly all of these are of the Spokane International, which gives the Canadian Pacific entrance into Spokane. This is a small road, which Sir Thomas Shaughnessy, President of the Canadian Pacific, says earned in its first year of operation, sufficient to pay expenses and fixed charges.

CHESAPEAKE & OHIO.—This company has sold to J. P. Morgan & Co., Kuhn, Loeb & Co. and Blair & Co $2,013,354 consolidated mortgage 5 per cent. bonds of 1889-1939, to meet an equal amount of 6 per cent. first mortgage bonds, series A and B, maturing July 1, 1908. The Chesapeake & Ohio has also sold to the same bankers $1,500,000 of an authorized issue of $2,500,000 6 per cent. notes to retire the $1,200,000 extended notes maturing June 28, 1908, and to get $300,000 new funds.

CHESAPEAKE WESTERN.—All the stock and bonds of this company were sold on April 22 to W. E. D. Stokes, of New York City, for $25,000. All these securities were hypothecated to secure a loan. The company owns or leases 11 miles of line.

CINCINNATI, NEW ORLEANS & TEXAS PACIFIC.—Preferred and common stockholders are offered the opportunity to subscribe at par for all or such part of the $1,000,000 preferred 5 per cent. stock as the board of directors shall determine to issue. The board of directors are to meet on or before June 1. Present holders of both common and preferred stock will have equal rights in subscribing to the new issue.

INTERBOROUGH RAPID TRANSIT.—J. P. Morgan & Co. have offered at par $25,000,000 three-year convertible 6 per cent. notes of May 1, 1908-1911. These notes are convertible for 2½ years into the new mortgage bonds of the company at 95. The notes are secured by a deposit of $30,000,000 new 45-year 5 per cent. mortgage bonds.

IOWA CENTRAL.—E. H. Rollins & Sons, of Boston and Chicago, have offered $750,000 first and refunding mortgage 4 per cent. bonds of 1901-1951. These bonds are part of a total of $25,000,000 authorized, of which about $3,320,000 are outstanding and $7,650,000 reserved to retire an equal amount of 5 per cent. bonds due 1938.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—See Canadian Pacific.

MISSOURI, OKLAHOMA & GULF.—W. H. Trumbull & Co., of Boston and the Banque Franco-Americaine, of Paris, France, have offered the Missouri, Oklahoma & Gulf's outstanding $2,500,000 5 per cent. first mortgage bonds of 1908-1944. The bonds are a first mortgage on the road at the rate of $25,000 per mile, comprising at the present time 95 miles. The road runs from Wagoner, Okla., to Rose, on the Canadian river, traversing the Henryetta and Lehigh coal fields.

MISSOURI PACIFIC.—A large amount of the Missouri Pacific two-year 6 per cent. convertible notes, secured by $12,000,000 Kansas & Colorado Pacific first refunding mortgage 30-year 6 per cent. bonds of 1908-1938, have been converted into these bonds. These notes were issued in January, 1908.

NEW YORK CENTRAL & HUDSON RIVER.—See Boston & Albany.

NEW YORK, NEW HAVEN & HARTFORD.—The Boston Chamber of Commerce has voted decisively to "firmly oppose the proposed control of the Boston & Maine by the New York, New Haven & Hartford." Some of the reasons given in this resolution are that it would place under one control a high percentage of the entire transportation facilities of the New England states, both steam railroads and trolley lines, and because such a consolidation would eliminate all competition, and, also because the Chamber of Commerce is strongly in favor of the Boston & Maine financing its improvements by an issue of its own securities.

The company has sold to Kidder, Peabody & Co., of Boston, $9,000,000 first mortgage bonds of constituent companies. These bonds have been held in the treasury. In addition, the company has sold about $2,000,000 short term notes to Kidder, Peabody & Co. Proceeds from the sale of these securities will provide upwards of $11,000,000 to meet an equal amount of notes and bonds which mature between now and January 1, 1910.

NORFOLK & WESTERN.—A semi-annual dividend of 2 per cent. has been declared on the common stock. This is a reduction of the annual rate from 5 per cent. to 4 per cent.

The Guaranty Trust Co. of New York has sold $7,500,000 two-year 5 per cent. notes of May 1, 1908-1910. These notes are secured by $10,000,000 divisional first lien and general mortgage 4 per cent. bonds of 1904-1944. The notes were offered at 99, yielding 5½ per cent.

SEABOARD AIR LINE.—The receivers were authorized on April 18 to issue $3,564,000 six per cent. receivers' certificates, dated May 1, and redeemable after six months.

SPOKANE INTERNATIONAL.—See Canadian Pacific.

WATERLOO, CEDAR FALLS & NORTHERN.—This company has made a mortgage securing $2,000,000 five per cent. bonds for extensions. The road runs from Cedar Falls, Iowa, via Waterloo and Waverly to Sumner, 52 miles. It also operates street car service at Waterloo and Cedar Falls.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK

BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York, N.Y., and the names of the officers and editors of the Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Pres't and Editor*
E. A. SIMMONS, *Vice President*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS

RAY MORRIS, *Managing Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., NO. 19. FRIDAY, MAY 8, 1908

Being content with loose, inaccurate and incomplete knowledge on important subjects is said to be one of the economic sins of the American people; and we are certainly open to the charge. An illustrative example may be found in the newspaper statements concerning the proposed general advance in freight rates. A Washington despatch of May 2 says that "the anticipated general increase in railroad freight rates seems likely soon to be made. The railroads of the southeastern territory have filed tariffs, effective June 1, increasing freight rates on fresh meats from 3 cents to 10 cents per 100 lbs. This will mean much to the consumers, as it will probably result in an increase of 1 cent a pound on low grades of meats, and perhaps as much as 2 cents a pound on the select cuts. This advance is intended as a feeler of public sentiment, with a view to making a general raise in rates on all commodities." The one statement in this item that will be remembered by the majority of readers is that meat is going to cost 2 cents more a pound—because of the exactions of the railroads. The highest proposed advance in freight rates is one-tenth of one cent a pound (and the lowest is three-hundredths of a cent), so that 1⁹⁄₁₀ cents of the 2 cents added by the retailer is for his own benefit; but that is a point which the reader does not notice. Probably the reporter is quite innocent, for if he saw the absurdity of the statement he would modify it, no doubt. In modifying the article he could lengthen it and thus increase his pay. It is all right for the railroads to put out feelers at proper times and places, but evidently the retail meat trade is not a favorable field in which to try the experiment; the art of raising prices on the strength of a false issue is too well known there.

There is one great objection to feelers just at present, though theoretically they may seem to be justified; it is a time when every man is engrossed with his own internal feelings—intense feelings—engendered by loss of business or fear of loss; and external things are likely to have no influence on him. If he gives a thought to freight rates at all, it will be to observe within himself that all other commodities are falling in price, and that the railroads must be fools. Wages controlled by labor unions, and the prices of some things controlled by powerful corporations, are, indeed, kept at high levels; but the "average man" does not consider these; he thinks more of those wage rates and commodity prices which are ruled by the law of supply and demand. Even if a railroad does feel justified in putting out a feeler, it is probable that a very small and very mild one will be the best. It will be at least two or three months before the rate clerks can prepare tariffs for the general advance that is talked of, and another month will be required for the statutory notice; and to feel the public pulse three months before the surgical operation is to be performed may be worse than useless. In that period there will be time for many changes to occur. One change may be important; the railroad presidents may change their minds as to whether an increase can be agreed on. They may conclude that the rates which cannot possibly be raised are so numerous as to make a general increase wholly impracticable. There is one other contingency: nearly all of these proposed changes are in interstate rates, and those presidents who have conferred about them may be imprisoned for violation of the anti-trust law!

The establishment of a through subway connection between Atlantic avenue, Brooklyn, and the main line on Manhattan island has an importance far beyond that of its immediate benefits. Heretofore, the time required for transit to the remote parts of Brooklyn and to Long Island points has been so great that development was slow; a densely populated territory had to be traversed and a river crossed. But the time-saving of the subway route is tremendous. The Long Island commuter to Wall street saves some twenty minutes each way; nearly or quite three-quarters of an hour a day. the man who sleeps in the Flatbush part of Brooklyn and works in Manhattan saves more than that. Since suburban residence around great cities is determined largely by two factors—ground rent and time of transit—it is obvious that the great empty areas east and northeast of Brooklyn are now going to have their chance, and that a great many city workers are going to have more light and air than they have ever before been able to have at the same rent without increasing the time length of their daily journey. The position of the Interborough Rapid Transit Company as a beneficiary of this travel is most interesting. By giving a service unparalleled in all the world, it gets a maximum haul in both directions at the same time during the rush hours. The southbound train that discharges a mob of passengers at Fulton street and at Wall street at 8.30 a.m. leaves Atlantic avenue 18 minutes later, northbound, with the cars crowded—that is to say, the same train discharges two maximum loads at Wall street in a little over thirty minutes. The Long Island Railroad is almost as fortunate as the Interborough, though not for the same reason. For years it has been spending great sums on its Atlantic avenue improvement, taking the tracks off grade, where rapid service was impossible, and building a splendid tunnel and elevated structure. Now the Interborough brings it the business for this line, and will doubtless continue to bring increasing amounts of it every year, changing the Long Island from a June-to-October road to a January-to-January one, and building up a steady suburban traffic that will tend to push out further and further along the main lines. Last but not least is the tribute the subway extension brings to construction by private capital. The Interborough contracted to open its line on May 1, and it opened it on May 1, in spite of all the construction difficulties that arose. When the city undertook the vastly simpler task of operating the Staten Island Ferry its new boats were two seasons late, its Staten Island terminal three seasons late, and its New York terminal is four seasons late at time of writing, and gives abundant promise of another year.

THE STRENGTH OF CULVERT PIPE.

There is little published information regarding the stresses to which culvert pipes in railroad embankments are subjected by the conditions of bedding and earth pressure. The ordinary cast iron water pipe, generally used for this purpose, is designed merely to withstand the internal hydrostatic pressures encountered in service, since in most cases this gives pipes of the desired rigidity. The external stresses have heretofore been regarded as indeterminate, authorities agreeing that there seemed no satisfactory way of computing them. For that reason the tests which have been made at the University of Illinois on both cast iron and reinforced concrete culvert pipe are of special interest and value in throwing light on this subject.

The experiences of different roads with cast iron culvert pipe do not seem to be uniform, some claiming to have little or no trouble, while others have a great many breakages. We have heard of one road which made it a rule not to use cast iron pipe in banks under 10 ft. or over 25 ft. high. But the real conditions to be observed are careful bedding and tamping to assure as even a distribution as possible of the bearing pressures. This may be further helped by shoring up the barrels of the sections to equalize the support, and some roads do this.

Proper trenching is presupposed. Engineers have reported pipes breaking without apparent adequate cause. With the ordinary rectangular-bottom trench it is harder to equalize the pressures than where the bottom is curved and the material is well tamped around and under the pipe. Tamping is very necessary; otherwise, the earth immediately under the bottom element is unduly compressed and concentrated loading results. There is a record of some 48-in. cast iron pipe $1\frac{1}{4}$ in. thick being flattened $\frac{1}{4}$ in. under an 8-ft. fill, and more than $\frac{7}{10}$ in. under a 22-ft. fill. Pipe of these dimensions distorts slightly from its own weight, careful measurements of lengths lying on the ground, and therefore having one line of support, showing a difference between the vertical and horizontal diameters of over $\frac{1}{10}$ in. With an increase of the thickness to $1\frac{1}{2}$ in. this distortion was not noticeable.

The results of the University of Illinois' tests were presented in condensed form by Professor Talbot, of that university, in a paper presented at the April 15 meeting of the Western Society of Engineers. In addition to the main tests, the investigation included a lot of auxiliary tests to give data on the action of pipes in other methods of testing. In discussing the mechanics of pipes and rings subject to external pressure, formulas were developed for the bending moments under certain assumed conditions of loading. These are intended only to serve as a basis for calculations, since the assumed conditions do not represent accurately the conditions of bedding and loading found in practice. The nature and extent of the possible or probable variations from the assumed conditions were discussed, however, and the effects of such divergence considered. In the main tests a special testing apparatus was used. It included a box of stiff construction, the pipes being embedded in sand in this box and the load applied through a saddle resting on the sand cushion. Nine cast iron and five reinforced concrete culvert pipes were tested. Both light and medium weights in the cast iron pipes were used. Four were of 36 in. diameter, two being 1 in. and two $1\frac{1}{4}$ in. thick. Five were of 48 in. diameter, three being $1\frac{1}{4}$ in. and two $1\frac{1}{2}$ in. thick. In the order given, the average breaking loads were, in pounds per lineal foot, 24,750 lbs., 37,250 lbs., 28,800 lbs. and 51,950 lbs.

The reinforced concrete culvert pipes were the designs of the Chicago, Burlington & Quincy Railroad, described in the *Railroad Gazette*, October 12, 1906, but improved in a number of respects since that time. All of the pipes were 3 in. thick, the difference being in the method of reinforcing. The load at first crack, in pounds per lineal foot, varied from 4,950 to 10,960 lbs. The maximum load varied from 23,800 to 31,500 lbs. The data does not indicate the method of reinforcing corresponding with these figures. It should be mentioned regarding these pipes that two of them were frankly experimental, and in one, for some reason unknown, the concrete proved poor. Only two of the five, therefore, were representative. We assume that it was these two that showed the highest loads.

One notable difference between the reinforced concrete and cast iron pipe is that while the latter collapse completely under a maximum dead load, the action of the reinforced concrete pipe is quite different. Final failure is through crushing of the concrete, and after passing the critical load there is a large margin of strength available in an emergency. Reinforced concrete pipe can be made as strong as cast iron pipe simply by increasing the thickness of the concrete, the gain being proportional to the square of the diameter. The object with this pipe, however, should be simply to make it strong enough to stand the service when carefully and properly laid and thus save as much as possible over the cast iron pipe. Another consideration is the possible saving in transportation costs, which are sometimes excessive on new work. We have heard of one case recently where 60 cents per ton mile was paid for testing cast iron culvert pipe for a new line which was being built through very rugged country. Reinforced concrete pipe can be made at or near the site, saving this considerable additional expense.

PIECE WORK AND PREMIUM WORK.

For just about ten years, or from 1898 through the greater part of 1907, the railroads of the country had so much work to do that the problem of getting it done was paramount, and economy and efficiency had often to be subordinated. Following the brief let-up in the fall of 1903 and the early part of 1904, the urgency was greatest in the last three years of the period of great prosperity, and one very unfortunate result of this urgency was the lessened control of the general manager, the superintendent, the division superintendent and the master mechanic over their men. When men are looking for jobs they are very amenable to discipline; when jobs are looking for men discipline is an exceedingly hard thing to enforce, and the practical application of this principle was, as everybody knows, that operating costs got pretty well out of hand last year. The day's work was small, the price high, the quality not good. Estimates of the average loss of efficiency per unit of labor ranged all the way from 15 to 50 per cent. or even higher, while wages had increased from 10 to 35 per cent. within two years.

The great economies now being practiced in all railroad departments are not due primarily to the increase of individual efficiency, they are due to rigorous weeding out of unnecessary labor—even of labor which is going to be necessary again very soon—to cessation of all except the most urgent work, and, to a certain extent, to reduced costs of material, principally lumber; but the individual efficiency is there, too, to an extent that it has not been for a decade, and the output of work along all lines where it is not strictly measured by rule is astonishingly great, per unit of labor. The place where it has been most difficult to put economy on any sort of basis that gives signs of permanency is in the shops. Wage reductions have been very difficult to make, with the result that a great many men have lost their jobs entirely who could have been retained to mutual advantage if a small general scaling down could have been effected.

It is very natural that it should have occurred to a great many master mechanics and general managers that the times were favorable for an extension of the piece work system or the premium system of work. Piece work and premium work have, on the whole, succeeded very well where they have been firmly established, but there has been the greatest difficulty in establishing them. The attitude of the mechanics' union has been not to refuse work in shops where piece work was already established, but to fight with the greatest bitterness new extensions of the principle. The reasons for this are very plain. When it comes to a show-down, union labor is unable to drive piece work and premium work out of its present strongholds, and it does not care to make the attempt, but every extension of the principle means more workmen who see a tangible reason why they should not be bound to the standard of the dullest—and labor and trade union strength, in the last analysis, rests on the standard of the dullest. It may truly be said, therefore, that piece work and premium work have two very important uses which are clearly defined from one another; they lessen manufacturing cost and they tighten the hold which the general manager or the master mechanic has over his men, not by imposing hard conditions, but by granting very easy ones, and by showing a workman, in terms of dollars and cents, that when he is doing good work for his company he is doing good work for himself, and that if he cares to be a sluggard the cost is borne by him and not by his company.

The strength of the piece work plan and of the premium plan alike is on the surface; the weakness of them lies in the violence which they do to human nature, particularly during the critical period when they are being discussed, but are not in operation, and the labor organizers have been quick to take advantage of the arguments which appeal most quickly to human nature. Unfortunately, in some cases, these arguments have been entirely true. The standard labor union argument against piece work is that the faster a man works the faster he has to work, and if there are three extremely able machinists in a shop of twenty, all working on piece work, in the long run there will be three men earning standard wage and 17 below, instead of 17 men earning standard wage and three men above standard.

Let us frankly admit that this has sometimes been true, or at least that the principle of it has sometimes been found, although the case as stated is exaggerated; but it has not generally been true. The three pacemakers have generally been able to earn a good deal more than they could have earned on the day wage plan, and the rest of the shop has also generally been able to increase its earning power, while the really useless men have been eliminated; but it has been necessary to handle the shop with the greatest care, the greatest skill, and the greatest fairness, to bring this about. When a shop is first put on piece work the master mechanic generally does a little quiet tallying for a few days or a few weeks and gets a good line on the normal average output of the ordinary man, and it is not difficult to get a fair average price out of the figure thus obtained. The difficulty has lain in convincing the workmen that it was a fair price. The premium or bonus plan undoubtedly has an advantage that psychology affords it in this connection. Under the normal workings of the premium plan the workman has his regular, accustomed day wage anyhow, and if he is disposed to accelerate he can earn a premium on the output above an established standard. If he cannot earn a premium, no harm is done; if he can, he does not damage his neighbor even in theory, because his neighbor's guaranteed wage is not affected thereby.

To ascertain the progress of the piece work and premium work movement we recently made inquiry of a large number of railroads, asking them whether or not they were using these methods and how the plan was working. Most of the officers who replied to our inquiry felt that the subject was a delicate one and did not wish to be quoted, either by name or by the name of their company, for the opinions which they expressed. It is possible without violation of confidence, however, to point out in a general way some of the tendencies which clearly appear from the correspondence.

It is curious and interesting that out of fifty replies, gathered from all parts of the country, and representing small individual railroads and large railroad systems alike, the division between those who use piece work or premium work, in whole or in part, and those who do not, was exactly even—25 to 25. Of the respondents who do not make use of piece work ten may be classed as individual roads, relatively small, and fifteen as railroad systems, relatively large. Of the twenty-five companies using piece work or premium work in whole or in part, eighteen are large roads and seven are small roads. It has been substantially the unanimous experience of piece work and premium work shops that car repairs were most easily placed upon the unit basis. In most cases locomotive repairs are also done on this basis, but one or two roads reply that they have been unable to make the change in the locomotive department. Yet difficulties arise in connection with repair work which are found to a much less degree in original manufacture. Where the employee makes only one article as his whole occupation, it is comparatively easy to adjust his pay; where any question arises as to the amount of time it ought to take to do the job, the uncertainty is always very unsatisfactory to the men. Thus in the repairs of freight cars a man may receive a given amount for changing a drawbar, but if the weather conditions are against him, or the make of the drawbar is peculiar, he is unable to make as much as his neighbor who is in better luck. The skilled mechanics on one road make objections on the ground that piece work and premium work alike restrict and limit a man to doing one thing, thereby narrowing his efficiency and limiting his ability. Some of the competent mechanics on this road, who have served their time and know that they are efficient workmen, feel strongly that they cannot afford to restrict their fields of work by confining their efforts to one line or to one machine.

The human nature objection to piece work—that the few men in a shop who can earn abnormally high wages are disliked and distrusted by all the others—is probably the most serious obstacle of all and requires much tact and fairness on the part of the master mechanic. As one superintendent of machinery puts it. "If the piece work price is high enough for the poor workman to make fair wages, the good workman will make such high wages that it is unsatisfactory to the other men."

These difficulties are all tangible, and the obvious chance which the shop foreman or the master mechanic has to discriminate between men and between trades by the piece price which he establishes is also obvious, consequently these objections have been urged so strongly that many roads have tried entirely without success to put some unit pay plan into effect, while others would like to try, but have given it up as hopeless without an attempt. In view of these things it is most interesting to trace out the actual workings of the system. (For simplicity we are now grouping piece work and premium work together, although the principle is radically different. A separation of the two will be made further on in the discussion.) The following list is taken direct from our replies and shows the different kinds of work which different roads specify they are doing on the piece or premium basis:

Turning car axles	Switch and frog work in forge shops
Boring car wheels	Buffing
Moulding	Part of tinsmith work
Some work in blacksmith shop	Coach cleaners
General repairs to locomotives	Brass cleaners
Work in paint shops	Caboose shop
Car cleaning	Air-brake shop
Wiping	General locomotive repair work
Upholstering	New car building
Bolt making	New locomotive building
Steel car repairs	Certain machine tool work

We asked specifically how the earnings of the men and the economy to the road compared under the two systems, and we have tabulated the specific replies to this very important question as follows:

	Men earn.	Saving to company
Road A	55 per cent. more.	45 per cent.
" B	1/3 to 1/2 more.	Output very much increased
" C	12 to 15 per cent. more.	15 per cent.
" D	25 per cent. more.	25 per cent.
" E	25 to 35 per cent. more.	....
" F	15 to 25 per cent. more	20 per cent.
" G	33 1/3 per cent more.	50 per cent
" H	Some men do not make their day rate, others on the same class of work make from 5 per cent to 18 per cent. above it.	

One large road gives a detail statement as follows: For the 1901 fiscal year, during which year all the company's shops doing general repair work turned out 282 locomotives, the cost of labor was $244,706. During the fiscal year 1907, when the company's shops turned out 491 locomotives, the cost of labor was $287,953; that is to say, the number of locomotives increased 74 1/2 per cent. in 1907 over 1901, while the cost of labor increased only 17.7 per cent. This change was not brought about entirely by the piece work system, since standardization of power, new and more improved machinery and better shop facilities also helped, but the principal item for the increased output and relatively reduced cost was the change from day work to piece work during the period. It is noteworthy in this connection that the average weight of the engines increased 66 per cent. during the period.

Another road gives the following comparative statement of employees working at piece work and at day rate in March, 1908:

Comparative Statement of Employees Working Piece Work and at Day Rate, March, 1908.

Department	Total amount earned: Piece work.	Total amount earned: Hourly rate	No. men who worked at: Piece work.	No. men who worked at: Hourly rate only	Average hourly rate paid for: P. W., cts.	Average hourly rate paid for: D. W., cts.	Efficiency for P. W. over day work per cent
Erecting	$1,051.31	$6,647.28	93	93	29.88	22.56	33.6
Machine	4,729.80	1,773.48	76	106	38.50	22.21	72.3
Blacksmith	3,060.24	2,137.85	72	26	34.33	22.13	55.1
Boiler	1,633.56	5,117.24	54	99	33.50	21.11	58.5
Air brake	1,176.92	1,945.20	16	40	44.25	22.81	94.0
Tender	854.62	203.59	21	5	23.52	18.05	[illegible]
Total	$12,506.45	$20,824.64	332	369	34.00	21.17	58.3

The foregoing outline of the piece work and premium work problem the present status of it and the economies to be effected by it must be regarded only as preliminary. We desire to enlarge the discussion, particularly with reference to the objections, good and bad, brought forward by labor when it is proposed to introduce piece work and to the best ways of meeting these objections. We shall welcome additional correspondence on this subject.

General Electric Company.

The sixteenth annual report of the General Electric Company, for the year ending January 31, 1908, shows gross profits of $6,586,653, after deducting all patent, general and miscellaneous expenses and allowances for depreciation and losses, and writing off $3,745,989 from factory plants. After paying $5,183,614 in dividends, a balance of $1,403,039 was carried to surplus account, bringing up the total surplus as of January 31, 1908, to $16,513,836. Last year the company's profits were $8,427,843, but the actual sales billed in the 1908 year amounted to $70,977,168, as against $60,071,883 in 1907.

The reports of the General Electric Company have for some time stood as an example of the way an industrial company ought to handle its finances and tell the public about them. The picture of the business year is made perfectly plain, and there are no frills in the asset and inventory values. The company has naturally had to make very heavy expenditures in the purchase of patents and will presumably have to continue doing so for many years to come in order to keep abreast with the best electrical science of the day. The value of its patents, franchises and good will account stood on the books of the company at $8,000,000 on January 31, 1897. On January 31, 1907, this account had been reduced to $1 by progressive writings off, charged to the current operating surpluses. During the 1908 fiscal year the company spent $872,346 in acquiring other patents, licenses under patents and in patent litigation, and promptly charged it off to profit and loss, so that the company's patents, franchises and good will still stand on the books at $1. This is an admirable record, and the manner in which the book values of the factory plants have been written off, year by year, is no less admirable. Starting in 1893 with plants at Schenectady, Lynn and Harrison, valued on the company's books at $3,958,528, the company during the subsequent 15 years to date has spent $30,892,486 on expenditures and betterments to its plants, making a total of $34,851,014, from which 22 millions have been written off for depreciation and replacement, leaving the book value of the plants, on January 31 of the current year, at $12,900,000, entirely free from mortgage or other lien; an average valuation of but $2 per square foot of floor space, including land, buildings, power houses, machinery, tools and all other equipment.

The company on January 31, 1908, had no floating debt at all and had only $1,759,517 in accounts payable, as against $29,857,727 of notes and accounts receivable. It reported $12,250,721 of cash, as against $3,910,709 in January, 1907, the difference being in considerable part accounted for by the funds derived during the year by the issue of $12,872,750 of 5 per cent. 10-year convertible debentures and by the sale of $1,594,600 of new capital stock. Thus the company's cash position is excellent, as it is highly important that it should be. Collections of its very large accounts receivable will presumably be slow in dull times, although the company actually collected some $66,000,000 from notes and accounts receivable during the year, as against $53,000,000 collected in the 1907 fiscal year. All but $3,544,586 of the $27,094,348, representing the face amount of notes and accounts receivable on January 31, 1907, was collected during the year.

Among the important orders received during the year were: One hundred and sixty-five-mile transmission for Great Western Power Company, California; Detroit tunnel electrification; Cascade tunnel electrification, Great Northern Railway; electrification of Southern Pacific suburban lines in California; electrification of Hudson tunnels; additional equipment for West Jersey & Sea Shore, and for New York City terminal of the New York Central.

The following table shows the company's sales and orders for the last six years:

	Sales billed.	Orders received.		Sales billed.	Orders received.
1908....	$70,977,168	$59,301,040	1905....	$39,231,328	$35,094,807
1907 ..	60,071,883	60,483,659	1904....	41,699,617	39,060,038
1906 ..	43,146,902	50,044,272	1903....	36,685,598	39,941,451

NEW PUBLICATIONS.

Locomotive Breakdowns, Emergencies and Their Remedies. By Geo. L. Fowler. Revised and enlarged by Wm. W. Wood. New York: Norman W. Henley Publishing Co. Fifth edition, 266 pages, 4½ in. by 6¾ in., 90 illustrations, semi flexible cover. Price, $1.00.

This is a revision and enlargement of a book that was first published in 1903 and was reviewed in the *Railroad Gazette* for November 27, of that year. The present revision consists of the addition of chapters on the Walschaerts valve gear and the Pyle-National headlight, the intercalation of a number of questions into the chapter on injector troubles, a complete revision and rewriting of the chapter on air-brake troubles and the omission of the one on the first aid to be given to the injured. The book is valuable and convenient.

American Railway Association, Proceedings, Vol. IV, 1903-1906. New York: Published by the Association, 24 Park Place. Price, $5.00.

This volume of the Proceedings brings the record down to and including October 24, 1906. It consists of 737 pages and, as in former volumes, the index is very full, serving in some cases to make unnecessary a reference to the text. For example, under the head of Car Service Committee's reports, the index item consists of a two-page abstract of the things done at the several meetings which were held in the four years covered by this volume. All of the doings of the association in connection with the International Railway Congress at Washington in 1905 are here recorded. The volume also contains the Rules for Determining the Educational and Physical Qualifications of Employees, which were reported in September, 1904, and again in April, 1905; also all the revisions of the standard code which were adopted in the four years named.

CONTRIBUTIONS

Written Examinations on Train Rules.

New York, May 4th, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

In your editorial on "Written Examinations on Train Rules" in your issue of April 24, 1908, you state "we understand that this is the first interurban road to follow this plan." The writer begs to call your attention that complete written examinations were required of all trainmen by the Rochester & Eastern Rapid Railway Company more than two years ago.

J. H. PARDEE,
Operating Manager, J. G. White & Co.

Young and Inexperienced Telegraphers.

TO THE EDITOR OF THE RAILROAD GAZETTE:

According to a press despatch of April 28 the Railroad Commissioners of New Hampshire blame the Federal government for a butting collision of freight trains which happened near Haverhill, in that state, on March 20, and in which five men were killed and two others injured. Because of the Federal statute the road "had to hire young and inexperienced operators." The collision was due to the dropping of the word "East" from a telegraphic order directing the trains to meet at East Haverhill, making it read "Haverhill." The trains met at Haverhill, running 30 miles an hour.

I do not know whether this is a true report of the Commissioner's opinion but there is no doubt that many citizens do accept the view set forth, especially where an official body, competent or incompetent, promulgated it as a reasonable one; therefore I ask you to take a line or two to show its absurdity. Assuming that good operators really are unobtainable, how is it that the New Hampshire Commissioners did not earlier report the fact to Washington? Congress allowed a year in which to prepare for the law, but no protest was made until the year had nearly expired. And if poor operators have to be employed is it rational to run trains in exactly the same way as though the offices were properly manned? It would seem more reasonable from the standpoint of safety of life and limb to reduce the speeds of trains if the operators are not well trained; or to run trains entirely by time-table rules as we used to do, and not to try to use the telegraph. Suppose the Federal government had ordered the railroads to dismiss their bridge inspectors and boiler inspectors and trust to luck for safe passage over bridges and for immunity from boiler explosions; would a sensible New Hampshire railroad man obey the order and continue trusting his life on his trains? Of course not. He would either disobey the order or else cease running trains. If the Federal government requires impossibilities why not accept the situation, and "lay down"? Then Congressmen might perhaps see their folly.

D. W. C.

[If such a dilemma really exists, the superintendent who aims to give safe service is indeed "up against" the question of going back to the methods of 1850. More likely, however, the story is only a hodge podge of generalities. We cannot class it as "sensational" because operators who omit words from orders, and despatchers who fail to detect errors in operators' repetitions have been heard of too frequently in the past. If "young and inexperienced" persons are the only ones available as telegraphers and if after a year no remedy is discoverable, it would seem wise to use telephones, as a number of railroads have done. Surely, an established railroad is not reduced to the necessity of employing "young and inexperienced persons" as station agents. But why have not the New Hampshire Commissioners long since secured the adoption of the block system in that state? Under that method of regulating trains "young and inexperienced" persons are far less likely to make fatal errors.—Editor.]

Refrigeration in the Transportation of Fruit.

BY JOSEPH H. HART.

The transportation of fruit from California and the South constitutes an ever increasing phase of railroad freight. The question of the preservation of this fruit during transit is one that has been solved in a general way with more or less success. At present, the greater part of the fruit is shipped under two general systems, namely, ventilation and icing in the winter and early spring when temperatures are low. The fruit is shipped in refrigerating cars with the ventilators left open, so that currents of air circulate through the car when in motion. Later in the season when the temperatures are higher, ventilators are closed and the tanks at the end of the cars kept filled with ice. Both of these methods are subject to considerable objection and are very inefficient from an economic viewpoint, at least in comparison to the possibilities in this line. In order to supply adequate ventilation the cars are never completely filled and the ice tank at the end of the car represents so much waste space. When ice is used the fruit undergoes a gradual cooling process which sometimes takes as much as seven days to lower the temperature of the fruit to that at which decay is prevented. Thus the ice must not only do the duty of cooling the fruit but also maintain low temperatures during transit. At least this is the condition in theory, while in actual practice much of the fruit is merely undergoing initial cooling during the entire period of transportation.

In order to determine the bearing of the different methods of handling and shipping and also of the effect of delayed shipment upon the losses by decay and the keeping quality of the fruit after arrival at the market a comprehensive series of shipping experiments have been conducted in California and elsewhere by the United States Agricultural Department and some interesting results have been attained. The results of these experiments are quite fully set forth in a bulletin which is in process of publication by the Bureau of Plant Industry. However, a number of railroads and individual shipping associations have conducted a series of similar experiments which have equal bearing upon the conditions and these are not fully stated.

Pre-cooling of the fruit has been the line upon which all these developments and experiments have been attempted. Oranges shipped from California have been pre-cooled in the government experiment plant in Los Angeles, and the Santa Fe interests and Southern Pacific system have also erected plants of the pre-cooling type. The chief difficulty in this process of pre-cooling is in the time which must elapse in order to accomplish this. Generally from 18 to 24 hours is required to cool oranges or other fruit in bulk to a temperature at which decay is impossible, and even under these circumstances portions of the fruit are cooled considerably below the danger point at which freezing occurs. The railroads, however, and private interests as well, are going ahead with pre-cooling plants, and it undoubtedly will prove a commercial success not only on account of the saving in fruit due to diminution in decay and the better quality of the shipment after transit but on account of a large number of other factors which enter as well in limiting the efficiency of the transportation process.

Thus pre-cooled fruit requires less ice for its transportation since the sole duty of the ice under these circumstances is to maintain the initial temperature. It is even advocated that pre-cooling be used during the period where ventilation is the prevailing method and icing is not necessary. With pre-cooled fruit, packing can be much closer and ventilation is not nearly as necessary and need not be as thorough. Thus recently oranges have been shipped to New York City in car lots from 519 to 584 boxes each, an increase of more than 40 per cent. over the standard car of 384 boxes. This increase in capacity is due not only to closer packing but higher packing as well. In many refrigerator cars during the icing period it is impossible to fill the car on the top tiers without very considerable loss due to the fact that the temperature is much higher at all times in the top of the car than in the bottom. With pre-cooling the average rise in temperature at the top of the car is from 8 to 10 deg. and the bottom about one-half of this. Even with this rise in temperature the average temperature of the fruit on arrival is usually lower than it is in a car under standard icing under the same conditions of weather and transit.

This development of pre-cooling fruit before shipment is undoubtedly bound to be of increased importance in the near future. The saving in ice for icing in space for shipment, in inefficient labor in handling, and in improved quality of the shipment after transit, are the main features which determine this result. With this question of pre-cooling as one apt to become important, the question of methods of pre-cooling and a determination in regard to the agent for the performance of this duty are of interest. Undoubtedly the railroads in supplying refrigeration for shipment do not keep the material cooled during transit. The effect of icing is merely to produce initial cooling toward the end of the transit period. The advantages of pre-cooling may be such in the line of space and increased efficiency for the railroad that they may undertake this duty for their own individual interest. The question of time involved, however, during this process is one of very great importance and its solution is dependent upon a number of factors which may or may not limit the efficiency. Thus, to-day pre-cooling is accomplished either before packing or after installation in cars. The Southern California system has erected in central California a plant of the car cooling type. This plant is arranged to cool one car at a time by circulating cold air through the car. It was completed too late this season to be used for extended experiments. A few experiments have been conducted by the Department of Agriculture here in the pre-cooling of grapes but considerable difficulty has been encountered in the cooling of the grapes at the centers of the packages. The Santa Fe line has erected a plant of the warehouse type to which the fruit is brought and unloaded for cooling. This plant has a capacity of six or eight carloads and is provided with an air circulation system. The government plant at Los Angeles is of the car cooling type, with air conducts and fans capable of handling large quantities of air, and is similar in many respects to the installation by the United Fruit Co. at Springfield, Mo., installed for the refrigeration of the bananas during transit. An average of 18 hours is generally required for cooling shipments already installed in cars by even the best methods of refrigeration. More inefficient methods easily require an increase in time of 50 per cent. over this amount.

The cooling of fruit before packing will probably not be accomplished without considerable development in refrigeration practice and the design of automatic handling machinery, since employees object to working in the low temperatures in packing. Thus, if pre-cooling is to come under present conditions, it must be accomplished either in car units or package units. The question of adequate refrigeration is essentially one for refrigerating engineers and presents interesting new developments, although ones not involving new principles. Again, from the railroad or shipper's point of view must be considered the first cost of installation of a refrigerating machine in consideration of the fact that this latter is used only a small fraction of the time throughout the entire year. The question will be in regard to the installation of these plants, whether a series of small plants will be more efficient in actual practice than the shipment of the fruit directly to large central station pre-cooling plants or whether possibly the refrigeration can be sent by pipe line to a number of surrounding sections. A number of interesting developments and possibilities present themselves to both the railroad manager and the refrigerating engineer in this development. The possibility of utilizing ice plants for this system is of interest to the railroads, since natural ice is in the majority of cases the chief source of refrigeration in this field, even though mechanical refrigeration can be accomplished very efficiently and with a distinct advantage to the railroads. Again, not only is variability of supply for transportation an important factor in railroad consideration, but often personal interests and weather conditions affect the demand greatly. Thus in the last season the Santa Fe system was compelled to carry 20,000 tons of ice nearly 1,000 miles to take care of an increase in the shipment by icing of about 10 per cent. of the citron crop. This increase did not represent increase in output really but was merely an increase in the percentage of the citron crop supplied to the railroad for shipment under standard icing conditions.

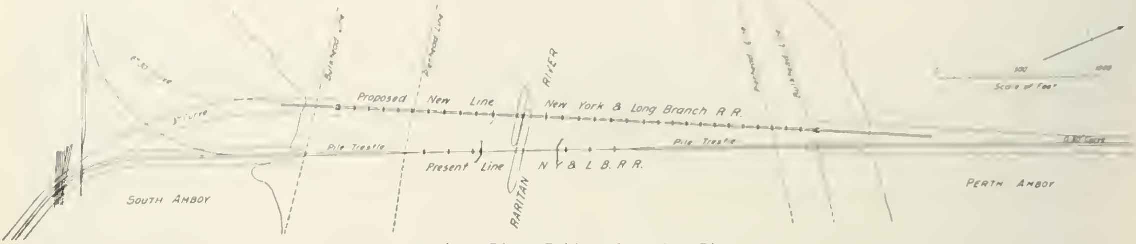
Thus the problem to the railroad is an essentially complicated one; not only cannot the demand for refrigeration be accurately foretold from crop conditions but immediate weather conditions enter as well. The requirement for railroad refrigeration is an extremely mobile and transportable refrigerating plant embodying all the increased efficiency of the mechanical refrigeration in the production of the icing but one capable of operating in large units with great efficiency and under what are often regarded as inadequate conditions by the refrigerating engineer. Whether this problem will be satisfactorily solved from the railroad viewpoint is a matter for the future alone to decide.

Training Enginemen—Prussian State Railroads.

The Prussian State Railroads had a rule which required a preliminary training as machinist or smith of all those who were permitted to become locomotive firemen. As an experiment, trial was made of approved laborers who had no trade, especially of men who had had experience in cleaning the engines. This has been so satisfactory that the practice will be continued; but such firemen are not eligible to promotion as locomotive enginemen, for whom the shop experience continues to be obligatory. And it is only after eight years' service on the railroad that laborers may be made firemen.

Raritan River Bridge; New York & Long Branch Railroad.

When the new bridge over the Raritan river between Perth Amboy, N. J., and South Amboy was put in operation on April 21, the New York & Long Branch Railroad was relieved of an obstruction which has been the source of troublesome delays in operation, especially during the months when seashore travel has been at the highest. The road is operated jointly by the Central Railroad of New Jersey and the Pennsylvania, and is on the direct line between New York and the numerous seaside resorts of the eastern coast of New Jersey—Long Branch, Asbury Park, Atlantic City and others. Heretofore, the Raritan river was crossed by a bridge near to the site selected for the one now in operation, but its capacity had been seriously hampered by the fact that although the line is double-track the draw was of the gauntlet type. Occupancy by two roads has made this feature even more objectionable than it would have been under other circumstances. In addition to the improvement which was effected by the reconstruction, advantage has been taken of the opportunity to adjust the alinement at the south end of the bridge so as to ease the curvature.



Raritan River Bridge; Location Plan.

The relations of the old and new alinement are shown upon the accompanying location plan. The lines of the New York & Long Branch and of the Pennsylvania Railroad diverge at South Amboy, just beyond the south approach to the bridge, the latter line leading to Camden and the former to the seaside resorts. As formerly built, there was a 7-deg. curve on the New York & Long Branch just at the approach to the bridge. By a change of alinement such that the south end of the bridge lies some 200 ft. west of the location of the old bridge it has been possible to reduce this curvature to 3 deg. without changing the curvature of the connection with the Pennsylvania line to Camden. This remains at 6 deg. 30 min. The new alinement strikes the former line at Perth Amboy, the new bridge thus standing at an acute angle to the position of the old.

In connection with the change of alinement at the south approach, other changes have been planned, but will not at present be carried out. In general, these involve the removal of the South Amboy station, or rather the construction of a new union station, in the angle of the Y formed by the divergence of the two routes, and the widening of the overhead roadway crossing to permit the construction of a road to the depot parallel to and west of the New York & Long Branch tracks. At present, such trains of the Pennsylvania Railroad as are scheduled to stop at South Amboy are forced to proceed around the curve and then back up to the station. The improvement will involve the expenditure of about $100,000 and will probably be undertaken in the near future.

Actual work upon the new bridge was begun two years ago—in February, 1906—though some preliminary work in the way of borings had been attempted before. Owing to the nature of the river bed borings were taken to a depth of 145 ft. as a maximum. The soil was found to consist of mud, clay and sand and gravel in order. Under such conditions piling formed a considerable proportion of the substructure work and some delays were experienced by the difficulty of securing piling of suitable length. As shown by the elevation the bridge consists of 17 spans of 88 ft. each, 11 spans each 100 ft., and a draw span of 331 ft. The magnitude of the pile-driving operations is best indicated by the accompanying table showing the number of piles, the length of piling used and the depth to which they were driven. Piers Nos. 1 and 31 are the north and south abutments respectively, and pier 20 is the pivot pier of the draw span.

The piers and abutments are of stone masonry with concrete backing. The center pier, rest piers and four piers on each side from the draw are of granite; the others are sandstone. Before piles were driven the river bed at the side of each pier was excavated, and the piles after driving were cut off from 5 ft. above the bottom of the dredged area. The space between the heads of the piles was filled in with broken stone and concrete. A grillage of five courses of 12 by 12 timbers was built upon the heads of the piles, 18 by 41 ft. in the case of piers Nos. 2 to 12 and Nos. 27 to 30, and increasing up to 26 by 58 ft. under piers 22 and 29 by 68 ft. under the rest piers Nos. 19 and 21. Under the pivot pier the grillage is 57 by 78 ft., and in this as under the rest piers six courses of

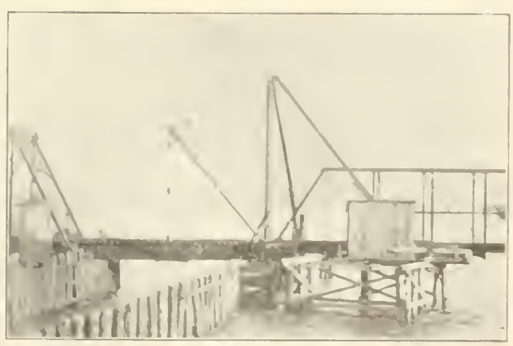
Sections and Plan of Abutments.



Improved Draw Span During Construction.

12 by 12-in. timber are used. The grillage and the outer rows of piles are protected on all sides by rip-rap extending to the level of the bottom of the foundation course of masonry.

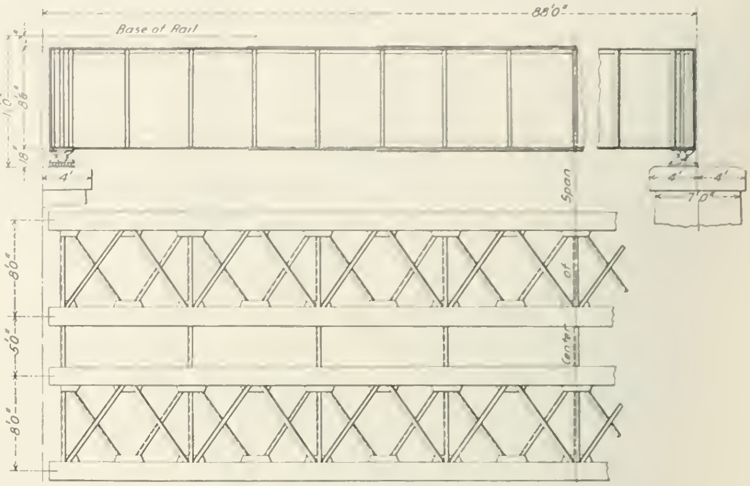
Upon this grillage the foundation courses are carried up to within 2 ft. of mean low water line where neat work commences. The latter is continued on a batter of ½ in. per foot and finished with a granite coping 2 ft. in thickness and with its bearing surface 6 ft. above the line of mean high water. The difference between mean high and mean low water is 5.4 ft.

For nearly the whole of the pile-driving a 70-ft. steam pile-driver was used, and it was found that the same number of piles could be driven in about one-third the time required by the use of the drop-hammer. The driver was one that was built by the contractors with such extensions as were necessary to adapt it to the driving piles of unusual length. The total number of piles driven was 7,600, ranging in length from 55 to 94 ft. Some of the other quantities involved in the work were: Dredging, 72,670 cu. yds.; rip-rap, 16,000 cu. yds.; lumber in grillage, 2,300,000 ft. board measure; concrete below neat line, 11,276 cu. yds.; masonry above neat line, 4,274 cu. yds.; granite coping, 660 cu. yds. The proportions in which the concrete was mixed were 1-2-5.

The entire length of the structure is: From face of south bridge seat to center line of rest pier, 936 ft.; from face of north bridge seat to center line of rest pier, 1,652 ft.; draw span, center to center of rest piers, 331 ft.; total, 2,919 ft. The length of the old draw was 172 ft.

The fenders for pivot and rest piers are built of 12 by 12-in. timbers supported on piling. That of the pivot pier is built in 10-ft. bents with 4 by 8-in. diagonal bracing between piles, 6 by 12-in. clamps and 4 by 8-in. bracing, all of yellow pine, and bolted with 1-in. and 1¼-in. bolts. The sheathing is 5-in. yellow pine placed vertically and carried by three 12 by 12-in. stringers. The bents next the pier itself, on each side, where pile support is impracticable on account of the pier foundation, have six 12 by 12-in. stringers in place of three.

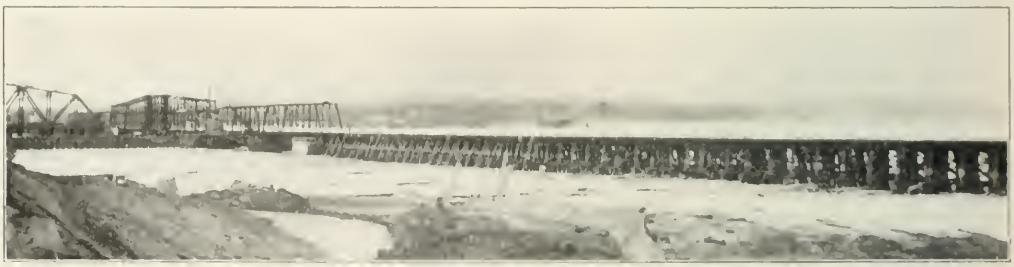
to their former position. The extent of the pressure exerted is shown by the bulging of the surface of the ground as far over as the embankment of the old line, some 200 ft., and by the fact that in some cases the ends of the brace piles were forced through the 5-in. sheathing though supported by the stringers on 5-ft. centers. The position of the abutment, however, was not disturbed.



Elevation and Floor System of Girder Spans.

SUPERSTRUCTURE.

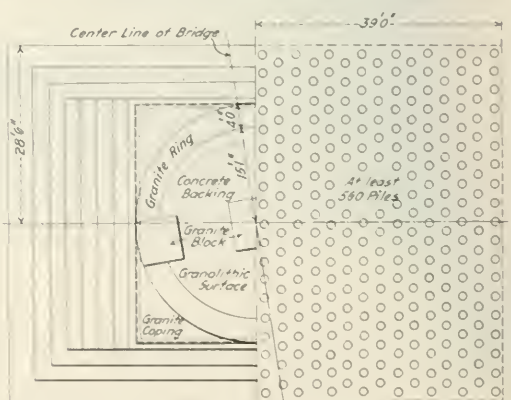
The superstructure, which was erected by the Pennsylvania Steel Company, presents no features of special interest beyond a general appearance of substantiality. With the exception of the draw, all spans are plate deck girders, 8 ft. 6 in. deep; four spans at the south end and 11 at the north end being 88 ft. long, the abutment spans 81 ft., the intervening spans 100 ft., and the draw span, as stated, 331 ft. The plate girders amount to about 4,000 tons of steel and the draw span to about 1,200 tons.



Raritan River Bridge; "Squashed-Out" Bulkhead and Old Trestle.

The fender for the rest piers is carried at an angle of 30 deg. to the face of the pier for a distance of 24 ft., and then at an angle of 60 deg. for a distance of 30 ft. on the side against the current of water traffic, and at the same angles for 24 and 30 ft. on the opposite side. The pivot pier is set at an angle of 10 deg. to the faces of the rest piers with the wider opening facing the current of river traffic. The construction of the rest pier fender is substantially the same as that of the pivot pier protection. The clear channel is 130 ft. on each side of the pivot pier.

At each approach the embankment is protected by a pile and sheathing bulkhead, that at the Perth Amboy approach being about 380 ft. long and that at the South Amboy approach about 275 ft. These were built 50 ft. on each side of the center line and the piles were driven to a depth of 45 to 50 ft. and spaced about 5 ft. apart with pile brace at each driven pile. The sheathing is 5-in. yellow pine plank carried by two 6 by 12-in. stringers. A remarkable demonstration of the character of the soil was given in the course of constructing the embankment within the south bulkhead. The weight of the fill carried the bulkheads in each direction to a maximum distance of perhaps 40 ft. The movement took place bodily until the position of the brace piles was brought so nearly to the vertical that they no longer afforded support, and the structure now rests with the brace piles in a substantially vertical position and the formerly vertical piles leaning at an angle of about 45 deg.



Raritan River Bridge; Foundation of Draw Span Pivot.

Though in no way connected with the new construction, an interesting expedient has been developed in connection therewith. On September 11, 1907, the center casting of the old draw span broke, making it impossible to operate the draw. In view of the prospect of speedy replacement with a new structure no attempts were made at repairs. Instead, the span next south of the draw was made removable and a derrick rigged on pile foundation just to one side of the adjacent span by means of which the span could be lifted from its seat and swung around away from the channel. A double row of piles was driven to serve as guides to the new channel, and in 18 days—during which, as may be supposed, the river on both sides became badly congested with craft of all kinds—the extemporized draw was in operation and afterwards worked as satisfactorily and expeditiously as the old draw. On the first day of its operation 115 boats passed through. Seventeen to 21 times per day is the maximum number of draw openings required in the busy season. The lift span weighs 20 tons, and it requires 1½ minutes to operate it with the derrick to give a clear passage way.

The cost of the entire structure as above described was about $1,000,000. All the steel work has been painted with Dixon's graphite. The contractors for the substructure and superstructure are named above. The work was done under the general super-

vision of Rufus Blodgett, General Superintendent, New York & Long Branch Railroad. James F. Cullen, Assistant Engineer, Pennsylvania Railroad, and H. R. Leonard, Engineer of Bridges and Buildings, Pennsylvania Railroad, were in actual charge of construction.

Foreign Railroad Notes.

Karl Stieler succeeds von Balz at the head of the Würtemberg State Railroads. Stieler, like his predecessor, had a juristic training, and has been in the railroad service only since 1900. The Würtemberg railroad administration is a bureau of the Ministry of Foreign Affairs.

A telegram from London prognosticates the completion of the "Cape-to-Cairo" Railroad in about six years, when the railroad in Portuguese West Africa from Lobito Bay to Katanga is opened. As this latter line is to extend nearly due east from the Atlantic in about 12 deg. south latitude, it is hard to see how it will bring the Cape railroads any nearer Cairo, an outlet which they need about as much as the Texas railroads need a connection with Hudson's Bay.

The Prussian State Railroads are experimenting with signal horns, with which conductors and brakemen are to repeat brake signals given by the enginemen, which on long freight trains sometimes are not heard by all the brakemen, especially in stormy weather when they have their collars turned up. It is also purposed to ascertain whether these horns may not be used to advantage when trains break in two. One management which has used the horns for repeating starting signals, reports that they can be heard for great distances, even against the wind.

Existing and Projected Railroads in China.

According to a consular report from Thornwell Haynes, of Nankin, the mileage of roads in the Chinese Empire now in operation, being built and projected, including the railroads built under the Manchurian concession, is about 9,000 miles. This is more than Spain's, only a thousand miles less than Italy's, and nearly half as much as in the United Kingdom. As compared with the United States, however, it is less than that of the single state of Illinois or of Ohio, or Pennsylvania, or Texas. The railroads are grouped below according to the nationality of their concessionaires.

CHINESE CONCESSIONS.

Peking-Siling.—This line, extending from the capital westward to Siling, is nearly 40 miles long. It was built by native engineers some years ago and has since been in continual operation.

Shanghai-Woosung.—This 12-mile line was first built in 1876 by an English firm. For a year it carried considerable traffic, but then the Chinese Government, objecting to its being in the hands of foreigners, bought it, tore it up and transferred the rails and rolling stock to Formosa. In 1898 the Chinese Government rebuilt it and it is now paying well. It is to be made a part of the Shanghai Soochow system.

Wuhu Sengan.—Surveys were recently begun on this line, beginning at Wuhu and running 30 miles to the southeast. At present the work seems to be at a standstill through lack of money. It is projected to Hangchow, in Chekiang, 150 miles, to connect with the projected railroad system of that province.

Pinghsiang Chuchow.—This line, which at first connected the coal mines of Anyuen with Liling, 23 miles, has been extended west to Chuchow, on the proposed Hankow-Canton, and east to Pinghsiang, 66 miles in all.

Nanchang-Kiukiang.—A concession for this line, 76 miles long was granted to a Chinese syndicate some years ago. Recently the gentry of Kiangsi decided to begin building.

Chengtu Hankow.—The building of this road was authorized some years ago. It is said that the gentry and officials of Szechuen have decided to start the construction of the 60 miles between Chengtu and Chiangkou and thus begin the building of the proposed road to Hankow, which will be the great trunk line crossing the Empire from west to east, as the Peking-Canton line is to be from north to south. When completed the road will be some 800 miles long.

Changsha-Chenchow.—During the early part of 1906 a Chinese syndicate was formed and got permission to build a road between Changsha and Chenchow via Changseh, about 200 miles. These cities are large and important commercially, all being in Hunan province, which is rich in coal.

Canton-Whampao.—A concession was given in 1906 to this line. It is only 10 miles long, but it is important not only because it would form part of a line passing through Swatow to Amoy to connect with the system of Fukien province, but that Whampao, with its deep and magnificent harbor, might seriously affect the commercial interests of Hongkong.

Amoy-Changchow.—This line, which will be about 30 miles long, is being built under the direction of the famous Lin family, formerly the millionaires of Formosa. It may, later, be extended to Foochow.

Swatow-Chaochowfu.—This line, which is 30 miles long, connects the port of Swatow with Chaochowfu, the capital of the prefecture of that name. It was built by Japanese contractors, and all the material except rails and locomotives was imported from Japan. It was finished in 1906.

Canton-Hankow.—This line was planned as a 750-mile extension to the coast of the existing line from Peking to Hankow. For financing the Canton Hankow line, the American China Development Company agreed in 1898 to spend $20,000,000. The concessions were sold back to the Chinese Government in 1906 for $6,750,000. Work on the main line has been carried about 70 miles above Canton, where it remains awaiting the settlement of a seemingly interminable struggle for dictatorship between the Viceroy at Canton, the gentry and the merchant.

Peking Kalgan.—This line, connecting the capital with Changchiakou or Kalgan, 125 miles, is being built with Chinese Government capital and by Chinese engineers at an estimated cost of $1,500,000. It has been decided by the government, at the recommendation of Viceroy Yuan Shih kai, to extend the line, when finished, from Kalgan to Urga, the capital of Mongolia, and thence to Kulun, on the Mongolian frontier, the funds for this extension have already been provided.

Chinanfu-Chentung.—The concession for building this line was originally granted to Germany, but, being redeemed, preparations for its construction and rolling stock are progressing.

Hangchow Soochow.—The gentry and people of Chekiang Province have formed a company to build their own railroad. They have appointed a Chinese engineer as chief engineer and are busily engaged in collecting capital. The first line to be built will run from Kungshun Bridge, near the settlement of Hangchow, to Kiangkan, on the Chentang River, 15 miles, whence it will be pushed on to Kashing and Soochow. A wise arrangement has been made among the gentry of the five provinces, Kiangsu, Kiangsi, Anhui, Chekiang and Fukien, by which the roads in their respective provinces when completed will have a uniform gage so as to form an intercommunicating system in east central China.

Kaifeng-Chengchou. This is a branch line of the Ching-han Railway, and connects Kaifeng and Chengchou. It is 50 miles long, and grading is completed.

Taiyuan-Pingyao.—This line is in Shansi Province, and the officials and gentry there have decided that the first road built by them shall connect Taiyuan and Pingyao, in the Fen Chou prefecture, 100 miles. They have also decided to build the following lines, for which they have the necessary authority: (1) From Tatungfu to Kalgan; (2) from Puchou to Tungkuan, in Shensi, crossing the Yellow River; and (3) from Pingyan to Tsechou, connecting with the Taokou & Tsechou Railway, which was built by the Peking Syndicate and afterward sold to the Chinese Government.

BRITISH CONCESSIONS.

By certain concessions in Shansi and Honan Provinces the Peking Syndicate (Anglo-Italian) secured rights to build a road from Taiyuan, in Shansi, to Singan, the capital of Shensi, whence a line is planned parallel to the Yellow river to connect with Kaifang, the terminus of a branch of the Peking-Hankow Railway. The same syndicate is also to build a line from Tsechou, on the southern boundary of its mine fields, to Singan, 250 miles, on the Han river. To connect the coal fields of northern Honan, work was begun on a line from Chinghua to Taokou, whence the Grand Canal could be reached by the Wei river, thus having water connection with Tientsin. The line has already been completed and ballasted for 90 miles from Taokou.

Peking-Newchwang.—This line, 555 miles long, is in operation. It was built with British capital, but sold two years ago to the Chinese Government. It runs from Peking to Tientsin, to which point it has a double track, thence through Tongku, Shanhaikwan and Kinchow to Newchwang.

Tientsin-Chinkiang.—The concession for this line is owned by the Anglo-German syndicate. The southern half has been apportioned to the British & Chinese Corporation and the northern half to a German company.

Soochow-Hangchow.—This line, 200 miles long, and the Kowloon-Canton line, which is under construction and 100 miles long, are concessions of the British & Chinese Corporation.

Shanghai-Nanking.—The concession for this line was secured by the British & Chinese Corporation. The Shanghai-Woosung line is included. The length of the road is 200 miles, passing through the cities of Soochow, Wusieh and Chinkiang. The line is in operation for about 150 miles from Shanghai. It is expected that the rest will be opened in the summer of 1908.

GERMAN CONCESSIONS.

Kiaochou-Chinanfu.—In 1889 certain German syndicates and the German Government obtained from the Chinese Government railroad and mining concessions in the province of Shangtung. By the treaty of March 6, 1898, the construction and maintenance of these roads were to be carried on by a German-Chinese company, formed as a joint stock company with the title of "Shangtung Eisenbahn Gesellschaft." This company was formed in Berlin in June, 1898, with a capital of $12,852,000, and shortly afterwards headquarters were transferred to Tsingtau. It was soon decided not to build the line from Chinanfu to Ichoufu, or any other point on the southern boundary of Shangtung Province. The Tsingtau-Chinanfu line was built during the winter of 1903, and has been in continuous operation ever since. It had its own postal and telegraph services until recently, when, owing to the strong representations of the Chinese Government, the separate postal service was given over to the Imperial Chinese postal service.

Tientsin-Chinkiang.—In May, 1898, a concession was granted to the Deutsch-Asiatische Bank and the British & Chinese Corporation, represented by the Hongkong & Shanghai Banking Corporation. The northern half of the line is to be under the control of the German bank, and the southern half is to be under the control of the Hongkong & Shanghai Bank, and is to run from Tahsien to Chinkiang on the Yangtse. The line will be in all about 600 miles long.

Chinan-Chingting.—A concession was granted to the Germans to build this line to connect with the Pekin-Hankow Railway, but the concession was recently, when the German railroad garrisons were withdrawn, resold to China for the price originally paid.

FRENCH CONCESSIONS.

Tongking-Yunnan.—This line is intended to connect Hanoi, in Tongking, with Mengtze and Yunnanfu, through the Lan river valley, about 290 miles. This line is in operation as far as Mengtze, and grading has been finished as far as Yunnan.

Langson Lunchow-Nanning.—The concession for this line, which is about 100 miles long, was secured in 1889. No work has been done on it.

Pakhoi-Nanning.—Nothing has been done on this line. The two cities are about 120 miles apart.

BELGIAN CONCESSIONS.

Ching-han or Peking-Hankow.—This line, which is about 800 miles long, was authorized in 1889. The part of the line between Lu-kao-chiao and Paotingfu, some 90 miles, was built with Chinese Government capital under the direction of British engineers. The concessionaire of the portion from Paotingfu to Hankow was the Franco-Belgian Syndicate. At present one train leaves Peking and one leaves Hankow daily and already attract many passengers and much freight.

PORTUGUESE CONCESSIONS.

Macao-Samshui. This line from Macao is to run to Siang-shan, thence to Kong-Moon and to Samshui, the terminus, where it connects with the Canton-Samshui branch of the Canton-Hankow Railway. Unlike nearly all the other railroads in China, this one will be an entirely commercial undertaking, free from all governmental interference or political control. As it will pass over the Canton and West river delta, many bridges will be necessary, making the work costly. The distance is about 130 miles.

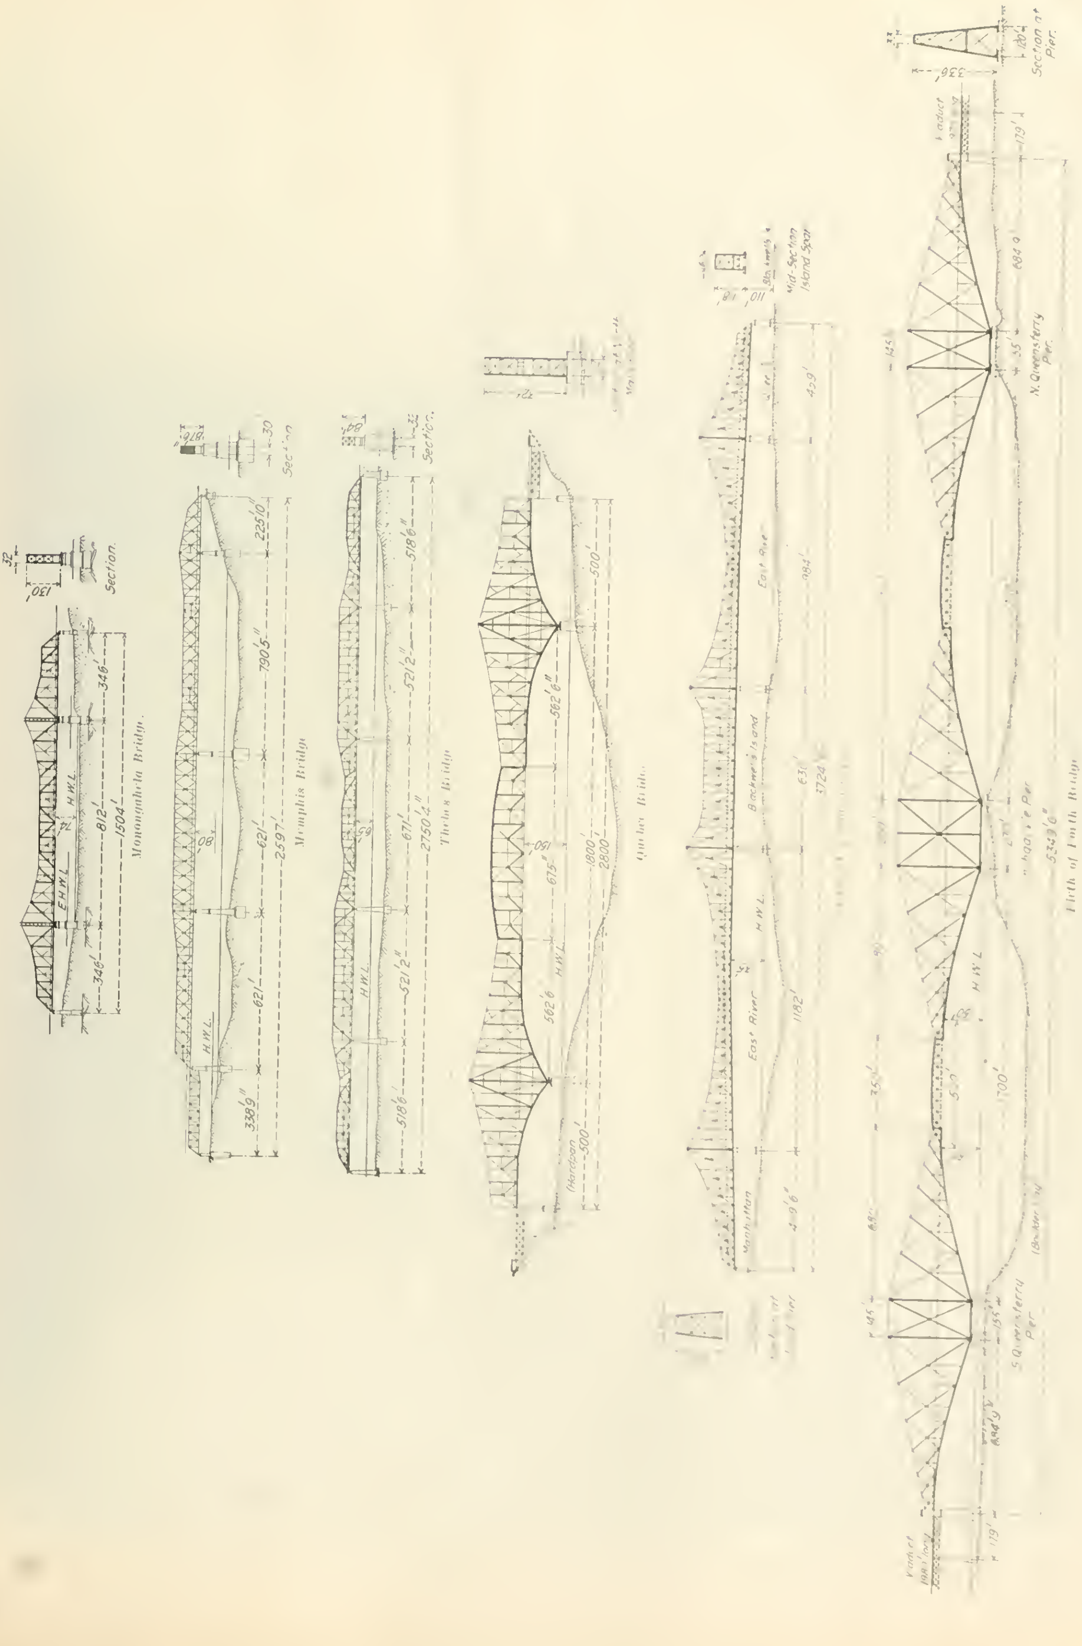
CHINESE IMPERIAL RAILWAYS.

Peking-Tientsin-Shanhaikwan-Newchwang.—For this road a loan of $11,155,000, bearing 5 per cent. interest, was made by the British & Chinese Corporation, whose agents are the Hongkong & Shanghai Banking Corporation. The lines mortgaged as security for this loan, and which are in operation, are the 84 miles Peking to Tientsin double track; 27 miles of single track Tientsin to Tongku, and 147 miles Tongku to Shanhaikwan, single track. This loan also has a first lien on the earnings of the 130 miles, Shanhaikwan to Kinchow, single track, and 130 miles Kinchow to Newchwang. These lines constitute a continuous 526 miles of road, exclusive of 30 miles of sidings, all of standard English gage. It has been computed by the engineer in chief of the imperial railroads in North China that the capital cost of the intra-mural line from Peking to Shanhaikwan, 258 miles, exclusive of sidings, was $9,529,000, or about $36,650 per mile. The cost of the line from Shanhaikwan to Chunghousu (40 miles) was about $40,315 per mile.

For the line from Peking to Chunghousu, a point 40 miles outside the Great Wall, according to the same authority mentioned above, the gross earnings before the year 1900 averaged $1,466,000, while the net income was $586,400, or 5 per cent. on the $11,728,000 capital. But railroad enterprise was then only in its infancy and the volume of both passenger and freight traffic must have greatly increased since, so that under proper management there is no reason why a profit of 8 or even 10 per cent. should not be returned. During 1905 it is computed that the net income was enough to pay a dividend of 20 per cent. on the capital cost. The bridges of these lines consist of steel girders resting on masonry or concrete piers and abutments, sunk by compressed air to a proper foundation. The largest and longest bridge on the intra-mural line is that over the Lan Ho, spanning a distance of 2,200 ft.

At Tongshan are the principal workshops, where several thousand men are employed in car building and general repair work. Here and in the vicinity are also the Chinese Engineering & Mining Company's mines, the products from which yield much traffic. The mines are now working as a joint stock company composed of foreign and Chinese stockholders and registered in London. They employ about 10,000 men; with an output of about 3,000 tons of coal per day. The shops for girder building are at Shanhaikwan, and can turn out 6,000 tons of girders per year.

The rolling stock is built similar to American types. The freight cars have 30 tons carrying capacity. The passenger cars are similar to those in America, having through passages and end platforms. At Kaochiao, which means "High Bridge" and is 60 miles from Shanhaikwan, there is a branch line running northwesterly for 30 miles, and connecting with the Nanpiao coal mines. These mines are pronounced by experts to be the richest and most valuable coal mines in North China. There are two large bridges on the Shanhaikwan-Newchwang lines—one across the Talingho, east of Kinchow, and the other over the Siaolingho, immediately south of the same city. The latter bridge, which was of much more difficult construction than the other, was built by a Chinese civil engineer who graduated from the Sheffield Scientific School of Yale University. At Yingkow, the sea port of Newchwang, is the more important terminus of the extra-mural line; 1,000 acres have been bought to take care of the traffic. The author states that in the preparation of this report he was greatly assisted by the *Chinese Daily Nanfangpao.*



Elevations and Spans of Six Great Cantilever Bridges.

Picked Up on the Road.

BY GULL.

The use of snow fences by American railroads in the northern climates has come *de novo* during the past 15 years. It was along in 1893 or 1894 that an article appeared in the *Revue Generale des Chemins de fer*, giving, in the usual French completeness of detail, the designs of snow fences on the several European roads and the results obtained from their use. At that time a snow fence was almost entirely unknown in the United States, while abroad they were common, especially in the Alpine country, though there was very far from being a uniformity of design. Soon afterward, in consequence of attention having been called to the matter or because of spontaneous processes of thought, the snow fence appeared in this country. Its form was tentative at first, and in some cases recourse was had to throwing up a bank of snow to serve as a deflector—a device said to have been efficient, but not sufficient. Soon, however, the present form was evolved, which now may be called standard. It consists of an open fence with horizontal bars of boards about 6 in. wide leaning towards the track at an angle of about 45 deg. with a slope back at the top at right angles to the lower part for a foot or 18 in. These fences are portable and it is interesting to note their location with reference to the track at different points, showing the effect of natural topography on the deflection of wind current and the drifting tendency of the snow. This drifting can be turned to good account, and it is strange, with all the troubles roads in the North had with snow shifts before the advent of the rotary plow, including expensive hand shoveling where the snow was thrown from one level to another until it reached the top of the bank, that no one ever noticed the tendency of snow to gather on the lee side of a fence, and utilized it to protect a suffering railroad beyond. But we didn't, and we had to wait for some scientific chap on the other side of the water to teach us the trick. However, we have evidently learned it now, and are profiting accordingly.

If there is any one thing more than another that adds to the comfort of the traveler by night, it is the berth light used in the sleeping cars of most western roads. It changes discomfort into luxury and is probably the most highly appreciated improvement that has been made for many a day. It does not take a very old man to recollect when there were no lights in the staterooms of our river boats, but that is a thing of the past, and it is to be hoped that the dark berth of a sleeping car will soon be in the same category. It seems strange that, though these lights have been used for years in the West, they are still a scarcity on eastern roads.

To paraphrase the enthusiasm of a western railroader, we (westerners) are the people. Whenever anything is brought out that makes for comfort or luxury, or, I may add, that has an advertising value, we take it up and put it through. So we have electrically lighted trains and trains brilliant with acetylene and Pintsch gas, and we use the latest wrinkles in them all. We have tourist sleeping cars to accommodate those who want them; and that weary, forlorn crowd that fills the ordinary coach on the night runs of eastern lines is almost unknown. We also have the chair car that gives almost all the comfort of a Pullman parlor and costs nothing extra.

Why is it that the average newspaper manager thinks that anyone can correctly report scientific matters, and, above all, matters pertaining to railroad mechanics, especially the mechanics of an accident, when they consider it necessary to have an especially trained expert to report on musical or dramatic performances? Are the intricacies of the locomotive or the track so very much simpler than the intricacies of the sonata or the fugue that anyone can understand, or, not understanding, can convey an understandable idea to the average reader? But really, isn't it quite as important, in its way, not to say that the main crank pin of the forward truck was broken off just inside the rear driving axle of a consolidation locomotive as it is to be able to point out the recurrence of the theme of the apprentice song in the Meistersinger? So, when some event of importance in railroad affairs is to be chronicled, why does not the Associated Press or the daily paper send a man who knows how to do the work? During a recent inquiry, the New York and Philadelphia papers gave from a half column to a column and a half every day to the matter, and discussed it very thoroughly and apparently to their own satisfaction, and yet not one of them came within gunshot of stating the case, but each went off and discussed a matter entirely foreign to that in hand, simply because the first reporter in the field jumped to a conclusion, and, as usual, jumped wrong.

I was the amused and highly instructed recipient of a Pullman porter's confidence the other day. "I ain't got no use fo de women," he said. "Dey needs mo waitin on dan a sick kitten. Dey wants dis and dey wants dat, and den dey wants de oder ting, and when you get true wid 'em, dey just says 'Tank yo.' Now you know dat a man can't live on 'Tank yo' and dat he wud starve to death on wot he gits fum de company. Now wid de men its diffunt; yo see a man puts his shoes down on de flo, and yo gits at 'em befo' he's up in de mawnin and blacks 'em up kinder nice, and dey ain one man in a hundred mean enuf not ter give yer suthin, whether he wants his shoes blacked or not. In a parlor car its diffunt too. What yo can make out o' a car depens morely on who sits in de front seat. If you comes along wid yo brush and he shakes his head, its mos' likely hat de men in de car will shake der heads too, and you won't git nuffin til yo comes to a man wif a lady. Den you kin git started and make suthin out o' de res' o' de car." All of which goes to show that there is a mutual understanding between the porter and the passenger that the tip is decidedly the result of a virtual hold-up, and that most men are too great moral cowards to resist, unless there is some courageous soul in the front end of a parlor car whom his fellow travelers follow with all the boldness of a flock of sheep.

Traffic Arrangements in Japan.

The annual report of the Imperial Government Railways of Japan for the year ended March 31, 1906, recently published, contains the following remarks:

"Among the principal traffic arrangements adopted during the year may be mentioned as follows:

"From April 1, 1905, alterations were effected as to the period of availability of tickets and at the same time rules relating to extra fare and overcharge were enacted and put into force. The available limit in the old system was graded at three days for distance of not less than 100 miles and under 200 miles, four days for distance of not less than 200 miles and under 300 miles, and five days for distance of over 300 miles. In the new arrangement one day is to be added for each additional 100 miles or fraction thereof, for distance of not less than 100 miles. The extra fare is to be exacted within the limit of three yen* for the first class, two yen for the second and one yen for the third in the following cases: when a traveler gets in a train without a ticket (this applies also to cases when a passenger has traveled without permission of the proper officials beyond the distination mentioned on the ticket), or has boarded a train with an invalidated ticket, or refuses to produce the ticket for examination or to deliver it for collection, the additional fare equal in amount to the regular fare will be exacted. When a traveler has removed to a superior class car without giving notice to the officials, besides exacting the balance the sum equal to it will be additionally charged. The additional payment is to be charged when a traveler who has no time to buy the ticket is allowed to get in the train by the proper officials, this payment being 20 sen† in addition to the regular fare. When the regular fare is less than 20 sen this payment shall not be more than the fare. * * *

"In April, 1905, a new arrangement was adopted for the handling of parcels of the same kind when they start at the same station and are destined to the same address and station, in case the parcels are more than two in number and come from one and the same consigner. The freight on such parcels is to be determined with the consent of the consigner on the average weight of one parcel. The new system was applied only to the three kinds of fresh fish, vegetables and fruit.

"In regard to the handling of wagon goods, it may be mentioned that from May 1, 1905, the grade of tea that was formerly included in the list of valuables was lowered to the third class. On October 1, rules relating to the rebate of freight for wagon goods were revised in regard to section pertaining to the Shin-Yetsu, Shinonoi and O-U lines. According to the former arrangement the rate was 3 per cent. for the sum that amounted to not less than 5,000 yen and under 8,000 yen a month, 4 per cent. for the sum of over 8,000 yen and under 10,000 yen a month, and 5 per cent. for the sum above 10,000 yen. In the new arrangement the rate was graded as follows: 2 per cent. for a sum over 10,000 yen and under 15,000 yen a month; 3 per cent. for a sum above 15,000 yen and under 20,000, 4 per cent. for a sum above 20,000 yen and under 25,000; 5 per cent. for a sum above 25,000 yen.

"From January 1, 1906, the scope of express delivery service of goods that was formerly confined within the limit of the seat of a station was extended and was made deliverable within the limit of a city where the station is situated or within the radius of 1½ miles from the station."

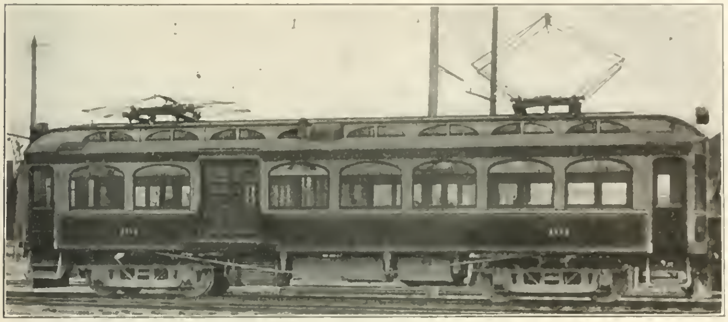
The railroads included in the German Railroad Union had 62,813 miles of road at the beginning of this year, of which 34,159 miles were in Germany, 24,338 in Austria-Hungary, 1,938 in Holland, 1,913 in Rumania, 306 in Russian Poland, and the remainder in Luxemburg and a Balkan state.

*A yen is about 50 cents in United States money.
†100 sen make a yen.

Single Phase Equipment for the Richmond & Chesapeake Bay.

The Richmond & Chesapeake Bay Railway was recently completed from Richmond, Va., to Ashland, 15 miles. It is planned to later extend it to serve the territory lying between Richmond and Washington. It is a single-track electric road with turn-outs, using single-phase current with a trolley potential of 6,600 volts.

There are no sub-stations for the operating current, but there is a lighting sub-station at the Ashland terminus. The road has at present no power station of its own, the generating apparatus being installed in the Twelfth street power house of the Virginia Passenger & Power Co. This consists of two General Electric 750-k.w., 25-cycle, three-phase generators running at 128.5 r.p.m. and designed to give 6,600 and 13,200 volts. One of these generators is direct-connected to a 1,450-h.p. hydraulic turbine at one end of the shaft and to a 750-k.w., 60-cycle, 2,300-volt, three-phase generator at the other end, both units being mounted on the same base. Should there be insufficient water to operate the turbine, the 60-cycle generator will be run as a motor. The other 25-cycle machine is coupled to a water turbine, and also to a 750-k.w. direct-current generator, the latter machine being used as a motor in the event of low water. When water power is plentiful the 60-cycle generator and the direct-current generator can be used for city lighting.



Combination Car, Single-Phase; Richmond & Chesapeake Bay Railway.

Under present operating conditions, only one phase of the generators is used to supply the line voltage. The transmission cable is laid underground in a vitrified earthern-ware conduit to the Richmond terminal depot, 1½ miles distant. It is a three-core, lead-covered cable, each core having the capacity of No. 0 wire. One core is used for the line feeder and the others are connected to the rails and serve as a return circuit. At the terminal depot the cable enters a high-tension cabinet before its connection to the trolley.

The electrical equipment of each of four motor-cars, which at present comprise the rolling stock, consist of four GEA-603-A railway motors, and a full complement of multiple unit, type M, Sprague-General Electric control apparatus. The motors are the series-repulsion type. The fractional pitch winding of the armatures performs the same function as do commutating poles in direct-current motors. Each motor has 125 h.p. capacity. The capacity and high starting torque of these motors were well illustrated on one of the trial trips, when one car was coupled up to a train of five Norfolk & Western standard passenger coaches carrying 300 passengers, and hauled the load with ease. To further test their capacity, two of the motors were cut out, and the remaining two started this same train on a 1 per cent. grade.

The control is in duplicate. Each pair of motors, with their compensator and contactors, forms a practically independent equipment. Should one motor or any part of half of the equipment become damaged, the car could be operated as a two-motor car by throwing one blade of a double-knife disconnecting switch. The actual control apparatus is nearly standard throughout. The master controller is type C-40-A and the contactors are the ordinary a.c. type.

These are the first General Electric equipments ever put in operation with two compensators. The compensators are oil cooled and are provided with taps to give 600, 450, 400, 340, 280 and 113 volts. The 600-volt taps are used only on the auxiliary circuits. All the high tension apparatus is enclosed in an asbestos-lined cabinet. Each car is equipped with two pantagraph trolleys with steel pans, this material having been found to give greater satisfaction than either copper or aluminum.

The car bodies were built by the St. Louis Car Co. and closely resemble the standard Pullman car. Each has separate accommodations for white and colored people. The combination passenger and smoking car has a seating capacity of 64 persons, and the seating capacity of the combination passenger and baggage car, shown in the accompanying photograph, is slightly less.

The trucks are the inside suspension type and were built by the Baldwin Locomotive Co. The air-brakes have graduated release, which is found in the straight air type, and can also be operated as an automatic system.

The overhead construction is the catenary suspended type. The

Reinforced Concrete Viaduct; Richmond & Chesapeake Bay Railway.

trolley wire is No. 0000 grooved copper, and the messenger cable is steel and has seven strands. On the first section of the road, between the Richmond depot and the car barns, the track is laid on a reinforced concrete viaduct shown herewith, the trolley being supported by steel spans. Bracket supports are used on the other sections of the road.

The sub-station at the Ashland terminus, as already mentioned, provides for the lighting of the town. This is probably the first time that an attempt has been made to supply a lighting system from a high tension single-phase trolley subjected to severe load fluctuations. Tirrill regulating apparatus is used in both the sub-stations and main station. The 6,600-volt single-phase current is transformed to 440 volts by two 25-cycle oil-cooled transformers of 150 k.w. each. From the low tension side, the current passes through a reactance or phase splitting device to the induction motor end of a motor-generator set, consisting of a 150-h.p., 25-cycle, 440-volt, single-phase induction motor direct connected to a 100-k.w., 2,300-volt, 60-cycle, single-phase generator. A 4-k.w., 125-volt exciter is mounted on the common shaft at the generator end. The 2,300-volt, 60-cycle current leaves the sub-station through a two circuit single-phase feeder panel for general lighting purposes in the town of Ashland. All oil switches are designed for 6,600 volts and are enclosed in cells constructed of brick and fiber floors. All the machinery, switchboards, indicating and measuring instruments are of General Electric manufacture.

Car Surpluses and Shortages to April 15.

The Committee on Car Efficiency of the American Railway Association has issued Bulletin 21-A, giving a summary of surpluses and shortages of freight cars by groups from October 30 to April 15. The total surplus, which showed a slight increase in the last bulletin, now reaches 375,770, the highest figure yet recorded. The largest increase is in coal cars, 160,205. There is a further increase of 26,317 in box cars, although the surplus is still considerably below the maximum for this class. Group 7 shows a slight improvement; Groups 1 (New England), 2 (Eastern), and 10 (Pacific), about hold their own, but there are increases in all other groups, the heaviest being in Group 3 (Middle), where the accumulation of idle coal cars is largest.

The Ocean Carrier.

BY J. RUSSELL SMITH, PH.D.

XVIII.

The Present Situation and Future Outlook.

Most of the factors which are now important in ocean transportation are factors in which there is progress. This is true both in the technical side which concerns the actual carrying of the goods and it is also true in the management side in which we find the transportation problems affecting law and public and economic relationships.

There are at least four aspects of the technical side which should be briefly referred to before taking up the more important or management side.

First.—The change of vehicle from sail to steam goes on apace. The general speed and celerity of modern business is violated by the irregular slowness of the sailer and the great size and economy of the modern steamship have long since enabled it to practically supercede all sail line traffic, and the last seven years of fierce competition in the shipping world has developed a steam tramp of such a size and such economy of operation that profit rarely hovers over the white wings of the sailer that tries to compete. The recent words of a British tramp vessel owner seem to be significant of its doom: "We still own five sailing ships but we find it very hard to make ends meet as steamers are getting into sailing ship trades. The passing of the sailing ship entirely as an ocean carrier is in my opinion only a matter of a few years."

Second.—The relative positions of charter and line traffic are both shown by the discussion of one, for the other has virtually all the rest. The tramp as a factor in traffic appears to be relatively on the decline and absolutely on the increase. These conditions will doubtless continue for a very considerable period although it is conceivable that in a few decades the tramp may assume a stationary and possibly a declining total of service. This possibility of a static or declining position arises from the great growth of commerce in all parts of the world which is continually causing the establishing of lines in places where the tramp alone had previously sufficed. A good illustration of this is to be found in the port of Pensacola, Florida, from which for a number of years tramp vessels had sailed to Europe and occasionally to the Orient with cargoes of lumber and cotton. This service, which has been almost entirely devoted to carrying the freights of the Louisville & Nashville Railroad, has been so organized that the management now announces a line service to various European ports, although the infrequency of departures has caused some people to question whether it is really a line service. However, the departure of vessels under regular management from one port to another, year after year, can probably be classed as line rather than chartered traffic although the interval is somewhat uncertain. It therefore represents a transfer of one more piece of the world's ocean from tramp to line territory—a development which must inevitably go on as world commerce following the development of railroads embraces a great and greater part of the world's sea coast.

Third.—The private steamship line seems destined to have considerable absolute growth during the reasonably near future. It is part of the growth of the modern industrial corporation and there is no indication that we have reached the end of the development of larger scale operations. Indeed the magnitude of industrial units is still on the increase and the development of integrated enterprises is very new. The exceedingly large part transportation plays in all manufacturing industry makes the development of units of transportation one of the most natural secondary developments in the integration of industry. Next after the acquisition of coal and ore lands by steel companies came the acquisition of steamship lines and railroads. The increasing knowledge of the world's resources, the limitations of local supplies are likely to make more and more reasons why the modern industrial corporation should have its own steamship service as a part of its equipment.

Fourth.—The railroad steamship line is also steadily increasing upon the surface of several oceans. It is also an accompaniment of the large scale enterprises, particularly those in which railroads are driven through vast and undeveloped territories and find their termini in ports of insignificant local trade. Another generalization may be pointed out, namely, that there is much greater likelihood of railroad steamship line development along coasts where the current of ocean trade is at right angles to the coast line rather than along the coast line. For example, the railroads to the Pacific coast of North America find the goal for their ocean traffic across the sea. The steamship line sails away from the coast, there is no temptation for it to pass other ports. In South America these conditions are essentially different. The commerce of both the western and eastern shores of that continent going up and down the coast passes all ports so that any railroad that taps that coast finds its terminal facilities within near reach of a stately procession of steamships which will gladly call for any reasonable amount of freight. The necessity of a South American railroad supplying its own oversea connections is therefore unthought of.

If there had been a similar coastwise development of transportation routes along the shores of the North Pacific to the only available markets our Pacific railroad steamship lines would probably never have existed. The conditions would have resembled those to be found in New York where every railroad that can get a terminal upon that splendid harbor is within reach of steamship connections to every quarter of the globe.

There is therefore a tendency for the necessity of railroad steamship lines to decline due to the development in other ports of many ocean lines, but there nevertheless remains and will remain a large number of ports which must be comparatively small because of the proximity of other ports, and for the small ports there will continue to be the need of railroad steamship lines.

The second main division, the management is one in which there are also changes in progress. There is steady increase in the size of the carrying unit, the vessel and in the management unit, the line. Both are growing astonishingly and the end is not in sight for either unit.

It is around the question of rates—line traffic rates—that the greatest interest centers and the greatest problems lie.

We have no great changes to expect on the cost of service to the shipper. He is already accustomed to all kinds of rates, one might say all kinds of rates together, so greatly do they at times fluctuate. The real rate question is that of rate control. Will it be by the free force of competition or by the restraint of rate agreements?

To start with we have the fundamental factor of the freedom of the sea, which has, so far as line traffic is concerned, practically developed for much of the world ocean into a normal condition of rate control with frequent adjustments. This is the normal condition in the trade of Europe with practically all parts of the world except the United States. Furthermore, it has come to be the normal condition with regard to the rates from New York to most quarters of the world, and it is probably safe to say that there is visible a distinct movement toward the increase of rate control. If it comes to include the North Atlantic it has practically embraced the world. Several reasons for this may be mentioned:

1. The companies are steadily getting larger and the time has now been reached when the agreement of seven or eight interests would produce a minimum agreement that might hold if a satisfactory freight classification omitting grain and flour should be made.

Will the greater part of the carrying trade upon the North Atlantic ever be controlled by stable agreements? As has been previously pointed out, the difficulties are many, but the chances of agreement seem better than they have ever been in the past.

2. The growth of the single port conferences is suggestive of the final control. The German situation described above is an overgrown port control with Hamburg as its point of origin. The London carriers have a better agreement than the Liverpool carriers, and it serves as a good example to those who have not agreed so well.

3. Grain, long the great staple of the eastbound trade, is now becoming of less relative importance in the trade, because of the great increase in manufactured goods. This freight change is favorable to rate control, because manufactures will stand a much higher and more steady rate than that paid by grain.

4. Recent improvements in ship building have practically emancipated the newer ships from their old dependence on grain. When they had to have it as ballast, they were willing to bid low to get it. Now the newer ships admit water into their ballast tanks, and they no longer depend on grain if it does not pay them as freight. The lowest mark in grain rates from New York to Liverpool occurred prior to 1890 before the general introduction of water ballast.

5. The losses of the last great depression in the ocean shipping business have brought home to the shipowning fraternity the necessity of some protection, and they have had some rather valuable object lessons in the various attempts that have been made to alleviate the situation.

There are some principles any freight agreement must observe. It must limit itself to a minimum and there must be rather frequent readjustments of rates and of traffic divisions. It is because of the necessity of readjustments of traffic divisions that most of these arrangements in other trades have come to their end. The steamship companies will probably have to do as the railroads do, agree on a rate, but compete in some of the other forms that competition may take, readjusting their agreements with resulting changes in conditions. The great trouble with these agreements is that a flat rate with insufficient business throws the traffic to the best lines and cuts off the poorest who at once begin to cut rates to get freight. The aim of the steamship rate agreements should be to maintain living rates and leave all parties free to grow and develop and then readjust without a resort to the rate wars which now come so easily. This is no simple task, and it is further complicated by the fact that it is impossible to establish and maintain a rate which prohibits the export of produce to a competitive market to meet regional competition. Those interested in shipping think that they have been more ready to make rate concessions for this than the American railroads. This has occurred in part because while the railroads, during the last five years, have been crowded with domestic traffic, the steamship lines have been sorely pushed for freight. The prompt concessions made by the Atlantic steamship lines have unquestionably rendered a valuable service to America's export trade. As one carrier expressed it: "If the hog crop in Austro-Hungary is larger than usual, it affects the provision market of the whole continent, and we have to reduce the rate on Chicago packing-house products to get them on the market. And the rate on southern cotton-seed oil is always the same as the rate on provisions."

This list of requirements as stated in the above paragraphs is essentially sound and its requirements bear upon human nature with a load almost as heavy as does the golden rule upon ordinary human conduct. The voluntary agreement is a weak thing and it must be so. Persons in the best of positions to know assure me that these gentlemen's agreements are frequently broken under the pressure to get freight.

That means that agreements to be strong will be dominated by some strong central force, like the Hamburg-American Line in the German-American situation, the International Mercantile Marine in the London American situation, or the Union Castle Line in the United Kingdom-South African situation.

A group with such a leonine member is strong enough to make tremendous competition to repel a new rival. It has cost a million dollars for a firm to fight its way into the South African conference, and this money was for the fight, not for the capital.

When once these rate control groups are established, especially as in the case of the Hamburg-American Company, where one management does nearly all and has many services it develops a peculiar death dealing power in competition.

There is no indication that the present wave of government control of corporations for the benefit of the individual is likely to stop rate control upon the sea, or limit the monopolistic power that comes with the power to kill that results from the great size of the largest companies.

The British government has recently investigated the matter very thoroughly through commissions and the result was a surprising amount of condoning after the many fierce and bitter things that have been said against the shipping combines. Upon the American side of the water the situation seems at the present time even more hopeless so far as government is concerned.

The recent attempt of Messrs. Peter Wright & Sons, of Philadelphia, to secure the aid of the Interstate Commerce Commission against the encroachments of the Hamburg-American Steamship Line is an interesting proof of this point. Their appeal for relief against pooling and rate control in restraint of trade has been denied. The closing words of the decision of the Commission are as follows: "This ruling is the only one which is consistent with what seems to be the policy of the law, viz., that while restriction and control are essential as to the inland carriers of foreign commerce, the ocean carriers of such commerce should remain unrestrained and free. There is not to-day, and never has been, such a thing as stability of rates upon the water. Perhaps it is not desirable that there should be. The ocean is a highway free to all. No franchise is needed to sail the seas, nor is the establishment of a line, of ships founded, either in law or in economics, upon the theory of a public serving monopoly which underlies the relation of the railroad to the state. It may well be, therefore, that without regulation and by reason of natural competitive conditions, the public will be best served, and in the end treated more equitably, by leaving the water carriers to foreign lands entirely unhampered by legal restrictions such as the people of this and other lands have found it necessary to impose upon the railroads. Under the ruling here made the fluctuation in the total through rate charged from an inland point in the United States to a European or Asiatic country will fall, where, in fact, the fluctuation is at the seaboard. The competition in rates will thus manifest itself where the competition really exists, and where the law presumes it will unrestrictedly continue, viz., where the ships bid against each other for cargo."

It is most unfortunate that the lawyer has to make our laws, for the legal mind dealing with precedents is like its Latin words fed by the medieval past and constantly striving to control and interpret present conditions in the terms of the long dead past. It is notorious that legislatures talk about railroad transportation and legislate about it with the idea that the business is as competitive as the selling of horses and wagons at a public vendue and here we see the Interstate Commerce Commission referring to the law's vision of the freedom and free competition of the sea "where ships bid against each other." This vision seems well nigh ludicrous when inspired by the Hamburg trade of the Hamburg American Company, which it is well known has long had a wonderful control over almost the entire line trade of the port of Hamburg with the North American continent.

This legal view point entirely overlooks the fact that there can be control through agreements where competition is theoretically possible and there can be the most emphatic kind of control through the development of one interest that has such great size that it can destroy by competition any ordinary new beginner in any field, and it can do this with profit to itself because with the great scope of its business it can be making money with eight or nine-tenths of its organization and losing money over the remaining fraction where it is effectively killing a competitor.

Just how far this rate control is going to go and how much it is likely to cause hardships through excessive rates it is difficult to predict. Unrestrained competition is usually disastrous to carriers, and monopoly is not noted for its reasonableness.

The opportunity and limitations of the individual and the way line competition soon works around into rate control are all well illustrated by a recent episode in the trade between New York and the Orient. The lines to this quarter of the globe had a good agreement to which they were holding with considerable firmness and to the irritation of many shippers. One of these shippers happened to be the United States Steel Corporation (the largest individual in the world), which in the year 1907 had contracts for the delivery of 100,000 tons of steel goods in Manchuria. This was a splendid nucleus for the founding of a new line in a trade where the ordinary vessel carried about 6,000 tons of freight, but inasmuch as there was prospect of other orders, the company itself was in a position to furnish more than half the cargo for a fortnightly sailing. Accordingly arrangements were made with European owners for the founding of a new line to China. As the steel goods furnished all the heavy cargo that the ships needed, the managers were in a position to make very keen competition for necessary light cargo to finish filling the space in the holds of every outgoing vessel. After a few months of this competition, the new line was admitted to the conference. By this agreement with the other members of the conference, competition ended, and the steel company got the full rate for the outside cargo which its vessels carried, and it of course got this much more advantage for the carrying of its own goods.

Rate agreements, or some form of rate control, with frequent readjustments are the normal thing in all important trades but the North Atlantic, and are the existing condition in a considerable part of that, and the prediction is made that this will increase. One of the two great traffic classes, namely, the passenger traffic, has a normal condition of rate agreement and is a constant and shining example for the warring makers of freight rates. Two causes are conspicuous in explaining the difference between the extent of passenger rate control and freight rate control. One is the question of ballast, the other of the great fluctuations in the amount of traffic.

Ballast.—For a long time, every ship that sailed the ocean had to get some heavy cargo from New York (usually grain) to make her ride well. There is now less need for this because of the construction of ships with water ballast compartments, but this ballast factor yet lingers in the making of freight rates because there is always a desire to get a certain kind of freight to complete the vessel's cargo. If she is full of heavy goods a little light goods can be put in and the rate be cut to get them. The reverse may be true for other kinds of goods for the ship in the next pier. Hence the constant tendency to cut rates. The passenger accommodations of a ship have no such shifting utility. They can be carried empty or full and it makes no difference to the navigation of the ship.

The fluctuations of passenger traffic.—There is no important body of passenger traffic where there is not at some season all the ships can carry and at some other season but a fractional part of this amount. Therefore this seasonal and absolute inability of all ships to get their full quota brings them annually face to face with the problem of rate cutting. If they start to cut the rates to get passengers they can come down and down to absolute cost and still most of the carriers cannot get the traffic. Therefore they have annually had this problem to face and they long ago found that wisdom demanded that they should restrain the desire to compete, for it could but lead to loss for all; hence the virtual constancy of passenger agreements.

In a period of almost uniform loss in 1902 we saw the same reasoning bring about a minimum freight agreement between carriers running 46 services between the North Atlantic and United Kingdom. There are good reasons why this will have many successors. At least two factors are of importance to make reasonable the expectation of this increase. First is the great tendency toward the decline in weight of the American trade with Europe. Our increase in population and industries are generally recognized as being factors which through our increasing demand for food and raw materials will cause a decline in the bulk of our traffic with Europe; certainly a decline in relation to its value, if not a positive decline in bulk.

Along with this there has been a tremendous increase in passenger traffic, both of the pleasure class and from the movement of labor which has lately taken developments which show us that we have an international labor market. Not only can prosperity in America call a million workers a year from Europe but the same prosperity will send scores of thousands of them back to winter with their friends in pleasant Europe, while depression in America sends hundreds of thousands back across the Atlantic possibly to stay, probably to return upon the next call of high wages, which call can be heard very promptly through millions of letters from friends scattered in almost every county in the United States.

This passenger increase and freight decrease is showing itself in the positive decline of purely freight lines from New York and in the great prominence of large steamers of medium speed which can carry surprising numbers of passengers or tremendous quantities of freight. Many of them go further and have considerable space which is useful for either freight or passengers as the exigencies of the trade demand.

This increased importance of passenger trade will bring more and more before the minds of trans-Atlantic carriers, particularly those from New York, the importance of agreements in their operations as evidenced by their passenger agreements. Further, the great amount of shipping that the passenger traffic demands is likely to bring with increasing frequence those periods when the amount of freight is utterly insufficient for their capacity so that they are with regard to freight as with regard to passengers in the dull season—not enough to go round, and if they choose to cut each other's throats by striving for the fraction that exists they can do so and still make little or no profit out of it. The freight business is becoming a by-product of the passenger business, with a tendency to share its rate control.

The Mediterranean is the first region in which these conditions have been developed to their fullest. Here the increase of passenger business has assumed unprecedented proportions and the freight has had a similar astonishing decline from the great development of the American fruit business in Florida and California which has almost entirely cut off the greatest staple of Mediterranean freights to New York.

A recent agreement covering Mediterranean freights is the most natural consequence of the above. Therefore we may expect normal developments to produce an ultimate freight control in the North Atlantic approaching in method and force the passenger control which already exists, and it may be expected to start in the Mediterranean and gradually embrace the North Atlantic trade. The trade of the Gulf of Mexico with its great seasonal development of cotton and grain will be more difficult to control because of the greater importance of the tramp steamer in it

(*The end.*)

Concrete Coal Trestle and Ash-Handling Plant.

In connection with the new power house which the Delaware, Lackawanna & Western has now nearly completed as a part of its Hoboken terminal station, a concrete coaling trestle and ash-handling plant have been built. The power house is south of the station tracks and a little beyond the center end of the train shed of the new terminal station. The purpose of the trestle is to form

Partly Finished Trestle before Power House Was Built.

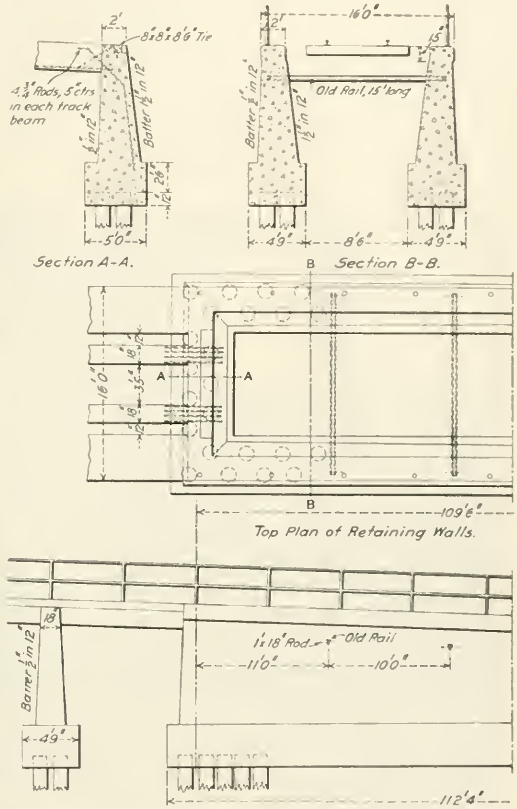
an approach by which loaded coal cars may be taken to the level of the second floor of the power house whence coal is dumped to the space in front of the boilers. The trestle also serves as the support, on one side, of a steel structure which carries the trolley track of the conveyor for handling ashes from the boiler room. The rest of the structure is entirely of reinforced concrete.

As shown in the accompanying photographs, the trestle lies alongside of and parallel to a two-story coach house and material building just beyond the power house, on the ground floor of which the boilers are located. The power house is three stories high. Between the trestle and the building is the ash-car track, over which, for 130 ft., extends the trolley and its supporting structure. The trestle proper is 226 ft. 3 in. long, consisting of 18 bents on piers spaced 12 ft. center to center. The inner abutment is the wall of the power house and the outer abutment is the end of an approach 112 ft. 4 in. long. The surface of the whole structure, trestle and approach is on a 1 per cent. grade up to the last three bents toward the power house. Here a vertical curve is introduced between the incline and the level within the power house, into which the tracks are carried through an arched entrance on the level of the second floor. The approach is filled in between retaining walls tied together near the abutment by old rails 15 ft. long extending from one wall to the other and fastened in each wall by an 18-in. rod passing through the end of the rail and embedded in the concrete. Four of these rails are used, spaced 10 ft. apart. The walls are necessary because of the limited ground space, the tracks on each side being too near to let the fill take its material slope. From out to out, the structure is 16 ft. wide, about one-half this width being occupied by a walk on each side. These are protected by railings of iron pipe.

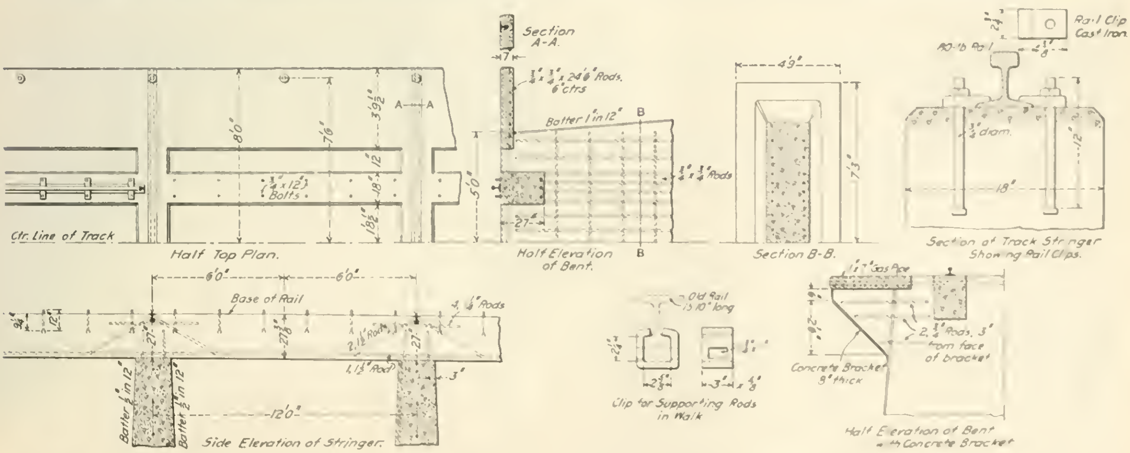
The bents vary in height from that of No. 1, next the approach abutment, which is 11.32 ft. high, to No. 18, nearest to the power house, which is 19 ft. All are on piles on account of the nature of the soil, which is largely made ground. Footings are 4 ft. 9 in. wide and in length vary from 11 ft. 9½ in., at bent No. 1, to 13 ft. 1 in. at bent No. 18. The thickness is 3 ft., of which 1 ft. is filling between the tops of the piles. Each pier is 19 ft. wide and 18 in. thick at the top with a batter of 1 in. per foot in cross section of the trestle and ½ in. per foot in longitudinal section. On these are concrete stringers, 18 in. x 27 in., in which are embedded ¾-in. bolts, 12 in. long, to which are secured the clamps which hold the rails in place. Ordinarily, in structures of this kind metal plates are put between the concrete stringer and the base of the rail. In this case, the plate was dispensed with and the indications are that this construction will prove satisfactory. The anchor bolts, however, project far enough above the stringer to allow for plates, should they subsequently be found desirable. Between the stringers and on each side of them open spaces, 3 ft. 5 in. and 12 in. wide, respectively, have been left, partly to separate the stringers which carry heavy loads from the floor structure which is of lighter construction, and partly to facilitate the dumping of material along the incline for any reason. This arrangement has already been made use

Side View of Trestle and Approach.

Trestle and Approach, Looking toward Power House.



Plan, Elevation and Sections of Approach.



Plan, Elevations and Details of Hoboken Coal Trestle; Delaware, Lackawanna & Western.

of in connection with the handling of construction materials for the power house

The piers are reinforced by ¾-in. square rods placed vertically in two rows 3 in. from the outside of the pier, spaced 5 in. apart underneath the stringers, and 8 or 9 in. apart outside of and between the stringers, by similar rods are laid horizontally, spaced 18 in. apart. The stringers are reinforced by three 1¼-in. square rods laid with centers 3 in. from the bottom of the stringer. Over each bearing point the upper part of the stringer is reinforced by four rods, each 1½ in. square and 8 ft. 4 in. long, and on these upper rods an inverted rail, extending the width of the structure, rests at each bent. On each side of this rail, abutting against the flange and web, are two 1¼ in. square rods, extending to the lower reinforcement at an angle of about 35 deg. with it.

In the construction of the sidewalks, a novel method was used. The cross rails above referred to are the principal means of support. These rails, as stated, extend to the outer edge of the sidewalk. At intervals of 6 in., clips of the form shown in one of the drawings are attached to and hang from the head, and through openings in each leg of the clip are passed the rods which form the horizontal reinforcement of the sidewalk. As shown in the cross-section, the sidewalk on the outside away from the power house, has no other support than that just described; on the opposite side, a bracket 8 in. thick, tied to the pier by reinforcing rods, is formed to serve as a support opposite each bent. This bracket is solely for the purpose of giving additional support to the columns on which the cross-beams of the ash handling plant are carried. The other extremities of these beams are supported in the wall of the power house extension.

The trestle was designed and built by the engineering department of the Delaware, Lackawanna & Western, Lincoln Bush, Chief Engineer, and George T. Hand, Assistant Engineer, to whom we are indebted for data and illustrations.

Foreign Railroad Notes.

The first section, 360 miles, of the road from Rio Janiero, Brazil, to Goyaz, 630 miles, has been opened.

The Chinese are building on their own account and with native engineers a railroad from Pekin northwest to the great wall at Kalgan. It is reported that in January a tunnel on the route caved in and killed 180 workmen.

Arrangements have been made for a railroad ferry between Lasznitz, on the island of Rugen, and Trelleborg, in Sweden, 63 miles. There are to be two ferry boats, each with a speed of 16 knots, and large enough to carry a whole train, after the manner of similar ferries on the Great Lakes in the United States. When in operation this will give direct connection between the railroad systems of Scandinavia and of Germany.

Russian journals say that foreigners are beginning to develop the meat production of Siberia, for which the railroad gives an outlet for the first time. Germans are raising, fattening and refrigerating cattle and sheep; and Englishmen, hogs and geese. Such production and preparation as was common to the natives furnished a product which foreign markets would not accept. There is an enormous field for the development of these industries—many times greater than that fit for grain production.

Construction of the St. Michel Station of the Paris Metropolitan Subway.

BY E. OMMEGANCK.

The construction of the St. Michel station of the Paris Metropolitan Railway is illustrated in the accompanying photographs. This station is under one of the boulevards of Paris. As it had to be built in water-soaked ground, the ordinary method of excavation could not be used. Neither could shield construction be used, because of the large dimensions of the station. The work was therefore done by caissons sunk vertically. These caissons were like coverless boxes with air-tight walls entirely surrounding the work. They were first built over the place where they were to be sunk with a working chamber at the bottom to allow the laborers to excavate underneath the caisson, which was sunk progressively by its own weight as the spoil was removed. Compressed air was used to keep the water out of the working chamber under a pressure that increases with the depth. The upper or main part of the caisson and the working chambers were separated by a strong horizontal partition made air tight by a thick layer of concrete. Passage of men and materials back and forth between the upper part of the caisson with normal air pressure and the lower part under compressed air, was made through air locks at the end of vertical shafts which, of course, were longer the farther down the caisson had gone. The caissons were sunk gradually, and finally disappeared completely under the soil with which they were covered, the shaft alone extending through the soil.

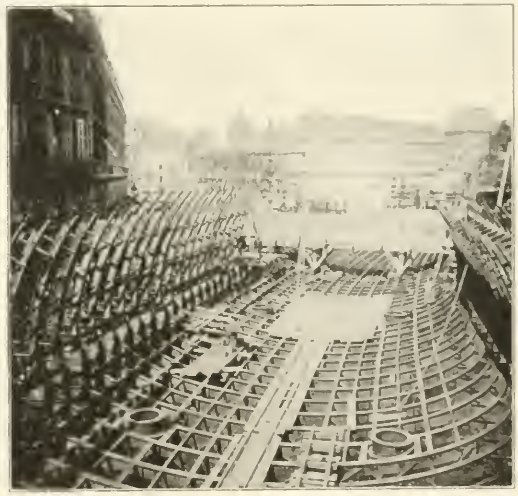
The St. Michel Station, Under Construction, Showing One of the End Caissons; Paris Metropolitan Railway.

The station itself is curved on a radius of 984 ft. It is made up of three caissons, 390 ft. long altogether. The center caisson is semi-cylindrical, 226 ft. long, 55 ft. wide and 41 ft. 8 in. high, containing the station proper. At each end an elliptical well connects the stations with the subway. The height of this well is the distance from a point 8 ft. below the lower part of the station to the level of the street. It contains the ticket office and stairs and elevators reaching to the passenger platform of the finished station.

The metallic frame of the large central caisson is made of transverse trusses in the form of an arc of a circle, 4 ft. apart and connected by cross ties. On the cross ties are placed the jointed iron plates which constitute the external envelope of the work. The transverse section of this caisson forms a semi-circular vault with an opening 41 ft. 8 in. wide. Its height in the clear is 28 ft. 3 in. The station will be provided with two lateral platforms for passengers, with a space for trains 18 ft. 3 in. wide. The platforms will each be 11 ft. 8 in. wide and as long as the station, which is about 250 ft.

The walls of this large caisson are formed of iron plates $^{7}/_{16}$ in. thick, riveted to the outside shell and stiffened internally by angle irons. These angle irons have holes for reinforcing irons forming a bed for a layer of concrete. The concrete will be faced with white enamel tiles. All around this internal envelope, concrete will be poured to a depth of 3 ft. 3 in. at the key and 6 ft. 6 in. at the springings of the vault, entirely embedding the transverse trusses. Moreover the iron plates of the external shell, instead of following the round contours of the caisson, are set vertically at its sides and held by steel stanchions that will serve as webs between two parallel sustaining walls of concrete. The object of this arrangement is to prevent any movement of the ground during the sinking which might result in the settling of the surface of the street. The working chamber of this central caisson is separated longitudinally by a central partition which divides it into two chambers, each with four working shafts. By this means the sinking of this large caisson will be made more sure and regular. Such precaution is necessary, for it weighs at least 18,000 tons, of which 7,000 are concrete and 11,000 steel, and, by reason of the inequality of the ground, it is likely to get out of plumb or even to become displaced.

The Large Central Caisson Being Mounted.



The Large Central Caisson Being Erected.

The two end caissons, one of which is shown in the largest photograph, are identical. They have an elliptical internal section, the major axis of which is 86 ft. long and the minor axis 61 ft. They are to be sunk about 76 ft. beneath the street level. For 66 ft. of the height the walls consist of a double lining of steel weighing 650 tons. The 5-ft. space within this lining has counterforts and crossbraces and is filled in with 2,500 tons of concrete. Once in place, the continuous ring thus formed will be surmounted by a masonry coping 6½ ft. high. This coping will support a strong metallic floor completely closing the work at the top. On this the roadway will be laid.

Working of the Massachusetts Stock Law.*

Strong complaints have been made to the Commission concerning the effect of the Massachusetts statutes which regulate the issue of stock by public service corporations. The opinion is widely spread among persons familiar with financial affairs that investment in these corporations is discouraged by our laws, and that money which should be invested in Massachusetts to the advantage of the public is attracted to other states where more profitable returns are permitted, with the result that such enterprises are sometimes altogether prevented, and when undertaken are often retarded in their development.

So far as concerns the laws which govern the inception of these corporations, and which prevent stock watering by requiring full payment of par value in cash as a condition for the issue of stock the Commission has heard little criticism and is satisfied that these requirements are salutary. While an opportunity to issue stock without such payment, or to give it as a bonus with bonds, as is permitted in some states, facilitates the raising of money for new enterprises, and may possibly be necessary in order to attract capital into a new and unsettled country, Massachusetts does not need to offer such inducements. No public service corporations bear a higher reputation as safe and conservative investments than those of Massachusetts, and her laws which prevent watering stock by an issue for less than par, and provide for supervising financial management, are generally accepted as models of wise state control, administered as they are by boards of commissioners free from suspicion of political influence or bias.

It is some of the provisions respecting a subsequent issue of stock when a public service corporation wishes to increase its capital that are questioned. There is, first, a requirement that no increase of capital be allowed except for a purpose approved by the Board of Railroad Commissioners. Of this no complaint has been heard, and in the judgment of the Commission it is in every respect wise. But there is a further regulation which forbids an increase of stock on the terms which apply to an original issue that is uniformly at par, and requires that if the stock has acquired a higher value the new stock must be issued at a price correspondingly advanced. This requirement, which first appeared in our law in 1893, is much criticised.

The course of our legislation on this subject has been as follows: prior to 1870 there seems to have been no regulation by general law, each case being dealt with by special act, and the recognized principle seems to have been that issues of stock whether made at the inception of the corporation or subsequently, stood on the same basis and were to be made at par, and in 1870 this principle was established by general law. The next year, however, a new method was introduced for railroad corporations, by requiring that when the new stock was worth more than par it should be offered at public auction; and this was soon extended to street railway companies.

This requirement of a sale at public auction was disapproved by the Board of Railroad Commissioners in their report for 1872, as seeming "to threaten results not contemplated in the passing of the act," and was declared to be "a reversal of the long-established policy of the commonwealth as regards its railroad corporations"; and the Railroad Commissioners proceed to criticise the act in these terms:

> The theory of our legislation hitherto has been that the state needed both new railroads and the most complete development of all old railroads, the full accomplishment of both objects require large investments of private capital upon which the Commonwealth guaranteed no certain return, but it authorized a return not exceeding 10 per cent if as much could be earned. In other words, a possible return of 10 per cent was held out to induce private capital to enter into railroad enterprises, and this amount, if it could be earned, the law declared the community willing to pay. There is not a railroad in Massachusetts of any general importance which does not now stand in urgent need of additional large outlays to accommodate the growing business wants of the community. Especially is this the case, without any exception, with the lines terminating in Boston; the growth of the community imperatively calls for liberal outlays on the part of all of them. The former policy of the Commonwealth by holding out a

*From the majority report of the Commission on Commerce and Industry, Massachusetts, 1908.

prospect of 10 per cent. dividends on the new capital necessary to effect these needed developments, offered a strong inducement to the stockholders of the corporations to adopt a liberal policy and to go energetically forward with it. The act of 1871 in its practical operation cuts off this inducement by limiting the return of new capital invested in the development of all the leading lines of the state not at 10 per cent. but at $10 per annum on the market value of the stock of such companies, thus reducing the return on new capital from 10 to 8 or even 7 per cent. Less inducement is thus held out to private capital to seek investment in the railroad system of Massachusetts than in any other state of the Union. In all of these the law authorizes a possible return of 10 per cent. as a minimum, and in many the limit is fixed much higher. It is therefore matter of consideration whether the act under discussion, by reducing the possible return to so low a point, will not cause those managing the corporations to become indifferent to a further development which cannot accrue to their own advantage, and to divert their capital to other quarters where it will be more liberally remunerated.

It is to be observed that since the report just quoted from was published, the holding out of 10 per cent. as a possible dividend has disappeared with the repeal, in 1874, of the law referred to by the Railroad Commissioners. There is now no statute restricting the power of the legislature to reduce tolls to be charged by steam railroads, so that the inducement to invest referred to above has been withdrawn.

The act requiring sale at public auction instead of an issue to stockholders at par stood (with an amendment not important to consider here) until in 1878 it was repealed for steam railroads, and in 1879 for street railways; and the law was then re-established as it had stood before 1871; that is, new stock was issued to stockholders at par. Thus re-established, the law was reaffirmed in 1882 in Public Statutes, and stood until 1893, when a regulation of a novel character were introduced. By this new provision it was required that, whenever a steam railroad or street railway company increased its stock by an issue exceeding 4 per cent. of its existing capital stock, the amount necessary for the contemplated purpose should be offered to shareholders at its market value at that time as determined by the Board of Railroad Commissioners, "taking into account previous sales of stock of the corporation and other pertinent conditions," any shares not subscribed for to be sold at public auction, but no share to be sold or issued at less than par. This act was amended by Acts of 1894, so as to cover gas, electric lighting, aqueduct or water companies and telegraph and telephone companies, and the law now stands substantially as enacted in 1894.

The introduction of this requirement for a sale of new stock at a premium instead of at par was referred to by the Board of Railroad Commissioners in their report for 1895 as establishing "a substantially new system of statutory regulation with respect to the increase and issue of capital stock." The Railroad Commissioners, without definitely expressing approval or disapproval of the new law, go on to observe:

The laws of this state have always recognized the right of the investor to an ample and even liberal return on the actual investment in railroad securities, such return to be made in the form of a regular cash payment of interest to the bondholder and a regular cash dividend to the stockholder. It is for the benefit of the public as well as the investor that this return be made more rather than less secure. Any cause of legislation that is calculated to reduce the revenue of the corporation to a point which does not admit of such return, and which does not moreover allow a margin of profit sufficient for the maintenance of a high standard of construction and equipment, is not only unjust but impolitic, as tending to discourage the investment of capital in legitimate railroad enterprise and to disable the corporation from rendering the best public service.

It appears from the successive enactments referred to above that prior to 1871 new stock issued by railroad corporations was to be offered to stockholders at par; from 1871 to 1878 it was to be sold at auction; from 1878 to 1893 it was again to be offered to stockholders at par; and since 1893 it is to be offered only at market value determined by the Railroad Commissioners, stock in street railway companies being regulated by similar legislation passed at nearly the same dates. We have therefore had 15 years' experience in which to judge of the operation of the present provision of law in its effect on railroads.

So far as known to the Commission, the provision in question was a novelty in corporate regulation in this country when adopted in Massachusetts. Since then our example appears to have been followed only by Maine and New Hampshire.

The theory on which the present law is based is apparently that it is for the public interest to keep new issues of stock as small as practicable, in order that the portion of profits to be applied to the payment of dividends may be kept down. It is assumed that by this means the tolls and charges paid by the public will keep at a minimum, and also that of the profits which are earned a greater proportion will be left available for improved service. It is asserted that an issue of stock in excess of what is actually necessary is stock-watering, and the law of 1894 which prohibits it is sometimes referred to as "the anti-stock-watering act."

It is undoubtedly a sound theory that the amount of the capital stock to be issued by a public-service corporation should be regulated by a law requiring each share when issued to represent what it purports to represent—a proportionate part of a capital authorized by law and actually paid in in full. The evils of excessive capitalization, by issuing shares which have not behind them what they purport to have, which is properly called stock watering, have been demonstrated by experience, and may be taken for granted. These evils are guarded against in Massachusetts by the long-established requirement that the stock shall be issued not below par, and for cash. Par is thus adopted as determining the normal and established value. From that point on the investor takes his risk of the market value increasing or diminishing as the enterprise goes on. Based on this par, the established proportionate value of each share is expressed in the certificate, by it is regulated the liability which each original subscriber is under to creditors, and with reference to it is determined the amount of bonds which the company is authorized to issue. By this and this alone should be determined what is a fair return of profit, whenever that question becomes material, since no other constant element exists by which the reasonableness of the return can be estimated.

Now, the provision introduced by the laws of 1893 and 1894 creates a fundamental difficulty. By requiring new stock to be issued at a price above par, it breaks in on the uniformity of the method of capitalization, with the result that it impairs the effectiveness of the control which the state can exercise in regulating the service to be furnished by the corporation. The declared object of keeping down the amount of shares is that a larger portion of the profits which might otherwise be paid out in dividends shall be applied in diminishing rates or improving service. Yet the moment that the state should demand such an application of profits, and insist that the rate of dividends should be reduced in order that the demand be complied with, it would be met with the proposition that the rate of dividend should be determined not by a reference to the par value of the stock, but by a reference to the higher price which the state itself has prescribed as a minimum. And this proposition would be reasonable.

Par being the established basis on which the rate of dividend is fixed and quoted, the state, so long as it does not interfere in the price to be paid, except to require that it be not less than par, is justified in treating par as the permanent standard by which the reasonableness of dividends shall be measured. Every one who buys in the open market buys on that basis, and takes his chance that the stock may go up or down, and the law pays no regard to market fluctuations. Though he buy at a premium, he cannot complain if the state subsequently deals with dividends by reference to the standard that it has itself fixed, and the only one that it has ever sanctioned or recognized. But all this is changed the moment the state prescribes a new and higher price. Every stockholder who has bought his stock at a premium fixed by the Board of Railroad Commissioners may properly insist that that price be taken as the basis in determining what rate is reasonable. For the state to forbid a sale below a stated price, and then refuse to recognize that price when it is proposed to regulate dividends, would be little short of bad faith; and any tribunal passing upon the reasonableness of rates charged, with a view to the stockholder's fair return, could hardly fail to find force in the contention that to ignore the price fixed by the state would approach confiscation. Nor would it be a sufficient answer to tell the stockholder that he had not been obliged to buy at all and, having bought, must take the consequences. This would do if he had bought in the ordinary open market, but not if he had bought at a price regulated by the state. The regulation becomes, in such a case, a part of the scheme of the enterprise into which the buyer enters; and if the state interposes the regulation for one purpose, it should not repudiate it for another purpose. Of course the state could expressly announce at the outset that, although the stock would be sold only at a premium, the premium was to be disregarded in all subsequent actions by the state, and this would free its hands. But how much stock could be got out in the face of such a warning may be conjectured.

By requiring a sale at a premium, it results that the state fixes, then, what becomes in effect a new par; and a new par not only for the particular stock now issued but, since all stock must stand on the same dividend basis and cannot be separated into classes, the new par is fixed for the entire capital stock. Thus it happens that for the sake of keeping down the number of shares to be issued on the occasion of some fractional increase, often a small one, the state has permanently estopped itself from treating any of the shares as having the par which it had originally fixed, and has advanced the measure of a fair dividend on all. In this way the law actually overreaches itself. A general advance of the dividend standard on all shares results, and this is tantamount, so far as the public is affected by dividends paid, to a stock-watering since it would increase the total of dividends to be permitted before public demands should be acceded to. This is the fundamental objection to recognizing by law any normal value other than par.

It is a misleading stretch of language to speak of issuing at par stock which commands a premium as "stock watering." So long as it is issued for cash at par it conforms to every standard set by the state, and every standard which the stock certificate purports on its face to require. To stigmatize stock as "watered" because it is not issued at a premium is to confuse the settled basis of capitalization and set up a basis varying with the prosperity of the company; and to do it, too, on a theory of the public interest, which, if we are right in our conclusion stated above, is short-sighted, because it weakens rather than strengthens the state's control at the point where it sought to sustain it.

Looking at the actual practical working of the law of 1894, there seems to be no doubt that it has worked badly, so far as concerns steam railroads, and apparently it is doing no good in street railways. The Commission has heard much condemnation of it from many quarters. The Commission on Taxation, in its report presented to the present legislature, confirms the conviction which this Commission had already reached, that the law is making it difficult to raise money needed for the proper development of our transportation facilities, and that report calls the attention of the general court to the need of legislation which shall lessen the severity of the present law.

The method now prescribed is unquestionably poorly adapted for raising money. It requires, first, that the Railroad Commissioners fix the market value, and this is usually difficult to do with any definiteness because quotations of sales of ordinary lots of stock furnish no proper criterion of the market value of a large block. Moreover, as the stock market is subject to wide fluctuations from causes quite independent of the intrinsic value of the stock, there is no assurance that a market price once adopted is to stand long enough to warrant any calculations of the result of a sale to be made in the future, when the necessary votes and other preliminaries shall have been arranged. The Railroad Commission is thus called upon to fix a price without definite or permanent facts on which to base its judgment. A recent experience of the Edison Electric Illuminating Company shows how impracticable a price carefully fixed by commissioners may become before the stock can be actually subscribed. After the commissioners have fixed a price the directors must offer the stock proportionately to shareholders, and as the price is purposely required to be fixed at a figure which precludes a special inducement to buy it is uncertain how much stock will be taken. Whatever is not subscribed must be sold at auction—a requirement which suggests to any stockholder that if he does not subscribe he may buy later at a lower price. An auction sale is uncertain, and in the case of a large block of stock has also the disadvantages of both of depressing the price and of carrying a substantial influence in the management of the railroad to any chance bidder—a prospect which neither the public nor a railroad management would look at with satisfaction. Meantime, the board of directors, which has a definite proposition on hand, is left unable to foresee how much money it is to have. Certainty on that point is so essential to proper financial arrangements that a competent board of directors would naturally make sure by a contract in advance that all stock not subscribed should be taken at some satisfactory price, but if an auction sale is to be interposed such an underwriting contract is difficult, if not impossible. Taken in all its parts the machinery which the present law prescribes for raising money for what is to be assumed to be a desirable public improvement is such as to make the process difficult and costly, if not impossible.

As might have been expected, railroad companies have been discouraged from raising money for large improvements, in the face of this law. The management of the Boston & Maine Railroad explains its backwardness in this respect as due almost wholly to this cause. Since the law was adopted there appears to have been but three applications made by railroad companies for a fixing of price, and the railroads have been driven, when making new issues, to resort to small issues of amounts less than 4 per cent. of their capital, since this can be done by sale at auction without the preliminary of fixing a price. Of the three applications made for large issues one was by the Norwich & Worcester Railroad Company, in 1899, when the price was fixed at 215; one by the Boston & Maine Railroad, in 1901, when the price was fixed at 190, and the third also by the Boston & Maine, in 1906, when the price was fixed at 165. The Commission is informed that the Boston & Maine Railroad was able to get out all its proposed issue in 1901, the market being favorable, but in 1906 the price was found to be so prohibitive that it never has been able to get out the entire issue. For issues of less than 4 per cent. of the capital the Old Colony Railroad Company has applied twelve times since 1893, the Connecticut River Railroad Company once, the Boston & Maine Railroad Company once and the Boston & Lowell Railroad Company twice.

Respecting street railway companies the actual effects of the law are less clear, the period since 1894 having been one of large investment in street railway enterprises throughout the country. While it cannot be said, therefore, that the starting of such enterprises has been prevented, it may still be true that the extension and development of the stronger companies, whose stock is at a premium, has been retarded, and it is asserted by many persons familiar with the situation that this is the fact. It appears that applications for new issues of stock of street railway companies have been made in 207 instances under the present law. Of these, however, 153 were cases of issue at par, leaving only 54 cases of sale at a premium. It is difficult to say with definiteness how far the present law is actually retarding desirable extensions and improvements in the case of street railways, but in the opinion of the Commission it certainly is not encouraging development. It is desirable that public service corporations, when they are so prosperous that their stock sells at a premium, should be encouraged to look for opportunities for development, provided the new plan be approved as promising well for the public, and Massachusetts capital should be drawn into just such investments, rather than tempted away.

Aside from the difficulties experienced in marketing stock at prices fixed by the Commissioners, it is to be remembered that allowing shareholders the possibility of getting new stock at less than its market value offers obvious advantages to shareholders, and works as an inducement to put money into Massachusetts enterprise of this character. Looked at in this light the question whether the state should offer such an inducement is one of practical expediency. These corporations are trustees and agents for the public, but they do not carry on the public business on the terms applicable to private trustees, who are allowed reasonable compensation but are forbidden to make any profit from the trust estate. Public service corporations are in a quasi-partnership with the state. They are allowed to receive all the profits, but are required to charge only such tolls and furnish such service as the public may reasonably demand. It is at the point of tolls and services, then, that the public interest should be protected and public control applied, and so long as these are satisfactory the state should not limit the profits of railroads, since it is always for the interest of the public to have railroads prosperous. An unsuccessful company is the poorest public servant. The right to issue stock at par, in so far as it is a privilege of pecuniary value, is to be considered as a part of the compensation allowed to the corporation. As railroad matters now stand in this state, it is expedient, in the judgment of the Commission, aside from the reasons given above, to concede this as an element of compensation, and by this means attract capital to investment in Massachusetts public enterprises.

It may be suggested that if the law is to be modified it need not be changed to the full extent of allowing the company to issue stock which bears a premium to be sold as low as par, but that some middle course might be found which would secure to the corporate treasury at least a part of the premium, while leaving something as an attraction to subscribers. But every regulation which fixes a price other than par is open to the objections stated above. Moreover, it would be difficult to frame a regulation which should be less explicit than that now in force, and yet be definite enough to work satisfactorily. If the commissioners are to fix a price, but are not to have market value as their criterion, by what rule shall they fix it? Is there any basis which can be prescribed for all cases? If it were left to the commissioners to determine price, with no direction as to the basis to be adopted, the commissioners would either have to adopt for themselves market value as the most definite standard obtainable, or they would be obliged to make arbitrary decisions for which only vague reasons could be given and the whole method would lack the certainty and uniformity which are desirable in such matters. A sale at public auction, without any price fixed by commissioners, and without a privilege of subscription first offered to shareholders (which was the law in force from 1871 to 1878), is open to the objections that it deprives stockholders of all benefit of the premium as effectively as they are now deprived of it, and that it involves the risk of undesirable control pointed out above.

The Commission recommends that the law be modified so as to permit railroad and street railway companies, when authorized to increase their capital, to issue new shares to be offered to stockholders at such price, not below par, as the stockholders may vote, any shares not subscribed for to be sold at public auction. By this modification the law as it stood prior to 1871, and again between 1878 and 1893, will be restored. It is not to be assumed that new stock will always be issued under this permission at par if a higher price can be obtained for the treasury. Experience in other states where the law is open shows that it is common for companies whose stock is at a premium to issue new shares at a price above par, though low enough to tempt investors. This has been the practice of the New York, New Haven & Hartford Railroad Company in issuing shares under its Connecticut charter. But whatever price may be adopted it will be the action of the company itself which fixes it and par will remain for all purposes the fixed standard by which the reasonableness of dividends shall be measured when concessions are demanded by the public.

The present provision, which requires approval by the Railroad Commissioners of the purpose for which an increase of stock is to be made, will prevent, in the opinion of the Commission, an issue for any purpose not warranted by public necessity or convenience.

The recommendation made above is made irrespective of the recommendations in this report concerning the New York, New Haven & Hartford Railroad Company and the Boston & Maine Railroad. Whatever may be done in that matter the Commission considers the change in the general law now recommended to be desirable.

The Commission has not examined the question of stock issues by public service corporations other than railroads and street railways with sufficient thoroughness to enable it to make any recommendation. Although the objections stated above are applicable in principle to an issue by any public service corporation at a premium fixed by the state, special considerations may apply, at least to gas companies, since the commodity furnished by these companies is susceptible of regulation on the basis of dividends paid, or otherwise, in a manner not practicable in the case of railroads, and special provisions of law for these companies may be expedient. That our laws are considered severe, however, by some public service corporations other than railroad companies is suggested by the experience of Massachusetts with the American Bell Telephone Company, which is understood to have left the state chiefly because of restrictions imposed by law on its capitalization and its power to hold stock in other companies.

Freight Car Balance and Performance for December, 1907.

The American Railway Association Committee on Car Efficiency has issued its Bulletin No. 22 covering Car Balance and Performance for December, 1907, the summary of which is given herewith. The committee says:

"A general decrease is noted in the total car mileage, ton mileage, and freight earnings, due to the prevailing business depression, and as a consequence the averages by which car efficiency is usually measured show a marked decrease. While the relief from congestion makes possible a higher mileage by loaded cars, and the homeward movement of empty foreign cars tends to accelerate their mileage, the increase is more than offset by the cessation of mileage by surplus cars.

"An approximate figure for cars actually in service may be obtained, however, by allowing for the idle cars reported in our Bulletins of Car Shortage and Surplus, and the increased percentage of cars in shop. These surpluses are as follows:

Per cent. of shop cars, December, 1907	5.57 per cent.
Normal percentage of shop cars (Jan. Mar., 1907)	5.02 "
Excess percentage	0.55 per cent.
Average surplus cars December, 1907, 164,325.	
Per cent. of total cars..........................	7.89 per cent.
Total per cent. surplus and excess shop cars..	8.44 per cent.

"Deducting 8.44 per cent. from the total cars for which mileage is reported, and applying the remainder to the total car mileage, an average of 23.9 miles per car per day is secured, which is very little lower than the normal average.

"The present rules governing freight car interchange are founded on the principle that every car owner has a right to the control of his cars, and each successive change in rules or rates simply emphasized this right. This principle, although based on strict equity, has had opposed to it the inevitable tendency toward a free interchange or common use of cars adapted to general traffic. The extent to which this natural tendency has prevailed over artificial regulations at variance with it, is denoted by the per cent. of foreign cars in use on all lines, which increased from 30 per cent. in 1904, to 41 per cent. for the first six months of 1907. The rate of rental for car hire which has not availed in times of car shortage to secure the car owner in the use of his property, operated immediately on the appearance of a car surplus to create a new difficulty, the excessive and useless cross haul of empty cars. The per cent. of cars on their home roads, which was but 56 per cent. during the first half of 1907, and only 54 per cent. during the month of April, 1907, averaged 64 per cent. in December, with indications that the homeward movement had only fairly started. This change was brought about only at great expense.

"The proportion of empty to total freight car mileage in December was 35.4 per cent. as against 27.1 per cent. in October. It is fair to assume that the average business can be handled with at least as low a percentage of empty mileage when the car supply is plentiful as during a period of shortage, and it would therefore appear that 8.3 per cent. of the total car mileage, or 117,287,407 miles, was absolutely unnecessary. It is impossible to calculate the cost of this enormous empty movement, but that it was a heavy drain on the already depleted revenues of the railroads, cannot be denied. It may be claimed that the saving made by individual roads in per diem balances justified the expenditure which this excess empty movement entailed, but the fallacy of this claim is apparent in the face of the fact that the gain by one line was necessarily offset by the loss to another. Further, in a majority of cases, the movement resulted in practically an even exchange of cars.

"Nor was this the only deplorable result. A great many roads took extreme measures to reduce the number of foreign cars on their lines and to force their own cars into service. Roads which had, during the period of shortage, gladly accepted cars belonging to affiliated lines, revised their rules when cars became plentiful and refused to accept cars not properly routing over their lines. Foreign cars were in many instances stopped at junction points and their lading transferred to home cars. In other cases home cars were applied on loading to foreign lines, while foreign cars were sent home empty in the same direction * * * The experience gained at such great cost may lead to the adoption of more flexible rules

governing the use of freight cars in interline traffic. To the extent that such rules recognize the necessity for free interchange of cars, with such regulation as the principle of private ownership demands, to that extent will the future efficiency of freight cars be increased."

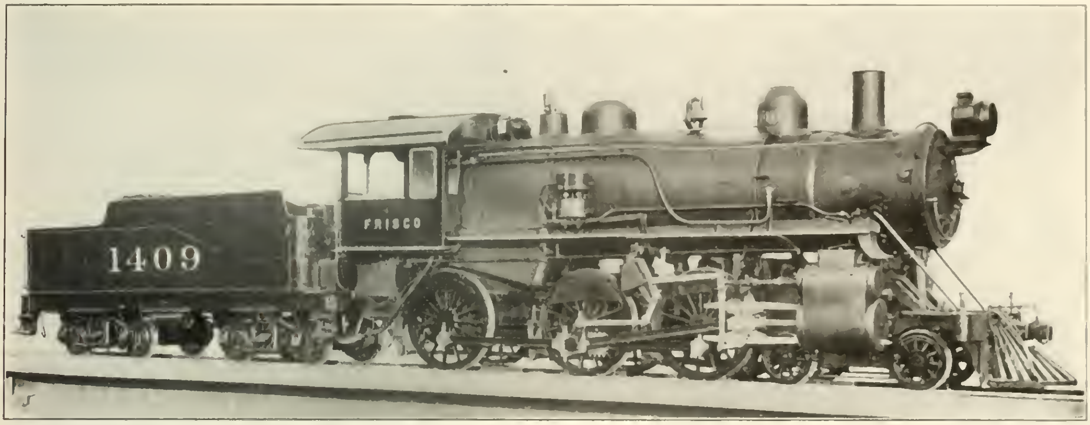
Ten-Wheel Passenger Locomotives for the 'Frisco.

The Baldwin Locomotive Works have recently delivered to the St. Louis & San Francisco ten passenger locomotives of the 10-wheel type. These are among the heaviest engines of this class thus far made by the builders, as they have a total weight of 194,450 lbs. in working order. The cylinders are 23 x 26 in. and the driving wheels 69 in. in diameter, the resulting tractive force with a steam pressure of 200 lbs. being 33,900 lbs. As the weight on the driving wheels is 141,050 lbs. the factor of adhesion is 4.16.

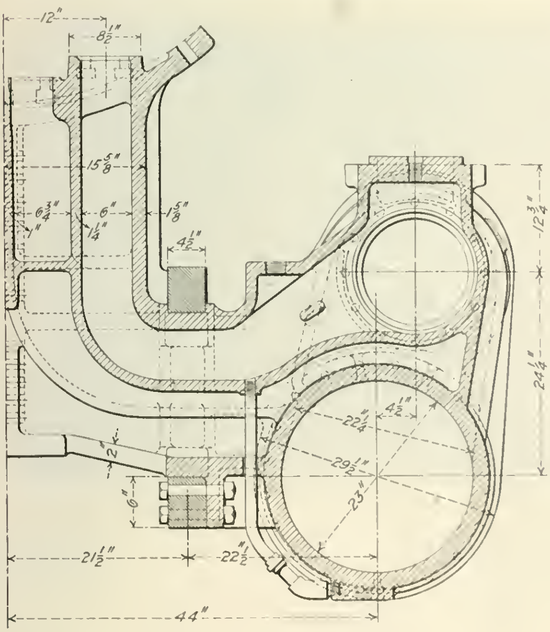
The cylinders are arranged for double front rails, and the castings are bolted to the smokebox and to each other by a double row of 1¼-in. bolts. The valves are of the internal admission piston type, 13 in. in diameter, and work in bushings ⅝ in. thick. The by-pass valve consists of a plate which rests on a horizontal seat, and normally covers openings leading to the live steam ports. When the throttle is open the plate is held down by boiler pressure which acts on its upper surface. Excessive pressure within the cylinder will cause the plate to lift from its seat, thus opening communication between the two live steam ports.

The center lines of the steam chests are placed 4½ in. outside the center lines of the cylinders, thus making possible a simple arrangement of Walschaert's valve gear, with all moving parts in practically the same vertical plane. As the engine is equipped with inside admission valves the eccentric cranks follow the pins. The cranks are of cast steel, and are secured to the main pins by a tapered fit and through bolt. A substantial steel casting, secured to each frame by three 1¼-in. bolts, supports at each end a combined link and reverse shaft bearing. The links are of the built-up type, with cast steel side plates. Each radius rod is made in one piece, the jaw which embraces the hanger and link block being slotted out. The combining levers are placed back of the crossheads and are coupled directly to the valve rods, which are supported in bearings bolted to the guide yoke. The valves are set with a constant lead of ¼ in. and a maximum travel of 6 in. The steam lap is 1 in. and the exhaust clearance ⅛ in.

The frames are of cast steel, 4½ in. wide, with double front



Ten-Wheel Locomotive; St. Louis & San Francisco.



Cylinder of Ten-Wheel Locomotive.

rails of wrought iron. The lower rail is double-keyed, while the top rail is hooked to the main frame, without keys. The pedestal binders are lugged and bolted to the pedestals.

The boiler is of the wagon-top type, with a wide firebox and sloping throat and back head. The center line is placed 9 ft. 8 in. above the rail, and the depth of the throat from the underside of the barrel to the bottom of the mud ring is 23⅛ in. By spacing the second and third pairs of driving wheels 9 ft. apart ample room is secured for a wide firebox with a moderate inclination of the grate. The mud ring is supported on sliding shoes in front and a buckle plate at the rear.

The firebox is radially stayed, with two T irons supporting the front end of the crown. The roof and side sheets are in three pieces, with a double riveted lap seam on each side, while the crown and sides of the inside box are in one piece. The boiler barrel is built up of three rings, with the gusset in the middle. The longitudinal seams are butt jointed and sextuple riveted, and are welded at each end. The seam on the dome ring is placed on the top center line and is welded throughout its entire length, with a heavy liner inside.

The tender is furnished with a steel channel frame and water bottom tank. The trucks are of the arch bar type, with cast steel bolsters, triple elliptic springs and steel-tired wheels.

The following are some of the principal dimensions of these engines:

Cylinder, diameter	23 in.
Piston, stroke	26 "
Boiler diameter of shell	68 "
Boiler, thickness of sheets	[illegible] in. and ¾ in.
Steam pressure	200 lbs.
Firebox, length	101⅜ in.
" width	67¼ "
" depth, front	77⅜ "
" depth back	59⅛ "
" thickness, side, back, crown	⅜ "
" thickness tube	½ "
" water space, front	4 "
" water space, sides and back	3½ "
Tubes, number	364
" diameter	2 in.
" length	15 ft. 1½ in.
Heating surface firebox	172 sq. ft.
" " tubes	2,867 "
" " total	3,039 "
Grate area	47.7 "
Wheels, diameter, driving	69 in.
" " truck	33 "
" " tender	33 "
Journals, main driving	10 in. x 12 in.
" trailing	9 " x 12 "
" truck	6½ " x 10 "
" tender	5½ " x 10 "

Wheel base, driving	15 ft. 10 in.
" " engine	26 " 10 "
" " engine and tender	57 " 10 "
Weight on driving wheel	141,050 lbs.
" on truck wheels	53,010 "
" of engine	194,450 "
" of engine and tender	315,000 "
Tank capacity, water	6,000 gals.
Tank capacity, coal	12 tons
Tractive effort	33,900 lbs.
Weight on drivers / Tractive effort	4.16
Total weight / Tractive effort	5.74
Tractive effort x diameter of drivers / Heating surface	769.6
Heating surface / Grate area	63.71
Firebox heating surface / Total heating surface	5.66*
Weight on drivers / Total heating surface	46.41
Total weight / Total heating surface	63.98
Volume of two cylinders, cu. ft.	12.5
Total heating surface / Volume of 2 cylinders	243.12
Grate area / Volume of 2 cylinders	3.82

*Per cent.

An Engineering Department Filing System.

The method of filing drawings in the engineering offices of many railroads is antiquated and unsystematic, and is a constant source of annoyance and delay within the department as well as without. When a managing officer asks for a drawing he wants it at once, and the engineering department should be able to produce it without delay. Under the system, or lack of system, followed in many offices, this is impossible. In addition to this important requisite, a satisfactory system should preserve the drawings in good shape and should be capable of being easily expanded. A system of this sort has recently been installed in the office of the engineer of maintenance of way of the Chicago & Eastern Illinois.

Special filing cases were designed, comprising units of two kinds: one containing shallow drawers and the other pigeon holes. The units are all 41 in. long, and all but one kind are $17\frac{1}{2}$ in. high. There are three widths of pigeon hole units—15 in., 22 in. and 29 in.—and of the last there are two arrangements, one having the pigeon holes running the 29-in. direction and the other running the 41-in. direction. The larger drawer unit is the same size as the largest pigeon hole unit—41 in. x 29 in. x $17\frac{1}{2}$ in.—and has eight drawers $1\frac{3}{4}$ in. deep. The small drawer unit is $9\frac{1}{2}$ in. high and has four drawers, $3\frac{1}{2}$ in. deep, arranged in two tiers of two drawers each. The pigeon-hole units are divided into an upper and lower story, each of which is closed by two sliding panels running in parallel grooves, so that only one-half of the opening can be uncovered at one time.

In the large drawers are placed the larger drawings, like right-of-way maps, according to the system of indexing to be described later. For the pigeon holes the drawings, which are tracings of course, are rolled around cardboard tubes $\frac{7}{8}$ in. in diameter, with closed ends. There are three different lengths—18 in., 26 in. and 38 in.—and midway of each is pasted, by one end, a strip of unprepared Hyperion cloth, about 5 in. x 10 in. for a 26-in. tube. This is rolled in with the tracing to keep the latter from slipping on the tube. A circular sticker on the end of the tube carries the filing numbers, which are made with a rubber stamp. The only rolled drawings not put around tubes are profiles, their length making a tube unnecessary. A blueprint copy is kept in the pigeon hole with each profile tracing to save too frequent handlings of the latter. The original drawings of all of the tracings in the filing cases are kept in a vault.

The small-drawer units are intended for miscellaneous small drawings such as sketches, small maps, etc., which are either legal size ($8\frac{1}{2}$ in. x 14 in.) or correspondence size ($8\frac{1}{2}$ in. x 11 in.) Also a stack consisting of a small-drawer unit, a 29 in. wide pigeon-hole unit and a base is put under each drafting table. In the pigeon-holes are kept drawings on which the draftsman may be working or using for reference, and in the drawers are kept drawing instruments, material, papers, etc.

The drawings are indexed in station order and also according to classification; therefore much that appears in one is cross-indexed in the other. There are three divisions of the road, each with branches. The stations are taken in order on the main line first, and then each branch in turn. For the more important points, where there are a great many drawings, the index is split up into subjects. As already mentioned, much that is in the "classification" index appears in the "station" index also. However, there are some things that cannot be indexed in the "station" file, as, for example, charts, diagrams, reports, forms, tables, statements, etc. The card gives all essential information concerning the drawing. For a right-of-way map, for instance, it will show the division or branch, the town, county, mile-post, scale and file number. These maps are kept in the large drawers, as already mentioned, there being one drawer for each county.

A photographic view showing both the drawer and pigeon-hole units is reproduced herewith. The units numbered 3 and 4 open at the left-hand end, the sliding panels showing plainly. The opened cases show the ends of the cardboard tubes on which the tracings are rolled.

In the index cabinet are three vertical file drawers in which are kept current records of side-track changes, there being one drawer for each division of the road. These changes are recorded on a regular blueprint form of legal size, and a blueprint map showing the change is attached. The office tracing is changed to correspond, and a notation of same made on the record. These drawers will hold a year's records, after which they are removed and placed in Shipman binders.

The C. & E. I. system of indexing has been made as compact as possible, a feature that its users consider a great advantage. Instead of one entry to a card, as with some systems, as many entries as possible are made on a single card. The cards are 4 in. x 6 in. and are ruled with 13 lines. It is claimed that less time is taken to glance over a dozen entries on a single card than to look at a dozen cards. It is absolutely essential, of course, that the index be kept up to date. The C. & E. I. engineering officers are much pleased with the system and say that it has justified its cost many times already in the short period it has been in use.

Filing Cases for Drawings; Engineering Dept., Chicago & Eastern Illinois.

It may possibly console some of us who have been impatient because sundry railroad terminals have been some years under way and are not yet completed to know that we have company in our misery. In 1878 a commission was appointed to report on what should be done to remedy the totally inadequate facilities of the passenger station in Copenhagen. In 1903 the Minister of Public Works submitted plans for a new station. Recently work was begun on it, and it is to be something fine, costing little less than \$7,000,000; it is to be completed in 1915.

GENERAL NEWS SECTION

NOTES.

The railroad commissioners of Massachusetts have declined to recommend that every street railway car be provided with a lifting jack.

The Southern Railway has decided to employ train collectors on its passenger trains generally throughout its lines, and has appointed as superintendent of the department R. W. Hunt.

The West Jersey & Sea Shore has announced an increase in passenger fares, taking effect June 1. Between Philadelphia and Atlantic City the round-trip rate will be advanced 25 cents.

The railroads of Mississippi, with the approval of the State Railroad Commission, are now issuing 1,000-mile books, good for families, at $25. The principal roads also issue 2,000-mile books at $40.

The railroads in the Transcontinental Passenger Association have abolished second class fares, so that henceforth passengers riding in tourist sleeping cars will have to pay at the first class rate.

Through passenger trains are now running between St. Paul and Spokane over the Canadian Pacific and the Spokane International. These trains were taken off about four months ago on account of the light traffic.

The Atchison, Topeka & Santa Fe has just opened at the Needles, Cal., a new hotel, "El Garces." The hotel cost approximately $250,000, and is one of the finest station hotels on the line. The building is of reinforced concrete, 518 ft. long and two stories high.

On the Pittsburgh division of the Pennsylvania two helping engines are now used with some of the heavy freight trains ascending grades, instead of one, as heretofore, thus increasing by 50 per cent. the number of cars that can be taken in a single train.

The railroads in the Central Passenger Association, in deciding to make a reduction of 25 per cent. in the round-trip rates to large conventions during the present year, voted to grant this allowance only for occasions where 1,000 or more passengers will be likely to want the reduced rate tickets.

At Spokane April 22 the Northern Pacific was fined $4,000 in the Federal Court for violation of the law forbidding carriers to keep animals in cars over 28 hours. It was shown that on two separate occasions the company had carried large shipments of cattle and sheep for many hours without water, feed or rest.

The State Railroad Commission of Texas has suspended the order which it issued some time ago requiring the Missouri, Kansas & Texas to buy 165 engines and 6,000 freight cars within three years, the railroad company having shown that it has a sufficient supply of cars and engines for the present amount of business.

The appellate division of the Supreme Court of New York has affirmed a decision awarding $120,000 damages against the Long Island Railroad for fires caused by sparks from locomotives. The decision is said to have been based on the neglect of the railroad company to burn all brush and other inflammable matter along its right-of-way twice a year, as required by law.

It appears that the 18-hour New York-Chicago train of the Pennsylvania road runs so slowly that it has been getting in the way of other trains! This we learn from a Chicago press despatch. The incident which gave rise to this statement was the running of a special train of four cars, carrying a theatrical party, on May 3, from Pittsburgh to Chicago in seven hours 42 minutes. This is almost exactly a mile a minute for the whole trip, the distance being 468 miles.

Near Walkers Mill, Pa., on the Pittsburgh, Cincinnati, Chicago & St. Louis, about ten miles west of Pittsburgh, Pa., on the night of April 30, the express messenger on westbound train No. 25 was overpowered and bound by robbers, and a number of bags of gold and other valuables were stolen from the express car. It appears that the robbers must have boarded the train at Pittsburgh, and they succeeded in stopping it and escaping before anyone but the express messenger knew of their presence on the train. On the same day a robbery of $63,000 from a Wells-Fargo express car on a railroad in Mexico was reported.

The Attorney-General has begun proceedings against 15 carriers for violations of the Safety Appliance Act reported by inspectors of the Interstate Commerce Commission. The companies are the following: Atchison, Topeka & Santa Fe; Baltimore & Ohio; Buffalo & Susquehanna; Buffalo, Rochester & Pittsburgh; Cleveland, Cincinnati, Chicago & St. Louis; Delaware, Lackawanna & Western; Erie; Illinois Central; New York Central & Hudson River; St. Louis, Iron Mountain & Southern; Seaboard Air Line, Washington Southern; Philadelphia, Baltimore & Washington; Southern, and Wiggins Ferry Company.

The Chicago, Milwaukee & St. Paul has organized the Continental Telegraph Company and the Continental Express Company, organizations which it is said will take and manage the telegraph and express business throughout the lines of that road. The contracts of the Western Union Telegraph and the United States Express Companies with the St. Paul road have expired, or will soon expire, it is said.

Samuel Rea on the Industrial Situation.

The *Wall Street Journal* quotes Samuel Rea as follows: "While I fully appreciate the present situation, which seems to me to be about as follows:

1. Business is seriously depressed—as it must be following a decided break in confidence;

2. Conditions are affected by the forthcoming Presidential election;

3. There are more idle railroad cars than since the inception of the panic, and from the railroad standpoint business can scarcely be worse.

On the other hand, every business man must not forget that:

1. This country is sound at the core. There has never been a time following a panic when the country had a better outlook.

2. There is no longer any question, as there has been in former panics, that the country is on anything but a gold basis.

3. Stocks in all lines of trade are depleted, which means that large orders must be given when demand arises.

We need a return of confidence and this requires time, patience and economy, both private and corporate, and especially do we need federal, state and municipal economy, because business retrenchment set in a year ago. We now have an indication of a return of confidence, and everything possible should be done to encourage it. The outlook for crops so far is good, and it would not be unlike the usual good fortune of this country to have in this particular year, when they are so badly needed, bountiful and profitable crops. It is, therefore, the duty of citizens to continue in a conservative and cheerful frame of mind, and to think, read, write and do only such things as will banish pessimism and timidity, which are no longer justifiable."

Telephones for Train Despatching.

The Chicago, Milwaukee & St. Paul is preparing to install telephones for train despatching between Chicago and Milwaukee, 85 miles, and between Chicago and Savanna, 138 miles. On the Chicago, Burlington & Quincy, between Aurora and Mendota, train orders are handled by telephone in the same general way as with the telegraph, except that the despatcher instead of sending the order and then copying it in the order book on the first repetition, now copies the order in the book as he talks it off. He thus gages his speed of conversation to his ability to write so that the receiving operator is not likely to be "rushed" beyond his ability to make a legible copy. All figures in the body of the order are spelt out, as for instance, "Engine 1,124—one, one, two, four," and on single-track the names of the stations are spelt. The operators in repeating observe the same rule as regards spelling out of figures and names. At unimportant stations where an operator is not always on duty a set of telephone instruments is maintained so that a conductor can if necessary, communicate direct with the despatcher and get an order.

Sixteen Months Under the Revised Rate Law.

Logan G. McPherson has made a two weeks' study of the complaints on file with the Interstate Commerce Commission and finds that, judging by the number of cases and the results, comparatively satisfactory service has been given by the railroads. Mr. McPherson found that in the 16 months from August 29, 1906, to Jan. 1, 1908, 5,952 complaints were filed with the Commission, the total including, presumably, all long standing grievances which had been held back owing to lack of confidence in the efficacy of the law as it was before the 1906 amendment. Of this total 2,105 were on matters not coming within the jurisdiction of the Commission. Of the remaining 3,847 complaints 3,374 were informal and 473 formal.

The informal complaints are taken up by the Commission with the railroad companies and adjusted without a set hearing. They refer almost entirely to oversights, clerical errors and misconstructions of tariff. Of the total of 3,374 in this class, practically one-half were adjusted by the carriers after correspondence with the Commission and the other half were dismissed by the Commission for lack of cause. Twenty-five of the 473 formal complaints apply to express and sleeping car companies. Of all the formal complaints considerably more than half are what Mr. McPherson designates as unimportant—that is, complaints that affect the transportation charge on but one shipment or a few scattering shipments, or that affect the transportation charge between stations that are not in a principal channel of traffic.

In the 16 months there were 87 complaints on the rates on food stuffs, 25 of these involving rates on grain and grain products. Of these 26 were decided in favor of the complainants, 23 were dismissed, withdrawn or indefinitely postponed, five were adjusted or compromised, and 33 had not been decided.

Cotton, the great staple of the South, produces but two complaints. Lumber is really the only article of commerce upon which the rates of freight are in turmoil, the rapidly changing sources of supply necessitating a continual readjustment of freight rates.

Summing up, Mr. McPherson showed that of 425 formal complaints affecting freight transportation, 86 were decided in favor of the complainants, 115 were dismissed, withdrawn or indefinitely postponed, 40 were adjusted or compromised and withdrawn, while 181 remained undecided on April 11.

"When the total number of complaints made during these 16 months," said the speaker, "is compared with the total transactions between the shippers and the railroads of the United States, with the volume and variety of the traffic movement, their number and their importance dwindle into insignificance."

Three-Cent Street-Car Fare in Cleveland.

Since Monday, April 28, all the street railway lines in Cleveland have been operated by the Municipal Traction Company, a company formed in pursuance of Mayor Johnson's plan for providing 3-cent fares throughout the city, which plan, after a controversy extending over seven years, has now been put into effect. At a meeting on April 27, the city council agreed with the different owning companies on the terms of a consolidation, and the "Cleveland Railway Company" was incorporated as a holding company. This company is the owner of the properties, which are leased to the Municipal Traction Company for 50 years. The total valuation of the property of the four companies which are included in the arrangement is $23,690,000; and it is proposed to make extensions and betterments aggregating about $11,310,000. All existing franchises were abandoned by the old companies. On Tuesday, April 28, by way of celebrating the "victory" of the people, all passengers were carried free throughout the city. Since Tuesday the uniform fare has been 3 cents. On Wednesday the 1,850 conductors and motormen employed on the lines presented a demand for an increase in their pay of 2 cents an hour, which, it is said, had been promised them by the old companies, and the newspapers talked of an impending strike; but after three or four days' discussion it was decided to submit all questions to arbitration. The people of East Cleveland have already entered a complaint in the courts because the new low rate does not extend into the village.

The Westinghouse Mill Motor.

The mill type direct-current motor, which has recently been put on the market by the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa., is designed to meet the severe conditions of service in steel mills. It is also adapted to such railroad work as operating transfer tables and bending rolls in the boiler shop. The motor used on the transfer table may be provided with two friction clutches, one of which operates the drum for pulling cars or dead engines on to the table, and the other the mechanism which drives the table. As it is possible to disconnect both clutches at once, there may be times when there is no load on the motor. An ordinary series motor relieved of all load would run at a dangerous speed; this motor has a shunt field connection, which limits the no load speed to approximately double the full load speed.

The motor frame is divided horizontally and is hinged so that the upper half can be quickly swung back for repairs. The frame is so heavy as to minimize vibration. The frame is provided with handholes for inspection of the commutator and windings, but the covers fit tightly and the frame and bearing housing are dustproof.

The shaft is large, with keyways of liberal dimensions. The bearings have large wearing surface and the air gap between the fields and the armature is large, so that there may be considerable wear in the bearings before the revolving and stationary parts could rub. The bearings are split and made interchangeable for either end of the motor. No dowel pins are used, as lugs cast with the bearings are used to keep them from turning. An eyebolt on each bearing makes handling the armature convenient. Only asbestos, mica, porcelain and an insulating compound are used for insulating. The coils are treated with the compound and then baked at a temperature far higher than any that will ever be met in actual service. The armatures are wound with strap copper insulated with mica tape, handwound. This form of coil can be easily repaired by the customer. The coils are held in place by hard fiber wedges and bands which are below the surface of the laminations.

Automatic Carline Grain Door Hook.

An automatic carline hook for grain doors, recently brought out by the Chicago Grain Door Co., Chicago, is illustrated herewith. This company has used for many years a malleable iron hook for holding the grain door in raised position against the carline which was satisfactory for cars which were not too high for a man to reach the hook. But with present large capacity cars, where the roof is above the reach of the tallest man, the hook has to be worked

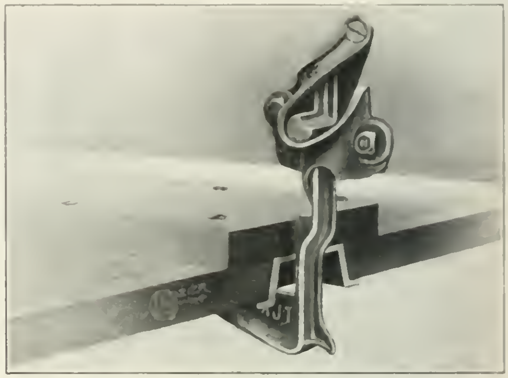


Fig. 1.

with a bar or stick. To meet this condition the fixture here shown was designed and patented. It works automatically, both in putting up grain doors in high box cars and taking them down from the roof when needed to load grain or other bulk cargoes. It is claimed that the hook is a positive lock when the door is folded up in the roof of the car, and the door cannot possibly fall down until released as described below.

To fold the grain door up in the roof of the car, raise it vertically until the swivels are on the top ledges of the rods, pull the bottom of the door inwardly to a horizontal position, then, with a

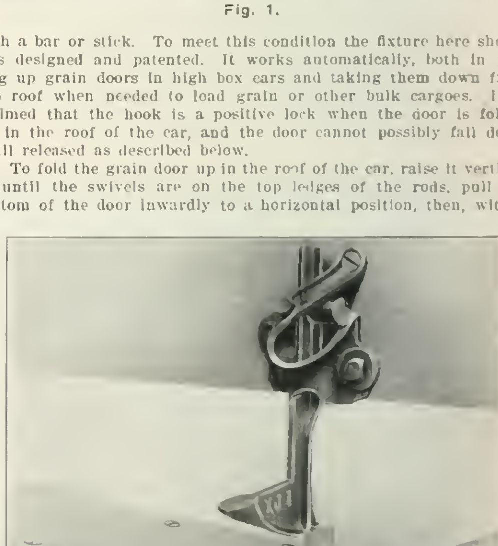

Fig. 2.

bar or stick, push the door upward against the hook XJ1, which will automatically raise, making a quarter turn to the left, pass by the door and immediately drop downward (by gravity and the slide) to its former position, under the grain door (Fig. 1). The door is positively locked between the hook and the slide plate of the box car and cannot possibly change its position until the hook is moved to release it. To take the door down (Fig. 2), use a bar or stick 3 ft. or more long, push upward on the bottom of the hook (or the small projection at the back of same) raising the grain door with the hook. The hook will make a quarter turn to the left, release the door and then, by gravity and the slide, drop to place and former position automatically.

A Southern Impression of the Railroad Situation.

The story, apocryphal but illustrative, is told of a visitor who desired to see the president of an important southern railroad. He called at the office and was told that the president was in Washington appearing before the Interstate Commerce Commission. He asked for the vice-president, and was informed that he was in Georgia attending a legislative conference. The general manager was reported as in Alabama, summoned there by the legislative conditions which threatened ruin to the railroads of that state. The passenger agent was in North Carolina pointing out to the Legislature the injury which would surely follow the enactment of its bill for lower passenger rates. Finally, in despair, the visitor asked for the highest official in authority, and the office boy told him that he was trying to run the railroad while all of the officials were trying to save it from destruction by legislation. That very nearly states the case.

What of the future? With the physical condition of railroads deteriorating because of their inability to find money to make improvements so long as anti-railroad legislation continues, we are facing what is probably the most critical period in the history of American railroads.

Of recent years the public seems to have come to the conclusion that men with bulging bank accounts are eagerly waiting for an opportunity to put money into railroad securities, though the control of the railroads is taken from them, and though other people who have no financial interest in them are given authority to fix the rates at which they can do business. The idea is fallacious. The capital needed for railroad expansion is not going to seek railroad investment, but railroad men must seek the capital with diligence. They must be able to present the matter in such a way as to indicate profits large enough to justify the risk, or otherwise those who have the bulging bank accounts will keep their money themselves or else put it in securities over which they do have some control. Are the people in public and private life who are fighting railroads or demanding impossible improvements willing to invest their own money in railroad securities at present? Not one of them. As a field for investment the railroad is no longer an attractive proposition, and this, too, comes at a time when never in our history did we need so much money for railroad expansion. We ought within the next five or ten years to put more than one-half as much money into the enlargement of railroad facilities as the total amount now represented in all the stocks and bonds of the railroads of the country. Where is so vast a sum to come from? If it should not come, then business will be halted, railroad facilities will grow steadily worse instead of better, and the country will suffer as it has suffered for the last few years because the railroads were unequal to the volume of traffic. The country holds its hands up in horror, and justly so, at the disastrous railroad wrecks. Under present conditions railroad wrecks are likely to increase rather than to decrease. Railroad wrecks are mainly due to the volume of traffic being in excess of the facilities of the road, to the low physical condition arising from lack of money to make improvements or to the inefficiency of men who have been taught during the last few years to seek to get as much as possible and give as little of faithful work in return as possible. In other words, they have drunk of the deadly poison—get something for nothing—which is now sapping the sturdy self-reliance and independence of so many of the American people. While railroad employees generally are faithful to their trust, some inefficient men, without a sense of their responsibility, have eagerly grasped at this teaching and feel that the railroads and the world at large owe them a living whether they earn it or not. The anti-railroad agitation is largely responsible for this.—*Richard H. Edmonds, in the Manufacturers' Record.*

American Institute of Chemical Engineers.

The committee appointed at Atlantic City last June to consider the formation of an American Institute of Chemical Engineers has found a strong sentiment for bringing together into closer relationship men who specialize in chemical engineering. A decisive vote has been received in favor of the formation of the society. For the purpose of organization, a meeting will be held in Philadelphia about the middle of June.

An Error Corrected.

The statement in the *Railway Age* of April 24, to the effect that Mr. H. H. Sessions had resigned his position as Vice-President of the Standard Coupler Company of New York, was an error. Mr. Sessions' connection with the Standard Coupler Company continues, as it has for many years, his official and personal relations with that company being entirely harmonious and satisfactory. His connection with another company, which conducts a business confined to the repairs of old or bad order cars exclusively, in no way interferes with his duties in the Standard Coupler Company, nor does it bring him in competition in any way with builders of new car equipment, either freight or passenger.

Manila and Cavité Line Open.

The first passenger train was run on May 2 between Manila and Cavité. Up to the present the only connection between Cavité and Manila was by a sea trip of six miles across the bay. The opening of the line means that stores and men can be quickly moved between these points in all weather.

The University of Colorado Engineering Shops.

On April 25 the new engineering shops of the University of Colorado were formally opened. President James H. Baker gave a short review of the growth of the engineering department from one instructor, one student, one drawing board and no room, in 1893, to the present faculty of 27 members, student enrolment of 271, and the full shop, laboratory, drawing and recitation room equipment.

The shops are 93 ft. x 122 ft., the building being in three sections, with modified saw-tooth roofs. The front section is two stories, the upper part being used by the general engineering drawing department. Below are rooms for wood turning and wood bench work. To the rear are the lathes and other heavy machine tools for working steel and iron. Across the hall are the forge and foundry rooms, equipped with all the appliances required in modern shop practice

The Retort Courteous.

Street Railway Superintendent—"I don't think we can use you any longer. Your cash register doesn't ring often enough."

Conductor—"I have got rheumatism and can't reach up to the register cord."

Superintendent—"All right. I think you need a long vacation."

Conductor—"I am much obliged to you for allowing me to run the car as long as you have."

Superintendent—"Don't mention it. I'm much obliged to you for bringing the car back."—*Judge.*

Medals for Bravery.

Upon recommendation of the Interstate Commerce Commission the President has awarded railroad life-saving medals to Frank Larson and Charles Bennett. On January 19 last, at Exeter, Neb., Larson, a fireman on the Chicago & North-Western, distinguished himself by crawling out on to the pilot of his engine and saving the life of a three-year-old child who was in the center of the track, and who but for Larson's heroism would have been run over and killed by the moving train. Bennett was a brakeman, also on the Chicago & North-Western. He rescued a woman who was in imminent danger of being struck by a fast passenger train at Waukegan, Ill.

Tug Boats in Straits of Magellan.

It is reported that a Danish company will establish a line of tugboats to tow vessels through the straits of Magellan. It is estimated that 3,000 sailing vessels under all flags pass around from the Atlantic to the Pacific yearly. It frequently takes weeks to round the Horn, while vessels could ordinarily be towed through the strait in 36 hours. It is proposed to station 10 powerful tugs at Punta Arenas in the straits.

INTERSTATE COMMERCE COMMISSION RULINGS.

Value of Testimony Concerning Past Secret Rates.

Frye & Bruhn et al. v. Northern Pacific and Chicago, Burlington & Quincy. Opinion by Commissioner Harlan.

The complaint alleged that the rate of $170 per car for the transportation of live hogs in 36-ft. single-deck cars from Missouri river, St. Paul and points intermediate to Seattle is unreasonable; that from branch-line stations west of the Missouri river the local rate to main line junctions is added to the $170 rate, making an unreasonable combination through rate; and that defendants unlawfully fail and refuse to publish rates for the transportation of live hogs in double-deck cars. The Commission held that the $170 rate is not shown to be unreasonable; that there is not sufficient evidence in the record to warrant a finding that the combination rate applied on shipments from branch-line stations is excessive, but it seems that the local rate on the branch line ought to be absorbed; that the record does not justify requiring defendants to furnish double-deck cars and re-establish double-deck carload rates; and that claim for reparation must be disallowed, except on certain 10 carloads shipped in 1904 under an excessive rate of $240 per single-deck car.

The Commission holds that evidence of rebates allowed in the past when offered by a shipper who unlawfully received them is not competent to show that the published rate is unreasonable.

The fact that defendants accepted, and complainant actually paid, less than the published rates, in violation and in defiance of law, raises no presumption that the published rate is unreasonable, but tends rather to raise a presumption that the defendants somewhere in their rate structure exacted from shippers of other commodities rates that were unreasonably high.

TRADE CATALOGUES.

Corrugated Steel Bars.—The 1908 catalogue of the Expanded Metal & Corrugated Bar Co., St. Louis, Mo., is a 112-page book, 8 in. x 10 in. Besides the regular squares and flats, it gives sizes and weights of the new round bars, just being placed on the market. The contents are subdivided into Building Construction, Foundations, Railroad Structures and Miscellaneous Structures. In each division, there are numerous photographs of reinforced concrete structures using corrugated bars. At the back of the book is a chapter on the strength of reinforced concrete beams, including a lot of tables for use in designing such beams.

Bolsters.—The Pittsburgh Equipment Co., Pittsburgh, Pa., has published a portfolio of blueprints, showing perspective views of different styles of truck and body bolsters, including draft carriers suited to different draft gears, combined cast steel and pressed steel underframes, cast steel end sills, cast steel side frames, spring planks and oil boxes.

Large Steam Engine Tests.—Bulletin No. 1,502 of the Allis-Chalmers Co., Milwaukee, Wis., describes tests of the steam engines furnishing power for the Interborough subway in New York. They are rated at 8,000 h.p., but the actual capacity is 12,000 h.p. The bulletin gives full details and information regarding the tests.

The Union Pacific passenger department is distributing a folder entitled "Homes in the West." It tells of free government lands in western Nebraska and in the South Platte valley, Colorado, and of the resources, climatic conditions and agricultural opportunities. It also explains how the government lands may be obtained.

Air Compressors.—The National Brake & Electric Co., Milwaukee, Wis., is distributing a card showing a halftone view of a single-step motor-driven, type 3 V S, three-cylinder air compressor. These are built in capacities from 50 to 225 cu. ft. of free air per minute.

MANUFACTURING AND BUSINESS.

A. L. Whipple has been appointed Sales Manager for Forsyth Brothers Co., Chicago, with headquarters in New York.

The offices of the American Steel Foundries, New York, have been removed to the Hudson Terminal buildings, 30 Church street.

The New York office of the Ajax Manufacturing Co., Cleveland, Ohio, has been moved to the Hudson Terminal buildings, 50 Church street.

The New York office of The Railway Materials Co., Chicago, has been moved to the new Singer building, Broadway and Liberty street.

The district office at San Francisco, Cal., of the Allis-Chalmers Co., Milwaukee, Wis., has been moved to the Phillips building, 599 Mission street.

Walter H. Baldwin, for eleven years Chicago Sales Manager of the Lidgerwood Manufacturing Co., New York, has been made Assistant General Manager of The Adams & Westlake Co., Chicago.

The Imperial Steel Works, operated by the Japanese Government, recently placed their orders for vise equipment, consisting entirely of double swivel vises, with the Pittsburgh Automatic Vise & Tool Co., Pittsburgh, Pa.

H. G. Perring, Secretary of the Engineers Club of Philadelphia, Pa., and formerly engineer with the Keystone Fireproofing Co., has gone to the General Fireproofing Co., Youngstown, Ohio, as District Manager at Philadelphia, with offices in the Drexel building.

W. R. Burrows, formerly Purchasing Agent of the Norfolk & Southern, has taken charge of the railroad department of Topping Brothers, 122 Chambers street, New York, manufacturers of ball bearing jacks, track drills, tool grinders and Totten's brake beam clamp.

The General Railway Supply Co., 922-23 Marquette building, Chicago, is agent for the metallic sheathing, "National" steel trap doors, "Schroyer" friction curtain rollers and "National" standard roofing, recent orders for which were noted in this column two weeks ago. An error in printing made the name read General Railway Specialty Co.

C. H. Spotts, for some ten years manager of the paint department of the Joseph Dixon Crucible Co., Jersey City, N. J., has resigned. Mr. Spotts has made no definite plans for the future, but has in mind identifying himself with building a new plant in the vicinity of New York for making paints especially adapted to railroad use. Mr. Spotts' address is in care of Engineers' Club, 32 West Fortieth street, New York.

W. G. Smith, Dr. Edwin Lodge and Herbert E. Boynton have resigned as Directors of the New York Car Wheel Co., Buffalo, N. Y. and are succeeded by Frederick L. Colby, Oscar C. Shimmel and Herbert E. Payne. Bernard Ginsburg has been elected Vice-President, succeeding W. G. Smith, resigned, and Edward W. Pendleton has been elected Secretary, succeeding J. A. Venable, who is now Treasurer and General Manager.

Paul R. Brooks has been appointed General Manager of the Machine Sales Co., 68 William street, New York. After leaving the Chicago, Burlington & Quincy, Mr. Brooks represented the Quincy, Manchester, Sargent Co., Chicago, and later went to The Otto Gas Engine Works, Chicago. The Machine Sales Co. has a plant at Peabody, Mass., and builds presses, machine tools, commercial automobiles and special machinery complete, on contract.

The Goldschmidt Thermit Co., New York, has established a branch office and works at 103 Richmond street west, Toronto, Ont., under the management of E. C. Rutherford. Mr. Rutherford is a Canadian by birth, and has been for several years Manager of the Magann Air Brake Co., Ltd., Toronto, and also of the Canadian Brake & Supply Co. A complete stock of Thermit and appliances will at all times be carried at Toronto, and a fully equipped repair shop will be in operation for the repair of steel castings up to 1,000 lbs. in weight.

Robert W. Hunt & Co., Chicago, have established an analytical chemical laboratory in connection with their St. Louis office, 1445 Syndicate Trust building. In addition to general analytical work, particular attention will be given to analyses of and advice on iron foundry mixtures. This work and the laboratory will be under the direction of J. B. Emerson, who for several years past has had charge of the metallurgical part of the wheel foundry of the Mt. Vernon Car Manufacturing Co., Mt. Vernon, Ill., and previously was in the employ of the Illinois Steel Co., Chicago.

The Technical Publicity Association at its annual meeting, April 30, 1908, elected the following officers to serve during the ensuing year: President, C. S. Redfield, advertising manager Yale & Towne Manufacturing Co., New York; First Vice-President, Rodman Gilder, publicity manager Crocker-Wheeler Co., Ampere, N. J., Second Vice-President, C. N. Manfred, manager advertising department, H. W. Johns-Manville Co., New York; Secretary, H. H. Kress, publicity department, A. S. Cameron Steam Pump Works, New York; Treasurer, H. M. Davis, advertising manager Sprague Electric Co., New York; Members of Executive Committee, F. H. Gale, in charge of advertising, General Electric Co., Schenectady, N. Y., and C. W. Beaver, special representative Yale & Towne Manufacturing Co. Twenty new members have joined the association since the last annual meeting.

Iron and Steel.

Bids for structural steel and iron for the first section of the Fourth avenue subway, in Brooklyn, were received on May 8.

The Maine Central has ordered 6,000 tons of rails from the Lackawanna Steel Co. An Australian road is in the market for 4,300 tons of rails.

OBITUARY NOTICES.

Frederick W. Huidekoper died at his home in Washington, D. C., on April 30. Mr. Huidekoper was born in 1840 at Meadville, Pa. He graduated from Harvard University in the class of 1862 and in 1877 was elected President of the Chicago & Eastern Illinois; from 1881 to 1882 he was also President of the Evansville & Terre Haute. In 1885 he was elected First Vice-President of the Richmond & Danville, the Richmond & West Point Terminal Railway & Warehouse Co., and the Virginia Midland, all now part of the Southern Railway. He became President of the Pittsburgh, Shenango & Lake Erie, now part of the Bessemer & Lake Erie, in 1889, and later Receiver of the same road. From 1892 to 1894 he was Receiver of the Richmond & Danville, and from 1893 to 1894 also Receiver of the Georgia Pacific and the Charlotte, Columbia & Augusta, now part of the Southern Railway. From May, 1896, to August, 1897, he was President of the Chicago, Peoria & St. Louis.

L. P. Farmer, Commissioner of the passenger department of the Trunk Line Association, died at his home in New York City on May 2. Mr. Farmer was 59 years old. He was born at Ellington, Conn., and entered railroad service in 1863 as a clerk in the treasurer's office of the Bellefontaine Railroad, now part of the Big Four. In 1864 he was transferred to the general ticket office of the same road, and in January, 1868, he was made chief clerk in the general ticket office of the Indianapolis & St. Louis, also now part of the C., C., C. & St. L. He served this company until 1871, when he became Assistant General Passenger Agent of the Missouri Pacific. In 1877 he was promoted to General Passenger Agent. In 1882 he became New England Passenger Agent for the Pennsylvania and five years later General Passenger Agent of the New York, Lake Erie and Western, now the Erie. On August 1, 1890, he was made Commissioner of the passenger department of the Trunk Line Association.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

International Railway General Foreman's Association.

The fourth annual convention of this association is to be held at the Lexington Hotel, Chicago, beginning May 25.

Franklin Institute.

At a section meeting of the Institute, May 7, there was an address on "The Construction of the Walnut Lane Bridge," by Moriz Bernstein, Philadelphia, Pa., illustrated by lantern slides.

New York Railroad Club.

At the next regular meeting of this club to be held May 15, a paper on "Reinforced Concrete, with Special Regard to Its Use in Railroad Work," by Alexander Crawford Chenoweth, will be presented.

American Society of Civil Engineers.

At a regular meeting of this society May 6 a paper on "Substructure of Piscataquis Bridge and Analysis of Concrete Work," by G. A. Hersey, was presented for discussion. This paper was printed in "Proceedings" for March, 1908.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Atchison, Topeka & Santa Fe.—Paul Morton has been elected a Director and a member of the Executive Committee. Mr. Morton was Second Vice-President of the Atchison in 1905, when he was appointed Secretary of the Navy. He is now President of the Equitable Life Assurance Society.

Beaumont, Sour Lake & Western.—R. C. Duff, President, has resigned. It is announced that A. J. Davidson, President of the St. Louis & San Francisco, is to be elected President in Mr. Duff's place. Mr. Duff has been connected with the B., S. L. & W. since 1903, when it was incorporated. For two years he was one of its general attorneys and in 1905 he was made President. He has not as yet made any announcement of his plans for the future.

See Colorado Southern, New Orleans & Pacific.

Colorado Southern, New Orleans & Pacific.—J. W. McCullough has been appointed Auditor of this company, and of the Beaumont, Sour Lake & Western, succeeding H. M. Hood, with office at Beaumont, Texas.

Delaware, Lackawanna & Western.—A. D. Chambers, Assistant Treasurer, has been appointed Secretary and Treasurer, succeeding the late F. F. Chambers. R. F. Schofield succeeds A. D. Chambers.

Missouri Pacific.—Stuyvesant Fish, formerly President of the Illinois Central, resigned as director of the Missouri Pacific on May 2.

New York Public Service Commission.—John Barstow Olmsted, of Buffalo, N. Y., who has been appointed to the Commission for the Second district succeeding C. H. Keep, was born at LeRoy, N. Y., in 1854. He graduated from Harvard in 1876, and afterward studied for two years in Germany, at Heidelberg University. He was admitted to the bar in New York State in 1879. He has since been practising law and has been prominent in politics at Buffalo. In 1880 he was President of the Garfield and Arthur Club, at LeRoy, and in 1884 Secretary of the Cleveland Republican Club at Buffalo. Since 1885 he has been attorney for the Buffalo Pitts Company, and since 1884, Treasurer of the Buffalo Civil Service Reform Association. He is an ex member of the Civil Service Commission for the city of Buffalo, is President of the Twenty-third Ward Good Government Club, and President of the Buffalo Municipal League. He was Dean of the Saturn Club in 1898 and 1899, President of the Liberal Club in 1900 and 1901, President of the Harvard Association of Western New York in 1901, and Vice-President of the Buffalo Municipal League in 1905. He is a Trustee of the Elmwood School and the Buffalo Seminary and a member of the council of the University of Buffalo.

John B. Olmsted.

Operating Officers.

Chicago & Alton.—C. F. Smith, Trainmaster at Dwight, Ill., has been appointed to the new office of Inspector of Transportation, with headquarters at Bloomington, Ill.

Chicago, Milwaukee & St Paul.—J. T Gillick, Superintendent of the Chicago & Milwaukee division, has been appointed Superintendent of Terminals at Chicago, succeeding P. C. Hart. L. R. Clausen, Superintendent of the Prairie du Chien and Mineral Point divisions, succeeds Mr. Gillick, with office at Chicago. F. H. Myers, Assistant Superintendent of Terminals at Chicago, succeeds Mr. Clausen, with office at Milwaukee, Wis. P. L. Rupp, Trainmaster at Minneapolis, Minn., succeeds Mr Myers.

Mr. Clausen is 31 years old, having been born in October 1877. He is a graduate of the University of Wisconsin, class of 1897, in electrical engineering, and entered railroad service in 1899 as baggageman on the C., M. & St. P. A year later he was put in charge of the maintenance of storage batteries and electric lighting equipment at the Chicago passenger yards. At the end of eight months he left railroad service and went to the Pacific coast, but soon returned to the C., M. & St. P. as a signal inspector. In September, 1903, he succeeded W. H. Elliott as Signal Engineer. Last November he was promoted to Superintendent of the Prairie du Chien and Mineral Point divisions, from which he is now advanced to the Chicago & Milwaukee division. Mr. Clausen is Vice-President of the Railway Signal Association.

Chicago, Rock Island & Pacific.—The position of Trainmaster of Omaha terminals has been abolished, and the territory of A. B. Ramsdell, heretofore Trainmaster at Des Moines, Iowa, has been extended to include Council Bluffs, Iowa, and Albright, Neb. Mr. Ramsdell's headquarters have moved to Council Bluffs.

Delaware, Lackawanna & Western.—Frank Cizek, Trainmaster of the Morris and Essex division, has been promoted to Superintendent of the Bangor and Portland division, a new office, with headquarters at Easton, Pa.

Illinois Central.—C. B. Fletcher, Superintendent of the Cherokee division, has been appointed also Superintendent of the Omaha division, his office remaining at Cherokee, Iowa.

Missouri Pacific.—H. G. Clark has been appointed Superintendent of the Colorado division, with headquarters at Pueblo, Colo. J. E. Snedeker Superintendent of the Southern Kansas division, has been appointed Superintendent of the Central Kansas division, with headquarters at Osawatomie, Kan., succeeding J. F. Simms, transferred. P. A. Buck Superintendent at Chester, Ill., succeeds Mr Snedeker, with office at Coffeyville, Kan. W. E. Merrifield, Trainmaster of the Northern Kansas division, has been appointed Superintendent of the Illinois division, with headquarters at Chester, Ill. D. H. Robinson, Trainmaster at Nevada, Mo., succeeds Mr. Merrifield, with office at Atchison, Kan.

New York Central & Hudson River.—Seth R. Payne, Superintendent of the Buffalo division, has been appointed General Superintendent of the Western district, with office at Syracuse, N. Y., succeeding L. H. Van Allen, resigned. Isaac H. McEwen, Assistant Superintendent of the Mohawk division, succeeds Mr. Payne, with office at Buffalo, N. Y.

Seaboard Air Line.—H. C. Grimshaw, Superintendent of the Fifth division, will move his office from Americus, Ga., to Savannah, on May 10. J. B. Glazier, Superintendent of Terminals at Savannah, has been appointed Trainmaster at that place, effective the same date, and the office of Superintendent of Terminals at Savannah has been abolished.

Southern Railway.—R. W. Hunt, Assistant General Passenger Agent at Atlanta, Ga., has been transferred to the auditing department and appointed Superintendent of Train Collectors. J. L. Meek, division passenger agent at Knoxville, Tenn., succeeds Mr. Hunt.

Traffic Officers.

Illinois Central.—E. K. Bryan, Acting Assistant General Freight Agent, has been appointed Assistant General Freight Agent, succeeding John Dwyer, who resigned to engage in other business.

Kalamazoo, Lake Shore & Chicago.—F. L. Comstock has been appointed General Freight Agent, with office at South Haven, Mich.

Lake Shore & Michigan Southern.—W. F. Carter, traveling passenger agent at Toledo, Ohio, has been appointed General Agent, passenger department at Toledo.

Missouri Pacific.—L. D. Knowles has been appointed General Agent at Denver, Colo., succeeding M. C. Post, resigned.

Philadelphia & Reading.—J. F. Auch, Assistant General Freight Agent, has been appointed General Freight Agent, with office at Philadelphia, Pa., succeeding B. H. Ball, who was made Freight Traffic Manager.

San Antonio & Aransas Pass.—J. B. Brooks, General Agent at San Antonio, Tex., has been appointed Assistant General Freight Agent, with office at the same place.

Southern Railway.—See this company under Operating Officers.

Engineering and Rolling Stock Officers.

Boston & Albany.—Everett E. Stone has been promoted from Engineer of Maintenance of Way and Structures to Chief Engineer, with headquarters at South Terminal Station, Boston, Mass. Mr. Stone was born at Leicester, Mass., in 1865, and graduated from Worcester Academy in 1885. He entered the service of the Boston & Albany two years later as a surveyor. The next year he was made assistant roadmaster, and in 1890 was promoted to roadmaster. He held this position for four years and was then appointed Assistant Chief Engineer, in which position he served until 1907, when he was appointed Engineer of Maintenance of Way and Construction. He began his duties as Chief Engineer on May 1 of the present year. Mr. Stone was for two years Mayor of Springfield, Mass., having before that been for five years President of the Common Council.

E. E. Stone.

Illinois Central.—W. Renshaw, Superintendent of Machinery, has resigned. J. G. Neuffer, Assistant Superintendent of Machinery, succeeds Mr. Renshaw.

Peoria & Pekin Union.—Stanley Millard, Chief Engineer, has resigned. Walter E. Emery, formerly Engineer of Maintenance of Way of the Chicago & Alton at Kansas City, Kan., succeeds Mr. Millard.

LOCOMOTIVE BUILDING.

The Chicago & Alton has ordered five locomotives from the Baldwin Locomotive Works.

The Chicago, Milwaukee & St. Paul, as mentioned in the *Railroad Gazette* of May 1, has ordered 50 locomotives from the American Locomotive Company.

The Delaware, Lackawanna & Western, as mentioned in the *Railroad Gazette* of May 1, has ordered from the American Locomotive Company eight hard coal ten-wheel passenger locomotives, five hard coal six-wheel switch engines, 15 soft coal six-wheel switch engines, 14 soft coal consolidation engines, five soft coal Mogul freight engines and two soft coal Mogul pusher engines.

CAR BUILDING.

The Washington Railway & Electric Co., Washington, D. C., is in the market for one interurban car.

The Salt Lake & Mercur has ordered one combination passenger and baggage car from the American Car & Foundry Company.

The Minneapolis & St. Louis has ordered two combination baggage and mail cars from the American Car & Foundry Company.

The Diamond State Rapid Transit Co., Smyrna, Del., it is said, will buy a number of interurban cars. This item is not yet confirmed.

The Brownsville, Masontown & Smithville Street Railway, McKeesport, Pa., under construction, W. J. Shelden, President, expects to ask bids on cars in about 30 days.

The Northern Pacific has ordered from the American Car & Foundry Company 10 combination mail and baggage cars, 10 combination passenger and baggage cars and 10 combination baggage and express cars. It is expected that an order for more passenger cars for use on new lines in the northwest will be placed within a month.

RAILROAD STRUCTURES.

ABILENE, TEXAS.—The Texas Railroad Commission has ordered the Texas & Pacific to put up new stations at Abilene, Lambert, Dothan and Judkins.

BLOOMINGTON, ILL.—The shops of the Chicago & Alton were recently destroyed by fire; loss $50,000.

CHIHUAHUA, MEX.—W. W. Colpitts, assistant chief engineer of the Kansas City, Mexico & Orient, is in charge of the work on the 850-ft. steel bridge now being built over the Conchas river, about 85 miles east of Chihuahua. Six of the concrete piers are finished and 12 more are to be built.

EVANSTON, WYO.—The Union Pacific, it is said, is arranging to make improvements here including a 43-stall roundhouse, and enlarging the present shops, at a cost of $250,000.

NEW ORLEANS, LA.—The New Orleans Terminal Company expects to open the new Union Passenger Station about June 1.

NEW WESTMINSTER, B. C.—Mayor Keary is quoted as saying that the Dominion Government will spend $2,000,000 for harbor and dock improvements here.

RANDALL, OHIO.—The Erie, it is said, has started work on a new ore trestle to be 2,800 ft. long, and to have a capacity of 250,000 tons. The cost of the improvement is to be about $60,000.

SPIRIT LAKE, IDAHO.—Contract is reported let to Westinghouse, Church, Kerr & Co., of New York, at about $200,000, for putting up brick shops, also a nine-stall roundhouse here, for the Idaho & Washington Northern. Work is to be started this month.

WESTPOINT, OHIO.—The Youngstown & Ohio River Railroad, it is said, is putting up a power house here to cost $285,000.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ABERDEEN & TOMBIGBEE VALLEY.—Building from Okolona, Miss., southeast to Pickensville, Ala., 65 miles. Grading finished on 32 miles. President Reynolds announces that the entire line is to be in operation by Jan. 1, 1909. W. T. McKee, Chief Engineer, Aberdeen, Miss. (March 27, p. 461.)

ARKANSAS, LOUISIANA & GULF.—Announcement is made that this company has opened its line for freight traffic from Monroe, La., north to Bastrop, 23½ miles. (March 13, p. 389.)

ATLANTIC, QUEBEC & WESTERN.—J. N. Lavoie, Second Vice-President, is quoted as saying that this company has built 20 miles on the extension toward Gaspe, and that an additional 80 miles is under contract. About 850 men are at work, and this number is to be at once increased. The work includes piercing a tunnel at Cap l'Enfer, 850 ft. through limestone rock. This is expected to be finished in June. It is expected to have the entire work finished through to Gaspe in the latter part of 1909. There are to be 26 concrete and steel bridges on the lower section. Terminal arrangements are being made at Gaspe. The passenger station is to be at the foot of Fort Ramsey, and the freight terminal at Sandy Beach, about four miles from the town, where there are good port facilities. (March 13, p. 395.)

Atlanta & St. Andrews Bay.—This company has started operation on the extension of its road from Fountain, Fla., south to Youngstown, eight miles.

Bessemer & Lake Erie.—The Western Allegheny, affiliated with the Great Lakes Coal Company, it is said, has finished connections with the Baltimore & Ohio at New Castle, Pa.

Bids, it is said, will shortly be asked for building the extension from Kaylor, Pa., northeast to Reidsburg, where connection is to be made with the projected Franklin & Clearfield line of the Lake Shore & Michigan Southern. (March 13, p. 390.)

Bingham Central.—Organized to build an ore line from Salt Lake City, Utah, south to Bingham, 10 miles. The company has given a mortgage to carry out the work. There will be a long tunnel. A. C. Ellis, Jr., President, Salt Lake City.

Canadian Northern.—Contract is reported let by this company to James Cowan for work on about 18 miles of line on the Rossburn branch.

Canadian Northern Ontario.—See this company under Railroad Corporation News.

Canadian Pacific.—An officer writes that the contract for building the new line from Lethbridge, Alb., west to McCloud has been let to Janse & McDonald, of McLeod. The work includes two bridges, one over the Belly river, 5,327 ft. long, and the other over the Old Man river, 1,890 ft. long. (April 3, p. 492.)

It is said that this company will spend $125,000 improving the Esquimalt & Nanaimo.

Canadian Roads.—According to reports from Fernie, B. C., arrangements are being made by D. C. Corbin to build a line from the Crows Nest Pass branch of the Canadian Pacific, to coal mines near McGilvrey, B. C., about 14 miles. It is expected to have the line in operation this summer. Address George Butler, Chief Engineer, Spokane, Wash.

Cananea, Yaqui River & Pacific.—See Southern Pacific.

Champlain & Sanford.—Incorporated in New York with $600,000 capital to build a line from Addison Junction, N. Y., northwest to Sanford Hill, on the east shore of Sanford lake, about 35 miles. The directors include C. M. Hyatt, J. M. Thompson, L. R. Parker, G. D. Hills, A. B. Jones, and MacNaughton Miller, all of Albany.

Colorado Roads.—Preliminary surveys, it is said, have been made, and construction work is to be started in July on a line, to be operated either by steam or electricity, from Ouray, Colo., northwest via Montrose and Olathe to Delta, 60 miles. J. Carmen Layton and B. A. Lockwood, of Des Moines, Iowa, are promoting the project.

Eastern British Columbia.—Incorporated with $750,000 capital, in Canada, to build a line from the south fork of Michel Creek, B. C., on the Crows' Nest branch of the Canadian Pacific, south 14 miles. Also to build branch lines. The provincial directors include D. C. Corbin, A. T. Herrick, J. A. Harvey and J. K. Osherwood.

El Reno, Red River & Pacific.—Incorporated in Oklahoma with $5,000,000 capital to build 145 miles of railroad from El Reno, Okla., southwest through Caddo, Washita, Kiowa and Jackson counties. The incorporators include H. C. Bradford, G. G. Lewis, L. B. Pennell, F. E. Gillette and M. D. Libby, all of El Reno.

Esquimalt & Nanaimo.—See Canadian Pacific.

Evansville Terminal Railway.—This company is offering $200,000 of bonds to secure funds to build a line from Evansville, Ind., east to Newburg, nine miles. It is proposed to use both steam and electric motive power. The company expects to lease the property of the Evansville & Eastern Electric Railway, operating a line from Newburg east to Rockport, 21 miles, and to operate the lines as one system, together with the line west to Mount Vernon, Ind., a total of 48 miles.

Georgia & Florida.—Sub-contracts are reported recently let for work on a connecting link from Nashville, Ga., south to Valdosta, 30 miles. Grading on this section is expected to be finished by the middle of July. This is part of the work intended to include about 150 miles of connecting links between existing lines to complete a through line from Augusta, Ga., south to Madison, Fla. A new line, it is also said, is being built from Willachoochee south to Nashville, which will shorten the line about three miles. (March 13, p. 391.)

Grand Trunk Pacific.—W. C. Chambers, of Harrison, Ont., it is said, has been given a contract for building 75 miles of railroad for this company near Lake Nepigon.

Grand Valley (Electric).—This company now operates 21½ miles of electric line connecting Brantford, Ont.; Paris, Glen Morris and Gault. It is said that the present rails will be replaced with 80-lb. sections. (April 21, p. 591.)

Kansas City, Mexico & Orient.—It is said that the Government of Mexico has offered this company a subsidy of $600,000 in bonds of the state of Chihuahua, Mex., for building its line through this state.

Los Angeles Harbor Company.—See Los Angeles Harbor Railroad Co.

Los Angeles Harbor Railroad Company.—An officer writes that the Los Angeles Harbor Company and the Los Angeles Harbor Railroad Co. are being organized, the former to retain a controlling interest in the railroad company. A charter has been granted in California, but no physical work has yet been undertaken. Application has been made to the cities of Los Angeles and Wilmington for franchises. The Harbor Company owns water frontage at the west basin of Wilmington with sufficient land adjoining for terminals. The purpose of the company is to develop the big west basin, dredging and building docks and wharfs, and to establish a trading company, operating ships on the west coast as far south as Panama. The Los Angeles Harbor Railroad is intended as an annex to the harbor enterprise and an outlet to the city of Los Angeles, also as a terminal line for other roads which may build into Los Angeles. It will be about 20 miles long, and will be located about half-way between the Pacific Electric Railway Company's line and the Los Angeles Interurban Line from Los Angeles south to San Pedro. The officers of both companies are: A. C. Bird, President; F. C. Wintrode, Secretary; J. W. Oakley, Treasurer, and A. H. Koebig, Consulting Engineer, Security Building, Los Angeles. (March 27, p. 461.)

Mountain Home & White River.—Rights of way have been secured and options taken on a large tract of timber land by this company. It is proposed to build a line from Mountain Home, in Baxter county, Ark., south 10 miles to a connection with the St. Louis, Iron Mountain & Southern. W. L. Marshall, Mountain Home, is the principal promoter.

Nashville & Huntsville.—According to reports from Huntsville, Ala., this company has given a contract to the American Construction Co. (L. L. McCord, President), to build the first section of its proposed line from Nashville, Tenn., south to Huntsville, 105 miles. The line is projected south to Birmingham, an additional hundred miles. The project is thought to be backed by Illinois Central interests.

New York Central & Hudson River.—According to a statement made by George W. Kittredge, Chief Engineer, before the Public Service Commission at Albany this company contemplates the following important improvements: Five million dollars for Gardenville yards near Buffalo, N. Y.; $1,326,000 for improvements in Buffalo, including grade crossings; $150,000 for Depew shops; $1,000,000 for grading and repairs to West Shore Railroad, $75,000 improvements to service at Fairport; $150,000 improvements at Syracuse; $400,000 improvements at Dewitt; $150,000 improvements at Oswego, $3,500,000 improvements at Utica, including grade crossings, yards and stations; $200,000, Little Falls; $500,000, West Albany; $300,000 improvement in the signal system.

New York Subways.—The New York Public Service Commission First district, will open bids May 8 for the construction of the Fourth avenue subway in Brooklyn. The contractor will have two years from the date of the delivery of the contract to complete the work. (April 3, p. 493.)

Ocean Shore (Electric).—This road has been extended from Pedro Valley, Cal., to Farallone, 5½ miles.

Ohio Electric.—The city of Bellefontaine, Ohio, has extended an old franchise for 25 years, and this company can now extend into Bellefontaine the line building from Lima, southeast, and which is finished to within three miles of Bellefontaine. It is expected to have cars in operation on the new line in June.

Ohio River & Northern.—Grading, it is said, is under way at Midland, Pa., on a line projected from that place west through East Liverpool, Ohio, and Wellsville, thence north via Westpoint to Lisbon, where connection is to be made with the Erie. Franchises have been granted at East Liverpool and at Wellsville. (Sept. 13, p. 307.)

Oklahoma-El Reno Interurban.—An officer writes that preliminary surveys have been made and work is to be started about July 1 on this projected line from Oklahoma City west to El Reno, 24.5 miles. H. M. Hyatt, Kansas City, Mo., may be addressed.

Orange & Northwestern.—See St. Louis & San Francisco.

Pacific & Southeastern.—Organized with a capital of $15,000,000 to build a line across the state of Washington, with a western terminus at Tacoma, with branches to Spokane, Seattle and British Columbia. Some surveys are being made, and construction, it is said, will be started this year. The incorporators include Gen. T. V. Hubbard, George Crocker, New York; Charles Lathrop, California; A. D. Shepard, General Manager of the Pacific Improvement Company, of California, and General Ashton, of Tacoma.

Pan-American.—J. M. Neeland, Vice-President and General Manager, is quoted as saying that work will be finished to the Guatemalan border this month, and through trains will be put in operation about July 1 from San Geronimo to Ayutala, 285 miles. The line was recently put in operation as far south as Tapachula, about 25 miles from the Guatemalan border.

Pennsylvania Lines West.—The rights of the old Canton & East Liverpool project, it is said, have been transferred to this company and preliminary work has already been done. The projected route is from Smith's Ferry, Pa., about eight miles east to East Liverpool, west across Columbiana county, Ohio, to Bayard, about 35 miles, where connection is to be made with the main line of the Cleveland & Pittsburgh.

St. Louis & San Francisco.—It is said that the Orange & Northwestern is to be extended from Newton, Tex., north to Hemphill, 40 miles. The line connects with the Colorado Southern, New Orleans & Pacific.

St. Louis, Brownsville & Mexico.—Trains are now being run by this company into Houston, Texas, using the freight and passenger stations of the Houston Belt & Terminal Company. (Nov. 1, p. 542.)

Southern Pacific (Mexico).—Important changes in the concessions held by this company, it is said, have recently been given by the Mexican Government for building the Cananea, Yaqui River & Pacific through the states of Sonora and Sinaloa. The construction of the branch from Tonichi, Sonora, north to the international boundary is to be started as soon as the section from Corral north to Tonichi is finished. Track laid from Corral north to Cumuripa, 11 miles. Grant Brothers Construction Company, of Los Angeles, Cal., contractors. According to the terms of the concession 50 miles must be built annually, and the entire line finished by March, 1914. The line when finished will be 386 miles long. (April 24, p. 591.)

Southwestern Railway of Texas.—This company was incorporated last year in Texas to build a line from Henrietta southwest to Graham, about 60 miles. It is said that it now has most of the surveys made and has work under way from Henrietta south. Grading is done for 22 miles and track laid for half that distance. H. J. Bradshaw, General Manager, and W. S. James, Chief Engineer, Henrietta.

Terre Haute, Robinson, Olney & Southwestern.—Incorporated in Illinois with a capital of $10,000, and office at Robinson. The company proposes to build a line from a point on the Wabash river at the Indiana boundary, southwest through the counties of Crawford, Richland, Wayne, to Mt. Vernon, in Jefferson county, about 100 miles. The incorporators and directors include H. C. Pugh, W. H. Moss, H. T. Taussig, W. H. Cisne, C. S. Wilson, and G. M. Barker.

Texas & Pacific.—The Texas Railroad Commission, on May 5, ordered improvements on the Texas & Pacific between Fort Worth and Sierra Blanca, a distance of 500 miles, which it is estimated will cost $2,000,000. This is in addition to the $2,000,000 previously ordered to be spent for betterments.

Union Industrial.—Incorporated in Oklahoma with $15,000 capital to build a connecting line between the Chicago, Rock Island & Pacific, and the Kansas City, Mexico & Orient, at Aline, Okla. The incorporators include George W. Graham, W. J. Woodliff, and J. A. Hartshorn, of Aline; H. L. Noah and H. A. Noah, of Alva, Okla.

Washington, Patuxent & Drum Point.—This company was incorporated last year to build a line from the Chesapeake Beach Railroad along the east side of Patuxent river to Drum Point, Md., about 30 miles. Contracts for the work are to be let next fall. There will be four bridges. Address C. N. Mayer, Washington, D. C.

Westchester & Wilmington (Electric).—A contract is reported let to the Eastern Railway Construction Company of Delaware for building this proposed line. The contract includes the erection of a power house and the installation and equipment of the entire line. The projected route is from West Chester, Pa., south to Wilmington, Del., 17 miles. There will be two bridges. (March 13, p. 395.)

Western Allegheny.—See Bessemer & Lake Erie.

Youngstown & Ohio River (Electric).—This company is now running cars to Salem, Ohio, and to Lisbon. Grading, it is said, has been nearly finished on an extension to East Liverpool, and it is expected to have the line finished to the Ohio river this fall. (Sept. 13, p. 308.)

RAILROAD CORPORATION NEWS.

Atchison, Topeka & Santa Fe.—Moffat & White and Clark, Dodge & Co., of New York, and Lee, Higginson & Co. of Boston, offer the unsold portion of $4,000,000 general mortgage 4 per cent. bonds of 1895-1995. There is outstanding $152,155,000 of an authorized issue of $165,490,500.

Canadian Northern Ontario.—The government will guarantee an issue of $2,500,000 40-year 3½ per cent. bonds, of which $1,000,000 will be issued to build 50 miles of new line at $20,000 a mile, including a proposed line to the Moose Mountain iron deposits and the Garson mines. The remaining $1,500,000 is to be issued for terminals in Toronto.

Idaho Northwestern.—This property, controlled by the B. R. Lewis Lumber Co., of Coeur d'Alene, Idaho, has gone into the hands of a receiver, together with the lumber company.

Missouri, Kansas & Texas.—H. W. Poor & Co., of New York and Boston, offer at 75½ a block of "first and refunding mortgage" 4 per cent. bonds of 1904-2004. There are $5,182,000 of these bonds outstanding and $4,797,000 held in the company's treasury. These bonds are a first mortgage on terminals at Kansas City, locomotive shops at Parsons, Kan., and equipment valued at $18,530,000.

The order of the Texas Railroad Commission, requiring the Missouri, Kansas & Texas to purchase 165 new locomotives and 6,000 freight cars during the years 1908 to 1910, has been indefinitely suspended.

National Railways of Mexico.—It is said that the deposit of various classes of securities of the Mexican Central and the National Railroad of Mexico has already reached a point insuring the success of the plan to merge these companies.

New York, New Haven & Hartford.—It is said that the bonds about to be issued to meet maturing obligations between now and January 1, 1910, consist of Harlem River & Portchester first mortgage bonds and Air Line and Northampton division first mortgage bonds, and in addition there are to be issued $2,000,000 short term notes. The bonds have been underwritten on a basis of between 4¼ and 4½ per cent., as compared with a 5 per cent. interest rate upon the obligations which they will retire.

Pennsylvania.—A semi-annual dividend of 3 per cent. was declared on May 1, thus reducing the annual rate from 7 per cent., established in November, 1906, to 6 per cent., the rate prevailing from May, 1900 to 1906. This means a present annual saving in dividend charges of a little over $3,000,000.

Subscribers for the $40,000,000 4 per cent. bonds offered last week by Kuhn, Loeb & Co. have been allotted only 5 per cent. of their subscriptions.

Southern Railway.—The Virginia & Southwestern, whose capital stock was purchased by the Southern Railway at $200 a share, has taken over the Virginia & Southeastern, a projected line, the Houston River railroad, and the Black Mountain railroad. The two latter roads, 40 miles and 30 miles long, respectively, with the Virginia & Southwestern, make about 210 miles of road, with equipment. The Virginia & Southwestern has authorized $7,000,000 fifty-year 5 per cent. bonds of April 1, 1908-1959. Of these bonds $2,000,000 will be issued to pay back the Southern Railway for money spent by it on the Black Mountain and the Houston River roads. There will be reserved in the treasury $3,000,000, and the proceeds from the remaining $2,000,000 will be used to complete building the Houston River road and to take care of equipment obligations.

Union Pacific.—According to a statement made by E. H. Harriman the financial requirements of the Union Pacific have been much exaggerated. The maximum amount needed at this time to put the company in funds does not exceed $25,000,000, but the company wants to resume developments and put its people to work. While the stockholders were asked at their meeting on May 5 to authorize an issue of $100,000,000 bonds, not more than $50,000,000 of the bonds are to be issued against property now owned. Instead of mortgaging new lines as built or acquired, a general mortgage will be provided for further extensions and new lines.

United Railways of St. Louis.—The Mississippi Valley Trust Co., and Francis, Brother & Co., both of St. Louis, Mo., are offering $800,000 collateral trust 5½ per cent. notes of 1907-1909. The total authorized issue of these notes is $1,200,000, secured by $1,500,000 general, first mortgage 4 per cent. bonds of the company, and $500,000 of its preferred stock. The notes are offered at 99.45, yielding 6 per cent.

Virginia & Southwestern.—See Southern Railway.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York N.Y., and the names of the officers and editors of the Railroad Gazette.

OFFICERS:

W. H. BOARDMAN, *Pres't and Editor*
E. A. SIMMONS, *Vice President*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 20. FRIDAY, MAY 15, 1908.

Beginning with the issue of June 5, the *Railroad Gazette* and *The Railway Age* will be issued as a single, combined periodical under the name *Railroad Age Gazette*. The business of a railroad paper is to collect from all parts of the country and all parts of the world, a current record of all that is best in railroad practice; to comment on what is noteworthy and, from its plentiful sources of information, to develop the truth. The *Railroad Gazette* has been doing this for more than 52 years; *The Railway Age* for 32, and each paper has worked hard and has built up a staff of editors and established lines of communication that make the facts sure and the comment easy. Besides this specific task, it has been the duty of these two papers to make railroad men more useful to their companies and to themselves by giving a broader aspect to the work of highly specialized departments; by making the mechanical engineer know what the traffic man was thinking about, and the division engineer and the auditor alike realize that they could not attain their highest usefulness in working for their departments unless they were working for the company as well. But there has been much duplication in this work. The principal office of one paper was in New York; the principal office of the other was in Chicago, and each office force had to hunt in the territory of the other. A consolidation with strong editorial forces in each city and with mutual co-operation instead of antagonism will leave for new work all the time formerly spent in overlapping. This, from the standpoint of the editor. The reader will have even more reason to be satisfied. He will get more valuable material, carefully selected, than the sum of the previous totals, and will not have to search two papers for it. It is surely not a vain expectation that with the combined organizations, working in Chicago and New York with full vigor, a railroad paper can be made a good deal better than any that has ever existed before.

The simple and direct way to settle the question whether the coal railroads shall be forced to sell their coal properties and confine themselves to the business of transportation would be to proceed against them in the courts at once; but the rational way is to do as the President and the Interstate Commerce Commission have done—to try to suspend the law until its constitutionality can be settled by an amicable suit. This course will be sharply criticized, of course; for the public officer who refrains from enforcing a plain statute can have no satisfactory defense except unanimous public opinion. Congress, which made this crude law, ought now to suspend it; but unfortunately the only considerations receiving attention in the Senate are those of personal jealousy or supposed political expediency. The Commission, in its reply to the Foraker resolution calling for information, said that the receiver of the Western Maryland (which road was specifically inquired about) had not observed the law, but the extent of its violation and the conditions which made it impossible to comply are points which are not yet explained. The receiver promises to send the information. As to other violations the Commission has not had time since the law went into effect (May 1, 1908) to get information as to whether its provisions are being observed or not. The commissioners declare that in recommending that the penalties of the commodity clause be suspended they acted with the approval of the President. The financial depression has rendered it impossible for railroads to convert their coal properties into money. "The Commission believed and still believes," says the report, "that it is in the public interest, as well as a matter of fairness to parties directly concerned, to suspend penalties for violation of this provision—penalties not specially imposed by its terms, but resulting from the general provision of the regulating statute—for a sufficient time to test in the courts the validity of the enactment." Not only fairness, but expediency also, demands that the matter be sent to the courts; for the ownership of coal mines, timber lands and other great properties is, in many railroad companies, so divided among stockholders and old and new bondholders, that to devise an equitable basis of segregation may be impossible. When the settlement of a question is impossible, only the Supreme Court can settle it—if the reader will pardon the paradox. The question whether Congress will do anything must wait, apparently, until the multifarious political questions now uppermost shall have been settled, which means probably the last day of the session. Congressmen now expect to adjourn next week Saturday.

THE MASSACHUSETTS TROLLEY DECISION.

A law of the state of Massachusetts enacted more than 30 years ago provides that "no railroad corporation, unless authorized by the general court, shall directly or *indirectly* subscribe for, take or hold the stock or bonds of or guarantee the bonds on dividends of any other corporation" except certain corporations named in five following sections of the act among which are not street railway companies. In those far away days at the time of the passage of the law no serious question of the relation of the old horse railroads to the steam roads had arisen. When, with electricity supplanting horse-power the question became acute especially in connection with long distance electric parallels, the New Haven company began, through its holding corporation, the Consolidated Railway Company, an active policy of acquiring trolleys in Massachusetts. Under President Hall, with legislative assent, it took in a trolley line in that state connecting with its system in eastern Connecticut. By President Hall's successor, President Mellen, the same policy was pushed swiftly under the legal theory that the Connecticut holding company was well within its legal rights. Opposition arose in Massachusetts and the trolleys were transferred to a "voluntary" holding corporation at Boston. The Attorney-General of the state brought suit under the quoted statutory phrase alleging that the New Haven Company was "indirectly" holding the trolleys and should surrender them. The Supreme Court of the state, consisting of five judges, in a unanimous opinion has now sustained him.

The opinion, which lies before us in its full text, is of the most sweeping character. It asserts, in the first place, that the device of a holding company constitutes an "indirect" holding of the Massachusetts street railways not less real in its influence and control than that of the New Haven Company over its steam lines. But the finding apparently goes ever so much further. Although the New Haven Company owns but six miles of track of its own in Massachusetts under its old charter—between the state line and Springfield—the responsibility of the corporation, which is chartered in both states, to Massachusetts is asserted, and asserted apparently almost without qualification where the corporation's acts conflict with Massachusetts policy as expressed in the statutes of the state. It is true that the court waives consideration of acts the results of which are specifically localized to Connecticut. But it does not exclude them; and where the acts affect both Massachusetts and Connecticut the court, by strong implication at least, includes them. The decision thus becomes far reaching. It hits so far as one state can do it, many of the numberless acts of President Mellen and his predecessors done under Connecticut law in pursuance of the policy of consolidation. Such matters as the issue of new stocks and bonds, purchase or lease of trolleys, guarantees, acquisition of navigation properties—not transatlantic—valid under the laws of Connecticut and Rhode Island, become illegal under Massachusetts statutes. Pressed home the decision would apparently disrupt the whole New Haven system and invalidate the Boston & Maine purchase. And, in its narrowest aspect, there arises a very grave question of state jurisdiction in the case of a doubly chartered corporation. Questions are raised in the finding of vital importance to every railroad or other transportation company in the land holding charters in two or more commonwealths.

But limiting the decision to the Massachusetts street railways held "indirectly" by the New Haven Company the case becomes sufficiently impressive. That corporation now holds no fewer than 16 street railways in Massachusetts taken in mainly as a protection against threatened long distance parallels. Saying nothing of the various holding companies the 16 lines are represented by \$11,626,200 of stock, \$6,360,000 of funded debt and \$3,234,924 of floating debt—a total of \$21,221,124. The 16 lines include 565 miles, the Worcester system alone having 158 miles, the Springfield system 99 miles and the Berkshire system 80 miles. They represent one-fifth of the total mileage and about one-sixth of the total capital of the Massachusetts street railways. They reach 56 Massachusetts towns and cities with a population of about 250,000. If this vast interest is to be surrendered under the logical decree of the court where is it to go? Is it to be sold out to a new holding company not under the New Haven's control? Is the state to take it and try again the not too halcyon Fitchburg venture in terms of street railway? Is it to pass by auction at forced sale either as a whole or in disintegration? To whom is it to go and is the acquiring interest likely to be more friendly to public interest than the New Haven; and where, in the final adjustment, are the holders of what have been conservative securities sustained practically by the guarantee of a great railroad corporation to come out? But it is certain that its Massachusetts trolleys, which happen to be the most prosperous and promising group of its street railway system, will not be parted with by the New Haven, save in the last extremity.

The situation is interesting, acute and not a little confusing. In its foreground is the question of state jurisdiction raising the vital legal point whether the state of Massachusetts or the New Haven Company is *ultra vires*. It seems very likely now that this must go to the highest federal court to which apparently it can readily be taken in the case of an interstate road like the New Haven or by a stockholder non-resident in Massachusetts. For the general interests of the railroads of the country and, as determining certain new questions in "double charter" jurisdiction as well as the scope of holding companies, such an outcome is not undesirable. In that connection it is to be remembered that the New Haven Company is now acting under and vested with the enormous powers, so far as Connecticut can bestow them, granted by a recent legislature of that state in the "omnibus" charter of the Consolidated railway corporation. The alternative of an appeal to the federal court is that the railroad company and the Massachusetts legislature get together, recognize that the case is one of conditions and not theory, and reach a final settlement and permanent arrangement—perhaps with the disputed trolleys vested in a new corporation with the state strongly represented in the directorate. It would be a natural and sane outcome of the present confusion of laws, interests and policies. But in the existing strange temper of Massachusetts, not less remarkable as exhibited in a state highly capitalized and of conservative traditions, no man can predict the sequel.

STARTING PIECE WORK.

The piece work experiences which were printed in the *Railroad Gazette* last week, show pretty well that railroads which run their shops on this plan are abundantly satisfied with the result, and that individual workmen are pretty sure to earn higher wages than they have been earning on the day wage plan. The difficulty comes in installing piece work in shops where it has not before been tried. The arrangements have a way of failing entirely if they are not made right, and there are plenty of railroads to-day which would be only too glad to start in on piece work Monday morning if they were not afraid of a bitter conflict with their workmen. Within the last three months two large and important railroads have failed signally in an attempt to institute piece work, and the failure in each case was apparently largely a diplomatic one.

The statement can be made without much fear of contradiction that in the present temper, piece work cannot be introduced by placard and by public announcement that on a certain day a certain arbitrary scale of prices will go into effect. One railroad system that has had great success with its piece work and now does a large part of its shop work on that basis, has devoted much thought to the diplomacy of the problem. Its methods are something like this. The superintendent of motive power has a series of conferences all along the road with the best men in his shops. He invites them up to a room of his hotel, gives them cigars to smoke and tells them how much they could earn on the piece work plan. That is all that he does on the occasion of his first visit. The next time he comes, he gets two or three steady men to figure out how much a certain job is worth on the piece plan, but he is in no hurry to establish the plan and there are no placards. By and by, after he has gotten what he calls the piece work feeling running strongly, he starts in by allowing a few of the best men to start working on this basis. There is no compulsion about it at all. They do not have to work on this plan unless they care to, and the day wage is guaranteed them in any event (as long as they remain in the employ), whether they earn more or less on the piece work plan. Consequently, it does not take long for a \$2.50 man to decide to take a chance on earning \$3.25, since he is sure that if he can hold his job at all he can earn \$2.50 at it.

It may be said that this road has laid down two cardinal principles of action in piece work shops. One is that the piece work price shall be established by the workmen, and not by the bosses; the other is that the piece price, when once established, is just as sacred as the day wage; that is to say, it will not be juggled about to reduce the earning capacity of able men and to act as an unfair goad to men who are less able. The plain intention of the company is that the men shall be able to earn the day wage at which they are classed and something more. In one case, under piece work, one man was able to produce so much above the ordinary day work output that he saved the company exactly and definitely the installation of an $11,000 machine. If the interest and depreciation of this machine be figured at $1,100 a year (and this is rather low), it is clear that the company could very well afford to let the machinist earn a good deal more than his day wage. After a couple of months' time, during which this man had been earning $125 a month for himself, the superintendent of motive power said to him:

"George, how do you like piece work; would you rather go back to the day wage basis?" The machinist replied:

"No sir, my wife wouldn't let me!"

Guaranteeing a day wage and making the piece work plan operative only above it and not below it, is an arrangement that produces very important benefits and, in the long run, costs nothing. If the large majority of men in the shop cannot earn more than their rated day wage when working piece work, there is something wrong with the piece work price. As a recent speaker before the New England Railroad Club said: "If you establish an irritating policy of rate cutting, the result is that the workman is afraid to work at his best speed, and it often pays to have a relatively high labor cost if it will increase production, because with large production all forms of fixed charges tend to decrease—interest on the cost of plant and machinery, and superintendence as well—and the total expense cost with high production is apt to be reduced faster than the labor cost goes up. A railroad shop, like any other kind of a shop, gets a bad name with its neighbors very quickly if it is in the habit of reducing piece work prices periodically by the standard of the fastest worker, and there is no surer way than this of creating an organization within the shop that makes it its business to see that nobody works too fast, and is detrimental to the interests of the company and of the able workmen alike. Of course, when new tools are installed or a radical change is made in old tools, enabling unit production to be greatly increased, it is necessary and fair that prices should be revised; but the people to do the revising ought to be the expert machinists, and they ought to be trusted. In one shop the piece work price for boring locomotive cylinders had been fixed at $3.50 for years. With the installation of a very much larger tool, it became necessary to revise the price, and a steady, reliable man was given the tool for a week and told to figure out the price at the end of that time. The price he figured was $1.20, and it made money both for the workmen and for the company.

One difficulty which occurs to everybody in connection with piece work is that it reduces the inclination of a man to help his neighbor and to lend a hand at times when time and money can be saved thereby. The solution for this is to install gang piece work. A case has been cited where one plant employed seven men in its shipping room. This gang was reduced to five men and put on piece work, the members of it being paid in proportion to their day wage rating. The result was that an increased number of shipments were handled and that the total cost of handling was reduced. It is possible to extend this co-operative gang principle to the entire shop, and in some cases this has been done with considerable success, but it is usually necessary, in order to make the gang plan successful, that the work be pretty well unified and that there be enough repetition about the daily output so that standards can be definitely and clearly known. There are cases, however, where shops doing work of the greatest diversity will tackle jobs, new or old, just as they come along, on the gang piece work plan, and keep the men satisfied and the work done cheaply, the price for each new job being established by guess work from its relation to the established day wage ratings.

It might be supposed in a case like this that it would make a good deal of difference who did the guessing, but it does not take the men long to find out whether or not the intention is fair. If they believe that the boss really means to have them earn more than their day wage, they are not disposed to criticise occasional errors in judgment; if they believe he is trying to drive them and have the company make all the profit, he is going to have his hands full. Of course, it is obvious that in making calculations of this sort the day wage ratings must be kept alive whether anybody ever works on that basis or not, and it must be clearly understood what the normal daily earning capacity of a man is before he can be rewarded for increasing that capacity to the mutual advantage of himself and his employer.

One superintendent of motive power, whose division was located in a district where labor union control was very strong, had for some time been unsuccessful in his efforts to establish piece work. The organizers told his shopmen that men who worked under piece work disliked it and had to work a good deal harder than the day wage men to earn the same amount of pay. To settle this bugaboo the superintendent of motive power picked out a delegation of six men who were reliable and carried weight with their neighbors, and sent them down to the head shops of the company, where piece work had been in effect for a great many years. After they had spent a week there and had abundant opportunity to talk with the workmen, they changed their views entirely and went home quite anxious to be allowed to earn as much as the piece work men were earning. In another instance where a large road was endeavoring to install piece work in a certain shop, the attitude of the union bosses became very threatening, and the superintendent of motive power had a long talk with them without evasions or subterfuge. "I don't mind your calling the men out in the X shop, where the piece work is going in," said he, "so long as you don't call men out all over the rest of the system at the same time. I don't think that's fair. There is no trouble anywhere else, and no shops are involved in this but the X shop."

The union delegate agreed that this was the case, and, with the rules of the game thus laid down by both sides, piece work went on in the X shop. The delegate tried to call the X men out, but they would not come, and the road kept the piece work without a strike—in fact has had no general machinists' strike since it began working piece work.

Some roads which do not guarantee their men their prevailing day wages right along, make a brief guarantee when piece work is first established, with very good success. One road says that when starting the men on the piece work basis they are always assured that if they do not in the first thirty days earn as much as they have been earning on day wage, they will get their day wage anyhow, but this guarantee has never yet cost the company anything. The men have invariably earned more than their guaranteed basis.

One road replies that the opponents of piece work are continually advancing theories against the inauguration of any shop system which tends to depart from the day wage basis on the ground that it results in specialization—in doing away with the all-around mechanic and in making it impossible to secure a desirable line of apprentices, but the company does not find that these claims are well founded. It has a list of applications for apprenticeship far in excess of requirements, and is enabled, without difficulty, to select what it considers good prospective mechanics. The company believes that with the proper apprenticeship system there is no reason why the apprentice should not have as good an opportunity to learn his trade throughout under the piece work system as he has under the day work system, although it is true to some extent that men, after completing their apprenticeship and working under the piece work system, are more inclined to remain on a particular line of work, in which they have acquired dexterity and facility. But this company has never had trouble in filling any position, nor have its apprentices created difficulties by leaving the company after completing their apprenticeship, although it is surrounded by shops working under the day work plan.

The union delegates claim that when it is desired to make a good showing under a piece work system, extra supervision is given and extra care is taken to select new and efficient tools and machinery. They claim, also, that quality under piece work suffers. But the widest experience, extending over a very large group of railroad shops, demonstrates clearly that these objections are theoretical rather than practical. While it is necessary under the piece work system to employ inspectors whose duties consist of taking the men's time and making a list of the work done, and also seeing that the work is properly done, the foreman does not have to watch his men as much as he does when working day work, because the piece work man is directly interested in seeing to it that he has enough work on hand to keep himself busy—an interest which has never been conspicuous under day work. As far as quality of work turned out is concerned, it is true that instances occasionally arise where piece work cannot be used with the highest advantage. One road has a corps of English and Scotch machinists employed in tool making, and pays them a high day wage—although almost all the work of the shops is done by piece work—because it wants them to devote substantially all their attention and interest to quality, the quantity of their output being entirely a secondary consideration. But cases like this are relatively scarce, and sometimes even such a situation is handled by figuring quality as well as quantity in the piece wage plan. A case has been cited of a leather plant, where the ends of leather strips for belts are cut off and the strips matched. On day work, the waste in this operation was $4\frac{1}{2}$ per cent.; a piece work rate was fixed around 28 cents per hundred strips for $4\frac{1}{2}$ per cent. waste, and ran up to 42 cents per hundred when 2 per cent. was reached. The result to-day is that the average waste is $2\frac{1}{2}$ per cent. In other words, it is perfectly feasible to pay men a special price for being careful as well as for being quick.

From the experiences of an important group of railroads, the following conclusions about piece work can be reached:

1. It gives the officers, all along the line, far better control of their men than is the case under day work.

2. It increases the efficiency of shop output and saves the company money.

3. It makes money for the workmen, and they are usually well satisfied with the piece work system after they have had experience with it.

4. The men are sure to be encouraged in hostility to the introduction of piece work by their union leaders.

5. Piece work cannot be introduced successfully by placard, but must be worked out by diplomacy and by fair and intelligent co-operation with the men.

6. There must be no juggling of piece prices after they have once been established on a equitable basis, and they should be as sacred as the day wage, and the men allowed to earn all they can.

Although the practice is not universal, it may also be added that in introducing piece work excellent results can be obtained by guaranteeing the day wage.

Texas & Pacific.

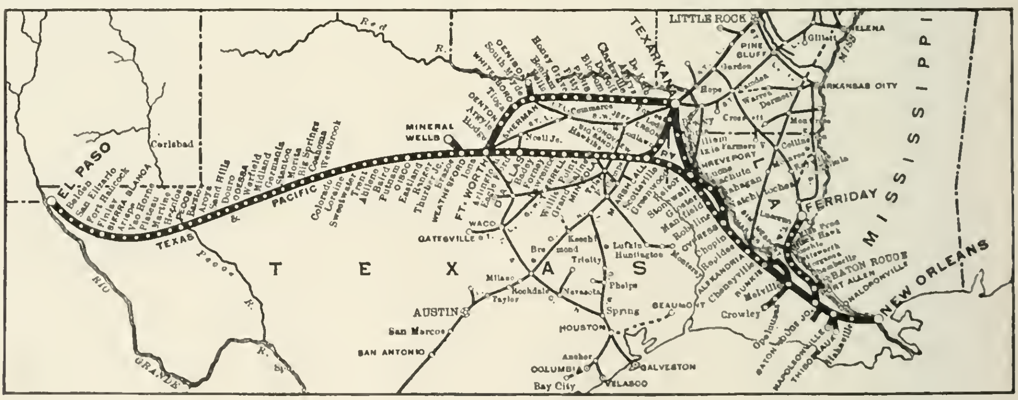
The company at the beginning of 1907 had a particularly bright outlook for a prosperous year. It had spent comparatively large sums on additions and betterments in 1906, and for the first time in its history, the Rio Grande division added materially to the gross earnings of the company. The road is divided into three divisions: the Rio Grande division, from El Paso, Tex., to Fort Worth, 613 miles; the Central division, or Eastern division, as it is called, including the direct line from Fort Worth, Tex., to Shreveport, La., together with the lines from Marshall, Tex., north to Texarkana, and the line from Fort Worth north to Sherman and east to Texarkana; the Louisiana division consists of the main line from Shreveport, to New Orleans, with a number of short branches in the sugar cane and rice districts, and also includes the line from Baton Rouge, north along the east bank of the Mississippi to Vidalia. It was the development of cotton raising on the Rio Grande division, the increased passenger traffic on this division, due to the rush of emigration to the Pecos river region, and the increase in the tonnage of products of agriculture shipped over the Rio Grande divisions, which made 1906 so successful a year for the company, and seemed to promise so much for 1907.

To a certain extent these promises were carried out. Freight earnings were $11,300,000 in 1907, an increase of $1,370,000 over 1906. Passenger earnings were $4,000,000 in 1907, an increase of $490,000 over the previous year, but the total cost of operation was $11,580,000 in 1907, increasing $1,700,000 over the previous year. Thus, in 1907, the operating ratio was 69.4 per cent., as compared with 66.08 per cent. in 1906. The increases in operating expenses can be largely accounted for by the $1,246,000 increase in the cost of labor, and the $456,000 increase in the cost of fuel consumed. The cost of conducting transportation was $7,146,000 in 1907, an increase of $1,068,000 over the previous year, and beside this increase there was $100,000 charged to traffic, as prescribed by the Interstate Commerce Commission. These traffic expenses were included in transportation in 1906, so that the actual increase in the cost of conducting transportation was $1,168,000. Some details of the increased cost of labor are as follows: Station employees were paid $876,000 in 1907, an increase of $180,000 over 1906; yard conductors and brakemen were paid $349,000, an increase of $64,400, and road trainmen were paid $827,000, an increase of $180,000 over 1906. The fact that the Pecos valley region was being rapidly developed and settled was probably one of the causes of the increased cost of labor. On the Rio Grande division the increase in cost of conducting transportation was more than twice as great as the increase on the Louisiana division, and almost twice as great as the increase on the Eastern division. On the other hand the company handled its freight and passengers more efficiently. The average number of trains run daily in freight service was from 105 in 1906, and 132 in 1907. The train load in 1907 was 215 tons, a decrease of only two tons from 1906. Revenue from local freight carried was $1.86 per ton in 1907, an increase of 2 cents per ton, over 1906, and the revenue from other freight was $2.31 per ton, an increase of 8 cents per ton over 1906. The revenue per local passenger was $1.19 in 1907, an increase of $3\frac{1}{2}$ cents over 1906, and the revenue per through passenger was $3.07 in 1907, an increase of $5\frac{1}{2}$ cents over the previous year.

The real causes of the company's unsatisfactory showing for 1907 is to be found in the bad cotton crop, and the large sums necessarily expended for additions and betterments. The revenue from carrying cotton was 10.7 per cent. of the total freight revenue in 1906, while in 1907 it was but 6.6 per cent. In 1906 the road carried 879,325 bales of cotton, while in 1907 it carried only 712,617 bales. On the other hand, the cost of transportation of this cotton was almost as great in 1907 as in 1906, because the movement of freight west on the Texas & Pacific increased, and as cotton moves east the road had increased facilities for carrying cotton at the very time that there was a decrease in the amount of cotton offered for shipment. The year of 1907 was one of short farm crops in Texas. Wheat and small grain crops were nearly an entire failure owing to the depredations of the green bug. This is the same pest that visited the state in 1901. The fruit crop of eastern Texas was also cut short by early spring frost. To add to the company's difficulties taxes on the property for the year 1907 were $555,000, an increase of $215,000 over the previous year, and the average tax paid per mile of road in Texas in 1907 was $306, an increase of $186 per mile over the previous year. With the exception of the decreased tonnage of cotton already mentioned, and the very slight decrease in tonnage of flour and grain and miscellaneous animal products, the tonnage of all classes of freight carried in 1907 increased over the previous year.

Maintenance of way cost $878 per mile operated in 1907, against $821 in 1906. Unit cost of maintenance and renewals of equipment were $2,429 per locomotive in 1907, against $2,184 in 1906, and $1,624 in 1905; $1,096 per passenger car in 1907, against $1,176 in 1906 and $955 in 1905; $72 per freight car in 1907, against $75 in 1906 and $17 in 1905. The company also spent for new equipment $1,128,000 in 1907, which is about double the amount spent for new equipment in 1906.

The company assumed obligations of $2,620,000 due from 1909 to 1917 for equipment. Total current assets on December 31, 1907, amounted to $2,700,000, while current liabilities at the same time amounted to $8,500,000. The current liabilities have increased during the year from $6,560,000 to $8,500,000. This current liability



Texas & Pacific.

in 1907 included $5,180,000 bills payable. In 1906 it included $4,550,000 bills payable. During the year 1907 the company added to the securities in its treasury $1,143,000 Opelousas, Gulf & Northeastern 5 per cent. bonds of 1906-1956, and $94,372, or 70 per cent. of the stock. The Opelousas, Gulf & Northeastern, a 57-mile line, was completed in 1907, and is now in operation. The Texas & Pacific also spent $1,098,000 for improvements during the year. Of this, $264,000 were for ballast, $104,000 for bridges and culverts, and $182,000 for shops and roundhouses, and $48,000 for double track; also $72,000 for steel rails, since the state of Texas compelled the railroad company to relay part of its tracks with heavier rails. For the period of seven years ended December, 1907, the company has spent $2,000,000 on new 75-lb. steel rails and fasteners. In addition to these improvements and since the annual report was completed the Texas Railroad Commission has ordered improvements which it is estimated will cost about $4,000,000. Half of this sum will be necessary for improvements between Fort Worth, Tex., and Sierra Blanca, a distance of 500 miles. The cost of the betterments ordered is variously estimated at from $800,000 to $2,000,000. The problem before the company now is one of financing these improvements and of financing its floating debt.

The following table shows the results of operation for the year:

	1907.	1906.
Mileage worked	1,885	1,848
Freight earnings	$11,273,331	$9,901,702
Passenger earnings	4,088,132	3,602,006
Gross earnings	16,671,668	14,914,608
Maint. way and structures	1,655,856	1,522,081
Maint. of equipment	2,245,957	1,838,040
Conducting transportation	7,145,760	6,077,626
General expenses	430,334	417,176
Traffic	100,033	....
Operating expenses	11,577,940	9,854,923
Net earnings	5,093,728	5,059,685
Net income	5,204,281	5,115,702
Fixed charges and taxes	2,286,214	1,981,724
Improvement and equipment	2,226,736	1,518,575
Sundry items	87,517	51,160
Surplus for the year	603,814	1,564,243

NEW PUBLICATIONS.

Standard Examination Questions and Answers for Locomotive Firemen. By W. G. Wallace. Chicago: Frederick J. Drake & Co. 343 pages; 4½ in. x 7 in.; illustrated; flexible covers.

This book is a reprint from the same plates and on thinner paper of the volume on the same subject that forms a part of the Art of Railroading, or the Technique of Modern Transportation, Vol. IV, reviewed in the *Railroad Gazette* Oct. 11, 1907.

Report of the United States Fuel Testing Plant at St. Louis, Mo. Washington Government Printing Office. 6 in. x 9 in.; 299 pages.

This report covers the work of the plant from Jan. 1, 1906, to June 30, 1907, and includes the results obtained in 214 tests of coals taken from the states of Alabama, Arkansas, Florida, Georgia, Illinois, Indiana, Indian Territory, Kansas, Kentucky, Maryland, Missouri, Montana, New Mexico, Ohio, Pennsylvania, Rhode Island, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, Wyoming and a few miscellaneous samples. The work done was divided into coking, steam and briquetting tests, to which a chemical analysis is added. The data are in the form of tables to which a few words of comment are usually added, so that any information that may be contained is instantly available. Of the value of such a report as this and of the work that is being done by the plant, nothing need be said, as it stands for itself, and can be appreciated by any who are called upon to decide in the matter of the probable values of different coals for the purposes set forth. It is information that has long been needed, and is appreciated accordingly.

Standard Handbook for Electrical Engineers. Written and compiled by a staff of specialists. New York: McGraw Publishing Co. 1283 pages, 4 in. x 6½ in. Illustrated; flexible covers. Price, $4.00.

As indicated by the title page, this book is a compilation by a number of specialists who have written the several sections into which the book is divided. These sections are as follows: Units; Electric and Magnetic Circuits; Measurements and Measuring Apparatus; Properties of Materials; Magnets; Transformers; Electric Generators; Electric Motors; Batteries; Central Stations; Transmission and Distribution; Illumination; Electric Traction; Electrochemistry; Telephony; Telegraphy; Miscellaneous Applications; Wiring; Standard Rules and Tables and Statistics. These 20 sections are written by 11 different authors.

The book differs from the usual handbook in that it offers a wider range of treatment than is usually met in works of this kind. Each section of the book is complete in itself, and though there is a great deal of condensation there is still a thread of connection between the successive parts. In treatment the text differs from the ordinary hand book, giving a discussion of the subject and some further information than the bare statement of a fact or the citation of a formula with the author's name as a credit and as a warrant of its value.

It is of course impossible to review in detail the contents of a book of this magnitude. It can be commended freely for the completeness of its general scope and the method of presenting the matter contained. Mechanically, it is presented in a very attractive manner. The covers are perfectly flexible and can be turned back to back without in the least straining the binding, and the paper is of the best India Bible quality; thin and yet so opaque that the printing does not show through. There is an elaborate index, containing more than 6,000 headings, arranged alphabetically with topical references, so that the searcher is brought as near as possible to the point for which he may be looking, thereby increasing the value of the work as a means of quick and convenient reference.

Directory to the Iron and Steel Works of the United States. Seventeenth edition. Philadelphia, Pa. The American Iron & Steel Association. 6 in. x 8½ in.; 516 pages; cloth. Price, $12.00.

This edition of the Iron and Steel Works Directory is corrected to March 1, 1908. It is compiled in the same way as the 1904 edition. Part 1 describes the United States Steel Corporation and controlled properties and the more prominent independent companies, including mines, railroads, furnaces, mills, steel car builders, etc., arranged alphabetically under the names of the operating companies. Part 2 describes all other iron and steel works in the United States, and, for the sake of completeness, the names and addresses of those described in Part 1 are also here included. The arrangement is by states and districts. Part 3 describes all rolling mills and steel works arranged according to products. Part 4 gives information of changes in officers and ownership which occurred while the rest of the book was in press. This edition of the directory is larger than the previous edition, the increase in size being in proportion to the growth of the industry. It lists 448 furnaces, as compared with 428 four years ago, the annual capacity having increased from some 28,000,000 tons to over 34,000,000 tons. There are now 598 completed rolling mills and steel works, as compared with 572 in 1904. The value of the book is due not only to the fulness and accuracy of the information, but also to the classifications of the descriptions and the indexing system, which makes it easy to quickly find the information wanted.

Concrete. By Edward Godfrey. Published by the Author, Pittsburg, Pa. 118 pages, 3¾ in. x 6½ in. Illustrated; semi-flexible cover. Price, $2.50.

The opening sentence of the Introduction announces "that the book is written to point the way to sound engineering in concrete by enunciating the principles thereof and by laying bare the falsity of much that passes for good engineering in this comparatively new branch of construction." And throughout, the author manifests the confidence that he has in his own ideas, with a vigor that must hold the attention of the reader, while he shows but little respect for the ordinary methods of handling concrete. The book resembles a series of separate essays on the subject in which each chapter is complete in itself and can be read in that way. The idea of the individuality of the several parts is emphasized in the method of handling formula in a way that will be appreciated by every one who has occasion to use the book for reference. This can best be explained by a quotation from the introduction:

"No attempt has been made to carry through the book a uniform nomenclature. Values needed for any equation will be found close to it in the reading matter. The author has found attempted standard nomenclature extremely annoying. A practical engineer has not the time, when he wishes to make use of a formula, to read an entire book in order to make sure of the meaning of the values in the formulas, and he is only wasting time when he must refer back to other chapters for their meaning. It is one of the greatest faults of books of reference and text books that must often be used for reference, that formulas are set down with a view of their correctness, solely, the convenience of the user in applying them being ignored."

Every engineer will say an amen to this statement, and unite in a prayer that others may follow the example that is here set down.

In dealing with the subject itself the author does not offer the same number of examples of construction that are to be found in most books on the subject, but he treats it in the manner of a teacher who wishes to inculcate the fundamental principles of the matter in hand to his readers. For example, in the chapter on the steel that is to be used in reinforced concrete the quality of the metal is discussed and the kind for use recommended. Its ultimate strength is set aside as immaterial, provided that it and the limit of elasticity are such as to indicate a uniformity of structure. The reasons for preferring a high steel to a mild one are stated and the tests that it should be able to withstand are given. The author goes through the matter of welds, shapes, bends and other items of the details of construction by dealing with them in a general way that will convey an idea to the designer that will be of value but which will be of little use to the man who is acting as a mere copyist and who is willing to blindly follow others' designs, regardless of the principles involved.

The same method is pursued in the treatment of cement, lime stone, sand and the other ingredients that are used in concrete construction. Especial emphasis is placed on the proper construction and handling of the forms that are to be used, and caution upon caution is uttered that they be not allowed to bend or be injured before using.

In the later chapters there are the reprints of a number of articles that have been written for the technical press by the author in which he has criticised, and has been criticised for opinions expressed. Here both sides of the controversy are printed and the reader is favored not only with the ideas of the writer but of those of men who disagree with him.

Of course examples are given of various types of construction and there are formulas for the calculation of the stresses that the material can be made to sustain, and these are especially full for beams and plates or slabs for floor construction. All this is interesting from the manner of its presentation and valuable because it does not content itself with a bare dogmatic statement of fact that must be accepted, but backs up each statement with the reasons for it.

Foreign Railroad Notes.

By building eight miles of railroad from the Chinese Eastern at Changchun westward, a connection is made for the first time from the Siberian Railroad to Pekin, and China proper—that is, China south of Manchuria.

During some labor troubles in Milan last October, in which the railroads were not involved, a mob was fired on in the streets. To show their indignation at this, a large number of railroad men struck work. Of these 180 were arrested for violation of an article of the criminal code which renders liable to a fine of $100 to $600 and to dismissal from the service public servants who abandon their duties in groups of three or more. The preliminary examination, which decides whether these men shall be held for trial, was held recently for a group of 60 of these men, of whom 55 were indicted, as we should say.

The Hungarian State Railroads in ordering 126 new locomotives of the State Engine Works specify that ten of them shall be of the prairie type, which is bringing the American language pretty well to the East.

The aggregate earnings of all railroads in the German Empire in January, 1908, were 0.4 per cent. more from freight and $4\frac{1}{4}$ per cent. more from passengers than in January, 1907, or $1\frac{1}{3}$ per cent. more in all. For the ten months ending with January their increase was 4.4 per cent., nearly nine-tenths of it in freight.

The opening of the Chilean section of the tunnel under the Andes on the Arica & La Paz Railroad is reported by telegraph recently, and has been taken by the newspapers generally as on the trans-Andine Railroad between Chile and Argentina. Actually Arica is 1,000 miles north of the Pacific terminus of the trans-Andine Railroad at Valparaiso, and only about 50 miles southeast of Peru, to which it formerly belonged. The Arica & Tacna Railroad, built by Americans, was famous in its day. It is on an extension of this line over the mountains into Bolivia that the new tunnel is made.

Heavy Tank Switching Locomotive for the Great Central Railway.

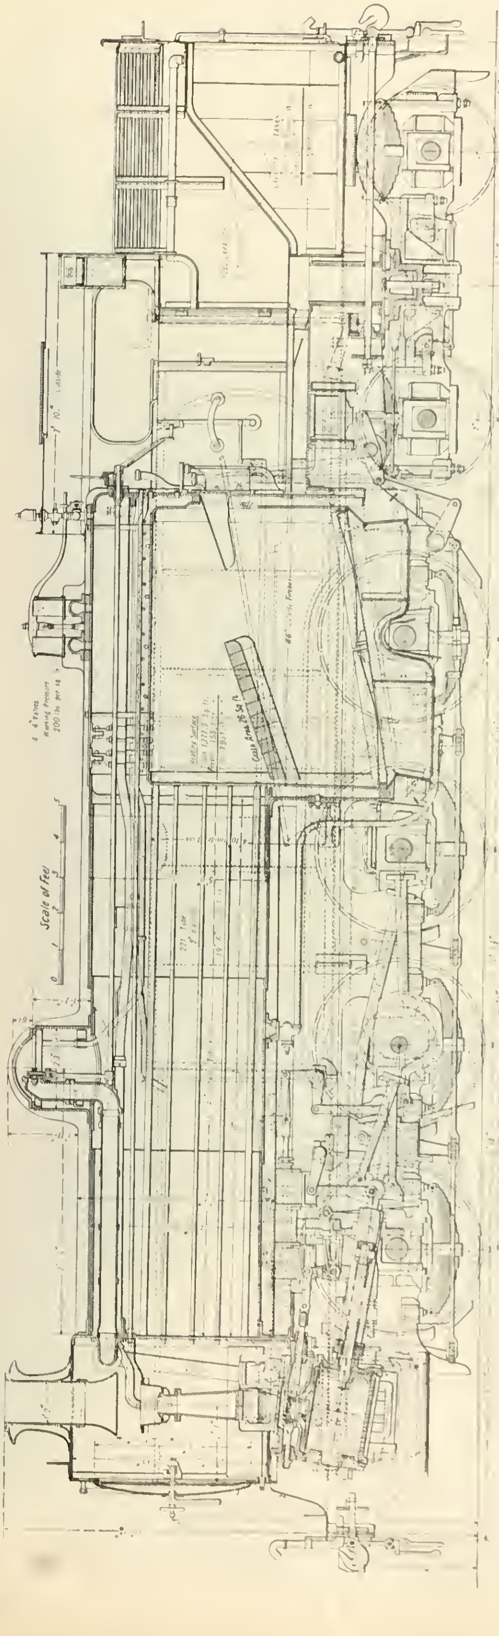
The heavy tank switching locomotive shown herewith ranks as the largest and heaviest of its class that has, up to the present time, been put into service on English railroads. It was designed by J. G. Robinson, the chief mechanical engineer of the Great Central, and is intended for service on the hump grades of the gravity yards of the company at Wath, near Doncaster. It was built by Beyer, Peacock & Co., Ltd. of Gorton. In fundamental principle it is based upon the Forney type wherein the main portion of the engine and the short tender or tank at the rear are carried by a single continuous frame. There is no leading truck but the bogie at the rear serves the purpose of the guiding truck when the engine is running with the cab to the front, which was the original intention in the Forney design. This truck is a compound of a front and rear engine truck. It has the inside bearings of the usual front truck, but with a spring and equalizer arrangement that secures the effect of the one usually put at the rear. The equalizer arrangement is one that is practically unknown in American practice though common abroad. Instead of the deep bars with strength enough to carry the load imposed by the springs between the axle boxes, the springs are set directly over the axles and taking hold of the frame at their outer ends, they are attached to bell cranks at the inner ends, and these latter are connected by a comparatively light tension rod. This makes it possible to obtain all of the advantages of a perfect equalization, with inside bearings, without the use of heavy bars and without interfering with bolsters or brake rigging. This equalization, however, stops abruptly at the truck and does not extend to any of the driving wheels. Here the semi-elliptic springs are underhung and each takes its load direct from the frame.

Heavy Tank Switching Locomotive for the Great Central Railway (England).

The boiler is of the same type and proportions as those fitted to the standard express locomotives of the Atlantic pattern on the Great Central Railroad. It has the Belpaire firebox and slightly extended smokebox. Four safety valves of the Rambottom type are mounted over the firebox, these being adjusted to a working pressure of 200 lbs. per sq. in. The firebox is fitted with a brick arch carried on side brackets, and a deep deflector above the fire door by which the air entering at that point is carried well forward towards the arch before rising and is thus heated to a high temperature before reaching the tubes.

The blow-off cock at the bottom of the shell is fitted with a discharge pipe that carries the water back to a point beneath the ash pan, thus avoiding the wetting of the machinery that so frequently occurs. In this case the pipe is a necessity because of the location of its point of connection to the shell immediately above the cranked axle. The throttle is of the sliding type commonly used abroad and the smokebox has the usual arrangement of English engines.

The characteristic feature of the engine is to be found in its use of three high-pressure cylinders, an arrangement not in use in the United States. They are all of 18 in. diameter with a common stroke of 26 in. The two on the outside are connected to pins in the third pair of driving wheels, while the single inside cylinder drives the cranked axle of the second pair of wheels. All the cylinders are slightly inclined, and each is controlled by a separate link motion. The links are of the Stephenson shifting type and they are operated by a single reversing gear. The lifting shaft for the



Heavy Tank Switching Locomotive for the Great Central Railway (England).

outside cylinders is of the usual type and is worked direct by the connection from the steam reversing cylinder. This is of the ordinary design of a steam cylinder having a piston stroke of 8⅝ in., with a water cylinder for checking the motion and locking in position. The two links are of different forms, and though they have the same throw the lifting shaft arms are of different lengths; probably for constructional reasons.

The engine is equipped with automatic vacuum, steam and hand brakes, and the shoes are fitted to all wheels including those of the truck. The work is on the hump of the Wath yard, where the grade is at the rate of 48.4 ft. per mile.

The following are some of the principal dimensions of the engine:

Tractive effort	38,359 lbs.
Cylinders (3), diameter	18 in.
Piston stroke	26 "
Wheels, coupled, diameter	4 ft. 8 in.
Wheels, truck, diameter	3 " 7 "
Wheel base, fixed	17 " 1 "
Wheel base, total	30 " 8 "
Boiler, diameter	5 ft.
Boiler, length	15 "
Heating surface, tubes	1,777.9 sq. ft.
" " firebox	133.1 "
" " total	1,911.0 "
Grate area	26.0 "
Working pressure	200 lbs. per sq. in.
Weight on drivers	165,760 lbs.
Weight, total	215,488 "

$$\frac{\text{Weight on drivers}}{\text{Tractive effort}} = 4.32$$

$$\frac{\text{Total weight}}{\text{Tractive effort}} = 5.61$$

$$\frac{\text{Tractive effort} \times \text{diameter of drivers}}{\text{Heating surface}} = 1124.67$$

$$\frac{\text{Heating surface}}{\text{Grate area}} = 72.72$$

$$\frac{\text{Weight on drivers}}{\text{Total heating surface}} = 86.71$$

$$\frac{\text{Total weight}}{\text{Total heating surface}} = 112.76$$

$$\text{Volume of three cylinders, cu. ft.} = 11.18$$

$$\frac{\text{Total heating surface}}{\text{Volume of 3 cylinders}} = 165.41$$

$$\frac{\text{Grate area}}{\text{Volume of 3 cylinders}} = 2.26$$

$$\frac{\text{Firebox heating surface}}{\text{Total heating surface}} = 1.36^*$$

*Per cent.

Mountain Railroad Location.*

The first requisite for a successful locating engineer is a good party. However capable any man may be he can work only with the materials at hand, and while a good man may secure results with poor tools he can get better results with better tools. Hence the necessity of the best possible party and instruments.

As to the personnel of the party, the common idea that any one who can turn and read an angle correctly is a transitman, he who can read a rod and keep a level book a levelman, while as for the topographer, any son of some prominent railroad official, who never saw a located line, is competent to take that most important place, and the boy who has done the blue-printing at headquarters will answer for draftsman—this idea should be gently but firmly discouraged by the man who finally bears the burden of all their derelictions. Instead, the transitman should be able successfully to take charge of the party in the absence of the locating engineer. The levelman should be capable of running the transit and doing it well, and the rodman should in that case be able to run the level. High priced men? To be sure. But every dollar of extra pay will return tenfold in results, and, after all, are not results what the party is sent out for? The topographer should be able to run either instrument and be a fair draftsman, for if he has at some time been a draftsman he will not bring in a book full of weird, wonderful marks that may mean anything except a representation of the country run over. The draftsman should be a rapid and accurate worker, capable of doing fairly neat work and should have had some field experience. If he has he will be able either to make out the notes turned in to him or be able to call on the field men for such additional data as may be absolutely essential, while not calling for anything that he can calculate in less time than it would take the party to get for him.

As to the rest of the party it should be made up of the best

*From a paper presented to the Pacific Northwest Society of Engineers by J. J. Cryderman, Civil Engineer, Bellingham, Wash.

men obtainable and plenty of them. There is no economy in working short-handed. * * * Usually the engineer in charge is furnished with all the men asked for, though too often the wages paid are grossly inadequate. Why any man who has worked his way up to the position of chief engineer should try to force wages down is beyond me. Of course we understand that a payroll presents a real and tangible thing that can be cut down, but why not pay decent salaries on location and cut down the cost of construction? In other words, hire men who can locate a better line that costs less money to build and operate. This does not advocate paying uniform wages nor salaries, but get good men and pay them decent wages, and not ask them "what is the least money you will take to do this work?" Know what they are worth and pay for it.

After a party is organized the writer has a certain amount of discipline in camp and on line. Seats at table and assignments to tents are made according to rank. If one wishes to talk shop at meals or at night he wants the men he is talking to near. The writer has found as soon as the men understand the arrangement they prefer it. The writer also believes it pays to let the men know as much about the work as you feel justified in telling. In experience the men have taken a more intelligent interest in the work and a caution to them not to talk outside of camp has nearly always been sufficient. In a few cases it has not succeeded, but if you cannot trust a crowd of bright, intelligent young men, such as comprises the average locating party, you had better get rid of them as soon as you can, for whether you tell them anything or not they will talk to outsiders.

In the matter of instruments the writer has used every standard make and many that were not standard and has never yet found the perfect instrument. However, any standard make of mountain transit with stadia wires, full vertical circle, reversible bubble tube and extension tripod, all in first class condition, will answer. The writer wishes to emphasize the requirements: The transit must be light, compact and convenient. When a transitman is hanging on the end of a rope 150 ft. long down a 70 deg. slope he does not want a 35-lb. transit, nor when it is necessary to give levels or read a vertical angle both backwards and forwards does he want to turn his instrument through 180 deg. to do so. As for an extension tripod, the writer has known good engineers who would not have them, but it seems to him to be the rankest kind of folly. We have heard men say, "I don't want a transitman who can't set up a stiff tripod anywhere." The ordinary location party costs from $5 to $10 an hour, and why waste that good money showing ability to do something that does not need to be done? They might as well want a transitman who could set up a transit while standing on his head. No stiff tripods should be made for mountain transits.

For the level, any standard make not exceeding an 18-in. will answer, though a 16-in. is better, and there should be at least one extension leg in the tripod, especially if a supported grade line is being run, where the levels need to be kept close up to the end of the line. In such cases the levelman must have every show that can be given him. All the reasons given for a light-weight transit apply to the level also. The writer uses a 12 or 13-ft. Philadelphia rod. Take a light, thin, narrow board 5 or 6 ft. long, and mark the top plainly as a sort of target. With the rod measure off and mark each half-foot down from the top, then measuring with a steel tape place the target mark at some exact even foot above the foot mark on the rod, fastening it on the back of the rod by means of small brads or screws. You now have a 16, 17 or 18-ft. rod, as you may desire, with the top marked to half feet, which answers for intermediate stations and on turns. The levelman reads and sets the target precisely as he would the target on the regular level rod and can add from 25 to 50 per cent. to the speed of the level party over rough country.

Besides the regular 100-ft. steel tapes always carried I have a 400 or 500-ft. steel tape to use on slopes, using the vertical circle and reducing to horizontal and vertical measurement. When the distance is too great for the tapes, or it is impossible to get them across, use the stadia wires and level rod, reducing the readings by the table given by Allen or Lavis. For mending tapes the writer prefers sleeves and solder, with the set-screw sleeve for temporary repairs. It takes less than three minutes to mend the tape with a piece of candle and the writer has never had one pull apart, preferring it to the punch and rivets.

For lining rods the best are the wide rods with a line struck down the center, stagger painted. With such a rod, if the transitman can get even a foot of the rod he can plumb it so he knows his tack is where it belongs.

The writer has the rear chainman carry a rod which he uses instead of the plumb bob for chaining, and also for helping the axman keep line. At first the average chainman has to be watched to see that he does not plant the rod on the ground instead of holding it clear, but he soon gets broken in and it is less bother than a plumb bob and has the advantage spoken of as to keeping the axman in line.

Camp Equipment.—In mountain work, as everything must be packed on horses or men's backs, equipment must be cut to a minimum, and made in convenient form to be packed.

The writer has found a modified form of the sheet iron Klondike stove fairly satisfactory for cooking and it can be packed and even a heavy form of it moved on an aperejo or Humboldt. For tables use the canvas lath arrangement. For any one who has not used them it may be explained that they are made of a strip of canvas of the desired width and length with lath tacked or nailed across them, spaced ¼ in. apart, and are unrolled on side poles fixed on posts and covered with oilcloth, as with the common plank camp table. They are very light, fairly strong and quite convenient, and can be rolled up and packed like a roll of blankets. They can be used for dining table and cook table in the kitchen, and a small section is convenient for the office.

In the way of dishes, use granite ware, but cut them down to the fewest your cook can conveniently get along with. As that depends on the cook, no rule can be made; however, take along two dozen miner's tin cups with open handles and let each man carry his own cup on line for lunch.

Within the past year the writer has experienced the two extremes as to the facility with which supplies can be obtained or delivered, in one instance being camped beside a trunk railroad and in the other, being in the interior of Alaska, in the one case being able to get everything in the market, and in the other—well we did not starve but beans 21 times a week grew monotonous, however, the men were as well in one case as the other and seemed to work as well, and some of the same men were in both parties.

In these days, with evaporated fruits and vegetables and concentrated extracts, it is easier to supply a party fairly well, and still cut the weight to a minimum. In the party this summer the daily weight only ran about 2½ lbs. per man per day, which is about as low as it is possible to get any variety for a party. As it is impossible in a paper of this length to give many details, supply lists of all sorts are omitted, referring any one to the works of E. H. McHenry and F. Lavis for all such information, merely cautioning any one who has had no experience that no two parties ever use the same quantities of any article and McHenry's parties must have had fearful and wonderful appetite for some things, judging from his supply lists—codfish and soap for instance. Likewise the list of Lavis. With the McHenry list is supposed to go fresh meat and vegetables, and if you are where they cannot be had the evaporated vegetables and sugar must be at least doubled, and the salt meats increased one-half. Fruit and flour will over run.

For office supplies take everything you can and keep within weight limit, using the knock-down drafting table and set it up like your kitchen table. The stationery chest should not exceed 12 in. x 12 in. x 31 in. in the clear, and even then is awkward to pack. Take tin map cases for maps and profiles, and when moving camp it is well to roll them in blankets to prevent battering up.

Medicines.—A few simple remedies, but no drug store, are needed. Most of the men carry some favorite remedy for themselves and all that is needed in the company chest are some pills, Sun cholera cure, quinine, some surgeon's needles and sutures in glass tubes, needles and silk thread in envelopes, gauze, rolls of bandages, surgeon's plaster, absorbent cotton, antiseptic tablets and some arnica. The latter is the writer's panacea for all cuts and bruises; one-half teaspoonful in a coffee cup of clear water is the best antiseptic he has ever used, and most cuts thoroughly washed out and sewed up and then kept wet with the mixture will heal without inflammation or suppuration.

If any one in charge of a party has never sewed up a big gash in some man's foot or leg, he had better go to some surgeon of his acquaintance and take a few lessons; he will be apt to get the necessary practice in the mountains.

There should be plenty of room in the tents for the men and they should be supplied with Sibley stoves which can be flattened out when packed on horses. Men come in wet and cold too often to economize on room and warmth. Wherever, as in Alaska, mosquitoes are bad, the company should furnish mosquito bars for the men and the engineer should see that they are used, for the man who fights mosquitoes all night cannot work well all day. As any undertaking succeeds in proportion to the attention given to its details, the writer considers the foregoing remarks as to the party, its personnel and equipment, of first importance.

We now come to the active work of preliminary and location with the methods used. Ability, or the lack of it, is shown by the preliminary an engineer runs. Should it not fit closely to the route followed by the location it is time and money thrown away. Do not understand by this that all preliminaries do, or should, follow such line. Many lines are run where the engineer knows them to be worthless, but he does so to show why the line was not located on that route. But to run random lines to develop the country shows a lack of ability that should transfer the engineer from locating to some other branch of the profession. Given the proper preliminary with good topography, and the final location is a question of mathematics. The skill consists in placing the preliminary not only where the location will go, which any one can do, but where the location should go, which sometimes is vastly different.

Usually in mountain work the preliminary is for a supported grade line. In such case the writer estimates how much curvature per station he is likely to have (commonly compensating .04 per degree of central angle) and then reduces it to a uniform grade per station. For example, we are running a 1 per cent. grade compensated .04 per degree. We judge we will have equal to a continuous 5 deg. curve, or a compensation of 0.2 per cent. per station, or equal to a straight 0.8 per cent. grade. Now make out a table of grades for 0.8 per cent. for the use of the transitman and levelman so they can tell just how they are for grade, whether the engineer is with them or not. Each night the line is platted up and a rough projection made, and the compensation figured to the end of the line and the trial grades corrected up. After the second day the topography is platted and the projection made more carefully and the grades re-checked and carried ahead to the end of line on rough projection. By this means the preliminary should be almost where the located line should run and the topography should cover the country desired.

As to the methods of field work on preliminary, there is really little difference among the general run of engineers. With the writer the transit notes are kept in the usual way, except that he always has the magnetic courses taken and recorded. It hardly ever checks with the angle, but if out over 1 deg. the angle is re-checked, and it will always save the transitman from making any serious errors in angle, though the writer has had men who made the same error in reading their angle and checking the course. The writer uses a hand level, or clinometer, and directs the head chainman, dodging obstacles as much as possible, and still keeping as near grade as can be done. In case of deep cuts, high trestles, or tunnels, follow grade around them, then run a line where the located line must go. This for the topography and for the reason previously given, to show why the line must go where it does.

The levels are kept up as closely as they can be, and the levelman leaves the elevation of stations and angle points for the topographer, usually on a stake, or piece of paper, every 400 or 500 ft. The writer tries to have the topography kept right up to the work so that the draftsman is only one day behind and the projection can be kept up.

When leaving the party to be gone over an hour the transitman is called to take the place of the engineer and the levelman runs the transit, for no man can run a party while standing behind a transit. In speaking of the levelman running transit, reference is made to the ideal party. The writer has had the rear chainman run transit and he did good work too, but some one must be ahead and some one must run transit. The principal thing is to get it done and done right.

Having the elevation of the station and angle points, the topographer, where he can, locates the 10-ft. contour above and below the line, and then takes the ground by slope measurement and distance, using a clinometer, measuring the distance with rod or tape where he can, estimating distance where he cannot measure. Besides entering these notes in his book, he also sketches in the general features of the line, showing stream and gulch crossings with their course or angle to the line, also character of the country, and any other information he can secure.

In reducing the topography to the map the writer uses a piece of celluloid about 6 in. x 12 in., out of which are cut slits running across, being about ⅛ in. wide and 4½ in. long, reaching to within ¾ in. of the edge. On the edge of these slits is marked 1-ft. contour intervals, with the 5-ft. x 10-ft. prominently shown, for each degree of slope up to 20 deg. Then by 5-ft. x 10-ft. contours and for each 2 or 3 deg. of slope up to 35 deg., then by 5 deg. intervals up to 60 deg. The one the writer uses is on a scale of 200 ft. to the inch and can be used for the 100 or 400-ft. maps by interpolating values. Any draftsman can use it at once and it is a very convenient labor saving device. The writer has not mentioned locating the contours on the ground and entering them in the book, as it is generally out of the question. The preliminary map is generally made on the 400-ft. scale, as it is most convenient, and on this is laid the trial location. Taking the table of grades worked out from the rough projection, step off 500 ft. with hair-spring dividers set as carefully as possible, following direction of the probable location and marking grade in pencil with a rivet pen, carrying these grades if possible for at least a mile of line. Now at a glance you have your grade line. Some men connect these points by a dotted line, but the writer has never found it necessary. Now try for the best line possible for the ground, as one should always try first for the best possible line, later trying to cheapen where it can be done, or, more truthfully, where it must be done.

For projection the writer uses thin celluloid curves, which he cuts out of a sheet of celluloid with a beam compass, as the manufactured ones are both bulky and expensive, and a dollar's worth of celluloid and a half-day's time will furnish a set.

The set the writer now has is for the curves he uses most, as, like most locators, he has favorite curves whose deflections are easy to figure, and wherever they will fit the ground they are used. The set mentioned is for a scale of 400 ft., but they can be used for any scale by interpolating values. Whether to lay the tangent and fit in the curves, or lay the curves and connect by tangents depends on the ground. Commonly both methods are used on the same sheet. In either case the tangents are drawn to intersect the meridian on the map and the courses are taken by scaling tangent distances from the intersection of the meridian and taking the course from the table of natural tangents, in the same way you would plat from tangents. The courses are marked on the tangents and the angles computed by differences in courses.

The writer might remark here that all his maps are platted by latitude and departures, and in the office copy of the field notes the co-ordinates to each angle point are recorded. The transitman calculates the traverse of his line, being checked by the draftsman, or, on rainy days, by other members of the party. The angles on the map are roughly checked by a protractor. The projected tangents are scaled from apex to apex and the tangents for the curves are taken directly from Butts' Field Book. On each curve is marked degree of curve, central angle, semi-tangent and length of arc, and it is penciled in on the map. Now for stationing scale distance to P. C. of first curve, P. C. plus arc equals P. T. Then apex distance, minus semi-tangent of curves 1 and 2, equals tangent length between curves; P. T. plus tangent length equals P. C. of curve No. 2, and so on. Now use stepping dividers and lay off stations, checking by the P. C.'s and P. T.'s on line. While stepping line take off your trial profile; usually you see at a glance the line must be shifted, which you do at once, re-check your angles and stationing and continue till you get a line that looks about right. Now using your table of grades, lay a temporary grade line and make a preliminary estimate, using a table of cutting on transverse slopes. You will almost always find your line must now be shifted once more. In doing all this use a soft pencil with as fine a point as possible, and even then the map looks disgraceful, but it does not look any worse than you feel after you have worked over it awhile. When you have exhausted yourself and the map you are ready to run in the line, but the writer only calls for and uses it as a trial location not marking the stakes L, but any letter not previously used, and not running in nor using spirals.

This line as run in is platted in on the preliminary map, also on a new map of 200 ft. to the inch, and in very bad country 100 ft. to the inch. As the line is run in, co-ordinates are figured to the apex of each curve and ties are calculated and made to the preliminary at frequent intervals. The writer does not run tangents to intersection as he does not think the value equal to the work required, but depends on ties to the preliminary to take its place. On this work the writer has a small tracing showing a mile or so of the projected line and preliminary with the ties, showing some topography but not much. The writer carries in a book bag a thin board, 8 in. x 12 in., smoothed on one side, some thumb tacks, a small protractor which has been checked and known to be accurate, a small triangle, a 6-in. pocket scale in case, and a pair of pocket dividers, also some loose sheets of scratch paper tacked on the board. If the projected line does not fit, use this small drawing outfit and tracing and project a line that does fit.

Sometimes, but not often, the writer backs up, sometimes makes offsets. In fact what is done with the line depends on what can be shown by levels and topography. If to get them we must back up we do so, if not we go ahead. On this trial location the levels are checked with the preliminary, as are the courses of the transit lines. The topography is taken with as much care as possible and platted on the new map, but no effort is made to try and fit it to the preliminary map.

On the new map is now projected the revised location, using some of the methods used on the first projection, but with many modifications. This time instead of carrying the tangents to meridians and scaling them for the course, latitude and departures of the apex points are scaled from the meridian, entering the co-ordinates on a traverse sheet. From these is found the latitude and departures for each course and from these is worked out course and distances. In other words, it is the traverse of the projected line worked backwards, and by frequently using some course or apex of the trial location the work is checked and rarely is out more than 5 min. on courses. On the revision, spirals are calculated for all curves exceeding 3 deg., and unless on some road that insists on some other the writer always uses Talbot's, as it is the simplest and most flexible of all spirals. The writer also runs the spirals in on the revised locations as it is the only way to secure the profile of the true line.

Some good engineers do not use spirals on location, leaving them for the construction parties, but the profile is incorrect and, of course, the estimate also. Besides, when left, it means an equation at the end of every curve, a thing every engineer abhors. Where there is an equation it should be carried to a tangent and then only marked on map and profile, short or long station, giving the length. If there is anything detestable it is to find a profile marked 139 + 10 = 138 + 72, and to the end of time one will wonder whether the man lost a station or found one.

The methods used in running in the revision are much the same as on the trial location. In running in curves in brush the writer uses long chords and offsets the stations. It means watching the chainmen to see that they hold off the correction. The table of long chords given in Shunk's Field Book are usually correct to within two-tenths up to 100 ft. for 6 deg. curves and it saves calculating them.

Some engineers object to offsetting stations on curves, but all the use you have for them in brush is for levels, topography and clearing, as the line must be re-run for cross-sectioning, and the man who cannot get them close enough for purposes mentioned had better try some other work. Personally, the writer has never felt called upon to slash the right-of-way to set a few stakes, and for that matter, many stakes must be left unset in the mountains, the best you can do, and left for the construction parties, who have both more time and ropes than the location parties. The writer has found, where there has been nothing to tie the lines to, that it is well to take an observation on polaris about every 10 or 15 miles. It corrects up the courses and catches an occasional error in courses that has slipped by. * * *

The amount of work that can be done by a party depends on the character of the country and the kind of line run. What might be a fair season's work expressed in miles in one locality would be poor in another. In 1903, from March to September inclusive, the writer ran 110 miles of preliminary at a total cost of $10,500, an average of $75 per mile. This included all expenses of every kind, including transportation for a full party and outfit from Bellingham, Wash., to Brewster, on the Columbia river, and the return of the party from Ruby creek, a branch of the Skagit, to Bellingham, besides the line run; but included in the cost was the building of 20 miles of trail by the party in the Cascades, a pack train, move of the camp and outfit 70 miles (requiring one week on account of rain and snow) to cover a gap four miles between the end of the trail being built and the one building to, as the four miles would have taken 30 men six weeks with a half ton of powder; also two months extra work of the writer and a draftsman completing all data in regard to the line. As a basis for comparing costs the following list of monthly salaries is given:

Transitman	$90	4 horse team and driver, 2 mos., Includes feed for team and board of driver	$125
Draftsman	85	Pack train, 20 horses, 5 mos.	150
Level and topographer	75	Packer, 5 mos.	75
Rodman and head chainman	45	Packer, helper	50
All other men, except cook	40		
Cook	75		

The company shod horses in pack train and furnished feed when required.

In 1906 the writer re-ran a portion of the location of the Washington & Great Northern from Wenatchee to Oroville. The work was revision of location as covered in the description of projecting and running in such work. There cannot be given so close a statement on this, but the average was 25 miles of location per month at a cost of $62 per mile; wages were about the same, as given above. These examples show how worthless, for purposes of comparison, tables purporting to give cost per mile of surveys can be, the preliminary of less than 100 miles costing much more than location. This would be shocking were it not that the same man did both, and both parties were equally good. As a further example, without going into details, the cost per mile of preliminary and location this season on Copper river, Alaska, will run over $350 per mile, and in the Alaska work, on location, the average was eight miles per month, as against 25 on the Columbia and a pack train of four horses cost $800 per month. The real basis of comparison should be for like work done under like circumstances, though that is hardly a possible condition.

DISCUSSION.

The following written discussion was offered by G. A. Kyle, Principal Assistant Engineer of the Chicago, Milwaukee & St. Paul Railway of Washington:

Regarding instruments, the older companies do not, as a rule, furnish as good instruments as smaller and newer companies, as their stock is generally antiquated. Perhaps there is some reason for their backwardness in this matter, owing to the fact that there is not enough attention paid to the care of instruments by the men using them.

The author's methods for running preliminary line on supported grade lines are very good, and the writer usually follows them quite closely, with the possible exception that in addition to taking needle readings the transitman always takes double sights with the transit, reversing the instrument for the second sight to average both the personal and the instrument's errors. This can usually be done without loss of time, especially in timber country when the speed of the party is determined by the ability of the axemen to clear the line; and the delay, if any, in clear country is more than counterbalanced by increased speed of the locating party in running out the projected location line on the ground, as this added accuracy in preliminary line insures the close fitting of projection, and saves backing up, which is expensive and has a tendency to discourage the members of the party.

As to keeping close to the proper grade in running the preliminary line, the writer has often adopted the method of keeping the level party up close to the transit and setting the head chainman in timber country or head flagman in prairie country for the sight ahead with the level allowing for the grade at the point ahead where man is stationed. He has often kept the level notes himself, to enable the levelman to run the level in order to keep up close to transit, in fact, the transit was not allowed to get ahead of the levelman to any extent. The preliminary line can be run almost exactly to fit the grade, and the tangents almost in their proper place by keeping close track of curvature to be used on location.

Topography.—The writer prefers to locate the contours on the ground, whenever possible, with a hand level, and take actual measurements from the center line with a chain or tape and plat same on sheets in the field. The topographer is allowed two men, one to run the hand level and the other the rod, both measuring the distance, measurements to be taken from each station each side of the center line to the first or second 10-ft. contour. At every 200 to 500 ft., depending on the character of the country, they take measurements to each 10-ft. contour to an elevation of say 100 ft. vertically in steep country, and take clinometer readings where the measurements leave off; in lighter country they take contours out from 500 to 1,000 ft. if necessary to locate some prominent point or object, all intermediate objects such as creeks, roads, etc., being noted, and the contours intermediate to the measurements can then be sketched in by the eye by looking at the shape of the ground. Wonderfully close work can be done by an experienced topographer, as with this system he has only to record the notes and sketch in the contours, and is relieved of the measurement by his assistants. At some points on the right-angle-lines he may take right angles to bring his line parallel with the main line, and measure along that to locate contours when irregular. In order to get a right-angle line to the center, he can use the board that is used to hold the topography sheets, mentioned below. The topographer sights one side of the board along the center line and the assistant sights along the end of the board, marking a tree or other object in the distance, or setting up a pole close to the center line for a sight to run to.

Whenever the line is running parallel with a water course the topographer should carry his levels down to the bottom of same every 1,000 or 1,500 ft., according to the character of bottom, in order that it may be shown on maps and profiles how far the line is above the bottom at any point. The topographer is always from one-half to one day's work behind the transit party by this method. Very good topography, however, can be taken by using a clinometer and one assistant to the topographer to measure the distances.

Topography Sheets and Maps.—The topography taken by hand level as above is plotted on sheets 12 in. x 18 in. to the same scale as the maps, which should be from 100 to 400 ft. per inch, according to the character of the country—easy country, 400 ft., mountainous country, 200 ft., very rough, steep slopes, 100 ft. per inch; but 200 ft. per inch is suitable for very rough steep country. The map should be broken where the scale changes, and the scale marked.

The line on the sheets should be plotted by the draftsman in the office and kept as near the center of the sheet as possible. The sheets should be marked so that they can be replaced in the same position they occupied when plotting the line so that the latter will be continuous on the sheets after the alinement is inked in. Each station should be marked on center line, and every even five or ten stations numbered. Light pencil lines should be drawn at right-angles to the center line at each station and parallel with the center line 100 ft. apart; dividing the paper into squares; then fasten the sheet or sheets on a board 12 in. x 18 in. x ½ in. with thumb tacks, and the topographer is ready to start.

He should note the distances out to all contours and objects such as roads, creeks, rivers, etc., on the edge of the sheet opposite the station where measurements are being taken, and plot the contours as measured with a scale or by the squares on the sheet and sketch in the contours, creeks, rivers, roads, etc., as nearly as possible between the measured points by looking at them on the ground. The topographer should ink the contours in the evening of each day's work (as he is more familiar with his own work than the draftsman) and turn the sheets over to the draftsman. The draftsman should plot the line separately on drawing paper and trace this on tracing cloth, then place the tracing over the sheets and trace the contours and topography shown on sheets. The draftsman should plot section ties on the sheet as well as on the maps. Each sheet should have the meridian shown on it, with magnetic variation shown. The writer has found that the topographer will take more interest in the topography when taken on sheets, as it is interesting to watch the development of the topography on the sheets; and after he gets the shape of the country started it is wonderful how closely he can sketch in the intermediate points between measurements.

Maps should be made of uniform widths generally from 18 to 21 in. wide, as this is half the width of the general run of tracing cloth.

Projecting Line.—The author's method of projecting line is good, and is followed by the writer, except that he uses a continuous dotted line for the grade contour instead of a few circles, as one then has practically a profile of the line on the map. The fitting of the line to the grade contours is then purely mechanical, requiring no thinking to locate the grade contour, and all one's faculties can be concentrated on the balancing of quantities, and the line can be laid nearer the correct place quicker and easier.

Celluloid curves are useful when of large radius, but when the radius can be reached with an ordinary compass with extension joint, the writer prefers this, as the curves are worked from the contour, purely a mechanical instead of mathematical method of locating the limits of the curve. The more the work can be simplified the more time the engineer will have for the proper adjustment of the line. With good topography and careful work on line and maps, and in making projections, figuring quantities from projections and doing the backing upon the maps, the line should be located in the proper place the first time in ordinary country. In other words, the location should be done on the map and duplicated on the ground with proper precautions, and trial locations very seldom used.

Regarding the cost per mile of preliminary line, the author states that he ran 140 miles preliminary at a cost of $75 per mile, and 25 miles at a cost of $67 per mile, which is very cheap indeed, as the general cost of work west of the Cascades is a great deal more. In Alaska the writer ran 185 miles of location costing $475 per mile and 600 miles of preliminary at a cost of $238 per mile, the conditions being very severe.

New Mexican Central Organization.

In the former organization of the Mexican Central, the superintendent had charge of track and transportation. The superintendent of motive power had charge of the shops, of the care of locomotives and practically of the engineers, firemen and mechanics. There was also a material agent who had charge of material over the whole line, and a fuel agent who had charge of fuel over the whole line, and the responsibility was so scattered that it was hard to secure good results. Under the new organization the superintendent is responsible for everything on his division; the master mechanic reports to him, the transportation officers report to him and also the engineer of maintenance of way. The superintendent is responsible for his stock of materials, for his fuel and for everything on his division.

The superintendent of motive power has immediate charge of the general shops of the company at Aguascalientes, but, so far as the other shops are concerned, he exercises only the supervision to secure uniformity of work and the maintenance of established standards. He is not responsible for discipline or the handling of the shops in any other way. The supervision of the chief engineer over the line is similarly restricted to seeing that standards are maintained and that engineering work generally is along the line of adepted practice. President Felton, to whom we are indebted for these details, describes the organization as being practically that of the Pennsylvania Railroad, modified to suit local conditions; that is to say, it is strongly divisional, whereas formerly it was departmental. In spite of the obvious fact that a railroad system cannot expect to find one man who is of really first-class value in all lines, mechanical, engineering and operating, most railroads in this country are getting better results from a strong divisional organization with what may be termed departmental staff officers, reporting to the president or general manager, than they are from a strictly departmental organization, and the Mexican Central is doubtless wise in making the change.

Walter G. Berg.

Walter G. Berg, Chief Engineer of the Lehigh Valley, died suddenly on May 12, of acute indigestion, at his home in New York. Mr. Berg had the unusual combination of executive ability and breadth of view, with the faculty of closest attention to details After designing a yard he could tell the operating officers how to use it. Yet this ability to understand all phases of a problem was not lessened by his habit of working out with his subordinates the minutest details of any design; a habit which destroys the perspective of most men who practice it. In making a report on a subject, he analyzed it exhaustively, and during the later years of his connection with the Lehigh Valley he was constantly called on by other companies and individuals to pass on plans and otherwise act as consulting engineer.

He was born in New York on January 12, 1858, and was educated in that city and in France and Germany. He took his C E degree at the Royal Polytechnic Institute at Stuttgart in 1878 During his course he won a gold medal for a treatise on Spherical Conic Sections; the only time an American has won that medal. He then returned to this country, and for a year was shop inspector of the Delaware Bridge Co., at New York He was then, for four years, in the engineering departments of the Richmond & Allegheny, now part of the Chesapeake & Ohio, and the East Tennessee, Virginia & Georgia, later taken over by the Southern. In 1883 he went to the Lehigh Valley as Assistant Engineer. He was in charge of some railroad construction, and also designed and built roundhouses and other structures at Packerton, Pa., and various other points on the Lehigh division He built the company's creosoting plant, and for a time was Superintendent in charge of it. In 1887 he was appointed Principal Assistant Engineer. In this year he designed and built the Jersey City Terminals of the road. This work was an example of his originality in design, being perhaps the first use in that locality of wooden transfer bridges, while the layout of the piers was also novel. Throughout his service he was always on the lookout for the latest ideas, keeping closely in touch with current practice all over the country. The idea of the circular freight yard built for the Harlem Transfer Company originated with him, when he was consulting engineer for this work, and the design has since been used at various points on the Lehigh Valley.

Walter G. Berg.

In 1898 he was made Engineer of Maintenance of Way, and in 1900, Chief Engineer The Sayre shops were designed and built by him in 1903. Mr. Berg was a member of the American Society of Civil Engineers and many other engineering and railroad associations, being at one time President of the Association of Railway Superintendents of Bridges and Buildings, and at the time of his death President of the American Railway Engineering and Maintenance of Way Association. He was the author of Buildings and Structures of American Railroads, American Railway Bridges and Buildings, Strength of Timber, and American Railway Shop Systems

Among the British possessions in South Africa is a territory extending along the west side of Lake Nyassa, the east side of which is the western border of German East Africa and Portuguese Mozambique, and extending from the southern end of Nyassa southward about 170 miles, and 90 miles from east to west, directly into the Portuguese territory The importance of this is that it contains the valley of the Shire river, which runs from Lake Nyassa to the great Zambesi river, and for part of its course is navigable For 100 miles of the unnavigable part of this river Port Herald north to Blantyre, a railroad has been built, the northern part of which, to Blantyre, was opened March 31 last. Lake Nyassa is about 360 miles long from north to south, so that the railroad will give an outlet to a large territory adjacent to navigable waters. The Germans are building a railroad from the sea westward towards the north end of Lake Nyassa but it will be several years before it reaches the lake.

Railway Signal Association.

The regular May meeting of this association was held at the Engineering Societies' building, West 39th street, New York City, on Tuesday of this week, with President A. H. Rudd (P. R. R.) in the chair. About 150 members were present at both the morning and afternoon sessions.

President Rudd said that in the six months since the annual meeting the committees had done more work than ever before in a similar length of time, and the chief feature of the meeting was the accounts given of what had been done by the principal committees. Mr. Patenall (B. & O.), speaking for Committee No. 1, said that progress had been made toward standardizing colored glasses. A sub-committee had met the manufacturers and had decided on methods of testing. It is proposed to adopt a standard photometer. Specifications for standard glass have been drafted and are now in the hands of signal engineers and manufacturers for criticism. Mr. Mock, reporting for another sub-committee of Committee No. 1, said that some progress had been made toward agreement on standards of signal construction. Agreement has been reached, or nearly reached, on signal posts, ladders and stays; and progress made toward the adoption of uniform specifications for 1 in. pipe and pipe couplings, cranks and pins. A standard semaphore casting has been discussed, but further progress must wait for the association to settle upon what aspects it will approve. Mr. Kelloway (A. C. L.) reported that his sub-committee had agreed on rules for the protection of drawbridges and had made progress on standard specifications for bolt locking, for circuits for interlocking, and for lamps.

Mr. Mann (Mo. P.), for Committee No. 3, on standard specifications for electric interlocking, presented a printed report embodying additions or modifications proposed by the committee. The changes proposed are the result of conferences between the committee and representatives of seven prominent manufacturers of electric signal material. This report was discussed by the meeting at length, especially those parts relating to gas engines, generators and storage batteries. The meeting resolved itself into a Committee of the Whole and gave Mr. Mann numerous suggestions for improving his recommendations for presentation to the annual meeting. Messrs. Stevens (A., T. & S. F.), Elliott (N. Y. C. & H. R.), Denny (L. S. & M. S.) and others gave their views as to the proper size of the gasolene engine as related to the capacity of the electric generator. Mr. Stevens believes that experience will show that for isolated electric interlocking plants a storage battery of 80 amp. hours or larger will be more economical than one of 40 amp. hours, which is the size now most commonly used.

The committee recommended that the electric generator for an interlocking plant should be at least large enough to operate two switches simultaneously; this to provide for the emergency of the storage battery being disabled. It was thought by some that this emergency was too remote to need consideration, but a motion to expunge the paragraph was voted down.

It was the sense of the meeting that storage battery cells should be arranged on the racks transversely instead of longitudinally, as is the practice among users of the storage battery in other than signal work.

In the discussion of bonding of rails, it was stated that copper clad wire is now being used experimentally by a number of roads for this purpose.

The first thing done at the afternoon session was to listen to a paper on the care of storage batteries, by H. M. Beck. The speaker dealt chiefly with the restoration of low cells. He said in part:

The care of a storage battery should have for its object the prevention of low cells, rather than their treatment. The most economical method is to make the expenditure required for the proper care and operation of the cells and this is absolutely essential, if satisfactory results are to be obtained. The tendency is just the reverse to allow the cells to run as long as possible with little or no attention, and it has frequently required a costly experience to bring about the needed reforms.

While the causes of low cells may be varied, the result produced and consequently the treatment required, is not so varied, being in fact, comparatively simple. The general procedure is as follows:

1. Restore the cell mechanically.
2. Renew the electrolyte if there is any question as to its purity.
3. Restore the cell electrically by charging.
4. Determine, if possible, the cause of the trouble.

The mechanical restoration covers the operation of examining the cell and putting it back into its original condition mechanically.

If the electrolyte were renewed in every case the expense would not be great in the small cells used in signal service and this operation would then be purely mechanical.

The electrical restoration has been probably the greatest stumbling block, t o it consists in simply charging the cell unt a maximum voltage and gravity l reached.

The determination of the cause of the trouble is sometimes difficult, but fortunately it is not one of the essentials, and is chiefly of value in preventing a recurrence of the trouble.

Thus reduced to its essential elements, the treatment of low cells consists simply of a mechanical overhauling followed by a prolonged charge, and should not be difficult for anyone to grasp.

Mr. Beck than gave a very thorough, detailed and clear statement of the troubles encountered in the management of accumulators, due to short circuits, sediment, worn plates, lack of care, impurities in the electrolyte, sulphating, lack of ventilation, and every other possible cause and told in simple and forcible language how to deal with each; and closed as he began, with the three essential points: Restore the cell mechanically renew the electrolyte if its purity is questioned, charge to a maximum In many cases the storing charge is all that will be found necessary

There was no discussion on this paper, the general opinion being that the author had treated his subject exhaustively. Following this, Mr. Yocum (P. & R.), for the committee on storage batteries, presented a printed report consisting of a carefully prepared and detailed description of the storage battery, with rules for installation and care. One of the rules proposed was that every two weeks storage batteries should be overcharged for about one hour. This provoked discussion, as some batteries in places not conveniently reached and not much used are overcharged far less frequently than this. Mr. Stevens (A., T. & S. F.) overcharges his batteries every sixth charge, no attention being paid to the number of weeks elapsed. The prevailing opinion was that a rule like this—for overcharging on one of a given number of occasions—would be satisfactory, and that a time limit was not necessary.

Mr. Ames (N. Y. C. & H. R.), for the committee on rubber covered wire, reported that his committee had been divided into sub-committees and that certain changes in the specifications had been drafted. The committee is going to give hearings to the wire makers. A report on copper clad wire has been drafted.

At the afternoon session the secretary announced the sudden death of Walter G. Berg, President of the American Railway Engineering and Maintenance of Way Association, and the meeting passed resolutions of sorrow and esteem and sent a message of sympathy to Mr. Berg's family.

Block Signaling Under the Supervision of the Train Despatcher.*

The A. B. C. Rules on the Northern Pacific have passed the experimental stage. Their value is no longer a matter of speculation. Apparently they have come to stay. They are, without doubt, superior to any single track system of rules and orders yet devised. They are now used on 63 miles of track, from Spokane to Ritzville. On this territory there are 15 telegraph offices and three blind sidings. It is all main line and handles a traffic so heavy that with the ordinary system of train orders it was found impossible to keep trains moving.

With the A. B. C. system no train orders are issued and there are no time-table schedules except for information to the public that passenger trains may be expected at certain times. A train obtaining a clear signal at a telegraph office and obtaining a clearance card from the operator has absolute right to the next telegraph station. There it receives further instruction by means of a three-position semaphore either to stop and wait, to take siding or to proceed to the next station. Clearance cards are delivered to conductor and engineman by means of hoops and no reduction of speed is necessary.

Four months' experience has shown surprisingly satisfactory results. It is difficult to arrive at an exact statement of increase of efficiency, but a comparison of statistics for one month with that of the corresponding period a year previous shows that the average speed of all freight trains in passing over this portion of the track was 11 miles an hour, as compared with 8.6 miles an hour the previous year. This includes all delays and also includes the movement of two way freights. Omitting the locals the record shows an average of 14 miles an hour. * * * The success of the venture is attributed to the hearty co-operation of the despatchers, trainmen and operators.

With the A. B. C. system three men must act simultaneously with each other. No move can be authorized and no signal can be cleared unless the three give their consent. The operator who is to clear the train first examines his own block record, and if the track is clear asks the despatcher for a clearance. The despatcher looks at his train sheet and if found proper issues the necessary authority. The operator then asks permission of the operator at the next station to admit the train to the block. If the latter is satisfied that the track is clear he gives his consent. The duties of each man are so simple, compared with the handling of a hundred or more train orders every day, that from the mere standpoint of clearing the atmosphere surrounding these men the system must recommend itself.

*By H. A. Dalby, in the *Firemen's Magazine*.

Erie Terminal Improvements in Jersey City.

The improvements which are now being carried out by the Erie Railroad at its terminals in Jersey City have in view two principal objects. An ingenious rearrangement of tracks provides for complete separation of freight and passenger business and for the movement of passenger trains to and from the several branches without interference with each other. The plans have been under consideration of the executive and engineering departments for nine years and are now fully worked out and with a view to probable electrification in the near future. Though they involve operations of great magnitude, they are being executed without delay on account of the prevailing financial depression.

West Approach, Lackawanna and Erie Tunnels.

The work now under way naturally divides itself into two sections: The separation of the passenger and freight business and the segregation of the trains from and to the several branches.

All passengers and all freight destined for or originating at Jersey City or New York must now be taken through a double-track tunnel about 4,400 ft. long. The traffic is so great as to occupy both tracks almost continually during the whole 24 hours. The requirements of the road's large suburban business, especially during the rush hours of morning and evening, have seriously hampered the freight business. It has been the custom during morning hours to use both tracks for inbound movement and for a period of about two hours to allow no westbound movement of any kind. In the evening inbound passenger trains are run in this way. In order to increase the capacity of the tunnel some trains with two locomotives are sent out as one. These are separated beyond the tunnel without serious delay.

But the increasing suburban and freight traffic has aggravated increasingly the difficulties of the situation and delays have been frequent. To relieve this congestion a four-track open cut is being made through Bergen hill, on the completion of which its four tracks will be used by passenger trains exclusively and the present tunnel will be used by freight trains only.

Passenger traffic, largely suburban, comes from six different Erie lines. These are the main line, New Jersey & New York Railroad, Northern Railroad of New Jersey, New York & Greenwood Lake, Newark branch and New York, Susquehanna & Western, and are shown in the plan on page 670. The New York, Susquehanna & Western now uses, for passenger traffic, the Pennsylvania station in Jersey City.

At some distance west of Bergen hill these six lines converge into three main stems, each carrying the traffic of two branches. These are known as the Main line, the Newark branch and the Susquehanna line. The New Jersey & New York joins the main line 5.5 miles from the west end of the open cut. At a point 2.1 miles west, the Newark branch and Greenwood Lake line meet. The union of the New York, Susquehanna & Western with the Northern of New Jersey is to be three miles west of the cut.

All lines of traffic therefore now converge at the west end of the Bergen tunnel. The handling of trains involves cross-overs which necessarily cause interference with trains moving in the same direction, and particularly with trains moving in opposite directions. All tracks are on the same grade. This interference will be avoided by a new track lay-out which will obviate, by means of an arrangement known as a "flying junction," all interference between trains. By this arrangement the direction of traffic on the four tracks through the open cut may be varied to suit. It is proposed, during the morning hours, to assign a separate track to inbound trains from each of the three main stems, leaving the fourth track to handle the outbound traffic. In the evening, this arrangement will be reversed. In the middle of the day the normal distribution will be two tracks for inbound and two for outbound service.

The four tracks emerging from the open cut will, as shown on the map, pass under the four tracks of the Lackawanna and under Tonnele avenue. At this point they will diverge into six tracks, two for each group of lines, one inbound and one outbound. One arrangement of the switches will provide for all inbound movements in the morning and another for all outbound movements in the evening. Having set the switches for such movements the operator is thereafter concerned only with handling light traffic to or from the proper lines.

View of Open Cut from Hudson County Boulevard; Erie Terminal Improvements.

The tracks of the Susquehanna line, both eastbound and westbound, rise together from Tonnele avenue on a 1.15 per cent. grade on an embankment and by an overhead bridge across the westbound main line and westbound Newark branch. This line will continue on a viaduct over all the yard and freight tracks. The two tracks continue together thence to the point of separation of the Susquehanna and Northern of New Jersey lines. This will make it possible for the New York, Susquehanna & Western to use Erie terminal instead of the Pennsylvania terminal, as at present.

Of the main line tracks, the westbound track passes under the passenger and freight tracks of the Susquehanna line, and the eastbound track passes under the freight tracks of the Susquehanna. Thence both tracks rise on separate embankments and continue together and parallel on a bridge over the westbound Newark branch and the Newark branch freight connection. The two tracks then

Cable Conveyors for Handling Excavated Material.
Location of present tunnel shown by ventilator.

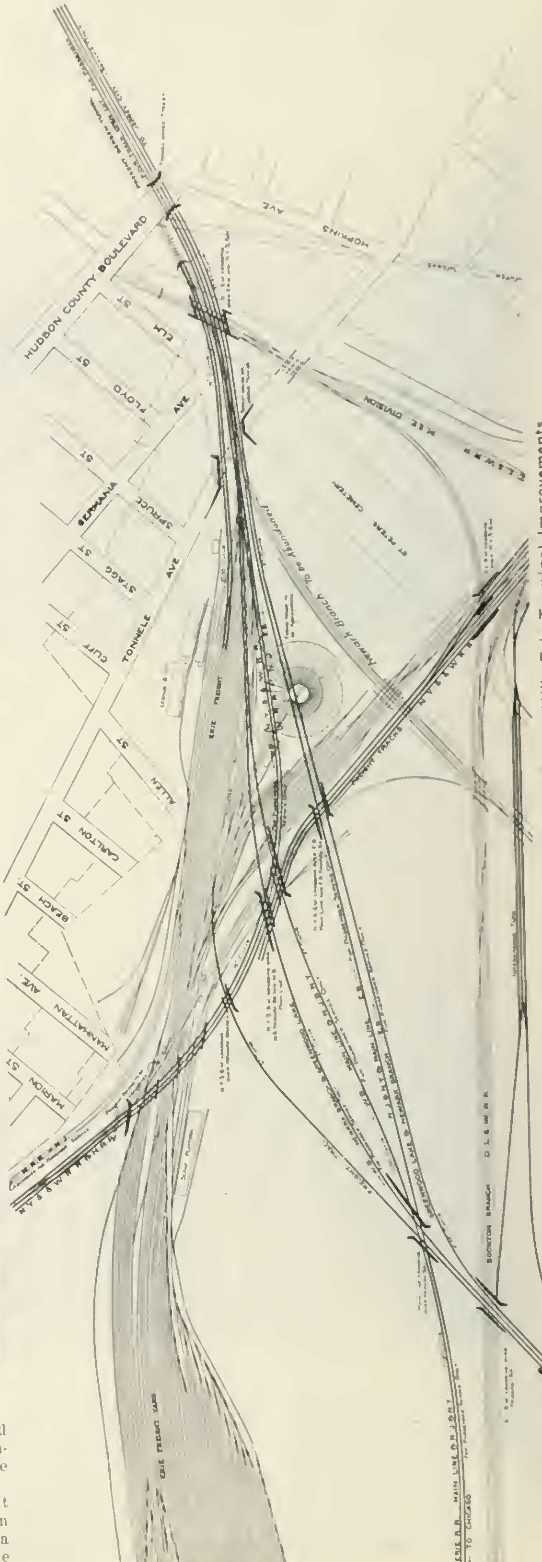
descend on an embankment and run parallel to the point of divergence of the main line and the New Jersey & New York.

The location of the Newark branch line and of the New York & Greenwood Lake line and their point of divergence will be changed. These lines now leave the main line just west of the tunnel and cross the Hackensack river, whence the Newark branch runs westerly, while the New York & Greenwood Lake follows the bend of the river and proceeds northwesterly. The old line of the New York & Greenwood Lake originally crossed the river at a point higher up. Under the rearrangement the tracks of the Newark

Anchor for Cable Conveyor.

branch and the New York & Greenwood Lake will be the same and will follow the old location of the latter road crossing the Hackensack river near Snake Hill on a new bridge now being built. The two lines will diverge just west of the bridge.

The westbound track of this line will pass under the freight and passenger tracks of the Susquehanna line and under the main line tracks. The eastbound track will pass under the Susquehanna freight tracks, joining the westbound and freight tracks of the Newark branch. All three will pass under the Boonton branch of



Plan of New Track Arrangement West of Bergen Hill; Erie Terminal Improvements.

the Lackawanna, and by a long curve reach the point of crossing the Hackensack. This rearrangement work is in progress to the extent that the necessary embankments are being built of the material taken from the open-cut excavation. There is required construction of 8.4 miles of new double-track line and partial abandonment of 8.7 miles of existing double-track line, most of which can be used in freight service. Just west of Bergen hill are the Hackensack meadows, where the necessary embankments will require some 530,000 cu. yds. of material, much of which will come from the open cut excavation.

The foundations of the new bridge across the Hackensack river is under way, and it is expected that the steel work will be placed this summer. This bridge will consist of six plate girder deck spans, some 78 ft. and some 79 ft. long, and a draw span of 264 ft., making a total length between abutment backwall faces of 736 ft. The abutments and piers are concrete on pile foundations. The contractors for the substructure are McMullen & McDermott, New York; the superstructure will be fabricated and erected by the American Bridge Company.

N. Y. S. & W. Connection With P. C. R. R.

General Plan of Bergen Hill Cut and Proposed Track Arrangement; Erie Terminal Improvements.

The new line through the cut follows the general direction of the existing tunnel 67 ft. to the south. The grade of the existing tunnel is slightly descending from west to east but the grade of the new line will be on an ascent of .73 per cent. from west to east, with a vertical curve of 700 ft. interposed at the east approach and a down-grade thence to the terminal station. The grade was determined with a view to reduce rock excavation to a minimum without too great interference with the track rearrangement west of the hill. Also on emerging from the western portal of its present tunnel the Erie passes immediately under the tracks of the Lackawanna and directly at the eastern portal over the tracks of the New Jersey Junction Railroad (West Shore). At the west side of the hill the portal of the Erie tunnel is almost directly below those of the Lackawanna tunnels; here the necessary room for the four additional tracks will be secured by excavation. This will necessitate the construction by the Lackawanna of a longer span than that now required, and it is understood that a lattice girder structure will replace the present plate girders. At the east side, to avoid the New Jersey Junction tracks, a four-track viaduct will be erected. The floor of the line through the cut was located at the east end about 40 ft. above that of the present tunnel, creating the grade previously referred to. The situation at the west portal of the tunnel is shown in one of the accompanying photographs.

The cut will be 60 ft. wide at the base and about 100 ft. at the top. The section of the cut at the west entrance will be 275 ft.; the next three in order are 700, 190 and 670 ft. respectively; while the east approach, from east of Palisade avenue to the first tunnel is 1,300 ft.; a total length of open cut of 3,135 ft. The whole length of the opening, however is nearly 4,400 ft., for, though known as an open cut, the opening through the hill includes four tunnels aggregating 1,310 ft., as follows: Under Hudson county boulevard, 190 ft.; under St. Paul's avenue and Bevan street, 285 ft.; under Summit avenue, 255 ft.; under Hoboken and Central avenues and intervening property, 580 ft. At the intersection of St. Paul's avenue and Bevan street it was originally planned to build bridges, but it was finally concluded that the tunnel construction would involve less difficulty than bridges at an intersection.

The proportions of material involved in the excavation are about: Rock, $4\frac{1}{2}$; earth, 1, the total estimated quantities being 113,890 cu. yds. earth excavation, and 198,550 cu. yds. rock, of which 79,050 cu. yds. are included in the four tunnels. The contract for the work is held by the Millard Construction Company, of Philadelphia.

The work has been made harder because part of the site of the cut was formerly residence property, and it has been necessary to keep streets open and unobstructed by even a contractor's transportation line. Certain parts of the work, also, are crossed by street railway lines. On account of the need for material for embankments west of the hill and the general nature of the location, it has been necessary to carry most of the excavated material for some distance in that direction, avoiding at the same time Hudson county boulevard, a busy thoroughfare, and the network of tracks on various levels at the west end.

One of the views herewith shows the excavation as it appears looking east from Hudson county boulevard. To avoid crossing this street, the narrow gage line shown is carried through a tunnel under the street and leads thence west to a stone-crushing plant near Tonnele avenue. Another line is carried on a trestle of wooden truss and plate girder spans over the Lackawanna tracks, thence out to the embankments on the meadows, about $1\frac{1}{2}$ miles.

In removing material from the cut the apparatus of the Balanced Cable Crane Company, New York, is used. The cables are supported from heavily counter-weighted shear legs on each side of the cut and from the conveyors the material is dumped into the cars on the track at the south side of the cut. One of the conveyors and one of the anchors for the conveyor line are shown herewith.

The crusher plant comprises one No. 10 and four No. 6 crushers. A belt conveyor carries the crushed stone to a point where it will be stored until required for use in tunnel linings and portals. The power and lighting plant of the contractors is at the same location. The main power plant includes an Atlas boiler and engine of 2,000 h.p. capacity for the crusher plant, and three Laidlaw-Dunn-Gordon compressors which supply power for about 65 drills. A generator forming a part of the same plant supplies current for lighting and for the operation of the conveyors.

This terminal improvement work has been under the general supervision of J. M. Graham, Vice-President of the engineering department, assisted by F. L. Stuart, Chief Engineer. Immediate supervision has been in charge of G. H. Burgess, formerly Engineer of Terminal Improvements, now Principal Assistant Engineer, assisted by A. L. Moorehead, Resident Engineer at Jersey City.

Railroad Regulation.*

BY ROBERT MATHER,
President of the Rock Island Company.

It is not because of the extent of Pittsburgh's commerce, vast as it is, nor because of its historic associations, absorbing as they are, that a discussion here of the subject of railroad regulation peculiarly appeals to me. It is rather because here, where a greater tonnage moves than anywhere else in the country, there is less of controversy between shipper and carrier than anywhere else in the land. I am told that here, in the country's nerve-center of traffic, out of all the multiplied millions of transactions between merchants and railroads, there has never been found a cause of complaint to present to the Interstate Commerce Commission. This does not mean that the railroads have never been wrong, or unreasonable, or exacting, or inefficient, or that the shipper has never demanded what he ought not to have received. I have no doubt that, in the weakness of human nature, many of these things, on both sides, have occurred. But there has been found a way in Pittsburgh to move an unparalleled tonnage in spite of all such discouragements and conflicts, with satisfaction to both shipper and carrier and without the intervention of courts or commissions. I hold that fact to be of great significance in these days of clamor for increased regulation of the business of transportation, and I deem it worthy of our serious thought.

I appreciate fully that, in this respect, no miracle has been wrought in Pittsburgh. I yield to you gentlemen of the Traffic Club high praise for the achievement I am extolling, but I still believe you to be an ordinary lot of men, uninspired except by the spirit of good sense. I understand that you proceed upon the very human and rational theory that the interests of producer, transporter and consumer are alike and mutually dependent, that without production there can be no transportation; and that unless the combined efforts of producer and transporter can lay down your product before the consumer upon a basis that the consumer can afford, your commercial activities are doomed to failure. So when you find that a consumer or a community that in view of all other commercial conditions ought to be taking your product, is not taking it, you look for the cause in the rates or practices of the railroad that carries your product to that place. If you find that a change in rates will secure the customer or the community, or that an improvement in train service or some addition to the carrier's facilities will move the traffic, instead of filing a complaint in Washington, you go to the railroads direct and ask them to help you, and at the same time to help themselves, by making the change that will produce the result. And so willingly have the railroads met and co-operated with you that, in the working out of the myriads of such problems that your teeming commerce has presented, you have not yet been denied a request the denial of which could give you ground for legal complaint.

I believe that this Pittsburgh plan of conference and co-operation between railroads and shippers should be given wider scope before we become finally wedded to the alternative plan of governmental compulsion. What you have done in conducting your manifold and stupendous dealings with the railroads, not only without clamor for additional restrictive laws against them, but without even invoking such laws as exist, can and ought to be done elsewhere. More than this, not only the carrier and the shipper, but the representatives of the regulating power of the government should meet on this platform of mutual confidence and co-operation. It is perfectly feasible in every commercial center like Pittsburgh for the railroad traffic associations to hold open meetings with the representatives of the shippers, to make up their docket of subjects to be acted upon not only from the requests of their members, but from the suggestions of their customers, and to place the docket in the hands of all entitled to attend a reasonable time in advance of the meeting. It is further not only practical, but in my judgment highly desirable that a member or a representative of the Interstate Commerce Commission should not only attend those meetings, but even preside over their deliberations and umpire their disputes, with possibly some provision for appeal to the Commission itself. Thus would we revert to the example of Washington when he and the colonial commissioners met in peace and not in strife to solve by mutual helpfulness the national problem of transportation. And thus the regulating power would get at first hand and through touch with the vital facts, its knowledge of the complicated commercial and social conditions which every contested rate question presents. It would be dealing with the parties at a time when, with open minds, both are striving to reach a point of mutual advantage, rather than when, as opposing parties to a complaint, each is trying to get the better of the other. Under such a plan of co-operation, perfectly consonant with provisions of existing law, the regulating power would become, as it ought to be, an instrument of conciliation, and the fruit of its exercise would be commercial peace. Through such an agency the difficulties in the way of uniform classification would be removed, a national and harmonious system of rates established, mystery taken out of traffic problems, and the path made smooth to the day when a stamp purchased from any carrier and affixed to a parcel of merchandise will carry the parcel to its destination, wherever it may be, as surely and unostentatiously as the postage stamp now performs its lowly task. I believe the railroads would welcome and support such a scheme of co-operative regulation of their rates and their traffic.

I fear that the public but dimly realize the willingness of the railroads to accept and to further the reforms in transportation methods that recent changes in our laws and in their administration have produced. The effective prohibition of rebates and of free transportation, and the elimination of the many forms of discriminations which expressed the subservience of the carriers to the large shippers mark the emancipation of the railroads from a slavery to abuses to which none of them would return. Most of them are not only willing but anxious to co-operate in any policy of reasonable regulation that will maintain their business on the higher plane of morality to which it has thus been forcibly lifted. And I think that spirit of co-operation should be reciprocated by the regulating power.

It continues, however, to be the claim of the railroads that they shall not be so regulated as to be prevented from earning interest on their bonds and reasonable dividends on their stocks. And they insist that not only they and their security-holders and their employees, but the nation at large is interested in their continuing ability to earn those charges and dividends. For, in the absence of such earnings, their securities become discredited, they are in consequence unable to provide the added mileage and increased facilities which the growing commerce of the country demands, and thus they fail to support not only their own normal quota of employees, but millions of others of our citizens who depend upon the many industries that the ordinary activities of our railroads

*From an address before the Traffic Club of Pittsburgh, April 3, 1908.

keep in operation. The dark days through which we are passing lend telling weight to this contention.

The insistence of the railroads upon this position involves no criticism of the policies of the President. Indeed, he admits that the railroads should earn their interest and charges, and concedes that, generally speaking, they are not over-capitalized. His policies, however, do not concern themselves, *primarily*, with the conservation of the revenues of the railroads. I understand his attitude in this respect to be expressed in the Scriptural injunction: "Seek ye *first* the Kingdom of God and his righteousness; and all these things shall be added unto you." The practice of the railroads in the past, it must be confessed, has been to reverse the order of this text; to seek first their revenues, and to await with patience the coming of the Kingdom of God. It is not surprising, therefore, that they take hold of the first part of the program of this new dispensation not only with awkwardness, but with some fear that the promise of the latter part may not be realized. It is a fact, however, that the first enforced steps taken by the railroads on the path of righteousness marked out for them by President Roosevelt have tended to increase rather than to diminish their revenues. The limitation of the pass privilege has clearly swollen the passenger receipts. The enforcement of the prohibition of rebates has not only turned our traffic men—and the traffic men of the shippers, too—from a life of daily crime, but has turned money into our treasuries. So clearly is this true that the chief political opponent of the President makes it his daily taunt that the only regulations the administration has actually enforced against the railroads have added to their revenues—as though that in itself were a crime to make the blood of the people boil.

But the statesmanship that rises no higher in its treatment of this great question than to see good in no regulation save that which takes money from the railroads, either lacks intelligence itself or assumes want of intelligence in the electorate to which it appeals. And I believe that the people could be led to see the essential identity of the prosperity of the country with that of the railroads, and the absolute dependence of the one upon the other, if only a voice could be found to raise that cry.

A program of rational regulation should oppose the regulation of railroad rates through the specious device of a physical valuation of railroad properties. The argument in favor of this suggestion is founded on the assertion that railroad rates are unreasonably high. If, it is argued, a value could be placed by governmental determination upon the physical properties owned by the railroads, that valuation would express the aggregate investment on which the earnings of the roads should yield a fair return, no matter what amount of outstanding securities represent the properties or what those securities cost to original or present holders. Wholesale reduction of rates could then be made to a basis just sufficient to yield this reduced return.

The premise of this argument is false and its conclusion immoral.

Railroad rates in this country are not unreasonably high. As shippers and consumers of freight we pay a transportation cost less than one-half that of Germany, barely more than one-third that of France, and but slightly in excess of one-fourth that of England and the other countries of Europe. Following are the figures for last year:

Country.	Freight cost, per ton mile, in cents.	Country.	Freight cost, per ton mile, in cents.
China	.10	Germany	.015
Japan	.05	France	.019
Russia	.022	England	.026
Italy	.024	United States	.0069
Austria	.0225		

Besides, the cost of transportation to the actual consumer is so slight a quantity as never to disturb his thoughts except when forced upon his attention as a campaign issue. A careful writer has computed the amount which freight charges actually add to the cost at Pittsburgh of necessary articles of wear and consumption, and I give you some of them:

A suit of clothes—three cents;
A pair of shoes—one and one half cents;
A man's hat—less than half a cent;
A lady's hat, trimmed for wear—less than one cent;
Muslin—one-twelfth of a cent per yard;
Flour—less than one fifth of a cent per pound;
Dressed meats—one fourth of a cent per pound;
Fish—one-third of a cent per pound;
Vegetables and canned goods—one sixth of a cent per pound.

We "plead the baby act" as a nation when we cry out against the alleged over-capitalization of our railroad corporations. The state and the nation had their opportunity, at the time of issue, to prevent the sale and consequent validation of these "watered" securities. Why was their issue not prevented? Because, as a people, we were willing to pay the price and to take the chance, in order to get the railroads built and the country developed. Well, the railroads were built and the country was developed because, by reason of this attitude of the people, the states and the nation, it was possible to sell the securities thus issued in the world's markets, and, through their sale, to obtain the money without which the railroads would not have been built and the country would not have been developed. In countless cases, under all sorts of circumstances, it has been attempted to invalidate railroad bonds on the claim that the corporation got inadequate consideration for their issue—that is, that they were issued in excess of the value of the property of the corporation. Against every such attempt our courts have held, with a unanimity that attests the essential righteousness of the holding, that all such securities, no matter how flagrantly over-issued, in the hands of holders for value are the enforceable obligations of the corporation and valid charges upon its properties and their earnings. The movement for a physical valuation of railroad properties seeks to accomplish, by administrative order, the invalidation of these securities which the courts deny. I repeat, such an effort is immoral.

Like all immoral acts, whether of nation or of individual, the movement for physical valuation of railroads is also foolish. The protection that the courts throw around the innocent holder of this class of securities lies, as an essential fact, at the very foundation of the credit of our corporate securities, at home and abroad. The threat that this protection may be nullified by an executive order fixing the ultimate capitalization upon which the railroads will be permitted to earn a return, without reference to the amount of outstanding stocks or bonds, menaces all of our railroad securities. In times like these, when it is generally accepted that the one thing our industrial situation needs is restoration of the confidence of the investing public, here and abroad, in our railroad securities, how foolish it would be, by the adoption of such a policy of regulation, to justify and to confirm the suspicion with which these securities are now regarded in the markets of the world!

To those regulations which seek to place under the control of officers of the government the administration of the internal affairs of the railroads, everyone interested not only in their prosperity, but in the prosperity and safety of the country, should protest. I do not include in this condemnation those regulations effectively designed to protect the safety of traveler and employee, or to secure to the latter fair compensation for injuries suffered through the negligence of his employer. In those questions the public has a direct interest which it may rightly safeguard. But when, under guise of accomplishing these public purposes, government takes hold of the operations of the railroads in such a way as to intrude its authority between the control of the employer and the obedience of the employee, it takes a step not only unjust to the railroads, but unsafe both to the traveling and shipping public and to the state. It is universal experience that nothing tends to good service in any line of employment so much as the realization that continuance in the employment with its consequent pay and hope of promotion, depends upon the character and loyalty of the service rendered.

It is, in my judgment, one of the regrettable effects of modern labor conditions—whatever may be the compensating benefits—that there has been largely substituted for this prop of self-reliance based on good service the all-supporting arm of the union. Intelligent and unprejudiced observers of the operations of our railroads trace a definite percentage of the increased operating costs of the past few years, of the decreased efficiency in service, of the increased casualties with their resulting growth of loss and damage to freight and loss of life and injury to persons, to the slackening influence of this very fact upon the hands and brains that load and make up and move the trains. If to this there be added the assurance to the employee that no longer his employer or his union, but a paternal government prescribes the hours and conditions of his employment, the nation itself will be the sufferer, not only in the diminution of its industrial efficiency, but in the deterioration of the fiber of its citizenship.

Nor should any governmental officer or body be given power to prescribe for the railroads schedules for the movement of perishable freight, or the conditions under which they shall interchange cars with their connections. I do not see how schedules for perishable freight can be made without making schedules for all other trains; and I do not think that government commissions or agents should make the time cards of the railroads. If control of these intricate details of operation and of the relations and practices that shall determine the interchange of cars at every connecting point on our 225,000 miles of railroad, be put in the hands of the commission, what remains of the work of operating the lines will be so unavoidably involved in these regulations that it might as well all be conducted from Washington. If it be answered that the purpose of these provisions is to prevent discriminations in these particulars, the sufficient reply is that existing law prohibits all discriminations, prescribes punishment therefor by fine and imprisonment, and provides pecuniary compensation for the party injured. If, as a cumulative and preventive remedy for these particular species of discrimination, it is necessary for government to take over the operation of the railroads in these particulars, then, for the preventive protection of others who may be injured by other kinds of discrimination, the government should operate the railroads *in toto*.

It is as a citizen, rather than as a railroad man, that I decry the growing tendency toward this kind of railroad regulation. Every such regulation loosens, by just so much, the control of the railroad manager over the property in his charge, and lessens, in the same degree, his accountability to its owners. For the resultant decrease in earnings and increase in expenses the responsibility is shifted from his shoulders to the regulating power—the government. Now, it is established by law and admitted in all discussion, that the owners of the property are entitled from its earnings to a fair return upon its value. There is, therefore, no escape, in logic or in morals, from the proposition that, to the extent that governmental interference with the owner's control of the operations of his railroad diminishes the ability of the property to return the fair profit to which, under the law, he is entitled, the government must make the owner whole. In other words, if the government is to undertake, in whole or in part, the operation of our railroads, a government guaranty must go with the act. And I don't think that is a good thing for the Republic, however soothing it might be to the railroads.

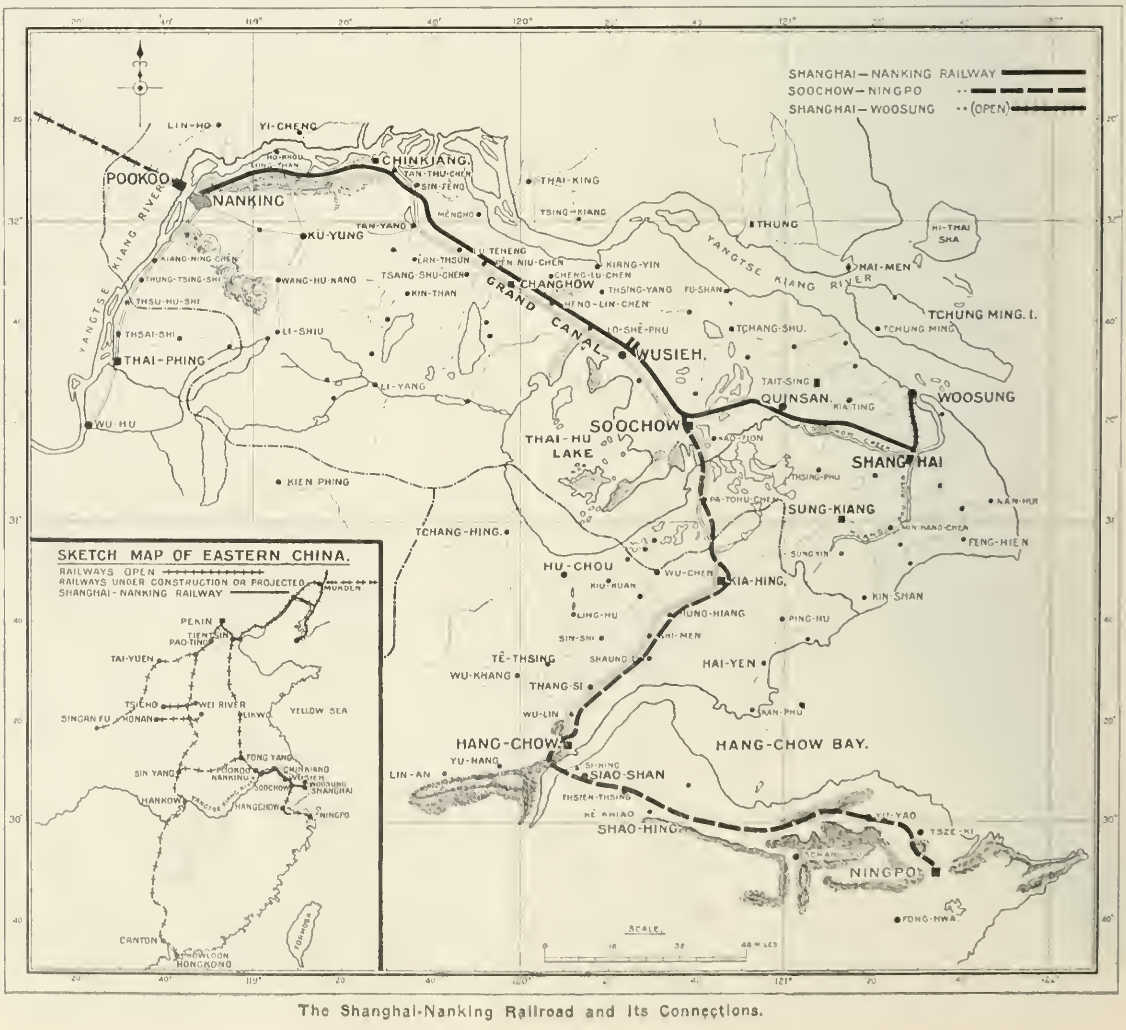
The Shanghai-Nanking Railroad.

The awakening of China after centuries of slumber is perhaps better illustrated by the rapid construction of railroads than by any other evidences of modern civilization. It is only within the lifetime of the present generation that the first line was built—that from Shanghai to Woosung—and destroyed, for a frightened Chinese mob uprooted the rails and threw them with the rolling stock into the sea. Not only, however, has this short 10-mile line been long ago restored, but a very considerable mileage has been built in various parts of the country, and a large addition to this is now in hand. Among these lines is the important connection of the Chinese Imperial lines from Shanghai to Nanking. Preliminary

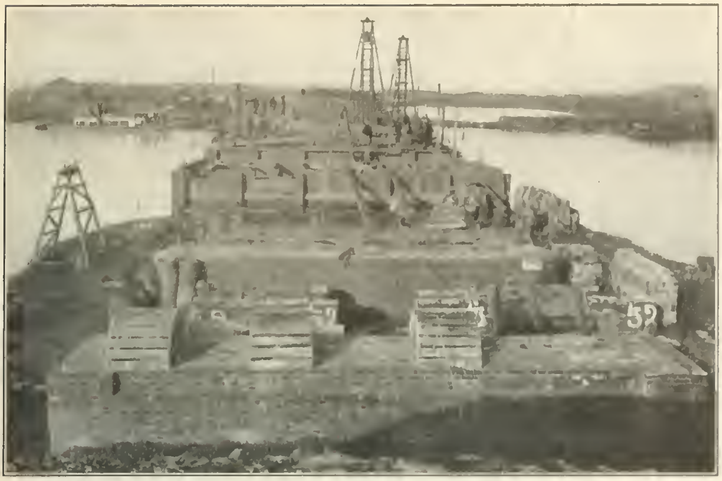
Small Bridge Near Soochow.

agreements were made some years ago by British capital and British engineers to build this line, and four others, the Tien-tsin-Yang-tsze, the Lin-Kwai-Quan-Sinyang, the Su-chan Hang-chau-Ningpo, and the Canton-Hongkong lines. It was not, however, till 1903 that a definite agreement was signed enabling the Shanghai-Nanking line to be started. Its total length is about 200 miles, of which 150 miles from the Shanghai end has been opened for traffic, while the remainder is expected to be finished in July or August next.

The route follows, as much as possible, the natural and artificial waterways, these and their tributaries forming valuable feeders to the railroad. Starting from Shanghai, the line follows the bank of



The Shanghai-Nanking Railroad and Its Connections.



Quinsan Viaduct; Shanghai-Nanking Railroad.

the Su-chan creek, and then that of the Grand canal, up to the important town of Chinkiang on the Yangtse-Kiang river. Following the south bank of this, one of the great rivers of China, Nanking is reached. The line stops here, leaving the river unbridged, the Pookoo terminus of the projected Tien-tsin line being at the opposite shore. The river is not only deep and wide at this point, but its bed is very unsuitable for bridge foundations unless expensive work is done. This important break in the connection between Shanghai and Ningpo and the capital Pekin will have to be dealt with by means of a steam ferry.

The location of the Shanghai-Nanking line, crossing so many waterways with a headway sufficient for sailing junks has entailed a great deal of expenditure on bridge work. On the 57 miles between Shanghai and Su-chan where the canal is reached, there are 111 bridges, and 60 between there and Wusich, which is only 28 miles further, while the Grand Canal is to be crossed by a bridge of three 60-ft. girders near Chinkiang. The country is easy for construction to Wusich, where it becomes undulating, and after Chinkiang is passed, it is fairly mountainous. The only tunnel, which is 435 yards long, is on this portion, and from thence to Nanking

Building a Cofferdam; Shanghai-Nanking Railroad.

Bridging the Grand Canal.

the works are fairly heavy, there being many high fills and deep cuts in the Yangtsze valley. The rails, 851 lbs. to the yard on Jarrah (Australian) ties, are laid for a single track, though the fills and bridges from Shanghai to Su-chan have been built for double track, the road being a first class one, designed for high speeds and heavy freight, while the steepest grade is only 0.66 per cent. The gage is 4 ft. 8½ in.

The passenger locomotives have been supplied by Messrs. Robert Stephenson & Co., of Newcastle-on-Tyne, England, and the freight locomotives by the North British Locomotive Co. The rest of the rolling stock was built by the Metropolitan Amalgamated Railway Carriage & Wagon Co.

The Shanghai-Woosung Railroad, to whose tumultuous infancy we have already alluded, has been absorbed and partly rebuilt by the Shanghai-Nanking branch of the Imperial Railways, and at Woosung completely equipped railroad shops have been erected for the manufacture of rolling stock and for locomotive repairs. These shops are driven and lighted by electricity. The estimate for the line, including the cost of land, is $38,400 per mile. The district is one of the most populous in China, particularly between Shanghai and Su-chan, so that it is expected that this portion of the line will be double-tracked at an early date. The provinces of the Yangtsze valley are the chief centers of the tea, cotton and silk industries, and are the richest and most productive in China, being thickly peopled by a wealthy and industrious population. The length of time occupied by passengers in traveling from Shanghai up to Nanking by steamer is about 28 hours, while that by rail will be reduced to eight hours, and the time in conveyance of freight will be reduced in a still greater degree. Deep water wharfage exists, and is capable of extension, at Woosung, and there are a number of projected railroads with which the new line will be ultimately connected, leading to Pekin on the north, and Hankow, Canton and Ningpo on the west and south. The railroad will be operated by a board of five commissioners, of whom three, including the engineer in chief, will be British, and the remaining two, Chinese. The consulting engineers to the railroad are Sir John Wolfe Barry and Arthur J. Barry, London.

A Compact Train Sheet for a Heavy Division.*

On the Northern Pacific the card system has been applied to the despatchers' train sheet. The large and often cumbersome sheet on which the records of train movements are kept has been abandoned and the despatcher's table is equipped with fixtures which admit of the use of the card system in its place. In the center of the desk there is, in permanent form, a column showing the names of the stations, with such other information as usually appears on the central column of the train sheet. On either side of the center, corresponding with the columns for train records, are grooves or slots into which slide the cards, each one to contain the record of a train. These cards are 18 in. long and 1¼ in. wide, and are arranged to contain all information concerning the train, such as delays, tonnage, etc. They fit securely into the spaces and are held so that each line on the card is opposite the name of the station to which it corresponds. Thus it answers exactly the purpose of the printed sheet. When the train completes its run the card containing its record is removed and filed away and the space may be used for another.

The advantages of the card system over the train sheet are many. The despatcher has no records before him except those of trains actually on the road. He may have all trains as near as possible to the central column instead of at a remote corner of the sheet. He is relieved of the inconvenience of handling two sheets at one time, a condition which always exists for several hours after midnight and sometimes continues until noon. The superintendent or other person wishing to examine the records of trains which have passed over the road, can get them from the file without interfering with the despatcher or his work.

Serious results have happened from a despatcher connecting a time with the wrong station on account of its being so far away from the station column. They have been known, also, to overlook a train still on the road, because of the many represented on the sheet with only here and there one still in existence. With the card system all are on the road and all near the center of the table. There is, in fact, a list of the stations printed on each of the slips, so that separation of station and time is impossible.

Car Surpluses and Shortages, April 29.

The Committee on Car Efficiency of the American Railway Association, Arthur Hale, Chairman, has issued Bulletin No. 21-B, giving a summary of surpluses and shortages of freight cars by groups from October 30 to April 29. The total of surplus cars reaches 413,605 in this report, being an increase of 37,835 cars over the report for April 15. The largest increase is in coal cars, although there is a marked increase in box, and slight increases in flat and miscellaneous cars. The box car surplus, however, is still 1,693 cars below the maximum for this class, which was reached on January 8. The increase is heaviest in Group 2 (Eastern), although Groups 3 (Middle), 5 (Southern) and 6 (Northwestern), also report quite large increases. The increases are slight in Groups 8 (Middle Western), 10 (Pacific) and 11 (Canadian), while Groups 1 (New England), 4 (North Atlantic) and 9 (Southwestern), show some improvement, the greatest gain appearing in the New England Group, which reports fewer idle cars than at any time since March 1.

The summary for 159 roads is shown in the double column table.

SURPLUSES AND SHORTAGES BI-WEEKLY, FROM OCTOBER 30, 1907, TO APRIL 29, 1908, INCLUSIVE.

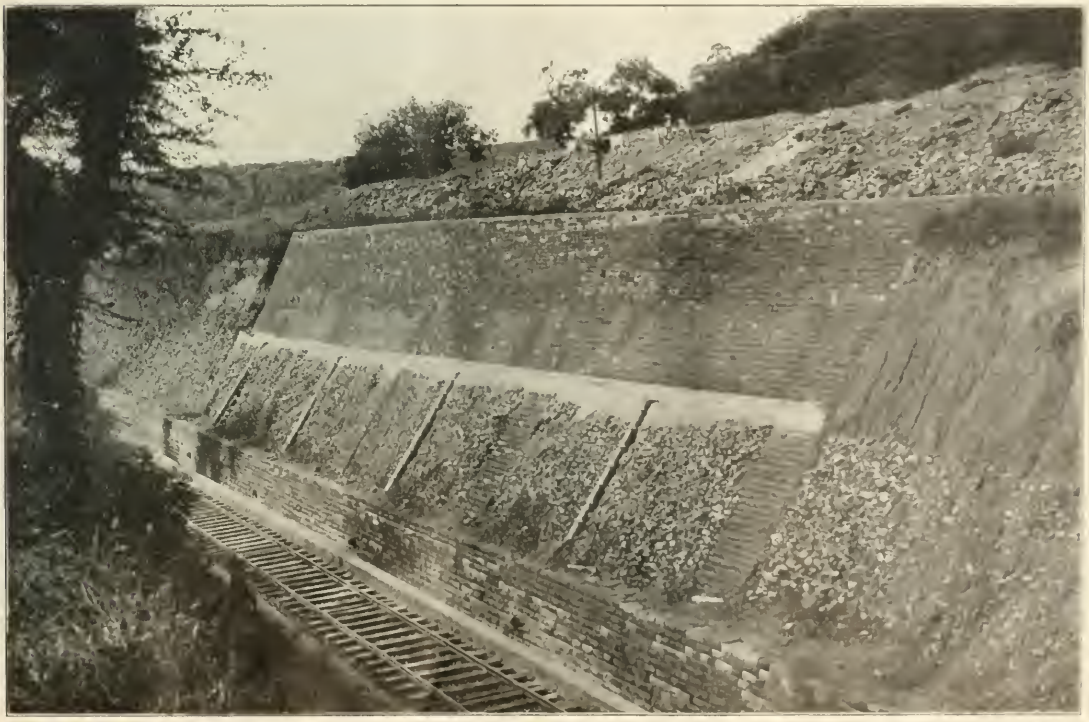
Protecting Wet Cuts in India.

The drainage and masonry protection of cuts through water-bearing ground is carried out on a much more enduring and expensive scale in Europe and some European possessions than in the United States. The photographs show the summit cut in the Durrah hills on the Nagda-Muttra State Railway, India. The maximum depth of the cut is 38 ft. It is through boulder-clay or treacherous yellow clay, mingled with black bottom soil. When it was first excavated, water ran through it for some months in a stream, owing to percolation from the neighboring hills, and a man would sink up to his waist in the slushy soil. Continuous drains 3 ft. x 3 ft., a mile long, have been made through the whole cut, with a ballast wall on one side and a massive revetment wall of dry stone on the other side. Both the revetment walls and ballast walls are amply provided with weep-holes, and are founded on a bed of concrete.

Between the ballast walls there is a deep layer of dry stone

Retaining Walls and Road Bed.



Revetment Wall and Drains in Durrah Hill Cut; Nagda-Muttra State Railway.

below the ballast. Where the soil is most treacherous, a concrete drain has been built half-way up the slope to interrupt the rainfall. Above the drain the soil is revetted with dry stone up to the top of the slope. Below the drain are dry stone counterforts and earthenware pipes carrying the rainfall into the solid masonry drains at foundation level.

We are indebted to *Indian Engineering* for the photographs and the details mentioned.

Transportation on the Great Lakes.*

BY WALTER THAYER,
Eastern Manager, Erie & Western Transportation Company, Philadelphia.

The prominence of the Panama Canal in the affairs of the nation has naturally resulted in greater interest in transportation by inland waterways. This is especially noticeable in the wider interest now being taken in our greatest waterways, the Northern Lakes, and in the conditions under which freight is handled on them.

Although the Great Lakes were originally individually navigable for boats of considerable size, the rapids at Sault Ste. Marie, and the narrow and shallow stretches of water connecting Lake Erie with Lake Huron, and Lake Huron with Lake Superior, through which the greatest volume of tonnage must pass, presented many obstacles to the passage of vessels. An increasing traffic transported, and a consequent decreasing cost of transportation, have accompanied the clearing of these impediments to navigation. The principal natural obstacles have been, and still are, the shallow water over the Lime Kiln Crossing, just south of Detroit, over the St. Clair flats not far above the same place, at the Straits of Mackinac, and, most important of all, the Sault Ste. Marie Rapids at the entrance to Lake Superior. The deepening by the United States Government of the first three stretches, and the building by the United States and Canada of the largest locks in the world at Sault Ste. Marie, where there is a total fall of about eighteen feet in three-quarters of a mile, now permit the passage of practically all the immense tonnage to and from Lake Superior. These improvements have perhaps yielded greater returns to this country than many times the same amount invested in any other character of public improvements.

The aim of this paper is to describe in a general way the origin, character and method of handling the tonnage of the Great Lakes.

TRAFFIC AND VESSEL TONNAGE ON THE GREAT LAKES.

Contrary to the general understanding this traffic consists of relatively few commodities, most of which are products of the mines, the forests and the grain fields, surrounding or lying beyond the Great Lakes. Iron ore and coal constitute the bulk of the tonnage.

The tonnage of ships and traffic passing the locks at Sault Ste. Marie gives the clearest index of the business handled on the lakes, though these figures do not include the tonnage passing between Lake Michigan and the East. Over one-third of the tonnage of ships under the American flag and half the steamers of 1,000 tons and upwards are on the Great Lakes, and last year the total tonnage of freight east and westbound passing over the Lime Kiln Crossing below Detroit, which would include the business of both Lake Michigan and Lake Superior to and from Lake Erie, amounted to over 70,000,000 tons in a season of 230 days. Over 25,000 vessels passed Detroit, an average of one ship every thirteen minutes, and 200 tons of freight per minute for the season. These figures exceed those of any navigable stream in the world. The records taken at the Sault Ste. Marie locks, indicate in a general way the character of this tonnage and the relative importance of the commodities of which it is composed. Last year the total freight through the Soo amounted to 51,751,080 tons, carried in 22,155 boats. It was valued at $540,000,000, and was divided in the proportion about 80 per cent. eastbound and about 20 per cent. westbound. The principal eastbound business was:

Iron ore, 35,357,042 tons; wheat, 84,271,358 bushels; other grain, 54,341,155 bushels; flour, 6,495,350 barrels; copper, 107,633 tons.

Westbound:

Bituminous coal, 7,728,255 tons; anthracite coal, 1,011,275 tons; general merchandise, not comparatively heavy, but of relatively large value.

The larger part of the total is iron ore and coal, and the eastbound movement overshadows the westbound in tonnage, and also in what is known as "bulk" freight; *i. e.*, ore, coal and grain as distinguished from package freight or general merchandise. The relation between the tonnage of the several classes of freight does not correspond with the ratios of the values. In 1905 it was estimated that of the total value of traffic through the Soo during that year, the value of the iron ore and products of iron represented 27 per cent.; cereals, 28 per cent.; copper, 7 per cent.; coal, both anthracite and bituminous, 5 per cent.; lumber, 4 per cent., and all other products, 28 per cent.

*Reprinted by permission, from a paper in the *Annals of the American Academy of Political and Social Science*.

The total number of vessels on the Great Lakes early in 1907, with their gross registered tonnage, was as follows:

	No.	Gross tonnage
Sailing vessels	519	299,136
Steam vessels	1,844	1,811,438
Canal boats	480	90,599
Barges	209	73,259
Total	3,052	2,274,432

Deducting the canal boats, the number of vessels actually engaged in lake traffic was 2,572, and the gross tonnage 2,183,833. The percentage of sailing vessels is decreasing year by year, most of those now running are on Lake Michigan. In 1895 sailing vessels carried 30 per cent. of the tonnage passing the Soo, in 1905 only 15 per cent. The craft on the lakes now range from the old boats of small size to the modern ore carriers made of steel, the latest of which are 605 feet over all, with sixty-foot beam, a depth of thirty-two feet, and a capacity of 13,000 tons. The barges referred to above are generally towed by steamers of the same line.

IRON ORE TRAFFIC.

The principal iron mining ranges are the Mesaba, Vermilion, Gogebic, Marquette and Menominee ranges, located in the territory adjacent to the western end of Lake Superior and in the upper peninsula of Michigan. The principal ore docks are located at Duluth, Superior, Two Harbors, Escanaba and Marquette. The mines, as a rule, are located from ten to sixty miles back from the water, and the ore is hauled in specially constructed cars to the docks. These docks are so constructed that the cars from the mines are run out on them. The hoppers in the bottom of the cars are let down, and ore is discharged by gravity into pockets from the bottom of which iron chutes lead to the vessel lying alongside the dock. Through the hatches of the vessel the ore is chuted by gravity into the hold at as many points as there are hatches. In this way very little manual labor is necessary. A cargo of 9,277 tons of ore has been loaded into the steamer "E. J. Earling" at Mesaba Dock No. 4, at Duluth, in seventy minutes or on an average of 7,288 tons per hour.

Just here we have the keynote of the transportation service on the lakes, which is to secure for each vessel the least possible delay at port of loading or of discharge and consequently the greatest number of round trips possible in a season. The average number of trips that a modern vessel is able to make from the head of Lake Superior to Lake Erie is usually estimated at twenty per season, although with good dispatch at terminals some boats may make twenty-five, and even more. Every additional trip in a season reduces the average cost of transportation, and the entire carrying trade is ever pressing to reduce delay, whether at terminals or en route. To the genius displayed in devising plans to accomplish this result is due in no small degree the record the lakes have made in affording the cheapest transportation in the world.

Based on records at the Soo, in 1905, the average distance that freight was carried was 833.3 miles. The average cost was .85 mill per ton per mile, as against an estimated average cost for rail handling of about four mills per ton per mile. Ingenuity in effecting dispatch of boats made it possible for the steamer "W. E. Corey" to make thirty trips between Duluth and Lake Erie ports during the season of 1906, and in that time to carry the enormous total of 302,000 tons of iron ore.

The chief iron ore ranges, and to a large extent the vessels engaged in this trade, are owned by the larger iron and steel companies of the United States. The United States Steel Corporation, through the Pittsburg Steamship Company, owns the largest fleet on the lakes, 101 vessels with an aggregate tonnage of 368,165 tons gross register, or about 16 per cent cent. of the total gross tonnage on the lakes. Next to them is the Gilchrist Transportation Company, with sixty-two vessels of 190,890 tons gross register; the latter, however, is not allied directly with the iron and steel interests. The chief steel companies, in addition to the United States Steel Corporation, now having ships on the lakes to carry their ore are the Lackawanna Steel Company, the Jones and Laughlin Steel Company, the Cambria Steel Company, the Tonawanda Iron and Steel Company.

The largest steamer on the lakes is the "Wm. B. Kerr," having a capacity of 14,000 tons of iron ore. She is the first of three sister boats, and there are others capable of handling from ten to twelve thousand tons.

The record cargo of ore is held by the steamer "Henry H. Rogers" from Escanaba to South Chicago, 13,333 tons, and over and over again this year greater cargoes of freight have been carried down the lakes than have ever gone out of the harbor of New York. The depth of water in New York harbor does not permit the largest ocean steamers to load to their full capacity, and the largest vessels are the fast passenger ships that carry but little freight.

The rate at which ore is carried on the lakes is practically fixed by the Pittsburg Steamship Company, owned by the United States Steel Corporation, which decides what rates these boats will carry for, and the price they will give others to carry the balance of the ore used by them. In 1907 it was 75 cents per ton from the head of Lake Superior to the ore dock on Lake Erie, and from Marquette 70 cents per ton; while from Escanaba to Lake Erie ports the charge was 60 cents per ton, and from Escanaba to Chicago, a haul entirely in Lake Michigan, only 35 cents per ton.

In 1906 the charge for unloading iron ore was 20 cents per ton, while vessels that required trimming in order to adjust their cargo, paid about 3 cents per ton for that service. A cargo of ore loaded in a modern ore carrier, however, does not require to be trimmed.

The docks for the discharge of ore, unless such ore is for some iron industry located directly on one of the lakes, are generally owned and operated by the railroads leading south and east from Lake Erie to the furnaces of Pittsburg and the Mahoning and Shenango Valleys, a distance of approximately 75 to 150 miles, or even farther, to the furnaces in Eastern Pennsylvania, where the ore is converted into iron and steel by the use of limestone and coke. Were it not for the necessity of using these articles in the manufacture of iron, and for the fact that iron ore, on account of the cheapness of lake transportation, is more economically brought to the coke, rather than the coke to the ore, the center of these industries might be in the neighborhood of Duluth rather than at Pittsburg; and the tonnage handled on the lakes might be comparatively insignificant.

The docks are located at Ashtabula, Cleveland, Conneaut, Buffalo, Lorain, Erie, Toledo, etc., all on the south shore of Lake Erie, and handle about 86 per cent. of all the iron ore carried on the lakes. The above points rank in importance about in the order named, the largest number of tons handled in 1906 being at Ashtabula, with a total of 6,833,852 tons. The amount of ore received at Lake Erie ports was, in 1906, 32,076,757 tons, as compared with only 17,014,076 tons in 1901, a fact which furnishes a clear idea of the increase in the iron ore trade during the past few years. The difference between the total output and the receipts at Lake Erie ports is understood to be in the ore for furnaces at Detroit and South Chicago. Practically the entire success of a dock for receiving ore from a vessel, like a dock for loading vessels, depends on the ability to unload quickly and cheaply, and place in cars the tonnage that is daily brought alongside the docks by the gigantic ore carriers so constructed as to permit the hoisting and dumping by the most modern appliances, both electric and otherwise, of the greatest number of tons per hour in order to accomplish the quickest possible release of the vessel and effect the maximum saving in the cost of operation.

The efficiency of the machinery for unloading is shown by the record of the "George W. Perkins," 10,346 tons having been taken off in four hours and ten minutes, or at an average rate of 2,582 tons per hour. Moreover, this record is being approximated in the unloading of all similar boats, and it is the ambition of the managers of every dock to hold the unloading record. The records are being lowered year by year, and often more than once in a season.

GRAIN TRAFFIC.

Next in importance to the management of the ore traffic is the handling of grain. This trade is participated in by all kinds and sizes of vessels, and consequently there is more fluctuation in grain rates than in those for any other commodity. Grain originates beyond the western lake ports and is brought there by rail and placed in elevators. From the elevators it is shipped by vessel, generally to the ports of Lake Erie, the cost by lake being less than by rail. At the western lake ports elevators in connection with and often owned by the prominent eastern rail lines, receive the grain, and in due course load it into cars for export via eastern seaboard cities or for transportation to interior points. The rates per bushel for carrying grain depend absolutely on the number of boats available for the trade. Charters for the season, such as are made for ore in large quantities, are not characteristic of the grain-carrying trade. When grain is wanted for any particular vessel the rate depends on the supply of or demand for vessels; or, in other words, upon what happens to be the immediate condition or the number of boats available at the time, or upon the desire of the shipper for immediate forwarding. The rate thus made per bushel for forwarding say, to Buffalo, is known as the "going rate," and is a matter of public information on the various boards of trade at the points of shipment and remains the standard until altered by a change in the conditions above mentioned. The average rate on wheat from Chicago to Buffalo was 1.7 cents per bushel in 1906, and from Duluth to Buffalo 2.2 cents per bushel. Grain is the only commodity that is occasionally handled by what are known as the package freight lines, which are engaged in through traffic in connection with railroad lines. The boats of these package freight lines as a rule take grain only when it is necessary or expedient to fill out their freight capacity. At such times they bid for grain in competition with the bulk carriers, none of it handled by the package lines, however, is taken on through rates to interior eastern points, but only to eastern lake port elevators, from which the grain is reforwarded to ultimate destination.

In loading grain from the elevators it is spouted into the holds of the vessels through the hatches, and unloaded by placing an elevator "leg" through the hatches into the vessel. This so-called leg is a contrivance on which is arranged an endless chain of buckets which scoop the grain out of the boat, carrying it up and into the elevator.

The largest grain cargo in number of bushels carried but not in tons, was 417,300 bushels of oats brought into Buffalo by the "Mary C. Elphicke."

The rates on which grain is carried by railroad from the eastern port elevator, if it goes to points east, are known as "At the East rates." This being a term used to indicate that the rate includes the cost of elevation from the vessel at eastern lake port and subsequent loading to cars, which service the ordinary rail rate would not include.

LUMBER.

Lumber is the other item of eastbound bulk freight on the lakes. The largest individual, although small, fleet in this trade is that of the Hines Lumber Company of Chicago. The rates this year have averaged, from Lake Superior to Lake Erie ports $2.25 per thousand feet, and from Lake Michigan to Lake Erie ports $2 per thousand feet. These rates are made by an association, with which practically all the lumber carriers are identified. The trade, however, seems to be falling off.

WESTBOUND COAL TONNAGE.

Coal is practically the only article handled in bulk westbound. This business is peculiar in its method of handling, for coal is the only westbound cargo available for ore carriers, and were it not for coal these ore carriers would go light westbound, as they often do, in order that they may secure as many loads of ore as possible in a season. The result of this is that coal is taken west at rates that would otherwise be impossible. It is hard to estimate the value of this to the people of the Northwest, to whom the coal is a necessity. Coal is handled in and out of the ship without charge to the vessel, and last year the hard coal rate averaged, from Buffalo to Chicago 46 cents and to Duluth 35 cents per ton. Soft coal averaged from Ohio ports to Chicago 46 cents and to Duluth 35 cents per ton. As practically all the ore boats are bound to Lake Superior the rates thence are lowest. Many of the big eastern coal companies have their own facilities and arrangements for handling coal at western lake ports.

PACKAGE FREIGHT SERVICE.

We may now consider the relation of the package freight lines to the traffic of the lakes. These lines are engaged in carrying all kinds of merchandise in such packages and of such size as can be transferred from cars to boats. Practically all passenger steamers on the lakes also carry package freight, although all package freight lines do not carry passengers, and in fact the big package lines, in operation between eastern and western lake ports, with perhaps few exceptions, do not carry any passengers, being made up exclusively of package freight boats. The most modern of these carry about 5,000 tons, and, as a rule, all of this is loaded between decks or in the hold reached through openings in the decks, the freight being handled in and out through gangways in the sides of the boat and up and down gangplanks from and to the docks.

There are several package freight lines, but they may be divided into two large classes:

First.—Those that make short runs between nearby ports or ports on the same lake, or are engaged in carrying freight, generally not of considerable volume, for local delivery at the ports at which they call.

Second.—Those lines that have through rates and prorating arrangements with the larger eastern and western rail lines, with which they connect.

The lines in the first class, on account of the generally local aspect of their service and of the fact that they are not usually a link in a through transportation service, may be passed over without discussion, in order that fuller consideration may be given to the other and more important class of package freight lines.

Although the business carried between ports on the Great Lakes by these lines is considerable in quantity and value, their chief traffic is that turned over to them as intermediate carriers between the rail lines leading east to the western lake ports of Chicago, Milwaukee, Gladstone and Duluth, etc., and west to the eastern lake ports of Buffalo, Erie, Cleveland, Detroit, Port Huron, etc.—this business to be again turned over by the lake lines to rail connections at the end of their route. To illustrate by a concrete example: business for rail and lake shipment may be taken in New York by the Pennsylvania Railroad to Erie and delivered to its lake connection, the Erie and Western Transportation Company, which takes the freight by water to Duluth or Chicago, as the case may be, and again turns it over to connecting rail lines to be delivered by them to consignees at St. Paul or Minneapolis. The same service may be performed in the other direction from Minneapolis, for example, to New York.

As these lines all have their rail connections, they may in turn be subdivided into two classes, according to the efficiency of their service. Some of them have direct routes, east of the lakes, for example, to and from New York, in connection with the big trunk line roads, such as the Pennsylvania Railroad and the New York

Central, while others are dependent on a short water haul, like the National Despatch, which takes business by water from New York to New London, Conn., and there turns it over to the Central Vermont Railroad, which in turn has a long haul in connection with the Grand Trunk to Depot Harbor, Canada, where it is at last delivered to boats to be carried to Chicago and points beyond. Another route is via canal boat through the Erie Canal from New York to Buffalo (requiring from twelve to fourteen days on the canal), where the freight is turned over to lake lines for forwarding west.

RATES BY THE LAKE LINES.

As a result of the different services thus offered there are three kinds of rates via the lakes: (1) westbound, from New York City, known as standard lake rates; (2) differential lake rates, and (3) canal and lake rates. These three are represented by the following rates in cents per hundred pounds, on the various classes, New York to Chicago:

	1.	2.	3.	4.	5.	6.
Standard Lake	$0.62	$0.54	$0.41	$0.30	$0.25	$0.21
Differential Lake	.52	.46	.35	.26	.22	.19
Canal and Lake	42	.36	.29	.23	.21	.18

It will be seen how complicated must be the adjustment of rates by the various routes, and how greatly the charges must vary in accordance with the services performed, particularly when it is remembered that the service between these points is also performed by all-rail routes, differential rail routes, and by an ocean-and-rail route via Norfolk. These routes in turn have the following rates, first class, in cents per hundred pounds, New York to Chicago: all-rail, 75 cents; differential rail, 69 cents; ocean and rail, 65 cents.

During the season of open navigation a shipper in New York who wishes to forward a hundred-pound case of blankets to Chicago, has, among others, a choice of the following routes, in connection with each of which the charge would be in cents the amount mentioned; all-rail, 75 cents; differential rail, 69 cents; ocean and rail, 65 cents; standard lake, 62 cents; differential lake, 52 cents, and canal and lake, 42 cents.

Prominent among the commodities handled by the package lines, westbound, are sugar and cement. The eastbound business, however, is the heaviest and consists almost exclusively of flour, mill feed and copper, with occasional deck loads of shingles, and now and then grain if the vessels are unable to secure a full load of package freight.

OWNERSHIP AND RAIL CONNECTIONS OF LAKE LINES.

As between the standard and the differential lake lines, much the more important are the standard lake lines operating between Lake Erie and Lake Michigan or Lake Superior ports. These lines are, with the exception of the Soo line, generally owned and operated by the eastern trunk lines, as feeders at their eastern lake ports. The railroad-lake lines are:

	Operated To and From.	Owned by.
Erie & Western Transp. Co.*	Lake Michigan—Lake Superior.	Penn.
†The Western Transit Co.	Lake Michigan—Lake Superior.	N.Y. C. & H. R.
The Union Steamboat Line	Lake Michigan	Erie.
Mutual Transit Co.	Lake Superior	Lehigh Valley. D., L. & W. Erie. N. Y. C. & H. R.
Lackawanna Transptat'n Co.	Lake Michigan	D., L. & W.
Lehigh Valley Transp. Co.	Lake Michigan	Lehigh Valley.
Minneapolis, St Paul & Buffalo Steamship Co. (Soo Line)	Lake Michigan	Minn., St. Paul & Sault Ste. Marie.

*Anchor Line.
†The Rutland Transit Company, owned by the Rutland Railroad, runs from Ogdensburg, N. Y., to Chicago.—EDITOR.

None of these, except the Anchor Line, operates passenger steamers. Like the bulk freighters, every effort is made to accomplish as many trips in a season as possible, and the boats are consequently, with the exception of the passenger boats during the passenger season, not operated on any schedule, but are turned as rapidly as possible. To accomplish this large warehouses are maintained at eastern lake ports by these lines, in order that the cargoes of eastbound vessels may be immediately unloaded for subsequent shipment east. These warehouses are equipped with various devices to secure the greatest possible dispatch in the loading and unloading of boats, and in many cases separate houses are devoted to the east and westbound business. At the western lake ports the facilities for through business are provided by the delivering rail lines at whose terminals the package freight lines call for or deliver business routed in their care.

On account of the slower speed of handling and of the increased number of transfers incident to business shipped by rail and lake, as compared with all rail, the rates are lower via the lakes than via the all-rail routes. The present difference is illustrated by the 17½-cent rate per hundred pounds on flour from Chicago to New York, via lake and rail as compared with 19½ cents per hundred pounds all rail, and by the westbound rate of 23½ cents per hundred pounds, New York to Chicago, on sugar via rail and lake, as compared with 26 cents per hundred pounds all-rail. The difference between these figures, in each case, is known as a differential. It represents the amount under the all-rail rate charged by the standard lines, which experience and long custom has established as being considered the difference between the value of the two kinds of service. The retail prices of granulated sugar and flour, per hundred pounds, being $5.50 and $3.50 respectively, it will be seen what a comparatively small part the cost of transportation must play in the price of such commodities to the consumer.

It is difficult to explain the various rates in existence over the several routes between the East and West; but it should be noted that the service via the lakes requires a transfer, where none is necessary when shipments are all-rail, and that there has grown up a fixed relation between the rates all-rail and the rates rail and lake, based on relative speeds, and that when reductions or advances are made in all-rail rates, consequent reductions or advances follow in the rates rail and lake, either eastbound or westbound. These principles of adjustment are further carried out in changes in rates by the differential rail-and-lake lines, and the canal lines.

The various standard lake lines were primarily considered as feeders for their rail connections, and in order that other railroads not equipped with lake lines may not reap the advantage of the tonnage thus provided, through prorating arrangements have been made only between the lake lines and their rail owners, or such other railroads as the owners of the lake line think it profitable to connect with.

SUMMARY—IMPORTANCE OF SERVICE OF PACKAGE FREIGHT LINES.

The foregoing discussion shows that by far the largest part of the tonnage of the lakes consists of ore, coal, grain, etc., handled in bulk by vessels ready to go from port to port for the highest compensation they can secure for their services. On account of the great quantities handled, and the ease with which it is loaded and unloaded, and also on account of the fact that the government has provided a free way and free harbors, the rates for transportation on the lakes are so low as to make unfair a comparison of those rates with average charges per ton per mile via rail lines.

The bulk freight handled on the Great Lakes consists almost exclusively of raw materials which can be moved at such low rates as to exclude competition by all-rail routes. With the package freight business the situation is different and there is active rivalry between the rail and water lines. The charges for package freight made by rail and water lines must be approximately equal because the difference in costs of the services by competing routes is relatively small.

Although the tonnage of package freight handled on the Great Lakes is small as compared with the volume of bulk traffic, the service performed by the package freight steamers is highly important. The package freight lake lines assist their rail connections by adding to the volume and regularity of their traffic, and afford the shipping public the choice between various routes. The shorter and more expensive routes provide a quicker service; the more circuitous, and to the shipper the less expensive routes, a slower service.

There is a business demand for both of these services. The package freight lines on the lakes perform a function of value to the carriers and to the public, and occupy an important place in the elaborate and delicately adjusted system of transportation that has grown up in the highly developed industrial section of the United States lying between the Mississippi River and the north Atlantic seaboard.

Foreign Railroad Notes.

The International Sleeping Car Co. made a profit of about $1,700,000 in 1907 from its cars, and about $240,000 from its hotels and restaurants, which are at winter resorts.

The head of the administration of the Hungarian State Railroads, who has 5,990 state employees under him, besides a small army of laborers, enjoys a salary of $3,000 a year. (To be exact, $3,034.50.) Among these employees are 193 "chief engineers" at $1,000 a year. The salary of the lowest grade of official is $320 a year.

An "abnormal physiological condition," according to Under Secretary of State Dari, is what caused a switchman to neglect to set a signal, for lack of which a serious collision occurred near Milan. A member of Parliament suggested that the abnormality of the switchman's condition was due to the propinquity of a drinking saloon.

To increase the capacity of the Giovi tunnel, which penetrates the Ligurian Appenines a few miles north of Genoa, it was determined to operate the line electrically from Ponte Decimo to Busalla. The more important electrical companies of the world were asked to compete for the installation, and the contract was let to the Westinghouse company, which will establish its power house at Vado, on the sea, about 30 miles southwest of Genoa.

GENERAL NEWS SECTION

NOTES.

The Richmond, Fredericksburg & Potomac has asked the Virginia State Corporation Commission to authorize the collection of an increased fare from passengers who needlessly board trains without having bought tickets.

At Austin, Texas, April 30, the Galveston, Harrisburg & San Antonio and the Texas & New Orleans were fined $200 each for disobedience of the law forbidding passenger trains to wait at junctions more than 30 minutes for connecting trains.

The passenger steamships "Yale" and "Harvard," of the Metropolitan Steamship Line, have resumed their direct trips between New York and Boston by the "Outside Line" around Cape Cod. These steamers last summer made the trip in 15 hours.

The Interstate Commerce Commission, in a report to the Senate, recommends that express companies be prohibited from buying and selling, on their own account, commodities transported by express. The order and commission business done by the express companies is approved, including that feature under which express agents find a market for perishable goods.

At Castle Rock, Colo., May 7, train robbers shot and killed Express Messenger Charles Wright on train No. 4 of the Denver & Rio Grande, and the robbers appear to have escaped before their work was discovered. They secured but little money, being unable to open the larger safe. On May 12 robbers disguised as brakemen overpowered the express messenger on a train of the Great Northern Railway, near Seattle, Wash., and robbed the safe of several thousand dollars.

In the United States District Court at Chicago, May 6, fines of $13,150 were imposed in 95 cases against six railroad companies, charging violation of the 28-hour law for the transportation of cattle. The roads fined were the Chicago, Rock Island & Pacific, 45 cases, fined $6,550; Chicago & North-Western, 26 cases, $3,600; Illinois Central, 9 cases, $1,100; Chicago, Milwaukee & St. Paul, 7 cases, $950; Atchison, Topeka & Santa Fe, 6 cases, $750, and the Chicago, Burlington & Quincy, 2 cases, $200.

It is announced that the Seaboard Air Line will, on June 1, reduce local passenger fares between Jacksonville, Fla., and River Junction, from 3 cents a mile to 2¾ cents. The fare from Jacksonville to Tampa will be reduced from $6.30 to $5.80; from Jacksonville to Tallahassee from $4.95 to $4.55. The company will also sell mileage books, 1,000 miles, at $20, good for the original purchaser; 2,000 miles, good for the purchaser, and four partners or employees, at $40, the ticket to be used by only one person at one time, and a 500-mile family book, good within the state of Florida, at $11.25.

The Arbitrary Depreciation Charge.

It has always been the understanding of railroad officials and has been the accepted practice on the best operated railroads, that operating expenses should show expenditures actually made. To put expenditures into operating expenses which have not been actually made, has been regarded as "padding" accounts. To make a charge for depreciation every month on a purely arbitrary basis, when the money thus charged is not actually spent in replacement, is obviously charging against operating expenses something for which no expenditure has been made. If it is advisable to make a charge for depreciation regardless of the fact that there is, in all probability, a counter credit greatly outweighing it, then that charge should be a charge against income account, to be offset by appropriations from income account when the money is taken from income for renewals or replacement.—*F. A. Delano, in the Wall Street Journal.*

Individual Car Owners' Association.

The Executive Committee of this association held a meeting at Chicago last week and instructed the President and Secretary to attend the meeting of the Master Car Builders' Association at Atlantic City, June 17, and that of the Car Accounting Officers at Niagara Falls, June 23, for the purpose of presenting the wishes of the individual car owners in regard to certain proposed improvements in service. Five resolutions were passed, as follows: First, to request the car accountants to have junction cards sent more promptly to private car owners, and to have train records of such cars sent to owners when asked for; second, to request the car accountants to put private cars on a more equitable basis in relation to their earning capacity. From October 1 the private car owners want 1 cent a mile for their cars. (The usual rate at present is 7½ mills a mile.) Third, that the members of the association should bring claims against and collect from railroads for misuse of their cars; fourth, that private cars ought to be loaded home by their proper route, and the accounting officers are requested to prevent diversion; fifth, the proposed adoption of distinctive marks to be put on private cars (for the purpose of reporting) under the auspices of the Car Accounting Officers' Association is approved, provided each owner is satisfied with the letter or letters assigned to his cars.

Railroad Earnings and Expenses in March.

The railroads shown in the two following tables, together with most of the railroads in the United States, show decreased gross earnings in March, 1908, from the corresponding month last year. The roads in the first table show a decrease in operating expenses proportionately larger than the decrease in gross. The roads in the second table show only as great a proportionate decrease in operating expenses, or a less proportionate decrease in operating expenses than the decrease in gross earnings.

TABLE I.

			Decrease	
National Railroad of Mexico:	March, 1908	March, 1907	Amount.	Per cent.
Gross earnings	$1,345,031	$1,407,974	$62,943	4
Operating expenses	823,547	914,181	90,634	10
Union Pacific:				
Gross earnings	5,345,264	6,200,050	854,786	14
Operating expenses	2,948,462	3,600,797	652,335	18
Norfolk & Western:				
Gross earnings	2,059,373	2,777,455	718,082	26
Operating expenses	1,253,900	1,773,759	519,859	29
Nashville, Chatt & St Louis:				
Gross earnings	924,825	1,139,918	215,093	19
Operating expenses	704,694	909,014	204,320	22
Chesapeake & Ohio:				
Gross earnings	1,946,931	2,250,703	303,772	13
Operating expenses	1,274,156	1,526,866	252,710	16
Philadelphia & Reading:				
Gross earnings	3,068,634	3,701,401	632,767	17
Operating expenses	1,949,226	2,367,654	418,428	18

TABLE II.

			Decrease	
Lehigh Valley:	March, 1908	March, 1907	Amount.	Per cent.
Gross earnings	$2,315,894	$2,976,315	$660,421	22
Operating expenses	1,579,142	1,845,059	265,917	14
Louisville & Nashville:				
Gross earnings	3,548,766	4,317,156	768,390	17
Operating expenses	2,579,484	2,946,913	367,429	12
Central of Georgia:				
Gross earnings	961,842	1,147,185	185,343	16
Operating expenses	*719,720	841,421	121,701	14

*Including taxes.

The Delaware & Hudson is an exception to the general rule. Its gross earnings for March, 1908, were $1,512,865, an increase of $58,979 over the same month last year, while its expenses and taxes were $996,083 in March, 1908, an increase of $38,811. Including a $3,021 increase in net earnings from the coal department the company had net earnings of $622,000 in March, 1908, an increase of $95,000 over March, 1907.

Oklahoma and the Rock Island.

It is stated that the threatened suit to break up the alleged merger between the Chicago, Rock Island & Pacific and the St. Louis & San Francisco has been abandoned by Attorney-General West, and the Rock Island has agreed to readjust its rates from Oklahoma on lumber, live stock and milled products.

Steel Spelerized Tubes.

The railroad companies and the manufacturers of tubes have long been desirous of obtaining a steel tube that will take the place of the charcoal iron tube for locomotive work. For a number of years spasmodic attempts have been made to secure a tube of this character that would have the life of the iron one and would not pit in bad waters. The railroads have used such tubes as have been proffered, but, for the most part, have returned to the iron products after a trial of greater or less duration. The report now comes, however, that in a test of the comparative durability of iron and the spelerized tubes, the latter have shown the greater durability of the two as well as the higher physical properties. Further particulars and details of the work that has been done will appear in a future issue.

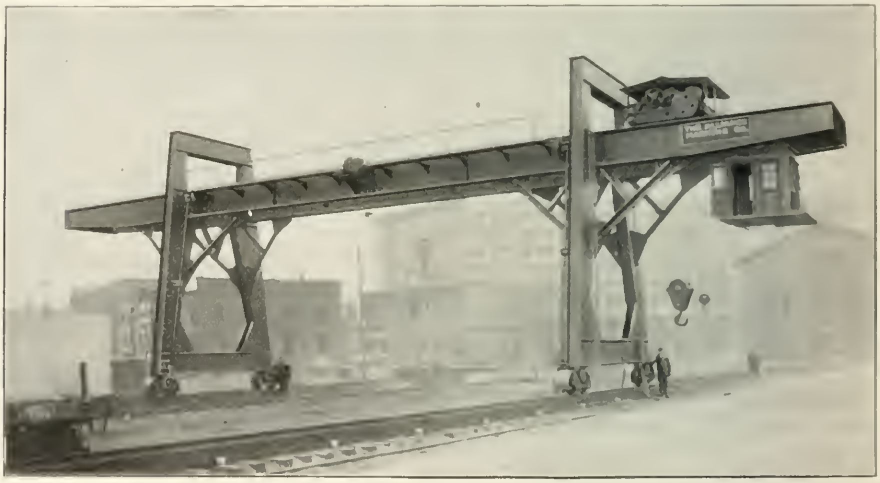
South American Railroad Strikes.

Railroad strikers in South America have had no cause to congratulate themselves on the results of their more recent campaigns in Argentina and Uruguay. The unconditional surrender at the end of January to the Buenos Ayres Great Southern management, over the dispute at the Banfield work shops, was followed last month by the complete failure of the Uruguayan railroad strike. The trouble began with the men staying away from the shops merely out of sympathy with strikers on other railroads. There was no demand for higher wages, shorter hours or improved conditions of service, but the movement threatened to spread and to undermine discipline throughout the system. On this issue the management fought the strikers. Having closed the shops it reopened them again, but not to the ringleaders. Nearly all the old men stood out, but new men to fill their places were gradually obtained, and the indispensable work of the shops was carried out. Finally, the old hands, seeing their places being filled up, about the end of January mustered up sufficient courage to defy the ringleaders, who for some months had been exercising a reign of terror, and asked to be taken back unconditionally. All those for whom vacancies could be found, and on whom the company could reasonably rely for loyal service have been taken back, but they have forfeited their pensions and all other privileges of their past service.

The Alliance Electric Cantilever Gantry Crane.

The accompanying photograph shows a 25-ton electric gantry crane with double cantilever ends, designed and built by The Alliance Machine Company, Alliance, Ohio, for the Lake Shore & Michigan Southern, for use in the freight yards at Toledo, Ohio. Owing to the constantly increasing weights of single pieces of structural material and heavy pieces of machinery, castings, blocks of stone, etc., that railroads are called on to handle, the question of whether a road has, or has not, the proper facilities for quickly unloading these heavy pieces at their destination often determines whether a road gets this freight business or not.

The Alliance crane can unload a car of freight very quickly, and thus tends to relieve congestion in freight yards. When cars and tracks are in great demand and the consignee is not ready to receive his heavy freight, the cars can be unloaded and the contents piled along the tracks until the consignee is ready for it. The entire expense will probably be much less than demurrage charges. This crane should span two tracks between its supporting legs and leave ample room for a wide double wagon roadway between the tracks. These supporting legs should be the shape of the letter A, but with a clear opening between the diagonal members, as shown in the cut, so that the crane operator can pick up a piece of freight from a car on any track, transfer it along the bridge, and, if necessary, through the supporting legs to one of the cantilever ends of the crane and deposit it on the delivery trucks. The cantilever ends should be long enough to reach over one track and one wagon roadway, and the supporting legs of the crane should be designed so that no part thereof projects more than 24 in. beyond the center of runway rails, in order that proper clearance may be maintained between the railroad tracks. Local conditions, of course, may vary the relative location of tracks and wagon roadways. The crane should be supported on not less than eight track wheels mounted on equalizing trucks, so that the crane can accommodate itself to irregularities of the runway tracks. The cranes are built for direct or alternating current.



Alliance Electric Cantilever Gantry Crane.

The crane shown has the following dimensions, etc.:

Lifting capacity—main hoist	25 tons at 12 ft. per min.
Lifting capacity—auxiliary hoist	5 tons at 60 " " "
Speed of trolley	125 " " "
Speed of bridge	250 " " "
Span, center to center of runway rails	55 ft
Length of crane girders, over all	103 "
Distance, under side of crane girders to top track rails	23 "

Prussian Railroad Electrification.

During the past few months various Berlin suburban lines have been electrically operated, in order to provide the State Railway Department with practical working data. These lines are, of course, distinct from Berlin's new privately owned electric railways, such as the High Level & Underground Railway, and are all part of the State system. It is now announced that a beginning is to be made with main line conversion for freight as well as passenger traffic. Two sections are said to have been chosen for experimental purposes —that between Leipzic and Magdeburg, a distance of 80 miles, and Leipzic to Halle, 23 miles in length. It is intended to reduce train length and weight by operating a smaller number of cars per train. The most careful comparisons between the cost of steam and electrical working are to be made in order that the results of conversion may show whether further electrification be commercially practicable and advisable. The sections chosen are admirably suited to this end, owing to the very heavy traffic passing over them, and very valuable data should be forthcoming as the result of electrification.

INTERSTATE COMMERCE COMMISSION RULINGS.

Switching Charges.

Wellington et al. v. St. Louis & San Francisco. Opinion by Commissioner Clements.

Complainants were awarded $84.50 on account of the non-absorption of switching charges at Kansas City, Mo., on shipments of wood.

Special Excursion Rates.

Koch Secret Service v. Louisville & Nashville. Opinion by Commissioner Clements.

Defendant was found guilty of unjust discrimination in refusing a special excursion rate between Nashville, Tenn., and Evansville, Ind., to parties of 10 or more persons, in the employ of complainant, while giving a special rate to parties of 10 or more persons, engaged in other employments, between the same points at the same time. Reparation for $85.50 was awarded.

Charges for Lumber.

Butters Lumber Co. v. Atlantic Coast Line et al. Opinion by Commissioner Clark.

Complainant is entitled to recover from defendants the sum of $51.94, as reparation for unjust charges on certain shipments of lumber from Boardman, N. C., to Pottsville, Pa., and Schuylkill.

Rate on Cattle to Chicago.

Morli v. Chicago, Milwaukee & St. Paul. Opinion by Commissioner Lane.

The carrier's rate of 31 cents per 100 lbs. for the transportation of cattle from Leon, Kan., to Chicago, Ill., was held to be unreasonable to the extent of 2½ cents per 100 lbs., and $38.50 was awarded to complainant.

Rate from Washington, D. C., to Glenndale, Md.

White Water Farms Co. v. Philadelphia, Baltimore & Washington. Opinion by Chairman Knapp.

A rate of 55 cents per ton charged by defendant on gross weight of car and lading for transportation of stable manure from Washington, D. C., to Glenndale, Md., was found unreasonable to the extent it exceeded 40 cents per ton on actual weight of shipment, and $17.54 was awarded to complainant.

Refrigeration Charges on Oranges.

Fain & Stamps v. Atlantic Coast Line and Central of Georgia. Opinion by Commissioner Cockrell.

The parties adjusted the matter without a formal hearing, and consented that the Commission establish a rate for the future and order reparation. Accordingly an order was entered requiring defendants to enforce for two years a refrigeration charge on oranges in carloads from St Petersburg, Fla., to Atlanta, Ga., not to exceed $35 per car. Reparation for $50 was awarded.

Car Shortage.

Wood River Grain Co. v. Union Pacific. Opinion by Commissioner Clements.

Reparation on account of alleged unjust discrimination of defendant in not furnishing complainant with his share of cars for shipment of grain at Wood River, Neb., where competitors at that station were favored with grain cars, was denied, as the testimony disclosed that the time mentioned was during the car-shortage season, and that the business of complainant and his competitors suffered in common during that time.

Correction of Irregularities.

Bannon v. Southern Express Co. Opinion by Commissioner Clark.

The defendant's regulations as to contents of packages of fish from Haines City, Fla., to St. Louis, Mo., shipped under estimated weights have, in the past, been disregarded by the complainant and laxly enforced by the defendant, resulting in charges less than provided in tariff for actual weight shipped. On correction of those irregularities complaint was made that rate was unreasonable and reparation was demanded. The Commission said that the rate is not unreasonable and that where a shipper has in effect received a reduced rate on account of his own and carrier's irregularities, correction of those irregularities cannot be made the basis for an award of reparation. The complaint was dismissed.

TRADE CATALOGUES.

Electric Generators and Motors and Steel Armored Hose.—Bulletin No. 107 of the Sprague Electric Co., New York, describes continuous current, direct driven, type S generators. These are made in standard sizes from 25 k.w. up.

Bulletin No. 310 supercedes No. 301 and describes d.c. motors for operating ventilating fans and blowers. There are two types of these—the round type motors, and type D multipolar motors. The first type is furnished in nine sizes from ¼ h.p. to 7½ h.p., shunt, series or compound wound, designed for 115, 230 or 500 volts. The other type is made in nine sizes, from 10 h.p. to 95 h.p., for standard slow speeds, and from 15 h.p. to 105 h.p. for standard moderate speeds, with the same windings and voltages as the round type. Small exhaust fans and desk and bracket fans are also described.

Bulletin No. 224 describes more fully the type D motors referred to above.

Bulletin No. 507 supercedes No. 505 and is devoted to flexible steel armored hose, which consists of rubber hose covered with a strip of galvanized steel wound spirally and interlocked. This hose is used for steam drills, pneumatic tools, air-brake and train line hose, etc. The bulletin also shows special hose fittings.

Acetylene Lighting and Appliances for Car Heating.—A pamphlet issued by the Gold Car Heating & Lighting Co., New York, describes the Gold improved system of acetylene car lighting. The generator, which may be placed in any convenient part of the car, holds enough carbide for several nights' service. No mantels are used and the burners, it is claimed, last for years without renewal. The pamphlet describes the system and its operation and is illustrated with photographs and drawings showing the piping, location of valves, etc.

Another pamphlet describes the improved temperature regulator and stop valve, which allows just enough steam from the train line to enter the radiators to maintain the proper temperature, the valve being set to give any heat desired. The pamphlet, which fully describes the device, is illustrated with drawings showing its operation and methods of application.

A third pamphlet describes, with illustrations, the improved gravity relief trap, which releases all water in steam couplings as soon as the pressure is released, the valve closing when the pressure is restored.

Electric Motors.—Bulletin 98 of the Crocker-Wheeler Co., Ampere, N. J., describes form L, belt type, d.c. motors in sizes from 0.05 h.p. to 5 h.p., and generators from 0.6 k.w. to 2.5 k.w. Illustrations show the motors driving centrifugal pumps, hoists, fans, various machine tools, and other machinery. Ratings, weights and dimensions of the different sizes are given.

Bulletin 99 describes the Crocker-Wheeler motors in the rail and structural mills of the Bethlehem Steel Co., South Bethlehem, Pa.

Bulletin No. 100 describes form I, belt type, d.c. motors of 5 h.p. to 15 h.p., and generators of 4.5 k.w. to 40 k.w. The motors are fitted for driving heavy machine tools. The usual dimensions, etc., are given.

Bulletin No. 95 describes belt type, a.c., 60 cycle generators, which are built in sizes from 35 K.V.A. to 200 K.V.A., either two or three phase, for voltages from 240 to 2,300 volts.

Electric Headlights and Electric Controllers.—Bulletin 4,579 of the General Electric Co., Schenectady, N. Y., describes a recently perfected arc headlight. The upper electrode is a copper forging, and the lower is an iron tube filled with a composition. It is claimed that this gives more light for the same wattage than the carbon arc, that the cost of operation and maintenance is very low, that the life of the copper electrode is from 2,000 to 3,000 hours, and that the lower electrode need be adjusted but once in 20 hours. Another advantage is that the light may be dimmed or "turned down" when passing through towns by reversing the direction of the current.

Bulletin 4,578 describes, briefly, various standard controllers for different operating conditions, and outlines the Sprague-General Electric type "M" control system.

Air-Brake Equipment.—Instruction pamphlet No. 5,034 of the Westinghouse Air-Brake Co., Pittsburgh, Pa., is devoted to the type L triple valve. This is described, with photographs and drawings, and its operation carefully gone into.

Instruction pamphlet No. T-5,033 of the Westinghouse Traction Brake Co., Pittsburgh, Pa., gives similar information for the type M triple valve.

The air-brake company has published a reprint of a paper on The Effect of Brake-beam Hanging Upon Brake Efficiency, read by R. A. Parke before the New York Railroad Club, in November, 1897. The preface calls attention to the fact that practice has shown the correctness of the predictions and recommendations of this paper.

Turbines, Dynamos, Motors and Pumps.—The De Laval Steam Turbine Co., Trenton, N. J., has issued bulletin No. 501 describing its steam turbines and machinery driven by them. Besides the turbines, the company makes centrifugal pumps, blowers, d.c. and a.c. dynamos to be driven by turbines, and, also, electric motors. The turbine is a single wheel, with milled buckets set radially on its periphery. The steam is directed at the buckets through four nozzles. The disc revolves at high speeds, from 10,600 r.p.m. for the largest size to 30,000 r.p.m. for the smallest. It is geared down about 10 to 1 through helical gears, giving direct shaft speeds of from 600 to 3,000 r.p.m.

Roller Bearings.—Bulletin 31 of the Hyatt Roller Bearing Co., Newark, N. J., describes the construction, application and advantages of Hyatt bearings. These products have now been standardized and the company can furnish them in over 300 sizes, each adapted to a particular condition of speed and load. Each bearing has a capacity rating so that the customer can decide exactly what he wants. The pamphlet referred to gives sizes and price lists and full directions for selecting the style desired. Attention is called to the fact that the bearings are applicable to many special forms of machinery, industrial cars, line shafting in railroad shops, etc.

Power Hammers.—A booklet issued by Beaudry & Co., Boston, Mass., is devoted to the Champion power hammer. The hammer is belt driven and the hammer proper or ram is operated by a device making the blow elastic, and also making it possible for the hammer to deliver its full blow without regard to the size of the metal which is being forged. It is made in sizes from 50 to 500 lbs. weight of ram, taking forgings up to 6 in. bars. Sizes and prices are given and also a list of railroads using the hammer.

Signal Devices.—Reference catalogue No. 5 of the Hall Signal Co., New York, gives full price lists and order numbers of parts of electric motor and electro-gas automatic semaphore signals, iron masts and fittings for automatic disk and semaphore signals, mechanical semaphore and station signals and auxiliary devices, including switch locks, electro-mechanical slots, batteries, etc. The catalogue is fully illustrated, each part on the drawings being numbered to correspond with the lists.

Engines and Centrifugal Pumps.—Catalogue F of the Erie Pump & Engine Co., Erie, Pa., describes centrifugal pumps, either direct connected or arranged for belt drive. These pumps are either single or multi-stage. It is claimed that the pumps can be used for handling any liquid, whether clear or having solids in suspension. The catalogue also describes two-cycle and four-cycle gas or gasolene engines of different types and sizes, and also, vertical steam engines from 4 to 35 h.p.

Reinforced Concrete Bridges.—A 118-page pamphlet issued by the National Bridge Co., Indianapolis, Ind., gives photographs of 85 Luten reinforced concrete bridges designed and erected by the company, or in process of construction. The photographs are followed by sections and dimensions of the same bridges and by illustrated accounts of various structural features and methods of design.

Passenger and Freight Cars.—The Barney & Smith Car Co., Dayton, Ohio, has published a handsome souvenir pamphlet entitled "Cars We Have Built." It contains 31 pages and is filled with full-page half-tone views of passenger car exteriors and interiors, and several types of freight cars. The embossed cover is brown and gold and the whole is tied with brown silk cord.

Steam Gages and Valves.—The full catalogue of the American Steam Gage & Valve Manufacturing Co., Boston, Mass., is a cloth bound volume of 246 pages. It is fully illustrated and describes, with sizes and prices, gages, valves, indicators and other devices for controlling steam pressure, water, air, gas, oil, ammonia and other pressures. These include a wide line of articles.

Flooring.—A folder issued by the J. G. Ellendt Company, 1 Madison avenue, New York, describes Elasto flooring. This is a cement composition, which it is claimed, is silent, not slippery, waterproof, sanitary, fireproof and durable. It is laid in thicknesses from ½ in. to ¾ in. and is furnished in any color or combination of colors desired.

Lehigh Valley.—"Land o' Lakes and Mountains," issued by the passenger department, consists of many excellent photographs of attractive spots reached by the Lehigh Valley in New Jersey, Pennsylvania and New York, with brief descriptions of health and summer resorts. These include lists of hotels at each place, with capacities and rates.

Pipe and Valves.—The April issue of the *Valve World*, published in the interest of Crane Co., Chicago, has an interesting description of 26-in. pipes bent at angles of 90 deg. and 48 deg. on curves of 9 ft. radius. Another article describes and illustrates Crane oil separators for removing cylinder oil from exhaust steam.

Locomotives.—The Baldwin Locomotive Works, Philadelphia, Pa., has published a pamphlet describing, with illustrations, the locomotives built by the firm for the Central Railroad of Brazil. The pamphlet gives briefly the history of the road and describes the locomotives built for it since the first three were built in 1862.

Locomotive Front-End Steam Pipes.—Julian L. Yale & Co., Chicago, have prepared a pamphlet illustrating and describing the locomotive front-end steam pipes with universal joints which they make and sell. The troubles with other kinds of steam pipes are described and the principal advantages of the universal-joint pipe given.

Dust Preventative.—The Barrett Manufacturing Co., New York, has published a booklet showing a number of photographs of roads treated with Tarvia B, a new form of the compound, which can be applied without heating. The pamphlet gives the advantages of the material and quotes reports made of its successful use.

Boiler Compound.—A pamphlet entitled "Magic Methods," issued by the H. W. Johns-Manville Co., New York, describes Magic boiler compound. This is a liquid, which, it is claimed, acts mechanically instead of chemically, working its way between the scale and the metal so that the scale is loosened and drops off.

Reinforced Concrete Construction.—Recent circulars issued by the General Fireproofing Co., Youngstown, Ohio, give photographs and drawings of powerhouses and other buildings erected on the General Fireproofing Co.'s system, with pin connected girder frames, with plain and twisted lug bar reinforcement.

Spokane & Inland.—A pamphlet entitled "Profitable Farming in the Spokane Country" takes up the farming possibilities of the regions served by the Spokane & Inland. Photographs and texts show strikingly what has already been done in raising wheat, fruit and vegetables and cattle and poultry.

Denver & Rio Grande.—A booklet issued by the passenger department on "Camping in the Rocky Mountains" lists with brief descriptions, many camping grounds, giving distances from Denver and information as to nearby hotels. Estimates of the costs of several vacation trips are included.

Roofing.—A pamphlet entitled "Ruberoid Pete," issued by the Standard Paint Co., New York, sets forth the advantages of Ruberoid in the form of a conversation between a prospective customer and an old customer. Copies are sent to those interested on application to the company.

Thermit.—A pamphlet issued by the Goldschmidt Thermit Co. New York, describes butt-welding of wrought iron and steel and of pipes and rods with thermit. The pamphlet also contains revised price lists of appliances used for these welds.

Graphite.—The May issue of *Graphite*, published by the Joseph Dixon Crucible Co., Jersey City, N. J., contains notes on the use of graphite as a boiler scale preventive, and an article on crucible economy in brass foundry work.

Steel Tires.—The Standard Steel Works, Philadelphia, Pa., has published a reprint of the paper on Steel Tires—Causes of Defects and Failures, read by George L. Norris before the Western Railway Club last October.

Brake-Shoes.—A pamphlet issued by the Illinois Malleable Iron Co., Chicago, announces that this company has begun the manufacture of a full line of brake-shoes for steam and electric railroads.

MANUFACTURING AND BUSINESS.

Lawson & Simons, 505 Fisher building, Chicago, have opened a warehouse at 52 West Washington street.

D. O. Settlemire, President of the Mount Vernon Car Manufacturing Co., Mt. Vernon, Ill., died in Litchfield, Ill., aged 81 years.

The Johnson Automatic Refrigerator Co. has moved its Chicago office from the Great Northern building to 209 Western Union building.

The Bettendorf Axle Co., Davenport, Iowa, has moved its Chicago office from 1590 Old Colony building to larger quarters at 1160-1170 Old Colony building.

The Dressel Railway Lamp Works, New York; Adreon & Co., St. Louis, and the L. J. Bordo Co., Philadelphia, Pa., which have joint Chicago offices, have moved them to larger quarters in 209 Western Union building.

Since the death of Mr. H. A. Clark, late President of the Central Inspection Bureau, New York, Mr. John E. Cobaugh has been made President and Treasurer; Mr. Geo. E. Pratt, Vice-President and General Manager, and Mr. T. C. Ashenfelter continues in the office of Secretary as formerly.

The Glacier Metal Co., Richmond, Va., expects shortly to erect a new plant in Manchester, across the James river from Richmond, for making Glacier anti-friction metal, Copper-Tin bearing metal, and other babbitt metals. The works will be about 100 ft. x 40 ft., two stories high, with capacity for 25,000 lbs. of babbitt metal a day.

The Kennicott Water Softener Co., Chicago, has moved its office there from 527 Railway Exchange building to Suite 601 Corn Exchange building. The new forge and plate-forming shop has been completed. With the angle-bending plant recently installed the capacity for tank and steel plate work has been increased over 50 per cent.

The H. W. Johns-Manville Co., New York, is about to open a branch at 72 Jefferson avenue, Detroit, Mich., under the management of Willard K. Bush, who has been connected with the Milwaukee branch of the company for a number of years. A complete stock will be carried at Detroit, so that shipments can ordinarily be made direct from that city.

Willis C. Squire has opened an office at 209 Western Union building, Chicago, as manufacturers' agent for railroad supplies and specialties, gasolene locomotives, turntables, cranes, signaling devices, etc. His line includes rail drills and benders, insulated rail joints, combination tieplate and guard-rail clamps, semaphore blade clasps and adjustable switch-point brackets.

Bids will be received until May 25, 1908, by the Isthmian Canal Commission, Washington, D. C., for the supply of hoisting engines, car-tenoning machine, automatic car-gaining machine, repair parts for steam shovels and flat cars, chain, twist drills, taps, water-closets, saw blades, mauls, hammers, track levels, lining bars, carpenters' braces, steam whistles, polishing paste, bran, cotton-seed meal, etc.

J. G. White & Co., Inc., New York, have been awarded the contract for a complete hydro-electric plant, with transmission lines, sub-stations, etc., for the Central Georgia Power Co., on the Ocmulgee river, about 36 miles above Macon, Ga., supplying power to Macon and to other places in the vicinity. The normal capacity of the plant will probably be 12,500 k.w., generated by water-wheels under a 100-ft. head. The crest of the dam will probably be 750 ft.

At the annual meeting of the stockholders of the General Electric Co., Schenectady, N. Y., on May 12, Vice-President B. E. Sunny, of Chicago, was elected a Director to succeed Frederick P. Fish, resigned. The other Directors were elected for another year, as follows: Gordon Abbott, Oliver Ames, C. A. Coffin, W. M. Crane, T. Jefferson Coolidge, Jr., George P. Gardner, Henry L. Higginson, J. Pierpont Morgan, J. P. Ord, Robert Treat Paine, 2nd, E. W. Rice, Jr., Marsden J. Perry, Chas. Steele and S. L. Schoonmaker.

The Westinghouse Machine Co., Pittsburgh, Pa., has an order for mechanical stokers, aggregating 14,400 boiler horse-power, for one of the large Brooklyn, N. Y., power stations operated by the Transit Development Co. (Brooklyn Rapid Transit). The order comprises 24 stokers suited to 600-h.p. B. & W. water tube boilers. This is the second large order given by this company for Roney stokers, the original 7,200-h.p. installation at the Kent avenue station having been in service for a year.

The Darley Engineering Co., 80 Broadway, New York, has been formed for the purpose of engineering, manufacturing and selling machinery and appliances for hoisting and conveying materials by suction and by air pressure. It has acquired the sole rights, for the United States, to make and sell the suction conveyor heretofore controlled by the Economic Engineering & Construction Co., Chicago, and it has taken over the business of the Economic Engineering & Construction Co., of Chicago, and the Darley Co., of Pittsburgh, Pa. W. W. Darley, President, will have charge of the Pittsburgh office. W. A. Stadelman, Vice-President, and M. D. Chapman, Secretary and Treasurer, will have charge of the New York office. W. A. Sharp, Vice-President, will have charge of the western business, with headquarters in Chicago.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Western Railway Club.

The annual meeting of this club is to be held May 29, at the Auditorium Hotel, Chicago, Ill. The committee was unable to secure suitable accommodations for an earlier date.

Engineers' Club of Philadelphia.

At a business meeting of this club to be held May 16, the papers to be presented are as follows:

"Sand—Its Use and Application in the Various Industries and Processes," by W. S. Reed, illustrated by lantern slides.

"Notes on the Theory of Steam Condensers," by Thomas C. McBride.

Accounting Officers.

The Association of American Railway Accounting Officers held its annual meeting at Washington, D. C., April 29 and 30 and May 1 and 2. The President of the association for the ensuing year is W. J. Hobbs, Fourth Vice-President of the Boston & Maine. C. G. Philips, of Chicago, was re-elected Secretary. The next annual meeting of the association will be held at Cincinnati in April, 1909.

The White House Conference on Natural Resources.

The conference on the Conservation of Natural Resources called by President Roosevelt was convened at the White House, Washington, on Wednesday of this week, being attended by the Governors of forty-four states and territories and representatives from all the rest; and by representatives of about all the learned societies of the country. The principal subjects were introduced by the following prominent speakers: Ores and Related Minerals, Andrew Carnegie; Mineral Fuels, Dr. I. C. White, State Geologist of West Virginia; Soil, Professor T. C. Chamberlin, University of Chicago; Forests, R. A. Long, Kansas City; Public Health, Dr. George M. Kober, Dean of the Medical Department of Georgetown University; Reclamation of Land by Irrigation and Drainage, Dr. George C. Pardee, ex-Governor of California; Grazing and Stock Raising, Hon. H. A. Jastro, President American National Livestock Association, The Public Lands and Land Tenure, Judge Joseph M. Carey of Wyoming. Water Resources: Transportation, James J. Hill, of the Great Northern Railway; Navigation, Professor Emory R. Johnson, University of Pennsylvania; Water Power, H. S. Putnam, American Institute of Electrical Engineers.

Invitations were sent to the chief officer of about every society devoted to the promotion of knowledge which is of national extent and to the heads of many others; for example: The American Association of Agricultural Colleges and Experiment Stations; American Association for the Advancement of Science; American Bar Association; American Federation of Labor; American Forestry Association; American Institute of Mining Engineers; American National Livestock Association; American Newspaper Publishers' Association; American Railway Association; American Railway Engineering and Maintenance of Way Association; American Statistical Association; Brotherhood of Locomotive Engineers; Brotherhood of Locomotive Firemen and Enginemen, Brotherhood of Railroad Trainmen; Farmers' National Congress; General Federation of Women's Clubs; Missouri Valley Improvement Association, National Association of Manufacturers; National Board of Fire Underwriters; National Grange; National Slack Cooperage Manufacturers Association; United Mine Workers of America, and about 40 others.

Railway Storekeepers' Association.

This association will hold its annual meeting at the Auditorium Hotel, Chicago, May 25, 26 and 27. One of the events in connection with this meeting will be the banquet on Tuesday evening, and which has heretofore been tendered the storekeepers by the supply men. This year the storekeepers decided to give this banquet themselves, and on behalf of the supply men, it has been proposed that those attending the banquet aside from the storekeepers pay at the rate of $5 a plate, any excess of the actual cost to go toward providing entertainment for the banquet and a dinner and entertainment for the ladies.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Chicago, Milwaukee & St. Paul.—O. W. Dynes has been appointed Assistant General Solicitor, succeeding John A. Russell, resigned.

Georgia, Florida & Alabama.—J. F. Ingalls, formerly Acting Auditor of the Mobile, Jackson & Kansas City, has been appointed Auditor of the Georgia, Florida & Alabama, with headquarters at Bainbridge, Ga., succeeding W. H. Carroll, resigned.

Interstate Commerce Commission.—Charles A. Lutz, Assistant Comptroller of the Louisville & Nashville, has been appointed Chief Statistician of the Board of Examiners in the division of accounts of the Interstate Commerce Commission.

Kansas City Southern.—W. G. Street has been elected a Director, succeeding Y. Van den Berg, resigned.

Louisville & Nashville.—See Interstate Commerce Commission.

Operating Officers.

Chicago, Milwaukee & St. Paul.—Frank H. Myers, the new Superintendent of the Prairie-du-Chien and Mineral Point divisions, was born in 1872 at Adeline, Ill., and started work with the Chicago, Milwaukee & St. Paul in 1890 as telegraph operator on the Chicago division. Six years later he became agent on the Chicago division, and in 1899 was promoted to assistant train despatcher, and five years later was promoted to chief train despatcher. In September, 1907, he was made Assistant Superintendent of Terminals at Chicago, and was appointed to his present position May 1, 1908.

E. W. Morrison has been appointed Trainmaster at Minneapolis, Minn., succeeding P. L. Rupp, promoted.

Hocking Valley.—R. S. Quigley, Superintendent, has been granted leave of absence on account of ill health, and H. E. Speaks, Superintendent of the Toledo & Ohio Central, has been appointed Acting Superintendent of the Hocking Valley, with office at Columbus, Ohio. The position of Superintendent of Terminals at Toledo, Ohio, has been abolished and C. A. Hoyt, dock agent, will assume all duties pertaining to dock operation. See Toledo & Ohio Central.

Jamestown, Chautauqua & Lake Erie.—Glenn E. Mason, Superintendent, has resigned and the office of Superintendent has been abolished. George F. Asper has been appointed Trainmaster, with office at Jamestown, N. Y.

St. Louis & San Francisco.—H. H. Brown, the new Superintendent of the Eastern division, with office at Springfield, Mo., was born in 1862. In 1893 he was made train despatcher at Monett, Mo., of the St. Louis & San Francisco. He became chief despatcher in 1896 and Trainmaster in 1898. In 1902 he was transferred to Springfield, Mo., and the next year was made Superintendent of the Western division at Neodesha, Kan. In 1904 he was transferred to the Southern division, where he remained until his recent appointment.

Seaboard Air Line.—T. F. Whittelsey, General Manager, has resigned and the duties of his position have been assumed by W. A. Garrett, Chief Executive Officer for the Receivers.

Toledo & Ohio Central.—C. L. Gardner, Assistant Superintendent, has been appointed Superintendent, succeeding H. E. Speaks, transferred. W. F. Elrod, Superintendent of Terminals of the Hocking Valley at Toledo, Ohio, succeeds Mr. Gardner. See Hocking Valley.

Union Pacific.—J. B. Sheldon has been appointed Superintendent of Telegraph, with office at Omaha, Neb., succeeding L. H. Korty, resigned.

Vera Cruz & Pacific.—Clayton Byers has been appointed Superintendent, with office at Tierra Blanca, Vera Cruz, succeeding J. S. Langston, resigned.

Traffic Officers.

Chicago, Rock Island & Pacific.—S. S. Butler has been appointed General Agent at Fort Smith, Ark., succeeding J. L. Reinach, deceased.

Erie.—M. W. De Wolf, General Eastern Freight Agent, has been appointed special agent, with office at 50 Church street, New York. H. S. Stebbins, Manager of the Erie Despatch Fast Freight Line, succeeds Mr. De Wolf, with office at New York.

Engineering and Rolling Stock Officers.

Erie.—George H. Burgess, who was recently appointed Principal Assistant Engineer, was born on June 19, 1874, at Oshkosh, Wis. He graduated from the University of Wisconsin, Civil Engineering course, in 1895, and entered railroad service in 1896 as a rodman on the Pennsylvania Lines West. In October, of the same year, he was made Assistant Bridge Inspector, and two years later was appointed Bridge Inspector. In January, 1901, he became Assistant Engineer, which office he held until September, 1905, when he left the Pennsylvania Lines West to become Assistant Engineer on the Erie. A year later he was made Engineer of Terminal Improvements, and on May 1, 1908, was appointed Principal Assistant Engineer, with office at New York. The Erie is making extensive terminal improvements at Jersey City, N. J., and Mr. Burgess has been in direct charge of these improvements, assisted by A. L. Moorhead, Resident Engineer at Jersey City.

George H. Burgess.

Illinois Central.—R. W. Bell, Master Mechanic at Waterloo, Iowa, has been appointed Assistant Superintendent of Machinery, with office at Chicago, succeeding J. G. Neuffer, promoted.

LOCOMOTIVE BUILDING.

The Fajardo Sugar Co. has ordered one consolidation locomotive from the American Locomotive Co.

The Eastern of France has ordered two Mallett compounds from the American Locomotive Co.

The St. Louis National Stock Yards have ordered one six-wheel switching locomotive from the American Locomotive Co.

The Paris-Orleans has ordered one 10-ft. 7-in. cut scoop wheel type standard gage rotary snow plow from the American Locomotive Co.

CAR BUILDING.

The Northern Pacific will build 500 stock cars at its own shops.

The Milwaukee Refrigerator Transit is considering building 100 refrigerator cars.

The International & Great Northern is asking prices on 750 thirty and forty-ton cars, including 500 box cars.

The Atlanta & St. Andrews Bay is said to be in the market for one combination baggage and mail car. This item is not yet confirmed.

The Western Heater Despatch (Starks Heater Car Co.), 189 La Salle street, Chicago, is in the market for 200 ventilated refrigerator cars.

RAILROAD STRUCTURES.

FREDERICTON, N. B.—Residents of this place have applied to the Minister of Railways for a new passenger station. They want one that would cost about $60,000.

MONTREAL, QUE.—Authority has been granted to the Canadian Northern Quebec to build bridges over the Jordan river, near St. Sophie, and over the river Rouge near Montcalm.

PARKERSBURG, W. VA.—According to reports from East Liverpool, Ohio, the Parkersburg Bridge Company was recently incorporated at that place to build a bridge over the Ohio river; also an interurban railroad, at a cost of $400,000. Joseph G. Lee, of the Knowles Pottery Co.; J. H. Brookes, S. C. Williams, of the S. C. Williams Co., and Charles Newell, of East Liverpool, are interested.

WINNIPEG, MAN.—A second bridge, it is reported, is to be built this year over the Assiniboine river by the Canadian Northern. It is to be of steel on concrete abutments.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

ALABAMA RAILWAY & ELECTRIC COMPANY.—This company proposes to build an electric line from Opelika, Ala., south to Eufaula, 60 miles, and eventually to the gulf. It is said that contracts for some of the work will shortly be let. A. M. Buchanan is President, Opelika, Ala. J. C. Chapman, Atlanta, Ga., Vice-President and General Counsel, will have charge of letting the work.

ALTUS, ROSWELL & EL PASO.—This company proposes to build a line from Altus, Okla., west via Duke and Hollis to Memphis or Childress, Tex., thence southwest via Lubock, Tex., and Roswell, N. Mex., to El Paso, Tex., about 400 miles. Location surveys reported made from Altus to Hollis, 34 miles, and grading work is now under way. Contracts have been given to J. E. Hines, of Altus; A. Key and N. Anderson, of Duke. On this section bids are asked for ties, rails and material for bridges. E. E. Kennedy, President, and E. K. Stimson, Chief Engineer, Altus.

BOSTON & ALBANY.—See New York Central & Hudson River.

BLACK MOUNTAIN RAILWAY.—See Virginia & Southwestern.

BROWNSVILLE, MASONTOWN & SMITHFIELD STREET RAILWAY (ELECTRIC).—An officer writes that contracts have been given to the Pennsylvania Railway Construction Company, and the General Construction Company, of Pittsburgh, Pa., to build this company's proposed electric line in Pennsylvania with terminals at Uniontown, Morgantown, Brownsville and Bentleyville. Work is now under way and track has been laid on $1\frac{1}{2}$ miles. There will be a number of viaducts and a bridge over the Monongahela river. (May 1, p. 623.)

CANADIAN NORTHERN.—D. B. Hanna, Vice-President of this company, is quoted as saying that the improvements to be made on the road during the present year will include relaying the main line between Port Arthur and Winnipeg with 80-lb. rails. The line west and north of Winnipeg is also to be improved. General Manager M. H. McLeod is quoted as saying that ties and rails will shortly be delivered and track laying started on the line to the Goose Lake District, Sask.

This company has built from Strathcona, Alb., into Edmonton, $4\frac{1}{2}$ miles, and 21 miles from Edmonton west to Stony Plain. An extension of this line is projected west to the boundary of British Columbia, passing south of Jasper House, about 200 miles west of Edmonton. An extension is also projected north of this line from Edmonton northwest to the British Columbia boundary, 300 miles, crossing the McLeod, Smoky and Wapiti rivers.

The Edmonton & Slave Lake has been granted a change in location in townships 54 and 55, range 25 west, by the Board of Railway Commissioners. In 1904 plans were filed for the first 50 miles from Edmonton, Alb., northeast to St. Albert, thence north to near Edison and Independent settlements, about halfway to Athabasca landing. The line is in operation to Morinville, 23 miles, and work is reported under way on the completion of the line to Athabasca landing.

The Edmonton, Yukon & Pacific, it is said, has started surveys from Edmonton, Alb., west to the Pacific coast. It is understood that the route will pass through British Columbia about midway between the lines of the Canadian Pacific, and the Grand Trunk Pacific, and will reach the Pacific coast probably at Bella Coola or Bute Inlet. The company has been granted permission to build a branch to Burrard Inlet. Preliminary surveys already made traverse a portion of the coal fields in the northern Cariboo district.

CANADIAN NORTHERN ONTARIO.—The branch lines already built and to be built by this company, and for which the government has granted a bonus of $20,000 a mile, aggregate 50 miles, are as follows: From Sudbury, Ont., to Moose Mountain; a four-mile branch to Garrow mines; a branch to Key Inlet on Georgian Bay, and a branch from near Udney to Orillia, 10 miles. Surveys are made and it is expected that work on the last named line will be started this year. Surveys have been made between Orillia and Georgian Bay, to which point a branch may be built.

CAROLINA, CLINCHPORT & OHIO.—It is now said that this road, formerly the South & Western, will be finished from St. Paul, Va., south to Marion, N. C., by January 1, 1909. The road is now in operation from Johnson City, Tenn., south to Pine Ridge, N. C., 69½ miles; also on the northern section from Dante, Va., south to Fink, 17 miles. The section from Johnson City to Marion, N. C., will probably be put in operation by August 1. A tunnel will be driven through the mountains in Dickenson county, Tenn., which will be the largest on the line and much longer than that through the Clinch mountain at Clinchport, Va., which is being completed by the S. Walton Contracting Company. (See South & Western, Mar. 13, p. 391.)

CHICAGO, MILWAUKEE & ST. PAUL.—According to reports from Tacoma, Wash., this company has incorporated the Port Angeles Railway & Terminal Co., with $1,000,000 capital to build the line to Olympic peninsula in the northwest corner of the state of Washington. The proposed line is to have its upper Sound terminal at or near Gig Harbor, opposite Tacoma, from which point a car ferry of three miles will connect with the St. Paul main terminal. A short branch is also to be built north to Bremerton. W. G. Collins, of Chicago, Ill., former General Manager of the C., M. & St. P., is the principal promoter.

COLORADO & SOUTHERN.—This company, it is said, is making plans to build an extension of the Wichita Valley, now in operation from Wichita Falls south to Abilene, 150 miles. The improvements include an extension from Abilene, south to Uvalde, 200 miles, and eventually from that point southeast to a connection with the St. Louis, Brownsville & Mexico at Sam Fordyce, 225 miles.

COLORADO, HEREFORD & GULF.—Incorporated in Texas with $420,000 capital to build a line from Dalhart, Texas, south via Hereford, thence southeast to San Angelo, about 400 miles. According to reports from Austin the company has notified the Texas Railroad Commission that contracts have been let for building the entire line from a point in Dallam county, and work is to be started at once both north and south of Hereford. The company has been granted a subsidy of $60,000 by Hereford. The incorporators include A. D. Goodnough, G. W. Irwin, Jr., W. M. Knight, C. W. Dodson, C. F. Kerr and J. D. Thompson. The office of the company is to be at Hereford.

COLUMBUS, COLORADO & MEXICO.—Local reports state that this company, which is being promoted by residents of El Paso, Texas, will shortly let grading contracts for about 150 miles of the proposed line. The projected route is from Columbus, N. Mex., northwest to the Mogollon district, with a branch from Tyrone to Silver City. A. A. Bailey, President, El Paso.

DELAWARE & EASTERN.—The Appellate division of the Supreme Court of New York, Third department, has recently sustained the action of the old State Board of Railroad Commissioners granting certificates of public necessity and convenience to the Schenectady & Margaretville, which proposes to build an extension of the Delaware & Eastern from Arkville, N. Y., north to Schenectady, 70 miles. Also to the Hancock & East Branch Railroad, organized to build a southern extension of the Delaware & Eastern, from East Branch, N. Y., southwest to Wilkesbarre, Pa., 160 miles. (Mar. 13, p. 391.)

DENVER, LARAMIE & NORTHWESTERN.—Work, it is said, has been started by this company on its proposed line. The projected route is from Denver, Colo., to the northern boundary of Wyoming, about 500 miles. S. Johnson, President. (Feb. 28, p. 297.)

DENVER, NORTH-WESTERN & PACIFIC.—This company, since January 1, has finished 17 miles of the extension it is building from Yarmony, Colo., towards Salt Lake City, Utah. Contract from Yarmony to Steamboat Springs, 68 miles, let to the Denver-Steamboat Springs Construction Company, of which Col. D. C. Dodge is President. In the line through Egeria canyon there will be two tunnels aggregating 2,400 ft. It is expected to open the line for operation from Yarmony to McCoy, 11 miles, May 15; to Toponas, 29 miles, August 15, and to Steamboat Springs by October 1.

EDMONTON & SLAVE LAKE.—See Canadian Northern.

EDMONTON, YUKON & PACIFIC.—See Canadian Northern.

FRANKFORT, DELPHI & CHICAGO TRACTION.—Incorporated in Indiana with $100,000 capital. The company proposes to build a line from Frankfort, Ind., northwest via Delphi and Monticello, to Hammond, about 125 miles. The Directors are A. S. Strauss, Wm. H. Conee, C. E. Hayman, Edward A. Stonehill, Herbert F. Wills. The headquarters of the company will be at Frankfort.

GREAT NORTHERN.—The Vancouver, Victoria & Eastern, through a consolidation of the Vancouver, Westminster & Yukon and the Victoria Terminal Railway & Ferry Company, now has under construction lines as follows: From the international boundary to Olivers, B. C., 11.32 miles, on which track has been laid for one mile and work is under way on the rest of the line. Line building from Brownsville, B. C., to Olivers, 9.80 miles, track laid on five miles. Line from Cloverdale, B. C. to Sumas at the International boundary, 26.25 miles, track laid on 1.10 miles and work is under way on the rest of the line. At Sumas Junction, B. C. (Sumas, Wash.) there is a connection with the Bellingham Bay & British Columbia Railway, the Northern Pacific, and the Canadian Pacific branch from Mission. Work is also under way on the line from Keremeos west to Princeton, 45 miles, on which grading is finished as far as Hedley. Surveys from Princeton to Sumas have been made, but have not yet been finally approved. (March 13, p. 391.)

This company, it is said, has projected branch lines as follows: Dewey Lake, Minn., north to International falls, about 78 miles, partially graded; Greenbush, Minn., northwest to Warroad, 44 miles, grading finished; Wenatchee, Wash., near where the line crosses the Columbia river, north to Oroville, 140 miles, partially graded.

HANCOCK & EAST BRANCH.—See Delaware & Eastern.

HOLSTON RIVER RAILWAY.—See Virginia & Southwestern.

MARYLAND ELECTRIC.—The proceeds of the remaining $250,000 first bonds of the Baltimore-Annapolis Short Line are to be used in building a terminal station in Annapolis, also for connections for entering Baltimore and other purposes.

MYERSDALE CONSTRUCTION & EQUIPMENT COMPANY.—This company was recently incorporated with $100,000 capital in Delaware to build railroads. The incorporators are H. D. Breen, W. A. Wood, Pittsburgh, Pa.; W. W. Stand, Bellevue, Pa.

NEBRASKA, KANSAS & SOUTHERN.—An officer writes that this company has not definitely financed its proposed line, and no active work will be undertaken until this is accomplished. The company was organized to build from Superior, Neb., southwest through Kansas, via Stockton, Ransom and Ness City, to Garden City, 267 miles. Definite location made from Stockton to Garden City, 167 miles. The work will include two steel bridges and handling about 25,000 cu. yds. per mile, including some rock work. (Mar. 13, p. 392.)

NEW YORK CENTRAL & HUDSON RIVER.—According to a statement of Woodward Hudson, of this company, it is proposed to spend $4,543,753 of the Boston & Albany bond issue for improvements on the road during the present year.

Reports from Buffalo, N. Y., state that this company is about to establish a large gravity freight yard at Suspension Bridge to handle freight coming from points north of Lake Erie. Freight from points south of Lake Erie is to be handled in the extension of the yards now being made at Gardenville, near East Buffalo. When finished the latter yards will have a capacity of 22,000 cars. At present there are 27 miles of tracks in use.

OREGON ELECTRIC RAILWAY.—An officer writes that this company now has its line in operation from Portland, Ore., south to Salem, 50 miles, and is building a branch from Garden Home on the main line, west to Hillsboro, 12 miles. The Willamette Construction Company is doing the work and W. S. Barstow & Co. are the engineers. After this branch is built, work is to be started on other proposed branches and extensions. (May 1, p. 622.)

PEACH RIVER & GULF.—Plans, it is said, are being made by this company to build an extension from its present eastern terminus at Bartle, Texas, east to Beaumont, where connection is to be made with the Galveston, Beaumont & Northeastern. Plans are also under consideration to build an extension south to Anahuac on Trinity bay.

PENNSYLVANIA.—It is said that orders to begin the work on the tunnel at Greensburg, Pa., which was stopped last fall, have been given by this company. About $1,000,000 will be spent cutting down the tunnel, reducing the grade and making a cut wide enough for six tracks.

The northern tunnel of the two which this company has been building under Bergen Hill, Hoboken, N. J., as part of its New York City improvements, was recently driven through. (April 17, p. 559.)

PORT ANGELES RAILWAY & TERMINAL CO.—See Chicago, Milwaukee & St. Paul.

SCHENECTADY & MARGARETVILLE.—See Delaware & Eastern.

SOUTH DAKOTA ROADS (ELECTRIC).—J. A. Cleaver, of Huron, S. Dak., is organizing a company to build an electric line from Huron north to Aberdeen, 82 miles. It is said that the necessary franchise for terminals at Huron has been secured, and application has been made for similar privileges at Aberdeen. Surveys started. Cross & Mack, of Minneapolis, will have charge of the work.

STEUBENVILLE & EAST LIVERPOOL (ELECTRIC).—An officer writes that this road is to form part of the line from Toronto, Ohio, north and east to Vanport. The company now operates a line from Steubenville, Ohio, to Wellsville, including the local lines in the city of Steubenville; and the East Liverpool Traction, which covers all lines in East Liverpool and Wellsville, and Liverpool township, also Chester, W. Va. The lines are run in connection with the Ohio River Passenger Railway, under construction for the past two years, from East Liverpool to Vanport, Pa., and now in operation from East Liverpool to Midland. At Vanport connection is to be made with the Beaver Valley Traction Company's lines to Rochester, Pa. Van Horn Ely is President; Edward McDonnell, Secretary and Treasurer, and J. C. Rothery, General Manager, of all three lines, which, however, are separate and distinct companies. (May 1, p. 624.)

UNION CENTRAL.—This company was organized last year to build a line from Dallas, Texas, southeast to New Orleans, 500 miles, of which 225 will be in Texas, and 275 miles in Louisiana. It is said that a contract to build 20 miles was recently given to the Tenney Construction Company, of Silver City, N. Mex., of which J. A. Sinclair is General Manager. A branch is also projected from Wortham, Tex., northeast to Tyler, 90 miles. This branch has been surveyed and surveys are now being made on the main line. W. J. Hogue, President, Dallas, and J. A. Eutis, Secretary and Treasurer, Edgewood. (Feb. 14, p. 234.)

VANCOUVER, VICTORIA & EASTERN.—See Great Northern.

VANCOUVER, WESTMINSTER & YUKON.—See Great Northern.

VERA CRUZ TERMINAL.—This company, organized in London with a capital of $6,000,000, expects shortly to let contracts for new terminal buildings and improvements at the Port of Vera Cruz, Mex. According to the plans, the proposed improvements will cost about $6,000,000. The company is composed of the several railroads entering Vera Cruz. The general office is at the City of Mexico. (Nov. 1, p. 542.)

VIRGINIA & SOUTHWESTERN.—An officer writes that this company has taken over the properties of the Black Mountain Railway, with a main line 30 miles long, and branches lately completed and now in operation, and the Holston River Railway with about 38 miles partly finished. Construction work has been suspended on the latter for the past two months; plans for the completion of this line have not yet been perfected. (Mar. 13, p. 395.)

VICTORIA TERMINAL RAILWAY & FERRY CO.—See Great Northern.

WICHITA VALLEY.—See Colorado & Southern.

RAILROAD CORPORATION NEWS.

BUFFALO, ROCHESTER & PITTSBURGH.—Wm. A. Read & Co., of New York, offer $200,000 Buffalo, Rochester & Pittsburgh 4½ per cent. consolidating mortgage bonds of 1907-1957. The total authorized issue is $35,000,000, of which there is outstanding $1,737,000.

CHICAGO, JOLIET & KANSAS CITY.—It is announced that a special meeting of the stockholders is to be held in Chicago, July 6, to authorize an increase in the capital stock. This is a projected road from Chicago, via Joliet, Ill., to Kansas City, Mo., 350 miles.

CHICAGO RAILWAYS CO.—It has been announced that this company has sold $1,200,000 collateral 6 per cent. notes secured by $1,666,000 Chicago Railways consolidated mortgage 4 and 5 per cent. bonds.

DENVER & RIO GRANDE.—See Western Pacific.

ERIE.—See Pittsburgh & Lake Erie.

GREENWICH & JOHNSONVILLE.—The Public Service Commission of New York, second district, has approved of a consolidated mortgage to secure $1,000,000 30-year 5 per cent. bonds of the Greenwich & Johnsonville. The company is to issue $100,000 of these bonds to pay indebtedness incurred in the construction of its Salem branch from Greenwich to the connection with the Delaware & Hudson. The remaining $600,000 bonds are to be held by the company.

ILLINOIS CENTRAL.—It is officially stated that the Illinois Central will begin regular operation of trains into Birmingham, Ala., by the end of April. The Mobile & Ohio will come into Birmingham over the same tracks.

INTERNATIONAL & GREAT NORTHERN.—The receiver, Thomas J. Freeman, has been authorized to issue 6 per cent. receiver's certificates to pay the $338,730 interest due May 1 on the first mortgage bonds. The certificates are to be secured by a first lien on the net revenues of the company and are to be sold at not less than par.

KANSAS CITY, FORT SCOTT & MEMPHIS.—The first mortgage 7 per cent. bonds maturing June 1, 1908, of which there are now outstanding $2,055,300, are to be extended until June 1, 1911, at 5 per cent. interest.

METROPOLITAN STREET RAILWAY.—Holders of the general mortgage and collateral trust 5 per cent. bonds of 1897-1997 of the Metropolitan Street Railway, of New York, are asked to deposit these bonds with the Guaranty Trust Company, of New York. The interest due on Feb. 1 was not paid, and the trust deed provides that after 90 days the default becomes absolute.

METROPOLITAN WEST SIDE ELEVATED RAILWAY (CHICAGO).—The Farwell Trust Co., and N. W. Halsey & Co., of Chicago, have bought the remaining $1,250,000 of an authorized $5,000,000 extension and terminal first mortgage 4 per cent. bonds. The sale of these bonds provides for the retirement of equipment notes and loans falling due June 1.

MIDLAND VALLEY.—All of the $5,600,000 old notes of the Cherokee Construction Co. have been deposited and holders will receive in exchange Midland Valley first mortgage 5 per cent. bonds and new Cherokee Construction Co. five-year 6 per cent. notes. These notes are dated December 2, 1907, and are due December 1, 1912. Of the authorized issue of $2,500,000 only $1,650,000 is outstanding.

NEW YORK, NEW HAVEN & HARTFORD.—The Supreme Court of Massachusetts has decided that the control of street railway companies in Massachusetts by the New York, New Haven & Hartford is illegal. Charles F. Choate, Jr., counsel for the road, gave out the following: "The company will promptly obey the decree of the court. We believe the principle enunciated by the court applies as well to the holding of Boston & Maine stock by the New Haven Company, and that it will be necessary for the company also to dispose of this stock unless the legislature decides that it is consistent with the interests of the commonwealth that it should be retained."

PITTSBURGH & LAKE ERIE.—Trackage rights on the Newcastle & Sharon 20-mile branch of the Erie have been obtained by the Pittsburgh & Lake Erie.

PUBLIC SERVICE CORPORATION OF NEW JERSEY.—Of the authorized issue of $50,000,000 first mortgage 5 per cent. bonds of 1908, only $3,725,000 are to be issued at present, and this amount has already been sold by the company.

ST. LOUIS & SAN FRANCISCO.—The proceeds of the sale to J. & W. Seligman and Redmond & Co., of New York, of all the refunding mortgage bonds free in the company's treasury, together with $1,353,000 of the same bonds pledged among other collateral to secure $1,750,000 notes with the Mercantile Trust Company, are to be used to pay at once the $1,750,000 notes due June 26, and to pay other pressing obligations. The amount of refunding mortgage bonds authorized was $85,000,000 of which $62,500,000 were to be reserved for refunding purposes, and the balance to be used for betterments, equipment, construction, etc. The company has been doing the work for which these bonds might be issued, but until now the bonds could only have been sold at a sacrifice.

SOUTHERN RAILWAY.—It is stated that the Southern Railway is to sell in the near future enough short-term notes to retire floating indebtedness and meet future expenses. It is said that a syndicate headed by J. P. Morgan & Co. will take these notes.

TOLEDO & OHIO CENTRAL.—The Little Kanawha syndicate turned over the Marietta, Columbus & Cleveland to the Toledo & Ohio Central for operation on Feb. 1. The Toledo & Ohio Central officials, it is said, claim that the physical condition of the property is such that its retention is undesirable and refuse to operate the road.

WESTERN MARYLAND.—The Mercantile Trust Company has been given an order permitting it to sell the entire capital stock of the George's Creek & Cumberland, which has been pledged with it by the Western Maryland to secure a loan of $1,101,875. The stock may be sold at public auction any time within 30 days.

WESTERN PACIFIC.—The Denver & Rio Grande, on behalf of the Western Pacific, has sold to Blair & Co., William Salomon & Co., and William A. Read & Co., of New York, $15,000,000 2-year 6 per cent. convertible notes. It is said that the money from this sale will finish the Western Pacific and provide it with equipment.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK

BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York the following announcement is made of the office of publication, at 83 Fulton St., New York, N. Y., and the names of the officers and editors of the Railroad Gazette.

OFFICERS

W. H. BOARDMAN, *Pres't and Editor*

E. A. SIMMONS, *Vice President*

RAY MORRIS, *Secretary*

R. S. CHISOLM, *Treas.*

CONTENTS

VOL. XLIV., No. 21. FRIDAY, MAY 22, 1908.

We print this week a letter from Mr. Griffin which is worth careful attention. The point made is one which the *Railroad Gazette* has often brought out: that cast-iron wheels as now made and at present costs are a source of danger under 50-ton cars, and that a general understanding and agreement about car wheels ought to exist between all roads exchanging cars, since the damage from a broken wheel occurs wherever the car may happen to be running, regardless of where it was built. The author offers no solution, but merely states his case. The *Railroad Gazette* will welcome full and free correspondence on the subject.

In 1899 some fast passenger locomotives having cylinders of 19 in. diameter with a piston stroke of 26 in. were built for the Lancashire & Yorkshire Railway. These cylinders were steam jacketed and the steam was controlled from the cab. The construction was an experimental one and a recent inquiry about the results obtained shows that these results tally with those so frequently encountered in stationary practice. There is a certain theoretical advantage in the use of the steam jacket that does not appear in practical operation, and for that reason it has never been extensively used. In the case of the Lancashire & Yorkshire locomotives, it was not found, after continuous experiments, that it was worth while to steam jacket any more cylinders. The steam jackets apparently had the effect of preventing the accumulation of water in the cylinders, and it was thought that a certain amount of economy was secured by their use, so long as they were carefully watched. That is to say, a good man got good results out of them, while an inferior man got no better results than with the ordinary engines. But they gave trouble from a mechanical point of view, and it was decided that it was not worth while to continue them. Experiments were also undertaken on the same road with a small superheater by which very dry steam was delivered to the cylinders, but owing to the small size that was used a sufficient degree of superheat was not obtained. The experiments were valuable, however, in pointing the advantages to be obtained from a system of this kind, and when the Schmidt superheater was developed in Germany and the results that were being obtained with it became known, a number of engines were equipped with it, and have shown a saving in many instances of 20 per cent. Besides this direct saving, it has been possible to use a lower steam pressure and thus increase the life of the boilers while at the same time there is a better steam pressure and a higher temperature in the cylinders.

Australia has so far recovered from its three-years drought that the people are discussing projects for new railroads, especially a transcontinental line. By far the larger part of the population and cultivable land are within 200 or 300 miles of the east and south coasts; there are important mining interests not far inland from the southwest coast; and very little population on the northwest: while the vast interior is mostly barren, with some grazing ground. But it is exactly on the northwest that Australia comes nearest to the world's great trade route from Europe and India to China and Japan. English steamers to Sydney take about 18 days from Colombo, Ceylon, eight of them along the stormy south coast of Australia. To Darwin bay, on the northwest coast the time is 10 days less, and the railroad journey across the island, about 1,800 miles, would at most require but five days. There is already a railroad from Port Darwin for 146 miles southeastward and from Sydney several hundred miles toward the northwest. But such a line is objected to by Melbourne, which is on the south coast near the southeast corner of Australia. It would have one of its own lines extended to cross the continent to the northwest; and Adelaide, which is still further west on the south coast, would have the railroad extend more nearly from south to north along the transcontinental telegraph line. And if this cannot be done, it would prefer an extension of its railroads westward not far from the south coast to Fremantle, the port of West Australia (near the southwest corner), which is 1,500 miles southwest of Port Darwin. This would enable passengers to substitute a rail journey for the sea passage along the south coast to Adelaide, Melbourne and Sydney, but would probably not serve as a freight route. Local interests prevent any union on one route. Sydney and Melbourne, the present great trade centers for exports and imports, both near the southeast corner of Australia, fear the establishment of a great port at Port Darwin, which is so much nearer the great international trade routes, though it has very little productive country within a thousand miles. Only the general government of the now united colonies would be likely to be able to carry through such an enterprise, the larger part of which would be in national territory, formerly the north territory of the colony of South Australia, a country, mostly barren, extending about 1,000 miles from south to north, and more than 500 from east to west. It is not expected that such a line, that is, the part yet to be built, would have any appreciable local traffic for some years to come; and it has been estimated that one through train a week would be sufficient for the business.

To learn how much of convenience and cost-saving can be secured to the maintenance of way department from a portable blacksmith shop, M. L. Byers, Chief Engineer Maintenance of Way of the Missouri Pacific, last fall had an outfit arranged for this purpose. It consisted of two box cars, one housing the blacksmith and his helper, and the other the shop. The latter included a forge, and the necessary tools, duplicate parts and supplies needed for repairing hand cars, frogs, switches, tools, etc. The outfit is moved by local freight trains. About one day is needed to do up the work of an ordinary section, and a longer time where the work of two sections is done at one point, or where there is a large yard. For repairing frogs where there is considerable traffic duplicates of the frogs to be fixed are put in the track while the work is being done; but when the traffic is light, or there is not much work to be done, the frogs are taken from the track, repaired and replaced under the protection of flagmen. The proper adjustment of guard rails is looked after at the same time, and section tools are sharpened and repaired. It has been found that the life of frogs can be extended considerably by repairs given on the ground in this way. The cost for labor and material in repairing about 225 main track spring frogs has averaged about $3.75 each. The fact that these frogs have not needed to be shipped justifies the opinion that the plan of field repairs is an economical one; particularly when the economies effected in repairing switches, tools, hand cars, etc., by saving the trouble and delay of sending them away for repairs, are taken into account.

The up-state New York Public Service Commission, on May 7, handed down a decision on the petition of the Lehigh & Hudson River Railway Company for leave to execute a supplementary mortgage and to issue bonds secured by the mortgage to the amount of $300,000. In asking the consent of the commission to issue these bonds, the first statement of the railroad company (afterward amended) was that the intended use of the funds was to reimburse the treasury of the company for part of the amounts paid by it on account of the construction and purchase of the Orange County Railroad, but the commission disallowed these reasons, holding that the Public Service Commission law permits capitalization in New York for four purposes only: (1) for the acquisition of property; (2) the construction, completion, extension or improvement of its facilities; (3) the improvement or maintenance of its service; (4) the discharge or lawful refunding of its obligations, provided the proper commission gives a certificate of reasonable necessary and authorizes the issue; and that, since part of the funds asked for were to be used in restoring funds already expended from the treasury, the terms of the statute were not complied with. It is easy to see the commission's line of argument, and we need go no further back into railroad history than the Chicago & Alton affair for an instance of genuine harm done a railroad property by capitalizing betterment work done for a series of years out of income, on so high a basis that the company's future borrowing power was seriously impaired thereby and the value of its securities was diminished. But it looks as if strict application of the principle laid down in the Lehigh & Hudson River case was going to do a great deal more harm than good. Like the Interstate Commerce Commission's depreciation system, it puts a premium on capitalizing all new work. It has been one of the best traditions of American railroad development that as much work as possible is done out of income—sometimes temporarily, sometimes permanently. At times when money costs a great deal, a road with an abundant cash surplus will pay its construction bills out of this surplus; at times when money is cheap it will issue long-term securities to restore its surplus—if one chooses to describe it in that way. It would be equally fair to say that the long-term securities were issued to pay for the construction work temporarily financed by means of the surplus; a process which saves money for the shareholders and saves time for all concerned. Moreover, if the company is prosperous, it will frequently omit to finance these improvements paid for out of surplus, but will let them stand to the permanent benefit of the values underlying the outstanding securities. The system gives flexibility of the highest value, and has very seldom been abused, but by the construction which the New York Public Service Commission places upon the law, it is henceforth impossible in New York. In doubtful cases it will be to the interest of the railroad company to issue securities at the start, whereas under the present system it will frequently happen that new construction on a small scale will be done without issuing any capital at all. There are a great many kinds of occasional ills for which a universal preventive can only be applied at very great disadvantage. We get along very well under compulsory vaccination, but if the Pasteur treatment was required of everyone, there would be riots; yet it is very clear that the Lehigh & Hudson River ruling of the New York Public Service Commission, like the Interstate commission's depreciation and the obstacles which Massachusetts places to raising new securities, is a heroic kind of Pasteur treatment which may at long intervals save a life, but is sure to cause a great deal of unnecessary sickness in the meantime.

A well-informed observer remarked recently that the three most serious causes of errors by trainmen are: (1) mental inefficiency due to drinking (not drunkenness); (2) mental dulness due to not taking adequate rest when off duty; (3) taking chances, contrary to the dictates of good judgment. It seems to us that this is a very plausible theory, and we have no doubt that it is based on a careful diagnosis. It is significant that all three faults are of a moral nature. In other words, the first element needed in their correction is a desire or purpose to improve, on the part of the faulty person himself. This shows most forcibly how futile must be all changes in method and all mechanical aids, unless the persons to be dealt with are men of some strength of character—men with consciences, who do some intelligent thinking for themselves. The man who drinks "moderately" yet constantly is a more difficult problem for the superintendent than the one who gets intoxicated; and he often needs as much backbone as does the drunkard, if he is going to try to make himself thoroughly efficient. Neglect to take the full amount of sleep needed is also a habit which is the result of, or at least is perpetuated by, a mental infirmity that needs a good moral backbone for its cure. This is perhaps the one danger most difficult for the superintendent to reach. The night worker who neglects to sleep in the day time as he ought to can delude himself into the notion that he does not need so much sleep as the normal worker, and in case of failure in his duty he will claim that sickness in his family or some other excusable irregularity forced him into this neglect of his health. That this defense often is utterly false does not help the superintendent much in his endeavors to demolish the claim and maintain efficient service. Surely nothing more useful for the promotion of the safety of trains could be done, if only the genius could be found to do it, than to educate young men's consciences in this matter. The reader will recall the confession of a well-known railroad manager, printed not long ago, of how he used to go to ball games in the day time, at the risk of impairing his efficiency as a telegraph operator the following night. Drinking too much, and keeping awake too much are, however, mild delinquencies compared with "taking chances." But while the cure of this vice is essentially a moral issue, it may be easier to accomplish than in the cases of the other two, for it is easier to show the folly of it. The engineman who runs the risk of reaching a meeting point when he knows that he lacks two minutes of the necessary time, does so largely because he has not coolly measured the risk; and this he can be trained to do, if the superintendent is determined. One cause of this kind of recklessness is the indifference of conductors; but the enforcement of regular, intelligent and prompt co-operation between enginemen and conductors is a thing wherein superintendents can greatly improve if they set out to do so. After all of the improvement in the instruction of trainmen that has been accomplished in the last ten years, and the increased dissemination of knowledge of train rules, we should be loath to believe that enginemen of experience would take chances, with their eyes open, were it not that instances are reported now and then in the government accident bulletins. A road sending in an accident report containing such a phrase as "took chances" would seem to offer a good field for the government accident investigators—who have not yet been appointed.

STRICT CONSTRUCTION OF SAFETY APPLIANCE LAW.

The strict construction put upon the anti-trust law a dozen years ago by Justice Peckham, of the Supreme Court of the United States, in the trans-Missouri Freight Association case, when he held that a combination of competitors, however innocent and beneficial, was illegal, has now a striking counterpart in a decision rendered last Monday by Justice Moody, of the same court, holding that the law requiring that the drawbars of empty freight cars shall be 34½ in. high (from the level of the tops of the rails) must be exactly complied with. To run a car having drawbars 34¾ in. high, when empty, or 34¼ in. high, is illegal. This opinion appears in the suit of Taylor against the St. Louis, Iron Mountain & Southern, arising in a court of Arkansas and appealed by the railroad company from the Supreme Court of that state to the Supreme Court of the United States. By parity of reasoning the law requiring all cars to have automatic couplers in good condition must be construed with the utmost rigidity. To run a car with a broken drawbar, even so little as five miles to a terminal, for repairs, will make the railroad liable to the full penalty of the law.

To the present decision there is no dissenting opinion, though Justice Brewer concurred only in the result, not in the entire language of the opinion. The decision incidentally sustains the right of Congress to delegate to the American Railway Association and the Interstate Commerce Commission the duty of fixing a standard height of drawbars for freight cars. As to the question of adhering to the standard height, it was contended by the railroad company that it had employed men whose business it was to see that the drawbars were of the standard height; that it had furnished them material and appliances to keep the drawbars at the standard height; that its employees were capable; in short, that reasonable care had been used to keep these appliances at the standard height. But the court holds that the statute is absolute, and that if the road fails to have the cars at all times in such condition as to comply with the statute, it is liable to an employee injured while using such unlawful couplers. This overrules a number of contrary decisions which have been made by district and circuit courts.

As to the claim that this strict construction would work hardship on the railroad company, Justice Moody said:

"Where an injury happens through the absence of a safe drawbar there must be hardship. Such an injury must be an irreparable misfortune to someone. If it must be borne entirely by him who suffers it, that is a hardship to him. If its burden is transferred, as far as it is capable of transfer, to the employer, it is a hardship to him. It is quite conceivable that Congress, contemplating the inevitable hardship of such injuries, and hoping to diminish the economic loss to the community resulting from them, should deem it wise to impose their burdens upon those who could measurably control their causes, instead of upon those who are in the main helpless in that regard."

SECONDARY STREET RAILWAY FINANCING.

Amid greater and more sensational events a new phase of street railway operation in Massachusetts bearing directly on street railway finance has almost escaped attention outside of that state. It is the extensive movement there toward the increase of railway fares. It cannot, as yet, be described as general. It does not affect much the fares in the cities of the state. But on country and cross-country lines the increase has already in many cases been adopted. It ranges all the way from the substitution of six cents for the familiar and convenient "nickel" up to the added nickel for runs not always long; and it is based, nominally, on the increased cost of labor, materials and the expense of operation generally. Actually it strikes back to conditions of street railway financing peculiar to Massachusetts and which suggest a secondary stage of such financing there and elsewhere.

It is a very familiar fact that during the last two decades of electric street railway expansion in this country while floods of water have been poured into both stock and bonds of street railway corporations and the unscrupulous "promoter" has been high in the saddle Massachusetts has insisted sternly on honest capitalization based mainly on actual replacement value. It is not too strong a statement to say that her enforced capitalization in stock and debt of about $50,000 a mile has fixed an American standard of just capitalization, contrasting strikingly with more than double that amount in Connecticut, and with the dropsy in such states as Rhode Island and Pennsylvania, saying nothing of the acuteness of that disease in the New York City lines. But honest financing in the Massachusetts trolleys has been attended with one unlooked for result. Theoretically it would argue high prosperity for her trolleys and few receiverships. In fact, returns on her trolley investments have not been high and receiverships have been many, while just over the line in Connecticut, under "high" trolley finance only one out of some 30 original street railway corporations has suffered reorganization—though it must be said that the contrast with other states would by no means be so impressive. The seeming paradox, however, is easily enough explained. In Massachusetts, with her 34 cities and dense population, excessive trolley building ensued *spite* of restrictive law and ensued under unusually strong competitive conditions. Low fares and good services—at pretty high cost in many cases—have been the rule as compared with other states; and, finally, to a much less degree than in other commonwealths have there been in Massachusetts the big trolley combinations in which the strong lines of high earning power have carried the weaker ones.

There comes now, in that state, a readjustment of the situation expressed in higher fares. This is interesting in itself. It is doubly interesting when correlated with the recent dictum of the Massachusetts special commission in favor of allowing street railway companies as well as other corporations, to issue new stock, no matter what its market value, at par instead of the market price and thus reverse the Massachusetts statutory rule in operation for 15 years. This is to be interpreted as the proffer of a higher reward than hitherto on street railway enterprise. In other states the proposition goes much further. Promoters are proclaiming loudly that, with profitable trolley territory to a great extent exhausted, a watery "bonus" of some sort must be an element in every new trolley project. Succinctly stated it has been "no bonus no trolley," though the claim has not been for a bonus of the size in the earlier days of trolley promotion. In the last Connecticut legislature this claim was made openly and, strangely enough, prevailed over a dozen or more vetoes of the Governor. "Give us the trolley no matter what its financing" was the dominating cry in the same commonwealth where the watering of street railway securities has been not only scandalous in amount but the object of the sharpest popular criticism.

In this secondary stage of street railway development in this country where the trolley project is necessarily breaking away from the cities and from dense populations into rural communities and into long distance lines it will be edifying and instructive to observe how the rival forces outlined are to work out. On the one hand there is the general outcry against watered stock, the assertion not unfounded in fact, that it implies poorer service and higher fares, and the demand that the lines be desiccated by new valuations based on actual cost. On the other hand, particularly when one panic period is past and capital becomes more free and fluent, we are certain to find fresh appeals to legislatures to validate the bonus in stock or bonds as the price of new electric lines. The material and localized temptation will be set against the same policy of a state and the same men who uphold that policy will be found yielding to temptation and sacrificing consistency when it comes to their own interests or that of their immediate constituency. We may also see the incongruity of one fiscal policy applied to lines in operation; another and entirely reversed policy to projected lines. As there is no middle way between honest and inflated capitalization some of the future results promise, to say the least, to be satirical

Train Accidents in April.

April, which may always be expected to show the lightest accident record of the year, well maintains its reputation, with the difference, this year, that it follows two other light months. The three together, February, March and April, make a showing more favorable than any three months since a time when the railroad system of the country was very much smaller than it is now.

None of the train accidents in the present list is of sufficient magnitude to be put into our "prominent" class, but we append notes of two of them, and also give, following the list, some notes on a number of accidents which do not come within the term "railroad train accident" though they are of a kind which should be mentioned here.

The collision of passenger trains at Cleveland, Ohio, on the 30th, is said to have wrecked the engines and the baggage cars of both trains, but fortunately only four persons were seriously injured. The accident was due to the misplacement of a switch just in season to send a southbound passenger train on to the side track, where it struck a northbound train. The switch was thrown, just before the train came along, by a man who is believed to be insane or demented. Having been arrested and questioned, he claimed to have obeyed a signal from a brakeman of the standing train; but the brakeman was attempting to make the man straighten the switch, having observed that it was wrong.

The collision near Rock Glen, Pa., on the 20th, which resulted in the death of a fireman, was between southbound passenger train No. 15 and a locomotive running in the opposite direction, which appears to have encroached on the time of the passenger train. The passenger was running about 35 miles an hour when it struck the empty engine, and both of the engines were wrecked and thrown into the ditch. The baggage car of the passenger train was crushed, but only one passenger was badly injured.

Of the dozen electric car accidents reported in the newspapers in April one resulted in the death of nine persons and three others were notable. The fatal one was a butting collision on the 28th between cars of the Detroit, Jackson & Chicago near Ypsilanti, Mich. Both the eastbound and the westbound cars were heavy and were running at high speed, the collision happening on a curve where the view was short. The responsibility is laid at the door of the motorman of the eastbound car, who was killed. The running time of this car had been changed, beginning on the day of the collision, but no evidence is published to show that this was the cause of the motorman's error. Whatever may have been his assumption as regards his right to the road, he ran at full speed past the side track where he should have waited. According to a press despatch the state railroad commissioner of Michigan attributes the collision to faults in the despatching system, and will take steps to secure the adoption of "a standard system of despatching"; he will call a meeting of railroad officers for this purpose. What is meant by "a standard system" we do not know; but the commissioner should know that the best standard in existence is unsatisfactory without the use of the block system along with it. The improvement of the American despatching system has been discussed for 25 years, but it still remains unsatisfactory. Those roads which have made the most intelligent and persistent attempts at the improvement of the despatching system are now adopting (or extending) the block system, the use of which removes the necessity for the impossible refinements of the despatching system. This action of these roads would seem to indicate that efforts to accomplish a satisfactory degree of safety by the use of the despatching system are likely to be fruitless.

At Chicago, on the 7th, the leading car of an elevated railroad train jumped the track near Indiana avenue and one end of it fell to the ground, lodging in the back yard of a residence. The rear end of the car, however, remained leaning against the elevated structure. Of the 50 persons in the car, eight were seriously injured. On the Washington, Baltimore & Annapolis electric road, near Crownsville, Md., on the 12th there was a butting collision of cars in which eight persons were slightly injured. In this case it is said that a special car standing on a side track was mistaken by the motorman of the eastbound car for the regular which he should meet.

Near Williamsport, Pa., on the 22d, nine lumbermen were killed and 15 others seriously injured in the wreck of a runaway train of logs; but this is not to be classed as a "railroad accident" as it occurred on a logging company's track.

A collision in Australia, on the 19th, killing 41 persons, and one in Mexico, on the 24th, killing 28, have already been reported in the *Railroad Gazette*.

[1] Abbreviations and marks used in Accident List:

rc........Rear collision.
bc........Butting collision.
xc........Other collisions; as at crossings or in yards. Where only one train is mentioned, it is usually a case of a train running into a standing car or cars, or a collision due to a train breaking in two on a descending grade.
b.........Broken.
d.........Defective.
dr........Defect of roadway.
eq........Defect in car or engine.
n.........Negligence.
unf.......Unforeseen obstruction.
unx.......Unexplained.
derail.....Open derailing switch (negligence of engineman or signalman).
ms........Misplaced switch.
acc. obst..Accidental obstruction.
malice....Malicious obstruction of track or misplacement of switch.
boiler.....Explosion of boiler of locomotive on road.
fire.......Cars burned while running.
Pass......Passenger train.
Ft.......Freight train (includes empty engines, work trains, etc.).
*Wreck wholly or partly destroyed by fire.
†One or more passengers killed.

New York Central & Hudson River.

The annual report of this company for the calendar year in 1907 is of quite unusual interest, for several reasons. It will be recollected that the first train operated by electricity on this company's line ran into Grand Central on September 30, 1906, and that on December 11, 1906, regular service with motor cars for the Yonkers local trains was begun between the Lexington avenue temporary terminal and the present terminus of electric operation on the Hudson division at Highbridge, the trains being hauled thence by steam locomotive to Yonkers. Therefore, as far as electrification is concerned, 1907 represents the first complete year of operation.

The difficulties have been very great. Yard and station changes have been continuous. The New Haven road has not even yet got to the point where it hauls all trains out of its part of the station by electricity, and the New York Central has consequently been impeded by the long-drawn-out continuation of the construction stage of the work. Both the New York Central locomotives and the New Haven locomotives fall short of satisfactory performance, one company experiencing its principal difficulty in obtaining full tractive power; the other in the effect of the electric locomotives upon the track. To add to these difficulties, the New York Central has not yet been able to extend the zone of electric operation beyond the boundary at Highbridge on the Hudson division, and delays at these points are none the less irritating because they are inevitable. The multiple-unit trains have proved to be a heavy drag on the steam locomotives used to draw them over the portions of their run which have not yet been put under electric operation, and this has occasioned further delays.

To add to the embarrassment of its local service, the west side extension of the Interborough Rapid Transit subway has taken a great deal of the short haul traffic and made many of the commutation trains entirely unprofitable. While following out a natural desire to economize in a period of depression by reducing unprofitable train service, the company has encountered severe local opposition and has had to comply with the train service requirements of the Public Service Commission. But it can be freely said that the suburban difficulties have been gradually clearing away, and may be expected to make themselves less and less felt, with each succeeding month. The great advantages of operating this kind of traffic by electricity are bound to make themselves felt as soon as the unsatisfactory mixture of steam and electric service in the same territory is done away with. Nevertheless, these suburban difficulties make perhaps the most characteristic feature of the company's year.

Another very interesting development, brought out during the past year, has been the practical demonstration of the value of the company's "equities." The market price of New York Central has always been higher than would have been justified by its available surplus earnings, and the reason for this, apart from the geographical location of the lines, has lain in the fact that some of the subsidiary properties, notably the Lake Shore & Michigan Southern and the Michigan Central, were earning free and clear a good deal more than they were paying out in dividends and were putting the money back into permanent improvements which increased earning power. The actual value of these "equities" was clearly shown this year. Net earnings of the New York Central in 1907 after all expenses were $3,262,087 smaller than they were in 1906, but by the simple device of increasing the dividends of subsidiary companies, the company increased its "other income" $3,768,313, so that the gross income available for charges and dividends was half a million dollars greater in 1907 than in 1906, and net income after charges, including the interest on the three-year 5 per cent. gold notes of 1907, was $116,182 greater than in 1906.

Gross earnings were $98,369,060, as against $92,089,769 in 1906, the increase being occasioned in considerable part by the large additional tonnage both of bituminous and anthracite coal as compared with the unusually light tonnage during the first six months of 1906, at the time of the strike in the bituminous coal fields. The average freight haul for the year shows a slight increase, but the relative increase in coal tonnage as compared with that of higher class freight produces the decrease in the average haul per ton per mile. Passenger earnings were $29,847,859—just about half the freight earnings—an increase of $1,269,081, due entirely to the volume of business interchanged with foreign lines, since commutation business continued to decrease, doubtless for the reasons already outlined in this review. The company has an important equity, if it may so be called, in the undeveloped state of its commutation business at the present time in densely populated territory, and when it gets its electric operation in really first class shape, it can add very materially to its passenger profits from this source. The profit of an ordinary commutation service, with steam trains, is a moot point; at best, it is doubtful, but an electric service permitting of very frequent trains in relatively small units without unduly high costs is probably going to change this, as soon as it gets a fair chance to do so. The results will be watched with great interest.

At the close of 1907, the Lake Shore dividend was increased from 8 to 12 per cent.; the Michigan Central dividend, from 4 per cent. to 6 per cent. (annual basis), and the New York Central rate from 5 per cent. to 6 per cent. In connection with the increased stock, of which $149,300 was issued during the year, this increase in the dividend rate cost the company $2,885,036; the entire dividend payments in 1907 amounting to $10,717,920. A quarterly dividend of 1½ per cent. was paid in January, 1908, in spite of the great falling off in earnings, but at the March meeting the road was put back on a 5 per cent. annual basis, and the April dividend was 1¼ per cent. Prior to the panic, the company was well able to pay the higher rate, in spite of its very large legitimate capital requirements, and it may be surmised that it will be able to do so again before many years.

An agreement was entered into during 1907 between the New York Central and the Pullman Company, providing for Pullman car service for 25 years from January 1, 1905, and with the Western Union Telegraph Company, for telegraph service for 30 years from January 1, 1906. These contracts supersede all prior agreements with these companies and are more favorable in their terms to the railroad company. The company's holding of 5,748 shares of Boston & Maine stock, acquired during the previous year, was exchanged for an equal amount of the capital stock of the New Haven road during 1907. The New York Central's funded debt was not changed during 1907, but to obtain equipment for immediate requirements the New York Central, Lake Shore, Michigan Central, Big Four, and the Chicago, Indiana & Southern have become parties to an equipment trust dated Nov. 1, 1907, providing for an issue of $30,000,000 of equipment trust certificates, being 90 per cent. of the total cost of the equipment to be furnished under the terms of the agreement. J. P. Morgan & Co., and Drexel & Co. offered these equipment trust certificates in January, 1908, on the basis of about a 5¾ per cent. yield to the purchaser.

Since the publication of the report, perhaps the most important item of news about the company is the fact that the option on the controlling interest in the New York, Ontario & Western, given during 1907 to the New Haven road, and expiring early in January, 1908, has been extended indefinitely, probably until the New Haven-Boston & Maine tangle is straightened out.

Maintenance of way per mile of road operated in 1907 was $3,295, against $3,052 in 1906. Repairs and renewals of equipment cost $2,242 per locomotive, against $2,038 in 1906; $836 per passenger car, against $723 in 1906, and $76 per freight car, against $60 in 1906. The company spent for additions to property and charged to capital account $6,400,000. About $1,000,000 was spent in double-tracking the West Shore railroad between Churchill, N. Y., and Syracuse junction; third and fourth tracks between Lake Crossing, Mass., and South Framingham, on the Boston & Albany, cost $184,000, and third track at various other places on the Boston & Albany cost an additional $379,000. Maintenance expenses used up about the same percentage of gross earnings last year as in 1906, but conducting transportation increased from 40.17 per cent of gross earnings to 46.76 per cent.

Traffic statistics show slightly increased efficiency of operation. The average trainload of revenue freight was 419 tons carried per train-mile, an increase of 16 tons over the previous year. While the empty freight car mileage increased from 219,000 to 278,000, the average number of empty freight cars per train-mile remained precisely the same, that is 12, in 1907 as in the previous year.

The principal statistics of operation were as follows:

	1907.	1906.
Mileage worked	3,782	3,784
Freight earnings	$59,406,147	$54,824,283
Passenger earnings	29,837,859	28,568,778
Gross earnings	98,369,060	92,089,769
Maint. of way and struct.	12,162,047	10,718,599
Maint. of equipment	14,823,631	14,569,057
Conducting transportation	45,995,903	37,267,589
Operating expenses	75,803,334	64,953,695
Net earnings	22,565,726	27,136,073
Other income	11,476,051	7,707,738
Gross income	34,041,777	34,843,811
Net income	11,083,829	12,275,907
Dividends	10,717,920	7,832,885
Appropriated for betterments	......	4,108,261
Year's surplus	66,539	19,134

NEW PUBLICATIONS.

Practical Hydraulic Tables and Diagrams. By C. B. Heasden, Superintending Engineer P. W. D. India. London and New York: Longmans, Green & Co. 105 pages. 7 in. x 4¾ in.

The object of this collection of tables and diagrams is to afford a means of quickly ascertaining the sizes and cost of the pipes required for a complicated system of water supply. Incidentally, they also apply to surface drains and underground sewers. They were originally designed for personal use and they bear the marks of this purpose even in their final form in that the compiler has overlooked the fact that the engineer who will use them is not as familiar with all of the methods and the abbreviations that are used as the compiler himself. Until this familiarity has been obtained, it is necessary to refer back constantly so as to see what the signs and symbols that are used refer to. This holds not only for the formulas but also for the tables and diagrams as they are presented in their completed shape for use. The value of frequent repetitions of the meaning of symbols cannot be too strongly emphasized where a book is to be used for reference and there is to be a search for one item of information only, regardless of what has preceded or what is to follow.

In a book like this where the final results only are to be used and the steps in the process are not fully explained, it must be borne in mind that the user is presupposed to have a large amount of information on the subject, so that there is no review of the general principles of hydraulics. For this subject, only the methods of preparing the tables are given, and it will be necessary for the engineer to make himself perfectly familiar with these methods and back this familiarity with a further knowledge of hydraulics before the tables can be successfully used. This can only be accomplished by a careful study of the development of the formulas and their results from the start, and when this has been done the tables and diagrams will be found to be in such form that the determinations of size and capacity of the piping to be used will be rapidly made.

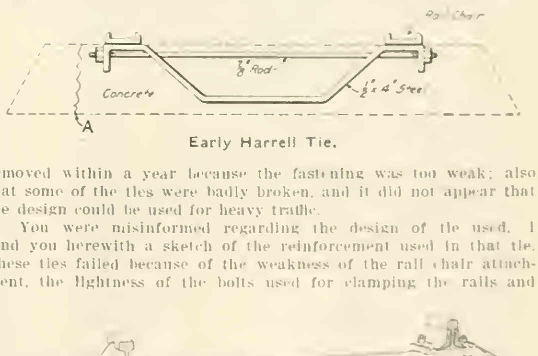
CONTRIBUTIONS

The Harrell Reinforced Concrete Tie.

Chicago, May 7th, 1908.

TO THE EDITOR OF THE RAILROAD GAZETTE:

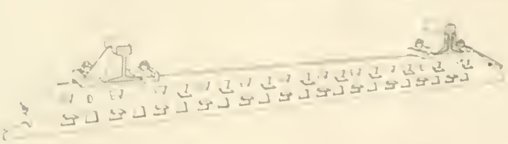
In the editorial on Metal and Reinforced Concrete Ties in your issue of May 1 you say there were 30 Harrell perforated vertical center-plate composite ties put in the Pennsylvania main line track near Harrison street, Chicago, in 1899. You state that they were all



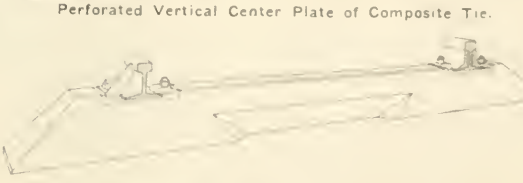
Early Harrell Tie.

removed within a year because the fastening was too weak; also that some of the ties were badly broken, and it did not appear that the design could be used for heavy traffic.

You were misinformed regarding the design of tie used. I send you herewith a sketch of the reinforcement used in that tie. These ties failed because of the weakness of the rail chair attachment, the lightness of the bolts used for clamping the rails and



Perforated Vertical Center Plate of Composite Tie.



Harrell Composite Tie.

Length, 8 ft.; depth [illegible]; width at bottom [illegible] 10 [illegible]; width at bottom in center, 11½ in.; [illegible] at top [illegible]; weight, approximately, 375 lbs. Reinforcing steel plate, 7 in. wide and [illegible] in. thick with 40 perforations 2 in. square. Bolts ¾ in. x 4 in. Rails clamped to and bear directly on steel center. End plates and bolts can be removed without disturbing the concrete.

the absence of reinforcement outside of the rail. The concrete in some of them broke at the point marked A in the sketch.

I also send you a drawing of the perforated vertical center-plate tie. The first ties from this design were made by McCord & Co. in 1901, 1,000 being made on contract at Hegewisch, Ill. These were tested in the tracks of the Illinois Car & Equipment Co.'s plant at Hegewisch and proved fully satisfactory. J. J. HARRELL.

Snow Fences.

Chicago, May 15, 1908.

To the Editor of the Railroad Gazette:

In your issue of May 8, page 636, I notice a statement in "Picked Up on the Road" which I know to be erroneous. Gulf says that snow fences were not common in this country until subsequent to 1893. I entered the service of the Chicago, Burlington & Quincy in October, 1882. In January, 1883, I made a trip over the entire line from Burlington, Iowa, to Denver, Colo., on a special. We also traveled some distance on the Humeston & Shenandoah (afterwards the Keokuk & Western and now part of the Burlington system), the Missouri Pacific and the Union Pacific. On all these roads as well as on the C., B. & Q. there were snow fences set up virtually along the same lines as we have them to-day.

I remember it distinctly because they were the first I had ever seen. From 1883 until 1893 I was employed on work that required my supervision of the taking down and storing snow fences for the summer and repairing same and setting them up in the fall.

As my duties along that line ceased in 1893 I know that it was prior to that time that snow fences were in general use throughout Illinois, Iowa, Nebraska, Kansas, Missouri and Colorado. I cannot say whether or not they were used further north at that time. If the Frenchmen did not adopt snow fences until 1890 they were certainly behind us. JAMES B. LATIMER,

Signal Engineer, Chicago, Burlington & Quincy.

For Better Car Wheels.

New York, May 18, 1908.

To the Editor of the Railroad Gazette:

In response to your invitation to present the car wheel subject again I will undertake to do so even at the risk of repeating some things that have been said before, and some things that are so well known that to mention them seems unnecessary.

No matter how old the car wheel story may be, no one can deny that it is a matter of increasing concern from year to year. Railroads may be constructed and operated according to one standard of merit or another. If the standard is good the results will correspond; if the standard is bad then the particular railroad in question will suffer. But there is one thing over which no railroad has control in respect to its particular standard of practice, and that is the car wheel. One of the leading American railroads has in the matter of its car wheel supply followed for years the plan of selecting its own materials conducting its own wheel manufacturing operation, and yet probably suffers as much as any other railroad of like magnitude with respect to the results obtained from wheels under cars running over its lines. The reason being that so large a proportion of its traffic consists of hauling cars built and owned by other companies, or even of its own cars equipped with wheels replaced on the lines of other companies. The same result obtains in great or lesser degree in the case of every railroad company endeavoring to live up to the standard of good practice in the purchase and use of wheels. If a car breaks down it is repaired and the cost charged where it belongs. If a rail breaks the penalty is paid by the railroad that purchased the rail, but the car wheel is purchased by any one railroad, to fail, perhaps, on some other, and allowing for the few dollars that may be recovered in the few instances that owners can be held responsible—the penalty is paid by the railroad on which the failure occurred. This one fact places the car wheel in the front rank of items for which any one railroad may have to pay the bill for the order of practice carried on by any other.

The failure of one wheel running under a car on tracks adjoining other tracks on which passenger trains with every part of equipment maintained at the highest standpoint of quality and efficiency may precipitate an accident as fatal to life and property as the failure of tho most carefully constructed part of the passenger train. In these days of continuous operation of passenger and freight trains over tracks but a few feet apart there is little time or opportunity to avoid the results of such accidents and the whole operation becomes one in which all parts affect other parts—the failure of one involves disaster to another. Such observations are part of the old story—to repeat them as stated seems unnecessary, but the point is, are they true, and is the effort to guard against such dangers being exercised as energetically as should be. There is no doubt that the great majority of the makers and users of wheels give their best efforts under their control to safeguard such operations, and that there is a greater appreciation than ever before of the necessity of bringing the order of practice as near as possible to the best standard on the part of all concerned.

The difficulty seems to be to agree upon the way in which progress toward the desired end can be made. Taking it for granted that it is the desire of all concerned to bring the car wheel up to the necessary standard of safety and durability, the first necessity is to determine the conditions which have to be met and provided for in the present order of operations, compared with those that existed a few years ago, when the makers and users of wheels were better able to meet the situation. There is a vital necessity of prompt action in this respect because there appears to be differences of opinion on matters which after all are simple mechanical questions.

The increased load and speed have produced two effects on the wheel.

First.—It has become more liable to failure through inability to support the load.

Second.—It has been called upon to sustain greater physical and molecular changes in the parts immediately affected by breaking friction and the shocks and strains of service. As the result of investigation and study of present service conditions and as proved by statistics concerning them it may be conceded that the strength of the wheel *as a whole* is sufficient. The percentage of failure in this regard is not increasing; in fact, considering the great increase in hardship of service, it may be said that progress in this direction is most satisfactory. During the past few years the subject has received such attention and study from the wheel makers and railroad officials through the action of their representative associations that uniform standards of section and weight for different classes of service have been adopted and have been put into general use with a promptness seldom known in past experience.

The results of the second effect referred to are more difficult to provide for. There has been a marked increase in the percentage of wheels removed for certain causes, and whether this increase can be or should be prevented by the maker or user of wheels is a question that so far is responsible for a great deal of delay in finding the remedy.

Naturally the user looks to the maker to provide the remedy if possible. The average railroad mechanical officer is a busy man; he has many problems to solve that call for immediate action, and until general problems become acute he does not usually spend much time upon them. In this part of the car wheel problem a practical if not technical knowledge is needed, and it is not to be expected that such knowledge is possessed by all concerned. To make careful investigation, to seek information from those having it and to be governed accordingly, is after all the most that can be expected from the average railroad official of the kind.

On the part of the manufacturer, to study conditions of manufacture and service, and to make provision so far as the limits of possible cost and price obtained, will admit whereby wheels suitable for the increased service conditions may be supplied is about all that can be expected.

The natural tendency of both maker and user is to feel that the responsibility rests principally on the other man. That may be so, but when both are confronted with a condition which involves the safety of life and property, and that condition is becoming daily more critical, then it becomes the duty of each to find the remedy as quickly as possible.

To provide the remedy in this case must first depend on finding the cause. The defects referred to in which the increase is serious are confined to the wearing surface of tread and flange. Fine cracks in the surface coming in contact with brake-shoe and rail develop until groups of such cracks make the wheel defective.

Some railroad officials and some car wheel makers say that it may be possible to make certain changes in the quality of metal used or in the process of manufacture that will overcome this defect—in other words prevent its occurrence.

This statement disregards the fact that the repeated heating and cooling of the surface of any metal will inevitably produce similar effects, for the reason that rapid heating of the surface causes expansion which does not occur with the metal under such surface and unless the heating is gradual enough to permit the proper expansion of the metal as a whole, then the heated part must expand regardless of the fact that expansion does not take place in adjoining parts.

When the surface of the tread and flange of the wheel is quickly heated and expands, the fine surface cracks must occur. Considering the great number of times that such surface heating is caused by the friction of brake-shoes, there can be no question that the reason for the defects in question arises from the condition described. No metal used in car wheels can be free from such defects under such conditions. It may be that certain changes in material used will apparently produce better immediate results, but this will be due to the fact that trials of that description occupy a certain period of time, during which the defects are developing in the trial lot of wheels.

The condition that produces such defects is repeated many times before its worst results accumulate and become plainly evident.

In any case railroads that have manufactured their own wheels, using the best of material, suffer as much from the defects referred to as those that have given much less time and trouble to the matter.

The conclusion that seems apparent is that relief will be obtained only by decreasing the severity of the conditions causing the defect or by providing some means of changing such conditions.

To find qualities of metal that will stand constant and excessive heating and rapid cooling and that will produce the conditions of safety and durability under such treatment, may be a future but certainly is not a present possibility. It therefore appears necessary to develop some other means of preventing the trouble. The need for some effective action is very great. Wheel manufacturers and railroad officials appreciate that fact. Not only does the great reduction in life of wheels cause a heavy increase in cost of operations but the menace of accidents that must result from the large number of wheels that are constantly having to be removed for the defects described is very great.

It is natural to conclude that if a large and increasing proportion of all wheels removed show flange defects, there is danger of accidents from wheels in service with similar defects. It is natural also that considerable time should be required to investigate and work out such matters, but after all the subject is about the most important practical one before the railroad public.

It appears from statistics that over 50 per cent. of all wheels are removed from service on account of flange wear and flange defects, and that the proportion is increasing. Some way must be found of meeting such a situation. There are about 20 million car wheels in use in America, of which over 95 per cent. are chilled wheels, the balance steel tired or solid steel wheels. A great deal has been said and written of the comparative merits and the demerits of each kind of wheel. That is probably a question that will be determined by service results.

The chilled wheels possess the advantage of low first cost, high relative scrap value and long life under proper conditions of service with very little expense of maintenance. The hardness of the wearing surface of tread and flange exceeds that of steel by about the relative difference in the proportion of combined carbon present in the metals.

Steel wheels have not been used under freight cars to a sufficient extent or for a sufficient time to afford very much knowledge of what they will accomplish and to what extent maintenance cost will be increased. Probably both classes of wheels have their advantages in point of wear and economy for certain classes of service, but these advantages will be determined by service results only.

If the situation is to be relieved by the use of steel wheels then railroads must certainly face a very heavy increase in first cost and maintenance charges. If it is to be by some modification of the chilled wheel then it is time for modifications to be tried. Railroads must have wheels that will do the work safely regardless of cost—to disregard this fact would be impossible. To allow the present condition to grow from bad to worse is not sensible.

Chilled wheel manufacturers have not changed their conditions of practice as much as might have been done to keep pace with the increasing demands of service, but this is largely if not wholly due to the fact that railroads in general have been unwilling to pay prices for car wheels that would admit of any such changes and improvements.

It appears now that railroads may take a different view in such matters, and it behooves the chilled wheel makers to take up the subject actively; otherwise the inference will become established that in the opinion of the majority of wheel makers improvements are not possible.

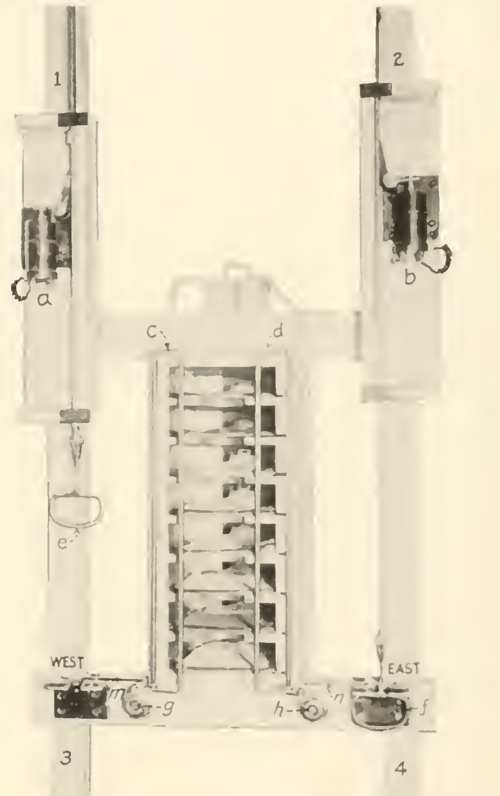
Of course such an inference would be absurd but only active work on the wheel makers' part will avoid its establishment. There is also the disinclination on the part of some wheel makers to concern themselves about such matters. In some particular sections of the country the use of heavy capacity cars has not yet attained considerable proportions, and wheel makers in such localities no doubt feel that they are not particularly concerned. The broad fact is, however, that the use of heavy equipment is rapidly increasing and that some way must be found of bringing the car wheel up to the point of greater safety and durability without much further delay.

F. H. GRIFFIN.

A Locked Cabinet for Train Orders.

The photographic illustration given herewith shows a safety device for handling train orders, invented and patented by W. R. Scott, Assistant General Manager of the Southern Pacific, at San Francisco, and E. M. Cutting, Supervisor of Signals of the Western division, of which Mr. Scott was formerly superintendent. The purpose of the invention is to keep operators from forgetting to deliver orders to trains, and this purpose is carried out by locking up the orders and blanks so that the operator cannot get a blank to use for making an order until his signals are displayed in the stop position. The different parts of the illustration are indicated as follows: 1, 2, 3, 4, frame; *a*, *b*, solenoid locks on signal levers; *c*, *d*, frames, in the nature of doors, by which the train order clips are locked in the cabinet; *e*, *f*, handles by which the signals are cleared; *g*, *h*, push buttons for closing electric circuits; *m*, rod connected to the door for preventing the locking of the handle of the signal lever in the clear position when clip boards are out.

The cabinet has as many shelves as may be required to furnish one for each train-order clip-board in use. These boards have at their back ends brass strips by means of which, when put in place on the shelf, they close each an electrical connection forming part of the circuits to the locks *a b* on the signal levers. With all the clips in place, the electric circuit is completed, so that by pressure on button, *g* or *h*, current from the battery is supplied to the solenoid *a* or *b* withdrawing the dog from beneath the boss on the signal rod and allowing the signal to be pulled clear. Either or both locks may be energized by pressing the appropriate button or buttons. Both signals must be displayed at stop before the operator can withdraw a clip-board, as both doors must be opened before a board



Southern Pacific Train Order Cabinet.

can be taken out. When the doors are open they prevent fastening the signals at clear by pushing rods *m* and *n* over the hooks by which the signal handles are held down. With any board out, it is impossible to close the circuit to either lock, and, therefore, the operator is unable to clear either signal until the boards are all restored to their places.

Having taken an order, the operator leaves it on the clip-board until the conductor comes in to affix his signature, and, with the board (and order) out of the cabinet, the operator may go about his other duties being assured that his signal is displayed at stop. Having delivered an order he restores the clip-board to the cabinet and closes the doors *c d*. Having closed these he has withdrawn rods *m n* so that either of the signal handles *e* or *f* may be hooked down, and therefore he can clear either signal.

The division between Russia and Japan on that part of the Chinese Eastern Railroad which extends from Charbin southward to Port Arthur is at the station Kuanchentsy, 148 miles south of Harbin, and 428 miles north of Port Arthur. The Japanese narrowed the gage on their part of the line, so that through trains are now impossible. Provision is made for tracks of both gages for 20 miles south of Kuanchentsy to Changchun, where transfers from southbound trains will be made. Kuanchentsy is the transfer station for northbound traffic.

Accident Bulletin No. 26.

The Interstate Commerce Commission has issued Accident Bulletin No. 26, giving a summary in the usual form of the railroad accidents in the United States during the three months ending December 31, 1907. The number of persons killed in train accidents was 220 and of injured 1,187. Accidents of other kinds, including those sustained by employees while at work and by passengers in getting on or off cars, etc., bring the total number of casualties up to 20,458 (1,092 killed and 19,366 injured). These reports deal only with (*a*) passengers and (*b*) employees on duty.

TABLE No. 1.—*Casualties to Persons.**

	Passengers Kil'd.	Passengers Inj'd.	Employees Kil'd.	Employees Inj'd.	Tot'l persons reported Kil'd.	Tot'l persons reported Inj'd.
Collisions	11	1,477	105	1,188	119	2,665
Derailments	7	629	71	519	78	1,148
Misc. accidents and boiler explosions	..	19	23	355	23	374
Total train accidents	21	2,125	199	2,062	220	4,187
Coupling or uncoupling	..	.....	77	945	77	945
Other work about trains or switches	..	.....	64	4,771	64	4,771
In contact, bridges, structures, etc.	..	5	26	422	26	427
Falling from or getting on cars or engs.	36	568	181	3,395	217	3,963
Other causes	24	626	464	4,447	488	5,073
Total, other than train accidents	60	1,199	812	13,980	872	15,179
Total all classes	81	3,324	1,011	16,042	1,092	19,366

*In Table No. 1 "passengers" includes passengers traveling on freight trains, postal clerks and express messengers, employees on Pullman cars, newsboys, live-stock tenders, men in charge of freight, etc.

This bulletin shows marked decreases in nearly every item of Table No. 1, reflecting the marked falling off in traffic which began last autumn on practically every railroad in the country. The largest proportional decrease, that in the number of passengers killed in train accidents, is in an item which is not so directly proportionate to the volume of traffic; this for reasons which have been noticed in previous bulletins; while the fatal accidents to passengers from other causes—largely from their own negligence or want of caution—have not decreased (60 now, 54 a year before). This probably indicates that the decrease in the total number of passengers traveling was not large; while, on the other hand, the diminution in the number or the severity of accidents affecting only trainmen undoubtedly is due, not alone to a falling off in traffic, but also to the diminished pressure under which the trainmen do their work. With the reduction in the volume of traffic there has been less of overwork and excessive hours, and also probably a weeding out of the less competent men.

The list of train accidents notable by their magnitude, heretofore of considerable length in each quarter, is now happily much reduced, the chief items in Table 2*a* being collisions 1, 9 and 11. Derailment No. 1, though comparatively of small magnitude, is noticeable as being one of a new class. It was a derailment of an electric car, running alone. Electric railroads doing interstate business have been so few that hitherto their reports have not been prominent in the accident records. Cars running alone are subject to accidents from defective brake apparatus which in trains of cars would not cause serious trouble.

In the amount of damage done to cars and engines there is no important decrease, as compared with the corresponding quarter in the preceding year.

TABLE 1*a*. *Comparisons with Last Bulletin and with Same Quarter One Year Back.*

	Bulletins No. 26.	No. 25.	No. 22.
Passengers killed in train accidents	21	110	180
Passengers killed, all causes	81	195	234
Employees killed in train accidents	199	236	294
Employees killed in coupling	77	87	84
Employees killed, all causes	1,011	1,144	1,196
Total passengers and employees killed, all causes	1,092	1,339	1,430

The total number of collisions and derailments was 3,964 as below:

TABLE No. 2. *Collisions and Derailments.*

	No.	Loss.	Killed.	Injured.

TABLE 2*a*.—*Causes of Forty-One Prominent Train Accidents (Class A).*

[NOTE.—R. stands for rear collision; B, butting collision; M, miscellaneous collisions; D, derailment; P, passenger train; F, freight and miscellaneous trains.]

COLLISIONS

No.	Class	Kind of train	Killed.	Injured.	Damage to engines, cars & roadway	Reference to record	Cause
1	B.	P. & F.	5	0	$2,125	76	Passenger train ran over misplaced switch and into head of freight train standing on side track; dense fog; man in charge of switch in service only five days but had been employed by this company two years before.
2	B.	P. & F.	0	18	2,215	46	Eastbound passenger collided with westbound standing freight; passenger ordered to run on westbound track; operator wrongfully reported freight had cleared that track. It was standing near his cabin, but he thought, or assumed, that it had passed.
3	R.	F. & F.	1	2	2,500	71	Engineman (killed) disregarded flag; had been on duty 28 hrs.
4	B.	F. & F.	2	1	2,500	81	Misplaced switch; misplaced by brakeman of seven months' experience; on duty 18 hrs. 30 mins.
5	R.	F. & F.	0	3	2,520	82	Failure to protect standing freight train by flag; conductor asleep in cab; flagman also in caboose; these men on duty 13 hrs. 57 mins.; following train had been warned by two torpedoes.
6	R.	F. & F.	3	0	3,275	41	Freight standing at water station not protected by flag; 3 men in caboose killed.
7	R.	P. & P.	1	4	5,075	5	See note in text below.
8	B.	P. & F.	0	11	5,725	20	Conductor held order giving him until 6:15 to reach a certain station; took it for 6:50 and so told engineman; engineman did not read order; order not shown to fireman or brakeman.
9	R.	P. & P.	3	36	5,920	67	Three passengers killed; passenger train ran past automatic block signal indicating stop and struck passenger train standing at station. Engineman on duty 11 hrs. 20 mins.
10	B.	P. & F.	1	165	6,042	12	Conductor and engineman of empty engine overlooked schedule of regular passenger train; engineman's experience, 6 months. Engineman depended on conductor; conductor forgot.
11	R.	P. & P.	3	22	6,500	68	Three passengers killed; train in yard not protected by flag; other train approached at uncontrollable speed in dense fog.
12	B.	P. & P.	0	15	6,660	13	Misplaced switch; southbound train ran through cross-over in dark tunnel and engineman did not discover that he was on wrong track; switch not in working condition; had been spiked, but was loosened and turned by employee of contractor without authority.
13	M.	P. & F.	1	1	6,980	9	See note in text below.
14	B.	P. & F.	0	10	7,100	75	Order misread by engineman; conductor did not deliver order to engineman in person as required by rule.
15	B.	P. & F.	1	3	7,927	79	Freight had 1 hr. 10 min. on time of passenger train; conductor and engineman unaccountably calculated 2 hrs. 10 min., though they had read the order aloud.
16	M.	F. & F.	0	1	9,252	55	Cars ran out of siding at night; derailing switch 290 ft. from fouling point; cars had been left outside of derailing switch.
17	B.	P. & F.	2	11	9,900	45	Conductor and engineman of freight overlooked schedule of passenger train.
18	B.	F. & F.	3	2	10,150	7	Cars ran out of side track. Contrary to orders, cars had been left on unsuitable temporary track. Believed brakes had been maliciously loosened.
19	B.	F. & F.	1	1	10,170	13	Northbound train approached station at uncontrollable speed; engineman, experienced, did not manage air brakes properly.
20	B.	F. & F.	1	4	10,500	8	Southbound met one northbound train, but men forgot that order specified two trains. Conductor (10 years' experience as brakeman) was on his first trip as conductor.
21	B.	F. & F.	2	1	10,800	51	Operator neglected to deliver one of four orders. Conductor accepted other orders knowing his signature had been prematurely and wrongfully sent to despatcher. Operator in service at this place 12 days.
22	B.	P. & F.	3	53	12,400	16	Misplaced switch at meeting point; brakeman, 8 months' experience, on duty 20 hrs. 40 mins.; should have closed switch, and claims that he had done so.
23	B.	F. & F.	1	2	12,800	1	Disregard of distant and home signals approaching station (2 a.m.); engineman believed to have been asleep; brakeman in cab also probably asleep; fireman not well acquainted with road.
24	B.	P. & P.	1	10	13,650	42	Collision opposite station, both enginemen disobeying rule to approach under control. (See note in text below.)
25	R.	F. & F.	0	3	15,789	72	Standing freight not protected by flag; flagman's experience 1½ years; damage largely due to fire started from broken stove in caboose and from overturned engine.
26	B.	F. & F.	1	5	17,000	19	See note in text below.

No.	Class.	Kind of train.	Killed.	Injured.	Damage to engines, cars & roadway.	Reference to record.	Cause.
27	M.	F. & F.	0	2	20,700	84	Westbound freight backed through cross-over into eastbound freight; brakeman, in service two months, set cross-over switch instead of side-track switch, as ordered.
28	B.	P. & F.	3	39	15,700	44	Conductor and engineman northbound freight encroached on time of regular southbound passenger train: men on duty 19 hrs. 52 mins. They knew that they were on the time of the passenger, detached engine and tried to reach station, evidently depending on possibility of passenger being a little behind time.
Total..			38	457	$271,875		
							DERAILMENTS.
1	D.	P.	1	35	$350	63	Excessive speed on curve due to broken brakebeam (electric car running alone).
2	D.	F.	0	3	2,700	29	Runaway on 2.2 per cent. descending grade; bad management of air; train pipe leaky; hand-brakes not promptly used. Engineman, on duty 28 hrs., did not seasonably signal to apply hand brakes.
3	D.	P.	1	13	3,100	32	Accidental obstruction; wreck caused by derailment No. 10.
4	D.	F.	1	0	5,865	35	Excessive speed on curve and steep descending grade; engineman making his first trip on this branch; conductor applied air brakes in caboose, but applied them too suddenly and broke coupling between engine and tender.
5	D.	P.	1	10	7,894	93	Two cars of passenger train blown off track by high wind.
6	D.	P.	0	3	10,287	97	Unknown.
7	D.	F.	0	2	10,400	95	Runaway on descending grade. (See note in text below.)
8	D.	F.	0	2	10,977	65	Mast of steam shovel struck overhead bridge, and bridge was weakened and fell. Height of shovel 19 ft. 6¾ in., clearance at bridge had formerly been 19 ft. 7 in., but new and thicker ties had been put in, raising the rails.
9	D.	P.	1	12	11,100	57	Accidental obstruction; wreck of freight train on adjacent track derailed by shock due to automatic application of air brakes. Triple valve on one car too sensitive.
10	D.	F.	0	0	13,210	31	Broken flange.
11	D.	F.	1	3	16,545	25	Unknown.
12	D.	F.	1	4	17,250	30	Runaway on descending grade; engineman in service on this steep grade two weeks; 7 years' experience elsewhere; had run four trips over this section as learner.
13	D.	F.	0	0	19,950	89	Broken flange.
Total......			7	87	$129,628		
Grand total			45	544	$401,503		

Collision No. 7 was caused by an error of a signalman. The signalman at A allowed a passenger train to leave A for B before a preceding passenger train had reached B. This signalman is 25 years old, and has been employed in that capacity for five years. His explanation is that he was busy setting the switches and signals for switching movements which were going on at his station at the time when he was called upon to give the signal for the passenger train.

Collision No. 13 was at a crossing, a freight train of road A running into the side of a passenger train of road B. One sleeping car conductor was killed and four passengers were injured. The collision occurred at 5.45 a.m. The freight train approached the crossing at uncontrollable speed, either on account of the air pressure in the air-brake system having been excessively reduced, or by reason of defective judgment on the part of the engineman. This freight train had begun its trip without proper inspection, the air-brakes not having been tested; and besides this, the rule requiring 75 per cent. of the train to be air-braked had been disobeyed, only 22 cars out of 34 having their air-brakes connected to the engine. Road A asserts that the passenger train did not comply with the law requiring a full stop before passing over this crossing, and that if this stop had been made the collision would not have happened. The men in charge of the other train declare that they had made the stop. The conductor of the freight train had been on duty 21 hours and the engineman 13 hours, the experience of the conductor, as such, was five months, and of the engineman two years and four months.

Collision No. 24 was between a regular westbound and a regular eastbound passenger train, and it occurred exactly opposite a block-signal station. According to the rule, both trains should have approached the block-signal station with speed under such control that a stop could be made before reaching the signal in case it was not clear. It is stated in the report that the block signal was obscured by fog and also by smoke from an engine standing nearby on a side track.

Collision No. 26, a butting collision between freight trains at 9.36 p.m., and causing the death of a fireman, was due to the error of a telegraph operator, 19 years of age, who had been in the service of the road two months, though, according to the report, he had had four years' experience as an operator. An order having been sent to this operator for train No. 6 and it having become desirable to change this order, the despatcher asked the operator if the train had passed, and was told in reply that it had not, whereupon he sent an order restricting the right of train No. 6. It appears that when the despatcher asked his question the operator looked out of his window and saw the headlight of a locomotive and took it for train No. 6, but afterwards found that No. 6 had already passed and that the light was that of a switching engine. Train No. 6 had passed this station some minutes ahead of time, this having been authorized by the despatcher.

Derailment No. 7 was due to the mismanagement of the air-brakes, a heavy freight train becoming uncontrollable on a steep descending grade. The train had two engines. The leading engineman is held responsible, having neglected to use "straight air" to apply the brakes when he found the train was eluding control; and the engineman of the helping engine is held at fault for not having been watchful so as to take an opportunity to recharge the "train line" (air pipes and cylinders) and apply the brakes. The leading engineman had been in the service on this division only three months, but is reported as having had one year's experience elsewhere. He had been on duty 21 hours, with five hours' intermission. The other engineman had been on duty 17 hours, with five hours' intermission.

The bulletin contains the usual tables showing in detail the causes of injuries to employees in coupling and from falling off cars, etc.

The Exchange Settlement for Cars.*

BY J. R. CAVANAGH,
Superintendent of Freight Transportation, Cincinnati Northern.

We hear a lot of talk about returning cars to owners, etc. We might as well talk about insisting on the individual national bank notes being returned to each bank within a given time as to ever hope of having a practicable economical rule of returning to owning lines, the individual cars, except at an enormous expense of empty mileage and loss of traffic. As common carriers, we must furnish through cars to carry the traffic contracted for on through bills-of-ladings and under through published tariff rates.

Let us distinctly understand that every restriction on a car retards the accomplishing of the very purpose for which the car was built, namely, to take care of traffic offering from originating point to destination.

After long and careful investigation, I have concluded that the solution is a system of car hire and equalization on junction or exchange balances. There is no system that can be evolved that will not be met with some objections, but I believe that the junction exchange plan will reduce such objections to a minimum. I have considered several plans in place of per diem, such as percentage of all revenue obtained from freight charges, switching, demurrage and reclaims to be paid the car owners in place of per diem, thus making them to a certain extent participators in the revenue derived from use of the car, but such an arrangement would be almost as burdensome in accounting as the present per diem plan. Under the exchange plan we deal only with our immediate connections instead of three or four hundred car owners. We do away with a lot of three cornered fights on account of discrepancies at remote points, thousands of miles away from the car owner. By the 20th of each month all car service accounts for the previous month should be settled. No voluminous reports to several hundred car owners for per diem on cars used. No large force of clerks to check up the stack of per diem reports received from several hundred roads, endless correspondence in regard to discrepancies, thousands of dollars outstanding unsettled account of the individual items too small to arbitrate, expense of errors in figuring and checking per diem, or elaborate expenses of postage and stationery.

The present interchange reports as adopted by the American Railway Association with slight modification and providing additional space as submitted herewith will cover the requirements.

Dr or Cr	Balance from last report	
	Delivered this date	
	Received this date ..	
Dr or Cr.	Balance this date	

Both agents have their copy and certify. The delivering line must pay the car balance rate until it has cleared the car. In cases of omissions, should recommend the use of a consecutively numbered credit slip to be taken into account in the current day's report. Under the proposed exchange settlement plan we can report and settle on a car basis, a ton capacity or both. We can, if deemed practicable, make a different rate for each class of car without materially increasing the accounting. The rates may be changed from time to time to meet the existing or temporary conditions, without disturbing the method of accounting as it would be simply changing the rate that the balance is multiplied by. Under this plan we exchange our cars under rules that may be agreed upon. This scheme also prevents any industrial or other road building

*From an address before the Central & Western Association of Car Service Officers.

a large equipment and forcing it with their own loading on connections, as they must take an equal number of cars in exchange if offered.

I do not suppose that this plan will insure absolute equalization, but I do think it will come nearer doing it than any other plan yet devised. Under the exchange plan, if a connection persists in not equalizing or in reducing the balance there are several remedies that can be applied, such as the stopping of loading *via* such a line, or, if deemed practicable, the application of a penalty in the nature of an advance rate after a given time, which would not affect any other road or territory.

The Minneapolis Freight Station of the Wisconsin Central.

The Wisconsin Central recently completed in Minneapolis, Minn., a fireproof freight station and storage warehouse to replace the one which was destroyed by fire in April, 1907. The building is at Hennepin avenue and Bridge square, in the heart of the wholesale district. It is 417 ft. long, 79 ft. 7 in. wide on Hennepin avenue, 66 ft. 1 in. wide at the rear, and is four stories high. Two photographic views of the station are shown herewith. From the rear view and the cross-section it will be observed that the tracks are below the street grade, which leaves 18 ft. clear headroom under the second-story floor beams. The freight is worked in this sub-story on a platform 24 ft. wide and 415 ft. long, and is hoisted to the storage floors by five electric elevators. Four of these are of 5 tons and one of 10 tons' capacity. Scales are located in front of every door on this floor. On the other side of this platform or sub-floor is a sub-street for incoming freight. Above this is a 34-ft. roadway from Hennepin avenue to First avenue north, which is intended primarily for transfer and storage vehicles. The front part of the second story, which is only a little above the street level, contains the offices and vaults, and the remainder of this floor and the two floors above are for storage, there being about 100,000 sq. ft. for this purpose.

The building is fireproof throughout. The floor system and supports are reinforced concrete on the Turner system, the walls are hard brick, the roof solid concrete slabs, and the windows have metal sash and wire glass. The elevator shafts and the stairways are incased in tile, with fireproof doors. All openings for loading have rolling steel doors.

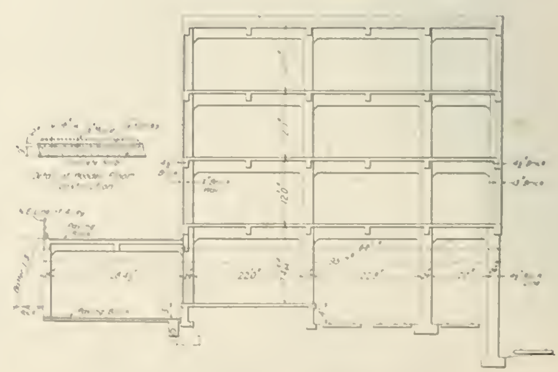
The footings of the building are on solid limestone ledge. The columns in the sub-story are 26 in. square, reinforced with eight vertical rods, banded together with bar hoops, at intervals. In the three upper stories the columns are round, 24 in. in diameter. The beam connection to these round columns was made without great difficulty. A beam ceiling was used, except under the 34-ft. driveway from Hennepin avenue. The maximum clear span is 26 ft. The reinforcement in the beams was well lapped at the continuous end to provide for maximum moment at that point, and bent suitably to provide for shear. Wire net wrapping was used in the beams. The maximum panel is 18 ft. x 26 ft.

The first, second and third floors were designed to carry a working load of 350 lbs. The floor slab was reinforced two ways, the

Minneapolis Freight Station and Warehouse; Wisconsin Central.

Plan of First Floor of Wisconsin Central Freight Station.

End View of Wisconsin Central Freight Station.



Section at North End of Freight Station.

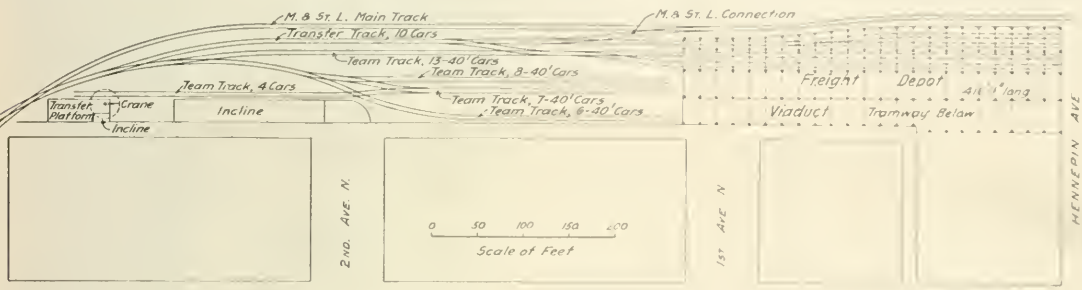
panel being subdivided by a secondary beam running from girder to girder. Nailing strips were laid on the slab with a filling between, 2-in. rough pine over this, and on the top a 1¾-in. maple floor.

The concrete was mixed in the sub-story at the level of the tracks by a "Cube" mixer, was raised to the floors by a Ransome hoist and placed by dump cars running on a narrow-gage railway. The concrete was a fairly rich gravel mixture, mixed wet.

The slab for the driveway is the Turner "mushroom" system. There are no beams, and the flat ceiling thus secured allows a good distribution of light, and accomplishes a very necessary object—the saving of headroom in the sub-story. This slab is 11½ in. thick and spans 30 ft. It is reinforced in four directions, directly and diagonally from column to column. A great many advantages are claimed for this system in the matter of speed of construction and cost. The centering for the slabs in this, as well as the beam construction, was corrugated iron. It was quickly placed and struck without material damage to the iron.

The need of erecting the building as quickly as possible afforded a comparison of some of the advantages of reinforced concrete over steel construction. Sketches were made and the steel order placed in a day's time. The building was erected complete in practically three months, or in the time ordinarily necessary to get structural steel on the ground. Shop details for such a structure of steel would take considerable time to get out, owing to the curved side of the building, where no two beams are of the same length. The reinforced concrete skeleton was pushed ahead in advance of the walls, which saved time and provided a floor for the masons, facilitating the laying of the curtain walls.

The design and erection of the building were under the supervision of C. N. Kalk, Chief Engineer of the Wisconsin Central. The reinforced concrete was designed by C. A. P. Turner, Consulting Engineer, Minneapolis. Butler Bros., St. Paul, were the contractors.



Proposed Reconstruction of Hennepin Avenue Yard; Wisconsin Central.

Rebates and the Steel Industry.*

On completion of the Erie, New York Central, Baltimore & Ohio, and the Pennsylvania systems between the Atlantic seaboard and the great West, a strong competition for through traffic at once began. At first it was a scramble, and each road got what it could, at the best rate it could, regardless of everything. The position was peculiar, and is so still, and must long remain so.

Matters went along tolerably well until railroad rates were thoroughly demoralized by war between the trunk lines. Our Carnegie Steel Company, upon this occasion, had had what it thought the certainty of a contract of great value for material with the Newport News Shipbuilding Company, freight from Pittsburgh to Newport News being much less than from Chicago. The contract went to Chicago, and upon investigation we found that the rate given to our Chicago competitor to Newport News was less than the Pennsylvania Railroad rate from Pittsburgh, the distance not one-half so great. President Ingalls of the Chesapeake & Ohio, then beginning his brilliant career, had made the low rate for his new line not yet embraced in the "gentlemen's agreement." We investigated, and found several rates of a similar nature prevailing to other points, and having a list of these made, the writer carried it to President Roberts of the Pennsylvania Railroad, with a request that he place us upon his own line on an equality with manufacturers on other lines. When the paper was presented to him, showing the overcharges we labored under, he pushed it aside, saying: "I have enough business of my own to attend to; don't wish to have anything to do with yours, Andy." I said: "All right, Mr. Roberts; when you wish to see me again, you will ask an interview. Good morning."

The situation had become intolerable, and we looked about for the best means of protecting ourselves. A railroad line of our own from Pittsburgh to the Lakes would be an invaluable acquisition. I purchased the harbor at Conneaut and a few miles of railroad connected with it, and began extending the line to Pittsburgh. I took good care that the authorities in Philadelphia were advised of the policy I had determined to pursue if there was the slightest interruption to our business. It was not long before I received a note from Vice-President Thomson, saying that President Roberts and himself would like an interview. I agreed to call as I passed through Philadelphia, and did so. My partners did not see their way to fight the great Pennsylvania Railroad; but my Scotch blood was up, and I was in to fight to the death. What I needed for the interview with my former railroad associates were the secret rebate rates prevailing elsewhere. Our freight agent, Mr. McCague, a clever young man, obtained these and placed them in my hands in a few days.

Entering President Roberts' room, I found him and my dear friend, Frank Thomson, vice-president, sitting together. My reception was cordial. "How are you, Andy?" "How are you, Mr. Roberts? How are you, Frank? Gentlemen, you asked me for an interview, and here is the culprit before you. Put me in the dock and question me as you wish." Frank said: "This is just what we want to do. May I be examiner?" "Yes," I said, "you are just the man." "What are you fighting the Pennsylvania Railroad for?" he asked. "You were brought up in its service. We were boys together." "Well, Frank, I knew you would ask me that question, and here is the answer." I handed him the packet of secret rates, and, begging to be excused for a few minutes, left the room, desirous of giving them an opportunity of looking it over together. Upon my return they were still sitting with the packet lying before them. Frank raised his head and exclaimed: "Andy, I feel like Rip Van Winkle." "Frank, the Pennsylvania Railroad officials have slept just about as long." "Well, tell us what you want." "I don't want anything. I did not ask to see you. You asked to see me." "Don't talk that way. What do you want? We wish to make an arrangement satisfactory to you. We did not know these things were going on. We can hardly believe it; but we shall now find out. Tell us what you think we ought to do."

I said: "Gentlemen, all that we have ever asked was that the rates charged us shall be at all times as low as those which competitors on other lines are paying on the same articles for similar distances. We ask for nothing else. Other lines are carrying freight for our competitors cheaper than you are carrying it for us, and you take part of this freight at the cut rates. We cannot stand that. We have never asked for lower rates than our competitors, but we shall never rest satisfied with less." "If you will stop building that line from the Lakes to your works, we will do what you ask," was his response. "Gentlemen, that cannot be. I have agreed to build that line, and certain parties have taken action in consequence of my promise. It has to be built." The result of the meeting was that I got all I asked for, and greatly obliged the Pennsylvania Railroad by allowing them to retain transportation of our own coke traffic from the coke fields to Pittsburgh. Everything was satisfactorily arranged, and we were all "boys together" again. I was the ally of the Pennsylvania Railroad, much to my delight. It was estimated that the agreement saved us about one and a half millions of dollars per year.

Some time after that, when war again broke out between the rival systems, the late William H. Vanderbilt asked me what I thought of the project of his son-in-law, Mr. Twombly, to extend the Reading system to Pittsburgh, through Pennsylvania. I said: "If you will undertake it, I and my friends will go with you to the extent of $5,000,000," a prodigious sum then—at least to us. "If you will, then I will put in $5,000,000 also," he replied. Thus the South Pennsylvania was organized, and its construction begun. Here was a chance for the New York Central to grip and hold its antagonist by the throat, but the Pennsylvania interests, seeing

*From a paper by Andrew Carnegie in the *Century Magazine*.

what the movement involved approached Mr. Vanderbilt while I was in Europe and induced him to surrender. Exactly what advantage the New York Central system received I do not know, but it should have been great indeed; for this was probably the greatest mistake in its history. The key to masterdom for the Vanderbilt interests was foolishly thrown away.

My personal effort to build the Bessemer Railroad to the Lakes came after these vain efforts of united Pittsburgh to emancipate herself. When Mr. Cassatt ended the agreement entered into between his predecessor and myself, I was quite prepared to take up the challenge. We were once more free. I called upon George Gould and said to him: "Years ago your father approached me and said he would buy the control of the Pennsylvania Railroad, and divide profits equally with me, if I would promise to devote myself to its management. My heart was in steel development, and I declined. This morning I come to you and offer an opportunity to create and control a through line from the Atlantic to the Pacific. Extend your line to Pittsburgh, and we will give you a contract for one-third of all our business, provided you agree to give us the rates prevailing elsewhere and enjoyed by our competitors." I offered to build west to meet him, and also to join him in building east. Fortunately he agreed, and the result is that the Gould system to-day is in Pittsburgh, enjoying that contract. We were just on the eve of arranging to extend the line eastward, taking in our coke works en route, which would have been a hard blow to the Pennsylvania Railroad, since we controlled our own coke traffic, when Mr. Morgan asked Mr. Schwab if I wished to retire from business; if so, he thought he could let me out. I replied in the affirmative. Of course we stopped all negotiations looking to eastern extension after this, and the result was my retirement from business.

Rail Section Tracing Machine.

At a recent meeting of the Institution of Civil Engineers (England), H. E. D. Walker gave a description of a rail section tracing machine that he had designed for obtaining a drawing of worn or new rail sections that would be accurate and reliable.

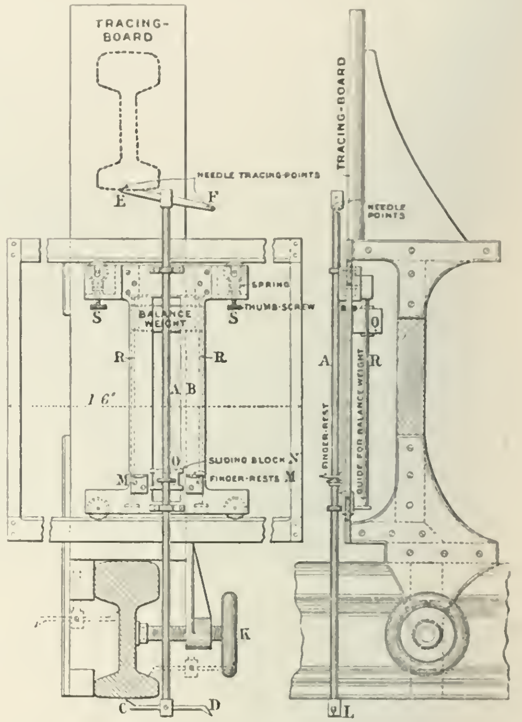
The machine consists of a rod A, having a free vertical and axial motion, and held by a carrier B, having a free horizontal motion. The bottom of the rod is fitted with a sharp pointed bent steel cross arm, C D; one of the sharp points (C) is bent upwards, and the other (D) downwards, so as to be able to follow the lower and the upper curves of the rail-section respectively. The top of the rod has a cross arm E F, fitted with two hardened needle-points at each end, which, when in contact with the paper affixed to the tracing-board, are adjusted to correspond with the position of their respective tracing-points below. This adjustment requires the lengths of the upper and lower tracing-arms to be different, as shown in the engraving, and the correct position is indicated by the line *hg*, being at right angles to the tracing-board and to the rail section to be taken. The sliding-block N, in which the boss O of the tracing-rod can freely turn, is attached by a string, passing over a pulley to the metal box Q, placed between the guide-rods R R. The box Q is filled with lead to balance the weight of the tracing-rod and of the arms, thus relieving the operator, in his necessarily cramped position, from the small but inconvenient weight of the tracing-rod. The horizontal motion of the carrier is steadied by fitting the upper wheels to a sliding axle-box backed by springs, the pressure of which may be regulated by the milled head-screws S S.

The first step is to oil thoroughly around the rail where the section is to be obtained, so that the steel point may pass easily along the roughened surface of the worn metal. The machine is then clamped firmly to the rail by the wheel-screw K. The paper having been fixed on to the tracing-board by drawing pins, the operator, sitting across the rail and facing the front of the machine, takes hold of the boss L at the bottom of the tracing-rod with the right finger and thumb and guides the pointer (C) across the under surfaces of the rail, at the same time placing two fingers of the left hand on the finger rests M to assist and steady the horizontal motion of the carriage. With this pointer he follows both the lower curved surfaces and the web on one side of the rail. Then, by running the carrier to the end of its path, he can turn the rod round on its axis, as it is then clear of the tracing-board, so that the downward bent pointer (D) can be made to follow all the upper curves on that side of the rail, and join up to the line already made for the vertical side of the web as indicated by lighter and darker dotted lines of the rail tracing in the front elevation. By allowing the rod to rise to its highest position the carriage can be passed across to the other side of the rail, which can then be traced, thus completing a perfect diagram of the rail section. The whole operation can be performed in from three to four minutes.

The paper is then taken off the board, and the section traced in the office, and by being placed within the lines of the original section or previously obtained diagram, the position and quantity of the worn portion is immediately seen; the area can be obtained by a planimeter. The rate of wear can be valued from the time elapsed since the preceding operation, and the modulus of section can also be calculated.

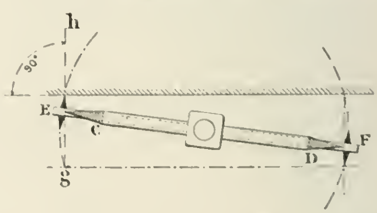
The author suggests, in order to obtain satisfactory data for determining the time for the renewal of any portion of a line, that the above operation should be repeated at two-year intervals, at exactly the same position, on a typical rail fairly representing the conditions of situation, curve and gradient of each length relaid.

As it is essential that the needle-points of the tracer E F should



Rail Section Tracing Machine.

not become worn, the author experimented with various surfaces on which to make the tracing, and finally adopted a strong smooth drawing paper which he covered with a very thin layer of melted white wax mixed with lamp-black. A black surface was obtained which the needle-point easily and smoothly cut through, and the section of the rail thus appeared as a thin white line on a black ground. This proved quite satisfactory, as it prevented any scratch-



Detail of Tracer.

ing or tearing of the paper surface, and the section was afterwards easily traced.

Such an apparatus as this offers the only really satisfactory method that there is of obtaining a correct cross section of a rail, and if this information is obtained at regular intervals it will not only provide the desired data as to the strength of the rail from time to time, but will also afford a reliable guide as to the position and the rate of the wasting in progress, by means of which the exact time may be determined when its renewal will be necessary, provided the conditions of service remain comparatively constant. As the rate of deterioration may vary considerably on even a short length of railroad, it is worth while logging the information obtained in the form of a continuous record.

The Thames Tunnel.

The old "traffic tunnel" under the Thames, in London, was designed by Brunel in 1823, and took upwards of 17 years to build, including a lapse of seven years when no progress was made. Through the courtesy of the Pennsylvania Railroad we are enabled to reproduce a pamphlet published in 1840, describing this work, together with the original illustrations. It will be observed that the fundamentals of the modern tunnel shield are all there except the tail tube, which only came into use when tunnels were given a perfectly circular form. The pamphlet, slightly excerpted, follows:

The constant inquiry for information relating to the construction of the tunnel under the Thames has induced the directors to publish the following account of the origin and progress of the work.

An acquaintance with the immense and various mercantile concerns carried on in the vicinity of London Bridge, and immediately in the neighborhood of the tunnel, will show the obvious utility, and the consequent importance, of a convenient communication by land from shore to shore at that part of the river Thames; and it appears from the number and magnitude of the shipping constantly passing, that the only plan which could be resorted to with a necessary regard to economy, and which should be free from objections on the ground of injury or inconvenience in the navigation of the river, is that of a tunnel under the bed of the river, of sufficient capacity to accommodate the local traffic.

The project of a tunnel at Gravesend was put forward in 1799, but the scheme was soon abandoned; this was followed by an attempt to form a tunnel from Rotherhithe to Limehouse in 1804, under the authority of an Act of Parliament. A shaft of 11 ft. in diameter was sunk to the depth of 42 ft., with a view to the commencement of the horizontal excavation, when from difficulties which were encountered it was for a time suspended. It was afterwards continued at a reduced diameter of 8 ft. to the depth of 76 ft., at which depth a small driftway was carried therefrom under the river to the extent of 923 ft., and to within 150 ft. of the opposite shore, when new difficulties having arisen, the engineer reported that any further progress was impracticable, and the work was abandoned.

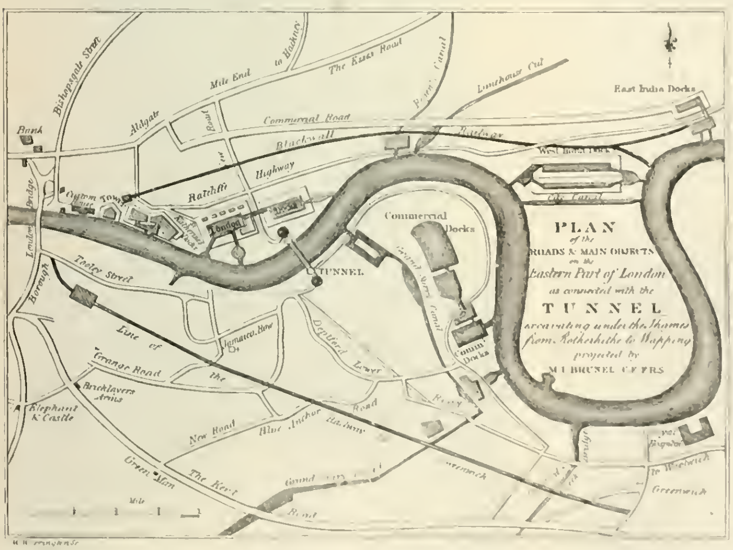
Various plans were, from time to time, proposed for the construction of a tunnel, none of which came to maturity; and they are now only adverted to, to show the interest and importance attached to such an undertaking.

Mr. Brunel, in 1823, proposed and exhibited his plan for constructing at once, and on a useful scale, a double and capacious roadway under the Thames, which was not only well received, but liberally supported by many gentlemen of rank and science, who were not discouraged by the extraordinary risks which an enterprise of such magnitude must encounter, and no one has given it more prominent and consistent support, under all its vicissitudes, than the Duke of Wellington. His Grace described it as "a work important in a commercial as well as in a military and political point of view."

The spot between Rotherhithe and Wapping, selected for the intended communication, is perhaps the only one situated between London Bridge and Greenwich, where such a roadway could be attempted without interfering essentially with some of the great mercantile establishments on both sides of the river. It is about two miles below London Bridge, in a very populous and highly commercial neighborhood, and where a facility of land communication between the two shores is very desirable, and will prove to be of very great advantage, not only to the immediate neighborhood, but also to the neighboring counties.

Cross Section of River and River Bed.

While the necessary steps were taking to obtain an Act of Parliament, and to raise money to carry the plan into effect, the committee of subscribers employed competent persons, unconnected with the engineer, to make borings across the river in the direction of the future work, in three parallel lines. On the 4th of April, 1824, they reported most favorably on the projected enterprise, upon which Mr. Brunel was induced to enlarge the dimensions of his original plan, and consequently the apparatus by which he intended to secure the excavation, while the brick work was in execution.



General Location Plan of Thames Tunnel.

An act of Parliament having been obtained on the 24th day of June, 1824 and Mr. Brunel appointed the engineer to the undertaking he began his operation by making preparation for a shaft of 50 ft. in diameter, which he commenced at 150 ft. from the river on the Rotherhithe side. This is effected by erecting a substantial cylinder of brick-work of that diameter 42 ft. in height, and 3 ft. in thickness, which was sunk *en masse* into the ground.

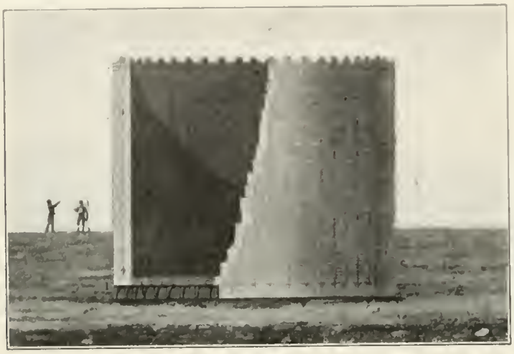
Upon the top of the cylinder was placed a steam engine for the pumping out of the water and for the purpose of raising the excavated earth. By this means Mr. Brunel succeeded in forcing the cylinder through a bed of gravel and sand 26 ft. deep, full of land-water, constituting, in fact, a quicksand in which the drift makers formerly had been compelled, as well to suspend their work, as to reduce the dimensions of their shaft from 11 to 8 ft.

While this operation was in progress, Mr. Brunel received an intimation from eminent geologists apprising him of the existence of a bed of sand lying at a greater depth, and advising him to go as little as possible below the bed of the river. This information corresponded with the account given before by the drift makers respecting the existence of a quicksand, and its depths beneath the level of high water.

The shaft having been sunk to the depth of 65 ft., another smaller shaft 25 ft. in diameter, destined to be a well or reservoir for the drainage of water, was also sunk from this lower level, but, at a depth of about 80 ft. the ground suddenly gave way, and sunk several feet at once, sand and water blowing up at the same time. Thus was the previous intelligence confirmed of the existence and the nature of the bed of sand in question, and which governed the engineer in the level he had proposed originally to take for his horizontal structure.

The shaft and reservoir having been completed, the excavation for the body of the tunnel was commenced at the depth of 63 ft.; and in order to have sufficient thickness of ground to pass safely under the deep part of the river, the excavation was carried on at a declivity of 2 ft. 3 in. per hundred feet.

The excavation which has been made for the Thames tunnel is 38 ft. wide, and 22 ft. 6 in. high, presenting a sectional area of



The Shaft.

850 ft., and exceeding 60 times the area of the drift which was attempted before.

The base of this excavation, in the deepest part of the river, is 76 ft. below high water mark.

It is by means of a powerful apparatus of iron, which has been designated a shield, that this extensive excavation has been effected, and that the double roadway and foot-paths, which now extend to within a few yards of the wharf at Wapping, have at the same time been constructed. This shield consists of 12 great frames lying close to each other, like so many volumes on the shelf of a bookcase; these frames are 22 ft. high and about 3 ft. wide. They are each divided into three stages or stories, thus presenting 36 chambers, or cells, for the workmen—namely, the miners, by whom the ground is cut down and secured in front, and the brick-layers, by whom the structure is simultaneously formed, and which serves also as a scaffolding for them.

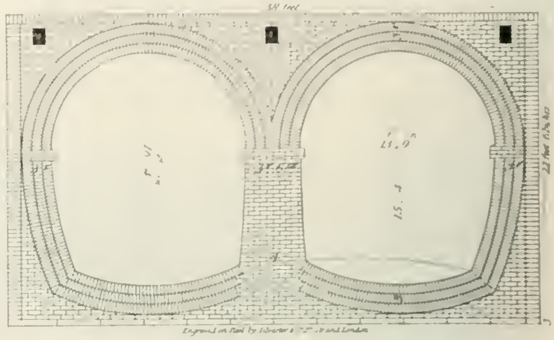
Powerful and efficient as this apparatus has proved to be in accomplishing the work, the greater part of which is now happily completed, the influence of the tide upon some portion of the strata beneath the bed of the river, greatly contributed to increase the labor, and to multiply the difficulties, and materially to add to the danger attending the excavation. That influence upon some of the strata, or upon some portions of the strata, was not noticed by the drift makers previously; owing, most probably, to the circum-

Working Inside the Shield.

stance that more than nine-tenths of their excavation had been carried on under a bed of rock, and the comparatively small dimensions of the work in question.

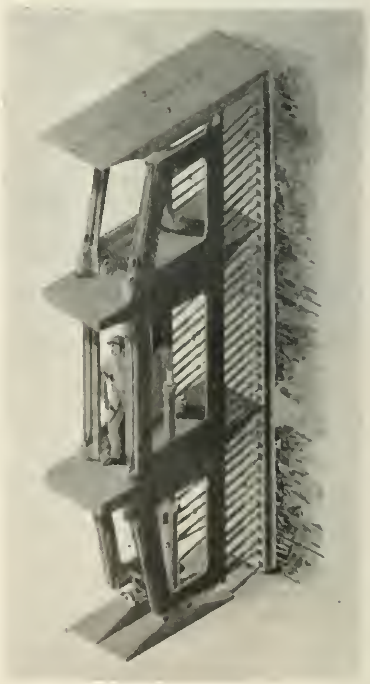
The shield was placed in its first position at the bottom of the shaft by the first of January, 1826, and the structure of the double archway of the tunnel was commenced under a bed of clay; but on the 25th of the same month the stratum of clay was discovered to break off abruptly, leaving the shield for upwards of six weeks open to a considerable influx of land water, which flowed copiously from a bed of sand and gravel, which was saturated anew at each rise of the tide. The progress of the work was in consequence much impeded.

On the 11th of March this fault or break in the clay being passed, and the shield again under a bed of clay, the work proceeded, and on the 13th of June, 1826, was advanced under the



Cross Section of Tunnels.

bed of the river, increasing daily in its progress. By the 13th of April, 1827, the tunnel had extended 400 ft. under the river; these 400 ft. of the tunnel were excavated, and the double archways substantially completed with brick-work in ten months and a half. On the 18th of May, 1827, and again in the month of January, 1828, the river broke in, and filled the tunnel; thereby occasioning the apprehension that this unprecedented undertaking, which had excited so much interest, not only in England, but throughout Europe, might be abandoned. After, however, filling



Frame of Shield.

the chasms in the bed of the river with bags of clay, and clearing the tunnel of water, upon re-entering it, the structure was found in a perfectly sound and satisfactory state; and the strongest proof is afforded of the efficiency of Mr. Brunel's system of constantly protecting as much as possible every part of the soil during the excavation; and finishing the structure in the most solid manner as the work proceeded, by the instrumentality wholly of the shield.

Subsequent to these eruptions of the river, such was the desire to see the work completed that several hundred plans were communicated to the directors and engineer for filling up the cavity, as well as for the prevention of future accidents. All the plans were duly examined, and attentively considered; and the board of directors expressed, under date of the 16th of December, 1828, their obligations to the many scientific men who had so spontaneously communicated their several ingenious suggestions for securing and completing the undertaking.

View of Wapping, With Cross Section of Tunnels.

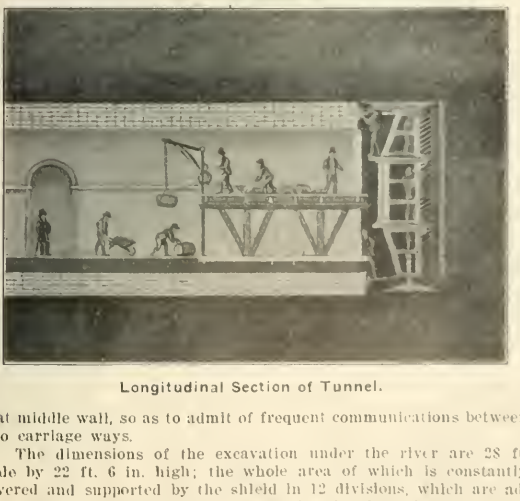
The works from that time remained suspended during a period of seven years, when they were re-commenced, and have been steadily and successfully continued to the present time.

To facilitate the access to the tunnel for the large population in its immediate neighborhood, it is intended to make the carriage way descents circular, and they will not exceed in any part the slope of Ludgate Hill, or Waterloo place, Pall Mall. The shaft, from whence the tunnel works are now carried on, was built at Rotherhithe in the form of a tower, 50 ft. in diameter, 42 ft. high and 3 ft. thick, at about 150 ft. from the edge of the wharf, and it was sunk into its position by excavating the earth within. In the annexed sketch the brick-work is supposed to be broken open, to show its construction, and the numbers below refer to the different parts of that "tower," which now forms the foot passenger's shaft, and is intended finally to be occupied by an easy double flight of steps, for the use of passengers going through the tunnel.

1, 1.—The wooden rings, or flat curbs.
2.—The iron curb.
3. Hoops, or laths, binding together the uprights.
4, 4.—Iron rods enclosed in wood } Screwed tight to the top and the bottom curb.
5, 5.—Wooden road . . . . }

A transverse section of the tunnel is here given, showing the dimensions of the mass of brickwork, which is all firmly set in Roman cement.

It must be observed that the middle wall is, for greater security while in progress, built quite solid; but for convenience, light and general effect, a succession of arches are subsequently opened in



Longitudinal Section of Tunnel.

that middle wall, so as to admit of frequent communications between two carriage ways.

The dimensions of the excavation under the river are 28 ft. wide by 22 ft. 6 in. high; the whole area of which is constantly covered and supported by the shield in 12 divisions, which are advanced alternately and independently of each other; they have each three floors, or stages, forming a succession of scaffolding and cells for the bricklayers and mines during their operations.

A longitudinal section of about 10 ft. of the tunnel, with a side view of the shield, and the miners as well as the bricklayers at work. This sketch represents also the moving stage, with two floors, used by the miners to throw thereon, for removal, the earth they excavate; and where the bricks, cement and other materials are placed in readiness for the bricklayers. Towards the head and foot of the shield is also shown the position the horizontal screws, a pair of which being attached to each of the divisions, and turned so as to press against the brick work, are used to propel each division forward.

The divisions of the shield are advanced separately and independently of each other, by the means pointed out in the foregoing sketch, each division, as is attempted to be shown in the annexed design, has boards in front (known by the technical name of poling boards) supported and kept in position by means of jack screws, which are lodged against the front of the iron frame; these boards are in succession taken down while the earth in front of each is excavated, the board being always replaced before a second is removed; thus forming a constant firm buttress. The several parts will be better understood by reference to the following numbers.

1. Poling boards.
2. Jack screws.
3. The "top staves" covering the upper part of the excavation, till the shield is succeeded by brickwork.
4. Screws to raise or depress the top staves.
5. "The legs" being jack screws fixed by ball joints to the shoes.
6. "The shoes" upon which the whole division stands.
7 and 8. The sockets where the top and bottom horizontal screws are fixed to force the division forward.

The opposite transverse section of the river Thames, with a longitudinal section of the tunnel beneath it, shows the progress of the work, which is now completed (1840) to the extent of 1,135 ft

The Municipality and Public Utilities.

City Operation.

Methods embarrassed by law.

Methods antiquated.

Methods non-direct; to increase the importance of officials.

Appointments of head men made as rewards for political service.

Appointments and dismissals of subordinates hampered by the civil service laws and by the exigencies of politics.

Many unnecessary or inefficient men carried on the pay roll, for political reasons.

Appropriations granted or withheld, largely for political reasons.

In many cases, 50 per cent. of a day's work accepted for a day's pay.

Honesty, sobriety, loyalty, willingness, energy, courtesy, and tact command no better rating than the opposite qualities; the civil service certification of competency levels all.

Corporation Operation.

Methods chosen by the head men of the corporation.

Methods kept up to date.

Methods direct; to make the minimum amount of work.

Appointments of head men made for fitness.

Appointments and dismissals of subordinates at the will of their immediate superiors, who are responsible for results.

A few unnecessary or inefficient men carried on the pay-roll for political reasons.

Appropriations granted or withheld in accordance with sound business reasons.

Generally 100 per cent. of a day's work demanded for a day's pay.

Honesty, sobriety, loyalty, willingness, energy, courtesy and tact command corresponding rewards in the shape of increase of salary, or promotion; or in the shape of a reputation which will attract the attention of other and more liberal employers.—*H. S. Wynkoop.*

Reinforced Concrete Overgrade Highway Crossings.

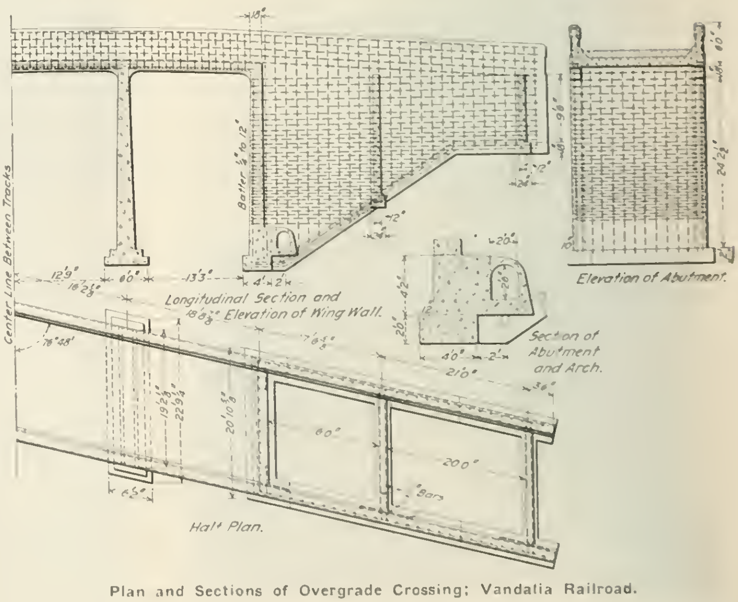
The photograph and drawings show a crossing built by the Vandalia in connection with line improvement work between Terre Haute, Ind., and Brazil. This bridge is near Seelyville. It is designed for four tracks, the central opening being 30 ft. between piers, and the side openings 17 ft. The latter are for proposed running tracks. The clearance is 22 ft., and the width, over all, 18 ft. 8 in. The floor of the bridge is on a vertical curve of 572-ft. radius, giving a 6 per cent. grade. Cross-sections show the floor construction and corrugated bar reinforcement. The filling for the roadway is 12 in. of gravel.

Overgrade Crossing near Seelyville, Ind.; Vandalia Railroad.

Another of these bridges was built near Turner, on the same work, the amount of material used in each of the two being exactly the same. Following is the cost of the Turner bridge:

Foundation excavation, 627 yds. at $0.40 ..			$250.80
Cost of placing:			
80 cu. yds. plain concrete at $3.45		$276.00	
466 " reinforced concrete at $3.65........		1,700.90	
			1,976.90
Material:			
457 cu. yds. gravel.... at $0.25	114.25		
220 " stone ... " .70	154.00		
786 bbls. cement ..... " 1.60	1,257.60		
28,807 lbs. bars...... " .02	576.15		
			2,102.00
			$4,329.70

This does not include the cost of grading the approaches. The specifications called for gravel concrete, but the gravel used was too fine and some 2½-in. stone was added. The material was furnished by the company and the work done by contract. We are indebted to Maurice Coburn, Engineer Maintenance of Way, for data.



Plan and Sections of Overgrade Crossing; Vandalia Railroad.

Drawings and a photograph of a reinforced concrete arch overgrade highway crossing designed by S. B. Fisher, Chief Engineer of the Missouri, Kansas & Texas, are shown herewith. Crossings of this kind are being put in as a part of the extensive grade revision and line improvement work being done by this road in the southwest, and are for country roads as well as city streets. Mr. Fisher objects to the form of overgrade crossing having rectangular openings, especially where permanent structures must be put in. To use his own words: "There always seemed to me something unsatisfactory in the appearance of the rectangular openings under these overgrade crossings as usually constructed. When made of wood they are not disagreeable to the eye, but when the form of a wooden structure is imitated in reinforced concrete it seems at odds with the fitness of things."

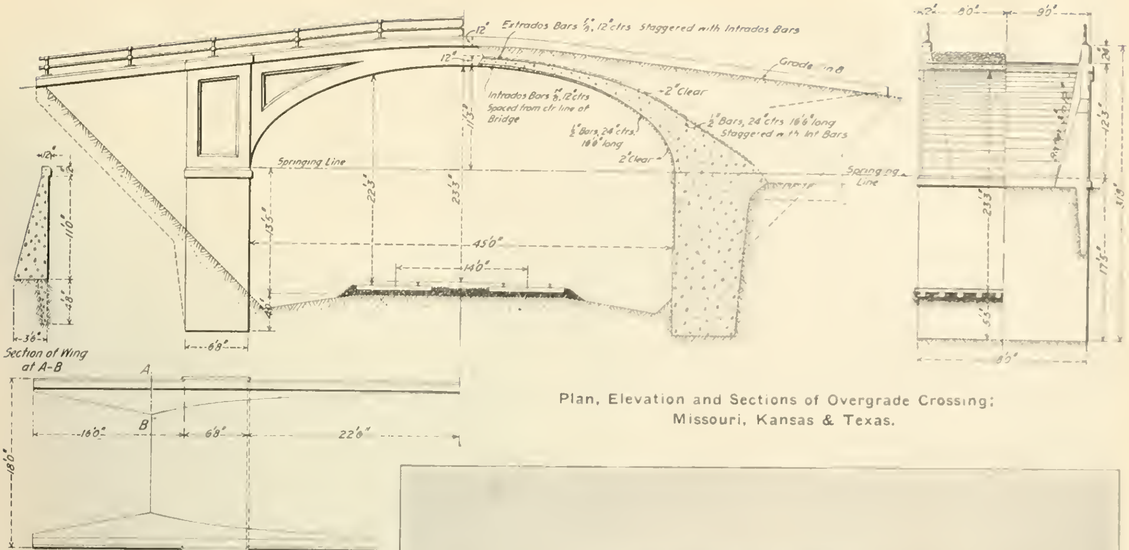
The bridge shown herewith is for a street or highway where the railroad cut is 10 ft. or more deep and the foundation is firm, preferably rock. The intrados of the arch is a true ellipse whose rise is one-fourth the span. The spandrel walls are carried back in cantilever form, as shown by the drawings. They have shallow panels moulded in them. The hand railing is made of old boiler tubes filled with grout to stiffen them and make them more durable. The horizontal tubes are connected with couplings and are continuous, passing through the crosses which are bored out for the purpose.

Details of the falsework are shown in the accompanying drawings. The same amount of thought was given to its design as to the arch, as it is made to be put up, used and taken down over traffic without any disturbance thereto.

Thus far, two of these arches have been built. One in the village of Caddo, Okla., with roadway 18 ft. wide, cost as follows:

Material for moulds, etc	$369.75
Excavating foundation	183.56
Shoring, setting up machinery all miscellaneous work	1,029.92
Concrete, about 319 cu. yds.	2,210.77
Hand railing	50.97
Total	$3,844.97

The other is near a section-corner in Oklahoma to take a north-



Plan, Elevation and Sections of Overgrade Crossing; Missouri, Kansas & Texas.

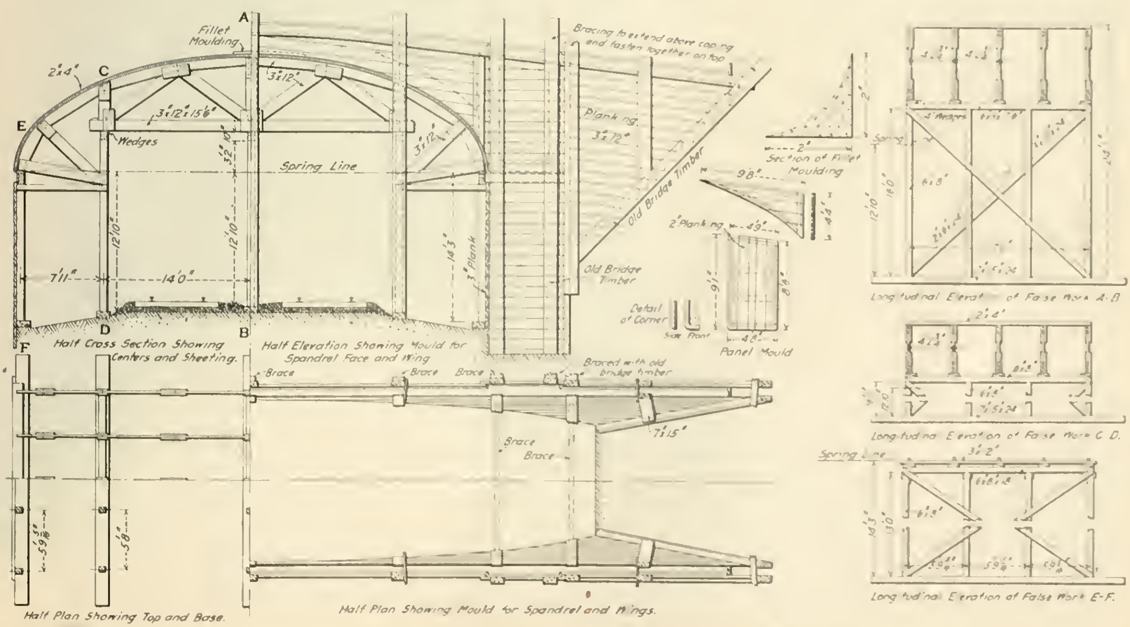
and-south and east-and-west public road. It has a 16-ft. roadway and was built with the same falsework as the first. The cost was:

Additional material for moulds..........	$51.35
Excavating foundation..................	167.40
Shoring, setting up machinery, all miscellaneous work	640.90
Concrete, about 390 cu. yds............	2,332.39
Hand railing	106.22
Total	$3,298.26

To the above should be added 50 cents per yard of concrete for freight charges on material. Plans are being prepared for another bridge for a street crossing in Fort Worth, Tex., with two 18-ft. roadways separated by a rib in the middle quite similar to the spandrel wall. This rib is intended to stiffen the arch and counteract any tendency of heavy and irregular traffic loads to distort it.

The span of 45 ft., shown in the draw-

Overgrade Highway Crossing; Missouri, Kansas & Texas.



Form for Erecting Highway Bridge; Missouri, Kansas & Texas.

ings, was selected as most suitable for a double-track road, giving sufficient room on each side for ditches. The clearance of 22½ ft. above the rail will probably be increased 6 in. or a foot in future structures; for while the present clearance is ample for some years to come, the unavoidable tendency of the track is to rise higher and higher as fresh ballast is put in.

Freight Car Efficiency.*

The railroads of the United State probably handled, during the year ending June 30, 1907, in the neighborhood of 1,800 million tons of freight. The freight handled by the whole of the railroads of teeming Europe can hardly have much exceeded 1,500 million tons. Physical conditions, and political prejudices and fears have co-operated in keeping at a low level the average haul in Europe, and consequently the more favorable environment here has placed the ton-mileage—the true measure of the freight service of a country—out of all comparison with that of the older continent. During the year named, the ton mileage of the United States probably amounted to 230 or 235 billions, against which Europe, so far as can be estimated, could not present more than about 100 billions. It goes without saying that enormous difficulties have to be met and overcome in order to administer successfully so huge a mass of business, diffused over a territory of more than 3,000,000 sq. mi. But the real extent of these difficulties is not realized until it is comprehended that during less than a generation—specifically, since 1880—the ton mileage of this country has not merely doubled or trebled, but actually septupled itself, an increase of more than 600 per cent. Under these circumstances, it would not be surprising to find the railroads experiencing difficulty in meeting the ever-increasing demands being made upon them, nor would it necessarily be discreditable to them that, in shaping their organization to the changing conditions, there resulted considerable friction of adjustment. Accordingly, the existence of shippers' complaints with reference to car supply, founded though they may be on facts, should not be regarded in itself as conclusive evidence of culpable negligence on the part of the managers of railroad transportation. Even without any special general development from year to year, every business has difficulties during the busiest season of each year in properly meeting the demands made upon the resources of its organization. In arguing thus, there is no desire on the part of the writer of the paper to justify the railroads in carelessness of management, whenever such exists, but his object is to deprecate the measurement of railroad performance by an impracticable standard, which the critics themselves would not consent to apply to their own business undertakings.

In the nineteenth annual report of the Interstate Commerce Commission on the statistics of railroads in the United States, figures are given covering the results of railroad operation during the year ending June 30, 1906, and a comparison of them with the corresponding figures for 1900 may serve as a text with which to introduce what I have to say. The ton mileage of the railroads operating in 1900 was 141,596 millions; in 1906, 215,877 millions—an increase of 52½ per cent., of which 40 per cent. occurred during the latter year. Though the mileage increased by no less than 31,017 miles during the six years, freight business was received and taken care of so well that the density of freight traffic, measured in tons carried one mile per mile of line, increased from 735,352 to 982,401 or about 35 per cent. The mere fact that the railroads were able to take care of this remarkable increase is an indication of the entire inappropriateness and injustice of those general charges of inefficiency which superficial observers, including some writers for the press, have felt themselves free to make. So great an achievement has been possible of accomplishment only by reason of the fact that past freedom of development (subjected though it has been to certain restrictions) has stimulated the growth of the most enterprising railroad policy in the world, admirably suited in many ways to its economic environment; it is not denied that this freedom has permitted some evils to thrive, though less during the last few years than previously.

The freight car equipment during the period was enlarged from 1,365,531 cars to 1,837,914 or 34½ per cent. At first glance this compares unfavorably with the 52½ per cent. increase of business. That this is not really so is obvious when the capacity of the car is taken into account. So far as I can judge from the equipment statistics, the increase of average capacity from 1900 to 1906 must have been close upon 20 per cent. Assuming that this increase of capacity were made full use of, the increase of car accommodation would be 61½ per cent. The enlargement of the freight car was not accompanied, however, by a raising of minimum weights, so that, in some cases, shippers made no practical use of the extra space facility. Hence, we cannot regard the whole of the 61½ per cent. as an actual increase of facility to the shipping public; it requires modification in proportion as the average carloads shipped by the various industrial and commercial concerns were not easily susceptible of increase. It must be borne in mind that, primarily, the transition to higher capacity cars is in the interests of the railroad operator. Subject to a certain amount of qualification, it may be said that, under normal conditions, the shipper prefers smaller cars and more of them to larger cars and fewer of them. But, in either case, the practical meaning of the car to him is measured by the position of carload minimum, marking as it does a very considerable difference in transportation charges. Of course, in the long run, under a competitive régime, the shipper is deeply interested in the high capacity car proposition because its utilization, in preference to smaller cars, means greater economy of operation, part of the benefit of which is likely to go, sooner or later, to the shipper.

The idea suggests itself here that, while working towards the higher capacity car, the railroads would be unwise to attempt to impose it upon the shipping public unless the conditions of freight movement were favorable, otherwise considerable inconvenience might result to those whose business organization and relations could not readily be adapted to larger units of distribution. Thus, if increase of car capacity were the sole consideration, an increase of car equipment (but not of car numbers) corresponding with the growth of tonnage to be transported, though theoretically a desirable achievement, might be no small impediment to the manufacturer and dealer in their efforts to attain maximum business expansion. It is to the credit of the far-sightedness of the leaders of railroad policy that, while fostering, for several years, the growth of the larger and more economically operated car, they refrained from even the appearance of coercion in connection with their economical utilization. Thus from the beginning of the present century, the increase of car size steadily proceeded, generally speaking without any notable sacrifice of number, but the carload minimum remained stationary.

The last general movement in the direction of increase of minimum carload weights was, I believe, in 1899, when under the official classification, general weights were raised in all the classes from 20,000 to 30,000 lbs., after having stood at 20,000 lbs. for third class and higher, and 30,000 lbs. for fourth class and lower, during a number of years. At the same time, the Western classification minimum for lower than third class was raised from 24,000 to 30,000 lbs.; four years previously the minimum for lower than third class had been increased from 20,000. The Southern classification minimum of 24,000 lbs. for all classes has remained undisturbed, for all practical purposes, during the last 20 years. Recently, however, a movement has set in toward an advance of existing minimum weights, to accord with the very pronounced advance of the last few years in average car capacity, and this has already found partial, though not very startling, realization in the official classification.

The policy of the railroads, it is plain, has been marked in this regard by great conservatism, and they have amply showed their desire to allow reasonable time for the assimilation of shipping methods to the improved car facilities. They are hardly open to charges of arbitrariness or inconsiderateness in now attempting to take an active step toward the realization of aims long announced, looking to the more effective use of the car accommodation they have provided. If there be any room for criticism at all, it should be directed towards the actual increase of minimum weights in individual cases with regard to the effect of the same upon existing methods of distribution in the industries concerned. But no general opposition to the increase of minimum weights simply because it is an increase is logically well grounded under the conditions.

The possible effect of the actual organization of the distribution of products in hindering full use being made of increased car capacity, secured through the substitution of a smaller increment of higher capacity cars for a larger increment of smaller capacity cars, has now been considered. It may be further observed that changes in the general character of production, while not preventing full use of car space provided, may similarly hinder an increase in car capacity, equaling in percentage the increase of business to be handled in ton miles, from establishing an equality of adjustment of freight equipment to traffic. The character of the tonnage may have altered so that equality of car adjustment can be secured only by a relative increase of car capacity. For instance, to take a hypothetical case of as simple a character as possible, if the tonnage at the beginning of the period of comparison were three-fourths coal and pig iron and one-fourth merchandise and hay, whereas, at the end of the period, the proportions were half and half, each cubic foot of car space would be less efficient on account of the greater space demand of each average ton of freight carried. To some extent, a movement of this kind has been in operation, but by reason of the continued marked preponderance of heavy freight in railroad tonnage, probably not sufficiently to reduce very materially the effectiveness of increase of car accommodation calculated on nominal capacity, yet it is worth bearing in mind that the real working capacity of a car is not its stenciled maximum, or, rather, that plus the additional 10 per cent. allowed, but the average ton-

*From a paper presented at the April meeting of the Western Railway Club, by E. R. Dewsnup, Professor of Railway Administration, University of Illinois.

nage it can accommodate of the class or classes of freight it is commonly required to convey.

So far as the practical results of American freight operation of recent years are concerned, it is not at all difficult to demonstrate that, coinciding with the movement toward a high tonnage car, there has been a material increase in average load, indicating that, to a certain extent at least, such a car has proved adaptable to modern methods of industrial distribution. To quote a few roads indiscriminately, the average carload per loaded car during the period 1900 to 1907, increased with the New York, New Haven & Hartford from 10.2 to 13.4 tons, with the Norfolk & Western from 19.9 to 25.5, with the Wabash from 14.9 to 18.1, with the Louisville & Nashville from 15.3 to 18.7, with the Illinois Central from 13.7 to 17.8, with the Southern from 12.7 to 14.8, with the Chicago & North-Western from 13.8 to 15.3, with the St. Louis & San Francisco from 13.6 to 15.9, with the A., T. & S. F. from 12.7 to 15.5, with the Northern Pacific from 13.4 to 17.8, and with the Great Northern from 16 to 20.4 tons. According to the 1906 statistical report of the Interstate Commerce Commission, the loaded freight car miles for that year amounted to 11,410,599,327 and, as before stated, the ton-mileage to 215,877,551,241. From these figures it appears that the average load per loaded car of all systems was 18.9 tons. It is impossible to say exactly what the average load was for 1900 on account of the failure of the Commission to collect and publish loaded car mileage before 1901, and, by the way, its Public Service tables still neglect the average load per loaded car. However, the average load for 1901 was 16.5 tons, and after an examination of the reports of a considerable number of railroads I am inclined to think that for 1900 the corresponding figure must have been approximately 16⅕ tons. Thus the increase of average loss per loaded car was about 17 per cent. The proportion of this increase due to higher capacity equipment and to improved loading methods respectively are not capable of being determined. After having observed loading methods fairly closely during the period, it does not strike the writer that there has occurred any particularly marked advance in this direction. The exceptions to this general statement are but sufficient to prove the rule. Accordingly I prefer to credit the higher capacity equipment with the greater part of the improvement. From 1900 to 1906, then, a 20 per cent. increase in average capacity has been met by a 17 per cent. increase, or thereabouts, in average load, indicating, as already remarked, the suitability of the high capacity car, within certain limits, to present industrial conditions. From this it follows that the deduction to be made from the 61½ per cent. increase of total car capacity during the period of our comparison, on account of shippers being unable to use to advantage the extra space of each car, is but small and assuredly not sufficient to reduce the per cent. increase of effective accommodation below the 52½ per cent. increase of business.

In the matter of adequacy of car accommodation, therefore, I fail to see how there can be any reasonable dissent from the conclusion that, under the unprecedented boom of business, the railroads as a whole have done astonishingly well in keeping their equipment level, and probably more than level, with the rapid increase of agricultural and manufacturing output.

I say this of the railroads as a whole, thus qualifying my statement because there are individual roads of which it could not be made, just as there are other roads of which more than this could be said. Quite a few railroads have not only managed to keep level with present needs, but have even anticipated future requirements, evidently determined, whatever the cost may be, to provide an adequate amount of car accommodation for their patrons. On the other hand, there would appear to be roads who are not indisposed to piece out their own inadequate car resources with forced loans from their more plentifully supplied neighbors, a larceny which the current of traffic hinders these good neighbors from effectively stopping. The saying attributed to a certain wit: "God help you if you get into the hands of your friends," is entirely apropos of the freight car situation in some respects. Curiously enough, some of the roads which, according to the bulletins of the committee of car efficiency, have been maintaining on their lines a marked excess of cars (amounting, in one case to 50 per cent., and at times to 100 per cent. over the number owned),[1] have really not done badly in the increase of their cars during recent years as compared with the increase of their business. For instance, in the case to which I have made reference the company increased its freight cars during the seven years ending in 1907, 51 per cent., as against an increase of ton mileage of 44 per cent., the difference being still greater in favor of the equipment when capacity is taken into account. Its record of ton miles per freight car in 1907 does not appear excessive on the face of it, when compared with that of numerous other companies. Of course, the explanation of its persistent retention of foreign cars lies in the nature of its tonnage which is comparatively light and bulky, thus necessitating a large proportional number of cars than is necessary for roads with heavier freight: its own equipment was evidently inadequate in space accommodation in 1900 (possibly lethargic car movement played some part) and the improvement accomplished subsequent to that date was obviously insufficient to reduce to really moderate proportions its demands upon foreign equipment. The light and bulky nature of the freight carried, occupying much car space per ton, explains also the moderate car ton-mileage record.[2] The unfortunate feature of a policy of foreign car detention is that it necessarily deprives other roads of equipment, usually at the time when it is particularly needed, so that the whole car situation of the country is disturbed. The railroads of the middle West with their extensive forwarding business are conspicuous sufferers, and the roads in New England, on the Pacific slope and in the Southwest conspicuous gainers by the interline shuffling of cars. In the old days, when freight was transferred at every junction point, it was necessary for each participating carrier to own sufficient cars to haul the freight over its own lines. It would seem proper that the introduction of interline organization should not change this requirement. Of course, the proportion of home and of foreign cars on the lines of a railroad will be determined to a great extent by the direction of the stream of traffic. Lack of promptness in handling foreign cars will soon swell up the number of such upon a road with the stream of traffic traveling toward it. Given a fairly dense and growing local traffic, substantial moral fiber is required to resist the obvious temptation—sometimes the moral element fails to make good. On the other hand, roads doing a large outward, but comparatively small inward, business must make allowance for this extra drain in the extent of their equipment. They must expect to be regularly deprived of the use of a certain proportion of equipment, and it is up to them to do the best that they can to keep track of its movements and to secure the enforcement of mutually agreed upon regulations directed toward securing prompt return.

One of the difficulties connected with per diem as a means of stimulating the prompt handling of foreign equipment is that at the times when cars are in most demand it is least effective. Whether the cost of car hire be 20, 25 or 50 cents a day, or even $1, it is obviously to the interest of a road short of cars to retain foreign equipment if, during the rush of business, the cars are capable of earning more than sufficient to cover operating and per diem expenses.[3] Conversely, when business is dull and cars less urgently needed by the home roads, low car earnings stimulate the effectiveness of per diem to the cost of, it may be, unnecessary empty mileage. There seems much to be urged in favor of a variable per diem charge, especially if handled, along with the whole matter of car interchange arrangements, by some permanently organized central bureau of the railroads. This is a tempting subject to dilate upon, but one impossible to discuss adequately in this paper.

Reference to the problem of car interchange brings our discussion very close to the matter of car shortages, the recent acute attack of which was so dramatically terminated at the close of last November by the financial crisis, whose industrial effects are still lingering with us. The more one studies the car situation in general, the more one realizes that the intensity of such car famines, as they recur from time to time, could be materially relieved if more skilful attention were applied to the supervision and improvement of the distribution and of the mileage performance of cars both in local and in interline business, the crowning difficulties of railroad operation. In speaking thus, it is not intended to have inferred that, under any reasonable economical system of car equipment, the

[1] The statement refers, of course, to the period prior to the present abnormal depression.

[2] Heavy freight would have revealed a striking ton mileage per car. The car ton mileage, at any one time, is the quotient of the total ton mileage divided by the number of revenue cars owned. In general, this represents sufficiently accurately the performance of the average car on the normal railroad, but not in the case of roads, with large standing excesses of cars (or the reverse); the real work secured by such railroads out of the cars operated by them can only be obtained by substituting, as the divisor, average number of cars on line for average number of cars owned. Allowance needs to be made, of course, for private cars.

[3] Suppose that, during the very active season of the business year, a car is capable of earning $2.50 a day after the costs of hauling the car and handling the freight (but not the maintenance charges against the car) are deducted. The railroad has more business than it can handle promptly with its own equipment, and therefore, must either build extra cars just for the traffic of this road, or it must borrow. If the period extends over, say, three months then, if it builds, it ought to debit all expenses of the cars to that short period. These expenses in the case of a modern car, a 40-ton steel underframe box car, for instance, probably average about 10 cents a day, the expenses of maintenance and renewals being distributed over the year, the car being assumed to be in more or less constant use. The estimate is based on $1,025 as the cost of such a car, with 20 to 25 years as average life, 5 per cent. interest on cost of car, $85 or thereabouts as cost of repairs and renewals, allowance also being made for maintenance of repair tracks and sheds, tools and the like including interest on capital invested in them. But in the case before us, these expenses have to be distributed over but three months, allowance being made for lighter repairs, longer life of car, etc., on account of its more limited use. It is not possible to do more than estimate very roughly the appropriate charge against each day of the earning period, but it probably would not be less than $1.25 a day. Thus to earn the assumed $2.50 a day, the railroad must spend (and could well afford to spend) $1.25 a day during the period of the employment of the car if it should provide its own car. But if it borrows other companies' equipment for the period, it will incur hardly any maintenance charges, probably not amounting to as much as 25 cents a day, at the most. So that, under the assumed conditions, there is no inducement for the road to provide its own extra equipment, even if a dollar per diem were levied upon it, and with a 50 cent or 75 cent per diem, it is considerably in pocket by borrowing equipment which it can send home as soon as it has no further use for it.

railroads could obviate such shortages. As a matter of fact the charges of gross inadequacy of equipment, so freely made by choleric shippers during periods of car shortages, are based entirely upon the reasoning that there is a shortage, that the railroads have no business to allow a shortage to take place, and that its existence is sufficient evidence of wilful neglect on the part of the railroads to provide a proper amount of equipment. No consideration is given to the relation of that equipment to business requirements during the periods when surpluses take the place of shortages nor to the possible loss which may result to a railroad maintaining an extra supply of cars whose service is necessary, perhaps, only three months out of the twelve. Unless the daily earnings of such cars during the limited period of their necessary service are sufficient to cover not only the costs of handling the freight, of moving the cars, of use of roadbed, terminals, motive power and so forth, but also interest on capital invested in the cars, maintenance charges, depreciation and insurance, and storage accruing during the whole year, it is patent that the provision of such cars would be a pure act of charity on the part of the railroads, and in no sense a commercial transaction. I am not going to assume gratuitously that it would be necessarily unprofitable for any specified railroad to provide this extra equipment, but note the possibility as something that needs to be investigated before charges of incompetent management are rested simply on shortages in car supply during busy seasons. And in connection with estimation of car shortage, it should be noticed that the extent of the same is not accurately measured by shippers' demands, since they frequently order more cars than they really need in the hope of securing a larger number than they would otherwise be likely to do. The actual shortage at any date is, undoubtedly, less by a considerable percentage than the total of the shippers' nominal requirements.

Moreover, while this shortage is a very real difficulty at the times of its recurrence, it is, in large measure, the result of a tendency on the part of shippers to keep their stocks down to the working minimum, frequently involving procrastination in the ordering of their supplies. An annual example of this is to be found in the coal trade in which the dealers regularly fail to make long enough preparation ahead for the fall trade, so that, with the advent of the cold season, orders for cars are rushed in with instructions that they are to be treated as urgent. They (and many others) are anxious to combine all the advantages of keeping as little capital as possible tied up in their stocks with an absence of all the disadvantages that naturally attach to the undue crowding of business. A little earlier preparation, even if at the expense of tying up more capital in the shape of stocks and storage facilities, would, in many cases, be entirely reasonable, and a legitimate expense of the business. At any rate, if this natural organization of their business arrangements is not attended to, such traders hardly ought to feel aggrieved if their aggregated demands make it impossible for the carriers to reply as promptly as they desire.

From what has been said, it must not be supposed that the railroads, on their side, are keeping down equipment to the level of the traffic of the least active seasons. As a matter of fact, they are providing cars in marked excess of this, and an appreciable portion of their equipment is lying idle or running light during the "off" season. The actual extent of their equipment is a compromise between the requirements of the periods of maximum and minimum trade. The railroads, of course, will continue to increase equipment so long as there is a reasonable profit arising from the receipts of the car during its active period after deducting the charges against it during both active and inactive periods. It is not easy to see how more than this can be expected from the railroads,[1] though it may happen, in consequence, that cars demanded during only three or four months of the year are not supplied. Shippers do not always realize that the surplusage of cars is quite as important a matter to the railroads as shortage is to them. The railroads are most keenly interested, naturally, in balancing supply with average demand, though even then they are liable to be hit pretty hard by business depressions, as witness the 300,000 car surplus during the past two months, the expense of whose enforced idleness (if cost of repairs, renewals, insurance, interest and storage be considered as distributed equally throughout the year) can hardly have been less than $4,500,000.

There are then, difficulties on both sides. But I have already indicated that shortage evils are accentuated among the roads themselves by the action of certain companies in persistently retaining and improperly using the equipment of other lines, thus reducing the pressure upon themselves, but, at the same time, causing it to be more widespread. Per diem arrangements so far tried, though an improvement upon the old mileage system, have failed to bring about an equitable distribution. A resort to car pooling methods really appears to be the only alternative, if economy of equipment is to be a consideration at all. Granted that capable administrators can be found to take charge of such pools—and no one familiar with the official personnel of the railroads would deny this—their influence upon the car situation in general would be very real. Possibly, there could be established district pools with jurisdictions covering, say, official classification territory, Southern classification territory, the Southwest, the St. Paul Chicago, St. Louis, Kansas City and Denver territory, and the territory between the latter and the Pacific coast, each of these district pools focusing in a central distributing office, which would receive full reports from the district pools and would arrange for transfer of equipment from district to district when necessary. In each district, the pooling principle could be made to apply separately to each of the major varieties of cars, and possibly, though the practicability of this is not quite clear, with a rough reference to their capacities. I have sufficient faith in the genius of the American railroad man to believe that the details of some such plan could be worked out satisfactorily. It is not unnatural that reluctance to enter into a car pool arrangement should arise from the dislike of some roads to hand over the management of a part of their equipment to an external authority, and from a fear that they will thereby get the worst of the transaction. Indeed, it is very likely that, during the formative period and early operation of such a scheme, equitable distribution would fail, at times, to be attained, but, in the long run, it would surely work out to the general advantage of all the roads concerned, except in the case of those who now habitually rely upon other people's supply to make good their own deficiences, and these we are not called upon to take into consideration.

Before concluding this paper, I should like to supplement the figures, with which the discussion of adequacy of car equipment was introduced, with one or two more relating to the cognate and equally important question as to how far such equipment is used efficiently. We have seen that the typical car of 1906-7 is considerably larger in capacity than the typical car of 1900; it is also performing a somewhat greater actual service. The real efficiency of a freight car is the resultant of two forces, if I may borrow the language of mechanics, one the average load, the other the mileage it covers, that is, its average rate of movement. Put into figures, the measure of this product in 1906 was 117,450 ton miles as against 103,700 ton miles in 1900, an increase of 13,750 ton miles per car, equivalent to 13¼ per cent. The average load for 1900 has been estimated at 16½ tons, and from this it follows that the loaded miles per car averaged 6,285; in 1906, the corresponding figure was 6,208. This indicates a backward movement so far as the matter of car movement is concerned. But there are reasons why this result should not be accepted at its face value. By reason of the absence of proper statistical data covering the whole of the railroad systems of the country during the years of comparison, I have been obliged to base the loaded mileage performance of each car upon the number of revenue cars owned at the end of the fiscal years. Obviously, the car mileage is made by the average number of cars owned throughout the year. If it were to be assumed that the net increase of cars, during 1900 and 1906, respectively, took place uniformly during these years, then the figures given above would be changed to 6,450 and 6,396, the decrease of miles per car being thereby reduced from 77 to 54. In dealing with the comparison of individual railroads, it would be necessary to take into account the fact that, at different periods and with different roads, the proportion of cars used in making the mileage to cars owned may vary, but, in dealing with all systems collectively, this is obviously unnecessary.

A further reason for neglecting the apparent decrease in car mileage lies in the omission of privately owned cars from the calculation, though the results of their movement are included in the record of total loaded car miles. If the proportion of private cars were the same in 1906 as in 1900, the net decrease as shown above would be slightly reduced, though the percentage of decrease would not be altered, of course. Private car statistics are not available, but I should take it as unlikely that such cars attained quite as large an increase (relative) as railroad owned cars, and, if this be true, a more appreciable reduction in both the absolute and the percentage decrease took place. For instance, private cars in 1900-1 were estimated to equal from 7 to 8 per cent. of railroad freight car equipment. If, during the following six years, they increased but 20 per cent. in number as against the 35 per cent. of railroad owned cars, the net decrease of loaded car miles per car would be reduced from 54 to 19.

A still additional reason for modifying the result first arrived at is to be found in the varying nature of railroad tonnage over the period. Coal and other mine traffic tends to limit the mileage performance of the cars engaged in it and, when such traffic increases more rapidly in volume than the rest, the effect upon general car mileage average is depressive. Undoubtedly, this has taken place, to a certain extent. The products of mines in 1906 accounted for more than 53 per cent. of total originating tonnage, whereas, in 1900, the proportion was slightly over 52½ per cent. Mineral ton mileage and car mileage figures are not accessible but, no doubt, this movement is reflected in them, and though the difference in percentage is hardly large enough to exert much influence upon the average in car, it would probably be sufficient to wipe out the decrease with which the present analysis of car mileage averages started.

[1] In the matter of car equipment, that is, as apart from the question of car movement.

It is satisfactory to find that, the railroad freight service being taken as a whole, there has been no absolute retrogression in the movement efficiency of the freight car, and yet unsatisfactory not to be able to say more than this. The efficiency of the freight car of 1906 over the car of 1900 is due entirely to improved load; there has apparently been no appreciable improvement in the average number of miles traveled per annum. Except in so far as the trader was able to secure lower rates, a supposition hardly justified by the facts, the benefits of the increased efficiency of the freight car during the period 1900-06 must be regarded as having been in favor of the railroad rather than the trader.

It is a somewhat remarkable fact that the power and ability displayed by railroad managers in so many directions has been unable to secure tangible improvement in a matter which is more vital than most things to the really economical and successful handling of a railroad. In scanning the results of freight operations during the half dozen years covered by the main figures of this paper, one may observe with pride the handling of an increase of business of 52½ per cent., with a train mileage increase of but 14 per cent. (492½ millions to 559½ million miles), and a consequent increase in train load of 42 per cent. (271 to 385 tons), accompanied by an increase of 17 per cent. or more (16⅛ to 18.9 tons) in car loading, but car mileage—the less said about it the better! Perhaps, it is incapable of improvement! But the query is inevitably provoked as to whether some of the improvements named have been purchased at too high a cost. The bulletins of the committee on car efficiency reveal great differences between the various roads in the mileage results obtained from their cars. Unquestionably, varying physical and economic conditions play an important part in these differences, yet one cannot help but believe that the personal equation, the organization of the railroad, is no trivial factor. To take but one illustration, the reports published impress one with the idea that a great deal of misapplied economy is frequently exercised with regard to shop repairs. No doubt, a road hauling heavy tonnage over adverse grades and around sharp curves must expect to be troubled more with the question of car repairs than a road working under the reverse conditions. Yet even in this case, the loss of car time may be seriously increased by lack of proper provision of shop facilities, usually a poor kind of economy, and, to the extent to which shop repairs accumulate, a lessening of the effective equipment of the road. In studying the returns covering July, 1906, to August, 1907, one is surprised, again and again, by the high percentages of cars in shops, and high not merely during the period of slack business. Some roads apparently maintain, during the major part of the year, 8, 9, 10 per cent. of their freight equipment, or even more, as shop ornaments. More attention needs to be given to shop policy, and, one might add, to the treatment cars receive in the yards; with the needed improvement, one hindrance to better freight car performance will be removed.

Yard working affords even more fruitful opportunities of improvement. Terminal yard delays is a vexed problem that is apparently eternal in nature. Poor yard design, or, to be more correct in many cases, lack of design, has been condemned again and again as too common a feature, but it is by no means an unknown thing to find the evils of bad design supplemented by those of poor organization and still poorer management. I think a mistake has been made frequently in locating terminal yards too near the centers of the cities, though sometimes the growth of a city has been so rapid as to reach out to fairly distant sites, crippling the possibilities of their expansion by the immense resulting increase in land values. Again the storage privileges of terminal yards have been notably abused. To judge by the space which railroad managements are often prepared to assign to storage tracks in response to the "needs" of the shippers, they do not always realize that, in the physiology of the yard system, the function of the storage yard is about that of the vermiform appendix. It is satisfactory to note, however, that demurrage regulations are being rounded into more uniform shape over the country at large and, with their steady enforcement, less trouble from shippers' delays can be expected.

Much more could be profitably said about the influence upon loaded car mileage of such trans-shipping arrangements as the Pennsylvania provides at Fort Wayne for the making up of "through" loaded cars at that point, thus reducing the pressure upon the Chicago yards, and much more upon the general extension of "consolidation" arrangements in relation to both increased average loading and mileage. A further interesting question is that of adequacy of motive power and the desirable ratio of such power to freight business and equipment. In this matter, as in so many others, there are marked differences in the practices of the various roads, the justification of which it would be desirable to have explained.

The lack of progress along the lines of car mileage is in such astonishing contrast with improvement in other branches of railroad operation, that everyone feels that something should be done to remedy the situation. There are many factors contributing toward a low daily car mileage which are unavoidable, but advance along the lines suggested, and, perhaps, more radical measures, will certainly do something toward raising the present standard.

The previous statistical analysis rests upon figures covering the operations of all systems, both large and small, during the years 1900 to 1906. It will be interesting to see how the general results are borne out and, indeed, emphasized, over a larger period, by the statistics of a group from which very small roads are excluded.

These are compared below, in the case of 31 railroad systems, some of the operating results of 1907 with the corresponding ones of 1897, a ten-year period. The roads whose statistics were available are the following (arranged in alphabetical order):

A. G. S.	Louisville & Nashville.
Atch., Top. & Santa Fe.	Michigan Central.
Baltimore & Ohio.	M. & O.
Boston & Maine.	Mo. Pac. and St. L., I. M. & S.
Central of Georgia.	N. Y. C. & St. Louis.
Chesapeake & Ohio.	Norfolk & Western.
Chic. & E. Ill.	Northern Pacific.
Chic. & North Western.	Pennsylvania Railroad.
C., C., C. & St. Louis and P. & E.	Rock Island.
Chic., Mil. & St. Paul.	St. Louis & San Francisco.
C., New Or. & T. P.	St. Louis Southwestern.
Erie.	Southern.
Great Northern.	Texas & Pacific.
Grand Trunk.	Union Pacific.
Illinois Central.	Wabash.
Kansas City Southern.	

In 1907 these railroads were handling considerably more than half the railroad traffic of the country, and hence, in spite of some prominent omissions, are well representative of the more important systems. They owned 538,830 revenue freight cars in 1897 and 1,065,548 in 1907, an increase of 97.8 per cent. In calculating the average capacity of these cars, I have been compelled to omit, in 1897, the L. & N., N. P., Rock Island, Mo. Pacific, B. & O., St. L. & S. F., Southern, C. of G., and K. C. S., representing a total of 140,074 cars, on account of average capacity for that year not being ascertainable, but I have added to the list previously given the C., B. & Q. with 36,469 cars. For 1897, accordingly, the average capacity has been based upon 23 roads with 435,225 revenue freight cars, having a total capacity of 9,780,211 tons, thus giving an average capacity of 22½ tons. For 1907 I have had to exclude four roads, the L. & N., C. of G., K. C. S. and Mo. Pacific, with 94,348 cars, but have again added the C. B. & Q. with 47,164 cars, making a net total of 1,018,364 cars, having a total capacity of 34,181,517 tons, or an average capacity of 33.9 tons. On account of the large number of cars included in the calculations, the omission of the roads named cannot materially affect these averages. An increase from 22.5 to 33.9 tons represents a percentage increase of 50.7, from which we can see, much more clearly than in the case of the general statistics covering the shorter period, the really great advance made by the larger and more progressive roads in the direction of the increase of car capacity. When this 50.7 per cent. increase of car capacity is combined with the 97.8 per cent. increase of car numbers, an increase of 198 per cent. of car accommodation is shown. How does this compare with the growth of business handled by these roads? The 31 systems handled, in 1897, 53,046,151,280 ton miles; in 1907, 136,037,276,970 ton miles, so that against the 198 per cent. of car accommodation there has to be set only 156½ per cent. increase of ton mileage. The average load per loaded car mile was 13.4 tons in 1897, and 19 tons in 1907, an increase of 41.8 per cent.* This substantiates the statement made in the body of the paper that there has been evidently a fairly economical utilization of the extra capacity of the enlarged car.

With respect to car movement figures, the 3,991,494,854 loaded car miles of 1897 represented 7,407 loaded car miles per revenue car owned. In 1907, the 7,143,781,875 loaded car miles average out to but 6,704 loaded miles per car owned, an apparent decrease of 9½ per cent. With some of the most important roads included in the averages, the decrease reaches as high as 15½ to 19 per cent. As noted already, these percentages would undoubtedly undergo reduction if adjustment were made for (1) average number of cars owned throughout each year; (2) railway cars owned but not on lines, or vice-versa; (3) average number of private cars operated throughout each year, and (4) proportion of coal and similar car delaying traffic to total traffic. It will be understood from previous remarks that the percentage results can be affected by adjustments under these four heads only when there is, in any of the cases, a percentage variation in the years compared. Should the proportions remain the same the percentage of decrease could not be influenced by such adjustments. It is not unlikely that some roads would find it extremely difficult to account statistically for the whole of the decrease.

Japan's acquisition of the railroads of the country for its state system seems to have been untimely to say the least. It was undertaken just after the great war which had brought the country much glory but no money, and had enormously increased the national debt. Then the railroads needed great expenditures for improvements. The Minister of Transportation asked for $180,000,000, to

*The average is based on the 31 roads named in the list with the exception that the Boston & Maine could not be included in the average for 1897 on account of the absence of loaded car mile figures for that year.

be expended within 12 years. But the Cabinet would only appropriate $15,000,000 at this time, and the authorities finally limited the amount to $12,000,000, whereupon the Railroad Minister resigned.

How Can the Railroads Best Serve the Public?

1. For the protection alike of those who have invested their money in railroads, and of the public served thereby, there should be a local ownership of shares, and that ownership as widely scattered as possible among the greatest number of people.

2. Directors should make full and frequent reports to their stockholders, and encourage the latter to question and discuss them at their meetings, as is done in England, in advance of declaring dividends.

3. Stockholders should realize they are partners in a common venture, and that it is their duty, alike on moral grounds and on grounds of self-interest, to hold their directors, as trustees, to frequent accounting and a strict accountability for all their acts.

4. The use of the misnomer, "interstate commerce," be discontinued, as the word "inter" means "between" rather than "among." The thing really is "domestic commerce."

5. The supervision of railroads should continue as at present under state and federal authority:

(*a.*) The state to exercise such measure of regulation as shall provide for the local trade therein prompt, frequent and safe service, adequate to the growing needs of the public and to retain all its police powers.

(*b.*) The larger matters, which really affect "commerce among the several states," being relegated to federal control, if need be, through an amendment to the constitution.

As to federal regulation:

6. Measures should be taken to expedite the investigation and determination of all questions affecting commerce among the several states, by putting the administrative work under the direct control of the executive, entrusting the judicial determination of all such questions to the judiciary, and leaving with congress itself all the legislative power.

7. The attempt under the present law to delegate to one body functions which our constitution has vested in the executive, legislative and judicial branches of government separately, be given over. A purely administrative body should be created as a part of one of the departments of the executive. Preferably this should have at its head one man as a "commissioner of domestic commerce," occupying, in respect to all companies engaged in transportation among the several states and territories, whether by land or water, much the same place as the comptroller of the currency does toward the national banks. He should be aided by such assistants in various parts of the country as may be necessary, and authorized to call upon the other departments of the executive, particularly the department of justice, and the secret service bureau, for assistance at all times and in all places. To this commissioner each company should make periodic reports, and it should be his duty to see that steps are promptly taken to enforce the law in every particular and in every case.

8. The judicial functions hitherto exercised by the interstate commerce commission should be relegated to the courts, where they properly belong. If needed, additional district and circuit judges should be appointed. I would not favor, as was, I believe, proposed some years ago by your distinguished fellow citizen, the Hon. Richard Olney, the creation of special courts in which to try cases relating to "commerce among the several states," because all citizens have an equal right to be heard in the same court.

9. The attempt by congress to delegate the legislative function of fixing in advance the rates be abandoned. At best, it is of doubtful constitutionality. All disputed cases before the interstate commerce commission must eventually be passed on by the courts; congress should, therefore, so legislate as to really expedite the final decision of such cases.

10. And lest it be said that I have left out the vital question of rates:

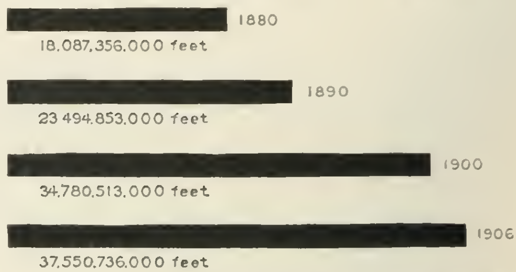
Let it be also provided that rates shall be fair in themselves; that is, above the cost of rendering the service, and below its value, which, while remunerating the owners, shall not restrict trade, but shall tend to stimulate its development. Such rates to be open and equal to all under like circumstances, and subject to legislative revision and regulation. Every trick and device in respect to them to be so promptly detected and punished, that those guilty of the offense shall be deterred by fines, and, if need be, prevented by imprisonment from repeating it.

It is obvious that this final recommendation contains nothing more than the Common Law has always provided as to carriers' charges. The time is coming, indeed it is at hand, when we will do well to revert to the practice of our fathers in basing our action on the Common Law, which, while called the "Sum of human wisdom," is but common sense and common honesty, as practised for centuries by intelligent free men. —*Stuyvesant Fish.*

The Drain on the Forests.

The Forest Service has issued a pamphlet by R. S. Kellogg, Chief of the Office of Wood Utilization, describing the annual consumption of wood in the United States and the timber supply available for the future. This is accompanied by several charts, most of which are reproduced herewith. These charts and the information given in the circular are based, with the exception of those for mine timbers, on statistics of forest products for 1906.

The total quantity of timber used annually for lumber, shingles, hewed cross ties, domestic pulpwood, cooperage stock, round mine timbers, lath, wood for distillation, veneer, and poles (these prod-

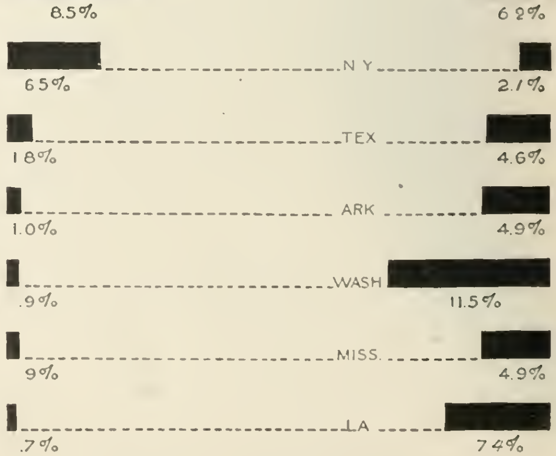


Lumber Production of the United States in 1880, 1890, 1900 and 1906.

ucts being mentioned in the order of their production during 1906) is equivalent to about 50 billion board feet. Of this amount lumber makes up about 37 billion board feet, which is about three times as much as for all the other items combined. Shingles and hewed cross ties each require about three billion board feet, and pulpwood about two billion.

The cut of lumber by kinds of woods in 1906 is shown by the accompanying diagram. Yellow pine furnished 31.1 per cent. of the total, Douglas fir 13.2 per cent., white pine 12.2 per cent., hemlock 9.4 per cent., oak 7.5 per cent., spruce 4.4 per cent., and western pine 3.7 per cent. These seven kinds of timber furnished over four-fifths of the total. The production of no other kind was as much as one billion feet.

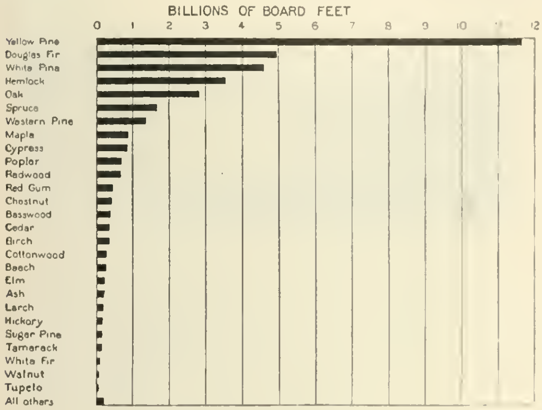
Another diagram shows the lumber cut by states in 1906. Washington produced 11.5 per cent. of the total, Louisiana 7.4 per cent., Wisconsin 6.2 per cent., and Michigan 5.6 per cent. The



Relative Lumber Production of Nine States in 1880 and 1906.

15 states which cut over one billion feet in 1906 supplied nearly three-fourths of the total production. Another diagram shows the proportion of the total lumber production from nine states in 1880 and in 1906. These nine states produced 52.8 of the total in 1880 and 51.5 in 1906. These proportions are about equal, but the changes in the output of individual states are very striking. Michigan, for instance, cut 23 per cent. of the total in 1880 and only 5.6 per cent. in 1906. Louisiana cut 0.7 per cent. of the total in 1880 and 7.4 per cent. in 1906. In 1880 Washington furnished only 0.9 per cent. of the lumber production of the country, but in 1906 it furnished 11.5 per cent. The cutting of the virgin timber in the North and East has been followed by greatly increased drains on the forest resources of the South and West.

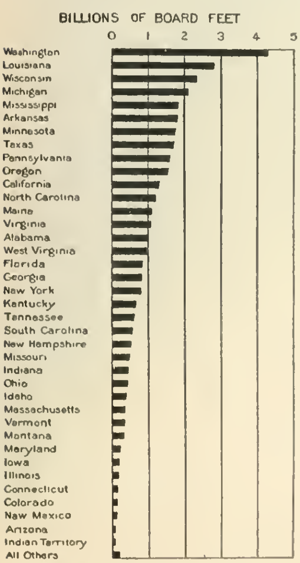
The hardwood and softwood lumber production in 1906 is shown in another figure. The amount of softwood cut was over four



Forest Products in 1906.

times the amount of hardwood. There has been a decided change in the ratio between the two kinds in recent years. In 1889 hardwoods furnished nearly 25 per cent. of the total, against 19½ per cent. in 1906. There has been a greatly increased cut of certain softwoods. In the last seven years the cut of yellow pine has increased 20.7 per cent., western pine 46.9 per cent., cypress 69.3 per cent., redwood 83.2 per cent., and Douglas fir 186.2 per cent. These increases far more than counterbalance the decrease during the same period of 40.8 per cent. in the cut of white pine. On the other hand, the cut of oak has decreased 36.4 per cent., and of poplar 38.7 per cent. These are the two most important hardwoods.

The total lumber production reported by the censuses of 1880,



Lumber Production by States in 1906.

Comparison of Hardwood and Softwood Production in 1906.

Excess of Annual Cut of Timber Over Annual Growth.

1890, 1900 and 1906 is shown in another figure. The cut of lumber has more than doubled since 1880. The annual per capita consumption during the same period has increased from 360 board feet to 440 board feet. The rate of increase in lumber production has been small during the last few years, which probably indicates that the maximum cut for the country as a whole has been nearly if not quite reached.

The United States uses each year 100,000,000 cross ties, three-fourths of which are hewed. Sawed ties are included in the item of lumber mentioned in the second paragraph. Of the hewed cross ties, the oaks, and chiefly the white oaks, furnish nearly one-half. The cut of the hewed ties from young oak trees constitutes, with the exception of lumber, the most serious drain on the oak forests. Two-fifths as much oak timber is required for ties as for lumber. The southern pines furnish nearly 18 per cent. of the hewed cross ties, cedar about 8 per cent., and chestnut about 7 per cent. Other woods which are used in large quantities for hewed cross ties are cypress, tamarack, western pine and redwood.

The annual consumption of lumber in firewood is estimated at 50 billion board feet. Much timber is also destroyed or damaged by fires and storms. For example, in 1891 it is estimated that 12,000,000 acres of forest land were burnt. Again, in the fall of 1906 a great deal of timber was thrown down by wind in the Gulf states. The present consumption of wood in all forms may therefore be conservatively estimated as at least 100 billion board feet a year, and possibly much more. One leading authority has estimated that the total annual use of wood in the United States is equivalent to 150 billion board feet.

Only approximate answers can be given as to how long our timber supply will last at the present rate of cutting. The accompanying diagram shows the excess of the annual cutting over the annual forest growth in the United States as nearly as can be estimated. The annual cut is about three times as great as the annual growth. The most detailed estimates of the standing timber in the United States range from 1,400 to 2,000 billion feet. On this basis the exhaustion of our timber supply is indicated in from 9 to 33 years, according to the method of estimating. Yellow pine, the most important single kind of timber at present, will probably be exhausted in from 10 to 25 years, and Douglas fir in from 25 to 70 years, though this estimate for these woods disregards annual growth.

At present only about 22 per cent. of our total forest area, assuming a forest area of 700,000,000 acres, is in State or National Forests, the remainder being on unreserved public lands or in private hands. The forest area of the United States is amply sufficient, if rightly managed, to produce eventually enough timber to supply all our needs. Yet private owners, as well as the state and national governments, must use their forest lands in a right way if we are to maintain our timber supply.

Foreign Railroad Notes.

Although there has been a decided check to the industrial activity of Germany, the railroad gross earnings are larger than last year; on the Prussian lines 7 per cent. larger in February.

By the electrification of the Giovi tunnel, a short distance north of Genoa, it is expected that 2,000 cars daily may be passed through, instead of 1,000, as at present. The improvement is to be completed early in June.

The degree of Doctor of Engineering was conferred by the Karlsruhe Technical School February 19 last, his 50th birthday, on Wilhelm Schmidt, in recognition of his merits in connection with the use of superheated steam in locomotives.

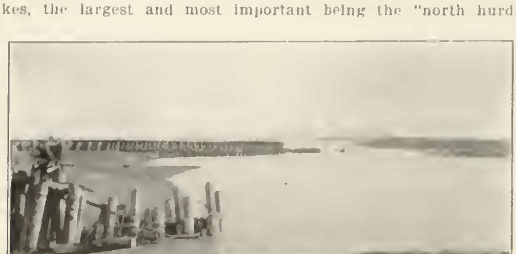
The production of cotton in the Russian dominions north of Afghanistan affords a considerable traffic to the Asiatic Midland (to the Caspian Sea) and the new Orenburg & Taskend line, and an appreciable contribution to the Russian cotton factories, though as yet not enough to make Georgia and Texas tremble. Up to the first of January last the shipments of last year's crop had amounted to 309,620 bales.

A railroad was recently built in Norway from Christiania westward over the mountains to Bergen, on the German ocean. This was snowed under so deep that the section over the mountains was closed in January, and not till April 6 was it attempted to dig it out, with a rotary snow plow. Several miles of snow sheds are to be built; but these will detract from the attractions of the journey.

In answer to a deputy who is an authority on German coal and iron traffic, and who had called attention to the advantages of cars of large capacity as used in America, the Prussian Minister of Public Works said that experience had shown that 20-ton (44,000 lbs.) cars were as large as could be used to advantage on their lines, and that self-unloading cars were economical only on short routes where they are discharged every day.

Repairing a Dike on the Southern Railway.

The "North Incline" of the Southern Railway leading to the freight car ferry on the Illinois side of the Mississippi river near Granite City—about half a mile north of the Merchants' bridge—handles as much if not more freight than any other incline in the vicinity of St. Louis. From the map shown herewith it will be seen that the incline trestle is double-track and is protected by three dikes, the largest and most important being the "north hurdle" dike. This was built in 1902-1903, a part of the work being done during the high water of the spring of the latter year when the stage of the river was about 25 ft. The current was so strong that it was impossible to sink matting to protect the piling against washing out. As a result, the floods of succeeding years cut the piling out until a gap of about 500 ft. had been made. This allowed the current to attack the incline, as shown by the river contours.

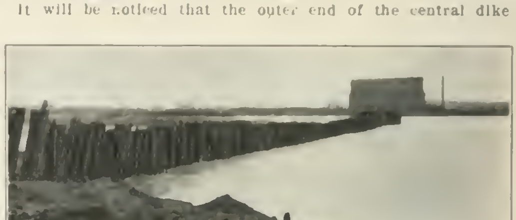


Dike Piles in Foreground Were Part of Original Structure.

It was decided, in repairing the dike, to build the new section at an angle that would deflect the direct current from Gaberet's slough, since during flood periods this current is very strong and difficult to break. The construction of the new work was favored by an extremely low stage of the river.

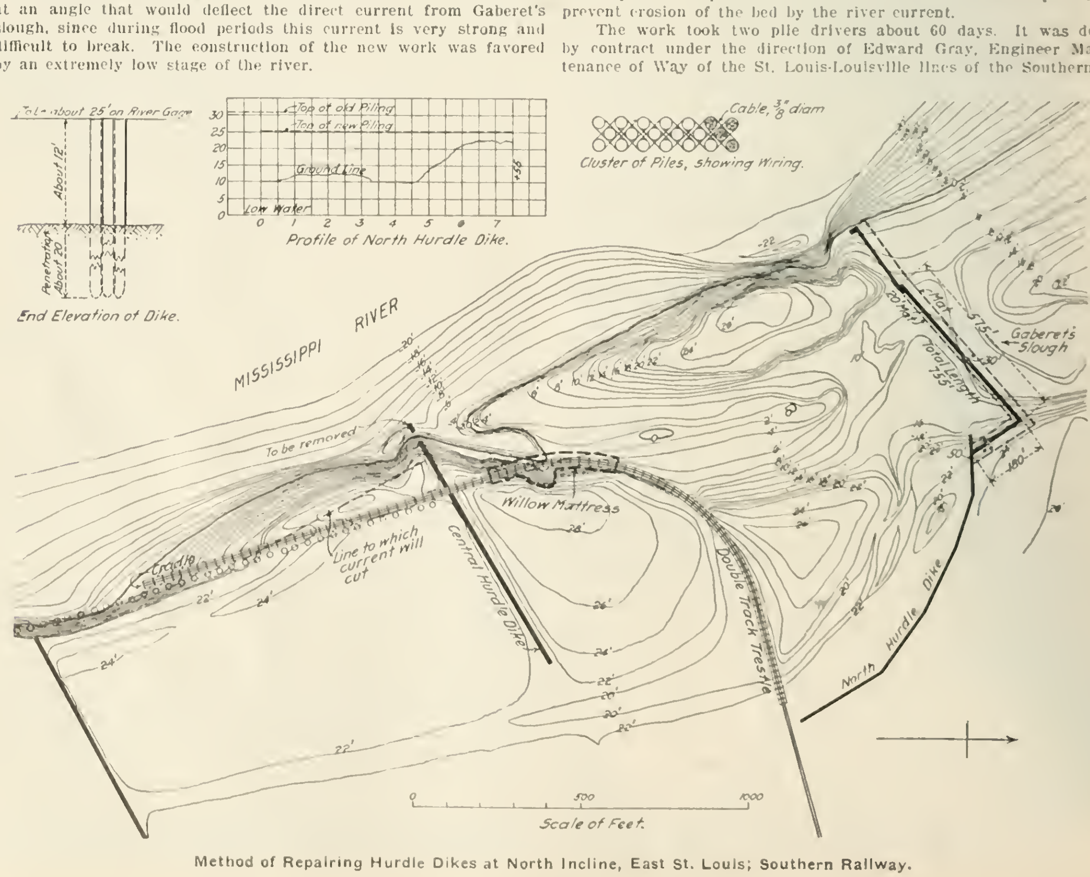
An excavation about 5 ft. deep and 50 ft. wide was made in the bed of the slough, which at this point is at an elevation of about 10 ft. Willow mattresses closely woven and wired were laid in this trench and covered with limestone riprap to the amount of about 1½ cu. yds. to each 100 sq. ft. of mattress. The up-stream side of the mattress was dipped about 2 ft. and heavily riprapped at the toe to prevent under-scour. The piling was then driven through the mattress about 20 ft. from the up-stream edge. The plan shows the spacing of the piling, which averages about two piles per lineal foot. These were carefully drawn into place and wired and stapled, and the tops of the piles cut off evenly. Theoretically, in one or two years' time all space between the dike and the trestle should be filled in with sand deposit to a contour of 18 to 20 ft., giving positive protection to the incline from floods.

It will be noticed that the outer end of the central dike is marked for removal. This dike now extends so far into the river as to keep the current too far away from the lower incline trestle, and sand banks form over the tracks during each high water, which have to be removed either by hand or hydraulic power. Cutting off about 50 ft. of the dike will allow the current to cut in close enough to the trestle to do away with this trouble. The presence of a mattress at the outer end of the trestle curve is indicated on the map. It was placed there at the time the dike was repaired to prevent erosion of the bed by the river current.



View of Dike Before Tops of Piles Were Cut Off.

The work took two pile drivers about 60 days. It was done by contract under the direction of Edward Gray, Engineer Maintenance of Way of the St. Louis-Louisville lines of the Southern.



Method of Repairing Hurdle Dikes at North Incline, East St. Louis; Southern Railway.

GENERAL NEWS SECTION

NOTES.

It is reported that the St. Louis & San Francisco will dispense with the services of train auditors.

The State Railroad Commission of Illinois has ordered sweeping reductions in switching charges at Chicago.

The New York Central has closed its telegraph school for the summer; this for the reason, it is stated, that the company now has a surplus of operators.

The Pittsburgh Traffic Club has passed resolutions complaining because the railroads are not so free as formerly in furnishing shippers with copies of all new freight tariffs.

At Columbus, Ohio, last week Judge Evans granted a temporary injunction against the enforcement on interstate shipments of the demurrage rules prescribed by the State Railroad Commission.

The Supreme Court of Texas has sustained the contracts, made before the passage of the present anti-pass law, under which the employees of express companies are carried free on railroads.

The newspapers say that there is to be a conference in Chicago, June 12, of members of the railroad commissions of six states—Illinois, Indiana, Wisconsin, Michigan, Ohio and New York, Second district.

Joseph Richardson, Chairman of the Southeastern Passenger Association, announces that after June 1 mileage books will not be accepted on trains but must be presented at the ticket offices for exchange.

The Wabash has issued freight tariffs at Chicago in which the rates, while no higher than before, include the charges for carrying freight in the tunnels from the shippers' stores to the Wabash freight houses.

The Massachusetts legislative committee on railroads and taxation, sitting jointly, has voted to report the bill based upon the petition of John P. Wainright, and advocated by President Tuttle of the Boston & Maine, to amend the Massachusetts anti-stock watering laws with regard to the issuing of new stock by steam railroads and street railways.

It is announced that beginning May 31, through passenger trains are to be run between Chicago and Savannah over the Illinois Central and the Central of Georgia. The route will be over the Illinois Central's main line to Jackson, Tenn.; from there to Birmingham, Ala., over the new line of the Illinois Central and from Birmingham to Savannah over the Central of Georgia.

Railroad Club of New York.

This is the name of a new social club which has just been opened in the "down town" section of New York City. It is in one of the two new Hudson Terminal buildings. At the dedication on Monday last about 1,000 members and guests were present. The rooms are in the twenty first and twenty-second stories of the building named, which is at the corner of Church and Cortlandt streets. The club's officers are E. H. Gary, of the United States Steel Corporation, President; F. D. Underwood, President of the Erie Railroad, Vice-President, and C. W. King, Secretary and Treasurer. The house committee is composed of W. G. McAdoo, W. G. Oakman, W. H. Marshal, F. B. Jennings and W. G. Besler.

Entering the foyer on the twenty first floor, one passes directly to the office, which is flanked by a broad staircase leading to the floor above. Off the foyer to the north are the smoking or lounging rooms and the grill, and in the southwest corner the main dining room for men. Along the east side of the building on this floor are 10 private dining rooms. It is possible here to open sliding doors throwing five of these rooms into one long banquet hall. The floor above has a ladies' dining room and a roof garden.

The Chicago Subway.

The lines of the underground electric freight railroad in Chicago now connect with the freight station of every railroad in the city except one, and with 34 large stores, warehouses, etc. The company has just completed a freight station at 169 West Jackson boulevard and one at Dearborn avenue and North Water street, for the accommodation of merchants whose buildings cannot profitably be connected directly, through their basements, with the railroad tunnels. From an article in the *Western Electrician* it appears that the tunnel roads now have 1,800 cars and [illegible] electric locomotives. The speed of trains is limited to 1[illegible] miles an hour. It has been found desirable to have signals of some kind at the numerous intersections of north and south with east and west lines, and an automatic arrangement is being put in, to be actuated through the trolley wire. With this a red light is shown at a crossing when a train is approaching. At the 13 places where the lines run beneath rivers, a similar connection to the trolley wire is to be made to provide an automatic block system for trains following one or another on the steep grades. These grades under the river are from [illegible] ft. to 160 ft. per mile. The officers of the Illinois Tunnel Co. are Samuel McRoberts, President; A. J. Earling, Chairman of the Executive Committee; W. J. C. Kenyon, General Manager, and J. W. Callahan, General Superintendent.

Scherzer Bridge in Egypt.

The contract for the bridge over the Nile at Cairo, costing over $1,500,000, has been given to the Compagnie de Fives-Lille, of France. The bridge will be about 900 ft. long between abutments, and will carry a road, two footpaths and a double-track electric railway. There will be one draw span, consisting of a Scherzer double-leaf, rolling lift bridge, 129 ft. 1 in., center to center of pins, and 63 ft. wide. The bridge will be built according to plans prepared by the late Sir Benjamin Baker, one of the designers of the Forth bridge in Scotland, and the Scherzer Rolling Lift Bridge Co., Chicago, which company will act as Consulting Engineers for the draw span and adjacent parts. It is expected that the bridge will be in service before the end of 1910.

Steel Fence Posts.

The standard steel post made by J. H. Downs, 299 Broadway, New York, is made of a single high carbon steel angle. It is driven into the ground, thus saving the expense of digging post holes. To hold it more firmly in place, a vitrified clay collar, fitting loosely on the post, is slid down it after the post is driven, leaving about 1 in. of the collar above ground. The posts are made in various lengths, and in sizes from $1\frac{1}{2}$ in. x $1\frac{1}{2}$ in. x $\frac{3}{16}$ in. to 2 in. x 2 in. x $\frac{3}{16}$ in. The fence wire is attached to the posts by special staples engaging the wire and then driven into holes punched through the post and clinched on the inside. Instead of staples, clips which grip the post may be used. This is a convenience when it is not known in advance what fencing will be used, so that the posts cannot be punched accordingly. A special non-climable fence post is furnished for use with barb wire, the top of the fence being bent inward at an angle of 45 deg.

Williamsburgh Bridge Terminal.

The new subway station under construction for the past two years at the Manhattan end of the Williamsburg bridge, New York City, has been opened for business. The station is used by the electric (surface) street cars which cross the bridge to and from Brooklyn. The new terminal station has eight loops with separate platforms, and entrances and exits for each loop, so that the streams of incoming and outgoing passengers will not get in each other's way.

In Brooklyn a connection is being made between the Broadway elevated road and the bridge, and it is expected that elevated cars will soon be run over the bridge.

The Amsterdam Corporation.

The Amsterdam Corporation, 165 Broadway, New York, has been organized for the purpose of acting as engineer on special railroad problems, such as electrification of steam lines; subaqueous tunnels; urban and interurban railways, passenger and freight terminals, and analyses of operating contracts. While the principal purpose is to give advice on these matters, the corporation is prepared, when desired, to act as agent for the principal in supervising and directing new construction to a conclusion. With this object in view, no alliance or connection has been nor will be made by the corporation, or its officers or employees, with any manufacturing company or others, that will interfere with unbiased and disinterested devotion to the interests of its clients.

The corporation is also prepared to initiate and perfect plans for new enterprises, accompanied by data that will demonstrate their merit to investors. The President, William J. Wilgus, was formerly vice-president of the New York Central. The Vice-President, Henry J. Pierce, is president of the International Railway, Buffalo, and president of the Netherlands Tramways Corporation.

Crop Conditions on May 1, 1908.

The crop reporting board of the Bureau of Statistics of the United States Department of Agriculture finds, from the reports of correspondents and agents of the bureau, that the area of winter wheat standing on May 1 to be harvested was about 29,751,000 acres, which is 4.2 per cent., or 1,318,000 acres, less than the area reported as sown last fall and 5.8 per cent., or 1,619,000 acres, more than the area of winter wheat harvested last year.

Winter wheat.—The average condition of the growing winter wheat on May 1 was 89.0 per cent. of a normal, as compared with 91.3 on April 1, 82.9 per cent. on May 1, 1907, and 85.8 per cent. the mean of the May 1 averages of the past 10 years.

Rye.—The average condition of the rye crop on May 1 was 90.3 per cent. of a normal, as compared with 89.1 on April 1, 88.0 on May 1, 1907, and 89.5 the mean of the May 1 averages of the past 10 years.

Meadows.—The average condition of meadow (hay) lands on May 1 was 93.5 per cent. of a normal, as compared with 83.6 on May 1, 1907, and 89.5 the mean of the averages on May 1 of the past 10 years.

Pastures.—The average condition of pastures on May 1 was 92.6 per cent. of a normal, as compared with 79.6 on May 1, 1907, and 87.8 the mean of the averages on May 1 of the past 10 years.

Spring plowing.—Of the total acreage of spring plowing contemplated, 66.6 per cent. is reported as actually done up to May 1, as compared with 71.5 per cent. at the corresponding date last year, and 65.9 the mean of the averages so reported in the past 10 years.

Spring planting.—Of spring planting 54.7 per cent. is reported as having been completed on May 1, as compared with 47.0 per cent. on May 1, 1907, and 52.6 per cent. on May 1, 1906.

Increase in Stockholders.

Since the panic of last year the number of stockholders of the principal railroads in the United States has increased greatly. A considerable part of this increase may be due to the registration of shares in the names of the individuals instead of in the names of brokerage firms, but it is also due to increased investment by people who were attracted by the relatively low price of railroad stock during and after the panic.

The following table compiled by the *Wall Street Journal* gives the approximate number of shareholders of certain corporations at present, compared with certain dates previous to the panic in October:

Company.	Shareholders Now.	Before panic.
U. S. Steel	95,000	68,000
New York Central	22,098	16,445
Big Four	1,650	1,277
Nickel Plate	807	630
Standard Oil	5,156	5,087
Rock Island preferred	3,020	2,295
Rock Island common	4,105	3,049
Chesapeake & Ohio	2,648	1,735
Norfolk & Western	4,530	3,679
Erie	10,050	9,258
Chicago Great Western	10,500	9,000
Chicago, Milwaukee & St. Paul	10,000	6,000
New York Air Brake	1,200	800
Atchison	25,000	19,700
Delaware & Hudson	5,861	3,700
Canadian Pacific	18,943	15,900

Sale of Passenger Coaches.

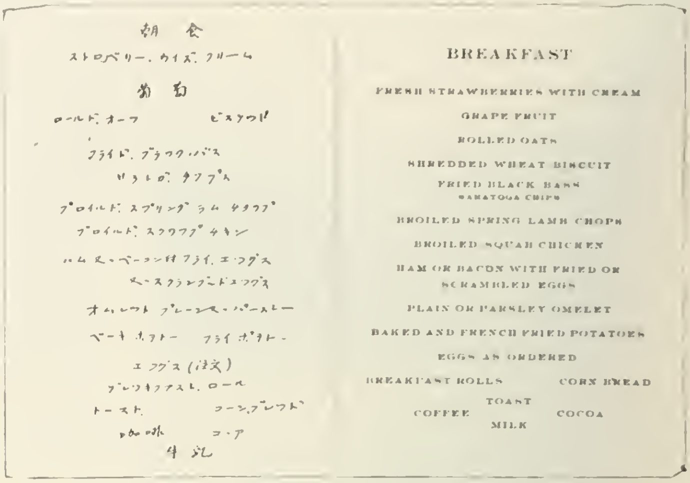
The Commissioner of Bridges will sell at public auction June 2, 1908, in Brooklyn, N. Y., 92 passenger coaches, 20 of which are motor cars weighing about 36 tons each, as noted on advertising page 22 of this issue.

Limit of New Security Issues in New York.

The Public Service Commission of Albany, in granting authority to the Lehigh & Hudson River Railway to issue only $270,000 bonds on its application for permission to issue $300,000, decides that bonds or stocks cannot be issued to repay money taken from the treasury, although this money may have been used for work properly chargeable to capital account. The Commission points out that the only thing that can be considered is the new use of the money acquired from the sale of bonds or stock. (See discussion on editorial page.)

A North Western Menu Card in Japanese.

A facsimile of a menu card prepared by the Chicago & North Western Ry. for a party of Japanese merchants, manufacturers, bankers and newspaper men which traveled over that road in April is shown herewith. The party was on a sight-seeing trip around the world. They traveled eastward from San Francisco on the Overland Limited. When nearing Chicago their sleeping cars and special dining car were detached and run as a special train to enable

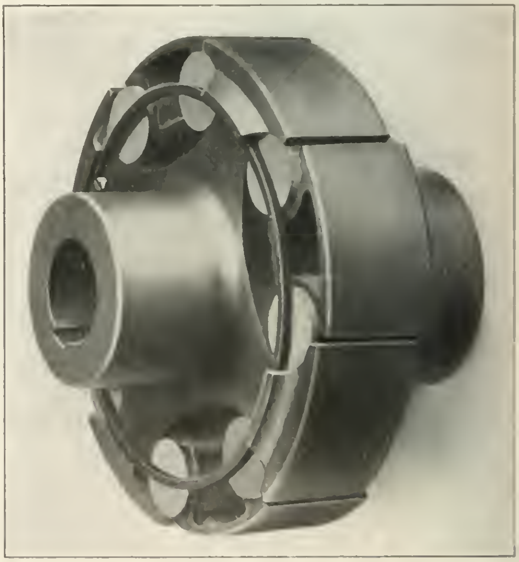


North Western Menu Card in Japanese.

the visitors to examine such industries on the North Western as interested them. The special menu card was bound in a cover bearing the crossed flags of Japan and the United States.

A New Flexible Insulated Coupling.

The illustration shows an improved flexible insulated coupling manufactured by the R. D. Nuttall Co., Pittsburgh, Pa. The coupling consists of two interlocking spiders of cast-iron, insulated by solid rubber cylinders. The only other parts are two steel rings



Nuttall Flexible Insulated Coupling.

used to hold the rubber cylinders in position. The rubber members provide ample insulation and at the same time give the desired flexibility. It is furnished in sizes from 5 h.p. up.

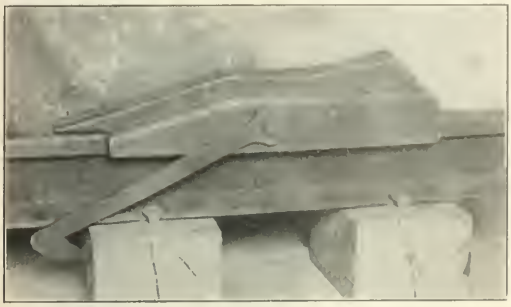
This coupling is especially desirable where electric motors are direct-connected to machinery subject to vibration; for example, a tube mill or a coal pulverizer in a cement plant, where the coupling relieves the motor from the shocks and jars of the machine. In addition, the end thrust of the crusher is overcome and the motor bearings run without heating.

Arthur Koppel.

Arthur Koppel, who died suddenly on May 13, at Baden Baden, Germany, was born in Dresden, Germany, in 1851, and started in business when he was 17 years old. He was first interested in a concern in the handling of structural iron and established his own firm in 1876, taking up the problem of making portable all kinds of material for narrow-gage railroads. In 1905 the firm was made a stock company. The American business, the Arthur Koppel Co., Pittsburgh, Pa., was established ten years ago. There will be no change in the company.

Davidson Locomotive and Car Raiser.

The accompanying illustration shows the Davidson locomotive and car raiser in position. This device is a practical emergency



Davidson Locomotive and Car Raiser.

jack, upon which the wheel of the locomotive or car is run and allowed to rest in the curve shown. In cases of failure in a locomotive equalizer system, the raiser, used under the wheel, lifts the engine frame into a position when temporary repairs can be made. The raiser is made of cast steel and will handle locomotives of any size. It is made by the U. S. Metal & Manufacturing Co., New York.

University of Illinois.

Prof. Ira O. Baker, for 34 years connected with the Department of Civil Engineering of the University of Illinois, has been granted by the trustees leave of absence for one year from July 1, 1908. It is understood that Professor Baker will devote his time to revising his book on Masonry Construction. The executive duties of the Department of Civil Engineering will, during his absence, be assumed by Prof. J. P. Brooks.

INTERSTATE COMMERCE COMMISSION RULINGS.

Relation of a Particular Rate to Rates Generally.

George R. Reynolds v. Southern Express Co. Opinion by Commissioner Clements.

The defendant's rate on cream of $3.90 per 10 gallons from Columbia, Tenn., to Jacksonville, Fla., was held to be unreasonable, and a rate not exceeding $2.75 for the movement of the cream and the return movement of the empties was prescribed. The law requires that the several classes of common carriers subject to its provisions shall fix reasonable charges for transportation, and the authority of the Commission to prescribe a reasonable rate is not restricted by the terms of any agreement between an express company and a railroad company. It is not sufficient, says the commission, for a carrier when called upon to justify a rate to assert that its rates generally are fair and just and that no change may properly be made in any particular rate because it would disturb the integrity of the system as a whole. In dealing with a particular rate the commission may consider such other rates as affording a basis for comparison, but where a given rate is found to be unreasonable the commission will not hesitate to order such rate reduced, although the reduction might disarrange the relative adjustment existing between this and other rates.

TRADE CATALOGUES.

Light Locomotives.—The H. K. Porter Co., Pittsburgh, Pa., has issued the tenth edition of its catalogue of light locomotives. The volume contains 224 pages bound in cloth and describes 559 locomotives, covering a wide range of sizes and designs up to engines of 17-in. cylinders. Attention is called to the fact that during the interval since the publication of the ninth-edition catalogue, there has been an increase in power and efficiency and in the quality of the locomotives greater than during any similar period in the history of the company. The catalogue also gives a large amount of engineering data concerning locomotive performance and track work.

Idaho & Washington Northern.—A folder describing the country through which this road runs is illustrated with striking photographs of standing timber and scenery along the Pend d'Oreille river, on which a line of steamers is operated in connection with the railroad. It also calls attention to the silver-lead mines, lumbering and farming opportunities and fishing and hunting. Other photographs show the solid vestibuled passenger trains of Pullman coaches operated by the road.

Electric Headlights.—Under the title "Two Aids to Better Service," the General Electric Co., Schenectady, N. Y., has issued a neat folder, No. 3,654, calling attention to some of the reasons why the G E Luminous Arc headlight has been adopted. On the front page are pictures of the headlight and the Belmont tunnel, New York, the "Two Aids." A list of a few of the roads now using the light is included.

Locomotive Raiser; Locked Clevis.—The U. S. Metal & Manufacturing Co., New York, has published a leaflet describing the Davidson locomotive raiser. Another leaflet describes the Hillman locked clevis and turnbuckle, reference to which was made in the *Railroad Gazette* of Feb. 7, 1908.

Derails.—Catalogue No. 51, of the Hayes Track Appliance Co., Geneva, N. Y., is a full catalogue of Hayes derails. The different styles are described and illustrated by photographs and drawings, and plans are also shown for operating the derails by pipe line from main track switch stands. Rules for installing and maintaining the devices are included.

Tanks.—The W. E. Caldwell Co., Louisville, Ky., recently issued the twentieth annual edition of its catalogue. The pamphlet contains 36 pages of useful information regarding tanks which have been installed and built by the company; these include both wooden and metal tanks of various designs, as used by railroads and manufacturing plants.

Industrial Railways.—Pamphlet No. 077 of the C. W. Hunt Co., West New Brighton, Staten Island, N. Y., briefly describes and illustrates industrial railways and rolling equipment for them, including many styles of cars and electric storage battery locomotives. References are given to other catalogues describing the company's products in more detail.

Jacks, Tool Grinders, Track Drills and Brake-Beam Clamps.—Topping Brothers, New York, have issued a pamphlet describing Burrows ball bearing jacks. These are made in 25 styles, in sizes from 15 tons to 50 tons. The Lightning tool grinder, the Lightning track drill and the Totten brake-beam clamps are also described and illustrated.

Signal Supplies.—Catalogue No. 13 of the Bryant Zinc Co., Chicago, has 160 pages and is bound in cloth. The products described and illustrated include battery materials, crossing signals and bells, relays, battery chutes, wire, track drills and other supplies and tools for the signal department.

Denver & Rio Grande.—The passenger department is sending out a circular, No. 55, giving a list of hotels and boarding houses on the lines of the Denver & Rio Grande, the Rio Grande Western and the Rio Grande Southern. Location, rates, capacity and similar information are given.

Pump Valves.—A circular which is being distributed by Jenkins Brothers, New York, calls attention to pump valves made of various compounds suited to water at different temperatures and pressures, as well as other liquids and also to air compressors.

Weatherproofing.—A circular issued by the H. W. Johns-Manville Co., New York, describes Keystone hair insulator, showing its application for sound deadening and weatherproofing.

MANUFACTURING AND BUSINESS.

The Chicago store of Jenkins Bros., New York, has been moved to larger quarters at 226-228 Lake street, corner of Franklin street.

Jerome & Elliott, Chicago, makers of Jerome metallic packing, have moved to 351 and 353 West Monroe street into larger quarters.

W. R. Toppan, for many years General Manager of the Kennicott Water Softener Co., Chicago, has resigned. His present address is Chicago Athletic Association.

Herbert C. Petty has been elected a Director of the Crocker-Wheeler Co., Ampere, N. J. Mr. Petty entered the sales department of the company in 1903, and is now Contract Manager.

David Newhall has been appointed manager of the department of supplies for railroads, manufacturers and contractors of the George M. Newhall Engineering Co., Ltd., 136 South Fourth street, Philadelphia, Pa.

William A. Pitcher, for two years the Eastern railroad representative of S. F. Bowser & Co., Fort Wayne, Ind., was one of the 12 who lost their lives in the burning of the Aveline Hotel in Fort Wayne on May 3. Mr. Pitcher was 48 years old.

The General Railway Signal Co., Rochester, N. Y., recently closed a contract with the Northern Pacific Railroad Co. for two electric interlocking plants at Duluth, Minn. These plants are for interlocking at two drawbridges about 2,200 ft. apart, and electric locking is provided between the towers.

The U. S. Metal & Manufacturing Co., New York, has just completed arrangements with the United Railroad Equipment Co., Baltimore, Md., by which it becomes the sole selling agent in the United States for the I. X. L. automatic track sander. Among the roads having engines equipped with this sander are the Philadelphia & Reading and the Central of Georgia.

The American Blower Co., Detroit, Mich., has bought the foundry of the Northwestern Foundry & Supply Co., Detroit, maker of cast iron soil pipe and fittings and plumbers' specialties. The foundry will be used for making blower, exhaust fan, engine and heater castings, and it is desired to dispose of all soil pipe fitting patterns and foundry equipment complete; also a large stock of finished pipe fittings, bell traps and other material.

George E. Pratt, formerly sales representative of the Hicks Locomotive and Car Works, Chicago, has been elected President of the H. A. Clark Co., New York, dealer in passenger and freight cars and car specialties and Sales Agent for the Middletown Car Works, Middletown, Pa. Mr. Pratt is also Vice-President and General Manager of the Central Inspection Bureau, 17 State street, New York, inspector of railroad equipment, iron and steel, bridge materials and kindred lines.

The C. I. F. Company, 11 Broadway, New York, takes its name from the three terms, cost, insurance and freight, used in the export trade. The method of the company, which acts as export commission merchant of machinery, tools, etc., is to simplify the complicated system of discounts and other factors entering into selling prices which often prevent foreign buyers from ordering from American firms. The C. I. F. Company puts before the prospective buyer in a standard form the actual net prices of the articles it deals in and also distributes easily understood indexes of these articles. These are published in English, French, German and Spanish.

OBITUARY NOTICES.

William J. Murphy, Vice-President of the Cincinnati, New Orleans & Texas Pacific, and Third Vice-President of the Alabama Great Southern, died at his home in Cincinnati, Ohio, on May 10. He was born in 1848, at Greenfield, Mass., and entered railroad service on the Erie, in 1862, as messenger in the telegraph office at Susquehanna, Pa. Two years later he became telegraph operator and ticket clerk at Deposit, N. Y., and the next year he was made train flagman, station agent and yardmaster at the same place. In 1866 he was transferred to the train despatcher's office, and in 1870 became train despatcher on the Delaware division. Three years later he was promoted to chief train despatcher of the same division, and in August, 1882, was made Superintendent. In 1887 he was promoted to General Superintendent. During 1890 he was out of railroad service, but in the next year he became Superintendent of the Brunswick division of the East Tennessee, Virginia & Georgia, now part of the Southern. In 1893 he went to the Cincinnati, New Orleans & Texas Pacific as Superintendent of the Cincinnati division, and in 1899 was appointed General Manager. On April 30, 1903, he was elected Vice-President of this road, and Third Vice-President of the Alabama Great Southern.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Brotherhood of Freight and Baggage Men.

This brotherhood held its third biennial convention at Lancaster, Pa., May 12, about 200 members being present.

American Society of Civil Engineers.

At a meeting of this Society, May 20, a paper on the "Effect of Temperature Changes on Masonry," by Charles S. Gowen, was presented for discussion. This paper was printed in the proceedings for April, 1908.

Canadian Railway Club.

This club has elected officers: President, L. R. Johnson, Canadian Pacific; Vice-President, H. H. Vaughan, Canadian Pacific; Second Vice-President, A. A. Mayer; Secretary, James Powell; Treasurer, S. S. Underwood.

The Franklin Institute.

At a stated meeting of the Institute, May 20, there was an address by Dr. Geo. Flowers Stradling, of Philadelphia, Pa., on "John Fitch, Pennsylvanian, Inventor of the Steamboat." The address was supplemented with illustrations.

International Brotherhood of Railway Employees.

This association met at Boston May 12, 120 delegates being present. The President of the association in his report said that the Canadian Government (operating the Intercolonial Railway) had agreed to recognize the union.

Railroad Special Agents.

The Railway Association of Special Agents and Police, of the United States and Canada, held its twelfth annual meeting at Lexington, Ky., May 11, about 150 members being present. The meeting was presided over by W. F. Riley, of Chicago, President of the association.

American Society of Mechanical Engineers.

At the semi-annual meeting of this society to be held in Detroit, Mich., June 23-26, an entire session will be devoted to the discussion of papers on the conveying of materials and hoisting and conveying machinery, including belt conveyors. At this meeting there will be a continuation of the paper on "Clutches," with special reference to automobile clutches, by Henry Souther, from the meeting of May 12. The other papers are as follows: "Some Pitot's Tube Studies," by W. B. Gregory and E. W. Schroder; "Thermal Properties of Superheated Steam," by R. C. H. Heck; "Horse Power, Friction Losses and Efficiencies of Gas and Oil Engines," by L. S. Marks; "A Journal Friction Measuring Machine," by Henry Hess; "A Simple Method of Cleaning Gas Conduits," by W. D. Mount; "A Rational Method of Checking Conical Pistons for Stress," by G. H. Shepard, and "The By-Product Coke Oven," by W. H. Blauvelt. There will be the usual excursions to points of interest in and around Detroit, including a visit to the University of Michigan, at Ann Arbor. The Society for the Promotion of Engineering Education and the Society of Automobile Engineers will hold a meeting in Detroit at the same time.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Indiana Harbor Belt.—R. M. Huddlestone, Auditor of the Lake Shore & Michigan Southern, has been appointed also Auditor of the Indiana Harbor Belt, succeeding John Stewart, resigned.

Lake Shore & Michigan Southern.—See Indiana Harbor Belt.

Operating Officers.

Chicago & Alton.—F. C. Runnels has been appointed Trainmaster at Dwight, Ill., succeeding C. F. Smith, transferred.

Delaware, Lackawanna & Western.—C. C. Foltz has been appointed Assistant Superintendent at Hoboken, N. J., succeeding J. G. Sickles, resigned.

F. W. Bennings, chief train despatcher, has been appointed Passenger Trainmaster at Hoboken, N. J., succeeding Frank Cizek, transferred.

El Paso & Southwestern.—S. R. Kennedy has been appointed Trainmaster at Tucumcari, N. Mex., succeeding H. H. White.

Mexican Central.—C. W. Everett has been appointed Assistant to the General Manager, with office at Mexico City.

C. E. Carson has been appointed Superintendent of Terminals at Tampico, Tam., succeeding J. J. Lewis, resigned.

Traffic Officers.

Chicago, Burlington & Quincy.—Mark Ford, Foreign Freight Agent in Chicago, has been appointed Texas Freight and Passenger Agent, with office at Dallas, Texas, succeeding C. W. Andrews, resigned. The position of Foreign Freight Agent in Chicago has been abolished.

Grand Trunk Pacific.—J. E. Dalrymple, the new Assistant Freight Traffic Manager, was born in 1869 in Montreal, Quebec and began railroad work in 1883 in the Treasurer's office of the Grand Trunk. In 1890 he was made secretary to the Traffic Manager of the Chicago & Grand Trunk, now the Grand Trunk Western. Six years later he became secretary to the General Traffic Manager of the Grand Trunk and was made division freight agent at Hamilton, Ont., in 1899. Later in the same year he was transferred to Detroit, Mich., and was also made Manager of the Grand Trunk Despatch Fast Freight Line. In 1900 he went to the Central Vermont as General Freight Agent, but the next year went back to the Grand Trunk as Assistant to the Second Vice-President and General Manager. In 1902, he again became General Freight Agent of the Central Vermont, where he stayed until August 14, 1905, when he was appointed General Freight Agent of the Grand Trunk. He remained in this position until his appointment on May 1 of this year as Assistant Freight Traffic Manager.

J. E. Dalrymple.

Iowa Central.—E. B. Johns, soliciting agent of the Piedmont Air Line, has been appointed General Eastern Agent of the Iowa Central, with office at New York, succeeding A. W. Osborn, resigned.

Southern Pacific.—M. O. Bicknell, district freight and passenger agent, has been appointed Assistant General Freight and Passenger Agent at Tucson, Ariz., with jurisdiction over the lines in Arizona and New Mexico, and his former office has been abolished.

Engineering and Rolling Stock Officers.

Arkansas, Louisiana & Gulf.—J. M. Marshall has been appointed Superintendent of Bridges and Buildings, with headquarters at Monroe, La.

Chicago, Milwaukee & St. Paul.—P. C. Hart, until recently Superintendent of Terminals at Chicago, is now on construction work on the Pacific extension, under the direction of the Chief Engineer of the C., M. & St. P. of Washington.

Lehigh Valley.—E. B. Ashby, Engineer of Maintenance of Way, has been appointed Chief Engineer, with office at New York, succeeding W. G. Berg, deceased.

Mexican Railway.—C. H. Burke, Assistant Superintendent of Machinery, at Aguascalientes, Aguas., has been appointed Locomotive Superintendent at Orizaba, Vera Cruz, succeeding W. Cockfield, resigned.

Illinois Central.—J. G. Neuffer, the new Superintendent of Machinery, was born in February, 1854, at Chillicothe, Ohio, and began railroad work in 1869 as machinist's apprentice on the Marietta & Cincinnati, now part of the Baltimore & Ohio Southwestern. He served as machinist, fireman, engineer and shop-foreman on the same road, and in March, 1880, was made road foreman of engines on the Baltimore & Ohio Southwestern. Two years later he was appointed Master Mechanic on the same road and from December, 1893, to November 1, 1903, he was General Master Mechanic and Superintendent of Motive Power. In November, 1903, he resigned from the Baltimore & Ohio Southwestern to become Assistant Superintendent of Machinery of the Illinois Central. He held this office until his recent appointment to the office of Superintendent of Machinery.

J. G. Neuffer.

LOCOMOTIVE BUILDING.

The Iowa Central has ordered six mogul locomotives from the Baldwin Locomotive Works.

CAR BUILDING.

The Bloomington, Pontiac & Joliet Electric is in the market for three interurban cars.

The Chicago Railways have increased their order from the Pullman Co. from 300 to 500 cars.

The International & Great Northern is in the market for 1,250 cars instead of 750, 500 of which are box cars.

RAILROAD STRUCTURES.

Chicago, Ill.—The Illinois Central, it is said, will build a bridge over the tracks of the New York, Chicago & St. Louis.

The Chicago, Indianapolis & Louisville, it is said, is in the market for bridges. The Chicago, Burlington & Quincy will soon give contracts for bridge material.

Fort William, Ont.—By an order of the Canadian Railway Commission, the Grand Trunk Pacific will have trackage rights over the Canadian Pacific from Port Arthur to Fort William, and a union passenger station will probably be built for the joint use of the Canadian Pacific, the Grand Trunk Pacific and the Canadian Northern.

Vera Cruz, Mexico.—Contract is reported let by the Vera Cruz Terminal Company for the extensive terminal improvements to be made here to S. Pearson & Son, who have an office at Mexico City. Work is to be started at once. (April 17, p. 559.)

Woodstock, Ont.—The Canadian Pacific has given a contract to Power & Brewer for concrete work on its proposed bridge at Upper Woodstock. The value of the contract is about $125,000.

Contract is also reported let to Power & Brewer, by the Grand Trunk Pacific at about $350,000 for concrete work involving 75,000 cu. yds. of concrete.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

Buffalo, Rochester & Pittsburgh.—Revision work, it is said, has been resumed on the 10-mile section of this road from Carmen, Pa., south to Brockwayville. The improvements include a double-track tunnel 1,000 ft. long and a new trestle. Contract for grading work let last year to Eyre-Shoemaker & Co. of Philadelphia. (March 13, p. 390.)

Canadian Pacific.—This company, it is said, will improve its line between Calgary, Alb., and Strathcona at a cost of about $50,000.

CHICAGO, LAKE SHORE & SOUTH BEND (ELECTRIC).—This company, which is building an electric line from South Bend, Ind., west to Chicago, Ill., 71 miles, will begin operating the section from South Bend to Michigan City, June 1. It is expected that the entire line will be in operation by July. (April 17, p. 559.)

ILLINOIS CENTRAL.—On the Natchez division of the Yazoo & Mississippi Valley new 75-lb. rails and new ties have been laid from Natchez, Miss., southwest to Harrison, 28 miles. Work is to be pushed on the remaining 70 miles southwest to Jackson.

JOPLIN & PITTSBURG (ELECTRIC).—This company is said to be asking bids for track laying, bonding and ballasting about 25 miles of the line it is building from Joplin, Mo., northwest to Pittsburg, Kan. (March 13, p. 391.)

MISSOURI & NORTH ARKANSAS.—This company, which recently began operating its extension from Seligman, Mo., northwest to Neosho, 41 miles, will shortly begin running trains through to Joplin, 19 miles north of Neosho, over the tracks of the Kansas City Southern.

Announcement is reported made that this company will build a branch from Negrohill, Ark., southwest to Little Rock, about 55 miles. Negrohill is on the extension of the main line under construction southeast towards Helena, on the Mississippi river.

NEW YORK & LONG ISLAND.—See this road under Railroad Corporation News.

NORTHWESTERN RAILROAD.—See Oregon Short Line.

OREGON SHORT LINE.—Work, it is said, has been resumed by this company on the Northwestern Railroad. The Northwestern was organized to build from Huntington, Ore., north along the Oregon-Idaho state line, following the Snake river, to Lewiston, Idaho. (March 13, p. 394.)

ROCHESTER-CORNING-ELMIRA TRACTION.—The New York Public Service Commission, Second district, has authorized this company to give a mortgage to pay for the building and equipment of its proposed double-track electric line. The company was organized in 1906 to build from Rochester, N. Y., south to Elmira, 120 miles. The directors include C. O. Geer, G. Abeel, M. H. Schultze, F. Eckstein and T. S. Breckinham. The office of the company is at 42 Broadway, New York.

SARATOGA & ENCAMPMENT.—Work, it is said, has been resumed by this company on the extension from Walcott, Wyo., south to Encampment, 45 miles. Track has been laid on all but about 12 miles, and it is expected to have the entire line in operation this month. (March 13, p. 394.)

SOUTH DAKOTA CENTRAL.—This company, it is said, has placed in operation its extension recently finished from Hayti, S. Dak., north to Watertown, about 18 miles. (Feb. 14, p. 234.)

SOUTHERN RAILWAY.—See this company under Railroad Corporation News.

SOUTH OMAHA & WESTERN.—See Union Pacific.

UNION PACIFIC.—The South Omaha & Western, it is said, has finished the new double-track line from South Omaha, Neb., to Lane, 11.60 miles, and the line is now in operation. (March 13, p. 395.)

YAZOO & MISSISSIPPI VALLEY.—See Illinois Central.

RAILROAD CORPORATION NEWS.

CHICAGO & ALTON.—This road, together with the Toledo, St. Louis & Western, has secured trackage rights from the Baltimore & Ohio Southwestern, which gives a connecting link for through freight trains between Springfield, Ill., and Cowden.

CHICAGO & EASTERN ILLINOIS.—William Salomon & Co., of New York, are offering Chicago & Eastern Illinois equipment trust 5 per cent. notes of Oct. 1, 1907, and due $124,000 semi-annually, Oct. 1, 1908, to Oct. 1, 1917, inclusive. The authorized amount of the notes is $2,480,000, of which there are $2,356,000 outstanding. The maturities after 1910 are being offered at prices to yield $5\frac{1}{2}$ per cent., and the earlier maturities to yield from $3\frac{1}{2}$ to $5\frac{1}{4}$ per cent. The issue is secured on 2,000 steel frame cars costing $2,737,912, equal to 16 per cent. margin on the outstanding notes.

CALUMET & SOUTH CHICAGO (ELECTRIC).—This company has taken over the Calumet Electric Street Railway and the South Chicago Street Railway, and has increased its capital stock from $1,000 to $5,000,000.

DENVER & RIO GRANDE.—Of this company's new mortgage of $150,000,000, which the stockholders will be asked to approve, $90,000,000 is to be reserved to refund the bonded debt of the Denver & Rio Grande and the Rio Grande Western. The total outstanding funded debt of the company is $84,843,900.

HAVANA CENTRAL.—A special meeting of the stockholders has been called for June 15, to authorize an issue of $3,500,000 bonds.

MANHATTAN RAILWAY (ELEVATED).—This company, which owns the elevated lines in Manhattan and the Bronx in New York, has applied to the Public Service Commission of the First District for permission to issue $11,712,000 bonds to be used to pay the first mortgage bonds of the Metropolitan Elevated, which fall due on July 1, and to repay the company for the cost of extending lines in the Bronx.

NEW YORK & LONG ISLAND.—This company—the "Belmont tunnel," New York City, has secured from the New York State Court of Appeals a decision sustaining the validity of its franchise. The litigation over this tunnel, which crosses the East river at 42d street, has been in the courts for more than two years, the city having steadily denied the right of the corporation to construct and operate the tunnel under the old Steinway franchise. Justice Blanchard at the outset of the litigation refused to grant a temporary injunction restraining the construction, holding that if the franchise had really lapsed and the city was entitled to the tunnel rights no harm could come if the construction went on at the risk of the company claiming the right to construct. In November last the Appellate Division sustained Justice Blanchard's contention, holding that a project of such great public importance should not be delayed on the mere possibility that at some future time it might be determined that the old franchise was invalid. It is this decision which has now been affirmed by the Court of Appeals. Meanwhile it has been rumored steadily that the city was about to purchase the tunnel from the Belmont interests, and a formal offer to sell for $7,239,476 was made in February by President Shonts to the Public Service Commission. That offer is still under consideration.

NEW YORK CITY RAILWAY.—The U. S. Court of Appeals, in a decision handed down May 20, sustained the order of the Circuit Court authorizing the Receivers to issue $3,500,000 certificates to put the roads in their charge in shape.

NEW YORK, NEW HAVEN & HARTFORD.—Kidder, Peabody & Co., Estabrook & Co., and R. L. Day & Co., of New York and Boston, Mass., are offering $4,000,000, first mortgage, 4 per cent., 50-year bonds of 1904-1954 at 98. This is the balance of $15,000,000 bonds authorized under this mortgage.

NORTHERN TEXAS TRACTION.—Estabrook & Co., and Lee, Higginson & Co., of Boston, Mass., are offering $500,000 three-year, 6 per cent. notes of May 1, 1908-1911, at $97\frac{1}{4}$, yielding 7 per cent. The Northern Texas Traction runs a street railway in Fort Worth, Texas, and an interurban line between Fort Worth and Dallas.

SEATTLE ELECTRIC.—Lee, Higginson & Co., N. W. Harris & Co., and Estabrook & Co., of New York and Boston, Mass., are offering $2,500,000 Seattle Electric consolidated and refunding mortgage sinking funds 5 per cent. bonds of 1907-1929 at $93\frac{1}{2}$, yielding $5\frac{1}{2}$ per cent.

SOUTHERN RAILWAY.—J. P. Morgan & Co. are offering $15,000,000 6 per cent. three-year convertible notes of May 1, 1908-1911, at $98\frac{1}{2}$. Holders of the Southern Railway two-year, 5 per cent. notes maturing on June 1 and July 2 may deposit their notes and will receive preference in the allotment of new notes. Preference will also be given to holders of the Southern Railway stock trust certificates. The new notes are secured by $20,000,000 Southern Railway development and general mortgage 4 per cent. bonds, Series A; $25,000,000 Tennessee Central, prior lien mortgage 4 per cent. bonds, and $2,000,000 Virginia & Southwestern first consolidated mortgage 5 per cent bonds. The notes may be converted into Southern Railway development and general mortgage bonds.

TONOPAH & TIDEWATER.—It is said that this company has purchased a controlling interest in the stock of the Bullfrog Goldfield railroad, and that the new company will be incorporated under the name of the Tonopah & Tidewater Railway.

VIRGINIAN RAILWAY.—Redmond & Co. and the Equitable Trust Co., of New York, have purchased $17,000,000 Tidewater Construction Co. first lien, five-year 6 per cent. convertible notes, secured by $33,500,000 first mortgage 5 per cent. bonds of the Virginian Railway and $3,000,000 first mortgage 5 per cent. terminal bonds. The notes are to be guaranteed unconditionally by H. H. Rogers. These new notes are being offered among the brokerage houses at 99, yielding $6\frac{1}{4}$ per cent.

RAILROAD GAZETTE

ESTABLISHED IN APRIL, 1856.

PUBLISHED EVERY FRIDAY BY THE RAILROAD GAZETTE AT 83 FULTON STREET, NEW YORK
BRANCH OFFICES AT 375 OLD COLONY BUILDING, CHICAGO, AND QUEEN ANNE'S CHAMBERS, WESTMINSTER, LONDON

EDITORIAL ANNOUNCEMENTS.

THE BRITISH AND EASTERN CONTINENTS edition of the Railroad Gazette is published each Friday at Queen Anne's Chambers, Westminster, London. It contains selected reading pages from the Railroad Gazette, together with additional British and foreign matter, and is issued under the name Railway Gazette.

CONTRIBUTIONS.—Subscribers and others will materially assist in making our news accurate and complete if they will send early information of events which take place under their observation. Discussions of subjects pertaining to all departments of railroad business by men practically acquainted with them are especially desired.

ADVERTISEMENTS.—We wish it distinctly understood that we will entertain no proposition to publish anything in this journal for pay EXCEPT IN THE ADVERTISING COLUMNS. *We give in our editorial columns* OUR OWN *opinions, and these only, and in our news columns present only such matter as we consider interesting and important to our readers. Those who wish to recommend their inventions, machinery, supplies, financial schemes, etc., to our readers, can do so fully in our advertising columns, but it is useless to ask us to recommend them editorially, either for money or in consideration of advertising patronage.*

OFFICERS.—In accordance with the law of the state of New York, the following announcement is made of the office of publication, at 83 Fulton St., New York N.Y., and the names of the officers and editors of the Railroad Gazette:

OFFICERS:

W. H. BOARDMAN, *Pres't and Editor*
E. A. SIMMONS, *Vice President*
RAY MORRIS, *Secretary*
R. S. CHISOLM, *Treas.*
I. B. RINES, *Cashier*
L. B. SHERMAN, *Western Manager*

EDITORS:

RAY MORRIS, *Managing Editor*
BRAMAN B. ADAMS
CHARLES H. FRY
FRANK W. KRAEGER
GEORGE L. FOWLER
HUGH RANKIN
BRADFORD BOARDMAN

CONTENTS

VOL. XLIV., No. 22. FRIDAY, MAY 29, 1908

It has taken two years and a half to convince the prosecuting officers of New York City that a mere error of judgment on the part of a signalman is not a crime for which he should go to state's prison. Cornelius A. Jackson, the signalman at Fifty-third street junction, on the Ninth Avenue Elevated road, who, on September 11, 1905, set the switch for the wrong track, was sentenced in the Court of General Sessions to five years' imprisonment; but the Appellate Division has now reversed that decision and set him free, holding that, as the signals (home and distant) showed, seasonably and plainly, which way the switch was set, the fault was the motorman's, not Jackson's. This, of course, is the only rational conclusion that could be reached by anyone conversant with all the facts. The movement of the train through the sharp curve leading to Fifty-third street at 25 miles an hour resulted in derailing one car and the death of a dozen passengers; and the officers of the law seemed to think that an exemplary punishment ought to be inflicted on some one, because of the magnitude of the disaster; though errors of a similar character (though not so disastrous) are no doubt committed in New York City every month. Paul Kelly, the motorman, had run away, so the whole force of public opinion, as represented by the legal department of the county, fell on Jackson. Kelly was followed, however, and after two years was caught and tried and is now in Sing Sing prison. Jackson's error consisted in leaving his post of duty for a minute or two (on account of illness, the court says), and leaving the switch and signals set for Fifty-third street. Probably he was breaking no vital rule for, as before stated, he left the signals properly set so that no motorman could excuse himself for not knowing that he was being directed to the sharp curve; but as trains follow one another every three or four minutes, or oftener, he should have allowed nothing but imperative necessity to take him away from his post until he knew which way the next approaching train was destined. To provide the utmost precaution the signalman at a place like this should not leave his post without first setting the switch for the straight track, as a runaway on that track would be less dangerous than on the curve; but, as we have intimated, this extreme precaution probably was not prescribed by the rules. The essential trouble appears to have been that Kelly was inexperienced and incautious, having never run on this division except along the straight track; and that the signals could not be set to indicate at the same time "stop" for both routes, they were disks, always showing a clear track for either one or the other of the two routes. The trouble with the legal gentlemen appears to have been that they were unable to see the necessity, or even the probable reasonableness, of a rule by which a signalman may at any time on a minute's notice safely leave his post. This rule is vital, for without it the safety of thousands of trains every day would depend not only on the lives and the sanity of signalmen, but on their unerring judgment. But everybody, including the lawyers, apparently prefers the romantic notion that every signalman repeatedly every day holds a hundred passengers' lives in his hands.

Fifty passengers have been killed in Belgium, in one of the most spectacular train accidents that ever occurred in Europe. The cause of the disaster is not clearly reported, but it seems to have been carelessness in making repairs to a switch (interlocked) while the signals had not been set to notify trains to reduce their speed. Belgium is the home of the International Railroad Congress and its railroad practice ought to embody the sum of all wisdom. In this particular feature the best wisdom may be summarized, no doubt, in the prescription of very simple yet precise rules, and rigid inspection to see that such rules are carried out; and we have no reason to doubt that in this respect Belgium stands as high as any other country. The reader will recall three recent accidents to passenger trains in this country from the same cause, one at Philadelphia, one near New York, and one at Washington.* The first one was due to the mistake of a repairman in spiking a switch the wrong way, the speed of the passenger train had been reduced but not reduced enough; in the other two cases the error was made by a contractor's employee. Happily the disaster in each case was greatly mitigated by favorable circumstances. The task of enforcing perfectly safe rules in repair work is one of the most difficult in railroad operation, difficult because in so many situations the rules seem unnecessary. Not one time in a thousand does the competent repairman need any rules, for he knows, without being told, that the signals must be set at "stop" before he disturbs the track. The rules are made for the thousandth or ten-thousandth time, when, if using his own judgment, he may not take *all* the precautions necessary. Rules which men thus are liable constantly to look upon as refinements that are

*Philadelphia, December 19, 1904; New York, August 4, 1905; Washington, November 19, 1907.

worse than useless always have been and always will be hard to enforce. Still, the only lesson is to enforce them. The ideal enforcer of rules is the military officer who so trains, governs and inspects his men that he is fully prepared for the enemy every minute of the 24 hours, but our task is even harder than the soldier's because he sometimes *knows* that the enemy is five miles away, while our enemy is *always* in ambush. The carefully prepared rules of the signal department of the Lake Shore & Michigan Southern for the conduct of outdoor repairs were reprinted in the *Railroad Gazette* of August 18, 1905, and they furnish very interesting reading for every signal engineer or supervisor who is not absolutely sure that his stable doors are locked. The English Railway Clearing House rules require that when repairs are going on the distant signal shall be disconnected from the lever in the machine. For the guidance of enginemen in running through interlocking plants where some of the functions are out of service, and the switch rails have not been spiked, the best rule is for them to reduce their speed sufficiently to be able to see by looking at the rails where they are being led to, though at many places it is difficult to enforce it. This rule is not practicable at night; but another good rule is to require the repairers to have all switches spiked some time before dark.

NORTHERN SECURITIES AND THE NEW HAVEN.

The famous Northern Securities case fills 214 pages of the United States Law Reports but its records can be condensed to a few leading points. Certain stockholders of the Great Northern and Northern Pacific railroad companies, "with competing and substantially parallel lines from the Great Lakes and Mississippi river to the Pacific ocean" endeavored to combine them in a holding corporation, the Northern Securities Company of New Jersey. Suit was brought by the government against the combination under the anti-trust (Sherman) act of 1890, and, on appeal, the United States Supreme Court held that the combination was in violation of the law and was in restraint of interstate commerce. Four judges, Harlan, Brown, McKenna and Day, interpreted the Sherman act radically and applied it to contracts in restraint of trade whether "reasonable" or not. Judge Brewer, the fifth judge, held, in substance, that they must be unreasonable and affirmed individual investment rights; but held, in the particular case, that there was an unlawful combination of individuals in restraint of trade and concurred with the four judges named, thus making a majority of one. The four other judges, Chief Justice Fuller, White, Peckham and Holmes, dissented, holding that the ownership of stock in railroads "is not commerce at all," and that the law does not apply to suppression of competition "by fusion." Such in its essence and stripped of collateral branches was the Northern Securities decision. Its narrow margins and infirm base as a precedent, especially in view of future changes on the supreme bench, are obvious at a glance.

Broadly speaking the suit just brought by the federal government against the New York, New Haven & Hartford under the same anti-trust act lies along the same lines as that against the Northern Securities corporation. There are counts which could be lifted almost bodily from one complaint into the other. The general principles run parallel. In the New Haven, as in the earlier case, the question of the legal status of a holding company may also get into the suit before it ends; and there are other external similarities. But, in details, and in what may be called physical conditions of the two cases there are striking disparities. In the New Haven case there is, strictly speaking, no combination of stockholders to suppress competition and the original agency is an old and single corporation. The Northern Securities suit related to two long and parallel lines with intensive competition while, in the New Haven case, competition is distributive and in the nature of general monopoly slowly built up. The New Haven suit involves a vast system of street railways, some originally competitive, others purely lateral and feeders and these trolleys, by the way, have, in corporate organization, been segregated to their states. This may affect the interstate question technically though the street railways are under "indirect" New Haven control. Why the marine properties of the New Haven are not named in the suit is one of the mysteries. Practically all of them are of an interstate character and of a nature to strengthen the federal suit. The omission of them is strong intrinsic evidence of the truth of the report of an original promise of the administration to exempt them. On the consistency of such federal action and attitude there need be no comment.

While so similar in the basic principles of law involved it will thus be seen that the New Haven suit is far more complicated than the case against the Northern Securities Company and it is not simplified by the coincident suit of the state of Massachusetts against the defendant corporation, saying nothing of the question of ultimate disposal of the New Haven properties should the government win a case, in which success would in many respects be more serious than defeat.

But it is not on the technical phases of the suit that the mental vision of the intelligent citizen and man of affairs pauses long. Behind law and the courts there are railroad history and a resulting situation of the deepest import. The New Haven corporation typifies a natural and inexorable law of railroad development and railroad unity. It is a corporation 60 years old. Almost 40 years ago, with the absorption of the New Haven, Hartford & Springfield line, its record of consolidation began. Since then it has absorbed in one form or another, not fewer than 50 transportation lines—railroad, street railway and marine. It has unified and expedited traffic. It has sustained and improved a host of weak subsidiary lines. Branch roads that were defective in public service conditions have been standardized. Its steam system as a whole, allowing for actual cost, improvements plowed in, and increased valuation has not only not been "watered" but has been desiccated. In the transition downward of freight rates it has, if due allowance be made for classification of traffic, surpassed both the Boston & Albany and the Boston & Maine. In passenger service it has been the only railroad corporation in the country to adopt *voluntarily* the two cents a mile rate upon its whole system. If it be rejoined that this was fiscal expediency on a system of great passenger density, the actual boon to the traveling public remains still as a truism. The corporation in the past has had sinister relations to legislation in Connecticut and Rhode Island, but they were much worse before the days of monopoly than since. It has taken in 1,400 miles of street railway, much of it in a high degree aqueous. But the policy was protective, the water had been turned on by state authority long before the street railways were acquired and, as related to absorbed parallels, the outcome has been the transfer of steam business to the street railways at lower fares and corresponding public benefit.

The question of the partial but serious disintegration of such a system, evolved in the same manner as other large railroad systems, is now at bar and the Northern Securities case has been transferred to New England. The suit is one that reaches through the years, it must pass from one federal administration into another and the courts may or may not try it out. But of its immediate unwisdom as an act of federal policy in the present exigency of the railroads and at a period of industrial and commercial stress there can be but one dispassionate opinion. In the event it may not even prove to be "good politics."

HOW TO REDUCE DAMAGE CLAIMS.

A certain railroad covering a large territory and handling a great deal of traffic has for several years been trying to classify by causes the claims it has paid out, and it has succeeded in determining causes for about half the amount of claims.

But the magnitude of unclassified losses is so great that it suggests that these losses are largely what is known as "concealed," their proportionate increase in the two years under consideration far exceeding the increase in business done. There is strong reason to believe that thousands of claims of this class are settled because of the difficulty which a carrier has in establishing proof that packages were short or damaged in contents when they were originally packed, perhaps due to the errors of shippers' employees or to more or less accidental causes, even when there is good ground for believing this to be the case. Of course, the effect of this is to make the carrier act as insurer of the contents of packages transported in condition which appears to be perfect, and to put a premium upon carelessness or even upon connivance. After careful study, this railroad has demonstrated clearly that some of these causes are more or less readily subject to cure. With others the conditions can be improved by careful attention, while in a few cases the situation appears to be growing worse rather than better, despite the best efforts of the management. Traffic congestion, which is the most prolific of all causes of loss and damage, has already disappeared, at least for the time being. During the last two years the volume of business transacted has been so enormous that it has inevitably led to carelessness in the effort to keep things moving and prevent accumulation, and this carelessness has affected not only the manner in which the freight is packed, but the way it is marked, shipped and handled on the road. It is believed that the loss and damage account from 1905 until the slackening of business occurred this year, was increased almost 50 per cent. by carelessness alone.

As regards the proper treatment of the determined causes, it has been found that car robberies by employees can be decreased substantially by care in selecting men, by closer general supervision and by specific checks; but robberies due to acts of trespassers and thieves have tended to increase, perhaps owing to the fact that it is very difficult to secure proper action from courts and magistrates on this great evil. The chances are that the local constabulary is more concerned in passing bad characters along and in getting them out of town than it is in locking them up at the expense of the community. No new laws are necessary to stop this short-sighted policy of local expediency, but small towns and cities alike should realize that the act of passing vagrants along turns them up again in due rotation, while the universality of the practice keeps the supply of vagrants always good. The trespassers steal rides, pillage freight cars and help swell the death roll of those hurt on railroad property, and this is true in the United States to a far greater extent than in any other country in the world. Unfortunately, the railroads themselves can do but little to remedy this evil—the burden rests with the communities.

As regards results to be gained by better packing, it should be observed that under prevalent practice it is the contents and not the bulk of a package which pays the freight; consequently a railroad ought to be interested in bringing about strong and compact methods of packing goods—strong, because the carrier is placed almost in the position of an insurer of safe delivery; compact, because of the saving in bulk, and because compactness itself is an element of strength. It is possible for receiving clerks to exercise some discretion about this, but anything like systematic inspection would be resented and might be made the ground of specious complaint. The apparent remedy for bad packing lies in such a modification of the classification and application of tariffs that it will be worth somebody's while to be careful.

Objections to insufficient marking of shipments, especially of packages shipped in less than carloads, are hard to sustain, above all, at competitive points, yet thousands of packages go astray for this reason. A large proportion of the claims on account of errors of employees and of delays are due to defective marking. Each package of l. c. l. freight should be marked plainly for identification and destination. The rule requiring a shipping memorandum from which the marking and the number of packages can be checked ought to be strictly enforced. This particular trouble is one in which the railroads themselves were in considerable part to blame, since they have the remedy in their own hands if they will only act with uniformity.

This remedy is now to be applied. The General Managers' Association of New York appointed a committee to consider the question of losses and damages on behalf of the Association with a view to arriving at a better standard practice among the membership with regard to receiving and transporting freight, and especially to the question of marking plainly l. c. l. packages. The committee presented a report as suggested by the General Managers' Association to the Trunk Line Association, with the result that all the roads east of the Mississippi river operating in the territory covered by the "official classification" have instructed their agents from July 1 to refuse all articles in l. c. l. lots, which are not plainly marked with the name of the consignee, and with the station, city and state, of destination. The railroads will enforce the rule not only in cases of shipments originating on their own lines, but agents at transfer points will also be instructed to refuse to receive from other roads, packages which are not properly marked.

This rule (Rule No. 3 of the classification), though it has long stood in the tariffs, is now to be filed with the Interstate Commerce Commission by each company, thus making it a part of the legal tariff, and therefore a requirement which cannot be ignored without breaking the law. To require one shipper to mark every one of a hundred bags of meal while allowing another to deliver the bags insufficiently marked, would be discrimination, which, of course, is unlawful. An officer of the Pennsylvania says that during the last fiscal year his company paid $342,520 for goods "lost in transit," which is 34 per cent. more than was paid on the same account in the preceding year. The term "lost in transit" refers, we suppose, to those losses which it was found wholly impossible to locate. More than one-half of this sum—or, to be exact, $176,260—represents losses on goods which had been improperly marked or not marked at all. During 1907 the Pennsylvania gathered at one place 18,000 packages on which there were no marks to show the proper destination of the goods, though it is not said that all of these packages remained forever unidentified. This same officer gives a further interesting item in connection with freight losses in the statement that the loss and damage payments by 17 of the principal railroads in 1907 amounted to $5,596,794, which is more than 1 per cent. of the total freight earnings of those companies for that year and more than one-fifth greater than the claims paid by the same companies in 1906. As it is estimated that 45 per cent. of the payments represent "losses in transit," it appears that losses of this class in 1907 must have amounted to about $2,500,000, and pursuing the estimating process a step further this officer concludes that one-half of this amount, or $1,250,000, was due to improper marking. Hence if the 416 roads using the official classification shall strictly adhere to their new resolution, this million and a quarter will be saved. The marking rule is, of course, entirely reasonable, but it is very hard to enforce. If a shipper sends a carload of bar iron or of bags of salt, he is allowed to omit the marks, carload shipments having been excepted from the rule since the year 1, but if he ships 100 bars of iron occupying a tenth of a car, or 1,000 bags of salt, filling only one end of it, the rule at once applies. If the bars are round and only a half inch in diameter, or if the bags are all trade-marked in large red and blue letters, the shipper feels particularly abused. Then he makes sarcastic remarks about the propriety of requiring the destination to be stamped on each kernel of corn in a 30-ton carload, and the freight agent ruminates on the diplomacy required of him by "the Hepburn law."

THE NATURE OF A PUBLIC SERVICE.

"The public does not take into account that a company, which is worked for the sake of profit, frequently understands better how to satisfy the requirements of its patrons than a less elastic official enterprise. Neither does it appreciate that it is better for the community to be sometimes in conflict, as passengers or consignors of merchandise, with shareholders over anxious for dividends, than to be compelled to pay in the shape of taxation for unnecessary facilities provided by a state service under electoral influences."

The phrases quoted above are taken from the introduction to Mr. C. Colson's "Les Travaux Publics et les Transports." At a period when the nationalization or municipalization of public services, using that expression in its most comprehensive sense, is being discussed from such widely differing standpoints, it is of interest to reproduce the views of a distinguished French writer, who has examined the whole question impartially, and whose opinions must inevitably be colored by the different relations existing in Europe between the government and other public authorities and private enterprise.

Public services can be divided into two kinds, of which the older type includes such functions as home defense, education, road making, etc. These services are usually undertaken by the state or municipality, because while they promise no immediate or direct profit to the individual citizen, their value is, nevertheless, manifest to the community in general. The maintenance of an efficient navy is a case in point. Transportation, none the less a public service, differs essentially from all other national or local services, because, as Mr. Colson aptly puts it, its inherently economic character renders it possible to figure out in hard cash, at least approximately, its value both to the nation and the individual. Therefore the impossibility of assessing the relative benefit given to the individual citizen by a standing army, for instance, has led the state to divide the expense among the community in the shape of taxation, whereas the value of the service given by a railroad can be exactly fixed and charged. The transportation of a ton of coal 50 miles constitutes a service from which the recipient obtains an immediate pecuniary benefit, the price of which can be determined and paid for by him. Incidentally, this forms one of the strongest arguments against railroad nationalization, since under private ownership the user is taxed in direct proportion to the use made by him, instead of being compelled to contribute toward the expenditure of the state railroads whether he uses them or not.

Now, according to our author, the characteristic feature of a railroad company is that it represents a public service of which the essential object is to benefit private interests. This may appear somewhat paradoxical, but it is to be remembered that in every civilized country an undertaking such as the construction of a railroad requires specific authorization, and the authorization, whether obtained by private act of the legislature or otherwise, represents in effect a delegation of governmental functions. In France the company obtains a concession permitting it to build and work the line for a given period, at the end of which the undertaking, with all its rights, passes into the hands of the state, which also exercises certain rights of supervision, of rate fixing, and sometimes of participation in the earnings during its existence as a company. The state may also guarantee a dividend, or the difference between a fixed rate of profit and that actually earned. In England and the United States there is no bargain with the state, and the charters are usually granted in perpetuity, with the exception of certain purely local concerns, such as urban railways, which the municipality may have the right to acquire after a fixed period, with or without payment. Similar terminable contracts obtain on the Indian railroads.

Discussing the relative advantages of public and private control, Mr. Colson points out that the construction of a long-distance railroad, between Paris and Marseilles, for example, not only requires governmental authorization, but is an undertaking of such general importance that the state cannot regard the matter with indifference, and must only favor the project if it can be proved to be in the interests of the public. In other words, a service involving certain alterations in the general *status quo*, such as in the ownership of landed property, must be in a position to fulfil its promises of public benefit before those alterations are sanctioned. Competition cannot be anticipated as a certainty, as the individual company possesses an absolute monopoly at least where certain localities are concerned, and can always combine, amalgamate or co-operate with competitors where alternative routes are provided by another concern. The state must, therefore, prevent this monopoly, created by itself, from abusing its powers.

Public services, he continues, are admittedly more spendthrift than private undertakings. This is owing to the fact that in a public administration the actual profits on the working are, if not a negligible, at least a secondary consideration. "Every engineer knows that public works executed by government departments cost more than when undertaken by contractors. In the case of state industries the causes of expense inherent to public administrations produce their full effect." This truism merits reflection, and it has been amply demonstrated by various municipal works departments in England. But the French railroads prove the same. For 1905 (the last year for which complete statistics were available) the ratio of expenditure of the state system amounted to 72 per cent., as against percentages varying from 46 per cent. to 57 per cent. in the case of the large companies. And, although the situation of the state lines is not ideal, from the traffic standpoint, they are, in fact, protected by just those rigid conditions of operations, *e. g.*, as regards the lowering of rates, of which the administration complains. The German system is also costly. On the surface its financial results appear satisfactory. The cost of construction was low, the traffic density is helped by that of the population, and the production of coal is five times that of France. The net profits amount to 5½ to 6 per cent. on the capital expenditure. This result has been obtained not owing to a more skilful administration, but, in spite of a much costlier one. In 1904 and 1905 the ratio of expenditure rose to 63 per cent., as against an average of 52 per cent. for the French lines. Average rates are not lower than in France when the greater proportion of mineral and similar traffic is properly allowed for.

Judicial control over operation, as distinguished from direct government interference, is the system adopted in England. The Railway and Canal Commission may be cited as an example. The Englishman regards the working of railroads, canals and harbors as a branch of industry dependent on private enterprise, and not as a public service worked under contract with the state. France, on the other hand, enjoys an administrative, as opposed to a judicial form of control. This is based on the idea that a company only utilizes the land occupied by the railroad as a delegate of the state or municipality. The privileges and duties accompanying the period of concession, always for a limited time, are clearly defined in the original agreement, and are insusceptible of subsequent legislative modification. In England subsequent legislation can always override the special acts originally obtained by each separate company. One of the weak points of the French system is that the government or other public body, represented by the Minister of Public Works or his agents, can exercise an excessive control that is not always satisfactory to the community at large. He can prescribe the hours of work, the speed, time and number of the trains; in fact, the entire organization of the service. Similar interferences on the part of the state railroad commissions is looming large in this country.

Mr Colson finally affirms that the delegation of a public service, for a limited period, to commercial concerns controlled by the state is a reasonable transaction. Such inconveniences or evils as may arise are ameliorated by the limitation of the concessions in point of duration, and the power to abridge the period of company working. In spite of the development of communistic ideas, the old system has worked satisfactorily enough, and it may be expected to continue to satisfy the needs of the future, provided that the state endeavor to obtain the greatest use from it, instead of seeking methods of destruction.

London Underground Electric Railways.

THE BAKER STREET & WATERLOO; THE GREAT NORTHERN, PICCADILLY & BROMPTON; AND THE CHARING CROSS, EUSTON & HAMPSTEAD.

The severest competitors are the motor omnibuses and the tramways. These have demonstrated their value for public comfort, but they are operated at a loss, although they occupy the streets—a right of way for which they pay nothing, in comparison with underground railways, which have cost, with their equipment, about £700,000 a mile. The effect and the limitations of this competition are now determinable. For journeys up to two miles long, at the present rates of fare, the motor omnibuses divide the traffic and reduce the underground railway earnings. It requires a nice adjustment of fares, not only to distance, but also to the tastes and requirements of people who live near specific railway stations, in order to get the maximum number of pennies. Sir George Gibb's comment is apt: "The city passenger is an elusive person. If you do not give him what he wants, or if you charge him a little too much, he vanishes in space." The competition of the motor omnibuses compels the maintenance of fares on an unremunerative basis, not alone because the omnibuses are carrying passengers at less than cost and interest, but also because unrestricted competition has lured investment into more omnibuses than are needed. They move in flocks, with too many empty seats, and form an immediate and tempting availability to a passenger to begin his journey at once without counting the time and cost of that journey. It is a condition of things that cannot last, but it is costly while it lasts to omnibus and railway owners alike. It would seem to be inevitable that the stop-loss period would soon come and that the omnibus owners must virtually increase fares by a shortening of the penny zones. This would raise the average fare for omnibus travel, without seriously diminishing the numbers traveling, and such traffic as the omnibuses might lose would probably be more than compensated for by the additional receipts from the traffic carried. In fact, the problem is to put the business on a paying basis. It is not good business permanently and deliberately to fix the price of the product of an industry at a figure which on the average cannot yield any return on capital invested.

The advantages, disadvantages and difficulties of the deep-level tube, reached by lifts, compared with those of the shallow subway reached by a short flight of steps from the street surface, have been fully and perhaps finally presented in a remarkable discussion at the Institution of Civil Engineers. Nothing needs to be added to the facts developed by Barclay Parsons' opening paper and other speeches by distinguished engineers and railway managers. In number of evenings and number of contributions to this discussion, the institution's record for 40 years is exceeded.

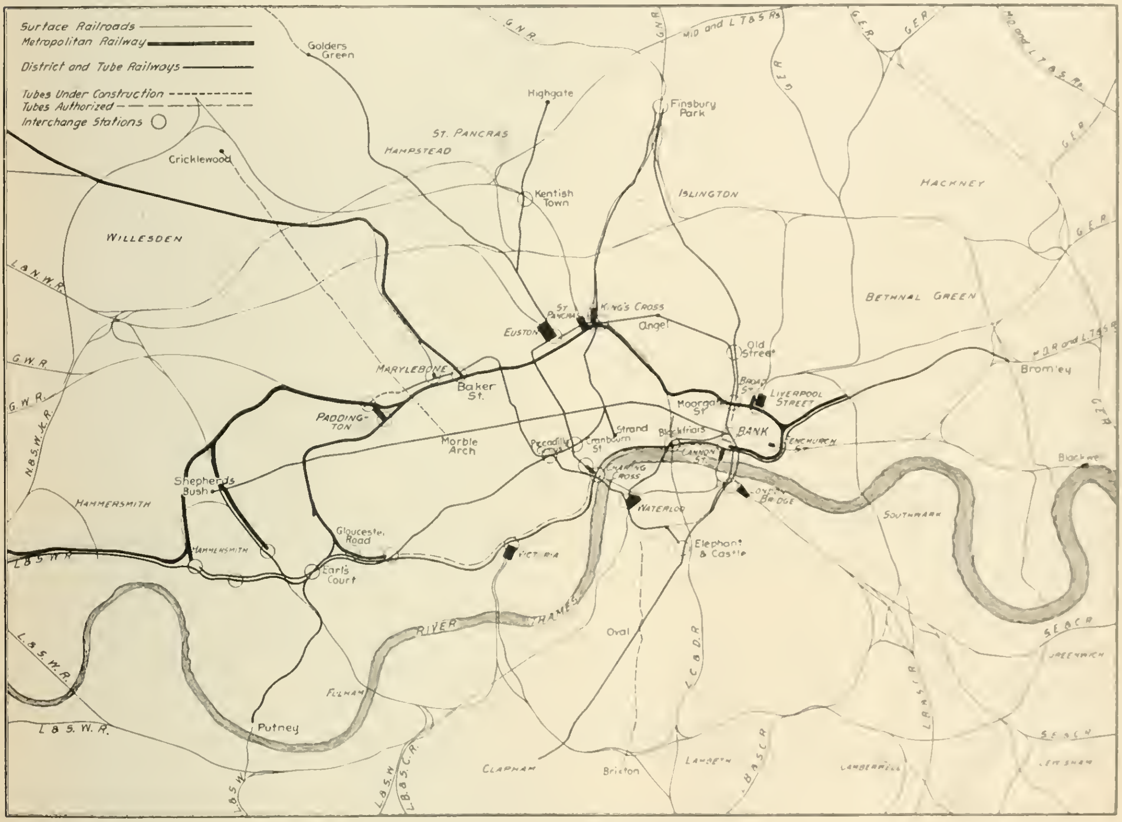
Some questions are settled. The shallow subway is the more effective competitor with surface means of transportation because of the saving of some minutes of the passenger's time on each journey, being time spent in the lifts and passages. The cost of operating lifts is an added cost. For these commercial reasons the shallow subway, where it can be built at reasonable cost, is the better money-earner. But it was made clear that in the narrower streets and congested districts in London the subway is not feasible, primarily because of the number of underground pipes to be dealt with in limited spaces. The obvious advantage of the deep level tube railway is greater comfort for passengers, due to less noise and smoother riding. There is the further important consideration that, so far as one can see in the future, the tube construction is decidedly more enduring than the subway. In the course of years the cost of upkeep, and possible costs of some subway reconstruction, are not to be ignored.

Though there are still some projects for underground railway construction in London in more or less distant view, it may be said that there is now such a fairly completed system that we may with advantage take stock of some of the results achieved, and of the lessons to be learnt from the experience thus gained. In doing so it is impossible to avoid comparisons, but with these, as indeed with all engineering works, progress is inevitable, and the later constructions necessarily obtain the advantage of the experience of the earlier ones. In drawing attention to that earlier experience, comparisons must not be regarded as invidious, for the inventive genius and practical capacity of the designers of the first works of the kind are by no means to be considered inferior to those of the later ones to which necessarily we turn for our instruction. In no profession perhaps more than in that of the railwayman, do we learn by the results of trial.

THE PERMANENT WAY.

It would probably occur to any permanent way engineer, on examining the drawings of the permanent way adopted as the standard for the three latest underground tubes (the Baker Street & Waterloo; the Great Northern, Piccadilly & Brompton; and the Charing Cross, Euston & Hampstead) that a basic principle is violated with the probable result of either breaking the sleepers or of producing unpleasant and possibly dangerous side oscillations. The result has proved, however, that here is another example of the broad fact that the engineer must not allow himself to be bigoted; that principles are based on conditions and that the conditions with the track firmly enclosed in a tube, are, in at least one respect, distinctly different to those which prevail in the open, being defective. The gangers are taught to tamp heavily directly under the rails and leave the center of the sleepers with only light filling. The reverse of this would produce what is called a "center-bound" track, likely to produce side oscillation in the vehicles and to break sleepers. In tube construction, however, there is this difference: The mass of crushed granite cubes directly underneath the sleepers, where the chairs rest, is confined laterally in the tube. The wheel pressures on the rail tend in a degree to drive this granite toward the sides of the tubes, but gravity acts in the reverse direction, tending to continually tamp the granite underneath the sleeper. The result is what might be expected: A track firmly supported but with a slight elasticity, or rather resiliency, that is useful in modifying shocks and reducing noise.

The amount of this elasticity can be accurately measured. Sawed Australian jarrah wood is used for the sleepers. Each sleeper has two fulcrums immediately beneath the inside of the inner lines of the chairs, so that the rolling loads on the rails have a leverage of a few inches, and each sleeper with its fixed center acts as a spring. The extent of this spring action in the sleeper can be ac-



London Tubes and Subways.

where the wheel pressure is transmitted through the sleepers to the ballast and can drive the ballast support downward and laterally from underneath the sleepers. The undertaking in designing this novel form of track was to prevent the jar, tremor and noise which had resulted in other deep tube construction in London, and which had proved to be not only an annoyance to passengers, but costly in damages and law suits with owners of nearby property. It was plain that if this could be avoided at any reasonable cost, the result would be a more attractive transportation machine accompanied with less cost.

The novelty consists in bedding the sleepers and fastening them to a cement grout center bearing, which clasps the sleepers firmly for a distance of 3 ft. 10 in., and furnishes a somewhat resilient support for the sleepers directly under the rail chairs. The support directly under the rail consists of clean crushed granite broken so as to pass through a $\frac{1}{4}$-in. ring. In all other permanent way construction the undertaking is to form as firm and rigid a support as possible directly underneath the rails and leave the center of the sleepers only lightly tamped. Any other method of supporting the sleepers in ordinary railway practice is rightly considered as curately indicated by attaching a pencil to the end of the sleeper in such a way as to mark on a nearby vertical board and accurately record the rise and fall as the trains pass over. Repeated records of this kind show that there is a vertical movement of about a quarter of an inch at the end of the sleeper, indicating that there is a springlike action under the wheels with a limit of movement of less than an eighth of an inch. It would be difficult for the engineer to say what amount of cushioning is ideal in taking up the shocks under the rolling loads, but in this case the results seem to be ideal. The passenger is able to observe but little jar and the wheel-on-rail sounds are slight. Careful examination with a seismograph on the street surface over the line of these underground tubes finds no evidence of tremor, and yet the seismograph was so delicately adjusted that the shocks due to a passing vehicle on the street at a considerable distance away, were easily recorded.

These records were made by A. Mallocks, of Greenwich Observatory, in March, 1906, and covered a wide range of observations in dwelling houses, street surfaces over the tubes, and station platforms in the tubes. These observations are recorded in an official report of great length. The results in general are that in dwellings over the line the vibrations produced by a person walking on the floor were something like 100 times as great as those produced by passing trains. The vibrations caused by a brewer's dray on the pavement directly over the tubes were more than five times that produced by the train underneath. Aside from the avoidance of law suits and costs, the result is nearly an ideal track, immovable, enduring, easy and economical for the rolling stock, comfortable for the passenger, and with a low cost of maintenance. It seems to be a novel undertaking; in some respects it was a bold one.

STATION ENTRANCES AND EXITS.

There is no doubt that in some of the London tubes the length of the passages between platforms and lifts and between lifts and street exits and entrances makes a serious addition to the time of the journey. It furnishes an effective argument to those who, like Sir John Wolfe Barry, are strong advocates of the shallow subway in preference to the deep tube. To avoid long passages it is obviously necessary to fix the station offices as nearly as possible vertically above the platform. The opposite condition arises from the principle so cherished in England, that the convenience of the million must give way to the rather exaggerated rights of the hundreds. To escape the costly demands of owners of property who possess not only special plots on the surface of the earth, but the pyramidical continuation of them to their apices at the center of our planet, the tube must be kept, as nearly as practicable curves will allow, under the streets, and as our mediæval ancestors who constructed them never contemplated tubes, there are curves, and sometimes sharp ones, to follow. As curved platforms are inconsistent with long cars, leaving ugly chasms for people entering or leaving them to fall through, and as they furnish obvious difficulties in the way of hand-starting signals, platforms must be kept to the straight or nearly straight portions. So much for the position of the subterranean work. As to the site of street entrances and exits, other conditions are influential. Any liquor legislation which would reduce the number of public houses would help in the convenience of approach to the tube platforms of the future. These establishments stand on most of the principal corners, a position eminently favorable for, and in the railwaymans' view, naturally much more suitably occupied by, railroad stations. The expensive acquisition of the proprietor's rights, and of these and other sites, greatly limit the choice of the engineer in fixing the position of street entrances and offices, and so these and the platforms have often to be widely separated horizontally. "Proputty, proputty," as Tennyson calls it, stands ever in the way of convenience in the route of nearly every railroad in older lands, but especially so in the particular case of tube station approaches. These difficulties have not been so much felt in the Central London line, owing to the nearly straight course of the overlying streets, which it followed without much difficulty. Nevertheless, the engineer appears to be open to criticism in not having more often succeeded in getting station entrances nearly over the platform centers and so avoiding long passages. The station entrance does not need to be at a street corner. It may be in a more obscure location, with a great saving of time for passengers.

LIFTS.

The lifts of the Piccadilly, the Bakerloo and the Hampstead Tubes are of all steel construction, except the floor, which is of the not easily inflammable jarrah wood, and have a maximum capacity of 1,000 passengers per hour in one direction. Unlike the general design which has been adopted in the earlier types, the exit of the cages at both ends of their range is at the opposite side to that of the entry, one controller in each cage controlling both doors. Of course this requires a different plan of approach passages. These lifts may certainly be considered absolutely fireproof.

THE AUTOMATIC SIGNALING SYSTEM.

The wonderful, the better-than-human, automatic, electro-pneumatic block signaling installation, and the pneumatic power interlocked movement of points and signals needs a long description in order to understand its details, but this has already been done. We are here concerned only with its purposes and results. These are: Safety in the prevention of rear-end collisions. Capacity for the greatest possible number of trains per hour. Economy in cost of operation.

The blocks on the tubes and busy parts of the Metropolitan District are only about 900 ft long. If the controlled manual system, such as is working on the Central London, were used it would require a cabin and a man for each of these short sections, and with their utmost skill not more than 30 trains an hour could be moved. In the new tubes and on the District the signals automatically set by the moving train, without man power, easily permit a safe movement of 40 trains an hour. This allows a large increase of earning power during the busy hours, and it is accompanied by a large saving in operating cost. Near each signal is an automatic train stop, a track instrument which lifts when the signal is at danger and, if the leading motor passes over it, catches a brake valve handle and sets the brakes throughout the train. This stops a Tube or District train, running at schedule speed, in a distance of little more than 200 ft.

At each interlocking station, the signalman has before him an automatically illuminated diagram which shows him the progressive movement of trains approaching him. He is also informed by an annunciator in his cabin of the route to which he should shunt a special train. This is accomplished by an electric combination called the "Magazine Train Describer."

Still another refinement and this entirely for the convenience of the public, is the "Train Destination Indicator" which is placed in plain view from the platforms of many stations on the District Railway. It tells waiting passengers the route and destination of the next three trains to the many branches of the line.

The economic results of this wonderful signaling installation are many. Like the steam shovel whose reason for existence is that it gets men off the bank and out of the way it does this and more, for it reduces the coefficient of human error. It saves something like one-third of the cost of signaling by human power. It increases the capacity of the line by one-third.

VENTILATION.

The advance has been great. In the City & South London, which was the first of the tubes, in the Waterloo & City and at first in the Central London, the subject was not ignored, but it was thought that the movement of the trains, filling as they do a large percentage of the area of the tube, would draw or push the air sufficiently rapidly, that with the help of the communication between the two tubes at stations, the outlets at the latter would become alternately exhaust and supply ducts for foul and fresh air respectively. This is commonly called "the piston action" of trains in tubes. Experiments in the Central London on the velocity and direction of the air at the mouth of a running tunnel showed that the air flowed first in a direction opposite to that of a moving train; that the velocity gradually decreased to zero just when the rear end of the train had entered the tunnel, and that the direction then was reversed. The City & South London line still trusts to this action and the air is chemically well within the limits of allowable CO_2, that is to say 13 parts in 10,000, but it must be said, taking into consideration other pollutions, there is much left to be desired in the enjoyment of the atmosphere. This defect is not so pronounced in the Waterloo & City owing, no doubt, to the shortness of the line and the fewer number of trains within the tunnel at the same time. The tunnel under the Mersey at Liverpool was ventilated by shafts midway between stations for the purpose of exhaust and intake, but taking into consideration the cost of property in London, any such arrangements would obviously be objectionable. In the Great Northern & City line, however, a space for the purpose was obtained comparatively cheaply between Essex and Old Street Stations. This arrangement was not possible on the Central London, where it was soon found, owing to its length and the enormous and continual traffic, that the train movement was insufficient, and that some other device would be necessary. The plan adopted was to install a mine fan of the Guibal type at Shepherd's Bush, by which the air from the whole six miles of the double tube to the Bank Station is supposed to be drawn out, but this is limited to the few hours at night when the traffic ceases. This proved a great improvement, but as every traveler on the line knows, the peculiar earthy smell has not been eradicated and is specially noticeable at the evening approaches, when the effects of the fan are beginning to be worked off. Whatever the chemical constituents of the atmosphere are under these conditions, they appear to have a soporific effect on the human system. The average travel on this line is probably not more than about 15 or 16 minutes, so that it is not likely that the health of the passengers is in the least degree affected, but in the face of severe competition with above-ground traffic, where, comparatively speaking, pure air can be breathed, the matter becomes of some importance to the public, and still more to the men working the trains.

Guided by these experiences, those who were responsible for the later tubes, the Great Northern, Piccadilly & Brompton, the Baker Street & Waterloo, and the Charing Cross, Euston & Hampstead, have adopted a system which is thoroughly effective. Fans are fixed at the roof of every station, except in parks, and exhaust the air by ducts of from 12 to 16 sq ft area. The intakes are the ordinary passage ways and lift wells. As the areas of these passages are much greater than the exhaust ducts, the velocity of the air in these passage ways is not found to be excessive. The fans are designed to draw off 1,000,000 cu. ft. per hour, which is sufficient to cause renewal of all the air in the average length between station and station in both tunnels every 30 minutes. In a test made at Waterloo the expenditure of power per million cubic feet exhausted was 8.1 horse-power hours, the revolutions being 240 per minute, and the quantity of air passed in the same time 1,125,000 cu. ft. The working of the fans is nearly noiseless. The results are ideal.

FIREPROOF CARS.

Electric traction escapes some of the dangers of the steam locomotive, but involves new and serious dangers to be guarded against. Fire can be caused by short circuiting of the conductors within the cars, provided there is anything in the car that will burn.

The Paris Metropolitan burning will be remembered as well as that on the Liverpool Overhead Railway when a large number of creosoted sleepers were burnt. In the Paris case, much of the material of the cars was pitch pine, untreated, which ignited readily under the fierce heat generated by the electric current, and by this catastrophe, more than any other, we have been warned of the needed precautions.

Underground travel is such that panic is easily excited at any apprehension of accident, a panic that is often in itself more dangerous than an accident. In the later London underground electrifications, practically all this danger is eliminated. The wood in the District Railway cars is treated with chemicals which render it almost incombustible. It becomes charred only under continuously applied intense heat. It does not flame, and does not by itself continue to burn. The cars of the three recent tubes—the Piccadilly, Bakerloo and Hampstead—are nearly all steel. That safety has been attained, even where all steel cars are not in use, is illustrated by the slight misadventure, for we can hardly call it more, which took place at Sloane Square, on the District line, on January 8 last. It was caused by defective insulation of the electric lighting wires. The resulting heat melted a small plug of bitumen, followed by an explosion caused by the ignition of the bituminous vapor, and making smoke and fumes. Electric flashing followed along the pipe carrying the lighting wires to the junction box under the cars, and the fireproofed timber flooring was slightly charred. All of this, though quite sufficient to create alarm, was not in the slightest degree dangerous, and it is probably due to the small number of people at the time in the car, and their self-possession, that a panic did not occur. Even the harmless explosion can be avoided by the use of an insulating material which would not emit inflammable vapor.

Though unnecessary to prevent spread of fire in the cars, which, as we have said, can be easily mastered, a provision against the consequences of collision has been adopted on the District cars which is worth notice. This is a heavy $\frac{3}{16}$ in. steel partial bulkhead at each side of the end entrance doors, transverse to the cars and stiffened with vertical angles. Though there have been many minor collisions on various occasions, not one of these has failed to protect the main portion of the car between them, and if unfortunately such an occurrence of a more important kind should take place, there is good reason to suppose that these strong plates would partly diminish bad results.

The Piccadilly and the Hampstead Tube cars are noisier than those on the Baker Street & Waterloo, although all of them run on the same nearly noiseless track. The most pronounced sounds come from the wheel pockets in the car bodies, just over the trucks, although there is an additional roaring which seems to come from the side walls. The side wall, under the window line, of the Baker street cars, consists of a continuous sheet of heavy boiler plate, thick enough to be dignified by an engineering definition as a web girder, a rigid support forming a nonvibrating structure. The walls of the other tube cars consist of a riveted truss, covered by a very thin sheet of metal. The result is what might be expected. But these tube trailer cars weigh 16 tons 13 cwt., while the Baker street trailers weigh one ton more. In electric traction the costs increase strictly in proportion to the tons hauled, so that at the present time the traction costs of an empty Baker street trailer car are 6 per cent. more than for the other tube cars. Additional comforts are apt to cost something.

AXLE BREAKAGES.

Some time ago the failure of axles on the Metropolitan District line, when the new cars were introduced on its electrification, caused some attention. There were really very few cases, but the breakage of an axle is a serious matter, and might cause derailments resulting in loss of life. It is therefore satisfactory to know that these failures arose from an easily ascertained and remediable cause, viz., the tightness of the gage of the rails at the crossings, which were found to be specially noticeable at the Mansion House station, amounting to as much, in some cases, as ¾ in. Since this defect, which put such a strain on the axle, has been corrected, the breakages have ceased.

COTTON BRAKE BLOCKS.

The use of metal brake blocks has long been a source of trouble on electrical lines. The pulverized steel resulting from the action of the brakes and ground from the blocks and the wheels accumulate in the road, and it is necessary to brush and clean the insulated rail joints carefully and frequently to preserve the track circuits. In the New York subway, the amount of metal lost from the brakeshoes is roughly about one ton per mile per month. This has been ascertained by the weight of brake-shoe metal required for renewals minus that which is scrapped. It may be inferred that the wear from the wheels is about the same. The quantity of pulverized steel collected in the Paris Metropolitan is scarcely less, and on the Boston subway these rapid accumulations are troublesome. To obviate this, brake blocks of cotton fiber have been adopted on the new London tubes, where they have been completely successful, though when used in the open parts of the District line, defects have been observed which are now being investigated. The blocks consist of five layers of heavy woven cotton impregnated with resin and asphalt. Its coefficient of friction is considerably higher than that of cast steel blocks, and in use it is necessary to train the motormen to make a somewhat lighter application than with the metallic blocks in order to avoid sticking and skidding, but when the train line pressure is reduced to 10 lbs. satisfactory results are obtained.

Trouble was at first experienced by the flowing of the sheets outwardly away from the wheel flanges so that, occasionally parts fell on the permanent way and, owing to the impregnation, clung to the rail where they usually dropped, giving rise to false reports of broken rails. Cotton fiber has no grinding effect on the wheel tire, but it has the slightly bad effect that it does not keep the wheels trued, and inexperienced motormen are liable to produce a series of small flat spots due to short-time skidding. The blocks having no cutting action, the tires remain somewhat rough to an extent that can be detected in rough riding. This is a small defect inasmuch as it can be easily obviated by training the men. On the other hand the absence of grinding action has a highly beneficial result in the saving of tire wear and the consequences of it to which we have already referred. The average life of the cotton composition brake block in the tubes is found to be on trailers about 20,000 miles, as against 13,000 miles with metallic blocks. The cotton fiber blocks have not so far been successful on the open parts of the Metropolitan District line, as shown by experiments made on their South Harrow branch, probably owing to damp. These become "clammy," in the language of the men in charge, and there appears to be difficulty in releasing the brake, showing a want of uniform adhesion and some erratic actions. The brake blocks have the appearance of having absorbed some moisture, although it should be possible to overcome this fault.

In these days of rapid retardation, on which the speed of short stop travel so much depends, it is worth the consideration of those who design city lines whether the switchback construction of station approach grades, which diminish so much the work of braking has been developed as fully as might be possible. Of course where the speed and weight are fairly uniform, it might be possible to plot a vertical grade curve, the effects of which, coupled with the ordinary train resistance, might, apart from the effects of wind, stop the train almost to a yard. In lines through city and suburbs where the level is near the surface, grades must be more or less subsidiary to existing levels of roads, streets and to other considerations, but with almost incessant heavy trains, the diminution of brake action in stopping, not to speak of assisted acceleration in starting, will, no doubt, be worth some extra expenditure in construction to attain it.

The engineering staff in charge of construction of the Baker Street, Hampstead and Piccadilly Tubes was organized as follows: Chief Engineer, James R. Chapman; Engineer of Tube Construction, H. H. D. Hay; Architect, Leslie W. Green, Substation Construction, J. W. Thomson; Construction Engineer, W. E. Hanson, Resident Engineer Power House, J. W. Towle; Electrical Engineer, S. B. Fortenbaugh; Lift and Ventilating Engineer, G. Rosenbusch, Signal Engineer, C. E. Strange; Purchasing Agent, H. B. Twyford, Rolling Stock Superintendent, E. S. Albanese.

In addition to the above there were Parliamentary engineers for the tube lines as follows: Baker Street & Waterloo Railway, Sir Benjamin Baker, Messrs. Galbraith & Church, Charing Cross, Euston & Hampstead, Sir Douglas Fox and partners. Great Northern, Piccadilly & Brompton, Finsbury Park to King's Cross, Alexander Ross, King's Cross to Covent Garden, Sir J. Szlumper & Son, Covent Garden to Hammersmith, Sir J. Wolfe Barry and partner.

The Legal Height of Freight Car Couplers.

We published last week the decision of the United States Supreme Court on a case which arose in Arkansas, in which it was held that railroads must strictly comply with the law that fixes a standard height for the drawbars of freight cars, the court holding that evidence of reasonable care on the part of the railroad company would be no excuse for failure. The information given was correct, as far as it went, but it was based on a press report which proves to have been incomplete. The full decision has since come to hand, and, in view of the differences of opinion which have existed as to the precise meaning of the drawbar rule, as it was formulated by the American Railway Association and approved by the Interstate Commerce Commission, we quote from the decision the full interpretation of this law as laid down by Mr. Justice Moody. Justice Moody says:

We think that this act requires that the center of the drawbars of freight cars used on standard gage railroads shall be, when the cars are empty, 34½ ins. above the level of the tops of the rails; that it permits, when a car is partly or fully loaded, a variation in the height downward, in no case to exceed 3 ins.; that it does not require that the variation shall be in proportion to the load, nor that a fully loaded car shall exhaust the full three inches of the maximum permissible variation and bring its drawbars down to the height of 31½ ins. above the rails. If a car, when unloaded, has its drawbars 34½ ins. above the rails and in any stage of loading, does not lower its drawbars more than three inches, it complies with the requirements of the law. If, when unloaded, its drawbars are of greater or less height than the standard prescribed by the law, or if, when wholly or partially loaded, its drawbars are lowered more than the maximum variation permitted, the car does not comply with the requirements of the law

It should be said that the supreme court decided the case in favor of the railroad company, reversing the opinion of the supreme court of the state of Arkansas. The two cars between which Taylor was killed had different types of drawbars; one a vertical plane, and the other a link and pin. So far as can be judged from the statement of facts, the case was litigated wholly on the technicality of the height of these drawbars, and the fatal injury to the man was not due to the difference in height. One of the cars was fully loaded and the other partly loaded, and the trial judge, who was sustained by the state supreme court, had charged that these cars were run in violation of the federal law, because the drawbar of the fully loaded car was more than 31½ in. high. The Supreme Court of the United States, in accordance with the rule quoted, held that the couplers did comply with the law.

The Cape Cod Canal Project.*

BY WM BARCLAY PARSONS.

In the consideration of an inside water route along the Atlantic seaboard of the United States, the link that will connect the waters of Long Island sound and Massachusetts bay is, in respect of size and character of vessels and the extent of tonnage that will use it, the most important, and historically the most interesting of all the sections that, when completed, will make possible a voyage from Maine to the Gulf of Mexico free from interference by stress of weather or attack by enemy in case of war.

A glance at the map of Massachusetts shows projecting from its southeastern corner a great arm, running first easterly thirty-five miles and then northerly about the same distance, terminating in a hook at Provincetown. To this arm the name of Cape Cod is applied. This curious geographical formation is everywhere flat, with few hills, especially to the east, and is composed chiefly of sand and gravel. Around this cape all sea-going traffic between Massachusetts bay ports, such as Boston and Portland, and all ports lying to the south must pass.

The circumnavigation of the cape is far from easy. On the south side lie Martha's Vineyard and Nantucket islands, inclosing Vineyard and Nantucket sounds, with their high tidal currents and many shoals; while to the east are the great shoals extending southeasterly to the celebrated Nantucket shoals, marked by the light vessel of that name. These shoals, the low, sandy coast, difficult to see in thick weather, the frequent fogs, and the unbroken exposure to northeast storms, have made the passage of the cape a dreaded one to all mariners, and the record of wrecks year by year, with their shocking loss of ships, cargoes and life, is ample testimony that their fears do not lack foundation.

The only place on the cape where its breadth is material is the southerly projection toward Falmouth, which, with the extended chain of islands, forms the eastern shore of Buzzards bay. At the head of the bay the distance overland to Barnstable bay is less than eight miles. This distance is made up in chief part by the Monument river to the south and the Scusset river to the north. Separating them is a ridge whose height is only 30 ft. above sea level. The deepening of the rivers and the cutting of a canal through this ridge, making thereby a direct water route, avoiding the journey around the cape, is so obvious a shortening of distance and reduction of marine risks as to cause wonder it was not long since done. The contemplation of such a channel is, in fact, almost coeval with the Pilgrim settlement at Plymouth in 1620. The records of that colony show that in 1622 a party succeeded in getting a boat around the cape, only to have it lost in Vineyard sound. The year following they discovered that from Manomet, an Indian town within twenty miles of Plymouth, there flowed a river southerly to a bay which opened towards Narragansett, and within a short time afterwards the thrifty colonists established there a trading station, between which and the Dutch settlement at Fort Amsterdam there at once developed a brisk trade, the Dutch vessels ascending the river to Manomet, whence the goods were carried the short remaining distance overland to Massachusetts bay. Before the seventeenth century was one-third gone there was thus established the beginning of the Boston-New York water-borne trade, which has since grown to such huge proportions. The old name of Manomet has unfortunately been corrupted into the meaningless form of Monument, and as such is now applied to the river which the Plymouth colonists found.

In 1791, Massachusetts having now become a state, the legislature appointed a committee to inquire into the possibility of a canal across the cape. From that time until 1824 the question was continually before the state legislature. In the latter year the government of the United States intervened, and by a joint resolution of both houses the President of the United States was authorized to cause the necessary surveys, plans and estimates to be made for a canal across the cape. As a result of this survey, detailed plans were finished for a canal which was to be 36 ft. wide on the bottom, 60 ft. wide at the surface of the water, with a depth of eight feet, the canal to be equipped with locks.

The eminent French engineer, Major William Tell Poussin, who visited this country in 1831, and who, on return to France, made an extensive report on public improvements of the United States, describes, with elaborate drawings, the Cape Cod Canal as being one of the greatest pieces of construction contemplated on the American continent. From 1830 to 1860 the project languished, but in the latter year the legislature of the state of Massachusetts once more took it up, reported, and again reported in 1864. From that date until the present the question of the canal has been at intervals under discussion. The state granted a charter under which work was actually begun; funds, however, were not forthcoming in sufficient amount, the work was abandoned and the charter allowed to lapse. In 1899 the legislature passed another charter, amended in 1900, in accordance with which plans for a canal have been prepared by the writer, submitted to the joint board of railroad and harbor and land commissioners of the state of Massachusetts, approved by them and work begun.

All the early schemes for a canal at this point contemplated locks. Brevet Major-General J. G. Foster, Lieutenant-Colonel of Engineers, U. S. Army, in 1870, was the first to call attention to the fact that, although there is a considerable difference in tidal phenomena at the two ends of the canal, nevertheless the resulting current will not be sufficient to require locks. This same view has been sustained by many eminent authorities, among them the late Colonel A. L. Rives, for many years superintendent and chief engineer of the Panama Railroad; Dr. Elmer L. Corthell, the associate with Captain Eads in the Mississippi jetties, and himself the constructor of many notable harbor developments in various parts of the world, and Mr. Clemens Herschel. The plans that are under construction therefore contemplate a canal free from locks or dams. The law requires that the bottom width shall be not less than 100 ft., with passing places where the bottom width shall be twice as great, and with a minimum depth at any point at mean low water of 25 ft. In actual construction it is probable that the minimum width will be greatly exceeded, in fact, it is most likely that the passing places, instead of being made three in number, will be connected so that the canal will have everywhere a bottom width of 150 to 200 ft., and a width at the surface of from 250 to 500 ft., depending upon the slope that the banks will take. These dimensions can be compared with a bottom width in the Suez canal of 147 ft., in the Kaiser Wilhelm canal at Kiel of 72 ft., and in the Manchester canal of 120 to 200 ft.; the depths of these canals vary from 26 to 30 ft.

From the shores of Barnstable bay to shores of Buzzards bay is a distance of eight miles. The sharpest curve is projected to have a radius of 7,640 ft., so that navigation for vessels of any size within the limits of depth will be simple. At the south end Buzzard's bay is land-locked and affords an excellent harbor, at the north end the canal will flow directly into the open waters of Barnstable bay without any natural protection. This bay is open to storms from the north and northwest. It is proposed to provide protection against winds coming from this direction, to build a breakwater for a distance of 3,000 ft., running easterly and extending to the six-fathom curve at low water, so that vessels entering from the open bay, even in rough weather, will be able to obtain smooth conditions before entering the canal. In addition, the United States government should construct a harbor of refuge by the building of other breakwaters, so that vessels, after having passed the canal, may lie at anchor in the waters of Barnstable bay until such times as they are ready to continue their voyages, if delayed by stress of weather, accident or other cause. Such harbor is so obviously a part of open sea navigation that it logically should be done by the government as similar works are done along the coast, and not by a private company.

This canal is not a channel for local traffic, but is essentially a ship canal for ocean-going vessels in through service. The figures of proposed depth and width of the Cape Cod canal show that it will be of the same general character as to size as the great ship canals of the world, and the dimensions are amply sufficient to accommodate all vessels engaged in the coastwise traffic at any stage of tide, and permit them to pass each other in opposite directions without hindrance. In fact, the canal will be of really greater capacity than the above figures would indicate, which are based on mean low water conditions. Since the tide rises in Buzzards bay about five feet, the depth of water in the canal when there is high tide in Buzzards bay will be 30 ft., a depth that will be substantially maintained at that time through the canal, as mean tide at Sandwich, which occurs when there is high tide in Buzzards bay, will also give 30 ft. depth at the north end. Available draft can therefore be said to vary from 25 ft. as the minimum to 30 ft. as the ordinary maximum. The latter depth would suffice to carry vessels of the battleship class, should the government ever have occasion to send such vessels through the canal.

*From a paper read before the Atlantic Deeper Waterways Conference, Philadelphia, November, 1907, and reprinted in the *Annals of the American Academy of Political and Social Science*, January, 1908

The general trend of the Atlantic coast is northeasterly. A straight line drawn from the mouth of the Chesapeake, or the mouth of the Delaware, or from Sandy Hook, to Boston, will cut the land well to the westward of the proposed canal. The actual saving in distance will therefore be the same for any vessel trading between a Massachusetts bay port and practically any of the ports on the Atlantic seaboard. Vessels now making this journey have two courses open. In going from New York they can pass through Long Island sound and Vineyard sound around the cape; or they can go by sea past Sandy Hook, and then from Montauk Point either through Vineyard sound, as before, or to the southward of Martha's Vineyard and Nantucket islands around the cape. Vessels from Philadelphia, Baltimore, Newport News, Norfolk, Wilmington, Charleston, Savannah, Brunswick, or any other port, can pass Montauk Point and go either through Vineyard sound, as above, or to the southerly of the two islands.

Taking a common point of departure by the inside route through Vineyard sound, there would be a saving in going through the canal of 66 miles in distance; or, by taking another common point of departure outside of Montauk Point, there would be a saving of 63 to 71 miles for vessels going through the canal instead of passing to the south of the islands, according as bad shoals are crossed or avoided. Or, if in the latter case, a vessel should wish to escape all the Nantucket shoals and make a complete circuit rather than go across, there would be a saving of 129 miles between New York and Boston, and 105 between Philadelphia and Boston. For points south of Philadelphia, the saving in distance would be substantially the same, although, as compared with the journey length, necessarily proportionately less. The saving in distance is not, however, the only saving that would be realized, as the worst part of the journey is the journey around the cape, whether it lies across the shoals or goes around them.

Fogs, storms and adverse currents frequently keep vessels storm-bound either at Provincetown or in Vineyard sound for days at a time, so that no certain time of arrival can be predicated even for vessels in tow, still less for vessels under sail, while the terrible list of wrecks on the shores of the cape attest the foolhardiness of attempting to make the journey in bad weather. During the year 1905, the last for which statistics are available, 11 vessels were lost on the shoals and the short stretch of 35 miles of Cape Cod coast. The tonnage of these wrecks composed 24.1 per cent., or say one-quarter, of the total tonnage of wrecks reported on the whole coast line of Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut and Long Island. So measurable is the danger of Cape Cod transit, as compared with the quiet navigation of Buzzards bay and the canal, that inquiries addressed to the marine underwriters in New York elicited the response that insurance rates on the cargoes of sailing vessels and barges would be reduced from 10 to 25 per cent. to vessels using the canal.

The traffic that would seek the canal route is of three classes:

First—Passenger steamers between New York and Boston. This business is now handled in two ways: by vessels running to Fall River, Providence, New Bedford, or other sound ports, and thence by rail to Boston, or by vessels going around the cape. The first method requires but one night for the journey, but it involves a transshipment of passengers and freight inconvenient to the former and expensive for the latter. The second method requires usually 18 to 20 hours, or say a night and the forenoon of the following day, unless further delayed by thick weather. The canal will permit the journey to be completed in 13 to 14 hours, or comfortably between evening and early morning. To show the extent of this traffic, there are running regularly every night between New England ports, exclusive of any north of Boston, 24 large steamers both ways, of which 16 carry passengers. During the summer not only is the total increased, but also the percentage carrying passengers. Of the 24, the New England Steamship Company controls 16. All these steamers pass out through Long Island sound, and by far the greater portion of the passengers and freight would be more expeditiously, economically and comfortably handled through the canal.

Second.—Steamers carrying chiefly freight, but also some passengers, between Boston and ports south of New York. Lines are regularly established from Boston to Philadelphia, Baltimore, Norfolk, Charleston, Savannah and Jacksonville, with 20 sailings weekly both ways, offering an annual freight capacity of more than 2,000,000 tons. In addition there is a large volume of freight traffic, chiefly fruit, from the West Indies and Central America, steamers from such ports entering at Boston custom house to the extent of over 200 annually. All this traffic could save by the canal, and much of it will use it.

Third.—Freight traffic of raw materials transported in sailing vessels or barges. This traffic would furnish the major volume of the canal business, and it consists chiefly in coal, southern lumber for New England, Maine lumber, such as spruce for points south of the cape, stone from Massachusetts and Maine, ice south-bound, cement, brick and lime north-bound, oil and oil products, cotton reshipped at New York, and other bulky commodities. Such articles must be transported cheaply. The New England railroads leading from New York are now so congested with passenger traffic and the carrying of high classified freights that such articles as those stated above cannot be given the low rates that their value demands—such traffic must go by sea.

In point of tonnage, the biggest item in the above list is coal. During the year ended June 30, 1907 it is estimated that the coal shipments to Massachusetts bay ports, of which Boston and Portland are the chief, amounted to no less than 12,000,000 tons, which were shipped from New York, Philadelphia, Baltimore and Norfolk. Exclusive of the freight carried in the regular coastwise steamers, it is estimated that the other commodities aggregated during the year some 5,000,000 tons, making a gross total of about 18,000,000 tons.

From these statistics, and the diversified points of origin of traffic, it will be seen that this canal is of national importance. Although nominally the bulk of the cargoes that will use it north-bound start from New York, that port is not the originating point. The cargoes represent the produce of the many states seeking their market through a convenient channel—coal from Pennsylvania and West Virginia, tobacco from Virginia and the Carolinas, timber from Georgia, cotton from the whole of the great South. It is an enterprise in which every state on the Atlantic seaboard from Maine to Florida and Texas, is interested.

If the volume of traffic already in existence is so great and the saving in distance, delay and danger of such importance, the question naturally arises why, after 300 years of agitation, the canal was not built before. The answer to this very natural question will be found in the change that has been taking place in water transportation, a change which has made it possible for the state of New York to throw away its enormous investment in the existing canal system of the state and build an entirely new system from Lakes Erie, Ontario and Champlain to Albany, at a cost of over $100,000,000.

As long as the coastwise traffic was controlled by schooners, with a recognized unknown length of journey and an amount of delay impossible to forecast, the value of the distance and time saved was not of so much importance as to overcome the expense to a sailing vessel in traversing the more or less narrow waters of Buzzards bay and being towed through the canal. Steam, however, within the last few years has been making the same inroads into the methods of coastwise traffic that it has already made in ocean traffic, so that the schooner is following in the footsteps of the picturesque clipper ship, and is giving way to the tug and tramp steamer.

As soon as a vessel owner adopts as a motive power an agent that will enable him to send his vessel on a schedule he at once begins to take account of delays, and places a money value against the time lost. This method of reasoning—and it is sound—warrants the expenditure of large sums in the improvement of waterways, such as the Cape Cod canal, that would not have been, and were not, justifiable one or two decades since.

To-day the greater part of the coal traffic between New England, New York, Philadelphia and Norfolk is handled in barges, usually two or three in number, behind an ocean-going tug. To show the extent to which the new methods of transportation are superseding the old, the statistics compiled by the chamber of commerce for the port of Boston each year are at hand. In 1902 there arrived in Boston from domestic ports south of Cape Cod 1,033 steamers, 1,209 sailing vessels, 909 tugs and 1,879 barges; total, 5,030. In 1906, four years later, there were 1,148 steamers, 900 sailing vessels, 1,166 tugs and 2,458 barges; total, 5,672. The aggregate vessel tonnage of the former years was a little over 5,000,000 tons, and of the latter nearly 7,000,000 tons.

The thing that strikes one in these statistics is the small increase in vessel number and yet the large increase in vessel tonnage, indicating an increase in average size of unit. While the total number of steamers remains substantially the same, sailing vessels have decreased 25 per cent. in number and the barges have increased more than 33 per cent. in number.

In 1902 of the total entrances at Boston, steamers comprised 20.5 per cent., tugs 18 per cent., sailing vessels 24 per cent. and barges 37.5 per cent. The same division in 1906 was: steamers 20.3 per cent., tugs 20.6 per cent., sailing vessels 15.8 per cent. and barges 43.3 per cent. Or, taking the United States government figures for 1905 and comparing them as a matter of convenience with the census returns for the year 1899, of the total tonnage carried to Boston, 53.9 per cent. went in steamers in 1899, and exactly the same in 1905; but while barges carried but 21.1 per cent. in 1899, they carried 31.3 per cent. in 1905, and the sailing vessel tonnage, which had accounted for 25 per cent. of the whole in the first year, had fallen to 14.8 per cent. in the second.

This same general change in traffic conditions will apply equally to all waterways that are to be hereafter constructed, and any waterway that is either to be constructed anew or to be made by the improvement of existing conditions must be undertaken with the view of its exploitation by vessels whose power will be for the most part something other than sails. With the Cape Cod canal established, the great source not only of danger but of delay will have been removed and the towing companies, whether private or part of the various coal companies' equipment, can estimate with reasonable certainty upon the time of departure and arrival of their tugs, in fact with a much greater certainty than for similar shipments by rail.

Its national rather than local character is to be impressed on the attention of this convention, as this canal will do more than make a water route from New York to Boston. It will at once, by means of the Raritan, Delaware and Chesapeake and other canals, complete an inside route safe at all seasons for all boats from North Carolina to Maine, and that without a single dollar more to be invested by the nation or any state. From that point the labors of this convention can be exerted to deepen, widen and develop the existing links and construct others that are now lacking, so that this inside route may be continuous and of sufficient size for modern requirements. To this end not only must canals be built and small rivers enlarged, but the attention of those in authority must be directed to the further increasing of the capacity of the limiting conditions of some of the main arteries. The port of New York is the country's largest gateway. The general government has been at work for years, and has at last completed a new deep channel to sea. That channel is, however, for foreign commerce. The harbor has another entrance from the sound through the East river; this is the channel for internal commerce. It is the channel on which three states—New York, Connecticut and New Jersey—look directly, and it is the one used chiefly by the domestic ocean commerce of the Atlantic states. Although much improved over conditions existing twenty years ago, it is still much restricted by islands, reefs and narrow channels. If any great inland route is to be established it becomes the throat where all traffic will be congested; it is the one place which all are interested in having developed; it is one of the improvements to be most urged by this convention upon the national authorities.

Westinghouse Double-Flow Steam Turbines.

The turbine equipment of the Brunot Island station of the Pittsburgh Railways consists of one 3,000 k.w. and three 5,000 k.w. Westinghouse double-flow units. The smaller unit has been in successful operation nearly one year; the larger ones are in course of erection. Each turbine is connected by a short and direct exhaust duct to an Alberger condenser of the centrifugal jet type. Both circulating and discharge pumps are mounted on the same shaft and driven by a Westinghouse compound, single-acting engine. Both condensers and pumps are beneath the engine room floor between the turbine foundations. A steam-driven, two-stage, dry air vacuum pump is also provided for each turbine. Cooling water is pumped to the condensers from an intake tunnel extending the length of the power house, at one side of the foundations, and the discharge from the condensers empties into a similar tunnel parallel to the intake. There is an adjustable gate in the intake tunnel leading from the screen house to a large central well in which the water level may be maintained at the desired point irrespective of the level to which floods may raise the Ohio river. Each unit rests on reinforced concrete plates supported entirely by six reinforced concrete columns, giving ample space around the condenser.

The principle of the double-flow turbine is not new, the original Parsons turbine, built in 1880, being of this type. Its advantages, however, can be best brought out only in large machines. For turbines above 5,000 k.w. capacity, the double-flow construction will become standard in all Westinghouse work. In sizes below 3,000 k.w., the Westinghouse-Parsons single-flow construction remains standard.

The low-pressure double-flow turbine consists simply of two similar Parsons turbines placed end to end, taking steam at the center and exhausting at both ends. The axial thrusts are balanced under all conditions of pressure, vacuum and load, without the use of dummy or balance pistons. The high-pressure machine is directly evolved from the low pressure by adding a high-pressure impulse element mounted at the center of the rotor. This element is analogous to the high-pressure cylinder of a triple expansion reciprocating engine.

Steam enters the turbine through a flanged opening in the lower half of the casing, from which it is piped directly to nozzle blocks. In the illustration, the nozzle block is shown at the top, but it may be located at any point in the periphery nearest the inlet. Expanding in suitable nozzles, the steam strikes the impulse blades, enters the impulse wheel chamber, and is distributed evenly around the casing so as to enter around the entire periphery of the rotor, the intermediate Parsons section of the turbine. As in the single-flow turbine, the steam then divides along two separate paths, one-half entering the left-hand section of low-pressure Parsons blading, the other passing through the interior of the rotor shell which forms the connecting passage to the remaining low-pressure section of Parsons blading at the right-hand end of the turbine. Discharging from the last rows of low-pressure blading, the steam passes into the exhaust connections and to the condenser in the usual manner.

As the same pressure exists on both sides of the impulse wheel disc this is not subjected to any end thrust and requires no balancing. The difference of pressure between the inlet and outlet of the Parsons intermediate section is balanced by a dummy piston of moderate dimensions, located between the impulse wheel and the right-hand low-pressure section.

All double-flow cylinders are made in two parts, the upper and lower halves each being a one-piece casting. The design is symmetrical throughout, without longitudinal flanges except those at the center required for bolting the two parts together. The castings are first rough-bored, after the flanges have been planed and drilled, and are then "seasoned" with high-pressure steam for a number of hours to remove any local casting strains in the metal. They are then given the finishing cut, assembled, and with boring bar running in the bearing housing so as to insure a truly concentric bore. Manholes are provided at each end of the cylinder for interior examination, and relief valves are fitted in each of the manhole covers to prevent the pressure in the exhaust passages rising to a dangerous point in case of failure of the condensing apparatus and sticking of the atmospheric relief valve.

A Y-connection fitted with two corrugated copper expansion joints below the base of the turbine connects the separate exhausts to the main exhaust nozzle. An atmospheric exhaust nozzle opens out of the side of the exhaust "Y" to permit non-condensing operation.

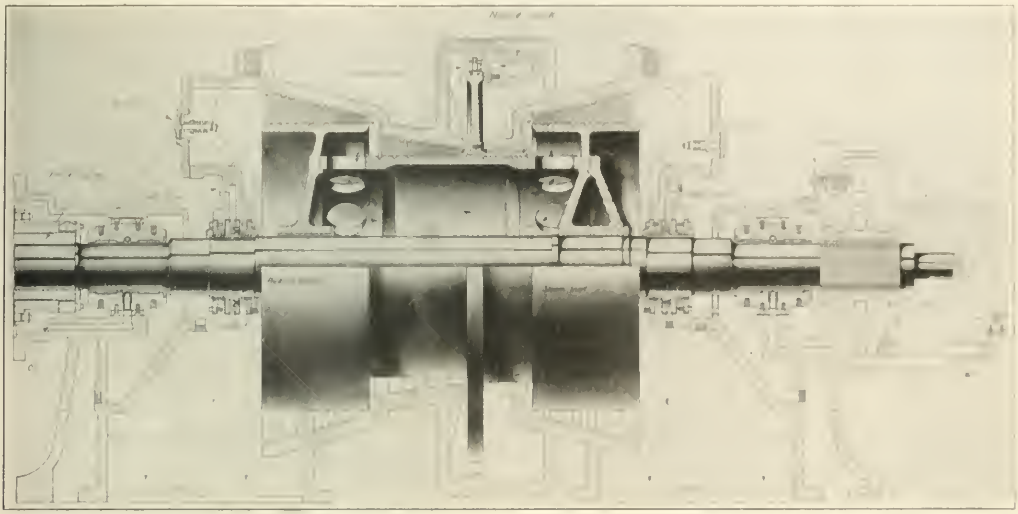
The rotor consists of five cast-steel members mounted on a through shaft. The shaft carries its load at one-third distance from the points of support, thus permitting a lighter shaft than required for distributed loading and greatly lessening the chances of deflection. The rotor is pressed on the shaft and locked at one end, and to the opposite end is fitted a bronze bushing surrounding the shaft, permitting it to move axially with any unequal expansion of shaft and rotor body.

Double-Flow Turbine Direct Connected to Generator.

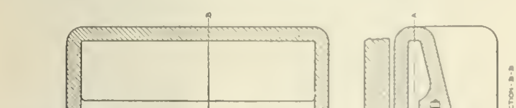
The impulse element consists of a flanged cast steel disc forced on to the rotor body with a pressed fit and securely keyed. The flange at the base is grooved and forms the dummy or balance piston for the intermediate Parsons section. A typical arrangement of blading and nozzles is shown herewith. The nozzle block is an independent casting separate from the turbine cylinder. Receiving steam from the governor valve, this restricts high pressure and high temperature to a comparatively small casting which is free to expand and contract with changes of temperature and may easily be designed with ample strength. As the steam is not expanded in the impulse element to less than about half of the initial pressure, divergent nozzles are unnecessary and simple straight-sided nozzles are used. The entire nozzle block may be removed in one piece, and the nozzle walls may be readily renewed if necessary independently of the block. As almost no difference of pressure exists on the two sides of the element, the area through the bucket increases to provide for the decreasing steam velocity in each rotating wheel. As in all high-pressure impulse turbines, the nozzle blocks cover but a small portion of the periphery of the impulse wheel, so that ample space is left around the remaining portion of the wheel to permit the free circulation of steam in all parts of the impulse wheel chamber before entering the Parsons element.

Except for the division of the low-pressure Parsons section, this part of the turbine is the same as the single-flow construction. The diameters of the low-pressure section are such that the same size blades can be used in both intermediate and low-pressure sections, thus simplifying the blading considerably.

No one metal has all the physical characteristics desirable for blading material. But recently a special, compound metal has been developed, which is exclusively used in Westinghouse turbines. This material, known as "Monnot," or duplex metal, consists of a steel core covered with a thin copper sheathing so welded to the steel that the blades may be drawn cold from the original ingot into the required finished section without in any way affecting the bond between the copper and steel. Experiments have shown that pure copper offers the maximum resistance to chemical corrosion resulting from bad feed water carried over in the steam during priming. At the same time the integrity and strength of the steel core is maintained. The original method adopted for reinforcing long blades was to insert a heavy brass wire in saw slots cut in the entrance edge of the blade, the brass wire being securely laced to the blades by a thin copper wire, and the whole then rigidly brazed together. An improved blade lashing is now used in all Westinghouse turbines. Comma-shaped holes are punched in the blades at any desired point of reinforcement. The blades are then strung on a comma-shaped lashing wire laced through these holes. After the blades have been caulked into the rotor or stator, the tail of the lashing is sheared over by a tool, wedging the tail of the lashing into the contracting space between the face and back of the adjacent blades, acting as a strut, while the lashing wire itself acts as a tie, thus securely interlocking the blades and preventing vibration. The short section remaining in the blade after being sheared off acts as a key to prevent a broken blade from swinging out and injuring adjacent rows.



Westinghouse Double-Flow Steam Turbine.



Sections of Nozzle Block and Impulse Blades.

A water-sealed gland is fitted on each end of the turbine shaft where it passes through the exhaust casings. This packing consists of a small centrifugal pump propeller running in an enclosed chamber to which water is supplied under a head of about 10 ft., which is slightly in excess of the head due to the centrifugal force acting on the water in the impeller blades. At starting, any external leakage water is caught in circular troughs and drained away. This gland always maintains a solid mass of water around the periphery of the impeller, which prevents the entrance of air to the condenser or the escape of steam to atmosphere when running non-condensing.

Picked Up on the Road.

BY GULF.

The following story concerning a fireman comes from the South, where a good many firemen are of very dark complexion, and are supposed to have very hard heads. This one, like most darkies in stories, bore the name of Sambo. He was a fireman on the principal railroad of the South. His entire term of service had been spent on a switching engine, but one day, in an emergency, he was called to fire on a passenger train. The passenger engineer gave him such instructions as he could in the short time at his disposal, and in particular told him that on a passenger engine one of the duties was to watch out for the mail bags hung out on the cranes at non-stopping stations to be taken up by the train while running at full speed. Sambo remembered this part of his instructions very faithfully and the engineer gave no further thought to the matter until, after having passed a half dozen mail stations, he was stopped by the conductor, who, at the request of the mail clerk, had pulled the air signal and then had come forward to find out what was the matter with the mail bags, no bag having been picked up at any one of the six stations which had been passed.

"Dere dey is'" said Sambo, pointing to the back part of the coal pile on the tender. He had caught each bag as he came to it. At this point the story comes to an end. The supposition is that he caught the bags by swinging out far enough to strike them with the port side of his cranium. By this process the shock was sufficiently "absorbed" to allow of the bag being grabbed and pulled in.

Speaking of the South reminds me that in returning from the South to New York one passes through Washington, a city which has just been furnished with a grand and imposing new station. The main waiting room of this station, 220 ft. long, occupies the central part of the immense building, and its ceiling consists of a magnificent and richly ornamented arch nearly 100 ft. high. At night this arch, which is decorated in white and gold, is lighted wholly by reflection from electric lights hidden out of sight at the springing lines on either side of the room, making a very pleasing effect. My reason for bringing the subject up at this time, however, has to do with the waiting room in the day time, rather than at night, and my topic is the train announcer. The reverberations completely destroy the effect of his work. Everything that he says is followed by echoes so numerous, loud and far reaching that nine-tenths of the people in the room have no idea what the man says. This particular train caller never was a shining success, even in the smaller room of the old station at Sixth street, but his uselessness is now intensified tenfold.

Possibly the satisfactory announcement of trains in a room of this kind is out of the question, it may be that the best elocutionist in the world would find himself baffled by the utterly bad acoustic properties of such a great space arranged in that shape. The main room of the Grand Central Station at New York, considerably smaller than this great hall at Washington, has proved a difficult proposition for the shouters there, and they claim that they have to wait a full second or more between every group of two or three words and the group next following, so as to give the echoes a chance to die out. If there is no remedy for this difficulty it would seem as though we might as well settle down to the conclusion that the only useful function of a train shouter is to call the attention of people in the room, at suitable hours, to the fact that it is time for at least some of them to ask themselves whether they should not be seeking their seats in the cars. An intelligent porter, of the right disposition, may do much good in a waiting room by answering questions which are asked of him by individual passengers, but to shout, where most of the shouting is unintelligible is only an annoyance to everybody within hearing distance. He would do better to ring a bell or beat a drum, and then let the people come and ask him what news he has to impart.

Another interesting feature of the new station at Washington, which confessedly has been built partly for the purpose of elevating our capital to the level of other imperialistic capitals, such as are to be found in Europe, and to give our most beautiful city a dignity which it never before enjoyed, is the magnificent scale of rates charged at the package room. These are fully in keeping with our present era of expansion. To leave a Gladstone bag, an overcoat and an umbrella there for 20 minutes costs 30 cents. The charge would be no higher for a whole day, but it is not unfair to state the case in this way; it is not extreme; for a great many people desire to avail themselves of this storage room for short periods of time. How much profit there will be in the operation of a busy coat room 8 ft. x 10 ft., in the course of a year, at rates like this, I will not stop to compute; but the average passenger will probably agree with a remark made by one of the station employees, who expressed the opinion that the directors of the Washington terminal company expect, in the course of a few years, to pay for the station out of the profits of the package room. Why should not this petty extortion be laid before our enlarged, reorganized and energetic interstate commerce commission? While it seems hardly the thing to ask seven dignified judges to give their time to the consideration of such a picayune question as that which just now grieves me, it is to be borne in mind that an important principle is involved. In a number of cities the Pennsylvania and other railroads have maintained carriages, for the purpose of taking passengers to and from their stations, at a loss to the company, the theory being that the accommodation of the passengers was the paramount consideration. This principle should (and does) apply to a coat room.

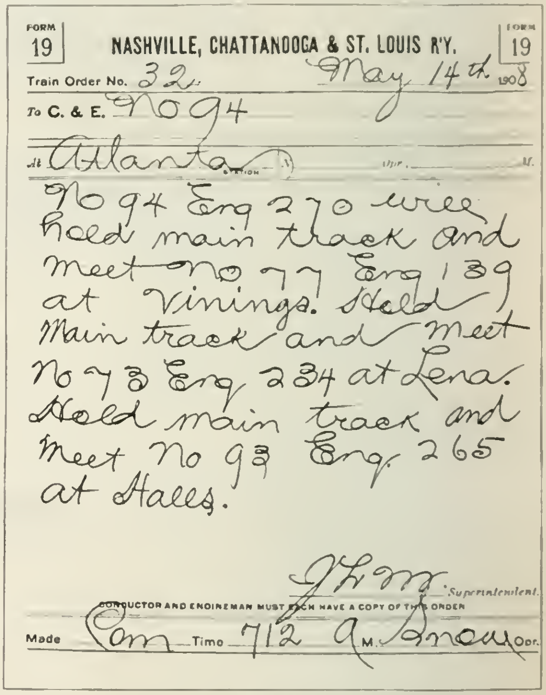
Congress itself sets the example of giving attention to small affairs by devoting its own time to the details of administration in the District of Columbia; and the House of Representatives has lately made a requirement under which the interstate commerce commission will have to follow the Congressional example; I mean the law concerning a street railway extension in Washington, which includes a proviso that the new railway must be managed under the supervision of the commission. If these ten-thousand dollar jurists can devote their time to deciding what kind of frogs shall be used at a street railroad junction, or how many cents per million may rightfully be paid for printing transfers (with a department store advertisement on the back) it will not be out of the way to ask them to relieve the irritated passenger who is held up by the coat room buccaneer.

Car Surpluses and Shortages May 13.

The Committee on Car Efficiency of the American Railway Association, Arthur Hale, Chairman, has issued Bulletin No. 23, giving a summary of surpluses and shortages of freight cars by groups from October 30 to May 13. The total surpluses of cars reaches 404,534 in this report, being a decrease of 9,071 from the report for April 29. The largest decrease is in box cars, although there is almost as great a decrease in coal and gondolas. The number of idle flat cars decreased slightly, while the number of miscellaneous cars idle remained about the same. The Eastern, Northwestern and Canadian groups show the largest percentage of decrease, while the New England, Middle Western and Pacific groups show increases. In the Middle and North Atlantic groups the reports for individual roads show some improvement, which is offset, however, by increases on other roads in these groups, leaving the total about the same as on April 29. The summary for 163 roads is shown in the double column table.

A Clearly Written Train Order.

The train order shown herewith, *reduced one-half in width and height*, is published for the purpose of putting on record, as a matter of history, the fact that legible penmanship is not a lost art in the railroad service. On many roads the typewriting machine has come into use to a considerable extent for making train orders, but at places where a machine is not available, it is refreshing to find an operator who can produce readable copy.



FORM 19 NASHVILLE, CHATTANOOGA & ST. LOUIS R'Y. FORM 19

Train Order No. 32 May 14th 1908

To C. & E. No 94

At Atlanta Station

No 94 Eng 270 will hold main track and meet No 77 Eng 139 at Vinings. Hold main track and meet No 73 Eng 234 at Lena. Hold main track and meet No 93 Eng 265 at Halls.

J F M Superintendent.

CONDUCTOR AND ENGINEMAN MUST EACH HAVE A COPY OF THIS ORDER

Made Com Time 712 a M. Brown Opr.

On the Nashville, Chattanooga & St. Louis train orders are carefully and constantly inspected by a sharp-eyed man from headquarters, and not only is slovenly penmanship rigidly subdued, but any tendency on the part of despatchers to use ambiguous wording also is nipped in the bud.

To write this order in three separate paragraphs, which would be a marked improvement in orders of this kind, the operator would have had to write a smaller hand.

Surpluses and Shortages Bi-Weekly, from October 30, 1907, to May 13, 1908, Inclusive.

Strang Gas-Electric Car Irene.

The J. G. Brill Company, Philadelphia, Pa., recently built for the Strang Gas Electric Car Company, New York, the car shown in the accompanying illustrations.

The Strang system consists of a four-cycle gas engine, direct-connected to a d.c. generator, supplying current to the truck motors. Normal requirements are met by the generator, the peak loads being carried by additional current supplied from a storage battery, which is charged during stops or when coasting down grades. While current is being supplied to the storage battery only, the engine is automatically throttled on reaching the capacity of the battery. In case of accident to the gas engine, it is claimed that the car can run 15 miles on current from the battery alone.

Strang Gas-Electric Car "Irene."

The Irene is equipped with multiple unit control, so that the car can furnish current to motors in cars coupled to it. As a motor car it can haul three trailers, seating 75 passengers each.

The car is built of steel, with an interior pleasing in design and finish. Just behind the engine room the forward compartment is furnished with transverse seats, upholstered in red leather. The rear half of the car has comfortable wicker chairs, similar to those used in Pullman cars. The car is heated from the engine jacket, water being circulated by means of a motor-driven centrifugal pump, through heating pipes inside the car. During the summer season, the jacket water is passed through radiators placed on the roof of the car.

Interior, Strang Gas-Electric Car "Irene."

The first Strang car was described in the *Railroad Gazette* of Feb. 23, 1906. This car was 52 ft. 9 in. long, accommodating 41 passengers; the Irene is 66 ft. long and carries 75 passengers. The new car is designed for a maximum speed of 55 miles an hour, the average consumption of gasolene is 0.6 gallons per mile and enough gasolene is carried for a 200-mile trip. The original car had a maximum speed of 50 miles an hour; it used an average of 0.45 gallons per mile and carried enough for a 225-mile trip. The electric equipment of the first car consisted of a 50-k.w., 250-volt, d.c. generator, 400 r.p.m.; two 50 h.p. series wound motors of the street railway type; two K-13 controllers and a storage battery of 112 cells, 200 ampere-hours capacity. The Irene has an 85-k.w., 250-volt, d.c. generator, shunt wound, of 425 r.p.m.; two 100-h.p., 250-volt, series wound interpole motors and a storage battery, Plante type, of 112 cells and 300 ampere-hours capacity. The six cylinders of the first car were mounted alternately at angles of 90 deg. to each other and 15 deg. from the verticle. The six cylinders of the engine of the Irene are all vertical.

Mikado Locomotive for the Kentucky & Tennessee Railway.

The Baldwin Locomotive Works have recently completed for the Kentucky & Tennessee Railway a Mikado type locomotive, which possesses a number of interesting features. This engine is intended for comparatively short hauls on a line having grades of 4 per cent., which occur in combination with curves of 20 deg. and not compensated. In order to enable the locomotive to easily enter sharp curves when running in either direction the 2-8-2-wheel arrangement is employed. The piston stroke is comparatively short, and by using driving-wheels of small diameter a tractive force of 40,900 lbs. is developed, while the rigid wheel base is only 11 ft. 6 in.

The leading truck is of the usual swing bolster design, with radius bar, and is equalized with the first and second pairs of driving wheels. The two remaining pairs are equalized with the rear truck, which is of the Rushton type, with inside journals. A half elliptic spring, having arms of unequal lengths, is used in the equalization system between the rear driving wheels and the back truck.

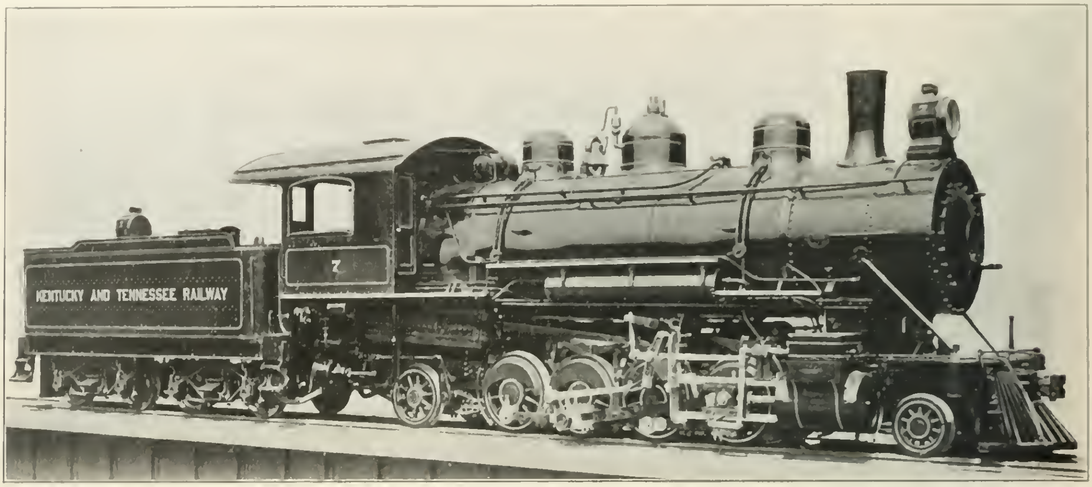
The main frames are of cast steel, with rear sections of the same material and double front rails of wrought iron. The splice between the main and rear sections is located back of the rear driving-wheels, at which point the frame is supported by the spring previously mentioned. The pedestal binders are lugged and bolted to the pedestals.

The cylinders are single expansion, equipped with balanced slide valves, which are actuated by the Walschaerts valve gear. The link is of the built up type, and is supported by a cast steel bearing which is bolted to the back of the guide yoke. The valve rod is supported by a bracket, which is bolted to the top guide bar. There is sufficient room in this design to place the combining lever in front of the crosshead, and thus use a short valve rod, which is substantially supported, adding to the rigidity of the motion. The reverse shaft is placed in bearings, which are bolted to the guide yoke. The radius rod is extended back of the link, and is suspended at the rear end. The valves have an outside lap of 1 in. and are line and line on the inside. They are set with a maximum travel of $5\frac{1}{2}$ in. and a constant lead of [illegible] in.

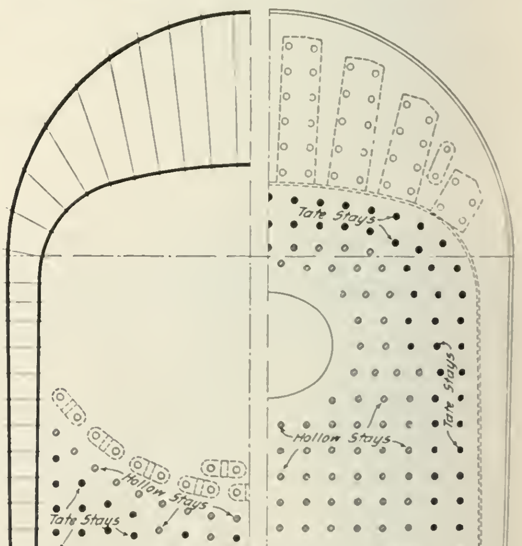
The guide yoke is made in three pieces, the lower extension, on each side, being securely bolted to the main section. This feature adds to the convenience in handling these parts. The guides are of the alligator form and the crossheads have cast steel bodies and bronze gibs.

The boiler is of the straight top, radial stay type, with wide firebox, having a vertical throat sheet and back head. The mud ring is supported on sliding shoes in front and a buckle plate at the rear. The front end of the crown is supported by one ⊥ bar, and 330 flexible staybolts are located in the breakage zone in the throat, sides and back, and here attention is again called to a point that has been repeatedly alluded to in these columns, namely—the variations in the use of the flexible staybolt and the tendency to increase the number used. In some engines built for the Wabash the flexible stays came down at the front and back, across the top and filled the triangular space in the throat sheet below the shell down to a horizontal line drawn through the bottom of the same. In this boiler the same area is covered with the addition of a cluster in the lower corners of the side sheets close to the foundation ring and the almost complete filling of the throat and tube sheet with them. In fact, they are used over the whole of these surfaces except in the top row next the shell and at four other points on each side where hollow bolts are used. In the side sheets, owing to the long radius of curvature at the sides of the crown, the top row of the flexible bolts are rather lower than usual, and are but just above the top of the door. The marked feature of the use of the flexible bolts in this instance is to be found in the fact that they are carried all of the way down to the foundation ring at the four corners and across the front. It is usually considered that the foundation ring holds the two sheets so firmly together that the possible variation of expansion in its immediate neighborhood is so slight that flexible bolts would be of no practical advantage. Their use, therefore, in this place indicates a growing conviction of the necessity for a greater flexibility between the sheets than was formerly regarded as essential.

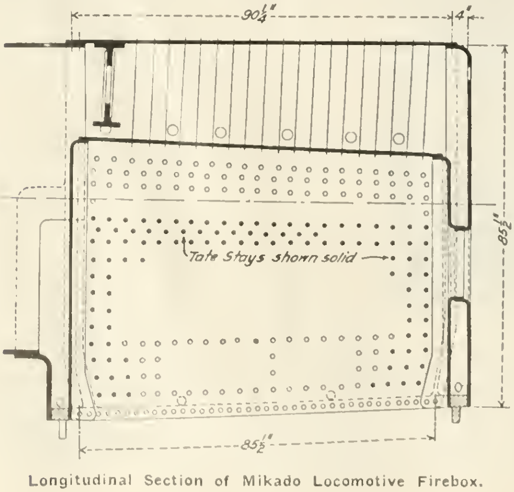
The boiler barrel is built with three rings, the dome being centrally located. The longitudinal seams are welded at the ends, except on the dome ring, where the seam is placed on the top center line and is welded throughout its length on either side of the dome opening. The seam is reinforced by a heavy inside liner.



Mikado Locomotive; Kentucky & Tennessee.



Cross Section and Rear Elevation of Mikado Locomotive Firebox.



Longitudinal Section of Mikado Locomotive Firebox.

The tender is carried on arch bar trucks, which are equipped with cast steel bolsters and chilled cast iron wheels. The tender frame is built of steel channels. A pilot is provided at the rear end.

This locomotive, although not intended for long hauls in main line service, is an interesting example of a design built to operate under difficult conditions. The 2-8-2-wheel arrangement is particularly suitable for roads having light rails and many curves, while it allows the use of a larger boiler than could be applied to a consolidation locomotive with the same weight on driving-wheels.

The following are some of the principal dimensions of this engine:

Cylinder, diameter	21 in.
Piston stroke	24 "

Boiler, diameter shell	72 in.
Boiler, thickness of sheets	¾ in.
Steam pressure	200 lbs.
Firebox, length	90 in.
" width	66 "
" depth, front	66½ "
" depth back	59 "
" thickness, side, crown and back sheets	⅜-in
" thickness tube sheets	½ in.
" water space front	4 in.
" water space sides and back	3½ "
Tubes, material	Iron
" thickness	No. 11
" number	315
" diameter	2 in.
" length	15 ft. 5 "
Heating surface, tubes	2,529 sq. ft.
" " firebox	148 "
" " total	2,677 "
Grate area	41.2 "
Wheels, diameter, driving	44 in.
" " front truck	28 "
" " rear truck	36 "
" " tender	33 "
Journals, driving axle	8½ x 10 in.
" truck	5½ x 10 "
" tender	5 x 9 "
Wheel base, driving	11 ft. 6 in.
" " total engine	25 " 5 "
" " engine and tender	51 " 10 "
Weight on driving wheels	140,050 lbs.
" " front truck wheels	16,350 "
" " back truck wheels	24,000 "
" total engine	180,400 "
" engine and tender	280,000 "
Tank capacity water	5,000 gals.
Tank capacity coal	6 tons
Tractive effort	40,900 lbs.

$$\frac{\text{Weight on drivers}}{\text{Tractive effort}} = 3.42$$

$$\frac{\text{Total weight}}{\text{Tractive effort}} = 4.41$$

$$\frac{\text{Tractive effort x diameter drivers}}{\text{Heating surface}} = 672.20$$

$$\frac{\text{Heating surface}}{\text{Grate area}} = 64.97$$

$$\frac{\text{Firebox heating surface}}{\text{Total heating surface}} = {}^*5.53$$

$$\frac{\text{Weight on drivers}}{\text{Heating surface}} = 52.31$$

$$\frac{\text{Total weight}}{\text{Heating surface}} = 67.38$$

Volume of two cylinders, cu. ft. = 9.62

$$\frac{\text{Total heating surface}}{\text{Volume of 2 cylinders}} = 278.27$$

$$\frac{\text{Grate area}}{\text{Volume of 2 cylinders}} = 4.28$$

*Per cent.

Foreign Railroad Notes.

The Prussian State Railroads contracted for 3,000 twenty-ton (44,000 lbs.) coal cars last year and will order 4,500 more this year, of an improved pattern.

The production of petroleum in Rumania has increased greatly of late years and amounted to 7,910,000 barrels in 1907, while no longer ago than 1898 it was only 1,260,000 barrels.

The Chinese have built a railroad 37 miles long from the coast south of Canton to Hsin-ming, notable as being financed and constructed by the Chinese themselves. It is said to pass over a flat country, but to be pretty much made up of curves, introduced to dodge graves, etc.

In the Prussian House of Delegates a motion was adopted asking the government to pass voters free on the railroads from their places of residence to the places where their votes were to be cast, and return, and to put on special trains for this purpose when necessary.

At last the depression in business has reduced the earnings of the German railroads, whose receipts in March were 8½ per cent. less from passengers and 2½ per cent. less from freight this year than last. The decrease in passenger earnings is largely due to the fact that the Eastern holidays were in March last year and in April this.

Old and New Interlocking at Batavia.

Although railroad signaling is still looked upon as rather young, as regards American railroads, its youthfulness is not extreme after all. The accompanying illustrations, Fig. 1 and Fig. 2, show a Toucey & Buchanan eight-lever interlocking machine, which until a few months ago was in service on the New York Central at Batavia, N. Y. We do not know the exact date that this machine was built, but the first one of the kind was put up at Spuyten Duyvil in 1874 or 1875. Other designs came into use within a few years thereafter. The Batavia machine has now been superseded by a 50-lever all-electric interlocking machine, made by the Union Switch & Signal Company. The old machine after being taken out was set up in the store-room and photographed, as here shown.

The Toucey & Buchanan interlocking was described in the *Railroad Gazette* of October 16, 1875. The unlocking of the lever was done by pressure of the signalman's foot; the downward movement of the treadle tilted the "flop," thus locking or unlocking the proper dog or dogs. The connection between the treadle and the "flop" is shown at *a*, *a*, Fig. 2. The cranks connecting the levers with the locking bars are shown at *a*, *a*, Fig. 1.

Toucey & Buchanan Interlocking Machine.

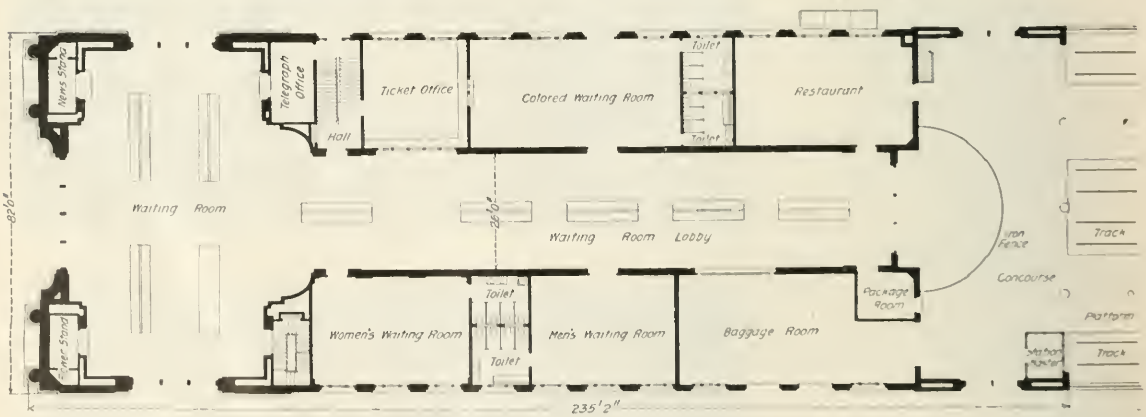
In service at Batavia, N. Y., about thirty years.

The New Union Station of the New Orleans Terminal Company.

Work on the new union station at New Orleans, La., of the New Orleans Terminal Company, which was begun about the first of June, 1907, is now about completed. The terminal is being built for the Frisco system and the Southern. Preliminary to its construction a large amount of property was acquired, as both the station and the track facilities in connection therewith are on ground not previously used for railroad purposes. As will be seen from the accompanying map of New Orleans showing all the railroads and their passenger terminals, the new station fronts on Canal street, the principal business street of the city, and is quite near the center of the business district. The site was previously five blocks of Basin avenue, a attic carrying an inscription. The main entrance archway is 30 ft. wide by 40 ft. high. It opens directly into the main waiting room, which is 80 ft. long, 40 ft. wide and 52 ft. high to the soffit of the central dome. There is also an archway 30 ft. high at each end of the waiting room, giving entrance from the two side streets. The main motive of the building is thus a large vestibule which can be entered freely from all sides. Each of the side entrances is protected by a marquise for the convenience of passengers using carriage or motor.

Extending centrally through the building from main waiting room to concourse is a lobby 26 ft. 4 in. wide. It is provided with benches like the main waiting room, which it is intended to supplement. Ranged along the two sides of this lobby are the principal

New Passenger Station at Canal and Basin Streets; New Orleans Terminal Company.



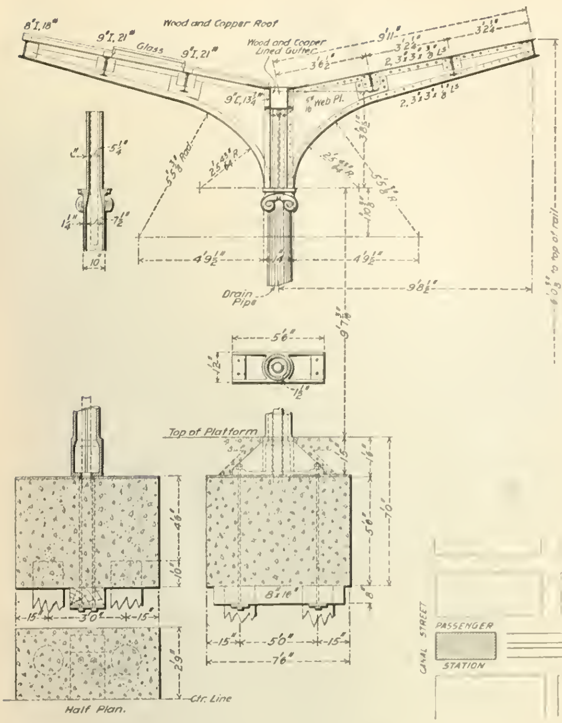
Plan of Passenger Waiting Room; New Orleans Terminal Company.

short avenue 172 ft. wide extending from Congo square to Tulane street. The new station occupies 82 ft. of this width, leaving a 45-ft. street on each side, called respectively East Basin and West Basin street. The portion of Basin avenue from Canal to Tulane street gives an open area fronting the station, providing an unusually favorable setting and a wide parked approach to the station two blocks long.

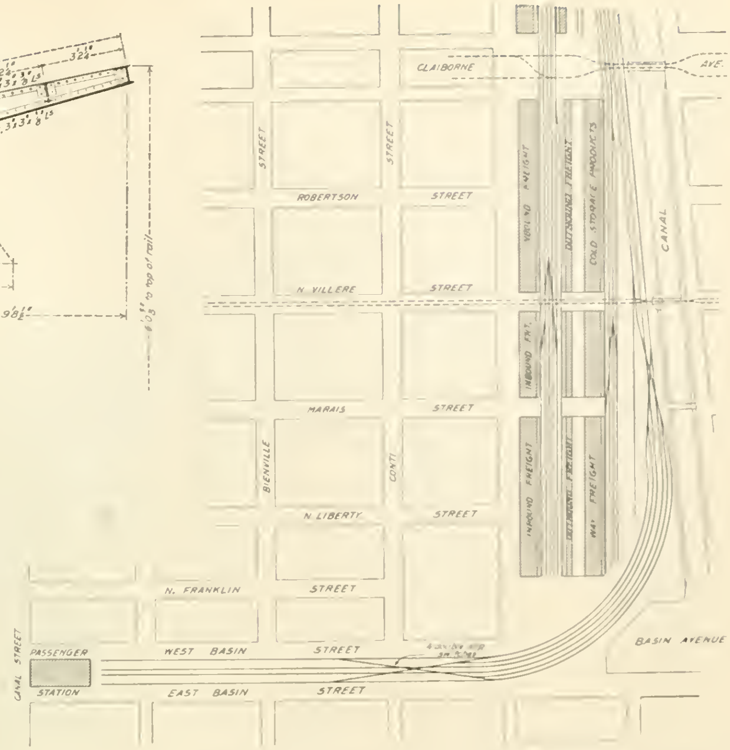
The station building is 82 ft. wide by 235 ft. long. The style of architecture is a sober treatment of the modern French. A primary aim of the design was to give an impression of openness, in keeping with the function of a station handling large crowds of people. The front of the building is therefore treated as a single large archway flanked by coupled columns and crowned by a high services, including ticket office, restaurant, baggage room, women's retiring room, men's smoking room and colored waiting room, the latter having a separate entrance from West Basin street. The telegraph office, news-stand and flower stand are in the main waiting room.

The concourse is 80 ft. long and 35 ft. wide. It has large doorways leading to the street at each end so that incoming passengers can make their way directly to the street without passing through the station and thus interfering with outgoing passengers.

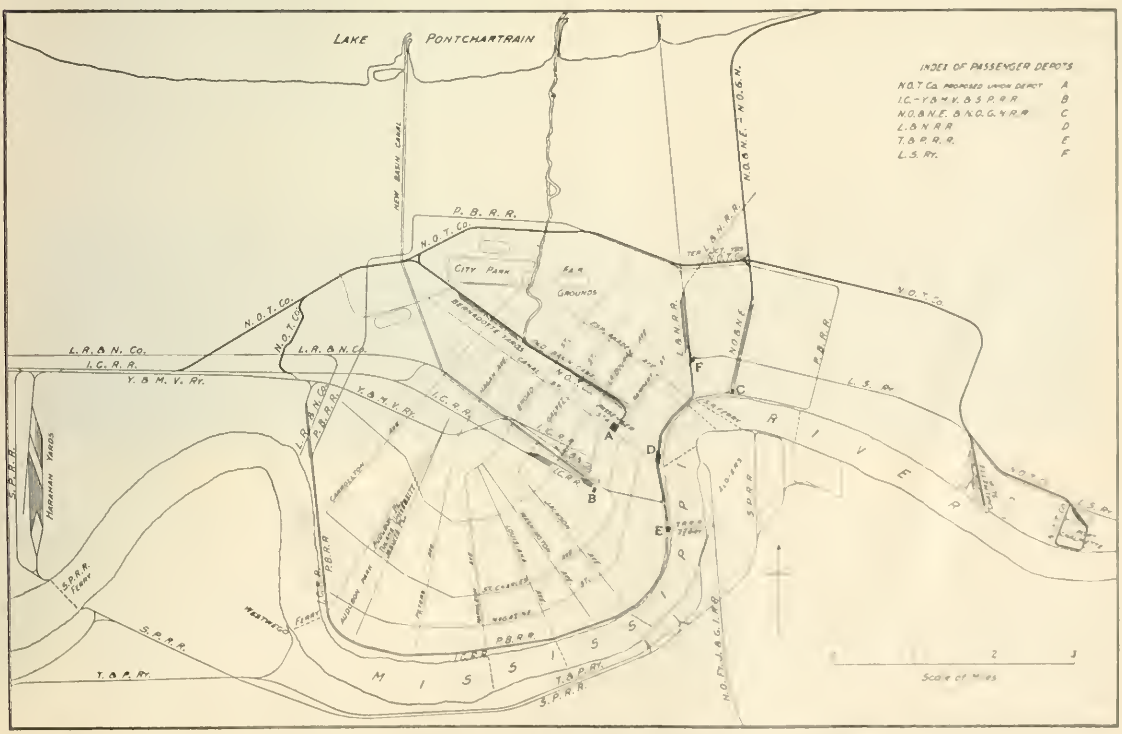
The building will have a concrete foundation resting on piling. A special feature in connection with the foundation is the difficulty of taking care of an old drainage canal 22 ft. wide running lengthwise under the center of the building.



Details of Inverted Umbrella Shed Over Platforms.

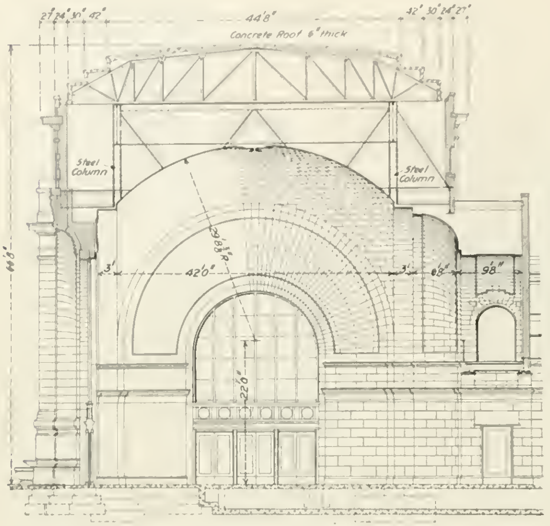


Plan of Freight and Passenger Terminals and Approaches; New Orleans Terminal Company.



Map of New Orleans Showing All Railroad Terminals and Connections.

The Canal street, or main waiting room section of the building, will have its exterior lower portion of granite and the upper part of Bedford stone. The remainder of the building exterior will be brick and stone, the brick being a special gray color to match the Bedford stone. The type of the interior of the main waiting room has already been indicated. There is a large central dome from which a barrel vault extends to each of the four sides of the room. The scheme of treatment is a masonry effect, consisting of marble



Cross-Section Through Dome of Waiting Room, Showing Steel Framing; New Orleans Terminal.

to a height of 12 ft. above the floor, the remainder being done in cement in imitation of light-colored stone to harmonize with the marble. The floor is mosaic tile. The central lobby will have the 12-ft. marble wainscot, with plaster walls and ceilings. The smaller rooms will have plaster walls and ceilings and mosaic tile floors. The portion of the building through which the lobby runs has a second floor for offices. These all have outside light and open on a corridor encircling an inside light court above the lobby. A small basement room will contain the heating plant.

The main waiting room has a steel frame to carry the dome and attic roof. This presented something of a special problem in adapting it to the floor plan and to the form of superstructure. The frame is supported at four points only, these four steel columns being symmetrically placed at the four points indicated on the first-floor plan—the inner corners of the four small rooms in the corners of the waiting room. These points of support are well within the lines of the attic walls and the latter are carried by cantilever members and suitable girders, as shown in the sectional view of the main waiting room. Above the girders, and resting on them, are the steel roof trusses, of which there are six—three in each direction. These carry a concrete roof 6 in. thick, including a skim coat of 1 in., the concrete spans being arched between I-beam purlins, as shown.

There are four tracks, separated from the streets by ornamental iron fencing and protected by umbrella sheds 704 ft. long. These latter are the "butterfly" type, with roofs sloping upward from a central gutter, and quite similar in general design to those used at the new Washington terminal. A detail of the shed design is included in the illustrations. The cast-iron supporting columns are anchored to concrete blocks 7 ft. 6 in. x 5 ft. 6 in. in plan and 5 ft. 6 in. high, each resting on four piles. A track plan is also reproduced, showing the six curved approach tracks from the west, and the proposed freight terminal layout.

The cost of the station building and train sheds, exclusive of all track work and interlocking, will be $250,000. The plans were prepared, and the construction work done, under the direction of J. F. Hinckley, Chief Engineer of the Frisco system. The architects were D. H. Burnham & Co., Chicago, and Jas. Stewart & Co., St. Louis, Mo., are the contractors. F. L. Jonah is Terminal Engineer, in immediate charge of the work.

Reinforced Concrete Bridge Over the Sangamon River.

The Wabash line formerly crossed the Sangamon river valley, 3½ miles east of Decatur, Ill., on a single-track line with 1 per cent. grade and 4 deg. maximum curvature. Two years ago work was started revising the alinement and double-tracking the section from Decatur to Sangamon, six miles. This was completed in December, 1907. The new alinement has only two 1-deg. curves and the maximum gradient is 0.3 per cent. so that heavy construction was necessary.

The track was carried over the valley formerly by a steel bridge approached by sharp curves and heavy grades. This has been replaced by a double-track reinforced concrete bridge, drawings of which were published in the *Railroad Gazette* of December 21, 1906. The new line crosses the river at such an angle that the bridge is built on a skew of 45 deg. There are four spans, each 100 ft. center to center of piers. The clear opening, parallel to the tracks, at the springing line of the arch is 85 ft. 10 in., and at the bottom of the pier, 82 ft. 5¼ in.

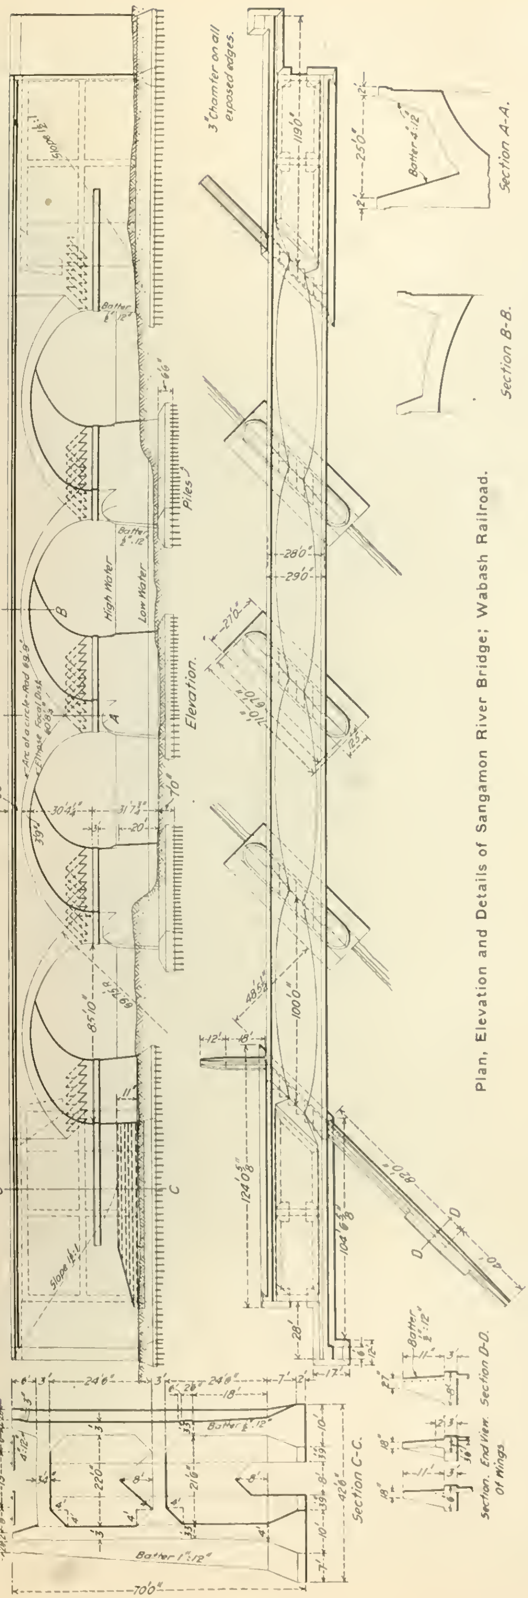
The extrados of the arch is an arc of a circle, and the intrados is an ellipse. This ellipse is, in reality, the projection of a circle on a plane set at an angle of 45 deg. to the plane of the circle. Thus the form required for molding the concrete arch is cylindrical, its axis being at an angle of 45 deg. to the track and its radius being 30 ft. 4¼ in. at right angles to the line of the piers. This makes the false work construction quite simple.

The piers and abutments were so built with concrete skew-backs as to give square bearings for the arch ribs instead of skew bearings. This is shown in the accompanying drawings and is noticeable in the photograph, as it resulted in a saw-tooth effect at the springing line of the arch.

The foundation of the bridge rests on gravel, overlying a layer of very stiff clay. Piles were driven through the gravel into the clay and on them, for the pier foundations, were laid reinforced concrete slabs of such sizes as to distribute the load over a large area and also tend to prevent scouring. For each pier, 259 piles, spaced 3 ft. on centers, are used. Each abutment rests on 395 piles, also spaced 3 ft. apart. Because of the height of the bridge the cost of ordinary abutments would have been excessive. The drawings show the abutments used. They are hollow, four chambers on two levels being formed; the rear lower chamber is filled with earth. The wing retaining walls are 10 ft. high (the height of maximum flood) and the fill rests against them. These prevent scouring of the toe of the high banks.

In erecting the bridge, concrete was built to the top of the skew-backs and allowed to harden. Then each arch ring was laid in one block by working night and day without stopping. The arch rings are heavily reinforced with 1-in. corrugated bars near the inner and outer faces. Throughout the structure, 1-in. rods furnished by the Expanded Metal & Corrugated Bar Company, St. Louis, were used. The abutment walls are reinforced with vertical ribs of three bars each, the ribs being spaced 2 ft. on centers; and with hori-

Reinforced Concrete Bridge over the Sangamon River; Wabash Railroad.



Plan, Elevation and Details of Sangamon River Bridge; Wabash Railroad.

zontal four-bar ribs, 3 ft. centers. The arches are reinforced on both extrados and intrados with longitudinal five-bar ribs, 1 ft. on centers, and with two-bar ribs, from 2 ft. to 3 ft. on centers, parallel to the center line of piers. The reinforcement of the spandrel walls consists of horizontal two-bar ribs only, spaced 2 ft. on centers. Where the bars were spaced close together the concrete mixture was one part cement, 2½ sand and five gravel. The plain concrete and the concrete in which the bars were spaced 12 in. or more apart was a 1·3·6 mixture. There are vertical joints in the spandrel walls over the centers of the piers and at the skew-backs, to allow for deflection of the arch rings.

The bridge is designed to carry a dead load consisting of concrete at 150 lbs. per cubic foot and earth fill at 100 lbs. per cubic foot. The live load capacity is 9,000 lbs. per lineal foot of track for each track. The permissive unit stress was 600 lbs. to the square inch in the concrete and 12,000 lbs. for the rods. The permissive load on the piles was 25 tons per pile.

The building of the bridge required 8,320 cu. yds. of earth excavation and 36,775 lineal feet of piling. A total of 16,170 cu. yds. of concrete was used, as follows:

	Cu. yds.
Foundation slabs for piers	1,300
Piers proper, with skew backs	2,270
Arch rings	2,370
Spandrel walls of arches	2,180
Foundations for abutments	1,580
Abutments above foundations, including slabs and intermediate walls, together with spandrel walls	5,930
Retaining walls	540

There were 215 tons of bars used and the cost of the whole bridge was slightly less than $124,000.

It was designed by A. O. Cunningham, Chief Engineer of the Wabash. The cement was made by the Wabash Portland Cement Company, Stroh, Ind., and the contractor for the work was the William P. Carmichael Company, Williamsport, Ind.; this company also designed the false work and forms.

The Capacity of the Interborough Subway.

On May 22 Bion J. Arnold presented to the New York City Public Service Commission the fourth of his reports dealing with the Interborough Rapid Transit subway. The last one of these reports, dealing with the signal system of the subway, was reviewed in the *Railroad Gazette* March 20; the general report on the operation of the subway was printed in the *Railroad Gazette* March 6, and the report on the cars was printed February 28.

In the report on the capacity of the subway, Mr. Arnold first calls attention to the fact that the previous reports dealt with minor changes which could easily be put into effect, such as improvements in the matters of despatching trains, changes in the signal system and the installation of additional side doors in the cars, some of which changes have already been adopted; but the present report analyzes the fundamental design of the subway, points out how further increase in its capacity can be obtained and directs attention to certain fundamental defects or omissions in the present subway which the author believes should be avoided in future subways. Mr. Arnold says that the spirit which prompts him in preparing these reports is to heartily commend the engineers who built the subway for the many excellent ideas embodied in this work and for the character of its construction, rather than to criticise them adversely for the few things which now seem to him advisable and which they did not do. He says also that it should be remembered that the pioneers in any field, acting without precedent to guide them, must overcome obstacles which are often lost sight of in subsequent criticism, and that it is always easier for those who follow these pioneers to point out what should have been done than it was to foresee them and to do them in advance. Mr. Arnold says that New York City has in its present subway the finest and most efficient example of underground railroad construction in the world; but this fact does not preclude the advisability of adoption of improvements if it can be shown that such improvements can be made, not only in the present subway, but in future subways.

An abstract of the report follows:

In considering an enterprise of this character it should be borne in mind that it should be the aim to establish and maintain a proper relationship between the fundamental elements entering into it, viz., safety, comfort, capacity, speed and a fair return on the investment.

In all of these elements, I find the present subway lacking. The absolute safety has been sacrificed to secure extra capacity, whereas even greater capacity than is now secured can be obtained by safe methods. The capacity of the subway decreases as the load, after it has reached a certain point, increases, which is exactly contrary to what should be expected. The speed of the trains is not maintained during rush hour periods just at a time when an advantage of speed would be of benefit not only to the greatest number of subway patrons, but also to the operators of the subway.

The comfort of the patrons is seriously interfered with by the arrangement of entrances and exits, both in the cars and in the stations themselves. With the present type of subway car, the conflicting lines of passenger movement in and out of the cars actually subjects passengers at times to danger of personal injury during certain hours of the day. Finally, the returns on the investment are not sufficient to pay the necessary operating and maintenance expenses, interest at a reasonable rate on the investment, the sinking fund as required by the city, and at the same time allow a sufficient fund to be set aside to take care of depreciation.

A study of the present subway will reveal the fact that one of its fundamental defects, as far as its capacity is concerned, is that it fails to carry sufficient passengers upon a fixed five-cent fare to justify the large investment which was finally found necessary to produce this splendid means of transportation. The total investment required to build and equip the subway as it exists to-day amounts to approximately $75,000,000, of which $50,000,000 may be charged to the cost of the permanent way and $25,000,000 to the cost of equipment. Should it be contended that these figures include an excessive construction profit, it is but fair to state that it is quite probable, in fact almost certain, that were the subway to be constructed now, the open cut method of construction would not be allowed and thus the actual cost of reproducing the present subway would be increased by a greater amount than is represented by any amount which may be included in the above figures as a construction profit.

In 1907 the subway carried 182,000,000 passengers and during the present year it may possibly carry 200,000,000 passengers, resulting in an annual income of $10,000,000. Thus the gross income per annum from passenger traffic will be equal to only about 13 per cent. on the actual investment, as compared with surface and elevated railway systems, many of which take in an amount equivalent to 20 per cent. to 25 per cent. of the costs necessary to reproduce them.

For the last two years the operating expenses of the subway have amounted to an average of approximately 45 per cent. of the gross receipts. On this basis the annual operating expenses, with a gross income of $10,000,000, will amount to $4,500,000, leaving $5,500,000 to be applied toward the payment of interest, depreciation taxes, sinking fund and profit. This amount is only 7.33 per cent. upon the above investment of $75,000,000, and it is thus apparent that the present subway, which is now overloaded, is not built in such a way as to furnish sufficient capacity, with the conditions under which it has to operate, to produce financial results consistent with the investment.

Another serious defect of the present subway, under present operating conditions, is that it is capable of serving only about 50,000 passengers in one direction during each hour of the rush periods, and has no overload capacity. One high building in the business district will accommodate fully 10,000 people and high buildings are being erected much faster than subways can be financed and built. As the configuration of the island of Manhattan provides room for only a limited number of north and south subways, it is apparent that each route occupied should be utilized to its greatest practical capacity.

TRAIN CAPACITY.

The time schedule now in use calls for 30 trains per hour both on the express tracks and on the local tracks south of 96th street during rush hours. This schedule corresponds to a time interval between trains or headway of 2 minutes. In actual practice, on busy days, the headway at Grand Central station often reaches an average of 2 minutes and 10 seconds, which corresponds to a rate of 27.7 trains per hour.

It has been shown in my report upon the subway signal system that, with the present subway, it will eventually be possible to maintain a headway of 90 seconds, which will allow 40 trains to pass a given point in one hour, and that for future subways with suitably designed stations, it is not unreasonable to expect a capacity of 60 trains per hour over each track.

Upon the local tracks, which are not at present fully equipped with a block signal system, it is possible at the present time to operate on a headway of 72 seconds, thus providing for 50 trains per hour, but on account of the traffic being lighter on the local tracks and the difficulty of operating two schedules with different time intervals, for the local trains than for the express trains, and at the same time fitting in the trains in their proper order at 96th street, it has been and in my judgment will be found better practice to maintain the same headway upon both the local and the express tracks.

CAR CAPACITY.

Eight cars now constitute an express train and five cars a local train during the rush hours. The present maximum schedule of 30 trains per hour will thus provide 30 x 8 or 240 cars per hour on express tracks, and 30 x 5 or 150 cars per hour on the local service; a total of 390 cars per hour, and this may be taken as the limit of the car capacity of the subway under present operating conditions. On account of the delays due to heavy travel during the rush hours, this rate of car movement is not maintained throughout the entire rush-hour period.

The maximum capacity of the present subway under the best conditions practicable, without rebuilding all the express stations, will be shown to be 40 express trains per hour, of 10 cars each (400 cars) and 40 local trains per hour, of 7 cars each (280 cars), or a total of 680 cars per hour, as compared with the present schedule of 390 cars; in other words, it is possible to increase the capacity of the present subway up to a total car capacity per hour 75 per cent greater than is attained at present.

SEATING CAPACITY.

Of the present cars, 800 are provided with 52 seats each, and the last 50 cars ordered, and recently put in service, are provided with 48 seats each. On a basis of a 2-minute headway upon both the local and the express tracks, the number of seats passing a given station can be taken at 370 cars with 52 seats each and 20 cars with 48 seats each, or 20,200 seats per hour.

It is possible to redesign the seating arrangement in the cars and to provide at least twice this seating capacity without adding to the number of cars operated, but for every additional seated passenger at least two standing passengers must be displaced. The present seating arrangements strike a fair balance between the two extremes of maximum seating capacity and maximum standing room.

PASSENGER CAPACITY.

During the rush hours the express trains carry an average of 125 passengers per car; that is, nearly twice as many passengers stand as are seated. Counts have been made showing as many as 180 people crowded into one car. If the 2-minute schedule could be maintained on the express tracks, the maximum carrying capacity under present conditions might be said to be 30 trains x 8 cars x 125 passengers per car, or 30,000 passengers per hour on one express track, and 30 trains x 5 cars x 125 passengers per car, or 18,750 passengers per hour, on one local track; a total of 48,750 passengers in one direction in one hour for both classes of service.

If 10-car express trains can be operated on a 90-second headway, each car carrying 125 passengers, then each express track should carry 40 trains x 10 cars x 125 passengers, or 50,000 passengers per hour in one direction, and this is the limit to the carrying capacity of each express track in the present subway. At the same time, if local trains of 7 cars could be operated on a 90-second headway, each local track should carry 40 trains x 7 cars x 125 passengers, or 35,000 passengers per hour in one direction. This would make a total carrying capacity through any one station, in one direction, of 85,000 passengers per hour, as compared with 48,750 passengers at the present time. In both cases the average loading of the cars has been taken at 125 passengers instead of at 150, as is frequently found at present on express cars.

HEADWAY.

The capacity of the subway is primarily a question of headway. Headway may be defined as the time interval between trains, it being understood that the time is taken at the instant the corresponding parts of each train pass a given point, i.e., the time elapsing between the instant the head end of one train moves by a signal until the head end of the following train moves by the same signal, or the headway may be easily determined by noting the time elapsing between the starting of one train from a station platform until the following train similarly starts.

This headway is influenced by two factors, which are independent of each other. The headway must therefore be determined in two different ways, and the operating, or actual headway, is found by taking the longest headway shown by either of the results. The two elements which influence the operating headway are the running headway and the station headway.

The safe time between trains running between stations which may be termed "running headway" is maintained by the block signal system. Under this arrangement, the time spacing of trains due to the running headway equals the time required to run three times the length of one block, plus the time required for two signals to clear, plus the time required for the train to run its full length at the maximum speed which it can run at this particular part of the road, plus the time required for the motorman to act after the distant signal has cleared from caution.

The time required for the train to clear a station block, which may be termed "station headway," is determined at present by the total time required by a train to enter the station block; to come to a stop; to open the doors; to unload; to load; to close the doors; to start, and to clear the platform.

The two headways are thus determined by entirely separate sets of conditions. A train in making a trip is influenced, first, by the "running headway," and then by the "station headway." The train, therefore, is constantly meeting varying conditions which influence the length of time which should elapse before the next train can follow. The minimum actual, or operating headway, is determined by the maximum length of time required to overcome these conditions at any limiting point throughout the entire trip.

As at present operated, these limiting points in the subway are now at the stations, that is, the station headway governs. The minimum running headway is considerably less than the minimum station headway, so that trains can get up to certain express stations faster than they can get through these station blocks.

As already shown, the problem of increasing the capacity of the present subway resolves itself into a study of and the removal of the delay at the limiting points. The most serious delays at present occur at the following points:

a. At Grand Central station and other express stations.

b. Combined station and cross-overs at 96th street.

c. In addition to these critical points, there is a situation at South Ferry station which must be changed before the extension of the subway to Brooklyn can be used most effectively.

At the present time the delays at Grand Central station, which are typical of the delays at all other express stations, are due to a combination of causes, including confusion in the methods of handling the passengers, inflexibility in the signal system and defects in the car design. These disadvantages have been pointed out in detail in Reports Nos. 1, 2 and 3, in which it has been shown that the headway between trains, which now often reaches 2 minutes and 10 seconds (130 seconds), can be reduced to 90 seconds by means of the following improvements:

	Saving over present method.
1—Close the doors promptly and give signal for starting trains to motorman by an automatic train signal................	10 seconds
2—Install a speed control signal system as an auxiliary to present signal system so as to allow the following train to reach the station platform more promptly than at present.......	15 seconds
3—Provide extra doors in the sides of the cars and guiding railings on the station platforms so as to avoid the present conflict of unloading and loading passengers and enable both operations to be carried on at the same time............	15 seconds

These suggested improvements will make it possible to maintain at all times a train movement of 40 trains per hour upon the express tracks of the present subway, whereas as at present operated there are times during rush hours of every busy day when this rate falls to 27 trains per hour, due to the defects referred to above, all of which have been completely analyzed in the reports previously mentioned.

COMBINED STATION AND CROSS-OVERS AT 96TH STREET.

In addition to the regular combined local and express station platforms at 96th street, there are two cross-overs between the local and the express tracks just north of the station platform. These cross-overs are used by every Broadway express train and by every Lenox avenue local train, and therefore wherever one of the Broadway express trains and one of the Lenox avenue local trains going in the same direction approach the cross-over at approximately the same time, there must be a delay for one of the trains, which may amount to as much as 40 seconds, as one train must necessarily wait while the other uses the cross-over. During rush hours there is a Broadway express train scheduled to use the cross-over every 4 minutes in one direction and a Lenox avenue local scheduled to cross over to or from the local tracks in the same direction every 4 minutes, so that the opportunities for a conflict at these cross-overs are numerous. The delay in the train movement due to the cross-over acts exactly like the delay due to a prolonged station wait, and often has a cumulative effect upon the train schedule. The records show that the delays at 96th street are fully twice as serious as those at Grand Central station, due to the fact that at this station there are not only transfer platforms but also these cross-overs.

To remove the effect of the grade crossings, a rearrangement of tracks has been proposed by the engineers of the Public Service Commission. When the work, which has been authorized, or the suggested modification of it, is completed, the trains passing through 96th street can reach their respective tracks without making use of a grade crossing. When the same improvements in regulations, signal system and cars which have been suggested for improving conditions at Grand Central station and other express stations have also been put in effect at 96th street, and the tracks have been rearranged as described, then 96th street will cease to be a limiting point and the proposed 90-second headway can be maintained at this part of the system without difficulty.

THE SOUTH FERRY LOOP.

The two tracks which pass through the tunnels under the East river to form the Brooklyn extension to the subway, leave the express tracks at Bowling Green station. The two express tracks continue to South Ferry station, where they form a loop—both loop and station being directly over the point where the Brooklyn tracks pass into the tubes leading under the river. Since the subway has been opened to the Atlantic avenue station (May 1, 1908) the Lenox avenue express trains and the Dyckman street express trains run through the tunnel to Brooklyn, and the Broadway Kingsbridge express trains continue on around the loop at South Ferry. During rush hours, the Lenox express trains are scheduled for a headway of 3 minutes and the Dyckman express trains are scheduled for a headway of 8 minutes through the Brooklyn tubes, that is, for a short time each day the Brooklyn schedule calls for a headway of an average of 2 minutes and 10 seconds. The Kingsbridge express trains, which continue on around the South Ferry loop, run every 8 minutes during the busiest part of the rush periods. This service to Brooklyn will not be as satisfactory as the service on the rest of the line and as the facilities offered by the complete extension will attract a large patronage through the Brooklyn tubes, there will be a demand and need for running all the express trains directly through to Brooklyn. To meet this demand it will first be necessary to work out some plan for serving the South Ferry station, which accommodates a certain number of patrons using the ferries leaving Battery Park, for until some plan is devised and adopted for accommodating these patrons it will be impracticable to run all the express trains to Brooklyn.

There are three plans which should have consideration in connection with this problem—

1—A double-decked station at South Ferry. This plan would involve changing the present 3 per cent grades of the tracks between the bulkhead of the tubes and Bowling Green station in order to provide an approximately level stretch of track at the stopping point or one upon which the grade does not exceed 0.5 of 1 per cent. in order that trains may remain at rest in case of failure of the brakes.

2—A shuttle-train service between South Ferry and Bowling Green station.

3—A moving platform either in the present subway between South Ferry and Bowling Green station or in an areaway just outside of the subway.

In my opinion it is advisable to install the shuttle train service first in order to give immediate relief, as this can be done at moderate expense, but when considering the subject in connection with future subways leading to the Battery, the other plans should receive careful attention.

INFLUENCE ON HEADWAY OF MORE EFFICIENT BRAKING.

A series of tests were made upon the rate of braking and these tests were compared to the results upon the Boston elevated electric road and upon other roads provided with improved braking equipments. These tests indicate that so far as efficiency is concerned the braking equipment of the subway cars is capable of producing results as effective as any that have been secured up to date with brakes acting upon the wheels. The tests showed, however, that these results were not always actually secured on account of the carelessness or timidity of the motormen. The tendency seems to be for a motorman to begin to apply his brakes too quickly—thus prolonging by perhaps four or five seconds the time that should be devoted to bringing the train to rest at the platform. At least five seconds can be taken from the headway by instructing the motormen to bring their trains up to the express station platform at a speed of at least 30 miles per hour, which will require that the trains be brought to a stop in from 16 to 17 seconds instead of the 20 to 22 seconds usually required. The fact that some of the motormen do this now shows that it can be done. There is no improvement which will show such effective results in proportion to the time and expense involved as will additional attention paid to this detail of operation.

Should it be determined to use platform railings as shown in Report No. 3 upon the "Subway Car," the saving of time which can be accomplished by this improvement in braking will more than offset the few seconds which may be required to accurately stop the trains.

INFLUENCE ON HEADWAY OF IMPROVED ACCELERATION.

It is but natural to expect and in fact it is contended by some, that considerable improvement could be made in the time required for accelerating the trains and that a number of seconds could be saved by moving the trains out of the stations more promptly.

As a matter of fact the actual acceleration tests show that in starting the trains and in moving them a distance equal to the length of the platform, there is but about two seconds difference between the best acceleration and the slowest acceleration observed. This would indicate that there is little improvement to be expected from training the motormen to be more skilful in using their controllers.

The tests indicate that the acceleration varies between 1.1 miles per hour per second and 1.4 miles per hour per second, and between these two figures fall all of the observations which have been made with varying loads and with different motormen.

The theoretical values of acceleration, which calculations based upon the motor curves indicate should be expected, fall between the values of 1.15 miles per hour per second for trains loaded with 150 passengers per car to 1.55 miles per hour per second for all cars empty and these theoretical figures agree very closely with the results of actual observation.

All eight-car express trains are provided with five motor cars each equipped with two 200 h.p. motors, and all five-car express trains have three motor cars similarly equipped.

Examination of other systems shows the following values of acceleration as the results of an average of a large number of observations:

Company	Description of train.	Per hour. per second
Metropolitan Elevated, Chicago...3 car	train light, 2 motor cars..	1.41 miles.
South Side Elevated, Chicago.. .5-car	" " all motor cars.	1.35 "
South Side Elevated, Chicago.....5-car	" load'd,all motor cars	1.19 "
Metropolitan Elevated, Chicago...5-car	" " 3 motor cars..	1.06 "
Northwestern Elevated, Chicago...3-car	" " 1 motor car.	0.84 "

These tests and figures indicate that the motor equipment of the present subway is doing all that can be expected of it.

If all the cars of the subway trains were equipped with motors, the initial acceleration in starting could be increased from 1.15 miles per hour per second to 1.65 miles per hour per second, with trains loaded with 150 passengers per car. This improvement in acceleration would cut down the time required for the train to leave the station platform by about two seconds, and this saving of two seconds is practically the limit of improvement which can be expected upon the headway by equipping all the cars with motors. It is apparent at once, therefore, that as far as the effect upon the capacity of the subway is concerned, the expense of increasing the present motor equipment would not be justified. The effect upon the speed of the trains of changes in the motor equipment will be discussed in a separate report.

Furthermore, if the signal system is re-arranged as recommended in Report No. 2 upon the signal system, the proceed signal will be given to the following train very soon after the leaving train starts to leave the platform and therefore the time required by the leaving train in accelerating will have no influence upon the cycle which determines the station headway.

A study of the comparative effect of improving the braking and acceleration of the trains indicates that more advantages can be expected from increasing the braking efficiency than can be anticipated from increasing the acceleration of the trains.

MORE CARS PER TRAIN.

In order to obtain the maximum practicable capacity of the present subway it will eventually be found desirable to increase the express trains from eight to ten cars, and the local trains from five to seven cars.

The easiest way to accomplish this change is to arrange to handle two more cars on each train, operating these cars on the ends of the trains, and not attempting to load or unload them directly from or to any platform south of 96th street.

These cars would soon become known to the regular patrons as through cars, and the guard in charge could discourage passengers who intended to stop at intermediate points from going into these cars.

It would be necessary to make a small number of changes in the block signal system in order to allow one of these lengthened trains to push a similar but disabled train to a terminal yard, an operation which is sometimes required, that is the block signal system must be slightly re-arranged, so that a double train of a total of 20 cars on the express tracks could be operated in case of accident.

Plans have been prepared to lengthen the platforms at 16 local stations south of 96th street from the present length of 200 ft. to 350 ft. each, so as to accommodate eight-car local trains. The estimates which have been prepared covering the cost of these changes run from $1,900,000 to $2,250,000. It is my opinion that the expenditure of this amount of money will not be justified at the present time. On account of the extensive use of the transfer privilege, the local trains are nearly always emptied of a load equivalent to their standing load at the present time at every express station stop, and the standing passengers, therefore, have an opportunity to find seats. Judging from present tendencies, the two through cars on each local train would prove attractive to a number of passengers who now use the express trains, and who would probably be glad to secure a seat on a local train running but a few minutes slower than the express in exchange for uncomfortable and crowded standing room upon an express train.

The increased car service on the local trains, should, therefore, tend to decrease the crowded condition of the express service. It would appear, therefore, that, if the added cars on the local trains can be devoted to through business, which originates and ends at or near their terminal stations, it will *not* be necessary to invest approximately $2,000,000 to provide an extension of the local platforms, which are now arranged to accommodate only five cars.

A similar line of reasoning will indicate that 10-car train service can be instituted on the express tracks without making a corresponding increase in the length of the platforms. To lengthen these express stations sufficiently to accommodate 10-car trains would also mean the extending of all station platforms north of 96th street. This would mean a large investment in order to do this work without interfering with the operation of the trains. In my judgment it is entirely feasible to operate 10-car trains on the express tracks and seven-car trains on the local tracks. A decided effort should be made to do this first without extending the platforms. If the difficulties attending this through-car service cannot be overcome in actual operation, then the platforms should eventually be extended.

WIDER CARS.

After the maximum practicable length of train has been reached and such trains operated at the rate of 40 trains per hour with the present subway, and through the use of double decked or reservoir stations at the rate of 60 trains per hour for future subways—there are apparently but two ways left for increasing the possible capacity of a subway without adding tracks and that is to widen the cars or to double deck them.

With the present subway, on account of the changes in stations, tracks, terminals and in the cars themselves the adoption of a higher or a wider car would be impracticable. For future subways the use of a wider car should be seriously considered but in my opinion greater advantages can be obtained by double decking the subways than by double decking the cars themselves.

In Report No. 3, "The Subway Car," I have discussed the proper design for a car at least 18 in. wider than the present car to be used in future subways, and as this wider car will add at least 25 per cent. to the possible carrying capacity without adding materially to the amount of the investment, it should be used unless reasons other than engineering and operating ones compel the adoption of cars having approximately the same width as those in the present subway.

MAXIMUM POSSIBLE CAPACITY OF SUBWAYS.

The minimum headway to be expected with the present subway upon tracks equipped with a block signal system is 90 seconds, corresponding to 40 trains per hour. It has been shown further that this limitation to the headway is due to the delay in the express station blocks. In future subways, this limitation to capacity should be eliminated by providing two station tracks at each express station to serve each main line track, so that one train at a station platform will not delay the following train, as is the case at present. In this way the tracks at the express stations would be arranged on the reservoir principle, so as to equalize and maintain at its maximum the rate of movement of the trains passing from one station to another. In other words, the stations which represent but a small portion of the cost of a subway system should be designed in such a manner that the great investment in the subway between the stations could be utilized to its fullest extent

If the tracks between stations can be worked up to a capacity of 60 trains per hour (60-second headway) then the train capacity of future subways will be 100 per cent. greater than the capacity obtained under existing operating conditions in the present subway. If 10-car trains can be run every minute, a car capacity of 600 cars per hour can be secured with each track of a future subway. If each car carries 150 persons, the possible carrying capacity of a single track will be 75,000 passengers per hour or 150,000 passengers for two tracks whereas the possible capacity of two tracks in the present subway, as now operated, is less than 50,000 passengers per hour.

To determine the possibility of running 10-car trains on a 60-second headway, it is necessary to analyze the elements entering into the determination of the "running" headway of a train.

RUNNING HEADWAY OF TRAINS.

It is safe to operate 10-car trains every minute, even with the present type of signal system and brake equipment This rate of train movement will be possible, however, only with railways where the stations are provided with two station tracks for each main line track, as the trains cannot operate on a 60-second headway if they are delayed in getting up to and through each station.

To increase the train capacity of the subway, improvements may be expected along the following lines:

(1) The present braking data upon which the signal system have been designed indicate a rate of deceleration or rate of braking of slightly less than two miles per hour per second. It is not improbable that tests made under subway conditions would show that an emergency stop at a rate somewhat in excess of this can be safely relied upon, provided the latest type of brake is used. A decrease in the length of the blocks of from 10 per cent. to 20 per cent. might be possible as a result of this revised information, and it is, therefore, important that a series of reliable tests showing the actual distance required to stop a loaded subway train by means of the automatic emergency trips be made before the block distances of future subways are decided upon.

(2) The signal system should allow the trains to run closer together than the minimum distance of three times the length of a block section, as is the case with the present subway. This can be done most effectively by arranging a series of caution signal lights, which will follow the movement of the preceding train more closely than the present caution signals which are now a full block distance apart. A traveling caution signal, if perfected, would allow the following train to encroach upon the overlap section of the block and approach nearer the danger signal, and thus safely reduce the minimum time interval between trains.

(3) Recent improvements in the signals themselves have been made by which the movable colored discs have been replaced by two sets of electric lights whereby the signal indications become practically instantaneous. In the figures from which the curves in the appendix have been prepared, a period of 2½ seconds was included to allow for these signal movements and the headways shown can therefore be reduced by this 2½ seconds in considering the absolute minimum headway possible for future subways.

These various improvements should make it possible to eventually maintain a 45-second "running" headway corresponding to a car capacity of 800 cars per hour with 10-car trains—but as it is impracticable to expect any system to be kept in operation for any great length of time up to its full ultimate capacity, I have based my calculations for the capacity of future subways upon a practicable maximum capacity of 600 cars per hour for each express track, which would only require trains to run on a 60-second headway.

If it were practicable to rebuild and double deck all of the express stations of the present subway, there is no good reason why the above capacity of 60 trains per hour could not be secured, but the difficulties which would be encountered in changing the stations while keeping the road in operation combined with the expense of undermining the foundations of certain high buildings under which the subway runs, make this improvement now practically prohibitive, although the expense of this change may some time prove advisable in order to get capacity.

The maximum train capacity, therefore, of any properly signaled track of the present subway is 40 trains per hour as previously shown.

CARRYING CAPACITY OF A MOVING PLATFORM.

It is possible to install and operate a moving platform for the transportation of passengers under sub-surface conditions, and this method of solving the transit problem has been often advocated, but has never been put into practical every day operation for city transit. Such a platform would have a number of loading and unloading platforms moving at different speeds, usually varying in steps of three miles per hour. The platform carrying the seats can thus be made to move at either nine or twelve miles per hour, the latter speed being in excess of the average speed of a surface car.

A moving platform can be arranged to seat one passenger per lineal foot or 5,280 passengers for each mile of platform. If this platform moves at the rate of 12 miles per hour its carrying capacity will therefore be 62,500 passengers per hour and each of the patrons will have a seat. This capacity is more than twice the possible seating capacity of 10-car trains running on 60-second headway with 50 seats per car—but the platform only moves at the rate of 12 miles per hour, whereas the train can move its patrons at an average schedule speed of 25 miles per hour. In other words, the train method of operation has the advantage of having double the speed of the platform method and the platform method on the other hand has the advantage of having twice the seating capacity of the train method. The question is, do patrons of an underground system of transportation prefer speed or comfort; that is, would they prefer to patronize trains traveling at 25 miles per hour, but with only half enough seats to accommodate them in preference to a moving platform traveling at the rate of 12 miles per hour, but provided with seats for all?

It is probable that for short distance when speed is not an important element the moving platform with its "seat for every passenger" would be preferred, but that for comparatively long distance speed, even at a sacrifice of some capacity, is the result desired and there is therefore in my opinion no question as to the advantage of the train method of operation, for long haul subway conditions

DESIGN OF STATION FOR FUTURE SUBWAYS TO SECURE MAXIMUM CAPACITY.

It has been shown that, with the present type of subway stations where the trains stop on the main line, the train capacity is limited to a 10-car train every 90 seconds or to 40 trains per hour, whereas if each station is provided with two station tracks for each main line track the trains could be handled at the rate of one every 60 seconds or 60 trains per hour. Therefore, the capacity of future subways can be materially increased by double tracking the stations, and this should be done at least on the express tracks at all express stations. Whether or not the local tracks should be double tracked depends entirely upon the use to which the local tracks are to be put. If, as in the present subway, these local tracks are to be used more as a collecting and distributing system for the express service than as a separate system of transportation, then there will be but little need of increasing the possible capacity of the local tracks above the capacity which will be provided by a single local track at each station. If, however, an effort is to be made, as it should be, to cultivate the short haul business by means of the local systems and at the same time encourage the use of the local trains for a certain amount of through travel, then arrangements should be made for double tracking the local as well as the express tracks at all transfer stations.

This arrangement of double tracks for the local service at the express stations would not necessarily mean double tracks for the local trains at intermediate local stations as the stops at these stations would not require over 15 seconds and this station wait would not materially affect the headway. At transfer stations, however, the local trains are liable to be held at the platforms as long as the express trains are held and therefore if there is a demand for frequent train service over the local tracks, these tracks should be provided with double tracks at the transfer stations, thus making each transfer station a double decked station with four tracks on each deck.

The question as to the best arrangement of the tracks in a station provided with double tracks for each main line track is an important one.

In the first place such a station must, as a rule, be "double decked"; that is, the express track platforms will be on a separate level (preferably a lower one) from the local track platforms.

In the next place, a decision must be reached as to whether or not separate platforms are to be provided for loading and for unloading the passengers. The policy of the extent of the transfer privilege from local to express service, and *vice versa*, must also be decided and, lastly, the question of how intimate a connection should be arranged between two intersecting subways must be settled.

CONCLUSIONS.

The facts brought out in this report upon the capacity of the subway may be briefly recapitulated as follows

(1) The present subway, although carrying more passengers than it was originally designed to handle, lacks sufficient passenger carrying capacity under the conditions that it is now operating to pay a fair return on the investment and at the same time allow for a suitable depreciation reserve.

(2) The present subway is also defective in not having sufficient passenger carrying capacity to take care of the demands of transportation along its route during the two rush-hour periods of the day; that is, the subway is lacking in what might be termed overload capacity.

(3) The headway and therefore the capacity of the present subway is governed by the station headway; that is, the number of trains is limited by the number that can be passed through the limiting station. The capacity of future subways should be limited only by the number that can safely be passed over the tracks between stations.

(4) The present rate of train movement of 30 trains per hour in one direction upon each track can be increased to 40 trains per hour by

a—Installing automatic closing door signals upon the cars;

b—Providing speed control signals auxiliary to the present block signal system at the approaches to the stations;

c—Altering the cars to provide more doors in the sides of each car.

(5) To most effectively secure the benefit of these changes the cross-overs in the tracks north of 96th street station should be removed in accordance with the plans, which have already been approved by the Public Service Commission.

(6) The 96th street changes can be made still more effective by adding to these plans, the feature of double decking, thus providing two additional express tracks in the station.

(7) To secure the same capacity for the Brooklyn extension that will eventually be obtained for the Manhattan subway, a plan for handling the South Ferry passengers should be worked out so that all express trains can be run through the Brooklyn tubes, thus increasing their present capacity at least 33 per cent.

(8) The train capacity of the subway cannot be increased by increasing the speed of the trains as the increased length of the signal blocks necessary for the higher speeds more than offsets the advantage of the increased speed.

(9) The capacity of the subway can be increased by greater care in using the brakes at the stations. Very little effect upon the capacity can be expected by improving the acceleration of trains.

(10) Considerable improvement in the capacity can be secured by running longer trains and a movement in this direction should be started as it will eventually be found desirable to run seven-car local trains and 10-car express trains, both at the rate of 40 trains per hour. When this is done the capacity of the present subway will be increased 75 per cent. which is the maximum increase in capacity of the present subway that can be expected without double decking the stations which for reasons previously given seems to be prohibitive.

(11) While double deck cars in subways are impracticable, the possibility of using wider cars should be thoroughly considered in making plans for future subways, as there is apparently no difficulty in the way of using wider cars for such subways except the question of transferring the equipment between the present subway and future ones.

(12) To secure the maximum possible capacity of future subways, tests should be made to determine more accurately than has been done, the braking distance required to bring a subway train to rest from full speed when the emergency stop is used

(13) An improvement in the block signal system which will have a material influence upon increasing the capacity of future subways can be secured by developing a traveling caution signal to act in conjunction with the present fixed one.

(14) Moving platforms have practically double the seating capacity of 10-car trains running upon 60-second headway, but on the other hand these moving platforms have a speed of only one-half the schedule speed of the train, and therefore the train method of operation is to be preferred for long distances.

(15) In order to secure maximum capacity for future subways these subways should be designed with double decked stations provided with double tracks for each main line and the cross section of the subway between stations should also where practicable be

double decked; this plan will allow the operation of 10-car trains on a 60-second headway on each track thus providing a carrying capacity of three times that of the present subway.

RECOMMENDATIONS.

The improvements suggested in this report may be summarized as follows:

(1) The changes required in the present subway to increase its capacity from 30 trains an hour to 40 trains an hour, with a marked increase in its earning capacity, should be carried out; that is, the block signal system should be improved, a speed control system developed, and the cars altered.

(2) The 96th street alterations should include not only the removal of the cross-overs as already approved by the commission, but also the altering of the station itself to provide a local track upon a lower level, allowing the four tracks upon the present level to be used by the express trains.

(3) A shuttle train service for the South Ferry station should be provided at once, and a comprehensive study should be made of a plan for a double-decked station at this point, which would not only give all South Ferry passengers a station on the main line, thus eliminating the shuttle train service, but also allow all trains to run through to Brooklyn.

(4) The braking of the trains at the station should be improved so as to save the 5 seconds which is now often lost by lack of skill in stopping the trains.

(5) One car should be added to the rear of each local train during rush hours, and the public should be encouraged to use this extra car upon the local trains, which, although not reaching the platforms, could be used for through travel, with the idea of adding even more cars to the trains if the public can be educated to take advantage of this increased accommodation.

(6) A series of braking tests showing the distance required to stop a train by means of the emergency stop from full speed should be made in order to secure reliable data for planning the block signal systems for future subways.

(7) The manufacturers of block signal systems should be encouraged to develop a traveling caution signal to supplement the present fixed caution signal, as this signal could be installed to advantage not only in the present subway but in future subways.

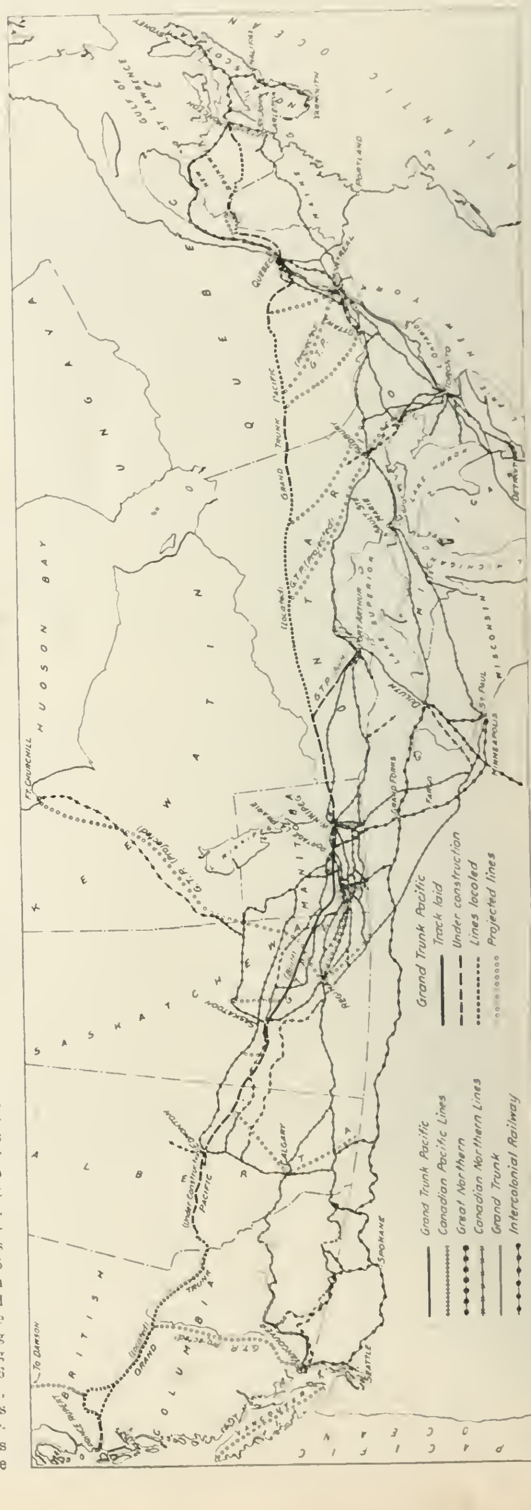
(8) If future subways are to be built and operated independently of the present one, the plans should be made with the idea of using multiple side door cars 18 in. wider than the present cars, thus adding at once 25 per cent. to the capacity of each car and increasing the possible carrying capacity of such subways without proportionately increasing their first cost.

(9) In order that future subways shall not only pay a fair return on their investment, but also allow for a satisfactory depreciation reserve, it is essential that such subways be located where there is sufficient density of traffic to justify their being built, and at the same time they should be so designed as to handle the volume of traffic which must be passed through them during rush hour periods in order to make them self-sustaining.

(10) All future trunk line subways should be designed with stations on the reservoir principle, that is, with double tracks in each station for each main line track. This can best be accomplished by not only double decking the stations, but also double decking the subways between stations, and by this method secure the carrying capacity necessary to justify the occupancy of the street, and at the same time produce a property which will justify its cost. Where a crosstown subway is to be provided for, the stations should be triple-decked.

The Grand Trunk Pacific.

The accompanying map shows the Grand Trunk Pacific lines completed, building and located, as well as the branch lines which are projected. The portion from Moncton, N. B., to Winnipeg, Man., 1,807 miles, is being built by the government under the name National Transcontinental. This is all located, except for a few miles near the Winnipeg terminals and possible revision at several other points. Contracts have been let for 656 miles from Moncton to Weymontachene, Que., and for separate sections between that point and Winnipeg aggregating 571 miles. The Lake Superior branch, running from Lake Superior Junction, Ont., southeast to Fort William, 210 miles, is being built by the Grand Trunk Pacific. On this branch grading except on eight miles has been finished and 125 miles of track has been laid. The Grand Trunk Pacific Branch Lines Co. has been authorized to build branch lines both east and west of Winnipeg. These are shown on the map as projected. The line from Winnipeg west to Prince Rupert, B. C., 1,750 miles, is being built by the Grand Trunk Pacific. This is all located. Grading is finished on the section from Winnipeg to Portage La Prairie, 56 miles, and track is laid from the latter point 500 miles to Earl, 75 miles west of Saskatoon, Sask. Work is under way from this point to Edmonton, Alb., 253 miles, and to a point 120 miles further west of Edmonton. From Prince Rupert eastward, work is under way on 100 miles of road to Kiteselas canyon, which is the junction between the direct line and the loop north of it. It is expected that the line from Winnipeg to Edmonton will be opened for traffic this year. Forces have been at work all through the winter from Winnipeg east to Lake Superior Junction, and it is estimated that during the summer about 30,000 men will be at work on the whole line from Moncton to Prince Rupert.



The Principal Canadian Railroads, Built and Building.

GENERAL NEWS SECTION

NOTES.

The New York legislature has passed a bill requiring railroad companies to pay their employees twice a month.

A press despatch from Bedford, Pa., says that the school of telegraphy maintained by the Pennsylvania Railroad at that place has graduated 60 students.

The Chicago & Alton now runs one of its trains through between Chicago and Kansas City in 13 hours, which is 30 minutes less than the previous time and 30 minutes less than the time made by any other line.

The five railroads running eastward from East St. Louis which absorb drayage charges on freight from St. Louis, will hereafter make the allowance on shipments brought by any one of 20 transfer companies, instead of only two companies, as heretofore.

Canadian papers report that the immigration into Canada this year has been smaller than last year by about 40,000 people, a result which is quite contrary to the expectations which were aroused by the heavy movement from Europe and the United States early in the spring.

A press despatch from Columbus, Ohio, says that the Brotherhood of Locomotive Engineers, now in convention in that city, has decided to admit to membership motormen on all those interurban electric railroads which operate 20 miles or more outside of an incorporated city.

The Canadian Pacific is to discontinue the 96-hour train which has been run between Quebec and Vancouver in connection with its ocean steamships. Under a new contract, the time allowed for carrying the mails from Liverpool to Hong Kong has been extended from 29½ days to 34 days.

At St. Paul, Minn., May 25, the United States Circuit Court of Appeals affirmed the conviction of the Chicago, St. Paul, Minneapolis & Omaha, and its General Freight Agent, H. M. Pearce, for having given illegal rebates on shipments of grain. The company was fined $20,000 and the agent $2,000.

The Chicago, Burlington & Quincy has announced a reduction of 25 cents a ton in the freight rates on coal carried from Wyoming and Colorado to points in Nebraska, west of Grand Island. This reduction is to meet one made by the Union Pacific in consequence of an order of the Interstate Commerce Commission.

The Black Diamond Express of the Lehigh Valley, between Buffalo and New York, which was taken off last winter, will be put back on its old schedule June 14. The train was taken off on February 9. It will leave Buffalo at 11 a.m., and New York at 12 o'clock daily, running through in 9 hours 55 minutes.

The Ohio legislature has passed a law under which the railroads of that state may, after July 7, collect from passengers paying fare on trains 10 cents more than from those who buy tickets at the offices. The law provides, however, that ticket offices at stations must be open 30 minutes before the departure of trains—which in thousands of instances will be 29 minutes more than is necessary.

A large part of Oklahoma and considerable territory in northern Texas were damaged by floods on May 23 and 24, about 20 inches of rain having fallen in 10 hours throughout a considerable part of this territory. At Dallas, Tex., a part of a bridge of the Texas & Pacific over the Trinity River was carried away by the flood and six men were drowned. Many railroad and wagon bridges were damaged in Oklahoma, and many miles of railroad suffered from washouts.

The Chicago, Burlington & Quincy will on May 31 begin running a fast limited train from Chicago, Omaha, Kansas City, St. Louis and other eastern points to the west over its Billings line, reducing the time to the Pacific coast 12 hours, arriving in Seattle in the morning instead of the evening as at present. An extra local train will be added for the accommodation of intermediate business. The train will leave all the eastern terminal points about as at present, but will cut the running time from 76 to 64 hours.

The New York, New Haven & Hartford announces that, beginning with June 10, it will make through freight rates from Connecticut points and from New York City to the west over the Boston & Maine and the Canadian Pacific (through Canada). Rates to Chicago and beyond by this route are 10 cents (first class) less than those by the direct routes, from points taking New York rates, and 5 cents (first class) less from Boston points. At present the Central Vermont, controlling the railroad from New London, Conn., northward to Montreal, and running steamers between New York and New London, is the only line which gives these low rates from places south of the Boston & Albany. Shipments by the new tariff will be sent through either Springfield or Worcester.

The gold medal offered by the *Scientific American* for the most meritorious invention in transportation, which has been competed for at the exhibition of the American Museum of Safety Devices which has been held in New York City during the past month, has been awarded to the Rich Marine Fire Detecting & Extinguishing system, which is an apparatus for detecting fires in the holds of vessels. From a glass case on the bridge pipes, 1 in. in diameter, run to each hold and coal bunker and, by means of a small exhaust fan, kept constantly running, any smoke which might be formed in a given compartment would emerge from the corresponding pipe in the glass case, and thus warn the officer in charge, of the danger of fire. Every 15 minutes a bell rings, calling attention to the necessity of looking at the pipes. In case a fire is detected, hose can be attached to the pipe and by this means the endangered hold can be flooded with steam. It is said that this device has been installed on the Cunard steamers "Lusitania" and "Mauretania."

Governor Hughes, of New York, has vetoed the Robinson bill, which was designed to facilitate the construction of rapid transit railroads in New York City by allowing the city the privilege of selling franchises to corporations for 50 years, instead of for periods not exceeding 25 years, as is stipulated in the present law. Governor Hughes says that although the 50-year provision is permissive, it would mean that all franchises would run for 50 years, for the city authorities could not be depended on to stand out for a shorter period; and the Governor believes that to surrender the rights of the city in its streets for so long a time as half a century is wrong. The exact financial status of the city as regards its power to borrow money, should be authoritatively determined, and then if the legislature takes action which shall result in the adoption of an amendment to the constitution, the city may, within a year and a half be able to build subways itself.

The proposal, embodied in a resolution by Senator Elkins, to suspend for a time the penalties which the Interstate Commerce Commission law imposes on railroads which carry their own commodities, was considered in the upper house of Congress last Friday; and, although no direct vote was taken, it is said that the subject has been laid aside finally for the present session. This leaves the penalties in full effect, so that an anthracite coal road for instance, carrying to market coal from its own mines, is subjecting itself to severe penalties, the only assurance of immunity being the promise of the President and the Attorney-General to refrain from prosecuting any road for the collection of a penalty until the constitutionality of the law shall have been decided by the Supreme Court.

A press despatch from Washington, May 25, says that the Department of Justice has agreed with the coal carrying railroads that the case involving the constitutionality of the law shall be heard before three Federal judges in Philadelphia on June 16 next. The case is to be tried upon an agreed state of facts and no prosecutions are to be begun against the railroads directly interested in the suit until a decision of the court has been reached.

Another Low-Fare Veto from Governor Hughes.

Governor Hughes of New York has vetoed a bill passed by the Legislature known as the Coney Island five-cent fare bill. His reasons are the same as those given a year ago in his veto of the general two-cent bill for the whole state, the main point being that the legislature has acted without sufficient investigation. In the present case he says:

This bill establishes a maximum rate of five cents [on electric roads from Manhattan to Coney Island] without regard to the length of the route or the reasonableness of such a fare. In other words, it is an arbitrary maximum imposed by legislative fiat. But it is clear that if the rate is not a reasonable one and if the requirement would operate as a confiscation of the company's property the legislature cannot impose it. The attempt to enforce such a rate under such circumstances would be abortive, as a successful appeal could be made to the courts. It is idle to suppose that the companies can be compelled to reduce their fare to five cents merely because the legislature says so.

Whether a five-cent fare is a fair one depends upon facts and not upon sentiment, desire or prejudice, whether the result be agreeable or disagreeable. It inevitably will be reached only after the facts have been ascertained and considered. Justice requires this and under the Constitution the requirement will be enforced. The proper way to deal with these matters is to provide for investigation in which the whole subject can be considered, specious claims sifted out, and a result just both to the corporations and to the public arrived at.

It is highly important that we should have transportation in our cities at the lowest fair rates. It is desirable that in New York City there should be low rates from the congested quarters to the breathing spots in the outlying districts and by the sea. The sure way and the only way to make real progress in this direction is through the ascertainment of the essential facts and the making of reasonable rates in accordance with the facts. This bill is wrong in principle and is not adapted to secure the desired result.

Wireless Controlled Electric Truck; Union Pacific.

W. C. Brown on Rate Increases.

I regard the present question as one of the most important that has ever engaged the attention of the business interests of the country. I firmly believe that upon its righteous solution depends the momentous question of an early return to prosperity, or a continuance of the depression of the past six months, emphasized and darkened by a struggle with organized labor such as this country has never experienced.

The issue is in the hands of the business men of the country. If the business interests of the nation shall, after mature consideration, say that railroad rates shall not be advanced, I doubt if it can be done. But it should be understood clearly, definitely and beyond all question of doubt, that in saying this they say just as clearly and definitely that the wages of the great army of 1,500,000 railroad employees shall be reduced, and they must accept their full measure of responsibility for the results which will follow.

A Lackawanna Circular to Employees.

"The principle that underlies courteous treatment of others is simply that of doing unto others as you would they should do unto you.

"In a highly complex and technical business such as that of the railroad, there are many things that you, with your training and daily experience, understand with perfect familiarity, but which the public do not understand; therefore, do not assume that the public should comprehend them without asking questions, but when they make inquiry of you give them the courtesy of a reply just as full and clear as you can make it, without any suggestion of superiority born of a greater knowledge.

"Words are only one means of expression, and manner is quite as important; therefore remember that a kindly and gracious manner is not only the sign and mark of a self-respecting man, but is to your words what oil is to machinery in making them move effectively to their purpose.

"True courtesy is no respector of persons. It gives the civil word and the helping hand quite as readily to the ill-clad stranger as to an official of the company.

"Courtesy is not only something the public have a right to expect of you, but it pays. It pays in the friends it makes you personally and as a representative of the company. It pays in minimizing the friction of your life, as well as that between the company and its patrons. It pays in raising your standing with the company.

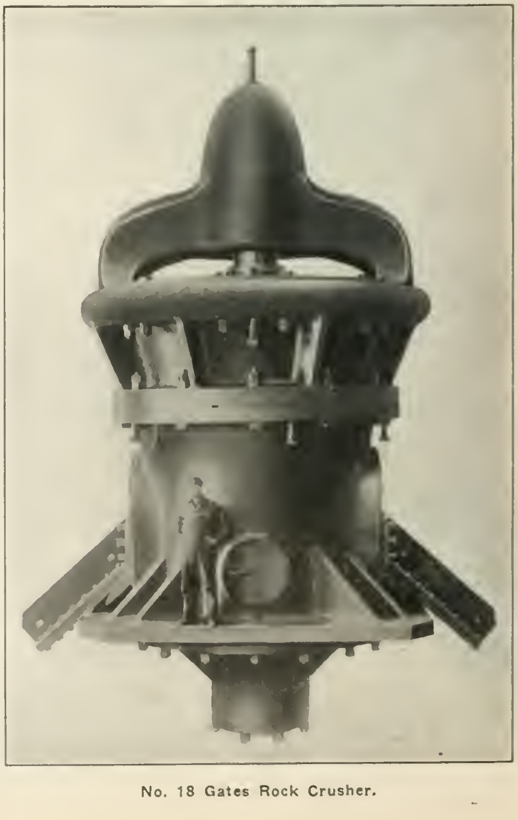
"It is the wish of the management of this company that all its representatives, whose work brings them into contact with the public, may appreciate and fully measure up to their duty and privilege in this respect."

Wireless Control of Shop Truck.

Frederick H. Millener, electrician, has for several months been working under the direction of W. R. McKeen, Jr., Superintendent of Motive Power and Machinery of the Union Pacific Railroad, on a system of wireless or remote control of a truck running on the industrial tracks of the Union Pacific shops at Omaha, Neb. The illustration shows an electric truck made by the Westinghouse Electric & Manufacturing Company, weighing about 5,500 lbs., which is driven by an electric motor supplied by a storage battery. The truck is capable of hauling a load of 10 tons at a speed of six miles an hour. It carries 144 ft. of copper wire made into a wireless wing and an antenna about 2 ft. high, by which the electric waves are picked up and transmitted to controlling devices beneath the frame. The experiments have progressed so far that it is now possible, by the use of the device, to move forward, reverse, stop, or to move at any desired speed by means of the specially shaped antenna and traveling ground communication. Similar antennae built like a cylinder and attuned to the car apparatus swing from a flag pole 65 ft. above the central controlling station. From these are sent waves that control the movement of the truck.

A Large Rock Crusher.

The Allis-Chalmers Co. has recently completed at its Reliance Works in Milwaukee, Wis., the No. 18 Gates, 600 to 800-ton capacity rock crusher shown in the accompanying cut. The machine weighs 200 tons and will reduce, to sizes suitable for railroad grouting and foundation work, rocks weighing three tons. It is said to be the largest rock crushing machine ever built.



No. 18 Gates Rock Crusher.

Disastrous Collision in Belgium.

Press despatches of May 21 report a rear collision of passenger trains at Contich, Belgium, at 8 o'clock on the morning of that day in which 50 or more persons were killed and over 100 injured. Nearly all of the killed were passengers in the three rear cars of a local passenger train carrying excursionists which, while standing on a side track, was struck by an express train running at full speed. The engineman and fireman of the express were killed. Several of the cars in the express train were badly broken, so that a number of passengers in this as well as in the local train, were injured. Contich is six miles southeast of Antwerp on the main line from Antwerp to Brussels. The reports give contradictory accounts of the cause of the accident, but at the present writing it looks as though it was the loosening by a repairman of a switch which was undergoing repairs. According to one account, the express train was derailed at this switch and its engine fell against the cars of the standing train after it had run off the rails.

New Traffic Order.

An executive order has been issued by the Interstate Commerce Commission as follows: "Under the decision of the commission in the case of '*Cosmopolitan Shipping Co. v. Hamburg-American Packet Co. et al.*,' and under rule 86 of tariff circular 15-A, carriers engaging in export and import traffic between points in the United States, and points in foreign countries not adjacent are required to publish their rates and fares to the ports and from the ports; and if as a matter of convenience to the public they publish in their tariffs through export and import rates or fares to or from foreign points in connection with ocean carriers such tariffs must distinctly state the inland rate of fare.

"Extensions of time have been granted to some carriers giving them until July 1, 1908, to comply with the requirements of said rule. It is now

"Ordered that all carriers subject to the act to regulate commerce shall comply with the requirements of rule 86, tariff circular 15-A, on or before July 1, 1908, by filing with the commission tariffs constructed in accordance with the rule and by canceling tariffs that do not conform to the requirements of this rule, and which contain rates or fares upon traffic exported to or imported from a foreign country not adjacent to the United States."

MANUFACTURING AND BUSINESS.

The Alexander Milburn Co., Baltimore, Md., recently received an order for a number of 5,000 c.p. acetylene lights for use on the Panama Canal.

William D. Ewart, the first president of the Link-Belt Co., Philadelphia, Pa., died at Rome, Italy, on May 3. Mr. Ewart was 56 years old. He invented the malleable iron detachable drive chain which was first known under his name. The Ewart Manufacturing Co. manufactured this chain, which is now called the link-belt, for many years, the product being handled by the Link-Belt Machinery Co., and the Link-Belt Engineering Co. In 1906 all three were consolidated into the present company, in which Mr. Ewart had a large interest and which is still being largely managed by his former associates. He combined inventive ability with executive capacity, being noticeably successful in harmonizing differences and getting co-operation. He retired on account of poor health and went abroad in the hope of recovery.

William D. Ewart.

Borlido Moniz & Co., P. O. Box 262, Rio de Janeiro, Brazil, wish to act as general commission agents for handling railroad equipment and supplies, electric machinery, builders' supplies, etc., in Brazil, and are asking for catalogues and correspondence from American firms.

The Glacier Metal Co., Richmond, Va., which is building a new plant at Manchester, Va., is now in the market for furnaces for the manufacture of babbitt metal, brass, etc., and also wants information on reclaiming metal from drosses and extracting tin from old cans.

The Maryland Railway & Electric Supply Co., Baltimore, Md., has opened branches at 1629 Candler building, Atlanta, Ga., and 312 Tyler building, Louisville, Ky.

F. P. Huntley, Vice-President and General Manager of the Gould Coupler Co., New York, has just returned from a several months' business and pleasure trip abroad.

Samuel E. Duff, formerly Manager of the Allegheny works of the Riter-Conley Manufacturing Co., Pittsburgh, Pa., has opened an office as Consulting Engineer in the Empire building, Pittsburgh, Pa. His specialties will be the designing of bridges, buildings, manufacturing plants, and special tools for steel work, while he will also develop his continuous steel railroad track support.

Fairbanks, Morse & Co., Chicago, Ill., have moved to their new offices at the corner of Wabash avenue and Eldredge place. The building, which is 165 ft. x 40 ft., is a seven story structure and contains the offices of all departments of the company, including the administrative, domestic and foreign sales, construction, purchasing, railroad departments, etc. The new warehouse of the company at Nineteenth and Sangamon streets is a five-story brick building, 100 ft. x 100 ft. The company's branch houses at Denver, Colo., Omaha, Neb., and San Francisco, Cal., have also moved into new buildings, and the Los Angeles, Cal., branch will do so within a few months.

MEETINGS AND ANNOUNCEMENTS.

(For dates of conventions and regular meetings of railroad conventions and engineering societies, etc., see advertising page 24.)

Transportation and Car Accounting Officers.

The Association of Transportation and Car Accounting Officers will hold its summer meeting at the Clifton Hotel, Niagara Falls, Ont., June 23 and 24. Reports will be received from the Committees on Car Service and Per Diem, on Office Methods and Accounting, on Handling Railroad Business Mail, on Conducting Freight Transportation, and on Conducting Passenger Transportation. There will be the regular election of officers.

American Association of General Baggage Agents.

The twenty-seventh annual convention of this Association is to be held at the Hotel Plankinton, Milwaukee, Wis., June 17. At this meeting the discussions will include the following subjects: Limited Liability on Baggage; Settlement of Line Claims; Division of Excess Baggage Earnings; Uniform Excess Baggage Rates; Interline Charge for Dogs; Borrowing of Tickets for Checking Excess Baggage; Showing Junction Points on C.O.D. Checks; New Form of Baggage Checks to Prevent Mis-Matches; Should Lead Pencil be Used in Making Out Baggage Checks?

American Society for Testing Materials.

This society, affiliated with the International Association for Testing Materials, will hold its eleventh annual meeting at Atlantic City, N. J., June 23-27. The headquarters will be at the Hotel Traymore. The programme includes reports as follows:

Testing is not Inspection. W. A. Aiken.

Standard Specifications for Cast Iron and Finished Castings. Walter Wood, Chairman.

Method of Obtaining a Truly Circular and Uniform Chill in Rolls. T. D. West.

Standard Tests for Road Materials. L. W. Page, Chairman.

The Acceptance of Stone for Use on Roads Based on Standard Tests. R. S. Greenman.

Fuel Investigations, Geological Survey. Progress During the Year. J. A. Holmes.

The Structural Timbers of the Pacific Coast. R. Thelen.

Address by the President on Some Features of the Present Rail Question.

Relative Corrosion of Steel and Wrought Iron Water Pipes. H. M. Howe.

Corrosion of Iron and Steel. A. S. Cushman, Chairman.

Electrolysis and Corrosion. A. S. Cushman.

Results of Endurance Tests on Wrought Iron, Steel and Alloys. Henry Souther.

Results of Tests of Steel Columns in Progress at Watertown Arsenal. J. E. Howard.

Heat Treatment of Iron and Steel. H. M. Howe, Chairman.

Practical Applications of Metallography. William Campbell.

Tempering and Testing of Steel Springs and Standard Specifications for Spring Steel. J. A. Kinkead, Chairman.

Tests of Staybolts. E. L. Hancock.

Standard Specifications for Paving and Building Brick. L. W. Page, Chairman.

Influence of the Absorptive Capacity of Bricks Upon the Adhesion of Mortar.

Standard Specifications for Iron and Steel Rails. W. R. Webster, Chairman.

Results of Work on the Metallurgy of Steel in Progress at Watertown Arsenal. J. E. Howard.

Microscopic Investigation of Broken Rails; Manganese Sulphide as a Source of Danger. Henry Fay.

Results Showing the Behavior of Rails under the Drop Test, and Proposed New Form of Standard Drop Testing Machine. S. S. Martin.

Failures in the Base of Cold Rolled Rails. P. H. Dudley.

Rail Failures—Split Heads. M. H. Wickhorst.

Notes on the Rail Situation. L. F. Kenney.
Standard Specifications for Cement. G. F. Swain, Chairman.
Portland Cement Standards, Especially for Tensile Strength. W. W. Maclay.
Reinforced-Concrete. F. E. Turneaure, Chairman.
Sands—Their Relation to Mortar and Concrete. H. S. Spackman and R. W. Lesley.
Permeability Tests of Concrete with the Addition of Hydrated Lime. S. L. Thompson.
Tests of Reinforced Concrete Beams Under Oft Repeated Loading. H. C. Berry.
Cement Analysis. S. F. Peckham.
Formulas for Reinforced Concrete Beams in the Light of Experimental Data. W. F. Scott.
Fireproof Qualities of Concrete. R. F. Tucker.
Shearing Values of Stone and Concrete. H. H. Quimby.
Methods and Records Used in the Laboratory for Testing Cement and other Materials for the Subway and Elevated Railway in Philadelphia. S. A. Brown.
Influence of Fine Grinding on the Physical Properties of Portland Cement. R. K. Meade.
Tests of Bond in Reinforced Concrete Beams. M. O. Withey.
Cement and Concrete Work of U. S. Reclamation Service, with Notes on Disintegration of Concrete by Action of Alkali Water. J. Y. Jewett.
Preservative Coatings. S. S. Voorhees, Chairman.
General Discussion "Will 'Pure Paint' Legislation Give Us Better Paints?"
Solubility Tests on Protective Coatings. G. W. Thompson.
Analysis of Varnishes. P. C. McIlhiney.
Standard Tests for Lubricants. A. H. Gill, Chairman.
Use of the Extensometer in Commercial Work. T. D. Lynch.
Features of a 600,000-lb. Universal Testing Machine. T. Y. Olsen.
Pendulum Testing Machines. T. Y. Olsen.
Automatic Recorder for Commercial Tension Tests. H. F. Moore.
Magnetic Testing of Iron and Steel. J. W. Esterline, Chairman.
Uniformity in Magnetic Testing and in the Specifications of Magnetic Properties. C. W. Burrows.
Uniform Specifications for Boilers. E. D. Meier, Chairman.
Forest Service Tests to Determine the Influence of Different Methods and Rates of Loading on the Strength and Stiffness of Timber. (a) The Purpose and Scope of the Investigations. McGarvey Cline. (b) Analytical Discussion of Speed-Strength Relation. H. D. Tieman.
Manganese Bronze. C. R. Spare.
Standard Specifications for Hard Drawn Copper Wire. J. A. Capp and W. H. Bassett.
Structural Materials Testing Laboratories, U. S. Geological Survey. R. L. Humphrey.
Combined Stresses on the Elastic Properties of Steel. E. L. Hancock.
Fireproofing Materials. I. H. Woolson, Chairman.
Waterproofing Materials. W. A. Aiken, Chairman.

At this meeting there will be an election of officers, and the official ballot is as follows: For President, Charles B. Dudley; Vice-President, Robert W. Lesley; Secretary-Treasurer, Edgar Marburg; Member of Executive Committee, James Christie.

Special rates on the American plan at the Hotel Traymore have been secured for members of the society and their guests.

ELECTIONS AND APPOINTMENTS.

Executive, Financial and Legal Officers.

Alaska Central.—John F. Goodwin has been appointed Receiver of the Alaska Central and the Tanana Railway Construction Co.

Canadian Pacific.—Joseph Dunsmuir, Lieutenant-Governor of British Columbia, has been elected a Director, succeeding Clarence Mackay.

Chesapeake & Western.—W. E. D. Stokes has been elected President, succeeding Robert McM. Gillespie, resigned, and A. H. Gleason has been elected Vice-President, succeeding J. J. Vatable, resigned.

Operating Officers.

Missouri Pacific.—L. B. McGuire, Trainmaster at Nevada, Mo., has assumed also the jurisdiction over the Rich Hill branch, Fort Scott branch, Asbury branch and Pittsburgh district of the Joplin division. D. H. Robinson, transferred, formerly had jurisdiction over these branches.

Traffic Officers.

Buffalo, Rochester & Pittsburgh.—H. E. Huntington, General Agent of the Erie at Buffalo, N. Y., has been appointed General Passenger and Baggage Agent of the Buffalo, Rochester & Pittsburgh, with office at Rochester, N. Y., succeeding E. C. Lapey, effective June 1.

Chicago, Rock Island & Pacific.—H. H. Embry, General Freight Agent west of the Missouri river, with office at Kansas City, Mo., is to be retired on account of retrenchments, his office abolished and his duties to be assumed by G. B. Albright, Assistant General Freight Agent, with office at Kansas City, Mo., effective June 15.

Lake Erie & Western.—L. B. Sweet, General Freight Agent, with office at Indianapolis, Ind., has resigned, effective June 15, and will be succeeded by M. D. Maxwell, now Assistant General Freight Agent at Indianapolis.

San Pedro, Los Angeles & Salt Lake.—William Bogart has been appointed General Agent at Pittsburgh, Pa., succeeding H. S. Drysdale, resigned.

Engineering and Rolling Stock Officers.

Mexican Central.—W. Byrd Page has been appointed Assistant Superintendent of Machinery, with office at Aguascalientes, Aguas., succeeding C. H. Burke, resigned.

LOCOMOTIVE BUILDING.

The American Railroad of Porto Rico has ordered two compound consolidation locomotives, cylinders 14 in. and 20 in. x 20 in. from the American Locomotive Co.

CAR BUILDING.

The American Dressed Beef & Packing Co., Kansas City, Mo., has ordered 50 refrigerator cars from the American Car & Foundry Co.

The Delaware, Lackawanna & Western, which has been figuring on 26 passenger cars and 300 forty-ton steel hopper coal cars, has postponed the purchase for the present.

RAILROAD STRUCTURES.

BEAVER, PA.—Contract is reported let by the Pittsburgh & Lake Erie for the steel, also the construction of its proposed bridge over the Ohio river at this place, to the McClintic-Marshall Construction Co., of Pittsburgh, at $1,000,000. (Oct. 25, p. 598.)

BLOOMINGTON, ILL.—The Chicago & Alton is rebuilding a part of its machine shops and offices, recently damaged by fire.

CHICAGO, ILL.—The Chicago & North-Western, it is said, has bought 30,000 sq. ft. on the river front near Fifteenth street in the southern district of Chicago, on which, it is said, a dock 750 ft. long will be built.

The proposed 15 bridges over the drainage canal with operating machinery to cost $1,000,000 to be put in within 18 months, include seven railroad bridges over the main channel of the canal, and eight public bridges.

CHILDRESS, TEXAS.—The shops of the Fort Worth & Denver City, recently damaged by fire at a loss of $200,000, are to be rebuilt.

DENVER, COLO.—The Colorado & Southern, it is said, is planning to build many bridges in Colorado.

HILLSBORO, TEXAS.—The Trinity & Brazos Valley, it is said, will put up a bridge and viaduct here to cost about $16,000.

MT. STERLING, KY.—The State Railroad Commission has ordered the Chesapeake & Ohio to replace the present station with a new structure.

NEW YORK, N. Y.—The New York Central & Hudson River has filed plans for the east section of its new station at Forty-second street. It is to have a frontage of 366 ft. on Depew place and a depth of 72 ft. The building is to be seven stories high with two underground floors to be used by trains.

NORTH PLATTE, NEB.—Local reports say that considerable improvements are to be made by the Union Pacific here to include large yards, new roundhouses, coal docks and car repair shops. The work is to be finished this fall.

OMAHA, NEB.—Local reports state that the Union Pacific will resume work on its shops here. The cost of the improvements will be about $1,000,000.

OTTAWA, ONT.—Bids are wanted June 9, by the National Transcontinental Railway Commission, for the construction and erection of steel superstructures and floors for bridges in District "A," as follows: Over the Canaan river, Salmon river, Little Salmon river, Four Mile brook, Grand river, Sigas river, to be finished May, 1909. Quisbia river, Green river, Iroquis river, Madawaska river, to be finished October, 1908, and Baker brook, to be finished May, 1909. P. E. Ryan, Secretary.

SPIRIT LAKE, IDAHO.—An officer of the Idaho & Washington Northern writes that work is to be started June 1 putting up shops and a roundhouse to cost, with the machinery, $250,000. Contract let to Westinghouse, Church, Kerr & Co., of New York.

SUPERIOR, WIS.—The Wisconsin & Minnesota Bridge Company, recently incorporated, is planning to build a bridge over the St. Louis river between Wisconsin and Minnesota.

RAILROAD CONSTRUCTION.

New Incorporations, Surveys, Etc.

AJO VALLEY RAILROAD.—An officer writes that this company proposes to build a line from Theba, Ariz., where connection is to be made with the Southern Pacific, south to the Ajo mines, and thence to the Mexican border, about 125 miles. Surveys are made but contracts are not yet let. Plans are being pushed for financing the project, also for building the line, and it is expected that work will be started shortly. Michael Meehan, President, 10 Tremont street, Boston, Mass., and F. A. Bordwell, Chief Engineer, Tucson, Ariz.

ALBANY & SCHOHARIE.—The bill extending the time for the construction of this line, projected since 1895, has been vetoed by the Governor of New York.

Alexander & Eastern.—Organized with a capital of $100,000, and office at 806 W. Pike street, Clarksburg, W. Va. The company proposes to build a line from Alexander, W. Va., northeast to Elkins, about 30 miles. J. B. Hart is interested.

Alexandria, Leesville & Lufkin.—Organized in Louisiana to build a line from Lufkin, Texas, east to Alexandria, La., about 110 miles. M. O'Brien, President; T. T. Wingate, J. J. Hicks and W. K. Ferguson are Vice-Presidents; C. W. Schwitzer, Secretary; J. E. Duff, Treasurer; D. M. Schollars, Attorney at Leesville, La., and H. H. White, Attorney at Alexandria.

Bitter Root.—Organized to build a line from Lewiston, Idaho, east to Butte, Mont., about 350 miles. Surveys made from Lewiston to Clearwater river, 85 miles, but construction work has been indefinitely postponed. C. G. Sutherland, President; G. W. Boschke, Chief Engineer.

Chicago, Rock Island & Pacific.—The first 20 miles of this company's proposed connecting line projected from Amarillo, Texas, west to Tucumcari, N. Mex., 110 miles, has been put in operation. (March 27, p. 461.)

Colorado, Texas & Mexico.—At the annual meeting of this company, President Morris K. Locke, of Abilene, Texas, reported that 79 miles of grading had been finished. Negotiations are pending for 100 miles of track material for immediate use on the line between Mangum, Okla., and Chillicothe, and on the Hollis branch. The line is projected south to Abilene, Texas. (April 17, p. 559.)

Cotton Belt.—Organized in Georgia to build a railroad from Louisville, Ga., northeast via Vidette and Walnsboro, to a point near Shell Bluff landing on the Savannah river, about 50 miles. Frank R. Durden, of the Durden Pine Co., Savannah, is President.

Delaware, Lackawanna & Western.—An officer writes that this company is asking contractors to submit bids for building the proposed cut-off from Port Morris, N. J., on Lake Hopatcong, west to Slateford, Pa., on the Delaware river, 28.7 miles. For this main line cut-off the surveys have been made. It will save 11½ miles of distance, besides reducing grades and curves, and eliminating tunnels, of which there are two on the present line. (March 13, p. 395.)

Grand Trunk.—The tracks of the main line of this road are being relaid with 100-lb. rails on the section from Mille Roches, Ont., west to Cardinal, 33 miles. The rest of the line between Brockville and Montreal was relaid last year.

Idaho Northern Railroad.—An officer writes that this company, organized to build 76 miles of line in the Coeur d'Alene district, Idaho, for which contract was let last fall to the Pacific Coast Construction Company, of Portland, Ore., expects to begin track laying June 1. The line is being built from Enaville, Idaho, on the Wallace-Tekoa branch of the Oregon Railroad & Navigation Company, near Kingston, northeast to a point six miles east of Murray, 33 miles. Grading is about one-third finished, and it is expected the line will be ready for operation this year. Branches aggregating 43 miles are also to be built. B. F. O'Neill, President, Wallace, Idaho. W. P. Smith, Chief Engineer, Enaville. (April 10, p. 595.)

Interborough Rapid Transit.—This company, operating the subways and elevated lines of Manhattan, New York City, has sent to the New York State Public Service Commission a proposition looking to the construction by the Interborough of a subway from Flatbush avenue and Fulton street, Brooklyn, along Flatbush avenue extension to the Manhattan bridge (not yet finished), with a view to making a rapid transit line from the starting point across the bridge and thence to the Bowery and Canal street, Manhattan, where a connection can be made with the Third avenue elevated road. The Interborough offers to do the necessary construction for $1,200,000 and to operate the line under lease. The route of the proposed subway in Brooklyn is identical with a part of the Fourth avenue subway, for the construction of which the Public Service Commission has just let contracts; and the proposition of the Interborough seems to have been made on the assumption that these contracts will not be carried out for the reason that the city is not at present in a position to provide the necessary money.

Mexican Roads.—A concession is reported granted by the federal government to General Julio M. Cervantes, of San Luis Potosi, to build 100 miles of railroad. The main line is to run from San Mateo, on the San Luis Potosi divisions of the Mexican Central, to Tiletla, with a branch to Tamazunchale.

Reports from Zacatecas state that a concession has been granted to Gustavo A. Madero, of Zacatecas, to build a line from Comacho, Zac., on the Mexican Central, east to Mazapil, 60 miles.

New York, Canadian & Pacific.—The bill extending the time for this company to build its road, projected since 1866, from New York City north to Canada, has been vetoed by the Governor of New York.

New York Subways.—The New York Public Service Commission, First district, recently let contracts for six sections of the Fourth avenue (Brooklyn) subway. In each case the contract was given to the bidder whose aggregate estimate on the cost of the railroad work and the pipe galleries was the lowest. The contracts are as follows:

Sec. No.	Location and bidder	Railroad work	Pipe galleries	Total
1.	Nassau to Willoughby streets; Jas. P. Graham	$1,020,476	$101,374	$1,121,850
2.	Willoughby street to Ashland place; William Bradley	3,436,019	58,695	3,494,714
3.	Ashland place to Sackett street; William Bradley	3,392,092	208,135	3,600,227
4.	Sackett street to 10th street; E. E. Smith Contracting Co.	2,283,533	206,672	2,490,205
5.	10th to 27th streets; Tidewater Building Co. and T. B. Bryson (joint bid)	1,945,640	251,076	2,196,716
6.	27th to 43d streets; E. E. Smith Contracting Co.	2,808,983	173,665	2,982,648
	Total	$14,886,743	$999,617	$15,886,360

The total of the awards for railroad work is $14,886,743 and for pipe galleries $999,617, making an aggregate cost for the six sections of $15,886,360. The beginning of work on these contracts must await action by the Board of Estimate and Apportionment on the question of providing funds.

North Midland (Electric).—The proposed route of this projected line is from London, Ont., north to St. Mary's, thence north east to Stratford, 35 miles. A. E. Welch, 171 Dundas street, London, has a contract for some of the work, which is to be started as soon as the project is financed. There are to be two bridges. W. Scarlett, President, Princess avenue, London.

Ohio Electric Railway.—The Lima & Toledo Traction Company, which is building a line from Deshler, Ohio, north to Toledo, 30 miles, has all the track laid from Maumee south to Waterville, and it is said that the approaches to the large concrete bridge near that place are about finished. It is expected that the company will begin operation to Toledo early in June. (March 27, p. 461.)

Oklahoma, El Reno & Shawnee (Electric).—Incorporated in Oklahoma with $1,500,000 capital to build an electric line from Shawnee, Okla., west via Oklahoma City and Yukon to El Reno, 60 miles. It is estimated that it will cost $20,000 a mile to build the road. The incorporators include C. E. Huber, President; J. A. Niblo, W. M. Sawyer and S. L. Niblo, of Oklahoma City, and Charles E. Davis of Lugert.

Oregon Eastern.—See Southern Pacific.

Pennsylvania.—This company on May 24 put in operation the last section of its extensive improvements on the Conemaugh division, between Pittsburgh, Pa., and Johnstown. This marks the completion of the plans, begun in 1902, for a low grade line from Pittsburgh to the Atlantic ocean. With the exception of 24 miles on the west side of the Allegheny mountains and one mile near Freeport on the Conemaugh division there is now a freight line with no adverse grade eastward of over 0.3 per cent. The work on the Conemaugh division required the excavation of 2,000,000 cu. yds. of material, the erection of 110,000 cu. yds. of masonry, and the piercing of a 760 ft. tunnel. Every grade crossing on the revised line has been eliminated. The company now has a low grade line parallel to the main line from Pittsburgh to Johnstown, from Gallitzin, at the summit of the Alleghenies, to Petersburg, on the main line, and from Harrisburg, Pa., to Trenton, N. J., thus providing two distinct lines, one of two tracks and another of four, for about 261 miles out of the total of 388 miles from Pittsburgh to Trenton. This has been accomplished by double-tracking and revision on the Conemaugh division as before stated, by building an entirely new double-track line from Gallitzin to Hollidaysburg, double-tracking the branch line from Hollidaysburg to Petersburg; building a new double track line from Harrisburg to Glen Loch, and revising the grades on the Trenton cut-off from Glen Loch to Morrisville. In addition it has been necessary to revise the grades and take out considerable curvature on the main line between Port Royal and Van Dyke and between Mount Union and Ryde. This latter work is almost but not quite finished. On the 24 miles from Johnstown to Gallitzin the ruling grade is 1 per cent. (March 13, p. 393.)

Pennsylvania Lines West.—According to reports surveys are being made by the Pennsylvania company for a low grade freight line from the Pittsburgh, Fort Wayne & Chicago at Enon, Pa., east to the Buffalo & Allegheny division of the Pennsylvania at Brady's Bend, about 50 miles. Such a line would enable the company to avoid sending much through freight through Pittsburgh.

Rio Grande, Sierra Madre & Pacific.—This company, which suspended work last year on the extension projected from Nueva Casas Grandes, Chihuahua, west to the Pacific coast, is reported to be preparing to resume work this fall. Grading has been finished from Nueva Casas Grandes south 25 miles, and rails are on the ground. A bridge has also been built over the Guerrero river. The proposed terminus is either Guaymas or Topolobampo. (Nov. 29, p. 669.)

San Juan, Tavicue & Oaxaca.—An extension of two years from May 9, 1908, has been granted to C. A. Hamilton, of Oaxaca, to build this line. The projected route is from San Pablo Zimatlin, Oaxaca, to the Taviche mining camp, about 17 miles. Most of the construction material is already on the ground. (April 3, p. 493.)

SOUTHERN PACIFIC.—The Oregon Eastern has finished surveys for a line from Natron, Ore., south to Klamath Falls, 152 miles. Surveys also made for a line from the Cascade Mountains east to the eastern boundary of the state at Ontario. The company recently had its charter amended so as to build a branch from Lakeview, Ore., south to the California state line, about 15 miles. It is the ultimate intention to further extend this line south through California. (March 13, p. 394.)

SUGAR CREEK & NORTHERN.—See Wheeling & Lake Erie.

TERRE HAUTE, ROBINSON, OLNEY & SOUTH-WESTERN.—An officer writes that the route of this proposed line is from Terre Haute, Ind., southwest via Robinson, Ill., and Olney, to Mount Vernon, 125 miles, where connection is to be made with the Wabash, Chester & Western, running to the Mississippi river. It is the intention of the company ultimately to build an extension on the Missouri side of the Mississippi river, southwest about 60 miles. Contracts for some of the work has been let to Charles B. Duffy, St. Louis, Mo. The construction of the road depends upon the company's securing the necessary right of way within six months. There are to be steel bridges over the Wabash and Embarras rivers, and plate girders or concrete structures over other streams. Harris C. Pugh, President, Terre Haute, Ind. (May 8, p. 656.)

TEXAS & PACIFIC.—An officer writes in regard to improvements to be carried out by this company that the only work contemplated at the present time is laying heavier rails on 56 miles of the line.

TEXAS NORTHERN.—An officer writes that this company's projected line is to run from Groveton, Texas, northeast via George, Apple Springs, Vair and Peavy to Lufkin, 36 miles. Grading has been finished and track laid on 23 miles. Bridgework and tracklaying is being done by the company's men. The Trinity County Lumber Company did all the construction work on the 23 miles between Groveton and Vair, at which point connection is to be made with the Texas South Eastern, over which the T. N. will have trackage rights to Lufkin, 13 miles. The Texas Northern will take over the railroad property of the Trinity County Lumber Company and operate it. P. A. McCarthy is Chief Engineer, Lufkin, Texas.

TEXAS ROADS.—According to reports from Port Arthur, Texas, John W. Gates, of New York, is arranging to finance two projects to build new lines in Texas. One of the proposed lines is to run from Port Arthur north to Waco, about 225 miles, and the other from Port Arthur, west to Houston, about 90 miles. Some construction work has already been done on the latter, and it is said that work on the Port Arthur and Waco line is to be started this fall and pushed to completion. R. C. Duff, of Beaumont, is interested.

TRINITY LUMBER COMPANY'S RAILROAD.—See Texas Northern.

UNION PACIFIC.—According to reports from Colorado, this company is planning to build a branch from Platteville, Colo., northwest to Fort Collins, about 35 miles.

VANCOUVER ISLAND & EASTERN.—A director of this proposed line states that the charter authorizing it to build has been passed by both the House of Commons and the Senate, but has not yet been signed by the Governor-General. The organization of the company is not yet complete. The proposed route is from Vancouver Island, northeast through British Columbia to Edmonton, Alb. H. A. Munn, Victoria, B. C., and James Smith, Edmonton, Alb., are among the provisional directors. (March 1, p. 624.)

WHEELING & LAKE ERIE.—An officer writes that work has not been resumed, as stated in recent reports, on the new cut-off of the Sugar Creek & Northern from Bolivar, Ohio, northwest to Orrville, 22 miles. At the time work was stopped three-fourths of the grading was finished and track laid on about eight miles. (March 13, p. 395.)

RAILROAD CORPORATION NEWS.

ALASKA CENTRAL.—John F. Goodwin has been appointed Receiver of the Alaska Central and the Tanana Railway Construction Co.

ATLANTA & CAROLINA (ELECTRIC).—This company has filed a mortgage securing $6,000,000 5 per cent. 30-year bonds of 1908-1938. This is a projected electric road between Atlanta, Ga., and Augusta, 160 miles.

ATLANTIC COAST LINE.—A semi-annual cash dividend of 2 per cent. on the common stock was declared on May 21. The dividend last January was 3 per cent., but was paid in Atlantic Coast Line 4 per cent. certificates of indebtedness.

CHESAPEAKE & OHIO.—Kissel, Kinnicutt & Co., and Moffat & White, of New York, are offering $2,000,000 first consolidated 5 per cent. mortgage bonds of the Chesapeake & Ohio at 112, yielding 4.30 per cent. The bonds were sold by the railroad company to provide for refunding first mortgage 6 per cent. bonds maturing July 1, 1908.

CHICAGO, BURLINGTON & QUINCY.—J. P. Morgan & Co., of New York, have sold $16,000,000 general mortgage 4 per cent. 50-year bonds of 1908-1958, at 95½. This is part of a total authorized issue of $300,000,000 secured by a mortgage dated March 2, 1908. The proceeds of the sale are to be used to repay the railroad company for money spent on improvements and acquisitions.

CHICAGO, MILWAUKEE & ST. PAUL.—On May 16 the train service between Chicago and Evanston, Ill., was cut down to two trains a day each way. The line north of Sheridan Park (Wilson avenue), is operated by the Northwestern Elevated, with through service between the loop and all stations north of Wilson avenue.

MAINE CENTRAL.—Lee, Higginson & Co., Kidder, Peabody & Co., R. L. Day & Co., and Estabrook & Co., of Boston, Mass., are offering the unsold portion of $2,119,000 first mortgage, 4½ per cent. 20-year bonds of 1908-1928 of the Portland & Ogdensburg. These bonds are guaranteed by the Maine Central. The bonds are offered at 104¾, yielding 4.15 per cent.

MISSOURI, KANSAS & TEXAS.—H. W. Poor & Company, of New York, are offering a block of the first and refunding mortgage 4 per cent. bonds of the Missouri, Kansas & Texas at a price to yield 5.35 per cent. The total outstanding of these bonds is $5,182,000.

NEW YORK & LONG ISLAND.—The Frawley bill giving the Public Service Commission, Second district, and the Board of Estimate authority to buy for the state, the Belmont tunnel which runs under the East river from Forty-second street to Long Island City, L. I., has been signed by the Governor of New York. The Court of Appeals of New York recently handed down a decision sustaining the validity of the franchise of the New York & Long Island to build and operate this tunnel. (May 22, p. 718.)

NEW YORK CENTRAL & HUDSON RIVER.—William A. Read & Company, of New York, are offering $150,000 stock of the Beach Creek Railroad, 4 per cent. dividends being guaranteed by the New York Central & Hudson River. This stock is offered at 96, yielding 4.20 per cent.

NEW YORK, NEW HAVEN & HARTFORD.—A bill in equity to restrain the New York, New Haven & Hartford from exercising any control over the Boston & Maine, and to separate from the New Haven road its trolley properties was filed in the U. S. Circuit Court in Boston on May 22. The suit was brought under the Sherman Anti-Trust Law and the railroad company has 30 days in which to file an answer. (Note page 720.)

The New York State Public Service Commission, Second district, has forbidden the use of soft coal by the engines of the New York, New Haven & Hartford at the Harlem River terminal yard.

PENNSYLVANIA LINES WEST.—The Pittsburgh, Youngstown & Ashtabula has authorized a $15,000,000 4 per cent. bond issue. The proceeds from the sale of these bonds are to be used in paying off prior lien bonds and making improvements.

SAN FRANCISCO, OAKLAND & SAN JOSE CONSOLIDATED (ELECTRIC).—The shareholders have authorized a consolidated mortgage to secure $7,500,000 bonds of which $4,500,000 are to be reserved to meet the present debt on the old San Francisco, Oakland & San Jose Railway, consisting of $3,000,000 first mortgage and $1,500,000 second mortgage 5 per cent. bonds due 1933.

SEABOARD AIR LINE.—A syndicate managed by the National City Bank of New York has purchased $3,000,000 three-year 6 per cent. receiver's certificates of June 1, 1908. The proceeds of this sale are to provide for the interest payments on underlying bonds and to pay interest and principal on various car trusts, and for certain new construction and other purposes.

SOUTHERN PACIFIC.—E. H. Harriman is said to have obtained control of the Ocean Shore railroad concession. The Ocean Shore holdings include a right of way through San Francisco.

UNDERGROUND ELECTRIC OF LONDON.—Secretary W. E. Mandelick announces that the holders of over 90 per cent. of the 5 per cent. profit sharing notes have deposited their notes and assented to the plan of readjustment. The company will, therefore, proceed with the readjustment as outlined in the plan dated April 14, 1908, and published by Speyer & Co.

UNITED RAILWAYS OF ST. LOUIS—The United States Supreme Court on May 18 handed down a decision sustaining the rights of the city of St. Louis, Mo., to levy a tax of one mill per passenger on the street railways. This ordinance, which went into effect January 1, 1904, succeeds an ordinance in which the city collected a license fee of $25 per car per year. The amount of back taxes due is about $850,000.

WESTERN MARYLAND.—The Mercantile Trust Co. will sell at public auction on June 9 all but seven shares of the stock of the George's Creek & Cumberland, which stock was pledged with the trust company by the Western Maryland to secure a note of $1,101,875. The par value of the stock is $999,600.
